Programme Management Department

Map of the Project Area

The designations employed and the presentation of the material in this map do not imply the expression of any opinion whatsoever on the part of IFAD concerning the delimitation of the frontiers or boundaries, or the authorities thereof.

Map compiled by IFAD | 07-11-2024

In line with IFAD mainstreaming commitments, the project has been validated as:

☐ Be gender transformative ☐ Be youth sensitive ☐ Be nutrition sensitive ☐ Prioritize persons with disabilities ☐ Prioritize indigenous peoples ☑ Include climate finance ☑ Build adaptive capacity

Executive Summary

This project is following the OPR procedures on Green Climate Fund (GCF) Cofinanced Projects (Annex XVII of the Project Design Guidelines).

GCF templates are being used accompanied by IFAD-specific Decision Memo (DM for Cofinancing GCF Projects). Please refer to the annexes for the full list of GCF-IFAD documents.

Chapter 1: Context

1.1 Project in brief

1. Please refer to the annexes.

1.2 National or Regional Context

2. Please refer to the annexes.

1.3 Strategic Alignment

3. Please refer to the annexes.

1.4 Portfolio and Lessons Learned

4. Please refer to the annexes.

1.5 Rationale and IFAD's comparative advantage

5. Please refer to the annexes.

Chapter 2: Project/Programme Description

2.1 Theory of Change

6. Please refer to the annexes.

2.2 Targeting Strategy

7. Please refer to the annexes.

2.3 Project/Programme Objectives

8. Please refer to the annexes.

2.4 Component, Sub-component and Activities

9. Please refer to the annexes.

2.5 Sustainability, Scaling Up and Exit Strategy

10. Please refer to the annexes.

2.6 Project financing

11. Please refer to the annexes.

2.7 Economic and Financial Analysis

12. Please refer to the annexes.

Chapter 3: Organisation and Management

3.1 Organisational set-up and Governance

13. Please refer to the annexes.

3.2 IFAD Supervision

14. Please refer to the annexes.

3.3 Planning, Monitoring and Evaluation

15. Please refer to the annexes.

3.4 Knowledge Management and Country Level Policy Engagement (CLPE)

16. Please refer to the annexes.

3.5 Target group engagement

17. Please refer to the annexes.

3.6 Strategic partnerships

18. Please refer to the annexes.

3.7 Financial Management

19. **1. Summary.** FM capacity and risk assessments have been completed per FMD guidelines; the assessment was made during the meetings with MOWRAM and NCCD ministry officials in January 2023. The overall FM risk at design is rated "Substantial" because of the risks at the entity and project control levels. The risk assessment takes into account the policy specifically designed for externally funded projects (SOP) that prove to be successful on other IFAD-funded projects; MOWRAM and NCCD already have experienced staff for implementation of donor funded projects with available computerized accounting software. . However, additional consultants will be required as government staff to be seconded will not have sufficient time to handle all FM aspects of the project and accounting software will need to be customized.

20. The Executing Entity (EE) for the project will be the Ministry of Water Resources and Meteorology (MOWRAM) which is responsible for sustainable water resource management and irrigation in Cambodia. MOWRAM will establish a Project Management Unit for the coordination of all components and consolidation of the project planning and reporting. In addition, the National Committee for Sub-National Democratic Development Secretariat (NCDD-S) will be responsible for the implementation of component 1 which is designed to improve farmlevel climate adaptation and resilience. The NCDD-S is a Direct Access Accredited Entity to the GCF and will have a
Project Implementation Unit (PIU) for implementing the component 1 activities. The FM operation is managed with the partial use of country PFM, especially the seconded staff for key positions and Standard Operating Procedures (SOP) on Financial Management of the externally financed project. Project fund flow, budget, accounting system and reporting, and external audit arrangements will not include the use of the Government's internal systems. They will be regulated in accordance with PIM and IFAD's FM requirements. This semi-ring-fencing model will mitigate the weakness of country risk and PFM shortcomings. Both MOWRAM and NCCD have extensive experience in working with international donors. MEF plays an essential role in the oversight and support of the project and effective collaboration with IFAD about project FM function. MOWRAM has no experience working on an IFAD-funded project; however, NCCD was the implanting agency of the ASPIRE project; the start-up training for PMU staff on FM and procurement is critical to ensure sufficient FM capacity.

21. Lesson learned from existing projects: Despite the country's high risk on the corruption perception index, internationally funded projects have been well performing with credit to the strong coordination of MEF, Ministries, and LPAs. The Standard Operating Procedure provides specific guidance on project FM operation.

22. **2. Organization and staffing.** MOWRAM is the Lead Project Agency, and NCCD is an implementing partner; MOWRAM and NCCD already have a finance unit with experience in international donor-funded projects that can support CAISAR. PMU and PIU will be set up for MOWRAM and NCCD with a combination of seconded staff and contract staff. The seconded Finance Officer will oversee the project's financial management to ensure the effective FM system and internal control are maintained in accordance with the procedures in SOP and PIM. The seconded Finance Officer will have relevant experience working on other internationally funded projects. The contract Finance staff will be hired to support project FM functions daily including: a) Ensuring sufficient supporting documentation and approvals for payment; b) Posting transactions to the accounting software; c) Providing periodical and financial reports to the management; d) submitting of IFR and WA to IFAD, providing other support to Seconded Finance Officer as required. The Finance staff will be recruited with relevant experience and qualifications. FM

functions will have clear roles and responsibilities to ensure the segregation of duty and payment authorization in accordance with SOP and PIM.

23. IFAD start-up training will be organized after project entry into force, focusing on IFAD financial control and financial management, budget and budget management preparation, disbursement procedures, financial reporting, and auditing.

24. **3. Budgeting.** The project budget is separate from the government budget; however, it will be integrated into the Public Investment Plan; the procedures for budget preparation are described in the SOP, and the AWPB will also include the projection of counterpart contributions. AWPB is subject to approval by MEF before submission to IFAD for no Objection.

25. NCCD-PIU will prepare the AWPB and submit it to MOWRAM-PMU; PMU will consolidate the AWPB and submit it to IFAD for NOL. The AWPB and procurement plan will be prepared in IFAD format with details and a summary of activities and categories.

26. The budget will be monitored in the accounting software. PMU/PIU will ensure to keep track of the progress reports against the budget and provide required information for interim financial reports and annual financial reports.

27. Integration of Project Budgets with PIP and Ministry/Sector Budgets. The Public Investment Program (PIP) is the Government's main mechanism for identifying and listing specific projects and activities to achieve the broader sectoral goals and targets specified in the NSDP. In turn, the Government's Rectangular Strategy and the NSDP are the two main documents that drive the Government's Development Agenda. The PIP is prepared on a three-year rolling program basis and is developed and approved prior to the commencement of the Government's Budget Cycle. For this to occur, the PIP process begins well in advance of the Budget Cycle, as described in the updated Manual on Project Management of the Standard Operating Procedures (SOP).

28. **4. Disbursement Arrangements and Flow of Funds.** The government treasury system is not applied for project fund flow. MEF will authorize the opening of a designated account (DA) in USD at the National Bank of Cambodia for the receipt of Financing from IFAD. There will be two USD project accounts (one for MOWRAM and one for NCCD) which shall be opened at commercial banks for the payment of project activities.

29. One Government Counterpart Fund Account is to be maintained by MEF through which the proceeds of the Financing shall be further transferred to two sub-accounts in commercial banks to receive the counterpart fund from the Counterpart Fund Account.

30. The disbursement of the IFAD fund will follow through the Revolving Fund Mechanism in which the project can withdraw/justify the advance based on the Interim Financial Report (IFR) following the procedures and conditions outlined in FMFCL. IFAD will send the FMFCL to MOWRAM and MEF with guidance on disbursement procedures; MEF will send IFAD the ICP letter providing the delegation and authorization of the persons who can request and approve the submission of IFR and WA in ICP.

31. As the Lead Project Agency, MOWRAM will be responsible for consolidating the IFR from NCCD and submit to MEF for approval via ICP; once MEF approves the WA, it is sent to IFAD for the justification and advance. Funds will be sent from IFAD to DA according to the consolidated cash forecast requested and then from DA to MOWRAM and NCCD project accounts according to the respective cash forecasts for each unit.

32. **5. Internal Controls and Internal audit arrangements.** According to the PEFA for Cambodia, the effectiveness of internal audits was rated C.

33. PMU and PIU will be set up separately from the government system and will follow the internal control procedures from the Government's Standard Operating Procedures (SOP), which is deemed to be effective for internationally funded projects. The SOP articulates the responsibilities and critical elements of internal control, financial delegation, transaction processing, and computerized accounting system controls. PIM and Financial Management Manual will outline key FM arrangements and controls.

34. The Internal Audit Department of MOWRAM and NCCD will conduct the internal audit of PMU and PIU annually to ensure compliance with the internal control procedures; the outcome of the internal audit will be shared with IFAD.

35. **6. Accounting Systems and Financial Reporting Mechanisms.** PMU and PIU accounting procedures will follow Standard Operating Procedures (SOP) for internationally funded projects. According to SOP, CAISAR will apply the Cambodia Public Sector Accounting Standard (cash basis), which is based on the International Public Sector Accounting Standards (IPSAS).

36. Standard accounting software shall be used for PMU/PIU that will be compatible with IFAD and other donor's financial reporting requirements. Standard Government's chart of accounts will be set up in the accounting software to capture all payment transactions; in addition, project components, categories, sources of funds, and other segments will be set up and recorded for the transactions in the software to ensure financial reports and budget reports produced in accordance with IFAD and Government requirements. The details of the accounting process and records are outlined in the SOP. All accounting records are required to be maintained in electronic format for a period of 10 years after project closure.

37. MOWRAM PMU will be responsible for the consolidation of financial reports from NCCD-PIU for each quarter; within 30 days, NCCD PIU will send to MOWRAM PMU the interim financial report (IFR) in the agreed format that will finally be consolidated and submitted to IFAD for justification of advance and requesting new advances.

38. Fixed asset register will be regularly maintained by PMU and PIU and subject to the verification and reconciliation as indicated in section 15 of SOP. Fixed asset register will be part of the audited financial report as required by IFAD.

39. **7. External Audit.** CAISAR project financial statements will be audited by a private audit firm appointed by MEF, with the TOR prepared by MEF taking into account the IFAD requirements. The audit will be conducted in accordance with Cambodian Auditing Standards, which is adapting the International Standards on Auditing. The unaudited annual Financial Statement will be

submitted to IFAD within 4 months after the end of the fiscal year; the audited financial statement will be submitted to IFAD within 6 months after the end of the fiscal year. The management letter with an assessment of the project's internal control matter will be included as an integral part of the audit report.

3.8 Procurement

40. Please refer to the annexes.

3.9 Risks and Risk Management

41. Please refer to the annexes.

3.10 Implementation Readiness

42. Please refer to the annexes.

DECISION MEMO

TO: QAG Secretariat

THROUGH: Reehana Raza
Regional Director, APR

FROM: Frew Behabtu
Country Director, APR

DATE: 21 November 2024

SUBJECT: **Memo for cofinancing GCF projects**
Kingdom of Cambodia: Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) **Project ID:** 2000003926

Map of the project area

Introduction

1. The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project is one of the pipeline projects in IFAD's Country Strategic Opportunities Programme (COSOP) 2022-27. The project directly links to COSOP's Strategic Objectives 3 of supporting the development and adoption of low carbon emission, climate resilient and environmentally sustainable agriculture techniques, promote agriculture diversification and climate resilience of poor rural people's economic activities in Cambodia. The project will be one of the pillars of the IFAD programmatic approach through the improvement of farm-level climate resilience and water use efficiency climate-proofing water infrastructure to complement other key pillars of the IFAD country programme: ASPIRE (extension programme), SAAMBAT (market infrastructure, digital technology, and youth programme), AIMS (value chain and market programme), and the IFAD non-sovereign operation facility with AMK micro finance one of the leading private microfinance institutions in the country.
2. The lack of irrigation water is a crucial barrier for farmers; alongside projected increase in dry days and rising temperatures aggravating climate change-induced water shortages which prevent the cultivation of more than a single crop each year. The lack of timely information on droughts and floods (seasonal forecasts, the changing length) is a major problem. Farmers lack the knowledge

and tools to adapt their farming practices and production techniques to climate change; they are largely unaware of climate resilient practices, stress-tolerant seed varieties and improved planting materials, efficient input management, or the benefits of applying these practices. Persistent poverty, limited access to finance, and insufficient institutional capacities have left the rural agrarian population vulnerable to the negative impacts of climate change, economic slowdown, and environmental degradation. The Royal Government of Cambodia (RGC) is committed to the sustainable development of the country's water resources and to strengthening resilience against unexpected shocks, such as those resulting from climate change impacts. Establishing sustainable irrigation is a key priority for Cambodia to alleviate food poverty and ensure economic growth in the face of climate change. The CAISAR project originated from the RGC's National Water Resources Management and Sustainable Irrigation Road Map and Investment Program (2019 -2023). The project will support the implementation of Cambodia's Sustainable Development Goals 2016-2030, the National Strategic Plan on Green Growth 2013-2030, and the Pentagonal Strategy, Phase I, which outlines the government's overarching objectives and provides a roadmap for economic growth, development, and poverty reduction. The project is also strongly aligned with Cambodia's Nationally Determined Contribution (NDC). The project is designed to assist the Ministry of Water Resources and Meteorology (MOWRAM) with its strategic plans to modernize the irrigation sector.

3. The overall goal of the project is to introduce controlled water management in the project areas to make the agriculture in these schemes' climate resilient and sustainable. The specific objective of the project is to modernize the irrigation sector by installing smart irrigation systems, enable farmers to adapt agricultural technologies to mitigate climate risks through use of energy and water efficient technologies, timely weather information and improved market integration and by introducing flood control facilities to prevent flooding of the downstream ends of the 6 selected irrigation schemes. CAISAR's Theory of Change is premised on the experience that addressing the complex impacts of climate change on rain-fed and irrigated agriculture requires action at three levels; farm level; irrigation scheme level and at the national level by creating a strong institutional base and an enabling environment.

4. The project's objective will be achieved by implementing three components that aim at addressing climate change vulnerabilities, increasing agriculture productivity, and developing institutional capacities. The components include Component 1: Farm-level climate adaptation and resilience which focuses on building climate resilience (CR) of smallholder farmers and enhance sustainable production through evidence-based planning and context-relevant climate resilient practices at the farm level. Component 2: Upgrading and climate-proofing of water infrastructure for increased resilience which will focus on rehabilitating and modernizing of irrigation and flood protection/drainage infrastructure in the 6 sub-projects, including irrigation and drainage canals, flood control embankments, and ponds, to provide high-efficiency climate-resilient irrigated agriculture systems for adapting to both increasing flood and drought conditions. And Component 3: Strengthened institutional and regulatory capacity for low-emission climate-resilient development pathways which aims to strengthen Government institutions, mainly the MOWRAM, MoE the NCDD-S and the FWUCs. The focus for MOWRAM will be on upgrading technical capacity in various aspects of Climate Resilient irrigation design and management. The key focus area under NCDD-S will be on climate resilient crop production. For MoE the emphasis will be on strengthening climate policies and strategies and in building capacities for monitoring climate actions at national level. This component will have three sub-components.

5. The project was initiated by the Asian Infrastructure Investment Bank (AIIB) and the Royal Government of Cambodia (RGC) and later tasked IFAD (as GCF Accredited Entity) to take lead in the preparation and the submission of the GCF funding proposal for additional resource of USD 80 Million. The total funding proposal is USD 240 Million (USD 100M from AIIB, USD 80M from GCF, USD 45M from IFAD- (USD 20M PBAS, USD 25M Financing Gap, and USD 15M from the RGC). The project will be implemented through the Ministry of Water Resources and Meteorology (MOWRAM) as Executing Agency and the national Direct Access Entity (DAE) –the National Committee for Sub-National Democratic Development Secretariat (NCDD-S) as an Implementing Agency.

Rationale for IFAD's Engagement in Co-financing and IFAD's Value Added

6. IFAD has been long engaged in Cambodia in areas of agriculture innovation and changes through various projects and program's focusing on poverty reduction and more recently on climate change impacts. To date IFAD, under the new COSOP 2022-27, has supported 4 investment projects and

pipeline, CAISAR, for a total project cost of US$ 700 million with financial contribution of US$ 218 million from IFAD and US$ 482 million in co-financing. With IFAD, Cambodia has previously mobilized climate and environment financing from the GEF (GEF6 S-RET) and through IFADs ASAP1 programme (ASPIRE). Recently additional GEF project, Climate Resilience Enhancement for Building Adaptive Capacity in Agri-Value Chais in Cambodia (CREA) was approved that will be implemented through ASPIRE-AT. The portfolio is in a good health, without any chronic problem project.

7. The RGC considers IFAD as one of the key donors and a valuable partner in its development initiative. IFAD has gained trust and confidence of the Government and the farming community. The project will benefit from IFAD's global experience of funding cost effective and people centred programmes. IFAD's comparative advantage lies in its targeting of the poor and vulnerable people and investing to ensure sustainability, climate resilience and inclusive economic progress.

8. Investments in the water sector are one of new pillars of the IFAD programme in order to stabilize and increase agriculture production, reduce farmers' susceptibility to droughts and floods, and ensure food security. Irrigation systems need to be rehabilitated and upgraded to improve their performance and enable multiple cropping of rice while, at the same time, rendering them more resilient to climate change impacts. In addition, given the important role of Farmer Water User Committees (FWUCs) in helping sustain irrigation schemes, it is necessary for IFAD to invest in establishment of efficient and effective FWUCs, through community organization, and provide them with adequate inputs and support, particularly training and capacity building, to ensure that they function well. FWUCs also need to be provided with financial assistance, especially during the initial years of irrigation system operation before irrigation service fees (ISFs) could be fully collected to meet O&M expenses. Policy and legal mechanisms need to be put in place to enable farmers, through the elected FWUCs, to collect water user fees to enable the schemes to be operated and maintained adequately with appropriate incentives.

Lessons Learned

9. While IFAD has not been engaged in irrigation and water sector in Cambodia so far, this project design builds on the lessons learned and experience gained out of implementation of similar projects and programs in the country. In addition, it will incorporate lessons and best practices available globally.

10. Structural transformation of the economy has been accompanied by increasingly market-oriented agriculture. The COSOP 2022-27 highlights lessons learned from IFAD's country programme including the potential for smallholders to successfully compete in the market given appropriate support which includes market-led "extension plus" services, increasing use of mobile applications and a programmatic approach to integrate capacity building with "hard" investments. The Country Strategic Programme Evaluation (CSPE) of 2018 highlighted the need for tailored strategies to support agricultural commercialisation of relatively advanced smallholders and to support the coping strategies of poor households.

11. IFAD's experience in helping smallholders transition to farming as a business highlights the importance of smallholder POs particularly in linking farmers with buyers. More than 1,400 POs mobilised by ASPIRE and AIMS have active contracts with buyers. Lessons from IFAD's Independent Office of Evaluation on value chain programs show that sufficient duration of training of PO is key for them to reach required maturity and sustainability levels. Systemic change requires use of a holistic approach focusing on: (i) social capital and inclusive governance; (ii) production and productivity; and (iii) PO's access to sustainable markets (domestic urban and export) and (iv) viable business model (revenue streams vs costs) and quality financial management. It implies a blend of tailor-made interventions to improve the technical, management and entrepreneurship skills of the smallholders and their apex POs/ACs so that they can borrow, invest in value addition, engage actively with key off-takers, and become recognized business entities within selected pro-poor value chains1. As suggested in PMI toolkit on producer organizations and lessons from several projects, developing and monitoring adapted score cards can help track progress and target required support.

[1] More specifically, the new Agriculture Services Programme for an Inclusive Rural Economy and Agricultural Trade (ASPIRE-AT) currently under design foresees in its exit strategy that "By the end of the project, producer organisations (ACs and Unions of ACs) should be registered as legal entities, have adequate business management capacity and have secure partnerships with agri-businesses and attract credit and investment from financial organizations."

12. To support scalable value chain investment, it is key to develop partnerships with financial institutions and adapt solutions to value chain economic needs.2. IFAD's partnership with AIIB is focused on achieving synergies between their mandates on capital intensive rural infrastructure and our focus on farmers capacity building and small-scale rural infrastructure. Natural hazards such as floods and droughts occur annually. There are annual water shortages because of the climate, topography, limited water storage, and accessibility, especially in the Tonle Sap River basin. During the wet season, extensive flooding and flash floods cause infrastructure damage and waterborne diseases. Climate change is likely to intensify storms and extend the number of consecutive dry days during the wet season and cause hotter days during the dry season. Annual rainfall is projected to increase by 3.6%–4.8% by 2050, whereas the number of wet days is projected to decrease by 3.7%–7.4%.7 This will likely lead to even greater pressure on water supplies during the dry season and flood management during the wet season.

13. The voice and civic engagement of farmers and other rural actors, remains limited in the decision making on the design and implementation of programs for value chain development. Farmer organizations in Cambodia tend to be small, with limited official recognition (unless they are registered as cooperatives) with the local authorities. Nonetheless, they have the potential to play an important role in supporting farmers, to ensure they have a voice in the design and implementation of programs and projects which are designed to improve their livelihoods. Along with their small size, farmer organizations in Cambodia are constrained by their limited human capacity. The main actors supporting farmer organizations in Cambodia are a range of non-governmental organizations that are active at the provincial level to build both their technical and leadership capacity. There is a need to partner with these organizations to ensure farmer organizations can act as an effective voice during the implementation of donor financed rural development program and to ensure that the views of all (regardless of age, gender, and ethnicity) are well represented.

14. Farmers lack also access to on-demand irrigation and adequate water management, which is essential for successful crop diversification and competitiveness improvements. Though overall Cambodia can be classed as having abundant water resources, its availability is highly variable both temporally and spatially. Even during the wet season, there can be long dry spells and supplementary irrigation is required to avoid crop moisture deficits between rainfall events. Most existing irrigation schemes have been developed for rice cultivation and would have to be adapted for diversified cropping with different irrigation methods to be introduced, depending on the crop.

15. One of the main reasons for the agriculture sector's underperformance is poor agricultural production infrastructure, which severely limits cropping intensity and crop diversification. Of the 3.98 million ha of agriculture land, only about 1.30 million ha are located within the command area of 2,480 irrigation systems.5 90% of the systems are underperforming or dysfunctional, mainly because of the lack of (i) proper design; (ii) a farm-level distribution system; and (iii) consideration for crop water requirements, water availability, and hydraulic conditions; (iv) system O&M owing to expensive and unpopular farm-level user fees; (iii) systems developed in regions with suitable soils; (iv) sustainability of many systems over a 10-20 year timeframe; and (v) farm credit, inhibiting the affordability of on-farm irrigation equipment (pumps, fuel) and tertiary access (feeder canal construction). As a result, dry season rice crop only accounted for about 18% of total rice production in Cambodia as farmers only have water for wet season rice and are not willing to invest in higher-value crops due to unreliable water supply.

16. One of the key lessons in Cambodia and globally has been the need to transform irrigation sector from a sectorial approach to that of an integrated approach. In the past, irrigation intervention has been more focused to rehabilitation of dilapidated infrastructures without giving due attention to social and agricultural dimensions. This has led to poor performance of irrigation sector. Learning from this, the proposed project integrates irrigation investment (component 2) with agriculture within broader framework of integrated water resource management. It also considers irrigation system as part of multiple water use systems (environmental, social uses) and technical designs will follow an integrated approach to address needs of different users.

17. Past irrigation and agriculture intervention has largely followed a top-down approach with users at the end of receiving end in Cambodia. This had serious implications for future sustainability of investments. Implementation of this project, in both components, largely follows a participatory

[2] Grow Asia report on inclusive value chain business model, 2020:
http://exchange.growasia.org/system/files/Grow%20Asia%20x%20iBAN%20Knowledge%20Paper_FINAL_0.pdf

approach. It will also invest in strengthening the local institutions like farmers water users' groups, producers' organizations and enhance their capacity in agriculture water management.

18. Future water management in the changing climate context is a complex issue world-wide. Application of evolving tools and technologies including the ICTs in both agriculture and water management has been globally recognized. In water management, water accounting, ET based water management, ICT applications for modernizing water control systems have been widely applied. For flood control and associated risks management, advance technologies including application of RS technologies have been adopted. This however needs new capacities and investments and reforms in policies and institutions. The project design has incorporated most of the evolving technologies and practices as applicable to Cambodian context.

Project Impact Potential

19. The project is expected to lead to (i) improved farm-level climate adaptation, resilience, and water use efficiency; (ii) rehabilitated/upgraded, climate proofed, and modernized irrigation infrastructure for increased resilience and (iii) strengthened institutional and regulatory capacity for low-emission climate-resilient development pathways. Training farmers on climate change adaptation and mitigation, the Project will enhance their knowledge and skills and improve the environment for enhancing climate resiliency in irrigated agriculture. The CAISAR investments are expected to improve yields and provide better drought and flood resilience over the 25-year asset life, with the project expecting significant yield and crop production improvements in all targeted irrigation sub-project areas3. The CAISAR project will be novel in Cambodia, with its focus on reducing the vulnerability of rural populations through the creation of a climate resilient IWRM based project design that incorporates flood protection, sustainable water resource development, climate smart solutions, environmentally aware design and gender equality4. The CAISAR project will promote economic growth and improve the livelihoods of those affected by enhancing agricultural production, reducing farmers' exposure to variability in crop yields, and increasing monthly income for families.

20. The use of innovative climate-smart solutions will reduce the overall climate impact of the scheme and endeavor to reduce the emission of greenhouse gases from the existing and proposed agricultural practices with the introduction of solar pumps and improved water management and agronomic practices in rice cultivation (Land Laser Levelling, Direct seeding, Alternate Wetting and Drying techniques together with improved agronomic practices like IPM). The project will support the RGC's effort to improve and strengthen the disaster resilience of the population of four provinces in Cambodia through improved water information system and agriculture advisory services. Through combining irrigation rehabilitation with climate smart and resilient design, the project will build a low carbon and climate resilient future, enabling rural populations to adequately adapt to current and future climate impacts and increase their food security and livelihoods whilst also enabling the RGC to meet its climate targets.

21. CAISAR is expected to impact 500,000 people directly and 2,300,000 people indirectly. The direct beneficiaries are expected to benefit from adopting improved and climate resilient cropping and diversification patterns, improved access to water, enhanced water governance, greater market integration for improved access to adaptive inputs and early warning systems. The combined impact of these investments will be to enhance water and food security. Improved irrigation infrastructure has the potential to increase Cambodia's potential rice yields. It is expected that changing from rain-fed irrigation or using dilapidated irrigation infrastructure to proper systems for irrigated rice cultivation with improved water management could result in significant production increase. Water security will be enhanced as a result of modernizing the irrigation systems, making them more resilient to climate risks and reducing conveyance losses. The project will enhance water use efficiency for an area of 32,056 ha out of a gross area of 80,000 ha in the target areas during the wet season for the rice crop. From this area, a second irrigated dry season rice crop can be established on 22,051 ha. In the remaining 10,005 Ha a non-rice crop will be established in the dry season, mainly homestead gardening including vegetables, chicken production and aquaculture production. The project will assist farmers gradually diversify their cropping patterns for additional income in the dry season. The project will develop the required irrigation infrastructure to allow for a second irrigated rice crop during the dry season using AIIB resources. GCF resources will be used to provide investments for flood control/drainage for the entire gross project area of 80,000 ha.

[3] Annex 2: Feasibility Study. WAPCOS Report. 2022.
[4] Ibid. 2023.

22. Reduction of GHG emissions from rice production will be achieved by shifting away from traditional flooded rice methods to improved water management with required drainage facilities diversifying to other crops/livestock/fisheries, promoting carbon sequestration activities, and use of renewable energy sources for pumping water from canals to fields instead of the diesel pumps currently used. The project will reduce and avoid GHG emissions as a result of better production practices for rice cultivation, improved soil management and replacement of diesel pumps with solar pumps for pumping water from the canals to the tertiary canals and farmer's fields. The key factors contributing to the decrease is the reduction in the area under flooded rice, improved irrigation practices and greater use of Alternate Wetting and Drying practices for rice production and the replacement of diesel pumps with solar pumps, assuming a 75% adoption rate for the switch. Based on these factors it is expected that - the total mitigation potential of the project over 20 years is -1,001,400 tCO2-eq. This would amount to a carbon balance of -2.3 tCO2-eq per hectare per year (Annex 22).

23. The indirect beneficiaries will be generated through wider dissemination of the adaptation practices and technologies through lead farmers, private sector and agriculture extension workers and by enhanced availability of inputs in the market once the practices are adopted and generate a demand to which private suppliers respond. Benefits are also expected to accrue as a result of the more sustainable production technologies and increase in yields along the selected value chains through greater resilience and enhanced access to water. One of the most widely spread benefits will result from the use of early warning systems that will have a coverage beyond the project area. The early warning systems are expected to help prepare the farmers in case of changes in precipitation and temperature, droughts, floods, to help prepare them against crop loss through pest infestation and disease.

24. Another aspect which will add to water security and sustainability is through improved water governance. The project will strengthen local level institutions such as the FWUCs which have the mandate to operate and maintain irrigation schemes at the tertiary level. The project will strengthen their capacity for collection of water fee and plans to pilot mechanisms for collection that will be up scaled by MOWRAM using the existing Cambodian water law under which the farmers have to contribute to the O&M costs of irrigation systems. The project expects that farmers will enhance their contribution to O&M based on a more reliable and efficient system that will make the water governance system more financially sustainable.

Contribution to SDGs and alignment with country sector and IFAD objectives

25. The project will directly support UNSCDF's the Outcome 1 (Economy – By 2028, people in Cambodia, especially those at risk of being left behand, benefit from and contribute to productive, diversified, gender equal, formalized and low carbon and climate adapted captivity), Output 2.1 (Agrifood systems are more efficient, climate-adapted, inclusive, formalized and safer. By focusing on climate resilient irrigation, the project will directly address to SDG 13 on climate action. In addition, its implementation will directly contribute to achievement of SDG 6, clean water and sanitation and SDG 12, responsible production and consumption. The Project is focusing on climate change adaptation with cross-cutting benefits through the reduction of GHG emissions linked to the use of high efficiency smart irrigation systems, the use of renewable energy for pumping, and agroforestry and cover techniques to reduce evapotranspiration and enhance GHG reduction. The Project is aligned with the RGC's priorities on low-carbon and climate resilient development as outlined in the RGC's overarching Rectangular Strategy Pillar IV 2019 -2023 and with the thematic portfolio Climate Change and Natural Resources Management of the Mekong Region Cooperation Programme (MRCP) 2022-2025.

26. The proposed Project with its disaster and climate change adaptation design features will be upscaled to other provinces. RGC and MOWRAM appreciate water is a limited resource and is taking an integrated water resource management (IWRM) approach to managing water resources nationwide. MOWRAM is establishing the Water Resources Data Management Center (NWRDMC) and a National Water Resources Information System (WRIS) with ADB assistance. WRIS is an adaptive system, housed in the MWRDMC facility, that integrates spatial information, CISIS and IAMS, meteorological data, hydrological data, ground measurements, satellite-derived remote sensing data, and Lidar. All CAISAR data is coalesced in WRIS and used to model water availability, use, and floods across entire watersheds.

27. The project will be one of the pillars of the IFAD programmatic approach through the improvement of farm-level climate resilience and water use efficiency climate-proofing water infrastructure in complement to other pillars: ASPIRE-AT stergnth the PO and AC, improve domestic and

international market), SAAMBAT (market infrastructure, digital technology, and youth programme), and AIMS (value chain and market programme). The project will support all the three COSOP's strategic objectives[5].

Definition of Target Groups and Targeting Strategy

28. The proposed project will benefit more than 2.3 million people (Roughly 13% of its population) in four provinces across Cambodia: Kampong Speu, Kampong Chhnang, Kandal and Pursat. Identification of the target areas has been done based on poverty situation and increasing threat of high flood risk. These geographic targets were accordingly selected by the RGoC given their vulnerability to climate change on water and irrigation sector and priority for Government in the context of their SDG targets, especially given the moderate-to-high poverty incidence rates that prevail in these four provinces. The IFAD and GCF investment will directly targeting the smallholder and poor farmers.

29. Geographical targeting strategies typically focus on less-developed or food insecure regions or districts. This can be problematic for value chain projects, as value chains are not bound by administrative borders. Following the 2019 Independent Evaluation of IFAD's engagement in pro-poor value chain development, the project will use a cluster approach, grouping poor areas with wealthier ones offering comparative advantages in markets. To ensure greater participation and social inclusion of the project's target groups, a combination of self and direct targeting methods will be set in place. For self-targeting, the selection of value chains will be conducted based on specific social and climate criteria to ensure investments are fitted for target beneficiaries. Direct targeting will be done through dedicated activities (e.g. specific pro-poor or women/youth-led value chains) as well as through quota for participation of target beneficiaries. The targeting strategy will be based on the following: i) selection of value chain and agricultural practices more conducive for specific targets (e.g. cassava with resource poor farmers, poultry with women participants, value chains with fewer capital intensive agricultural innovations etc.); ii) providing pro-poor incentives while also enforcing pro-poor requirements along financial and value chain partnership and screening of underlying business proposals and farming practices; iii) mobilization of farmers in inclusive PO that can negotiate effectively with other actors and create value for members through functional upgrading (e.g. through processing, and reducing the role of intermediaries); iv) investments opportunity in enabling environment.

IFAD's Mainstreaming Areas

30. The project is targeting financing from the Green Climate Fund therefore is fully aligned with a climate focus and the strong rationale of the project which guides all aspects. The project meets IFADs mainstreaming commitments for climate adaptation and has co-benefits of mitigation through climate smart rice production activities. The project will prioritize opportunities lower Cambodia's overall methane emissions through low emission practices and diversification. The project is linked to the global methane pledge through investments to improve existing canals and pumping facilities to enable controlled water management. The project will also promote training and an awareness campaign to encourage better water management behavior.

31. The project aims to be a gender mainstreamed project and ensure both men and women will equally benefit from project intervention. Needs, criteria and preference of women will be incorporated in the project design involving them in all project activities and at all stage of project implementation. The aspects of the project focused on diversification of rural livelihoods as well as more consistent access to water will also significantly improve the nutrition of beneficiaries. The aspects of youth will be further defined during the project design. Project's result framework will include indicators that will help evaluate how Gender, youth and nutrition have been mainstreamed in project implementation.

Results Framework

32. See the Logical Framework in section E of the GCF FP and ORMS that includes IFAD core indicators.

[5] COSOP's SO1: productive capacity of 250,000 poor Cambodian rural households increased, including measures to raise productivity in farming and employment as a basis for; SO2: 250,000 poor Cambodian rural households increase their incomes through participation in remunerative agricultural value chains, to be achieved primarily through interventions to assist smallholders to form producer organizations linked to strengthened pro-poor value chains; and SO3: strengthen the environmental sustainability and climate resilience of poor rural people's economic activities.

Knowledge Management

33. The project will engage with the International Rice Research Institute (IRRI) through a technical assistance contract to prepare high-level knowledge products and provide capacity support to MAAF, service providers, and other stakeholders. IRRI will organize 15 consultative workshops and seminars and develop 16 knowledge products and training materials on the application of Mechanized Dry Seeded Rice. The project will integrate the roles of project officer to handle both M&E and KM, exemplifying a strong integration between knowledge management activities and the project's monitoring and evaluation system, thereby providing evidence for policy engagement. The facilitation of knowledge management themes through workshops and focused studies ensures continuous knowledge sharing and learning. Additionally, the project is dedicated to transparency and broad stakeholder engagement by disseminating information to the public via various channels—including electronic media, printed materials, and press articles. The PMU and PIUs will actively disseminate knowledge and green solutions in climate adaptation and mitigation among farmers, policy and decision-makers, and rural communities.

Sustainability and Scaling up

34. The project will introduce a self-sustaining climate-smart agriculture sector in which farmers will adopt climate-resilient technologies and practices, including water-efficient adaptation methods. Two factors will support this transformation: First, these practices offer better economic returns while adapting to climate-resilient methods. Second, farmers will receive technical support, awareness, capacity-building assistance, and access to modernized and climate-proofed irrigation infrastructure tailored to their service requirements, helping them overcome initial adoption barriers. The project will facilitate and demonstrate the benefits of climate-resilient agricultural practices. It will mainstream the use of a range of climate-smart farming technologies and practices that reduce vulnerability to evolving climate threats (such as floods and droughts), create financial benefits for farmers, ensure increased production, and protect production assets.

35. The project has developed a scalable model for climate adaptation and mitigation, designed to be upscaled through both the public and private sectors. It will invest in climate-resilient agricultural technologies and practices, modernize and climate-proof irrigation infrastructure, and strengthen the institutional capacity of relevant organizations to enhance climate resilience. The lessons learned and experiences gained from this initiative will guide future efforts to improve climate resilience in irrigated agriculture across Cambodia.

Management Arrangements

36. IFAD will serve as the Accredited Entity (AE) for this project and will be responsible for the overall management of the project, including: (i) administrative, financial and technical oversight and supervision throughout project implementation; (ii) ensuring funds are effectively managed to deliver results and achieve objectives; (iii) ensuring the quality of project monitoring, as well as the timeliness and quality of reporting to GCF; and (iv) undertake project mid-term and completion evaluation. IFAD will ensure that each of these areas of responsibility are undertaken in accordance with the detailed provisions outlined in the Accreditation Master Agreement (AMA) between IFAD and GCF. IFAD's role as AE will be assigned to its sub-regional office in Hanoi and its country office in Cambodia. AIIB is co-financing the project and will provide funds directly to the MEF for remitting to MOWRAM. In its capacity as co-financier, AIIB will undertake joint supervision of the project with IFAD and also participate in and contribute to the evaluation of the project.

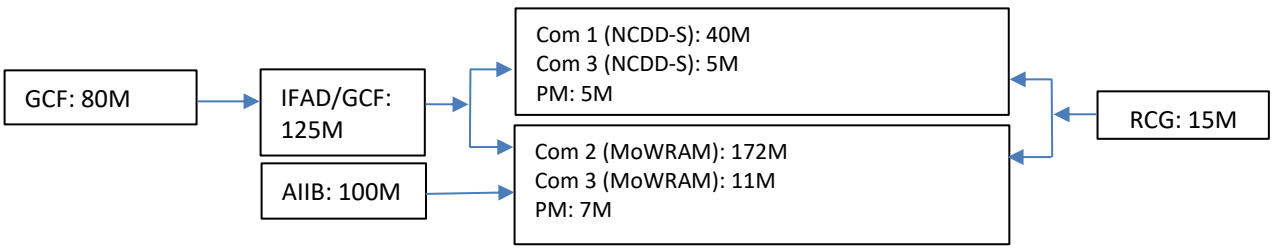
37. The project builds on the expertise of MoWRAM, which successfully implemented the Rehabilitation and Improvement of the Stung Chinit Irrigation System, aimed at enhancing agricultural productivity and water management efficiency. Key modifications have been made to increase the project's impact, including a stronger focus on agriculture and the integration of green and climate-smart technologies. These social investments will be implemented by NCDD-S, which has developed a robust capacity for executing a variety of livelihood projects aimed at enhancing local governance and community development. NCDD-S's organizational structure is designed to support these initiatives, with a clear mandate to coordinate and support sub-national administrations. The committee is effective in stakeholder engagement, working closely with local governments, communities, and international partners to ensure project success. Strengthening these partnerships and communication channels can further enhance project outcomes.

38. The project secures a start-up advance of up to US$500,000 and does not anticipate the need for the Facility for Faster Implementation of Project Start-Up (FIPS). The plan includes essential

preparatory steps such as opening designated accounts, setting up project management offices, and scheduling onboarding sessions for key PCU staff on IFAD's OPEN system and Client Portal.

Executing Agency

39. The Executing Entity (EE) for the project will be the Ministry of Water Resources and Meteorology (MOWRAM) which is responsible for sustainable water resource management and irrigation in Cambodia. MOWRAM will establish a Project Management Unit for the coordination of all components and consolidation of the project planning and reporting. In addition, the National Committee for Sub-National Democratic Development Secretariat (NCDD-S) will be responsible for the implementation of component 1 which is designed to improve farm-level climate adaptation, resilience, and water use efficiency. The NCDD-S is a Direct Access Accredited Entity to the GCF and will have a Project Implementation Unit (PIU) for implementing the component 1 activities.



40. A Project Steering Committee (PSC) will be established for inter-ministerial coordination. It will be chaired by the Minister of MOWRAM and comprise of senior officials from MOWRAM, the Ministry of Economy and Finance (MEF), the Ministry of Interior (MOI) which is responsible for the NCDD-S), Ministry of Agriculture, Forestry and Fisheries (MAFF), Ministry of Environment (MOE), and the Provincial Governor's Offices of Pursat, Kampong Chhnang, Kandal, and Kampong Speu provinces. An Inter-Ministerial Resettlement Committee (IRC), chaired by MEF, will manage resettlement and land acquisition issues where they arise. The National Project Coordinator of the Project Management Unit (PMU) will serve as a secretariat to the PSC.

Flow of Funds

41. The Asian Infrastructure Investment Bank (AIIB) and GCF are the two main co-financiers of the project, with IFAD and the RCG also providing significant funds. AIIB and IFAD have provided grant funds and technical assistance for project preparation activities. The GCF funds will be provided to IFAD and then transmitted through the Ministry of Economy and Finance (MEF) of the Government of Cambodia and then through the Ministry of Water Resources and Meteorology. The funds of the Asian Infrastructure Investment Bank (AIIB) will also be provided through the MEF to MOWRAM for investment in the climate resilience and modernization of irrigation infrastructure. The Royal Cambodian Government will provide in kind support directly during the implementation of the project.

42. MEF will authorize MOWRAM PMU and the NCDD-S PIU to open a designated account (DA) at the National Bank of Cambodia for funding from IFAD and GCF. MOWRAM PMU and NCDD-S PIU shall open one project account at a commercial bank to receive the fund transfer from the IFAD DA to pay for project activities.

Figure 1: Funds Flow Diagram

Supervision Arrangements

43. IFAD will act as Accredited Entity (AE) and will assume the oversight function. It is responsible for the project design, and administration of the component and sub-components to be financed by GCF and IFAD in close coordination with AIIB. AIIB agreed to follow IFAD's environmental and social safeguards policy and procedure. Project supervision, Mid-Term Review (MTR) and Completion Reviews will be conducted jointly by GoKC, IFAD and AIIB in line with GCF requirement.

Risk

44. It is a medium risk project in overall terms. While the risk associated with the operational dimensions of the project (technical, financial and procurement, staffing etc.) are moderate, while environmental and social risks are high. Cambodia is already integrated to the global economy and changing global economic context will have profound impact on project's outcomes and implementation measures. Key factors include increasing commodity prices as a result of Ukraine conflict and impacts of COVID

19 which is expected to continue for several years. While addressing the impacts of these external shocks are challenging and needs continuous monitoring of the evolving situations, the associated risks can be reduced through appropriate policy interventions by the government.

45. The project is going to be implemented in complex agro-ecological setting. The project sites are adjacent to the Tonle-sap Lake connected to Mekong River. High flood risks and vulnerability to irrigation system not only depends on the climate change context of the project area, but also to the wider Tonlesap-Mekong hydrological settings. Addressing flood risk and future water management, which are the core part of the project, are therefore complex. This will be addressed through establishing a sound water accounting systems and through flood risk management strategies and will be included in the component 2 of the project.

46. Technical capacities within MoWRAM and other relevant Government institutions is generally low to address the complex issue of climate change in water and agriculture. Likewise, there are limited skilled efficient contractors and service providers to implement the project in timely and cost-effective manner. This will be addressed through two different ways. First, the project will invest in capacity development of Government institutions and relevant private sectors. Second, specific knowledge, skills and expertise will be provided through specialized service providers where necessary.

47. Many of the irrigation systems included in the project are large size, over 1000 ha. The project involves construction of new irrigation canals and will come across land ownership and acquisition issues. The project is therefore high-risk category from safeguard perspective. To address the safeguard issues, first an ESMF will be prepared as there are numerous sub projects scattered within the project area and detail information will be available only at design stage. Followed by this, a detail environmental and social impact assessment (ESIA) will be conducted leading to preparation of ESMP.

Update status on the design process

48. The CN project received approval from IFAD on December 5, 2022. Since then, project designs have been developed under the leadership of MOWRAM, with the support from IFAD, AIIB, and FAO. AIIB has transferred USD 4.5M to MOWARM for the design of the full funding proposal, including the study for Detail Design Engineering (DED) for one of the proposed schemes, as DED is a prerequisite for the approval of AIIB-financed projects. The target approval dates for the AIIB, GCF, and IFAD Executive Boards are set for February 2025, June 2025, and September 2025, respectively. If the project is not approved during the June GCF Board meeting as planned, a contingency plan is in place. IFAD will continue with the Executive Board as scheduled, and the funding initially expected from GCF will be reallocated to the Funding Gaps to be filled by GCF or other DP. This approach will ensure the project's integrity and help avoid any delays in start-up or implementation after the AIIB Board Approval. Additionally, the initial costs for establishing the Project Management Unit (PMU) will be covered by the Government and AIIB, ensuring that the project implementation can commence without delay.

ATTACHMENTS (in ORMS):

For DRM Meetings:

1. *Updated Decision Memo for co-financing GCF projects for DRM*
2. *GCF Funding Proposal (FP)*
3. *Results framework from GCF (with IFAD core indicators clearly integrated)*
4. *Annex (IFAD standard requirement at DRM): Theory of change*
5. *Annex (IFAD standard requirement at DRM): First Annual Work Plan and Budget (AWPB) for first 18 months*
6. *Annex (IFAD standard requirement at DRM): Integrated Project Risk Matrix (IPRM)*
7. *Annex (IFAD standard requirement at DRM): Exit Strategy*
8. *Annex (IFAD standard requirement at DRM): Mainstreaming Tool*
9. ***GCF ANNEX 1:** NDA no-objection letter(s) **(template provided)** **(mandatory)***
10. ***GCF ANNEX 2:** Feasibility study - and a market study, if applicable **(mandatory)***
11. ***GCF ANNEX 3** (and also IFAD standard requirement at DRM): Economic and Financial Analysis **(mandatory)***
12. ***GCF ANNEX 4** (and also IFAD standard requirement at DRM)**:** Detailed budget plan (template provided) **(mandatory)***

13. ***GCF Annex 5.*** *Implementation timetable including key project/programme milestones* ***(template provided)*** ***(mandatory)***
14. ***GCF Annex 6: SECAP*** *(ESS disclosure form provided): Environmental and Social Impact Assessment (ESIA) or Environmental and Social Management Plan (ESMP) or Environmental and Social Management System (ESMS), or Others (e.g. Resettlement Action Plan, IP Plan, Gender Plan, Land Acquisition Plan, etc.)* ***(mandatory)***
15. ***GCF ANNEX 7:*** *Summary of consultations and stakeholder engagement plan* ***(mandatory)***
16. ***GCF ANNEX 8:*** *Gender assessment and project level action plan* ***(template provided)*** ***(mandatory)***
17. ***GCF ANNEX 9:*** *Legal Due Diligence (Regulation, Taxation and Insurance)* ***(mandatory)***
18. ***GCF ANNEX 10*** *(and also IFAD standard requirement at DRM)****:*** *Procurement Plan for first 18 months (template provided)* ***(mandatory)***
19. ***GCF Annex 11:*** *Monitoring and evaluation plan* ***(template provided)*** ***(mandatory)***
20. ***GCF ANNEX 12:*** *AE fee request* ***(template provided)*** ***(mandatory)***
21. ***GCF ANNEX 13:*** *Co-financing commitment letter, if applicable* ***(template provided)*** ***(mandatory)***
22. ***GCF ANNEX 14:*** *Term sheet including a detailed disbursement schedule and, if applicable, repayment schedule* ***(mandatory)***
23. ***GCF ANNEX 21*** *(and also IFAD standard requirement at DRM): Project Implementation Manual (PIM)*
24. ***GCF Annex 22.*** *Assessment of GHG emission reductions and their monitoring and reporting (for mitigation and cross cutting-projects)* ***(Annex 22 is mandatory for mitigation or cross-cutting projects)***

Inputs needed for ORMS

1. Project Identification Form (PIF)
2. Integrated Integrated Project Risk Matrix (IPRM)
3. Logframe core IFAD indicators
4. Mainstreaming Validation (done after DRM, before final endorsement)

Climate Adaptive Irrigation and Sustainable Agriculture for Resilience

Project Design Report

Annex 3: Project Cost and Financing

Document Date:	28/07/2025
Project No.	2000003926
Report No.	7034-KH

Asia and the Pacific Division
Programme Management Department

IFAD Design Guidelines Annex XVII: Green Climate Fund (GCF) Cofinancing Projects

Requirement for DRM Meetings:

1. Updated Decision Memo for co-financing GCF projects for DRM
2. GCF Funding Proposal (FP)
3. Results framework from GCF (with IFAD core indicators clearly integrated)
4. Annex (IFAD standard requirement at DRM): Theory of change
5. Annex (IFAD standard requirement at DRM): First Annual Work Plan and Budget (AWPB) for first 18 months
6. Annex (IFAD standard requirement at DRM): Integrated Project Risk Matrix (IPRM)
7. Annex (IFAD standard requirement at DRM): Exit Strategy
8. Annex (IFAD standard requirement at DRM): Mainstreaming Tool
9. GCF Annex 1: NDA no-objection letter(s) (template provided) (mandatory)
10. GCF Annex 2: Feasibility study - and a market study, if applicable (mandatory)
11. GCF Annex 3 (and also IFAD standard requirement at DRM): Economic and Financial Analysis (mandatory)
12. GCF Annex 4 (and also IFAD standard requirement at DRM): Detailed budget plan (template provided) (mandatory)
13. GCF Annex 5. Implementation timetable including key project/programme milestones (template provided) (mandatory)
14. GCF Annex 6: SECAP (ESS disclosure form provided): Environmental and Social Impact Assessment (ESIA) or Environmental and Social Management Plan (ESMP) or Environmental and Social Management System (ESMS), or Others (e.g. Resettlement Action Plan, IP Plan, Gender Plan, Land Acquisition Plan, etc.) (mandatory)
15. GCF Annex 7: Summary of consultations and stakeholder engagement plan (mandatory)
16. GCF Annex 8: Gender assessment and project level action plan (template provided) (mandatory)
17. GCF Annex 9: Legal Due Diligence (Regulation, Taxation and Insurance) (mandatory)
18. GCF Annex 10 (and also IFAD standard requirement at DRM): Procurement Plan for first 18 months (template provided) (mandatory)
19. GCF Annex 11: Monitoring and evaluation plan (template provided) (mandatory)
20. GCF Annex 12: AE fee request (template provided) (mandatory)
21. GCF Annex 13: Co-financing commitment letter, if applicable (template provided) (mandatory)
22. GCF Annex 14: Term sheet including a detailed disbursement schedule and, if applicable, repayment schedule (mandatory)
23. GCF annex 21 (and also IFAD standard requirement at DRM): Project Implementation Manual (PIM)
24. GCF Annex 22. Assessment of GHG emission reductions and their monitoring and reporting (for mitigation and cross cutting-projects) (Annex 22 is mandatory for mitigation or cross-cutting projects)

Inputs needed for ORMS

1. Project Identification Form (PIF)
2. Integrated Integrated Project Risk Matrix (IPRM)
3. Logframe core IFAD indicators
4. Mainstreaming Validation (done after DRM, before final endorsement)

Climate Adaptive Irrigation and Sustainable Agriculture for Resilience

Project Design Report

Annex 5: SECAP Review Note

Document Date:	28/07/2025
Project No.	2000003926
Report No.	7034-KH

Asia and the Pacific Division
Programme Management Department

The SECAP Review note should build on the preliminary note mentioned above, draw on the results of the screening exercise and be informed by the issues raised during the design mission, the stakeholders interviews, publicly available tools and dataset, and environmental, social or climate-related studies that inform on the characteristics of the project location. The SECAP review note includes the revised ESMP and should be attached to the Project Design Report, integrated in Draft Project Implementation Manual (PIM) and COSTAB and shall be submitted to Design Review Meeting (DRM) or IRC (for NSOs).

1. Introduction

1. This preliminary Social, Environmental and Climate Assessment Procedures (SECAP) review note was prepared in support of the formulation of the new Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project covered in the 12th IFAD's replenishment cycle 2022-2024. The purpose of this note is to highlight potential environmental, social, and climate-related impacts, both positive and negative. Design-stage consultations are planned to take place (and some are currently underway) with the Government of the Kingdom of Cambodia (GoKC) line agencies at central, provincial, district levels; civil society and non-governmental organisations, and target groups including the Indigenous Peoples in potential project areas. This SECAP review note is also based on a desk review of recent projects in Cambodia funded by IFAD, World Bank, and other International Financing Institutions. As the CAISAR project is still in the nascent stage of design, the preparation of this note was limited by time and further consultations/assessment will take place once the design has further developed.

2. The CAISAR project's objective is to increase climate adaptation, mitigate the negative impact of extreme climate events, and improve livelihoods of smallholder farmers and vulnerable rural communities in four provinces of Cambodia. The project objective will be achieved by implementing two components that aim at addressing climate change vulnerabilities, increasing agriculture productivity, and developing capacity for efficient water resources management and climate proofing of infrastructure and agroecosystems. The investments to be implemented will: (i) combine robust climate adaptation water use management practices at the farm level with climate-proofed irrigation and flood-control infrastructure; (ii) develop institutional capacity to plan, maintain, and operate irrigation and flood control infrastructure; and (iii) promote low-carbon strategies and climate-resilient agricultural practices. Some of the activities will include disaster and climate resilient water-use initiatives, ecosystem-based and climate informed smart irrigation systems, and enhanced systems for monitoring, evaluation, verification, and reporting of climate information by various government agencies.

2. Situational analysis and potential project impacts

n/a

2.1 Socio-economic assessment

a. Overall poverty situation

3. Poverty in Cambodia is defined by the Ministry of Planning as people living with daily earnings under the poverty line threshold[i]. Under this definition, the poverty headcount fell from around 15% in 2013 to less than 10% in 2019, but the COVID-19 pandemic has reversed some of the progress made in poverty alleviation. National poverty headcount is now estimated at 17.8% of the total population, ranging from 12.6% in urban areas other than Phnom Penh to 22.8% in rural areas, based on the results of the Cambodia Socio-Economic Survey 2019-2020 (MoP, 2021).

4. Cambodia's HDI value for 2019 is 0.594— which put the country in the medium human development category—positioning it at 144 out of 189 countries and territories (UNDP Human Development Report 2020). With a Gender Inequality Index of 0.474 in 2019, Cambodia is ranked 117 over 162 countries (HDR report, 2020).

5. The target provinces of the CAISAR project are: Kampong Speu, Kampong Chhnang, Kandal and Pursat (Figure 1). These areas have the highest population density, high total percentage of poor households (Figure 2) and high percentage of women headed households.[i] The livelihoods of the most vulnerable people in the region depend on agricultural production and water availability through precipitation, river flow, or irrigation schemes. As such, these persons are expected to be positively impacted through the CAISAR project activities.

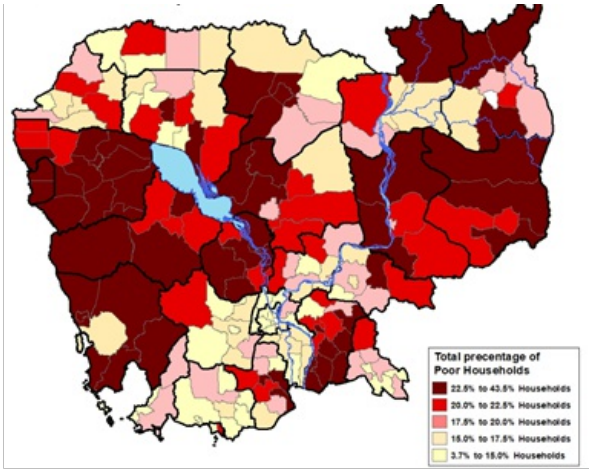

Figure 1: Map of project area and 4 target provinces **Figure 2:** Total percentage of poor households by (level 1 & 2) 2016 (AF, 2018)

[i] The Asia Foundation (2018). cambodia-atlas-on-gender-and-environment.pdf.pdf (opendevelopmentmekong.net)

[i] The poverty line has been updated as: KHR 10,951 (USD 2.67) per day for Phnom Penh, KHR 9,571 (USD 2.33) per day in other urban areas of Cambodia and KHR 8,908 (USD 2.17) per day in rural areas

b. Gender

6. In the five-year strategic plan for strengthening gender mainstreaming and women's empowerment (Neary Rattanak V, 2019-2023), the Ministry of Women's Affairs (MoWA) reported that gender equality and women's empowerment had progressively improved before the pandemic. The ministry adopts the Gender Gap Index as a key indicator widely used to quantify the gaps between women and men in four key areas: health, education, economy, and politics.

7. Cambodia's gender gap ranking improved from 108th in 2014 to 89th out of 152 countries in 2019. However, the pandemic has had a negative impact on gender equality and some of the progress made over the last decade has been reversed. The latest gender gap report indicates that Cambodia had a gender parity score of 0.684 in 2021, ranking 103rd out of 156 countries worldwide and 12th out of 20 countries of East Asia-Pacific region.

Table 1. Gender Gap indicators for Cambodia (Global Gender Gap Report, 2021)

	Rank in 2006	**Rank in 2019 (pre-pandemic)**	**Rank in 2021**	**Score 2021**
Global Gender Gap Index	89	89	103	0,684 *
Economic Participation and Opportunity	29	25	46	0.729
Educational Attainment	105	124	128	0.919
Health and Survival	1	73	46	0.978
Political Empowerment	94	119	126	0.111

(*) Score of 1 reflects gender parity

8. Another metric, the UN Gender Inequality Index (GII) is a composite measure reflecting inequality in achievement between women and men in three dimensions: reproductive health, empowerment and the labour market (UNDP, 2019). It has a value of 0.474 for Cambodia, ranking it 144 out of 170 countries in 2019, but it has not been updated since the pandemic started to impact Cambodia in early 2020.

9. Economic empowerment: As per the latest Cambodia Socio-Economic Survey 2019/20, women's share of wage employment was the highest in the service sector (39%) followed by agriculture sector (36%) and the industrial sector (25%). Women participation in the labour force is 80.5%, significantly less than men (89.6%) and wage equality for similar work remains far from achieving parity: Women in Cambodia earn an estimated USD 3,500 on average, vs USD 4,400 for men. However, Cambodia fares well in terms of income earned by women, ranking 13th Job positions with higher responsibilities (legislators, senior officials and managers) are overwhelmingly held by men (75.9%) while professional and technical work positions are more evenly balanced (54.1% men and 45.9% women). Gender imbalance in economic opportunities has worsen during the pandemic. As many jobs were lost in the garment, hospitality, entertainment, restaurant, and construction sectors, women suffered high levels of unemployment in 2020, forcing many from the formal economy into the informal economy and/or into debt. Recent data suggest that at least as many women re-entered the labour market in the second half of 2020 as those who had left in the first half of the year, but they did so into 'lower quality' jobs than they had prior to the crisis, often informal, own-account or contributing family work (ADB, 2022).

10. Workload of rural women and division of labour: Women have a relatively high representation in agricultural households[i]: Members of agricultural households are in vast majority female (61%), and 24% of agricultural households are women-headed, vs 21.5% in the general population[ii]. They have a higher work burden because of their triple role (which includes their reproductive, productive, and social roles). Women generally perform most of the on-farm work (sowing, weeding, crop maintenance, animal feeding), at the exception of operations involving agricultural machinery such as land preparation (mechanized at 98%) and harvesting (mechanized at 75%, although machinery availability remains a constraint during peak season).

11. Based on a desk review of SECAP notes from recent projects in the country, field visit findings from those projects demonstrated that women employed in agri-processing factories were generally assigned low technical labour-intensive tasks (sorting pepper, peeling mangoes, shelling cashew nuts, etc.) whilst men perform more technical tasks (e.g. operating machinery and equipment) and are more often in supervisor and manager positions.

12. Access and control over assets: Gender discrimination remains a key constraint for women to control and manage productive assets such as land, buildings, and equipment. Legally, the Land Law guarantees equal rights to land for men and women but in practice female-headed households as much as women in male-headed households face various constraints with regard to access to land. Customary practices undermine principles of joint ownership in male-headed households. In addition, gender-biased norms often prevent women from exercising or claiming their rights[iii]. It is estimated that less than 9% of women between 15 and 49 years of age own land, both alone and jointly[iv]. Women have also relatively less access to productive services such as credit, markets, etc.

13. Women's voice and role in decision making: For decision making at the household level, 86.3% of women participated in making major decisions in the household in 2014; 96% of women participate in decisions about visits to family, relatives, or friends; 93% in decisions about major household purchases; and 91% in decisions about their own health care (World Bank gender data).

14. Data-based evidence from on-going projects show that women are relatively well represented in community-based producers organisations/at the community organization level and that their participation in decision making has improved, but gender parity is yet to be achieved. Among the 1200 Agricultural Cooperatives currently registered nationwide, women account for 63% of the total membership. In business clusters (like the informal producers' organisations supported by the IFAD-funded ASPIRE programme), women represent around 40% of the membership. A recent assessment of around 2,000 business clusters showed that gender parity in decision-making positions is almost achieved with 40% of administrative positions occupied by women. In most cases, however, women are assigned the role of cashier (46%) while they are much less likely to be in deputy and leader positions (31% and 23% respectively). The same pattern is also valid across the 1200 Agricultural Cooperatives registered nationwide: there are around 40% of women in cooperative management committees. Women represented 20.1% of those employed in senior and middle management in 2017 and at national level, only 20% of seats in national parliament were held by women in 2020 (World Bank gender data). Women are generally well represented in last-mile extension workers positions, and gender parity is almost achieved for roles such as Community Extension Workers (CEWs).

15. Gender based violence: Economic pressures such as loss of employment, reduced income, or indebtment are known factors that contributes to gender-based violence (GBV), by causing women to remain in abusive situations for financial reasons or to become vulnerable to exploitation (report by the NGO Committee on the United Nations' Convention on the Elimination of All Forms of Discrimination Against Women (CEDAW)). In Cambodia, the share of women who have experienced intimate partner violence[v] is 27%, less than the world average (World Bank gender data). However, recent studies and assessments indicate that the pandemic's impact on employment and indebtedness had direct repercussions on more frequent GBV.

16. The CAISAR project will take place in provinces with a high percentage of women headed households, and it is expected that the project activities pertaining to on-farm

[i] Ministry of Planning – NIS, Cambodia Inter-Censal Agriculture Survey 2019
[ii] Ministry of Planning - Cambodia Socio-Economic Survey 2019/2020
[iii] Anne Hennings, 2021: https://landportal.org/book/narratives/2021/cambodia
[iv] The percentage of women age 15-49 who both solely and jointly with someone else own a land which is legally registered with their name or cannot be sold without their signature. "Both alone and jointly" Implies a woman owns a land alone and another land jointly with someone else.
[v] Intimate partner violence is by far the most prevalent form of violence against women globally and is defined as the percentage of ever-married women (ages 15-49) who have ever experienced physical or sexual violence committed by their husband or partner, whereas those who have ever experienced any form of sexual violence is the percentage of women (ages 15-49) who ever

experienced sexual violence irrespective of marital status and perpetrator.

c. Youth

17. Youth are defined[i] by people who are between 15 and 30-year-old of age as per the National Youth Policy and the National Youth Action Plan. The share of youth aged 15-29 not in employment, education, or training (NEET) is relatively low at 6.4%. The majority of NEETs are inactive, i.e. not looking for a job and not studying, and they are mostly women[ii]. Young women are clearly disadvantaged compared to young men in the labour market.

18. Civil society organisations are progressively gearing up to the challenge and provide support to youth to integrate in the society and take part in the national economy. For example, JCI has a network of seven chapters nationally and work in four areas: Entrepreneur ship, skill development, community impact, international cooperation. Business matching events are also organised to facilitate access to finance and support for potential young entrepreneurs.

19. Entrepreneurship opportunities for youth in rural areas remains rare. Rural youth may be attracted by modern farm business models (hydroponic, net-houses, etc.). Ultimately, agro-processing facilities owned and operated by either SMEs or ACs in rural areas are the best options to provide employment opportunities to youth, both for unskilled work and technical, administrative or management positions.

20. CAISAR activity 1.1.3, *"improve enabling conditions, capacities and disaster risk management strategies and implementation capacities,"* will support rural youth as the proposed agricultural centres of excellence would provide opportunities for training rural youth in productive skills, particularly the installation, operation and maintenance of agricultural productions, green infrastructures and equipment. In addition, the CAISAR project will comprise one pillar of IFAD's programmatic approach through the improvement of farm-level climate resilience and water use efficiency, climate-proofing water infrastructure in complement to other pillars – including those related to youth (e.g. SAAMBAT project on market infrastructure, digital technology, and youth programme).

[i] In IFAD-funded ASPIRE, the Management Information System was revised in 2019 to change the acceptation of Youth as people between 16 and 24 years of age.
[ii] Youth Well-being Policy Review of Cambodia, OECD 2017: https://www.oecd.org/dev/inclusivesocietiesanddevelopment/Youth-well-being-policy-review-Cambodia.pdf

d. Indigenous peoples

21. In Cambodia, the government defined indigenous peoples as the group of people that resides in the territory of the Kingdom of Cambodia whose members manifest ethnic, social, cultural and economic unity and who practice a traditional lifestyle, and who cultivate the lands in their possession according to customary rules of collective use.[i]

22. The National Report on Demography Socio-Economic Status of Indigenous People published by the Ministry of Planning in 2021 stated that indigenous peoples or groups were identified on the basis of their mother tongue and, using this parameter, there were found to be 22 indigenous ethnic groups[ii] located across 15 provinces[iii] with a population of 183,831 (equal to 1.25% of the total population of Cambodia[iv]). Among the 22 indigenous ethnic groups, there are six groups who comprise the majority of the indigenous population (i.e. over 10,000 people). These groups include: Tampoun, Bunong, Kroeung, Kui, Jarai and Brov, which make up for a combined 88% of the total indigenous population in Cambodia. Even though the indigenous peoples live across 15 provinces, the majority of them (92.40%) are living in the six provinces of Ratanakiri, Mondulkiri, Kratie, Stung Treng, Kampong Thom and Preah Vihear[v].

23. As the CAISAR project occurs outside of the six provinces listed above, high IP populations are *not* anticipated within the project area. There are only two provinces targeted by the CAISAR project which have recorded populations of IPs (albeit in limited numbers): Kampong Speu and Pursat. Details on IPs residing in those areas and/or IPs adjacent to those areas with the potential of being affected by the project will be presented in an Indigenous Peoples' Plan (including Free, Prior and Informed Consent (FPIC)) at the time of the full funding proposal submission.

[i] Land law 2001 article 23 paraph #1
[ii] The 24 IPs groups are, Tumpun, Jarai, Kreung, Prao, Kavet, Pnong, Kouy, Steang, Kraol, Mil, Kachak, Por, Khaonh, Chorng, Sui, Thmol, Lun, Sa-och, Rode, Khe, Ro-orng, Spung, Laern, and Samre IPs groups.
[iii] Rattanakiri, Mondulkiri, Kratie, Preah Vihear, Kampong Thom, Stung Treng, Oddor Meanchey, Kampong Cham, Pursat, Kampong Speu, Koh Kong, Kampong Saom, Battambang, Bantheay Meanchey and Siem Reap provinces
[iv] National report on demography, socio-economic status of indigenous peoples in Cambodia.
[v] National report on demography, socio-economic status of indigenous peoples in Cambodia.

e. Marginalised groups

24. According to the 2019 General Population Census, 4.9% of Cambodia's population aged five years and above experiences some difficulty in performing basic functions. Persons with disabilities face multiple challenges such as inequality and discrimination in access to education, healthcare, employment, social protection, and justice, public transport and are particularly vulnerable to

violence and other violations of their rights. Women and girls with disabilities face additional discrimination and barriers when accessing services compared to men with disabilities. They are also vulnerable to violence because of their gender and disabilities (UNDP).

25. The CAISAR project will develop a Stakeholder Engagement Plan (SEP) as part of the full funding proposal package which will take into consideration the diversified needs of potential beneficiaries and/or project affected persons with disabilities and those who have been historically marginalized.

f. Nutrition

26. Prevalence of undernourishment[i] decreased from 17% in 2004/2006 to 6.2% in 2019, but overall prevalence of food insecurity in the general population is still high: severe food insecurity affects 13.4% of the population and moderate food insecurity 44.8%. Another preoccupying issue is the severe prevalence of anaemia that affected more than 47% of women of reproductive age (age 15-49) in 2019 (State of food security and nutrition in the World, SOFI, 2021).

27. At the consumer level, food safety concerns influence dietary behaviours in low- and middle-income countries (LMICs) but despite food safety concerns, consumers could not always ensure that they consumed safe food; barriers were affordability, accessibility and appeal. Key concerns included fear of pesticides, fertilizers, hygiene in/around food outlets, unhygienic vendor practices and household storage/preparation methods (Liguor J. et al, 2021).

28. Food safety at farm and Producers Organisation levels is a concern in post-harvest and processing operations (food safety being the absence of – or safe, acceptable levels of – hazards in foods that may harm the health of consumers). Food borne hazards can be microbiological, chemical, or physical in nature and are often invisible to the plain eye; bacteria, viruses or pesticide residues are some examples. The food products for which food safety challenges are most prominent are cereals and nuts susceptible to aflatoxin contamination, and high-value fresh products such as fresh fruit and vegetables, meat and dairy (IFAD, 2017).

29. The CAISAR project does not seek to address food safety concerns, however it does address food security insofar as it will focus on increasing climate resilience and agricultural productivity. To this end, the project is expected to have a positive impact on food security within the project area.

[i] after World Bank data

2.2 Environment and climate context, trends and implications

n/a

a. Environmental assessment

30. Landscapes and biodiversity: Within the broad Indo-Malayan ecological region, Cambodia encompasses a rich diversity of landscapes, categorised in eight distinct eco-regions, three of which have conservation status assessed as critical/endangered. The links in the figure below provide detailed information on the characteristics of each eco-regions including their intrinsic biodiversity features[i].

31. Cambodia has a total land area of 176,500 km², of which 41% is under protected area status. The 2008 Protected Areas Law (2008) defined eight categories of natural protected areas, for forest land, wetland and marine ecosystems. As late 2017, Cambodia had almost 50 protected areas, covering 7.5 million hectares. However, fragile forest habitats of Cambodia have been affected by deforestation, and three of the country's eight ecoregions are now considered as critical / endangered.

32. Current estimates of remaining natural forest cover vary considerably, but the official consensus is that about half of Cambodia's land area has some form of forest cover (MoP-NIS, Statistical Yearbook, 2021). The World Bank data show that forest cover declined from 60% in 2009 to less than 46% in 2020. Hayward, D. and Diepart J.C. (2021) identified three key drivers of deforestation: (i) large-scale acquisition of land for agro-industrial development; (ii) agrarian expansion by smallholder farmers; and (iii) illegal logging. The study estimates that large-scale agro-industrial plantations cover 831,300 ha, equivalent to about 31% of the deforestation that occurred between 2001 and 2019. The study also links smallholder's agrarian expansion to deforestation, due to internal migratory movements between rural areas, in the context of on-going transition from subsistence farming to commercial agriculture.

33. Land use and land degradation: Cambodia's 31.5% of the total land area is agricultural land. Soils of Cambodia belong to two main texture classes: Clay-loam in the low-lying areas of the Tonle Sap and Mekong delta zones, and sandy clay loam (SaClLo, as per USDA classification) on sloping land of higher grounds in the plateau/mountain zone, where siliceous sedimentary formations occur.

34. These sandy soils are of low fertility and are also the most prevalent in agricultural lands. When not under vegetation cover, these soils are also particularly susceptible to erosion and land degradation. In respect to soil erosion, Cambodia has about 4.45 million ha of land under highly erodible class. The map in figure 4 (below) shows the Land Productivity Dynamics, which is a representation of land productivity trends that have persisted between 2001 and 2018. These trends (decline, stress, stability and gain of productivity) are generated through the interaction of three NDVI-based indicators (steadiness, initial standing biomass, and standing biomass at change).

35. The drivers of land degradation in Cambodia have been attributed mainly to deforestation, expanding agricultural lands, climate

change, pest and diseases, unsustainable land management, and infrastructure development (MAFF, 2018)[i].

36. In the framework of the United Nations Convention to Combat Desertification (UNCDD), the government has determined Land Degradation Neutrality Targets to 2030. A set of ambitious measures have been defined to achieve the target of Land Degradation Neutrality by 2030, including forest protection and reforestation, restoration of degraded and deforested landscapes in Kampong Thom, Preah Vihear and Siem Reap provinces[ii] (all outside of the CAISAR project area), reduction of forest land conversion by cessation of economic land concession program, governance and law enforcement, increased productivity of cropland by applying good agriculture and animal husbandry production standards (GAP and GAHP), application of sustainable agricultural practices (Conservation agriculture, organic farming) to increase soil organic matter content to 4% of cropland per year (Rice, vegetables, fruit trees), among other measures (MAFF, 2018).

37. Agricultural Soils: Agricultural soils in Cambodia are generally assessed as having low chemical fertility. Analysis of soil sample in the national database showed that all types of soils low pH (ranging from 4.6 to 5.4), low to very low Cation Exchange Capacity and very low organic Carbon content (ranging from 0.25 to 1.17%). In addition, conventional rice cultivation destroys any structure that they have.

38. Potential pathways to build and maintain soil fertility are to shift from monocropping and promote more diversified crop rotations and introduce relay crops, cover crops, mix/intercrop, and other form of crop association. Other options include soil conservation techniques (zero tilling or minimal soil preparation) to limit soil disturbance and promote soil microorganisms. Moreover, use of bio compost and innovative soil carbon sequestration options that have multiple benefits on soils structure, microbiological activity, water retention capacity. In turn this soil management approach has proven positive impacts on plant health that ensure higher tolerance to pests and diseases.

39. Another emerging issue in agricultural soil management is linked to the intensification of vegetable production under net-houses. With up to nine production cycles a year, nutrient depletion of soils under net-housing is a growing concern. Similarly, the use of hormones to produce mango three times a year is also affecting the soil health and local biodiversity.

40. Agricultural intensification and monocropping is also linked with pests and disease outbreaks affecting cassava, banana, mango, cashew nut as well as poultry production. Increased use of agrochemicals has direct adverse impact on rural households' health, and ecosystems (aquatic life, soil biodiversity, fauna and flora). Agricultural intensification is also associated with increased use of equipment made of plastic for greenhouses, plastic sheets for mulching and soil solarization, drip lines and other "water saving irrigation" equipment, protective fruit bagging on mango, banana trees, agro-chemical packages, vegetable and fruit retail packages, etc. In absence of adequate handling and disposal practices, plastics may end up in the soils and negatively affect the soil microbiologic activity.

41. The project will mitigate many of the above inherent risks by promoting climate-resilient and sustainable production practices under Component 1, such as activity 1.1.1 which facilitates the planning and deployment of resilient measures, introducing farmers to climate-resilient and sustainable options based on climate knowledge, and encouraging the use of ecosystem-based solutions at the farm level. Activity 1.1.3 also support the establishment of agricultural centers of excellence in partnership with the private sector for the development and dissemination of improved sustainable agricultural techniques in response to climate change and income diversification. Activity 1.1.3 will include (i) improved tolerance to pests and diseases, including control techniques and climate resistant cultivars; (ii) modern production techniques, including efficient resource-use and low-carbon and climate resilient agriculture; (iii) climate- and market-informed crop planning; (iv) smart soil fertility management; (v) agricultural machinery, including innovative renewable energy efficient models; (vi) post-harvest, processing and storage techniques; and (vii) climate and early warning systems.

42. Water resources: About 70% of the annual water resources are water inflow from upstream countries, mostly through the Mekong River. About 86% of Cambodian territory is located within the Mekong River Basin that include the Mekong Mainstream, the Bassac river, the Tonle Sap River and associated Great Lake. Variations in water availability are by nature highly seasonal in Cambodia, due to the rainfall distribution and fluctuations of river discharges in the Mekong basin. This annual pattern typically features floods, typhoon and droughts and poses challenges in terms of water management to fulfill the ever-increasing water demand of various end users: agriculture accounts for 96% of all water use; domestic rural use 1%; and industry, domestic urban, and aquaculture use less than 1%. Water quality in the Lower Mekong Basin is regularly monitored by the River Mekong Committee[iii] and has been consistently assessed as of good or very good for the protection of both human health and aquatic life.

43. It is estimated that only about 2% of the total surface water volume is currently used, but water shortages regularly occur (frequently in dry season in the Tonle Sap river basin), due to lack of water storage and constraints in access to water. Water shortage directly affect crops, livestock, fisheries, and domestic use but also ecosystems sustainability. It is expected that the current water management challenges will be further compounded by the effect of climate change (see SECAP note sub-section on climate). To address these challenges, the Government, through the Ministry of Water Resources and Meteorology has defined a National Water Resources Management and Sustainable Irrigation Road Map and Investment Program 2019–2033. It has identified the water management constraints as: (i) lack of water storage to support all water user needs including agriculture, urban, and the environment; (ii) minimal water resources information to support evidence based decision-making; (iii) lack of integrated water resources management and water allocation plans at river basin levels; and (iv) irrigation schemes that lack modern facilities to support efficient water delivery and higher agriculture production including diversification into high value crops.

44. There is tremendous potential to improve irrigated agriculture and production: There are about 2,500 irrigation schemes nationwide, serving a cumulated command area of about 1.2 million hectares, which represents only 22% of all arable land. In more than 50% of the irrigation schemes, only one crop cycle can be achieved. The schemes located in the Tonle Sap River Basin represent 60% of the country's irrigated areas but the majority do not have access to reliable, year-round water sources

(ADB brief 171, 2021).

45. CAISAR explicitly focuses on improving irrigation systems under Component 2, which is linked with Component 1 and focuses on rehabilitating and modernizing infrastructure above farm-level including canals, ponds, flood-proof existing and rehabilitated irrigation infrastructure and supplying high efficiency climate-resilient irrigation systems. These climate adaptation activities will ensure that the projected increase in extreme wet days and more frequent upstream flooding do not lead to damages and destruction of irrigation infrastructure and also transform this risk into green opportunity by storing more water in irrigation ponds. Finally, more efficient irrigation technologies will ensure that farmers can irrigate for longer periods throughout the year. Given the extent of rehabilitation and modernization anticipated under Component 2, the associated risk is considered high. To ensure that the related potential impacts (both social and environmental) are addressed prior to on-ground implementation, the project plans to commission an Environmental and Social Impact Assessment (ESIA) via an independent third-party.

[i] Cambodia is one of the most biodiverse countries in Southeast Asia, with as many as 8,260 plant species (10% of which may be endemic) along with more than 250 species of amphibian and reptile, 874 fish species and over 500 bird species (https://www.fauna-flora.org/countries/cambodia/)
[i] Land Degradation Neutrality Targets, MAFF, January 2018
[ii] Approaches include implementing Restoration Opportunities Assessment Methodology (ROAM) and Forest Landscape Restoration, as well as assisted natural regeneration
[iii] http://interactive.mrcmekong.org/sobr-2018-findings/environmental-dimension/

b. Climate trends and impacts

46. Like other monsoon dependent countries, climate change is altering Cambodia's and project areas' monsoon calendar[i], increasing total drought days and shifting the start of the rainy season. While annual rainfall is expected to increase, the number of days with rain is decreasing and daily rain intensity is increasing, resulting in extreme rainfall events and potential flooding. World Resource institute (WRI) rates the upper and lower Tonle Sap watershed as extremely high for water risk (WRI, Aqueduct). Inter-annual variability in rainfall significantly influences river discharges and between one and four million hectares of Cambodia's floodplain, of which about 25 falls in the project areas, may be submerged during the wet season, reaching critical thresholds for irrigation and ecosystem stability.

47. Flooding in the project areas generally occurs between July and October driven by rainfall as well as high water levels in the Mekong River and Tonle Sap Lake. With the increased intensity of wet-season rainfall, both the duration and extent of flooding have increased in some areas. While local rainfall patterns are important for rainfed agricultural systems, irrigation and water supply also depends on the Mekong River's hydrology and upstream sections in the neighbouring countries.

48. Observed impacts of climate change trends in recent years have manifested by longer dry seasons and more intense "El Niño" related droughts, delayed onset of the monsoon season, increased rain intensity and frequency, leading to floods, and unexpected dry periods during the rainy season. Annual mean temperature anomaly has increased at a rate of 0.23 °C per decade since 1950[ii], with a stronger signal of increase during the dry season. The rate of temperature change is notable in the dry season (December, January and February) followed by pre-monsoon (March, April and May) and, to a minor extent, by wet season months (June, July and August). The increase in mean annual temperature and decrease in dry season rainfall have manifested in droughts and water shortages significantly impact rainfed agriculture due to a late start and early ending of the wet season.[iii]

49. Future projections of climate change in the project area under the RCP4.5 scenario indicate temperature increase of 6°C by mid-century (2036-2065) and up to 2.2°C by the end of the 21st century (2066-2095). Nights exposed to high temperatures are projected to become more frequent during the 21st century (+114 nights by mid-century and +151 nights by the 2080s). Population, crop and livestock systems will also experience heat extremes more frequently in comparison to the reference period (42 days by mid-century and reaching to 62 days by the 2080s) (IFAD's preliminary climate analysis).

50. The changes in precipitation and temperature patterns induced by climate change in the project area could affect the climatic suitability of cereals, vegetables and starchy crops produced. On average, for most crops analysed for this project, it was found that precipitation suitability could remain constant across the century, while temperature suitability could progressively decrease with some crops falling outside their optimal temperature levels. Overall, this change in patterns could contribute to a reduction in crop yield for both irrigated and non-irrigated crops. For example, in the Kampong Chhang region, rice yield could decrease from 9 to 12%, with and without irrigation respectively, by 2050 (period of 20 years centred around 2050) compared to 2020. These projections are for the RCP8.5 scenario and without CO2 fertilization. As smallholder farmers' income are largely dependent on their yield, it is anticipated that farmers' income could become more volatile with a decreasing trend over time.

51. The CAISAR project aims to explicitly address climate change issues through its targeted interventions which would (i) improve water security and community resilience in a changing climate; and (ii) climate-proof irrigation infrastructure.

[i] Climate change & Agriculture in Cambodia, AIIB-IFAD CAISAR: climate (RCP4.5), crops and livestock analyses (2021-12-08)
[ii] Thoeun, H. C. (2015) Observed and projected changes in temperature and rainfall in Cambodia. *Weather and Climate Extremes.* 7:61.
[iii] MAFF (2017) MAFF Annual Report 2016-17

c. Climate change mitigation

52. Potential adaptation and mitigation measures will be further assessed during the full design.

2.3 Target group profiles

53. CAISAR is designed to target four provinces (Kampong Speu, Kampong Chhnang, Kandal, and Pursat) with the highest population density, high total percentage of poor households, and high percentage of women-headed households. The livelihoods of these most vulnerable peoples in the region depend on agricultural production and water availability through precipitation, river flow or irrigation schemes. Under Component 1, activities are set to target and directly work with youth, women, and those most vulnerable to climate change. Component 1 will address the needs of the climate vulnerable/women/youth in terms of livelihoods opportunities and climate resilience. By design, the activities will also help to economically empower youth and women. Whilst IP groups are not explicitly targeted within the project design, the project will address the needs of IPs in and adjacent to the project areas through the Indigenous Peoples' Framework (and, at a later stage, the IP Plan). An overview of youth, women, rural poor, and indigenous persons in the project area has been provided in section 2.1 of this preliminary SECAP note.

54. In addition to youth, women, rural poor and climate vulnerable populations, the CAISAR project also aims to build capacity within the Royal Government of Cambodia and work with line ministries to implement the project. As such, another key target group of the project is the line ministries within the government, notably: Ministry of Water Resources and Meteorology (MoWRAM) and the National Committee for Sub-National Democratic Development (NCDD).

3. Institutional analysis

55. The CAISAR project will work with the Royal Government of Cambodia's (RGC's) Ministry of Water Resources and Meteorology (MoWRAM), Provincial Departments of Water Resources and Meteorology (PDWRAM), and the National Committee for Sub-National Democratic Development (NCDD). It also employs the services of consulting agencies like Water and Power Consultancy Services (WAPCOS) for preparatory work in terms of feasibility studies for the planned rehabilitation, modernization, and climate-proofing of irrigation infrastructure under Component 2. Under Component 1, the project will namely engage Farmer Organizations (FOs), Farmer Water Use Communities (FWUCs), and agricultural extension personnel.

56. A major barrier to sustainable and climate-resilient development of irrigation and water infrastructure in the project area is insufficient investment in planning and long-term maintenance of infrastructure in a systematic way. In addition, technical capacities of relevant national institutions and Farmer Water Use Communities (FWUCs) are rarely assessed in detail at the design stage. In most irrigation schemes, there is largely no systematic cost-recovery practice leading to a lack of incentive for the FWUCs members to manage the infrastructure properly. A capacity and needs assessment of MoWRAM, PDWRAM, and relevant FWUCs / FOs in the region has been planned for the design stage (currently underway) to ensure targeted interventions and suitable training programs are included in the project to build the skills needed to undertake O&M responsibilities. This assessment will also include information on readiness for implementation, monitoring, and enforcement of environmental and social safeguards-related measures.

57. Another important barrier in the project area is the lack of extension services at the provincial level. Agricultural extension lacks personnel, capacity, and network to access remote communities. In addition, current extension personnel possess an inadequate understanding of climate change and responsive practices and technologies that are suitable for local contexts. Farmers have limited knowledge of technologies and techniques that are more sustainable and climate resilient. Agricultural expansion has been possible through unsustainable practices including the mono-cropping, excessive application of chemical fertilizers and pesticides and poor soil nutrient management. Farmers, agricultural cooperatives, and SMEs have limited access to finance which may facilitate the adoption of appropriate technologies and techniques. Access to finance remains the major barrier as farmers and agribusinesses often cannot meet the high collateral requirements and financial institutions tend to charge high interest and provide short-term loans because of the risks associated with agriculture. The lack of credit history and low financial literacy are other reasons for their poor financial access.

58. The CAISAR project builds on existing national policies, strategies, and regulatory frameworks, specifically: CAISAR is aligned with the RGC's priorities on low-carbon and climate resilient development as outlined in the RGC's overarching Rectangular Strategy Pillar IV 2019 -2023.[i] Cambodia has developed and implemented the Climate Change Strategic Plan 2014 – 2023, and associated action plans developed by each relevant ministry. These plans are Cambodia's first ever comprehensive national policy documents that illustrate the country's priority adaptation needs. The Updated NDCs 2020 identify a lack of access to financial, technological and human resources as the primary challenge. Adaptation priorities for agriculture include: (i) scaling-up of climate-resilient agriculture systems including the introduction of climate-resilient and ecologically appropriate crop varieties; (ii) community-based actions to restore and maintain critical environmental services affected by climate change; (iii) strengthening of early warning and climate information systems and dissemination; and (iv) strengthening of capacity to conduct climate impact assessments and carry out cross-sectoral planning. The project is also aligned with the thematic portfolio Climate Change and Natural Resources Management of the Mekong Region Cooperation Programme (MRCP) 2022-2025 and it will include indicators on: national policies and legal frameworks in the field of climate change (CCE_TRI_1); disaster risk prevention and reduction (DRR_TRI_3); and persons benefiting from concrete climate change adaptation measures (CCE-ARI-1).

[i] Rectangular Strategy-Phase IV, 9 Sep 2018, International Relations Institute of Cambodia.

4. Environmental and social category

59. Whilst the types of interventions in the CAISAR project are standard to most IFAD projects (e.g. irrigation rehabilitation, improving livelihoods and resilience of rural farming communities, increasing agricultural productivity), the topography of Cambodia and scale of the project interventions under Component 2 (i.e. the irrigation infrastructure) require a high risk rating to ensure that the project does no harm and, rather, actively improves the environmental and social situation in the project areas. This high risk rating is also based on the associated flood risks given projected changes in climate, which necessitates thorough feasibility studies, ESIAs, and related assessments to ensure: (i) no adverse impacts in terms of changes to flood plains and water flows; (ii) clear resettlement plans and procedures to avoid/mitigate/compensate, where needed, instances of physical and/or economic displacement. The process will involve iterative consultations with communities, particularly those of marginalized groups (women, youth, IPs, extreme poor, disabled, elderly). With adequate safeguards measures and incorporation of these measures directly into the project design (wherever possible), the residual risk will be reduced to substantial or moderate, depending on the sub-project.

5. Climate risk category

60. Based on the climate projections and current climate scenario for Cambodia (as listed in section 2 of this note), this project has a substantial climate risk rating. Whilst the inherent climate risk based on projections and present-day situation is substantial, the project has been explicitly designed to address climate risk through the climate-proofing of key irrigation infrastructure and building of community resilience to climate changes.

6. Recommendations for project design and implementation

61. Recommendations for project design and implementation are detailed in the table 2, below.

Table 2. Recommendations Disaggregated by Component for Project Design and Implementation:

Component	Design stage	Implementation stage
1) Improving farm-level climate adaptation, resilience, and water use efficiency The objective of this component is to build sustainable climate adaptation solutions for smallholder farmers and enhance engagement sustainable water-user practices through evidence-based planning and context-relevant climate resilient practices at the farm level. The component will support smallholder farmer groups to implement climate-resilient crop and water management methods and promote viable business models for the private sector to deliver affordable, smart and efficient technology solutions for water and crop management. Local financial institutions, agricultural cooperatives and farmer organizations will be engaged to facilitate uptake. A credit line for climate-resilient investments will be employed.	Iterative consultations based on the project's Stakeholder Engagement Plan (under development) to be held with key target groups, notably: youth involved with the agricultural centres of excellence; women-headed households; and IP groups within the project area. The consultations will help to establish a grievance redress mechanism based on differentiated needs; determine areas where participatory monitoring/reporting can be used during implementation; and key needs/preferred methods of engagement for that group. Needs-assessment of FOs/FWUCs to better specify and target sub-component activities. Build-in indicators relating to engagement of women and youth as part of the Results Framework.	Recommendations for implementation are to be determined pending further design studies. Initial recommendations include the use of participatory monitoring (where relevant) and provision of credit to women specifically under Component 1.1.2.

2) Climate-proofing water infrastructure for increased resilience Component 2 is linked with Component 1 and it will focus on rehabilitating and modernizing infrastructure above farm-level including canals, ponds, flood-proof existing and rehabilitated irrigation infrastructure and supplying high efficiency climate-resilient irrigation systems. These climate adaptation activities will ensure that the projected increase in extreme wet days and more frequent upstream flooding do not lead to damages and destruction of irrigation infrastructure and also transform this risk into green opportunity by storing more water in irrigation ponds. Finally, more efficient irrigation technologies will ensure that farmers can irrigate for longer periods throughout the year.	Full ESIA to be prepared for by an independent third party for any tentative high-risk subprojects involving large-scale rehabilitation/ modernization/ climate-proofing of irrigation infrastructure. In instances where the sub-projects are not identified, a list of first-year projects is to be determined with accompanying feasibility studies. Study on the state of land tenure and access to resources in the proposed project areas, with accompanying recommendations on how to address potential economic and/or physical displacement. This study will feed into the Resettlement Framework document. Where applicable, hydrological modelling to determine potential changes/shifts in flood plains and spillways.	Recommendations for implementation are to be determined pending further design studies.

7. Further studies needed

62. Based on CAISAR's high risk rating, the following studies will be prepared during the full design:

- Environmental, Social, and Climate Management Framework (ESCMF);
- Resettlement Action Framework (RAF);
- Indigenous Peoples Planning Framework (IPPF);
- Gender Analysis/Assessment & Gender Action Plan (GAP);
- Stakeholder Engagement Plan (SEP).
- Climate analysis and rationale.

63. The ESCMF, RF, IPF, GAP, and SEP will be primary documents for preparation and disclosure at least 120 days prior to submission to the Board of the Green Climate Fund. A larger ESIA is to be prepared by an independent third party during the first year of the project (prior to the implementation of any high risk subprojects). Costing for each of these documents is under discussion and a budget will be provided later during the design phase.

8. Monitoring and evaluation

64. The Project will define a project management and monitoring system in line with the AIIB and IFAD's requirements and the government' standard operating procedures (SOPs). Separate consulting firms and individual consultants will be recruited to support the project implementation; to undertake detailed design services and construction supervision; and provide project management support to the Project Management Unit (PMU) and the Project Implementation Units (PIUs), including monitoring and evaluation. The PMU will submit quarterly annual progress reports reporting on the status of the Project, including the status of environmental & social safeguards. A dedicated monitoring and evaluation specialist at the PMU will be responsible for the data collection by the staff of the PIUs and for reporting. AIIB and IFAD Project teams will conduct quarterly virtual missions per year until business travel resumes and coordinates with the PMU and the PIUs through virtual monthly progress meetings. The project team is considering additional digital tools based on augmented reality to better monitor specific issues arising under the Project.[i]

65. MoWRAM is a project Implementing Entity (IE), and the IE budget is in Component 2. The Executing Agency (EA) will coordinate and consolidate planning and reporting, contracting with Technical Assistance Team for the overall project implementation. NCDD is a sub-IE and their management budget is in the Component 1.

66. Key indicators relating to gender, youth, IPs, and safeguards more broadly are currently under discussion and will be developed prior to submission of the full funding proposal.

[i] The augmented reality package constitutes of virtual 3D glasses connected to smart phone cameras onsite with a proprietary communication software to be purchased during Project preparation.

9. References

67. Please refer to the footnotes listed at the end of this document.

ESCMP Matrix

68. The ESCMP matrix will be prepared later in the design stage and will be integrated into the project's implementation manual.

Footnotes

Footnotes included in the main text.

Environmental and Social Safeguards Classification: High

Environmental and Social Safeguards				
Biodiversity conservation	**Yes/No**	**Likelihood**	**Consequence**	**Risk Rating**
1.1 Could the project potentially involve or lead to conversion or degradation of biodiversity, habitats (including modified habitat, natural habitat and critical natural habitat) and/or ecosystems and ecosystem services?	Yes	Possible	Moderate Project will significantly affect modified habitat, but will not impinge on natural habitat or critical natural habitat.	Moderate
1.2 Could the project involve or potentially lead to activities involving habitats that are legally protected, officially proposed for protection, or recognized as protected by traditional local communities and/or authoritative sources (e.g. National Park, Nature Conservancy, Indigenous Community Conserved Area, ICCA, etc.)?	Yes	Unlikely	Minor Project is close to a protected area, and associated facilities may have an indirect impact unless the project is modified	Low
1.3 Could the project potentially involve or lead to an increase in the chance of human-wildlife encounters/conflict?	Yes	Possible	Moderate Conflict leads to some loss of livelihood or threat to wildlife, but this is not catastrophic	Moderate
1.4 Could the project potentially involve or lead to risks to endangered species (e.g. reduction, encroachment on habitat)?	Yes	Possible	Moderate Net loss in biodiversity with a status of Endangered, or status change to Edangered due to project impacts.	Moderate
1.5 Could the project potentially involve or lead to impacts/risks to migratory wildlife?	Yes	Possible	Moderate Project or associated facilities close to sites of importance to migratory wildlife sites. No direct impact, but possible indirect impact.	Moderate
1.6 Could the project potentially involve or lead to introduction or utilization of any invasive alien species of flora and fauna, whether accidental or intentional?	Yes	Possible	Moderate High potential for invasive alien species of flora and fauna to be introduced, but strict controls likely to be adequate.	Moderate
1.7 Could the project involve or lead to the handling or utilization of genetically modified organisms?	No			Low
1.8 Could the project involve or lead to procurement through primary suppliers of natural resource materials?	Yes	Possible	Moderate Poject requires procurement of natural resources through primary suppliers, and resource extraction is tightly regulated	Moderate
Resource Efficiency and Pollution Prevention	**Yes/No**	**Likelihood**	**Consequence**	**Risk Rating**
2.1 Could the project involve or lead to the release of pollutants to the environment due to routine or non-routine circumstances with the potential for adverse local, regional, and/or transboundary impacts?	Yes	Possible	Moderate Pollutants may possibly be released, either routinely or by accident, but treatment systems are proven and verified. Receiving environment is highly senstive.	Moderate

Environmental and Social Safeguards				
2.2 Could the project involve or lead to primary not environmentally sustainable production of living natural resources? (Note: this includes the cultivation or rearing of plants or animals, including annual and perennial crop farming, animal husbandry (including livestock), aquaculture, plantation forestry, etc)	Yes	Possible	Moderate Project is fully dependent on production of living natural resources. Project is sited in an existing agricultural area, with low environmental and/or social sensitivity.	Moderate
2.3 Could the project involve or lead to engagement in areas of forestry, including the harvesting of natural forests, plantation development, and/or reforestation?	No			Low
2.4 Could the project involve or lead to significant consumption of raw materials, energy, and/or water?	Yes	Possible	Moderate The project will require consumption of raw materias, energy, and/or water. This will be a significant component of the project, but impacts can be appropriately managed.	Moderate
2.5 Could the project involve or lead to significant extraction, diversion or containment of surface or ground water (e.g. construction of dams, reservoirs, river basin developments, groundwater extraction)?	Yes	Likely	Severe The project relies entirely on water-based (groundwater and/or surface water) development. It incudes construction of medium to large irrigation schemes (above 999 ha per scheme); significant extraction/diversion/containment of surface water, leaving the river flow less than 5% above the environmental flow when downstream user requirements are taken into account; withdrawal of groundwater in areas already experiencing soil subsidence due to over-abstraction and/or increasing groundwater depth (e.g. observed in existing wells); withdrawal of groundwater close to the recharge rate considering all abstraction needs from the groundwater unit.	High
2.6 Could the project involve inputs of fertilizers and other modifying agents?	Yes	Likely	Moderate The project requires use of fertilizers, but options are available to replace polluting fertilizers with alternatives.	Substantial
2.7 Could the project involve or lead to procurement, supply and/or result in the use of pesticides on crops, livestock, aquaculture or forestry?	Yes	Possible	Moderate The project requires use of pesticides, but options are available to replace potentially polluting pesticides with alternatives.	Moderate
2.8 Could the project be located in an area which is being, or has been, polluted by an external source (e.g. a mine, smelter, industry)?	No			Low

Environmental and Social Safeguards				
2.9 Could the project involve livestock – extensive and intensive systems and animal products (dairy, skins, meat, etc.)?	Yes	Unlikely	Moderate Intensive/extensive livestock/aquaculture systems are in place, but these are only one component of the project.	Moderate
Cultural Heritage	**Yes/No**	**Likelihood**	**Consequence**	**Risk Rating**
3.1 Could the project be located in areas that are considered to have archaeological (prehistoric), paleontological, historical, cultural, artistic, and religious values or contains features considered as critical cultural heritage?	Yes	Possible	Moderate The project is thought to be close to an area that is considered to have archaeological (prehistoric), paleontological, historical, cultural, artistic, and religious values or contains features considered as critical cultural heritage. The site has not been surveyed, and so the presence of cultural heritage is not well known.	Moderate
3.2 Could the project directly or indirectly affect indigenous peoples' rights, lands, natural resources, territories, livelihoods, knowledge, social fabric, traditions, governance systems, and culture or heritage (tangible and intangible)?	Yes	Possible	Moderate Moderate impact on indigenous population. Damage to/or temporary loss of access to indigenous land, assets, resources, and/or cultural heritage.	Moderate
3.3 Could the project involve or lead to significant excavations, demolitions, movement of earth, flooding or other environmental changes?	Yes	Possible	Moderate Moderate impact on land. Some short-term earth moving and environmental changes required. Rehabilitation is straightfoward.	Moderate
3.4 Could the project involve or lead to adverse impacts to sites, structures, or objects with historical, cultural, artistic, traditional or religious values or intangible forms of culture (e.g. knowledge, innovations, practices)? (Note: projects intended to protect and conserve Cultural Heritage may also have inadvertent adverse impacts)	Yes	Possible	Moderate The project is thought to be close to an area that is considered to have archaeological (prehistoric), paleontological, historical, cultural, artistic, and religious values or contains features considered as critical cultural heritage. The site has not been surveyed, and so the presence of cultural heritage is not well known.	Moderate
3.5 Could the project involve or lead to alterations to landscapes and natural features with cultural significance?	Yes	Possible	Moderate Moderate impact on indigenous population. Some short-term earth moving and environmental changes required. Rehabilitation is straightforward.	Moderate
3.6 Could the project involve or lead to utilization of tangible and/or intangible forms (e.g. practices, traditional knowledge) of Cultural Heritage for commercial or other purposes?	No			Low
indigenous peoples	**Yes/No**	**Likelihood**	**Consequence**	**Risk Rating**

Environmental and Social Safeguards				
4.1 Could the project be sited in areas where indigenous peoples are present (including the project area of influence)?	Yes	Possible	Moderate The project may have a moderate impact on indigenous people, because it is sited within commuting distance of indigenous communities, and because it offers employment to indigenous people.	Moderate
4.2 Could the project result in activities located on lands and territories claimed by indigenous peoples?	Yes	Possible	Moderate The project is sited in an area that was previously used by indigenous people, and groups are mobilizing with the intention of making a claim.	Moderate
4.3 Could the project result in impacts on the rights of indigenous peoples or to the lands, territories and resources claimed by them?	Yes	Possible	Moderate Moderate impact on indigenous population. Damage to/or temporary loss of access to indigenous land, assets, resources, and/or cultural heritage.	Moderate
4.4 Could the project result in the utilization and/or commercial development of natural resources on lands and territories claimed by indigenous peoples?	No			Low
4.5 Could the project lead to impacts on the Cultural Heritage of indigenous peoples, including through the commercialization or use of their traditional knowledge and practices?	No			Low
Labour and Working Conditions	**Yes/No**	**Likelihood**	**Consequence**	**Risk Rating**
5.1 Could the project operate in sectors or value chains that are characterized by working conditions that do not meet national labour laws or international commitments? (Note: this may include discriminatory practices, high gender inequality and the lack of equal opportunities, denial of freedom of association and collective bargaining, labour migrants)	Yes	Possible	Moderate The project operates in sectors or value chains that have, in the past, not met national labour laws, or international commitments, but is now adequately nationally regulated. However, international value chains are not regularly audited for environmental or social performance.	Moderate
5.2 Could the project use or operate in a value chain where there have been reports of forced labour? (Note: Risks of forced labour may be increased for projects located in remote places or where the status of migrant workers is uncertain)	Yes	Possible	Moderate The project does not operate in sectors or value chains where forced labour was evident in the past. The status of forced labour regulation is currently unclear.	Moderate
5.3 Could the project involve children (a) below the nationally-defined minimum employment age (usually 15 years old) or (b) above the nationally-defined minimum employment age but below the age of 18 in supported activities or in value chains?	Yes	Possible	Moderate The project does not operate in sectors or value chains where child labour was evident in the past. The status of forced labour regulation is currently unclear.	Moderate

Environmental and Social Safeguards				
5.4 Could the project: (a) operate in a sector, area or value chain where producers and other agricultural workers are typically exposed to significant occupational and safety risks, and/or (b) promote or use technologies or practices that pose occupational safety and health (OSH) risks for farmers, other rural workers or rural populations in general? (Note: OSH risks in agriculture might include: dangerous machinery and tools; hazardous chemicals; toxic or allergenic agents; carcinogenic substances or agents; parasitic diseases; transmissible animal diseases; confined spaces; ergonomic hazards; extreme temperatures; and contact with dangerous and poisonous animals, reptiles and insects. Psychosocial hazards might include violence and harassment.)	Yes	Possible	Moderate The project operates in a sector, area, or value chain where workers are occasionally exposed to significant OSH risks, and where regulation is known to be weak or non-existent.	Moderate
Community Health, Safety and Security	**Yes/No**	**Likelihood**	**Consequence**	**Risk Rating**
6.1 Could the project be at risk from water-borne or other vector-borne diseases (e.g. temporary breeding habitats), and/or communicable and non-communicable diseases?	Yes	Possible	Moderate The project is situated in an area where there is past evidence of negative impacts from water-borne or other vector-borne diseases, or communicable/non-communicable diseases, but where regulation or containment of these impacts has been shown to be effective.	Moderate
6.2 Could the project lead to unintended negative impacts on nutrition?	No			Low
6.3 Is there a possibility of harm or losses due to failure of structural elements of the project (e.g. collapse of buildings or infrastructure)?	No			Low
6.4 Could the project involve or lead to the construction or rehabilitation of dams?	Yes	Possible	Minor The project involves the rehabilitation of dam(s) and/or reservoir(s) meeting at least one of the following criteria: - less than 10 metre high wall; - less than 300m long crest; or - less than 1 million m3 reservoir capacity.	Moderate
6.5 Could the project involve or lead to transport, storage, and use and/or disposal of hazardous or dangerous materials (e.g. explosives, fuel and other chemicals during construction and operation)?	Yes	Possible	Minor The project has only minor involvement with the transport, storage, and use and/or disposal of hazardous or dangerous materials, and regulation of hazardous materials is effective.	Moderate
6.6 Could the project lead to adverse impacts on ecosystems and ecosystem services relevant to communities' health (e.g. food, surface water purification, natural buffers from flooding)?	Yes	Possible	Moderate Moderate adverse impacts to ecosystems and their services that could negatively affect the health of communities in the direct vicinity of the project are possible, but similar projects have shown that Impacts can be mitigated or offset through schemes such as Payment for Ecosystem Services.	Moderate

Environmental and Social Safeguards				
6.7 Could the project lead to the potential for gender-based violence, including sexual harassment, exploitation and abuse, as a result of labour influx, land redistribution, or other actions that alter community dynamics?	Yes	Possible	Moderate Moderate changes to community dynamics may result in increased potential for gender-based violence or sexual exploitation. Gender-based violence interventions are integrated into project design.	Moderate
6.8 Could the project lead to increases in traffic or alteration in traffic flow?	Yes	Possible	Moderate Moderate changes to traffic volumes or alterations to traffic flow. Risk of injury or death is reduced by good design and implementation of safety protocols. New construction, rehabilitation or upgrade of rural roads, with Annual Average Daily Traffic (AADT) below 400	Moderate
6.9 Could the project lead to an influx of project workers?	Yes	Possible	Moderate The project is partly dependent on an influx of project workers, but the majority of workers are local. Risks of impacts have been planned for, and protocols are in place	Moderate
6.10 Could the project involve or lead to the engagement of security personnel to protect facilities and property or to support project activities?	No			Low
Physical and economic resettlement	**Yes/No**	**Likelihood**	**Consequence**	**Risk Rating**
7.1 Could the project result in temporary or permanent and full or partial physical displacement (including people without legally recognizable claims to land)?	Yes	Almost certain	Severe >100 households/ businesses displaced.	High
7.2 Could the project result in economic displacement (e.g. loss of assets or access to resources due to land acquisition or access restrictions – even in the absence of physical relocation)?	Yes	Possible	Major Significant loss of assets or access to resources. Project may result in between 10% and 15% reduction in a farmer assets or a community assets.	Substantial
7.3 Could the project present a risk of forced evictions?	No			Low
7.4 Could the project result in impacts on or changes to land tenure arrangements and/or community-based property rights/customary rights to land, territories and/or resources?	Yes	Likely	Major Signficant changes to land tenure arrangements and/or community-based property rights. Legal recourse and other forms of arbitration/conflct resolution are available.	Substantial
Financial intermediaries and direct investments	**Yes/No**	**Likelihood**	**Consequence**	**Risk Rating**
8.1 Could the investment be granted to an institution that does not have an environmental and social policies and an associated environmental and social management system (ESMS) in place (transparent, publicly available)?	No			Low

Environmental and Social Safeguards				
8.2 Could the investment be granted to an institution with insufficient capacities (i.e. unqualified personnel e.g. ES Officer) to implement the ESMS?	No			Low
8.3 Could the investment be granted to an institution that does not have an Exclusion List?	No			Low
8.4 According to the institution's portfolio classification: Could the institution have potential high-risk projects in their portfolio?	No			Low
8.5 Is there evidence that the institution does not comply with the local legal framework?	No			Low
8.6 Does the institution provide a stable communication channel with stakeholders and local communities (e.g. a Grievance Redress Mechanism)?	No			Low
8.7 Does the organization provide auxiliary or capacity building support services.	No			Low

Climate Risk Classification: Substantial

Step 1: Hazard identification	
What are the expected hazards in the project intervention area?	**No, Yes, TBD**
River flood	Yes
Costal Flood	No
Urban Flood	Yes
Landslide	Yes
Cyclone	Yes
Water Scarcity (agricultural droughts and/or dry spells)	Yes
Extreme Heat	Yes
Wildfires	Yes
Future climate scenarios foreseen (period 2040-2059) - Change in frequency and intensity	**No, Yes, TBD**
Change in temperature (increase or decrease)	Yes
Change in rainfall (increase or decrease)	Yes
Climate variability (larger or smaller)	Yes
Intensity and frequency of extreme events (larger or smaller)	Yes
Is the project expected to have an impact on climate change (i.e. contribute to greenhouse gas emissions)?	**No, Yes, TBD**
Is the project expected to be a significant emitter of greenhouse gases?	No
Step 2: Exposure Assessment	
Is the project located in exposed areas to weather-related natural hazards?	**No, Yes, TBD**
Low-lying areas (valleys, coastal zones, and small islands)	No
Very warm areas (subtropical)	No
Tropical areas (rainforests)	Yes
Arid and semi-arid areas (deserts)	No
Mountains zones and permafrost areas (tundra)	No
River banks	Yes
Does the project target agricultural systems, ecosystems or livelihoods exposed to weather-related hazards?	**No, Yes, TBD**
Is crop production frequently affected by rainfall variability, prolonged droughts, changes in temperature or pests and diseases?	Yes
Is livestock productivity frequently affected by rainfall variability, prolonged droughts, changes in temperature or diseases?	Yes
Are fisheries frequently affected by ocean acidification, water salinity and changes in sea surface temperature due to ocean-atmospheric oscillations or climate change?	Yes
Is forest productivity frequently affected by wildfires, diseases, rainfall variability, prolonged droughts, or changes in temperature?	N/A
Is the biodiversity in the project area likely to be affected by changes in climate variables?	Yes
Is any stage of the agricultural value chain (production, storage, processing and marketing) exposed to climate related hazards?	Yes
Is any rural infrastructure likely to be affected by flooding, landslides, changes in temperatures, and extreme winds.	Yes
Step 3: Sensitivity Assessment	
What are key sensitivities for the populations in the project's areas of intervention?	**No, Yes, TBD**
Is conflict exacerbating the population's sensitivity to weather related hazards?	No
Is population displacement being exacerbated by climate change impacts?	No

Are diseases (e.g. COVID-19, malaria, cholera) increasing the population´s vulnerability and affecting their capacity to address potential weather-related hazards?	No
Is the income of the target population predominately coming from agriculture?	Yes
Are social inequalities (e.g. based on gender, youth, indigenous persons and other marginalized groups) being exacerbated by climate change?	Yes
Is the Human Development Index (HDI) equal to or below 0.6?	Yes
Is the Multidimensional Poverty Index (MPI) equal to or above 0.1?	Yes
Step 4: Adaptive capacity and climate resilience	
What are key adaptive capacities in the areas of project intervention?	**No, Yes, TBD**
Is the country well ranked in the Disaster risk reduction progress score?	No
Are climate and weather information services (real-time weather data, seasonal forecasts etc.) effectively being delivered (through radio, TV, SMS, extension services etc.) to farmers, rural dwellers, and end users?	No
Does the project country have an early action plan (preparedness and emergency response) to mitigate the impacts of weather-related hazards once the shock occurs?	Yes
Does the government or other institutions support the target population/communities with the necessary social and economic resources to prepare for or respond to climate-related events?	No
Is the target community carrying out (using their own means) agricultural adaptation?	Yes
Does the target population have the economic means or support to adjust or adapt their activities in response to weather related shocks?	No
Do policies/mechanisms exist that make financial credit, loans, and agricultural insurance available?	Yes
Are rural infrastructures effectively delivering services to farmers and rural dwellers?	No

Detailed FM arrangements in the Project Design Report (PDR) (Annex 7)
Cambodia: Climate Adaptive Irrigation And Sustainable Agriculture For Resilience (CAISAR)

I. Summary of Financial Management arrangements[1]

1. FM capacity and risk assessments have been completed per FMD guidelines; the assessment was made during the meetings with MOWRAM and NCCD ministry officials in January 2023. The overall FM risk at design is rated "Substantial" because of the risks at the entity and project control levels. The risk assessment takes into account the policy specifically designed for externally funded projects (SOP) that prove to be successful on other IFAD-funded projects; MOWRAM and NCCD already have experienced staff for implementation of donor funded projects with available computerized accounting software. However, additional consultants will be required as government staff to be seconded will not have sufficient time to handle all FM aspects of the project and accounting software will need to be customized.
2. Strengths and weaknesses of proposed FM arrangements.
   Key strengths of the CAISAR FM arrangements are:
   - Cambodian SOPs that are mandatory for all IFAD-funded projects are well-designed documents for each step of project implementation.

   However, the most challenging issues for CAISAR FM arrangements are:
   - Potential low FM staff capacity at implementing agencies.
   - No previous experience of the MOWRAM in IFAD-funded projects.
   - Past external audit reports did not comply with IFAD requirements.

   Both Inherent and Residual risks are substantial for CAISAR due to the abovementioned weaknesses. Residual risk will be revised when mitigation measures are implemented.
   The design of CAISAR includes mitigation measures to minimize potential risks and integrates current strengths into overall FM arrangements. Therefore, CAISAR design includes competitive recruitment of FM consultants with adequate experience and education background to mitigate low staff capacity related risks. In addition, development of PIM and FMM with clear roles for supporting documents filing and accounting record keeping for all implementing partners and

[1] Normally this summary will be included only in the main design report under Financial / Fiduciary section, Annex 7.

implementation of accounting software for accounting record keeping, financial reporting and accounts reconciliations will further strength overall FM arrangements. As a result, the FM arrangements for CAISAR are satisfactory to IFAD. First Disbursement conditions in the FA will be (i) PIM approval, (ii) Accounting software customization, and (iii) recruitment of experienced and qualified FM staff for CAISAR.

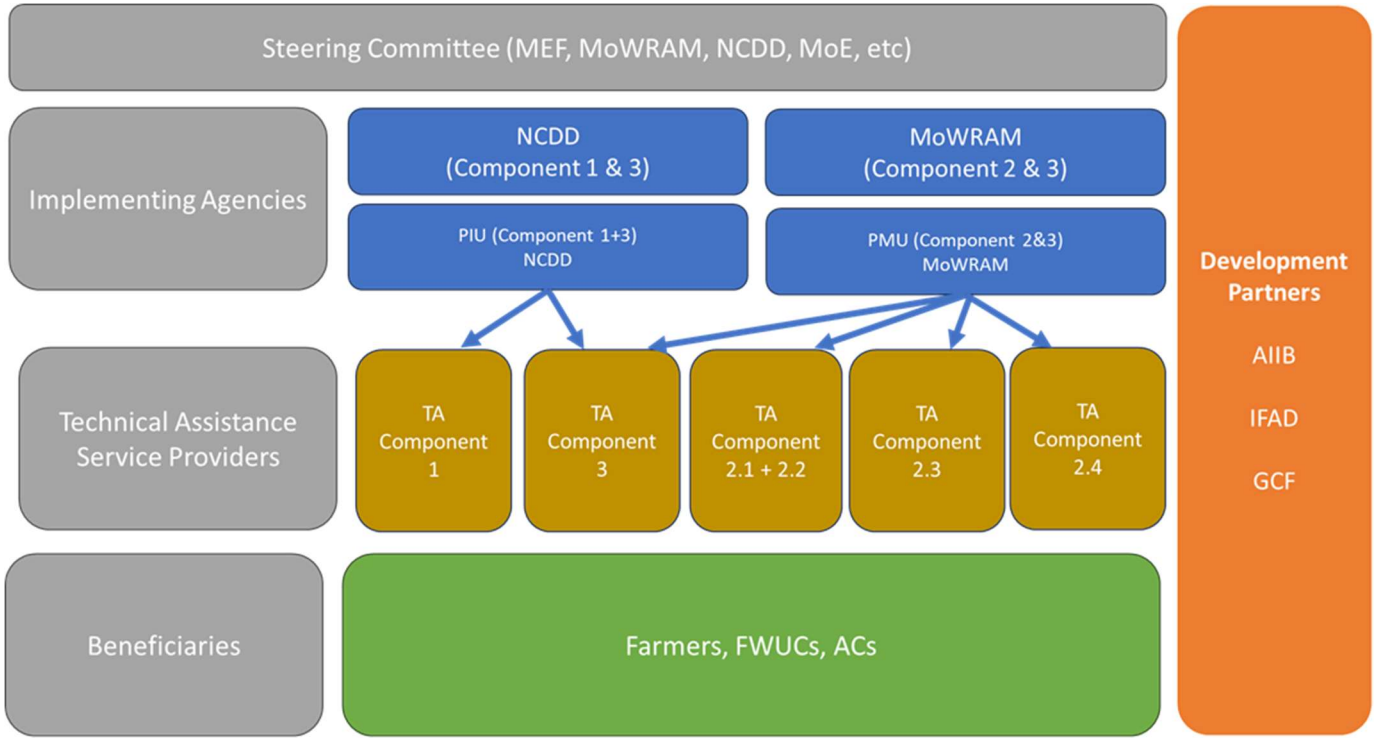
II. Project financial profile[2]

3. The total incremental investment and recurrent costs for CAISAR, including price and physical contingencies, are estimated at US$ 240.1 million. As per the Vietnamese laws, IFAD funds are not used for recurrent costs. Overall, the recurrent cost share as a percentage of total project cost is 5.5%. The breakdown of the costs by component is shown in Table 1 below.
4. Table 1. CAISAR costs by component.

US$ million

Components	Total Cost (USD)	Funding Sources				
		Green Climate Fund (Grant)	Green Climate Fund (Credit)	IFAD (Credit)	AIIB (credit)	Government (in kind)
Component 1 - Farm Level Climate Adaptation and Resilience	**40.4**	11.0	-	27.9	-	1.5
Component 2 - Upgrading and climate-proofing water infrastructure for increased resilience	**167.7**	20.8	36.8	3.8	96.3	10.0
Component 3 - Strengthened institutional and regulatory capacity for low-emission climate-resilient development pathways	**10.7**	4.1	3.2	1.4	-	2.0
Project monitoring & evaluation	**13.3**	4.1	-	3.8	3.7	1.6
Contingency credit	**8.0**	-	-	8.0	-	-

[2] Note that COSTAB and Financing Plan may be finalized at a later date after the design mission. In such cases this section, as well as other relevant information, should be revised and updated by the Finance Officer before the President's Report is presented in Scriptoria for FMD clearance.



TOTAL	**240.1**	**40.0**	**40.0**	**45.0**	**100.0**	**15.1**
		16.7%	**16.7%**	**18.7%**	**41.6%**	**6.3%**

5. The financing plan will be as follows: IFAD contribution (PBAS 13) is US$ 45.0 million- 18.7%. In addition, AIIB will allocate US$ 100 million (41.6%) in parallel financing and GCF will allocate US$ 40 million loan (16.7%) and US$ 40 million grant (16.7%). Government will contribute US$ 15.1 million (6.3%).

6. Description of cost categories and eligible expenditures:
The CAISAR will not have cost categories. Instead, it will have cost allocations by components as per GCF requirements.

III. Implementation Arrangements

7. **Organizational Structure:** The Executing Entity (EE) for the project will be the Ministry of Water Resources and Meteorology (MOWRAM) which is responsible for sustainable water resource management and irrigation in Cambodia. MOWRAM will establish a Project Management Unit for the coordination of all components and consolidation of the project planning and reporting. In addition, the National Committee for Sub-National Democratic Development Secretariat (NCDD-S) will be responsible for the implementation of component 1 which is designed to improve farm-level climate adaptation and resilience. The NCDD-S is a Direct Access Accredited Entity to the GCF and will have a Project Implementation Unit (PIU) for implementing the component 1 activities.
8. A Project Steering Committee (PSC) will be established for inter-ministerial coordination. It will be chaired by the Minister of MOWRAM and comprise of senior officials from MOWRAM, the Ministry of Economy and Finance (MEF), the Ministry of Interior (MOI) which is responsible for the NCDD-S, Ministry of Agriculture, Forestry and Fisheries (MAFF), Ministry of Environment (MOE), and the Provincial Governor's Offices of Pursat, Kampong Chhnang, Kandal, and Kampong Speu provinces. An Inter-Ministerial Resettlement Committee (IRC), chaired by MEF, will manage resettlement and land acquisition issues where they arise. The National Project Coordinator of the Project Management Unit (PMU) will serve as a secretariat to the PSC.
9. Overall project organizational structure:

10. FM staffing arrangements. CAISAR will employ the existing seconded staff from MOWRAM and NCCD. However, each of them will recruit one additional consultant with adequate experience and educational background to maintain project accounting records in the accounting software and financial reporting.

IV. Financial Management Risk Assessment[3]

11. Project risk assessment

Inherent risk: Substantial

Transparency International (TI)

12. Cambodia's 2023 TI Corruption Perception Index (CPI) score is 22, representing a two-point decrease compared to 2022. This places Cambodia at 158th position out of 180 countries assessed, down from 150th last year. The result marks a concerning trend, as Cambodia's CPI score has fluctuated within the low 20s for the past decade, despite sporadic improvements.

Public Financial Management (PFM) and Debt Assessment.

13. Growth for 2023 is projected at 5.3 percent. This is backed by the recovery in tourism and non-garment exports—notably solar panels and electric parts, as well as fiscal support. The public debt to GDP ratio is projected to increase moderately, and the risk of debt distress remains low. According to staff's debt sustainability analysis, in the baseline scenario, the total public and publicly guaranteed (PPG) debt-to-GDP ratio, which is 35 percent of GDP as of end-2022, is projected to rise by around 4 percentage points of GDP during the next decade due to higher financing costs of the fiscal deficit. This ratio is projected to remain stable under several stress scenarios, suggesting a low risk of debt distress.9 However, the analysis shows that Cambodia's external debt remains vulnerable to shocks in exports and growth.

14. FM risk summary.

FM Control Area (level 3 risk)	Comment(Risk identified)	Mitigation actions	Inherent Risk	Residual Risk
1. Organization and Staffing	• Lack of experience in IFAD-funded operations/projects • Delay of recruitment of PMU/PIU staff, including finance staff. • Staff needs training on IFAD FM and disbursement procedures.	• Competitive and transparent selection of candidates. • Start-up training for FO. • Networking of FOs of IFAD-funded projects in Cambodia.	Substantial	Substantial
2. Budgeting	• MOWRAM does not have experience in IFAD AWPB preparation • Delay of AWPB preparation due to challenges related to coordination between PMU and PIU. • Budget may not be closely monitored due to lack of expertise and	• Training on preparation of AWPB. • Customized accounting software to monitor budget vs actual will be introduced within 6 months of the entry into force of the project.	Substantial	Moderate
3. Funds Flow / Disbursement Arrangements	Delay in the preparation and submission of IFR and WA to IFAD	• MOWRAM and NCCD will cooperate to prepare and consolidate IFR, and then WA can be submitted to IFAD promptly. • Training on IFR and ICP will be conducted at the start-up.	Moderate	Moderate
4. Internal Controls	• PEFA: Effectiveness of internal audit was rated C Internal Audit Department be established in each ministry and state enterprise and report to its head, with a copy to the National Audit Authority. • Risk of unclear role, responsibility, and delegation. • Risk of insufficient controls for detecting fraud.	• PIM will be approved at the project inception.] • IFAD anti-corruption training will be conducted at the start-up. • PMU and PIU will follow the internal control procedures from Government Standard Procedures (SOP) for internationally funded projects. • PMU/PIU will be subject to line-ministry inspection on internal control and procurement.	Substantial	Substantial

5. Accounting and Financial Reporting	• PMU/PIU will apply the Cambodia Public Sector Accounting Standard (cash basis). • Standard accounting software shall be used for PMU/PIU and be compatible with IFAD and other donors' financial reporting requirements.	• Ensure the Accounting software is installed, customized, and capable of providing the financial information for IFR. • IFR training will be conducted at the project start-up.	Substantial	Substantial
6. External Audit	• External Auditors may not follow standard TOR and audit contract requirements.	• Audit TOR will be reviewed by IFAD and cleared. Coordination with MEF will be essential to ensure compliance with IFAD audit requirements.	Substantial	Substantial
Overall rating	CAISAR FM Residual risk is Substantial before mitigation measures are implemented. The project will benefit from an adaptation of a semi-ring-fenced PMU with seconded staff from a designated unit specializing in implementing donor-funded projects. However, recruiting qualified FM staff, installing and customizing accounting software, developing PIM/FMM, and adequate external audit arrangements must be completed before the residual risk becomes moderate. The project shall comply with the government's SOP like other donor-funded projects.		Substantial	Substantial

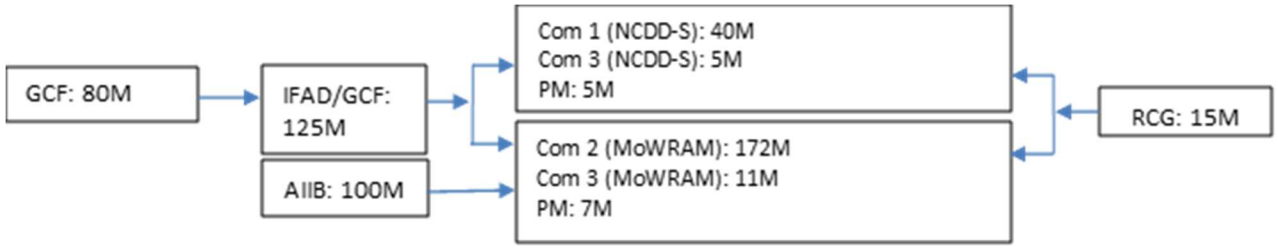
15. Overall risk: The Inherent FM risk is Substantial due to (i) Potential low FM staff capacity at implementing agencies, (ii) No previous experience of the MOWRAM in IFAD-funded projects; (iii) Past external audit reports did not comply with IFAD requirements. The IR and RR are Substantial. RR will be revised after project negotiations.
16. CAISAR design will include the following to mitigate the risks:
    - Recruitment of qualified consultants with relevant experience and educational background.
    - Development of PIM and FMM with clear roles for supporting documents filing and accounting record keeping for all implementing partners.
    - Customization of accounting software for accounting record keeping and financial reporting.
    - Close coordination with MEF to ensure compliance with IFAD audit requirements.

V. Financial Management and Disbursement Arrangements

17. ***Disbursement*:** The government treasury system is not applied for project fund flow. MEF will authorize the opening of a designated account (DA) in USD at the National Bank of Cambodia for the receipt of Financing from IFAD. There will be two USD project accounts (one for MOWRAM and one for NCCD) which shall be opened at commercial banks for the payment of project activities. One Government Counterpart Fund Account is to be maintained by MEF through which the proceeds of the Financing shall be further transferred to two sub-accounts in commercial banks to receive the counterpart fund from the Counterpart Fund Account. The disbursement of the IFAD fund will follow through the Revolving Fund Mechanism in which the project can withdraw/justify the advance based on the Interim Financial Report (IFR) following the procedures and conditions outlined in FMFCL. IFAD will send the FMFCL to MOWRAM and MEF with guidance on disbursement procedures; MEF will send IFAD the ICP letter providing the delegation and authorization of the persons who can request and approve the submission of IFR and WA in ICP.
18. **Staffing:** MOWRAM is the Lead Project Agency, and NCCD is an implementing partner; MOWRAM and NCCD already have a finance unit with experience in international donor-funded projects that can support CAISAR. PMU and PIU will be set up for MOWRAM and NCCD with a combination of seconded staff and contract staff. The seconded Finance Officer will oversee the project's financial management to ensure the effective FM system and internal control are maintained in accordance with the procedures in SOP and PIM. The seconded Finance Officer will have relevant experience working on other internationally funded projects. The contract Finance staff will be hired to support project FM functions daily including: a) Ensuring sufficient supporting documentation and approvals for payment; b) Posting transactions to the accounting software; c) Providing periodical and financial reports to the management; d) submitting of IFR and WA to IFAD, providing other support to Seconded Finance Officer as required. The Finance staff will be recruited with relevant experience and qualifications. FM functions will have clear roles and responsibilities to ensure the segregation of duty and payment authorization in accordance with SOP and PIM.
19. ***Planning and budgeting:*** The project budget is separate from the government budget; however, it will be integrated into the Public Investment Plan; the procedures for budget preparation are described in the SOP, and the AWPB will also include the projection of counterpart contributions. AWPB is subject to approval by MEF before submission to IFAD for no Objection. NCCD-PIU will prepare the AWPB and submit it to MOWRAM-PMU; PMU will consolidate the AWPB and submit it to IFAD for NOL. The AWPB and procurement plan will be prepared in IFAD format with details and a summary of activities and categories. The budget will be monitored in the accounting software. PMU/PIU will ensure to keep track of the progress reports against the budget and provide required information for interim financial reports and annual financial reports.

20. ***Internal control:*** According to the PEFA for Cambodia, the effectiveness of internal audits was rated C. PMU and PIU will be set up separately from the government system and will follow the internal control procedures from the Government's Standard Operating Procedures (SOP), which is deemed to be effective for internationally funded projects. The SOP articulates the responsibilities and critical elements of internal control, financial delegation, transaction processing, and computerized accounting system controls. PIM and Financial Management Manual will outline key FM arrangements and controls. The Internal Audit Department of MOWRAM and NCCD will conduct the internal audit of PMU and PIU annually to ensure compliance with the internal control procedures; the outcome of the internal audit will be shared with IFAD.
21. ***Accounting systems, policies, procedures, and financial reporting:*** PMU and PIU accounting procedures will follow Standard Operating Procedures (SOP) for internationally funded projects. According to SOP, CAISAR will apply the Cambodia Public Sector Accounting Standard (cash basis), which is based on the International Public Sector Accounting Standards (IPSAS). Standard accounting software shall be used for PMU/PIU that will be compatible with IFAD and other donor's financial reporting requirements. Standard Government's chart of accounts will be set up in the accounting software to capture all payment transactions; in addition, project components, categories, sources of funds, and other segments will be set up and recorded for the transactions in the software to ensure financial reports and budget reports produced in accordance with IFAD and Government requirements. The details of the accounting process and records are outlined in the SOP. All accounting records are required to be maintained in electronic format for a period of 10 years after project closure. MOWRAM PMU will be responsible for the consolidation of financial reports from NCCD-PIU for each quarter; within 30 days, NCCD PIU will send to MOWRAM PMU the interim financial report (IFR) in the agreed format that will finally be consolidated and submitted to IFAD for justification of advance and requesting new advances.
22. ***External audits*****:** CAISAR project financial statements will be audited by a private audit firm appointed by MEF, with the TOR prepared by MEF taking into account the IFAD requirements. The audit will be conducted in accordance with Cambodian Auditing Standards, which is adapting the International Standards on Auditing. The unaudited annual Financial Statement will be submitted to IFAD within 4 months after the end of the fiscal year; the audited financial statement will be submitted to IFAD within 6 months after the end of the fiscal year. The management letter with an assessment of the project's internal control matter will be included as an integral part of the audit report.
23. ***Country systems*****:** Government staffing, partial budgeting, internal controls (SOPs), accounting and audit standards will be used to implement CAISAR.
24. ***Lessons learned*****:** Despite the country's high risk on the corruption perception index, internationally funded projects have been well performing with credit to the strong coordination of MEF, Ministries, and LPAs. The Standard Operating Procedure provides specific guidance on project FM operation.

VI. Implementation Readiness



25. Table 3: FM Actions Summary: The actions needed to mitigate FM risks are summarised below:

	Action	Responsible Party / Person	Target Date / Covenants[4]
1.	PIM and FMM development.	CAISAR PMU/PIU	By the entry into force FA Covenant required
2.	Accounting software customization.	CAISAR PMU/PIU	By the entry into force FA Covenant required
3.	Recruitment of experienced and qualified FM staff.	CAISAR PMU/PIU	By the entry into force FA Covenant required
4.	Collaboration with MEF to ensure audit compliance	IFAD	ongoing

26. **FM Supervision plan**

FMS or FO will join the IFAD Supervision mission once a year. In addition, FMS will participate in the Implementation Support Mission every year until project residual risk is reduced to Medium.

Climate Adaptive Irrigation and Sustainable Agriculture for Resilience

Project Design Report

Annex 8: 18-month Procurement Plan

Document Date:	28/07/2025
Project No.	2000003926
Report No.	7034-KH

Asia and the Pacific Division
Programme Management Department

Annex 10: Procurement Plan

I. General

1. **Project information** *[Project name, Project Number, Country]*:
   Project Name: Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR)
   Project Number:
   Country: Cambodia

2. **Version of the Plan**: Version 3.0 dated 17 November 2024

3. **Procurement Plan clearance date (to be indicated by GCF)**:

4. **Period covered by this procurement plan:** The first 18 months

   This initial procurement plan is expected to cover at least the first 18 months of project/program implementation, or the full implementation period if available. Subsequent procurement plans (if needed) or substantial changes to this approved plan shall be communicated to the GCF upfront.

II. Procurement Methods and Prior Review Thresholds

	Procurement Category and Method[1]	Financial threshold applicable[2] / Threshold for use of method	Prior Review Threshold (applicable if the Executing Entity is not the AE)[3]	Remarks
A	**Goods and goods-related non-consulting services**			
1	International Competitive Bidding for Goods	Always allowed	US$ 150,000 or more	
2	National Competitive Bidding for Goods	Always allowed	US$ 150,000 or more	
3	Shopping for Goods	US$ 40,000 or less	US$ 150,000 or more	
4	Direct Contracting	With due justification	US$ 5,000 or more	
B	**Works and work-related non-consulting services**			
1	International Competitive Bidding for Goods	Always allowed	US$ 300,000 or more	
2	National Competitive Bidding for Goods	Always allowed	US$ 300,000 or more	
3	Shopping for Goods	US$ 40,000 or less	US$ 300,000 or more	
4	Direct Contracting	With due justification	US$ 5,000 or more	
C	**Consulting services and related non-consulting services**			
1	Quality and Cost Based Selection (QCBS)	Always allowed	US$ 80,000 or more	
2	Quality Based Selection (QBS)	Always allowed	US$ 80,000 or more	
3	Fixed Budget Selection (FBS) OR Lest Cost Selection (LCS)	Always allowed	US$ 80,000 or more	
4	Consultants Qualification Selection (CQS)	US$ 150,000 or less	US$ 80,000 or more	
5	Individual Consultant Selection (ICS)	Contracts with individuals regardless of the value	US$ 30,000 or more

7	Single Source Selection (SSS) – Individual Consultant	With due justification	US$ 5,000 or more	

1. As per applicable procurement policy of the Accredited Entity. The procurement methods and procedures are specified under IFAD Procurement Handbook (accessible via https://www.ifad.org/en/w/document/ifad-procurement-handbook). The procurement thresholds will be inserted into IFAD's Online Procurement End-to-End system (OPEN) for plans and monitoring implementation of project procurement activities.
2. Financial threshold for which the indicated procurement method should be used.
3. Financial threshold above which the Accredited Entity will review and provide clearance prior procurement process is initiated (not applicable if AE is the executing entity).

III. Procurement activities

												solid working relationships with other international crop research institutes belonging to the Consortium of International Agricultural Research Centers (CGIAR). Concerning the wide-ranging achievements in development of climate resilient rice varieties and dissemination of climate smart agricultural practices and technologies to various countries, and in recognition of outstanding contributions to advancements in Cambodian rice breeding programs, strengthening of rice seed systems, on-farm mechanization and capacity development of Cambodian scientists, extension workers and policymakers, IRRI is ideally placed to provide its services under the TA package for increasing farmer capacity on climate resilient rice production under Sub-component 1.1 in a comprehensive manner. The project plans to engage IRRI

1. Introduction

1. This Project Operation Manual (POM) guides implementation of the Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR). The POM is intended primarily for use by Project Management, the Project Management Unit and Project Implementing Units. The purpose of the POM is to assist Project Management to achieve the Project Development Objective and Project Outcomes defined in the Project Design Report and the Project Financing Agreement. The POM reflects agreements between the Asian Infrastructure Investment Bank (AIIB) and Government of the Kingdom of Cambodia (GoKC) on how project funds provided by AIIB will be used. The POM provides guidance on:

    - Project implementation structure, including roles and responsibilities;
    - Project planning;
    - Eligible uses of project funds;

- Rules that apply to project implementation, including sub-project selection and prioritization, environmental and social safeguards (ESS), project administration, financial management, procurement; and monitoring and evaluation (M&E) and Reporting.

The POM presents important principles and guidelines for implementing project activities. The POM cannot provide every detail. Detailed procedures will be developed as needed by the project implementation team and consultants during the start-up phase of implementation. The POM itself is a living document that can be changed through agreement between the Project Director and AIIB/IFAD. The framework for implementation of CAISAR is RGC's Sub-Decree on Promulgating the Updated Standard Operating Procedures on Project Management, Standard Operating Procedures on Financial Management, Standard Operating Procedures on Procurement for Implementing All Externally Financed Projects / Programs, in Cambodia, Updated Version December 2019, and its subsequent amendments.

Under the agreement between AIIB and RGC, in any case where AIIB rules and procedures are different from RGC rules and procedures, AIIB rules will take precedence in particular the AIIB Environmental and Social Safeguards and AIIB Guide to Procurement.

1.1 The Project at a Glance

Project Name	Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR)
Executing Agencies (EA)	There will be two Executing Entities in the Project, The Ministry of Water Resources and Meteorology (MOWRAM) will be the main Executing Entity (EE) for CAISAR. The Ministry will be responsible for implementation of Component 2 and a part of Component 3. The National Committee for Sub-National Democratic Development Secretariat (NCDDS will also be an Executing Entity for the project. NCDDS will play a crucial role in the implementation of Component 1 and part of Component 3, in close collaboration with provincial departments and service providers.
Start Date	01/06/2025
End Date	31/12/2032
Project Cost	USD 240 million
Project Financing	Project amounts to US 240 million with AIIB being the major lender with USD 100 million along with USD 80 Million grant/loan financing from the GCF, and USD 45 Million from IFAD, and USD 15 Million as in-kind co-financing from RGC.
Sectors	Irrigation, Agriculture, Rural Economic Development
Themes	Irrigation, Flood protection, Drainage, Value Chain, Rural Infrastructure, Skill Development, SME Development, Digital Technology, Climate Change Adaptation and Mitigation.
Target Area	Pursat, Kampong Chhnang, Kampong Speu, Kandal
Targeting Strategy	This project will directly target 71,266 households identified as the poorest by the government, prioritizing women and youth. Indirectly, it will benefit 1.15 million people living along improved canals and roads. The project also includes "self-targeting," allowing young people (15-30 years old) and women-headed households to actively participate in project activities.

Goal	Modernize Irrigation, Improve Flood and Drainage, Reduce Poverty, Enhance Food Security, Climate Adaptation and Mitigation
Development Objective	Inclusive and sustainable agriculture sector growth based on better market access, early warning system.
Beneficiaries	562,757 direct beneficiaries 1.15 million indirect beneficiaries
Components, Outcomes and Key Results	
Component 1	Farm-level climate adaptation and resilience
1.1 Climate Resilient crop-water management practices and pro-poor adaptation measures at farm level	Increased farmer capacity in climate smart agriculture Direct - 40000 HH Indirect - 98906 HH
1.2 Climate Adaptive Value Chains	Climate adaptive value chains developed by 4Ps and increased access to finance. No of MSME - 120 HH benefiting 28000 Access to Grant - 120 MSME Access to BDS - 120 MSME
1.3 Agro-meteorological information and service S	Increased access to and use of climate information and advisory services for climate responsive water-use and crop planning. Direct - 563000
1.4 Resilient Farm Roads	Increased resilience of farm road infrastructure to climate changes 90 Km of Rural Road for better access to the market. Direct - 10700 HH
Component 2	Upgrading and climate-proofing water infrastructure for increased resilience

2.1 Modernized Irrigation Schemes and Ponds	Three sub-projects with a total of six separate irrigation schemes covering an area of 22,051 ha
2.2 Flood-proofed and Improved Drainage	The flood protection works will directly benefit an area of 10,005 ha, including a proposed semi-polder area of around 2,550 ha The improved drainage will include both the irrigated and flood proofed area covering a total area of 32,056 ha
2.3 Farmers Water User Communities (FWUC) established and trained	Eleven FWUCs will be established and trained under the project
2.4 Water information system established and operational in three sub-projects	A SCADA system will be established for ensuring the distribution of water to irrigation schemes covering an intervention area of 123,838 ha
Component 3	Strengthened institutional and regulatory capacity for low-emission climate-resilient development pathways
3.1 Strengthening MOWRAM Capacity	250 Individuals
3.2 Strengthening of NCDDs	350 Individuals

1.2 Project description

Project Overview. The Project originated from the RGC's National Water Resources Management and Sustainable Irrigation Road Map and Investment Program (2019-2023). The Project is designed to assist the Ministry of Water Resources and Meteorology (MOWRAM) with its strategic plans to modernize the irrigation sector. The overall goal of the Project is to make the agriculture sector in Cambodia climate resilient and sustainable.

The Project area is expected to comprise 32,056 hectares. The sub-projects under the Project will include the Ou Tapaong (OTP) and Lum Harch along with four smaller sub-projects in the Krang Ponley Valley. The selected provinces covered by the Project have the highest population density, a high proportion of poor households, and a significant percentage of female-headed households. The livelihoods of the poorest and most vulnerable people in the region depend mainly on agricultural production and water availability through precipitation, river flow, and irrigation schemes.

The Project has significantly benefited from AIIB's PPSF-funded upstream studies (USD4.7 million), which have supported key preparatory work, including the Climate Vulnerability Assessment Report, Hydrology and Hydraulic Reports, Livelihood and Vulnerability Analysis, a GCF Funding Proposal, and Detailed Engineering Designs (DEDs) for the AIIB-financed

component 2.1 modernization of schemes and GCF financed component 2.2 flood proofing and drainage improvements. The DEDs are covering the five sub-schemes; Kropeu Trom, Ou Tapaoung, Brambei Mom, Yutasast and Stung Kraing Bat. The DED of Lum Harch will be taken up by the PMIC which is jointly financed by all the financiers. To address coordination complexities and delays in completing DEDs, the Project's Grant Agreement, signed between AIIB and the Kingdom of Cambodia, has been extended to December 31, 2026. With USD 3.2 million PPCF grant allocated out of USD 4.7 million for Phase 2, efforts are now focused on finalizing DEDs for key irrigation schemes, ensuring Project readiness for AIIB-identified investments.

Project Goal and Objectives

The project goal and objective are to increase climate adaptation, mitigate the negative impact of extreme climate events, and improve the livelihoods of smallholder farmers and vulnerable rural communities in four provinces of Cambodia. The Project aims to make the agriculture sector in Cambodia climate resilient and sustainable through modernization of the irrigation sector by installing resilient irrigation systems. It will also enable farmers to adapt to climate risks and mitigate crop emissions through use of energy- and water-efficient technologies and practices. The Project will provide timely weather information and improved market integration, ultimately enhancing the livelihoods of vulnerable rural groups in the target provinces of Cambodia. The objective will be achieved by implementing three components that aim at addressing climate change vulnerabilities, increasing agriculture productivity, and developing institutional capacities. The components include:

Component 1: Improving farm-level climate adaptation, resilience, water use efficiency which focuses on climate resilient crop-water management practices, improve food security and income generation through strengthening and improving adaptive capacity and climate resilience focusing on rice, vegetable, poultry and aquaculture production, provide opportunities for greater market integration and agro-meteorological information and services.

Component 2. Upgrading and climate-proofing of water infrastructure for increased resilience which will focus on modernization of irrigation schemes and ponds, flood-proofing and drainage improvements, establishment and training of FWUC and improve the water management of large-scale irrigation scheme with the establishment of a SCADA system.

Component 3. Institutional Strengthening which aims to strengthen Government institutions, mainly the MOWRAM and the National Committee for Sub-National Democratic Development (NCDD) and the FWUC's. While the focus for MOWRAM will be on up-grading technical capacity in various aspects of irrigation design and management, the key focus area for NCDD will be on provide capacity building in climate resilient agriculture, application of agrometeorological systems and strengthening climate policies and strategies at provincial level.

1.3 Project Area

Geographical area & Province selection: The proposed project CAISAR will benefit more than 1.8 million people (Roughly 11% of its population) in four provinces across Cambodia viz, Kampong Speu, Kampong Chhnang, Kandal and Pursat. Identification of the target areas has been done based on i) greater prevalence of poverty, ii) higher exposure to disaster risk especially flood iii) higher vulnerability to climate change. The specific characteristics of each province, mapped against the criteria for selection.

District & village selection: Within the four (4) provinces, the CAISAR project implementation will be concentrated in eleven (11) districts. The districts have been selected based on the climate vulnerability, flood risks and high poverty index. The project activities will mostly be concentrated around the six schemes identified jointly by MOWRAM and NCDDS. The project is targeting 31 communes and 184 villages from the identified 11 districts following IFAD's targeting strategy for component 1.

Table 1.1 - Details of the districts, communes and villages

Sl No	Scheme Name	Command Area(ha)	No of District	No of Commune	No of Village
1	Ou Ta Paong	17,079	1	2	31
2	Lum Harch	6,350	3	10	55
3	Kropeu Trom	1,140	1	1	14
4	Yotasast	2,693	1	3	15
5	Stoeung Krang Bat	1,394	2	3	13
6	Brambei Mom	3,400	3	12	56
	Total	32,056	11	31	184

CAISAR project area is composed of the three sub-projects covering six schemes in four provinces of Cambodia covering a total of 32,056 ha as shown in Tables 1-2 and 1-3.

- Ou Ta Pong sub-project (Pursat Province)
- Lum Harch sub-project (Kampong Chhnang province)
- Krang Ponley sub-project (Kampong Speu, Kampong Chhnang and Kandal Province).

The six sub projects and schemes were selected from the four provinces mentioned in the following Table 1.2.

Table 1-2 presents the sub-project, schemes and provinces targeted by CAISAR project.

Provinces	Sub-project	Schemes
Pursat	Ou Tapaong sub-project	Ou Tapaong
Kampong Chhnang	Lum Hach	Lum Hach scheme
Kampong Speu, Kampong Chhnang and Kandal	Krang Ponley	Krapeu Troum Yotasast Steung Krang Bat Brambei Mom

C2.3* Masterplan area potential impact (80.000 ha) – OTP scheme area (not included in total area)

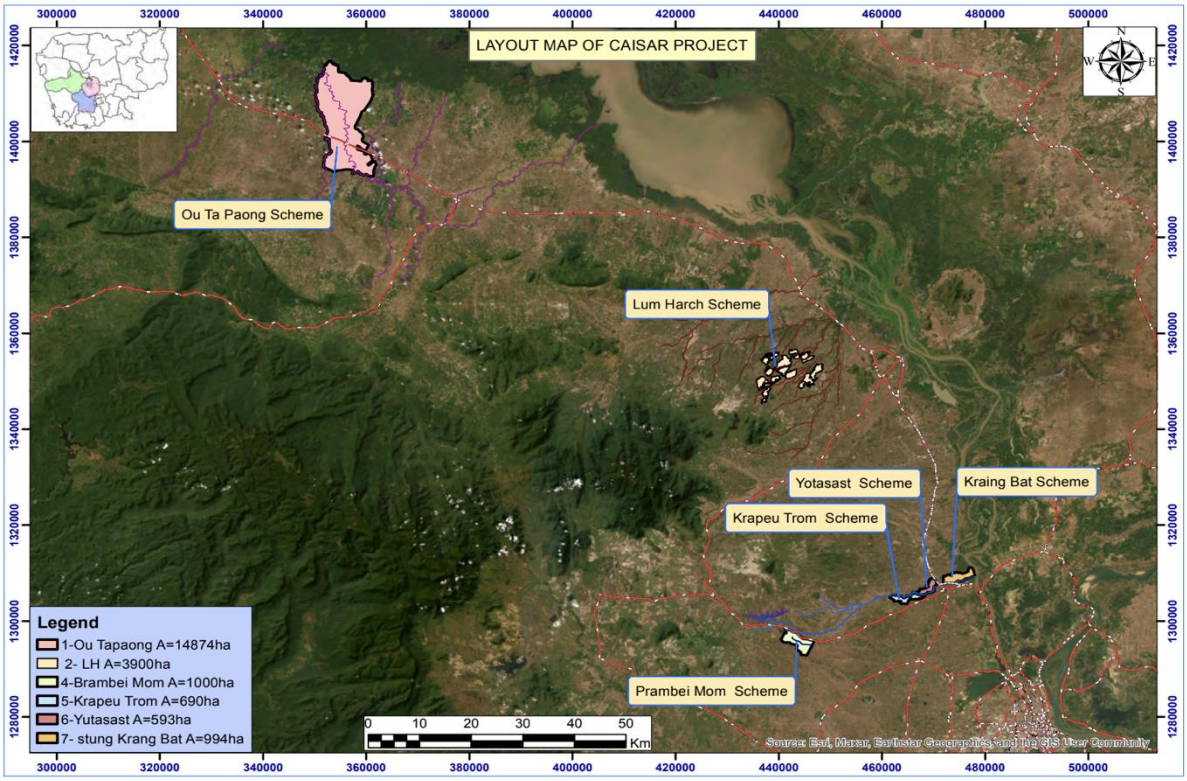

Figure 1 – Maps of CAISAR target Area.

1.4 Project outreach

CAISAR interventions will directly benefit 71,266 households covering 500,000 individuals. Out of these 500,000 individuals, 40 % will be women and 15 % will be youth beneficiary.

Target groups

The CAISAR project will be working with mainly five types of the target groups very poor & poor HH, HH above poverty line, women, youth, and smallholder farmers.

Poor 1 (Very Poor) and Poor 2 (Poor) Households: In Cambodia, 17.8% of the population lived below the national poverty line as per government record in 2019. Government of Cambodia has published province wise poverty data in 2023[1].

Poverty scenario of the selected province (derived from the poverty data GoRC):

Province	Poverty Rate	Total Number of Households (HH)	Total Number of Poor HH	Number of Poor 1 HHs	Number of Poor 2 HHs
Kampong Chhnang	12.27 %	138,950	17,055	3,494	13,561
Kampong Speu	14.18 %	196,076	27,811	7,082	20,729
Pursat	19.16 %	131,457	25,181	8,779	16,402
Kandal	12.61 %	300,945	37,958	10,946	27, 012

Very poor: Out of the total 71, 266 households targeted for the project 64 % of the households will fall into this category of Poor 1 and Poor 2. These HHs will be selected from the i) Poorest of the poor (based on the government data on below poverty line), ii) a climatically vulnerable families, (iii) having children less than two years of age (iv) pregnant and/or lactating women, (v) adolescent girls, elderly, PWDs, (vi) women-headed households, (vii) IP households, (viii) landless families, ix) experienced complete loss of production owing to climate change. Any two to three of the mentioned criteria will make the households eligible for project interventions.

Above Poverty line Households: The rest of the Households, 36 % of 71,266 will be selected from relatively less poor community. Some of these families already have some kind of trainings on the enterprise development or they have started some enterprises viz., rice processing, dairy or poultry enterprises etc. They will be provided matching grants to scale up their existing enterprises or they will be supported to start the business by providing start up capital, capacity building training etc. mentioned in the project activities. They will also be supported by training on quality standard food items and marketing of products etc.

Women: Rural women are among the most vulnerable due to discriminatory gender norms and social stigma. They struggle with unemployment, food insecurity, malnutrition, and limited awareness on climate resilient technologies and have poor access for modern agricultural machineries and equipment. However, women in Cambodia shouldered majority of the household's responsibility and helps their male counter parts in farming activities which includes home gardening, animal husbandry and rice production. Many women, particularly the women headed HHs, face the difficulties of finding labourers for agriculture work and have very limited access to the modern machineries, often take care of rice during cropping season. CAISAR will

include 40 % of such women from very poor and poor HHs in all activities including, awareness of agrometeorological advisories, knowledge sharing, agrometeorology information, skill development, Farmers Field School training etc. CASIAR project is designed to target women to be the member of the water user group (FWUC) and their voice will be included during decision making on water use, choice of crops etc. which is beyond the norm in Cambodia. This will be able to mitigate some of the constraints women face in typical societies in Cambodia. A special advantage will be given for women led enterprises (MSMEs) from Public Private Partnership Facility (4PF).

Youth: According to the General Population Census of the Kingdom of Cambodia 2019, one in six Cambodians was between 15 and 24 years old and more than a quarter of the population was at the age of between 15 and 29. Seventy per cent of young people aged 15-29 were economically active in 2019. Furthermore, young people aged 15-29 made up a major part of Cambodia's working-age population (37 per cent). A structured survey of young people aged 15-24 that was conducted as part of the "Youth Situation Analysis in Cambodia" (December 2020), indicated that 59 % of those surveyed were not in employment, education, or training (NEET). Moreover, rural youth face difficulties in finding decent rural employment opportunities and accessing land, which also limits access to credit. Thus, a high proportion migrate to urban areas in search of work. Poverty incidence among ethnic minorities is not significantly higher than among the majority, but they suffer disadvantages in access to health, education, financial and other services. CAISAR project will include minimum 15 % youth both male and female in all activities mentioned above. In some cases, especially for creating MSMEs or accessing loans, preference will be given to the youth and minimum 20 % youth will get access to financial support from the 4PF initiative. The 4PF initiative aims to support at least 100 MSMEs, with a goal of achieving an 80% increase in net turnover among recipients and a return on investment exceeding 10%.

Smallholder Farmers: The majority of the population in the target area are rural farmers (rice typically), whilst some also supplement their income via alternative jobs such as working in the service sector. Households typically do not have stable annual incomes or expenditures due to the annual cycle of the wet and dry season and the impact this has on agricultural yields and livelihoods. Most rice farmers are smallholders who use low input rainfed systems to produce rice for food and income. They have limited capacity to adapt to climate change and lack the technical and financial resources to access the technologies and adopt the practices that can build their resilience. CAISAR will directly target the smallholder farmers who are cultivating rice and help them adapt to climate risks and help them diversify and increase their sources of income from agriculture. The women will be trained on poultry and home gardening to increase the income of the families and improve the dietary requirements of the families.

1.5. Target Groups and Targeting Strategy

Targeting Strategy

The targeting strategy that will be adopted for this project areas are as follows:

Direct Targeting: Direct targeting will follow the same methodology described in para 15. The HHs will be selected from the poorest of the poor based on the government below poverty line data along with women and youth related data. 71,266 HHs will be impacted by several activities mentioned in component 1 and 2. The direct beneficiary of each of these activities have been given in table xxx in para 9. Total number of direct beneficiaries is 500,000 and indirect beneficiary will

be around 1.8 million. The male and female number of individuals is mentioned in para 15. The indirect beneficiaries will be the inhabitants along the canals selected for renovation and the road infrastructure. These activities will support in terms of accessibility and availability of water and road infrastructure which in turn will help in increasing their income potential and ability to adapt against the climate variabilities and change.

Self Targeting: The above-mentioned activities will attract the young men and women aged between (15-30 years) and will be enrolled many of these above-mentioned activities and will be covered as self targeting beneficiaries. They will not be covered by the eligibility of the direct targeting group. The youth and women of the poor and above poor families also be part of this self targeting in addition to already targeted as direct targeting group. Any women headed HHs who has not covered by direct targeting, can also be part of the self targeting group for the project. They will get preference of any project related benefits. The self targeted group can come from the activities mentioned in para 19 as well.

Gender equality and women empowerment (GEWE): Cambodia's irrigated agriculture faces increasing challenges from adverse impacts of climate change, especially the changes in rainfall patterns, duration and timing of the rainy season, and climate induced water disasters such as floods and droughts. Climate Resilient and low emission practices and investments in agriculture and water management are, therefore, crucial to protect and enhance Cambodia's agricultural production and productivity, and contribute to increasing food security, poverty reduction, and livelihood development. A gender assessment has been conducted in accordance with GCF's Gender Policy. The assessment examines the livelihood activities of project's target, covering existing gender norms and how these norms affect people's daily livelihood activities. For livelihood/income generation activities, the assessment focuses on the main income source for majority of target farmers (rice), and other secondary income sources (cash crops, animal husbandry). The gender assessment found that women have limited access to climate-smart technologies, water, income diversification and value-chain development opportunities. Yet, given the primary role that women play in rural society, strengthening of their adaptive capacity is essential to contributing to the resilience of their households and communities. Inputs for the gender assessment were gathered from the poor, ethnic minority groups, women, men, elderlies who participated individual interviews and FGDs during the feasibility study.

Five key barriers are identified as current gender gap and potential constraint to promoting new technology adoption for improved adaptation. These include:

- Traditional gender norms,
- Burden of household chores,
- Limited education and skills,
- Lack of local wage jobs and increasing migration

27. Gender norms shape the gender division of labour in household chores, farming, and income generation. Men generally take care of heavy works (physically heavy) in farming and participate in social activities. Women bear the primary responsibility for childbearing, raising and domestic works. Domestic work is time consuming. For instance, fetching water can take up to 3 hours a day.

28. In addition to their domestic role, women also participate in farming including home gardening, animal husbandry and rice production alongside men. Many women take care of rice during cropping season and participate in harvesting in case they do not have access to modern machinery. This is particularly the case for women headed households who face chronic lack of labour and more limited access to machinery and equipment. A total number of 71,266 households will be positively

benefitted from the project activities from the four provinces. Out of these many households, 145,371 male and 156,035 females will be enefitted from the project directly, apart from these number, 1.8 million people will be indirectly benefitted from the project activities.

The gender strategy of the project aims specifically at:

29. Alleviating women's workload. This will be done by a) raising awareness on the importance of sharing household chore and farming workload to give women more time to learn new skills (climate-smart farming technologies, irrigation system, financial management, business) that are essential for them to enhance they adaptation capacity.

30. Promoting women's economic empowerment. This will be done by enhancing women's access to skills and business development training that are centred around project target value chains for commodities such as rice, poultry, vegetable and fish that are appropriate to them. Women will be encouraged to participate in project trainings that help them address the potential impact of climate changes which include a) adoption of water-saving alternate wet and dry, b) adopt new seed varieties (which are more pest resistant and drought tolerant), c) adopt sustainable intensification packages that reduce seed rate, fertilizers and pesticide to save agricultural input costs and increase crop yield. Women will be invited to take part in relevant trainings either jointly with their husbands or individually to support adoption of climate-smart technologies that also respond to their needs and preferences. Out of the 40,000 farmers who will be trained in Farmers Field School, 40 % which is around 16000 farmers will be women and they will be trained in women friendly climate resilient technologies. In addition, they will be encouraged to diversify their existing sources of income, to improve the efficacy of existing income sources such as home-based gardening, animal husbandry (poultry and fish); promoting women's access to grant schemes as well as employment opportunities through value-chain development and 4PF.

31. Strengthening women's role in decision-making both at the household and community level. It is expected that the role of women in decision making at household level will be enhanced as the outcome from component 1 and 2 above. At the household level, gender specific tools will be used to encourage joint decision-making in technology adoption and investment decisions. Women will participate in consultation activities and planning of irrigation infrastructures, value-chain development and early warning system. The project will also promote women's participation and leadership in FWUCs, which will be trained on how to enhance equitable access to water for women and other vulnerable groups.

Table 1: Target group categories and development pathways:

Category/classification	Key Characteristics	Direct outreach	Targeting strategy	Targeted activities & Development Pathways
Very poor and poor Households: This category consists poor and very poor Households, lying below poverty line and vulnerable due to climate variabilities (recurrent flood and drought situation)	These HHs are resource-poor, climatically vulnerable and food insecure, having children less than 2 years of age group, women/ youth headed HHs, pregnant/ lactating women, landless families, people with disabilities (PwDs),	64 % of 71,266 HHs will fall into this category. Which will be	Direct Targeting (as described in para 20. This strategy will thus form a part of the broader exit plan for Component 1.	These poor farmer HHs will be capacitated with CR technologies mainly focusing on rice cultivation and diversify the agricultural practices. HHs having insufficient irrigation water supply in the dry season for a second rice-crop, they will be supported for alternatives such as vegetable production, poultry, and aquaculture especially for farmers with small land holdings. Women will be capacitated to decide on their own crop's choice. Farmers will be trained on Alternate Wetting and Drying technique (AWD), direct seeded rice (DSR), Land Laser Levelling (LLL), and rice straw management which can directly reduce methane emissions from agricultural field. Farming HHs will be trained in

				Farmers Field Schools where 40% women will be given training on women friendly crops and management of water and energy in efficient manner. Landless HHs will get other support like poultry, and aqua culture to improve their livelihoods.
Households above the poverty line	These HHs are not below the poverty line of the government data, having marginal lands, they have started some micro level enterprise but not having any market linkages and never received any financing from banks or other financial Institutions.	36 % of the total 71,266 HH will be under this category	Direct Targeting and self-targeting as described in para 20 and 21 above.	Providing training for startup enterprise Capacity development through the 4PF initiative Providing matching grant from the project Establishing market linkages for them for increased earnings
Youth	Youth (age group between 15-30) will be given special attention while providing credit linkages from 4PF initiative.	Minimum 15 % youth will be included in all activities mentioned in component 1 and 2. In case of establishing MSMEs, 20 % youth will get preferential services from 4 PF initiative.	Direct targeting & Self targeting	Providing CR technology training Providing agrometeorological advisories and techniques for adaptation to climate variabilities and change Providing Enterprise support training Providing matching grant from 4 PF initiative

				Establishing market linkages for their products
Women	Very poor vulnerable families, women headed HHs, having small children, pregnant/ lactating mothers, aged women, Women with PwDs	40 % women will be included in all project activities.	Direct targeting & Self targeting	Providing CR technology training as they are mostly ignored while selecting beneficiaries due to lack of awareness. Providing agrometeorological advisories and techniques for adaptation to climate variabilities and change Providing capacity building support on decision making on distribution of water Inclusion in FWUCs for better decision making on water use efficiency and crop choice. Providing Enterprise support training including financial management, balance sheet, marketing etc. Providing grants from 4 PF initiative for new entrepreneurs Establishing market linkages for their products.

2. Implementation Arrangements

The Project implementation will follow the Royal Government of Cambodia's (RGC's) Standard Operating Procedures (SOPs) and the Project Operational Manual (POM) for the Project management, procurement, and financial management (FM). A Project Steering Committee (PSC) will be established for inter-ministerial coordination. The establishment of the PSC has been set as a disbursement condition. It will be chaired by the Minister of MOWRAM and comprise of

senior officials from MOWRAM, the Ministry of Economy and Finance (MEF), the Ministry of Interior (MOI) which is responsible for the National Committee for Sub-National Democratic Development Secretariat (NCDD-S), Ministry of Agriculture, Forestry and Fisheries (MAFF), Ministry of Environment (MOE), and the Provincial Governor's Offices of Pursat, Kampong Chhnang, Kandal, and Kampong Speu provinces. An Inter-Ministerial Resettlement Committee (IRC), chaired by MEF, will manage resettlement and land acquisition issues as they arise. The National Project Coordinator of the Project Management Unit (PMU) will serve as a secretariat to the PSC.

The Ministry of Water Resources and Meteorology (MOWRAM) will serve as the main Executing Entity for the Project, responsible for sustainable water resource management and irrigation in Cambodia. MOWRAM has established a Project Management Unit (PMU) for the implementation of the Project and to coordinate all components and consolidate project planning and reporting. The PMU is led by the Secretary of State (MOWRAM) as the National Project Director (NPD) and managed by an appointed National Project Manager (NPM). The NPM will be responsible for overall project management and coordination. The PMU includes personnel from MOWRAM, the Department of Hydrology and River Works (DHRW), and Provincial Departments of Water Resources and Meteorology (PDWRAMs) of the selected provinces involved. The PDWRAMs will coordinate field activities with Farmer Water User Committees (FWUCs), while the Department of FWUC will appoint additional personnel at provincial and district levels to support FWUC operations. The PMU will directly implement Component 2 (irrigation infrastructure) and Sub-Component 3.1 (institutional strengthening).

The PMU is responsible for the overall management of the Project; it will coordinate directly with project stakeholders, support execution of day-to-day activities, and ensure the technical quality of the Project outputs, activities, financial management, procurement, monitoring and evaluation.

The National Committee for Sub-National Democratic Development Secretariat (NCDD-S) will also be an Executing Entity and be responsible for the implementation of Component 1 and sub-component 3.1. A Project Implementation Unit (PIU) will be established and contract service providers at the provincial level as required. The NCDDS is a Direct Access Accredited Entity to the GCF. The National Committee for Sub-National Democratic Development (NCDD) has demonstrated significant capacity in project management and implementation over the years, executing a wide range of development initiatives aimed at enhancing governance, climate resilience, livelihoods, and rural poverty reduction in Cambodia. From 2001 to 2023, NCDD managed over 10 major projects with the support of international partners such as UNDP, SIDA, DFID, JICA, and the World Bank, among others. These projects, such as the *Project for Support to Democratic Development through Decentralization and Deconcentration (PSDD)* and the *Tonle Sap Poverty Reduction and Smallholder Development Project (TSSD)*, collectively mobilized millions of dollars in funding. The NCDD's focus on decentralization, climate change adaptation, natural resource management, and gender equality is reflected in its ability to implement complex, multi-sectoral initiatives, including the *Strategic Programme for Climate Resilient Development* and the *Food Security and Community-based Recovery Support to Flood-affected Communities in Cambodia*. The effective execution of these projects highlights NCDD's expertise in managing large-scale, multi-donor programs and its central role in shaping Cambodia's governance and development landscape.

MEF will open two separate designated accounts in the name of MOWRAM and NCDD-S, respectively. The budget allocation between MOWRAM and NCDD-S will be determined based on prepared cost tables. Monthly coordination between MOWRAM and NCDD-S will ensure synergies between components. Additionally, NCDD-S will work closely with provincial and

district agencies for agriculture, coordinating with other programs to leverage existing synergies and institutional capacities.

Accredited Entity (AE) The International Fund for Agriculture Development (IFAD) has a long history of implementing rural development projects in Cambodia, which became a member in 1992. IFAD has supported twelve investment projects for a total value of USD 940 million in collaboration with a host of co-financing partners and its own financing of USD 309 million benefitting 1,565 million households. IFAD will serve as the Accredited Entity (AE) for this project and will be responsible for the overall management of the IFAD/GCF funded activities including: (i) administrative, financial and technical oversight and supervision throughout project implementation; (ii) ensuring funds are effectively managed to deliver results and achieve objectives; (iii) ensuring the quality of project monitoring, as well as the timeliness and quality of reporting to GCF; and (iv) undertake project mid-term and completion evaluation. IFAD will ensure that each of these areas of responsibility are undertaken in accordance with the detailed provisions outlined in the Accreditation Master Agreement (AMA) between IFAD and GCF. IFAD's role as AE will be assigned to its sub-regional office in Hanoi and its country office in Cambodia.

Major Co-Financer. AIIB is co-financing the project and will provide funds directly to the MEF for a separate designated account in the name of MOWRAM. In its capacity as co-financier, AIIB will be responsible of management of component 2.1 and undertake joint supervision of the project with IFAD and also participate in and contribute to the evaluation of the project.

Implementation organization charts

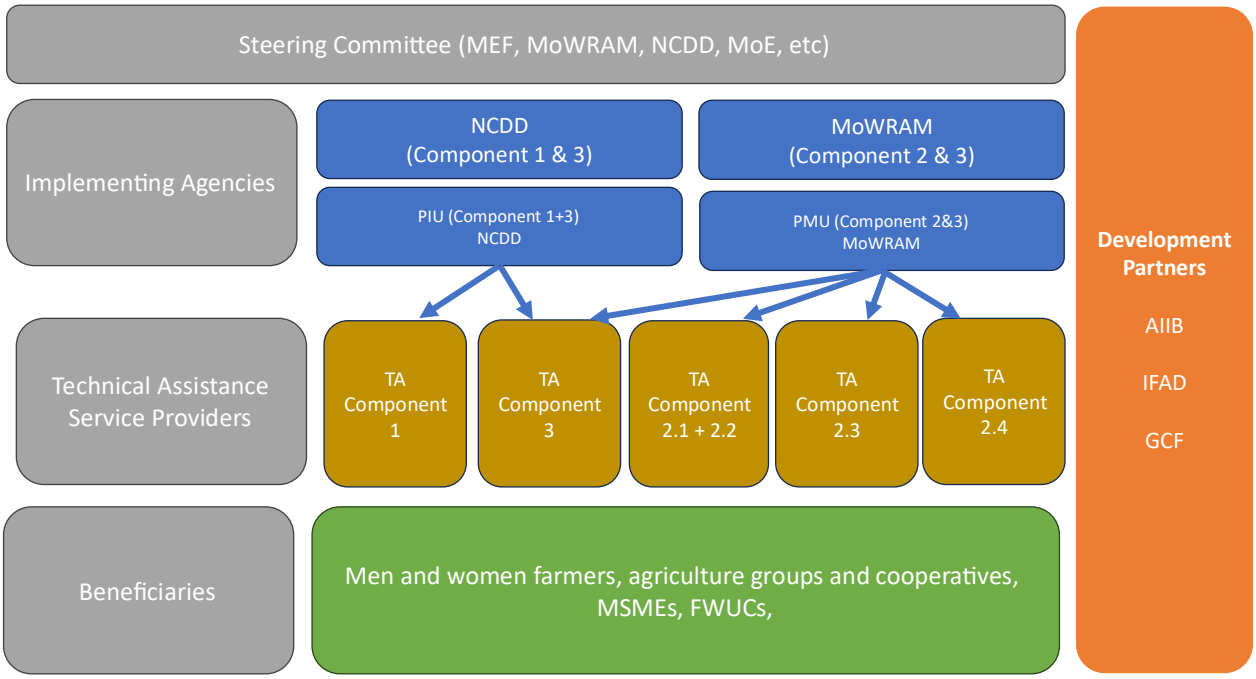

Figure – 1 The figure presents the implementation organization charts.

Project Oversight and Steering Arrangements A Project Steering Committee (PSC) will be established for inter-ministerial coordination. It will be chaired by the Minister of MOWRAM and comprise of senior officials from MOWRAM, the Ministry of Economy and Finance (MEF), the Ministry of Interior (MOI) which is responsible for the NCDDS, Ministry of Agriculture, Forestry and Fisheries (MAFF), Ministry of Environment (MOE), and the Provincial Governor's Offices of Pursat, Kampong Chhnang, Kandal, and Kampong Speu provinces. An Inter-Ministerial Resettlement Committee (IRC), chaired by MEF, will manage resettlement and land acquisition issues where they arise. The National Project Coordinator of the Project Management Unit (PMU) will serve as a secretariat to the PSC.

Chair: Minister, MOWRAM
Secretary: Deputy Director, DFWUC/Project Manager

Members:

H.E. Secretary of State, MOWRAM
H.E. Secretary of State, MOI (NCDDS)
H.E. Secretary of State, MEF
H.E. Secretary of State, MOE
H.E. Under Secretary of State, MEF
H.E. Under Secretary State, MAFF
H.E. Director General, MEF
H.E. Four Provincial Governors
Director of Department of Multilateral Cooperation, MEF

Operational Management Arrangements As mentioned above MOWRAM will establish a Project Management Unit (PMU) for the implementation of the CAISAR project. The PMU will be led by the Secretary of State (MOWRAM) as the National Project Director (NPD) and managed by an appointed National Project Manager (NPM). The NPM will be responsible for overall project management and coordination. Within the PMU, project-recruited staff and staff seconded by the government will collectively comprise a project delivery team that will ensure sound and effective project implementation. The PMU will also include an Operations Officers, Gender Specialist, Finance Officer, Human Resources and Administration Officer, Procurement Officer and Monitoring and Evaluation Officer. To ensure a smooth implementation also a team of international project management specialists with extensive knowledge of the CAISAR background and technical activities will be contracted during the first part of the implementation to get the Project Management Implementation Consulting firm and NCCD PIU off to a proper implementation considering the complexities and size of the project. A Project Management and Implementation Consulting firm and individual consultants will be recruited to support the project implementation and undertake detailed design services and construction supervision and provide technical and management report to MOWRAM PMU and to a lesser extent to NCDD PIU. Start-up orientation sessions will be organized to orient staff with regards to the procedures of AIIB, GCF, and IFAD. Capacity building sessions in understanding the procurement, financial management and monitoring and evaluation sessions will be held as needed.

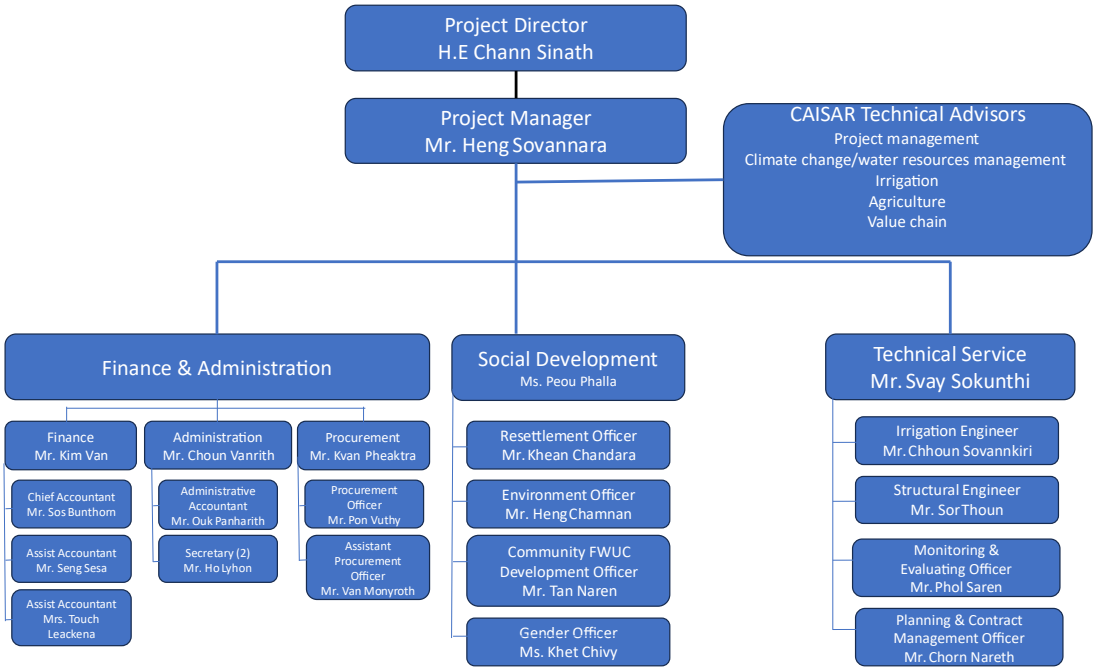

Figure 2. The organization of PMU under the implementation of CAISAR.

The Project Management Unit will besides the positions mentioned above consist of personnel from MOWRAM, the Department of Hydrology and River Works (DHRW) of MOWRAM, and Provincial Departments of Water Resources and Meteorology (PDWRAMs) of the four provinces in which the project will be implemented. The PDWRAMs will be responsible for coordinating all field activities with Farmer Water User Committees (FWUCs). The Department of Farmer Water User Committees (DFWUC) has personnel at the central level but no office or personnel at the Province and District level. For the effective operation of the committees, the Department of FWUC will through the PDWRAMS appoint additional personnel at the provincial and district levels.

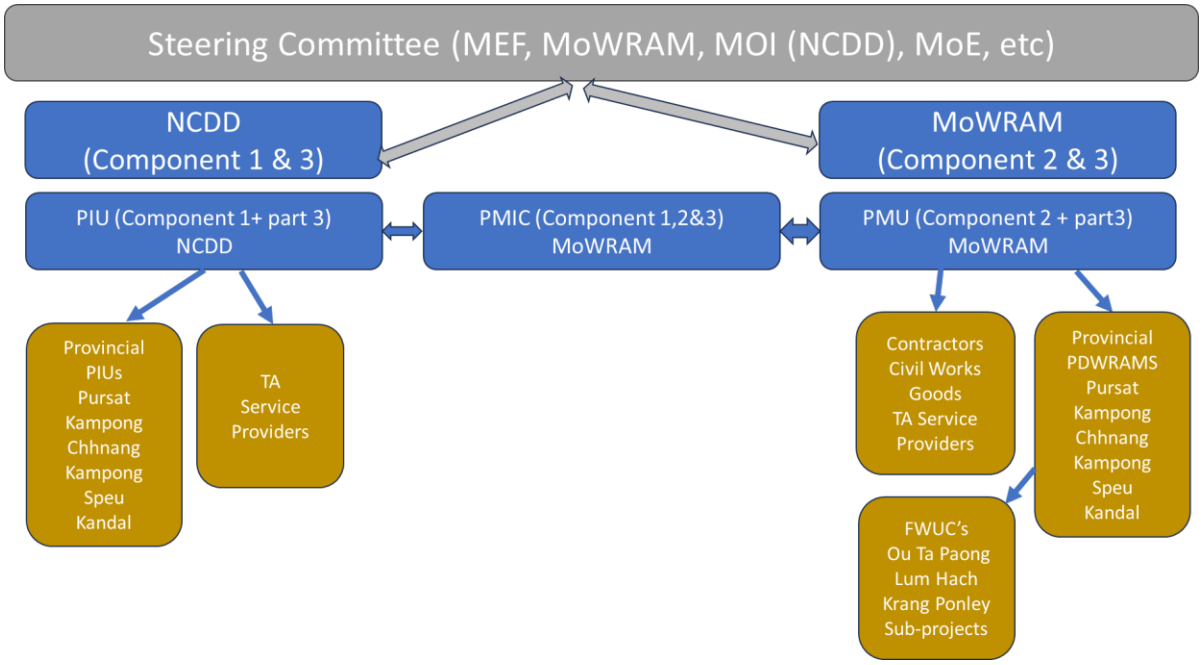

Figure – 3 Project operational management arrangement

The PMU will be responsible for the overall management of the project; it will coordinate directly with EEs and project stakeholders, be responsible for providing support to the execution of day-to-day activities and be responsible for the technical quality of the project outputs, activities, financial management, procurement, monitoring and evaluation. The National Committee for Sub-National Democratic Development Secretariat (NCDDS) will be responsible for the implementation of Component 1 and sub-component 3.2. NCDDS will establish a National Project Implementation Unit (PIU) and contract Service providers at the provincial level as required. The PMU will be directly responsible for the implementation of Component 2 (irrigation infrastructure) and sub-component 3.1 (institutional strengthening).

The roles and responsibilities of each organization have been clearly outlined, with MOWRAM responsible for overall supervision and guidance, for preparing the annual work plan and budgets, initiating and coordinating communication, coordinating with the NCDDS PIU on agriculture support activities, and implementing social and environmental safeguards, among other tasks. The PDWRAM will assist the PMU in disseminating information and coordinating with the Ministry of Economy and Finance-General Department of Resettlement (MEF-GDR) to implement the resettlement plan, among other tasks. NCDDS PIU will work in close coordination with the provincial and district agencies for agriculture to implement the activities under Component 1 through Provincial PIUs in each province. The role and relevance of the NCDDS in CAISAR underscores its institutional capacity in successfully implementing farm-level components which are one of its mandates under the Decentralization and De-concentration (D&D) Management Policy which the NCDDS is tasked with discharging.

The project is attempting to transform farmer behaviour in their production decisions and beneficiaries will play a central role in all project activities and their participation and ownership will be critical to the success and sustainability of project interventions. Beneficiaries are expected to participate in the Farmer Field Schools and lead farmers are expected to disseminate the information to other households not directly participating in project activities. Similarly, farmers and other players along the value chain are expected to play an active role in the Multi-Stakeholder Platforms for greater market integration. In the irrigation sector, the water users will play an active role in scheme supervision and oversight and the FWUCs will play a critical role in the operation and maintenance of the schemes and will sustain the systems through payment of O&M charges as stipulated by the regulation.

The contracted Project Management and Implementation Consultant (PMIC) working with the PMU will be responsible for the implementation of the Component 2 activities and sub-component 3.1 and oversee and coordinate with the NCDD PIU. The detailed scope of work for PMIC is in the Terms of Reference.

PMIC will hold joint monthly meetings with all project partners and prepare minutes of the meeting.

PMIC will prepare quarterly progress reports with input from PMU and PIU and other partners. The progress reports should be submitted to PMU who will then submit to Development Partners for review and commenting. The PMIC will also produce mid-term and completion reports, as required.

The below table 1 illustrate the roles and responsibilities of the development partners, the executing entities and their implementation units. As seen from the table IFAD is responsible for M&E for the main part of the project and AIIB only for Component 2.1. For the overall Component 2 and sub-component 3.1 the AIIB will have a supporting role. The table also indicates the funding source of each of the sub-components.

Table 1: Roles and responsibilities of national institutions and development partners

Project Outputs and Outcomes	Funding Source	Executing Entity	Responsible for Implementation	Responsible for M&E	Support/ Supervision of Sub-Components
Outcome 1 Reduced crop losses and improved agricultural production					
Output 1.1: Increased farmer capacity in climate resilient agriculture.	GCF/IFAD	NCDDS	PIU	IFAD	IFAD
Output 1.2: Climate adaptive value chains developed through the adoption of the 4P model	GCF	NCDDS	PIU	IFAD	IFAD
Output 1.3: Access to climate information and advisory services improved for climate responsive water-use and crop planning.	GCF	NCDDS	PIU	IFAD	IFAD
Output 1.4: Increased resilience of farm road infrastructure to climate change.	GCF	NCDDS	PIU	IFAD	IFAD
Outcome 2: Increased water use conveyance and use efficiency					
Output 2.1: Irrigation schemes and ponds modernized	AIIB	MOWRAM	PMU	AIIB	AIIB
Output 2.2: Flood-proofed and improved drainage	GCF/IFAD	MOWRAM	PMU	IFAD	AIIB
Output 2.3: Farmers Water User Communities (FWUC) established and trained	GCF	MOWRAM	PMU	IFAD	AIIB
Output 2.4: Water information system (CIEWS and SCADA) established and operational in three subprojects.	GCF	MOWRAM	PMU	IFAD	AIIB
Outcome 3: Enhanced environmental governance					
Output 3.1: Training and capacity building support provided to MOWRAM	GCF	MOWRAM	PMU	IFAD	AIIB
Output 3.2: Training and capacity building support provided to NCDDS at national and provincial levels	GCF	NCDDS	PIU	IFAD	IFAD

Component 1. *Farm-level climate adaptation and resilience.* *(NCDD-S)*

The objective of this component is to build climate resilience (CR) of smallholder farmers and enhance sustainable production through evidence-based planning and context-relevant climate resilient practices at the farm level. This component is designed to address the lack of knowledge and skills to deploy technologies and practices at farm level by farmers and the lack of appropriate extension services to propagate them. It will introduce farmers with various climate resilient technologies and practices for both rice and non-rice commodities such as vegetable, poultry and aquaculture. The component will assist in value addition, facilitate market linkages, introduce agro-meteorological information and services for climate informed agriculture planning and improve both physical and digital connectivity to facilitate improved production and marketing. Component 1 is expected to benefit over 110,000 farming households. In addition, some of the technologies and practices, for example the Alternate Wetting and Drying technique (AWD), direct seeded rice (DSR), Land Laser Levelling (LLL), and rice straw management will directly reduce methane emissions contributing to GHG reduction. The component will be implemented by NCDDS through four outputs described in the following paragraphs. The activities under this component will also capitalize on the presence of existing platforms, studies and plans in order to avoid potential overlapping, duplication or spending unnecessarily resources in planning activities. The agencies responsible for implementation this component will undertake the tasks of identifying existing resources at the outset.

Outcome 1: Reduction in crop losses & improved production

Output 1.1: Increased farmer capacity in climate resilient agriculture *(NCDD-S)*

This output will focus on developing farmer's capacity in deploying climate resilient technologies and practices to transform the agricultural production system to adapt to the changing climate context. Separate dialogues will be held with women to ensure that their concerns and needs are addressed in designing the training curricula, the schedule and delivery methodology. The main objective is to strengthen adaptive management strategies to mitigate climate variability risks. Both men and women farmer's will be trained to first develop Action Plans (AP) to re-orient farmer behaviour and assist them in transforming the agriculture production system in a manner that is better adapted to factoring in the agro-ecological context and expected climate change impacts. Farmer capacities will be strengthened in CR technologies mainly focusing on rice cultivation. However, for those parts of the project areas which have insufficient irrigation water supply in the dry season for a second rice-crop, alternatives will be supported such as vegetable production, poultry and aquaculture especially for farmers with small land holdings. Crops of interest to women will be included in the selection. Farmers are generally resistant to adopting new technologies due to their inability to afford the technologies or technological incompatibility i.e. when the technology is not climatically fit or it is labour intensive, costly or not suitable for smallholder farmers. Those designing the courses and the technological packages under CAISAR will be mindful of these barriers. The plans will be refined over time based on the local context and crop choices and emerging adaptation technologies. The project will use the Farmer's Field and Business School approach (FFBS) and design context specific training materials to enhance the capacities of the farming communities. The FFBS will run for both rice and non-rice crops and will use a cascade approach to disseminate the training messages to a wider audience using key farmers including both women and men leaders. It is expected that 40,000 farmers will be re-oriented of which at least 40% will be women. The improvement of the irrigation systems will be critical to fully capitalise on the training provided to farmers.

Activity 1.1.1 Preparation of community-based action plans (AP) to transform agriculture with CR practices and technologies (NCDD-S)

The project will utilize a Climate Smart (CS) Mapping approach[50] to develop awareness materials on climate change and its impacts on men and women separately. IRRI will conduct CS Mapping in the first year as a part of their TA contract, combining participatory data with GIS and crop modeling to create risk maps identifying areas vulnerable to climate stresses like drought and flood. These maps will also outline recommended adaptation options and be gender disaggregated where required to ensure that the needs of women are reflected. Additionally, the project will facilitate the creation of Value Chain Action Plans (VCAP) at the provincial level, which will inform annual commune-level Action Plans (AP). There is currently no agricultural value chain planning at the provincial level. The VCAP will help the target provinces to conduct VC planning and the communes in augmenting their development plans with considerations on agronomic and market opportunities. The APs will be developed through participatory sessions involving both men and women farmers, Producer Organizations, water users' groups, service providers, and NGOs, ensuring representation from men, women, and minority groups. Communities will identify and prioritize potential adaptation options and prepare a plan to implement them. Such options may include crop diversification such as vegetable or fruit production, poultry and aquaculture production, rotation or changing varieties (for e.g. flood or drought resistant varieties in rice) or improved water management (for e.g. AWD) and new practices such as Laser Land Levelling (LLL), mechanized direct seeded rice (mDSR), soil health management options, and Integrated Pest Management (IPM) in both rice and non-rice crops, rice straw management, etc.

The annual AP will specify preferred rice varieties, vegetable choices, and adaptation measures like poultry production and aquaculture, along with capacity support needed for the selected value chains. It will also outline implementation schedules, targets, and monitoring arrangements, with revisions made annually based on new data and community feedback. The APs will ensure the inclusion of women and women-headed-households in their development. A community-based monitoring and evaluation system will track AP outcomes, integrating findings from climate information systems and groups of both men and women farmers. Furthermore, representatives from each commune involved in AP preparation will participate in district-level multi-stakeholder platforms (DMSPs) to enhance value-chain coordination, ensuring effective communication between the commune and district levels. Special efforts will be made to ensure the inclusion of at least 30% women and 20% youth in these forums. MSMEs will also be a key part of these forums given their vital role in agriculture development in Cambodia. CAISAR will include elements of the APs into commune plans and build local capacity to enable them to develop them on their own. Representatives from other communes will be invited to learn from the experience for further dissemination. Provincial level staff will also be trained in the development of these VCAP to enable them to develop them on their own. Medium, Small MSMEs[51] will be engaged in the exercise to enable the private sector to work with local farmer groups and cooperatives and develop them independently. Representatives from other provinces and communes will be invited to learn from the experience and ensure that the MSMEs and private sector service providers are able to expand the idea to other areas due to the value they add in helping them increase their revenue and increase farmer incomes. Lead farmers are expected to be an important resource to demonstrate the impact on agriculture productivity.

Activity 1.1.2 Preparation of training materials to support implementation of the AP (NCDD-S)

The project will create and update training curricula and materials to support farmer adoption of climate-resilient (CR) technologies and practices outlined in action plans. Emphasizing user-friendly, visual learning materials like charts, leaflets, and short notes, the initiative aims

to accommodate men and women farmers with lower literacy rates. Training materials will be regularly revised based on field experiences, new practices, varieties, and climate information and feedback from the participants particularly women for the crops they are involved in producing. IRRI and a service provider will develop these materials for rice and non-rice commodities, respectively, which will be suitable for Training of Trainers (ToTs) and Farmer Field and Business School (FFBS) training. The materials will encompass both technical and facilitation aspects of crop, livestock, and agribusiness management, featuring hands-on activities related to production and business planning. The specific tasks that women perform in each crop will be considered in designing the training programmes.

Key training topics will include best practices for irrigated and rainfed lowland rice, vegetable production techniques (e.g., drip irrigation), fish farming, and improving household chicken production. Where required separate training sessions will be conducted for men and women. Existing materials from GDA, CARDI, and IRRI will be adapted to the specific contexts of target provinces and needs by gender. TOT will also draw on activity 1.3.3, 1.3.4, and 1.3.5 for CIEWs. Collaborative input will be sought from various stakeholders, including service providers and men and women farmers, through consultative meetings to ensure the training materials are context-specific and relevant. The training materials and course content will be provided to both NCDDS and the MAFF for further dissemination and use. The staff from both these institutions will be invited to attend these courses to build their capacity and introduce them to other areas.

Activity 1.1.3 Conduct training of trainers to create a pool of expertise to demonstrate and propagate the CR technologies and practices (NCDD-S)

Once the training materials are prepared, ToTs will be organized to create a pool of expertise to propagate the CR technologies and practices, and outreach to farmers and disseminate information about CIEWS (including, awareness of mobile app(s))About 200 champions from interested NGOs, PDAF, universities or any external institutions and private entities will be trained, who will be able to work as Master Trainers (MTs). At least 40% of the TOTs will be women. The training will be organized by the SMSs who will continue to provide support to the MTs in testing and adapting to new technologies and practices, and create awareness and understanding of how to use CIEWS in decision making.

The project will organize two ToT sites in each province or a total of 8 in the project area. The 8 ToT sites will be retained until the fifth year of the project to strengthen the knowledge base of the MTs and to test, modify and demonstrate new technologies and practices as required based on the changing context. The pool of expertise developed will help address the extension gaps in CR practices and technologies and will be able to disseminate and expand the evolving practices even after project completion.

Activity 1.1.4 Training and advisory on CR technologies and practices (NCDD-S)
The core team trained will start training farmers using the training materials developed. Altogether, 40,000 farmers will be trained through 1600 Farmer's Field Schools. Given the need to cover such huge numbers of farmers in a short time, a cascade approach will be followed. The details of the cascade system are described in Annex 2. It will begin with a 160 FFS in the first year implemented by the Master Trainers (MTs), and will be expanded utilizing newly trained key farmers, which include women and youth under the supervision of the MTs. Inclusion of women as Master Trainers and separate sessions for women will be considered wherever this is preferred by the participants. The program will continue until the 7th year of the project. The project will enter into agreement with training entities who have been trained earlier (MT trainings above) to implement the FFS programs. Arrangements will be made to keep a roster of the MTs with both MAFF and NCDDs for further dissemination of the

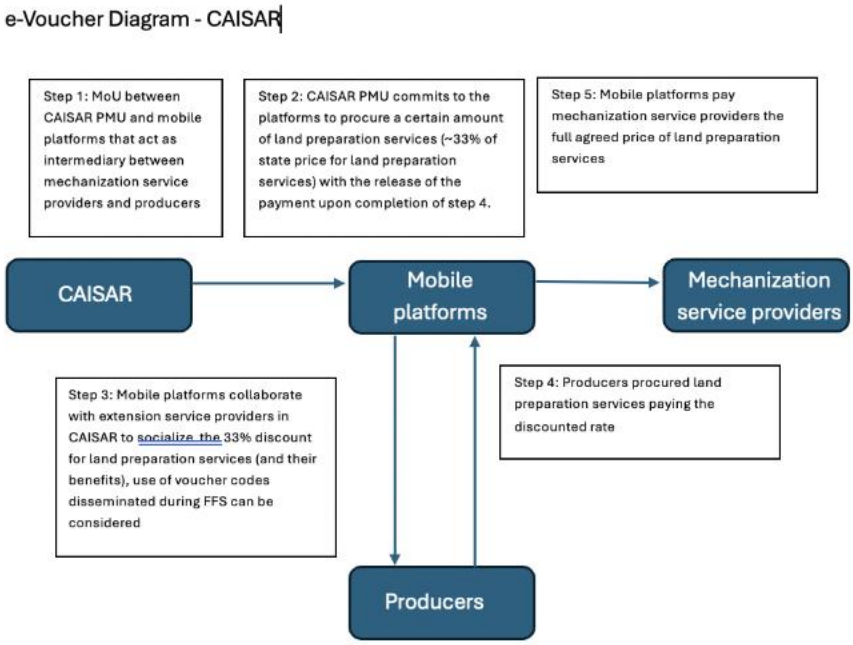
techniques and technologies disseminated through the FFS in other areas for programmes that can help finance the training.

Table 3: Outreach of FFS

Year	Target groups	FFS target	Beneficiary target	Objective	Remarks
1	Master trainers only (NGOs, /PDAFF, research institutes, young ag. graduates etc.)	8	200	Develop master trainers (MTs) to conduct training to farmers	Trained by subject matter specialists (SMS) at IRRI and a service provider in collaboration with commune facilitators. These MTs will be responsible for training to farmers from year 2.
2	Farmers	160	4000	Build farmers 'capacity on CR technologies	Trained by MTs, supported/ supervised by SMS
3	Farmers	320	8000	Build farmers 'capacity on CR technologies	Trained by key farmers and MTs, overall supervision by SMS
4	Farmers	320	8000	Build farmers 'capacity on CR technologies	Trained by key farmers and MTs, overall supervision by SMS
5	Farmers	320	8000	Build farmers 'capacity on CR technologies	Trained by key farmers and MTs, overall supervision by SMS
6	Farmers	320	8000	Build farmers 'capacity on CR technologies	Trained by key farmers and MTs, overall supervision by SMS
7	Farmers	160	4000	Build farmers 'capacity on CR technologies	Trained by key farmers and MTs, overall supervision by SMS
		1600	40,000		
About 40% of FFS will be focused on women groups only (vegetable production, mushrooms, chicken production, aquaculture etc.), FFS will have at least 40% women participation and at least 15 % youth participation (age group till 30 years)					

The FFBS activities will be used to link the farmers with markets and build their capacities in value chain development covered under Output 1.2. An important element of the training will be the integration of some of these alternative crops in the rice farming system and the focus on post-harvest management and marketing. To further fortify the capacity development post-FFBS, practical video library and online advisory services on rice and non-rice commodities will be developed through mobile application, allowing farmers to access information and troubleshoot via their mobile phones.

Activity 1.1.5 Strengthening and fostering tailored mechanization service providers for improved mechanization service delivery (NCDD-S)



This activity aims to enhance the availability of high-quality mechanization services to farmers, especially to support them to shift towards the mechanized direct seeded rice (mDSR) IRRI.

The mechanization service providers will be linked with the machinery dealers and mechanics for smooth service delivery to farmers. As explained in Annex 2, there is already a strong desire among farmers and willingness to pay to shift mDSR from existing manual broadcasting method.

For LLL, there is a growing interest among farmers, but the technique is still seen as expensive by farmers. In addition, farmers have seen benefit of LLL mostly in dry season rice or in dry direct seeded rice practices. The project will therefore procure 20 LLL units (five for each province) for demonstration purpose and will integrate it with the service providers so that interested farmers can more readily access LLL. This approach has already worked well to establish successful private industry laser levelling providers in Cambodia. IRRI will be engaged for high level knowledge products and capacity support to commune agricultural officers. IRRI will organize training for commune agricultural officers on facilitating the growth

of mechanization service providers at the commune level, provide continuous backstop and develop knowledge products and training materials on the application of mDSR.

The project will strengthen the commune agricultural officers' current extension model to promote mechanization especially in rice cultivation. MAFF's commune level extension workers will be trained on promotion of mDSR and other technologies and will co-ordinate the services of service providers through capacity support and in assisting them in developing viable business models. A mobile platform connecting service providers and farmers will be developed in mobile app and farmers will be incentivized to try the mDSR services through eVoucher in the app. By demonstrating the value of these technologies, the project will increase demand which will encourage Private sector to provide these services on an on-going basis. The demonstration of increased yields from the use of these technologies will increase demand beyond the project area and scale their use through provision by private sector.

Activity 1.1.6 Community-based monitoring and evaluation (CBME) of the implementation (NCDD-S)

Local farming communities play a crucial role in implementing climate-resilient measures, and their involvement in monitoring outcomes is vital for the sustained adoption of these practices. The Community Based Monitoring and Evaluation (CBME) approach enhances community ownership from planning to evaluation. Performance indicators will be developed in collaboration with men and women farmers and stakeholders to track the effectiveness of interventions. These indicators may include metrics on training participation, engagement of female farmers in various production activities, and the introduction of new crop varieties. The indicators will be validated for integration into the project's monitoring and evaluation framework and national Climate Action Monitoring systems.

Results and lessons from the CBME will be linked to a Web-based monitoring system. This will facilitate information flow both ways, allowing feedback from national levels to inform community-based systems. The feedback from agriculture cooperative and farmer groups will also be reported. By the sixth year, discussions will be initiated at the sub-national level to explore the potential for integrating community action planning and CBME processes into

routine operations beyond the project's duration. The M&E system will report also on the project performance in the inclusion of women and youth in the training programmes. Commune level officers and MAFF and NCDDs staff will be included in understanding the monitoring system so that they can then use it for their own purposes. The participation of the MAFF and NCDDs staff in the commune monitoring system may lead to its upscaling to other areas.

Output 1.2 **Climate adaptive value chains developed by 4Ps and increased access to finance** *(NCDD-S)*

This output aims to address financial barriers to invest and improve sales of smallholder farmers, farmer groups, agricultural cooperatives and related MSMEs by helping them leverage capital for adaptation and value chain investments. The scaling up of climate smart practices, services, and technologies demonstrated under output 1.1 will be supported under this output. This output consists of three key and synergistic activities: (i) Value chain (VC) study that aims to identify the gaps and improve VC governance; (ii) Establish and facilitate multi-stake holder platforms to improve VC coordination and stimulate investment from the financial sector to invest in climate change adaptation through VC development; (iii) Public – Private – Producer – Partnership Facility (4PF) that crowd in, de risk, and co-finance investment with MSMEs and farmers in support of climate-sensitive commodity development and rural employment generation. The development of these value chains activities will be undertaken through a gender lens to capture the engagement of women in the different agriculture commodities and their specific role in each value chain and how they can benefit from the activities of the project.

Activity 1.2.1. Value chain study and planning (NCDD-S)

The project will focus on enhancing the value chains for rice, vegetables, native chicken, and fish in Cambodia, with the possibility of adding more commodities later. Within the first six months, the Agri-Enterprise Development (AED) team, supported by international experts, will train provincial and district partners to develop concise value chain action plans (VCAP). These plans will involve mapping commodity actors, identifying value-added processes, and pinpointing challenges and opportunities. The VCAPs aim to highlight interventions that provide higher income potential, are inclusive of vulnerable groups, and are climate resilient.

The VCAP development process will consist of five steps: conducting background research, mapping commodity sectors, analyzing structural and dynamic factors, performing financial and economic analysis, and hosting a workshop to validate findings. Each target province will produce at least four approved VCAPs, which will guide commodity development integration into provincial programs, provide technical support, mentor value chain actors, and facilitate business operations. The VCAPs will also inform community-based adaptation planning, ensuring ongoing updates and relevance to agribusiness entrepreneurs in the region.

