8	ESS1	S6	PS4	Community health and safety	• Law on Road Traffic (2014), • The Law on Suppression of Human Trafficking and Sexual Exploitation 2008, • Law on the Protection and the Promotion of the Rights of Persons with Disabilities 2009,	The RGC has established Labor Law the protect the health and safety of the workers. However, the concern and mitigation are more on individual rather than community as a whole. The AIIB ESS1 aims on protection of both individual and community for health and safety.	The ESCIA provides provisions to monitor compliance by contractor on community and health safety in bidding documents and supervision contracts. The requirement on raising awareness to local community on health and safety are also included in the bidding documents.
9	ESS1	S9	PS1	Climate change	• Environmental Code and Natural Resource Management 2023	The newly adopted code requires all relevant sectors to integrate climate resilient concepts into their strategic action plan along with different measures to tackle the issues. No gap being identified.	

- Note: AIIB = Asian Infrastructure Investment Bank, IFAD = International Fund for Agricultural Development, GCF = Green Climate Fund, ESS = Environment and Social Standard, S = Standard, PS = Performance Standards, RGC = Royal Government of Cambodia, SOP-LAR =: Promulgation of the Standard Operating Procedures for Land Acquisition and Involuntary Resettlement, IPPF = Indigenous People Planning Framework, IP = Indigenous Peoples, IPP = Indigenous Peoples Plans, ESCIA = Environmental, Social, and Climate Impact Assessment, DRPs = Detailed Resettlement Plans.

Overall, the Royal Government of Cambodia (RGC) has established various legal documents ranging from royal decrees, sub-decrees, and circulars framing the management, and implementation of all types of development projects and activities within the country at the pre-construction, construction and implementation periods. The laws cover the management and protection of the natural resources, and biodiversity including underground, inland and water bodies. These legal frameworks also contain the standards that are applicable to the country context including water quality, soil quality, air, noise quality and vibration. Regarding human well-being including health, safety, labour and sexual exploitation, the country has made significant progress over the past years promoting the working environment of workers and labour forces embracing various laws and policies for ensuring the well-being of workers as well as the compliances that employers must comply. Laws to protect sexual exploitation, and social protection guarded the public, especially the vulnerable including the poor, and people with disability. Although the country's legal frameworks cover the requirements, there are still limited report in terms of actual enforcement which need to be taken care where a proper implementation plan and resources are needed.

CHAPTER 5 – PROJECT AREA OF INFLUENCE

5.1 INTRODUCTION

This chapter outlines the areas of influence where the project may have potential impacts. It examines the geographical regions, ecosystems, and communities likely to be affected, addressing both environmental and socio-economic considerations. The analysis aims to inform mitigation strategies and ensure project activities align with sustainability while minimizing adverse effects.

Under CAISAR project, term "Areas of Influence" (AoI) comprise, as appropriate, areas that are likely to be affected by the project activities, accumulating with the other projects as well as the associated facilitates of the project.

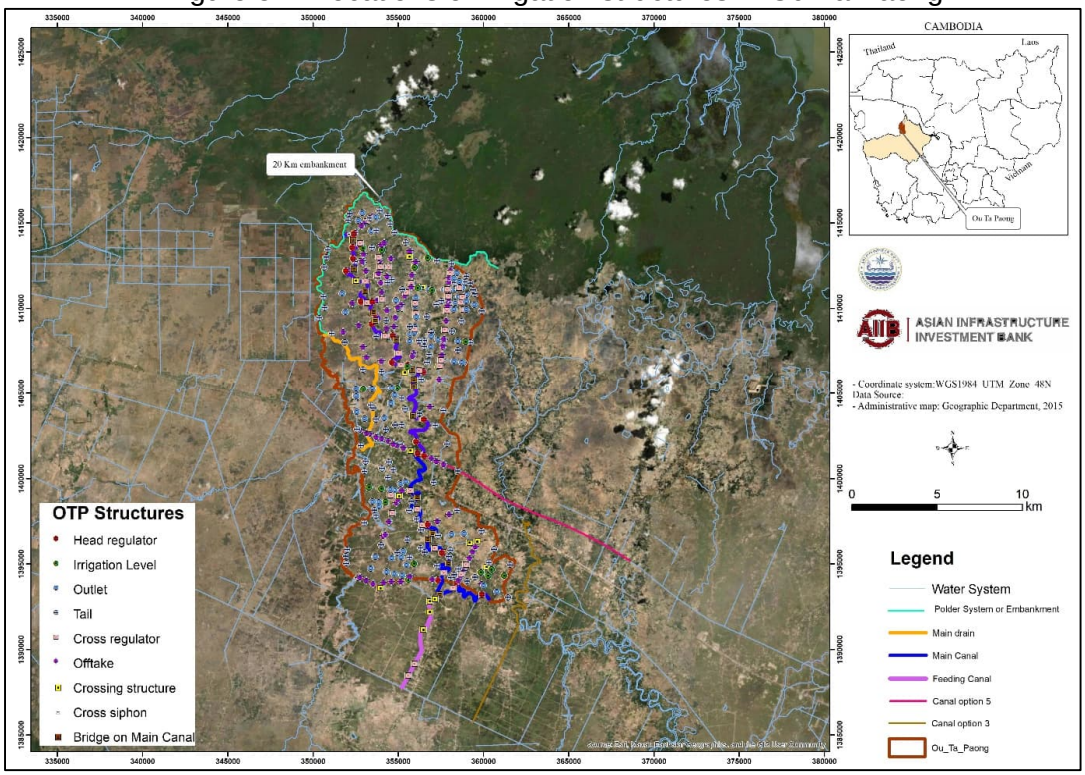
5.2 DETERMINING PROJECT AREAS OF INFLUENCE

Under CAISAR, since project design is still ongoing, area of influence (of each of the six (6) sub-schemes) is anticipated based on: a) target command area of each scheme (where most proposed project activities will take place during project construction, and later during project operation), and b) the environmental footprint that are likely caused by project activities during project construction (as direct and indirect impacts due to activities under Component 2), and by project activities (mainly cumulative impacts due to intenstified crop production activities under component 1).

These above anticipated areas of influence need to be updated when more information becomes available to allow a more reliable assessment, particularly when project detailed design is completed, and construction measures proposed by construction constractors are identified. Future update on area of influence (at respective sub-scheme) will be made on the basis of updated environmental and social assessments once a) locations of construction sites, auxiliary facilities (such as borrow pits), and logistics operations are confirmed, and b) the full scope of the project's impacts (direct, indirect, and cumulative) is firmed up based on detailed engineering design (for Component 2) and project implementation approach (for Component 1).

It is noted that while direct and indirect impacts could be reasonably anticipated based on currently proposed scope of works and prior experience for similar works, cumulative impacts, particularly their spatial extent and severity (over the time) require collection of supporting scientific evidence from data collected under project's environmental and social monitoring program (See also Chapter 9 - Environmental & Social Management).

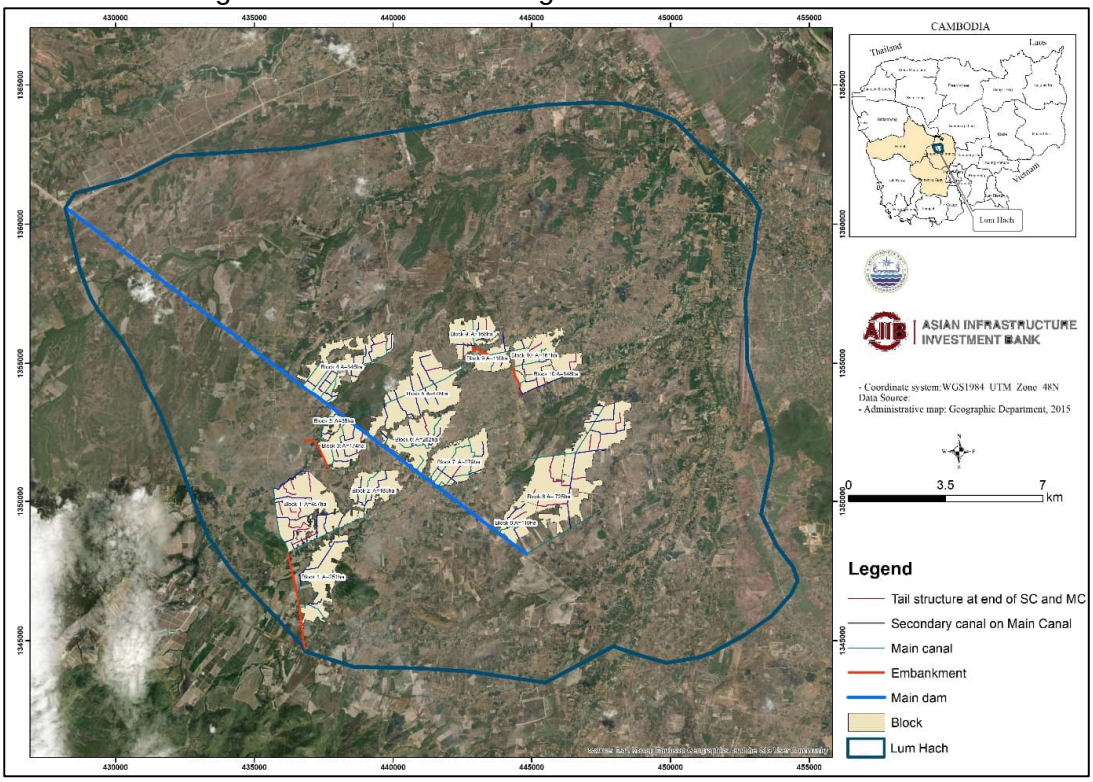
5.3 DESCRIPTION OF KEY COMPONENTS THAT POTENTIALLY CAUSE THE INFLUENCIAL IMPACT



5.3.1 Air, Noise and Vibration

The area of influence for air quality, noise, and vibration during the construction and rehabilitation of irrigation systems extends beyond the construction site, affecting nearby communities and the environment. Dust, emissions from machinery, and material handling can temporarily increase particulate matter and pollutants in the air. Noise from heavy equipment may disturb residents and wildlife, while vibrations from activities like dredging and excavation can affect nearby structures, potentially causing discomfort or minor damage. These impacts, though short-term, typically extend up to 100 meters from the site, with heavier activities affecting a larger area. Post-construction, greenhouse gas emissions from farming activities could have minimal long-term impacts at a global scale. Each of the sub-scheme the area of influence include:

- Surrounding the sites of the rehabilitated/dredged rivers/stream
- Surrounding the rehabilitated main and tertiary canals, and
- Surrounding the rehabilitated/upgraded structure
- Along the road used for transporting materials by the construction activities



These effects occur only during the construction period while the emission of greenhouse gas emission from farming activities. The following are maps indicating the area of influence at each sub-scheme.

Figure 5.4: Locations of irrigation structures in Kropeau Truom, Yutasas, and Stoeng Krang Bat

(Source: CAISAR Project, 2024)

5.3.2 Water Quality

The construction and operation of irrigation systems can significantly impact water quality, both in terms of surface water and groundwater.

Construction Phase:

- **Surface Water:** During the construction phase, sedimentation due to excavation, dredging, and earthworks is a primary cause of water quality degradation. Loose soil can be washed into nearby water bodies, increasing turbidity, reducing light penetration, and altering the aquatic habitat. Additionally, the use of machinery and equipment introduces risks of oil spills, fuel leaks, and chemical contamination, which can enter water sources through surface runoff, affecting aquatic life and water usability downstream.
- **Groundwater:** Construction activities, such as drilling and excavation, can disrupt the soil and rock layers, potentially allowing contaminants from surface activities, such as chemicals, to infiltrate groundwater. Chemical spills or leaching from construction materials can further degrade groundwater quality. Additionally, the disruption of natural flow patterns in the subsurface may allow pollutants to spread more easily, threatening water quality over a wide area.

Operation Phase:

- **Surface Water:** Once the irrigation system is in operation, water quality can be affected by the increased use of fertilizers and pesticides in the command areas. Runoff from agricultural fields may carry these chemicals into nearby rivers, streams, and lakes, causing nutrient pollution, algal blooms, and eutrophication, which can lead to oxygen depletion and harm aquatic ecosystems. Over-irrigation can also lead to increased runoff, carrying sediments and pollutants into surface water bodies.
- **Groundwater:** The operation of irrigation systems may result in groundwater contamination, particularly through leaching of agricultural chemicals such as nitrates and phosphates. Excessive irrigation can cause these chemicals to infiltrate the soil and reach groundwater aquifers, leading to long-term contamination. Furthermore, changes in water table levels due to extensive irrigation can alter the flow patterns of groundwater, potentially mobilizing contaminants that would otherwise remain contained.

In both phases, the key impacts on water quality include contamination of water resources with sediments, nutrients, chemicals, and reduced ecosystem health in the affected water bodies. These impacts can lead to long-term environmental damage and human health effects downstream along Ou Ta Paong River, Svay Don Keo River, the Tonle Sap Lake, Boribour River, Stung Krang Ponley and The Tonle Sap Lake due the reduction of the availability of clean water for agricultural, and domestic uses.

5.3.3 Soil Quality

The area of influence for soil quality during the construction and operation of irrigation systems extends well beyond the immediate project site, affecting surrounding agricultural land, natural habitats, and downstream regions impacted by runoff and water movement. In both phases, the area of influence extends beyond the construction site, impacting nearby agricultural land, natural habitats, and drainage systems. Proper management is essential to minimize long-term soil degradation across the broader irrigation zone.

Construction Phase:

- **Soil Erosion:** The area of influence for soil erosion encompasses not just the construction site but also adjacent areas, as excavation, grading, and vegetation removal expose large sections of land to wind and water erosion. This can lead to topsoil loss, affecting soil fertility on-site and causing sedimentation in nearby fields and water bodies.
- **Soil Compaction:** The influence of soil compaction extends several meters beyond the worksites, particularly where heavy machinery is used for construction or access. Compacted soil reduces water infiltration and root penetration, impacting surrounding agricultural land and natural ecosystems.
- **Soil Contamination:** While soil contamination from fuel spills and construction debris is often localized, it can spread through surface runoff during rainfall or irrigation, affecting nearby fields and watercourses, potentially degrading soil quality in those areas.

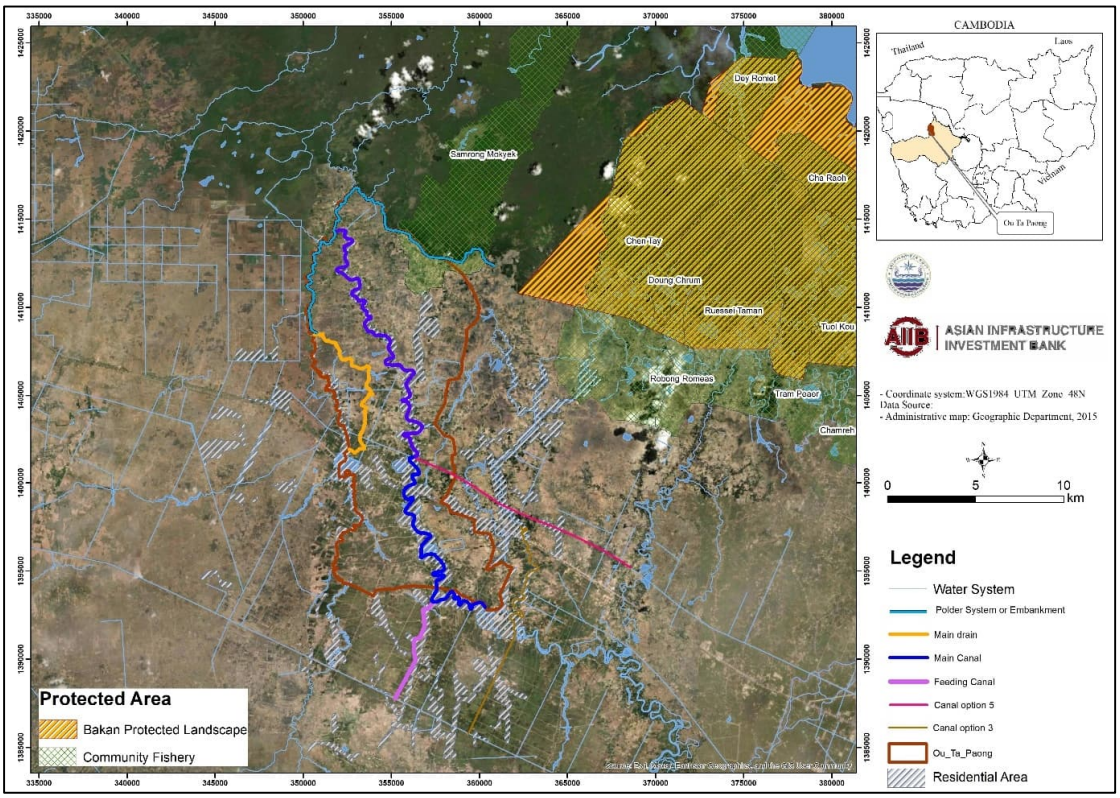
Operation Phase:

- **Salinization:** The area of influence for soil salinization covers the entire irrigated zone. Poor drainage and excessive irrigation can lead to salt buildup, particularly in low-lying areas, reducing soil productivity across large sections of the command area.
- **Nutrient Imbalance:** Nutrient leaching or accumulation affects the entire irrigated region and nearby fields. Over-irrigation can cause essential nutrients to wash away, while poor management of fertilizers can lead to nutrient buildup, creating imbalances that degrade soil quality.
- **Waterlogging:** The impact of waterlogging is concentrated in the irrigated fields but can extend to neighboring areas due to the movement of water through the soil layers. Prolonged waterlogging reduces soil aeration and affects soil structure, ultimately diminishing productivity.

At Ou Ta Paong sub-scheme, the area of influence will include the areas along the feeder canals which will extend beyond the command area. This includes the construction activities as described earlier and the acquisition of land and resettlement along the feeder canals.

5.3.4 Biodiversity

The environmental impact of the project on biodiversity extends across a larger landscape, as it influences the movement of wildlife, including birds, mammals, reptiles, and fish. The project's area of influence, determined through biodiversity assessments, encompasses regions identified as key habitats for these species, where they actively move and interact with their environment. Each sub-scheme of the project impacts these areas, reflecting the interconnectedness of ecosystems and wildlife movement patterns.



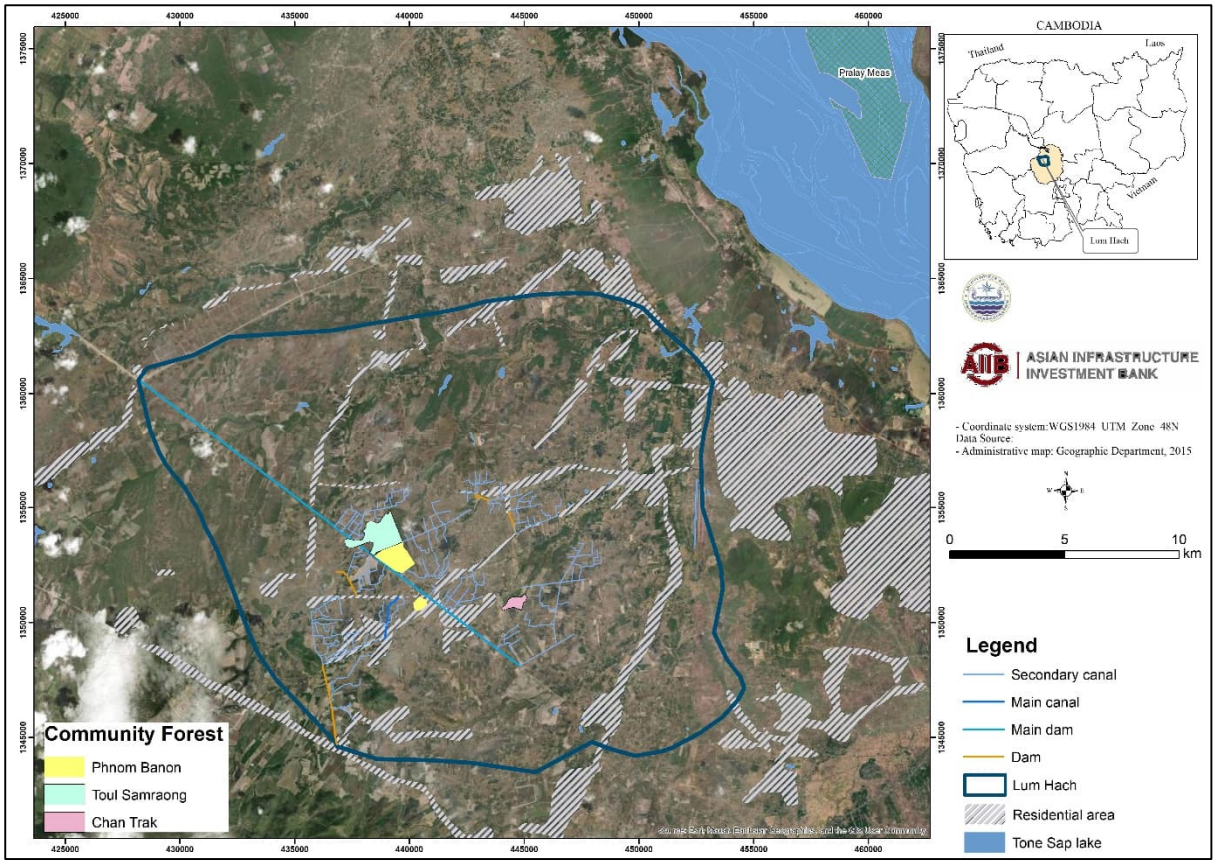
- **Ou Ta Paong**

The Ou Tapaong Irrigation Sub-scheme’s estimated area of influence encompasses a) the entire command area (some 14,000 hectare, including the upper, middle, and lower parts),

and b) any other areas outside the command area that project activities leave environmental footprint during project implementation, and sub-scheme operations. While the first is clear in terms of the boundary, the latter needs additional information based on the final project engineering design, and environment monitoring data to establish the additional area of influence that is outside of the command area (due to project's environmental footprint).

It is noted within the command area, there is a lake called Boeng Kanseang or Kanseang Lake which is home to fishes and birds. There are four (4) area located downstream the sub-scheme. The preliminary assessment focuses on the two (2) that are closest to the Ou Ta Paong: Flood Forest Conservation, b) Bakan Grassland protected area[7].

Figure 5.5: Map of Residential Area and protected areas in Ou Ta Paong



(Source: ESCIA Study, 2024)

- **Lum Hach**

The Lum Hach Irrigation Sub-scheme has a limited area of influence due to its small size and the surrounding farmland. The initial identified critical habitats within the area include Toul Samraong, Phnom Banon, and Chan Trak Community Forests. These areas are characterized by small, fragmented, and degraded dry deciduous forests (DDFs). However, these forests are crucial for the conservation of Green Peafowl, which have been confirmed to be present in these areas. The protection and restoration of these community forests should be a priority in the biodiversity action plan.

Figure 5.6: Map of Construction Sites and Residential Area in Lum Hach

(Source: ESCIA Study, 2024)

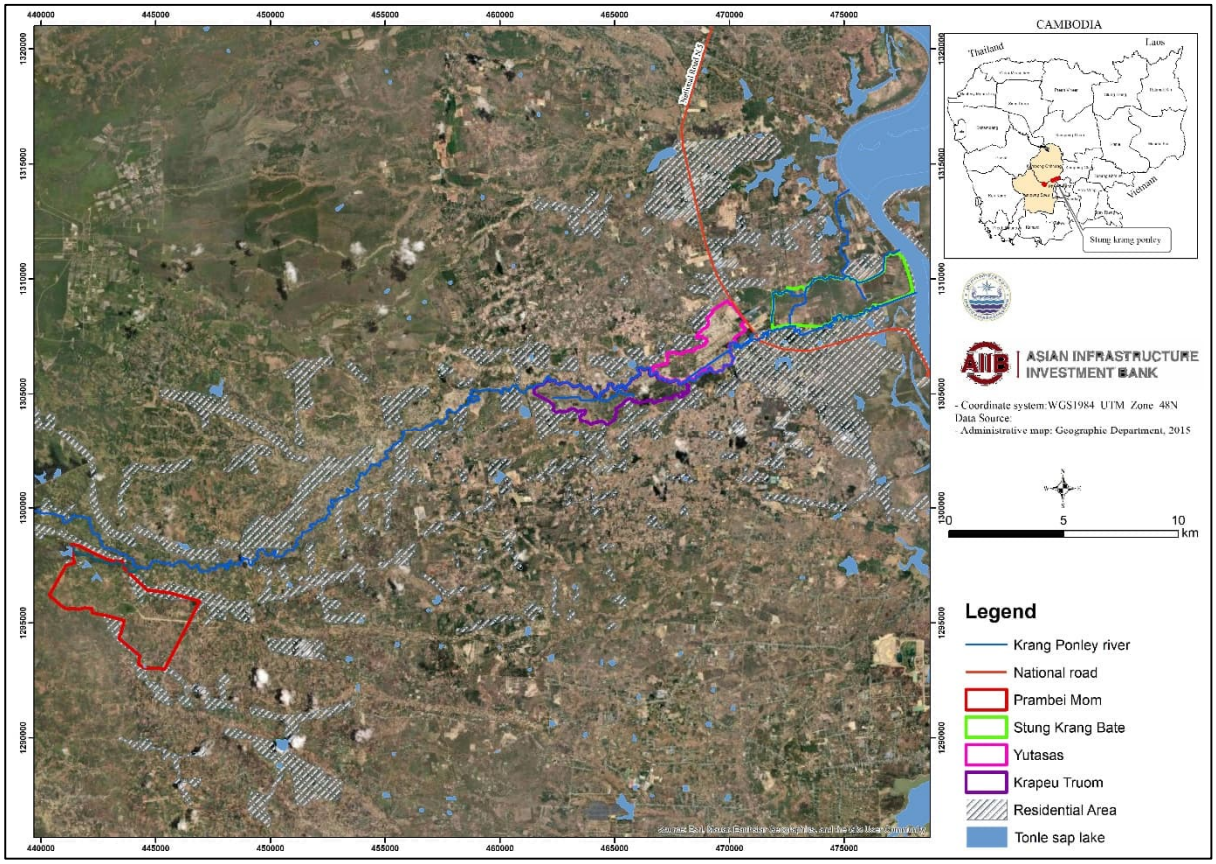
- **Stung Krang Ponley**

Brambei Mom. The Brambei Mom Irrigation Innovation sub-scheme has an extensive area of influence that includes adjacent communities and ecosystems dependent on its water resources. The areas directly affected by the project's activities include agricultural lands within a certain radius from irrigation canals or reservoirs.

Krapeu Truom. Potential areas of influence might include:

- **Downstream areas:** The lower reaches of the Stoeung Krang Ponley River and the Tonle Sap Lake, which may be affected by water quality, sediment loads, and fish migration from Krapeu Trom.
- **Upstream areas:** The upper reaches of the Stoeung Krang Ponley River and its tributaries, which may be influenced by water flow regulation and sediment transport from Krapeu Trom.
- **Adjacent ecosystems:** Forests, wetlands, and agricultural areas that are connected to Krapeu Trom through hydrological or ecological processes.

Yutasas. The area of influence for the Yatasas irrigation renovation scheme encompasses the direct and indirect impacts of the project. This includes:



- **Direct Impacts:** The immediate area where the irrigation infrastructure will be constructed and operated, including canals, pumping stations, and reservoirs.
- **Indirect Impacts:** The surrounding areas that may be affected by changes in water flow, land use, or other project-related activities. This includes the Stueng Krang

Ponlai River, the Tonle River, and the habitats of endangered species within the Yotasas command area.

Stung Krang Bat. The area of influence for the Stueng Krang Bat irrigation sub-scheme encompasses both modified and natural habitats within its command area. It extends along the Tonle Sap River, encompassing floodplains, wetlands, and associated ecosystems. The project activities have the potential to directly or indirectly impact biodiversity within this region.

The area of influence for the Stueng Krang Bat irrigation sub-scheme includes both direct and indirect impacts. Direct impacts may occur within the project area itself, such as construction sites and irrigation canals. Indirect impacts may extend to surrounding areas, including the Tonle Sap River, wetlands, and adjacent ecosystems.

Figure 5.7: Map of Construction Sites and Residential Area in Stung Krang Ponley

(Source: ESCIA Study, 2024)

5.2.2.3.1 Extent of Social Impacts

The Project's Area of Influence for social aspects extends beyond the immediate project site to include the broader region where the project's effects will be felt throughout its implementation phases. This area encompasses not only the physical location of the project but also regions affected by environmental, physical, and biological changes resulting from project activities. Social interactions in this area of influence may involve communities and stakeholders impacted by changes in land use, water availability, employment opportunities, and local infrastructure development. These interactions might include shifts in livelihoods, migration patterns, or community dynamics because of project-related opportunities and disruptions, land acquisition and resettlement along the main canals, feeder canal, polder

system, and farm roads, ethnic minority, gender, and loss of access to natural resources. Additionally, the area of influence considers the indirect impacts on health, education, and social services, as local populations respond to new economic and environmental conditions brought about by the project's operations. The social area of influence often aligns with the environmental footprint but also includes areas affected by induced socio-economic changes and community adaptations to these footprints. In addition, although the construction activities are at the existing systems, the impacts on cultural sites need to be carefully considered at the surrounding area ranging up to 500 m from the identified cultural sites.

5.4 SUMMARY OF THE PROJECT AREAS OF INFLUENCE

As per the description above, the Project Area of Influence can be summarized as Table 5.1 Below.

Table 5.1: Summary of the project area of influence

No	Sub-Scheme	Direct/Indirect Impact Areas	Receptors and Scale of Impacts
1	**Ou Ta Paong**	Along the irrigation canals, mainly the Ou Ta Paong River, main canals of the Kbal Hong Canal to Ou Ta Paong command area, the feeder canals, and subsidiary canals within the command area where the construction occurs. Noise, vibration, and air quality from construction activities and noise from worker camps are potential occur along the transport roads while water quality impact can go directly at the site as well as beyond the areas such as downstream water body.	• Residential, school, pagoda and hospital areas along the river, streams, canals where construction occurs, transport roads, and camp sites. • Downstream water body where water can carry pesticides and other contamination and protected areas where people can reach for further expansion of agricultural land as water become available.
2	**Lum Hach**	Main canals where construction plan to rehabilitate and build the embankments. Noise, vibration, and air quality from construction activities and noise from worker camps are potential occur along the transport roads while water quality impact can go directly at the site as well as beyond the areas such as downstream water body. The project will directly impact the community forestry as the planned canal will make water become available within the forest area.	• Residential, school, pagoda and hospital areas along the river, streams, canals where construction occurs, transport road and camp sites. • Downstream water body where water can carry pesticides and other contamination. • Community forestry within the command area and beyond as the fragmented forest area are somehow connected to the mountain area at the upstream of Boribour river.
3	**Krang Ponley**	Main canals in all the four sub-schemes, drainage canals in Krapeu Troum, Yutasas, and feeder canal and Polder in Stung Krang Bat where construction occurs. Noise, vibration, and air quality from construction activities and noise from worker camps are potential occur along the transport roads while water quality impact can go directly at the site as well as beyond the areas such as downstream water body.	• Residential, school, pagoda and hospital areas along the river, streams, canals where construction occurs and camp site. • Downstream water body where water can carry pesticides and other contaminated substances to downstream.

CHAPTER 6 – BASELINE CONDITIONS

6.1 INTRODUCTION

This chapter provides a comprehensive overview of the existing environmental and social conditions within the project target areas. It serves as the baseline data, capturing the current state of the environment and social dynamics that may be influenced by the proposed project. Understanding these baseline conditions is crucial as environmental factors significantly contribute to poverty reduction and socio-economic development. This chapter focuses on the physical, biological, and socio-economic resources present in the area, establishing a foundation for assessing the potential impacts of the project. By presenting this detailed baseline information, we aim to highlight the intricate relationships between these resources and the broader environmental impacts within the project area. This understanding is essential for identifying the potential changes and influences the project may have, ensuring that all environmental and social aspects are carefully considered in the decision-making process.

6.2 METHODOLOGY

The collection and analysis of secondary and primary data to establish a set of environmental and social baseline conditions is an important part to identification and assessment of E&S risks and impacts. The method for collecting baseline information –as per the ToR, is described below.

6.2.1 Environmental and Natural Resources

6.2.1.1 Climate and Meteorology

Weather and climatic condition are essential to implementation and achieving expected results for project activities under Component 1 & 2.

To establish baseline weather and climate conditions, the study reviewed and analyzed climatic variability using available records mainly from Nasa Power website for each sub-scheme location because the existing data of the MoWRAM is discontinuous and limited in terms of number of years and duration. Moreover, available stations are mainly at the provincial level which are located far away from the sub-scheme locations. The parameters gathered from the study include rainfall, temperature, humidity, and wind speed.

6.2.1.2 Hydrological System and Water Quality

To understand the hydrological systems of the sub-schemes under the project, the existing studies on hydrology and water systems within the project areas were the main sources of information for consideration in this ESCIA report preparation.

For water quality, both surface and groundwater, collection of raw data from the field were conducted to gather the intended data. The process in collecting data and parameters for surface water quality and groundwater quality is provided beginning from the identification of

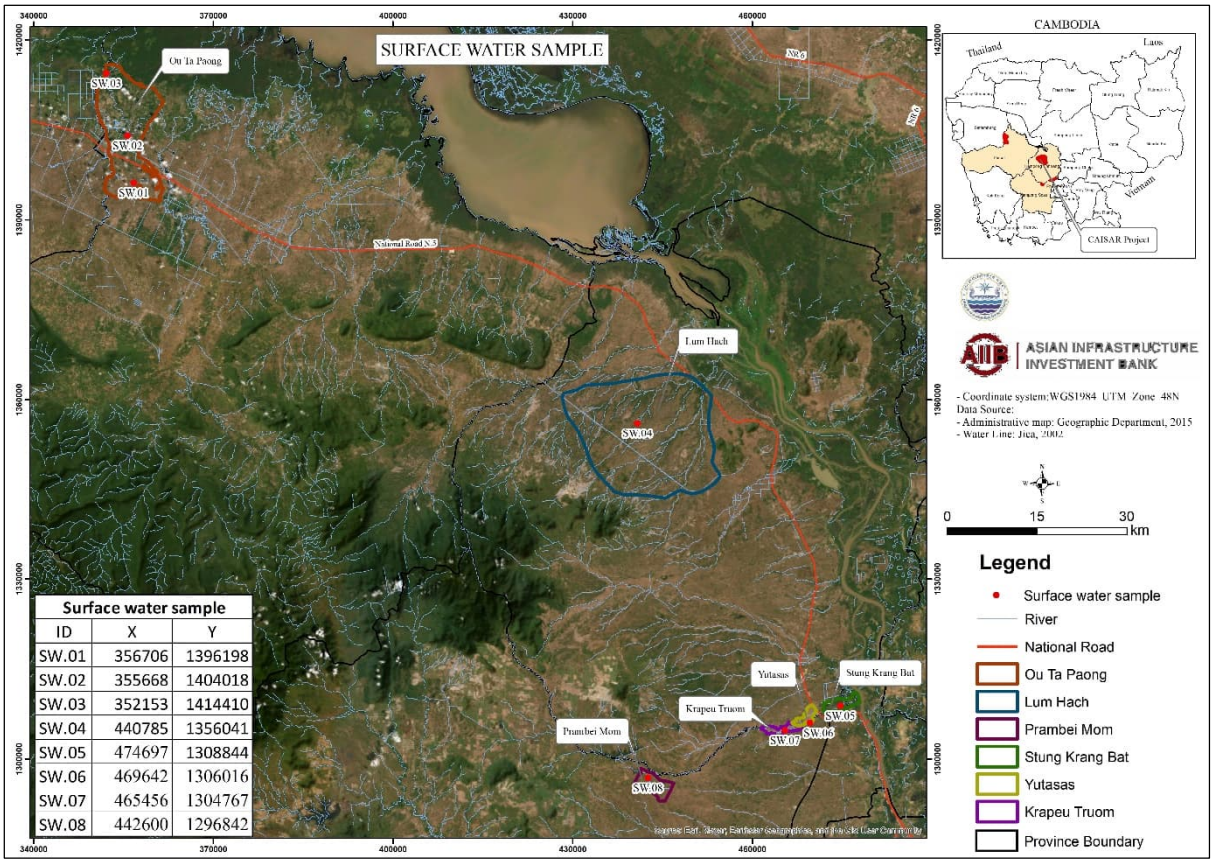
the potential risks on quality of water and soil in each sub-scheme. Firstly, parameters for water and soil testing were determined based on the environmental risks that are identified due to project activities for each of the six (6) sub–schemes as shown in Table 6.1.

Table 6.1: The identification of risks for determining the locations of water and soil quality testing in all sub-schemes

No	Names of Sub–Schemes	Contamination of **surface and ground water** due to project operation (increased use of chemical inputs) (Comp 1)	Contamination of **surface water** due to construction activities (Comp 2)	Contamination of **soils** due to construction (Comp 2)
1	Ou Ta Paong	X	X	X (upper part of OTP)
2	Lum Hach	X	X	X (main canal)
3	Brambei Mom	X	X	
4	Krapeau Trom	X	X	
5	Yutasas	X	X	
6	Steung Krang Bat	X	X	

Based on the nature of the risks, the following tests are proposed, including the time when the tests could be conducted to ensure result reliability.

- ***Testing for Surface Water Quality***



To obtain a representativeness for **surface water testing**, samples for surface water quality were taken as in table below. The number of samples are proposed based on the size of each sub–scheme and the connectivity of these sub–schemes. More samples are proposed for Ou Ta Paong because OTP is the largest and most complex scheme. Brambei Mom, Krapeau Trom, Yutasas, and Steung Krang Bat are connected and close to each other geographically. Thus 1 sample is proposed for each site (Table 6.2).

Table 6.2: The selected locations for surface water sample collection

No	**Names of Sub–Schemes**	**Upstream**	**Middle**	**Downstream**	**Total**
1	Ou Ta Paong	1	1	1	3
2	Lum Hach		1		1
3	Brambei Mom		1		1
4	Krapeau Trom		1		1
5	Yutasas		1		1
6	Steung Krang Bat		1		1
	Total	**1**	**6**	**1**	**8**

The locations of the sample collection are presented in Figure 6.1. The samples, labelled SW1 to SW8 respectively, were selected between 10 and 11 August 2024.

Figure 6.1: Map showing the locations of selected surface water samples

Prambei Mom	SW8	Kampong Speu	Thpong	Prambei Mom	Tang Pou	442600	1296842

SW = Surface water, UTM = Universal Transverse Mercator.

In addition, since some community people use groundwater for irrigation, **three (3) groundwater samples** were collected for testing, including one (1) in Ou Ta Paong sub-

scheme, one (1) in Lum Hach sub-scheme and one (1) for Krang Ponley. The water from tube wells were sampled after 5–10 min of pumping to flush the standing water out. Groundwater quality was collected from various locations within the project sites. Water testing is used to determine the existing groundwater quality at the project sites before construction and operation. Note that the GW1 is a dug well with a depth of up to 40 meters that can be used in both dry and wet seasons. In the dry season, the water level is about 25 meters, while in the rainy season, the water level is about 7 meters above the surface. GW2 and GW2 is a type of open well with a depth of 10 meters and can only be used during the rainy season. In both wells, the water level is around two (2) meters above the surface during the rainy season. The groundwater analytical method follows the same method as surface water quality testing whereas the parameters are following the minimum standard of the Cambodian Drinking Water Quality Standard (CDWQS) (Figure 6.2 and table 6.4).

Figure 6.2: Map showing the locations of selected groundwater samples

(Source: ESCIA Study 2024)

Table 6.4: Groundwater sampling locations

No.	Location				UTM	
	Province	District	Commune	Village	X	Y
GW1	Pursat	Bakan	Ou Ta Paong	Oknha Moan	356481	1406982
GW2	Kampong chhnang	Rolea Bíer	Prasneb	Prey Sampov	443830	1355685

GW3	Kampong Speu	Odongk	Veal Pung	Khnaor Ampil	465653	1303947

GW = Groundwater, UTM = Universal Transverse Mercator.

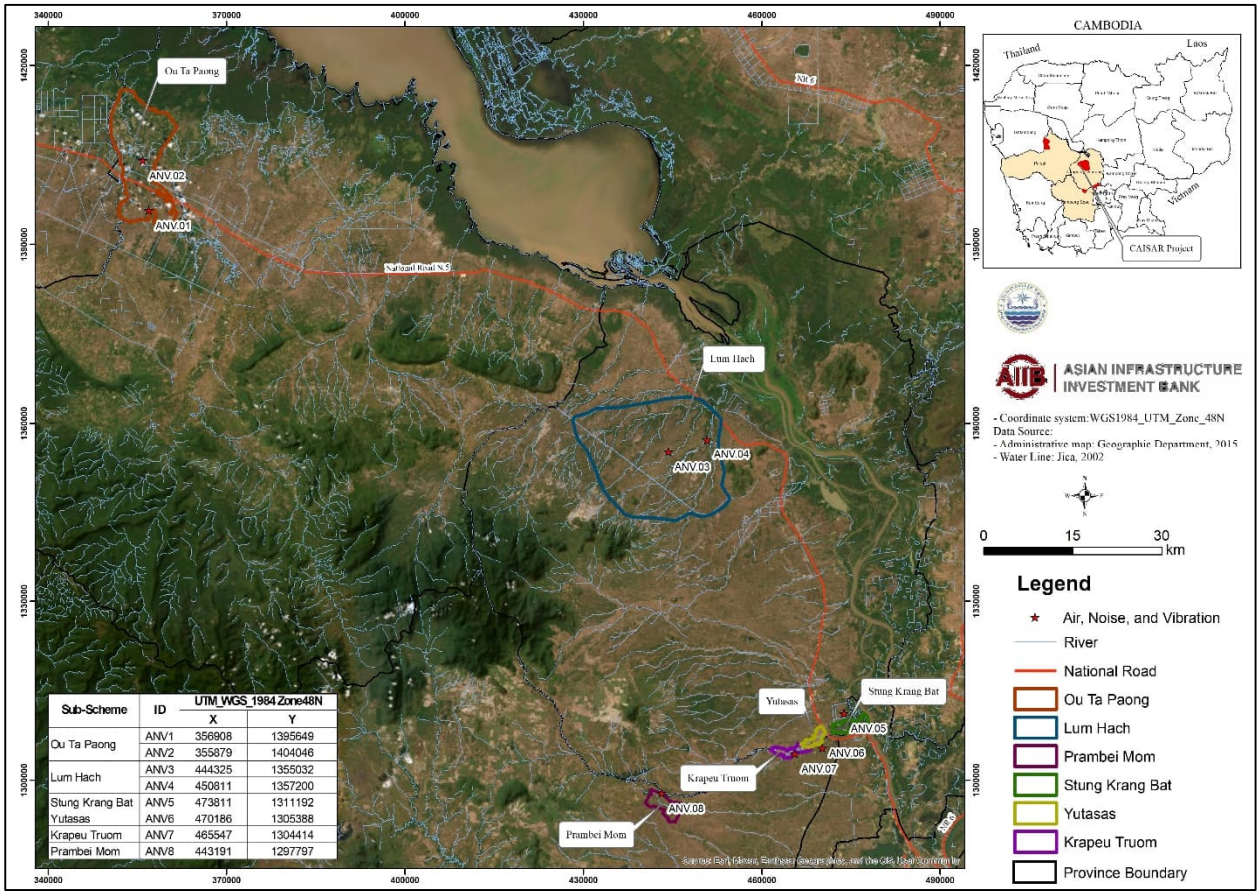
- ***Testing for contamination of surface and ground water due to project operation (increased use of chemical inputs) (Comp 1)***

It is anticipated that use of chemical inputs such as pesticides and chemical fertilizers would be increased due to intensified crop production (rice) – indicative of increased area of cultivation per year and increased use of shorter rice varieties. Since testing of pesticide has not been yet available in Cambodia, the ESCIA suggests the testing of pesticides to be done at year 1 of project implementation and testing potentially carried out abroad as per the suggestion in Table 9.1 and Table 9.3 of Chapter 9.

- **Testing for contamination of surface water due to project construction (Comp 2)**

Since the scope and location where canal would be rehabilitated have not yet been confirmed at this stage, testing for contamination of surface water due to project construction will be determined when detailed design is available.

6.2.1.3 Air Quality, Noise and Vibration



As the construction is expected to begin at the end of 2027, the ESCIA recommends the baseline data collection of the air quality and noise and vibration to be conducted prior to the construction (early 2027) as this period holds high potential of being changed. Due to the project's rural location, it is anticipated that project activities will have minimal impact on these environmental factors. Moreover, key Informant Interviews with village leaders included rating questions regarding the status of these parameters. The proposed locations for air quality, noise and vibration testing prior to the construction are proposed as Table 6.5 bellow.

Table 6.5: Locations of air quality, noise and vibration

Sub-Scheme	Label	Location				UTM	
		Province	District	Commune	Village	X	Y
Ou Ta Paong	ANV1	Pursat	Bakan	Rumlech	Prasat	356908	1395649

(Source: ESCIA Study 2024)

6.2.1.4 Geology, Soil and Land Cover

The primary data on soil quality and land pollution were determined through testing and reviewing the existing document relevant to the contamination of the soil within the area. Soil quality for agriculture were tested in five (5) locations as per shown in Figure 6.4.

Figure 6.4: Map with illustration of locations of soil quality samples

Soil sample

ID	X	Y
SS.01	355662	1399063
SS.02	354509	1406852
SS.03	441471	1355655
SS.04	465450	1304887
SS.05	469602	1306117

(Source: ESCIA Study 2024)

As per the guidance of MoE, the process will involve the collection of soil samples through the division of soil sampling area into equal-sized squares. Within each square, soil samples will be collected at the four (4) corners and the center, reaching a depth of approximately 50 centimeters below the topsoil. The collected soil from each square will be thoroughly mixed before being divided into four (4) equal portions. Subsequently, one (1) of these portions will be further divided into four (4) equal parts, with one (1) of the resulting sub-samples placed in a sample bag for storage taken for testing.

The primary data on soil quality and land pollution will be analyzed and compared to the national standard. Thirteen soil quality parameters in the context of agriculture as per the Circular No. 120 of Ministry of Environment were tested including:[8]

- ✓ Soil classification or particle size,
- ✓ Soil moisture,
- ✓ Nitrogen (N), Phosphorus (P), Potassium (K), Magnesium (Mg), Sodium (Na),
- ✓ Organic Metter
- ✓ Ratio of the mass of carbon to the mass of nitrogen in organic residues (C/N Ratio),
- ✓ Total phosphorus (P),
- ✓ Cation exchange capacity (CEC),
- ✓ pH,

[8] Circular No. 120 on the Guidance for the development of Terms of Reference for the Infrastructure and Tourism development, MoE

- ✓ Electrode Conductivity.

- **Additional Soil Quality Testing**

In addition to the agricultural soil quality testing stated above, testing for soil should be taken focusing on 1) materials that will be dredged at certain part of Ou Ta Paong River and the main canal of Lum Hach and 2) disposal sites. Since exact locations where dredging will be carried out and where materials will be disposed of have not been determined at this stage, soil testing for these locations will not be carried out as part of this ESCIA until the detailed design stage for Ou Ta Paong and Lum Hach.

6.2.1.5 Biodiversity Assessment

a. Scope and Methodology

The assessment aims to align with relevant standards, contributing to the project's goals of climate resilience and sustainable development. This biodiversity assessment prioritizes the protection of endangered and critically endangered species and their habitats, promotes sustainable natural resource management, and ensures that development activities adhere to international conservation standards. The specific purpose of the Priority Biodiversity Values is to confirm the status of key wildlife species presenting in the area to ensure the protection and sustainable management of natural resources and livelihood improvement. This includes evaluating current conditions and potential impacts and developing mitigation and compensation measures. The identification and evaluation of Priority Biodiversity Values help prioritise areas with exceptional biodiversity or crucial ecological functions.

The assessment adopts the International Finance Corporation's Performance Standard 6 (PS6) and its associated Guidance Note (GN) as a framework for identifying and evaluating critical habitat (CH). Characterized by its irreplaceability and vulnerability, CH is essential for preserving biodiversity and ecological integrity. The three-step process outlined in PS6 and GN6 involves identifying CH through specific criteria, assessing its irreplaceability and vulnerability, and mapping its location. By understanding the distribution of CH, projects can effectively mitigate risks to biodiversity and ensure alignment with environmental sustainability goals.

The process involved literature review and field survey as described below:

- **Literature review**

The literature review was conducted for this assessment at the national, regional, and sub-scheme levels. The review at the regional level looks at the status quo on biodiversity and management at the Tonle Sap Floodplain because the project area is located upstream of the Tonle Sap Lake. At the sub-scheme level, based on IBAT and eBird data (where relevant), the review focuses on species that fall under the IUCN category as Endangered (EN) and Critically Endangered (CN) and assesses its potential impact due to CAISAR's project activities, and relevant projects that contribute to the cumulative impacts on biodiversity of the project's area of influence in the long run. The review illuminates the precarious state of Cambodia's critically endangered species. It underscores the multifaceted threats these taxa face, including habitat degradation, illegal hunting, pollution, and other anthropogenic

pressures. The diversity of taxa represented, spanning animals, birds, fish, plants, and fungi, highlights the intricate tapestry of Cambodia's ecosystems.

- **Field Assessment**

Field works: Based on the potential area of influence estimated based on proposed activities at the sub-scheme level, two field surveys were conducted for the six sub-schemes during July 25-27 and August 3-9, 2024 (which is the wet season). Prior to fieldwork, GIS-based habitat modelling was conducted to identify key hotspots for each of the six sub-schemes. This aims to facilitate the prioritization of locations that should be subject to field observation and data collection. Key hotspots were also screened based on the potential area of influence initially identified as part of the E&S screening exercise that was conducted for each sub-scheme9. Apart from a focus on the potential area of influence, an attempt has been made to visit the potentially vulnerable areas that are located beyond but adjacent to the potential AoI, particularly areas that are vulnerable to potential environmental impact due to environmental footprints (e.g. spreading of pesticide residues) that need sound evidence to support the extent of impact – as cumulative impacts. Observations by Drone10 and transect walks were used. A drone is particularly used for the areas that are difficult to conduct a transect walk and areas that need a broad aerial view at the boundary between the estimated AoI and beyond.

Consultation: Consultations were conducted with representatives of local authorities and community-based organizations to supplement and validate field observations, particularly information on the potential presence of species that have been screened and identified for the AoI. In the sub-schemes where hotspots such as community forests and community fisheries are found (either inside and outside the area of influence, or both, like the cases of Ou Ta Paoing and Lum Hach), local organizations that manage such community forests and community fisheries hotspots were consulted to gather local ecological knowledge and experience, particularly the historical background about the population change of a particular species in relation to human activities (e.g. related to farming and other income generation activities such as hunting for food, and for trading). Approximately 10-12 individuals were chosen from each sub-scheme and interviewed using a semi-structured and structured questionnaire with visual aids (photos). A multi-faceted approach was applied to elicit reliable information, including using all alternative local names and asking questions about species' ecological niches. This allowed us to assess the informants' depth of knowledge.

This data, combined with desk-based research and expert consultation, informs the assessment of potential impacts and the development of appropriate mitigation measures.

- **Forest resources and wildlife**

[9] Potential area of influence is defined by the respective command areas (which include cultivation area, its supporting utilities such as farm road, technical facilities, and houses…) and areas located adjacent to the above command area that may include paddy fields, natural areas such as forest, pasture, and roads that are potentially used by project's construction contractors in connection with construction material supply site, borrow pits, disposal site, and so forth.

[10] A DJI Mavic 3T, an advanced drone equipped with cutting-edge features, was utilized to gather essential data from key biodiversity hotspots, wildlife habitats, and areas crucial for ecological connectivity and functions. With a remarkable flight range of up to 15 kilometers, the drone's capabilities allowed for comprehensive aerial surveys, even in remote or inaccessible regions.

This comprehensive approach to ensure that both the environmental and economic values of forest resources, ecological functions and biodiversity are considered to protect and safeguard throughout the project lifecycle. Below are selective key assessment tools that were used for this study:

1. **Biodiversity Mapping:** Create comprehensive biodiversity maps by integrating data from field assessments, interviews, and existing maps from various management and administrative entities (CF, Community Fisheries (Cfi), KBA, protected areas).
2. **Species Inclusion Criteria:** Limit the assessment to species sighted within the past 1-5 years to ensure a focus on current and relevant data for developing risk and mitigation strategies. Sighting data older than 5 years is important for predicting future trends based on their habitats and ecological changes.
3. **Community Engagement:** Consult with committee members from Community Forests (CF) and Community Fisheries (CFi) to gather their insights on wildlife presence, movement patterns, and potential impacts of the proposed system on their conservation areas.
4. **Species Data Verification:** Verify all species sightings and information against existing literature to ensure accuracy and reliability.
5. **Detailed Species Assessment:** Conduct in-depth inquiries about confirmed species, focusing on morphological characteristics, behavior, habitat preferences, and reproductive strategies. This will provide valuable data on local ecological knowledge and species distribution for informing conservation efforts.
6. **Critical Habitat Identification:** Identify critical habitats for target species based on field data and biodiversity mapping. Highlight areas of significant influence on biodiversity, endangered (EN) and critically endangered (CR) species, and ecological functions to inform mitigation strategies.
7. **A3-Sized Color Maps:** Create A3-sized color maps for each scheme, containing key information such as administration boundaries, specific location names, and unique landscape features (streams, lakes, river reservoirs). These maps will be used to determine the distribution of endangered and critically endangered species based on information provided by key informants.

- **Aquatic Biodiversity and Fisheries**

This study aims to assess the status of endangered fish species in each sub-scheme. It involved data review, interviews with local fishers and authorities, and field surveys. The information will inform impact assessments, mitigation measures, and conservation efforts.

We adopted a similar assessment approach used for forest resources and wildlife, focusing on experienced fishermen. This comprehensive approach ensures a thorough understanding of aquatic biodiversity and fisheries.

Recognizing the challenges of identifying fish without direct observation, we will enhance our assessment by examining fish migration connectivity, and species ecological niches, and cross-verifying data with relevant government agencies and research institutions. This

rigorous approach will strengthen the reliability of our findings and inform effective management strategies.

- **Methods used for Critical Habitat Assessment**

IFC PS6 presented the following criteria to assess for projects in Critical Habitat. These were as follows:

- Criterion 1: Critically Endangered (CR)and Endangered (E) species;
- Criterion 2: Restricted-range/Endemic species;
- Criterion 3: Migratory/congregatory species;
- Criterion 4: Highly threatened and/or unique ecosystems; and
- Criterion 5: Key Evolutionary Processes.

In addition to the above five biological criteria, there were further circumstances in which an area might be recognized as Critical Habitat. For simplicity, there were two further criteria:

- Criterion 6: Most Legally Protected Areas (particularly IUCN Categories I-IV) and Internationally Recognized Areas (e.g., KBAs and IBAs);
- Criterion 7: Other areas of high biodiversity value, such as areas of high scientific value or areas of old growth forest.

Criteria 1-3 have quantitative thresholds which help determine whether an area is Critical Habitat. Criteria 4 and 5 are qualitatively defined at present and so require consultation with experts. Criterion 4 covers rare and threatened habitats which might not necessarily hold species triggering Criteria 1-3. Criterion 5 is particularly identified by physical landscape features promoting evolution (e.g. islands, mountains, ecotones), or by groups of species with distinct evolutionary history.

Table 6.6 provides the formal quantitative thresholds for species Criteria 1-3. Discreet Management Units (DMUs) may be ecologically-defined (e.g. a whole patch of a certain habitat type or a watershed) or politically-defined (e.g. a protected area, property or local political unit).

- DMUs with ≥10% global population of a CR or EN species (or, generally, the equivalent in terms of known sites for that species, e.g. if the DMU is one of only 10 sites globally) = Tier 1 (Sub-criteria 1a+1b)
- DMUs with a single regularly occurring individual of a CR species = Tier 2 (Sub-criterion 1c)
- DMUs with regionally important concentrations of a EN species = Tier 2 (Sub-criterion 1c)
- DMUs with ≥95% of the global population of a restricted-range, endemic or migratory/congregatory species (effectively site endemics) = Tier 1 (Sub-criteria 2a+3a)
- DMUs with ≥1% of the global population of a restricted-range, endemic or migratory/congregatory species (this is the easiest category in which to trigger CH) = Tier 2 (Sub- criteria 2b+3b)

Table 6.6: Quantitative thresholds for criteria 1-3 relating to tier 1 and tier 2 critical habitat

Criteria	Tier 1	Tier 2
1. Critically Endangered (CR)/ Endangered (EN) Specie	(a) Habitat required to sustain ≥ 10 percent of the global population of a CR or EN species/subspecies where there are known, regular occurrences of the species and where that habitat could be considered a discrete management unit for that species. (b) Habitat with known, regular occurrences of CR or EN species where that habitat is one of 10 or fewer discrete management sites globally for that species.	c) Habitat that supports the regular occurrence of a single individual of a CR species and/or habitat containing regionally-important concentrations of a Red-listed EN species where that habitat could be considered a discrete management unit for that species/subspecies. (d) Habitat of significant importance to CR or EN species that are wide-ranging and/or whose population distribution is not well understood and where the loss of such a habitat could potentially impact the long-term survivability of the species. (e) As appropriate, habitat containing nationally/regionally important concentrations of an EN, CR or equivalent national/regional listing.
2. Endemic/ Restricted Range Species	(a) Habitat known to sustain ≥ 95 percent of the global population of an endemic or restricted-range species where that habitat could be considered a discrete management unit for that species (e.g., a single-site endemic).	(b) Habitat known to sustain ≥ 1 percent but < 95 percent of the global population of an endemic or restricted-range species/subspecies where that habitat could be considered a discrete management unit for that species, where data are available and/or based on expert judgement.
3. Migratory/ Congregatory Species	(a) Habitat known to sustain, on a cyclical or otherwise regular basis, ≥ 95 percent of the global population of a migratory or congregatory species at any point of the species lifecycle where that habitat could be considered a discrete management unit for that species.	b) Habitat known to sustain, on a cyclical or otherwise regular basis, ≥ 1 percent but < 95 percent of the global population of a migratory or congregatory species at any point of the species lifecycle and where that habitat could be considered a discrete management unit for that species, where data are available and/or based on expert judgement. (c) For birds, habitat that meets BirdLife International's Criterion A4 for congregations and/or Ramsar Criteria 5 or 6 for Identifying Wetlands of International Importance. (d) For species with large but clumped distributions, a provisional threshold is set at ≥ 5 percent of the global population for both terrestrial and marine species. (e) Source sites that contribute ≥ 1 percent of the global population of recruits.

6.2.2 Socio-Economic Resources

6.2.2.1 Socio-Economic Survey

The project is estimated to benefit 100,000 households[11] residing within the six (6) sub-schemes of the four (4) provinces. Paddy rice is the main agricultural production for the benefited households, using the irrigation water from the systems. The assessment of socio-economic situation is to determine the scale of the impacts which they may face.

The socio-economic survey was conducted through various approaches including focus group discussion (FGDs), Key Informant Interviews (KIIs) and household survey.

Qualitative Information

The selection of the communes is conducted based on geographical location of each commune within the sub-schemes, i.e. upstream, middle and downstream. In addition, the commune with larger administrative boundary within the sub-scheme command area will be prioritized. The number of selected communes equal to 70% (14/20) of the total communes within the command areas whereas the number of selected villages represent 37% of the total villages in all sub-scheme (31/83 villages). The result of the number of selected communes and villages for each sub-scheme is presented in Table 6.7.

Table 6.7: The selected communes and villages for consultation in the six (6) sub-schemes

No.	Scheme Name	No. of Commune	No. of Selected Commune	No. of Total Village	No. of Selected Villages
1	Ou Ta Paong	7	4	26	8
2	Lum Harch	5	3	32	9
3	Kropeu Trom	3	2	9	4
4	Yotasass	1	1	5	3
5	Stoeung Krang Bat	2	2	2	2
6	Brambei Mom	2	2	9	5
Total		**20**	**14**	**83**	**31**

The consultations which were conducted including Focus Group Discussion (FGD) and Key Informant Interviews (KII). The question guides for KIIs with Farmer Water User Group (FWUG), Community Forestry (CF), Community and Fisheries (CFi) will be asked on relevant aspects to their situation and impact from the project. Vegetable farmers, rice farmers, poultry farmers and agricultural cooperatives (ACs) will be also consulted to understand changes as per the result of the project, both positive and negative. The identified list of KII is provided in Table 6.8 below:

Table 6.8: List of identified KIIs at local level

No.	Scheme Name	# of KII			
		FWUG	CF/CFi	AC	Total
1	Ou Ta Paong	1	1	3	5
2	Lum Hach	1	2	1	4
3	Kropeu Trom	1	1	3	5
4	Yotasass	1	1	1	3
5	Stoeung Krang Bat	1	0	1	2
6	Brambei Mom	1	1	1	3
Total		**6**	**6**	**10**	**22**

[11] The latest figure from the engineering team of CAISARP

KII = Key Informant Interviews, FWUG = Farmer Water User Groups, CF/CFI = Community Forestry/Community Fisheries, AC = Agricultural Cooperatives.

List of tools used for data collection of each group is provided as Annexes.

In addition, 30% of the FGDs will be given to the vulnerable groups for the number of FGDs in the target villages. The figures of the FGDs are provided in Table 6.9.

Table 6.9: List of FGDs to be consulted for agricultural production

No.	Scheme Name	No. of Selected Villages	# of FGDs				
			Veg. Farmers	Rice Farmers	Chicken Farmers	Duck Farmers	Total
1	Ou Ta Paong	8	3	6	2	2	**13**
2	Lum Hach	9	3	6	2	2	**13**
3	Krapeu Truom	4	3	3	2	2	**10**
4	Yutasas	3	3	3	2	2	**10**
5	Stoeung Krang Bat	2	1	2	1	1	**5**
6	Brambei Mom	5	3	4	2	2	**11**
Total		**31**	**16**	**24**	**11**	**11**	**62**

FGDs = Focus Group Discussions, Veg. = Vegetables.

Quantitative Information

As per the household survey is also important, the household survey was conducted to gather additional information regarding socio-economic data at household level. The calculation of sample size for the survey used the following formula:

$$x = Z^2 * r * (100 - r)$$

$$n = \frac{N * x}{(N-1)E^2 + x}$$

Where (Z) is confidence level, (r) is sample proportion rate, and (E) is error margin. Using the margin error of 6%, confidence level of 95%, sample proportion rate at 50%, the number of sample size to be interviewed is calculated at 263. The project rounded the number to 270 HHs. This sample size is distributed across the 3 target ESCMP sub-schemes and types of the benefits they are expected to obtain from the project. The proposed sample size and distribution is provided in Table 6.10.

Table 6.10: Sample sizes for socio-economic data collection at household level

No.	Scheme Name	No. of HHs	HH Survey		
			Beneficiary HHs	Potentially Adversely Affected HHs	Total
1	Ou Ta Paong	15,000	95	45	140
3	Krapeu Truom	700	45	20	65
4	Yutasas	650	45	20	65
Total		**16,350**	**185**	**85**	**270**

HH = Household.

6.2.2.2 Cultural Heritage and Archaeology

Through the consultation with the Provincial Department of Cult and Religion in each province and, all reported archaeological and cultural heritage locations were recorded for each sub-

scheme to generate the . Then, the consultations were conducted with relevant authorities as applicable to determine any potential negative impacts on cultural heritages so that the construction can be avoided and mitigation measures can be proposed, if not avoidable.

Key questions regarding the cultural heritages and archaeological sites were included in the KIIs with provincial department of culture and fine art, district governors, and commune leaders.

6.3 PHYSICAL AND ENVIRONMENTAL CONDITIONS

6.3.1 Geological Conditions

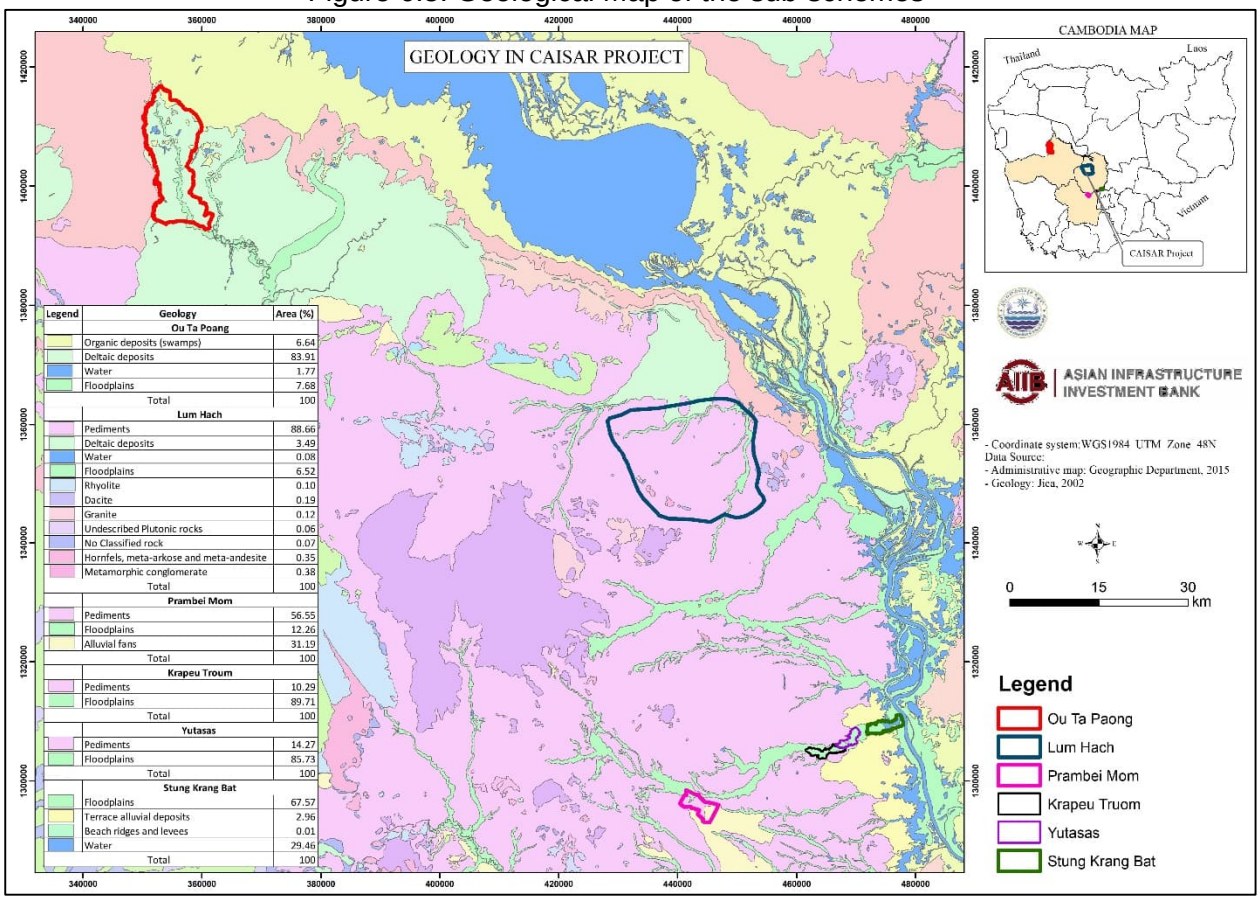
6.3.1.1 Ou Ta Poang

The geology of Ou Ta Poang is predominantly characterized by deltaic deposits, which cover 83.91% of the area, indicating that this region is primarily formed by sediment deposits from rivers, likely contributing to fertile land. Organic deposits, which are found in swamp areas, make up 6.64%, suggesting the presence of wetlands that might play a role in sustaining biodiversity. Floodplains account for 7.68%, indicating seasonal flooding, while a small portion, 1.77%, is water, likely from rivers or lakes within the area.

6.3.1.2 Lum Hach

The geology of Lum Hach is dominated by pediments, which make up 88.66% of the area. These gently sloping rock formations suggest significant erosion processes shaping the landscape. The sub-scheme has minor deltaic deposits (3.49%) and floodplains (6.52%), indicating some water-influenced geological features. Additionally, small percentages of various rock types such as rhyolite, dacite, granite, and metamorphic rocks reflect a diverse and complex geological structure, with potential implications for mineral resources or variations in soil properties.

6.3.1.3 Stung Krang Ponley



Prambei Mom. Prambei Mom is primarily composed of pediments, covering 56.55%, indicating the dominance of weathered rock formations. Alluvial fans account for 31.19%, suggesting areas where sediments are deposited by flowing water, often near mountain bases. Floodplains occupy 12.26%, reflecting regions that are seasonally flooded and may be important for agriculture or water management.

Krapeu Troum. The geology of Krapeu Troum is overwhelmingly characterized by floodplains, which cover 89.71% of the area, indicating that the region is highly influenced by periodic flooding, likely contributing to fertile soils for agricultural use. Pediments, which account for the remaining 10.29%, suggest some areas of more stable and eroded rock formations.

Yutasas. Yutasas is dominated by floodplains, which constitute 85.73% of the area, indicating frequent flooding and fertile soil suitable for agricultural practices. Pediments cover 14.27% of the area, suggesting some eroded rock formations. This geological composition highlights the importance of water management in this sub-scheme due to the extensive floodplain areas.

Stung Krang Bat. The geology of Stung Krang Bat is mainly composed of floodplains (67.57%), which indicates a landscape shaped by seasonal flooding, likely suitable for farming. Water bodies cover 29.46% of the area, emphasizing the significance of water features in this region. Terrace alluvial deposits make up a small portion (2.96%), which could represent old floodplain areas, while beach ridges and levees, though minimal (0.01%), suggest some coastal or riverine features.

Figure 6.5: Geological Map of the sub-schemes

Legend	Geology	Area (%)
	Ou Ta Poang	
	Organic deposits (swamps)	6.64
	Deltaic deposits	83.91
	Water	1.77
	Floodplains	7.68

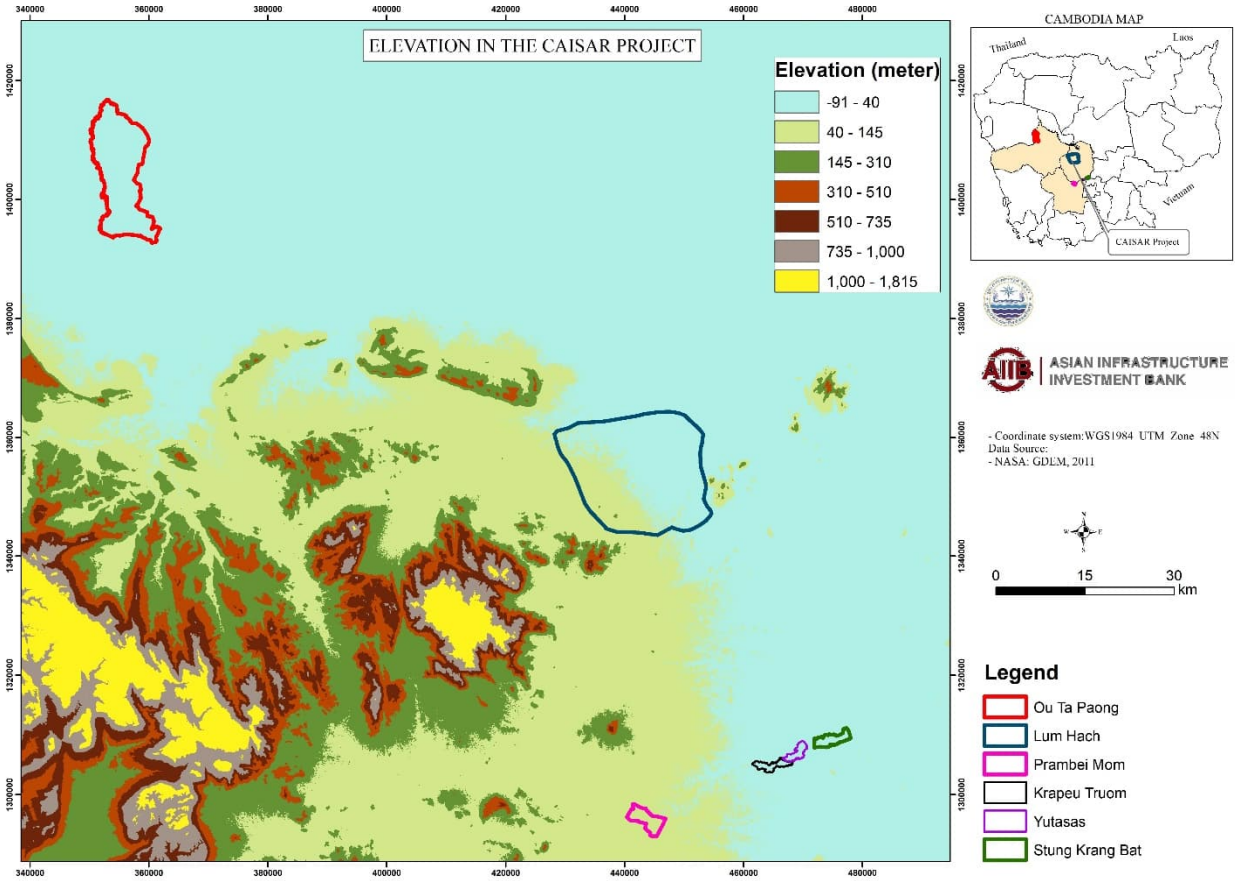
(Source: ESCIA Study 2024)

6.3.2 Topography

6.3.2.1 Ou Ta Paong

Ou Ta Paong lies at a low elevation of less than 40 meters, indicative of flat, low-lying terrain. This relatively low elevation, combined with its predominant deltaic deposits and floodplains, suggests a region that is prone to seasonal flooding and is likely situated near river systems or coastal plains. The flat terrain, coupled with its elevation, makes it well-suited for agriculture but vulnerable to waterlogging.

6.3.2.2 Lum Hach



Lum Hach features a more varied topography, with some areas having an elevation between 40 and 145 meters and others below 40 meters. The higher elevation areas (40-145 m) are likely associated with pediments, suggesting gently sloping terrain or foothills that may have experienced significant erosion. Meanwhile, the lower elevation areas (<40 m) are likely to be

floodplains or deltaic regions, indicating a mix of flat and slightly undulating landscapes. The variation in elevation indicates more diverse landforms and potential differences in land use practices.

6.3.2.3 Stung Krang Ponley

Prambei Mom. Prambei Mom is situated in an elevation range between 40 and 145 meters, indicating moderate terrain with gentle to more noticeable slopes, particularly in pediment areas. The presence of alluvial fans further supports the idea of sloping land, as they are formed by sediment deposition on sloped surfaces. The higher elevation, relative to the other sub-schemes, suggests that the region might have less flooding risk compared to the floodplains, but the terrain is still conducive to water flow and drainage from nearby hills or mountains.

Figure 6.6: Topographical map of the project area

(Source: ESCIA Study 2024)

Krapeu Troum. The sub-scheme, with an elevation of less than 40 meters, has a predominantly flat topography. This low-lying region is dominated by floodplains, reflecting its susceptibility to seasonal flooding and water accumulation. The low elevation also suggests proximity to rivers, lakes, or coastal areas where sediment deposition has shaped the landscape. The flat terrain at this low elevation is likely ideal for wetland ecosystems or agriculture but may require careful water management.

Yutasas. The area is another low-elevation sub-scheme with terrain less than 40 meters. The topography here is mostly flat, with large expanses of floodplains. The presence of pediments suggests there may be minor elevations or gentle slopes within the otherwise flat landscape.

However, the general topography is primarily low-lying, prone to seasonal floods, and likely situated near river systems. This type of terrain is typically fertile but may face waterlogging challenges.

Stung Krang Bat. Stung Krang Bat is characterized by low-lying terrain with an elevation of less than 40 meters, like several other sub-schemes. The predominance of floodplains and significant water bodies at this elevation indicates that the region is flat, with large areas subject to periodic flooding. The overall flatness and low elevation suggest that the region may be part of a larger river basin or coastal plain, contributing to fertile soil and abundant water resources, but also presenting challenges related to flood risk management.

6.3.3 Land Cover and Water Use

6.3.3.1 Ou Ta Paong

The majority of the command area consists of existing rice fields interspersed with fragmented bushes, particularly along streams and rivers. Agricultural land dominates the Ou Ta Paong Command Area, covering approximately 80% of the total area. Soil fertility is relatively high, with 69% classified as high-productivity soil and 31% as medium-productivity soil. This fertility is largely attributed to the lowland nature of the area, with its northern section situated within the active floodplain of the Tonle Sap, which experiences annual flooding.

Farmers in the area typically cultivate two to three rice crops per year, making intensive use of the soil. Dry-season rice crops generally yield higher production per hectare due to the selection of rice varieties suited for this period and the increased application of fertilizers. With improved drainage and a more reliable water supply, the Ou Ta Paong Command Area has the potential to support up to three rice crops annually. Additionally, between rice cropping cycles, farmers may have opportunities to grow vegetables. However, most farmers remain reluctant to cultivate three rice crops per year, and vegetable cultivation is currently limited due to the lack of a reliable water source.