Activity 1.2.2 – Establish Multi-Stakeholder Platforms (MSPs) (NCDD-S)

The project will establish Multi-Stakeholder Platforms (MSPs) to facilitate collaboration among value chain actors, focusing on enhancing governance and improving relationships within selected agricultural value chains. Two types of MSPs will be created: District Commodity-Based Multi-Stakeholder Platforms (DMSPs) and Provincial Agro-Financing Workshops. DMSPs shall strengthen coordination among stakeholders such as farmers, traders, and financial institutions, and Provincial Agro-Financing Workshops to connect local financiers and producers. The DMSPs aim to organize at least 1,000 events throughout the project to improve market linkages, enhance transparency, and foster partnerships, while the Agro-Financing

Workshops will occur bi-annually at the provincial level to inform participants about financing options and opportunities.

The DMSPs will provide a structured approach to identify challenges and opportunities within the value chains, facilitating discussions on potential interventions and joint actions among stakeholders. These will be undertaken from a gender perspective. The outcomes may include improved market information, stronger partnerships, coordinated actions, and conflict resolution among value chain actors. Follow-up actions will be tailored to stakeholder needs, and the success of these platforms will rely on effective facilitation and engagement. How women can best be engaged in the value chains will be an area of focus. The Provincial Agro-Financing Workshops will be coordinated with local and regional financial institutions and relevant stakeholders to share innovative financing options, ensuring the participation of MSMES, and relevant Financial Institutions. It is expected that some sustainable relationships will be built after the organization of the large number of events throughout the project lifecycle which will foster partnerships and can be continued on their own. In case some of these partnerships are successful they are expected to be scaled up beyond the project area due to mutual benefit. While the bi-annual workshops at the provincial level may not continue after the end of the project it is expected that some of the introductions made during the process will lead to better access to financial institutions and some of the access to financing options are expected to continue beyond the project period.

Activity 1.2.3. Public Private Producer Partnership Facility (4PF) and leveraging of capital (NCDD-S)

Cambodia's agricultural sector has experienced substantial growth over the past two decades, leading to significant poverty reduction and improved food security. However, concerns persist regarding the quality, sustainability, and environmental impact of this growth. In response, the Royal Government of Cambodia (RGC) is evolving its agricultural and rural development strategy to emphasize sustainable development through the "Triple Bottom Line" approach, focusing on economic, social, and environmental goals. The RGC aims to foster public-private partnerships to enhance investments, improve the quality of services, encourage innovation, and manage resources more effectively.

The Public Private Partnership Facility (4PF) is designed to strengthen micro, small, and medium enterprises (MSMEs) in the agricultural sector, particularly focusing on supporting young rural entrepreneurs and women entrepreneurs. Through grants and technical assistance, the 4PF encourages investments that benefit both businesses and local men and women farmers. Eligible enterprises can receive financial support based on their investment size, with specific criteria for applicant selection, including economic viability, equity participation and potential impact on target groups. The types of investments which are eligible for financing will include both production-oriented activities and value-added activities that improve the capacity for processing, access to markets, improve product quality, reliability and produce in sufficient scale to attract the private sector. The initiative aims to support at least 120 MSMEs, with a goal of achieving an 80% increase in net turnover among recipients and a return on investment exceeding 10%. At least 40% of these enterprises will be those which are led by women or have a majority of women shareholders or employees. To ensure inclusion of youth, a target of 20% will be established for inclusion of youth. Separate windows will be established to ensure the inclusion of women and youth in the grant application call. The 4PF will be managed, likely by a third party contractor, to ensure a private sector approach, including due diligence and standards of service. It will operate in close collaboration with other project components to ensure that supported investments positively affect local farmers and agricultural practices. Details of the grant and/or TA mechanism are outlined in Annex 2. The grant facility is envisaged as an incentive for demonstration purposes, to derisk first responders and those with significant climate risks. The project will

provide technical assistance for a specific period and grant support of a specific amount after which it will only provide mentoring and supervisory support during the project period. The role of the financial institutions will be to subsequently upscale the investments through a system that provides finance on a more sustainable basis through loans and equity of the investors.

Building on IFAD's ongoing projects, such as AIMS and SAAMBAT, the initiative will encourage the financial sector to identify and invest in climate change adaptation and rural value chain development opportunities. While MFIs report having sufficient capital for medium and long-term investments, they lack risk management tools to engage in climate adaptation efforts. To bridge this gap, CAISAR aims to attract financing from various financial institutions by enhancing their understanding of rural activities and investments including capitalizing on increased business opportunities which the project seeks to stimulate at the farm and business level by organizing semi-annual Provincial Agro-Finance Workshops to improve information flow between value chain actors and financial institutions and address asymmetries of information. Further, commercial finance will also be integrated into the 4p investments where possible, creating viable pipelines for finance and both reinforcing existing, and stimulating new, value chain finance. This proactive approach is expected to unlock substantial financial resources for agricultural investments, significantly impacting rural economies and poverty alleviation in the target provinces.

Output 1.3. Increased access to climate information and advisory services for climate responsive water-use and crop planning *(NCDD-S)*

In Cambodia, the capacity to utilize weather and climate data for agricultural applications is limited, despite significant investments in data generation. The PEARL project by the GCF identifies critical gaps in agro-meteorological services, particularly in value-added services and their uptake by farmers. While some NGOs have provided climate-informed advisories, these efforts tend to be project-specific and lack sustainability. Existing platforms, such as the PRISM initiative by the WFP, focuses primarily on social protection against climate events rather than comprehensive farm-level advisory services. There is a pressing need to enhance the capabilities of the Department of Meteorology and the Department of Hydrology and River Works to improve data collection, modeling, and the translation of weather forecasts into actionable agricultural advisories.

To address these challenges, Component 2.4 of the project will focus on strengthening national institutions to improve water and weather information systems, enabling more effective forecasts and early warnings for floods and droughts. This output aims to develop and disseminate relevant agrometeorological information tailored to local agricultural needs, facilitating better climate risk management for farmers. It will draw on approaches such as PICSA (Participatory Integrated Climate Services for Agriculture) that allows for co-designing advisories with intermediate and end-users, ensuring timely, relevant and actionable information. The information needs of women and the most appropriate channels of communication for them will be examined to ensure they access the information they need given their key role in crop and livestock management. A diversity of dissemination channels and mechanisms has been proposed to take unique circumstances into account. In general, information will be accessible through mobile apps but also disseminated through traditional communication channels where appropriate and feasible (extension system, local radio, village commune leaders). Within the mobile apps, the project will explore alternatives to text-based content – using visual and verbal options. In addition, reinforcement on availability of information and its utility will occur through FFS (in which 40% of target participants are women) and FWUCs, with FFS sessions dedicated to discussing forecasts and advisories at critical junctures in the cropping season or when specific risks are triggered. A coordination platform will be established at the provincial level to integrate national advisories into localized services, benefiting approximately 90,000 people (40% women) across four provinces. This

approach will ensure a collaborative and adaptive learning process, promoting effective agricultural practices and enhancing resilience to climate change.

Activity 1.3.1 Strengthening agro-meteorological stations in the project area (NCDD-S)

This activity involves the procurement and rehabilitation of six automatic hydromet stations and four agrometeorological stations, enhancing data collection capabilities in areas not covered by the Ou Ta Paong SCADA system. Additionally, four automatic weather stations will be established. The network will generate reliable data to support decision-making across national, provincial, district, and local levels, while improving connectivity and data-sharing mechanisms among various departments. Equipped with sensors to measure temperature, water levels, rainfall, turbidity and soil pH-moisture sensor, soil temperature sensor, evaporation pan, pyranometer, etc as required. The infrastructure will be managed by (MoWRAM) through its General Department of Meteorology (GDM) and the data collected will be transmitted to a server as part of the SCADA system, facilitating better water management and providing farmers with quality agrometeorological information. To ensure data sharing and operability at national and provincial levels, CAISAR will leverage and align with similar activities of existing projects (e.g., PEARL).

Activity 1.3.2 Establish Provincial-Level Coordination Platform for climate-informed agricultural advisories (NCDD-S)

A process to integrate meteorological with agricultural data and produce national level agrometeorological advisory is being developed outside this project. This component will facilitate the translation of national level agrometeorological advisories into district level advisories. Provincial coordination platforms will be established to prepare Agricultural Meteorological Advisory Services (AMAS) at the district level, tailored to specific target crops. This platform will include representatives from provincial departments of water resources, meteorology, agriculture, research institutes, key farmers, NGOs, and relevant private sector members. It will integrate weather, climate, and soil data to produce routine, crop-specific advisory services, verify past forecasts, enhance dissemination efforts, and gather feedback from farmers to improve these services. The provincial coordination platform will receive technical support from organizations like IRRI that are involved in the project's implementation.

Activity 1.3.3 Build the capacities to deliver services (NCDD-S)

Capacity development will focus on enhancing the technical skills necessary for climate data collection and management, as well as translating this data into agricultural advisories through modeling and statistical analyses. The initiative will involve focus group discussions to facilitate co-creation among various government entities and farming communities, primarily targeting staff and professionals in climate and agriculture data management, public services, research, and NGOs. The program aims to train approximately 250 individuals through structured training courses, including short-term summer courses on GIS and data validation, as well as advanced training in areas like crop modeling. Both formal training and on-the-job learning approaches will be employed to build these capacities effectively. Inclusion of women will be an area of focus for capacity building ensuring that at least 40% of the individuals are women.

Activity 1.3.4. Establish the agrometeorology information and warning systems and the mechanisms including awareness raising (NCDD-S)

The dissemination of advisory services will be structured as a daily, bi-weekly and/or weekly bulletin (interval will be confirmed during implementation), utilizing multiple channels to reach

farmers and stakeholders effectively. Some bulletins will be seasonal in nature to allow FWUCs to plan cropping area and project irrigation requirements. Given the existing gaps in systematic communication within Cambodia, the project will leverage various methods to ensure that essential information is widely shared. This includes posting advisories on the websites of the Ministry of Water Resources and Meteorology (MOWRAM), as well as local government platforms. Additionally, advisories will be broadcast through local radio and television programs, tailored into accessible audio and video formats for greater community reach. Special effort will be made to identify the channels of communication most accessible to women and use them as well. To further enhance accessibility, SMS messages will be sent to men and women farmers, commune leaders, and Farmer Water User Communities (FWUCs), who will help disseminate the information to the wider farming population. The advisories will also be integrated into ongoing Farmer Field Schools (FFS) to educate and inform participants directly. Furthermore, mobile applications (e.g., Chamkar app that is used in other IFAD-funded projects in Cambodia) will be employed to provide real-time access to advisory services, ensuring that farmers can easily obtain relevant information and make informed decisions about their agricultural practices.

To enhance farmers' awareness of agrometeorological advisories, an effective delivery mechanism will be established through participatory and cross-disciplinary approaches. This involves organizing awareness programs and seminars that bring together men and women farmers, research institutions, and other stakeholders as equal partners. These initiatives aim to educate farmers about the weather forecast process, its challenges, and how to utilize climate information in their decision-making. Existing platforms, such as FFBS and Agricultural Planning (AP) formulation processes, will be leveraged for outreach, incorporating field days and visits to explain the significance of climate-informed practices in simple, relatable terms. Additionally, targeted training sessions on climate-informed agricultural decision-making will be conducted, involving 320 key farmers and stakeholders. These trained individuals will serve as resource persons, promoting the importance of climate awareness during the FFBS and AP processes. The key farmers will also include 40% of women farmers. Feedback and lessons learned from these interactions will be continuously integrated into the advisory services, ensuring that the information provided remains relevant and effective for the farming community.

Output 1.4: Increased resilience of farm road infrastructure to climate change *(NCDD-S)*

Approximately 90 kilometers of rural roads in targeted project areas will be upgraded to enhance climate resilience, providing a safer and more cost-effective road network with year-round access to markets and social services. These improvements will differ from "inspection roads" constructed atop embankments of primary and secondary irrigation canals, which also serve local communities and aid in the operation and maintenance of upgraded irrigation systems under Component 2. When feasible, flood defense embankments will be designed to serve dual purposes of flood control and road access. This initiative will benefit about 10,673 farmers across 35 villages directly and another 1.15 million people indirectly by improving connectivity.

Road designs will take into account current and future climate change risks, including increased flooding and drought incidents. Drought conditions significantly affect unpaved roads, leading to higher dust levels, reduced visibility, and poorer air quality. Addressing flooding and soil moisture concerns will be prioritized to protect road investments. Resilience will be enhanced through climate-resilient designs, embankment raising, surface strengthening, drainage improvements, and erosion protection using vegetation and bio-engineering methods.

A list of potential farm roads has been identified, with feasibility studies completed (See Annex 2). Improving local road networks is a key-supporting factor for socio-economic development and will be integrated with Component 2, particularly along irrigation canals allowing farmers to better monitor crop progress and water levels. Independent farm-to-market roads fall under Component 1, managed by NCDDS. Activities for these roads will include:

Activity 1.4.1 Identification, selection and initial planning (NCDD-S)

The initial planning will involve consultative meetings with the communities and stakeholders to gather insights on local contexts, opportunities and challenges. This engagement will inform the design process, utilizing lessons from the Community Participation Framework (ADB 2018) prepared under the Rural Roads Improvements Project III. Key data on traffic volumes, climate change impacts, and existing conditions will be collected, along with future maintenance needs.

Activity 1.4.2 Technical survey and design considerations, preparation of cost estimation (NCDD-S)

In this activity, the design of rural roads will prioritize climate resilience, addressing the anticipated increases in flooding and drought due to climate change. The hydrology of the project areas indicates that both the frequency and intensity of flooding will rise during wet seasons, while droughts will become more prevalent in dry seasons. To mitigate these impacts, design approaches will incorporate advanced techniques, such as raising embankments, enhancing drainage, and utilizing bioengineering solutions for erosion control. The integration of climate resilience features will ensure roads remain functional year-round, with specific design elements including sufficient drainage capacity, flexible pavement materials, and vegetation-based erosion protection.

Three types of roads will be considered for improvement: polder embankment roads, canal embankment roads, and standalone rural roads (Type 3 and Type 4). For polder embankments, the design will maintain a minimum top width of 4.5 meters with a slope of 1:2.5, while ensuring adequate side protection using local vegetation. Canal embankments will follow similar criteria, reinforcing their dual function as transport routes. Type 3 and Type 4 roads will incorporate features such as increased embankment heights, improved cross drainage, and the selection of permeable materials to enhance resilience against flooding. Overall, the design will be informed by hydrological data and best practices to ensure sustainable, climate-proof road infrastructure.

Activity 1.4.3 Improve 90 Kilometers of farm roads (NCDD-S)

The construction of the road works will be executed through competitively procured local contractors and supervised by both technical experts and community members for proper quality assurance. The local communities will be engaged in monitoring and reporting on the construction works and will be trained for the purpose by the consultants.

Activity 1.4.4 Handing over of the completed works (NCDD-S)

The completed roads will be handed over to the Ministry of Rural Development (MRD). The MRD will commit to the operation and maintenance of the roads in line with the sustainable road maintenance program. This will be agreed prior to construction in an MOU between the project and MRD. The costs of the annual O&M will be estimated and indicated in the MOU.

Component 2: Upgrading and climate-proofing water infrastructure for increased resilience. (MOWRAM)

Component 2 is linked with Component 1 such that it facilitates the implementation of CR on farm crop and water management practices through improved field level water supply delivery and drainage. It will focus on rehabilitating and modernizing of irrigation and flood protection/drainage infrastructure in the 3 sub-projects[52], including irrigation and drainage canals, flood control embankments, and ponds, to provide high-efficiency climate-resilient irrigated agriculture systems for adapting to both increasing flood and drought conditions.

The expected outcome of this component is that within the 6 irrigation schemes the water management condition throughout the year is improved and can be controlled, meaning that there will be no major flooding in the wet season and no severe drought in the dry season. As concluded during the re-evaluation of the Feasibility Study and Project Preparation (FIRM) study, the Overall Feasibility Study (Annex 2) proposes to modernize and rehabilitate the irrigation and drainage infrastructure serving 32,056 has. The anticipated cropping calendar is based on a rain-fed/partially irrigated rice crop in the wet season in the entire project area, while in the dry season in around 70% of the total project area a second dry season irrigated rice crop can be grown, with in the remaining 30% of the project area (mainly the Lum Hach irrigation scheme) the other 3 value chains will be providing sustainable livelihoods as availability of irrigation water in this area is limited. The climate adaptation activities will ensure that the projected increase in extreme wet days and more frequent upstream flooding do not lead to damage and destruction of irrigation infrastructure and also transform this risk into a green opportunity by storing more water in irrigation ponds, improved drainage facilities to drain the excess flood and increased access to water through solar pumping. Additionally, more efficient irrigation technologies will ensure that farmers can irrigate larger parts of the schemes for longer periods throughout the year.

This component will be implemented through four integrated outputs. Output 2.1 is dedicated to the enhancement, establishment, and modernization of hydraulic infrastructure to elevate irrigation practices within the framework of the three sub-projects. In addition, component 2.2 is geared towards enhancing infrastructure that protects the project areas against flooding by means of encompassing rivers, drainage systems, and embankments. Consequently, the project aims to deliver irrigation systems that are highly efficient and resilient to climate change, catering to both increased flood risks and drought conditions. These two components aim to ensure and boost agricultural production by improving irrigation supply and safeguarding crops from water-related disasters.

The sustainability of the irrigation scheme will be ensured by strengthening the O&M capacities of the FWUC (Output 2.3) and PDoWRAM with the creation of a SCADA system for Ou Ta Paong scheme (output 2.4). The proposed areas that combine adequate potential with greatest need for assistance have been identified in consultation with MOWRAM and PDWRAMs. For ensuring that local information is taken into account, the FIRM study undertook field surveys and stakeholder consultations. Output 2.3 aims to strengthen the FWUC for improved irrigation management while the last output provides farmers relevant water information and SCADA based canal operation. Based on available water and weather information, farmers will be supported with the agro meteorological services as described in output 1.3. These four outputs are described in more detail in the following paragraphs.

Output 2.1: Modernized irrigation schemes and ponds (MOWRAM)

Rehabilitating, upgrading and, where water and land resources are available and socially and environmentally possible, constructing new irrigation facilities and storage ponds within the 6 irrigation schemes, which will all have positive climate adaptation and mitigation impacts.

Thus, this output has two main benefits: (i) increasing water availability and restoring existing and introducing new storage capacity for irrigation in the form of ponds while decreasing the destructiveness of floods on downstream locations; and (ii) the possibility of implementing crop diversification and new activities to increase farming incomes such as vegetables, poultry production and/or aquaculture. It will also allow for creation of employment opportunities, especially for young people. This measure would be part of integrated and resilient water resources management and climate proofing to secure the sustainability of the overall irrigation system against negative climate impacts of droughts and dry spells as well as floods during the monsoon season. Output 2.1 and 2.2 will be implemented in three sub-projects within a total of six separate irrigation schemes. The flood protection works will directly benefit an area of 10,005 ha, including a proposed semi-polder area of around 2,550 ha (Output 2.2).
Activity 2.1.1: Technical analysis, field surveys and preparation of plans for system upgrading *(MOWRAM)*

After the detailed topo-surveys have been completed in all 6 irrigation schemes a detailed DED for all irrigation and drainage/flood control systems will be prepared taking into consideration the detailed social-and environmental impact assessment to minimize the amount of private land to be used and plot the new infrastructure as much as possible on public land. For the larger schemes, tertiary distribution systems are foreseen. This DED will primarily be based on gravity-driven flow irrigation but in case the natural slopes are insufficient to allow for gravity flow, solar-driven pumps will be considered at the beginning of the secondary or tertiary canals to allow for sufficient head to have good distribution of the available water over the entire scheme.

In this final DED the different layout options as identified in the FIRM phase will also be reinvestigated for technical, environmental and social/safeguard considerations. The implementation will focus on maximizing ecosystem-based solutions, reducing energy consumption, and consequently reducing GHG emissions. In addition, current diesel pumps lifting water to tertiary and secondary canals will be replaced where possible by collective solar pumping systems when the pre-conditions are acceptable with low pressure water delivery at the plot level to increase the water efficiency, avoid land losses and improve water use efficiency. Moreover, these technologies will allow to save time and labour, especially for women, and offer opportunities to engage rural youth.

Activity 2.1.2: Implementation of infrastructure upgrading *(MOWRAM)*

The implementation will follow a participatory approach involving farmers' at all stages from the survey, design, construction, implementation and operations. It will also cover all cross-cutting issues such as gender, environmental and social issues, resettlement, etc. The land rights aspects in construction-related activities will be guided by the Resettlement Planning Framework (RPF). The project will minimize land acquisition by following existing rights of way, where land acquisition is required, it will implement fair and transparent processes under the RPF. The ESCMF includes detailed procedures for managing land acquisition, including socio-economic surveys, eligibility and entitlement criteria, consultation, grievance redress, and monitoring, ensuring access to recourse for affected persons. This subcomponent will be financed by AIIB and Government.

Activity 2.1.3: Preparation of canal O&M plans including application of ICT and SCADA for operation *(MOWRAM)*

Upon completion of construction works, schemes will be handed over to the Irrigated Agriculture Department (IAD) of MOWRAM, and O&M responsibilities will be shared between the concerned Provincial Department of Water Resources and Meteorology (PDWRAM) and FWUC. MOWRAM's Irrigated Agriculture Department will be assigned overall management

responsibility and required to introduce a system of on-going M&E and reporting of scheme performance. FWUCs will receive financial support until they become financially independent. PDWRAMs will provide technical backstopping to FWUCs. MOWRAM will arrange government budget for funding routine and periodic maintenance of the infrastructure retained under government control and for providing financial support over the first five years after FWUC formation. MOWRAM will authorize the transfer of management responsibility to a FWUC after training and assessment of the FWUC being financially independent (Prakas 306/2000-PID-RGOC Annex 21). It is expected that the impact of the project on increase water use efficiency through modernization of the schemes will encourage greater allocation of resources for expanding the modernization of irrigation schemes in other areas.

Output 2.2: Flood-proofing and drainage improvement (MOWRAM)

It focuses on improving disaster prevention and protection of farmlands and assets by establishment of early warning systems and improvement of the existing drainage and flood protection systems. Existing drainage and river training networks will be improved based on the results of the hydrological modelling and consultation with stakeholders living in the project areas.

Activity 2.2.1 Technical analysis, field surveys and preparation of plans for system upgrading *(MOWRAM)*

This output focuses on equipping the 6 schemes with facilities to withstand the currently annually recurring flooding of all parts, but mostly the downstream parts of the 6 schemes and also disaster prevention and protection of farmlands and assets by the establishment of flood protection embankments and drainage canals helped by early warning systems to improve capacities of the existing drainage networks and flood embankments. This flooding is partially due to the water inflow from the downstream end of the scheme from the Tonle Sap Lake and partly from local runoff of the higher areas upstream of the scheme for which no proper drainage infrastructure was made. Existing drainage and river training networks (especially in the Ou Ta Paong and Lum Harch schemes) will be improved based on the results of the hydrological modelling and consultation with stakeholders living in the project areas. Also, at the downstream end of these subprojects in the new semi-polder area solar-driven water pumps will be installed wherever necessary to pump excess drainage water to the outer area.

Activity 2.2.2: Strengthening and construction of flood control and drainage infrastructures (*MOWRAM)*

The applicability of nature-based solutions in flood management (e.g., revival of old river channels like Ou Ta Paong River, embankment improvement with vegetation strips, etc.) will be reviewed and subsequently used to inform the investment planning under this component. Farmers will also be supported to restore, and construct farm level drainages as required while project will install sub surface drainages in needy areas. In addition, it will also support strengthening of river training and their embankments to make them resilient against intensifying flood threat under the changing climate context. These improved embankments will be linked to the flood risk assessments improved in Component 1 and the water-related data will feed into the national database to improve flood early warnings for target areas (delivered through output 1.3). New flood protection embankments will be constructed in Ou Ta Paong and Stoeung Krang Bat irrigation schemes to avoid high season water levels in the neighboring Tonle Sap River into the command area.

The levels of the embankments have been based on the topo surveys recently carried out and the 2 water models focusing on the impact of the climate change on the flood levels in the Tonle Sap Lake and the rivers crossing the various project areas. For more information reference is made to the D.4 report of the FIRM study. One additional very considerable

benefit of these embankments will be improved accessibility for the communities in these lower parts of the scheme as now they will be able to use the newly built embankments for local transport while in the past they had to use small boats. This will facilitate local communities to access markets and the flow of agriculture inputs and outputs. Annex 2 provides more details of the drainage infrastructure at the sub-basin level.

Output 2.3: Farmers Water User Communities (FWUC) established and trained (MOWRAM)

Establishment and training of FWUC: FWUCs are critical for ensuring the sustainable and effective operation and maintenance of irrigation schemes, in particular at the distributary network system (secondary tertiary and quaternary levels. With the rehabilitation of the irrigation systems and the creation of a flood protection embankment system of the three subprojects, the project will support the establishment and capacity building of the FWUC from the participatory approach of FWUC creation in the design, development and sustainable use of the rehabilitated irrigation schemes to be rehabilitated by the Project as these organisations are crucial for O&M management.

Activity 2.3.1: Formation and institutional strengthening of the FWUC *(MOWRAM)*

FWUCs are critical for ensuring the sustainable and effective operation and maintenance of irrigation schemes, in particular at the secondary and tertiary levels. With the rehabilitation of the irrigation system and the creation of a flood protection/drainage embankment and canal system in the lower parts of the 3 sub-projects, the project will also focus on establishing new FWUCs and strengthening the existing FWUCs as these organizations are crucial for water management. This will include investments in improving the capacities in O&M activities, water use efficiency, improving the arrangement of water rights, water allocation, use of green technology, service fee collection and making them more inclusive. Furthermore, the project will train women and men farmers on using sustainable local water resources, climate adaptation strategies, and mitigation tools to reduce GHG emissions and increase agriculture productivity without negatively impacting the environment. The activities will be designed to strengthen the capacity of FWUCs for sustainable operation of the climate-resilient and climate-proofed irrigation systems. The inclusion of women in the FWUCs will be encouraged in both leadership positions and as members.

Activity 2.3.2: Build technical capacities of FWUCs for canal O&M *(MOWRAM)*

Build technical capacities of FWCUs for canal structure O&M and 2.3.3. prepare long term financing plan for O&M of the systems including the WUAS. The participation of women in these forums will be encouraged in discussion with women farmers. This will require an identification of the capacity needs, membership, and functionality of the FWUCs in the area. The concept of water pricing is embodied in the *Water Law*. However, mechanisms for water pricing have yet to be implemented. Thus, CAISAR will assist them in developing a business model for the operation and maintenance of each irrigation scheme on a self-sustaining basis in partnership with the farming communities and the private sector. This will entail the development of an O&M plan for the infrastructure investments, assessment of the willingness and ability of the users to pay for the services and a regulatory framework that gives the WUAs the authority to collect the fee and assess the basis on which water fee will be paid as Irrigation fees that can be based on the size of the land being irrigated or the volume of water used. Fees will be charged only when the scheme becomes operational.

Output 2.4: Water information system established and operational in three sub-projects[53] (MOWRAM)

The SCADA model is crucial to tackle the significant challenges in the agricultural sector on the inefficiency of irrigation practices, characterised by both indiscriminate and irregular water

distribution, leading to substantial water wastage. This approach offers real-time information on water levels and flow rates, enabling more accurate and timely responses to fluctuations in water demand. The SCADA presents a contemporary solution for the modernization of existing irrigation systems, prevent flooding and it does so with a fundamental, cost-effective approach. Implementing the Water Information System allows for command-and-control functionalities while collecting valuable data on irrigation. This, in turn, will rationalise and streamline the irrigation process, significantly mitigating the wastage of water.

Activity 2.4.1 Preparing all processes for establishment of the SCADA and water information system *(MOWRAM)*

This output aims to establish a water information and warning system such that farmers and other relevant stakeholders are fully aware of climate condition, water availability, silt condition so as to effectively plan their irrigation scheduling and operation. The water and weather information will further help develop crop specific advisory services as described in component 1. However, the forthcoming IWRM, CWISP programs in the MoWRAM will be developing area specific flood and drought warning system, water information and will also engage in capacity support. The project will directly use these available systems to help farmers in the project areas better plan their agriculture and protect their livelihood assets. Working together with the above projects, a communication system using mobile phones will be established so that farmers are timely informed on evolving threats and challenges.

At irrigation system level, it will install Supervisory Control and Data Acquisition systems (SCADA) in the Pursat hydraulic system network that includes the Ou Ta Pong irrigation scheme. The SCADA system will allow the water manager to monitor the real-time information on water levels and flow rates and the possibility to respond to fluctuations more accurately and timely. It provides command and control and collect data on irrigation to rationalize and streamline the process of irrigation service delivery. The proposed SCADA system will involve remote terminal units (RTU) to collect local data (water levels, flow rates, gate positions) and command local equipment (gates); a command center, to supervise/manage all the RTU; a communication system, to link the RTUs to the command center. Further details are explained in Annex 2.

The component 2 will be implemented by the Project Management Unit (PMU) at MOWRAM and its Project Implementation Units (PIUs) at the provincial level, including training and capacity development on development partners' policies and standards, monitoring, evaluation, reporting and verification, including climate rating and climate finance. Thus, PMU and PIUs will actively disseminate knowledge and green solutions in climate adaptation and mitigation among farmers, policy- and decision-makers, and rural communities.

Component 3. Strengthened institutional and regulatory capacity for low-emission climate-resilient development pathways.

This component aims to strengthen Government institutions, mainly the MOWRAM, MoE the NCDDS and the FWUCs. The focus for MOWRAM will be on upgrading technical capacity in various aspects of CR irrigation design and management. The key focus area under NCDDS will be on climate resilient crop production.

Output 3.1 Strengthened MOWRAM *(MOWRAM)*

This output supports, training and capacity development for the project management unit (PMU) and will enhance the institutional capacity of the Ministry of Water Resources and Meteorology (MOWRAM) and Provincial Departments of Water Resources and Meteorology (PDWRAM). This includes preparation of design manuals, capacity building and training in river basin management and water accounting, the operation of Supervisory Control and Data

Acquisition (SCADA) systems, in the design and implementation of climate-resilient green technology, low-carbon pathways, climate-proof irrigation systems and gender mainstreaming and social inclusion. The development of standard designs and construction manuals will enhance the replicability and long-term sustainability of the project. In addition, it will build capacities to employ digital platforms and the best-available climate and water data to monitor and boost the operational performance of the irrigation systems and future maintenance plans.

Activity 3.1.1 Strengthening river basin management and water accounting systems *(MOWRAM)*

CAISAR's investment in irrigation development envisages improved water availability to and throughout each of the schemes. This will require careful management of water resources storage, allocation, and delivery, and careful distribution of delivered water to the farmer/water users. Therefore, CAISAR will support capacity strengthening for water accounting in the river basins where CAISAR will rehabilitate and climate proof the irrigation infrastructure. CAISAR Component 2.4 will support MOWRAM with establishing a water information system, and this will serve and needs to be designed in such a manner that it provides the water accounting systems that will be strengthened with the data these systems need. The CAISAR activity will support MOWRAM and the four PDWRAMs in reviewing their current water accounting system in the project-related river basins and to plan/implement improvements where desirable and feasible. Activity 3.1.2. Communicating with stakeholders

Activity 3.1.2 Communication with stakeholders *(MOWRAM)*

MOWRAM's PDOWRAMs participate actively in the various Provincial-level meetings where water-related aspects are relevant in the discussions. Key items are the flood management plan for the wet season and the water allocation plan for the dry season. For MOWRAM/PDOWRAM to prepare and implement these plans properly, it will make use of the water information system and water accounting system mentioned above. This will be achieved efficiently and effectively by publishing the water situation on a website that can easily be consulted by the stakeholders. MOWRAM already has such an information website, namely for Flood and Drought Forecasting and is in the process of establishing a water data and information centre, which will result in more data coming available. These are centrally managed, with data being provided by PDWRAMs and other MOWRAM units, closer to 'the field'.

Activity 3.1.3. Support to and guidance of leaders of commune, village and FWUCs and gender awareness *(MOWRAM)*

The development of standard designs and construction manuals will enhance the replicability and long-term sustainability of the investment. Building capacities to employ digital platforms and the available climate and water data will also benefit other irrigation systems. More details are provided in Annex 2 section 6-part B page no194-195.

Output 3.2 NCDDS strengthened at national and provincial level

NCDDS plays a crucial role in promoting democratic development through decentralization and deconcentration of reforms throughout the country. To effectively carry out this mission, the secretariat of NCDDS has been actively engaged in capacity development initiatives aimed at enhancing the skills and knowledge of sub-national government officials

Activity 3.2.1 Strengthening of NCDDS at the national level (NCDDS)

The capacity development efforts of NCDDS will include:

Strengthening NCDDS' project management capacity: This includes training on project cycle management, financial management, monitoring and evaluation, human resources management, climate change and gender perspectives.

Policy formulation and implementation: Enhancing the capacity to develop and implement effective policies and programs at the sub-national level, especially the Sub decree 182 on the functions transferred to the district level. Disseminate and knowledge sharing the role and responsibility of district and municipality to support farmers.

Resource mobilization: Strengthening skills in resource mobilization, and planning at the sub-national level. GCF is another window where institutions can access to Climate Fund, so capacity building of NCDDS staff on project feasibility study and preparing full project proposal to GCF can help NCDDS to mobilize more resources.

Institutional strengthening and coordination: Promoting efficient institutional structures, coordination mechanisms, and inter-agency/ministry collaboration at the national level and sub-national level.

Activity 3.2.2 Strengthening of the provincial teams (NCDDS)

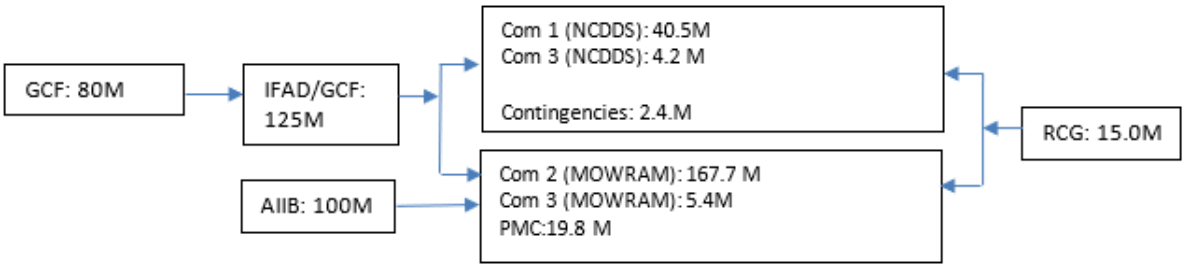
This will involve the following sub-activities:

Conduct a detailed capacity development needs assessment - The full evaluation of the current capacity of PDAFF, PDOC, PDWA to support extension service will be done by a consultant recruited for this purpose. Tools to be developed and administered to provincial staff and a report capturing the findings will be drafted. The purpose of a capacity development needs assessment is to identify the gaps between the current capacity of the Provincial Staff and the capacity required to achieve its objectives.

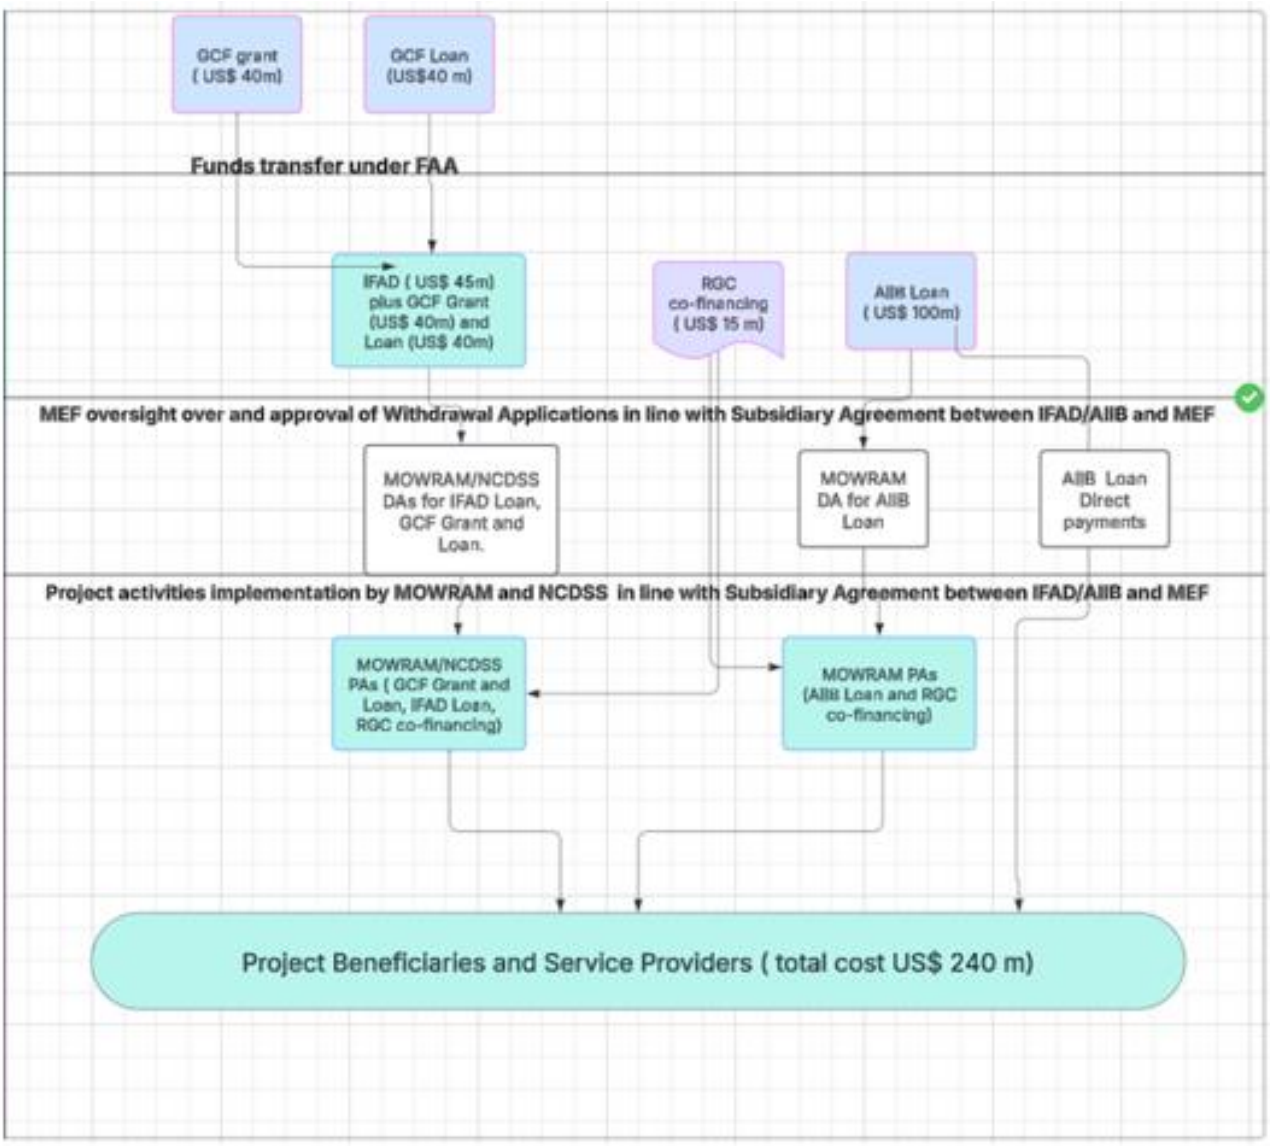
Training in technical concepts and cross-cutting subjects - Training and capacity building for Provincial staff in areas such as policy analysis, project management, market systems development, use of ICT tools and incorporating gender perspectives. Support to the adoption of ICT tools to improve the project efficiency, effectiveness, and transparency. To effectively carry out their duties, Provincial staff need to be well-versed in a wide range of technical concepts and cross-cutting subjects. In addition to the gaps, topics like - Sustainable agriculture, climate change adaptation and Information and communication technology (ICT) and gender analysis to be included in the training. The project will provide structured support to ensure that the participants are able to conduct some of the activities independently. The trainings will be structured to provide skills adequate for the functions that NCDDS staff are expected to complete. The increase in management capacity will be useful for deploying in other areas and the resource mobilization capacity will ensure the generation of resources for scaling up. The strengthening of the provincial teams will enable them to scale up and expand to other areas.

2.1 Financial management and Disbursement Arrangements

The Asian Infrastructure Investment Bank (AIIB) and GCF are the two main co-financiers of the project, with IFAD and the RGC also providing significant funds. AIIB and IFAD have provided grant funds and technical assistance for project preparation activities. The GCF funds will be provided to IFAD and then transmitted through the Ministry of Economy and Finance (MEF) of the Government of Cambodia to the Ministry of Water Resources and Meteorology and the National Committee for Sub-National Democratic Development The funds of the Asian Infrastructure Investment Bank (AIIB) will also be provided through the MEF to MOWRAM for investment in the climate resilience and modernization of irrigation infrastructure. The Royal Cambodian Government (RGC) will provide in kind support directly during the implementation of the project.



MEF will authorize MOWRAM PMU and the NCDDS PIU to open a designated account (DA) at the National Bank of Cambodia for funding from AIIB and IFAD/GCF. MOWRAM PMU and NCDDS PIU shall open one project account at a commercial bank to receive the fund transfer from the AIIB and IFAD DA to pay for project activities.



2.2 Project Cost and Financing

The total cost of the project is USD 240 Million (100M from AIIB, 80M from GCF, 15M from RGC, and 45 M from IFAD). The financing arrangement for each component and flow of fund is described in the below tables.

2.3 Flow of Funds

Figure 4: Funds Flow Diagram (USD)

Parallel co-financing

The Project will be co-financed with IFAD and GCF, with AIIB acting as lead co-financier. As project preparation was initiated prior to AIIB's GCF accreditation, components that will be funded by GCF will be administered by IFAD. IFAD and AIIB will be applying their respective policies for components which are financed in parallel. For Component 3 (Project Management) of the Project it will be jointly co-financed between AIIB, IFAD and GCF, The Project adopted a common documentation approach for the investment aligning the ES policies of AIIB, IFAD, and GCF, focusing on a client-first strategy to simplify processes for the government while maintaining environmental and social standards AIIB policies will apply to the sub-components it funds (2.1 and 3.4).

AIIB will serve as the lead financier for the Project, which will be co-financed in parallel by the International Fund for Agricultural Development (IFAD) and the Green Climate Fund (GCF). To support project preparation, AIIB has provided a USD4.7 million grant through its Project Preparatory Special Fund (PPSF). This funding is being utilized for detailed engineering designs (DEDs), procurement package support, and additional surveys required for the feasibility studies.

Further, The DEDs of the 5 sub-schemes; Kropeu Trom, Ou Ta Poung, Brambei Mom, Yutasast and Stung Krang Bat include Component 2.1 modernization of schemes and 2.2. flood-proofing and drainage improvements.

Co-Financing Arrangements and Alignment of Policy Application.

The Project is a collaborative initiative co-financed jointly and in parallel by the Asian Infrastructure Investment Bank (AIIB), the International Fund for Agricultural Development (IFAD), and the Green Climate Fund (GCF), with AIIB serving as the lead co-financier. Given that Project preparation commenced prior to AIIB's GCF accreditation, components funded by GCF will be administered by IFAD. To ensure consistency and effective coordination among all stakeholders, Annex 3 has been appended which outlines the framework for aligning policy application and procedures of the development partners involved in the Project—AIIB, IFAD, and GCF. It addresses key areas such as environmental and social risks and impacts management, procurement, financial management, reporting, and overall project implementation. This harmonization is essential for efficient project execution, clearly defining roles and responsibilities, and promoting the long-term sustainability of the Project outcomes. By streamlining processes, the Project reduces complexity for the government, providing clarity while facilitating smooth multi-partner collaboration.

Financing Plan

AIIB, IFAD and GCF will co-finance the Project jointly and in parallel. The AIIB portion of the financing will support the modernization of infrastructure for six irrigation schemes, improving water use efficiency and supporting project management and implementation consultants. A breakdown of the Project costs and financing plan are presented in Table x below and a more detailed one is presented in annex xx. The funding from RGC will be used for land acquisition, resettlement and compensation costs, taxes and duties, Project administration, and supporting consultants to the Project Management Unit (PMU). The remaining costs will be borne by the loans of AIIB, IFAD, and GCF grants.

Table xx: Project Budget by Component and Funding Source

Components	Total Cost (USD)	Funding Sources					%
		Green Climate Fund (Grant)	Green Climate Fund (Credit)	IFAD (Credit)	AIIB (credit)	Government (in kind)	
Component 1 - Farm Level Climate Adaptation and Resilience	40.4	26.3	-	12.9	-	1.2	16.9%
Component 2 - Upgrading and climate-proofing water infrastructure for increased resilience	167.7	3.3	39.0	18.3	96.0	11.1	69.9%
Component 3 - Strengthened institutional and regulatory capacity for low-emission climate-resilient development pathways	9.6	8.7	-	-	-	0.9	4.0%
Project Management and Coordination (PMC)a/	19.8	1.7	1.0	11.3	4.0	1.8	8.3%
Contingencies	2.4	-	-	2.4	-	-	1.0%
TOTAL	240.0	40.0	40.0	45.0	100.0	15.0	100.0%
		16.7%	16.7%	18.8%	41.7%	6.3%	

a/ it includes M&E cost

AIIB Loan Disbursement Procedures

AIIB will handle project disbursements for its financed activities according to its disbursement procedures. Disbursements will follow the transaction-based method, including the following procedures: Advance method (through advances to the Designated Account), Direct Payment method, Special Commitment method and Reimbursement method with full documentation, including reimbursements under the Retroactive Financing procedure. The withdrawal applications should be submitted by post to AIIB. Initially and later by electronic submission to be introduced by AIIB to streamline the process. Further details will be described in the Disbursement Letter.

The Government Counterpart Financing USD Account will be opened at the National Bank of Cambodia (NBC), the initial advance being based on a six-month cash forecast and replenishments based on paid expenses with supporting documentation. The submission Process for WA will initially be by post and later by electronic. The DA will be opened at an AIIB-approved commercial bank with ceiling limit of cash requirements for six months.

MOWRAM PMU will establish and maintain a separate Designated Account (DA) in any financial institution agreed between AIIB and PMU for AIIB funds. The currency of the DA will be the US dollar.

MOWRAM, through its PMU, administers the DA and is accountable and responsible for the proper use of advances, including advances to any sub-accounts.

MOWRAM PMU may request initial and additional advances to the DA based on the six-month cash forecast, which sets out the estimated expenditures to be financed through the DA for the forthcoming six months. Supporting documents should be retained by MOWRAM PMU in accordance with AIIB's Interim Loan Disbursement Manual for Sovereign-backed Loans (issued in September 2016) when liquidating or replenishing the DA. The SOE procedure will be used to reimburse eligible expenditures or liquidate advances to the DA. Supporting documents and records for the expenditures claimed under the SOE should be maintained and made readily available for review upon AIIB's request for the submission of supporting documents on a sampling basis and for an independent audit.

IFAD Loan, and GCF Grant and Loan Disbursement Procedures

As IFAD will administer the GCF grant and loan, IFAD's Disbursement procedures will apply to the withdrawal of GCF grant funds. The government treasury system is not applied for project fund flow. MEF will authorize the opening of a designated account (DAs) in USD at the National Bank of Cambodia for the receipt of Financing from IFAD for IFAD loan and GCF grant and loan. There will be two USD project accounts (one for MOWRAM and one for NCCD), which shall be opened at commercial banks to pay for project activities. The IFAD loan and GCF grant and loan disbursements will follow through the Revolving Fund Mechanism in which the project can withdraw/justify the advance based on the Interim Financial Reports (IFRs) following the procedures and conditions outlined in FMFCL. IFAD will send the FMFCL to MOWRAM and MEF with guidance on disbursement procedures; MEF will send IFAD the ICP letter providing the

delegation and authorization of the persons who can request and approve the submission of IFR and WA in ICP.

For IFAD funds, the Designated Account (DA) will be opened in any financial institution agreed between IFAD and PMU and the ceiling limit will be cash requirements for six months and replenishments based on paid expenses with supporting documentation.

There will be separate legal agreements with RGC: One for AIIB, another for IFAD. RGC's SOP for FM to be applied to the project are (i) GCF requires adoption of a Project Implementation Manual (PIM) as a withdrawal condition for IFAD financing, (ii) PIM includes FM Manuals for MOWRAM and NCDDS and (iii) MOWRAM's FM Manual outlines FM arrangements for AIIB and IFAD. AIIB will provide FM-related services to IFAD, including IUFR reviews and sharing annual audit results.

Accounting Software

Project accounts will be maintained using a suitable accounting software package to be agreed with IFAD and the AIIB. An online / web-based package is preferred. The same accounting software packages will be implemented in each Executing Entity.

The PMU uses Sage 50 Quantum Accounting Software to automate accounting under current projects financed by MDBs. The data capture and mapping of this system allows customization of financial reports and is found suitable for the Project. A similar or the same program shall be used to automate accounting for the proposed Project. The Project Chart of Accounts will reflect expenditure types and sources of financing. MEF's National Accounting Committee issued Guidance on Implementing the Cambodia Public Sector Accounting Standards "Cash Basis of Accounting" for Externally Financed Projects in October 2020. In compliance with this, the Project shall adopt the cash basis method for budgeting, accounting, and reporting. The Project shall record financial transactions and maintain the main Project accounts and records in US Dollars. All prime financial reports must be in US Dollars.

PMU and PIU accounting procedures will follow Standard Operating Procedures (SOP) for internationally funded projects. According to SOP, CAISAR will apply the Cambodia Public Sector Accounting Standard (cash basis), which is based on the International Public Sector Accounting Standards (IPSAS). Standard accounting software shall be used for PMU/PIU that will be compatible with IFAD and AIIB financial reporting requirements. Standard Government's chart of accounts will be set up in the accounting software to capture all payment transactions; in addition, project components, categories, sources of funds, and other segments will be set up and recorded for the transactions in the software to ensure financial reports and budget reports produced in accordance with IFAD/GCF, AIIB and Government requirements. The details of the accounting process and records are outlined in the SOP. All accounting records must be maintained in electronic format for 10 years after project closure. MOWRAM PMU will be responsible for the consolidation of financial reports from NCCD-PIU for each quarter; within 30 days, NCCD PIU will send to MOWRAM PMU the interim financial report (IFR) in the agreed format that will finally be consolidated and submitted to IFAD for justification of advance and requesting new advances.

Audit

To monitor project progress and financial performance, consolidated Interim Un-audited Financial Reports (IUFRs) will be prepared for the proposed project. NCDD-S will prepare its part

of IUFR and send it to MOWRAM. The PMU will enter its part into the IUFR file and finalize the consolidation of the IUFR. MOWRAM will submit the consolidated IUFRs every calendar quarter throughout the Project. The format of IUFRs will be agreed upon with the MOWRAM, NCDDS, and IFAD before the Bank's negotiations. It may include (a) Project Sources and Uses of Funds, (b) Uses of Funds by Project Activity, (c) Uses of Funds by Disbursement Category, (d) Designated Account Statements, and (e) Annex 1-Information about RGC in-kind contributions. IUFRs should be submitted to the Bank and IFAD within 45 days of the end of each quarter. The PMU shall submit the first report under the proposed Project after the end of the first calendar quarter of initial disbursement.

MOWRAM established its Internal Audit Department (IAD) in November 2006. The IAD was under the oversight and guidance of the General Department of Internal Audit of MEF (GDIA-MEF) until August 2023. The GDIA-MEF is responsible for developing and issuing guidelines for the internal audit function. The GDIA-MEF is also responsible for capacity building by providing continuous support and training. Since August 2023, the IAD reports to MOWRAM only and has twenty-seven staff members. The IAD designs its overall annual work program and selects the actual projects or sub-projects to be audited in coordination with MOWRAM management. The IAD does not typically conduct internal audits of projects financed by MDBs. The IAD's staff capacity can be strengthened through training activities funded through the proposed Project. This option can be further discussed during the Project implementation between AIIB and MOWRAM.

MEF is responsible for appointing external auditors for all donor-financed projects. The audits are conducted following the Cambodian Standards on Auditing and Assurance (CSAA), which conforms with the International Standards of Auditing (ISA). An independent auditor will conduct the external audit of the Project Financial Statements under ToR, which shall be acceptable to AIIB and IFAD. The audit costs are not charged to projects and are borne by the RGC. For Project purposes, separate audit reports will be issued for AIIB and IFAD financing. The first report will include the audited financial statements for AIIB parallel-financed sub-components and a management letter. The second report will include the audited financial statements for IFAD parallel-financed components and a management letter. The second audit report will be consolidated, consisting of NCDD-S and MOWRAM implemented IFAD's financed components. The PMU will furnish audited financial statements (and any accompanying Management Letters) to AIIB and IFAD, respectively, no later than six months after the end of each fiscal year.

Internal Audit will be conducted on an annual basis by the Internal Audit Department of the relevant ministries, if the Internal Audit Department has enough capacity for this task, as confirmed by IFAD and / or AIIB Supervision Mission. If the Internal Audit Department is not confirmed as having enough capacity, a private internal auditor will be hired to perform internal controls review, propose improvements, and issue recommendations. External audit will be conducted by a private audit firm hired by MEF, while IFAD and AIIB would provide NOL to the TORs.

The IFAD Policy on Anti-Corruption and Fraud requires that the staff of IFAD, (including beneficiaries of IFAD loans) as well as all bidders, suppliers, contractors, and consultants under IFAD-financed contracts observe the highest standard of ethics and integrity during the procurement and execution of such contracts. Mechanisms for whistle-blowers to access IFAD systems can be accessed under http://www.ifad.org/governance/anticorruption/how.htm. In line with IFAD policies on anticorruption, sexual harassment, sexual exploitation and abuse, all bidders and contractors/service providers/suppliers are required to sign self-certification forms as a part of bids and contract documents.

Based on the results of the financial management assessment, the current organizational structures of the implementing agencies are found appropriate to manage the new project. The funds flow arrangements are conducive for project implementation, especially in view of the direct fund transfer arrangement from provincial level to district level. The proposed accounting standards, policies, procedures, asset management, budgeting, audit, reporting, and accounting system are in place and considered effective for the existing organizations.

The project can rely on the prevailing structure and systems as regards fiduciary requirements and quality of outputs if the required mitigation measures are implemented to address identified weaknesses. Specifically, risk level could be lowered pending the actions of project management as follows:

i. To establish a control framework integrating periodic internal audits, independent external audits, and social safeguards based on IFAD policies;
ii. To adopt a good governance and mutual accountability framework to strengthen accountability and transparency in line with international best practices.
iii. To outline the project specific financial management procedures and disbursement
iv. To establish a Project Management Information System (MIS) in order to facilitate proper segregation of duties and overarching control of information and data flows and;
v. Recruitment of qualified consultants with relevant experience and educational background.
vi. Development of FMM with clear roles for supporting documents filing and accounting record keeping for all implementing partners.
vii. Customization of accounting software for accounting record keeping and financial reporting, considering GCF reporting requirements.
viii. Close coordination with MEF to ensure compliance with IFAD and AIIB audit requirements.

Taxation.

The IFAD financing proceeds must not be used to pay taxes. All taxes are to be borne by the Government.

Disbursements

AIIB will handle project disbursements according to its disbursement procedures. The Project will use direct payment and advance procedures for AIIB financing. The PMU plans to use the advance method of disbursement for consultancy and operating expenses, while the direct payment method will be used primarily for work payments. The PMU will prepare Withdrawal Applications and supporting documents and submit them to AIIB through MEF. After receiving the signed applications from MEF, AIIB will make the payments for the AIIB portion directly. For now, the applications will be delivered by post; later, AIIB may introduce electronic submission. Further details will be described in the Disbursement Letter (DL).

There will be a separate Designated Account in any commercial bank agreed between and held jointly by MEF and MOWRAM, which will be delegated to and administered by MOWRAM. Before opening the account, the PMU will email AIIB to confirm the acceptability of the selected bank.

The RGC's funding will follow the standard RGC system for cash contributions to development projects. A separate bank account in USD for the government counterpart financing will be opened in the National Bank of Cambodia (NBC). Whenever the PMU needs to receive funds from

the government counterpart financing, the PMU will prepare a cash request along with the cash forecast for 6 months or a replenishment request with paid expenses.

3. Social, Environmental and Climate Assessment Procedures

Environmental and Social Policy and Categorization. As some components of the Project will be parallel financed by AIIB, IFAD and GCF, the AIIB's Environmental and Social Policy (ESP, 2022), the IFAD's Social, Environmental, and Climate Assessment Procedures (SECAP) will be applied to the respective co-financiers' parts of the Project. IFAD's SECAP will be applied for Component 1, Component 2.2, and Component 2.3 and AIIB's ESP will be applied for Component 2.1, as the parallel financed components of the Project. For the joint co-financing component between AIIB, IFAD and GCF (Component 3), AIIB's ESP will be applied as AIIB is the lead financing agency. As two safeguard policies will be applied to the Project, coordination between the financiers to manage the environmental and social (ES) risks and impacts of the Project has been discussed and indicated in Annex 9. The AIIB's Environmental and Social Standard 1 (Environmental and Social Assessment and Management) and the Environmental and Social Standard 2 (Involuntary Resettlement) are applicable for Components 2.1, as construction activities will cause land acquisition and resettlement of local people. The Project is not situated in the areas where Ethnic Minorities/Indigenous Peoples are present; therefore, the policies relating to ethnic minority/indigenous peoples of the co-financiers are not triggered.

The Methodology for Risk Categorization included:

Project-related and inherent environmental, social, and climate risks were determined by: (i) screening the project activities against the International Fund for Agricultural Development's (IFAD's) Social, Environmental, and Climate Assessment Procedures (SECAP) requirements, the AIIB's Environmental & Social Framework (ESF), and the Green Climate Fund's (GCF's) Environmental & Social Policy; (ii) considering the findings of desk research on risks associated with similar projects and relevant background papers; and (iii) incorporating findings from the first round of ESCMF stakeholder consultations and previous stakeholder engagement efforts in the form of household surveys (630 households in total), 100 focus group discussions, and 100 key informant interviews. Numerous missions to the project areas and discussions with provincial and district agencies and communes enhanced understanding of project objectives.

The initial SECAP review identified patterns of existing issues inherent to the project area which could increase risk to the project, its personnel, and/or beneficiaries. Additional desk research highlighted further areas of potential inherent risk and lessons-learned from other projects. The screening of CAISAR project activities, together with the ESCMF stakeholder meetings, household survey responses, focus group discussions, key informant interviews, and field visits with consultations provided insight on the latest conditions which could affect the success of the project and the potential project-specific impacts (both positive and negative).

Framework Approach: The design team had agreed to use a framework approach consistent with IFAD's SECAP and GCF's ESS. Documentation is based on the format typically provided for a GCF project, rather than the typical IFAD SECAP note format, to simplify the approval process. This was agreed upon with AIIB and IFAD headquarters prior to development of the ESCMF.

Project Impacts & Inherent Risks: The safeguards categorization for CAISAR is high for both social and environmental impacts and risks. To address issues of climate-induced risks and impacts, the CAISAR project will apply several climate resilience measures and adaptation strategies including climate-informed planning, integrated water resources management, efficient irrigation practices, water storage and reservoir management, ecosystem-based approaches, early warning

systems, climate-resilient infrastructure, capacity building and awareness, stakeholder engagement and participatory approaches, and monitoring and evaluation. These measures will be financed under the project, as the project explicitly targets climate mitigation and adaptation by design.

Key social impacts to be considered as part of the ESCIA included: (i) potential contraction of diseases (e.g. sexually transmitted diseases such as HIV/AIDS, and/or other communicable diseases) due to labor influx; (ii) potential conflict with local communities due to construction workers who work and stay near the community; (iii) potential labour-related accidents for persons hired by the project construction companies to support seasonal construction work; (iv) gender based violence and/or sexual harassment and abuse (e.g. verbal and physical abuse, sexual harassment, violence against children) due to the influx of labour; (v) child labour/age inappropriate work, (vi) forced labour (e.g. coerced to work through the use of violence/intimidation, or by more subtle means such as debt manipulation, retention of identity papers, or similar threats); (vii) possible social exclusion (due to vulnerability, land tenure issues, disability, etc.); and (viii) lack of contract for EM workers, particularly for seasonal works of less than one month's duration.

The above risks evaluated as part of the ESCIA are not considered to be serious in nature and mitigation measures are included in the ESCMP. General mitigation measures are provided within Chapter IV of this Environmental, Social and Climate Management Framework (ESCMF).

Key environmental impacts to be considered as part of the ESCIA included: The project is expected to have largely positive environmental impacts, including improved ecosystem services, soil fertility/soil health, forest health, and natural resources management. Potential negative environmental impacts to be mitigated are related to small-scale infrastructure (e.g. construction/repair of small- scale rural roads, irrigation channels, small-scale reservoirs, etc.). These impacts may include: (i) erosion and run-off to water bodies during earthworks/construction; (ii) temporary traffic blocks and related safety issues during construction and operation; (iii) temporary pollution from construction (e.g. dust, noise, vibration, waste & wastewater generation from workers, campsites); (iv) potential water pollution from sourcing aggregates/construction materials (soil, gravels); and (v) increased water consumption. Additional environmental risks (not explicitly linked to construction activities) include: (i) presence of unexploded ordinances (UXOs) at project sites (an inherent risk listed below); and (ii) increased use of pesticides due to crop intensification/improved crop yields. As with the social risks and impacts, mitigation measures for the environmental risks and impacts are provided in Chapter IV of the ESCMF.

To mitigate issues pertaining to social exclusion and conflict over land use/land tenure/land management, related safeguards documents, like the Stakeholder Engagement Plan (SEP), Indigenous Peoples' Plan (IP Plan), and Gender Assessment and Action Plan (GAP), have been developed to supplement this ESCMF and improve overall project design. The Grievance Redress Mechanism (GRM) is also available for any project affected persons who feel they have been negatively impacted or excluded and is detailed in Chapter IX of the ESCMF.

Inherent Risks: There are inherent risks pertaining to presence of landmines and unexploded ordinances (UXOs) if construction occurs in new areas (i.e., areas without existing construction/infrastructure/activities). Inherent risks are addressed with project-related impacts under Chapter IV of the ESCMF.

Implementation: The ESCMF will be implemented with the support of two safeguards specialists with MOWRAM Project Management Unit. Further support at the commune level will be determined by inclusion of safeguards-related obligations within the Terms of Reference of the project staff/implementing agencies. For construction financed under the project, contractors will be obliged to abide by the GCF and AIIB and IFAD safeguards requirements, in addition to national legislation/regulations, and commit to Environmental and Social Management Plans (ESCMPs) and Environmental Codes of Practices (ECOPs) as part of their contract. Independent ESC monitoring will be conducted over the life of the project construction and implementation phase.

3.1 Annual Gender Action & Social Inclusion Plan (GASIP)

To ensure gender equality is promoted – through enhanced participation of female members in project activities as the first step, a Gender Action; Social Inclusion Plan template has been prepared at project level for PMU's use. During project implementation, PMU will undertake the followings:

Step 1 - Update the template of Gender Action & Social Inclusion Plan into PMU's annual GASIP

Step 2 - Submit the annual GASIP to IFAD and AIIB for prior review and clearance before implementation;

Step 3 - Implement approved GASIP in an integral manner with overall project implementation work plan and Annual IP Plan. Implementation of GASIP includes monitoring and evaluation of outputs and outcomes of GASIP activities towards pre-set development targets in Annual GASIP.

4. Procurement Procedure.

4.1 Procurement principles and arrangement.

Procurement using AIIB/GCF/IFAD funds will follow the Standard Operating Procedures on Procurement for All Externally Financed Projects/Programs in Cambodia (SOP) to the extent such are consistent with the IFAD Project Procurement Guidelines, and AIIB's Procurement Policy and AIIB's Interim Operational Directive on Procurement Instructions for Recipients. Procurement using AIIB financing (Sub-component 2.1) will be undertaken with oversight by AIIB. For activities which are financed by IFAD/GCF (Component 1, Sub-component 2.2-2.4, Component 3) and does not include joint co-financing from AIIB, IFAD Procurement Framework will be applied with oversight by IFAD. For activities which are co-financed between IFAD and AIIB (Project Management), AIIB procedures will be applied. For activities which are co-financed between IFAD and AIIB and subject to prior review, AIIB will lead the prior reviews, and IFAD will enforce in OPEN the prior review decisions taken by AIIB.

NCDD-S PIU will be directly responsible for project procurement activities of Component 1 and Sub-component 3.2. MOWRAM PMU will be directly responsible for project procurement activities of Component 2 and Sub-component 3.1. The NCDD-S PIU will recruit a national procurement specialist. MOWRAM PMU will have a procurement officer and procurement assistant(s) (government staff) and recruit a national procurement specialist.

The initial 18-month Procurement Plan, and subsequently the annual procurement plans in consistence with the AWPBs shall be prepared and obtained IFAD and AIIB no objection before proceeding with procurement activities. The procurement plans shall identify procedures that must be implemented by the borrower/recipient in order to ensure consistency with the IFAD and AIIB Procurement Guidelines. The project procurement plan will be prepared and monitored through the OPEN system. The first 18-month procurement plan and subsequently annual procurement plan must include as a minimum: (i) a brief description of each procurement activity to be undertaken during the period; (ii) the estimate value of each procurement activity; (iii) the

method of procurement or selection to be adopted for each procurement activity; and (iv) an indication as to whether IFAD or AIIB shall carry out prior or post review in respect of every procurement activity. The 18-month procurement plan and the project procurement strategy (PPS) were drafted.

A detailed Project Procurement Arrangement Letter (PAL) will be issued to establish the detailed procurement requirements and thresholds for procurement methods and IFAD prior review. IFAD's Online Procurement End-to-end System (OPEN) will be used for preparation and monitoring implementation progress of project procurement plans. Requests for IFAD prior review and no objection shall be routed through the OPEN system.

The Standard Procurement/Bidding Documents issued by IFAD and AIIB shall be adopted and used for ICB and for consulting services with international advertisement. The national standard procurement /bidding documents under the SOP/Procurement Manual can be used for other methods (NCB/NS, consulting services with national advertisement) with additional provisions to meet IFAD's and AIIB's SECAP standards and the IFAD's or AIIB's Project Procurement Guidelines and IFAD Procurement Handbook including the IFAD self-certification form at bidding and at contract stage. Data and information of all contracts and related payments must be listed and updated regularly in the OPEN system. The register of contracts must be kept up to date on a quarterly basis.

4.2 Procurement methods and prior review requirements.

The following procurement methods will be used:

a. Works and works-related Non-Consulting Services

- International Competitive Bidding (ICB): Always allowed. Under ICB, the borrower/recipient may apply a margin of domestic preference to local contractors of 7.5% excluding industrial plants;
- National Competitive Bidding (NCB): Always allowed;
- Shopping: might be applied to contracts estimated to cost USD 40,000 or less; and
- Direct Contracting: applies to the indicated contracts in the Procurement Plan. Direct contracts to cost more than USD 5,000 shall be subject to IFAD's prior review and no objection, and post review shall be applied for direct contacts of low value procurement valued below USD 5,000 up to an aggregate amount of USD 400 000 per annum.

b. Goods and goods-related Non-Consulting Services

- International Competitive Bidding (ICB): Always allowed. Under ICB, the borrower/recipient may apply a margin of domestic preference of 15%;
- National Competitive Bidding (NCB): Always allowed;
- Shopping: might be applied to contracts estimated to cost USD 40,000 or less; and
- Direct Contracting: applies to the indicated contracts in the Procurement Plan. Direct contracts to cost more than USD 5,000 shall be subject to IFAD's prior review and no objection, and post review shall be applied for direct contacts of low value

procurement valued below USD 5,000 up to an aggregate amount of USD 200 000 per annum.

c. Consulting Services and related Non-Consulting Services

- Quality and Cost Based Selection (QCBS): Always allowed;
- Quality Based Selection (QBS): Always allowed;
- Fixed Budget Selection (FBS) or Least Cost Selection (LCS): Always allowed;
- Consultants Qualification Selection (CQS): might be applied to contracts with firms estimated to cost USD 150,000 or less;
- Individual Consultants Selection (ICS): applies to contracts with individuals regardless of the value;
- Sole/Single Source Selection (SSS): applies to the indicated contracts (with firms or individuals) in the Procurement Plan. SSS contracts to cost more than USD 5,000 shall be subject to IFAD's prior review and no objection, and post review shall be applied for direct contacts of low value procurement valued below USD 5,000 up to an aggregate amount of USD 200 000 per annum for firm selections and USD 100,000 per annum for individual consultant selections.

In accordance with IFAD's and AIIB's Procurement Guidelines and IFAD's Procurement Handbook, the following are subject to prior review by IFAD and/or AIIB:

- Procurement Plans submitted as part of Annual Work Plans and Budget and any subsequent upgrade of these plans;
- Award of any contract for goods and goods-related non-consulting services estimated to cost USD 150,000 or more;
- Award of any contract for works and works-related non-consulting services estimated to cost USD 300,000 or more;
- Award of any contract for consulting services and related non-consulting services and/or Memorandums of Understanding/Agreement estimated to cost USD 80,000 or more;
- Award of any contract for an Individual Consultant estimated to cost USD 30,000 or more;
- Award of any Direct Contracting or Sole/Single Source Selection to cost more than USD 5,000. A sufficiently detailed justification shall be submitted to IFAD and shall include the rationale for the choice of direct contracting/single source selection instead of competitive procurement and the basis for recommending a particular contractor/service provider in all such cases.

While the above procurement and prior review threshold are not elaborated, a detailed PAL (Procurement Arrangement Letter) would be issued to establish the detailed procurement thresholds. These thresholds may be modified by IFAD or AIIB during the course of Project implementation. Requests for IFAD prior review and no objection, should be routed through IFAD's online procurement end-to-end system (OPEN).

4.3 Guidance on environmental and social safeguard measures in procurement.

SECAP Criteria	Risk Rating	Consequence	Guidance on safeguard measures in procurement
Resource Efficiency and Pollution Prevention			
2.1 Could the project involve or lead to the release of pollutants to the environment due to routine or non-routine circumstances with the potential for adverse local, regional, and/or transboundary impacts?	Moderate	Moderate Construction of irrigation systems and rural roads might cause (i) erosion and run-off to water bodies during earthworks/construction; (ii) temporary traffic blocks and related safety issues during construction and operation; (iii) temporary pollution from construction (e.g. dust, noise, vibration, waste & wastewater generation from workers' campsites); (iv) potential water pollution from sourcing aggregates/construction materials (soil, gravels).	Environmental and social management plans (ESCMP) will be prepared for sub-projects and included in the bidding documents. Contractors will be required to prepare and implement contractor's site-specific ESCMP.
2.6 Could the project involve inputs of fertilizers and other modifying agents?	Moderate	Minor The project only requires minimal amounts of fertilizer	Include a list of approved/certified chemicals in tender documents.
2.7 Could the project involve or lead to procurement, supply and/or result in the use of pesticides on crops, livestock, aquaculture or forestry?	Moderate	Minor The project only requires minimal amounts of pesticide.	Include in the technical specifications that the project will only use approved pesticides and respect WHO-FAO codes for safe labelling, packaging, handling, storage, application and disposals of pesticides. Include the list of approved pesticides in the tender documents.
Cultural Heritage			
3.1 Could the project be located in areas that are considered to have archaeological (prehistoric), paleontological, historical, cultural, artistic, and religious values or contains features considered as critical cultural heritage?	Moderate	Minor The project is thought to be close to an area that is considered to have archaeological (prehistoric), paleontological, historical, cultural, artistic, and religious values or contains features considered as critical cultural heritage. The site has been comprehensively surveyed, and all tangible and intangible cultural heritage is well known.	The bidder qualifications for contractors intervening in areas that have cultural heritage should include previous experience in carrying out works in similar settings. Contract conditions to include safeguards to protect chance finds. Adequate safeguards will be introduced in consultation with the Lead Implementing Agency.
3.2 Could the project directly or indirectly affect indigenous peoples' rights, lands,	Moderate	Minor Minor impact to indigenous population. No damage to/or loss of	Technical specifications to encourage use of local

SECAP Criteria	Risk Rating	Consequence	Guidance on safeguard measures in procurement
natural resources, territories, livelihoods, knowledge, social fabric, traditions, governance systems, and culture or heritage (tangible and intangible)?		access to indigenous land, assets, resources, and/or cultural heritage.	knowledge (intangible heritage). Bidder qualification to include previous work experience in similar projects in the vicinity or with likelihood of presence of tangible heritage sites. Adequate safeguards will be introduced in consultation with the Lead Implementing Agency. Based in FPIC and measure would be introduced to minimize impact.
Labor and Working Conditions			
5.4 Could the project: (a) operate in a sector, area or value chain where producers and other agricultural workers are typically exposed to significant occupational and safety risks, and/or (b) promote or use technologies or practices that pose occupational safety and health (OSH) risks for farmers, other rural workers or rural populations in general? (Note: OSH risks in agriculture might include: dangerous machinery and tools; hazardous chemicals; toxic or allergenic agents; carcinogenic substances or agents; parasitic diseases; transmissible animal diseases; confined spaces; ergonomic hazards; extreme temperatures; and contact with dangerous and poisonous animals, reptiles and insects. Psychosocial hazards might include violence and harassment.)	Moderate	Minor The project operates in a sector, area, or value chain where workers are occasionally exposed to significant OSH risks, and where regulation is known to be effective.	OSH measures to protect project's workers from injury, illness or impacts encountered in the workplace or while working to be included in the technical specifications. The safeguard provision shall be included in qualification and contract condition in consultation with the implementing agencies Bid evaluation criteria to favor contractors with a high-quality Health and Safety Management Plan (HSMP) be considered for high impact and high value civil works and other related industries.
Community Health, Safety and Security			

SECAP Criteria	Risk Rating	Consequence	Guidance on safeguard measures in procurement
6.5 Could the project involve or lead to transport, storage, and use and/or disposal of hazardous or dangerous materials (e.g. explosives, fuel and other chemicals during construction and operation)?	Low	Minor Possible presence of landmines and unexploded ordinances (UXOs) if construction occurs in new areas (i.e., areas without existing construction/infrastructure/activities)	Conduct UXO clearance by competent agency before handing the construction site to the contractor.
6.7 Could the project lead to the potential for gender-based violence, including sexual harassment, exploitation and abuse, as a result of labour influx, land redistribution, or other actions that alter community dynamics?	Moderate	Minor During implementation of infrastructure subprojects, there are potential impacts to community health, safety and security: (i) potential contraction of diseases (e.g. sexually transmitted diseases such as HIV/AIDS, and/or other communicable diseases) due to labor influx; (ii) potential conflict with local communities due to construction workers who work and stay near the community; (iii) potential labor-related accidents for persons hired by the project construction companies to support seasonal construction work; (iv) gender based violence and/or sexual harassment and abuse (e.g. verbal and physical abuse, sexual harassment, violence against children) due to the influx of labor.	Include in the general clauses of the bidding documents of suppliers, subcontractors and service providers compliance with IFAD's policy on preventing and responding to sexual harassment, exploitation and sexual abuse and mandatory references to security policies will be included in tender documents and concluded contracts as a mandatory self-certification. Code of Conduct for Contractor's Personnel Form will be included in the bidding document. The Code of Conduct for Contractor's Personnel will be signed by contractor's workers who working at the subproject site.
Financial intermediaries and direct investments			
8.1 Could the investment be granted to an institution that does not have an environmental and social policies and an associated environmental and social management system (ESMS) in place (transparent, publicly available)?	Moderate	Minor The institution has an ESMS in place. Reports are not publicly available.	Agreements with FIs should include a requirement for a functional ESMS. The agreement clauses should include the submission by FIs, in a form acceptable to IFAD, of annual environmental and social reports on the implementation of the ESMS and on-lending operations.
8.2 Could the investment be granted to an	Moderate	Minor	Agreements with FIs should include a

SECAP Criteria	Risk Rating	Consequence	Guidance on safeguard measures in procurement
institution with insufficient capacities (i.e. unqualified personnel e.g. ES Officer) to implement the ESMS?		The institution employs an ES Officer, and employs field staff to implement the ESMS.	requirement for a functional ESMS including capacity to effectively implement it.

4.4 Governance and Anti-corruption measures

Project staff, beneficiaries, and all bidders, suppliers, contractors and consultants under IFAD-financed contracts are expected to observe the highest standard of ethics and integrity during the procurement and execution of project activities. IFAD will not finance expenditures for goods, works or consulting services that have not been procured in accordance with IFAD Project Procurement Guideline and the Financing Agreement. In such cases, IFAD may, in addition, take other remedial action under the financing agreement, including cancellation of the amount in question from the loan account by declaring it ineligible. Even if the contract was awarded following IFAD's "no objection" statement, IFAD may still declare mis-procurement if it concludes that this statement was issued on the basis of incomplete, inaccurate or misleading information furnished by the Borrower/Recipient.

The Policy on Preventing Fraud and Corruption has been integrated into IFAD's legal framework (Project Procurement Guidelines, General Conditions for Agricultural Development Financing [1], IFAD's Code of Conduct [2]) and applies to all recipients of IFAD financing. In line with this, the implementing agencies will ensure that all project activities are implemented within a transparency framework. This framework will include measures to ensure that procurement activities are carried out in accordance with IFAD project procurement guidelines and the project implementation manual. Measures that form part of the framework for transparency include:

- Upload information on procurement plans, contract awards and resolution of procurement complaints on IAs/project websites;
- Annexes on Additional Provisions and Self-Certification Form to be included in bidding document/RFP and contract documents;
- Bidders and contractors signing the Self-Certification Forms on anticorruption, sexual harassment, sexual exploitation and abuse as a part of bids/proposals and contract documents;
- Debriefing and Protest procedures for all procurement activities based on the procedures laid down in the IFAD Procurement Handbook including the requirements to issue a Notice of Intent to Award and of a standstill period.
- Conduct prior and ex-post reviews to strengthen enforcement of the debarment system;
- IFAD's direct supervision to address fiduciary compliance;
- Involvement of Project stakeholders (and especially farmers and their organizations) in planning, implementation and M&E of project activities.

AIIB is similarly committed to preventing fraud and corruption in the projects it finances. It places the highest priority on ensuring that projects AIIB finances are implemented in strict compliance with

[1] https://www.ifad.org/web/guest/document-detail/asset/39500875

[2] https://www.ifad.org/web/guest/document-detail/asset/40186603

AIIB's Policy on Prohibited Practices (2016). The Policy on Prohibited Practices (2016) applies to all Bank-financed components of the Project. The Bank reserves the right to investigate, directly or indirectly through its agents, any alleged corrupt, fraudulent, collusive, coercive, or obstructive practices, and misuse of resources and theft relating to the project and to take necessary measures to prevent and address any issues in a timely manner, as appropriate.

4.5 Grievance Redress Mechanisms (GRM)

A harmonized project specific grievance redress mechanism (GRM) will be established to address concerns raised by stakeholders. The GRM follows the provisions of the Government's relevant laws and regulations – and meets the requirements of the joint financiers.

Unified GRM System: A single, coordinated GRM system will be used to track and resolve grievances, ensuring stakeholders have access to a transparent and effective process.

Accountability Mechanism: A clear accountability structure will define the roles and responsibilities of each partner in managing grievances to ensure timely resolution. Monthly virtual meetings will be organized to share the status of grievances, settlements for received cases, and discuss non-compliance issues related to ES between joint financiers.

Agreement between AIIB and IFAD will be prepared to outline the policies applicable to project components, independent accountability mechanisms, and the respective roles and responsibilities of each organization. AIIB's PPSF, available until December 31, 2026, will be utilized to prepare the DEDs for the sub-schemes a5 as early as possible to ensure readiness for the AIIB component.

A single project-specific Grievance Redress Mechanism (GRM) will be applied on the ground with sufficient resources allocated at both the provincial and PMU levels. However, if any affected household is not satisfied with the solution provided by the project-specific GRM, the Accountability Mechanism of the financier responsible for the component related to the ES complaint or grievance will be invoked. Information dissemination will be adequate and proper to ensure local people are informed about the appropriate accountability mechanisms, the co-financiers and their corresponding financed component(s). Monthly coordination meetings will facilitate ongoing alignment among financiers, tracking environmental and social compliance, discussing, and addressing emerging risks, and ensuring timely remedial actions. By fostering collaboration, mitigating risks, and enhancing long-term project sustainability, the investment streamlines both safeguards and operational procedures, ensuring efficiency and responsiveness in delivering development outcomes.

Bank's Project-Affected People's Mechanism. If any complainant is not satisfied with the responses and/or measures provided following the Project-level GRM, complainants can lodge their case using the Independent Accountability Mechanism (IAM) of the financier of the Project component related to the complaint. Information on IAM of the financiers will be disclosed to the Project communities so that the complainant, if any, can send their case to the IAM of the appropriate financier.

AIIB's project preparation support

AIIB's Project Preparation Special Fund (PPSF) is the main source for overall preparatory work, facilitating key deliverables such as the Climate Vulnerability Assessment Report, Hydrology and Hydraulic Report, Livelihood and Vulnerability Analysis, Funding Proposal for the GCF, and Detailed Engineering Designs for the AIIB investment and overall Project.

The detailed designs of five sub-schemes mentioned earlier are being produced under the AIIB PPSF grant which is supporting or providing a service by preparing the design of the sub component 2.2 flood-proofing and drainage improvements the civil works of which are financed by GCF. The preparatory work through the consulting firm involves preparing the designs and system layouts of not only modernization works but also control structures, drainage networks, flood diversion channels, flood control structures, polders, levees, and associated facilities and flood management plans. In addition to this, AIIB PCCF grant is supporting GCF in preparing the full funding proposal for its appraisal and approval by GCF.

AIIB's Implementation Support. As the lead co-financier, AIIB will proactively plan and coordinate with other partners on mission timing, objectives, and the key skills required for joint missions with IFAD and GCF, ensuring sufficient resources are allocated to the missions and reviews. A MoU or a Co-lenders Agreement between AIIB and IFAD will be prepared to outline the policies applicable to project components, independent accountability mechanisms, and the respective roles and responsibilities of each organization. AIIB's PPSF, available until December 31, 2026, will be utilized to prepare the DEDs for the five sub-schemes as early as possible to ensure readiness for the AIIB component.

Annexes

Annex 1: Procurement Plan

Project Name: Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR)
Country: Cambodia

Version of the Plan: Version 5.0 dated 29 March 2025

Period covered by this procurement plan: The first 18 months

This initial procurement plan is expected to cover at least the first 18 months of project/program implementation, or the full implementation period if available. Subsequent procurement plans (if needed) or substantial changes to this approved plan shall be communicated to the IFAD/GCF and AIIB upfront.

II. Procurement Methods and Prior Review Thresholds

	Procurement Category and Method[1]	Financial threshold applicable[2] / Threshold for use of method	Prior Review Threshold (applicable if the Executing Entity is not the AE)[3]	Remarks
A	**Goods and goods-related non-consulting services**			
1	International Competitive Bidding for Goods	Always allowed	US$ 150,000 or more	
2	National Competitive Bidding for Goods	Always allowed	US$ 150,000 or more	
3	Shopping for Goods	US$ 40,000 or less	US$ 150,000 or more	
4	Direct Contracting	With due justification	US$ 5,000 or more	

B	**Works and work-related non-consulting services**			
1	International Competitive Bidding for Goods	Always allowed	US$ 300,000 or more	
2	National Competitive Bidding for Goods	Always allowed	US$ 300,000 or more	
3	Shopping for Goods	US$ 40,000 or less	US$ 300,000 or more	
4	Direct Contracting	With due justification	US$ 5,000 or more	
C	**Consulting services and related non-consulting services**			
1	Quality and Cost Based Selection (QCBS)	Always allowed	US$ 80,000 or more	
2	Quality Based Selection (QBS)	Always allowed	US$ 80,000 or more	
3	Fixed Budget Selection (FBS) OR Lest Cost Selection (LCS)	Always allowed	US$ 80,000 or more	
4	Consultants Qualification Selection (CQS)	US$ 150,000 or less	US$ 80,000 or more	
5	Individual Consultant Selection (ICS)	Contracts with individuals regardless of the value	US$ 30,000 or more	
6	Single Source Selection (SSS) – Consulting Firm	With due justification	US$ 5,000 or more	
7	Single Source Selection (SSS) – Individual Consultant	With due justification	US$ 5,000 or more	

1. As per applicable procurement policy of the Accredited Entity. The procurement methods and procedures are specified under IFAD Procurement Handbook (accessible via https://www.ifad.org/en/w/document/ifad-procurement-handbook). The procurement thresholds will be inserted into IFAD's Online Procurement End-to-End system (OPEN) for plans and monitoring implementation of project procurement activities.
2. Financial threshold for which the indicated procurement method should be used.
3. Financial threshold above which the Accredited Entity will review and provide clearance prior procurement process is initiated (not applicable if AE is the executing entity).

III.Procurement activities

1	2	3	4	5	6	7	8	9	10	11	12	13
Item No.	**Activity/ Component Reference No.**	**Description of works, goods, non-consultancy and consultancy services to be procured**	**Required Delivery/ Commencement of Services time (weeks/ months after FP approval)**	**Procuring entity**	**Estimated cost (USD)**	**Procurement/ Selection method**	**Prequalification (Yes/No)**	**Review by AE (Prior/Post procurement process)**	**Tender issuing (e.g. weeks/months from the FP approval, etc)**	**Bid submission deadline (days/weeks after tender issuing day)**	**Evaluation and contract signing time (days/weeks after bid submission deadline)**	**Remarks**
A.		**Consultancy services (Firms)**			**28,343,545**							
1	1.1.1, 1.1.2, 1.1.3, 1.1.4	Service provider in charge of vegetables, poultry and aquaculture	11mths	NCDD PIU	1,195,208	QCBS	Yes	Prior	6mths	6wks	12wks	07 years
2	1.1.4, 1.1.5, 1.1.6	Service Provider to produce extension materials, conduct awareness raising and facilitate e-voucher	11mths	NCDD PIU	1,195,194	QCBS	Yes	Prior	6mths	6wks	12wks	07 years
3	1.1	Service Provider on rice (IRRI)	09mths	NCDD PIU	1,500,000	SSS	Yes	Prior	6mths	4wks	9wks	60 months over 07 years; IRRI recruited through SSS method. International Rice Research Institute (IRRI) has been continuously active in Cambodia since 1986. The organization has supported the government agencies in Cambodia in various aspects of rice sector development, including varietal development, seed systems, IPM, improved agronomic practices, mechanization and water management (please see more in HYPERLINK

												"http://books.irri.org/Cambodia_IRRI_brochure.pdf"). IRRI also maintains solid working relationships with other international crop research institutes belonging to the Consortium of International Agricultural Research Centers (CGIAR). Concerning the wide-ranging achievements in development of climate resilient rice varieties and dissemination of climate smart agricultural practices and technologies to various countries, and in recognition of outstanding contributions to advancements in Cambodian rice breeding programs, strengthening of rice seed systems, on-farm mechanization and capacity development of Cambodian scientists, extension workers and policymakers, IRRI is ideally placed to provide its services under the TA package for increasing farmer capacity on climate resilient rice production under Sub-component 1.1 in a comprehensive manner. The project plans to engage IRRI through a TA contract on several aspects of this Sub-component 1.1, including activities 1.1.1 - 1.1.5.

- PIU: Project Implementation Unite at NCDD-S

Annex 2: Results Monitoring Framework

Refer to Result Framework

Timeline and Reporting

Overall Goal: To strengthen the capacity of MOWRAM, NCDDS, its PMU, provincial departments (PDOWRAMs), Farmer Water Users' Communities (FWUCs) and sub-national administration at district and commune level in key areas to ensure the successful implementation and sustainability of the CAISAR investment, in full alignment with GCF's commitment to long-term transformational change.

Phase & Objective	Key Activities	Timeline (Relative to Project Start)	Outputs/Deliverables	Reporting Frequency & Recipient
Phase 1: Inception & Detailed Planning	1. Kick-off & Stakeholder Workshops: Introduce initiative, confirm needs, foster buy-in.	Month 1 - Month 2	Workshop reports, confirmed stakeholder engagement.	Annually (as part of overall project inception reporting)
Objective: Finalize detailed plans for all capacity building areas, including specific objectives, methodologies, resource allocation, and responsibilities.	2. Current Position Assessment: Inventory & review current formal procedures & actual practices (staffing, equipment, work procedures) for river basin & irrigation scheme management.	Month 1 - Month 3	Comprehensive "Current Capacity Assessment Report."	Annually (as part of overall project inception reporting)
	3. Define Future Position & Objectives: Define clear, measurable objectives, incorporating climate change considerations. Evaluate current effectiveness & identify desired/possible improvements.	Month 3 - Month 4	"Targeted Capacity Objectives Document."	Annually (as part of overall project inception reporting)
	4. Develop Detailed Change Plans: Prepare detailed plans for each capacity building area: methodologies, timelines, resources, responsibilities (Change Plan Managers, Monitors, Reporters). Include specifics for: training modules (climate-smart irrigation,	Month 3 - Month 5	Comprehensive "Detailed Capacity Strengthening Action Plans."	Annually (as part of overall project inception reporting)

	financial management, safeguards, SCADA, GIS), partnership agreements (e.g., ITC), competency-based systems, cross-level coordination, gender-responsive actions.			
	5. Obtain Endorsements: Secure all necessary approvals for detailed plans from MOWRAM, NCDDS & other relevant stakeholders.	End of Month 5	Endorsed Capacity Strengthening Plans.	Annually (as part of overall project inception reporting)
	Reporting (End of Phase 1): Submit "Inception Phase Report" summarizing all outputs. Outcomes will inform subsequent GCF reports.	End of Month 5	"Inception Phase Report."	GCF: Initial progress report (as part of first APR, if applicable)
Phase 2: Implementation (Core Project Duration)	1. Resource Acquisition: Procure necessary training materials, equipment, digital tools (SCADA, GIS licenses), and engage trainers/experts.	Month 6 - Year 7 (Ongoing as needed)	Acquired resources, contracts with trainers/experts.	Quarterly (as part of quarterly progress updates)
Objective: Execute the detailed capacity strengthening action plans across all identified areas, ensuring continuous capacity development and application.	2. Training Delivery: Conduct targeted training sessions (climate-smart irrigation, financial management, safeguards, SCADA, GIS) for MOWRAM, PMU, PDOWRAMs, FWUCs, private service providers. Implement gender-responsive actions. Note: Training will be phased, potentially with refresher courses or advanced modules.	Month 6 - Year 6 (Ongoing, phased delivery)	Training session reports, attendance records, participant feedback, follow-up assessments.	Quarterly (as part of quarterly progress updates)
	3. Institutionalization & Partnership Activities: Formalize partnerships (e.g., ITC) to integrate curricula into national frameworks. Note: Focus on sustainability beyond project life.	Month 7 - Year 7 (Ongoing, with key milestones in early years)	Formalized partnership agreements, curriculum integration plans, institutionalized training programs.	Quarterly (as part of quarterly progress updates)
	4. System Upgrades & Implementation (SCADA, GIS): Oversee upgrades/implementation of SCADA & other digital tools. Provide hands-on training & support for effective use. Note: Phased rollout of	Month 7 - Year 5 (Initial rollout & optimization), Year 6-7 (Sustained use &	Functional SCADA/GIS systems, user manuals, implementation reports, ongoing support logs.	Quarterly (as part of quarterly progress updates)

	technology and ongoing support.	minor updates)		
	5. Competency-Based Certification & Assessment: Conduct regular assessments & administer certifications to ensure knowledge application & retention.	Quarterly, from Month 9/10 (Ongoing throughout implementation)	Assessment reports, certification records, skills gap analyses.	Quarterly (as part of quarterly progress updates)
	6. Cross-Level Coordination Meetings/Workshops: Organize regular meetings/workshops across MOWRAM,, ,NCDDS PDOWRAMs, FWUCs, private sector to foster coordination & share best practices.	Quarterly, from Month 8 (Ongoing throughout project)	Meeting minutes, action plans, coordination outcomes, best practice sharing documents.	Quarterly (as part of quarterly progress updates)
	Reporting (During Phase 2 - Ongoing):			
	Covenant: The Accredited Entity shall monitor the implementation of the institutional capacity strengthening plan on a quarterly basis.	Quarterly	Quarterly Monitoring Reports on capacity plan implementation, including progress, challenges, and adjustments.	Quarterly (Accredited Entity to Project Management)
	GCF Reporting: The Accredited Entity shall inform the outcomes to the Fund in the Annual Performance Reports (APR). This will include summary of activities, progress vs. targets, challenges, mitigation, qualitative assessment of enhanced capacity, evidence of gender-responsive design.	Annually (as per GCF APR cycle)	GCF Annual Performance Reports (APR) sections on capacity strengthening.	GCF (via Accredited Entity)
Phase 3: Monitoring, Evaluation & Sustenance	1. Periodic Reporting/Review Meetings: Discuss progress, challenges, adjustments.	Quarterly throughout project implementation (Year 1 - Year 7)	Review meeting minutes, updated action plans.	Quarterly (PMU, Accredited Entity, Key Stakeholders)
Objective: Continuously monitor progress, evaluate effectiveness,	2. Post-Training Application Monitoring: Monitor actual application of newly acquired skills &	Ongoing, from Month 12 onwards	Application monitoring reports, case studies of	Quarterly (as part of quarterly progress

and ensure the sustainability of strengthened capacities throughout the project life and beyond.	knowledge in daily operations by MOWRAM, NCDDS, PDOWRAMs, & FWUCs.		impact.	updates)
	3. Mid-term & Final Impact Assessment: Periodically assess the broader impact of capacity strengthening on organizational performance, project results, & long-term transformational change. This includes formal mid-term and final evaluations.	Mid-term (e.g., end of Year 3/start of Year 4), Final (end of Year 7)	Mid-term Impact Assessment Report, Final Evaluation Report.	Annually (as part of APR, with dedicated reports for mid-term/final)
	4. Lessons Learned & Documentation: Continuously document lessons learned, best practices, & challenges throughout the project lifecycle.	Ongoing throughout the project (Year 1 - Year 7)	Lessons learned log, best practice guidelines, knowledge products.	Quarterly (as part of quarterly progress updates)
	Reporting (Post-Implementation & Sustenance):			
	GCF Reporting: Continuation of quarterly monitoring & annual reporting of outcomes through APRs until project closure.	Annually until project closure (Year 1 - Year 7)	GCF Annual Performance Reports (APRs).	GCF (via Accredited Entity)
	Final Capacity Assessment Report: Comprehensive report at project closure on overall impact, sustained improvements, & future recommendations.	At Project Closure (End of Year 7)	Final Capacity Assessment Report.	Annually (as part of final APR)

Annex 4: Terms of Reference – Project Management Implementation Consultants

Engineering consultancy

Component 2.1 include the contracting of a consortium of both, international and national companies to prepare the detailed design and tender documents of the 3 sub-projects (6 schemes) for component 2.1 and 2.2, support the MOWRAM in the procurement process, but also undertake the work supervision and commissioning of the scheme's rehabilitation/constructions.

Consultants' activities

The Consultant shall collect, review and analyse available documents on the project in order to undertake detailed designs for irrigation schemes and flood protection/drainage improvement.

The Consultant shall also undertake a specific study of the West Pursat hydraulic system of the irrigation schemes to implement the SCADA system.

Detailed design

Mains tasks for the detailed design studies

The main tasks of the consultancy services to be carried out within the detailed design work for all project components comprise, but are not necessarily limited to the following items:

1 Conduct additional geo-technical investigations, topographical survey, hydrological, if required;

2 Availability of borrow pits in the volumes and quality sufficient for construction;

3 Hydraulic and structural design of head works, reservoir repairs if necessary, its supporting structures, the irrigation scheme including secondary, tertiary and on- farm canals that include distributary canals/ structures, drainage system/structures and associated structure as community requirement: foot bridge, FWUC office, access roads, etc;

4 Hydraulic and structural design modelling, computation and design of the irrigation scheme (pipeline/canals system), simulation of operation, etc.

5 Structural calculation notes, preparation of detailed plans and drawings in appropriate scale;

6 Technical description of the projected system with justification of selected materials and equipment, implementation;

7 Specification of the necessary materials and equipment;

8 Preparation of technical conditions for delivery of materials, equipment, spare parts, repair material, equipment to be procured under the Project;

9 Preparation of technical conditions for the construction and the assembly works;

10 Detailed calculation of the overall costs, total calculation of the works (confidential cost estimate), separated in supply and construction works. Based on the findings, the Consultant shall submit a detailed cost breakdown including contingencies and other general costs. The cost estimate shall be divided in local and foreign costs.

11 Green House Gas (GHG) reductions: analysis of the potential of green-house gas (GHG) reductions in the frame of the current stage of the investment program.

The Consultant is required to work with the Board of Engineer of Cambodia (BEC) for the Khmer translation of the technical specifications that shall be in accordance to stated and agreed standards and codes of practice, that include also the specifications for environmental, social, health and safety management (ESHS) of the civil works.

Based on the findings, the Consultant shall assess the local/regional/international construction capacities and interest and submit a proposal for contract packaging. It is expected that all construction works shall be submitted to national bidding procedures.

The purpose of the drawings is to convey graphically to the bidders and later on to the construction engineers and contractors the work to be done. All information which can best be shown by reference to drawings and their accompanying dimensions and notes shall be shown on the plans. The consultant shall produce comprehensive engineering drawings to the standards of internationally accepted design practices using CAD. These drawings shall cover all features of the work and be of adequate detail for the bidding and award of contract.

The drawings will consist of general arrangement drawings, detailed drawings, longitudinal and cross-sections which indicate the dimensions of the works and the materials required for the execution. The detailed design drawings will become an integral part of the contract documents.

The confidential cost estimate shall comprise a comprehensive descriptive part which outlines and justifies in detail the assumptions taken and assessments made by the consultant for calculating and/ or defining important unit prices under full consideration of individual geographical and project specific aspects.

The relevant design calculations, supplementary maps and drawings, schedules, charts, notes and reports etc. which support the engineering designs and drawings shall be furnished to the PIU in English.

For irrigated schemes, the recommended criteria to overcome the detailed design study phase for each project, and move to tender preparation and implementation phase, are:

- Output : (i) Detailed design and tender documents, Scheme Design Agreement, (ii) Resettlement framework and COI and schedule (IRC)
- Water/Environment : (i) Water management Apex committee is appointed at basin or sub-basin level if required, (ii) Environmental mitigation measures in design, (iii) IEE is approved by the relevant authority
- Cost/Economic : there is no major increase in construction cost compared with the estimated costs at feasibility level, (ii) Reconfirmation that EIRR is > 9%, (iii) construction cost are around $2,500 per ha cropped in 1 year (including the tertiary canals)

- Social / Poverty : (i) resettlement: DMS is completed by IRC and compensation levels agreed by affected households, (ii) Resettlement framework is approved by RGC/IRC,
- Sustainability : (i) Construction Sub-Committee established, (ii) Design Layout, Beneficiaries' contribution to the construction and O&M costs and FWUC revision/creation are approved by 2/3 of beneficiaries and Local Authorities, (iii) Membership fees paid by 2/3 of the users/members of the FWUC, (iv) Design Agreement signed by local authorities and Construction sub-committee.

Deliverables

For each Irrigation scheme, reports to be delivered are listed here after. These reports should be fully reviewed by MoWRAM to ensure agreement on executive choices regarding the project. However, explicit approval is not required for every report scheduled. The following list gives the review level proposed to be considered for each report.

- Mid-term Detailed Design Report: Review only;
- Detailed Design Report (draft version): Review only;
- Detailed Design Report (final version): Review and approval required.
- Drawings: Design drawings will be submitted throughout the study. In a general way, drawings submitted while the studies are still on-going will be submitted under draft format. Drawings to be submitted as part of Detailed Design Report however will be considered as representative of the project development and submitted as such.

West Pursat hydraulic system analysis

In addition to the usual work for the rehabilitation/creation of irrigation schemes (FS, DED, procurement, work supervision), it is requested of the Consultant to perform a specific study of the West Pursat hydraulic system to have a better understanding of the hydraulic functioning of this area.

The analysis should include at least:

- An extensive data field collection: size of the structures, hydraulic measurements, etc

- A river basin modeling of the Pursat catchment of the water availability for irrigation, which depends from the basin characteristics (precipitation, runoff), the reservoirs infrastructures and management as well as non-agricultural needs; and,
- A scheme modeling with adequate software like SIC to be able to identify the structural limitation, which is dependent on the canals and gates capacities along the schemes, and integrate all the schemes within the study area and be a base for the development of the SCADA. The software should be able to design and management of a network of canals and / or rivers with a friendly interface and the calculations of hydraulic unidimensional steady and unsteady flows

The results of the study will be upgraded with the different scenarios to irrigate Ou Ta Paong scheme and confirm the feasibility study and be a base for the development of the SCADA system.

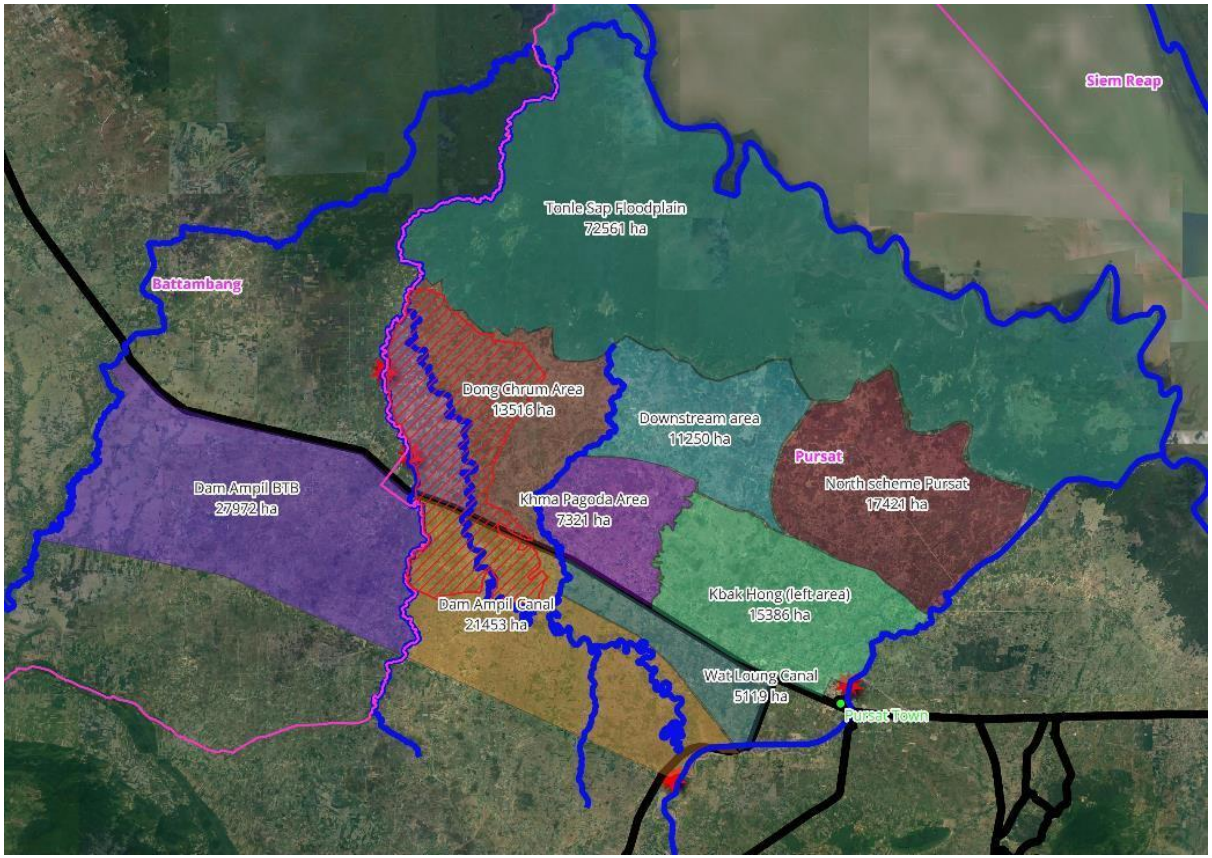

Figure 5-23. irrigation scheme of West Pursat Province

Preparation of tender documents and procurement support

The tender documents shall be prepared regarding packaging of tenders and based on the Detailed Design study. The tender documents shall be prepared in accordance with Standard Operating Procedures by the Sub-Decree No.74 ANK. BK dated 22 May 2012 which are the standard operating procedures of the Client, as amended from time to time, providing procedures applicable to all externally financed projects and programs.

Preparation of the tender documents

In order to assist in the tendering process, the tender documents should be prepared including clear specifications. The specifications shall describe the work to be done, supplementing the information shown on the drawings. The specifications shall cover all technical provisions of the future construction contracts. The design shall be sufficiently detailed for construction and leave for the Contractors the preparation of Final Design study (drawings). All technical specifications shall be fully described and the tender documents shall include the ESMP to be implemented by the Constructor.

Reference to brand names, catalogs or other details that limit any materials or equipment to a specific manufacturer shall be avoided. Where standard specifications or construction codes and practices are referred to, a statement shall follow that ISO shall be applied and other national or international standards that ensure equivalence will also be acceptable.

The bill of quantities shall provide sufficient information on the quantities of works to be performed in order to enable bidders to prepare accurate cost estimates and the owner or its consultant to make periodic evaluations of the executed works according to the detail provided in the bill of quantities. The bill of quantities shall divide the items into different classes (civil works, mechanical and electrical equipment and materials, etc.) and categories (earth works, concrete works, mechanicals, etc.).

In order to enable the PMU/PIU to allocate a budget for the implementation of the works, including any amounts to be allocated for any physical and price contingencies, the Consultant shall prepare the cost estimates of items listed in the bill of quantities. Similar contracts recently awarded in Cambodia may serve as a guideline for the evaluation of unit costs. The Consultant shall, however, carry out its own investigations on the local market for construction materials available there and the local labour skills and in foreign markets for any equipment and materials to be imported or any skilled labour where necessary.

For each lot, the Tender Documents for the works contractors shall contain at least the following sections:

- Invitation to tender;
- Instruction to tenderers;
- General and specific conditions;
- Form sheets;
- Form of contract agreement;
- Technical specifications;
- Description of works, subdivided in specific lots;
- Bill of quantities for each lot and in total;

- Maps and drawings;
- ESMP

Tender documents to be delivered are listed here after:

- Tender documents (draft version): Review only;
- Tender documents (final version): Review and approval required.

Support on the tender process

The consultant should assist MOWRAM in the following tasks:

- Assistance in Tender Announcement: The Consultant shall assist the Employer in all related activities regarding announcement of the project in national and international gazettes and on the internet.
- Assistance in Clarification Meeting: The Consultant shall assist the Employer in the site visits of the bidder and clarification meetings to be held in course of the tender process. Questions which might rise up during the clarification meeting shall be responded by the Consultant via PIU and shall be forwarded to all tenderers.
- Assistance in bids evaluation: The Consultant shall assist the Employer during bid opening, bids evaluation and selection of the technically and financially most favorable offer. The Consultant shall provide up to two members to each Evaluation Committee.
- Assistance in Contract Negotiations: The Consultant shall assist the Employer during contract negotiations for each Work Contract and shall assist the Employer in all preparations up to when the contracts are signed.

The Consultant shall submit inter alia the following:

- Copy of Announcement;
- Tender Opening Protocol for each Works Contract;
- Bids Evaluation Report for each Works Contract;

- Works Contract.

Work supervision

The Technical Supervisor's role shall include project management, technical, contractual, financial, environmental and social aspects as described in the following sections.

A key objective of the Technical Supervisor role is to ensure that all elements of the project implementation including the construction contracts and ESMP are coordinated, thus minimising the scope for completion and commissioning delays due to programming constraints or incompatibilities between individual components, while making sure that quality of works and equipment respect the final, approved design.

This includes assisting and advising the PMU and PIUs with smooth execution of all works under the investment program for its timely and successful completion without having cost overruns. This applies to supervising all works, surveys, field studies, investigations, trainings, and consulting services packages under the investment program. The consultant shall be responsible for documenting all the design drawings, reports, as-built drawings, and construction monitoring and quality certificates. The consultant shall develop an appropriate documentation plan for this purpose.

Direct liaison with FWUC for on-the-job training regarding work supervision and O&M. Khmer translation of BOQ, technical specification and designed drawings, reports, as-built drawings should be provided to FWUCs to ensure good appropriation by FWUCs of the designs and O&M tasks and to enhance their contribution to temporary and final reception of works.

The Consultant will supervise the construction of the works included under the Contract issued to the Contractor, to the standards and specifications detailed in the construction contract including checking layout and dimensions, quantities, material qualities, workmanship, safety and employment conditions and environmental standards.

The Consultant will keep the PMU fully informed of construction progress with regular monthly progress reports and will ensure that regular interim payment certificates (IPCs) for works completed on the contract are prepared and approved at the end of each period.

- The Consultant will summarize the construction works in (i) a brief monthly report, (ii) technical report including certification that the works were completed in compliance with the Agreement and notice of where works deviated from the Contract and (iii) comprehensive final Completion Report.
- Upon completion of the construction of the works included in the Contract, the Consultant shall notify the PMU in order that they can make a final inspection of the work for acceptance that will trigger the mechanism for release of payments to the Contractor subject to contract conditions.
- The Consultant shall submit detail scope of the service for the supervision of construction works prior to the delivery by PMU of the letter of commencement of work.

The Consultant will help administer the contractual responsibilities and obligations of the Client in the Contract and all related contracts for engineering, supervision, supply, erection and construction, to the extent allowed for in the construction and supply contracts.

Activities to be performed on site for the civil works will consist mainly of the following:

- Approve the contractors' construction methods;
- Check and approve the contractors' work, temporary installations and equipment;
- Coordinate, supervise and inspect all aspects of construction, fabrication and assembly;
- Check the conformity of the drawings with the contractual arrangements on site;
- Monitor defects reports and the corresponding replacement of damaged equipment;
- Check all final layouts of structures built by the contractors, on the basis of the layout drawings;
- Supervise the performance of all tests required to ensure the good quality of all materials used in construction, in particular soils, rocks, aggregates, cement, etc. and analyse test results to ensure good-quality construction;
- Check the quality control and safety procedures proposed by the contractors, paying special attention to the following tasks:
- Checking of preliminary tests prior to the works on the concrete mix designs proposed by the contractors;
- Checking of reinforcement drawings and assembly drawings;
- Perform the necessary checks to assess the progress of works and conformity with the corresponding regulations,
- Approve the equipment acceptance procedures to be followed on site by contractors,
- Issue payment certificates to contractors,
- Recommend any additional modification judged to be necessary in relation to the provisions set forth in the contract,
- Record all site activities,
- Assist the Client with all contractual aspects relating to contractors (guarantees, test certificates, insurance, claims, etc.),
- Check and supervise the measures needed to ensure safety and environmental protection,
- Draw up a Final Report on the works,
- Gather all information concerning the site, drawings and sketches and prepare “as- built” drawings of the civil engineering works,
- Issue completion and pre-commissioning certificates for the equipment,
- Ensure that all arrangements required by the environmental and social management plan have been made by the contractors responsible for carrying out the works.

The consultancy services to be rendered shall include but not be limited to the sub-tasks specified below.

Monitoring of Construction Progress

The Consultant shall monitor the progress of the construction and pursue compliance with the latest agreed version of the Master Programme for the Project. The Consultant shall arrange periodic co-ordination meetings with the contractors to discuss progress, and to assist in deriving suitable remedial action where necessary to address issues arising.

The Consultant shall report regularly to Client at least monthly and more frequently in the event of specific circumstances requiring immediate consideration.

Monitoring of Manufacture of Equipment

The Consultant shall monitor the manufacture of the hydro-mechanical equipment, electro- mechanical equipment including main factory acceptance tests. In particular, the Consultant shall:

- Monitor compliance with deadlines for manufacturing, testing, shipping and supplying equipment on site by performing systematic inspections;
- Ensure that equipment conforms with contract specifications and standards;
- Examine any modification in relation to the contract specifications that the contractors may wish to make. Any modification leading to additional costs must be submitted to the Client for approval;
- Examine and approve the programme for testing and works acceptance proposed by the contractors, participate in works acceptance procedures and draw up the reports for each works inspection.
- Ensure that the main items of equipment have been subjected to the prescribed tests on the basis of the corresponding test certificates, which must be submitted to the Technical Supervisor for approval;
- Participate in the routine tests for the main items of equipment.

Commissioning Tests and Works Completion Inspection

Commissioning tests shall be witnessed by the Consultant with the participation of the Client's employees. The Consultant shall ensure compliance with the procedures established in the specifications and contracts, and performance levels, check the quality and conformity of test reports, collect all documents, and approve the test reports drawn up by contractors. These reports shall be signed jointly by the Technical Supervisor, Client and the Contractors.

At the end of the construction works and commissioning the Consultant shall:

- Witness the specified acceptance procedures for all the structures and equipment (power generation plant and transmission lines) and issue the corresponding certificates in agreement with the PIU,
- Check and approve the as-built drawings and diagrams provided by contractors,
- Review and approve the operation and maintenance manuals provided by contractors.

Certification of Payments: The Consultant shall certify the Contractors' entitlement to payment based on regular monitoring of defined milestones achieved in the construction of the works.

Operation and Maintenance Manuals: The Consultant shall review and approve, if appropriate, the Operation and Maintenance Manuals provided by the Contractors and shall ensure that these are provided in good time prior to commissioning of the Works.

As-built Drawings of Hydro-mechanical and Electro-mechanical Equipment: The Consultant shall review and approve, if appropriate, the As-built Drawings provided by the Contractors and shall ensure that these are provided within 2 months after commissioning of the Works or as stated in the Contractors' Contracts.

Assistance to Client: The Consultant shall assist Client with regard to all questions relating to the Contracts, in particular compliance with performance bonds, insurance and claims, etc.

Assistance in Conflict Resolution: The Consultant shall provide assistance to Client in their efforts to settle any conflict arising between the Contractors and the Client.

Site Meetings and Reporting: The Consultant shall chair regular site meetings with the Contractors to be held at least once per month. The Consultant shall draw up minutes of meetings, periodic site monitoring reports and acceptance reports and shall issue such reports to the Client without delay.

Co-ordination of ESMP: The Consultant shall monitor progress by the Contractors in implementing the ESMP. The Consultant shall draw the immediate attention of the Client any slippage in the progress of these activities in order that remedial actions may be put in place in a timely manner to allow completion of critical activities prior to the planned date of reservoir impounding of the dam.

Supervision of Defect Correction: The Consultant shall supervise the activities of the Contractors in rectifying identified defects in the works and shall ensure that the final works are in accordance with the contract.

Reporting to MoWRAM PMU/PIU: The Consultant shall attend and shall chair regular site meetings with the Contractors to be held at least once per month. The Consultant shall draw up minutes of meetings, periodic defects correction status reports and shall issue such reports to the Client without delay. Before taking any action under the contracts designating the Consultant as "Technical Supervisor", for which action, pursuant to such contracts, the written approval of the Client as "Employer" is required.

Reporting: The Consultant shall report regularly to Client. These reports will primarily serve to record the status of each contractual element of the project with regard to progress of all aspects of the project, identifying any impending problems with respect to project coordination, time over-runs or any situations potentially having cost implications.

Reporting include:

Monthly reports

The Consultant will submit monthly progress reports (hard and soft copies) covering technical and financial matters pertaining to the contracts for construction of the project to the Client throughout the duration of the services. The Consultant shall also provide a monthly report of progress relating ESMP drawing upon information from monitoring of the activities of the implementing agencies. The reports will be submitted by the 7th day of the month following the reporting period. The monthly reports will document services performed by the Consultant during the reporting period. The reports will be structured

consistent with the separate contracts under the Consultant's supervision. Programming interface issues will also be addressed in the reports. The monthly report shall be drawn up in three (3) copies in English + 1 electronic copy.

Quarterly report

Throughout the duration of the main works, detailed quarterly reports (hard and soft copies) will be submitted two weeks after the end of each quarter. These reports shall be drawn up in three (3) copies in English + 1 electronic copy.

Preliminary completion report

At the end of the works and after provisional acceptance of the installations under the contracts, the Technical Supervisor shall send a preliminary completion report within a period of two months. This report shall take into account both technical and financial aspects and will be produced in three (3) copies in English + 1 electronic copy.

Final completion report

At the end of the guarantee period and after final acceptance under the contracts, the preliminary completion report drawn up after the provisional acceptance of the works shall be updated to form the final completion report for the works. This will then be sent in three (3) copies in English + 1 electronic copy.

Water Social Management Consultancy

A Consultant will be hired to provide service for the establishment of the operational FWUC from the participatory approach of FWUC creation in the design, development and sustainable use of the rehabilitated irrigation schemes and Preks to be rehabilitated by the Program to the signature of shared responsibility for the management and maintenance of irrigation infrastructure between FWUC and MOWRAM for all the irrigation schemes under the project area.
The support to the FWUC shall address the following issues:

- Institutional: dialogue with MoWRAM, legal recognition, responsibility sharing agreement,
- Organisational: governance, internal operating rules for water and scheme management, agricultural development and marketing,
- Technical: participation to the design of the irrigation networks, execution of maintenance and servicing tasks, farming practices;
- Financial: preparation of budgets, fundraising, accounting management, Irrigation Contribution Service (ISC) planning and collection, access to financial institutions,
- Gender focus with strong action for women's empowerment and their social participation.

MOWRAM gives a mandate to a Consultant for the establishment and support to the FWUCs in the irrigation schemes and Preks rehabilitated by the Program, to (i) assist farmers water users to create and organize one FWUC in each of the irrigation schemes to be rehabilitated under the project, and (ii) to build up the capacities of these FWUCs to fulfil their operation and maintenance responsibilities.
The consultant will work closely with the DED consultant on the specific topics:

- Technical design for the rehabilitation of irrigation schemes and Preks: (i) attempt to accommodate farmers' views in designing the irrigation scheme layout, (ii) define the appropriate consultation procedures with beneficiaries for establishment of farmers' water user community (FWUC) and for system design to enable the envisaged water allocation.
- Social water management: assist in the preparation of operation and maintenance (both routine and periodic) manuals (guidelines and procedures) for the subprojects at the detail design stage, and in their further improvement during the first years of operation and maintenance.

For each FWUC to be created, the services to be provided by the Consultant shall include the following steps:
<u>Phase 1: Consultation/validation on concept of irrigation system design:</u> The concept and design of irrigation systems will be presented, discussed and validated with and by farmers (or users). The main points to be discussed and agreed upon at this phase are: type of irrigation, irrigation method, canal alignment, scale of irrigation unit, estimation cost of this type of irrigation system per ha. This task will be conducted in close cooperation with the PDWRAM, DED consultant , who is in charge of the feasibility study and detail design of the schemes. It starts at the feasibility design phase of each scheme with main activities:

- Communicate with DED consultant to get information concerning with type of irrigation, irrigation method, canal alignment, scale of irrigation unit, estimation cost of this type of irrigation system per ha
- Prepare consultation meetings and tools

- Organize and facilitate consultation meetings with potential users and local authority
- Restitution meeting on consultation results with
- Approval by the farmer beneficiaries on design of irrigation system

Phase 2: FWUC establishment/registration and database of land owners: FWUC is established and officially registered with MoWRAM; the data base is built and available; social recognition of farmland ownership, database or list of plot owners. This phase begins immediately after Phase 1 and is scheduled, for each scheme/Prek, to take place during the rehabilitation works with main activities:

- Organize villagers meetings for consultation purpose
- Information sharing within the village concerned
- Coordination with the Service Provider in charge of detail measurement survey and the provincial Department of Land Management, Urban Planning and Construction for official delivery of farming land title to farmer beneficiaries.
- FWUC membership registration
- Draft and validate FWUC organizational structure
- Inform local authorities and organize the dialogue between the authorities and the FWUC
- Draft, validate and form a FWUC's supporting committee
- Organize the FWUC elections
- Validate FWUC election results during the first FWUC general assembly
- Develop a database system (soft and hard copy) including all information about members property and plot location and plot surface (with code system)
- Drawing interactive map by hand and develop into digital map

Facilitate the process of legal registration from local to national level.

Phase 3: Training and Technical Assistance: FWUC is able to perform its statutory functions (in particular water management) and to collect fees from members (up to a minimum of 70% of fees to be collected). Besides training sessions, there should be study tours organized to visit some FWUC of FWN members as well. The objectives of these study tours are to let farmers see performance of FWUC function and O&M etc. The phase may begin after Phase 2, but mainly after rehabilitation works with and will combine on-site training and technical assistance to the FWUC and groups of water users.

Phase 4: Responsibility sharing agreements support: In an irrigation system, water diversion and conveyance infrastructures are usually large hydraulic structures that the State, through MoWRAM, or the province, through PDWRAM, is in charge of construction and management operation and maintenance. The objective is:

- First to alleviate the burden of the State or the province,
- Second to make the farmer aware that water is a free gift of nature, but water service, that allows to get water on time, in place and in quantity required, requests investment and costs money that water users should pay for, at least partly,

- Third to assume that, once the farmers fully understand that irrigation infrastructures are one of their own production tools, they might take much care of them and take in charge their management operation and maintenance provided they have been involved and heard in the design and construction phases.

The question are: 1/ what are the works the communities are in charge of from on-farm canals up to what canal rank (tertiary, secondary, even primary), 2/ what are they responsible for (management, operation, seasonal maintenance, whole maintenance), 3/ what cost the farmers have to pay for.
These questions will be answered scheme-by-scheme, prek by prek. They will depend on two main factors: the size of the scheme or the prek and the capacity and willingness of the farmers. For those reasons, every scheme or prek will have its own specific Responsibility Sharing Agreement specific conditions that will be discussed and agreed with the local or national authority. Nevertheless general conditions of the RSA will be the same. The program will assist the parties in writing the general conditions and the frame of the specific conditions, possibly in the specific conditions themselves when major issues occur.
The consultant will bring a specific attention to gender during implementation:

- Assess and identify potential gender-differentiated impacts of each irrigation scheme.
- Collect sex-disaggregated baseline data that could be used to monitor potential gender impacts.
- Identify community-based organizations, and women's associations or groups whose work focuses on gender and the specific area of intervention that the Program can collaborate with during its implementation. Assess their capacity.
- Conduct gender-sensitive analyses to ensure the differential needs, constraints, capacities, priorities of women and men targeted by the Program are understood and addressed;
- Assess the obstacles that prevent women to get actively involved in the FWUC management and commercialisation of agricultural products and propose/implement the alleviation proposals to overcome those issues.

One of the objectives of the program regarding gender is to reach at least one-third of women as FWUC management/board member with roles and responsibilities identified. The consultant is required to support this objective by (i) identifying then providing direct coaching to potential active female candidates, (ii) promoting their candidacy and (iii) ensuring equal opportunity to women board members to attend vocational training in irrigation scheme operation and water management and other related training such as management skills and (iv) promoting female leadership in the water management, services, commercialisation of agricultural products.

PMU Individual Consultants Terms of Reference

Position	Type	Under	Duty Station
Water Resources Specialist/Team Leader	International	PMU	MOWRAM
Irrigation Engineer	International	PMU	MOWRAM
Climate Specialist	International	PMU	MOWRAM

Agriculture Value Chain Specialist	International	PMU/PIU	MOWRAM/NCDDS
Procurement Specialist	National	PMU	MOWRAM
M&E & Gender Specialist	National	PMU	MOWRAM

Position: International Water Resources Specialist/Team Leader

The specialists will, as the team leaders, provide overall direction and manage DED and relationships with MOWRAM, other relevant ministries, provincial governments, ADB, AIIB and other stakeholders, to ensure effective coordination and synergies between all concerned including MOWRAM's other consultants for the project.
He/she will be overall responsible for preparing the projects' outputs, manage all experts' inputs, activities, and outputs, and ensure the consistencies between project outputs, and the quality of the system wide planning exercises, feasibility studies and other reports.

He/she will also:

(v) ensure compliance of project outputs with ADB and AIIB guidelines;
(v) Manage the entire DED team, and ensure that all consultants will work closely with each other so that all individual outputs are well integrated and complement each other to ensure quality of the DED and relevant documentation for tendering.
(v) Ensure timely delivery of DED and tender package outputs, and of other outputs, in accordance with contract requirements.
(v) Review all aspects of implementation and construction to identify constraints, bottlenecks, concerns, and synergies; and
(v) At least quarterly meetings with the Project Director to update progress.

(v) The team leader will be expert in water resources, He/she shall have a master's degree or higher in WRM and FRM, civil engineering, or a related subject.
(v) He/she should have at least 15 years (10 years for national position) of work experience in both IWRM and hydraulic structure design and construction water use and flood risk management (FRM) projects.
(v) He/she should have experience as team leader (as deputy team leader for national position) in at least two project preparatory services or similar activities for both IWRM and FRM projects in Southeast Asia countries.

Position – International Irrigation Engineer

The position will be based at the PIU/MoWRAM office in Phnom Penh with periodic field supervision visits to the Sub-Projects implemented in targeted provinces under Project Component 2.

He/she will be responsible for:

- Provide technical assistance, guidance, and necessary documents to Implementing Agencies (IAs), including the PIU (MoWRAM) and Provincial Departments/Project Management Units (PD/PMUs).
- Support the preparation of recommendations for the approval of proposed Sub-Project Lists under Project Component 2.
- Review comments and reports submitted from PD/PMUs and the PMU (MoWRAM).
- Contribute to the preparation and updates of the Project Operations Plan, Financial and Procurement Plans.
- Conduct coordination, problem-solving, monitoring, and control of Component 2 project implementation.
- Coordinate field visits, site inspections, and spot checks at Sub-Projects and Civil Works sites in targeted provinces.
- Supervise and verify the completion of contracted Sub-Projects' works.
- Assist in the review of Work Contracts and Variation Orders, providing recommendations and decisions to avoid delays in the approval process.
- Coordinate investigations of irregularities, variations/changes, delays, and Force Majeure cases.
- Coordinate and support the preparation of designs, cost estimates, bills of quantities, and contracting documents for Sub-Project irrigation structures.
- Support the preparation and issuance of Consolidated Project Progress Reports, the Project Completion and Outcome Evaluation Report, and other necessary reports.
- Maintain accurate records, correspondence, and diaries.
- Assist the Employer and IAs with the updating and implementation of manuals and guidelines.
- Provide on-the-job training to staff members of PMU (MoWRAM) in irrigation works, small irrigation system construction and rehabilitation, and other professional engineering skills.
- Undertake other activities as necessary within the area of responsibility, as instructed by the Team Leader, Project Manager, and Project Director.

Minimum Qualifications:

- Bachelor's Degree in Civil Engineering or equivalent.
- At least 5 years of professional experience in civil engineering.
- At least 2 years of public sector project experience in the design, management, construction, and supervision of small and medium-scale irrigation systems and rehabilitation.
- Working experience with Government Implementing Agencies/Ministries and rural communities is an advantage.

Position - International Climate Specialist -

The Climate Expert will be responsible for:

The consultant will assess the current policy and institutional landscape in Cambodia to assess and identify priority actions to deliver short and long-term climate targets. The policy assessment will include, but not be limited to, the following activities: Gather existing policy and institutional actions aimed at climate action in Cambodia. Leverage existing analyses, including the climate policy diagnostic. Evaluate the robustness of existing policy actions under different scenarios. Assess the potential impact of current policies on achieving climate targets. Engage with key stakeholders to assess the effectiveness and feasibility of existing policy actions. Gather diverse perspectives and insights to inform policy improvements. Determine the most critical policy and institutional changes needed to support Cambodia's transition to a carbon-neutral and climate-resilient future.

Support policymakers in designing effective policy and institutional instruments to deliver ambitious climate action. This will include the design of legal, financial, economic, regulatory, and market-based instruments required to design and implement policy actions.

Key activities will include:

- Across all project activities, ensure aspects related to climate, environment and biodiversity are mainstreamed and adequately considered.
- (i) Particularly, (i) ensuring livelihood activities are climate resilient, (ii) promoting integration of climate-proofed design in infrastructure (iii) ensuring awareness of early warning and climate information system among all project stakeholders, including appropriate content and dissemination mechanisms, (iv) ensuring (ESCMP) exclusion criteria are enforced and avoiding adverse impacts of project activities on the ecosystem and biodiversity, and (v) promoting mainstreaming of climate change, environment and biodiversity considerations in all investments and trainings of the PMU.
- (ii) Undertake site visits, on-ground review, and check and document implementation of climate change and environmental activities.
- Coordinate with Design Engineers, and other specialists to provide expert guidance to ensure that infrastructure design is climate-proof.
- Coordinate with project partners on the development and implementation of the Early Warning System.
- Ensure that the timing, content, and medium of communication for CIEWS are context specific; periodically engage in focus group discussions and provide inputs to M&E surveys to get feedback on the community and households in order to improve content / dissemination of CIEWS.
- ● Develop partnerships with other IFAD (and non-IFAD) projects to promote wider uptake of Early Warning system.
- Conduct in-depth analysis of legal, regulatory, financial, and institutional aspects of policy implementation. Guide the policy design process based on the findings of the policy assessment.
- Develop and draft specific policy instruments (e.g., legislation, regulations, fiscal incentives) to support the implementation of climate action plans.
- Support on embedding the developed policy instruments into existing systems.
- Work with the policy working group to develop a comprehensive implementation strategy for the prioritized policy instruments.

- Provide training and capacity building to relevant government officials and other stakeholders on the application of the new policy instruments.
- Create and disseminate policy briefs to enhance understanding of policy actions and their implications.
- Support capacity and knowledge strengthening through consultations, dissemination workshops, and the production of knowledge products (e.g., policy briefs).
- Share knowledge and best practices on successful climate policies implemented in other countries. Analyze the potential impacts of these approaches in the Mongolian context.
- Policy briefs will be developed and circulated during stakeholder dissemination workshops to share key findings and recommendations.

Qualifications and Experience

The consultant will have

- Master's degree, preferable in the Water Resource Management, Hydrology, Environmental or Climate Science, or equivalent professional qualifications appropriate to the Consultancy Services requested.
- A minimum of 12 years of demonstrable experience in implementing and monitoring rural infrastructure and agriculture livelihood projects.
- The consultants must also have at least 12 years of relevant professional experience in climate policy and strategy development and has demonstrated experience in drafting climate mitigation and adaptation policies and strategies is highly desirable.
- Excellent knowledge of climate policy and finance issues under the UNFCC, particularly the Paris Agreement and the NDCs; sector expertise in the key economic sectors covered in DMC NDCs is preferred;
- Excellent oral and written communication skills in English; strong analytical skills; and proven track record in producing high quality technical reports.

<u>Position: International Agriculture/Value Chain Specialist</u>

The Specialist together with the Team Leader will serve as the main focal points for liaisons between the implementing agency (IA), The Agricultural and Value Chain Specialist will lead efforts to develop sustainable value chains across the project's five prioritized value chain : Rice, Vegetable, Chicken, and aquaculture. This role requires close collaboration with stakeholders to drive commercialization, improve production practices, enhance market access, and ensure that all value chain activities are both socially and environmentally sustainable.

- Provide Strategic and Technical Guidance: Support the project team in developing comprehensive project plans, management frameworks, and implementation strategies to ensure effective and efficient delivery;
- Value Chain Development: Lead the design and execution of Value Chain Accelerators tailored to each value chain, enhancing market integration and growth potential;
- Agri-Business and Entrepreneurship Promotion: Design and implement targeted activities to foster agribusiness skills and entrepreneurial practices among farmers;

- Capacity Building for SMEs: Strengthen the capacity of farmer and small- to medium-sized enterprises (SMEs) in sustainable agricultural practices, climate resilience, and productivity-enhancing methods across the value chain;
- Stakeholder Engagement: Collaborate with the Business Specialist to identify and establish partnerships with key stakeholders, including off-takers, financial institutions, and relevant industry actors;
- Market Research and Analysis: Work with relevant Ministries, Departments, and Agencies to conduct market research, gathering insights on consumer preferences, market needs, and enterprise selection to guide business-related activities of the Project;
- Project Management and Resource Optimization: Develop and monitor project timelines, budgets, and resource allocation to maximize efficiency and achieve project targets;
- Policy and Market Solutions: identify market bottlenecks, assess risks, and devise solutions that address challenges and leverage opportunities within project interventions;
- Training and Mentorship: Provide comprehensive training, coaching, and mentorship to agricultural workers and other value chain participants, enhancing their knowledge of agribusiness and modern agricultural practices;
- District-Level Support: Assist district staff with budgeting, planning, and translating project objectives into actionable activities for local implementation;
- Planning and Reporting: In coordination with other specialists, ensure timely preparation and submission of quarterly, annual, and other required project reports. Lead the preparations of activity plans, review of budget and facilitates approval of national and district level activities;
- Facilitate project monitoring and progress reviews with the project team, providing actionable recommendations to the project manager for continuous improvement

Position: Procurement Specialist – National MOWRAM PMU

The National Procurement Specialist will be based in the CAISAR PMU and responsible for providing professional assistance to CAISAR PMU to implement, coordinate, and monitor project procurement activities under the project in accordance with the agreed and applicable procurement procedures, guidelines, and the financing agreement of the project. In doing so, he/she must work in close consultation and cooperation with PMU staff, consultants and all concerned entities of CAISAR. The National Procurement Specialist will work under the supervision and guidance of the PMU Project Director and Project Manager.

 Scope of Work

In close collaboration and consultation with the PMU procurement staff, the National Procurement Specialist is expected to carry out the following tasks:

3.1 Capacity-building

Develop and implement a procurement capacity building program for training of relevant government staff of the departments and ministries under the Project, particularly the MOWRAM procurement unit, to enable them to successfully carry out procurement activities. Develop a ‘learning culture’, including regular learning opportunities and application of the learning and on-the-job training in the workplace;

3.2 Support for Procurement carried out by MOWRAM

- Undertake and support MOWRAM PMU in identifying the procurement requirement and provide necessary inputs for the procurement plan. The Procurement Plan will include contract packaging, cost estimates & delivery time, procurement methods, IFAD/AIIB prior/post review arrangements, and key procurement processing dates until completion of each contract;
- Undertake and support MOWRAM PMU in updating the Procurement Plan;
- Undertake and support MOWRAM PMU in preparing the project's necessary procurement documents for goods and works including the preparation of Invitation for Bid advertisements, bidding/Request for Quotation documents, organizing and conducting bid openings, evaluation reports, obtaining the necessary clearances (from the Procurement Review Committee (PRC) and No Objection Letters from IFAD/AIIB where required, arranging for the contract signing, and distribution to appropriate authorities;
- Undertake and support MOWRAM PMU in preparing procurement documents for consultant services including the preparation of requests for Expressions of interest (EOI) advertisements, evaluation of EOIs and shortlisting, liaising with technical teams on the preparation of terms of reference, preparation of request for proposal documents, proposal evaluations, preparation of draft contracts, obtaining the necessary clearances from the PRC and IFAD/AIIB where required, assisting in contract negotiations, arranging for the contract signing, and distribution to appropriate authorities;
- Undertake and support MOWRAM PMU in ensuring that all procurement is carried out in accordance with the agreed procedures, procurement guidelines and the Financing Agreements for the project;
- Undertake and support MOWRAM PMU in monitoring the timeliness of the procurement and delivery of goods, works, and services in accordance with the approved Procurement Plan, the AWPB, and contracts between MOWRAM and contractors, suppliers, and consultants;
- Undertake and support MOWRAM PMU in ensuring that a proper filing/record keeping system is established for the procurement to be done by MOWRAM. Maintain a contract register with updated key procurement information of all contracts procured under the Project.
- Provide guidance to involving Ministry staff to enable them to successfully carry out activities relating to procurement (i.e., preparation of technical specifications, among others);
- Collaborate with the concerned units where necessary to ensure smooth procurement process and contract management;
- Other tasks as may be assigned and/ or delegated by the PMU Project Manager and Project Director.

 Location, Timing and Duration

The duration of the contract is 12 months from the contract signing date and renewable subject to the annual performance assessment and availability of funds and the needs for project.

The National Procurement Specialist will be based at CAISAR PMU office located in MOWRAM.

 Supervision and Reporting

The National Procurement Specialist will report to CAISAR Project Director. The Procurement Specialist will prepare and submit monthly performance reports on the tasks performed by him/her to the Project Director.

In collaboration with the procurement staff of MOWRAM PMU, the National Procurement Specialist will undertake and support MOWRAM in monitoring the procurement progress and updating procurement progress in Procurement Tracking Form on the monthly basis.

- Qualification and Experience Requirements

Bachelor's degree Business Administration & Management, Civil Engineering, Law or relevant field.

Familiarity and experience in carrying out public procurement of goods, works and consultant services. Experience working with Government's Public Services/ Projects/Programs is an advantage.

Have demonstrated at least 5-year professional experience with donor financed projects in the areas of procurement implementation and management.

Familiarity with IFAD/AIIB or other Development Partner' Procurement Procedures, Policy and Guidelines for Consultants' Services, Goods and Civil Works.

Having attended and obtained a certificate of the BUILDPROC training course organized by IFAD/ITC-ILO is an advantage.

Ability and demonstrated experience in providing procurement training is giving an advantage.

Fluency in written and spoken English and Khmer.

Comprehensive computer skills with minimum in use of Microsoft Office.

Position: M&E and Gender Specialist (National)

Duty Station - PMU

Responsibilities:

The MOWRAM PMU will have a senior and experienced staff member responsible for M&E and reporting. S/he will report to the Project Director and Team Leader responsible for planning and executing agency related functions. The TORs are as follows:

- Assist in the consolidation of the annual work plan and budget through the participatory planning workshops conducted at district, provincial and national level.
- Develop a work plan and schedule for monitoring and evaluation of specific Implementation contracts in accordance with approved criteria.
- Review the quarterly monitoring reports received from each of the implementing agencies and assist in the consolidation of the Quarterly Progress Reports for submission to the MOWRAM Project Manager in accordance with reporting guidelines and procedures.
- Provide training in planning, budgeting & reporting systems & procedures to staff of the MOWRAM & NCDDS at sub-national level.
- Mainstream M&E practices to technical staff particularly the qualitative aspects e.g., impact assessment, comparison of farmers' practices and new technologies, satisfaction of the services provided.
- Provide the Project Team with regular status reports, including information on progress made, issues outstanding and action recommended.
- Provide support and training to relevant staff at subnational level to ensure that the design and implementation of project financed implementation contracts address monitoring and evaluation concerns.

- Mainstream the M&E practices to the technical staff particularly the qualitative aspects e.g., impact assessment, comparison of farmers' practices and new technologies, satisfaction of the services provided.
- Undertake other tasks assigned by the Project Director.

- Act as the Gender Focal Point. S/he will have the following responsibilities:
    - (i) Monitor the implementation of the gender action plan in relation to the activities under the responsibility of the project.
    - (ii) Ensure that the relevant information on gender relating to the activities under NCDDs responsibility are updated at the sub-national level in the Gender Monitoring Framework on a quarterly basis.
    - (iii) Assist in the updating of the gender action plan reported for inclusion in the Quarterly Progress Report that is compiled by the PMU Team.
    - (iv) Ensure that gender sessions are included in relevant technical and capacity building trainings and where needed act as a resource person during the training to ensure that gender concerns are addressed.

Qualifications and Experience:

- A relevant post-graduate university degree in an agricultural or appropriate social science discipline: postgraduate study an advantage.
- Preferably five years of experience of planning, monitoring and reporting in rural development projects/programs; experience with government planning process, M&E systems and reporting procedures at the national and sub-national levels and working at sub-national level would be an advantage.
- Knowledge of the government's ongoing reforms of sub-national government.
- Knowledge of government and development partners procedures, policies and financial rules and regulations.
- Knowledge of computer information system, word processing, database and financial and project management software.
- Excellent English communication skills, written and spoken.
- Availability and willingness to undertake visits to the target communes.

Annex 5: Terms of Reference – NCDD Project Implementation Unit

PIU Individual Consultants Terms of References -

Position	Type	Under	Duty Station
Project Advisor	National	PIU	NCDD
Project management Specialist	National	PIU	NCDD
Procurement Specialist	National	PIU	NCDD
M&E & Gender Specialist	National	PIU	NCDD
Admin and Finance Assistant	National	PIU	NCDD

Position: Project Advisor (National)
Duty Station - NCDD

The Project Advisor, working with the Project Management Specialist, will report to the NCDD Project Director and Project Manager. S/he will be based at NCDD office but will work at NCDD and MOWRAM on an agreed work plan. S/he will carry out the following tasks:

- Advise NCCD Project Directors and Project Managers, and staff on project management and implementation related issues regularly to ensure that the project implementation is in line with government policies, guidelines and the evolving framework for sub-national government and follows the provisions of the loan and grant agreements.
- Advise the Project Directors and Project Managers of NCCD & MOWRAM continuously to ensure that the project achieves the outcome and outputs envisaged in the project design and monitoring framework.

- Mentor the Project Directors, Project Manager of NCCDS and regularly assist them in the management of the team of staff and consultants (either under firm or individual) so that the Project Directors and Project Manager NCCDS and the Project Management Specialist can manage the Project Advisor's tasks when s/he is absent.
- Provide technical advice to the sub-national agencies and consultants responsible for supporting the infrastructure, agricultural value chain investments.
- Ensure that appropriate quality assurance measures are established and effective so that the design and construction of the infrastructure investments are fit for purpose and are practically and operationally sustainable throughout their design life.
- Assist NCDD in the recruitment of supervision consultants, individual consultants and all special service providers, monitor and support the service teams, provide capacity building training and mentoring, deliver value chain improvements to market improvement and support commune councils to facilitate value chain improvement, support agricultural productivity improvement and diversification on irrigated areas constructed under the project with double cropping, and diversified cropping.
- Provide continuous guidance to subnational team in the implementation of the agricultural productivity enhancement program with a particular focus on strengthening the rice and vegetable and livestock and fish value chains.
- Support the rural ICT interventions, in particular the CIEWS.
- Advise the project in matters relating to planning and preparation of the annual work plan and budgets and establishing and operating the monitoring and evaluation system and the associated reporting requirements.
- Assist all project consultants and the MOWRAM and NCDDS project management units in ensuring that there is good coordination with MEF, MOWRAM, and NCDDS and all project consultants and special service providers in all policy and major operational matters related to the project implementation e.g., flow of funds to national agencies supporting implementation, provincial, district, and commune councils and propose revisions to the arrangements, if necessary.
- Ensure that the Project Directors, Project Managers and staff of the MOWRAM and NCDDS project management units will be able to provide secretariat services to the Project Steering Committee with regular physical and financial progress reports, including information on progress made, issues outstanding and actions recommended.
- Assist MOWRAM and NCDDS project management units in preparing quarterly physical and financial progress reports for submission to AIIB and IFAD.
- Oversee and coordinate the work of the project consultants under PIU, ensure that they are fulfilling their terms of reference and handle all administrative matters relating to the consulting company's or individual contractual arrangements with the executing and implementing agencies.
- Provide the Project Directors and the Project Managers of NCDDS with regular physical and financial progress reports, including information on progress made, issues outstanding and actions recommended.
- Coordination with the consulting firm on contracts and personnel of the consulting services.
- Work with the Project Management Specialist to produce at least three project knowledge products to be shared with project stakeholders.
- Work with the M&E & Gender Specialist to ensure the implementation and monitoring of the gender action plan.

- Work with the Social Safeguards and Environmental Safeguards/Climate Change Specialist to ensure the implementation and monitoring of the environmental assessment and review framework, resettlement framework, and indigenous peoples planning framework, as well as applicable initial environmental examination, environmental management plans, land acquisition and resettlement plans, and indigenous peoples plans.
- Undertake other tasks as requested by the Project Directors and Project Managers.

Minimum qualifications are:

- A relevant post-graduate university degree; formal qualifications in agriculture with a major of agronomy or a related agricultural subject.
- Preferably 15 years of experience in the management of large-scale agricultural and rural development projects financed by the international financial institutions; wide experience of participatory agricultural development, including irrigation.
- Experience of agribusiness and value chain development will be an advantage.
- Sound knowledge of current development partner procedures, policies and financial rules and regulations; and government financial management and administrative procedures.
- Proven planning, management and reporting skills.
- Knowledge of computer information management systems, Microsoft Office applications, database management systems and financial and project management software and of the internet and digital communications including the use of mobile telephone, email, and mobile devices.
- Excellent English communication skills, written and spoken.
- Proven track record as team leader for at least two development partner-financed projects.
- Availability and willingness to undertake visits to the target communes.

Position: Project Management Specialist (National)
Duty Station – PIU

The Project Management Specialist, working with the Project Advisor/service providers, will report to the NCDD Project Director and Project Manager. S/he will be based at NCDD office but will work at NCDD, MOWRAM, MoE, on an agreed work plan. S/he will carry out the following tasks:

- Advise the Project Directors and the Project Managers of NCDD and MOWRAM on project management and implementation related issues to ensure that the project implementation is in line with government policies, guidelines and the evolving framework for sub-national government and follows the provisions of the loan and grant agreements.
- Advise the Project Directors and Project Managers of NCDD and MOWRAM to ensure that the project achieves the outcome and outputs envisaged in the project design and monitoring framework.
- Ensure that the executing and implementing agencies and sub-national agencies implement the Gender Action Plan.

- Advise the project in matters relating to planning and preparation of the annual work plan and budgets and establishing and operating the monitoring and evaluation system and the associated reporting requirements.
- Assist all project consultants and NCDD and MOWRAM project management units in ensuring that there is good coordination among MEF, NCDD, MoE in all policy and major operational matters related to the project implementation e.g., flow of funds to national agencies supporting implementation, provincial, district, and commune councils and other stakeholders and propose revisions to the arrangements, if necessary.
- Ensure that the Project Director, Project Managers and NCDD staff will be able to provide the secretariat services to the Project Steering Committee with regular physical and financial progress reports, including information on progress made, issues outstanding and actions recommended.
- Provide support to the NCDD and MOWRAM in managing service provider contracts to support value chain development and validate the technical content of training modules to be delivered by service providers to the target groups.
- Assist in the design and deliver of training on marketing, value chain analysis and agribusiness (farm as a business as well as small and medium enterprises) approaches for the sub-national project teams and advisors and provide ongoing guidance in the use of these tools to improve marketing efficiencies and increased returns to the target group members.
- Oversee and coordinate the work of the other consultants, ensure that they are fulfilling their terms of reference and handle all administrative matters relating to the consulting company's contractual arrangements with NCDD.
- Provide the Project Directors and Project Managers of NCDD and MOWRAM with regular physical and financial progress reports, including information on progress made, issues outstanding and actions recommended.
- Coordinate with the firm on contracts and personnel of the consulting services.

14. Minimum qualifications are:

- A relevant post-graduate university degree in agriculture or combination of education and appropriate agricultural and rural development experience.
- 10 years' experience of project management experience in the management of large-scale agricultural and rural development projects financed by the international financial institutions.
- Five years' experience of Cambodian private sector agribusiness development and knowledge of value chains.
- Good up to date knowledge of AIIB/IFAD procedures, policies, and financial rules and regulations; and government financial management and administrative procedures.
- Proven planning, management and reporting skills.
- Computer literacy: word processing, spreadsheets, power point and database programs.
- Excellent English communication skills, written and spoken.
- Availability and willingness to undertake visits to the target communes.

Position: Monitoring & Evaluation Specialist (National)
Duty Station - PIU
Responsibilities:
The NCDDs will have a senior and experienced staff member responsible for M&E and reporting. S/he will report to the NCDDs Project Advisor and Project Manager responsible for planning and executing agency related functions. The TORs are as follows:

- Assist in the consolidation of the annual work plan and budget through the participatory planning workshops conducted at district, provincial and national level.
- Develop a work plan and schedule for monitoring and evaluation of specific Implementation contracts in accordance with approved criteria.
- Review the quarterly monitoring reports received from each of the implementing agencies and assist in the consolidation of the Quarterly Progress Reports for submission to the MOWRAM Project Manager in accordance with reporting guidelines and procedures.
- Provide training in planning, budgeting & reporting systems & procedures to staff of the NCDDs at sub-national level.
- Mainstream M&E practices to technical staff particularly the qualitative aspects e.g., impact assessment, comparison of farmers' practices and new technologies, satisfaction of the services provided.
- Provide the NCDDs Project Team with regular status reports, including information on progress made, issues outstanding and action recommended.
- Provide support and training to relevant NCDDs staff at subnational level to ensure that the design and implementation of project financed implementation contracts address monitoring and evaluation concerns.
- Mainstream the M&E practices to the technical staff particularly the qualitative aspects e.g., impact assessment, comparison of farmers' practices and new technologies, satisfaction of the services provided.
- Undertake other tasks assigned by the Project Director.

- Act as the NCDDs Gender Focal Point. S/he will have the following responsibilities:
  (i) Monitor the implementation of the gender action plan in relation to the activities under the responsibility of the NCDDs.
  (ii) Ensure that the relevant information on gender relating to the activities under NCDDs responsibility are updated at the sub-national level in the Gender Monitoring Framework on a quarterly basis.
  (iii) Assist in the updating of the gender action plan reported for inclusion in the Quarterly Progress Report that is compiled by the PMU Team.
  (iv) Ensure that gender sessions are included in relevant technical and capacity building trainings and where needed act as a resource person during the training to ensure that gender concerns are addressed.

Qualifications and Experience:

- A relevant post-graduate university degree in an agricultural or appropriate social science discipline: postgraduate study an advantage.

- Preferably five years of experience of planning, monitoring and reporting in rural development projects/programs; experience with government planning process, M&E systems and reporting procedures at the national and sub-national levels and working at sub-national level would be an advantage.
- Knowledge of the government's ongoing reforms of sub-national government.
- Knowledge of government and development partners procedures, policies and financial rules and regulations.
- Knowledge of computer information system, word processing, database and financial and project management software.
- Excellent English communication skills, written and spoken.
- Availability and willingness to undertake visits to the target communes.

Position - Procurement Specialist (National)
Duty Station – PIU

The National Procurement Specialist will be based in the NCDD-S PIU and responsible for providing professional assistance to NCDD-S PIU to implement, coordinate, and monitor project procurement activities under the project in accordance with the agreed and applicable procurement procedures, guidelines, and the financing agreement of the project. In doing so, he/she must work in close consultation and cooperation with PIU staff, consultants and all concerned entities of CAISAR. The National Procurement Specialist will work under the supervision and guidance of the NCDD-S PIU Project Director and Project Manager.
Scope of Work

In close collaboration and consultation with the PMU procurement staff, the National Procurement Specialist is expected to carry out the following tasks:
3.1 Capacity-building
Develop and implement a procurement capacity building program for training of relevant government staff of the departments and ministries under the Project, particularly the NCDD-S procurement unit, to enable them to successfully carry out procurement activities. Develop a 'learning culture', including regular learning opportunities and application of the learning and on-the-job training in the workplace;

3.2 Support for Procurement carried out by NCDD-S

Undertake and support NCDD-S PIU in identifying the procurement requirement and provide necessary inputs for the procurement plan. The Procurement Plan will include contract packaging, cost estimates & delivery time, procurement methods, IFAD/AIIB prior/post review arrangements, and key procurement processing dates until completion of each contract;

Undertake and support NCDD-S PIU in updating the Procurement Plan;

Undertake and support NCDD-S PIU in preparing the project's necessary procurement documents for goods and works including the preparation of Invitation for Bid advertisements, bidding/Request for Quotation documents, organizing and conducting bid openings, evaluation reports, obtaining the necessary clearances (from the Procurement Review Committee (PRC) and No Objection Letters from IFAD/AIIB where required, arranging for the contract signing, and distribution to appropriate authorities;
Undertake and support NCDD-S PIU in preparing procurement documents for consultant services including the preparation of requests for Expressions of interest (EOI) advertisements, evaluation of EOIs and shortlisting, liaising with technical teams on the preparation of terms of reference, preparation of request for proposal documents, proposal evaluations, preparation of draft contracts, obtaining the necessary clearances from the PRC and IFAD/AIIB where required, assisting in contract negotiations, arranging for the contract signing, and distribution to appropriate authorities;
Undertake and support NCDD-S PIU in ensuring that all procurement is carried out in accordance with the agreed procedures, procurement guidelines and the Financing Agreements for the project;
Undertake and support NCDD-S PIU in monitoring the timeliness of the procurement and delivery of goods, works, and services in accordance with the approved Procurement Plan, the AWPB, and contracts between NCDD-S and contractors, suppliers, and consultants;
Undertake and support NCDD-S PIU in ensuring that a proper filing/record keeping system is established for the procurement to be done by NCDD-S. Maintain a contract register with updated key procurement information of all contracts procured under the Project.
Provide guidance to involving Ministry staff to enable them to successfully carry out activities relating to procurement (i.e., preparation of technical specifications, among others);
Collaborate with the concerned units where necessary to ensure smooth procurement process and contract management;
Other tasks as may be assigned and/ or delegated by the PMU Project Manager and Project Director.
Supervision and Reporting
The National Procurement Specialist will report to the NCDD-S PIU Project Director. The Procurement Specialist will prepare and submit monthly performance reports on the tasks performed by him/her to the Project Director.
In collaboration with the procurement staff of NCDD-S PIU, the National Procurement Specialist will undertake and support NCDD-S PIU in monitoring the procurement progress and updating procurement progress in Procurement Tracking Form on the monthly basis.
Qualification and Experience Requirements

Bachelor's degree Business Administration & Management, Civil Engineering, Law or relevant field.
Familiarity and experience in carrying out public procurement of goods, works and consultant services. Experience working with Government's Public Services/ Projects/Programs is an advantage.
Have demonstrated at least 5 years professional experience with donor financed projects in the areas of procurement implementation and management.
Familiarity with IFAD/AIIB or other Development Partner' Procurement Procedures, Policy and Guidelines for Consultants' Services, Goods and Civil Works.
Having attended and obtained a certificate from the BUILDPROC training course organized by IFAD/ITC-ILO is an advantage.
Ability and demonstrated experience in providing procurement training is an advantage.
Fluency in written and spoken English and Khmer.
Comprehensive computer skills with minimum in use of Microsoft Office./.

Position: Admin & Finance Specialist (National)
Duty station - PIU
The Finance and Administration Specialist will be responsible for the management and coordination of the administrative and finance support to the Project implementation activities within the PIU/NCDDS; in coordination with all PD and with other agencies involved. Under the supervision and overall guidance of the Project Manager the specialist will work closely with the Financial and Accounting team; with the Procurement and Contracts Team, coordinating project activities with PD/ PIU, along with other agencies involved, to manage administrative support in the project implementation following the Project procedures. The specialist will report to the Project Manager and the Project Director.
He/she will be responsible for:

- ensuring provision to PIUs and PD and other agencies involved support, advice, guidance and all documents necessary for the successful Project implementation;
- ensuring and coordinating support to efficient operations of the PIU, and other project offices in terms of day-to-day administration and administrative support
- ensuring administrative support in preparation of the recommendations for the approval of the proposed Sub-Projects Lists
- ensuring efficient support in preparation and update of the Project plans, such as the Operations Plan; the Financial and the Procurement Plans ensuring the establishment and maintaining a sound system of the Project documentation filing, classification, storing and backing up of the essential hard and soft copies
- Maintain sound finance and accounting systems throughout the project;
- Assist the PIU to maintain the project accounts for efficient project implementation;
- Maintain the books of accounts, monitor the project cash flow accounts, and manage the daily cash transactions at the PIU;
- Prepare the financial statements of the project account;
- Prepare imprest account reconciliation for 2nd generation imprest account;
- Assist and provide on the job-training to IAs in maintaining the imprest accounts;
- Assist in managing finance and accounting records for the project;
- Maintain the project bank accounts, including the preparation of monthly bank reconciliations;

Minimum Qualification Requirements

- The specialist will have at least a Bachelor's degree (or equivalent) in business administration /accounting/ economics and at least 8 (eight) years of relevant professional experience.
- The Consultant is required to have at least 5 (five) years of work experience on public sector projects in the same professional areas and with similar responsibilities, as mentioned below.

- Substantial working experience in administrative management of the Government projects at national and sub-national levels; and/or experience with the RGC Implementing Agencies/ Ministries in a professional support capacity, especially in agriculture and 2 rural development sectors, will be an advantage.
- The specialist should be familiar with the Royal Government financial and procurement management regulations and procedures.
- Demonstrated advanced computer skills related to the MIS/ databases, spreadsheets and project planning tools are required.
- Excellent English language skills, and ability to translate written and oral work communication in both English and Khmer languages, are preferable.

Overall	**Substantial**	**Substantial**

Country Context	**Moderate**	**Moderate**
Political Commitment	***Moderate***	***Moderate***
Risk: Change in the Government of Cambodia (GoC) commitment to agriculture development and/or prioritization regarding climate action. The current Cambodian political situation, after election in mid-2023, has a low likelihood of major change of policy towards agriculture.	Moderate	Moderate
Mitigations: The project is strongly aligned with Cambodia's Nationally Determined Contributions (NDCs) priority actions, the Cambodia Climate Change Strategic Plan (CCCSP) 2014 – 2023 and the National Adaptation Programme of Action (NAPA) 2006. The project's focus on smart and climate resilient irrigation and flood control infrastructure; institutional development of the Farmer Water User Cooperatives (FWUCs); and to strengthen GoC agencies water rights management and ensure policies are aligned with the Climate Change Action Plans of the Ministry of Water Resources and Meteorology (MOWRAM) and Ministry of Agriculture, Forestry and Fisheries' (MAFF's) Agriculture Sector Master Plan 2030. The project proposal aligns with RGC's National Water Resources Management and Sustainable Irrigation Road Map and Investment Program (2019 -2023), providing a Strategic Framework for the Irrigation Sector.		
Governance	***Moderate***	***Low***
Risk: Private agribusiness unwilling to invest because of governance concerns such as hidden transaction costs associated with agriculture processing and exporting.	Moderate	Low
Mitigations: The project design assumes a willingness to invest consistent with experience and survey observations. Through policy engagement, IFAD continues to support GoC to improve ease of doing business in the agriculture sector.		
Macroeconomic	***Moderate***	***Moderate***
Risk: International economic recession reduces market opportunities. There is a risk that current economic trends lead to a reduction in demand for the export commodities targeted by the project, impacting on the viability of investments financed by the project	Moderate	Moderate

Mitigations: The project will target domestic and export markets, with domestic demand for safe vegetables and chicken; and export markets for rice. The project design is to maintain flexibility, so that production and marketing channels can be reoriented with changing trade conditions, demand, and partners. IFAD will be in touch with WB/ ADB/ Ministries and other partners to anticipate and address any risks. The IFAD country team is in close and regular contact with senior officials of the Ministry of Economy and Finance and will anticipate and try and ensure the program is protected from any such risks.		
Risk: Impact of Ukraine conflict on prices worsens Cambodia's terms of trade. Cambodia imports all its fuel and fertiliser and most capital equipment, so increases in costs of these items are likely to harm Cambodia's competitiveness. Conversely, increased food prices could favour Cambodia as a food exporting country.	Moderate	Moderate
Mitigations: (1) The project design includes monitoring and adjustment strategy in the event either recession changes demand or important materials' cost inflate to a level that impacts the project stakeholders. (2) The project's financial analysis includes possible price fluctuation and inflation rate conditions at the time at the time of implementation.		
Fragility and Security	***Low***	***Low***
Risk: Insecurity (political conflict, corruption) pose a risk to project implementation. Despite a history as a fragile state, Cambodia has a 25-year history of good internal security, so the risk is assessed low.	Low	Low
Mitigations: IFAD team and project supervision consultants will monitor any emerging situation closely and take necessary actions on time.		
Sector Strategies and Policies	**Moderate**	**Moderate**
Policy alignment	***Low***	***Low***
Risk: Change in government policy regarding climate action. Government commences a new policy to be guided by a Pentangular Strategy from mid-2023 (after the election); however the key themes of KAISAR: water infrastructures, rural roads, and technical skills training are remain as high priorities.	Low	Low
Mitigations: Project aligned with Cambodia's current Climate Change Strategic Plan 2014 – 2023 and associated action plans developed by each relevant GoC ministry. The project is included into the "National Water Resources Management and Sustainable Irrigation Road Map and Investment Program 2019 - 2033" issued in July 2019 by MOWRAM, with the assistance of the development partners. These align also with Pentangular Strategy phase 1. There are no significant changes expected.		
Policy Development and Implementation	***Moderate***	***Moderate***
Risk: Key policies on irrigation and climate adaptation not effectively implemented.	Moderate	Moderate

Mitigations: (1) Project interventions approach development objectives by using diverse approaches and not over dependent on a single policy. (2) The combination of project partners with IFAD, FAO, AIIB, and GCF work as a team to monitor and advise the GoC on relevant policies and their implementation.		
Environment and Climate Context	**High**	**High**
Project vulnerability to environmental conditions	***High***	***High***
Risk: Issues related to mono-cropping, excessive application of chemical fertilizers and pesticides and poor soil fertility are common in the Cambodian agricultural sector.	High	High
Mitigations: The project will promote good agricultural practices such as crop diversification, intercropping, use of bio compost and innovative soil carbon sequestration options that have multiple benefits on soils structure, microbiological activity and water retention capacity. In turn this soil management approaches have proven positive impacts on plant health that ensure higher tolerance to pests and diseases.		
Project vulnerability to climate change impacts	***Substantial***	***Substantial***
Risk: Observed impacts of climate change trends in recent years have already manifested in longer dry seasons and more intense “El Niño” related droughts, delayed onset of the monsoon season, increased rainfall intensity and frequency – leading to floods and unexpected dry periods during the rainy season. These trends and future climate variability / extreme events may have significant adverse impacts on food and nutrition security, access to markets, increased pest / disease incidence with effects on target population’s livelihoods and the ecosystem services they rely on. Extreme intensity floods have also resulted in damage to rural infrastructure, including irrigation and drainage canals and roads. Hence, the SECAP Review Note classifies as the project as Substantial under Climate Risk category.	Substantial	Substantial
Mitigations: The project design is informed by detailed analysis of climate risks for all interventions and relevant stakeholders. The assessment of risks informed the selection of climate-adaptive investments in irrigation infrastructure, agricultural development and institutional strengthening; analysis of climate hazards, vulnerability and exposure will continue to inform planning and prioritization processes during implementation to ensure reduced vulnerability of irrigation and agricultural system to climate change and enhanced livelihoods of rural populations dependent on agriculture.		
Project Scope	**Moderate**	**Moderate**
Project Relevance	***Low***	***Low***
Risk: MORWAM’s technical and management capacities are insufficient to deliver the project objectives.	Low	Low
Mitigations: MOWRAM’s PMU has the required technical staff in-place to deliver the project. The PMU is currently implementing ADB, EIB, and WB irrigation projects and has experience with project delivery. Using a centralized PMU to implement all DPs irrigation programmes and using the IFAD Programmatic Approach lowers the risk of issues with multiple project deliverables.		

Risk: Inaccurate climate risks assigned to the project. They include: (1) reduction in precipitation during rainy season and an increase in dry periods; (2) rapidly increasing temperatures causes deteriorating suitability conditions for many crops, poor water quality, and further drying in the wet season; and (3) increasing risk of heavy precipitation, flooding, and landslides cause destruction of crops, livestock, and infrastructures.	Low	Low
Mitigations: The design team's GCF project design experience ensures up-to-date IPCC models; and local and elevation meteorological data. GCF's review of the project design and climate risk assessment further reduces an error in assessing climate risk.		
Technical Soundness	***Moderate***	***Moderate***
Risk: Uncertainty regarding buy-in from the project beneficiaries and sustainability of service fee payment by water user committee.	Moderate	Moderate
Mitigations: Under component 1, the project will collaborate with all key stakeholders, including the agriculture development and financial institution in the target area to ensure that ultimate benefit is provided directly to the farmer. The project includes consultation directly with farmers on the benefits and on financing operations and maintenance (O&M).		
Risk: Institutional challenges in hiring government staff or procurement of feasibility studies. Delays in mobilization of consultants, consultation and surveys because of poor weather or COVID-19 containment measures.	Moderate	Moderate
Mitigations: Consider relevant modalities for staffing in project design and put in place necessary agreements and external staff to ensure effective delivery. Consultation with the stakeholders will take place before the start of the monsoon season (May) and surveys as part of the detailed design after the rainy season (from November). Consulting services for the feasibility study will take place during the monsoon months. Consultation and surveys are conducted by national consultants not affected international border closures due to COVID-19 containment.		
Institutional Capacity for Implementation and Sustainability	**Moderate**	**Moderate**
Implementation Arrangements	***Moderate***	***Moderate***
Risk: Insufficient project management capacity to successfully deliver project.	Moderate	Moderate
Mitigations: Component 2 includes technical support, training, and capacity development for PMU and PIUs (enhancing the institutional capacity of MOWRAM and PDWRAM).		
Risk: Financial management, Environment & Social and Procurement risks caused by significant turnover of staff as well as new PMU and PIUs	Moderate	Moderate

Mitigations: MOWRAM will consider additional stipend for provincial staff to secure stable human resources for the project. AIIB grant to MORWAM includes capacity building for procurement, noting that this is a key bottleneck for project delivery.		
Risk: Decentralized management in four provinces of mostly national contractors.	Moderate	Moderate
Mitigations: The PMU (at MOWRAM) organizationally directs the four PIUs located. The national contractors working for the PMU are explicitly directed by MOWRAM to work with the PIU's on local issues and consultations. The project includes an overall project management consultant based at the PMU and in the PIUs.		
Monitoring and Evaluation Arrangements	***Moderate***	***Moderate***
Risk: Insufficient capacity to collect sufficient / reliable data on project outcomes and impacts.	Moderate	Moderate
Mitigations: The Project includes a monitoring and evaluation (M&E) program that aligns with AIIB, IFAD's, GCF's and the GoC requirements. Consultants will be recruited to support the project implementation; to undertake detailed design services and construction supervision; and provide project management support to the PMU and the PIUs, including M&E. Third party evaluations verify the M&E data.		
Project Financial Management	**Substantial**	**Substantial**
Project Organization and Staffing	***Substantial***	***Substantial***
Risk: • Lack of experience in IFAD-funded operations/projects • Delay of recruitment of PMU/PIU staff, including finance staff. • Staff needs training on IFAD FM and disbursement procedures.	Substantial	Substantial
Mitigations: • Competitive and transparent selection of candidates. • Start-up training for FO. • Networking of FOs of IFAD-funded projects in Cambodia.		
Project Budgeting	***Substantial***	***Moderate***
Risk: • MOWRAM does not have experience in IFAD AWPB preparation • Delay of AWPB preparation due to challenges related to coordination between PMU and PIU. • Budget may not be closely monitored due to lack of expertise and necessary systems.	Substantial	Moderate
Mitigations: • Training on preparation of AWPB. • Customized accounting software to monitor budget vs actual will be introduced within 6 months of the entry into force of the project.		
Project Funds Flow/Disbursement Arrangements	***Moderate***	***Moderate***

Risk: • Delay in the preparation and submission of IFR and WA to IFAD •	Moderate	Moderate
Mitigations: • MOWRAM and NCCD will cooperate to prepare and consolidate IFR, and then WA can be submitted to IFAD promptly. • Training on IFR and ICP will be conducted at the start-up.		
Project Internal Controls	***Substantial***	***Substantial***
Risk: • PEFA: Effectiveness of internal audit was rated C Internal Audit Department be established in each ministry and state enterprise and report to its head, with a copy to the National Audit Authority. • Risk of unclear role, responsibility, and delegation. • Risk of insufficient controls for detecting fraud.	Substantial	Substantial
Mitigations: • PIM will be approved at the project inception. • IFAD anti-corruption training will be conducted at the start-up. • PMU and PIU will follow the internal control procedures from Government Standard Procedures (SOP) for internationally funded projects. • PMU/PIU will be subject to line-ministry inspection on internal control and procurement.		
Project Accounting and Financial Reporting	***Substantial***	***Substantial***
Risk: • PMU/PIU will apply the Cambodia Public Sector Accounting Standard (cash basis). • Standard accounting software shall be used for PMU/PIU and be compatible with IFAD and other donors' financial reporting requirements.	Substantial	Substantial
Mitigations: • Ensure the Accounting software is installed, customized, and capable of providing the financial information for IFR. • IFR training will be conducted at the project start-up.		
Project External Audit	***Substantial***	***Substantial***
Risk: • External Auditors may not follow standard TOR and audit contract requirements.	Substantial	Substantial
Mitigations: • Audit TOR will be reviewed by IFAD and cleared. Coordination with MEF will be essential to ensure compliance with IFAD audit requirements.		
Project Procurement	**Moderate**	**Moderate**
B.1 Assessment of Project Complexity	***Moderate***	***Moderate***

Risk: - There are some medium/large irrigation infrastructure and facility investments (with the estimated cost above US$ 10 million per irrigation system) using AIIB financing under Sub-component 2.1. – Modernization of irrigation scheme and ponds. - The project is classified with High SECAP risks, based on the SECAP screening tool.	Moderate	Moderate
Mitigations: - Procurement using AIIB financing will be oversight by AIIB and will comply with AIIB's Procurement Policy (2016) and AIIB's Interim Operational Directive on Procurement Instructions for Recipients (2016). - The PIM shall include a clear list of procurement actions needed to address the project's environmental, social and climate risks and adverse impacts, as identified in the SECAP review note. Each of the risks flagged as relevant for procurement in the ORMS SECAP Screening Tool need to be addressed in the PIM.		
B.2 Assesment of Implementing Agency Capacity	***Low***	***Low***
Risk: - Procurement planning process is in general effective and in consistence with IFAD's requirements, except constraints in preparation of procurement strategy. - Procurement Management and Contract Administration systems and internal control /audit procedures are generally in consistence with IFAD's requirements.	Low	Low
Mitigations: - Conduct prior reviews of the draft procurement plans to ensure compliance with the PAL, addressing procurement risks and value for money. The project procurement strategy developed at the project design stage will be updated and used for preparation of annual procurement plans. - Include IFAD's templates of self-certification forms and in the bidding document/RFP and contract documents. - Incorporate IFAD SECAP requirements into Standard bidding documents and contract documents.		
Project Procurement Overall	***Moderate***	***Moderate***
Risk: - Public procurement in Cambodia is governed by well-drafted legislation, rules and guidelines, designed to create a coordinated and robust procurement framework consistent with international best practices. All public procurement is organized by the Committee of Public Procurement at each relevant institution. These institutions include government ministries, national bodies, public enterprises, administrative institutions and sub-national administrations. - Overall, the public procurement system operates with integrity, that has appropriate controls, and that has anti-corruption measures in place. There are some constraints on application of e-procurement, access to information by the public, monitoring procurement performance, effective sanction and enforcement system, and training to conduct procurement audit. - There are some medium/large irrigation infrastructure and facility investments (with the estimated cost above US$ 10 million per irrigation system) using AIIB financing under Sub-component 2.1. – Modernization of irrigation scheme and ponds. - The project is classified with High SECAP risks, based on the SECAP screening tool. - Procurement planning process is in general effective and in consistence with IFAD's requirements, except constraints in preparation of procurement strategy.	Moderate	Moderate

Mitigations: - Upload information on procurement plans, contract awards on IAs/project websites. - Using IFAD's online procurement end-to-end system (OPEN) and ICP Contract Monitoring Tool for monitoring project procurement activities. - Include IFAD's templates of self-certification forms for bidders and contractors in the bidding document/RFP and contract documents. - Conduct capacity building programs for internal auditors at government agencies. - Procurement using AIIB financing will be oversight by AIIB and will comply with AIIB's Procurement Policy (2016) and AIIB's Interim Operational Directive on Procurement Instructions for Recipients (2016). - Each of the risks flagged as relevant for procurement in the ORMS SECAP Screening Tool need to be addressed in the PIM. - Conduct prior reviews of the draft procurement plans to ensure compliance with the PAL, addressing procurement risks and value for money. - Include IFAD's templates of self-certification forms and in the bidding document/RFP and contract documents. - Incorporate IFAD SECAP requirements into Standard bidding documents and contract documents.		
A.1 Legal, Regulatory and Policy Framework	***Moderate***	***Moderate***
Risk: The legal, regulatory and policy framework is sufficiently clear and integrated into international procurement practices. There are certain constraints on the application of electronic public procurement and sustainable public procurement.	Moderate	Moderate
Mitigations: IFAD may assist MEF to prepare a mandatory nationwide program for procurement staff training in public procurement, and contract management. Procurement Law may be amended to require procuring agencies regularly update reports and disclose information related to procurement processes including contract awards on their website and such information may be made available to interest bidders, when required. - Upload information on procurement plans, contract awards and resolution of procurement complaints on IAs/project websites. - Using IFAD's web-based procurement management and tracking systems (OPEN and ICP Contract Monitoring Tool) for monitoring project procurement activities. - IFAD SECAP policy and procedures to be integrated in the national bidding documents.		
A.2 Institutional Framework and Management Capacity	***Moderate***	***Moderate***
Risk: The institutional framework and public procurement management capacity are moderately satisfactory, taking into account the existing constraints in terms of e-procurement, centralized procurement body and monitoring of procurement performance. The MEF serves as the Center and focal point of all the public procurement and oversights the procurement carried out by the respective agencies. The role of MEF, in addition to the responsibility to manage and control public procurement, is to provide guidance and support and play a mentor and facilitator's role in the identification, formulation, implementation and completion of development projects in Cambodia.	Moderate	Moderate
Mitigations: Training, capacity building and the use of IFAD procurement tools can improve the implementation of funded projects. - Develop the online national procurement portal including a module for procurement data management. - Using IFAD's online procurement end-to-end system (OPEN) and ICP Contract Monitoring Tool for monitoring project procurement activities.		
A.4 Accountability, Integrity and Transparency of the Public Procurement System	***Moderate***	***Moderate***

Risk: Overall, the public procurement system operates with integrity, has appropriate controls and anticorruption measures. There are some constraints in terms of public access to information, engagement of civil society in the consultative process for the development of procurement policies, provisions on fraud, corruption and others prohibited practices in accordance with IFAD policies, and training to conduct procurement audits.	Moderate	Moderate
Mitigations: IFAD to collaborate with MEF to establish best practices across Cambodia; namely transparent and open institutions, citizen participation, private sector engagement, collaboration with oversight institutions as well as inclusive and fair competition to facilitate the multi-stakeholder approach. - Include IFAD's templates of self-certification forms for bidders and contractors in the bidding document/RFP and contract documents. - Conduct capacity building programs for internal auditors at government agencies. - Upload information on procurement plans, contract awards on IAs/project websites.		
A.3 Public Procurement Operations and Market Practices.	***Low***	***Low***
Risk: There is a reasonably well functioning private sector, but competition for large contracts is concentrated in a relatively small number of firms. Associations of consultants and contractor also exist in the country.	Low	Low
Mitigations:		
Environment, Social and Climate Impact	**High**	**High**
Biodiversity Conservation	***Moderate***	***Moderate***
Risk: Project activities entail risks to biodiversity conservation, as infrastructure upgrades could contribute to habitat disturbance and fragmentation, particularly during the construction phase. For instance, road rehabilitation and increased traffic flow may disrupt ecological corridors or lead to indirect effects such as increased human intrusion or wildlife collisions. Similarly, the use, storage, and disposal of hazardous materials pose risks of soil and water contamination that could degrade sensitive ecosystems and aquatic habitats, especially near community fish refuges and biodiversity hotspots identified around the project's subcommand areas.	Moderate	Moderate
Mitigations: To address the risks in relation to biodiversity, the project incorporates a comprehensive set of mitigation measures within the sub-project ESCMPs, including the application of environmental codes of practice during construction, strict controls on the handling and disposal of hazardous materials, and careful planning of rural road alignments to avoid ecologically sensitive areas. Additionally, the project will implement a Biodiversity Management Planning Framework to guide site-specific assessments and protection measures during subproject preparation. The SECAP instruments developed—such as the Environmental and Social Impact Assessment (ESIA), Environmental and Social Management Plans (ESMPs), and screening checklists—ensure that biodiversity considerations are integrated into all stages of project design and implementation. These tools help prevent or minimize habitat disturbance, protect critical ecosystems, and promote compliance with national legislation and international best practices.		
Resource Efficiency and Pollution Prevention	***High***	***High***

Risk: The project activities include the potential release of pollutants from construction activities and agricultural intensification, such as fuel, wastewater, dust, and agrochemical runoff, which may degrade soil and water quality. The development and rehabilitation of irrigation infrastructure will result in significant extraction or diversion of surface and groundwater, with possible consequences for local ecosystems and water availability downstream. The use of agrochemicals further amplifies the risk of contamination, particularly if not managed through integrated pest and nutrient management practices. Additionally, the project involves energy and material consumption for infrastructure and agricultural production, raising resource efficiency challenges.	High	High
Mitigations: The project includes several targeted actions in its ESCMF to address this risk, including the development and implementation of site-specific Environmental and Social Management Plans (ESMPs) that mandate proper handling, storage, and disposal of hazardous substances such as fuels, agrochemicals, and wastewater. Integrated Pest and Nutrient Management Plans will be promoted to reduce dependence on harmful agrochemicals and minimize runoff into water bodies. Water use efficiency will be enhanced through the adoption of climate-smart irrigation technologies, such as alternate wetting and drying (AWD) for rice and drip irrigation systems, which help conserve water and reduce over-extraction from surface and groundwater sources. Energy and raw material use will be optimized by promoting renewable energy solutions and low-carbon infrastructure designs. Contractors will be required to follow Environmental Codes of Practice (ECOPs) and conduct regular monitoring to ensure compliance with pollution prevention measures. These actions are complemented by farmer training, awareness campaigns, and institutional capacity building to ensure long-term adoption of sustainable practices.		
Cultural Heritage	***Moderate***	***Moderate***
Risk: The project presents moderate risks to cultural heritage, primarily due to its potential to inadvertently affect sites or landscapes of historical, archaeological, or spiritual significance. Construction-related activities—such as earthworks, canal excavation, and infrastructure development—could disturb or damage archaeological remains, sacred sites, or culturally significant natural features. There is also the possibility of altering culturally important landscapes or triggering adverse impacts even in areas not previously identified as heritage-sensitive.	Moderate	Moderate
Mitigations: To address this risk, the project will implement a set of preventive and responsive measures embedded in the ESCMF, including the application of a Chance Finds Procedures. Site selection and infrastructure design will be informed by pre-construction cultural heritage assessments, conducted in close coordination with local authorities and communities to identify and avoid culturally significant areas. Contractors will be trained on heritage sensitivity and required to follow Environmental Codes of Practice that incorporate heritage protection protocols. Moreover, the project will maintain continuous community engagement, especially with Indigenous Peoples and local custodians of cultural knowledge, to ensure that traditional practices, sacred sites, and intangible heritage are respected and integrated into planning decisions. These actions are designed to prevent damage, foster cultural inclusion, and uphold national and international standards on heritage protection.		
Indigenous People	***Moderate***	***Moderate***
Risk: The project recognizes the presence of Indigenous Peoples in project area of influence, which may require proactive measures to safeguard their rights, territories, and traditional livelihoods. Although the likelihood of adverse impacts on Indigenous Peoples is considered unlikely, the potential severity of impacts is moderate, particularly concerning land access, cultural integrity, and resource use.	Moderate	Moderate

Mitigations: To address these risks, the project requires the preparation and implementation of a Free, Prior, and Informed Consent (FPIC) Implementation Plan. The FPIC plan will ensures meaningful consultation in culturally appropriate ways, and that consent is obtained prior to any activity affecting them. Additionally, the Indigenous Peoples Planning Framework (IPPF) provides the basis for inclusive planning, outlining procedures for social screening, engagement, and tailored benefit-sharing mechanisms. Mitigation actions include documenting customary land tenure, safeguarding cultural sites, and incorporating Indigenous knowledge into project design and implementation. Where needed, specific Indigenous Peoples Plans (IPPs) will be developed for subprojects, ensuring culturally appropriate mitigation and development benefits .		
Labour and Working Conditions	***Moderate***	***Moderate***
Risk: The project presents risks related to labor and working conditions, particularly concerning child labor, forced labor, and occupational health and safety (OHS). Working conditions may expose workers to hazardous substances, dangerous equipment, or extreme environmental conditions. Specific risks include the potential employment of children under the national minimum age in farming activities, informal labor with no contractual protections, and unsafe exposure to pesticides or mechanized tools by smallholder farmers and laborers.	Moderate	Moderate
Mitigations: To mitigate these risks, the project will implement a suite of measures, in line with IFAD's labor standards and national regulations. These include: (i) mandatory compliance with national labor laws and international labor conventions, particularly on minimum age and forced labor; (ii) the preparation of labor management procedures that define standards for recruitment, grievance redress, and working conditions; (iii) training and awareness-raising for implementing partners, contractors, and farmers on acceptable labor practices and occupational safety protocols; and (iv) the promotion of safe and mechanization-appropriate technologies and personal protective equipment (PPE). In addition, the ESCMF calls for due diligence across the value chain, including subproject screening for labor risks, integration of mitigation measures in Environmental and Social Management Plans (ESMPs), and active monitoring of labor practices during implementation. The project will also establish worker grievance mechanisms to report labor-related concerns anonymously and without retaliation.		
Community health, safety and security	***Moderate***	***Moderate***
Risk: The project activities entail risks to community health and safety, primarily due to potential exposure to hazardous materials, increased traffic, labour influx, and gender-based violence (GBV). The transport and use of hazardous substances (e.g., fuel, agrochemicals) during construction and agricultural activities could pose risks of spills, contamination, or accidental exposure to local populations. Rehabilitation of rural roads is expected to lead to increased traffic and changes in flow patterns, which may heighten the risk of accidents and road-related injuries. Additionally, the anticipated influx of project workers—although assessed as low in scale—could disturb local social dynamics and elevate the risk of sexual harassment, exploitation, and GBV, particularly in vulnerable or remote communities. Public health concerns are also flagged due to the possible transmission of vector-borne and communicable diseases, especially in areas with poor waste and water management.	Moderate	Moderate

Mitigations: The project includes measures to address and manage the risks in this aspect. Specific mitigation measures, including: the adoption of hazardous materials management protocols, road safety and traffic management plans, community sensitization on health and safety, and the development of a GBV Action Plan with survivor-centered support mechanisms and grievance pathways will be implemented, as well as continuous stakeholder management activities to ensure consultation wilth local stakeholders consistently address these issues.		
Physical and Economic Resettlement	***High***	***High***
Risk: The project is expected to involve both physical and economic displacement due to land acquisition for irrigation schemes, rural roads, and related infrastructure. According to the risk screening, physical displacement is considered almost certain and severe, particularly for households without legally recognized land rights, while economic displacement—such as loss of access to land, water, or livelihood resources—is deemed substantial. Although forced evictions are not anticipated, the project may lead to changes in land tenure arrangements and impact customary or community-based property rights.	High	High
Mitigations: The project has developed a Land Acquisition and Resettlement Planning Framework (LARPF) which outlines all measures that will be implemented to ensure that the risks in relation to resettlement are systematically identified and managed consistent with the requirements of IFAD, AIIB and national requirements, Tge LARPF also provides guidance regarding Voluntary Land Donation (VLD), to ensure it is conducted under strict conditions. The preparation of Resettlement Action Plans (RAPs) for subprojects involving displacement, and compensation at full replacement cost will also consider livelihood restoration for affected persons and recognize customary tenure systems, particularly for vulnerable groups such as Indigenous Peoples and ethnic minorities. Continuous stakeholder engagement specific to address this risk will be maintained with all relevant stakeholders, and affected communities in particular to ensure their needs and views are considered throughout the process.		
Greenhouse Gas Emissions	***Low***	***Low***
Risk: Rice is a major source of GHG emissions in the AFOLU sector in Cambodia, owing to the practice of continuous flooding in the cultivation season (water is drained only when there are threats of floods) and the use of fertilizers in excess and unadjusted to local soil conditions. There is also some use of compost. Sustainable intensification practices are limited, and rice yields are also the lowest in Asia – implying that GHG emission intensity is on the higher end (i.e., yield-scaled emissions are likely high). Fertilizer use for non-rice crops also contributes to Cambodia's agricultural GHG emissions. Finally, farmers resort to using diesel pumps to irrigate their rice fields because (a) gravity systems is insufficient / unfeasible or (b) meet irrigation requirements during the dry season and dry days of the wet season.	Low	Low

Mitigations: The project aims to support rice and other agricultural production to achieve food security and agricultural sector growth, without compromising on Cambodia's GHG emission reduction targets outlined in its NDCs. The project will enable increased cropping intensity and rice productivity through (a) management practices (e.g., increased and appropriate use of compost, system of rice intensification - SRI, alternate wetting and drying - AWD, drip irrigation, land leveling), (b) deployment of solar irrigation as an alternate to diesel pumping systems, and (c) timely and relevant CIEWS, improved irrigation schemes, and water user governance capacity to inform irrigation scheduling and improve water-use efficiency, which can improve yields without increasing rice cultivation area and underpin practices such as AWD. Innovations such as the reclamation of rice straw for production of mushrooms will also be supported. Similarly, diversification into, and sustainable intensification of, non-rice crops and aquaculture / poultry production will also be promoted. The combination of these transitions is expected to reduce GHG emissions, in addition to contributing to climate change adaptation and resilience. EX-ACT analysis has been completed, with a clear outline of assumptions.		
Vulnerability of target populations and ecosystems to climate variability and hazards	***Substantial***	***Substantial***
Risk: The target populations and ecosystems are highly vulnerable to the impacts of climate change.	Substantial	Substantial
Mitigations: The project objective is to increase climate adaptation, mitigate the negative impact of extreme climate events, and improve livelihoods of smallholder farmers and vulnerable rural communities. The project activities will be informed by a rigorous climate risk analysis and climate rationale to ensure a good integration of locally adapted resilient practices and technologies and avoid any risks of maladaptation. This is presented in the Climate Context section of GCF proposal (IFAD Targeted Adaptation Assessment), including identification and prioritization of relevant adaptation measures. The project will not increase the exposure or vulnerability of target populations' livelihoods, ecosystems, economic assets or infrastructure to climate variability and hazards.		
Stakeholders	**Moderate**	**Moderate**
Stakeholder Engagement/Coordination	***Moderate***	***Moderate***
Risk: Insufficient consultation / engagement with stakeholders on key project interventions	Moderate	Moderate
Mitigations: Stakeholder engagement based on ACs, with governance benchmarks including consultation and engagement to be achieved as criteria for investments.		
Stakeholder Grievances	***Moderate***	***Moderate***
Risk: No effective channel established for investigation and redress of stakeholder grievances.	Moderate	Moderate
Mitigations: Multi-level grievance redress mechanism to be established and information made available to project affected persons through multiple channels (online, information leaflets, meetings).

IFAD Design Guidelines Annex XVII: Green Climate Fund (GCF) Cofinancing Projects

Requirement for DRM Meetings:

1. Updated Decision Memo for co-financing GCF projects for DRM
2. GCF Funding Proposal (FP)
3. Results framework from GCF (with IFAD core indicators clearly integrated)
4. Annex (IFAD standard requirement at DRM): Theory of change
5. Annex (IFAD standard requirement at DRM): First Annual Work Plan and Budget (AWPB) for first 18 months
6. Annex (IFAD standard requirement at DRM): Integrated Project Risk Matrix (IPRM)
7. Annex (IFAD standard requirement at DRM): Exit Strategy
8. Annex (IFAD standard requirement at DRM): Mainstreaming Tool
9. GCF Annex 1: NDA no-objection letter(s) (template provided) (mandatory)
10. GCF Annex 2: Feasibility study - and a market study, if applicable (mandatory)
11. GCF Annex 3 (and also IFAD standard requirement at DRM): Economic and Financial Analysis (mandatory)
12. GCF Annex 4 (and also IFAD standard requirement at DRM): Detailed budget plan (template provided) (mandatory)
13. GCF Annex 5. Implementation timetable including key project/programme milestones (template provided) (mandatory)
14. GCF Annex 6: SECAP (ESS disclosure form provided): Environmental and Social Impact Assessment (ESIA) or Environmental and Social Management Plan (ESMP) or Environmental and Social Management System (ESMS), or Others (e.g. Resettlement Action Plan, IP Plan, Gender Plan, Land Acquisition Plan, etc.) (mandatory)
15. GCF Annex 7: Summary of consultations and stakeholder engagement plan (mandatory)
16. GCF Annex 8: Gender assessment and project level action plan (template provided) (mandatory)
17. GCF Annex 9: Legal Due Diligence (Regulation, Taxation and Insurance) (mandatory)
18. GCF Annex 10 (and also IFAD standard requirement at DRM): Procurement Plan for first 18 months (template provided) (mandatory)
19. GCF Annex 11: Monitoring and evaluation plan (template provided) (mandatory)
20. GCF Annex 12: AE fee request (template provided) (mandatory)
21. GCF Annex 13: Co-financing commitment letter, if applicable (template provided) (mandatory)
22. GCF Annex 14: Term sheet including a detailed disbursement schedule and, if applicable, repayment schedule (mandatory)
23. GCF annex 21 (and also IFAD standard requirement at DRM): Project Implementation Manual (PIM)
24. GCF Annex 22. Assessment of GHG emission reductions and their monitoring and reporting (for mitigation and cross cutting-projects) (Annex 22 is mandatory for mitigation or cross-cutting projects)

Inputs needed for ORMS

1. Project Identification Form (PIF)
2. Integrated Integrated Project Risk Matrix (IPRM)
3. Logframe core IFAD indicators
4. Mainstreaming Validation (done after DRM, before final endorsement)

Climate Adaptive Irrigation and Sustainable Agriculture for Resilience

Project Design Report

Annex: Theory of Change GCF approved

Document Date:	28/07/2025
Project No.	2000003926
Report No.	7034-KH

Asia and the Pacific Division
Programme Management Department

IMPACT PARADIGM SHIFT
IF the irrigation system is upgraded and modernized, farmers are made aware of climate risks and extended support for mitigation and adaptation THEN 1.7 million people will improve their health, livelihoods and food security and 1 million tonne of CO2-eq emission will be reduced BECAUSE of enhanced resilience of the agriculture sector to climate change resulting from improved agricultural productivity practices, more resilient irrigation infrastructure, water and soil management, better market linkage, and institutional support.
OUTCOMES & Co-BENEFITS
Outcome 1:. Reduction in crop losses & improved production
Co-benefit 1 Increased decision-making power of women through greater community collaboration and participation
Co-benefit 2:Greater private sector integration in rural economy
Outcome 2 Increased water use conveyance and use efficiency
Outcome 3 Enhanced environmental governance
OUTPUTS
Output 1.1 Increased farmer capacity in climate smart agriculture
Output 1.2:Climate adaptive value chains developed by 4Ps and increased access to finance
Output 1.3 Increased access to and use of climate information and advisory services for climate responsive water-use and crop planning.
Output 1.4 Increased resilience of farm road infrastructure to climate change
Output 2.1 Modernized irrigation schemes and ponds
Output 2.2 Flood-proofing and drainage improvement
Output 2.3 Farmers Water User Communities (FWUC) established and trained
Output 2.4 Water Information System in the three sub-projects
Output 3.1 Strengthened MOWRAM
Output 3.2 NCDDS strengthened at national and provincial level
ACTIVITIES
1.1.1 Preparation of community-based action plans (AP)
1.1.2 Preparation of training materials to support AP implementation
1.1.3 Conduct TOT to create pool of expertise to demonstrate CR technologies
1.1.4 Training and advisory on CR technologies and practices
1.1.5 Tailored mechanization for improved services
1.1.6 Community-based M&E of the implementation
1.2.1 Value chain study and planning
1.2.2 Establish Multi-Stakeholder Platforms (MSPs)
1.2.3 Public-Private-Producer-Partnership Facility (4PF) and capital
1.3.1 Strengthening agrometeorological stations
1.3.2 Establish provincial coordination platform for climate-informed advisories
1.3.3 Build the capacities to deliver services
1.3.4 Establish agromet information, warning systems, awareness
1.4.1 to 1.4.4 Planning, DED and construction of 90 km farm roads
2.1.1 Technical analysis, field survey & preparation of plan for system upgrade
2.1.2 Implementation of infrastructure upgrading
2.1.3 Prepare canal O&M plans
2.2.1 Technical analysis, field surveys and preparation of plans for system upgrading
2.2.2 Strengthening and construction of flood control and drainage infrastructures
2.3.1 Formation and institutional strengthening of the FWUC
2.3.2 Build technical capacities of FWUC for canal O&M
2.4.1 Preparing all processes for establishment of the SCADA and water information system
3.1.1 Strengthening river basin management and water accounting systems
3.1.2 Communicating with stakeholders
3.1.3 Support to and guidance of leaders of commune, village and FWUCs and gender awareness
3.2.1 Strengthening of NCDDS at the national level
3.2.2 Strengthening of the provincial teams
BARRIERS, RISKS
Lack of knowledge about adaptation technologies and practices
Limited access to improved adaptation technologies and clean energy sources
Lack of access to investment and working capital for production inputs
Limited access to financial resources for investment in irrigation infrastructure
Irrigation infrastructure vulnerable to climate events
Weak capacity of users to manage the water system
Weak institutional capacity - water governance, weather forecasting, M&E, and O&M
The available technologies are beyond the financing capacity of farmers.
Low risk appetite of financial institutions to lend to the agriculture sector
Private sector does not have interest to enter mitigation / adaptation market in view of limited demand
Frequent damage due to climate threats provides limited incentive to RGC to invest in these large schemes
Social and environmental risks limits the appetite to invest in these schemes
Competing demands on Government budget limits government commitment.
ASSUMPTIONS
Overall political and economic stability in the country and no overall risk that restricts social and economic interaction
Higher input costs and fluctuating rice revenues do not discourage the smallholder farmers
The volumes and quality of produce attracts the private sector to engage with smallholder farmers
The employment and income opportunities in the agriculture sector attract youth to the sector.

Re: Funding proposal for the GCF by IFAD regarding Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR)

Dear Ms. Duarte,

We refer to the project titled CAISAR in Cambodia as included in the funding proposal submitted by IFAD to us on 18 February 2025. The undersigned is the duly authorized representative of Ministry of Environment, the National Designated Authority of Cambodia. Pursuant to GCF decision B.08/10, the content of which we acknowledge to have reviewed, we hereby communicate our no-objection to the project as included in the funding proposal.

By communicating our no-objection, it is implied that:

(a) The government of Cambodia has no-objection to the project as included in the funding proposal;
(b) The project as included in the funding proposal is in conformity with the national priorities, strategies and plans of Cambodia;
(c) In accordance with the GCF's environmental and social safeguards, the project as included in the funding proposal is in conformity with relevant national laws and regulations.

We also confirm that our national process for ascertaining no-objection to the project as included in the funding proposal has been duly followed.

We acknowledge that this letter will be made publicly available on the GCF website.

Please, **Ms. Duarte**, accept the assurances of my consideration and regards.

Sincerely Yours,
Minister

EANG Sophalleth

MINISTRY OF WATER RESOURCES AND METEOROLOGY

Climate Adaptive Irrigation and Sustainable Agriculture for Resilience Project

Annex 6

ENVIRONMENTAL, SOCIAL AND CLIMATE MANAGEMENT FRAMEWORK

Version 2

30 September 2023

ACKNOWLEDGEMENTS

The CAISAR project is composed of three sub-project command areas – Ou Ta Paong, in Pursat Province, Lum Hach, in Kampong Chhnang Province and Krang Ponley in Kampong Chhnang, Kapong Speu and Kandal This ESCMF report was submitted by the Cambodia Ministry of Water Resources and Meteorology (MOWRAM) (Accredited Entity) for GCF financing under the CAISAR project. The report was prepared by Ron Livingston (CAISAR SECAP Team Leader) with key inputs from Tuan Anh Le (CAISAR SECAP Gender and Social Safeguards Expert); Sopheak Kong (CAISAR SECAP National Deputy Team Leader) and Socheat Penh (CAISAR SECAP National Environmental Expert under the overall guidance of his H.E. Chann Sinath, MOWRAM AIIB Project Director; Ms. Bo Zhang, CAISAR Project Team Leader, Investment Operations Officer, AIIB; and Mr. Frew Behabtu, Country Director for Cambodia, IFAD.

The ESCMF report should be read in conjunction with the other safeguards documents (Stakeholder Engagement Plan, Resettlement Planning Framework, Indigenous Peoples Planning Framework, Gender Assessment & Social Action Plan, and Environmental and Social Impact Assessment).

Assessment of environmental and social risks and impacts, both inherent and project-related, was based on supporting background reports, desk reviews of literature and similar projects, and extensive consultation during the project design. Many consultations with National, Provincial and District agencies and community members in project communes have been undertaken on the various aspects of the CAISAR project. The first round of consultations specific to the ESCMF were conducted during June 2023. We are grateful to the focal points of four project provinces who worked hard to support the introduction of the planned projects and discussions on the planned objectives, outcomes and benefits. Without their commitment and active support in leading the extensive consultation effort, the consultations would not have been possible.

We are grateful to each and every member of the target communities from the communes and districts of the four project provinces who participated in various consultation sessions. Their important insights about their respective communities and suggestions to the project's design are key to its success. The information they provided was extremely helpful for guiding the focus, design, and planned implementation of the project interventions.

We also thank colleagues and reviewers for their insights, comments, and suggestions, including: Mr. Sheikh Naveed Ahmed, AIIB Social Safeguard Specialist, Ms. Xinchen Zhang, AIIB Environmental Safeguard Specialist, Mr. Rahul Srivastava, AIIB Senior Environment Specialist, Ms. Alessandra Gage, FAO Environment Officer (Climate Change), and Susmita Bandyopadhyay, IFAD Safeguards Specialist for Asia & Pacific Region and many other colleagues whose comments and suggestions have enhanced the quality of the safeguard reports.

EXECUTIVE SUMMARY

1. **Project Rationale**: The CAISAR project covers a total command area of 45,000ha and is composed of three sub-project command areas – Ou Ta Paong, in Pursat Province, Lum Hach, in Kampong Chhnang Province and Krang Ponley in Kampong Chhnang, Kapong Speu and Kandal. The project objective is to improve agriculture productivity by providing irrigation and flood protection in the project areas. The project design is to increase climate adaptation, mitigate the negative impact of extreme climate events, and improve livelihoods of smallholder farmers and vulnerable rural communities in four provinces of Cambodia (Pursat, Kampong Chhnang, Kampong Speu, and Kendal). Mitigation is a co-benefit of this adaptation project, as it will also contribute to reduce GHG emissions, including methane emissions from rice fields. These objectives will be achieved by implementing three components that aim at addressing climate change vulnerabilities, increasing agriculture productivity, and developing institutional capacities. The investments to be implemented will (i) combine robust climate-resilient water management and agricultural practices at the farm level, (ii) establish climate-proofed irrigation and flood control infrastructure and (iii) develop institutional capacity to plan, maintain and operate irrigation and flood control infrastructure in a changing climate context. The CAISAR project has a broad positive impact benefitting 120,000 households (500,000 rural people) directly while its effect will propagate to over 3 million people in the region. The project will be executed through the Ministry of Water Resources and Meteorology (MOWRAM) and the National Committee for Sub-National Democratic Development Secretariat (NCDD-S), a Direct Access Accredited Entity to the GCF. The expected timelines for the approval of the co-financing by IFAD and AIIB Executive Boards are respectively September 2024 and January 2024, with the inception of the project is expected to take place in December 2024.

2. **Methodology for Risk Categorization:** Project-related and inherent environmental, social, and climate risks were determined by: (i) screening the project activities against the International Fund for Agricultural Development's (IFAD's) Social, Environmental, and Climate Assessment Procedures (SECAP) requirements, the AIIB's Environmental & Social Framework (ESF), and the Green Climate Fund's (GCF's) Environmental & Social Policy; (ii) considering the findings of desk research on risks associated with similar projects and relevant background papers; and (iii) incorporating findings from the first round of ESCMF stakeholder consultations and previous stakeholder engagement efforts in the form of household surveys (630 households in total), 100 focus group discussions, and 100 key informant interviews. Numerous missions to the project areas and discussions with provincial and district agencies and communes enhanced understanding of project objectives.

3. The initial SECAP review identified patterns of existing issues inherent to the project area which could increase risk to the project, its personnel, and/or beneficiaries. Additional desk research highlighted further areas of potential inherent risk and lessons-learned from other projects. The screening of CAISAR project activities, together with the ESCMF stakeholder meetings, household survey responses, focus group discussions, key informant interviews, and field visits with consultations provided insight on the latest conditions which could affect the success of the project and the potential project-specific impacts (both positive and negative).

4. **Framework Approach:** Given that site locations for project implementation have not been finalized, the design team agreed to use a framework approach consistent with IFAD's SECAP and GCF's ESS. Documentation is based on the format typically provided for a GCF project, rather than the typical IFAD SECAP note format, to simplify the approval process. This was agreed upon with AIIB and IFAD headquarters prior to development of this ESCMF.

5. **Project Impacts & Inherent Risks:** The safeguards categorization for CAISAR is high for both social and environmental impacts and risks. To address issues of climate-induced risks and impacts, the CAISAR project will apply several climate resilience measures and adaptation strategies including climate-informed planning, integrated water resources management, efficient irrigation practices, water storage and reservoir management, ecosystem-based approaches, early warning systems, climate-resilient

infrastructure, capacity building and awareness, stakeholder engagement and participatory approaches, and monitoring and evaluation. These measures will be financed under the project, as the project explicitly targets climate mitigation and adaptation by design.

6. **Key social impacts to be considered as part of the ESCIA** include: (i) potential contraction of diseases (e.g. sexually transmitted diseases such as HIV/AIDS, and/or other communicable diseases) due to labor influx; (ii) potential conflict with local communities due to construction workers who work and stay near the community; (iii) potential labour-related accidents for persons hired by the project construction companies to support seasonal construction work; (iv) gender based violence and/or sexual harrassment and abuse (e.g. verbal and physical abuse, sexual harrassment, violence against children) due to the influx of labour; (v) child labour/age inappropriate work, (vi) forced labour (e.g. coerced to work through the use of violence/intimidation, or by more subtle means such as debt manipulation, retention of identity papers, or similar threats); (vii) possible social exclusion (due to vulnerability, land tenure issues, disability, etc.); and (viii) lack of contract for EM workers, particularly for seasonal works of less than one month's duration.

7. The above risks to be evaluated as part of the ESCIA are not considered to be serious in nature and mitigation measures will be included in the ESCMP. General mitigation measures are provided within Chapter IV of this Environmental, Social and Climate Management Framework (ESCMF).

8. **Key environmental impacts to be considered as part of the ESCIA include:** The project is expected to have largely positive environmental impacts, including improved ecosystem services, soil fertility/soil health, forest health, and natural resources management. Potential negative environmental impacts to be mitigated include are related to small-scale infrastructure (e.g. construction/repair of small-scale rural roads, irrigation channels, small-scale reservoirs, etc.). These impacts may include: (i) erosion and run-off to water bodies during earthworks/construction; (ii) temporary traffic blocks and related safety issues during construction and operation; (iii) temporary pollution from construction (e.g. dust, noise, vibration, waste & wastewater generation from workers' campsites); (iv) potential water pollution from sourcing aggregates/construction materials (soil, gravels); and (v) increased water consumption. Additional environmental risks (not explicitly linked to construction activities) include: (i) presence of unexploded ordinances (UXOs) at project sites (an inherent risk listed below); and (ii) increased use of pesticides due to crop intensification/improved crop yields. As with the social risks and impacts, mitigation measures for the environmental risks and impacts are provided in Chapter IV of this ESCMF.

9. To mitigate issues pertaining to social exclusion and conflict over land use/land tenure/land management, related safeguards documents, like the Stakeholder Engagement Plan (SEP), Indigenous Peoples' Plan (IP Plan), and Gender Assessment and Action Plan (GAP), have been developed to supplement this ESCMF and improve overall project design. The Grievance Redress Mechanism (GRM) is also available for any project affected persons who feel they have been negatively impacted or excluded and is detailed in Chapter IX of this ESCMF.

10. **Inherent Risks:** There are inherent risks pertaining to presence of landmines and unexploded ordinances (UXOs) if construction occurs in new areas (i.e., areas without existing construction/infrastructure/activities). Inherent risks are addressed with project-related impacts under Chapter IV of the ESCMF.

11. **Implementation:** The ESCMF will be implemented with the support of two safeguards specialists with MOWRAM Project Management Unit. Further support at the commune level will be determined by inclusion of safeguards-related obligations within the Terms of Reference of the project staff/implementing agencies. For construction financed under the project, contractors will be obliged to abide by the GCF and AIIB and IFAD safeguards requirements, in addition to national legislation/regulations, and commit to Environmental and Social Management Plans (ESCMPs) and Environmental Codes of Practices (ECOPs) as part of their contract. Independent ESC monitoring will be conducted over the life of the project construction and implementation phase. A socio-economic and census survey will be conducted to support the development of the Resettlement Plan.

1. INTRODUCTION

1.1 Project Rationale

1 The CAISAR project covers a total command area of 45,000ha and is composed of three sub-project command areas – Ou Ta Paong, in Pursat Province, Lum Hach, in Kampong Chhnang Province and Krang Ponley in Kampong Chhnang, Kapong Speu and Kandal. The project objective is to improve agriculture productivity by providing irrigation and flood protection in the project areas. The project design is to increase climate adaptation, mitigate the negative impact of extreme climate events, and improve livelihoods of smallholder farmers and vulnerable rural communities in four provinces of Cambodia, including Pursat, Kampong Chhnang, Kampong Speu, and Kendal provinces. Mitigation is a co-benefit of this adaptation project, as it will also contribute to reduce GHG emissions, including methane emissions from rice fields. These objectives will be achieved by implementing three components that aim at addressing vulnerabilities of farming communities to climate change, increasing agriculture productivity, and developing institutional capacities. The investments to be implemented will (i) combine robust climate- resilient water management and agricultural practices at the farm level, (ii) establish climate-proofed irrigation and flood control infrastructure and (iii) develop institutional capacity to plan, maintain and operate irrigation and flood control infrastructure in a changing climate context. The CAISAR project has a broad positive impact 'enefitting 120,000 household (500,000 people) directly while its effect will propagate to over 3 million people in the region. The project will be executed through the Ministry of Water Resources and Meteorology (MOWRAM) and the National Committee for Sub-National Democratic Development Secretariat (NCDD-S), a Direct Access Accredited Entity to the GCF. The expected timelines for the approval of the co-financing by IFAD and AIIB Executive Boards are respectively September 2024 and January 2024, with the inception of the project is expected to take place in December 2024.

1.2 Country & Project Context

2 The CAISAR Feasibility Study noted that Cambodia is highly vulnerable to climate change and natural disaster risks. It is ranked 151 out of 181 countries in the 2020 ND-GAIN Index, was the 12th most disaster-prone country among 172 countries for 1999–2018 and remains one of the few Least Developed Countries (LDCs) in Asia. Annual economic losses resulting from natural disasters in the country were estimated at 0.7% of GDP in 2011. The World Risk Index of 15.8% indicates a very high risk of disaster because of extreme natural events, with an exposure index of 27% and a vulnerability index of 59%. Approximately 80% of the country is within the Mekong River and Tonle Sap basins, increasing exposure to floods, storms, and droughts. Identified hazards are assessed as high across the whole country for river floods and coastal floods, cyclones, extreme heat, and wildfires. By mid-century, climate change will result in more frequent heavy precipitation days, from 2.4 days to 4.9 days in the rainy season, and an increase in the number of consecutive dry days in the same season from 0.8 days to 4.4 days. The median temperature is projected to increase by 1.6°C by 2060.

3 Cambodia has approximately 4.5 million ha of cultivated land, 70% of which is rice production, as well as industrial crops (20%), rubber plantations (7%), and permanent crops (4%). Cambodia maintains a high reliance on the agriculture sector, which accounts for nearly 22% of the country's GDP while the rural population represents 75.8% of the national population[1]. In Cambodia, relatively low yields, coupled with frequent natural disasters, contribute to temporary food shortages for vulnerable communities. Based on food availability and food access, a mapping of food security has been conducted for the country. Seven of Cambodia's 25 provinces (including Phnom Penh) are classified as acutely food insecure, and an additional seven are moderately insecure. Livelihoods rely heavily on rain-fed agriculture and non-poor households are vulnerable to falling back into poverty in the event of extreme or frequent climate shocks[2].

[1] UNDESA (2018) The Least Developed Country Category: 2018 Country Snapshots. Available at: https://www.un.org/development/desa/dpad/wp-content/uploads/sites/45/Snapshots2018.pdf.

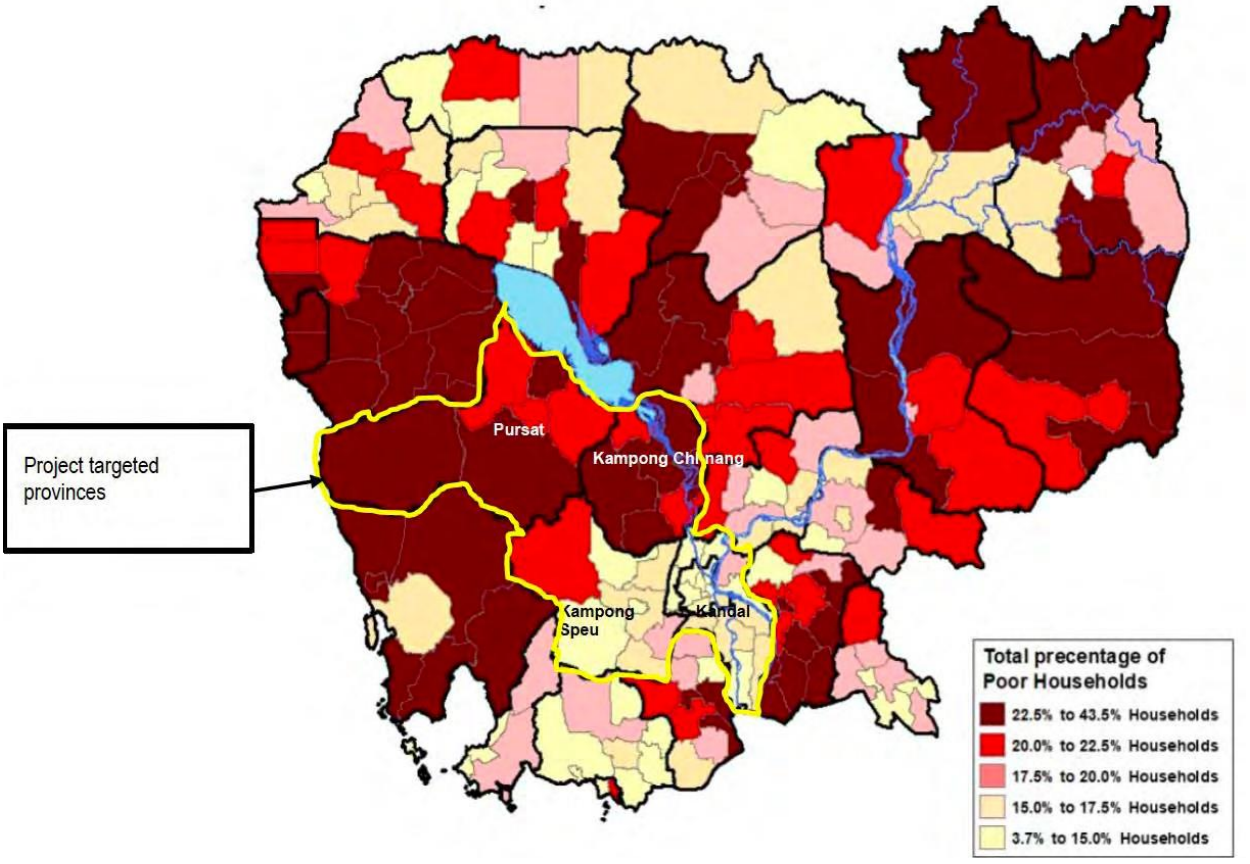
4 Women and children are among the most vulnerable groups to climate change. Climate adaptation among rural populations and national institutions remains low as many households face rising debt caused by coping with natural disasters and the COVID-19 pandemic. Since 2020, the negative impacts of climate change and the pandemic led to a 10% loss in Gross Domestic Product (GDP). In addition to negative climate impacts, the stagnating global agricultural commodity prices, rising labor costs and the limited scope for cropland expansion in the country will challenge the agriculture sector (WB, 2015)[3].

5 Farming remains mostly subsistence-based and rain-fed, with low productivity. Only 7 – 8% of the total potential agricultural land area is under full irrigation in Cambodia. Further, only 15% of the cultivated rice area is irrigated (compared to 28% in Thailand and 46% in Viet Nam), and 85% of the rice cropping area is vulnerable to changing rainfall patterns[4]. Therefore, while rice accounts for 50% of agricultural GDP, yields are lower than neighboring countries. The lack of water for irrigation is a crucial barrier for farmers to deal with climate change-induced water shortages, and to cultivate more than a single crop per year – limiting their resilience and adaptive capacity. Studies suggest that shifting to irrigated cultivation could result in annual overall production increases of up to 40%. The lack of timely information on droughts and floods (seasonal forecasts, the changing length) is another barrier. Furthermore, farmers lack the knowledge and tools to adapt their farming practices / production techniques to climate change; they are largely unaware of climate resilient practices (e.g., alternatives to flooded rice cultivation or application of AWD methods in rice), stress-tolerant seed varieties and improved planting materials, efficient input management, and the benefits of applying such practices. The labor shortage in rural areas has increased due to migration to urban areas, which in turn has led to a rise in agricultural wages. Other significant barriers for small-scale farmers include access to credit on attractive and appropriate terms, and market intelligence. Cambodia is unlikely to achieve 5% of their annual agricultural growth target by 2030, without more investment in climate adaptation, sustainable irrigation, and flood control and drainage schemes. Persistent poverty, limited access to finance, and insufficient institutional capacities have left the rural agrarian population vulnerable to the negative impacts of climate change, economic slowdown, and environmental degradation.

6 The local private sector also fails to offer technologies that farmers need (e.g., stress tolerant seeds, bio-inputs) and engage in value addition (e.g., rice milling prior to exports) adequately and sufficiently. Production and distribution costs of agricultural products are high compared to the neighboring countries, largely due to high energy and transport costs. Private sector investment in water saving micro technologies in irrigation and extension services remains low due to an unfavorable agri-business environment, such as access to appropriate finance, poor communication and cooperation between government and private sector, and the absence of a clear regulatory framework for the establishment, operation and pricing for the private management of water. Large agri-businesses face high costs and shortages of working capital. Many agri-business firms operate below capacity and potential new investors are reluctant to invest due to low profitability and high risk of failure.



7 There are several obstacles to women's economic empowerment in Cambodia, including (i) the amount of time and responsibility for unpaid domestic and care work, (ii) low levels of literacy and education, and (iii) a lack of access to resources necessary for economic empowerment, and (iv) resilience to climate risks. Women have higher participation in agriculture than men but receive lower benefits and have lower access to land, extension services, financial services, markets, and technologies. Rural youth face difficulties in accessing land, which also limits access to credit, as financial institutions generally require land as collateral and a high proportion migrate to urban areas in search of work. Poverty incidence among ethnic minorities is not significantly higher than among the majority, but they suffer disadvantages in access to health, education and other services.

[4] Kono, A. and Chey, T. 2019. Rapid assessment of upland cashew, mango, organic rice, and vegetable production. Actions for Climate-resilient and Sustainable Agricultural Production in the Northern Tonle Sap Basin. FAO.

8 In Cambodia, GHG emissions are dominated by the Forestry and Other Land Uses (FOLU) sector (60.90%) and agriculture (16.9%), followed by energy (12.10%), IPPU (7.90%) and waste (2.20%) sectors. Under a business-as-usual (BAU) scenario, Cambodia forecasts an increase in emissions from 125.2 MtCO2eq in 2016 to 155.0 MtCO2eq in 2030. While the emissions reduction scenarios (by 2030) in the NDCs largely target AFOLU and energy sectors, owing to the links between FOLU (land-use and forest conversion) and agriculture, actions to increase productivity of agricultural lands and interventions such as home gardens are likely to have indirect effect on AFOLU targets[5].

9 The CAISAR target provinces include: Kampong Speu, Kampong Chhnang, Kandal, and Pursat. These provinces[6] have the highest population density, high total percentage of poor households, and a high percentage of women-headed households (Figure 1). The livelihoods of the poorest and most vulnerable people in the region depend mainly on agricultural production and water availability through precipitation, river flow, and irrigation schemes. This area and its population is particularly vulnerable to climate risks due to changing weather patterns and flooding.

10 The project area was already under stress prior to the COVID-19 pandemic with small-scale farmers and larger food producers struggling to produce food and access markets. Food shortages face, additional pressure from climate change with serious droughts[7] during the dry months and heavy monsoon during the rainfall season. Rural communities highlight major water problems with competition in irrigation due to aging/lack of infrastructure and reduced water availability in rivers and ponds, which poor communities and households depend on. The proposed underlying investment project will support the government's efforts to sustain food security and rural livelihood after the COVID-19 crisis through the restoration and enhancement of climate-smart and climate-resilient irrigation systems under the "Build Back Better" approach in the target provinces.

1.2.1 *Climate Change Impacts and Vulnerability of the Agriculture Sector*

11 The concept note stated that similar to other monsoon-dependent countries, climate change is altering Cambodia's and project areas' monsoon calendar, increasing total drought days and shifting the start of the rainy season. While annual rainfall is expected to increase, the number of days with rain is decreasing and daily rain intensity is increasing, resulting in extreme rainfall events and flooding risks. The World Resource Institute (WRI) rates the upper and lower Tonle Sap watershed as extremely high for water risk (WRI, Aqueduct). Inter-annual variability in rainfall significantly influences river discharges and between one and four million hectares of Cambodia's floodplain, of which about 25% falls in the project areas, may be submerged during the wet season, reaching critical thresholds for irrigation and ecosystem stability.

12 Flooding in the project areas generally occurs between July and October, driven by rainfall as well as high water levels in the Mekong River and Tonle Sap Lake. With the increased intensity of wet-season rainfall, the duration and extent of flooding have increased in some areas. While local rainfall patterns are important for both irrigated and rainfed agricultural systems, the Mekong-Tonle Sap flood impulse dominates the flooding pattern and hence plays an important role in the overall water management.

13 Observed impacts of climate change trends in recent years have manifested by longer dry seasons and more intense "El Niño" related droughts, delayed onset of the monsoon season, increased rain intensity and frequency, leading to floods, and unexpected dry periods during the rainy season. Annual mean temperature anomaly has increased at a rate of 0.23 °C per decade since 19508, with a stronger signal of increase during the dry season. The rate of temperature change is notable in the dry season (December, January and February) followed by pre-monsoon (March, April and May) and, to a minor extent, by wet season months (June, July and August). The increase in mean annual temperature and decrease in dry season rainfall has manifested in droughts and water shortages significantly impacting rainfed agriculture due to a late start and early ending of the wet season.9

14 On average, annual damages and loss of wet season rice caused by floods and droughts is approximately 120,501 hectares, of which 70 percent of the damage and loss is due to floods and 30 percent is the result of droughts. Flooding occurs frequently and extensively in Cambodia. The source of these floods can be the Mekong River including the Tonle Sap Great Lake, tributary flash floods, urban flooding, and failure of structures such as protection levee and storages. In terms of the population affected, Cambodia is one of the world's most flood-exposed countries in the world. By 2050, population exposed to flood is expected to reach 19% of the population. Projected climate change trend indicates more severe floods and droughts, which is expected to affect Cambodia's GDP by nearly 10% by 2050[10]

[7] Kampong Spoeu, one of the four target provinces, reported the highest number of droughts (one of the eight main natural hazards in Cambodia) between 1996 and 2013. (https://www.unccd.int/sites/default/files/country_profile_documents/1%2520FINAL_NDP_Cambodia%255B1157%255D.pdf).

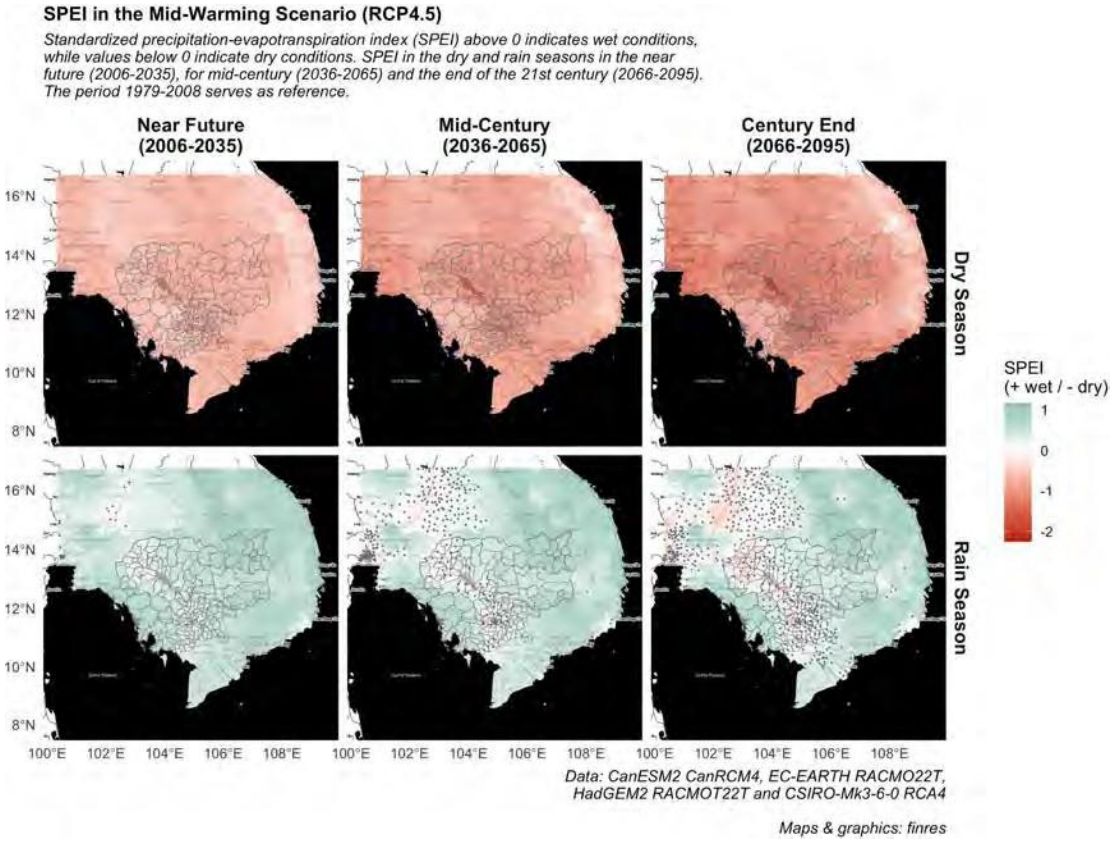
[10] Climate risk country profile, Cambodia. 2021. https://climateknowledgeportal.worldbank.org/sites/default/files/2021-08/15849-WB_Cambodia%20Country%20Profil

15 Drought has significant social and economic impacts in Cambodia, in particular in the project areas. According to the Ministry of Environment. (2002). Report on the Impact of Drought in Cambodia, the drought in 2002 affected 43 districts in eight provinces. Some 442,419 families (2,017,340 individuals) were affected. The total estimated damage was US$ 9 million. Rice and crop production was affected in all provinces and about half a million rural people faced food insecurity. Droughts events have become more frequent as further explained in annex 1, and are expected to intensify in future. According to the International Rice Research Institute, rice grain yield will decline by 10% for each 1°C increase in growing-season minimum (night) temperature in the dry season. In Cambodia, drought has been negatively impacting rice production, and is widely recognized as one of the most serious climate risks for the agriculture sector.



16 The Climate Risk Country Profile, Cambodia 2021 noted that future projections of climate change in the project area under the RCP4.5 scenario (Figure 1-1) indicate a temperature increase of 1.6°C by mid-century (2036-2065) and up to 2.2°C by the end of the 21st century (2066-2095)[11]. Nights exposed to high temperatures are projected to become more frequent during the 21st century (+114 nights by mid- century and +151 nights by the 2080s). Population, crop and livestock systems will also experience heat extremes more frequently in comparison to the reference period (42 days by mid-century and reaching 62 days by the 2080s) and IFAD is expecting a drastic reduction in the productivity of crops and livestock (IFAD's preliminary climate analysis). Out of all the rivers within the Mekong River Basin, the water levels of the Tonle Sap Lake tributaries are anticipated to experience the greatest water decline. These changes in water levels are attributed to shifts in seasonal rainfall distribution and prolonged dry periods (IPCC, 2021).

17 The changes in precipitation and temperature patterns induced by climate change in the project area could affect the climatic suitability of cereals, vegetables and starchy crops produced. On average, for most crops analysed for this project, the temperature suitability could progressively decrease with some crops falling outside their optimal temperature levels. Overall, this change in patterns could contribute to a reduction in crop yield for both irrigated and non-irrigated crops. For example, in the Kampong Chhang region, rice yield could decrease from 9 to 12%, with and without irrigation, respectively, by 2050 (a period of 20 years centred around 2050) compared to 2020 (Climate Risk Country Profile, Cambodia, 2021). These projections are for the RCP8.5 scenario and without CO2 fertilization. As smallholder farmers' incomes are largely dependent on their yield, it is anticipated that farmers' income could become more volatile with a decreasing trend over time. It is projected that vegetables will be increasingly exposed to heat-stress conditions during the pre-monsoon and early wet-season months (March-June). Over these months, heat-stress conditions (>36ºC) will be exceeded more than 50 days during the growing season, lasting approximately 90 days.

18 Climate change affects women, men, and vulnerable people differently, and their responses to its impacts also differ, including in relation to safeguarding food security and livelihoods and coping with hazards and risks. In the project area, women have significantly less access than men to financial instruments, land, natural resources, climate change resources and technologies, education, and other development services for successful adaptation to climate change. Cambodia's Women's Resilience Index, ActionAid, 2022 found women less resilient in times of disaster than men due to women's unstable and insecure sources of income, limited access to shelters or safe places, inadequate early warning information, poor housing, weak social safety nets and absence of emergency networks. Furthermore, women's responsibilities in household resources position them well to contribute to livelihood strategies adapted to

[11] Climate risk country profile, Cambodia. 2021. https://climateknowledgeportal.worldbank.org/sites/default/files/2021-08/15849-WB_Cambodia%20Country%20Profil

changing environmental realities. However, lack of information, access to planning processes, and care obligations, limit their ability to contribute.

Source: GCF Concept Note

Legend: Above 0 indicates wet conditions, while values below 0 indicate dry conditions.

Figure 1-2: SPEI in the high warning scenario (RCP4.5)

19 Agriculture is central to the economic and social life of Cambodia. With 76% of the population currently living in rural areas, Cambodia's populace and economy rely heavily on agriculture and fisheries, contributing 22% of GDP and employing 34% of the country's labour force[12]. As a result, Cambodia has a high dependency on natural resources and climate-sensitive sectors of the economy, which makes it particularly vulnerable to inter-annual and intra-annual changes in climatic conditions. Natural hazards have significant effects on Cambodia's population and pose a serious challenge for water resource management and poverty alleviation in the country. This vulnerability to hazards combined with high exposure to climatic extremes, means that Cambodia is faced with a heightened disaster risk from both floods and droughts.

20 Current climate models project that these climatic extremes will worsen over the coming century, meaning that they must be considered when addressing poverty reduction and economic development. The Royal Government of Cambodia is making efforts to devise strategies that decrease this vulnerability through improved flood and drought proofing, natural disaster preparedness and climate adaptation strategies to reduce risks from floods and droughts. Reducing the impacts of floods and droughts are key priorities for sustainable development (IPCC, **2021**).

[12] Data for 2020, World Bank, World Development Indicators

21 The Royal Government of Cambodia is committed to meetings its greenhouse gas emission targets and ensuring that appropriate mitigation and adaptation efforts are adopted across key sectors of the economy. The Climate Change Strategic Plan 2014 – 2023 sets out the main strategic objectives and directions for climate-smart development in Cambodia over the coming decade and the agriculture sector will be a key player to ensure that the objectives of the plan are met (National Climate Change Strategic Plan 2014-2023, Royal Government of Cambodia, 2013). The agricultural sector therefore has significant potential to reduce poverty, food insecurity and ensure rural populations are resilient and adapted to climate change.

22 The CAISAR project will support the RGC's effort to improve and strengthen the disaster resilience of the populations of four provinces in Cambodia. Through combining irrigation rehabilitation with climate smart and resilient design, the project will build a low carbon and climate resilient future, enabling rural populations to adequately adapt to current and future climate impacts and increase their food security and livelihoods whilst also enabling the RGC to meet its climate targets.

23 **Stakeholder Engagement:** To support development and design of this project, extensive stakeholder engagement was conducted to discern potential positive and negative project impacts, as well as key design opportunities to improve accessibility and participation. In July and September of 2023 stakeholder meetings were conducted with potential communities affected in each project area as well as with key NGOs. Continued stakeholder engagement must involve iterative consultations throughout the project's life cycle with particular attention to vulnerable populations and groups prone to exclusion, be that for reasons of gender, orientation, age, ability, religious beliefs, and/or ethnicity. The guidelines for stakeholder engagement are available in the Stakeholder Engagement Plan (SEP).

24 **Indigenous Peoples/Ethnic Minorites, Women, and Vulnerable, Disadvantaged Persons:** to ensure adequate inclusion of ethnic minorities, women, and other vulnerable persons, an Indigenous Peoples' Plan (IP Plan) and Gender Assessment & Action Plan (GAP) have been prepared to guide project implementers and ensure that considerations for the differentiated needs of ethnic minority (EM) communities, women, and vulnerable persons are built into the project design and monitoring indicators.

25 **Environmental, Social and Climate Management Framework (ESCMF)** serves as the primary guidance document for management and mitigation of environmental, social, and climate risks and impacts throughout the project cycle.

1.3 Purpose and Application of the ESCMF

26 The project objective is to increase climate adaptation, mitigate the negative impact of extreme climate events, and improve livelihoods of smallholder farmers and vulnerable rural communities in four provinces of Cambodia (Pursat, Kampong Chhnang, Kampong Speu, and Kendal). Mitigation is a co-benefit of this adaptation project, as it will also contribute to reduce GHG emissions, including methane emissions from rice fields. These objectives will be achieved by implementing three components that aim at addressing climate change vulnerabilities, increasing agriculture productivity, and developing institutional capacities. The investments to be implemented will (i) combine robust climate-resilient water management and agricultural practices at the farm level, (ii) establish climate-proofed irrigation and flood control infrastructure and (iii) develop institutional capacity to plan, maintain and operate irrigation and flood control infrastructure in a changing climate context.

27 The CAISAR project involves numerous subprojects and activities where specific locations are still to be identified during further design and implementation. Based on the inability to confirm specific sub-projects prior to project appraisal, this Environmental and Social Management Framework (ESCMF) has been prepared. Given small discrepancies in the format of the environmental, social, and climate risks/impacts documentation required for IAAB, FAO, IFAD and GCF funded projects, the Government of Cambodia agreed with IFAD's SECAP specialists based in headquarters to follow the standard GCF documentation, rather than developing two separate sets of documents. According to IFAD's Social, Environmental and Climate Assessment Procedures (SECAP) and the Green Climate Fund's (GCF's)

Environmental and Social Standards, the Lead Agency of the proposed project must prepare and disclose this ESCMF[13] before appraisal.

28 The purpose of the ESCMF is to ensure that the project has concrete plans and processes in place to avoid, minimize, and/or mitigate the risks and potentially adverse project-related environmental and social (E&S) impacts, including climate risks, once the CAISAR activities and/or subprojects are identified, planned, and implemented. This living document: (i) assesses and summarizes project-related risks and impacts; and (ii) sets out the principles, rules, guidelines, and procedures to assess any potential risks and impacts of future subproject and activities identified at a later time. It provides measures to reduce, mitigate, and/or offset those adverse risks and impacts from the project and highlights information about areas where subprojects are expected to be located (including any specific E&S-related vulnerabilities of those areas; potential impacts that may occur; and mitigation measures that might be used). Specific objectives of this ESCMF are to:

- Assess the potential environmental, social, and climate-related risks and impacts of the project, both positive and negative, and propose mitigation measures which will effectively address these risks and impacts;
- Establish clear procedures for the E&S planning, review, approval, and implementation of subprojects and other activities to be financed under the project;
- Specify appropriate roles and responsibilities and outline the necessary reporting procedures for managing and monitoring E&S issues/concerns related to subprojects, TA, and activities;
- Determine the training, capacity building, and technical assistance needed to successfully implement the provisions of this ESCMF;
- Outline and address mechanisms for public consultation and disclosure of project documents, as well as redress of possible grievances; and
- Establish the budget requirements for implementation of this ESCMF.

29 This ESCMF provides information on (i) items ineligible for Project funding; (ii) how to conduct the E&S screening; (iii) risks and impacts classifications; (iv) identification of various E&S documents to be prepared (both prior to and after project approval) and the process to be followed for their preparation (including the clearance process); (v) implementation arrangements; (vi) training and capacity building; (v) grievance redress mechanism; (vi) estimated costs and budget requirements; and (vii) guidelines and specific forms for preparation of the identified E&S documents required. This ESCMF will be applied to all subprojects and activities to be financed by CAISAR.

1.4 Scope of the ESCMF

30 This ESCMF was developed based on a review of project-relevant government laws, regulations, ordinances, and other legal documents; various background papers and reports pertaining to environmental and social conditions of the proposed project areas and potential subproject sites, including feasibility studies; as well as numerous field visits, 630 interviews through Livelihood Household Surveys, 100 focus group discussions, 100 key informant interviews, and other consultations (community meetings) in those areas. Safeguards documents prepared for similar projects and/or projects in related areas (e.g. others financed by AIIB, IFAD, World Bank, FAO, etc.) were also taken into consideration.

31 This ESCMF follows the requirements of AIIB, IFAD's SECAP and the GCF's Environmental & Social Policy, taking into consideration the related guidance notes and documents. Information is presented in ten sections, as follows:

1. Introduction
2. Project Description
3. Policy, Legal, and Administrative Framework
4. Environmental and Social Assessment and Proposed Mitigation Measures

[13] The ESCMF examines the risks and impacts when a project consists of a program and/or a series of subprojects, and the risks and impacts cannot be determined until the program or subproject details have been identified.

5. Procedures for Review, Clearance, and Implementation of Subproject E&S Instruments
6. Implementation Arrangements
7. Capacity Building, Training, and Technical Assistance
8. ESCMF Implementation Budget
9. Grievance Redress Mechanism (GRM)
10. ESCMF Consultation and Disclosure

Other information to be considered includes: (i) ineligible activities; (ii) list of banned and restricted pesticide in Cambodia; (iii) Pesticide Management plan; (iv) Chance Find Procedures; (v) List of Consultations & Attendance; (vi) ESCIA Timeline; (vii) ESCIA Budget; (viii) Environmental and Social Screening Checklist; (ix) Indigenous Peoples Planning Framework; (x) Biodiversity Management Planning Framework; (xi) Resettlement Planning Framework; (xii) Gender Assessment & Social Inclusion Plan; (xiii) Climate Management Framework; (xiv) Stakeholder Engagement Plan

32 **Associated facilities.** This ESCMF is also applied to activities or facilities that are, in the judgement of the AIIB, associated activities and/or facilities as defined in the AIIB's ESF. When this is the case, this ESCMF will be applied to such associated activities and/or facilities – to the extent that MoWRAM has influence over such activities and facilities.

2. PROJECT DESCRIPTION

2.1 Project Objective, Components, Area and Beneficiaries

33 The project's focus is on low-carbon and climate resilient at the farm-level, combined with efficient irrigation and flood control infrastructure and their climate proofing, and institutional development of the FWUCs and the government agencies to strengthen water rights, irrigation fees, and enhance sustainability. Thus, disaster resilience compensation is expected to significantly contribute towards achieving climate change adaptation policy objectives outlined in the NDC, and the individual climate change action plans of the Ministry of Water Resources and Meteorology (MOWRAM). The Project originated from the RGC's National Water Resources Management and Sustainable Irrigation Road Map and Investment Program (2019 -2023), which provides a Strategic Framework for the Irrigation Sector.

The CAISAR project is focusing on climate change adaptation with cross-cutting benefits through the reduction of GHG emissions linked to the use of high-efficiency smart irrigation systems, the use of renewable energy for pumping, and cover techniques to reduce evaporanspiration and enhance GHG reduction. While rice production is a major source of GHG emissions in the AFOLU sector in Cambodia, and the project aims to support production to achieve food security and sector growth, target GHG reduction actions in the project aim to support intensification and diversification without compromising GHG emission reduction targets. This is achieve through adoption of water saving technologies such as alternative wet dry, drip irrigation). A full greenhouse gas accounting will be prepared during the project formulation phase. However, a preliminary analysis of GHG in the target provinces has estimated a reduction of GHG of 90,000 Mt CO2-eq annually and 1,800,000 Mt CO2-eq over the life span of 20 years. The investment in agricultural practices and a whole-of-system irrigation approach will irrigate approximately 40,000 hectares (ha) in the rainy monsoon season and about 20,000 ha in the dry season and, as a result, improve energy efficiency by reducing the water and the carbon footprints.

34 The planned CAISAR project has the following planned components

2.2 Component 1: Improving Farm-level climate adaptation, resilience, and water use efficiency

35 The objective of this component is to build climate resilience (CR) of smallholder farmers and enhance sustainable production through evidence-based planning and context-relevant climate resilient practices at the farm level. This component is designed to address the lack of knowledge and skills to deploy technologies and practices at farm level by farmers and the lack of appropriate extension services to propagate them. It will introduce farmers with various climate resilient technologies and practices for both rice and non-rice activities such as vegetable production, poultry and aquaculture.

Sub-component 1.1 Deployment of farm-level climate adaptation and water use efficiency measures

Output 1.1: Increased capacity of farmers to deploy climate resilient (CR) practices at farm level

This output will focus on developing farmer's capacity in deploying CR technologies and practices to transform the agricultural production system to adapt to the changing climate context. Farmer's will be trained to first develop Action Plans (AP) to re-orient farmer behaviour and assist them in transforming the agriculture production system in a manner that is better adapted to factoring in the agro-ecological context and expected climate change impacts.

- Activity 1.1.1 Preparation of community-based action plans (AP) to transform agriculture with CR practices.
- Activity 1.1.2 Preparation of training materials to support implementation of the AP.
- Activity 1.1.3 Conduct trainings to create a pool of expertise to demonstrate and propagate the CR technologies and practices.
- Activity 1.1.4 Train farmers on applying CR technologies using the FFS approach.
- Activity 1.1.5 Strengthening and fostering tailored mechanization service providers for improved mechanization service delivery.
- Activity 1.1.6 community-based monitoring and evaluation (CBME) of implementation

Sub-Component 1.2 Climate adapted, value added, and market led agricultural investments

Output 1.2 CR value added, and market led agriculture investments secured.

This output involves improving and enhancing some value chains that are key for the project area and include rice, vegetable, chicken and aquaculture value chains, through the use of Public Private Producer Partnerships (4Ps) and increased access to finance, which will improve market access, climate adaptability, and ensure increased income for smallholders in the value chains.

- Activity 1.2.1 Value chain study and planning
- Activity 1.2.2 Establish District Multi-Stakeholder Platforms (MSPs)
- Activity 1.2.3 Public Private Producer Partnership Facility (4PF)

Sub-component 1.3 Improve enabling conditions, capacities and disaster risk management strategies

Output 1.3. Increased access to and use of climate information and advisory services for climate responsive agriculture planning

This sub-component will strengthen the production and dissemination of tailored agro-meteorological information to inform climate responsive management and planning of agriculture in the project target areas through ICT technologies. The aim is to ensure that agro-meteorological services are accessible and useful to farmers to manage climate risks, access to and use of water and efficient cropping systems.

- Activity 1.3.1 Establish ICT based multi-disciplinary platform at provincial level.
- Activity 1.3.2 Building the capacities of the platform to deliver services.
- Activity 1.3.3. Establish the agromet information systems and the outreach mechanisms.
- Activity 1.3.4 Awareness raising and capacity building of farmers and stakeholders in applying the services.

Sub-component 1.4 Rural roads

Output 1.4: Increased resilience of farm road infrastructure to climate change

- Activity 1.4.1 Initial planning and identification
- Activity 1.4.2 Technical survey and design considerations, preparation of cost estimation
- Activity 1.4.3 Improve 50 Kilometers of farm roads.
- Activity 1.4.4 Handing over of the completed works.

2.3 Component 2. Irrigation Infrastructure for increased resilience

Component 2 is linked with Component 1 such that it facilitates the implementation of CR on farm crop and water management practices through improved field level water supply delivery and drainage. It will focus on rehabilitating and modernizing of irrigation and flood protection/drainage infrastructure in the six sub-projects, including irrigation and drainage canals, flood control embankments, and ponds, to provide high-efficiency climate-resilient irrigated agriculture systems for adapting to both increasing flood and drought conditions.

Sub-Component 2.1: Modernization of irrigation scheme and ponds

Sub-Component 2.2: Flood-proofing and Drainage improvements

Sub-Component 2.3: Establishments and training of Farmers Water User Communities (FWUC)

- Activity 2.3.1 Formation of institutional strengthening of the FWUC
- Activity 2.3.2 Build technical capacities of FWCU for canal structure O&M
- Activity 2.3.3 prepare long term financing plan for O&M of the systems including the WUAS.

Sub-Component 2.4: Water information and Management (SCADA)

2.4 Component 3. Institutional Strengthening

36 This component aims to strengthen Government institutions, mainly the MoWRAM, MoE and the NCDD and local institution, the FWUC. While the focus for MoWRAM will be on upgrading technical capacity in various aspects of CR irrigation design and management, key focus area for MoE will be on strengthening climate policies and strategies and in building capacities for monitoring climate actions at national level. It will have three sub-components.

Sub-Component 3.1 MOWRAM capacity Support.

Output 3.1 Strengthened MOWRAM Capacity

Sub-Component 3.2 Strengthening of NDA and NCDD.

Output 3.2 Improved capacities for climate action monitoring

- Activity 3.2.1 Preparation of Loss and Damage Strategy
- Activity 3.2.2 Strengthen national M&E process for climate action
- Activity 3.2.3 Enhancing Capacity of NDA and other stakeholders.

37 **Proposal consistent with Government Framework and priorities and existing investments:** The proposed Project is in line with the national policies of the RGC, especially the "National Water Resources Management and Sustainable Irrigation Road Map and Investment Program 2019 - 2033" issued in July 2019 by MOWRAM with the assistance of the development partners. The proposed Project, with its disaster and climate change adaptation design features, will be upscaled to other provinces. RGC and MOWRAM appreciate that water is a limited resource and is taking an integrated water resource management (IWRM) approach to manage water nationwide. MOWRAM is establishing the Water Resources Data Management Center (NWRDMC) and a National Water Resources Information System (WRIS) with ADB assistance. WRIS is an adaptive system housed in the MWRDMC facility that integrates spatial information, CISIS and IAMS, meteorological data, hydrological data, ground measurements, satellite-derived remote sensing data, and Lidar. All data generated on the CAISAR, and all watersheds, are coalesced in WRIS and used to model water availability, use, and floods across entire watersheds.

38 For this project, AIIB requested IFAD to co-finance and assist with the project design, the project implementation, the country's knowledge to maximize people's resilience to climate change impacts and support the reduction of GHG emissions in agriculture.

3. POLICY, LEGAL AND ADMINISTRATIVE FRAMEWORK

3.1 Applicable National Laws and Regulations

39 In 1993, the Royal Government of Cambodia confirmed a new Constitution in which environmental considerations were included for the first time. Specifically, Article 59 requires the State to protect the environment and balance of abundant natural resources and to establish a precise plan for the management of land, water, air, wind, geology, ecological systems, mines, energy, petrol and gas, rock and sand, gems, forests and forestry products, wildlife, and fish and aquatic resources. It was within this constitutional context that the Ministry of Environment (MOE) was established.

40 The hierarchy of legislation in Cambodia is:

- Royal Decree signed by the King;
- Sub-decree signed by the Prime Minister;
- Ministerial Decision signed by a Minister; and
- Regulation issued by Ministry.

41 A Royal Decree ratifies laws passed by parliament. These can be supplemented by "Prakas" or ministerial decisions. These laws allow sub-decrees and regulations to be passed which can stipulate procedures and standards to be met in order to ensure compliance with the law. Many sub-decrees and standards have been drafted but not yet ratified by parliament.

3.1.1 Laws/Sub-Decrees relevant to Environment and Natural Resources Management

42 The Government of Cambodia has established laws and regulations for forests, protected areas, and land management to ensure sustainable development that are relevant to environmental protection and natural resources management. The key elements of the legal and policy framework for the project are summarized in Table 3-1 below.

Table 3-1: Environmental and Natural Resource Management Policies, Laws & Guidelines

Law/Regulation/Guideline	Year	Summary
Royal Decree on the Protection of Natural Areas	1993	Classified 23 protected areas in Cambodia into four categories: (i) natural parks; (ii) wildlife sanctuaries; (iii) protected landscapes; and (iv) multiple-use areas. Designated the Tonle Sap (316,250 ha) as a multiple-use area or area necessary for the stability of the water, forestry, wildlife and fishery resources, for tourism, and for conservation of long-term existing natural resources with a view to assure sustainable economic development.
Royal Decree on the Establishment and Management of Tonle Sap Biosphere Reserve (Royal Decree No. NS/RKT/0401/070)	2001	Establishes the Tonle Sap Biosphere Reserve (TSBR) in accordance with the statutory framework of the World Network of Biosphere Reserves. Divides the TSBR into 3 zones: (i) core areas; (ii) buffer zone and (iii) flexible transition zone. Core area: set aside for long term protection, human activity is limited to monitoring and research. Buffer zone: area surrounding the core areas helping to protect the environment. It may accommodate education and training activities. Transition area: may contain a variety of agricultural activities and human settlements. Here all stakeholders have to cooperate to achieve sustainable development.

Law/Regulation/Guideline	Year	Summary
Royal Decree No. NS/RKM/0208/007 on Protected Areas	2008	Defines the framework of management, conservation & development of protected areas to ensure the conservation of biodiversity, & sustainable use of natural resources in protected areas. The Law gives the Royal Government of Cambodia the authority to establish or modify Protected Areas (Article 9 and 10). A Protected Area shall be established by sub-decree. Article 11 divides the protected area into 4 zones namely, core zone, conservation zone, sustainable use zone & community zone. Article 36 strictly prohibits all types of public infrastructure in the Core Zone & Conservation Zone; & allows development of public infrastructures in the Sustainable Use Zone & Community Zone with approval from the Royal Government at MoE's request. Article 41 provides for the protection of each protected area against destructive/harmful practices, such as destroying water quality in all forms, poisoning, using of chemical substances, disposing of solid and liquid wastes into water or on land. Article 44 requires all proposals & investments within or adjacent to protected area boundary an Environmental and Social Impact Assessment. The law defines Protected Area as **"***An area of the State's public properties in land or water territories, including coasts and sea, located in the area established by a Royal Decree or a new area established in the jurisdiction of the Ministry of Environment. These areas are of physical and biological importance which requires management by law with the purpose of protecting and maintaining biological, natural and cultural resources, and shall be sustainably managed in every generation for environmental, social and economic benefits*". Each protected area shall be divided into four (4) management zoning systems: **1. Core zone:** management area(s) of high conservation value containing threatened and critically endangered species, and fragile ecosystems. Access to the zone is prohibited except for the Nature Conservation and Protection Administration's officials and researchers who, with prior permission from the Ministry of Environment, conduct nature and scientific studies for the purpose of preservation and protection of biological resources and natural environment with the exception of national security and defence sectors. **2. Conservation zone:** management area(s) of high conservation value containing natural resources,

Law/Regulation/Guideline	Year	Summary
		ecosystems, watershed areas, and Natural landscape located adjacent to the core zone. Access to the zone is allowed only with prior consent of the Nature Conservation and Protection Administration at the area with the exception of national security and defence sectors. Small-scale community uses of Non-Timber Forest Products to support local ethnic minorities' livelihood may be allowed under strict control, provided that they do not present serious adverse impacts on biodiversity within the zone. **3. Sustainable use zone:** management area(s) of high economic value for national economic development and management, and conservation of the protected area(s) itself thus contributing to the local community, and indigenous ethnic minorities' livelihood improvement. After consulting with relevant ministries and institutions, local authorities, and local communities in accordance with relevant laws and procedures, the Royal Government of Cambodia may permit development and investment activities in this zone in accordance with the request from the Ministry of Environment. **4. Community zone:** management area(s) for socio-economic development of the local communities and indigenous ethnic minorities and may contain existing residential lands, paddy field and field garden or swidden (Chamkar).
Law on Environmental Protection and Natural Resources Management	1996	The Law was enacted by the National Assembly and launched by the Preah Reach Kram/NS-RKM-1296/36. It was enacted on 24 December 1996. This law has the following objectives: i. To protect and promote environment quality and public health through prevention, reduction and control of pollution; ii. To assess the environmental impacts of all proposed projects prior to the issuance of a decision by the government; iii. To ensure the rational and sustainable conservation, development, management and use of the natural resources of the Kingdom of Cambodia; iv. To encourage and provide possibilities for the public to participate in the protection of environment and the management of the natural resources; and v. To suppress any acts that cause harm to the environment.
Law on the Protection of Cultural Heritage (NS/RKM/0196/26)	1996	Regulates the protection of national cultural heritage and cultural property in general against illegal destruction, modification, alteration, excavation, alienation, exportation or importation. Its Article 37 stipulates that in case of chance find of a cultural property during construction, work should be stopped and the person who found the property should immediately make a declaration to the

Law/Regulation/Guideline	Year	Summary
		local police, who shall, in turn, transmit the property to the Provincial Governor without delay.
Law on Forestry	2002	Article 1: This law defines the framework for management, harvesting, use, development and conservation of the forests in the Kingdom of Cambodia. The objective of this law is to ensure the sustainable management of these forests for their social, economic and environmental benefits, including conservation of biological diversity and cultural heritage.
Law on Water Resources Management (NS/RKM/0607/016)	2007	Requires license/permit/written authorization for the: (i) abstraction & use of water resources other than for domestic purposes, watering for animal husbandry, fishing & irrigation of domestic gardens and orchards; (ii) extraction of sand, soil & gravel from the beds & banks of water courses, lakes, canals & reservoirs; (iii) filling of river, tributary, stream, natural lakes, canal & reservoir; and (iv) discharge, disposal or deposit of polluting substances that are likely to deteriorate water quality and to endanger human, animal and plant health. (Articles 12 & 22) Its Article 24 stipulates that Ministry of Water Resources and Meteorology (MOWRAM), in collaboration with other concerned agencies, may designate a floodplain area as flood retention area.
Law on the Management of Pesticides and Fertilizers	2012	The Law on the Management of Pesticides and Fertilizers was enacted on 14 January 2012. This law has the following objectives: i. To support a policy promoting the effectiveness potentiality of agriculture sector, for the development of social and national economy; ii. To ensure the safe and effective control of pesticides and fertilizers, whether in consistent with the international standards; iii. To enhance public awareness on the implementation of standard requirements of pesticides and fertilizers for all relevant activities related to these products; and iv. To reduce risks caused by the use of pesticides and fertilizers, for beneficiary of farmers and people in the nationwide, by ensuring food security, food safety, public health, and the sustainability of environment. The scope of the law shall apply to the management and the implementation of standard requirements for: i. All type of pesticides and fertilizers, raw materials or active ingredients and other compositions of pesticides and fertilizers which are used as inputs in agricultural production. ii. All activities of natural persons or legal entities who are traders, formulators, pests control services operators, advertisers, donors, and users of all types of pesticides and fertilizers.
Sub-decree on Environmental Impact Assessment Process	1999	The Sub-decree No. 72 ANRK.BK in the Law on Environmental Impact Assessment Process dated 11 August 1999 sets out EIA procedures. The main objectives of this sub-decree are:

Law/Regulation/Guideline	Year	Summary
		i. To determine an EIA for every private and public project or activity, through review by the MOE, prior to the submission for a decision from the government; ii. To determine the type and size of the proposed project(s) and activities, including existing and ongoing activities in both private and public sector prior to undertaking the process of EIA; and iii. To encourage public participation in the implementation of the EIA process and take into account their input and suggestions for reconsideration prior to theimplementation of any project.
Sub-decree No. 36 ANK/BK on Solid Waste Management	1999	Article 1: Regulates solid waste management to ensure the protection of human health and the conservation of biodiversity through using appropriate technical approaches. Article 2: This sub-decree applies to all activities related to disposal, storage, collection, transport, recycling, dumping of garbage and hazardous waste. Article 4: The Ministry of Environment shall establish guidelines on disposal, collection, transport, storage, recycling, minimizing, and dumping of household waste in provinces and cities in order to ensure the safe management of household waste. The authorities of the provinces and cities shall establish the waste management plan in their province and city for short, medium and long-term.
Sub-decree No. 27 ANRK/BK on Water Pollution Control	1999	Regulates activities that cause pollution in public water areas in order to sustain good water quality so that the protection of human health and the conservation of biodiversity are ensured. Annex 2 contains effluent standards. Discharge of landfill leachate shall comply with the effluent standards for discharge of wastewater to public water area and sewer. Annex 13 contains ambient water quality standards for biodiversity conservation, and annex 6 includes ambient water quality standards for public health.
Sub-decree No. 42 ANK/BK on Control of Air Pollution and Noise Disturbance	2000	Regulates air and noise pollution from mobile and fixed sources through monitoring, curb and mitigation activities to protect the environmental quality and public health. It contains the following relevant standards: (i)) ambient air quality standard (Annex 6); and (ii) maximum allowable noise level in public and residential areas (Annex 6). Article 3 A. “Source of pollution” is defined and separates mobile sources (including transport) and fixed sources such as factories and construction sites. Article 3 B. “Pollutant” is defined as smoke, dust, ash particle substance, gas, vapour, fog, odour, radio-active substance.
		-The goal of this sub-decree is to enhance the management of garbage and solid waste of downtowns with effectiveness, transparency and accountability,

Law/Regulation/Guideline	Year	Summary
Sub-decree on Garbage and Urban Solid Waste Management	2015	referring to ensure aesthetics, public health and environmental protection -This sub-decree covers separating, storing, cleaning, collecting, transporting, recycling and management of landfills of garbage and solid waste of downtowns in the Kingdom of Cambodia
Sub-decree N0. 235 on Management of Drainage and Wastewater Treatment System	2017	-Aims to improve the management of drainage and wastewater treatment systems in term of efficiency, transparency, and accountability to ensure safety, public health, and biodiversity conservation. -The scope of this Sub-Decree applies to the management of drainage and wastewater treatment systems in capital, provincial, district, khan and resorts or recreation centers in the Kingdom of Cambodia. Its annexes 1 and 2 provide Effleunt Discharge Standards from Commercial Building, Borey, Satellite City and Resort or Recreation Center Discharges Directly to the Drainage/Sewerage System connected to Centralized Wastewater Treatment Plant, and to the Public Waterbody or Drainage/ Sewerage System
Prakas on the Launch of Standards of the Quantity of Toxins or Hazardous Substances Allowed to be Disposed	2015	This Parkas includes the standards of the quantity of toxic chemicals or hazardous substances contained in hazardous waste which is allowed to be disposed in sanitary landfills and standards of the quantity of toxic chemicals or hazardous substances allowed in soils. Any disposal of chemical waste or hazardous substances as stipulated in the Parkas out of sites determined by the ministry and competent institutions shall be absolutely prohibited and deemed as the infringement of law.
Prakas on Environmental Impact Assessment Classification for Development Projects No. 21 PRK.BST	2020	The Prakas determines the types and sizes of projects that are required to prepare environmental impact assessments. Projects having minor environmental impacts are required to prepare an Environmental Protection Agreement together with an Environmental Management Plan. Projects having medium impacts shall prepare an Initial Environmental Impact Assessment report, and projects with significant impacts are required to prepare a full EIA. All sizes of rubbish disposal sites are required to undertake an IESIA and all sizes of industrial waste disposal sites are required to undertake an EIA.
Environmental Guidelines on Solid Waste Management	2006	Contains a Landfill Ordinance that regulates landfill requirements to: (i) reduce as far as possible the adverse effects of waste disposal on the environment; (ii) preserve groundwater, surface water & air quality & to reduce emissions of greenhouse gases (iii) ensure waste is not harmful to human, natural & animal health during operation & decommissioning; and (iv) provide information and technical recommendation on the construction, operation, closure and aftercare management of landfills to ensure public health and safety and environmental protection.

Law/Regulation/Guideline	Year	Summary
Technical Guideline on Garbage and Urban Solid Waste Management	2016	The technical guideline provides standards for all activities related to disposal, storage, collection, transportation, recycling, dumping of municipal and hazardous waste as well as management of final dumpsite (closing Landfill) and continued management. The technical guidelines list the requirements to be implemented within 90 days for landfill closing (e.g. monitoring, gas management).
National Integrated Pest Management Program		The Integrated Pest Management (IPM) Program in Cambodia was established in 1993 after conducting national workshop on "Environment and IPM". The overall goal of National IPM Program is to promote food security in Cambodia by enhancing the sustainability of intensified crop production system through the promotion of integrated crop management (ICM) skills at farm level. The objectives of this program are: i. to reduce dependence on agricultural chemical, especially pesticides, in agricultural production and to minimize hazards to the human health, animals and environment; ii. to develop the capacity of farmers and agricultural technical officers in conducting training and experiments so that they are able to identify problems occurring in agricultural production and find appropriate solution to deal with the problem by themselves; and iii. Educate farmers on agricultural technology by enhancing their knowledge on field ecology and by developing skills among farmers in monitoring and analyzing field situations that enable them to manage crops properly. At the national level the position of the IPM program was strengthened by a Prakas (Ministerial Declaration) in July 2002, recognizing the National IPM Program as coordinating body for all IPM related activities in Cambodia. The Prakas also established a steering committee and a deputy director to act as the national coordinator

Law/Regulation/Guideline	Year	Summary
Labour Law (1997) Decree No. CS/RKM/0397/01 On October 5, 2021, Cambodia enacted the third amendment to the country's main employment legislation, the Labor Law of 1997, revising the rules governing individual labor dispute resolution, work shifts, and public holidays falling on Sundays.	1997	This law governs relations between employers and workers resulting from employment contracts to be performed within Cambodia. The key sections relevant to this project include: **<u>Chapter VIII Health and Safety of Worker</u>** The key provisions relate to the quality of the premises; cleaning and hygiene; lodging of personnel, if applicable (such as workers camps); ventilation and sanitation; individual protective instruments and work clothes; lighting and noise levels in the workplace. Article 230: Workplaces must guarantee the safety of workers. However, the only specific occupational health and safety Prakas relates to the garment industry and brick manufacture. **<u>Chapter IX Work-Related Accidents</u>** Article 248: All occupational illness, as defined by law, shall be considered a work-related accident. The law sets out how accidents should be managed in terms of compensation.

Law on Land (NS/RKM/0801/14)	2001	Provides that: (i) unless it is in the public interest, no person may be deprived of ownership of his immovable property; and (ii) ownership deprivation shall be carried out according to legal forms and procedures and after an advanced payment of fair and just compensation. (Article 5)
Expropriation Law	2010	Defines the principles, mechanisms, and procedures of expropriation, and defining fair and just compensation for any construction, rehabilitation, and public physical infrastructure expansion project for the public and national interests and development of Cambodia.
The Law on Road Traffic	2015	The law is intended to ensure road traffic safety and order, and protection of human and animal health and lives, properties and environment. Its establishment a requirement for all motor vehicles, trailers, and semi-trailers moving on the road to obtain a technical inspection certificate. It also outlines road safety requirements.
National Policy on the Development of Indigenous Peoples		1. The guiding document to address Indigenous Peoples' issues in Cambodia is the National Policy on the Development of Indigenous Peoples. The Policy, prepared starting in 1994, was approved by the Council of Ministers on April 24, 2009 and sets out government policies related to indigenous peoples concerning culture, education, vocational training, health, environment, land, agriculture, water resources, infrastructure, justice, tourism, industry and mines and energy. The Policy provides principles for formal registration of indigenous communities as legal entities with their own bylaws and enables their participation in economic development that affects their lives and cultures. It states: "Indigenous Peoples shall be fully entitled to express their comments and opinions and to make any decisions on the development of the economy, society and their cultures towards growth in the society
Policy on Registration and Right to Use of Indigenous Communities		The policy was approved by the Council of Ministers on April 24, 2009, and a Sub-Decree on procedures of registration of Land of Indigenous communities was signed on June 9, 2009 by the Prime Minister. This policy takes as its basis the recognition in the Land Law of 2001, of the right of indigenous communities to possess and use land as their collective ownership. The policy states that the registration of indigenous communities as collective ownership is different from the registration of individual privately owned land parcels because the land registration of the indigenous communities is the registration of all land parcels belonging to the communities as a whole, consisting of both State Public Land and State Private Land in accordance with the articles 25, 26, and 229 of the Land Law and related Sub-decrees. These land parcels are different in size and can be located within the same or different communes/sangkat

3.1.2 EIA Classification

43 In order to provide guidelines on effective implementation of sub-decree No 72 ANRK.BK on environmental impact assessment Procedures for development projects, MoE promulgated sub- decree No. 21 on Environmental Impact Assessment Classification for Development Projects.

44 According to this sub-decree, environmental impact assessment for projects is classified into three categories.

- Projects requiring full environmental impact assessment (full ESIA), equivalent to AIIB's

environmental category A, and IFAD's high risk
- Projects that require initial environmental impact assessment (IEIA), equivalent to AIIB's environmental category B, and IFAD's substantial risk
- Projects requiring the Contract on Environmental Protection (EPC), equivalent to AIIB's environmental category C plus simple EIA analysis and EMP, equivalent to IFAD's moderate/low risk

45 The sub-decree includes an annex listing projects under various sectors and their categorization on the basis of their nature, type and size. The sector and EIA classification for irrigation project is summarized in Table 3-2 below.

Table 3-2: ESIA Classification for Development ProjectsClassification for Development Projects

No.	Project Type	ESIA (Equiv. to AIIB's A	IESIA (Equiv. to AIIBB's B	Env. Protection Contract
142	Irrigation systems		≥5000ha	1000-5000ha
143	Water diversion systems		≥5000ha	1000-5000ha
176	All building construction	Build area>45000m^2	15000 – 45000m^2	3000-15000m^2
179	Road construction (new)	>100km	≥30 – 100km	10-<30km
180	Railroad and road expansion	>100km	≥50 – 100km	10-<50km
181	Road in protected areas	>30km	≥ 10-30 Km	10km
182	Road widen in protected area	>50km	≥ 10-50 km	10km

Source: Prakas No. 021 PRK.BST dated 03 February 2020.

3.1.3 Occupational and Community Safety and Health

46 Government Occupational and Community Safety and Health (OHS) guidelines follow the OHS Program for Cambodia (2010-2013) that was developed by the International Labor Organization (ILO). The draft guidelines provide the framework for instituting OHS at the workplace and in the community. The OHS guidelines for Cambodia will likely need to be supplemented with the international the IFC EHS/OHS Guidelines for Construction and Decommissioning, Waste Management Facilities, and Toll Roads.

47 Additionally, the National MoH's guideline on Covid-19 and National Guideline for Infection prevention and control for healthcare facilities of Cambodia will be applied due to the current situation in respect of the Covid-19 outbreak to reduce the incidence and risk of preventable Nosocomial Infection (NI). Occupational and community health and safety, as laid out in the EHS guidelines, will be a cross-cutting assessment for the subprojects.

48 The Ministry of Labor and Vocational Training (MLVT) has the following guidelines which will be implemented during the construction phase of the Project:

- MLVT Prakas2 No. 075/11 K.B/BR.K (March 2011) - Sanitation at the Construction Site: The Prakas sets to ensure that the sanitation and safety conditions are fulfilled for workers at construction sites by owners, directors, contractors or sub-contractors of construction establishments or construction companies. Articles 3 and 4 ensure that workers are provided with shelter, sanitation facilities and safe potable water for drinking and washing.

- MLVT Prakas No. 076/11 K.B/BR.K (March 2011) - The Protection of Risk Resulting From Climate Change at Construction Sites. Articles of this Prakas require safety measures and break times for workers at the construction site during extreme weather events.

- MLVT Prakas No. 077/11 K.B/BR.K (March 2011) - Providing of Information at the Construction Site. This Prakas states requirements for owners or responsible persons of a construction site to provide information, i.e. name and address of the owner of enterprise, construction establishment, Construction Company, name and address of architect, nature of construction, date for the start of the construction, estimated time

to finish the construction works, and estimated number of workers to be employed for construction activities.

- MLVT Prakas No. 078/11 K.B/BR.K (March 2011) - Stock of Materials, Waste Disposal and Clearance at Construction Site. This Prakas provides safety guidelines and requirements for the safe storage of construction of materials and hazardous substances/objects that can pose health and safety risks to workers.

49 The key national environmental quality standards applied to the subproject are listed in Table-3-3 below together with relevant international guidelines.

Table-3-3: Key National and International Environmental Standards and Guidelines

Environmental Issue	National Standards	International Guidelines
Ambient air quality	Annex 1, Ambient Air Quality Standard, of Sub-decree on Control of Air Pollution and Noise Disturbance, 2000	WHO Air Quality Guidelines, global update 2005
Noise	Annex 6, Max. Standard of Noise Level Allowable in the Public and Residential Areas, of Sub-decree on Control of Air Pollution and Noise Disturbance, 2000	WHO Guidelines for Community Noise, 1999
Surface water quality	Sub-decree No. 27 ANRK/BK 1999 on Water Pollution Control: Annex 4, Water Quality Standards for Public Waters for the Purpose of Biodiversity Conservation, and Annex 5, Water Quality Standards for Public Waters and Health	US EPA National Recommended Water Quality Criteria Mekong River Commission (MRC)_ Technical Guidelines for the Protection of Aquatic Life MRC Technical Guidelines for the Protection of Human Health

3.1.4 Applicable Evaluation Ambient Quality Standards

50 Water quality standard in public water area for public health protection is shown in Table-3-4 below.

Table-3-4: Water quality standard in public water areas for public health protection

No.	Parameter	Unit	Surface water Standard
1	Carbon tetrachloride	µg/l	< 12
2	Hexachloro-benzene	µg/l	< 0.03
3	DDT	µg/l	< 10
4	Endrin	µg/l	< 0.01
5	Diedrin	µg/l	< 0.01
6	Aldrin	µg/l	< 0.005
7	Isodrin	µg/l	< 0.005
8	Perchloroethylene	µg/l	< 10
9	Hexachlorobutadiene	µg/l	< 0.1
10	Chloroform	µg/l	< 12
11	1,2 Trichloroethylene	µg/l	< 10
12	Trichloroethylene	µg/l	< 10
13	Trichlorobenzene	µg/l	< 0.4
14	Hexachloroethylene	µg/l	< 0.05
15	Benzene	µg/l	< 10
16	Tetrachloroethylene	µg/l	< 10
17	Cadmium	µg/l	< 1

51 Water quality standards in public water areas for biodiversity conservation is shown in Table-3-5 below.

Table-3-5: Water quality standard in public water areas for bio-diversity conservation

Parameter	Unit	Standard Value		
		River	Lake/Reservoir	Coastal Water
pH		6.5-8.5	6.5-8.5	7.0-8.3
BOD5	mg/l	1-10	NV	NV
Suspended Solid	mg/l	25-100	1-15	n/a
Dissolved Oxygen	mg/l	2.0-7.5	2.0-7.5	2.0-7.5
Coliforms	MPN/100ml	<5000	<1000	<1000
COD	mg/l	NV	1-8	2-8
Total Nitrogen	mg/l		0.1 – 0.6	0.2– 1.0
Total Phosphorus	mg/l		0.005– 0.05	0.02 – 0.09
Oil content	mg/l	NV	NV	0

NV=No value
Source: Annex 4 of Sub-decree on No 27 ANRK.BK Water Pollution Control, 2009.

52 Ambient Air Quality Standards are shown in Table-3-6below.

Table-3-6: Ambient Air Quality Standard

Parameters	Cambodia[a]				IFC-EHS[b] Guidelines WHO
	Period 1h Average mg/m3	Period 8h Average mg/m3	Period 24h Average mg/m3	Period 1year Average mg/m^3	interim target1 ug/m3
Carbon monoxide (CO)	40	20	-	-	
Nitrogen dioxide (NO2)	0.3	-	0.1	-	40（1yr.） 200 (1 hr.)
Sulfur dioxide (SO2)	0.5	-	0.3	0.1	500 (10 min) 125 (24hr.)
Ozone (O3)	0.2	-	-	-	100 (8 hr. daily)
Lead (Pb)	-	-	0.005	-	
Particulates	-	-	0.33	0.1	150 (PM10 24hr) 75 (PM2.5 24hr)

[a] Sub-decree N0 42 ANRK.BK on Air Pollution Control and Noise Disturbance.
[b] Environmental, Health, and Safety Guidelines, IFC.

Maximum permitted noise levels in public and residential areas are shown in Table-3-7 below.

Table-3-7: Maximum permitted noise level in public and residential area (dB (A))

Location	Cambodian Standard			IFC-EHS Guidelines	
	06:00 to 18:00	18:00 to 22:00	22:00 to 6:00	Day 7:00 to 22:00	Night 22:00 to 7:00
Silence Area Hospital; Library, School, Nursery	45	40	35	55	5
Resident Area Hotel; Administration place, House	60	50	45		

Commercial, Services Areas and mix	70	65	50	70	70
Small Industrial factories intermingling in residential areas	75	70	50		

Note: This standard is applied to control of noise level of any source of activity that emitted noise into the public and residential areas.
Source: Annex 6 of Sub-Decree on Air Pollution Control and Noise Disturbance, 2000

3.1.5 International Conventions

53 Cambodia is a signatory to many international environmental treaties and conventions which provide a comprehensive legal framework. These include:

- Biodiversity Convention in 1994;
- Convention on International Trade in Endangered Species of Fauna and Flora (CITES) in 1997;
- Ramsar Convention in 1999;
- United Nations Framework Convention on Climate Change (UNFCC), 1992, entered into force on 21 March 1994 (Cambodia ratified on 18 December 1995);
- Kyoto Protocol 1997, entered into force on 16 February 2005 (Cambodia accessed on 22 August 2002);
- Vienna Convention for the Protection of the Ozone Layer, entered into force on 22 September 1988 (Cambodia accessed on 27 June 2001);
- Montreal Protocol on Substances that Deplete the Ozone Layer, 1987, entered into force on 1 January 1989 (Cambodia accessed on 27 June 2001);
- The International Convention for the Prevention of Marine Pollution from Ships, 1973 as modified by the Protocol of 1978 relating thereto “MARPOL 73/78”, fully entered into force on 2 October 1983 (Cambodia ratified on 1994);
- Basel Convention on the Control of Trans-boundary Movements of Hazardous Wastes and their Disposal, entered into force on 5 May 1992 (Cambodia accessed on 02 March 2001);
- United Nations Convention to Combat Desertification, entered into force on 26 December 1996 (Cambodia ratified on 18 August 1997);
- Convention on International Trade in Endangered Species of Wild Fauna and Flora, entered into force on 01 July 1975 (Cambodia ratified on 04 July 1997);
- Cambodia joined the UNESCO Network of Biosphere Reserves in 1997. It committed to the Millennium Development Goals and subsequently endorsed the Sustainable Development Goals at the UN General Assembly in 2015;
- At the regional level, it ratified the following ASEAN Agreements: (a) on Transboundary Haze Pollution in 2006; and (b) on Disaster Management and Emergency Response, which entered into force in 2009; and
- At the subregional level, Cambodia, along with Lao PDR, Thailand and Viet Nam, signed the “Agreement on the Cooperation for the Sustainable Development of the Mekong River Basin” (or the Mekong Agreement) in April 1995.

3.2 Application of AIIB, IFAD and GCF Environmental, Social, and Climate Risks Standards/Procedures

3.2.1 AIIB’s Environmental and Social Framework

54 The objectives of this ESF are to:

- Reflect institutional aims to address environmental and social risks and impacts in Projects (defined below in *Section II, Definitions,* of the ESP).
- Provide a robust structure for managing operational and reputational risks of the Bank and its shareholders in relation to Projects’ environmental and social risks and impacts.
- Support the environmental and social soundness and sustainability of Projects.

- Facilitate the integration of environmental and social aspects of Projects into the decision-making process by all parties.
- Provide a mechanism for addressing environmental and social risks and impacts in Project identification, preparation and implementation.
- Enable Clients (defined below in *Section II, Definitions,* of the ESP) to identify and manage environmental and social risks and impacts of Projects, including those of climate change.
- Provide a framework for public consultation and disclosure of environmental and social information in relation to Projects.
- Provide a grievance redress mechanism designed to enable Project-affected people to voice their concerns and grievances in connection with the environmental and social aspects of Projects.
- Improve development effectiveness and impact to increase results on the ground, in both the short and long term.
- Support Clients, through Bank financing of Projects, to strengthen their environmental and social management systems.
- Support Clients, through Bank financing of Projects, to implement their obligations under national environmental and social legislation (including under international agreements adopted by the Member) governing these Projects, including commitments relating to climate change.
- Support Clients, where feasible and appropriate, to mobilize resources for technical assistance for the preparation of environmental and social documents and capacity enhancement.
- Facilitate cooperation on environmental and social matters with development partners.

3.2.2 *AIIB's Environmental and Social Standards*

3.2.3 *Environmental and Social Standard 1: Environmental and Social Assessment and Management Scope and Application:*

55 Environmental and Social Standard (**ESS**) 1 applies if the Project is likely to have adverse environmental risks and impacts or social risks and impacts (or both). The scope of the environmental and social assessment and management measures are proportional to the risks and impacts of the Project. ESS 1 provides both for quality environmental and social assessment and for management of risks and impacts through effective mitigation and monitoring measures during the course of Project implementation.

- **Environmental coverage:** Environmental Risks and Impacts, Biodiversity Consideration, protected areas, ecosystem services, sustainability of land and water use, precautionary approach, pollution prevention, resource efficiency, climate change and greenhouse gases.
- **Social coverage:** Social Risks and Impacts, Scope of Social Coverage, Vulnerable/Disadvantaged Groups and Discrimination, Gender, Gender-based violence, Land and Natural Resource Access Loss of access to assets or resources or restriction on land use, Cultural resources
- **Heath and safety:** health and safety of workers and communities, occupational heath and safety, labor influx, building safety, traffic and road safety, security personnel, safety of dam.
- **Labor and Working conditions:** labor management relationships, civil servants, child labor and forced labor,

3.2.4 *Environmental and Social Standard 2: Land acquisition and involuntary resettlement*

56 **Scope and Application.** ESS 2 applies if the Project would or may involve Involuntary Resettlement (including Involuntary Resettlement of the past or foreseeable future that the Bank determines is directly linked to the Project).

3.2.5 *Environmental and Social Standard 3: Indigenous Peoples*

57 **Scope and Application:** ESS 3 applies if Indigenous Peoples are present in, or have a collective attachment to, the proposed area of the Project, and are likely to be affected by the Project.

The term Indigenous Peoples is used in a generic sense to refer to a distinct social and cultural group possessing the following characteristics in varying degrees:2 (a) self-identification as members of a distinct indigenous cultural group and recognition of this identity by others; (b) collective attachment to geographically distinct habitats, ancestral territories or areas of seasonal use or occupation in the Project area and to the natural resources in these areas; (c) customary cultural, economic, social or political institutions that are distinct or separate from those of the dominant society or culture; and (d) a distinct language or dialect, often different from the official language or languages of the country or region in which they live. In considering these characteristics, national legislation, customary law and any international conventions to which the Member in whose territory the Project is located is a party may be taken into account. A group that has lost collective attachment to geographically distinct habitats or ancestral territories in the Project area because of forced severance remains eligible for coverage as an Indigenous People, under ESS 3.

3.2.6 *Application of IFAD and GCF Environmental, Social, and Climate Risks Standards/Procedures*

58 Based on the IFAD SECAP and GCF ESS, the following safeguards documents were prepared: (i) Environmental and Social Management Framework (ESCMF) including climate considerations; (ii) Indigenous Peoples' Plan (IP Plan); (iii) Stakeholder Engagement Plan (SEP); and (iv) Gender Assessment & Action Plan (GAP). The documents have been publicly disclosed in advance of implementation and board approval to respect the Pelosi Amendment[14] as a best practice, even though the project is not high or substantial risk (the risk rating is only moderate), and the documents collectively respond to the standards described below.

3.2.7 SECAP's Environment and Social Standards (ESSs) are described as below:

- Standard 1: Biodiversity Conservation;
- Standard 2: Resource Efficiency and Pollution Prevention;
- Standard 3: Cultural Heritage
- Standard 4: Indigenous Peoples
- Standard 5: Labour and Working Conditions
- Standard 6: Community Health and Safety;
- Standard 7: Physical and Economic Resettlement;
- Standard 8: Financial Intermediaries and Direct Investments;
- Standard 9: Climate Change

59 Not explicitly listed as a standard, but considered a vital part of project design, implementation, and safeguarding is stakeholder engagement. Provisions to ensure meaningful engagement are provided within the Stakeholder Engagement Plan and initial feedback and engagement was mainstreamed into the project design.

The scope of the safeguard standards are detailed in Table-3-8.

Table-3-8: Scope of Safeguards Standards

Safeguards Standard	Scope
Standard 1: Biodiversity Conservation	**Scope:** In accordance with the Convention on Biological Diversity (CBD), this standard recognizes that biodiversity is about more than plants, animals and micro-organisms, and includes people and their need for food security, medicines, fresh air and water, shelter, and a clean and healthy environment. Key objectives include: • Maintain and conserve biodiversity

[14] The 1989 Pelosi Amendment requires disclosure of environmental impacts at least 120 days prior to board approval for high- and sometimes substantial-risk projects (URL: https://www.gao.gov/archive/2000/ns00192.pdf)

Safeguards Standard	Scope
	• Ensure the fair and equitable sharing of benefits from the utilization of generic resources; • Respect, preserve, maintain, and encourage knowledge, innovations, and practices of indigenous peoples and local communities relevant for the conservation and sustainable use of biodiversity, and their customary use of biological resources; and • Adopt a precautionary approach to natural resource conservation and management to ensure opportunities for environmentally sustainable development.
Standard 2: Resource Efficiency and Pollution Prevention	**Scope:** This Standard recognizes that economic activity and development can often pollute the air, water, and land. They may also result in the consumption of finite resources, which may in turn threaten people, ecosystem services and the environment. It advocates for a precautionary approach with the following objectives: • Avoid, minimize and manage the risks and impacts associated with hazardous substances and materials, including pesticides; • Avoid or minimize project-related emissions of short- and long-lived climate pollutants; • Promote more sustainable use of resources, including energy, land and water; and • Identify opportunities for improving resource efficiency.
Standard 3: Cultural Heritage	**Scope:** This Standard recognizes that cultural heritage is central to individual and collective identity and memory, providing continuity between the past, present, and future. Objectives include: • Preserve and safeguard cultural heritage; • Ensure that active efforts are made to prevent IFAD-supported projects from altering, damaging or removing any tangible or intangible cultural heritage; • Promote the equitable sharing of benefits from the use of cultural heritage; and • Promote meaningful consultation on matters related to cultural heritage.
Standard 4: Indigenous Peoples	**Scope:** This standard focuses on the rights of Indigenous Peoples and promotes the following objectives: • Support indigenous peoples to determine priorities and strategies for exercising their right to development; • Ensure that each project is designed in partnership with indigenous peoples and with their full, effective and meaningful consultation, leading to FPIC; • Ensure that indigenous peoples obtain fair and equitable benefits and opportunities from project-supported activities in a culturally appropriate and inclusive manner; and • Recognize and respect the rights of indigenous peoples to the lands, territories, waters and other resources that they have traditionally owned, used or relied upon.
Standard 5: Labour and Working Conditions	**Scope:** This standard is focused on fostering inclusive, diversified, and productive rural economies that create opportunities for decent work and higher incomes. Objectives of this standard are to: • Promote direct action to foster decent rural employment;

Safeguards Standard	Scope

	• Promote, respect and realize fundamental principles and rights by:
	  ○ Preventing discrimination and promoting equal opportunities for workers;
	  ○ Supporting freedom of association and the right to collective bargaining; and
	  ○ Preventing the use of child labour and forced labour;
	• Protect and promote the safety and health of workers;
	• Ensure that projects comply with national employment and labour laws, and international commitments;
	• Leave no one behind by protecting and supporting workers in disadvantaged and vulnerable situations, including women (e.g. maternity protection), young workers, migrant workers, workers in the informal economy and workers with disabilities.

Standard 6: Community Health and Safety	**Scope:** These standard stresses avoiding – and where avoidance is not possible, minimizing and mitigating – health-related and safety-related risks and impacts that may arise from IFAD-supported projects, with special attention to marginalized and disadvantaged groups. Objectives include to: • Ensure quality and safety in the design and construction of programming-related infrastructure, preventing and minimizing potential safety risks and accidents; • Avoid or minimize community exposure to disaster risks, diseases and hazardous materials associated with project activities; • Ensure that the safeguarding of personnel and property minimizes risks to communities and is carried out in accordance with international human rights standards and principles; and • Have in place effective measures to address emergency events, whether human-made or natural hazards.
Standard 7: Physical and Economic Resettlement	**Scope:** This Standard not only considers resettlement as the physical relocation of people but as economic, social and cultural displacement restricting people's access to livelihoods and culturally important sites. Objectives include to: • Avoid involuntary resettlement or, when unavoidable, minimize involuntary resettlement by exploring alternative project designs and sites; • Avoid forced eviction; • Ensure that resettlement activities are planned and implemented collaboratively with the meaningful participation of affected people; • Enhance and restore the livelihoods of all displaced peoples; and • Provide explicit guidance to borrowers/recipients/partners on the conditions that need to be met regarding involuntary resettlement.
Standard 8: Financial Intermediaries and Direct Investments	**Scope:** This Standard recognizes that investments in FIs (indirect investments) and private-sector companies (direct investments) are critical for promoting sustainable financial markets and providing financial products and services to farming businesses and rural micro, small and medium-sized enterprises. Objectives include to:

Safeguards Standard	Scope
	• Promote sound environmental, social and climate practices, and sound human resource management with FIs and direct investees; • Ensure that FIs and direct investees assess and manage any environmental and social risks and impacts of subprojects; and • Promote good environmental and social management practices by direct investees and in the subprojects financed by FIs.
Standard 9: Climate Change	**Scope:** This standard is focused actively considering, planning for, and responding to projected climate changes. Objectives include to: • Ensure alignment of IFAD-supported projects with the Nationally Determined Contributions of countries and the goals of the Paris Agreement and other international frameworks; • Ensure that proposed activities are screened and assessed for climate change and disaster risks and impacts, including both impacts of projects and on them; • Apply the mitigation hierarchy in project design; • Strengthen the resilience of communities to address the risk of climate change impacts and climate-related disasters; and • Increase the ability of communities to adapt to the adverse impacts of climate change, and foster climate resilience and low GHG-emitting projects that do not threaten food production.

3.3 Gap Analysis and Gap Filling Measures

60 IFAD classifies projects and subprojects into one of four classifications: *high risk*, s*ubstantial risk*, *moderate risk* or *low risk* and discloses a project's risk classification and basis for that classification in project documents and on the IFAD website. GCF classifies projects and subprojects into one of three classifications: high risk, moderate risk, or low risk, however the GCF accepts the standards and risk classifications of Accredited Entities, like IFAD, thus for this project (and to simplify approval for IFAD-funded activities) the ESCMF utilizes the IFAD classifications.

61 The assessment identified key gaps between the county's legal system and international recognized environmental and social standards (e.g. AIIB, IFAD, GCF) and priority needs to ensure full compliance of the ESSs. The conclusion was that Cambodia has a comprehensive regulatory framework that in many cases meets the requirements of the ES standards, and key issues are more associated with implementation and differentiated capacities between the central and provincial PMUs and the provinces. There are opportunities to accelerate implementation of recent improvements in the country system, especially on labour, community safety, and stakeholder engagement.

62 Based on the project's high or category A risk rating for environment, social, and climate considerations, national regulations are adequate for most of the investments, while additional gap-filling measures will be applied for the preparation of an Environmental, Social and Climate Impact Assessment (ESCIA) for the overall project particularly related to the civil works so that contractors and implementation partners can adequately address issues related to contract management, safety of local communities, and workers. Capacity building efforts pertaining to regulation and oversight are also incorporated as part of the safeguards management of the CAISAR project and as part of the project design (e.g. under Component 2 activities).

63 There are key gaps between the environmental, social, and climate assessment requirements of the Asian Infrastructure Investment Bank (AIIB), International Fund for Agricultural Development (IFAD), Green Climate Fund (GCF), and the Cambodian Government.

64 One key difference is the scope of their assessments. The AIIB and GCF focus on infrastructure and climate projects, while IFAD focuses on agricultural development. As a result, the types of environmental and social risks and impacts that are assessed may differ.

65 Another difference is the level of detail required in the assessments. The AIIB requires a comprehensive Environmental and Social Framework (ESF) that covers all projects, while the GCF requires a simplified Environmental and Social Management System (ESMS) that is tailored to each project. IFAD requires an Environmental and Social Assessment (ESA) that is specific to each project.

66 In terms of climate assessments, the GCF requires a detailed assessment of the project's potential greenhouse gas emissions and its contribution to climate change mitigation and adaptation. The AIIB also considers climate risks and opportunities in its project assessments but does not require a specific climate assessment. Cambodia's Environmental Impact Assessment (EIA) requirements do not explicitly specify climate assessment procedures. However, the EIA process does consider the potential impacts of projects on the environment, which includes climate-related factors. The assessment typically covers aspects such as air quality, water resources, biodiversity, and social impacts, which indirectly address climate considerations.

67 Overall, while there are some similarities in the environmental, social, and climate assessment requirements of these institutions, there are also key differences that reflect their different mandates and priorities.

68 A detailed list of the Green Climate Fund's climate assessment requirements for an irrigation and flood protection project in Cambodia require:

1. Project description: The project description should include a detailed description of the irrigation and flood protection project in Cambodia, including the location, size, and scope of the project, as well as the expected benefits and impacts.
2. Climate rationale: The project should have a clear climate rationale that explains how it will contribute to climate change mitigation and adaptation. This should include an analysis of the project's potential greenhouse gas emissions and its contribution to reducing emissions.
3. Baseline emissions: The project should include a baseline emissions assessment that estimates the greenhouse gas emissions that would occur in the absence of the project.
4. Project emissions: The project should estimate the greenhouse gas emissions that will be generated by the project, including direct and indirect emissions.
5. Mitigation potential: The project should assess its potential to reduce greenhouse gas emissions and contribute to climate change mitigation. This should include an analysis of the project's potential to reduce emissions compared to the baseline scenario.
6. Adaptation potential: The project should assess its potential to contribute to climate change adaptation, including an analysis of the project's ability to increase resilience to climate change impacts such as flooding and drought.
7. Co-benefits: The project should identify and assess any co-benefits that may result from the project, such as improved food security, increased access to water, or improved livelihoods.
8. Risks and uncertainties: The project should identify and assess any risks and uncertainties associated with the project, including potential environmental, social, and economic risks.
9. Monitoring and evaluation: The project should include a monitoring and evaluation plan that outlines how the project's greenhouse gas emissions, climate change mitigation and adaptation impacts, and co-benefits will be monitored and evaluated over time.

69 Overall, the Green Climate Fund's climate assessment requirements for an irrigation and flood protection project in Cambodia are designed to ensure that the project is aligned with the Fund's climate change objectives and that its potential greenhouse gas emissions and contributions to climate change mitigation and adaptation are carefully evaluated.

70 It is important to ensure that the environmental, social, and climate assessments of an irrigation and flood control project in Cambodia meet both the requirements of the international organizations as well as the legal requirements of the Cambodia government. This will help to ensure that the project is implemented in a way that is legally compliant and meets international standards for environmental and social sustainability and climate change mitigation and adaptation.

3.3.1 *Environmental, Social and Climate Assessment in Cambodia*

71 The Environmental Impact Assessment (EIA) process in Cambodia faces several issues that hinder its effectiveness and transparency. Some of the key issues include:

1 Limited public participation: The EIA process in Cambodia often lacks meaningful public participation. Communities and affected stakeholders are not adequately informed or involved in decision-making processes, limiting their ability to provide input, voice concerns, and influence project outcomes.
2 Inadequate assessment quality: The quality of environmental impact assessments conducted in Cambodia is often criticized for being insufficient and not meeting international standards. This can result in inaccurate or incomplete assessments, leading to inadequate identification and mitigation of potential environmental and social impacts.
3 Lack of independence: The EIA process in Cambodia suffers from a lack of independence, as project proponents are often responsible for conducting and financing their own environmental impact assessments. This can create conflicts of interest and raise concerns about the credibility and objectivity of the assessment process.
4 Weak enforcement and compliance: Despite having regulations in place, the enforcement of EIA requirements and conditions is often weak in Cambodia. This can lead to non-compliance by project developers, with inadequate monitoring and enforcement mechanisms to ensure adherence to environmental safeguards.
5 Limited capacity and resources: Cambodia faces challenges in terms of limited technical capacity and resources for conducting robust environmental impact assessments. Insufficient expertise and resources can result in inadequate assessments and monitoring, compromising the effectiveness of the EIA process.
6 Lack of transparency and accountability: The EIA process in Cambodia lacks transparency, with limited public access to information and documentation related to environmental impact assessments. This lack of transparency hampers accountability and the ability of affected communities to understand and challenge project decisions.

72 While climate change is not explicitly mentioned in the Cambodian EIA requirements, the government has recognized the importance of climate change mitigation and adaptation. The country has developed policies and strategies to address climate change, such as the National Adaptation Plan and the National Climate Change Strategic Plan. These initiatives aim to integrate climate change considerations into various sectors, including infrastructure development and land use planning.

73 In recent years, there has been recognition globally of the need to include climate change considerations in the EIA process. This includes assessing the potential greenhouse gas emissions, vulnerability to climate impacts, and the resilience of projects to climate change.

74 In conclusion the ESCIA requirements of AIIB, IFAD, GCF and the Cambodian government are similar intent and must include the specific climate assessment requirements as defined by GCF.

3.3.2 *Labor and Working Conditions in Cambodia*

75 Cambodia’s labor law does address various aspects related to child labor, gender equality, forced labor, and occupational health and safety. However, it is important to note that there are still challenges in effectively enforcing these laws and ensuring full compliance across all sectors.

76 Regarding child labor, Cambodia’s labor law prohibits the employment of children under the age of 15 in any economic activity. However, there are exceptions for light work that is not harmful to their health and development, and the law also allows for children aged 12 to 15 to engage in light work with certain restrictions. Despite these regulations, child labor remains a concern in Cambodia, particularly in sectors such as agriculture, construction, and informal work.

77 In terms of gender equality, Cambodia’s labor law prohibits discrimination based on gender in recruitment, remuneration, promotion, and other employment-related matters. It also guarantees equal

pay for equal work. However, gender-based discrimination and disparities in the labor market, including lower wages for women and limited representation in higher-level positions, continue to persist.

78 Regarding forced labor, Cambodia's labor law explicitly prohibits any form of forced or compulsory labor. It also prohibits debt bondage and human trafficking. However, forced labor remains a significant issue, particularly in sectors such as agriculture, construction, and domestic work. The government has taken steps to combat this problem, including establishing mechanisms for reporting and addressing cases of forced labor.

79 Occupational health and safety is another area addressed by Cambodia's labor law. The law requires employers to provide a safe and healthy working environment, including measures to prevent accidents, injuries, and occupational diseases. It also mandates the establishment of workplace safety committees and the provision of training on occupational health and safety. However, the enforcement of these regulations and the implementation of effective safety measures can be challenging, particularly in sectors with informal or hazardous working conditions.

80 In summary, while Cambodia's labor law does address child labor, gender equality, forced labor, and occupational health and safety, there are still gaps in enforcement and compliance. Efforts are needed to strengthen the implementation of these laws and ensure the protection of workers' rights in practice.

81 Systematic labor inspection heavily relies on self-reporting, especially when construction contractors and primary suppliers are involved. For this reason, a template for labor management procedures must be included in bidding documents of contracted workers. For primary suppliers of materials, the practice of conducting due diligence on labour and working conditions among potential sources of aggregate material is uncommon. Therefore, a monitoring procedure must be established prior commencement of related works, and the site-specific ESA must assess potential labor issues, including risks of child and forced labour for suppliers and in the value chains relevant for the CAISAR project, and other health hazards on workers due to waste management and handling of any related hazardous materials during construction to ensure compliance with national laws and Standards. MOWRAM as the Lead Agency of the CAISAR project must ensure that OHS procedures and a working grievance redress mechanism are stipulated within the contract, including the system for monitoring third party contractors' compliance with the agreed OHS procedures and GRM.

4. ENVIRONMENT, SOCIAL & CLIMATE ASSESSMENT

4.1 Project Objective, Components, Areas and Beneficiaries

82 The project rationale is provided in Section 1.1. The Country and project context is provided in Section 1.2, and the CAISAR Project components are outlined in Chapter 2.

83 The CAISAR project has a broad positive impact benefitting approximately 120,000 households (500, 000 rural people) directly while its effect will propagate to over 3 million people in the region (CAISAR Feasibility Study 2023). The project will be executed through the Ministry of Water Resources and Meteorology (MOWRAM) and the National Committee for Sub-National Democratic Development Secretariat (NCDD-S), a Direct Access Accredited Entity to the GCF. The expected timelines for the approval of the co-financing by IFAD and AIIB Executive Boards are respectively September 2024 and January 2024, with the inception of the project is expected to take place in December 2024.

4.2 Project Area

84 The CAISAR project aims to enhance Cambodia's resilience against climate change through investments in innovative practices such as flood protection, drainage, and solar pumping, with a total estimated budget of $280 million. The costs are distributed among different CAISAR objectives, with flood and drainage costing $47.4 million, solar and raised tertiary costing $82.1 million, and irrigation and storage costing $150.6 million. The project is divided into three sub-projects, each with different requirements and costs. The CAISAR scheme is expected to improve yields and provide better drought resilience over the 25-year asset life, with the project expecting significant yield improvements in all three sub-project areas.

85 The core benefits of the project include food security in the face of climate change as well as significant economic contributions to poor rural households by enabling climate change resilient and adaptive agriculture as well as nationally important greenhouse gas emission reductions. The scheme will bring several indirect benefits improving the socio-economic situation for communities living within the command areas such as improved access to transport links, education and community strengthening through the establishment of FWUCs. The project is expected to be economically viable even under pessimistic assumptions, with the baseline internal rate of return for the project at 17%.

86 Through nature-based approaches including river restoration and rehabilitation and creation of natural ponds, the CAISAR project is expected to provide several environmental enhancements whilst ensuring that the environmental impacts of the construction and operational phases of the project are limited and mitigated where possible. In addition to this, the use of innovative climate-smart solutions will reduce the overall climate impact of the scheme and endeavor to reduce the emission of greenhouse gases from the existing and proposed agricultural practices with the introduction of solar pumps and Alternate Wetting and Drying techniques.

87 The character and existing farming systems differ widely in each sub project as will be described below. The CAISAR feasibility study covers a total command area of 45,000ha and is composed of three sub-project command areas – Ou Ta Paong, in Pursat Province, Lum Hach, in Kampong Chhnang Province and Krang Ponley in Kampong Chhnang, Kapong Speu and Kandal Province as shown in
Source: CAISAR Feasibility Study

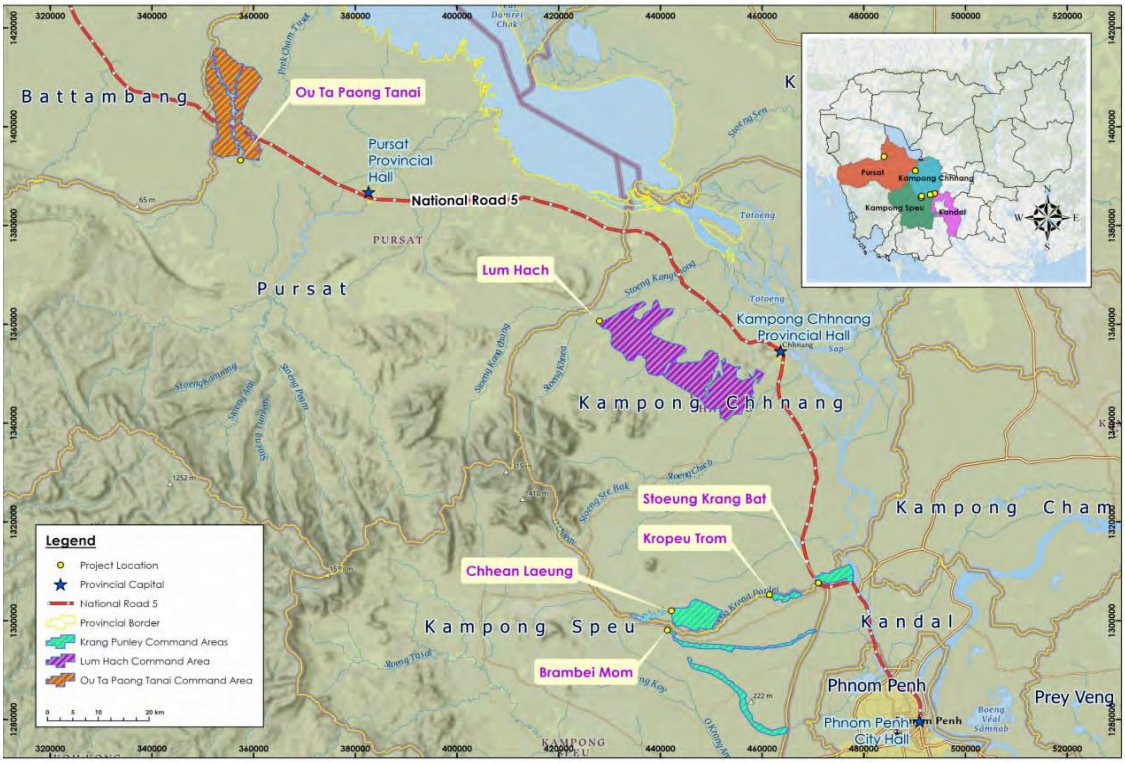

Figure 4-1: Map showing the location of the CAISAR project areas and& Provincial Boundaries

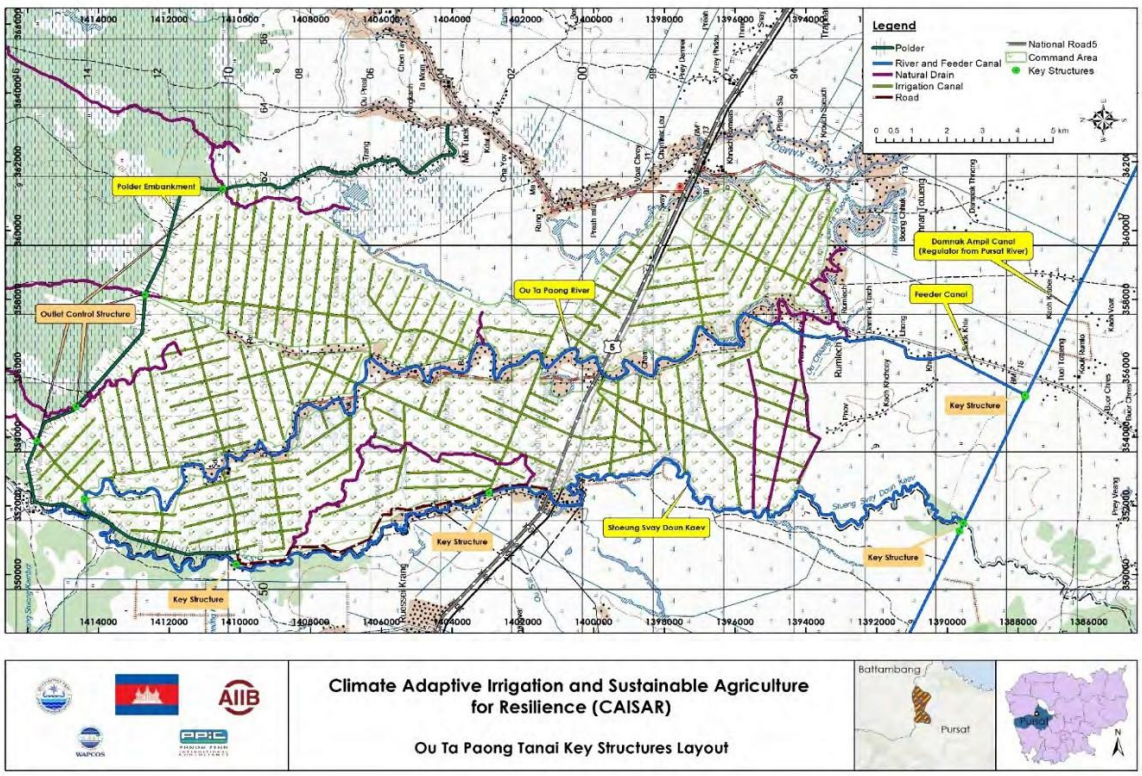
88 .

89 Detailed characteristics of the different sub-project command areas, with respect to historical and present-day conditions, temperature, precipitation, agricultural cover, and current water resources are presented in each Feasibility report for the corresponding projects which will be available to the team.



90 The sub-project areas, except for Kampong Chhnang, each have existing irrigation infrastructure which needs rehabilitation and/or has a suitable nearby water source that could enhance the agricultural output from the area and make it more resilient to the effects of climate change. The final command areas were then established based on field surveys and stakeholder consultations and

target areas that require the greatest assistance. Each sub-project area is currently experiencing or projected to experience challenges because of climate change and is therefore in need of climate adaptation and resilience measures. This work has been conducted in consultation with MOWRAM and the PDWRAM to ensure that local information is considered at each project stage.

Figure 4-3 Lum Hach Feasibility Level Canal Layouts and Storage (excluding JICA System)

91 Krang Ponley scheme differs from the Ou Ta Paong and Lum Hach schemes in that it consists of 4 separate command areas. These are grouped according to their hydrological connectivity via the Ponley River and geographical proximity in the North East of the Kampong Speu province and crossing slightly into Kampong Chhnang and Kandal (Source: CAISAR Feasibility Study 2023

4.3 Project target areas and beneficiaries

94 The following section describes the CAISAR sub-projects and their beneficiaries.

4.3.1 *Krang Ponley*

95 The Krang Ponley sub-project is located within the Krang Ponley catchment and is made up of four sub areas: Brambei Mom, Krapeu Troum, Krang Bat and Cheung Luong. The Krang Ponley river is long and fed from the Anlong Chrey Reservoir. The reservoir has a storage capacity of 30M m3 and was rehabilitated by KOICA in 2012 as part of the *Krang Ponley Water Resources Development Project*. With the exception of Chhean Laeung, each of the sub-project areas has existing irrigation infrastructure. These were largely constructed under the Khmer Rouge (1975 – 1979) and have since fallen into disrepair despite farmers excavating and maintaining some main and branch canals. Severe sedimentation and embankment erosion resulting from a lack of maintenance has resulted in damaged concrete structures and an inefficient irrigation system.

96 The proposed works are expected to benefit 3 communes across the four separate sub-schemes, making use of both the Anlong Chrey reservoir and the Brambei Mom reservoir. Pond and storage area rehabilitation and excavation, upgrading main, secondary, and tertiary canals as well as a new scheme at Chhean Leung will be hugely beneficial to local communities, increasing their resilience to climate change and enabling them to increase their agricultural outputs resulting in a number of indirect social benefits. In total there are 47,000 households in the Krang Ponley sub-project area. Dry season yields are expected to increase from 4.5 tons/ha to 6.5 tons/ha and during the wet season, they are expected to increase from 3.9 tons/ha to 5.8 tons/ha.

4.3.2 *Lum Hach*

97 The Lum Hach irrigation scheme is in close proximity to the work undertaken by JICA as part of the West Tonle Sap Irrigation Project (2022). Unfortunately, due to the infilling of the 1st January canal from discarded excavated material and the lowering of the headworks on the main canal, the CAISAR Lum Hach scheme can no longer make use of the existing main canal as a water source for irrigation. Therefore, alternative water sources have been assessed and analysed to determine if they are available and sufficient for the new scheme (Annex 1).

98 The existing irrigation infrastructure has received limited farm maintenance by farmers and others. This has resulted in sedimentation, embankment erosion and damaged concrete structures making the current system unreliable.

99 The proposed works are expected to benefit people living in four communes across three districts of Kampong Chhnang Province. The overall design will enhance the existing irrigated area to enable farmers to increase yields during the wet season from 2.5 tons/ha to 4.5 tons/ha. Additionally, with the provision of a reliable water source during the dry season and sufficient training provided through the proposed FWUCs, dry season cropping will be feasible with an estimated yield of 5 tons/ha.

100 Overall there are 18000 households in the Lum Hach sub-project area.

4.3.3 *Ou Ta Paong*

101 The Ou Ta Paong sub-project lies within Pursat Province. The area is highly climate vulnerable due to its proximity to the Tonle Sap lake and the Svay Donkeo river which have shown erratic flood patterns in recent years.

102 The existing irrigation scheme at Ou Ta Paong was constructed during the Khmer Rouge. Some sections have been rehabilitated by farmers and from social funds but due to an overall lack of maintenance and finance, many sections of canal have been damaged from sedimentation and erosion. The main water source is from the Don Nak ChheKrom canal which receives water from the Steng Pursat River.

103 The proposed scheme will include flood defense investment around the command area to enable the community to protect it's farming livelihood from future flood events from the Tonle Sap but taking into consideration the importance of local fisheries.

104 The current irrigation system is not connected to upstream water sources and current farming practices are heavily dependent on rainfall and flood recession agriculture. The design proposals will reduce this climate dependence and vulnerability to climatic changes by providing a reliable source of water for irrigation from the Svay Donkeo River via the Damnak Ampil Canal. 40km of Main Canal will convey water from the Damnak Ampli Head Works via the China Main Canal to feed the irrigation scheme.

105 The scheme will benefit communities living within two communes in the Bakan and Pursat Province and overall, there are 6000 households in the sub-project area. Dry season yields are expected to increase from 5.8 tons/ha to 6.5 tons/ha and wet season yields are expected to increase from 3.9 tons/ha to 5.8 tons/ha.

106 The following provides a summary of the three irrigation and flood control schemes.

Table-4-1: Summary of the Sub Project Elements

Sub Project	Ou Ta Paoung	Lum Hach	Krang Ponley
Area Cultivated (ha)	13,000	17,000	15,000
Water Source	Pursat River and Svay Don Keo	Local Streams and diversion of Boribo tributary	Krang Ponley River with existing storage at Anlong Chrey and Brambei Mom
Nature Based Solution	Restoration of Ou Ta Paoung River, fish passage on Donkeo and OTP, Natural Management of TS floods.	Enhancement of Main Canal environmental features, local storages and riparian corridors along local rivers. 200 Ponds	Control of flood regime at Krang Bat for flood recession and fisheries. Rehabiltate 31 major ponds.
Solar Pump Installations	35 (Not suitable in flood areas)	179	110(BBM)+47(CL)+27(KPT)
Main/Feeder Canals C/L(km)/N	1_8.0km_29	1_30.0_52	
Secondary Canal C/L (km)/N (Exist and New)	8_30.0km_ 13_35.8km_108	12_12.2km_673	
Tertiary Canal C/L (km)/N Exist and New	34_47.5km 139_151.0km_1452	179_107km_1487	
Main/Secondary Drains (C/L km/N)	7_36.3km_15	12_107km_99	
Existing Land Area (Ha)	300	66	144
New Land Area Required (Ha)	278	532	249

Note: (L=km C= Number of Canals, N= Number of Structures)

4.4 Socio-economic context and vulnerability

107 As part of the feasibility study for the CAISAR project, WAPCOS conducted a comprehensive livelihoods and vulnerability study of the target population. The study conducted surveys across more than 630 households in the project areas, 100 focus groups and 100 key informant interviews to understand the social and economic issues affecting the target population in the areas where CAISAR will be implemented. Issues such as poverty rates, land ownership, access to goods, education and health care as well as institutional capacities and gender related issues were all explored and analyzed by the WAPCOS team. It was important for the CAISAR project to assess such issues to get an improved understanding of the social society living in the command areas and any long-standing social inequalities which may impact their ability to adapt and be resilient to climate change. This could then assist the design and implementation of targeted and area specific aspects of both Component 1 and 2.

108 The survey results were assessed and found that the populations of all command areas follow similar social economic indicators, in terms of poverty, income, household debt, education levels, health and vulnerabilities.

109 Most of the population are rural farmers (rice typically), whilst some also supplement their income via alternative jobs such as working in the service sector. Households typically do not have stable annual incomes or expenditures due to the annual cycle of the wet and dry season and the impact this has on agricultural yields and livelihoods. This correlated with the vulnerability analysis which found that the majority of the population is at the edge of poverty despite most respondents having incomes above traditional poverty lines (the World Bank or UNDP thresholds are between 2-8 USD per day). The WAPCOS survey found that based on responses to the monthly income section in the livelihood analysis for the four provinces, the highest proportion of households earn between 200 to 300 USD/month (17.1%) and then 300 to 400 USD/month (16.0%). The high-income band per household of over 1000 USD/month was only attributed to 4.8% of households and the lowest income band of less than 50$/month was attributed to 7% of households. These average income values hide the variability between provinces, for example in Kandal province, 3% of households earn less than $50/month whereas in Kampong Chhnang the number is much higher at 10%. The low number of low-income households in Kandal may be due to the proximity to good transport links and towns/cities such as Phnom Penh. There are less alternative income sources in rural areas, such as selling produce and groceries, business, or service providers, so most households are dependent on agriculture for their livelihoods which typically does not generate large monthly incomes.

110 Since 2007, Cambodia has made significant progress in terms of educating its Children. The number of children enrolled in primary education increased from 82% in 1992 to 97% in 2017/8. However, the country still faces a number of challenges, particularly educating those living in poor rural areas as children are not reaching standards appropriate for their age.

111 At primary level, nearly 25% of children in Grade 3 cannot write a single word in a dictation test. Only 27% of 3 to 5 year old's are developmentally on track in literacy and numeracy and by the time they are 17 years old, 55% of adolescents will have dropped out of school. Overall, large numbers of girls and boys remain out of school at all levels of education, from early childhood through to adolescence. Most children drop out before reaching secondary school. Girls and boys from disadvantaged groups are struggling to realize their potential as they face difficulties getting to, and staying in, school.

112 Across the CAISAR project areas, high school dropout rates are common. The highest education level attained for 59% of households questioned during the survey was primary school. Only 22% had been to secondary school and less than 1% to university. 12% of households had never been to school and of these, 82% could not read or write. It must be noted that these average values hide the range of results which varied by province and sub project area. In Ou Ta Paong, 17% of households had never been to school. For 54% of the households questioned, primary school was their highest education level with 22% going to secondary school and 3% to university. Low education levels in this area will make it more challenging to implement climate resiliency measures.

113 By contrast, in Lum Hach, 7% of households had never been to school and 43% had been to primary school, 13% to secondary school and 2% to university. The variable educational levels attained by the households across the sub-project areas highlights the potential social inequalities experienced by local communities. There are various reasons why children may drop out of school such as cost, distance from home, engagement in agricultural activities. In most provinces of Cambodia, upper secondary schools are mainly located in district or provincial centers. Students in remote areas may therefore not be able to access them due to poor quality roads or general lack of transport. Long distances to schools and bad road conditions often require students to make use of accommodation in another district but this is not possible for the majority of poor rural families, limiting their capacity to meet their potential.

114 High school dropout rates are common in the CAISAR project areas and are typically experienced in these rural areas due to the cost, long travel times and bad road conditions. This is a social issue that the CAISAR project could address by providing good quality roads adjacent to canals and within the command areas.

115 In recent years, consecutive annual crop failures have led to household individuals sourcing other, more profitable non-farm incomes. In 2018, an estimated 1,000,000 Cambodian migrants were registered in Thailand looking for other income sources to support their families. However, the COVID19 pandemic resulted in a backflow of mostly rural labor migrants which posed its own challenges to the agricultural sector in Cambodia (ADB, 2022).

116 There continues to exist a large disparity between the rural and urban populations of Cambodia. In 2016, the estimated average monthly household income was $717 in Phnom Penh and $607 in other urban areas. By contrast, monthly incomes were on average $374 in rural areas (Government of Cambodia, Socio-Economic Survey, 2016). Rural incomes are therefore only about 50% - 60% of all urban areas although the gap does appear to be closing with the disparity in 2012 being 40% - 55% (ADB, 2022).

117 This section has discussed several direct and in-direct beneficiaries living in the project areas. It highlights the importance of surveying communities to identify any existing social inequatlies and looking for opportunities to reduce these. The CAISAR project will look to improve the general wealth, well-being, priorities, and opportunities of communities living within the command areas through providing a reliable irrigation system that is resistant to climate change and will enable farmers to improve their livelihoods.

4.5 Agriculture

118 Agriculture is the primary source of livelihood for the communities living in most provinces of Cambodia and it accounts for 22.5% of the country's Gross Domestic Product and employs over 3 million people. Rice is the dominant food crop grown on an estimated 4.5 million hectares or 70% of the country's total cultivated area (ADB, 2022). The cultivated area of rice in Cambodia increased from 3.2 million ha in 2017 to 3.3 million ha in 2018, comprising of 2.7 million ha of wet-season rice and 0.6 million ha of dry-season rice (ADB, 2022).

119 Each sub-project command area has unique climatic conditions and geology which results in different soil qualities. This in turn affects land use and farming practices as communities have adapted over time to the areas in which they live and the resources that they have.

120 Access to transport and agricultural co-operations additionally influences farming practices. Where there are agricultural co-operations, a network is already established between the farmers growing and selling the vegetables and those buying them. This facilitates vegetable cultivation and marketability, encouraging farmers to move away from rice farming to more diverse horticultural agriculture. Krang Ponley for example is very accessible and close to the city of Phnom Penh. Farmers there produce more vegetables than in other provinces as they have better access to the cities markets to sell their produce.

121 In May-June 2022, the CAISAR team conducted an agronomy survey. Based on the findings, the agronomy experts have suggested proposed cropping patterns for each sub-project area which are discussed below.

122 **In Lum Hach**, the soil quality is particularly low due to the dominance of sandy surface soils. As a result the land is not considered suitable for agricultural use. Crops can be particularly vulnerable to drought stress due to the high hydraulic conductivity of the soils resulting in fast runoff and drainage. In conjunction with insufficient water resources and irrigation supply, this results in high rates of nutrient leaching and low crop yields. The agronomy survey and livelihood survey conducted by WAPCOS found that crop yields in the Lum Hach Command Area are water limited to one annual wet season crop of rice. Interviewed farmers reported average annual yields of 1.5 to 2 tons/ha whereas district statistics report crop yields of 3.2 to 3.8 tons/ha but it is thought that this dataset does not account for failed crop years. Currently only 30% of the Command Area is agricultural land but this is expected to change under the CAISAR project, once a more reliable source of water is provided. With a more reliable water supply, dry season rice cropping would be possible but farmers in Lum Hach explained they have limited technical experience and understanding of dry season rice so in order for this to be a success, it is critical that the CAISAR project provides adequate training.

123 As highlighted in the agronomy survey, the low soil quality in Lum Hach significantly limits crop yields and opportunities for expansion. Therefore, the CAISAR scheme proposes that between wet season rice crops, farmers grow cover crops such as mung bean to improve soil organic matter and fertility. This will have an indirect benefit to crop yields by improving soil productivity and therefore enhancing rice crop yields over time. Using cover crops has a further benefit of reducing input costs as farmers are required to use less fertilizer once the cover crops improve soil fertility. Crop rotation has the added benefit that it reduces the number of pests and diseases thereby reducing crop yield losses.

124 Additionally, farmers in Lum Hach could diversify to alternative horticultural crops such as cucumber, watermelon, pumpkin etc. between wet season crops to help increase soil organic content and interrupt the intensive rice cropping which inhibits the soil from rejuvenating.

125 **The Ou Ta Paong** Command Area is dominated by agricultural land (80%). Soil fertility is high, made up of 69% high productivity soil and 31% medium productivity soil. This is largely due to the low-land nature of the command area with the northern part lying within the active floodplain of the Tonle Sap which floods annually. There are two to three crops per year, producing 3.9 tons/ha in the wet season and 5.8 tons/ha in the dry season. Dry season rice crops typically produce more yield per hectare due to the rice variety that is used during this cropping period and the additional fertilizer that is applied.

126 The improved drainage and more reliable water supply to Ou Ta Paong will enable up to three rice crops per year. In addition, between rice crops, it may be possible for famers to cultivate vegetables. Currently, the majority of farmers are reluctant to do this due to the lack of reliable water source. Once this is resolved by the CAISAR project, farmers have said they would be willing to try vegetable cultivation.

127 The dominant cropping pattern in **Krang Ponley** consists primarily of wet season rice cropping. There is however variation between the provinces depending on soil quality and water availability. Where possible, a dry season recession crop is planted with a typical yield of 4.5 tons/ha. The wet season rice yields are slightly lower at 3.9 tons/ha. However, flood inundation of the command areas can result in crop failures and reduced yields, particularly during the wet season.

128 In Krang Ponley, the overall soil quality is medium and similar to Ou Ta Paong due to the low-lying topography and annual flood inundation (particularly in Krang Bat) of the command area. Due to the proximity to markets in Phnom Penh, more farmers in this sub-project area have moved away from rice farming to horticultural produce such as watermelon, long bean, corn, eggplant and pumpkin. Farmers can either rely solely on vegetables throughout the year or grow vegetables outside of the wet season rice cropping period.

4.6 Water Resources

129 Rainfall is extremely variable across Cambodia both spatially and temporally. The Southwest monsoon in Cambodia provides 87% of the yearly rainfall during the months of May to October (Salvadore

et al, 2020). As a result, Cambodia receives an abundant amount of water during this part of the year but can also experience extreme water shortages during the dry season. The extreme volumes of water during the wet season can lead to extensive flooding which can result in crop and infrastructure damage. This is particularly an issue where flood waters inundate irrigation command areas. On the other hand, prolonged periods of dry days can lead to drought in the dry season. In areas where there are limited areas for water storage, crops can become water stressed and crop yields may be reduced or entire crops may fail. Water scarcity is therefore primarily a result of a lack of water management and water storage capacity rather than an insufficient volume of water available annually (ADB, 2022).

130 The extreme variability in rainfall results in serious challenges for rice farmers, particularly during the first few months of the wet season, when rainfall is most erratic and early season droughts are common. Short droughts can occur prior to the wettest period at the end of August to the end of November. Such short droughts can last 15 days but occasionally they can be prolonged and last up to 60 days after the first monsoon rains (ADB, 2014). This causes additional difficulties for rice farmers, particularly those who are dependent on rain-fed irrigation. Irrigation infrastructure is often lacking or is damaged due to lack of investment and maintenance which should otherwise provide reliable water supplies during these dry periods.

131 Across the three CAISAR project command areas, the majority of rice farmers are reliant on rain-fed irrigation or recession rice which brings both challenges and opportunities. Due to the erratic and unpredictable nature of the climate, farmers are reluctant to take more risks and diversify their cropping patterns as they have no reliable water source to support their crops if a period of drought occurs. In addition, there is a lack of drainage and flood protection which additionally inhibits farmers from meeting their yield potentials. Climate Change will impact Cambodia's water resources and it is critical that this is taken into account at each stage of the CAISAR project including project design and hydrological and hydraulic modelling.

132 Extensive modelling has been undertaken as part of this feasibility study to ensure that there are sufficient water resources both under current and future scenarios, taking uncertainty into account. This is summarized in detail in the D4 modelling report and the results show that the project is feasible in terms of the available of water resources both now and in the future, to support the proposed yield increases in the 45,000 ha CAISAR project command areas.

4.7 Irrigation

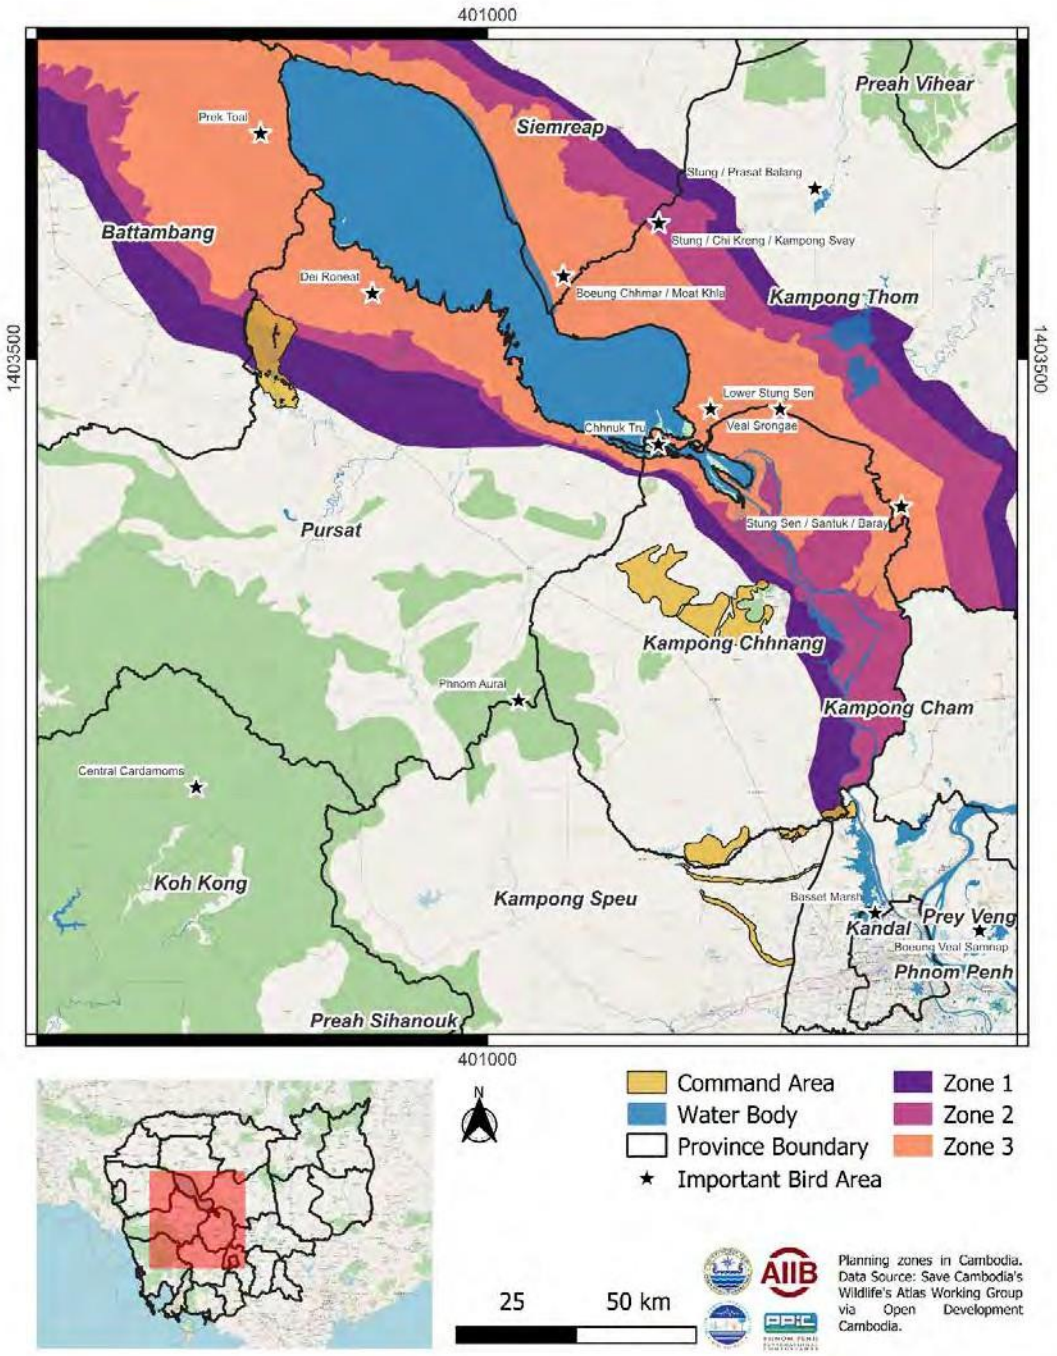
133 Access to water is a challenge, particularly for those with irrigation schemes located close to the Tonle Sap as flooding in the wet season and shortage in the dry season can limit annual cropping intensity. Successful water resource management is therefore critical to ensuring that the CAISAR irrigation schemes are a success.

134 Rehabilitation and climate proofing of existing irrigation infrastructure will be key. Constructing irrigation ponds also forms part of an integrated and smart water resource management plan. Climate proofing involves securing the irrigation system's resilience and sustainability against longer droughts in the dry season and to mitigate the impacts of flood events.

135 Irrigation has the potential to increase Cambodia's potential rice yields. Currently, the dominance of low wet-season rice yield limits the productivity and profitability of Cambodian farmers. For example, Cambodia's wet-season rice is about 30% less than that of Thailand's Central Plains region (ADB, 2022). There are opportunities for crop diversification that are being explored but this is likely to be on a smaller scale than rice production.

136 The infrastructure proposed is a full package for water management improvements including storage, gravity supply without repumping where possible and use of solar pumping where it is not, drainage and flood control including allowance for aquatic animals and fish.

4.8 Biodiversity



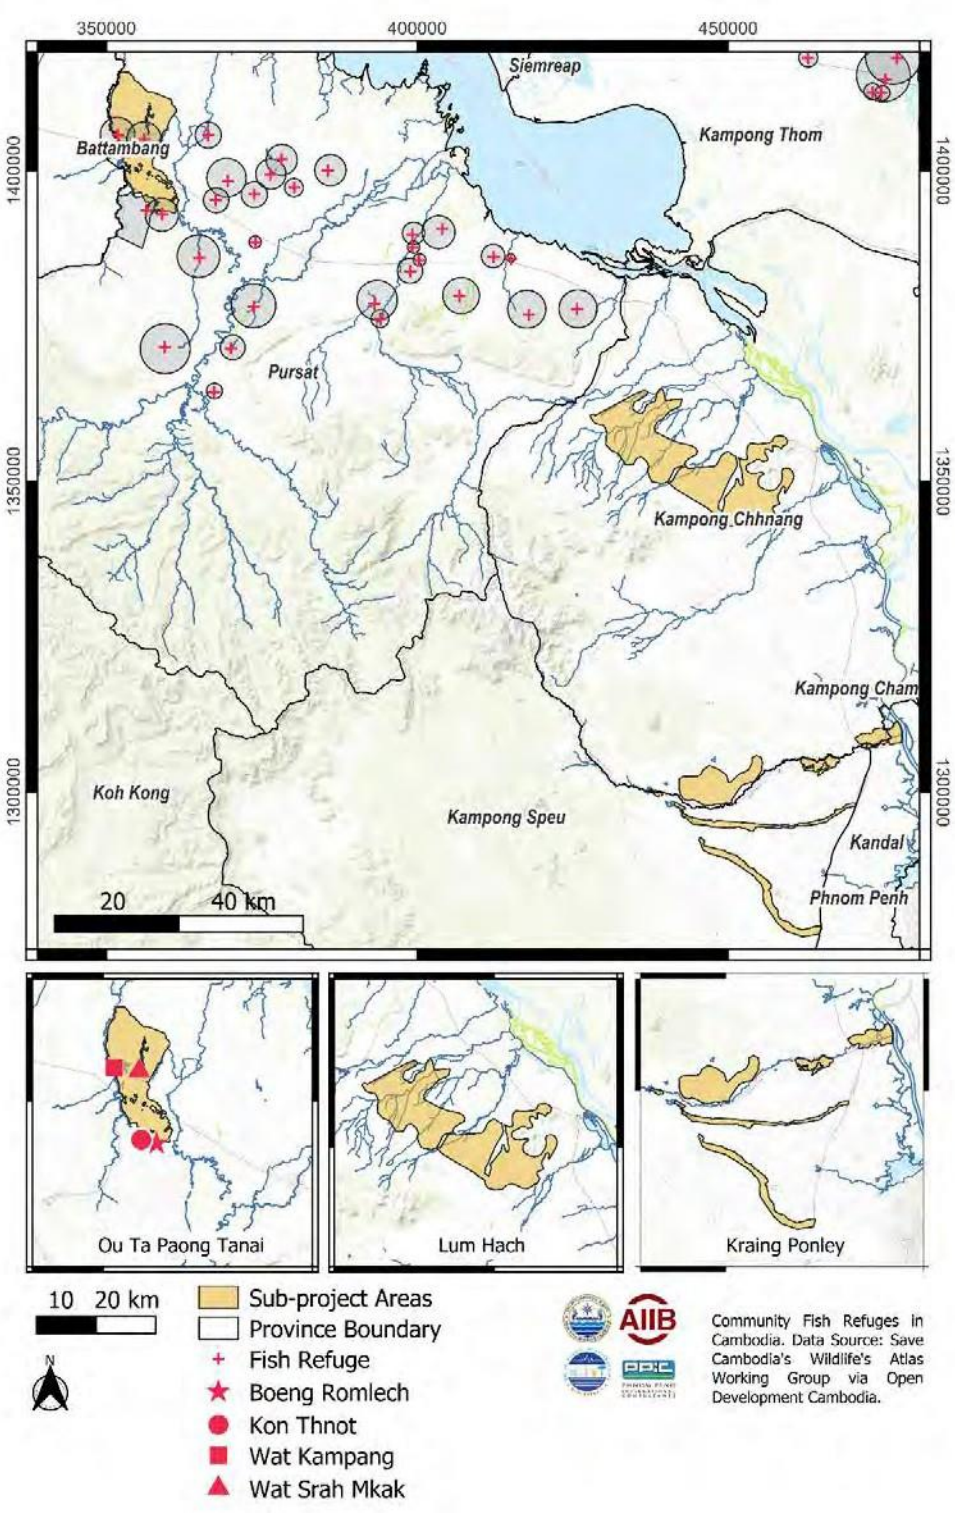
4.8.1 Designated areas and species of interest

137 The Feasibility Studies have noted the unique ecosystem in Tonle Sap lake and floodplain which is protected as a UNESCO Biosphere Reserve. The Great Lake itself if one of the most productive fisheries systems in the world, providing key breeding grounds for fish and 60% of Cambodia's protein intake. In addition, it is home to some of the largest breeding colonies of some of the world's most threatened water birds. This unique ecosystem faces unprecedented threats from population increases and pressure on natural resources. As a result, there are a number of conservation projects taking place to protect this precious environment and in 2021, the conservation areas surrounding the Tonle Sap Great Lake were updated and re-instated.

138 The agricultural protection zones are shown in Source: CAISAR Feasibility Study

139 Figure 4-8. The Zone 1 and 2 are areas where farming is allowed. In zone 1, people can live and obtain land title certificates. In zone 2, local communities are allowed to do land cultivation. In Zone 3, closest to the lake is where agriculture and fishing are officially banned and the areas of flooded forest must be protected and conserved. This re-zoning allows the government an opportunity to restore the Tonle Sap's unique forests.

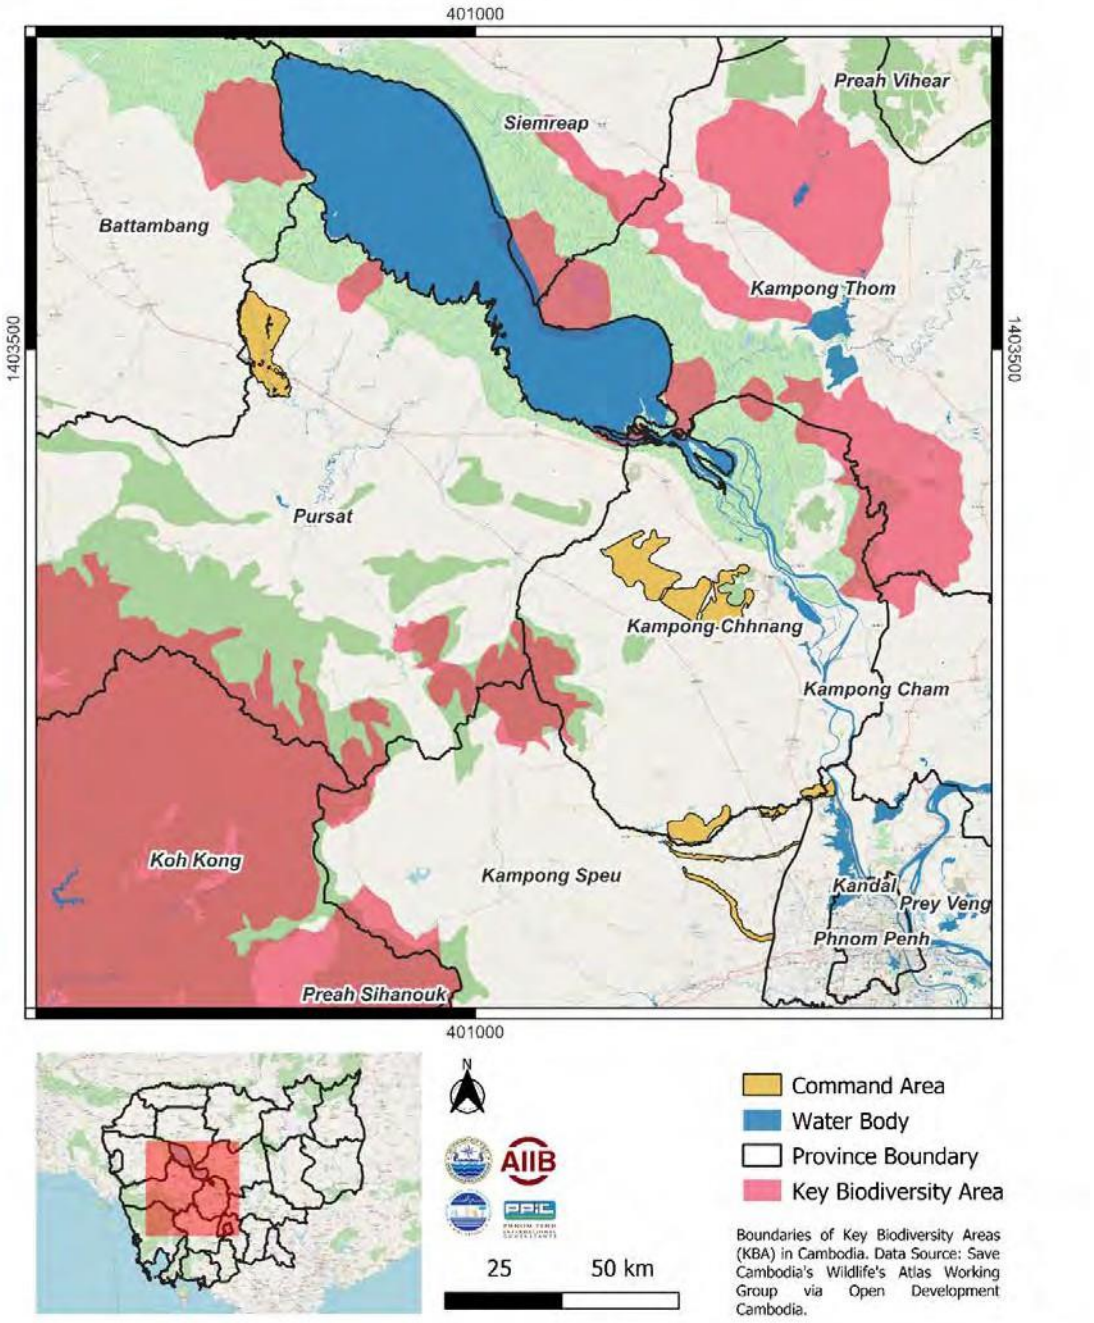
140 The CAISAR command areas lie outside of zone 3. Most of the Ou Ta Paong command area falls within zones 1 and 2 where agricultural practices are permitted. The majority of the Lum Hach command area lies outside of the protection zones, with a small section to the north falling within zone 1. The majority of the Krang Ponley scheme falls outside of the protection zones although a small section of Krang Bat lies within zone 1. Based on this, there are no limitations on agricultural practices required by the Tonle Sap Agricultural Protection Zones.



Source: CAISAR Feasibility Study

Figure 4-8 Tonle Sap Agricultural Protection Zones

141 Rice Field Fisheries are a vital source of food and income for almost all rural households in Cambodia. Fishing typically occurs during the wet season from July to February and takes place in and around flooded rice fields. Despite contributing 20-25% of the country's inland fish catch, community fish refuges are often poorly managed and have low productivity. Several projects, such as the USAID-funded Enhancing Rice Field Fisheries project, have been implemented to increase the productivity of these vital food production systems. Through improved management and inclusion of best-practice methods amongst local communities, the projects can ensure that fish are available and accessible to all poor and rural families. The location of Community Fish refuges in the CAISAR Command Areas are shown in
142 Figure 4-9. There are only 2 refuges in the Ou Ta Paong Command Area which should be considered during DED stage and allowance made in the scheme design to expand and enhance the number of fish refuges and the linkage through canals and rice fields.



143 The key biodiversity areas are shown in Figure 4-10. The CAISAR Command Areas fall outside of these areas. However, due to the proximity, it is recommended that further analysis is undertaken during the SECAP analysis and DED to determine whether any further environmental considerations are needed.

144 The CAISAR Command areas are located largely outside of all the protected areas. The surrounding land use is dominated by paddy field thus, potential impact on local ecological features is not envisaged although this will be investigated further as part of the ESCIA.

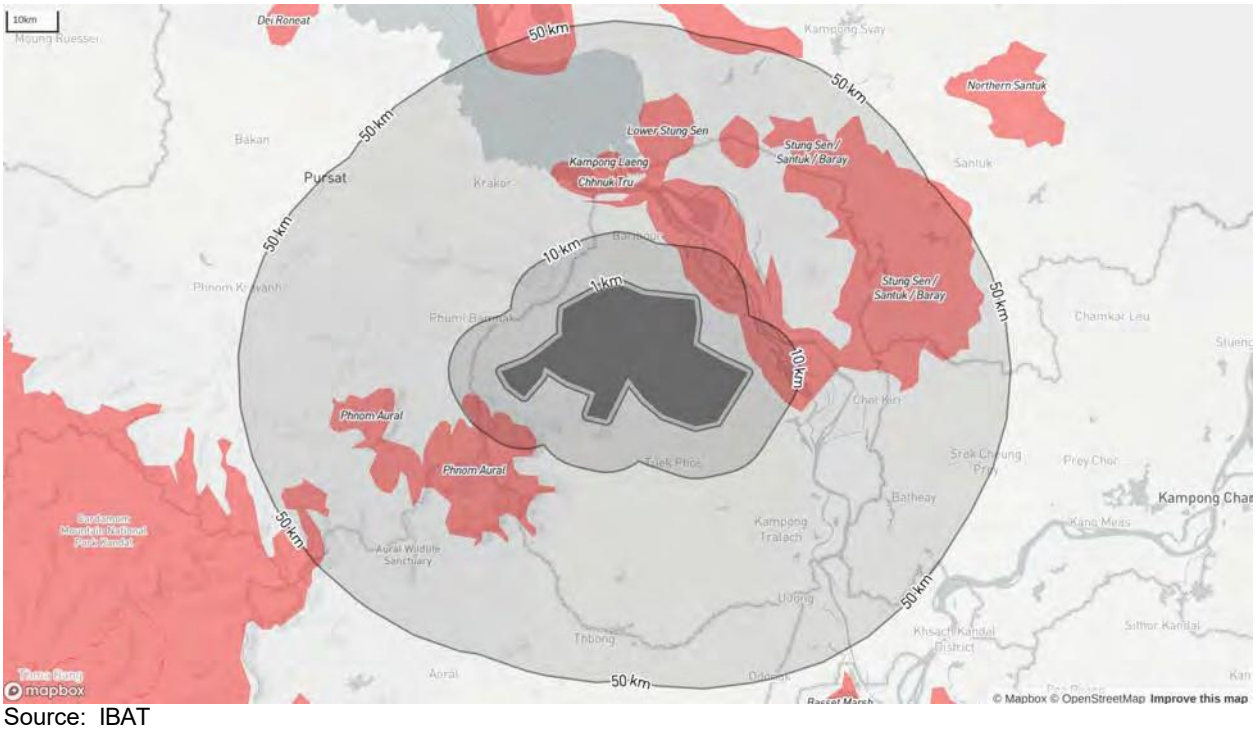
4.8.2 IBAT Initial Biodiversity Assessment

145 The initial biodiversity assessment utilized the IBAT system. IBAT offers rapid visual screening for critical biodiversity. The tool is used as basic risk screening on biodiversity. This review provides an indication of the potential biodiversity related features including protected areas, key biodiversity areas and species close to the proposed project locations. It provides an early indication of potential biodiversity concerns and can provide valuable guidance in making decisions. The IBAT screening does not provide details of potential indirect, downstream, or cumulative impacts. This information may be helpful when assessing the potential environmental risk and impact of a site, categorizing investments/projects, preparing the terms of

reference or an impact assessment, focusing attention on key species of conservation concern and sites of known conservation value.



146 IBAT provides information on key biodiversity areas (KBA) which are sites contributing significantly to the global persistence of biodiversity in terrestrial, freshwater and marine ecosystems: information available from the World Database on Protected Areas (WDPA); and information form the IUCN Red List of Threatened Species (also known as the IUCN Red List) which is a compendium of information on threats, ecological requirements, and habitats and on conservation actions that can be taken to reduce or prevent extinctions (Figure 4-11, Figure 4-12, Figure 4-13).

4.8.3 Protected Areas, Key Biodiversity Areas and IUCN Threatened Species

Lum Hach Scheme

147 The IBAT assessment identified the following biodiversity features within a 5 km, 20 km and 50 km distance from the Lum Hach Irrigation and flood protection scheme.

- Protected Areas - 12
- Key Biodiversity Areas - 9
- IUCN Red List of Threatened Species – 96 (Annex ___)

Source: IBAT

Figure 4-11 IBAT Biodiversity Features around Lum Hach Scheme

148 The following protected areas were identified within a 5 km, 20 Km and 50 km radius of Lum Hach Scheme.

LH Protected Areas

Area Name	Within Buffer of KPL Project Area
Phnom Aoral – Wildlife Sanctuary	5 km
Phnom Krang Dey Meas – Protected Landscape	5 km
Tonle Sap – UNESCO-MAB Biosphere Reserve	5 km
Phnom Neang Kong Rey- Phnom Touk Meas – Multiple Use area	20 km
Boeng Chhmar Core Area (Ramsar Site)	50 km
Cardamom Corridor	50 km
Central Kravanh	50 km
North Tonle Sap	50 km
Stung Sen Core Area (Ramsar Site)	50 km

149 Key Biodiversity Areas within 5 km, 20 Km and 50 km of the Lum Hach Scheme included:

LH Key Biodiversity Areas

Area name	Distance
Kampong Laeng	5 km
Phnom Aural	5 km
Chhnuk Tru	20 km
Lower Stung Sen	20 km
Stung Sen / Santuk / Baray	20 km
Boeung Chhmar / Moat Khla	50 km
Central Cardamoms	50 km
Stung / Chi Kreng / Kampong Svay	50 km
Veal Srongae	50 km

150 The IBAT system identified 19 Critically Endangered Species and 31 Endangered Species in the IUCN Red List of Threatened Species within the 5 km, 20 and 50 km buffer areas of the Lum Hach Scheme.

Krang Ponley Scheme

151 The IBAT assessment identified the following biodiversity features within a 5 km, 20 km and 50 km distance from the Krang Ponley Irrigation and flood protection scheme.

- Protected Areas - 6
- Key Biodiversity Areas - 7
- IUCN Red List – 104 (Annex __)

Source: IBAT

Figure 4-12 IBAT Biodiversity Features around Krang Ponley Scheme

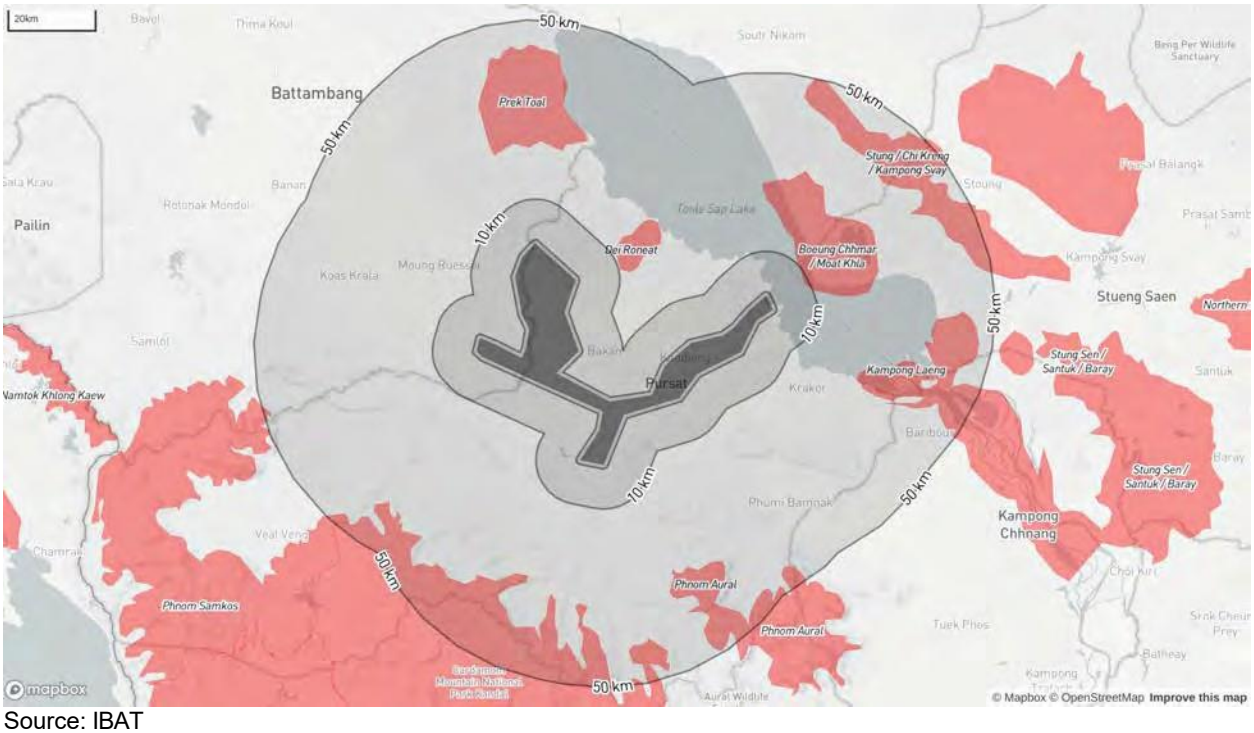
152 The following protected areas were identified within a 5 km, 20 and 50 km radius of Krang Ponley Scheme.

KPL Protected Areas

Area Name	Within Buffer of KPL Project Area
Cardamom Corridor	50 km
North Tonle Sap	50 km
Phnom Aoral	50 km
Phnom Krang Dey Meas	50 km
Phnom Neang kong Rey – Phnom Touk Meas	50 km
Souther Kravanh	50 km

153 Key Biodiversity Areas within 5 km, 20 and 50 km of the Krang Ponley Scheme included:

KPL Key Biodiversity Areas



Area name	Distance
Basset Marsh	5 km
Boeung Veal Samnap	20 km
Bassac Marsh	50 km
Kampong Laeng	50 km
Phnom Aural	50 km
Southern Cardamoms	50 km
Stung Sen / Santuk / Baray	50 km

154 The IBAT system identified 18 Critically Endangered Species and 35 Endangered Species in the IUCN Red List of Threatened Species within the 5 km, 20 and 50 km buffer areas of the Krang Ponley Scheme.

Ou Ta Paong Scheme

155 The IBAT assessment identified the following biodiversity features within a 5 km, 20 km and 50 km distance from the Ou Ta Paong Irrigation and flood protection scheme.

- Protected Areas - 13
- Key Biodiversity Areas - 10
- IUCN Red List of Threatened – 97

Source: IBAT

Figure 4-13 IBAT Biodiversity Features around Ou Ta Paong Scheme

156 The following protected areas were identified within a 5 km, 20 Km and 50 km radius of Ou Ta Paong Scheme.

Protected Areas

Area Name	Within Buffer of KPL Project Area
Tonle Sap – UNESCO-MAB Biosphere Reserve	5 km
Boeng Chhmar Core Area (Ramsar Site)	20 km
Cardamom Corridor – Biodiversity Area of Protected Area	20 km
Central Kravanh	50 km
North Tonle Sap	50 km
Phnom Aoral	50 km
Phnom Somkos	50 km
Prek Toal Core Area (Ramsar Site)	50 km
Stung Sen Core Area (Ramsar Site)	50 km

157 Key Biodiversity Areas within 5 km, 20 Km and 50 km of the Ou Ta Paong Scheme included:

Key Biodiversity Areas

Area name	Distance
Boeung Chhmar / Moat Khla	20 km
Dei Roneat	20 km
Central Cardamoms	50 km
Chhnuk Tru	50 km
Kampong Laeng	50 km
Lower Stung Sen	50 km
Phnom Aural	50 km
Phnom Samkos	50 km
Prek Toal	50 km
Stung / Chi Kreng / Kampong Svay	50 km

158 The IBAT system identified 7 Endangered Species in the IUCN Red List of Threatened Species within the 5 km, 20 and 50 km buffer areas of the Ou Ta Paong Scheme.

159 The IBAT system analysis of biodiversity near the project areas suggests that a more detailed biodiversity assessment is required.

4.9 Assessment of Environmental, Social and Climate Risks, Impacts and Mitigation Measures

160 Potential risks, impacts and mitigation measures have been identified for the CAISAR irrigation and flood control protection schemes during the Pre-Construction Phase; Construction Phase and the Operations Phase in the provinces of Kampong Speu, Kampong Chhnang, Kandal, and Pursat Cambodia.

4.9.1 Pre-Construction Phase

161 Potential environmental, social, and climate-related risks and impacts to be considered specifically associated with the pre-construction phase of the planned CAISAR irrigation and flood protection project include:

4.9.1.1 Environmental Risks and Impacts (Pre-construction Phase):

1. **Habitat Assessment:** Before construction begins, there should be a thorough assessment of the project area's habitats to identify potential impacts on local flora and fauna.
2. **Vegetation Clearance**: Clearing land for construction can lead to habitat destruction and loss of biodiversity. Pre-construction activities like land clearing should be carefully planned and managed.
3. **Soil Erosion**: Pre-construction activities like excavation and grading can increase soil erosion, potentially affecting nearby water bodies and ecosystems.
4. **Land Use Changes**: Conversion of land for project purposes may alter local land use patterns, impacting agricultural and forestry activities.
5. **Waterbody Alteration:** The assessment of water bodies like rivers, streams, and wetlands should be conducted to understand potential impacts on aquatic ecosystems.
6. **Waste Management -** increase in volume of hazardous and non-hazardous waste requiring safe disposal.

4.9.1.2 Social Risks and Impacts (Pre-construction Phase):

1. **Land Acquisition:** The process of acquiring land for the project can disrupt local communities, potentially leading to land tenure issues and conflicts.
2. **Livelihood Disruption**: Even before construction starts, the anticipation of project impacts can disrupt local livelihoods as residents may alter their activities or move.

3. **Cultural Heritage**: Pre-construction surveys should identify any cultural heritage sites or traditions that may be affected, and appropriate measures should be taken to protect them.
4. **Community Engagement:** Engaging with local communities during the pre-construction phase is critical to understanding their concerns and needs, helping to design mitigation measures.
5. **Indigenous Peoples Exclusion –** Potential disbenefit to IP's or lack of inclusion in project benefits and opportunities.
6. **Gender Inequities –** Potential inequities and lack of project opportunities and benefits.

4.9.1.3 Climate Risks and Impacts (Pre-construction Phase) (See Annex 13: CAISAR Climate Change Impact Rationale)

1. **Climate Data Analysis:** It's important to analyze historical climate data during the pre-construction phase to identify climate-related risks that may affect project design and location.
2. **Future Climate Projections**: Understanding future climate projections, such as changes in rainfall patterns or increased frequency of extreme weather events, can inform the project's design for resilience.
3. **Adaptation Planning:** Pre-construction phase should involve planning for climate change adaptation measures, ensuring the project can withstand anticipated climate impacts.
4. **Mitigation Strategies:** Identifying opportunities to reduce greenhouse gas emissions associated with pre-construction activities, such as transportation or energy use, is important for climate mitigation.
5. **Data Collection**: Establishing baseline data on environmental conditions, community demographics, and climate variables during the pre-construction phase is crucial for monitoring and evaluation throughout the project's lifecycle.

162 During the pre-construction phase, thorough assessments, community consultations, and climate resilience planning should be integrated into the project's design to minimize environmental, social, and climate-related risks. This will help lay the foundation for a more sustainable and resilient project during the construction and operational phases.

163 Mitigation measures to address the environmental, social, and climate-related issues associated with the **pre-construction** phase of the CAISAR irrigation and flood protection project include:

4.9.1.4 Environmental Mitigation Measures (Pre-construction Phase):

1. **Habitat Assessment and Preservation:**
   - Conduct a detailed habitat assessment and implement measures to preserve critical habitats, such as wetlands and forests, by avoiding or minimizing construction within these areas.
2. **Revegetation and Reforestation**:
   - Implement reforestation and revegetation programs in areas where land clearance is necessary. Use native species to restore habitats.
3. **Soil Erosion Control**:
   - Implement erosion control measures, such as silt fences, erosion control blankets, and sediment basins, to prevent soil erosion during pre-construction activities.
4. **Sustainable Land Use Planning**:
   - Work with local authorities and communities to develop land use plans that minimize negative impacts on agriculture and forestry.
5. **Water Management:**
   - Develop and implement a water management plan to minimize waterbody alteration during pre-construction activities.
6. **Waste Management**:

- Prepare and implement waste management plan.

4.9.1.5 Social Mitigation Measures (Pre-construction Phase):

1. **Land Acquisition and Resettlement:**
   - Follow Resettlement Planning Framework and develop a fair and transparent land acquisition and resettlement plan, ensuring affected communities are adequately compensated and resettled, if necessary.
2. **Livelihood Restoration**:
   - Implement livelihood restoration programs, such as vocational training and alternative income generation activities, to mitigate disruptions caused by pre-construction activities.
3. **Cultural Heritage Protection**:
   - Identify and protect cultural heritage sites and traditions through measures like site preservation, documentation, and community involvement.
4. **Community Engagement**:
   - Engage in meaningful consultations with local communities to gather their input and concerns and incorporate their feedback into project planning and design.
5. **Indigenous Peoples:**
   - Implement IPP and ensure full participation of vulnerable or disadvantages groups (e.g., ethnic minorities).
6. **Gender Participation**:
   - Implement Gender Action Plan and measures to promote female beneficiaries for improved participation in project planning and implementation, and economic empowerment.

4.9.1.6 Climate Mitigation and Adaptation Measures (Pre-construction Phase):

1. **Climate-Resilient Design**:
   - Incorporate climate resilience into the project design by considering future climate projections and ensuring infrastructure can withstand extreme weather events and changing climate conditions.
2. **Low-Carbon Practices**:
   - Minimize greenhouse gas emissions from pre-construction activities by using energy-efficient machinery, promoting green transportation, and reducing construction-related emissions.
3. **Adaptive Management:**
   - Develop adaptive management plans that can be adjusted based on changing climate conditions, ensuring the project's long-term viability.
4. **Baseline Data Collection**:
   - Establish baseline data for environmental, social, and climate variables during the pre-construction phase to enable effective monitoring and evaluation throughout the project's lifecycle.
5. **Climate Risk Assessments:**
   - Regularly assess climate risks and vulnerabilities during the pre-construction phase to identify emerging issues and adjust plans accordingly.
6. **Community Resilience**:
   - Support local communities in building resilience to climate change through capacity-building programs, education, and access to climate-resilient livelihood options.
7. **Green Infrastructure:**
   - Consider the use of green infrastructure solutions, such as natural flood management techniques, to complement traditional engineering approaches and enhance climate resilience.

164 It's essential that these mitigation measures are integrated into the project's planning and design from the early stages of the pre-construction phase. Collaboration with relevant stakeholders, including local communities, environmental experts, and climate specialists, is crucial to ensure the successful implementation of these measures and the overall sustainability of the project. Regular monitoring and evaluation is also essential to assess the effectiveness of these mitigation efforts and make necessary adjustments as needed.

4.9.2 Construction Phase

165 The potential environmental, social, and climate-related risks and impacts to be considered that are associated with the construction phase of the CAISAR irrigation and flood protection project include:

4.9.2.1 Environmental Risks and Impacts (Construction Phase):

1. **Habitat Destruction:** Construction activities can result in the direct destruction of natural habitats, including wetlands, forests, and aquatic ecosystems.
2. **Soil Erosion and Sedimentation:** Excavation, grading, and land clearing can increase soil erosion, leading to sedimentation in nearby water bodies, affecting water quality and aquatic ecosystems.
3. **Water Pollution**: Construction machinery, equipment, and runoff from construction sites can introduce pollutants, such as sediment, oil, and chemicals, into nearby water bodies.
4. **Noise and Air Pollution:** Construction activities generate noise pollution and emissions from heavy machinery, impacting local air quality and disturbing wildlife.
5. **Resource Consumption**: Construction materials, water, and energy are often consumed in large quantities, leading to resource depletion and increased carbon emissions.
6. **Waste Management** – increase in volume of hazardous and non-hazardous waste requiring safe disposal.

4.9.2.2 Social Risks and Impacts (Construction Phase):

1. **Displacement and Resettlement:** The construction phase may require the displacement of local households leading to potential land tenure issues and disruption of livelihoods.
2. **Traffic and Access Disruption**: Increased construction-related traffic can disrupt local transportation networks, impacting communities and businesses along transportation routes.
3. **Health and Safety:** Construction sites pose health and safety risks to workers and nearby communities. Accidents and exposure to construction-related hazards can have serious consequences.
4. **Cultural Heritage:** Construction activities and in migration of labor may threaten cultural heritage sites or disrupt local traditions and practices, leading to social and cultural impacts.
5. **Indigenous Peoples Exclusion –** Potential disbenefit to IP's or lack of inclusion in project benefits and opportunities.
6. **Gender Inequities –** Potential inequities and lack of project opportunities and benefits.

4.9.2.3 Climate Risks and Impacts (Construction Phase):

1. **Emissions**: Construction machinery and transportation can generate significant greenhouse gas emissions, contributing to climate change if not properly managed.
2. **Climate-Related Disruptions**: Extreme weather events, such as heavy rainfall or flooding, can disrupt construction activities, leading to delays and increased costs.
3. **Water Management**: Managing water resources during construction, including temporary diversion of rivers or drainage, can impact local hydrology and potentially lead to downstream flooding.
4. **Infrastructure Vulnerability:** The construction phase may expose infrastructure to climate risks, such as flooding or storm damage, if proper precautions and design considerations are not taken into account.
5. **Temperature Extremes**: Construction workers may be exposed to temperature extremes, including heat stress in hot seasons and cold stress during cooler months, affecting worker health and productivity.

166 To address these risks and mitigate negative impacts during the construction phase, it's essential to implement environmental and social management plans. These plans will include measures to minimize habitat destruction, control pollution, ensure worker safety, and engage with local communities.

167 Additionally, climate resilience measures will be integrated into the construction process to mitigate climate-related risks and ensure the infrastructure's long-term sustainability. Regular monitoring and adherence to best practices will be implemented to minimize adverse effects during this phase of the project.

168 Suggested mitigation measures to address the potential environmental, social, and climate-related risks and impacts associated with the **construction phase** of the CAISAR irrigation and flood protection include.

4.9.2.4 Environmental Mitigation Measures (Construction Phase):

1. **Habitat Protection and Restoration:**
   - Establish construction exclusion zones around sensitive habitats to prevent disturbance.
   - Implement habitat restoration programs in areas where construction has occurred.
2. **Erosion and Sediment Control:**
   - Install erosion control measures such as silt fences, sediment basins, and check dams to prevent soil erosion.
   - Implement best management practices for construction site runoff, including sediment ponds.
3. **Water Pollution Control:**
   - Properly manage construction chemicals, fuels, and waste to prevent water pollution.
   - Use environmentally friendly construction materials and techniques to reduce the risk of pollution.
4. **Noise and Air Pollution Management:**
   - Implement noise barriers and schedule noisy activities during non-sensitive hours.
   - Ensure construction equipment meets emissions standards and maintain equipment properly.
5. **Resource Efficiency:**
   - Reduce resource consumption by optimizing construction material use and recycling where feasible.
   - Implement energy-efficient construction practices and use renewable energy sources where possible.
6. **Waste Management**
   - Implement waste management plan

4.9.2.5 Social Mitigation Measures (Construction Phase):

1. **Community Engagement:**
   - Maintain ongoing communication with affected communities to address concerns and keep them informed about construction activities.
   - Implement grievance mechanism to address community complaints and issues promptly.
2. **Displacement and Resettlement:**
   - Implement resettlement plans, ensuring affected communities receive fair compensation, land, and livelihood restoration support.
   - Support affected households in finding alternative housing and income opportunities.
3. **Health and Safety:**
   - Enforce strict health and safety regulations on construction sites to protect both workers and nearby communities.
   - Provide appropriate training and personal protective equipment to workers.
4. **Cultural Heritage Protection:**

- Conduct archaeological surveys before construction in culturally sensitive areas.
- Develop mitigation strategies to protect cultural heritage sites and involve local communities in preservation efforts.

5. **Indigenous Peoples:**
   - Implement IPP and ensure full participation of vulnerable or disadvantages groups (e.g., ethnic minorities).
6. **Gender Participation:**
   - Implement Gender Action Plan and measures to promote female beneficiaries for improved participation in project planning and implementation, and economic empowerment.

4.9.2.6 Climate Mitigation and Adaptation Measures (Construction Phase):

1. **Emission Reduction:**
   - Use low-emission construction equipment and vehicles.
   - Minimize idling time for construction machinery to reduce emissions.
   - Promote sustainable transportation options for workers and materials.
2. **Climate-Resilient Construction:**
   - Incorporate climate-resilient design features into infrastructure construction to withstand climate-related risks.
   - Implement flood and stormwater management measures to prevent construction site flooding.
3. **Temperature Extremes:**
   - Implement heat stress prevention measures for workers, such as shaded rest areas and hydration stations in hot weather.
   - Provide adequate clothing and equipment for workers during cold weather.
4. **Community Resilience Building:**
   - Support local communities in building climate resilience by providing training and resources for climate adaptation.
5. **Monitoring and Compliance:**
   - Establish regular monitoring and reporting mechanisms to ensure compliance with environmental, social, and climate mitigation measures.
   - Conduct periodic audits to assess the effectiveness of mitigation efforts and make necessary adjustments.

169 These mitigation measures should be integrated into the construction management plan and closely monitored throughout the construction phase. Collaboration with relevant stakeholders, including local communities, environmental experts, and safety professionals, is essential to ensure successful implementation and the overall sustainability of the project.

4.9.3 Operations Phase

170 The potential environmental, social, and climate-related risks and impacts associated with the operations phase of the planned CAISAR irrigation and flood protection project include:

4.9.3.1 Environmental Risks and Impacts (Operations Phase):

1. **Water Management**: Inadequate water management during operations can lead to over-extraction of water resources, which may cause downstream water scarcity, altered hydrology, and harm to aquatic ecosystems.

2. **Water Quality**: The irrigation system's operations can affect water quality, with potential risks of contamination from agricultural runoff, pesticide use, or improper wastewater disposal.
3. **Erosion and Sedimentation:** Ongoing maintenance and operation activities can contribute to soil erosion and sedimentation in water bodies, impacting water quality and aquatic habitats.
4. **Invasive Species:** Poorly managed water flows can facilitate the spread of invasive aquatic species, potentially harming native ecosystems.
5. **Energy Use:** The energy requirements for pump stations, flood control systems, and other infrastructure elements can result in increased carbon emissions if not managed efficiently.
6. **Waste Management -** increase in volume of hazardous and non-hazardous waste requiring safe disposal.

4.9.3.2 Social Risks and Impacts (Operations Phase):

1. **Land Use Conflicts**: Conflicts over water allocation and land use may arise among competing stakeholders, such as farmers, leading to disputes and social tensions.
2. **Access to Water:** Unequal access to water resources during the operations phase can exacerbate social inequalities, impacting vulnerable communities and livelihoods.
3. **Health and Safety:** Ongoing maintenance and operations work can pose health and safety risks to workers and nearby communities, particularly if safety measures are inadequate.
4. **Community Engagement**: Maintaining effective communication and engagement with local communities is crucial to address their concerns and ensure the equitable distribution of benefits.
5. **Indigenous Peoples Exclusion –** Potential disbenefit to IP's or lack of inclusion in project benefits and opportunities.
6. **Gender Inequities –** Potential inequities and lack of project opportunities and benefits.

4.9.3.3 Climate Risks and Impacts (Operations Phase):

1. **Climate Variability:** Changes in rainfall patterns, increased temperature, or more frequent extreme weather events can affect water availability and the effectiveness of flood protection systems.
2. **Extreme Events**: The irrigation and flood protection infrastructure must be resilient to withstand extreme weather events, including floods, droughts, and storms.
3. **Maintenance Challenges**: Climate-related impacts, such as increased sedimentation or infrastructure damage from extreme events, can pose challenges for ongoing maintenance and operations.
4. **Energy Efficiency**: Climate mitigation efforts should focus on optimizing energy use and transitioning to cleaner energy sources to reduce greenhouse gas emissions associated with ongoing operations.
5. **Adaptive Management:** The operations phase should include adaptive management strategies to respond to changing climate conditions and ensure infrastructure remains effective.
6. **Community Resilience**: Local communities will require support to build resilience to climate-related risks, such as training in climate-smart agriculture or flood preparedness.
7. **Water Management**: Climate-related changes may necessitate adjustments in water management practices to ensure sustainable and equitable water distribution.

171 Addressing these potential risks and impacts during the operations phase requires proactive planning, ongoing monitoring, and adaptive management. Sustainable water management practices, efficient energy use, and community engagement are crucial components of mitigating these issues and ensuring the long-term success and resilience of the irrigation and flood protection project. Regular maintenance and assessment of the infrastructure's performance under changing climate conditions are essential for its continued effectiveness.

172 Suggested mitigation measures to address the potential environmental, social, and climate-related risks and impacts during the operations phase of the CAISAR irrigation and flood protection project include:

4.9.3.4 Environmental Mitigation Measures (Operations Phase):

1. **Sustainable Water Management:**
   - Implement efficient water management practices to prevent over-extraction and ensure equitable water distribution.
   - Monitor water quality regularly and implement measures to reduce contamination, such as the responsible use of pesticides and proper wastewater treatment.
2. **Erosion and Sedimentation Control:**
   - Develop and implement erosion control measures to minimize soil erosion and sedimentation in water bodies.
   - Regularly maintain sediment basins and silt fences to manage sediment runoff.
3. **Invasive Species Management:**
   - Implement monitoring and control programs to prevent the spread of invasive aquatic species in irrigation and flood protection infrastructure.
4. **Energy Efficiency:**
   - Optimize energy use through efficient pump systems, renewable energy integration, and regular maintenance of energy-consuming equipment.
5. **Waste Management**
   - Implement waste management plan.

4.9.3.5 Social Mitigation Measures (Operations Phase):

1. **Stakeholder Engagement:**
   - Maintain transparent and ongoing engagement with local communities and stakeholders to address concerns and ensure the equitable distribution of water resources.
   - Establish mechanisms for conflict resolution and dispute management related to land use and water allocation.
2. **Access to Water:**
   - Ensure that water access is fair and inclusive, with mechanisms in place to support vulnerable and marginalized communities in accessing water resources.
3. **Health and Safety:**
   - Continue to enforce strict health and safety regulations for workers and nearby communities during ongoing maintenance and operation activities.
   - Provide ongoing safety training and personal protective equipment to workers.
4. **Indigenous Peoples:**
   - Implement IPP and ensure full participation of vulnerable or disadvantages groups (e.g., ethnic minorities).
5. **Gender Participation:**
   - Implement Gender Action Plan and measures to promote female beneficiaries for improved participation in project planning and implementation, and economic empowerment.

4.9.3.6 Climate Mitigation and Adaptation Measures (Operations Phase):

1. **Climate-Resilient Infrastructure:**
   - Regularly assess and maintain flood protection and irrigation infrastructure to ensure its resilience to changing climate conditions.
   - Develop flood and drought management strategies based on climate projections.
2. **Maintenance and Repairs:**

- Implement a robust maintenance program to promptly address damage or sedimentation issues caused by climate-related events.
- Ensure that infrastructure components remain in good working condition to maintain their effectiveness.

3. **Energy Transition:**
   - Transitioning to cleaner energy sources for operation, implement and maintain solar solar pumps to reduce carbon emissions.
   - Promote energy-efficient practices within the operational phase.
4. **Adaptive Management:**
   - Establish adaptive management plans that allow for adjustments in water management and infrastructure operations in response to climate variability and extreme events.
5. **Community Resilience Building:**
   - Support local communities in building climate resilience through education, capacity-building programs, and climate-smart agriculture practices.
   - Encourage community-led initiatives for flood preparedness and disaster risk reduction.
6. **Water Management Adjustments:**
   - Be prepared to adjust water management practices, such as reservoir release schedules, in response to changing climate conditions and hydrological patterns.
7. **Monitoring and Reporting:**
   - Continue regular monitoring and reporting on environmental, social, and climate-related factors to assess the effectiveness of mitigation efforts and make necessary adjustments.

173 These mitigation measures will be integrated into the ongoing operation and maintenance plan for the CAISAR irrigation and flood protection infrastructure. Collaboration with relevant stakeholders, including local communities, environmental experts, and climate specialists, is essential to ensure the successful implementation of these measures and the long-term sustainability and resilience of the project during the operations phase. Regular evaluation and adaptation are critical components of managing risks and impacts effectively.

174 The CAISAR irrigation and flood protection project is planned to have the following positive environmental, social, and climate impacts:

4.9.4 Positive Environmental, Social and Climate Impacts:

4.9.4.1 Positive Environmental Impacts:

1. **Improved Water Management:** Irrigation systems help optimize water use, reducing wastage and ensuring efficient distribution of water resources. This will mitigate water scarcity issues and enhance ecosystem health.
2. **Increased Crop Yields**: Irrigation can significantly increase agricultural productivity, reducing the need to expand agricultural land into forests and natural habitats, thereby preserving biodiversity.
3. **Reduced Soil Erosion:** Flood protection measures can prevent soil erosion caused by heavy rains and floods, which helps maintain soil fertility and prevents sedimentation in rivers and water bodies.
4. **Enhanced Ecosystem Services**: Sustainable water management will positively impact wetland ecosystems by maintaining water levels and preserving habitats for aquatic plants and wildlife.

4.9.4.2 Positive Social Impacts:

1. **Improved Food Security**: Increased agricultural productivity due to irrigation will lead to greater food security for local communities, reducing dependence on external food sources.
2. **Poverty Alleviation**: Higher crop yields will enhance the income and livelihoods of local farmers, potentially reducing poverty rates in the region.
3. **Health Benefits**: Access to clean water for irrigation will improve public health by reducing waterborne diseases and improving sanitation practices.
4. **Employment Opportunities:** The construction and maintenance of irrigation and flood protection infrastructure will generate employment opportunities for local communities.
5. **Infrastructure Development:** The project will improve transportation and connectivity, making it easier for people to access markets, healthcare, and educational facilities.

4.9.4.3 Positive Climate Impacts:

1. **Climate Resilience:** Flood protection infrastructure will help communities adapt to climate change by reducing the impacts of extreme weather events and flooding.
2. **Carbon Sequestration**: Irrigation will enhance the carbon sequestration capacity of soils, contributing to climate change mitigation efforts.
3. **Reduced Emissions**: By increasing agricultural productivity and reducing the need for land conversion, the project will indirectly help reduce greenhouse gas emissions associated with deforestation and land-use changes.
4. **Improved Water Efficiency**: Efficient irrigation practices will reduce the energy and water requirements for agriculture, which can lower greenhouse gas emissions associated with water pumping and distribution.

175 The success of the CAISAR project depends on effective planning, sustainable practices, and community engagement. Environmental impact assessments and social safeguards will be in place to mitigate any potential negative consequences and ensure the long-term sustainability of these positive impacts.

5. PROCEDURES FOR REVIEW, CLEARANCE, AND IMPLEMENTATION OF SUBPROJECT E&S INSTRUMENTS

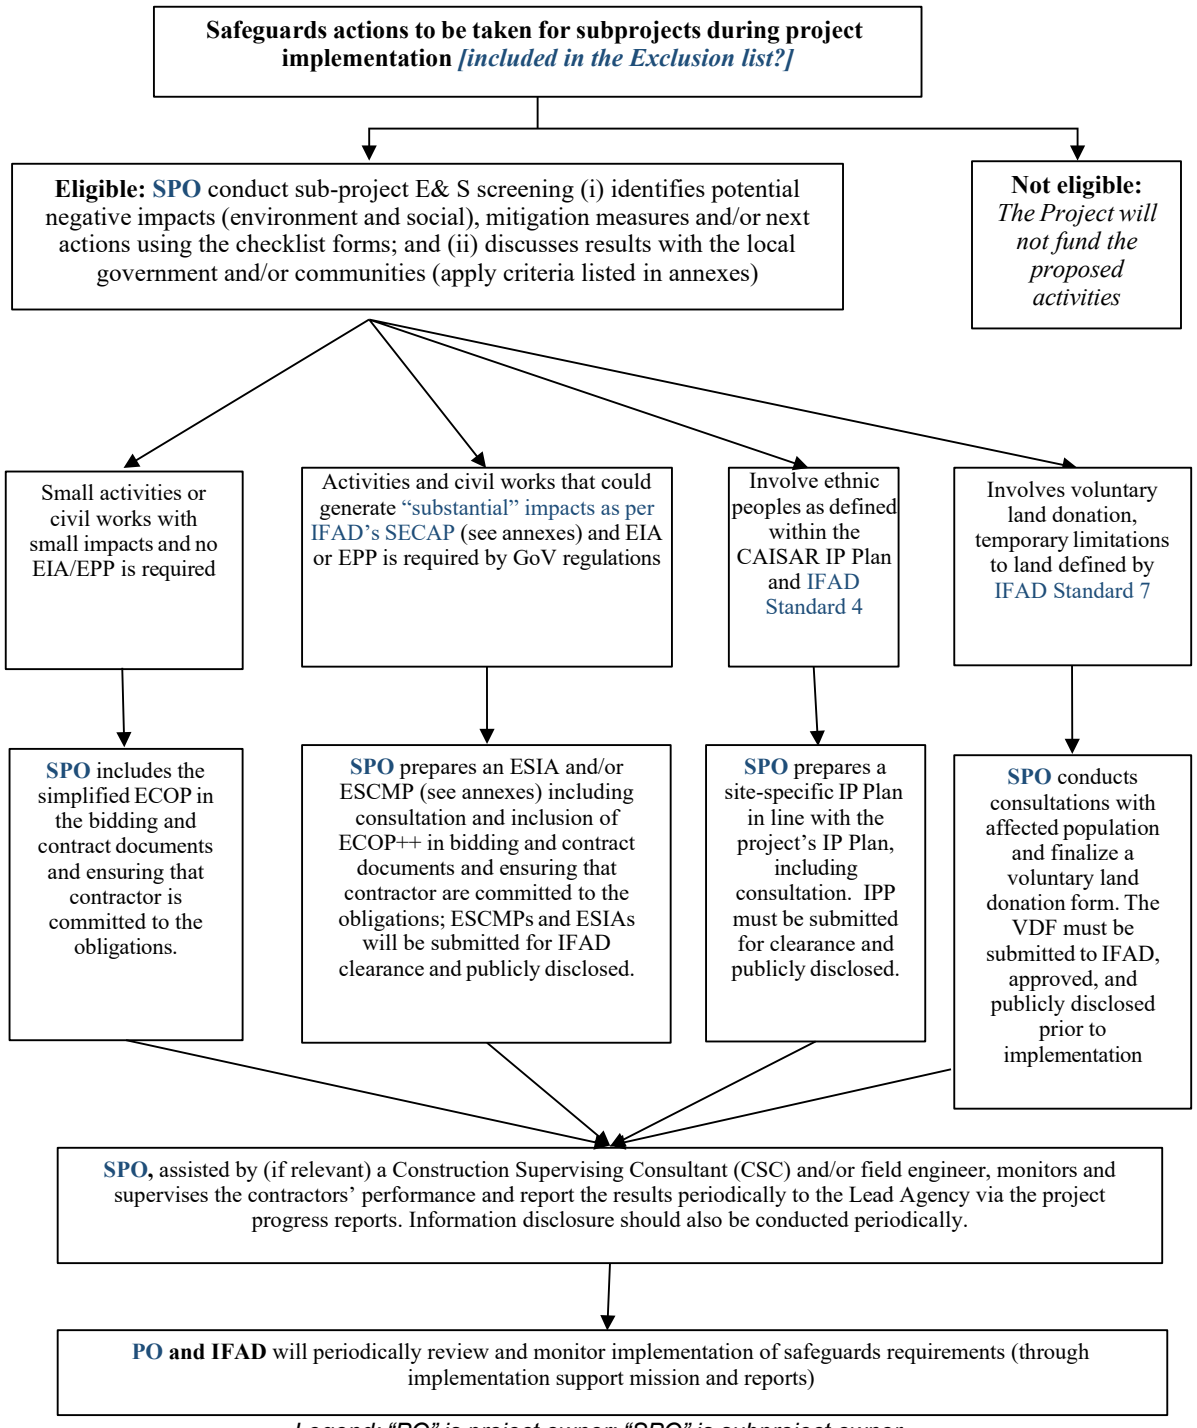
5.1 Objective and Approach

176 Since some of the activities and subprojects will be identified during implementation, this ESCMF was prepared to apply to all subprojects and investment activities. The main objective of the ESCMF process is to ensure that the subprojects and activities financed by the project will not create adverse impacts on the local environment and communities, and the residual and/or unavoidable impacts are mitigated in line with the IAAB, IFAD and GCF safeguards standards.

177 During implementation, identified activities/subprojects will be screened for and given a risk classification based on their E&S issues and applicable safeguards standards (ESSs), after which any necessary environmental and social assessment (ESA) and other E&S instruments will be prepared based on the requirements laid out in this ESCMF. The assessments, instruments, and mitigation measures will be proportionate to the nature and scale and the potential risks and impacts of the project and consistent with the requirements of IAAB, IFAD, the GCF, and national laws/regulations. The safeguards plans prepared for subprojects may include but are not limited to: Environmental and Social Management Plans (ESCMPs); including health and workers issues related to sexual exploitation and abuse (SEA); and IP Plans. Terms of reference, work plans, and documents defining the scope and outputs of any site-specific safeguard's capacity building activities (for example, through the annual Information, Education, and Communication program) will be drafted so that the advice and support provided is also consistent with the IAAB, IFAD and GCF safeguards standards. Based on the initial sub-project safeguards screening, any subsequent ESA would: (i) cover the requirements established under the relevant safeguard standard for that subproject; and (ii) identify the environmental and social risks and impacts including direct, indirect, cumulative, and residual impacts.

5.2 Key Steps

178 The ESCMF process is comprised of four steps, as depicted in **Figure 7** and summarized below:



STEP 1: Screening for eligibility and E&S issues including risks and impacts using screening criteria, application of ESSs, and identification of and needs for preparation and implemenation of E&S documents/instruments.

STEP 2: Prepare E&S documents, including the development of mitigation measures in the ESCMP, IP Plan, and RP to be incorporated into bidding and contractual documents and subjected to close monitoring of the contractor performance. ESCMPs clearly identify mitigation measures for potential negative impacts during site clearance and construction, including the management of contractors, chance finds, EHS application, and workers' Codes of Conduct.

STEP 3: Clearance and disclosure of E&S documents; and

STEP 4: Implementation, monitoring, and reporting.

179 The risk analysis, impact assessment, and preparation of E&S documents for all subprojects will be carried out during implementation. A full ESIA is being conducted for the project. Preparation of a subproject ESCMP occurs when the subproject activities have been clearly identified and locations are known. During the preparation of the ESCMP, due attention will be given to address the issues of biodiversity conservation and sustainable management of living natural resources, resource efficiency and pollution prevention, labour and working conditions, community health and safety, indigenous persons/ethnic minorities, women, cultural heritage, and stakeholder engagement and information disclosure.

Legend: "PO" is project owner; "SPO" is subproject owner

Figure 5-1: Flowchart for Safeguard Actions for Subprojects

180 Key safeguards actions can be highlighted as follows:

- Small works to be carried out under Component 2 will incorporate a site-specific ESCMP requirements and an ECOP into the bidding documents and consultant contracts, with contractor performance closely monitored by the responsible persons of the implementing agencies.
- If screening highlights the need for voluntary land donation or temporary disruption to land use, a Voluntary Land Donation form must be prepared and consulted upon (in line with the VGGT principles and IFAD Standard 7), as well as approved and disclosed prior to sub-project implementation.
- If the ethnic minorities are present in the subproject, a site-specific IP Plan will be prepared and implemented according to IFAD Standard 4 and the guidelines can found in the project's overarching IP Plan.
- All the major E&S documents of a given subproject will be submitted for IFAD clearance before their respective approval and implementation.

5.3 E&S Risk and Impact Assessment

181 This step (Step 1) aims to confirm the eligibility of subproject and/or activities to be financed by the Project as well as identify the potential E&S issues and assess potential impacts of the subprojects/activities including needs for preparation of E&S documents as required by IFAD/GCF standards using an E & S screening checklist. The agencies responsible for implementing the subproject/activity will be responsible for undertaking and signing the screening forms. PPMUs will each be responsible for screening their own activities. Consultation with IFAD safeguards specialists can be made as needed, depending on subproject complexity.

5.4 Development of E&S Documents

182 This step (Step 2) is focused on preparing safeguards documents in relation to the issues identified in Step 1. Guidelines for the preparation of an ESCMP are provided in the annexes, whereas a project-level SEP and IP Plan have been developed separately. Again, PPMUs will be responsible for their own activities and subprojects, and their corresponding safeguards specialists will be responsible for the preparation of E&S documents. Consultation with IFAD safeguards specialists for complex subprojects will be made as needed.

183 It is also crucial that the implementing agencies of the subprojects and activities are responsible for preparation of E&S documents (e.g. EPP, EIA, etc.) required by the Government of Cambodia's EIA regulation and secure approval of responsible agencies.

5.5 Review, Approval, and Disclosure of E&S Documents

184 **IFAD review and clearance:** Before approval and commencement of subproject works, the Subproject Officer (SPO) will submit all key E&S documents to IFAD for review, clearance, and public disclosure. For CAISAR, it is suggested that IFAD conduct reviews of the first three ESCMPs prepared by each province and may then reduce (or increase) frequency as needed. The approval process described herein may also be reviewed occasionally, particularly once the E&S capacity of the implementation partners has been built with the support of the E&S capacity-building consultants/project safeguards specialists. At that point, IFAD may choose to review ESCMPs selected at random.

185 All E&S documents will be posted on the official websites of MOWRAM and the project provinces, and hardcopies in the Khmer language will be available at the CPMU, PPMU, and subproject sites. The CPMU and PPMUs must publish a notification of disclosure of information and solicit comments within the month following that disclosure date. The English version of the ESCMPs will be disclosed on the IFAD (and potentially GCF) website(s).

186 Government approval: Responsible agencies are also required to approve the ESIA or EPP documents as required by Government regulation. Any prepared EIA (in Khmer or English) as well as the approval conditions will be provided to IFAD for information and will be disclosed to the public.

5.6 Implementation, Supervision, Monitoring, and Reporting

187 ESCMF implementation, supervision, monitoring, and reporting is an integral part of project and subproject implementation. Each E&S staff is responsible for specific activities. IFAD SECAP specialists also supervise and monitor the implementation of safeguards activities during IFAD project supervision missions. Delegation of responsibilities is as follows:

- ***Gender Action Plan and IP Plan monitoring:*** The PPMU will hire a social inclusion/gender specialist to monitor the implementation of the IP Plan and GAP and report results to IFAD.
- ***E&S monitoring of contractor performance during construction:*** To ensure compliance with the national laws and regulations as well as some specific requirements of the IFAD SECAP standards at subproject level, PPMUs will hire a qualified national consultant to conduct monthly monitoring and reporting while assigning the Construction Supervision Consultant (CSC) or field engineers to be responsible for monitoring and reporting of contractor's compliance to the construction-focused ESCMPs on a day-to-day basis. At the project level, the PPMU Environmental Safeguards Specialist will ensure monitoring of environmental and social performance at sub-project sites and of the construction contractor throughout construction. The Environmental Safeguards Specialist will report their findings in the Project E&S monitoring reports for IFAD and GCF (this will be done on a six-month basis, or as agreed with IFAD and GCF in accordance with the legal agreement). The PPMU will also be responsible for monitoring and evaluating implementation of the Stakeholder Engagement Plan, including responses to grievances and/or complaints of the project/subproject affected peoples as well as the project workers (see Section 10).
- ***E&S monitoring during implementation of activities/operation of infrastructure:*** Specialized training will be provided on risks inherently associated with project activities that involve waste management, occupational health and safety, and community health and safety. E&S staff must pay extra attention – proportional to the more substantial risks – to those activities during implementation. To ensure sustainability after project closure, the awareness and capacity of MOWRAM/PDWRAM staff and related implementing agencies must be increased through trainings and during implementation supervision. This will require E&S capacity building consultants (including extension staff). PPMUs will detail safeguards progress in the subprojects' E&S monitoring reports for submission to the CPMU. The CPMU will then aggregate and submit the information to IFAD and the GCF.

6. IMPLEMENTATION ARRANGEMENTS

6.1 Responsibility for ESCMF Implementation

188 The feasibility study included recommendations on how the CAISAR Project should be implemented and is summarized in the following paragraphs. The CAISAR project has a clear objective related to both climate and poverty, but the ambitious scope requires cooperation between government agencies. The project will be adopted by the existing country program steering committee chaired by the Ministry of Economy and Finance (MEF). The executing agency, the Ministry of Water Resources and Meteorology (MOWRAM) will provide overall management of the project and implementation of Component 2 (Infrastructure). The National Committee for Sub National Democratic Development (NCDD) will be the implementing agency for component 1.

189 The Project Management Unit (PMU) will consist of personnel from MOWRAM, the Department of Hydrology and River Works (DHRW) of MOWRAM, and Provincial Departments of Water Resources and Meteorology (PDWRAMs) of four provinces.

190 The NCDD working with the International Fund for Agricultural Development (IFAD) will lead Component 1, which involves providing farm level support, capacity building and training of FWUCs, and promoting the adoption of efficient and climate resilient farming practices. IFAD will also be responsible for communications and visibility throughout the project's implementation.

191 Other key phases of implementation include a pilot program for solar pumping and geofabrics to identify any inefficiencies before the full construction phase, with a budget of $60k. Surveys will also be carried out on dam structures and river sections and structures to determine where work is required to rehabilitate and climate-proof the infrastructure, with a budget of $70k managed by the PMU. It is known that the Anlong Chrey dam has limited freeboard and MOWRAM wish to improve safety of the structure.

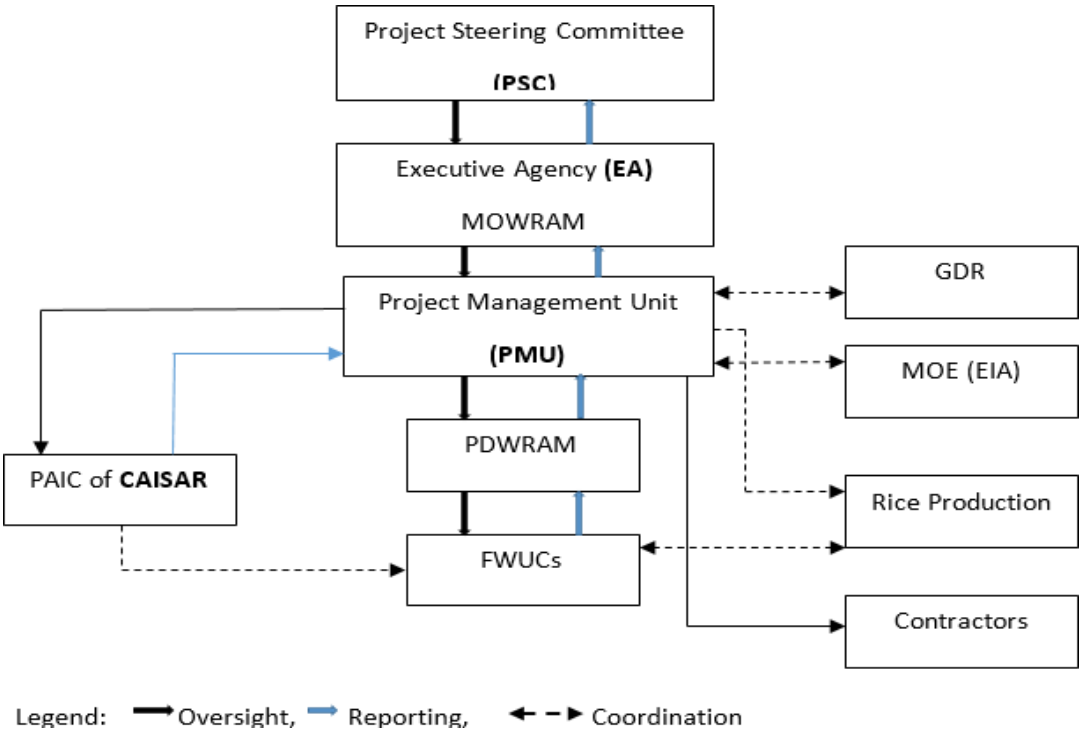
192 Monitoring and evaluation will be a crucial aspect of the project's success, with engagement at the FWUC level monitoring and reporting to ensure capacity is being increased in time to realize the significant benefits expected upon completion of construction. Material effectiveness and quality of design will also be monitored and evaluated to ensure the scheme is delivered to a standard consistent with at least a 25-year asset life.

193 The roles and responsibilities of each organization have been clearly outlined, with MOWRAM responsible for overall supervision and guidance, and the DFWUC responsible for preparing the annual work plan and budgets, initiating, and coordinating communication, coordinating with the Ministry of Agriculture, Forestry and Fisheries (MAFF) on agriculture support activities, and implementing social and environmental safeguards, among other tasks. The PDWRAM will assist the PMU in disseminating information and coordinating with the Ministry of Economy and Finance-General Department of Resettlement (MEF-GDR) to implement the resettlement plan, among other tasks.

194 The project steering committee (PSC), chaired by the Minister of MOWRAM, will provide policy guidance and oversee project implementation, while the Inter-Ministerial Resettlement Committee (IRC), chaired by MEF, will manage resettlement and land acquisition. By following this implementation arrangement, the CAISAR project can proceed smoothly and achieve its goals of improving water resource management and enhancing agricultural productivity in Cambodia.

6.2 Project Implementation Organizations (Component 2)

195 The expansion of irrigated areas and the modernization of irrigation systems are high in the order of priorities of the Royal Government of Cambodia as well as the Ministry of Water Resources and Meteorology (MOWRAM), which is responsible for sustainable water resources management, including irrigation in Cambodia. Proper irrigation O&M can only be successfully implemented when the five basic pillars of irrigation are properly addressed. These five pillars are: (i) security of water



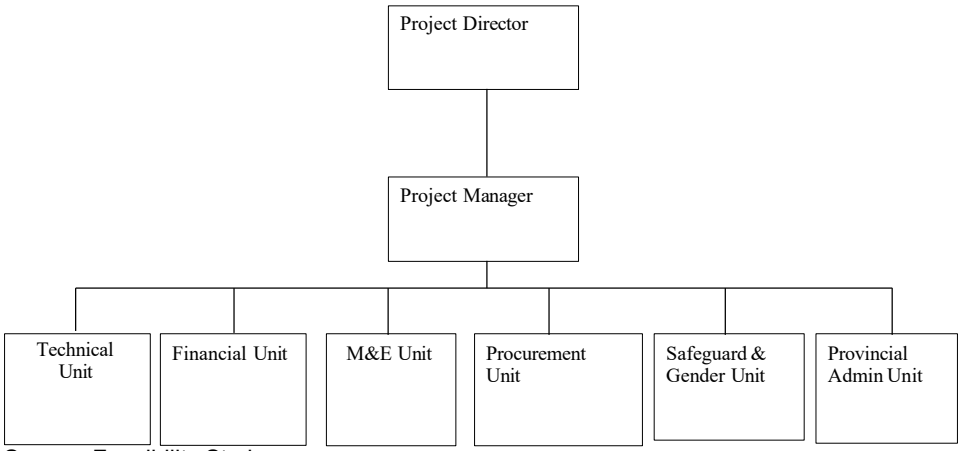
availability; (ii) sustainable infrastructure; (iii) water management, (IV) Irrigation institution and (v) human capital.

196 The FWUC Department has personnel at the Central level but no Office and personnel at the Province and District level so for the effective operation of FWUC the DFWUC should recruit and or appoint additional personnel and train them to meet the right qualification and experience for the FWUC office at the provincial and district levels.

197 A CAISAR project implementation organization chart is defined in Source: Feasibility Study
198 Figure 6-1. MOWRAM is the Executing Agency for implementation of the Project. However, successful implementation of the Project requires the cooperation of several ministries. The project steering committee (PSC) was established to achieve the inter-ministerial coordination and chaired by the Minister of MOWRAM and comprising of senior officials from MOWRAM, MOI (NCDD), MAFF, Ministry of Environment (MOE), Ministry of Economy and Finance (MEF), and the Provincial Governor's Offices of Pursat, Kampong Chhnang, Kandal, and Kampong Speu provinces will oversee project implementation and provide support to the project. The Table 6-1 below show the Management, Executive and Implementation body and Figure 6-1 show the Project organization Structure.

Table 6-1: PSC Management Arrangement.

Descriptions	**Arrangements**
Management	
(i) Oversight Body	**Project Steering Committee (PSC)** Chair: H.E. Lim Kean Hor, Minister, MOWRAM Secretary: H.E. Chann Sinath, Deputy Director General, DFWUC/Project Director Members: H.E. Secretary of State, MOI (NCDD) H.E. Secretary of State, MEF H.E. Secretary of State, MOWRAM H.E. Under Secretary of State, MEF H.E. Under Secretary State, MAFF H.E. Director General, MEF H.E. 4 Provincial Governors Director of Department of Cooperation and Debt Management, MEF Office of Multilateral Cooperation 1, MEF
(ii) Executing Agency	MOWRAM
(iii) Implementation Unit	Establish PMU at MOWRAM Level and possibly PIU at PDWRAM Level



Source: Feasibility Study

Figure 6-1: CAISAR Project (Component 1) Structure Chart

199 A project management unit (PMU) has been established for the CAISAR project. The PMU will be headed by the Secretary of State of MOWRAM as Project Director, with assistance from the DFWUC Director as Project Manager. The PMU will be fully involved in the preparation and implementation of the project. The PMU is composed of designated personnel from MOWRAM, the Department of Hydrology and River Works (DHRW) of MOWRAM, and the PDWRAMs of Pursat, Kampong Chhnang, Kampong Speu, and Kandal provinces.

200 The PDWRAMs are responsible for coordinating all field activities with FWUCs and DFWUC and implementing O&M activities.

201 The PMU is supported by the Project Management Implementation Consulting (PMIC) and consists of Project Director, Project Manager, Technical Unit, M&E Unit, Financial Unit, Procurement Unit, Safeguard & Gender Unit and Provincial Administration Unit as show in Figure 6-2 below.

Source: Feasibility Study

Figure 6-2 PMU Structure Chart.

6.3 Project Implementation Organizations at Sub-National Level

202 Note that the following text applies to Component 2 only. It is envisaged that IFAD will detail further the role of the NCDD and the coordination with the provincial and district agencies for agriculture, rural development etc.

6.4 Provincial Department of Water Resources and Meteorology (PDWRAM)

203 The Provincial Department of Water Resources and Meteorology of MOWRAM is the mandated body tasked to undertake full responsibilities for the O&M of the Main system/scheme. Specifically, PDWRAM is expected to perform the following responsibilities:

a) Ensures that the main canal infrastructure is properly maintained and repaired.
b) Ensures that the seasonal water management plan is endorsed and approved.
c) Ensure that in the dry season the main canal system provides sufficient water.
d) Provide technical assistance to FWUC and its members in the operation and maintenance of the irrigation systems/scheme.
e) Assume leadership in the resolution of conflicts on water disputes.
f) Operation and maintenance of main canal systems with appropriate funding provided by the Royal Government of Cambodia.
g) Implement routine maintenance of the Main Canal system including the structures.
h) Update report to MOWRAM on the deferred maintenance needs of the system including an estimate cost and time repair work.
i) Monitor the volume of water in the main canal and the level of water released to the water users in order for it to function normally.

6.5 Project Implementation Organizations at Scheme Level

204 According to the FWUC Sub-decree of March 2015, a FWUC shall be established and registered with MOWRAM for each irrigation system/scheme in Cambodia. Establishing the FWUC is important in helping sustain the irrigation schemes to be constructed under the Project. Therefore, the Project will establishment an efficient and effective FWUC and will provide adequate inputs and supports to ensure that the FWUC will be able to function effectively.

205 The FWUC will be established as early as possible after a subproject has been proved feasible and endorsed for the construction to enable the local farmers to participate in all stages of the project formulation and implementation.

206 The establishment of a FWUC requires considerable efforts in community organization and training of the established FWUC. The general strategy in mobilizing and organizing the farmers is described below:

(i) One FWUC is organized in each irrigation system/scheme, hence, there will be 4 FWUCs established in the CAISAR, 1 FWUC will need to be restructured or have the committee members re-elected, and 1 FWUC needs more capacity building as mention in Table 6-2 below.
(ii) One FWUG is delineated and organized within the command area of one secondary canal (SC). When the SC area is small, a FWUG could also cover more than one SC.
(iii) One FWUSG is delineated and organized within the command area of one or more tertiary canal (TC)

Table 6-2: Distribution Network & Name of FWUC to be established in the CAISAR Scheme.

No	Scheme Name	Command Area (ha)	Number			Number		
			District	Commune	Village	FWUC	FWUG	FWUSG
1	Ou Tapoang Tanai	13, 270	1	2	31	1	2	31
2	Lum Hach	16,664	3	10	55	1	10	55
3	Chhean Laeung	5,307	1	3	15	1	3	15
4	Stueng Krang Bat	1,500	2	3	13	1	3	13

No	Scheme Name	Command Area (ha)	Number			Number		
			District	Commune	Village	FWUC	FWUG	FWUSG
5	Brambei Mom	16,556	3	12	56	The current FWUC is weak and incapable of collecting ISF. It needs to be restructured and or re-elected as the current FWUC is governed by only 4 communes out of 12 communes in the CAISAR Project scheme.		
6	Krapeu Troum	903	1	1	14	This FWUC is active and they need more capacity building, support and documentation.		