Water management in the command area faces several challenges. Inaccurate cultivation data, particularly the underreporting of actual cultivated areas, affects planning and resource allocation. Water shortages are also a major concern, as high demand often exceeds the available supply based on PDoWRAM guidelines. Conflicts in water allocation arise due to noncompliance with distribution rules, while some farmers neglect field maintenance and do not participate in water distribution or monitoring activities. Mismanagement further exacerbates the situation, with water gates often left open, leading to unnecessary water loss, while community representatives struggle to provide adequate oversight. Unauthorized water usage during off-hours, particularly between 10 p.m. and midnight, is another significant issue, as some individuals extract water when monitoring is unavailable. Addressing these challenges will require improved water governance, strengthened monitoring mechanisms, and greater farmer participation in sustainable water management practices.

6.3.3.2 Lum Hach

Currently, only 30% of the Command Area is agricultural land, while the remaining area consists of degraded forest and grassland. This is expected to change under the CAISAR project, as a more reliable water source is introduced. With an improved water supply, dry-

season rice cultivation would become feasible. Additionally, with availability of water, farmers will have opportunities to diversify into alternative horticultural crops such as cucumber, watermelon, and pumpkin between wet-season rice cycles. This diversification will help improve soil organic content and mitigate the negative effects of intensive rice cultivation, which often inhibits soil rejuvenation. One of the key challenges in the area is the insufficient water supply for pumping, as the stream frequently runs dry after each pump cycle. The village canal currently lacks a designated management authority, and all farmers collectively share the responsibility for its maintenance.

6.3.3.3 Krang Ponley

The land cover across all four sub-schemes is predominantly rice fields, with only a limited presence of bushes along streams, rivers, and the edges of the rice fields. Sharing the same water sources, farmers in this irrigation system face several key challenges, including water shortages during the dry season, limited market access, pest infestations, and conflicts arising from water scarcity. These issues are primarily driven by the lack of reliable water sources and the impacts of climate change, which have extended the duration of dry seasons. During the dry season, the canal frequently lacks sufficient water, and if there is no rainfall at the start of the wet season, the canal remains dry. Additionally, inefficient irrigation management results in water losses, while extreme heat negatively affects market conditions.

One of the most critical concerns is the water shortage during the rice reproductive stage, as there is no consistent water supply to the fields, leading to significant crop damage. Farmers are often forced to wait for water, which only reaches them after upstream farmers have secured an adequate supply. The Water User Community is responsible for managing the irrigation system, but the current canal infrastructure presents challenges, as the canals are shallow and can only store a limited amount of water. During the dry season, the canals frequently run dry, forcing villagers to take turns pumping water, a process that is both time-consuming and inefficient.

6.3.4 Soil Types

6.3.4.1 Cambodia

Dr. Crocker travelled across Cambodia to create a map, with a scale of 1 to 1,000,000 and it was publicly published by the Ministry of Agriculture in 1963 (Crocker, Charles D, 1962). The soil of Cambodia is classified into 16 types according to the soil taxonomy of the Ministry of Agriculture, the United States of America. Table below is the detailed information on 16 types of soil in Cambodia (please see in table 6.11).

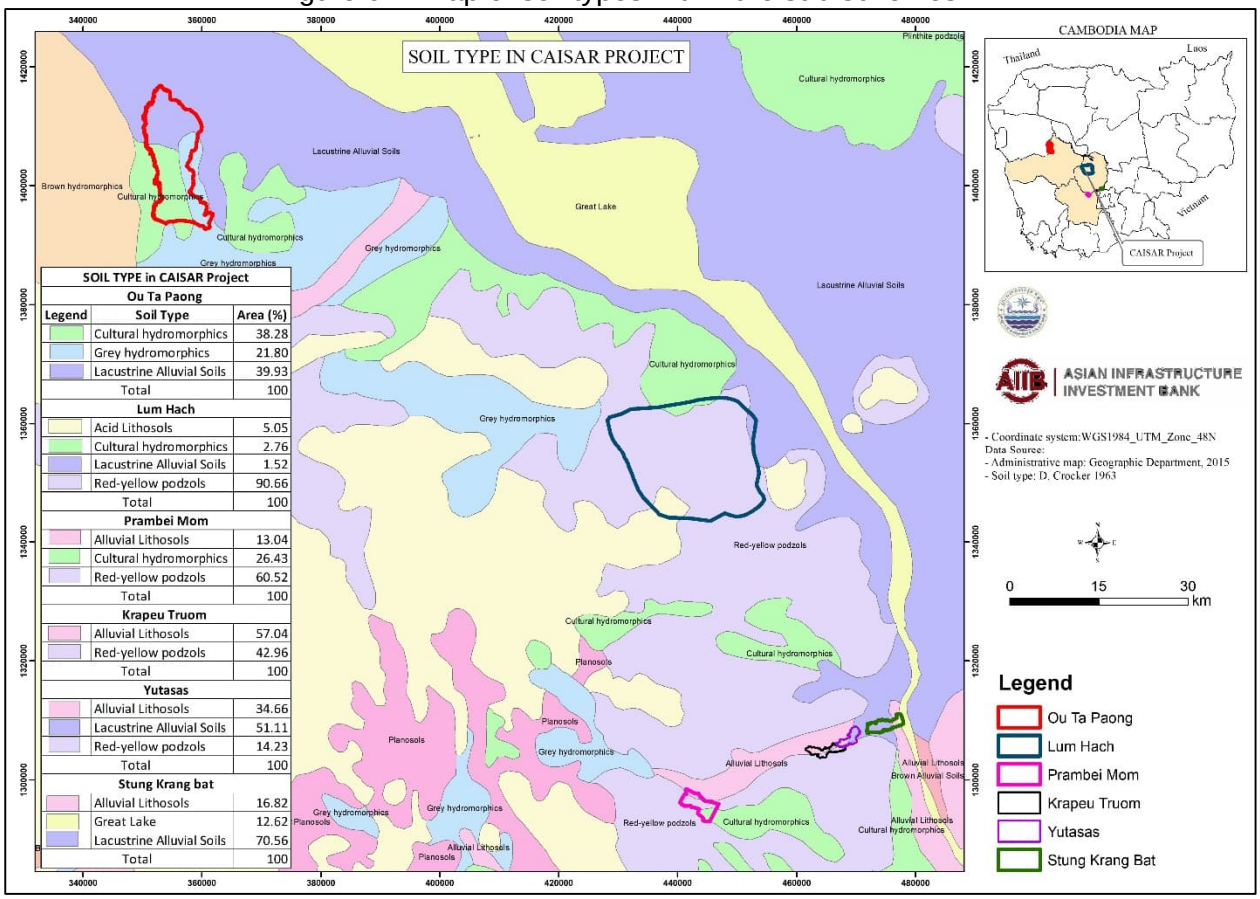


Table 6.11: Soil types and area in Cambodia

No.	Classification	Land area	
		Km^2	%
1	Red, yellow podzols	22,763.00	12.57%
2	Latosols	7,123.00	3.93%
3	Planosols	1,666.00	0.92%
4	Plinthite podzols	17,147.00	9.47%
5	Cultural hydromorphics	12,896.00	7.12%

6	Grey hydromorphics	17,252.00	9.53%
7	Plenthitic hydromorphics	1,275.00	0.70%
8	Brown hydromorphics	6,701.00	3.70%
9	Alumisols	2,782.00	1.54%
10	Regurs	6,570.00	3.63%
11	Acid lithosols	45,271.00	25.01%
12	Basic lithosols	3,418.00	1.89%
13	Alluvial soils	17,064.00	9.43%
14	Brown alluvials	2,764.00	1.53%
15	Lacustrine alluvials	10,373.00	5.73%
16	Coastal complex	2,229.00	1.23%
	Total (land area)	177,295.00	97.94%
	Water area	3,721.00	2.06%
	Total	**181,035.00**	**100.00%**

(Source: Crocker, 1962)

Figure 6.7: Map of soil types within the sub-schemes

SOIL TYPE in CAISAR Project		
Ou Ta Paong		
Legend	**Soil Type**	**Area (%)**
	Cultural hydromorphics	38.28
	Grey hydromorphics	21.80
	Lacustrine Alluvial Soils	39.93

6.3.4.2 Ou Ta Paong

According to the soil type data collected by Dr. Crocker in 1962[12], three (3) distinct soil types were identified within the Ou Ta Paong scheme site including Cultural hydromorphics, Gray hydromorphics, and Lacustrine alluvial Soils. The first type is the cultural hydromorphics soils which human societies interact with, modify, and influenced by water bodies and landscapes over time. This type is characterized by a dense layer beneath the plow as per the continuous changes of soil nutrients due to human interaction including cultural practices, adaptation and modification in combination with hydrological regime influences. The second type is gray hydromorphics, a type of soil characterized by a wet, dry, and watery composition. They typically feature a gray layer overlying a yellow-gray clay layer. Lastly, lacustrine alluvial soils are annual, submerged soils that can accumulate varying amounts of sediment based on the surrounding topography.

6.3.4.3 Lum Hach

The Lum Hach sub-scheme features a diverse range of soil types, each contributing uniquely to the area's agricultural and environmental landscape. The dominant soil type in this region is red-yellow podzols, which make up 90.66% of the area. These soils are characterized by their distinct A2 layer (iron brick) and a B layer with a mix of red, yellow, or gray hues, lacking clear divisions between layers.

In addition to red-yellow podzols, the Lum Hach area includes acid lithosols, cultural hydromorphics, and lacustrine alluvial soils. Acid lithosols cover 5.05% of the sub-scheme and are derived from the underlying bedrock in the hilly and foothill regions of Cambodia, characterized by their acidic nature. Cultural hydromorphics, occupying 2.76% of the area, are notable for their dense layer beneath the plow, distinguishing them from other soil types. Lacustrine alluvial soils, which cover 1.52% of the sub-scheme, are periodically submerged soils that accumulate sediment influenced by local topography.

6.3.4.4 Stung Krang Ponley

Stung Krang Ponley area, encompassing the Brambei Mom, Krapeu Truom, Yutasas, and Steung Krang Bat sub-schemes, features a diverse range of soil types that influence land use and agricultural practices. The distribution of these soil types varies significantly across the different sub-schemes, affecting their suitability for various uses.

Brambei Mom is characterized by three (3) predominant soil types. The most widespread is red-yellow podzols, covering 60% of the area. This type is followed by cultural hydromorphics, which occupy 26.43% of the site. Alluvial lithosols are present but constitute a smaller proportion at 13.4%. This distribution suggests that red-yellow podzols are the primary soil type influencing land use in the Brambei Mom project area, with the other types providing supplementary characteristics.

Krapeu Truom also features a two-soil type distribution but with a different balance compared to Brambei Mom. Alluvial lithosols dominate 57.04% of the area, while red-yellow podzols make up 42.96%. This balance indicates that alluvial lithosols are the more prevalent soil type,

[12] Crocker, Charles D. (1962). *The general soil map of the Kingdom of Cambodia and the exploratory survey of the soils of Cambodia*.

which may influence agricultural practices and land management strategies within the project area.

Yutasas presents a diverse soil composition with three (3) types present. Lacustrine alluvial soils are the most common, covering 51.11% of the area, followed by alluvial lithosols at 34.66%. Red-yellow podzols are less common, comprising 14.23% of the site. The predominance of lacustrine alluvial soils suggests their significant role in shaping agricultural and land use practices in the Yutasas area.

Steung Krang Bat is characterized by a predominance of lacustrine alluvial soils, which cover 70.56% of the area. This is followed by alluvial lithosols at 16.82% and great lake soils at 12.62%. The dominance of lacustrine alluvial soils highlights their importance in the land management and agricultural planning of the Steung Krang Bat project site. The smaller proportions of the other soil types indicate their supplementary roles in the overall soil profile of the area.

6.3.5 Hydrological Resources

6.3.5.1 Cambodia

Cambodia has considerable water resource potential, with abundant surface water and aquifers and a high level of seasonal rainfall. In spite of the abundance of water sources, many areas in the central plains and plateaus lack water in the dry season and are therefore dependent on unreliable rainfall patterns. The country's water resources are dominated by the Mekong River system (86% of country's territory), including the catchments of the Bassac River, the Tonle Sap River, and the Lake Tonle Sap and its tributaries[13], and the river system flowing into the Gulf of Thailand (remaining 14%) as per shown in Figure 6.8.

Figure 6.8: River Basin Groups in Cambodia

[13] The Mekong River and Lake Tonle Sap are connected by the Tonle Sap River, which twice a year reverses its direction of flow. From July to October, when the level of the Mekong is high, water flows into the Tonle Sap River, which fills Lake Tonle Sap, thereby increasing the size of the lake from 2,600 km^2 to about 10,500 km^2 at its maximum. The storage capacity of Lake Tonle Sap is estimated at 72 km^3. In November, when the level of the Mekong decreases, the Tonle Sap river reverses its flow, and water flows from Lake Tonle Sap to the Mekong river and thence to the Mekong Delta (https://wateractionhub.org/geos/country/37/d/cambodia/).

(Source: Ministry of Water Resources and Meteorology, 2019)[14]

However, **75% renewable freshwater comes from upstream transboundary** sources via the Mekong River system (355.5 km^3/year of surface water), mainly from Lao PDR (91.3%), but also Thailand (8.4%) and Viet Nam (0.3%). As an intermediate basin country, up to 471.51 km^3/year of surface water flows out of the country to Vietnam through the Mekong and its tributaries. This emphasizes the critical inter-dependency of Mekong states, and their sensitivity to the actions of neighboring countries, particularly those that are upstream[15]. In terms of groundwater, 17.6 km^3/year is estimated to be produced in-country, although there is no register of transboundary for inflow or outflow of groundwater.

Agriculture accounts for 96% of all **water use,** domestic rural use 1%, and industry, domestic urban, and aquaculture use less than 1%16. Although the amount of water used is estimated to be only about 2% of total surface water volume[17], water shortages do occur during the dry season, especially in the Tonle Sap River system—due to the lack of stored water and limited access to water. [18] Cambodia's water resources sector faces a range of multisectoral, geographical, and hydro-meteorological issues. The Mekong River, particularly the Lower Mekong Basin (LMB), has been identified as a region that is highly vulnerable to the impacts of climate change, more frequent and intense. Climate change is affecting the water cycle, bringing change in the hydrology of major rivers and tributaries as well as groundwater recharge. Recurrent floods occurred in the last decade, with important economic losses,

[14] Irrigated Agriculture Improvement Project: National Water Resources Data Management Center and Water Resources Information System Report

[17] ADB. 2014. Cambodian National Water Status Report 2014. Phnom Penh.
[18] https://MoWRAM.adb.org/sites/default/files/publication/689106/adb-brief-171-surface-water-resouces-rbgs-cambodia.pdf

mainly on rice crops, but also people's lives[19]. Farmers, who depend on rain-fed agriculture, will be increasingly at risk of disasters, and especially droughts and floods, causing severe damage to rice harvests[20]. In short, Cambodia faces the common climate change challenges of **too much** water in the wet season, **too little** in the dry season, and gradually **too dirty** due the increasing pollution, particularly in populated cities.

The feasibility study report indicates that Cambodia is likely to face changes in water balances and flood regimes due to projected increases in temperature and altered precipitation patterns. An increase in consecutive dry days is expected to worsen water scarcity, especially during the dry season, impacting communities in rain-fed areas around the Tonle Sap more severely than those with year-round access to the Mekong River or irrigation systems.

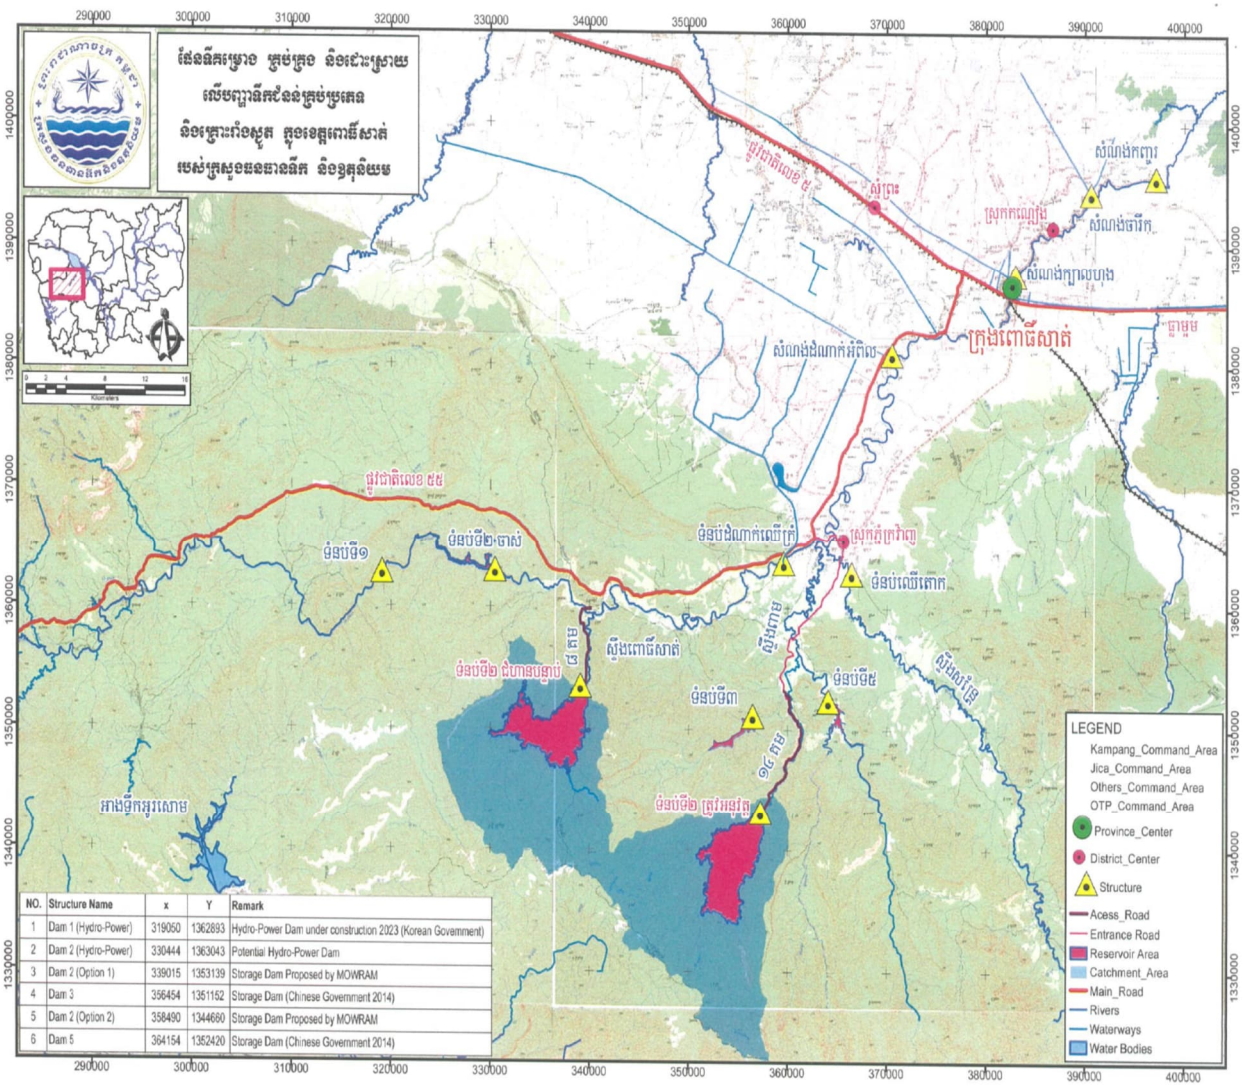
6.3.5.2 Ou Ta Pong

The water sources for irrigation in Ou Ta Paong primarily come from three (3) rivers: the Pursat River, Ou Ta Paong River, and Svay Don Keo River. The Pursat River is the largest water source for Ou Ta Paong, originating approximately 25–35 km upstream and covering a catchment area of around 4,245 km². Water from the Pursat River is stored in three (3) main dams located on the river's tributaries: Dam No. 3, Dam No. 5, and Dam No. 1. The available water from Dam No. 3 and Dam No. 5 is relatively small (24.5 MCM and 25.5 MCM, respectively), while Dam No. 1, currently under construction, is expected to have a storage capacity of 1,014 MCM. However, the primary purpose of Dam No. 1 is hydropower. Downstream of the Pursat River, several headworks have been constructed to store and divert water mainly for irrigation, including Damnak Chheu Krom, Damnak Ampil, and Kbal Hong, which supply water to a series of agricultural lands along the river, primarily for paddy rice cultivation.

In contrast, the Svay Don Keo River is relatively small, with a catchment area of 322 km², and is situated on the left side of the command area. This river runs parallel to the Ou Ta Paong River, with both rivers discharging into Tonle Sap Lake at the end of their watercourses. Due to water diversions along the stream for agricultural production, Ou Ta Paong has now transformed into a series of ponds, especially in the lower part of the river.[21]

The CAISAR Feasibility Study reported that water availability will be adequate at the time that Dam No. 1 is completed, provided there is proper coordination among the stated dams. At the current stage, Pursat Provincial Department of Water Resources and Meteorology (PDoWRAM) has reported that the available water is insufficient for irrigation purposes within the province, with a shortfall of approximately 700 MCM. Additionally, PDoWRAM acknowledged that the water from Dam No. 1 is designated solely for hydroelectric purposes, which may limit the amount available for agriculture or irrigation. There is, however, another dam, Dam No. 2, which was approved by the government in late June 2024. PDoWRAM also reported that the construction is in the process of mobilizing equipment to the site. The

[19] i.e. Floods accounted for 70% of rice production losses between 1998 and 2002, whereas droughts accounted for 20% of those losses. The most recent report on floods showed that the country had lost 40, 45, 188, 250, and 43 lives in 2020, 2014, 2013, 2011, and 2009, respectively. In addition, the economic loss was estimated at USD 1.000, 521, 70, and 132 million due to floods in 2013, 2011, 2010, and 2009, respectively.



[20] Mak Sithirith (2017). Water Governance in Cambodia: From Centralized Water Governance to Farmer Water User Community. MDPI.

[21] MoWRAM. 2024. Report on Screening of Associated Facilities. CAISAR Project.

reservoir for this dam covers 4,016 hectares, with a storage capacity of 861.75 MCM. The dam is expected to be completed by the end of 2026 (Figure 6.9). Earlier projections indicated that the combined water supply from Dam No. 1, Dam No. 3, and Dam No. 5 would likely be sufficient. With the addition of Dam No. 2, it is highly likely that the province's water needs will be fully met.

The current discussion with farmers on water availability at Ou Ta Paong showed that during the periods that the crop requires irrigation, conflicts about water tend to arise. The available water along the river was diverted into the rice field via secondary canals along the river. The limited availability of water regulated from the upstream, mainly the Damnak Ampil canal cannot flow until the end of the river where the river has become a string of ponds, causing some locations of the rivers to have been turned into backyard garden of the residents along the river. As water is limited, water shortage has become the main cause for financial losses. This causes much stress, because of the risk of drought damage to the crops, and the cost of pumping from low water levels. The risks reduce farmers' motivation to invest in new technologies and climate-smart agriculture.

Figure 6.9: Map with Illustration of Dam No. 2

(Source: Pursat PDoWRAM, 2024)

6.3.5.3 Lum Hach

Water availability in the Lum Hach area has been a significant challenge, primarily due to the poor functionality and disrepair of the original irrigation infrastructure. The '1st of January Canal,' constructed in the mid-1970s, was intended to provide water from the Boribo River through a 30 km main canal and branch canals. However, a major flood soon after its completion caused the collapse of the headworks, rendering the canal non-operational. Since then, the canal has been neglected, with its hydraulic gradient too low to transport water effectively. In 2005, a study by JICA identified the potential for irrigation development in the area, focusing on a 3,100-ha command area under the first branch canal. JICA's efforts culminated in the completion of the Lum Hach 1 Scheme in 2020, which included a new barrage and modified canal systems. However, the new lower barrage required additional excavation work to fully re-establish water flow in the canal system.

Despite these improvements, water shortages remain a concern. The lower levels of the new headworks and canals prompted the CAISAR project to explore alternative water sources, including utilizing the network of streams to the southwest of the 1st of January Canal. Additionally, the sparse and inadequate irrigation infrastructure in the area limits the system's ability to function efficiently. Compounding the issue, the Achang Irrigation Scheme, constructed downstream in 2016, now competes for water from the Boribo River. Because the Lum Hach headworks are upstream, they can divert water, leaving the downstream Achang Scheme vulnerable to water shortages. This competition, coupled with the need for further canal excavation and improvements, presents ongoing challenges for reliable water supply in Lum Hach.

6.3.5.4 Stung Krang Ponley

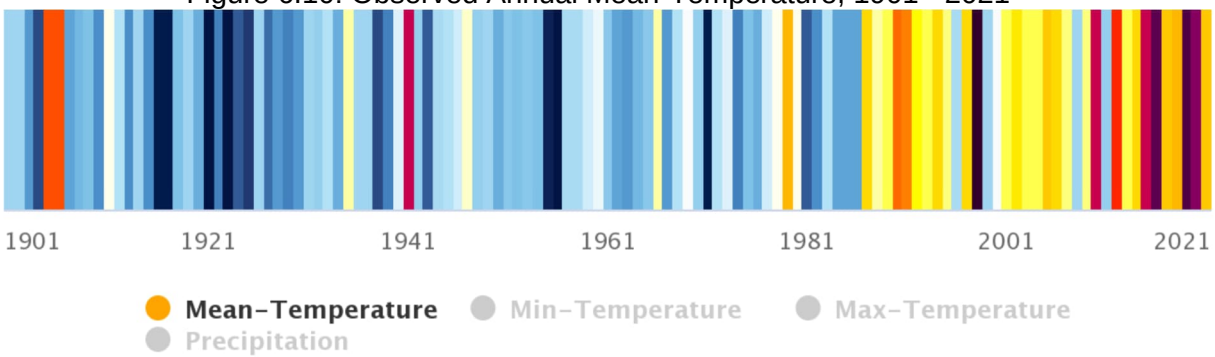
The Stung Krang Ponley irrigation scheme relies on various water sources to support its sub-schemes, with water availability playing a crucial role in agricultural productivity. The Brambei Mom scheme is supplied by the Ou Khley River and its reservoir, completed in 2012 as part of the Krang Ponley Project. The reservoir, covering 67 hectares, supports domestic use and small-scale agriculture, particularly during the dry season. Water is also drawn from the larger Anlong Chrey Reservoir, enhancing the scheme's capacity. However, the system is incomplete, with canals that are too short and in poor condition, requiring rehabilitation. The siltation of the 37-kilometer-long Ou Khley River further complicates water management, leading to frequent flooding and reduced irrigation capacity, especially during the wet season.

Krapeu Truom, another sub-scheme, primarily relies on the Anlong Chrey Reservoir and the Kdol Dam as secondary water sources. The system consists of two (2) main canals, 11 secondary canals, and multiple distribution and check structures. While the canals are largely functional, some design defects have led to damage in the downstream structures. Additionally, the crest elevations of some offtakes are lower than the adjacent rice fields, hindering irrigation. Despite these challenges, the Farmer Water User Community (FWUC), established in 2016, has been successful in managing water distribution, although improvements are needed to enhance overall efficiency.

Yutasas and Steung Krang Bat, the remaining sub-schemes, also depend heavily on water from Anlong Chrey Dam and Kdol Dam. Yutasas, added to the CAISAR project in 2023, is located between Krapeu Truom and Steung Krang Bat, and shares a similar layout with its

neighboring schemes. Steung Krang Bat, with an extensive canal network, includes over 13 kilometers of main canals and over 20 kilometers of drainage canals. While functional, the scheme requires repairs to its crosscheck and offtake structures and extensions to its drainage system. Both schemes face infrastructure challenges but remain vital to the region's irrigation system, with ongoing efforts needed to ensure sustainable water availability.

6.3.6 Climatic Conditions



6.3.6.1 Overview

The feasibility study document of the project highlighted the vulnerability of Cambodia to climate change impacts at a high level, ranked at 12th out of 181 countries in the Global Climate Risk Index between period 1999 and 2018 as its score provided by the Notre Dame Global Adaptation Index between a high-vulnerability score and low-readiness score. The high-risk rating of Cambodia is attributable to geographical condition being highly exposed to climatic extreme events such as floods and droughts, high reliance on agriculture sector and low adaptive capacity of the country given its limited financial, institutional and technical resources. Such a trend has caused the projection of the country's GDP to be reduced by nearly 10% by 2050. It is also reported that the climatic changes will alter how land and natural resources are accessed and used as they are expected to induce geographic shifts in resource productivity and availability and land use patterns. Moreover, the general trend shows that the country will have less rainfall certainty with more and shorter duration and higher intensity posing significant challenges to water resource management of the country.[22]

6.3.6.2 Past Trends

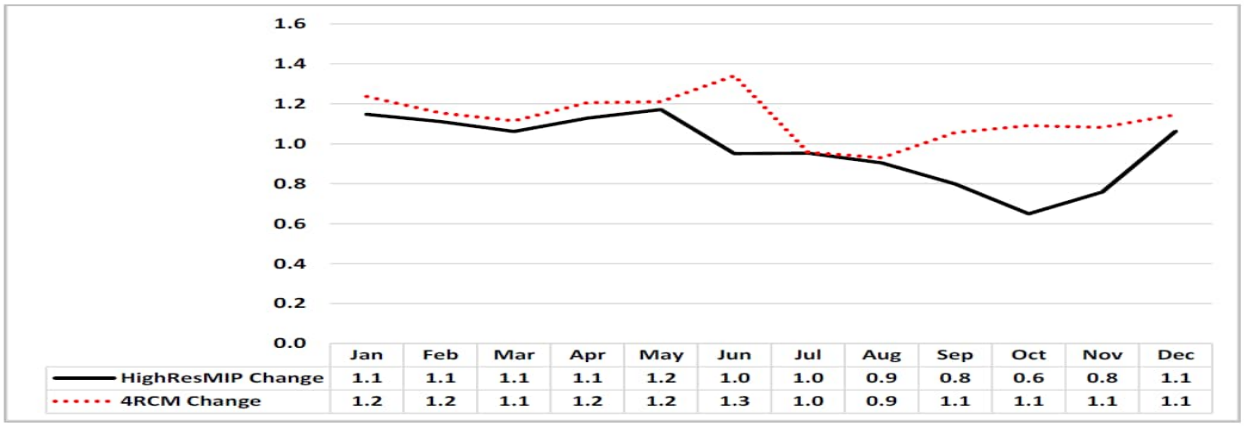
The historical change of the country had been severely impacted by longer dry seasons and more intense "El Niño" related droughts with the delay of the monsoon season; increased rain intensity and frequency, leading to floods; and unexpected dry periods during the rainy season. The increase of the annual mean temperature anomaly in Cambodia is at a rate of 0.23 °C per decade since 1950, with a stronger signal during the dry season along with increasing number of hot days since 1960 to an average of 46 by 2016 (Temperature maximum >35 °C[2]).

Figure 6.10: Observed Annual Mean-Temperature, 1901 - 2021

(Source: ESCIA Study 2024)

[22] WAPCOS (2023). CAISAR Feasibility Study – Main Volume. Ministry of Water Resources, and Meteorology, Cambodia

It was also reported that precipitation across Cambodia varies significantly, ranging from 4,000mm annually near the Cardamom mountains to 1,400mm in the central lowlands, with the CAISAR project areas receiving 1,300–1,500mm mostly during the rainy season (May–October). Rainfall variability is linked to the El Nino Southern Oscillation, which correlates with periods of drought. Historical patterns show that floods and droughts have caused widespread damage to crops, infrastructure, and economic activities, while also increasing water-borne diseases. Although no significant trend in overall precipitation has been statistically confirmed, anecdotal evidence suggests an increase in rainfall intensity, floods, and severe droughts, leading to greater crop yield losses and pressures on authorities to manage these events.



6.3.6.3 Future Trends

According to the Feasibility Study Report, the climate projections for Cambodia indicate an increase in average rainfall, with precipitation becoming more concentrated and leading to dry spells even during the wet season, which may result in more frequent flood events. Additionally, mean temperatures are expected to rise, extending drought periods and potentially causing significant economic impacts. A detailed analysis of the effects of climate change on agriculture reveals that changes in precipitation and temperature will critically affect water availability and crop yields, emphasizing the need for effective adaptation and resilience strategies.

The Climate Vulnerability Analysis (CVA) report – using historical data between 1990 and 2021 – compared historical climate data with future projections for 2026–2050 using various climate models, revealing variability and uncertainty in the results. While some models, such as the 4RCM, showed an annual increase in rainfall of about 6%, others, like HighREsMIP, suggested a slight decrease of around 1%. Seasonal fluctuations were evident, with some months experiencing significant increases in rainfall and others facing notable decreases. These findings highlight the complex nature of climate change predictions and the necessity for thorough analysis beyond annual averages. Overall, the models consistently indicate reduced rainfall during the dry season and increased rainfall during the wet season, which poses challenges for sustainable agriculture in Cambodia and underscores the importance of adaptive measures to cope with changing water availability.

Modelled changes in temperature between the historic period 1995 – 2021 and the future scenario 2026 – 2050 are consistent, with a general projected increase of 1°C. Temperature increases are expected to be marginally higher during the dry season compared to the wet season although there is still some degree of variability observed throughout the year (Figure 6.11).

Figure 6.11: Temperature change factor in °C between ’95-’21 and ’26-‘50

	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
HighResMIP Change	1.1	1.1	1.1	1.1	1.2	1.0	1.0	0.9	0.8	0.6	0.8	1.1
4RCM Change	1.2	1.2	1.1	1.2	1.2	1.3	1.0	0.9	1.1	1.1	1.1	1.1

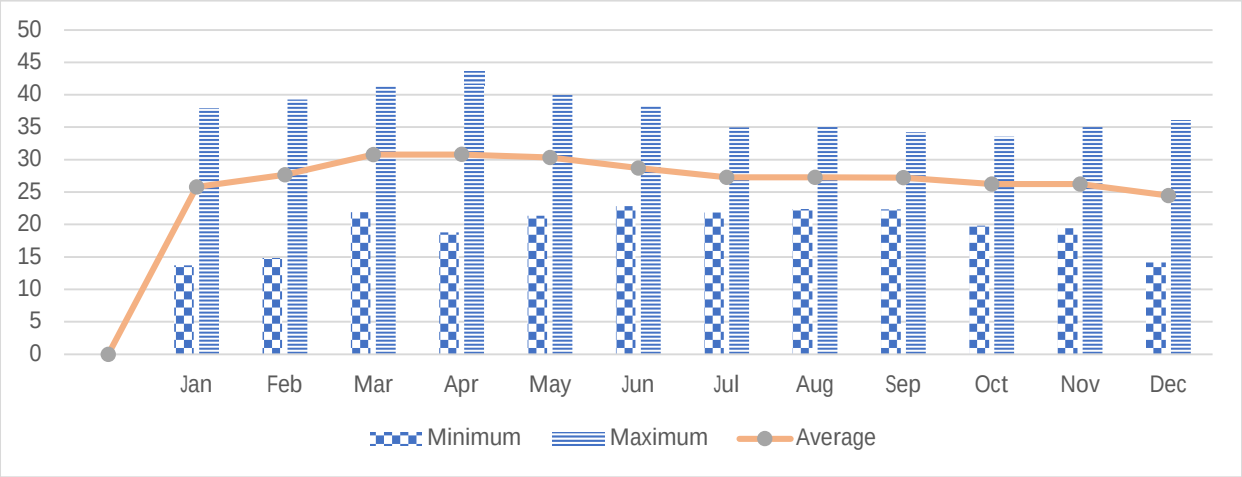
6.3.6.4 *Floods*

The feasibility study report also described Cambodia as the most flood-prone countries in Southeast Asia due to its monsoonal climate condition with two (2) distinct hydrological regimes. There are two (2) main types of flooding in the country: seasonal overflows from the Mekong River, its tributaries, and the Tonle Sap, and flash floods from heavy rains in mountainous areas. Seasonal flooding can be beneficial by providing fertile soil for agriculture, but if it becomes severe, it can cause extensive damage to crops, infrastructure, and communities. Flash floods, often triggered by heavy rains, can destroy crops and damage infrastructure, particularly in the tributaries of the Tonle Sap Lake. Extreme flood events in recent years have led to significant economic losses, crop failures, and infrastructure damage, underscoring the need for improved flood management and disaster preparedness.

Inadequate maintenance of drainage channels and irrigation infrastructure exacerbates the impact of floods, leading to prolonged inundation and increased damage to agriculture and communities. The unpredictability of flood events, influenced by upstream development and climate change, highlights the vulnerability of Cambodia's agricultural sector and rural livelihoods. Understanding the expected annual damage from floods is crucial for managing risks and planning for future impacts, as it helps estimate the long-term economic effects of recurring flood events on rice cultivation and other agricultural activities.

6.3.6.5 *Droughts*

Droughts are a significant hazard in Cambodia, particularly affecting agricultural productivity for rain-fed rice farmers. Droughts are often linked to El Niño events, such as the severe 2015/16 drought that affected 2.4 million people across 18 provinces. During this period, many households reported water shortages, crop failures, decreased agricultural production, and high animal mortality rates, leading to significant income losses. Recent surveys indicate that consecutive years of drought have made farming economically unviable for many, forcing them to seek employment in neighboring countries like Thailand. Climate change is expected to exacerbate drought conditions by increasing the number of consecutive dry days, further straining limited water resources and impacting rain-fed agricultural communities.



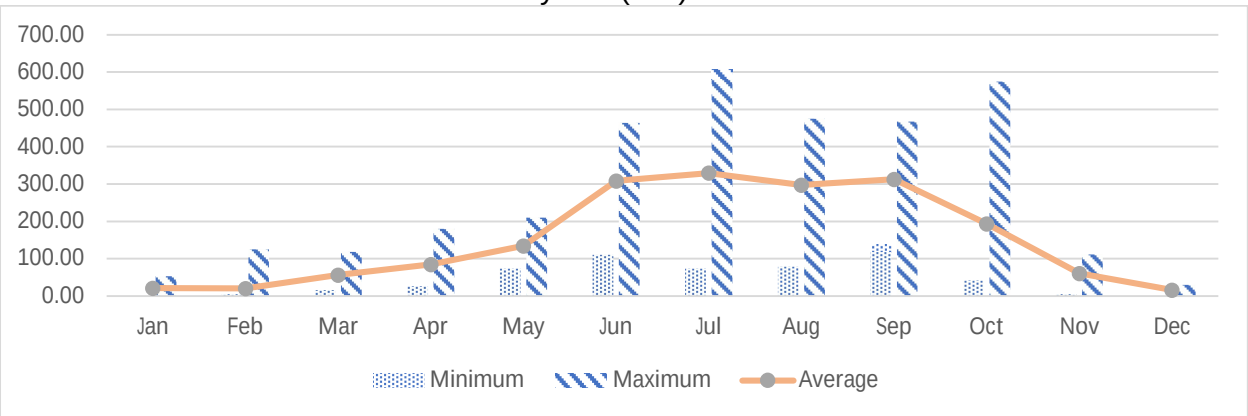
6.3.6.6 *Ou Ta Paong*

Temperature

This temperature study was conducted over the last 10 years (2013-2022) using NASA POWER data. For the last decade, the annual average maximum temperature was 43.55 °C,

the annual average minimum temperature was 13.68 °C, and the annual average temperature was 36.95 °C. In addition, for each 10-year monthly, the lowest minimum monthly temperature was in January at 13.68 °C and the highest maximum monthly temperature in April was 43.55°C.

Figure 6.12: The maximum average and minimum monthly temperature for the last 10 years (°C)

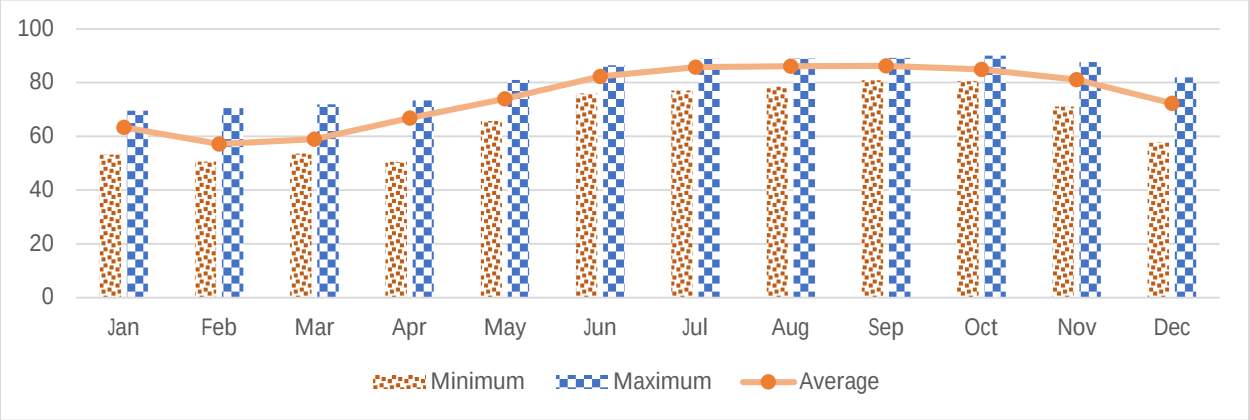


Source: NASA POWER (2024)

Precipitation

According to the latest 10-year rainfall data (2013-2022) by NASA POWER, the average annual rainfall was 1837.37 mm, the minimum annual rainfall was 791.02 mm in 2016, and the maximum annual total was 2591.04 mm in 2022. While the monthly rainfall indicates that July was the month with the highest average monthly rainfall of 329.81 mm, and the lowest average monthly rainfall was December, which had a rainfall of 16.39 mm.

Figure 6.13: The maximum, average, and minimum monthly precipitation for the last 10 years (mm)



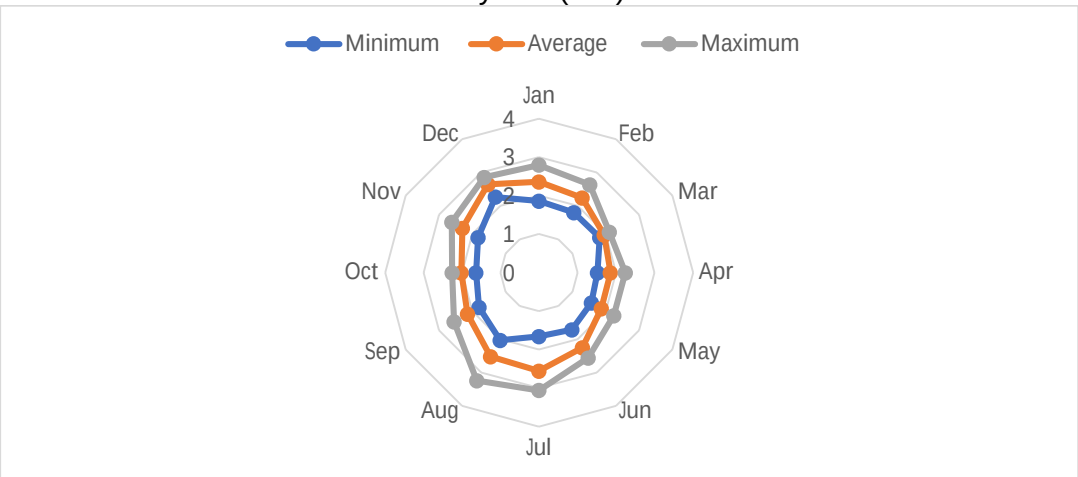
Source: NASA POWER (2024)

Humidity

Humidity data in the Ou Ta Paong scheme area for the last 10 years (2013-2022) show that the annual minimum average humidity was 69.62% in 2016, the maximum annual average humidity was 80.19% in 2022, and the annual average humidity equals 75.01%. On the other

hand, the highest monthly maximum humidity was 90.06% in October, and the lowest monthly minimum humidity was in April at 50.5%.

Figure 6.14: The maximum, average, and minimum monthly humidity for the last 10 years (%)

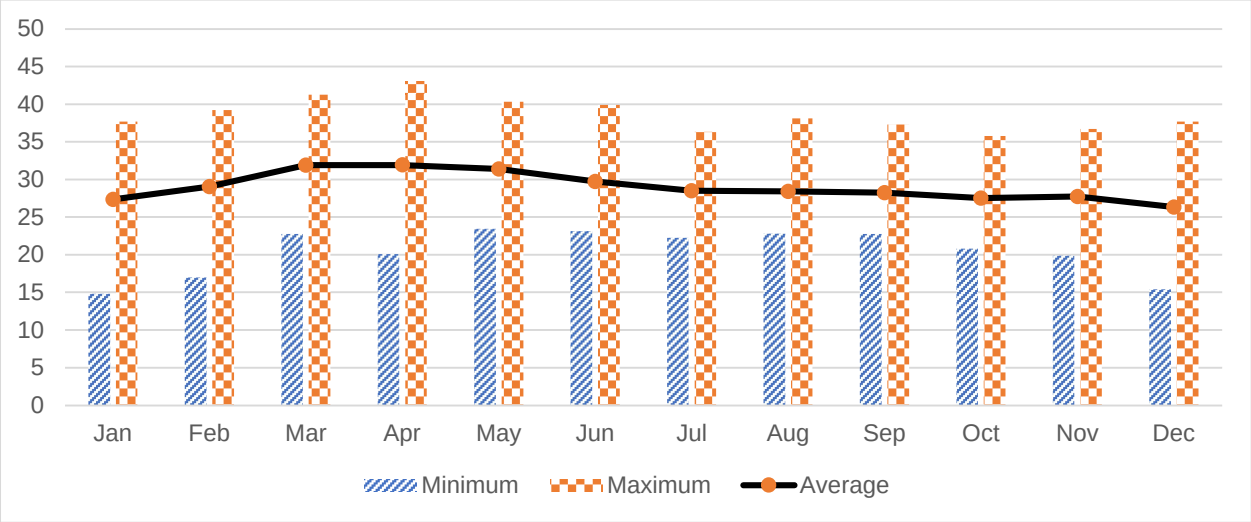


Source: NASA POWER (2024)

Wind speed

The table below shows the monthly wind speed in the Ou Tan Paong scheme area for the last 10 years (2013-2022). The annual minimum wind speed was 2.09 m/s in 2020, the annual average wind speed was 2.23 m/s, and the annual maximum wind speed was 2.38 m/s in 2016. In addition, the lowest monthly wind speed in April was 1.52 m/s, and the maximum wind speed in August was 3.24 m/s.

Figure 6.15: The maximum, average, and minimum monthly wind speed for the last 10 years (m/s)



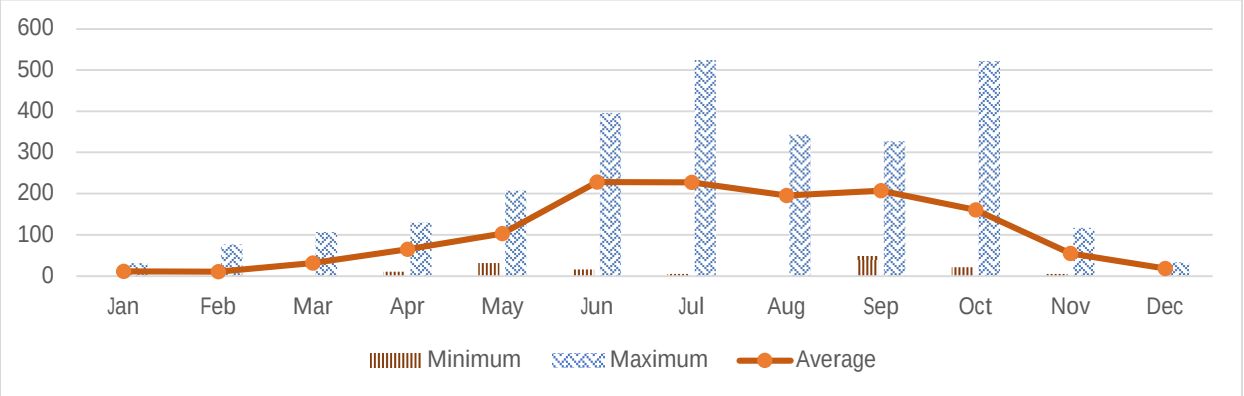
Source: NASA POWER (2024)

6.3.6.7 Lum Hach

Temperature

The table presents monthly temperature data for the Lum Hach scheme area from 2013 to 2022, based on NASA POWER data. In the table below also provides the overall minimum and maximum temperatures recorded during the decade, as well as average monthly and annual temperatures. In fact, the lowest monthly minimum temperature in January was 14.80°C, and the highest maximum temperature in other months was in April at 43.06°C.

Figure 6.16: The maximum, average, and minimum monthly temperature for the last 10 years (°C)

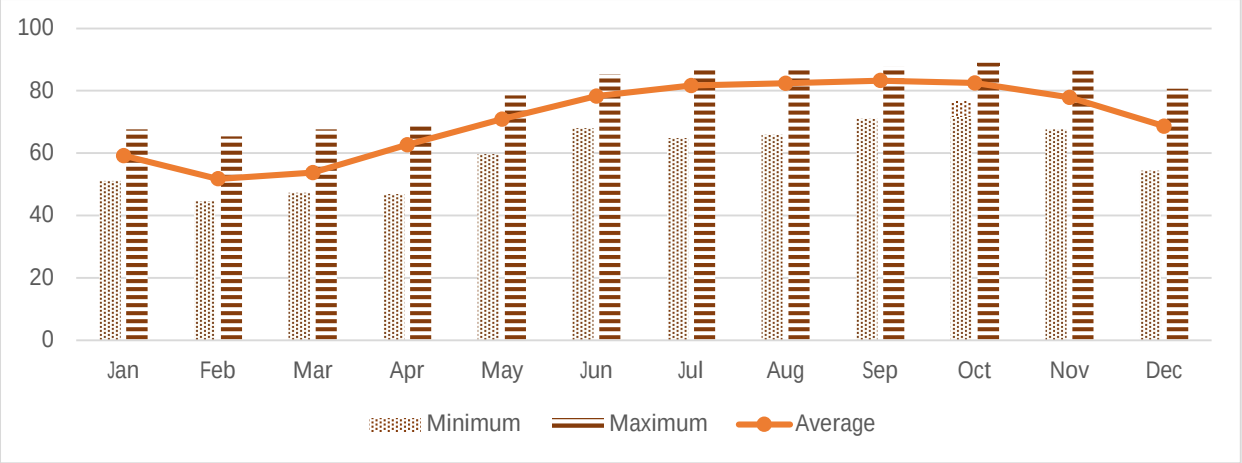


Source: NASA POWER (2024)

Precipitation

The table presents monthly precipitation data for the Hum Hach scheme area from 2013 to 2022. The lowest minimum precipitation recorded was 0 mm in multiple months throughout the decade. The highest monthly precipitation occurred in August 2021, reaching 342.77 mm. This indicates significant rainfall variability in the region, with some months experiencing no precipitation while others receiving a lot.

Figure 6.17: The maximum, average, and minimum monthly precipitation for the last 10 years (mm)

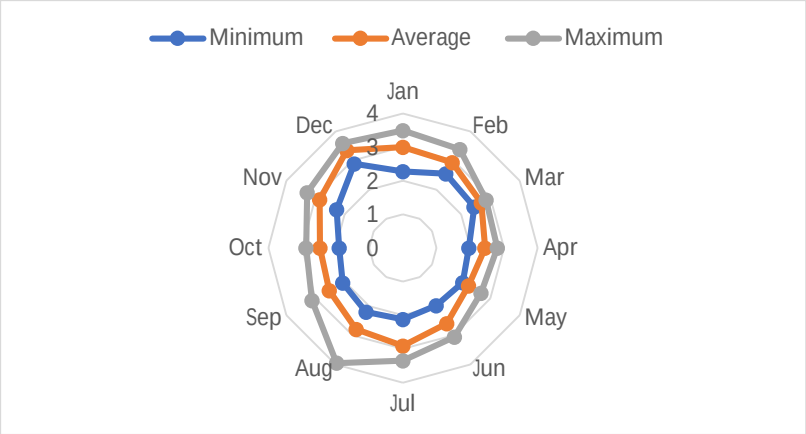


Source: NASA POWER (2024)

Humidity

The table presents monthly humidity data for the Lum Hach scheme area from 2013 to 2022. The annual minimum average humidity was 62.38% in 2016, while the maximum annual average humidity was 77.94% in 2022. Overall, the annual average humidity 71.19% over the decade. Regarding monthly variations, the highest monthly maximum humidity was observed in October 2020 at 89.06%, and the lowest monthly minimum humidity was recorded in February 2014 at 44.56%.

Figure 6.18: The maximum, average, and minimum monthly humidity for the last 10 years (%)

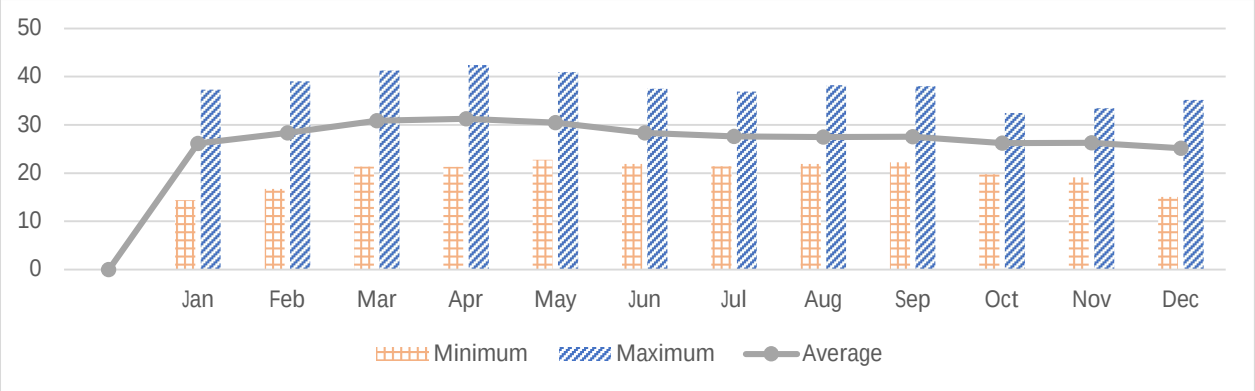


Source: NASA POWER (2024)

Wind Speed

The annual minimum average wind speed was 2.57 m/s in 2014, while the maximum annual average wind speed was 2.98 m/s in 2016 and 2022, and the annual average wind speed was 2.73 m/s over the decade. Regarding monthly variations, the highest monthly maximum wind speed was observed in August 2016 at 3.95 m/s, and the lowest monthly minimum wind speed was recorded in October 2015 at 1.9 m/s.

Figure 6.19: The maximum, average, and minimum monthly wind speed for the last 10 years (m/s)



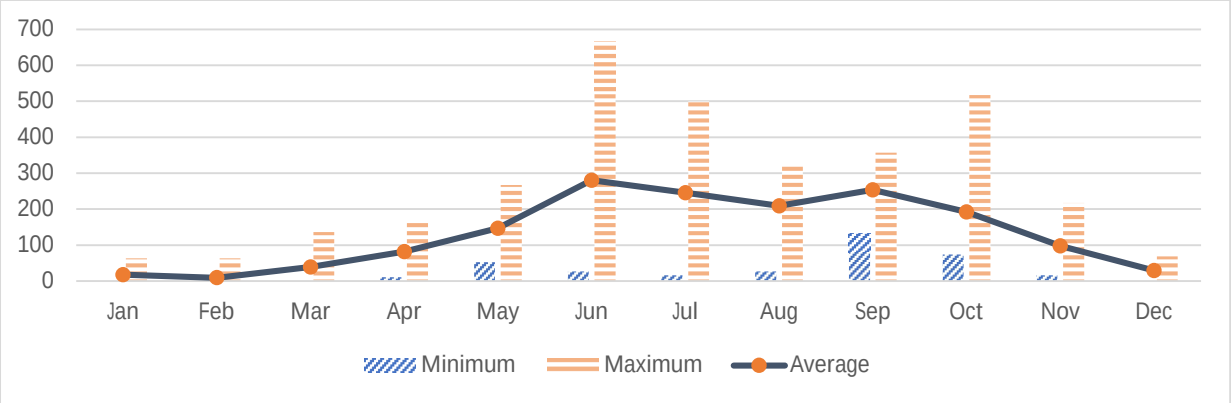
Source: NASA POWER (2024)

6.3.6.8 Stung Krang Ponley

Temperature

Temperatures in the Stung Krang Ponley scheme area for the last 10 years between 2013-2022 using NASA POWER data. According to the table below shown, the annual average temperature was 27.96 °C, the annual average minimum temperature was 14.37 °C in 2014, and the annual average maximum temperature in 2016 at 42.4 °C. Regarding monthly temperature extremes, the lowest minimum temperature of 14.37°C was observed in January, and the highest maximum temperature of 42.4°C occurred in April.

Figure 6.20: The maximum, average, and minimum monthly temperature for the last 10 years (°C)

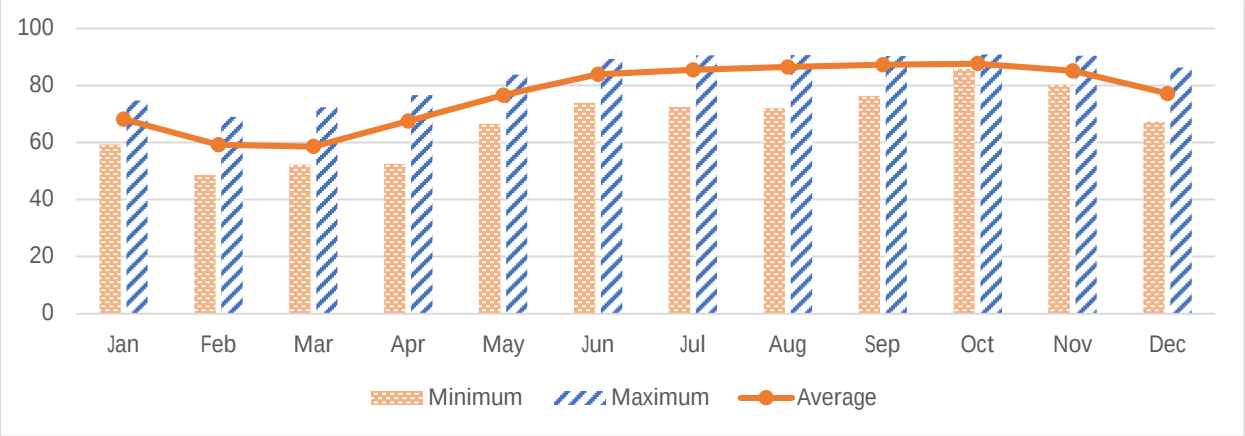


Source: NASA POWER (2024)

Precipitation

The Stung Krang Ponley scheme area shows an average annual precipitation of 1604.14 mm over the decade from 2013 to 2022. The annual minimum precipitation was recorded in 2016 at 653.91 mm, while the annual maximum precipitation occurred in 2020, reaching 2293.95 mm. The lowest minimum rainfall data were found in January, February, March, and December at 0 mm. In October, the highest average monthly rainfall was 516.6 mm.

Figure 6.21: The maximum, average, and minimum monthly precipitation for the last 10 years (mm)

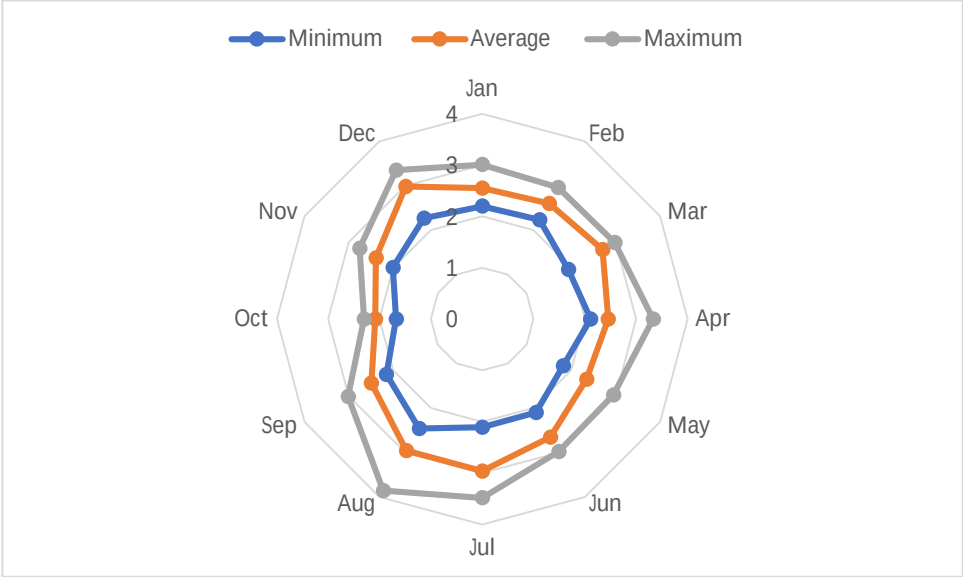


Source: NASA POWER (2024)

Humidity

The table presents monthly humidity data for the Stung Krang Ponley scheme area from 2013 to 2022. The annual minimum average humidity was 69.44% in 2016, while the maximum annual average humidity was 82.81% in 2022. In additional, the annual average humidity was 77.03% over the decade. Regarding monthly variations, the highest monthly maximum humidity was observed in October 2020 at 90.88%, and the lowest monthly minimum humidity was recorded in January 2016 at 48.69%.

Figure 6.22: The maximum, average, and minimum monthly humidity for the last 10 years (%)



Source: NASA POWER (2024)

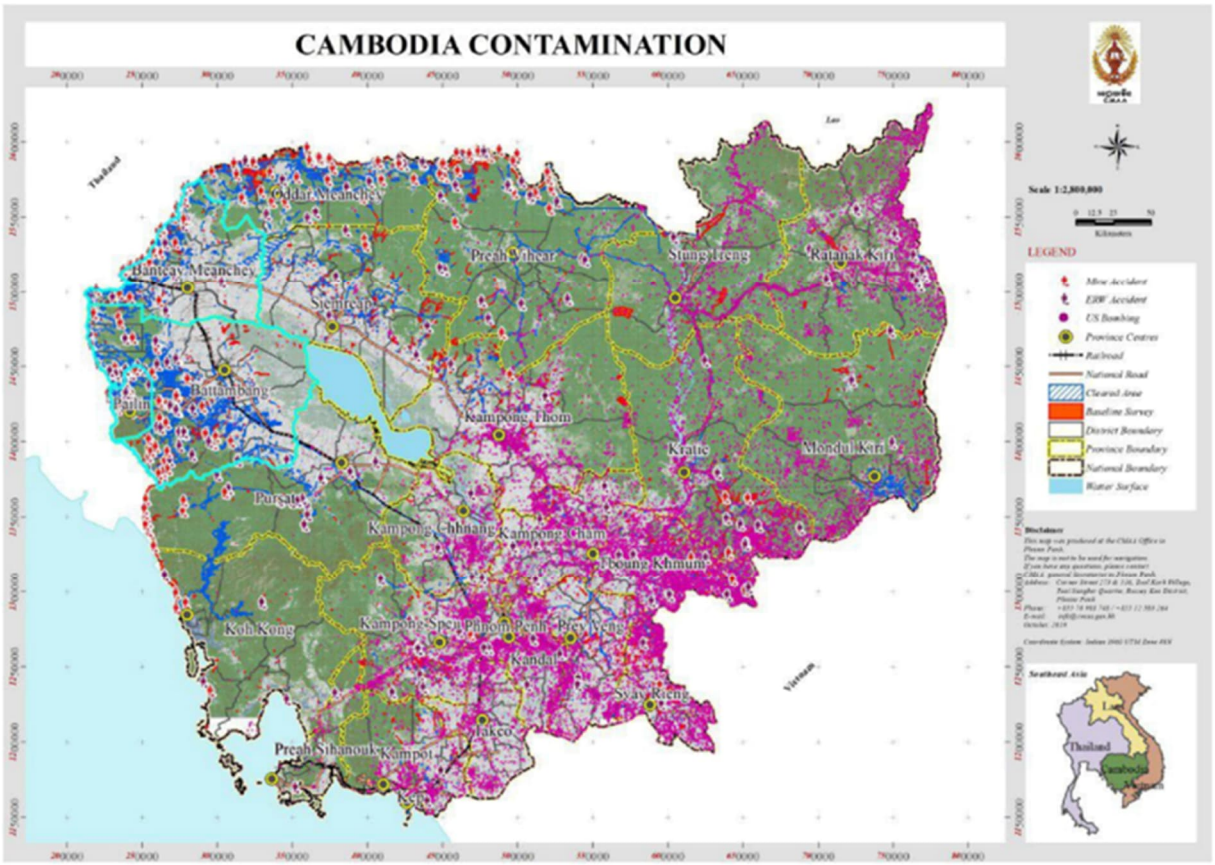
Wind Speed

The monthly wind speed data for the Stung Krang Ponley scheme area from 2013 to 2022. The annual minimum average wind speed was 2.45 m/s in 2022, and the maximum annual average wind speed was 2.85 m/s in 2016. While the annual average wind speed was 2.60 m/s in the last 10 years. Regarding monthly variations, the highest monthly maximum wind speed was in August 2016 at 3.86 m/s, and the lowest monthly minimum wind speed was recorded in October 2013 at 1.68 m/s.

Figure 6.23: The maximum, average, and minimum monthly wind speed for the last 10 years (m/s)

6.4 BASELINE ENVIRONMENTAL QUALITY

6.4.1 Unexploded Ordnances (UXO)



Cambodia remains one of the most heavily landmine-contaminated countries globally, a legacy of decades of conflict that has left a significant portion of its territory affected by landmines and unexploded ordnance (UXO). This contamination poses ongoing threats to safety and hinders socio-economic development, particularly in rural areas. According to the

Cambodian Mine Action and Victim Assistance Authority (CMAA), as of 2023, approximately 1,854 square kilometers of land remain contaminated, affecting more than 1.1 million people.[23]

This contamination has caused thousands of casualties over the years and continues to hinder socio-economic development by restricting land use, infrastructure projects, and agricultural expansion. Among the affected provinces, Pursat, Kampong Chhnang, and Kampong Speu have been identified as high-risk areas due to their history of intense conflict and strategic military significance. While mine clearance operations have made progress in these regions, large tracts of land remain dangerous, necessitating ongoing demining efforts to ensure safety and sustainable development. These provinces are critical for agriculture and infrastructure projects, making landmine clearance an urgent priority to enable safe land use and improve local livelihoods.

For construction projects, strict adherence to mine-related regulations is essential. Before initiating any construction activities, risk assessments and clearance operations must be conducted. This includes engaging professional demining organizations to carry out detailed surveys, safely remove and dispose of any detected UXO, and obtain official clearance certificates from recognized authorities like the CMAA. Ensuring compliance with these legal requirements is not only critical for the safety of construction personnel and future occupants but also aligns with Cambodia's national and international commitments to UXO and landmine management.

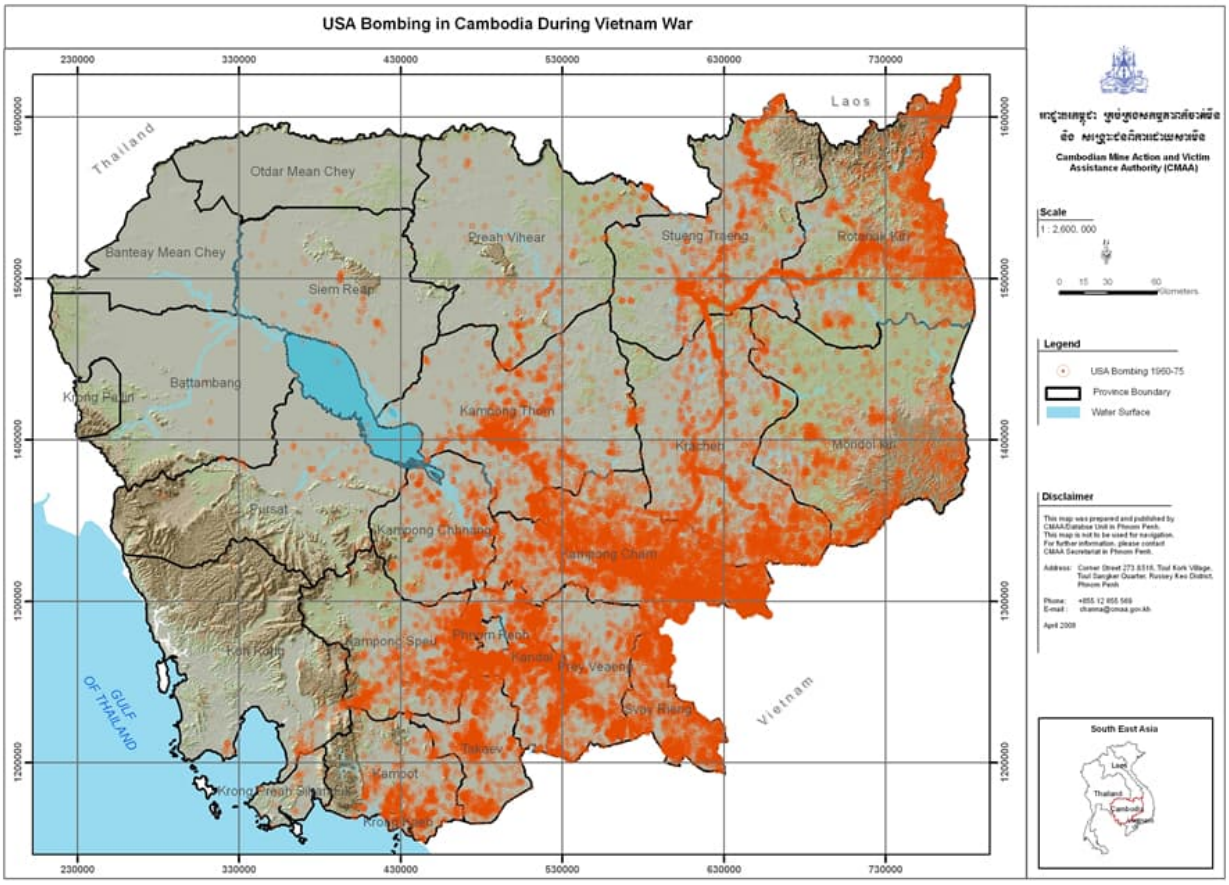


Figure 6.24: The landmine contamination map in Cambodia

[23] Yet another Cambodian province bids farewell to landmines - UCA News

(Source: Cambodian Mine Action and Victim Assistance Authority (CMAA) 2020)

Figure 6.25: Map of USA Bombing in Cambodia

(Source: Cambodian Mine Action and Victim Assistance Authority (CMAA) 2020)

Summary of the result of the landmine reports from local community is provided as Table below:

Table 6.12: Soil types and area in Cambodia

No.	Sub-scheme	Mine and UXO Situation
1	Ou Ta Paong	The location was declared a mine-free area in 2020. However, the last report on mine-explosion was in 2023 in Ou Ta Paong commune, indicating there is still a possibility of mine within the area.
2	Lum Hach	Although province was declared a mine-free area in March 2023, there was still a report on mine-witnessed in 2024 during a road construction in Krang Leav commune.
3	Krang Ponley	The province was declared a mine-free province in October 2023. However, there was a report of mine-discovered in the 2024 in Yutasas sub-scheme.

UXO = Unexploded Ordnance.

6.4.2 Ambient Air quality, Noise and Vibration

6.4.2.1 Air Quality

Overall, air quality in Cambodia has been reported to be at an acceptable level, given limited disturbance and emission of dust and gases within the country. In February 2024, Ministry of Environment (MoE) reported at the average air quality in Cambodia at excellent condition (MoE, 2024). Moreover, the air quality of the project target provinces is excellent, except Pursat which is good in quality. The same sources also reported the level of $PM_{2.5}$ in average in the four (4) provinces were below the permit standard of 50 ug/m^3.

6.4.1.1.1 Ou Ta Paong

At provincial level, the air pollution level is considered moderate[24]. The AQI is 58, which is equivalent to 13.1 µg/m^3. The ambient air quality, noise, and vibration is being linked to increases in industrial development, and the rapid urbanization. However, the Ou Ta Paong sub-scheme is located in the rural settings and about 35km from the major population centers and industrial areas in Pursat town. The baseline ambient air quality, noise and vibration in Ou Ta Paong scheme is considered generally good. Ambient air quality is sometime affected by dust from tillage and unpaved road users, including smoke from burning of rice stubble after harvest. Whilst noise and vibration disturbance are sometime affected by motorist. However, the impacts are minor and short time. In addition, the air testing results from the Damnak Chheu Krom irrigation system in Ta Lou commune, Bakan district, Pursat province located about 15 km from Ou Ta Paong reported that all five parameters (CO, NO2, SO2, TSP, and PM10) followed the standard of the Ministry of Environment at all durations (8 and 24 hours) (See Table below). The result can be referenced as the baseline for the sub-scheme since it is located within the same district and the environment of the area is the same. Further air quality tests can be conducted during the preparation of the domestic EIA.

Table 6.13: Air quality testing result of Damnak Chheu Krom project

No.	Parameter	Unit	Result	Standard
1	Carbon Monoxide (CO)	mg/m^3	0.35	<20 (8 hrs)
2	Nitrogen Dioxide (NO2)	mg/m^3	0.028	<0.1 (24 hrs)
3	Sulfur Dioxide (SO2)	mg/m^3	0.020	<0.3 (24 hrs)
4	Total Suspended Particles (TSP)	mg/m^3	0.088	<0.33 (24 hrs)
5	PM10	mg/m^3	0.044	<0.05 (24 hrs)

(Source: Ministry of Environment, June 2020)

Figure 6.26: Ou Ta Paong Water River Body

Figure 6.27: Kbal Hong Main Canal

[24] https://www.iqair.com/cambodia/pursat, accessed on 23rd September 2024

6.4.1.1.2 Lum Hach

At provincial level, the air pollution level is considered moderate[25]. The AQI is 58, which is equivalent to 12.8 µg/m^3. The Lum Hach scheme is located in the rural settings and about 60km from the major population centers and industrial areas in Kampong Chhnang town. The baseline ambient air quality, noise and vibration in Lum Hach scheme is considered generally good. The air testing results from another project reported that all five parameters (CO, NO2, SO2, TSP, and PM10) followed the standard of the Ministry of Environment at all durations (8 and 24 hours) (See Table below). In addition, the result can be used as the reference for the sub-scheme since the location of the test is only 17 km from the project location. Ambient air quality is sometime affected by dust from tillage and unpaved road users, including smoke from burning of rice stubble after harvest and burning from swidden cultivation activities. Whilst noise and vibration disturbance are sometime affected by motorist. However, the impacts are minor and short time. Further air quality tests can be conducted during the preparation of the domestic EIA.

Table 6.14: Air quality testing result

No.	Parameters	Unit	Testing Result	Standard	Duration
1	CO	mg/m^3	1.970	20	8 hrs
2	NO_2	mg/m^3	0.044	0.1	24 hrs
3	SO_2	mg/m^3	0.137	0.3	24hrs
4	O_3	mg/m^3	0.101	0.2	1hrs
5	Pb	mg/m^3	ND	0.005	24hrs
6	TSP	mg/m^3	0.029	0.33	24hrs

6.4.1.1.3 Stung Krang Ponley

Stung Krang Ponly located in two (2) provinces – Kampong Chhnang and Kampong Speu. At provincial level, the air pollution level in Kampong Chhnang province is considered moderate. The air pollution level in Kampong Speu province also consider moderate. The AQI is 58[26], which is equivalent to 12.7 µg/m^3. The Stung Krang Ponly is in the rural settings; therefore, the baseline ambient air quality, noise and vibration is considered generally good. Ambient air quality is sometime affected by dust from tillage and unpaved road users, including smoke from burning of rice stubble after harvest and burning from swidden cultivation activities. Whilst noise and vibration disturbance are sometime affected by motorist. However, the impacts are minor and short time. The air testing results from another project located about 8 km from Stung Krang Ponley, 6 km from Yotasas, 6 km from Krapeu Troum, and 25 km from Brambei Mom reported that all five parameters (CO, NO2, SO2, TSP, and PM10) followed the standard of the Ministry of Environment at all durations (8 and 24 hours) (See Table below). The actual air quality testing prior and during construction are required to be conducted. Further air quality tests can be conducted during the preparation of the domestic EIA.

Table 6.15: Air quality testing result

Parameters	**Unite**	**Testing Result**	**Standard (MoE)**
CO	mg/m^3	1.237	**20**
NO_2	mg/m^3	0.038	**0.1**
SO_2	mg/m^3	0.062	**0.3**
O_3	ppm	0.074	**0.2**
TSP	mg/m^3	0.018	**0.33**

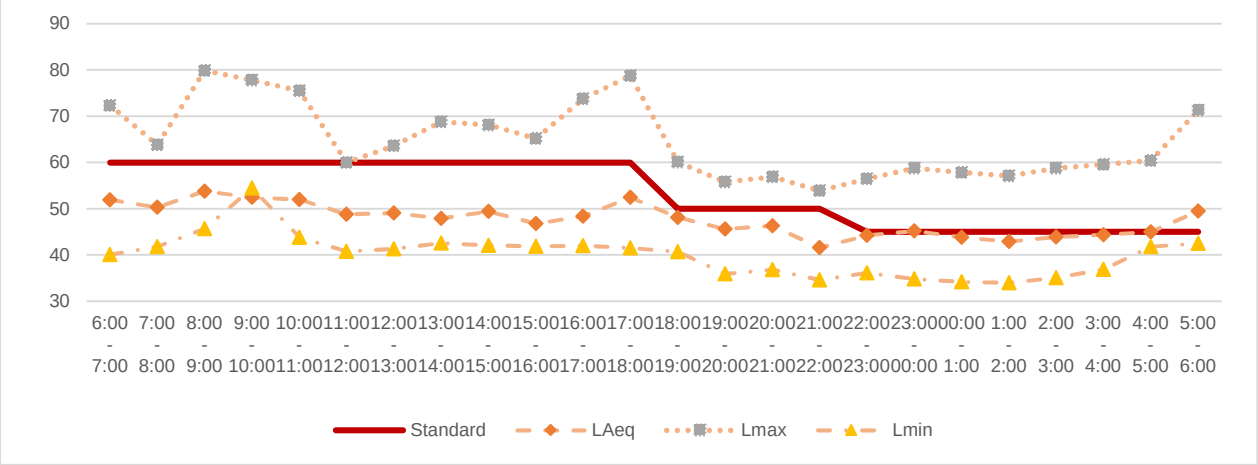
Figure 6.32: Yutasas sub-scheme

Figure 6.33: Stung Krang Bat sub-scheme

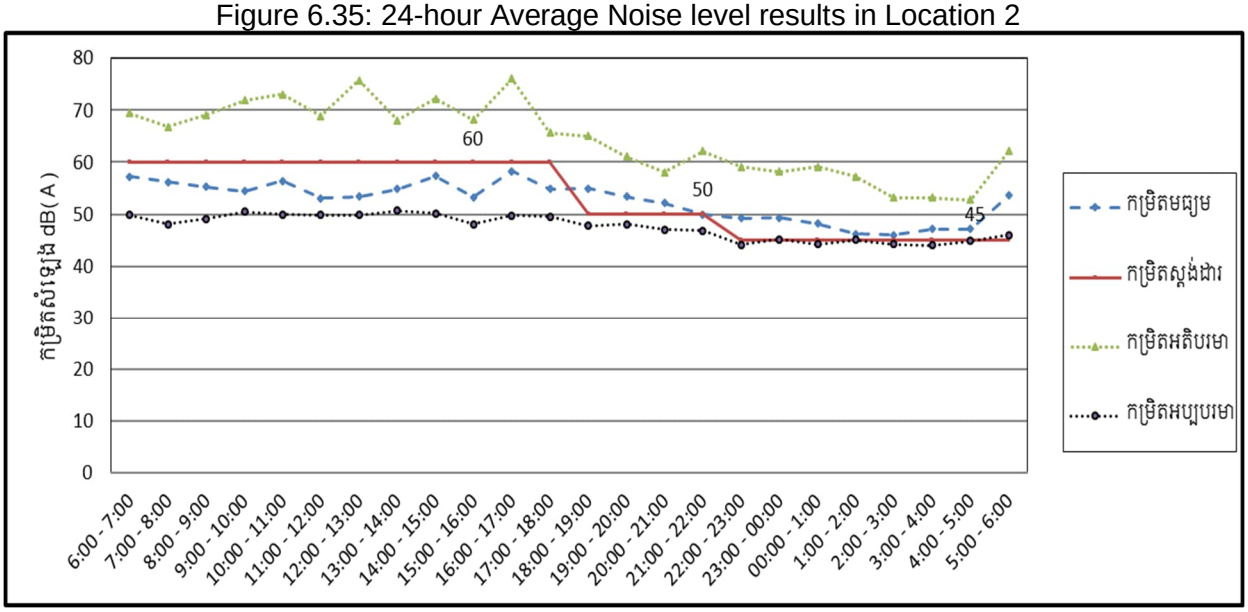


6.4.2.2 Noise and Vibration

Noise and vibration of the project locations in each sub-scheme are currently affected mainly by the commuters mainly along the roads within the areas which can be either the national or local road. As they are subjected to change over time, the testing of noise and vibration are required to be conducted right before the beginning of the construction.

Ou Ta Paong Field observation and result of interviews with village chiefs indicated a slight disturbance of traffic along national road # 5 which were reported to be moderately annoying. In addition, the result of noise testing from the ADB project at the Damnak Chheu Krom area, approximately 15 km away in 2020 can be used as the reference for the baseline of the sub-scheme. The prior and during construction activities are required to be conducted to ensure the noise will follow the standard of the IFC and MoE. Further noise and vibration tests can be conducted during the preparation of the domestic EIA.

Figure 6.342: 24-hour Average Noise level results

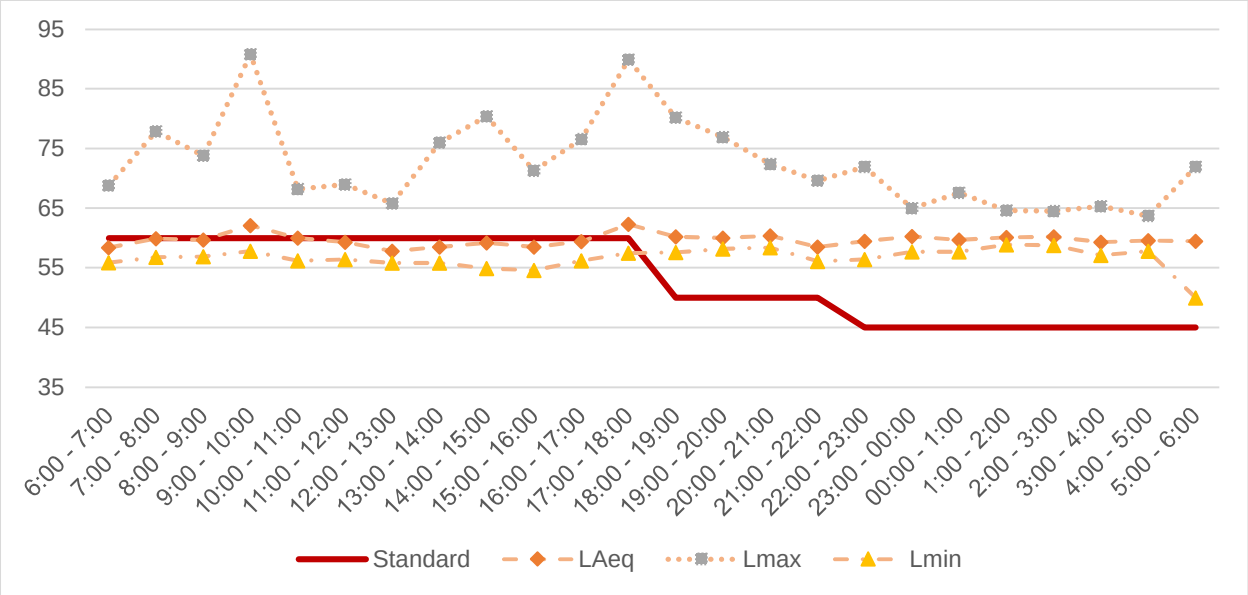


(Source: Laboratory of the Ministry of Environment, 2020)

Lum Hach

Interviews with village chiefs indicated that 5 out of 9 found noise within their communities moderately annoying, mostly due to neighbours' activities, particularly family gatherings and parties. While maximum noise levels were above the limit, vibration levels at both locations remained well below the standard. However, village chiefs reported that daily activities in their communities were still a source of annoyance. In addition, the result of the noise testing from Solar Power Project located in 2023 (Figure below) around 17 km from the project site can be used as the reference for the baseline as the situation of the area is the same to the project's environment. Further noise and vibration tests can be conducted during the preparation of the domestic EIA.

Figure 6.35: 24-hour Average Noise level results in Location 2



(Source: Laboratory of the Ministry of Environment, 2023)

Krang Ponley

Interviews with 14 village chiefs revealed that 64% of them perceived their villages as slightly (43%) or moderately (21%) noisy, primarily during the evening, with traffic and neighbors' activities being the main sources of disturbance. In addition, the noise testing result of the Animal Feeding Plant project in 2024 located 8 km from Stung Krang Ponley, 6 km from

Yotasas, 6 km from Krapeu Troum, and 25 km from Brambei Mom (shown in Figure below) can be used as the reference for the baseline of this project as it is situated within the same environmental condition as the project areas. Further noise and vibration tests can be conducted during the preparation of the domestic EIA.

Figure 6.36: Results of noise analysis at location 1

(Source: Laboratory of the Ministry of Environment, 2024)

6.4.3 Soil Quality

The soil quality study for this project took soil samples from five (5) agricultural locations across different schemes in the region. The Ou Ta Paong sub-scheme was represented by two (2) sites (SS.01 & SS.02), one (1) for Lum Hach (SS.03) and two (2) (SS.04 & SS.05) for Stung Krang Ponley (Please see Table 6.16). The analysis results, presented in the table below, provide valuable insights into the physical, chemical, and biological properties of the soils at these locations, which can inform agricultural management practices and decision-making.

Table 6.16: Soil analysis results in an agricultural context

No.	Description Parameter		Result

SS = Soil Samples.

(Source: Laboratory of the General Directorate of Agriculture, MAFF, 2024)

The soil characteristics of three (3) areas—Ou Ta Paong, Lum Hach, and Stung Krang Ponley—were analyzed for their agricultural suitability.

- **Ou Ta Paong** has loam soil, ideal for agriculture due to its balance of sand, silt, and clay, with moderate organic matter and slightly acidic pH (4.12 to 5.36). However, low nitrogen and potassium levels may need supplementation for optimal crop growth.
- **Lum Hach** is classified as sandy loam, with a higher sand content that improves drainage but reduces water retention. The soil is slightly acidic (pH 6.51-7.67) with low nitrogen and potassium, which may limit crop yields. The organic matter content is moderate, supporting soil health, but nutrient and irrigation management is necessary due to sandy texture.
- **Stung Krang Ponley** soils are also sandy loam, with similar challenges of low water retention due to the high sand content. The pH ranges from slightly acidic to neutral (4.47-7.41), and nutrient analysis shows low nitrogen and potassium levels. Despite these limitations, the soil is generally suitable for agriculture with careful nutrient and water management.

Overall, all three (3) areas show potential for agriculture, but improvements in nitrogen, potassium, and organic matter, along with proper irrigation, are necessary for sustained productivity.

6.4.4 Surface Water Quality

Water quality does not seem to be a critical issue for surface water, but the overuse of fertilizers and domestic wastewater are important threads. It is known to be a black market of all sorts of fertilizers, pesticides, insecticides, rodenticides, etc. sold at the borders with Viet Nam and applied indiscriminately by farmers to increase the numbers of crops a year[27]. Sub-Degree 103 on Water Pollution Control of Ministry of Environment (MoE) in 2021 with the purpose of regulating water pollution to prevent and reduce water pollution of public water areas so that the protection of human health and the conservation of biodiversity can be ensured. The collected water samples were measured at the premises as well as at the laboratory, commissioned by Innovation Lab which is partner of Royal University of Phnom Penh (RUPP).

6.4.4.1 Ou Ta Paong

The water quality data of Ou Ta Paong at the collecting point and time compared to the Ministry of Environment (MoE) standards reveals several concerns. Key parameters such as arsenic, cadmium, lead, pH, total dissolved solids, and electrical conductivity are within acceptable limits, meeting the MoE standards for rivers and lakes/reservoirs. However, total nitrogen, total phosphorus, and total coliform levels exceed the standard limits, with nitrogen levels (3.5-4.8 mg/l) surpassing the river and lake limits (<3 and <2 mg/l, respectively), and total phosphorus (0.4-0.8 mg/l) significantly higher than the allowed levels (<0.25 and <0.15 mg/l). Additionally, total coliform levels are alarmingly high, far exceeding the permissible limit of 1000 CFU/100mL. Dissolved oxygen levels are adequate, remaining above the minimum requirement (>3 and >4 mg/l). These results indicate potential nutrient pollution and microbial contamination in the water caused by the application of fertilizers for agricultural production, especially for dry season rice. In addition, domestic waste and animal production along the river were also the cause since the people are living along the river.

Figure 6.37: Ou Ta Paong Water River Body

Figure 6.38: Kbal Hong Main Canal

6.4.4.2 Lum Hach

The water quality data of Lum Hach at the collecting point and time, when compared to the Ministry of Environment (MoE) standards, shows compliance in several parameters but also some significant deviations. Parameters such as arsenic, cadmium, lead, total dissolved

[27] The sustainable rice platform, supported by MAFF, is working towards controlling this market and training farmers on proper use (products' labels are not translated to Khmer). https://sustainablerice.org

solids, electrical conductivity, temperature, and dissolved oxygen meet the required standards for both river and lake environments. However, the total nitrogen level (6.8 mg/l) is well above the MoE standards for rivers and lakes (<3 and <2 mg/l), and total phosphorus (0.6 mg/l) also exceeds the permissible limits (<0.25 and <0.15 mg/l) mainly caused by the application of fertilizers for agricultural production within the command area. Additionally, total coliform levels are extremely high (19,100 CFU/100mL), far surpassing the allowed limit of 1000 CFU/100mL, indicating severe microbial contamination, mainly caused by residential area along the canal as well as the decomposition of tree leaves and other biodegradable matters into the water body. The pH is slightly below the standard range, suggesting slightly acidic conditions. These results suggest nutrient pollution and microbial contamination in Lum Hach, posing environmental and health concerns. This result is sometime aligned and contrasting to the perception of some stakeholders.

Figure 6.39: Lum Hach Main Canal

Figure 6.40: Lum Hach Main Dam

6.4.4.3 Stung Krang Ponley

The water quality data for Stung Krang Ponley at the collecting point and time shows that while some parameters are within acceptable limits set by the Ministry of Environment (MoE), several issues are evident. Parameters such as arsenic, lead, total dissolved solids, electrical conductivity, temperature, and dissolved oxygen meet the MoE standards. However, the cadmium concentration at SW8 (0.009 mg/l) exceeds the standard limit of <0.003 mg/l. The total nitrogen levels are particularly high across most sampling points (4.7 to 18.1 mg/l), significantly exceeding the limits. Total phosphorus is also elevated at SW6 (0.9 mg/l) and SW7 (0.7 mg/l), far above the permissible levels (<0.25 and <0.15 mg/l). Furthermore, total coliform levels are alarmingly high at all sampling points. These results suggest substantial nutrient pollution and microbial contamination, especially concerning for health and environmental safety. The observation indicated the utilization of chemical fertilizers for rice production has caused the high level of substance along the command area since the upstream and natural decomposition of biodegradable matters within the water catchment is also the contribution. The result was similar to what was reported by the villagers on water quality of the areas.

Summary of the water quality testing is provided in Table 6.17 below:

Table 6.17: Result of surface water quality

No	Parameter	Unit	Ou Ta Paong			Lum Hach		Stung Krang Bat	Yutas as	Krapeu Truom	Brambei Mom	Standard (MoE)

6.4.5 Groundwater Quality

The selected samples were analysed and the results of the testing both at the field and at laboratory is provided in Table 6.18 below. In addition to the selected samples, another groundwater quality testing result from another ESIA was also included to compare the groundwater quality of the sites. The reference sample was named “GWR1” and only some of the parameters are available for comparison due to the purpose of the ESIA was different.

Table 6.18: Result of groundwater quality

No	Parameter	Unit	Results				CDWQS
			GW1	GW2	GW3	GWR1[29]	
1	Arsenic	mg/l	0.005	0.005	0.005	0.00	0.05
2	Cadmium	mg/l	0.003	0.001	0.001	0.001	0.003
3	Lead	mg/l	0.0004	0.005	0.005	-	0.01
4	pH	-	**6.01**	**6.5**	**6.48**	7.49	6.5-8.8

GW = Groundwater, GWR = Groundwater Result, CDWQS = Cambodia Drinking Water Quality Standard.
(Source: Water Innovation Lab, 2024)

Test results show that almost all parameters are below Cambodia's drinking water quality standards of the Ministry of Industry, Science, Technology, and Innovation (MISTI) in 2004, except pH parameters are below the standard range and the total coliform exceeds the standard. Total coliforms are a common group of related bacteria found in soil, vegetation, and water. Boiling or filtering groundwater before drinking is required. Overall, the quality of groundwater in the project sites are safe for daily use, such as cooking, bathing, as well as laundry but not for drinking.

6.5 BIODIVERSITY

The result of the biodiversity assessment which are used as the baseline information for each sub-scheme is presented in below sub-sections. The baseline information covers three steps of the biodiversity assessment including the analysis for determining Critical Habitat status (Steps 1 & 2); and Determining Critical Habitat status (Step 3) whereas the results on the impact assessment on biodiversity are presented in the impact assessment chapters.

6.5.1 Ou Ta Paong

6.5.1.1 Analysis to prepare for determining CH status

6.5.1.1.1 Species with Potential Occurrence within the AoA

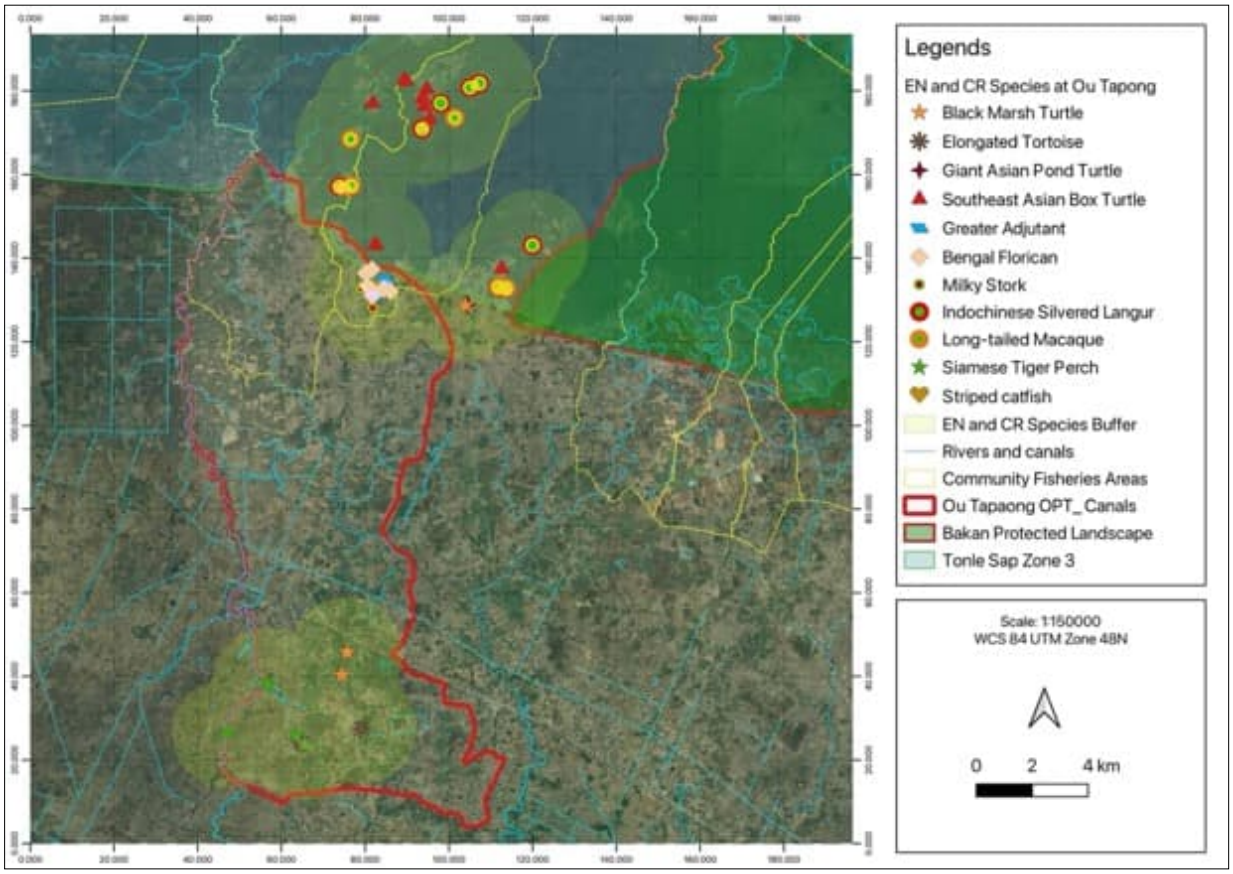
A list of threatened species with potential occurrence was generated for OTP. The coordinates of OTP (via KMZ file) are used to inform the IBAT radius of screening. Since the default radius of IBAT screening is 50km, steps were taken to narrow down to the sub-scheme's area of influence to identify only EN and CR species that are potentially present in the sub-scheme area of influence. The narrowing-down aims to practically identify EN and CR species that could be found in the sub-scheme area of influence and to determine the Critical Habitat status of the identified species. After three rounds of screening focusing on EN and CR species, 11 EN and CR species are found as potentially present in the sub-scheme area of influence. These species include 4 reptile species, 2 mammals, 2 fishes, and 3 birds (See list of 11 EN and CR species in Table 6.19 below).

6.5.1.1.2 Description of screening for narrowing down

For Ou Ta Paong, three rounds of screening have been conducted. The first screening (Round 1) was conducted in December 2023. Round 2 was carried out in April 2024, and Round 3 in August 2025. The purpose of repeated screening is to validate the screening results (for the same area) with a wide range of local stakeholders. The screening aims to identify only EN and CR species that are potentially present in the OTP area of influence, covering reptiles,

mammals, fish, birds, amphibians, and aquatic plants. Screening was done based on the IBAT report generated and provided by the AIIB.

In the first two rounds of screening, 17 EN and CR species were identified in the OTP area of influence (See Table below). In the 3rd round of screening (in August 2024), however, 11 (out of a total of 17 species) were confirmed as “potentially present” in the OTP’s area of influence.



So, the assessment for Ou Ta Paong focuses on the confirmed list of **11 species** that are categorized by IUCN as EN and CR species, including 4 reptile species (Black Marsh Turtle, Giant Asian Pond Turtle, Southeast Asian Box Turtle, and Elongated Tortoise), 2 mammals (Indochinese Silvered Langur and Long-tailed Macaque), and 2 fishes (Striped catfish and Siamese Tiger Perch), and 3 birds (Greater Adjutant, Milky Stork, and Bengal Florican) See Table 6.19 below for the list of confirmed species and see Figure 6.45 for potential locations of these species in the projects are of influence.

Table 6.19: Confirmed List of endangered and critically endangered species for the Ou Ta Paong sub-scheme

No.	Local Name	English Name	Scientific Name	IUCN Cat	Screened Species from Round 1&2 (Total=17)	Confirmed Species in Round 3 (Total = 11)
I. Reptile spices						
1	អណ្តើកភ្នែក	Black Marsh Turtle	*Siebenrockiella crassicollis*	EN	Yes	Yes

Figure 6.45: Map showing the observed distribution of identified EN and CR species (with the potential movement of 1-2 km within and around suitable habitats (2020 to 2024)

6.5.1.1.3 Ecological State of Habitats within the Area of Analysis (AoA)

Understanding of the ecological state of habitats is necessary to assess the Likelihood of occurrence (LoO) of the above 11 screened species - as part of the CHA. For this CHA, species were classified into four LoO categories: Present, Possible, Unlikely and Not Present. Species known to be Present or with a Possible LoO are further assessed in Step 3. This understanding takes into account the classification of habitats as either modified or natural based on levels of human-induced disturbance to species composition and ecological functions. In this session, a brief assessment of the 11 confirmed species are presented. The assessment discusses historical range, distribution, habitat conditions, current status, and potential threats identified by key informants[30].

The OTP command area, therefore, the ecosystem within the OTP command area has been subject to human-induced changes over the past several decades. Previously, the zoning areas of OTP contains Zone 1 (transition zone), Zone 2 (buffer zone) and Zone 3 (core zone)

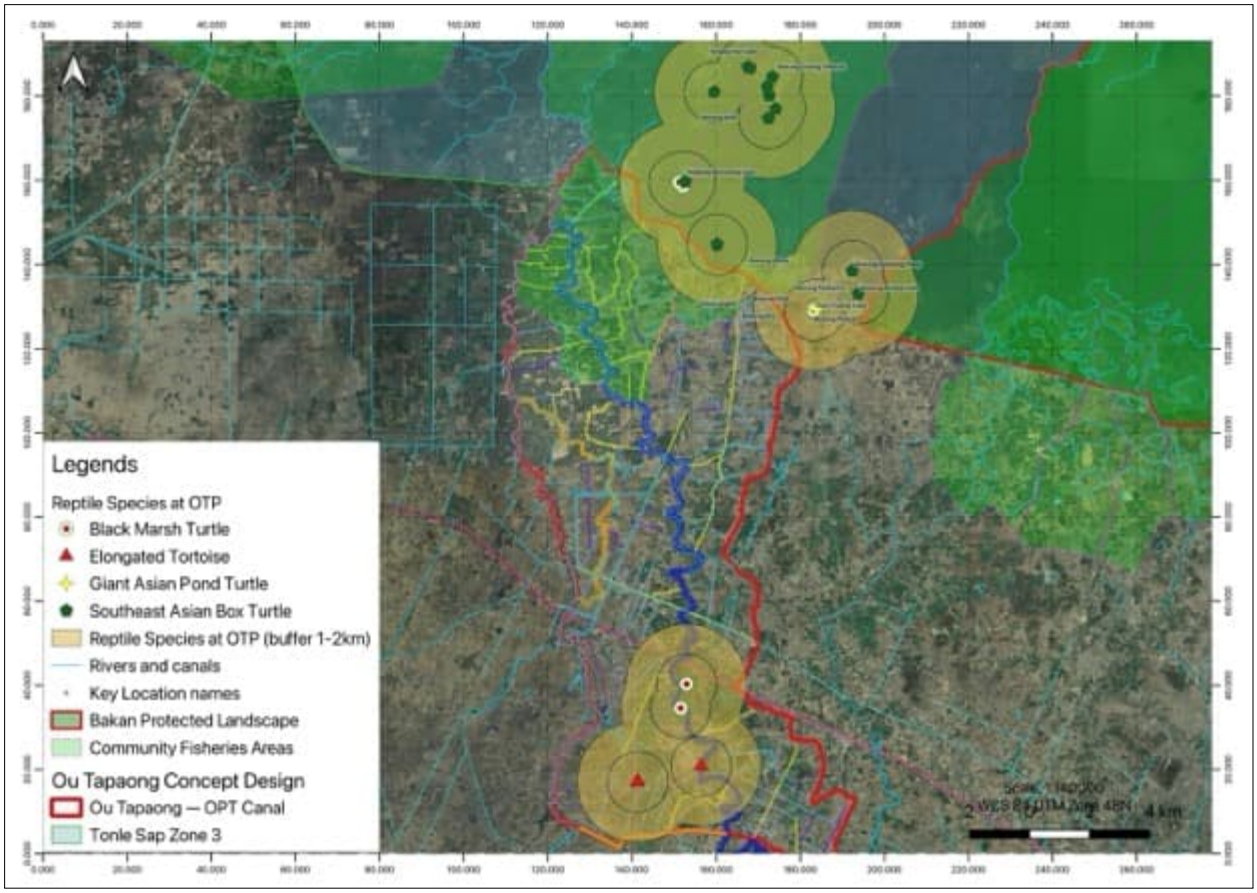
[30] Community councils and committees, including community fisheries (CFi) and farmer water user community (FWUC), were convened on July 25 and August 4, 2024. These meetings aimed to identify potential field assessment areas and select individuals with deep local ecological knowledge and experience for interviews. A total of 13 key informants were interviewed in Ou Topaong. Five of these individuals were from the upper command area, while seven were from the lower command area. Additionally, one representative from Punleu Komar Organization, which supports the Samraong Muk Yeik Community Forest Initiative, was included. Notably, the Samraong Muk Yeik and Sdok Khlouk Community Fisheries locations overlaps with portions of the Lower Ou Tapaong Command Area.

which does not exist anymore for Zone 2 and Zone 1. As such, the OTP command area is a modified habitat.

❖ **Reptiles (4 species)**

The Black Mash Turtle was observed in both upper and lower sections of the command area, as well as along the main Ou Ta Paong River (which is being used as a key canal feeding irrigation water for the command area). Conversely, the Elongated Tortoise was only found in the upper reaches while the Giant Asian Pond Turtle and Southeast Asian Box Turtle were found only in the lower section within Tonle Sap Zone 3 (figure 6.46 above). Details are below:

- **The Black Mashed Turtle *(Cuora galbinifrons)*** was confirmed to be present in the area of influence based on the accounts of four local informants. Residents from the upper reaches of Ou Tapaong reported historical sightings of this species within the past 10-20 years although recent spotting has been scarce. Key informants who live in the lower part of the command area and had livelihoods closely intertwined with the Tonle Sap Management Zone indicated that there have been ongoing efforts to bring the **Black Mashed Turtle back** to the region albeit its rarity. One informant successfully captured a Black Mashed Turtle just before the interview. This species is highly valued in the local market, particularly among middlemen, and is often used for traditional medicinal purposes. The Black Mashed Turtle is listed as Critically Endangered by the IUCN Red List, and its presence in the area of influence indicates that the habitat is essential for its survival and reproduction. Therefore, the habitat meets the criterion of being significant for a Critically Endangered species of criteria 1a of IFC PS6.
- **Elongated Tortoise:** This species wasn't initially screened for the interview, but it was identified and spotted by two key informants at the upper section of the Ou Tapaong based on the turtle images that were shown to facilitate the identification of species. No such sightings have been documented in the lower portions of the command area. One informant, a local resident near Ou Tapaong, provided a firsthand account of capturing this species. After a thorough examination of the accompanying photographs and a comparison with verified identifying features, this species is confirmed present as reported by the local informant. The Elongated Tortoise is listed as Critically Endangered by the IUCN Red List. The presence of this species within the project area indicates that the habitat is essential for its survival and reproduction, meeting the requirements of Criterion 1a.
- **Giant Asian Pond Turtle:** Three local informants who were interviewed in the lower Ou Tapaong River region confirmed the presence of the Giant Asian Pond Turtle. One informant reported spotting this species in Boeung Kum Traeng, a wetland within Tonle Sap Zone 3 while the other two informants indicated their encounters with this species in the mountainous regions of Kravanh District. Asian Pond Turtle is listed as Critically Endangered by the IUCN Red List. The reported sightings in Boeung Kum Traeng and the mountainous regions of Kravanh District indicate that these areas may be important habitats for the survival and reproduction of this species, meeting the requirements of Criterion 1a.
- **Southeast Asian Box Turtle:** During our survey in the lower section of the Ou Ta Paong, we obtained valuable information about the Southeast Asian Box Turtle. All



seven informants in this area confirmed the presence of this species in nearby wetlands and flooded forest areas within Tonle Sap Zone 3, which is close to the command area boundary. While three informants reported recent encounters with this species, the remaining four mentioned that they had encountered it 10 to 20 years ago. They explained that the turtle was once abundant but has become very rare in recent years.
Similarly, all turtle species, including the Southeast Asian Box Turtle, are threatened by ongoing illegal hunting for trading purposes. Some people were hesitant to share recent information about these species.

Mr. Pheoun Moeun, Deputy Chief of Samraong Muk Yeik Community Fishery (SMY-CFi) is exceptionally knowledgeable about wildlife species in his Cfi area. He has been actively participating in forest patrols and community activities. He mentioned that some people who go fishing in the forest occasionally bring back one or two turtles with them, but he preferred not to disclose this information.

One key informant admitted that they captureed a turtle from a nearby forest and sold it for income. Income was shared among the four individuals. While informants were willing to share their past incidents, they were reluctant to provide details about the recent events because these activities are illegal.

the Southeast Asian Box Turtle, a Critically Endangered species, is present in the lower section of the Ou Tapaong and nearby wetlands. These unique ecosystems are highly threatened. Therefore, Criteria 1a and 4 of IFC PS6. Additionally, Criteria 1b may also apply due to the high threat level and declining population. are potentially met.

Figure 6.46: Distribution of identified turtle and tortoise species in and outside the OTP Command Area

❖ **Birds (3 species)**

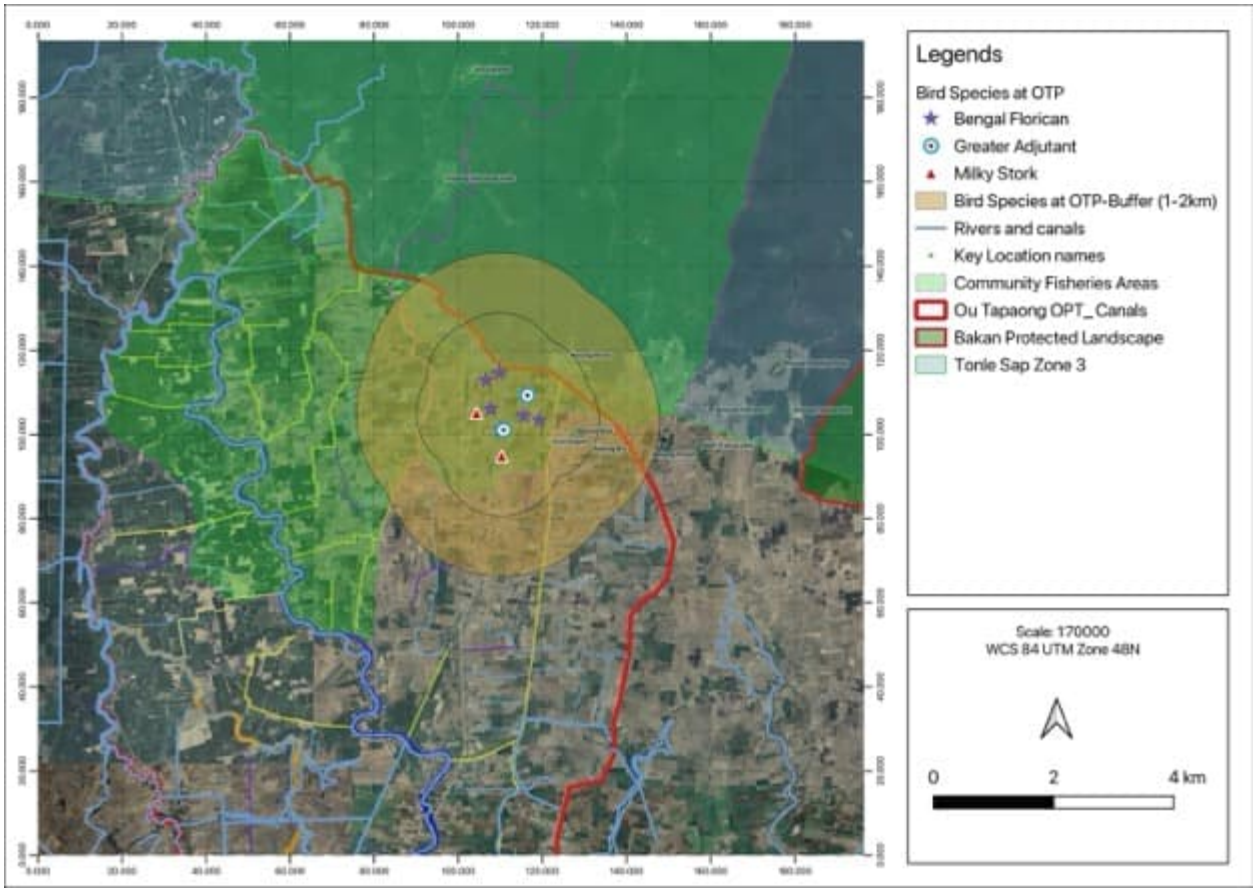
Despite extensive interviews with key informants residing in the upper reaches of Ou Ta Paong, numerous endangered or critically endangered bird species were reported within their community. Conversely, only three of six bird species were confirmed by both key informants and CFi committees in the lower section. The following paragraphs summarize the primary findings and justifications for each species' presence, along with the associated level of confidence. These conclusions are based on in-depth interviews, technical expertise, and consultations with relevant units, which provided valuable assistance in verifying species of high conservation significance. Several species were initially identified by local residents.

- **Bengal Florican:** Five informants confirmed the presence of the Bengal Florican in the area of influence. Two individuals reported sightings within the past 10-20 years while three others have observed the species within the last five years and in the past. Notably, one informant witnessed a pair (male and female) as recently as March 2024 (see Figure 6.47). The lower reaches of Ou Tapaong exhibit a diverse mosaic of habitats, including open wetlands, grasslands, flooded forests, and minimally intensified paddy fields, creating a relatively undisturbed environment that is potentially conducive to Bengal Florican populations. Notably, the Ou Tapaong Command Area is situated only 1 kilometre from the Bakan Protected Landscape (BPL), a region characterized by similar ecological conditions (figure 6.47).

  Established in July 2023 through a joint effort by the Ministry of Environment and the Wildlife Conservation Society (WCS), the BPL aims to safeguard the southernmost Bengal Florican subpopulation within the Tonle Sap Great Floodplain. Moreover, the

BPL serves as a critical wintering habitat for the Yellow-breasted Bunting, Manchurian Reedwarbler, and Cambodia's unique population of the Chinese Grassbird, along with other globally threatened avian and wildlife species (WCS 2023).

The project area likely meets Criterion 1a (habitat of significant importance to Critically Endangered species) due to the presence of the Bengal Florican. Additionally, it may meet Criterion 4 (highly threatened and/or unique ecosystems) given the diverse habitat mosaic. However, a detailed ecological assessment is crucial to confirm these findings and identify any other relevant criteria.



- **Greater Adjutant:** During field assessments within the study area, multiple informants reported sightings of Greater Adjutants. While most individuals were unable to definitively distinguish between the Greater Adjutant and the similar-looking bird, which is Lesser Adjutant), one informant positively identified a Greater Adjutant within the Ou Tapaong Command area. This sighting occurred in recent years (figure 6.47). Unfortunately, due to the time of the observation, the Greater Adjutant had likely already migrated to its breeding grounds at Prek Toal Ramsar Site, a protected wetland area situated in Koh Chiveang community, Ek Phnom District, Battambang province (MoE 2012).

  Prek Toal Ramsar Site is the sole known breeding habitat for the greater adjutant in Southeast Asia and is recognized as the second-largest breeding colony for this species globally, following Assam, India. In December 2015, the Royal Government of Cambodia and the Ramsar Convention Secretariat designated the Prek Toal Core Area as a Wetland of International Importance due to its exceptional biological, social, and economic value. This designation solidified Prek Toal's status as Cambodia's fourth Ramsar Site (WCS 2016). Following the breeding season, greater adjutants migrate across the Tonle Sap Floodplain to their foraging habitats, with the lower section of Ou Tapaong serving as a critical foraging ground.

  Despite the challenges faced during the field observation due to the time of year, the confirmed sighting of a Greater Adjutant in the study area is a significant finding. It suggests that the species may still be present in the region and that a suitable habitat may exist for its continued survival.

  The findings indicate that the project area meets IFC PS6 Criteria 1a and 3. This is due to the presence of the Critically Endangered Greater Adjutant, a migratory species that utilizes the area as a critical foraging habitat, particularly during the non-breeding season.

Figure 6.47: A spatial distribution map was generated for three bird species—the Bengal Florican, Greater Adjutant, and Milky Stork—within the lower Ou Tapaong Command Area. 1-2 km buffer zones were included to approximate their minimum movement range around suitable habitats.

- **Milky Stork:** Despite repeated attempts to elicit accurate information, many key informants were unable to distinguish between the Painted Stork and the Milky Stork, two similar-looking bird species. This confusion is a common challenge in bird identification, especially for non-experts. While the Milky Stork is considered extremely rare in Cambodia, with sightings typically limited to 1-3 individuals, some informants claimed to have encountered larger groups. This discrepancy can be attributed to misidentification and the difficulty of accurately counting birds in the field.

  Based on my experience in bird identification and conservation, I was able to evaluate the credibility of the information provided. Two informants offered the most reliable accounts, describing sightings of 2-3 Milky Storks feeding alongside numerous Painted Storks in seasonal wetland areas near flooded forests (figure 6.48). These observations align with the limited available data on Milky Stork distribution and behavior in Cambodia. When the flooding season arrives, they migrate to degraded forest areas in the uplands. Milky Stork and Great Adjutant are migratory birds that move both locally and across international borders. The Prek Toal Ramsar Site serves as the only known breeding ground for Milky Stork and Greater Adjutant in Southeast Asia; after breeding, they migrate to other wetland areas throughout the country.

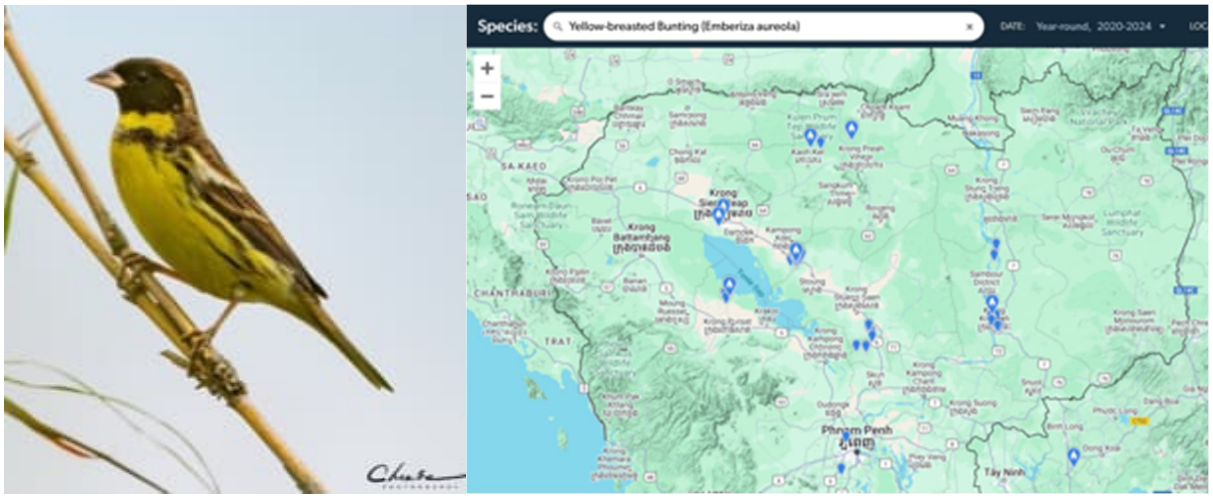
The Milky Stork's situation appears to align with several IFC PS6 criteria:

- **Species Level:** Endangered Species (Criterion 1a): The Milky Stork's rarity and the challenges in accurately assessing its population make it a strong candidate for this criterion. Its limited distribution and potential threats further emphasize its vulnerability.

Migratory Species (Criterion 3): The migratory nature of the Milky Stork, particularly its reliance on the Prek Toal Ramsar Site as a breeding ground and its movements to other wetland areas, highlights its dependence on various habitats throughout its range.

Ecosystem Level: Highly Threatened and/or Unique Ecosystems (Criterion 4): The wetland habitats used by the Milky Stork, especially the flooded forests and seasonal wetlands, are often threatened by human activities like deforestation, agriculture, and pollution. These ecosystems are essential for the survival of the species and other biodiversity.

Figure 6.48: Photograph of a Milky Stork foraging alongside a flock of Painted Storks (credit: Sang Mony, Sam Veasna Conservation Tour), and a map illustrating the distribution of Milky Stork sightings in Cambodia from 2020 to 2024, extracted from eBird data.



- **Yellow-breasted Bunting**: The Yellow-breasted Bunting is a small, migratory songbird found in Southeast Asia, including Cambodia. It is characterized by its bright yellow breast and throat, contrasting with its olive-green upperparts. The Yellow-breasted Bunting is a winter visitor and spring passage migrant in Cambodia, often found in rice fields, scrub, grasslands, and marshes in the lowlands. In Cambodia November to May, the species has been recorded in the Tonle Sap Floodplain and the Lower Mekong Delta. Yellow-breasted Buntings are typically observed in rice fields, scrublands, grasslands, and marshes in the lowlands of Cambodia (Ly et al. 2022).

  The local population often mistakenly identifies this species as a sparrow or a weaver due to their similar size, appearance, and shared habitats. After conducting inquiries, none of the locals could confirm whether they had observed this species in the area. This highlights a common gap in local ecological knowledge regarding small bird species like this one. Identifying such species typically requires individuals with advanced birdwatching experience, who can locate them in the appropriate habitat at the right time.

  Based on an overall assessment of the habitat conditions in the lower part of Ou Ta Paong, we can confirm that this area has the potential to serve as a wintering habitat for this species. Additionally, the boundary of the Ou Tapaong Command Area is just 1 km away from the Bakan Protected Landscape.

The Yellow-breasted Bunting's Critically Endangered status and the Ou Tapaong area's potential as a wintering habitat potentially meet IFC PS6 Criteria 1a. Additionally, the species' restricted range and migratory behavior align with Criteria 2 and 3. The Yellow-breasted Bunting, a CR species, is known to inhabit such areas during its winter migration.

Figure 3.49: Photo of Yellow-breasted Bunting (Emberiza aureola) and its distribution map from eBird data (2020-2024) recorded by birdwatcher and wildlife overserves.

- **Wild-winged Duck:** Regarding the Wild-winged Duck, there was some confusion among informants who mistakenly identified it as the Knob-billed Duck (Sarkidiornis melanotos). However, after discussing key identification features and ecological characteristics, such as breeding and nesting habitats, we determined that none of them had actually encountered the Wild-winged Duck before. Due to it's tiny population, Wild-winged Duck is very sensitive, and live in the forest close to the lake, wetland, river and waterhold with less disturbance. Due to its limited population, the Wild-winged Duck is particularly sensitive to disturbances and prefers to reside in relatively undisturbed forests adjacent to lakes, wetlands, rivers, and watering holes. This preference for quieter, less populated areas help to ensure the survival of this vulnerable species.

❖ **Mammals/ primates (2 species)**

No suitable habitats or sightings of three mammal species were identified in the upper section of Ou Ta Paong. Two primate species (Indochinese Silvered Langur and Long-tail Macaque) were confirmed at the lower section in the Flooded Forest habitat of the Tonle Sap Zone 3 and CFi Areas. Additionally, multiple reports indicated the presence of Hiary-nosed Otters in the region, particularly in the deep waters of the flooded forest near the Tonle Sap Great Lake's mouth. The following paragraphs summarize the key findings and justifications for the presence of these two primate species, along with their associated confidence levels. These conclusions are based on comprehensive interviews, technical expertise, and consultations with relevant units, which contributed to the verification of species with high conservation importance.

- **Indochinese Silvered Langur:** Six local informants (86%) reported frequent encounters with Indochinese Silvered Langurs within the flooded forests of Tonle Sap

Zone 3 which is outside of the OTP command area. These sightings, primarily near natural lakes, have been confirmed by multiple individuals engaged in livelihood activities within these areas. While the population of Indochinese Silvered Langur was once plentiful, informants noted a significant decline in recent decades, with only smaller troops now being observed. The species is known to inhabit areas near rivers and large bodies of water.

Mr. Chem Sophal from Punleu Komar Organization highlighted that his organization provides support for the Samraong Muk Yeik Community Fishery (SMY-CFi) and Sdok Khlouk Community Fishery (SK-CFi) in managing and protecting fisheries resources and flooded forests within their Community Fishery Area (figure 6.50). Portions of these CFi Areas overlap with the Lower section of Ou Tapaong Command Area. This effort is part of the EU “Our Tonle Sap” Project, led by the Wildlife Conservation Society and funded by the European Union. Mr Sophal emphasized the presence of numerous endangered and critically endangered species, including the Indochinese Silvered Langur, within this CFi Area. To confirm the presence of any Community Fisheries (CFIs) within the specified area, we interviewed the Chief of Pursat Fishery Administration Cantonment. Our inquiry revealed that two CFi areas overlap with the designated region, as illustrated in the accompanying map (see map below).

Based on the provided information, the following IFC PS6 criteria are potentially met regarding the Indochinese Silvered Langur and the flooded forests of Tonle Sap Zone 3:

Species Level:

- Criterion 1: Critically Endangered and Endangered Species: The Indochinese Silvered Langur is an endangered species, making its habitat a potential candidate for this criterion. Criterion 2: Highly Threatened Species: Given the observed decline in the population and potential threats to its habitat, the species could be considered highly threatened.

Ecosystem Level:

- Criterion 5: Highly Threatened and Unique Ecosystems: The flooded forests of Tonle Sap Zone 3 represent a unique and threatened ecosystem, particularly due to factors such as habitat loss and degradation.

- **Long-tailed Macaque:** Indochinese Silvered Langurs and Long-tailed Macaques were commonly reported by key informants residing within the Tonle Sap Zone 3. These informants, who frequently engaged in fishing activities in the surrounding forests, encountered Long-tailed Macaques regularly. They added that these primates, known for their social nature, live in troops and communicate vocally to alert their group members of potential threats or discoveries. Some troops inhabit flooded forests situated close near the command area.

  However, informants expressed deep concern over the significant decline in the population of Long-tailed Macaques over the past several years. This alarming trend has prompted urgent action from conservation organizations. In response to the deteriorating situation, the primate specialist group upgraded the conservation status

of this species from Vulnerable to Endangered in March 2022. This elevated status underscores the urgent need for increased protection measures to mitigate the species' decline, which is primarily driven by the high demand for these primates in the illegal pet trade (*Primate Conservation Alliance. 2022)*

The provided information strongly suggests that the Tonle Sap Zone 3 adjacent to the OTP meets multiple IFC PS6 criteria related to the Critically Endangered Long-tailed Macaque:

- Criteria 1a: The recent uplisting of the Long-tailed Macaque to Endangered status by the IUCN Red List underscores the habitat's critical importance for the species' survival and reproduction. The frequent sightings of these primates by local informants, especially in the flooded forests, highlight the area's significance as a key habitat.
- Criteria 4: The flooded forests of the Tonle Sap Zone 3 represent a highly threatened and unique ecosystem. They face significant threats from habitat loss, pollution, and climate change. These forests provide a crucial habitat for the Long-tailed Macaque and other potentially threatened species.

Figure 6.50: A spatial distribution map was generated for two primate species—the Indochinese Silvered Langur and Long-tailed Macaque—within the lower Ou Tapaong Command Area. 1-2 km buffer zones were included to approximate their minimum movement range around suitable habitats.

❖ **Fishes (2 species)**

Overall, these statements provide valuable insights into sightings and knowledge about Siamese Tiger Perch and Striped Catfish within different sections of the Ou Tapaong Command area. The following paragraphs summarize the key findings and justifications for the presence of these two fish species confirmed by key informants, along with their associated confidence levels and their ecological knowledge of fish diversity and migration.

- **Siamese Tiger Perch:** According to four key informants in the upper section of the Ou Tapaong Command area, Siamese Tiger Perch has been consistently observed in Boeng Kansaeng Lake, located in the southwest part of the Ou Tapaong Command Area. Three of them reported encountering a few individuals of this fish species in 2023 and 2024 (figure 6.51), while another informant saw them about 20 years ago during the fully flooded period. This particular informant stopped fishing for many years after becoming older.

  The Siamese Tiger Perch is believed to migrate from Tonle Sap Great Lake to the upstream through Svay Daun Kav River (along the western boundary of command area) and then move into Boeng Kansaeng through its tributary canal during flooding periods. Common fishing gear used includes line nets, cast nets, and small fish traps. The informants mentioned that catching this species is extremely rare, with only one to two individuals caught per season using line nets. They possess extensive knowledge about fish and make a living through fishing.

  On the other hand, two key informants from the lower Ou Tapaong section stated that although they are familiar with Siamese Tiger Perch, they have never seen them in their area. One informant mentioned having seen this species in 1979 but not recently. Similarly, Mr. Chem Sophal from Punleu Komar Organization confirmed his awareness of this species but stated that it is not present in the lower Ou Tapaong Area.

  The Criterion 1a of IFC Performance Standard 6 (PS6) is potentially met. The Siamese Tiger Perch, a Critically Endangered species, has been observed in Boeng Kansaeng Lake, a habitat within the Ou Tapaong Command Area. However, the frequency of sightings is low and historical, suggesting that further investigation is necessary to definitively establish the habitat's significance for the species' survival and reproduction.

- **Striped catfish**: One informant recalled seeing the Striped Catfish approximately 7 years ago in a small wetland area during the peak of flooding. This species is exceptionally rare, and it is known to migrate to this specific area when the entire region becomes submerged in floodwater.

  Based on what we know, the habitat for the Critically Endangered Striped Catfish likely meets two of the IFC PS6 criteria:

  - Criterion 1a: This habitat is super important for the survival of this super rare fish. It's like their special breeding ground during floods.
  - Criterion 3: The fish migrates to this specific area when it floods, making it a key spot for this travelling species.

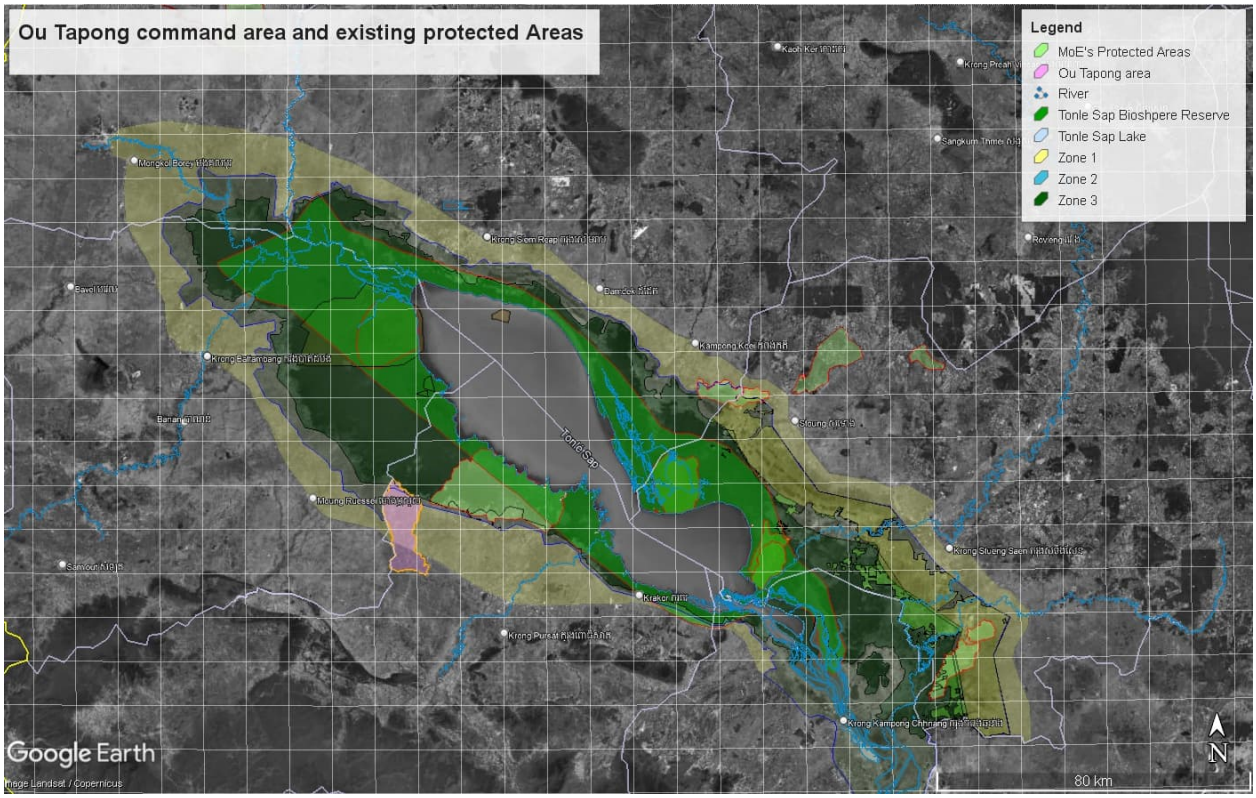
Figure 6.51: A spatial distribution map was generated for two fish species—the Siamese Tiger Perch, and Striped Catfish (old record-7 years ago)—within the lower Ou Tapaong Command Area. 1-2 km buffer zones were included to approximate their minimum movement range around suitable habitats.

6.5.1.1.4 Occurrence of Protected Areas near the Sub-scheme Area

A review of protected areas in the vicinity of the sub-scheme has been conducted as a preparatory step before proceeding with Step 3 of the CHA. There are four areas located near and downstream of the OTP sub-scheme (See Table below). The preliminary assessment focuses on the two that are closest to the OTB: Flood Forest Conservation, b) Bakan Grassland Protected Area[31].

No.	Name of Protected Area	Designated by	Main target and requirement	Distance (km) to OTP sub-scheme
1	Flooded Forest Conservation	Royal Government of Cambodia: Sub-decree No. 197 dated 29 August 2011	The Tonle Sap's flooded forests are a vital part of its unique ecosystem. During the wet season, the Mekong River's waters back up into the Tonle Sap, flooding vast areas and creating a rich habitat for	0 (share the border)

[31] Bakan grassland is a protected area for birds designated by sub-decree No. 144 in 2023.



No.	Name of Protected Area	Designated by	Main target and requirement	Distance (km) to OTP sub-scheme
			diverse wildlife. This dynamic ecosystem supports a multitude of fish species, waterbirds, and other wildlife. However, it faces threats like deforestation, overfishing, and pollution, necessitating conservation efforts to protect this vital resource.	
2	Bakan Grassland protected area	Royal Government of Cambodia: Sub-decree No. 144, dated 04 July 2023	Bakan Grassland, a 38,430-hectare protected area in Cambodia, is a vital part of the Tonle Sap ecosystem. It's home to endangered bird species like the Bengal Florican and Chinese Grassbird. The Wildlife Conservation Society (WCS) and local communities are working together to protect this unique habitat.	2
3	Dei Roneat Important Bird Area (IBA)	BirdLife Internation	The IBA supports breeding colonies of important birds like the Darter, Lesser Adjutant, and Greater Adjutant. Its diverse habitat supports various bird species, but faces threats from human activities. Conservation efforts include monitoring, community engagement, habitat restoration, and policy advocacy to protect this crucial site.	12
4	Tonle Sap Biosphere Reserve (TSBR)	Royal Government of Cambodia: Royal Decree in 2001[32]	The Tonlé Sap Biosphere Reserve is a distinctive ecological region encompassing the Tonlé Sap, or Great Lake of Cambodia. The reserve was successfully designated a UNESCO Biosphere Reserve in 1997 and subsequently	16

6.5.1.2 Determination of Critical Habitat Status (Step 3)

This section assesses the information (obtained from the above sub-section) vis-a-vis the criteria (presented in Section 3.4 - CH assessment method). This assessment aims to determine whether any species (identified in the list of 11 EN and CR species) qualify for Critical Habitat features.

All information presented in this study report has been meticulously verified against reliable sources, including key government research institutes, national and international organizations, and expert consultations. To ensure accuracy, fish, bird, mammal, and reptile species identification at Ou Ta Paong, Lum-Hach, Brambei Mom, Kraeu Trom, and Yutasas was confirmed through consultations as below:

Table 6.20: List of international and national key expert was consulted to check and verify each all target EN and CR species

Name	Position and institution	Key Area of expertise/ consultation	Contact
Dr. Ea Chitra	Head of the Aquaculture Faculty at the Kampong Speu Institute of Technologies	Key fish species were released by his faculty at Anlong Chrey and Brambei Mum Reserviors.	+855 14 388 694
Mr. Robert Tizard	Senior Project Lead for Tonle Sap Landscape, WCS Camodia	Confirmation and historical sighting data of Bengal Florican and other key bird species around Ou Ta Pang sub-scheme	rtizard@wcs.or

Mr. Tach Sovannara	Head of the Fisheries Lab at the Inland Freshwater Research and Development Institute of the Fisheries Administration	Identification and clarification of EN and CR species of fish and reptiles across all sub-schemes	
Mr. Khim Sokha	Chief of office of the Fisheries Conservation Department	Identification and clarification of EN and CR species of fish and reptiles across all sub-schemes	+855 12 784 687
Mr. Chuem Sophal	Program Manager, Punleu Komar Organization	Confirm present of birds and key wildlife species at Ou Ta Paong Sub-scheme	
Mr. Morn Ravy	Bakan Protected Landscape Project Coordination, WCS Cambodia	Confirm present of birds and key wildlife species at Ou Ta Paong Sub-scheme	morn@wcs.org
Mr. Somony Thay	Direct of Aquaculture Department, FiA	Fish identification, key fish species releasing data, and distribution range across all schemes	+855 12 829 971
Mr. Neang Ty	Conservation Program Manager, Wild Earth Allies	Internation and national expert on reptile	+855 12 864 409
Mr. Hong Chamnan	Director of the Freshwater Wetland Conservation Department, MoE	Confirmation and historical sighting data of Bengal Florican and other key bird species around Ou Ta Pang sub-scheme, national protected area data	+855 12 922 429
Mr. Sun Visal	Deputy Director of the Freshwater Wetland Conservation Department, MoE	Confirmation and historical sighting data of Bengal Florican and other key bird species around Ou Ta Pang sub-scheme, national protected area data	+855 12 708 836

All information concerning avian and other key wildlife species, including their behavioral patterns, was corroborated through sighting data verified by relevant experts from the Wildlife Conservation Society (WCS), a long-standing partner of the Ministry of Environment (MoE), Fisheries Administration, and Forestry Administration in conservation efforts spanning over 25 years. Additionally, consultations were held with Mr. Hong Chamnan, Director of the Freshwater Wetland Conservation Department, and Mr. Sun Visal, his Deputy Director and the head of the Tonle Sap Biosphere Reserve. Both individuals possess extensive experience, ranging from 20 to 30 years, in avian ecology and protected area management within the Tonle Sap Lake region.

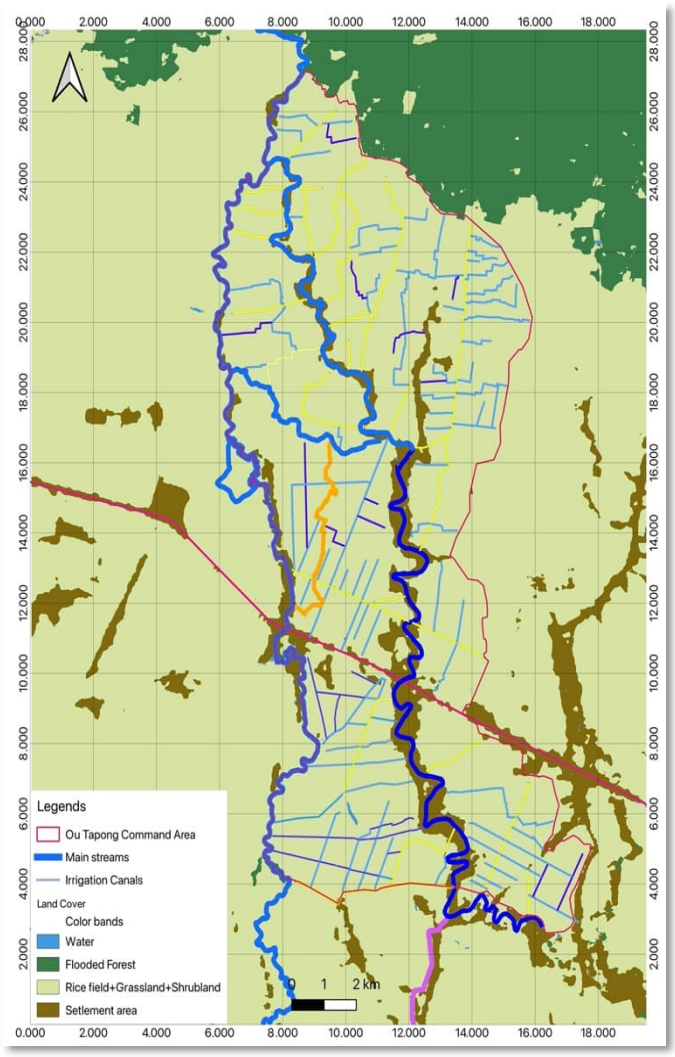
Finally, information related to reptiles and amphibians was validated through consultations with Mr. Neang Ty and his team from Wild Earth Allies, renowned experts who have made

significant contributions to the discovery of new reptile and amphibian species in Cambodia, including the Cardamon Shrub Frog (Philautus cardamonus).

6.5.1.2.1 Overview of the current land use and land cover at OPT

The map below features the current land and use and land cover at Ou Tapaong Command Area in late 2023. The colour bands failed to distinguish between rice fields, grassland and shrubland areas. However, based on field assessment, the command area is dominated by existing rice fields and some modified habitats. There are some small and fragmented natural habitats like shrubland, and grassland along the natural streams, seasonal ponds and wetland habitat creating a mosaic habitat for many wildlife species to strive as the area is situated within the Tonle Sap Floodplain close to many protected areas and IBBAs. Residential areas are situated along the main roads, rivers, and streams.

The northern portion of the OTP Command Area is a dynamic landscape characterized by a varied mosaic of habitats. Here, agricultural lands coexist with modified habitats, wetlands, shrublands, and remnants of grassland, seamlessly transitioning into the vast expanse of the Tonle Sap Zone 3 flooded forest.



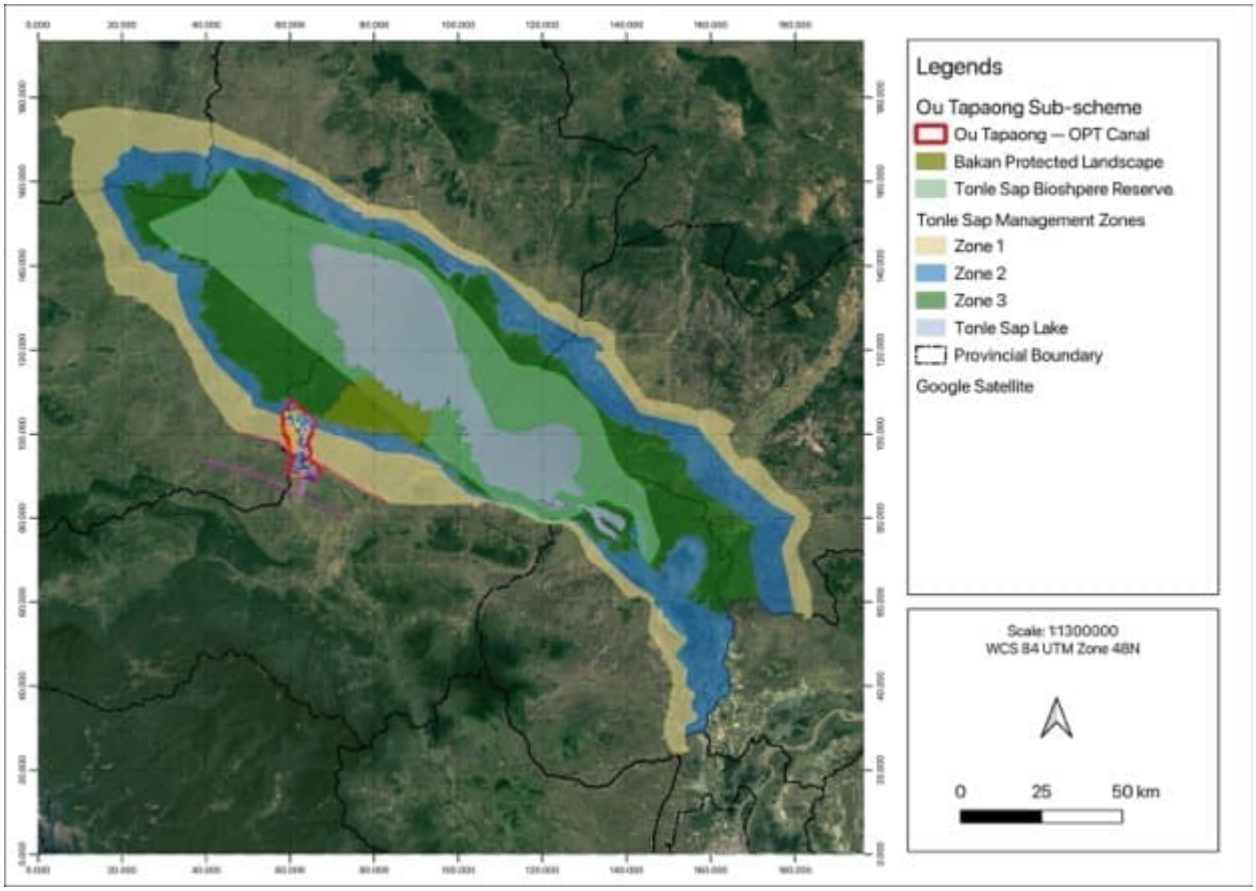
This diverse ecological mosaic plays a crucial role in supporting a rich array of biodiversity. The area serves as a vital foraging ground for numerous migratory bird species, providing them with abundant food resources. Additionally, it functions as a critical refuge and breeding ground for fish during the wet season, when the flooded forests and wetlands offer ideal conditions for spawning and juvenile development.

The intricate interplay of these habitats sustains a diverse community of wildlife, including birds, mammals, fish, and reptiles. These species rely on the unique characteristics of the flooded forest and wetland ecosystems for essential life cycle activities such as breeding, nesting, and foraging. The area's significance as a biodiversity hotspot is underscored by its role in supporting a wide range of Habitat of significant importance to CE and EN species

As presented in Section on Ecological State earlier, species that qualify as critical habitat features include:

- **Reptile** (4 species): Black Marsh Turtle, Giant Asian Pond Turtle, Southeast Asian Box Turtle, and Elongated Tortoise,
- **Mammals** (2 species): Indochinese Silvered Langur and Long-tailed Macaque),
- **Fishes** (2 species): Striped catfish and Siamese Tiger Perch, and
- **Birds** (3 species): Greater Adjutant, Milky Stork, and Bengal Florican.

Figure 6.53: Land use and land cover map based on the satellite image from Sentinel-2 with 10m resolution.



First of all, the Ou Tapaong command area was assessed as a modified habitat because the command area which is around 14,000 hectares is a mixture of paddy fields, rivers, shrubland, seasonal ponds, farmers, and houses. Rivers such as Ou Ta Paong River and Svay Donkeo River have been substantially modified at various locations of the river for water collection, storage, as well as for other living and farming purposes.

In this assessment, we divided Ou Tapaong Command Area into three parts: 1) the upper part to the south, 2) the middle part along National Road 5, and 3) the lower part to the north which is situated within the floodplain of Tonle Sap Zones 2 and adjacent to Tonle Sap Zone 3 for key informant interview and habitat assessment purposes as this command area is large and maintain different demographic and natural habitat conditions. On August 7, 2024, the Cambodian government discussed the decision to register two zones (Zone 2 and Zone 3) of the Tonle Sap Lake Basin as state land to protect the natural resources of the lake. This decision will prohibit any further requests for land concessions in these zones. The Ministry of Land Management, Urban Planning and Construction hopes that this will help to preserve the biodiversity of the lake[34]. The assessment focused on the upper and lower parts because these areas are known to have a diverse biodiversity landscape. While the survey revealed variations in knowledge about wildlife among local communities, it also highlighted the need for increased awareness and understanding across all areas.

Figure 6.54: Map of Ou Ta Paong command area and other existing protected area within the Tonle Sap Basin

[34] Land Management, Urban Planning and Construction, Cambodia (2024). Zones 2 and 3 of the Tonle Sap Lake will be registered as state land to preserve this precious natural resource for inheritance for all generations.

The southern part of the command area is predominantly agricultural, with limited remaining natural habitats. Boeng Kansaeng, the largest seasonal wetland, faces challenges in water retention during the dry season. While the command area mostly gets water for irrigation from the Svay Daunkaev and Pursat rivers, the water volume is insufficient to maintain natural flows (e.g. Ou Tapaung River). Additionally, human interventions such as earth dams and conversion of waterways into fishponds have fragmented the natural habitats and as such hindered the movement of aquatic species (Figures 6.55 and 6.56).

The northeastern part of the command area, though dominated by agriculture, includes a significant area of flooded forests. This diverse habitat supports a range of endangered and critically endangered species. However, the entire water system faces challenges that limit its suitability for species requiring extensive, interconnected habitats. The lowest part of this area is connected to a very healthy flooded forest habitat, consisting of many small and large waterholes, and wetland areas, creating a mosaic habitat that provides suitable ecological niches for many endangered and critical species in the area. This huge, flooded forest habitat is part of the Tonle Sap Multiple Use Area, Tonle Sap Biosphere Reserve under the Ministry of Environment, and Tonle Sap Management Zone under the administration mandate of the Tonle Sap Authority, and Flooded Forest Protected Area under the Fisheries Administration. Additionally, a portion of Ou Ta Paong's lower command area overlaps with two Community Fisheries (CFIs) areas.

The critical habitat for these bird species within the Ou Ta Paong Irrigation sub-scheme includes flooded forests, wetlands, lakes, rivers, grassland, abandoned and fellow rice fields, and waterways. The flooded forests in Tonle Sap Zone 3 serve as crucial habitats for several

endangered and critically endangered primate species like the Indochinese Silvered Langur and Long-tailed Macaque and are characterised with lakes and wetlands inside that are crucial foraging habitats for birds. Based on this key finding we can identify and characterise critical habitats of various EN and CR species presence within and close the command area as below:

- Flooded forests, particularly those in Tonle Sap Zone 3, are particularly significant for biodiversity. These forests provide crucial habitat for endangered primates such as the Indochinese Silvered Langur and Long-tailed Macaque. Additionally, the lakes and wetlands within these forested areas offer essential foraging grounds for various bird species including Greater Adjutant and Milky Stork.
- Wetlands, such as Boeung Kansaeng, play a vital role in supporting aquatic and terrestrial biodiversity. These areas provide essential food, shelter, and breeding grounds for a variety of species including birds, reptiles, and fish.
- Rivers and waterways, like the Svay Daun Kav River, serve as important corridors for fish migration and connectivity between different habitats. This can indirectly benefit birds by providing a healthy aquatic ecosystem.
- Grasslands and open areas, while less diverse than forested habitats, can still support certain Bengal Florican, Yellow-breasted Bunting and other bird species. Abandoned and fallow rice fields may also offer temporary refuge for many bird birds including the Florican. The Bengal Florican utilizes this habitat for nesting and feeding during the dry season. The Yellow-breasted Bunting winters in this region before returning to its breeding ground in Siberia, Russia, from May to November

Based on the biodiversity assessment conducted at Ou Tapaong Irrigation Sub-scheme, several critical habitats have been identified, and described below. These habitats support a range of endangered and critically endangered species, highlighting their ecological significance. The critical habitat assessment activities that should be taken for the Ou Tapaong Command area, considering IFC PS 6 guidance on biodiversity conservation and sustainable management of living natural resources, are as follows:

1. Baseline Studies: Conduct comprehensive baseline studies to identify and understand the biodiversity values in the area. This should include a literature review, stakeholder engagement and consultation, field surveys, and other relevant assessments. The focus should be on identifying key species (such as Greater Adjutant, Milky Stork, Bengal Florican), fish (Siamese Tiger Perch and Striped Catfish), reptiles (Black Marsh Turtle, Southeast Asian Box Turtle, Giant Asian Pond Turtle, Elongated Tortoise), mammals (Indochinese Silvered Langur and Long-tailed Macaque), and their habitats.
2. Habitat Mapping: Map out the different habitats present within the Ou Tapaong Command area. This should include flooded forests, lakes (such as Boeung Kamsaeng Lake), rivers (Svay Daunkav River), waterholes, grasslands, and fellowed rice fields used by bird species for foraging.
3. Threat Assessment: Assess potential threats to critical habitats identified in step 2. Consider factors such as habitat loss due to infrastructure development or land-use changes related to irrigation system renovation.

4. Stakeholder Engagement: Engage with relevant stakeholders including local communities living in or around critical habitats to gather their knowledge about biodiversity values in the area.
5. Mitigation Measures: Develop mitigation measures specific to each identified critical habitat that aligns with IFC PS 6 guidance on avoidance of impacts whenever possible; implementation of measures to minimize habitat fragmentation; restoration activities during operations or after project completion; implementation of set-asides for protection; consideration of biodiversity offsets where appropriate based on no net loss principle.
6. Environmental and Social Impact Assessment (ESIA): Conduct an ESIA that considers all potential impacts on critical habitats identified through steps 1-5 above.
7. Monitoring Plan: Develop a comprehensive monitoring plan that includes regular monitoring of key species populations within critical habitats identified in step 2 above.

Figure 6.55: Boeung Kansaeng located in Ou Tampaong's upper reaches, offers sighted records of Siamese Tiger Parch. The area's upper part in this photo is a settlement along the Svay Daunkav River.

Figure 6.564: Overview of Boeung Kansaeng, located upstream of Ou Tapaong Command Area. A canal connects to Stueng Svay Daunkav River (left) and Ou Tapaong (right), a potential fish migration route during floods.

Figure 6.57: Aerial photograph depicting the Ou Tapaong Stream/canal fragmented by earth dams, roads, and ponds, illustrating its diversion for non-intended purposes.