207 After the FWUC's are recognized and officially registered, the Farmer Water User Committee (FWUC) will have full responsibility for the operation and maintenance of the irrigation system as follows:

a) Has the obligation to collect the irrigation service fee (ISF) from all its members for repair and maintenance of the secondary and tertiary irrigation system.
b) Resolve all internal conflicts involving water distribution between and among other FWUC leaders.
c) Convene the General Meeting once a year and other meetings with group and subgroup member as required.
d) Take action to replace vacant position of the structure as required and in accordance with its Statute.
e) Ensure that ISF are collected and kept properly and evaluate expenditures, manage and monitor the level of ISF in each phase and adjust as needed after approval from the members.
f) Assist in facilitating the support of the MOWRAM, PDWRAM and Development Partners on repairs, maintenance, and development of irrigated infrastructure as well as on agricultural development.
g) Mobilize local labor and financial resources to support regularly and seasonally operations and maintenance of irrigation system such as secondary and or tertiary canals and other parts.
h) Review on all kinds of secondary and tertiary canals and structures and Submit report to the PDWRAM.
i) Conduct seasonal maintenance before season of planting.
j) Prepare seasonal water distribution schedule for each growing season and provide a copy to PDWRAM for the preparation of the seasonal water management plan.
k) Manage the distribution of water under the guidance of PDWRAM because these structures are usually under the responsibility of PDWRAM but the operation of these gates will be transferred to the FWUC.

6.6 Procurement

208 The procurement principles to be followed by the CAISAR project were set out in the Aide Memorandum between MOWRAM, AIIB and IFAD following missions in December 2020 and January 2021. Project procurement using AIIB/GCF/IFAD financings will follow the Standard Operating Procedures on Procurement for All Externally Financed Projects/Programs in Cambodia (the SOP 2019/ Procurement Manual) to the extent such are consistent with the IFAD and AIIB Project Procurement Guidelines. NCDD PIU will be directly responsible for project procurement activities of Component 1. MOWRAM PMU will be directly responsible for project procurement activities of Component 2. Procurement review committees for both components will have representatives from both MOWRAM PMU and NCDD PIU.

209 Procurement method thresholds and prior review thresholds for GCF/IFAD financed activities will be determined and specified in the Project Procurement Arrangements Letter (PPA). Requests for IFAD prior review and no objection (for 18-month/annual procurement plans, procurement documents subjected to IFAD prior review) shall be routed through IFAD's web-based procurement management and tracking system (the current NOTUS system to be upgraded in 2023).

210 For the procurement of AIIB/GCF/IFAD financed activities, the standard bidding documents under the MEF's Standard Operational Procedures will be adopted and used with integration of additional provisions in compliance with the AIIB/IFAD Policy on Preventing Fraud and Corruption in its Activities and Operations, and IFAD's Social, Environmental and Climate Assessment Procedures (SECAP).

211 For Component 2 activities, three areas will be identified, (a) Project Management by PMU (b) Preparation of TOR's for DED and Pilots, surveys, detailed engineering design (DED) and contract preparation and tendering towards implementation (c) Packages of work and purchase/Installation of M&E goods such as solar pump stations.

212 For (a) and (b) the PMU already have a procurement plan detailing when the work is expected, how and when it will be procured and budgets. These do not need to be repeated here as they are continually updated by the PMU.

213 For the implementation phase a series of packages for civil works of around $10m-$20m can readily be defined and contracts requiring specific expertise such as the nature-based works on the river restoration work at Ou Ta Poung River, or the heavier engineering work for the upgrading of the offtake structure on the Damnak Ampil and widening/lining of the feeder canal linking to the Ou Ta Paoung River. Lining of secondary offtake canals to increase capacity whilst limiting additional land take may be similarly packaged. For tertiary and quaternary canals significant work with the local communities is needed to finalise design and layout acceptable to the farmers and landowners. To avoid double pumping raised canals and solar pump installations are needed. Land requirements may be reduced through buried pipe or channel systems with access roads above. Continuity for drainage and fish may require small siphons. On the Krang Ponley particularly, expertise in storages and pond restoration is needed as well as more significant drainage works and embankment raising. Creating farm ponds in Cambodia is significantly more expensive than in Thailand where conditions are similar and there is potential for improving efficiencies.

6.7 Monitoring and Reporting Arrangements

214 The E&S performance will be included in the subproject and overall project progress reports. The two safeguards specialists in each of the PPMUs, with assistance from the CSC/field engineers (where relevant), will monitor and report on the E&S performance of the project. The safeguards specialists in the PPMUs will submit E&S performance reports at the subproject level to the CPMU on a monthly basis. At the central level, the CPMU will prepare E&S monitoring report twice per year for submission to IFAD and the GCF, describing the project's progress and compliance with the SECAP/GCF safeguards standards and other requirements.

215 The progress report submitted to the CPMU must include sufficient information on subproject implementation progress and E&S issues related to ESCMF implementation. The overall progress report from CPMU to be submitted to IFAD and the GCF must include adequate information regarding: (i) preparation and disclosure of the E&S instruments for subprojects; (ii) implementation progress of the ESCMP, including incorporation of the ECOP/COC on SEA/other ESCMP requirements pertaining to the contractor in the bidding and contractual documents; (iii) monitoring and supervision on implementation perforamnce of contractors, CSCs, and PPMUs according to the ESCMP, ECOP, and COC on SEA; and (iv) any challenges, solutions, and lessons learned during E&S/ESCMF implementation. Table 6-3 provides a summary of reporting procedures.

Table 6-3: Reporting Procedures

	Report Prepared by	Submitted to	Frequency of Reporting
1	Contractor to the Employer	PPMUs	Once before construction commences and monthly thereafter
2	Construction Supervision Consultant (CSC)	PPMUs	Weekly and monthly

3	Community Monitoring	PPMUs	When the community has any complaint about the subproject E&S/ESCMF implementation
4	PPMUs	CPMU	Monthly
5	CPMU	IFAD and GCF	Once every six-months, in accordance with any signed legal agreements.

6.8 Incorporation of ESCMF into Project Operational Manual

216 The ESCMF process and requirements will be incorporated into the Project Implementation Manual (PIM) and the CPMU will provide training to ensure that the subproject owners (PPMUs) understand them and will supervise and monitor the ESCMF implementation periodically. The E&S section in the POM will also refer to the ESCMF and related safeguards documents, as needed.

7. CAPACITY BUILDING, TRAINING, AND TECHNICAL ASSISTANCE

7.1 Capacity Building for Efficient Project Management

217 Capacity building is a component that will provide supports to MOWRAM/ PMU and PDWRAM to strengthen their capacity with the objective to expedite Project implementation and ensure effective Project management. The capacity building will cover (i) overall Project management, (ii) establishment of FWUCs and capacity building of FWUCs and iii) international and national consultants to fill capacity gaps of MOWRAM/ PMU and PDWRAM.

7.2 MOWRAM/ PMU and PDWRAM

218 The institutional assessment report prepared by PPIC and WAPCOS, December 2022 noted that the weak and insufficient capacity of human resource in all levels of the irrigation management is the primary cause of the slow rural development in Cambodia. The need for adequately trained professionals in water resources and irrigation management in Cambodia is an issue. The capacity building can be performed through education, training, workshop, etc.

219 Based on the institutional assessments report of the Water Resources Management Sector Development Program (WRMSDP), the training for MOWRAM and PDWRAM will include all personnel at the central and provincial levels that are involved in the CAISAR project scheme. This means that the officers who will be involved in the CAISAR project will also be trained. However, the training for FWUCs TOT must be included. For the CAISAR project it is advised that the training plan covers all 6 Irrigation Schemes with both for CAISAR PMU and PDWRAM with topics including 1) Project Orientation and Presentation of Project Plans; 2) FWUC Formation and Strengthening; 3) Gender Awareness and Gender Action Plan; 4) Data Management for Hydro and Meteorological Data and O&M for Meteorological Equipment; 5) Environmental Awareness; 6) Construction Management and Supervision and 7) On-Farm Water Management and Operation and Maintenance.

7.3 FWUC/FWUG/FWUSG

220 To help the trainees clearly understand and be able to apply them to their work, it was noted that each training program needs to dedicate sufficient time for each topic.

221 For FWUC management training programs are needed to strengthen the capacity of existing or new FWUCs that includes: a. Basic administrative management, b. Accounting and finance, c. Conflict resolution, d. Operation and maintenance of irrigation facilities and e. Collection of irrigation service fees.

222 It is suggested that FWUC need to have the opportunity to meet regularly and exchange their personal experiences and to learn from each other regarding FWUC management. Interaction between FWUCs can help to reduce conflicts between FWUCs in the same irrigation scheme/ reservoir.

223 As each FWUC have different geographical characteristics, socio-economic condition and different issues, training materials should be simplified by using the simple words and expressions commonly used by the local people

224 A well-defined FWUC Organizing Framework within MOWRAM/PDWRAM needs to be synchronized with the Water Distribution Schedule and agreed upon within the FWUC and disseminated to all farmer-water users within the Irrigation scheme.

225 The Project should construct the secondary and tertiary canals until the tertiary gates and will assist FWUC in collection of ISF.

226 The institutional assessment report has suggested that Technical and financial support will be provided to the FWUC that will manage the operation of Ou Tapoang, Lum Hach and Kraing Pomley Scheme to ensure that system O&M is conducted in an effective and sustainable manner.

227 To ensure effective and consistent training on E&S, particularly under the new IFAD SECAP (2021) and GCF ESS (2022), training should be provided by qualified national consultants. In addition to refresher training on safeguards pertaining to waste management, use and disposal of pesticides/fertilizers, etc., there must be additional training focused on ensuring the effective performance of contractors – including provision of adequate services related to health, safety of workers and local communities.

7.4 Training and Technical Assistance

228 Training and capacity building on the IFAD SECAP/GCF ESS has been recommended to address the concepts of proportionality and adaptive management as well as cover the implementation of the safeguards documents as they relate to: (i) contractor management and monitoring of E&S issues concerning labour; (ii) community health and safety; (iii) environmental health and safety; and (iv) requirements for systematic stakeholder engagement. The targeted training programs focused on E&S risk management could also help strengthening inter-agency coordination and cooperation which is critical for ensuring effective management of all aspects of climate change adaptation. Given the project structure and the plan to implement a number of subprojects in each province involved, significant inputs from qualified national consultants will be required, along with on-the-job training on assessing risks and impacts management during preparation and implementation.

229 During implementation of Project, E&S training and technical assistance will be provided to the implementing agencies both at the Project and subproject level. During the first three years, the CPMU will conduct at least two safeguard training workshops per year (one on environment and one on social) to the subproject owners regarding the ESCMF process and needs for preparation of safeguard documents (ESCMPs, SEP, IP Plans, and ECOP etc.). When possible, an IFAD SECAP Specialist will participate in these training workshops. Safeguards technical training for any other specific issues and related aspects should occur at least once per year for three years. This could be combined with the annual IEC.

230 Priority for training should include, but is not limited to, the following:

(i) The ESCMF process and guidelines for preparation, implementation, and supervision of E&S instruments designed for CAISAR and its subprojects;
(ii) Specific training on the IP Plans, SEP, and labour management with regard to planning and implementation, including the application of differentiated GRM pathways to more effectively respond to local complaints;
(iii) Specific training on supervision and monitoring of contractor performance, including forms and reporting processes; basic knowledge on health and safety; good construction practices for reducing potential impacts on local environment and local peoples; Codes of Conduct on SEA; and communication and GRM procedures and other social issues related to communicable diseases (including covid-19), etc.;
(iv) Specific training on IPM; safe use and disposal of pesticides/herbicides/chemical fertilizers being used in primary production;
(v) Specific training on waste management, including hazardous and bio-hazardous waste;
(vi) Specific training on the use of PPE and best practices (during construction, pesticide application, etc.).

7.5 Technical Assistance on E&S Capacity Building

231 Given the specific needs related to E&S training and limited capacity of some agencies with respect to the newest IFAD SECAP and GCF ESS, a qualified national firm could be mobilized by the CPMU to provide E&S training, supervision, monitoring, and reporting of the ESCMF implementation and SECAP/ESS compliance to IFAD and the GCF. If required by IFAD and/or the GCF, the CPMU will also mobilize an independent monitoring agency (IMA) for monitoring of IP Plan implementation, voluntary land donation (if applicable), and other E&S consultants to assist in the preparation and/or monitoring of various E&S activities during implementation. PPMUs may mobilize E&S consultants

(either individual or hired through a firm) to assist in the implementation of ESCMF, preparation of E&S documents, and mitigation measures of the subprojects under their responsibility.

232 MoWRAM have significant experience in application of the World Bank ESF and the Asian Development Bank safeguards policy through a number of similar projects over the past several years. Through this project, MoWRAM have maintained a proven track record for safeguards compliance. MoWRAM keep improving their capacities, through continued capacity development of staff of the Environmental and Social Office (ESO). Some of the staff within the ESO have solid working experience in engineering, community development, environment, social and public administration, engaging with indigenous people, and most have been trained by the World Bank on various topics related to environment and social management in rural development projects. The ESO with MoWRAM have a total of 7 staff (4 are female) who are assigned to different projects. The ESO will need additional technical support during the WASAC project implementation from E&S specialized staffs. MoWRAM will engage additional national consultants to work alongside staff of ESO to support the PMUs of MoWRAM in day-to-day E&S implementation and management.

Review of MoWRAM/PMUs capacity in prevention of SEA/SH risks

233 The MoWRAM PMUs have experience in identifying SEA/SH risks and prevention of SEA/SH based on lessons learned from several previous projects. Under this project, based on identified risks of SEA/SH, an approach and framework for management of SEA/SH risks has been proposed, and further addressed in the Labor Management Procedures. PMUs will appoint one social officer and one GRM officer to ensure the SEA/SH risks are monitored and reported. In addition, the MoWRAM PMUs have assigned a gender focal point to provide on-the-job training to the Contractors.

234 At an early stage of project implementation, MoWRAM PMUs will recruit E&S consultants, and engage a consultant specialized in SEA/SH to carry out SEA/SH trainings for PMU members and relevant members of MoWRAM, ESOs. MoWRAM also ensure that SEA/SH risks will be updated based on local experience and site conduct at respective subprojects. Accordingly, actions to be taken to prevent SEA/SH will be updated and included as part of the ESCMPs, and which will be subsequently applied as part of construction Contractor responsibilities (as prescribed in the Contractors' Work Contract). Budget will also be allocated (in Contractor's bill-of-quantity) to ensure the Contractor has budget in place to recruit a SEA/SH consultant to conduct public awareness raising on SEA/SH at subprojects, and to undertake SEA/SH management measures on the part of Contractors' workers and staff to minimize the risks of SEA/SH. In case where SEA/SH incidence is frequent or a significant episode has occurred.

235 Land acquisition and voluntary donations training will be conducted by the E&S Consultant. It is expected this training could be started as soon as E&S specialized staff are engaged by MoWRAM. Additional support from E&S staffs will be needed monthly or bimonthly during the construction phase, and quarterly or biannually during maintenance phase based on the need for support for the select subprojects. These training initiatives will be carried out face-to-faced. In case COVID-19 restrictions return, virtual training will be conducted. Zoom or Webex will be used for online training, The training will have knowledge session combined with discussion/exercises/role plays/quiz with Questions & Answers session at the end of each day. The training will be delivered in different time format, depending on the topics, number of participants, time availability, and may typically range from one day to three days. MoWRAM and PMUs will engage qualified trainers for the above training topics. For new topics, MoWRAM can ask support from the AIIB and IFAD to support in terms of sharing training material, references, and assist in training facilitation, if possible, to provided MoWRAM PMUs with practical, hands-on experience at the first stage of project implementation, particularly soon after project effectiveness.

8. ESCMF IMPLEMENTATION BUDGET

236 The roles and responsibilities of each organization have been clearly outlined, with MOWRAM responsible for overall supervision and guidance, and the DFWUC responsible for preparing the annual work plan and budgets, initiating, and coordinating communication, coordinating with the Ministry of Agriculture, Forestry and Fisheries (MAFF) on agriculture support activities, and implementing social and environmental safeguards, among other tasks. The PDWRAM will assist the PMU in disseminating information and coordinating with the Ministry of Economy and Finance-General Department of Resettlement (MEF-GDR) to implement the resettlement plan, among other tasks.

237 The E&S performance will be included in the subproject and overall project progress reports. The two safeguards specialists with assistance from the CSC/field engineers (where relevant), will monitor and report on the E&S performance of the project. The safeguards specialists in the PPMUs will submit E&S performance reports at the subproject level to the CPMU on a monthly basis.

238 The ESCMF process and requirements will be incorporated into the Project Implementation Manual (PIM) and the PMU will provide training to ensure that the subproject owners (PMUs) understand them and will supervise and monitor the ESCMF implementation periodically. The E&S section in the POM will also refer to the ESCMF and related safeguards documents, as needed.

239 Monitoring and evaluation will be a crucial aspect of the project's success, with engagement at the FWUC level monitoring and reporting to ensure capacity is being increased in time to realize the significant benefits expected upon completion of construction. Material effectiveness and quality of design will also be monitored and evaluated to ensure the scheme is delivered to a standard consistent with at least a 25-year asset life.

240 The following ESCMF implementation costs include two safeguards' specialists in the PMU, Their responsible include: (a) preparation of E&S documents of subprojects, including consultation with local authorities and communities; (b) supervision, monitoring, and training workshops on E&S issues; (c) implementation and monitoring of the ESCMPs, SEP, IP Plan, and Gender Action Plan. (with the support of the project's Monitoring & Evaluation Specialist); and (d) ensuring contractors implement their respective Environmental Code of Practice and Codes of Conduct for Gender Based Violence (GBV) and Violence Against Children (VAC) and any site-specific measures. The budget also includes the social economic survey including the census for the resettlement plan. A budget for an Independent E&S Monitoring Consultant for an estimated 6 year construction period for the 6 schemes.

241 MoWRAM will appoint at least one Environmental Specialist, one Social Specialist, and one GRM Focal Point (hereinafter ESOs) for full time support for the project. The ESOs of MoWRAM will be instrumental in ensuring the environmental and social performance of the project. The ESOs, who are supported by Design and Supervision consultants and E&S consultants, will be responsible for ensuring effective environmental and social management for all project activities. The ESOs, Design and Supervision consultants and E&S consultants will work together as a team in which ESOs play the lead role in E&S monitoring for the whole project. In particular, ESOs will review all related project and E&S documents which are prepared by E&S consultants. Where necessary, ESO will conduct site visits, interview contractor, construction supervisors, workers, provincial-level government staff of MoWRAM, local authorities and local communities to collect necessary E&S information for the purpose of internal monitoring. The ESO will monitor Contractors' compliance with Construction-ESCMP and visit each subproject location at least once a month during construction. Upon completion of each site visit, the MoWRAM'S ESOs should prepare a Monitoring Report reflecting main issues found, resolution arrangements and timing for the resolution.

The **ESOs** will be responsible for:

- Implementing and monitoring performance of environment and social mitigation measures, including health and safety;

- Conducting screening and scoping on environment and social impacts, including screening for land acquisition impacts based on the guidance in the RPF and presence of Indigenous Peoples based on the guidance in the IPPF;
- Conducting trainings on health, safety, gender, SEA/SH, VAC, labor rights, HIV/AIDS, STDs, Covid-19 and the grievance redress mechanism to project communities, and monitoring contractor's training for their workers on Workers' Code of Conduct which covers SEA/SH/VAC, HIV/AIDS, STDs, and COVID-19 and the workers' grievance redress mechanism;
- Monitoring environmental and social activities of the project, in particular the implementation of the ESCMPs for subprojects, and any other relevant project documents such as RP and IPP;
- Monitor, including ensuring effective functioning of project's Grievance Redress Mechanism and solve grievances submitted to the PMUs level;
- Leading all stakeholder engagement activities, including information disclosure, consultations, reporting back to stakeholders, according to the provisions in the SEP;
- Working closely with Provincial Department of Water Resource and Meteorology, General Department of Resettlement, and other line ministries and/or relevant departments as necessary;
- Prepare monthly reports on E&S implementation and submit to the PM and PD.

E&S Consultants

242 The E&S consultants are responsible for assisting the ESO in monitoring and reporting on the safeguard implementation performed by the contractors.

- Develop screening checklist to assess risks and potential environmental and social impacts for each subproject;
- Take lead in building capacity for the project (based on list of potential training topics, including periodic provision of on-the-job training to contractors, ESO and PMUs on the implementation and management of E&S risks and impact at subproject level;
- Review C-ESCMP and ensure C-ESCMP is consistent and cover all risks and potential impacts identified in site-specific ESCMP, particularly risks related to OHS, CHS, SEA/SH/VAC taking into account local knowledge and experience in prevention and management of these risks.
- Ensure C-ESCMP have actionable plan to addressed identified risks and potential impacts, including allocation of resources to implement fully such actions.
- Make recommendation for improvement before PMU's and PMU's DISS Consultant's approval of C-ESCMP;
- Conduct site visit to construction sites and worker camp and make above assessment as part of monitoring and reporting responsibility;
- Develop E&S monitoring checklist and reporting template;
- Participate and support ESO in monthly safeguard monitoring and reporting;

243 The Government of Cambodia and AIIB, IFAD and GCF will co-finance the ESCMF implementation budget, except for costs related to all aspects of land acquisition, resettlement, and livelihood restoration. When needed, qualified national (individual or firm) consultants for capacity building and training on ESCMF implementation and the concepts of the AIIB's ESF, IFAD's SECAP and GCF's ES Policy will be provided. Budget for trainings and capacity building are mainstreamed into the project budget across project outputs/components, so are not listed explicitly in the ESCMF implementation budget. Likewise, the budget for preparation of the Biodiversity Impact Assessment and related Biodiversity Management Plan, if any, are not listed in the ESCMF implementation budget, as they have already been contracted by MOWRAM as part of the ESCIA.

244 Costs related to staffing, implementation, and monitoring of the ESCMF, as well as costs more broadly focused on safeguards are built into existing project activities/components, can be found in Table 8-1.

Table 8-1: Estimated ESCMF Implementation Cost

Line Item	Estimated cost (USD)	Remarks
Environment & Climate Safeguards Specialist	USD 240,000 (60 months at USD 4000 per month) per PMU	The PMU will be responsible for management of this budget.
Gender & Social Safeguards Specialist	USD 240,000 (60 months at USD 4000 per month) per PMU	
GRM Focal Point	USD 240,000 (60 months at USD 4000 per month) per PMU	
Socioeconomic and census survey for Resettlement Plan 840 ha impacted (private & public) with estimate of 10 households per ha	USD 250,000	
Independent E&S Monitoring Consultant (Estimated 6 year project implementation period)	USD 500,00	
TOTAL	**USD 1,470,000**	

9. GRIEVANCE REDRESS MECHANISM (GRM)

245 As part of environmental and social policies of the AIIB, IFAD, and GCF, the Lead Agency is required to establish and implement a GRM to respond to concerns and grievances of project-affected parties related to the E&S performance of the project/subprojects in a timely manner. The GRM may include: (a) different ways in which users can submit their grievances, including submission in person, by phone, text messages, mail, email or via a web site; (b) a log where grievances are registered in writing and maintained in a database; (c) publicly advertised procedures, setting out the length of time users can expected to wait for acknowledgement, response, and resolution of their grievances; (d) transparency about the grievance procedures, governing structure, and decision makers; and (e) an appeals process (including the natural judiciary) to which unsatisfied grievances may be referred when resolution of grievance has not been achieved. The project/subject owner may provide mediation as an option where users are not satisfied with the project's resolution. Project/subproject owners must establish and implement the project GRM to receive and facilitate resolution of such concerns and grievances. As best practice, this ESCMF stipulates that contracted workers will have access to the project GRM to also raise workplace-related concerns. Those workers will be informed of the GRM upon their recruitment, as well as the measures put in place to protect them against any reprisal for its use.

246 As part of overall implementation of the subproject, the GRM will be established by the implementing agencies. The GRM identifies procedures, responsible persons, and contact information; will be readily accessible for the public; and will handle grievances and resolve them at the lowest level required and as quickly as possible. The GRM provides the framework within which complaints about environmental and safety issues can be handled, grievances can be addressed, and disputes can be settled quickly. The GRM will be in place before the subproject activities commence.

247 General Process: Complaints and claims through the project GRM can be lodged verbally, in writing, or by telephone/email. On receipt of a complaint, or project representative will register the complaint in the Complaints File and maintain a Log of Events pertaining to the complaint, until its resolution. Information to be recorded in the Complaints Log will include:

- The date and time of the complaint;
- The name, address and contact details of the complainant;
- A short description of the issue of complaint;
- Actions taken to address the complaint, including persons contacted and findings of each step in the complaint redress process;
- The dates and times when the complainant is contacted during the redress process;
- The final resolution of the complaint;
- The date, time and manner in which the complainant was informed thereof; and
- The complainant's signature when resolution has been obtained.

9.1 Objectives of the Project GRMs

248 The objective of the GRM is to provide affected persons with redress procedures that can be conveniently used to raise a project related concern or grievance. The GRM guides how a complaint can be lodged, including forms and channels through which a complaint can be submitted. To facilitate the grievance resolution process, grievances received will be acknowledged in writing and solved within a specified timeframe. During the resolution process, where necessary, dialogue will be held with aggrieved person for mutual understanding and effective resolution. Once a complaint is resolved, the aggrieved person will be notified of the resolution results.

249 The GRM has sequential steps that aggrieved person can use. If the aggrieved person is not satisfactory with the grievance resolution result, or if their complaint is not resolved within the timeframe specified for a particular step, aggrieved person can move on to the next step which is higher in resolution hierarchy. The project has an appeal process where complainant can resort if they

are not satisfied with a resolution decision at a particular step, or their complaints are not resolved within a specified timeframe.

9.2 Summary of national legislation related to grievance and complaint

250 The RGC has various laws and sub-decrees that have been in place to guide the implementation of the complaint resolution process. These documents specify the right of the complainants as well as the responsibilities of concerned governmental agencies as to complaint resolution. Relevant legal documents include:

- Law on Expropriation (dated 26 February 2010);
- Labor Law (dated 13 March 1997, amended on 20 July 2007 and 26 June 2018);
- Law on Prevention of Domestic Violence and Protection of Victims (dated 24 October 2005);
- Sub-decree No. 22 ANK/BK (2018) on Standard Operating Procedures for Land Acquisition and Involuntary Resettlement for Externally Financed Projects in Cambodia. Guidelines for Grievance Redress Mechanism (Appendix 8);
- Law on Administrative Management of Capital, Provinces, Municipalities, Districts and Khans (dated 22 May 2008) – Section 6 on Solution of Local Conflicts;
- Sub-decree No. 22 (25 March 2002) on Decentralization of Roles, Functions, and Power to Commune Councils (Article 61: duty to promote the role of conciliating disputes between citizens);
- Sub decree No 47 ANK.BK (31 May 2002) on Organization and Functioning of the Cadastral Commission (Chapter 4 – District/Khan Level Conciliation).

9.3 Principles of the Project GRMs

251 Under CAISAR, the following principles will be applied:

- **Channels.** Different channels are established to enable affected person to submit their grievances, including submission to village committee, as well as district and provincial levels.
- **Forms.** Grievances can be submitted in writing and verbally, and either directly by the affected households, or by a person delegated by the complainant.
- **Complainant can delegate a representative who acts on their behalf.** A person lodging a grievance can ask assistance from their family or from individual to act as their representative.
- **Disclosure.** GRM procedures are disclosed in public domain (e.g., websites of PMU, public notice board at village hall, and in front of substation).
- **Documentation.** A grievance logbook will be maintained at substation (subproject level) and at PMU level (through PMU GRM focal point).
- **Transparency.** Grievance procedures include steps, time frame for grievance resolution for each step, notification to affected person, how decision is made.
- **Acknowledgement.** The unit in charge of complaint resolution will notify complainant upon complaint receipt and will initiate the complaint resolution process.
- **Appeal.** If the agency in charge does not resolve a grievance in a manner that is satisfactory to the affected person, a multistakeholder committee will be established (ad-hoc) to resolve the dismissed grievance – as an alternative for affected person going to court.
- **Monitoring.** All grievances received are recorded by PMU and relevant substations, and are processed/resolved in a given timeframe, and are monitored by PMU GRM focal point.
- **Time-limit.** Time-limit is specified for each step in the grievance resolution process.
- **Complainants bear no costs.** Complaint resolution is free of charge to aggrieved person. However, if the complaints bring their case to court, they will bear the costs associated with their lawsuit.
- **Any grievance concerning urgent health and safety issues** shall be resolved immediately.

252 The project has in place complaint handling procedures for three types of potential grievances, including grievances related to 1) land acquisition, 2) labor and working conditions, and 3) sexual exploitation and abuse and sexual harassment (SEA/SH/GBV/GBV), and 3) general complaints. These procedures are established based on the above GRM principles and are in accordance with pertinent national legislation. The GRM for complaints related to land acquisition is provided in the project's Resettlement and Policy Framework (RPF) and that for IPs is provided in the project's IPPF. Summary for the above four procedures is provided below:

9.4.1 Redress Procedure for Complaints related to Land Acquisition

9.4 Project's Redress Procedures

253 Under this project, to facilitate the grievance redress, the informal and formal steps are combined for convenient use of affected people, as follows:

- **Step 1 − Commune/Sangkat level.** APs will seek assistance from commune/Sangkat chief or community elderlies who will discuss with the leader of the PRSC-WG to find a solution. Verbal grievance can be provided to the commune/Sangkat chief or community elderlies. So, no written complaint is required. It is noted that even if the complaint is made verbally, the complaint will be registered in project's logbook, including resolution process and result for such verbal grievance for monitoring purpose. Upon receipt of the verbal complaint, the PRSC-WG will consult with the IRC-WG to ensure the complaint is addressed timely. If the grievance is not resolved to the satisfaction of the AP, or if the AP prefers, s/he may lodge their complaint through the formal route which includes the steps below.
- **Step 2 − District level**. AH can lodge a written complaint to the Head of the District Office (where the subproject is located). The AH can bring a community elderly or their representative to discuss their grievance at the District Office. A conciliation meeting shall be held and a decision be made within 15 working days from the date of complaint is received by the District Office. If the complaint is resolved to the satisfaction of the AH, the IRC-WG will inform GDR's Department of Internal Monitoring and Data Management (DIMDM) who will review and seek the approval of the Director General of GDR for appropriate remedial action. GDR will inform the AF of the decision/ remedial action within 15 working days from the receipt of the grievance by the District Office. If the complaint is rejected at this step, District Office will inform the AH of the rejection in writing. If the complainant is not satisfied with the decision/resolution result, s/he can proceed to step 3 (below).
- **Step 3 − GDR level.** The complainant who is not satisfied with proposed resolution from Step 2 shall lodge a written complaint to the GDR for resolution.The GDR, through its DIMDM, will carry out a holistic review of the complaint and submit a report on its findings with the relevant recommendations, if any, to the Director General of GDR for review and decision. GDR may conduct a field visit to meet the complaint and the IRC-WG to gather relevant information. The final report must be completed within 30 working days from the date of receipt of the complaint by GDR for submission to the Director General of GDR who will make a final decision within 5 working days of receipt of the final report. In the event that the subject matter requires a policy level intervention, it will be referred to the IRC for a decision which may require that an additional 10 working days be extended from the original deadline for final decision.
- **Step 4 − Provincial level.** AH will submit a written complaint to the PGRC through the Provincial Governor's Office. The complainant or a representative will be given an opportunity to present its case during a meeting and the PGRC may consider any compelling and special circumstances of the AH to inform their decision. The GDR will send a representative, as a non-voting member, to provide an explanation to the rejection of the complaint at Step 3 with the GDR. The decision of the PGRC must be made on a consensus basis and will be final and binding except when the matter relates to government's policy. Decisions related to government's policy matters on land acquisition and resettlement are decided by the IRC. The PGRC will have 40 working days from the date of receipt of the complaint to reach a final decision. The decision of the PGRC will be sent to the IRC (through the GDR) for endorsement before any remedial action is taken.

  There are no fees or charges levied on the AH for their lodgment of complaint and for complaint resolution for the above 4 steps.
- **Step 5 − Court of Law**. If the aggrieved person prefers filing a lawsuit at the Provincial/Municipal Courts, as applicable, to seek a resolution, AP can do so but will bear cost related to the lawsuit as per the Expropriation Law. When the case is brought to a Court

of Law, there is no involvement of the GDR, PRSC or IRC-WG unless there is a judicial order from the competent courts.

9.4.2 Redress Procedure for Complaints related to Labor and Working Conditions

254 Project workers can lodge their grievance/complaint as follows:

- **Step 1 – Employer Level (Contractor and Subcontractor).** Aggrieved person (AP) can submit their grievance to their Employer who serves as the first focal point for receiving and resolving grievance. Grievance can be lodged verbally or in writing, in person or by phone, text message, mail or email (anonymous complaint is accepted). The Employer involved will resolve the case no later than 15 working days. Once resolved and the AP is satisfactory, the Employer will report the case, including resolution process and results, to the SEO of the MOWRAM for information and record. If the AP is not satisfied with the resolution of their Employer, the Employer will refer the AP to the SEO of MOWRAM, if needed and inform the AP of this referral. It is noted that if a complaint concerns the safety and health of one or several individuals, such complaint shall be resolved as soon as possible – depending on the nature and urgency of the grievance.
- **Step 2 – PMU level.** MOWRAM SEO will resolve the complaint referred to by the Employer (Step 1) and acknowledge receipt of the AP's complaints within two weeks from the date of complaint receipt. If the SEO of MOWRAM cannot resolve the complaint, the SEO Team will consult with the Project Manager/Director for resolution. The SEO of the MOWRAM will inform the AP (in writing) of the PMU's resolution result within 30 days from the date of complaint receipt. If the AP is not satisfied with the resolution result proposed by PMU, PMU will refer the case to the Project Steering Committee of the project and shall inform the AP (in writing) of this referral.
- **Step 3 – Project Steering Committee level.** At this level, the case will be resolved no later than 21 days. The AP will be informed of the resolution decision in writing. In case the grievance has not been solved within the specified timeframe, or the AP does not agree with the proposed resolution, the AP can approach the Labor Inspector of his/her province or municipality.
- **Step 4 – Court of Law.** If the AP is not satisfied with the resolution proposed above, a multistakeholder committee will be established (ad-hoc) to resolve the dismissed grievance – as an alternative for affected person going to court. If the grievance could not be resolved satisfactorily by the multistakeholder committee, the affected person may resort to the court of law. The cost associated with the lawsuit shall be borne by the AP. The decision of the Court will be final.

9.4.3 Redress Procedure for Complaints related to SEA/SH/GBV

255 Under the project, the GRM for SEA/SH/GBV mainly serves to: (i) refer complainants to a local GBV service provider; and (ii) record resolution of the complaint. In line with the above, the following principles apply so as to recognize SEA/SH/GBV victim as principal decision makers in their own care, and treat them with agency, dignity and respect for their needs and wishes:

- **Multiple channels** are in place for easy access and lodge complaints.
- **SEA/SH/GBV survivors will be referred to a local GBV service provider** for immediate support if they make a complaint directly to PMU.
- **Confidentiality of survivors is protected.** GM operator (at PMU and local GBV service providers) will keep confidential for SEA/SH/GBV allegation report.
- **No identifiable information on the survivor shall be collected and stored** in Project Grievance Logbook.
- **Costs of operating the SEA/SH/GBV GRM will be covered by the project**.

256 **It is noted that under this project, GBV service provider will be engaged** for subprojects that are rated "High" or "Substantial" for SEA/SH/GBV risks − based on SEA/SH/GBV risk assessment as part of site-specific ESMP.

The following channels can be used to submit a grievance related to SEA/SH/GBV:

+ Channel 1 – AP who believe the SEA/SH/GBV incidence is related to project workers can follow steps outlined in Section 6.4.2 (above) to lodge a SEA/SH/GBV complaint.

+ Channel 2 – Alternatively, AP can lodge their complaint, verbally or in writing, to the GRM's Focal Point within the SEO of MOWRAM for advice and resolution (contact of GRM Focal Point is provided in Section 5.1 (Resources).

+ Channel 3 – If AP wants to bring the case to the Court of Law, AP can follow steps below for prosecution. Prosecution related to SEA/SH/GBV is administered under the Criminal Code and the Code of Criminal Procedure and is as follows:

- **Step 1 – Judicial Police.** SEA/SH/GBV victim or a representative can submit their grievance to a local Judicial Police (JP) Officer. JPs include a) Commune/ Sangkat Chief, b) Commune/ Sangkat/ District/ Provincial/ National Police, and c) District/ Provincial/ National Military Police. The JP is responsible for receiving, recording complaints, and may conduct preliminary investigations to identify and arrest the perpetrator. The JP will also collect evidence to support the prosecutors. If the SEA/SH/GBV happens at home and/or falls under the domain of domestic violence (as per Law on the Prevention of Domestic Violence and Protection of Victims), the SEA/SH/GBV survivor may seek support from a local qualified Judiciary Police Officer (appointed by the Ministry of Women's Affairs) who can act as a complaining party on behalf of the SEA/SH/GBV survivor15.
- **Step 2 – Prosecutor.** Upon receiving the completed written record from the JP, the prosecutor can decide on if the prosecutor will hold a file without processing it further or conduct proceedings against the perpetrator. The prosecutor may bring the case to the Court of Law and present the evidence in Court hearings.
- **Step 3 – Investigation by Judge.** During this step, the investigating Judge will conduct interrogation of the charged person and perform other required investigation procedure.
- **Step 4 – Hearing.** After issuing an order of indictment, the investigating Judge will submit the case to the trial court president who shall arrange a date for the trial. The decision of the Court on SEA/SH/GBV resolution is final.

9.4.4 Redress Procedure for General Complaints

257 In case individuals, households, or communities are affected by any other aspects, for instance, environmental impacts such as increased dust, noise, or lack of safety measures that increase risks of traffic accident to road users or to local EM, various channels will be established for convinient use by affected parties, including IPs. These include:

- **PMU GRM focal point's telephone** (See Section 5.1 – Resources).
- **Local EM leaders** (in case affected individual/households are EM)
- **Contractor's hotline:** to report cases that they think contractors can solve timely (contact detail of Contractos will be posted at construction sites, and distributed to IPs (through Subproject Information Booklet) during consultation, and post at public billboard of Commune/Sangkat offices, pagodas, etc.
- **Commune/Sangkat offices**

9.5 Registration of Project Grievance

258 The SEO, Project 6.Managers within MOWRAM is responsible to establishing and maintaining the project grievance logbook (PGL). The PGL will be established by the SEO to record all concerns/ grievance that are submitted by project stakeholders during project implementation. In case there is serious complaint, the World Bank should be notified of these complaints within 24 hours of complaint receipt (See Annex 3 for Guidance for establishing and maintaining Project Grievance Logbook).

[15] In 2007, Inter-Ministerial Prakas No. 64 was issued by the Ministry of Women's Affairs (MoWA) and the Ministry of Justice (MoJ) appointing MoWA officials who have legal qualifications to be officials of the MoWA Judicial Police. The roles and authority of the JPO under MoWA is defined in the MoWA's Prakas No. 072 KKN/BS (2007) and is as follows: (1) act as a plaintiff representing the victim (2) prepare reports and records (3) monitor and follow up on relevant investigations (4) follow up on Court's procedures (decisions and convictions). In addition, Prakas of the Ministry of the Interior (No. 3840, 2020) on Establishment and Functioning of the Commune/ Sangkat Committee for Women and Children, has defined the roles and responsibilities of these Committees in prevention, mitigation and collaboration with juridical agencies to prevent, resolve cases related to domestic violence, sexual abuses, sexual harassment, human trafficking (such as exportations of women and children in commune/ sangkat for sexual exploitation).

259 **The GRM is an integral project management element** that intends to seek feedback from beneficiaries and resolve of complaints on project activities and performance. The GRMs for the project are based on IAAB, IFAD, UN, and GCF requirements and, most importantly, national requirements for solving potential problems between project owners and local residents/persons affected by the subproject(s).

10. ESCMF STAKEHOLDER CONSULTATION AND DISCLOSURE

10.1 Consultation Requirements

260 AIIB, IFAD and GCF require that consultations be held with the project affected peoples, local communities, vulnerable persons/ethnic minorities, and other relevant stakeholders. The consultations should provide information on the following aspects: a) purpose of the project; b) results of the environmental and social assessment; and c) presentation of the complementary studies required, in any instances where they apply. This ESCMF has been prepared through a detailed consultative process at both the field and central level, and consultations findings may also be used for subsequent safeguards documents.

261 Consultation through community outreach during project implementation is good practice to ensure that the potential adverse impacts and concerns are properly addressed during project construction and operation. Consultation with affected populations and ethnic minorities is required when the activities involve physical relocation, land acquisition, and ethnic minorities.

10.2 Consultation Process Summary

262 Public consultation is a key component of CAISAR and it was pivotal in preparation of the following documents:

- Environmental and Social Management Framework (ESCMF)
- Resettlement Planning Framework (RPF)
- Indigenous Peoples Planning Framework (IPPF)
- Gender Assessment & Social Inclusion Plan
- Stakeholder Engagement Plan (SEP), and
- Environmental, Social, Climate Assessment report (ESCA)

10.3 Initial Stakeholder Consultation Results

263 A number of missions and stakeholder engagement meetings have been held which are all part of the process of informing stakeholders about the proposed project, getting understanding and acceptance of the project, and getting input to further optimize the design and implementation of the project.

10.3.1 *Missions 1 and 2*

264 A two-stage joint mission was conducted by the Asian Infrastructure Investment Bank (AIIB), the International Fund for Agricultural Development (IFAD) and Ministry of Water Resources and Metrology (MoWRAM) for design and review of progress on the Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) Project (the Project) from 11 to 24 December 2022[1] and 9 to 19 January 2023.[2]

265 During the mission, discussions were held with key stakeholders in Phnom Penh and field visits to four provinces (Pursat, Kampong Chnang, Kampong Speu, and Kandal province) were conducted. Mission members visited all the key points of the irrigation areas guided by the Secretary of State His Excellency Chan Sinath and the directors of the Provincial Water Resource Management (PDWRAM). Districts and commune administrations, farmers and agribusiness entrepreneurs were met to determine and reach agreement on the directions and focus of the Project design and to review progress to date.

266 The objectives of the mission were (a) to check the requirements at the Project sites and review preparation progress, (b) to prepare all necessary information, studies and relevant documentation necessary for completing the Feasibility Study (FS), Green Climate Fund (GCF) Project Concept Note (CN) and GCF's Full Funding Proposal package, and (c) to define and

check the key studies required for the feasibility study and carry out the relevant consultations for the design mission.

10.3.2 *Mission 3*

267 A third field mission was conducted during the period of 18-26 May 2023 to Ou Tapoung (Pursat Province), Lum Hach (Kampong Chhnang Province) and Krang Ponley (Kampong Pseu, Kandal Province). The objectives of this mission were to: 1. Conduct discussions with provincial agencies with respect to planned projects and possible issues, and 2. Better understand the irrigation and flood control schemes as well as the smart irrigation needs; 3. Investigate the potential environmental and social issues related to the planned project schemes; and 4. To discuss appropriate environmental, social and climate safeguard measures suitable for the project (Annex 12).

10.3.3 *Ou Tapoung Feasibility Study Consultations*

During the preparation of the Ou Tapoung Feasibility Study, several meetings were held with FWUC commune representatives. These included:

- Meeting with Village Leaders from the Ou Ta Paong tail-end area, which included the following Villages of Ou Ta Paong Commune:
    1) Prey Yeang
    2) Robors Reang
    3) Chamkar Muol
    4) Chamkar Khluy
    5) Ou Tapoang
    6) Anglong Kray
    7) Srash Mkak
    8) Bot Kokichas
    9) Sdok Khlork
    10) Chhouk Krobao
    11) Somroung Pok
    12) Psar Angdoeurk
    13) Ornga Mean,
    14) Srash Ron
    15) Bot Kokithmey
    16) Ta nai
    17) Ou Bot
    18) Tuol Rokeang
- Meeting with FWUC of Kampang Irrigation Scheme on Svay Doun Kaev River
- Meeting with Bakan District Chairman
- Meeting with FWUC Damnak Ampil
- Meeting with FWUC Krouch Saeuch

PDWRAM explained that most of the systems in the DAC command area have at one or another time in the past 15 years undergone a rehabilitation. OTP is sort of a 'left-over'. PDWRAM explained that the rehabilitation of the OTP system is included in the current Five-Year Plan (PDWRAM). PDWRAM envisages that the OTP command area will receive its irrigation water via a gate on Damnak Ampil Canal (DAC).[16] An existing branch of Damnak Ampil Canal (DAC) is destined as the most logic route for delivering water to OTP River.

The feasibility study is to recommend options for improvement of the irrigation services in the area between the rivers Kambot and Svay Doun Khay. The work to be undertaken includes rehabilitation, upgrading, and extension of existing infrastructure systems for irrigation, drainage, flood protection, water storage, and transport.

[16] The ToR for the CAISAR Consultancy Services states:

10.3.4 *First Round of Stakeholder Engagement Meetings*

268 The first round of stakeholder meetings were held during the 26th to 30th June 2023 at commune and provincial levels in all three subprojects and six irrigation schemes. There were potential affected people and local authorities in the subproject areas and command areas that attended the consultation meetings at commune level, while representatives from provincial administration and provincial departments attended the public consultation meeting at provincial level.

269 The SECAP team provided a presentation at each meeting that included the following topics:

- Background of the CAISAR project
- Purpose of the Public Consultation
- Technical scope of each scheme
- Anticipated environmental and social risks and impacts
- Environmental and social safeguards documents to be prepared
- Grievance redress mechanism

270 Key comments and concerns raised by meeting participants included:

- Is there a **compensation** program for affected people?
- How can **complaints** be lodged if there is an issue?
- Participants generally expressed support for the project to be implemented soon

271 The key recommendations from the first round of stakeholder meetings include:

- Brambei Mom (Kampong Speu): there is a community forestry of 800ha. Wild animals such as wild boar, peafowl, tiger cat, banteng, gaur and so on.
- UXO: still found in some areas.
- Kampong Chhnang Department of Agriculture: suggested further assessment for the reservoir of Lum Hach.
- Reservoir of Lum Hach was reserved for irrigation purpose and it is state land. However, local people encroach and occupy the land inside the Lum Hach reservoir over the past years.
- Provincial Department of Health: recommended to ensure the health and safety of workers in the project (e.g., disease transmission and medical staff should standby at each construction site.
- Provincial Department of Education: should avoid adverse impacts on schools and students.

10.4 Information Disclosure

272 AIIB, IFAD and GCF funded projects are required to disclose all safeguards related documents locally in an accessible place and in a form and language understandable to key stakeholders (in this instance, Khmer and English) and on the external website of MOWRAM and of IFAD and the GCF prior to appraisal.

ANNEX 1: EXCLUSION LIST

Any sub-project that meets one or more of the following screening criteria will not be approved for financing under the project:

- Rural roads with total length of more than 10 kilometres per scheme;
- Irrigation canals with base width more than 10m; sluices with total drainage width more than 10m; irrigation embankments to protect cultivation areas of more than 500 hectares; large dams (higher than 15m) or any dams resulting in a high-risk rating (in terms of environment, social, and/or dam safety).
- Reservoirs with capacity of more than 3 million cubic meters;
- Infrastructure schemes that require physical resettlement of more than 20 people per subproject area or affect more than 10 percent (in value term) of assets of an individual household, or adversely impacts security of tenure of EM households.
- Any sub-project that physically displaces EM or dilutes/changes their security of tenure.
- Relocation and/or demolition of any permanent houses or business.
- Use of the project as an incentive and/or a tool to support and/or implement involuntary resettlement of local people and village consolidation.
- Land appropriation
- New settlements or expansion of existing settlements.
- Activities that would likely create adverse impacts on ethnic groups/indigenous peoples within the village and/or in neighboring villages, or activities unacceptable to ethnic groups living in an ethnic homogenous village or a village of mixed ethnic composition.
- Damage or loss to cultural property, including sites having archeological (prehistoric), paleontological, historical, religious, cultural and unique natural values.
- Resources access restriction (e.g. restricted access to farming land) that could not be mitigated and will result in adverse impacts on the livelihoods of ethnic groups and disadvantage peoples.
- Purchase of banned pesticides, insecticides, herbicides and other unbanned pesticides, unbanned insecticides and unbanned herbicides and dangerous chemicals exceeding the amount required to treat efficiently the infected area. However, if pest invasion occurs, the use of small amounts of eligible and registered pesticides in Cambodia will be allowed if supplemented by additional training of farmers to ensure pesticide safe uses in line with IFAD/GCF ESS policies and procedures. Highly Hazardous Pesticides (HHP) will not be used by the project.
- Purchase of destructive farming gear and other investments detrimental to the environment.
- Unsustainable exploitation of natural resources.
- Introduction of non-native species, unless these are already present in the vicinity or known from similar settings to be non-invasive.
- Significant conversion or degradation of natural habitat or where the conservation and/or environmental gains do not clearly outweigh any potential losses.
- Production or trade in any product or activity deemed illegal under Cambodia's laws or regulations or international conventions and agreements, or subject to international bans.
- Labor and working conditions involving harmful, exploitative, involuntary or compulsory forms of labor, forced labor[17], child labor[18] or significant occupational health and safety issues.
- Trade in any products with businesses engaged in exploitative environmental or social behavior. Sub-activities that require full EIA will not be funded including any projects that will use or induce the use of hazardous materials (including asbestos) or any banned chemicals.

[17] Forced labor means all work or service, not voluntarily performed, that is extracted from an individual under threat of force or penalty.

[18] Harmful child labor means the employment of children that is economically exploitive, or is likely to be hazardous to, or to interfere with, the child's education, or to be harmful to the child's health, or physical, mental, spiritual, moral, or social development.

ANNEX 3: TERMS OF REFERENCE FOR E&S SAFEGUARDS MONITORING CONSULTANT

The following is meant to serve as a sample Terms of Reference and should, therefore, be amended accordingly to fit the context of the CAISAR project once final decisions have been made about budget and division of tasks (e.g. whether the project's Monitoring & Evaluation (M&E) specialist will be separate from the Safeguards M&E consultant).

BACKGROUND

[Hiring unit should insert background information on the CAISAR project within the given Provincial PMU and project area here]

OBJECTIVES OF THE ASSIGNMENT

MOWRAM seeks the Consultancy Services of an experienced Individual Consultant "Environmental & Social Safeguards and Project Monitoring & Evaluation Consultant" as part of the Provincial Project Management Unit (full-time engagement). The objective of this assignment is monitoring compliance of the project activities with Environmental & Social Safeguards instruments. In addition, the Consultant will support the Project's overall M&E.

SCOPE OF WORK

Duties and Responsibilities:
The specific tasks stipulated in this ToR to be undertaken by the Environmental & Social Safeguards and Project M&E Consultant include, but are not limited to the following:

With regard to Environmental and Social Safeguards:
The Consultant will assist the Project Coordinator/Project Manager and will work closely with the Environmental & Social Safeguards staff within the Provincial PMU to handle Environmental and Social Safeguards related responsibilities. Specifically:

- Undertake site visits and on-ground review, check and document compliance with site-specific measures as presented in site-specific ESCMPs.
- Provide guidance to contactors, site supervisors, and other stakeholders on manners of implementation and documentation of compliance related to environmental mitigation and monitoring measures, as presented in site-specific ESCMPs.
- Check that all documents necessary to ensure full compliance with Environmental & Social Safeguard instruments, in particular, Environmental and Social Management Plans (ESCMPs) and Indigenous Peoples' Plans (IPPs) are prepared, regularly updated, and available to relevant stakeholders;
- Ensure that project activities, being developed as a part of the Project, are designed to include avoidance of potential social and environmental risks, as recommended in the ESCMPs and annual IP Plans already prepared;
- Provide overall Environmental and Social Management oversight during the implementation of CAISAR's activities and advise the implementation agencies in addressing the environmental issues;
- Ensure that each subproject and related activities under the project are subject to the Project's ESCMP procedures;
- Review subproject and activity plans, design, costs, and bidding documents and be involved in procurement of Civil Works and Supervision to ensure that Civil Works and Supervision contracts include provisions concerning the Environmental and Social Safeguard issues;
- Coordinate with relevant agencies for obtaining environmentally related permits, as necessary;
- Communicate with local governments, contractors, and with any Environmental, Social, Health and Safety (ESHS) Experts that may be part of the subproject supervision team in all matters related to design, implementation, documenting and reporting on environmental compliance, as indicated in site-specific ESCMPs;

- Monitor implementation of site-specific ESCMPs by the Contractors to ensure that appropriate management process and procedures are in place, that Environmental and Social Safeguards related measures are adequately addressed and to ensure that in the event of a noncompliance agreed remedial actions are applied and documented;
- Check and ensure that the regular reports are prepared and timely submitted by the Contractor as per content agreed and provide comments, as appropriate;
- Contribute to, along with the E&S Provincial PMU Specialists, preparation of semi-annual ESCMP Compliance Reports for IFAD and the GCF
- Participate in missions and technical visits by IFAD, and work closely with the IFAD SECAP Specialists and Provincial PMU E&S Specialists to ensure the Project's compliance with relevant environmental and social policies.
- Undertake other actions related to environmental and social aspects of the Project, as may be instructed by the Project Manager/Coordinator from time to time and/or the E&S Specialists in the Provincial PMU, in order to ensure full compliance of the Project with national and international environmental and social standards and legislation.

With regard to Project Monitoring & Evaluation:

The Consultant will be in charge of the Project's Monitoring & Evaluation (M&E), design the strategic and technical approach to implementing project goals within the technical framework outlined for the Results Monitoring. The Consultant will coordinate and work with other members of the Provincial PMU, particularly any staff which DARD has assigned to operate the REDD+ MIS SIS and/or Project MIS, to ensure adequate monitoring of progress against the project indicators. In addition, the Consultant will also work closely with any specialists hired to carry out Mid-Term and/or Terminal Project Monitoring & Evaluation and facilitate the gathering of information.

- Review and familiarize themselves with the Project's documents, in particular with Project Operational Manual (POM) and Monitoring Information System (MIS) already established;
- Carry out the preparation and implementation of the M&E program and keep records on achievements, breakdowns of indicators;
- Continuously monitor progress towards the project's objectives and according to agreed Performance Monitoring Indicators;
- Report in semi-annual reports on the project objectives and Results Framework updates;
- Monitor the project's implementation and evaluate outcomes and results for each Component and Subcomponent, using the MIS;
- Determine whether the inputs in the project are well utilized;
- Monitor the project's implementation against the planned activities (physical and financial), analyze reasons for delays (if any), and propose measures and solutions to overcome delays;
- Ensure that the project's activities are properly implemented as per the agreed program, and take corrective actions when necessary;
- Identify good practices and advantages within the project, recording lessons-learned for future consideration;
- Carry out the roles and responsibilities given by the Project Coordinator/Manager;
- Support the beneficiary survey and other end-of-project evaluations
- Take all necessary measures for the maintenance of the MIS to keep it operational.

QUALIFICATIONS REQUIREMENTS

The person suitable for the position of the Environmental & Social Safeguard and Project Monitoring & Evaluation Consultant should have the following qualifications:

- Master's degree, preferable in the Environmental Sciences, Environmental Engineering or equivalent professional qualifications appropriate to the Consultancy Services requested;
- A minimum of 5 (five) years of relevant experience in Environmental & Social Safeguard Monitoring;
- Knowledge of Cambodia's regulations and laws (particularly in the EIA processes) is required;
- Familiarity with the IFAD, GCF, and REDD+ Safeguard policies will be an advantage;
- Knowledge and experience in Project Monitoring & Evaluation is desirable;

- Proficiency in using computer and office software packages (word processing, spreadsheet etc.). Experience in the handling of web-based data and Management Information Systems will be an added advantage;
- Fluent written and spoken Khmer and English.

REPORTING OBLIGATIONS

The Consultant will work under the direction of and report to the CAISAR Project Manager/Coordinator within the PMU, and in close consultation with the E&S Specialists of the PMU. The Consultant will deliver monthly progress reports concerning the accomplishment of their assignments.

In addition, concerning the overall Project M&E, the Consultant shall prepare semi-annual and annual surveys on project outcomes indicators and prepare semi-annual and annual project progress reports, updating relevant parts of the Result Framework, as appropriate. This work shall be conducted in close consultation with any relevant specialists with the PMU.

CLIENT'S INPUTS

The Consultant will be based and work in the Provincial PMU office. MOWRAM, as host of the Provincial PMU, will provide the office space and equipment required to perform the tasks assigned.

TERMS OF THE ASSIGNMENT AND DURATION

- The Consultant will work on full-time basis.
- Remuneration will be paid on a monthly basis.
- The Consultant will be offered the opportunities to grow up professionally by attending relevant training events and courses during the term of the contract.
- The initial contract with the Consultant will cover one year, with a 3 month probation period, at which time the performance of Consultant shall be evaluated and extension may be made annually pending continued performance.
- Evaluation of the 3 (three) month probation period and any contract extension would be fully based on the consultant's performance certified by the Project Coordinator/Manager and as agreed with IFAD.

ANNEX 4: CHANCE FINDS PROCEDURE

The following *"chance find"* procedures must be included in all third-party contracts (e.g. Letters of Agreement) in instances where the contracted party is assisting with project implementation and/or construction activities.

Provincial PMUs will ensure that the bidding documents and work contract for civil works contractors include clauses on chance find procedures. Specifically, the clause will stipulate that if the Contractor discovers archeological sites, historical sites, remains and objects, including graveyards and/or individual graves during project implementation, the Contractor shall:

- Stop the activities in the area of the chance find;
- Delineate the discovered site or area;
- Secure the site to prevent any damage or loss of removable objects. In cases of removable antiquities or sensitive remains, a night guard shall be arranged until the responsible local or provincial authorities take over;
- Notify the supervisory Safeguards Specialist within the PMU who, in turn, will notify the responsible local and provincial authorities immediately (within 24 hours or less);
- Responsible local and/or provincial authorities would oversee protecting and preserving the site before deciding on subsequent appropriate procedures. This would require a preliminary evaluation of the findings to be performed by government approved archeologists. The significance and importance of the findings should be assessed according to the various criteria relevant to cultural heritage; those include the aesthetic, historic, scientific or research, social and economic values;
- Decisions on how to handle the finding shall be taken by the responsible local and provincial authorities. This could include changes in the layout (such as when finding an irremovable remain of cultural or archeological importance) conservation, preservation, restoration and salvage;
- Implementation for the authority decision concerning the management of the finding shall be communicated in writing by relevant local authorities; and
- Project activities could resume only after permission is given from the responsible local or provincial authorities concerning safeguard of the heritage.

Note that the reporting of chance finds only occurs when an item/area/etc. of cultural significance is found, and is only carried out insofar as what is detailed above (i.e. reporting the find, reporting how the item/area will be treated moving forward). Reporting begins with the local level implementer (e.g. staff tasked to the implement the project within a village) notifying the Safeguards Specialist, after which, the Safeguards Specialist guides the process according to the instructions above (e.g. notifying the relevant government authorities).

ANNEX 5: E & S CODES OF PRACTICE FOR CONSTRUCTION

Generic contract clauses are provided to assist with environmental and social management works. These clauses are general and should be modified as needed. These clauses are intended to be included as requirements in the works contract and shall remain in force throughout the contract period.

Clause on ESCMP

The Contractor is required to implement this ESCMP. The Contractor is responsible for the implementation of construction and rehabilitation activities for the sites and for implementing the impact mitigation measures in the construction phase. The Contractor's approach shall be detailed in the Contractor's Management Plan.

The Contractor shall include a suitably qualified and experienced Environmental, Occupational Health and Safety Officer (and other staff or consultants as necessary) to be specifically responsible for preparation and regular update and supervision of the ESCMP. The Environmental, Occupational Health and Safety Officer is responsible for the daily supervision and monitoring of the Contractors implementation of the Plan and compliance with the Project ESCMP for the duration of the contract. The Contractor's approach to comply with the ESCMP shall be approved by PMU prior to the Contractor's mobilization to the site.

The Contractor will be required to report on the implementation status of the ESCMP to PMU. The damages due to the violation of the stipulations by the Contractor shall be compensated and/or restored by the Contractor at his or her own expense. Performance will be monitored by PMU and will be enforced by withholding of payments (refer to relevant clause in the bid documents).

Other Standard Clauses

Permits and Approvals

The contractor shall be responsible for ensuring that he or she has all relevant legal approvals and permits required to commence works.

Site Security

The contractor shall be responsible for maintaining security over the construction site including the protection of stored materials and equipment. In the event of severe weather, the contractor shall secure the construction site and associated equipment in such a manner as to protect the site and adjacent areas from consequential damages. This includes the management of onsite, construction materials, construction and sanitary wastes, additional strengthening of erosion control and soil stabilization systems and other conditions resulting from contractor activities which may increase the potential for damages.

Discovery of Antiquities and Cultural Heritage

If, during the execution of the activities contained in this contract, any material is discovered onsite which may be considered of historical or cultural interest, such as evidence of prior settlements, native or historical activities, evidence of any existence on a site which may be of cultural significance, all work shall stop and the supervising contracting officer shall be notified immediately and the Chance Find Procedures followed (Appendix 5). The area in which the material was discovered shall be secured, cordoned off, marked, and the evidence preserved for examination by the local archaeological or cultural authority. No item believed to be an artefact must be removed or disturbed by any of the workers. Work may resume, without penalty of prejudice to the contractor upon permission from the contracting officer with any restrictions offered to protect the site.

Worker Occupational Health and Safety

The contractor shall ensure that all workers operate within a safe environment. Sanitation facilities shall be provided for all site workers. All sanitary wastes generated as a result of project activities shall be managed in a manner approved by the contracting officer and the local authority responsible for public health. The contractor shall ensure that there are basic medical facilities on site and that there are staff trained in basic first aid. Workers must be provided with the necessary protective gear as per their specific tasks such as hard hats, overalls, gloves, goggles, boots, etc. The contractor shall

provide the contracting officer with an occupational health and safety plan for approval prior to the commencement of site activities.

The contractor must ensure that all workers operate within a safe environment. All relevant Labor and Occupational Health and Safety regulations must be adhered to ensure worker safety. Sanitary facilities must be provided for all workers on site. Appropriate posting of information within the site must be done to inform workers of key rules and regulations to follow.

Noise Control

The contractor shall control noise emissions generated as a result of contracting activities to the extent possible. In the case of site locations where noise disturbance will be a concern, the contractor shall ensure that the equipment is in good working order with manufacturer supplied noise suppression (mufflers etc.) systems functioning and in good repair.

Where noise management is a concern, the contractor shall make reasonable efforts to schedule activities during normal working hours (between 7 am and 5 pm). Where noise is likely to pose a risk to the surrounding community either by normal works or working outside of normal working hours or on weekends, the contractor shall inform the contracting officer and shall develop a public notification and noise management plan for approval by the contracting officer.

Use and Management of Hazardous Materials, fuels, solvents and petroleum products

The use of any hazardous materials including pesticides, oils, fuels and petroleum products shall conform to the proper use recommendations of the product. Waste hazardous materials and their containers shall be disposed of in a manner approved by the contracting officer in accordance with State and/or national laws and the Project ESCMP. A site management plan will be developed by the contractor if the operation involves the use of these materials to include estimated quantities to be consumed in the process, storage plans, spill control plans, and waste disposal practices to be followed. Any plans required shall be approved by the contracting officer.

Elements of the hazardous materials management shall include:

- Contractor must provide temporary storage on site of all hazardous or toxic substances in safe containers labeled with details of composition, properties and handling information;
- Hazardous substances shall be placed in a leak-proof container to prevent spillage and leaching; and
- Wastes shall be transported and disposed of in a manner outlined in the ESCMP, and cleared by the PMU Safeguards Team compliant with national laws and policies and the ESCMP.

12.

Use and Management of Pesticides

Any use of pesticides shall be approved by the contracting officer and shall conform to the manufacturers' recommendations for use and application. Any person using pesticides shall demonstrate that they have read and understood these requirements and are capable of complying with the usage recommendations to the satisfaction of the contracting officer. All pesticides to be used shall conform to the list of acceptable pesticides that are not banned by the relevant local authority.

If termite treatment is to be utilized, ensure appropriate chemical management measures are implemented to prevent contamination of surrounding areas, and use only licensed and registered pest control professionals with training and knowledge of proper application methods and techniques.

Use of Explosives

No explosives shall be used on the Project.

Site Stabilization and Erosion Control

The Contractor shall implement measures at the site of operations to manage soil erosion through minimization of excavated area and time of exposure of excavated areas, preservation of existing ground cover to the extent possible, provision of approved ground cover and the use of traps and filtration systems. Where excavations are made, contractor shall implement appropriate stabilizing techniques to prevent cave-in or landslide. Measures shall be approved by the contracting officer.

The contractor must ensure that appropriate erosion control measures such as silt fences are installed. Proper site drainage must be implemented. Any drain clogged by construction material or sediment must be unclogged as soon as possible to prevent overflow and flooding. The use of retaining

structures and planting with deep rooted grasses to retain soil during and after works must be considered. The use of bio-engineering methods must be considered as a measure to reduce erosion and land slippage. All slopes and excavated areas must be monitored for movement.

The contractor will establish appropriate erosion and sediment control measures such as hay bales, sedimentation basins, and / or silt fences and traps to prevent sediment from moving off site and causing excessive turbidity in nearby streams, rivers and wetlands. Construction vehicles and machinery will be washed only in designated areas where runoff will not pollute natural surface water bodies.

Air Quality

The Contractor shall comply with the Project ESCMP requirements for dust management.

Traffic Management

In the event that construction activities should result in the disruption of area transportation services, including temporary loss of roadways, blockages due to deliveries and site related activities, the contractor shall provide the contracting officer with a traffic management plan including a description of the anticipated service disruptions, community information plan, and traffic control strategy to be implemented so as to minimize the impact to the surrounding community. This plan shall consider time of day for planned disruptions, and shall include consideration for alternative access routes, access to essential services such as medical, disaster evacuation, and other critical services. The plan shall be approved by the contracting officer.

Elements of the traffic management plan to be developed and implemented by contractor shall include:

- Alternative routes will be identified in the instance of extended road works or road blockages;
- Public notification of all disturbance to their normal routes;
- Signage, barriers and traffic diversions must be clearly visible, and the public warned of all potential hazards;
- Provision for safe passages and crossings for all pedestrians where construction traffic interferes with their normal route;
- Active traffic management by trained and visible staff at the site or along roadways as required to ensure safe and convenient passage for the vehicular and pedestrian public; and
- Adjustment of working hours to local traffic patterns, e.g. avoiding major transport activities during rush hours or times of livestock movement.

13.

Water Quality

The Contractor shall comply with the Project ESCMP requirements for water quality. Under no circumstances shall the contractor permit the collection of standing water as a consequence of contractor activities to ensure that it does not create breeding grounds for any pests such as mosquitoes.

Management of Solid Wastes and Construction Debris

The contractor shall provide a solid waste management plan that conforms to the national solid waste management policies and regulations and the site-specific ESCMP for approval by the PMU and IFAD (see Appendix 3 for an outline of a site-specific ESCMP). The site's waste management plan shall include a description of waste handling procedures including collection, storage and disposal through the national waste management system. There will be no open burning of waste material and the contractor shall endeavor to recycle wastes as appropriate. Under no circumstances shall the contractor allow construction wastes to accumulate so as to cause a nuisance or health risk due to the propagation of pests and disease vectors.

Management of Workers

The Contractor will prepare a specific Code of Conduct (see Appendix 9) to describe the expected behaviors of their project worker in relation to the local communities and their social sensitivities. This is to avoid creating demand for illegal sex work, avoid SEA/SH and Violence against Children, manage alcohol consumption and avoid the use of illegal substances, and abide by cultural and social norms of the host community. The Contractor is to ensure no children (persons under the age of 18) are hired to work in the project.

The Contractor is to ensure that all overseas project staff undergo a training on the Staff Code of Conduct. Gender based violence and HIV/AIDS and communicable disease awareness raising and resources shall also be provided to all workers. MARD shall provide to the Contractor a list of approved service providers, which shall include recognized NGOs and others for conducting this training.

The Contractor is to stipulate the conditions under which visitors may attend the workers' accommodation, including curfews. The Contractor shall ensure that basic social/collective rest and recreation spaces and activities within the workers accommodation to help minimize the impact that the workers would have on the leisure and recreational facilities of the nearby communities. The Contractor must comply with the Guidelines for Worker's Camps (Appendix 7).

As per guidelines in the ESCMP, the Contractor must ensure that Worker's Camps are located at least 500m from nearby communities and schools (see Appendix 7).

ANNEX 6: GUIDELINES FOR WORKERS' CAMPS

To ensure the compliance to the OHS and ESF requirement, these guidelines will help the contractor when setting up worker's camps.

GENERAL

The Workers Camp Management Plan will be compliant with the specific prescriptions of the site-specific ESCMP. Contractors must ensure that Worker's Camps are located at least 500m from nearby communities and schools.

WORKER RECRUITMENT

The Contractor is required to minimise the number of skilled workers that are recruited from overseas. No unskilled labour will be sourced from overseas. Local communities should be prioritized for unskilled labour, including a target of 15% female unskilled workers when/where applicable. The Contractor will maximize the number of skilled and unskilled workers that are recruited from the communities along the project site.

The Contractor will be required to provide justification for any skilled workers recruited from overseas and explain why this position cannot be filled locally.

WORKERS CAMP FACILITIES

All facilities in the Workers Camp must be complaint with the stipulations of the ESCMP. The camp shall be provided with the following minimum facilities:

- Eating space and dormitories as required shall be constructed of suitable materials to provide a safe healthy environment for the workforce and which facilitate regular cleaning and the provision of ventilation and illumination.
- At least one water closet toilet, one urinal and one shower per 10 personnel engaged either permanently or temporarily on the project. Separate toilet and wash facilities shall be provided for male and female employees, including ensuring that toilets are available close to working sites/road sections where women are working.
- A sick bay and first aid station.
- Sewage collection facilities to allow for the treatment of black and grey wastewater discharge from toilets, washrooms, showers, kitchens, laundry and the like. The management of all camp wastewater water shall be as prescribed in the ESCMP.
- All camp facilities shall be maintained in a safe clean and or appropriate condition throughout the construction period.
- Throughout the period of the contract the employer, the engineer, or their representatives shall have uninterrupted access to and from the camp for the purpose of carrying out routine inspections of all buildings, facilities or installations of whatever nature to ensure compliance with this specification.

WORKERS CAMP OPERATIONS

- The Contractor will be required to provide adequate provisions for the workers for the duration of the project so as not to be a burden on the food or water security of the surrounding communities. The Contractor will strive to hire local labour to provide cleaning and food services.
- All wastewater, solid waste, freshwater usage, noise levels, handling and storage of hazardous materials shall be as prescribed in the ESCMP.

MANAGEMENT OF OFF DUTY WORKERS

- The Contractor will prepare ensure all staff sign and adhere to the Workers' Code of Conduct to describe the expected behaviours of their project worker in relation to the local communities and their social sensitivities.

- The Contractor is to ensure that all overseas project staff, not already living in Cambodia undergo a cultural familiarisation session as part of their induction training. The purpose of this induction will be to introduce the project staff to the cultural sensitivities of the local communities and the expected behaviours of the staff in their interactions with these communities.
- The Contractor is to stipulate the conditions under which visitors may attend the workers camp. Strict visiting hours should be enforced, and all visitors will be required to sign in and out of the worker's camp. No overnight visitors will be allowed.
- The Contractor shall ensure that basic social/collective rest spaces are provided equipped with seating within the Workers Camp to help minimise the impact that the workers would have on the leisure and recreational facilities of the nearby communities. Provisions should also be made to provide the workers with an active recreation space within the camp.

WORKERS CAMP MANAGEMENT PLAN

A Worker Camp Management Plan shall be submitted by the Contractor to the Provincial PMU. The Workers' Camp Management Plan shall describe how this document and the ESCMP shall be implemented in the following:

- Recruitment strategy
- Accommodation
- Canteen and dining areas
- Ablutions
- Water supply
- Wastewater management system
- Proposed power supply
- Code of Conduct for Workers
- Recreational/leisure facilities for workers
- Visitors to the Workers Camp
- Interactions with the local communities

ANNEX 7: CONTRACTORS' COVID-19 GUIDELINE

The objective of the Contractors' General Guideline on COVID-19 Considerations in Construction Works is to provide guidance on Prevention Measures and Response to possible cases of COVID-19 following the update-to-day guidance of the Ministry of Health.

Prevention Measures:

- Dissemination of COVID-19 prevention measures to staff and workers through orientation or distributing leaflet/poster at information/safety board at each construction and camp site
- Daily checking temperature of staff and workers prior to start working
- Staff and workers are wearing masks all the time
- Do not share personal items or supplies such as phones, pens, notebooks, tools, etc
- Avoid common physical greetings, such as handshakes
- Maintain a minimum physical distance of one metre from others if possible
- Wash hands often with soap and water for at least 20 seconds after using the washroom, before handling food, after blowing nose, coughing, or sneezing, and before smoking. If hands are not visibly soiled, and soap and water are unavailable, alcohol-based hand sanitizer can be used
- All offices and jobsites implement additional cleaning measures of common areas. All door handles, railings, ladders, switches, controls, eating surfaces, shared tools and equipment, taps, toilets, and personal workstation areas are wiped down at least twice a day with a disinfectant, such as disinfectant wipes. Individuals are responsible for cleaning and disinfecting their workstations
- Commonly touched surfaces on vehicles and equipment are thoroughly cleaned and disinfected at the end of shifts and between users
- Coughing or sneezing into a tissue or the bend of your arm, not your hand; dispose of used tissues you have as soon as possible in a lined waste basket and wash your hands afterwards
- Complying with any instructions announced by the Ministry of Health

Response to Possible Cases of COVID-19

- Individuals who have been potentially exposed to the virus, or who are exhibiting flu-like symptoms such as fever, tiredness, coughing, or congestion are instructed to:
  - Not come to work;
  - Contact their supervisor and/or human resources department;
  - Stay at home and self-isolate; and
  - Contact local health authorities for further direction.

- Such individuals are required to follow the directions of the local health authority and may not return to work until given approval by the proper health authorities;
- Individuals who begin to display flu-like symptoms on site are instructed to avoid touching anything, take extra care to contain coughs and sneezes, and return home immediately to undergo self-isolation as directed by the local health authority;
- All areas on site potentially infected by a confirmed or probable case are barricaded to keep individuals two meters away until the area is properly cleaned and disinfected.

ANNEX 8: WORKERS' CODE OF CONDUCT

Instructions: This Code of Conduct should be included in bidding documents for the civil works contractor(s) and in their contracts once hired. This Code of Conduct should also be included in bidding documents, and the contracts, of construction contractor. This Code of Conduct is to be signed by all contractor, including subcontractors, if any, including contractors and subcontractors' managers who work under the CAISAR project.

I, _____, acknowledge that adhering to environmental, social, health and safety (ESHS) standards, following the project's occupational health and safety (OHS) requirements, and preventing Sexual Exploitation Abuse (SEA)/Sexual Harassment (SH) is important.

The Contractor/DDIS considers that failure to follow ESHS and OHS standards, or to partake in activities constituting SEA and SH be it on the work site, the work site surroundings, at workers' camps, or the surrounding communities—constitute acts of gross misconduct and are therefore grounds for sanctions, penalties or potential termination of employment. Prosecution by the Police of those who commit VAC, SEA/SH may be pursued if appropriate.

I agree that while working on the project I will:

- Carry out his/her duties competently and diligently;
- Comply with this Code of Conduct and all applicable laws, regulations and other requirements, including requirements to protect the health, safety and well-being of other Contractor's Personnel and any other person;
- Maintain a safe working environment including by:
- Ensure that workplaces, machinery, equipment and processes under each person's control are safe and without risk to health;
- Use appropriate measures relating to chemical, physical and biological substances and agents; and
- Follow applicable emergency operating procedures.
- Report work situations that he/she believes are not safe or healthy and remove himself/herself from a work situation which he/she reasonably believes presents an imminent and danger to his/her life or health;
- Consent to a background check in any place I have worked for more than six months.
- Attend and actively partake in training courses related to ESHS, OHS, VAC, SEA/SH as requested by my employer.
- Will wear my personal protective equipment (PPE) at all times when at the work site or engaged in project related activities.
- Take all practical steps to implement the environmental and social management plan (ESCMP).
- Implement the OHS Management Plan.
- Adhere to a zero-alcohol policy during work activities, and refrain from the use of narcotics or other substances which can impair faculties at all times.
- Treat women, children (persons under the age of 18), and men with respect regardless of race, color, language, religion, political or other opinion, national, ethnic or social origin, property, disability, birth or other status.
- Not use language or behavior towards women, children or men that is inappropriate, harassing, abusive, sexually provocative, demeaning or culturally inappropriate.
- Not sexually exploit or abuse project beneficiaries and members of the surrounding communities.

- Not engage in sexual harassment of work personnel and staff —for instance, making unwelcome sexual advances, requests for sexual favors, and other verbal or physical conduct of a sexual nature is prohibited: i.e. looking somebody up and down; kissing, howling or smacking sounds; hanging around somebody; whistling and catcalls; in some instances, giving personal gifts.
- Not engage in sexual favors —for instance, making promises of favorable treatment (i.e. promotion), threats of unfavorable treatment (i.e. loss of job) or payments in kind or in cash, dependent on sexual acts—or other forms of humiliating, degrading or exploitative behavior.
- Not use prostitution in any form at any time.
- Not participate in sexual contact or activity with children under the age of 18—including grooming or contact through digital media. Mistaken belief regarding the age of a child is not a defense. Consent from the child is also not a defense or excuse.
- Unless there is the full consent[19] by all parties involved, I will not have sexual interactions with members of the surrounding communities. This includes relationships involving the withholding or promise of actual provision of benefit (monetary or non-monetary) to community members in exchange for sex (including prostitution). Such sexual activity is considered "non-consensual" within the scope of this Code.
- Consider reporting through the GRM or to my manager any suspected or actual SEA/SH by a fellow worker, whether employed by my company or not, or any breaches of this Code of Conduct.
- Complete relevant training courses that will be provided related to the environmental and social aspects of the Contract, including on health and safety matters, and Sexual Exploitation, and Sexual Assault (SEA);
- Report violations of this Code of Conduct; and

With respect to children under the age of 18:

- Bring to the attention of my manager the presence of any children on the construction site or engaged in hazardous activities.
- Wherever possible, ensure that another adult is present when working in the proximity of children.
- Not invite unaccompanied children unrelated to my family into my home unless they are at immediate risk of injury or in physical danger.
- Not use any computers, mobile phones, video and digital cameras or any other medium to exploit or harass children or to access child pornography (see also "Use of children's images for work related purposes" below).
- Refrain from physical punishment or discipline of children.
- No hiring of children for any CAISAR project activity (no persons under the age of 18).
- Comply with all relevant local legislation, including labor laws in relation to child labor and World Bank's safeguard policies on child labor and minimum age.
- Take appropriate caution when photographing or filming children (see x-bb below). Photos or films of children should generally not be taken in the CAISAR, except in instances showing the benefits or impacts of road works, such as impacts to schools or school safety trainings.

Use of children's images for work related purposes

When photographing or filming a child for work related purposes, I must:

- Before photographing or filming a child, assess and endeavor to comply with local traditions or restrictions for reproducing personal images.
- Before photographing or filming a child, obtain informed consent from the child and a parent or guardian of the child. As part of this I must explain how the photograph or film will be used.

[19] **Consent** is defined as the informed choice underlying an individual's free and voluntary intention, acceptance or agreement to do something. No consent can be found when such acceptance or agreement is obtained using threats, force or other forms of coercion, abduction, fraud, deception, or misrepresentation. In accordance with the United Nations Convention on the Rights of the Child, the World Bank considers that consent cannot be given by children under the age of 18, even if national legislation of the country into which the Code of Conduct is introduced has a lower age. Mistaken belief regarding the age of the child and consent from the child is not a defense.

- Ensure photographs, films, videos and DVDs present children in a dignified and respectful manner and not in a vulnerable or submissive manner. Children should be adequately clothed and not in poses that could be seen as sexually suggestive.
- Ensure images are honest representations of the context and the facts.
- Ensure file labels do not reveal identifying information about a child when sending images electronically.

Raising Concerns

If any person observes behavior that he/she believes may represent a violation of this Code of Conduct, or that otherwise concerns him/her, he/she should raise the issue promptly. This can be done in either of the following ways:

- Contact [enter name of the Contractor's Social Expert with relevant experience in handling gender-based violence, or if such person is not required under the Contract, another individual designated by the Contractor to handle these matters] in writing at this address [ ] or by telephone at [ ] or in person at [ ]; or
- Call [ ] to reach the Contractor's hotline (if any) and leave a message.

The person's identity will be kept confidential, unless reporting of allegations is mandated by the country law. Anonymous complaints or allegations may also be submitted and will be given all due and appropriate consideration. We take seriously all reports of possible misconduct and will investigate and take appropriate action. We will provide warm referrals to service providers that may help support the person who experienced the alleged incident, as appropriate.

There will be no retaliation against any person who raises a concern in good faith about any behavior prohibited by this Code of Conduct. Such retaliation would be a violation of this Code of Conduct.

Sanctions

I understand that if I breach this Workers' Code of Conduct, my employer will take disciplinary action which could include:

- Informal warning;
- Formal warning;
- Additional Training;
- Loss of up to one week's salary;
- Suspension of employment (without payment of salary), for a minimum period of 1 month up to a maximum of 6 months;
- Termination of employment;
- Report to the Police if warranted.

I understand that it is my responsibility to ensure that the environmental, social, health and safety standards are met. That I will adhere to the occupational health and safety management plan. That I will avoid actions or behaviors that could be construed as VAC or SEA/SH. Any such actions will be a breach this Workers' Code of Conduct. I do hereby acknowledge that I have read the foregoing Workers' Code of Conduct, do agree to comply with the standards contained therein and understand my roles and responsibilities to prevent and respond to ESHS, OHS, VAC and SEA/SH issues. I understand that any action inconsistent with this Workers' Code of Conduct or failure to act mandated by this Workers' Code of Conduct may result in disciplinary action and may affect my ongoing employment.

ANNEX 9: SAMPLE TORS FOR AN ENVIRONMENT & CLIMATE SAFEGUARDS SPECIALIST

BACKGROUND: [This section must include the project background, ideally tailored to the specific PPMU]

OBJECTIVE:

The Environment & Climate Safeguards Specialist will be responsible for the implementation, monitoring, and reporting of all environment and climate-related safeguards for the project. This will include, when relevant, implementation of the project's Grievance Redress Mechanism (GRM), and any items listed in the Environmental, Social, and Climate Management Framework (ESCMF). You will work in close collaboration with the Gender & Social Safeguards Specialist, as well as the project's Monitoring & Reporting specialist. You will report to the lead of the Provincial Project Management Unit.

RESPONSIBILITIES:

- Prepare, implement, and monitor environmental safeguards instruments, including the environmental & climate-risk aspects of ESCMPs and any Biodiversity Management Plans.
- Compile the environmental baseline data for ESCMPs and Biodiversity Management Plans (when applicable) at sub-project sites based on requirements of the Government of Cambodia, IFAD, and GCF
- Identify key issues & ways to manage issues pertaining to the environment and climate.
- Conduct consultations, in collaboration with the Gender & Social Safeguards Specialist, with target communities in the project area to assess the (i) current environmental situation (at local level, this includes peoples' perception of the situation); (ii) environmental & climate-related impacts of sub-projects; and (iii) mitigation measures (including the communities' recommendations/solutions) that can be taken pertaining to any negative environmental/climate impacts
- Obtain data from, sensitize, and clearly explain to relevant government staff (or civil society organizations/partners, etc.) the data, M&E, and compliance requirements for environmental safeguards & climate risk considerations during project implementation.
- Manage, along with the Gender & Social Safeguards Specialist, the project's Grievance Redress Mechanism.

MINIMUM REQUIREMENTS:

- Manage, along with the Gender & Social Safeguards Specialist, the project's Grievance Redress Mechanism.
- Advanced University degree in Environmental Science, Biology, Environmental/Civil Engineering, or any related field.
- Minimum of 5 years of relevant operational experience and proven track record in working agricultural, forest management, and construction activities, including compliance with Environmental and Social standards
- Familiarity with climate science and management of climate risks
- Working knowledge of English and Khmer proficiency.
- National of Viet Nam.

CORE COMPETENCIES:

- Results Focus
- Teamwork
- Communication
- Building Effective Relationships
- Knowledge Sharing and Continuous Improvement

TECHNICAL/FUNCTIONAL SKILLS:

- Work experience in implementation and management of international safeguards standards pertaining to environment, climate, and agroforestry activities.
- Knowledge of issues pertaining to environment, climate, and biodiversity.

- Knowledge of computer-aided design programs, AutoCAD required and Structural Analysis programs.
- Knowledge and understanding of international environmental and social safeguards standards and practices

SELECTION CRITERIA:

- Demonstrated capacity supervise agricultural, forest management, and construction activities, including compliance with Environmental and Social standards
- Demonstrated ability to liaise with multiple agencies and contractors, effectively building an understanding and partnership with other UN bodies, NGOs, government agencies, and contractors
- Ability to plan, organize, implement, and report
- Excellent communication, writing, and presentation skills in English and Khmer
- Teamwork spirit, ability to work under minimum supervision
- Ability to build effective working relationships with national and international colleagues, with different cultural and technical backgrounds
- Proven strong communication, interpersonal and negotiation skills
- Analytical skills and experience.
- Ability to keep sensitive information as confidential.

ANNEX 10: SAMPLE TORS FOR A GENDER & SOCIAL SAFEGUARDS SPECIALIST

BACKGROUND: [This section must include the project background, ideally tailored to the specific PPMU]

OBJECTIVE:

The Gender & Social Safeguards Specialist will be responsible for the implementation, monitoring, and reporting of all environment and climate-related safeguards for the project. This will include, when relevant, implementation of the project's Grievance Redress Mechanism (GRM), and any items listed in the Environmental, Social, and Climate Management Framework (ESCMF). You will work in close collaboration with the Gender & Social Safeguards Specialist, as well as the project's Monitoring & Reporting specialist. You will report to the lead of the Provincial Project Management Unit.

RESPONSIBILITIES:

- Prepare, implement, and monitor social safeguards instruments, including the social aspects of ESCMPs, the Labour Management Plan, and IP Plan.
- Compile the social baseline data for ESCMPs, LMPs, and IP Plans at sub-project sites with information on demographics, ethnic/religious minorities and indigenous populations, overall population, education, health, social protection, language(s), religion, and any other areas required based on IFAD and GCF guidelines
- Identify key issues & ways to manage issues pertaining to gender, IP, and social inclusion.
- Conduct consultations, in collaboration with the Environment & Climate Specialist, with target communities in the project area to assess the (i) current social situation (at local level, this includes peoples' perception of the situation); (ii) social impacts of sub-projects; and (iii) mitigation measures (including the communities' recommendations/solutions) that can be taken pertaining to any negative social impacts
- Obtain data from, sensitize, and clearly explain to relevant government staff (or civil society organizations/partners, etc.) the data, M&E, and compliance requirements for social safeguards & gender/IP/social inclusion during project implementation.
- Manage, along with the Environment & Climate Safeguards Specialist, the project's Grievance Redress Mechanism.

MINIMUM REQUIREMENTS:

- Advanced University degree in Social Sciences, Gender Studies, International Development, or any related field to social inclusion/gender and social safeguards.
- Minimum of 5 years of relevant operational experience and proven track record in working on development projects in the agriculture/forest sector.
- Working knowledge of English and Khmer proficiency.
- National of Viet Nam.

14.

CORE COMPETENCIES:

- Results Focus
- Teamwork
- Communication
- Building Effective Relationships
- Knowledge Sharing and Continuous Improvement

TECHNICAL/FUNCTIONAL SKILLS:

- Work experience in implementation and management of gender and social inclusion activities, and social safeguards to international standards.
- Knowledge of issues pertaining to ethnic minorities, Indigenous Persons, gender, youth, and other vulnerable populations.
- Knowledge and understanding of international environmental and social safeguards standards and practices

SELECTION CRITERIA:

- Demonstrated capacity supervise agricultural, forest management, and construction activities, including attention to issues of gender and social inclusion and compliance with Environmental and Social standards
- Demonstrated ability to liaise with multiple agencies and contractors, effectively building an understanding and partnership with other UN bodies, NGOs, government agencies, and contractors
- Ability to plan, organize, implement, and report
- Excellent communication, writing, and presentation skills in English and Khmer
- Teamwork spirit, ability to work under minimum supervision
- Ability to build effective working relationships with national and international colleagues, with different cultural and technical backgrounds
- Proven strong communication, interpersonal and negotiation skills
- Analytical skills and experience.
- Ability to keep sensitive information as confidential.

ANNEX 11: MISSION 3 LIST OF PARTICIPANTS

MINISTRY OF ECONOMY AND FINANCE(MEF)

1.	1.	Heng Hanglim, Deputy Director, GDR
2.	2.	Khem Sopheamony, Officer, GDR
3.	3.	Huy Cahnnan, Officer, GDR

PMU ADB & WB MOWRAM

1.	4.	H.E Chann Sinath, Secretary of State and Director of PMU-ADB&WB MOWRAM
2.	5.	Im Soursdey, Deputy Director of DFWUC and IAIP Project Manager
3.	6.	Chhim Sophea, Irrigation Engineer
4.	7.	Ngorn Ly Leakina, Officer Administration Office of DoFWUC
5.	8.	Chev Dalis, Procurement Assistant and Officer of DoFWUC
6.	9.	Kim Vann, Finance Officer, DoFWUC
7.	10.	Thou Vannak, Consultant
8.	11.	Lang Sokkim, Vice Chief Officer
9.	12.	Pol Saren, Deputy Director of Department
10.	13.	Tan Naren, Chief of Office
11.	14.	Hem Visal, Vice Chief Officer
12.	15.	Prum Vanndy, Officer
13.	16.	Vann Vathanak, Officer
14.	17.	Eam Sophorn, Officer
15.	18.	Vann Munirath, Officer
16.	19.	Heng Sovannara, Director, TSA
17.	20.	Khvan Pheaktra, Officer, TSA
18.	21.	Tong Seng, Chief of Office, DHRW
19.	22.	Chhun Thai Sreng,PMU
20.	23.	Penh Socheat, National Environment, Consultant Team
21.	24.	Le Anh Tuan, International Social Specialist
22.	25.	Sreng Vanmly, Deputy of Office
23.	26.	Sok KHOM, Deputy Secretary General, CNMC
24.	27.	Roeun Sophanna, Procurement Team

MINISTRY OF ENVIRONMENT (MOE)

1.	28.	Thiv Sophearith, DDG/GDEP
2.	29.	Pech Moran, Deputy Director
3.	30.	Chea Puthea, Official

MINISTRY OF AGRICULTURE,FORESTRY AND FISHERIES (MAFF)

1.	31.	Koeut Kitlineath, Deputy Secretary General
2.	32.	Seng Tuy, Acting Director, DAEng

MINISTRY OF INDUSTRY, SCIENCE, TECHNOLOGY & INNOVATION (MISTI)

1.	33.	Kim Thunsamnang, Deputy Director General
2.	34.	Chhoeun Raksmey, Deputy Diector
3.	35.	Vong Sanin, Technical Officer & Project Management

MINISTRY OF RURAL DEVELOPMENT (MRD)

1. 36. Ong Ponnaka, Deputy Director General
2. 37. Soem Sopheara, Chief Office
3. 38. Se Vophorn, Chief Office

MINISTRY OF WOMEN AFFAIR (MOWA)

1. 39. Sav Kimsoeurn, Deputy Director General
2. 40. Meas ChinVut, Chief Office
3. 41. Phay Chan Makara, Vice Chief Office

MINISTRY OF LAND MANAGEMENT, URBAN PLANNING AND CONSTRUCTION (MLMUPC)

1. 42. CHHIM Sokun, Deputy Director General
2. 43. Meng Sotha, Director

MINISTRY OF PLANNING (MOP)

1. 44. Laing Bolin, Deputy Director

PDWRAM_Kandal

1. 45. Prak LAK, Director of PDoWRAM
2. 46. Hor Sophal, Deputy of PDoWRAM
3. 47. Heng Kearithy, Officer

PDWRAM_Kampong Chhnang

1. 48. H.E PECH KEYMONY, Deputy Governor
2. 49. Dauk BunThon, Director of PDoWRAM
3. 50. Gnin Hun, Director of PDAFF
4. 51. Seing Sokhan, Deputy Governor of Teuk Phos District
5. 52. Lun Pisey, Officer of of PDAFF
6. 53. Pen Sophea, Chief Commune of Svay Chuk
7. 54. Phan Sophalla, Commune Council of Krang Skea
8. 55. Keo Yan, Chief Commune of Krang Skea
9. 56. Sam San, Chief Commune of Tbeng Khpos
10. 57. Ouk Proeung, Chief Commune of Svay
11. 58. Meas Sokea, Commune Clerk
12. 59. Mak Sothearith, Commune Clerk
13. 60. Mong Vath, Chief Commune of Anchanh Rong
14. 61. Seam Senghour, Chief Commune of Prey Moul
15. 62. Khuy Khy, Chief Commune of Prasnoeb
16. 63. Prum Thorn, Chief Commune of Banteay Preal
17. 64. Moeng Visalsok, Chief Commune of Kdol Senchey
18. 65. Mey Sophally, Deputy Governor of Rolea Bier District
19. 66. Phal Sopheap, Deputy Governor of Baribour District
20. 67. Suon Sokha Rithy, Deputy Governor of Samakey Meanchey District

PDWRAM_Kampong Speu

1. 68. Nhanh Cheabhorng, Director of PDoWRAM

PDWRAM_Pursat

1. 69. H.E Khouy Ryda, Chief of Provincial Governor
2. 70. Lay Seth, Deputy Governor
3. 71. Tep Chamroeun, Director of Administration
4. 72. Kang Penghak, Chief Department of Public Work and Transport

5. 73. Hai Thoura, Chief of PDoAFF
6. 74. Keo Vey, Director of PDoWRAM
7. 75. Oum Sokna, Deputy Governor of Ba Kan District
8. 76. Nin Sinath, Deputy Director of PDoRD
9. 77. Sat Tongno, Chief Office
10. 78. Kit Phal, Deputy of PDoWRAM
11. 79. Dos Dara, Commune Council of Rom Lech
12. 80. Lav Sokha, Chief Office of PDoWRAM
13. 81. Mao Minea, Vice Office of PDoWRAM
14. 82. Meng Chhon, Chief Commune of Outa Poung
15. 83. Em Phovibol, Chief Office of PDoE
16. 84. Suong Saravuth, Deputy Director of Administration
17. 85. Nget Seyha, Official
18. 86. Sat Banve, Officer

AIIB

1. 87. Ron Liuingston, Team Leader, SECAP
2. 88. Y. Chan San, Consultant
3. 89. Bo Zhang, Officer
4. 90. Sheikh Naveed Ahmed, Officer
5. 91. Xiang Xu, Officer

CAISAR

1. 92. Anthony Green, Team Leader
2. 93. Srey Heang, Deputy Team Leader

IFAD

1. 94. Frew Behabtu, Country Director
2. 95. Susmita Bandyopadhyoy, Senior SECAP Specialist
3. 96. MENG Sakphouseth, Country Officer
4. 97. Suos Pinreak, Program Specialist

FAO

1. 98. ALESSANDRA GAGE, International Environment Officer

CS-01PMIC

1. 99. Willem J van Diest, Team Leader of PMIC
2. 100. Ung Kotaro, Deputy Team Leader

CS-02 NWRDMC

1. 101. Pen Sarith, Deputy Team Leader
2. 102. IAN Thomas, PPC

CS-03 INDIVIDUAL

1. 103. Yin Phalleap, Finance and Accounting Management Specialist

ANNEX 12: TOR BIODIVERSITY MANAGEMENT SPECIALIST

TERMS OF REFERENCE

International Biodiversity Specialist

Background

The Government of Cambodia (GoC) has applied for financing from the Asian Infrastructure Investment Bank (AIIB or the Bank) toward the cost of the Climate Adaptive Irrigation Supporting Agricultural Resilience (CAISAR) which will support the GoC's efforts to sustain food security and improve climate resilience during and after the COVID-19 crisis through restoration and enhancement of smart and climate-resilient irrigation systems and associated ecosystems, flood control management and disaster resilience measures in 3 irrigation schemes situated in four provinces, namely: Kampong Speu, Kampong Chhnang, Kandal, and Pursat. The development objective of the CAISAR project is to restore and enhance the adaptive capacity and resilience of rural populations and agronomic systems to cope with climate change, including and disaster risk brought on by extreme events (flooding and drought), to achieve increased food security, agro-economics, and the maintenance of the companion biodiversity and ecosystem services that support it.

The estimated budget of the CAISAR project will exceed US 240 Million with AIIB being the major lender but with substantial grant co-financing for Green Climate Fund (GCF) and IFAD. MOWRAM has received a project preparation grant from AIIB (PPSF) for project preparation. The project will be implemented through the following 3 components: 1) Improving farm-level climate resilience and water use efficiency, 2) Climate-proofing water infrastructure for increased resilience and 3) Institutional Strengthening. In 2022/23, under this PPSF grant, MOWRAM implemented a first project formulation and feasibility study (FIRM) to provide the basis for the GCF funding proposal. MOWRAM is now seeking additional TA to complement this FIRM reporting and support the formulation of the Full-Funding Proposal.

General

Based on an assessment of climate change risk analyses, the Biodiversity Consultant will identify and assess the manner in which climate change is likely to impact biodiversity in the project area; with particular attention to species that either support agriculture (e.g. wild fish, birds, pollinators, soil micro-biome,) or conflict with agriculture (e.g. crop pests, displaced wildlife, alien invasive species). The climate and project risks to Threatened species existing in the project area would also be assessed and potential mitigation responses identified. This analysis will be used to generate a number of practical and cost effective recommendations to be included in a Biodiversity Management Plan.

The Consultant will also work in collaboration with the multidisciplinary CAISAR team to help identify biodiversity risk to and opportunities associated with proposed project agricultural interventions/adaptive solutions and to provide timely recommendations for their more sustainable design, selection, implementation, monitoring and associated local, inclusive, capacity building.

The Consultant will also provide guidance related to consideration, selection and development of biodiversity offsets where unavoidable residual impacts associate with proposed project interventions, can be offset and in some cases applied to Kunming declaration objectives.

The analysis will prioritize biodiversity mitigation and management programs based on their relevance and cost-effectiveness, to address the risks and opportunities associated with climate change and project initiatives. The prioritization exercise would include consideration of opportunities to adaptively enhance and benefit from the cultivation of local heirloom genetic varieties, wild cultivars and potential enhanced propagation of more resilient native fish and potential other faunal species. To the extent possible, solutions that are adapted to the needs of the poor, women, youth, and indigenous groups should be highlighted.

To achieve the above objective with high quality deliverables, the international climate change biodiversity specialist is required to fulfil the following tasks and responsibilities:

1. *Describe the methodology, location time and costs for a series of strategic biodiversity surveys within the CAISAR project study area to validate and expand on the existing IBAT data set. The data collected will provide baseline data against which project intervention, project impact and climate driven change can be monitored. These data will provide essential information that can be used to apply adaptive management practices to ensure project initiatives optimize positive biodiversity and ecosystem service outcomes.*

   ***Deliverable**: Guidance document detailing methodology to be used for biodiversity surveys.*

2. *Identify species of flora and fauna, including threatened and invasive species in the project area, most likely to be impacted by Climate change, climate extremes and expansion of agriculture, including CAISAR projects, as well as species used by local communities and or, on which there are dependencies.*

   ***Deliverable**: **prioritized flora and fauna species list** with summary data on species habitat associations, conservation status, record of occurrence in the project area, probable key habitats, population trends, population drivers, and assessment of climate risk to species*)

3. *Prepare a high-level/landscape-level? Biodiversity Management Plan (BMP) addressing each of the 6 CAISAR sub-project areas. The BMP will highlight species and habitats of concern, and Identify potential approaches to deliver positive environmental externalities (e.g. air quality, soil, water quality and availability, ecosystem services, biodiversity) that can be incorporated into CAISAR initiatives. CAISAR BMP will include guidance for the assessment of residual biodiversity impacts, provision for adaptive management, monitoring requirements, and development of site-specific Biodiversity Action Plans.*

   Deliverable: CAISAR Landscape Level BMP

4. *Refine biodiversity sensitivity mapping based on available data and make this available to the CAISAR planning and design process.*

   ***Deliverable: refined biodiversity sensitivity map** for the CAISAR project area and each of the 6 sub-project areas)*

5. *Prepare a community biodiversity survey questionnaire to better understand biodiversity trends, perceived drivers, local use and community perspectives on biodiversity conservation and local importance in the CAISAR study area/area of influence. A detailed methodology, including questions, target communities, time and costs estimate would be prepared.*

   ***Deliverable: Local Biodiversity Knowledge Questionnaire and Survey Guidance document**.*

6. *Identify key biodiversity stakeholders to be engaged while identifying biodiversity conservation priorities and concerns, development of biodiversity management/action plans, and residual impact biodiversity offsets,*

   ***Deliverable: Biodiversity Stakeholders List and contact information**)*

7. *Identify potential priority biodiversity offset locations and site management requirements based on site analysis and consultation with government and community authorities.*

   ***Deliverable: List of priority biodiversity offset sites** proximate to each of the 6 CAISAR project areas that would be more suitable and relevant for the development of biodiversity offsets.*

8. *Integrate biodiversity initiatives into the overall CAISAR stakeholder engagement plan identifying the relevant stakeholder groups and the engagement process to be followed.*

   ***Deliverable: Specific reference to biodiversity in the CAISAR stakeholder Engagement Plan**.*

9. *Work collaboratively and cooperatively with the CAISAR multi-disciplinary team to ensure biodiversity conservation and enhancement is practically integrated into project planning, design elements and companion documentation.*

Deliverable: Reference to biodiversity considerations where appropriate in CAISAR assessments, design, execution, and reporting*.*

10. *Ensure the biodiversity component of the CAISAR project provides for local, inclusive, capacity building where practical and appropriate.*

    Deliverable: specific reference to opportunities for engagement of a broad cross section or local society in biodiversity-related initiatives *and documentation of participants in same.*

Key Deliverables

The main task of the International Climate Change Adaptation Biodiversity Specialist (CCABS) will be to provide discipline input to the Full Funding Proposal and the associated Annexes based on the guidance given in GCF's programming manual. With regard to biodiversity, the GEF programming manual highlights the following considerations:

1. "*The project/programme is expected to promote positive* ***environmental externalities*** *(e.g. air quality, soil*)". The CAISAR biodiversity specialist is expected to help ensure the project delivers enhanced ecosystems services to the intervention area.
2. "*Since project activities often target multiple areas and provide multiple benefits (e.g. co-benefits from improved agricultural productivity,* ***biodiversity conservation benefiting from improved ecosystems management****), additional financial contributions from other donors should be sought, where possible."*
3. "*The excessive development of land for agriculture worldwide has impacted the Earth's climate by reducing the carbon stored in intact forests, and has caused* ***biodiversity and ecosystem service losses***." The CAISAR biodiversity specialist is expected to strive to ensure the project results in a net improvement in local ecosystems services as a result of the project.
4. "*As may be required by specific environmental and social safeguards, the Environmental and Social Policy and the Indigenous Peoples Policy, additional stand-alone assessment and management plans may need to be prepared and disclosed. Examples of additional instruments include: a resettlement policy framework, resettlement action plan, Indigenous peoples planning framework, Indigenous peoples plan, and* ***biodiversity action plan*****"**

Consultant qualifications

Environmental specialist with a minimum Masters level degree in applied environmental science with expertise in biodiversity, biodiversity management and action plans, conservation biology and environmental planning. The consultant should have at least 10 years related experience, be comfortable working in a multi-disciplinary and cultural environment as well have working experience in South Asia. The consultant should have completed at least 5 previous biodiversity management plans and have recent experience with critical habitat assessment.

Duration: 60 working days from mid-June to mid-September 2023.

Location: Phnom Penh, Cambodia with field visits in lower Tonle Sap basin.

ANNEX 13: CAISAR CLIMATE CHANGE IMPACT RATIONAL

Project activity	Description and promotion strategy in the project	specific practice	adaptation or mitigation	Primary climate benefits	Climate rational (primary impact)	Climate rationale (secondary impact	Climate co primary is a prim
Component 2. Upgrading and climate-proofing water infrastructure for increased resilience							
Outcome 2.1. Modernization of irrigation scheme and ponds							
2.1.1.Technical analysis, field survey and preparing plan for system upgrading	This activity involves conducting a technical analysis and field survey of the existing irrigation system. The purpose is to identify areas that require upgrading or rehabilitation and to assess the feasibility of constructing new irrigation schemes and storage ponds. The promotion strategy will likely involve engaging farmers and stakeholders in the survey process to ensure a participatory approach. The findings from the analysis will be used to prepare a comprehensive plan for upgrading the irrigation system.	The specific practices under this sub-component include: o Rehabilitating and upgrading existing irrigation schemes. o Constructing new irrigation schemes and storage ponds where feasible and appropriate. o Deploying ecosystem-based solutions that better serve the environment. o Implementing energy-efficient measures to reduce greenhouse gas (GHG) emissions. o Utilizing high-efficiency irrigation systems like drip and sprinkler irrigation to minimize water losses. o Replacing current diesel pumps with single-point solar pumping systems. o Integrating nature-based solutions and Indigenous materials for constructing flood protection embankments.	The specific practices listed above include both adaptation and mitigation measures: o Adaptation: Upgrading and modernizing irrigation systems, establishing early warning systems, and flood-proofing infrastructure to cope with increasing flood and drought conditions. o Mitigation: Deploying energy-efficient irrigation technologies, replacing diesel pumps with solar pumps, and utilizing nature-based solutions to reduce GHG emissions.	The primary climate benefits of these practices are: o Improved resilience of the water delivery system, reducing damage to crops and infrastructure during extreme wet days and upstream flooding. o Enhanced climate adaptation through climate-proofing measures, allowing the irrigation system to cope with changing climate conditions.	The climate rationale or primary impact is to ensure a climate-resilient water supply for farmers. The project aims to reduce the negative climate impacts of droughts, dry spells, and flood during the monsoon season by upgrading the irrigation system and implementing climate-adaptive measures.	The secondary impact is the creation of green opportunities and additional benefits, such as: oIncreased water availability and storage capacity for irrigation. o Implementation of crop diversification and new income-generating activities like fish farming or duck breeding. oCreation of employment opportunities, especially for young people. o Time and labor savings, particularly for women, through the use of efficient irrigation technologies.	The Climate co-b o Mitigation: Red the use of en solar pumping, an o Adaptation: Im infrastructure, le coping with extrem
2.1.2.Implementation of infrastructure upgrading	Sub-Component 2.1.2 involves the actual implementation of infrastructure upgrading activities identified in the technical analysis and plan prepared in Sub-Component 2.1.1. The upgrading process may include rehabilitating existing irrigation systems, modernizing infrastructure, and constructing new irrigation schemes and storage ponds as required. The promotion strategy is likely to focus on engaging stakeholders, including farmers, in the implementation process to ensure their active participation and buy-in.	Specific practices under this sub-component include: o Executing the rehabilitation and modernization plans for irrigation systems and infrastructure. o Constructing new irrigation schemes and storage ponds according to the prepared plans. o Utilizing climate-proofing measures to enhance the resilience of the irrigation system against extreme weather events. o Implementing engineering techniques and nature-based solutions to ensure the long-term sustainability of the upgraded infrastructure.	The specific practices listed above are primarily adaptation measures aimed at: o Enhancing the resilience of the irrigation system to cope with increasing flood and drought conditions. o Reducing the damage and destruction of irrigation infrastructure during extreme weather events.	The primary climate benefits of Sub-Component 2.1.2 are: oImproved climate resilience of the irrigation system, ensuring consistent water delivery to farmers. oMinimized damage to crops and infrastructure during flood and drought events.	The climate rationale or primary impact is to ensure a climate-resilient water supply for farmers by implementing infrastructure upgrades and modernization to withstand the impacts of changing climatic conditions.	The secondary impact is the creation of green opportunities and additional benefits, including: oIncreased water availability and storage capacity for irrigation purposes. o Potential for crop diversification and income generation through alternative farming activities. o Employment opportunities, especially for young people involved in the implementation and maintenance of the upgraded infrastructure.	The Climate co-b oMitigation: Poten through the use o systems and ec techniques. oAdaptation: Impr water infrastructur events.
2.1.3.Preparing canal O&M plans including application of ICT and SCADA for operation. The implementation will follow a participatory approach involving farmers right from survey, design, prioritization, and construction implementation. This subcomponent will be financed by GCF, IFAD and Government. Moreover, these technologies will allow to save time and labour, especially for women, and offer opportunities to engage rural youth.	Sub-Component 2.1.3 involves the preparation of Operation and Maintenance (O&M) plans for the upgraded irrigation canals and systems. This includes integrating Information and Communication Technology (ICT) and Supervisory Control and Data Acquisition (SCADA) systems for efficient operation. The promotion strategy may involve raising awareness among stakeholders about the benefits of adopting ICT and SCADA technologies to optimize water management and ensure effective maintenance.	Specific practices under this sub-component include: oDeveloping comprehensive O&M plans for the upgraded irrigation canals. oIncorporating ICT and SCADA systems for real-time monitoring and control of water flow and distribution. oUtilizing modern technology to optimize water allocation and minimize water losses. oTraining personnel in the operation and maintenance of the new systems.	The specific practices listed above are primarily adaptation measures aimed at: oEnhancing the resilience of the irrigation system through efficient water management. oCoping with changing climate conditions and reducing vulnerability to extreme weather events.	The primary climate benefits of Sub-Component 2.1.3 are: oImproved water efficiency and reduced water losses through advanced monitoring and control systems. oIncreased climate resilience of the irrigation infrastructure through effective O&M practices.	The climate rationale or primary impact is to ensure the sustainable and climate-resilient operation of the irrigation system through the adoption of modern technologies and efficient water management practices.	The secondary impact includes: oEnhanced water resource management and allocation. oImproved agricultural productivity through optimized water distribution. oReduction of maintenance costs and increased system longevity.	The Climate co-b oMitigation: Redu energy consumpti management and technologies. oAdaptation: Impr irrigation infrastru coping with chang
Outcome 2.2: Flood-proofing and Drainage improvements							
2.2.1.Establish flood monitoring, information, and early warning systems.	Sub-Component 2.2.1 involves the establishment of flood monitoring, information, and early warning systems. This includes setting up mechanisms to monitor weather conditions, water levels, and other relevant data to detect potential floods. The promotion strategy may involve raising awareness among stakeholders about the importance of early warning systems, training local communities to respond to flood warnings, and ensuring effective dissemination of flood-related information.	Specific practices under this sub-component include: oInstalling flood monitoring equipment and sensors in vulnerable areas. oSetting up a system to collect and analyze meteorological and hydrological data. oDeveloping protocols for issuing flood warnings and disseminating information to affected communities.	The specific practices listed above are primarily adaptation measures aimed at: oEnhancing disaster prevention and protection of farmlands and assets by providing early warnings to vulnerable communities.	The primary climate benefits of Sub-Component 2.2.1 are: oImproved disaster preparedness and reduced vulnerability to flood events through early warning systems. oEnhanced ability to respond proactively to potential flood situations.	The climate rationale or primary impact is to strengthen flood preparedness and response capacities to cope with the increasing threat of floods under changing climate conditions.	The secondary impact includes: oReduction of damages to farmlands and assets due to improved flood protection measures. oEnhanced safety and well-being of vulnerable communities through timely flood warnings.	The Climate co-b oMitigation: Poten property damage which enable pro management. oAdaptation: Impr climate-related flo vulnerable comm
2.2.2.Strengthening and construction of flood control and drainage infrastructures. It will be implemented in an integrated manner with component 2.1 activities as required. The climate information and early warning activities will be strengthened as part of component 3 and are detailed in that section	Sub-Component 2.2.2 focuses on strengthening and constructing flood control and drainage infrastructures. The project will prioritize areas identified as flood-prone based on hydrological modeling and stakeholder consultation. The promotion strategy may involve community engagement and participation in the planning and implementation of flood control measures.	Specific practices under this sub-component include: oStrengthening existing drainage networks through excavation and widening. oConstructing new flood protection embankments using resilient indigenous materials and nature-based solutions. oInstalling sub-surface drainages in needy areas to improve water drainage.	The specific practices listed above are primarily adaptation measures aimed at: oEnhancing the resilience of the drainage networks and flood embankments to protect farmlands and assets from flood events.	The primary climate benefits of Sub-Component 2.2.2 are: oImproved flood protection and drainage infrastructure to minimize damages during flood events. oIncreased resilience of the irrigation system against intensifying flood threats under changing climate conditions.	The climate rationale or primary impact is to strengthen flood protection measures and improve drainage systems to cope with the increasing frequency and intensity of floods resulting from climate change.	The secondary impact includes: oEnhanced protection of agricultural lands and infrastructure from flood damages. oImproved water management and reduced flood-induced risks for farmers.	The Climate co-b oMitigation: Utiliz and resilient mate measures can co and reduce emiss methods. oAdaptation: Incr system and farml flood events.
Outcome 2.3.: Establishments and training of Farmers Water User Communities (FWUC)							
2.3.1.Formation of institutional strengthening of the FWUC	Sub-Component 2.3.1 focuses on forming and strengthening Farmers Water User Communities (FWUCs). FWUCs play a crucial role in the sustainable operation and maintenance of irrigation schemes. The promotion strategy may involve encouraging community participation, providing training in FWUC management, and promoting inclusivity in decision-making processes.	Specific practices under this sub-component include: oEstablishing new FWUCs and strengthening existing ones. oImproving capacities in O&M activities, water use efficiency, and green technology adoption. oEnhancing the arrangement of water rights and water allocation to promote equitable and efficient water use.	The specific practices listed above are primarily adaptation measures aimed at: oStrengthening institutional capacity to effectively manage and operate the irrigation system. oPromoting sustainable water use practices and climate adaptation strategies among farmers.	The primary climate benefits of Sub-Component 2.3.1 are: oEnhanced sustainability and long-term operation of the climate-smart and climate-proof irrigation systems. oImproved capacity of FWUCs to cope with climate-related challenges and implement climate adaptation strategies.	The climate rationale or primary impact is to ensure the sustainable operation and maintenance of the irrigation system under changing climate conditions through the establishment and strengthening of FWUCs.	The secondary impact includes: oImproved water use efficiency and equitable water allocation. oIncreased capacity of farmers to adopt climate-smart practices and technologies.	The Climate co-b oMitigation: Adop sustainable practi reduced emission oAdaptation: Incr system through ef adaptation strateg
2.3.2 Build technical capacities of FWCU for canal O&M	Sub-Component 2.3.2 focuses on building the technical capacities of Farmers Water User Communities (FWUCs) in canal operation and maintenance (O&M). The project will provide training and support to FWUC members to effectively manage and operate the irrigation canals. The promotion strategy may involve conducting training sessions, workshops, and capacity-building programs for FWUC members to enhance their technical skills.	Specific practices under this sub-component include: oConducting technical training for FWUC members on canal O&M. oEquipping FWUCs with the necessary knowledge and skills for efficient water distribution and maintenance. oImplementing best practices in water resource management.	The specific practices listed above are primarily adaptation measures aimed at: oStrengthening the capacity of FWUCs to cope with changing climate conditions and efficiently manage water resources.	The primary climate benefits of Sub-Component 2.3.2 are: oEnhanced climate resilience of the irrigation system through improved canal operation and maintenance. oIncreased efficiency in water distribution, reducing water losses during irrigation.	The climate rationale or primary impact is to empower FWUCs with the technical skills needed to effectively manage the irrigation system under changing climate conditions.	The secondary impact includes: oImproved water use efficiency and reduced water wastage. oEnhanced agricultural productivity through efficient water distribution.	The Climate co-b oMitigation: Effici reduced water los contributing to low oAdaptation: Incr irrigation system practices.
2.3.3prepare long term financing plan for WUAS: This will require an identification of the capacity needs, membership, functionality of the FWUCs in the area . This will be followed by assisting them in developing a business model for the operation and maintenance of each irrigation scheme on a self-sustaining basis in partnership with the private sector. This will entail the development of an O&M plan for the infrastructure investments, assessment of the willingness and ability of the users to pay for the services and a regulatory framework that gives the WUAs the authority to collect the fee and assess the basis on which water fee will be paid as irrigation fees can be based on the size of the land being irrigated or the volume of water used. These elements will be further reviewed during the preparation of the FFP.	Sub-Component 2.3.3 involves preparing a long-term financing plan for Water User Associations (WUAs). This plan will outline the financial resources required for the sustainable operation and maintenance of the irrigation system. The promotion strategy may involve working with relevant stakeholders, including private sector partners, to develop a financially viable plan.	Specific practices under this sub-component include: oIdentifying the financial needs of WUAs for irrigation system operation and maintenance. oAssessing the willingness and ability of users to pay for irrigation service. oDeveloping a regulatory framework for water fee collection.	The specific practices listed above are primarily adaptation measures aimed at: oEnsuring the long-term sustainability of the irrigation system by securing adequate financial resources.	The primary climate benefits of Sub-Component 2.3.3 are: oIncreased financial resilience of WUAs to cope with climate-related challenges in the operation and maintenance of the irrigation system. oEnhanced capacity to sustainably manage the irrigation infrastructure under changing climate conditions.	The climate rationale or primary impact is to develop a long-term financing plan that enables WUAs to effectively manage and maintain the irrigation system in the face of climate-related risks.	The secondary impact includes: oImproved financial sustainability of the irrigation system. oEnhanced capacity of WUAs to invest in climate-resilient infrastructure and technologies.	The Climate co-b oMitigation: Finan more likely to in friendly irrigation t emissions. oAdaptation: Incr climate impacts th financing.

Definitions

Disadvantaged individuals/groups

Refers to individuals or groups who, due to certain own circumstances such as their age, gender, disabilities, health, economic and ethnic status, and so forth, are more likely affected adversely by the project impacts and/or more limited in their ability to take advantage of project benefits. Disadvantaged individuals/groups are more likely excluded from, or unable to participate fully in the mainstream consultation process. Thus, they may require specific assistance to stay engaged during project planning and implementation. In this project, disadvantaged individuals/ groups are defined as those who have the following characteristics: i) from an ethnic group, (ii) landless/ limited productive land, (iii) female headed household with dependents, (iv) frequent lack of male labor at home (e.g. migrant workers); (v) jobless, or limited economic opportunities; (vi) family member(s) with chronic illness, or disabilities; (vii) elderlies who live on their own; (viii) youth, particularly very young couple with children (early marriage), (ix) live in an especially difficult circumstance, and (x) don't meet above criteria but are concurred by local community as vulnerable to poverty and need project's support to reduce their vulnerability. Disadvantaged individuals are usually from a poor, or a near poor household.

Environmental and social risk

Environmental (including climate change and natural disasters) and social risks are determined by a combination of project design and operational characteristics, together with exogenous factors, which: (i) may adversely affect the ability of a project to achieve and sustain its development objective(s); and (ii) define the nature, scale and significance of direct and indirect environmental and social impacts.

Free, Prior, and Informed Consultation (FPICon)

According to ESS 3 of AIIB's ESF, FPICon is established as follows:

- The scope of FPICon applies to project design, implementation arrangements and expected outcomes related to risks to, and impacts on, the affected Indigenous Peoples;
- FPICon builds on the process of meaningful consultation and requires good faith negotiation between the Client and the affected Indigenous Peoples;
- The Client documents: (a) the details of the process by which the support of the affected local indigenous communities will be determined, in a written consultation process agreement with these communities; and (b) the details of the Project-related matters on which their broad community support has been obtained, in a consultation statement, which includes all agreements reached as well as dissenting views; and
- FPICon does not require unanimity and may be achieved even when individuals or groups within or among these affected Indigenous Peoples explicitly disagree with support for the Project.

Inclusion

Inclusion means empowering all people to participate in, and benefit from, the development process. Inclusion encompasses policies to promote equality and nondiscrimination by improving the access of all people, including the poor and disadvantaged, to services and benefits such as education, health, social protection, infrastructure, affordable energy, employment, financial services and productive assets. It also embraces action to remove barriers against those who are often excluded from the development process, such as women, children, persons with disabilities, youth and minorities, and to ensure that the voice of all can be heard.

Indigenous Peoples

According to the AIIB's Environment and Social Framework, the term "Indigenous Peoples" is used in a generic sense to refer exclusively to a distinct social and cultural group possessing all the following characteristics – in varying degrees:

- Self-identification as members of a distinct indigenous social and cultural group and recognition of this identity by others; and
- Collective attachment[1] to geographically distinct habitats, ancestral territories, or areas of seasonal use or occupation, as well as to the natural resources in these areas; and
- Customary cultural, economic, social, or political institutions that are distinct or separate from those of the mainstream society or culture, and
- A distinct language or dialect, often different from the official language or languages of the country or region in which they reside.

According to IFAD's SECAP, IPs are defined as follows:

- Priority in time, with respect to occupation and use of a specific territory;
- The voluntary perpetuation of cultural distinctiveness, which may include aspects of language, social organization, religion and spiritual values, modes of production, laws and institutions;
- Self-identification, as well as recognition by other groups, or by state authorities, as a distinct collectivity; and
- An experience of subjugation, marginalization, dispossession, exclusion or discrimination.

According to GCF's Indigenous People Policy, IPs are defined as follows:

- Self-identification as members of a distinct indigenous social and cultural group and recognition of this identity by others;
- Collective attachment to geographically distinct habitats, ancestral territories, or areas of seasonal use or occupation as well as to the natural resources in these areas;
- Customary cultural, economic, social, or political systems that are distinct or separate from those of the mainstream society or culture; and
- A distinct language or dialect, often different from the official language or languages of the country or region in which they reside. This includes a language or dialect that has existed but does not exist now due to impacts that have made it difficult for a community or group to maintain a distinct language or dialect.

Information disclosure

[1] Collective attachment means that for generations there has been a physical presence in and economic ties to land and territories traditionally owned, or customarily used or occupied, by the group concerned, including areas that hold special significance for it, such as sacred sites.

The process of disseminating project information to stakeholders to allow them to understand the risks and impacts of the project, and potential opportunities. Information disclosure should be in line with the project's Stakeholder Engagement Plan which is in line with the requirements of the ESF of AIIB, SECAP of IFAD, and Information Disclosure Policy of GEF. It is required that the disclosure of project information include: (a) purpose, nature and scale of the project; (b) duration of proposed project activities; (c) environmental and social risks and potential impacts of the project on local communities, particularly the vulnerable/disadvantaged groups and proposed mitigation measures; (d) proposed stakeholder engagement process highlighting approach that will be taken to promote meaningful participation of project affected persons; (e) time and venue of proposed public consultation meetings, and the process by which meetings will be notified, meeting results summarized, and reported back to project stakeholders; and (f) process and means by which grievances can be received and addressed timely.

Meaningful consultation

Two-way process that (a) begins early in project planning process to gather initial views on project proposal and inform project design; (b) encourages stakeholder feedback, particularly as a way of informing project design and engagement by stakeholders in the identification and mitigation of environmental and social risks and impacts; (c) continues on an ongoing basis, as risks and impacts arise; (d) is based on prior disclosure and dissemination of relevant, transparent, objective, meaningful and easily accessible information in a timeframe that enables meaningful consultation with project stakeholders in a format culturally appropriate, and in relevant local language(s) and is understandable to stakeholders; (e) considers and responds to feedback; (f) supports active and inclusive engagement with project-affected parties; (g) is free of external manipulation, interference, coercion, discrimination, and intimidation; and (h) is documented and disclosed by the Government.

Vulnerable individuals /groups

Refers to individuals/groups who, by virtue of factors beyond their control, are: (a) more likely to be adversely affected by the Project's environmental and social impacts; (b) more likely than others to be limited in their ability to claim or take advantage of Project benefits. Such individuals or groups are also more likely to be excluded from or unable to participate fully in the mainstream consultation process and may require specific measures or assistance (or both) to do so.

Based on the results of the vulnerability assessment conducted for the project, vulnerable individuals/groups need differentiated mitigation measures to cope with project's adverse impacts (e.g. loss of productive land/ income source), take advantage of project's intended benefits, and fully participate in meaningful consultation process during project design, implementation, and operations. Therefore, under this project, the following groups are considered vulnerable under this project: (i) poor[2] and near-poor[3], (ii) female headed households with dependents; (iii) households from Indigenous Peoples or Ethnic Minority group that meet the definitions of Indigenous Peoples of AIIB, IFAD, and GCF, (iv) households headed by an elderly, or a disabled person with no regular income, (v) household having at least a family member with chronic illness that needs regular medical treatment.

[2] The poor are those who a) live below the poverty line (which is KHR 10,951 per person per day as defined by the World Bank for Cambodia), or b) have IDPoor 1 (very poor) or IDPoor 2 (poor).

[3] The near-poor are those whose daily per capita consumption lies between poverty line and 1.25 times the poverty line – as proposed by the World Bank. Near-poor households also have not only lower income per capita but also less diversified incomes than non-poor households (cf. WB 2022, Cambodia Poverty Assessment – Toward A More Inclusive and Resilient Cambodia).

Executive Summary

This Executive Summary summarizes the main points in the project's Indigenous Peoples Planning Framework (IPPF) which was prepared by the Ministry of Water Resources and Meteorology. This IPPF will be applied to all activities that will be carried out under the CAISAR. This IPPF is a living document which may be updated as required during project implementation. If updated, the latest IPPF version will be disclosed through the same channels.

Project Development Objective and Project Components

The project objective is to increase climate adaptation, mitigate the negative impact of extreme climate events, and improve livelihoods of smallholder farmers and vulnerable rural communities in four provinces: Pursat , Kampong Chhnang, Kampong Speu, and Kandal.

The project will be implemented through various activities organized through the following three components:

- Component 1. Improving farm-level climate adaptation, resilience, and water use efficiency
- Component 2. Upgrading and climate-proofing water infrastructure for increased resilience
- Component 3. Institutional strengthening

Purpose of the Indigenous Peoples Planning Framework

This framework is a guide to screening, assessment, and planning, including an arrangement of the outline of culturally appropriate and meaningful consultations with Indigenous peoples, conducting social impact assessments (SIA) and preparation of the IPP that pertains to any specific subproject. The purpose of this Indigenous Peoples Planning Framework (IPPF) is to set out the requirements of the AIIB's ESS3 on Indigenous Peoples and the IFAD's SECAP Standard 4, and the RGC's policy on development of Indigenous Peoples. Based on the gaps between the AIIB's ESS3, IFAD's SECAP Standard 4, and RGC's policies, measures are proposed to close the gaps through implementation arrangements, procedures, design criteria, etc. to be applied to all subprojects and project components that were confirmed during project preparation and will be identified during project implementation.

Gaps between National Policies & Donor's Environmental and Social Policies

Despite the fact that Cambodia has a policy that recognizes the rights of IPs to culture, education, justice, health, environment, land, agriculture, water resources and infrastructure among others, there are no decrees, sub-decrees or procedures for specific safeguards to protect the interest of IPs, other than those related to land or forestry. The Cambodia Land Law does recognize the right of indigenous communities in Cambodia to own immovable property - their land - with collective title. However, in practice, the procedure to register collective title can be very time consuming and only a few indigenous communities have received collective title since the Land Law was enacted in 2001. Similarly, the Forest Law also guarantees and recognizes the right of IPs to continue the use and access to certain forest areas that they traditionally use and practice.

Overall, there is an acceptable level of consistency between the government system, the AIIB'ESS and the IFAD standards on IPs. The self-identification process of indigenous communities defined in the national

policy is broadly consistent with international good practice. The national framework does not exclude communities who have become more mainstream, and indigenous communities may apply for legal status regardless of whether or not they still use their own language or practice traditional agriculture.

However, while there are some complementary links between Cambodian laws and regulations related to IPs and the ESS 3, there are no sufficiently detailed regulations or operating procedures to facilitate full implementation of the IPPs. Therefore, this IPPF has been prepared on the basis of the ESS 3 by considering relevant Cambodian policies and regulations. The IPPF also outlines the Grievance Redress Mechanism (GRM), based on the GRM that is used for the Project, which will need to be further refined in consultation with IPs, if any are found to be residing at any subproject sites.

Project's Environmental and Social Risk and Impacts

The project will bring about an overall positive impact to local farmers. In subproject where IP peoples have farmland in the command area, these IPs will benefit from improved irrigation, water supply, government's agricultural extension services, and services from local farmers' cooperatives. As IPs participate in project activities, particularly agricultural extension services, they can grow more crops, participate in value chain, increase income, and eventually improve their livelihoods. Reliable water access and promising farming opportunities thanks to improved irrigation and extension services also keep the poor, including the poor IPs, from migrating to other areas in search for income generation opportunities. Adverse impacts on IPs are foreseen. However, these impacts are mostly local, small-scaled, such as minor land acquisition in some subproject to allow construction of irrigation canal. Land impacts would be very small at household level (e.g. loss of strip of land) which would not affect the livelihoods of the IP remarkably.

During subproject construction and operation, there are a number of environmental and social risks that may apply to local people, including IP peoples who may happen to be present in a subproject area. Environmental and social risks and impacts that have been identified during project preparation have been discussed in consultation meetings with a) IP peoples who are present in subproject area, and b) other project stakeholders at commune, district, provincial and central level. These consultations aim to ensure potentially affected people, and relevant project stakeholders, are aware of such risks and stay engaged during subproject preparation and implementation for risk prevention and mitigation (Please see full list of social and environmental risks in the project's ESCMF (Section E&S Risks and Impacts) that may apply to any ethnic minorities who are present in subproject area. See also SEP, particularly section (Proposed Strategy for Consultation with Vulnerable/Disadvantaged Groups) for guidance on conducting consultation with IPs when IPs are present in the subproject area.

Mitigation Measures

Although above risks and impacts will be validated, and assessed at further length when subproject locations become known, IP(s) in a subproject's area may be affected disproportionately compared to the mainstream group. The distinctive cultural and socioeconomic characteristics of the IPs, including their existing livelihoods, etc. may expose IPs to further risks and impacts, increase their vulnerability and compromise their ability to respond to such risks and impacts – if a holistic approach is not in place. Effective communication, such as IEC, and active participation of involved IPs, are among important factors that contribute to effective engagement of IPs for meaningful consultation during subproject preparation and participatory monitoring during subproject implementation. The coordination of project stakeholders, including PMU, Contractors, local authorities, local agencies, local service providers, and

most notably the active and full participation of IPs, collectively contribute to minimizing identified risks and potential impacts at identified subprojects.

Detailed mitigation measures for the above risks and potential impacts are proposed in the project's ESCMF. These mitigation measures are specific for design stage, pre-construction stage, construction stage, and operation stage,

Purpose of Engaging IP during project preparation and implementation

The AIIB's ESF defines stakeholder engagement as a process of identifying relevant stakeholders, conducting stakeholder analysis, and organizing a series of consultations to meet with project stakeholders for collecting stakeholders' feedback and concerns on project's risks and impacts, as well as stakeholders' development needs in relation to project purposes and activities. This aims to ensure the project's adverse impacts on IPs can be avoided, or minimized and mitigated if avoidance is not possible. For this project, it is important that IPs need to be consulted on their development needs (in relation to project purposes) to ensure they can receive socioeconomic benefits that are appropriate to them culturally.

Information Disclosure

Prior to conducting consultations, MoWRAM will notify the concerned IPs of the consultation plan during preparation. MoWRAM will provide affected IPs with initial subproject information in the form of booklet in both Khmer and local language (if applicable). This initial information should be provided to IP at least two weeks prior to consultation. If the concerned IPs do not have a written language, the IP will be provided the information in Khmer and are explained verbally in the local language of the concerned IP to ensure the IP are fully informed of the consultation purpose and initial subproject information.

> For public consultation, the draft IPPF (in English) and its Executive Summary (in Khmer) was (should be?) disclosed on MoWRAM's website on XXX (https://www.). The Executive Summary (in Khmer) was also disclosed in hard copy at MoWRAM's public library in Phnom Penh, and in the offices of Provincial Departments of Water Resources and Meteorology in all four project provinces. Once finalized, the IPPF will be re-disclosed again through the above channels prior to AIIB's and IFAD's project appraisal. The draft and final IPPF will be disclosed in English on the AIIB's and IFAD's website.

During project implementation, all draft IPPs, once completed by MoWRAM and submitted to the Bank for review, shall be disclosed to affected IP communities in Khmer language. The summary of the IPP (in the form of an Information Booklet) will be translated into IP's language if the consulted IPs have their own written language. Public meetings will be hold with the affected IP(s) to explain the contents of the relevant IPP in their mother language to ensure affected IPs understand what and how the activities under the IPP will be carried out, including E&S risks and impacts of subproject activities, and how the IPs will be engaged by MoWRAM in consultation meetings during subproject preparation, and in monitoring during subproject implementation to minimize identified E&S risks and impacts. IPPs – prepared for relevant subprojects, will be disclosed locally in Khmer and local IP language (if applicable), as well as in Khmer and English language on MoWRAM's website. The English version of the IPPs will be disclosed on the AIIB's and IFAD's website.

Grievance Redress Procedures

The following section outlines complaint handling procedures that are designed to assist affected Indigenous Peoples (IPs) in making complaints regarding the project. These procedures are designed to address potential impacts and risks during project preparation and cover the following key areas: a) land

acquisition, where individual IP land is acquired either permanently or temporarily during construction, b) Gender based violence, where IPs are victims, survivors, witnesses, or otherwise affected by SEA/SH actions related to the project, and c) general complaints and concerns related to project design, adverse impacts on IPs such as dust, noise, vibration, and any other aspects that IPs attribute to project activities.

Implementation Arrangements

The MoWRAM will be responsible for implementing this IPPF. The Project Director (PD) at MoWRAM will be responsible for providing overall guidance, policy advice, conducting internal coordination, discussing and resolving issues at project level − in association with relevant government agencies where needed. The Project Manager (PM) at MoWRAM will provide day-to-day support to the PD and will be responsible for ensuring that the IPPF will be followed. The PM will oversee the work of the ESOs and ensure proper screening of IP groups will be carried out for each subproject, and steps for IP screening and social assessment described in this IPPF are followed. Within MoWRAM, the ESOs will be responsible for carrying out day-to-day activities set forth in this IPPF. An IP specialist will be appointed within MoWRAM's PMU (in addition to a Resettlement and Environmental Specialist) to provide guidance to Provincial PDWRAM in conducting consultation with affected IP in respective subprojects.

The MoWRAM needs to inform the AIIB and IFAD of the IP screening results and steps that MoWRAM will take in case IPs are present in the subproject area. When IPs are found in the subproject, MoWRAM will engage IP consultants to work closely with PMU's IP Specialist and PDWRAM to conduct Social Assessment and prepare IPPs. PMU's IP specialist and IP consultants will visit the subproject sites and work closely with PDWRAM, local authorities, relevant agencies, NGOs, particularly local IP leaders and IP members, including vulnerable groups of affected IP communities, to conduct Social Assessment.

Capacity Building

Since the MOWRAM is new to AIIB's ESF and IFAD's SECAP, and have not been familiar with requirements of AIIB's ESS3 and IFAD's SECAP Standard 4, they may not be able to conduct meaningful consultation from initial years of project implementation. In the first year, these specialists will be trained by the AIIB task team on ESF with a particular focus ESSs and IFAD's SECAP with a particular focus Standard that apply to this project to enable newly appointed ES specialists at the MOWRAM to provide appropriate support. Where needed, IP consultant will be engaged to provide additional support to PMUs' specialist, particularly in the initial years of project implementation. Since independent ES monitoring consultant will be engaged by PMU at MoWRAM, feedback from this consultant, alongside internal monitoring results, will provide regular feedback to PMU on how IPPF/IPP is carried out so that adjustment/improvement could be made appropriately and timely.

Monitoring & Evaluation

The application of this IPPF and preparation and implementation of subproject IPPs will be monitored internally by the MoWRAM. Adverse impact on IPs (if any) due to land acquisition will be monitored by GDR and MoWRAM as part of implementation arrangement set forth in Section 9.1.2 of project's Resettlement Planning Framework (RPF).

Within MoWRAM, the ESOs or the Detailed Design Implementation and Supervision (DDIS) will be responsible for conducting quarterly monitoring activities of the activities set for under all subproject IPPs. Monitoring of IPPF/IPP implementation will focus on assessing the compliance of IPP implementation against the followings:

- IP screening process and results;

- Quality of Social Assessment and adequacy of IPPs prepared based on SAs;
- Information disclosure;
- Functioning of project's GRM (as customized to the respective IP groups present in each subproject area to ensure the GRM is culturally appropriate to the local IPs);
- Development activities carried under IPPs (based on development needs of IPs);
- Results and impacts of IPPs (in ensuring the affected IP receive socioeconomic benefits of the project that is culturally appropriate, gender and intergenerational inclusive, and contributing to achieving the objective of the AIIB's ESS3 and IFAD's SECAP Standard 4).

In addition to internal monitoring, the project will encourage IPs in subproject areas to participate in monitoring and evaluation of IPP implementation process and implementation outcome which affects them. During SA exercise, feedback and suggestions from IPs will be solicited as to how they wish to participate in monitoring and evaluation of IPP activities.

MOWRAM will provide a quarterly IPP implementation report to the AIIB and IFAD. These results will be incorporated into MoWRAM's consolidated Environmental and Social Compliance Report (ESCR) (See Annex 5 for Indicative Indicators for Internal Monitoring of IPP implementation).

Reporting

MoWRAM's ESOs will ensure feedback from affected and interested IP, as well as grievances submitted by affected IPs, are resolved timely and effectively, and that resolution results are reported timely back to the aggrieved IPs. The method of reporting back depends on the stakeholders, and as follows:

- For stakeholders at national level, email and/or official letter will be used to report back to stakeholders following consultations and/or workshops. The content of the report will summarize what comments, suggestions, concerns that have been received, by whom and when, and how such comments, suggestions, concerns were considered.
- For stakeholders at local level, follow-up meetings/consultations will be conducted to informed stakeholders know on how comments, suggestions, concerned were considered.
- For Indigenous Peoples, project's responses to their comments, suggestions, concerns are reported back to them in subsequent face-to-face consultations – in line with the project's SEP and the IPPF, including how the project had considered and addressed their concerns through concrete actions to be carried out during subproject implementation process and through IPP implementation.

Grievances of all project IP will be reported back to them through project's GRM channels within the timeframes specified for each step of the above GRM procedure.

Costs

Indicative costs for IPPF implementation are estimated during project preparation for the purpose of budget planning. The actual costs of IPPF implementation depend on the number of IPPs, including scope and activities to be carried out under each IPP, during project implementation. The estimated cost below may be updated once the list of subprojects is finalized. Costs incurred as compensation payment for land acquisition and associated impacts are covered by counterpart funds and are estimated in the project' Resettlement Planning Framework (RPF).

Budget

The budget for implementing IPPF/IPPs will be allocated from counterpart funding. implementation, based on infrastructure construction subprojects that will be identified/confirmed during project implementation, this budget plan will be updated to ensure funding is sufficiently planned annually to ensure timely and effective activities in Figure below.

1. INTRODUCTION

1.1 Project Background

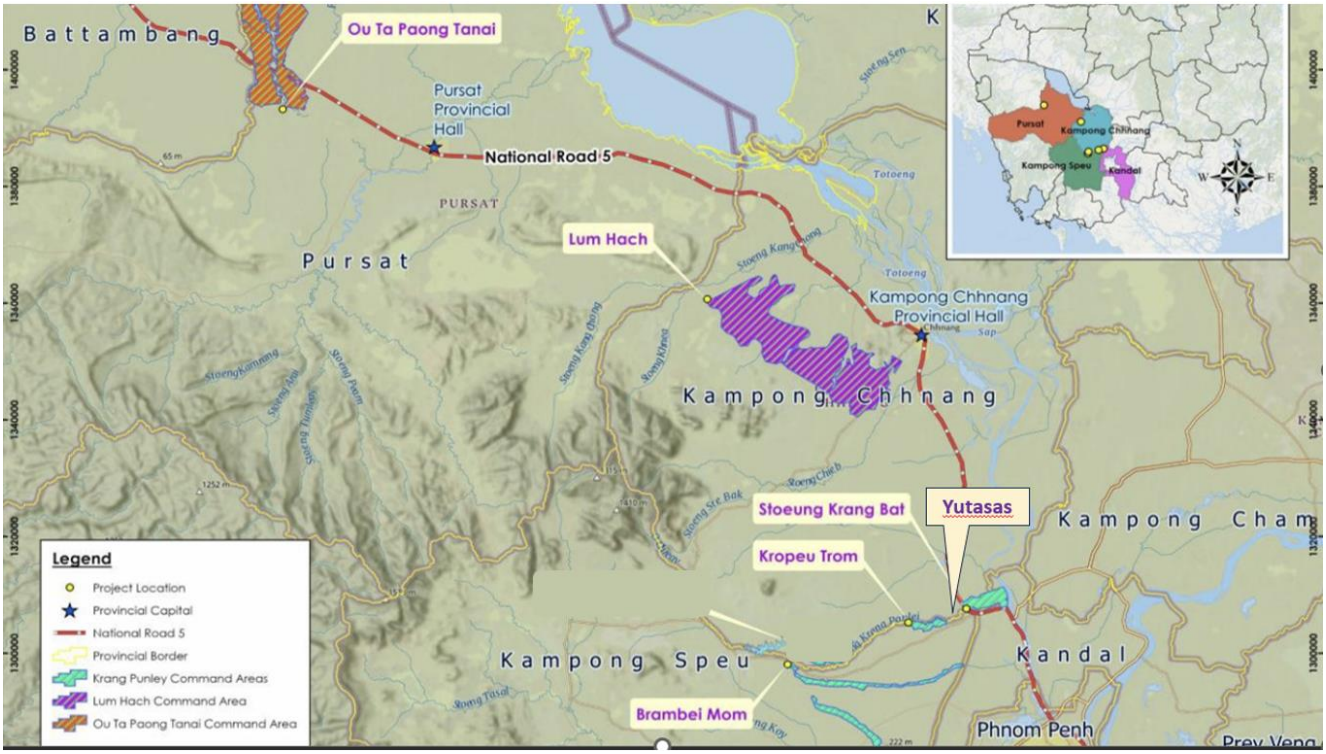
1.1.1 Project Context

Cambodia's irrigated agriculture faces increasing challenges from adverse impacts of climate change, especially the changes in rainfall patterns, duration and timing of the rainy season, and climate induced water disasters such as floods and droughts. Climate Resilient (CR) and low emission practices and investments in agriculture and water management are therefore crucial to protect and enhance Cambodia's agricultural production and productivity which will in turn contribute to poverty reduction and increased food security.

Addressing the complex impacts of climate change on rain fed and irrigated agriculture requires action at both farm and irrigation scheme, including enabling environment at regional and national level. Farm level actions will help communities adapt to climate change while also saving water and decreasing GHG emissions from BAU of agriculture, water use and management. This will help farmers to diversify their farming while also addressing changing rainfall patterns and increasing drought conditions throughout the growing season. Actions at system level will help achieve a modernized and climate proofed irrigation infrastructure delivering irrigation services to farmers in line with the requirements at the farm level. It will also protect the natural capital stocks, especially the land and water against the increasing threats of flood. In addition, replacement of diesel pumps with solar pumps and combination of both grey and green solutions for irrigation modernization and flood proofing works will help reduce GHG emissions.

The integrated actions combining both farm and system levels has a transformative potential to reduce vulnerability of water and agriculture systems to climate change impacts while also reducing GHG emissions and enhancing the livelihood of rural populations who primarily depend on agriculture.

The theory of change demonstrates how the project shifts the BAU from poorly constructed and maintained irrigation systems to a smart, climate resilient water management system with climate proofed irrigation and flood control infrastructures for smallholder farmers. The project's outcomes and outputs are in-line with GCF's adaptation and mitigation goals, objectives, and long-term sustainability principles.



The paradigm shifting aspects of the project will include the data driven climate-proofing of irrigation infrastructure and focus on last-mile engagement of vulnerable communities. The TOC shows that IF climate resiliency of irrigated agriculture is enhanced then the agricultural outputs and income of small-scale farmers will increase, as well as the climate resilience of vulnerable households and in particular to women will increase because water and food systems are less vulnerable to increasing temperatures, changing rainfall patterns and the extreme water events, AND low-emission irrigation and sustainable agriculture adaptation practices will contribute to NDC mitigation targets.

The project's goal stated above shall be achieved through the generation of the following three outcomes: (1) Improved resiliency of small holder farmers (2) Resilient water control infrastructure and water service delivery with less crop and asset damage and (3) Reduced GHG emission. These three outcomes are derived from interventions at farm and irrigation system level together with institutional strengthening of relevant stakeholders (MoWRAM, NCDD, MoF, and MAAF) and will contribute towards an irrigated agricultural system that is climate resilient and productive ultimately reducing the climatic vulnerability of poor farmers in the project areas.

1.1.2 Project Development Objective and Project Components

The project objective is to increase climate adaptation, mitigate the negative impact of extreme climate events, and improve livelihoods of smallholder farmers and vulnerable rural communities in four provinces of Cambodia in Kampong Speu, Kampong Chhnang, Kandal, and Pursat province (see map below).

Figure 1 – Map showing six irrigation schemes located in four provinces

The project will be implemented through various activities organized through the following three components:

- Component 1. Improving farm-level climate adaptation, resilience, and water use efficiency
- Component 2. Upgrading and climate-proofing water infrastructure for increased resilience
- Component 3. Institutional strengthening

1.2 Objectives and Principles of the Indigenous Peoples Planning Framework

1.2.1 Objectives

This Indigenous Peoples Planning Framework (IPPF) is prepared in case the project is affect any Indigenous Peoples. This framework guides screening, assessment, and planning, including an arrangement of the outline of culturally appropriate and meaningful consultations with Indigenous peoples, conducting social impact assessments (SIA), and preparing the IPP for any specific subproject. This IPPF is prepared in accordance with the requirements of the AIIB's ESS3 on Indigenous Peoples and the IFAD's SECAP Standard 4, and the RGC's policy on development of Indigenous Peoples. Based on the gaps between the AIIB's ESS3, IFAD's SECAP Standard 4, and RGC's policies, measures are proposed to close the gaps through implementation arrangements, procedures, design criteria, etc. to be applied to all subprojects and project components that were confirmed during project preparation and will be identified during project implementation.

The objectives of this IPPF are:

- Ensure the Project is designed and implemented in a way that fosters full respect for Indigenous Peoples' identity, dignity, human rights, economies and cultures, as defined by the Indigenous Peoples

themselves, so that they a) Receive culturally appropriate social and economic benefits; b) Do not suffer adverse impacts as a result of Projects; and c) Can participate actively in Projects that affect them.

In particular, IPPF aims to subproject's activities:

- Avoid adverse impacts of the project on IP communities. When avoidance is not possible, minimize, mitigate and/or compensate for such impacts.
- Promote sustainable development benefits and opportunities for IP communities in a manner that is accessible, culturally appropriate and inclusive.
- Improve subproject design and promote local support by establishing and maintaining an ongoing relationship based on meaningful consultation with the IP communities affected by CAISAR throughout project cycle.
- Recognize, respect and preserve the culture, knowledge, and practices of IP communities, and provide IPs with an opportunity to adapt to changing conditions in a manner and in a timeframe acceptable to them.

1.2.2 Principles

To achieve the above mentioned objectives, the following principles will be observed – at subproject level:

a) Early screening to determine IP presence and/or collective attachment to the Project area as well as potential impacts on IPs.

b) Conduct of culturally appropriate, gender-sensitive and technically backed-up social impact assessment where full consideration to IP−generated options as regards benefits and mitigation measures are considered and translated into the IP plans.

c) Undertake meaningful consultations with affected IP communities and concerned organizations to solicit their participation across the subproject cycle to avoid adverse impacts or in cases when avoidance is not possible, to minimize, mitigate, or compensate for such effects by establishing culturally appropriate and gender inclusivecapacity development modalities and grievance mechanisms.

d) Ensure free, prior and informed consent of affected IP communities to project activities that may introduce commercial development of cultural resources and indigenous knowledge, physical displacement from traditional or customary land, and commercialdevelopment of natural resources within customary lands that impact on livelihoods or cultural uses that define the identity and community of IPs. Consent refers to a collective expression by affected IP communities, through individuals and/or their recognized representatives, of broad community support for Project/project activities even if some individuals or groups object.

e) Avoid restricted access to and physical displacement from protected areas and naturalresources but when not possible, ensure that affected IP communities participate in allaspects of the subproject cycle and that their benefits are equitably shared.

f) An IPP will be prepared that is based on the social impact assessment with the assistance of qualified and experienced experts that draw on indigenous knowledge through consultation with affected IP communities. The IPP will include a framework for continued consultation with the affected IP communities during project implementation; specifies measures to ensure that IPs receive culturally

appropriate benefits; identification of measures to avoid, minimize, mitigate, or compensate for any adverse project impacts; culturally appropriate grievance procedures; M&E arrangements, and a budget and time-bound actions for implementing the planned measures.

g) The draft IPP after approval by the AIIB is disclosed including documentation of the consultation process and the results of the social impact assessment in a timely manner and made available in an accessible place and in a form and local languages understandable to affected IPs communities and other stakeholders. The final IPP andits updates will also be disclosed to the affected IP communities and other stakeholders.

h) Prepare an action plan for legal recognition of customary rights to lands and territories or ancestral domains when the project involves (i) activities that are contingent on establishing legally recognized rights to lands and territories that IPs have traditionallyowned or customarily used or occupied, or (ii) involuntary acquisition of such lands.

i) Monitor implementation of the IPP using qualified and experienced experts; adopt a participatory monitoring approach, wherever possible; and assess whether the IPP's objective and desired outcome have been achieved, considering the baseline conditions and the results of IPP monitoring and disclose the monitoring report.

2. LEGAL FRAMEWORK

2.1 Overview

Over 97 percent of Cambodia's population belongs to the Khmer ethnic group, while the remainder comprise a range of ethnic groups, including Chams (predominantly Muslim), ethnic Vietnamese, ethnic Chinese, and indigenous Khmer Loeu (hill-tribes). Amongst the non-ethnic groups, only the hill-tribes are categorized as IPs by the government. There are also isolated villages Cham (Muslim) communities that are non-Khmer ethnic groups, but they are generally well assimilated in Khmer society and not recognized as IPs.

2.2 National Laws and Regulations Related to Indigenous Peoples

Cambodia has a number of laws and policies that protect the rights of local communities, including IPs. Since the IPs have strong ties to the land and natural resources, the Land Law (2001) is the most significant for them because it sets out the basis for their rights to land. Article 25 provides for the collective ownership of land, while Article 26 recognizes the role of traditional authorities, mechanisms and customs in decision-making and exercising ownership rights. The subsequent Policy and Sub-decree for Indigenous Peoples Registration of Collective Land Rights sets the incorporation of the community as a legal entity as a condition for receiving a collective title. National policies applicable to the indigenous peoples include:

Cambodia Constitution (1993). Article 31 stipulates that Khmer citizens are entitled to the same rights, freedom and duties and are equal before the law, regardless of their race, color, sex, language, beliefs, religions, political tendencies, birth of origin, social status, resources, and any position. Article 44 guarantees all persons, individually or collectively, shall have the right to own property. Only natural persons or legal entities of Khmer nationality shall have the right to own land. Legal private ownership shall be protected by law. Expropriation of ownership from any person shall be exercised only in the public interest as provided for by law and shall require fair and just compensation in advance.

Land Law (2001) recognizes the collective land rights of indigenous communities by the State that offer a unique chance for indigenous peoples in Cambodia to exercise their right to self-determined development that include Article 26: Ownership of the lands is granted by the State to indigenous communities as collective ownership, including all the rights and protections enjoyed by private owners. The exercise of collective ownership rights are the responsibility of the traditional authorities and decision-making mechanisms of the indigenous community, according to their customs and subject to laws such as the law on environment protection; Article 28: No authority outside the community may acquire any rights to immovable properties belonging to an indigenous community. Indigenous communities have the right to collective ownership of their lands, which gives them all the rights and protection of ownership as enjoyed by private landowners. The lands of indigenous communities include residential and agricultural land and encompass land actually cultivated and the lands reserved/fallow land for shifting cultivation. Indigenous communities shall continue to manage their community land according to their traditional customs, pending the determination of their legal status. Once they are registered as legal entities, communities can apply for the registration of their collective title (Land Law 2001, Article 23 to 25). Article 43 stipulates the Commune Council's role in protecting and preserving the environment and natural resources. They also have a role in the classifying and setting of boundaries for all forests in their area of jurisdiction, in coordination with the Ministry of Agriculture, Fisheries and Forestry (Forestry Law 2002, Article 10).

Land Concessions 2003 and 2005. A sub-decree on Social Land Concessions (SLC)was established in 2003 to accompany the implementation of the Land Allocation for Social and Economic Development Project (LASED). The SLC aims at providing state private land for purposes of settlement and family farming to private families particularly the poor, disabledsoldiers, and families of deceased soldiers who have no or not enough land.

In late December 2005, the ELC sub-decree was established, defining a mechanism to grant state private land through a specific ELC contract to a concessionaire to use the land for agricultural and agro-industrial production. This refers to the cultivation of food or industrial crops, animal raising and aquaculture and the construction of facilities for the processing of domestic agricultural raw materials (Sub-Decree No.146 on ELC, article 2). For an ELC, which can be granted to private or investment companies, it must have been classified and registered in the Land Register as state private land, complying with the necessary legal procedures (Land Law 2001 Article 17, Sub-Decree No.118 on State Land Management article. 3 & 21, Sub- Decree No. 146 on ELC article. 2).

All responsibilities and authorities in granting ELCs lie with the MAFF. The concession land cannot exceed 10,000 ha and may only be granted when some additional requirements are fulfilled as follows (sub decree No.146 on ELC, article 4 & 5):

a) A land use plan for the land has been adopted by the Provincial or Municipal State Land Management Committee, and the land use is consistent with the plan.

b) Environmental and social impact assessments have been completed with respect to the land use and development plan.

c) There are solutions for resettlement issues in accordance with the existing legal framework and procedures. There shall be no involuntary resettlement and access to private land shall be respected.

d) Public consultations have been conducted with territorial authorities and local residents, relating to economic land concession projects or proposals.

Moreover, the proposal for ELC has to be evaluated against criteria that include the promotion of people's living standards, perpetual environmental protection and natural resource management, avoidance or minimization

of adverse social impacts, creation of increased employment and with linkages and mutual support between SLC and ELC.

Organic Law (2008) recognizes the vulnerability of the indigenous peoples in Cambodia. It mandates that provincial and district councils in rural areas, capital, municipal and khan levels in urban areas formulate development plans that identify the needs of vulnerable groups, including those from the IP communities.

Protected Area Law (2008) defines the framework of management, conservation and development of protected areas. The law aims to ensure effective management and conservation of biodiversity, and sustainable use of natural resources in protected areas. The law recognizes the right of forest-dependent indigenous peoples to live within the protected areas and to use sustainably the natural resources. Under this law, protected areas are divided into four zones, including core zone, conservation zone, sustainable use zone, and community zone. The law has provisions that define how land can be used and managed in each zone.

Forestry Law 2003 authorizes the granting of forest concessions. The sub-decree on the Management of Forest Concessions states that cancelled or revoked forest concessions shall revert to natural forest protected areas and cannot be converted into an Economic Land Concession (ELC) or awarded to other companies.

Law on Education (2007) aims to promote development of human resources of the nation by providing lifetime education to all people to enable their improvements in terms of knowledge, skills, capacities, dignity, good moral behaviors and characteristics. It also encourages people to learn to better understand, love and protect the national identity, cultures and language. Article 11, 15, 16, and 40 of the Forest Law (2002) recognizes and protects the rights of indigenous peoples to access and use certain forest areas, which they traditionally rely on to sustain their way of life and enjoy the benefits of the forest

Sub-Decree No. 83 ANK, BK (2009) on Procedures of Registration of Land of Indigenous Communities. The objective of this Sub-Decree is to provide indigenous communities with legal rights to land tenure, ensure land tenure security, and protect collective ownership by preserving the identity, culture, good custom and tradition of each indigenous community.

Policy on Environmental and Social Safeguards for Sub-National Democratic Development (RGC-NCDD, 2019) states in the strategy No.7 that Indigenous Peoples also are known in Cambodia as 'Khmer Leou' who have their own cultures and customs and make their own living in a way that is significantly different from those of 'Khmer Kroam' who live in small groups. The "Khmer Leou" is considered vulnerable IP groups and receive special care and attention by the government. It is required that development projects implemented at sub-national administration should not negatively impact their lives, and traditions and customs of the "Khmer Leou", particularly with regards to resettlement and land. In terms of application, specifically in land acquisition and resettlement, this policy is applied through the RGC's SOP-LAR (2018) – Land Acquisition and Involuntary Resettlement, which requires the avoidance of land acquisition or minimization of its use where avoidance is not possible.

Manual for Indigenous Communities Identification; Legal Entity Registration; and Communal Land Registration Process *(*OHCHR, MoI, MRD, MLMUPC (2018) *provide detailed guidance on steps and measures that need to be taken for identification of indigenous communities, registration of legal entities, and community land registration process.*

RGC (2018) Land Acquisition and Involuntary Resettlement, Standard Operating Procedures for Externally Financed Projects in Cambodia. In Section E (Impact on Indigenous Peoples), it is stipulated that land acquisition and resettlement that potentially affects indigenous people should be avoided – to the maximum extent possible, through selection of site, alignment, and land demarcation. However, when land acquisition is not avoidable, a separate social impacts assessment will need to be carried out to understand clearly how the indigenous peoples use their land; how they conduct their economic activities; how they organize their social

activities; and how the project would potentially affect the IP's identity, culture, and customary livelihoods. As per the decree, a separate Indigenous Peoples Plan (IPP) must be developed to address social impacts, compensation and resettlement packages, and implementation arrangements. The consultation process should consider customary practices, and in most cases, tribal or customary leaders will be consulted as they make decisions for their people. The Project Preparation Consultants (PPC), along with the Executing Agency/Implementing Agency (EA/IA) and local commune authorities, typically prepare the IPP. This is separate from the preparation of the BRP and DRP, although the latter will include a compensation package for the displaced indigenous peoples.

Registration of Lands of Indigenous Communities 2009. Sub-decrees on tenurial security have been issued by the GKC to put in place procedures whereby IPs can process claims to their rightful lands (provided they are the majority population at commune level). Recognition and certification of lands among IPs are ongoing with the issuance of the 2009 Sub-Decree on Procedures of Registration of Lands of Indigenous Communities.

National Policy on the Development of Indigenous Peoples (NPDIP). The Council of Ministers approved the NPDIP on 24 April 2009, serving as a guiding document for the implementation of government policies related to Indigenous Peoples across various sectors such as culture, education, health, land, agriculture, infrastructure, justice, tourism, industry, and energy. The NPDIP recognizes the necessity of specific policies for indigenous communities and establishes principles for their formal registration as legal entities with their own bylaws. Additionally, the NPDIP supports the participation of indigenous communities in economic development that affects their lives and cultures, ensuring their full entitlement to express their opinions and make decisions on the development of the economy, society and their cultures towards societal growth. The NPDIP promotes the use of local languages in multilingual primary education, media, and public consultation. It also lists ten brief sector strategies dedicated to culture, education and vocational training, health, environment, land, agriculture, water resources, infrastructure, justice, industry and mines and energy. The NPDIP calls for conducting impact assessments for all infrastructure projects: "Development projects in the living areas of indigenous peoples can function only if there has been an environmental and social impact assessment and publicity to relevant indigenous peoples' communities in advance in order for those people to have an opportunity to provide input about their need." The NPDIP recognizes the rights of indigenous peoples in traditional lands, culture and traditions. This is consistent with the national Land Law (2001).

Policy on Registration and Right to Use of Land of Indigenous Communities: The Council of Ministers approved on April 24, 2009. The Prime Minister signed a Sub-Decree on procedures of registration of Land of indigenous communities on June 9, 2009. This policy was developed on basis of the Land Law (2001), which recognizes the right of the indigenous communities to possess and use land under their collective ownership. The policy states that the registration of indigenous communities' land, as collective ownership, is different from the registration of individually owned land parcel. This is because land registration of the indigenous communities entails the registration of all land parcels that the communities own and use. The policy consists of both State Public Land and State Private Land in accordance with articles 25, 26, and 229 of the Land Law (2001) and related Sub-decrees. These land parcels vary in size and can be located within the same or different communes/ sangkat. Therefore, the registration of land parcels of indigenous communities requires a separate Sub-decree that supplements the existing procedures for sporadic and systematic land registration.

Other Policy Considerations. Apart from its Constitution and other national laws, Cambodia has adopted and supports the UN Declaration of Rights of Indigenous Peoples (IP)by way of ending discrimination and promoting the rights of Cambodia's recognized IPs.

2.3 AIIB's ESS3 on Indigenous Peoples

The AIIB Environmental and Social Framework (ESF) sets out the requirements for all Bank supported operations to comply with the Bank policies addressing environmental and social impacts, among other policies[4]. The ESF includes three mandatory Environmental and Social Standards (ESSs) that detail the requirements applicable to Bank clients on, respectively: Environment and Social Assessment and Management (ESS 1), Land Acquisition and Involuntary Resettlement (ESS 2) and Indigenous Peoples (ESS 3).

Objective. The objective of the ESS 3 is to enable the design and implementation of Projects in a way that fosters full respect for IPs identity, dignity, human rights, economies and cultures, as defined by the IPs themselves, so that: (a) they receive culturally appropriate social and economic benefits; (b) they do not suffer adverse impacts as a result of Projects; and (c) can participate actively in Projects that affect them.

[4] https://www.aiib.org/en/policies-strategies/_download/environment-framework/AIIB-Revised-Environmental-and-Social-Framework-ESF-May-2021-final.pdf

Scope and application.

The ESS 3 applies if IPs are present in, or have a collective attachment to, the proposed area of a subproject, and are likely to be affected by the subproject. The term IP is used in a generic sense to refer to a distinct social and cultural group possessing the following characteristics in varying degrees: (a) self-identification as members of a distinct indigenous cultural group and recognition of this identity by others; (b) collective attachment to geographically distinct habitats, ancestral territories or areas of seasonal use or occupation in the subproject area and to the natural resources in this area; (c) customary cultural, economic, social or political institutions that are distinct or separate from those of the dominant society or culture; and (d) a distinct language or dialect, often different from the official language or languages of the country in which they reside. 4 In considering these characteristics, national legislation, customary law and any international conventions to which the member in whose territory the subproject is located is a party may be considered. A group that has lost collective attachment to geographically distinct habitats or ancestral territories in the Project area because of forced severance remains eligible for coverage as an IP under ESS 3.

Indigenous Peoples Planning Framework: An Indigenous Peoples Planning Framework (IPPF) is prepared when a Project is likely to involve IPs and consist of a program or series of activities whose details had not yet been identified at the time the Project was approved by the Bank. In the case of this Project, and under exceptional circumstances, the AIIB determined that the environmental and social assessment of the identified Project activities could be conducted using a phased approach as defined under Section E, Special Circumstances of the IPP of the ESS 3, during the development of the activities in conformity with the IPPF that is approved by the Bank.

Indigenous Peoples Plan. Generally, if the subproject process determines that IPs are present in, or have collective attachment to, a subproject area, and furthermore are likely to be affected by the subproject, the Project is required to prepare an Indigenous Peoples Plan (IPP). The IPP should draw on indigenous knowledge and participation by any affected IP communities and take into consideration differentiated impacts of the Project with respect to gender and different generations. The IPP includes (a) a framework for continued consultation with those affected IPs during the subproject implementation; (b) measures to provide these IPs with gender sensitive and culturally appropriate benefits; (c) measures to avoid, minimize. Mitigate, offset or compensate for any adverse subproject impacts, and actions to address these impacts on the different groups in the community; (d) culturally appropriate grievance procedures, monitoring and evaluation arrangements; and (e) a budget and time-bound actions for implementing the planned measures.

In the event where project activities: (a) have impacts on land and natural resources subject to traditional ownership or under customary occupation or use; (b) cause relocation of IP and/or EM from land and/or limitations on access to natural resources subject to traditional ownership or under customary occupation or use; or (c) have significant impacts on Indigenous Peoples' cultural resources, the project needs to engaged the affected IP communities in a Free, Prior and Informed Consultation (FPICon) and thereafter obtain the broad support of the affected IP/EM communities for project activities that affect them.

For CAISAR, based on the current assessment, it is anticipated that the project would not affect any land and/or natural resources that are traditionally owned or under customary occupation or use by IP and/or EM, nor their cultural resources. Therefore, FPICon is not likely triggered under the Project albeit the applicability of FPICon will be determined based on the SIA to be carried for relevant subprojects.

2.4 Gaps between National Policies & Donor's Environmental and Social Policies

Despite the fact that Cambodia has a policy that recognizes the rights of IPs to culture, education, justice, health, environment, land, agriculture, water resources and infrastructure among others, there are no decrees, sub-decrees or procedures for specific safeguards to protect the interest of IPs, other than those related to land or forestry. The Cambodia Land Law does recognize the right of indigenous communities in Cambodia to own immovable property - their land - with collective title. However, in practice, the procedure to register collective title can be very time consuming and only a few indigenous communities have received collective title since the Land Law was enacted in 2001. Similarly, the Forest Law also guarantees and recognizes the right of IPs to continue the use and access to certain forest areas that they traditionally use and practice.

Overall, there is an acceptable level of consistency between the government system, the AIIB'ESS and the IFAD standards on IPs. The self-identification process of indigenous communities defined in the national policy is broadly consistent with international good practice. The national framework does not exclude communities who have become more mainstream, and indigenous communities may apply for legal status regardless of whether or not they still use their own language or practice traditional agriculture.

However, while there are some complementary links between Cambodian laws and regulations related to IPs and the ESS 3, there are no sufficiently detailed regulations or operating procedures to facilitate full implementation of the IPPs. Therefore, this IPPF has been prepared on the basis of the ESS 3 of AIIB and Standard 4 of IFAD (Indigenous Peoples), considering relevant Cambodian policies and regulations. The IPPF also outlines the Grievance Redress Mechanism (GRM), based on the GRM that is used for the Project, which will need to be further refined in consultation with IPs, if any are found to be residing at any subproject sites.

Items for Clarification	RGC's Policies	AIIB's ESS3	IFAD's SECAP Standard 7	Clarifications
Definition of IPs	Have list of IPs that are officially recognized as IPs	• Self-identification as members of a distinct indigenous social and cultural group and recognition of this identity by others; and • Collective attachment[5] to geographically distinct habitats, ancestral territories, or areas of seasonal use or occupation, as well as to the natural resources in these areas; and • Customary cultural, economic, social, or political institutions that are distinct or separate from those of the mainstream society or culture, and • A distinct language or dialect, often different from the official language or languages of the country or region in which they reside.	• Priority in time, with respect to occupation and use of a specific territory; • The voluntary perpetuation of cultural distinctiveness, which may include aspects of language, social organization, religion and spiritual values, modes of production, laws and institutions; • Self-identification, as well as recognition by other groups, or by state authorities, as a distinct collectivity; and • An experience of subjugation, marginalization, dispossession, exclusion or discrimination.	Screening of IP will be conducted based on all ethnic groups to identified in the subproject's area of influence. Screening of IP will be based on the definitions of IP in AIIB's ESS 3 and IFAD's ESS4.
FPIC	No requirements about FPIC	***Environmental and Social Standard 3*** Conduct meaningful consultation (based on **Free, Prior, Informed Consultation** – FPICon) to obtain broad support from affected IP community when project activities: • Have impacts on land and natural resources subject to traditional ownership or under customary occupation or use; • Cause relocation of Indigenous Peoples from land and natural resources subject to traditional ownership or under customary occupation or use;	***SECAP standard 4*** Conduct meaningful consultations to obtain **Free, Prior, Informed Consent** from affected IPs when project activities: • Have an impact on the land access and use rights of rural communities; and • Target indigenous peoples or rural areas that are home to indigenous peoples. Engagement with indigenous peoples will be undertaken in good faith, in a culturally appropriate manner and with full regard to these peoples'	

[5] Collective attachment means that for generations there has been a physical presence in and economic ties to land and territories traditionally owned, or customarily used or occupied, by the group concerned, including areas that hold special significance for it, such as sacred sites.

Items for Clarification	RGC's Policies	AIIB's ESS3	IFAD's SECAP Standard 7	Clarifications
		• have significant impacts on Indigenous Peoples' cultural resources. Apply Free, Prior and Informed Consent if the laws of the Member in whose territory the Project is located mandate free, prior and informed consent (FPIC) if AIIB has determined that the requirements of such FPIC are consistent with those of FPICon.	institutions, governance systems, customs and methods of decision-making.	

3. RISKS, IMPACTS AND MITIGATION MEASURES

3.1 Overview of Indigenous Peoples

3.1.1 Overview of IPs in Cambodia

There are 22 indigenous groups that are recognized by the RGC in Cambodia. The total population of these 22 indigenous groups is 171,193 people. Most of the indigenous people (92.4%, 2013) live in the northern and eastern parts of country, particularly in provinces of Ratanakiri, Mondulkiri, Kratie, Stung Treng, Kampong Thom, and Preah Vihear provinces. Of 22 indigenous groups, 6 groups are considered major groups as they have more than 10,000 people each. These 6 groups account for 88% of the total ethnic population of the country, including Tampuan, Pnong, Kreung, Kuy, Jarai, and Prev[6].

The indigenous families are larger than the average family size of the Cambodian population, with an average of 5.3 members per family in 2008 and 4.9 in 2013. Female-headed household accounted for 14% in 2008 and 22% in 2013.

Education. Among the indigenous population aged 15 and over, almost 66% did not attend a school or complete any educational degrees. In comparison, 24.1% attended only primary school (in total, 90% had little or no education). About 10% have at least completed lower secondary education, of which 4% have joined upper secondary education, and less than 1% have received a high school diploma. However, the data show that younger indigenous peoples have a better education rate than the older indigenous peoples, and men are more educated than women.

Employment and Economic Situation. The employment rate is 87.7% among men and 85.5% among women. According to different indigenous groups, the larger indigenous groups tend to have higher labor force participation rates, such as Tampuan, Pnong, Kreung, Preu, Kuy, Kraol, and Kavet. However, the majority of indigenous peoples work without pay (57.3%) and are self-employed (38%), with more men being self-employed (58.9%) and the majority of women working without pay (78.4%). In terms of the economic sectors, the vast majority of indigenous peoples aged 15 and over are employed in agriculture (93.3% of the population, 90.6% of men, and 95.9% of women), a few in the industry sector (total 1.6%, men 1.8%, and women 1.4%), and in the services sector (total 5.1%, men 7.6%, and women 2.8%).

Health and Hygiene. There is no data on indigenous peoples' health problems other than the data on disability from the censuses and intercensal population surveys, and the data on disability, maternal health, access to health and childcare services from Cambodian Socio-Economic Surveys containing only the information about local ethnic minority groups in Cambodia. According to the 2015 Cambodia Socio-Economic Survey, 14% of local ethnic minorities were sick in 30 days before the survey, with children and the elderly being sick the most and the working-age population being sick the least. In addition, boys and older men were twice as likely to be ill as girls and older women, and adult women were 2.7 times as likely to be sick as adult men. The fact that boys were more likely to be sick than girls can be explained by the fact that boys tend to accompany their parents to work in agriculture or collect nontimber forest products. The most common diseases are malaria, respiratory diseases, typhoid fever, and tuberculosis. The health services visited include pharmacies, public hospitals, and private clinics.

Housing and ownership. In 2013, more than 95% of indigenous families had their own houses (96.3% in 2013). The majority of indigenous households used kerosene lamps and batteries as the main source of light. In contrast, 20.6% of households used electricity or their own generators as the main light source in 2013. For the primary fuel type for cooking, most indigenous households used firewood (95% in 2013). For household items

[6] Report on the Demographic and Socio-economic Situation of Indigenous Peoples in Cambodia (2021).

for information and communication, almost a third of indigenous households have television, 110% have mobile phones, and less than 1% have internet. For traveling, 76.1% of indigenous households had motorbikes, 2.2% had cars, 9.1% had tractors, 7.8% had boats, and 37.4% had bicycles (2013).

3.1.2 Overview of IPs in the Project Area

IPs were found in the four project provinces including Pursat, Kampong Chhnang, Kampong Speu, and Kandal. (See Table 2 below).

Table 1 – Distribution of Indigenous People Groups in Project Provinces

No.	Province	Indigenous Groups (>= 1000 people)	Indigenous Groups (>= 100 people)	Indigenous Groups (<100 people)
1	Pursat		Jarai, Poar	Kavet, Kleung, Kuoy, Kreung, Stieng, Ja'ong, Kroul, S'och, Kajrouk
2	Kampong Chhnang		Jarai	Kavet, Kleung, Kuoy, Kreung, Lun, Tampuon, Stieng, Ja'ong, Kroul, Rodae, S'och, Kajrouk
3	Kampong Speu		Jarai, Souy	Kavet, Kleung, Kuoy, Kreung, Lun, Stieng, Ja'ong, Kroul, Mel, Kajrouk
4	Kandal		Jarai, Kleung, Stieng, Ja'ong	Kavet, Kuoy, Lun, Bunong, Praov, Tampoun, Kroul, Rodae, L'moon, Souy, Kajrouk, Mon

Source. *Ministry of Planning and Ministry of Rural Development (2021) Report on Demographic and Socio-economic Situation of Indigenous Peoples in Cambodia.*

3.2 Project's Environmental and Social Risk and Impacts

The project will bring about an overall positive impact to local farmers. In subproject where IP peoples have farmland in the command area, these IPs will benefit from improved irrigation, water supply, government's agricultural extension services, and services from local farmers' cooperatives. As IPs participate in project activities, particularly agricultural extension services, they can grow more crops, participate in value chain, increase income, and eventually improve their livelihoods. Reliable water access and promising farming opportunities thanks to improved irrigation and extension services also keep the poor, including the poor IPs, from migrating to other areas in search for income generation opportunities. Adverse impacts on IPs are foreseen. However, these impacts are mostly local, small-scaled, such as minor land acquisition in some subproject to allow construction of irrigation canal. Land impacts would be very small at household level (e.g. loss of strip of land) which would not affect the livelihoods of the IP remarkably.

During subproject construction and operation, there are a number of environmental and social risks that may apply to local people, including IP peoples who may happen to be present in a subproject area. Environmental and social risks and impacts that have been identified during project preparation have been discussed in consultation meetings with a) IP peoples who are present in subproject area, and b) other project stakeholders at commune, district, provincial and central level. These consultations aim to ensure potentially affected people, and relevant project stakeholders, are aware of such risks and stay engaged during subproject preparation and implementation for risk prevention and mitigation (Please see full list of social and environmental risks in the project's ESCMF (Section E&S Risks and Impacts) that may apply to any ethnic minorities who are present in subproject area. See also SEP, particularly section (Proposed Strategy for Consultation with Vulnerable/Disadvantaged Groups) for guidance on conducting consultation with IPs when IPs are present in the subproject area.

3.3 Mitigation Measures

Although above risks and impacts will be validated, and assessed at further length when subproject locations become known, IP(s) in a subproject's area may be affected disproportionately compared to the mainstream group. The distinctive cultural and socioeconomic characteristics of the IPs, including their existing livelihoods, etc. may expose IPs to further risks and impacts, increase their vulnerability and compromise their ability to respond to such risks and impacts – if a holistic approach is not in place. Effective communication, such as IEC, and active participation of involved IPs, are among important factors that contribute to effective engagement of IPs for meaningful consultation during subproject preparation and participatory monitoring during subproject implementation. The coordination of project stakeholders, including PMU, Contractors, local authorities, local agencies, local service providers, and most notably the active and full participation of IPs, collectively contribute to minimizing identified risks and potential impacts at identified subprojects.

Detailed mitigation measures for the above risks and potential impacts are proposed in the project's ESCMF. These mitigation measures are specific for design stage, pre-construction stage, construction stage, and operation stage,

During subproject design and pre-construction stage:

To avoid, minimize potential impacts related to land acquisition:

- Effort will be made by PMU to ensure irrigation and road design avoid acquisition of land from IPs;
- In case where avoidance is not feasible (because of technical requirements), minimize the need for land acquisition through alternative designs;
- Compensate affected IP in accordance with RPF, if avoidance is not possible.
- Provide additional financial and developmental support, as needed, based on meaningful consultation, to support affected IPs to fully and timely restore their livelihoods and income to the pre-project level, as a minimum.

During pre-construction stage:

To address identified risks for affected IPs at subproject level, PMU will implement the following:

- Prepare site-specific ESCMP
- Screen for presence of IP(s) in subproject area, based on detailed design
- Conduct Social Assessment (based on site-specific ESCMP)
- Develop IPPs, incorporating results from SA, including mitigation measures, etc. based on meaningful consultations
- Implement IPP (as part of site-specific ESCMP)
- As part of IPP, conduct Behavior Change Communication using audio-visual and local IP language to provide knowledge, raise awareness, change attitude, and promote behavior change among IP and local stakeholders to respond effectively to identified risks, particularly risks related to SEA/SH/VAC, communicable disease, traffic safety, culture related conflicts, etc.
- Where necessary, engage service provider (e.g. SEA/SH service providers) (for subproject being risk "high" or "substantial" on SEA/SH risk (risk is assessed as part of preparation of site specific ESCMP).

During construction stage:

- Implement the following as an integrated approach:
  i. PMU to implement site-specific ESCMP
  ii. PMU to continue implementing IPP – as part of site specific ESCMP (in close collaboration with IPs and local partners)
  iii. Contractor to implement C-ESCMP (including IEC campaign)
  iv. PMU to allow budget fully and timely (based on budget plan in IPP, Contractors' bill-of-quantity)
  v. PMU will enhance monitoring process to ensure risks are minimized. This can be achieved through coordinated works of SEO-PMU, DDIS consultant, E&S consultant, and independent E&S monitoring consultant, and participatory consultation of local IPs.

During operation stage:

- Ensure safety measures are in place (e.g. signpost, warnings, safe crossing, etc.)
- Continue IEC campaign, where need, to raise awareness of IPs on safe driving before new road is open to traffic
- PMU to maintain GRM's focal point (particularly during liability stage of contractors following construction completion)
- Ensure routine maintenance is carried out to ensure the road functions as designed

4. PREPARATION OF INDIGENOUS PEOPLES PLAN

When Indigenous Peoples and/or Ethnic Minority groups are present in a subproject area, PMU needs to prepare an IPP for the respective subproject. It is noted the IPP shall be prepared whether the identified IPs/EMs are affected positively (as subproject beneficiaries), or adversely, or both. To prepare an IPP for a subproject, a social assessment will be conducted for that subproject to inform the content development for the IPP and guide the IPP implementation. To ensure the social assessment focuses, social assessment shall be conducted vis-à-vis investment activities that are proposed under the mentioned subproject.

The following three steps shall be followed to prepare an IPP: 1) Screen for Indigenous Peoples/ Ethnic Minorities, 2) Conduct social assessment to develop IPP, and 3) Write-up the IPP:

4.1 Screening for Indigenous Peoples/ Ethnic Minorities (IP/EM)

Once the six subprojects (Ou Ta Pong, Lum Hach, Brambei Mom, Krapeau Trom, Yotassas, and Steung Krang Bat are approved, PMU's Consultant will conduct IP screening for these seven subprojects. The IP Screening involves two key tasks: 1) Define subproject area (based on subproject's area of influence), and 2) Screen for IP/EMs in the subproject area (See Annex 2 for more guidance). If the IP screening indicates that IP and/or EMs are present in the subproject area, an IPP has to be prepared.

4.2 Preparing an IPP

Preparation of an IPP involve two key steps: 1) conducting a Social Assessment and 2) writing up the IPP.

Step 1. Conduct a Social Assessment (SA)

The purpose of the social assessment is to identify and examine the potential impacts of the approved subproject on the livelihoods of the IP/EMs. In particular, the SA explores how the environmental and social risks and impacts associated with the proposed subproject activities affect the IP/EM. Based on this understanding, measures will be proposed to avoid, or mitigate the adverse impacts and risks and meanwhile enhancing the intended positive impacts of the subproject. The social assessment shall be conducted in a manner that is inclusive, culturally appropriate and gender sensitive. The depth and breadth of the SA should be based on the scope, scale and nature of the subproject impacts and risks. These are determined based on:

a) The magnitude of subproject's impacts on the affected IP/EM, including: (i) customary rights of use and access to land and natural resources; (ii) socioeconomic status; (iii) cultural and communal integrity and heritage; (iv) health, education, livelihood systems and social security status; and (v) indigenous knowledge; and
b) The vulnerability of the affected IP/EM.

The social assessment needs to have the following key elements:

a) Description of the subproject, including a map of the subproject area;
b) Policy, legal and administrative framework, including the international and national legal framework applicable to the subproject;
c) Scoping, including stakeholder identification and consultation plan;
d) Baseline environmental and social data;
e) Evaluation of environmental and social risks and impacts;
f) Development of mitigation, monitoring and management measures and actions.

Step 2. Write-up an IPP

Based on the information generated from the above social assessment, PMU's consultant will write up the IPP. An IPP shall include the key following elements, as a minimum.

a) A framework for continued consultation with these affected Indigenous Peoples during Project implementation;
b) Measures to provide these Indigenous Peoples with gender sensitive and culturally appropriate benefits;
c) Measures to avoid, minimize, mitigate, offset or compensate for any adverse Project impacts, and actions to address these impacts on the different groups in the community;
d) Culturally appropriate grievance procedures, monitoring and evaluation arrangements; and
e) A budget and time-bound actions for implementing the planned measures.

It is recommended that the IPP should be developed as an overall community development plan to address specific issues associated with the needs of the affected IP/EM. The IPP needs to address not only any adverse impacts and risks, but also enhance the intended positive impact of the subprojects through a continuous IP/EM engagement process during sub-sheme design, implementation, monitoring. This aims to promote the ownership of affected IP/EM and enhance subproject's development effectiveness.

4.3 Approving an IPP

PMU will submit all IPPs to the AIIB for review and clearance prior to IPP implementation.

4.4 Disclosing an IPP

All IPPs, once cleared by AIIB, will be disclosed locally in both English and Khmer at subproject area and will be posted on the websites of MoWRAM and MAFF. The same version will also be disclosed on AIIB's and IFAD's website.

4.5 Implementing an IPP

The IPP should be implemented in coordination with the local authorities and affected IP. The activities and the outcomes of the IPPs implementation should be monitored and evaluated (See also Section 7.3). MoWRAM and MAFF will ensure sufficient financial and human resources available timely prior to embarking IPP implementation.

5. STAKEHOLDER ENGAGEMENT AND INFORMATION DISCLOSURE

5.1 Purpose of Engaging IP during project preparation and implementation

The AIIB's ESF defines stakeholder engagement as a process of identifying relevant stakeholders, conducting stakeholder analysis, and organizing a series of consultations to meet with project stakeholders for collecting stakeholders' feedback and concerns on project's risks and impacts, as well as stakeholders' development needs in relation to project purposes and activities. This aims to ensure the project's adverse impacts on IPs can be avoided, or minimized and mitigated if avoidance is not possible. For this project, it is important that IPs need to be consulted on their development needs (in relation to project purposes) to ensure they can receive socioeconomic benefits that are appropriate to them culturally.

5.2 Consultation results during Project Preparation

Consultation on project design and related IP issues was conducted in XXX 2023 at national level (as listed below), and with IPs potentially affected at subprojects during 25-30 June 2023 (on proposed project), and XXX September 2023 (based on initial design). (See summary of consultation results at Annex 1).

5.3 Consultation with IPs during Project Implementation

5.3.1 Overview of consultation process

During project implementation, consultations with IPs will be carried out for subprojects where IP screening has confirmed that IPs, as per AIIB ESS3 and IFAD's SECAP Standard 4, are present in the subproject areas. The consultations with identified IPs will be carried out on an iterative basis throughout subproject cycle, to ensure affected IP are informed of the risks and impacts identified for the subproject, and provide meaningful feedback. To ensure relevant IP stakeholders are engaged in project consultations, MoWRAM will identify IP group(s) present in subprojects, then conduct consultations with them – as per Section 4.2. The consultations with identified IP groups will be conducted in a culturally appropriate manner that takes into consideration gender sensitivity and intergenerational perspectives.

The consultations will seek also feedback from IPs on subproject's risks and impacts, suggestions to avoid or mitigate such risks and impacts, and developmental needs of the IP in relation to the project goal and subproject activities. To promote effective project design and build project support and ownership of local IPs, while reducing risk of potential delays during subproject implementation, MoWRAM will apply the engagement strategy. The engagement process will include analysis of IPs as project stakeholders, engagement planning, disclosure of information, and conducting meaningful consultations with the affected IP(s). The consultations will be based on the existing customary institutions and decision-making processes of the consulted IPs to

promote IP's participation and support for the subprojects. In particular, the consultations to be conducted by MoWRAM at subproject level will:

a) Involve the participation of IPs' representative bodies and organizations, such as councils of elders or village councils, or chieftains. Where appropriate, consultations shall be carried out with other members of the IP communities;

b) Allow for IPs to participate effectively in the design of project activities or mitigation measures that could potentially affect them – either positively or negatively;

c) Provide IPs sufficient time to confirm the broad support from the affected IP for proposed project activities, and associated risks and impacts.

Stage	Stakeholders	Activities	Outcomes
1. Subproject identification	▪ MoWRAM and MAFF ▪ Implementing agency at provincial and district level (e.g. PDWRAM, PDAFF) ▪ Commune and village authorities ▪ Target beneficiary households, including poor, vulnerable, and disadvantaged groups	▪ Government and agency meetings to explain need for safeguards, agree on selection criteria. ▪ Scoping – visiting potential sites, physical inspection. ▪ Meetings and briefings with provincial and district agencies. ▪ Meetings with commune and village authorities. ▪ Meetings with target beneficiaries.	▪ Agreement on objectives, priorities. ▪ Indicative development priorities for community. ▪ Identification of problems and issues. ▪ Basic design needs. ▪ Records of community participation disaggregated by sex and ethnicity.
2. Subproject preparation	▪ MoWRAM and MAFF ▪ Implementing agency at provincial and district level (e.g. PDWRAM, PDAFF) ▪ Commune and village authorities ▪ Target beneficiary households, including poor, vulnerable, and disadvantaged groups	▪ data requirements, participatory methods, consultation process and need for indigenous people /ethnic minority	▪ Data for preparation of socioeconomic profiles. ▪ Needs and constraints identified. ▪ Special considerations identified.

	▪ Commune and village authorities ▪ Target beneficiary households ▪ Members of vulnerable or minority groups ▪ Project technical assistance	▪ Open village meeting to explain purpose and process of consultations. ▪ Field level data collection – socio- economic data and surveys.	▪ Identification of gender issues, women's needs, and priorities. ▪ Identification of specific needs for tailoring innovative behavior change campaign
		▪ Household level and focus group discussions for identifying needs ▪ IP/ Ethnic minority households and separate focal discussion groups by gender. ▪ Discuss proposed project design. ▪ Obtain feedback, determine level and scope of support. ▪ Update briefings for provincial and district agencies.	▪ Identification of indigenous peoples/ethnic minority households that will be qualified/covered under the IP/EM ▪ Identification of needs for Information, Education and Communication material to be prepared in IP/EM language. ▪ Records of community participation and consultation results.
3. Subproject completion and evaluation	▪ MoWRAM and MAFF ▪ Implementing agency at provincial and district level (e.g. PDWRAM, PDAFF) ▪ Commune and village authorities ▪ Target beneficiary households, including poor, vulnerable, and disadvantaged groups	▪ Meetings with commune and village officials to discuss benefits and issues. ▪ Focus group discussions to review/evaluate benefits received, implementation issues, and improvements needed. ▪ Separate focal group discussion (by gender) where needed.	▪ Feedback on implementation progress, issues, and constraints. ▪ Suggestions for future improvements ▪ Records of community participation and consultation results

5.3.2 Free, Prior and Informed Consultation/Consent

The project will be designed to avoid any project activities that may

(a) have impacts on land and natural resources subject to traditional ownership or under customary occupation or use;
(b) cause relocation of Indigenous Peoples from land and/or limitations on access to natural resources subject to traditional ownership or under customary occupation or use; or
(c) have significant impacts on Indigenous Peoples' cultural resources.

The SIA process will determine the applicability of FPIC but on top of it, the project will ensure engaged the affected IP/EM in a meaningful consultation process by adopting the Informed Consultation and Participation (ICP) approach to ensure affected IP/EM are engaged in the informed consultation process and participating in project's consultation sessions. The consultation process adopted will be inclusive and iterative and promote in-depth exchange of views and information. PMU will ensure the views of the affected IP/EM concerning matters that affect IP/EM directly are considered and incorporated into subproject's design and implementation, particularly into proposed mitigation measures, sharing of development benefits and opportunities, and implementation issues.

The consultation process will also aim to capture both men's and women's views that are obtained from separate engagements/meetings, and will reflect men's and women's different concerns and priorities about subproject's risks and impacts, mitigation mechanisms, and benefits, in subproject implementation process. PMU will document the consultation process, particularly measures that PMU will take to avoid or minimize risks to and adverse impacts on affected IP/EM, and inform affected people of how their concerns have been considered and taken into action.

5.4 Information Disclosure

Prior to conducting consultations, MoWRAM will notify the concerned IPs of the consultation plan during preparation. MoWRAM will provide affected IPs with initial subproject information in the form of booklet in both Khmer and local language (if applicable). This initial information should be provided to IP at least two weeks prior to consultation. If the concerned IPs do not have a written language, the IP will be provided the information in Khmer and are explained verbally in the local language of the concerned IP to ensure the IP are fully informed of the consultation purpose and initial subproject information.

For public consultation, the draft IPPF (in English) and its Executive Summary (in Khmer) will be disclosed on MoWRAM's website on XXX (https://www.). The Executive Summary (in Khmer) will also be disclosed in hard copy at MoWRAM's public library in Phnom Penh, and in the offices of Provincial Departments of Water Resources and Meteorology in all four project provinces. Once finalized, the IPPF will be re-disclosed again through the above channels prior to AIIB's and IFAD's project appraisal. The draft and final IPPF will be disclosed in English on the AIIB's and IFAD's website.

During project implementation, all draft IPPs, once completed by MoWRAM and submitted to the Bank for review, shall be disclosed to affected IP communities in Khmer language. The summary of the IPP (in the form of an Information Booklet) will be translated into IP's language if the consulted IPs have their own written language. Public meetings will be hold with the affected IP(s) to explain the contents of the relevant IPP in their mother language to ensure affected IPs understand what and how the activities under the IPP will be carried out, including E&S risks and impacts of subproject activities, and how the IPs will be engaged by MoWRAM in consultation meetings during subproject preparation, and in monitoring during subproject implementation to minimize identified E&S risks and impacts. IPPs – prepared for relevant subprojects, will be disclosed locally in Khmer and local IP language (if applicable), as well as in Khmer and English language on MoWRAM's website. The English version of the IPPs will be disclosed on the AIIB's and IFAD's website.

6. GRIEVANCE REDRESS MECHANISM

6.1 Purpose of Project's GRM

The purpose of the GRM in this IPPF is to provide aggrieved IP with grievance redress procedures that are accessible, easily used, and free of charge to ensure that the grievances submitted by the affected IPs are solved timely. The GRM in this IPPF guides how a complaint of affected IP can be lodged, including forms of grievance lodging, channels, and steps that can be taken.

The GRM also describes the time-limits, where possible, for each step, such as time-limit for acknowledging receipt of complaints, notification of resolution decision. During the grievance resolution progress, where necessary, dialogues will be held between the aggrieved IP and project's GRM focal point that are designated for each step. Dialogues with affected IP during complaint resolution process aims to promote mutual understanding and collaboration among concerned parties.

The project also includes an appeal process that a complainant can use when they are dissatisfied with the resolution results/decision, or their complaints are not resolved within a specified timeframe. During subproject implementation, IPs in the subproject area will be reminded of the availability of this GRM and will be explained during consultations about how to use it.

6.2 Grievance Redress Procedures

The following section outlines complaint handling procedures that are designed to assist affected Indigenous Peoples (IPs) in making complaints regarding the project. These procedures are designed to address potential impacts and risks during project preparation and cover three key areas: a) land acquisition, where individual IP land is acquired either permanently or temporarily during construction, b) gender based violence, where IPs are victims, survivors, witnesses, or otherwise affected by SEA/SH actions related to the project, and c) general complaints and concerns related to project design, adverse impacts on IPs such as dust, noise, vibration, and any other aspects that IPs attribute to project activities.

6.2.1 Grievances related to Land Acquisition

The project has prepared a standardized GRM for stakeholders affected by land acquisition, including IPs. However, given the presence of various IP groups in project provinces, the IP groups in each subproject area will be consulted for feedback on the project's standardized GRM, as presented below. The purpose of consultation on the GRM in this IPPF is to ensure that the standardized steps and process below are culturally appropriate to the affected IP group. If required by the consulted IPs, the GRM below will be updated to reflect the customary complaint handling procedures currently practiced by the consulted IP and/or may be preferred by the affected IPs, based on the Social Assessment of IPs once site-specific subprojects are identified or confirmed during project implementation (See detailed Procedures at Section 6.2.2 of project's Resettlement Policy Framework).

6.2.2 Grievances related to Gender Based Violence/SEA/SH

In case the IP wishes to submit a grievance related to gender based violence, they can lodge their grievance using the Redress Procedure for Complaints related to gender (See Section 6.4.3 in the Stakeholder Engagement Plan for details).

6.2.3 Grievances related to any other aspects not covered in the above GRM

If environmental factors, such as elevated levels of dust or increased noise during evening hours, negatively impact the living or business activities of IPs, several channels will be established for their convenience. These channels may include:

- **PMU GRM focal point's telephone;**

- **Local IP leaders;**
- **Contractor's hotline:** to report cases that they think contractors can timely address them (contact detail of Contractors will be posted at construction sites, and distributed to IPs (through Subproject Information Booklet) during consultations, and posted at public billboards of Commune/Sangkat offices, pagodas; and
- **Commune/Sangkat offices**

7. IMPLEMENTATION ARRANGEMENTS

7.1 Implementation Arrangements

The MoWRAM will be responsible for implementing this IPPF. The Project Director (PD) at MoWRAM will be responsible for providing overall guidance, policy advice, conducting internal coordination, discussing and resolving issues at project level – in association with relevant government agencies where needed. The Project Manager (PM) at MoWRAM will provide day-to-day support to the PD and will be responsible for ensuring that the IPPF will be followed. The PM will oversee the work of the ESOs and ensure proper screening of IP groups will be carried out for each subproject, and steps for IP screening and social assessment described in this IPPF are followed. Within MoWRAM, the ESOs will be responsible for carrying out day-to-day activities set forth in this IPPF. An IP specialist will be appointed within MoWRAM's PMU (in addition to a Resettlement and Environmental Specialist) to provide guidance to Provincial PDWRAM in conducting consultation with affected IP in respective subprojects.

The MoWRAM needs to inform the AIIB and IFAD of the IP screening results and steps that MoWRAM will take in case IPs are present in the subproject area. When IPs are found in the subproject, MoWRAM will engage IP consultants to work closely with PMU's IP Specialist and PDWRAM to conduct Social Assessment and prepare IPPs. PMU's IP specialist and IP consultants will visit the subproject sites and work closely with PDWRAM, local authorities, relevant agencies, NGOs, particularly local IP leaders and IP members, including vulnerable groups of affected IP communities, to conduct Social Assessment.

7.2 Capacity Building

Since the MOWRAM is new to AIIB's ESF and IFAD's SECAP, and have not been familiar with requirements of AIIB's ESS3 and IFAD's SECAP Standard 4, they may not be able to conduct meaningful consultation from initial years of project implementation. In the first year, these specialists will be trained by the AIIB task team on ESF with a particular focus ESSs and IFAD's SECAP with a particular focus Standard that apply to this project to enable newly appointed ES specialists at the MOWRAM to provide appropriate support. Where needed, IP consultant will be engaged to provide additional support to PMUs' specialist, particularly in the initial years of project implementation. Since independent ES monitoring consultant will be engaged by PMU at MoWRAM, feedback from this consultant, alongside internal monitoring results, will provide regular feedback to PMU on how IPPF/IPP is carried out so that adjustment/improvement could be made appropriately and timely.

7.3 Monitoring & Evaluation

The application of the IPPF, including implementation of subproject IPPs, will be monitored internally by the MoWRAM. Adverse impact on IPs (if any) due to land acquisition will be monitored by GDR and MoWRAM as part of implementation arrangement set forth in Section 9.1.2 of project's Resettlement Planning Framework (RPF).

Within MoWRAM, the ESO will be responsible for conducting quarterly monitoring activities of the activities set for under all subproject IPPs. Monitoring of IPPF/IPP implementation will focus on assessing the compliance of IPP implementation vis-à-vis the followings:

- IP screening process and results;
- Information disclosure;
- Quality of Social Assessment and of IPP preparation;
- IPP implementation process, the level of achievement at output, outcome, and purpose levels;

- Functioning of project's GRM (as customized to respective EG/IP groups present in each subproject area to ensure the GRM is culturally appropriate to the local EG/IPs);
- Development activities carried under IPPs (based on development needs of IPs);
- Results and impacts of IPPs (in ensuring the affected IP receive socioeconomic benefits of the project that is culturally appropriate, gender and intergenerational inclusive, and contributing to achieving the objective of the AIIB's ESS3 and IFAD's SECAP Standard 4).

In addition to internal monitoring, the project will encourage IPs in subproject areas to participate in monitoring and evaluation of IPP implementation process and implementation outcome which affects them. During SA exercise, feedback and suggestions from IPs will be solicited as to how they wish to participate in monitoring and evaluation of IPP activities.

MOWRAM will provide a quarterly IPP implementation report to the AIIB and IFAD. These results will be incorporated into MoWRAM's consolidated Environmental and Social Compliance Report (ESCR) (See Annex 4 for Indicative Indicators for Internal Monitoring of IPP implementation).

7.4 Reporting

MoWRAM's ESOs will ensure feedback from affected and interested IP, as well as grievances submitted by affected IPs, are resolved timely and effectively, and that resolution results are reported timely back to the aggrieved IPs. The method of reporting back depends on the stakeholders, and as follows:

- For stakeholders at national level, email and/or official letter will be used to report back to stakeholders following consultations and/or workshops. The content of the report will summarize what comments, suggestions, concerns that have been received, by whom and when, and how such comments, suggestions, concerns were considered.
- For stakeholders at local level, follow-up meetings/consultations will be conducted to informed stakeholders know on how comments, suggestions, concerned were considered.
- For Indigenous Peoples, project's responses to their comments, suggestions, concerns are reported back to them in subsequent face-to-face consultations – in line with the project's SEP and the IPPF, including how the project had considered and addressed their concerns through concrete actions to be carried out during subproject implementation process and through IPP implementation.

Grievances of all project IP will be reported back to them through project's GRM channels within the timeframes specified for each step of the above GRM procedure.

8. COSTS AND BUDGET

8.1 Costs

Indicative costs for IPPF implementation are estimated during project preparation (See Figure below) for the purpose of budget planning. The actual costs of IPP implementation depend on the number of IPPs, including scope and activities to be carried out under each IPP, during project implementation. The estimated cost below may be updated once the list of subprojects is finalized.

8.2 Budget

The budget for implementing IPPs will be allocated from project's financing (See Figure below). Implementation, based on subprojects that will be identified/confirmed during project implementation. This budget plan will be updated to ensure funding is planned annually to ensure timely and effective implementation of proposed activities.