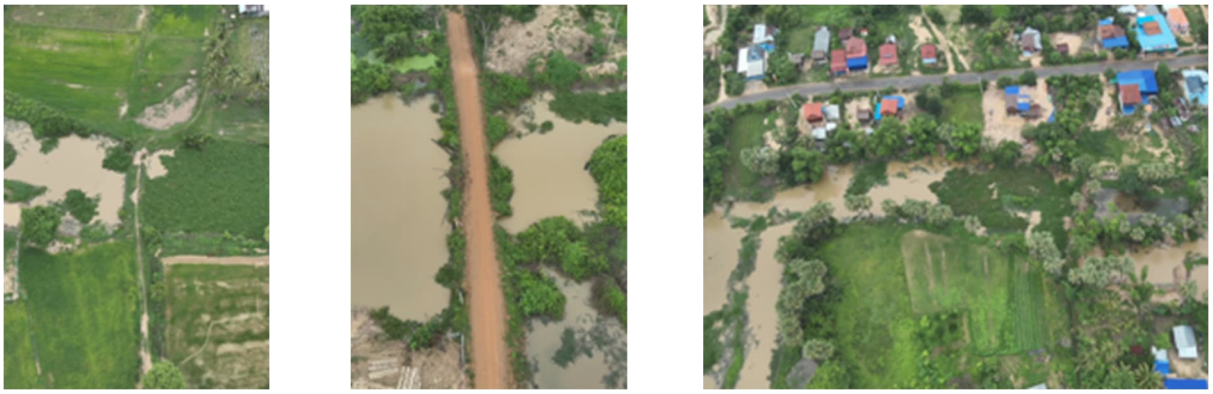


Figure 6.58: Aerial photograph of intake flooded forest habitat within Tonle Sap Zone 3 and the continuous land encroachment, converting forest land for rice cultivation.

6.5.1.2.2 Habitat of significant importance to endemic or restricted-range species

None of the species under EN and CR classification are restricted-range species (based on IBAT report for Ou Ta Paong).

6.5.1.2.3 Habitat supporting globally or nationally significant concentrations of migratory or congregation species

None of the IBA that are recognized for significant concentrations of migratory birds or other species are found within the vicinity of the sub-scheme. No other evidence of significant concentrations of migratory or congregatory species is available. The AoA for OTP, therefore is expected to qualify as critical habitats under this criterion**.**

6.5.1.2.4 Highly threatened or unique ecosystems

Each of the reservoirs are modified habitat and is associated with numerous rice paddies. There is no evidence that these areas are highly threatened or unique ecosystems, and no critical habitats are recognized under this criterion.

6.5.1.2.5 Ecological functions or characteristics that are needed to maintain the viability of the biodiversity values described above in (a) to (d)

Boeung Kansaeng Lake still maintains hydrological connectivity for fish migration from Stueng Svay Daunkav River through its canals, where the Siamese Tiger Perch was confirmed. Some small wetland areas at the lower part of the OTP command area support ecological functions and connectivity for confirmed birds, reptiles and fish species for their local movement, nesting, and foraging ground. So, that is necessary to support biodiversity values that require applying biodiversity mitigation measures and protection efforts (described under the above criteria) have been identified. Pumping, drainage, and discharge of chemical inputs into that wetland can have a significant impact on the biodiversity and survival rate of EN and CR species present in that area.

6.5.2 Lum Hach

6.5.2.1 Analysis to prepare for determining CH status

6.5.2.1.1 Species with Potential Occurrence within the AoA

A list of threatened species with potential occurrence was generated for the LH Command Area. The coordinates of this command area (via KMZ file) are used to inform the IBAT radius of screening. Since the default radius of IBAT screening is 50km, steps were taken to narrow down to the sub-scheme's area of influence to identify only EN and CR species that are potentially present in the sub-scheme area of influence. The narrowing-down aims to practically identify EN and CR species that could be found in the sub-scheme area of influence

and to determine the Critical Habitat status of the identified species. After three rounds of screening focusing on EN and CR, only one endangered bird species of Green Peafowl was confirmed see table 6.21 below.

Description of screening for narrowing down

For Lum Hach, three rounds of screening have been conducted. The first screening (Round 1) was conducted in December 2023. Round 2 was carried out in April 2024, and Round 3 in August 2024. The purpose of repeated screening is to validate the screening results (for the same area) with a wide range of local stakeholders. The screening aims to identify only EN and CR species that are potentially present in the Lum Hach area of influence, covering reptiles, mammals, fish, birds, and mushrooms. Screening was done based on the IBAT report generated and provided by the AIIB.

In the first two rounds of screening, 5 EN and CR species were identified in this area of influence (see Table below). In the 3rd round of screening (in August 2024), however, one of five species was confirmed as “potentially present” in the LH’s area of influence. So, the assessment for Lum Hach focuses on the confirmed list of **1 species** that are categorized by IUCN as Endangered species.

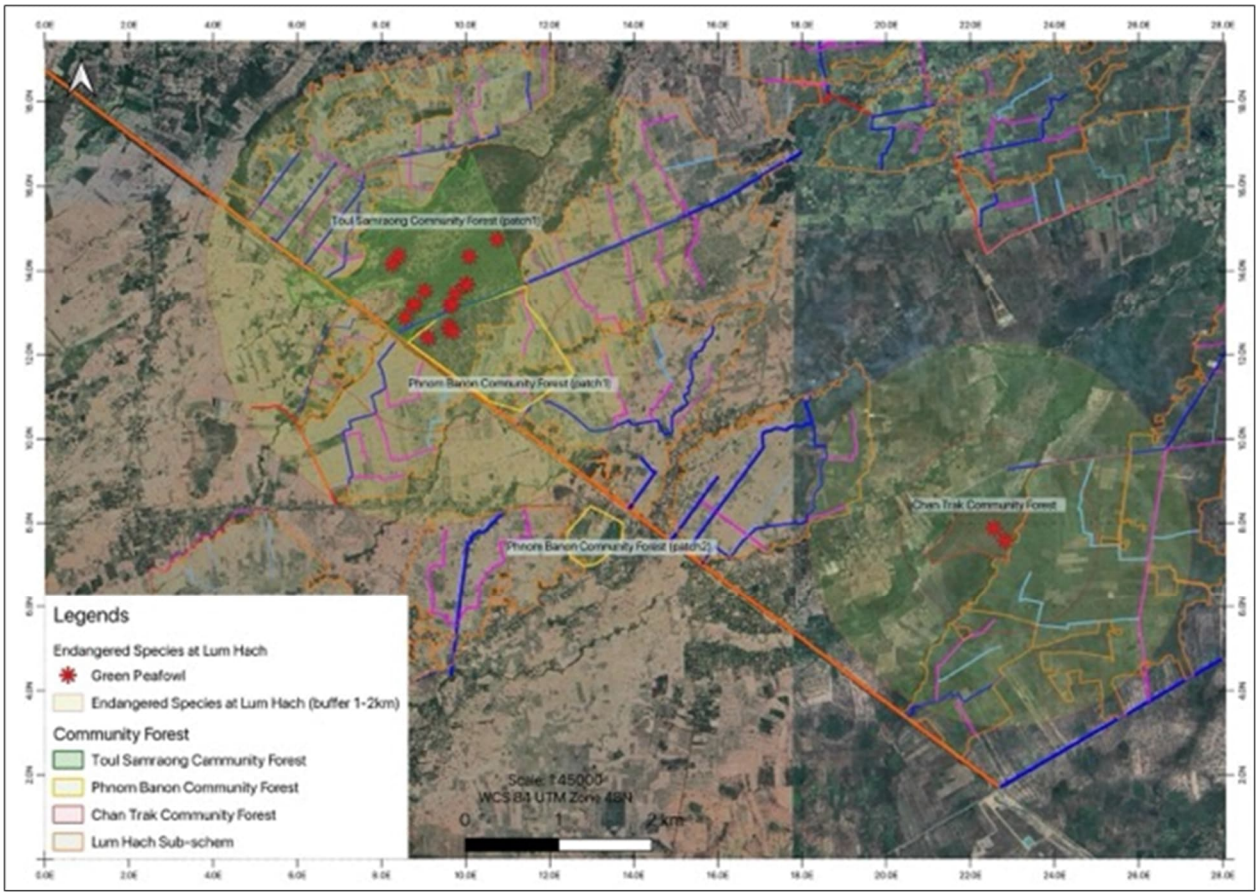
Table 6.21: Confirmed List of endangered and critically endangered species for the Lum Hach sub-scheme

No.	Local Name	English Name	Scientific Name	IUCN Cat	Screened Species from Round 1&2 (Total=5)	Confirmed Species in Round 3 (Total = 1)
I. Mammal species						
1	ឆ្កែព្រៃ	Dhole	Cuon alpinus	EN	Yes	No
2	ជ្រីងជំ	Large Flying-fox	Pteropus vampyrus	EN	Yes	No
II. Fish species						
3	ក្រីកន្ត្រៀប ខ្លា	Siamese Tiger Perch	*Datnioides pulcher*	CR	Yes	No
III. Bird species						
4	ក្អែក	Green Peafowl	Pavo muticus	EN	Yes	Yes
IV. Mashroom						
5	ផ្សិតកែវ	Puffball mushrooms	Calostoma insigne	EN	Yes	No

6.5.2.1.2 Ecological State of Habitats within the AoA

Understanding of the ecological state of habitats is necessary to assess the likelihood of occurrence (LoO) of Green Peafowl - as part of the CHA. For this CHA, species was classified into four LoO categories: Present, Possible, Unlikely and Not Present. Species known to be Present or with a Possible LoO are further assessed in Step 3. This understanding takes into

account the classification of habitats as either modified or natural based on levels of human-induced disturbance to species composition and ecological functions. In this session, a brief assessment of the one confirmed species is presented. The assessment discusses historical range, distribution, habitat conditions, current status, and potential threats identified by key informants.



The remaining forest patches within the Lum Hach Irrigation Sub-scheme are characterized by small size, fragmentation, and degradation. They are classified as very open and degraded Dry deciduous forests (DDFs), which are not suitable for many species, including Long-tailed Macaques, Large Flying-fox, and Puffball mushrooms. The limited availability of suitable habitats is a significant factor contributing to the scarcity of biodiversity in the area.

The biodiversity assessment at Lum Hach Irrigation Sub-scheme initially identified several potential endangered (EN) or critically endangered (CR) species using the Integrated Biodiversity Assessment (IBAT) and key informant interviews. However, further investigation revealed that only Green Peafowl was confirmed to be present within the Toul Samraong, Phnom Banon, and Chan Trak Community Forests (see map in Figure 6.59 below).

Species Distribution:

- **Green Peafowl:** Found in all three community forests, indicating their adaptability to the local environment and the importance of these habitats for their conservation.
- **Dhole:** Despite initial screenings, no confirmed sightings were made within the study area. This may be attributed to factors such as habitat fragmentation, human disturbance, or low population densities.
- **Flying-fox:** The survey result is similar to the dhole, no flying-fox was confirmed within the study area. This could be due to habitat loss, hunting pressure, or other factors affecting their survival.
- **Siamese Tiger Perch:** This species was not found within the study area, likely due to its preference for larger water bodies like the Tonle Sap Great Lake. Three KII reportd that they countered this specie when they went for fishing at Tonle Sap every year but they had never seen this species within this area (Lum Hach).
- **Puffball mushrooms:** Although not confirmed within the study area, there is potential for their presence in higher elevations of the Cardamom Mountains.

Figure 6.59: Green Peafowl distribution in Toul Samraong, Phnom Banon, and Chan Trak Community Forests, as confirmed by local sources from 2020 to 204.

6.5.2.2 Determination of Critical Habitat Status (Step 3)

A habitat assessment was conducted in key areas known for endangered species within the region. Interviews with local authorities, community committees, and key informants confirmed the presence of Green Peafowl in three community forest areas.

Two of these forests, Toul Samraong and Phnom Banon (a large patch), share a boundary and are primarily composed of dry, open dipterocarp forests with some closed dipterocarp areas along the natural canal. These three community forests are small, fragmented, and surrounded by farmland, with some remaining degraded forest land nearby. Despite their poor ecological connectivity, they are crucial for supporting the small remaining Green Peafowl population.

During a meeting, it was discovered that two community forest boundaries had been revised, and one had changed its name from Trapeang Mlu to Phnom Banon. All forest representatives confirmed that their areas were undergoing registration with the Ministry of Land Management, Urban Planning, and Construction (PLMUPC). However, some key informants expressed

concerns about ongoing land encroachment into their community areas. Despite previous complaints, the offenders continue to use and sell the land without any repercussions.

6.5.2.2.1 Habitat of significant importance to CE and EN species

As presented in Section 4.2.3.3 (Ecological State), species that qualify as critical habitat features for Green Peafowl is listed as Endangered Species in the IUCN RedList. The natural dry forest habitats within the community forests of the Lum Hach Irrigation Sub-Scheme are critical for the survival of the Green Peafowl population. These forests provide essential

resources for Green Peafowl, including food, shelter, and breeding sites. However, the quality and extent of these habitats can vary significantly, affecting their suitability for the species (Figures 6.60 and 6.61).

Figure 6.60: The upperpart of Hum Hack next to Boribou river catchment area

Figure 6.61: Overview from the above of the general condition of Toul Samroang and Phnom Banon Community Forests

Figure 6.62: Overview from the above of the general condition of Chan Trak Community Forest

Figure 6.63: An expert consulted with the Toul Samraong CF management committee to verify the identification of a canine species, ensuring it was correctly identified as either a dhole or a jackal.

6.5.2.2.2 Habitat of significant importance to endemic or restricted-range species

None of the species under EN and CR classification are restricted-range species (based on IBAT report for Lum Hach).

6.5.2.2.3 Habitat supporting globally or nationally significant concentrations of migratory or congregatory species

None of the IBA that are recognized for significant concentrations of migratory birds or other species are found within the vicinity of the sub-scheme. No other evidence of significant concentrations of migratory or congregatory species is available. The AoA for LH, therefore is expected to qualify as critical habitats under this criterion.

6.5.2.2.4 Highly threatened or unique ecosystems

Each of the reservoirs are modified habitat and is associated with numerous rice paddies of there the three community forest areas are trimmed out from the command area. There is no evidence that these areas are highly threatened or unique ecosystems, and no critical habitats are recognized under this criterion. However, the concern of illegal agriculture expansion into the community forest areas was questioned by some key informants (management committee and patrol members of community forests).

6.5.2.2.5 Ecological functions or characteristics that are needed to maintain the viability of the biodiversity values described above in (a) to (d)

No ecological functions that are necessary to support biodiversity values (described under the above criteria) have been identified.

6.5.3 Brambei Mom

6.5.3.1 Analysis to prepare for determining CH status

6.5.3.1.1 Critical Habitat Area of Analysis

Critical habitat is defined as an Area of Analysis (AoA), and the project's command area is used as an AoA.

6.5.3.1.2 Species with Potential Occurrence within the AoA

A list of threatened species with potential occurrence was generated for Brambei Mom. The coordinates of BM (via KMZ file) are used to inform the IBAT radius of screening. Since the default radius of IBAT screening is 50km, steps were taken to narrow down to the sub-scheme's area of influence to identify only EN and CR species that are potentially present in the sub-scheme area of influence. The narrowing-down aims to practically identify EN and CR species that could be found in the sub-scheme area of influence and to determine the Critical Habitat status of the identified species. After three rounds of screening, there's on EN and CR species confirmed.

Description of screening for narrowing down

For Brambei Mom, three rounds of screening have been conducted. The first screening (Round 1) was conducted in December 2023. Round 2 was carried out in April 2024, and Round 3 in August 2024. The purpose of repeated screening is to validate the screening results (for the same area) with a wide range of local stakeholders. The screening aims to identify only EN and CR species that are potentially present in the Brambei Mom area of influence, covering reptiles, mammals, fish, birds, and mushrooms. Screening was done based on the IBAT report generated and provided by the AIIB.

The four sub-schemes (Brambei Mom, Krapeu Truom, Yotasas, and Stueng Kang Bat) are integral components of the Stoeung Krang Ponley River catchment system, a tributary of the Tonle Sap. These areas share geographic connectivity and ecological functions. Semi-structured and structured interviews were conducted to collect data on species information, distribution, and fisheries ecosystems. In the first two rounds of screening, 2 EN and CR species including 1) one reptile (Black Marsh Turtle), and 2) one fish species (Striped Catfish) were identified in this area of influence. In the 3rd round of screening (in August 2024), however, none of these species was confirmed" in the Brambei Mom's area of influence.

6.5.3.1.3 Ecological State of Habitats within the AoA

Understanding of the ecological state of habitats is necessary to assess the likelihood of occurrence (LoO) of the above 2 screened species - as part of the CHA. For this CHA, species were classified into four LoO categories: Present, Possible, Unlikely and Not Present. Species known to be Present or with a Possible LoO are further assessed in Step 3. This understanding takes into account the classification of habitats as either modified or natural based on levels of human-induced disturbance to species composition and ecological functions. In this

session, a brief assessment of the 11 confirmed species are presented. The assessment discusses historical range, distribution, habitat conditions, current status, and potential threats identified by key informants.

The four sub-schemes (Brambei Mom, Krapeu Truom, Yotasas, and Stueng Kang Bat) are integral components of the Stoeung Krang Ponley River catchment system, a tributary of the Tonle Sap. These areas share geographic connectivity and ecological functions. Semi-structured and structured interviews were conducted to collect data on species information, distribution, and fisheries ecosystems. Two National Fisheries Day ceremonies were held at Kbol and Anlong Chrey Reservoirs, during which millions of fish were released by the former prime minister. The aquaculture department of the Technology Institute of Kampong Speu also releases fish into these reservoirs. Investigations with relevant government departments confirmed that no endangered or critically endangered species were released during these events.

6.5.3.2 Habitat Assessment

Brambei Mom Command Area is located within the Stoeung Krang Ponley River catchment system, a tributary of the Tonle Sap. These areas are geographically and ecologically interconnected. The habitat is characterized by three large reservoirs (Anlong Chrey, Brambei Mom, and Kdol) in the upper reaches, while the lower areas consist of riverine, wetland, and agricultural landscapes. The water quality, vegetation density, and soil composition vary across these habitats. However, the hydrological functions of the system are disrupted by numerous dams and spillways along the main canal and irrigation canals, hindering fish migration from downstream to upstream. This may be one factor contributing to the absence of the targeted species in the area.

Semi-structured interviews were conducted with multiple fishermen at Anlong Chrey and Brambei Mom reservoirs. Many claimed to have seen or caught Striped Catfish, Mekong Giant Barb, and Isok barb/Jullien's Golden Carp. To verify their claims, we sent photographs of the fish to Thach Panara, head of the Inland Fisheries Research and Development Institute. It was determined that all of the fishermen had mistakenly identified Mekong Giant Barb as Rohu (Labeo rohita). Additionally, none of the fishermen reported encountering any turtles or tortoises in their fishing area. Despite consulting visual aids, we were unable to confirm the reported sightings of Jullien's Golden Carp and Striped Catfish due to a lack of clear identification evidence.

Ten key informants were interviewed with the support of commune councils. None reported encountering the targeted species within the command area. Discussions with the Chief of Brambei Mom commune revealed a history of large-scale fish farming in the area, including Pangasianodon sp. and Hypsibarbu sp. A flood event years ago led to the release of these fish into the Anlong Chrey reservoir, resulting in increased catches by local fishermen. However, it remains uncertain whether the Pangasianodon sp. was indeed Striped Catfish.

Figure 6.64: Interviewing and verifying Mekong Giant Barb with similar look of other fish species and their ecological niches

Figure 6.65: Local fishermen in Brabei Mom mistakenly identified their catch of Rohu (Labeo rohita) as Mekong Giant Barb.

6.5.3.3 Determination of Critical Habitat Status (Step 3)

This section assesses the information (obtained from the above sub-section) vis-a-vis the criteria (presented in Section 3.4 - CH assessment method). Based on the assessment result there are no EN and CR with their critical habitat confirmed for this sub-scheme.

6.5.3.3.1 Habitat of significant importance to CE and EN species

As presented in Section 4.3.3.2 (Ecological State), no EN and CR species confirmed.

6.5.3.3.2 Habitat of significant importance to endemic or restricted-range species

None of the species under EN and CR classification are restricted-range species (based on IBAT report for for Brambei Mom).

6.5.3.3.3 Habitat supporting globally or nationally significant concentrations of migratory or congregation species

None of the IBA that are recognized for significant concentrations of migratory birds or other species are found within the vicinity of the sub-scheme. No other evidence of significant concentrations of migratory or congregatory species is available. The AoA for Brambei Mom, therefore is expected to qualify as critical habitats under this criterion.

6.5.3.3.4 Highly threatened or unique ecosystems

Each of the reservoirs are modified habitat and is associated with numerous rice paddies. There is no evidence that these areas are highly threatened or unique ecosystems, and no critical habitats are recognized under this criterion.

6.5.3.3.5 Ecological functions or characteristics that are needed to maintain the viability of the biodiversity values described above in (a) to (d)

No ecological functions that are necessary to support biodiversity values (described under the above criteria) have been identified.

6.5.4 Krapeu Trom

6.5.4.1 Analysis to prepare for determining CH status

6.5.4.1.1 Critical Habitat Area of Analysis

Critical habitat is defined as an Area of Analysis (AoA), and the project's command area is used as an AoA.

6.5.4.1.2 Species with Potential Occurrence within the AoA

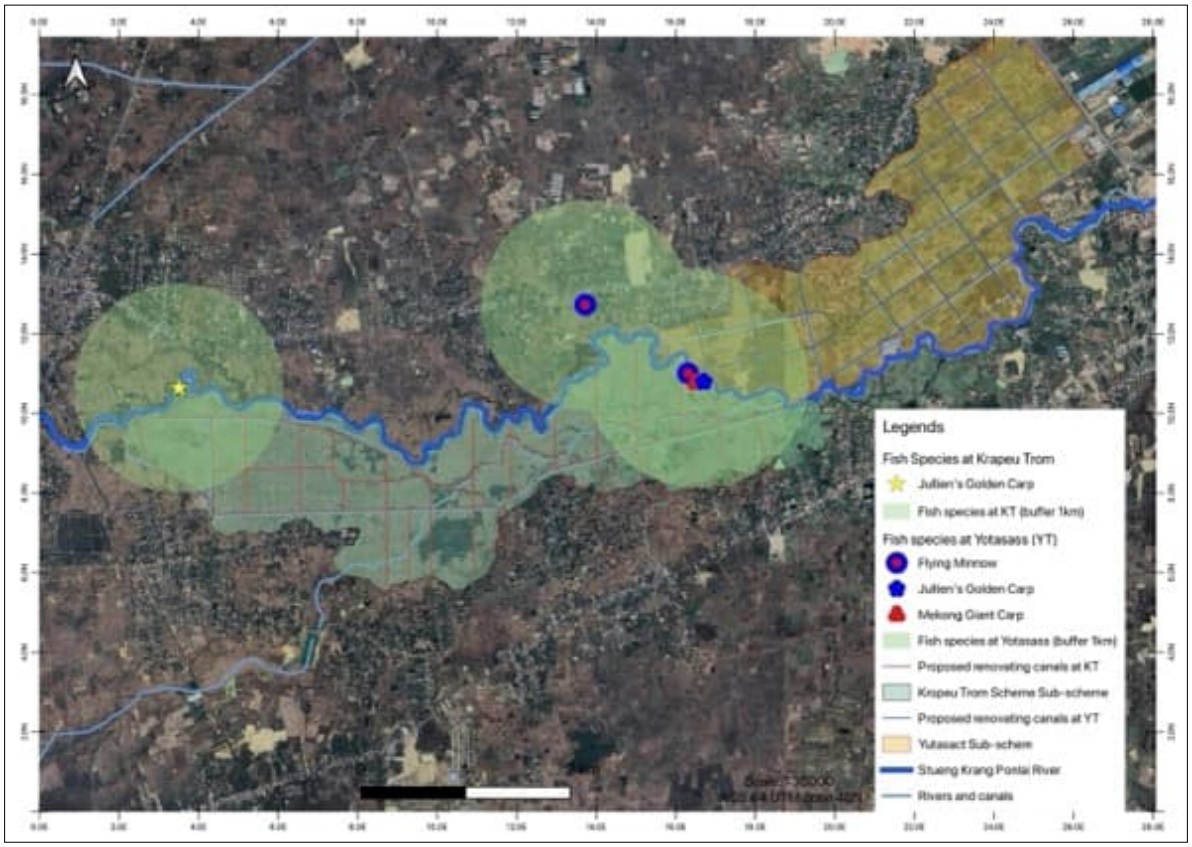
A list of threatened species with potential occurrence was generated for Krapeu Trom (KT). The coordinates of KT (via KMZ file) are used to inform the IBAT radius of screening. Since the default radius of IBAT screening is 50km, steps were taken to narrow down to the sub-scheme's area of influence to identify only EN and CR species that are potentially present in the sub-scheme area of influence. The narrowing-down aims to practically identify EN and CR species that could be found in the sub-scheme area of influence and to determine the Critical Habitat status of the identified species.

6.5.4.1.3 Description of screening for narrowing down

For Krapeu Trom, three rounds of screening have been conducted. The first screening (Round 1) was conducted in December 2023. Round 2 was carried out in April 2024, and Round 3 in August 2024. The purpose of repeated screening is to validate the screening results (for the same area) with a wide range of local stakeholders. The screening aims to identify only EN and CR species that are potentially present in the OTP area of influence, covering reptiles, mammals, fish, birds, amphibians, and aquatic plants. Screening was done based on the IBAT report generated and provided by the AIIB.

In the first two rounds of screening, there were two fish species (Isok barb/Jullien's Golden Carp and Leaping barb/Flying Minnow) were screened for the first two rounds. After three rounds of screening focusing on EN and CR species, only Flying Minnow is confirmed as potentially present in the sub-scheme area of influence.

6.5.4.1.4 Ecological State of Habitats within the AoA



Understanding of the ecological state of habitats is necessary to assess the Likelihood of occurrence (LoO) of the above 11 screened species - as part of the CHA. For this CHA, species were classified into four LoO categories: Present, Possible, Unlikely and Not Present. Species known to be Present or with a Possible LoO are further assessed in Step 3. This understanding takes into account the classification of habitats as either modified or natural based on levels of human-induced disturbance to species composition and ecological functions. In this session, a brief assessment of the one confirmed species is presented. The assessment discusses historical range, distribution, habitat conditions, current status, and potential threats identified by key informants.

The Krapeu Trom command area has been in existence since the 1970s. The KT is a mixture of paddy fields, farm roads, and residential areas. Natural rivers, such as the Stueng Krang Ponlai serve as the sole ecological and hydrological connection between its upstream watershed and the Tonle Sap River basin downstream. This river is crucial for fish migration during the flooding season. However, reservoirs, spillways, and drought conditions have disrupted these essential ecological functions.

- **Fish (1 species)**

Krapeu Trom, like Brambei Mom, is situated within the same river catchment area in the lower reaches, near the Tonle Sap's annual floodplain. Two fish species, the Isok barb/Jullien's Golden Carp (Probarbus jullieni) and Leaping barb/Flying Minnow (Laubuka caeruleostigmata), were targeted for interviews in this command area. Among ten key informants interviewed, only one reported encountering the Jullien's Golden Carp once in 2022, approximately 500 meters downstream of the reservoir facility during a flooding event (see map below). This individual stated that the species migrated upstream from the Tonle Sap during the flood season but became trapped in spillways. They added that if flooding is insufficient, fish populations decline, and rare species may no longer be present in the area.

Figure 6.66: A spatial distribution map was generated for four fish species at Krapeu Trom and Yotasas Command Area. 1 km buffer zones were included to approximate their minimum movement range around suitable habitats.

6.5.4.2 Determination of Critical Habitat Status (Step 3)

This section assesses the information (obtained from the above sub-section) vis-a-vis the criteria (presented in Section on - CH assessment method). This assessment aims to determine whether any species qualify for Critical Habitat features.

6.5.4.2.1 Habitat of significant importance to CE and EN species

As presented in Section 4.4.3.3 (Ecological State), the species that qualifies as a critical habitat feature is the Flying Minnow. Krapeu Trom Command Area is part of Stueng Krang Ponlai River system (Tonle Sap's tributary) and situated approximately 11 km from Tonle Sap River. The area was influenced by flood-plus water from Stueng Krang Ponlai upstream and the push-up of flood water from Tonle Sap River Basic allowing fish to short distance migration for food and breeding.

Although climate change has caused dry and drought more frequently, this area still receives a good amount of flood from its upstream and downstream making a good connectivity and providing ecological function for migratory fish.

6.5.4.2.2 Habitat of significant importance to endemic or restricted-range species

None of the species under EN and CR classification are restricted-range species (based on IBAT report for sub-scheme).

6.5.4.2.3 Habitat supporting globally or nationally significant concentrations of migratory or congregation species

None of the IBA that are recognized for significant concentrations of migratory birds or other species are found within the vicinity of the sub-scheme. No other evidence of significant concentrations of migratory or congregatory species is available. The AoA for KT, therefore is expected to qualify as critical habitats under this criterion.

6.5.4.2.4 Highly threatened or unique ecosystems

Each of the reservoirs are modified habitat and is associated with numerous rice paddies. There is no evidence that these areas are highly threatened or unique ecosystems, and no critical habitats are recognized under this criterion.

6.5.4.2.5 Ecological functions or characteristics that are needed to maintain the viability of the biodiversity values described above in (a) to (d)

No ecological functions that are necessary to support biodiversity values (described under the above criteria) have been identified.

6.5.5 Yutasas

6.5.5.1 Analysis to prepare for determining CH status

6.5.5.1.1 Critical Habitat Area of Analysis

Critical habitat is defined as an Area of Analysis (AoA), and the project's command area is used as an AoA.

6.5.5.1.2 Species with Potential Occurrence within the AoA

A list of threatened species with potential occurrence was generated for Yutasas. The coordinates of Yutasas (via KMZ file) are used to inform the IBAT radius of screening. Since the default radius of IBAT screening is 50km, steps were taken to narrow down to the sub-scheme's area of influence to identify only EN and CR species that are potentially present in the sub-scheme area of influence. The narrowing-down aims to practically identify EN and CR species that could be found in the sub-scheme area of influence and to determine the Critical Habitat status of the identified species. After three rounds of screening focusing on EN and CR species, 6 EN and CR species are found as potentially present in the sub-scheme area of influence. These species include 3 reptile species, and 3 fishes (See list of 11 EN and CR species in Table below).

Description of screening for narrowing down

For Yutasas, three rounds of screening have been conducted. The first screening (Round 1) was conducted in December 2023. Round 2 was carried out in April 2024, and Round 3 in

August 2024. The purpose of repeated screening is to validate the screening results (for the same area) with a wide range of local stakeholders. The screening aims to identify only EN and CR species that are potentially present in the Yutasas area of influence, covering reptiles and fish. Screening was done based on the IBAT report generated and provided by the AIIB.

In the first two rounds of screening, 5 EN and CR species were identified in the Yutasas area of influence (See Table 6.22 below). In the 3rd round of screening (in August 2024), however, 3 (out of a total of 5 species) were confirmed as “potentially present” in the Yutasas’s area of influence.

So, the assessment for Yutasas focuses on the confirmed list of **3 species of fish** that are categorized by IUCN as EN and CR species (see map in Krapeu Trom section above).

Table 6.22: Confirmed List of endangered and critically endangered species for the Yutasas sub-scheme

No.	Local Name	English Name	Scientific Name	IUCN Cat	Screened Species from Round 1&2 (Total=5)	Confirmed Species in Round 3 (Total = 3)
I. Reptile species						
1	អណ្តើកព្រោច	Elongated Tortoise	Indotestudo elongata	CR	Yes	Yes
II. Fish species						
2	ត្រីក្រសក់ក្រហម	Jullien's Golden Carp	Probarbus jullieni	CR	Yes	Yes
3	ត្រីចង្វាស្ទឹង	Leaping barb/Flying Minnow	Laubuka caeruleostigmata	EN	Yes	Yes
4	ត្រីកាហោ/ត្រីកុលរ៉ាង	Mekong giant barb/Giant Carp	Catlocarpio siamensis	CR	Yes	Yes
II. Bird species						
5	ទាព្រៃស្លាបស	White-winged Duck	Asarcornis scutulata	EN	Yes	No

6.5.5.1.3 Ecological State of Habitats within the AoA

Understanding of the ecological state of habitats is necessary to assess the Likelihood of occurrence (LoO) of the above 3 screened species - as part of the CHA. For this CHA, species were classified into four LoO categories: Present, Possible, Unlikely and Not Present. Species known to be Present or with a Possible LoO are further assessed in Step 3. This understanding takes into account the classification of habitats as either modified or natural based on levels of human-induced disturbance to species composition and ecological functions. In this session, a brief assessment of the 3 confirmed species are presented. The assessment discusses historical range, distribution, habitat conditions, current status, and potential threats identified by key informants.

The Yutasas command area has been in existence since the 1970s. This command area is a mixture of paddy fields, farm roads, and residential areas. Natural rivers, such as the Stueng Krang Ponlai, are the sole ecological and hydrological connection between its upstream watershed and the downstream Tonle Sap River basin. This river is crucial for fish migration during the flooding season. However, reservoirs, spillways, and drought conditions have disrupted these essential ecological functions.

6.5.5.2 Determination of Critical Habitat Status (Step 3)

This section assesses the information (obtained from the above sub-section) vis-a-vis the criteria (presented in Section 3.4 - CH assessment method). This assessment aims to determine whether any species (identified in the list of 3 EN and CR species) qualify for Critical Habitat features

6.5.5.2.1 Habitat of significant importance to CE and EN species

As presented Ecological State, species that qualify as critical habitat features include:

Based on the interviews and habitat assessments, three of the five endangered species were confirmed to be present in the Krapeu Trom section: Jullien's Golden Carp, Flying Minnow, and Mekong Giant Barb (see map above in Krapeu Trom section).

- **Jullien’s Golden Carp:** A female fisher reported encountering this rare species in the lower part of the reservoir during a flood in 2022. She caught five individuals using a fishing net. The other informants had not seen this species in several years. After careful verification, it was determined that the fishers were familiar with the species and had not mistaken it for another.
- **Flying Minnow:** Two informants reported encountering this small fish species in 2022 and 2023. One caught them in the lower part of the Yotasass reservoir, where they had migrated from a downstream area. The other found them in her natural fish pond after pumping it. Both informants were confirmed to be familiar with the species.
- **Mekong giant Barb**: A key informant reported catching five individuals of this species in July 2022 after heavy rains. The fish were small, approximately 1.5 kilograms each, and were found in the lower part of the reservoir. The informant was familiar with the species and believed that they were attempting to migrate upstream but were trapped by the reservoir.

6.5.5.2.2 Habitat of significant importance to endemic or restricted-range species

None of the species under EN and CR classification are restricted-range species (based on IBAT report for Yutasas).

6.5.5.2.3 Habitat supporting globally or nationally significant concentrations of migratory or congregation species

None of the IBA that are recognized for significant concentrations of migratory birds or other species are found within the vicinity of the sub-scheme. No other evidence of significant concentrations of migratory or congregatory species is available. The AoA for Yutasas, therefore is expected to qualify as critical habitats under this criterion.

6.5.5.2.4 Highly threatened or unique ecosystems

Each of the reservoirs are modified habitat and is associated with numerous rice paddies. There is no evidence that these areas are highly threatened or unique ecosystems, and no critical habitats are recognized under this criterion.

6.5.5.2.5 Ecological functions or characteristics that are needed to maintain the viability of the biodiversity values described above in (a) to (d)

No ecological functions that are necessary to support biodiversity values (described under the above criteria) have been identified.

Table 6.232: Initial Screening of CH-qualifying Species Confirmed or Likely to Occur in the Yutassas sub-scheme of the Project Area

English Name	Scientific Name	IUCN Status	Global population	Cambodia population	Migratory/ Congregatory	Habitat and Distribution	Likelihood of Occurrence	Rationale for Critical Habitat Screening	Screened In or Out
Reptile									
Elongated Tortoise	Indotestudo elongata	CR	Unknown-kept declining	Unknown-kept declining	No	Endangered and elusive, inhabit the Tonle Sap Floodplain's diverse wetlands, including flooded forests and marshes. Their survival is threatened by habitat loss, hunting, and bycatch.	Not confirmed	There's some qualified habitat but lack of permanent and deep-water body. The species was confirmed present around 15 to 12 km way downstream far from the project area. Therefore, It's likely absent in the project AoI.	Out
Fish									
Jullien's Golden Carp	Probarbus jullieni	CR	Unknown-kept declining	Unknown-kept declining > 80% over three generations	Yes	*Probarbus jullieni* inhabits Cambodia's Mekong tributaries and large rivers, favoring deep, flowing lowland pools. Once widespread in the Mekong and Tonle Sap systems, its range is now fragmented and drastically reduced.	Low - Confirmed in AoI in 2024	Critically endangered due to overfishing, dams, and habitat loss, it is now extremely rare in Cambodian waters. This species migrates from Tonle Sap River system into the AoI through Stueng Krang Ponlai river system (Tonle Sap tributary). Likely to qualify the Yutasas as CH under Criterion 1, 3, and 4threshold.	IN
Leaping barb/Flying Minnow	Laubuka caeruleostigmata	EN	Unknown-kept declining	Unknown-kept declining	Yes	This species prefers clear, forested streams and tributaries across Cambodia's river systems. While likely widespread in suitable freshwater habitats, its precise distribution remains poorly documented.	Low-Confirmed in AoI in 2024	Endangered due to overfishing, dams, and habitat loss, it is now extremely rare. This species migrates from Tonle Sap River system into the AoI through Stueng Krang Ponlai river system (Tonle Sap tributary). Likely to qualify the Yutasas as CH under Criterion 1, 3, and 4 threshold.	IN
Mekong giant barb/ Giant Carp	Catlocarpio siamensis	CR	Unknown-declined over 90%	Unknown-kept declining	Yes	*Catlocarpio siamensis* once lived in deep Mekong pools and tributaries but are now extremely	Very Low - Confirmed in AoI in	Critically endangered, with severe population declines attributed to overfishing, dam construction, and	IN

			in the last three generations			rare and restricted to isolated spots due to overfishing and habitat loss.	2024	habitat degradation, rendering it exceptionally rare. It's reported that only juvenile individuals migrate from the Tonle Sap River system into the Area of Influence (AoI) via the Stueng Krang Ponlai River, a Tonle Sap tributary. Likely to qualify the Yutasas as CH under Criterion 1, 3, and 4t hreshold.	
Bird									
White-winged Duck	Asarcornis scutulata	EN	Unknown	Unknown	No	Rare and poorly studied aquatic plant species endemic to Thailand, specifically found in the Chanthaburi Province.	Not confirmed	IUCN listed as EN and as the Endemic to the Thailand and therefore it has been screened out	**Out**

6.5.6 Stueng Krang Bat

6.5.6.1 Analysis to prepare for determining CH status

6.5.6.1.1 Critical Habitat Area of Analysis

Critical habitat is defined as an Area of Analysis (AoA), and the project's command area is used as an AoA.

6.5.6.1.2 Species with Potential Occurrence within the AoA

A list of threatened species with potential occurrence was generated for Stueng Krang Bat (SKB). The coordinates of SKB (via KMZ file) are used to inform the IBAT radius of screening. Since the default radius of IBAT screening is 50km, steps were taken to narrow down to the sub-scheme's area of influence to identify only EN and CR species that are potentially present in the sub-scheme area of influence. The narrowing-down aims to practically identify EN and CR species that could be found in the sub-scheme area of influence and to determine the Critical Habitat status of the identified species. After three rounds of screening focusing on EN and CR species, 5 EN and CR species are found as potentially present in the sub-scheme area of influence. These species include 3 reptile species, and 2 fishes (see a list of 6 EN and CR species in Table 6.24 below).

Description of screening for narrowing down

For Ou Ta Paong, three rounds of screening have been conducted. The first screening (Round 1) was conducted in December 2023. Round 2 was carried out in April 2024, and Round 3 in August 2024. The purpose of repeated screening is to validate the screening results (for the same area) with a wide range of local stakeholders. The screening aims to identify only EN and CR species that are potentially present in the SKB area of influence, covering reptiles, mammals, fish, birds, amphibians, and aquatic plants. Screening was done based on the IBAT report generated and provided by the AIIB.

In the first two rounds of screening, 5 EN and CR species were identified in the SKB area of influence (See Table below). In the 3rd round of screening (in August 2024), however, 6 (one additional critically endangered species) were confirmed as "potentially present" in the OTP's area of influence.

So, the assessment for SKB focuses on the confirmed list of 6 species that are categorized by IUCN as EN and CR species including 3 reptile species (Asian giant softshell turtle, Black Marsh Turtle and Southeast Asian Box Turtle) and 3 fish species (Striped catfish, Mekong Giant Barb and Siamese Tiger Perch). See Table below for the list of confirmed species and see Figure 6.67 for potential locations of these species in the project's area of influence.

Table 6.24: List of endangered and critically endangered species based on the IBAT Screening result vs. key informant interview at Stueng Krang Bat Sub-scheme

No.	Local Name	English Name	Scientific Name	IUCN Cat	Screened Species from Round 1&2 (Total=5)	Confirmed Species in Round 3 (Total = 3)
I.	**Reptile spices**					

1	កន្ធាយក្បាលកង្កែប	Asian giant softshell turtle	Pelochelys cantorii	CR	No	Yes
2	អណ្តើកក្អែក	Black Marsh Turtle	Siebenrockiella crassicollis	EN	Yes	Yes
3	អណ្តើកបិទមុខ	Southeast Asian Box Turtle	Cuora amboinensis	EN	Yes	Yes
III. Fish species						
4	ត្រីជ្រោង	Striped catfish	Pangasianodon hypophthalmus	EN	Yes	Yes
5	ត្រីកាហោ/ត្រីគុលរ៉ាង	Mekong Giant Barb	Catlocarpio siamensis	CR	Yes	Yes
6	ត្រីកន្ត្រៃប់ខ្លា	Siamese Tiger Perch	Datnioides pulcher	CR	Yes	Yes

6.5.6.1.3 Ecological State of Habitats within the AoA

Understanding of the ecological state of habitats is necessary to assess the Likelihood of occurrence (LoO) of the above 11 screened species - as part of the CHA. For this CHA, species were classified into four LoO categories: Present, Possible, Unlikely and Not Present. Species known to be Present or with a Possible LoO are further assessed in Step 3. This understanding takes into account the classification of habitats as either modified or natural based on levels of human-induced disturbance to species composition and ecological functions. In this session, a brief assessment of the 11 confirmed species are presented. The assessment discusses historical range, distribution, habitat conditions, current status, and potential threats identified by key informants.

The SKB command area has been in existence since the 1970s. The SKB is a mixture of paddy fields, farm roads, and residential areas. The Stueng Krang Bat (SKB) irrigation sub-scheme was initially screened for a biodiversity assessment, utilizing the Integrated Biodiversity Assessment (IBAT) approach and key informant interviews. Located on the edge of the Tonle Sap River and annual floodplains of the Tonle Sap and Mekong Rivers, this area holds significant ecological importance. The initial screening identified six EN and CR of reptiles and fish species for this command area. These included the Black Marsh Turtle, Southeast Asia Box Turtle, Striped catfish, Mekong giant barb/Giant Carp, and Siamese Tiger Perch.

Upon conducting key informant interviews (KII), it was confirmed that several endangered (EN) and critically endangered (CR) species inhabit SKB. These included reptiles such as the Black Marsh Turtle, Southeast Asia Box Turtle, and Asian giant softshell turtle along with fish species like Striped catfish, Mekong giant barb/Giant Carp, and Siamese Tiger Perch. The confirmation of these vulnerable species underscores the ecological significance of SKB's command area (see map below).

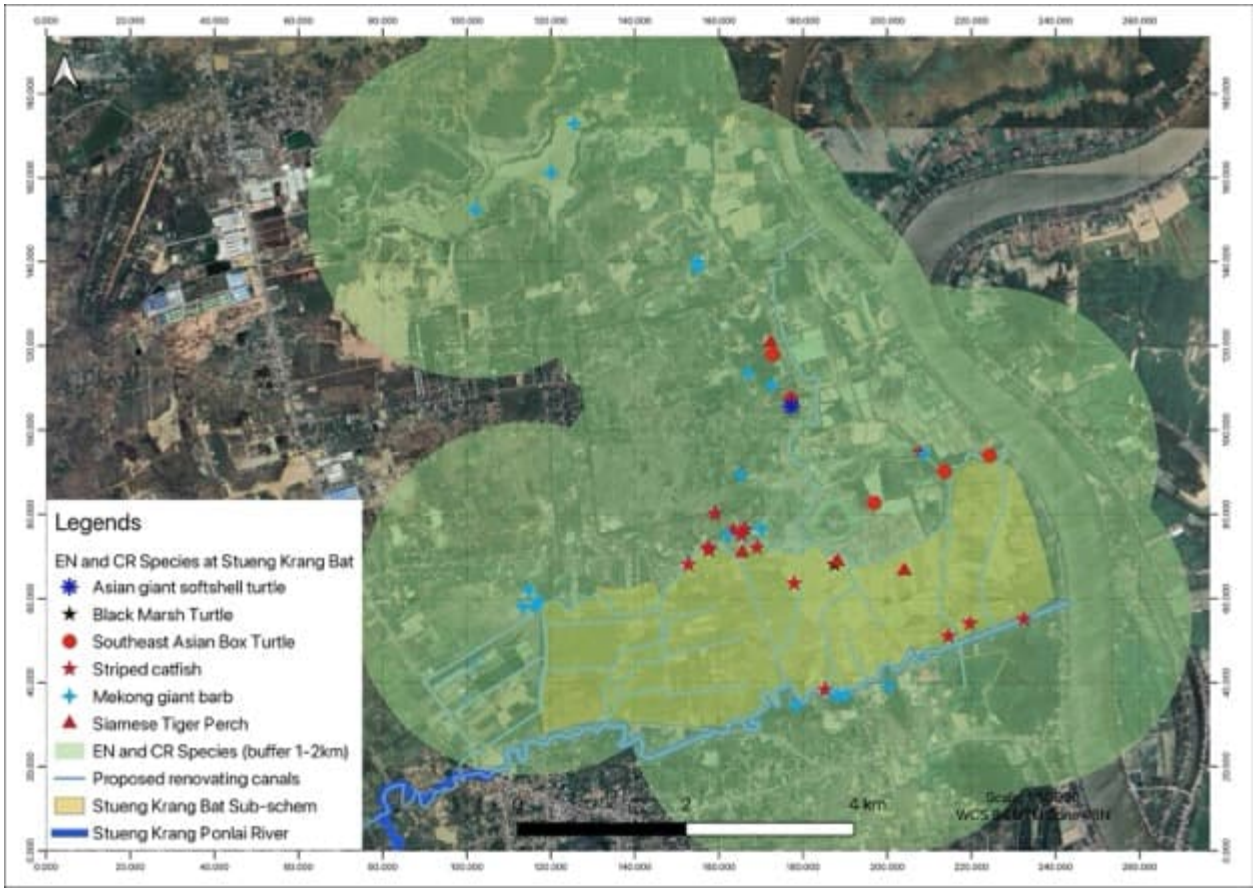
This information emphasizes the importance of further biodiversity surveys in this region to comprehensively document all wildlife present. Furthermore, these findings highlight potential

conservation efforts needed to protect these threatened or endangered species identified through initial screening at SKB.

Ten key informants were selected in collaboration with the commune council and village chiefs for interviews. These individuals were chosen based on their extensive local ecological knowledge and experience in fishing within their communities. The following paragraphs summarize the key information gathered from interviews regarding each confirmed species.

❖ **Reptiles (3 species)**

- **Asian giant softshell turtle:** This species was not initially screened for interviews at this sub-scheme but was confirmed during the interview process. Only one informant reported encountering the Asian Giant Softshell Turtle in 2024 at Boeung Thom. This extremely rare species was last sighted by this informant many years ago. It prefers large lakes and river systems with abundant vegetation and flooded forests. The remaining key informants had not seen this species in many years, and some had never encountered it in their lifetimes.
- **Black Marsh Turtle**: Two key informants confirmed their familiarity with this species. One informant reported encountering the Black Marsh Turtle in the area over a decade ago but has not seen it since then. A second informant also recalled encountering the species more than ten years ago, but not within the specific command area.
- **Southeast Asian Box Turtle:** Five key informants confirmed their familiarity with the Southeast Asian Box Turtle. Two of these informants reported encountering the species in the Boeung Thom and Rek Trors areas in 2022. Another two informants encountered the turtle 7 years ago near the spillway close to the village and in Reahny Longvaek, which has since been converted into a real estate development project. One informant reported seeing the species in the same location for over a decade but has not observed it recently.



❖ **Fish Species**

- **Striped Catfish:** The local fishermen in the Stueng Kran Bat Command Area have consistently encountered the Striped Catfish species during the flooding season for several years. However, they have noticed a rapid decline in population size, with individuals being caught at much smaller sizes. The estimated catch by comparison to previous years is only around 30%. The fishermen report encountering these fish annually during full flooding and receding periods, with sightings randomly occurring within approximately 900m distance surrounding the village area. These fish typically migrate from the Tonle Sap Lake to the Stueng Kraing Ponlai River in August or September, depending on flood levels. Once in the Stueng Kraing Ponlai River, they disperse throughout the floodplain during the flooding season. All key informants reported consistently catching this species in the following areas for all reported fish species: Veal Braing (the floodplain area around the village), Trek Tor, Boeung Kralor Meach, Boeung Braing, Stueng Krang Ponlay River, Boeung Thom, and Boeung Toek La-ork.
- **Mekong Giant Barb:** Local fishermen in the Stueng Kran Bat Command Area have consistently encountered the Mekong Giant Barb species during the flooding season

for several years. However, they have noticed a rapid decline in population size, with individuals being caught at much smaller sizes. The fishermen do not intentionally target these fish species they are at the fingerling stage, but they often become trapped in line nets. Two of the fishermen mentioned that they had encountered this species around a decade ago but stopped going out for fishing for many years. Seven fishermen reported encountering them every year during flooding and early receding periods near the village and within the floodplain area. The catch sizes are small during flooding season but grow significantly (2 to 3 km per individual) during receding periods. Another fisherman noted that there has been a decrease in both catch amounts and size of these fish over time, with fewer being caught with nets each year. They also mentioned that some of these fish get stuck in large lakes near the Tonle Sap River when floods occur. Overall, it is estimated that there has been a significant decline of more than 70% in catch amounts, and today's Mekong Giant Barb are much smaller compared to previous years at this time of year due to their rarity and the delay and not enough floods.

- **Striped Catfish:** The information provided by the local fishermen regarding the Striped Catfish species in the command area is varied. Two of them reported recent sightings in 2022 and 2023 between 3 to 5 individuals per catch, while one informant mentioned their last encounter was 7 years ago, and two others stated that they haven't seen this species in over a decade. The encounters typically occurred during flooding and receding periods. The number of individuals caught has been very low, and the size of the fish has been decreasing year by year. One fisherman mentioned that he encountered this species in the Tonle Sap River but not around the village area.

Figure 6.67: Map showing the distribution of endangered (EN) and critically endangered (CR) species, with 1-2 km buffers indicating their potential movement ran ge within and around suitable habitats as identified by key informants sighted from 2020 to 2024.

6.5.6.2 Determination of Critical Habitat Status (Step 3)

This section assesses the information (obtained from the above sub-section) vis-a-vis the criteria (presented in CH assessment method). This assessment aims to determine whether any species (identified in the list of 11 EN and CR species) qualify for Critical Habitat features.

6.5.6.2.1 Habitat of significant importance to CE and EN species

As presented in Ecological State, species that qualify as critical habitat features include:

The habitat assessment identified both modified and natural habitats within the command area. Modified habitats include areas substantially altered by human activity, such as agricultural land, natural lakes, wetlands, and river systems. Natural habitats consist of viable assemblages of native plants and animals, where primary ecological functions and species composition remain largely intact. Identifying critical habitats is essential for understanding the ecological requirements of different fish species within the project areas. The critical habitats identified in the assessment are diverse and support a range of endangered and critically endangered species. These habitats include:

- **Floodplains:** The floodplains, particularly those connected to the Tonle Sap Lake and Mekong River, provide important habitats for fish species during the flooding season. These areas are periodically inundated, creating a dynamic ecosystem that supports fish migration, spawning, and feeding.
- **Rivers and Streams:** The rivers and streams within the sub-schemes serve as crucial habitats for fish migration and spawning. The Stueng Krang Ponlai River in Krapeu

Trom sub-scheme plays a vital role in connecting upstream watersheds to the Tonle Sap River basin.

- **Wetlands:** Wetlands such as marshes, swamps, lakes, and ponds are critical for supporting aquatic biodiversity. They provide breeding grounds for fish species and serve as important habitats for reptiles like Black Marsh Turtle and Southeast Asia Box Turtle.
- **Aquatic Vegetation:** Aquatic plants play a key role in providing food, shelter, and spawning sites for various fish species. They contribute to the overall health of aquatic ecosystems by improving water quality through nutrient uptake.

6.5.6.2.2 Habitat of significant importance to endemic or restricted-range species

None of the species under EN and CR classification are restricted-range species (based on IBAT report for SKB).

6.5.6.2.3 Habitat supporting globally or nationally significant concentrations of migratory or congregation species

This command area lies on the heart of Tonle Sap River Basin (TSRB) receiving annual flooding and submerging under the water seasonally. The whole floodplain area provides a signification congregation under the water during the wet season from August or September to January or February (depending on the flood situation) creating significant habitat for migratory fish, congregating downstream to upstream and vice versa.

6.5.6.2.4 Highly threatened or unique ecosystems

The Stueng Krang Bat irrigation sub-scheme is located in an area of high ecological importance within the Tonle Sap River system. The area is characterized by its proximity to the Tonle Sap Lake, the Mekong River, and their connecting channels, which provide a diverse range of habitats for fish species. This complex network of waterways supports a diverse range of fish species, making it a global hotspot for aquatic life. The confirmed presence of endangered and critically endangered species in the sub-scheme area highlights its ecological significance.

6.5.6.2.5 Ecological functions or characteristics that are needed to maintain the viability of the biodiversity values described above in (a) to (d)

Stueng Kang Ponlai or Krang Bat and its floodplain area serve as critical habitat for EN and CR species of fish and reptiles. These ecological functions are necessary to support biodiversity values (described under the above criteria). Protecting flooded forest habitats and maintaining hydrological functions and connectivity are key to securing the free movement of these rare species.

Table 6.25: Initial Screening of CH-qualifying Species Confirmed or Likely to Occur in the Stueng Krang Bat sub-scheme of the Project Area

English Name	Scientific Name	IUCN Status	Global population	Cambodia population	Migratory/ Congregatory	Habitat and Distribution	Likelihood of Occurrence	Rationale for Critical Habitat Screening	Screened In or Out
Reptile									
Giant Asian Pond Turtle	*Heosemys grandis*	CR	Unknown (suspected to have decreased by about 80%)	Unknown-kept declining	N/A	Thrive in the Tonle Sap Floodplain's slow-moving waters and abundant vegetation, shrubland, wetland, and ponds; 5-20 masl.	Very Low - Confirmed in AoI in 2024	There're large proportion of suitable habitats comprise of permanent wetland, ponds, flooded forest, complex river system lie on the mouth of Tonle Sap River and receive regular season flood of the Tonle Sap Basin. It's confirmed the present of this species. Likely to qualify as CH under Criterion 1& 4 threshold.	IN
Black Marsh Turtle	*Siebenrockiella crassicollis*	EN	Unknown (suspected to have decreased by about 80% in SEA)	Unknown-kept declining	N/A	Inhabits slow-moving shallow wetlands (marshes, swamps, ponds) in Cambodian lowlands. Historically widespread, its range remains broad but fragmented due to habitat loss, though it persists in some degraded areas.	Moderate - Confirmed in AoI in 2024	There're large proportion of suitable habitats comprise of permanent wetland, ponds, flooded forest, complex river system lie on the mouth of Tonle Sap River and receive regular season flood of the Tonle Sap Basin. It's confirmed the present of this species. Likely to qualify as CH under Criterion 1& 4 threshold.	IN
Southeast Asian Box Turtle	*Cuora amboinensis*	EN	Unknown-kept declining	Unknown-kept declining	N/A	The species inhabits lowland still-water environments such as ponds, marshes, and rice paddies. Their distribution is considered widespread across suitable wetland habitats in Cambodia, with a higher concentration likely in southern and western regions.	Moderate - Confirmed in AoI in 2024	There're large proportion of suitable habitats comprise of permanent wetland, ponds, flooded forest, complex river system lie on the mouth of Tonle Sap River and receive regular season flood of the Tonle Sap Basin. It's confirmed the present of this species. Likely to qualify as CH under Criterion 1& 4 threshold.	IN

Fish									
Striped catfish	*Pangasianodon hypophthalmus*	EN	Unknown	Unknown	Yes	This freshwater fish is native to the Mekong River Basin in Southeast Asia, including countries like Thailand, Laos, Cambodia, and Vietnam	Moderate - Confirmed in AoI in 2024	There're large proportion of suitable habitats comprise of permanent wetland, ponds, flooded forest, complex river system lie on the mouth of Tonle Sap River and receive regular season flood of the Tonle Sap Basin. It's confirmed the present of this species. Likely to qualify as CH under Criterion 1& 3 threshold.	**IN**
Mekong giant barb/ Giant Carp	Catlocarpio siamensis	CR	Unknown-declined over 90% in the last three generations	Unknown-kept declining	Yes	*Catlocarpio siamensis* once lived in deep Mekong pools and tributaries but are now extremely rare and restricted to isolated spots due to overfishing and habitat loss.	Very Low - Confirmed in AoI in 2024	Critically endangered, with severe population declines attributed to overfishing, dam construction, and habitat degradation, rendering it exceptionally rare. It's reported that only juvenile individuals migrate from the Tonle Sap River system into the Area of Influence (AoI) via the Stueng Krang Ponlai River, a Tonle Sap tributary. Likely to qualify as CH under Criterion 1& 3 threshold.	**IN**
Siamese Tiger Perch	*Datnioides pulcher*	CR	Unknown	Unknown	Yes	This freshwater fish species is native to the Mekong and Chao Phraya River basins in Southeast Asia, including Thailand, Cambodia, Laos, and Vietnam.	Moderate - Confirmed in AoI in 2024	There're large proportion of suitable habitats comprise of permanent wetland, ponds, flooded forest, complex river system lie on the mouth of Tonle Sap River and receive regular season flood of the Tonle Sap Basin. It's confirmed the present of this species. Likely to qualify as CH under Criterion 1& 3 threshold.	**IN**

6.6 SOCIO-ECONOMIC AND CULTURAL CONDITIONS

6.6.1 Administrative and Social Structure

6.6.1.1 Administrative System

Cambodia's administrative system at sub-national level is organized into three (3) tiers: capital city/province, district/municipality/khan, and sangkat/commune. Phnom Penh, the capital, is divided into khans and further into sangkats, while provinces are divided into municipalities and districts, with municipalities subdivided into sangkats and districts into communes and sangkats. The sub-national government is guided by organic laws, including the Law on Administration of Commune/Sangkat and the Law on Administration of Capital City, Province, Municipality, District, and Khan, supporting decentralization and deconcentration. Commune/sangkat administrations operate with legal, financial, and administrative autonomy, governed by elected councils responsible for budgets, development, and public order. Higher levels, such as provinces and districts, are governed by councils (legislative) and boards of governors (executive), with council members indirectly elected by commune/sangkat councils and supported by technical committees. Boards of governors, nominated by the Ministry of Interior, implement policies and supervise ministry units in their jurisdiction. Recent legal amendments aim to expand local administrations' authority over civil servants from national bodies, awaiting implementation through sub-decrees.

6.6.1.2 None-Governmental Organizations

Another institution which are playing an important role in the development of the country at sub-national level is the civil society. The civil society in Cambodia, particularly the NGOs plays a vital role in development and democratization. These organizations address challenges such as poverty, education, human rights, gender equality, and environmental conservation, filling gaps in governance and social services. NGOs contribute by providing microfinance, vocational training, and livelihood programs to alleviate poverty; supporting education through school construction, scholarships, and inclusive learning; and improving health outcomes with maternal health programs, HIV/AIDS awareness, and mental health support. They advocate for human rights, labor rights, and good governance, engaging in election monitoring and raising awareness about corruption and land rights. Additionally, NGOs promote environmental sustainability and climate resilience while advancing gender equality by combating violence and discrimination and empowering women in leadership. Within the project area, there are a number of NGOs being identified within the area in different sectors including environment, community development, such as Wildlife Conservation Society (WCS), Adventist Development Relief Agency (ADRA), Advocacy Policy Institute (API), and People In Need (PIN).

6.6.1.3 Community-Based Organizations

Another social organization is Community-based organizations (CBOs). Cambodia, CBOs play a critical grassroots role, directly addressing local needs. Unlike NGOs, they are often less formalized and focus on mobilizing local resources for infrastructure, livelihood improvements, and strengthening community networks. CBOs contribute significantly to

disaster resilience, especially in flood-prone areas, and foster cultural preservation and social cohesion through community events and initiatives. Together, NGOs and CBOs empower communities, protect rights, and promote inclusive development, offering hope for a more equitable and sustainable future despite ongoing challenges. Types of CBOs include Community Fishery, Forestry Community, Agricultural Cooperatives, and social organizations such as saving groups, old age association, etc. All of these types are reported within the project target areas.

The identified agriculture-related community-based association is provided in Table below:

Table 6.26: Status of relevant CBOs within the project area

No.	Types of Associations	OTP	Lum Hach	Krang Ponley
1	Agricultural Cooperatives	There are three (3) agricultural cooperatives in OTP focusing on vegetables, and rice.	There is one (1) agricultural cooperative allocated in this command area focusing on rice and vegetable production.	Seven (7) agricultural cooperatives located in Brambei Mom (1), Yutasas (1), and Krapeu Trom (5) which focus on rice and vegetable. Stueng Krang Bat is the only sub-scheme without AC.
2	Farmer Water User Community	There is a farmer water users' community. However, it is nonfunctional due to insufficient water supply for farmers.	Farmer water user community is not available in this sub-scheme due to the unstable water support for irrigation system.	Yutasas and Krapeu Trom sub-scheme has FWUC but none of them are operational due to lack of cooperation in paying contribution fees of members. Brabie Mom and Stung Krang Bat sub-scheme has no FWUC.
3	Community Forestry	No community forestry in the command area.	There are three (3) communities' forestry in Lum Hach. These CFs aim to protect remain forest land, restoration, and sustainable forest consumption.	No community forestry in the command area.
4	Community Fishery	There is one community fishery in Ou Ta Paong sub-scheme, located in this sub-command area covering a total area of 60 hectares.	No community fishery within this sub-scheme	No community fishery within this sub-scheme

6.6.1.4 Culture and Religion

Cambodia's culture reflects its rich history and diversity, shaped by the ethnic Khmer majority (90%) and minority groups like ethnic Vietnamese, Cham Muslims, and indigenous highland

communities. While Khmer is the official language, many minorities maintain unique languages and traditions. Buddhism, practiced by 95% of the population, deeply influences cultural norms, often blended with Hindu and animist elements such as ancestor worship. As per the commune database and consultation with local authorities regarding the indigenous people, there is no indigenous people being present within the target areas.

6.6.2 Social Conditions

The project covers a large and distinctive areas in four (4) provinces: Pursat, Kampong Chhnang, Kampong Speu and Kandal province. Ou Ta Paong and Lum Hach sub-schemes are administratively and geographically independent whereas Prambei Mom, Krapeu Truom, Yutasas and Stung Krang Bat are connected to each other as the sub-schemes share the same river basin and somehow have associated water sources. The sociological conditions of the sub-schemes are described in the following sections.

6.6.2.1 Ou Ta Paong

Ou Ta Pong command area is located solely in Bakan District, Pursat Province. The command area is approximately 16,074 hectares, comprising of cultivation area, residential, and non–residential areas (e.g. farm roads, other infrastructure works). The sub-scheme spans across parts of six (6) communes in Bakan district including Boeung Khnar, Ou Ta Paong, Rumlech, Svay Don Keo, Me Teok, and Khnar Torteng. In total, there are 38 villages from these communes that are geographically located within the command areas, resulting from the verification with commune councils, the SECAP II team and overlaying of map between the administrative boundary of the communes and the command area. The total number of households within these 38 villages were reported at 8,130 HHs, given the total population of 34,189 people (out of which 17,602 are females) (Table 6.27).

Table 6.27: Administrative and population coverage of Ou Ta Paong sub-scheme

No.	Province/ District	Communes	Number of Villages	Total HH	Total Population	Female Population
1	Pursat/ Bakan	Beung Khnar	1	254	1040	516
		Ou Ta Paong	19	3,973	17,263	8,949
		Rumlech	1	263	960	503
		Svay Doun Keo	6	1,178	2,691	5,143
		Me Teok	8	2,176	4,385	8,686
		Khnar Torteung	3	286	1,097	558
	Total	**6**	**38**	**8,130**	**34,189**	**17,602**

(Source: Ministry of Planning, Commune Database, 2023)

6.6.2.2 Lum Hach

The updated gross command area of Lum Hach is estimated at approximately 3,900 ha situated within three (3) districts of Kampong Chhnang province including Toek Phus, Rolea B'ear, and Boribour districts. The sub-scheme spans across five (5) communes including Krang Skear commune, Toek Phus district, Banteay Preal, Krang Leav, and Praseob commune in Rolea B'ear district and Anchang Rong commune in Boribour district. In total, there are 36 villages from these communes that are geographically located within the

command areas as the result of the verification with commune councils, the SECAP II team and overlaying of map between the administrative boundary of the communes and the command area. The total number of households within these 36 villages in 2023 were reported at 7,958 HHs, given the total population of 30,844 people (out of which 16,019 are females) (Table 6.28).

Table 6.28: Administrative and population coverage of Lum Hach sub-scheme

No.	Province/ District	Communes	Number of Villages	Total HH	Total Population	Female Population
1	Kampong Chhnang / Toek Phus	Krang Skear	6	2,044	7,746	3,926
2	Kampong Chhnang / Rolea B'ear	Banteay Preal	10	1,301	4,929	2,568
		Krang Leav	8	1,729	6,647	3,528
		Prasneob	6	1,412	5,377	2,767
3	Kampong Chhnang / Boribour	Anchanh Rung	6	1,472	6,145	3,230
Total		**5**	**36**	**7,958**	**30,844**	**16,019**

(Source: Ministry of Planning, Commune Database, 2023)

6.6.2.3 Stung Krang Ponley

The command areas of Stung Krang Ponley under the project is 3,277 ha, home to four (4) sub-schemes of the project including Brambei Mom (1,000 ha), Krapeu Truom (700 ha), Yutasas (650 ha), and Steung Krang Bat (1,000 ha).

Administratively, the command areas located in three (3) provinces including Kampong Chhnang, Kampong Speu, and Kandal span across the 7 communes of the three (3) provinces, giving the total of 30 villages, giving the total households of 6,702 HHs with a total population of 28,163 people (out of which 14,612 are females) (Table 6.29). One (1) commune, Svay Commune, Sameaki Meanchey district, Kampong Chhnang province, stretches across two (2) sub-schemes: Krapeu Truom and Yutasas.

Table 6.29: Administrative and population coverage of Lum Hach sub-scheme

No.	Province/ District	Communes	Number of Villages	Total HH	Total Population	Female Population
	Brambei Mom					
1	Kampong Speu / Thpong	Brambei Mom	5	1,042	4,405	2,288

(Source: Ministry of Planning, Commune Database, 2023)

6.6.3 Demographic and Facilities

As per the description from above section on sociological condition, the ESCIA extracted the data from Commune Database, Ministry of Planning to obtain the statistics of all villages located within and nearby the command areas. It is noticeable that not all households hold the land assets within the command areas whereas it is possible that villagers from the other residential locations can also own the land within the command areas. The later population are not included in this information describes in the following section. It is noted that the commune database in 2023 is the full recorded information of village chief in every village across the country being submitted to commune further submitted to district, province and national level for compilation. Annually the data is collected during June or July and the release will be around 6 to 8 months later.

According to the commune database in 2023, the total number of households who are residing within and nearby the command area is 21,319 HH (out of which 3,941 HHs (17%) are female headed), giving the total population of 86,876 people (48,233 females). Moreover, the population are young with more than 64% of them are aging below 34 years old. More than half of the people (54%) completed education at primary school and below whereas those with secondary, high school, and higher education is only 23%, 14%, and 4%, respectively. It is noticeable that illiterate people have still existed at 4% (Table 6.30).

Overall, it is apparent that all the sub-schemes contain young population indicating its high potential in future development activities. However, it is a concern as the population have very limited education, especially for Lum Hach, Brambei Mom, and Krapeu Tuom. Stung Krang Bat was found to be the best among the 6 sub-schemes.

Table 6.30: Demographic information of the HH living within and the vicinity of the command areas

Parameters	Sub-scheme						Total
	Ou Ta Paong	Lum Hach	Brambei Mom	Krapeu Truom	Yutasas	Stung Krang Bat	
Overall							
Total HH	8,130	6,486	1,914	2,430	1,339	1,020	22,791

HH = Household, TVET = Technical and Vocational Education and Training.
(Source: Ministry of Planning, Commune Database, 2023)

Energy access of the population within the target area was found to be high, giving its proportion at 93% access to electricity and only a minority of them continue using battery (4%), solar energy (2%), and biogas (0.1%). However, the sources of water for domestic consumption were low with only 27% of them having access to water supply system while the rest continue using pump well, tube-well, opened-well, rainwater and river, indicating the access to clean water continue to be a huge constraint within the project target areas. A good sign for the people is how they are using water for drinking purposes which was found to be almost all using safe water for drinking (tape water 21%, filtered water 61%, and boiled water 19%). There is a concern, however, regarding the reliability of the tape water quality which may create significant impact on the people's health, if they are not properly monitored. Interestingly, almost all the people within the target areas own a toilet showing their understanding of the importance of water, sanitation and hygiene.

Across the sub-schemes, Lum Hach has the lowest access to energy, water and sanitation facilities while the rest was found to be at a high proportion. Interestingly, Brambei Mom has the highest rate of utilizing solar energy (6%) indicating potential in promoting this type of clean energy (Table 6.31).

Table 6.31: Access to energy and water and sanitation facilities

Parameters	Sub-scheme						Total
	Ou Ta Paong	Lum Hach	Brambei Mom	Krapeu Truom	Yutasas	Stung Krang Bat

6.6.4 Socio–economic Conditions of the Beneficiaries

Agriculture was reported as the main occupation of the population within the command areas (Table 6.32). However, the second rank for the main occupation varies from one (1) sub-scheme to another. Whle business and services is the second highest proportion (22%) for all command areas, full-time worker was found to be the highest in Brambei Mom (23%), Krapeu Truom (24%) and Yutasas (29%). It is observable that Lum Hach is the most agricultural dependent sub-scheme with 62% of the households engaged in agriculture as their main occupation. Another significant main occupation is working as laborers, giving its proportion at 6% with the highest proportion in Ou Ta Paong (9%), followed by Lum Hach and Stung Krang Bat at 5%.

As a secondary occupation, rice and crop production remains the most prevalent among the population, with animal raising as the second most common activity, followed by business and service sectors.

Table 6.32: Occupation of the HHs living within and the vicinity of the command areas

Parameters	**Sub-Schemes**						**Total**
	Ou Ta Paong	**Lum Hach**	**Brambei Mom**	**Krapeu Truom**	**Yutasas**	**Stung Krang Bat**

(Source: Ministry of Planning, Commune Database, 2023)

A significant proportion of the population with poor 1 & 2 is reported at 14%, indicating the level of economic condition of the areas while the proportion of the people with disability (PWD) is at 1.5%. The highest rate of poverty is reported at Ou Ta Paong (15%), followed by Lum Hach (8%), Brambei Mom (6%), Stung Krang Bat (4%), Krapeu Truom (2%), and Yutasas (1%), indicating the project should pay attention the most to Ou Ta Paong and Lum Hach. People are migrated to both inside and outside the country with the highest one is within the country (6.4%) while only 2.7% migrated to abroad. This makes the total migration of 9.1% (Table 6.33).

Table 6.33: Migration and vulnerability of the people within the sub-schemes

(Source: Ministry of Planning, Commune Database, 2023)

Wooden houses are the most dominated shelter of the people comprising of 57% of the total settlement. One (1) floor or brick wall is the second most popular (34%) while the rest belong to apartments, semi-permanent, and villa. Interestingly, 1% of them live in temporary houses. Stung Krang Bat is the one (1) with the highest proportion of wooden houses (72%) while Brambei Mom is the highest in one (1) floor or brick wall. Lum Hach is the one (1) with the highest proportion of temporary houses being reported indicating the people are spreading their living associated with the most agricultural occupation sub-scheme. The assets that people own the most are Television (73%), followed by motorbike (70%), and bicycle (58%), and power tiller (34%) while the rest are in small proportion (Table 6.34).

HH = Household

(Source: Ministry of Planning, Commune Database, 2023)

The data highlights family violence (2.2%) and drug use (1.7%) as the most pressing issues, followed by land disputes (1.3%). In contrast, sexual harassment, human trafficking, and crime report no cases, suggesting potential areas for further investigation into reporting mechanisms or community dynamics (Table 6.35).

Table 6.35: Issues in the project communities

6.6.5 Cultural Sites

A key aspect of the environmental and social safeguards assessment (SECAP) includes the consideration of sites of cultural importance and heritage. Cultural heritage is an important component of the cultural identity of local communities, groups and individuals. It is key to social cohesion and therefore cultural heritage sites, structures and values should be protected, where possible, from construction of project components which could cause disturbance or disruption. Sites of cultural and heritage importance within the CAISAR command areas shall be protected and not affected during or after the irrigation system design and construction phases.

Across the command areas of CAISAR, there are two (2) important cultural sites, the post-Angkorian capital of Longvek, the 16th century king's palace, near the Stung Krang Bat command area and Bardez Stupa in Lum Hach command area. Firstly, the Longvek Capital is an ancient complex containing varies of cultural important sites across vast areas. A canal, Preak Longvek', connects the site of the King's palace to the Tonle Sap River. Creeks through the paddy field area connect Preak Kruos/Chumnik in the South with Preak Longvek in the North. The preaks were for navigation towards/out from Krang Ponley/Krang Bat, and perhaps also functioned as a flood way to protect the low-lying paddy field area from water coming in from the Krang Ponley, via the Krang Bat. The alignment of the walls of the capital can still be distinguished and is indicated on the topographic map.

Another important cultural site is the Bardez Stupa, a standalone stupa located in the Lum Hach command area. This stupa was built in commemoration of a French administrator who was killed by the Krang Leav villagers in 1925 for attempting to collect taxes considered excessive at the time. The murder angered the French, and the King later ordered to change the village's name from Krang Leav to Derichhan Village.

In addition to these two (2) historic and culturally important sites, there are also many cultural sites being identified in each of the sub-scheme as per shown in the following maps of each sub-scheme.

Figure 6.68: Maps of archaeological and cultural sites in and near Ou Ta Paong Sub-scheme

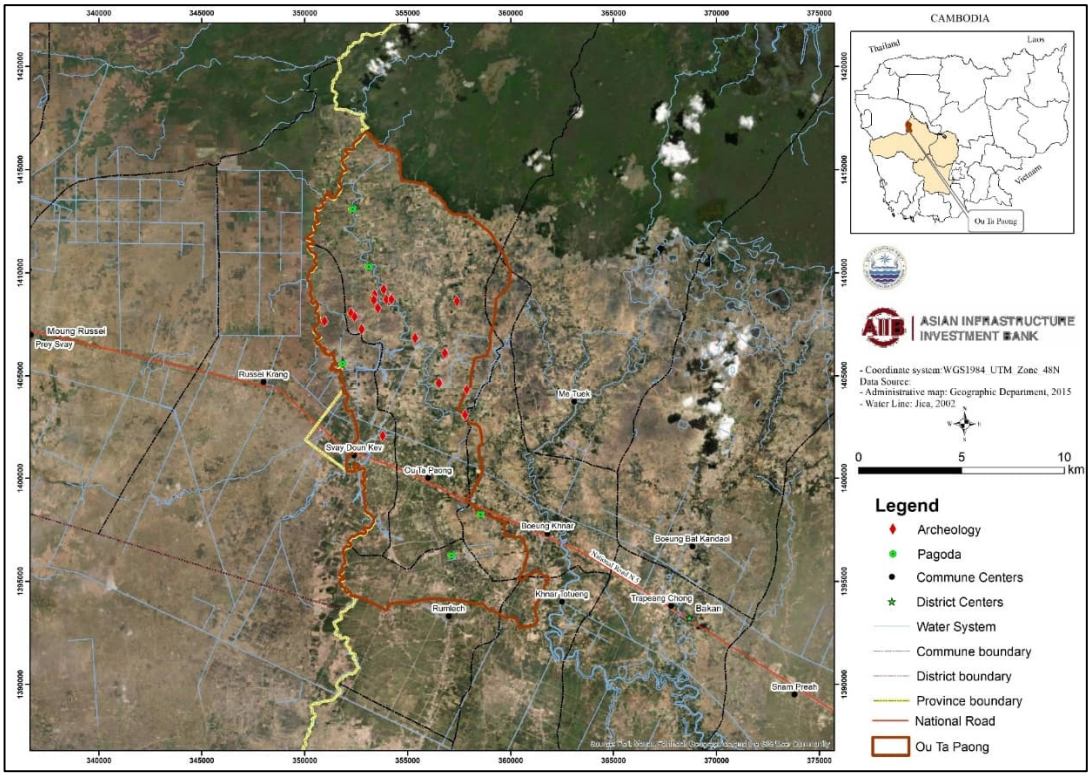

Figure 6.69: Maps of archaeological and cultural sites in and near Lum Hach Sub-scheme

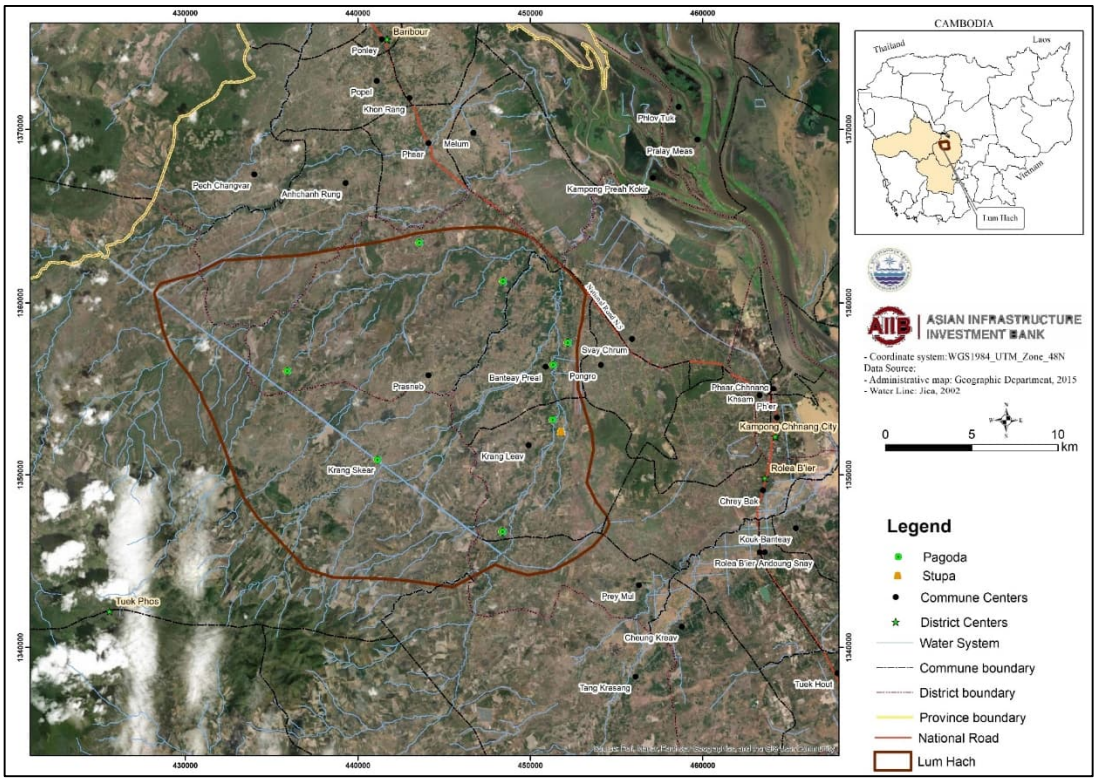

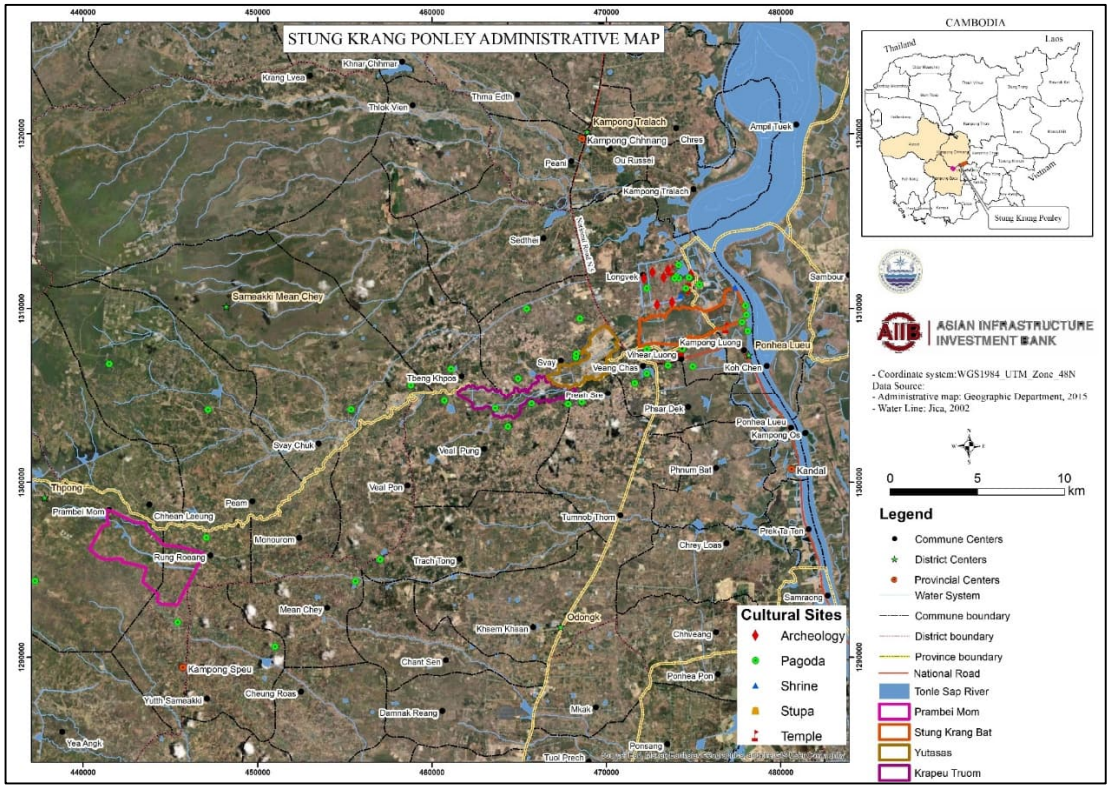

Figure 6.70: Maps of archeological and cultural sites in Stung Krang Ponley Sub-scheme

6.6.6 Agricultural Production

6.6.6.1 Rice Production

Ou Ta Paong

In the Ou Ta Paong area, farmers adapt to seasonal flooding from the Tonle Sap Lake, which lasts about three (3) months annually. They plant long-duration, flood-resistant crops in areas prone to shallow flooding, and short-duration, rain-fed crops before the floods in more severely flooded areas. After the floodwaters recede, a second short-duration crop is planted, though it is vulnerable to drought without irrigation. The dominant crop is rice, with most farmers cultivating about 2.15 hectares per household. Roughly 40% of the area is rain-fed, while 60% benefit from irrigation. Farmers typically plow in May, seed in May-June, and harvest in September. Wet season rice yields range from 4 to 5.5 tons per hectare, slightly higher than dry season yields, which range from 4 to 5 tons per hectare.

About 5% of farmers plant traditional, long-duration rice varieties, which are more drought-tolerant and yield around 2.5 to 3 tons per hectare. In irrigated, flood-free areas, farmers can grow two (2) wet-season crops, with short-growth varieties like OM 5451, known for high yield and pest resistance, being popular. Direct seeding is common, and seed sources include both saved seed and purchases. Fertilizer use is higher in the dry season, with application rates ranging from 180 to 250 kg/ha, while pesticide application occurs 3 to 5 times per season. Urea and di-ammonium phosphate (DAP) are the most used fertilizers.

Farmers face challenges such as water shortages during the dry season, shallow riverbeds, water conflicts, high input costs, lack of capital, counterfeit pesticides in the market and labor shortages.

Some farmers hire labor for seeding and pesticide spraying, while machinery is used for soil preparation, harvesting, and threshing. The average rice production cost is about $615 per hectare. In addition to rice, around 5% of farmers grow non-rice crops, like watermelon and sweet corn, during the dry season, with potential to expand into exportable crops such as soybeans, mung beans, and maize if irrigation improves. Some of rice farmer group addressed that previously they attended in training course on rice production but some mentioned that they never and request to obtain planting and relevant techniques for rice cultivation. Moreover, they also request to MAFF to conduct inspections of fertilizers and pesticides in the market to address counterfeit products.

Lum Hach

With limited access to irrigation systems, most farmers can only cultivate one (1) paddy crop per year, primarily using medium or late-maturity rice varieties such as Romdoul and Krasang Teap, with growth periods ranging from 130 to 150 days. The areas capable of producing two (2) or more crops annually are few and rare. Planting usually begins between May and June when the rains start, but yields vary across regions. In Rolea B'ier district and parts of Krang Skear commune, yields range from 3.2 to 3.8 tons per hectare, whereas lower yields of 1 to 2 tons per hectare are reported in Prasneb and Krang Leav communes. The average yield across the region is estimated at 1.75 tons per hectare.

Labor shortages are a significant challenge in the area, as many men and young women seek jobs in construction or factories, leaving behind the elderly and children who cannot meet the labor demands. This lack of labor affects the potential for horticulture, and the few vegetables grown near homes are shared among neighbors with no market for sales. The average land size for rice production is 1.56 hectares, and farmers rely on self-produced seeds, purchasing only when necessary. On average, 120 kg of seed is used per hectare during the wet season, while no rice is grown during the dry season due to water scarcity.

Farmers use 235 kg of chemical fertilizer and 450 kg of compost per hectare in the wet season, along with three (3) pesticide applications for pests and one (1) for weeds. Farmers use chemical fertilizer and compost as their traditional knowledge.Challenges include a lack of capital, weed management, pest outbreak, market and unreliable water sources. Straw is typically used as cattle feed, burned, or left in the field for 2-3 months before plowing into the soil for the next season. The cost of rice production is $403.13 per hectare, and while some farmers have received training on transplanting, organic production, and crop management, others have not received any capacity-building support. Farmers request to obtain training on fertilizer and pesticide usage. There are less farmers consume water from irrigation system where farmer mostly rely on groundwater and rain water for farming.

Stung Krang Ponley

Brambei Mom. Rice cultivation in the area is primarily for household consumption, but there are opportunities for commercialization during the wet season (WS) due to low production costs, particularly for medium to late-maturity rice varieties, and the aromatic qualities of the chosen strains. Despite the proximity to the Anlong Chrey water reservoir, dry season (DS)

rice cultivation is limited because the land is not suitable for large-scale farming, lacking the vast plains needed for effective DS production.

The average land size for rice farming ranges from 1 to 3 hectares, with common rice varieties including Chhmar Lait, Chhmar Prum, Phka Mlis, and Phka Rumduol. During the wet season, farmers use approximately 100-150 kg of rice seed per hectare, while no rice is grown in the dry season due to water scarcity. Most farmers produce their own seeds and only purchase additional supplies when community shortages arise. Fertilizer use during the wet season varies, with 150-300 kg of chemical fertilizers and 500-1000 kg of compost applied per hectare. Pesticide use is minimal.

Household labor is the primary source for rice production, but external labor is often hired for tasks such as soil preparation, harvesting, and transporting rice from the field. The average yield during the wet season is 4.25 tons per hectare, but challenges such as water scarcity, high soil preparation costs, high price of fertilizers and pesticide and lack of capital hinder production. Environmental issues like heavy rains during broadcasting, pest outbreaks (especially fall armyworm), and weed infestations further complicate cultivation efforts.

After harvesting, straw is typically stored for cattle feed, while stubble is left in the field for three (3) months before either being burned or plowed under. The average cost of production ranges from 1,200,000 to 1,500,000 riel per hectare, approximately $350. Unfortunately, none of the four (4)-focus group discussion reported having received any formal capacity-building training to improve their practices. As the consultation with rice farmer group, they mentioned that previously they never received any training on rice production.

Krapeau Truom. In Kropeau Troum, most farmers cultivate paddy rice during the wet season, while some areas grow watermelon, wind gourd, and cucumber in the dry season between March and May. The average land size for rice production ranges from 0.3 to 1 hectare. Common rice varieties grown include Neang Menh, Phka Mlis, Reang Chey, and Phka Rumduol. Farmers typically use about 120 kg of rice seed per hectare during the wet season, with no rice production in the dry season due to water scarcity. Most seeds are self-produced, and farmers only purchase additional supplies when shortages arise.

Fertilizer use during the wet season averages 100 kg of chemical fertilizer and 200 kg of compost per hectare, while pesticide application is not common. Labor for rice farming is primarily household-based, but machinery is hired for tasks such as soil preparation, harvesting, and transporting rice. The average rice yield during the wet season is 4.25 tons per hectare, but production faces significant challenges due to damaged irrigation gates, which lead to water shortages, along with pests like the walker insect and weed infestations.

After harvesting, straw is typically kept for cow feed, sold, or left in the field for 2-3 months before being either burned or ploughed under. The average cost of production ranges from 1,500,000 to 2,000,000 riel, approximately 400 USD per hectare. Farmers in the area have received training on water consumption management, techniques for rice seed storage and use, as well as proper fertilizer and pesticide application techniques. Regarding to consultation with rice farmer group, farmer have previously received training from the APSARA company on the use of seeds, fertilizers, and pesticides. However, some mentioned that they never gain any training course related rice production.

Yutasas. In Yutasas, rice is the main crop cultivated by most farmers, with a small number of households also growing cash crops like watermelon and vegetables. The average land size for rice production ranges from 1 to 1.5 hectares. Common rice varieties include Reang Chey, Changkuah Ampeak, Angka No 55, and Angka No 85. Farmers use between 70 to 200 kg of rice seeds per hectare, with traditional varieties being self-produced, while Angka No 55 and 85 are purchased from the market.

Fertilizer use varies between the wet and dry seasons, with 100-300 kg of chemical fertilizer and 40-60 kg of compost applied per hectare during the wet season, and 100-320 kg of chemical fertilizer during the dry season. Pesticide usage is focused on controlling pests and weeds, with application occurring 2-4 times for pests and 1-2 times for weeds in the wet season, and 4-5 times for pests and 1-2 times for weeds in the dry season. Labor for rice farming is primarily sourced from households, but rented labor is used for soil preparation, pesticide spraying, harvesting, and transporting rice.

The average rice yield ranges from 2.5 to 5 tons per hectare in the wet season and about 3 tons per hectare in the dry season. Farmers face several challenges, including water scarcity for both rice and crop production, with canals often lacking water and no inflow sources. Other issues include limited capital, pest infestations (such as the walker pest during the boosting stage), limited market and weed management.

After harvesting, straw is either kept for cow feed or sold, while stubble is typically left in the field for 2-3 months before being burned or plowed under. The average cost of rice production is between 1,500,000 and 2,000,000 riel per hectare. In terms of capacity building, some groups have received training on rice production (three (3) times) and crop production (once), but one (1) group has not received any training.

Stung Krang Bat. In the Krang Bat area, which spans an estimated 1,000 hectares of low-lying rice fields, farmers primarily cultivate paddy rice. The area is intersected by several creeks and experiences seasonal flooding from the Mekong River via the Tonle Sap River, with inundation depths reaching up to three (3) meters for about three (3) months. This flooding affects the crop patterns, with farmers planting paddy rice as soon as the water recedes sufficiently. By the end of the crop cycle, the fields dry out, creating a need for irrigation, and during severe dry seasons, there is a high risk of crop failure. The area's agricultural potential is declining as parts of the command area are being converted into residential and commercial developments due to rising land prices.

The average land size for rice production ranges from 0.5 to 2 hectares. Farmers cultivate rice varieties like Reang Chey, Phka Rumduol, Chhmar Prum, Kang Soay, and Angka No 85. They use 200-300 kg of rice seeds per hectare, with most seeds being self-produced and additional supplies purchased from the market when necessary. Fertilizer usage varies, with 170-300 kg of chemical fertilizer applied per hectare during the wet season and 300 kg per hectare during the dry season. Pesticide use is minimal, applied twice for pest control in both seasons, and weeds are only treated once during the dry season.

Household labor is the primary source of manpower, though machinery is rented for tasks like soil preparation, harvesting, and transporting rice from the field. The average yield in the wet season ranges from 1 to 2.5 tons per hectare, while the dry season yield reaches 4 tons per hectare. Farmers face several challenges, including a lack of water and an insufficient

irrigation system, frequent flooding from Anlong Chrey, rising fertilizer costs, and issues with pests (particularly walker pests during the boosting stage), weeds and market access. After harvesting, straw is either kept for cow feed, sold, or left in the field for 2-3 months before being burned or plowed under. The average cost of rice production is between 1,200,000 and 1,400,000 riel per hectare. Notably, neither farming groups in the area have received any capacity-building training.

6.6.6.2 Vegetable Production

Ou Ta Paong

In the area, very few households are involved in vegetable production for the market, with small-scale horticulture activities taking place around homesteads during the dry season. These activities are supported by water from wells and ponds and are observed in two (2) 'Agriculture Communities' (AC): Psar Andeth AC and Chamkar Khluy AC, as well as in the neighboring Rumlech Commune, where farmers grow crops like watermelon on dry paddies.

The most popular vegetables grown in the area include pumpkin, cucumber, eggplant, wax gourd, long bean, luffa gourd, morning glory, mustard, and green onion. The average land size for vegetable cultivation ranges from 450 to 600 square meters. Farmers use both organic and chemical cultivation practices, applying compost and chemical fertilizers. Seeds are typically purchased from the market, and water sources for irrigation include canals, ponds, rainwater, and rivers. There are no agricultural cooperatives or associations in the area.

Farmers spend between 250$ and 450$ on vegetable production, covering expenses for seeds, pesticides, water, fertilizers, labor, and land preparation. The income from vegetable sales is approximately 500$ per year, which constitutes about 10% to 30% of their total income. The main markets for these vegetables are local markets and brokers. Key challenges faced include a lack of water during the dry season, extreme heat, insect pests, low prices, poor soil fertility, diseases, and climate change. Farmers have received agricultural services related to seed variety selection, nursery management, crop irrigation, and the use of fertilizers and pesticides. However, some farmers never attended in training course or agricultural information. Therefore, a request is made for the project to provide training on vegetable cultivation techniques, natural pest control methods, and to supply vegetable seeds.

Lum Hach

In the area, the most popular vegetables grown include luffa gourd, morning glory, pumpkin, wax gourd, long bean, white radish, cucumber, mustard green, amaranth, and corn. The average land size dedicated to vegetable cultivation ranges from 100 to 1,000 square meters. Farmers employ both organic and chemical cultivation practices, using manure and chemical fertilizers along with pesticides.

Water sources for irrigation include rainwater, wells, and ponds. In terms of agricultural associations, two (2) out of three (3) areas have associations, while one (1) does not. Farmers' expenditures on vegetable production typically range from 100,000 to 400,000 riels, covering costs for seeds, fertilizers (both manure and chemical), and irrigation materials. Income from vegetable sales varies between 1,600,000 and 3,000,000 riels, or approximately USD 325 and USD 750.

Vegetables are sold through household consumption, village markets, and brokers. Challenges faced by farmers include insect pests, (esp. armyworm), low market prices, diseases, water shortages, high level of sediment in water, lack of access to modern agricultural techniques due to limited participation in training programs and the impacts of climate change. They have received some agricultural services related to planting techniques, seed production, and crop maintenance. However, some farmers have not received any training as well as smart agriculture.

Stung Krang Ponley

Brambei Mom. In Brambei Mom district, particularly in Doun Tip village, horticultural activities are prominent, with a focus on vegetables like curly cabbage, cucumber, choy sum, pumpkin, luffa gourd, long bean, peanut, green bean, and morning glory. The average land size for vegetable cultivation varies from 200 to 8,000 square meters. Farmers use a combination of organic and chemical cultivation practices, including Good Agricultural Practices (GAP). They primarily use compost and manure fertilizers and apply pesticides less frequently.

Irrigation for these vegetable farms is sourced from the Stung Krang Ponley river, accessed mainly through diesel-powered pumps with a pumping distance of up to 500 meters. Some areas have agricultural associations. The expenditures on vegetable production are highly varied ranging from 150 USD to USD 1,500 per household, covering costs for seeds, labor, pesticides, manure, plastic covers, fertilizers, nets, and other materials. Income from vegetable sales ranges between USD 500 and USD 3,500 per household with GAP cultivation yielding higher income and involving larger land areas.

Vegetables are sold in local markets and through brokers, including wholesalers at Oudong market. Challenges include insect pests, diseases, high temperatures, water shortages, infertile soil, and water containing limestone. Farmers have received agricultural services from NGO related to smart climate agriculture and planting techniques. However, they request more training program, also organic fertilizer support.

Krapeu Truom. The average land size for vegetable cultivation ranges from 200 to 2,000 square meters. During the dry season, watermelon fields are situated near Stung Krang Ponley, with water accessed through short-distance pumping. In the wet season, some farmers relocate their watermelon cultivation to upland areas, relying on rainwater for irrigation. Rice fields used for watermelon in the dry season are converted back to rice paddies for the wet season. Farmers practice both chemical and organic cultivation methods. Water sources include rainwater, ponds, canals, rivers, and tap water. There are no agricultural associations in the area. Expenditures for vegetable production, including seeds, fertilizers (both chemical and manure), labor, and irrigation (pump rentals), range from USD 50 to USD 500. The average income from vegetable sales is around USD 1,000.

Vegetables are sold for household consumption and at local markets. Challenges faced include insect pests, diseases, water shortages, inadequate planting techniques, lack of materials, low quality of soil, high temperatures, low prices, and climate change. Farmers have received agricultural services such as seed provision from the provincial department, market information, and farm demonstrations on planting techniques. However, they remain more training courses related to agriculture.

Yutasas. In the area, vegetable cultivation includes a variety of crops such as cucumber, watermelon, curly cabbage, luffa gourd, wax gourd, morning glory, long bean, and peanut. The average land size for vegetable farming ranges from 1,000 to 10,000 square meters. Farmers employ both traditional and chemical cultivation practices, using water sourced from canals, ponds, and wells from the Yutasas scheme. Soil quality in Yutasas is good, allowing for high yields, as farmers regularly use cow manure to enrich the soil's nutrients. Some areas have agricultural associations.

Expenditures for vegetable farming range from USD 250 to USD 3,500, covering seeds, manure, fertilizers, pesticides, pump machines, petroleum, straw, nets, drip systems, and soil covering materials. Income varies between USD 500 and USD 6,000, with higher earnings in areas that use land covering and irrigation systems.

Vegetables are sold at local markets, through brokers for Phsar Doem Kor, Phsar Odoung, and supermarkets. Key challenges include insect pests, diseases, low soil fertility, and water shortages. Farmers have received agricultural services such as growing techniques, compost making, irrigation system practice, implementation of good agricultural practices (GAP), market information from social media, and support from trainers and agriculture district officers. Farmers in the village have substantial knowledge of smart agriculture but practice it to a limited extent and they request to obtain more training course on modern agricultural techniques and assistance in finding markets for farmers.

Stung Krang Bat. The area is not popular in terms of vegetable production. In the area, vegetable cultivation features crops such as luffa gourd, morning glory, long bean, eggplant, cucumber, and wax gourd. The average land size used for vegetable farming is between 700 and 1,000 square meters. Farmers practice traditional cultivation methods, utilizing manure fertilizer and chemical pesticides. Water for irrigation is sourced from ponds and pump wells.

There are no agricultural associations in the area. Expenditures for vegetable farming range from USD 100 to USD 135, covering seeds, manure, and pesticides, while income is between USD 135 and USD 150. Vegetables are sold at local markets, including village and district markets.

Challenges faced by farmers include insect pests, diseases, low prices, lack of water, and water containing limestone. Agricultural services received include learning growing techniques from social media.

6.6.6.3 Animal Production

In the CAISAR Project area, a diverse range of animal production activities is prevalent among local households. Cattle farming is the most common, with 38% of households raising cows. Buffaloes are also kept, though by a smaller proportion of households, with only 9% engaging in buffalo farming. Pig farming is similarly practiced by 9% of households. Chicken farming is the most widespread, with 66% of households involved in raising chickens, reflecting their significant role in the local economy and diet. Ducks are the least common among the livestock options, with just 4% of households raising them. This distribution highlights the varied livestock practices within the area, with a strong emphasis on poultry farming and a notable presence of cattle and buffalo farming. However, there is a limitation of livestock production. As the consultation with chicken and duck farmers, faced challenge is lack of technical, and they request to exist more training program on breeding, as well as the whole production of

poultry. Fish farming also limited due to inadequate infrastructure, insufficient location, limited technical and expert, and market access.

6.6.7 Profiles of the Beneficiaries

6.6.7.1 Demographic Information

The survey conducted by the ESCIA with 272 households (HHs) reported a total of 1,274 family members, averaging 4.68 members per household. Of the total population, 644 are female (50.55%) and 630 are male (49.45%), with an average of 2.37 female members and 2.32 male members per household. The near-equal distribution of male and female members indicates a balanced gender ratio across the surveyed households. In addition to this figure, there are 25 HHs (9%) of the households are categorized as poor households (table 6.36).

Table 6.36: Demographic Information of the beneficiaries HHs (n=272)

Family Members	**Figure**
Total HHs	272
Total HH members	1274
Avg. member per HH	4.68
Total female members	644
Avg. female member per HH	2.37
Total male members	630
Avg. male member per HH	2.32
% of female members	50.55%
% of male members	49.45%

HH = Household, Avg. = Average.

6.6.7.2 Occupation

The majority of household heads are primarily engaged in rice and crop production, accounting for 72% of the main occupations whereas animal production is reported the most as secondary occupation, accounting for 22% of the respondents. Other notable occupations include trade (5% for main and 3% for secondary), government staff (4% for main and 1% for secondary), and seasonal private sector work, which, though only 3% report it as their main job, represents 7% of secondary occupations. The service and handicraft sectors provide modest contributions to both primary and secondary employment. Interestingly, a considerable portion (32%) of household heads report having no secondary occupation, while 3% also indicate having no primary job. This data highlights the heavy reliance on agriculture as the backbone of household livelihoods, supplemented by a mix of other occupations, particularly in secondary roles (table 6.37).

Table 6.37: Occupation of the beneficiaries HHs (n=272)

HH head	**Main Occupation**		**Secondary Occupation**	
	#	**%**	**#**	**%**
Rice and crop production	197	72%	37	14%
Animal production	3	1%	61	22%
Fishing/aquaculture	1	0%	4	1%
Forest	0	0%	0	0%

Trade	14	5%	7	3%
Service	8	3%	15	6%
Handicrafts	2	1%	4	1%
Government staff	12	4%	4	1%
Workers (full-time, private sector)	7	3%	5	2%
Workers, (seasonal, private sector)	8	3%	20	7%
Housewife	6	2%	16	6%
Student	0	0%	0	0%
Other (specify)	7	3%	12	4%
No job	7	3%	87	32%
Total	**272**	100%	**272**	100%

Table 6.38 shows the occupations of the members of the potentially affected households showing a diverse distribution, with rice and crop production being the predominant one for main occupation, representing 31% of households, while also serving as a secondary occupation for 18%. A notable 22% of household heads are students, which is consistent across both main and secondary occupations. Full-time workers in the private sector make up 16% of both main and secondary occupations, reflecting significant engagement in formal employment. Government staff account for 2% of main occupations and 3% of secondary occupations, while trade represents 4% of main occupations and 3% of secondary occupations. Interestingly, 14% of household heads report having no main job, while a higher proportion, 20%, report no secondary job. Seasonal private sector work, services, and housewives contribute smaller percentages to the household economy, with some variation between main and secondary roles. Overall, the data highlights a strong reliance on agriculture and formal employment, supplemented by a variety of other roles, while a significant portion of the population is engaged in education or lacks formal employment.

Table 6.38: Occupation of the members of the potentially affected beneficiaries HHs

Variable	**Main Occupation**		**Secondary Occupation**	
	#	**%**	**#**	**%**
Rice and crop production	397	31%	232	18%
Animal production	4	0%	66	5%
Fishing/aquaculture	2	0%	5	0%
Forest	-	0%	-	0%
Trade	48	4%	41	3%
Service	28	2%	34	3%
Handicrafts	4	0%	6	0%

Student	280	22%	280	22%
Other (specify)	28	2%	32	3%
No job	177	14%	258	20%
Total	**1,274**	**100%**	**1,274**	**100%**

The data on the types of houses of beneficiary households (Table 6.39) indicates that the majority (48.53%) live in semi-permanent houses, which are likely more durable but not fully modern, with a larger average size of 67.23 square meters. Wooden houses with thatched roofs, with an average size of 54.85 square meters, accounting for 39.34%. These homes represent traditional, simpler structures commonly found in rural or less developed areas. A smaller proportion, 9.19%, live in more modern and durable houses made of brick walls or reinforced concrete roofs, which are typically larger, with an average size of 107.24 square meters, indicating better living conditions for these households.

Only 2.57% of the households live in temporary houses, which are the smallest, with an average size of just 20.43 square meters, suggesting highly vulnerable living conditions. Another 0.37% fall into the other category, with an average size of 48 square meters, but no further details are provided. Overall, the majority of the affected households live in relatively simple and modest housing, with a small proportion living in more durable and spacious homes.

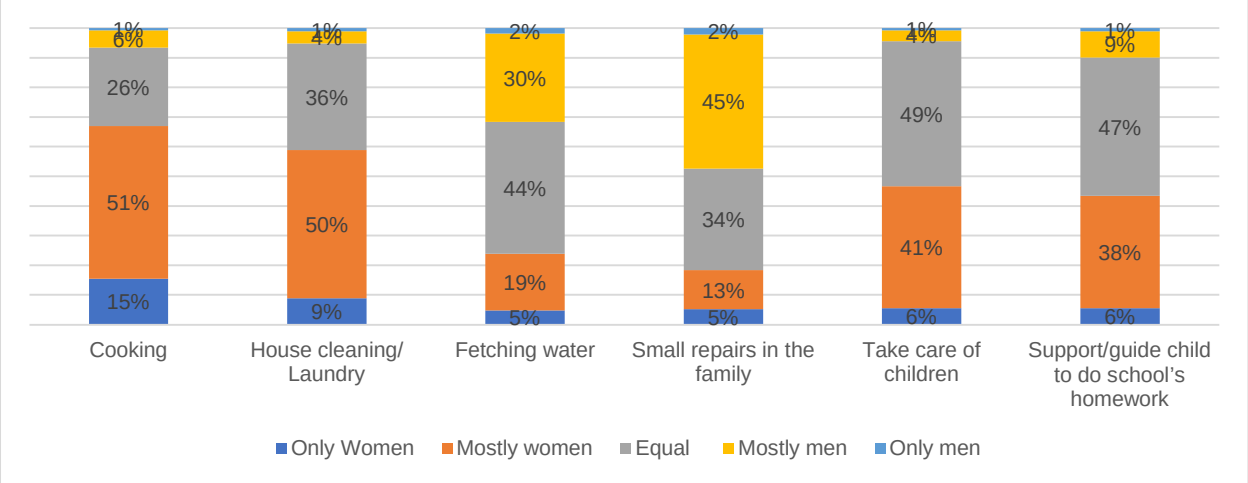
Table 6.39: Houses of the beneficiaries HHs (n=272)

Types of the houses	Number	Figure	Average size (m²)
Semi-permanent	107	48.53%	67.23
Wooden house, thatched	132	39.34%	54.85
House built of 1 floor or more/brick wall, reinforced concrete roof	25	9.19%	107.24
Temporary houses	7	2.57%	20.43
Other	1	0.37%	48.00

6.6.7.3 Land Ownership/Land Tenure

Table 6.40 shows different levels of land ownership and documentation across various land types. Residential land is owned all households (270), with an average land size of 1,298 m². Of these, 75% hold official title deeds, 15% have soft title deeds, and 10% do not have any form of title. Riceland, which is much larger at an average size of 14,237 m², is owned by 256 households, with the same percentage (75%) holding official title deeds. However, 12% hold soft title deeds, and 13% have no title. Garden land, owned by 52 households with an average size of 4,709 m², has lower formal ownership rates, with only 63% holding official title deeds. 12% have soft title deeds, and 25% of garden landowners do not have any form of title. This data highlights a strong degree of formal land ownership for residential, Riceland, and other land categories, but garden land shows a considerable gap in formal land documentation. Additionally, households without any form of land title are most prevalent in garden land and Riceland, pointing to potential areas of concern for securing land rights.

Table 6.40: Lands of the surveyed HHs (n=270)



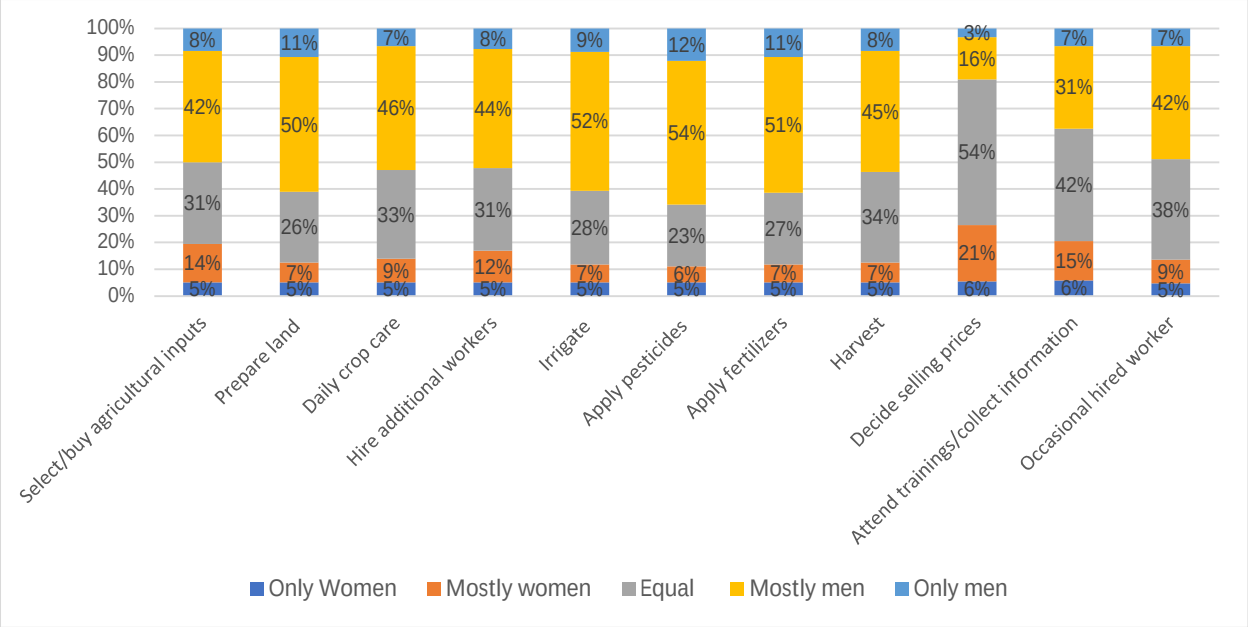
No.	Type of Land	N	Size (m2)	Tittle Deed	Soft Tittle Deed	None
1	Residential land	270	1,298	75%	15%	10%
2	Riceland	256	14,237	75%	12%	13%
3	Garden land	52	4,709	63%	12%	25%
4	Other land	2	37,500	100%	0%	0%

6.6.7.4 Labor Division and Decision Making

CAISAR Gender Assessment and Social Inclusion Plan reported that men spend on average of 59.4% of their time for farming whereas women spend only 40.5%. In traditional farming context, men involve the most during cultivation stage while women are more engaged in the later production. Heavy duty tasks such as land preparation are designated to men while seedling preparation and weeding are commonly assigned to women. Transplanting, uprooting, harvesting, and marketing are generally shared by both. However, the practices have been changed lately due to the presence of mechanization where land preparation, harvesting and threshing have been replaced by machinery.[35]

Coming comes to household chores; women handle 90% of the workload. During the COVID-19 outbreak, women spent even more time on domestic and caregiving tasks. Elderly family members bear the full responsibility for raising grandchildren when their mothers have migrated. In the project area, similarly, in families where women work in nearby garment factories or migrate for paid employment, domestic duties are often shifted to young girls and the elderly. [36]The ESCIA field survey showed that cooking, housing and cleaning, child caring and schooling are mainly at the hand of women, except repairing in the household and fetching water where men involve the most (Figure 6.71).

Figure 6.71: Division of Roles in Household Chores of the Beneficiaries HHs (n=270)



(Source: ESCIA Field Survey, 2024)

In crop production, the distribution of labor was found to be male dominated for majority of the tasks, especially at production level. However, women were found to be a slightly higher dominated at the time of selling prices for their produces. Interestingly, men are the one involves the most in the production, but it tends to be women who participated the most in the occasion of training or obtaining any agriculture related information (Figure 6.72).

Figure 6.72: Share of Roles in Crop Cultivation of the Beneficiaries HHs (n=272)

[36] CAISARP (2024). Gender Assessment and Gender Action & Social Inclusion Plan. CAISAR Project. MoWRAM.

(Source: ESCIA Field Survey, 2024)

In animal production, the distribution of labor is still found to be male dominated for majority of the tasks at production level. Once again, women were found to be a slightly higher dominated at the time of selling prices for their animals. Interestingly, the involvement of men and women are bias to a more equally contributed at the time of selling and training and obtaining related information.

Figure 6.73: Share of roles in Animal Husbandry of the Beneficiaries (n=272)

(Source: ESCIA Field Survey, 2024)

6.6.7.5 Income

According to the ESCIA survey, the average annual household income is USD 10,490, given the average annual income amounts to USD 2,239.54 per household member. Table 31 reported the distribution of annual household income across 272 households. A total of 37 households (14%) earns less than USD 2,500 annually, while 56 households (21%) fall within the USD 2,500 to 5,000 income range. Another 51 households (19%) earn between USD

5,001 and 7,500, and 27 households (10%) report an income between USD 7,501 and 10,000. The largest group, comprising 101 households (37%), earns more than USD 10,000 annually. This distribution shows that a significant portion of the households (37%) are in the higher income bracket, while a smaller proportion (14%) earns below USD 2,500 annually (table 6.41).

Table 6.41: Average annual income per household of the survey households (n=272)

Total annual income (US$)	Figure	%
Less than 2,500	37	14%
2,500 - 5,000	56	21%
5001 - 7,500	51	19%
7,501 - 10,000	27	10%
Higher than 10,000	101	37%
Total	**272**	**100%**

The CAISAR Gender Assessment and Social Inclusion Plan revealed notable findings regarding income differences by gender. On an individual level, the average monthly income for female household members is $121.4 (n=238), which is lower than the $166.6 earned by male members (n=366), showing a statistically significant income gap of $45.2. However, at the household level, there is no significant difference in average income between female-headed and male-headed households, with a small mean difference of $17.3. Nationally, 48% of married men (aged 15–49) reported making joint decisions with their wives on income use, 46% said their wives mainly make these decisions, and 6% said they decide alone. Additionally, 97% of married women (aged 15–49) who earn cash from employment participate in decisions about their earnings, with 63% making these decisions mainly on their own.[37]

6.6.8 Profiles of the Potentially Affected Households

6.6.8.1 Demographic Information

The survey conducted by the ESCIA with 85 affected households (HHs) reported a total of 387 family members, averaging 5 members per household. Of the total population, 204 are female (52.71%) and 183 are male (47.29%), with an average of 2.4 female members and 2.2 male members per household. The near-equal distribution of male and female members indicates a balanced gender ratio across the affected households. In addition to this figure, there are 5 HHs (6%) of the households are categorized as poor households (please see table 6.42).

Table 6.42: Demographic Information of the potentially affected HHs (n=85)

Family Members	Figure
Total HHs	85
Total HH members	387
Avg. member per HH	5
Total female members	204
Avg. female member per HH	2.4
Total male members	183

[37] CAISARP (2024). Gender Assessment and Gender Action & Social Inclusion Plan. CAISAR Project. MoWRAM.

Avg. male member per HH	2.2
% of female members	52.71%
% of male members	47.29%

HH = Household, Avg. = Average.

6.6.8.2 Occupation

The majority of household heads are primarily engaged in rice and crop production, accounting for 69% of the main occupations whereas animal production is reported the most as secondary occupation, accounting for 25% of the respondents. Other notable occupations include government staff (7% for main and 4% for secondary), trade (5% for main and 1% for secondary), and seasonal private sector work, which, though only 4% report it as their main job, represents 8% of secondary occupations (Table 6.43). The service and handicraft sectors provide modest contributions to both primary and secondary employment. Interestingly, a considerable portion (34%) of household heads report having no secondary occupation, while 5% also indicate having no primary job. This data highlights the heavy reliance on agriculture as the backbone of household livelihoods, supplemented by a mix of other occupations, particularly in secondary roles.

Table 6.43: Occupation of the potentially affected HHs head (n=85)

HH head	Main Occupation		Secondary Occupation	
	#	%	#	%
Rice and crop production	59	69%	10	12%
Animal production	0	0%	21	25%
Fishing/aquaculture	1	1%	0	0%
Forest	0	0%	0	0%
Trade	4	5%	1	1%
Service	3	4%	4	5%
Handicrafts	1	1%	1	1%
Government staff	6	7%	3	4%
Workers (full-time, private sector)	0	0%	1	1%
Workers, (seasonal, private sector)	3	4%	7	8%
Housewife	1	1%	4	5%

Other (specify)	3	4%	4	5%
No job	4	5%	29	34%
Total	**85**	**100%**	**85**	**100%**

HH = Household.

Table 6.44 shows the occupations of the members of the potentially affected households showing a diverse distribution, with rice and crop production being the predominant one for main occupation, representing 31% of households, while also serving as a secondary occupation for 18%. A notable 22% of household heads are students, which is consistent across both main and secondary occupations. Full-time workers in the private sector make up 14% of both main and secondary occupations, reflecting significant engagement in formal employment. Government staff account for 5% of main occupations and 4% of secondary occupations, while trade represents 4% of both categories. Interestingly, 13% of household heads report having no main job, while a higher proportion, 19%, report no secondary job. Seasonal private sector work, services, and housewives contribute smaller percentages to the

household economy, with some variation between main and secondary roles. Overall, the data highlights a strong reliance on agriculture and formal employment, supplemented by a variety of other roles, while a significant portion of the population is engaged in education or lacks formal employment.

Table 6.44: Occupation of the members of the potentially affected HHs

Variable	Main Occupation		Secondary Occupation	
	#	%	#	%
Rice and crop production	120	31%	71	18%
Animal production	0	0%	21	5%
Fishing/aquaculture	2	1%	1	0%
Forest	0	0%	0	0%

Total	**387**	**100%**	**387**	**100%**

The data on the types of houses of potentially affected households (Table 6.45) indicates that the majority (48.24%) live in wooden houses with thatched roofs, with an average size of 48.54 square meters. These homes represent traditional, simpler structures commonly found in rural or less developed areas. Semi-permanent houses, which are likely more durable but not fully modern, account for 40% of the households, with a larger average size of 55.38 square meters. A smaller proportion, 9.41%, live in more modern and durable houses made of brick walls or reinforced concrete roofs, which are typically larger, with an average size of 96.13 square meters, indicating better living conditions for these households.

Only 1.18% of the households live in temporary houses, which are the smallest, with an average size of just 21 square meters, suggesting highly vulnerable living conditions. Another 1.18% fall into the other category, with an average size of 48 square meters, but no further details are provided. Overall, the majority of the affected households live in relatively simple and modest housing, with a small proportion living in more durable and spacious homes.

Table 6.45: Houses of the potentially affected HHs (n=85)

Types of the houses	Number	Figure	Average size (m^2)
Wooden house, thatched	41	48.24%	48.54
Semi-permanent	34	40.00%	55.38
House built of 1 floor or more/brick wall, reinforced concrete roof	8	9.41%	96.13
Temporary houses	1	1.18%	21.00
Other	1	1.18%	48.00

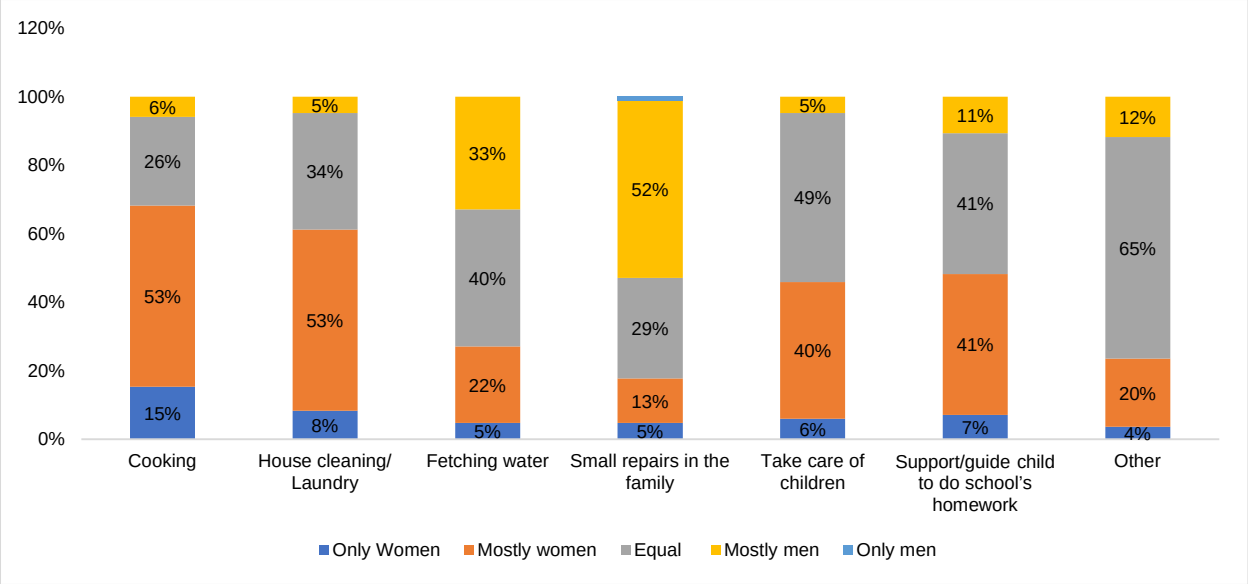
6.6.8.3 Land Ownership/Land Tenure

The potentially affected households hold various types of land with different levels of tenure security. Residential land is the most common, averaging 1,452 square meters, with 75% of households having hard title deeds, 12% holding soft titles, and 13% lacking documentation. Riceland, with an average size of 14,741 square meters, is similarly well-secured, with 74% holding hard titles, 12% soft titles, and 14% without documentation. Garden land, averaging 6,012 square meters, with only 52% of households having hard titles, 19% soft titles, and 29% have no documentation (Table 6.46). The other land is owned by one (1) household with a secure hard title. Overall, while most households have secure tenures for residential and Riceland, a significant portion, particularly in garden land, lacks formal documentation.

Table 6.46: Lands of the potentially affected HHs (n=85)

Type of Land	N	Size (m2)	Types and Land Titles					
			Hard title deed		Soft title deed		None	
Residential land	85	1,452	64	75%	10	12%	11	13%
Riceland	77	14,741	57	74%	9	12%	11	14%
Garden land	21	6,012	11	52%	4	19%	6	29%
Other land	1	5,000	1	100%	0	0%	0	0%

6.6.8.4 Gender, Labor Division and Decision Making



CAISAR Gender Assessment and Social Inclusion Plan reported that men spend on average of 59.4% of their time for farming whereas women spend only 40.5%. In traditional farming context, men involve the most during cultivation stage while women are more engaged in the later production. Heavy duty tasks such as land preparation are designated to men while seedling preparation and weeding are commonly assigned to women. Transplanting, uprooting, harvesting, and marketing are generally shared by both. However, the practices have been changed lately due to the presence of mechanization where land preparation, harvesting and threshing have been replaced by machinery.[38]

Coming comes to household chores; women handle 90% of the workload. During the COVID-19 outbreak, women spent even more time on domestic and caregiving tasks. Elderly family members bear the full responsibility for raising grandchildren when their mothers have migrated. In the project area, similarly, in families where women work in nearby garment factories or migrate for paid employment, domestic duties are often shifted to young girls and the elderly. [39]The ESCIA field survey with affected household showed that cooking, and housing and cleaning, are mainly at the hand of women, except repairing in the household where men involve the most while fetching water, take care of their children and other tasks addressed to be equal both men and women (Figure 6.74).

Figure 6.74: Division of Roles in Household Chores of Affected HHs (n=85)

(Source: ESCIA Field Survey, 2024)

In crop production, the distribution of labor was found to be male dominated for majority of the tasks, especially at production level. However, women were found to be a slightly higher dominated at the time of selling prices for their produces. Men are the one involves the most in the production and they participated the most in the occasion of training or obtaining any agriculture related information (Figure 6.75).

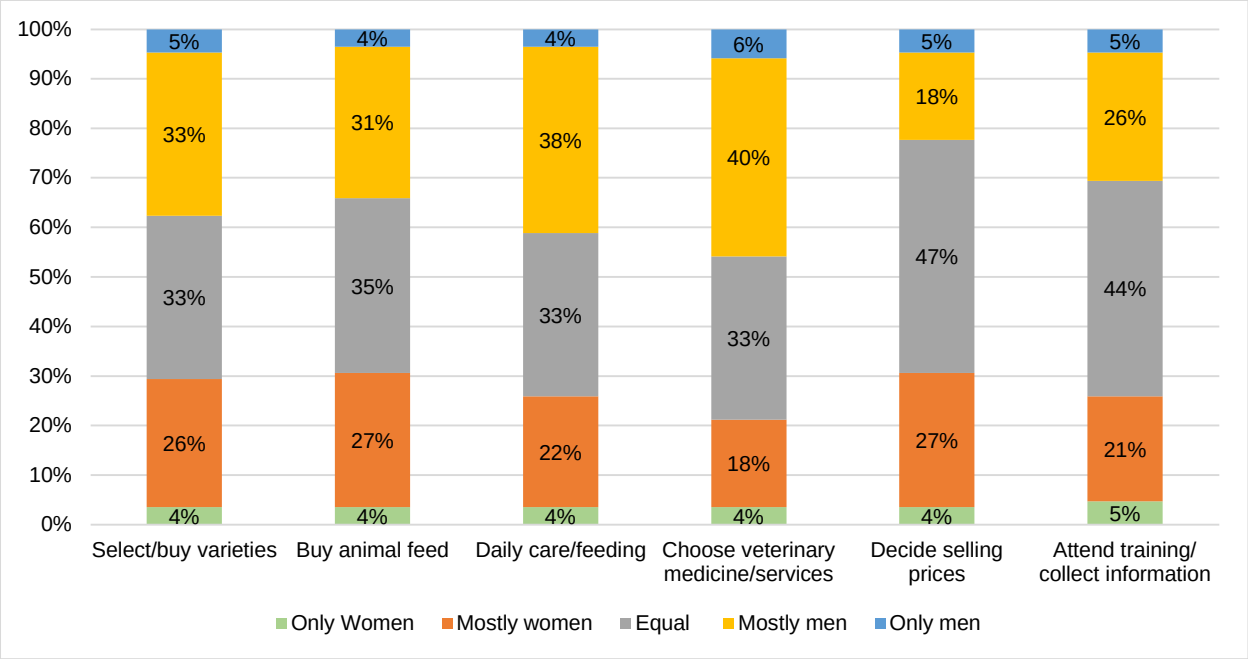

Figure 6.75: Share of Roles in Crop Cultivation of the Affected HHs (n=85)

(Source: ESCIA Field Survey, 2024)

In animal production, the distribution of labor is still found to be male dominated for majority of the tasks at production level. Once again, women were found to be a slightly higher dominated at the time of selling prices for their animals. Interestingly, the involvement of men and women are bias to a more equally contributed at the time of selling and training and obtaining related information.

Figure 6.76: Share of roles in animal husbandry of the affected HHs (n=85)

6.6.8.5 *Social Issues within the Vulnerable Households*

According to the commune database, a number of social issues are reported. The violence in the family and land-related disputes are the most significant social issues in Ou Ta Paong and Lum Hach sub-schemes. In Ou Ta Paong, 15 households were reported for domestic violence, compared to 13 in Lum Hach. Land disputes impacted 14 households in Ou Ta Paong and 18 in Lum Hach. Additionally, nine households experiencing land issues in both areas appeared to be linked to social conflict. No cases of sexual harassment or crime were reported in two area (Please see also Table 6.47). However, a case of human trafficking was recorded in each category group in Ou Ta Paong. In Brambei Mom and Krapeu Trom sub-schemes, cases of violence, drug use, theft, and land disputes were reported across all categories though in small number. Interestingly, Krapeu Trom reported one (1) case of sexual harassment. In Yutasas, only three social issues—violence in the family, drug use, and theft—occurred. Meanwhile, Stueng Krang Bat recorded only one (1) land-related issue.

Table 6.47: Socio-economic and safety challenges affecting different segments of the population in the sub-scheme

Parameters	Vulnerable Group	People with Disability	Women Household Head	Poor Household	Conflict

6.6.8.6 Income

According to the ESCIA survey, the average annual household income is USD 10,490, given the average annual income amounts to USD 2,239.54 per household member. Table 6.48 reported the distribution of annual household income across 85 households. A total of 8 households (9%) earns less than USD 2,500 annually, while 16 households (19%) fall within

the USD 2,500 to 5,000 income range. Another 22 households (26%) earn between USD 5,001 and 7,500, and 9 households (11%) report an income between USD 7,501 and 10,000. The largest group, comprising 30 households (35%), earns more than USD 10,000 annually. This distribution shows that a significant portion of the households (35%) are in the higher income bracket, while a smaller proportion (9%) earns below USD 2,500 annually.

Table 6.48: Average annual income per household of the affected HHs (n=85)

Total annual income (US$)	Figure	%
Less than 2,500	8	9%
2,500 - 5,000	16	19%
5001 - 7,500	22	26%
7,501 - 10,000	9	11%
Higher than 10,000	30	35%
Total	**85**	100%

The CAISAR Gender Assessment and Social Inclusion Plan revealed notable findings regarding income differences by gender. On an individual level, the average monthly income for female household members is $121.4 (n=238), which is lower than the $166.6 earned by male members (n=366), showing a statistically significant income gap of $45.2. However, at the household level, there is no significant difference in average income between female-headed and male-headed households, with a small mean difference of $17.3. Nationally, 48% of married men (aged 15–49) reported making joint decisions with their wives on income use, 46% said their wives mainly make these decisions, and 6% said they decide alone. Additionally, 97% of married women (aged 15–49) who earn cash from employment participate in decisions about their earnings, with 63% making these decisions mainly on their own.[40]

6.7 CLIMATE CHANGE SCENARIOS

In this section, climate assessment and projection for climate change was drawn from the works of the Feasibilty Study team and the FAO team who do the Climate Change Project using EXACT model (This information was drawned from Annex 2 of the Funding Proposal which is prepared to fulfil the requirements of the Green Climate Fund).

6.7.1 Current Impacts of Climate Change

On average, annual damage and loss of wet season rice caused by floods and droughts is approximately 120,501 hectares, of which 70 percent of the damage and loss is due to floods and 30 percent is the result of droughts. Flooding occurs frequently and extensively in Cambodia. The source of these floods can be the Mekong River including the Tonle Sap Great Lake, tributary flash floods, urban flooding, and failure of structures such as protection levees and storages.

[40] CAISARP (2024). Gender Assessment and Gender Action & Social Inclusion Plan. CAISAR Project. MoWRAM.

The agricultural sector accounts for 94-98% of the water use in Cambodia, with 1-2% from industry and 4% from domestic sectors (FAO 2005).[41,42] Water use across sectors is 2-7% of available water that flows through the country annually, and water scarcity results primarily from limited access to irrigation and a lack of water storage capacity, particularly in the dry season[43]. Projections in 2003 suggested that industrial and domestic uses will increase to 15% and 11% by 2025 in Cambodia and other South-east Asian countries, and while this may no longer apply, it is plausible that there will be increased competition in the near-future due to climate impacts and economic changes upstream of the river basins (industrial use, deforestation, etc.) that are transboundary or national. Therefore, enhancing water use efficiency in agriculture and the agro-industrial sector are critical – including through tailoring advisories linked to agrometeorological information and climate forecasts.

Floods also damage roads, collapse ponds and cause canal breakages – impacting the irrigation infrastructure directly, and this then results in inadequate water supply for cultivation in subsequent years. Of the estimated[44] US$ 356.23 million loss and damage from 2013 floods, water and irrigation infrastructure accounted for US$ 52 million (14.5%) and national / rural roads for another US$ 79.61 million (22.3%). It is also the case that when irrigation infrastructure is designed without taking climate scenarios into account — as they are currently, it can affect water flow and drainage from fields. Stakeholder consultations[45] identified at least one instance when a drain that passes under the main canal was too small in diameter to handle large flows, resulting in rice fields upstream becoming flooded during the wet season, breakage of main canal embankment and drainage water entering the main canal, and another where the opening of the water gates was too narrow and under conditions of large discharge, the flow and velocity of turbulence causes soil erosion.

Climate change affects women, men, and vulnerable people differently, and their responses to its impacts also differ, including in relation to safeguarding food security and livelihoods and coping with hazards and risks. In the project area, women have significantly less access than men to financial instruments, land, natural resources, climate change resources and technologies, education, and other development services for successful adaptation to climate change. Women are also underrepresented in FWUCs, and typically perform administrative roles. A study of 10 selected irrigation schemes: three (3) in Kompong Thom, three (3) in Pursat and four (4) in Kompong Chhnang showed that among 43 members of FWUCs in the study areas, only nine (9) are female (21%)[46]. Most of the important positions in FWUCs, such

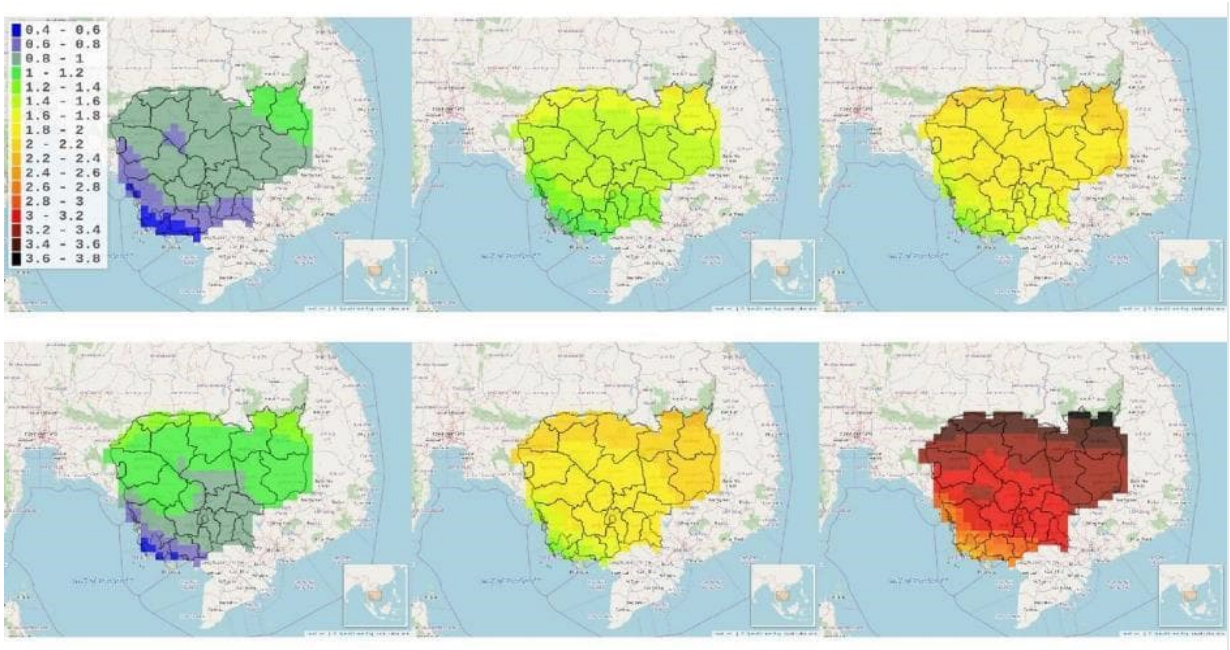
[46] Gender and Water Governance: Women's Role in Irrigation Management and Development in the Context of Climate Change. CDRI Working Paper Series No. 89 -2014

as chair and first and second vice-chair, are dominated by men. While women mostly hold positions as treasurers and accountants in the committees. Cambodia's Women's Resilience Index found women less resilient in times of disaster than men due to women's unstable and insecure sources of income, limited access to shelters or safe places, inadequate climate information and early warning systems, poor housing, weak social safety nets and absence of emergency networks. Furthermore, women's responsibilities in household resources position them well to contribute to livelihood strategies adapted to changing environmental realities. However, lack of information, access to planning processes, and care obligations, limit their ability to contribute.

6.7.2 Climate Change Projections

Precipitation and temperature have become increasingly unpredictable. The temperature anomalies by 2040-2059 against the reference period of 1986-2006 for Cambodia and CAISAR provinces are presented in Table 6.49. The average monthly temperature is projected to increase by 1.83°C by 2040-59. By mid-century, climate change will result in more frequent heavy precipitation days: from 2.4 days to 4.9 days in the rainy season, and an increase in the number of consecutive dry days in the same season: from 0.8 days to 4.4 days.

Table 6.49: Projected anomaly (changes °C) for average monthly temperatures, using median values of CCKP multi-model ensembles and showing 10-90th percentile in brackets



Region	Average Monthly temperature, 2040-2059	
	RCP 4.5	RCP 8.5
Kampong Speu	1.35 (0.22, 2.05)	1.75 (0.49, 2.54)
Kampong Chhnang	1.37 (0.13, 2.21)	1.81 (0.34, 2.83)
Kandal	1.34 (0.17, 2.1)	1.76 (0.49, 2.62)
Pursat	1.36 (0.10, 2.29)	1.72 (0.35, 2.89)
National	1.39 (0.04, 2.23)	1.83 (0.22, 2.78)

RCP = Representative Concentration Pathways.

Future projections of climate change in the project area under the RCP4.5 scenario (Figure 6.77) indicate a temperature increase of 1.4-1.6°C by mid-century (2040-2070) and up to 2.2°C by the end of the 21st century (2070-2100); the increase is much higher under RCP8.5 scenario (3.6°C, 2070-2100). With regards to the spatial variability, the inner Cambodia will experience a higher temperature change compared to coastal areas. While the changes over time will be lower than 1°C along the coastal areas, the inner parts of the country will experience a temperature rise of more than 2°C in both RCPs.

Nights exposed to high temperatures are projected to become more frequent during the 21st century (+114 nights by mid-century and +151 nights by the 2080s). Population, crop and livestock systems will also experience heat extremes more frequently in comparison to the reference period (42 days by mid-century and reaching 62 days by the 2080s) and IFAD is expecting a drastic reduction in the productivity of crops and livestock.

Figure 6.77: Temperature maximum deviation from historical baseline period (1980-2005) under RCP 4.5 (top row) for the period 2011-2040 (left), 2040-2070 (middle) and 2070-2100 (right) and RCP8.5 (bottom row) for the same time periods. The deviation highlights the projected changes into the future in degree Celsius based on projections from bias corrected regional CORDEX data (FAO analysis, CAVA tool).

While annual rainfall is expected to increase, the number of days with rain is decreasing and daily rain intensity is increasing, resulting in extreme rainfall events and flooding risks[47].

Across Southeast Asia, a modest increase in precipitation is projected – from 1-8% by 2100 (IPCC AR5), but there are some uncertainties in the direction of changes in annual precipitation and river flows for the Mekong River Basin[48]. In general, it can be said that for the CAISAR observation points, models[49] show a reduction in rainfall during the dry season but an increase in rainfall during the wet season and an increase in frequency and intensity of heavy rainfall events which is described in more detail later.

For the Lower Mekong Basin, both an increase in drought days by 2100[50] and an increase in drought frequency[51] is predicted, and flooding is expected to increase in frequency, severity, and duration[52]. Studies find more severe flood inundation magnitude in the Lower Mekong Basin, in the future (2075-2099) compared to 1979-2003, under four (4) RCP scenarios and sea surface temperature patterns[53].

[53] Try, S., Tanaka, S., Tanaka, K., Sayama, T., Lee, G., and Oeurng, C., 2020. Assessing the effects of climate change on flood inundation in the lower Mekong Basin using high-resolution AGCM outputs. Progress in Earth and Planetary Science, 2020 (7): 34. https://doi.org/10.1186/s40645-020-00353-z

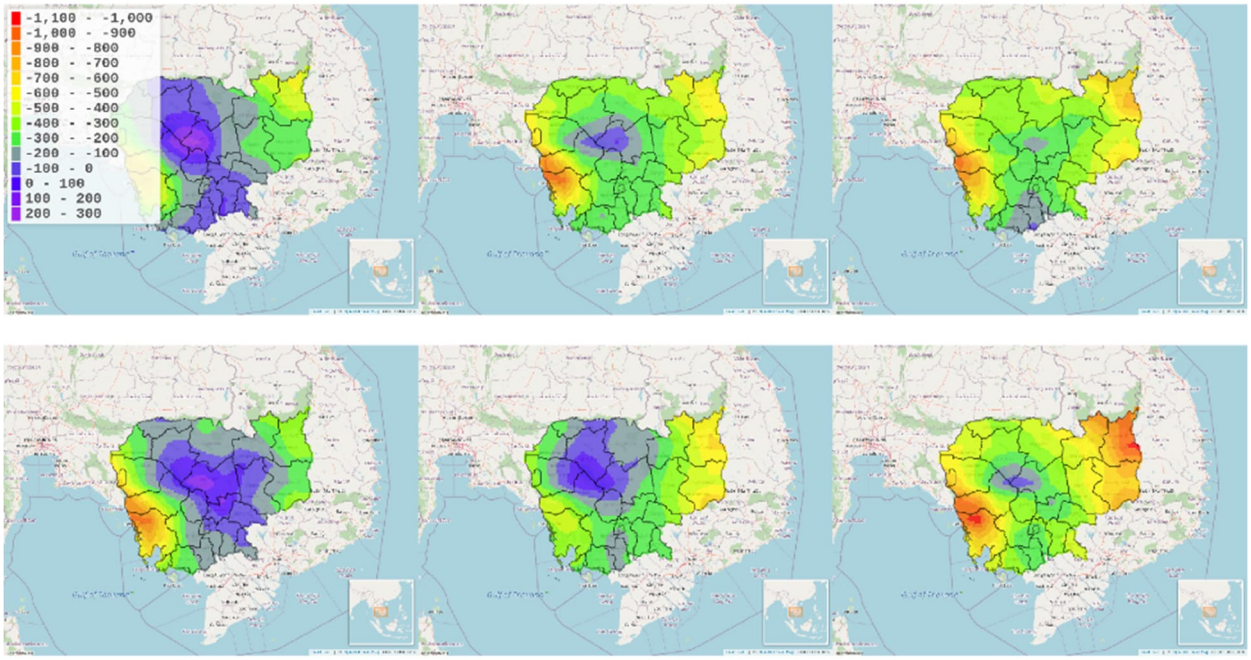

Figure 6.78: Cumulative precipitation per year deviation from historical baseline period (1980-2005) under RCP 4.5 (top row) for the period 2011-2040 (left), 2040-2070 (middle) and 2070-2100 (right) and RCP8.5 (bottom row) for the same time periods. The deviation highlights the projected change into the future in millimeter/year based on projections from bias corrected regional CORDEX data (FAO analysis).

Although there is significant variability in modelled future precipitation projections in Cambodia, most estimates of the mean annual rainfall indicate a decrease in rainfall into the near future (Figure 6.78) with potential more intense decreases in the medium to far future. There is an increasing trend in seasonal rainfall between June and August in the northwest, and a decreasing trend in the northeast of the country. Precipitation deviation from the historical average period (1980-2005), shows the largest increase in the near future, with subsequent decreases in annual precipitation in the medium and far future, with variation geographically.

As many agricultural producers rely on rainfed production in the wet season, Figure 6.79 shows changes in cumulative precipitation in the wet season precipitation and deviation from the historical average in the wet season, respectively. This analysis suggests decreasing wet season precipitation into the future, to a higher degree under RCP8.5 and with changes up to -500 mm/year.

Figure 6.79: Deviation in cumulative precipitation in rainy season (May-October) from historical baseline period (1980-2005) under RCP 4.5 (top row) for the period 2011-2040 (left), 2040-2070 (middle) and 2070-2100 (right) and RCP8.5 (bottom row) for the same time periods. The deviation highlights the projected change into the future in millimeters based on projections from bias corrected regional CORDEX data (FAO analysis).

Other studies[54] find that climate change, in combination with land use change and other developments, could significantly reduce river flows within the Mekong River basin. That is, climate change will also likely induce a decrease in both wet and dry season river flows in all 11 sub-basins contributing to Tonle Sap Lake: mean annual projected flow reductions range from 9-29% for 2030s, 10-35% for 2060s, and 7-41% for 2090s. Additionally, future flood magnitudes are projected to reduce for all 11 sub-basins over a majority of time horizons and under at least one (1) scenario; reductions are also projected for other scenarios used in the simulation for most sub-basins. Since a decrease in extreme river flows is also modeled, this would cause a decline in flood magnitudes and an increase in drought occurrences (in both wet and dry season) throughout the basin as well as an increase in extreme droughts in most sub-basins.

6.7.3 Greenhouse Gas Emissions and Agriculture Sector in NDCs

In Cambodia, GHG emissions (2016) are dominated by the Forestry and Other Land Uses (FOLU) sector (60.9%)– the main driver for which is deforestation – and agriculture (16.9%), followed by energy (12.0%), IPPU (7.9%) and waste (2.1%) sectors. Forest cover of Cambodia was 73% in 1960 and had declined to 57% in 2010 and 54% in 2014[55]. GHG emissions without the FOLU sector are dominated by the agriculture sector (43.3%), followed by energy (30.9%), waste (5.5%), and IPPU (20.3%). Agricultural emissions increased by ~3% each year between 1994 and 2016 – the main driver being rice cultivation. Under a business-as-usual (BAU)

[54] Oeurng, C., Cochrane, T.A., Chung, S., Kondolf, M.G., Piman, T., and Arias, M.E., 2019. Assessing Climate Change Impacts on River Flows in the Tonle Sap Lake Basin, Cambodia. Water, 11(3): 618. https://doi.org/10.3390/w11030618

[55] Cambodia, Third National Communication, September 2022.

scenario, Cambodia forecasts an increase in emissions from 125.2 MtCO2eq in 2016 (Table 6.50, Col A) to 155.0 MtCO2eq in 2030 (Table 6.50, Col C).

The NDC emissions reduction scenario by 2030 (Table 6.50) largely targets FOLU and energy but also IPPU sectors with 40-50% reduction. Agriculture emissions will only reduce by 23% in the same period – the sector contributing about 9.6% of the overall 64.5MtCO2eq reduced (difference between Table 6.50 Col C and Col D); but owing to the links between FOLU (land-use and forest conversion) and agriculture, actions to increase productivity of agricultural lands and interventions such as land management and organic input agriculture are likely to have an indirect effect on FOLU targets. Improving water use efficiency of rice cultivation using techniques such as AWD or SRI, introducing stress-tolerant and improved seed varieties, and deploying drip irrigation for certain crops can directly reduce methane emissions from rice and indirectly reduce intensity of agricultural emissions (CO2eq per ton of production) through better yield stability or increased yields. Finally, gravity irrigation is not feasible in all parts of the command area, and farmers resort to pumping water from rivers and canals using diesel engines to irrigate their rice fields. In fact, even farmers who primarily rely on gravity irrigation may resort to pumping groundwater or surface water from ponds during the dry season or dry days in the rainy season. Shifting to solar irrigation would help reduce costs in the long run and reduce energy emissions associated with agriculture.

Table 6.50: GHG emissions and scenarios (BAU, NDC)

Sector	A. BAU 2016[56], MtCO2eq (% of total)	B. 2016 GHG inventory[57], MtCO2eq (% of total)	C. BAU scenario 2030[58], MtCO2eq (% of total)	D. NDC scenario 2030[59], MtCO2eq (% of total)	E. BAU scenario 2050[60], MtCO2eq (% of total)
FOLU	76.3 (60.94%)	131.01 (80.08%)	76.3 (49.2%)	38.2 (42.21%)	21.2 (13.59%)
Agriculture	21.1 (16.93%)	18.39 (11.25%)	27.1 (17.5%)	20.9 (23.09%)	34.9 (22.37%)
Energy	15.1 (12.06%)	9.60 (5.87%)	34.4 (22.19%)	20.7 (22.87%)	82.7 (53.0%)
Waste	2.7 (2.16%)	2.76 (1.69%)	3.3 (2.13%)	2.7 (2.98%)	6.5 (4.17%)
IPPU	9.9 (7.91%)	1.82 (1.11%)	13.9 (8.97%)	8.0 (8.84%)	10.7 (6.86%)
Total	125.2	163.59	155.0	90.5	156.0

FOLU = Forestry and Other Land Uses, IPPU = Industrial Processes and Product Use, BAU = Business-as-usual, GHG = Green House Gas, NDC = Nationally Determined Contribution.

6.8 CAPACITY, EXPERIENCE OF THE IMPLEMENTING AGENCIES AND NEEDS

6.8.1 MOWRAM/ PMU and PDWRAM

[56] Cambodia, First NDC (Updated submission), Dec 2020

[57] Cambodia, First Biennial Update Report, August 2020 & NCSD, MOE

[58] Cambodia, First NDC (Updated submission), Dec 2020

[59] Cambodia, First NDC (Updated submission), Dec 2020. FOLU has 3 NDC scenarios, and the numbers presented here correspond to scenario 2: reduction of 50% of historical emissions by 2030 (REDD+ programme).

[60] Cambodia, National Inventory Report (NIR), November 2020.

The institutional assessment report by PPIC and WAPCOS (December 2022) highlighted that the weak and insufficient human resource capacity at all levels of irrigation management is a key factor slowing rural development in Cambodia. There is a clear need for adequately trained professionals in water resources and irrigation management, which can be addressed through education, training, and workshops.

According to the institutional assessment of the Water Resources Management Sector Development Program (WRMSDP), training for MOWRAM and PDWRAM personnel at both central and provincial levels involved in the CAISAR project is necessary. This includes officers engaged in the project, along with the need for Training of Trainers (TOT) for FWUCs. It is recommended that the training plan for the CAISAR project cover all six (6) irrigation schemes and include both CAISAR PMU and PDWRAM staff. Key training topics should include: 1) Project Orientation and Plan Presentation, 2) FWUC Formation and Strengthening, 3) Gender Awareness and Action Plan, 4) Data Management for Hydro and Meteorological Data and O&M for Equipment, 5) Environmental Awareness, 6) Construction Management and Supervision, and 7) On-Farm Water Management and O&M.

6.8.2 FWUC/FWUG/FWUSG

To ensure trainees understand and apply the training effectively, sufficient time should be allocated for each topic. FWUC management training programs should focus on strengthening capacity in key areas, including a) Basic administrative management, b) Accounting and finance, c) Conflict resolution, d) Operation and maintenance of irrigation facilities, and e) Collection of irrigation service fees.

Regular meetings between FWUCs are recommended to facilitate knowledge exchange and reduce conflicts within the same irrigation scheme or reservoir. Since each FWUC faces unique geographical and socio-economic conditions, training materials should be simplified using language familiar to local communities.

A well-structured FWUC Organizing Framework within MOWRAM/PDWRAM should align with the Water Distribution Schedule and be agreed upon by the FWUC, ensuring it is communicated to all farmer-water users in the scheme. The project will construct secondary and tertiary canals up to the tertiary gates and assist FWUCs in collecting irrigation service fees (ISF).

The institutional assessment report recommends providing technical and financial support to FWUCs managing the Ou Tapoang, Lum Hach, and Kraing Pomley schemes to ensure effective and sustainable O&M. As per the consultation with stakeholders, water fee needs to be discussed and properly considered within the management plan of the FWUCs.

For consistent and effective E&S training, especially under the new IFAD SECAP (2021) and GCF ESS (2022), qualified national consultants should deliver the training. In addition to refresher training on safeguards like waste management and pesticide use, there should be a focus on improving contractor performance, particularly in ensuring adequate health and safety services for workers and local communities.

6.8.3 Training and Technical Assistance

Training and capacity building on IFAD SECAP/GCF ESS should focus on proportionality, adaptive management, and implementing safeguards related to: (i) contractor management and labor issues, (ii) community health and safety, (iii) environmental health and safety, and (iv) systematic stakeholder engagement. These E&S risk management training programs will enhance inter-agency coordination, critical for climate change adaptation. Qualified national consultants will provide support and on-the-job training for assessing and managing risks during project preparation and implementation.

During project implementation, E&S training and technical assistance will be provided at both the project and subproject levels. In the first three (3) years, the CPMU will hold at least two (2) safeguard training workshops per year (one (1) on environment, one (1) on social) for subproject owners on ESCMF and safeguard document preparation. An IFAD SECAP Specialist will participate when possible. Specific safeguard technical training will be held annually, covering:

1. ESCMF processes for preparing and supervising E&S instruments.
2. Training on IP Plans, SEP, labor management, and GRM pathways for local complaints.
3. Supervision and monitoring of contractor performance, health and safety, SEA Codes of Conduct, and communicable diseases.
4. IPM and safe use/disposal of pesticides and chemicals.
5. Waste management, including hazardous waste.
6. PPE use and best practices for construction and pesticide application.