Table 2 – Key activities and costs for supporting IPP implementation (in US Dollars)

No.	Key activities	Stakeholders involved	Estimated costs (per province x 4)	Sub-Total (Counterpart Budget)	Sub-Total (AIIB finance)	Sub-Total (IFAD finance)	Total
1	Recruitments of IP consultants to conduct screening and SA	• MoWRAM (oversight) • ESO (implement)	3,000 x 4	12,000	-		12,000
2	Recruitment of bilingual facilitators to support consultations as part of SA	• MoWRAM • ESO (implement)	1,000 x 4	4,000	-		4,000
3	Conduct Social Assessment and Prepare subproject IPPs	• MoWRAM (oversight) • ESO (lead) • IP Consultant (implement)	5,000 x 4	20,000	-		20,000
4	Conduct mitigation measures, development activities, and relevant activities, as part of IPP (based on the needs of consulted IPs, e.g. trainings for IP on good agriculture practices such as Integrated Pest Management, water saving technology (e.g. alternative wet dry, fertilizer needs assessment/ application, alternative job that is not land based for income generation activities which are culturally appropriate, etc.)	• MoWRAM (lead) • Consultant (implement)	5,000 x 4	20,000	-		20,000
5	Monitoring and Evaluation, Reporting	• MoWRAM (oversight) • ESO (implement)	2,000x4	8,000	-		8,000
6	Staff allowance	• MoWRAM (oversight) • ESO (implement)	$34 x 7 staffs x 10 days x 4 provinces	9,520	-		9,520
7	Transport		1,000 x 4	4,000	-		4,000
8	Data collection		1,000x 4	4,000	-		4,000
9	Others		500 x 60	30,000	-		30,000
10	Contingency (10% of above 9 items)						11,152
					Grand-Total		**122,672**

ANNEXES

Annex 1 – Guidance for Screening for Indigenous Peoples/Ethnic Minorities

Once a subproject is approved, PMU's Consultant will conduct initial screening for the presence of IP/EM in the subproject area. The following steps could be followed:

1) **Define area of influence** (subproject area): subproject area needs to be defined, spatially, based on the subproject area described in the most updated Environmental and Social Impact Assessment/ Environmental and Social Management Plan prepared for the subproject.

2) **Screening.** Screening of IP/EM consist of two key tasks: desktop review and field works.

Desktop screening. Conduct IP/EM screening vis-à-vis above defined subproject. Identification of potential presence of IP/EM could be carried out initially based on the IP database managed by the Ministry of Rural Development and the Ministry of Planning. In addition, commune authorities within the subproject area could be asked to provide the most updated information about IP/EM groups living in their respective communes to facilitate consultant's initial desktop screening. It is noted that Ethnic Minorities refer to all groups by their own ethnicity and IP in the context of Cambodia refers to IP groups that are officially recognized. Screening results need to be updated if there is change to subproject area.

Consultant's screening needs to cover IP groups (that are recognized by the Government), and other ethnic groups based on the definition of IP of AIIB and IFAD (See also Definitions section of this document).

Field visit. After completing desktop review, PMU's consultant will visit the subproject's area of influence to validate their above initial screening results In addition to face-to-face validation with local commune authorities (and district authorities if needed) on initial screening result, the consultant need to conduct field observation in area where identified IP/EM are living, and their production area. Consultant may need to interview IP/EM and their respective leaders living in subproject area, and local people who are knowledgeable about IP/EM such as the village chiefs, opinion leaders, mass organizations such as commune women's union, farmers' association, to understand more about the socioeconomic and cultural life, livelihood activities, cultural heritages of the identified IP/EM in the subproject area. Consultant needs to visit the field again if there is change to subproject area.

While doing desktop screening and making field visit for validation of desktop review, the following guiding questions and IP screening form can be used:

- Are there socio-cultural groups in or use the subproject area who may be considered as hill tribes, ethnic minorities or indigenous communities within the subproject area?
- Are there national or local laws or policies as well as anthropological research or studies that consider these groups residing in or using the subproject area as belonging to ethnic minorities, IPs or cultural communities?
- Do such groups identify themselves as being part of a distinct social or cultural group?
- Do such groups maintain collective attachments to distinct habitats or ancestral territories and/or to the dominant society in these habitats and territories?
- Do such groups maintain cultural, economic, social and political institutions distinct from the dominant society and culture?
- Do such groups speak a distinct language or dialect?
- Have such groups been historically, socially and ecologically marginalized, disempowered, excluded and/or discriminated against?
- Are such groups represented as IPs in any formal decision-making bodies a the National of local levels?

- Do such groups experience subjugation, marginalization, dispossession, exclusion or discrimination?
- How vulnerable the groups are under the subproject's impacts and risks?

If screening result indicates that the ethnic groups being considered matches the definition of IPs as per AIIB's ESS 3 and IFAD's Standard 4 (See definition of IPs at section "Definitions" of this document), the IP screening results should be documented fully in the form of IP Screening Report and recommend that an IPP will be prepared for the relevant subproject.

Screening checklist				
Questions	**Yes**	**No**	**Not known**	**Remarks**
A. Indigenous Peoples Identification				
1. Are there socio-cultural groups present in or usethe Project/Subproject area who may be considered as "tribes" (hill tribes, schedules tribes,tribal peoples), "minorities" (ethnic or national minorities), or "indigenous communities" in the Subproject area?				
2. Are there national or local laws or policies as wellas anthropological research/studies that consider these groups present in or using the subproject areas belonging to "ethnic minorities", scheduled tribes, tribal peoples, national minorities, or cultural communities?				
3. Do such groups self-identify as being part of a distinct social and cultural group?				
4. Do such groups maintain collective attachmentsto distinct habitats or ancestral territories and/or tothe natural resources in these habitats and territories?				

5. Do such groups maintain cultural, economic, social, and political institutions distinct from the dominant society and culture?				
6. Do such groups speak a distinct language or dialect?				
7. Has such groups been historically, socially and economically marginalized, disempowered, excluded, and/or discriminated against?				
8. Are such groups represented as "Indigenous Peoples" or as "ethnic minorities" or "scheduled tribes" or "tribal populations" in any formal decision-making bodies at the national or local levels?				

Questions	**Yes**	**No**	**Not known**	**Remarks**
B. Identification of potential impacts *(provide elaboration in Remarks column)*				
9. Will the subproject directly or indirectly benefit or target IPs?				
10. Will the subproject directly or indirectly affect Indigenous Peoples' traditional sociocultural and belief practices? (e.g. childrearing, health, education, arts, and governance)				
11. Will the subproject affect the livelihood systemsof Indigenous Peoples? (e.g., food production system, natural resource management, crafts and trade, employment status)				
12. Will the subproject be in an area (land or territory) occupied, owned, or used by Indigenous Peoples, and/or claimed as ancestral domain?				
C. Identification of Specialist Requirements				
13. Commercial development of the cultural resources and knowledge of IPs?				
14. Physical displacement from traditional or customary lands?				
15. Commercial development of natural resources (such as minerals, hydrocarbons, forests, water, hunting or fishing grounds) within customary lands under use that would impact the livelihoods or the cultural, ceremonial, spiritual uses that define the identity and community of Indigenous Peoples?				
16. Establishing legal recognition of rights to landsand territories that are traditionally owned or customarily used, occupied or claimed by IPs?				
17. Acquisition of lands that are traditionally ownedor customarily used, occupied or claimed by IPs?				

Anticipated impact on IPs

Subproject activities		**Expected positive impact**	**Expected negative impact**

Subproject Category	Subproject eligibility	Next steps
A. Subproject has impacts (negative or positive) on IP communities residing withinthe subproject area.	A/B	Prepare IPP describing the completion of meaningful consultations with the IPs and the identification of appropriate mitigation measures to obviate or mitigate any identified negative impacts.
B. Subproject has no impacts sine there are no IP communities residing in thesubproject area.	C	No IPP required and no further action is needed.

Annex 2 – Guidance for Preparing an Indigenous People Plan (IPP)

As mentioned in Section 4.2, preparation of an IPP involves two key steps: conducting a Social Assessment (SA) and writing up the IPP.

1. Conducting a Social Assessment for the purpose of IPP

The SA aims to understand how the IP is affected by the subproject's activities, which informs how mitigation and development measures shall be proposed. The SA aims to explore measures to ensure a) affected IPs shall receive socioeconomic benefits culturally appropriate to them; b) if there are any potential adverse impacts and risks for IPs, such risks and impacts will be avoided to extent possible; c) where avoidance is not possible, measures are proposed to minimize, mitigate, and compensate for unavoidable adverse impacts. Mitigation and development measures will be proposed based on meaningful consultations with the IP households affected by subproject's investment activities.

The scope of SA will be proportionate to: (a) the magnitude of subproject's risks and impacts on the IP; socioeconomic status; cultural and communal integrity and heritage; health, education, livelihood systems and social security status; and indigenous knowledge; and (b) the vulnerability of the affected Indigenous Peoples. The IPP will also need to complement the broader coverage of environmental and social risks and impacts identified in subproject's Environmental and Social Impact Assessment that is conducted to develop subproject Environmental and Social Management Plan. The IPP need to provide specialized guidance on how specific issues associated with the needs of affected IP shall be addressed.

The level of detail and comprehensiveness of the IPP should be proportionate to subproject's risks and impacts. Mitigation and development measures that are proposed for the affected IPs should be culturally appropriate to the IPs.

2. Writing up the IPP

An Indigenous Peoples Plan (IPP) is required for subprojects that have impacts on IPs (positive, adverse, or both). The level of detail and comprehensiveness of IPP is commensurate with the significance of potential impacts on indigenous peoples. The substantive aspects of this outline will guide the preparation of IPPs,although not necessarily in the order shown.

1. **Executive Summary of the Indigenous Peoples Plan**
   This section concisely describes the critical facts, significant findings, and recommended actions.

2. **Description of the Project**
   This section provides a general description of the subproject, discusses the subproject interventions and activities that may bring impacts on indigenous peoples; and identifies the subproject area.

3. **Social Impact Assessment**
   This section:
   a) Reviews the legal and institutional framework applicable to IPs in the subproject context.
   b) Provides baseline information on the demographic, social, cultural, and political characteristics of the affected indigenous peoples communities; the land and territoriesthat they have traditionally owned or customarily used or occupied; and the natural resources on which they depend.

c) Identifies key Project stakeholders and elaborate a culturally appropriate and gender- sensitive process for meaningful consultation with indigenous peoples at each stage of subproject preparation and implementation, taking the review and baseline informationinto account.
d) Assesses, based on meaningful consultation with the affected indigenous peoples, thepotential adverse and positive effects of the Project. Critical to the determination of potential adverse impacts is a gender-sensitive analysis of the relative vulnerability of,and risks to, the affected indigenous peoples given their particular circumstances andclose ties to land and natural resources, as well as their lack of access to opportunitiesrelative to those available to other social groups in the communities, regions, or national societies in which they live.
e) Includes a gender-sensitive assessment of the affected IPs perceptions about the project and its impact on their social, economic, and cultural status.
f) Identifies and recommends, based on meaningful consultation with the affected IPs, the measures necessary to avoid adverse effects or, if such measures are not possible,identifies measures to minimize, mitigate, and/or compensate for such effects and to ensure that the indigenous peoples receive culturally appropriate benefits under the Project.

4. Information Disclosure, Consultation, and Participation

This section: (i) describes the information disclosure, consultation, and participation process with the affected indigenous peoples that was carried out during subproject preparation; (ii) summarizes their comments on the results of the ESIA and identifies concerns raised during consultation and how these have been addressed in the Project design; (iii) in the case of Project activities requiring broad community support, documents the process and outcome ofconsultations with affected IPs and any agreement resulting from such consultations for the Project activities and safeguard measures addressing the impacts of such activities; (iv) describes consultation and participation mechanisms to be used during implementation to ensure ethnic minority participation during implementation; and (v) confirms disclosure of thedraft and final IPP to the affected IPs.

5. Beneficial Measures

This section specifies the measures to ensure that the IPs receive social and economic benefits that are culturally appropriate, and gender responsive.

6. Mitigation Measures

This section specifies the measures to avoid adverse impacts on IPs; and where the avoidance is impossible, specifies the measures to minimize, mitigate and compensate for identified unavoidable adverse impacts for each affected indigenous peoples.

7. Capacity Building

This section provides measures to strengthen the social, legal, and technical capabilities of (i)government institutions to address IPs issues in the Project area; and (ii) IPs organizations inthe Project area to enable them to represent the affected IPs more effectively.

8. Grievance Redress Mechanism

This section describes the procedures to redress grievances by affected IPs. It also explains how the procedures are accessible to indigenous peoples and culturally appropriate and gender sensitive.

9. Implementation Arrangement

This section describes institutional arrangement responsibilities and mechanisms for carryingout the various measures of the IPP. It also describes the process of including relevant local organizations and nongovernment

organizations in carrying out the measures of the IPP.

10.Monitoring, Reporting and Evaluation

This section describes the mechanisms and benchmarks appropriate to the Project for monitoring and evaluating the implementation of the IPP. It also specifies arrangements for participation of affected indigenous peoples in the preparation and validation of monitoring, and evaluation reports.

11.Cost Estimate and Financing

This section provides an itemized budget for all activities described in the IPP.

Annex 3 – Indicators for IPP Implementation Monitoring

Monitoring indicators should assist the project to assess progress of the Indigenous Peoples Plan (IPP) and whether mitigation measures are effective, resulting in desired outcomes. This enables the project to respond to any issues and manage change accordingly.

Indicators that show implementation progress are called process indicators and give some certainty that the project is proceeding according to plan.

Indicators that measure whether the IPP mitigation measures are successful are called outcome indicators and reflect the results of the process.

It is important that an appropriate number of indicators be included in the monitoring plan. Too few may leave gaps in critical areas. Too many may overburden the collection process, and diminish quality. Use the minimum but necessary number of monitoring indicators to ensure adequate IPP implementation and expected outcomes.

Some examples of process and outcome indicators are shown below. They are not an exhaustive list, and should be selected as required.

Example of Process Indictors	
Demographic baseline	• The numbers of affected Indigenous Peoples (IP) by category of impact, gender, age, habitat (village etc.), income, status and position • Number of households with handicapped, elderly or invalid members • Number of female headed households • Number of vulnerable households (poor, elderly) • Number of households by ethnic group • Number of births and deaths
Consultation and participation	• Number of consultation and participation activities that occur—meetings, information dissemination, brochures; flyers, training • Percentage of IP women as participants; number of meetings exclusively with IP women • Percentage of vulnerable IP groups represented / attending meetings; number of meetings exclusively with vulnerable IP groups. • Languages used at meetings • Good faith negotiations—recording of process, participants, locations, correspondence • Broad community support—record of processes, participants, locations and agreement obtained • Consultation and participation progress against plan and budget
Mitigation measures	• Progress of implementation of mitigation / beneficial measures against plan • Number of activities that occur/completed—such as construction, livelihood restoration, disbursements, training • Percentage progress against timelines and budget
Grievance redress	• Total number of people/groups using the grievance redress procedure. • Number of distinct people/groups. Any IP group with significantly more grievances? • How many times has a household submitted the same grievance? • Number of grievances resolved? • Length of time taken to be resolved? • Types of grievance categories and prevalence

Implementation problems	• Identified delays — (days, cost) due to personnel, capacity, insufficient funds, etc. • Number of times implementation schedule revised
Example of Outcome Indicators	
Consultation and participation program	• Awareness of IP issues among implementing stakeholders in each sector • Awareness of IPP mitigation and beneficial measures amongst recipients • Awareness of project details amongst stakeholders • IP perception of effectiveness, cultural appropriateness and inclusiveness of consultation measures • Attendance at consultation and participation activities Level of involvement by IP and representatives in the design and implementation of consultation and participation
Enhanced dignity of IP groups, integrity of traditional kinship networks and livelihood patterns	• Changes in religious/cultural practices • Changes in cultural governance • Participation in cultural governance (by gender, status) • Number of people (age and sex) who can speak national language and/or local dialect • Changes in condition of schools, community buildings, temples structures • Numbers of religious/cultural events and persons (monk shamans, priests etc.) • Participation in cultural/religious events (by gender, time/resources allocated)
Livelihoods and living standards	• Major asset inventory—e.g. vehicle, phone, tools, kitchen equipment • Changes in patterns of IP occupation, production, and resource use • Changes in income and expenditure patterns among IP households • Savings • Change in food used by IP—amount, nutrition source • Cost of living changes—market prices etc. • Changes in key social parameters—gender roles of production • Vulnerable groups—status, relative income, livelihood · Education—literacy and numeracy level in national/ethnic language • School attendance of IP children (by sex and age) • Key health indicators of IP (by gender, age)

Climate Adaptive Irrigation and Sustainable Agriculture for Resilience Project

Annex 6

ENVIRONMENTAL, SOCIAL AND CLIMATE MANAGEMENT FRAMEWORK

Version 2

30 September 2023

ACKNOWLEDGEMENTS

The CAISAR project is composed of three sub-project command areas – Ou Ta Paong, in Pursat Province, Lum Hach, in Kampong Chhnang Province and Krang Ponley in Kampong Chhnang, Kapong Speu and Kandal This ESCMF report was submitted by the Cambodia Ministry of Water Resources and Meteorology (MOWRAM) (Accredited Entity) for GCF financing under the CAISAR project. The report was prepared by Ron Livingston (CAISAR SECAP Team Leader) with key inputs from Tuan Anh Le (CAISAR SECAP Gender and Social Safeguards Expert); Sopheak Kong (CAISAR SECAP National Deputy Team Leader) and Socheat Penh (CAISAR SECAP National Environmental Expert under the overall guidance of his H.E. Chann Sinath, MOWRAM AIIB Project Director; Ms. Bo Zhang, CAISAR Project Team Leader, Investment Operations Officer, AIIB; and Mr. Frew Behabtu, Country Director for Cambodia, IFAD.

The ESCMF report should be read in conjunction with the other safeguards documents (Stakeholder Engagement Plan, Resettlement Planning Framework, Indigenous Peoples Planning Framework, Gender Assessment & Social Action Plan, and Environmental and Social Impact Assessment).

Assessment of environmental and social risks and impacts, both inherent and project-related, was based on supporting background reports, desk reviews of literature and similar projects, and extensive consultation during the project design. Many consultations with National, Provincial and District agencies and community members in project communes have been undertaken on the various aspects of the CAISAR project. The first round of consultations specific to the ESCMF were conducted during June 2023. We are grateful to the focal points of four project provinces who worked hard to support the introduction of the planned projects and discussions on the planned objectives, outcomes and benefits. Without their commitment and active support in leading the extensive consultation effort, the consultations would not have been possible.

We are grateful to each and every member of the target communities from the communes and districts of the four project provinces who participated in various consultation sessions. Their important insights about their respective communities and suggestions to the project's design are key to its success. The information they provided was extremely helpful for guiding the focus, design, and planned implementation of the project interventions.

We also thank colleagues and reviewers for their insights, comments, and suggestions, including: Mr. Sheikh Naveed Ahmed, AIIB Social Safeguard Specialist, Ms. Xinchen Zhang, AIIB Environmental Safeguard Specialist, Mr. Rahul Srivastava, AIIB Senior Environment Specialist, Ms. Alessandra Gage, FAO Environment Officer (Climate Change), and Susmita Bandyopadhyay, IFAD Safeguards Specialist for Asia & Pacific Region and many other colleagues whose comments and suggestions have enhanced the quality of the safeguard reports.

EXECUTIVE SUMMARY

1. **Project Rationale**: The CAISAR project covers a total command area of 45,000ha and is composed of three sub-project command areas – Ou Ta Paong, in Pursat Province, Lum Hach, in Kampong Chhnang Province and Krang Ponley in Kampong Chhnang, Kapong Speu and Kandal. The project objective is to improve agriculture productivity by providing irrigation and flood protection in the project areas. The project design is to increase climate adaptation, mitigate the negative impact of extreme climate events, and improve livelihoods of smallholder farmers and vulnerable rural communities in four provinces of Cambodia (Pursat, Kampong Chhnang, Kampong Speu, and Kendal). Mitigation is a co-benefit of this adaptation project, as it will also contribute to reduce GHG emissions, including methane emissions from rice fields. These objectives will be achieved by implementing three components that aim at addressing climate change vulnerabilities, increasing agriculture productivity, and developing institutional capacities. The investments to be implemented will (i) combine robust climate-resilient water management and agricultural practices at the farm level, (ii) establish climate-proofed irrigation and flood control infrastructure and (iii) develop institutional capacity to plan, maintain and operate irrigation and flood control infrastructure in a changing climate context. The CAISAR project has a broad positive impact benefitting 120,000 households (500,000 rural people) directly while its effect will propagate to over 3 million people in the region. The project will be executed through the Ministry of Water Resources and Meteorology (MOWRAM) and the National Committee for Sub-National Democratic Development Secretariat (NCDD-S), a Direct Access Accredited Entity to the GCF. The expected timelines for the approval of the co-financing by IFAD and AIIB Executive Boards are respectively September 2024 and January 2024, with the inception of the project is expected to take place in December 2024.

2. **Methodology for Risk Categorization:** Project-related and inherent environmental, social, and climate risks were determined by: (i) screening the project activities against the International Fund for Agricultural Development's (IFAD's) Social, Environmental, and Climate Assessment Procedures (SECAP) requirements, the AIIB's Environmental & Social Framework (ESF), and the Green Climate Fund's (GCF's) Environmental & Social Policy; (ii) considering the findings of desk research on risks associated with similar projects and relevant background papers; and (iii) incorporating findings from the first round of ESCMF stakeholder consultations and previous stakeholder engagement efforts in the form of household surveys (630 households in total), 100 focus group discussions, and 100 key informant interviews. Numerous missions to the project areas and discussions with provincial and district agencies and communes enhanced understanding of project objectives.

3. The initial SECAP review identified patterns of existing issues inherent to the project area which could increase risk to the project, its personnel, and/or beneficiaries. Additional desk research highlighted further areas of potential inherent risk and lessons-learned from other projects. The screening of CAISAR project activities, together with the ESCMF stakeholder meetings, household survey responses, focus group discussions, key informant interviews, and field visits with consultations provided insight on the latest conditions which could affect the success of the project and the potential project-specific impacts (both positive and negative).

4. **Framework Approach:** Given that site locations for project implementation have not been finalized, the design team agreed to use a framework approach consistent with IFAD's SECAP and GCF's ESS. Documentation is based on the format typically provided for a GCF project, rather than the typical IFAD SECAP note format, to simplify the approval process. This was agreed upon with AIIB and IFAD headquarters prior to development of this ESCMF.

5. **Project Impacts & Inherent Risks:** The safeguards categorization for CAISAR is high for both social and environmental impacts and risks. To address issues of climate-induced risks and impacts, the CAISAR project will apply several climate resilience measures and adaptation strategies including climate-informed planning, integrated water resources management, efficient irrigation practices, water storage and reservoir management, ecosystem-based approaches, early warning systems, climate-resilient

infrastructure, capacity building and awareness, stakeholder engagement and participatory approaches, and monitoring and evaluation. These measures will be financed under the project, as the project explicitly targets climate mitigation and adaptation by design.

6. **Key social impacts to be considered as part of the ESCIA** include: (i) potential contraction of diseases (e.g. sexually transmitted diseases such as HIV/AIDS, and/or other communicable diseases) due to labor influx; (ii) potential conflict with local communities due to construction workers who work and stay near the community; (iii) potential labour-related accidents for persons hired by the project construction companies to support seasonal construction work; (iv) gender based violence and/or sexual harrassment and abuse (e.g. verbal and physical abuse, sexual harrassment, violence against children) due to the influx of labour; (v) child labour/age inappropriate work, (vi) forced labour (e.g. coerced to work through the use of violence/intimidation, or by more subtle means such as debt manipulation, retention of identity papers, or similar threats); (vii) possible social exclusion (due to vulnerability, land tenure issues, disability, etc.); and (viii) lack of contract for EM workers, particularly for seasonal works of less than one month's duration.

7. The above risks to be evaluated as part of the ESCIA are not considered to be serious in nature and mitigation measures will be included in the ESCMP. General mitigation measures are provided within Chapter IV of this Environmental, Social and Climate Management Framework (ESCMF).

8. **Key environmental impacts to be considered as part of the ESCIA include:** The project is expected to have largely positive environmental impacts, including improved ecosystem services, soil fertility/soil health, forest health, and natural resources management. Potential negative environmental impacts to be mitigated include are related to small-scale infrastructure (e.g. construction/repair of small-scale rural roads, irrigation channels, small-scale reservoirs, etc.). These impacts may include: (i) erosion and run-off to water bodies during earthworks/construction; (ii) temporary traffic blocks and related safety issues during construction and operation; (iii) temporary pollution from construction (e.g. dust, noise, vibration, waste & wastewater generation from workers' campsites); (iv) potential water pollution from sourcing aggregates/construction materials (soil, gravels); and (v) increased water consumption. Additional environmental risks (not explicitly linked to construction activities) include: (i) presence of unexploded ordinances (UXOs) at project sites (an inherent risk listed below); and (ii) increased use of pesticides due to crop intensification/improved crop yields. As with the social risks and impacts, mitigation measures for the environmental risks and impacts are provided in Chapter IV of this ESCMF.

9. To mitigate issues pertaining to social exclusion and conflict over land use/land tenure/land management, related safeguards documents, like the Stakeholder Engagement Plan (SEP), Indigenous Peoples' Plan (IP Plan), and Gender Assessment and Action Plan (GAP), have been developed to supplement this ESCMF and improve overall project design. The Grievance Redress Mechanism (GRM) is also available for any project affected persons who feel they have been negatively impacted or excluded and is detailed in Chapter IX of this ESCMF.

10. **Inherent Risks:** There are inherent risks pertaining to presence of landmines and unexploded ordinances (UXOs) if construction occurs in new areas (i.e., areas without existing construction/infrastructure/activities). Inherent risks are addressed with project-related impacts under Chapter IV of the ESCMF.

11. **Implementation:** The ESCMF will be implemented with the support of two safeguards specialists with MOWRAM Project Management Unit. Further support at the commune level will be determined by inclusion of safeguards-related obligations within the Terms of Reference of the project staff/implementing agencies. For construction financed under the project, contractors will be obliged to abide by the GCF and AIIB and IFAD safeguards requirements, in addition to national legislation/regulations, and commit to Environmental and Social Management Plans (ESCMPs) and Environmental Codes of Practices (ECOPs) as part of their contract. Independent ESC monitoring will be conducted over the life of the project construction and implementation phase. A socio-economic and census survey will be conducted to support the development of the Resettlement Plan.

1. INTRODUCTION

1.1 Project Rationale

1 The CAISAR project covers a total command area of 45,000ha and is composed of three sub-project command areas – Ou Ta Paong, in Pursat Province, Lum Hach, in Kampong Chhnang Province and Krang Ponley in Kampong Chhnang, Kapong Speu and Kandal. The project objective is to improve agriculture productivity by providing irrigation and flood protection in the project areas. The project design is to increase climate adaptation, mitigate the negative impact of extreme climate events, and improve livelihoods of smallholder farmers and vulnerable rural communities in four provinces of Cambodia, including Pursat, Kampong Chhnang, Kampong Speu, and Kendal provinces. Mitigation is a co-benefit of this adaptation project, as it will also contribute to reduce GHG emissions, including methane emissions from rice fields. These objectives will be achieved by implementing three components that aim at addressing vulnerabilities of farming communities to climate change, increasing agriculture productivity, and developing institutional capacities. The investments to be implemented will (i) combine robust climate- resilient water management and agricultural practices at the farm level, (ii) establish climate-proofed irrigation and flood control infrastructure and (iii) develop institutional capacity to plan, maintain and operate irrigation and flood control infrastructure in a changing climate context. The CAISAR project has a broad positive impact 'enefitting 120,000 household (500,000 people) directly while its effect will propagate to over 3 million people in the region. The project will be executed through the Ministry of Water Resources and Meteorology (MOWRAM) and the National Committee for Sub-National Democratic Development Secretariat (NCDD-S), a Direct Access Accredited Entity to the GCF. The expected timelines for the approval of the co-financing by IFAD and AIIB Executive Boards are respectively September 2024 and January 2024, with the inception of the project is expected to take place in December 2024.

1.2 Country & Project Context

2 The CAISAR Feasibility Study noted that Cambodia is highly vulnerable to climate change and natural disaster risks. It is ranked 151 out of 181 countries in the 2020 ND-GAIN Index, was the 12th most disaster-prone country among 172 countries for 1999–2018 and remains one of the few Least Developed Countries (LDCs) in Asia. Annual economic losses resulting from natural disasters in the country were estimated at 0.7% of GDP in 2011. The World Risk Index of 15.8% indicates a very high risk of disaster because of extreme natural events, with an exposure index of 27% and a vulnerability index of 59%. Approximately 80% of the country is within the Mekong River and Tonle Sap basins, increasing exposure to floods, storms, and droughts. Identified hazards are assessed as high across the whole country for river floods and coastal floods, cyclones, extreme heat, and wildfires. By mid-century, climate change will result in more frequent heavy precipitation days, from 2.4 days to 4.9 days in the rainy season, and an increase in the number of consecutive dry days in the same season from 0.8 days to 4.4 days. The median temperature is projected to increase by 1.6°C by 2060.

3 Cambodia has approximately 4.5 million ha of cultivated land, 70% of which is rice production, as well as industrial crops (20%), rubber plantations (7%), and permanent crops (4%). Cambodia maintains a high reliance on the agriculture sector, which accounts for nearly 22% of the country's GDP while the rural population represents 75.8% of the national population[1]. In Cambodia, relatively low yields, coupled with frequent natural disasters, contribute to temporary food shortages for vulnerable communities. Based on food availability and food access, a mapping of food security has been conducted for the country. Seven of Cambodia's 25 provinces (including Phnom Penh) are classified as acutely food insecure, and an additional seven are moderately insecure. Livelihoods rely heavily on rain-fed agriculture and non-poor households are vulnerable to falling back into poverty in the event of extreme or frequent climate shocks[2].

[1] UNDESA (2018) The Least Developed Country Category: 2018 Country Snapshots. Available at: https://www.un.org/development/desa/dpad/wp-content/uploads/sites/45/Snapshots2018.pdf.

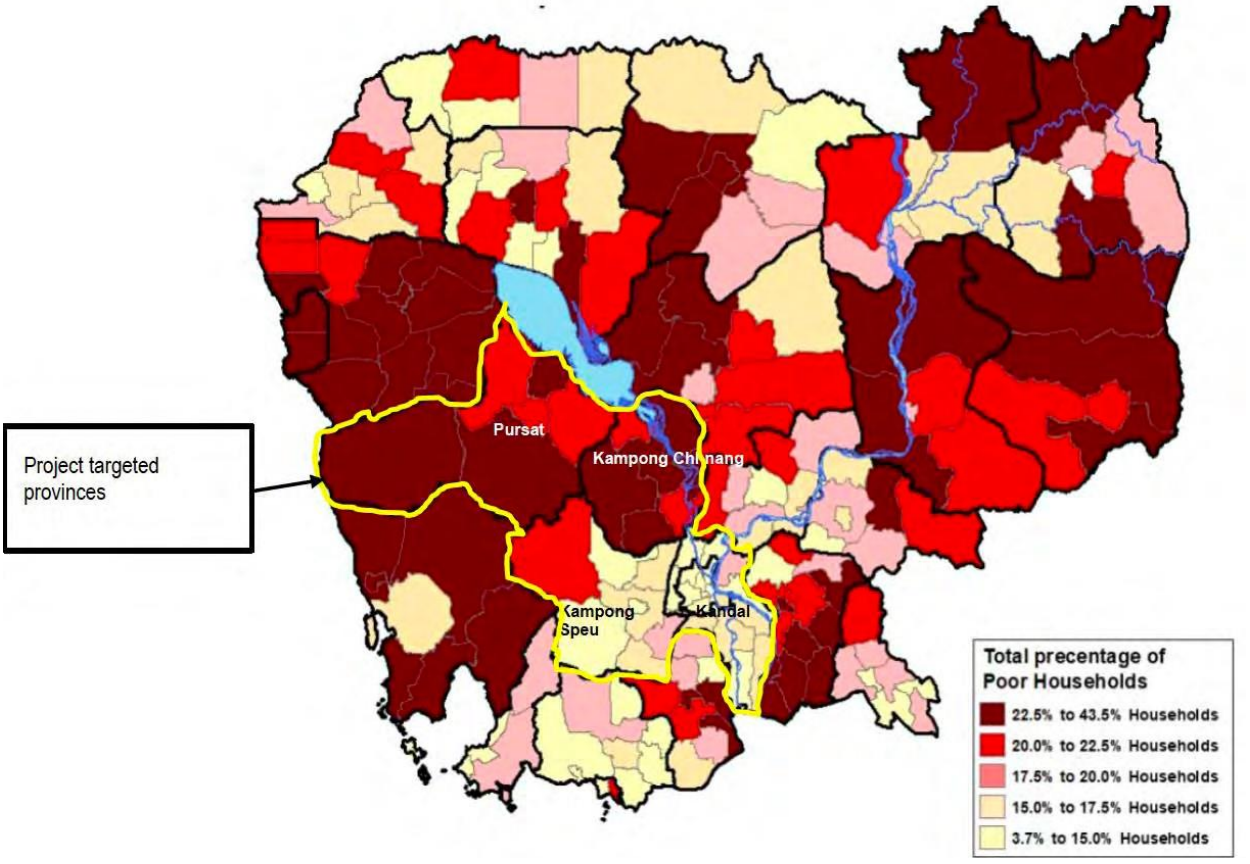
4 Women and children are among the most vulnerable groups to climate change. Climate adaptation among rural populations and national institutions remains low as many households face rising debt caused by coping with natural disasters and the COVID-19 pandemic. Since 2020, the negative impacts of climate change and the pandemic led to a 10% loss in Gross Domestic Product (GDP). In addition to negative climate impacts, the stagnating global agricultural commodity prices, rising labor costs and the limited scope for cropland expansion in the country will challenge the agriculture sector (WB, 2015)[3].

5 Farming remains mostly subsistence-based and rain-fed, with low productivity. Only 7 – 8% of the total potential agricultural land area is under full irrigation in Cambodia. Further, only 15% of the cultivated rice area is irrigated (compared to 28% in Thailand and 46% in Viet Nam), and 85% of the rice cropping area is vulnerable to changing rainfall patterns[4]. Therefore, while rice accounts for 50% of agricultural GDP, yields are lower than neighboring countries. The lack of water for irrigation is a crucial barrier for farmers to deal with climate change-induced water shortages, and to cultivate more than a single crop per year – limiting their resilience and adaptive capacity. Studies suggest that shifting to irrigated cultivation could result in annual overall production increases of up to 40%. The lack of timely information on droughts and floods (seasonal forecasts, the changing length) is another barrier. Furthermore, farmers lack the knowledge and tools to adapt their farming practices / production techniques to climate change; they are largely unaware of climate resilient practices (e.g., alternatives to flooded rice cultivation or application of AWD methods in rice), stress-tolerant seed varieties and improved planting materials, efficient input management, and the benefits of applying such practices. The labor shortage in rural areas has increased due to migration to urban areas, which in turn has led to a rise in agricultural wages. Other significant barriers for small-scale farmers include access to credit on attractive and appropriate terms, and market intelligence. Cambodia is unlikely to achieve 5% of their annual agricultural growth target by 2030, without more investment in climate adaptation, sustainable irrigation, and flood control and drainage schemes. Persistent poverty, limited access to finance, and insufficient institutional capacities have left the rural agrarian population vulnerable to the negative impacts of climate change, economic slowdown, and environmental degradation.

6 The local private sector also fails to offer technologies that farmers need (e.g., stress tolerant seeds, bio-inputs) and engage in value addition (e.g., rice milling prior to exports) adequately and sufficiently. Production and distribution costs of agricultural products are high compared to the neighboring countries, largely due to high energy and transport costs. Private sector investment in water saving micro technologies in irrigation and extension services remains low due to an unfavorable agri-business environment, such as access to appropriate finance, poor communication and cooperation between government and private sector, and the absence of a clear regulatory framework for the establishment, operation and pricing for the private management of water. Large agri-businesses face high costs and shortages of working capital. Many agri-business firms operate below capacity and potential new investors are reluctant to invest due to low profitability and high risk of failure.



7 There are several obstacles to women's economic empowerment in Cambodia, including (i) the amount of time and responsibility for unpaid domestic and care work, (ii) low levels of literacy and education, and (iii) a lack of access to resources necessary for economic empowerment, and (iv) resilience to climate risks. Women have higher participation in agriculture than men but receive lower benefits and have lower access to land, extension services, financial services, markets, and technologies. Rural youth face difficulties in accessing land, which also limits access to credit, as financial institutions generally require land as collateral and a high proportion migrate to urban areas in search of work. Poverty incidence among ethnic minorities is not significantly higher than among the majority, but they suffer disadvantages in access to health, education and other services.

[4] Kono, A. and Chey, T. 2019. Rapid assessment of upland cashew, mango, organic rice, and vegetable production. Actions for Climate-resilient and Sustainable Agricultural Production in the Northern Tonle Sap Basin. FAO.

8 In Cambodia, GHG emissions are dominated by the Forestry and Other Land Uses (FOLU) sector (60.90%) and agriculture (16.9%), followed by energy (12.10%), IPPU (7.90%) and waste (2.20%) sectors. Under a business-as-usual (BAU) scenario, Cambodia forecasts an increase in emissions from 125.2 MtCO2eq in 2016 to 155.0 MtCO2eq in 2030. While the emissions reduction scenarios (by 2030) in the NDCs largely target AFOLU and energy sectors, owing to the links between FOLU (land-use and forest conversion) and agriculture, actions to increase productivity of agricultural lands and interventions such as home gardens are likely to have indirect effect on AFOLU targets[5].

9 The CAISAR target provinces include: Kampong Speu, Kampong Chhnang, Kandal, and Pursat. These provinces[6] have the highest population density, high total percentage of poor households, and a high percentage of women-headed households (Figure 1). The livelihoods of the poorest and most vulnerable people in the region depend mainly on agricultural production and water availability through precipitation, river flow, and irrigation schemes. This area and its population is particularly vulnerable to climate risks due to changing weather patterns and flooding.

10 The project area was already under stress prior to the COVID-19 pandemic with small-scale farmers and larger food producers struggling to produce food and access markets. Food shortages face, additional pressure from climate change with serious droughts[7] during the dry months and heavy monsoon during the rainfall season. Rural communities highlight major water problems with competition in irrigation due to aging/lack of infrastructure and reduced water availability in rivers and ponds, which poor communities and households depend on. The proposed underlying investment project will support the government's efforts to sustain food security and rural livelihood after the COVID-19 crisis through the restoration and enhancement of climate-smart and climate-resilient irrigation systems under the "Build Back Better" approach in the target provinces.

1.2.1 *Climate Change Impacts and Vulnerability of the Agriculture Sector*

11 The concept note stated that similar to other monsoon-dependent countries, climate change is altering Cambodia's and project areas' monsoon calendar, increasing total drought days and shifting the start of the rainy season. While annual rainfall is expected to increase, the number of days with rain is decreasing and daily rain intensity is increasing, resulting in extreme rainfall events and flooding risks. The World Resource Institute (WRI) rates the upper and lower Tonle Sap watershed as extremely high for water risk (WRI, Aqueduct). Inter-annual variability in rainfall significantly influences river discharges and between one and four million hectares of Cambodia's floodplain, of which about 25% falls in the project areas, may be submerged during the wet season, reaching critical thresholds for irrigation and ecosystem stability.

12 Flooding in the project areas generally occurs between July and October, driven by rainfall as well as high water levels in the Mekong River and Tonle Sap Lake. With the increased intensity of wet-season rainfall, the duration and extent of flooding have increased in some areas. While local rainfall patterns are important for both irrigated and rainfed agricultural systems, the Mekong-Tonle Sap flood impulse dominates the flooding pattern and hence plays an important role in the overall water management.

13 Observed impacts of climate change trends in recent years have manifested by longer dry seasons and more intense "El Niño" related droughts, delayed onset of the monsoon season, increased rain intensity and frequency, leading to floods, and unexpected dry periods during the rainy season. Annual mean temperature anomaly has increased at a rate of 0.23 °C per decade since 19508, with a stronger signal of increase during the dry season. The rate of temperature change is notable in the dry season (December, January and February) followed by pre-monsoon (March, April and May) and, to a minor extent, by wet season months (June, July and August). The increase in mean annual temperature and decrease in dry season rainfall has manifested in droughts and water shortages significantly impacting rainfed agriculture due to a late start and early ending of the wet season.9

14 On average, annual damages and loss of wet season rice caused by floods and droughts is approximately 120,501 hectares, of which 70 percent of the damage and loss is due to floods and 30 percent is the result of droughts. Flooding occurs frequently and extensively in Cambodia. The source of these floods can be the Mekong River including the Tonle Sap Great Lake, tributary flash floods, urban flooding, and failure of structures such as protection levee and storages. In terms of the population affected, Cambodia is one of the world's most flood-exposed countries in the world. By 2050, population exposed to flood is expected to reach 19% of the population. Projected climate change trend indicates more severe floods and droughts, which is expected to affect Cambodia's GDP by nearly 10% by 2050[10]

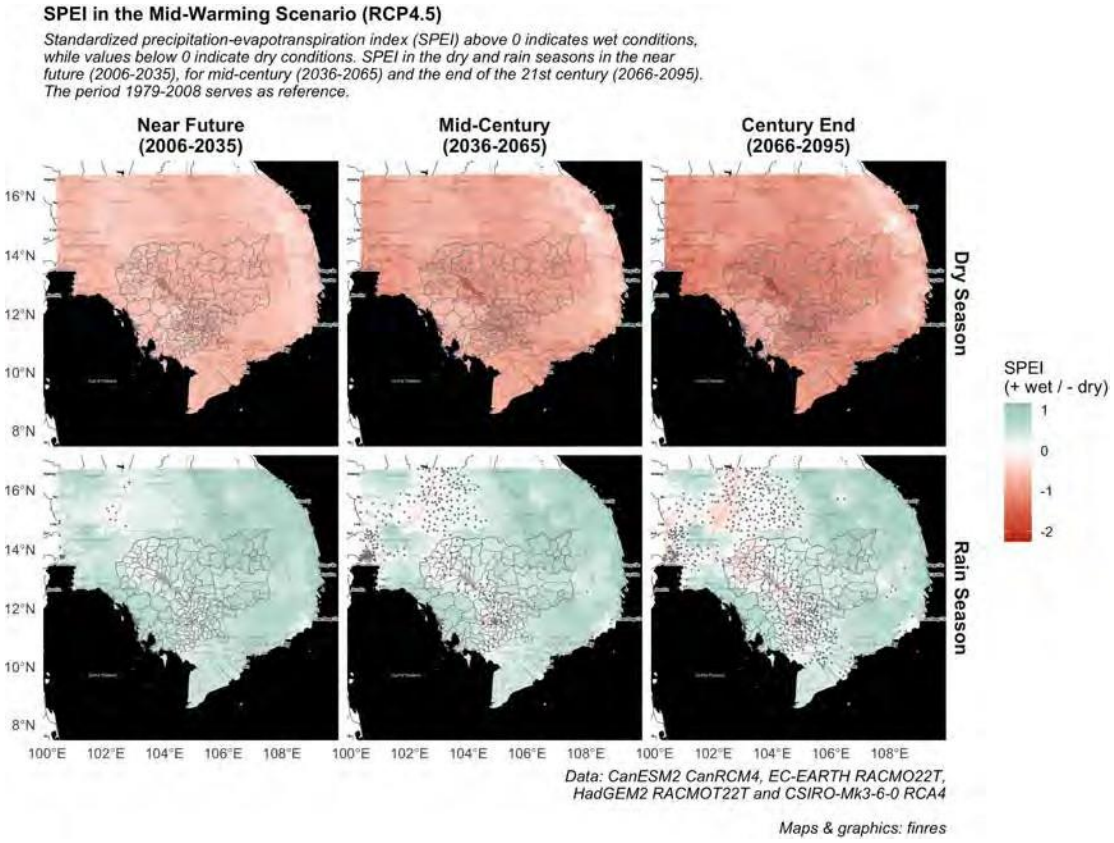
[7] Kampong Spoeu, one of the four target provinces, reported the highest number of droughts (one of the eight main natural hazards in Cambodia) between 1996 and 2013. (https://www.unccd.int/sites/default/files/country_profile_documents/1%2520FINAL_NDP_Cambodia%255B1157%255D.pdf).

[8] Thoeun, H. C. (2015) Observed and projected changes in temperature and rainfall in Cambodia. Weather and Climate Extremes. 7:61. [old reference]

[9] MAFF (2017) MAFF Annual Report 2016-17

[10] Climate risk country profile, Cambodia. 2021. https://climateknowledgeportal.worldbank.org/sites/default/files/2021-08/15849-WB_Cambodia%20Country%20Profil

15 Drought has significant social and economic impacts in Cambodia, in particular in the project areas. According to the Ministry of Environment. (2002). Report on the Impact of Drought in Cambodia, the drought in 2002 affected 43 districts in eight provinces. Some 442,419 families (2,017,340 individuals) were affected. The total estimated damage was US$ 9 million. Rice and crop production was affected in all provinces and about half a million rural people faced food insecurity. Droughts events have become more frequent as further explained in annex 1, and are expected to intensify in future. According to the International Rice Research Institute, rice grain yield will decline by 10% for each 1°C increase in growing-season minimum (night) temperature in the dry season. In Cambodia, drought has been negatively impacting rice production, and is widely recognized as one of the most serious climate risks for the agriculture sector.



16 The Climate Risk Country Profile, Cambodia 2021 noted that future projections of climate change in the project area under the RCP4.5 scenario (Figure 1-1) indicate a temperature increase of 1.6°C by mid-century (2036-2065) and up to 2.2°C by the end of the 21st century (2066-2095)[11]. Nights exposed to high temperatures are projected to become more frequent during the 21st century (+114 nights by mid- century and +151 nights by the 2080s). Population, crop and livestock systems will also experience heat extremes more frequently in comparison to the reference period (42 days by mid-century and reaching 62 days by the 2080s) and IFAD is expecting a drastic reduction in the productivity of crops and livestock (IFAD's preliminary climate analysis). Out of all the rivers within the Mekong River Basin, the water levels of the Tonle Sap Lake tributaries are anticipated to experience the greatest water decline. These changes in water levels are attributed to shifts in seasonal rainfall distribution and prolonged dry periods (IPCC, 2021).

17 The changes in precipitation and temperature patterns induced by climate change in the project area could affect the climatic suitability of cereals, vegetables and starchy crops produced. On average, for most crops analysed for this project, the temperature suitability could progressively decrease with some crops falling outside their optimal temperature levels. Overall, this change in patterns could contribute to a reduction in crop yield for both irrigated and non-irrigated crops. For example, in the Kampong Chhang region, rice yield could decrease from 9 to 12%, with and without irrigation, respectively, by 2050 (a period of 20 years centred around 2050) compared to 2020 (Climate Risk Country Profile, Cambodia, 2021). These projections are for the RCP8.5 scenario and without CO2 fertilization. As smallholder farmers' incomes are largely dependent on their yield, it is anticipated that farmers' income could become more volatile with a decreasing trend over time. It is projected that vegetables will be increasingly exposed to heat-stress conditions during the pre-monsoon and early wet-season months (March-June). Over these months, heat-stress conditions (>36ºC) will be exceeded more than 50 days during the growing season, lasting approximately 90 days.

18 Climate change affects women, men, and vulnerable people differently, and their responses to its impacts also differ, including in relation to safeguarding food security and livelihoods and coping with hazards and risks. In the project area, women have significantly less access than men to financial instruments, land, natural resources, climate change resources and technologies, education, and other development services for successful adaptation to climate change. Cambodia's Women's Resilience Index, ActionAid, 2022 found women less resilient in times of disaster than men due to women's unstable and insecure sources of income, limited access to shelters or safe places, inadequate early warning information, poor housing, weak social safety nets and absence of emergency networks. Furthermore, women's responsibilities in household resources position them well to contribute to livelihood strategies adapted to

[11] Climate risk country profile, Cambodia. 2021. https://climateknowledgeportal.worldbank.org/sites/default/files/2021-08/15849-WB_Cambodia%20Country%20Profil

changing environmental realities. However, lack of information, access to planning processes, and care obligations, limit their ability to contribute.

Source: GCF Concept Note

Legend: Above 0 indicates wet conditions, while values below 0 indicate dry conditions.

Figure 1-2: SPEI in the high warning scenario (RCP4.5)

19 Agriculture is central to the economic and social life of Cambodia. With 76% of the population currently living in rural areas, Cambodia's populace and economy rely heavily on agriculture and fisheries, contributing 22% of GDP and employing 34% of the country's labour force[12]. As a result, Cambodia has a high dependency on natural resources and climate-sensitive sectors of the economy, which makes it particularly vulnerable to inter-annual and intra-annual changes in climatic conditions. Natural hazards have significant effects on Cambodia's population and pose a serious challenge for water resource management and poverty alleviation in the country. This vulnerability to hazards combined with high exposure to climatic extremes, means that Cambodia is faced with a heightened disaster risk from both floods and droughts.

20 Current climate models project that these climatic extremes will worsen over the coming century, meaning that they must be considered when addressing poverty reduction and economic development. The Royal Government of Cambodia is making efforts to devise strategies that decrease this vulnerability through improved flood and drought proofing, natural disaster preparedness and climate adaptation strategies to reduce risks from floods and droughts. Reducing the impacts of floods and droughts are key priorities for sustainable development (IPCC, **2021**).

[12] Data for 2020, World Bank, World Development Indicators

21 The Royal Government of Cambodia is committed to meetings its greenhouse gas emission targets and ensuring that appropriate mitigation and adaptation efforts are adopted across key sectors of the economy. The Climate Change Strategic Plan 2014 – 2023 sets out the main strategic objectives and directions for climate-smart development in Cambodia over the coming decade and the agriculture sector will be a key player to ensure that the objectives of the plan are met (National Climate Change Strategic Plan 2014-2023, Royal Government of Cambodia, 2013). The agricultural sector therefore has significant potential to reduce poverty, food insecurity and ensure rural populations are resilient and adapted to climate change.

22 The CAISAR project will support the RGC's effort to improve and strengthen the disaster resilience of the populations of four provinces in Cambodia. Through combining irrigation rehabilitation with climate smart and resilient design, the project will build a low carbon and climate resilient future, enabling rural populations to adequately adapt to current and future climate impacts and increase their food security and livelihoods whilst also enabling the RGC to meet its climate targets.

23 **Stakeholder Engagement:** To support development and design of this project, extensive stakeholder engagement was conducted to discern potential positive and negative project impacts, as well as key design opportunities to improve accessibility and participation. In July and September of 2023 stakeholder meetings were conducted with potential communities affected in each project area as well as with key NGOs. Continued stakeholder engagement must involve iterative consultations throughout the project's life cycle with particular attention to vulnerable populations and groups prone to exclusion, be that for reasons of gender, orientation, age, ability, religious beliefs, and/or ethnicity. The guidelines for stakeholder engagement are available in the Stakeholder Engagement Plan (SEP).

24 **Indigenous Peoples/Ethnic Minorites, Women, and Vulnerable, Disadvantaged Persons:** to ensure adequate inclusion of ethnic minorities, women, and other vulnerable persons, an Indigenous Peoples' Plan (IP Plan) and Gender Assessment & Action Plan (GAP) have been prepared to guide project implementers and ensure that considerations for the differentiated needs of ethnic minority (EM) communities, women, and vulnerable persons are built into the project design and monitoring indicators.

25 **Environmental, Social and Climate Management Framework (ESCMF)** serves as the primary guidance document for management and mitigation of environmental, social, and climate risks and impacts throughout the project cycle.

1.3 Purpose and Application of the ESCMF

26 The project objective is to increase climate adaptation, mitigate the negative impact of extreme climate events, and improve livelihoods of smallholder farmers and vulnerable rural communities in four provinces of Cambodia (Pursat, Kampong Chhnang, Kampong Speu, and Kendal). Mitigation is a co-benefit of this adaptation project, as it will also contribute to reduce GHG emissions, including methane emissions from rice fields. These objectives will be achieved by implementing three components that aim at addressing climate change vulnerabilities, increasing agriculture productivity, and developing institutional capacities. The investments to be implemented will (i) combine robust climate-resilient water management and agricultural practices at the farm level, (ii) establish climate-proofed irrigation and flood control infrastructure and (iii) develop institutional capacity to plan, maintain and operate irrigation and flood control infrastructure in a changing climate context.

27 The CAISAR project involves numerous subprojects and activities where specific locations are still to be identified during further design and implementation. Based on the inability to confirm specific sub-projects prior to project appraisal, this Environmental and Social Management Framework (ESCMF) has been prepared. Given small discrepancies in the format of the environmental, social, and climate risks/impacts documentation required for IAAB, FAO, IFAD and GCF funded projects, the Government of Cambodia agreed with IFAD's SECAP specialists based in headquarters to follow the standard GCF documentation, rather than developing two separate sets of documents. According to IFAD's Social, Environmental and Climate Assessment Procedures (SECAP) and the Green Climate Fund's (GCF's)

Environmental and Social Standards, the Lead Agency of the proposed project must prepare and disclose this ESCMF[13] before appraisal.

28 The purpose of the ESCMF is to ensure that the project has concrete plans and processes in place to avoid, minimize, and/or mitigate the risks and potentially adverse project-related environmental and social (E&S) impacts, including climate risks, once the CAISAR activities and/or subprojects are identified, planned, and implemented. This living document: (i) assesses and summarizes project-related risks and impacts; and (ii) sets out the principles, rules, guidelines, and procedures to assess any potential risks and impacts of future subproject and activities identified at a later time. It provides measures to reduce, mitigate, and/or offset those adverse risks and impacts from the project and highlights information about areas where subprojects are expected to be located (including any specific E&S-related vulnerabilities of those areas; potential impacts that may occur; and mitigation measures that might be used). Specific objectives of this ESCMF are to:

- Assess the potential environmental, social, and climate-related risks and impacts of the project, both positive and negative, and propose mitigation measures which will effectively address these risks and impacts;
- Establish clear procedures for the E&S planning, review, approval, and implementation of subprojects and other activities to be financed under the project;
- Specify appropriate roles and responsibilities and outline the necessary reporting procedures for managing and monitoring E&S issues/concerns related to subprojects, TA, and activities;
- Determine the training, capacity building, and technical assistance needed to successfully implement the provisions of this ESCMF;
- Outline and address mechanisms for public consultation and disclosure of project documents, as well as redress of possible grievances; and
- Establish the budget requirements for implementation of this ESCMF.

29 This ESCMF provides information on (i) items ineligible for Project funding; (ii) how to conduct the E&S screening; (iii) risks and impacts classifications; (iv) identification of various E&S documents to be prepared (both prior to and after project approval) and the process to be followed for their preparation (including the clearance process); (v) implementation arrangements; (vi) training and capacity building; (v) grievance redress mechanism; (vi) estimated costs and budget requirements; and (vii) guidelines and specific forms for preparation of the identified E&S documents required. This ESCMF will be applied to all subprojects and activities to be financed by CAISAR.

1.4 Scope of the ESCMF

30 This ESCMF was developed based on a review of project-relevant government laws, regulations, ordinances, and other legal documents; various background papers and reports pertaining to environmental and social conditions of the proposed project areas and potential subproject sites, including feasibility studies; as well as numerous field visits, 630 interviews through Livelihood Household Surveys, 100 focus group discussions, 100 key informant interviews, and other consultations (community meetings) in those areas. Safeguards documents prepared for similar projects and/or projects in related areas (e.g. others financed by AIIB, IFAD, World Bank, FAO, etc.) were also taken into consideration.

31 This ESCMF follows the requirements of AIIB, IFAD's SECAP and the GCF's Environmental & Social Policy, taking into consideration the related guidance notes and documents. Information is presented in ten sections, as follows:

1. Introduction
2. Project Description
3. Policy, Legal, and Administrative Framework
4. Environmental and Social Assessment and Proposed Mitigation Measures

[13] The ESCMF examines the risks and impacts when a project consists of a program and/or a series of subprojects, and the risks and impacts cannot be determined until the program or subproject details have been identified.

5. Procedures for Review, Clearance, and Implementation of Subproject E&S Instruments
6. Implementation Arrangements
7. Capacity Building, Training, and Technical Assistance
8. ESCMF Implementation Budget
9. Grievance Redress Mechanism (GRM)
10. ESCMF Consultation and Disclosure

Other information to be considered includes: (i) ineligible activities; (ii) list of banned and restricted pesticide in Cambodia; (iii) Pesticide Management plan; (iv) Chance Find Procedures; (v) List of Consultations & Attendance; (vi) ESCIA Timeline; (vii) ESCIA Budget; (viii) Environmental and Social Screening Checklist; (ix) Indigenous Peoples Planning Framework; (x) Biodiversity Management Planning Framework; (xi) Resettlement Planning Framework; (xii) Gender Assessment & Social Inclusion Plan; (xiii) Climate Management Framework; (xiv) Stakeholder Engagement Plan

32 **Associated facilities.** This ESCMF is also applied to activities or facilities that are, in the judgement of the AIIB, associated activities and/or facilities as defined in the AIIB's ESF. When this is the case, this ESCMF will be applied to such associated activities and/or facilities – to the extent that MoWRAM has influence over such activities and facilities.

2. PROJECT DESCRIPTION

2.1 Project Objective, Components, Area and Beneficiaries

33 The project's focus is on low-carbon and climate resilient at the farm-level, combined with efficient irrigation and flood control infrastructure and their climate proofing, and institutional development of the FWUCs and the government agencies to strengthen water rights, irrigation fees, and enhance sustainability. Thus, disaster resilience compensation is expected to significantly contribute towards achieving climate change adaptation policy objectives outlined in the NDC, and the individual climate change action plans of the Ministry of Water Resources and Meteorology (MOWRAM). The Project originated from the RGC's National Water Resources Management and Sustainable Irrigation Road Map and Investment Program (2019 -2023), which provides a Strategic Framework for the Irrigation Sector.

The CAISAR project is focusing on climate change adaptation with cross-cutting benefits through the reduction of GHG emissions linked to the use of high-efficiency smart irrigation systems, the use of renewable energy for pumping, and cover techniques to reduce evaporanspiration and enhance GHG reduction. While rice production is a major source of GHG emissions in the AFOLU sector in Cambodia, and the project aims to support production to achieve food security and sector growth, target GHG reduction actions in the project aim to support intensification and diversification without compromising GHG emission reduction targets. This is achieve through adoption of water saving technologies such as alternative wet dry, drip irrigation). A full greenhouse gas accounting will be prepared during the project formulation phase. However, a preliminary analysis of GHG in the target provinces has estimated a reduction of GHG of 90,000 Mt CO2-eq annually and 1,800,000 Mt CO2-eq over the life span of 20 years. The investment in agricultural practices and a whole-of-system irrigation approach will irrigate approximately 40,000 hectares (ha) in the rainy monsoon season and about 20,000 ha in the dry season and, as a result, improve energy efficiency by reducing the water and the carbon footprints.

34 The planned CAISAR project has the following planned components

2.2 Component 1: Improving Farm-level climate adaptation, resilience, and water use efficiency

35 The objective of this component is to build climate resilience (CR) of smallholder farmers and enhance sustainable production through evidence-based planning and context-relevant climate resilient practices at the farm level. This component is designed to address the lack of knowledge and skills to deploy technologies and practices at farm level by farmers and the lack of appropriate extension services to propagate them. It will introduce farmers with various climate resilient technologies and practices for both rice and non-rice activities such as vegetable production, poultry and aquaculture.

Sub-component 1.1 Deployment of farm-level climate adaptation and water use efficiency measures

Output 1.1: Increased capacity of farmers to deploy climate resilient (CR) practices at farm level

This output will focus on developing farmer's capacity in deploying CR technologies and practices to transform the agricultural production system to adapt to the changing climate context. Farmer's will be trained to first develop Action Plans (AP) to re-orient farmer behaviour and assist them in transforming the agriculture production system in a manner that is better adapted to factoring in the agro-ecological context and expected climate change impacts.

- Activity 1.1.1 Preparation of community-based action plans (AP) to transform agriculture with CR practices.
- Activity 1.1.2 Preparation of training materials to support implementation of the AP.
- Activity 1.1.3 Conduct trainings to create a pool of expertise to demonstrate and propagate the CR technologies and practices.
- Activity 1.1.4 Train farmers on applying CR technologies using the FFS approach.
- Activity 1.1.5 Strengthening and fostering tailored mechanization service providers for improved mechanization service delivery.
- Activity 1.1.6 community-based monitoring and evaluation (CBME) of implementation

Sub-Component 1.2 Climate adapted, value added, and market led agricultural investments

Output 1.2 CR value added, and market led agriculture investments secured.

This output involves improving and enhancing some value chains that are key for the project area and include rice, vegetable, chicken and aquaculture value chains, through the use of Public Private Producer Partnerships (4Ps) and increased access to finance, which will improve market access, climate adaptability, and ensure increased income for smallholders in the value chains.

- Activity 1.2.1 Value chain study and planning
- Activity 1.2.2 Establish District Multi-Stakeholder Platforms (MSPs)
- Activity 1.2.3 Public Private Producer Partnership Facility (4PF)

Sub-component 1.3 Improve enabling conditions, capacities and disaster risk management strategies

Output 1.3. Increased access to and use of climate information and advisory services for climate responsive agriculture planning

This sub-component will strengthen the production and dissemination of tailored agro-meteorological information to inform climate responsive management and planning of agriculture in the project target areas through ICT technologies. The aim is to ensure that agro-meteorological services are accessible and useful to farmers to manage climate risks, access to and use of water and efficient cropping systems.

- Activity 1.3.1 Establish ICT based multi-disciplinary platform at provincial level.
- Activity 1.3.2 Building the capacities of the platform to deliver services.
- Activity 1.3.3. Establish the agromet information systems and the outreach mechanisms.
- Activity 1.3.4 Awareness raising and capacity building of farmers and stakeholders in applying the services.

Sub-component 1.4 Rural roads

Output 1.4: Increased resilience of farm road infrastructure to climate change

- Activity 1.4.1 Initial planning and identification
- Activity 1.4.2 Technical survey and design considerations, preparation of cost estimation
- Activity 1.4.3 Improve 50 Kilometers of farm roads.
- Activity 1.4.4 Handing over of the completed works.

2.3 Component 2. Irrigation Infrastructure for increased resilience

Component 2 is linked with Component 1 such that it facilitates the implementation of CR on farm crop and water management practices through improved field level water supply delivery and drainage. It will focus on rehabilitating and modernizing of irrigation and flood protection/drainage infrastructure in the six sub-projects, including irrigation and drainage canals, flood control embankments, and ponds, to provide high-efficiency climate-resilient irrigated agriculture systems for adapting to both increasing flood and drought conditions.

Sub-Component 2.1: Modernization of irrigation scheme and ponds

Sub-Component 2.2: Flood-proofing and Drainage improvements

Sub-Component 2.3: Establishments and training of Farmers Water User Communities (FWUC)

- Activity 2.3.1 Formation of institutional strengthening of the FWUC
- Activity 2.3.2 Build technical capacities of FWCU for canal structure O&M
- Activity 2.3.3 prepare long term financing plan for O&M of the systems including the WUAS.

Sub-Component 2.4: Water information and Management (SCADA)

2.4 Component 3. Institutional Strengthening

36 This component aims to strengthen Government institutions, mainly the MoWRAM, MoE and the NCDD and local institution, the FWUC. While the focus for MoWRAM will be on upgrading technical capacity in various aspects of CR irrigation design and management, key focus area for MoE will be on strengthening climate policies and strategies and in building capacities for monitoring climate actions at national level. It will have three sub-components.

Sub-Component 3.1 MOWRAM capacity Support.

Output 3.1 Strengthened MOWRAM Capacity

Sub-Component 3.2 Strengthening of NDA and NCDD.

Output 3.2 Improved capacities for climate action monitoring

- Activity 3.2.1 Preparation of Loss and Damage Strategy
- Activity 3.2.2 Strengthen national M&E process for climate action
- Activity 3.2.3 Enhancing Capacity of NDA and other stakeholders.

37 **Proposal consistent with Government Framework and priorities and existing investments:** The proposed Project is in line with the national policies of the RGC, especially the "National Water Resources Management and Sustainable Irrigation Road Map and Investment Program 2019 - 2033" issued in July 2019 by MOWRAM with the assistance of the development partners. The proposed Project, with its disaster and climate change adaptation design features, will be upscaled to other provinces. RGC and MOWRAM appreciate that water is a limited resource and is taking an integrated water resource management (IWRM) approach to manage water nationwide. MOWRAM is establishing the Water Resources Data Management Center (NWRDMC) and a National Water Resources Information System (WRIS) with ADB assistance. WRIS is an adaptive system housed in the MWRDMC facility that integrates spatial information, CISIS and IAMS, meteorological data, hydrological data, ground measurements, satellite-derived remote sensing data, and Lidar. All data generated on the CAISAR, and all watersheds, are coalesced in WRIS and used to model water availability, use, and floods across entire watersheds.

38 For this project, AIIB requested IFAD to co-finance and assist with the project design, the project implementation, the country's knowledge to maximize people's resilience to climate change impacts and support the reduction of GHG emissions in agriculture.

3. POLICY, LEGAL AND ADMINISTRATIVE FRAMEWORK

3.1 Applicable National Laws and Regulations

39 In 1993, the Royal Government of Cambodia confirmed a new Constitution in which environmental considerations were included for the first time. Specifically, Article 59 requires the State to protect the environment and balance of abundant natural resources and to establish a precise plan for the management of land, water, air, wind, geology, ecological systems, mines, energy, petrol and gas, rock and sand, gems, forests and forestry products, wildlife, and fish and aquatic resources. It was within this constitutional context that the Ministry of Environment (MOE) was established.

40 The hierarchy of legislation in Cambodia is:

- Royal Decree signed by the King;
- Sub-decree signed by the Prime Minister;
- Ministerial Decision signed by a Minister; and
- Regulation issued by Ministry.

41 A Royal Decree ratifies laws passed by parliament. These can be supplemented by "Prakas" or ministerial decisions. These laws allow sub-decrees and regulations to be passed which can stipulate procedures and standards to be met in order to ensure compliance with the law. Many sub-decrees and standards have been drafted but not yet ratified by parliament.

3.1.1 Laws/Sub-Decrees relevant to Environment and Natural Resources Management

42 The Government of Cambodia has established laws and regulations for forests, protected areas, and land management to ensure sustainable development that are relevant to environmental protection and natural resources management. The key elements of the legal and policy framework for the project are summarized in Table 3-1 below.

Table 3-1: Environmental and Natural Resource Management Policies, Laws & Guidelines

Law/Regulation/Guideline	Year	Summary
Royal Decree on the Protection of Natural Areas	1993	Classified 23 protected areas in Cambodia into four categories: (i) natural parks; (ii) wildlife sanctuaries; (iii) protected landscapes; and (iv) multiple-use areas. Designated the Tonle Sap (316,250 ha) as a multiple-use area or area necessary for the stability of the water, forestry, wildlife and fishery resources, for tourism, and for conservation of long-term existing natural resources with a view to assure sustainable economic development.
Royal Decree on the Establishment and Management of Tonle Sap Biosphere Reserve (Royal Decree No. NS/RKT/0401/070)	2001	Establishes the Tonle Sap Biosphere Reserve (TSBR) in accordance with the statutory framework of the World Network of Biosphere Reserves. Divides the TSBR into 3 zones: (i) core areas; (ii) buffer zone and (iii) flexible transition zone. Core area: set aside for long term protection, human activity is limited to monitoring and research. Buffer zone: area surrounding the core areas helping to protect the environment. It may accommodate education and training activities. Transition area: may contain a variety of agricultural activities and human settlements. Here all stakeholders have to cooperate to achieve sustainable development.

Law/Regulation/Guideline	Year	Summary
Royal Decree No. NS/RKM/0208/007 on Protected Areas	2008	Defines the framework of management, conservation & development of protected areas to ensure the conservation of biodiversity, & sustainable use of natural resources in protected areas. The Law gives the Royal Government of Cambodia the authority to establish or modify Protected Areas (Article 9 and 10). A Protected Area shall be established by sub-decree. Article 11 divides the protected area into 4 zones namely, core zone, conservation zone, sustainable use zone & community zone. Article 36 strictly prohibits all types of public infrastructure in the Core Zone & Conservation Zone; & allows development of public infrastructures in the Sustainable Use Zone & Community Zone with approval from the Royal Government at MoE's request. Article 41 provides for the protection of each protected area against destructive/harmful practices, such as destroying water quality in all forms, poisoning, using of chemical substances, disposing of solid and liquid wastes into water or on land. Article 44 requires all proposals & investments within or adjacent to protected area boundary an Environmental and Social Impact Assessment. The law defines Protected Area as **"***An area of the State's public properties in land or water territories, including coasts and sea, located in the area established by a Royal Decree or a new area established in the jurisdiction of the Ministry of Environment. These areas are of physical and biological importance which requires management by law with the purpose of protecting and maintaining biological, natural and cultural resources, and shall be sustainably managed in every generation for environmental, social and economic benefits*". Each protected area shall be divided into four (4) management zoning systems: **1. Core zone:** management area(s) of high conservation value containing threatened and critically endangered species, and fragile ecosystems. Access to the zone is prohibited except for the Nature Conservation and Protection Administration's officials and researchers who, with prior permission from the Ministry of Environment, conduct nature and scientific studies for the purpose of preservation and protection of biological resources and natural environment with the exception of national security and defence sectors. **2. Conservation zone:** management area(s) of high conservation value containing natural resources,

Law/Regulation/Guideline	Year	Summary
		ecosystems, watershed areas, and Natural landscape located adjacent to the core zone. Access to the zone is allowed only with prior consent of the Nature Conservation and Protection Administration at the area with the exception of national security and defence sectors. Small-scale community uses of Non-Timber Forest Products to support local ethnic minorities' livelihood may be allowed under strict control, provided that they do not present serious adverse impacts on biodiversity within the zone. **3. Sustainable use zone:** management area(s) of high economic value for national economic development and management, and conservation of the protected area(s) itself thus contributing to the local community, and indigenous ethnic minorities' livelihood improvement. After consulting with relevant ministries and institutions, local authorities, and local communities in accordance with relevant laws and procedures, the Royal Government of Cambodia may permit development and investment activities in this zone in accordance with the request from the Ministry of Environment. **4. Community zone:** management area(s) for socio-economic development of the local communities and indigenous ethnic minorities and may contain existing residential lands, paddy field and field garden or swidden (Chamkar).
Law on Environmental Protection and Natural Resources Management	1996	The Law was enacted by the National Assembly and launched by the Preah Reach Kram/NS-RKM-1296/36. It was enacted on 24 December 1996. This law has the following objectives: i. To protect and promote environment quality and public health through prevention, reduction and control of pollution; ii. To assess the environmental impacts of all proposed projects prior to the issuance of a decision by the government; iii. To ensure the rational and sustainable conservation, development, management and use of the natural resources of the Kingdom of Cambodia; iv. To encourage and provide possibilities for the public to participate in the protection of environment and the management of the natural resources; and v. To suppress any acts that cause harm to the environment.
Law on the Protection of Cultural Heritage (NS/RKM/0196/26)	1996	Regulates the protection of national cultural heritage and cultural property in general against illegal destruction, modification, alteration, excavation, alienation, exportation or importation. Its Article 37 stipulates that in case of chance find of a cultural property during construction, work should be stopped and the person who found the property should immediately make a declaration to the

Law/Regulation/Guideline	Year	Summary
		local police, who shall, in turn, transmit the property to the Provincial Governor without delay.
Law on Forestry	2002	Article 1: This law defines the framework for management, harvesting, use, development and conservation of the forests in the Kingdom of Cambodia. The objective of this law is to ensure the sustainable management of these forests for their social, economic and environmental benefits, including conservation of biological diversity and cultural heritage.
Law on Water Resources Management (NS/RKM/0607/016)	2007	Requires license/permit/written authorization for the: (i) abstraction & use of water resources other than for domestic purposes, watering for animal husbandry, fishing & irrigation of domestic gardens and orchards; (ii) extraction of sand, soil & gravel from the beds & banks of water courses, lakes, canals & reservoirs; (iii) filling of river, tributary, stream, natural lakes, canal & reservoir; and (iv) discharge, disposal or deposit of polluting substances that are likely to deteriorate water quality and to endanger human, animal and plant health. (Articles 12 & 22) Its Article 24 stipulates that Ministry of Water Resources and Meteorology (MOWRAM), in collaboration with other concerned agencies, may designate a floodplain area as flood retention area.
Law on the Management of Pesticides and Fertilizers	2012	The Law on the Management of Pesticides and Fertilizers was enacted on 14 January 2012. This law has the following objectives: i. To support a policy promoting the effectiveness potentiality of agriculture sector, for the development of social and national economy; ii. To ensure the safe and effective control of pesticides and fertilizers, whether in consistent with the international standards; iii. To enhance public awareness on the implementation of standard requirements of pesticides and fertilizers for all relevant activities related to these products; and iv. To reduce risks caused by the use of pesticides and fertilizers, for beneficiary of farmers and people in the nationwide, by ensuring food security, food safety, public health, and the sustainability of environment. The scope of the law shall apply to the management and the implementation of standard requirements for: i. All type of pesticides and fertilizers, raw materials or active ingredients and other compositions of pesticides and fertilizers which are used as inputs in agricultural production. ii. All activities of natural persons or legal entities who are traders, formulators, pests control services operators, advertisers, donors, and users of all types of pesticides and fertilizers.
Sub-decree on Environmental Impact Assessment Process	1999	The Sub-decree No. 72 ANRK.BK in the Law on Environmental Impact Assessment Process dated 11 August 1999 sets out EIA procedures. The main objectives of this sub-decree are:

Law/Regulation/Guideline	Year	Summary
		i. To determine an EIA for every private and public project or activity, through review by the MOE, prior to the submission for a decision from the government; ii. To determine the type and size of the proposed project(s) and activities, including existing and ongoing activities in both private and public sector prior to undertaking the process of EIA; and iii. To encourage public participation in the implementation of the EIA process and take into account their input and suggestions for reconsideration prior to theimplementation of any project.
Sub-decree No. 36 ANK/BK on Solid Waste Management	1999	Article 1: Regulates solid waste management to ensure the protection of human health and the conservation of biodiversity through using appropriate technical approaches. Article 2: This sub-decree applies to all activities related to disposal, storage, collection, transport, recycling, dumping of garbage and hazardous waste. Article 4: The Ministry of Environment shall establish guidelines on disposal, collection, transport, storage, recycling, minimizing, and dumping of household waste in provinces and cities in order to ensure the safe management of household waste. The authorities of the provinces and cities shall establish the waste management plan in their province and city for short, medium and long-term.
Sub-decree No. 27 ANRK/BK on Water Pollution Control	1999	Regulates activities that cause pollution in public water areas in order to sustain good water quality so that the protection of human health and the conservation of biodiversity are ensured. Annex 2 contains effluent standards. Discharge of landfill leachate shall comply with the effluent standards for discharge of wastewater to public water area and sewer. Annex 13 contains ambient water quality standards for biodiversity conservation, and annex 6 includes ambient water quality standards for public health.
Sub-decree No. 42 ANK/BK on Control of Air Pollution and Noise Disturbance	2000	Regulates air and noise pollution from mobile and fixed sources through monitoring, curb and mitigation activities to protect the environmental quality and public health. It contains the following relevant standards: (i)) ambient air quality standard (Annex 6); and (ii) maximum allowable noise level in public and residential areas (Annex 6). Article 3 A. “Source of pollution” is defined and separates mobile sources (including transport) and fixed sources such as factories and construction sites. Article 3 B. “Pollutant” is defined as smoke, dust, ash particle substance, gas, vapour, fog, odour, radio-active substance.
		-The goal of this sub-decree is to enhance the management of garbage and solid waste of downtowns with effectiveness, transparency and accountability,

Law/Regulation/Guideline	Year	Summary
Sub-decree on Garbage and Urban Solid Waste Management	2015	referring to ensure aesthetics, public health and environmental protection -This sub-decree covers separating, storing, cleaning, collecting, transporting, recycling and management of landfills of garbage and solid waste of downtowns in the Kingdom of Cambodia
Sub-decree N0. 235 on Management of Drainage and Wastewater Treatment System	2017	-Aims to improve the management of drainage and wastewater treatment systems in term of efficiency, transparency, and accountability to ensure safety, public health, and biodiversity conservation. -The scope of this Sub-Decree applies to the management of drainage and wastewater treatment systems in capital, provincial, district, khan and resorts or recreation centers in the Kingdom of Cambodia. Its annexes 1 and 2 provide Effleunt Discharge Standards from Commercial Building, Borey, Satellite City and Resort or Recreation Center Discharges Directly to the Drainage/Sewerage System connected to Centralized Wastewater Treatment Plant, and to the Public Waterbody or Drainage/ Sewerage System
Prakas on the Launch of Standards of the Quantity of Toxins or Hazardous Substances Allowed to be Disposed	2015	This Parkas includes the standards of the quantity of toxic chemicals or hazardous substances contained in hazardous waste which is allowed to be disposed in sanitary landfills and standards of the quantity of toxic chemicals or hazardous substances allowed in soils. Any disposal of chemical waste or hazardous substances as stipulated in the Parkas out of sites determined by the ministry and competent institutions shall be absolutely prohibited and deemed as the infringement of law.
Prakas on Environmental Impact Assessment Classification for Development Projects No. 21 PRK.BST	2020	The Prakas determines the types and sizes of projects that are required to prepare environmental impact assessments. Projects having minor environmental impacts are required to prepare an Environmental Protection Agreement together with an Environmental Management Plan. Projects having medium impacts shall prepare an Initial Environmental Impact Assessment report, and projects with significant impacts are required to prepare a full EIA. All sizes of rubbish disposal sites are required to undertake an IESIA and all sizes of industrial waste disposal sites are required to undertake an EIA.
Environmental Guidelines on Solid Waste Management	2006	Contains a Landfill Ordinance that regulates landfill requirements to: (i) reduce as far as possible the adverse effects of waste disposal on the environment; (ii) preserve groundwater, surface water & air quality & to reduce emissions of greenhouse gases (iii) ensure waste is not harmful to human, natural & animal health during operation & decommissioning; and (iv) provide information and technical recommendation on the construction, operation, closure and aftercare management of landfills to ensure public health and safety and environmental protection.

Law/Regulation/Guideline	Year	Summary
Technical Guideline on Garbage and Urban Solid Waste Management	2016	The technical guideline provides standards for all activities related to disposal, storage, collection, transportation, recycling, dumping of municipal and hazardous waste as well as management of final dumpsite (closing Landfill) and continued management. The technical guidelines list the requirements to be implemented within 90 days for landfill closing (e.g. monitoring, gas management).
National Integrated Pest Management Program		The Integrated Pest Management (IPM) Program in Cambodia was established in 1993 after conducting national workshop on "Environment and IPM". The overall goal of National IPM Program is to promote food security in Cambodia by enhancing the sustainability of intensified crop production system through the promotion of integrated crop management (ICM) skills at farm level. The objectives of this program are: i. to reduce dependence on agricultural chemical, especially pesticides, in agricultural production and to minimize hazards to the human health, animals and environment; ii. to develop the capacity of farmers and agricultural technical officers in conducting training and experiments so that they are able to identify problems occurring in agricultural production and find appropriate solution to deal with the problem by themselves; and iii. Educate farmers on agricultural technology by enhancing their knowledge on field ecology and by developing skills among farmers in monitoring and analyzing field situations that enable them to manage crops properly. At the national level the position of the IPM program was strengthened by a Prakas (Ministerial Declaration) in July 2002, recognizing the National IPM Program as coordinating body for all IPM related activities in Cambodia. The Prakas also established a steering committee and a deputy director to act as the national coordinator

Law/Regulation/Guideline	Year	Summary
Labour Law (1997) Decree No. CS/RKM/0397/01 On October 5, 2021, Cambodia enacted the third amendment to the country's main employment legislation, the Labor Law of 1997, revising the rules governing individual labor dispute resolution, work shifts, and public holidays falling on Sundays.	1997	This law governs relations between employers and workers resulting from employment contracts to be performed within Cambodia. The key sections relevant to this project include: **<u>Chapter VIII Health and Safety of Worker</u>** The key provisions relate to the quality of the premises; cleaning and hygiene; lodging of personnel, if applicable (such as workers camps); ventilation and sanitation; individual protective instruments and work clothes; lighting and noise levels in the workplace. Article 230: Workplaces must guarantee the safety of workers. However, the only specific occupational health and safety Prakas relates to the garment industry and brick manufacture. **<u>Chapter IX Work-Related Accidents</u>** Article 248: All occupational illness, as defined by law, shall be considered a work-related accident. The law sets out how accidents should be managed in terms of compensation.

Law on Land (NS/RKM/0801/14)	2001	Provides that: (i) unless it is in the public interest, no person may be deprived of ownership of his immovable property; and (ii) ownership deprivation shall be carried out according to legal forms and procedures and after an advanced payment of fair and just compensation. (Article 5)
Expropriation Law	2010	Defines the principles, mechanisms, and procedures of expropriation, and defining fair and just compensation for any construction, rehabilitation, and public physical infrastructure expansion project for the public and national interests and development of Cambodia.
The Law on Road Traffic	2015	The law is intended to ensure road traffic safety and order, and protection of human and animal health and lives, properties and environment. Its establishment a requirement for all motor vehicles, trailers, and semi-trailers moving on the road to obtain a technical inspection certificate. It also outlines road safety requirements.
National Policy on the Development of Indigenous Peoples		1. The guiding document to address Indigenous Peoples' issues in Cambodia is the National Policy on the Development of Indigenous Peoples. The Policy, prepared starting in 1994, was approved by the Council of Ministers on April 24, 2009 and sets out government policies related to indigenous peoples concerning culture, education, vocational training, health, environment, land, agriculture, water resources, infrastructure, justice, tourism, industry and mines and energy. The Policy provides principles for formal registration of indigenous communities as legal entities with their own bylaws and enables their participation in economic development that affects their lives and cultures. It states: "Indigenous Peoples shall be fully entitled to express their comments and opinions and to make any decisions on the development of the economy, society and their cultures towards growth in the society
Policy on Registration and Right to Use of Indigenous Communities		The policy was approved by the Council of Ministers on April 24, 2009, and a Sub-Decree on procedures of registration of Land of Indigenous communities was signed on June 9, 2009 by the Prime Minister. This policy takes as its basis the recognition in the Land Law of 2001, of the right of indigenous communities to possess and use land as their collective ownership. The policy states that the registration of indigenous communities as collective ownership is different from the registration of individual privately owned land parcels because the land registration of the indigenous communities is the registration of all land parcels belonging to the communities as a whole, consisting of both State Public Land and State Private Land in accordance with the articles 25, 26, and 229 of the Land Law and related Sub-decrees. These land parcels are different in size and can be located within the same or different communes/sangkat

3.1.2 EIA Classification

43 In order to provide guidelines on effective implementation of sub-decree No 72 ANRK.BK on environmental impact assessment Procedures for development projects, MoE promulgated sub- decree No. 21 on Environmental Impact Assessment Classification for Development Projects.

44 According to this sub-decree, environmental impact assessment for projects is classified into three categories.

- Projects requiring full environmental impact assessment (full ESIA), equivalent to AIIB's

environmental category A, and IFAD's high risk
- Projects that require initial environmental impact assessment (IEIA), equivalent to AIIB's environmental category B, and IFAD's substantial risk
- Projects requiring the Contract on Environmental Protection (EPC), equivalent to AIIB's environmental category C plus simple EIA analysis and EMP, equivalent to IFAD's moderate/low risk

45 The sub-decree includes an annex listing projects under various sectors and their categorization on the basis of their nature, type and size. The sector and EIA classification for irrigation project is summarized in Table 3-2 below.

Table 3-2: ESIA Classification for Development ProjectsClassification for Development Projects

No.	Project Type	ESIA (Equiv. to AIIB's A	IESIA (Equiv. to AIIBB's B	Env. Protection Contract
142	Irrigation systems		≥5000ha	1000-5000ha
143	Water diversion systems		≥5000ha	1000-5000ha
176	All building construction	Build area>45000m^2	15000 – 45000m^2	3000-15000m^2
179	Road construction (new)	>100km	≥30 – 100km	10-<30km
180	Railroad and road expansion	>100km	≥50 – 100km	10-<50km
181	Road in protected areas	>30km	≥ 10-30 Km	10km
182	Road widen in protected area	>50km	≥ 10-50 km	10km

Source: Prakas No. 021 PRK.BST dated 03 February 2020.

3.1.3 Occupational and Community Safety and Health

46 Government Occupational and Community Safety and Health (OHS) guidelines follow the OHS Program for Cambodia (2010-2013) that was developed by the International Labor Organization (ILO). The draft guidelines provide the framework for instituting OHS at the workplace and in the community. The OHS guidelines for Cambodia will likely need to be supplemented with the international the IFC EHS/OHS Guidelines for Construction and Decommissioning, Waste Management Facilities, and Toll Roads.

47 Additionally, the National MoH's guideline on Covid-19 and National Guideline for Infection prevention and control for healthcare facilities of Cambodia will be applied due to the current situation in respect of the Covid-19 outbreak to reduce the incidence and risk of preventable Nosocomial Infection (NI). Occupational and community health and safety, as laid out in the EHS guidelines, will be a cross-cutting assessment for the subprojects.

48 The Ministry of Labor and Vocational Training (MLVT) has the following guidelines which will be implemented during the construction phase of the Project:

- MLVT Prakas2 No. 075/11 K.B/BR.K (March 2011) - Sanitation at the Construction Site: The Prakas sets to ensure that the sanitation and safety conditions are fulfilled for workers at construction sites by owners, directors, contractors or sub-contractors of construction establishments or construction companies. Articles 3 and 4 ensure that workers are provided with shelter, sanitation facilities and safe potable water for drinking and washing.

- MLVT Prakas No. 076/11 K.B/BR.K (March 2011) - The Protection of Risk Resulting From Climate Change at Construction Sites. Articles of this Prakas require safety measures and break times for workers at the construction site during extreme weather events.

- MLVT Prakas No. 077/11 K.B/BR.K (March 2011) - Providing of Information at the Construction Site. This Prakas states requirements for owners or responsible persons of a construction site to provide information, i.e. name and address of the owner of enterprise, construction establishment, Construction Company, name and address of architect, nature of construction, date for the start of the construction, estimated time

to finish the construction works, and estimated number of workers to be employed for construction activities.

- MLVT Prakas No. 078/11 K.B/BR.K (March 2011) - Stock of Materials, Waste Disposal and Clearance at Construction Site. This Prakas provides safety guidelines and requirements for the safe storage of construction of materials and hazardous substances/objects that can pose health and safety risks to workers.

49 The key national environmental quality standards applied to the subproject are listed in Table-3-3 below together with relevant international guidelines.

Table-3-3: Key National and International Environmental Standards and Guidelines

Environmental Issue	National Standards	International Guidelines
Ambient air quality	Annex 1, Ambient Air Quality Standard, of Sub-decree on Control of Air Pollution and Noise Disturbance, 2000	WHO Air Quality Guidelines, global update 2005
Noise	Annex 6, Max. Standard of Noise Level Allowable in the Public and Residential Areas, of Sub-decree on Control of Air Pollution and Noise Disturbance, 2000	WHO Guidelines for Community Noise, 1999
Surface water quality	Sub-decree No. 27 ANRK/BK 1999 on Water Pollution Control: Annex 4, Water Quality Standards for Public Waters for the Purpose of Biodiversity Conservation, and Annex 5, Water Quality Standards for Public Waters and Health	US EPA National Recommended Water Quality Criteria Mekong River Commission (MRC)_ Technical Guidelines for the Protection of Aquatic Life MRC Technical Guidelines for the Protection of Human Health

3.1.4 Applicable Evaluation Ambient Quality Standards

50 Water quality standard in public water area for public health protection is shown in Table-3-4 below.

Table-3-4: Water quality standard in public water areas for public health protection

No.	Parameter	Unit	Surface water Standard
1	Carbon tetrachloride	µg/l	< 12
2	Hexachloro-benzene	µg/l	< 0.03
3	DDT	µg/l	< 10
4	Endrin	µg/l	< 0.01
5	Diedrin	µg/l	< 0.01
6	Aldrin	µg/l	< 0.005
7	Isodrin	µg/l	< 0.005
8	Perchloroethylene	µg/l	< 10
9	Hexachlorobutadiene	µg/l	< 0.1
10	Chloroform	µg/l	< 12
11	1,2 Trichloroethylene	µg/l	< 10
12	Trichloroethylene	µg/l	< 10
13	Trichlorobenzene	µg/l	< 0.4
14	Hexachloroethylene	µg/l	< 0.05
15	Benzene	µg/l	< 10
16	Tetrachloroethylene	µg/l	< 10
17	Cadmium	µg/l	< 1

52 Ambient Air Quality Standards are shown in Table-3-6below.

Table-3-6: Ambient Air Quality Standard

Parameters	Cambodia[a]				IFC-EHS[b] Guidelines WHO
	Period 1h Average mg/m3	Period 8h Average mg/m3	Period 24h Average mg/m3	Period 1year Average mg/m^3	interim target1 ug/m3
Carbon monoxide (CO)	40	20	-	-	
Nitrogen dioxide (NO2)	0.3	-	0.1	-	40（1yr.） 200 (1 hr.)
Sulfur dioxide (SO2)	0.5	-	0.3	0.1	500 (10 min) 125 (24hr.)
Ozone (O3)	0.2	-	-	-	100 (8 hr. daily)
Lead (Pb)	-	-	0.005	-	
Particulates	-	-	0.33	0.1	150 (PM10 24hr) 75 (PM2.5 24hr)

[a] Sub-decree N0 42 ANRK.BK on Air Pollution Control and Noise Disturbance.
[b] Environmental, Health, and Safety Guidelines, IFC.

Maximum permitted noise levels in public and residential areas are shown in Table-3-7 below.

Table-3-7: Maximum permitted noise level in public and residential area (dB (A))

Location	Cambodian Standard			IFC-EHS Guidelines	
	06:00 to 18:00	18:00 to 22:00	22:00 to 6:00	Day 7:00 to 22:00	Night 22:00 to 7:00
Silence Area Hospital; Library, School, Nursery	45	40	35	55	5
Resident Area Hotel; Administration place, House	60	50	45		

Commercial, Services Areas and mix	70	65	50	70	70
Small Industrial factories intermingling in residential areas	75	70	50		

Note: This standard is applied to control of noise level of any source of activity that emitted noise into the public and residential areas.
Source: Annex 6 of Sub-Decree on Air Pollution Control and Noise Disturbance, 2000

3.1.5 International Conventions

53 Cambodia is a signatory to many international environmental treaties and conventions which provide a comprehensive legal framework. These include:

- Biodiversity Convention in 1994;
- Convention on International Trade in Endangered Species of Fauna and Flora (CITES) in 1997;
- Ramsar Convention in 1999;
- United Nations Framework Convention on Climate Change (UNFCC), 1992, entered into force on 21 March 1994 (Cambodia ratified on 18 December 1995);
- Kyoto Protocol 1997, entered into force on 16 February 2005 (Cambodia accessed on 22 August 2002);
- Vienna Convention for the Protection of the Ozone Layer, entered into force on 22 September 1988 (Cambodia accessed on 27 June 2001);
- Montreal Protocol on Substances that Deplete the Ozone Layer, 1987, entered into force on 1 January 1989 (Cambodia accessed on 27 June 2001);
- The International Convention for the Prevention of Marine Pollution from Ships, 1973 as modified by the Protocol of 1978 relating thereto “MARPOL 73/78”, fully entered into force on 2 October 1983 (Cambodia ratified on 1994);
- Basel Convention on the Control of Trans-boundary Movements of Hazardous Wastes and their Disposal, entered into force on 5 May 1992 (Cambodia accessed on 02 March 2001);
- United Nations Convention to Combat Desertification, entered into force on 26 December 1996 (Cambodia ratified on 18 August 1997);
- Convention on International Trade in Endangered Species of Wild Fauna and Flora, entered into force on 01 July 1975 (Cambodia ratified on 04 July 1997);
- Cambodia joined the UNESCO Network of Biosphere Reserves in 1997. It committed to the Millennium Development Goals and subsequently endorsed the Sustainable Development Goals at the UN General Assembly in 2015;
- At the regional level, it ratified the following ASEAN Agreements: (a) on Transboundary Haze Pollution in 2006; and (b) on Disaster Management and Emergency Response, which entered into force in 2009; and
- At the subregional level, Cambodia, along with Lao PDR, Thailand and Viet Nam, signed the “Agreement on the Cooperation for the Sustainable Development of the Mekong River Basin” (or the Mekong Agreement) in April 1995.

3.2 Application of AIIB, IFAD and GCF Environmental, Social, and Climate Risks Standards/Procedures

3.2.1 AIIB’s Environmental and Social Framework

54 The objectives of this ESF are to:

- Reflect institutional aims to address environmental and social risks and impacts in Projects (defined below in *Section II, Definitions,* of the ESP).
- Provide a robust structure for managing operational and reputational risks of the Bank and its shareholders in relation to Projects’ environmental and social risks and impacts.
- Support the environmental and social soundness and sustainability of Projects.

- Facilitate the integration of environmental and social aspects of Projects into the decision-making process by all parties.
- Provide a mechanism for addressing environmental and social risks and impacts in Project identification, preparation and implementation.
- Enable Clients (defined below in *Section II, Definitions,* of the ESP) to identify and manage environmental and social risks and impacts of Projects, including those of climate change.
- Provide a framework for public consultation and disclosure of environmental and social information in relation to Projects.
- Provide a grievance redress mechanism designed to enable Project-affected people to voice their concerns and grievances in connection with the environmental and social aspects of Projects.
- Improve development effectiveness and impact to increase results on the ground, in both the short and long term.
- Support Clients, through Bank financing of Projects, to strengthen their environmental and social management systems.
- Support Clients, through Bank financing of Projects, to implement their obligations under national environmental and social legislation (including under international agreements adopted by the Member) governing these Projects, including commitments relating to climate change.
- Support Clients, where feasible and appropriate, to mobilize resources for technical assistance for the preparation of environmental and social documents and capacity enhancement.
- Facilitate cooperation on environmental and social matters with development partners.

3.2.2 *AIIB's Environmental and Social Standards*

3.2.3 *Environmental and Social Standard 1: Environmental and Social Assessment and Management Scope and Application:*

55 Environmental and Social Standard (**ESS**) 1 applies if the Project is likely to have adverse environmental risks and impacts or social risks and impacts (or both). The scope of the environmental and social assessment and management measures are proportional to the risks and impacts of the Project. ESS 1 provides both for quality environmental and social assessment and for management of risks and impacts through effective mitigation and monitoring measures during the course of Project implementation.

- **Environmental coverage:** Environmental Risks and Impacts, Biodiversity Consideration, protected areas, ecosystem services, sustainability of land and water use, precautionary approach, pollution prevention, resource efficiency, climate change and greenhouse gases.
- **Social coverage:** Social Risks and Impacts, Scope of Social Coverage, Vulnerable/Disadvantaged Groups and Discrimination, Gender, Gender-based violence, Land and Natural Resource Access Loss of access to assets or resources or restriction on land use, Cultural resources
- **Heath and safety:** health and safety of workers and communities, occupational heath and safety, labor influx, building safety, traffic and road safety, security personnel, safety of dam.
- **Labor and Working conditions:** labor management relationships, civil servants, child labor and forced labor,

3.2.4 *Environmental and Social Standard 2: Land acquisition and involuntary resettlement*

56 **Scope and Application.** ESS 2 applies if the Project would or may involve Involuntary Resettlement (including Involuntary Resettlement of the past or foreseeable future that the Bank determines is directly linked to the Project).

3.2.5 *Environmental and Social Standard 3: Indigenous Peoples*

57 **Scope and Application:** ESS 3 applies if Indigenous Peoples are present in, or have a collective attachment to, the proposed area of the Project, and are likely to be affected by the Project.

The term Indigenous Peoples is used in a generic sense to refer to a distinct social and cultural group possessing the following characteristics in varying degrees:2 (a) self-identification as members of a distinct indigenous cultural group and recognition of this identity by others; (b) collective attachment to geographically distinct habitats, ancestral territories or areas of seasonal use or occupation in the Project area and to the natural resources in these areas; (c) customary cultural, economic, social or political institutions that are distinct or separate from those of the dominant society or culture; and (d) a distinct language or dialect, often different from the official language or languages of the country or region in which they live. In considering these characteristics, national legislation, customary law and any international conventions to which the Member in whose territory the Project is located is a party may be taken into account. A group that has lost collective attachment to geographically distinct habitats or ancestral territories in the Project area because of forced severance remains eligible for coverage as an Indigenous People, under ESS 3.

3.2.6 *Application of IFAD and GCF Environmental, Social, and Climate Risks Standards/Procedures*

58 Based on the IFAD SECAP and GCF ESS, the following safeguards documents were prepared: (i) Environmental and Social Management Framework (ESCMF) including climate considerations; (ii) Indigenous Peoples' Plan (IP Plan); (iii) Stakeholder Engagement Plan (SEP); and (iv) Gender Assessment & Action Plan (GAP). The documents have been publicly disclosed in advance of implementation and board approval to respect the Pelosi Amendment[14] as a best practice, even though the project is not high or substantial risk (the risk rating is only moderate), and the documents collectively respond to the standards described below.

3.2.7 SECAP's Environment and Social Standards (ESSs) are described as below:

- Standard 1: Biodiversity Conservation;
- Standard 2: Resource Efficiency and Pollution Prevention;
- Standard 3: Cultural Heritage
- Standard 4: Indigenous Peoples
- Standard 5: Labour and Working Conditions
- Standard 6: Community Health and Safety;
- Standard 7: Physical and Economic Resettlement;
- Standard 8: Financial Intermediaries and Direct Investments;
- Standard 9: Climate Change

59 Not explicitly listed as a standard, but considered a vital part of project design, implementation, and safeguarding is stakeholder engagement. Provisions to ensure meaningful engagement are provided within the Stakeholder Engagement Plan and initial feedback and engagement was mainstreamed into the project design.

The scope of the safeguard standards are detailed in Table-3-8.

Table-3-8: Scope of Safeguards Standards

Safeguards Standard	Scope
Standard 1: Biodiversity Conservation	**Scope:** In accordance with the Convention on Biological Diversity (CBD), this standard recognizes that biodiversity is about more than plants, animals and micro-organisms, and includes people and their need for food security, medicines, fresh air and water, shelter, and a clean and healthy environment. Key objectives include: • Maintain and conserve biodiversity

[14] The 1989 Pelosi Amendment requires disclosure of environmental impacts at least 120 days prior to board approval for high- and sometimes substantial-risk projects (URL: https://www.gao.gov/archive/2000/ns00192.pdf)

Safeguards Standard	Scope
	• Ensure the fair and equitable sharing of benefits from the utilization of generic resources; • Respect, preserve, maintain, and encourage knowledge, innovations, and practices of indigenous peoples and local communities relevant for the conservation and sustainable use of biodiversity, and their customary use of biological resources; and • Adopt a precautionary approach to natural resource conservation and management to ensure opportunities for environmentally sustainable development.
Standard 2: Resource Efficiency and Pollution Prevention	**Scope:** This Standard recognizes that economic activity and development can often pollute the air, water, and land. They may also result in the consumption of finite resources, which may in turn threaten people, ecosystem services and the environment. It advocates for a precautionary approach with the following objectives: • Avoid, minimize and manage the risks and impacts associated with hazardous substances and materials, including pesticides; • Avoid or minimize project-related emissions of short- and long-lived climate pollutants; • Promote more sustainable use of resources, including energy, land and water; and • Identify opportunities for improving resource efficiency.
Standard 3: Cultural Heritage	**Scope:** This Standard recognizes that cultural heritage is central to individual and collective identity and memory, providing continuity between the past, present, and future. Objectives include: • Preserve and safeguard cultural heritage; • Ensure that active efforts are made to prevent IFAD-supported projects from altering, damaging or removing any tangible or intangible cultural heritage; • Promote the equitable sharing of benefits from the use of cultural heritage; and • Promote meaningful consultation on matters related to cultural heritage.
Standard 4: Indigenous Peoples	**Scope:** This standard focuses on the rights of Indigenous Peoples and promotes the following objectives: • Support indigenous peoples to determine priorities and strategies for exercising their right to development; • Ensure that each project is designed in partnership with indigenous peoples and with their full, effective and meaningful consultation, leading to FPIC; • Ensure that indigenous peoples obtain fair and equitable benefits and opportunities from project-supported activities in a culturally appropriate and inclusive manner; and • Recognize and respect the rights of indigenous peoples to the lands, territories, waters and other resources that they have traditionally owned, used or relied upon.
Standard 5: Labour and Working Conditions	**Scope:** This standard is focused on fostering inclusive, diversified, and productive rural economies that create opportunities for decent work and higher incomes. Objectives of this standard are to: • Promote direct action to foster decent rural employment;

Safeguards Standard	Scope

	• Promote, respect and realize fundamental principles and rights by:
	  ○ Preventing discrimination and promoting equal opportunities for workers;
	  ○ Supporting freedom of association and the right to collective bargaining; and
	  ○ Preventing the use of child labour and forced labour;
	• Protect and promote the safety and health of workers;
	• Ensure that projects comply with national employment and labour laws, and international commitments;
	• Leave no one behind by protecting and supporting workers in disadvantaged and vulnerable situations, including women (e.g. maternity protection), young workers, migrant workers, workers in the informal economy and workers with disabilities.

Standard 6: Community Health and Safety	**Scope:** These standard stresses avoiding – and where avoidance is not possible, minimizing and mitigating – health-related and safety-related risks and impacts that may arise from IFAD-supported projects, with special attention to marginalized and disadvantaged groups. Objectives include to: • Ensure quality and safety in the design and construction of programming-related infrastructure, preventing and minimizing potential safety risks and accidents; • Avoid or minimize community exposure to disaster risks, diseases and hazardous materials associated with project activities; • Ensure that the safeguarding of personnel and property minimizes risks to communities and is carried out in accordance with international human rights standards and principles; and • Have in place effective measures to address emergency events, whether human-made or natural hazards.
Standard 7: Physical and Economic Resettlement	**Scope:** This Standard not only considers resettlement as the physical relocation of people but as economic, social and cultural displacement restricting people's access to livelihoods and culturally important sites. Objectives include to: • Avoid involuntary resettlement or, when unavoidable, minimize involuntary resettlement by exploring alternative project designs and sites; • Avoid forced eviction; • Ensure that resettlement activities are planned and implemented collaboratively with the meaningful participation of affected people; • Enhance and restore the livelihoods of all displaced peoples; and • Provide explicit guidance to borrowers/recipients/partners on the conditions that need to be met regarding involuntary resettlement.
Standard 8: Financial Intermediaries and Direct Investments	**Scope:** This Standard recognizes that investments in FIs (indirect investments) and private-sector companies (direct investments) are critical for promoting sustainable financial markets and providing financial products and services to farming businesses and rural micro, small and medium-sized enterprises. Objectives include to:

Safeguards Standard	Scope
	• Promote sound environmental, social and climate practices, and sound human resource management with FIs and direct investees; • Ensure that FIs and direct investees assess and manage any environmental and social risks and impacts of subprojects; and • Promote good environmental and social management practices by direct investees and in the subprojects financed by FIs.
Standard 9: Climate Change	**Scope:** This standard is focused actively considering, planning for, and responding to projected climate changes. Objectives include to: • Ensure alignment of IFAD-supported projects with the Nationally Determined Contributions of countries and the goals of the Paris Agreement and other international frameworks; • Ensure that proposed activities are screened and assessed for climate change and disaster risks and impacts, including both impacts of projects and on them; • Apply the mitigation hierarchy in project design; • Strengthen the resilience of communities to address the risk of climate change impacts and climate-related disasters; and • Increase the ability of communities to adapt to the adverse impacts of climate change, and foster climate resilience and low GHG-emitting projects that do not threaten food production.

3.3 Gap Analysis and Gap Filling Measures

60 IFAD classifies projects and subprojects into one of four classifications: *high risk*, s*ubstantial risk*, *moderate risk* or *low risk* and discloses a project's risk classification and basis for that classification in project documents and on the IFAD website. GCF classifies projects and subprojects into one of three classifications: high risk, moderate risk, or low risk, however the GCF accepts the standards and risk classifications of Accredited Entities, like IFAD, thus for this project (and to simplify approval for IFAD-funded activities) the ESCMF utilizes the IFAD classifications.

61 The assessment identified key gaps between the county's legal system and international recognized environmental and social standards (e.g. AIIB, IFAD, GCF) and priority needs to ensure full compliance of the ESSs. The conclusion was that Cambodia has a comprehensive regulatory framework that in many cases meets the requirements of the ES standards, and key issues are more associated with implementation and differentiated capacities between the central and provincial PMUs and the provinces. There are opportunities to accelerate implementation of recent improvements in the country system, especially on labour, community safety, and stakeholder engagement.

62 Based on the project's high or category A risk rating for environment, social, and climate considerations, national regulations are adequate for most of the investments, while additional gap-filling measures will be applied for the preparation of an Environmental, Social and Climate Impact Assessment (ESCIA) for the overall project particularly related to the civil works so that contractors and implementation partners can adequately address issues related to contract management, safety of local communities, and workers. Capacity building efforts pertaining to regulation and oversight are also incorporated as part of the safeguards management of the CAISAR project and as part of the project design (e.g. under Component 2 activities).

63 There are key gaps between the environmental, social, and climate assessment requirements of the Asian Infrastructure Investment Bank (AIIB), International Fund for Agricultural Development (IFAD), Green Climate Fund (GCF), and the Cambodian Government.

64 One key difference is the scope of their assessments. The AIIB and GCF focus on infrastructure and climate projects, while IFAD focuses on agricultural development. As a result, the types of environmental and social risks and impacts that are assessed may differ.

65 Another difference is the level of detail required in the assessments. The AIIB requires a comprehensive Environmental and Social Framework (ESF) that covers all projects, while the GCF requires a simplified Environmental and Social Management System (ESMS) that is tailored to each project. IFAD requires an Environmental and Social Assessment (ESA) that is specific to each project.

66 In terms of climate assessments, the GCF requires a detailed assessment of the project's potential greenhouse gas emissions and its contribution to climate change mitigation and adaptation. The AIIB also considers climate risks and opportunities in its project assessments but does not require a specific climate assessment. Cambodia's Environmental Impact Assessment (EIA) requirements do not explicitly specify climate assessment procedures. However, the EIA process does consider the potential impacts of projects on the environment, which includes climate-related factors. The assessment typically covers aspects such as air quality, water resources, biodiversity, and social impacts, which indirectly address climate considerations.

67 Overall, while there are some similarities in the environmental, social, and climate assessment requirements of these institutions, there are also key differences that reflect their different mandates and priorities.

68 A detailed list of the Green Climate Fund's climate assessment requirements for an irrigation and flood protection project in Cambodia require:

1. Project description: The project description should include a detailed description of the irrigation and flood protection project in Cambodia, including the location, size, and scope of the project, as well as the expected benefits and impacts.
2. Climate rationale: The project should have a clear climate rationale that explains how it will contribute to climate change mitigation and adaptation. This should include an analysis of the project's potential greenhouse gas emissions and its contribution to reducing emissions.
3. Baseline emissions: The project should include a baseline emissions assessment that estimates the greenhouse gas emissions that would occur in the absence of the project.
4. Project emissions: The project should estimate the greenhouse gas emissions that will be generated by the project, including direct and indirect emissions.
5. Mitigation potential: The project should assess its potential to reduce greenhouse gas emissions and contribute to climate change mitigation. This should include an analysis of the project's potential to reduce emissions compared to the baseline scenario.
6. Adaptation potential: The project should assess its potential to contribute to climate change adaptation, including an analysis of the project's ability to increase resilience to climate change impacts such as flooding and drought.
7. Co-benefits: The project should identify and assess any co-benefits that may result from the project, such as improved food security, increased access to water, or improved livelihoods.
8. Risks and uncertainties: The project should identify and assess any risks and uncertainties associated with the project, including potential environmental, social, and economic risks.
9. Monitoring and evaluation: The project should include a monitoring and evaluation plan that outlines how the project's greenhouse gas emissions, climate change mitigation and adaptation impacts, and co-benefits will be monitored and evaluated over time.

69 Overall, the Green Climate Fund's climate assessment requirements for an irrigation and flood protection project in Cambodia are designed to ensure that the project is aligned with the Fund's climate change objectives and that its potential greenhouse gas emissions and contributions to climate change mitigation and adaptation are carefully evaluated.

70 It is important to ensure that the environmental, social, and climate assessments of an irrigation and flood control project in Cambodia meet both the requirements of the international organizations as well as the legal requirements of the Cambodia government. This will help to ensure that the project is implemented in a way that is legally compliant and meets international standards for environmental and social sustainability and climate change mitigation and adaptation.

3.3.1 *Environmental, Social and Climate Assessment in Cambodia*

71 The Environmental Impact Assessment (EIA) process in Cambodia faces several issues that hinder its effectiveness and transparency. Some of the key issues include:

1 Limited public participation: The EIA process in Cambodia often lacks meaningful public participation. Communities and affected stakeholders are not adequately informed or involved in decision-making processes, limiting their ability to provide input, voice concerns, and influence project outcomes.
2 Inadequate assessment quality: The quality of environmental impact assessments conducted in Cambodia is often criticized for being insufficient and not meeting international standards. This can result in inaccurate or incomplete assessments, leading to inadequate identification and mitigation of potential environmental and social impacts.
3 Lack of independence: The EIA process in Cambodia suffers from a lack of independence, as project proponents are often responsible for conducting and financing their own environmental impact assessments. This can create conflicts of interest and raise concerns about the credibility and objectivity of the assessment process.
4 Weak enforcement and compliance: Despite having regulations in place, the enforcement of EIA requirements and conditions is often weak in Cambodia. This can lead to non-compliance by project developers, with inadequate monitoring and enforcement mechanisms to ensure adherence to environmental safeguards.
5 Limited capacity and resources: Cambodia faces challenges in terms of limited technical capacity and resources for conducting robust environmental impact assessments. Insufficient expertise and resources can result in inadequate assessments and monitoring, compromising the effectiveness of the EIA process.
6 Lack of transparency and accountability: The EIA process in Cambodia lacks transparency, with limited public access to information and documentation related to environmental impact assessments. This lack of transparency hampers accountability and the ability of affected communities to understand and challenge project decisions.

72 While climate change is not explicitly mentioned in the Cambodian EIA requirements, the government has recognized the importance of climate change mitigation and adaptation. The country has developed policies and strategies to address climate change, such as the National Adaptation Plan and the National Climate Change Strategic Plan. These initiatives aim to integrate climate change considerations into various sectors, including infrastructure development and land use planning.

73 In recent years, there has been recognition globally of the need to include climate change considerations in the EIA process. This includes assessing the potential greenhouse gas emissions, vulnerability to climate impacts, and the resilience of projects to climate change.

74 In conclusion the ESCIA requirements of AIIB, IFAD, GCF and the Cambodian government are similar intent and must include the specific climate assessment requirements as defined by GCF.

3.3.2 *Labor and Working Conditions in Cambodia*

75 Cambodia’s labor law does address various aspects related to child labor, gender equality, forced labor, and occupational health and safety. However, it is important to note that there are still challenges in effectively enforcing these laws and ensuring full compliance across all sectors.

76 Regarding child labor, Cambodia’s labor law prohibits the employment of children under the age of 15 in any economic activity. However, there are exceptions for light work that is not harmful to their health and development, and the law also allows for children aged 12 to 15 to engage in light work with certain restrictions. Despite these regulations, child labor remains a concern in Cambodia, particularly in sectors such as agriculture, construction, and informal work.

77 In terms of gender equality, Cambodia’s labor law prohibits discrimination based on gender in recruitment, remuneration, promotion, and other employment-related matters. It also guarantees equal

pay for equal work. However, gender-based discrimination and disparities in the labor market, including lower wages for women and limited representation in higher-level positions, continue to persist.

78 Regarding forced labor, Cambodia's labor law explicitly prohibits any form of forced or compulsory labor. It also prohibits debt bondage and human trafficking. However, forced labor remains a significant issue, particularly in sectors such as agriculture, construction, and domestic work. The government has taken steps to combat this problem, including establishing mechanisms for reporting and addressing cases of forced labor.

79 Occupational health and safety is another area addressed by Cambodia's labor law. The law requires employers to provide a safe and healthy working environment, including measures to prevent accidents, injuries, and occupational diseases. It also mandates the establishment of workplace safety committees and the provision of training on occupational health and safety. However, the enforcement of these regulations and the implementation of effective safety measures can be challenging, particularly in sectors with informal or hazardous working conditions.

80 In summary, while Cambodia's labor law does address child labor, gender equality, forced labor, and occupational health and safety, there are still gaps in enforcement and compliance. Efforts are needed to strengthen the implementation of these laws and ensure the protection of workers' rights in practice.

81 Systematic labor inspection heavily relies on self-reporting, especially when construction contractors and primary suppliers are involved. For this reason, a template for labor management procedures must be included in bidding documents of contracted workers. For primary suppliers of materials, the practice of conducting due diligence on labour and working conditions among potential sources of aggregate material is uncommon. Therefore, a monitoring procedure must be established prior commencement of related works, and the site-specific ESA must assess potential labor issues, including risks of child and forced labour for suppliers and in the value chains relevant for the CAISAR project, and other health hazards on workers due to waste management and handling of any related hazardous materials during construction to ensure compliance with national laws and Standards. MOWRAM as the Lead Agency of the CAISAR project must ensure that OHS procedures and a working grievance redress mechanism are stipulated within the contract, including the system for monitoring third party contractors' compliance with the agreed OHS procedures and GRM.

4. ENVIRONMENT, SOCIAL & CLIMATE ASSESSMENT

4.1 Project Objective, Components, Areas and Beneficiaries

82 The project rationale is provided in Section 1.1. The Country and project context is provided in Section 1.2, and the CAISAR Project components are outlined in Chapter 2.

83 The CAISAR project has a broad positive impact benefitting approximately 120,000 households (500, 000 rural people) directly while its effect will propagate to over 3 million people in the region (CAISAR Feasibility Study 2023). The project will be executed through the Ministry of Water Resources and Meteorology (MOWRAM) and the National Committee for Sub-National Democratic Development Secretariat (NCDD-S), a Direct Access Accredited Entity to the GCF. The expected timelines for the approval of the co-financing by IFAD and AIIB Executive Boards are respectively September 2024 and January 2024, with the inception of the project is expected to take place in December 2024.

4.2 Project Area

84 The CAISAR project aims to enhance Cambodia's resilience against climate change through investments in innovative practices such as flood protection, drainage, and solar pumping, with a total estimated budget of $280 million. The costs are distributed among different CAISAR objectives, with flood and drainage costing $47.4 million, solar and raised tertiary costing $82.1 million, and irrigation and storage costing $150.6 million. The project is divided into three sub-projects, each with different requirements and costs. The CAISAR scheme is expected to improve yields and provide better drought resilience over the 25-year asset life, with the project expecting significant yield improvements in all three sub-project areas.

85 The core benefits of the project include food security in the face of climate change as well as significant economic contributions to poor rural households by enabling climate change resilient and adaptive agriculture as well as nationally important greenhouse gas emission reductions. The scheme will bring several indirect benefits improving the socio-economic situation for communities living within the command areas such as improved access to transport links, education and community strengthening through the establishment of FWUCs. The project is expected to be economically viable even under pessimistic assumptions, with the baseline internal rate of return for the project at 17%.

86 Through nature-based approaches including river restoration and rehabilitation and creation of natural ponds, the CAISAR project is expected to provide several environmental enhancements whilst ensuring that the environmental impacts of the construction and operational phases of the project are limited and mitigated where possible. In addition to this, the use of innovative climate-smart solutions will reduce the overall climate impact of the scheme and endeavor to reduce the emission of greenhouse gases from the existing and proposed agricultural practices with the introduction of solar pumps and Alternate Wetting and Drying techniques.

87 The character and existing farming systems differ widely in each sub project as will be described below. The CAISAR feasibility study covers a total command area of 45,000ha and is composed of three sub-project command areas – Ou Ta Paong, in Pursat Province, Lum Hach, in Kampong Chhnang Province and Krang Ponley in Kampong Chhnang, Kapong Speu and Kandal Province as shown in
Source: CAISAR Feasibility Study

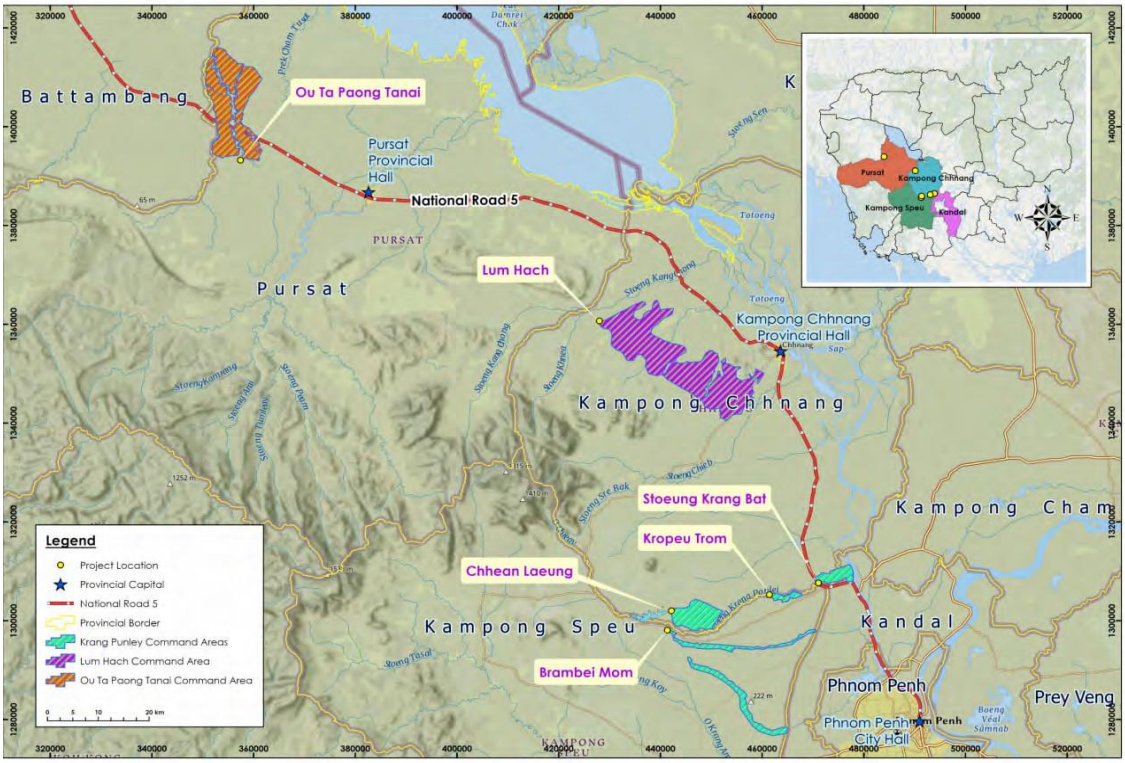

Figure 4-1: Map showing the location of the CAISAR project areas and& Provincial Boundaries

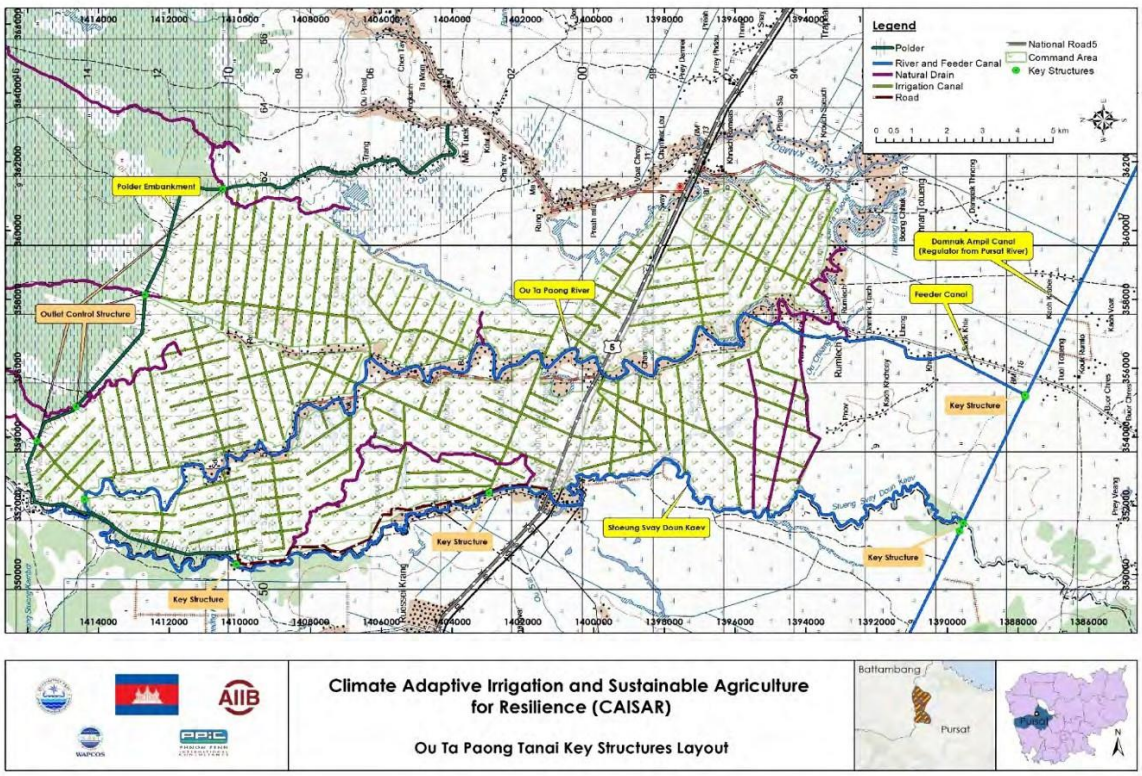
88 .

89 Detailed characteristics of the different sub-project command areas, with respect to historical and present-day conditions, temperature, precipitation, agricultural cover, and current water resources are presented in each Feasibility report for the corresponding projects which will be available to the team.



90 The sub-project areas, except for Kampong Chhnang, each have existing irrigation infrastructure which needs rehabilitation and/or has a suitable nearby water source that could enhance the agricultural output from the area and make it more resilient to the effects of climate change. The final command areas were then established based on field surveys and stakeholder consultations and

target areas that require the greatest assistance. Each sub-project area is currently experiencing or projected to experience challenges because of climate change and is therefore in need of climate adaptation and resilience measures. This work has been conducted in consultation with MOWRAM and the PDWRAM to ensure that local information is considered at each project stage.

4.3 Project target areas and beneficiaries

94 The following section describes the CAISAR sub-projects and their beneficiaries.

4.3.1 *Krang Ponley*

95 The Krang Ponley sub-project is located within the Krang Ponley catchment and is made up of four sub areas: Brambei Mom, Krapeu Troum, Krang Bat and Cheung Luong. The Krang Ponley river is long and fed from the Anlong Chrey Reservoir. The reservoir has a storage capacity of 30M m3 and was rehabilitated by KOICA in 2012 as part of the *Krang Ponley Water Resources Development Project*. With the exception of Chhean Laeung, each of the sub-project areas has existing irrigation infrastructure. These were largely constructed under the Khmer Rouge (1975 – 1979) and have since fallen into disrepair despite farmers excavating and maintaining some main and branch canals. Severe sedimentation and embankment erosion resulting from a lack of maintenance has resulted in damaged concrete structures and an inefficient irrigation system.

96 The proposed works are expected to benefit 3 communes across the four separate sub-schemes, making use of both the Anlong Chrey reservoir and the Brambei Mom reservoir. Pond and storage area rehabilitation and excavation, upgrading main, secondary, and tertiary canals as well as a new scheme at Chhean Leung will be hugely beneficial to local communities, increasing their resilience to climate change and enabling them to increase their agricultural outputs resulting in a number of indirect social benefits. In total there are 47,000 households in the Krang Ponley sub-project area. Dry season yields are expected to increase from 4.5 tons/ha to 6.5 tons/ha and during the wet season, they are expected to increase from 3.9 tons/ha to 5.8 tons/ha.

4.3.2 *Lum Hach*

97 The Lum Hach irrigation scheme is in close proximity to the work undertaken by JICA as part of the West Tonle Sap Irrigation Project (2022). Unfortunately, due to the infilling of the 1st January canal from discarded excavated material and the lowering of the headworks on the main canal, the CAISAR Lum Hach scheme can no longer make use of the existing main canal as a water source for irrigation. Therefore, alternative water sources have been assessed and analysed to determine if they are available and sufficient for the new scheme (Annex 1).

98 The existing irrigation infrastructure has received limited farm maintenance by farmers and others. This has resulted in sedimentation, embankment erosion and damaged concrete structures making the current system unreliable.

99 The proposed works are expected to benefit people living in four communes across three districts of Kampong Chhnang Province. The overall design will enhance the existing irrigated area to enable farmers to increase yields during the wet season from 2.5 tons/ha to 4.5 tons/ha. Additionally, with the provision of a reliable water source during the dry season and sufficient training provided through the proposed FWUCs, dry season cropping will be feasible with an estimated yield of 5 tons/ha.

100 Overall there are 18000 households in the Lum Hach sub-project area.

4.3.3 *Ou Ta Paong*

101 The Ou Ta Paong sub-project lies within Pursat Province. The area is highly climate vulnerable due to its proximity to the Tonle Sap lake and the Svay Donkeo river which have shown erratic flood patterns in recent years.

102 The existing irrigation scheme at Ou Ta Paong was constructed during the Khmer Rouge. Some sections have been rehabilitated by farmers and from social funds but due to an overall lack of maintenance and finance, many sections of canal have been damaged from sedimentation and erosion. The main water source is from the Don Nak ChheKrom canal which receives water from the Steng Pursat River.

103 The proposed scheme will include flood defense investment around the command area to enable the community to protect it's farming livelihood from future flood events from the Tonle Sap but taking into consideration the importance of local fisheries.

104 The current irrigation system is not connected to upstream water sources and current farming practices are heavily dependent on rainfall and flood recession agriculture. The design proposals will reduce this climate dependence and vulnerability to climatic changes by providing a reliable source of water for irrigation from the Svay Donkeo River via the Damnak Ampil Canal. 40km of Main Canal will convey water from the Damnak Ampli Head Works via the China Main Canal to feed the irrigation scheme.

105 The scheme will benefit communities living within two communes in the Bakan and Pursat Province and overall, there are 6000 households in the sub-project area. Dry season yields are expected to increase from 5.8 tons/ha to 6.5 tons/ha and wet season yields are expected to increase from 3.9 tons/ha to 5.8 tons/ha.

106 The following provides a summary of the three irrigation and flood control schemes.

Table-4-1: Summary of the Sub Project Elements

Sub Project	Ou Ta Paoung	Lum Hach	Krang Ponley
Area Cultivated (ha)	13,000	17,000	15,000
Water Source	Pursat River and Svay Don Keo	Local Streams and diversion of Boribo tributary	Krang Ponley River with existing storage at Anlong Chrey and Brambei Mom
Nature Based Solution	Restoration of Ou Ta Paoung River, fish passage on Donkeo and OTP, Natural Management of TS floods.	Enhancement of Main Canal environmental features, local storages and riparian corridors along local rivers. 200 Ponds	Control of flood regime at Krang Bat for flood recession and fisheries. Rehabiltate 31 major ponds.
Solar Pump Installations	35 (Not suitable in flood areas)	179	110(BBM)+47(CL)+27(KPT)
Main/Feeder Canals C/L(km)/N	1_8.0km_29	1_30.0_52	
Secondary Canal C/L (km)/N (Exist and New)	8_30.0km_ 13_35.8km_108	12_12.2km_673	
Tertiary Canal C/L (km)/N Exist and New	34_47.5km 139_151.0km_1452	179_107km_1487	
Main/Secondary Drains (C/L km/N)	7_36.3km_15	12_107km_99	
Existing Land Area (Ha)	300	66	144
New Land Area Required (Ha)	278	532	249

Note: (L=km C= Number of Canals, N= Number of Structures)

4.4 Socio-economic context and vulnerability

107 As part of the feasibility study for the CAISAR project, WAPCOS conducted a comprehensive livelihoods and vulnerability study of the target population. The study conducted surveys across more than 630 households in the project areas, 100 focus groups and 100 key informant interviews to understand the social and economic issues affecting the target population in the areas where CAISAR will be implemented. Issues such as poverty rates, land ownership, access to goods, education and health care as well as institutional capacities and gender related issues were all explored and analyzed by the WAPCOS team. It was important for the CAISAR project to assess such issues to get an improved understanding of the social society living in the command areas and any long-standing social inequalities which may impact their ability to adapt and be resilient to climate change. This could then assist the design and implementation of targeted and area specific aspects of both Component 1 and 2.

108 The survey results were assessed and found that the populations of all command areas follow similar social economic indicators, in terms of poverty, income, household debt, education levels, health and vulnerabilities.

109 Most of the population are rural farmers (rice typically), whilst some also supplement their income via alternative jobs such as working in the service sector. Households typically do not have stable annual incomes or expenditures due to the annual cycle of the wet and dry season and the impact this has on agricultural yields and livelihoods. This correlated with the vulnerability analysis which found that the majority of the population is at the edge of poverty despite most respondents having incomes above traditional poverty lines (the World Bank or UNDP thresholds are between 2-8 USD per day). The WAPCOS survey found that based on responses to the monthly income section in the livelihood analysis for the four provinces, the highest proportion of households earn between 200 to 300 USD/month (17.1%) and then 300 to 400 USD/month (16.0%). The high-income band per household of over 1000 USD/month was only attributed to 4.8% of households and the lowest income band of less than 50$/month was attributed to 7% of households. These average income values hide the variability between provinces, for example in Kandal province, 3% of households earn less than $50/month whereas in Kampong Chhnang the number is much higher at 10%. The low number of low-income households in Kandal may be due to the proximity to good transport links and towns/cities such as Phnom Penh. There are less alternative income sources in rural areas, such as selling produce and groceries, business, or service providers, so most households are dependent on agriculture for their livelihoods which typically does not generate large monthly incomes.

110 Since 2007, Cambodia has made significant progress in terms of educating its Children. The number of children enrolled in primary education increased from 82% in 1992 to 97% in 2017/8. However, the country still faces a number of challenges, particularly educating those living in poor rural areas as children are not reaching standards appropriate for their age.

111 At primary level, nearly 25% of children in Grade 3 cannot write a single word in a dictation test. Only 27% of 3 to 5 year old's are developmentally on track in literacy and numeracy and by the time they are 17 years old, 55% of adolescents will have dropped out of school. Overall, large numbers of girls and boys remain out of school at all levels of education, from early childhood through to adolescence. Most children drop out before reaching secondary school. Girls and boys from disadvantaged groups are struggling to realize their potential as they face difficulties getting to, and staying in, school.

112 Across the CAISAR project areas, high school dropout rates are common. The highest education level attained for 59% of households questioned during the survey was primary school. Only 22% had been to secondary school and less than 1% to university. 12% of households had never been to school and of these, 82% could not read or write. It must be noted that these average values hide the range of results which varied by province and sub project area. In Ou Ta Paong, 17% of households had never been to school. For 54% of the households questioned, primary school was their highest education level with 22% going to secondary school and 3% to university. Low education levels in this area will make it more challenging to implement climate resiliency measures.

113 By contrast, in Lum Hach, 7% of households had never been to school and 43% had been to primary school, 13% to secondary school and 2% to university. The variable educational levels attained by the households across the sub-project areas highlights the potential social inequalities experienced by local communities. There are various reasons why children may drop out of school such as cost, distance from home, engagement in agricultural activities. In most provinces of Cambodia, upper secondary schools are mainly located in district or provincial centers. Students in remote areas may therefore not be able to access them due to poor quality roads or general lack of transport. Long distances to schools and bad road conditions often require students to make use of accommodation in another district but this is not possible for the majority of poor rural families, limiting their capacity to meet their potential.

114 High school dropout rates are common in the CAISAR project areas and are typically experienced in these rural areas due to the cost, long travel times and bad road conditions. This is a social issue that the CAISAR project could address by providing good quality roads adjacent to canals and within the command areas.

115 In recent years, consecutive annual crop failures have led to household individuals sourcing other, more profitable non-farm incomes. In 2018, an estimated 1,000,000 Cambodian migrants were registered in Thailand looking for other income sources to support their families. However, the COVID19 pandemic resulted in a backflow of mostly rural labor migrants which posed its own challenges to the agricultural sector in Cambodia (ADB, 2022).

116 There continues to exist a large disparity between the rural and urban populations of Cambodia. In 2016, the estimated average monthly household income was $717 in Phnom Penh and $607 in other urban areas. By contrast, monthly incomes were on average $374 in rural areas (Government of Cambodia, Socio-Economic Survey, 2016). Rural incomes are therefore only about 50% - 60% of all urban areas although the gap does appear to be closing with the disparity in 2012 being 40% - 55% (ADB, 2022).

117 This section has discussed several direct and in-direct beneficiaries living in the project areas. It highlights the importance of surveying communities to identify any existing social inequatlies and looking for opportunities to reduce these. The CAISAR project will look to improve the general wealth, well-being, priorities, and opportunities of communities living within the command areas through providing a reliable irrigation system that is resistant to climate change and will enable farmers to improve their livelihoods.

4.5 Agriculture

118 Agriculture is the primary source of livelihood for the communities living in most provinces of Cambodia and it accounts for 22.5% of the country's Gross Domestic Product and employs over 3 million people. Rice is the dominant food crop grown on an estimated 4.5 million hectares or 70% of the country's total cultivated area (ADB, 2022). The cultivated area of rice in Cambodia increased from 3.2 million ha in 2017 to 3.3 million ha in 2018, comprising of 2.7 million ha of wet-season rice and 0.6 million ha of dry-season rice (ADB, 2022).

119 Each sub-project command area has unique climatic conditions and geology which results in different soil qualities. This in turn affects land use and farming practices as communities have adapted over time to the areas in which they live and the resources that they have.

120 Access to transport and agricultural co-operations additionally influences farming practices. Where there are agricultural co-operations, a network is already established between the farmers growing and selling the vegetables and those buying them. This facilitates vegetable cultivation and marketability, encouraging farmers to move away from rice farming to more diverse horticultural agriculture. Krang Ponley for example is very accessible and close to the city of Phnom Penh. Farmers there produce more vegetables than in other provinces as they have better access to the cities markets to sell their produce.

121 In May-June 2022, the CAISAR team conducted an agronomy survey. Based on the findings, the agronomy experts have suggested proposed cropping patterns for each sub-project area which are discussed below.

122 **In Lum Hach**, the soil quality is particularly low due to the dominance of sandy surface soils. As a result the land is not considered suitable for agricultural use. Crops can be particularly vulnerable to drought stress due to the high hydraulic conductivity of the soils resulting in fast runoff and drainage. In conjunction with insufficient water resources and irrigation supply, this results in high rates of nutrient leaching and low crop yields. The agronomy survey and livelihood survey conducted by WAPCOS found that crop yields in the Lum Hach Command Area are water limited to one annual wet season crop of rice. Interviewed farmers reported average annual yields of 1.5 to 2 tons/ha whereas district statistics report crop yields of 3.2 to 3.8 tons/ha but it is thought that this dataset does not account for failed crop years. Currently only 30% of the Command Area is agricultural land but this is expected to change under the CAISAR project, once a more reliable source of water is provided. With a more reliable water supply, dry season rice cropping would be possible but farmers in Lum Hach explained they have limited technical experience and understanding of dry season rice so in order for this to be a success, it is critical that the CAISAR project provides adequate training.

123 As highlighted in the agronomy survey, the low soil quality in Lum Hach significantly limits crop yields and opportunities for expansion. Therefore, the CAISAR scheme proposes that between wet season rice crops, farmers grow cover crops such as mung bean to improve soil organic matter and fertility. This will have an indirect benefit to crop yields by improving soil productivity and therefore enhancing rice crop yields over time. Using cover crops has a further benefit of reducing input costs as farmers are required to use less fertilizer once the cover crops improve soil fertility. Crop rotation has the added benefit that it reduces the number of pests and diseases thereby reducing crop yield losses.

124 Additionally, farmers in Lum Hach could diversify to alternative horticultural crops such as cucumber, watermelon, pumpkin etc. between wet season crops to help increase soil organic content and interrupt the intensive rice cropping which inhibits the soil from rejuvenating.

125 **The Ou Ta Paong** Command Area is dominated by agricultural land (80%). Soil fertility is high, made up of 69% high productivity soil and 31% medium productivity soil. This is largely due to the low-land nature of the command area with the northern part lying within the active floodplain of the Tonle Sap which floods annually. There are two to three crops per year, producing 3.9 tons/ha in the wet season and 5.8 tons/ha in the dry season. Dry season rice crops typically produce more yield per hectare due to the rice variety that is used during this cropping period and the additional fertilizer that is applied.

126 The improved drainage and more reliable water supply to Ou Ta Paong will enable up to three rice crops per year. In addition, between rice crops, it may be possible for famers to cultivate vegetables. Currently, the majority of farmers are reluctant to do this due to the lack of reliable water source. Once this is resolved by the CAISAR project, farmers have said they would be willing to try vegetable cultivation.

127 The dominant cropping pattern in **Krang Ponley** consists primarily of wet season rice cropping. There is however variation between the provinces depending on soil quality and water availability. Where possible, a dry season recession crop is planted with a typical yield of 4.5 tons/ha. The wet season rice yields are slightly lower at 3.9 tons/ha. However, flood inundation of the command areas can result in crop failures and reduced yields, particularly during the wet season.

128 In Krang Ponley, the overall soil quality is medium and similar to Ou Ta Paong due to the low-lying topography and annual flood inundation (particularly in Krang Bat) of the command area. Due to the proximity to markets in Phnom Penh, more farmers in this sub-project area have moved away from rice farming to horticultural produce such as watermelon, long bean, corn, eggplant and pumpkin. Farmers can either rely solely on vegetables throughout the year or grow vegetables outside of the wet season rice cropping period.

4.6 Water Resources

129 Rainfall is extremely variable across Cambodia both spatially and temporally. The Southwest monsoon in Cambodia provides 87% of the yearly rainfall during the months of May to October (Salvadore

et al, 2020). As a result, Cambodia receives an abundant amount of water during this part of the year but can also experience extreme water shortages during the dry season. The extreme volumes of water during the wet season can lead to extensive flooding which can result in crop and infrastructure damage. This is particularly an issue where flood waters inundate irrigation command areas. On the other hand, prolonged periods of dry days can lead to drought in the dry season. In areas where there are limited areas for water storage, crops can become water stressed and crop yields may be reduced or entire crops may fail. Water scarcity is therefore primarily a result of a lack of water management and water storage capacity rather than an insufficient volume of water available annually (ADB, 2022).

130 The extreme variability in rainfall results in serious challenges for rice farmers, particularly during the first few months of the wet season, when rainfall is most erratic and early season droughts are common. Short droughts can occur prior to the wettest period at the end of August to the end of November. Such short droughts can last 15 days but occasionally they can be prolonged and last up to 60 days after the first monsoon rains (ADB, 2014). This causes additional difficulties for rice farmers, particularly those who are dependent on rain-fed irrigation. Irrigation infrastructure is often lacking or is damaged due to lack of investment and maintenance which should otherwise provide reliable water supplies during these dry periods.

131 Across the three CAISAR project command areas, the majority of rice farmers are reliant on rain-fed irrigation or recession rice which brings both challenges and opportunities. Due to the erratic and unpredictable nature of the climate, farmers are reluctant to take more risks and diversify their cropping patterns as they have no reliable water source to support their crops if a period of drought occurs. In addition, there is a lack of drainage and flood protection which additionally inhibits farmers from meeting their yield potentials. Climate Change will impact Cambodia's water resources and it is critical that this is taken into account at each stage of the CAISAR project including project design and hydrological and hydraulic modelling.

132 Extensive modelling has been undertaken as part of this feasibility study to ensure that there are sufficient water resources both under current and future scenarios, taking uncertainty into account. This is summarized in detail in the D4 modelling report and the results show that the project is feasible in terms of the available of water resources both now and in the future, to support the proposed yield increases in the 45,000 ha CAISAR project command areas.

4.7 Irrigation

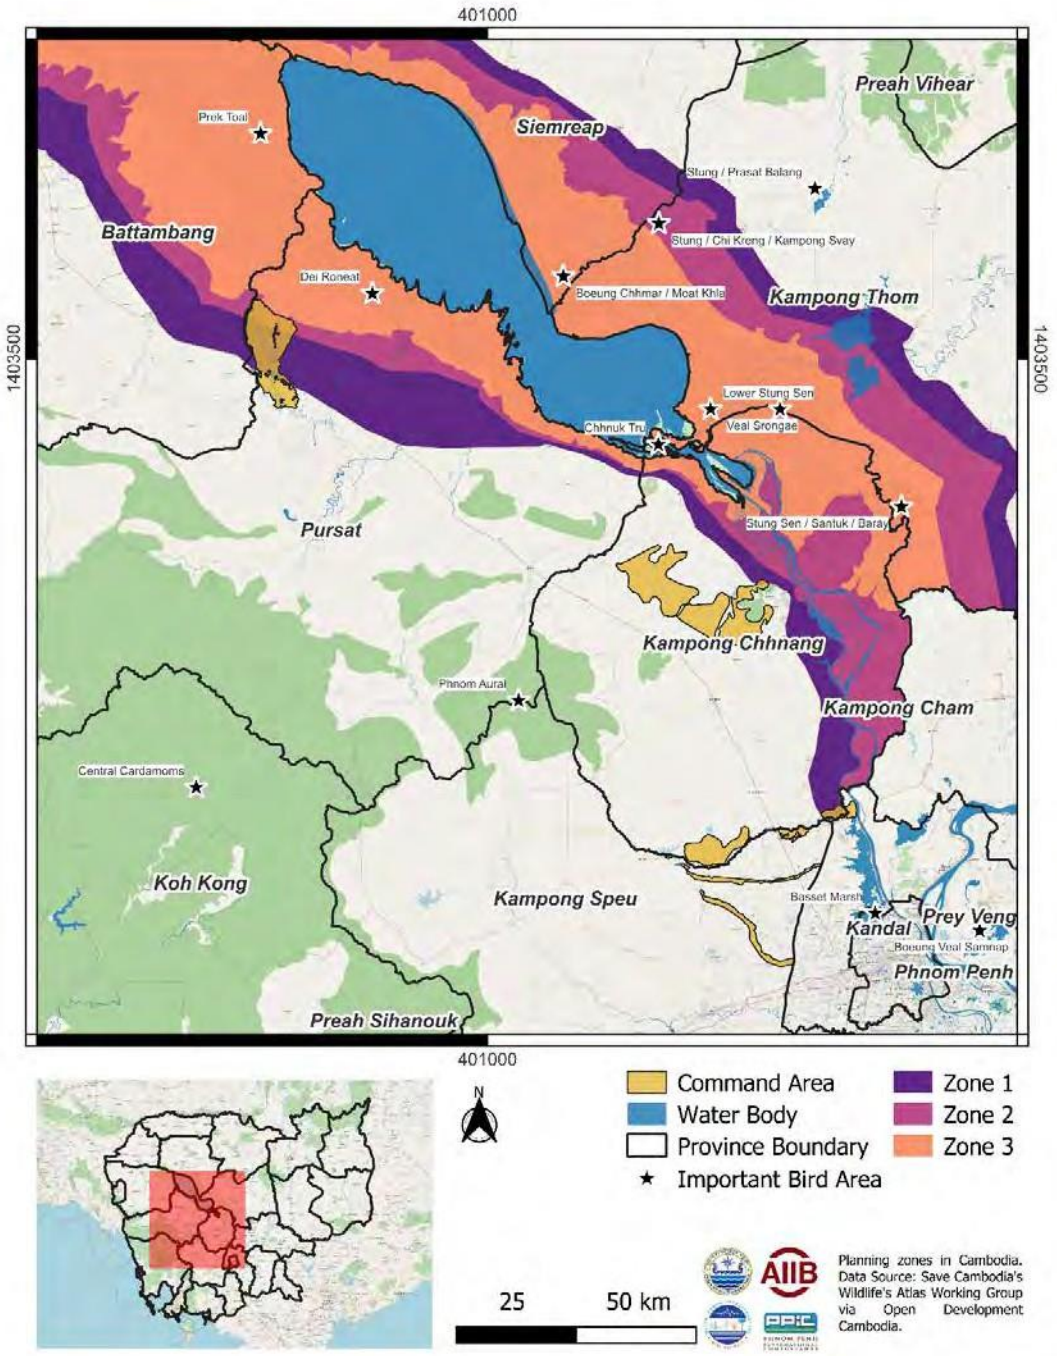
133 Access to water is a challenge, particularly for those with irrigation schemes located close to the Tonle Sap as flooding in the wet season and shortage in the dry season can limit annual cropping intensity. Successful water resource management is therefore critical to ensuring that the CAISAR irrigation schemes are a success.

134 Rehabilitation and climate proofing of existing irrigation infrastructure will be key. Constructing irrigation ponds also forms part of an integrated and smart water resource management plan. Climate proofing involves securing the irrigation system's resilience and sustainability against longer droughts in the dry season and to mitigate the impacts of flood events.

135 Irrigation has the potential to increase Cambodia's potential rice yields. Currently, the dominance of low wet-season rice yield limits the productivity and profitability of Cambodian farmers. For example, Cambodia's wet-season rice is about 30% less than that of Thailand's Central Plains region (ADB, 2022). There are opportunities for crop diversification that are being explored but this is likely to be on a smaller scale than rice production.

136 The infrastructure proposed is a full package for water management improvements including storage, gravity supply without repumping where possible and use of solar pumping where it is not, drainage and flood control including allowance for aquatic animals and fish.

4.8 Biodiversity



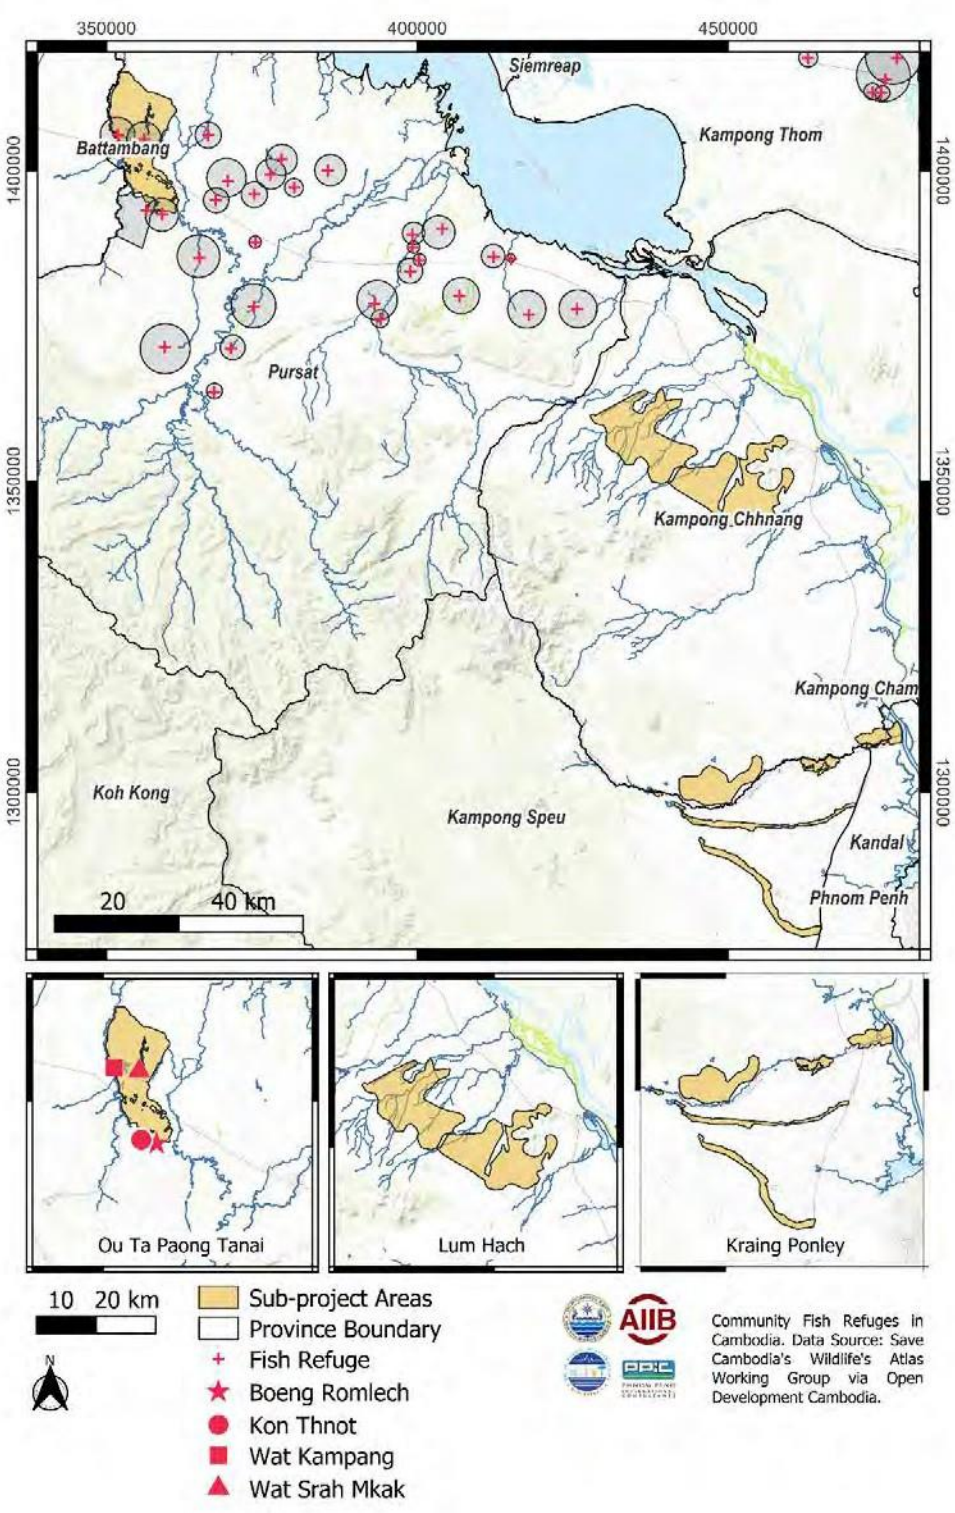
4.8.1 Designated areas and species of interest

137 The Feasibility Studies have noted the unique ecosystem in Tonle Sap lake and floodplain which is protected as a UNESCO Biosphere Reserve. The Great Lake itself if one of the most productive fisheries systems in the world, providing key breeding grounds for fish and 60% of Cambodia's protein intake. In addition, it is home to some of the largest breeding colonies of some of the world's most threatened water birds. This unique ecosystem faces unprecedented threats from population increases and pressure on natural resources. As a result, there are a number of conservation projects taking place to protect this precious environment and in 2021, the conservation areas surrounding the Tonle Sap Great Lake were updated and re-instated.

138 The agricultural protection zones are shown in Source: CAISAR Feasibility Study

139 Figure 4-8. The Zone 1 and 2 are areas where farming is allowed. In zone 1, people can live and obtain land title certificates. In zone 2, local communities are allowed to do land cultivation. In Zone 3, closest to the lake is where agriculture and fishing are officially banned and the areas of flooded forest must be protected and conserved. This re-zoning allows the government an opportunity to restore the Tonle Sap's unique forests.

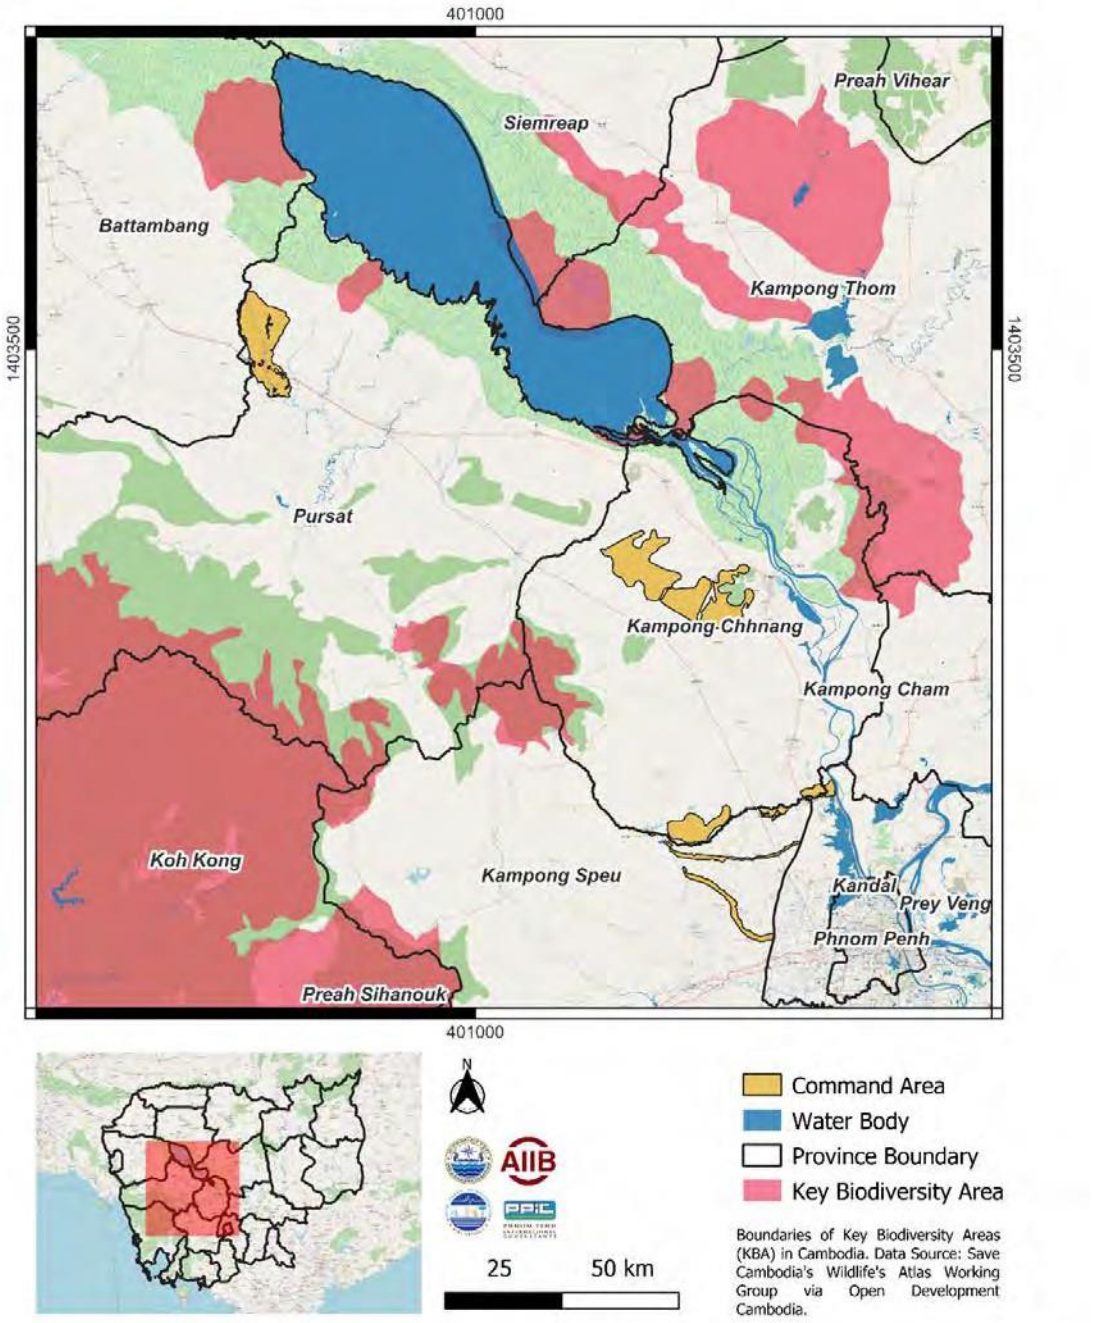
140 The CAISAR command areas lie outside of zone 3. Most of the Ou Ta Paong command area falls within zones 1 and 2 where agricultural practices are permitted. The majority of the Lum Hach command area lies outside of the protection zones, with a small section to the north falling within zone 1. The majority of the Krang Ponley scheme falls outside of the protection zones although a small section of Krang Bat lies within zone 1. Based on this, there are no limitations on agricultural practices required by the Tonle Sap Agricultural Protection Zones.



Source: CAISAR Feasibility Study

Figure 4-8 Tonle Sap Agricultural Protection Zones

141 Rice Field Fisheries are a vital source of food and income for almost all rural households in Cambodia. Fishing typically occurs during the wet season from July to February and takes place in and around flooded rice fields. Despite contributing 20-25% of the country's inland fish catch, community fish refuges are often poorly managed and have low productivity. Several projects, such as the USAID-funded Enhancing Rice Field Fisheries project, have been implemented to increase the productivity of these vital food production systems. Through improved management and inclusion of best-practice methods amongst local communities, the projects can ensure that fish are available and accessible to all poor and rural families. The location of Community Fish refuges in the CAISAR Command Areas are shown in
142 Figure 4-9. There are only 2 refuges in the Ou Ta Paong Command Area which should be considered during DED stage and allowance made in the scheme design to expand and enhance the number of fish refuges and the linkage through canals and rice fields.



143 The key biodiversity areas are shown in Figure 4-10. The CAISAR Command Areas fall outside of these areas. However, due to the proximity, it is recommended that further analysis is undertaken during the SECAP analysis and DED to determine whether any further environmental considerations are needed.

144 The CAISAR Command areas are located largely outside of all the protected areas. The surrounding land use is dominated by paddy field thus, potential impact on local ecological features is not envisaged although this will be investigated further as part of the ESCIA.

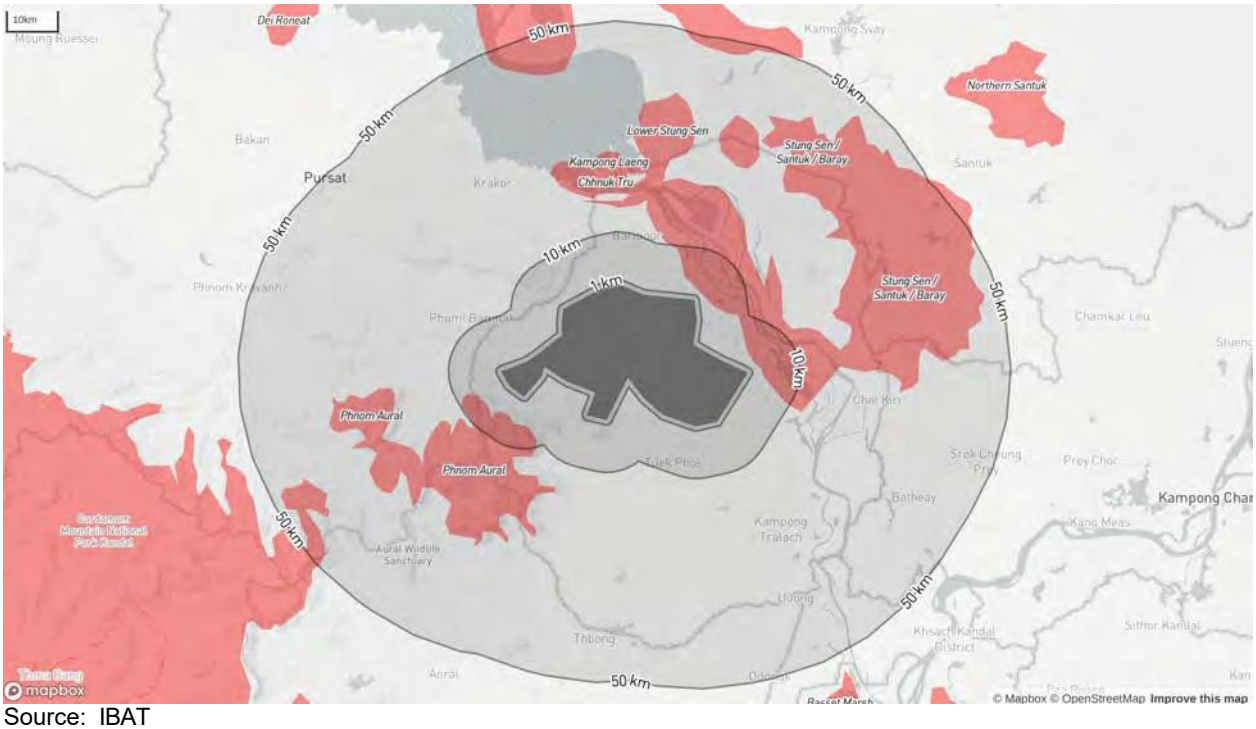
4.8.2 IBAT Initial Biodiversity Assessment

145 The initial biodiversity assessment utilized the IBAT system. IBAT offers rapid visual screening for critical biodiversity. The tool is used as basic risk screening on biodiversity. This review provides an indication of the potential biodiversity related features including protected areas, key biodiversity areas and species close to the proposed project locations. It provides an early indication of potential biodiversity concerns and can provide valuable guidance in making decisions. The IBAT screening does not provide details of potential indirect, downstream, or cumulative impacts. This information may be helpful when assessing the potential environmental risk and impact of a site, categorizing investments/projects, preparing the terms of

reference or an impact assessment, focusing attention on key species of conservation concern and sites of known conservation value.



146 IBAT provides information on key biodiversity areas (KBA) which are sites contributing significantly to the global persistence of biodiversity in terrestrial, freshwater and marine ecosystems: information available from the World Database on Protected Areas (WDPA); and information form the IUCN Red List of Threatened Species (also known as the IUCN Red List) which is a compendium of information on threats, ecological requirements, and habitats and on conservation actions that can be taken to reduce or prevent extinctions (Figure 4-11, Figure 4-12, Figure 4-13).

4.8.3 Protected Areas, Key Biodiversity Areas and IUCN Threatened Species

Lum Hach Scheme

147 The IBAT assessment identified the following biodiversity features within a 5 km, 20 km and 50 km distance from the Lum Hach Irrigation and flood protection scheme.

- Protected Areas - 12
- Key Biodiversity Areas - 9
- IUCN Red List of Threatened Species – 96 (Annex ___)

Source: IBAT

Figure 4-11 IBAT Biodiversity Features around Lum Hach Scheme

148 The following protected areas were identified within a 5 km, 20 Km and 50 km radius of Lum Hach Scheme.

LH Protected Areas

Area Name	Within Buffer of KPL Project Area
Phnom Aoral – Wildlife Sanctuary	5 km
Phnom Krang Dey Meas – Protected Landscape	5 km
Tonle Sap – UNESCO-MAB Biosphere Reserve	5 km
Phnom Neang Kong Rey- Phnom Touk Meas – Multiple Use area	20 km
Boeng Chhmar Core Area (Ramsar Site)	50 km
Cardamom Corridor	50 km
Central Kravanh	50 km
North Tonle Sap	50 km
Stung Sen Core Area (Ramsar Site)	50 km

149 Key Biodiversity Areas within 5 km, 20 Km and 50 km of the Lum Hach Scheme included:

LH Key Biodiversity Areas

Area name	Distance
Kampong Laeng	5 km
Phnom Aural	5 km
Chhnuk Tru	20 km
Lower Stung Sen	20 km
Stung Sen / Santuk / Baray	20 km
Boeung Chhmar / Moat Khla	50 km
Central Cardamoms	50 km
Stung / Chi Kreng / Kampong Svay	50 km
Veal Srongae	50 km

150 The IBAT system identified 19 Critically Endangered Species and 31 Endangered Species in the IUCN Red List of Threatened Species within the 5 km, 20 and 50 km buffer areas of the Lum Hach Scheme.

Krang Ponley Scheme

151 The IBAT assessment identified the following biodiversity features within a 5 km, 20 km and 50 km distance from the Krang Ponley Irrigation and flood protection scheme.

- Protected Areas - 6
- Key Biodiversity Areas - 7
- IUCN Red List – 104 (Annex __)

Source: IBAT

Figure 4-12 IBAT Biodiversity Features around Krang Ponley Scheme

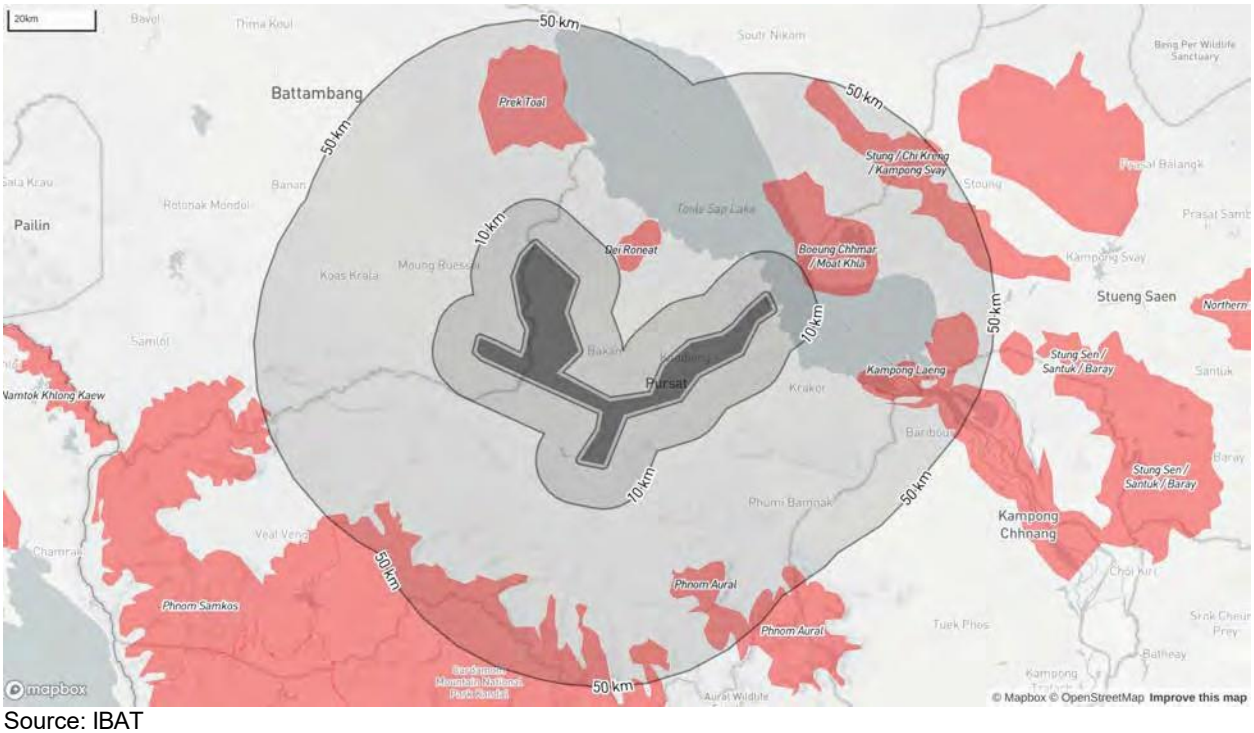
152 The following protected areas were identified within a 5 km, 20 and 50 km radius of Krang Ponley Scheme.

KPL Protected Areas

Area Name	Within Buffer of KPL Project Area
Cardamom Corridor	50 km
North Tonle Sap	50 km
Phnom Aoral	50 km
Phnom Krang Dey Meas	50 km
Phnom Neang kong Rey – Phnom Touk Meas	50 km
Souther Kravanh	50 km

153 Key Biodiversity Areas within 5 km, 20 and 50 km of the Krang Ponley Scheme included:

KPL Key Biodiversity Areas



Area name	Distance
Basset Marsh	5 km
Boeung Veal Samnap	20 km
Bassac Marsh	50 km
Kampong Laeng	50 km
Phnom Aural	50 km
Southern Cardamoms	50 km
Stung Sen / Santuk / Baray	50 km

154 The IBAT system identified 18 Critically Endangered Species and 35 Endangered Species in the IUCN Red List of Threatened Species within the 5 km, 20 and 50 km buffer areas of the Krang Ponley Scheme.

Ou Ta Paong Scheme

155 The IBAT assessment identified the following biodiversity features within a 5 km, 20 km and 50 km distance from the Ou Ta Paong Irrigation and flood protection scheme.

- Protected Areas - 13
- Key Biodiversity Areas - 10
- IUCN Red List of Threatened – 97

Source: IBAT

Figure 4-13 IBAT Biodiversity Features around Ou Ta Paong Scheme

156 The following protected areas were identified within a 5 km, 20 Km and 50 km radius of Ou Ta Paong Scheme.

Protected Areas

Area Name	Within Buffer of KPL Project Area
Tonle Sap – UNESCO-MAB Biosphere Reserve	5 km
Boeng Chhmar Core Area (Ramsar Site)	20 km
Cardamom Corridor – Biodiversity Area of Protected Area	20 km
Central Kravanh	50 km
North Tonle Sap	50 km
Phnom Aoral	50 km
Phnom Somkos	50 km
Prek Toal Core Area (Ramsar Site)	50 km
Stung Sen Core Area (Ramsar Site)	50 km

157 Key Biodiversity Areas within 5 km, 20 Km and 50 km of the Ou Ta Paong Scheme included:

Key Biodiversity Areas

Area name	Distance
Boeung Chhmar / Moat Khla	20 km
Dei Roneat	20 km
Central Cardamoms	50 km
Chhnuk Tru	50 km
Kampong Laeng	50 km
Lower Stung Sen	50 km
Phnom Aural	50 km
Phnom Samkos	50 km
Prek Toal	50 km
Stung / Chi Kreng / Kampong Svay	50 km

158 The IBAT system identified 7 Endangered Species in the IUCN Red List of Threatened Species within the 5 km, 20 and 50 km buffer areas of the Ou Ta Paong Scheme.

159 The IBAT system analysis of biodiversity near the project areas suggests that a more detailed biodiversity assessment is required.

4.9 Assessment of Environmental, Social and Climate Risks, Impacts and Mitigation Measures

160 Potential risks, impacts and mitigation measures have been identified for the CAISAR irrigation and flood control protection schemes during the Pre-Construction Phase; Construction Phase and the Operations Phase in the provinces of Kampong Speu, Kampong Chhnang, Kandal, and Pursat Cambodia.

4.9.1 Pre-Construction Phase

161 Potential environmental, social, and climate-related risks and impacts to be considered specifically associated with the pre-construction phase of the planned CAISAR irrigation and flood protection project include:

4.9.1.1 Environmental Risks and Impacts (Pre-construction Phase):

1. **Habitat Assessment:** Before construction begins, there should be a thorough assessment of the project area's habitats to identify potential impacts on local flora and fauna.
2. **Vegetation Clearance**: Clearing land for construction can lead to habitat destruction and loss of biodiversity. Pre-construction activities like land clearing should be carefully planned and managed.
3. **Soil Erosion**: Pre-construction activities like excavation and grading can increase soil erosion, potentially affecting nearby water bodies and ecosystems.
4. **Land Use Changes**: Conversion of land for project purposes may alter local land use patterns, impacting agricultural and forestry activities.
5. **Waterbody Alteration:** The assessment of water bodies like rivers, streams, and wetlands should be conducted to understand potential impacts on aquatic ecosystems.
6. **Waste Management -** increase in volume of hazardous and non-hazardous waste requiring safe disposal.

4.9.1.2 Social Risks and Impacts (Pre-construction Phase):

1. **Land Acquisition:** The process of acquiring land for the project can disrupt local communities, potentially leading to land tenure issues and conflicts.
2. **Livelihood Disruption**: Even before construction starts, the anticipation of project impacts can disrupt local livelihoods as residents may alter their activities or move.

3. **Cultural Heritage**: Pre-construction surveys should identify any cultural heritage sites or traditions that may be affected, and appropriate measures should be taken to protect them.
4. **Community Engagement:** Engaging with local communities during the pre-construction phase is critical to understanding their concerns and needs, helping to design mitigation measures.
5. **Indigenous Peoples Exclusion –** Potential disbenefit to IP's or lack of inclusion in project benefits and opportunities.
6. **Gender Inequities –** Potential inequities and lack of project opportunities and benefits.

4.9.1.3 Climate Risks and Impacts (Pre-construction Phase) (See Annex 13: CAISAR Climate Change Impact Rationale)

1. **Climate Data Analysis:** It's important to analyze historical climate data during the pre-construction phase to identify climate-related risks that may affect project design and location.
2. **Future Climate Projections**: Understanding future climate projections, such as changes in rainfall patterns or increased frequency of extreme weather events, can inform the project's design for resilience.
3. **Adaptation Planning:** Pre-construction phase should involve planning for climate change adaptation measures, ensuring the project can withstand anticipated climate impacts.
4. **Mitigation Strategies:** Identifying opportunities to reduce greenhouse gas emissions associated with pre-construction activities, such as transportation or energy use, is important for climate mitigation.
5. **Data Collection**: Establishing baseline data on environmental conditions, community demographics, and climate variables during the pre-construction phase is crucial for monitoring and evaluation throughout the project's lifecycle.

162 During the pre-construction phase, thorough assessments, community consultations, and climate resilience planning should be integrated into the project's design to minimize environmental, social, and climate-related risks. This will help lay the foundation for a more sustainable and resilient project during the construction and operational phases.

163 Mitigation measures to address the environmental, social, and climate-related issues associated with the **pre-construction** phase of the CAISAR irrigation and flood protection project include:

4.9.1.4 Environmental Mitigation Measures (Pre-construction Phase):

1. **Habitat Assessment and Preservation:**
   - Conduct a detailed habitat assessment and implement measures to preserve critical habitats, such as wetlands and forests, by avoiding or minimizing construction within these areas.
2. **Revegetation and Reforestation**:
   - Implement reforestation and revegetation programs in areas where land clearance is necessary. Use native species to restore habitats.
3. **Soil Erosion Control**:
   - Implement erosion control measures, such as silt fences, erosion control blankets, and sediment basins, to prevent soil erosion during pre-construction activities.
4. **Sustainable Land Use Planning**:
   - Work with local authorities and communities to develop land use plans that minimize negative impacts on agriculture and forestry.
5. **Water Management:**
   - Develop and implement a water management plan to minimize waterbody alteration during pre-construction activities.
6. **Waste Management**:

- Prepare and implement waste management plan.

4.9.1.5 Social Mitigation Measures (Pre-construction Phase):

1. **Land Acquisition and Resettlement:**
   - Follow Resettlement Planning Framework and develop a fair and transparent land acquisition and resettlement plan, ensuring affected communities are adequately compensated and resettled, if necessary.
2. **Livelihood Restoration**:
   - Implement livelihood restoration programs, such as vocational training and alternative income generation activities, to mitigate disruptions caused by pre-construction activities.
3. **Cultural Heritage Protection**:
   - Identify and protect cultural heritage sites and traditions through measures like site preservation, documentation, and community involvement.
4. **Community Engagement**:
   - Engage in meaningful consultations with local communities to gather their input and concerns and incorporate their feedback into project planning and design.
5. **Indigenous Peoples:**
   - Implement IPP and ensure full participation of vulnerable or disadvantages groups (e.g., ethnic minorities).
6. **Gender Participation**:
   - Implement Gender Action Plan and measures to promote female beneficiaries for improved participation in project planning and implementation, and economic empowerment.

4.9.1.6 Climate Mitigation and Adaptation Measures (Pre-construction Phase):

1. **Climate-Resilient Design**:
   - Incorporate climate resilience into the project design by considering future climate projections and ensuring infrastructure can withstand extreme weather events and changing climate conditions.
2. **Low-Carbon Practices**:
   - Minimize greenhouse gas emissions from pre-construction activities by using energy-efficient machinery, promoting green transportation, and reducing construction-related emissions.
3. **Adaptive Management:**
   - Develop adaptive management plans that can be adjusted based on changing climate conditions, ensuring the project's long-term viability.
4. **Baseline Data Collection**:
   - Establish baseline data for environmental, social, and climate variables during the pre-construction phase to enable effective monitoring and evaluation throughout the project's lifecycle.
5. **Climate Risk Assessments:**
   - Regularly assess climate risks and vulnerabilities during the pre-construction phase to identify emerging issues and adjust plans accordingly.
6. **Community Resilience**:
   - Support local communities in building resilience to climate change through capacity-building programs, education, and access to climate-resilient livelihood options.
7. **Green Infrastructure:**
   - Consider the use of green infrastructure solutions, such as natural flood management techniques, to complement traditional engineering approaches and enhance climate resilience.

164 It's essential that these mitigation measures are integrated into the project's planning and design from the early stages of the pre-construction phase. Collaboration with relevant stakeholders, including local communities, environmental experts, and climate specialists, is crucial to ensure the successful implementation of these measures and the overall sustainability of the project. Regular monitoring and evaluation is also essential to assess the effectiveness of these mitigation efforts and make necessary adjustments as needed.

4.9.2 Construction Phase

165 The potential environmental, social, and climate-related risks and impacts to be considered that are associated with the construction phase of the CAISAR irrigation and flood protection project include:

4.9.2.1 Environmental Risks and Impacts (Construction Phase):

1. **Habitat Destruction:** Construction activities can result in the direct destruction of natural habitats, including wetlands, forests, and aquatic ecosystems.
2. **Soil Erosion and Sedimentation:** Excavation, grading, and land clearing can increase soil erosion, leading to sedimentation in nearby water bodies, affecting water quality and aquatic ecosystems.
3. **Water Pollution**: Construction machinery, equipment, and runoff from construction sites can introduce pollutants, such as sediment, oil, and chemicals, into nearby water bodies.
4. **Noise and Air Pollution:** Construction activities generate noise pollution and emissions from heavy machinery, impacting local air quality and disturbing wildlife.
5. **Resource Consumption**: Construction materials, water, and energy are often consumed in large quantities, leading to resource depletion and increased carbon emissions.
6. **Waste Management** – increase in volume of hazardous and non-hazardous waste requiring safe disposal.

4.9.2.2 Social Risks and Impacts (Construction Phase):

1. **Displacement and Resettlement:** The construction phase may require the displacement of local households leading to potential land tenure issues and disruption of livelihoods.
2. **Traffic and Access Disruption**: Increased construction-related traffic can disrupt local transportation networks, impacting communities and businesses along transportation routes.
3. **Health and Safety:** Construction sites pose health and safety risks to workers and nearby communities. Accidents and exposure to construction-related hazards can have serious consequences.
4. **Cultural Heritage:** Construction activities and in migration of labor may threaten cultural heritage sites or disrupt local traditions and practices, leading to social and cultural impacts.
5. **Indigenous Peoples Exclusion –** Potential disbenefit to IP's or lack of inclusion in project benefits and opportunities.
6. **Gender Inequities –** Potential inequities and lack of project opportunities and benefits.

4.9.2.3 Climate Risks and Impacts (Construction Phase):

1. **Emissions**: Construction machinery and transportation can generate significant greenhouse gas emissions, contributing to climate change if not properly managed.
2. **Climate-Related Disruptions**: Extreme weather events, such as heavy rainfall or flooding, can disrupt construction activities, leading to delays and increased costs.
3. **Water Management**: Managing water resources during construction, including temporary diversion of rivers or drainage, can impact local hydrology and potentially lead to downstream flooding.
4. **Infrastructure Vulnerability:** The construction phase may expose infrastructure to climate risks, such as flooding or storm damage, if proper precautions and design considerations are not taken into account.
5. **Temperature Extremes**: Construction workers may be exposed to temperature extremes, including heat stress in hot seasons and cold stress during cooler months, affecting worker health and productivity.

166 To address these risks and mitigate negative impacts during the construction phase, it's essential to implement environmental and social management plans. These plans will include measures to minimize habitat destruction, control pollution, ensure worker safety, and engage with local communities.

167 Additionally, climate resilience measures will be integrated into the construction process to mitigate climate-related risks and ensure the infrastructure's long-term sustainability. Regular monitoring and adherence to best practices will be implemented to minimize adverse effects during this phase of the project.

168 Suggested mitigation measures to address the potential environmental, social, and climate-related risks and impacts associated with the **construction phase** of the CAISAR irrigation and flood protection include.

4.9.2.4 Environmental Mitigation Measures (Construction Phase):

1. **Habitat Protection and Restoration:**
   - Establish construction exclusion zones around sensitive habitats to prevent disturbance.
   - Implement habitat restoration programs in areas where construction has occurred.
2. **Erosion and Sediment Control:**
   - Install erosion control measures such as silt fences, sediment basins, and check dams to prevent soil erosion.
   - Implement best management practices for construction site runoff, including sediment ponds.
3. **Water Pollution Control:**
   - Properly manage construction chemicals, fuels, and waste to prevent water pollution.
   - Use environmentally friendly construction materials and techniques to reduce the risk of pollution.
4. **Noise and Air Pollution Management:**
   - Implement noise barriers and schedule noisy activities during non-sensitive hours.
   - Ensure construction equipment meets emissions standards and maintain equipment properly.
5. **Resource Efficiency:**
   - Reduce resource consumption by optimizing construction material use and recycling where feasible.
   - Implement energy-efficient construction practices and use renewable energy sources where possible.
6. **Waste Management**
   - Implement waste management plan

4.9.2.5 Social Mitigation Measures (Construction Phase):

1. **Community Engagement:**
   - Maintain ongoing communication with affected communities to address concerns and keep them informed about construction activities.
   - Implement grievance mechanism to address community complaints and issues promptly.
2. **Displacement and Resettlement:**
   - Implement resettlement plans, ensuring affected communities receive fair compensation, land, and livelihood restoration support.
   - Support affected households in finding alternative housing and income opportunities.
3. **Health and Safety:**
   - Enforce strict health and safety regulations on construction sites to protect both workers and nearby communities.
   - Provide appropriate training and personal protective equipment to workers.
4. **Cultural Heritage Protection:**

- Conduct archaeological surveys before construction in culturally sensitive areas.
- Develop mitigation strategies to protect cultural heritage sites and involve local communities in preservation efforts.

5. **Indigenous Peoples:**
   - Implement IPP and ensure full participation of vulnerable or disadvantages groups (e.g., ethnic minorities).
6. **Gender Participation:**
   - Implement Gender Action Plan and measures to promote female beneficiaries for improved participation in project planning and implementation, and economic empowerment.

4.9.2.6 Climate Mitigation and Adaptation Measures (Construction Phase):

1. **Emission Reduction:**
   - Use low-emission construction equipment and vehicles.
   - Minimize idling time for construction machinery to reduce emissions.
   - Promote sustainable transportation options for workers and materials.
2. **Climate-Resilient Construction:**
   - Incorporate climate-resilient design features into infrastructure construction to withstand climate-related risks.
   - Implement flood and stormwater management measures to prevent construction site flooding.
3. **Temperature Extremes:**
   - Implement heat stress prevention measures for workers, such as shaded rest areas and hydration stations in hot weather.
   - Provide adequate clothing and equipment for workers during cold weather.
4. **Community Resilience Building:**
   - Support local communities in building climate resilience by providing training and resources for climate adaptation.
5. **Monitoring and Compliance:**
   - Establish regular monitoring and reporting mechanisms to ensure compliance with environmental, social, and climate mitigation measures.
   - Conduct periodic audits to assess the effectiveness of mitigation efforts and make necessary adjustments.

169 These mitigation measures should be integrated into the construction management plan and closely monitored throughout the construction phase. Collaboration with relevant stakeholders, including local communities, environmental experts, and safety professionals, is essential to ensure successful implementation and the overall sustainability of the project.

4.9.3 Operations Phase

170 The potential environmental, social, and climate-related risks and impacts associated with the operations phase of the planned CAISAR irrigation and flood protection project include:

4.9.3.1 Environmental Risks and Impacts (Operations Phase):

1. **Water Management**: Inadequate water management during operations can lead to over-extraction of water resources, which may cause downstream water scarcity, altered hydrology, and harm to aquatic ecosystems.

2. **Water Quality**: The irrigation system's operations can affect water quality, with potential risks of contamination from agricultural runoff, pesticide use, or improper wastewater disposal.
3. **Erosion and Sedimentation:** Ongoing maintenance and operation activities can contribute to soil erosion and sedimentation in water bodies, impacting water quality and aquatic habitats.
4. **Invasive Species:** Poorly managed water flows can facilitate the spread of invasive aquatic species, potentially harming native ecosystems.
5. **Energy Use:** The energy requirements for pump stations, flood control systems, and other infrastructure elements can result in increased carbon emissions if not managed efficiently.
6. **Waste Management -** increase in volume of hazardous and non-hazardous waste requiring safe disposal.

4.9.3.2 Social Risks and Impacts (Operations Phase):

1. **Land Use Conflicts**: Conflicts over water allocation and land use may arise among competing stakeholders, such as farmers, leading to disputes and social tensions.
2. **Access to Water:** Unequal access to water resources during the operations phase can exacerbate social inequalities, impacting vulnerable communities and livelihoods.
3. **Health and Safety:** Ongoing maintenance and operations work can pose health and safety risks to workers and nearby communities, particularly if safety measures are inadequate.
4. **Community Engagement**: Maintaining effective communication and engagement with local communities is crucial to address their concerns and ensure the equitable distribution of benefits.
5. **Indigenous Peoples Exclusion –** Potential disbenefit to IP's or lack of inclusion in project benefits and opportunities.
6. **Gender Inequities –** Potential inequities and lack of project opportunities and benefits.

4.9.3.3 Climate Risks and Impacts (Operations Phase):

1. **Climate Variability:** Changes in rainfall patterns, increased temperature, or more frequent extreme weather events can affect water availability and the effectiveness of flood protection systems.
2. **Extreme Events**: The irrigation and flood protection infrastructure must be resilient to withstand extreme weather events, including floods, droughts, and storms.
3. **Maintenance Challenges**: Climate-related impacts, such as increased sedimentation or infrastructure damage from extreme events, can pose challenges for ongoing maintenance and operations.
4. **Energy Efficiency**: Climate mitigation efforts should focus on optimizing energy use and transitioning to cleaner energy sources to reduce greenhouse gas emissions associated with ongoing operations.
5. **Adaptive Management:** The operations phase should include adaptive management strategies to respond to changing climate conditions and ensure infrastructure remains effective.
6. **Community Resilience**: Local communities will require support to build resilience to climate-related risks, such as training in climate-smart agriculture or flood preparedness.
7. **Water Management**: Climate-related changes may necessitate adjustments in water management practices to ensure sustainable and equitable water distribution.

171 Addressing these potential risks and impacts during the operations phase requires proactive planning, ongoing monitoring, and adaptive management. Sustainable water management practices, efficient energy use, and community engagement are crucial components of mitigating these issues and ensuring the long-term success and resilience of the irrigation and flood protection project. Regular maintenance and assessment of the infrastructure's performance under changing climate conditions are essential for its continued effectiveness.

172 Suggested mitigation measures to address the potential environmental, social, and climate-related risks and impacts during the operations phase of the CAISAR irrigation and flood protection project include:

4.9.3.4 Environmental Mitigation Measures (Operations Phase):

1. **Sustainable Water Management:**
   - Implement efficient water management practices to prevent over-extraction and ensure equitable water distribution.
   - Monitor water quality regularly and implement measures to reduce contamination, such as the responsible use of pesticides and proper wastewater treatment.
2. **Erosion and Sedimentation Control:**
   - Develop and implement erosion control measures to minimize soil erosion and sedimentation in water bodies.
   - Regularly maintain sediment basins and silt fences to manage sediment runoff.
3. **Invasive Species Management:**
   - Implement monitoring and control programs to prevent the spread of invasive aquatic species in irrigation and flood protection infrastructure.
4. **Energy Efficiency:**
   - Optimize energy use through efficient pump systems, renewable energy integration, and regular maintenance of energy-consuming equipment.
5. **Waste Management**
   - Implement waste management plan.

4.9.3.5 Social Mitigation Measures (Operations Phase):

1. **Stakeholder Engagement:**
   - Maintain transparent and ongoing engagement with local communities and stakeholders to address concerns and ensure the equitable distribution of water resources.
   - Establish mechanisms for conflict resolution and dispute management related to land use and water allocation.
2. **Access to Water:**
   - Ensure that water access is fair and inclusive, with mechanisms in place to support vulnerable and marginalized communities in accessing water resources.
3. **Health and Safety:**
   - Continue to enforce strict health and safety regulations for workers and nearby communities during ongoing maintenance and operation activities.
   - Provide ongoing safety training and personal protective equipment to workers.
4. **Indigenous Peoples:**
   - Implement IPP and ensure full participation of vulnerable or disadvantages groups (e.g., ethnic minorities).
5. **Gender Participation:**
   - Implement Gender Action Plan and measures to promote female beneficiaries for improved participation in project planning and implementation, and economic empowerment.

4.9.3.6 Climate Mitigation and Adaptation Measures (Operations Phase):

1. **Climate-Resilient Infrastructure:**
   - Regularly assess and maintain flood protection and irrigation infrastructure to ensure its resilience to changing climate conditions.
   - Develop flood and drought management strategies based on climate projections.
2. **Maintenance and Repairs:**

- Implement a robust maintenance program to promptly address damage or sedimentation issues caused by climate-related events.
- Ensure that infrastructure components remain in good working condition to maintain their effectiveness.

3. **Energy Transition:**
   - Transitioning to cleaner energy sources for operation, implement and maintain solar solar pumps to reduce carbon emissions.
   - Promote energy-efficient practices within the operational phase.
4. **Adaptive Management:**
   - Establish adaptive management plans that allow for adjustments in water management and infrastructure operations in response to climate variability and extreme events.
5. **Community Resilience Building:**
   - Support local communities in building climate resilience through education, capacity-building programs, and climate-smart agriculture practices.
   - Encourage community-led initiatives for flood preparedness and disaster risk reduction.
6. **Water Management Adjustments:**
   - Be prepared to adjust water management practices, such as reservoir release schedules, in response to changing climate conditions and hydrological patterns.
7. **Monitoring and Reporting:**
   - Continue regular monitoring and reporting on environmental, social, and climate-related factors to assess the effectiveness of mitigation efforts and make necessary adjustments.

173 These mitigation measures will be integrated into the ongoing operation and maintenance plan for the CAISAR irrigation and flood protection infrastructure. Collaboration with relevant stakeholders, including local communities, environmental experts, and climate specialists, is essential to ensure the successful implementation of these measures and the long-term sustainability and resilience of the project during the operations phase. Regular evaluation and adaptation are critical components of managing risks and impacts effectively.

174 The CAISAR irrigation and flood protection project is planned to have the following positive environmental, social, and climate impacts:

4.9.4 Positive Environmental, Social and Climate Impacts:

4.9.4.1 Positive Environmental Impacts:

1. **Improved Water Management:** Irrigation systems help optimize water use, reducing wastage and ensuring efficient distribution of water resources. This will mitigate water scarcity issues and enhance ecosystem health.
2. **Increased Crop Yields**: Irrigation can significantly increase agricultural productivity, reducing the need to expand agricultural land into forests and natural habitats, thereby preserving biodiversity.
3. **Reduced Soil Erosion:** Flood protection measures can prevent soil erosion caused by heavy rains and floods, which helps maintain soil fertility and prevents sedimentation in rivers and water bodies.
4. **Enhanced Ecosystem Services**: Sustainable water management will positively impact wetland ecosystems by maintaining water levels and preserving habitats for aquatic plants and wildlife.

4.9.4.2 Positive Social Impacts:

1. **Improved Food Security**: Increased agricultural productivity due to irrigation will lead to greater food security for local communities, reducing dependence on external food sources.
2. **Poverty Alleviation**: Higher crop yields will enhance the income and livelihoods of local farmers, potentially reducing poverty rates in the region.
3. **Health Benefits**: Access to clean water for irrigation will improve public health by reducing waterborne diseases and improving sanitation practices.
4. **Employment Opportunities:** The construction and maintenance of irrigation and flood protection infrastructure will generate employment opportunities for local communities.
5. **Infrastructure Development:** The project will improve transportation and connectivity, making it easier for people to access markets, healthcare, and educational facilities.

4.9.4.3 Positive Climate Impacts:

1. **Climate Resilience:** Flood protection infrastructure will help communities adapt to climate change by reducing the impacts of extreme weather events and flooding.
2. **Carbon Sequestration**: Irrigation will enhance the carbon sequestration capacity of soils, contributing to climate change mitigation efforts.
3. **Reduced Emissions**: By increasing agricultural productivity and reducing the need for land conversion, the project will indirectly help reduce greenhouse gas emissions associated with deforestation and land-use changes.
4. **Improved Water Efficiency**: Efficient irrigation practices will reduce the energy and water requirements for agriculture, which can lower greenhouse gas emissions associated with water pumping and distribution.

175 The success of the CAISAR project depends on effective planning, sustainable practices, and community engagement. Environmental impact assessments and social safeguards will be in place to mitigate any potential negative consequences and ensure the long-term sustainability of these positive impacts.

5. PROCEDURES FOR REVIEW, CLEARANCE, AND IMPLEMENTATION OF SUBPROJECT E&S INSTRUMENTS

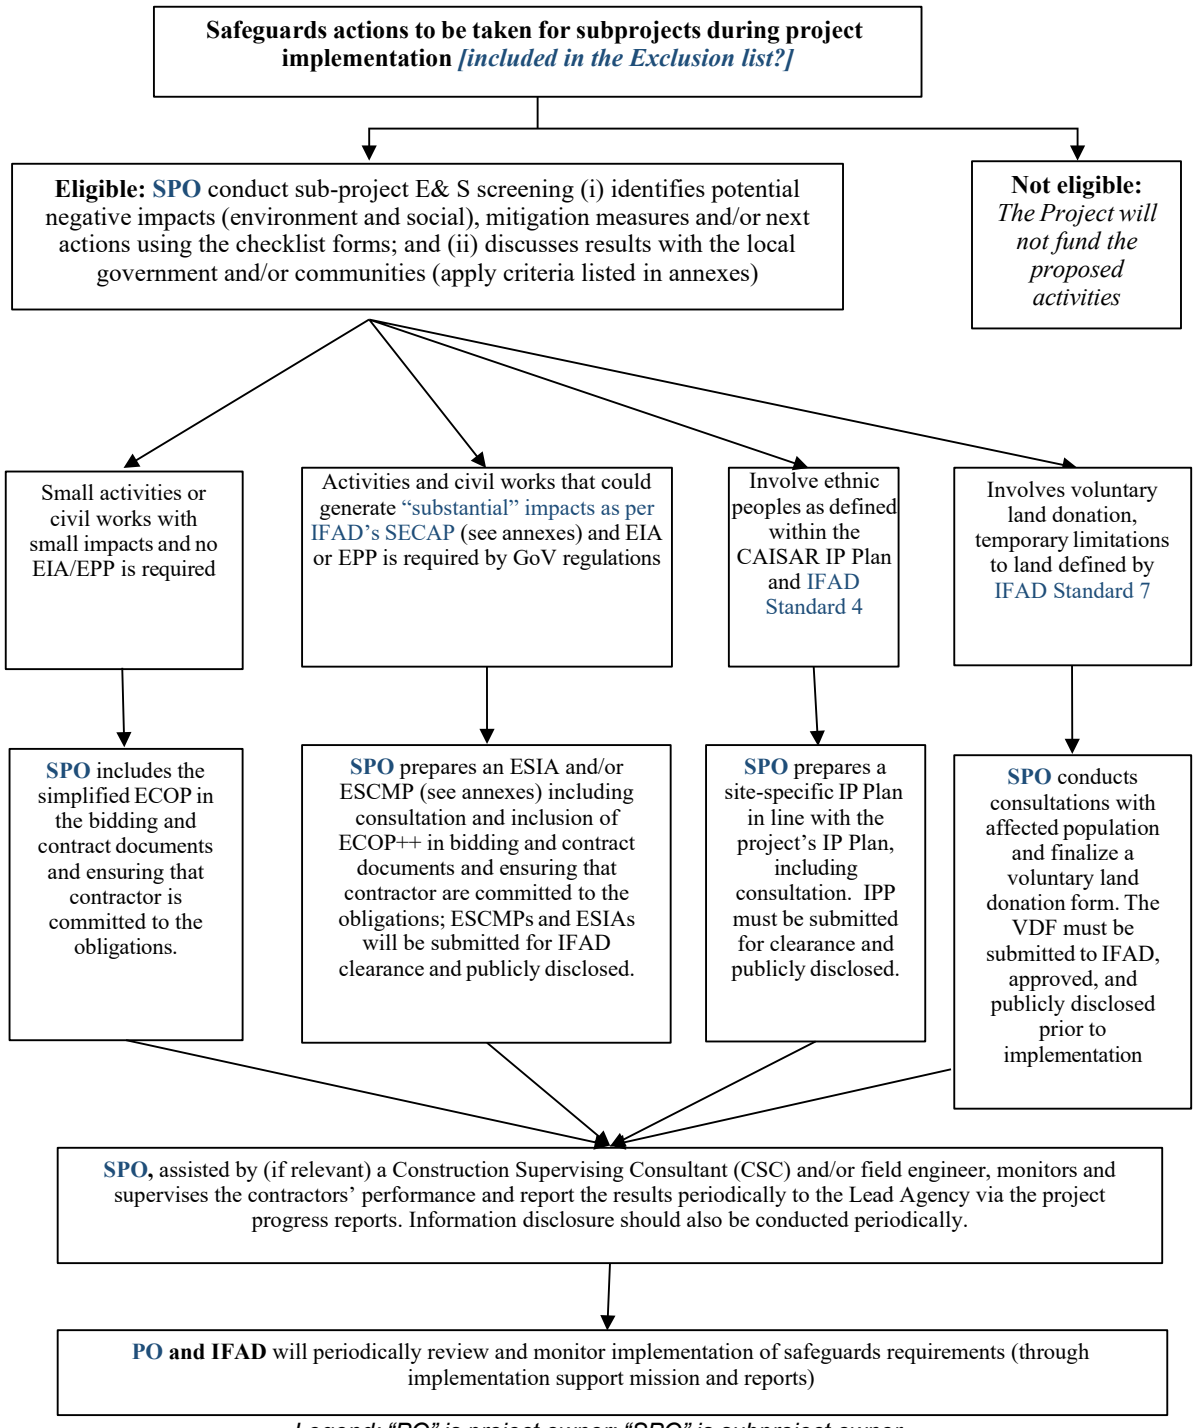
5.1 Objective and Approach

176 Since some of the activities and subprojects will be identified during implementation, this ESCMF was prepared to apply to all subprojects and investment activities. The main objective of the ESCMF process is to ensure that the subprojects and activities financed by the project will not create adverse impacts on the local environment and communities, and the residual and/or unavoidable impacts are mitigated in line with the IAAB, IFAD and GCF safeguards standards.

177 During implementation, identified activities/subprojects will be screened for and given a risk classification based on their E&S issues and applicable safeguards standards (ESSs), after which any necessary environmental and social assessment (ESA) and other E&S instruments will be prepared based on the requirements laid out in this ESCMF. The assessments, instruments, and mitigation measures will be proportionate to the nature and scale and the potential risks and impacts of the project and consistent with the requirements of IAAB, IFAD, the GCF, and national laws/regulations. The safeguards plans prepared for subprojects may include but are not limited to: Environmental and Social Management Plans (ESCMPs); including health and workers issues related to sexual exploitation and abuse (SEA); and IP Plans. Terms of reference, work plans, and documents defining the scope and outputs of any site-specific safeguard's capacity building activities (for example, through the annual Information, Education, and Communication program) will be drafted so that the advice and support provided is also consistent with the IAAB, IFAD and GCF safeguards standards. Based on the initial sub-project safeguards screening, any subsequent ESA would: (i) cover the requirements established under the relevant safeguard standard for that subproject; and (ii) identify the environmental and social risks and impacts including direct, indirect, cumulative, and residual impacts.

5.2 Key Steps

178 The ESCMF process is comprised of four steps, as depicted in **Figure 7** and summarized below:



STEP 1: Screening for eligibility and E&S issues including risks and impacts using screening criteria, application of ESSs, and identification of and needs for preparation and implemenation of E&S documents/instruments.

STEP 2: Prepare E&S documents, including the development of mitigation measures in the ESCMP, IP Plan, and RP to be incorporated into bidding and contractual documents and subjected to close monitoring of the contractor performance. ESCMPs clearly identify mitigation measures for potential negative impacts during site clearance and construction, including the management of contractors, chance finds, EHS application, and workers' Codes of Conduct.

STEP 3: Clearance and disclosure of E&S documents; and

STEP 4: Implementation, monitoring, and reporting.