6.8.4 Technical Assistance on E&S Capacity Building

Given the specific E&S training needs and limited capacity of some agencies regarding the latest AIIB, IFAD SECAP and GCF ESS, the CPMU may mobilize a qualified national firm to provide E&S training, supervision, monitoring, and reporting on ESCMF implementation and SECAP/ESS compliance for IFAD and GCF. If needed, an Independent Monitoring Agency (IMA) will be engaged to monitor IP Plan implementation, voluntary land donation (if applicable), and other E&S activities. PPMUs may also hire E&S consultants to support ESCMF implementation, document preparation, and mitigation measures for their subprojects.

MoWRAM has extensive experience applying the Bank's ESF and ADB's safeguards policy from similar past projects, maintaining a strong track record for safeguards compliance. The ministry continues to develop the capacity of its Environmental and Social Office (ESO), which has staff with expertise in engineering, community development, environment, social issues, and public administration. Many of the seven (7) ESO staff (four (4) of whom are female) have been trained by the World Bank in E&S management for rural development. Additional technical support, including national consultants, will be required to assist ESO in E&S implementation during the WASAC project.

6.8.5 Review Of MOWRAM/PMUS Capacity in Prevention of SEA/SH Risks

MoWRAM PMUs have experience in identifying and managing SEA/SH risks based on lessons learned from previous projects. For this project, a framework for addressing SEA/SH risks has been proposed and integrated into the Labor Management Procedures. Each PMU will appoint a social officer and a GRM officer to monitor and report SEA/SH risks, and a gender focal point will provide on-the-job training to contractors.

Early in the project, MoWRAM PMUs will recruit E&S consultants, including a SEA/SH specialist to deliver training to PMU members and relevant MoWRAM staff. SEA/SH risks will be updated based on local conditions, and preventive actions will be incorporated into ESCMPs and contractor responsibilities. A budget will be allocated to ensure contractors can hire SEA/SH consultants to raise public awareness and manage SEA/SH risks among workers.

Land acquisition and voluntary donation training will be provided by the E&S Consultant, starting as soon as specialized staff are engaged. Additional E&S support will be required monthly or bimonthly during construction, and quarterly or biannually during maintenance, depending on project needs.

The training will be face-to-face or virtual options as per condition allow. These sessions will include knowledge sharing, discussions, role plays, and quizzes, with Q&A at the end of each day. The duration of the training will vary based on the topics, participant numbers, and time availability, typically ranging from one (1) to three (3) days. MoWRAM will engage qualified trainers and may request support from AIIB and IFAD for new topics, including training materials and facilitation, to ensure practical, hands-on experience at the early stages of project implementation.

CHAPTER 7 – ENVIRONMENTAL AND SOCIAL IMPACT ASSESSMENT

7.1 INTRODUCTION

This chapter identify, and assess the nature, scope and scale of the environmental and social risks and impacts which are potentially associated with the proposed project, particularly with activities under Component 1 (intentified crop production and rehabilication of farm road) and Component 2 (rehabilitation of canal for water use efficiency). Activities under Component 1 and Component 2 are inter-related – in the sense that the results obtained under Component 2 (which focuses more on irrigation infrastructure) is desgined to facilitate the achievement of results expected under Component 1 (which introduces and facilitates farmers's uptake of climate-smart agricutlural practices to improve income, livelihoods, and enhance their resilience to climate change impact.

The risks and impacts identified, and assessed, in this chapter cover the direct, indirect, and cumulative impacts that would arise under the six (6) sub-schemes, to varying extent, during project design, implementation, and operations. In risk assessment, assessment of risks in this chapter are rated on the basis of no consideration of mitigation measures that are in place.

7.2 APPROACH TO ASSESMENT OF RISK AND IMPACTS

7.2.1 Identification and Assessment of Risks and Impacts

The assessment of environmental and social risks and impacts involves three (3) steps: identification, analysis, and assessment. Assessment of risks and impacts involves evaluating the nature, scope and scale, duration of project activities, potential impact receptors, and the magniture of impact – indicative of direct, indirect, or cumulative effects from proposed project activites.

The following factors are considered when assessing the risks and potential impacts:

- Impacts characterization (negative, positive, mixed);
- Impacts nature and duration (direct, secondary, indirect, cumulative; short-term, long term, permanent, reversible);
- Impact significance/magnitude (negligible, minor, moderate, major);
- Impacts likelihood (unlikely, possible, very likely);
- Spatial scale (national, regional, local);

- Measures to mitigate (adverse) or enhance (positive) impacts;
- Significance/magnitude of residual impacts (negligible, minor, moderate, major); and
- Where relevant receptor sensitivity/vulnerability (negligible, low, medium, high).

7.2.2 Project Activities

As per the description in Chapter 02, the project involves the construction of a number of structures aimed at enhancing agricultural productivity and flood control. River dredging and rehabilitation improve water flow and reduce siltation, while canal rehabilitation, expansion, and upgrades (both main and tertiary) facilitate better irrigation for farming. Dam upgrades and rehabilitation strengthen water storage and management capabilities. The installation or upgrading of hydraulic structures such as cross-check structures and head regulators ensures controlled water distribution. River training and drainage system construction help mitigate flooding, while the polder system provides land protection from floods by controlling water levels. Solar pumping system installation promotes sustainable water access, particularly in remote areas, and the construction of feeder canals and ponds further supports water availability for agriculture and community use, enhancing overall water management systems. Summary of the construction works in the six (6) sub-schemes are provided in Table 7.1 below:

Table 7.1: Key project activities potentially causing environmental & social risks & impacts – during project implementation & operations

No.	Key Project Activities	Descriptions	Sub-Schemes (06)					
			Ou Ta Paong	Lum Hach	Brambei Mom	Krapeu Truom	Yutasas	Stung Krang Bat
	COMPONENT 1	**Improving farm-level climate adaptation, resilience, and water use efficiency**						
1	Planning	Preparation of community-based action plans (AP) to transform agriculture with Climate Resilience (CR) practices.	√	√	√	√	√	√
2	Training	Preparation of training materials to support implementation of the Action Plan.	√	√	√	√	√	√
		Conduct trainings to create a pool of expertise to demonstrate and propagate the CR technologies and practices.	√	√	√	√	√	√
		Train farmers on applying CR technologies using the FFS approach.	√	√	√	√	√	√
3	Mechanization	Strengthening and fostering tailored mechanization service providers for improved mechanization service delivery.	√	√	√	√	√	√
4	Farm road	Improve 50 Kilometers of farm roads	√	√	√	√	√	√
	COMPONENT 2	Irrigation Infrastructure for increased resilience						
1	River dredging or rehabilitation	The activities will involve the excavation of existing river/stream which have become shallow or too small to store water or limit the water flow regime.	√	√				√
2	Canal rehabilitation / minor expansion canals	These activities will include the widening, deepening, or structural improvement of both main and tertiary canals to enhance their capacity for water conveyance, ensuring efficient irrigation and water distribution to agricultural fields.	√	√	√	√	√	√
4	Installing small–scaled structure (e.g. cross structure, head regulator)	This includes the construction or enhancement of hydraulic control structures that regulate water flow, ensuring proper water distribution across irrigation systems and improving the overall efficiency of water management.	√	√	√	√	√	√

No.	Key Project Activities	Descriptions	Sub-Schemes (06)					
			Ou Ta Paong	Lum Hach	Brambei Mom	Krapeu Truom	Yutasas	Stung Krang Bat
4	River training	These activities will focus on reshaping river channels and constructing drainage systems to manage water flow effectively, reduce the risk of flooding, and protect agricultural lands and surrounding communities.	√					
5	Polder system construction	This will involve creating an embanked area to prevent flooding by controlling water levels, typically through the construction of levees or dikes, enabling the reclaimed land to be used for agriculture or habitation.						√
6	Solar pumping system installation	These activities will involve the installation of solar-powered water pumps, providing a sustainable and energy-efficient means of extracting water from rivers, canals, or groundwater sources for irrigation and community use.	√	√	√	√	√	√
7	Construction of feeder canals	This includes the development of smaller, subsidiary canals designed to distribute water from main canals to agricultural fields, improving the reach and efficiency of irrigation systems.	√					
8	Pond construction/ rehabilitation	This will involve the excavation or repair of ponds to increase water storage capacity, providing reliable water sources for irrigation, livestock, and community use, especially during dry seasons.		√				

AP = Action Plan, CR = Climate Resilience, FFS = Farmer field school.

7.3 ASSESSMENT OF ENVIRONMENTAL AND CLIMATE RISKS AND IMPACTS

In this section, the E&S risks and impacts (that potentially arise during activity implementation and operationalization) are identified, analysed, and evaluated at project level — with regards to the nature, scope, scale, and the potential extent of activity impacts — through classification of such risks and impacts as direct, indirect, and cumulative. The assessment of E&S risks and impacts in this chapter is based on the following grounds that is fundamental to proposing measures to avoid, minimize, and mitigate for the impacts in the next chapter:

Project's original technical reports

- Feasibility Studies (August 2023)
- Feasibility Studies (updated by November 2023).
- Additional Pre–Feasibility for Ou Ta Pong Sub–scheme.
- Environmental and Social Management Framework – ESMF (Updated by October 2023)
- IBAT reports for project locations (Ou Ta Pong, Lum Hach and Stung Krang Ponley Irrigation Schemes)

Stakeholder Consultations (national, provincial, district, commune, and village levels)

- Community Meetings
- Focus Group Discussions
- Key Information Interview.

Field observation, using

- Transect walks.
- Drones (for E&S screening and biodiversity assessment)
- For detail information on Biodiversity Assessment, please refer to Biodiversity Impact Assessment Report

External technical reports

- Statistical reports/database.
- Publications and Technical Reports from national and internation institutions.

The description on the assessment as per each aspect is provided in the following section:

The assessment was conducted vis-a-vis the environmental and social risks and impacts that were initially identified for each of the six sub-schemes. The assessment, in particular, focuses on the direct, indirect, and cumulative effects of identified E&S risks and impacts. As a result, this process considered relevant threats to biodiversity and ecosystem services due to a) project activities, and b) activities of relevant projects that constitute the cumulative impact on the identified species, including habitat loss, interference with migratory routes or wildlife movement, degradation and fragmentation, invasive alien species, overexploitation,

hydrological changes, nutrient loading, and pollution (61). It also accounted for the diverse values attached to biodiversity and ecosystem services upon which affected communities' livelihoods depend.

The six sub-schemes are located to upstream of the Tonle Sap Lake, constituting the Tonle Sap Floodplain which is a complex ecosystem. This ecosystem and its ecosystem services are characterized with unique hydrology, rich biodiversity, vital livelihood support, and irrigated agricultural production which are located upstream of the Tonle Sap. Given the link between the project's command area and ecosystems located downstream of these sub-schemes, this assessment also evaluate the significance of the risks and impacts due to project activities. This assessment would focus more on areas immediately located outside the command area and to downstream.

Based on the potential risks and impacts, an adaptive management approach is proposed. Under this project, due to a lack of reliable information to confirm the extent and severity of potential impact – over a time dimension, mitigation and management measures proposed would be responsive – based on the changing conditions that were known based on monitoring results conducted periodically throughout the project cycles. Where necessary, adjustments can be made to mitigation and management measures. This iterative process aims to ensure the project follows the hierarchy of mitigation that avoids impacts. Where avoidance is not possible, adverse effects on the ecosystem and local communities will be minimized.

7.3.1 Risks and Impacts at Preparation and Construction Stage

7.3.1.1 UNEXPLODED ORDNANCES (UXO)

Construction and rehabilitation activities, particularly those involving earthworks, soil excavation, and river dredging, pose a significant risk of unexploded ordnance (UXO). Despite past demining efforts and clearance of the UXO existence in some sub-scheme as per the report in the Baseline, mortar shells, aerial bombs, and other UXO may still be present within the subproject area. This risk is particularly high in areas where deep excavation is required for structural upgrades or dredging.

The potential detonation of UXO poses a substantial threat to residents, construction workers, animals, and any other entities located near the construction sites. The risk of encountering UXO is considered **moderate** due to the country's long history of civil war and the limitations of past demining operations, which are often focused on surface-level clearance. While consultations with local authorities and communities on the incidents and presence of UXO were reported in Ou Ta Paong, Lum Hach, and Yutasas sub-schemes, the case should be put on alert.

- **Mitigation Measures**

- Carry out UXO screening/assessment by certified UXO experts before any physical/ construction activities are allowed.
- In case UXOs are found by certified experts during on-site screening, removal of UXO will be carried out by certified experts.

(61). World Bank Performance Standards (OP 4.03), 20220. Environmental and Social Review Summary (ESRS Concept Stage)

- A UXO clearance certificate shall be obtained from related authority for each sub-project prior to commencing any subproject activities.
- As part of site-specific ESCMP, conduct training and awareness activities for local community with regards to UXO risks and chance finds.

7.3.1.2 ENVIRONMENTAL, HEALTH, AND SAFETY

❖ **Noise and Vibration**

During construction phase, noise and vibration will be generated where machineries such as excavator, bulldozer, cement concrete mixing, and trucks are operated. While noise will be a nuisance to construction workers and nearby residents, these impacts are anticipated to local and intermittent during mostly during daytime. During night–time, noise may be occasionally generated from workers' camps due to living activities and occasional maintenance of machinery and equipment. These impacts are expected to have no or minimal impact on local residents as workers' camps will be located near construction site and far away from residential area. The construction of small-scale hydraulic structures is mostly located in the cultivation area and as such far away from residential areas (except for Ou Ta Paong and Lum Hach where some hydraulic structures are located near areas with limited residence. However, people who live along the national road (e.g. in Stung Krang Ponley) and small roads that project's trucks use to carry project's equipment and materials, may experience occasional traffic noise during daytime. Given the nature and scope of physical works under the six schemes, impact of noise on local residents is expected to be none to minor, and temporary.

▪ **Mitigation Measures**

- Before commencing the irrigation system restoration, the Ministry is requested to organize public forums in collaboration with the commune to gather feedback from the local population, especially from residents who may be affected by the project. Moreover, training sessions for the commune help them understand the project's processes, including the size of the infrastructure systems and the standards for excavation and construction. This will ensure that the commune is well-informed about the project
- Right before the construction, conduct noise testing at the sensitive locations as per the detail engineering design comparing to the national and IFC EHS Guideline
- Locate the workers' camp far away from the residential area as much as possible
- Avoid night-time construction in populated/village areas.
- Minimize project transportation through community areas where possible.
- Ensure proper maintenance and proper operation of construction machinery to minimize noise generation.
- No construction-related activities will be carried out from 21:00 hours to 06:00 hours along residential areas, hospitals, schools and during religious or cultural events near the subproject
- All construction equipment and vehicles must be well maintained, regularly inspected for noise emissions

- Impose speed limits on construction vehicles to minimize noise emission along areas where sensitive receptors are located (houses, schools, temples, hospitals, etc.
- Restrict use of vibrating rollers and operation of heavy equipment near sensitive structures.

❖ **Air pollution**

During construction phase, a number of project activities may cause air pollution. These include physical activities such as movement of trucks (for transportation of materials), clearing & grubbing, grading, excavation, leveling, truck hauling, stockpiling, disposal of solid waste, dredging which may generate dust and particulate matter (PM10 and PM2.5) (if water spraying does not apply). Exhaust emissions from trucks and heavy machinery will release nitrogen oxides (NOx), carbon monoxide (CO), sulfur dioxide (SO2), and volatile organic compounds (VOCs) which may contribute to smog formation and greenhouse effect. Burning of waste (by contractors) may release harmful pollutants into the air. While air pollution due to dust, particulate matter, and exhaust emissions from trucks and engines, are anticipated, location where pollution is generated vary and impact for one (1) location is temporary, intermittent, and minor, and are particularly for residents who live along the project's roads.

▪ **Mitigation Measures**

- Avoid burning solid waste or construction waste
- Spray or sprinkle water on the work surfaces and other piled materials to minimize dust at least 3-6 times per day in windy and dry weather and/or based on the weather condition
- Conduct proper maintenance of machineries and equipment
- Place sitting concrete mixing plants, crushing plants, quarries and other facilities far from settlement and other sensitive receptors
- Use cover for vehicles that transport all construction materials such as cements and excavated soils
- Test air quality (NO2, SO2, CO, TSP, PM10, PM2.5) prior and during the construction to assess the level of impact

❖ **Impact on Water**

Water pollution is anticipated, primarily due to physical activities that involves dredging and excavation near or in water course/ source. Such activities do not only cause turbulence for water but also cause increased sedimentation. Disturbed soil – caused by excavation to improve irrigation canal, for instance, may contaminate water at places where water is collected for domestic purpose (e.g. along Ou Ta Paong river which serves as the main canal). sources. The impact is anticipated particularly for planned dredging operation at the upper part of Ou Ta Paong canal. However, water pollution would be minimized through construction methods and time. For example, dredging operation of Ou Ta Paong river could be concentrated during dry season when water on Ou Ta Paong and other canals are minimal, and some Ou Ta Paong river sections are completely dry.

Wastewater (released from workers' camps) and leaks of hazardous materials (e.g., oil, diesel, chemical) could make their way into nearby water bodies and during rainy season which cause water contamination and leave varying level impacts on the receptors. The main receptors

vulnerable to water pollution during construction include nearby residents and construction workers. Due to the scope and scale of physical works anticipated for each of the six schemes, project impact due to water pollution is anticipated to be minor and localized.

- **Surface Water:** During the construction phase, sedimentation due to excavation, dredging, and earthworks is a primary cause of water quality degradation. Loose soil can be washed into nearby water bodies, increasing turbidity, reducing light penetration, and altering the aquatic habitat. Additionally, the use of machinery and equipment introduces risks of oil spills, fuel leaks, and chemical contamination, which can enter water sources through surface runoff, affecting aquatic life and water usability downstream.
- **Groundwater:** Construction activities, such as drilling and excavation, can disrupt the soil and rock layers, potentially allowing contaminants from surface activities, such as chemicals, to infiltrate groundwater. Chemical spills or leaching from construction materials can further degrade groundwater quality. Additionally, the disruption of natural flow patterns in the subsurface may allow pollutants to spread more easily, threatening water quality over a wide area.

▪ **Mitigation Measures:**

- Implement a waste management plan to ensure the proper disposal of all construction waste, including wastewater
- Use environmentally friendly construction materials and techniques to reduce the amount of pollutants that are released into the environment
- Install erosion and sediment control measures, such as silt fences, sediment basins, and check dams
- Properly manage construction chemicals, fuels, and waste to prevent water pollution.
- Regularly inspect and maintain construction equipment to prevent leaks and spills.
- Wash construction vehicles and machinery only in designated areas where runoff will not pollute natural surface water bodies.
- Train construction workers on the importance of preventing water pollution.
- Construct of retaining structures.
- Test surface water quality (Depth, pH, EC, AS, Cd, Pb, TN, TP, TDS, TSS, DO, and Total Coliform)

❖ **Solid and Hazardous Waste**

During project implementation, solid wastes – both non–hazardous and hazardous, are anticipated to be generated, primarily due to rehabilitation of irrigation canals and rural roads. In particular, solid waste could be generated from operations that involved site clearing, excavation, trenching, demolition of existing cement and earthworks structures, construction and disassembly of worker camps, maintenance of machineries, and so forth. Regarding dredged and excavated material, the construction activities can lead to surface erosion and sedimentation, particularly in water bodies. However, the estimates for the amount of dredged or excavated material per scheme do not estimate amounts for reuse or disposal. Improper handling of solid waste generated from the above operation may result environmental pollution

that may include soil and water contamination, habitat disruption, visual pollution and give rise to concerns of public health.

- **Mitigation Measures**

- All vehicles/drivers will be provided with plastic bags for waste collection and prevent any unauthorized waste disposal with particular attention paid to prevention of littering.
- The Contractor will be required to train the workers in proper waste management.
- Recyclables will be separated at source and given/sold to recycler (plastic, metal, card, paper as a minimum).
- Non-hazardous, non-recyclable solid waste will be temporarily deposited and managed together at existing landfill/dumpsite.
- Safe temporary storage of hazardous waste as required.
- Storage facilities for fuels, oil, cement, and chemicals shall be within secured areas on impermeable surfaces, provided with bunds and cleanup installations.
- Vehicles, machinery, and equipment maintenance and re-fueling will be carried out in such a way that spilled materials do not seep into the soil.
- Oil traps will be provided for service areas and parking areas.
- Fuel storage and refilling areas will be located at least 50m from canals and channels and will be protected by temporary drainage bunds to contain spills.
- Use or reuse the dredge material on properties with a residential or recreational use (dredging material, if planned for reuse, will be subject to testing to ensure the material is safe for reuse).

❖ **Wastewater**

During construction phase, generation of wastewater is expected, mainly from a) workers' camp (e.g. domestic wastewater), b) cleaning and washing of machinery, c) treatment of leakage and spill, etc. Depending how wastewater is managed, receptors of wastewater may include immediate receiving environment which may include soil, water bodies which may subsequently affect human including construction workers, residents nearby, and fauna and flora along the way wastewater goes.

- **Mitigation Measures**

- Reduce, recycle, and reuse waste [e.g. plastic waste, electronic waste, agricultural waste (natural, animal faces for later use as manure, plant waste)] wherever and whenever possible.
- Latrines must be built at construction sites and camp sites for appropriate domestic waste management.
- Hazardous waste, including any spills of chemicals or fuels, should be collected separately and disposed of following environmental regulations.
- Ensure construction sites have enough well-maintained sanitation facilities to prevent the direct discharge of untreated wastewater.
- Promote clean living practices, reduce plastic usage, and improve waste management.

- The construction company must regularly monitor the workers' living conditions, waste management, and ensure there are proper sanitation facilities and adequate housing for the workers.
- The company provides education and guidance on maintaining cleanliness and hygiene for the workers (such as proper waste disposal and handling of oil) and prohibits activities like fish poaching and hunting.

7.3.1.3 OCCUPATIONAL HEALTH AND SAFETY

❖ **Physical Hazards**

The construction or rehabilitation of irrigation canals and farm roads during the construction phase of the project presents significant physical hazards to workers and those in close proximity to the construction sites. These hazards can result in a range of consequences, from minor injuries requiring medical attention to severe and potentially fatal accidents. The sources highlight several specific types of physical hazards, including Falls from Heights, Drowning and Water-Related Injuries, Falling Objects, Falls into Open Holes, and Injuries from Heavy Equipment.

The impact receptors for physical hazards are primarily construction workers, but also include inspectors, visitors, and nearby residents and children, as well as domestic animals. The sources assess the risk of physical hazards as high, acknowledging that working in the construction field can result in injuries or fatalities if safety standards are not met. The sources emphasize that unsafe practices by construction companies can lead to accidents, injuries, illnesses, and fatalities. While the overall risk might be lower due to the anticipated number of workers involved, stakeholders at the community, district, and provincial levels have expressed concerns about the potential hazards posed to both workers and community members.

▪ **Mitigation Measures**

- Prepare a health and safety plan containing site-specific precautions in accordance with relevant occupational health and safety guidelines.
- Inspect and check the relevant construction equipment to ensure that it meets the applicable mechanical and safety requirements.
- Inspect the worksite to ensure that the equipment can be safely mobilized and operated, and that there are no unmitigated risks.
- Install appropriate fencing and control access to the site.
- Install appropriate safety signage and markings.
- Provide fall protection when workers are exposed to unguarded platforms or walkways higher than 2 m.
- Ensure there are safe ways to enter and exit the excavation.
- Provide safety precautions when using high voltage electric power tools.
- Carry out daily toolbox meetings (safety briefings).
- Maintain an accident record book where all major or minor accidents and incidents are recorded with actions taken.
- Educate the workers on construction hazards.
- Train drivers in safe driving skills and traffic regulations.
- Appoint an Environment, Health and Safety Officer who is a qualified engineer.

- Make adequate first aid equipment available on site.
- Carry out training and awareness of the workers on HIV-AIDS prevention.
- implement emergency preparedness and response procedures Response Plan as planned in the CEMP.
- Ensure that all workers are equipped with and use Personal Protective Equipment (PPE).
- The Contractor will set out an Emergency Response Plan

❖ **Heat Stress**

The construction phase of the project, which includes rehabilitating irrigation canals and ponds, presents potential risks of heat stress to workers. This is particularly concerning given Cambodia's tropical climate, characterized by high temperatures and humidity. Construction activities are often physically demanding and performed outdoors, increasing the risk of heat-related illnesses.

Construction workers exposed to prolonged high temperatures and humidity may experience heat stress, potentially leading to heat exhaustion or heat stroke. This can result in reduced productivity, increased accidents, and even fatalities. Heat stress can also exacerbate existing health conditions. The project's Environmental and Social Management Framework (ESCMF) highlights the importance of considering temperature extremes during the construction phase, emphasizing the need for mitigation measures to ensure worker health and productivity.

▪ **Mitigation Measures**

- Providing regular breaks and shaded rest areas for workers to cool down and rehydrate.
- Ensuring access to cool drinking water throughout the workday.
- Adjusting work schedules to avoid the hottest hours of the day, if feasible.
- Providing training to workers and supervisors on recognizing the signs and symptoms of heat stress and appropriate first aid measures.
- Encouraging the use of personal protective equipment, such as light-colored, loose-fitting clothing and wide-brimmed hats, to minimize heat absorption.
- Monitoring weather conditions and adjusting work practices accordingly.
- Developing and implementing an emergency response plan for heat-related illnesses.
- Providing adequate ventilation and cooling systems in worker accommodations.
- Encouraging workers to maintain good physical fitness and hydration levels.
- Regularly monitoring workers for signs of heat stress and taking appropriate action.

7.3.1.4 COMMUNITY HEALTH AND SAFETY

The construction phase, the project will rehabilitate existing irrigation canals and build new irrigation channels in an estimated six schemes located in four provinces. Construction activities may disrupt local transportation networks and increase traffic volume, including heavy trucks and machinery, impacting communities and businesses along transportation routes. Construction sites pose health and safety risks to workers and nearby communities. Accidents and exposure to construction-related hazards can have serious consequences. The influx of construction workers from different regions may increase the risk of spreading communicable diseases such as HIV/AIDS to the local community.

Open canals and ponds during rehabilitation work pose a risk of drowning, particularly to children and individuals unfamiliar with the area. Construction activities may increase the depth or alter the flow of water, further increasing the risk. Construction sites can attract curious individuals, particularly children, who may be unaware of the potential hazards. This includes the risk of falls, being struck by moving machinery or vehicles, and contact with hazardous materials. It is important to secure construction areas, implement safety awareness campaigns, and enforce hygiene and sanitation standards at construction camps.

- **Mitigation Measures**

- Prior to start of construction work, the contractor in cooperation with the PIU will consult with the local authorities and potentially affected residents/private landowner. Inform them about the upcoming construction work, safety precautions and how to raise concerns or file complaints (GRM).
- The contractor shall fence off the construction area and control access to the site.
- A speed limit of 30 km/h for construction related traffic through inhabited areas.
- The contractor shall install traffic signage and fluorescent bollards and warning lights to direct traffic and prevent vehicles driving into the lanes with construction activities.
- The contractor in cooperation with the local authorities shall implement traffic management to ensure a smooth traffic and prevent congestion.

7.3.1.5 BIODIVERSITY

- **Impact Assessment Results**

The result of the impact assessment on biodiversity are presented here where a number of the results can be also applied within the project operation phase as well. The results are the finding from the biodiversity assessment covering step 4 on Potential Impacts & Feasibility of Net Gain Requirements.

Ou Ta Paong

- Potential Impacts & Feasibility of Net Gain Requirements

The species that are assessed as “Present” or “Possible” in sub-scheme AoI are included in the impact assessment. These include the following 8 species: 1) Four reptiles (Black Marsh Turtle, Giant Asian Pond Turtle, Southeast Asian Box Turtle, Elongated Tortoise), 2) Three birds (Greater Adjutant, Milky Stork, and Bengal Florican), and 3) One fish (Siamese Tiger Perch).

- Potential impacts

Reptiles (Substantial risk)

All four species of reptiles are found in the upper and lower part of the OTP command area, particularly in areas near natural water courses (rivers and streams). During construction, these reptiles are potentially affected directly due to a) disturbances from noise and vibration due to increased vehicle activity and human presence, b) being hit by vehicles, equipment from increased traffic movement and river dredging/training at Ou Ta Paong river, excavating of the extended canal of Kbal Hong and other relevant canals, c) caught by workers, local people, and hunters. During project operation, these reptiles may be directly affected, including a) being caught by local people and hunters, and b) pesticide residues from intensified crop production.

Birds (Moderate risk)

Greater Adjutant, Milky Stork, and Bengal Florican are found seasonally in the command area, mainly in the lower/downstream part which is subject to annual flooding. These birds are migratory and as such are rare. Local people don't catch these birds for food. However, since these birds feed on aquatic species available from the command area, they may be affected by the feeds that are contaminated with pesticide residues.

- Net gain assessment

Additionally, during construction activities, these birds may be indirectly affected through disturbance and habitat loss caused by increased human activity and changes in water levels. It is important to note that the Ou Tapaong Command Area serves as a critical habitat for these endangered bird species, making it crucial to minimize any potential negative impacts.

Based on the potential impacts identified above, it is evident that measures need to be implemented to achieve a net gain in biodiversity within the Ou Tapaong Command Area. These measures should focus on minimizing direct disturbances and habitat loss during construction activities, as well as implementing sustainable agricultural practices to prevent pesticide contamination of food sources for these bird species.

In conclusion, based on the assessment results, it is recommended that comprehensive actions be taken to protect critical habitats for species such as reptiles (Black Marsh Turtle, Giant Asian Pond Turtle, Southeast Asian Box Turtle Elongated Tortoise), birds (Greater Adjutant, Milky Stork, Bengal Florican), ensuring their survival alongside irrigation system renovation projects.

Lum Hach

The species that are assessed as "Present" or "Possible" in sub-scheme AoI are included in the impact assessment on one bird (Green Peafowl).

- Potential impacts on Green Peaflow (Substantial risk)

The Green Peafowl is found in three community forest areas located within the vicinity of Lum Hach command area. During construction, these species is potentially affected directly due to a) disturbances from noise and vibration due to increased vehicle activity and human presence, b) caught by workers, local people, and hunters.

- Net gain assessment

Based on the assessment conducted for the Lum Hach Irrigation Sub-scheme, it has been determined that there is a net loss of biodiversity and ecological value within its area of influence. The critical habitat analysis identified only one endangered species, the Green Peafowl, with a confirmed presence in the sub-scheme's area of influence. The ecological state of habitats within this area is classified as very open and highly susceptible to human disturbances, posing potential threats to the Green Peafowl population.

It is evident that despite efforts to balance agricultural needs with conservation, there are significant risks and impacts on biodiversity within this project. Therefore, measures must be taken to mitigate these risks and minimize further loss of ecological value in order to achieve a net gain for biodiversity in the long term. This may include prioritizing protection and restoration efforts for critical habitats such as Toul Samraong, Phnom Banon, and Chan Trak Community Forests within the sub-scheme's area of influence.

❖ **Habitat Loss and Fragmentation**

During the construction phase of the irrigation infrastructure project, habitat loss and fragmentation pose some risk to biodiversity. The primary activity contributing to this risk is the rehabilitation of irrigation canals and farm roads. This process often necessitates the clearance of bushes, forests, or vegetation along the areas designated for rehabilitation, leading to the direct removal of farm-level habitats. Additionally, activities like river dredging and rehabilitation, as well as the construction and upgrading of dams in specific schemes like Ou Ta Paong, Lum Hach, and Stung Krang Bat, can further contribute to habitat loss and fragmentation.

The construction of canals and roads, especially those that cut across community forestry like the one planned in Lum Hach, can lead to significant changes in wildlife habitats. The removal of vegetation for these projects directly results in habitat loss. Moreover, the construction of these linear features can create barriers for wildlife movement, leading to habitat fragmentation. This fragmentation isolates populations, making it difficult for species to migrate, find mates, and maintain healthy populations.

The impact receptors for habitat loss and fragmentation are primarily terrestrial species, especially those dependent on forests and wetlands. The Lum Hach command area as a location where the project might cause a significant change for wildlife due to the plan to construct the canal across community forestry through the existing road trail. The assessment of the impact of habitat loss varies depending on the specific location and scale of the activities.

In the Ou Ta Paong (OTP), the receptors include avian species such as the Greater Adjutant, Milky Stork, and Bengal Florican. Construction activities such as canal rehabilitation and farm road development, as well as land use changes and altered water management practices, may lead to habitat loss and fragmentation. These activities involve digging, dredging, or changing existing waterways and infrastructure. This can destroy habitats, make it harder for animals to find places to nest and eat, and mess up the natural flow of water, which can have an effect on life on land and in water.

For the case of Lum Hach, there will be the division of Toul Samroang community forestry where the irrigation will be broken the protected area into two parts, even if it is built on the existing road trial. The total protected land area that will be acquired was estimated at 36,182 m^2, giving the length of the main canal across the protected area at 1.49 km and the width the canal at 24.3 meters. However, the construction is along the existing road trail crossing the protected area rather than a fresh new forestry area. Regarding the biodiversity impact assessment report, it was found that the green peafowl was confirmed to be present within the Toul Samraong, Phnom Banon, and Chan Trak community forests. The consultation with the engineering team to avoid the construction of the canal confirmed that it is unavoidable due to the elevation inappropriateness if it is changed to any other location. In this regard, the project will move on with the construction of the canal. The consultation with committee members of the community forestry (Figure 7.1 & 7.2) indicated both positive and negative thoughts over the construction. At the positive side, the community expected that the water shortage could be solved giving adequate water for wildlife within the forestry and possibly brought in more vibrant environment for wildlife. On the other hand, construction has sparked a concern regarding the encroachment of community people into the protected area to grasp

the land for agricultural purpose since the community has limited capacity and resources to patrolling as well as the power to stop such kind of illegal activities.

Figure 7.1: Consultation with Toul Samroang community forestry

Figure 7.2: Visiting the forestry area and drone taking photo

- **Mitigation Measures**

- Minimize the negative impact from land clearing on habitat connectivity by minimizing fragmentation and maintaining canopy connectivity across cleared areas.
- Establishing and maintaining guard posts on access roads near residential and biodiversity priority areas.
- Implementing measures such as habitat restoration, creating wildlife corridors, and ensuring that water management practices are sustainable and supportive of biodiversity.
- Creation of fish passageways, wetland restoration, and reforestation of riparian areas to facilitate fish migration and provide suitable habitats for endangered species.
- Installing signage to restrict access and prohibit harmful activities.
- Reporting illegal activities to the appropriate authorities.
- Implementing and enforcing policies against poaching and illegal collection of wildlife by workers and subcontractors, with appropriate penalties.
- Implement erosion control measures to prevent sedimentation in water bodies and downstream impacts.
- Create corridors or buffer zones between fragmented forest.
- Rescuing and properly handling wildlife encountered during land clearing and construction, following SOPs.
- Identify and avoid sensitive areas, such as known habitat for Green Peafowl or other endangered species.
- Implement habitat management measures to improve the quality and suitability of habitats for species.
- Detailed impact mitigation measures are in the Biodiversity Action Plan attached as Annex 1 within the Biodiversity Assessment Report.

Hunting, trading, and consumption of wildlife

During the construction phase of the irrigation infrastructure project, the influx of a new labor force presents a significant risk to hunting, trading, and consumption of wildlife. The arrival of workers from other regions can increase the demand for exotic local foods, including wildlife and endangered species, which are often perceived as interesting delicacies or possessing health-promoting properties. The hunting may be done for relaxation or belief that wildlife is tasty or making people healthy. This heightened demand can drive illegal hunting and trading activities, posing a severe threat to biodiversity and the stability of local ecosystems.

The impact receptors of this risk are primarily aquatic and terrestrial species, particularly those already threatened or endangered. The potential impact on rare and endangered species, as their rarity often increases their market value, further incentivizing unsustainable hunting and trading practices that can lead to their extinction. Several sub-schemes and their surrounding areas are identified as particularly vulnerable:

- Ou Ta Paong: This sub-scheme and its surrounding area, particularly the lower section and adjacent Tonle Sap Zone 3, support diverse EN and CR species: reptiles (Black Marsh Turtle, Elongated Tortoise, Giant Asian Pond Turtle, Southeast Asian Box Turtle), mammals (Indochinese Silvered Langur, Long-tailed Macaque), fish (Siamese Tiger Perch, Striped Catfish), and birds (Greater Adjutant, Milky Stork, Bengal Florican).
- Lum Hach: Construction activities and worker presence pose substantial risks to the endangered Green Peafowl through direct disturbance, habitat degradation, and increased access for illegal hunting and trapping.
- Yutasas: Confirmed sightings of critically endangered Jullien's Golden Carp, Leaping Barb (Flying Minnow), and Mekong Giant Barb are at risk from habitat disturbance and increased illegal fishing.
- Stueng Krang Bat: Supports several EN and CR species of reptiles and fish that face habitat disturbance and increased access for illegal hunting and capture.

The consumption of wild animals also poses health risks to consumers due to the potential transmission of zoonotic diseases. Additionally, it can negatively impact local economies by depleting valuable fish stocks, which can have detrimental effects on communities that rely on these resources for their livelihoods.

The influx of workers, coupled with the potential availability of markets for wild animal products, creates a concerning situation that requires attention and mitigation measures to protect the region's biodiversity.

- **Mitigation Measures**

- Develop and enforce a strict Code of Conduct/ethics against wildlife collection, possession, and trafficking. This includes clear policies and sanctions for employees and subcontractors.
- Conduct thorough biodiversity inspections along access roads and at quarry sites before starting land clearing works to identify habitats or nesting sites of endangered/protected species.
- Provide mandatory training for contractors' management staff and site workers on the Code of Conduct, Standard Operating Procedures (SOP) for wildlife protection and handling, and human-wildlife conflict management.

- Incorporate a policy in the Project Administration Manual (PAM) and Worker's Agreement that prohibits employees and/or subcontractors from possessing, purchasing, trading, or collecting wildlife or forest resources that are legally protected, CITES listed, or classed as threatened by the IUCN Red List.
- Minimize forest encroachment and wildlife poaching by developing and implementing a community-based management plan. This includes establishing guard posts, conducting surveillance, and installing signage.
- Undertake regular monitoring of all access roads to prevent poaching activities.
- Properly handle and rescue wildlife encountered during land clearing and construction, following the SOP for wildlife protection and handling.
- Establish a rapid response unit to address human-wildlife conflict effectively.
- Educate the community on local wildlife behavior, avoidance techniques, and deterrent methods.
- Report observed/recorded incidents of illegal activities to relevant authorities.
- Educate construction workers about the importance of wildlife conservation and the laws regarding hunting and trading of protected species.
- Implement strict penalties for violating wildlife protection laws.
- Collaborate with local communities to monitor wildlife populations and report any suspicious activities.
- Report incidents of illegal activities to relevant authorities.
- Detailed impact mitigation measures are in the Biodiversity Action Plan attached as Annex 1 within the Biodiversity Assessment Report.

❖ **Loss of fauna and flora**

The primary activity contributing to this risk is the construction of canals and roads, particularly in areas that require clearing vegetation and disrupting natural habitats. This is especially concerning locations like the Lum Hach command area, where the project might involve building a canal across community forestry, potentially leading to substantial changes in the local wildlife. The construction activities can lead to both direct and indirect impacts on fauna and flora:

- Habitat loss and fragmentation due to construction activities like canal and farm road rehabilitation, land use changes, and altered water management practices can affect species survival and connectivity. These activities may involve dredging, excavation, or modification of existing water channels and infrastructure, leading to habitat destruction and disturbance to nesting and foraging sites.
- Habitat Loss and Fragmentation: Clearing vegetation for the main canal construction in the Toul Samroang community forestry within the Lum Hach scheme directly removes habitats, leading to habitat loss, the roughly estimated this impact at about 36,182 m^2. The construction of this linear feature also fragments remaining habitats, isolating populations and hindering their movement, ultimately reducing their chances of survival.

- Construction activities and increased worker presence can lead to forest encroachment, wildlife poaching, and tree cutting.
- Increased vehicle movement increases the chance of collisions with wildlife.

The impact receptors for the loss of fauna and flora are diverse and include various species, particularly those dependent on the Toul Samroang community forestry in the Lum Hach and wetlands areas along each sub-scheme. The biodiversity study has found endangered and critically endangered species in the area, including reptiles (Black Marsh Turtle, Elongated Tortoise, Giant Asian Pond Turtle, Southeast Asian Box Turtle), mammals (Indochinese Silvered Langur, Long-tailed Macaque), fish (Siamese Tiger Perch, Striped Catfish), and birds (Greater Adjutant, Milky Stork, Bengal Florican) in the Ou Ta Poang. The Yutasas has confirmed sightings of the critically endangered Jullien's Golden Carp, Leaping Barb (Flying Minnow), and Mekong Giant Barb. While the Stueng Krang Bat supports several EN and CR species: reptiles (Asian giant softshell turtle, Black Marsh Turtle, Southeast Asian Box Turtle) and fish (Striped catfish, Mekong Giant Barb, Siamese Tiger Perch). So, the construction of canal expansion and restoration will impact these species.

- **Mitigation Measures**

- Properly handle and rescue wildlife incidentally encountered or caught during land clearing and construction by relocating them to safer habitats, following the Standard Operating Procedure (SOP) for wildlife protection and handling.
- Conduct thorough biodiversity inspections along the access roads and at quarry sites before starting any land clearing works to identify any habitat and/or nesting sites of endangered/ protected species that may be affected by the clearing and identify hotspots where collisions with wildlife are likely to occur.
- Train field workers to recognize and avoid wildlife.
- Install signage to alert drivers to the presence of wildlife and require them to slow down and drive with caution, especially in hotspots where collision with wildlife is likely to occur.
- Develop a system in which drivers report locations of wildlife crossings and wildlife sightings.
- Workers will receive training on frequently encountered wildlife.
- The contractor shall install signs to ban hunting or catching wildlife in the area.
- Apply Find Chance Procedure
- Detailed impact mitigation measures are in the Biodiversity Action Plan attached as Annex 1 within the Biodiversity Assessment Report.

7.3.1.6 CLIMATE CHANGE

- **GHG emission**

The main activities that contribute to this risk is the use of heavy machinery and trucks for excavation, transportation, and rehabilitation of irrigation canals and farm roads. The operation of these machineries releases carbon dioxide (CO2), methane (CH4) and nitrous oxide (N2O)

into the atmosphere. Waste burning at worker campsites may also contribute to GHG emission.

- **Mitigation Measures**

- Construction vehicles and machinery will be maintained to a high standard to minimize emissions and ensure compliance with the National exhaust emission standards. All mobile equipment should be fitted with catalytic converters.
- Use energy-efficient machinery and equipment during construction to reduce fuel consumption and emissions.
- All open burning of construction and demolition of waste material and refuse will be prohibited.
- Implement proper maintenance programs for equipment and vehicles to ensure they operate efficiently and with lower emissions.
- Engage with local communities and stakeholders to raise awareness of emission reduction practices and encourage their participation in sustainability efforts.

7.3.2 Risks and Impacts at Operation Stage

7.3.2.1 ENVIRONMENTAL, HEALTH AND SAFETY ASPECT/ISSUE

❖ **Water Management**

During the operation phase of the irrigation infrastructure project, alterations to hydrology present potential risks. The main activity that causes these risks is increased irrigation. This can lead to the depletion of water sources if proper management practices are not implemented. The sources emphasize the importance of efficient irrigation practices to mitigate these risks.

The impact receptors for these risks include the Tonle Sap Lake, upstream watersheds, wetlands, aquatic ecosystems, and downstream communities. The assessment of the impact of hydrology changes during operation is moderate. This takes into consideration the potential for both positive and negative impacts of irrigation systems. Poor water management can result in downstream water scarcity, altered hydrology, and damage to aquatic ecosystems. However, well-designed and properly managed irrigation systems can contribute to improved agricultural productivity and water resource management.

- **Mitigation Measures**
- A water user community should be organized prior to construction to participate in identifying key locations and ensure there are caretakers in place.
- Establish detailed water management plans that ensure equitable water distribution and allocation, considering the needs of various users and the environmental flow requirements to maintain healthy aquatic ecosystems.
- Design and construct robust irrigation infrastructure, including canals, ponds, and storage areas, capable of withstanding extreme weather events like floods and droughts. This investment should also include lining canals and refurbishing storage areas to reduce water losses and improve water storage capacity.

- Integrate natural infrastructure, such as wetlands and forests, into water management strategies. Protect and restore degraded habitats to enhance their water regulation capabilities, improve water quality, and support biodiversity.
- Establish and provide training to FWUCs on sustainable water management practices, equitable water rights, and allocation procedures. These communities play a vital role in the operation and maintenance of the irrigation system, ensuring its long-term sustainability.

❖ **Water pollution**

During this phase, the primary activity that causes this risk is the intensification of agricultural production in the command areas as irrigation water becomes readily available. This intensification can lead to an increased use of chemicals, such as fertilizers and pesticides, to enhance crop yields. These chemicals infiltrate the soil and reach groundwater aquifers, leading to long-term contamination. The excessive application of these chemicals can result in contamination of both surface and groundwater resources. Furthermore, changes in water table levels due to extensive irrigation can alter the flow patterns of groundwater, potentially mobilizing contaminants that would otherwise remain contained. The impact receptors for water pollution include:

- Farmers
- Nearby residents who rely on water resources for domestic use
- Aquatic ecosystems within the command areas and downstream, including the Tonle Sap Lake

The assessment of the impact of water pollution during operation is moderate. The sources acknowledge the potential for significant water quality degradation due to the widespread use of chemical fertilizers and pesticides in rice production. High concentrations of these chemicals in water resources can harm biodiversity, not only within the command areas but also in the downstream river systems and the Tonle Sap Lake.

Mitigation Measures

- Implement Simplified Pesticide Management Plan
- Conduct regular water quality test to track the change in water quality due to pesticide application using oversea laboratory testing.
- Encourage farmers to adopt IPM techniques that minimize pesticide use and rely on biological control methods, thereby reducing the increased risk of chemical contamination of water resources.
- Provide training and extension services to farmers on the judicious use of fertilizers and, ensuring they apply the correct type and amount based on soil nutrient levels.
- Promote the adoption of organic fertilizers and soil amendments, such as cover crops and green manures, which can improve soil fertility and reduce the need for chemical fertilizers.
- Implement a robust water quality monitoring program to track the levels of pesticides, nitrates, and other pollutants in surface and groundwater resources within and around the command areas.

- Encourage the adoption of water-saving irrigation methods, such as alternate wetting and drying (AWD) in rice cultivation, which can reduce water consumption and minimize the leaching of agrochemicals.

❖ **Soil pollution**

During the operation phase of the irrigation infrastructure project, soil pollution/quality reduction poses a considerable risk. The primary activity contributing to this risk is the increased agricultural production facilitated by the improved irrigation infrastructure. This intensification can lead to the overuse of agri-chemicals, such as chemical pesticides and fertilizers, if farmers lack adequate training or support in adopting environmentally friendly practices. The excessive application of these chemicals can lead to various detrimental effects on soil health:

- Nutrient Depletion: Over-reliance on chemical fertilizers can disrupt the natural nutrient cycle in the soil, leading to nutrient imbalances and depletion of essential elements necessary for plant growth.
- Salinization: In areas where irrigation water is not properly managed, the accumulation of salts in the soil can occur, leading to soil salinization. This condition makes it difficult for crops to absorb water and nutrients, reducing productivity.
- Pollution from Chemical Residues: The persistent use of chemical pesticides can result in the accumulation of harmful residues in the soil. These residues can contaminate food crops, pose risks to human health, and disrupt the balance of soil microorganisms essential for soil fertility.
- In the lowland regions, soil erosion is prevalent, and rice yields decrease annually due to rising temperatures and water shortages.

The impact receptors for soil pollution/quality reduction are multifaceted, encompassing such as soil health, water quality, and biodiversity. The sources assess the impact of soil pollution/quality reduction during the operation phase as moderate. This assessment considers the potential for increased agricultural production to lead to the overuse of agri-chemicals if sustainable farming practices are not adopted.

As consultation result, the construction and project activities may cause water and air pollution, soil erosion, waste from workers and machinery, noise pollution, and impacts on residential and commercial lands. Wastewater and debris could enter conservation zones and multi-use areas (Tonle Sap), polluting water and affecting fish in the Tonle Sap area.

▪ **Mitigation Measures**

- Implement Simplified Pesticide Management Plan
- Conduct regular water quality test to track the change in water quality due to pesticide application using oversea laboratory testing

7.3.2.2 BIODIVERSITY

7.3.2.2.1 Biodiversity

❖ **Habitat loss and fragmentation**

During the operation phase of the irrigation infrastructure project, habitat loss and fragmentation are significant risks to biodiversity. The primary activity that drives this risk is the intensification of farming made possible by the increased availability of irrigation water. This often leads to the conversion of land for agricultural purposes. Flooded forests and wetlands, or Zone 3 in Ou Ta Paong sub-scheme, which provide crucial habitats for various species, may be deforested, drained or filled to create more arable land. This conversion process directly results in the loss of habitat for species that depend on these ecosystems. This would be the same for the case of community forestry land within Lum Hach sub-scheme.

The impact receptors for habitat loss and fragmentation are aquatic and terrestrial species, particularly those that rely on flooded forests and wetlands for their survival. The sources specifically mention the potential for habitat conversion to extend beyond the local level and impact on the region, particularly with the possible expansion of agricultural land into protected areas. In Ou Ta Paong, a mix of paddy fields, rivers, and shrubland provides foraging habitat for avian species such as the Greater Adjutant, Milky Stork, and Bengal Florican. In Lum Hach, community forests are crucial for the conservation of the Green Peafowl.

The assessment of the impact of habitat loss and fragmentation during the operation phase is considered **moderate**. There is also concern that the increased accessibility to water for irrigation provided by the new infrastructure could encourage further encroachment into the protected areas, potentially leading to more extensive habitat loss in the long term.

Consultation results mentioned that the project improves fish habitats, allowing aquatic species to migrate and increasing fish production due to larger waterways. Residents benefit from higher fish catches, reduced costs, expanded agricultural production, and livestock farming. The project also helps clean the environment by reducing unauthorized constructions and indiscriminate waste dumping by the community.

- **Mitigation Measures**

- Identify and protect critical habitats, such as flooded forests and wetlands, ensuring their preservation against conversion for agricultural land.
- Implement measures to restore degraded habitats and improve their suitability for biodiversity.
- Promote sustainable agricultural practices to minimize negative impacts on biodiversity and water quality. This can include encouraging practices that reduce the need for land conversion.
- Implement sustainable water management practices to ensure adequate water availability for both human needs and ecological functions, avoiding excessive water extraction that could harm wetland habitats.
- Involve local communities in decision-making, monitoring, and conservation efforts to build ownership and support for protecting natural habitats.
- Promote sustainable livelihoods that are compatible with biodiversity conservation, offering alternatives to activities that lead to habitat loss.
- Establish a long-term monitoring program to track changes in habitat quality, species populations, and the effectiveness of mitigation measures.

- Minimize forest encroachment and wildlife poaching by developing and implementing a community-based management plan. This includes establishing guard posts, conducting surveillance, and installing signage.
- Implement and enforce policies against poaching and illegal collection of wildlife by workers and subcontractors, with appropriate penalties.
- Raise awareness and educate the community on the importance of protecting fish populations and aquatic ecosystems.
- Detailed impact mitigation measures are in the Biodiversity Action Plan attached as Annex 1 within the Biodiversity Assessment Report.

❖ **Invasive Species**

The activity that causes this risk is the intensification of farming, which can lead to changes in land use and water management practices. The key change in land use is the increased cropping intensity and the introduction of dry-season irrigated crops made possible by the rehabilitated irrigation infrastructure. The project aims to increase the cropping intensity up to 270% in the Ou Ta Paong scheme and introduce a second irrigated rice crop during the dry season in other areas. This shift from rain-fed or flood recession agriculture to irrigated cultivation will significantly alter water management practices and create conditions that may be favorable to invasive species. These changes can create favorable conditions for non-native plant and animal species to establish themselves in the command areas. For instance, altered water flow and flooding patterns due to the new irrigation infrastructure can disrupt the natural balance of wetlands, making them more susceptible to invasion. Moreover, Introduction of invasive species through irrigation canals Irrigation canals may facilitate the introduction of invasive plant or animal species into native aquatic ecosystems. Examples of invasive species mentioned in the Biodiversity Impact Assessment report are Water Hyacinth, Mimosa Pigra, and Tilapia. These invasives can outcompete native species for resources such as food and habitat space. Invasive species can introduce plant and animal species that outcompete native species and alter ecosystem dynamics.

The impact receptors for invasive species are aquatic and terrestrial species, particularly those native to the affected ecosystems. The risk of invasive species spreading through waterways, especially in areas like Ou Ta Paong and Stung Krang Bat, where water flows in both directions from and to the Tonle Sap Lake.

The assessment of the impact of invasive species during the operation phase is considered minor overall. However, the sources note that the scale of the impact can vary depending on the specific location and the types of invasive species introduced. The impact is expected to be more significant in Ou Ta Paong due to the larger scale of the irrigation infrastructure and the increased risk of invasive species spreading through the connected waterways.

▪ **Mitigation Measures**

- Implement a robust monitoring system, including regular surveys of waterways and terrestrial habitats, to detect invasive species early. Train personnel to identify and map invasive species, and establish rapid response protocols for eradication or control, such as manual removal, targeted pesticide application, or biological control agents.

- Implement specific water management practices to minimize the risk of invasive species spreading through waterways.
- Foster collaboration among government agencies, research institutions, local communities, and NGOs for effective invasive species management. Facilitate information sharing, coordinate efforts, and leverage resources for maximum impact.
- Public Awareness and Education: Raise awareness among all stakeholders.
  - Educate farmers, local communities, and other stakeholders about the risks of invasive species, their identification, and prevention measures.
  - Establish a system for reporting suspected invasive species to enable rapid response and prevent spread. Set up a hotline or a reporting mechanism accessible to all stakeholders
  - Collaboration with the Environmental Department.
- Detailed impact mitigation measures are in the Biodiversity Action Plan attached as Annex 1 within the Biodiversity Assessment Report.

7.3.2.3 CLIMATE CHANGE

❖ **GHG emission**

During the operation phase, the intensification of farming activities is expected to result in a rise in greenhouse gas (GHG) emissions. This increase will stem primarily from the greater energy requirements associated with boosting agricultural production. The operation of machinery and equipment for various farming tasks, including tillage, irrigation, harvesting, and transportation, will demand a substantial amount of energy. If this energy comes from fossil fuels, it will lead to higher carbon emissions. The practice of burning rice straw after harvest, a common agricultural method in the region, also releases significant amounts of GHGs, such as carbon dioxide and methane, into the atmosphere. Additionally, the intensification of farming often results in greater use of chemical fertilizers, and the production and application of these fertilizers also contribute to GHG emissions.

The main impact receptor for GHG emissions is the atmosphere. The increase in GHG emissions adds to the problem of global climate change, which can have a wide range of negative consequences. These consequences include rising temperatures, shifts in weather patterns, sea-level rise, and an increase in the frequency and intensity of extreme weather events.

The sources classify the impact of GHG emissions during the operation phase as minor. This evaluation takes into account the relatively limited scale of the project and the short duration of the construction activities. However, it is essential to recognize that even small increases in GHG emissions contribute to the overall effects of climate change.

▪ **Mitigation Measures**

- The project needs to introduce renewable energy sources such as solar-powered irrigation to lower the carbon footprint of rice production.
- The project needs support training farmers to use alternatives to straw burning, such as mulching or biomass energy generation, to reduce air pollution.

- The project promotes the utilization of efficient irrigation methods like alternate wetting and drying (AWD) to conserve water and minimize methane emissions.
- The project needs to advocate for policies that discourage straw burning and provide incentives for adopting sustainable agricultural practices.

7.3.2.4 ANNUAL CROP MANAGEMENT PLAN

❖ **Water resource efficiency**

In this phase, inefficient irrigation practices can lead to a reduction in water resource efficiency. Moreover, people in community faced with flooding in wet season and drought in dry season generally. Additionally, farmers also pose with climate change issue which harm to their crop. The increased demand for irrigation, coupled with poor water management practices and lack of infrastructure, can result in the over-extraction of water resources. This over-extraction can have several detrimental effects on the surrounding environment and communities:

- Downstream Water Scarcity: Excessive withdrawal of water for irrigation can deplete water sources downstream, leading to water shortages for other users, such as communities, industries, and ecosystems.
- Altered Hydrology: Over-extraction can disrupt the natural flow patterns of rivers and other water bodies, affecting the balance of aquatic ecosystems and the services they provide.
- Damage to Aquatic Ecosystems: Reduced water flow and altered water levels can harm fish populations, other aquatic organisms, and the overall health of downstream ecosystems.

The impact receptors for inefficient water resource use are downstream communities and aquatic ecosystems, including those in the Tonle Sap Lake and its surrounding watersheds. This assessment highlights the importance of implementing effective water management strategies to ensure the sustainable use of water resources and minimize negative impacts on downstream users and ecosystems.

▪ **Mitigation Measures**

Project need to implement efficient water management practices to prevent over-extraction and ensure equitable water distribution. This can include:

- Water use monitoring system to track consumption and identify areas for improvement.
- implementing appropriate irrigation scheduling based on crop water requirements and weather conditions.
- Utilizing efficient irrigation systems, such as drip irrigation or sprinkler systems, to minimize water loss.
- Exploring opportunities for water reuse, such as capturing and reusing runoff water.

❖ **Soil erosion and soil erosion risk**

The various agricultural activities can elevate the risk of soil erosion and contribute to the degradation of soil health. Land preparation practices, such as tillage and site clearing, along with the use of heavy machinery, can disrupt the soil structure, making it more vulnerable to

erosion by wind and water. Additionally, the intensification of farming can lead to changes in vegetation cover, reducing the natural protection against erosion.

Soil erosion poses significant threats to both the environment and agricultural productivity. The loss of topsoil, the fertile upper layer of soil rich in nutrients and organic matter, is a primary concern. This loss diminishes soil fertility, impacting its ability to retain water and nutrients crucial for plant growth. Consequently, agricultural yields decline, and farmers may experience reduced productivity. Furthermore, eroded soil particles contribute to increased sedimentation in water bodies such as rivers and lakes. This sedimentation can harm aquatic ecosystems and degrade water quality, increasing the costs associated with treating water for human consumption.

The impact receptors for soil erosion are soil health, water quality, and agricultural productivity. The sources assess the impact of soil erosion during the operation phase as high, emphasizing the need for sustainable land management practices to prevent and mitigate soil erosion.

- **Mitigation Measures**

- Minimize soil compaction and disturbance by using appropriate machinery and timing land preparation activities.
- Consider erosion management practices such as contour planting, terracing, and grass barriers.
- Adopt reduced tillage or no-till farming practices to minimize soil disturbance.
- Establish cover crops during fallow periods or in rotation with main crops to protect the soil from erosion.
- Practice contour farming on sloping land to reduce runoff and erosion.
- Construct terraces on steep slopes to prevent soil loss.
- Establish windbreaks or shelterbelts to reduce wind erosion.
- Install erosion control structures, such as grassed waterways or sediment basins, to manage runoff.
- Apply much to the soil surface to protect it from rainfall impact and erosion.

❖ **Nutrient application and management**

The excessive or improper application of fertilizers poses a significant risk to water quality and the health of aquatic ecosystems. The intensification of agricultural production, driven by improved irrigation, can lead to an increased reliance on chemical fertilizers to enhance crop yields. However, if these fertilizers are not applied judiciously and managed effectively, they can have detrimental effects on the environment:

- Nutrient Runoff: When fertilizers are applied in excess or at inappropriate times, such as before heavy rainfall, a significant portion of the nutrients can be washed away from the fields and carried into nearby water bodies.
- Nutrient Leaching: Fertilizers can also leach through the soil and contaminate groundwater resources.

The impact receptors for nutrient runoff and leaching are water quality, aquatic ecosystems, and human health. High levels of nutrients, particularly nitrogen and phosphorus, in water

bodies can lead to eutrophication, a process that causes excessive growth of algae. This algal bloom can deplete oxygen levels in the water, harming fish and other aquatic organisms. Additionally, contaminated water sources can pose risks to human health if used for drinking or recreational purposes.

The sources assess the impact of nutrient application and management during the operation phase as high, emphasizing the urgent need for sustainable farming practices that optimize fertilizer use and minimize the risks of nutrient pollution.

- **Mitigation Measures**

- Conduct periodic soil analysis to determine nutrient needs and avoid over-fertilization.
- Establish buffer zones near watercourses to filter nutrient runoff.
- Consider using green manures and cover crops to replenish soil nutrients and reduce leaching.

❖ **Use and effectiveness of pesticides**

The use of pesticides to protect crops from pests and diseases can pose significant risks to human health, biodiversity, and the environment. The intensification of farming often leads to an increased reliance on pesticides to maintain high crop yields. However, the effectiveness of pesticides can decline over time as pests develop resistance, requiring farmers to apply higher doses or switch to more potent chemicals.

This cycle of pesticide use, and resistance can have several negative consequences. Pesticide exposure can pose health risks to both farmers who handle and apply these chemicals and consumers who ingest pesticide residues on food. Pesticides can harm non-target organisms, including beneficial insects, pollinators, and soil organisms, disrupting the balance of ecosystems. Environmental Contamination: Pesticides can contaminate soil and water resources, potentially affecting water quality and the health of aquatic ecosystems.

The sources assess the risks and impacts associated with pesticide use and effectiveness as high, highlighting the need for integrated pest management strategies that minimize reliance on chemical pesticides.

- **Mitigation Measures**

- Promote Integrated Pest Management (IPM) strategies to minimize pesticide use.
- Implement training and awareness programs for farmers on the safe handling and application of pesticides.
- Providing training materials that are user-friendly and accessible to farmers with varying literacy levels.
- Including climate information and agrometeorology services in training materials when available.
- Preparing training materials for rice and other crops such as vegetables, poultry, and aquaculture.
- Organizing trainings on "climate-informed agriculture decisions and planning" and having trained individuals disseminate information.

❖ **Pesticide residues on site soil**

The repeated application of pesticides, especially persistent pesticides, and the improper disposal of pesticide containers can lead to the accumulation of pesticide residues in the soil. This accumulation can have several detrimental effects on the environment such as contamination of Groundwater and impacts on Soil Organisms.

The impact receptors for pesticide residues on-site soil are soil health, biodiversity, and water quality. The sources assess the risk of pesticide residue accumulation in the soil as high, emphasizing the need for judicious pesticide use, proper disposal of pesticide containers, and integrated pest management strategies to minimize the risks associated with pesticide contamination.

- **Mitigation Measures**

- Promote the use of pesticides with low persistence and mobility in the environment.
- Implement a soil monitoring program to assess pesticide residue levels.
- Consider crop rotation and the use of cover crops to help break down pesticide residues.
- Minimize pesticide use by adopting IPM strategies.
- Conduct soil testing to monitor pesticide residue levels.
- Utilize cover crops to improve soil health and enhance pesticide degradation.

❖ **Pesticide residues on produce**

During the operation phase of the irrigation project, the application of pesticides close to harvest, improper pesticide application techniques, and inadequate pre-harvest intervals can lead to pesticide residues on produce, posing risks to consumer health. Consuming produce with pesticide residues can have adverse effects on human health.

The main impact receptor for pesticide residues on produce is human health, specifically consumers who ingest the contaminated food. The sources assess the impact of pesticide residues on produce as moderate. This assessment highlights the importance of implementing safe pesticide application practices, adhering to pre-harvest intervals, and promoting alternative pest control methods to minimize the risks to consumer health.

- **Mitigation Measures**

- Enforce pre-harvest intervals to allow for pesticide breakdown before harvest.
- Promote the use of pesticides with low toxicity to humans.
- Properly wash and handle produce to remove surface residues.
- Implement a monitoring program to test produce for pesticide residues.
- Ensure compliance with established MRLs for pesticide residues on produce.

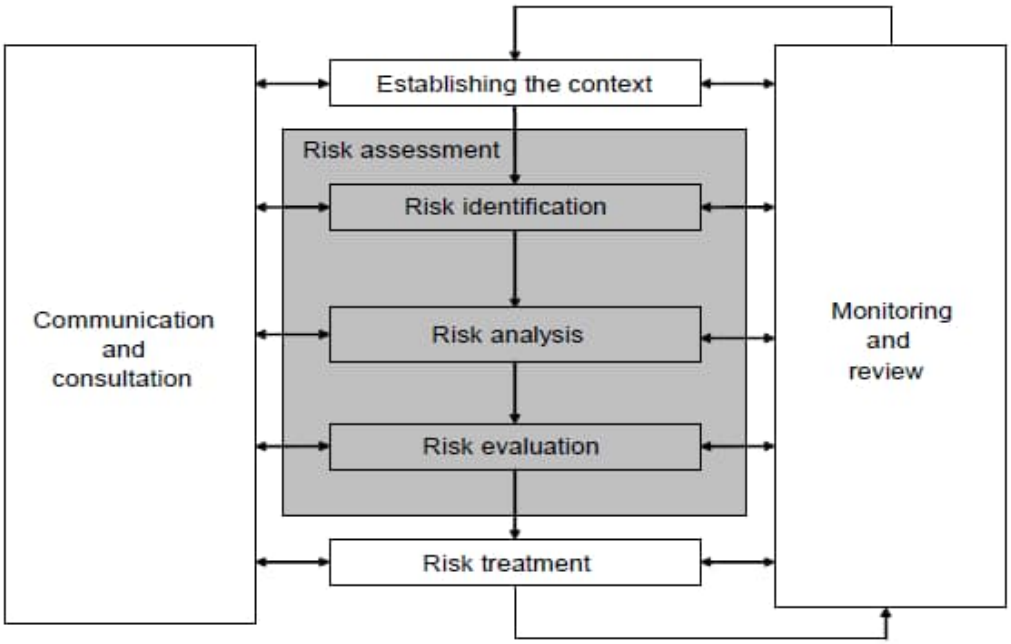
7.4 ASSESSMENT OF SOCIAL RISKS AND IMPACTS

A Social Impact Assessment (SIA) is a systematic process used to analyze, monitor, and manage the social consequences of planned interventions, such as policies, programs, plans, or projects. It aims to identify, predict, and mitigate potential negative social impacts while maximizing positive ones.

Methods:

- Participatory Rural Appraisal (PRA): Engage local communities through focus group discussions, interviews, and mapping exercises to identify their concerns, needs, and perceptions of the project.
- Social Surveys: Conduct structured surveys to gather quantitative data on socio-economic conditions, livelihoods, and potential impacts on households.
- Key Informant Interviews: Interview key stakeholders, such as local leaders, government officials, and experts, to gain insights into local dynamics and potential risks.

Data/Information:



- Baseline Data: Collect baseline data on demographics, land use, water resources, livelihoods, and social indicators.
- Secondary Data: Utilize existing data from government agencies, research institutions, and other relevant sources.
- Primary Data: Gather primary data through field surveys, interviews, and observations.

Consultations:

- Individual Consultations: Conduct one-on-one consultations with key individuals and groups to address specific issues and concerns.

The assessment of environmental and social risks and impacts involves both the identification of risks and the identification of impacts. The identification of risks involves with three (3) steps: the risk identification, risk analysis, and risk evaluation (Figure 7.3) whereas the assessment of impacts involves with five (5) steps: characterizing the impacts, identifying the nature and duration of the impacts, determining the impact significance, determining the level of impact likelihood, determining the impact scale, determining the measures to mitigate the impacts, assessing the residual impacts after mitigation, and determining receptor sensitivity/vulnerability.

Figure 7.3: The process of risk assessment Risk assessment process (shaded) within the overall risk management process

(Source: AS/NZS ISO31000)

The activities in the rehabilitation of irrigation canals and farm roads cause risks and potential impacts prior and during construction, including child labor, forced labor, disease transmission, occupational health and safety, underpaid pay, and unequal treatment.

7.4.1 Risks and Impacts at Preparation Stage

7.4.1.4 LAND ACQUISTION

❖ **Land acquisition and resettlement**

The rough estimate of land acquisition and resettlement were conducted in four steps. Firstly, the assessment was based mainly on the result of the consultations between the AIIB Social Development Specialist and the PMU engineering team to come up with more practical and latest conceptual design options to use as the basis for the land acquisition and land resettlement estimations. Then, rough calculations of the scale of the impacts were conducted using the agreed engineering designs to obtain the impacted figures. At the same time, google earth with the specific types of infrastructure locations were also used to indicatively determine the affected areas at each subproject location along the canals. Thirdly, the estimates were also consulted with relevant Provincial Departments of Land Management Urban Planning and Construction (PDLMUPC) and local authority representatives to confirm the estimated land titling at the impacted project sites. Lastly, the results were then brought back to consult with the PMU engineering team to verify the estimated figures. Although the consultation and the process had covered various aspects, the estimates were considered as a rough figure subjected to the final detailed engineering design (DEDs) outcomes. In addition, the estimation based on the google earth has its limitation on the accuracy, and the impact may differ from the actual impacts resulting from the upcoming DEDs to be carried out at a later stage.

The rough estimation of the land acquisition impacts was encountered mainly at Ou Ta Paong and Lum Hach sub-schemes as there are the canals being planned to expand. The other four

sub-schemes have minimal expansion of the canals across the sub-schemes. Tables below are the summaries of the estimated impacts. Firstly, the rehabilitation of irrigation infrastructure, which would take place mostly at feeder canals, main canals, and occasionally at secondary canals, may require additional land (linear) for canal widening. Canal widening and/or dredging aims to improve water flow leading to better water distribution to areas that have limited irrigation access by farmers. Improved water distribution efficiency aims to increase total cultivation command area and crop intensity per year, crop productivity, and incomes of small households.

Overall, the estimated impacts were mainly found at the Ou Ta Paong and Lum Hach sub-schemes while minor impacts were apparently reported at the other sub-schemes. The practical impacts primarily involve land, houses, crops, and rice fields. A total of 1,553,130 m² of public land and 1,499,233 m² of agricultural land within the right-of-way are affected, with Ou Ta Paong and Lum Hach accounting for the majority. Residential land impacted is limited to 53,897 m² across the same areas. Seven houses in Ou Ta Paong are fully affected and may require resettlement, while 70 households in Ou Ta Paong and Lum Hach face partial building impacts. Additionally, 1,507 trees owned by 164 households are affected. Rice fields totaling 1,031,543 m² are impacted, affecting 4,102 households, predominantly in Ou Ta Poung and Lum Hach. Business disruption may affect 483 households in these two areas as well, based on the estimated assumption

Temporary impacts are limited arising from land acquisition to support contractor operations during the scheme construction phase, affecting 35 households across all areas. These impacts are minimal compared to permanent effects. The data highlights significant disruptions in Ou Ta Paong and Lum Hach, with Brambei Mom, Krapeu Truom, Yutasas, and Stueng Krang Bat experiencing smaller-scale impacts, mainly related to rice fields and minor temporary land acquisitions (Table below).

Table 7.2: Indicative figure of canal expansion at all sub-schemes

Type of Impacts	Ou Ta Paong	Lum Hach	Brambei Mom	Krapeu Truom	Yutasas	Stueng Krang Bat	TOTAL

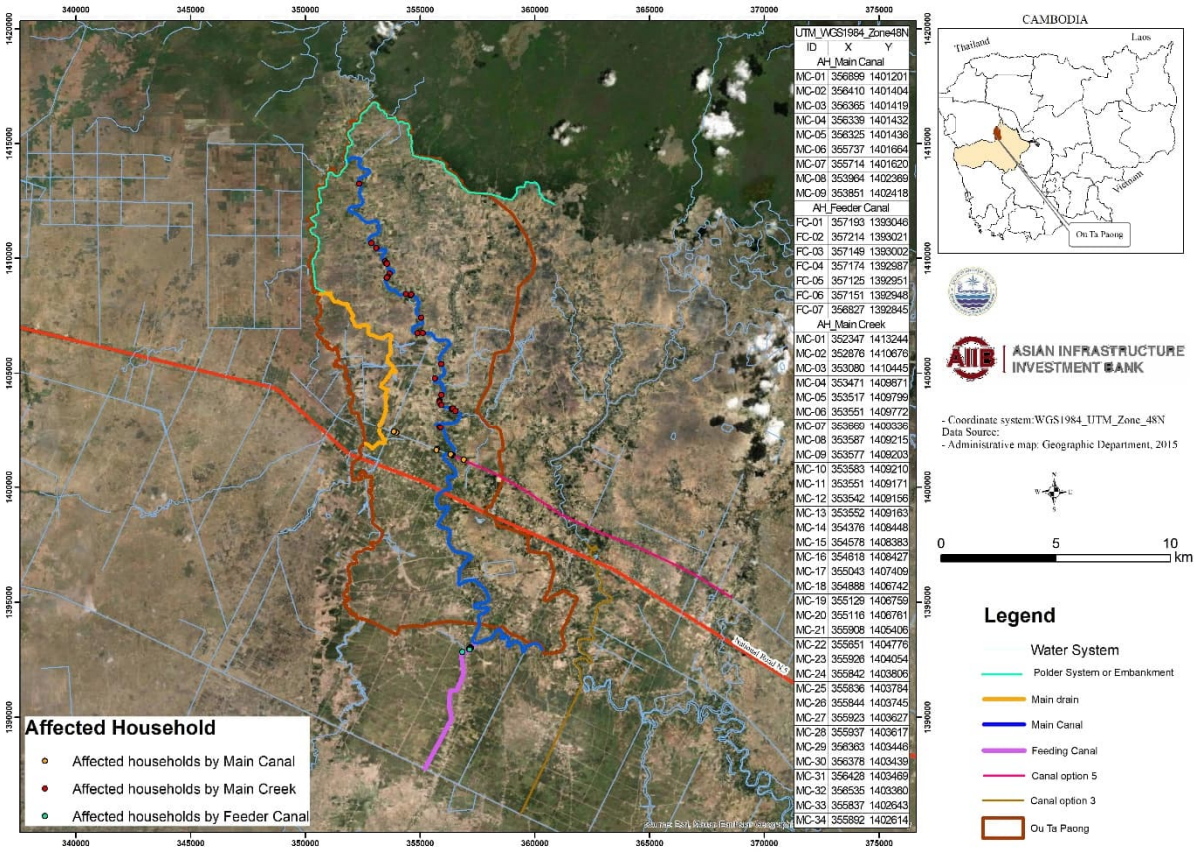
- **Ou Ta Paong**

The impact of the land acquisition is expected to encounter mostly at the Ou Ta Paong sub-scheme within the proposed Feeder canal 1, feeder canal 2, main canals (mainly from Kbal



Hong to Ou Ta Paong, and the secondary canals due to possible expansion of the design width in order to adequately provide water distribution and water carrying capacity to feed the entire irrigation system (Table 7.4). The impact includes the expansion of the canal body as well as the rural road along the canals. However, due to limited number of households living along these planned expanding canals, the affected number of households are few.

Table 7.4: Indicative figure of canal expansion at Ou Ta Paong

No	Structures	Designed Length (km)	Existing Width (Average) (m)	Expansion (L) (m)	Expansion (R) (m)	Total Width (m)
1	Feeder 1	8.80	16.00	7.00	7.00	30.00
2	Feeder 2	6.10	29.10	1.50	1.50	32.10
3	Main Canals	37.50	37.10	5.00	5.00	47.10
4	Creek Re-shape	27.60	61.00	0.00	0.00	42.00
5	Main Drainage	11.70	52.00	Reshape	Reshape	42.00

L = Left, R = Right.

Figure 7.4: Locations of the potentially affected households in Ou Ta Paong sub-scheme

(Source: ESCIA Study 2024)

Using this figure, the land acquisition is estimated at 516,500m2. The consultations with Provincial Departments of Land Management, Urban Planning and Construction (PDoLMUPC) indicated that with this size, all of the acquired land are the public land. There are, however, 50 households and 288 trees apparently to be affected due to the irrigation expansion as the households have been located within the expended locations (Figure 7.4). There are seven (7) households along the Ou Ta Poung River observed to be affected entirely which may require displacement or a full resettlement. The cost for compensation to the

affected households are projected at 121,119 USD as per the government rate, derived from official rate at the PDoLMUPC website. The seven (7) entirely affected households may need to be resettled. Specific measures and solutions needed may include reconsideration of the canal design width at the spots (Table 7.5). However, the PMU engineering team confirmed that technical and strategic consideration can only be provided at the time of the DED stage since possible reduction of the irrigation infrastructure design width will result in the reduction of water flow and water carrying capacity of the canal which may affect the required water distribution and requirements to effectively and efficiently deliver the irrigation purpose and project objective.