179 The risk analysis, impact assessment, and preparation of E&S documents for all subprojects will be carried out during implementation. A full ESIA is being conducted for the project. Preparation of a subproject ESCMP occurs when the subproject activities have been clearly identified and locations are known. During the preparation of the ESCMP, due attention will be given to address the issues of biodiversity conservation and sustainable management of living natural resources, resource efficiency and pollution prevention, labour and working conditions, community health and safety, indigenous persons/ethnic minorities, women, cultural heritage, and stakeholder engagement and information disclosure.

Legend: "PO" is project owner; "SPO" is subproject owner

Figure 5-1: Flowchart for Safeguard Actions for Subprojects

180 Key safeguards actions can be highlighted as follows:

- Small works to be carried out under Component 2 will incorporate a site-specific ESCMP requirements and an ECOP into the bidding documents and consultant contracts, with contractor performance closely monitored by the responsible persons of the implementing agencies.
- If screening highlights the need for voluntary land donation or temporary disruption to land use, a Voluntary Land Donation form must be prepared and consulted upon (in line with the VGGT principles and IFAD Standard 7), as well as approved and disclosed prior to sub-project implementation.
- If the ethnic minorities are present in the subproject, a site-specific IP Plan will be prepared and implemented according to IFAD Standard 4 and the guidelines can found in the project's overarching IP Plan.
- All the major E&S documents of a given subproject will be submitted for IFAD clearance before their respective approval and implementation.

5.3 E&S Risk and Impact Assessment

181 This step (Step 1) aims to confirm the eligibility of subproject and/or activities to be financed by the Project as well as identify the potential E&S issues and assess potential impacts of the subprojects/activities including needs for preparation of E&S documents as required by IFAD/GCF standards using an E & S screening checklist. The agencies responsible for implementing the subproject/activity will be responsible for undertaking and signing the screening forms. PPMUs will each be responsible for screening their own activities. Consultation with IFAD safeguards specialists can be made as needed, depending on subproject complexity.

5.4 Development of E&S Documents

182 This step (Step 2) is focused on preparing safeguards documents in relation to the issues identified in Step 1. Guidelines for the preparation of an ESCMP are provided in the annexes, whereas a project-level SEP and IP Plan have been developed separately. Again, PPMUs will be responsible for their own activities and subprojects, and their corresponding safeguards specialists will be responsible for the preparation of E&S documents. Consultation with IFAD safeguards specialists for complex subprojects will be made as needed.

183 It is also crucial that the implementing agencies of the subprojects and activities are responsible for preparation of E&S documents (e.g. EPP, EIA, etc.) required by the Government of Cambodia's EIA regulation and secure approval of responsible agencies.

5.5 Review, Approval, and Disclosure of E&S Documents

184 **IFAD review and clearance:** Before approval and commencement of subproject works, the Subproject Officer (SPO) will submit all key E&S documents to IFAD for review, clearance, and public disclosure. For CAISAR, it is suggested that IFAD conduct reviews of the first three ESCMPs prepared by each province and may then reduce (or increase) frequency as needed. The approval process described herein may also be reviewed occasionally, particularly once the E&S capacity of the implementation partners has been built with the support of the E&S capacity-building consultants/project safeguards specialists. At that point, IFAD may choose to review ESCMPs selected at random.

185 All E&S documents will be posted on the official websites of MOWRAM and the project provinces, and hardcopies in the Khmer language will be available at the CPMU, PPMU, and subproject sites. The CPMU and PPMUs must publish a notification of disclosure of information and solicit comments within the month following that disclosure date. The English version of the ESCMPs will be disclosed on the IFAD (and potentially GCF) website(s).

186 Government approval: Responsible agencies are also required to approve the ESIA or EPP documents as required by Government regulation. Any prepared EIA (in Khmer or English) as well as the approval conditions will be provided to IFAD for information and will be disclosed to the public.

5.6 Implementation, Supervision, Monitoring, and Reporting

187 ESCMF implementation, supervision, monitoring, and reporting is an integral part of project and subproject implementation. Each E&S staff is responsible for specific activities. IFAD SECAP specialists also supervise and monitor the implementation of safeguards activities during IFAD project supervision missions. Delegation of responsibilities is as follows:

- ***Gender Action Plan and IP Plan monitoring:*** The PPMU will hire a social inclusion/gender specialist to monitor the implementation of the IP Plan and GAP and report results to IFAD.
- ***E&S monitoring of contractor performance during construction:*** To ensure compliance with the national laws and regulations as well as some specific requirements of the IFAD SECAP standards at subproject level, PPMUs will hire a qualified national consultant to conduct monthly monitoring and reporting while assigning the Construction Supervision Consultant (CSC) or field engineers to be responsible for monitoring and reporting of contractor's compliance to the construction-focused ESCMPs on a day-to-day basis. At the project level, the PPMU Environmental Safeguards Specialist will ensure monitoring of environmental and social performance at sub-project sites and of the construction contractor throughout construction. The Environmental Safeguards Specialist will report their findings in the Project E&S monitoring reports for IFAD and GCF (this will be done on a six-month basis, or as agreed with IFAD and GCF in accordance with the legal agreement). The PPMU will also be responsible for monitoring and evaluating implementation of the Stakeholder Engagement Plan, including responses to grievances and/or complaints of the project/subproject affected peoples as well as the project workers (see Section 10).
- ***E&S monitoring during implementation of activities/operation of infrastructure:*** Specialized training will be provided on risks inherently associated with project activities that involve waste management, occupational health and safety, and community health and safety. E&S staff must pay extra attention – proportional to the more substantial risks – to those activities during implementation. To ensure sustainability after project closure, the awareness and capacity of MOWRAM/PDWRAM staff and related implementing agencies must be increased through trainings and during implementation supervision. This will require E&S capacity building consultants (including extension staff). PPMUs will detail safeguards progress in the subprojects' E&S monitoring reports for submission to the CPMU. The CPMU will then aggregate and submit the information to IFAD and the GCF.

6. IMPLEMENTATION ARRANGEMENTS

6.1 Responsibility for ESCMF Implementation

188 The feasibility study included recommendations on how the CAISAR Project should be implemented and is summarized in the following paragraphs. The CAISAR project has a clear objective related to both climate and poverty, but the ambitious scope requires cooperation between government agencies. The project will be adopted by the existing country program steering committee chaired by the Ministry of Economy and Finance (MEF). The executing agency, the Ministry of Water Resources and Meteorology (MOWRAM) will provide overall management of the project and implementation of Component 2 (Infrastructure). The National Committee for Sub National Democratic Development (NCDD) will be the implementing agency for component 1.

189 The Project Management Unit (PMU) will consist of personnel from MOWRAM, the Department of Hydrology and River Works (DHRW) of MOWRAM, and Provincial Departments of Water Resources and Meteorology (PDWRAMs) of four provinces.

190 The NCDD working with the International Fund for Agricultural Development (IFAD) will lead Component 1, which involves providing farm level support, capacity building and training of FWUCs, and promoting the adoption of efficient and climate resilient farming practices. IFAD will also be responsible for communications and visibility throughout the project's implementation.

191 Other key phases of implementation include a pilot program for solar pumping and geofabrics to identify any inefficiencies before the full construction phase, with a budget of $60k. Surveys will also be carried out on dam structures and river sections and structures to determine where work is required to rehabilitate and climate-proof the infrastructure, with a budget of $70k managed by the PMU. It is known that the Anlong Chrey dam has limited freeboard and MOWRAM wish to improve safety of the structure.

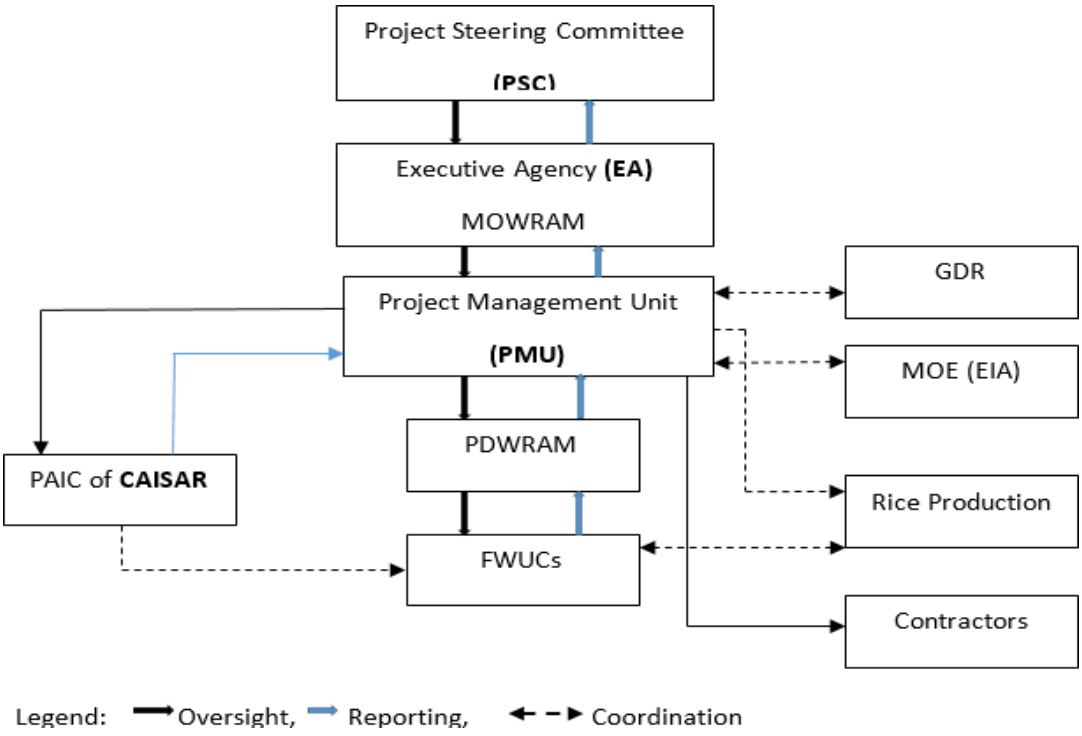
192 Monitoring and evaluation will be a crucial aspect of the project's success, with engagement at the FWUC level monitoring and reporting to ensure capacity is being increased in time to realize the significant benefits expected upon completion of construction. Material effectiveness and quality of design will also be monitored and evaluated to ensure the scheme is delivered to a standard consistent with at least a 25-year asset life.

193 The roles and responsibilities of each organization have been clearly outlined, with MOWRAM responsible for overall supervision and guidance, and the DFWUC responsible for preparing the annual work plan and budgets, initiating, and coordinating communication, coordinating with the Ministry of Agriculture, Forestry and Fisheries (MAFF) on agriculture support activities, and implementing social and environmental safeguards, among other tasks. The PDWRAM will assist the PMU in disseminating information and coordinating with the Ministry of Economy and Finance-General Department of Resettlement (MEF-GDR) to implement the resettlement plan, among other tasks.

194 The project steering committee (PSC), chaired by the Minister of MOWRAM, will provide policy guidance and oversee project implementation, while the Inter-Ministerial Resettlement Committee (IRC), chaired by MEF, will manage resettlement and land acquisition. By following this implementation arrangement, the CAISAR project can proceed smoothly and achieve its goals of improving water resource management and enhancing agricultural productivity in Cambodia.

6.2 Project Implementation Organizations (Component 2)

195 The expansion of irrigated areas and the modernization of irrigation systems are high in the order of priorities of the Royal Government of Cambodia as well as the Ministry of Water Resources and Meteorology (MOWRAM), which is responsible for sustainable water resources management, including irrigation in Cambodia. Proper irrigation O&M can only be successfully implemented when the five basic pillars of irrigation are properly addressed. These five pillars are: (i) security of water



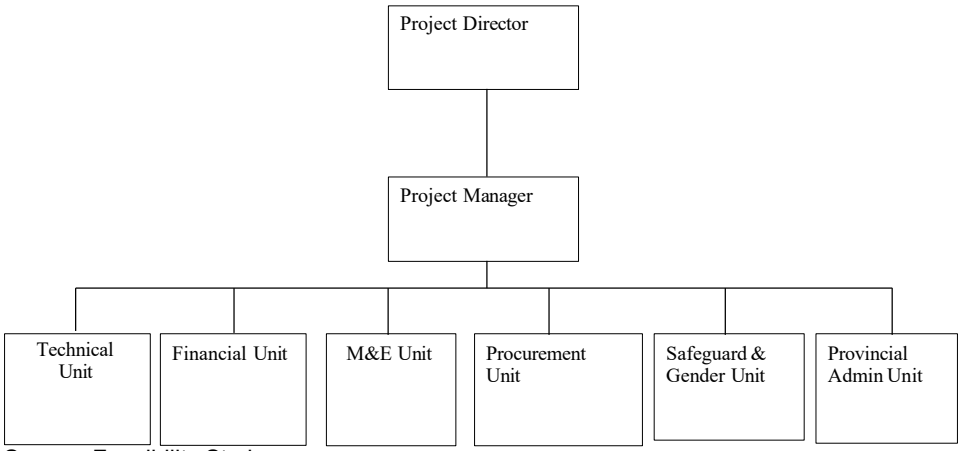
availability; (ii) sustainable infrastructure; (iii) water management, (IV) Irrigation institution and (v) human capital.

196 The FWUC Department has personnel at the Central level but no Office and personnel at the Province and District level so for the effective operation of FWUC the DFWUC should recruit and or appoint additional personnel and train them to meet the right qualification and experience for the FWUC office at the provincial and district levels.

197 A CAISAR project implementation organization chart is defined in Source: Feasibility Study
198 Figure 6-1. MOWRAM is the Executing Agency for implementation of the Project. However, successful implementation of the Project requires the cooperation of several ministries. The project steering committee (PSC) was established to achieve the inter-ministerial coordination and chaired by the Minister of MOWRAM and comprising of senior officials from MOWRAM, MOI (NCDD), MAFF, Ministry of Environment (MOE), Ministry of Economy and Finance (MEF), and the Provincial Governor's Offices of Pursat, Kampong Chhnang, Kandal, and Kampong Speu provinces will oversee project implementation and provide support to the project. The Table 6-1 below show the Management, Executive and Implementation body and Figure 6-1 show the Project organization Structure.

Table 6-1: PSC Management Arrangement.

Descriptions	**Arrangements**
Management	
(i) Oversight Body	**Project Steering Committee (PSC)** Chair: H.E. Lim Kean Hor, Minister, MOWRAM Secretary: H.E. Chann Sinath, Deputy Director General, DFWUC/Project Director Members: H.E. Secretary of State, MOI (NCDD) H.E. Secretary of State, MEF H.E. Secretary of State, MOWRAM H.E. Under Secretary of State, MEF H.E. Under Secretary State, MAFF H.E. Director General, MEF H.E. 4 Provincial Governors Director of Department of Cooperation and Debt Management, MEF Office of Multilateral Cooperation 1, MEF
(ii) Executing Agency	MOWRAM
(iii) Implementation Unit	Establish PMU at MOWRAM Level and possibly PIU at PDWRAM Level



Source: Feasibility Study

Figure 6-1: CAISAR Project (Component 1) Structure Chart

199 A project management unit (PMU) has been established for the CAISAR project. The PMU will be headed by the Secretary of State of MOWRAM as Project Director, with assistance from the DFWUC Director as Project Manager. The PMU will be fully involved in the preparation and implementation of the project. The PMU is composed of designated personnel from MOWRAM, the Department of Hydrology and River Works (DHRW) of MOWRAM, and the PDWRAMs of Pursat, Kampong Chhnang, Kampong Speu, and Kandal provinces.

200 The PDWRAMs are responsible for coordinating all field activities with FWUCs and DFWUC and implementing O&M activities.

201 The PMU is supported by the Project Management Implementation Consulting (PMIC) and consists of Project Director, Project Manager, Technical Unit, M&E Unit, Financial Unit, Procurement Unit, Safeguard & Gender Unit and Provincial Administration Unit as show in Figure 6-2 below.

Source: Feasibility Study

Figure 6-2 PMU Structure Chart.

6.3 Project Implementation Organizations at Sub-National Level

202 Note that the following text applies to Component 2 only. It is envisaged that IFAD will detail further the role of the NCDD and the coordination with the provincial and district agencies for agriculture, rural development etc.

6.4 Provincial Department of Water Resources and Meteorology (PDWRAM)

203 The Provincial Department of Water Resources and Meteorology of MOWRAM is the mandated body tasked to undertake full responsibilities for the O&M of the Main system/scheme. Specifically, PDWRAM is expected to perform the following responsibilities:

a) Ensures that the main canal infrastructure is properly maintained and repaired.
b) Ensures that the seasonal water management plan is endorsed and approved.
c) Ensure that in the dry season the main canal system provides sufficient water.
d) Provide technical assistance to FWUC and its members in the operation and maintenance of the irrigation systems/scheme.
e) Assume leadership in the resolution of conflicts on water disputes.
f) Operation and maintenance of main canal systems with appropriate funding provided by the Royal Government of Cambodia.
g) Implement routine maintenance of the Main Canal system including the structures.
h) Update report to MOWRAM on the deferred maintenance needs of the system including an estimate cost and time repair work.
i) Monitor the volume of water in the main canal and the level of water released to the water users in order for it to function normally.

6.5 Project Implementation Organizations at Scheme Level

204 According to the FWUC Sub-decree of March 2015, a FWUC shall be established and registered with MOWRAM for each irrigation system/scheme in Cambodia. Establishing the FWUC is important in helping sustain the irrigation schemes to be constructed under the Project. Therefore, the Project will establishment an efficient and effective FWUC and will provide adequate inputs and supports to ensure that the FWUC will be able to function effectively.

205 The FWUC will be established as early as possible after a subproject has been proved feasible and endorsed for the construction to enable the local farmers to participate in all stages of the project formulation and implementation.

206 The establishment of a FWUC requires considerable efforts in community organization and training of the established FWUC. The general strategy in mobilizing and organizing the farmers is described below:

(i) One FWUC is organized in each irrigation system/scheme, hence, there will be 4 FWUCs established in the CAISAR, 1 FWUC will need to be restructured or have the committee members re-elected, and 1 FWUC needs more capacity building as mention in Table 6-2 below.
(ii) One FWUG is delineated and organized within the command area of one secondary canal (SC). When the SC area is small, a FWUG could also cover more than one SC.
(iii) One FWUSG is delineated and organized within the command area of one or more tertiary canal (TC)

Table 6-2: Distribution Network & Name of FWUC to be established in the CAISAR Scheme.

No	Scheme Name	Command Area (ha)	Number			Number		
			District	Commune	Village	FWUC	FWUG	FWUSG
1	Ou Tapoang Tanai	13, 270	1	2	31	1	2	31
2	Lum Hach	16,664	3	10	55	1	10	55
3	Chhean Laeung	5,307	1	3	15	1	3	15
4	Stueng Krang Bat	1,500	2	3	13	1	3	13

No	Scheme Name	Command Area (ha)	Number			Number		
			District	Commune	Village	FWUC	FWUG	FWUSG
5	Brambei Mom	16,556	3	12	56	The current FWUC is weak and incapable of collecting ISF. It needs to be restructured and or re-elected as the current FWUC is governed by only 4 communes out of 12 communes in the CAISAR Project scheme.		
6	Krapeu Troum	903	1	1	14	This FWUC is active and they need more capacity building, support and documentation.		

207 After the FWUC's are recognized and officially registered, the Farmer Water User Committee (FWUC) will have full responsibility for the operation and maintenance of the irrigation system as follows:

a) Has the obligation to collect the irrigation service fee (ISF) from all its members for repair and maintenance of the secondary and tertiary irrigation system.
b) Resolve all internal conflicts involving water distribution between and among other FWUC leaders.
c) Convene the General Meeting once a year and other meetings with group and subgroup member as required.
d) Take action to replace vacant position of the structure as required and in accordance with its Statute.
e) Ensure that ISF are collected and kept properly and evaluate expenditures, manage and monitor the level of ISF in each phase and adjust as needed after approval from the members.
f) Assist in facilitating the support of the MOWRAM, PDWRAM and Development Partners on repairs, maintenance, and development of irrigated infrastructure as well as on agricultural development.
g) Mobilize local labor and financial resources to support regularly and seasonally operations and maintenance of irrigation system such as secondary and or tertiary canals and other parts.
h) Review on all kinds of secondary and tertiary canals and structures and Submit report to the PDWRAM.
i) Conduct seasonal maintenance before season of planting.
j) Prepare seasonal water distribution schedule for each growing season and provide a copy to PDWRAM for the preparation of the seasonal water management plan.
k) Manage the distribution of water under the guidance of PDWRAM because these structures are usually under the responsibility of PDWRAM but the operation of these gates will be transferred to the FWUC.

6.6 Procurement

208 The procurement principles to be followed by the CAISAR project were set out in the Aide Memorandum between MOWRAM, AIIB and IFAD following missions in December 2020 and January 2021. Project procurement using AIIB/GCF/IFAD financings will follow the Standard Operating Procedures on Procurement for All Externally Financed Projects/Programs in Cambodia (the SOP 2019/ Procurement Manual) to the extent such are consistent with the IFAD and AIIB Project Procurement Guidelines. NCDD PIU will be directly responsible for project procurement activities of Component 1. MOWRAM PMU will be directly responsible for project procurement activities of Component 2. Procurement review committees for both components will have representatives from both MOWRAM PMU and NCDD PIU.

209 Procurement method thresholds and prior review thresholds for GCF/IFAD financed activities will be determined and specified in the Project Procurement Arrangements Letter (PPA). Requests for IFAD prior review and no objection (for 18-month/annual procurement plans, procurement documents subjected to IFAD prior review) shall be routed through IFAD's web-based procurement management and tracking system (the current NOTUS system to be upgraded in 2023).

210 For the procurement of AIIB/GCF/IFAD financed activities, the standard bidding documents under the MEF's Standard Operational Procedures will be adopted and used with integration of additional provisions in compliance with the AIIB/IFAD Policy on Preventing Fraud and Corruption in its Activities and Operations, and IFAD's Social, Environmental and Climate Assessment Procedures (SECAP).

211 For Component 2 activities, three areas will be identified, (a) Project Management by PMU (b) Preparation of TOR's for DED and Pilots, surveys, detailed engineering design (DED) and contract preparation and tendering towards implementation (c) Packages of work and purchase/Installation of M&E goods such as solar pump stations.

212 For (a) and (b) the PMU already have a procurement plan detailing when the work is expected, how and when it will be procured and budgets. These do not need to be repeated here as they are continually updated by the PMU.

213 For the implementation phase a series of packages for civil works of around $10m-$20m can readily be defined and contracts requiring specific expertise such as the nature-based works on the river restoration work at Ou Ta Poung River, or the heavier engineering work for the upgrading of the offtake structure on the Damnak Ampil and widening/lining of the feeder canal linking to the Ou Ta Paoung River. Lining of secondary offtake canals to increase capacity whilst limiting additional land take may be similarly packaged. For tertiary and quaternary canals significant work with the local communities is needed to finalise design and layout acceptable to the farmers and landowners. To avoid double pumping raised canals and solar pump installations are needed. Land requirements may be reduced through buried pipe or channel systems with access roads above. Continuity for drainage and fish may require small siphons. On the Krang Ponley particularly, expertise in storages and pond restoration is needed as well as more significant drainage works and embankment raising. Creating farm ponds in Cambodia is significantly more expensive than in Thailand where conditions are similar and there is potential for improving efficiencies.

6.7 Monitoring and Reporting Arrangements

214 The E&S performance will be included in the subproject and overall project progress reports. The two safeguards specialists in each of the PPMUs, with assistance from the CSC/field engineers (where relevant), will monitor and report on the E&S performance of the project. The safeguards specialists in the PPMUs will submit E&S performance reports at the subproject level to the CPMU on a monthly basis. At the central level, the CPMU will prepare E&S monitoring report twice per year for submission to IFAD and the GCF, describing the project's progress and compliance with the SECAP/GCF safeguards standards and other requirements.

215 The progress report submitted to the CPMU must include sufficient information on subproject implementation progress and E&S issues related to ESCMF implementation. The overall progress report from CPMU to be submitted to IFAD and the GCF must include adequate information regarding: (i) preparation and disclosure of the E&S instruments for subprojects; (ii) implementation progress of the ESCMP, including incorporation of the ECOP/COC on SEA/other ESCMP requirements pertaining to the contractor in the bidding and contractual documents; (iii) monitoring and supervision on implementation perforamnce of contractors, CSCs, and PPMUs according to the ESCMP, ECOP, and COC on SEA; and (iv) any challenges, solutions, and lessons learned during E&S/ESCMF implementation. Table 6-3 provides a summary of reporting procedures.

Table 6-3: Reporting Procedures

	Report Prepared by	Submitted to	Frequency of Reporting
1	Contractor to the Employer	PPMUs	Once before construction commences and monthly thereafter
2	Construction Supervision Consultant (CSC)	PPMUs	Weekly and monthly

3	Community Monitoring	PPMUs	When the community has any complaint about the subproject E&S/ESCMF implementation
4	PPMUs	CPMU	Monthly
5	CPMU	IFAD and GCF	Once every six-months, in accordance with any signed legal agreements.

6.8 Incorporation of ESCMF into Project Operational Manual

216 The ESCMF process and requirements will be incorporated into the Project Implementation Manual (PIM) and the CPMU will provide training to ensure that the subproject owners (PPMUs) understand them and will supervise and monitor the ESCMF implementation periodically. The E&S section in the POM will also refer to the ESCMF and related safeguards documents, as needed.

7. CAPACITY BUILDING, TRAINING, AND TECHNICAL ASSISTANCE

7.1 Capacity Building for Efficient Project Management

217 Capacity building is a component that will provide supports to MOWRAM/ PMU and PDWRAM to strengthen their capacity with the objective to expedite Project implementation and ensure effective Project management. The capacity building will cover (i) overall Project management, (ii) establishment of FWUCs and capacity building of FWUCs and iii) international and national consultants to fill capacity gaps of MOWRAM/ PMU and PDWRAM.

7.2 MOWRAM/ PMU and PDWRAM

218 The institutional assessment report prepared by PPIC and WAPCOS, December 2022 noted that the weak and insufficient capacity of human resource in all levels of the irrigation management is the primary cause of the slow rural development in Cambodia. The need for adequately trained professionals in water resources and irrigation management in Cambodia is an issue. The capacity building can be performed through education, training, workshop, etc.

219 Based on the institutional assessments report of the Water Resources Management Sector Development Program (WRMSDP), the training for MOWRAM and PDWRAM will include all personnel at the central and provincial levels that are involved in the CAISAR project scheme. This means that the officers who will be involved in the CAISAR project will also be trained. However, the training for FWUCs TOT must be included. For the CAISAR project it is advised that the training plan covers all 6 Irrigation Schemes with both for CAISAR PMU and PDWRAM with topics including 1) Project Orientation and Presentation of Project Plans; 2) FWUC Formation and Strengthening; 3) Gender Awareness and Gender Action Plan; 4) Data Management for Hydro and Meteorological Data and O&M for Meteorological Equipment; 5) Environmental Awareness; 6) Construction Management and Supervision and 7) On-Farm Water Management and Operation and Maintenance.

7.3 FWUC/FWUG/FWUSG

220 To help the trainees clearly understand and be able to apply them to their work, it was noted that each training program needs to dedicate sufficient time for each topic.

221 For FWUC management training programs are needed to strengthen the capacity of existing or new FWUCs that includes: a. Basic administrative management, b. Accounting and finance, c. Conflict resolution, d. Operation and maintenance of irrigation facilities and e. Collection of irrigation service fees.

222 It is suggested that FWUC need to have the opportunity to meet regularly and exchange their personal experiences and to learn from each other regarding FWUC management. Interaction between FWUCs can help to reduce conflicts between FWUCs in the same irrigation scheme/ reservoir.

223 As each FWUC have different geographical characteristics, socio-economic condition and different issues, training materials should be simplified by using the simple words and expressions commonly used by the local people

224 A well-defined FWUC Organizing Framework within MOWRAM/PDWRAM needs to be synchronized with the Water Distribution Schedule and agreed upon within the FWUC and disseminated to all farmer-water users within the Irrigation scheme.

225 The Project should construct the secondary and tertiary canals until the tertiary gates and will assist FWUC in collection of ISF.

226 The institutional assessment report has suggested that Technical and financial support will be provided to the FWUC that will manage the operation of Ou Tapoang, Lum Hach and Kraing Pomley Scheme to ensure that system O&M is conducted in an effective and sustainable manner.

227 To ensure effective and consistent training on E&S, particularly under the new IFAD SECAP (2021) and GCF ESS (2022), training should be provided by qualified national consultants. In addition to refresher training on safeguards pertaining to waste management, use and disposal of pesticides/fertilizers, etc., there must be additional training focused on ensuring the effective performance of contractors – including provision of adequate services related to health, safety of workers and local communities.

7.4 Training and Technical Assistance

228 Training and capacity building on the IFAD SECAP/GCF ESS has been recommended to address the concepts of proportionality and adaptive management as well as cover the implementation of the safeguards documents as they relate to: (i) contractor management and monitoring of E&S issues concerning labour; (ii) community health and safety; (iii) environmental health and safety; and (iv) requirements for systematic stakeholder engagement. The targeted training programs focused on E&S risk management could also help strengthening inter-agency coordination and cooperation which is critical for ensuring effective management of all aspects of climate change adaptation. Given the project structure and the plan to implement a number of subprojects in each province involved, significant inputs from qualified national consultants will be required, along with on-the-job training on assessing risks and impacts management during preparation and implementation.

229 During implementation of Project, E&S training and technical assistance will be provided to the implementing agencies both at the Project and subproject level. During the first three years, the CPMU will conduct at least two safeguard training workshops per year (one on environment and one on social) to the subproject owners regarding the ESCMF process and needs for preparation of safeguard documents (ESCMPs, SEP, IP Plans, and ECOP etc.). When possible, an IFAD SECAP Specialist will participate in these training workshops. Safeguards technical training for any other specific issues and related aspects should occur at least once per year for three years. This could be combined with the annual IEC.

230 Priority for training should include, but is not limited to, the following:

(i) The ESCMF process and guidelines for preparation, implementation, and supervision of E&S instruments designed for CAISAR and its subprojects;
(ii) Specific training on the IP Plans, SEP, and labour management with regard to planning and implementation, including the application of differentiated GRM pathways to more effectively respond to local complaints;
(iii) Specific training on supervision and monitoring of contractor performance, including forms and reporting processes; basic knowledge on health and safety; good construction practices for reducing potential impacts on local environment and local peoples; Codes of Conduct on SEA; and communication and GRM procedures and other social issues related to communicable diseases (including covid-19), etc.;
(iv) Specific training on IPM; safe use and disposal of pesticides/herbicides/chemical fertilizers being used in primary production;
(v) Specific training on waste management, including hazardous and bio-hazardous waste;
(vi) Specific training on the use of PPE and best practices (during construction, pesticide application, etc.).

7.5 Technical Assistance on E&S Capacity Building

231 Given the specific needs related to E&S training and limited capacity of some agencies with respect to the newest IFAD SECAP and GCF ESS, a qualified national firm could be mobilized by the CPMU to provide E&S training, supervision, monitoring, and reporting of the ESCMF implementation and SECAP/ESS compliance to IFAD and the GCF. If required by IFAD and/or the GCF, the CPMU will also mobilize an independent monitoring agency (IMA) for monitoring of IP Plan implementation, voluntary land donation (if applicable), and other E&S consultants to assist in the preparation and/or monitoring of various E&S activities during implementation. PPMUs may mobilize E&S consultants

(either individual or hired through a firm) to assist in the implementation of ESCMF, preparation of E&S documents, and mitigation measures of the subprojects under their responsibility.

232 MoWRAM have significant experience in application of the World Bank ESF and the Asian Development Bank safeguards policy through a number of similar projects over the past several years. Through this project, MoWRAM have maintained a proven track record for safeguards compliance. MoWRAM keep improving their capacities, through continued capacity development of staff of the Environmental and Social Office (ESO). Some of the staff within the ESO have solid working experience in engineering, community development, environment, social and public administration, engaging with indigenous people, and most have been trained by the World Bank on various topics related to environment and social management in rural development projects. The ESO with MoWRAM have a total of 7 staff (4 are female) who are assigned to different projects. The ESO will need additional technical support during the WASAC project implementation from E&S specialized staffs. MoWRAM will engage additional national consultants to work alongside staff of ESO to support the PMUs of MoWRAM in day-to-day E&S implementation and management.

Review of MoWRAM/PMUs capacity in prevention of SEA/SH risks

233 The MoWRAM PMUs have experience in identifying SEA/SH risks and prevention of SEA/SH based on lessons learned from several previous projects. Under this project, based on identified risks of SEA/SH, an approach and framework for management of SEA/SH risks has been proposed, and further addressed in the Labor Management Procedures. PMUs will appoint one social officer and one GRM officer to ensure the SEA/SH risks are monitored and reported. In addition, the MoWRAM PMUs have assigned a gender focal point to provide on-the-job training to the Contractors.

234 At an early stage of project implementation, MoWRAM PMUs will recruit E&S consultants, and engage a consultant specialized in SEA/SH to carry out SEA/SH trainings for PMU members and relevant members of MoWRAM, ESOs. MoWRAM also ensure that SEA/SH risks will be updated based on local experience and site conduct at respective subprojects. Accordingly, actions to be taken to prevent SEA/SH will be updated and included as part of the ESCMPs, and which will be subsequently applied as part of construction Contractor responsibilities (as prescribed in the Contractors' Work Contract). Budget will also be allocated (in Contractor's bill-of-quantity) to ensure the Contractor has budget in place to recruit a SEA/SH consultant to conduct public awareness raising on SEA/SH at subprojects, and to undertake SEA/SH management measures on the part of Contractors' workers and staff to minimize the risks of SEA/SH. In case where SEA/SH incidence is frequent or a significant episode has occurred.

235 Land acquisition and voluntary donations training will be conducted by the E&S Consultant. It is expected this training could be started as soon as E&S specialized staff are engaged by MoWRAM. Additional support from E&S staffs will be needed monthly or bimonthly during the construction phase, and quarterly or biannually during maintenance phase based on the need for support for the select subprojects. These training initiatives will be carried out face-to-faced. In case COVID-19 restrictions return, virtual training will be conducted. Zoom or Webex will be used for online training, The training will have knowledge session combined with discussion/exercises/role plays/quiz with Questions & Answers session at the end of each day. The training will be delivered in different time format, depending on the topics, number of participants, time availability, and may typically range from one day to three days. MoWRAM and PMUs will engage qualified trainers for the above training topics. For new topics, MoWRAM can ask support from the AIIB and IFAD to support in terms of sharing training material, references, and assist in training facilitation, if possible, to provided MoWRAM PMUs with practical, hands-on experience at the first stage of project implementation, particularly soon after project effectiveness.

8. ESCMF IMPLEMENTATION BUDGET

236 The roles and responsibilities of each organization have been clearly outlined, with MOWRAM responsible for overall supervision and guidance, and the DFWUC responsible for preparing the annual work plan and budgets, initiating, and coordinating communication, coordinating with the Ministry of Agriculture, Forestry and Fisheries (MAFF) on agriculture support activities, and implementing social and environmental safeguards, among other tasks. The PDWRAM will assist the PMU in disseminating information and coordinating with the Ministry of Economy and Finance-General Department of Resettlement (MEF-GDR) to implement the resettlement plan, among other tasks.

237 The E&S performance will be included in the subproject and overall project progress reports. The two safeguards specialists with assistance from the CSC/field engineers (where relevant), will monitor and report on the E&S performance of the project. The safeguards specialists in the PPMUs will submit E&S performance reports at the subproject level to the CPMU on a monthly basis.

238 The ESCMF process and requirements will be incorporated into the Project Implementation Manual (PIM) and the PMU will provide training to ensure that the subproject owners (PMUs) understand them and will supervise and monitor the ESCMF implementation periodically. The E&S section in the POM will also refer to the ESCMF and related safeguards documents, as needed.

239 Monitoring and evaluation will be a crucial aspect of the project's success, with engagement at the FWUC level monitoring and reporting to ensure capacity is being increased in time to realize the significant benefits expected upon completion of construction. Material effectiveness and quality of design will also be monitored and evaluated to ensure the scheme is delivered to a standard consistent with at least a 25-year asset life.

240 The following ESCMF implementation costs include two safeguards' specialists in the PMU, Their responsible include: (a) preparation of E&S documents of subprojects, including consultation with local authorities and communities; (b) supervision, monitoring, and training workshops on E&S issues; (c) implementation and monitoring of the ESCMPs, SEP, IP Plan, and Gender Action Plan. (with the support of the project's Monitoring & Evaluation Specialist); and (d) ensuring contractors implement their respective Environmental Code of Practice and Codes of Conduct for Gender Based Violence (GBV) and Violence Against Children (VAC) and any site-specific measures. The budget also includes the social economic survey including the census for the resettlement plan. A budget for an Independent E&S Monitoring Consultant for an estimated 6 year construction period for the 6 schemes.

241 MoWRAM will appoint at least one Environmental Specialist, one Social Specialist, and one GRM Focal Point (hereinafter ESOs) for full time support for the project. The ESOs of MoWRAM will be instrumental in ensuring the environmental and social performance of the project. The ESOs, who are supported by Design and Supervision consultants and E&S consultants, will be responsible for ensuring effective environmental and social management for all project activities. The ESOs, Design and Supervision consultants and E&S consultants will work together as a team in which ESOs play the lead role in E&S monitoring for the whole project. In particular, ESOs will review all related project and E&S documents which are prepared by E&S consultants. Where necessary, ESO will conduct site visits, interview contractor, construction supervisors, workers, provincial-level government staff of MoWRAM, local authorities and local communities to collect necessary E&S information for the purpose of internal monitoring. The ESO will monitor Contractors' compliance with Construction-ESCMP and visit each subproject location at least once a month during construction. Upon completion of each site visit, the MoWRAM'S ESOs should prepare a Monitoring Report reflecting main issues found, resolution arrangements and timing for the resolution.

The **ESOs** will be responsible for:

- Implementing and monitoring performance of environment and social mitigation measures, including health and safety;

- Conducting screening and scoping on environment and social impacts, including screening for land acquisition impacts based on the guidance in the RPF and presence of Indigenous Peoples based on the guidance in the IPPF;
- Conducting trainings on health, safety, gender, SEA/SH, VAC, labor rights, HIV/AIDS, STDs, Covid-19 and the grievance redress mechanism to project communities, and monitoring contractor's training for their workers on Workers' Code of Conduct which covers SEA/SH/VAC, HIV/AIDS, STDs, and COVID-19 and the workers' grievance redress mechanism;
- Monitoring environmental and social activities of the project, in particular the implementation of the ESCMPs for subprojects, and any other relevant project documents such as RP and IPP;
- Monitor, including ensuring effective functioning of project's Grievance Redress Mechanism and solve grievances submitted to the PMUs level;
- Leading all stakeholder engagement activities, including information disclosure, consultations, reporting back to stakeholders, according to the provisions in the SEP;
- Working closely with Provincial Department of Water Resource and Meteorology, General Department of Resettlement, and other line ministries and/or relevant departments as necessary;
- Prepare monthly reports on E&S implementation and submit to the PM and PD.

E&S Consultants

242 The E&S consultants are responsible for assisting the ESO in monitoring and reporting on the safeguard implementation performed by the contractors.

- Develop screening checklist to assess risks and potential environmental and social impacts for each subproject;
- Take lead in building capacity for the project (based on list of potential training topics, including periodic provision of on-the-job training to contractors, ESO and PMUs on the implementation and management of E&S risks and impact at subproject level;
- Review C-ESCMP and ensure C-ESCMP is consistent and cover all risks and potential impacts identified in site-specific ESCMP, particularly risks related to OHS, CHS, SEA/SH/VAC taking into account local knowledge and experience in prevention and management of these risks.
- Ensure C-ESCMP have actionable plan to addressed identified risks and potential impacts, including allocation of resources to implement fully such actions.
- Make recommendation for improvement before PMU's and PMU's DISS Consultant's approval of C-ESCMP;
- Conduct site visit to construction sites and worker camp and make above assessment as part of monitoring and reporting responsibility;
- Develop E&S monitoring checklist and reporting template;
- Participate and support ESO in monthly safeguard monitoring and reporting;

243 The Government of Cambodia and AIIB, IFAD and GCF will co-finance the ESCMF implementation budget, except for costs related to all aspects of land acquisition, resettlement, and livelihood restoration. When needed, qualified national (individual or firm) consultants for capacity building and training on ESCMF implementation and the concepts of the AIIB's ESF, IFAD's SECAP and GCF's ES Policy will be provided. Budget for trainings and capacity building are mainstreamed into the project budget across project outputs/components, so are not listed explicitly in the ESCMF implementation budget. Likewise, the budget for preparation of the Biodiversity Impact Assessment and related Biodiversity Management Plan, if any, are not listed in the ESCMF implementation budget, as they have already been contracted by MOWRAM as part of the ESCIA.

244 Costs related to staffing, implementation, and monitoring of the ESCMF, as well as costs more broadly focused on safeguards are built into existing project activities/components, can be found in Table 8-1.

Table 8-1: Estimated ESCMF Implementation Cost

Line Item	Estimated cost (USD)	Remarks
Environment & Climate Safeguards Specialist	USD 240,000 (60 months at USD 4000 per month) per PMU	The PMU will be responsible for management of this budget.
Gender & Social Safeguards Specialist	USD 240,000 (60 months at USD 4000 per month) per PMU	
GRM Focal Point	USD 240,000 (60 months at USD 4000 per month) per PMU	
Socioeconomic and census survey for Resettlement Plan 840 ha impacted (private & public) with estimate of 10 households per ha	USD 250,000	
Independent E&S Monitoring Consultant (Estimated 6 year project implementation period)	USD 500,00	
TOTAL	**USD 1,470,000**	

9. GRIEVANCE REDRESS MECHANISM (GRM)

245 As part of environmental and social policies of the AIIB, IFAD, and GCF, the Lead Agency is required to establish and implement a GRM to respond to concerns and grievances of project-affected parties related to the E&S performance of the project/subprojects in a timely manner. The GRM may include: (a) different ways in which users can submit their grievances, including submission in person, by phone, text messages, mail, email or via a web site; (b) a log where grievances are registered in writing and maintained in a database; (c) publicly advertised procedures, setting out the length of time users can expected to wait for acknowledgement, response, and resolution of their grievances; (d) transparency about the grievance procedures, governing structure, and decision makers; and (e) an appeals process (including the natural judiciary) to which unsatisfied grievances may be referred when resolution of grievance has not been achieved. The project/subject owner may provide mediation as an option where users are not satisfied with the project's resolution. Project/subproject owners must establish and implement the project GRM to receive and facilitate resolution of such concerns and grievances. As best practice, this ESCMF stipulates that contracted workers will have access to the project GRM to also raise workplace-related concerns. Those workers will be informed of the GRM upon their recruitment, as well as the measures put in place to protect them against any reprisal for its use.

246 As part of overall implementation of the subproject, the GRM will be established by the implementing agencies. The GRM identifies procedures, responsible persons, and contact information; will be readily accessible for the public; and will handle grievances and resolve them at the lowest level required and as quickly as possible. The GRM provides the framework within which complaints about environmental and safety issues can be handled, grievances can be addressed, and disputes can be settled quickly. The GRM will be in place before the subproject activities commence.

247 General Process: Complaints and claims through the project GRM can be lodged verbally, in writing, or by telephone/email. On receipt of a complaint, or project representative will register the complaint in the Complaints File and maintain a Log of Events pertaining to the complaint, until its resolution. Information to be recorded in the Complaints Log will include:

- The date and time of the complaint;
- The name, address and contact details of the complainant;
- A short description of the issue of complaint;
- Actions taken to address the complaint, including persons contacted and findings of each step in the complaint redress process;
- The dates and times when the complainant is contacted during the redress process;
- The final resolution of the complaint;
- The date, time and manner in which the complainant was informed thereof; and
- The complainant's signature when resolution has been obtained.

9.1 Objectives of the Project GRMs

248 The objective of the GRM is to provide affected persons with redress procedures that can be conveniently used to raise a project related concern or grievance. The GRM guides how a complaint can be lodged, including forms and channels through which a complaint can be submitted. To facilitate the grievance resolution process, grievances received will be acknowledged in writing and solved within a specified timeframe. During the resolution process, where necessary, dialogue will be held with aggrieved person for mutual understanding and effective resolution. Once a complaint is resolved, the aggrieved person will be notified of the resolution results.

249 The GRM has sequential steps that aggrieved person can use. If the aggrieved person is not satisfactory with the grievance resolution result, or if their complaint is not resolved within the timeframe specified for a particular step, aggrieved person can move on to the next step which is higher in resolution hierarchy. The project has an appeal process where complainant can resort if they

are not satisfied with a resolution decision at a particular step, or their complaints are not resolved within a specified timeframe.

9.2 Summary of national legislation related to grievance and complaint

250 The RGC has various laws and sub-decrees that have been in place to guide the implementation of the complaint resolution process. These documents specify the right of the complainants as well as the responsibilities of concerned governmental agencies as to complaint resolution. Relevant legal documents include:

- Law on Expropriation (dated 26 February 2010);
- Labor Law (dated 13 March 1997, amended on 20 July 2007 and 26 June 2018);
- Law on Prevention of Domestic Violence and Protection of Victims (dated 24 October 2005);
- Sub-decree No. 22 ANK/BK (2018) on Standard Operating Procedures for Land Acquisition and Involuntary Resettlement for Externally Financed Projects in Cambodia. Guidelines for Grievance Redress Mechanism (Appendix 8);
- Law on Administrative Management of Capital, Provinces, Municipalities, Districts and Khans (dated 22 May 2008) – Section 6 on Solution of Local Conflicts;
- Sub-decree No. 22 (25 March 2002) on Decentralization of Roles, Functions, and Power to Commune Councils (Article 61: duty to promote the role of conciliating disputes between citizens);
- Sub decree No 47 ANK.BK (31 May 2002) on Organization and Functioning of the Cadastral Commission (Chapter 4 – District/Khan Level Conciliation).

9.3 Principles of the Project GRMs

251 Under CAISAR, the following principles will be applied:

- **Channels.** Different channels are established to enable affected person to submit their grievances, including submission to village committee, as well as district and provincial levels.
- **Forms.** Grievances can be submitted in writing and verbally, and either directly by the affected households, or by a person delegated by the complainant.
- **Complainant can delegate a representative who acts on their behalf.** A person lodging a grievance can ask assistance from their family or from individual to act as their representative.
- **Disclosure.** GRM procedures are disclosed in public domain (e.g., websites of PMU, public notice board at village hall, and in front of substation).
- **Documentation.** A grievance logbook will be maintained at substation (subproject level) and at PMU level (through PMU GRM focal point).
- **Transparency.** Grievance procedures include steps, time frame for grievance resolution for each step, notification to affected person, how decision is made.
- **Acknowledgement.** The unit in charge of complaint resolution will notify complainant upon complaint receipt and will initiate the complaint resolution process.
- **Appeal.** If the agency in charge does not resolve a grievance in a manner that is satisfactory to the affected person, a multistakeholder committee will be established (ad-hoc) to resolve the dismissed grievance – as an alternative for affected person going to court.
- **Monitoring.** All grievances received are recorded by PMU and relevant substations, and are processed/resolved in a given timeframe, and are monitored by PMU GRM focal point.
- **Time-limit.** Time-limit is specified for each step in the grievance resolution process.
- **Complainants bear no costs.** Complaint resolution is free of charge to aggrieved person. However, if the complaints bring their case to court, they will bear the costs associated with their lawsuit.
- **Any grievance concerning urgent health and safety issues** shall be resolved immediately.

252 The project has in place complaint handling procedures for three types of potential grievances, including grievances related to 1) land acquisition, 2) labor and working conditions, and 3) sexual exploitation and abuse and sexual harassment (SEA/SH/GBV/GBV), and 3) general complaints. These procedures are established based on the above GRM principles and are in accordance with pertinent national legislation. The GRM for complaints related to land acquisition is provided in the project's Resettlement and Policy Framework (RPF) and that for IPs is provided in the project's IPPF. Summary for the above four procedures is provided below:

9.4.1 Redress Procedure for Complaints related to Land Acquisition

9.4 Project's Redress Procedures

253 Under this project, to facilitate the grievance redress, the informal and formal steps are combined for convenient use of affected people, as follows:

- **Step 1 − Commune/Sangkat level.** APs will seek assistance from commune/Sangkat chief or community elderlies who will discuss with the leader of the PRSC-WG to find a solution. Verbal grievance can be provided to the commune/Sangkat chief or community elderlies. So, no written complaint is required. It is noted that even if the complaint is made verbally, the complaint will be registered in project's logbook, including resolution process and result for such verbal grievance for monitoring purpose. Upon receipt of the verbal complaint, the PRSC-WG will consult with the IRC-WG to ensure the complaint is addressed timely. If the grievance is not resolved to the satisfaction of the AP, or if the AP prefers, s/he may lodge their complaint through the formal route which includes the steps below.
- **Step 2 − District level**. AH can lodge a written complaint to the Head of the District Office (where the subproject is located). The AH can bring a community elderly or their representative to discuss their grievance at the District Office. A conciliation meeting shall be held and a decision be made within 15 working days from the date of complaint is received by the District Office. If the complaint is resolved to the satisfaction of the AH, the IRC-WG will inform GDR's Department of Internal Monitoring and Data Management (DIMDM) who will review and seek the approval of the Director General of GDR for appropriate remedial action. GDR will inform the AF of the decision/ remedial action within 15 working days from the receipt of the grievance by the District Office. If the complaint is rejected at this step, District Office will inform the AH of the rejection in writing. If the complainant is not satisfied with the decision/resolution result, s/he can proceed to step 3 (below).
- **Step 3 − GDR level.** The complainant who is not satisfied with proposed resolution from Step 2 shall lodge a written complaint to the GDR for resolution.The GDR, through its DIMDM, will carry out a holistic review of the complaint and submit a report on its findings with the relevant recommendations, if any, to the Director General of GDR for review and decision. GDR may conduct a field visit to meet the complaint and the IRC-WG to gather relevant information. The final report must be completed within 30 working days from the date of receipt of the complaint by GDR for submission to the Director General of GDR who will make a final decision within 5 working days of receipt of the final report. In the event that the subject matter requires a policy level intervention, it will be referred to the IRC for a decision which may require that an additional 10 working days be extended from the original deadline for final decision.
- **Step 4 − Provincial level.** AH will submit a written complaint to the PGRC through the Provincial Governor's Office. The complainant or a representative will be given an opportunity to present its case during a meeting and the PGRC may consider any compelling and special circumstances of the AH to inform their decision. The GDR will send a representative, as a non-voting member, to provide an explanation to the rejection of the complaint at Step 3 with the GDR. The decision of the PGRC must be made on a consensus basis and will be final and binding except when the matter relates to government's policy. Decisions related to government's policy matters on land acquisition and resettlement are decided by the IRC. The PGRC will have 40 working days from the date of receipt of the complaint to reach a final decision. The decision of the PGRC will be sent to the IRC (through the GDR) for endorsement before any remedial action is taken.

  There are no fees or charges levied on the AH for their lodgment of complaint and for complaint resolution for the above 4 steps.
- **Step 5 − Court of Law**. If the aggrieved person prefers filing a lawsuit at the Provincial/Municipal Courts, as applicable, to seek a resolution, AP can do so but will bear cost related to the lawsuit as per the Expropriation Law. When the case is brought to a Court

of Law, there is no involvement of the GDR, PRSC or IRC-WG unless there is a judicial order from the competent courts.

9.4.2 Redress Procedure for Complaints related to Labor and Working Conditions

254 Project workers can lodge their grievance/complaint as follows:

- **Step 1 – Employer Level (Contractor and Subcontractor).** Aggrieved person (AP) can submit their grievance to their Employer who serves as the first focal point for receiving and resolving grievance. Grievance can be lodged verbally or in writing, in person or by phone, text message, mail or email (anonymous complaint is accepted). The Employer involved will resolve the case no later than 15 working days. Once resolved and the AP is satisfactory, the Employer will report the case, including resolution process and results, to the SEO of the MOWRAM for information and record. If the AP is not satisfied with the resolution of their Employer, the Employer will refer the AP to the SEO of MOWRAM, if needed and inform the AP of this referral. It is noted that if a complaint concerns the safety and health of one or several individuals, such complaint shall be resolved as soon as possible – depending on the nature and urgency of the grievance.
- **Step 2 – PMU level.** MOWRAM SEO will resolve the complaint referred to by the Employer (Step 1) and acknowledge receipt of the AP's complaints within two weeks from the date of complaint receipt. If the SEO of MOWRAM cannot resolve the complaint, the SEO Team will consult with the Project Manager/Director for resolution. The SEO of the MOWRAM will inform the AP (in writing) of the PMU's resolution result within 30 days from the date of complaint receipt. If the AP is not satisfied with the resolution result proposed by PMU, PMU will refer the case to the Project Steering Committee of the project and shall inform the AP (in writing) of this referral.
- **Step 3 – Project Steering Committee level.** At this level, the case will be resolved no later than 21 days. The AP will be informed of the resolution decision in writing. In case the grievance has not been solved within the specified timeframe, or the AP does not agree with the proposed resolution, the AP can approach the Labor Inspector of his/her province or municipality.
- **Step 4 – Court of Law.** If the AP is not satisfied with the resolution proposed above, a multistakeholder committee will be established (ad-hoc) to resolve the dismissed grievance – as an alternative for affected person going to court. If the grievance could not be resolved satisfactorily by the multistakeholder committee, the affected person may resort to the court of law. The cost associated with the lawsuit shall be borne by the AP. The decision of the Court will be final.

9.4.3 Redress Procedure for Complaints related to SEA/SH/GBV

255 Under the project, the GRM for SEA/SH/GBV mainly serves to: (i) refer complainants to a local GBV service provider; and (ii) record resolution of the complaint. In line with the above, the following principles apply so as to recognize SEA/SH/GBV victim as principal decision makers in their own care, and treat them with agency, dignity and respect for their needs and wishes:

- **Multiple channels** are in place for easy access and lodge complaints.
- **SEA/SH/GBV survivors will be referred to a local GBV service provider** for immediate support if they make a complaint directly to PMU.
- **Confidentiality of survivors is protected.** GM operator (at PMU and local GBV service providers) will keep confidential for SEA/SH/GBV allegation report.
- **No identifiable information on the survivor shall be collected and stored** in Project Grievance Logbook.
- **Costs of operating the SEA/SH/GBV GRM will be covered by the project**.

256 **It is noted that under this project, GBV service provider will be engaged** for subprojects that are rated "High" or "Substantial" for SEA/SH/GBV risks − based on SEA/SH/GBV risk assessment as part of site-specific ESMP.

The following channels can be used to submit a grievance related to SEA/SH/GBV:

+ Channel 1 – AP who believe the SEA/SH/GBV incidence is related to project workers can follow steps outlined in Section 6.4.2 (above) to lodge a SEA/SH/GBV complaint.

+ Channel 2 – Alternatively, AP can lodge their complaint, verbally or in writing, to the GRM's Focal Point within the SEO of MOWRAM for advice and resolution (contact of GRM Focal Point is provided in Section 5.1 (Resources).

+ Channel 3 – If AP wants to bring the case to the Court of Law, AP can follow steps below for prosecution. Prosecution related to SEA/SH/GBV is administered under the Criminal Code and the Code of Criminal Procedure and is as follows:

- **Step 1 – Judicial Police.** SEA/SH/GBV victim or a representative can submit their grievance to a local Judicial Police (JP) Officer. JPs include a) Commune/ Sangkat Chief, b) Commune/ Sangkat/ District/ Provincial/ National Police, and c) District/ Provincial/ National Military Police. The JP is responsible for receiving, recording complaints, and may conduct preliminary investigations to identify and arrest the perpetrator. The JP will also collect evidence to support the prosecutors. If the SEA/SH/GBV happens at home and/or falls under the domain of domestic violence (as per Law on the Prevention of Domestic Violence and Protection of Victims), the SEA/SH/GBV survivor may seek support from a local qualified Judiciary Police Officer (appointed by the Ministry of Women's Affairs) who can act as a complaining party on behalf of the SEA/SH/GBV survivor15.
- **Step 2 – Prosecutor.** Upon receiving the completed written record from the JP, the prosecutor can decide on if the prosecutor will hold a file without processing it further or conduct proceedings against the perpetrator. The prosecutor may bring the case to the Court of Law and present the evidence in Court hearings.
- **Step 3 – Investigation by Judge.** During this step, the investigating Judge will conduct interrogation of the charged person and perform other required investigation procedure.
- **Step 4 – Hearing.** After issuing an order of indictment, the investigating Judge will submit the case to the trial court president who shall arrange a date for the trial. The decision of the Court on SEA/SH/GBV resolution is final.

9.4.4 Redress Procedure for General Complaints

257 In case individuals, households, or communities are affected by any other aspects, for instance, environmental impacts such as increased dust, noise, or lack of safety measures that increase risks of traffic accident to road users or to local EM, various channels will be established for convinient use by affected parties, including IPs. These include:

- **PMU GRM focal point's telephone** (See Section 5.1 – Resources).
- **Local EM leaders** (in case affected individual/households are EM)
- **Contractor's hotline:** to report cases that they think contractors can solve timely (contact detail of Contractos will be posted at construction sites, and distributed to IPs (through Subproject Information Booklet) during consultation, and post at public billboard of Commune/Sangkat offices, pagodas, etc.
- **Commune/Sangkat offices**

9.5 Registration of Project Grievance

258 The SEO, Project 6.Managers within MOWRAM is responsible to establishing and maintaining the project grievance logbook (PGL). The PGL will be established by the SEO to record all concerns/ grievance that are submitted by project stakeholders during project implementation. In case there is serious complaint, the World Bank should be notified of these complaints within 24 hours of complaint receipt (See Annex 3 for Guidance for establishing and maintaining Project Grievance Logbook).

[15] In 2007, Inter-Ministerial Prakas No. 64 was issued by the Ministry of Women's Affairs (MoWA) and the Ministry of Justice (MoJ) appointing MoWA officials who have legal qualifications to be officials of the MoWA Judicial Police. The roles and authority of the JPO under MoWA is defined in the MoWA's Prakas No. 072 KKN/BS (2007) and is as follows: (1) act as a plaintiff representing the victim (2) prepare reports and records (3) monitor and follow up on relevant investigations (4) follow up on Court's procedures (decisions and convictions). In addition, Prakas of the Ministry of the Interior (No. 3840, 2020) on Establishment and Functioning of the Commune/ Sangkat Committee for Women and Children, has defined the roles and responsibilities of these Committees in prevention, mitigation and collaboration with juridical agencies to prevent, resolve cases related to domestic violence, sexual abuses, sexual harassment, human trafficking (such as exportations of women and children in commune/ sangkat for sexual exploitation).

259 **The GRM is an integral project management element** that intends to seek feedback from beneficiaries and resolve of complaints on project activities and performance. The GRMs for the project are based on IAAB, IFAD, UN, and GCF requirements and, most importantly, national requirements for solving potential problems between project owners and local residents/persons affected by the subproject(s).

10. ESCMF STAKEHOLDER CONSULTATION AND DISCLOSURE

10.1 Consultation Requirements

260 AIIB, IFAD and GCF require that consultations be held with the project affected peoples, local communities, vulnerable persons/ethnic minorities, and other relevant stakeholders. The consultations should provide information on the following aspects: a) purpose of the project; b) results of the environmental and social assessment; and c) presentation of the complementary studies required, in any instances where they apply. This ESCMF has been prepared through a detailed consultative process at both the field and central level, and consultations findings may also be used for subsequent safeguards documents.

261 Consultation through community outreach during project implementation is good practice to ensure that the potential adverse impacts and concerns are properly addressed during project construction and operation. Consultation with affected populations and ethnic minorities is required when the activities involve physical relocation, land acquisition, and ethnic minorities.

10.2 Consultation Process Summary

262 Public consultation is a key component of CAISAR and it was pivotal in preparation of the following documents:

- Environmental and Social Management Framework (ESCMF)
- Resettlement Planning Framework (RPF)
- Indigenous Peoples Planning Framework (IPPF)
- Gender Assessment & Social Inclusion Plan
- Stakeholder Engagement Plan (SEP), and
- Environmental, Social, Climate Assessment report (ESCA)

10.3 Initial Stakeholder Consultation Results

263 A number of missions and stakeholder engagement meetings have been held which are all part of the process of informing stakeholders about the proposed project, getting understanding and acceptance of the project, and getting input to further optimize the design and implementation of the project.

10.3.1 *Missions 1 and 2*

264 A two-stage joint mission was conducted by the Asian Infrastructure Investment Bank (AIIB), the International Fund for Agricultural Development (IFAD) and Ministry of Water Resources and Metrology (MoWRAM) for design and review of progress on the Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) Project (the Project) from 11 to 24 December 2022[1] and 9 to 19 January 2023.[2]

265 During the mission, discussions were held with key stakeholders in Phnom Penh and field visits to four provinces (Pursat, Kampong Chnang, Kampong Speu, and Kandal province) were conducted. Mission members visited all the key points of the irrigation areas guided by the Secretary of State His Excellency Chan Sinath and the directors of the Provincial Water Resource Management (PDWRAM). Districts and commune administrations, farmers and agribusiness entrepreneurs were met to determine and reach agreement on the directions and focus of the Project design and to review progress to date.

266 The objectives of the mission were (a) to check the requirements at the Project sites and review preparation progress, (b) to prepare all necessary information, studies and relevant documentation necessary for completing the Feasibility Study (FS), Green Climate Fund (GCF) Project Concept Note (CN) and GCF's Full Funding Proposal package, and (c) to define and

check the key studies required for the feasibility study and carry out the relevant consultations for the design mission.

10.3.2 *Mission 3*

267 A third field mission was conducted during the period of 18-26 May 2023 to Ou Tapoung (Pursat Province), Lum Hach (Kampong Chhnang Province) and Krang Ponley (Kampong Pseu, Kandal Province). The objectives of this mission were to: 1. Conduct discussions with provincial agencies with respect to planned projects and possible issues, and 2. Better understand the irrigation and flood control schemes as well as the smart irrigation needs; 3. Investigate the potential environmental and social issues related to the planned project schemes; and 4. To discuss appropriate environmental, social and climate safeguard measures suitable for the project (Annex 12).

10.3.3 *Ou Tapoung Feasibility Study Consultations*

During the preparation of the Ou Tapoung Feasibility Study, several meetings were held with FWUC commune representatives. These included:

- Meeting with Village Leaders from the Ou Ta Paong tail-end area, which included the following Villages of Ou Ta Paong Commune:
    1) Prey Yeang
    2) Robors Reang
    3) Chamkar Muol
    4) Chamkar Khluy
    5) Ou Tapoang
    6) Anglong Kray
    7) Srash Mkak
    8) Bot Kokichas
    9) Sdok Khlork
    10) Chhouk Krobao
    11) Somroung Pok
    12) Psar Angdoeurk
    13) Ornga Mean,
    14) Srash Ron
    15) Bot Kokithmey
    16) Ta nai
    17) Ou Bot
    18) Tuol Rokeang
- Meeting with FWUC of Kampang Irrigation Scheme on Svay Doun Kaev River
- Meeting with Bakan District Chairman
- Meeting with FWUC Damnak Ampil
- Meeting with FWUC Krouch Saeuch

PDWRAM explained that most of the systems in the DAC command area have at one or another time in the past 15 years undergone a rehabilitation. OTP is sort of a 'left-over'. PDWRAM explained that the rehabilitation of the OTP system is included in the current Five-Year Plan (PDWRAM). PDWRAM envisages that the OTP command area will receive its irrigation water via a gate on Damnak Ampil Canal (DAC).[16] An existing branch of Damnak Ampil Canal (DAC) is destined as the most logic route for delivering water to OTP River.

The feasibility study is to recommend options for improvement of the irrigation services in the area between the rivers Kambot and Svay Doun Khay. The work to be undertaken includes rehabilitation, upgrading, and extension of existing infrastructure systems for irrigation, drainage, flood protection, water storage, and transport.

[16] The ToR for the CAISAR Consultancy Services states:

10.3.4 *First Round of Stakeholder Engagement Meetings*

268 The first round of stakeholder meetings were held during the 26th to 30th June 2023 at commune and provincial levels in all three subprojects and six irrigation schemes. There were potential affected people and local authorities in the subproject areas and command areas that attended the consultation meetings at commune level, while representatives from provincial administration and provincial departments attended the public consultation meeting at provincial level.

269 The SECAP team provided a presentation at each meeting that included the following topics:

- Background of the CAISAR project
- Purpose of the Public Consultation
- Technical scope of each scheme
- Anticipated environmental and social risks and impacts
- Environmental and social safeguards documents to be prepared
- Grievance redress mechanism

270 Key comments and concerns raised by meeting participants included:

- Is there a **compensation** program for affected people?
- How can **complaints** be lodged if there is an issue?
- Participants generally expressed support for the project to be implemented soon

271 The key recommendations from the first round of stakeholder meetings include:

- Brambei Mom (Kampong Speu): there is a community forestry of 800ha. Wild animals such as wild boar, peafowl, tiger cat, banteng, gaur and so on.
- UXO: still found in some areas.
- Kampong Chhnang Department of Agriculture: suggested further assessment for the reservoir of Lum Hach.
- Reservoir of Lum Hach was reserved for irrigation purpose and it is state land. However, local people encroach and occupy the land inside the Lum Hach reservoir over the past years.
- Provincial Department of Health: recommended to ensure the health and safety of workers in the project (e.g., disease transmission and medical staff should standby at each construction site.
- Provincial Department of Education: should avoid adverse impacts on schools and students.

10.4 Information Disclosure

272 AIIB, IFAD and GCF funded projects are required to disclose all safeguards related documents locally in an accessible place and in a form and language understandable to key stakeholders (in this instance, Khmer and English) and on the external website of MOWRAM and of IFAD and the GCF prior to appraisal.

ANNEX 1: EXCLUSION LIST

Any sub-project that meets one or more of the following screening criteria will not be approved for financing under the project:

- Rural roads with total length of more than 10 kilometres per scheme;
- Irrigation canals with base width more than 10m; sluices with total drainage width more than 10m; irrigation embankments to protect cultivation areas of more than 500 hectares; large dams (higher than 15m) or any dams resulting in a high-risk rating (in terms of environment, social, and/or dam safety).
- Reservoirs with capacity of more than 3 million cubic meters;
- Infrastructure schemes that require physical resettlement of more than 20 people per subproject area or affect more than 10 percent (in value term) of assets of an individual household, or adversely impacts security of tenure of EM households.
- Any sub-project that physically displaces EM or dilutes/changes their security of tenure.
- Relocation and/or demolition of any permanent houses or business.
- Use of the project as an incentive and/or a tool to support and/or implement involuntary resettlement of local people and village consolidation.
- Land appropriation
- New settlements or expansion of existing settlements.
- Activities that would likely create adverse impacts on ethnic groups/indigenous peoples within the village and/or in neighboring villages, or activities unacceptable to ethnic groups living in an ethnic homogenous village or a village of mixed ethnic composition.
- Damage or loss to cultural property, including sites having archeological (prehistoric), paleontological, historical, religious, cultural and unique natural values.
- Resources access restriction (e.g. restricted access to farming land) that could not be mitigated and will result in adverse impacts on the livelihoods of ethnic groups and disadvantage peoples.
- Purchase of banned pesticides, insecticides, herbicides and other unbanned pesticides, unbanned insecticides and unbanned herbicides and dangerous chemicals exceeding the amount required to treat efficiently the infected area. However, if pest invasion occurs, the use of small amounts of eligible and registered pesticides in Cambodia will be allowed if supplemented by additional training of farmers to ensure pesticide safe uses in line with IFAD/GCF ESS policies and procedures. Highly Hazardous Pesticides (HHP) will not be used by the project.
- Purchase of destructive farming gear and other investments detrimental to the environment.
- Unsustainable exploitation of natural resources.
- Introduction of non-native species, unless these are already present in the vicinity or known from similar settings to be non-invasive.
- Significant conversion or degradation of natural habitat or where the conservation and/or environmental gains do not clearly outweigh any potential losses.
- Production or trade in any product or activity deemed illegal under Cambodia's laws or regulations or international conventions and agreements, or subject to international bans.
- Labor and working conditions involving harmful, exploitative, involuntary or compulsory forms of labor, forced labor[17], child labor[18] or significant occupational health and safety issues.
- Trade in any products with businesses engaged in exploitative environmental or social behavior. Sub-activities that require full EIA will not be funded including any projects that will use or induce the use of hazardous materials (including asbestos) or any banned chemicals.

[17] Forced labor means all work or service, not voluntarily performed, that is extracted from an individual under threat of force or penalty.

[18] Harmful child labor means the employment of children that is economically exploitive, or is likely to be hazardous to, or to interfere with, the child's education, or to be harmful to the child's health, or physical, mental, spiritual, moral, or social development.

ANNEX 3: TERMS OF REFERENCE FOR E&S SAFEGUARDS MONITORING CONSULTANT

The following is meant to serve as a sample Terms of Reference and should, therefore, be amended accordingly to fit the context of the CAISAR project once final decisions have been made about budget and division of tasks (e.g. whether the project's Monitoring & Evaluation (M&E) specialist will be separate from the Safeguards M&E consultant).

BACKGROUND

[Hiring unit should insert background information on the CAISAR project within the given Provincial PMU and project area here]

OBJECTIVES OF THE ASSIGNMENT

MOWRAM seeks the Consultancy Services of an experienced Individual Consultant "Environmental & Social Safeguards and Project Monitoring & Evaluation Consultant" as part of the Provincial Project Management Unit (full-time engagement). The objective of this assignment is monitoring compliance of the project activities with Environmental & Social Safeguards instruments. In addition, the Consultant will support the Project's overall M&E.

SCOPE OF WORK

Duties and Responsibilities:
The specific tasks stipulated in this ToR to be undertaken by the Environmental & Social Safeguards and Project M&E Consultant include, but are not limited to the following:

With regard to Environmental and Social Safeguards:
The Consultant will assist the Project Coordinator/Project Manager and will work closely with the Environmental & Social Safeguards staff within the Provincial PMU to handle Environmental and Social Safeguards related responsibilities. Specifically:

- Undertake site visits and on-ground review, check and document compliance with site-specific measures as presented in site-specific ESCMPs.
- Provide guidance to contactors, site supervisors, and other stakeholders on manners of implementation and documentation of compliance related to environmental mitigation and monitoring measures, as presented in site-specific ESCMPs.
- Check that all documents necessary to ensure full compliance with Environmental & Social Safeguard instruments, in particular, Environmental and Social Management Plans (ESCMPs) and Indigenous Peoples' Plans (IPPs) are prepared, regularly updated, and available to relevant stakeholders;
- Ensure that project activities, being developed as a part of the Project, are designed to include avoidance of potential social and environmental risks, as recommended in the ESCMPs and annual IP Plans already prepared;
- Provide overall Environmental and Social Management oversight during the implementation of CAISAR's activities and advise the implementation agencies in addressing the environmental issues;
- Ensure that each subproject and related activities under the project are subject to the Project's ESCMP procedures;
- Review subproject and activity plans, design, costs, and bidding documents and be involved in procurement of Civil Works and Supervision to ensure that Civil Works and Supervision contracts include provisions concerning the Environmental and Social Safeguard issues;
- Coordinate with relevant agencies for obtaining environmentally related permits, as necessary;
- Communicate with local governments, contractors, and with any Environmental, Social, Health and Safety (ESHS) Experts that may be part of the subproject supervision team in all matters related to design, implementation, documenting and reporting on environmental compliance, as indicated in site-specific ESCMPs;

- Monitor implementation of site-specific ESCMPs by the Contractors to ensure that appropriate management process and procedures are in place, that Environmental and Social Safeguards related measures are adequately addressed and to ensure that in the event of a noncompliance agreed remedial actions are applied and documented;
- Check and ensure that the regular reports are prepared and timely submitted by the Contractor as per content agreed and provide comments, as appropriate;
- Contribute to, along with the E&S Provincial PMU Specialists, preparation of semi-annual ESCMP Compliance Reports for IFAD and the GCF
- Participate in missions and technical visits by IFAD, and work closely with the IFAD SECAP Specialists and Provincial PMU E&S Specialists to ensure the Project's compliance with relevant environmental and social policies.
- Undertake other actions related to environmental and social aspects of the Project, as may be instructed by the Project Manager/Coordinator from time to time and/or the E&S Specialists in the Provincial PMU, in order to ensure full compliance of the Project with national and international environmental and social standards and legislation.

With regard to Project Monitoring & Evaluation:

The Consultant will be in charge of the Project's Monitoring & Evaluation (M&E), design the strategic and technical approach to implementing project goals within the technical framework outlined for the Results Monitoring. The Consultant will coordinate and work with other members of the Provincial PMU, particularly any staff which DARD has assigned to operate the REDD+ MIS SIS and/or Project MIS, to ensure adequate monitoring of progress against the project indicators. In addition, the Consultant will also work closely with any specialists hired to carry out Mid-Term and/or Terminal Project Monitoring & Evaluation and facilitate the gathering of information.

- Review and familiarize themselves with the Project's documents, in particular with Project Operational Manual (POM) and Monitoring Information System (MIS) already established;
- Carry out the preparation and implementation of the M&E program and keep records on achievements, breakdowns of indicators;
- Continuously monitor progress towards the project's objectives and according to agreed Performance Monitoring Indicators;
- Report in semi-annual reports on the project objectives and Results Framework updates;
- Monitor the project's implementation and evaluate outcomes and results for each Component and Subcomponent, using the MIS;
- Determine whether the inputs in the project are well utilized;
- Monitor the project's implementation against the planned activities (physical and financial), analyze reasons for delays (if any), and propose measures and solutions to overcome delays;
- Ensure that the project's activities are properly implemented as per the agreed program, and take corrective actions when necessary;
- Identify good practices and advantages within the project, recording lessons-learned for future consideration;
- Carry out the roles and responsibilities given by the Project Coordinator/Manager;
- Support the beneficiary survey and other end-of-project evaluations
- Take all necessary measures for the maintenance of the MIS to keep it operational.

QUALIFICATIONS REQUIREMENTS

The person suitable for the position of the Environmental & Social Safeguard and Project Monitoring & Evaluation Consultant should have the following qualifications:

- Master's degree, preferable in the Environmental Sciences, Environmental Engineering or equivalent professional qualifications appropriate to the Consultancy Services requested;
- A minimum of 5 (five) years of relevant experience in Environmental & Social Safeguard Monitoring;
- Knowledge of Cambodia's regulations and laws (particularly in the EIA processes) is required;
- Familiarity with the IFAD, GCF, and REDD+ Safeguard policies will be an advantage;
- Knowledge and experience in Project Monitoring & Evaluation is desirable;

- Proficiency in using computer and office software packages (word processing, spreadsheet etc.). Experience in the handling of web-based data and Management Information Systems will be an added advantage;
- Fluent written and spoken Khmer and English.

REPORTING OBLIGATIONS

The Consultant will work under the direction of and report to the CAISAR Project Manager/Coordinator within the PMU, and in close consultation with the E&S Specialists of the PMU. The Consultant will deliver monthly progress reports concerning the accomplishment of their assignments.

In addition, concerning the overall Project M&E, the Consultant shall prepare semi-annual and annual surveys on project outcomes indicators and prepare semi-annual and annual project progress reports, updating relevant parts of the Result Framework, as appropriate. This work shall be conducted in close consultation with any relevant specialists with the PMU.

CLIENT'S INPUTS

The Consultant will be based and work in the Provincial PMU office. MOWRAM, as host of the Provincial PMU, will provide the office space and equipment required to perform the tasks assigned.

TERMS OF THE ASSIGNMENT AND DURATION

- The Consultant will work on full-time basis.
- Remuneration will be paid on a monthly basis.
- The Consultant will be offered the opportunities to grow up professionally by attending relevant training events and courses during the term of the contract.
- The initial contract with the Consultant will cover one year, with a 3 month probation period, at which time the performance of Consultant shall be evaluated and extension may be made annually pending continued performance.
- Evaluation of the 3 (three) month probation period and any contract extension would be fully based on the consultant's performance certified by the Project Coordinator/Manager and as agreed with IFAD.

ANNEX 4: CHANCE FINDS PROCEDURE

The following *"chance find"* procedures must be included in all third-party contracts (e.g. Letters of Agreement) in instances where the contracted party is assisting with project implementation and/or construction activities.

Provincial PMUs will ensure that the bidding documents and work contract for civil works contractors include clauses on chance find procedures. Specifically, the clause will stipulate that if the Contractor discovers archeological sites, historical sites, remains and objects, including graveyards and/or individual graves during project implementation, the Contractor shall:

- Stop the activities in the area of the chance find;
- Delineate the discovered site or area;
- Secure the site to prevent any damage or loss of removable objects. In cases of removable antiquities or sensitive remains, a night guard shall be arranged until the responsible local or provincial authorities take over;
- Notify the supervisory Safeguards Specialist within the PMU who, in turn, will notify the responsible local and provincial authorities immediately (within 24 hours or less);
- Responsible local and/or provincial authorities would oversee protecting and preserving the site before deciding on subsequent appropriate procedures. This would require a preliminary evaluation of the findings to be performed by government approved archeologists. The significance and importance of the findings should be assessed according to the various criteria relevant to cultural heritage; those include the aesthetic, historic, scientific or research, social and economic values;
- Decisions on how to handle the finding shall be taken by the responsible local and provincial authorities. This could include changes in the layout (such as when finding an irremovable remain of cultural or archeological importance) conservation, preservation, restoration and salvage;
- Implementation for the authority decision concerning the management of the finding shall be communicated in writing by relevant local authorities; and
- Project activities could resume only after permission is given from the responsible local or provincial authorities concerning safeguard of the heritage.

Note that the reporting of chance finds only occurs when an item/area/etc. of cultural significance is found, and is only carried out insofar as what is detailed above (i.e. reporting the find, reporting how the item/area will be treated moving forward). Reporting begins with the local level implementer (e.g. staff tasked to the implement the project within a village) notifying the Safeguards Specialist, after which, the Safeguards Specialist guides the process according to the instructions above (e.g. notifying the relevant government authorities).

ANNEX 5: E & S CODES OF PRACTICE FOR CONSTRUCTION

Generic contract clauses are provided to assist with environmental and social management works. These clauses are general and should be modified as needed. These clauses are intended to be included as requirements in the works contract and shall remain in force throughout the contract period.

Clause on ESCMP

The Contractor is required to implement this ESCMP. The Contractor is responsible for the implementation of construction and rehabilitation activities for the sites and for implementing the impact mitigation measures in the construction phase. The Contractor's approach shall be detailed in the Contractor's Management Plan.

The Contractor shall include a suitably qualified and experienced Environmental, Occupational Health and Safety Officer (and other staff or consultants as necessary) to be specifically responsible for preparation and regular update and supervision of the ESCMP. The Environmental, Occupational Health and Safety Officer is responsible for the daily supervision and monitoring of the Contractors implementation of the Plan and compliance with the Project ESCMP for the duration of the contract. The Contractor's approach to comply with the ESCMP shall be approved by PMU prior to the Contractor's mobilization to the site.

The Contractor will be required to report on the implementation status of the ESCMP to PMU. The damages due to the violation of the stipulations by the Contractor shall be compensated and/or restored by the Contractor at his or her own expense. Performance will be monitored by PMU and will be enforced by withholding of payments (refer to relevant clause in the bid documents).

Other Standard Clauses

Permits and Approvals

The contractor shall be responsible for ensuring that he or she has all relevant legal approvals and permits required to commence works.

Site Security

The contractor shall be responsible for maintaining security over the construction site including the protection of stored materials and equipment. In the event of severe weather, the contractor shall secure the construction site and associated equipment in such a manner as to protect the site and adjacent areas from consequential damages. This includes the management of onsite, construction materials, construction and sanitary wastes, additional strengthening of erosion control and soil stabilization systems and other conditions resulting from contractor activities which may increase the potential for damages.

Discovery of Antiquities and Cultural Heritage

If, during the execution of the activities contained in this contract, any material is discovered onsite which may be considered of historical or cultural interest, such as evidence of prior settlements, native or historical activities, evidence of any existence on a site which may be of cultural significance, all work shall stop and the supervising contracting officer shall be notified immediately and the Chance Find Procedures followed (Appendix 5). The area in which the material was discovered shall be secured, cordoned off, marked, and the evidence preserved for examination by the local archaeological or cultural authority. No item believed to be an artefact must be removed or disturbed by any of the workers. Work may resume, without penalty of prejudice to the contractor upon permission from the contracting officer with any restrictions offered to protect the site.

Worker Occupational Health and Safety

The contractor shall ensure that all workers operate within a safe environment. Sanitation facilities shall be provided for all site workers. All sanitary wastes generated as a result of project activities shall be managed in a manner approved by the contracting officer and the local authority responsible for public health. The contractor shall ensure that there are basic medical facilities on site and that there are staff trained in basic first aid. Workers must be provided with the necessary protective gear as per their specific tasks such as hard hats, overalls, gloves, goggles, boots, etc. The contractor shall

provide the contracting officer with an occupational health and safety plan for approval prior to the commencement of site activities.

The contractor must ensure that all workers operate within a safe environment. All relevant Labor and Occupational Health and Safety regulations must be adhered to ensure worker safety. Sanitary facilities must be provided for all workers on site. Appropriate posting of information within the site must be done to inform workers of key rules and regulations to follow.

Noise Control

The contractor shall control noise emissions generated as a result of contracting activities to the extent possible. In the case of site locations where noise disturbance will be a concern, the contractor shall ensure that the equipment is in good working order with manufacturer supplied noise suppression (mufflers etc.) systems functioning and in good repair.

Where noise management is a concern, the contractor shall make reasonable efforts to schedule activities during normal working hours (between 7 am and 5 pm). Where noise is likely to pose a risk to the surrounding community either by normal works or working outside of normal working hours or on weekends, the contractor shall inform the contracting officer and shall develop a public notification and noise management plan for approval by the contracting officer.

Use and Management of Hazardous Materials, fuels, solvents and petroleum products

The use of any hazardous materials including pesticides, oils, fuels and petroleum products shall conform to the proper use recommendations of the product. Waste hazardous materials and their containers shall be disposed of in a manner approved by the contracting officer in accordance with State and/or national laws and the Project ESCMP. A site management plan will be developed by the contractor if the operation involves the use of these materials to include estimated quantities to be consumed in the process, storage plans, spill control plans, and waste disposal practices to be followed. Any plans required shall be approved by the contracting officer.

Elements of the hazardous materials management shall include:

- Contractor must provide temporary storage on site of all hazardous or toxic substances in safe containers labeled with details of composition, properties and handling information;
- Hazardous substances shall be placed in a leak-proof container to prevent spillage and leaching; and
- Wastes shall be transported and disposed of in a manner outlined in the ESCMP, and cleared by the PMU Safeguards Team compliant with national laws and policies and the ESCMP.

12.

Use and Management of Pesticides

Any use of pesticides shall be approved by the contracting officer and shall conform to the manufacturers' recommendations for use and application. Any person using pesticides shall demonstrate that they have read and understood these requirements and are capable of complying with the usage recommendations to the satisfaction of the contracting officer. All pesticides to be used shall conform to the list of acceptable pesticides that are not banned by the relevant local authority.

If termite treatment is to be utilized, ensure appropriate chemical management measures are implemented to prevent contamination of surrounding areas, and use only licensed and registered pest control professionals with training and knowledge of proper application methods and techniques.

Use of Explosives

No explosives shall be used on the Project.

Site Stabilization and Erosion Control

The Contractor shall implement measures at the site of operations to manage soil erosion through minimization of excavated area and time of exposure of excavated areas, preservation of existing ground cover to the extent possible, provision of approved ground cover and the use of traps and filtration systems. Where excavations are made, contractor shall implement appropriate stabilizing techniques to prevent cave-in or landslide. Measures shall be approved by the contracting officer.

The contractor must ensure that appropriate erosion control measures such as silt fences are installed. Proper site drainage must be implemented. Any drain clogged by construction material or sediment must be unclogged as soon as possible to prevent overflow and flooding. The use of retaining

structures and planting with deep rooted grasses to retain soil during and after works must be considered. The use of bio-engineering methods must be considered as a measure to reduce erosion and land slippage. All slopes and excavated areas must be monitored for movement.

The contractor will establish appropriate erosion and sediment control measures such as hay bales, sedimentation basins, and / or silt fences and traps to prevent sediment from moving off site and causing excessive turbidity in nearby streams, rivers and wetlands. Construction vehicles and machinery will be washed only in designated areas where runoff will not pollute natural surface water bodies.

Air Quality

The Contractor shall comply with the Project ESCMP requirements for dust management.

Traffic Management

In the event that construction activities should result in the disruption of area transportation services, including temporary loss of roadways, blockages due to deliveries and site related activities, the contractor shall provide the contracting officer with a traffic management plan including a description of the anticipated service disruptions, community information plan, and traffic control strategy to be implemented so as to minimize the impact to the surrounding community. This plan shall consider time of day for planned disruptions, and shall include consideration for alternative access routes, access to essential services such as medical, disaster evacuation, and other critical services. The plan shall be approved by the contracting officer.

Elements of the traffic management plan to be developed and implemented by contractor shall include:

- Alternative routes will be identified in the instance of extended road works or road blockages;
- Public notification of all disturbance to their normal routes;
- Signage, barriers and traffic diversions must be clearly visible, and the public warned of all potential hazards;
- Provision for safe passages and crossings for all pedestrians where construction traffic interferes with their normal route;
- Active traffic management by trained and visible staff at the site or along roadways as required to ensure safe and convenient passage for the vehicular and pedestrian public; and
- Adjustment of working hours to local traffic patterns, e.g. avoiding major transport activities during rush hours or times of livestock movement.

13.

Water Quality

The Contractor shall comply with the Project ESCMP requirements for water quality. Under no circumstances shall the contractor permit the collection of standing water as a consequence of contractor activities to ensure that it does not create breeding grounds for any pests such as mosquitoes.

Management of Solid Wastes and Construction Debris

The contractor shall provide a solid waste management plan that conforms to the national solid waste management policies and regulations and the site-specific ESCMP for approval by the PMU and IFAD (see Appendix 3 for an outline of a site-specific ESCMP). The site's waste management plan shall include a description of waste handling procedures including collection, storage and disposal through the national waste management system. There will be no open burning of waste material and the contractor shall endeavor to recycle wastes as appropriate. Under no circumstances shall the contractor allow construction wastes to accumulate so as to cause a nuisance or health risk due to the propagation of pests and disease vectors.

Management of Workers

The Contractor will prepare a specific Code of Conduct (see Appendix 9) to describe the expected behaviors of their project worker in relation to the local communities and their social sensitivities. This is to avoid creating demand for illegal sex work, avoid SEA/SH and Violence against Children, manage alcohol consumption and avoid the use of illegal substances, and abide by cultural and social norms of the host community. The Contractor is to ensure no children (persons under the age of 18) are hired to work in the project.

The Contractor is to ensure that all overseas project staff undergo a training on the Staff Code of Conduct. Gender based violence and HIV/AIDS and communicable disease awareness raising and resources shall also be provided to all workers. MARD shall provide to the Contractor a list of approved service providers, which shall include recognized NGOs and others for conducting this training.

The Contractor is to stipulate the conditions under which visitors may attend the workers' accommodation, including curfews. The Contractor shall ensure that basic social/collective rest and recreation spaces and activities within the workers accommodation to help minimize the impact that the workers would have on the leisure and recreational facilities of the nearby communities. The Contractor must comply with the Guidelines for Worker's Camps (Appendix 7).

As per guidelines in the ESCMP, the Contractor must ensure that Worker's Camps are located at least 500m from nearby communities and schools (see Appendix 7).

ANNEX 6: GUIDELINES FOR WORKERS' CAMPS

To ensure the compliance to the OHS and ESF requirement, these guidelines will help the contractor when setting up worker's camps.

GENERAL

The Workers Camp Management Plan will be compliant with the specific prescriptions of the site-specific ESCMP. Contractors must ensure that Worker's Camps are located at least 500m from nearby communities and schools.

WORKER RECRUITMENT

The Contractor is required to minimise the number of skilled workers that are recruited from overseas. No unskilled labour will be sourced from overseas. Local communities should be prioritized for unskilled labour, including a target of 15% female unskilled workers when/where applicable. The Contractor will maximize the number of skilled and unskilled workers that are recruited from the communities along the project site.

The Contractor will be required to provide justification for any skilled workers recruited from overseas and explain why this position cannot be filled locally.

WORKERS CAMP FACILITIES

All facilities in the Workers Camp must be complaint with the stipulations of the ESCMP. The camp shall be provided with the following minimum facilities:

- Eating space and dormitories as required shall be constructed of suitable materials to provide a safe healthy environment for the workforce and which facilitate regular cleaning and the provision of ventilation and illumination.
- At least one water closet toilet, one urinal and one shower per 10 personnel engaged either permanently or temporarily on the project. Separate toilet and wash facilities shall be provided for male and female employees, including ensuring that toilets are available close to working sites/road sections where women are working.
- A sick bay and first aid station.
- Sewage collection facilities to allow for the treatment of black and grey wastewater discharge from toilets, washrooms, showers, kitchens, laundry and the like. The management of all camp wastewater water shall be as prescribed in the ESCMP.
- All camp facilities shall be maintained in a safe clean and or appropriate condition throughout the construction period.
- Throughout the period of the contract the employer, the engineer, or their representatives shall have uninterrupted access to and from the camp for the purpose of carrying out routine inspections of all buildings, facilities or installations of whatever nature to ensure compliance with this specification.

WORKERS CAMP OPERATIONS

- The Contractor will be required to provide adequate provisions for the workers for the duration of the project so as not to be a burden on the food or water security of the surrounding communities. The Contractor will strive to hire local labour to provide cleaning and food services.
- All wastewater, solid waste, freshwater usage, noise levels, handling and storage of hazardous materials shall be as prescribed in the ESCMP.

MANAGEMENT OF OFF DUTY WORKERS

- The Contractor will prepare ensure all staff sign and adhere to the Workers' Code of Conduct to describe the expected behaviours of their project worker in relation to the local communities and their social sensitivities.

- The Contractor is to ensure that all overseas project staff, not already living in Cambodia undergo a cultural familiarisation session as part of their induction training. The purpose of this induction will be to introduce the project staff to the cultural sensitivities of the local communities and the expected behaviours of the staff in their interactions with these communities.
- The Contractor is to stipulate the conditions under which visitors may attend the workers camp. Strict visiting hours should be enforced, and all visitors will be required to sign in and out of the worker's camp. No overnight visitors will be allowed.
- The Contractor shall ensure that basic social/collective rest spaces are provided equipped with seating within the Workers Camp to help minimise the impact that the workers would have on the leisure and recreational facilities of the nearby communities. Provisions should also be made to provide the workers with an active recreation space within the camp.

WORKERS CAMP MANAGEMENT PLAN

A Worker Camp Management Plan shall be submitted by the Contractor to the Provincial PMU. The Workers' Camp Management Plan shall describe how this document and the ESCMP shall be implemented in the following:

- Recruitment strategy
- Accommodation
- Canteen and dining areas
- Ablutions
- Water supply
- Wastewater management system
- Proposed power supply
- Code of Conduct for Workers
- Recreational/leisure facilities for workers
- Visitors to the Workers Camp
- Interactions with the local communities

ANNEX 7: CONTRACTORS' COVID-19 GUIDELINE

The objective of the Contractors' General Guideline on COVID-19 Considerations in Construction Works is to provide guidance on Prevention Measures and Response to possible cases of COVID-19 following the update-to-day guidance of the Ministry of Health.

Prevention Measures:

- Dissemination of COVID-19 prevention measures to staff and workers through orientation or distributing leaflet/poster at information/safety board at each construction and camp site
- Daily checking temperature of staff and workers prior to start working
- Staff and workers are wearing masks all the time
- Do not share personal items or supplies such as phones, pens, notebooks, tools, etc
- Avoid common physical greetings, such as handshakes
- Maintain a minimum physical distance of one metre from others if possible
- Wash hands often with soap and water for at least 20 seconds after using the washroom, before handling food, after blowing nose, coughing, or sneezing, and before smoking. If hands are not visibly soiled, and soap and water are unavailable, alcohol-based hand sanitizer can be used
- All offices and jobsites implement additional cleaning measures of common areas. All door handles, railings, ladders, switches, controls, eating surfaces, shared tools and equipment, taps, toilets, and personal workstation areas are wiped down at least twice a day with a disinfectant, such as disinfectant wipes. Individuals are responsible for cleaning and disinfecting their workstations
- Commonly touched surfaces on vehicles and equipment are thoroughly cleaned and disinfected at the end of shifts and between users
- Coughing or sneezing into a tissue or the bend of your arm, not your hand; dispose of used tissues you have as soon as possible in a lined waste basket and wash your hands afterwards
- Complying with any instructions announced by the Ministry of Health

Response to Possible Cases of COVID-19

- Individuals who have been potentially exposed to the virus, or who are exhibiting flu-like symptoms such as fever, tiredness, coughing, or congestion are instructed to:
  - Not come to work;
  - Contact their supervisor and/or human resources department;
  - Stay at home and self-isolate; and
  - Contact local health authorities for further direction.

- Such individuals are required to follow the directions of the local health authority and may not return to work until given approval by the proper health authorities;
- Individuals who begin to display flu-like symptoms on site are instructed to avoid touching anything, take extra care to contain coughs and sneezes, and return home immediately to undergo self-isolation as directed by the local health authority;
- All areas on site potentially infected by a confirmed or probable case are barricaded to keep individuals two meters away until the area is properly cleaned and disinfected.

ANNEX 8: WORKERS' CODE OF CONDUCT

Instructions: This Code of Conduct should be included in bidding documents for the civil works contractor(s) and in their contracts once hired. This Code of Conduct should also be included in bidding documents, and the contracts, of construction contractor. This Code of Conduct is to be signed by all contractor, including subcontractors, if any, including contractors and subcontractors' managers who work under the CAISAR project.

I, _____, acknowledge that adhering to environmental, social, health and safety (ESHS) standards, following the project's occupational health and safety (OHS) requirements, and preventing Sexual Exploitation Abuse (SEA)/Sexual Harassment (SH) is important.

The Contractor/DDIS considers that failure to follow ESHS and OHS standards, or to partake in activities constituting SEA and SH be it on the work site, the work site surroundings, at workers' camps, or the surrounding communities—constitute acts of gross misconduct and are therefore grounds for sanctions, penalties or potential termination of employment. Prosecution by the Police of those who commit VAC, SEA/SH may be pursued if appropriate.

I agree that while working on the project I will:

- Carry out his/her duties competently and diligently;
- Comply with this Code of Conduct and all applicable laws, regulations and other requirements, including requirements to protect the health, safety and well-being of other Contractor's Personnel and any other person;
- Maintain a safe working environment including by:
- Ensure that workplaces, machinery, equipment and processes under each person's control are safe and without risk to health;
- Use appropriate measures relating to chemical, physical and biological substances and agents; and
- Follow applicable emergency operating procedures.
- Report work situations that he/she believes are not safe or healthy and remove himself/herself from a work situation which he/she reasonably believes presents an imminent and danger to his/her life or health;
- Consent to a background check in any place I have worked for more than six months.
- Attend and actively partake in training courses related to ESHS, OHS, VAC, SEA/SH as requested by my employer.
- Will wear my personal protective equipment (PPE) at all times when at the work site or engaged in project related activities.
- Take all practical steps to implement the environmental and social management plan (ESCMP).
- Implement the OHS Management Plan.
- Adhere to a zero-alcohol policy during work activities, and refrain from the use of narcotics or other substances which can impair faculties at all times.
- Treat women, children (persons under the age of 18), and men with respect regardless of race, color, language, religion, political or other opinion, national, ethnic or social origin, property, disability, birth or other status.
- Not use language or behavior towards women, children or men that is inappropriate, harassing, abusive, sexually provocative, demeaning or culturally inappropriate.
- Not sexually exploit or abuse project beneficiaries and members of the surrounding communities.

- Not engage in sexual harassment of work personnel and staff —for instance, making unwelcome sexual advances, requests for sexual favors, and other verbal or physical conduct of a sexual nature is prohibited: i.e. looking somebody up and down; kissing, howling or smacking sounds; hanging around somebody; whistling and catcalls; in some instances, giving personal gifts.
- Not engage in sexual favors —for instance, making promises of favorable treatment (i.e. promotion), threats of unfavorable treatment (i.e. loss of job) or payments in kind or in cash, dependent on sexual acts—or other forms of humiliating, degrading or exploitative behavior.
- Not use prostitution in any form at any time.
- Not participate in sexual contact or activity with children under the age of 18—including grooming or contact through digital media. Mistaken belief regarding the age of a child is not a defense. Consent from the child is also not a defense or excuse.
- Unless there is the full consent[19] by all parties involved, I will not have sexual interactions with members of the surrounding communities. This includes relationships involving the withholding or promise of actual provision of benefit (monetary or non-monetary) to community members in exchange for sex (including prostitution). Such sexual activity is considered "non-consensual" within the scope of this Code.
- Consider reporting through the GRM or to my manager any suspected or actual SEA/SH by a fellow worker, whether employed by my company or not, or any breaches of this Code of Conduct.
- Complete relevant training courses that will be provided related to the environmental and social aspects of the Contract, including on health and safety matters, and Sexual Exploitation, and Sexual Assault (SEA);
- Report violations of this Code of Conduct; and

With respect to children under the age of 18:

- Bring to the attention of my manager the presence of any children on the construction site or engaged in hazardous activities.
- Wherever possible, ensure that another adult is present when working in the proximity of children.
- Not invite unaccompanied children unrelated to my family into my home unless they are at immediate risk of injury or in physical danger.
- Not use any computers, mobile phones, video and digital cameras or any other medium to exploit or harass children or to access child pornography (see also "Use of children's images for work related purposes" below).
- Refrain from physical punishment or discipline of children.
- No hiring of children for any CAISAR project activity (no persons under the age of 18).
- Comply with all relevant local legislation, including labor laws in relation to child labor and World Bank's safeguard policies on child labor and minimum age.
- Take appropriate caution when photographing or filming children (see x-bb below). Photos or films of children should generally not be taken in the CAISAR, except in instances showing the benefits or impacts of road works, such as impacts to schools or school safety trainings.

Use of children's images for work related purposes

When photographing or filming a child for work related purposes, I must:

- Before photographing or filming a child, assess and endeavor to comply with local traditions or restrictions for reproducing personal images.
- Before photographing or filming a child, obtain informed consent from the child and a parent or guardian of the child. As part of this I must explain how the photograph or film will be used.

[19] **Consent** is defined as the informed choice underlying an individual's free and voluntary intention, acceptance or agreement to do something. No consent can be found when such acceptance or agreement is obtained using threats, force or other forms of coercion, abduction, fraud, deception, or misrepresentation. In accordance with the United Nations Convention on the Rights of the Child, the World Bank considers that consent cannot be given by children under the age of 18, even if national legislation of the country into which the Code of Conduct is introduced has a lower age. Mistaken belief regarding the age of the child and consent from the child is not a defense.

- Ensure photographs, films, videos and DVDs present children in a dignified and respectful manner and not in a vulnerable or submissive manner. Children should be adequately clothed and not in poses that could be seen as sexually suggestive.
- Ensure images are honest representations of the context and the facts.
- Ensure file labels do not reveal identifying information about a child when sending images electronically.

Raising Concerns

If any person observes behavior that he/she believes may represent a violation of this Code of Conduct, or that otherwise concerns him/her, he/she should raise the issue promptly. This can be done in either of the following ways:

- Contact [enter name of the Contractor's Social Expert with relevant experience in handling gender-based violence, or if such person is not required under the Contract, another individual designated by the Contractor to handle these matters] in writing at this address [ ] or by telephone at [ ] or in person at [ ]; or
- Call [ ] to reach the Contractor's hotline (if any) and leave a message.

The person's identity will be kept confidential, unless reporting of allegations is mandated by the country law. Anonymous complaints or allegations may also be submitted and will be given all due and appropriate consideration. We take seriously all reports of possible misconduct and will investigate and take appropriate action. We will provide warm referrals to service providers that may help support the person who experienced the alleged incident, as appropriate.

There will be no retaliation against any person who raises a concern in good faith about any behavior prohibited by this Code of Conduct. Such retaliation would be a violation of this Code of Conduct.

Sanctions

I understand that if I breach this Workers' Code of Conduct, my employer will take disciplinary action which could include:

- Informal warning;
- Formal warning;
- Additional Training;
- Loss of up to one week's salary;
- Suspension of employment (without payment of salary), for a minimum period of 1 month up to a maximum of 6 months;
- Termination of employment;
- Report to the Police if warranted.

I understand that it is my responsibility to ensure that the environmental, social, health and safety standards are met. That I will adhere to the occupational health and safety management plan. That I will avoid actions or behaviors that could be construed as VAC or SEA/SH. Any such actions will be a breach this Workers' Code of Conduct. I do hereby acknowledge that I have read the foregoing Workers' Code of Conduct, do agree to comply with the standards contained therein and understand my roles and responsibilities to prevent and respond to ESHS, OHS, VAC and SEA/SH issues. I understand that any action inconsistent with this Workers' Code of Conduct or failure to act mandated by this Workers' Code of Conduct may result in disciplinary action and may affect my ongoing employment.

ANNEX 9: SAMPLE TORS FOR AN ENVIRONMENT & CLIMATE SAFEGUARDS SPECIALIST

BACKGROUND: [This section must include the project background, ideally tailored to the specific PPMU]

OBJECTIVE:

The Environment & Climate Safeguards Specialist will be responsible for the implementation, monitoring, and reporting of all environment and climate-related safeguards for the project. This will include, when relevant, implementation of the project's Grievance Redress Mechanism (GRM), and any items listed in the Environmental, Social, and Climate Management Framework (ESCMF). You will work in close collaboration with the Gender & Social Safeguards Specialist, as well as the project's Monitoring & Reporting specialist. You will report to the lead of the Provincial Project Management Unit.

RESPONSIBILITIES:

- Prepare, implement, and monitor environmental safeguards instruments, including the environmental & climate-risk aspects of ESCMPs and any Biodiversity Management Plans.
- Compile the environmental baseline data for ESCMPs and Biodiversity Management Plans (when applicable) at sub-project sites based on requirements of the Government of Cambodia, IFAD, and GCF
- Identify key issues & ways to manage issues pertaining to the environment and climate.
- Conduct consultations, in collaboration with the Gender & Social Safeguards Specialist, with target communities in the project area to assess the (i) current environmental situation (at local level, this includes peoples' perception of the situation); (ii) environmental & climate-related impacts of sub-projects; and (iii) mitigation measures (including the communities' recommendations/solutions) that can be taken pertaining to any negative environmental/climate impacts
- Obtain data from, sensitize, and clearly explain to relevant government staff (or civil society organizations/partners, etc.) the data, M&E, and compliance requirements for environmental safeguards & climate risk considerations during project implementation.
- Manage, along with the Gender & Social Safeguards Specialist, the project's Grievance Redress Mechanism.

MINIMUM REQUIREMENTS:

- Manage, along with the Gender & Social Safeguards Specialist, the project's Grievance Redress Mechanism.
- Advanced University degree in Environmental Science, Biology, Environmental/Civil Engineering, or any related field.
- Minimum of 5 years of relevant operational experience and proven track record in working agricultural, forest management, and construction activities, including compliance with Environmental and Social standards
- Familiarity with climate science and management of climate risks
- Working knowledge of English and Khmer proficiency.
- National of Viet Nam.

CORE COMPETENCIES:

- Results Focus
- Teamwork
- Communication
- Building Effective Relationships
- Knowledge Sharing and Continuous Improvement

TECHNICAL/FUNCTIONAL SKILLS:

- Work experience in implementation and management of international safeguards standards pertaining to environment, climate, and agroforestry activities.
- Knowledge of issues pertaining to environment, climate, and biodiversity.

- Knowledge of computer-aided design programs, AutoCAD required and Structural Analysis programs.
- Knowledge and understanding of international environmental and social safeguards standards and practices

SELECTION CRITERIA:

- Demonstrated capacity supervise agricultural, forest management, and construction activities, including compliance with Environmental and Social standards
- Demonstrated ability to liaise with multiple agencies and contractors, effectively building an understanding and partnership with other UN bodies, NGOs, government agencies, and contractors
- Ability to plan, organize, implement, and report
- Excellent communication, writing, and presentation skills in English and Khmer
- Teamwork spirit, ability to work under minimum supervision
- Ability to build effective working relationships with national and international colleagues, with different cultural and technical backgrounds
- Proven strong communication, interpersonal and negotiation skills
- Analytical skills and experience.
- Ability to keep sensitive information as confidential.

ANNEX 10: SAMPLE TORS FOR A GENDER & SOCIAL SAFEGUARDS SPECIALIST

BACKGROUND: [This section must include the project background, ideally tailored to the specific PPMU]

OBJECTIVE:

The Gender & Social Safeguards Specialist will be responsible for the implementation, monitoring, and reporting of all environment and climate-related safeguards for the project. This will include, when relevant, implementation of the project's Grievance Redress Mechanism (GRM), and any items listed in the Environmental, Social, and Climate Management Framework (ESCMF). You will work in close collaboration with the Gender & Social Safeguards Specialist, as well as the project's Monitoring & Reporting specialist. You will report to the lead of the Provincial Project Management Unit.

RESPONSIBILITIES:

- Prepare, implement, and monitor social safeguards instruments, including the social aspects of ESCMPs, the Labour Management Plan, and IP Plan.
- Compile the social baseline data for ESCMPs, LMPs, and IP Plans at sub-project sites with information on demographics, ethnic/religious minorities and indigenous populations, overall population, education, health, social protection, language(s), religion, and any other areas required based on IFAD and GCF guidelines
- Identify key issues & ways to manage issues pertaining to gender, IP, and social inclusion.
- Conduct consultations, in collaboration with the Environment & Climate Specialist, with target communities in the project area to assess the (i) current social situation (at local level, this includes peoples' perception of the situation); (ii) social impacts of sub-projects; and (iii) mitigation measures (including the communities' recommendations/solutions) that can be taken pertaining to any negative social impacts
- Obtain data from, sensitize, and clearly explain to relevant government staff (or civil society organizations/partners, etc.) the data, M&E, and compliance requirements for social safeguards & gender/IP/social inclusion during project implementation.
- Manage, along with the Environment & Climate Safeguards Specialist, the project's Grievance Redress Mechanism.

MINIMUM REQUIREMENTS:

- Advanced University degree in Social Sciences, Gender Studies, International Development, or any related field to social inclusion/gender and social safeguards.
- Minimum of 5 years of relevant operational experience and proven track record in working on development projects in the agriculture/forest sector.
- Working knowledge of English and Khmer proficiency.
- National of Viet Nam.

14.

CORE COMPETENCIES:

- Results Focus
- Teamwork
- Communication
- Building Effective Relationships
- Knowledge Sharing and Continuous Improvement

TECHNICAL/FUNCTIONAL SKILLS:

- Work experience in implementation and management of gender and social inclusion activities, and social safeguards to international standards.
- Knowledge of issues pertaining to ethnic minorities, Indigenous Persons, gender, youth, and other vulnerable populations.
- Knowledge and understanding of international environmental and social safeguards standards and practices

SELECTION CRITERIA:

- Demonstrated capacity supervise agricultural, forest management, and construction activities, including attention to issues of gender and social inclusion and compliance with Environmental and Social standards
- Demonstrated ability to liaise with multiple agencies and contractors, effectively building an understanding and partnership with other UN bodies, NGOs, government agencies, and contractors
- Ability to plan, organize, implement, and report
- Excellent communication, writing, and presentation skills in English and Khmer
- Teamwork spirit, ability to work under minimum supervision
- Ability to build effective working relationships with national and international colleagues, with different cultural and technical backgrounds
- Proven strong communication, interpersonal and negotiation skills
- Analytical skills and experience.
- Ability to keep sensitive information as confidential.

ANNEX 11: MISSION 3 LIST OF PARTICIPANTS

MINISTRY OF ECONOMY AND FINANCE(MEF)

1.	1.	Heng Hanglim, Deputy Director, GDR
2.	2.	Khem Sopheamony, Officer, GDR
3.	3.	Huy Cahnnan, Officer, GDR

PMU ADB & WB MOWRAM

1.	4.	H.E Chann Sinath, Secretary of State and Director of PMU-ADB&WB MOWRAM
2.	5.	Im Soursdey, Deputy Director of DFWUC and IAIP Project Manager
3.	6.	Chhim Sophea, Irrigation Engineer
4.	7.	Ngorn Ly Leakina, Officer Administration Office of DoFWUC
5.	8.	Chev Dalis, Procurement Assistant and Officer of DoFWUC
6.	9.	Kim Vann, Finance Officer, DoFWUC
7.	10.	Thou Vannak, Consultant
8.	11.	Lang Sokkim, Vice Chief Officer
9.	12.	Pol Saren, Deputy Director of Department
10.	13.	Tan Naren, Chief of Office
11.	14.	Hem Visal, Vice Chief Officer
12.	15.	Prum Vanndy, Officer
13.	16.	Vann Vathanak, Officer
14.	17.	Eam Sophorn, Officer
15.	18.	Vann Munirath, Officer
16.	19.	Heng Sovannara, Director, TSA
17.	20.	Khvan Pheaktra, Officer, TSA
18.	21.	Tong Seng, Chief of Office, DHRW
19.	22.	Chhun Thai Sreng,PMU
20.	23.	Penh Socheat, National Environment, Consultant Team
21.	24.	Le Anh Tuan, International Social Specialist
22.	25.	Sreng Vanmly, Deputy of Office
23.	26.	Sok KHOM, Deputy Secretary General, CNMC
24.	27.	Roeun Sophanna, Procurement Team

MINISTRY OF ENVIRONMENT (MOE)

1.	28.	Thiv Sophearith, DDG/GDEP
2.	29.	Pech Moran, Deputy Director
3.	30.	Chea Puthea, Official

MINISTRY OF AGRICULTURE,FORESTRY AND FISHERIES (MAFF)

1.	31.	Koeut Kitlineath, Deputy Secretary General
2.	32.	Seng Tuy, Acting Director, DAEng

MINISTRY OF INDUSTRY, SCIENCE, TECHNOLOGY & INNOVATION (MISTI)

1.	33.	Kim Thunsamnang, Deputy Director General
2.	34.	Chhoeun Raksmey, Deputy Diector
3.	35.	Vong Sanin, Technical Officer & Project Management

MINISTRY OF RURAL DEVELOPMENT (MRD)

1. 36. Ong Ponnaka, Deputy Director General
2. 37. Soem Sopheara, Chief Office
3. 38. Se Vophorn, Chief Office

MINISTRY OF WOMEN AFFAIR (MOWA)

1. 39. Sav Kimsoeurn, Deputy Director General
2. 40. Meas ChinVut, Chief Office
3. 41. Phay Chan Makara, Vice Chief Office

MINISTRY OF LAND MANAGEMENT, URBAN PLANNING AND CONSTRUCTION (MLMUPC)

1. 42. CHHIM Sokun, Deputy Director General
2. 43. Meng Sotha, Director

MINISTRY OF PLANNING (MOP)

1. 44. Laing Bolin, Deputy Director

PDWRAM_Kandal

1. 45. Prak LAK, Director of PDoWRAM
2. 46. Hor Sophal, Deputy of PDoWRAM
3. 47. Heng Kearithy, Officer

PDWRAM_Kampong Chhnang

1. 48. H.E PECH KEYMONY, Deputy Governor
2. 49. Dauk BunThon, Director of PDoWRAM
3. 50. Gnin Hun, Director of PDAFF
4. 51. Seing Sokhan, Deputy Governor of Teuk Phos District
5. 52. Lun Pisey, Officer of of PDAFF
6. 53. Pen Sophea, Chief Commune of Svay Chuk
7. 54. Phan Sophalla, Commune Council of Krang Skea
8. 55. Keo Yan, Chief Commune of Krang Skea
9. 56. Sam San, Chief Commune of Tbeng Khpos
10. 57. Ouk Proeung, Chief Commune of Svay
11. 58. Meas Sokea, Commune Clerk
12. 59. Mak Sothearith, Commune Clerk
13. 60. Mong Vath, Chief Commune of Anchanh Rong
14. 61. Seam Senghour, Chief Commune of Prey Moul
15. 62. Khuy Khy, Chief Commune of Prasnoeb
16. 63. Prum Thorn, Chief Commune of Banteay Preal
17. 64. Moeng Visalsok, Chief Commune of Kdol Senchey
18. 65. Mey Sophally, Deputy Governor of Rolea Bier District
19. 66. Phal Sopheap, Deputy Governor of Baribour District
20. 67. Suon Sokha Rithy, Deputy Governor of Samakey Meanchey District

PDWRAM_Kampong Speu

1. 68. Nhanh Cheabhorng, Director of PDoWRAM

PDWRAM_Pursat

1. 69. H.E Khouy Ryda, Chief of Provincial Governor
2. 70. Lay Seth, Deputy Governor
3. 71. Tep Chamroeun, Director of Administration
4. 72. Kang Penghak, Chief Department of Public Work and Transport

5. 73. Hai Thoura, Chief of PDoAFF
6. 74. Keo Vey, Director of PDoWRAM
7. 75. Oum Sokna, Deputy Governor of Ba Kan District
8. 76. Nin Sinath, Deputy Director of PDoRD
9. 77. Sat Tongno, Chief Office
10. 78. Kit Phal, Deputy of PDoWRAM
11. 79. Dos Dara, Commune Council of Rom Lech
12. 80. Lav Sokha, Chief Office of PDoWRAM
13. 81. Mao Minea, Vice Office of PDoWRAM
14. 82. Meng Chhon, Chief Commune of Outa Poung
15. 83. Em Phovibol, Chief Office of PDoE
16. 84. Suong Saravuth, Deputy Director of Administration
17. 85. Nget Seyha, Official
18. 86. Sat Banve, Officer

AIIB

1. 87. Ron Liuingston, Team Leader, SECAP
2. 88. Y. Chan San, Consultant
3. 89. Bo Zhang, Officer
4. 90. Sheikh Naveed Ahmed, Officer
5. 91. Xiang Xu, Officer

CAISAR

1. 92. Anthony Green, Team Leader
2. 93. Srey Heang, Deputy Team Leader

IFAD

1. 94. Frew Behabtu, Country Director
2. 95. Susmita Bandyopadhyoy, Senior SECAP Specialist
3. 96. MENG Sakphouseth, Country Officer
4. 97. Suos Pinreak, Program Specialist

FAO

1. 98. ALESSANDRA GAGE, International Environment Officer

CS-01PMIC

1. 99. Willem J van Diest, Team Leader of PMIC
2. 100. Ung Kotaro, Deputy Team Leader

CS-02 NWRDMC

1. 101. Pen Sarith, Deputy Team Leader
2. 102. IAN Thomas, PPC

CS-03 INDIVIDUAL

1. 103. Yin Phalleap, Finance and Accounting Management Specialist

ANNEX 12: TOR BIODIVERSITY MANAGEMENT SPECIALIST

TERMS OF REFERENCE

International Biodiversity Specialist

Background

The Government of Cambodia (GoC) has applied for financing from the Asian Infrastructure Investment Bank (AIIB or the Bank) toward the cost of the Climate Adaptive Irrigation Supporting Agricultural Resilience (CAISAR) which will support the GoC's efforts to sustain food security and improve climate resilience during and after the COVID-19 crisis through restoration and enhancement of smart and climate-resilient irrigation systems and associated ecosystems, flood control management and disaster resilience measures in 3 irrigation schemes situated in four provinces, namely: Kampong Speu, Kampong Chhnang, Kandal, and Pursat. The development objective of the CAISAR project is to restore and enhance the adaptive capacity and resilience of rural populations and agronomic systems to cope with climate change, including and disaster risk brought on by extreme events (flooding and drought), to achieve increased food security, agro-economics, and the maintenance of the companion biodiversity and ecosystem services that support it.

The estimated budget of the CAISAR project will exceed US 240 Million with AIIB being the major lender but with substantial grant co-financing for Green Climate Fund (GCF) and IFAD. MOWRAM has received a project preparation grant from AIIB (PPSF) for project preparation. The project will be implemented through the following 3 components: 1) Improving farm-level climate resilience and water use efficiency, 2) Climate-proofing water infrastructure for increased resilience and 3) Institutional Strengthening. In 2022/23, under this PPSF grant, MOWRAM implemented a first project formulation and feasibility study (FIRM) to provide the basis for the GCF funding proposal. MOWRAM is now seeking additional TA to complement this FIRM reporting and support the formulation of the Full-Funding Proposal.

General

Based on an assessment of climate change risk analyses, the Biodiversity Consultant will identify and assess the manner in which climate change is likely to impact biodiversity in the project area; with particular attention to species that either support agriculture (e.g. wild fish, birds, pollinators, soil micro-biome,) or conflict with agriculture (e.g. crop pests, displaced wildlife, alien invasive species). The climate and project risks to Threatened species existing in the project area would also be assessed and potential mitigation responses identified. This analysis will be used to generate a number of practical and cost effective recommendations to be included in a Biodiversity Management Plan.

The Consultant will also work in collaboration with the multidisciplinary CAISAR team to help identify biodiversity risk to and opportunities associated with proposed project agricultural interventions/adaptive solutions and to provide timely recommendations for their more sustainable design, selection, implementation, monitoring and associated local, inclusive, capacity building.

The Consultant will also provide guidance related to consideration, selection and development of biodiversity offsets where unavoidable residual impacts associate with proposed project interventions, can be offset and in some cases applied to Kunming declaration objectives.

The analysis will prioritize biodiversity mitigation and management programs based on their relevance and cost-effectiveness, to address the risks and opportunities associated with climate change and project initiatives. The prioritization exercise would include consideration of opportunities to adaptively enhance and benefit from the cultivation of local heirloom genetic varieties, wild cultivars and potential enhanced propagation of more resilient native fish and potential other faunal species. To the extent possible, solutions that are adapted to the needs of the poor, women, youth, and indigenous groups should be highlighted.

To achieve the above objective with high quality deliverables, the international climate change biodiversity specialist is required to fulfil the following tasks and responsibilities:

1. *Describe the methodology, location time and costs for a series of strategic biodiversity surveys within the CAISAR project study area to validate and expand on the existing IBAT data set. The data collected will provide baseline data against which project intervention, project impact and climate driven change can be monitored. These data will provide essential information that can be used to apply adaptive management practices to ensure project initiatives optimize positive biodiversity and ecosystem service outcomes.*

   ***Deliverable**: Guidance document detailing methodology to be used for biodiversity surveys.*

2. *Identify species of flora and fauna, including threatened and invasive species in the project area, most likely to be impacted by Climate change, climate extremes and expansion of agriculture, including CAISAR projects, as well as species used by local communities and or, on which there are dependencies.*

   ***Deliverable**: **prioritized flora and fauna species list** with summary data on species habitat associations, conservation status, record of occurrence in the project area, probable key habitats, population trends, population drivers, and assessment of climate risk to species*)

3. *Prepare a high-level/landscape-level? Biodiversity Management Plan (BMP) addressing each of the 6 CAISAR sub-project areas. The BMP will highlight species and habitats of concern, and Identify potential approaches to deliver positive environmental externalities (e.g. air quality, soil, water quality and availability, ecosystem services, biodiversity) that can be incorporated into CAISAR initiatives. CAISAR BMP will include guidance for the assessment of residual biodiversity impacts, provision for adaptive management, monitoring requirements, and development of site-specific Biodiversity Action Plans.*

   Deliverable: CAISAR Landscape Level BMP

4. *Refine biodiversity sensitivity mapping based on available data and make this available to the CAISAR planning and design process.*

   ***Deliverable: refined biodiversity sensitivity map** for the CAISAR project area and each of the 6 sub-project areas)*

5. *Prepare a community biodiversity survey questionnaire to better understand biodiversity trends, perceived drivers, local use and community perspectives on biodiversity conservation and local importance in the CAISAR study area/area of influence. A detailed methodology, including questions, target communities, time and costs estimate would be prepared.*

   ***Deliverable: Local Biodiversity Knowledge Questionnaire and Survey Guidance document**.*

6. *Identify key biodiversity stakeholders to be engaged while identifying biodiversity conservation priorities and concerns, development of biodiversity management/action plans, and residual impact biodiversity offsets,*

   ***Deliverable: Biodiversity Stakeholders List and contact information**)*

7. *Identify potential priority biodiversity offset locations and site management requirements based on site analysis and consultation with government and community authorities.*

   ***Deliverable: List of priority biodiversity offset sites** proximate to each of the 6 CAISAR project areas that would be more suitable and relevant for the development of biodiversity offsets.*

8. *Integrate biodiversity initiatives into the overall CAISAR stakeholder engagement plan identifying the relevant stakeholder groups and the engagement process to be followed.*

   ***Deliverable: Specific reference to biodiversity in the CAISAR stakeholder Engagement Plan**.*

9. *Work collaboratively and cooperatively with the CAISAR multi-disciplinary team to ensure biodiversity conservation and enhancement is practically integrated into project planning, design elements and companion documentation.*

Deliverable: Reference to biodiversity considerations where appropriate in CAISAR assessments, design, execution, and reporting*.*

10. *Ensure the biodiversity component of the CAISAR project provides for local, inclusive, capacity building where practical and appropriate.*

    Deliverable: specific reference to opportunities for engagement of a broad cross section or local society in biodiversity-related initiatives *and documentation of participants in same.*

Key Deliverables

The main task of the International Climate Change Adaptation Biodiversity Specialist (CCABS) will be to provide discipline input to the Full Funding Proposal and the associated Annexes based on the guidance given in GCF's programming manual. With regard to biodiversity, the GEF programming manual highlights the following considerations:

1. "*The project/programme is expected to promote positive* ***environmental externalities*** *(e.g. air quality, soil*)". The CAISAR biodiversity specialist is expected to help ensure the project delivers enhanced ecosystems services to the intervention area.
2. "*Since project activities often target multiple areas and provide multiple benefits (e.g. co-benefits from improved agricultural productivity,* ***biodiversity conservation benefiting from improved ecosystems management****), additional financial contributions from other donors should be sought, where possible."*
3. "*The excessive development of land for agriculture worldwide has impacted the Earth's climate by reducing the carbon stored in intact forests, and has caused* ***biodiversity and ecosystem service losses***." The CAISAR biodiversity specialist is expected to strive to ensure the project results in a net improvement in local ecosystems services as a result of the project.
4. "*As may be required by specific environmental and social safeguards, the Environmental and Social Policy and the Indigenous Peoples Policy, additional stand-alone assessment and management plans may need to be prepared and disclosed. Examples of additional instruments include: a resettlement policy framework, resettlement action plan, Indigenous peoples planning framework, Indigenous peoples plan, and* ***biodiversity action plan*****"**

Consultant qualifications

Environmental specialist with a minimum Masters level degree in applied environmental science with expertise in biodiversity, biodiversity management and action plans, conservation biology and environmental planning. The consultant should have at least 10 years related experience, be comfortable working in a multi-disciplinary and cultural environment as well have working experience in South Asia. The consultant should have completed at least 5 previous biodiversity management plans and have recent experience with critical habitat assessment.

Duration: 60 working days from mid-June to mid-September 2023.

Location: Phnom Penh, Cambodia with field visits in lower Tonle Sap basin.

ANNEX 13: CAISAR CLIMATE CHANGE IMPACT RATIONAL

Project activity	Description and promotion strategy in the project	specific practice	adaptation or mitigation	Primary climate benefits	Climate rational (primary impact)	Climate rationale (secondary impact	Climate co primary is a prim
Component 2. Upgrading and climate-proofing water infrastructure for increased resilience							
Outcome 2.1. Modernization of irrigation scheme and ponds							
2.1.1.Technical analysis, field survey and preparing plan for system upgrading	This activity involves conducting a technical analysis and field survey of the existing irrigation system. The purpose is to identify areas that require upgrading or rehabilitation and to assess the feasibility of constructing new irrigation schemes and storage ponds. The promotion strategy will likely involve engaging farmers and stakeholders in the survey process to ensure a participatory approach. The findings from the analysis will be used to prepare a comprehensive plan for upgrading the irrigation system.	The specific practices under this sub-component include: o Rehabilitating and upgrading existing irrigation schemes. o Constructing new irrigation schemes and storage ponds where feasible and appropriate. o Deploying ecosystem-based solutions that better serve the environment. o Implementing energy-efficient measures to reduce greenhouse gas (GHG) emissions. o Utilizing high-efficiency irrigation systems like drip and sprinkler irrigation to minimize water losses. o Replacing current diesel pumps with single-point solar pumping systems. o Integrating nature-based solutions and Indigenous materials for constructing flood protection embankments.	The specific practices listed above include both adaptation and mitigation measures: o Adaptation: Upgrading and modernizing irrigation systems, establishing early warning systems, and flood-proofing infrastructure to cope with increasing flood and drought conditions. o Mitigation: Deploying energy-efficient irrigation technologies, replacing diesel pumps with solar pumps, and utilizing nature-based solutions to reduce GHG emissions.	The primary climate benefits of these practices are: o Improved resilience of the water delivery system, reducing damage to crops and infrastructure during extreme wet days and upstream flooding. o Enhanced climate adaptation through climate-proofing measures, allowing the irrigation system to cope with changing climate conditions.	The climate rationale or primary impact is to ensure a climate-resilient water supply for farmers. The project aims to reduce the negative climate impacts of droughts, dry spells, and flood during the monsoon season by upgrading the irrigation system and implementing climate-adaptive measures.	The secondary impact is the creation of green opportunities and additional benefits, such as: oIncreased water availability and storage capacity for irrigation. o Implementation of crop diversification and new income-generating activities like fish farming or duck breeding. oCreation of employment opportunities, especially for young people. o Time and labor savings, particularly for women, through the use of efficient irrigation technologies.	The Climate co-b o Mitigation: Red the use of en solar pumping, an o Adaptation: Im infrastructure, le coping with extrem
2.1.2.Implementation of infrastructure upgrading	Sub-Component 2.1.2 involves the actual implementation of infrastructure upgrading activities identified in the technical analysis and plan prepared in Sub-Component 2.1.1. The upgrading process may include rehabilitating existing irrigation systems, modernizing infrastructure, and constructing new irrigation schemes and storage ponds as required. The promotion strategy is likely to focus on engaging stakeholders, including farmers, in the implementation process to ensure their active participation and buy-in.	Specific practices under this sub-component include: o Executing the rehabilitation and modernization plans for irrigation systems and infrastructure. o Constructing new irrigation schemes and storage ponds according to the prepared plans. o Utilizing climate-proofing measures to enhance the resilience of the irrigation system against extreme weather events. o Implementing engineering techniques and nature-based solutions to ensure the long-term sustainability of the upgraded infrastructure.	The specific practices listed above are primarily adaptation measures aimed at: o Enhancing the resilience of the irrigation system to cope with increasing flood and drought conditions. o Reducing the damage and destruction of irrigation infrastructure during extreme weather events.	The primary climate benefits of Sub-Component 2.1.2 are: oImproved climate resilience of the irrigation system, ensuring consistent water delivery to farmers. oMinimized damage to crops and infrastructure during flood and drought events.	The climate rationale or primary impact is to ensure a climate-resilient water supply for farmers by implementing infrastructure upgrades and modernization to withstand the impacts of changing climatic conditions.	The secondary impact is the creation of green opportunities and additional benefits, including: oIncreased water availability and storage capacity for irrigation purposes. o Potential for crop diversification and income generation through alternative farming activities. o Employment opportunities, especially for young people involved in the implementation and maintenance of the upgraded infrastructure.	The Climate co-b oMitigation: Poten through the use o systems and ec techniques. oAdaptation: Impr water infrastructur events.
2.1.3.Preparing canal O&M plans including application of ICT and SCADA for operation. The implementation will follow a participatory approach involving farmers right from survey, design, prioritization, and construction implementation. This subcomponent will be financed by GCF, IFAD and Government. Moreover, these technologies will allow to save time and labour, especially for women, and offer opportunities to engage rural youth.	Sub-Component 2.1.3 involves the preparation of Operation and Maintenance (O&M) plans for the upgraded irrigation canals and systems. This includes integrating Information and Communication Technology (ICT) and Supervisory Control and Data Acquisition (SCADA) systems for efficient operation. The promotion strategy may involve raising awareness among stakeholders about the benefits of adopting ICT and SCADA technologies to optimize water management and ensure effective maintenance.	Specific practices under this sub-component include: oDeveloping comprehensive O&M plans for the upgraded irrigation canals. oIncorporating ICT and SCADA systems for real-time monitoring and control of water flow and distribution. oUtilizing modern technology to optimize water allocation and minimize water losses. oTraining personnel in the operation and maintenance of the new systems.	The specific practices listed above are primarily adaptation measures aimed at: oEnhancing the resilience of the irrigation system through efficient water management. oCoping with changing climate conditions and reducing vulnerability to extreme weather events.	The primary climate benefits of Sub-Component 2.1.3 are: oImproved water efficiency and reduced water losses through advanced monitoring and control systems. oIncreased climate resilience of the irrigation infrastructure through effective O&M practices.	The climate rationale or primary impact is to ensure the sustainable and climate-resilient operation of the irrigation system through the adoption of modern technologies and efficient water management practices.	The secondary impact includes: oEnhanced water resource management and allocation. oImproved agricultural productivity through optimized water distribution. oReduction of maintenance costs and increased system longevity.	The Climate co-b oMitigation: Redu energy consumpti management and technologies. oAdaptation: Impr irrigation infrastru coping with chang
Outcome 2.2: Flood-proofing and Drainage improvements							
2.2.1.Establish flood monitoring, information, and early warning systems.	Sub-Component 2.2.1 involves the establishment of flood monitoring, information, and early warning systems. This includes setting up mechanisms to monitor weather conditions, water levels, and other relevant data to detect potential floods. The promotion strategy may involve raising awareness among stakeholders about the importance of early warning systems, training local communities to respond to flood warnings, and ensuring effective dissemination of flood-related information.	Specific practices under this sub-component include: oInstalling flood monitoring equipment and sensors in vulnerable areas. oSetting up a system to collect and analyze meteorological and hydrological data. oDeveloping protocols for issuing flood warnings and disseminating information to affected communities.	The specific practices listed above are primarily adaptation measures aimed at: oEnhancing disaster prevention and protection of farmlands and assets by providing early warnings to vulnerable communities.	The primary climate benefits of Sub-Component 2.2.1 are: oImproved disaster preparedness and reduced vulnerability to flood events through early warning systems. oEnhanced ability to respond proactively to potential flood situations.	The climate rationale or primary impact is to strengthen flood preparedness and response capacities to cope with the increasing threat of floods under changing climate conditions.	The secondary impact includes: oReduction of damages to farmlands and assets due to improved flood protection measures. oEnhanced safety and well-being of vulnerable communities through timely flood warnings.	The Climate co-b oMitigation: Poten property damage which enable pro management. oAdaptation: Impr climate-related flo vulnerable comm
2.2.2.Strengthening and construction of flood control and drainage infrastructures. It will be implemented in an integrated manner with component 2.1 activities as required. The climate information and early warning activities will be strengthened as part of component 3 and are detailed in that section	Sub-Component 2.2.2 focuses on strengthening and constructing flood control and drainage infrastructures. The project will prioritize areas identified as flood-prone based on hydrological modeling and stakeholder consultation. The promotion strategy may involve community engagement and participation in the planning and implementation of flood control measures.	Specific practices under this sub-component include: oStrengthening existing drainage networks through excavation and widening. oConstructing new flood protection embankments using resilient indigenous materials and nature-based solutions. oInstalling sub-surface drainages in needy areas to improve water drainage.	The specific practices listed above are primarily adaptation measures aimed at: oEnhancing the resilience of the drainage networks and flood embankments to protect farmlands and assets from flood events.	The primary climate benefits of Sub-Component 2.2.2 are: oImproved flood protection and drainage infrastructure to minimize damages during flood events. oIncreased resilience of the irrigation system against intensifying flood threats under changing climate conditions.	The climate rationale or primary impact is to strengthen flood protection measures and improve drainage systems to cope with the increasing frequency and intensity of floods resulting from climate change.	The secondary impact includes: oEnhanced protection of agricultural lands and infrastructure from flood damages. oImproved water management and reduced flood-induced risks for farmers.	The Climate co-b oMitigation: Utiliz and resilient mate measures can co and reduce emiss methods. oAdaptation: Incr system and farml flood events.
Outcome 2.3.: Establishments and training of Farmers Water User Communities (FWUC)							
2.3.1.Formation of institutional strengthening of the FWUC	Sub-Component 2.3.1 focuses on forming and strengthening Farmers Water User Communities (FWUCs). FWUCs play a crucial role in the sustainable operation and maintenance of irrigation schemes. The promotion strategy may involve encouraging community participation, providing training in FWUC management, and promoting inclusivity in decision-making processes.	Specific practices under this sub-component include: oEstablishing new FWUCs and strengthening existing ones. oImproving capacities in O&M activities, water use efficiency, and green technology adoption. oEnhancing the arrangement of water rights and water allocation to promote equitable and efficient water use.	The specific practices listed above are primarily adaptation measures aimed at: oStrengthening institutional capacity to effectively manage and operate the irrigation system. oPromoting sustainable water use practices and climate adaptation strategies among farmers.	The primary climate benefits of Sub-Component 2.3.1 are: oEnhanced sustainability and long-term operation of the climate-smart and climate-proof irrigation systems. oImproved capacity of FWUCs to cope with climate-related challenges and implement climate adaptation strategies.	The climate rationale or primary impact is to ensure the sustainable operation and maintenance of the irrigation system under changing climate conditions through the establishment and strengthening of FWUCs.	The secondary impact includes: oImproved water use efficiency and equitable water allocation. oIncreased capacity of farmers to adopt climate-smart practices and technologies.	The Climate co-b oMitigation: Adop sustainable practi reduced emission oAdaptation: Incr system through ef adaptation strateg
2.3.2 Build technical capacities of FWCU for canal O&M	Sub-Component 2.3.2 focuses on building the technical capacities of Farmers Water User Communities (FWUCs) in canal operation and maintenance (O&M). The project will provide training and support to FWUC members to effectively manage and operate the irrigation canals. The promotion strategy may involve conducting training sessions, workshops, and capacity-building programs for FWUC members to enhance their technical skills.	Specific practices under this sub-component include: oConducting technical training for FWUC members on canal O&M. oEquipping FWUCs with the necessary knowledge and skills for efficient water distribution and maintenance. oImplementing best practices in water resource management.	The specific practices listed above are primarily adaptation measures aimed at: oStrengthening the capacity of FWUCs to cope with changing climate conditions and efficiently manage water resources.	The primary climate benefits of Sub-Component 2.3.2 are: oEnhanced climate resilience of the irrigation system through improved canal operation and maintenance. oIncreased efficiency in water distribution, reducing water losses during irrigation.	The climate rationale or primary impact is to empower FWUCs with the technical skills needed to effectively manage the irrigation system under changing climate conditions.	The secondary impact includes: oImproved water use efficiency and reduced water wastage. oEnhanced agricultural productivity through efficient water distribution.	The Climate co-b oMitigation: Effici reduced water los contributing to low oAdaptation: Incr irrigation system practices.
2.3.3prepare long term financing plan for WUAS: This will require an identification of the capacity needs, membership, functionality of the FWUCs in the area . This will be followed by assisting them in developing a business model for the operation and maintenance of each irrigation scheme on a self-sustaining basis in partnership with the private sector. This will entail the development of an O&M plan for the infrastructure investments, assessment of the willingness and ability of the users to pay for the services and a regulatory framework that gives the WUAs the authority to collect the fee and assess the basis on which water fee will be paid as irrigation fees can be based on the size of the land being irrigated or the volume of water used. These elements will be further reviewed during the preparation of the FFP.	Sub-Component 2.3.3 involves preparing a long-term financing plan for Water User Associations (WUAs). This plan will outline the financial resources required for the sustainable operation and maintenance of the irrigation system. The promotion strategy may involve working with relevant stakeholders, including private sector partners, to develop a financially viable plan.	Specific practices under this sub-component include: oIdentifying the financial needs of WUAs for irrigation system operation and maintenance. oAssessing the willingness and ability of users to pay for irrigation service. oDeveloping a regulatory framework for water fee collection.	The specific practices listed above are primarily adaptation measures aimed at: oEnsuring the long-term sustainability of the irrigation system by securing adequate financial resources.	The primary climate benefits of Sub-Component 2.3.3 are: oIncreased financial resilience of WUAs to cope with climate-related challenges in the operation and maintenance of the irrigation system. oEnhanced capacity to sustainably manage the irrigation infrastructure under changing climate conditions.	The climate rationale or primary impact is to develop a long-term financing plan that enables WUAs to effectively manage and maintain the irrigation system in the face of climate-related risks.	The secondary impact includes: oImproved financial sustainability of the irrigation system. oEnhanced capacity of WUAs to invest in climate-resilient infrastructure and technologies.	The Climate co-b oMitigation: Finan more likely to in friendly irrigation t emissions. oAdaptation: Incr climate impacts th financing.

Definitions

Disadvantaged individuals/groups

Refers to individuals or groups who, due to certain own circumstances such as their age, gender, disabilities, health, economic and ethnic status, and so forth, are more likely affected adversely by the project impacts and/or more limited in their ability to take advantage of project benefits. Disadvantaged individuals/groups are more likely excluded from, or unable to participate fully in the mainstream consultation process. Thus, they may require specific assistance to stay engaged during project planning and implementation. In this project, disadvantaged individuals/ groups are defined as those who have the following characteristics: i) from an ethnic group, (ii) landless/ limited productive land, (iii) female headed household with dependents, (iv) frequent lack of male labor at home (e.g. migrant workers); (v) jobless, or limited economic opportunities; (vi) family member(s) with chronic illness, or disabilities; (vii) elderlies who live on their own; (viii) youth, particularly very young couple with children (early marriage), (ix) live in an especially difficult circumstance, and (x) don't meet above criteria but are concurred by local community as vulnerable to poverty and need project's support to reduce their vulnerability. Disadvantaged individuals are usually from a poor, or a near poor household.

Environmental and social risk

Environmental (including climate change and natural disasters) and social risks are determined by a combination of project design and operational characteristics, together with exogenous factors, which: (i) may adversely affect the ability of a project to achieve and sustain its development objective(s); and (ii) define the nature, scale and significance of direct and indirect environmental and social impacts.

Free, Prior, and Informed Consultation (FPICon)

According to ESS 3 of AIIB's ESF, FPICon is established as follows:

- The scope of FPICon applies to project design, implementation arrangements and expected outcomes related to risks to, and impacts on, the affected Indigenous Peoples;
- FPICon builds on the process of meaningful consultation and requires good faith negotiation between the Client and the affected Indigenous Peoples;
- The Client documents: (a) the details of the process by which the support of the affected local indigenous communities will be determined, in a written consultation process agreement with these communities; and (b) the details of the Project-related matters on which their broad community support has been obtained, in a consultation statement, which includes all agreements reached as well as dissenting views; and
- FPICon does not require unanimity and may be achieved even when individuals or groups within or among these affected Indigenous Peoples explicitly disagree with support for the Project.

Inclusion

Inclusion means empowering all people to participate in, and benefit from, the development process. Inclusion encompasses policies to promote equality and nondiscrimination by improving the access of all people, including the poor and disadvantaged, to services and benefits such as education, health, social protection, infrastructure, affordable energy, employment, financial services and productive assets. It also embraces action to remove barriers against those who are often excluded from the development process, such as women, children, persons with disabilities, youth and minorities, and to ensure that the voice of all can be heard.

Indigenous Peoples

According to the AIIB's Environment and Social Framework, the term "Indigenous Peoples" is used in a generic sense to refer exclusively to a distinct social and cultural group possessing all the following characteristics – in varying degrees:

- Self-identification as members of a distinct indigenous social and cultural group and recognition of this identity by others; and
- Collective attachment[1] to geographically distinct habitats, ancestral territories, or areas of seasonal use or occupation, as well as to the natural resources in these areas; and
- Customary cultural, economic, social, or political institutions that are distinct or separate from those of the mainstream society or culture, and
- A distinct language or dialect, often different from the official language or languages of the country or region in which they reside.

According to IFAD's SECAP, IPs are defined as follows:

- Priority in time, with respect to occupation and use of a specific territory;
- The voluntary perpetuation of cultural distinctiveness, which may include aspects of language, social organization, religion and spiritual values, modes of production, laws and institutions;
- Self-identification, as well as recognition by other groups, or by state authorities, as a distinct collectivity; and
- An experience of subjugation, marginalization, dispossession, exclusion or discrimination.

According to GCF's Indigenous People Policy, IPs are defined as follows:

- Self-identification as members of a distinct indigenous social and cultural group and recognition of this identity by others;
- Collective attachment to geographically distinct habitats, ancestral territories, or areas of seasonal use or occupation as well as to the natural resources in these areas;
- Customary cultural, economic, social, or political systems that are distinct or separate from those of the mainstream society or culture; and
- A distinct language or dialect, often different from the official language or languages of the country or region in which they reside. This includes a language or dialect that has existed but does not exist now due to impacts that have made it difficult for a community or group to maintain a distinct language or dialect.

Information disclosure

[1] Collective attachment means that for generations there has been a physical presence in and economic ties to land and territories traditionally owned, or customarily used or occupied, by the group concerned, including areas that hold special significance for it, such as sacred sites.

The process of disseminating project information to stakeholders to allow them to understand the risks and impacts of the project, and potential opportunities. Information disclosure should be in line with the project's Stakeholder Engagement Plan which is in line with the requirements of the ESF of AIIB, SECAP of IFAD, and Information Disclosure Policy of GEF. It is required that the disclosure of project information include: (a) purpose, nature and scale of the project; (b) duration of proposed project activities; (c) environmental and social risks and potential impacts of the project on local communities, particularly the vulnerable/disadvantaged groups and proposed mitigation measures; (d) proposed stakeholder engagement process highlighting approach that will be taken to promote meaningful participation of project affected persons; (e) time and venue of proposed public consultation meetings, and the process by which meetings will be notified, meeting results summarized, and reported back to project stakeholders; and (f) process and means by which grievances can be received and addressed timely.

Meaningful consultation

Two-way process that (a) begins early in project planning process to gather initial views on project proposal and inform project design; (b) encourages stakeholder feedback, particularly as a way of informing project design and engagement by stakeholders in the identification and mitigation of environmental and social risks and impacts; (c) continues on an ongoing basis, as risks and impacts arise; (d) is based on prior disclosure and dissemination of relevant, transparent, objective, meaningful and easily accessible information in a timeframe that enables meaningful consultation with project stakeholders in a format culturally appropriate, and in relevant local language(s) and is understandable to stakeholders; (e) considers and responds to feedback; (f) supports active and inclusive engagement with project-affected parties; (g) is free of external manipulation, interference, coercion, discrimination, and intimidation; and (h) is documented and disclosed by the Government.

Vulnerable individuals /groups

Refers to individuals/groups who, by virtue of factors beyond their control, are: (a) more likely to be adversely affected by the Project's environmental and social impacts; (b) more likely than others to be limited in their ability to claim or take advantage of Project benefits. Such individuals or groups are also more likely to be excluded from or unable to participate fully in the mainstream consultation process and may require specific measures or assistance (or both) to do so.

Based on the results of the vulnerability assessment conducted for the project, vulnerable individuals/groups need differentiated mitigation measures to cope with project's adverse impacts (e.g. loss of productive land/ income source), take advantage of project's intended benefits, and fully participate in meaningful consultation process during project design, implementation, and operations. Therefore, under this project, the following groups are considered vulnerable under this project: (i) poor[2] and near-poor[3], (ii) female headed households with dependents; (iii) households from Indigenous Peoples or Ethnic Minority group that meet the definitions of Indigenous Peoples of AIIB, IFAD, and GCF, (iv) households headed by an elderly, or a disabled person with no regular income, (v) household having at least a family member with chronic illness that needs regular medical treatment.

[2] The poor are those who a) live below the poverty line (which is KHR 10,951 per person per day as defined by the World Bank for Cambodia), or b) have IDPoor 1 (very poor) or IDPoor 2 (poor).

[3] The near-poor are those whose daily per capita consumption lies between poverty line and 1.25 times the poverty line – as proposed by the World Bank. Near-poor households also have not only lower income per capita but also less diversified incomes than non-poor households (cf. WB 2022, Cambodia Poverty Assessment – Toward A More Inclusive and Resilient Cambodia).

Executive Summary

This Executive Summary summarizes the main points in the project's Indigenous Peoples Planning Framework (IPPF) which was prepared by the Ministry of Water Resources and Meteorology. This IPPF will be applied to all activities that will be carried out under the CAISAR. This IPPF is a living document which may be updated as required during project implementation. If updated, the latest IPPF version will be disclosed through the same channels.

Project Development Objective and Project Components

The project objective is to increase climate adaptation, mitigate the negative impact of extreme climate events, and improve livelihoods of smallholder farmers and vulnerable rural communities in four provinces: Pursat , Kampong Chhnang, Kampong Speu, and Kandal.

The project will be implemented through various activities organized through the following three components:

- Component 1. Improving farm-level climate adaptation, resilience, and water use efficiency
- Component 2. Upgrading and climate-proofing water infrastructure for increased resilience
- Component 3. Institutional strengthening

Purpose of the Indigenous Peoples Planning Framework

This framework is a guide to screening, assessment, and planning, including an arrangement of the outline of culturally appropriate and meaningful consultations with Indigenous peoples, conducting social impact assessments (SIA) and preparation of the IPP that pertains to any specific subproject. The purpose of this Indigenous Peoples Planning Framework (IPPF) is to set out the requirements of the AIIB's ESS3 on Indigenous Peoples and the IFAD's SECAP Standard 4, and the RGC's policy on development of Indigenous Peoples. Based on the gaps between the AIIB's ESS3, IFAD's SECAP Standard 4, and RGC's policies, measures are proposed to close the gaps through implementation arrangements, procedures, design criteria, etc. to be applied to all subprojects and project components that were confirmed during project preparation and will be identified during project implementation.

Gaps between National Policies & Donor's Environmental and Social Policies

Despite the fact that Cambodia has a policy that recognizes the rights of IPs to culture, education, justice, health, environment, land, agriculture, water resources and infrastructure among others, there are no decrees, sub-decrees or procedures for specific safeguards to protect the interest of IPs, other than those related to land or forestry. The Cambodia Land Law does recognize the right of indigenous communities in Cambodia to own immovable property - their land - with collective title. However, in practice, the procedure to register collective title can be very time consuming and only a few indigenous communities have received collective title since the Land Law was enacted in 2001. Similarly, the Forest Law also guarantees and recognizes the right of IPs to continue the use and access to certain forest areas that they traditionally use and practice.

Overall, there is an acceptable level of consistency between the government system, the AIIB'ESS and the IFAD standards on IPs. The self-identification process of indigenous communities defined in the national

policy is broadly consistent with international good practice. The national framework does not exclude communities who have become more mainstream, and indigenous communities may apply for legal status regardless of whether or not they still use their own language or practice traditional agriculture.

However, while there are some complementary links between Cambodian laws and regulations related to IPs and the ESS 3, there are no sufficiently detailed regulations or operating procedures to facilitate full implementation of the IPPs. Therefore, this IPPF has been prepared on the basis of the ESS 3 by considering relevant Cambodian policies and regulations. The IPPF also outlines the Grievance Redress Mechanism (GRM), based on the GRM that is used for the Project, which will need to be further refined in consultation with IPs, if any are found to be residing at any subproject sites.

Project's Environmental and Social Risk and Impacts

The project will bring about an overall positive impact to local farmers. In subproject where IP peoples have farmland in the command area, these IPs will benefit from improved irrigation, water supply, government's agricultural extension services, and services from local farmers' cooperatives. As IPs participate in project activities, particularly agricultural extension services, they can grow more crops, participate in value chain, increase income, and eventually improve their livelihoods. Reliable water access and promising farming opportunities thanks to improved irrigation and extension services also keep the poor, including the poor IPs, from migrating to other areas in search for income generation opportunities. Adverse impacts on IPs are foreseen. However, these impacts are mostly local, small-scaled, such as minor land acquisition in some subproject to allow construction of irrigation canal. Land impacts would be very small at household level (e.g. loss of strip of land) which would not affect the livelihoods of the IP remarkably.

During subproject construction and operation, there are a number of environmental and social risks that may apply to local people, including IP peoples who may happen to be present in a subproject area. Environmental and social risks and impacts that have been identified during project preparation have been discussed in consultation meetings with a) IP peoples who are present in subproject area, and b) other project stakeholders at commune, district, provincial and central level. These consultations aim to ensure potentially affected people, and relevant project stakeholders, are aware of such risks and stay engaged during subproject preparation and implementation for risk prevention and mitigation (Please see full list of social and environmental risks in the project's ESCMF (Section E&S Risks and Impacts) that may apply to any ethnic minorities who are present in subproject area. See also SEP, particularly section (Proposed Strategy for Consultation with Vulnerable/Disadvantaged Groups) for guidance on conducting consultation with IPs when IPs are present in the subproject area.

Mitigation Measures

Although above risks and impacts will be validated, and assessed at further length when subproject locations become known, IP(s) in a subproject's area may be affected disproportionately compared to the mainstream group. The distinctive cultural and socioeconomic characteristics of the IPs, including their existing livelihoods, etc. may expose IPs to further risks and impacts, increase their vulnerability and compromise their ability to respond to such risks and impacts – if a holistic approach is not in place. Effective communication, such as IEC, and active participation of involved IPs, are among important factors that contribute to effective engagement of IPs for meaningful consultation during subproject preparation and participatory monitoring during subproject implementation. The coordination of project stakeholders, including PMU, Contractors, local authorities, local agencies, local service providers, and

most notably the active and full participation of IPs, collectively contribute to minimizing identified risks and potential impacts at identified subprojects.

Detailed mitigation measures for the above risks and potential impacts are proposed in the project's ESCMF. These mitigation measures are specific for design stage, pre-construction stage, construction stage, and operation stage,

Purpose of Engaging IP during project preparation and implementation

The AIIB's ESF defines stakeholder engagement as a process of identifying relevant stakeholders, conducting stakeholder analysis, and organizing a series of consultations to meet with project stakeholders for collecting stakeholders' feedback and concerns on project's risks and impacts, as well as stakeholders' development needs in relation to project purposes and activities. This aims to ensure the project's adverse impacts on IPs can be avoided, or minimized and mitigated if avoidance is not possible. For this project, it is important that IPs need to be consulted on their development needs (in relation to project purposes) to ensure they can receive socioeconomic benefits that are appropriate to them culturally.

Information Disclosure

Prior to conducting consultations, MoWRAM will notify the concerned IPs of the consultation plan during preparation. MoWRAM will provide affected IPs with initial subproject information in the form of booklet in both Khmer and local language (if applicable). This initial information should be provided to IP at least two weeks prior to consultation. If the concerned IPs do not have a written language, the IP will be provided the information in Khmer and are explained verbally in the local language of the concerned IP to ensure the IP are fully informed of the consultation purpose and initial subproject information.

> For public consultation, the draft IPPF (in English) and its Executive Summary (in Khmer) was (should be?) disclosed on MoWRAM's website on XXX (https://www.). The Executive Summary (in Khmer) was also disclosed in hard copy at MoWRAM's public library in Phnom Penh, and in the offices of Provincial Departments of Water Resources and Meteorology in all four project provinces. Once finalized, the IPPF will be re-disclosed again through the above channels prior to AIIB's and IFAD's project appraisal. The draft and final IPPF will be disclosed in English on the AIIB's and IFAD's website.

During project implementation, all draft IPPs, once completed by MoWRAM and submitted to the Bank for review, shall be disclosed to affected IP communities in Khmer language. The summary of the IPP (in the form of an Information Booklet) will be translated into IP's language if the consulted IPs have their own written language. Public meetings will be hold with the affected IP(s) to explain the contents of the relevant IPP in their mother language to ensure affected IPs understand what and how the activities under the IPP will be carried out, including E&S risks and impacts of subproject activities, and how the IPs will be engaged by MoWRAM in consultation meetings during subproject preparation, and in monitoring during subproject implementation to minimize identified E&S risks and impacts. IPPs – prepared for relevant subprojects, will be disclosed locally in Khmer and local IP language (if applicable), as well as in Khmer and English language on MoWRAM's website. The English version of the IPPs will be disclosed on the AIIB's and IFAD's website.

Grievance Redress Procedures

The following section outlines complaint handling procedures that are designed to assist affected Indigenous Peoples (IPs) in making complaints regarding the project. These procedures are designed to address potential impacts and risks during project preparation and cover the following key areas: a) land

acquisition, where individual IP land is acquired either permanently or temporarily during construction, b) Gender based violence, where IPs are victims, survivors, witnesses, or otherwise affected by SEA/SH actions related to the project, and c) general complaints and concerns related to project design, adverse impacts on IPs such as dust, noise, vibration, and any other aspects that IPs attribute to project activities.

Implementation Arrangements

The MoWRAM will be responsible for implementing this IPPF. The Project Director (PD) at MoWRAM will be responsible for providing overall guidance, policy advice, conducting internal coordination, discussing and resolving issues at project level − in association with relevant government agencies where needed. The Project Manager (PM) at MoWRAM will provide day-to-day support to the PD and will be responsible for ensuring that the IPPF will be followed. The PM will oversee the work of the ESOs and ensure proper screening of IP groups will be carried out for each subproject, and steps for IP screening and social assessment described in this IPPF are followed. Within MoWRAM, the ESOs will be responsible for carrying out day-to-day activities set forth in this IPPF. An IP specialist will be appointed within MoWRAM's PMU (in addition to a Resettlement and Environmental Specialist) to provide guidance to Provincial PDWRAM in conducting consultation with affected IP in respective subprojects.

The MoWRAM needs to inform the AIIB and IFAD of the IP screening results and steps that MoWRAM will take in case IPs are present in the subproject area. When IPs are found in the subproject, MoWRAM will engage IP consultants to work closely with PMU's IP Specialist and PDWRAM to conduct Social Assessment and prepare IPPs. PMU's IP specialist and IP consultants will visit the subproject sites and work closely with PDWRAM, local authorities, relevant agencies, NGOs, particularly local IP leaders and IP members, including vulnerable groups of affected IP communities, to conduct Social Assessment.

Capacity Building

Since the MOWRAM is new to AIIB's ESF and IFAD's SECAP, and have not been familiar with requirements of AIIB's ESS3 and IFAD's SECAP Standard 4, they may not be able to conduct meaningful consultation from initial years of project implementation. In the first year, these specialists will be trained by the AIIB task team on ESF with a particular focus ESSs and IFAD's SECAP with a particular focus Standard that apply to this project to enable newly appointed ES specialists at the MOWRAM to provide appropriate support. Where needed, IP consultant will be engaged to provide additional support to PMUs' specialist, particularly in the initial years of project implementation. Since independent ES monitoring consultant will be engaged by PMU at MoWRAM, feedback from this consultant, alongside internal monitoring results, will provide regular feedback to PMU on how IPPF/IPP is carried out so that adjustment/improvement could be made appropriately and timely.

Monitoring & Evaluation

The application of this IPPF and preparation and implementation of subproject IPPs will be monitored internally by the MoWRAM. Adverse impact on IPs (if any) due to land acquisition will be monitored by GDR and MoWRAM as part of implementation arrangement set forth in Section 9.1.2 of project's Resettlement Planning Framework (RPF).

Within MoWRAM, the ESOs or the Detailed Design Implementation and Supervision (DDIS) will be responsible for conducting quarterly monitoring activities of the activities set for under all subproject IPPs. Monitoring of IPPF/IPP implementation will focus on assessing the compliance of IPP implementation against the followings:

- IP screening process and results;

- Quality of Social Assessment and adequacy of IPPs prepared based on SAs;
- Information disclosure;
- Functioning of project's GRM (as customized to the respective IP groups present in each subproject area to ensure the GRM is culturally appropriate to the local IPs);
- Development activities carried under IPPs (based on development needs of IPs);
- Results and impacts of IPPs (in ensuring the affected IP receive socioeconomic benefits of the project that is culturally appropriate, gender and intergenerational inclusive, and contributing to achieving the objective of the AIIB's ESS3 and IFAD's SECAP Standard 4).

In addition to internal monitoring, the project will encourage IPs in subproject areas to participate in monitoring and evaluation of IPP implementation process and implementation outcome which affects them. During SA exercise, feedback and suggestions from IPs will be solicited as to how they wish to participate in monitoring and evaluation of IPP activities.

MOWRAM will provide a quarterly IPP implementation report to the AIIB and IFAD. These results will be incorporated into MoWRAM's consolidated Environmental and Social Compliance Report (ESCR) (See Annex 5 for Indicative Indicators for Internal Monitoring of IPP implementation).

Reporting

MoWRAM's ESOs will ensure feedback from affected and interested IP, as well as grievances submitted by affected IPs, are resolved timely and effectively, and that resolution results are reported timely back to the aggrieved IPs. The method of reporting back depends on the stakeholders, and as follows:

- For stakeholders at national level, email and/or official letter will be used to report back to stakeholders following consultations and/or workshops. The content of the report will summarize what comments, suggestions, concerns that have been received, by whom and when, and how such comments, suggestions, concerns were considered.
- For stakeholders at local level, follow-up meetings/consultations will be conducted to informed stakeholders know on how comments, suggestions, concerned were considered.
- For Indigenous Peoples, project's responses to their comments, suggestions, concerns are reported back to them in subsequent face-to-face consultations – in line with the project's SEP and the IPPF, including how the project had considered and addressed their concerns through concrete actions to be carried out during subproject implementation process and through IPP implementation.

Grievances of all project IP will be reported back to them through project's GRM channels within the timeframes specified for each step of the above GRM procedure.

Costs

Indicative costs for IPPF implementation are estimated during project preparation for the purpose of budget planning. The actual costs of IPPF implementation depend on the number of IPPs, including scope and activities to be carried out under each IPP, during project implementation. The estimated cost below may be updated once the list of subprojects is finalized. Costs incurred as compensation payment for land acquisition and associated impacts are covered by counterpart funds and are estimated in the project' Resettlement Planning Framework (RPF).

Budget

The budget for implementing IPPF/IPPs will be allocated from counterpart funding. implementation, based on infrastructure construction subprojects that will be identified/confirmed during project implementation, this budget plan will be updated to ensure funding is sufficiently planned annually to ensure timely and effective activities in Figure below.

1. INTRODUCTION

1.1 Project Background

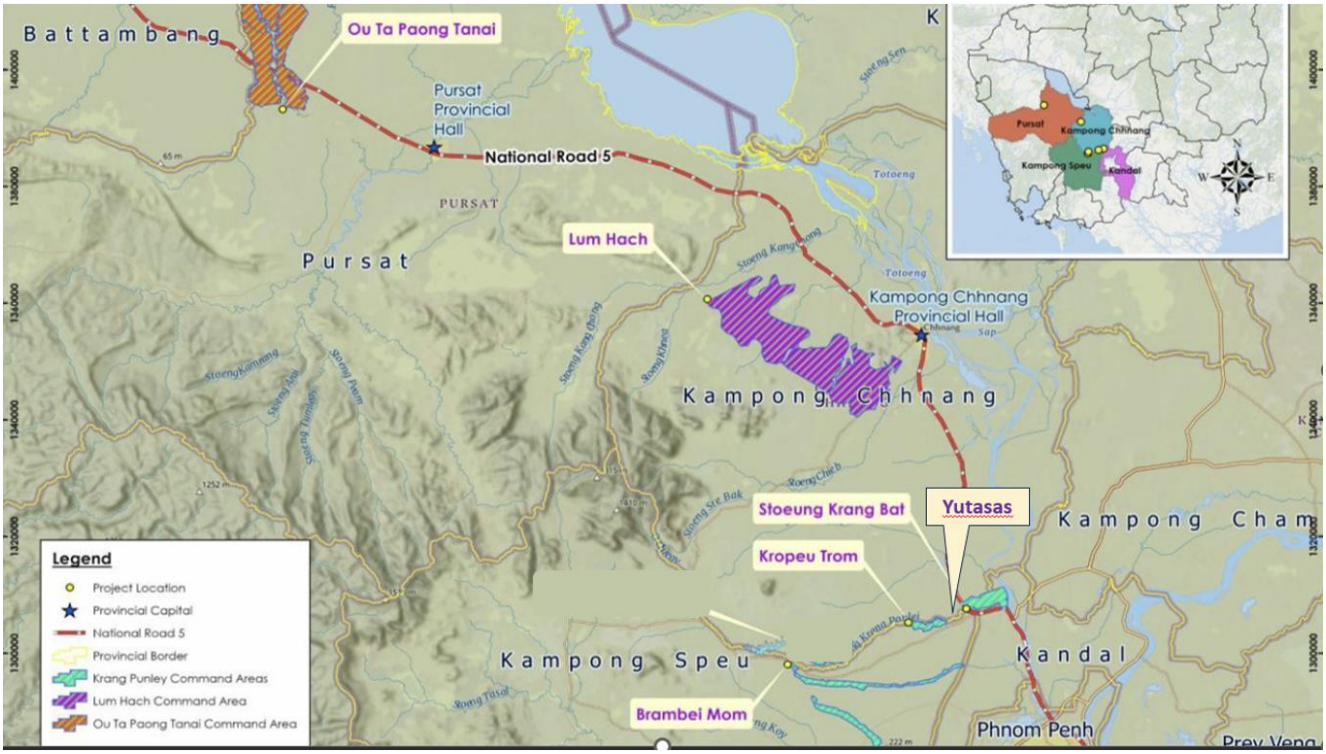
1.1.1 Project Context

Cambodia's irrigated agriculture faces increasing challenges from adverse impacts of climate change, especially the changes in rainfall patterns, duration and timing of the rainy season, and climate induced water disasters such as floods and droughts. Climate Resilient (CR) and low emission practices and investments in agriculture and water management are therefore crucial to protect and enhance Cambodia's agricultural production and productivity which will in turn contribute to poverty reduction and increased food security.

Addressing the complex impacts of climate change on rain fed and irrigated agriculture requires action at both farm and irrigation scheme, including enabling environment at regional and national level. Farm level actions will help communities adapt to climate change while also saving water and decreasing GHG emissions from BAU of agriculture, water use and management. This will help farmers to diversify their farming while also addressing changing rainfall patterns and increasing drought conditions throughout the growing season. Actions at system level will help achieve a modernized and climate proofed irrigation infrastructure delivering irrigation services to farmers in line with the requirements at the farm level. It will also protect the natural capital stocks, especially the land and water against the increasing threats of flood. In addition, replacement of diesel pumps with solar pumps and combination of both grey and green solutions for irrigation modernization and flood proofing works will help reduce GHG emissions.

The integrated actions combining both farm and system levels has a transformative potential to reduce vulnerability of water and agriculture systems to climate change impacts while also reducing GHG emissions and enhancing the livelihood of rural populations who primarily depend on agriculture.

The theory of change demonstrates how the project shifts the BAU from poorly constructed and maintained irrigation systems to a smart, climate resilient water management system with climate proofed irrigation and flood control infrastructures for smallholder farmers. The project's outcomes and outputs are in-line with GCF's adaptation and mitigation goals, objectives, and long-term sustainability principles.



The paradigm shifting aspects of the project will include the data driven climate-proofing of irrigation infrastructure and focus on last-mile engagement of vulnerable communities. The TOC shows that IF climate resiliency of irrigated agriculture is enhanced then the agricultural outputs and income of small-scale farmers will increase, as well as the climate resilience of vulnerable households and in particular to women will increase because water and food systems are less vulnerable to increasing temperatures, changing rainfall patterns and the extreme water events, AND low-emission irrigation and sustainable agriculture adaptation practices will contribute to NDC mitigation targets.

The project's goal stated above shall be achieved through the generation of the following three outcomes: (1) Improved resiliency of small holder farmers (2) Resilient water control infrastructure and water service delivery with less crop and asset damage and (3) Reduced GHG emission. These three outcomes are derived from interventions at farm and irrigation system level together with institutional strengthening of relevant stakeholders (MoWRAM, NCDD, MoF, and MAAF) and will contribute towards an irrigated agricultural system that is climate resilient and productive ultimately reducing the climatic vulnerability of poor farmers in the project areas.

1.1.2 Project Development Objective and Project Components

The project objective is to increase climate adaptation, mitigate the negative impact of extreme climate events, and improve livelihoods of smallholder farmers and vulnerable rural communities in four provinces of Cambodia in Kampong Speu, Kampong Chhnang, Kandal, and Pursat province (see map below).

Figure 1 – Map showing six irrigation schemes located in four provinces

The project will be implemented through various activities organized through the following three components:

- Component 1. Improving farm-level climate adaptation, resilience, and water use efficiency
- Component 2. Upgrading and climate-proofing water infrastructure for increased resilience
- Component 3. Institutional strengthening

1.2 Objectives and Principles of the Indigenous Peoples Planning Framework

1.2.1 Objectives

This Indigenous Peoples Planning Framework (IPPF) is prepared in case the project is affect any Indigenous Peoples. This framework guides screening, assessment, and planning, including an arrangement of the outline of culturally appropriate and meaningful consultations with Indigenous peoples, conducting social impact assessments (SIA), and preparing the IPP for any specific subproject. This IPPF is prepared in accordance with the requirements of the AIIB's ESS3 on Indigenous Peoples and the IFAD's SECAP Standard 4, and the RGC's policy on development of Indigenous Peoples. Based on the gaps between the AIIB's ESS3, IFAD's SECAP Standard 4, and RGC's policies, measures are proposed to close the gaps through implementation arrangements, procedures, design criteria, etc. to be applied to all subprojects and project components that were confirmed during project preparation and will be identified during project implementation.

The objectives of this IPPF are:

- Ensure the Project is designed and implemented in a way that fosters full respect for Indigenous Peoples' identity, dignity, human rights, economies and cultures, as defined by the Indigenous Peoples

themselves, so that they a) Receive culturally appropriate social and economic benefits; b) Do not suffer adverse impacts as a result of Projects; and c) Can participate actively in Projects that affect them.

In particular, IPPF aims to subproject's activities:

- Avoid adverse impacts of the project on IP communities. When avoidance is not possible, minimize, mitigate and/or compensate for such impacts.
- Promote sustainable development benefits and opportunities for IP communities in a manner that is accessible, culturally appropriate and inclusive.
- Improve subproject design and promote local support by establishing and maintaining an ongoing relationship based on meaningful consultation with the IP communities affected by CAISAR throughout project cycle.
- Recognize, respect and preserve the culture, knowledge, and practices of IP communities, and provide IPs with an opportunity to adapt to changing conditions in a manner and in a timeframe acceptable to them.

1.2.2 Principles

To achieve the above mentioned objectives, the following principles will be observed – at subproject level:

a) Early screening to determine IP presence and/or collective attachment to the Project area as well as potential impacts on IPs.

b) Conduct of culturally appropriate, gender-sensitive and technically backed-up social impact assessment where full consideration to IP−generated options as regards benefits and mitigation measures are considered and translated into the IP plans.

c) Undertake meaningful consultations with affected IP communities and concerned organizations to solicit their participation across the subproject cycle to avoid adverse impacts or in cases when avoidance is not possible, to minimize, mitigate, or compensate for such effects by establishing culturally appropriate and gender inclusivecapacity development modalities and grievance mechanisms.

d) Ensure free, prior and informed consent of affected IP communities to project activities that may introduce commercial development of cultural resources and indigenous knowledge, physical displacement from traditional or customary land, and commercialdevelopment of natural resources within customary lands that impact on livelihoods or cultural uses that define the identity and community of IPs. Consent refers to a collective expression by affected IP communities, through individuals and/or their recognized representatives, of broad community support for Project/project activities even if some individuals or groups object.

e) Avoid restricted access to and physical displacement from protected areas and naturalresources but when not possible, ensure that affected IP communities participate in allaspects of the subproject cycle and that their benefits are equitably shared.

f) An IPP will be prepared that is based on the social impact assessment with the assistance of qualified and experienced experts that draw on indigenous knowledge through consultation with affected IP communities. The IPP will include a framework for continued consultation with the affected IP communities during project implementation; specifies measures to ensure that IPs receive culturally

appropriate benefits; identification of measures to avoid, minimize, mitigate, or compensate for any adverse project impacts; culturally appropriate grievance procedures; M&E arrangements, and a budget and time-bound actions for implementing the planned measures.

g) The draft IPP after approval by the AIIB is disclosed including documentation of the consultation process and the results of the social impact assessment in a timely manner and made available in an accessible place and in a form and local languages understandable to affected IPs communities and other stakeholders. The final IPP andits updates will also be disclosed to the affected IP communities and other stakeholders.

h) Prepare an action plan for legal recognition of customary rights to lands and territories or ancestral domains when the project involves (i) activities that are contingent on establishing legally recognized rights to lands and territories that IPs have traditionallyowned or customarily used or occupied, or (ii) involuntary acquisition of such lands.

i) Monitor implementation of the IPP using qualified and experienced experts; adopt a participatory monitoring approach, wherever possible; and assess whether the IPP's objective and desired outcome have been achieved, considering the baseline conditions and the results of IPP monitoring and disclose the monitoring report.

2. LEGAL FRAMEWORK

2.1 Overview

Over 97 percent of Cambodia's population belongs to the Khmer ethnic group, while the remainder comprise a range of ethnic groups, including Chams (predominantly Muslim), ethnic Vietnamese, ethnic Chinese, and indigenous Khmer Loeu (hill-tribes). Amongst the non-ethnic groups, only the hill-tribes are categorized as IPs by the government. There are also isolated villages Cham (Muslim) communities that are non-Khmer ethnic groups, but they are generally well assimilated in Khmer society and not recognized as IPs.

2.2 National Laws and Regulations Related to Indigenous Peoples

Cambodia has a number of laws and policies that protect the rights of local communities, including IPs. Since the IPs have strong ties to the land and natural resources, the Land Law (2001) is the most significant for them because it sets out the basis for their rights to land. Article 25 provides for the collective ownership of land, while Article 26 recognizes the role of traditional authorities, mechanisms and customs in decision-making and exercising ownership rights. The subsequent Policy and Sub-decree for Indigenous Peoples Registration of Collective Land Rights sets the incorporation of the community as a legal entity as a condition for receiving a collective title. National policies applicable to the indigenous peoples include:

Cambodia Constitution (1993). Article 31 stipulates that Khmer citizens are entitled to the same rights, freedom and duties and are equal before the law, regardless of their race, color, sex, language, beliefs, religions, political tendencies, birth of origin, social status, resources, and any position. Article 44 guarantees all persons, individually or collectively, shall have the right to own property. Only natural persons or legal entities of Khmer nationality shall have the right to own land. Legal private ownership shall be protected by law. Expropriation of ownership from any person shall be exercised only in the public interest as provided for by law and shall require fair and just compensation in advance.

Land Law (2001) recognizes the collective land rights of indigenous communities by the State that offer a unique chance for indigenous peoples in Cambodia to exercise their right to self-determined development that include Article 26: Ownership of the lands is granted by the State to indigenous communities as collective ownership, including all the rights and protections enjoyed by private owners. The exercise of collective ownership rights are the responsibility of the traditional authorities and decision-making mechanisms of the indigenous community, according to their customs and subject to laws such as the law on environment protection; Article 28: No authority outside the community may acquire any rights to immovable properties belonging to an indigenous community. Indigenous communities have the right to collective ownership of their lands, which gives them all the rights and protection of ownership as enjoyed by private landowners. The lands of indigenous communities include residential and agricultural land and encompass land actually cultivated and the lands reserved/fallow land for shifting cultivation. Indigenous communities shall continue to manage their community land according to their traditional customs, pending the determination of their legal status. Once they are registered as legal entities, communities can apply for the registration of their collective title (Land Law 2001, Article 23 to 25). Article 43 stipulates the Commune Council's role in protecting and preserving the environment and natural resources. They also have a role in the classifying and setting of boundaries for all forests in their area of jurisdiction, in coordination with the Ministry of Agriculture, Fisheries and Forestry (Forestry Law 2002, Article 10).

Land Concessions 2003 and 2005. A sub-decree on Social Land Concessions (SLC)was established in 2003 to accompany the implementation of the Land Allocation for Social and Economic Development Project (LASED). The SLC aims at providing state private land for purposes of settlement and family farming to private families particularly the poor, disabledsoldiers, and families of deceased soldiers who have no or not enough land.

In late December 2005, the ELC sub-decree was established, defining a mechanism to grant state private land through a specific ELC contract to a concessionaire to use the land for agricultural and agro-industrial production. This refers to the cultivation of food or industrial crops, animal raising and aquaculture and the construction of facilities for the processing of domestic agricultural raw materials (Sub-Decree No.146 on ELC, article 2). For an ELC, which can be granted to private or investment companies, it must have been classified and registered in the Land Register as state private land, complying with the necessary legal procedures (Land Law 2001 Article 17, Sub-Decree No.118 on State Land Management article. 3 & 21, Sub- Decree No. 146 on ELC article. 2).

All responsibilities and authorities in granting ELCs lie with the MAFF. The concession land cannot exceed 10,000 ha and may only be granted when some additional requirements are fulfilled as follows (sub decree No.146 on ELC, article 4 & 5):

a) A land use plan for the land has been adopted by the Provincial or Municipal State Land Management Committee, and the land use is consistent with the plan.

b) Environmental and social impact assessments have been completed with respect to the land use and development plan.

c) There are solutions for resettlement issues in accordance with the existing legal framework and procedures. There shall be no involuntary resettlement and access to private land shall be respected.

d) Public consultations have been conducted with territorial authorities and local residents, relating to economic land concession projects or proposals.

Moreover, the proposal for ELC has to be evaluated against criteria that include the promotion of people's living standards, perpetual environmental protection and natural resource management, avoidance or minimization

of adverse social impacts, creation of increased employment and with linkages and mutual support between SLC and ELC.

Organic Law (2008) recognizes the vulnerability of the indigenous peoples in Cambodia. It mandates that provincial and district councils in rural areas, capital, municipal and khan levels in urban areas formulate development plans that identify the needs of vulnerable groups, including those from the IP communities.

Protected Area Law (2008) defines the framework of management, conservation and development of protected areas. The law aims to ensure effective management and conservation of biodiversity, and sustainable use of natural resources in protected areas. The law recognizes the right of forest-dependent indigenous peoples to live within the protected areas and to use sustainably the natural resources. Under this law, protected areas are divided into four zones, including core zone, conservation zone, sustainable use zone, and community zone. The law has provisions that define how land can be used and managed in each zone.

Forestry Law 2003 authorizes the granting of forest concessions. The sub-decree on the Management of Forest Concessions states that cancelled or revoked forest concessions shall revert to natural forest protected areas and cannot be converted into an Economic Land Concession (ELC) or awarded to other companies.

Law on Education (2007) aims to promote development of human resources of the nation by providing lifetime education to all people to enable their improvements in terms of knowledge, skills, capacities, dignity, good moral behaviors and characteristics. It also encourages people to learn to better understand, love and protect the national identity, cultures and language. Article 11, 15, 16, and 40 of the Forest Law (2002) recognizes and protects the rights of indigenous peoples to access and use certain forest areas, which they traditionally rely on to sustain their way of life and enjoy the benefits of the forest

Sub-Decree No. 83 ANK, BK (2009) on Procedures of Registration of Land of Indigenous Communities. The objective of this Sub-Decree is to provide indigenous communities with legal rights to land tenure, ensure land tenure security, and protect collective ownership by preserving the identity, culture, good custom and tradition of each indigenous community.

Policy on Environmental and Social Safeguards for Sub-National Democratic Development (RGC-NCDD, 2019) states in the strategy No.7 that Indigenous Peoples also are known in Cambodia as 'Khmer Leou' who have their own cultures and customs and make their own living in a way that is significantly different from those of 'Khmer Kroam' who live in small groups. The "Khmer Leou" is considered vulnerable IP groups and receive special care and attention by the government. It is required that development projects implemented at sub-national administration should not negatively impact their lives, and traditions and customs of the "Khmer Leou", particularly with regards to resettlement and land. In terms of application, specifically in land acquisition and resettlement, this policy is applied through the RGC's SOP-LAR (2018) – Land Acquisition and Involuntary Resettlement, which requires the avoidance of land acquisition or minimization of its use where avoidance is not possible.

Manual for Indigenous Communities Identification; Legal Entity Registration; and Communal Land Registration Process *(*OHCHR, MoI, MRD, MLMUPC (2018) *provide detailed guidance on steps and measures that need to be taken for identification of indigenous communities, registration of legal entities, and community land registration process.*

RGC (2018) Land Acquisition and Involuntary Resettlement, Standard Operating Procedures for Externally Financed Projects in Cambodia. In Section E (Impact on Indigenous Peoples), it is stipulated that land acquisition and resettlement that potentially affects indigenous people should be avoided – to the maximum extent possible, through selection of site, alignment, and land demarcation. However, when land acquisition is not avoidable, a separate social impacts assessment will need to be carried out to understand clearly how the indigenous peoples use their land; how they conduct their economic activities; how they organize their social

activities; and how the project would potentially affect the IP's identity, culture, and customary livelihoods. As per the decree, a separate Indigenous Peoples Plan (IPP) must be developed to address social impacts, compensation and resettlement packages, and implementation arrangements. The consultation process should consider customary practices, and in most cases, tribal or customary leaders will be consulted as they make decisions for their people. The Project Preparation Consultants (PPC), along with the Executing Agency/Implementing Agency (EA/IA) and local commune authorities, typically prepare the IPP. This is separate from the preparation of the BRP and DRP, although the latter will include a compensation package for the displaced indigenous peoples.

Registration of Lands of Indigenous Communities 2009. Sub-decrees on tenurial security have been issued by the GKC to put in place procedures whereby IPs can process claims to their rightful lands (provided they are the majority population at commune level). Recognition and certification of lands among IPs are ongoing with the issuance of the 2009 Sub-Decree on Procedures of Registration of Lands of Indigenous Communities.

National Policy on the Development of Indigenous Peoples (NPDIP). The Council of Ministers approved the NPDIP on 24 April 2009, serving as a guiding document for the implementation of government policies related to Indigenous Peoples across various sectors such as culture, education, health, land, agriculture, infrastructure, justice, tourism, industry, and energy. The NPDIP recognizes the necessity of specific policies for indigenous communities and establishes principles for their formal registration as legal entities with their own bylaws. Additionally, the NPDIP supports the participation of indigenous communities in economic development that affects their lives and cultures, ensuring their full entitlement to express their opinions and make decisions on the development of the economy, society and their cultures towards societal growth. The NPDIP promotes the use of local languages in multilingual primary education, media, and public consultation. It also lists ten brief sector strategies dedicated to culture, education and vocational training, health, environment, land, agriculture, water resources, infrastructure, justice, industry and mines and energy. The NPDIP calls for conducting impact assessments for all infrastructure projects: "Development projects in the living areas of indigenous peoples can function only if there has been an environmental and social impact assessment and publicity to relevant indigenous peoples' communities in advance in order for those people to have an opportunity to provide input about their need." The NPDIP recognizes the rights of indigenous peoples in traditional lands, culture and traditions. This is consistent with the national Land Law (2001).

Policy on Registration and Right to Use of Land of Indigenous Communities: The Council of Ministers approved on April 24, 2009. The Prime Minister signed a Sub-Decree on procedures of registration of Land of indigenous communities on June 9, 2009. This policy was developed on basis of the Land Law (2001), which recognizes the right of the indigenous communities to possess and use land under their collective ownership. The policy states that the registration of indigenous communities' land, as collective ownership, is different from the registration of individually owned land parcel. This is because land registration of the indigenous communities entails the registration of all land parcels that the communities own and use. The policy consists of both State Public Land and State Private Land in accordance with articles 25, 26, and 229 of the Land Law (2001) and related Sub-decrees. These land parcels vary in size and can be located within the same or different communes/ sangkat. Therefore, the registration of land parcels of indigenous communities requires a separate Sub-decree that supplements the existing procedures for sporadic and systematic land registration.

Other Policy Considerations. Apart from its Constitution and other national laws, Cambodia has adopted and supports the UN Declaration of Rights of Indigenous Peoples (IP)by way of ending discrimination and promoting the rights of Cambodia's recognized IPs.

2.3 AIIB's ESS3 on Indigenous Peoples

The AIIB Environmental and Social Framework (ESF) sets out the requirements for all Bank supported operations to comply with the Bank policies addressing environmental and social impacts, among other policies[4]. The ESF includes three mandatory Environmental and Social Standards (ESSs) that detail the requirements applicable to Bank clients on, respectively: Environment and Social Assessment and Management (ESS 1), Land Acquisition and Involuntary Resettlement (ESS 2) and Indigenous Peoples (ESS 3).

Objective. The objective of the ESS 3 is to enable the design and implementation of Projects in a way that fosters full respect for IPs identity, dignity, human rights, economies and cultures, as defined by the IPs themselves, so that: (a) they receive culturally appropriate social and economic benefits; (b) they do not suffer adverse impacts as a result of Projects; and (c) can participate actively in Projects that affect them.

[4] https://www.aiib.org/en/policies-strategies/_download/environment-framework/AIIB-Revised-Environmental-and-Social-Framework-ESF-May-2021-final.pdf

Scope and application.

The ESS 3 applies if IPs are present in, or have a collective attachment to, the proposed area of a subproject, and are likely to be affected by the subproject. The term IP is used in a generic sense to refer to a distinct social and cultural group possessing the following characteristics in varying degrees: (a) self-identification as members of a distinct indigenous cultural group and recognition of this identity by others; (b) collective attachment to geographically distinct habitats, ancestral territories or areas of seasonal use or occupation in the subproject area and to the natural resources in this area; (c) customary cultural, economic, social or political institutions that are distinct or separate from those of the dominant society or culture; and (d) a distinct language or dialect, often different from the official language or languages of the country in which they reside. 4 In considering these characteristics, national legislation, customary law and any international conventions to which the member in whose territory the subproject is located is a party may be considered. A group that has lost collective attachment to geographically distinct habitats or ancestral territories in the Project area because of forced severance remains eligible for coverage as an IP under ESS 3.

Indigenous Peoples Planning Framework: An Indigenous Peoples Planning Framework (IPPF) is prepared when a Project is likely to involve IPs and consist of a program or series of activities whose details had not yet been identified at the time the Project was approved by the Bank. In the case of this Project, and under exceptional circumstances, the AIIB determined that the environmental and social assessment of the identified Project activities could be conducted using a phased approach as defined under Section E, Special Circumstances of the IPP of the ESS 3, during the development of the activities in conformity with the IPPF that is approved by the Bank.

Indigenous Peoples Plan. Generally, if the subproject process determines that IPs are present in, or have collective attachment to, a subproject area, and furthermore are likely to be affected by the subproject, the Project is required to prepare an Indigenous Peoples Plan (IPP). The IPP should draw on indigenous knowledge and participation by any affected IP communities and take into consideration differentiated impacts of the Project with respect to gender and different generations. The IPP includes (a) a framework for continued consultation with those affected IPs during the subproject implementation; (b) measures to provide these IPs with gender sensitive and culturally appropriate benefits; (c) measures to avoid, minimize. Mitigate, offset or compensate for any adverse subproject impacts, and actions to address these impacts on the different groups in the community; (d) culturally appropriate grievance procedures, monitoring and evaluation arrangements; and (e) a budget and time-bound actions for implementing the planned measures.

In the event where project activities: (a) have impacts on land and natural resources subject to traditional ownership or under customary occupation or use; (b) cause relocation of IP and/or EM from land and/or limitations on access to natural resources subject to traditional ownership or under customary occupation or use; or (c) have significant impacts on Indigenous Peoples' cultural resources, the project needs to engaged the affected IP communities in a Free, Prior and Informed Consultation (FPICon) and thereafter obtain the broad support of the affected IP/EM communities for project activities that affect them.

For CAISAR, based on the current assessment, it is anticipated that the project would not affect any land and/or natural resources that are traditionally owned or under customary occupation or use by IP and/or EM, nor their cultural resources. Therefore, FPICon is not likely triggered under the Project albeit the applicability of FPICon will be determined based on the SIA to be carried for relevant subprojects.

2.4 Gaps between National Policies & Donor's Environmental and Social Policies

Despite the fact that Cambodia has a policy that recognizes the rights of IPs to culture, education, justice, health, environment, land, agriculture, water resources and infrastructure among others, there are no decrees, sub-decrees or procedures for specific safeguards to protect the interest of IPs, other than those related to land or forestry. The Cambodia Land Law does recognize the right of indigenous communities in Cambodia to own immovable property - their land - with collective title. However, in practice, the procedure to register collective title can be very time consuming and only a few indigenous communities have received collective title since the Land Law was enacted in 2001. Similarly, the Forest Law also guarantees and recognizes the right of IPs to continue the use and access to certain forest areas that they traditionally use and practice.

Overall, there is an acceptable level of consistency between the government system, the AIIB'ESS and the IFAD standards on IPs. The self-identification process of indigenous communities defined in the national policy is broadly consistent with international good practice. The national framework does not exclude communities who have become more mainstream, and indigenous communities may apply for legal status regardless of whether or not they still use their own language or practice traditional agriculture.

However, while there are some complementary links between Cambodian laws and regulations related to IPs and the ESS 3, there are no sufficiently detailed regulations or operating procedures to facilitate full implementation of the IPPs. Therefore, this IPPF has been prepared on the basis of the ESS 3 of AIIB and Standard 4 of IFAD (Indigenous Peoples), considering relevant Cambodian policies and regulations. The IPPF also outlines the Grievance Redress Mechanism (GRM), based on the GRM that is used for the Project, which will need to be further refined in consultation with IPs, if any are found to be residing at any subproject sites.

Items for Clarification	RGC's Policies	AIIB's ESS3	IFAD's SECAP Standard 7	Clarifications
Definition of IPs	Have list of IPs that are officially recognized as IPs	• Self-identification as members of a distinct indigenous social and cultural group and recognition of this identity by others; and • Collective attachment[5] to geographically distinct habitats, ancestral territories, or areas of seasonal use or occupation, as well as to the natural resources in these areas; and • Customary cultural, economic, social, or political institutions that are distinct or separate from those of the mainstream society or culture, and • A distinct language or dialect, often different from the official language or languages of the country or region in which they reside.	• Priority in time, with respect to occupation and use of a specific territory; • The voluntary perpetuation of cultural distinctiveness, which may include aspects of language, social organization, religion and spiritual values, modes of production, laws and institutions; • Self-identification, as well as recognition by other groups, or by state authorities, as a distinct collectivity; and • An experience of subjugation, marginalization, dispossession, exclusion or discrimination.	Screening of IP will be conducted based on all ethnic groups to identified in the subproject's area of influence. Screening of IP will be based on the definitions of IP in AIIB's ESS 3 and IFAD's ESS4.
FPIC	No requirements about FPIC	***Environmental and Social Standard 3*** Conduct meaningful consultation (based on **Free, Prior, Informed Consultation** – FPICon) to obtain broad support from affected IP community when project activities: • Have impacts on land and natural resources subject to traditional ownership or under customary occupation or use; • Cause relocation of Indigenous Peoples from land and natural resources subject to traditional ownership or under customary occupation or use;	***SECAP standard 4*** Conduct meaningful consultations to obtain **Free, Prior, Informed Consent** from affected IPs when project activities: • Have an impact on the land access and use rights of rural communities; and • Target indigenous peoples or rural areas that are home to indigenous peoples. Engagement with indigenous peoples will be undertaken in good faith, in a culturally appropriate manner and with full regard to these peoples'	

[5] Collective attachment means that for generations there has been a physical presence in and economic ties to land and territories traditionally owned, or customarily used or occupied, by the group concerned, including areas that hold special significance for it, such as sacred sites.

Items for Clarification	RGC's Policies	AIIB's ESS3	IFAD's SECAP Standard 7	Clarifications
		• have significant impacts on Indigenous Peoples' cultural resources. Apply Free, Prior and Informed Consent if the laws of the Member in whose territory the Project is located mandate free, prior and informed consent (FPIC) if AIIB has determined that the requirements of such FPIC are consistent with those of FPICon.	institutions, governance systems, customs and methods of decision-making.	

3. RISKS, IMPACTS AND MITIGATION MEASURES

3.1 Overview of Indigenous Peoples

3.1.1 Overview of IPs in Cambodia

There are 22 indigenous groups that are recognized by the RGC in Cambodia. The total population of these 22 indigenous groups is 171,193 people. Most of the indigenous people (92.4%, 2013) live in the northern and eastern parts of country, particularly in provinces of Ratanakiri, Mondulkiri, Kratie, Stung Treng, Kampong Thom, and Preah Vihear provinces. Of 22 indigenous groups, 6 groups are considered major groups as they have more than 10,000 people each. These 6 groups account for 88% of the total ethnic population of the country, including Tampuan, Pnong, Kreung, Kuy, Jarai, and Prev[6].

The indigenous families are larger than the average family size of the Cambodian population, with an average of 5.3 members per family in 2008 and 4.9 in 2013. Female-headed household accounted for 14% in 2008 and 22% in 2013.

Education. Among the indigenous population aged 15 and over, almost 66% did not attend a school or complete any educational degrees. In comparison, 24.1% attended only primary school (in total, 90% had little or no education). About 10% have at least completed lower secondary education, of which 4% have joined upper secondary education, and less than 1% have received a high school diploma. However, the data show that younger indigenous peoples have a better education rate than the older indigenous peoples, and men are more educated than women.

Employment and Economic Situation. The employment rate is 87.7% among men and 85.5% among women. According to different indigenous groups, the larger indigenous groups tend to have higher labor force participation rates, such as Tampuan, Pnong, Kreung, Preu, Kuy, Kraol, and Kavet. However, the majority of indigenous peoples work without pay (57.3%) and are self-employed (38%), with more men being self-employed (58.9%) and the majority of women working without pay (78.4%). In terms of the economic sectors, the vast majority of indigenous peoples aged 15 and over are employed in agriculture (93.3% of the population, 90.6% of men, and 95.9% of women), a few in the industry sector (total 1.6%, men 1.8%, and women 1.4%), and in the services sector (total 5.1%, men 7.6%, and women 2.8%).

Health and Hygiene. There is no data on indigenous peoples' health problems other than the data on disability from the censuses and intercensal population surveys, and the data on disability, maternal health, access to health and childcare services from Cambodian Socio-Economic Surveys containing only the information about local ethnic minority groups in Cambodia. According to the 2015 Cambodia Socio-Economic Survey, 14% of local ethnic minorities were sick in 30 days before the survey, with children and the elderly being sick the most and the working-age population being sick the least. In addition, boys and older men were twice as likely to be ill as girls and older women, and adult women were 2.7 times as likely to be sick as adult men. The fact that boys were more likely to be sick than girls can be explained by the fact that boys tend to accompany their parents to work in agriculture or collect nontimber forest products. The most common diseases are malaria, respiratory diseases, typhoid fever, and tuberculosis. The health services visited include pharmacies, public hospitals, and private clinics.

Housing and ownership. In 2013, more than 95% of indigenous families had their own houses (96.3% in 2013). The majority of indigenous households used kerosene lamps and batteries as the main source of light. In contrast, 20.6% of households used electricity or their own generators as the main light source in 2013. For the primary fuel type for cooking, most indigenous households used firewood (95% in 2013). For household items

[6] Report on the Demographic and Socio-economic Situation of Indigenous Peoples in Cambodia (2021).

for information and communication, almost a third of indigenous households have television, 110% have mobile phones, and less than 1% have internet. For traveling, 76.1% of indigenous households had motorbikes, 2.2% had cars, 9.1% had tractors, 7.8% had boats, and 37.4% had bicycles (2013).

3.1.2 Overview of IPs in the Project Area

IPs were found in the four project provinces including Pursat, Kampong Chhnang, Kampong Speu, and Kandal. (See Table 2 below).

Table 1 – Distribution of Indigenous People Groups in Project Provinces

No.	Province	Indigenous Groups (>= 1000 people)	Indigenous Groups (>= 100 people)	Indigenous Groups (<100 people)
1	Pursat		Jarai, Poar	Kavet, Kleung, Kuoy, Kreung, Stieng, Ja'ong, Kroul, S'och, Kajrouk
2	Kampong Chhnang		Jarai	Kavet, Kleung, Kuoy, Kreung, Lun, Tampuon, Stieng, Ja'ong, Kroul, Rodae, S'och, Kajrouk
3	Kampong Speu		Jarai, Souy	Kavet, Kleung, Kuoy, Kreung, Lun, Stieng, Ja'ong, Kroul, Mel, Kajrouk
4	Kandal		Jarai, Kleung, Stieng, Ja'ong	Kavet, Kuoy, Lun, Bunong, Praov, Tampoun, Kroul, Rodae, L'moon, Souy, Kajrouk, Mon

3.2 Project's Environmental and Social Risk and Impacts

The project will bring about an overall positive impact to local farmers. In subproject where IP peoples have farmland in the command area, these IPs will benefit from improved irrigation, water supply, government's agricultural extension services, and services from local farmers' cooperatives. As IPs participate in project activities, particularly agricultural extension services, they can grow more crops, participate in value chain, increase income, and eventually improve their livelihoods. Reliable water access and promising farming opportunities thanks to improved irrigation and extension services also keep the poor, including the poor IPs, from migrating to other areas in search for income generation opportunities. Adverse impacts on IPs are foreseen. However, these impacts are mostly local, small-scaled, such as minor land acquisition in some subproject to allow construction of irrigation canal. Land impacts would be very small at household level (e.g. loss of strip of land) which would not affect the livelihoods of the IP remarkably.

During subproject construction and operation, there are a number of environmental and social risks that may apply to local people, including IP peoples who may happen to be present in a subproject area. Environmental and social risks and impacts that have been identified during project preparation have been discussed in consultation meetings with a) IP peoples who are present in subproject area, and b) other project stakeholders at commune, district, provincial and central level. These consultations aim to ensure potentially affected people, and relevant project stakeholders, are aware of such risks and stay engaged during subproject preparation and implementation for risk prevention and mitigation (Please see full list of social and environmental risks in the project's ESCMF (Section E&S Risks and Impacts) that may apply to any ethnic minorities who are present in subproject area. See also SEP, particularly section (Proposed Strategy for Consultation with Vulnerable/Disadvantaged Groups) for guidance on conducting consultation with IPs when IPs are present in the subproject area.

3.3 Mitigation Measures

Although above risks and impacts will be validated, and assessed at further length when subproject locations become known, IP(s) in a subproject's area may be affected disproportionately compared to the mainstream group. The distinctive cultural and socioeconomic characteristics of the IPs, including their existing livelihoods, etc. may expose IPs to further risks and impacts, increase their vulnerability and compromise their ability to respond to such risks and impacts – if a holistic approach is not in place. Effective communication, such as IEC, and active participation of involved IPs, are among important factors that contribute to effective engagement of IPs for meaningful consultation during subproject preparation and participatory monitoring during subproject implementation. The coordination of project stakeholders, including PMU, Contractors, local authorities, local agencies, local service providers, and most notably the active and full participation of IPs, collectively contribute to minimizing identified risks and potential impacts at identified subprojects.

Detailed mitigation measures for the above risks and potential impacts are proposed in the project's ESCMF. These mitigation measures are specific for design stage, pre-construction stage, construction stage, and operation stage,

During subproject design and pre-construction stage:

To avoid, minimize potential impacts related to land acquisition:

- Effort will be made by PMU to ensure irrigation and road design avoid acquisition of land from IPs;
- In case where avoidance is not feasible (because of technical requirements), minimize the need for land acquisition through alternative designs;
- Compensate affected IP in accordance with RPF, if avoidance is not possible.
- Provide additional financial and developmental support, as needed, based on meaningful consultation, to support affected IPs to fully and timely restore their livelihoods and income to the pre-project level, as a minimum.

During pre-construction stage:

To address identified risks for affected IPs at subproject level, PMU will implement the following:

- Prepare site-specific ESCMP
- Screen for presence of IP(s) in subproject area, based on detailed design
- Conduct Social Assessment (based on site-specific ESCMP)
- Develop IPPs, incorporating results from SA, including mitigation measures, etc. based on meaningful consultations
- Implement IPP (as part of site-specific ESCMP)
- As part of IPP, conduct Behavior Change Communication using audio-visual and local IP language to provide knowledge, raise awareness, change attitude, and promote behavior change among IP and local stakeholders to respond effectively to identified risks, particularly risks related to SEA/SH/VAC, communicable disease, traffic safety, culture related conflicts, etc.
- Where necessary, engage service provider (e.g. SEA/SH service providers) (for subproject being risk "high" or "substantial" on SEA/SH risk (risk is assessed as part of preparation of site specific ESCMP).

During construction stage:

- Implement the following as an integrated approach:
  i. PMU to implement site-specific ESCMP
  ii. PMU to continue implementing IPP – as part of site specific ESCMP (in close collaboration with IPs and local partners)
  iii. Contractor to implement C-ESCMP (including IEC campaign)
  iv. PMU to allow budget fully and timely (based on budget plan in IPP, Contractors' bill-of-quantity)
  v. PMU will enhance monitoring process to ensure risks are minimized. This can be achieved through coordinated works of SEO-PMU, DDIS consultant, E&S consultant, and independent E&S monitoring consultant, and participatory consultation of local IPs.

During operation stage:

- Ensure safety measures are in place (e.g. signpost, warnings, safe crossing, etc.)
- Continue IEC campaign, where need, to raise awareness of IPs on safe driving before new road is open to traffic
- PMU to maintain GRM's focal point (particularly during liability stage of contractors following construction completion)
- Ensure routine maintenance is carried out to ensure the road functions as designed

4. PREPARATION OF INDIGENOUS PEOPLES PLAN

When Indigenous Peoples and/or Ethnic Minority groups are present in a subproject area, PMU needs to prepare an IPP for the respective subproject. It is noted the IPP shall be prepared whether the identified IPs/EMs are affected positively (as subproject beneficiaries), or adversely, or both. To prepare an IPP for a subproject, a social assessment will be conducted for that subproject to inform the content development for the IPP and guide the IPP implementation. To ensure the social assessment focuses, social assessment shall be conducted vis-à-vis investment activities that are proposed under the mentioned subproject.

The following three steps shall be followed to prepare an IPP: 1) Screen for Indigenous Peoples/ Ethnic Minorities, 2) Conduct social assessment to develop IPP, and 3) Write-up the IPP:

4.1 Screening for Indigenous Peoples/ Ethnic Minorities (IP/EM)

Once the six subprojects (Ou Ta Pong, Lum Hach, Brambei Mom, Krapeau Trom, Yotassas, and Steung Krang Bat are approved, PMU's Consultant will conduct IP screening for these seven subprojects. The IP Screening involves two key tasks: 1) Define subproject area (based on subproject's area of influence), and 2) Screen for IP/EMs in the subproject area (See Annex 2 for more guidance). If the IP screening indicates that IP and/or EMs are present in the subproject area, an IPP has to be prepared.

4.2 Preparing an IPP

Preparation of an IPP involve two key steps: 1) conducting a Social Assessment and 2) writing up the IPP.

Step 1. Conduct a Social Assessment (SA)

The purpose of the social assessment is to identify and examine the potential impacts of the approved subproject on the livelihoods of the IP/EMs. In particular, the SA explores how the environmental and social risks and impacts associated with the proposed subproject activities affect the IP/EM. Based on this understanding, measures will be proposed to avoid, or mitigate the adverse impacts and risks and meanwhile enhancing the intended positive impacts of the subproject. The social assessment shall be conducted in a manner that is inclusive, culturally appropriate and gender sensitive. The depth and breadth of the SA should be based on the scope, scale and nature of the subproject impacts and risks. These are determined based on:

a) The magnitude of subproject's impacts on the affected IP/EM, including: (i) customary rights of use and access to land and natural resources; (ii) socioeconomic status; (iii) cultural and communal integrity and heritage; (iv) health, education, livelihood systems and social security status; and (v) indigenous knowledge; and
b) The vulnerability of the affected IP/EM.

The social assessment needs to have the following key elements:

a) Description of the subproject, including a map of the subproject area;
b) Policy, legal and administrative framework, including the international and national legal framework applicable to the subproject;
c) Scoping, including stakeholder identification and consultation plan;
d) Baseline environmental and social data;
e) Evaluation of environmental and social risks and impacts;
f) Development of mitigation, monitoring and management measures and actions.