Table 7.5: Land Acquisition and Asset Impacts in the Ou Ta Paong sub-scheme

No	Structures	Affected public land (m^2)	Affected Assets (Tree)	Affected Households	Physical Displacement (HHs)
1	Feeder 1	123,200	5	7	-
2	Feeder 2	18,300	-	-	-
3	Main Canals	375,000	130	9	-
5	Creek Re-shape	-	100	34	7
6	Main Drainage	-	-	-	-
Total		516,500	235	50	7

HHs = Households.

- **Lum Hach**

The second most affected sub-scheme in terms of land acquisition is anticipated within Lum Hach as the possible expansion is planned at the improvement of the main canal to store the water within the canal itself as well as the roads along the embankment of the canals (Table 7.6).

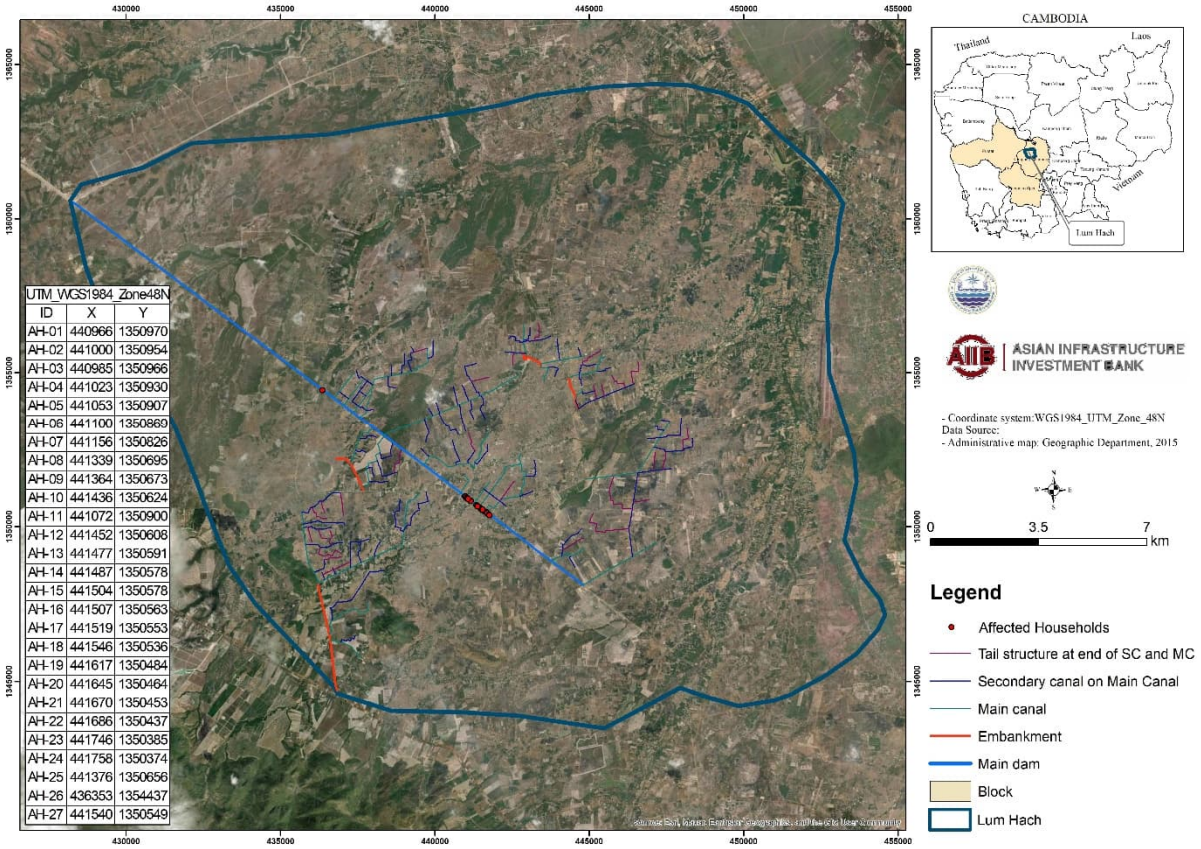


Table 7.6: Indicative figure of canal expansion at Lum Hach

No.	Structures	Designed Length km	Existing Width (Average) m	Expansion (L) m	Expansion (R) m	Total Width (m)
1	Channel Improvements	20.70	80.00	Design of 90 m width (excavation + slopes) with 5 m depth		**90.00**
2	Embankments	7.20	13.10	9.00	9.00	**31.10**
3	Main Canals	48.80	11.30	6.50	6.50	**24.30**

L = Left, R = Right.

The estimate land area to be acquired along the canals is approximately summed at 971,000 m^2, covering all the public land. There are, however, 27 affected households which the design width will may be affected, and the land may need to be partially acquired. The results of the consultation with the engineering team confirmed that the affected households may be able to be avoided by reducing the design width at the affected project locations as the canal purpose is mainly used for storing water not the conveyors. However, the consideration and appropriate approach to address the impacts will need to be properly discussed at the DED phase since there might be the some consequence arising from the subproject civil work., if one house is allowed to continue staying along the canal while the other may not. The locations of the households are illustrated within Figure 7.5 below.

Figure 7.5: Locations of the potentially affected households in Lum Hach sub-scheme

(Source: ESCIA Study 2024)

- **Krang Ponley**

The land acquisition for the construction of the irrigation system within the four sub-schemes has been limitedly anticipated since the construction of the new system has been avoided the most. Very limited expansion of the canal was reported with the decision (Table 7.7).

Table 7.7: Indicative figure of canal expansion at Krang Ponley

No.	Structures	Designed Length km	Existing Width (Average) m	Expansion (L) m	Expansion (R) m	Total Width (m)	Affected Land (m^2)
Brambei Mom Scheme							
1	Main Canals	6.3	51.5	0	0	51.50	0
Krapeu Trom Scheme							
1	Main Canal 1	2.82	30	0	0	30.00	0
2	Main Canal 2	6.8	30	0	0	30.00	0
3	Drainage Canal	6.8	5	1	1	7.00	13,600
4	Carrying Roads (MC2)	6.8	Only one (1) section of 1.5 Km canal's embankment requires expansion to be the rural road. The section of 5.3 km is already large enough to be the rural road.		1.5		2,250
Yutasas Scheme							
1	Embankment	1	18.4	1.6	0.8	20.80	2,400
2	Main canal	6.6	21.3	2.2	1.1	24.60	21,780

No.	Structures	Designed Length km	Existing Width (Average) m	Expansion (L) m	Expansion (R) m	Total Width (m)	Affected Land (m^2)
4	Main Drain	7.4	59	0	0	59.00	0
5	Secondary Drain	2.2	21.3	0	0	21.30	0
Steung Krang Bat Scheme							
1	Feeder Canal	5.12	30	2.5	2.5	35.00	25,600
2	Folder	2.22	18.5	0	0	18.50	0
3	Main canal1	2	51.1	0	0	51.10	0
4	Main canal2	10.3	35	0	0	35.00	0
6	Main Drain	40.2	40	0	0	40.00	0
7	Secondary Drain	7.7	22	0	0	22.00	0

L = Left, R = Right, MC2 = Main Canal 2.

The land acquisition in the Krang Ponley sub-scheme is primarily driven by the construction of infrastructure components such as the Drainage Canal and Carrying Roads (MC2) in Krapeu Troum, Embankment and Main Canal in Yutasas, and Feeder Canal in Steung Krang Bat. These activities are projected to affect a total land area of 65,630 m2 distributed across different locations: Krapeu Trom (approximately 15,850 m2), Yutasas (approximately 24,180 m^2), and Steung Krang Bat (approximately 25,600 m2).

Consultation result addressed that they have concerns of land affected by construction near irrigation systems or the placement of construction projects, with some areas of land that people are using being close to harvest time and potentially rendered unusable but due to the project announcement the project implementation will be inform 6 months in advanced where this issue will be encounter. The affected households will feel not well due to land impact.

Consultation with the Provincial Department of Land Management, Urban Planning and Construction (PDoLMUPC) has revealed that all the land required for this sub-scheme falls under public ownership. Therefore, the land acquisition process is anticipated to proceed without impacting any private property.

- **Mitigation Measures**

- Since the affected households are only 77 (50 in Ou Ta Paong and 27 in Lum Hach, Abbreviated Land Resettlement Plan is required to be prepared.

- **Economic displacement**

The risk of economic displacement is linked to activities like the rehabilitation of irrigation canals and farm roads, and land acquisition. These activities can disrupt existing economic activities and displace households and businesses. The upgrading of irrigation systems may result in the removal of informal farming areas due to dredging, impacting those who rely on these areas for income. Additionally, during the construction phase, local businesses and transportation routes might face disruptions due to construction activities, affecting the community's daily life and economic activities.

The impact receptors for economic displacement include households in Ou Ta Paong and Lum Hach who have production land along the water bodies, informal land users, informal settlers, and nearby construction site business owners. The sources assess the impact of economic

displacement as moderate, recognizing that while it is a significant concern, the scale of the impact is still uncertain. The upgrading of irrigation systems may lead to the removal of informal farming areas, impacting the livelihoods of households who rely on these areas for food and income. The risk of economic displacement of each sub-scheme is reported here.

- **Ou Ta Paong**

The Ou Ta Paong Sub-scheme includes various infrastructure components such as Feeders, Main Canals, Creek Re-shaping, and Main Drainage. These structures span a total length of 91.7 km. A total of 41 households estimated as the shop owners and 1,012 households use the land along these infrastructure components while the other 10 households are estimated to be engaged for land acquiring for contractors' operation. The proper informing to these households is required to ensure that their production and economic activities will not be severely affected (Table 7.8).

Table 7.8: Affected and Vulnerable Households in Ou Ta Paong Sub-scheme

Structures	Number of households own the affected rice field	Vulnerable HHs	Total Households temporarily affected during construction	Land acquisition for contractors' operation
Feeder 1	346	48	3	
Feeder 2	174	24	4	
Main Canals	492	71	6	10
Creek Re-shape	-	6	28	
Main Drainage	-	-	-	
Total	**1,012**	**149**	**41**	**10**

HHs = Households.

The proper informing to these households is required to ensure that their production and economic activities will not be severely affected.

- **Lum Hach**

The Lum Hach Sub-scheme primarily focuses on Channel Improvements, Embankments, and Main Canals. These infrastructure components extend over a total length of 76.7 km and are situated along which 2,333 households are estimated to be the users of the farm land in the rights of way and a total of 35 households estimated as the shop owners while the other 5 households are estimated to be engaged for land acquiring for supporting contractors' operation (Table 7.9).

Table 7.9: Affected and Vulnerable Households in Lum Hach Sub-scheme

Structures	Number of households own the affected rice field	Vulnerable HHs	Total Households temporarily affected during construction	Land acquisition for contractors' operation
Channel Improvements	210	39	23	
Embankments	110	20	2	5
Main Canals	2,013	325	10	
Total	**2,333**	**384**	**35**	**5**

HHs = Households.

- **Krang Ponley**

The Krang Ponley Sub-scheme encompasses various infrastructure components, including Main Canals, Drainage Canals, Carrying Roads (MC2), Embankments, and Feeder Canals. These structures are distributed across different locations within the sub-scheme, such as Brambei Mom, Krapeu Trom, Yutasas, and Steung Krang Bat. Each location features varying lengths of these infrastructure components extend over a total length of 114.26 km. A total of 1,249 households are estimated to be the users of the land situated along these canals and infrastructure elements within the Krang Ponley Sub-scheme. Moreover 20 households across the four sub-schemes are estimated to be engaged in acquiring land for supporting the operations of the constructions (Table 7.10).

Table 7.10: Affected and Vulnerable Households in Krang Ponley Sub-scheme

Structures	Number of households own the affected rice field	Vulnerable HHs	Total Households temporarily affected during construction	Land acquisition for contractors' operation
Drainage Canal	378	11	-	
Carrying Roads (MC2)	53	2	-	
Embankment	58	1	-	20
Main canal	382	6	-	
Feeder Canal	379	23	-	
Total	**1,249**	**43**		**20**

HHs = Households, MC2 = Main Canal 2.

- **Mitigation Measures**

- The households who own the land along the rehabilitated canals which will be expanded at the public land should be properly informed prior to the construction to avoid their crops will be damaged at the time of construction.
- Although the acquired land is the public land, there are a need of a proper consultation and information to be conducted to inform and obtain agreement from the affected households.

7.4.2 Risks and Impacts at Construction Stage

7.4.2.1 *PROTECTING THE WORKFORC*

- **Child Labor**

The risk of child labor emerges due to the demand for unskilled labor in rural areas where the use of child labor is prevalent. Contractors and subcontractors involved in the project's construction activities may employ children or youth under the legal working age due to labor shortages or the drive to minimize costs. This practice exploits vulnerable children, depriving them of education and opportunities, and perpetuates a cycle of poverty.

The risk of child labor, particularly due to the influx of labor and pre-existing societal inequalities. Vulnerable groups, such as poor and near-poor households, female-headed households with dependents. Children from these groups are often driven to work due to economic hardship, and the increased demand for labor during project construction can exacerbate this situation. Migrant workers, often facing precarious working conditions and separated from support systems, are also highly vulnerable to exploitation, including child labor. The project's Gender Assessment identifies the lack of local wage jobs and increasing migration as key challenges that could further heighten the risk of child labor.

- **Mitigation Measures**

- Apply LMP for age check prior to engagement of labor with regular monitoring through proper screening and registering all workforce for the work
- To mitigate the risk of child labor, the project will implement strict measures to ensure compliance with national and international labor laws. Regular monitoring and inspections will be conducted to identify and address any instances of child labor.
- Additionally, awareness-raising campaigns will be implemented to educate communities about the harmful effects of child labor and the importance of sending children to school. The project will also collaborate with local authorities and NGOs to strengthen law enforcement and provide support services to vulnerable children and their families.

❖ **Forced Labor**

In the construction phase, the risk of forced labor is anticipated, especially for vulnerable individuals who may be coerced into working against their will. Forced labor can manifest in various ways, including:

- Economic Coercion: Individuals may be forced to work due to financial pressures, such as the need to repay debts or support their families.
- Exploitation of Young People: Young people, particularly those from impoverished backgrounds, may be forced to work to contribute to family income or due to a lack of educational opportunities.
- Debt Bondage: Workers may be trapped in a cycle of debt by unscrupulous employers who advance them loans with exploitative terms, effectively binding them to work until the debt is repaid.
- The rehabilitation of irrigation canals and farm roads creates a demand for local labor which can be exploited by those who seek to profit from forced labor.

- **Mitigation Measures**

- Strict Code of Conduct for workers with no tolerance for physical or verbal abuse of women or children
- The Project Owner and Sub-Contractors will collaborate with the relevant Government Agency to disseminate information to local communities. This information will include the Contractor's Code of Conduct and the minimum working age as mandated by national laws and international standards.
- The Ministry of Water Resources and Meteorology (MOWRAM) will provide information to local communities about the contractor's policies and responsibilities, including the Contractor's Code of Conduct and minimum working age.

7.4.2.2 *COMMUNITY HEALTH AND SAFETY*

❖ **Disease transmission**

During construction phase, the risk of disease transmission is anticipated due to the influx of construction workers, the potential for their lack of hygiene in living conditions, and their interaction with local community members. The influx of workers increases the likelihood of spreading and contracting communicable diseases, both among the workers themselves and

between workers and the local community. Workers may experience poor eating habits, homesickness, stress, and unhygiene living conditions which make them susceptible to diseases.

- **Mitigation Measures**

- Conduct public awareness raising activities (IEC) to ensure local people and contractors know about the risks of contracting and spreading communicable diseases such as COVID-19, HIV/AIDS, and water-borne diseases (e.g., amoebiasis, giardiasis, and toxoplasmosis. etc.
- In the event of a disease outbreak (e.g. COVID-19), provide immediate training/awareness raising to the risk groups.
- Conduct training to workers on communicable diseases prior to mobilization to construction sites.
- For water-borne diseases that arise due to polluted or contaminated water, mitigations measures may include:
  - Implement filtration, chlorination, or UV disinfection to ensure safe drinking water.
  - Build and maintain proper sewage systems and latrines to prevent water contamination.
  - Promote handwashing, safe food preparation, and proper sanitation practices in communities.
  - Control and properly dispose of waste to prevent water pollution.
  - Test water sources frequently for contamination and take corrective actions promptly.

❖ **Sexual Exploitation and Abuse, Sexual Harassment**

The risk of Sexual Exploitation and Abuse/ Sexual Harassment (SEA/SH) is envisaged due to several factors. The influx of workers estimated to be approximately 735 (Table 7.11), frequent visits by project personnel, and pre-existing SEA/SH issues in the area all contribute to this risk. This risk is primarily associated with the rehabilitation of irrigation canals and farm roads. The influx of labor includes not only construction workers but also individuals who provide logistical services, increasing the potential for exploitation. The sources highlight that approximately 430 workers are estimated to be involved, and their isolation and potential loneliness may increase their vulnerability to SEA/SH. However, the figure varies based on actual arrangement of the contraction companies.

Table 7.11: The estimated influx labor within the sub-schemes

Type of project workers	Characteristics of project workers	Duration of Labor Requirements	Ou Ta Paong	Lum Hach	Krang Ponley	Total Workers
Direct Workers						
PIU's member MoWRAM & NCDDS	Individual consultants (e.g., E&S Specialists, Design Engineers, Construction	From project preparation till project completion				20

	Supervision Engineers, etc.					
Contracted Worker						
Engaged by PIU						
Detailed Design Consultant	National specialists	From project preparation until project completion	15	10	10	35
Construction Supervision consultant	National specialists		15	5	5	25
Independent E&S Monitoring Consultant		One (1) month in very six (6) months	10	5	5	20
Technical Assistance			15	10	10	35
Engaged by construction contractors						
Skilled workers	National specialists	Durations vary, depending on construction stages & needs.	80	40	40	160
Unskilled workers	Local workers (around subproject location)		150	60	60	270
Primary Supply Workers						
Workers producing materials for core project activities	Mostly local workers	Construction stage	30	15	15	60
Other Stakeholders Working in Connection with Project						
Civil servants of MoWRAM, PDWRAM at provincial & district level	SEO safeguard team	The construction stage of the project.	18	8	8	34
Civil servants of NCDDS	Staff of NCDDS	From project preparation until project completion	15	8	8	31
Civil servants of MEF	Staff of GDR	From project preparation until project completion	10	5	5	20
Civil servants of relevant Ministries	Staff	The construction stage of the project.	15	5	5	25
Total						**735**

PIU = Project Implementation Units, MoWRAM = Ministry of Water Resources and Meteorology, E&S = Environmental and Social, NCDDS = National Committee for sub-National Democratic Development Secretariat, PDWRAM = Provincial Department of Water

Resources and Meteorology, SEO = Social and Environmental Officer, MEF = Ministry of Economy and Finance, GDR = General Department of Resettlement.

People prone to the risk of SEA/SH are anyone but the most vulnerable group are women and children.

- **Mitigation Measures**

- Contractors need to explicitly state zero tolerance for sexual harassment, exploitation, and abuse within the workplace.
- Require Code of Conduct (CoC) to be signed by all construction workers.
- For victims coming forward: referral to qualified SEA/SH service provider. The GRM will include a confidential channel for reporting SEA/SH.
- Strict Code of Conduct for workers with no tolerance for physical or verbal abuse of women or children
- Training to workers on maintaining good community relations, with emphasis on proper conduct around women and children.
- Training on SEA/SH and VAC for community members, in particular women and girls (may be done separately for men and women).
- Ensuring workers' sites are situated (at least 500m) from schools and/or other areas where children congregate.
- Children are prohibited from construction sites and worker's camp.
- Ensure access to grievance redress mechanisms for all project-affected persons, including both stakeholders and workers, to address Sexual Exploitation and Abuse, and Sexual Harassment. Support (in the form of training, awareness raising, etc.) to local law enforcement to act on community complaints regarding SEA/SH and VAC.
- Provision of information to local communities about the contractor's policies and responsibilities, including the Contractor's Code of Conduct and minimum working age.
- Provide counselling services for male and female workers, wives and other female partners of contractors' workers.
- Build partnerships with local health providers and SEA/SH service providers to conduct community awareness activities, and referrals.
- Implement public awareness campaigns to address sexual harassment in transport services and hubs, and training of police on women's security needs when using transport. This is included on GRM:

  - Accessibility for Workers
  - Multiple Reporting Channels
  - Confidentiality and Support
  - Contractor Accountability

❖ **Traffic safety & Security**

During construction phase, traffic safety is among the local concerns. The rehabilitation of irrigation canals and farm roads necessitates increased transportation of construction materials and equipment, potentially leading to road accidents, especially if safety measures are not strictly enforced. Construction activities can also attract unauthorized individuals seeking to steal or vandalize equipment and materials, further compromising security. The influx of construction workers into the project area may also contribute to a perceived or actual increase in crime rates, impacting the sense of safety among residents.

People subject to risk of traffic accident include anyone which may include project workers and local people who live near the construction sites or travel on transportation routes.

- **Mitigation Measures**

- Arrange security guard or engage local authority to guard the construction sites
- Conduct public awareness raising activities (IEC) to ensure local people and road user are aware of road safety regulations and risks and act accordingly while using road.
- Monitor and observe speed limit.

❖ **Community Health and diseases**

During the construction phase, community health and safety risks extend beyond disease transmission and include the potential for accidents and injuries related to construction activities. Rehabilitation work on canals and ponds poses drowning risks, especially for children and those unfamiliar with the altered water bodies. Trespassing in construction zones, which may contain storage areas, camps, lay down areas for construction materials, vehicles, and machinery, presents further risks of incidents and accidents for community members. Additionally, construction activities can lead to traffic and access disruptions that may cause safety issues for the community. The presence of construction workers and associated activities can also lead to potential conflicts with local communities. Construction sites also pose risks of accidents and exposure to construction related hazards.

- **Mitigation measures:**

- Establish clear and well-marked construction exclusion zones to prevent unauthorized access, especially to areas with open water, heavy machinery, and storage areas.
- Implement fencing and barriers to prevent trespassing and ensure community safety around construction areas.
- Provide warning signs in local languages to inform communities about the dangers and restricted access to construction areas.
- Install safety barriers around construction sites to minimize risks to the community and workers.
- Ensure proper storage of construction materials, with no materials left unsecured and scattered around the site.
- Develop and implement traffic management plans to minimize traffic and access disruptions and ensure pedestrian and vehicle safety.
- Conduct community awareness campaigns to educate the community about the potential risks and safety measures during construction.

- Establish and maintain a grievance mechanism to address community complaints and issues promptly.
- Implement safety measures around canals and ponds to prevent drowning incidents, such as installing safety barriers and providing warning signs in local languages.
- Create and enforce clear rules regarding access to canals and ponds during construction, and post those rules.
- Implement strict health and safety regulations at all construction sites to protect both workers and the nearby communities.
- Provide training to workers on safety protocols, including how to work safely around water, avoid accidents and minimize risks to the community.
- Ensure all workers are provided with necessary personal protective equipment (PPE) and enforce its use.

❖ **Personal Protective Equipment**

The construction or rehabilitation of irrigation canals and farm roads during the construction phase presents significant risks to worker safety and health due to the potential lack of personal protective equipment (PPE). These activities involve Canal Rehabilitation and Construction, Structure Construction and Rehabilitation, and Drainage Improvement, which expose workers to various hazards, such as Falling Debris, Sharp Objects, and Heavy Machinery.

The absence of proper PPE significantly increases the likelihood of injuries, such as cuts, fractures, or head trauma. Workers without respiratory protection may inhale dust, fumes, or toxic substances, potentially leading to respiratory problems. Similarly, inadequate eye and hearing protection can result in vision impairment or hearing loss due to flying particles and high noise levels. Furthermore, the lack of proper footwear and gloves increases the risk of slips, trips, and falls, and exposure to hazardous materials.

The impact receptors for risks associated with the lack of PPE are primarily construction workers but also include inspectors and visitors to the construction sites. The sources assess the risk associated with inadequate PPE as high, particularly in rural construction settings where cost-cutting measures might compromise worker safety. The sources emphasize that the absence of PPE not only jeopardizes individual safety but also reduces productivity and increases liability risks for the project.

▪ **Mitigation Measures**

- Continue and active use of PPE at all time of construction.
- Identification and provision of appropriate PPE that offers adequate protection to the worker, co-workers, and occasional visitors, without incurring unnecessary inconvenience to the individual
- Proper maintenance of PPE, including cleaning when dirty and replacement when damaged or worn out.
- Proper use of PPE should be part of the recurrent training programs for employees.

❖ **Working conditions and Management of Worker**

The construction or rehabilitation of irrigation canals and farm roads during the construction phase of the project carries a risk of underpaid pay and unequal treatment for local workers hired by project contractors. This risk is exacerbated by the lack of written contracts for unskilled workers, particularly those recruited locally. Without a formal contract, these workers are vulnerable to being underpaid compared to the demands and scope of their work.

The sources highlight the potential for underpayment to occur based on gender and temporary work status, further marginalizing already vulnerable groups. The absence of clear contractual terms also increases the risk of late wage payments or even non-payment, jeopardizing the workers' livelihoods and potentially delaying the project's progress.

The impact receptors for underpaid pay and unequal treatment are primarily unskilled workers (mostly local people) and construction workers, particularly women. The sources assess the risk associated with these issues as moderate. The sources underscore that gender discrimination in the construction workforce, coupled with the presence of unregistered labor and weak enforcement of labor laws, can lead to exploitation and unfair treatment of workers, especially regarding payments. While the widespread use of social media and access to support systems might mitigate the scale of these issues, the risk remains significant.

- **Mitigation Measures**

- Implement a grievance mechanism for workers where workers can report issues related to underpayment or unequal treatment without fear of retaliation.
- Advise companies to provide equal opportunities for employment and promotions to all workers, regardless of gender, ethnicity, or background, to avoid discrimination.
- Regularly monitor and audit payroll and employment practices to ensure compliance with labor regulations and address any disparities.
- Offer training and capacity-building programs for all workers to enhance their skills and qualify them for higher-paying roles.
- Ensure that subcontractors and suppliers also adhere to fair wage and equal treatment policies.
- Set up worker committees or unions to allow collective bargaining and ensure workers have a voice in addressing wage and treatment issues.
- Provide accessible information to workers about their rights, entitlements, and the proper channels to address grievances through the establishment of the GRM for workers. This includes training on topics such as:
  - Environmental and Social Safeguards
  - Gender Awareness and the Gender Action Plan
  - Sexual Exploitation, Abuse, and Harassment (SEA/SH)
- Labor Rights and the Workers' Code of Conduct Regularly engage with labor rights organizations or third-party auditors to evaluate labor conditions and make improvements where necessary.

7.4.2.3 *CULTURAL HERITAGE*

The potential risk of the project during the construction phase to cultural heritage sites located within the project area. While the initial assessments indicate that the identified cultural sites in Ou Ta Paong and Lum Hach are minimally associated with the construction areas, there is

still a risk that smaller, undocumented sacred places within the command areas could be inadvertently damaged or destroyed during construction.

The sources highlight the case of Stung Krang Bat, where numerous historical and cultural heritage locations exist. Even though construction is expected to focus on existing canals, there is a possibility that construction activities might unearth archaeological artifacts buried deep in the soil. The ancient city of Longvek, once situated in this area, experienced many wars, leading to the possibility that treasures or artifacts of historical significance were hidden underground.

The impact receptors for cultural heritage risks are primarily underground cultural sites, and the sources assess the risk as minor. However, the sources emphasize that the detailed design plans have not yet been released or discussed with the community, leaving a degree of uncertainty about the potential impact on these sites. The lack of detailed information and community consultation underscores the need for careful consideration and mitigation measures to ensure the protection of cultural heritage during the construction phase.

- **Mitigation Measures**

- Conduct archaeological surveys before construction in culturally sensitive areas.
- Implement Find Chance Procedure

7.4.2.4 *CROSS-CUTTING*

- **Loss access to land and other assets**

In the construction phase, activities like upgrading existing reservoirs, constructing new dams, and implementing river training measures, carries a moderate risk of temporarily or permanently restricting access to natural resources for local communities. This restriction will likely affect farmers and fishers along the main streams of Ou Ta Paong and Lum Hach, as well as feeder canals in Ou Ta Paong. Additionally, the influx of construction workers and the establishment of temporary facilities like worker camps could strain local resources, including water sources and forest products, potentially leading to overexploitation and environmental degradation.

- **Mitigation Measures**

- The project will prioritize avoiding physical resettlement and minimizing land acquisition. Design adjustments will be made to avoid or reduce land requirements, especially on private land. Public land will be prioritized for any necessary acquisition.
- Where land acquisition is unavoidable, the project will employ a negotiated settlement process with affected households. This process, guided by the RGC's Standard Operating Procedures on Land Acquisition and Involuntary Resettlement (SOP-LAR), aims to ensure that affected households receive fair and adequate compensation for their losses and maintain or improve their income and livelihood status.
- All individuals with assets within the Corridor of Impact (COI) before the Cut-Off-Date (COD) will be eligible for compensation, regardless of their legal status. Compensation will be provided for various losses, including land, structures, crops, trees, and income-generating activities.

- Recognizing the potential disruption of income streams during relocation or construction, the project will provide transitional allowances to affected households. These allowances will help cover living expenses and bridge the gap until they can resume their livelihoods.
- A multi-tiered GRM will be established to address grievances from any project-affected person. The GRM will operate based on the principles of the Green Climate Fund (GCF) and be accessible at no cost to the complainant.

❖ **Loss access to natural resources**

The construction phase of the irrigation project, specifically activities like upgrading existing reservoirs, constructing new dams, and implementing river training measures, carries a moderate risk of temporarily or permanently restricting access to natural resources for local communities. This restriction will likely affect farmers and fishers along the main streams of Ou Ta Paong and Lum Hach, as well as feeder canals in Ou Ta Paong. Additionally, the influx of construction workers and the establishment of temporary facilities like worker camps could strain local resources, including water sources and forest products, potentially leading to overexploitation and environmental degradation.

▪ **Mitigation Measures**

- Implement efficient water management practices during construction and operation to prevent over-extraction of water resources from reservoirs and rivers and ensure equitable distribution for downstream communities and ecosystems.
- Use environmentally friendly construction materials and techniques to reduce the risk of pollution. Properly manage construction chemicals, fuels, and waste to prevent water pollution and contamination of natural resources. Prepare and implement a waste management plan to handle waste generated from construction activities and worker camps.
- Optimize construction material use and recycle, when possible, to minimize the extraction of new resources. Implement energy-efficient construction practices and use renewable energy sources where possible.
- Maintain ongoing communication with affected communities, including farmers, fishers, and downstream communities, to address concerns about natural resource access. Provide information and education to construction workers about responsible use of local resources and respect for community access rights. This suggestion is informed by the sources but is not directly stated in them.
- Ensure the GRM is accessible to all community members to address complaints related to natural resource access.

❖ **Social inequality**

The engagement and consultation processes during the design and construction phases of the irrigation project present a moderate risk of social inequality. The sources indicate that while landowners in the project areas are mainly from local communities, suggesting relatively equal access to the consultation process, vulnerable groups without farmland may have limited opportunities to participate and benefit from the rehabilitated irrigation system.

This potential for exclusion raises concerns about the fair distribution of project benefits. While the overall impact of social inequality during the construction phase is assessed as moderate, the sources acknowledge the need for targeted efforts to ensure that vulnerable groups are adequately consulted and included in the project's development.

The total number of households and vulnerable individuals in the sub-scheme was reported at 6,863 (25.4%), of which 3,523 are headed by women, 2,048 are classified as poor families (9%), 986 are disabled (1%), 151 are elderly (0.2%), and 155 are living without parents (0.2%). These individuals were thought to have little direct access to the project's benefits. Therefore, the local government should provide for these individuals and assign them to construction projects if they are capable. Project implementation should also take into account avoiding areas where vulnerable homes or land are fully impacted. In line with the project component, this move might enable them to continue receiving water or other benefits from the irrigation system.

- **Mitigation Measures**

- Conduct participatory planning and regular consultations with local communities, particularly marginalized groups (e.g., women, smallholder farmers, indigenous communities).
- Prioritize hiring local labor, with special provisions for disadvantaged groups (e.g., youth, women, minorities) in both skilled and unskilled positions.
- Develop and enforce water allocation plans that ensure fair access to water resources for all users, including small-scale and subsistence farmers, during and after construction.
- Implement fair and transparent compensation or resettlement plans for those displaced or affected by construction activities, especially vulnerable households.
- Establish accessible and responsive grievance redress mechanisms, ensuring all community members can raise concerns or complaints during construction.
- Conduct regular social impact assessments, with a focus on identifying inequality trends, and adjust project strategies to mitigate negative effects.
- Provide support and training for affected communities to diversify their livelihoods, especially for those whose livelihoods may be disrupted by construction (e.g., farmers, traders).
- Ensure transparency in the contracting process, including the selection of subcontractors and suppliers, with opportunities for local businesses, especially those run by marginalized groups.

- **Elite capture**

The risk of elite capture is anticipated given the fact these local elite could potentially influence the project to provide them project benefits. While the majority of landowners within the command areas are from the local community, which reduces the likelihood of large-scale land grabbing by powerful individuals or groups, the sources acknowledge the potential for the wealthy to use their influence, connections, or resources to encroach upon protected areas for personal gain. The risk of elite capture is assessed as moderate.

- **Mitigation Measures**

- Consultation will be conducted farmers in potential command area, focusing on vulnerable/disadvantaged groups
- Alternative livelihoods for vulnerable group are identified based on their needs vis-à-vis project's investment eligibility
- Conduct consultation at community level (in the command area) to achieve a consensus on how water needs are balanced between different groups in one command area.
- During subproject design, water availability, storage capacity, and water needs of upstream and downstream population are calculated to inform design, and water use coordination during project operation.
- Water user groups should be established for upstream and downstream population and should be coordinated by a higher-level committee/group to negotiate and optimize water coordination
- Guidelines/Manual should be developed to provide guideline for upstream and downstream communities at subprojects to meet, discuss, and achieve consensus on how water is distributed for equal use between upstream and downstream population

❖ **Gender inequality**

The risk of gender inequality due to limited access for women to training, resources, and decision-making processes related to irrigation and agriculture. This risk stems from pre-existing gender inequalities in Cambodia, where women often face barriers in accessing resources, technology, and leadership roles. The impact receptors for this risk are women farmers and laborers, who may be excluded from the full benefits of the project.

A gender analysis was conducted. Most income from project target group are generated from rice production, followed by animal husbandry, including chicken, cow, duck, and buffalo. Home-based fish farming and vegetable are rare: 1.7% (n=11) and 0.9% (n=6), respectively. Five key barriers are identified as current gender gap and potential constraint to promoting new technology adoption for improved adaptation. These include: 1) Traditional gender norms, 2) Burden of household chores, 3) Limited education and skills, 4) Lack of local wage jobs and increasing migration. Gender norms shape the gender division of labour in household chores, farming and income generation. Men generally take care of heavy works (physically heavy and poisonous) in farming and participate in social activities. Women bear the primary responsibility for child bearing and domestic works. Yet, they also play an important role in farming including home gardening, animal husbandry and rice production alongside men. Many women take care of rice during cropping season and participate in harvesting in case they do not have access to machinery. This is particularly the case for women headed households who face chronic lack of labour and more limited access to machinery and equipment. From project survey (n=630), Overall, it is estimated that male workers spend, on average, 59.4% of their time for farming vis-à-vis female counterpart who spend 40.5% of their time. However, most women participate jointly with their husband in decision making related to finance and play a dominant role (over their husband) when it comes to daily home expense and child care. However, since rice is mainly considered to be a male crop, this can have negative implication to promoting sustainable adoption of new rice farming techniques for rice farming households for an estimated 40,000 hectare across six irrigation schemes in four project provinces. Indeed, men typically dominate decision making in rice farming such as

selection of rice variety, use of pesticide and fertilizers as well as on-farm irrigation management. For instance, women tend to be under-represented in FWAC where key decisions on water management and irrigation use are made. This also means that extension activities targeting rice production are typically focused on male farmers.

- **Mitigation Measures**

- Implement the Gender Action Plan and measures to promote women beneficiaries' improved participation in project planning and implementation, and their economic empowerment.
- Ensure women have access to training, resources, and decision-making processes related to irrigation and agriculture. This includes providing training in local languages at times and locations convenient for women. Childcare provisions can facilitate women's attendance.
- Set targets for women's participation in all project activities.
- Raise awareness of the importance of sharing household chores and farming workloads. This can give women more time to learn new skills, attend training, and participate in project activities.
- Promote women's access to skills and business development training centered around project target value chains for commodities such as rice, poultry, vegetables, and fish.
- Encourage the use of labor-saving technologies that can help reduce women's workloads in farming and household activities.
- Support women's involvement in off-farm activities, such as processing and value addition as well as investments in green products and women-led green enterprises.

7.4.3 Risks and Impacts at Operation Stage

7.4.3.1 *COMMUNITY HEALTH AND SAFETY*

The potential for water use conflicts during the operation phase, particularly between upstream and downstream users, and recognizes the risk of accidental drowning, especially among children. The introduction of irrigation infrastructure and increased agricultural activity may alter existing water allocation patterns, leading to disputes between upstream and downstream communities. Upstream users may prioritize their own irrigation needs, potentially reducing water availability downstream, affecting livelihoods and ecosystems. For example, the Anlong Chrey reservoir, with a limited capacity of 30 Mm^3, is insufficient to meet the dry season irrigation demands of all four proposed irrigation sub-schemes in the Krang Ponley sub-project. This situation could exacerbate competition for water resources. The construction of new canals and reservoirs introduces open water bodies into the landscape, increasing the risk of accidental drowning, particularly for children.

- **Mitigation Measures:**

- The project will promote IWRM principles to ensure the equitable and sustainable allocation of water resources. This involves considering the needs of all stakeholders, including upstream and downstream communities, as well as environmental flow requirements for maintaining healthy ecosystems.

- Establishing a system for monitoring water use and enforcing water allocation regulations will help prevent over-extraction and ensure a reliable water supply for all users. This may involve installing flow meters, conducting regular water audits, and implementing penalties for non-compliance.
- The project will strengthen the capacity of FWUCs to manage water resources at the local level. This includes training on water allocation, conflict resolution, and operation and maintenance of irrigation infrastructure. Effective FWUCs can play a crucial role in mediating disputes and ensuring fair water distribution within their communities.
- Raising awareness about water safety and the risks associated with open water bodies, especially among children, is essential. Educational campaigns, signage, and community outreach programs can help promote responsible behavior and prevent accidents. This information could be included in the training programs that will be provided to farmers and communities.
- The project will consider incorporating safety features into the design of irrigation infrastructure. This may include fencing around canals and reservoirs, installing safety ladders, and providing designated swimming areas away from irrigation structures.

7.4.3.2 *CROSS-CUTTING*

❖ **Gender inequality**

The sources emphasize that women are less resilient to climate change than men and face unique vulnerabilities in terms of income, housing, and access to information and support systems. Socially defined gender roles can also hinder the adoption of climate-smart technologies among women. As a result, women may experience unequal access to water resources, limited participation in Farmer Water User Communities (FWUCs), and a disproportionate burden of negative impacts on their livelihoods.

Women-led households made up 15% of all sub-schemes, which is seen as a significant percentage. There is still gender disparity, which makes it difficult for them to participate in and profit from the project. Men often overestimate, which diverts women's attention from the involvement. Increased gender-based trainings for men and increased support for all vulnerable groups should be proposed by the local government and project implementer. There are 6,863 households and vulnerable people in the sub-scheme overall (25.4%), 2048 poor families (9%), 986 disabled people (1%), 151 elderly people (0.2%), and 155 parentless people (0.2%).

▪ **Mitigation Measures**

- The project should actively encourage women's participation in the formation of FWUCs, empowering them through critical decision-making roles and equipping them with the necessary skills and resources to amplify their voices.
- The project should ensure that women have equal access to training programs and resources, such as land, credit, and technology.
- The project should monitor gender equality indicators and should make adjustments as needed to ensure that women are benefiting from the project.

❖ **Social inequality**

In this phase, the concerning the competition for water resources among different user groups (farmers, communities, industries) and the potential displacement or restricted access to land due to irrigation infrastructure expansion, presents a minor risk of social inequality. Although the project aims to engage and consult with communities during the design and construction phases, vulnerable groups may still face limited access to irrigation water during the operation stage. This risk is especially relevant for farming communities, indigenous populations (if present), landless or land-poor households, and other vulnerable groups.

The vulnerable groups without farmland might have limited opportunities to benefit from the rehabilitated irrigation system. The impact of this social inequality is considered minor due to the relatively small proportion of poor people within the command area. However, it is important to note that the limited access to resources and capacity could hinder the full potential of efforts to support these vulnerable groups.

Approximately one-fourth (25.4%) of the vulnerable groups were included in the total sub-scheme. These groups often face challenges in accessing and participating as project beneficiaries due to limited land ownership, insufficient water-related equipment, and a lack of capital for agricultural production. To address this, local authorities and project managers should provide tailored support based on their needs and actively encourage their involvement in the project to improve their livelihoods.

- **Mitigation Measures**

- Ensure Equitable Water Access: Mechanisms should be in place to support vulnerable and marginalized communities in accessing water resources.
- FWUCs will manage the irrigation systems and ensure sustainability through fee collection. The project will invest in establishing and training FWUCs, emphasizing inclusivity and capacity building for vulnerable groups.
- Implement a Simplified Integrated Pest Management (IPM) Plan.

❖ **Elite capture**

The operation of the irrigation system during the operation phase creates a minor risk of elite capture due to the potential for unequal distribution of project benefits. This could result in powerful individuals or groups gaining a disproportionate share of the benefits at the expense of the intended beneficiaries. This risk is linked to the engagement and consultations conducted during the design and construction phases, as those processes might not fully prevent elite capture during the operational phase.

The main impact receptors are smallholder farmers, marginalized communities, and other vulnerable groups. Despite the project's efforts to ensure equitable access to resources, the sources highlight that wealthy individuals or groups could potentially leverage their power, connections, and resources to secure a larger share of water resources or control over irrigation infrastructure. This situation could further exacerbate existing social disparities and undermine the project's goal of improving livelihoods for all community members. The sources assess the risk of elite capture during the operation phase as minor. This assessment considers factors like the predominance of local landowners within the command areas and the current high land prices, which make large-scale land grabbing economically unfeasible.

- **Mitigation Measures**

- Transparent and accountable FWUC management: Clear guidelines, diverse representation, and grievance redress mechanisms are essential to prevent manipulation and ensure equitable water distribution.
- Regular monitoring and evaluation: Continuous monitoring of project impact, especially on vulnerable groups, can identify and address elite capture.
- Strengthened land tenure security: Clarifying land rights can protect smallholder farmers and marginalized communities from land grabbing.
- Community engagement: Active community participation, especially from vulnerable groups, empowers them and ensures their needs are met.

CHAPTER 8 – RAPID CUMULATIVE IMPACT ASSESSMENT

8.1 INTRODUCTION

Cumulative impacts are those that result from the incremental impact of the project when added to other existing, planned and reasonably predictable future projects and developments. Under CAISAR, the implementation of infrastructure investment (Component 2) and non-infrastructure investments to support upscaled crop production (Component 1) under the six (6) sub–schemes are envisaged to result in cumulative impacts over a geographical area that is larger than the identified area of influence, particularly for Ou Ta Paong where other similar project(s) are being planned and there are a number of high biodiversity areas located to the downstream of these projects.

As part of the ESCIA exercise, a rapid assessment will be conducted to identify potential cumulative impacts and the preliminary high-level assessment of how the combined effects of the Project with other projects and activities, and natural environmental drivers, could affect valued environmental and social components (VECs) in the Project's area. As part of the ESCIA prepared for the sub–scheme, the assessment will focus on potential cumulative impacts associated with the sub–scheme, and for both intra-sub–schemes (where VEC are affected by multiple aspects of the sub–scheme) and inter-sub–scheme (where effects are enhanced due to other reasonably foreseeable activities/sub–schemes as well as from past and existing activities. Additionally, the RCIA is to assess the significance of the identified cumulative risks and impacts, evaluate the Project's contribution to these impacts and suggest management measures that could be implemented to prevent unacceptable VEC condition and for which the Project could contribute. The assessment will be conducted within the sub–scheme's area of influence and will be ex-ante[62] by nature.

The identification and management of cumulative impacts will be limited to the effects that are generally recognized as important based on a) scientific concerns and/or b) concerns of communities, including both adversely affected people and project's beneficiary community. In addition, cumulative impacts from other existing or planned projects in the neighboring projects will also be identified.

8.2 STEPS FOR CONDUCTING RCIA (PROJECT LEVEL)

The following six (6) steps, which are proposed by IFC, are adopted for this rapid Cumulative Impact Assessment:

Step 1: Scoping: Identification of Valued Environmental Components (VECs) and Spatial and Temporal Boundaries

[62] Ex-ante effect is assessed based on either modeling of original data collected under the Project, or on secondary data sources that are plausible to make an informed judgement.

The objectives of this step are:

- Identify VEC to include in the RCIA
- Identify the spatial boundary of the RCIA, and
- Identify the temporal boundary of the RCIA

During this step, the following key questions will be answered:

- Whose involvement is key?
- Which VEC resources, ecosystems, or human values are affected?
- What is the temporal boundary of the project?
- What are the spatial boundaries of identified VECs?
- Are there concerns from existing cumulative impacts?

Step 2: Identification of other Projects, Activities and External Stressors

The objectives of this step include:

- Identify other existing and reasonably predictable projects and human activities that do/would affect the VECs to be included in the RCIA.
- Identify natural environmental drivers that also impact the condition VECs

The following key questions would be answered during this step:

- Are there any other existing or planned activities affecting the same VEC?
- Are there any natural forces and/or phenomena affecting the same VEC?

Step 3: Establish Baseline Conditions of VECs

Objectives of this step include:

- Collect available information on the impacts of the other activities and natural drivers on the condition of the VECs.
- Collect available information on trends in VEC condition.
- Collect available information on regional thresholds for VEC condition

Questions to be answered in this step include:

- What is the existing condition of the VEC?
- What are the indicators used to assess such condition?
- What additional data are needed?
- Who may already have this information?

Step 4: Assess Cumulative Impacts on VECs

Objectives:

- Establish indicators for expression of VEC condition.
- Estimate the “future baseline” for condition of the VECs - i.e., the condition of VECs as affected by the other projects, human activities, and natural drivers
- Estimate the project impact on VEC condition. This estimation is done with the effects of planned project mitigation included
- Estimate the cumulative impact on VECs—the total impact on the VECs when the impacts of the development are combined with the future baseline

Questions to answer:

- What are the key potential impacts and risks that could affect the long-term sustainability and/ or viability of each VEC?
- Are there known or predictable cause-effect relationships?
- Can these impacts and risks interact with each other?

Step 5: Assess Significance of Anticipated Cumulative Impacts

Objectives:

- Assess the significance of the foreseen cumulative impacts on the VEC

Questions to answer:

- Do these impacts affect the sustainability and/or viability of the resource and/or VEC?
- What are the consequences and/or trade-offs of taking the action versus no action?

Step 6: Design and Implement Cumulative Impact Management Measures

Objectives:

- Identify, when necessary, additional project mitigation to reduce an estimated unacceptable cumulative impact on a VEC to an acceptable level.
- If necessary, identify the potential, or need for, additional mitigation of other existing or reasonably predictable future projects.
- Identify the potential for other regional strategies that could maintain VECs at acceptable conditions.
- Undertake best efforts to engage, enhance, and contribute to a multistakeholder collaborative approach for the implementation of management actions that are beyond the capacity of the project proponent.

Questions to answer:

- How can cumulative impacts be avoided, minimized, and/or mitigated?
- How can the effectiveness of proposed management measures be assessed?
- What are the triggers for specific adaptive management decisions?

8.3 SOURCES OF INFORMATION AND LIMITATIONS OF RCIA

Rapid Cumulative Impact Assessments (RCIA) rely on diverse sources of information to evaluate combined effects of multiple activities on the environment and society. Key sources include existing Environmental and Social Impact Assessments (ESIAs), scientific research, and government reports, which provide baseline data and insights on potential impacts. Geospatial data, such GIS maps, along with climate data, help analyze land use changes, and vegetation. Stakeholder input through consultations and interviews enriches the understanding of local contexts, while monitoring data from ongoing projects and biodiversity studies contribute to assessing ecological and social systems.

The limitations of the RCIA include unavailable studies being conducted at specific sites as well as relevant information being publicly disclosed. In addition, some information is

incomplete or outdated information. Moreover, stakeholder engagement may be limited or biased, and institutional or regulatory frameworks often lack clear guidance on cumulative assessments, reducing effectiveness.

8.4 RESULTS OF THE RAPID CIA

The nature of this proposed RCIA will be *ex-ante* and will be based on 1) scientific concerns, 2) concerns of affected communities within the sub-scheme's area of influence, or beyond the downstream, 3) consultation with concerned project stakeholders and interested stakeholders. Based on stakeholder consultation, a list of VEC is proposed to define the scope of the proposed RCIA (See next section).

8.4.1 Identification of Valued Environmental and Social Components (VECs) (Step 1)

Based on the ESCIA, stakeholder consultations, and scientific evidence, the following VECs are identified for activities proposed under project component 1 and component 2, as well as for all other existing, planned, or reasonably defined developments that may also affect these VECs (Table 8.1).

Table 8.1: Identification of valued environmental and social components (VECs) under the RCIA

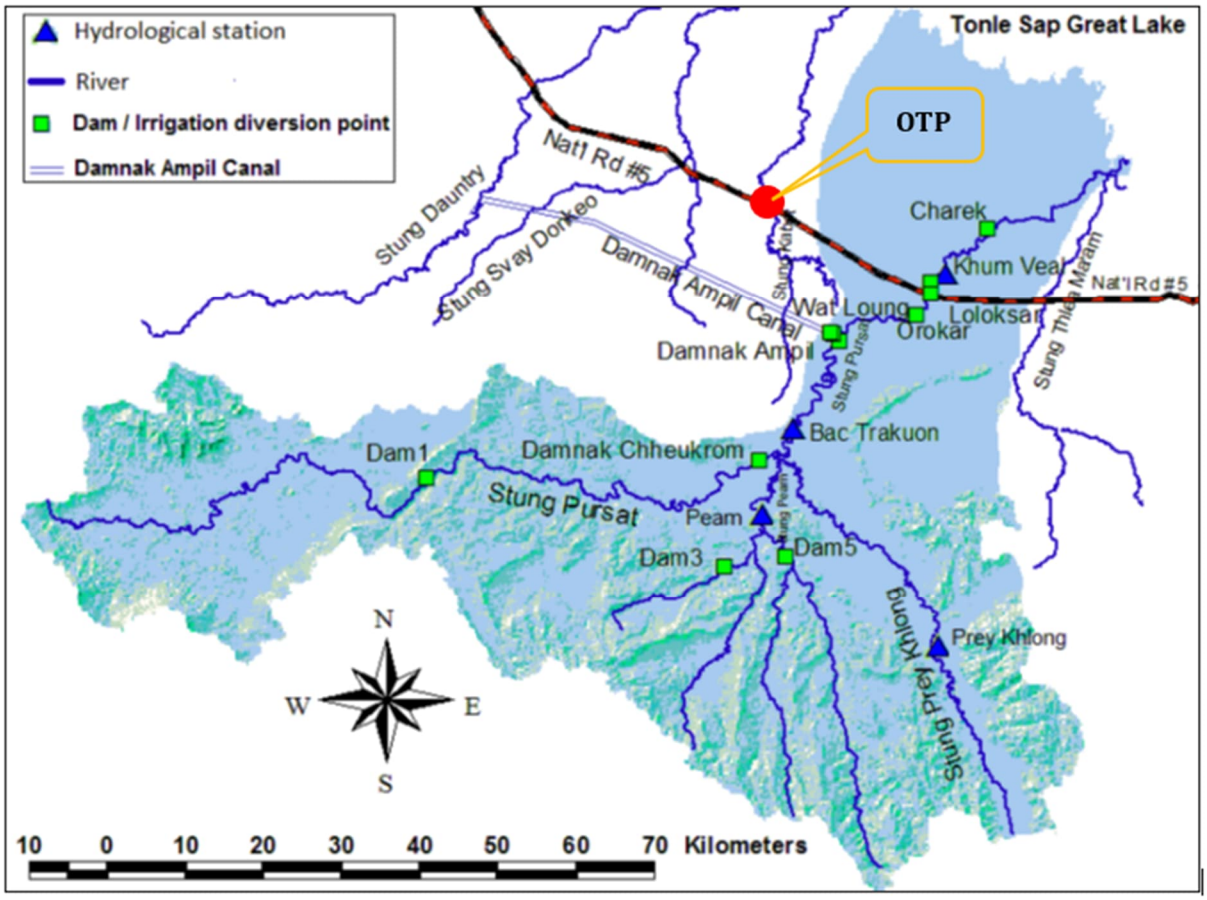
VECs	**Criteria Rating**	**Criteria Rating Rationale**
Water Pollution	Nature	The project has the potential to contribute to water pollution in various ways, including runoff from agricultural fields, utilization of pesticides and fertilizers, construction activities, and industrial discharge.
	Duration: Long term	The impacts of water pollution can persist over extended periods, particularly if not adequately mitigated.
	Livelihood:	Water pollution directly threatens the livelihoods of communities reliant on fishing and clean water resources for domestic use and agriculture.
	Spatial scale:	Water pollution can spread beyond the immediate project area, affecting downstream water quality and potentially impacting ecosystems and communities in neighboring regions.
	Magnitude: Medium	The magnitude of potential water pollution is significant, considering the project's scale, the vulnerability of aquatic ecosystems, and the potential for cumulative impacts from existing pollution sources.
	Receptors	**Ecosystems:** Aquatic life, riparian vegetation, water-dependent species.

VECs	Criteria Rating	Criteria Rating Rationale
		Human communities: Communities reliant on clean water for drinking, sanitation, and irrigation.
	Involved Stakeholders	PMU, Line Ministries (MoWRAM, MEF, Ministry of Environment), Local Authorities, NGOs focusing on water resources and environmental protection, CBOs (FWUCs), Community People, particularly those directly dependent on water resources.
Soil Pollution	Nature	The project can contribute to soil pollution through the use of fertilizers and pesticides, construction activities, and improper waste disposal.
	Duration: Long term	Soil contamination can persist for many years, impacting soil fertility and potentially posing risks to human health and ecosystems.
	Livelihood: Medium	Soil pollution directly affects agricultural productivity and can reduce crop yields, impacting the livelihoods of farmers in the project area.
	Spatial scale:	The impacts of soil pollution are primarily localized to the project area, affecting agricultural land and potentially nearby ecosystems.
	Magnitude: Medium	While the project aims to promote sustainable agricultural practices, the potential for soil pollution from intensified agriculture and construction activities warrants a medium magnitude rating.
	Receptors	**Soil organisms:** Microorganisms, invertebrates, and plants essential for soil health and fertility. **Crops:** Agricultural productivity and food security. **Human health:** Potential risks from contaminated food and water.
	Involved Stakeholders	PMU, Line Ministries (MAFF, Ministry of Environment), Local Authorities, Agricultural Extension Services, NGOs working on sustainable agriculture, CBOs (Farmer Organizations), Community People, particularly farmers and those involved in agricultural production.
Loss of biodiversity and ecosystem services	Nature	The project has the potential to impact biodiversity and ecosystem services through habitat loss, fragmentation, water pollution, and altered flow regimes. For the case of Lum Hach, there will be the division of Toul Samroang community forestry where the irrigation will be broken the protected area into two parts. The total protected land area that will be acquired was estimated at 36,182 m^2, giving the

VECs	Criteria Rating	Criteria Rating Rationale
		length of the main canal across the protected area at 1.49 km and the width the canal at 24.3 meters.
	Duration: Long term	Biodiversity loss and ecosystem degradation can have long-lasting and potentially irreversible impacts on ecological integrity and the provision of ecosystem services.
	Livelihood: Medium	Communities reliant on natural resources, particularly fishing and forest products, will be affected by biodiversity loss and changes in ecosystem services.
	Spatial scale: Local	The impacts on biodiversity are primarily localized to the project area and surrounding ecosystems.
	Magnitude: Medium	Considering the presence of critical ecosystems like the Tonle Sap Lake and its floodplain, the potential for habitat loss and degradation warrants a medium magnitude rating.
	Receptors	**Species:** Plants, animals, fish, and other organisms reliant on the affected ecosystems. **Habitats:** Community Forests in Lum Hach, wetlands, rivers, and other areas providing essential habitat for biodiversity. **Ecosystem services:** Water purification, flood regulation, pollination, and other services essential for human well-being.
	Involved Stakeholders	PMU, Line Ministries (Ministry of Environment, MAFF, MoWRAM), Local Authorities, NGOs focused on biodiversity conservation, Research Institutions, Community People, particularly those dependent on natural resources and ecosystem services.

VECs = Valued Environmental and Social Components, PMU = Project Management Unit, MoWRAM = Ministry of Water Resources and Meteorology, MEF = Ministry of Economy and Finance, NGOs = Non-governmental Organizations, CBOs = Community-Based Organizations, FWUCs = Farmer Water User Communities, MAFF = Ministry of Agriculture, Forestry and Fisheries.

8.4.2 Identification of other Projects, Activities and External Stressors (Step 2)



The projects which are considered to accumulatively create the combined impacts with CAISAR project are mainly the irrigation projects which can be the previous, the current and the planned one. The identified projects nearby each sub-scheme are described below:

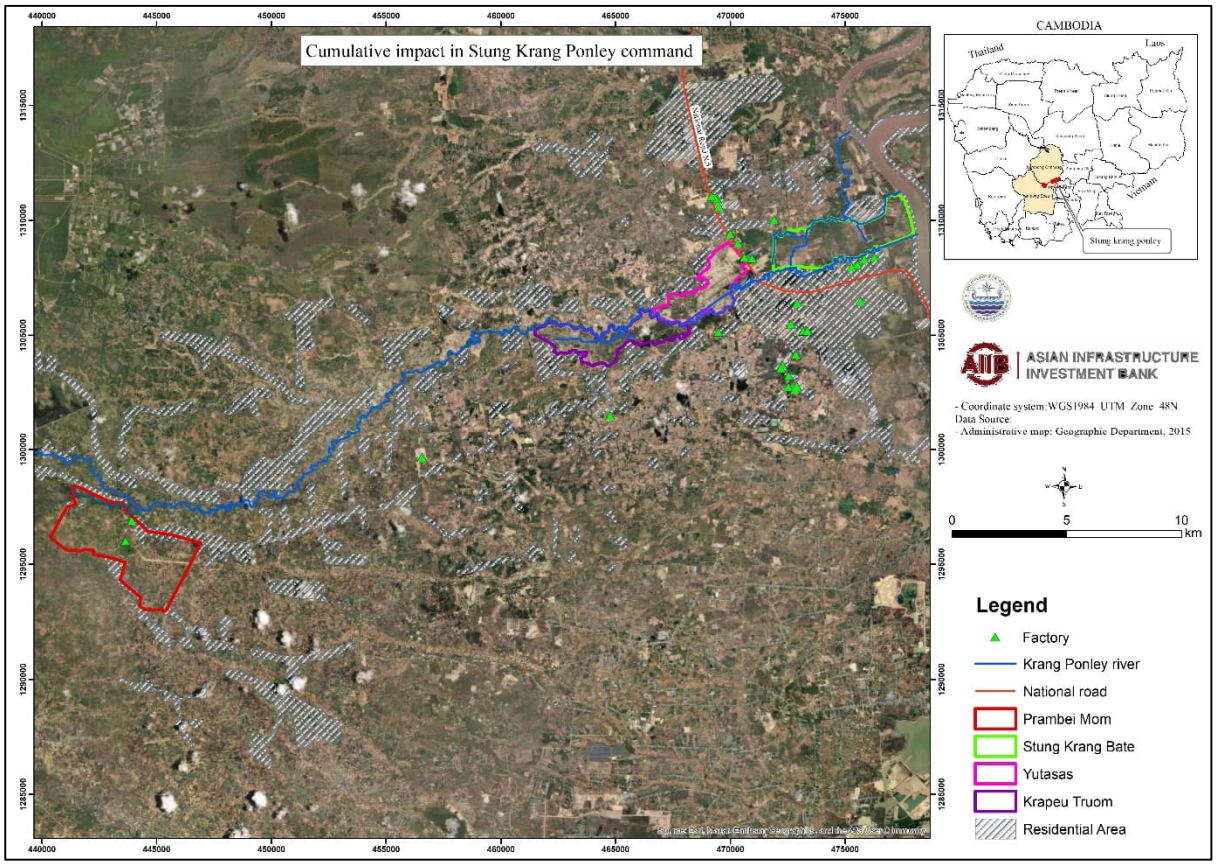
8.4.2.1 Ou Ta Paong

Pursat province has several significant hydropower and irrigation projects, including the Stung Pursat Hydropower I Dam, Damnak Chheukrom Irrigation Project, Damnak Chheu Krom Dam,

and Domnak Ampil Canal. These projects are currently under construction or have already been operational, playing an important role in energy supply and the province's agricultural development. However, all these projects are located at a considerable distance from the Ou Ta Poang command area, with the exception of the Domnak Ampil canal, which is located upstream and approximately 5 kilometres away from Ou Ta Poang. The commuters along the national roads are part of the air and dust contributors as well which may reduce air quality. On the other hand, the OTP is mostly covered by paddy fields and residential areas.

Figure 8.1: Location of Water resources development in the Pursat river (JICA, 2013)

8.4.2.2 Lum Hach



In the Lum Hach irrigation scheme, apart from the existing and rehabilitated irrigation systems, there are no other projects. Additionally, the Lum Hach area is located west and near the Tonle Sap Lake, which is identified as covered by paddy fields and residential areas. Therefore, beside the construction activities in the Lum Hach scheme, there are agriculture activities that are going to have an impact on the environment, community health, and GHG emissions as well.

8.4.2.3 Krang Ponley

The Stung Krang Ponley sub-scheme, identified by a mix of residential areas, paddy fields, and factories, faces a complex interplay of environmental impacts from these diverse activities. Factory operations often contribute to air and water pollution through emissions and discharges, while agricultural activities can lead to water pollution from pesticide runoff and

greenhouse gas emissions. In addition, residential areas can generate waste and contribute to noise pollution.

Figure 8.2: Cumulative impact in Stung Krang Ponley

(Source: ESCIA Study 2024)

8.4.3 Baseline Conditions of VECs (Step 3)

As per the current water pollution monitoring report, the contamination of Tonle Sap Lake (TSL) in Cambodia caused by pesticide runoff from agricultural fields and households, particularly after rainfall. This contamination pathway implies that pesticides can accumulate in the soil, potentially affecting its quality and health. Rainwater then carries these pesticides into rivers, ultimately reaching TSL and polluting the water. The anthropogenic activities, including pesticide use, threaten the lake's water quality including various pesticides such as Chlorfenapyr, Terbcarb, Atrazine, 2-Phenylphenol, Parathion, Dieldrin, Malathion, Methyl parathion, and Biphenyl, in TSL water samples. The detection of these pesticides confirms their use and presence in the lake and its surrounding areas.[63] In addition to the pollution of water and soil, the areas are gradually deteriorated in terms of biodiversity and ecosystem services due to habitat loss, pollution, and hydrological disruptions from upstream dams and climate change. These factors have led to declines in fish diversity, waterbird populations, and wetland habitats, alongside reduced ecosystem services such as fisheries productivity, water quality regulation, and nutrient cycling. The lake's seasonal flood-pulse system, essential for

[63] Meas, Mardi, May Phue Wai, Nimol Vat, Senghong Kin, Si Chheng Im, Sopheak Trerm, Sreynith Lis, and Rina Heu. "Monitoring of Pesticide Residues in Tonle Sap Lake, Cambodia."

maintaining its ecological balance, is increasingly disrupted.[64&65] The identified VECs conditions at the period are described here (Table 8.2).

Table 8.2: Baseline conditions of the identified valued environmental and social components (VECs) under the RCIA

VECs	Ou Ta Paong	Lum Hach	Stueng Krang Ponley
Water pollution and soil pollution	• Potential for water contamination due to the existing use of agricultural chemicals in the OTP sub-scheme and neighboring areas. • Runoff from agricultural fields could carry pollutants into water bodies and groundwater.	• Potential for water contamination from agricultural runoff and industrial discharge.	• Potential for water pollution from both agricultural and industrial sources. • Water quality in the Stueng Krang Bat sub-scheme could be impacted by runoff from upstream areas and potential industrial discharge.
Loss of Biodiversity and ecosystem services	• Degradation of flooded forest habitats due to land encroachment and conversion to rice cultivation. • Fragmentation of the Ou Ta Paong Stream/canal by earth dams, roads, and ponds, impacting its natural flow. - Presence of several Endangered and Critically Endangered reptile and fish species.	• Habitat loss and degradation due to agricultural expansion and other land use changes. • Potential impacts on endangered and critically endangered species, as identified through IBAT screening. • The division of the Toul Samroang community forestry, where the irrigation system will divide the protected area into two parts, was estimated at 36,182 m^2.	• The Stueng Krang Bat sub-scheme is in an ecologically important area with a diverse range of habitats, including flooded forests, grasslands, and scrublands. • Potential for habitat loss and degradation due to irrigation infrastructure development and agricultural intensification. • Presence of Endangered and Critically Endangered reptile and fish species, including the Black Marsh Turtle, Elongated Tortoise, and Mekong Giant Catfish.

VECs = Valued Environmental and Social Components, OTP = Ou Ta Paong.

8.4.4 Assessment of the Cumulative Impacts of VECs (Step 4)

The assessment of the cumulative impacts on the identified VECs is presented in Table 8.3 below.

[64] Chen, Aifang, Anping Chen, Olli Varis, and Deliang Chen. "Large net forest loss in Cambodia's Tonle Sap Lake protected areas during 1992–2019." *Ambio* 51, no. 8 (2022): 1889-1903.

Table 8.3: Analysis result of the identified valued environmental and social components under the RCIA

VECs	Potential and Assessment of Impacts on the VECs	Key activities that cause risks and impacts			Potential Receptors		Supporting evidence	
		CURRENT PROJECT (CAISAR Project)	**PAST PROJECTS** (active command areas in the larger area)	**PLANNED PROJECT**	**Within current estimated area of influence**	**Beyond current estimated area of influence**	Scientific concerns	Affected Stakeholders
Water pollution & Soil pollution	- The increased use of agricultural chemicals under the OTP sub–scheme (about 14,000 ha), existing neighboring schemes, and the planned ADB financed project (IWRM), and various active command areas (See picture below). - Intensifying crop production may affect the quality of water (both surface and underground water). - Factories located along the Stung Krang Ponley command area also contribute to pollution of surface and groundwater, exacerbating the overall water quality issues	Increased crop production during operation phase (indicative of increased cultivated area per year)	Dannak Chheu Krom and Damnak Ampil irrigation schemes at the upstream of Ou Ta Paong. JICA-led Lum Hach 1 Irrigation Scheme upstream of Lum Hach sub-scheme and Achang irrigation Scheme downstream. No past projects being reported within Krang Ponley schemes which are additional the rehabilitated activities. The present of these projects are accumulated in terms of pesticide application along the irrigated areas within their command areas, especially in Ou Ta Paong while limited connected in Lum Hach.	IWRM Project upstream along the Kbal Hong main canal will lead to the increased crop production during operation phase of the project.	Soil and water sources within the project targeted command area	Soil and water sources outside the project targeted command area and to the downstream (e.g. Ou Tapaong,	X	X

VECs	Potential and Assessment of Impacts on the VECs	Key activities that cause risks and impacts			Potential Receptors		Supporting evidence	
		CURRENT PROJECT (CAISAR Project)	**PAST PROJECTS** (active command areas in the larger area)	**PLANNED PROJECT**	**Within current estimated area of influence**	**Beyond current estimated area of influence**	Scientific concerns	Affected Stakeholders
	Biodiversity							
Loss of Biodiversity and ecosystem services	- Critical habitats important to EN and CN species are potentially affected due to polluted surface, food poisoning, and decreased sources of food essential to EN and CN species due to water and soil pollution. - Disruption of Ecosystem Services: The loss of biodiversity can disrupt ecosystem services such as water purification, flood control, and carbon storage, slightly contributing to the long-term impact. - Industrial activities along the Stung Krang Ponley command further contribute to biodiversity loss through the release of solid and liquid waste into water resources - Agricultural activities, including the use of fertilizers, pesticides, and machinery in paddy fields, can disturb water quality and disrupt aquatic and terrestrial ecosystems.	Construction of the irrigation systems Farming activities Factory activities	Construction of the past irrigation systems have already led to the expansion of the production areas and this will be likely to accumulated with the current systems.	Construction of the irrigation systems Farming activities Factory activities	Aquatic and terrestrial species	Potentially the protected area at the downstream of Ou Ta Paong and at the upstream of Lum Hach	X	X

VECs = Valued Environmental and Social Components, IWRM = Integrated Water Resources Management, OTP = Ou Ta Paong, ADB = Asian Development Bank, CAISAR = Climate Adaptive Irrigation and Sustainable Agriculture for Resilience, EN = Endangered, CN = Critically Endangered.

8.4.5 Assessing the Impacts Significance (Step 5) and Management Measures (Step 6)

The assessment of the impact significance and management measures are provided in table 8.4 below:

Table 8.4: Analysis of the Identified VECs Baseline Condition, Impacts Significance and Management Measures, and Responsible Stakeholders

VECs	Existing Conditions and Trends of VECs	Cumulative Impacts Expected from the Other Project Activities	Significance of Cumulative Impacts	Suggested Management Actions for Cumulative Impacts	Responsible Stakeholders
Water pollution & Soil pollution	▪ Existing agricultural practices, including fertilizer and pesticide use, contribute to water and soil pollution. ▪ Industrial activities along the Stung Krang Ponley command area release waste into water resources. ▪ Soil quality varies across sub-schemes, with some areas facing low fertility and high hydraulic conductivity.	▪ Increased fertilizer and pesticide use associated with intensified crop production can exacerbate water and soil pollution. ▪ Construction activities can contribute to soil contamination through the release of oils and chemicals. ▪ Waste disposal from industrial activities can further impact water and soil quality.	▪ Potentially high significance, as water and soil pollution can impact human health, agricultural productivity, and ecosystem health. ▪ Cumulative impacts from multiple sources can lead to long-term degradation.	- Promote sustainable agricultural practices, including integrated pest management (IPM) and reduced fertilizer use, to minimize pollution from agricultural activities. - Implement strict measures for the handling, storage, and disposal of chemicals and waste during construction and operation. - Develop and enforce regulations for industrial waste discharge to protect water and soil quality. - Monitor water and soil quality regularly to assess impacts and identify necessary mitigation measures. - Remediate contaminated sites to restore soil health and prevent further pollution.	- CAISAR PMU and Involved executing agencies and - PMU of the IWRM, Agriculture, Environment Department, local Authorities, Farmers Water Users Community to monitor the impacts.
Loss of Biodiversity and ecosystem services	▪ Existing industrial and agricultural activities have already contributed to biodiversity loss and habitat degradation. ▪ Tonle Sap Lake and its floodplain are a critical ecosystem supporting diverse species and livelihoods. ▪ Community fish refuges and key biodiversity areas	▪ Micro-habitat loss and fragmentation due to construction activities and expansion of agricultural land. ▪ Water pollution and altered flow regimes can impact aquatic ecosystems and fish populations. ▪ Increased pesticide use can negatively affect	Potentially moderate to high significance, as biodiversity loss and ecosystem degradation can undermine long-term ecological resilience and the provision of ecosystem services essential for livelihoods and well-being.	- Avoid sensitive habitats and critical areas during project siting and design. - Minimize habitat disturbance and fragmentation during construction activities. - Establish buffer zones around water bodies and sensitive areas to protect biodiversity. - Restore degraded habitats and create ecological corridors to enhance connectivity.	- CAISAR PMU and Involved executing agencies and - PMU of the IWRM, Agriculture, Environment Department, local Authorities, Farmers Water Users Community to monitor the impacts.

VECs	Existing Conditions and Trends of VECs	Cumulative Impacts Expected from the Other Project Activities	Significance of Cumulative Impacts	Suggested Management Actions for Cumulative Impacts	Responsible Stakeholders
	(KBAs) are present in the project region.	pollinators and other beneficial insects.		- Implement monitoring programs to assess impacts on biodiversity and ecosystem services and adapt management practices accordingly. - Engage local communities in biodiversity conservation efforts and promote sustainable land management practices.	

VECs = Valued Environmental and Social Components, IPM = Integrated Pest Management.

8.5 CONCLUSION

The cumulative impact assessment for the Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project. This project aims to improve irrigation systems in three (3) sub-schemes: Ou Ta Paong, Lum Hach, and Stung Krang Ponley. The assessment identifies potential environmental and social impacts associated with the project, including air, water, and soil pollution, waste disposal, biodiversity loss, GHG emissions, and economic displacement. This assessment has analyzed that, besides the CAISAR project, there are existing activities, such as agricultural practices and industrial activities, in the surrounding project areas. These activities, when combined with the projected activities, had cumulative impacts on the environment and society in certain areas.

CHAPTER 9 − ENVIRONMENTAL & SOCIAL MANAGEMENT

9.1 INTRODUCTION

This chapter outlines the purpose, roles, and responsibilities related to the management of environmental and social impacts associated with the project. The primary purpose of the chapter is to present a structured framework for mitigating and monitoring potential environmental and social risks throughout the project lifecycle. It highlights the importance of integrating environmental and social considerations into project planning and implementation to ensure compliance with national regulations, international best practices, and the project's sustainability goals.

Key institutions involved in the environmental and social management process include government agencies, local authorities, and specialized environmental and social monitoring bodies. These institutions are responsible for ensuring adherence to environmental laws, assessing the project's social impacts, and overseeing the implementation of mitigation measures. Their roles also involve collaborating with stakeholders, including affected communities, to address concerns and facilitate transparent project execution.

Furthermore, the proposed monitoring program is designed to track the effectiveness of mitigation measures and ensure that environmental and social risks are managed proactively. This program involves regular assessments of key indicators such as air and water quality, biodiversity conservation, community health, and socio-economic conditions. Continuous monitoring ensures that any negative impacts are identified early, allowing for timely interventions to minimize adverse effects on both the environment and surrounding communities.

9.2 ENVIRONMENTAL, SOCIAL AND CLIMATE MANAGEMENT MEASURES

Based on the ESC risks and impacts identified and assessed (in Chapter 06), a summary of proposed mitigations measures is presented below.