Step 2. Write-up an IPP

Based on the information generated from the above social assessment, PMU's consultant will write up the IPP. An IPP shall include the key following elements, as a minimum.

a) A framework for continued consultation with these affected Indigenous Peoples during Project implementation;
b) Measures to provide these Indigenous Peoples with gender sensitive and culturally appropriate benefits;
c) Measures to avoid, minimize, mitigate, offset or compensate for any adverse Project impacts, and actions to address these impacts on the different groups in the community;
d) Culturally appropriate grievance procedures, monitoring and evaluation arrangements; and
e) A budget and time-bound actions for implementing the planned measures.

It is recommended that the IPP should be developed as an overall community development plan to address specific issues associated with the needs of the affected IP/EM. The IPP needs to address not only any adverse impacts and risks, but also enhance the intended positive impact of the subprojects through a continuous IP/EM engagement process during sub-sheme design, implementation, monitoring. This aims to promote the ownership of affected IP/EM and enhance subproject's development effectiveness.

4.3 Approving an IPP

PMU will submit all IPPs to the AIIB for review and clearance prior to IPP implementation.

4.4 Disclosing an IPP

All IPPs, once cleared by AIIB, will be disclosed locally in both English and Khmer at subproject area and will be posted on the websites of MoWRAM and MAFF. The same version will also be disclosed on AIIB's and IFAD's website.

4.5 Implementing an IPP

The IPP should be implemented in coordination with the local authorities and affected IP. The activities and the outcomes of the IPPs implementation should be monitored and evaluated (See also Section 7.3). MoWRAM and MAFF will ensure sufficient financial and human resources available timely prior to embarking IPP implementation.

5. STAKEHOLDER ENGAGEMENT AND INFORMATION DISCLOSURE

5.1 Purpose of Engaging IP during project preparation and implementation

The AIIB's ESF defines stakeholder engagement as a process of identifying relevant stakeholders, conducting stakeholder analysis, and organizing a series of consultations to meet with project stakeholders for collecting stakeholders' feedback and concerns on project's risks and impacts, as well as stakeholders' development needs in relation to project purposes and activities. This aims to ensure the project's adverse impacts on IPs can be avoided, or minimized and mitigated if avoidance is not possible. For this project, it is important that IPs need to be consulted on their development needs (in relation to project purposes) to ensure they can receive socioeconomic benefits that are appropriate to them culturally.

5.2 Consultation results during Project Preparation

Consultation on project design and related IP issues was conducted in XXX 2023 at national level (as listed below), and with IPs potentially affected at subprojects during 25-30 June 2023 (on proposed project), and XXX September 2023 (based on initial design). (See summary of consultation results at Annex 1).

5.3 Consultation with IPs during Project Implementation

5.3.1 Overview of consultation process

During project implementation, consultations with IPs will be carried out for subprojects where IP screening has confirmed that IPs, as per AIIB ESS3 and IFAD's SECAP Standard 4, are present in the subproject areas. The consultations with identified IPs will be carried out on an iterative basis throughout subproject cycle, to ensure affected IP are informed of the risks and impacts identified for the subproject, and provide meaningful feedback. To ensure relevant IP stakeholders are engaged in project consultations, MoWRAM will identify IP group(s) present in subprojects, then conduct consultations with them – as per Section 4.2. The consultations with identified IP groups will be conducted in a culturally appropriate manner that takes into consideration gender sensitivity and intergenerational perspectives.

The consultations will seek also feedback from IPs on subproject's risks and impacts, suggestions to avoid or mitigate such risks and impacts, and developmental needs of the IP in relation to the project goal and subproject activities. To promote effective project design and build project support and ownership of local IPs, while reducing risk of potential delays during subproject implementation, MoWRAM will apply the engagement strategy. The engagement process will include analysis of IPs as project stakeholders, engagement planning, disclosure of information, and conducting meaningful consultations with the affected IP(s). The consultations will be based on the existing customary institutions and decision-making processes of the consulted IPs to

promote IP's participation and support for the subprojects. In particular, the consultations to be conducted by MoWRAM at subproject level will:

a) Involve the participation of IPs' representative bodies and organizations, such as councils of elders or village councils, or chieftains. Where appropriate, consultations shall be carried out with other members of the IP communities;

b) Allow for IPs to participate effectively in the design of project activities or mitigation measures that could potentially affect them – either positively or negatively;

c) Provide IPs sufficient time to confirm the broad support from the affected IP for proposed project activities, and associated risks and impacts.

Stage	Stakeholders	Activities	Outcomes
1. Subproject identification	▪ MoWRAM and MAFF ▪ Implementing agency at provincial and district level (e.g. PDWRAM, PDAFF) ▪ Commune and village authorities ▪ Target beneficiary households, including poor, vulnerable, and disadvantaged groups	▪ Government and agency meetings to explain need for safeguards, agree on selection criteria. ▪ Scoping – visiting potential sites, physical inspection. ▪ Meetings and briefings with provincial and district agencies. ▪ Meetings with commune and village authorities. ▪ Meetings with target beneficiaries.	▪ Agreement on objectives, priorities. ▪ Indicative development priorities for community. ▪ Identification of problems and issues. ▪ Basic design needs. ▪ Records of community participation disaggregated by sex and ethnicity.
2. Subproject preparation	▪ MoWRAM and MAFF ▪ Implementing agency at provincial and district level (e.g. PDWRAM, PDAFF) ▪ Commune and village authorities ▪ Target beneficiary households, including poor, vulnerable, and disadvantaged groups	▪ data requirements, participatory methods, consultation process and need for indigenous people /ethnic minority	▪ Data for preparation of socioeconomic profiles. ▪ Needs and constraints identified. ▪ Special considerations identified.

	▪ Commune and village authorities ▪ Target beneficiary households ▪ Members of vulnerable or minority groups ▪ Project technical assistance	▪ Open village meeting to explain purpose and process of consultations. ▪ Field level data collection – socio- economic data and surveys.	▪ Identification of gender issues, women's needs, and priorities. ▪ Identification of specific needs for tailoring innovative behavior change campaign
		▪ Household level and focus group discussions for identifying needs ▪ IP/ Ethnic minority households and separate focal discussion groups by gender. ▪ Discuss proposed project design. ▪ Obtain feedback, determine level and scope of support. ▪ Update briefings for provincial and district agencies.	▪ Identification of indigenous peoples/ethnic minority households that will be qualified/covered under the IP/EM ▪ Identification of needs for Information, Education and Communication material to be prepared in IP/EM language. ▪ Records of community participation and consultation results.
3. Subproject completion and evaluation	▪ MoWRAM and MAFF ▪ Implementing agency at provincial and district level (e.g. PDWRAM, PDAFF) ▪ Commune and village authorities ▪ Target beneficiary households, including poor, vulnerable, and disadvantaged groups	▪ Meetings with commune and village officials to discuss benefits and issues. ▪ Focus group discussions to review/evaluate benefits received, implementation issues, and improvements needed. ▪ Separate focal group discussion (by gender) where needed.	▪ Feedback on implementation progress, issues, and constraints. ▪ Suggestions for future improvements ▪ Records of community participation and consultation results

5.3.2 Free, Prior and Informed Consultation/Consent

The project will be designed to avoid any project activities that may

(a) have impacts on land and natural resources subject to traditional ownership or under customary occupation or use;
(b) cause relocation of Indigenous Peoples from land and/or limitations on access to natural resources subject to traditional ownership or under customary occupation or use; or
(c) have significant impacts on Indigenous Peoples' cultural resources.

The SIA process will determine the applicability of FPIC but on top of it, the project will ensure engaged the affected IP/EM in a meaningful consultation process by adopting the Informed Consultation and Participation (ICP) approach to ensure affected IP/EM are engaged in the informed consultation process and participating in project's consultation sessions. The consultation process adopted will be inclusive and iterative and promote in-depth exchange of views and information. PMU will ensure the views of the affected IP/EM concerning matters that affect IP/EM directly are considered and incorporated into subproject's design and implementation, particularly into proposed mitigation measures, sharing of development benefits and opportunities, and implementation issues.

The consultation process will also aim to capture both men's and women's views that are obtained from separate engagements/meetings, and will reflect men's and women's different concerns and priorities about subproject's risks and impacts, mitigation mechanisms, and benefits, in subproject implementation process. PMU will document the consultation process, particularly measures that PMU will take to avoid or minimize risks to and adverse impacts on affected IP/EM, and inform affected people of how their concerns have been considered and taken into action.

5.4 Information Disclosure

Prior to conducting consultations, MoWRAM will notify the concerned IPs of the consultation plan during preparation. MoWRAM will provide affected IPs with initial subproject information in the form of booklet in both Khmer and local language (if applicable). This initial information should be provided to IP at least two weeks prior to consultation. If the concerned IPs do not have a written language, the IP will be provided the information in Khmer and are explained verbally in the local language of the concerned IP to ensure the IP are fully informed of the consultation purpose and initial subproject information.

For public consultation, the draft IPPF (in English) and its Executive Summary (in Khmer) will be disclosed on MoWRAM's website on XXX (https://www.). The Executive Summary (in Khmer) will also be disclosed in hard copy at MoWRAM's public library in Phnom Penh, and in the offices of Provincial Departments of Water Resources and Meteorology in all four project provinces. Once finalized, the IPPF will be re-disclosed again through the above channels prior to AIIB's and IFAD's project appraisal. The draft and final IPPF will be disclosed in English on the AIIB's and IFAD's website.

During project implementation, all draft IPPs, once completed by MoWRAM and submitted to the Bank for review, shall be disclosed to affected IP communities in Khmer language. The summary of the IPP (in the form of an Information Booklet) will be translated into IP's language if the consulted IPs have their own written language. Public meetings will be hold with the affected IP(s) to explain the contents of the relevant IPP in their mother language to ensure affected IPs understand what and how the activities under the IPP will be carried out, including E&S risks and impacts of subproject activities, and how the IPs will be engaged by MoWRAM in consultation meetings during subproject preparation, and in monitoring during subproject implementation to minimize identified E&S risks and impacts. IPPs – prepared for relevant subprojects, will be disclosed locally in Khmer and local IP language (if applicable), as well as in Khmer and English language on MoWRAM's website. The English version of the IPPs will be disclosed on the AIIB's and IFAD's website.

6. GRIEVANCE REDRESS MECHANISM

6.1 Purpose of Project's GRM

The purpose of the GRM in this IPPF is to provide aggrieved IP with grievance redress procedures that are accessible, easily used, and free of charge to ensure that the grievances submitted by the affected IPs are solved timely. The GRM in this IPPF guides how a complaint of affected IP can be lodged, including forms of grievance lodging, channels, and steps that can be taken.

The GRM also describes the time-limits, where possible, for each step, such as time-limit for acknowledging receipt of complaints, notification of resolution decision. During the grievance resolution progress, where necessary, dialogues will be held between the aggrieved IP and project's GRM focal point that are designated for each step. Dialogues with affected IP during complaint resolution process aims to promote mutual understanding and collaboration among concerned parties.

The project also includes an appeal process that a complainant can use when they are dissatisfied with the resolution results/decision, or their complaints are not resolved within a specified timeframe. During subproject implementation, IPs in the subproject area will be reminded of the availability of this GRM and will be explained during consultations about how to use it.

6.2 Grievance Redress Procedures

The following section outlines complaint handling procedures that are designed to assist affected Indigenous Peoples (IPs) in making complaints regarding the project. These procedures are designed to address potential impacts and risks during project preparation and cover three key areas: a) land acquisition, where individual IP land is acquired either permanently or temporarily during construction, b) gender based violence, where IPs are victims, survivors, witnesses, or otherwise affected by SEA/SH actions related to the project, and c) general complaints and concerns related to project design, adverse impacts on IPs such as dust, noise, vibration, and any other aspects that IPs attribute to project activities.

6.2.1 Grievances related to Land Acquisition

The project has prepared a standardized GRM for stakeholders affected by land acquisition, including IPs. However, given the presence of various IP groups in project provinces, the IP groups in each subproject area will be consulted for feedback on the project's standardized GRM, as presented below. The purpose of consultation on the GRM in this IPPF is to ensure that the standardized steps and process below are culturally appropriate to the affected IP group. If required by the consulted IPs, the GRM below will be updated to reflect the customary complaint handling procedures currently practiced by the consulted IP and/or may be preferred by the affected IPs, based on the Social Assessment of IPs once site-specific subprojects are identified or confirmed during project implementation (See detailed Procedures at Section 6.2.2 of project's Resettlement Policy Framework).

6.2.2 Grievances related to Gender Based Violence/SEA/SH

In case the IP wishes to submit a grievance related to gender based violence, they can lodge their grievance using the Redress Procedure for Complaints related to gender (See Section 6.4.3 in the Stakeholder Engagement Plan for details).

6.2.3 Grievances related to any other aspects not covered in the above GRM

If environmental factors, such as elevated levels of dust or increased noise during evening hours, negatively impact the living or business activities of IPs, several channels will be established for their convenience. These channels may include:

- **PMU GRM focal point's telephone;**

- **Local IP leaders;**
- **Contractor's hotline:** to report cases that they think contractors can timely address them (contact detail of Contractors will be posted at construction sites, and distributed to IPs (through Subproject Information Booklet) during consultations, and posted at public billboards of Commune/Sangkat offices, pagodas; and
- **Commune/Sangkat offices**

7. IMPLEMENTATION ARRANGEMENTS

7.1 Implementation Arrangements

The MoWRAM will be responsible for implementing this IPPF. The Project Director (PD) at MoWRAM will be responsible for providing overall guidance, policy advice, conducting internal coordination, discussing and resolving issues at project level – in association with relevant government agencies where needed. The Project Manager (PM) at MoWRAM will provide day-to-day support to the PD and will be responsible for ensuring that the IPPF will be followed. The PM will oversee the work of the ESOs and ensure proper screening of IP groups will be carried out for each subproject, and steps for IP screening and social assessment described in this IPPF are followed. Within MoWRAM, the ESOs will be responsible for carrying out day-to-day activities set forth in this IPPF. An IP specialist will be appointed within MoWRAM's PMU (in addition to a Resettlement and Environmental Specialist) to provide guidance to Provincial PDWRAM in conducting consultation with affected IP in respective subprojects.

The MoWRAM needs to inform the AIIB and IFAD of the IP screening results and steps that MoWRAM will take in case IPs are present in the subproject area. When IPs are found in the subproject, MoWRAM will engage IP consultants to work closely with PMU's IP Specialist and PDWRAM to conduct Social Assessment and prepare IPPs. PMU's IP specialist and IP consultants will visit the subproject sites and work closely with PDWRAM, local authorities, relevant agencies, NGOs, particularly local IP leaders and IP members, including vulnerable groups of affected IP communities, to conduct Social Assessment.

7.2 Capacity Building

Since the MOWRAM is new to AIIB's ESF and IFAD's SECAP, and have not been familiar with requirements of AIIB's ESS3 and IFAD's SECAP Standard 4, they may not be able to conduct meaningful consultation from initial years of project implementation. In the first year, these specialists will be trained by the AIIB task team on ESF with a particular focus ESSs and IFAD's SECAP with a particular focus Standard that apply to this project to enable newly appointed ES specialists at the MOWRAM to provide appropriate support. Where needed, IP consultant will be engaged to provide additional support to PMUs' specialist, particularly in the initial years of project implementation. Since independent ES monitoring consultant will be engaged by PMU at MoWRAM, feedback from this consultant, alongside internal monitoring results, will provide regular feedback to PMU on how IPPF/IPP is carried out so that adjustment/improvement could be made appropriately and timely.

7.3 Monitoring & Evaluation

The application of the IPPF, including implementation of subproject IPPs, will be monitored internally by the MoWRAM. Adverse impact on IPs (if any) due to land acquisition will be monitored by GDR and MoWRAM as part of implementation arrangement set forth in Section 9.1.2 of project's Resettlement Planning Framework (RPF).

Within MoWRAM, the ESO will be responsible for conducting quarterly monitoring activities of the activities set for under all subproject IPPs. Monitoring of IPPF/IPP implementation will focus on assessing the compliance of IPP implementation vis-à-vis the followings:

- IP screening process and results;
- Information disclosure;
- Quality of Social Assessment and of IPP preparation;
- IPP implementation process, the level of achievement at output, outcome, and purpose levels;

- Functioning of project's GRM (as customized to respective EG/IP groups present in each subproject area to ensure the GRM is culturally appropriate to the local EG/IPs);
- Development activities carried under IPPs (based on development needs of IPs);
- Results and impacts of IPPs (in ensuring the affected IP receive socioeconomic benefits of the project that is culturally appropriate, gender and intergenerational inclusive, and contributing to achieving the objective of the AIIB's ESS3 and IFAD's SECAP Standard 4).

In addition to internal monitoring, the project will encourage IPs in subproject areas to participate in monitoring and evaluation of IPP implementation process and implementation outcome which affects them. During SA exercise, feedback and suggestions from IPs will be solicited as to how they wish to participate in monitoring and evaluation of IPP activities.

MOWRAM will provide a quarterly IPP implementation report to the AIIB and IFAD. These results will be incorporated into MoWRAM's consolidated Environmental and Social Compliance Report (ESCR) (See Annex 4 for Indicative Indicators for Internal Monitoring of IPP implementation).

7.4 Reporting

MoWRAM's ESOs will ensure feedback from affected and interested IP, as well as grievances submitted by affected IPs, are resolved timely and effectively, and that resolution results are reported timely back to the aggrieved IPs. The method of reporting back depends on the stakeholders, and as follows:

- For stakeholders at national level, email and/or official letter will be used to report back to stakeholders following consultations and/or workshops. The content of the report will summarize what comments, suggestions, concerns that have been received, by whom and when, and how such comments, suggestions, concerns were considered.
- For stakeholders at local level, follow-up meetings/consultations will be conducted to informed stakeholders know on how comments, suggestions, concerned were considered.
- For Indigenous Peoples, project's responses to their comments, suggestions, concerns are reported back to them in subsequent face-to-face consultations – in line with the project's SEP and the IPPF, including how the project had considered and addressed their concerns through concrete actions to be carried out during subproject implementation process and through IPP implementation.

Grievances of all project IP will be reported back to them through project's GRM channels within the timeframes specified for each step of the above GRM procedure.

8. COSTS AND BUDGET

8.1 Costs

Indicative costs for IPPF implementation are estimated during project preparation (See Figure below) for the purpose of budget planning. The actual costs of IPP implementation depend on the number of IPPs, including scope and activities to be carried out under each IPP, during project implementation. The estimated cost below may be updated once the list of subprojects is finalized.

8.2 Budget

The budget for implementing IPPs will be allocated from project's financing (See Figure below). Implementation, based on subprojects that will be identified/confirmed during project implementation. This budget plan will be updated to ensure funding is planned annually to ensure timely and effective implementation of proposed activities.

Table 2 – Key activities and costs for supporting IPP implementation (in US Dollars)

No.	Key activities	Stakeholders involved	Estimated costs (per province x 4)	Sub-Total (Counterpart Budget)	Sub-Total (AIIB finance)	Sub-Total (IFAD finance)	Total
1	Recruitments of IP consultants to conduct screening and SA	• MoWRAM (oversight) • ESO (implement)	3,000 x 4	12,000	-		12,000
2	Recruitment of bilingual facilitators to support consultations as part of SA	• MoWRAM • ESO (implement)	1,000 x 4	4,000	-		4,000
3	Conduct Social Assessment and Prepare subproject IPPs	• MoWRAM (oversight) • ESO (lead) • IP Consultant (implement)	5,000 x 4	20,000	-		20,000
4	Conduct mitigation measures, development activities, and relevant activities, as part of IPP (based on the needs of consulted IPs, e.g. trainings for IP on good agriculture practices such as Integrated Pest Management, water saving technology (e.g. alternative wet dry, fertilizer needs assessment/ application, alternative job that is not land based for income generation activities which are culturally appropriate, etc.)	• MoWRAM (lead) • Consultant (implement)	5,000 x 4	20,000	-		20,000
5	Monitoring and Evaluation, Reporting	• MoWRAM (oversight) • ESO (implement)	2,000x4	8,000	-		8,000
6	Staff allowance	• MoWRAM (oversight) • ESO (implement)	$34 x 7 staffs x 10 days x 4 provinces	9,520	-		9,520
7	Transport		1,000 x 4	4,000	-		4,000
8	Data collection		1,000x 4	4,000	-		4,000
9	Others		500 x 60	30,000	-		30,000
10	Contingency (10% of above 9 items)						11,152
					Grand-Total		**122,672**

ANNEXES

Annex 1 – Guidance for Screening for Indigenous Peoples/Ethnic Minorities

Once a subproject is approved, PMU's Consultant will conduct initial screening for the presence of IP/EM in the subproject area. The following steps could be followed:

1) **Define area of influence** (subproject area): subproject area needs to be defined, spatially, based on the subproject area described in the most updated Environmental and Social Impact Assessment/ Environmental and Social Management Plan prepared for the subproject.

2) **Screening.** Screening of IP/EM consist of two key tasks: desktop review and field works.

Desktop screening. Conduct IP/EM screening vis-à-vis above defined subproject. Identification of potential presence of IP/EM could be carried out initially based on the IP database managed by the Ministry of Rural Development and the Ministry of Planning. In addition, commune authorities within the subproject area could be asked to provide the most updated information about IP/EM groups living in their respective communes to facilitate consultant's initial desktop screening. It is noted that Ethnic Minorities refer to all groups by their own ethnicity and IP in the context of Cambodia refers to IP groups that are officially recognized. Screening results need to be updated if there is change to subproject area.

Consultant's screening needs to cover IP groups (that are recognized by the Government), and other ethnic groups based on the definition of IP of AIIB and IFAD (See also Definitions section of this document).

Field visit. After completing desktop review, PMU's consultant will visit the subproject's area of influence to validate their above initial screening results In addition to face-to-face validation with local commune authorities (and district authorities if needed) on initial screening result, the consultant need to conduct field observation in area where identified IP/EM are living, and their production area. Consultant may need to interview IP/EM and their respective leaders living in subproject area, and local people who are knowledgeable about IP/EM such as the village chiefs, opinion leaders, mass organizations such as commune women's union, farmers' association, to understand more about the socioeconomic and cultural life, livelihood activities, cultural heritages of the identified IP/EM in the subproject area. Consultant needs to visit the field again if there is change to subproject area.

While doing desktop screening and making field visit for validation of desktop review, the following guiding questions and IP screening form can be used:

- Are there socio-cultural groups in or use the subproject area who may be considered as hill tribes, ethnic minorities or indigenous communities within the subproject area?
- Are there national or local laws or policies as well as anthropological research or studies that consider these groups residing in or using the subproject area as belonging to ethnic minorities, IPs or cultural communities?
- Do such groups identify themselves as being part of a distinct social or cultural group?
- Do such groups maintain collective attachments to distinct habitats or ancestral territories and/or to the dominant society in these habitats and territories?
- Do such groups maintain cultural, economic, social and political institutions distinct from the dominant society and culture?
- Do such groups speak a distinct language or dialect?
- Have such groups been historically, socially and ecologically marginalized, disempowered, excluded and/or discriminated against?
- Are such groups represented as IPs in any formal decision-making bodies a the National of local levels?

- Do such groups experience subjugation, marginalization, dispossession, exclusion or discrimination?
- How vulnerable the groups are under the subproject's impacts and risks?

If screening result indicates that the ethnic groups being considered matches the definition of IPs as per AIIB's ESS 3 and IFAD's Standard 4 (See definition of IPs at section "Definitions" of this document), the IP screening results should be documented fully in the form of IP Screening Report and recommend that an IPP will be prepared for the relevant subproject.

Province-Capital:	**Municipality-District-Khan:**	**Location map attached**	
		Yes	No

Type of civil work/activity:			
Brief description of work/activity and location of civil work*: [Roads, community pond. required/purpose of civil work, (table/explain each activity) number of village (number of population) affected with explanation aboutthe affected community]*			

Screening checklist				
Questions	**Yes**	**No**	**Not known**	**Remarks**
A. Indigenous Peoples Identification				
1. Are there socio-cultural groups present in or usethe Project/Subproject area who may be considered as "tribes" (hill tribes, schedules tribes,tribal peoples), "minorities" (ethnic or national minorities), or "indigenous communities" in the Subproject area?				
2. Are there national or local laws or policies as wellas anthropological research/studies that consider these groups present in or using the subproject areas belonging to "ethnic minorities", scheduled tribes, tribal peoples, national minorities, or cultural communities?				
3. Do such groups self-identify as being part of a distinct social and cultural group?				
4. Do such groups maintain collective attachmentsto distinct habitats or ancestral territories and/or tothe natural resources in these habitats and territories?				

5. Do such groups maintain cultural, economic, social, and political institutions distinct from the dominant society and culture?				
6. Do such groups speak a distinct language or dialect?				
7. Has such groups been historically, socially and economically marginalized, disempowered, excluded, and/or discriminated against?				
8. Are such groups represented as "Indigenous Peoples" or as "ethnic minorities" or "scheduled tribes" or "tribal populations" in any formal decision-making bodies at the national or local levels?				

Questions	**Yes**	**No**	**Not known**	**Remarks**
B. Identification of potential impacts *(provide elaboration in Remarks column)*				
9. Will the subproject directly or indirectly benefit or target IPs?				
10. Will the subproject directly or indirectly affect Indigenous Peoples' traditional sociocultural and belief practices? (e.g. childrearing, health, education, arts, and governance)				
11. Will the subproject affect the livelihood systemsof Indigenous Peoples? (e.g., food production system, natural resource management, crafts and trade, employment status)				
12. Will the subproject be in an area (land or territory) occupied, owned, or used by Indigenous Peoples, and/or claimed as ancestral domain?				
C. Identification of Specialist Requirements				
13. Commercial development of the cultural resources and knowledge of IPs?				
14. Physical displacement from traditional or customary lands?				
15. Commercial development of natural resources (such as minerals, hydrocarbons, forests, water, hunting or fishing grounds) within customary lands under use that would impact the livelihoods or the cultural, ceremonial, spiritual uses that define the identity and community of Indigenous Peoples?				
16. Establishing legal recognition of rights to landsand territories that are traditionally owned or customarily used, occupied or claimed by IPs?				
17. Acquisition of lands that are traditionally ownedor customarily used, occupied or claimed by IPs?				

Anticipated impact on IPs

Subproject activities		**Expected positive impact**	**Expected negative impact**

Subproject Category	Subproject eligibility	Next steps
A. Subproject has impacts (negative or positive) on IP communities residing withinthe subproject area.	A/B	Prepare IPP describing the completion of meaningful consultations with the IPs and the identification of appropriate mitigation measures to obviate or mitigate any identified negative impacts.
B. Subproject has no impacts sine there are no IP communities residing in thesubproject area.	C	No IPP required and no further action is needed.

Annex 2 – Guidance for Preparing an Indigenous People Plan (IPP)

As mentioned in Section 4.2, preparation of an IPP involves two key steps: conducting a Social Assessment (SA) and writing up the IPP.

1. Conducting a Social Assessment for the purpose of IPP

The SA aims to understand how the IP is affected by the subproject's activities, which informs how mitigation and development measures shall be proposed. The SA aims to explore measures to ensure a) affected IPs shall receive socioeconomic benefits culturally appropriate to them; b) if there are any potential adverse impacts and risks for IPs, such risks and impacts will be avoided to extent possible; c) where avoidance is not possible, measures are proposed to minimize, mitigate, and compensate for unavoidable adverse impacts. Mitigation and development measures will be proposed based on meaningful consultations with the IP households affected by subproject's investment activities.

The scope of SA will be proportionate to: (a) the magnitude of subproject's risks and impacts on the IP; socioeconomic status; cultural and communal integrity and heritage; health, education, livelihood systems and social security status; and indigenous knowledge; and (b) the vulnerability of the affected Indigenous Peoples. The IPP will also need to complement the broader coverage of environmental and social risks and impacts identified in subproject's Environmental and Social Impact Assessment that is conducted to develop subproject Environmental and Social Management Plan. The IPP need to provide specialized guidance on how specific issues associated with the needs of affected IP shall be addressed.

The level of detail and comprehensiveness of the IPP should be proportionate to subproject's risks and impacts. Mitigation and development measures that are proposed for the affected IPs should be culturally appropriate to the IPs.

2. Writing up the IPP

An Indigenous Peoples Plan (IPP) is required for subprojects that have impacts on IPs (positive, adverse, or both). The level of detail and comprehensiveness of IPP is commensurate with the significance of potential impacts on indigenous peoples. The substantive aspects of this outline will guide the preparation of IPPs,although not necessarily in the order shown.

1. **Executive Summary of the Indigenous Peoples Plan**
   This section concisely describes the critical facts, significant findings, and recommended actions.

2. **Description of the Project**
   This section provides a general description of the subproject, discusses the subproject interventions and activities that may bring impacts on indigenous peoples; and identifies the subproject area.

3. **Social Impact Assessment**
   This section:
   a) Reviews the legal and institutional framework applicable to IPs in the subproject context.
   b) Provides baseline information on the demographic, social, cultural, and political characteristics of the affected indigenous peoples communities; the land and territoriesthat they have traditionally owned or customarily used or occupied; and the natural resources on which they depend.

c) Identifies key Project stakeholders and elaborate a culturally appropriate and gender- sensitive process for meaningful consultation with indigenous peoples at each stage of subproject preparation and implementation, taking the review and baseline informationinto account.
d) Assesses, based on meaningful consultation with the affected indigenous peoples, thepotential adverse and positive effects of the Project. Critical to the determination of potential adverse impacts is a gender-sensitive analysis of the relative vulnerability of,and risks to, the affected indigenous peoples given their particular circumstances andclose ties to land and natural resources, as well as their lack of access to opportunitiesrelative to those available to other social groups in the communities, regions, or national societies in which they live.
e) Includes a gender-sensitive assessment of the affected IPs perceptions about the project and its impact on their social, economic, and cultural status.
f) Identifies and recommends, based on meaningful consultation with the affected IPs, the measures necessary to avoid adverse effects or, if such measures are not possible,identifies measures to minimize, mitigate, and/or compensate for such effects and to ensure that the indigenous peoples receive culturally appropriate benefits under the Project.

4. Information Disclosure, Consultation, and Participation

This section: (i) describes the information disclosure, consultation, and participation process with the affected indigenous peoples that was carried out during subproject preparation; (ii) summarizes their comments on the results of the ESIA and identifies concerns raised during consultation and how these have been addressed in the Project design; (iii) in the case of Project activities requiring broad community support, documents the process and outcome ofconsultations with affected IPs and any agreement resulting from such consultations for the Project activities and safeguard measures addressing the impacts of such activities; (iv) describes consultation and participation mechanisms to be used during implementation to ensure ethnic minority participation during implementation; and (v) confirms disclosure of thedraft and final IPP to the affected IPs.

5. Beneficial Measures

This section specifies the measures to ensure that the IPs receive social and economic benefits that are culturally appropriate, and gender responsive.

6. Mitigation Measures

This section specifies the measures to avoid adverse impacts on IPs; and where the avoidance is impossible, specifies the measures to minimize, mitigate and compensate for identified unavoidable adverse impacts for each affected indigenous peoples.

7. Capacity Building

This section provides measures to strengthen the social, legal, and technical capabilities of (i)government institutions to address IPs issues in the Project area; and (ii) IPs organizations inthe Project area to enable them to represent the affected IPs more effectively.

8. Grievance Redress Mechanism

This section describes the procedures to redress grievances by affected IPs. It also explains how the procedures are accessible to indigenous peoples and culturally appropriate and gender sensitive.

9. Implementation Arrangement

This section describes institutional arrangement responsibilities and mechanisms for carryingout the various measures of the IPP. It also describes the process of including relevant local organizations and nongovernment

organizations in carrying out the measures of the IPP.

10.Monitoring, Reporting and Evaluation

This section describes the mechanisms and benchmarks appropriate to the Project for monitoring and evaluating the implementation of the IPP. It also specifies arrangements for participation of affected indigenous peoples in the preparation and validation of monitoring, and evaluation reports.

11.Cost Estimate and Financing

This section provides an itemized budget for all activities described in the IPP.

Annex 3 – Indicators for IPP Implementation Monitoring

Monitoring indicators should assist the project to assess progress of the Indigenous Peoples Plan (IPP) and whether mitigation measures are effective, resulting in desired outcomes. This enables the project to respond to any issues and manage change accordingly.

Indicators that show implementation progress are called process indicators and give some certainty that the project is proceeding according to plan.

Indicators that measure whether the IPP mitigation measures are successful are called outcome indicators and reflect the results of the process.

It is important that an appropriate number of indicators be included in the monitoring plan. Too few may leave gaps in critical areas. Too many may overburden the collection process, and diminish quality. Use the minimum but necessary number of monitoring indicators to ensure adequate IPP implementation and expected outcomes.

Some examples of process and outcome indicators are shown below. They are not an exhaustive list, and should be selected as required.

Example of Process Indictors	
Demographic baseline	• The numbers of affected Indigenous Peoples (IP) by category of impact, gender, age, habitat (village etc.), income, status and position • Number of households with handicapped, elderly or invalid members • Number of female headed households • Number of vulnerable households (poor, elderly) • Number of households by ethnic group • Number of births and deaths
Consultation and participation	• Number of consultation and participation activities that occur—meetings, information dissemination, brochures; flyers, training • Percentage of IP women as participants; number of meetings exclusively with IP women • Percentage of vulnerable IP groups represented / attending meetings; number of meetings exclusively with vulnerable IP groups. • Languages used at meetings • Good faith negotiations—recording of process, participants, locations, correspondence • Broad community support—record of processes, participants, locations and agreement obtained • Consultation and participation progress against plan and budget
Mitigation measures	• Progress of implementation of mitigation / beneficial measures against plan • Number of activities that occur/completed—such as construction, livelihood restoration, disbursements, training • Percentage progress against timelines and budget
Grievance redress	• Total number of people/groups using the grievance redress procedure. • Number of distinct people/groups. Any IP group with significantly more grievances? • How many times has a household submitted the same grievance? • Number of grievances resolved? • Length of time taken to be resolved? • Types of grievance categories and prevalence

Implementation problems	• Identified delays — (days, cost) due to personnel, capacity, insufficient funds, etc. • Number of times implementation schedule revised
Example of Outcome Indicators	
Consultation and participation program	• Awareness of IP issues among implementing stakeholders in each sector • Awareness of IPP mitigation and beneficial measures amongst recipients • Awareness of project details amongst stakeholders • IP perception of effectiveness, cultural appropriateness and inclusiveness of consultation measures • Attendance at consultation and participation activities Level of involvement by IP and representatives in the design and implementation of consultation and participation
Enhanced dignity of IP groups, integrity of traditional kinship networks and livelihood patterns	• Changes in religious/cultural practices • Changes in cultural governance • Participation in cultural governance (by gender, status) • Number of people (age and sex) who can speak national language and/or local dialect • Changes in condition of schools, community buildings, temples structures • Numbers of religious/cultural events and persons (monk shamans, priests etc.) • Participation in cultural/religious events (by gender, time/resources allocated)
Livelihoods and living standards	• Major asset inventory—e.g. vehicle, phone, tools, kitchen equipment • Changes in patterns of IP occupation, production, and resource use • Changes in income and expenditure patterns among IP households • Savings • Change in food used by IP—amount, nutrition source • Cost of living changes—market prices etc. • Changes in key social parameters—gender roles of production • Vulnerable groups—status, relative income, livelihood · Education—literacy and numeracy level in national/ethnic language • School attendance of IP children (by sex and age) • Key health indicators of IP (by gender, age)

Definitions

Affected People (AP)/Affected Households (AHs). In the context of involuntary resettlement, APs are those who are physically displaced (relocation, loss of residential land, or loss of shelter) and/or economically affected (loss of land, assets, access to assets, income sources, or means of livelihood) as a result of (i) land acquisition and involuntary resettlement; or (ii) involuntary restrictions on land use or on access to legally designated parks and protected areas. In the case of AP/AHs, it includes all members residing under one roof and operating as a single economic unit who is adversely affected by the project or any of its components. They can also be referred to as Displaced Persons. In this Land Acquisition and Resettlement Planning Framework (LARPF), the term used will be "AH."

Abbreviated Resettlement Plan (ARP). Where impacts on the entire displaced population are minor, or fewer than 200 people are displaced, the Client may, with the prior approval of the Bank, prepare an abbreviated resettlement plan, covering such elements as the Bank may specify. Impacts are considered "minor" if the affected people are not physically displaced and less than 10 percent of their productive assets are lost.

Corridor of Impacts (COI). It is the area which is required for construction of the planned civil works under the Project. The COI is agreed by the implementing agency and is demarcated by the civil work consultant within which the construction activities will take place.

Cut-Off Date (COD). Date established by the government that establishes the eligibility of the AHs for receiving compensation and resettlement assistance. For this project, the COD of each subproject financed under the Project will be date of the completion of the census undertaken during the detailed measurement survey (DMS) stage. The COD will be announced in the consultation meeting prior to DMS. Any persons who encroach upon the subproject's COI after the COD will not be eligible for any compensation or assistance. Persons not covered in the census result can be eligible for compensation if they can show proof that they have been inadvertently missed during the census survey.

Detailed Measurement Survey (DMS). With the aid of detailed engineering design, this activity involves finalization of the results of the inventory of losses, measurement of affected land and assets attached to land, 100% socioeconomic survey and 100% census of AHs.

Detailed Resettlement Plan (DRP). To be prepared following the completion of the Detailed Measurement Survey when impacts on land, assets, livelihood activities of affected people become known following the DMS.

Economic displacement. Loss of land, assets, access to assets, income sources, or means of livelihood as a result of (i) involuntary acquisition of land, or (ii) involuntary restrictions on land use or on access to legally designated parks and protected areas.

Eligibility. All AHs confirmed to be residing in, doing business, or cultivating land within the project affected area or land to be acquired or used for the project before the COD are eligible for resettlement compensation for their affected properties.

Eminent Domain. The right of Cambodia using its sovereign power to acquire land for public purposes. National law establishes which public agencies have their prerogative to exercise eminent domain.

Entitlements. Refers to a range of measures comprising compensation for loss of assents, resettlement assistance, income restoration, etc. which are due to the AHs, depending on the type and severity of their losses, to restore their economic and social base.

Expropriation. Process whereby a public authority, usually in return for compensation, requires a person, household, or community to relinquish rights to land that it occupies or otherwise uses. Expropriation under the Cambodian law refers to the confiscation of ownership or real right to immovable property of a natural person,

private legal entity, and legal public entity, which includes land, buildings, and cultivated plants and economically productive crops/trees, for the purpose of constructing, rehabilitating, or expanding public physical infrastructure for the national and public interests with prior and fair compensation.

Grievance Redress Mechanism. Refers to a mechanism established under the project to receive, facilitate, resolve, and report back to affected persons the grievance resolution outcome. In the context of this LARPF, the GRM aims to address timely and effectively the grievances arising from involuntary land acquisition, physical resettlement, accesses restrictions as well as economic displacement.

Host communities. Communities receiving physically affected persons of a project as re-settlers.

Income Restoration. Improve, or at least restore, the livelihoods of all persons displaced by the Project through: (i) where possible, land-based resettlement strategies when affected livelihoods are land-based or where land is collectively owned; or cash compensation at replacement value for land, including transitional costs, when the loss of land does not undermine livelihoods; (ii) prompt replacement of assets with assets of equal or higher value; (iii) prompt compensation at full replacement cost for assets that cannot be restored; and (iv) capacity building programs to support improved use of livelihood resources and enhance access to alternative sources of livelihood.

Income Support. Re-establishing the productive livelihood of the AHs to enable income generation equal to or, if possible, better than that earned by the AHs before the project.

Indigenous Peoples. "Indigenous Peoples" is used in a generic sense to refer exclusively to a distinct social and cultural group possessing all the following characteristics in varying degrees: Self-identification as members of a distinct indigenous social and cultural group and recognition of this identity by others; and Collective attachment[1] to geographically distinct habitats, ancestral territories, or areas of seasonal use or occupation, as well as to the natural resources in these areas; and Customary cultural, economic, social, or political institutions that are distinct or separate from those of the mainstream society or culture, and A distinct language or dialect, often different from the official language or languages of the country or region in which they reside.

Information Disclosure. The process of disseminating project information to stakeholders to allow them to understand the risks and impacts of the project, and potential opportunities.

Inventory of Losses. This is the process where all fixed assets (i.e. lands used for residence, commerce, agriculture, including ponds; dwelling units; stalls and shops; secondary structures, such as fences, tombs, wells; trees with commercial value; etc.) and sources of income and livelihood inside the Project right of way are identified, measured, their owner identified, their exact location pinpointed, and their replacement costs calculated.

Involuntary Resettlement. Resettlement is considered involuntary when directly affected persons or communities do not have the right to refuse project-related land acquisition or restrictions on land use that result in their displacement.

Land Acquisition. Refers to process and methods that are adopted to acquire land for the project purpose. This may include outright purchase, expropriation of property and acquisition of access rights, such as easements or rights of way. Land acquisition may also include: (a) acquisition of unoccupied or unutilized land whether or not the landholder relies upon for income or livelihood purpose; (b) repossession of public land that is used or occupied by individuals or households; and (c) project impacts that result in land being flooded or otherwise rendered unusable or inaccessible. Land acquisition refers to anything growing on or permanently affixed to land, such as crops, buildings, and other improvements.

[1] Means that for generations there has been a physical presence in, and economic ties to, land and territories traditionally owned, or customarily used or occupied, by the group concerned, including areas that hold special significance for it, such as sacred sites.

Land Acquisition and Resettlement Planning Framework (LARPF). Prepared when project components are not known and therefore land acquisition needs cannot be identified. The LARPF will guide the preparation of future Resettlement Plans if these become necessary.

Meaningful consultation. Two-way process that (a) begins early in project planning process to gather initial views on project proposal and inform project design; (b) encourages stakeholder feedback, particularly as a way of informing project design and engagement by stakeholders in the identification and mitigation of environmental and social risks and impacts; (c) continues on an ongoing basis, as risks and impacts arise; (d) is based on prior disclosure and dissemination of relevant, transparent, objective, meaningful and easily accessible information in a timeframe that enables meaningful consultation with project stakeholders in a format culturally appropriate, and in relevant local language(s) and is understandable to stakeholders; (e) considers and responds to feedback; (f) supports active and inclusive engagement with project-affected parties; (g) is free of external manipulation, interference, coercion, discrimination, and intimidation; and (h) is documented and disclosed by the Government of Cambodia. Under this LARPF, which is specific for land acquisition and involuntary resettlement, the meaningful consultation refers to consultation in respect of land acquisition, economic displacement, and physical resettlement which is clearly stipulated in the Government's Standard Operating Procedures (SOP) for Land Acquisition and Involuntary Resettlement (LAR) and incorporates all the above elements.

Physical Displacement. Relocation, loss of residential land, or loss of shelter as a result of (i) involuntary acquisition of land, or (ii) involuntary restrictions on land use or on access to legally designated parks and protected areas.

Relocation. This is the physical relocation of an AH from her/his pre-project place of location and/or business to another location.

Replacement cost. A method of valuation that yields compensation sufficient to replace affected assets, plus necessary transaction costs associated with asset replacement. Where markets are active, replacement cost is the market value as established through independent and competent real estate valuation, plus transaction costs. Where functioning markets do not exist, replacement cost may be determined through alternative means, such as calculation of output value for land or productive assets, or the undepreciated value of replacement material and labor for construction of structures or other fixed assets, plus transaction costs. In all instances where physical displacement results in loss of shelter, replacement cost must at least be sufficient to enable purchase or construction of housing that meets acceptable minimum community standards of quality and safety. The valuation method for determining replacement cost should be documented. Transaction costs include administrative charges, registration or title fees, reasonable moving expenses, and any similar costs imposed on affected persons.

Relocation Assistance. Support provided to persons displaced by the Project, including the following: (i) if there is relocation, security of tenure (with tenure rights that are as strong as the rights the displaced persons had to the land or assets from which they have been displaced) of relocation land (and assets, as applicable), proper housing at resettlement sites with comparable access to employment and production opportunities, integration of resettled persons economically and socially into their host communities and extension of Project benefits to host communities to facilitate the resettlement process; (ii) transitional support and development assistance, such as land development, credit facilities, training or employment opportunities, food, shelter, transportation; and (iii) civic infrastructure and community services, as required.

Right-of-Way. It is a government owned strip of land following a centerline (such as for roads, canals, etc.) providing an area of access.

Voluntary donation. Defined as the ceding of a property by an owner who is (a) appropriately informed about the project and their right to seek compensation and (b) can refuse to donate. This does not apply to voluntary,

legally recorded market transactions unless such voluntary land transactions may result in displacement of persons other than the seller.

Poor and Vulnerable Persons/Groups.[2] A distinctive group of APs who by virtue of factors beyond their control: (a) are to be more adversely affected by the project's environmental and social impacts; and (b) may be more limited than others in their ability to claim or take advantage of project benefits. Such individuals or groups are also more likely to be excluded from or unable to participate fully in the mainstream consultation process and may require specific measures or assistance (or both) to do so. Poor and vulnerable persons are categorized as: (i) households living below the poverty rate as established by the Royal Government of Cambodia; (ii) elderly people headed households with no means of support; (iii) female headed households with dependents living below the poverty rate; (iv) disabled headed households, (v) landless poor living below the national poverty rate; and (vi) indigenous peoples (who often have traditional land rights but no formal titles).

Due to their vulnerability, particular attention will be paid to such displaced persons to provide them with an opportunity to improve their status and benefit from development/resettlement to the same extent as other displaced persons. This group of displaced persons will be provided with additional assistance to re-establish their livelihood status if they lose their livelihood source permanently.

[2] The group is classified under Sub-Decree No. 291 ANKr. BK on identification of Poor and Vulnerable Households issued with ID Poor Cards by Royal Government of Cambodia.

Executive Summary

1. This is an Executive Summary of the main points discussed in this Land Acquisition Resettlement Planning Framework (LARPF). The Executive Summary should not be relied on for full information; the full LARPF should be read for this purpose.

2. This LARPF has been prepared by the Ministry of Water Resources and Meteorology (MoRWAM) for the Climate Adaptive Irrigation and Sustainable Agriculture for Resilience Project (CAISARP) with the guidance and direction of the General Department of Resettlement (GDR) of the Ministry of Economy and Finance (MEF). This LARPF will be applied to all investments to be financed under this CAISARP irrespective of financing source (e.g. the AIIB, IFAD, and Royal Government of Cambodia). The LARPF has been prepared in line with the Royal Government of Cambodia's (RGC) Standard Operating Procedures on Land Acquisition and Resettlement (RGC's SOP-LAR), the Asian Infrastructure Investment Bank's (AIIB) Environment and Social Framework, 2022 (ESF), and International Fund for Agriculture Development's (IFAD) Social, Environmental and Climate Assessment Procedures 2020 (SECAP) Standard 7.

3. This document is considered a living document and shall be modified and updated in line with the changing situation or scope of the activities. The Detailed Resettlement Plans (DRPs) and Abbreviated Resettlement Plans (ARPs) will be developed when and if necessary, in close consultation with affected stakeholders and the AIIB and IFAD. Clearance of future DRPs/ARPs by the AIIB will be necessary.

4. The objective of CAISARP is to improve aspects of water security and increase agricultural water productivity in Kampong Speu, Kampong Chhnang, Kandal, and Pursat province.

5. The CAISARP will be implemented through various activities organized through the following three components: (i) Component 1. Improving farm-level climate adaptation, resilience, and water use efficiency; (ii) Component 2. Upgrading and climate-proofing water infrastructure for increased resilience; and (iii) Component 3. Institutional strengthening.

6. In Cambodia, the Expropriation Law (2010) is the main legal framework that governs land acquisition and involuntary resettlement (LAR). Under the Article 3 that governs the provision for projects financed by development partners in Cambodia, the RGC issued in 2018 the Standard Operating Procedures on Land Acquisition and Involuntary Resettlement (SOP-LAR). The GDR of the MEF is responsible for providing guidance and clarification to users of SOP-LAR. Given that the proposed CAISARP is financed by the Asian Infrastructure Investment Bank (AIIB) and International Fund for Agriculture Development (IFAD), the SOP-LAR is the guiding RGC's sub-decree for land acquisition and should be read together with this document. This LARPF also complies with the AIIB's Environment and Social Standard (ESS2) and IFAD's Social, Environmental and Climate Assessment Procedures (SECAP) Standard 7. There are some minor, but no significant gaps between the policies of the SOP-LAR, AIIB's ESS2, and IFAD's SECAP Standard 7. Two most relevant is that the SOP-LAR does not have a provision for voluntary donations (VDs) and negotiated settlement as the SOP-LAR addresses involuntary resettlement. This LARPF describes a process for VDs consistent with the AIIB's ESS2, which will be followed for the CAISARP and the required steps and documentation. The approach to manage resettlement under CAISARP follows the mitigation hierarchy by:

- Adjusting designs to avoid impact on land and assets;
- When impacts cannot be avoided, minimize them;
- Once risks and impacts have been minimized or reduced, mitigate through compensation payment for affected assets and income generation activities; and
- Where land acquisition impacts remain, compensate people as per this LARPF.

7. This LARPF covers resettlement: (i) where land, or assets, are voluntarily donated; (ii) where land, or assets, are involuntarily acquired. Voluntary contributions, with proper information and documentation as explained in this LARPF, can be justified because irrigation infrastructure rehabilitation will directly benefit farmers for irrigation, water consumptions and fisheries. However, the benefit from an irrigation infrastructure rehabilitation may far outweigh the impact on a small asset such as a small temporary movable farm cottage, trees/crops. Besides the process for VD and involuntary land acquisition, the LARPF also details the institutional arrangements and responsibilities, consultations, information disclosure, funding arrangements and monitoring and reporting.

8. The LARPF applies to permanent or temporary physical and economic displacement as described in the SOP-LAR, and compliant with AIIB's ESS2 and IFAD's SECAP Standard 7. All affected households (AHs) who have assets in the Corridor of Impact (COI) before the Cut-Off-Date (COD) will be eligible for compensation as described in this LARPF, regardless of their legal status. COD is the date established by the government that establishes the eligibility for receiving compensation and the resettlement assistance by the project affected persons. The COD needs to be well-documented. Persons not covered may be eligible in case they can show proof that they have inadvertently missed out during the census.

9. Based on the scope, scale, and nature of potential subprojects, the CAISARP may involve minor land acquisition – both permanent and temporary, to facilitate rehabilitation/upgrading of existing reservoirs, irrigation canals, weirs, barrage, including construction of new water distribution system (to increase command areas), and so forth. Physical resettlement of local people is envisaged but could be avoided through alternative designs since existing works are in remote rural areas where local population is small and scattered. If permanent land acquisition is required at subproject level, public land will be prioritized. If not feasible because of technical requirements, private agricultural land would be acquired which is anticipated to be of small-scale at household level due to linear land impact, particularly where land is required for building new canals to extend existing water distribution system for new command area. It is noted that as existing reservoirs are upgraded to increase water retention capacity (impounding additional water amount), both upstream and downstream impacts are anticipated but scope and magnitude of land impacts may vary depending on various factors such as maximum water retention capacity, water flow regulation during subproject operation, seasonal rainfall, current land use (for upstream) and water use (for downstream). Upstream impact might include extended inundation (area and time duration) which may restrict local land access for agriculture/non-agricultural income generation activities, and/or animal raising, etc. Downstream impact may include restricted access to normal volume of water for farming/water supply purposes, and so on.

10. The LARPF outlines the Grievance Redress Mechanism to be established as a locally based arrangement for receiving, recording, assessing, and facilitating the resolution of complaints and grievances raised by the affected persons in relation to the CAISARP. The LARPF also describes the process for consultation and information disclosure in cases of VDs and for land acquisition.

1. INTRODUCTION

1.1 Project Background

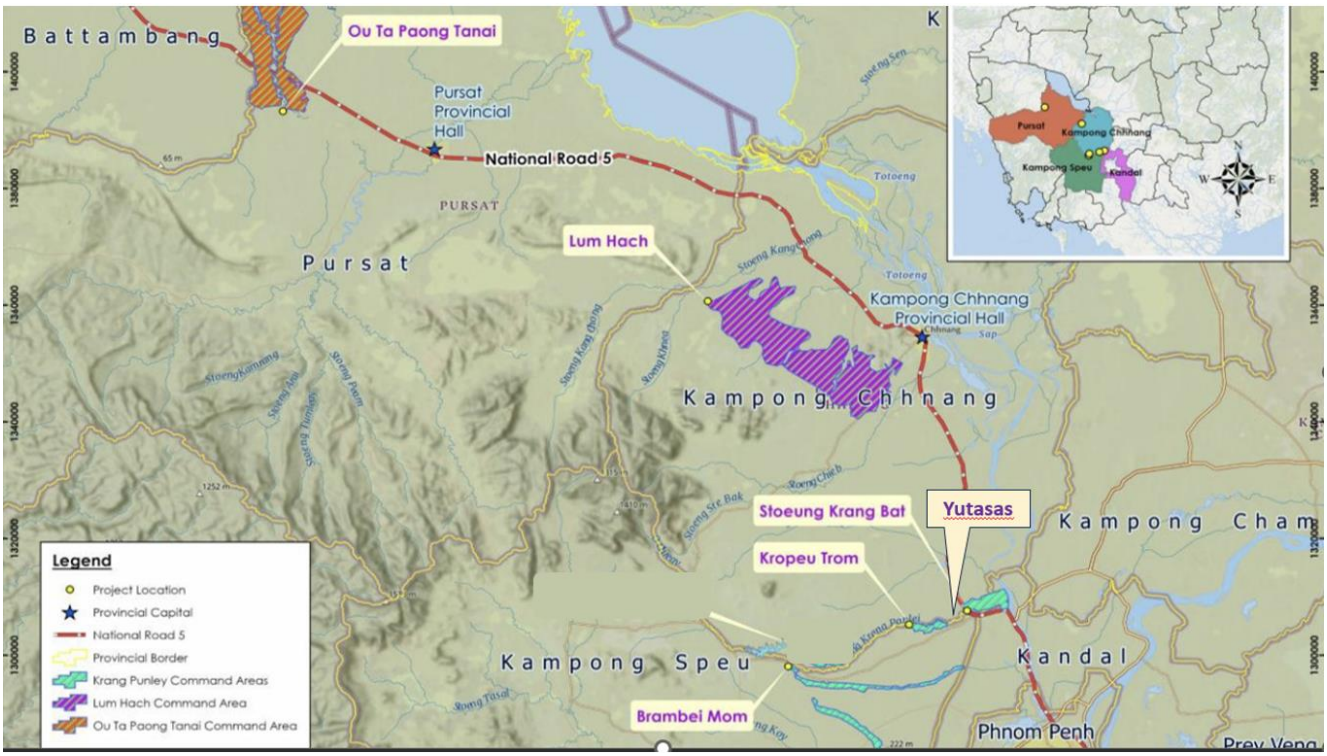
1.1.1 Project Context

11. Cambodia's irrigated agriculture faces increasing challenges from adverse impacts of climate change, especially the changes in rainfall patterns, duration and timing of the rainy season, and climate induced water disasters such as floods and droughts. Climate Resilient and low emission practices and investments in agriculture and water management are therefore crucial to protect and enhance Cambodia's agricultural production and productivity which will in turn contribute to poverty reduction and increased food security.

12. Addressing the complex impacts of climate change on rain fed and irrigated agriculture requires action at both farm and irrigation scheme, including enabling environment at regional and national level. Farm level actions will help communities adapt to climate change while also saving water and decreasing Green House Gas (GHG) emissions from BAU of agriculture, water use and management. This will help farmers to diversify their farming while also addressing changing rainfall patterns and increasing drought conditions throughout the growing season. Actions at system level will help achieve a modernized and climate proofed irrigation infrastructure delivering irrigation services to farmers in line with the requirements at the farm level. It will also protect the natural capital stocks, especially the land and water, against the increasing threats of flood. In addition, replacement of diesel pumps with solar pumps and combination of both grey and green solutions for irrigation modernization and flood proofing works will help reduce GHG emissions.

13. The integrated actions combining both farm and system levels has a transformative potential to reduce vulnerability of water and agriculture systems to climate change impacts while also reducing GHG emissions and enhancing the livelihood of rural populations who primarily depend on agriculture.

14. The theory of change diagram demonstrates how the project shifts the BAU from poorly constructed and maintained irrigation systems to a smart, climate resilient water management system with climate proofed irrigation and flood control infrastructures for smallholder farmers. The project's outcomes and outputs are in-line with Global Climate Fund's adaptation and mitigation goals, objectives, and long-term sustainability principles.



15. The paradigm shifting aspects of the CAISARP will include the data driven climate-proofing of irrigation infrastructure and focus on last-mile engagement of vulnerable communities. The Terms of Condition shows that if climate resiliency of irrigated agriculture is enhanced then the agricultural outputs and income of small-scale farmers will increase, as well as the climate resilience of vulnerable households and in particular to women will increase because water and food systems are less vulnerable to increasing temperatures, changing rainfall patterns and the extreme water events, and low-emission irrigation and sustainable agriculture adaptation practices will contribute to Nationally Determined Contributions mitigation targets.

16. The project's goal stated above shall be achieved through the generation of the following three outcomes: (1) Improved resiliency of small holder farmers (2) Resilient water control infrastructure and water service delivery with less crop and asset damage and (3) Reduced GHG emission. These three outcomes are derived from interventions at farm and irrigation system level together with institutional strengthening of relevant stakeholders and will contribute towards an irrigated agricultural system that is climate resilient and productive ultimately reducing the climatic vulnerability of poor farmers in the CAISARP areas.

1.1.2 Project Development Objective and Project Components

17. The objective of CAISARP is to increase climate adaptation, mitigate the negative impact of extreme climate events and improve livelihoods of smallholder farmers and vulnerable rural communities in four provinces of Cambodia in Kampong Speu, Kampong Chhnang, Kandal, and Pursat province (Figure 1).

Figure 1 – Map showing six irrigation schemes located in four provinces

Source: CAISAR Feasibility Study July 2023

18. The proposed CAISARP will be implemented through various activities organized through the following three components:

- Component 1. Improving farm-level climate adaptation, resilience, and water use efficiency
- Component 2. Irrigation Infrastructure for increased resilience
- Component 3. Institutional strengthening

1.1.3 Project Budget and Implementation Agency

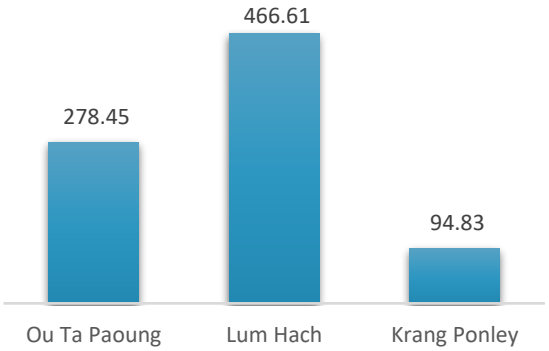
19. The proposed CAISARP will be implemented by the Ministry of Water Resources and Meteorology (MoWRAM) from 2025 to 2031 with an estimated cost of US$240 million.

1.2 Rationale and Purpose of the Resettlement Planning Framework

1.2.1 Rationale

20. The Asian Infrastructure Investment Bank's (AIIB) Environment and Social Standard (ESS2) on Land Acquisition and Involuntary Resettlement (LAR) and the International Fund for Agriculture Development's (IFAD) Social, Environmental and Climate Assessment Procedures (SECAP) Standard 7 requires that Borrowing country prepares a Land Acquisition and Resettlement Planning Framework (LARPF) in case a project requires land acquisition and/or have restriction on land use, but impact zones of the subprojects cannot be determined during project preparation. Under this CAISARP, since land acquisition are anticipated and the number, nature, and scale of subprojects have not been confirmed during project preparation stage, this LARPF is prepared in accordance with AIIB's Environmental and Social Framework (ESF), specifically: ESS1 and ESS2; the IFAD's SECAP – Standard 7, and in compliance with the Royal Government of Cambodia's relevant laws and regulations, including the Sub-Decree No.22 ANK/BK (2018) on Promulgation of the Standard Operating Procedures for Land Acquisition and Involuntary Resettlement (SOP-LAR) for externally financed Projects in Cambodia.

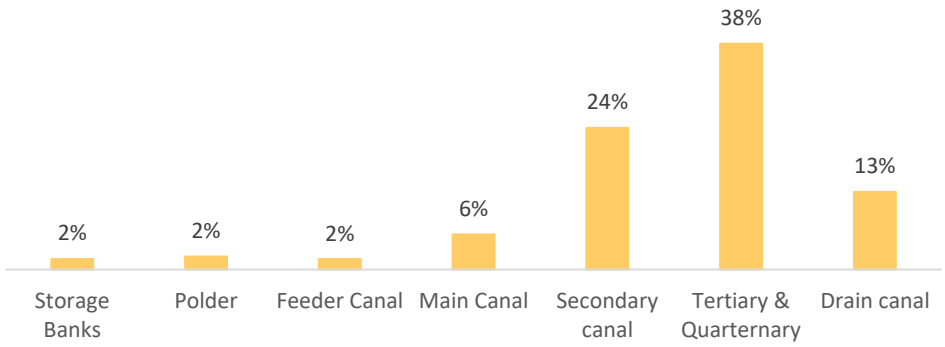
1.2.2 Purpose



21. The purpose of this LARPF is to establish principles and procedures for consultation with affected households, compensation payment, resettlement, eligibility criteria for affected households, entitlements and

livelihoods restoration plan, implementation arrangements, a grievance redress mechanism, monitoring and reporting arrangements, estimated costs and budget, etc. which are to be applied to prepare Resettlement Plan(s) for relevant subprojects to be finalized/confirmed during CAISARP's implementation. This LARF is intended to avoid or minimize any adverse impacts associated with physical or economic displacement, and to ensure arrangements are in place to mitigate any adverse impacts that may occur. The Borrower agrees to apply the principles, procedures, and standards incorporated in ESS2 of the AIIB ESF and the IFAD's SECAP Standard 7 if obtaining any sites for project use would cause economic displacement or physical displacement.

2. PRELIMINARY ASSESSMENT OF LAND ACQUISITION & RESETTLEMENT IMPACT



22. The proposed CAISARP will rehabilitate existing irrigation canals and build new irrigation channels in an estimated six schemes located in four provinces (Kampong Speu, Kampong Chhnang, Kandal, and Pursat). In some subprojects, small-scale roads will be built alongside existing/new canals to improve transportation of farm produce for the rice farmers. Due to the construction of new canals and roads, land acquisition of small scale may be required. However, the scope of land acquisition is expected to be small at household level (linear impact) and as such would not affect remarkably the livelihood of those who are land based. Physical resettlement is anticipated but the number of affected households would be very small because most land acquisition (required for construction) would take place in the command area where residential houses are not present. An estimated 839ha of public and private land (Figure 2) would be required for the planned construction of irrigation systems at subproject command areas, including Ou Ta Paong Tanai, in Pursat province, Lum Hach in Kampong Chhnang province, and Krang Ponley which including sub project areas—Brambei Mom, Chhean Laeung, Krapeu Trom, Stoeng Krang Bot, in Kampong Chhnang, Kapong Speu and Kandal provinces (Figure 1).

Figure 2 – Estimated land need (hectare) for construction of irrigation system

23. Of the total land (about 839ha) to be required for construction, most of the land that are required for project construction are within the command areas and are at tertiary and quaternary canals (38%), followed by secondary canal (24%), drain (13%) (Figure 3).

Figure 3 – Estimated land acquisition by type of construction

- **Physical resettlement**

24. The proposed CAISARP makes every effort to avoid physical resettlement. However, physical resettlement may not be avoidable, particularly in some road sections (located along main canals) where existing roads could be widened which requires some households to resettle.

- **Temporary Restriction of Irrigation Access**

25. During subproject construction, in some irrigated areas, water from existing reservoir may be restricted to facilitate the construction process. However, this temporary impact is anticipated to be minor since most of the current project area is rainfed.

- **Impact on collective land owned by IPs**

26. Based on the above preliminary assessment of the locations of land impact, it is anticipated that there is no land collectively owned by IP community located in the command area (where most land acquisition is required). Under the proposed CAISARP, impact on land collectively owned by IP community, if any, will be avoided through alternative designs.

3. LEGAL FRAMEWORK GOVERNING LAND ACQUISITION & INVOLUNTARY RESETTLEMENT

3.1 National Laws and Regulations

27. **The Expropriation Law (2010)** is the key legal framework that governs land acquisition and involuntary resettlement in the Kingdom of Cambodia. The law defines land expropriation in the Kingdom of Cambodia by specifying principles, mechanisms, procedures required for land expropriation and for fair and just compensation for affected peoples under any construction, rehabilitation, and public infrastructure projects implemented for public and national interest, and for the development of Cambodia. The law defines the development of public infrastructure as one of its objectives and extends the definition of public infrastructure to any infrastructure "required by the Nation in accordance with the determination made by the government." Public interest is also understood in a broad manner as "the use of land or property by the public or by public institutions or their agents." The expropriation of the ownership of immovable property and real right to immovable property can be exercised only if the Expropriation Committee has paid fair and just compensation to the owner and/or holder of real right in advance.

28. Key articles of the Expropriation Law (2010) are:

- **Article 2**: The law aims to: (i) ensure just and fair deprivation of legal rights to private property, (ii) ensure prior fair and just compensation, (iii) serve the national and public interest, and (iv) develop public physical infrastructures;
- **Article 3**: Under the Article 3 of the Expropriation Law (2010) that governs the provision for projects financed by Development Partners in Cambodia, the RGC issued the SOP-LAR in 2018. The SOP-LAR reflects the polices, regulations and procedures relating to the acquisition of land and the involuntary

resettlement consistent with the safeguard policies and procedures of the development partners like AIIB, IFAD, ADB, WB, and incorporates international good practices in resettlement planning, implementation, monitoring and reporting. The SOP-LAR has a specific provision which stipulates that where a provision conflicts with the mandatory safeguard requirement of the Development Partner, then the later will prevail;

- **Article 7**: Only the State may carry out an expropriation for use in the public and national interests;
- **Article 22**: The amount of compensation to be paid to the owner of and/or holder of real right to the immovable property shall be based on the market prices or replacement costs as of the issuance date of the declaration on the expropriation project. The market prices or replacement costs shall be determined by an independent committee or agent appointed by the Expropriation Committee;
- **Article 29**: A tenant of the immovable property with proper contract shall be entitled to allowance for disturbances because of the expropriation including the dismantling of structures, materials, and transportation to the new relocation site. A tenant of the immovable property who is operating a business shall be entitled to compensation for the impact on their business operation and to additional assistance at fair and just compensation to the capital value actually invested for the business operation activities as of the date of the issuance of the declaration on the expropriation project. For the expropriation of a location that is operating business activities, the owner of the immovable property shall be entitled to additional compensation at fair and just compensation against the value of the property actually affected by the expropriation as of the date of the issuance of the declaration on the expropriation project.

29. **RGC's Sub-Decree No. 22 ANK/BK (2018) on the Promulgation of the Standard Operating Procedures for Land Acquisition and Involuntary Resettlement (SOP-LAR) for Externally Financed Projects in Cambodia**. The General Department of Resettlement (GDR) of the Ministry of Economic and Finance (MEF) is responsible for providing guidance and clarification to users regarding the SOP-LAR. Given that the proposed CAISARP will use counterpart funding for compensation and support, the provisions of SOP-LAR will apply to the proposed CAISARP and therefore should be read in conjunction with this LARPF.

30. **Sub-Decree No.19 on Social Land Concession of March 2003** provides for allocations to landless people of state lands for free for residential or family farming purposes, including the provision of replacement land lost in the cases of involuntary resettlement.

31. **RGC's Sub-Decree No.118 ANK/BK (2005) on State Land Management.** The Sub-Decree defines principles, procedures, mechanisms, and institutional arrangement for state land management. In line with key sections of Article 4, public state land has a public interest use and falls within one of the following specific types of property having a public interest use:

32. Properties that have a natural origin, such as

- Forests
- Courses of navigable or floatable water
- Natural lakes
- Banks of navigable or floatable waters

33. Properties available in its natural state or specifically developed for public use, such as

- Roads
- Tracks
- Oxcart ways
- Pathways
- Gardens and public parks
- Reserved land

34. **RGC's Sub-Decree No.98 ANK/BK (2015) on River Basin Management.** The Sub-Decree regulates the management, conservation, and development of the river basins in a manner that is effective and sustainable – as stated in the Law on Water Resources Management in the Kingdom of Cambodia (2007). The Sub-Decree specifies procedures for establishment and implementation of the plans for management, conservation and development of the river basin, sub-river basin, watershed, ground water and aquifer.

35. Key chapters and articles of RGC's Sub-Decree No.98 ANK/BK (2015) on River Basin Management are:

- **Chapter 3 River Basin Zoning and Delineation of Riparian Land, Article 8**: The distance of riparian and coastal strips along key natural water features and water works in rural areas of river basins is defined below:
  - Coastal strip and estuary 100 (one hundred) meters from the coastal bank and estuary bank;
  - River 50 (fifty) meters from its bank;
  - Stream 30 (thirty) meters from its bank;
  - Creek 20 (twenty) meters from its bank;
  - Small stream 10 (ten) meters from its bank;
  - Main channel 10 (ten) meters from the terrace of channel embankment;
  - Distribution channel 5 (five) meters from the terrace of channel embankment;
  - Irrigation channel 3 (three) meters from the terrace of channel embankment;
  - Basin area 100 (one hundred) meters from the maximum water level from the basin water surface;
  - Lakes 50 (fifty) meters from the maximum water level allocated in the reservoir;
  - Basin embankment 20 (twenty) meters from the terrace beneath the basin embankment of less than 04 (four); 100 (one hundred) meters from the terrace between 4 to 8 meters high. In case the embankment height exceeds 8 (eight) meters high, it shall be determined by separate sub-decree.

36. The riparian land as stated above is the state's public asset. The delineation of riparian land has no retroactivity on existing land with ownership titles issued before this sub-decree is in force.

- **Chapter 4 – Jurisdiction, Mechanism and Committee for River Basin Management, Article 10:** The MoWRAM is responsible in leading, monitoring and coordinating and consulting with concerned institutions for the management, conservation, and development of all river basins in the Kingdom of Cambodia.

3.2 AIIB's Environmental and Social Framework

37. The AIIB Environmental and Social Framework (ESF) sets out the requirements for all Bank supported operations to comply with the Bank policies addressing environmental and social impacts, among other policies[3]. The following AIIB's Environmental and Social Standards (ESSs) applies to this LARPF:

- **ESS1: Environment and Social Assessment and Management**
  The objectives of ESS1 are to achieve the environmental and social soundness and sustainability of Projects and to support the integration of environmental and social considerations into Project decision-making process and implementation. The ESS1 applies if the Project is likely to have adverse environmental risks and impacts or social risks and impacts (or both). The scope of the environmental and social assessment and management measures are proportional to the risks and impacts of the Project. ESS1 provides both for quality environmental and social assessment and for management of risks and impacts through effective mitigation and monitoring measures during the course of Project implementation.
- **ESS2: Land Acquisition and Involuntary Resettlement**
  The objectives of ESS2 are (a) to avoid Involuntary Resettlement wherever feasible; (b) to minimize Involuntary Resettlement by exploring Project alternatives; (c) where avoidance of Involuntary Resettlement is not feasible, to enhance, or at least restore, the livelihoods of all displaced persons in real terms relative to pre-Project levels and to provide resettlement assistance; (d) to understand and

[3] https://www.aiib.org/en/policies-strategies/_download/environment-framework/AIIB-Environmental-and-Social-Framework_ESF-November-2022-final.pdf

address gender-related risks and differential impacts of Involuntary Resettlement; (e) to improve the overall socioeconomic status of the displaced poor and other vulnerable groups; and (f) to conceive and implement resettlement activities as sustainable development programs, providing sufficient resources to enable the persons displaced by the Project to share in Project benefits.

3.3 IFAD's Social, Environmental and Climate Assessment Procedures

38. The IFAD's Social, Environmental and Climate Assessment Procedures (SECAP) comprise key requirements for the environmental and social sustainability of projects. Under the CAISARP, IFAD's SECAP Standard 7 − Physical and economic resettlement applies.

39. The objectives of SECAP Standard 7 are (i) Avoid involuntary resettlement or, when unavoidable, minimize involuntary resettlement by exploring alternative project designs and sites; (ii) Avoid forced eviction; (iii) Ensure that resettlement activities are planned and implemented collaboratively with the meaningful participation of affected people; (iv) Enhance and restore the livelihoods of all displaced people; and (v) Provide explicit guidance to borrowers/recipients/partners on the conditions that need to be met regarding involuntary resettlement.

40. This Standard applies to CAISARP because the project involves displacement and resettlement. The displacement may be full or partial, permanent, or temporary, and could result from a variety of project activities. This Standard also applies to any physical or economic displacement for purposes relevant to the project before IFAD's involvement. Application of this Standard must be consistent with universal respect for fundamental human rights and freedoms, the principles of non-discrimination, equal opportunity and fair treatment, and the right to private property, adequate housing and improvement of living conditions.

3.4 Gap Analysis: AIIB ESS2, IFAD SECAP, and RGC SOP-LAR

41. The AIIB's ESS2 and IFAD's SECAP Standard 7 recognizes that project related land acquisition and restrictions on land use can have impacts on communities and persons. AIIB's ESS2, IFAD's SECAP Standard 7, and RGC's SOP-LAR have specified its objectives and principles of LAR to ensure affected people are not worse off because of land acquisition. The principles of the AIIB's ESS2, IFAD's SECAP Standard 7, and the RGC's SOP-LAR are largely similar on consultation, grievance redress, social support, livelihood restoration, resettlement assistance, standard of living of poor and vulnerable, entitlements for persons without title or legal rights except for land, information disclosure, payment of compensation and entitlements prior to physical displacement, and the supervision and monitoring of implementation of resettlement plans. The key departure is on the requirement on **negotiated settlement**.

However, in terms of procedures, the SOP-LAR does not have procedures for negotiated settlement and Voluntary Donations (VD). Since the GDR has a lot of experience in acquiring land through a negotiated settlement, particularly under Asian Development Bank and World Bank financed projects, the negotiated settlement approach could be applied to CAISARP. To assist the GDR in conducting acquisition of land through a negotiated settlement, this LARPF spells out the detailed procedures that the GDR will follow in case involuntary acquisition of land through negotiated settlement.

42. The key requirements under AIIB ESS2, IFAD SECAP 7 and the corresponding provisions in the RGC's SOP-LAR demonstrating any gaps in voluntary land donations and clarifications on LAR are summarized in Table 1.

Table 1 – Summary of Gaps and Clarifications Between RGC's SOP-LAR, AIIB's ESS2, and IFAD's SECAP Standard 7

Items for Clarification	RGC's SOP-LAR	AIIB's ESS2	IFAD's SECAP Standard 7	Clarifications
Livelihood Restoration	SOP-LAR details specific measures to restore livelihoods which are land-based, employment-based and business-based.	Restore livelihoods through (i) land-based resettlement strategies, where possible or cash compensation at replacement values plus transitional cost; (ii) prompt replacement of assets with assets or equal or higher value; (iii) prompt compensation at replacement value; (iv) capacity building programs; additional revenues through benefit sharing.	Action plans have been designed to enhance and restore the standards of living and livelihoods of affected persons. Such plans will address, at a minimum, the following element: Established eligibility criteria, cut-off dates, compensation and entitlements for all categories of affected persons. Measures to provide (a) fair and just compensation; (b) transition support (both financial and in-kind); and (c) assistance such as land development, credit facilities, direct benefits, training and provision of expertise, as appropriate.	There are no gaps. Based on RGC's SOP-LAR, an Income Restoration Program would be provided in order to re-establish sources of livelihoods for all APs who have permanently lost any of their sources of livelihood. If applicable in CAISARP, DRPs will include provisions to ensure livelihood restoration programs are robust and can accurately meet the livelihood restoration objectives in line with AIIB's ESS2 and IFAD's SECAP Standard 7.
Compensation and Resettlement Assistance	The SOP-LAR includes the compensation and transition/disturbance allowance to the DPs in its entitlement. The SOP-LAR has provisions for relocation land (for DPs with title or recognized rights to land) and are subject to conditions (e.g., availability of government land).	Provide DPs needed assistance: (i) • If relocated, security of tenure rights as strong as DP had to the prior land; • Proper housing at resettlement sites with comparable access to employment/production opportunities; and • Social and economic integration into host communities. (ii) • Transitional support; and • Development assistance such as land development assistance, credit facilities, training or employment opportunities (ii) civic infrastructure and community services	Provide (i) fair and just compensation at full replacement cost prior to displacement (based on the cost of replacement at resettled sites and locations) for any losses of personal, real or other property or goods, noting that compensation and support may be collective in nature; (ii) transitional support (both financial and in-kind) based on reasonable estimates of the time required to restore and improve income earning capacity, production levels and living standards; and (iii) assistance with land development, credit facilities, direct benefits, training or employment opportunities, and expertise as needed (the combination of compensation, transitional support and assistance is aimed at enhancing and restoring displaced persons' pre-displacement productive capacity and earning potential).	There are no gaps. This LARPF will align with the SOP-LAR's provisions on compensation and assistance.

Items for Clarification	RGC's SOP-LAR	AIIB's ESS2	IFAD's SECAP Standard 7	Clarifications
Grievance Redress Mechanism	Appendix 8 of the SOP-LAR provides the structure and details on the operating guidelines and procedures of an effective functioning Grievance Redress Mechanism. It provides a 3-step process including the registration and recording of complaints and the judicial process if the complaints remain unresolved at the administrative level. The detailed procedures for at each step are also provided in the SOP-LAR.	Establish a suitable grievance mechanism to receive and facilitate the resolution of concerns of DPs; utilize existing formal or informal grievance mechanism; supplemented by the project specific mechanism.	All borrowers/recipients/partners must ensure that an effective, accessible and culturally appropriate grievance redress mechanism is established to facilitate the resolution of concerns and complaints (e.g., compensation, relocation or livelihood restoration) by affected individuals.	There are no gaps. The SOP states that there will be consultations with APs at various stages including during Basic Resettlement Plan and RP preparation. Prior to the preparation of the RP, consultation is carried out to confirm eligibility criteria and discuss entitlement matrix, as well as to introduce GRM. In addition, the copies of the Guidelines for GRM are translated in Khmer or/and IPs' language and provided and explained in detail to the APs during the public consultation process. There are clear mechanisms for grievance redress in the SOP. While the mechanisms are clearly set out, GDR will ensure it is accessible to all APs, in particular vulnerable APs and women.
Consultations and Stakeholder Engagement	• The SOP-LAR details out a number of steps to carry out consultations at various stages of the land acquisition and resettlement process and compensation. • Para 126 mentions that the consultation is undertaken throughout the project cycle. • SOP-LAR provides for stakeholder engagement in respect of land acquisition and involuntary resettlement. The SOP-LAR provides for disclosure of the LARPF to the stakeholders and public before the approval of the project. Similarly, the DRPs are also disclosed to stakeholders and	Carry out meaningful consultations with persons to be displaced by the Project, host communities and non-governmental organizations, and facilitate their informed participation in the consultations, consult with all persons to be displaced on their rights within the resettlement process, entitlements and resettlement options, and further participation process. Ensure their involvement in planning. Implementation, monitoring and evaluation of the resettlement plan. Pay particular attention to the needs of vulnerable groups, especially those below the poverty line, the landless, the elderly, women and children, indigenous peoples and those without	Ensure that resettlement activities are planned and implemented collaboratively with the meaningful participation of affected people.	Meaningful consultations, inclusive of all groups and gender including vulnerable persons, as per AIIB's ESS2 should be conducted, with particular attention to ensuring it is a two-way process, that allows for feedback from APs and they are informed how their feedback was incorporated.

Items for Clarification	RGC's SOP-LAR	AIIB's ESS2	IFAD's SECAP Standard 7	Clarifications
	public after approval by the GDR.	legal title to land and ensure their participation in consultations.		
Voluntary Donation (VD)	• The SOP deals with land acquisition and involuntary resettlement and therefore does not provide guidance on VDs.	AIIB's ESS2 prescribes that where affected people choose to voluntarily donate land or assets without payment of full compensation, based on conditions (a) the potential donor or donors have been appropriately informed and consulted about the project and the choices available choices regarding the land and their implications, including refusal to donate the land, and has confirmed in writing their willingness to proceed with the donation; (b) the amount of land being donated is minor and will not reduce the donor's remaining land area below that required to maintain the donor's livelihood at current levels; (c) no household relocation is involved; (d) the donor is expected to benefit directly from the project	There is no Standard applicable to resettlement resulting from voluntary transactions.	SOP-LAR does not prescribe VDs. However, this LARPF provides guidance on when VDs would be appropriate and the process of carrying out the donations, including documentation which will need to be followed by MoWRAM.

4. SCOPE AND APPLICATION, PRINCIPLES AND PROCESS

4.1 Scope and Application

43. This LARPF pertains to situations of permanent or temporary resettlement and economic displacement directly resulting from the CAISARP within the subproject area. These situations should align with the RGC's SOP-LAR and complied with the AIIB's ESS2.

44. It's important to note that this LARPF does not encompass impacts on incomes and livelihoods that are not directly influenced by CAISARP's land acquisition or land use restrictions. Such impacts will fall under AIIB's ESS1 on Environmental and Social Assessment and Management. They will also be addressed in accordance with CAISARP's Environmental Code of Practice (or, if deemed necessary, through the development of an Environmental and Social Management Plan specific to the respective subprojects.

45. In cases where a VD procedure is applied to households affected by the subproject, the MoWRAM must document the entire land donation process following the guidelines provided in this LARPF. It is important to emphasize that AHs have the right to refuse participation in this procedure.

46. Under exceptional circumstances that necessitate additional land acquisition, the GDR team will carry out a negotiated settlement, as outlined in this LARPF. This applies when there are no more than 20 AHs. However, the willingness of the AHs to engage in a negotiated settlement will be determined during the initial consultation meeting with the community and the AHs.

47. In the proposed CAISARP, efforts will be made to avoid any adverse impact on land collectively owned by Indigenous Peoples (IP) communities through alternative project designs. Meaningful consultation will be conducted with IPs, if applicable, and it should be noted that Free, Prior, and Informed Consultation and Free, Prior and Informed Consent are not required in this specific context.

4.2 Eligibility Criteria

48. People whose assets such as houses, structures, business, crops, etc. are in a subproject area before the COD for the subproject is announced will be eligible for compensation for their affected assets, loss of livelihoods, and livelihood restoration support – regardless of the legal status of the affected land[4]. People who occupy any land portion of the subproject area after the COD is publicly announced will not be eligible for any compensation or any other resettlement assistance. Ideally COD should be established at the DMS stage when the full census will be conducted.

4.2.1. Category of Project Affected Persons

49. All AHs who have assets in the COI before the COD will be eligible for compensation and resettlement assistance, regardless of their legal status – as follows:

a) Those who have formal legal rights to land, including customary and traditional rights recognized under the national laws, will be entitled to compensation for the land they lose, all assets affixed to the land, as well as livelihood restoration measures;
b) Those who do not have formal legal rights to land at the time the census begins but have a claim to such land or assets—provided that such claims are recognized under the national laws or become recognized through a process identified in the resettlement plan, will be will be entitled to compensation for the land they lose, all assets affixed to the land, as well as income restoration measures; and

[4] With formal legal rights to land or assets; without formal legal rights but with recognized or recognizable claim under national law; with no recognizable legal right or claim to land or assets they occupy and use.

c) Those who have no recognizable legal right or claim to the land they are occupying will be entitled to all assets affixed to the land, as well as income restoration measures.

50. Persons covered under a) and b) are provided compensation for the land they lose, and other assistance in accordance with paragraph 6. Persons covered under c) are provided financial assistance *in lieu of* compensation for the land they occupy, and other assistance, as necessary, to ensure they could restore that livelihoods to pre-project level – if they occupy the subproject area prior to a cut-off date established by the borrower and acceptable to the Bank.

4.2.2 Cut-Off-Date

51. The COD for this CAISARP is defined as the date that establishes for receiving the compensation and resettlement assistance by the project AHs. The COD for each subproject financed under the Project will be the date of the completion of the census undertakenduring the DMS stage. The COD will be announced in the consultation meeting prior to the DMS. Any persons who encroach upon the subproject's corridor of impact (COI) after the COD will not be eligible for any compensation or assistance. Persons not covered in the census result can be eligible for compensation if they can show proof that they have been inadvertently missed during the census survey.

4.3 Process for Land Acquisition

52. If the survey of the subproject or DED shows that there will be a need for land acquisition and resettlement, MoWRAM will inform GDR after the completion of the survey. In case where there are a small number of AHs or less than 20 AHs, the GDR will acquire the land through **negotiated settlement** outlined in this LARPF. Where there are more than 20 AHs, the GDR will prepare an abbreviated RP (ARP) or a DRP and submit to the AIIB for review and approval.

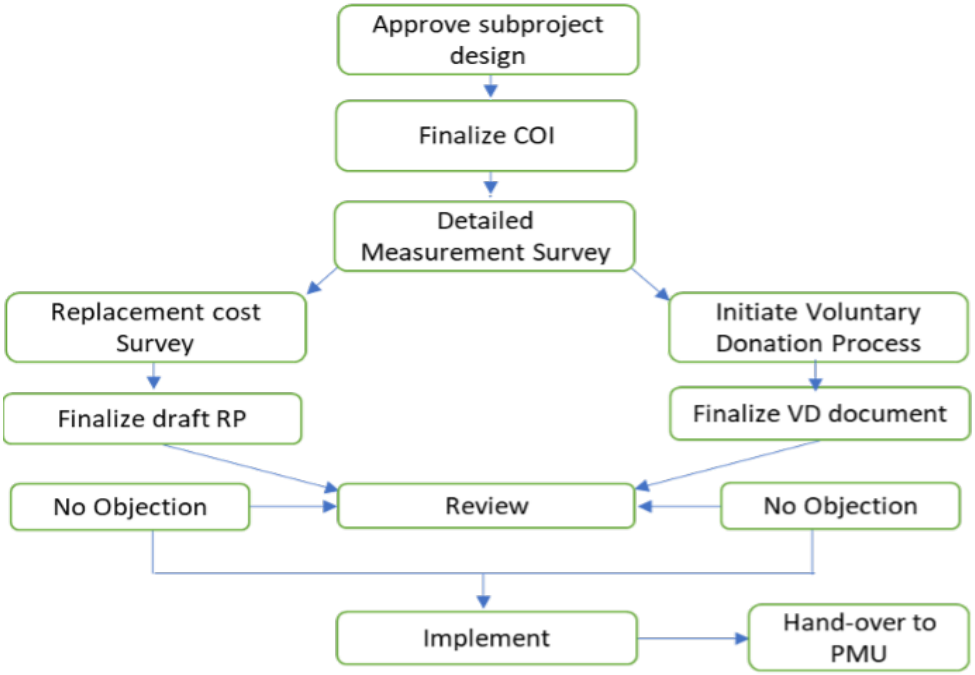
53. For **negotiated settlement**, the GDR will develop procedures in a transparent, consistent, and equitable manner if land acquisition or changes in land use rights are acquired through negotiated settlement for a subproject, to ensure that the AHs who enter into negotiated settlements maintain the same or better income and livelihood status. To achieve this, GDR will engage an independent external party to validate and document the negotiation and settlement process.

54. If the failure of negotiated settlement results in expropriation, then there is still a need for the preparation of a DRP. Under the provisions of the AIIB ESS2, where impacts on the entire displaced population are minor, or fewer than 200 people are displaced, the GDR may, with the prior approval of the Bank, prepare an ARP, covering such elements as the Bank may specify. Impacts are considered "minor" if the AHs are not physically displaced and less than 10 percent of their productive assets are lost.

4.3.1 Principles of Land Acquisition and Resettlement

55. Under CAISARP, the following specific principles will be applied to guide the whole process of land acquisition and resettlement.

- Avoid involuntary resettlement or, when unavoidable, minimize involuntary resettlement by exploring project design alternatives and prepare a timebound Resettlement Plan.
- Mitigate unavoidable adverse social and economic impacts from land acquisition or restrictions on land use by: (a) providing timely compensation for loss of assets at replacement cost; and (b) assisting AHs in their efforts to improve, or at least restore, their livelihoods and living standards, in real terms, to pre-project levels.
- Improve living conditions of poor or vulnerable persons who are physically and economically displaced to at least the national minimum standards including access to social protection systems. Provide legal and affordable access to land and resources.Non-titled AHs will be provided livelihood allowance and will be fully compensated at replacement cost on assets other than land.
- Legalizable AHs will be legalized and fully compensated at replacement cost for land losses.



- Establish a transparent, fair, and equitable procedure of land acquisition through negotiated settlement. An independent external party shall be engaged to validate and document the negotiation and settlement process;
- Conceive and execute resettlement activities as sustainable development programs, providing sufficient investment resources to AHs to benefit directly from the project, as the nature of the project may warrant;
- Ensure that resettlement activities are planned and implemented with appropriate disclosure of information, meaningful consultation, and the informed participation of those affected.
- Ensure conduct of meaningful consultations with AHs on social impact assessment, entitlements, disclosure of resettlement information to AHs, and participation of AHs in planning and implementing subprojects. The social impact assessment and Resettlement Plan will be disclosed to the AHs in the local language; and
- Establish a grievance redress mechanism for AHs and stakeholders to address grievances and concerns.
- Pay full compensation to all the AHs who are physically displaced before their relocation.

4.3.2 Key Tasks during Resettlement Process

Once subprojects' detailed engineering designs (DED) are finalized/approved and the need for involuntary land acquisition is confirmed for the subproject, MoWRAM will inform the GDR of the need for land acquisition under the subproject and will share with the GDR the DED and information on the COI. However, before the finalization DED, MoWRAM will invite GDR for a joint site visit to inspect and assess the resettlement impacts and seek GDR's advice on avoidance and minimization of the impacts. MoWRAM will then finalize the DED and COI and submit it to GDR. Based on the DED and COI, GDR will conduct consultation meeting with the AHs, distribute the updated project information booklet (PIB), explain the DMS/SES processes and GRM procedures and then conduct the house-to-house DMS jointly with the AHs. The GRM will be functional prior to the DMS and the updated PIB will include the COD. If the analysis of DMS data shows that AHs have lost their livelihood source permanently, the IRC-WG and PRSC-WG will carry out consultations with the AHs and prepare the livelihood restoration program and include it in the draft DRP.

56. The key tasks in the resettlement process to be undertaken by MoWRAM/GDR are summarized in the flow chart in Figure 4.

Figure 4 – Summary of Key Task in the Resettlement Process

4.3.3.1 Corridor of Impact

Based on the final DED, a field trip will be conducted for land demarcation. The output of land demarcation process is the land areas that are identified as subproject's corridor of impact (COI) within which any assets such as land, houses, structures, crops, fruit and non-fruit trees etc. that are owned by the AH, private sector, or government, local community are considered as affected under the subproject.

57. Once the preliminary design of a subproject is defined, MoWRAM will prepare a PIB prior to feasibility study stage, to be endorsed by GDR. Thereafter MoWRAM with its feasibility study consultants and GDR will conduct the first round of consultations with potential AHs and local authorities to discuss project/subproject information, the benefits potential impacts, anticipated land requirements, compensation policy, entitlements and eligibility. The PIB will be distributed and explained during the consultations.

4.3.3.2 Detailed Measurement Survey

58. Based on the final DED and COI, GDR will make arrangements for establishing the Inter-ministerial Resettlement Committee (IRC) and its Working Group (IRC-WG) and Provincial Resettlement Sub-Committee (PRSC) and its Working Group (PRSC-WG) for conducting the DMS/SES and the replacement cost study (RCS) and liaise with the Commune and Village Offices to inform the AHs and commune/village authorities of this survey exercise before the survey is carried out. The PIB will be updated by GDR which will include the entitlements, GRM processes and procedures and GRM focal contact persons at Commune, District, GDR and PGRC levels A consultation meeting will be undertaken prior to DMS to explain the DMS process, GRM procedures and its operationalization, PPM and the updated PIB will be distributed and explained.

59. DMS will be undertaken as soon as the COI is demarcated. The measurement of the affected land, structures, and other productive assets of each AH or of public facilities to be acquired will be carried out during the DMS to record of the impact at household level, and to prepare corresponding compensation package for each household. The DMS shall be carried out with the full participation of the AHs to ensure agreement from affected people and avoid potential dispute over incorrect measurements or calculations of compensation payment package. In particular, the DMS team will install pegs/markers to demarcate the affected land and identify assets affected within the COI in the presence of the AHs. This demarcated area

will be measured the for calculation of the land area and other assets that will be lost. The affected land willl also be classified by type of land at this time based on actual land use.

60. The DMS will be conducted by the IRC-WG assisted by the PRSC-WG and relevant local authorities. The RCS will be conducted in parallel with the DMS by an independent agency hired by IRC[5]. Based on the results of DMS and RCS, GDR with the assistance of project consultants will jointly update the subproject Basic Resettlement Plans, if any, into draft DRPs or prepare the draft DRPs. The draft DRP will be submitted to AIIB for review and comments. GDR will finalize the draft DRP in liaison with AIIB project team for approval by IRC and will then submit it to AIIB for clearance and disclosure. After the disclosure of the approved DRP, GDR will calculate the compensation amount and subsequently request resettlement budget from RGC.

4.3.3.4 Replacement Cost Study (RCS) and Asset Valuation

61. The RCS will be conducted by a local independent consultant qualified and experienced in asset valuation. The RSC consultant will be hired by GDR. RCS results will be used as the basis for calculating compensation package. The rates will be valid for one year from the date of the approval the RCS Report by the IRC.[6] In case compensation payment to AHs is late and the compensation unit rates are no longer valid before commencing compensation, the RCS results will be updated by the RCS consultant to reflect the current market prices of the affected assets.

62. The RCS aims to assess the values of affected assets to propose compensation rates for various affected assets – at full replacement cost. Full replacement compensation includes affair market value that is sufficient to replace the affected assets (without depreciation), plus all necessary transaction costs, interest accrued, transitional and restoration costs, and administrative charges related to new land title, construction permits, reasonable moving (relocation) expenses and any similar additional costs potentially borne by AHs. The compensation payment for the lost assets is based on replacement cost for affected assets such as lands, houses, structures, crops and trees prevailing at the time of the DMS. Their proposed asset valuation methods and results will be subject to confirmation and approval of the GDR.

63. The compensation payment package proposed for each AH will be calculated based on the results of the DMS and RCS. The agreement of AHs as to the proposed compensation package for them is confirmed in an official and binding contract between the IRC-WG and the AH. Any errors that are found will be corrected during a one-to-one consultation process of the compensation package with each AH.

64. A binding legal instrument recording all affected assets of each AH which will be signed by the AH and IRC-WG, and witnessed by local authority (normally by the Commune or Village Chief). The compensation and support to be provided to the AHs will be based on the entitlement matrix, final DMS and RCS results as outlined in the ARP/DRP and agreed with AHs.

65. The following procedures will be applied to determine the replacement costs of affected assets:

a) For replacement costs of land, the RCS Consultant will directly interview households that have recently bought or sold land to collect the evidence of the rate of land transaction, and interview households who are looking for properties to sell or buy within and around the subproject area. The RCS Consultant will also find out from local residents, subject to confirmation/validation through official records of local authorities, the price of various types of land that have been the subject of transactions in the past six months to one year in the community or nearby areas and the prices of various types of land local residents are willing to buy or sell as well as collects data from government offices on recent land transactions and land market assessment.

[5] An independent local consulting firm qualified and experienced in asset valuation will be recruited by GDR to carry out the RCS. The resettlement budget will include the estimate costs of RCS consultancy services.

[6] Ministry of Economy and Finance. Land Acquisition and Involuntary Resettlement para.186 of the Standard Operating Procedure for Externally Funded Projects in Cambodia, 22 February 2018. Phnom Penh, Cambodia.

b) For structures, the RCS Consultant will interview owners of structures to determine the construction materials usually used in the locality for each type of building following existing government categories or standards; sources of construction materials used and the unit costs of said materials, including the costs of transporting the same to the locality; and the cost of labour for constructing each type of building found in the locality. In the survey, interviews will also be conducted with building contractors to determine the cost of construction materials for each type of structures in the subproject area following existing government categories; the cost of transporting construction materials to the subproject area (community); the cost of labour for constructing each type of building; and the unit cost per meter square of each type of building in the subproject area following existing government categories. The replacement cost will be based on the latest item rates for construction within the subproject area.

c) For the crops and trees, interviews will be conducted with owners, market vendors and seedling suppliers to determine the current selling farm gate price of fruits or crops in the area and compensated accordingly as described above. RCS will collect data from statistics offices on average yields per type of crop and/or tree identified during the DMS.

66. The inventory of loss (IOL) and the measurements will be recorded and signed by the IRC-WG and the AH and witnessed by the Commune/Village Official, normally the Chief.

4.3.3.5 Detailed Resettlement Plan

67. Table 2 summarizes the key tasks on the preparation of DRP as per the SOP-LAR and compliance with the AIIB's ESS2.

Table 2 – Key Tasks on the Preparation of Detailed Resettlement Plan

Tasks	Requirements
Institutional Arrangements	• Establishment of the IRC and IRC-WG. • Establish the Provincial Resettlement Sub-Committee and the Provincial Resettlement Sub-Committee Working Group.
Detailed Measurement Survey	• Conduct demarcation of land and DMS (100% survey, 100% Inventory of Losses, and full Census through DMS Questionnaire).
Gender	• Gather gender information.
Poor and Vulnerable Groups	• Update the database based on DMS. • Determine different categories of poor and vulnerable groups, and the eligibility of each to receive additional assistance package. • Finalize the additional assistance package
Replacement Cost Study	• Hire external expert to carry out RCS to determine prevailing market rates to replace lost assets. Methods of valuing affected assets and calculating compensation for each eligible AP or household will be at full replacement cost in line with ESS2 of the AIIB's ESF.
Compensation Package	• Update the LARPF Entitlement Matrix to show the full and complete compensation package that will be made available to the AHs.
Livelihood Support Plan *(if applicable)*	• Prepare plan for Livelihood Support Program for permanent loss of sources of livelihood, in consultation and active participation with the AHs and include in the DRP.
Grievance Redress Mechanism	• Operationalize GRM at the Provincial level[7] • Outline procedures for handling complaints in line with SOP-LAR, provide details to AHs during the consultation process and ensure it is readily accessible and useful to the AHs

[8] The MEF will facilitate the establishment of a Provincial Grievance Redress Committee (PGRC) which will be responsible for addressing grievances for all externally financed projects located in the respective province/city. The PGRC will be established by the Provincial Governor in consultation with the IRC.

Consultation	• Conduct meaningful consultation with AHs at the commune level based on AIIB ESS 2, to inform them of overall entitlements and the method of computation of compensations, as well as the GRM procedures. Seek their feedback of the resettlement process. • Meaningful consultation with AHs eligible for relocation on the Resettlement Sites (if applicable) at commune/village level as per guidelines above • House-to-house consultations to confirm measurement surveys during DMS. • Consultations with APs on compensation rates prior to signing of contracts.
Monitoring and Reporting	• Make arrangements, roles and responsibilities for monitoring and reporting of the implementation of the DRP, and the reporting requirements. • Determine scope of internal monitoring.
Formulation of Budget	• Prepare estimates of land acquisition costs by GDR.

Source: RGC's SOP-LAR, 2018

4.3.3 Approach for Negotiated Settlement

68. In case of negotiated settlement, the following will be adopted:

- The GDR will prepare an IOLs to pave the way for DMS and RCS which will be conducted to design compensation package for each AH;
- The RCS will help calculate the replacement value at current market price including transaction costs, interest accrued, transitional and restoration costs, and any other applicable payments, if any of affected land and assets such as houses, structures, and trees, etc. Where market rates for land are unavailable, the RCS unit rates will be developed in consultation with the AHs or land users to determine the compensation amounts for the land to be purchased and the assets attached to the land.[8];
- If there is loss of income, the RCS consultant will calculate the number of losses based on the project's Entitlement Matrix (Annex 3 of this LARPF);
- In case of loss of fruit trees, the RCS consultant will calculate the economic loss based on maturity and formula shown in the Entitlement Matrix;
- If there is physical displacement, transition allowances will be provided at the rates shown in the Entitlement Matrix;
- The total amount of compensation will be calculated and offered as a lump sum amount;
- Conduct consultation and negotiation with the landowner/land user, and negotiation to be conducted in good faith, and all relevant information has been provided to and understood by the landowner including project use of land, terms and conditions of the agreement. This will be adequately documented;
- A contract will be prepared, showing the total amount of compensation and the breakdown to facilitate negotiation with each AH. Once agreed, a Minutes will be prepared and signed by the AH, that both spouses or single heads of households will be required to sign and the IRC-WG with the witness of the Commune or Village official;
- If all AHs agree with their lump sum compensation package, the lump sum amount will be paid upon contract signing;
- A report on the process and results of the negotiated settlement will be prepared after completion of compensation payment and will be submitted to the AIIB;
- In case an AH does not agree on the proposed negotiated settlement option, the offer of negotiated settlement for all the AHs will be withdrawn and the GDR will prepare a DRP for submission to the AIIB for review and approval;

[8] The cost of compensation equivalent to replacement cost will look at information on recent transactions, quality and type of land, crop cycles and production, and land availability.

- A report on a negotiated settlement will be prepared after the process is completed and submitted to the AIIB.
- GDR will engage an independent external party to validate and document the negotiation and settlement process.

4.3.4 Approach for Voluntary Donation

69. Voluntary land donation will be the sole responsibility of MoWRAM. The GDR will not be involved in the voluntary land donation process.

70. The Voluntary Donation (VD) process should be initiated only when census survey/IOL, DSM, are completed (See Figure 3 above). When VD is the case, an AR) or a DRP will not be prepared. MoWRAM will ensure that only potential donors who meet pre-requisite are approached to tender VD as an option (See Eligibility Criteria at Section 4.3.4.2 below). The potential donors/AHs have the right to refuse to donate their affected assets if they don't wish to.

71. The VD process will be transparent. All potential donors will be informed of their choice for VD and will be consulted fully and appropriately. MoWRAM will be responsible for full and careful documentation of the entire VD process which will be subject to AIIB's prior review and approval.

4.3.4.1 Principles

72. Under CAISARP, the principles below will be adopted:

a) The donor will be fully informed about the subproject and available choices regarding the land and their implications, including refusal to donate the land, and need to confirm in writing their willingness to proceed with the donation;
b) The amount of donated land is minor and will not reduce the donor's remaining land area below that which is required to maintain the donor's livelihood at current levels;
c) No physical household relocation is involved;
d) The donor is expected to benefit directly from the subproject; and
e) Donations from collective land owned by IPs, if any, are not accepted.

4.3.4.2 Eligibility Criteria

73. **For households who are willing to donate,** all conditions below must be met:

- Donating household must not be from any vulnerable households – as defined by the Project and must be direct beneficairy household of the planned subproject;
- Donated land must be minor in nature, and must not exceed 5% of the land plot to be donated;
- Affected assets (intended to be donated) should be lower than 400,000 Riels in value per household and donation of affected land or assets shall not reduce the donor's remaining area below that required to maintain the donor's livelihood at current level;
- No physical or economic displacement of AH is involved except for minor shift back at same location which will be financed under the subproject budget to restore to pre-existing condition;
- Donating person/people should have sole ownership to the land portion and is free from any legal land disputes;
- Donated household bear no fees related to the transfer of the ownership of the donated plot of land. Any fees or taxes owed for processing or registration of the land transfer, if applicable, are paid in full by the Project; and
- All AHs will be informed of project's grievance redress procedures.

For households who do not wish to donate.

- Technical design will be adjusted, if technically feasible, to avoid the land impact.
- If avoidance of land impact is not possible, compensation payment will be made to the affected people in accordance with the Entitlement Matrix of this LARPF.
- Eminent domain or other powers of the state shall not be used for those who refuse donating affected land or assets.

4.3.4.3 Key Steps in Conducting Voluntary Donation

Step 1. Conduct Initial Screening for VD Eligibility

For each subproject, based on the final COI, MoWRAM will:

- Collect key demographic data[9] about affected individuals/households within the subproject COI;
- Collect information on the magnitude of land and/asset impacts based on the IOL;
- Screen to identify individuals/households who are potentially qualified for VD, using the Eligibility Criteria in Section 4.3.4.2 (above);
- Summarize this step using the form in **Annex 2**.

Step 2. Consult with Potential Donors

- In collaboration with Commune and village Council, convene meetings with potential donors qualified from Step 1;
- Explain to potential donors all the details of VD procedures (Section 4.3.4.3), highlighting the affected peoples' right to compensation. Donor could donate portion of affected land and/or other non-land assets if they wish;
- Provide potential donors with sufficient time to consider his or her disposition of the property and has knowingly rejected the right to renege on his or her decision.
- Identify if there are anyone who are using the part of land intended for donation; if there is, consult with them to obtain their consent related to planned donation;
- Finalize the list of donors who wish to donate affected assets;
- Establish a formal statement of donation which will be signed by each owner and user involved, if any, including obtaining donor's informed consent and confirmation there is no dispute associated with part of land that is being considered for donation. There are also no claims by renters, users, squatters, or encroachers (use Form in Annex 2);
- Submit VD documents to the AIIB for review and approval.

Step 3. Start Donation Process

- Proceed the formal procedures for donating the part of land/asset following the government's procedures;
- Hand over/transfer of land title of the donated land to the Project;
- MoWRAM will maintain all records of asset donations and ensure supporting documents are available for review in case where grievance arises;
- MoWRAM will document fully and carefully the entire VD process and compile a report which includes the followings:
- Subproject name, location, geographical area (including timing of the report and disclosure information);
- Description of the subproject's construction work site/section, the COI and the extent of impacts on assets (attach Annex 1);
- Description of consultation activities and procedures that have been undertaken to ensure donors are appropriately informed of the project's VD procedures and requirements, including their rights to choosing compensation payment or opting for VD;

[9] Demographic data may include information about household members such as names, age, education, ethnicity, sex, etc.

- A detailed list of assets voluntarily donated and corresponding donors, disaggregated by gender (attach Annex 2);
- Minutes of consultation, including consultation process and consultation outcomes as to asset donation, and grievance redress mechanism;
- Ensure that VD process is regularly monitored as part of MoWRAM's internal monitoring arrangement.

4.3.4.4 Responsibilities

74. In collaboration with Commune Council, MoWRAM will:

- Develop fair and transparent procedures for VDs in consultation with affected households (AHs) and the communities;
- Provide guidance to and ensure that the Chief of the involved Commune prepares a Voluntary Land Donation Report, following the guidelines outlined in the Commune/Sangkat Fund Project Implementation Manual. This report should confirm that all affected households have been fully informed about the subproject and their right to refuse donating their land and/or other assets;
- Ensure the detailed design avoids impacts on land, houses, structures and other fixed assets. When avoidance is not possible, effort shall be made to minimize such impacts;
- Screen for eligible donating household(s) who meet the donation prerequisite (See Section 4.3.4.1 – Principles) to explore they wish to make voluntary contribution based on the VD principle;
- Ensure eligible potential donating household(s) are appropriately informed[10] that by donating their affected land and/or asset for the subproject purpose, they are reneging on their right to compensation;
- Ensure donating households are those who receive direct benefit from the planned subproject (e.g., access to irrigation, flood protection, etc.)
- Ensure that donated assets are owned and used by the owner, and that if others are using the asset, land or asset users are fully consulted on the potential donation by the asset owner[11];
- Ensure that the person donating land/asset pays no fee associated with their donation. Any fees or taxes incurred to land donation and any update of land ownership documents are covered by MoWRAM;
- Obtain the consent of the community involved, including individuals who are using or occupying the land in case where community or collective land is proposed for donation;
- Keep AHs informed timely and appropriately about the VD process, including their rights and project's grievance redress procedure (See Section 6 of this document);
- Inform potential donors of their right in deciding the extent of their VD (out of the total impact that the project may cause to them);
- Attention shall be paid to vulnerable/ disadvantaged group, such as Indigenous Peoples, women, the elderlies, where relevant;
- Resolve any grievances that may occur in relation to VD process; and
- Ensure that the entire VD process and its outcome is fully and timely documented by MoWRAM and submitted to the AIIB for review.

[10] "Appropriately informed" means that the potential donor has all available information regarding the proposed project activity and its impacts, its land requirements, and its alternative activity sites, as well as the potential donors' rights to compensation as per this LARPF. The potential donor has also been provided with sufficient time to consider his or her disposition of the affected assets and has knowingly rejected the right to renege on his or her decision.

[11] For instance, if part of a business stall is leased and is being donated by the owner, the person leasing the stall should also be consulted.

4.4 Project's Compensation, Livelihood Restoration Program and Relocation

4.4.1 Compensation and other Resettlement Assistance

75. This section applies in cases of LAR activities only. All persons with assets in the COI before COD will be eligible for compensation for lost assets regardless of their legal status. Given that irrigation infrastructure rehabilitation is expected to be conducted in the Riparian Land, which is state-owned land, there would be no compensation for land but loss of income from loss of use of land, land improvements, businesses affected by land, employment, and other income sources; transportation allowances; subsistence allowances during the transition period; and income/livelihood restoration programs. For the vulnerable group, in addition to the above, a special assistance package is provided thereby cash grant for subsistence allowances and livelihood restoration program are doubled.

76. Fruit and vegetable crops, rice, other economic trees and standing crops will be compensated according to the principles of replacement cost in the RGC's SOP-LAR and the AIIB's ESS2. Where possible, AHs will be allowed to harvest crops before acquisition or temporary use of the land.

77. Cash compensation based on the principles of replacement cost will be paid to AHs who lose structures or parts of structures, such as kiosks, roofs, concrete pavements, fences, shops, house-cum-shops and houses. Transport allowances will be provided where relevant.

78. For AH losing income during the transition period, allowances will be provided. If applicable, livelihood restoration programs will be provided for AHs who permanently lose their source of livelihoods.

79. AHs whose land is used temporarily during construction will be compensated for loss of income from crops or other assets during the period of construction.

80. A tenant of the immovable property who is operating a business shall be entitled to compensation for the impact on their business operation and to additional assistance at fair and just compensation to the capital value actually invested for the business operation activities as of the date of the issuance of the declaration on the expropriation project (Article 29 of the Expropriation Law, 2010).

81. Regarding the RGC's SOP-LAR, all AHs who lose their business from fixed structures whose businesses are relocated to a new site will be compensated with the projected loss of net income for 60 days. For those whose business is relocated on-site (move back or within the same area), compensation will be projected loss of net income for 30 days. The businesses may be registered or non-registered. The employees of those with loss of business will be provided with a transitional allowance as per the entitlement matrix.

82. The following types of displaced persons shall be eligible to compensation, but compensation would vary depending on their situation:

- Legal owners and holders of title or rights to land, including customary rights;
- Tenants and leaseholders, including employees, workers and hawkers;
- Those who have no formal title or rights to the land (illegal occupiers) who are engaged in farming or businesses, and
- Poor and vulnerable groups.

However, if the business is engaged in illegal activities like gambling, prostitution, drugs or similar nature, no compensation will be paid.

4.4.2 Vulnerable Groups

83. Poor and Vulnerable Persons/Groups, those who are perceived to be more vulnerable than others such as (i) households living below the poverty line, identified by the Ministry of Planning[12]; (ii) elderly people headed households with no means of support; (iii) female headed households with dependents living below the poverty rate; (iv) disabled headed households, , (v) landless poor living below the national poverty rate; and (vi) indigenous peoples (who often have traditional land rights but no formal titles).

84. To improve living conditions of poor or vulnerable persons who are physically displaced, through provision of adequate housing, access to services and facilities, and security of tenure, the poor or vulnerable persons who are classified as poor and vulnerable under the above criteria (para. 83) and hold ID Poor Cards lose any **livelihood source permanently** will participate in any one of the three programs and the corresponding skills training program. In addition, these AHs will be entitled to the following: (a) Double the financial support rate offered in the three different livelihood programs. (b) Priority access to employment opportunities under the Project.

85. In cases where Land Acquisition is required from vulnerable groups, the needs of the vulnerable groups need to be assessed and included in DRPs. Special attention should be paid to gender aspects. In cases where vulnerable groups are Indigenous Peoples, DRPs should be done concurrently and in coordination with the Indigenous Peoples Plans, which will be prepared by MoWRAM.

4.4.3 Livelihood Restoration Program

- Eligibility for Participation

86. The purpose of the Livelihood Restoration Program (LRP) is to assist households who lose their livelihood source permanently due to physical relocation to restore their livelihoods and income to the pre-project level, or better. To this end, households who lose their livelihood source permanently are eligible to receive benefit from the CAISARP's LRP. This may be either in the form of cash grants for them to seek new or upgrade their skills or through a LRP (land based, employment base, or business based) depending on the choice of the DPs. Eligible members of affected households, determined through the DMS and detailed in DRP, will have access to skill training tailored to their preferences and economic opportunities in the area at designated vocational centers. This initiative, to be facilitated by the Provincial Department of Labor and Vocational Training, aiming to enhance employability and match participants with potential employment or livelihood opportunities, ensuring a holistic approach to livelihood restoration. Details of the LRP such as types of vocational/skill training, number of APs eligible for LRP, institutional arrangements, enrolment procedure, etc. as well as the budget will be described in the DRP. Those APs who are classified as poor and vulnerable as per the category stipulated in the definition of Vulnerable Groups and will substantiate with ID Poor Cards will also be provided additional assistance to improve their living status.

87. Under the CAISARP, it is anticipated that part of the affected population would be affected significantly. The LRP will be prepared in close consultation and active participation with the AHs and simultaneously implemented in parallel with the DRP to assist AHs in restoring their livelihoods and income levels.

88. Depending upon their existing livelihood, eligible AHs would be entitled to participate in one of the support options as outlined in SOP-LAR: (i) Land-based Livelihood Restoration; (ii) Employment-based Livelihood Restoration; and (iii) Business-based Livelihood Restoration.

Option 1 – Land-based Livelihood Restoration:

[12] RGC, Sub-decree on Identification of Poor Households, No: 291 ANKr. BK (2011), Article 17: Relevant government ministries/institutions, non-governmental organizations and local communities which intend to provide services or assistance to poor households or individuals, including any appropriate emergency interventions, must primarily use valid national poor household data.

AHs who depend on and permanently lose land-based sources of livelihood such as agricultural and livestock will be provided with:

- Access to other land-based sources of income, like vegetable gardening, fruit trees and livestock, if alternate land is not available.
- Soft skill training will be provided such as introductory training on crops of higher value, or training that adds value to existing crops, and other related agricultural job skills that AHs may need. The content of training will be based on a training need assessment to be conducted for AHs.
- Financial support - as a lump sum grant of $200, to assist AHs in re-establishing their livelihood.

If no alternative agricultural land is available, or if the AHs prefer to undertake an alternate type of livelihood, they will be offered the option to participate in either an employment-based or business-based livelihood restoration program.

Option 2 – Employment-based Livelihood Restoration

89. For AHs who rely primarily on employment for their livelihood and have permanently lost that employment as a result of LAR, or for AHs with land-based livelihood who opt for new livelihood, an employment-based livelihood restoration support will be offered to provide them with:

- Employment skills training, based on employment opportunities in the community. A survey of the employment opportunities in the proximity of the relocation sites would be carried out as part of the preparation of the DRP which would be analyzed to determine the types of jobs available, and the skills set requirements. The training program would be developed to help build these skills set for the AHs.
- Financial support as a form of cash grant equivalent to 3 months income based on the official poverty rate prescribed by the RGC to support to the affected family members of the AHs during the training period. The amount will be the monthly poverty rate x number of members in the AH x 3.
- The subproject may also provide temporary job opportunities at the construction site, at the office or other places. For jobs in offices or those requiring higher levels of skills, skill training will be provided to the APs to access those jobs.

Option 3 – Business-based Livelihood Restoration

90. For households (AHs) whose livelihoods are based on business activities and have suffered permanent loss of their businesses, or for those AHs who choose to participate in this program, a business-oriented livelihood program will be available. This program will include the following support:

- Business Skills Training: AHs will receive training in essential business skills, with a specific focus on small or home-based businesses. The training will be tailored to the business opportunities that may exist within their local community.
- Financial Assistance: Given that a limited number of AHs may require this training, a cash grant will be provided to enable them to pursue skills training of their choice.
- Financial support as a lump sum cash grant of $200, to assist them and their families in re-establishing their micro or home-based businesses.

4.4.4 Contracts with AHs and Compensation Payments

91. The agreement on the compensation package is confirmed under a formal and binding contract between IRC-WG and each of the AH. In the case of negotiated settlement, a meeting is held at the commune or village office or community hall where the contracts are offered and explained to the AHs on an individual basis before negotiation and signing. Upon signing, compensation will be paid to AH as a lump sum. If errors are identified during the meeting, they will be corrected on the spot.

92. In the case of the DRP, a meeting will be held with the AHs and the contracts are offered and explained to the AHs on a one-to-one basis. The AH can sign the Contract at that time or within the next three (3) days. The compensation payments are not made at this stage and a separate meeting is scheduled for

making the compensation payments at a later date. The AHs will be informed in advance of the date of the meeting for the compensation payments through the Commune and/or Village Offices.

93. Payment of compensation and rehabilitation assistance to the AHs is central to the implementation of SOP-LAR. The GDR must ensure transparency and integrity of the budget disbursement and compensation payments process which will be governed by the following principles:

- Full payment of the compensation shall be offered and made to all AHs prior to land acquisition;
- Payments for all allowances must be completed prior to relocation to the new sites or self-relocation. In case of AHs who dispute or refuse to accept the offer or payment, the payment will deem to have been made at the same time as payments are made to the other AHs;
- Payments will be made in the joint names of both spouses or the single head of the AH, where applicable or a designated adult member of the AH in case where both spouses are unable to receive the payments;
- Payments should preferably be made by cheque. However, where access to banking facilities is not available or difficult, cash payments can be made with the necessary safeguard protection for the AHs to verify that payments have been actually received by the AHs;
- All payments should be made in a public place as far as possible and witnessed by a representative of the local authorities; and
- On completion of the payments, a proper and due notice shall be issued to AHs to vacate the land/occupation within one month from date of issuance of the notice.

4.4.5 Relocation

94. Relocation of displaced persons to a new site resulting from involuntary resettlement is not envisaged under the CAISARP. However, in the event of relocation of persons displaced by the CAISARP to another new site, all physical relocation will be verified during the DMS and included in the DRP. For the physically relocated AHs, the DRP will include option for self-relocation. Under this option, the displaced persons will be provided cash assistance towards purchase of an affordable land, including site development and transitional allowances, to their preferred choice of self-relocation. The displaced persons can do this for economic reasons, including employment opportunities and availability of employment, or due to social consideration such as proximity of kin. The RCS will determine the costs for self-relocation which will be included in the budget estimates in the DRP.

95. The physically relocated AHs are also entitled to transportation allowance to cover both relocation of AHs from their place of residence, material transport for relocating businesses and temporary relocation or rental allowance. The physical relocation will not commence until full compensation has been paid to the AHs. Monitoring will follow up that the physically relocated AHs have a permanent residence after relocation. Subprojects having a large number of AHs for relocation to another site will not be financed under the CAISARP.

5. INSTITUTIONAL AND IMPLEMENTATION ARRANGEMENTS

5.1 Ministry of Water Resource and Meteorology

96. The Ministry of Water Resources and Meteorology (MoWRAM) is a lead project implementation agency, responsible for public irrigation infrastructure, through its Project Management Project (PMU) and Project Implement Unit (PIU) of PDWRAM. If there is any involuntary resettlement impacts and LAR activities the MoWRAM will request GDR to address them in accordance with the policies and procedures in this LARPF.

5.2 Inter-Ministerial Resettlement Committee

97. The Inter-Ministerial Resettlement Committee (IRC) is the decision making and oversight body for LAR activities. The IRC has the mandate to review and evaluate resettlement impacts and land acquisition for public physical infrastructure projects in the Kingdom of Cambodia. The IRC is a collective entity, permanently chaired and led by the Ministry of Economy and Finance (MEF), with members of other line Ministries. The IRC carries out its responsibilities through a Working Group (IRC-WG) which is established by the MEF for each public investment project. The powers of the IRC are delegated to its permanent Chairman. The key responsibilities of IRC include:

- Provide effective oversight and ensure LAR complies with the laws and implementing rules and regulations.
- Ensure effective coordination between line ministries, provincial/local authorities and GDR in carrying out LAR.
- Provide overall guidance on implementing rules and regulations for LAR and propose updates; as necessary;
- Initiate the establishment of PGRC; and
- Approve of LARPF, RPFs, RFs, BRPs, ARPs, DRPs and any updated ARPs/DRPs.

5.3 General Department of Resettlement

98. The General Department of Resettlement (GDR) is the permanent Secretariat of the IRC and is the lead agency for LAR activities for public investment projects. It is directly responsible for the preparation, implementation, and monitoring and reporting of DRPs in accordance with the laws and implementing rules and regulations related to LAR and the mandatory requirements of the safeguard policies of the development partners. The GDR carries out these activities through its Resettlement Departments (RD). For this project, the Resettlement Department 2 (RD2) of GDR will be the first point of contact and interface with MoWRAM for the entire project and resettlement cycle. Key responsibilities of GDR include:

- Coordinate and collaborate with line ministries and other agencies involved in LAR activities;
- Conduct public consultations and focus group discussions with the affected peoples and vulnerable groups (if any);
- Prepare the ARP/DRP for the subprojects and submit to the AIIB for review and concurrence;
- Develop terms of reference and recruit the replacement cost appraiser;
- Prepare and secure the necessary budget for the implementation of the ARP/DRP;
- Calculate, prepare contracts, and make payments for compensation for each AH based on the entitlement matrix in the ARP/DRP;
- Implement all LAR activities in compliance with the ARP/DRP;
- Ensure proper functioning of the GRM, including training/refresher training for GRC members, adequate record keeping, etc.;
- Supervise, monitor, and report on implementation progress of the ARP/DRP;
- Prepare and submit to MoWRAM and copy to the AIIB a handover letter for AIIB's no objection to commencement of civil works;
- Prepare and submit to AIIB semi-annual monitoring reports;
- Prepare, agree with AIIB and implement corrective action plan, if any, during implementation; and submit the corrective action plan implementation report to AIIB for concurrence and disclosure;

- Conduct awareness workshops for MoWRAM, line ministries, local authorities, and construction contractor on the implementing rules and regulations as specified in the ARP/DRP;
- Acquire the land and provide land handover letter to MoWRAM with a copy to AIIB; and
- Serve as the focal knowledge center for resettlement of the project.

99. The Department of Internal Monitoring and Data Management (DIMDM) of GDR is responsible for carrying out the internal monitoring of the implementation of the ARP/DRP. Its role extends to internal verification of all LAR activities for compliance with the provisions under the agreed ARP/DRP and reports directly to the Director General of GDR. In addition, it records and reviews all complaints and grievances submitted by affected people; investigates them and makes recommendations on compliance to the Director General of GDR.

5.4 Inter-Ministerial Resettlement Committee Working Group

100. The Inter-Ministerial Resettlement Committee Working Group (IRC-WG) is established by the GDR and will carry out the day-to-day land acquisition activities under the project/subproject, led by the Deputy Director/Chief of the Resettlement Department 2 (RD2) of GDR. The IRC-WG comprises technical staff of MoWARM, staff of GDR and staff of the Ministry of Land Management, Urban Planning and Construction. The IRC-WG will be responsible for all the fieldwork under the supervision of the Director of the RD2 and overall guidance and direction of the Director General of the GDR.

5.5 Provincial Resettlement Sub-Committee

101. The Provincial Resettlement Sub-Committee (PRSC) is established by the Provincial Governor at the request of the IRC for each project/subproject and comprises (i) the Provincial Governor or the Deputy Provincial Governor as the Head, (ii) Provincial Department Directors of the Line Ministries represented in the IRC, and (iii) the respective chiefs of the Districts and Communes of the locations affected by the project/subproject as Members.

The role of the PRSC is as follows:

- Provide the coordination and supporting role to the GDR, IRC and IRC-WG for land acquisition activities at the local level;
- Ensure all relevant provincial and local government authorities provide the necessary support for land acquisition;
- Manage the public consultation meetings at Provincial Level;
- Oversee and monitor the work of the PRSC-Work Group;
- Responsible and accountable for the disbursements of the compensation payments at the provincial level; and
- Assist the IRC-WG in developing measures to assist vulnerable households by the project.

5.6 Provincial Resettlement Sub-Committee Working Group

102. The Provincial Resettlement Sub-Committee Working Group (PRSC-WG) is established by the Provincial Governor and is mainly responsible for technical functions of the PRSC and works with the IRC-WG in carrying out the LAR activities at the provincial level. In addition to supporting the PRSC, the PRSC-WG has the following specific functions:

- Facilitate all public consultation and information disclosure meetings and maintain records;
- Cooperate with IRC-WG in carrying out DMS and IOLs and in the implementation of the approved DRP;
- Lead the payments of compensation; and
- Prepare monthly progress reports on all land acquisition activities at the provincial level and submit them to PRSC and GDR.

5.7 Cadastral Administration Office

103. The Cadastral Administration Offices under the Ministry of Land Management, Urban Planning and Construction is responsible for issuing titling documents, including the certificate of land use rights, hard titles, and social land concession as part of securing tenure for landless and issuing title documents for the land plots acquired in favor of MoWRAM.

5.8 The concerned local administrative authorities (district, commune and village)

104. The districts, communes, and villages where the Subproject is located will coordinate and work closely with the PRSC-WG and IRC-WG on the DRP preparation and implementation. Their roles and responsibilities include:

(i) Identify and coordinate the venue for the public consultation meetings and invite AHs to participate in the consultation activities, such as DMS, SES, RCS and other resettlement related activities;
(ii) Assist in the resolving of grievances/complaints lodged by the AHs; and
(iii) Assist the IRC-WG, PRSC-WG, and GDR in developing suitable measures to assist the vulnerable AHs by the Subproject.

6. GRIEVANCE REDRESS MECHANISM

6.1 Overview of Grievance Redress Mechanism

105. The Grievance Redress Mechanism (GRM) seeks to resolve concerns promptly, using an understandable process that is culturally appropriate and readily accessible at no cost. Grievances can be submitted if an AH or any person believes the Project/Subproject is having a direct detrimental impact on them as a result of land acquisition impacts.

106. In provinces where the CAISARP requires acquisition of land or loss of other livelihood assets, a GRM will be set up or activated to handle complaints and concerns of local people on all land acquisition and involuntary resettlement aspects of the project/subproject. The MEF will facilitate the establishment of the Provincial Grievance Redress Committee (PGRC) for addressing grievances of the project/subproject. The PGRC will be established by the Provincial Governors in consultation with the IRC. The Expropriation Law of the RGC provides for a GRC to handle complaints with the additional provision for the AHs to seek judicial redress in case they dispute the decision of the grievance redress committee.

6.1.1 Provincial Grievance Redress Committee

107. The PGRC will consist of representatives from relevant provincial authorities and the MEF as follows:

- Chair: Provincial Governor, or person appointed by the Provincial Governor
- Vice Chair: Director of Provincial Department of Land Management, Urban Planning and Construction or representative
- Member: Director of Provincial Department of Economy and Finance or representative
- Member: Director of Provincial Department of Water Resource and Meteorology or representative
- Member: Chief of Provincial Office of Law and Public Security or representative
- Member: District Governor or representative
- Member: One Representative of a Local-Based Civil Society Organization.

108. The GRC functions at three levels or tiers to handle LAR grievances:

1. The first level will be at the district level by the concerned District Head;
2. The second level will be at the GDR level by the Director General of GDR; and
3. The third level will be at PGRC level by PGRC before going to the judicial system.

6.2 Grievance Redress Procedure

6.2.1 Types of Complaints

109. Complaints can be categorized as either an individual or an anonymous or a group or complaints:

1. **Individual Complaint**: Lodged by a single affected person (AP) facing a grievance. The complainant has access to all three steps in the process.
2. Anonymous Complaint: Complaint lodged in written or oral, received by the GDR, in which the identity of the complainant is not revealed.
3. **Group Complaint:** Filed by a group of APs with the same grievance(s) based on the same facts. If the group consists of fewer than five APs, they can follow the same procedures as individual complaints. However, if the complaint contains different grievances that don't apply to all group members, separate complaints are requested. Group complaints skip Step 1 and proceed directly to Steps 2, 3, and 4, similar to individual complaints.

110. GRM requires that complaints (or comments/suggestions) should be made in writing. As such, the head of aggrieved affected households must lodge a complaint in writing to the Head of the District Office. In case the aggrieved person has difficulties writing, the Administration Officer at the District Office will assist the aggrieved person to fill in the Individual Complaint Form based on the verbal complaint of aggrieved person. While anonymous complaints are accepted, potential APs will be advised that anonymous complaints related to specific entitlements, for example, may take longer time to resolve, if necessary, details are not provided in anonymous grievance letter to allow appropriate investigation and resolution. As such, response to anonymous grievance cannot be provided. However, where sufficient information is provided (in anonymous grievance letter), anonymous complaints will be resolved. Anonymous complaints will be addressed directly by the GDR, and if the grievance cannot be resolved, it will be forwarded to the PGRC (the third step of the GRM) for resolution. The grievance will be handled thorough a 3-step formal approach as outlined in the SOP-LAR and detailed below.

111. However, prior to the First Step, the AH may informally seek the assistance of the commune chief or a community elder to discuss and find an amicable solution to his/her complaint or grievance with the leader of the PRSC-WG. This is done verbally and informally and moreover; its aim is to resolve the matter to avoid lodging formal written complaints. If this verbal process of problem solving does not resolve the complaint to the satisfaction of the AH, s/he can seek the formal route for lodging the grievance. Formal lodging can be done verbally (to community elder or representative who will record the complaint) or in writing. The GRM process is detailed below:

- **Step 1 – District level**. AH can lodge a written complaint to the Head of the District Office (where the subproject is located). The AH can bring a community elderly or their representative to discuss their grievance at the District Office. A conciliation meeting shall be held, and a decision be made within **15 working days** from the date of complaint is received by the District Office. If the complaint is resolved to the satisfaction of the AH, the IRC-WG will inform GDR's Department of Internal Monitoring and Data Management (DIMDM) who will review and seek the approval of the Director General of GDR for appropriate remedial action. GDR will inform the AP of the decision/ remedial action within **15 working days** from the receipt of the grievance by the District Office. If the complaint is rejected at this step, District Office will inform the AH of the rejection in writing. If the complainant is not satisfied with the decision/resolution result, s/he can proceed to step 2 (below).

- **Step 2 – GDR level.** The complainant who is not satisfied with proposed resolution from Step 1 shall lodge a written complaint to the GDR for resolution. GDR, through its DIMDM, will carry out a holistic review of the complaint and submit a report on its findings with the relevant recommendations, if any, to the Director General of GDR for review and decision. GDR may conduct a field visit to meet the complaint and the IRC-WG to gather relevant information. The final report must be completed within **30 working days** from the date of receipt of the complaint by GDR for submission to the Director General of GDR who will make a final decision within **5 working days** of receipt of the final report. In the event that the subject matter requires a policy level intervention, it will be referred to the IRC for a decision which may require that an additional **10 working days** be extended from the original deadline for final decision.
- **Step 3 – Provincial level.** AH will submit a written complaint to the PGRC through the Provincial Governor's Office. The complainant or a representative will be given an opportunity to present its case during a meeting and the PGRC may consider any compelling and special circumstances of the AH to inform their decision. The GDR will send a representative, as a non-voting member, to provide an explanation to the rejection of the complaint at Step 3 with the GDR. The decision of the PGRC must be made on a consensus basis and will be final and binding except when the matter relates to government's policy. Decisions related to government's policy matters on land acquisition and resettlement are decided by the IRC. The PGRC will have **40 working days** from the date of receipt of the complaint to reach a final decision. The decision of the PGRC will be sent to the IRC (through the GDR) for endorsement before any remedial action is taken.

112. The handling of the complaint at the administrative stage ends at the Third Step. There are no fees or charges levied on the AH for their lodgment of complaint and for complaint resolution for the above 3 steps. However, as provided for in the Expropriation Law, the aggrieved AH at any step can file a suit at the Provincial/Municipal Courts, as applicable, to seek a resolution. At this stage, there is no involvement of the GDR, PRSC or IRC-WG unless there is a judicial order from the competent court.

113. However, if the aggrieved person prefers filing a lawsuit at the Provincial/Municipal Courts, as applicable, to seek a resolution, AH can do so but will bear cost related to the lawsuit as per the Expropriation Law. When the case is brought to a Court of Law, there is no involvement of the GDR, PRSC or IRC-WG unless there is a judicial order from the competent courts.

114. **Project Affected People's Mechanism (PPM)**. People who believe they have been or are likely to be adversely affected by a failure of the Bank (Asia Infrastructure Investment Bank) to implement the Bank's Environment and Social Policy may submit complaints to the Bank's PPM in accordance with the Policy on the PPM, when their Project-related concerns cannot be addressed satisfactorily through the above Project-level GRMs or the Bank's management processes.

115. Information on the availability of the PPM will be provided in the Khmer language and in English and disclosed in the PIB and the Project's Website.

116. The GRM details and guidelines on LAR will be circulated and explained in detail to the AHs during consultations during the ARP/DRP preparation and implementation. These guidelines outline each of the above Steps and include the administrative procedures for receiving and addressing complaints during the consultative meetings. The GRM procedures, focal person and their contact details will be included the updated PIB and will be distributed and explained in detail to all AHs during the preparation and implementation of the DRP.

6.3 Recording and Documentation of Grievances

117. The RGC's SOP-LAR details the GRM process, registers, records, and documentation. The forms for individual complaint form, register of complaint and Letter from Head of District-Khan to be used for grievance documentation will be included in the updated PIB and distributed and explained to the AHs.

7. FUNDING AND IMPLEMENTATION ARRANGEMENTS

7.1 Budget and Financing

118. The budget for land acquisition and resettlement is prepared after the DMS and RCS are completed and is included in the DRP. In the case of negotiated settlement, it is included in a separate report on negotiated settlement. The budget is financed by the counterpart funds allocated from the national budget by the RGC and no CAISARP loan funds from AIIB and IFAD will be required. The budget will include the estimate costs of all the affected/items such as land, buildings, structures, crops and trees, relocation, vulnerable, transitional and transport allowances, income and livelihood support etc. for compensation payments that are due to any AHs that will be in the DRP. The field surveys, consultation meetings, GRM, etc. will be financed from GDR's and Provincial Administration's budget.

119. The GDR will be responsible and accountable for all financial management functions relating to the use of the budgeted funds. The funds for land acquisition are provided to the GDR from the Counterpart Funds Account. Once the budget is approved by the MEF, the funds are released by the General Department of Treasury and deposited into a project designated account established by the GDR for the Project/Subproject in the National Bank of Cambodia. Following an internal process, the funds are released from the project/subproject designated account, as and when necessary, and provided to the PRSC which is responsible for making payments to the AHs.

7.2 Implementation Plan

120. The Project is expected to be implemented from 2024 to 2031. Land acquisition for six schemes is expected to take place from 2024-2026.

7.2.1 Voluntary Donations

121. It is expected that priority irrigation infrastructure will be identified in Year 1 and screened for involuntary resettlement impacts as detailed in this LARPF. In cases of VDs, the implementation process will consist of iterative consultation to ensure affected people are adequately informed of options available for their choices and of the donation process, COI, COD, and time when the civil works is scheduled to start. The donation of assets will be fully and carefully documented by MoWRAM, as described in this LARPF.

122. The MOWRAM-PMU's ESOs will work closely with the DED team to identify any potential land acquisition and will lead the consultation process on VDs, including COD, as detailed in this LARPF. The process for documenting VDs shall be completed before the civil works contractor commences works on that construction work site/section. During civil works, the contractor will work with Commune and PDWRAM-PIU to remove donated assets at contractors' costs. The removed assets will be provided to donating households if they wish. The contractors will restore the affected area and the area next to the affected area to a good condition, if needed, to the satisfaction of the donating person. For instance, if part of a concrete driveway is donated, the contractor will assist to ensure the rest of the driveway is in good condition.

7.2.2 Land Acquisition

123. In the case of Land Acquisition, the procurement of civil works will commence after the DEDs have been finalized, the demarcation of land is completed jointly by MoWRAM and GDR, and the COD has been announced and relevant project/subproject information is disseminated as described in this LARPF. It is expected that the census survey, IOL and DMS will commence after the DEDs for a construction component is submitted to GDR. The preparation of the DRP/ARP and its approval by the IRC and the AIIB is expected within 90 days thereafter if the number of AHs is minimal (less than 100). After the approval of the budget and release of funds, the payment of the compensation will take about 30 days to 45 days depending on the number of AHs.

124. Civil works can commence only in sections where the payment of compensation and other entitlements have been paid in full to the AHs in that section and a comprehensive income restoration program, where applicable, is in place and supported by an adequate budget. In case AH refuses the compensation payment, or where complaints have been lodged for resolution under the GRM, these cannot prevent the commencement of civil works and funds should be put in a separate special account on hold for the AH. In the event if any assets outside the COI are damaged during construction by the civil works contractor, the contractor will be required to restore/repair them to the original or better standard.

8. INFORMATION DISCLOSURE AND STAKEHOLDER CONSULTATION

8.1 Information Disclosure

125. For public consultation, the draft LARPF (in English) and its Executive Summary (in Khmer) was disclosed on MoWRAM's website on http://www.mowram.gov.kh/. The Executive Summary (in Khmer) was also disclosed in hard copy at MoWRAM's public library in Phnom Penh, and in the offices of PDWRAM in the commune offices of the all-subproject provinces. Once the LARPF is finalized and approved, it will be again disclosed through the above channels. The final approved LARPF will be disclosed in English on the AIIB's website.

126. Once the subprojects are identified and selected, the proposed subproject information will be explained in detail to the subproject stakeholders in Khmer language with translation into the language spoken by IPs for those locations where IPs are identified in the subproject areas, and the PIB will be distributed to them. The proposed project/subproject information in the PIB covers the following:

(i) The purpose, nature, and the scale of the proposed project/subproject.
(ii) The location of the proposed project/subproject, project/subproject components and activities.
(iii) The duration of proposed project/subproject activities.
(iv) The COIs, timing of census, IOL, DMS/SES, eligibility criteria, compensation policy, RCS, the timing of the establishment of the GRM, and contact details for the GRM focal persons.
(v) The options for voluntary land contribution and relevant procedures.
(vi) Potential risks and impacts of the proposed project/subproject on local communities, and proposed mitigation measures, highlighting potential risks and impacts that might disproportionately affect vulnerable and disadvantaged groups and describes the differentiated measures taken to avoid or minimize them; and
(vii) Names and contact details of key persons on LAR technical matters on the project/subproject.

8.2.1 Voluntary Donation

127. In addition to the PIB explained and distributed to the stakeholders, in cases of VDs, affected people with assets in the riparian corridor will be informed about the subproject and their options for them to receive compensation or to voluntarily donate their affected assets. The GRM will be explained in detail and donors will be appropriately informed and consulted about the sub-project and choices available to them. The contact information of MoWRAM's SEOs will also be disclosed during the consultation process. As described, when people choose to voluntarily donate, the process of land VD will be adequately recorded and documented in English and Khmer. In the case IPs are identified to be present in the subproject area by MoWRAM, documentation will be translated into the language used by IPs. Documentation will be publicly disclosed at the local level (such as commune/Sangkat halls) and at national level (MoWRAM's website). Personal details and sensitive information of donating people will be removed to protect their privacy.

8.2.2 Land Acquisition

128. In cases of Land Acquisition, the relevant information will be disclosed timely in Khmer language and translated in the language used by IPs in the case IPs are identified to be in the sub-project area, and in places easily accessible to AHs and the communities. Information disclosed to AHs relevant to land acquisition will be done through PIB at the first consultation stage during Basic Resettlement Plan (BRP) preparation, and through updated PIBs at a second consultation stage prior to DMS and at third consultation stage upon

contract offer. The BRPs and ARPs/DRPs, without sensitive personal information, will also be disclosed at MoWRAM's and the AIIB's website.

8.2 Stakeholder Consultation

8.1.1 Consultation and Stakeholder Engagement for Voluntary Donation

129. Once project implementation begins, in cases of VDs, potentially AHs will be invited to consultation sessions to understand the project compensation pprocesses as well as the availability of the VD option that affected people may consider. Special attention will be given to disadvantaged/vulnerable individuals/groups, Indigenous Peoples, if any, and women. Local authorities will also be invited to participate in these consultations.

130. As outlined in this LARPF, consultations will begin as early as subproject's design and location are identified and will be facilitated by the SEO at MoWRAM. The consultation will be an iterative process in which all AHs will be informed of their right to compensation and the option for a VD of assets, including VD procedures, and the subproject's benefits.

8.1.2 Consultation and Stakeholder Engagement for Land Acquisition and Involuntary Resettlement

131. In cases of Land Acquisition, key stakeholders participating in the consultation process will include:

- AHs, with special attention to women, Indigenous Peoples include their representative (if any), and disadvantaged/vulnerable people;
- MoWRAM and PDWRAM-PIU; its Provincial Departments;
- Provincial Department of Land Management, Urban Planning and Construction;
- Provincial Department of Agriculture, Forestry and Fisheries;
- Provincial River Basin Management Committee;
- IRC and GDR, including IRC-WG and PRSC-WG;
- Provincial and Local authorities (District/Khan, Commune Councils and Village Offices), including representatives of women's groups; and
- Civil Society Organizations, if relevant.

132. Consultations on land acquisition and involuntary resettlement will be an iterative process and will consist of various rounds taking place in various subproject locations, as described in the SOP-LAR. Consultations will start when subproject's construction work sites are identified. In addition to information disclosed as in in this Section above, concerns, questions and comments raised by AHs will be recorded and considered for incorporation into subproject planning, design and implementation.

133. The first consultation will aim to introduce the project/subproject, its goal, benefits, risks and impacts, including land acquisition and VD procedures. The option of a negotiated settlement will be explained in detail. The consultation will target both potential affected people and interested parties. The PIB prepared by MoWRAM and endorsed by GDR will be shared and made available at the commune/village council offices located in the subproject area. The GRM procedures and processes will be introduced to AHs and their views sought. If the subproject spans across a few provinces or multiple communes, then multiple consultative meetings will be held to cover all the affected communes. The major concerns and suggestions raised by the AHs will be recorded in the Minutes of the Meeting in summary form. If AHs agree on a negotiated settlement, this will also be recorded in the Minutes.

134. The second round of consultations will be at DMS stage and will focus on DMS process, the DMS Questionnaire and the IOL which will be explained to the AHs. This consultation will be undertaken jointly by IRC-WG and PRSC-WG assisted by local authorities. The updated PIB by GDR reflecting the entitlements for AHs, including GRM procedures and GRM focal persons and their contact details at commune, district, GDR and provincial levels will be shared and explained in detail. The consultation will be conducted with

participation of AHs and relevant authorities before DMS starts. Thereafter the DMS team will meet AHs on one-on-one basis and explain the purpose of the DMS process before proceeding to filling out the DMS Questionnaire and carrying out the measurements of the affected assets. The measurements will be taken in the presence of the AH and the AH will confirm the loss of the affected assets and measurements. This is to ensure AHs fully understand the basis on which the compensation will be paid for their lost assets, and other relevant entitlements. The DMS Questionnaire, which also includes the SES Questionnaire will also be shared and discussed so that the AHs know what information and data will be gathered during house-to-house DMS. The AH will sign the completed DMS Questionnaire and the IOL and witnessed by a community elder or official or commune chief. This process is also followed for a negotiated settlement.

135. The third public consultative meeting will be held prior to the signing of the agreement/contract for the compensation package and will be undertaken jointly by the IRC-WG and PRSC-WG. At this stage, the DMS and the RCS are completed, the compensation package for each AH is known and draft contracts will be prepared. The consultative meeting explains the compensation package, compensation schedule, procedures, entitlements and GRM, among others. The AHs will be provided with the option to sign the contract during this consultation stage or given 3 working days to submit the signed contract to the IRC-WG through the commune council office. For AHs who are unable to participate in the meeting, best efforts will be made to visit them at their home or seek the assistance of the village office to contact them. During the DMS the IRC-WG and PRSC-WG will obtain the mobile phone contact details from all AHs, and they will be outreached through mobile phones, when required.

136. Additional formal consultative meetings will be conducted when the compensation payment is ready to be disbursed. Details on consultation entitlements, schedule and process will be provided as well as the GRM. This consultation will be undertaken jointly by the IRC-WG and PRSC-WG. The schedule for compensation payments will be informed to AHs at least one week in advance through the commune and village offices.

137. The disclosure of relevant project/subproject information helps the AHs and other stakeholders to understand the risks, impacts and opportunities of the project/subproject. Meanwhile meaningful dialogue in consultations can avoid the potential for conflicts, address the concerns of APs to the extent possible, avoid bottlenecks to minimize project/subproject delays and contribute towards mitigating adverse impacts.

138. The consultation and disclosure activities associated with IFAD and AIIB-funded projects in Cambodia adhere to the principles of meaningful consultation, transparency, and alignment with local procedures, including the Royal Government of Cambodia's SOP-LAR, as well as any applicable Social and Environmental Plans or requirements. This ensures that projects funded in Cambodia prioritize community engagement and adhere to established standards for environmental and social risk management. The consultation and disclosure activities that are specified in the RGC's SOP-LAR and are consistent with that of AIIB's ESF (stakeholder engagement, para. 18) including requirements for meaningful consultation that begins early and is ongoing throughout the project/subproject.

9. MONTORING AND REPORTING

139. While the MoWRAM will be responsible for monitoring the overall implementation of the CAISARP, its process and outcomes of activities set forth in this LARPF, the DIMDM of GDR will be directly responsible for the monitoring and reporting of the implementation of the DRP. MoWRAM will engage the Detailed Design Implementation and Supervision consultants under CAISARP to assist MoWRAM in the management, implementation and monitoring of CAISARP. The DIMDM of GDR remains responsible for the monitoring and reporting of the implementation of the land acquisition activities under the ARPs/DRPs.

9.1 Internal Monitoring

140. The role of internal monitoring of the LAR activities are to ensure that resettlement activities are implemented in accordance with the implementation schedule outlined in the subprojects' ARP/DRP. In this

way, the protection of AHs' interests and the schedule for civil works can be assured. Primary responsibility for internal monitoring lies with MoWRAM as the project implementing agency and will be coordinated by its PMU. PMU will be responsible for overseeing the formation, function, and activities of each of the implementing agencies, and through quarterly monitoring reports, summarizing this progress. All monitoring data will be collected to ensure gender and ethnicity disaggregation.

9.1.1 Voluntary Donations

141. MoWRAM-PMU will be responsible for keeping adequate records of VD process and outcomes in accordance with the provisions outlined in this LARPF. As part of internal monitoring, the Project Manager (PM) will be responsible for reviewing the reports submitted by the SEO on VDs and grievances, if any. The files of record should be kept in the PMU office for at least five years after the project/subproject is completed.

142. It is expected that SEO will conduct due diligence on the voluntary land donations. The due diligence report provided by MoWRAM will cover the followings:

- Validation that donating assets is within the COI and the donors (individuals/households) are direct project beneficiaries;
- Validation and documentation that assets required for the subproject (within COI) were donated voluntarily and are free from any dispute on ownership or any other encumbrances;
- Validation that donated asset is minor and have not reduced the donor's remaining area below that required to maintain the donor's livelihood at current levels;
- Validation that no physical relocation or displacement of person is involved;
- Validation that meaningful consultation has been conducted in good faith with all potential donors, including that donors were aware that they were entitled to compensation. Separate discussions to be held with women as required to facilitate meaningful participation;
- Validation that a GRM is in place and a review and documentation of grievances, if relevant;
- In cases of community donation, that there is a consent of individuals using/occupying the land; and
- PMU will report will prepare a special report detailing the VDs when these are completed for subprojects for each contract package and submit to AIIB with all the relevant supporting documents. In addition, it will report on all aspects of VDs in the quarterly progress reports and submit them to AIIB.

9.1.2 Land Acquisition and Involuntary Resettlement

143. In case of Land Acquisition and Involuntary resettlement, the objective of internal monitoring is to (i) measure and report to keep MoWRAM informed on the progress in the preparation and implementation of the ARP/DRP; (ii) identify problems and risks, if any, and measures to mitigate them; and (iii) assess if the compensation and rehabilitation assistance are in accordance with the provisions under the ARP/DRP.

1. The GDR's DIMDM will be responsible for carrying out the internal monitoring which will review quarterly DRP progress reports provided by the RD2 including fielding its own missions to the fields to verify the progress made and the validity of the data and information, where necessary. The DIMDM will validate that the (i) entitlements and the corresponding compensation are paid to AHs in accordance with the EM in the DRP; and (ii) GRM is functioning as per the guidelines. The GDR's DIMDM will prepare and submit a semi-annual monitoring report on the implementation of the DRP. A single monitoring report will be prepared covering all subprojects under DRP per province. An indicative list of internal monitoring indicators is provided in **Annex 4**.

2. The internal monitoring reports will include the followings:
   (i) Set up of Institutional Arrangements;

(ii) Compensation Payments for Entitlements;
(iii) Relocation, if any;
(iv) Livelihood Restoration Program, where applicable;
(v) GRM;
(vi) Public Consultations;
(vii) Budget Expenditures;
(viii) Overall RP Implementation Progress against agreed Implementation Schedule in the DRP;
(ix) Problems and issues; and
(x) Proposed remedial actions.

144. In case of a negotiated settlement, when this is completed for the subprojects under each contract package, the GDR will submit a report detailing the negotiated settlement process together with the relevant supporting documents to the AIIB.

9.2 External Monitoring

145. In addition to internal monitoring, GDR will engage an Independent Monitoring Consultant (IMC) to conduct periodically independent monitoring on implementation of DRP where there is significant impact. The purpose of IMC is to monitor the implementation of the approved DRP to ensure the implementation complies with regulations and policies stipulated in the DRP. The IMC will prepare a completion report within 6 months of the completion of the resettlement activities under the DRP. The final report should include all findings from monitoring and evaluation and corrective action plan (if needed) and will be submitted to GDR. GDR will submit the final completion report to AIIB.

ANNEXES

Annex 1 – Screening Form for Land Acquisition and Resettlement

Initial Screening on Land Acquisition

Initial Screening is to be done during the feasibility study and confirmed during DED.

Province:		**District:**				**Commune:**	
Name of Subproject:		**Name of contractor:**				**Name/number of irrigation infrastructure:**	
Section of Construction Work (m/Kms)	**Villages/ Communes / Districts located/ crossed**	**Describe what is within COI (i.e. possible asset impacted such as trees, parts of structure, concrete driveway, livelihoods etc.)**				**Number of AHs impacted**	**Would voluntary donations be appropriate? (small impacts, no major impact on livelihood, no relocation etc. see Section 3.1 of this LARPF)**
		Western Side (W)	**Eastern Side (E)**	**Northern Side (N)**	**Southern Side (S)**		

Annex 2 – Voluntary Asset/Land Donation Form

Province:	District:	Commune:	Villages:
Subproject ID:	Name of contractor:		
Names of Persons Donating:	Name of Husband:		ID Number:
	Name of Wife:		ID Number:
Address:			
Beneficiary of the project: Y/N			
Living/Operating/with land, structure or tree/crop on COI: Y/N			
How does the persons donating **directly benefit** from the project? Please detail:			
Is the asset being donated used by anyone other than the owners? Please detail:			

Description of land that will be taken for the subproject:	Area affected:	Total landholding area:	Ratio of land affected to total land held (%):	Map code, if available:
Description of annual crops growing on the land now and subproject impact:				

	Details (number, etc.)	What the donating person is left with?
Trees/crops that will be donated		
Fruit trees/crops		
Mature non-fruit trees		
Trees/crops used for other economic or household purposes		
Describe any other assets that will be lost or must be moved to implement the subproject:		
Assets that will be donated (including parts of structures, wells, fences, etc.)		

Total value of donated assets:	Land*	Structures	Trees/crops
Other:			
If the asset being donated is used by someone other than the owner, a description of the remaining assets of that person, and/or description of why their livelihoods are not made worse by the donation.			

* *VLD will be accepted when the land area does not exceed 5% of the total land area*

By signing or providing thumbprint on this form the owner and/or user agrees to contribute assets for CAISAR's subprojects. The contribution is voluntary, and the person affected understands they could refuse or have the option to seek compensation, but they choose to donate. If the owner or user does not want to contribute his/her assets to the subproject, s/he should refuse to sign or provide thumbprint and ask for compensation instead.

Date:	Date:
District MoWRAM representative's signature	Donating person's signature (both husband and wife if applicable)

Witnessed by village/commune authority:

Annex 3 – Entitlement Matrix

Category	Type of Loss	Application	Category of AH	Entitlements	Clarification
1. LOSS OF LAND					
1a	**Land**	Agricultural, residential and commercial land	Legal owners, including those covered by customary rights	• Cash compensation for land at full replacement cost or land swap of equal productive value. • Provision of all and full stamp duties, land registration fees and other similar taxes, if applicable by the time of compensation, for acquiring legal rights in case of replacement land (land for land swap). • Includes option of compensation at same replacement cost for affected land that remains after acquisition if remaining land becomes unviable or unusable. • For customary ownership, replacement land to sustain livelihood and way of life. Land registration, stamp duty and other fees to register land ownership or right to use will be reimbursed at cost	• If land for land is offered, title will go to both husband and wife. • Applies only to partial loss of land.
1b	**Land**		Tenants and Leaseholders	• No compensation for loss of land as not legal owners of land (compensation made to landowner)	
1c	**Land**		Illegal occupiers/squatters without legal titles or rights to land	• No compensation made for land loss as not legal owners of land.	
2. LOSS OF USE OF LAND					
2a	**Crops, Perennial trees, fruit trees, timber**	Agricultural land	All AHs who are engaged in farming, irrespective of titled and non-titled	• **For rice/crop farming:** **Net annual income X 1year.** In addition, AHs can harvest and retain income from standing crops. • **For fruit trees,** replacement cost of loss based on following formula: **[Quantity Harvested per Year) X (Market Price) X (Number of years it will bear fruit)] + Cost of Seedling.**	• RCS will determine the amounts. • Market Price is based on Farm-Gate Price
				• **Perennial trees** that have a growth period of more than 5 years are classified as follows: + ***Sapling trees*** *under 1 year*: not compensated as it can be replanted. Cost of seedling will be provided. + ***Young trees*** (1 to 3 years): Valued at 1/3 of its full cost as it can be replanted plus cost of seedlings. • ***Young trees*** (More than 3 to 5 years) bearing some fruits: valued at 2/3 of its full cost plus cost of seedlings.	• RCS will determine the value. • Full compensation price is the amount to be calculated from the formula shown in [ ] without cost of seedling.

Category	Type of Loss	Application	Category of AH	Entitlements	Clarification
				• ***Mature trees*** (more than 5 years): full bearing fruits valued at full cost plus cost of seedling. • ***Wood and other Productive Trees***: based on age and wood value.	
2b	**Businesses**	Commercial use and business use	All AHs who are engaged in businesses, irrespective of titled and non-titled	• For businesses which need to be relocated to a new site, an amount equal to loss of projected net income for **two months**. • For businesses relocated on-site (move back or same area), an amount equal to loss of projected net income for **one month.** • For illegal businesses such as gambling, prostitution, drugs and similar types, no compensation is paid.	• RCS will determine the amounts. • Both registered and unregistered businesses are compensated except businesses that are not legal.
3. LOSS OF HOUSES AND STRUCTURES					
3a	**Houses and Structures**	Residential, commercial structures and other assets	Owners of houses, buildings and structures	• Cash compensation equivalent to full replacement cost of lost portion of the house/ building/ structure (without depreciation) • If the owner rents or leases, compensation for any improvements/ construction carried out by the renter/leaseholder will be deducted from the compensation payment to the owners. • In case houses/ buildings are rented/leased, any improvements/construction added by renters and leaseholders will be compensated at replacement cost and paid to renter or leaseholder. Owners will not get compensation for such improvements or construction. • In case of loss of only part of the houses/ buildings/ structure and the remaining portion is not usable, compensation will be paid for complete structure at full replacement cost.	• RCS will determine the replacement cost. • When loss is 75 % or more of the floor space
3b	**Houses and Structures**	Residential, commercial structures and other assets	Tenants and Leaseholders	• Cash compensation at full replacement cost for any improvements or construction by the tenants or leaseholders • In the case of no improvements or construction, no compensation is paid. • Transfer/ Disturbance Allowance equivalent to **1 month** of rental or lease amount	• RCS will determine replacement cost. • Documentary evidence is required.
3c	**Houses and Structures**	Residential, commercial structures and other assets	Illegal occupiers/squatters	• Cash compensation at full replacement value of affected structures, including also cost of labor involved in rebuilding such structure)	• RCS will determine replacement value.
3d	**Transport Allowance**	Transport allowance for household and personal goods	AHs (legal owners, tenants and Illegal occupiers/ squatters)	• Fixed Lump Sum allowance per AH based on average cost of transportation to new relocation place for: o Up to 5 km o More than 5 km	• RCS will determine the lump sum amount for 2 cases.

Category	Type of Loss	Application	Category of AH	Entitlements	Clarification
3e	**Tombs/ graveyard**	Relocation of affected tombs	AHs	• Compensation payment for affected tombs includes full replacement costs associated with a) buying of land (if needed) for re-burial, b) excavation, c) relocation, d) reburial, e) construction of new tombs, and f) other reasonable costs for conducting rituals in accordance with local customs. • If affected people are from EM community, consultation with affected EM households and local EM leaders will be held to ensure the impact is addressed in a manner that is culturally appropriate to the affected EM households/community.	• The relocation of tombs shall be carried out based on full consultation with affected households to meet local customs of affected households. • In case the owner of the affected tombs could not be identified, public announcement has to be made (through popular local media) to look for the tomb owners. Within a reasonable time, if the tomb owners could not be identified, relocation of tombs could be done by a specialized unit in consultation with local authorities and local people. Prior to relocation, photos of unknown tomb(s) shall be taken, and procedures of tomb relocation, and the new location of the tombs shall be documented carefully. • If affected households are from EM group, local EM leaders and community shall be consulted to ensure tomb relocation rituals are fully observed and proceeded in accordance with local EM tradition/practice
4. LOSS OF INCOME AND LIVELIHOOD					
4a	**Loss of Income during transition Period (Subsistence Allowance)**	Loss of Income	AHs who lose income during the transition period including employees of businesses	• Lump sum amount equivalent to **3 months** of income based on the official monthly poverty rate established by RGC. **Monthly Poverty Rate X Number of Members in AH X 3** • In case affected person is classified as poor and vulnerable group, the **above lump sum amount is doubled**.	• Monthly Poverty Rate as established by the RGC

Category	Type of Loss	Application	Category of AH	Entitlements	Clarification
4b	**Permanent Loss of Livelihood Source**	Income Restoration	AHs who lose their source of livelihood permanently	AHs can choose to participate in one of the following Livelihood Restoration options: **+ Land–Based Livelihood Restoration** for AHs engaged in land-based livelihood (i) facilitate access to replacement land (land-for-land if land is available) to enable AHs to continue their farming activities (rice cultivation, gardening, growing fruit trees, livestock, and other similar land-based farming activities; (ii) access to trainings on farming or livestock; and (iii) lump sum cash of **USD 200** to assisted affected households to start new income generation activity. OR **+ Business–Based Livelihood Restoration** for AHs who opt for alternative non-farm business, including: (i) access to training on new business skills; (ii) a lump sum cash of **USD 200** to assist in starting a new non-farm business. OR **+ Employment–Based Livelihood Restoration** for members of AHs who lose land-based employment permanently, and prefer to learn new job skills, including: (i) access to employment skills training; (ii) lump sum cash equivalent to **3 months** of income based on official poverty rate to supplement income support during the training period. **Affected household who are "Poor" and "Vulnerable" by project's definition will receive doubled lump sum cash** (as mentioned above) and have priority in accessing suitable employment opportunity under the Project.	AHs will be eligible for any one of the three options based on their preferred choice.
4c	**Relocation**	Self-relocation	AHs who will be permanently displaced and relocated	Cash compensation for self-relocation of the AHs to their preferred choice of site.	RCS will determine the cost of self-relocation.
5. TEMPORARY IMPACTS DURING CONSTRUCTION					
5.a	Damages to private and public assets, structures, properties		Local people, private sector and government	• Damage to properties that are caused by civil works contractors during construction will be compensated for property owners by involved contractors. Compensation shall be at full replacement costs. • Where public structures such as schools, health centers, recreational parks, public roads, water transmission pipelines, and electricity transmission lines (including electricity poles) are	

Category	Type of Loss	Application	Category of AH	Entitlements	Clarification
				affected, such affected works will be restored, and repaired, or compensated at full replacement cost to ensure normal operation is timely resumed at no cost to the local community, or private entitles who own and operate such public facilities. • The principles adopted for this LARPF apply for calculation of compensation.	
5.b	Unanticipated Impacts			• Any unforeseen impacts or damage due to the Project will be properly assessed and compensated in accordance with the LARPF and AIIB's ESF. The Borrower will inform AIIB of the occurrence of the unanticipated impacts and actions to be undertaken to mitigate these. These shall also be included in the monitoring report to AIIB.

Annex 4 – Indicative Internal Monitoring Indicators for Land Acquisition

Indicative Internal Monitoring Indicators for Land Acquisition

Purpose	Activities	Monitoring Indicators
Identification of compensation recipients	Verify list of compensation recipients against eligibility criteria for compensation	Number of persons in list of compensation recipients who do not meet eligibility criteria (included in error)
	Identification of persons who may claim eligibility for compensation but are not included in list of compensation recipients. Separate verification should be performed for each claim.	Number of persons who meet eligibility criteria but not included in list of compensation recipients (excluded in error)
Verification of affected area and assets	Confirmation of area of affected assets, but with legal ownership and without, against the RP / A-RP	Area of land subject to acquisition, for which compensation has been paid
		Area of other assets subject to acquisition, for which compensation has been paid
Verification of compensation amount, processing and payment	Examination of financial documents	Number of persons who received compensation in time and in full amount, disaggregated by compensation type
	Identification and analysis of reasons for compensation not being paid in full and in time	Number of persons who did not receive compensation in time and in full, disaggregated by compensation type
		Amount of funding allocated for payment of compensations
	Identification of reasons for which funds for compensation have been under- or overspent	Rate of spending of funds actually allocated for compensation, as % of amount envisioned in the RP/A-RP
Verification of compensation timeline	Identification of reasons payment of compensation is delayed (i.e., inheritance issues, court case)	Number of persons who received delayed compensation, disaggregated by compensation type and reason for delay; and any changes in amount of compensation (if any)
Verification of consultation and participation	Determine level of involvement and reasons for inadequate participation	Number of compensation recipients participating in consultations and coordination meetings at each stage of land acquisition / resettlement process, disaggregated by vulnerability status and IPs
		Number of IPs consulted in their own language through verbal translation
	Examination of grievance cases; analysis of disputes and complaints content and the resolution of conflicts	Number of complaints received disaggregated by grievance type and project activity
		Number of complaints resolved disaggregated by grievance type and project activity

	Footnote	Unit	Quantity	Direct Beneficiaries				Footnote	Indirect Beneficiaries				
Component and Output				**Men**	**Women**	**Total**			**Men**	**Women**	**Total**		Remarks
Component 1 - Farm Level Climate Adaptation and Resilience													
Output 1.1Increased farmer capacity in climate smart agriculture.		Master Trainer		120	80	200							
	a1	People		24 000	16 000	40 000		a1	96 000	104 000	200 000		**Please note:** This is an output indicator and reflects the number of farmers directly participating in FSS and trained (male or female, each representing a unique household). a1: Direct beneficiaries: It is assumed that each FFS (1600 in total) will have 25 participants of whom 40% will be women. Each FFS participant represents one unique household. [40,000 FFS participant households hence represent 78.9% of the targeted commune farming households]. a2: Indirect beneficiaries: Each FFS participant will benefit the spouse in their own household, and influence two (2) additional households (with one male and one female farmer who co-manage their agricultural plot or fish/poultry) beyond the commune, at the district level.
	b	Mechanization services	20										These are service providers for LLLs (Laser Land Levelling) and direct rice seeder (mDSR)
Output 1.2 Climate adaptive value chains developed by 4Ps and increased access to finance.													
Number of MSMEs involved	c	MSMEs	120	72	48	120							c: 120 MSMEs benefit from 4PF: Allocated budget for 4PF is US$ 3million. Grant for each enterprise (fully or partially – see the PIM) is in the range from US$15,000 (maximum 200 MSMEs) to USD 50,000 (Maximum 60 MSMEs). In discussions with four provinces, it was agreed that each province (four) will attract at least 25 MSMEs - i.e., will be highly local in nature. Other MSMEs (additional 20) might be regional or provincial in nature. MSME grants be delivered on a competitive basis in between provinces.
Number of households per MSME	d	people		3 600	2 400	6 000							d1: Examples from other IFAD project in the regions showed that an effective contract farming (between MSME and farmers) should be around 50 households.
Access to Finance through linkages	e	people		-	-	-			16 800	11 200	28 000		e: Access to Finance: It is assumed that 70% of FFS farming households will have improved access to finance and will be able to invest it in their adoption of more sustainable agriculture practices. https://www.khmertimeskh.com/501052053/70-percent-of-cambodians-have-access-to-financial-services/
Access to grants	f	MSMEs		72	48	120							f: Access to grants under the 4PF
Access to BDS	g	MSMEs		72	48	120							g: Access to Business Development Services under the 4PF
Output 1.3. Increased access to and use of climate information and advisory services for climate responsive water-use and crop planning	h1	people		337 654	225 103	562 757		h2	112 551	75 034	187 586		h1: Direct beneficiaries: Based on the assumption that 75% of farming households in the target provinces will benefit from climate information and early warning services (CIEWS) delivered through a mobile app. Direct CIEWS beneficiaries comprise male and female farmers from the household within the irrigation command areas (1.1) who will participate in FFS, adopt climate-resilient agricultural practices (rice, fish, poultry) and benefit from access to markets. Direct CIEWS beneficiaries also includes farmers from adjoining communes and districts who benefit from access to advisories and early warnings via mobileapp. h2: Indirect beneficiaries: Are the remaining 25% of farming households in the target provinces. **n.b.** Unit corrected from "provinces, commune, mobile" to "people"
Output 1.4: Increased resilience of farm road infrastructure to climate change	i1	people		5 341	5 341	10 683		i2	575 809	575 809	1 151 618		i1: Direct beneficiaries 9,417,017 rural population over 14,545 villages - gives the average number of households in a Cambodian village. 66% of population in each village is farming households. Assuming that 3 members (male and female farmer + youth or another adult farmer) from each household directly benefit from roads. 90 kms of road was mapped to 35 villages, based on Preliminary Report on Road Survey. i2: Indirect beneficiaries Since these are climate-resilient roads, in addition to farmers within 35 villages, indirect beneficiaries are farming and non-farming households across the communes, districts and provinces who benefit from improved connectivity. 40% of the population is assumed to indirectly benefit.
Component 2. Irrigation Infrastructure for increased resilience													
Output 2.1 Irrigation schemes and ponds modernized	j	Ha	22 051										Worksheet "Schemes" Component 2.1, Cells D4-D9 references to command area per scheme.
Output 2.2 Flood-proofed and improved drainage.	k	Ha	10 005										Worksheet "Schemes" Component 2.1, Cells F4-F9 references to flooded area per scheme.
Output 2.3 Farmers Water User Communities (FWUC) established and trained	m	FWUC	11										A total of 11 FWUCs are planned, 4 of which are partially functioning.
Output 2.4 Water information system (CIEWS and SCADA)	n1	people		10 683	10 683	21 366		n2	66 175	66 175	132 350		n1: Direct beneficiaries SCADA (a system for measurement of flows and influencing operation of irrigation/drainage gates) covers only the Ou Ta Pong scheme within the project, and is meant to ensure sufficient water availability for this scheme, which is located downstream in the water basin. The project communes of OTP have 10,683 households. Both male and female adult farmers from each household, co-managing agriculture, will directly benefit. n2: Indirect beneficiaries Farming households in non-project schemes (still in Pursat province) that rely on the same water resources (Pursat water basin), and allow for rotational distribution of water. OTP province has 76,858 households, and both male and female adult farmers from each household, co-managing agriculture, will indirectly benefit.
Component 3. Institutional Strengthening													
Output 3.1 MOWRAM Capacity Support		people		150	100	250							These are staff from MOWRAM who will benefit from upgraded technical capacity in various aspects of climate resilient irrigation design and management, river basin management and
Output 3.3 Strengthening of NCDD		people		210	140	350							These are staff from NCDD, an Accredited Entity to GCF will improve capacity to implement climate finance projects (project management, financing management, MEL, gender and social

Beneficiary Type	Benefit Description	Units	Direct	Indirect
Smallholder farmers in the four target provinces	Improved access to climate information and early warning services, specifically tailored advisories for crop cultivation	people	562 757	187 586
Smallholder farmers, and people with farming and non-farming households who benefit from improved and climate-resilient rural roads acros the four target provinces **(a-direct, b-indirect)**	Improved access to markets and services for climate-resilient livelihoods	people	10 683	1 151 618
Smallholder farmers living in the communes associated with schemes **(c)**	Improved access to information on climate-resilient agriculture, improved market access, and support for adoption of climate-resilient, low-emission practices and technologies for crops, fish and poultry	people	40 000	200 000
Local MSMEs and mechanization services	Service providers who provide mechanization services, local MSMEs who receive business development support and grants	MSMEs	140	-
MOWRAM, NDA / DOE, NCDD staff	Capacity development, improved access and awareness of tools, improved capacity to implement and manage climate finance projects	people	600	-

	TOTAL ADAPTATION BENEFICIARIES (Unique, no. of people)	**1 714 375**	562 757	1 151 618

0

NOTES

(a) Direct beneficiaries are part of the 562,757 direct beneficiaries

(b) 187,586 indirect beneficiaries who are male/female farmers within 375,171 farming households in four provinces are cautiously assumed to be a part of the 1.15M people who benefit from improved rural roads

(c) They are a part of the 562,757 beneficiaries

Integrated Results Management Framework										
	Unit	Number (Total)	Number (Women)	Assumption	Reference	people	people	women	women	**Assumptions related to women beneficiaries and CoI G-H, if any**
Core Indicator 1: Greenhouse gas (GHG) emissions reduced, avoided or removed/sequestered	tonnes of carbon dioxide equivalent	Reduction of 213,501.58 tCO2eq by end of implementation period (year 7) Reduction of 1,006,507 tCO2eq by the end of Implementation and capitalization phase (year 20)	Not Applicable	Please refer to EX-ACT annex and associated Excel worksheets	Annex 22 EX-ACT	-	-	-	-	
Supplementary 1.4: Renewable energy generated (MWh)	MWh	3123	Not Applicable	15,000 hectares (ha) of cultivated area will switch to (off-grid) solar irrigation, from diesel powered irrigation systems. The size of solar irrigation pumping units to be installed will vary from one FWUC / farmer to another. If a relatively large system is installed with 135 solar panels (each 340W) that can power a 30kW motor pump this can irrigate about 300 ha of land and will cost US$ 66,000. The 300 ha of land corresponds to 250 farmers (assuming ~1.2 ha per farming household) and each smallholder farmer will need to contribute US$ 264. 50 such systems will be needed to cover 15,000 ha. 135 panels X 340W X 50 = 2,295,000 watts (W) or 2.295 MW. If each MW is assumed to generate 1,361 MWh annually (IWMI reference for solar irrigation system: https://solar.iwmi.org/wp-content/uploads/sites/43/2023/11/Issue-brief-06-1.pdf), the total capacity is 3,123.75 MWh (in theory). This assumes that all solar irrigation pumps are operational and there is no wasted energy.						
Core indicator 2: Direct and indirect beneficiaries reached					Annex 23B (Beneficiary Estimates)					
Supplementary 2.1: Beneficiaries (female/male) adopting improved and/or new climate-resilient livelihood options.	number of individuals	192 000	96 000	Based on the assumption that 80% of the 40,000 participants (each representing a unique household) in the FFS adopt climate-resilient and/or improved livelihoods (direct beneficiaries). Each of those 40,000 FFS participants will influence one member in their household (typically, their spouse with whom they manage their plots and livestock), and an additional two (2) households with two (2) adult farmers. 80% adoption rate assumption is retained (indirect beneficiaries) 40% of the direct FFS participants are assumed to be women. Overall, 50% of the farmers who benefit directly and indirectly (through diffusion) are assumed to be women (women farmers and women-headed households). Finally,420% of the beneficiaries (non-farming, MSMEs) are assumed to be women. **N.b.** There are 50,711 households in the project communes. However, spillover effects are likely go beyond project commune and involve farmers in the wider district through FFS replication as well as informal market interactions (learning from one another).		32 000	160 000	12 800	83 200	40% of the farmer-participants in FFS are assumed to be women.
Supplementary indicator 2.2: Beneficiaries (female/male) with improved food security	number of individuals	282 240	141 120	This is now linked to total number of beneficiary households (Supplementary 2.1): 40,000 households that participate in FFS and an additional 2 households per FFS participant. 80% adoption rate is retained. Household size is 4.20 members for the four provinces. Assuming that 70% of households will improve their food security. 50% of household members with improved food security are women. **[All household members are counted into the indicator since targeted support will be provided at the household level.]**		134 400	268 800	67 200	134 400	Cell G7-H7 compute number of members in each household, only 70% of who are assumed to benefit from improved food security. 50% of household members are women / girls.
Supplementary indicator 2.4: Beneficiaries (female/male) covered by new or improved early warning systems	number of individuals	750 342	375 171	Based on the assumption that only farming households in all four provinces (computed as 375,171) will benefit from CIEWS, even though the early warnings on floods and droughts from the CIEWS app will benefit all households (691,846 households in the four provinces). Further, assume that information will be shared between male and female farmers within the household co-managing the agriculture activity (crop, fish, livestock), doubling the number of beneficiaries per farm household. **[Beneficiaries "covered" means those individuals residing within an area covered by the early warning system supported by GCF-funded interventions and can receive or have received early warning information.]**		562 757	187 586	281 378	93 793	50% of farmers in each household assumed to be women (either male-headed or female-headed households)
Core Indicator 3: Value of physical assets made more resilient to the effects of climate change and/or more able to reduce GHG emissions	value of physical assets in USD	-	-							None
Core Indicator 4: Hectares of natural resource areas brought under improved low-emission and/or climate-resilient management practices	hectares	32 056	-	This includes areas that were fallow owing to flooding and can now be cultivated, and area of land that was uncultivable and now will have irrigation access. The number has been corrected and adjusted downwards to reflect FFP wherein Chhean Laeung is dropped (from 36,909 ha to 32,056 ha). 22,051 hectares of the command area, and an additional 10,001 hectares of the flood-protection area. This calculation does not multiply cultivated area by seasons. E.g., if out of 20,008 ha of rice area cultivated in May under Ou Ta Pong scheme, 11,156 hectares is cultivated again in Oct.		-	-	-	-	None
Supplementary indicator 4.1: Hectares of terrestrial forest, terrestrial non-forest, freshwater and coastal marine areas brought under restoration and/or improved ecosystems	hectares	32 056	-	Through FWUCs, lands will be brought under improved water management. Through FFS, lands will benefit from improved soil (and irrigation) management. Both actions will contribute to better ecosystem services on production landscapes.		-	-	-	-	None
Core indicator 5: Degree to which GCF investments contribute to strengthening institutional and regulatory frameworks for low-emission climate-resilient development pathways in a country-driven manner	high	-	-	None		-	-	-	-	None
Core indicator 6: Degree to which GCF investments contribute to technology deployment, dissemination, development or transfer and innovation;	Medium	-	-	None		-	-	-	-	None

The following indicator is dropped after a careful review of GCF IRMF. The definition of innovations *"refer to a resilience-building model, technology, tool, practice, service or product that was demonstrated (i.e. successfully tested) for the first time in a country by the project. Innovations that had already been demonstrated elsewhere but never in the country or countries where the project is implemented can be counted under this indicator"*

The crop management practices, fish and poultry value chains, and CIEWS promoted through the project are present in Cambodia (though not adopted at scale, and not underpinned by flood and drought management infrastructure in these targeted regions)

Supplementary indicator 2.5: Beneficiaries	number of individuals	30 000	12 000	Based on the assumption that 75% of the 40,000 participants of the FFS adopt climate		30 000		12 000

24TH FEBRUARY 2025

EXECUTIVE SUMMARY

This summary provides a detailed overview of the Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project in Cambodia, drawing on information from the provided sources. The project, designed to improve irrigation systems and enhance agricultural productivity, spans four (4) provinces and six (6) sub-schemes. The project has undergone thorough environmental and social impact assessments to mitigate potential adverse effects, and it prioritizes community engagement and information disclosure.

Project Origins and Goals

The CAISAR project emerged from the Royal Government of Cambodia's (RGC) strategic framework for the irrigation sector, aiming to achieve the goals outlined in their National Water Resources Management and Sustainable Irrigation Road Map and Investment Program (2019-2023). The project aims to enhance climate adaptation and mitigate the negative impacts of extreme climate events on smallholder farmers and vulnerable communities, particularly in the Mekong River and Tonle Sap region.

Project Scope and Coverage

The project focuses on six (6) sub-schemes: Ou Ta Paong, Lum Hach, Brambei Mom, Krapeu Troum, Yutasas, and Steung Krang Bat, covering a total command area of 25,604 hectares and benefiting approximately 22,500 farmers. The project will conduct a comprehensive Environmental, Social, and Climate Impact Assessment (ESCIA) covering all six (6) sub-schemes and formulate Environmental, Social, and Climate Management Plans (ESCMP) for three (3) selected sub-schemes: Ou Ta Paong, Krapeu Truom, and Yutasas.

Legal and Policy Framework

The project's impact assessment adheres to international standards, including the Asian Infrastructure Investment Bank's (AIIB) Environmental and Social Framework (ESF), the International Fund for Agricultural Development's (IFAD) Social, Environmental, and Climate Assessment Procedures (SECAP), and the Green Climate Fund's (GCF) environmental and social standards. The assessment also considers the RGC's legal framework, including provisions for environmental protection, land acquisition, and involuntary resettlement. The project proposes measures to address any gaps between international standards and the RGC's legal framework.

Defining the Area of Influence

The project recognizes three (3) categories of influence: areas affected by project activities, areas affected by cumulative impacts from past and planned projects, and areas impacted by associated facilities. During the construction phase, air quality, noise, and vibration impacts are anticipated, primarily affecting areas within approximately 100 meters of construction sites, including rehabilitated rivers and canals, upgraded structures, and transportation routes. Water quality is also a concern during both construction and operation phases, with potential impacts arising from sedimentation, chemical contamination, and agricultural runoff. These

impacts could extend downstream along various rivers and ultimately affect the Tonle Sap Lake, impacting water availability for agriculture and domestic use.

Soil quality is anticipated to be affected by erosion, compaction, and contamination during construction, while operational impacts include salinization, nutrient imbalance, and waterlogging. The project acknowledges the potential impacts on biodiversity, particularly on wildlife movement patterns and habitats. Specific areas of concern have been identified for each of the six (6) sub-schemes, including the Boeng Kanseang Lake, Toul Samraong, Phnom Banon, and Chan Trak Community Forests, the Stoeung Krang Ponley River, and the Tonle Sap River.

Social impacts are expected to extend beyond the immediate project sites and will be influenced by changes in land use, water availability, and employment opportunities. The project recognizes the potential for shifts in livelihoods, migration patterns, and community dynamics, and aims to address potential negative impacts through community engagement and consultation, particularly with vulnerable groups. The report emphasizes the importance of mitigation measures to minimize these impacts, such as environmental monitoring, sustainable farming practices, and social safeguards to protect workers and communities.

Baseline Environmental and Social Conditions

This assessment covers a range of environmental and social factors, including geological, hydrological, climatic, and socio-economic conditions, and identifies key considerations for sustainable project implementation.

Geological and Topographical Features: The project area exhibits diverse geological formations, including deltaic deposits, organic deposits, and alluvial plains. Elevations range from less than 40 meters in Ou Ta Paong to 40-145 meters in Prambei Mom, indicating variations in terrain and land use potential. Soil types also vary across sub-schemes, with red-yellow podzols being the most common in Brambei Mom.

Hydrological Resources and Water Availability: Cambodia, particularly the CAISAR project area, possesses abundant water resources, primarily from the Mekong River and Tonle Sap Lake. However, water availability fluctuates seasonally, leading to challenges in the dry season. The project relies on several rivers and reservoirs, including the Pursat River, Ou Ta Paong River, and Svay Don Keo River. Existing irrigation infrastructure varies in condition and capacity, with some systems facing limitations due to damage, neglect, or inadequate design.

Climatic Conditions and Climate Change: Cambodia's climate is characterized by distinct wet and dry seasons, with precipitation ranging from 1,300 to 1,500 mm in the project areas. Historical climate data reveals rising temperatures, particularly during the dry season, and projections indicate a continued warming trend in the future. Flooding is a significant concern, with the project area highly susceptible to both riverine and flash floods.

Air and Water Quality: Air quality in the project area is generally good, though dust and smoke from agricultural activities can periodically affect local conditions. Noise and vibration levels vary across sub-schemes, with locations near major roads experiencing higher noise levels. Water quality assessments reveal concerns regarding nutrient pollution and microbial contamination in certain areas, particularly elevated levels of nitrogen, phosphorus, and total coliform.

Biodiversity and Species Distribution: The project area supports diverse ecosystems and a range of endangered and critically endangered species. Assessments have identified key species in various sub-schemes, including turtles, fish, birds, mammals, and plants. However, some species face population declines due to habitat loss, overfishing, and limited flooding events, highlighting the need for conservation efforts.

Socio-economic Conditions: The project area is predominantly rural, with agriculture as the primary occupation. The population is generally young, but educational levels vary across sub-schemes. Access to energy and sanitation facilities is high, but water supply reliability remains a concern. Rice production is the dominant agricultural activity, with varying yields and challenges across sub-schemes. Vegetable production is also prevalent, with farmers facing limitations related to market access, pest management, and water availability.

Cultural Heritage: The project area contains important cultural sites, including the Longvek Capital and Bardez Stupa, which require protection during project implementation.

Institutional Capacity and Needs: The report highlights capacity gaps in water resources and irrigation management at various levels, including within the Ministry of Water Resources and Meteorology (MOWRAM), Provincial Departments of Water Resources and Meteorology (PDOWRAM), and Farmer Water User Communities (FWUCs). Recommendations for capacity building include training programs on technical and administrative aspects of water management, environmental awareness, and social safeguards.

Climate Change Adaptation: The project recognizes the need to address climate change risks, including projected temperature increases, changes in rainfall patterns, and increased flood frequency and intensity. Mitigation measures, such as promoting drought-resistant crops, improving water storage and distribution systems, and strengthening early warning systems, are crucial for enhancing resilience.

Identifying and Assessing Potential Impacts

The project's environmental and social impact assessment meticulously identifies and analyzes potential risks and impacts associated with project activities, such as the construction and rehabilitation of irrigation canals, river dredging, and intensified crop production. These potential impacts are categorized as direct, indirect, and cumulative.

Direct Impacts: These are immediate and localized consequences of project activities. Examples include noise and dust pollution from construction, soil erosion from earthworks, and habitat disturbance during the construction of irrigation canals.

Indirect Impacts: These are secondary effects extending beyond the immediate project area. They may include water pollution from agricultural chemical runoff, increased demand for wildlife products due to labor influx, and changes in local economic activities due to project-related employment opportunities.

Cumulative Impacts: These arise from the combined effects of the project and other past, present, and reasonably foreseeable future projects in the area. Examples include the cumulative impact on water resources from multiple irrigation projects, the combined effects of agricultural intensification on biodiversity, and the overall impact of development projects on the socio-economic landscape.

Mitigating Environmental and Social Impacts

To minimize potential environmental and social impacts, the project proposes several management measures. The report highlights the potential environmental and social risks and impacts associated with the project, particularly during the construction and operation phases, and proposes mitigation measures to address these concerns.

The construction phase involves activities such as dredging, excavation, and the establishment of worker camps, which can lead to environmental pollution, habitat loss, and increased greenhouse gas emissions. The operation phase, characterized by intensified farming practices, poses risks related to water and soil pollution from agricultural chemicals and potential social inequalities.

To mitigate these risks, the report proposes several measures. These include implementing strict environmental monitoring programs to track air and water quality, conducting biodiversity assessments, and promoting sustainable farming practices. Social mitigation strategies focus on preventing child and forced labor, addressing potential sexual exploitation and abuse, and ensuring community health and safety through awareness campaigns and training programs. The report emphasizes the importance of community engagement and consultation, particularly with vulnerable groups, to ensure equitable access to resources and benefits from the project. Clear roles and responsibilities are outlined for various stakeholders, including government agencies, the Project Management Unit (PMU), contractors, and local communities, to ensure effective implementation and monitoring of these measures. The report also establishes an environmental and social compliance framework with detailed reporting procedures to ensure transparency and accountability throughout the project lifecycle.

Public Consultation and Information Disclosure

The project emphasizes public consultation and information disclosure throughout its lifecycle. Consultations were held with local communities, relevant authorities, and other stakeholders to inform them about the project's objectives, gather feedback, and address concerns. Concerns raised during consultations included potential pollution from construction, impacts on biodiversity, labor and working conditions, and community health and safety. The project is committed to disclosing the Environmental and Social Climate Impact Assessment (ESCIA) report and the Environmental and Social Climate Management (ESCM) Plan to the public in both English and Khmer. This includes a Non-Technical Summary (NTS) in Khmer, which provides a simplified explanation of the project.

Grievance Redress Mechanism (GRM)

The project establishes a comprehensive Grievance Redress Mechanism (GRM) to address concerns and complaints from affected communities and individuals. The GRM provides multiple channels for submitting grievances, a system for logging and tracking complaints, and procedures for resolving issues in a timely and transparent manner. The GRM aims to ensure accountability and responsiveness to community concerns throughout the project lifecycle.

Cost and Budget

The project's ESCIA includes detailed cost and budget analysis for mitigating potential environmental and social impacts. The budget outlines financial requirements for implementing mitigation measures, monitoring environmental and social indicators, capacity-building initiatives, and community engagement programs. The estimated cost for implementing the Environmental and Social Climate Management Plan (ESCMP) is $3,324,064, covering additional costs not originally factored into the project's budget. The ESCMP budget allocates funds to various stakeholders, including the Ministry of Water Resources and Meteorology (MOWRAM). A significant portion of the budget is dedicated to the Biodiversity Plan, supporting protected areas and biodiversity actions in specific locations like Ou Ta Paong, Lum Hach, and Stung Krang Ponley. The budget also covers UXO clearance, consultation outreach, awareness-raising campaigns, and a comprehensive Environmental and Social Monitoring Program. This monitoring program involves regular assessments of soil quality, air quality, noise and vibration levels, and water quality at designated locations within the project area.

CHAPTER 1 – INTRODUCTION 1
1.1 RATIONALE 1
1.2 PREPARING THE ESCIA 2
1.2.1 Objectives of the ESCIA 2
1.2.2 Project Location 2
1.2.3 Scope and Coverage 3
CHAPTER 2 – PROJECT DESCRIPTION 6
2.1 INTRODUCTION 6
2.2 PROJECT DESCRIPTION 6
2.2.1 Background 6
2.2.2 Project Area and Beneficiaries 9
2.2.3 Description of the Sub-Schemes 10
2.3 PROPOSED INFRASTRUCTURE 21
2.3.1 Ou Ta Paong 21
2.3.2 Lum Hach 28
2.3.3 Stung Krang Ponley 31
2.3.4 Project Activities 37
2.3.5 Construction Equipment 41
2.4 ASSOCIATED FACILITIES 42
2.5 IMPLEMENTATION RESOURCES REQUIREMENT 46
2.5.1 Labour and Workforce 46
2.5.2 Power Usage 47
2.5.3 Supporting Facilities 48
2.5.4 Water Consumption 48
2.5.5 Expected GHG Emission and Discharge 49
2.5.6 Land Acquisition for Material Storage 50
CHAPTER 3 – PROJECT ALTERNATIVES ANALYSIS 51
3.1 INTRODUCTION 51
3.2 ALTERNATIVE ANALYSIS 51
3.2.1 Ou Ta Pong 51

3.2.2 Lum Hach 60
3.2.3 Stung Krang Ponley 63
CHAPTER 4 − LEGAL AND POLICY FRAMEWORK 68
4.1 INTRODUCTION 68
4.2 RELEVANT LAW AND REGULATIONS OF THE ROYAL GOVERNMENT OF CAMBODIA 68
4.2.1 The Constitution of the Kingdom of Cambodia (1993) 68
4.2.2 Legal Framework on the Management and Conservation of Natural Resources and Biodiversity 68
4.2.3 Legal Framework on Labour, Public Well-Being, and Safety 71
4.2.4 Legal Framework on Governance and Social Inclusion 72
4.2.5 EIA Classification 73
4.2.6 Applicable Ambient Quality Standards 73
4.3 AIIB'S ENVIRONMENTAL AND SOCIAL FRAMEWORK (ESF) 75
4.4 IFADs' SECAP 76
4.5 GEF'S ENVIRONMENTAL AND SOCIAL SAFEGUARDS POLICIES 77
4.5.1 International Conventions and Treaties 78
4.6 Good International Industry Practices (GIIP) 79
4.6.1 WBG General EHS Guidelines (2007) 79
4.6.2 WBG EHS Guidelines for Annual Crop Production (2016) 79
4.7 GAP ANALYSIS OF NATIONAL LEGAL FRAMEWORK AND POLICIES OF AIIB, IFAD AND GCF 80
CHAPTER 5 − PROJECT AREA OF INFLUENCE 86
5.1 INTRODUCTION 86
5.2 DETERMINING PROJECT AREAS OF INFLUENCE 86
5.3 DESCRIPTION OF KEY COMPONENTS THAT POTENTIALLY CAUSE THE INFLUENCIAL IMPACT 87
5.3.1 Air, Noise and Vibration 87
5.3.2 Water Quality 89
5.3.3 Soil Quality 90
5.3.4 Biodiversity 91
5.4 SUMMARY OF THE PROJECT AREAS OF INFLUENCE 95
CHAPTER 6 − BASELINE CONDITIONS 96
6.1 INTRODUCTION 96
6.2 METHODOLOGY 96
6.2.1 Environmental and Natural Resources 96
6.2.2 Socio-Economic Resources 107
6.3 PHYSICAL AND ENVIRONMENTAL CONDITIONS 110

6.3.1 Geological Conditions 110
6.3.2 Topography 111
6.3.3 Land Cover and Water Use 113
6.3.4 Soil Types 114
6.3.5 Hydrological Resources 117
6.3.6 Climatic Conditions 122
6.4 BASELINE ENVIRONMENTAL QUALITY 130
6.4.1 Unexploded Ordnances (UXO) 130
6.4.2 Ambient Air quality, Noise and Vibration 133
6.4.3 Soil Quality 138
6.4.4 Surface Water Quality 139
6.4.5 Groundwater Quality 143
6.5 BIODIVERSITY 144
6.5.1 Ou Ta Paong 144
6.5.2 Lum Hach 168
6.5.3 Brambei Mom 173
6.5.4 Krapeu Trom 175
6.5.5 Yutasas 178
6.5.6 Stueng Krang Bat 184
6.6 SOCIO-ECONOMIC AND CULTURAL CONDITIONS 192
6.6.1 Administrative and Social Structure 192
6.6.2 Social Conditions 194
6.6.3 Demographic and Facilities 196
6.6.4 Socio–economic Conditions of the Beneficiaries 198
6.6.5 Cultural Sites 201
6.6.6 Agricultural Production 203
6.6.7 Profiles of the Beneficiaries 210
6.6.8 Profiles of the Potentially Affected Households 215
6.7 CLIMATE CHANGE SCENARIOS 222
6.7.1 Current Impacts of Climate Change 222
6.7.2 Climate Change Projections 224
6.7.3 Greenhouse Gas Emissions and Agriculture Sector in NDCs 227
6.8 CAPACITY, EXPERIENCE OF THE IMPLEMENTING AGENCIES AND NEEDS 228
6.8.1 MOWRAM/ PMU and PDWRAM 228
6.8.2 FWUC/FWUG/FWUSG 229
6.8.3 Training and Technical Assistance 230

6.8.4 Technical Assistance on E&S Capacity Building 230
6.8.5 Review Of MOWRAM/PMUS Capacity in Prevention of SEA/SH Risks 231
CHAPTER 7 − ENVIRONMENTAL AND SOCIAL IMPACT ASSESSMENT 232
7.1 INTRODUCTION 232
7.2 APPROACH TO ASSESMENT OF RISK AND IMPACTS 232
7.2.1 Identification and Assessment of Risks and Impacts 232
7.2.2 Project Activities 233
7.3 ASSESSMENT OF ENVIRONMENTAL AND CLIMATE RISKS AND IMPACTS 236
7.3.1 Risks and Impacts at Preparation and Construction Stage 237
7.3.2 Risks and Impacts at Operation Stage 251
7.4 ASSESSMENT OF SOCIAL RISKS AND IMPACTS 261
7.4.1 Risks and Impacts at Preparation Stage 262
7.4.2 Risks and Impacts at Construction Stage 270
7.4.3 Risks and Impacts at Operation Stage 282
CHAPTER 8 – RAPID CUMULATIVE IMPACT ASSESSMENT 286
8.1 INTRODUCTION 286
8.2 STEPS FOR CONDUCTING RCIA (PROJECT LEVEL) 286
8.3 SOURCES OF INFORMATION AND LIMITATIONS OF RCIA 288
8.4 RESULTS OF THE RAPID CIA 289
8.4.1 Identification of Valued Environmental and Social Components (VECs) (Step 1) 289
8.4.2 Identification of other Projects, Activities and External Stressors (Step 2) 291
8.4.3 Baseline Conditions of VECs (Step 3) 293
8.4.4 Assessment of the Cumulative Impacts of VECs (Step 4) 294
8.4.5 Assessing the Impacts Significance (Step 5) and Management Measures (Step 6) 297
8.5 CONCLUSION 299
CHAPTER 9 − ENVIRONMENTAL & SOCIAL MANAGEMENT 300
9.1 INTRODUCTION 300
9.2 ENVIRONMENTAL, SOCIAL AND CLIMATE 300
9.2.1 Mitigation Measures for the Environmental and Climate Risks and Impacts 300
9.2.2 Mitigation Measures for the Social Risks and Impacts 311
9.2.3 Environmental Monitoring Program 323
9.2.4 Social Monitoring Program 333
9.2.5 E&S Auditing 341

9.3 ROLES AND RESPONSIBILITIES FOR IMPLEMENTATION OF SUB-SCHEME ESCMP 341
9.4 ENVIRONMENTAL AND SOCIAL COMPLIANCE FRAMEWORK 341
9.4.1 Institutional Arrangement and Capacity Development 341
9.4.2 Environmental and Social Duties of the PMU/Detail Design Consultants 343
9.4.3 Environmental and Social Duties of the Contractor 345
9.4.4 Contractor's Environmental and Social Management Plan (C-ESCMP) ... 345
9.4.5 Safety, Social and Environmental Officer (SSEO) 346
9.4.6 Reporting Arrangements 347
CHAPTER 10 − PUBLIC CONSULTATION AND INFORMATION DISCLOSURE 350
10.1 INTRODUCTION 350
10.2 SUMMARY OF PUBLIC CONSULTATION PROCESS & RESULTS 350
10.2.1 The Consultation 350
10.2.2 Results of the Consultations 352
10.3 INFORMATION DISCLOSURE 373
10.4 GRIEVANCE REDRESS MECHANISM (GRM) 373
10.4.1 Objectives of the Project GRMs 374
10.4.2 Summary of National Legislation Related to Grievance and Complaint .. 374
10.4.3 Principles of the Project GRMs 375
10.4.4 Project's Redress Procedures 376
10.4.5 Registration of Project Grievance 381
CHAPTER 11 – COSTS AND BUDGET 382
11.1 INTRODUCTION 382
11.2 ESTIMATED COSTS FOR ESCMP IMPLEMENTATION 382
ANNEX 385
ANNEX 1: BIODIVESITY ASSESSMENT REPORT 385
ANNEX 2: SUMMARY OF HOUSEHOLD SURVEY RESULTS 492
ANNEX 3: SUMMARY OF SURVEY DATA WITH VILLAGE CHIEFS 495
ANNEX 4: SUMMARY OF SUB-SCHEME COMMUNE DATA 497
ANNEX 5: LABORATORY TESTING RESULT 501
ANNEX 6: CHANCE FIND PROCEDURE 517
ANNEX 7: LIST OF ARCHEOLOGICAL AND CULTURAL SITES 518
ANNEX 8.1: RESULTS OF THE CONSULTATIONS IN PURSAT PROVINCE 530
ANNEX 8.2: RESULTS OF THE CONSULTATIONS WITH COMMUNE COUNCILS IN PURSAT PROVINCE 548
ANNEX 8.3: RESULTS OF THE CONSULTATIONS WITH VILLAGE CHEFS IN PURSAT PROVINCE 555
ANNEX 9.1: RESULT OF CONSULTATION: KAMPONG CHHNANG PROVINCE 561

ANNEX 9.2: RESULTS OF THE CONSULTATIONS WITH COMMUNE COUNCILS IN KAMPONG CHHNANG PROVINCE 582

ANNEX 9.3: RESULTS OF THE CONSULTATIONS WITH VILLAGE CHEFS IN KAMPONG CHHNANG PROVINCE 594

ANNEX 10.1: RESULTS OF THE CONSULTATIONS IN KAMPONG SPEU PROVINCE 605

ANNEX 10.2: RESULTS OF THE CONSULTATIONS WITH COMMUNE COUNCILS IN KAMPONG SPEU PROVINCE 619

ANNEX 10.3: RESULTS OF THE CONSULTATIONS WITH VILLAGE CHEFS IN KAMPONG SPEU PROVINCE 625

ANNEX 11: RESULTS OF THE CONSULTATIONS WITH RICE FARMERS 632

ANNEX 12: RESULTS OF THE CONSULTATIONS WITH VEGETABLE FARMERS 647

ANNEX 13: RESULTS OF THE CONSULTATIONS WITH CHICKEN FARMERS 658

ANNEX 14: RESULTS OF THE CONSULTATIONS WITH DUCK FARMERS 667

ANNEX 15: STANDARD OPERATION PROCEDURE (SOP) FOR LAND CLEARING AND REHABILITATION 676

LIST OF TABLES

Table 1.1: List of six (6) sub-schemes under CAISAR 2
Table 2.1: Summary of the CAISAR project targeted area 9
Table 2.2: List of six (6) sub-schemes under CAISAR 10
Table 2.3: Administrative coverage of Ou Ta Paong sub-scheme 10
Table 2.4: The Water Resources by Region of Ou Ta Paong sub-scheme 12
Table 2.5: Key Characteristics of the Ou Ta Pong Irrigation Scheme 12
Table 2.6: Administrative coverage of Lum Hach sub-scheme 14
Table 2.7: Irrigation Resources and Development Potential for Lum Hach sub-scheme 15
Table 2.8: Administrative coverage of the Krang Ponley Sub-scheme 15
Table 2.9: Main Water Resources for the Krang Ponley sub-scheme 17
Table 2.10: Water sources for the four (4) sub-schemes in Krang Ponley area 18
Table 2.11: Water sources for the Krapeu Truom sub-schemes 19
Table 2.12: Main water Resources for the Krapeu Truom sub-schemes 20
Table 2.13: Frequency and seriousness of natural disasters in Krapeu Truom sub-scheme 21
Table 2.14: Tentative implementation schedule of Ou Ta Paong irrigation scheme. 21
Table 2.15: Ou Ta Paong Sub-Project Key Characteristics 24
Table 2.16: Tentative implementation schedule of Lum Harch irrigation scheme. 29
Table 2.17: Summary of design options in Lum Hach 30
Table 2.18: Tentative implementation schedule of Krang Ponley irrigation scheme 31
Table 2.19: Key Features of the Krang Ponley Sub-Project 32
Table 2.20: Summary of the Project Activities in relation to the infrastructure investment ... 40
Table 2.21: Screening of potential Associated Facilities under CAISAR* 44
Table 2.22: Assessment of Project Associated Facilities 45
Table 2.23: The estimated influx labor within the sub-schemes 46
Table 2.24: The estimated quantity of water for domestic use of the project 49
Table 3.1: Irrigation System Design and Options 51

Table 3.2: River Training Design Options 54
Table 3.3: Slope Design Options Comparison 56
Table 3.4: Slope Design Option Comparison 57

CHAPTER 1 – INTRODUCTION

1.1 RATIONALE

The Project originated from the Royal Government of Cambodia (RGC)'s National Water Resources Management and Sustainable Irrigation Road Map and Investment Program (2019 -2023), which provides a Strategic Framework for the Irrigation Sector. It is designed to assist the Ministry of Water Resources and Meteorology (MOWRAM) with plans to make the irrigation sector climate resilient, The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project will be focusing on climate change adaptation with cross-cutting benefits through the reduction of Green House Gas (GHG) emissions linked to the use of high-efficiency smart irrigation systems use of renewable energy for pumping, and cover techniques to reduce evapotranspiration and enhance GHG reduction. Cambodia's Irrigated agriculture faces increasing challenges from adverse impacts of climate change, especially the changes in rainfall patterns, duration and timing of the rainy season, and climate induced water disasters such as floods and droughts. Climate Resilient (CR) and low emission practices and investments in agriculture and water management are therefore crucial to protect and enhance Cambodia's agricultural production and productivity which will in turn contribute to poverty reduction and increased food security.

CAISAR's Theory of Change is premised on the experience that addressing the complex impacts of climate change on rain fed and irrigated agriculture requires action at three (3) levels; farm level; irrigation scheme level and at the national level for creating a strong institutional base and an enabling environment. The theory of change of the project has therefore premised its investments on an understanding of the pathways that can help to reduce GHG emissions and help smallholder farmers adapt to climate change by applying climate resilient agricultural technologies. The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project will adopt a three-pronged strategy to bring about a paradigm shift in the farming systems and the water management governance in Cambodia. The integrated actions combining the various elements of the strategy can have a transformative impact on reducing vulnerability of water and agriculture systems to climate change impacts while also reducing GHG emissions and enhancing the livelihood of rural populations who primarily depend on agriculture.

The Theory of Change of the project assumes if the irrigation system is upgraded and modernized, farmers are made aware of improved energy efficient and water use technologies, and value chains of key agricultural commodities are strengthened. The country will then be able to transform agriculture to become more climate resilient and sustainable because through the positive changes in cropping pattern and production techniques that reduce GHG emissions, farmers communities are able to better adapt to climate change and increase and productivity and their incomes from agriculture, irrigation, and infrastructure is made more resilient and able to withstand extreme climate events, and institutional and regulatory capacity strengthened for low-emission climate-resilient development pathway. Some of the co-benefits that will emerge includes reduction in GHG emissions due to change in cropping pattern, switching to solar pumps and reduction in use of diesel pumps, improved

health, and well-being due to increased incomes from increased crop, poultry and aquaculture production, enhanced community collaboration and participation of women in managing water systems and much more active participation of the private sector in the water economy.

The CAISAR project will be parallel-financed by the Asian Infrastructure Investment Bank (AIIB), International Fund for Agricultural Development (IFAD), and Green Climate Fund (GCF) along with in kind contribution of the Royal Government of Cambodia.

1.2 PREPARING THE ESCIA

1.2.1 Objectives of the ESCIA

The overall objective of the study is to conduct a comprehensive assessment on the Environmental, Social, and Climate Impact Assessment (ESCIA) that covers the entire scope of the project, inclusive of its six (6) sub-schemes, as one (1) sub-scheme was removed from the project, which will lead to the formulation of the Environmental, Social, and Climate Management Plans (ESCMP) for three (3) selected sub-schemes.

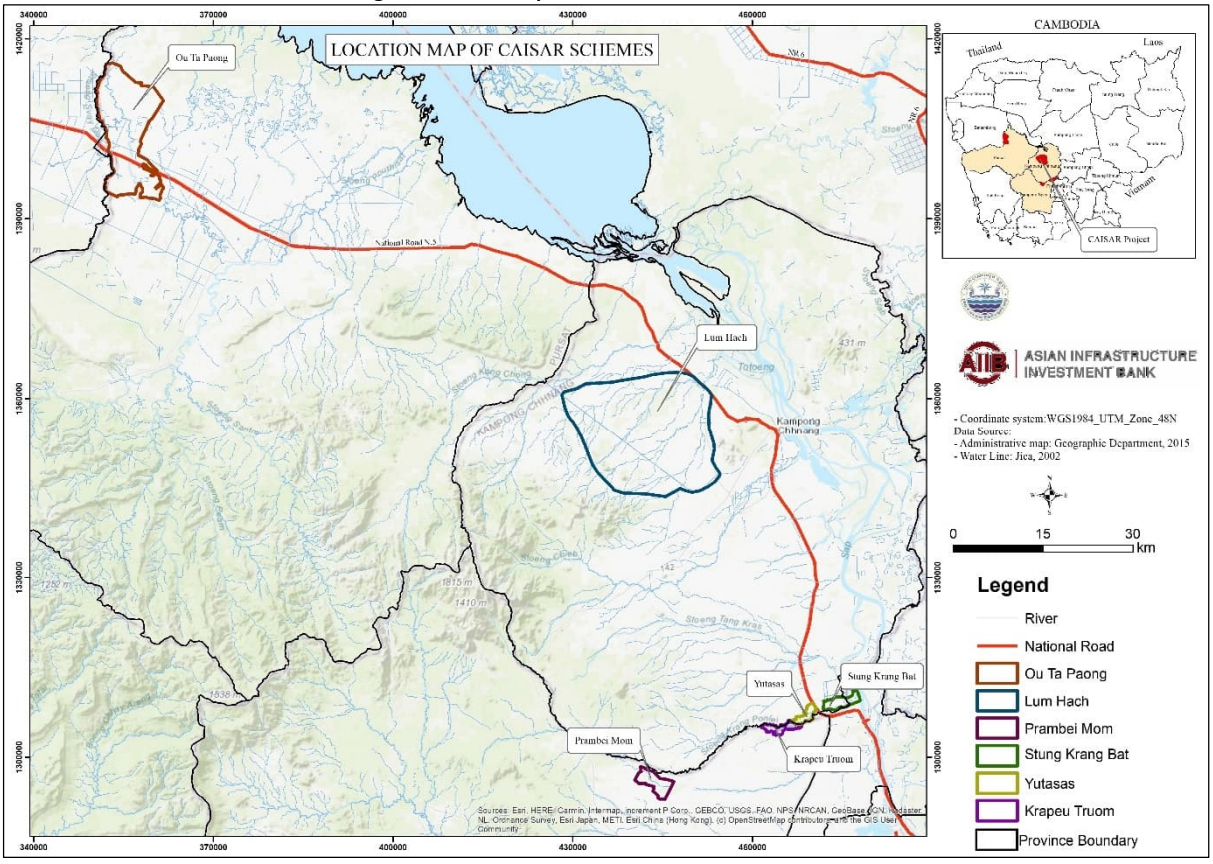
The specific objectives of the assessment involve two (2) key tasks:

- To conduct and develop a comprehensive Environmental, Social, and Climate Impact Assessment (ESCIA) report that covers the entire scope of the project, inclusive of its six (6) sub-schemes.
- To formulate Environmental, Social, and Climate Management Plans (ESCMP) for selected sub-schemes, specifically focusing on:
    - ESCMP for the Ou Ta Paong sub-scheme in Pursat Province.
    - ESCMP for the Krapeu Truom sub-scheme in Kampong Speu Province.
    - ESCMP for the Yotassas sub-scheme, also in Kampong Chhnang Province.

1.2.2 Project Location

The assessment covers the CAISAR project's areas situated in Pursat, Kampong Chhnang, Kampong Speu and Kandal provinces in six (6) sub-schemes, namely Out Ta Paong, Lum Hach, Krapeu Truom, Yutasas, Soeung Krang Bat, and Brambei Mom. The size and proportional area of the sub-schemes are provided in Table 1.1:

Table 1.1: List of six (6) sub-schemes under CAISAR



No.	Scheme Name	Component 2				Total	
		Irrigation		Rainfed area			
		Area (ha)	Ratio (%)	Area (ha)	Ratio (%)	Area (ha)	Ratio (%)
1	Ou Ta Paong	14,874	67%	1,200	16%	16,074	55
2	Lum Hach	3,900	18%	2,400	32%	6,300	21
3	Brambei Mom	1,000	5%	2,400	32%	3,400	12
4	Krapeu Truom	690	3%	400	5%	1,090	4
5	Yutasas	593	3%	600	8%	1,193	4
6	Stoeung Krang Bat	994	5%	400	5%	1,394	5
Total		**22,051**	**100%**	**8,600**	**100%**	**34,204**	**100**

1.2.3 Scope and Coverage

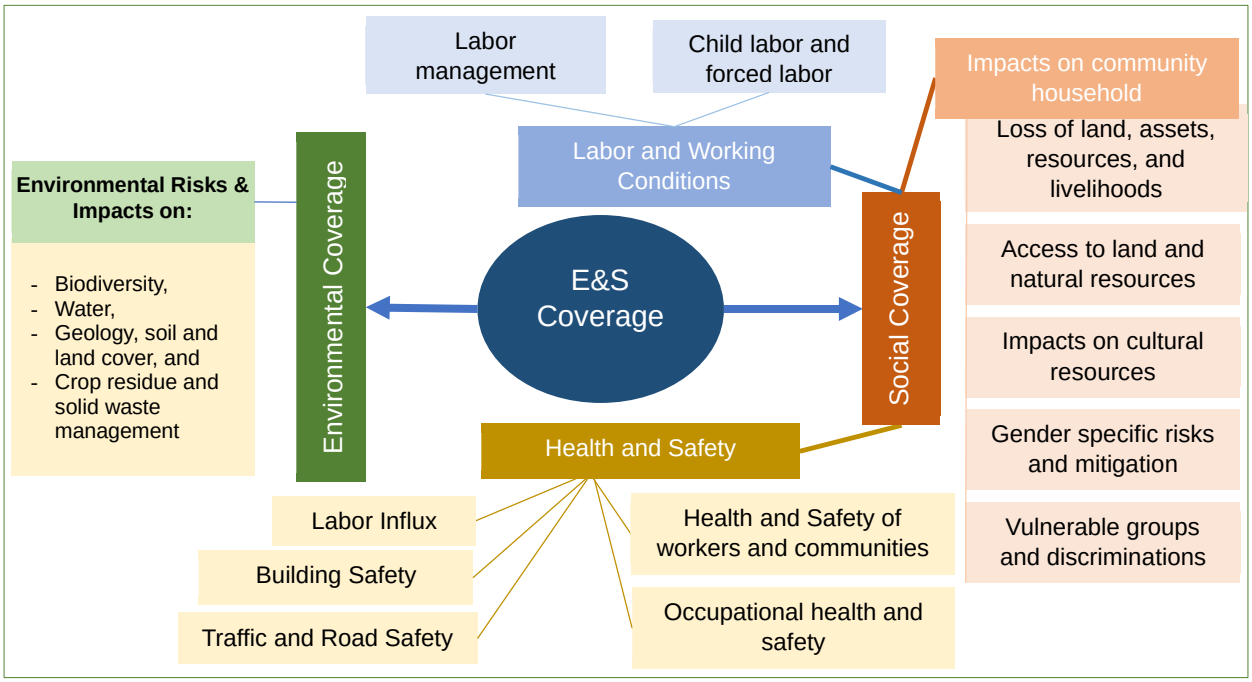
1.2.3.1 Geographical Scope

As stated in the objectives of the assessment, the ESCIA will cover the entire project areas while the ESCMPs will be prepared for three (3) sub-schemes: Out Ta Paong, Krapeu Truom and Yutasas.

Figure 1.1: Map of the CAISAR Schemes

(Source: CAISAR Project, 2024)

1.2.3.2 Conceptual Framework Coverage



According to the Terms of Reference (ToR), the E&S study addresses two (2) key dimensions: social and environmental, both of which potentially affect the living conditions and/or income generation activities of the affected households - directly or indirectly

Firstly, the social dimension covers the impacts on community people either individual or collectively as a community due to the causes of the construction, which may lead to loss of their assets, income, access to their land and natural resources, etc. due to land acquisition for the purpose of construction. Moreover, some of these locations might be sacred, representing their cultural and religious worship. The presence of the infrastructure systems may also lead to conflicts or foster positive recognition among genders and vulnerable groups. In addition to the long-term impacts of the infrastructure after its completion, there are also immediate effects during the construction phase, including health and safety concerns. These may involve an influx of labour, traffic and road safety issues, building safety, and the health and safety of workers and the surrounding community. The influx of labour could be caused by the labour forces required during the construction and the ongoing operations of the

infrastructure, which may lead to migration to the areas, causing conflicts over land and water, or migration of local people due to increasingly competitive living conditions. This situation may lead to increased or decreased utilization of child labour during both the construction phase and after the completion of the project.

A diagram illustration of the project conceptual coverage is provided below:

Figure 1.2: Illustration of key assessment conceptual coverage

E&S = Environmental and Social.

Secondly, the environmental dimension also includes the potential effects of climate change, which the project intervention might mitigate positively, thereby potentially enhancing agricultural resilience. However, the project could also lead to degradation of ecosystem services and biodiversity, especially endangering certain species mainly the endangered species and the critically endangered species, either directly or indirectly because of the infrastructure projects, whether individually or collectively. The water quality for both surface and groundwater and hydrology are also required to be studied while geology, soil and land cover are part of the ESCIA. Lastly, crop residue and solid waste management are required to ensure that hazardous and non-hazardous waste will be properly considered.

The environmental and social impact assessment will incorporate the characteristics of the impacts, their nature and duration, significance/magnitude, likelihood, spatial scale, measures to mitigate or enhance, and significance/magnitude of residual impacts where relevant receptor sensitivity/vulnerability.

1.2.3.3 Legal Coverage

It is expected that the formulation of the reports will encompass relevant national policies, laws, regulations, as well as international guidelines and standards specified by the Asian Infrastructure Investment Bank (AIIB), International Fund for Agricultural Development (IFAD), Green Climate Fund (GCF), and the regulatory of the country. The list of the standard is provided here:

- **AIIB's Environmental and Social Framework (ESF) (2022):**
  - Environmental and Social Standard 1: Environmental and Social Assessment and Management
  - Environmental and Social Standard 2: Land Acquisition and Involuntary Resettlement
  - Environmental and Social Standard 3: Indigenous Peoples
- **IFAD's Social, Environmental and Climate Assessment Procedures (SECAP, 2021 edition)**
  - Standard 1: Biodiversity conservation
  - Standard 2: Resource efficiency and pollution prevention
  - Standard 3: Cultural heritage
  - Standard 4: Indigenous peoples
  - Standard 5: Labor and working conditions
  - Standard 6: Community health and safety
  - Standard 7: Physical and economic resettlement
  - Standard 9: Climate change
- **GCF's Environmental and Social Policy**
  - All International Labour Organization (ILO) conventions signed and ratified by the country, all ILO conventions covering core labor standards and all ILO conventions covering the basic terms and conditions of employment.
  - Other relevant international treaties and conventions to which Cambodia is a signatory; and
  - Other relevant good international industry practices (GIIP)
- **National Legal Framework:** In addition to the provided legal framework, PPIC will also undertake the Environmental Impact Assessment (EIA) for the Project, examining the law and key regulatory requirements related to environment of the Kingdom, in which is also relevant to the project on infrastructure.

CHAPTER 2 – PROJECT DESCRIPTION

2.1 INTRODUCTION

This chapter provides a comprehensive overview of the project, detailing the specific conditions and characteristics of each sub-scheme, along with the proposed structures and planned investments. It also includes a brief analysis of the various alternatives that were considered during the planning and design stages of the project. The analysis explores the potential impacts of each alternative, assessing both positive and negative outcomes, and evaluating their respective benefits. This chapter aims to provide a thorough understanding of the rationale behind the chosen design, ensuring that the proposed project aligns with the overall goals while minimizing potential risks and maximizing benefits for all stakeholders.

2.2 PROJECT DESCRIPTION

2.2.1 Background

The projects' intention is to increase climate adaptation, mitigate the negative impact of extreme climate events, and improve the livelihoods of smallholder farmers and vulnerable rural communities in four (4) provinces of Cambodia, including Pursat, Kampong Chhnang, Kampong Speu, and Kandal. The Mekong River and its tributaries dominate the hydrology of the Tonle Sap region in Cambodia, making it especially vulnerable to floods, storms and droughts. Agriculture is the primary source of livelihood for the people in most provinces of Cambodia and it accounts for 22.5% of the country's Gross Domestic Product and employs over 3 million people. Rice is the primary food crop grown on an estimated 2.3 million hectares or nearly 85% of the country's total cultivated area.

This objective will be achieved through implementing three (3) project components that aim at addressing climate change vulnerabilities, increasing agricultural productivity, and strengthening institutional capacities. The components include:

The project will be implemented through various activities organized under the following three (3) components:

Component 1. Improving farm-level climate adaptation, resilience, and water use efficiency

The objective of this component is to build climate resilience (CR) of smallholder farmers and enhance sustainable production through evidence-based planning and context-relevant climate resilient practices at the farm level. This component is designed to address the lack of knowledge and skills to deploy technologies and practices at farm level by farmers and the lack of appropriate extension services to propagate them. It will introduce farmers with various climate resilient technologies and practices for both rice and non-rice activities such as vegetable production, poultry and aquaculture.

Sub-component 1.1 Deployment of farm-level climate adaptation and water use efficiency measures

Output 1.1: Increased capacity of farmers to deploy climate resilient (CR) practices at farm level. This output will focus on developing farmer's capacity in deploying CR technologies and practices to transform the agricultural production system to adapt to the changing climate context. Farmer's will be trained to first develop Action Plans (AP) to re-orient farmer behaviour and assist them in transforming the agriculture production system in a manner that is better adapted to factoring in the agro-ecological context and expected climate change impacts.

- Activity 1.1.1 Preparation of community-based action plans (AP) to transform agriculture with CR practices.
- Activity 1.1.2 Preparation of training materials to support implementation of the AP.
- Activity 1.1.3 Conduct trainings to create a pool of expertise to demonstrate and propagate the CR technologies and practices.
- Activity 1.1.4 Train farmers on applying CR technologies using the Farmer Field School (FFS) approach.
- Activity 1.1.5 Strengthening and fostering tailored mechanization service providers for improved mechanization service delivery.
- Activity 1.1.6 Community-based monitoring and evaluation (CBME) of implementation

Sub-Component 1.2 Climate adapted, value added, and market led agricultural investments

Output 1.2 CR value added, and market led agriculture investments secured. This output involves improving and enhancing some value chains that are key for the project area and include rice, vegetable, chicken and aquaculture value chains, through the use of Public Private Producer Partnerships (4Ps) and increased access to finance, which will improve market access, climate adaptability, and ensure increased income for smallholders in the value chains.

- Activity 1.2.1 Value chain study and planning
- Activity 1.2.2 Establish District Multi-Stakeholder Platforms (MSPs)
- Activity 1.2.3 Public Private Producer Partnership Facility (4PF)

Sub-component 1.3 Improve enabling conditions, capacities and disaster risk management strategies

Output 1.3. Increased access to and use of climate information and advisory services for climate responsive agriculture planning. This sub-component will strengthen the production and dissemination of tailored agro-meteorological information to inform climate responsive management and planning of agriculture in the project target areas through Information Communication Technologies (ICT). The aim is to ensure that agro-meteorological services are accessible and useful to farmers to manage climate risks, access to and use of water and efficient cropping systems.

- Activity 1.3.1 Establish ICT based multi-disciplinary platform at provincial level.
- Activity 1.3.2 Building the capacities of the platform to deliver services.
- Activity 1.3.3. Establish the agromet information systems and the outreach mechanisms.
- Activity 1.3.4 Awareness raising and capacity building of farmers and stakeholders in applying the services.

Sub-component 1.4 Rural roads

Output 1.4: Increased resilience of farm road infrastructure to climate change

- Activity 1.4.1 Initial planning and identification
- Activity 1.4.2 Technical survey and design considerations, preparation of cost estimation
- Activity 1.4.3 Improve 50 Kilometers of farm roads.
- Activity 1.4.4 Handing over of the completed works.

Component 2: Irrigation Infrastructure for increased resilience

Component 2 is linked with Component 1 such that it facilitates the implementation of CR on farm crop and water management practices through improved field level water supply delivery and drainage. It will focus on rehabilitating and modernizing of irrigation and flood protection/drainage infrastructure in the six (6) sub-projects, including irrigation and drainage canals, flood control embankments, and ponds, to provide high-efficiency climate-resilient irrigated agriculture systems for adapting to both increasing flood and drought conditions.

Sub-

Component 2.1: Modernization of irrigation scheme and ponds

- Activity 2.1.1 Technical analysis, field surveys and preparation of plans for system upgrading.
- Activity 2.1.2 Implementation of infrastructure upgrading.
- Activity 2.1.3 Preparation of canal operation and maintenance (O&M) plans including application of ICT and SCADA for operation

Sub-Component 2.2: Flood-proofing and Drainage improvements

- Activity 2.2.1 Establish flood monitoring, information, and early warning systems.
- Activity 2.2.2 Strengthening and construction of flood control and drainage infrastructures.

Sub-Component 2.3: Establishments and training of Farmers Water User Communities (FWUC)

- Activity 2.3.1 Formation of institutional strengthening of the FWUC
- Activity 2.3.2 Build technical capacities of FWUC for canal structure O&M

- Activity 2.3.3 Prepare long term financing plan for O&M of the systems including the Water User Associations.

Sub-Component 2.4: Water information and Management - The Supervisory Control and Data Acquisition (SCADA)

Component 3. Institutional Strengthening

Sub-Component 3.1 MOWRAM capacity Support.

Output 3.1 Strengthened MOWRAM Capacity

- Activity 3.1.1 Preparation of climate resilient design manuals for irrigation and train staff
- Activity 3.1.2 Building capacities on application of ICT and RS technologies, data management
- Activity 3.1.3 Capacity building in water Accounting and Auditing

Sub-Component 3.2 Strengthening of National Designated Agencies (NDA) and National Committee for Sub-National Democratic Development (NCDD).

Output 3.2 Improved capacities for climate action monitoring

- Activity 3.2.1 Preparation of Loss and Damage Strategy
- Activity 3.2.2 Strengthen national Monitoring and Evaluation (M&E) process for climate action
- Activity 3.2.3 Enhancing Capacity of NDA and other stakeholders.

2.2.2 Project Area and Beneficiaries

The CAISAR project covers a total command area of 25,604 ha and is composed of six (6) sub-schems – Ou Ta Paong (Pursat Province), Lum Hach (Kampong Chhnang Province).

Brambei Mom (Kampong Speu province), Krapeu Troum (Kampong Speu and Kampong Chhnang), Yutasas (Kampong Chhnang), and Steung Krang Bat Kampong Speu and Kampong Chhnang.

Table 2.1 (below) provides a summary of project communes (by district and province) that each sub-scheme covers.

Table 2.1: Summary of the CAISAR project targeted area

No.	Sub-Schemes	Provinces	Districts	Communes
1	Ou Ta Pong	Pursat	Bakan	1. Beung Khnar 2. Ou Ta Paong 3. Rumlech 4. Svay Doun Keo 5. Me Teok 6. Khnar Torteung
2	Lum Hach	Kampong Chhnang	Toek Phus	1. Krang Skear

			Rolea B'ear	1. Banteay Preal 2. Krang Leav 3. Prasneob
			Boribour	1. Anchanh Rung
3	Brambei Mom	Kampong Speu	Thpong	1. Brambei Mom 2. Rung Reung
4	Krapeu Troum	Kampong Speu	Odoung Maechey	1. Veal Pong
		Kampong Chhnang	Sameakki Meanchey	1. Thbeng Khpos 2. Svay
5	Yotasas	Kampong Chhnang	Sameakki Meanchey	1. Svay
6	Steung Krang Bat	Kampong Chhnang	Kampong Tralach	1. Longvek
		Kandal	Ponnhea Leu	2. Kampon Leung

With a coverage of 25,604 ha, CAISAR is expected to provide support to an estimated 22,500 people who do farming in the six (6) sub-scheme area (See table below).

Table 2.2: List of six (6) sub-schemes under CAISAR

No.	Scheme Name	Component 2						Beneficiaries	
		Irrigation		Rainfed area		Total			
		Area (ha)	Ratio (%)	Area (ha)	Ratio (%)	Area (ha)	Ratio (%)	HH*	Ratio
1	Ou Ta Paong	14,874	67%	1,200	16%	16,074	55	15,000	67%
2	Lum Hach	3,900	18%	2,400	32%	6,300	21	3,900	18%
3	Krapeu Truom	690	3%	400	5%	1,090	4	1,100	3%
4	Yutasas	593	3%	600	8%	1,193	4	700	3%

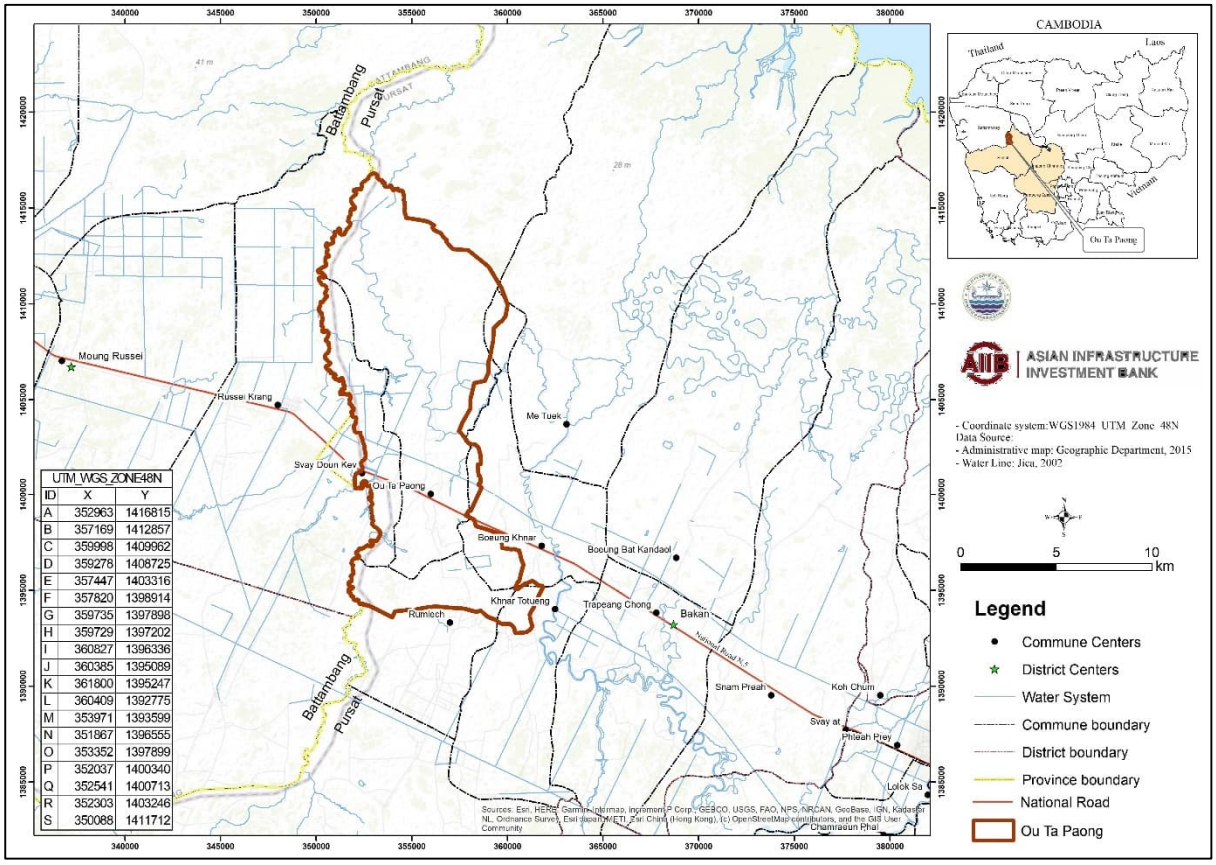
2.2.3 Description of the Sub-Schemes

2.2.3.1 Ou Ta Paong

2.2.3.1.1 Location and Coverage



The OTP command area, located in Bakan District, Pursat Province, spans approximately 16,074 hectares and is a crucial rice-producing region. The Ou Ta Paong scheme encompasses five (5) communes within Bakan district, Pursat province: Ou Ta Paong, Boeung Khnar, Svay Duon Kev, Khnar Totueng, and Rulech. Additionally, three (3) surrounding communes affect the scheme: Me Tuek commune in Bakan district, Pursat province, Russei Krang Moung in Russei district, and Prey Tralach in Rokkiri district, Battambang province. For detailed information, please refer to Table 2.3.

Table 2.3: Administrative coverage of Ou Ta Paong sub-scheme

Category	Commune Name	District	Province
Within the Scheme	Ou Ta Paong	Bakan	Pursat
	Boeung Khnar	Bakan	Pursat
	Svay Duon Kev	Bakan	Pursat

	Khnar Totueng	Bakan	Pursat
	Rulech	Bakan	Pursat
Surrounding the scheme	Me Tuek	Bakan	Pursat
	Russei Krang Moung	Russei	Battambang
	Prey Tralach	Rokkiri	Battambang

Figure 2.1: Map of Ou Ta Paong Sub-Scheme

(Source: CAISAR Project, 2024)

2.2.3.1.2 Agro- and Hydrological Characteristics

The command area utilizes water from multiple sources, including the Pursat River, Svay Donkeo River, and Ou Ta Paong River. These rivers create distinct hydraulic zones within the scheme, influencing water availability and agricultural productivity. The upper part of the scheme, south of National Road 5, primarily relies on the Pursat River, which feeds the Damnak Apil Canal and its irrigation network. Due to the area's natural slope from south to north, gravity-fed irrigation is possible, but the existing infrastructure is inadequate. To improve water distribution, it is necessary to enhance the canal networks and build additional regulating structures.

The eastern part of the scheme lies between the Ou Ta Paong River to the west, Wat Chre scheme to the east, and National Road 5 to the north. Water in this region comes from a combination of southern infrastructure, including the Damnak Apil and Kbal Hong hydraulic systems, the Wat Loung canal, and parts of the Svay Donkeo and Ou Ta Paong rivers.

However, the area's low hydraulic gradient prevents gravity irrigation, necessitating one-stage pumping and the development of more efficient distribution networks. Similarly, the western section of the scheme, between the Svay Donkeo River on the west and the Ou Ta Paong River on the east, also requires pumping due to the low gradient, with Svay Donkeo serving as the primary water source. As shown in table 2.4.

Table 2.4: The Water Resources by Region of Ou Ta Paong sub-scheme

Region	**Water Resources**
Upper Part	Pursat River, Damnak Apil Canal
Eastern Part	Damnak Apil, Kbal Hong, Wat Loung, Svay Donkeo River, Ou Ta Paong River
Western Part	Svay Donkeo River, Ou Ta Paong River

In all these blocks there are ample opportunities to develop two (2) wet season rice crops by developing proper canal system. This blocks proper canal bed slope of the canal, tertiary canals, regulating structures and most importantly the canal management. As per study there is also an opportunity to develop dry season in 10% command area.

Several key facilities potentially impact the water availability for the Ou Ta Pong (OTP) command area, including Dam 1, Dam 2, Dam 3, Dam 5, the Damnak Cheukrom barrage, and the Damnak Apil Headwork. Each of these structures' influences water flow and availability in various ways within the OTP sub-scheme.

Dam 1, currently under construction and expected to be operational by 2026, is the largest contributor to the Pursat River, which serves as the primary water source for the OTP area. With a catchment area of 3,499 km², Dam 1 is projected to provide a substantial water supply of 1,014 MCM, far exceeding the contributions of Dams 3 and 5 but the purpose of the dam is for hydropower generation. Meanwhile, Dam 2, approved for construction in June 2024, will add significant water capacity to the region with its reservoir covering 4,016 hectares and a storage capacity of 861.75 MCM. Its completion in 2026 is expected to ensure that the province's water needs are fully met, particularly when combined with the existing water supplies from Dams 1, 3, and 5 (Please see table 2.5).

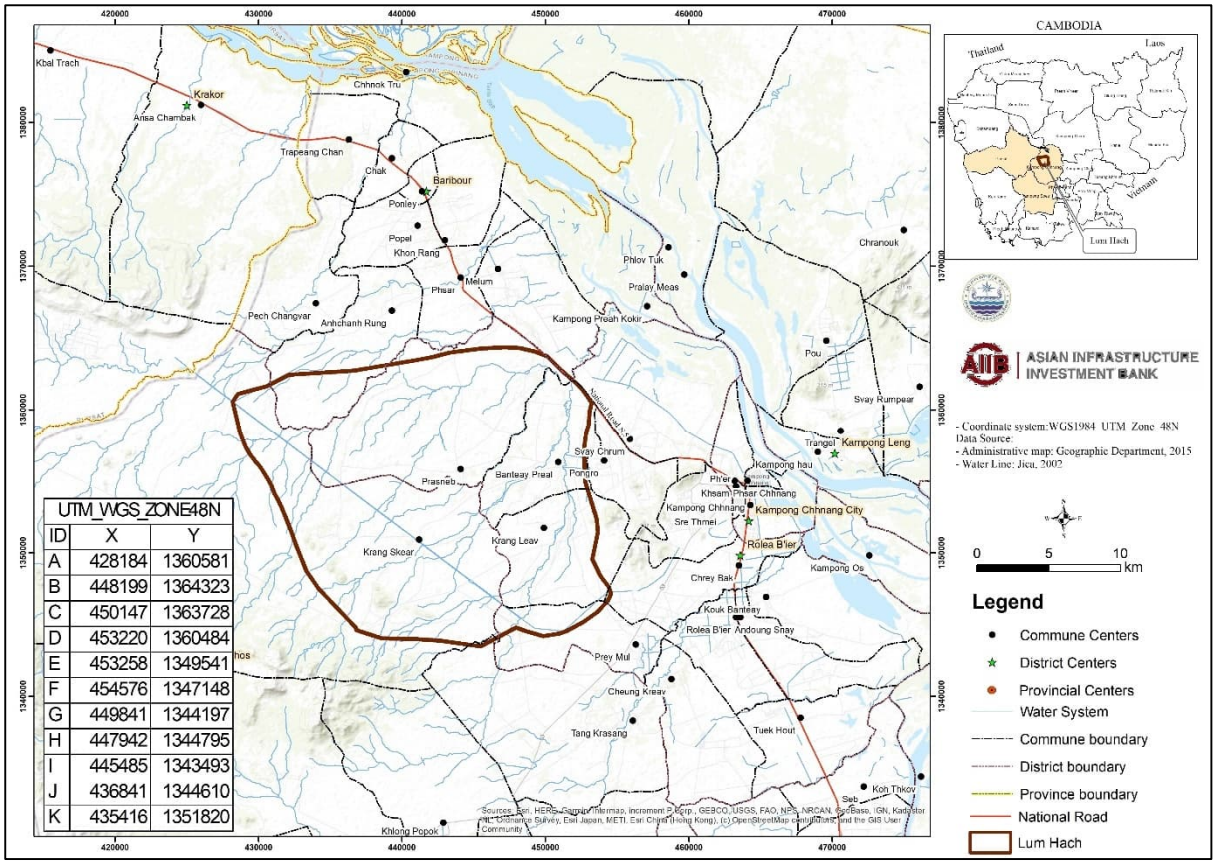
The water distribution system for Ou Ta Pong is managed by the Farmer Water User Community (FWUC), which coordinates with the Provincial Department of Water Resources and Meteorology (PDWRAM) in Pursat. The FWUC handles requests from local farmers and oversees the allocation of water to the various villages within the command area. Water from the Damnak Apil Headwork is diverted into the OTP scheme based on these requests. Additionally, the Damnak Cheukrom barrage, which manages a 16,100-hectare command area, will receive priority water supply from Dam 1 once it becomes operational, potentially affecting the water availability downstream to the OTP area.

Table 2.5: Key Characteristics of the Ou Ta Pong Irrigation Scheme

Aspects	**Description**
Water Sources	Pursat River, Svay Donkeo River, Ou Ta Paong River
Hydraulic Zones	Upper, Eastern, and Western Zones
Irrigation Methods	Gravity-fed irrigation (upper zone), Pumped irrigation (eastern and western zones)

Infrastructure Needs	Canal network improvement, regulating structures, pumping stations
Cropping Potential	Two (2) wet season rice crops, potential for dry season cropping in 10% of the command area

Annual flooding, particularly in the downstream areas near Tonle Sap, impacts farming activities. Farmers in these flood-prone areas typically cultivate two (2) crops: one (1) rain-fed crop before the flood and another after the floodwaters recede. Despite the challenges, the existing canal system provides ample opportunity to develop two (2) wet-season rice crops across the scheme, and there is potential for dry-season cultivation in about 10% of the command area, provided that proper canal management and infrastructure improvements are implemented.



2.2.3.2 Lum Harch Scheme

2.2.3.2.1 Location and Coverage

The Lum Harch Irrigation scheme encompasses a command area situated downstream the old Lum Harch canal built during Pol Pot period (1975-1977), drawing its water supply from various streams crossing the canal. These sources comprise several other rivers that traverse the scheme and have very limited catchment area and flow.

The sub-scheme is situated across three (3) districts in Kampong Chhnang province: Baribour, Rolea B'ier, and Tuek Phos. Within its command area, six (6) communes' benefit from its water supply: Prasneb, Banteay Preal, Krang Leav, Prey Mul, Anhchanh Rung, and Krang Skear. Additionally, several communes surrounding the scheme also utilize its water resources, including Phsar, Melum, Svay Chrum, Chrey Bak, Tang Krasang, Pech Changvar, and Khlong Popok (Please see table 2.6).

Figure 2.2: Map of Lum Hach Sub-Scheme

(Source: CAISAR Project, 2024)

Table 2.6: Administrative coverage of Lum Hach sub-scheme

District	Communes within the scheme	Communes surrounding the scheme
Baribour	Anhchanh Rung	Phsar, Melum, Pech Changvar
Rolea B'ier	Prey Mul, Prasneb, Banteay Preal, Krang Leav	Svay Chrum, Chrey Bak
Tuek Phos	Krang Skear	Tang Krasang, Khlong Popok

2.2.3.2.2 Agro- and Hydrological Characteristics

The Lum Hach area spans 25,142 hectares, but only 30% of this land is currently used for agriculture, while the rest consists of shrubland and grassland, some of which is intermittently farmed. Most farmers cultivate a single paddy crop annually, relying on medium or late-maturity rice varieties, with multiple cropping being rare. Planting typically begins around May or June, depending on rainfall patterns. The primary irrigation infrastructure, known as the 1st of January Canal, was built in the mid-1970s, including a headworks on the Boribo River and a 30-kilometer main canal. However, shortly after its completion, severe flooding caused the collapse of the headworks, leaving the canal in a state of disrepair.

This water supply system results in the creation of distinct hydraulic zones within the scheme, each characterized by specific water availability levels, which in turn have a direct impact on agricultural output.

The area presents a general slope in the direction from south-west to north-East. This explains that the area is mainly supplied by the super streams and makes it challenging to divert water

from other sources. The gradient hydraulic is low and due to the existing infrastructure design (Existing Lum Harch irrigation), the area cannot be irrigated by the existing infrastructure. Gravity irrigation will not be possible and will require one (1) stage pumping. In all the schemes there is an opportunity to improve the river training and develop two (2) wet season rice crops by developing proper irrigation system adapted to the local context: limited of water resource, soils conditions, lack of road access, low agricultural activities. Some upper land could also diversify crops all through the year.

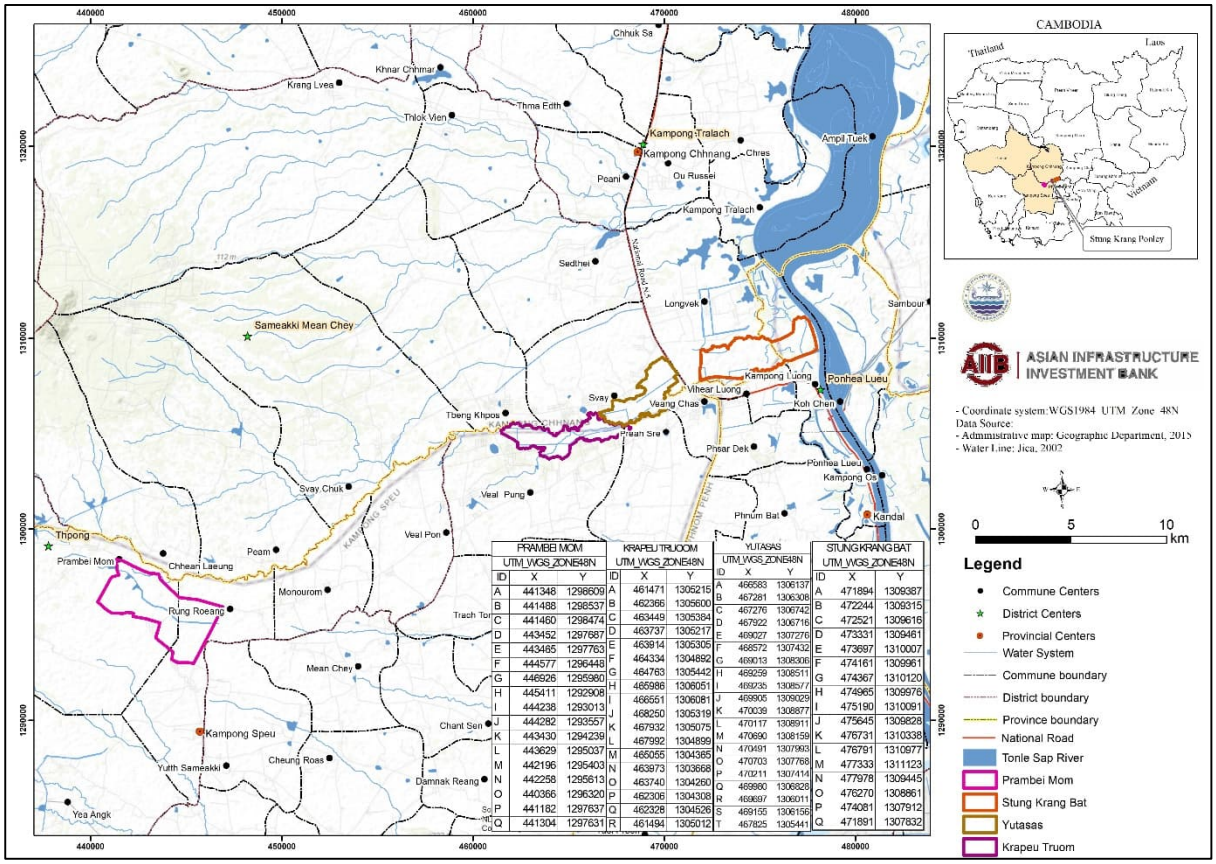
In response to these challenges, the Japan International Cooperation Agency (JICA)-)-)-led Lum Hach 1 Scheme was initiated in 2005-2006, identifying a 3,100-hectare potential irrigation area. The project, completed in 2020, involved constructing a new barrage and modifying the main canal's first section. However, the lowered headworks require exploring alternative water supply options, such as utilizing natural streams and water storage solutions, as much of the irrigation infrastructure remains underdeveloped. Additionally, in 2016, the Achang Irrigation Scheme, supported by China, was built downstream, covering 10,300 hectares. Despite its larger water demand, Lum Hach's upstream location allows it to divert its share of the Boribo River's flow which may affect the Achang scheme. However, significant improvements are still needed to fully realize Lum Hach's irrigation potential (please see Table 2.7).

Table 2.7: Irrigation Resources and Development Potential for Lum Hach sub-scheme

Aspects	Description
Water Sources	Boribo River, Canals, Ponds
Nearby Irrigation Schemes	JICA-led Lum Hach 1 Scheme, Achang Irrigation Scheme (Downstream)
Irrigation Methods	Rainfed, Gravity-fed irrigation, Pumped irrigation
Infrastructure Needs	Canal network improvement, regulating structures, pumping stations
Cropping Potential	Paddy rice expansion, vegetable and perennial crops as the alternatives

2.2.3.3 Krang Ponley Sub-scheme

2.2.3.3.1 Location and Coverage



The Krang Ponley Sub-project encompasses four (4) distinct irrigation schemes—Brambei Mom, Krapeu Troum, Yutasast, and Stung Krang Bat—spanning across Kampong Speu, Kampong Chhnang, and Kandal provinces (Figure 2.3). The four (4) schemes of the Krang Ponley sub-project, Brambei Mom, Krapeu Troum, Yutasast, and Stung Krang Bat, are situated across Kampong Speu, Kampong Chhnang, and Kandal provinces. Each scheme encompasses specific communes within its designated district. Additionally, surrounding communes from neighboring districts contribute to the overall regional context, as shown in Table 2.8.

Table 2.8: Administrative coverage of the Krang Ponley Sub-scheme

Sub-Scheme	Location	Communes Within	Communes Surrounding
Brambei Mom	Brambei Mom and Rung Roeang commune, Phpong district, Kampong Speu	Brambei Mom, Rung Roeang	Yuth Sameakki, Monourom, Peam, Chhean Laeung

Krapeu Troum	Preah Sre and Veal Pung commune, Odongk district, Kampong Speu	Preah Sre, Veal Pung	Svay, Tbeng Khpos
Yutasast	Svay commune, Sameakki Mean Chey district, Kampong Chhnang	Svay	Veang Chas, Preah Sre, Veal Pung, Longvek
Stung Krang Bat	Longvek, Kampong Tralach district, Kampong Chhnang and Kampong Luong, Ponhea Lueu district, Kandal	Longvek, Kampong Luong	Vihear Luong

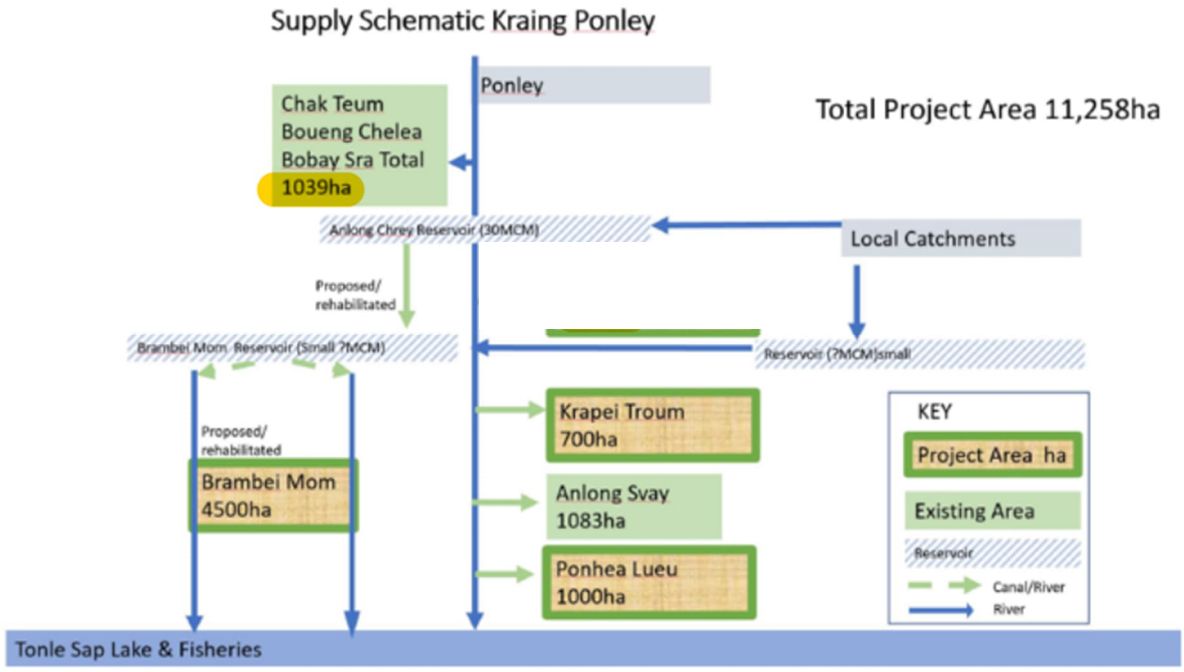
Figure 2.3: Map of Sub-Scheme in Krang Ponley Basin

(Source: CAISAR Project, 2024)

The floodplain of Krang Ponley, located at an elevation of approximately 10 meters above sea level, is characterized by low permeability due to its fine soil particles, making it highly susceptible to frequent flooding. Although river-based flooding is minimal, the project areas in Krang Ponley face severe flooding during the wet season and periods of heavy rainfall. Floodwater from the Bassac and Mekong rivers regularly inundate the floodplain, eventually draining into the Tonle Sap, with the lower sections experiencing the most persistent flooding.

The Krang Ponley River serves as the main water source for these irrigation schemes, except for the Brambei Mom scheme, which is situated along the Ou Khley River. Brambei Mom has a small reservoir but can receive supplementary water from the Anlong Chrey Reservoir via an outlet, ensuring a more reliable water supply for irrigation.

2.2.3.3.2 Agro- and Hydrological Characteristics



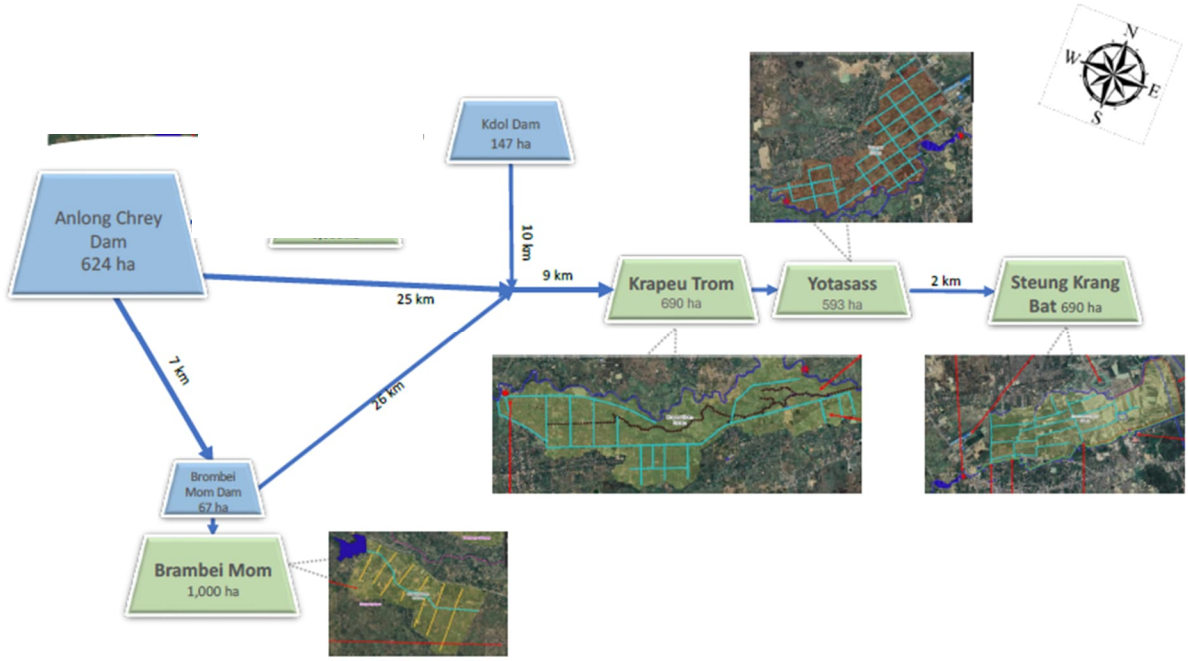
The Krang Ponley scheme is a unique irrigation system comprising four (4) interconnected areas, drawing water primarily from the Anlong Chrey reservoir and secondarily from the Kdol Dam. This integrated approach ensures a reliable water supply for the scheme's agricultural needs (Table 2.9).

Table 2.9: Main Water Resources for the Krang Ponley sub-scheme

Resource	Description
Anlong Chrey Reservoir	Primary water source for the Krang Ponley scheme
Kdol Dam	Secondary water source, providing additional water supply
Ponley River	Connects the four (4) separate scheme areas, facilitating water transfer

The Krang Ponley River Basin serves as the primary water source for the Krang Ponley subproject and its irrigation schemes. The basin includes several key reservoirs and irrigation infrastructures, developed over time to support agricultural needs and water management in the region. The river itself is extensive, and irrigation infrastructure exists across various subproject areas (Figure 2.4). Much of this infrastructure dates to the Khmer Rouge era (1975–1979) but has fallen into disrepair due to a lack of maintenance. Despite efforts by local farmers to maintain some main and branch canals, sediment buildup, embankment erosion, and damaged concrete structures have resulted in an inefficient irrigation system.

Figure 2.4: Schematic Supply Map of Krang Ponley



Three (3) main reservoirs—Anlong Chrey, Brambei Mom, and Kdol—were constructed under the Krang Ponley Water Resources Development Project in 2012. These reservoirs have improved water availability for downstream irrigation and play a significant role in flood protection. However, the Anlong Chrey reservoir (Figure 2.5), with a capacity of only 30 million cubic meters (Mm^3), is small compared to the estimated annual inflow of 123 Mm^3 and the

irrigation demands of the area. A small hydropower station was installed at the site, but it remains unused due to insufficient water supply.

One (1) of the irrigation schemes, Stung Krang Bat, is in the lower basin and partially within the active floodplain of the Tonle Sap River. During the rainy season, floodwaters from the Mekong cause the Tonle Sap River to rise, submerging agricultural land for up to three (3) months, with water depths reaching 3 meters. This seasonal flooding shapes local agricultural practices. Additionally, local rivers cause flash floods that can last 5 to 7 days, damaging rice crops. This flooding is further aggravated by vegetation growth, silt buildup in drainage channels, and encroachment on these channels by residents, leading to inadequate drainage and extended flood durations.

Figure 2.5: Length from Sub-Scheme to Another of Krang Ponley

The subproject's five (5) proposed irrigation schemes aim to irrigate nearly 3,000 hectares, largely dependent on the Anlong Chrey reservoir (Table 2.10). However, the reservoir's capacity is insufficient to meet full irrigation demands during the dry season. The primary management goal is to release water early in the wet season (May and June) to allow for the timely planting of Early Wet Season crops, followed by a Late Wet Season paddy crop. Nevertheless, challenges remain, including potential conflicts between hydropower generation and irrigation needs, a lack of clarity in reservoir operating rules, and inconsistent runoff that may prevent the reservoir from reaching full capacity in some years.

Table 2.10: Water sources for the four (4) sub-schemes in Krang Ponley area

No	Irrigation scheme	Proposed target command area (ha)	Main Water source	Secondary water source
1	Brambei Mom	1,000	Brambei Mom dam (2 MCM) from Ou Khley Ou Rumlich Meun Ram rivers)	Anlong Chrey Dam

2	Kropeau Truom	690	Anlong Chrey Dam (30 MCM)	Kdol dam (4.7 MCM), Kdol river
3	Yutasas	593	Anlong Chrey Dam (30 MCM)	Kdol dam (4.7 MCM), Kdol river
4	Steung Krang Bat	690	Anlong Chrey Dam (30 MCM)	Kdol dam (4.7 MCM), Kdol river

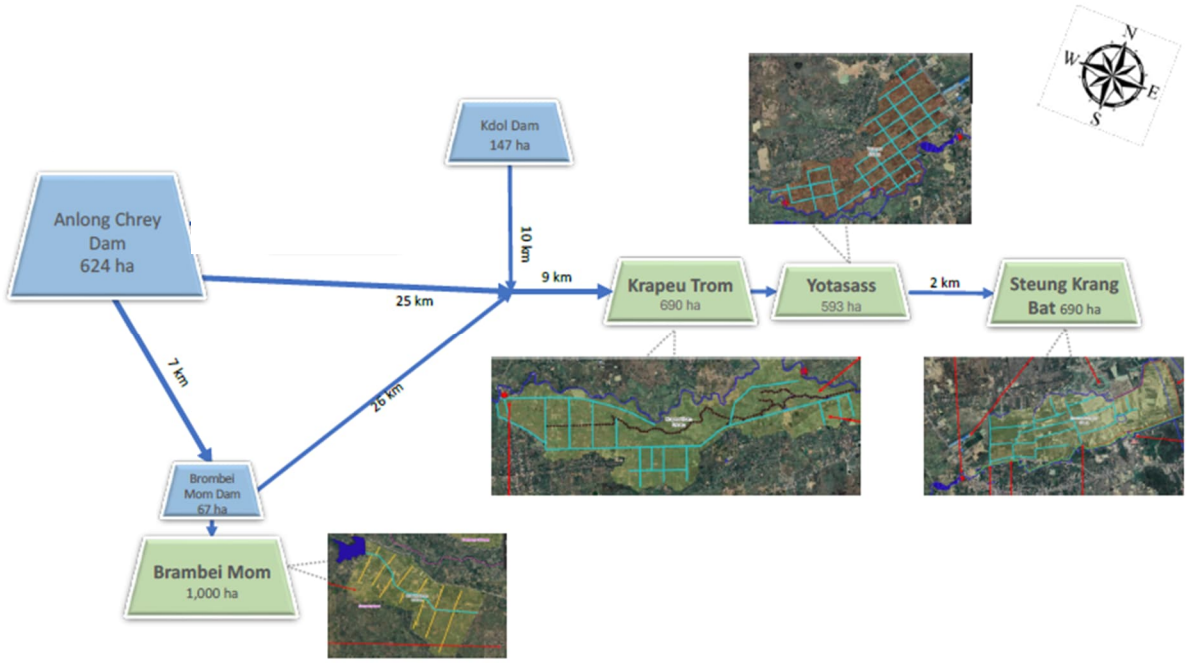
MCM = Million Cubic Metres

2.2.3.3.3 Krapeu Troum

Water Availability

The Krapeu Truom sub-scheme, located within the Krang Ponley River Basin, relies primarily on the Anlong Chrey Reservoir as its principal water source. The Kdol Dam and River serve as secondary sources, supplementing water supply when needed. This integrated system is crucial for ensuring reliable irrigation for the sub-scheme's target command area of 690 hectares.

The Anlong Chrey Reservoir, while essential for the Krang Ponley sub-project's water needs, has a relatively small capacity of 30 million cubic meters (Mm^3). This poses a challenge as the estimated annual inflow into the reservoir is 123 Mm^3, significantly exceeding its storage capacity. This discrepancy highlights the need for efficient water management strategies to balance irrigation demands with the reservoir's limitations (please see in Table 2.11).



Despite efforts to manage water release for optimal crop planting during both early and late wet seasons, the reservoir's limited capacity may struggle to meet full irrigation demands, particularly during the dry season. Factors like inconsistent runoff, which could prevent the reservoir from reaching full capacity, further complicate water availability.

Table 2.11: Water sources for the Krapeu Truom sub-schemes

No	Irrigation scheme	Proposed target command area (ha)	Main Water source	Secondary water source
2	Kropeau Truom	690	Anlong Chrey Dam (30 MCM)	Kdol dam (4.7 MCM), Kdol river

MCM = Million Cubic Metres.

Figure 2.5: Length from Sub-Scheme to Another of Krang Ponley

Anlong Chrey and Kdol Dam are the main water sources for Krapeu Truom sub-scheme. Given its close location to the two (2) dams, the sub-scheme is at an advantageous position compared to the other sub-scheme downstream of Krang Ponley River basin (Please see Table 2.12).

Table 2.12: Main water Resources for the Krapeu Truom sub-schemes

Resource	Description
Anlong Chrey Reservoir	Primary water source for the Krang Ponley scheme
Kdol Dam	Secondary water source, providing additional water supply
Ponley River	Connects the four (4) separate scheme areas, facilitating water transfer

Irrigation Management

The Kropeau Troum Irrigation Project was constructed by PDWRAM with Korean Support. By operating gates on the main canal, water can be raised and brought onto some of the fields by gravity; other fields need to pump water from the canals. The FWUC was established in 2016 and is referred to by PDWRAM as a very successful one. The main management strategy focuses on releasing water early in the wet season (May and June) to support the timely planting of Early Wet Season crops, followed by a Late Wet Season rice crop. Despite these efforts, challenges persist, including potential conflicts between hydropower and irrigation needs, unclear reservoir operating rules, and inconsistent runoff that may prevent the reservoir from reaching full capacity in some years.

Natural challenges

Over the past 10 years, the Krapeu Truom irrigation sub-scheme has encountered several natural challenges. Drought was the most frequently reported, affecting 58% of respondents, with an average of three (3) occurrences over the decade. However, two (2) of these

occurrences were considered serious. Floods were the second most reported issue, noted by 36% of respondents, with an average of three (3) events, of which one (1) was deemed serious. Storms were the third most common natural disaster, reported by 31% of respondents and occurring three (3) times, with one (1) of these events considered serious. Insect outbreaks were experienced by 27% of respondents, with an average of two (2) occurrences over the last decade, but only one (1) event was considered serious (shown in Table 2.13).

Table 2.13: Frequency and seriousness of natural disasters in Krapeu Truom sub-scheme

Types	Figures	Percent	Times	Number of Seriousness
Drought	39	58%	3	2
Flood	24	36%	3	1
Storms	21	31%	3	1
Insect outbreak	18	27%	2	1

2.3 PROPOSED INFRASTRUCTURE

2.3.1 Ou Ta Paong

2.3.1.1 Activities and Timeline

Should the feasibility study for the Ou Ta Paing subproject proceed to detailed design, then allowing for the design process, procurement process and approvals, it has been assumed the following planning as displayed in Table 2.14.

The following assumptions have been made:

- The detailed design will start in January 2025; it will take two (2) years to get a better understanding of the upstream hydraulic infrastructure, conduct additional survey and propose the best solution for a sustainable water supply of the scheme.
- The procurement process will not take more than three (3) quarters.
- The work construction will start after the rainy season in Cambodia with a mobilization period (last quarter of the year).
- The work construction duration will not last more three (3) dry seasons.

Hence the construction would be able to commence at the last quarter 2027, with completion by mid-2030

Table 2.14: Tentative implementation schedule of Ou Ta Paong irrigation scheme.

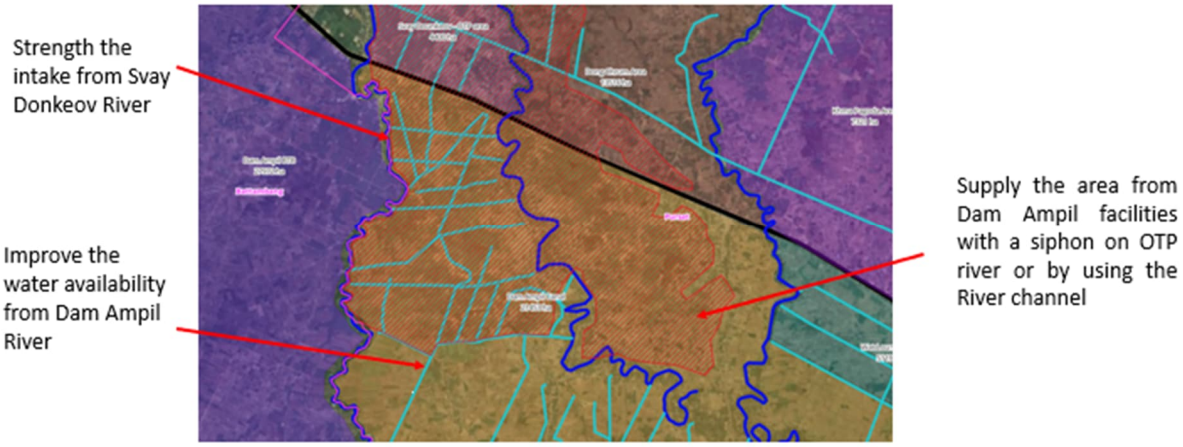
2.3.1.2 Design Concepts and Options

The Ou Ta Paong River system is divided into three (3) distinct blocks for irrigation purposes as per the block colour in Figure below. Block A, located south of National Road shaded in light yellow colour, is supplied by the Pursat River through the Dam Ampil Canal and upstream



infrastructure, covering an area of 4,198 hectares. Some of the upstream infrastructure may require rehabilitation to increase its hydraulic capacity and fully irrigate the area. Block B, situated in the northwest and covering approximately 4,400 hectares shaded in light green colour, is currently supplied by the Svay Donkeov River. It relies on existing canals, which require upgrades to improve water delivery, with additional overflow from Block A and drainage from National Road 5 also contributing to water supply. Block C, in the northeast, covers around 6,276 hectares shaded in light blue colour and is the most challenging area to irrigate, as it depends on multiple sources of water, including the Svay Donkeov River, Kbal Canal, and Dam Ampil Canal, all of which require rehabilitation and upgrades to meet irrigation needs.

Figure 2.6: Three (3) blocks (sub-scheme) of Ou Ta Pong sub-project

(Source: CAISAR Project, 2024)

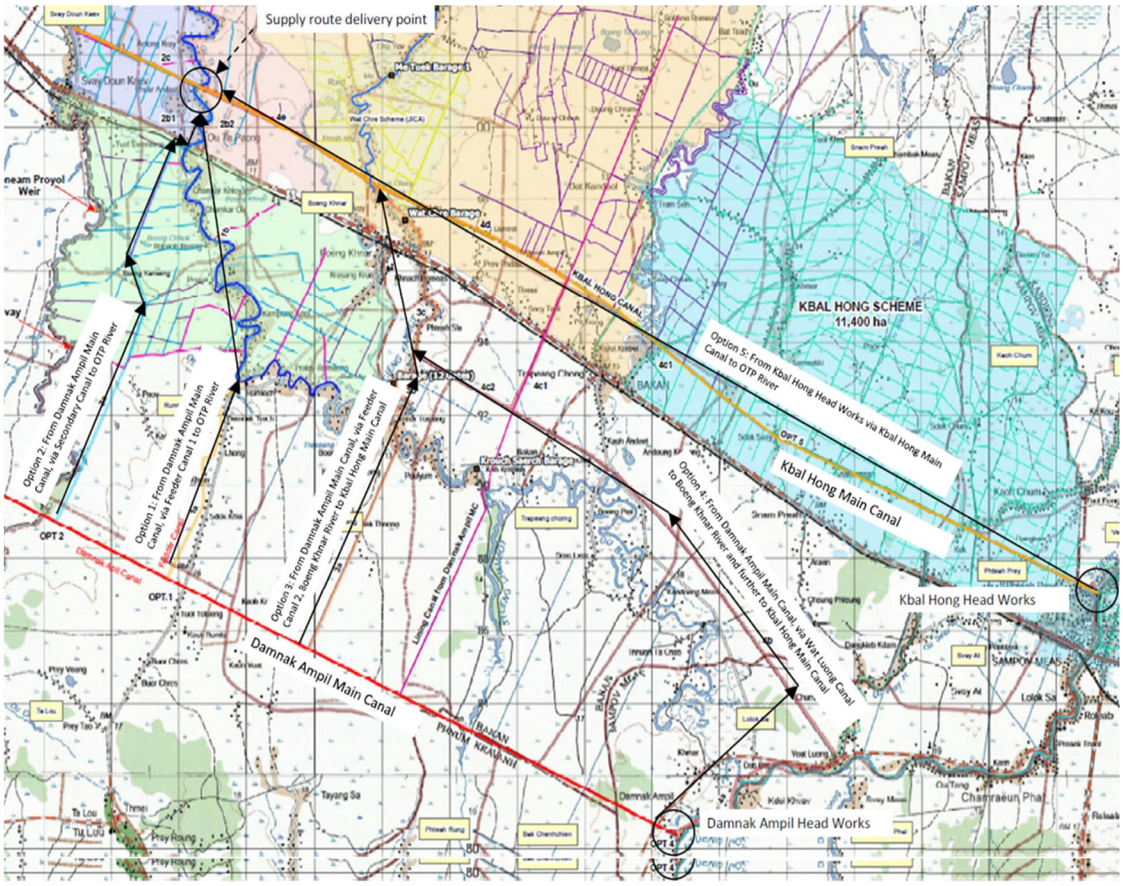


Figure 2.7: Concept design of Block A of Ou Ta Pa Ong Scheme

In addition, existing infrastructure along the Svay Donkeov river should be investigated at the design study to see if the western side can still be irrigated partially from the stream or directly from Dam Ampil Canal which intercept the river upstream. The eastern part is more difficult to be irrigated by Dam Ampil existing infrastructures as the Ou Ta Paong River creates a natural upstream barrier. Five options were proposed and considered (described bellow). But only three options were finally selected to proceed with detailed design: including Option 1, Option 3 and Option 5 (See Figure 2.8):

- **Option 1**: The option will release part of the required water of the Damnak Ampil secondary canal to the Ou Ta Paong River and create necessary work rehabilitation/ construction to divert the extra flow to the eastern area (river rehabilitation under component 2.2 and river diversion). The canal is routed from Damnak Ampil Headwater (DAHW),),), via Damnak Ampil Main Canal (DAMC) (18.7 km), via the Secondary Canal ('Feeder Canal 1', 8.8 km), into OTP River, and via OTP River's section (13.8 km) South of the National Road to the supply point. The totaltotaltotal length of this route is 41.3 km.
- **Option 3**: Parallel to Option 1, the canal will additionally release water from Damnak Ampil but extended further reaching Kbal Hong Canal, then continues to Ou Ta Paong River. **Route description:** From DAHW, via DAMC (16.7 km), via the Secondary Canal at km 16.7 ('Feeder Canal 2', 6.1 km), into Boeng Khnar River's section (9.9 km) South of the National Road to Wat Chrey Head Works, and via link canal (0.5 km) into KHMC, and via KHMC (7.2 km) to the supply point. Total length of this route is 40.4 km.
- **Option 5:** The option begins at Kbal Hong barrage at Pursat provincial town involving the enhancement of the Watergate height and the distance of carrying water will be approximately like Option 4. However, the increase in the height of the Watergate will cause inundation of the upper area of the Pursat River which may cause flooding in the town. This may bring in huge discontentment of the people in the city as height water level may cause in delay of storm water flow during raining period. The route is from Kbal Hong Head Water (KHHW), via Integrated Water Resources Management (IWRM) Kbal Hong Main Canal (KHMC) (17.0 km) into KHMC Extension (17.0 km) to the supply point on OTP River. The total length of this route is 34.0 km.

Figure 2.8: The Selected 3 Options

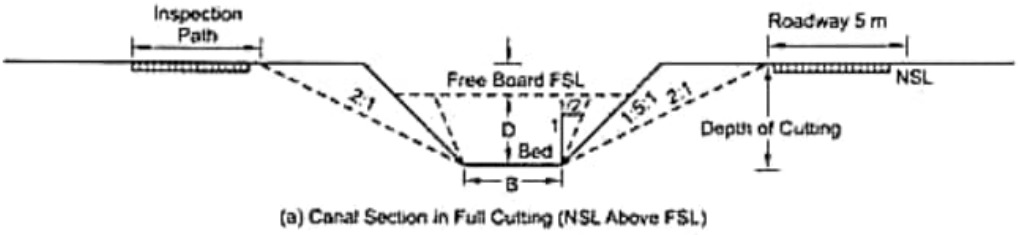
(Source: CAISAR Project, 2024)

2.3.1.3 Types of Infrastructure and Design

The Ou Ta Paong sub-project utilize water from the Pursat River and Svay Don Keo. It integrates nature-based solutions such as the restoration of the Ou Ta Paong River, fish passages on Don Keo and OTP, and natural management of Tonle Sap floods. The project includes 35 solar pump installations. Canal infrastructure development comprises a main/feeder canal of 8 km with 29 structures, secondary canals totalling 65.8 km with 121 structures, and tertiary canals extending 198.5 km with 1,591 structures. Additionally, there are 36.3 km of drains and 21 km of flood embankments with five (5) structures. Storage solutions include local ponds, fish refuges, and two (2) existing reservoirs within the Pursat catchment, with the Pursat Dam 1 hydropower project under construction and Dam 2 water storage. Please see also Table 2.15.

Table 2.15: Ou Ta Paong Sub-Project Key Characteristics

Sub Project	Ou Ta Paong
Area Cultivated (ha)	13,000
Water Source	Pursat River and Svay Don Keo
Nature Based Solution[1]	Restoration of Ou Ta Paong River, fish passage on Donkeo and OTP,



[1] Nature-Based Solution, in this case is the restoration of the river system through dredging, is applied to contribute to the recovery of the natural condition of the Ou Ta Paong as the system has already

	Natural Management of TS floods.
Solar Pump Installations	35 (Not suitable in flood areas)
Main/Feeder Canals C/L(km)/N	1_8.0km_29

Land Area of Canals (Existing proposed Ha)	299_575
Cost Estimate (USD/m)	70.8
Cost/ha $	5,450

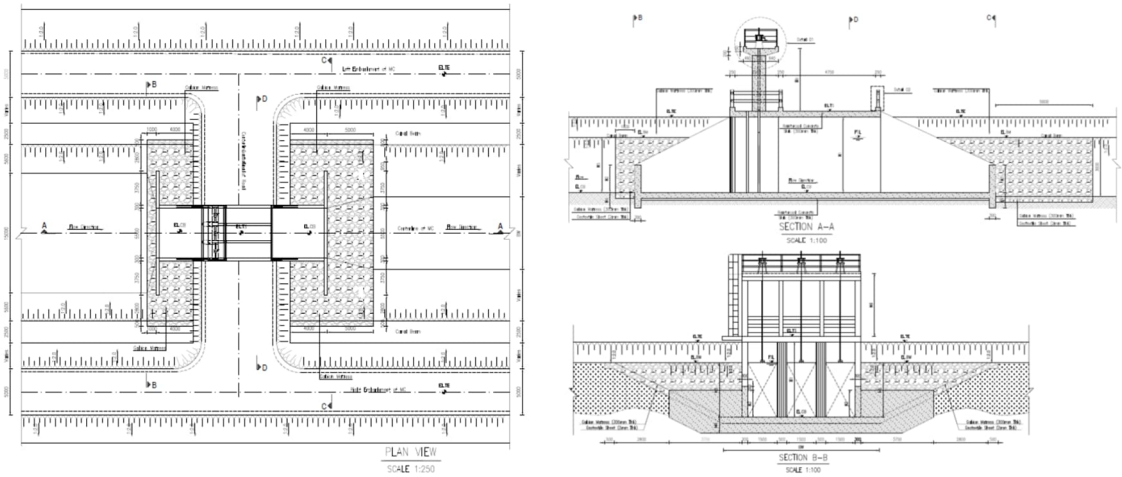
The latest decision on the infrastructure in OTP confirmed that the polder system is no longer needed, and the focus is given to the existing canal system only. The key components of OTP include a canal system with concrete linings, and water regulation structures. Two (2) tertiary canal options are proposed, one (1) using diesel pumps and another employing solar-powered pumps for improved sustainability. Expansion of existing feeder canals is also planned, though specifics remain subject to change. The following are the conceptual design for each of the design where the detail design is supposed to be considered:

Canal. The design of the canal system (Figure 2.9) aims to serve both irrigation and drainage functions, considering the topography, limited water resources, and potential land resettlement issues. Where possible, the canals will follow existing paths to minimize social impacts. The size of the canals will be adjusted based on the irrigated area and the local topography. To ensure long-term sustainability and reduce water loss through percolation, it is recommended to construct the main canals using concrete linings or suitable alternatives. This approach will help maintain water distribution efficiency and improve the durability of the infrastructure.

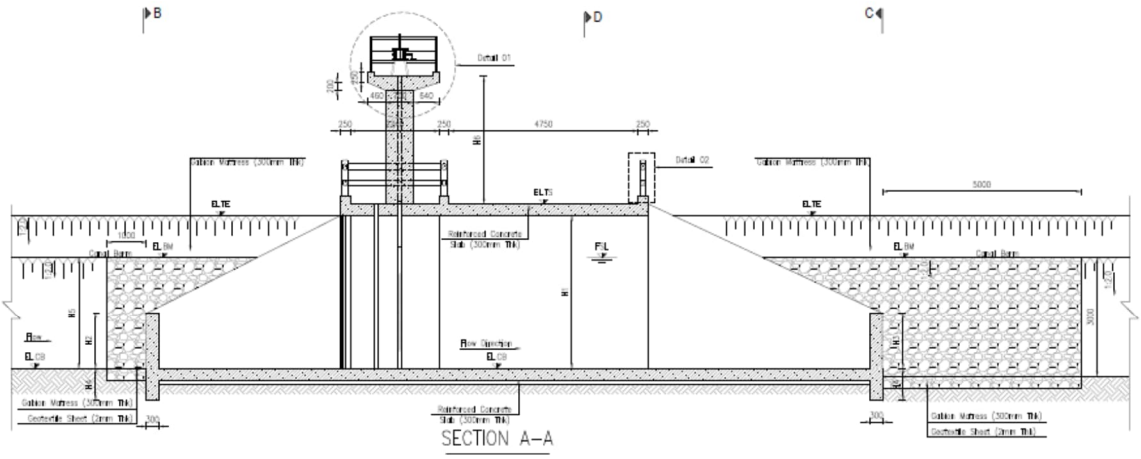
Figure 2.9: Typical canal section in full cutting

(a) Canal Section in Full Cutting (NSL Above FSL)

River Training and Drainage: A well-designed drainage system will be a critical component of the project, intended to manage excess runoff during the rainy season and prevent



been deteriorated due to over water abstraction and blockage of the river system while the restoration of fish passage/sliding gate is going to be decided at the time of DED since no specific design being considered at this stage.



waterlogging in the command area. This system will also serve as the outlet for the on-farm drainage network, which is designed to control groundwater levels and drain surplus irrigation water. The layout of the drainage system will be based on the main natural drainage channels, upstream watersheds, rainfall over the command area, and changes in water levels in the Tonle Sap. It will also consider land use, crop types, and the planned irrigation systems to ensure efficient water management.

Water Regulation and Off-Take Structures: Water will be diverted from multiple sources into the main canals according to water availability and a demand schedule prepared by the FWUC and PDoWRAM, based on crop needs. Various cross structures (off-take structures) will be installed to maintain the full supply level in the main and secondary canals where necessary. The flow of water into each canal will be controlled by operating the gates of the head regulators, ensuring efficient delivery to the tertiary canals, which will distribute water to individual fields. Farmers will have the option to irrigate their plots either through plot-to-plot irrigation or by constructing field ditches through the diversion of water using these off-take structure (See also Figure 2.10).

Tertiary System: The irrigation system design extends to the tertiary canal level, which is the final distribution point before water reaches individual plots. Two (2) options are considered for the tertiary canals. The first option involves creating traditional tertiary canals through excavation, where farmers will individually pump water using diesel pumps based on their needs. However, this requires significant cooperation from beneficiaries, as canal alignment must be accepted without land compensation. The second option is to install collective solar pumping stations, a more sustainable and cost-effective solution that eliminates the need for diesel pumps and reduces CO2 emissions.

Collective Solar Pumping System: The project aims to implement a solar-powered pumping system as a low-tech, sustainable alternative to diesel pumps, with a pilot test covering 30-50 hectares in each irrigation block. The solar pumping system requires minimal maintenance and has no fuel costs, making it an environmentally friendly and cost-effective solution for farmers. The southern part of Block A is particularly suitable for the implementation of this system due to its proximity to villages and protection from floods. The solar pumping system could cover 4,198 hectares with 80-90 units, improving water efficiency by 20% and reducing the risk of land conflicts along the canal alignment. This system would ensure reliable water delivery and support sustainable agricultural practices.

2.3.2 Lum Hach

2.3.2.1 Activities and Timeline

Should the feasibility study for the Lum Harch subproject proceed to detailed design, then allowing for the design process, procurement process and approvals, it has been assumed the following planning as displayed in the Table 2.16.

The following assumptions have been made:

- The detailed design will start in January 2025.
- The procurement process will not take more than three (3) quarters.
- The work construction will start after the rainy season in Cambodia with a mobilization period (last quarter of the year);
- The work construction duration will not last more three (3) dry seasons.

Hence the construction would be able to commence at the last quarter 2027, with completion by mid-2030.

2.3.2.2 Design Concepts and Options

The Lum Harch Irrigation scheme serves an area downstream of the old Lum Harch canal, built during the Pol Pot era (1975-1977). The system pulls water from multiple streams that intersect the canal, but the catchment areas of these rivers are small, limiting water availability and creating distinct hydraulic zones that affect agricultural productivity. The region's slope, from southwest to northeast, primarily relies on upstream streams, making it difficult to divert water from other sources, such as the Bouribor River. An initial proposal to divert water from the Bouribor River with an impoundment option was removed due to environmental and social concerns. To address the issues of water availability, the system has focused more on pond system across the entire system. The design option of the system is provided in Table 2.17. In addition, the project has shifted to a “Nature-Based Solution” approach, focusing on rehabilitating existing streams and ponds to improve irrigation, diversify crops, and protect against flooding. The project includes:

- Rehabilitation of streams crossing the command area.
- Creation or rehabilitation of 50-80 ponds along the scheme for irrigation development.
- Rehabilitation of the old Lum Harch Canal to be used as a reservoir.

Figure 2.11: Principles of river rehabilitation for Lum Hach scheme

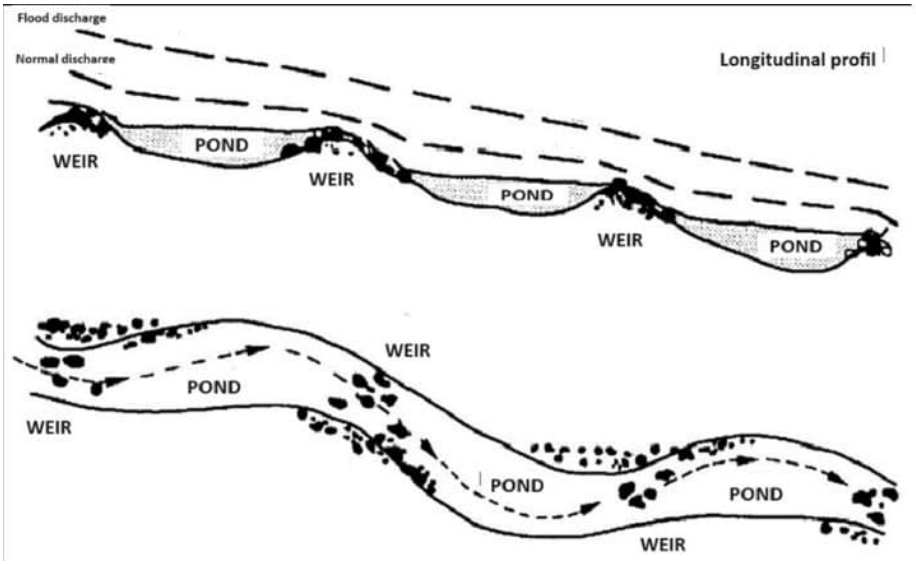

Table 2.17: Summary of design options in Lum Hach

Sub Project	Lum Hach
Area Cultivated (ha)	3,900
Water Source	Local Streams and diversion of Boribo tributary
Nature Based Solution [2]	Enhancement of Main Canal environmental features, local storages and riparian corridors along local rivers. 200 Ponds
Solar Pump Installations	179
Main/Feeder Canals C/L(km)/N	1_30.0_52
Secondary Canal C/L (km)/N (Existing)	12_12.2km_673
Tertiary Canal C/L (km)/N Existing	179_107km_1487
Main/Secondary Drains (C/L km/N)	12_107km_99
Flood Embankments /structures (Km/N)	Main Canal Bank included above
Storages	Development of upstream storage area, local ponds
Land Area of Canals (Existing proposed Ha)	65_532
Cost Estimate (USD/m)	85.4
Cost/ha $	5,400

Canals: No new canals are planned for this sub-project.

River Training and Drainage: The drainage system layout will focus on using the main natural drainage channels to manage excess runoff during the rainy season and prevent waterlogging. The system will also control groundwater levels and drain surplus irrigation water. The drainage system is designed with a 5-year return period (5% probability) for main rivers and a 5-year (20% probability) return period for all other drains. The layout will be based on natural drainage channels, upstream watersheds, rainfall over the command area, and Tonle Sap water level changes. It will also consider land use, crop types, field management, and planned irrigation systems. Additional drains will be built upstream and parallel to the main canal to divert floodwaters and protect the canal.

[2] Nature-Based Solution, in this case is the improvement of water storage capacity including canal enhancement and pond restoration, is applied to contribute to the recovery of the natural condition of the water system within the command area.

Water Sources: Lum Hach Will take advantage of Watershed protection in the Aural Mountain and a new regulator to provide storage of 40MCM at an existing site is proposed. This will be linked to the Lum Hach 2 area through a small link canal.

Flood Management: Flood issues in the area are limited to floodplain flows along the smaller streams and management of flood flows across the main canal. The proposed regulator may offer some flood control function to downstream communities on the Boribour. Improvement of drainage will help reduce flood damages.

Water Distribution:

(a) Restoration of main canal for 26.3km will improve control as a distribution between inflow from creeks and main supply and outflows at secondary canals and river channels. Improve eroded spills to operate during flood and enhance environmental functioning and bank on east side. The canal banks however maintain significant riparian vegetation and restoration as a functioning river and the spine of the conveyance system will have multiple benefits.
(b) Secondary Canals: 31 secondary canals with a length of 104km most of these canals will be newly built as the original Lum Hach scheme was not fully completed.
(c) Tertiary and Quaternary Canals

2.3.3 Stung Krang Ponley

2.3.3.1 Activities and Timeline

Should the feasibility study for the Krang Ponley subproject proceed to detailed design, then allowing for the design process, procurement process and approvals, it has been assumed the following planning as displayed in the Table 2.18.

The following assumptions have been made:

- The detailed design will start in January 2025.
- The procurement process will not take more than three (3) quarters.
- The work construction will start after the rainy season in Cambodia with a mobilization period (last quarter of the year);
- The work construction duration will not last more two (2) dry seasons.

Hence the construction would be able to commence at the last quarter 2026 for the four (4) first schemes (Chhean Laeung, Kropeu Trom, Yotosast, and Stoeung Krang Bat) with total completion by mid-2030 for Brambei Mom irrigation scheme.

Table 2.18: Tentative implementation schedule of Krang Ponley irrigation scheme.

2.3.3.2 Design Concept and Options

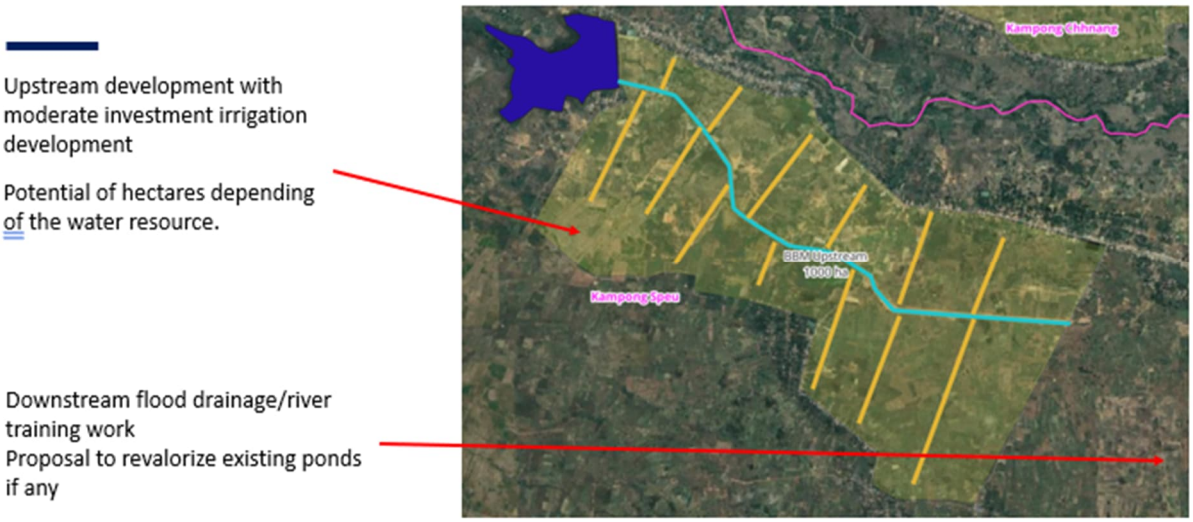
The current planning coverage area of Krang Ponley sub-project is around 3,000 hectares, drawing water from the Krang Ponley River, with existing storage at Anlong Chrey and Brambei Mom. Nature-based solutions include controlling the flood regime at Krang Bat for flood recession and fisheries, alongside the rehabilitation of 31 major ponds. Solar pump installations total 184 units distributed across Brambei Mom (110), Chrey Loeu (47), and Krang Ponley Teuk (27). Canal infrastructure includes 31.3 km of main/feeder canals, 29.2 km of secondary canals, and 63.5 km of tertiary canals. Drainage infrastructure comprises 42.8 km of main and secondary drains, while flood embankments and channels are planned for flood management, with raised canal banks in Krang Ponley Teuk. Storage facilities include the upgrade and safety improvement of the Anlong Chrey Reservoir, 31 rehabilitated ponds at Brambei Mom, and support for local storages and fish refuges. The land area for canals is 383 hectares, comprising 144 existing and 239 proposed hectares (Table 2.19).

Table 2.19: Key Features of the Krang Ponley Sub-Project

Sub-Project	**Krang Ponley**
Area Cultivated (ha)	3,000
Water Source	Krang Ponley River with existing storage at Anlong Chrey and Brambei Mom
Nature Based Solution[3]	Control of flood regime at Krang Bat for flood recession and fisheries. Rehabilitate 31 major ponds.
Solar Pump Installations	110 (BBM) + 47(CL) + 27(KPT)
Main/Feeder Canals C/L(km)/N	6_31.3km
Secondary Canal C/L (km)/N (Exist)	35_29.2km
Tertiary Canal C/L (km)/N Existing	77_ 63.5km
Main/Secondary Drains (C/L km/N)	17_42.8km
Flood Embankments /structures (Km/N)	Storage/Operation in AC reservoir for flood, Raised canal bank on KPT, flood channels in KPT and embankment on TS
Storages	Existing Anlong Chrey Reservoir to be upgraded and safety improvements. 31 major ponds on Barambei Mom. Support local storages and fish refuge.
Land Area of Canals (Existing proposed Ha)	144/239

BBM = Brambei Mom, CL= Chrey Loeu, KPT = Krang Ponley Teuk.

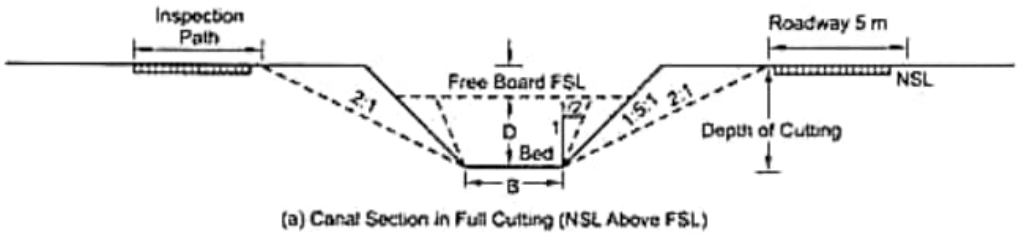
[3] Nature-Based Solution, in this case is the improvement of water storage capacity including canal enhancement and pond restoration, is applied to contribute to the recovery of the natural condition of the water system within the command area.



2.3.3.2.1 Brambei Mom

The Brambei Mom irrigation system (Figure 2.12) consists of:

- The creation of irrigation distributary canals to irrigate 1,000 ha. It is envisaged to investigate the possibility of collective solar pumping system at the tertiary level.
- The rehabilitation of the downstream river to prevent flooding and water disaster.



These concerted activities aim to enhance irrigation capabilities, optimize water distribution, and reduce potential water-related risks within the project area.

Figure 2.12: Concept design Layout of Brambei Mom irrigation scheme

Canal Design: The canal design (Figure 2.13) will serve both irrigation and drainage purposes, considering the topography, limited water resources, and potential land resettlement issues. Wherever possible, canal alignments will follow existing paths to minimize social impacts. Canals should be constructed with measures to reduce percolation and infiltration, using concrete linings or suitable alternatives to enhance long-term sustainability and water distribution efficiency. All canal characteristics will be finalized during the detailed design phase.

Figure 2.13: Canal section on full cutting section

River Training and Drainage

The drainage system layout for the project will focus on utilizing the main natural drainage channels to manage excess runoff during the rainy season and mitigate waterlogging in the

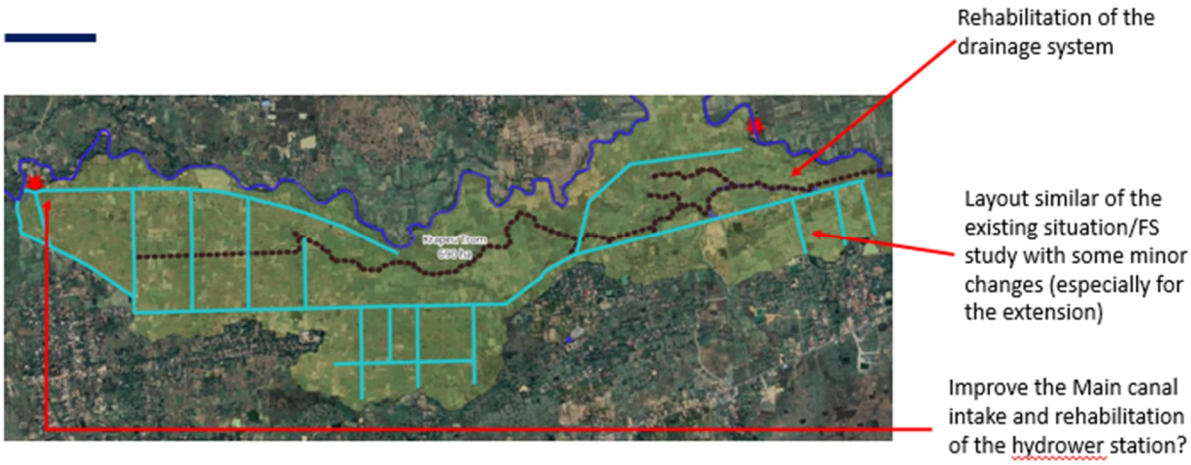
command area. This system will also serve as the outlet for the on-farm drainage system, which is designed to drain surplus irrigation water and control the groundwater table.

The primary goal of the drainage system is to support increased agricultural production in the area. To achieve this, the drainage system will be designed for a 5-year return period with a 5% probability for main rivers, and a 20% probability for all other drains.

The drainage layout will consider:

- Main natural drainage channels as the foundation.
- Incoming sources, such as upstream watersheds, direct rainfall over the command area, and water level changes in the Tonle Sap.
- Land use, including crop types, field layout, and management practices.
- Planned irrigation systems.

The main drains will be based on existing natural rivers, and the internal drainage system will be adapted to the layout of agricultural plots and irrigation systems. Additional drains will be constructed upstream and parallel to the main canal to act as diversion and interception drains, reducing crossings over the canal and protecting it from floodwater. These additional drains will divert floodwater according to the topography to effectively integrate into the overall drainage system.



2.3.3.2.2 Kropeu Trom

The proposed Kropeu Trom project, as per the design layout in Figure 2.14, includes several key components aimed at enhancing irrigation capabilities and mitigating water-related hazards. These include:

- Rehabilitation of the Intake Structure on the Anlong Chrey stream.
- Rehabilitation of Irrigation Distributary Canals to irrigate 690 hectares, with the possibility of lining key canals.
- Development of Sub-distributary Canals (tertiary level), with investigations into implementing a collective solar pumping system.
- Rehabilitation of Drainage Systems, including the Anlong Chrey stream and main drainage systems to mitigate flooding.

These activities collectively aim to enhance irrigation capabilities, improve water distribution, and mitigate potential water-related hazards in the project area.

Figure 2.14: Concept design of Kropeu Trom irrigation scheme.

Preferred Technical Design Option

The rehabilitation, construction and activities of CAISAR project in Krapeu Truom sub-scheme consist of canals, river training and drainage, improvement of water regulation and structure and tertiary systems, and installation of solar power systems.

Canal. The design of the canal system aims to serve both irrigation and drainage functions, considering the topography, limited water resources, and potential land resettlement issues. Where possible, the canals will follow existing paths to minimize social impacts. The size of the canals will be adjusted based on the irrigated area and the local topography. To ensure long-term sustainability and reduce water loss through percolation, it is recommended to construct the main canals using concrete linings or suitable alternatives. This approach will help maintain water distribution efficiency and improve the durability of the infrastructure.

River Training and Drainage: A well-designed drainage system will be a critical component of the project, intended to manage excess runoff during the rainy season and prevent waterlogging in the command area. This system will also serve as the outlet for the on-farm drainage network, which is designed to control groundwater levels and drain surplus irrigation water. The layout of the drainage system will be based on the main natural drainage channels, upstream watersheds, rainfall over the command area, and changes in water levels in the Tonle Sap. It will also consider land use, crop types, and the planned irrigation systems to ensure efficient water management.

Water Regulation and Structures: Water will be diverted from multiple sources into the main canals according to water availability and a demand schedule prepared by the FWUC and PDoWRAM, based on crop needs. Various cross structures will be installed to maintain the full supply level in the main and secondary canals where necessary. The flow of water into each canal will be controlled by operating the gates of the head regulators, ensuring efficient delivery to the tertiary canals, which will distribute water to individual fields. Farmers will have the option to irrigate their plots either through plot-to-plot irrigation or by constructing field ditches. Once again, the off-take structures (Figure 2.14) will be installed for farmers to divert water into their field using plot-to-plot irrigation method or they can construct small canals as per agreement within their groups.

Tertiary System: The irrigation system design extends to the tertiary canal level, which is the final distribution point before water reaches individual plots. Two (2) options are considered

for the tertiary canals. The first option involves creating traditional tertiary canals through excavation, where farmers will individually pump water using diesel pumps based on their needs. However, this requires significant cooperation from beneficiaries, as canal alignment must be accepted without land compensation. The second option is to install collective solar pumping stations, a more sustainable and cost-effective solution that eliminates the need for diesel pumps and reduces CO_2 emissions.

Collective Solar Pumping System: The project aims to implement a solar-powered pumping system as a low-tech, sustainable alternative to diesel pumps, with a pilot test covering 30-50 hectares in each irrigation block. The solar pumping system requires minimal maintenance and has no fuel costs, making it an environmentally friendly and cost-effective solution for farmers. The southern part of Block A is particularly suitable for the implementation of this system due to its proximity to villages and protection from floods. The solar pumping system could cover 4,198 hectares with 80-90 units, improving water efficiency by 20% and reducing the risk of land conflicts along the canal alignment. This system would ensure reliable water delivery and support sustainable agricultural practices.

2.3.3.2.3 Yutasas

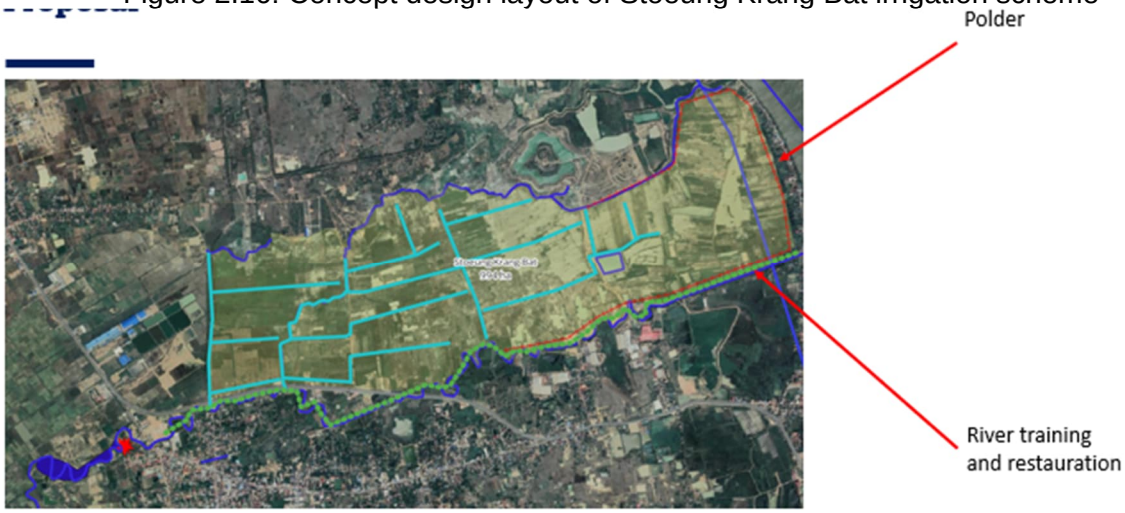
The Yutasas irrigation system as per the design layout in Figure 2.15 consists of:

- The rehabilitation of the intake structure on Anlong Chrey stream.
- The rehabilitation of the irrigation distributary canals to irrigate 593 ha. It is envisaged to have canal lining for the main infrastructures (main and secondary canal)
- The development of sub-distributary canals (tertiary). Investigation will be performed to envisage the possibility of collective solar pumping system at the tertiary level.
- The rehabilitation of the Anlong Chrey and existing main drainage system to prevent flooding and water disaster.

These combined efforts seek to elevate irrigation capabilities, refine water distribution, and alleviate potential water-related risks within the project area.

Figure 2.15: Conceptual design layout of Yotasas irrigation scheme

2.3.3.2.4 Stoeung Krang Bat



The Steung Krang Bat irrigation system as per the design layout in Figure 2.16 consists of:

- The rehabilitation of the intake structure on Anlong Chrey stream.
- The rehabilitation of the irrigation distributary canals to irrigate 994 ha. It is envisaged to have canal lining for the main infrastructures (main and secondary canal)
- The development of sub-distributary canals (tertiary). Investigation will be performed to envisage the possibility of collective solar pumping system at the tertiary level.
- The rehabilitation of the Anlong Chrey and existing main drainage system to prevent flooding and water disaster.
- The creation of a polder on the eastern side to protect the area from flooding of Tonle Sap.

These joined activities aim to enhance irrigation capabilities, optimize water distribution, and reduce potential water-related risks within the project area.

Polder System. This polder system will be added along the existing road of the system, allowing for the cultivation of wet-season paddy and providing protection for homes and property from floods. A typical polder includes an encircling embankment that keeps water out, drainage canals inside the polder to remove excess water, and a sluice gate that releases water during low tides. The sluice gate will also serve as an irrigation intake during water shortages, ensuring water availability even during dry spells within the rainy season (Please see Figure 2.16 for the location of the polder).

Figure 2.16: Concept design layout of Stoeung Krang Bat irrigation scheme

2.3.4 Project Activities

The infrastructure investment of the project, as outlined in the previous section, involves several key activities during the pre-construction phase. These activities set the foundation for the successful implementation of the project's construction work and ensure that resources and personnel are well-prepared for the task.

The project is divided into two (2) key components. Component 1 focuses on improving farm-level climate adaptation, resilience, and water use efficiency. This involves planning and

training activities to develop community-based action plans and build capacity among farmers. Additionally, mechanization efforts and farm road improvements will enhance agricultural productivity and accessibility. Component 2 aims to strengthen irrigation infrastructure for increased resilience. This includes a range of activities such as river dredging, canal rehabilitation, construction of small-scale structures, river training, polder system development, solar pumping system installation, feeder canal construction, and pond construction or rehabilitation. These interventions will improve water management, increase water storage capacity, and ensure efficient water distribution to agricultural fields.

2.3.4.1 Pre-construction Phase

At the pre-construction phase, there are several activities that need to be done where disturbance to local people as well as natural resources may occur. These activities are:

1. Land and Right of Way Negotiation: This initial step focuses on securing the necessary land and access rights for the construction. Negotiations with local authorities, landowners, and other stakeholders ensure that all legal and logistical requirements are met, minimizing potential delays or disputes that could arise during the project.
2. Contracting and Training of Staff: The project then engages in the recruitment and contracting of skilled personnel, including construction teams, engineers, and project management staff. This step is critical to ensure that the workforce has the necessary expertise and experience. Alongside recruitment, training programs are provided to align staff with the project's goals, safety standards, and technical requirements.
3. Mine and UXO Clearance: In areas with potential unexploded ordnance (UXO), safety is the highest priority. Before any construction begins, the project undertakes mine and UXO clearance to ensure that the site is free of hazardous materials, creating a safe environment for workers and preventing accidents.

These pre-construction activities are integral to establishing a strong foundation for the project, ensuring that the necessary infrastructure, workforce, and materials are in place to proceed smoothly with the subsequent phases of construction.

2.3.4.2 Construction Phase

The construction phase of the project involves a comprehensive set of activities aimed at establishing the required infrastructure while ensuring safety, environmental management, and efficient use of resources. Key construction activities include:

1. Mobilization of Construction Materials, Consumables, Machinery, Equipment, and Staff: Once the team is in place, the project moves into the mobilization phase, where all essential materials, machinery, and equipment are transported to the construction site. This also includes the deployment of consumables and other resources required for ongoing construction. Ensuring the timely arrival and organization of these assets is crucial for avoiding disruptions in the construction timeline. Similarly, staff are mobilized to ensure a coordinated start to the construction activities.
2. Installation and Operation of Temporary Infrastructure: Temporary facilities, such as worker camps, asphalt plants, concrete mixing stations, and ground material processing plants, are set up to support the construction process. These facilities are

critical for providing on-site accommodation for workers and ensuring the continuous supply of construction materials.

3. Site Clearing and Cleaning: This phase involves clearing the construction site of any obstructions such as vegetation, debris, and existing infrastructure. It ensures that the land is prepared and ready for subsequent construction activities.
4. Demolition and Removal of Existing Infrastructure: In areas where existing structures need to be replaced or upgraded, demolition and removal are necessary. This ensures that the site is clear for the installation of new infrastructure and allows for efficient use of the available land.
5. Land Movements (Excavations, Dredging, and Fills): Major land movements, including excavations and dredging, are conducted to reshape the land and prepare it for new infrastructure. These activities also involve filling areas to achieve the required ground levels for construction stability and support.
6. Construction of Hydraulic Works (Including Occupation of Waterways): Hydraulic works, such as dams, levees, or irrigation systems, are constructed to manage water resources effectively. This stage often requires temporary occupation of waterways, making careful planning and environmental considerations critical.
7. River Training: As part of managing water flow and preventing erosion, river training is conducted to stabilize riverbanks and direct water movement, which is essential for protecting both the construction site and surrounding ecosystems.
8. Dismantling of Temporary Facilities and Camps: Once the primary construction activities are completed, temporary infrastructure such as camps and material plants are dismantled. This marks the transition toward the final stages of the construction process.
9. Final Cleanup of Intervened Areas: A thorough cleanup of the construction site is conducted to remove debris, materials, and any temporary installations.
10. Site Retoration: To ensure the aesthetic and environmental sustainability of the project, landscaping efforts are undertaken, including replanting vegetation, managing drainage, and shaping the landscape to blend with the natural surroundings.

This series of construction activities ensures that the project is completed according to design specifications, with an emphasis on safety, environmental responsibility, and efficient resource management.

2.3.4.3 Operation and Maintenance

The post-construction phase of the project involves the transition from infrastructure development to its operational use, with a focus on agricultural intensification, resource management, and long-term maintenance. The key activities during this phase include:

1. Intensifying Agricultural Production: Following the completion of the infrastructure, there is a focus on enhancing agricultural productivity. The improved infrastructure allows for more efficient farming practices, increased crop yields, and the introduction of advanced agricultural techniques. This intensification contributes to greater food security and economic development in the region.

2. Increased Use of Energy and Fuel for Agriculture Production: With the intensification of agricultural activities, there is a corresponding rise in the use of energy and fuel to power farming machinery, irrigation systems, and other agricultural equipment. This increased demand for energy supports the scaling up of production but also requires careful management to ensure sustainability and minimize environmental impacts.
3. Operation and Maintenance: To ensure the long-term functionality and durability of the newly constructed infrastructure, regular operation and maintenance activities are critical. This includes monitoring the condition of the infrastructure, performing repairs, and ensuring that the systems in place continue to function as designed. Routine maintenance helps prevent deterioration and ensures that agricultural productivity remains high.
4. Water Management: Effective water management becomes a priority in this phase, especially with the new hydraulic infrastructure in place. This includes controlling irrigation systems, managing water levels in reservoirs, and ensuring that water resources are used efficiently to support agricultural activities. Sustainable water management is crucial for balancing agricultural demands with environmental conservation.

These post-construction activities ensure the long-term success of the project, contributing to sustainable agricultural growth, resource efficiency, and the ongoing maintenance of infrastructure to support continued productivity in the agricultural sector. Summary of the project activities is provided in Table 2.20.

Table 2.20: Summary of the Project Activities in relation to the infrastructure investment

No.	Stage	Activities
1	Pre-Construction	Land and right of way negotiation
		Contracting and training of staff
		Mobilization of construction materials, consumables, machinery, equipment and staff
2	Construction	Mine and UXO clearance
		Installation and operation of temporary infrastructure (camps, asphalt, concrete and ground material plants)
		Site clearing and cleaning
		Demolition and removal of existing infrastructure in areas to be intervened
		Land movements (excavations, dredging and fills)
		Construction of hydraulic works (includes occupation of waterways)
		River training
		Dismantling of temporary facilities and camps
		Final cleanup of intervened areas
		Landscaping management
	After Construction	Intensifying agricultural production
		Increased use of energy and fuel for agriculture production
		Operation and maintenance
		Water management

UXO = Unexploded Ordnance.

2.3.5 Construction Equipment

To support the construction activities, the project will require a variety of construction equipment and machinery. Below is the potentially used equipment for different stages of the project:

- Earthworks and Land Preparation
  - Excavators – For digging canals, ponds, and trenches.
  - Backhoe Loaders – For smaller excavation and loading tasks.
  - Bulldozers – For clearing and leveling land.
  - Motor Graders – For grading and leveling road and embankment surfaces.
  - Scrapers – For removing and transporting soil over short distances.
  - Soil Compactors/Rollers – For compacting soil before construction.
- Water Infrastructure Construction
  - Dredgers – For clearing and deepening irrigation canals and reservoirs.
  - Trenchers – For laying underground pipelines.
  - Pipe Layers – For positioning and installing large-diameter water pipes.
  - Concrete Pumps – For pumping concrete into irrigation structures.
  - Concrete Mixers (Stationary & Mobile) – For mixing and delivering concrete.
  - Cranes – For lifting heavy pipes, gates, and pre-cast structures.
  - Pile Driving Machines – For driving piles into the ground for dam or levee construction.
- Road and Pathway Construction
  - Asphalt Pavers – For paving roads within the project.
  - Dump Trucks – For transporting materials such as gravel, sand, and asphalt.
  - Bitumen Sprayers – For road surfacing.
  - Road Rollers – For compacting asphalt or gravel surfaces.
- Drainage and Irrigation System Development
  - Water Pumps (Diesel & Electric) – For water transfer and dewatering.
  - Drilling Rigs – For well construction and deep water extraction.
  - Channel Forming Machines – For shaping and lining irrigation channels.
  - Concrete Pipe Making Machines – For on-site production of irrigation pipes.
- Structural and Facility Construction
  - Tower Cranes – For lifting heavy materials in building sites.
  - Scaffolding Systems – For workers' access and safety.
  - Rebar Cutters and Benders – For reinforcing concrete structures.
  - Shotcrete Machines – For spraying concrete onto embankments.
- Environmental and Erosion Control
  - Hydroseeding Equipment – For erosion control and vegetation replanting.
  - Rock Crushers – For breaking stones for embankment protection.

- Geotextile Laying Machines – For soil stabilization in embankments and canal lining.

- Power and Electrical Systems
  - Generators – For power supply in remote project sites.
  - Transformers & Substations – For irrigation pumping stations.
  - Solar Panel Installation Equipment – If renewable energy is incorporated.

- Monitoring and Surveying Equipment
  - Total Stations & GPS Survey Equipment – For site mapping and project layout.
  - Drones – For aerial surveys and project monitoring.
  - Water Flow Meters – For irrigation system performance assessment.

2.4 ASSOCIATED FACILITIES

Under CAISAR, the screening for potential Associated Facilties (AF) was conducted by SECAP team. The definition for "Associated facilities" (AF) in the AIIB's Environmental and Social Framework (May 2021 version) are activities that are not included in the description of the Project set out in the Legal Agreements governing the Project, but they are qualified to the following criteria:

> (a) **directly** and **materially** related to the Project.
>
> (b) **carried** out, or **planned to be carried out**, **contemporaneously** with the Project; and
>
> **(c) necessary** for the Project to be **viable** and would **not be carried out if the Project did not exist**".

Below is the summary of a) methods that was used by the team to screen for AF, and b) the results of the AF screening.

Methods

Interpretation of AF definition in the context of CAISAR project

Under CAISAR project, the key terms used in the above definition are interpreted as follows:

- **Project**: refers to CAISAR project
- **Direct**, in the context of environmental and social risk and impact assessment, refers to the **impact, which is caused by the project**, and **occurs contemporaneously in the location of the project**. This is to differentiate with an indirect impact which is an impact which is caused by the project and is later in time or farther removed in distance than a direct impact, but is still reasonably foreseeable, and will not include induced impacts. "Direct", in the context of AIIB's ESF refers to the "direct" relationship between a potential associated facilities (e.g. dam, reservoir, barrage) and its impact on the achievement of the intended project development.
- **Material**: significant, important, substantive. In the context of CAISAR, "material" refers to the strength of the above "direct" relationship between the impact of a potential AF

on the intended outcome for each subproject which is indicative of **reliable and increased water access** for the target project groups – as per project plan, to achieve expected development outcome.

- **Contemporaneous**: at the same time, which is the relative overlap of time with regards to planning and actual implementation of potential AF and CAISAR project activities (defined by project planning period and project implementation life).
- **Viable**: for CAISAR sub–schemes to **achieve** mostly the **intended impacts** (expected outcome, i.e. increased irrigated area and/or number of crops per year/reliable irrigation access).
- **Not be carried out if the Project did not exist.** Indicates the functional interdependency between the AF and CAISAR project.

Findings

As per the consultation with the CAISAR PMU and SECAP team, the document regarding the AF had already been approved. Therefore, the result from the assessment were used in this report. Further assessment will be conducted on any emerging facilities after the consultation and agreement being provided by the PMU. Based on the screening by the SECAP team, five (5) existing works have been screened and assessed if they are associated facilities (See table next page). The screening results indicates that none of the five (5) water resources facilities met the definition of AIIB's Environmental and Social Framework on Associated Facilities. Therefore, no further actions are required in connection with these five (5) works (please see in table 2.21).

Table 2.21: Screening of potential Associated Facilities under CAISAR*

Assessment criteria	Anlong Chrey Dam	Kdol Dam	Brambei Mom Dam	Kropeau Truom diversion work	Yutasas barrage
a) **directly** and **materially** related to the Project; and	Directly and materially (substantially) related to Brambei Bom, Kropeau Truom, Yutasas, and Stoeng Krang Bat.	Directly and materially (moderately) related to Kropeau Truom, Yotasas, and Stoeung Krang Bat	Directly and materially (substantially) related to Brambei Mon sub–scheme	Directly and materially (substantially) related to Kropeau Truom sub–scheme	Directly and materially (substantially) related to Yutasas sub–scheme
b) **carried out**, or **planned to be carried out**, **contemporaneously** with the Project; and	The Anlong Chrey construction was completed in 2012 under Krang Ponley Water Resources Development Project. **Not carried out contemporaneously** with Brambei Bom, Kropeau Truom, Yotasas, and Stoeung Krang Bat sub–schemes.	Kdol Dam construction was completed in 2012 under Water Resources Development Project. **Not carried out contemporaneously** with Kropeau Truom, Yutasas, and Stoeung Krang Bat	The Brambei Mom Dam construction was completed in 2012 Krang Ponley Water Resources Development Project. Not carried out contemporaneously with Brambei Mom sub–scheme	The Kropeau Truom Dam construction was completed in 2015 **Not carried out contemporaneously** with Kropeau Truom sub–scheme	The Yutasas Dam construction was completed in 2015 **Not carried out contemporaneously** with Yutasas sub–scheme
c) **necessary** for the Project to be **viable** and **would not be carried out** if the Project did not exist.	**Necessary** for Brambei Mon, Kropeau Truom, Yutasas, and Stoeung Krang to be **viable** and **still carried out** even if these schemes did not exist	**Necessary** for Kropeau Truom, Yutasas, and Stoeung Krang to be **viable** and **still carried out** if even these schemes did not exist	**Necessary** for the Brambei Mom sub–scheme to be **viable** and **still carried out** even if Brambei Mom sub–scheme did not exist.	**Necessary** for the Kropeau Truom sub–scheme to be **viable** and **still carried out** even if Kropeau Truom sub–scheme did not exist.	**Necessary** for the Yutasas sub–scheme to be **viable** and **still carried out** even if Yutasas sub–scheme did not exist.

2.5 IMPLEMENTATION RESOURCES REQUIREMENT

2.5.1 Labour and Workforce

Table 2.23 outlines the estimated labor requirements for the construction of the irrigation system under the CAISAR project. Four main groups of the labor forces include: Direct Workers, Contracted Workers, Primary Supply Workers, and Other Stakeholders. The Direct Workers include individual consultants and members of the Project Implementation Unit (PIU), who are essential from the project preparation phase through to completion. The Contracted Workers, engaged by the PIU and construction contractors, consist of national specialists such as Detailed Design Consultants and Construction Supervision Consultants, as well as skilled and unskilled laborers. This group is engaged on intermittent basis. The Primary Supply Workers are mostly local workers involved in providing services to the project at local level during construction, while Other Stakeholders include civil servants from various government ministries and departments, such as MoWRAM, NCDDS, and MEF are technical support. Ou Ta Paong has the highest number of workers in most categories as it is the largest sub-scheme, given 80 skilled workers and 150 unskilled workers while only 40 skilled and 60 unskilled workers in both Lum Hach and Krang Ponley.

The involvement of local workers and civil servants is a key feature of the labor requirements. Local workers are heavily engaged as unskilled laborers and primary supply workers, emphasizing the project's reliance on local resources and its potential to create employment opportunities in the region. Additionally, civil servants from ministries such as MoWRAM, NCDDS, and MEF play a significant role, particularly during the construction phase, ensuring compliance with safeguards and providing technical and administrative support. The total estimated labor requirement of 735 workers demonstrates the scale and complexity of the CAISAR project, requiring careful coordination among consultants, contractors, government agencies, and local communities to ensure successful implementation.

Table 2.23: The estimated influx labor within the sub-schemes

Type of project workers	Characteristics of project workers	Duration of Labor Requirements	Ou Ta Paong	Lum Hach	Krang Ponley	Total Workers
Direct Workers						
PIU's member MoWRAM & NCDDS	Individual consultants (e.g., E&S Specialists, Design Engineers, Construction Supervision Engineers, etc.	From project preparation till project completion				20
Contracted Worker						
Engaged by PIU						
Detailed Design Consultant	National specialists	From project preparation until project completion	15	10	10	35

Type of project workers	Characteristics of project workers	Duration of Labor Requirements	Ou Ta Paong	Lum Hach	Krang Ponley	Total Workers
Construction Supervision consultant	National specialists		15	5	5	25
Independent E&S Monitoring Consultant		One (1) month in very six (6) months	10	5	5	20
Technical Assistance			15	10	10	35
Engaged by construction contractors						
Skilled workers	National specialists	Durations vary, depending on construction stages & needs.	80	40	40	160
Unskilled workers	Local workers (around subproject location)		150	60	60	270
Primary Supply Workers						
Workers producing materials for core project activities	Mostly local workers	Construction stage	30	15	15	60
Other Stakeholders Working in Connection with Project						
Civil servants of MoWRAM, PDWRAM at provincial & district level	SEO safeguard team	The construction stage of the project.	18	8	8	34
Civil servants of NCDDS	Staff of NCDDS	From project preparation until project completion	15	8	8	31
Civil servants of MEF	Staff of GDR	From project preparation until project completion	10	5	5	20
Civil servants of relevant Ministries	Staff	The construction stage of the project.	15	5	5	25
Total						**735**

PIU = Project Implementation Units, MoWRAM = Ministry of Water Resources and Meteorology, E&S = Environmental and Social, NCDDS = National Committee for sub-National Democratic Development Secretariat, PDWRAM = Provincial Department of Water Resources and Meteorology, SEO = Social and Environmental Officer, MEF = Ministry of Economy and Finance, GDR = General Department of Resettlement.

2.5.2 Power Usage

During the construction, the project requires a reliable and sufficient power supply to support various construction activities including equipment operation, worker facilities, and site management. A significant portion of power consumption will be allocated to heavy machinery and equipment, including concrete mixers, cranes, drilling rigs, welding machines, water

pumps, and earthmoving equipment such as excavators and bulldozers. These machines require high-power supply mainly from the self-propel engine using diesel or gasoline as the fuel whereas the power for lighting and security systems for general visibility on the construction site could be from the power grid as the location is accessible to power grid. Apart from machinery, electricity for worker facilities and site infrastructure can be the power grid or diesel generators. Worker camps will require power for lighting, cooking, air circulation, and mobile charging.

The overall power demand will vary based on the project's phase, the number of workers, and the type of equipment used. However, the estimate of the demand is far from actual since many information is lacking. The engineering team recommended to wait until the DED stage. A hybrid power system using a combination of grid electricity, and diesel generators. Efficient energy management strategies will help optimize power use, reduce costs, and minimize environmental impact.

2.5.3 Supporting Facilities

Several supporting facilities that are required for the construction activities include site offices and administrative facilities, worker accommodation and welfare facilities such as worker camps containing toilets, showers, handwashing stations, and kitchens to ensure proper hygiene and nutrition. A stable power supply is needed for machinery operation, lighting, and worker facilities, sourced from grid electricity, diesel generators, or solar panels can be the options. Additionally, wastewater treatment facilities are need to manage sewage and reduce environmental pollution for the camp sites.

Proper storage and material handling facilities is needed to protect construction materials such as cement, steel, and gravel. Transportation infrastructure and access roads is used to facilitate the movement of materials and personnel, with designated loading and unloading zones to streamline logistics. To ensure safety, security measures such as perimeter fencing, guard posts, and fire safety stations is needed. Furthermore, environmental management facilities such as waste segregation units, drainage systems, and recycling bins are also needed to minimize environmental impact. The specific layout and location of the facilities can only be projected at after obtaining the final design layout plan of the engineering team during the construction stage after the contract award.

2.5.4 Water Consumption

Water is needed for construction activities and domestic uses of workers. Water is essential for various activities, including material preparation, earthworks, equipment operation, worker sanitation, and site maintenance. A significant portion of water use is allocated to concrete and material preparation, where it is needed for mixing concrete, mortar preparation, curing, and soaking bricks or blocks to prevent rapid water absorption. Additionally, earthworks and dust control require water for soil compaction, suppressing dust on unpaved roads, and softening the ground during grading and levelling. Water is also crucial for equipment and machinery operations, including cooling construction machinery, cleaning tools and formworks, and conducting hydraulic testing of pipelines to check for leaks and pressure integrity. In road construction and asphalt work, water is required for wetting base layers before compaction, mixing with bitumen, and cooling asphalt equipment. Estimate the quantity of water for such activities need the figure of the facilities. As per the consultation with the

engineering team, it is not feasible to make an estimate on the water need for such a work since the scope of work including volume of excavated soil, volume of concrete to be used, and so on are not available.

The estimate of water needs for domestic use of the project associated workforce use the 70 liters per day[4] as the basis for the calculation. As the duration of engagement of staff and officials, workers, civil servants over the project life time are varied from one to another. The PMU staff engagement at the field is estimated at 3 days per month over the period of 6 years. The DED Consultant is estimated at 100 days per year for one year, following by construction supervision consultant at 250 days per year for 2.5 year, independent E&S Monitoring Consultant at 25 days per year for 3 years, technical consultant at 50 days per year for 3 years, skilled and unskilled workers at 250 days per year for 2 years, primary supply workers at 50 days per year for 2 years, officials for MOWRAM and PDoWRAM at 50 days per year for 6 years, and other officials at 40 days per year for 6 years. The result of the estimate for water demand is provided below:

Table 2.24: The estimated quantity of water for domestic use of the project

No.	Type of Workers	Total Workers	Number of Days at Field	Total Water Demand (liters/day)	Total Water Demand (m3)
1	PIU member MoWRAM & NCDDS	20	4,320	1,400	6,048
2	Detailed Design Consultant	35	3,500	2,450	8,575
3	Construction Supervision consultant	25	15,625	1,750	27,344
4	Independent E&S Monitoring Consultant	20	1,500	1,400	2,100
5	Technical Assistance	35	5,250	2,450	12,863
6	Skilled workers	160	80,000	11,200	896,000
7	Unskilled workers	270	135,000	18,900	2,551,500
8	Primary Supply Workers	60	7,500	4,200	31,500
9	Civil servants of MoWRAM, PDWRAM	34	10,200	2,380	24,276
10	Civil servants of NCDDS	31	7,440	2,170	16,145
11	Civil servants of MEF	20	4,800	1,400	6,720
12	Civil servants of relevant Ministries	25	6,000	1,750	10,500
	Total				**3,593,570**

PIU = Project Implementation Units, MoWRAM = Ministry of Water Resources and Meteorology, NCDDS = National Committee for sub National Democratic Development Secretariat, E&S = Environmental and Social, PDWRAM = Provincial Department of Water Resources and Meteorology, MEF = Ministry of Economy and Finance.

The estimated water demand is mainly for needed during the construction period, given less than 1% of the estimated water is required for pre-construction stage.

2.5.5 Expected GHG Emission and Discharge

[4] water-quantity.pmd

During construction, the construction activities will generate Greenhouse Gas (GHG) emissions from various activities, primarily due to the use of fossil fuels, electricity consumption, and material production. One of the major contributors to emissions is fuel combustion in heavy machinery and construction equipment, such as excavators, bulldozers, cranes, and trucks. These machines rely mainly on diesel fuel, which releases carbon dioxide (CO_2), methane (CH_4), and nitrous oxide (N_2O) into the atmosphere. Additionally, transportation of materials such as sand, gravel, cement, and steel to the construction site will also contribute to emissions through fuel consumption by trucks and other vehicles.

Another significant source of GHG emissions is the production and use of construction materials, particularly cement, steel, and asphalt. Cement manufacturing is known for high CO_2 emissions due to the chemical process of calcination, while steel production requires significant energy, leading to further emissions. The use of electricity for site operations, including lighting, worker accommodations, water pumping, and equipment, will also add to the overall carbon footprint, depending on the energy mix used. However, the exact amount of GHG emissions can only be determined after the detailed engineering design is completed, which will provide specific information on construction scope, number and size of equipment usage, and material requirements. Future calculations should take into account project-specific data to ensure a more accurate estimation of the environmental impact.

2.5.6 Land Acquisition for Material Storage

To support construction activities, contractors will need to rent land or engage local households to store materials and vehicles. This land will be used for essential contractor facilities, such as temporary storage areas, worker accommodations, and machinery stations. Securing this land is critical for ensuring efficient operational logistics and smooth construction management throughout the project. Ou Ta Paong, being the largest sub-scheme, is estimated to require the highest allocation. Overall, it is projected that a total of 35 households or land units will be needed across the six sub-schemes, including 10 units in Ou Ta Paong and 5 units each in Lum Hach, Brambei Mom, Krapeu Truom, Yutasas, and Stueng Krang Bat.

CHAPTER 3 – PROJECT ALTERNATIVES ANALYSIS

3.1 INTRODUCTION

Chapter 3 analyzes project alternatives, comparing the implications of implementing or not implementing the proposed interventions across various sub-schemes. It contrasts the "without-project" baseline scenario with the anticipated benefits of the "with-project" scenario, including improved irrigation, enhanced water management, and increased agricultural productivity. The chapter also examines design options and their technical, environmental, social, and economic impacts. By focusing on each sub-scheme, it highlights the potential for the project to boost farmer incomes, enhance resilience to climate and market risks, and promote sustainability through better water management and community participation.

3.2 ALTERNATIVE ANALYSIS

3.2.1 Ou Ta Pong

3.2.1.1 Site Selection

The number of hectares of Ou Ta Paong is approximately 14,000 hectares. This command area will be the same regardless of any options being proposed.

3.2.1.2 Project Layout and Design

The design layout of the irrigation system in OTP remains the same as per the project description (please see in table 3.1). However, a number of design options have been finalized and removed from the design options. The (i) Polder improvements (20.1 Km); (ii) “new” secondary canal (8.78 Km), (iii) “new” tertiary canal (19.3 Km); and (iv) “new” quaternary canal (4.2 km) in the previous design of PPTA Team had been agreed to remove to minimize the impacts from land acquisition and resettlement. To supplement the removals, off-take structures will be installed leaving farmers to abstract water as per their internal agreement on the conveyor type to be built within their block command area. The off-take structures that will be installed and locations to install will be identified during the DED.

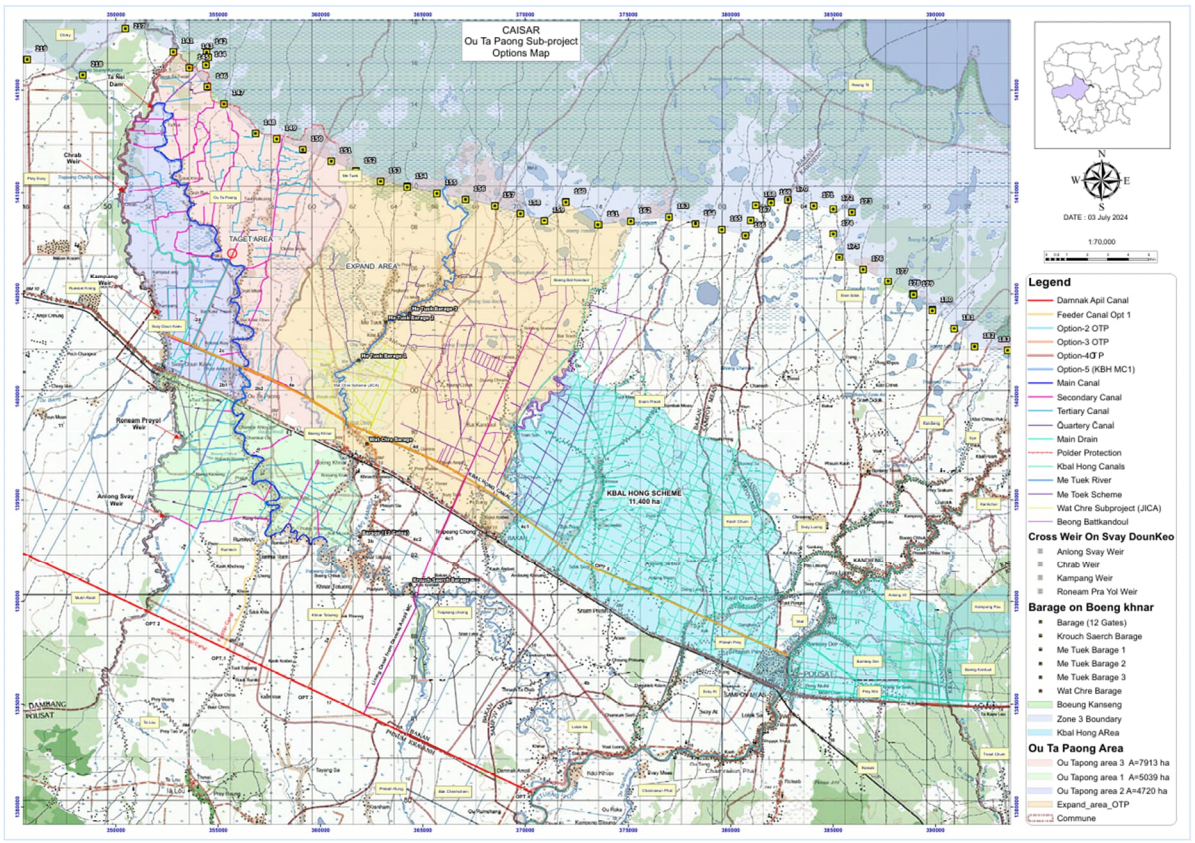
Table 3.1: Irrigation System Design and Options

No	Structures	Design Length (km)	Existing Width (Average) (m)	Expansion (L) (m)	Expansion (R) (m)	Total Width (m)
1	Feeder 1	8.80	16.00	7.00	7.00	**30.00**
2	Feeder 2	6.10	29.10	1.50	1.50	**32.10**
3	Main Canals	37.50	37.10	5.00	5.00	**47.10**
5	Creek Re-shape	27.60	61.00	0.00	0.00	**42.00**
6	Main Drainage	11.70	52.00	Reshape	Reshape	**42.00**
7	Secondary Canals	60.12	16.10	2.50	2.50	**21.10**

L = Left, R = Right.

Feeder Canals. The feasibility study of Ou Ta Paong indicated no other design layout except the construction of the feeder canals to abstract water to feed the irrigation system. All options have its own specific strengths and shortage as describe below:

Option 1: Water is extracted from Pursat River through Damnak Ampil Main canal with a length of 6.5 km extended from the main canal feeding into Ou Ta Paong River. The option is one (1) of the best choices, given its shortest length from the main canal to reach command area. However, expanding only the feeder canal reaching a width that can carry adequate water to the sub-scheme will acquire a huge land area along the canal for canal expansion, and side road.



Option 2: The feeder canal is parallel to Option 1 but it extends further down. Prior to releasing water into Ou Ta Paong River, the canal releases water into Boeng Kanseng, flowing across the block allowing the irrigation to take place at this area. With the extension, the canal is about 12 km in length. Once again, the issue of land acquisition along the canal will be encountered due to the expansion.

Option 3: Similar to Option 1, the feeder canal extends further, allowing the water to flow into Kbal Hong main canal prior to the connection to Ou Ta Paong River at further downstream at the middle part of the catchment, making the total length of the canal at about 14 km from Damnak Ampil to Kbal Hong. This option may cause the water availability at the upper part of the sub-scheme being concerned while water will be fed into another area prior to Ou Ta Paong. The option, therefore, requires the budget for excavation to be around twice as much as Option 1.

Option 4: The option carries water from Wat Loang canal, flowing through the barrage at Damnak Ampil. The option will require the expansion of the canal to ensure that an adequate volume of water can be carried to Ou Ta Paong. The canal length to reach Ou Ta Paong is approximately 30 km. The expansion of the canal would result in huge acquisitions of land areas along the main canal.

Option 5: The option begins at Kbal Hong barrage at Pursat provincial town involving the enhancement of the Watergate height and the distance of carrying water will be approximately like Option 4. However, the increase in the height of the Watergate will cause inundation of the upper area of the Pursat River which may cause flooding in the town. This may bring in huge discontentment of the people in the city as height water level may cause in delay of storm water flow during raining period.

Figure 3.1: Ou Ta Paong Sub-project Options Map

(Source: CAISAR Project, 2024)

Evaluation of Options:

Evaluating the OTP Options is not easy as there are many factors that need to be considered, which makes the matter complex. So, the approach below are proposed for adoption:

- Reduce the number of cross regulators on OTP River
- Focus on improving the existing distribution system
- No new canals (in principle)
- No lining of canals
- No construction of the tertiary canals
- No pump stations, and
- No canals in fill

With the above approach, which aims to maximize water distribution (to support prefered crop patterns) while minimizing investment costs (including potential social and environmental impacts, three options (Option 1, Option 3 and Option 5) were extensively discussed, agreed, and finally selected by MOWRAM and AIIB. The combination of these three options does not only complement each other (minimizing costs related to construction and land acquisition) but also water use efficiency is enahnced through improved water distribution across thre three blocks within the command area.

Polder System. The polder system is expected to play a role as an embankment for protecting flood and invasive species from the Tonle Sap during early raining season. The discussion on the system agreed to remove the system as the operation of the system may face challenges. Firstly, the land areas for the construction are needed since it is the new

system which may cause a lot of land impact. Secondary, managing challenge may lead to delay in draining function during flooding period for the command area while flooding protection function would affect a lot of biodiversity exchange between the command area and zone 3 fauna and flora. Lastly, the meeting with engineering team decided not to include the system within the project design.

Secondary Canals. The construction of new secondary canal is expected to acquire huge land areas of farmers which may result in disruption of household economy. To avoid the negative impact, the construction of the canal was agreed to remove the newly plan secondary canal while off-take structure (culverts) will be used to allow farmers to abstract water from the system as per their block command areas. Farmers who own the land within the block need to discuss and agree whether they are going to build their own water canal or use plot by plot irrigation. The risk as per this option is when farmers could come up with the agreement on the construction of a small canal on their own, they have to continue irrigating their farm through deploying plot-to-plot irrigation or using long range pumping which involve with high cost and limited water use efficiency. Since the design is trying to avoid land acquisition, this will be the option for the system which is also applied to the quaternary and fourth-level canal as well.

River Training. River training methods are designed to regulate and stabilize river flows for various purposes, including irrigation, flood control, and erosion prevention. Below are three common types of river training, along with their respective advantages and disadvantages adopted from online source to provide general overview regarding the design and possible options which should be considered for the actual practices. However, it is up to the DED team to decide as per the consultation with Social Safeguard consultant (Table 3.2).

Table 3.2: River Training Design Options

River Training	**Description**
Embankments (Levees)	Embankments are artificially raised banks made of earth, concrete, or stone along the sides of a river to prevent water from overflowing into adjacent lands.
Advantages:	• **Flood Control:** Protects agricultural lands and infrastructure from river flooding. • **Irrigation Water Regulation:** Helps direct water flow into irrigation channels efficiently. • **Erosion Prevention:** Reduces bank erosion, safeguarding nearby farmlands and structures. • **Cost-Effective:** Generally, less expensive compared to more complex river training structures.
Disadvantages:	• **Sediment Deposition Issues:** Can lead to sediment buildup within the riverbed, raising water levels and increasing flood risks over time. • **Breaching Risk:** If poorly maintained, embankments can break during extreme floods, leading to catastrophic damage.

	• **Ecological Impact:** Alters natural river dynamics, affecting aquatic ecosystems and wetlands.
Spurs (Groynes)	Spurs (also called groynes) are structures extending perpendicularly from the riverbank into the river. They help deflect and slow down water flow to prevent erosion and sediment deposition in key areas.
Advantages:	• **Bank Protection:** Reduces erosion by redirecting strong currents away from vulnerable banks. • **Sediment Control:** Helps accumulate sediments in specific areas, aiding in land reclamation or creating stable riverbanks. • **Improves Water Availability:** Can be strategically placed to direct water flow into irrigation systems.
Disadvantages:	• **Local Scouring:** Can cause deep erosion near the structure, affecting nearby irrigation headworks or riverbanks. • **Periodic Maintenance Required:** Sediment accumulation may require periodic dredging to maintain functionality. • **High Initial Cost:** Construction and material costs can be relatively high compared to natural erosion control measures.
Weirs and Barrages	Weirs are low dams built across a river to regulate water flow, while barrages are adjustable structures with gates that control water levels for irrigation and flood management.
Advantages:	• **Water Level Control:** Maintains steady water levels in irrigation channels, ensuring consistent supply to farmlands. • **Hydropower Potential:** Some barrages can integrate small-scale hydroelectric generation. • **Prevents Saltwater Intrusion:** Useful in coastal areas where tidal effects can introduce salinity into freshwater irrigation systems.
Disadvantages:	• **Disrupts Natural River Flow:** Can impact fish migration and aquatic ecosystems if fish passages are not incorporated. • **Expensive to Build and Maintain:** High initial investment and ongoing maintenance are required for long-term functionality. • **Flooding Risk Upstream:** Can cause water accumulation upstream, leading to potential flooding in extreme weather conditions.

Design Slope. As per the confirmation of the Engineering Team, canal slopes will either be protected or left as earthen slopes based on their condition and the available budget, which will be determined during the detailed design phase. For weak slopes, concrete lining and geosynthetic materials will be recommended for reinforcement. The feasibility of bio-

engineering solutions will be assessed based on the specific site conditions of the project. The following is the comparison between the vegetated and concretized design slope:

Table 3.3: Slope Design Options Comparison

Concretized Canal Slopes	• Erosion Control: Concretized canal slopes provide strong erosion resistance, reducing sedimentation in water bodies downstream. This helps maintain water quality and prevents sediment-related ecological degradation. • Maintenance Needs: Concretized slopes generally require less maintenance compared to vegetated banks. They are easier to inspect and repair, reducing ongoing operational costs. • Habitat Impact: Concretized slopes typically offer limited habitat for aquatic organisms and vegetation compared to natural or vegetated banks. This can reduce biodiversity and ecological resilience in the waterway. • Heat Absorption: Concrete can absorb and retain heat, leading to higher water temperatures in the canal. This can affect aquatic life, especially sensitive species, and alter ecosystem dynamics. • Aesthetics: Concretized slopes may be perceived as less visually appealing compared to natural or vegetated banks. This could impact recreational use and community engagement with the water resource.
Vegetated Banks	• Erosion Control: Vegetated banks provide natural stabilization, reducing erosion by absorbing water, slowing runoff, and binding soil with root systems. They contribute to maintaining soil structure and preventing sedimentation downstream. • Biodiversity: Vegetated banks offer diverse habitats for aquatic and terrestrial species, promoting biodiversity and supporting ecological balance. They can serve as wildlife corridors and provide nesting sites for birds. • Water Quality: Vegetated banks act as buffers, filtering pollutants, and absorbing excess nutrients from runoff. This improves water quality and supports healthier aquatic ecosystems. • Temperature Regulation: Vegetation provides shade, helping to regulate water temperature and mitigate thermal pollution. This is particularly important for species sensitive to temperature fluctuations. • Community Benefits: Vegetated banks enhance the aesthetic value of the waterway, offering green spaces for recreation, relaxation, and cultural activities. They can also contribute to community engagement and ownership of the water resource.

Cross-Regulator/Off-Take Structure. The structure is required for all sub-schemes and specific size, number, and locations need to be assessed during DED stage. The calculation

regarding the design specification need to consider the water requirement in each block of the sub-command areas.

Fish Passes/Sliding Gate. There is practice using fish passage in barrage or headworks across the river where environmental flow is available. The engineering team indicated that the option is not practical at the field level canal because the water flow at the hydraulic structures along the canal system need to be fully closed for some time for farmers to irrigate their system. However, the fish passage may be practical for OTP river and Svay Doun Keo river which needs to be assessed at the DED stage. Two fish passes are provided below:

Table 3.4: Slope Design Option Comparison

Vertical Slot Fish Passway:	• Biodiversity Risks: o Habitat Fragmentation: Vertical slot fish passways can contribute to habitat fragmentation by interrupting the natural flow of rivers. This interruption can create barriers to fish migration, leading to isolated populations and reduced gene flow between different sections of the river. o Species-Specific Challenges: Some fish species may face difficulties navigating through the narrow, vertical slots of the passway. Species with limited jumping abilities or specific habitat preferences may struggle to ascend or descend through the structure, limiting their access to essential spawning or feeding areas. • Environmental Risks: o Sedimentation: Improperly designed vertical slot fish passways can alter flow patterns, leading to increased sedimentation downstream. Changes in flow velocity and direction can cause erosion of riverbanks and streambeds, resulting in sediment accumulation in downstream habitats. Excessive sedimentation can degrade water quality, smother benthic habitats, and reduce oxygen levels, harming aquatic life. o Hydraulic Impacts: Vertical slot fish passways may create hydraulic conditions that are unsuitable for fish passage. High velocities and turbulent flows within the passway can impede fish movement and cause physical stress or injury. Additionally, rapid changes in water level or flow rate can disorient fish and hinder their ability to navigate through the structure.
Cone Fishway	• Biodiversity Risks o Selective Passage: Cone fishways may not provide equal passage opportunities for all fish species. Some species may have difficulty navigating through the structure due to factors such as water depth, flow velocity, or hydraulic complexity. This selective passage can create barriers to migration for certain

	species, leading to reduced genetic exchange and population fragmentation. o Altered Hydrology: Cone fishways can modify natural flow patterns within river systems, potentially altering habitat availability and quality for aquatic organisms. Changes in flow velocity, turbulence, and water depth can influence the distribution and abundance of fish and other aquatic species, impacting ecosystem dynamics and biodiversity. • Environmental Risks o Habitat Modification: Construction of cone fishways may require alterations to river channels and banks to accommodate the structure. Channel dredging, bank stabilization, and other habitat modifications can disrupt natural riverine habitats and alter ecosystem processes. Changes in habitat structure and composition can affect the distribution of aquatic flora and fauna, leading to shifts in community composition and trophic interactions. o Sediment Transport: Cone fishways can affect sediment transport dynamics within river systems, with potential implications for downstream habitats. Changes in flow velocity and turbulence induced by the structure can influence sediment deposition and erosion patterns, altering habitat availability and quality for benthic organisms and other aquatic life.

3.2.1.3 Project Technology

There are different technological options being proposed for the project activities. The key technological options are provided here:

Table 3.5: Irrigation System Options

Options	Component	Options	Description
Pumping	1	Diesel water pump	Traditional water pumping systems powered by diesel engines. These are commonly used in areas where electricity is unavailable but it has higher operational cost and environmental impacts. However, it can be used anywhere in the sub-scheme.
		Solar pumps	Sustainable and cost-effective water pumping systems that harness solar energy, suitable for remote areas with abundant sunlight. They offer lower long-term costs but may require higher initial investment.
		Electric pumps	Powered by electricity from the grid or other sources, these pumps are efficient but depend on the availability of consistent electrical supply which

			maybe inapplicable at farm level in most of the sub-scheme
IPM	1	Pesticide application	A conventional approach involving chemical pesticides to manage pests, often leading to quick results but with potential risks to health, environment, and biodiversity. The times of application without IPM will be up to 6 times as per the reported from the field survey.
		With IPM*	The application of pesticides will be reduced to only around 3 times, minimizing the impacts on the quality and health of water, environment, wildlife, fauna and flora, human and animal
Agromet	1	Without Agromet	Farming practices carried out without the use of weather and climate data, potentially leading to inefficiencies and higher vulnerability to climate risks.
		Agromet	Incorporates meteorological data and forecasts into agricultural decision-making, enhancing productivity, resource optimization, and resilience to climate variability. However, the major challenge is mainly the operational cost of the system.
SCADA**	2	Convention	Manual or semi-automated control systems for monitoring and managing operations, which may be labour-intensive and less efficient in handling complex systems.
		SCADA	Advanced digital systems that provide real-time monitoring, data analysis, and remote-control capabilities for improved efficiency and operational oversight.

*. IPM = Integrated Pest Management

**. SCADA = Supervisory Control and Data Acquisition

For pumping, there is a need to be case specific to each of the option. Applying these technological options are important since the technologies will facilitate the agricultural production and complimenting each other is needed. The promotion of only one (1) option would decrease the effective farming activities. Regarding the IPM, it is quite important to promote the technologies as it will reduce the negative impacts which will be caused by the farming activities. The application of agromet will require technical skill and management capacity

3.2.1.4 Project Scenario Analysis

In the without-project scenario, the net command area in OTB (14,874 ha), will continue to be cultivated with a cropping intensity of 155% (23,055 ha). This includes 14,131 ha of wet-season paddy and 8,924 ha of dry-season paddy. In addition, the land area for vegetable production within the sub-scheme is reported to be approximately 141 ha, approximately 1% of the total command area.[5] The without-project scenario suggests that continuation of

[5] MoP (2023). Commune Database 2023. Ministry of Planning.

ongoing agricultural practices in the project area, with suboptimal yields for rice cultivation and poor crop diversification resulting in low farmer income and high vulnerability to climate risk. With poor rice yield and agricultural productivity, there is the possibility that farmers will alternate their livelihood options to seeking for additional sources of income such as illegal fishing, hunting, and migrating to other areas for income making to feed their families. Without adequate water, their livelihood is highly depending on climate which tends to be highly variated over the past years with series of climate occurrence at a high level of severity and frequency, reported to be approximately occurred every two (2) years both drought and flood and 29% of migration rate. This would be likely to be accelerated when the level of climate impact continues to increase.

In the with-project scenario, it is anticipated that the net command area will be cultivated with greater intensity, increasing from one (1) cropping cycle to two (2) or three (3) cycles per year. This improvement is attributed to enhanced water availability, better water management, higher water transmission efficiency, and improved drainage as a result of the project's investments. The rehabilitation of existing irrigation canals and the construction of new ones will enable an increase in cropping intensity of up to 270%, covering 40,161 hectares. This will yield a net increase of up to 17,106 hectares with reliable irrigation access, including 26,776 hectares of wet-season paddy, 11,899 hectares of dry-season paddy, and 1,488 hectares of high-value crops, such as fruits and leafy vegetables.

The project is expected to deliver the following agricultural outcomes for the 8,130 farming households in the OTP scheme: i) improved yields for wet-season rice, ii) expanded cultivation area and increased yields for dry-season rice, and iii) the introduction of high-value crops like leafy and fruit vegetables for dry-season cultivation. These changes are projected to boost agricultural production, raise farmer incomes, and enhance farmer resilience to drought, pests, diseases, and market risks through crop diversification.

3.2.2 Lum Hach

3.2.2.1 Site Selection

The sub-project area was chosen as the area has the potential in terms of agricultural production while limited water availability for production. The command area is changing as per the available design options due to water availability. The feasibility aims at achieving up to 8,000 ha, if water being adequately stored for irrigation. However, with huge acquisition of land area for construction of water storage, the command area was reduced to approximately 3,900 ha.

3.2.2.2 Project Layout and Design

The Lum Hach Irrigation Scheme is being rehabilitated under the CAISAR project, with the aim of improving agricultural productivity in the area. The project feasibility study has identified two (2) design options for improving agricultural productivity. The first design option involves rehabilitating existing irrigation infrastructure, such as canal improvement, embankment, main and secondary canals, and improving water availability and irrigation management (please see in table 3.6). The project will also work with PDWRAM and MOWRAM to establish, train, and manage FWUCs, which will provide farmers with training specific to their land type,

improving their land management capabilities. Farmers will be encouraged to diversify their cropping patterns and include short term horticultural crops, such as watermelon, on their dry paddies. The benefits of crop rotation in terms of returns and improvements in soil quality have been identified as important, particularly given the poor soil quality in Lum Hach.

The second design option involves constructing impoundments upstream to provide a storage system that will improve water availability both now and in the future under climate change. Although this option comes with additional costs, the benefits and improvement in agricultural productivity are expected to far outweigh the costs. The command area is expected to increase from 8,000 ha to 14,000ha, benefiting a greater number of farmers in the area and enabling them to be more resilient to climatic changes.

With limited hydrological analysis of water availability and the high potential of land acquisition for the construction of water storage at the upstream, option 2 is not feasible, leaving the first option as the option for the construction of the irrigation within the command area. The option reduces the command area to be around 3,900 ha.

Table 3.6: Irrigation System Options in Lum Hach

No.	Structures	Designed Length (km)	Existing Width (Average) m	Expansion (L) m	Expansion (R) m	Total Width (m)
1	Channel Improvements	20.70	80.00	Design of 90 m width (excavation + slopes) with 5 m depth		**90.00**
2	Embankments	7.20	13.10	9.00	9.00	**31.10**
3	Main Canals	48.80	11.30	6.50	6.50	**24.30**

L = Left, R = Right.

Once again, the secondary and tertiary canals were removed from the earlier conceptual design to avoid the impact of land acquisition as the same reasons to that of the OTP system. The system will involve with the construction of the slope for the channel improvement, embankments and main canal rehabilitation. The options for these types of the designs were the same to that of the OTP.

Ponds. Pond is another option being included in the sub-theme. Type and options in the construction of the pond have not been decided. There are a number of options for pond construction can be considered. A few of them are provided here:

Table 3.7: Options for pond construction

Design	Description	Description	
Large-Scale Reservoir	- Reinforced embankments (compacted soil with grass cover for erosion control). - Inlet channel from main water sources (river, reservoir, or rain-fed catchment).	Advantages	- Ensures continuous irrigation supply during dry seasons. - Connected to large irrigation networks, benefiting multiple farming areas. - Gravity-fed system, reducing reliance on pumps. - Flood mitigation, preventing downstream overflows.

	- Outlet structure (sluice gate) to regulate water flow into secondary irrigation canals. - Sediment trap at the inlet to reduce siltation. - Safety spillway for overflow management.	Disadvantages	- High construction cost due to excavation and embankment reinforcement. - Requires significant land area, possibly affecting resettlement. - Siltation risk, requiring regular dredging. - Complex management, requiring government oversight and water governance policies.
Mid-Sized Regulating Pond (Distribution & Buffer Storage)	- Lined embankments (clay or compacted soil) to prevent erosion. - Connected to primary storage reservoirs via secondary irrigation canals. - Water regulation structures (gated outlets to control water release). - Canal branching system directing water towards drip or furrow irrigation fields. - Low-cost pump station (solar or diesel backup) if needed for controlled release.	Advantages	- Balances water supply between large reservoirs and farm irrigation plots. - Reduces water losses by controlling distribution. - Lower land requirement compared to primary reservoirs. - Supports modern irrigation techniques (drip, furrow, and sprinkler systems).
		Disadvantages	- Limited storage capacity, requiring consistent water flow from upstream. - Medium construction cost, higher than earthen ponds but cheaper than reservoirs. - Pump dependency in low-lying areas, increasing operational costs. - Moderate maintenance needs, including sediment removal and embankment repair.
Farm-Level Irrigation Pond	- Compact clay or HDPE lining to reduce seepage. - Water inlet from tertiary irrigation canals for refilling. - Overflow drainage system to prevent waterlogging. - Drip or furrow irrigation system connected to the pond. - Possible integration with fish farming for dual-purpose use.	Advantages	- Reduces dependence on seasonal irrigation, allowing flexible water use. - Prevents water shortages, storing backup supply during dry spells. - Cost-effective, as smaller-scale ponds require less excavation. - Supports climate resilience, reducing drought risks for farmers.
		Disadvantages	- Limited storage, requiring regular refilling from main irrigation canals. - High evaporation loss, especially in hot climates. - Land use challenges, as space is required for pond construction. - Regular maintenance needed, including lining repairs and sediment removal.

Impacts on Natural Habitats. In addition to the stated option above, one existing main canal traverses the Toul Samroang community forestry as the improvement of the canal would impact on biodiversity of the area. The total protected land area that will be acquired was estimated at 36,182 m^2, giving the length of the main canal across the protected area at 1.49 km and the width the canal at 24.3 meters. The construction of the canal cannot be avoided as there is no suitable location that can be used to construct the canal in alternate to this one.

3.2.2.3 Project Technology

Similar to Ou Ta Paong, the project will involve different technology options for irrigating and cultivating. All pumping technologies and sustainable agricultural practices are important to the command area. However, the application of SCADA would be inapplicable since the construction of ponds would not be connected.

3.2.2.4 Project Scenario Analysis

In the without-project scenario, the net command area of 3,900 ha will continue to be cultivated with a cropping intensity of 100% (3,900 ha). This includes 1,950 ha of late wet-season paddy, 1,560 ha of medium wet season paddy and 390 ha of early wet season paddy. According to the commune database, the sub-scheme contains approximately 156 ha of vegetable production, given the land area for horticulture of 4%. Farmers will continue to produce crop production with limited sources of water, which is high risk of failure, even during wet season.

In the with-project scenario, although the net command area will remain unchanged, improvements in water availability, management, transmission efficiency, and drainage will increase cropping intensity to 110% (covering 4,290 hectares). This includes 1,170 hectares of late wet-season paddy, 1,560 hectares of medium wet-season paddy, 1,170 hectares of early wet-season paddy, and 390 hectares allocated to high-value crops such as fruits and vegetables.

The project is expected to deliver the following agricultural benefits for the 7,958 farming households in the LH scheme: i) improved yields for wet-season rice, ii) expanded cultivation area and higher yields for dry-season rice, and iii) the introduction of high-value crops like leafy vegetables and fruit vegetables for dry-season cultivation. These changes are expected to increase agricultural productivity, boost farmer incomes, and enhance farmer resilience to drought, pests, diseases, and market risks through crop diversification.

In contrast, the without-project scenario would see the continuation of existing agricultural practices, leading to suboptimal rice yields, limited crop diversification, lower farmer incomes, and heightened vulnerability to climate risks.

3.2.3 Stung Krang Ponley

3.2.3.1 Site Selection

The Krang Ponley sub-project is located within the Krang Ponley catchment, made of four (4) sub-areas: Brambei Mom, Krapeu Troum, Yutasas and Krang Bat covering a total area of 3,277 hectares.

3.2.3.2 Project Layout and Design

Rehabilitation and enhancement of the existing irrigation system is the main design option under the project opting out from the feasibility design stage as huge land area acquisition found to be critical and generate high social impacts on community people (please see in table 3.8).

Table 3.8: Irrigation System Options in Stung Krang Ponley

No.	Structures	Designed Length (km)	Existing Width (Average) m	Expansion (L) m	Expansion (R) m	Total Width (m)
Brambei Mom						

1	Main Canals	6.3	51.5	0	0	51.50
Krapeu Troum						
1	Main Canal 1	2.82	30	0	0	30.00
2	Main Canal 2	6.8	30	0	0	30.00
3	Drainage Canal	6.8	5	1	1	7.00
4	Carrying Roads (MC2)	6.8	Only one (1) section of 1.5 Km canal's embankment requires expansion to be the rural road. The section of 5.3 km is already large enough to be the rural road.		1.5	
Yutasas						
1	Embankment	1	18.4	1.6	0.8	20.80
2	Main canal	6.6	21.3	2.2	1.1	24.60
3	Main Drain	7.4	59	0	0	59.00
4	Secondary Drain	2.2	21.3	0	0	21.30
Stung Krang Bat						
1	Feeder Canal	5.12	30	2.5	2.5	35.00
2	Folder	2.22	18.5	0	0	18.50
3	Main canal1	2	51.1	0	0	51.10
4	Main canal2	10.3	35	0	0	35.00
5	Main Drain	40.2	40	0	0	40.00
6	Secondary Drain	7.7	22	0	0	22.00

L = Left, R = Right, MC2 = Main Canal 2

Once again, the secondary and tertiary canals were removed from the earlier conceptual design to avoid the impact of land acquisition as the same reasons to that of the OTP system. The system will involve with the construction of the slope for the channel improvement, embankments and main canal rehabilitation. The options for these types of the designs were the same to that of the OTP. The application is also the same for the case of pond design.

3.2.3.3 Project Technology

The feasibility study has assessed the climate vulnerabilities of the Command Areas and their communities to design suitable, sustainable, and climate-resilient irrigation systems. The scheme will make use of nature-based, adaptive, and data-driven technologies to ensure its resilience to extreme floods and climate change. Smart SCADA technology will be installed to monitor the system for leaks and flood damages, while drainage systems will also be installed to reduce waterlogging, flood impacts, and crop failures.

Solar pumping will be employed in place of costly and high-carbon diesel alternatives to create a self-sustaining system. The lining of canals is an important feature of the system's climate resilience, and a range of investment options exist depending on the extent of lining in the new network. Concrete will be used for certain sections to reduce the carbon footprint.

3.2.3.4 Project Scenario Analysis

3.2.3.4.1 Brambei Mom

In the without-project scenario, the net command area of 1,000 ha will continue to be cultivated with a cropping intensity of 100% (1,000 ha). This includes 200 ha of late wet-season

paddy and 800 ha of medium wet season paddy. There are also proportion of vegetable production approximately 40 ha[6] continue to grow with limited water sources.

In the with-project scenario, while the net command area will remain unchanged, improvements in water availability, management, transmission efficiency, and drainage will result in a cropping intensity increase to 130% (covering 1,300 hectares). This will include 100 hectares of late wet-season paddy, 400 hectares of medium wet-season paddy, 500 hectares of early wet-season paddy, and 300 hectares dedicated to high-value crops, such as fruits and vegetables.

The project is expected to achieve the following agricultural outcomes for the 1,914 farming households in the Brambei Mom scheme: i) higher yields for wet-season rice cultivation, ii) expanded cultivation area and higher yields for dry-season rice, and iii) the introduction of high-value crops like leafy vegetables and fruit vegetables for dry-season farming. These improvements are projected to increase agricultural productivity, raise farmer incomes, and enhance farmer resilience to drought, pests, diseases, and market risks through crop diversification.

In contrast, the without-project scenario would maintain the current agricultural practices, leading to suboptimal rice yields, limited crop diversification, lower farmer incomes, and higher vulnerability to climate risks.

The proposed Brambei Mom scheme will install secondary and tertiary irrigation canals along with associated infrastructure in the existing Brambei Mom irrigation system, thereby improving dry-season water availability for 1,000 hectares of nearby farmland. Additionally, the project will establish and train Farmer Water User Communities (FWUCs) to operate and maintain the irrigation infrastructure, ensuring its long-term sustainability. Agricultural extension services will also be provided to local farmers, focusing on improved agricultural techniques, value chain optimization, the use of improved seed varieties, cover crop application, and the optimal use of fertilizers and pesticides.

3.2.3.4.2 Krapeau Truom

Without-project scenario, the net command area of 690 has will continue to be cultivated with a crop intensity of 100% whereas the 15% of command area (73 ha) will continue to produce vegetables with limited water sources, facing the risk of crop failure even during rainy season.

In the with-project scenario, although the net command area will remain unchanged, improvements in water availability, management, transmission efficiency, and drainage will increase cropping intensity to 115% (covering 793 hectares). This will consist of 69 hectares of late wet-season paddy, 276 hectares of medium wet-season paddy, 345 hectares of early wet-season paddy, and 103 hectares of high-value crops, including fruits and vegetables.

The project is expected to bring the following agricultural benefits for the 2,430 farming households in the Kropeau Truom scheme: i) improved yields for wet-season rice, ii) expanded cultivation area and higher yields for dry-season rice, and iii) the introduction of high-value crops like leafy vegetables and fruit vegetables for dry-season cultivation. These changes are

[6] MoP (2023). Commune Database 2023. Ministry of Planning.

expected to increase agricultural productivity, raise farmer incomes, and enhance farmer resilience to drought, pests, diseases, and market risks through crop diversification.

In contrast, the without-project scenario would maintain current agricultural practices, resulting in suboptimal rice yields, poor crop diversification, lower farmer incomes, and heightened vulnerability to climate risks.

The proposed Kropeau Truom sub-scheme aims to rehabilitate the existing canals only, enhancing dry-season water availability for 690 hectares of nearby farmland. Additionally, the project will establish and train Farmer Water User Communities (FWUCs) to manage and maintain the irrigation infrastructure, ensuring long-term sustainability. Further agricultural extension services will be provided to local farmers, focusing on improved agricultural techniques, value chain optimization, the use of improved seed varieties, cover crop application, and optimal fertilizer and pesticide use.

3.2.3.4.3 Yutasas

In the without-project scenario, the net command area of 593 ha will continue to be cultivated with a cropping intensity of 100% (593 ha). This includes 119 ha of late wet-season paddy and 474 ha of medium wet season paddy. This is the same to the land area of 1% (6 ha) continue to grow vegetable with the risk of crop failure due to limited water sources.

In the with-project scenario, while the net command area will remain unchanged, improvements in water availability, water management, transmission efficiency, and drainage will increase cropping intensity to 117% (covering 693 hectares). This will include 59 hectares of late wet-season paddy, 237 hectares of medium wet-season paddy, 297 hectares of early wet-season paddy, and 100 hectares dedicated to high-value crops such as fruits and vegetables.

The proposed Yutasas scheme aims to install secondary and tertiary irrigation canals along with related infrastructure within the existing scheme, enhancing water availability during the dry season for 593 hectares of nearby agricultural fields. The project will also establish and train Farmer Water User Communities (FWUCs) to manage and maintain the irrigation infrastructure, ensuring its long-term sustainability. Additional agricultural extension services will be offered to local farmers, focusing on improved agricultural practices and value chain development, the use of improved seed varieties, cover crop application, and optimal fertilizer and pesticide use.

The project is expected to deliver the following agricultural benefits for the 1,339 targeted farming households: i) higher yields for wet-season rice, ii) expanded cultivated areas and increased yields for dry-season rice, and iii) the introduction of high-value crops like leafy and fruit vegetables for dry-season farming. These improvements are projected to enhance agricultural productivity, increase farmer incomes, and boost farmer resilience against drought, pests, diseases, and market risks through crop diversification.

In the without-project scenario, ongoing agricultural practices would persist, leading to suboptimal rice yields, limited crop diversification, low farmer incomes, and increased vulnerability to climate risks.

3.2.3.4.4 Steung Krang Bat

In the without-project scenario, the net command area of 994 ha will continue to be cultivated with a cropping intensity of 100% (994 ha). This includes 199 ha of late wet-season paddy and 795 ha of medium wet season paddy. As it is reported that 10% of the land area within this location are using for growing vegetable, the 9 ha of vegetable production will also continue to grow with the water sources.

In the with-project scenario, although the net command area will remain the same, improvements in water availability, management, transmission efficiency, and drainage will result in a cropping intensity increase to 124% (covering 1,235 hectares). This will include 99 hectares of late wet-season paddy, 389 hectares of medium wet-season paddy, 497 hectares of early wet-season paddy, and 250 hectares of high-value crops, such as fruits and vegetables.

The proposed Stoeung Krang Bat scheme seeks to install secondary and tertiary irrigation canals and related structures in the existing Stoeung Krang Bat irrigation system, improving water availability during the dry season for 994 hectares of nearby agricultural fields. The project will also establish and train Farmer Water User Communities (FWUCs) to manage and maintain the irrigation infrastructure, ensuring its long-term sustainability. Additional agricultural extension services will be provided to farmers in the area, focusing on enhanced agricultural practices, value chain development, the use of improved seed varieties, cover crop application, and optimal fertilizer and pesticide use.

The project is expected to bring the following agricultural benefits to the 1,020 farming households targeted in the Stoeung Krang Bat scheme: i) increased yields for wet-season rice, ii) expanded cultivated areas and higher yields for dry-season rice, and iii) the introduction of high-value crops, such as leafy and fruit vegetables, for dry-season cultivation. These improvements are anticipated to boost agricultural productivity, raise farmer incomes, and strengthen resilience to drought, pests, diseases, and market risks through crop diversification.

However, the sub-scheme is located closest proximity to Phnom Penh. The land value was very high ranging from USD 100,000 to USD 250,000 per hectare and highly potential to be converted into residential area. If the area is converted, the residential area is not suitable for agriculture production anymore and the benefit from the investment would be turned into nothing.

CHAPTER 4 – LEGAL AND POLICY FRAMEWORK

4.1 INTRODUCTION

This chapter reviews environmental and social legal and policy frameworks that apply to the CAISAR project. Since CAISAR implementation is financed by the AIIB, IFAD, GEF, and the Royal Government of Cambodia (RGC), policies and stardards that are relevant to CAIRSAR are reviewed and key policy objectives and requirements are reviewed. Where policy gaps are identified, measures are proposed to address such policy gaps – in a manner that are in harmony with the policy objectives of the AIIB, IFAD, GEF, and the Royal Government of Cambodia and for improved regulatory alignment.

4.2 RELEVANT LAW AND REGULATIONS OF THE ROYAL GOVERNMENT OF CAMBODIA

Following a framework for effective project development as well as environmental sustainability, MOWRAM shall observe the national legal framework and protocols ratified by the Kingdom of Cambodia. For CAISAR Project, the following laws, regulations and guidelines are relevant:

4.2.1 The Constitution of the Kingdom of Cambodia (1993)

The Constitution is the highest legal authority in Cambodia and establishes the fundamental rights and duties of citizens and the state. It sets the groundwork for environmental protection, governance, social inclusion, and public well-being, ensuring that environmental and social rights are integrated into national laws.

4.2.2 Legal Framework on the Management and Conservation of Natural Resources and Biodiversity

This framework aims to ensure sustainable use and conservation of Cambodia's natural resources, including water, land, biodiversity, and ecosystems. Laws under this framework help guide ESCIA processes to minimize environmental degradation.

- **Royal Decree on Protected Areas (2008)** sets the standard for managing Cambodia's protected areas. It categorizes these areas into **National Parks**, **Wildlife Sanctuaries**, **Protected Landscapes**, and **Multiple-Use Areas** to conserve biodiversity, ecosystems, and cultural heritage while supporting sustainable development.

- **Law on Environmental Protection and Natural Resource Management (1996)**: Establishes principles for sustainable development and environmental protection, requiring environmental assessments for projects impacting natural resources.
- **Environmental and Natural Resources Code 2023**: Provides a comprehensive approach to natural resource governance, setting standards for the sustainable management of resources.
- **Law on Land Management, Urban Planning and Construction (1994)**: Governs land use, urban development, and construction to ensure that environmental and social impacts are mitigated.
- **Law on Water Resource Management (2007)**: Regulates water usage, conservation, and management, ensuring that development projects do not negatively impact water resources.
- **Law on Fisheries (2006)**: Focuses on sustainable fisheries management and biodiversity conservation in aquatic ecosystems, crucial for ESCIA in projects affecting water bodies.
- **Protected Areas Law (2008)**: Establishes protected areas to conserve biodiversity and natural resources, ensuring that development projects respect these protected regions.
- **Land Law (2001)**: Regulates land ownership and management to promote sustainable land use practices.
- **Forest Law (1994):** Regulating the management, use, protection, and restoration of Cambodia's forests, this law is crucial for balancing economic development with environmental conservation, particularly in biodiversity-rich ecosystems.
- **Biodiversity Law (2009):** This foundational law provides a comprehensive legal structure for the sustainable management of biodiversity resources. It addresses habitat protection, species conservation, genetic resource management, and the sustainable use of biodiversity, outlining the government's responsibilities and promoting public participation.
- **Sub-Decree on Water Pollution Control (1999)**: Sets standards for water quality and pollution control in development projects.
- **Sub-Decree on Water Quality Standard for Public Waters for the Purpose of Biodiversity Conservation (1999):** These standards aim to maintain conditions suitable for aquatic ecosystems by limiting pollutants, ensuring water remains safe for the survival and reproduction of aquatic life, and preventing ecological degradation.
- **Sub-Decree on Environmental Impact Assessment (1999)**: Requires EIA for development projects, ensuring environmental impacts are assessed and mitigated.
- **Sub-Decree on Air Pollution Control and Sound Disturbance (2000)**: Provides standards to control air pollution and noise disturbances from development projects.

- **Sub-Decree on Solid Waste Management (1999)**: Governs solid waste management in projects, preventing environmental harm from improper waste disposal.
- **Prakas on Environmental Impact Assessment Reports (1999)**: Offers guidelines for preparing EIA reports to ensure thorough assessment of environmental impacts.
- **Prakas on Hazardous Substances (2015)**: Sets limits on the disposal of toxic substances, preventing environmental contamination from hazardous materials.
- **Biodiversity Convention (1994)**: Focuses on conserving ecosystems, species, and genetic diversity. Promotes sustainable use of resources, establishment of protected areas, and fair benefit-sharing from genetic resources.
- **Nagoya Protocol (2010):** As a party to the Nagoya Protocol under the Convention on Biological Diversity (CBD), Cambodia commits to the fair and equitable sharing of benefits arising from the utilization of genetic resources. This protocol supports Cambodia's efforts to protect its biodiversity while ensuring that the benefits of its genetic resources are shared with local communities and stakeholders.
- **Ramsar Convention (1999)**: Aims to conserve wetlands of international importance for biodiversity, water management, and climate resilience. Encourages sustainable use and designation of Ramsar sites.
- **UNFCCC (1994)**: Provides a framework to combat climate change impacts on ecosystems. Supports sustainable land use, forest conservation, and integration of climate adaptation into conservation strategies.
- **Kyoto Protocol (1997, entered into force 2005, Cambodia accessed 2002)**: Strengthens the UNFCCC by setting legally binding targets for reducing greenhouse gas emissions, promoting sustainable development and renewable energy.
- **Vienna Convention for the Protection of the Ozone Layer (1988, Cambodia accessed 2001)**: Aims to protect the ozone layer through global cooperation, encouraging research, monitoring, and measures to phase out harmful substances.
- **Montreal Protocol on Substances that Deplete the Ozone Layer (1987, entered into force 1989, Cambodia accessed 2001)**: A legally binding treaty to phase out ozone-depleting substances. Contributes to environmental and climate protection.
- **Basel Convention (1992, Cambodia accessed 2001)**: Controls the transboundary movement of hazardous wastes and their disposal, emphasizing waste reduction and environmentally sound management.
- **United Nations Convention to Combat Desertification (1996, Cambodia ratified 1997)**: Addresses land degradation and desertification through sustainable land management, conservation of soil and water resources, and restoration of degraded land.
- **CITES (1975, Cambodia ratified 1997)**: Regulates trade in endangered species to ensure their survival, focusing on sustainable management and combatting illegal wildlife trade.

- **UNESCO Network of Biosphere Reserves (Cambodia joined in 1997)**: Promotes the sustainable management of biodiversity, ecosystems, and cultural heritage through conservation and sustainable development practices.
- **Millennium Development Goals (MDGs) and Sustainable Development Goals (SDGs)**: Cambodia committed to global goals for environmental sustainability, including biodiversity conservation, climate action, and ecosystem protection.
- **ASEAN Agreement on Transboundary Haze Pollution (2006)**: Focuses on preventing and mitigating air pollution caused by forest fires through regional cooperation and sustainable forest management.
- **ASEAN Agreement on Disaster Management and Emergency Response (2009)**: Strengthens disaster preparedness, risk reduction, and environmental resilience in the ASEAN region.
- **Mekong Agreement (1995)**: Promotes sustainable development, equitable water use, and conservation of the Mekong River Basin's ecosystems and resources.

4.2.3 Legal Framework on Labour, Public Well-Being, and Safety

This framework emphasizes the protection of workers' rights, public safety, and well-being in project development. It ensures that development projects comply with labor laws and safety standards.

- **Labor Law (1997)**: Protects workers' rights, ensuring safe and fair working conditions during project implementation.
- **Law on Roads (2014)**: Governs the construction and maintenance of roads, with provisions for minimizing environmental and social impacts.
- **Law on Road Traffic (2014)**: Addresses traffic management and safety measures to prevent accidents and disruptions during development.
- **Law on Suppression of Human Trafficking and Sexual Exploitation (2008)**: Protects vulnerable populations during project implementation from exploitation and trafficking.
- Government Occupational and Community Safety and Health (OHS) guidelines follow the OHS Program for Cambodia (2010-2013) developed by the International Labor Organization (ILO). The draft guidelines provide the framework for instituting OHS at the workplace and in the community.
- The Ministry of Labor and Vocational Training (MLVT) has the following guidelines which will be implemented during the construction phase of the Project:
    - MLVT Prakas on Sanitation at the Construction Site (March 2011). The Prakas sets to ensure that the sanitation and safety conditions are fulfilled for workers at construction sites by owners, directors, contractors or subcontractors of construction establishments or construction companies. Articles 3 and 4 ensure that workers are provided with shelter, sanitation facilities and safe potable water for drinking and washing.

- MLVT Prakas on The Protection of Risk Resulting from Climate Change at Construction Sites (March 2011). Articles of this Prakas require safety measures and break times for workers at the construction site during extreme weather events.
- MLVT Prakas on Providing of Information at the Construction Site (March 2011). This Prakas states requirements for owners or responsible persons of a construction site to provide information, i.e. name and address of the owner of enterprise, construction establishment, Construction Company, name and address of architect, nature of construction, date for the start of the construction, estimated time to finish the construction works, and estimated number of workers to be employed for construction activities.
- MLVT Prakas on Stock of Materials, Waste Disposal and Clearance at Construction Site (March 2011). This Prakas provides safety guidelines and requirements for the safe storage of construction of materials and waste.

4.2.4 Legal Framework on Governance and Social Inclusion

This framework ensures that development projects promote inclusive governance, respect cultural heritage, and safeguard social rights. It includes provisions for tax obligations, land acquisition, resettlement, and social protection schemes.

- **Law on Taxation (1997)**: Governs the taxation of development projects, ensuring they contribute to national revenue and economic sustainability.
- **Sub-Decree on Construction Permit (1993)**: Requires permits for construction activities, ensuring they comply with environmental standards and social safeguards.
- **Law on Protection of the Rights of Persons with Disabilities (2009)**: Ensures that development projects consider the needs and rights of persons with disabilities.
- **Law on Social Security Schemes (2002)**: Provides social protection for workers, ensuring their well-being during project execution.
- **Sub-Decree on Health Care Scheme (2016)**: Extends social security and health care protection to workers involved in development projects.
- **Law on the Protection of Cultural Heritage (1996)**: Safeguards cultural heritage sites, ensuring that development projects do not damage or destroy culturally significant areas.
- **Expropriation Law (2010)**: Regulates land acquisition for public purposes, ensuring fair compensation and minimizing the impact on affected populations.
- **Sub-Decree on Land Acquisition and Resettlement (2018)**: Provides procedures for land acquisition and involuntary resettlement, particularly for externally financed projects.
- **Sub-Decree on Social Land Concession (2003)**: Allows for the allocation of state land to landless citizens, particularly when development projects displace communities.

- **Sub-Decree on State Land Management (2005)**: Regulates the management of state land, ensuring its sustainable use in development.
- **Sub-Decree on River Basin Management (2015)**: Promotes sustainable management of river basins, ensuring that development projects do not harm water systems and dependent ecosystems.

4.2.5 EIA Classification

In order to provide guidelines on effective implementation of sub-decree No 72 ANRK.BK on environmental impact assessment Procedures for development projects, MoE promulgated sub-decree No. 21 on Environmental Impact Assessment Classification for Development Projects.

According to this sub-decree, environmental impact assessment for projects is classified into three categories.

- Appendix 1: Projects requiring full environmental impact assessment (full ESIA)
- Appendix 2: Projects that require initial environmental impact assessment (IEIA)
- Appendix 3: Projects requiring the Contract on Environmental Protection (EPC)

The sub-decree includes an annex listing projects under various sectors and their categorization on the basis of their nature, type and size. The sector and EIA classification for irrigation project is summarized in Table 4.1 below.

Table 4.1: ESIA Classification for Development Projects relevant

No	Project Type	ESIA (Equiv. to ADB's A)	ESIA (Equiv. to ADB's B)	Env. Protection Contract	Apply to CAISAR Project
1	Irrigation systems		≥5000ha	1000-5000ha	√
2	Water diversion systems		≥5000ha	1000-5000ha	√
3	All building construction	>45000m2	15000 – 45000m2	3000-15000m2	
4	Road construction (new)	>100km	≥ 30 – 100km	10-<30km	√
5	Railroad and road expansion	>100km	≥50 – 100km	10-<50km	√
6	Road in protected areas	>30km	≥ 10-30 Km	10km	
7	Road widens or rehabilitation in protected area	>50km	≥ 10-50 km	10km	

Source: Prakas No. 021 PRK.BST dated 03 February 2020.

4.2.6 Applicable Ambient Quality Standards

4.2.6.1 Water quality standards for public health protection

Water quality standards in public water areas for biodiversity conservation are shown in Table 4.2 below. These are applied as the national standards on surface water quality.

Table 4.2: Water quality standards in public water areas for bio-diversity conservation

No	Parameter	Unit	Surface water Standard	
			River	Lake etc
1	pH	mg/l	6.5-8.5	6.5-8.5
2	Total suspended solids (TSS)	mg/l	25-100	1-15
3	Dissolved oxygen (DO)	mg/l	7.5-2.0	7.5-2.0
4	Biochemical oxygen demand (BOD5)	mg/l	1-10	<30
5	Chemical oxygen demand (COD)	mg/l	<50	1-8
6	Total Nitrate (TN)	mg/l	0.1-0.6	0.1-0.6
7	Total phosphorous (TP)	mg/l	0.005-0.05	0.005-0.05
8	Arsenic (As)	mg/l	<0.01	<0.01
9	Iron (Fe)	mg/l	<1	<1
10	Total Coliform	MPN/100ml	<5,000	<1,000

Note: Standard* = Surface water quality standards for lake, reservoirs and river of the MoE's Prakas on the adoption of terms of references for infrastructure and tourism sectors (2018).

The Royal Government of Cambodia has established a comprehensive policy on National Water Supply and Sanitation for both urban and rural water supplies. Based on this policy, and to ensure access to safe drinking water to all people, quality standards for both drinking water and groundwater are developed by an inter-ministerial process initiated by the Ministry of Industry, the Mines and Energy, and other concerned ministries with support from the World Health Organization (please see in table 4.3).

Table 4.3: Groundwater and Drinking Water Quality Standards.

No.	Parameters	Unit	Standard		
			River	Lake and reservoir	CDWQS*
1	Depth				
2	pH	-	6.5-8.5	6.5-8.5	6.5-8.8
3	Electrode Conductivity (EC)	mg/l	500-1500	500-1500	-
4	Arsenic (AS)	mg/l	<0.01	<0.01	0.05
5	Cadmium (Cd)	mg/l	<0.003	<0.003	<0.003
6	Lead (Pb)	mg/l	<0.01	<0.01	0.01
7	Total Nitrogen (TN)	mg/l	<3	<2	-
8	Total Phosphorus (TP)	mg/l	<0.25	<0.15	-
9	Total Dissolved Solid (TDS)	mg/l	<1000	<1000	<800
10	Total Suspended Solid (TSS)	mg/l	<100	<100	-
11	Dissolved Oxygen (DO)	mg/l	>3	>4	-
12	Total Coliform	MPN/100ml	<1000	<1000	0

*. Cambodia Drinking Water Quality Standard

Ambient Air Quality Standards are presented in Table 4.4. Maximum permitted noise levels in public and residential areas are shown in Table 4.5.

Table 4.4: Ambient Air Quality Standards.

Parameters	Cambodia				WHO Air Quality Guideline 2021
	Period 1h Average mg/m³	**Period 8h Average mg/m³**	**Period 24h Average mg/m³**	**Period 1year Average mg/m³**	
Carbon monoxide (CO)	40	20	-	-	4mg/m³ (24h Average)
Nitrogen dioxide (NO2)	0.3	-	0.1	-	10 ug/m³(1 year average) 25 ug/ m³ (24h average)
Sulfur dioxide (SO2)	0.5	-	0.3	0.1	40 ug/ m³ (24 h average)
Ozone (O3)	0.2	-	-	-	100 ug/ m³ (8h average)
Lead (Pb)	-	-	0.005	-	-
Particulates	-	-	0.33	0.1	5 ug/m³ (PM2.5, 1year) 15 ug/m³ (PM2.5, 24h average)

Note: 1. Sub-decree N0 42 ANRK.BK on Air Pollution Control and Noise Disturbance. Source: https://www.who.int/news-room/feature-stories/detail/what-are-the-who-air-quality-guidelines.

Table 4.5: Maximum permitted noise levels in public and residential areas (dB (A))

Location	Cambodia Standard			IFC-EHS Guideline	
	06:00 to 18:00	**18:00 to 22:00**	**22 to 6:00**	**Day 7:00 to 22:00**	**22:00 to 7:00**
Silence Area Hospital; Library, School, Nursery	45	40	35	55	45
Resident Area Hotel; Administration place, House	60	50	45	-	-
Commercial, Services Areas and mix	70	65	50	70	70
Small Industrial factories intermingling in residential areas	75	70	50		

Note: This is permitted noise level of any source of activity at the public and residential areas. Source: Sub-Decree on Air Pollution Control and Noise Disturbance, 2000.

4.3 AIIB'S ENVIRONMENTAL AND SOCIAL FRAMEWORK (ESF)

The Environmental and Social Framework (ESF) of the AIIB outlines the principles and standards to ensure environmentally and socially sustainable development practices for projects it finances. The framework consists of several Environmental and Social Standards (ESS) that provide comprehensive guidance on managing potential impacts and risks associated with AIIB-financed projects. The following AIIB's Environmental and Social Framework (ESF) apply to CAISAR.

- **Environmental and Social Standard 1: Environmental and Social Assessment and Management**: This ESS guides the assessment and management of environmental and social risks, requiring projects to evaluate alternatives, mitigate impacts, and disclose information. It emphasizes protecting the natural environment, particularly biodiversity and critical habitats, while addressing pollution, resource efficiency, and climate change. Social risks, including impacts on vulnerable groups, gender, and access to resources, must be considered. The standard also covers labor conditions, community health and safety, child labor, and security, ensuring proper grievance mechanisms, monitoring, and implementation plans.
- **Environmental and Social Standard 2: Land Acquisition and Involuntary Resettlement.** The ESS provides guidance to avoid Involuntary Resettlement where possible. The requirements under the standard contain 18 points of action to which the executing agency needs to follow.
- **Environmental and Social Standard 3: Indigenous Peoples.** The ESS aims to design and carry out projects in a way that fully respects Indigenous Peoples' identity, dignity, human rights, economies, and cultures. This ensures that Indigenous Peoples: (a) receive social and economic benefits that are culturally appropriate; (b) do not experience negative impacts from the projects; and (c) can actively participate in projects that affect them. The standard contains 15 points to follow.

4.4 IFADs' SECAP

The International Fund for Agricultural Development's (IFAD) Social, Environmental, and Climate Assessment Procedures (SECAP) provide a framework to ensure that IFAD-financed projects are sustainable, socially inclusive, and environmentally sound. The following Standards apply to CAISAR:

- **Standard 1: Biodiversity Conservation**: This standard ensures the protection of biodiversity by requiring projects to assess and mitigate biodiversity risks, avoid critical habitats, and provide compensation for unavoidable damages. It promotes sustainable use of genetic resources, discourages invasive species, and emphasizes expert advice and adherence to protected area laws.
- **Standard 2: Resource Efficiency and Pollution Prevention**: Focuses on efficient use of resources and pollution control. It requires projects to reduce energy, water, and material use, manage hazardous materials safely, and prevent

pollution, with an emphasis on sustainable natural resource management, including water, soil, fisheries, and forests.

- **Standard 3: Cultural Heritage**: This standard ensures the protection of tangible and intangible cultural heritage by screening and managing impacts, consulting local communities, and preserving access to cultural sites. Projects must avoid, minimize, or mitigate damage and follow legal requirements in protected areas.
- **Standard 4: Indigenous Peoples**: Supports and empowers indigenous communities by requiring free, prior, and informed consent (FPIC), promoting equitable resource access, and protecting cultural heritage. Projects must involve indigenous peoples in decision-making, ensure fair benefits, and avoid involuntary resettlement.
- **Standard 5: Labor and Working Conditions**: Sets requirements for safe, non-discriminatory workplaces, prohibiting forced and child labor. It requires the establishment of grievance mechanisms, safety protocols, and equal opportunities, with contractors and suppliers adhering to these standards.
- **Standard 6: Community Health and Safety**: Requires projects to assess and manage health risks, prevent exposure to hazards, and ensure infrastructure safety. It includes emergency preparedness, traffic and security management, and protection against gender-based violence.
- **Standard 7: Physical and Economic Resettlement**: Ensures resettlement is conducted legally and fairly, avoiding forced evictions. It requires special consideration for vulnerable groups, economic displacement, and establishing grievance mechanisms for affected communities.
- **Standard 9: Climate Change**: Ensures projects address climate risks and reduce GHG emissions. It mandates climate risk screening, adoption of climate-smart practices, and GHG accounting to guide project design towards reducing environmental impacts.

4.5 GEF'S ENVIRONMENTAL AND SOCIAL SAFEGUARDS POLICIES

GEF adopts the interim environmental and social safeguards to identify, measure, and mitigate environmental and social risks based on IFC Performance Standards (PS). Under CAISAR, the following PSs are applied:

- Performance Standard 1 – Assessment and Management of Environmental and Social Risks and Impacts;
- Performance Standard 2 – Labor and Working Conditions
- Performance Standard 3 – Resource Efficiency and Pollution Prevention
- Performance Standard 4 – Community Health, Safety, and Security
- Performance Standard 5 – Land Acquisition and Involuntary Resettlement

- Performance Standard 6 – Biodiversity Conservation and Sustainable Management of Living Natural Resources
- Performance Standard 7 – Indigenous Peoples
- Performance Standard 8 – Cultural Heritage

4.5.1 International Conventions and Treaties

Cambodia has ratified all eight (8) of the International Labor Organisation (ILO)'s conventions which cover core labour standards recognized as human rights. These conventions focus on issues such as freedom of association, elimination of forced labour, abolition of child labour, and elimination of discrimination in employment.

- **Freedom of Association and Protection of the Right to Organise Convention, 1948 (No. 87)**: Ratified by Cambodia in 1999, this convention protects workers' and employers' rights to freely form and join organizations without interference, ensuring autonomy and safeguarding against dissolution by authorities.
- **Right to Organise and Collective Bargaining Convention, 1949 (No. 98)**: Ratified in 1999, it protects workers' rights to organize, engage in collective bargaining, and prevents discrimination for union activities, promoting fair wage negotiations and just working conditions.
- **Forced Labour Convention, 1930 (No. 29)**: Ratified in 1969, this convention aims to eliminate all forms of forced labour, including coercive work for public works or political purposes, protecting workers' rights and dignity.
- **Abolition of Forced Labour Convention, 1957 (No. 105)**: Ratified in 1999, it strengthens the prohibition of forced labour for political coercion, discipline, or discrimination, ensuring freedom and justice in the workplace.
- **Minimum Age Convention, 1973 (No. 138)**: Ratified in 1999, it sets a minimum age for employment (usually 15) to prevent child labour, promoting access to education and protection from hazardous work.
- **Worst Forms of Child Labour Convention, 1999 (No. 182)**: Ratified in 2006, this convention seeks to eliminate extreme forms of child labour like slavery, trafficking, and hazardous work, prioritizing children's safety and rehabilitation.
- **Equal Remuneration Convention, 1951 (No. 100)**: Ratified in 1999, it promotes equal pay for men and women for work of equal value, combating gender-based wage discrimination and fostering economic justice.
- **Discrimination (Employment and Occupation) Convention, 1958 (No. 111)**: Ratified in 1999, this convention addresses workplace discrimination based on race, gender, religion, and other factors, promoting equal treatment and opportunities for all workers.
- **Employment Policy Convention, 1964 (No. 122)**: Ratified in 1971, it requires active employment policies to promote full, freely chosen employment, aiming to reduce unemployment and support economic and social development.

- **Weekly Rest (Industry) Convention, 1921 (No. 14)**: Ratified in 1969, this convention guarantees a weekly rest period of at least 24 consecutive hours for workers, helping protect their health and well-being.
- **Labour Inspection Convention, 1947 (No. 81)**: Ratified by Cambodia in 1974, this convention establishes labour inspections in industrial and commercial workplaces to ensure compliance with national labour laws, promoting safe, fair, and decent working conditions.
- **Labour Inspection (Agriculture) Convention, 1969 (No. 129)**: Ratified in 1999, it extends labour inspection to agriculture, ensuring workers in this sector, including migrant and seasonal labourers, are protected by labour laws and safe working conditions are maintained.
- **Tripartite Consultation (International Labour Standards) Convention, 1976 (No. 144)**: Ratified by Cambodia in 2009, this convention promotes consultation between governments, employers, and workers on international labour standards. It ensures that all stakeholders are involved in the implementation of labour policies, enhancing social dialogue and cooperation for fair labour practices.

4.6 Good International Industry Practices (GIIP)

4.6.1 WBG General EHS Guidelines (2007)

The World Bank Group (WBG) General Environmental, Health, and Safety (EHS) Guidelines (2007) provide internationally recognized technical guidance on managing environmental, health, and safety risks. These guidelines are designed to support project developers and operators, particularly in emerging markets, by outlining best practices for environmental sustainability, worker health and safety, and community well-being.

Key sections include:

- **Environmental Guidelines:** Focus on pollution prevention and control, resource efficiency, and managing air, water, and soil impacts.
- **Occupational Health and Safety (OHS):** Address workplace hazards, accident prevention, and worker welfare.
- **Community Health and Safety:** Cover topics like traffic safety, emergency preparedness, and protecting communities from project-related risks.
- **Construction and Decommissioning:** Provide guidance on managing risks during the life cycle of a project.

The guidelines emphasize compliance with local regulations and international standards and are intended to be applied alongside sector-specific EHS guidelines.

4.6.2 WBG EHS Guidelines for Annual Crop Production (2016)

The World Bank Group (WBG) Environmental, Health, and Safety (EHS) Guidelines for Annual Crop Production (2016) provide technical guidance on sustainable practices for cultivating

annual crops, such as grains, legumes, and vegetables. These guidelines aim to minimize environmental impacts, ensure worker safety, and promote efficient resource use.

Key focus areas include:

- **Environmental Management:** Guidance on soil conservation, water use efficiency, pest management, and biodiversity preservation.
- **Occupational Health and Safety (OHS):** Measures to prevent injuries, promote safe pesticide handling, and protect workers from physical and chemical hazards.
- **Community Health and Safety:** Recommendations to prevent risks like pesticide drift, water contamination, and traffic safety concerns related to agricultural operations.
- **Sustainable Practices:** Emphasis on integrated pest management (IPM), crop rotation, and efficient irrigation techniques to maintain productivity and environmental health.

These guidelines align with international standards and are designed to support sustainable agricultural development.

4.7 GAP ANALYSIS OF NATIONAL LEGAL FRAMEWORK AND POLICIES OF AIIB, IFAD AND GCF

The study and analysis of the national legal framework against the requirements under the policies of AIIB, IFAD and GCF can be summarised as Table 4.6 below:

Table 4.6: Summary of the RGC's legal framework corresponding to the policies of AIIB, IFAD and GCF

No.	Standards/ Policies of AIIB and IFAD			Coverage	RGC's Corresponding Legal Framework	Gap Analysis and suggestions	Proposed measures to address the gaps
	AIIB	**IFAD**	**GCF**				
1	ESS1		PS1	Environmental and Social Assessment and Management	• Environmental and Natural Resources Code (2023), • Law on Water Resource Management (2007), • Law on fisheries (2026), • Sub-Decree on Water Pollution Control (1999), • Sub-Decree on Environmental Impact Assessment (1999), • Sub-Decree on Air Pollution Control and Sound Disturbance (2000), • Sub-Decree on Solid Waste Management (1999), • Prakas on the General Guideline for Preparing the Initial and Full Environmental Impact Assessment Reports (1999), • Prakas on the Launch of Standards of the Quantity of Toxins or Hazardous Substances Allowed to be Disposed (2015)	The RGC has established a wide range of regulations especially in the recent Environmental and Natural Resources Code (2023) that aim to environmental protection and natural resource management are well aligned to the provisions of the AIIB ESS1.	This ESCIA covers both direct, indirect, and cumulative impacts and mitigation measures, taking a holistic approach to the project and looking at impacts in an integrated way.
2	ESS2	S7	PS5	Land Acquisition and Involuntary Resettlement	• Law on Land Management, Urban Planning and Construction (1994), • Land Law (2001), • The Expropriation Law (2010), • RGC's Sub-Decree No. 22 ANK/BK (2018) on the Promulgation of the Standard Operating Procedures for Land Acquisition and Involuntary Resettlement (SOP-LAR) for Externally Financed Projects in Cambodia, • Sub-Decree No.19 on Social Land Concession of March 2003,	The RGC has the SOP-LAR which is well aligned with the provisions in the AIIB ESS 2. The AIIB ESS 2 on land acquisition and involuntary resettlement recognizes that project related land acquisition and land use can have impacts on communities. The RGC's SOP-LAR is consistent with the specific requirements under the AIIB ESS 2 on consultation, grievance redress, social support, resettlement assistance, standard of living	According the RGC's SOP-LAR, an income restoration program would be provided in order to re-establish sources of livelihoods for those affected households who have permanently lost their sources of livelihood. In this CAISAR project, the DRPs will include provisions to ensure livelihood

No.	Standards/ Policies of AIIB and IFAD			Coverage	RGC's Corresponding Legal Framework	Gap Analysis and suggestions	Proposed measures to address the gaps
	AIIB	**IFAD**	**GCF**				
					• RGC's Sub-Decree No.118 ANK/BK (2005) on State Land Management, • RGC's Sub-Decree No.98 ANK/BK (2015) on River Basin Management	of poor and vulnerable, entitlements for persons without title or legal rights except for land, information disclosure, payment of compensation and entitlements prior to physical displacement, and the supervision and monitoring of implementation of resettlement plans. However, there are gaps on negotiated settlement and livelihood restoration. The SOP-LAR does not describe procedures for negotiated settlement and lack of clear benchmark to assist monitoring and evaluation to confirm if the affected households restore their livelihood to the level prevailing prior to the beginning of the project implementation.	restoration program are robust and can accurately meet the aim of livelihood restoration in line the AIIB ESS2.
3	ESS3	S4	PS7	Indigenous Peoples	• The Constitution of Cambodia (1993) • Land Law (2001)	No detailed regulations on how to avoid impacts to Indigenous Peoples or how to include them in project benefits. Lack of requirement to consult IP(s) in a manner that is culturally appropriate and special disclosure and consultation requirements as described in the AIIB ESS3.	An IPPF has been prepared on the basis of the AIIB ESS3. The IPPF details procedures on the preparation of IPP(s) and how to conduct meaningful consultation and disclose that is culturally appropriate.
4	ESS1	S1	PS6	Biodiversity conservation	• Environmental and Natural Resources Code (2023),	The code requires a proper consideration of biodiversity resources and payment of ecosystem services which support the conservation process. There is limited	This ESCIA include the biodiversity assessment and management plan.

No.	Standards/ Policies of AIIB and IFAD			Coverage	RGC's Corresponding Legal Framework	Gap Analysis and suggestions	Proposed measures to address the gaps
	AIIB	IFAD	GCF				
						guidance on how to compensate in the ecosystem services once its pristine condition is affected.	
5	ESS1	S2	PS3	Resource efficiency and pollution prevention	• Environmental and Natural Resources Code (2023), • Sub-Decree on Environmental Impact Assessment (1999), • Sub-Decree on Air Pollution Control and Sound Disturbance (2000), • Sub-Decree on Solid Waste Management (1999), • Prakas on the General Guideline for Preparing the Initial and Full Environmental Impact Assessment Reports (1999), • Prakas on the Launch of Standards of the Quantity of Toxins or Hazardous Substances Allowed to be Disposed (2015)	The RGC has in place a set of separate provision and requirements for pollution prevention and management that are well align with the AIIB ESS 1 that aims to promote the sustainable use of resources and avoid or minimize the pollution from sources/project activities.	This ESCIA has included all relevant national laws and regulation as well as the requirement for AIIB ESS1.
6	ESS1	S3	PS8	Cultural heritage	• Environmental and Natural Resources Code (2023), • Law on the Protection of Cultural Heritage (1996)	The RGC has in place the law on protection of cultural heritage aligns with the requirement of the AIIB ESS1. However, there is lack of detail procedures for protection of the intangible cultural heritage.	This ESCIA provided details procedures and requirement to protect both tangible and intangible cultural heritage through Chance Find Procedure (Annex 6).
7	ESS1	S5	PS2	Labor and working conditions	• Labor Law (1997), • Law on Taxation (1997), • Sub-Decree on Construction Permit (1993), • Law on Social Security Schemes for Persons defined by the Provision of the Labor Law (2002),	The RGC has in place a set of law and regulations on labour and working conditions which is consistent with the requirement of the AIIB ESS1. However, the enforcement of these law and regulation is still limited. For example,	The ESCIA provides provisions to monitor compliance by contractor and of their primary suppliers in bidding documents and supervision contracts in order

No.	Standards/ Policies of AIIB and IFAD			Coverage	RGC's Corresponding Legal Framework	Gap Analysis and suggestions	Proposed measures to address the gaps
	AIIB	**IFAD**	**GCF**				
					• Sub-Decree on Establishment of Social Security Scheme "Health Care Scheme" for Persons Defined by the Provisions of the Labor Law (2016)	regulation against forced labor and using child labor are not strictly enforced.	to prohibit using forced labour and child labour.