9.2.1 Mitigation Measures for the Environmental and Climate Risks and Impacts

Table 9.1: Preconstruction, Construction, and Operation Phase Environmental Mitigation Measures

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
Preconstruction phase				
1	Unexploded Ordnance (UXO) survey & removal			
	Risk of injuries or fatalities among workers or members of the public	• Carry out UXO screening/assessment by certified UXO experts before any physical/ construction activities are allowed. • In case UXOs are found by certified experts during on-site screening, removal of UXO will be carried out by certified experts. • A UXO clearance certificate shall be obtained from related authority for each sub-project prior to commencing any subproject activities. • As part of site-specific ESCMP, conduct training and awareness activities for local community with regards to UXO risks and chance finds.	PMU Contractor	Before construction
Construction phase				
ENVIRONMENTAL, HEALTH, AND SAFETY				
1	Noise and Vibration			
	• Earthmoving activities and operation of machineries at construction sites will generate dusts and exhaust fumes. • Construction activities, operation of vehicular movement, excavation machineries, concrete mixing, and other construction activities will generate noise and vibration and will be a nuisance to workers and residents near the site. • Noise may be generated from workers' camp, particularly during living activities or entertainment at nighttime, or due to certain maintenance /repair of equipment, machinery, vehicles.	• Maintain all exhaust systems in good working order and undertake regular equipment maintenance to ensure compliance with applicable regulations and manufacturers' instructions. • Implementation of operating and maintenance practices of equipment and machinery to ensure that they are well-maintained. • Ensure that noise control options such as silencers and mufflers are fitted to exhausts, compressors and fans for construction equipment (such as hydraulic excavator, bulldozer, front loader, backhoe and trucks). • Provide advance warning to the community on timing of noisy activities. Seeking suggestions from community members to reduce noise annoyance and notify the communities about how to raise their concerns (if any) through the Grievance Redress Mechanism. • Undertake noise monitoring at the closest residential area and other noise sensitive receptor during times with ongoing construction work to ensure compliance with the relevant noise standards. • The contractor shall provide all construction personnel working in the vicinity of noisy construction activities (defined as those activities generating noise levels greater than 80 dB(A)), or any construction personnel who requests hearing protection, with hearing protection equipment. • A speed limit of 30 km/h for construction related traffic through inhabited areas. • The contractor shall conduct noise testing at the sensitive locations as per the detail engineering design comparing to the IFC EHS Guideline • Avoid night-time construction in populated/village areas.	• PMU • Contractor	Daily/ Every 06 months

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
		• No noisy construction-related activities will be carried out from 21:00 hours to 06:00 hours along residential areas, hospitals, schools and during religious or cultural events near the subproject • Provide temporary noise barriers (3–5-meter-high barrier can reduce 5–10 dB(A)), as necessary, if site works will generate high noise levels that could disturb nearby households, hospital, school and other sensitive receptors. • Restrict use of vibrating rollers and operation of heavy equipment near sensitive structures.		
2	**Air pollution**			
	• Dust and particulate matter (PM10 and PM2.5) generation from soil disturbances, stockpiles, and road works • Exhaust emissions from trucks and heavy machinery (NOx, CO, SO2, VOCs) • Waste disposal, particularly through burning	• Spray or sprinkle water on the work surfaces and other piled materials to minimize dust at least 3-6 times per day in windy and dry weather and/or based on the weather condition. • Select Borrow sites located as close as possible to the construction to reduce distances. • If Concrete batching facilities are in need, it will be located at least 500 m (0.5 km) downwind from the nearest dwellings to reduce the impact of dust and fumes on humans and to be fitted with necessary equipment such as bag house filters to reduce fugitive dust emissions. • Water will be regularly sprayed to suppress fugitive dust at construction sites, material handling areas, access road and borrow pits. • Trucks carrying dry construction materials such as earth or waste will be covered with tarpaulins or other suitable cover. • Construction vehicles and machinery will be maintained to a high standard to minimize emissions and ensure compliance with the National exhaust emission standards. All mobile equipment should be fitted with catalytic converters. • A speed limit of 30 km/h for construction related traffic through inhabited areas and on the access road will be enforced. • All open burning of construction and demolition waste material and refuse will be prohibited. • Testing air quality (NO2, SO2, CO, TSP, PM10, PM2.5)	• SEO • E&S specialist consultants • PMU	Daily/ Every 06 months
3	**Impact on Water**			
	• Dredging and excavation can significantly increase sedimentation in water bodies. • Disturbed soil can enter rivers and lakes, potentially polluting domestic water sources. • Large-scale dredging projects, like the 30km Ou Ta Paong dredging, pose a	• Installation of temporary non-erodible ditches or bunds at the construction site to divert clean runoff away from exposed areas, and convey potentially dirty runoff to sediment control devises. • Stockpiles and materials will be stored at least 50 m from surface waters with drainage directed away from the canals and streams or water sources. • The sediment quality of the dredge spoil will need to be tested and assessed against an appropriate standard before re-use in the structure of embankments. The sediment testing results will confirm safe re-use of the material	• SEO • E&S specialist consultants • PMU	Daily/ Every 06 months

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
	significant risk to water quality throughout the excavation period. • Sedimentation can reach downstream areas, including the Tonle Sap Lake, if not properly mitigated. • Infiltration of wastewater from workers' camps can contaminate groundwater. • Leakage of hazardous materials like oil and diesel from machinery and vehicles can pollute both surface and groundwater.	• No washing or repair of machinery within 50 m of surface waters. • Construction working areas will be clearly demarcated and encroachment onto adjacent areas avoided. • Portable toilets and small wastewater treatment units will be provided at the construction site and labour camps. All sanitary facilities will be located at least 50 m from surface water bodies. All workers must be instructed to use these facilities, which shall be kept clean at all times. • Pit latrines and septic tanks should be placed at least 2 m above the groundwater table must be located at least 50 m from surface water bodies and water wells and in areas of suitable soil profiles. • All hazardous materials including hazardous waste will be stored on an impervious surface, under cover, in adequate tanks or containers and within secondary containment. A bund will be provided around any above ground fuel storage tank with capacity of 110% of the largest single tank. Storage of hazardous materials shall be at least 50 m from surface water bodies with no direct drainage to surface water. • Areas where spills of fuel or oil may occur will be equipped with easily accessible spill control kits to assist in prompt and effective spill control. • Refueling of machineries by service vehicles will be conducted with measures preventing oil spillage during refueling including placement of buckets under refueling nozzles. • Runoff accumulating at the bottom of excavation pits during construction will be pumped out, reused where practicable or otherwise conveyed to appropriate sediment retention devises before being discharged to the environment. • Hazardous waste (oil waste) shall be properly collected and stored in closed containers under shelter for recycling or disposal by a duly authorizes enterprise. • Regularly inspect and maintain construction equipment to prevent leaks and spills. • Testing surface water quality (Depth, pH, EC, AS, Cd, Pb, TN, TP, TDS, TSS, DO, and Total Coliform) and pesticide residues in water (to be conducted overseas).		
4	**Solid and Hazardous Waste**			
	• Hazardous wastewater, such as oil or fuel, polluting materials used for machinery and construction process at the construction site.	• Storage facilities for fuels, oil, cement, and chemicals shall be within secured areas on impermeable surfaces, provided with bunds and cleanup installations; • Vehicles and equipment shall be properly staged in designated areas to prevent contamination of soil and surface water; • Vehicles, machinery, and equipment maintenance and re-fueling will be carried out in such a way that spilled materials do not seep into the soil;	• PMU • Contractor	Daily

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
		• Oil traps will be provided for service areas and parking areas; • Fuel storage and refilling areas will be located at least 50m from canals and channels and will be protected by temporary drainage bunds to contain spills.		
5	**Waste and Wastewater**			
	• Domestic wastewater comes from workers/staff's water consumption daily.	• Recyclables will be separated at source and given/sold to recycler (plastic, metal, card, paper as a minimum). • Safe temporary storage of hazardous waste as required • To the extent possible, a duly authorized waste company will be contracted to recycle hazardous waste. • Non-hazardous, non-recyclable solid waste will be temporarily deposited and managed together at existing landfill/dumpsite. • All vehicles/drivers will be provided with plastic bags for waste collection and prevent any unauthorized waste disposal with particular attention paid to prevention of littering. • The Contractor will be required to train the workers in proper waste management.	• PMU • Contractor	Daily
6	**OCCUPATIONAL HEALTH AND SAFETY**			
		• Prepare a health and safety plan containing site-specific precautions in accordance with relevant occupational health and safety guidelines; • Inspect and check the relevant construction equipment to ensure that it meets the applicable mechanical and safety requirements; • Inspect the worksite to ensure that the equipment can be safely mobilized and operated, and that there are no unmitigated risks; • Install appropriate fencing and control access to the site; • Install appropriate safety signage and markings; • Provide fall protection when workers are exposed to unguarded platforms or walkways higher than 2 m; • Ensure there are safe ways to enter and exit the excavation; • Keep excavations dry; • Provide safety precautions when using high voltage electric power tools; • Carry out daily toolbox meetings (safety briefings); • Maintain an accident record book where all major or minor accidents and incidents are recorded with actions taken; • Educate the workers on construction hazards; • Train drivers on safe driving skills and traffic regulations; • Appoint an Environment, Health and Safety Officer who is a qualified engineer; • Make adequate first aid equipment available on site; • Carry out training and awareness of the workers on HIV-AIDS prevention; • implement emergency preparedness and response procedures Response Plan as planned in the CEMP.	• PMU • Contractor	Daily/Weekly

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
		• Ensure that all workers are equipped with and use Personal Protective Equipment (PPE). • The Contractor will set out an Emergency Response Plan		
7	**COMMUNITY HEALTH AND SAFETY**			
		• Prior to the start of construction work, the contractor in cooperation with the PIU will consult with the local authorities and potentially affected residents/private landowner. Inform them about the upcoming construction work, safety precautions and how to raise concerns or file complaints (GRM). • The contractor shall fence off the construction area and control access to the site. • A speed limit of 30 km/h for construction related traffic through inhabited areas. • The contractor shall install traffic signage and fluorescent bollards and warning lights to direct traffic and prevent vehicles driving into the lanes with construction activities. • The contractor, in cooperation with the local authorities shall implement traffic management to ensure a smooth traffic and prevent congestion.	• PMU • Contractor	Daily/Weekly
BIODIVERSITY				
1	**Habitat Loss and Fragmentation:**			
	• Conversion of forests and wetlands at micro or large may be needed for canal construction such as Lum Hach community forestry leading to broken down of the habitat. • The remaining natural habitats may become isolated patches, making it difficult for species to migrate, find mates, and maintain healthy populations. • In Lum Hach, there will be the division of Toul Samroang community forestry where the irrigation will be broken the protected area into two parts.	• Minimize the negative impact from land clearing on habitat connectivity by minimizing fragmentation and maintaining canopy connectivity across cleared areas. • Establishing and maintaining guard posts on access roads near residential and biodiversity priority areas. • Implementing measures such as habitat restoration, creating wildlife corridors, and ensuring that water management practices are sustainable and supportive of biodiversity. • Rescuing and properly handling wildlife encountered during land clearing and construction, following SOPs. • Identify and avoid sensitive areas, such as known habitat for Green Peafowl or other endangered species. • Implement habitat management measures to improve the quality and suitability of habitats for species.	• SEO • PMU • Contractor	Daily/Weekly
2	**Hunting and trading, and consumption of wildlife**			
	• The influx of a new labour force can increase demand for exotic local foods, including wildlife and endangered species, which are often seen as interesting and delicious. This may be	• Develop and enforce a strict Code of Conduct/ethics against wildlife collection, possession, and trafficking. This includes clear policies and sanctions for employees and subcontractors.	• SEO • PMU • Contractor	Daily/Weekly

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
	done for relaxation or belief that wildlife is tasty or making people healthy.	• Provide mandatory training for contractors' management staff and site workers on the Code of Conduct, Standard Operating Procedures (SOP) for wildlife protection and handling, and human-wildlife conflict management. • Incorporate a policy in the Project Administration Manual (PAM) and Worker's Agreement that prohibits employees and/or subcontractors from possessing, purchasing, trading, or collecting wildlife or forest resources that are legally protected, CITES listed, or classed as threatened by the IUCN Red List. • Educate construction workers about the importance of wildlife conservation and the laws regarding hunting and trading of protected species. • Implement strict penalties for violating wildlife protection laws. • Collaborate with local communities to monitor wildlife populations and report any suspicious activities.		
3	**Loss of fauna and flora**			
	• Construction activities, particularly in areas like Lum Hach with community forestry, can significantly impact wildlife habitats. • New canals and roads require vegetation clearance, further fragmenting habitats. • Habitat loss poses a serious threat to endangered species like the Elongated Tortoise, Giant Asian Pond Turtle, and Hairy-nosed Otter.	• Properly handle and rescue wildlife incidentally encountered or caught during land clearing and construction by relocating them to safer habitats, following the Standard Operating Procedure (SOP) for wildlife protection and handling. • Conduct thorough biodiversity inspections along the access roads and at quarry sites before starting any land clearing works to identify any habitat and/or nesting sites of endangered/ protected species that may be affected by the clearing and identify hotspots where collisions with wildlife are likely to occur. • Train field workers to recognize and avoid wildlife. • Install signage to alert drivers to the presence of wildlife and require them to slow down and drive with caution, especially in hotspots where collision with wildlife is likely to occur. • Develop a system in which drivers report locations of wildlife crossings and wildlife sightings. • Workers will receive training on frequently encountered wildlife. • The contractor shall install signs to ban hunting or catching wildlife in the area. • Apply Find Chance Procedure	• SEO • E&S specialist consultants • PMU	Daily/Weekly
	• The activity contributing to this risk is the rehabilitation of irrigation canals and farm roads.	• Implement Biodiversity Action Plan • Apply Find Chance Procedure	• PMU • Contractor	Daily/Weekly
4	**GHG emission**			
	• The construction and operation of heavy machinery, such as excavators and bulldozers, during these projects release carbon dioxide (CO2) into the atmosphere, i.e. the energy	• Use energy-efficient machinery and equipment during construction to reduce fuel consumption and emissions. • Optimize construction logistics to reduce the number of vehicle trips and machinery usage, minimizing fuel use and emissions. • Implement proper maintenance programs for equipment and vehicles to ensure they operate efficiently and with lower emissions.	• SEO • E&S specialist consultants • PMU	Daily

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
	requirements for construction works can result in increased carbon emissions • At the time of construction, there are possibility of smoke generated by burning of straw in the rice field.	• Reduce deforestation and land-use changes that contribute to carbon emissions by preserving vegetation and replanting trees in affected areas. • Use low-carbon materials and construction techniques that reduce the embodied carbon in construction materials. • Offset unavoidable GHG emissions by investing in carbon offset projects, such as reforestation or renewable energy initiatives. • Engage with local communities and stakeholders to raise awareness of emission reduction practices and encourage their participation in sustainability efforts.		
DURING OPERATION				
ENVIRONMENTAL				
1	**Water Management**			
	• Irrigation systems have both benefits and drawbacks. • Proper design and management are crucial. • Minimizing negative impacts on the natural water cycle is essential.	• Implement water-saving irrigation technologies like drip irrigation and sprinkler systems to reduce water consumption and minimize the strain on water resources. • Encourage the adoption of the AWD technique in rice cultivation to optimize water use and reduce water withdrawals for irrigation. • Establish detailed water management plans that ensure equitable water distribution and allocation, considering the needs of various users and the environmental flow requirements to maintain healthy aquatic ecosystems. • Design and construct robust irrigation infrastructure, including canals, ponds, and storage areas, capable of withstanding extreme weather events like floods and droughts. This investment should also include lining canals and refurbishing storage areas to reduce water losses and improve water storage capacity. • Integrate natural infrastructure, such as wetlands and forests, into water management strategies. Protect and restore degraded habitats to enhance their water regulation capabilities, improve water quality, and support biodiversity. • Establish and provide training to FWUCs on sustainable water management practices, equitable water rights, and allocation procedures. These communities play a vital role in the operation and maintenance of the irrigation system, ensuring its long-term sustainability.	• PMU	Annually
2	**Water Pollution**			
	• Increased use of chemicals, such as fertilizers and pesticides, to enhance crop yields. The excessive application of these chemicals can result in contamination of both surface and groundwater resources.	• Implement Simplified Pesticide Management Plan • Conduct regular water quality test to track the change in water quality due to pesticide application using oversea laboratory testing. • Encourage farmers to adopt IPM techniques that minimize pesticide use and rely on biological control methods, thereby reducing the risk of chemical contamination of water resources.	• PMU	Annually

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
		• Provide training and extension services to farmers on the judicious use of fertilizers, ensuring they apply the correct type and amount based on soil nutrient levels. • Promote the adoption of organic fertilizers and soil amendments, such as cover crops and green manures, which can improve soil fertility and reduce the need for chemical fertilizers. • Implement a robust water quality monitoring program to track the levels of pesticides, nitrates, and other pollutants in surface and groundwater resources within and around the command areas. • Encourage the adoption of water-saving irrigation methods, such as alternate wetting and drying (AWD) in rice cultivation, which can reduce water consumption and minimize the leaching of agrochemicals.		
3	**Soil Pollution**			
	• Increased production could lead to overuse of agri-chemicals if farmers are not adequately trained or supported in adopting environmentally friendly practices.	• Implement Simplified Pesticide Management Plan • Conduct regular water quality test to track the change in water quality due to pesticide application using oversea laboratory testing	• PMU	Annually
BIODIVERSITY				
1	**Habitat Loss and Fragmentation**			
	• Conversion of land: Flooded forests and wetlands may be drained or filled to create more arable land for agriculture, leading to significant loss of habitat. • Fragmentation: Remaining natural habitats may become isolated patches, making it difficult for species to migrate, find mates, and maintain healthy populations. • However, key biodiversity areas/species/habitats are not affected by the project but have been improved instead. Biodiversity areas are primarily located in the Tonle Sap region, which could face impacts if construction workers improperly dispose of waste.	• Identify and protect critical habitats, such as flooded forests and wetlands, ensuring their preservation against conversion for agricultural land. • Implement measures to restore degraded habitats and improve their suitability for biodiversity. • Promote sustainable agricultural practices to minimize negative impacts on biodiversity and water quality. This can include encouraging practices that reduce the need for land conversion. • Implement sustainable water management practices to ensure adequate water availability for both human needs and ecological functions, avoiding excessive water extraction that could harm wetland habitats. • Involve local communities in decision-making, monitoring, and conservation efforts to build ownership and support for protecting natural habitats. • Promote sustainable livelihoods that are compatible with biodiversity conservation, offering alternatives to activities that lead to habitat loss. • Establish a long-term monitoring program to track changes in habitat quality, species populations, and the effectiveness of mitigation measures. • Minimize forest encroachment and wildlife poaching by developing and implementing a community-based management plan. This includes establishing guard posts, conducting surveillance, and installing signage. • Implement and enforce policies against poaching and illegal collection of wildlife by workers and subcontractors, with appropriate penalties.	• PMU	Annually

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
		• Raise awareness and educate the community on the importance of protecting fish populations and aquatic ecosystems.		
2	**Invasive Species**			
	• Changes in land use and water management can introduce invasive plant and animal species that outcompete native species and alter ecosystem dynamics	• Implement a robust monitoring system, including regular surveys of waterways and terrestrial habitats, to detect invasive species early. Train personnel to identify and map invasive species, and establish rapid response protocols for eradication or control, such as manual removal, targeted pesticide application, or biological control agents. • Implement specific water management practices to minimize the risk of invasive species spreading through waterways. • Foster collaboration among government agencies, research institutions, local communities, and NGOs for effective invasive species management. Facilitate information sharing, coordinate efforts, and leverage resources for maximum impact. • Public Awareness and Education: Raise awareness among all stakeholders. • Educate farmers, local communities, and other stakeholders about the risks of invasive species, their identification, and prevention measures. • Establish a system for reporting suspected invasive species to enable rapid response and prevent spread. Set up a hotline or a reporting mechanism accessible to all stakeholders.	• **PMU**	Annually
3	**GHG emission**			
	• Increased GHG emissions from farming activities: - Fertilizer use - Livestock production - Rice cultivation • Increased energy requirements: - Rice field preparation - Flood control systems - Other infrastructure	• The project is to promote sustainable practices like crop rotation and agroforestry to reduce energy consumption and improve soil health. • The project needs to introduce renewable energy sources such as solar-powered irrigation to lower the carbon footprint of rice production. • The project needs to support on training farmers to use alternatives to straw burning, such as mulching or biomass energy generation, to reduce air pollution. • The project promotes the utilization of efficient irrigation methods like alternate wetting and drying (AWD) to conserve water and minimize methane emissions. • The project needs to advocate for policies that discourage straw burning and provide incentives for adopting sustainable agricultural practices.	• PMU • Farmer	Daily
ANNUAL CROP MANAGEMENT PLAN				
	❖ **WATER**			
1	**Water resource efficiency**			
	• Over-extraction of water resources can lead to downstream water scarcity, altered hydrology, and damage to aquatic ecosystems.	• Project need to implement efficient water management practices to prevent over-extraction and ensure equitable water distribution. This can include: • water use monitoring system to track consumption and identify areas for improvement.	• PMU • FWUC	Daily

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
		• implementing appropriate irrigation scheduling based on crop water requirements and weather conditions. • Utilizing efficient irrigation systems, such as drip irrigation or sprinkler systems, to minimize water loss. • Exploring opportunities for water reuse, such as capturing and reusing runoff water.		
	❖ **SOIL AND SOIL MANAGEMENT**			
2	**Soil erosion and soil erosion risk**			
	• Soil erosion can lead to loss of topsoil, reduced soil fertility, and increased sedimentation in water bodies.	• Minimize soil compaction and disturbance by using appropriate machinery and timing land preparation activities. • Consider erosion management practices such as contour planting, terracing, and grass barriers. • Adopt reduced tillage or no-till farming practices to minimize soil disturbance. • Establish cover crops during fallow periods or in rotation with main crops to protect the soil from erosion. • Practice contour farming on sloping land to reduce runoff and erosion. • Construct terraces on steep slopes to prevent soil loss. • Establish windbreaks or shelterbelts to reduce wind erosion. • Install erosion control structures, such as grassed waterways or sediment basins, to manage runoff. • Apply mulch to the soil surface to protect it from rainfall impact and erosion.	• PMU • Agricultural extension officers	After significant rainfall events Annually
3	**Nutrient application and management**			
	• Over-fertilization and nutrient runoff can contaminate water resources, negatively impacting aquatic ecosystems and potentially leading to eutrophication.	• Conduct periodic soil analysis to determine nutrient needs and avoid over-fertilization. • Establish buffer zones near watercourses to filter nutrient runoff. • Consider using green manures and cover crops to replenish soil nutrients and reduce leaching.	• PMU • Farmers	Before and after fertilizer application Regularly during the growing season
	❖ **PESTICIDE**			
4	**Use and effectiveness of pesticides:**			
	• Pesticide use can have adverse effects on human health, non-target organisms, and the environment. Pesticide resistance can develop, requiring increased application rates.	• Promote Integrated Pest Management (IPM) strategies to minimize pesticide use. • Implement training programs for farmers on the safe handling and application of pesticides. • Ensure proper disposal of pesticide containers and leftover products.	• PMU • Agricultural extension officers	Regularly during the growing season
5	**Pesticide residues on site soil**			
	• Pesticide residues can accumulate in the soil, potentially harming soil organisms and affecting water quality.	• Promote the use of pesticides with low persistence and mobility in the environment. • Implement a soil monitoring program to assess pesticide residue levels. • Consider crop rotation and the use of cover crops to help break down pesticide residues.	• PMU • Third-party laboratories	Periodically (e.g., annually or before planting sensitive crops)

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
		• Minimize pesticide use by adopting IPM strategies. • Conduct soil testing to monitor pesticide residue levels. • Rotate crops to break pest cycles and reduce the need for repeated pesticide applications. • Utilize cover crops to improve soil health and enhance pesticide degradation. • Consider bioremediation techniques to remove pesticide residues from contaminated soil.		
6	**Pesticide residues on produce**			
	• Pesticide residues on produce can pose a risk to consumer health.	• Enforce pre-harvest intervals to allow for pesticide breakdown before harvest. • Promote the use of pesticides with low toxicity to humans. • Properly wash and handle produce to remove surface residues. • Implement a monitoring program to test produce for pesticide residues. • Ensure compliance with established MRLs for pesticide residues on produce.	• PMU • Third-party laboratories	Before harvest

UXO = Unexploded Ordnance, PMU = Project Management Unit, SEO = Social and Environmental Officer, E&S = Environmental and Social, IFC = International Finance Corporation, EHS = Environmental, Health, and Safety, GHG = Green House Gas, FWUC = Farmer Water User Communities, ESCMP = Environmental, Social, and Climate Management Plans.

9.2.2 Mitigation Measures for the Social Risks and Impacts

Table 9.2: Social Risks, Impacts and Mitigation Measures

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
BEFORE CONSTRUCTION				
LAND ACQUISITION				
1	**Land acquisition and resettlement**			
	• Land acquisition requirements differ significantly across the six sub-schemes. • Ou Tapaong and Lum Hach are projected to have the highest land acquisition needs. • Brambei Mom, Krapeau Trom, and Yutasas are expected to require minimal land acquisition due to their smaller scale and lack of planned canal system expansion.	• Since the affected households are only 77 (50 in Ou Ta Paong and 27 in Lum Hach, Abbreviated Land Resettlement Plan is required to be prepared.	PMU Contractor	Before construction

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
	• The specific land acquisition needs for each scheme will be determined by the final concept design.			
2	**Economic displacement**			
	• The potentially disrupting existing economic activities and displacing households and businesses, including informal farmers and businesses. In Ou Ta Paong, 1,012 households using land along the infrastructure and 41 shop owners may be affected, with 10 households facing land acquisition. In Lum Hach, 2,333 households using farmland and 35 shop owners may be affected, with 5 households facing land acquisition. In Krang Ponley, 1,249 households using land along the infrastructure may be affected, with 20 households across all sub-schemes facing land acquisition.	• The households who own the land along the rehabilitated canals which will be expanded at the public land should be properly informed prior to the construction to avoid their crops will be damaged at the time of construction. • Although the acquired land are the public land, there are a need of a proper consultation and information to be conducted to inform and obtain agreement from the affected households.	PMU Contractor	Before construction
DURING CONSTRUCTION				
	CHILD LABOR & FORCED LABOR			
1	**Child Labor**			
	• Project activities will occur in rural areas where child labor is prevalent. • Construction contractors and subcontractors may employ children under 18 years old for unskilled labor. • Local children may be particularly vulnerable to exploitation due to poverty and limited educational opportunities.	• Apply LMP for age check prior to engagement of labor with regular monitoring through proper screening and registering all workforce for the work • To mitigate the risk of child labor, the project will implement strict measures to ensure compliance with national and international labor laws. Regular monitoring and inspections will be conducted to identify and address any instances of child labor. • Additionally, awareness-raising campaigns will be implemented to educate communities about the harmful effects of child labor and the importance of sending children to school. The project will also collaborate with local authorities and NGOs to strengthen law enforcement and provide support services to vulnerable children and their families.	• Contractors • PMU	Daily Screening prior to engaging services of primary supplier
2	**Forced Labor**			
	• The risk of forced labor, particularly for vulnerable individuals, due to economic coercion, exploitation of	• Strict Code of Conduct for workers with no tolerance for physical or verbal abuse of women or children	• Contractors • Primary supplier • PMU	Daily Screening prior to engaging services of primary supplier

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
	young people, and debt bondage. The increased demand for local labor during irrigation and road rehabilitation could exacerbate this risk.	• The Project Owner and Sub-Contractors will collaborate with the relevant Government Agency to disseminate information to local communities. This information will include the Contractor's Code of Conduct and the minimum working age as mandated by national laws and international standards. • The Ministry of Water Resources and Meteorology (MOWRAM) will provide information to local communities about the contractor's policies and responsibilities, including the Contractor's Code of Conduct and minimum working age.		
COMMUNITY HEALTH AND SAFETY				
3	**Disease transmission**			
	• Disease transmission risks are anticipated due to the influx of construction workers, potentially exacerbated by unhygienic living conditions and interaction with the local community. This influx increases the risk of spreading communicable diseases among workers and between workers and residents, with workers' susceptibility potentially increased by factors like poor diet, stress, and unhygienic conditions.	• Conduct public awareness raising activities (IEC) to ensure local people and contractors know about the risks of contracting and spreading communicable diseases such as COVID-19, HIV/AIDS, and water-borne diseases (e.g., amoebiasis, giardiasis, and toxoplasmosis. etc. • In the event of a disease outbreak (e.g. COVID-19), provide immediate training/awareness raising to the risk groups. • Conduct training to workers on communicable diseases prior to mobilization to construction sites. • For water-borne diseases that arise due to polluted or contaminated water, mitigations measures may include: o Implement filtration, chlorination, or UV disinfection to ensure safe drinking water. o Build and maintain proper sewage systems and latrines to prevent water contamination. o Promote handwashing, safe food preparation, and proper sanitation practices in communities. o Control and properly dispose of waste to prevent water pollution. o Test water sources frequently for contamination and take corrective actions promptly. o Provide access to clean water supplies, such as bottled water or tankers, during outbreaks or disasters. o Promote immunizations against water-borne diseases like cholera and typhoid in high-risk areas.	• PMU • Contractors • Local health authorities	• Monthly • During outbreaks • Periodic community health awareness campaigns
4	**Sexual Exploitation and Abuse, Sexual Harassment**			

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
	• The project's influx of approximately 735 workers, including construction and logistical personnel, along with frequent project staff visits and pre-existing SEA/SH issues, creates a risk of sexual exploitation and abuse/harassment, particularly during irrigation and road rehabilitation. An estimated 430 of these workers may be especially vulnerable due to potential isolation.	• Contractors need to explicitly state zero tolerance for sexual harassment, exploitation, and abuse within the workplace. • Require Code of Conduct (CoC) to be signed by all construction workers. • For victims coming forward: referral to qualified SEA/SH service provider. The GRM will include a confidential channel for reporting SEA/SH. • Strict Code of Conduct for workers with no tolerance for physical or verbal abuse of women or children • Training to workers on maintaining good community relations, with emphasis on proper conduct around women and children. • Training on SEA/SH and VAC for community members, in particular women and girls (may be done separately for men and women). • Ensuring workers' sites are situated (at least 500m) from schools and/or other areas where children congregate. • Children are prohibited from construction sites and worker's camp. • Ensure access to grievance redress mechanisms for all project-affected persons, including both stakeholders and workers, to address Sexual Exploitation and Abuse, and Sexual Harassment. Support (in the form of training, awareness raising, etc.) to local law enforcement to act on community complaints regarding SEA/SH and VAC. • Provision of information to local communities about the contractor's policies and responsibilities, including the Contractor's Code of Conduct and minimum working age. • Provide counselling services for male and female workers, wives and other female partners of contractors' workers. • Build partnerships with local health providers and SEA/SH service providers to conduct community awareness activities, and referrals. • Implement public awareness campaigns to address sexual harassment in transport services and hubs, and training of police on women's security needs when using transport. This is included on GRM: - Accessibility for Workers - Multiple Reporting Channels - Confidentiality and Support - Contractor Accountability	• Contractors • PMU	• Monthly and during subproject cycle • Reported to PMU within 48 hours if occurred

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
		• It is necessary to consider deploying specialists to educate and raise awareness about issues of violence. • Project should provide budget support to women affair provincial department during the project activities for sexual exploitation and abuse, sexual harassment monitoring.		
5	**Traffic safety & Security**			
	• Increased transport of materials and equipment in the construction stage raises the risk of road accidents, theft, vandalism, and a perceived or actual increase in crime, affecting project workers, community members, and those living or traveling near construction sites.	• Arrange security guard or engage local authority to guard the construction sites • Conduct public awareness raising activities (IEC) to ensure local people and road user are aware of road safety regulations and risks and act accordingly while using road. • Monitor and observe speed limit.	• PMU • Contractors	• Daily during construction • Weekly during construction • Monthly during operation
6	**Community Health and diseases**			
	• Construction activities, including canal and pond rehabilitation, pose community health and safety risks beyond disease transmission, encompassing drowning, accidents from trespassing in construction zones (including storage and laydown areas), traffic disruptions, potential community conflicts, and general construction site hazards.	• Establish clear and well-marked construction exclusion zones to prevent unauthorized access, especially to areas with open water, heavy machinery, and storage areas. • Implement fencing and barriers to prevent trespassing and ensure community safety around construction areas. • Provide warning signs in local languages to inform communities about the dangers and restricted access to construction areas. • Install safety barriers around construction sites to minimize risks to the community and workers. • Ensure proper storage of construction materials, with no materials left unsecured and scattered around the site. • Develop and implement traffic management plans to minimize traffic and access disruptions and ensure pedestrian and vehicle safety. • Conduct community awareness campaigns to educate the community about the potential risks and safety measures during construction. • Establish and maintain a grievance mechanism to address community complaints and issues promptly. • Implement safety measures around canals and ponds to prevent drowning incidents, such as installing safety barriers and providing warning signs in local languages. • Create and enforce clear rules regarding access to canals and ponds during construction, and post those rules. • Implement strict health and safety regulations at all construction sites to protect both workers and the nearby communities.	• PMU • Contractors	• Monthly • During outbreaks • Periodic community health awareness campaigns

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
		• Provide training to workers on safety protocols, including how to work safely around water, avoid accidents and minimize risks to the community. • Ensure all workers are provided with necessary personal protective equipment (PPE) and enforce its use.		
7	**Personal Protective Equipment**			
	• The activities involve Canal Rehabilitation and Construction , Structure Construction and Rehabilitation, and Drainage Improvement , which expose workers to various hazards, such as Falling Debris, Sharp Objects, and Heavy Machinery.	• Continue and active use of PPE at all time of construction. • Identification and provision of appropriate PPE that offers adequate protection to the worker, co-workers, and occasional visitors, without incurring unnecessary inconvenience to the individual • Proper maintenance of PPE, including cleaning when dirty and replacement when damaged or worn out. • Proper use of PPE should be part of the recurrent training programs for employees.	• Contractors • PMU	• Regular inspections/training
8	**Working conditions and Management of Worker**			
	• The lack of written contracts for unskilled, especially locally recruited, workers increases their vulnerability to underpayment, unequal treatment based on gender and temporary status, and late or non-payment of wages, impacting their livelihoods and potentially hindering project progress.	- Implement a grievance mechanism for workers where workers can report issues related to underpayment or unequal treatment without fear of retaliation. - Advise companies to provide equal opportunities for employment and promotions to all workers, regardless of gender, ethnicity, or background, to avoid discrimination. - Regularly monitor and audit payroll and employment practices to ensure compliance with labor regulations and address any disparities. - Offer training and capacity-building programs for all workers to enhance their skills and qualify them for higher-paying roles. - Ensure that subcontractors and suppliers also adhere to fair wage and equal treatment policies. - Set up worker committees or unions to allow collective bargaining and ensure workers have a voice in addressing wage and treatment issues. - Provide accessible information to workers about their rights, entitlements, and the proper channels to address grievances	• Contractors • PMU	• Regular payroll audits • Periodic worker satisfaction surveys • Prompt investigation of any reported grievances

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
		through the establishment of the GRM for workers. This includes training on topics such as: • Environmental and Social Safeguards • Gender Awareness and the Gender Action Plan • Sexual Exploitation, Abuse, and Harassment (SEA/SH) - Labor Rights and the Workers' Code of Conduct Regularly engage with labor rights organizations or third-party auditors to evaluate labor conditions and make improvements where necessary.		
9	**CULTURAL HERITAGE**			
	Ou Ta Paong: • Some cultural sites may be minimally impacted. • Risk of overlooking and destroying smaller sacred places. • Detailed design is crucial to assess the full impact. Lum Hach: • Two identified sites are outside the current construction area. • Confirmation of the final design is still needed. Stung Krang Bat: • Rich in historical and cultural heritage. • Potential for encountering archaeological artifacts during construction due to the history of the ancient city of Longvek.	• Conduct archaeological surveys before construction in culturally sensitive areas. • Implement Find Chance Procedure	• Contractors • PMU	• Daily • Reported to PMU within 48 hours
CROSS-CUTTING				
10	**Gender inequality**			
	• Women are more vulnerable to climate change impacts due to unequal access to resources, information, and decision-making power, often hindered by social gender roles. While women-led households represent a significant portion of project sub-schemes, they	• The project should actively encourage women's participation in the formation of FWUCs, empowering them through critical decision-making roles and equipping them with the necessary skills and resources to amplify their voices. • The project should ensure that women have equal access to training programs and resources, such as land, credit, and technology.	• Contractors • PMU	• Daily/ weekly

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
	still face barriers to participation and benefits. The project area includes a substantial number of vulnerable individuals, including the poor, disabled, elderly, and parentless, highlighting the need for targeted support.	• The project should monitor gender equality indicators and should make adjustments as needed to ensure that women are benefiting from the project.		
11	**Social inequality**			
	• Risk of being unequally engaged and treated, during the design phase and construction. The vulnerable are likely to be limitedly consulted and having limited access to available irrigation water.	• Conduct participatory planning and regular consultations with local communities, particularly marginalized groups (e.g., women, smallholder farmers, indigenous communities). • Prioritize hiring local labor, with special provisions for disadvantaged groups (e.g., youth, women, minorities) in both skilled and unskilled positions. • Develop and enforce water allocation plans that ensure fair access to water resources for all users, including small-scale and subsistence farmers, during and after construction. • Implement fair and transparent compensation or resettlement plans for those displaced or affected by construction activities, especially vulnerable households. • Establish accessible and responsive grievance redress mechanisms, ensuring all community members can raise concerns or complaints during construction. • Conduct regular social impact assessments, with a focus on identifying inequality trends, and adjust project strategies to mitigate negative effects. • Provide support and training for affected communities to diversify their livelihoods, especially for those whose livelihoods may be disrupted by construction (e.g., farmers, traders). • Ensure transparency in the contracting process, including the selection of subcontractors and suppliers, with opportunities for local businesses, especially those run by marginalized groups.	• Contractors • PMU	• Continuously
12	Elite capture			

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
	• The rich have the resources to grab both available land and water resources, creating greater social disparities	• Consultation will be conducted farmers in potential command area, focusing on vulnerable/disadvantaged groups • Alternative livelihoods for vulnerable group are identified based on their needs vis-à-vis project's investment eligibility • Conduct consultation at community level (in the command area) to achieve a consensus on how water needs are balanced between different groups in one command area. • During subproject design, water availability, storage capacity, and water needs of upstream and downstream population are calculated to inform design, and water use coordination during project operation. • Water user groups should be established for upstream and downstream population and should be coordinated by a higher-level committee/group to negotiate and optimize water coordination • Guidelines/Manual should be developed to provide guideline for upstream and downstream communities at subprojects to meet, discuss, and achieve consensus on how water is distributed for equal use between upstream and downstream population	• PMU • Contractors	• Throughout project implementation • Regular community meetings and consultations
13	**Loss access to land and other assets**			
	• Construction activities, particularly land acquisition for canals and roads, can displace communities or restrict their access to land, homes, and other assets. • Temporary restriction of irrigation access during construction may occur in some areas, potentially impacting livelihoods, even though the project area is mainly rainfed.	• The project will prioritize avoiding physical resettlement and minimizing land acquisition. Design adjustments will be made to avoid or reduce land requirements, especially on private land. Public land will be prioritized for any necessary acquisition. • Where land acquisition is unavoidable, the project will employ a negotiated settlement process with affected households. This process, guided by the RGC's Standard Operating Procedures on Land Acquisition and Involuntary Resettlement (SOP-LAR), aims to ensure that affected households receive fair and adequate compensation for their losses and maintain or improve their income and livelihood status. • All individuals with assets within the Corridor of Impact (COI) before the Cut-Off-Date (COD) will be eligible for compensation, regardless of their legal status. Compensation will be provided for	• Contractors • PMU	• Before land acquisition • During land • After resettlement

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
		various losses, including land, structures, crops, trees, and income-generating activities. • Recognizing the potential disruption of income streams during relocation or construction, the project will provide transitional allowances to affected households. These allowances will help cover living expenses and bridge the gap until they can resume their livelihoods. • A multi-tiered GRM will be established to address grievances from any project-affected person. The GRM will operate based on the principles of the Green Climate Fund (GCF) and be accessible at no cost to the complainant.		
14	**Loss access to natural resources**			
	• Construction activities and project operations can restrict communities' access to forests, fishing grounds, water sources, or other natural resources they depend on for livelihoods	• Implement efficient water management practices during construction and operation to prevent over-extraction of water resources from reservoirs and rivers and ensure equitable distribution for downstream communities and ecosystems. • Establish construction exclusion zones around sensitive habitats, such as wetlands and forests, to prevent disturbance and minimize impacts on fishing grounds and biodiversity. Implement habitat restoration programs in areas where construction has occurred. • Use environmentally friendly construction materials and techniques to reduce the risk of pollution. Properly manage construction chemicals, fuels, and waste to prevent water pollution and contamination of natural resources. Prepare and implement a waste management plan to handle waste generated from construction activities and worker camps. • Optimize construction material use and recycle when possible, to minimize the extraction of new resources. Implement energy-efficient construction practices and use renewable energy sources where possible. • Maintain ongoing communication with affected communities, including farmers, fishers, and downstream communities, to address concerns about natural resource access. Provide information and education to construction workers about responsible use of local resources and respect for community access rights. This suggestion is informed by the sources but is not directly stated in them. • Ensure the GRM is accessible to all community members to address complaints related to natural resource access.	• PMU • Contractors	• Regular water quality and quantity monitoring • During project implementation: Monitor the effectiveness of mitigation measures.
DURING OPERATION				

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
1	**COMMUNITY HEALTH AND SAFETY**			
	• Water use conflicts, especially between upstream and downstream users, are a potential risk due to altered water allocation from new irrigation infrastructure, exemplified by the Anlong Chrey reservoir's limited capacity, and increased drowning risk, particularly for children, due to new canals.	• The project will promote IWRM principles to ensure the equitable and sustainable allocation of water resources. This involves considering the needs of all stakeholders, including upstream and downstream communities, as well as environmental flow requirements for maintaining healthy ecosystems. • Establishing a system for monitoring water use and enforcing water allocation regulations will help prevent over-extraction and ensure a reliable water supply for all users. This may involve installing flow meters, conducting regular water audits, and implementing penalties for non-compliance. • The project will strengthen the capacity of FWUCs to manage water resources at the local level. This includes training on water allocation, conflict resolution, and operation and maintenance of irrigation infrastructure. Effective FWUCs can play a crucial role in mediating disputes and ensuring fair water distribution within their communities. • Raising awareness about water safety and the risks associated with open water bodies, especially among children, is essential. Educational campaigns, signage, and community outreach programs can help promote responsible behavior and prevent accidents. This information could be included in the training programs that will be provided to farmers and communities. • The project will consider incorporating safety features into the design of irrigation infrastructure. This may include fencing around canals and reservoirs, installing safety ladders, and providing designated swimming areas away from irrigation structures.	• PMU • PDWRAM	• Daily for site inspections • Monthly for reports and consultations • Within 48 hours for reporting accidents, disease outbreaks.
CROSS-CUTTING				
2	**Gender inequality**			
	• Women are more vulnerable to climate change due to limited access to resources, information, and decision-making power, often exacerbated by gender roles, resulting in unequal access to water, limited participation in water management, and disproportionately negative impacts on their livelihoods.	• The project should actively encourage women's participation in the formation of FWUCs, empowering them through critical decision-making roles and equipping them with the necessary skills and resources to amplify their voices. • The project should ensure that women have equal access to training programs and resources, such as land, credit, and technology.	• PMU • PDWRAM	• Monthly for data collection and reporting

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
		• The project should monitor gender equality indicators and should make adjustments as needed to ensure that women are benefiting from the project.		
3	**Social inequality**			
	• The competition for water and land displacement, and despite project consultations, vulnerable groups, particularly landless or land-poor households, may still experience limited access to irrigation benefits, though the impact is lessened by the relatively small proportion of poor within the area.	• Ensure Equitable Water Access: Mechanisms should be in place to support vulnerable and marginalized communities in accessing water resources. • FWUCs will manage the irrigation systems and ensure sustainability through fee collection. The project will invest in establishing and training FWUCs, emphasizing inclusivity and capacity building for vulnerable groups. • Implement a Simplified Integrated Pest Management (IPM) Plan.	• PMU • PDWRAM	• Monthly for data collection and reporting
4	**Elite capture**			
	• The rich have the resources to grab both available land and water resources, creating greater social disparities	• Transparent and accountable FWUC management: Clear guidelines, diverse representation, and grievance redress mechanisms are essential to prevent manipulation and ensure equitable water distribution. • Regular monitoring and evaluation: Continuous monitoring of project impact, especially on vulnerable groups, can identify and address elite capture. • Strengthened land tenure security: Clarifying land rights can protect smallholder farmers and marginalized communities from land grabbing. • Community engagement: Active community participation, especially from vulnerable groups, empowers them and ensures their needs are met.	• PMU • PDWRAM	• Regularly during FWUC meetings and project implementation • Continuously through the GRM.

PMU = Project Management Unit, LMP = Labour Management Plan, NGOs = Non-governmental Organizations, HIV/AIDS = Human immunodeficiency virus/Acquired immunodeficiency syndrome, UV = Ultraviolet, GRM = Grievance Redress Mechanism, SEA = Sexual Exploitation and Abuse, SH = Sexual Harassment, VAC = Violence Against Children, ESHS = Environmental Social Health and Safety, STDs = Sexually transmitted diseases, PPE = Personal Protective Equipment, IPM = Integrated Pest Management, PDWRAM = Provincial Department of Water Resources and Meteorology, FWUCs = Farmer Water User Communities.

9.2.3 Environmental Monitoring Program

Table 9.3: Environmental monitoring plan

Monitoring Parameters	Monitoring Indicators	Location	Measurements	Frequency	Responsibility
Pre-construction phase					
UNEXPLODED ORDNANCES (UXO)	• UXO screening by certified experts required before any construction. • Found UXOs to be removed by certified experts. • UXO clearance certificate required before subproject activities. • UXO risk training and awareness for the local community.	Along the canales (construction site)	• Confirm all relevant areas are clear from UXO by consulting national military. • Obtain a certificate of UXO clearance	Before construction	PMU Contractor
During construction phase					
	ENVIRONMENTAL				
Noise and Vibration	• Avoid working during night-time from 21:00 hours to 06:00 hours • Provide ear sets for workers to prevent noise if the noise level exceeds the standard • Check and maintain construction machinery regularly to avoid noisy and high vibration • Restrict use of vibrating rollers and operation of heavy equipment near sensitive structures	Construction site Nearby sensitive structures	Site inspection Visual observation	Daily	SEO E&S specialist consultants PMU

9.2.4 Social Monitoring Program

To ensure the effectiveness of social management, the social monitoring program is prepared to monitor social issues. Contractor and/or sub-contractor is responsible for monitoring using appropriate method, equipment and system. Details on monitoring parameters are shown in the table below:

Table 9.4: Social monitoring plan during preconstruction, construction, and operational phase

Monitoring Parameters	Monitoring Indicators	Locations	Measurements	Frequency	Responsibility
Preconstruction phase					
Land acquisition/ Economic displacement	• Track the process of acquiring land for the project, ensuring fair compensation is provided to affected landowners. • Implement programs to help displaced individuals and communities restore their livelihoods. • Establish effective grievance mechanisms to address complaints and concerns related to economic displacement.	Construction sites	• Monitor the distribution of compensation payments and address any disputes or concerns. • Monitor the effectiveness of these programs.	• Daily • Reported to PMU within 48 hours	• PMU
During construction phase					
PROTECTING THE WORKFORC					

Child Labor/ Forced Labor	• Involvement of child labor/ forced labor in main contractor and subcontractors' workforce • Involvement of child labor/ forced labor among primarily supply workers	• Construction sites • Worksite of primary supplier	• Site inspection • Observation	• Daily • Screening prior to engaging services of primary supplier	
COMMUNITY HEALTH AND SAFETY					
Community Health and diseases	• Incidence of waterborne diseases • Prevalence of vector-borne diseases (e.g., malaria, dengue fever) • Respiratory illnesses related to dust and air pollution • Availability and accessibility of healthcare services • Community awareness of health risks and preventative measures	• Construction sites • Worker camps • Community and neighboring areas	• Health data collection • Site inspections • Health surveys and interviews • Consultation with workers and community members	• Monthly • During outbreaks • Periodic community health awareness campaigns	• PMU • Contractors • Local health authorities
SEA/SH	• Before mobilizing workers to construction site, conduct orientation/training on SEA/SH (using sample Code of Conduct as a minimum) for all Contractors' managers and workers mobilized to construction site • As part of the above training/orientation, ensure all workers understand SEA/SH risks, disciplines and penalty, and understand project's grievance procedures related to SEA/SH • As part of the workers and manager's work contract, require all workers engaged for project (both workers mobilized to site or work in contractors' office) to peruse and sign Workers' CoC • Ensure Contractors appoint a focal point in charge of ESHS and grievance reception, processing and resolution • Apply all measures related to management of work camps	• Construction sites • Relevant local communities	• Number and percentage of workers trained on SEA/SH prior to mobilization to subproject site • Number and percentage of workers signing Code of Conduct as part of Work Contract • Percentage of workers perpetrating SEA/SH and percentage of cases reported to PMU and resolved	• Monthly and during subproject cycle • Reported to PMU within 48 hours if occurred	• Contractors • PMU

			• Name and contact of ESHS and grievance focal report reported in Contractor's ESMP.		
Traffic safety and Security	• Security cautions • General disease prevalence • Worker health • Communicable diseases	• Construction sites • Access roads to construction sites • Newly constructed/rehabilitated roads	• Site inspections • Incident reports • Data collection • Consultation with workers and community members • Review of contractor safety plans	• Daily during construction • Weekly during construction • Monthly during operation	• Contractors • PMU • Local authorities
Community Health and diseases	• Consultations with target communities to assess the current social situation and social impacts of sub-projects. • Recommendations and solutions from communities obtained regarding negative social impacts.	• Target communities • Workers	• Assessment of social situation and social impacts. • Collection of community recommendations and solutions.	• During consultations	• Contractors • PMU
Personal Protective Equipment	• Health and safety regulations enforced at construction sites. • Appropriate training and personal protective equipment (PPE) provided to workers.	• Construction sites and worker camps	• Monitoring that contractors provide appropriate PPE and enforce its use. • Observation of training sessions. • Review records of PPE distribution and training.	• Monthly monitoring during construction	• Contractors • PMU
Working conditions and Management of Worker	• Worker wages and benefits compared to legal requirements and industry standards • Instances of discrimination or unfair treatment based on gender, ethnicity, or other factors	• Construction sites • Worker camps	• Payroll records review: Verify worker wages and benefits. • Worker interviews:	• Regular payroll audits • Periodic	• Contractors • PMU

	• Access to grievance mechanisms for workers to report unfair labor practices		Confidential interviews to gather feedback on labor conditions and treatment. • Observation of worker interactions: Monitor for signs of discrimination or unfair treatment. • Review of contractor labor policies and practices: Ensure compliance with labor laws and ethical standards.	worker satisfaction surveys • Prompt investigation of any reported grievances	
Cultural heritage	• Unexpected impacts on heritage resources	• Construction sites	• Site inspection • Observation • Report by local people/local authority	• Daily • Reported to PMU within 48 hours	• PMU • Contractors
CROSS-CUTTING					
Loss access to land and other assets	• Number of households affected by land acquisition or temporary restrictions on land use • Types of assets affected (e.g., land, houses, crops, trees) • Adequacy of compensation and resettlement measures for affected households	• Project areas where land acquisition is required • Areas affected by temporary restrictions on land use	• Land surveys and asset inventories • Consultations with affected households • Review of compensation and resettlement plans • Monitoring of resettlement implementation	• Before land acquisition • During land • After resettlement	• Contractors • PMU

Loss access to natural resources:	• Impacts on community access to water resources (e.g., for drinking, irrigation, fishing) • Impacts on access to forests and other natural resources • Measures to mitigate impacts and provide alternative access to resources	• Areas downstream of irrigation schemes • Areas surrounding project activities that may affect natural resources	• Water quality and quantity monitoring: Assess impacts on water resources downstream of project activities. • Consultations with communities: Gather feedback on impacts on natural resource access and use. • Development and implementation of mitigation plans: Address impacts and provide alternative access to resources.	• Regular water quality and quantity monitoring • During project implementation: Monitor the effectiveness of mitigation measures.	• PMU • Relevant government agencies • Contractors
Social inequality	• Any actions on the part of Contractors' workers or community member that cause social conflicts (e.g. SEA/SH, the way construction activities are carried out [pollution, restricted access, loss of local income/livelihoods, accidents…)	• Construction sites • Relevant local communities	• Number of social conflicts arising and nature and scope of conflict • Number of social conflicts resolved by contractors within 7 days • Number of social conflicts resolved by local authorities • Number of serious cases that have happened and reported to PMU within 48 hours	• Daily • Monthly	• Contractors • PMU
	• Conflicts between upstream farmers who prioritize water storage for their crops and downstream farmers who require a consistent water supply for their agricultural needs.	• Local communities are living downstream and upstream.			

Elite capture	• Equitable distribution of project benefits among community members • Transparency and accountability in decision-making processes • Mechanisms for community participation and feedback	• Project implementation areas • Community meetings and consultations	• Monitoring of benefit distribution: Track who is receiving project benefits and ensure fairness. • Observation of decision-making processes: Assess inclusivity and transparency. • Community feedback mechanisms: Establish channels for communities to voice concerns and provide input.	• Throughout project implementation • Regular community meetings and consultations	• PMU • Contractors • Community representatives
Gender inequality	• Percentage of female beneficiaries • Percentage of beneficiaries who are youth • Average percentage women consulted • Number of action plans integrating specific women's • Average percentage FWUC with women in leadership positions • Women/youth trained in O&M • Number of training on gender and social inclusion delivered to MOWRAM staff	• Project sites • Community level	• Data collected through surveys and consultations • Review of project documents, training plans, and meeting minutes	• Monthly monitoring • Quarterly • Semi-annually • Annually	• PMU • Contractors •
During operation phase					
COMMUNITY HEALTH AND SAFETY	• Number of accidents and fatalities related to construction activities • Number of disease outbreaks and environmental pollution incidents • Number of reported cases of worker health issues	• Construction sites • Camp site and Worker camps • Nearby community	• Site inspection reports • Accident/Incident reports • Medical records/reports • Consultation minutes/reports	• Daily for site inspections • Monthly for reports and consultations • Within 48 hours for	• PMU • PDWRAM

				reporting accidents, disease outbreaks.	
CROSS-CUTTING					
Gender inequality	• Percentage of female workers in different roles (skilled, unskilled) • Number of reported cases of gender-based violence or discrimination • Participation of women in FWUCs and decision-making processes related to water management.	• Construction sites • FWUC meetings • Community consultations	• Observation of worker roles and interactions. • Records of complaints and their resolution. • Attendance records and meeting minutes.	• Monthly for data collection and reporting	• PMU • PDWRAM
Social inequality	• Employment rates of vulnerable groups (poor, ethnic minorities, people with disabilities) in project activities. • Access to project benefits (training, information, resources) among different social groups.	• Construction sites • Training sessions • Community consultations	• Employment records and beneficiary lists. • Attendance records and feedback surveys. • Consultations with community members and representatives of vulnerable groups.	• Monthly for data collection and reporting	• PMU • PDWRAM
Elite capture	• Participation and representation of different social groups in decision-making bodies (FWUCs, committees). • Transparency and accountability in the allocation of project resources and benefits. • Monitoring of complaints related to favoritism or exclusion in decision-making.	• FWUC meetings • Community consultations • Project implementation records	• Observation of meeting dynamics and representation • Analysis of resource allocation records. • Records of complaints and their resolution.	• Regularly during FWUC meetings and project implementation • Continuously through the GRM.	• PMU • PDWRAM

PMU = Project Management Unit, ESMP = Environmental and Social Management Plan, IP = Indigenous Peoples, SEA = Sexual Exploitation and Abuse, SH = Sexual Harassment, ESHS = Environmental Social Health and Safety, CoC = Code of Conduct, PDWRAM = Provincial Department of Water Resources and Meteorology, FWUC = Farmer Water User Communities, GRM = Grievance Redress Mechanism.

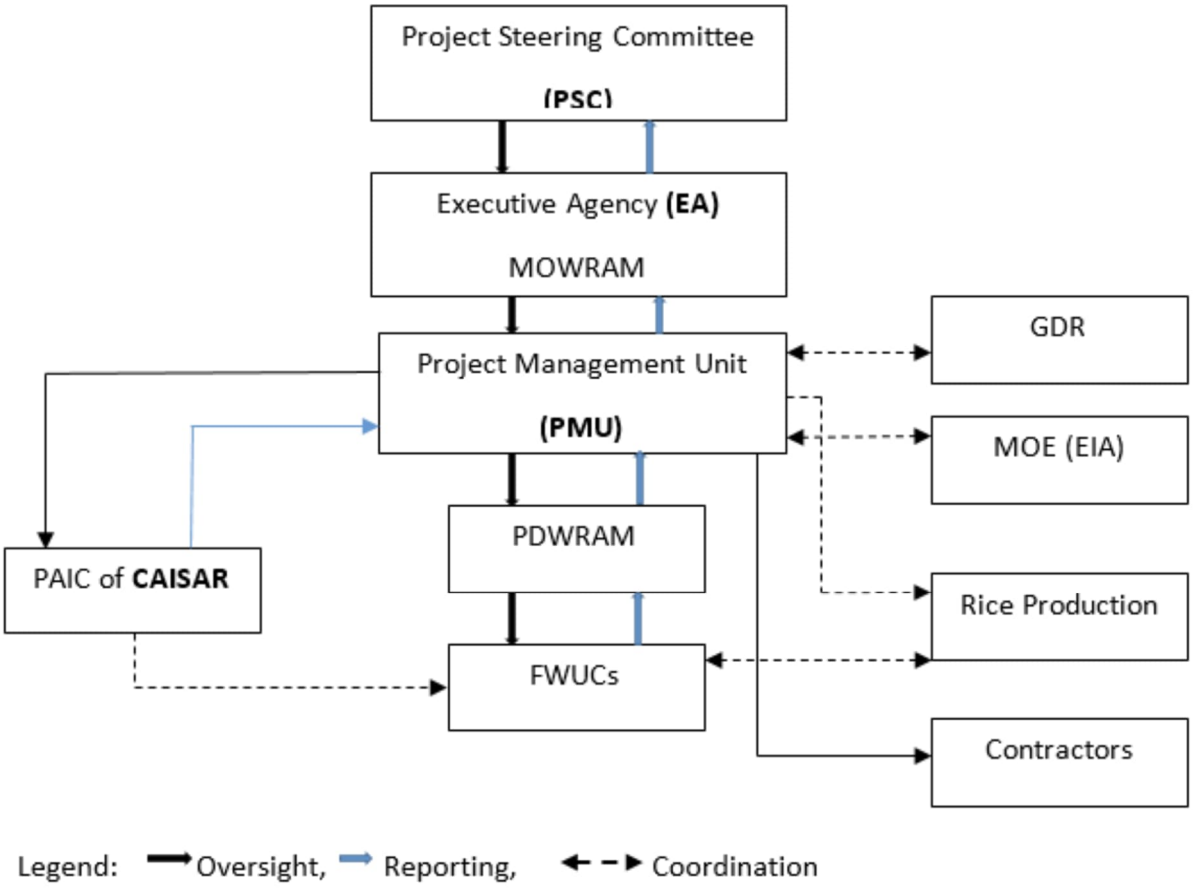
9.2.5 E&S Auditing

Auditing is a critical requirement for Category A projects, necessitating the engagement of an Independent Environmental and Social (ES) Monitoring Agency to ensure compliance during both construction and operation phases, as mandated by the AIIB Environmental and Social Framework (ESF). During the construction phase, audits must be conducted at regular intervals aligned with the lenders' requirements, typically quarterly, to monitor adherence to environmental and social safeguards, including waste management, pollution control, and worker safety. In the operation phase, annual audits are required to assess the long-term impacts on the environment and community, ensuring mitigation measures remain effective and operational standards are upheld. This dual-phase auditing approach ensures comprehensive monitoring and accountability throughout the project lifecycle.

9.3 ROLES AND RESPONSIBILITIES FOR IMPLEMENTATION OF SUB-SCHEME ESCMP

The feasibility study for the CAISAR Project provides key recommendations for implementation, focusing on climate and poverty goals. The project will be managed by the Ministry of Water Resources and Meteorology (MOWRAM) under the oversight of the Ministry of Economy and Finance (MEF) through the country program steering committee. MOWRAM will lead the project's overall management and implementation of Component 2 (Infrastructure), while the National Committee for Sub-National Democratic Development (NCDD) will handle Component 1, which includes farm support, capacity building, and climate-resilient farming practices. The International Fund for Agricultural Development (IFAD) will assist NCDD in leading Component 1 and will manage project communications.

The Project Management Unit (PMU) will include personnel from MOWRAM, the Department of Hydrology and River Works (DHRW), and Provincial Departments of Water Resources and Meteorology (PDWRAM) from four (4) provinces. Key phases include a program for solar pumping to improve infrastructure resilience and climate resilient infrastructure.



Monitoring and evaluation will focus on increasing capacity at the FWUC level, ensuring the project meets its long-term goals. MOWRAM will oversee project supervision, while PDWRAM and the Ministry of Agriculture, Forestry and Fisheries will handle resettlement and agricultural support. The project steering committee, chaired by the Minister of MOWRAM, will guide policy and implementation, with resettlement managed by an Inter-Ministerial Resettlement Committee led by MEF. Through these arrangements, the CAISAR project aims to enhance water management and agricultural productivity in Cambodia.

9.4 ENVIRONMENTAL AND SOCIAL COMPLIANCE FRAMEWORK

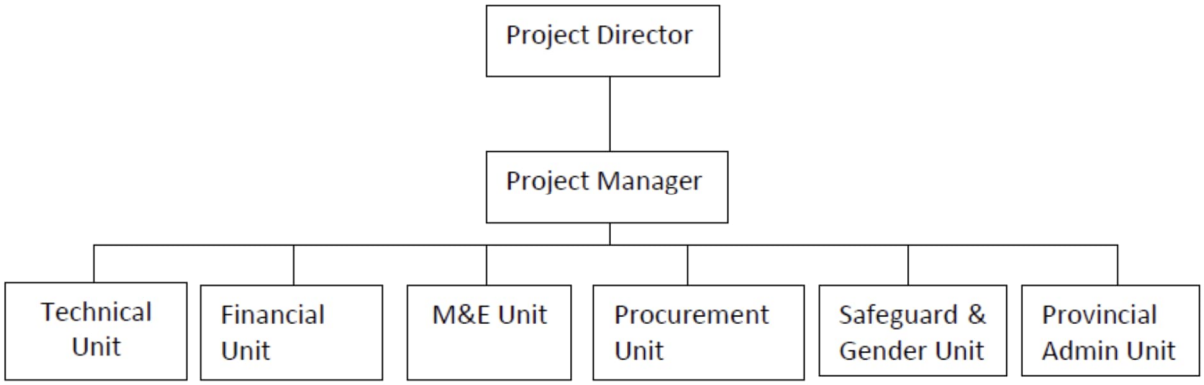
9.4.1 Institutional Arrangement and Capacity Development

MOWRAM is the Executing Agency for implementation of the Project. However, successful implementation of the Project requires the cooperation of several ministries. The project steering committee (PSC) was established to achieve the inter-ministerial coordination and chaired by the Minister of MOWRAM and comprising of senior officials from MOWRAM, MOI (NCDD), MAFF, Ministry of Environment (MOE), Ministry of Economy and Finance (MEF), and the Provincial Governor's Offices of Pursat, Kampong Chhnang, Kandal, and Kampong Speu provinces will oversee project implementation and provide support to the project. Figure 9.1 below shows the Project organization Structure.

Figure 9.1: CAISAR Project (Component 1) Structure Chart

PAIC = Project Appraisal and Implementation Committee, CAISAR = Climate Adaptive Irrigation and Sustainable Agriculture for Resilience, PDWRAM = Provincial Department of Water Resources and Meteorology, FWUCs = Farmer Water User Communities, GDR = General Department of Resettlement, MOE = Ministry of Environment, EIA = Environmental Impact Assessment.

(Source: Feasibility report structure chart)



A project management unit (PMU) has been established establish for the CAISAR project. The PMU will be headed by the Secretary of State of MOWRAM as Project Director, with assistance from the DFWUC Director as Project Manager. The PMU will be fully involved in the preparation and implementation of the project. The PMU is composed of designated personnel from MOWRAM, the Department of Hydrology and River Works (DHRW) of

MOWRAM, and the PDWRAMs of Pursat, Kampong Chhnang, Kampong Speu, and Kandal provinces.

The PDWRAMs are responsible for coordinating all field activities with FWUCs and DFWUC and implementing O&M activities.

The PMU is supported by the Project Management Implementation Consulting (PMIC) and consists of Project Director, Project Manager, Technical Unit, M&E Unit, Financial Unit, Procurement Unit, Safeguard & Gender Unit and Provincial Administration Unit as show in Figure 9.2 below.

Figure 9.2: CAISAR Project PMU structure chart

M&E = Monitoring and Evaluation.

9.4.2 Environmental and Social Duties of the PMU/Detail Design Consultants

9.4.2.1 MOWRAM'S PMU

MOWRAM's PMU will work closely with PDWRAM in planning and implementing subprojects located within their province. The PDWRAMs will also supervise project officers at the district-level Department of Water Resource and Meteorology, and are responsible for:

- Coordinating effectively with all project stakeholders, including MOWRAM's SEO, consultants, contractors, local authorities, provincial departments, and project communities.
- Supporting provincial and district-level project officers in monitoring and evaluating progress and performance of consultants and contractors.
- Supporting MOWRAM'S SEO to conduct training on labor, gender, SEA, SH, VAC, and HIV/AIDS.
- Supporting MOWRAM'S SEO to disseminate project information and conduct consultation activities, as well as ensuring effective grievance redress resolution within their province.
- Supporting MOWRAM'S SEO to conduct screening and scoping of the subprojects, and identifying environment, social, land acquisition impacts and screening for presence of IPs in the subproject area.

- Liaising with village authorities in subproject area to encourage vulnerable groups to apply for jobs that may be offered by project contractors.
- Collaborating with relevant departments involved in land acquisition and/or other environment or social mitigation measures.

9.4.2.2 NCDD'S PMU

NCDD's PMU will work closely with Provincial Cabinet in planning and implementing subproject located within their province. NCDD PMU will be responsible for day-to-day project implementation, monitoring and evaluation of Project Component 1, 2.1 and 2.2 in collaboration with MAFF. PMU will work under the oversight and guidance of NCDDS and will be responsible for all aspects of environmental and social performance, including E&S monitoring and evaluation, reporting of E&S performance, and relevant incidence during project implementation.

9.4.2.3 Provincial Department of Water Resources and Meteorology

PDWRAM's main responsibility includes:

During subproject preparation and construction:

- Support design parties in their surveys and consultation to prepare Feasibility Study and Detailed Design for sub-scheme.
- Oversee construction activities under Component 2, particularly construction of the new irrigation canal in the command area

During operation:

- Collaborate with other relevant technical departments, especially PDAFF at provincial level, farmer water user groups (FWUG) to ensure its regulators (located within the water distribution network) are operated effectively, and in a manner that minimizes water use conflicts among target water user community in the command area.
- Conduct regular maintenance of the reservoir and irrigation canals during subproject operation and maintenance stage.

9.4.2.4 Provincial Department of Agriculture, Forestry and Fisheries

PDAFF is responsible for implementing activities under Component 1, 2.1 & 2.2. Under this subproject, PDAFF is responsible for developing and implementing agricultural techniques that make full use of improved water access (under Component 1) to enable farmers in the command area to produce more food in a sustainable manner which improves farmers' income and livelihoods. PDAFF will focus on the following:

- Promoting crop diversification for farmers in the command area (e.g. crop rotation for rice and horticulture production improves soil conditions whereas enhancing vegetation production for household's better nutrition and income.
- Introducing to farmers new agricultural engineering techniques to promote a) mechanization to increase productivity in crop production (e.g. mechanization in soil

preparation using laser land leveling, use of combine harvester to save labor and reduce production costs, b) save water by applying alternate wet and dry (AWD) and drip irrigation for horticultural activities, c) reduce GHG.

- Scaling up Crop Production and engaging Private Sector in value chain development for specific farm product (e.g. rice, bean, and other cash crops such as vegetables…) and relevant agricultural services through agricultural cooperatives, producer groups, etc.

9.4.3 Environmental and Social Duties of the Contractor

The contractor and its subcontractors, if any, shall comply with the ESMP. In particular, the Contractor must prepare a Contractor's ESMP (C-ESMP) to elaborate this ESMP based on a) site condition, b) capacity of the Contractors and their subcontractors (if any), c) national regulations that are active by the time of subproject implementation.

To ensure that necessary action has been undertaken and that steps to avoid adverse impacts and/or reoccurrence have been implemented, the Project Manager, the Safeguard Focal Persons, and/or contractor must report to PMU within 48 hours of any serious incidents of non-compliance that may have serious consequence. In the event of working practices being deemed dangerous either by the subproject, the local authorities, or the other concerned agencies, immediate remedial action must be taken by the contractors. The contractor must keep records of any incidents and any corrective action taken. The records of non-compliance that could be practically addressed (not cause serious impacts) will be reported to the DDIS with a copy to PMU monthly.

The contractor will be responsible for dealing with any reports/grievance forwarded by the local communities, authorities, police or other agencies as soon as practicable, preferably within one (1) hour but always within 48 hours. The Project Manager/Safeguard Focal Persons will monitor and ensure that the contractor has taken appropriate action. Where appropriate, approval of remedial actions may require an agreement from the local authorities and/or other government agencies. Procedures should be put in place to ensure, as far as is reasonably practical, that necessary actions can be undertaken to avoid recurrence and/or serious damage.

9.4.4 Contractor's Environmental and Social Management Plan (C-ESCMP)

The civil works contractor is responsible for implementing the Environmental and Social (E&S) mitigation measures outlined in this ESMP for Component 2, which involves constructing the irrigation canal and related structures like gates and regulators. Based on the ESMP and the project's Labour Management Plan (LMP), the contractor will:

- Prepare and submit a Contractor's Environmental and Social Management Plan (C-ESMP) for each contract, detailing how E&S risks related to construction activities, workers, camps, machinery, and vehicles will be mitigated. The C-ESMP must also include a labor management plan (C-LMP) and be site-specific, addressing risks based on the contractor's capacity and site conditions.

- If subcontractors are engaged, they must prepare their own E&S plan aligned with the ESMP and LMP, outlining how they will manage identified risks and impacts. Reporting arrangements between the subcontractor and the main contractor must be detailed, with the main contractor consolidating subcontractor reports into monthly E&S performance reports to the PMU, with quarterly reporting potentially required.
- If changes occur to the proposed works and activities during the contract period, the contractor must update the C-ESMP to reflect these changes, including relevant subcontractor plans. The C-ESMP should include:
    - A policy statement outlining the contractor's commitment to the site-specific ESMP.
    - Document details (issue date, revision status, distribution list, and signatures).
    - Applicable laws, regulations, and required permits.
    - Plans to manage E&S risks, including mitigation measures, a Workers' Code of Conduct, and a Contractor's LMP.
    - A list of required environmental and social training for all personnel, including occupational health and safety, SEA/SH/VAC risks, and emergency response.
    - Financial resources and responsibilities for implementing the C-ESMP, including subcontractor responsibilities and training for local workers.
    - Monthly environmental reports, covering accident/incident reporting within 48 hours to MoWRAM, compliance with the C-ESMP, challenges, non-compliance issues, subcontractor activities, and meeting minutes with MoWRAM.

The contractor must ensure timely funding, human resources, and implementation of pre-construction and construction mitigation measures, along with any additional E&S mitigation required.

9.4.5 Safety, Social and Environmental Officer (SSEO)

Under the PMU, the consultant must be competent on-site Safety, Social, and Environment, trained in environmental management, to oversee contractors and subcontractor personnel. The SSEO's responsibilities include:

- Supervising subcontractor compliance with the Contractor's LMP and C-ESMP.
- Submit the LMP and C-ESMP to the PMU/DDIS for approval before mobilizing staff.
- Conducting site inspections and audits to ensure compliance with environmental and social mitigation measures.
- Monitoring and reporting on E&S compliance and preparing audit reports.
- Investigating complaints, recommending corrective actions, and addressing non-compliance.
- Informing the contractor, PMU, and DDIS of any E&S issues, and maintaining detailed records.

- Collaborating on labor issues and preparing the Contractor's LMP and C-ESMP, including OHS regulations.
- Maintaining employment records, verifying minimum working age, and ensuring signed Workers' Codes of Conduct.
- Providing regular training on occupational safety, SEA/SH/VAC, and community relations.
- Ensuring primary suppliers address SEA/SH/VAC, child labor, forced labor, and OHS risks.
- Developing and implementing a grievance mechanism for contracted workers, resolving grievances promptly, and reporting to the PMU.
- Ensuring all workers sign the Code of Conduct and implement measures to prevent SEA/SH.
- Developing and enforcing COVID-19 prevention and mitigation plans.

Incident reporting

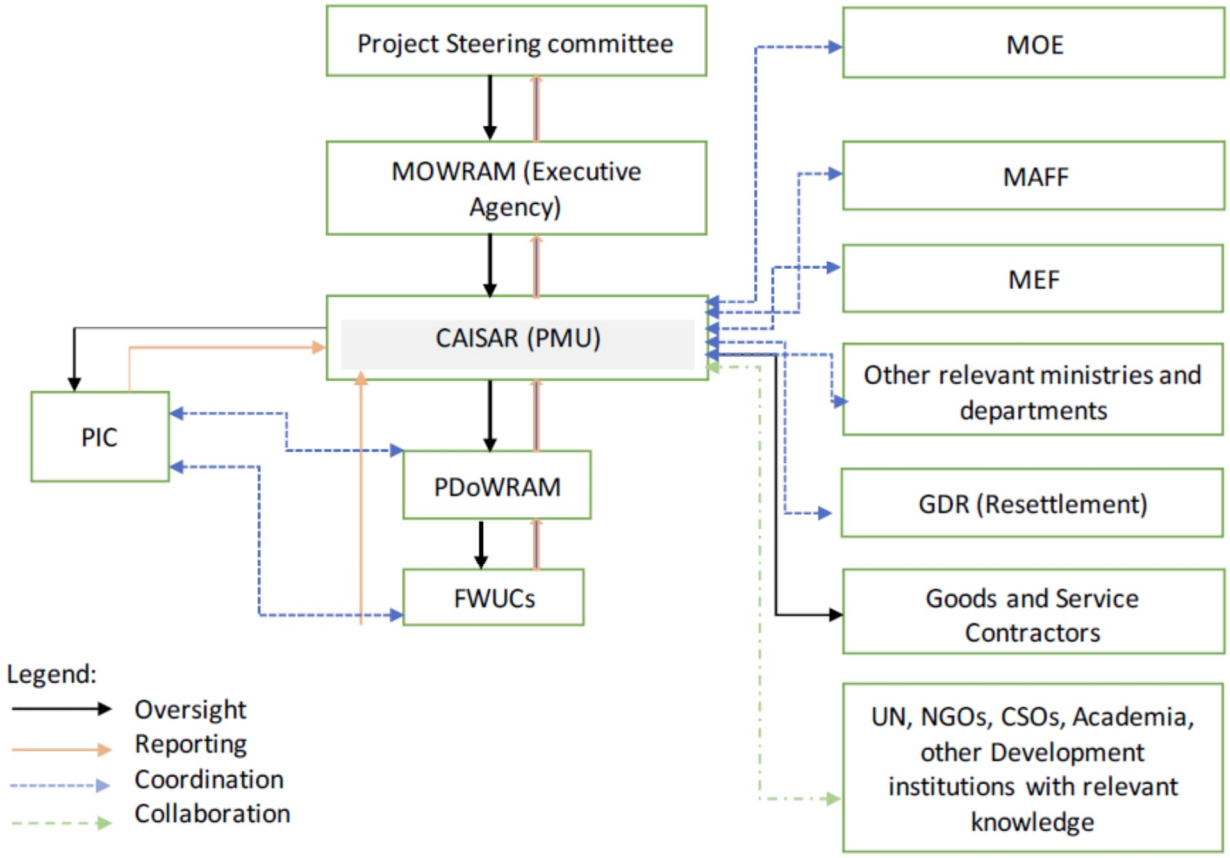
The contractors are required to inform DDIS and PMU any incidents listed below within agreed timeframe (e.g. 48 hours):

- Any violations to national laws, regulations, or international agreements.
- Any serious accidents or fatalities,
- Significant impacts that cause losses to personal property such as traffic accidents, damages to local houses/roads and other incidents.
- Serious surface/ground water pollution.
- Failures of embankments at disposal sites that cause serious pollutions to the surroundings,
- Fire related to worker's behaviours,
- Any claims related to SEA/SH/VAC, or any other incidents related to children, and
- Receive a complaint about pollution or damages.

9.4.6 Reporting Arrangements

E&S performance will be included in both subproject and overall project progress reports. Safeguard specialists in each PPMU, with support from CSC/field engineers, will monitor and report on E&S performance. These specialists will submit monthly E&S reports at the subproject level to the CPMU. At the central level, the CPMU will prepare biannual E&S monitoring reports for submission to IFAD and the GCF, outlining project progress and compliance with SECAP/GCF safeguards (See also Table 9.6).

The progress report to CPMU must provide sufficient details on subproject implementation and E&S issues related to ESCMF. The flow in reporting of the project is depicted in Figure 9.3. The overall report from CPMU to IFAD and GCF will include: (i) preparation and disclosure



of E&S instruments for subprojects; (ii) progress on ESCMP implementation, including ECOP/COC on SEA requirements in bidding documents; (iii) monitoring of contractor, CSC, and PPMU performance under ESCMP, ECOP, and COC on SEA; and (iv) challenges, solutions, and lessons learned during implementation. Table 9.6 summarizes reporting procedures.

Table 9.5: Report procedure

	Report Prepared by	Types of Report	Project Com.	Submitted to	Frequency of Reporting
1	Contractor to the Employer	Progress Report: Progress, issues and challenges, and suggestions	1, 2	PPMUs	Once before construction commences and monthly thereafter
2	Construction Supervision Consultant (CSC)	Monitoring report: Testing, inspection and observation results, status of construction: quality, conflict, compliance.	1, 2	PPMUs	Weekly and monthly
3	Community Monitoring	Monitoring report: Observation, complaints, solutions, challenges, and suggestion	1, 2	PPMUs	When the community has any complaint about the subproject E&S/ESCMF implementation
4	PPMUs	Progress Report: Progress, issues and challenges, and suggestions	1, 2, 3	CPMUs	Monthly
5	CPMUs	Progress Report: Progress, issues and challenges, and suggestions	1,	IFAD and GCF	Once every six (6)-months, in accordance with any signed legal agreements.

PPMUs = Provincial Project Management Unit, E&S = Environmental and Social, ESCMF = Environment, Social, Climate Management Framework, CPMUs = Central Project Management Unit, IFAD = International Fund for Agricultural Development's, GCF = Green Climate Fund.

CHAPTER 10 – PUBLIC CONSULTATION AND INFORMATION DISCLOSURE

10.1 INTRODUCTION

This chapter, "Public Consultation and Information Disclosure," focuses on the consultation process and the dissemination of project-related information to ensure transparency and stakeholder engagement. It outlines the steps taken to involve local communities, relevant authorities, and other stakeholders in the consultation process, providing them with opportunities to voice their concerns, feedback, and suggestions. The chapter also details how information was disclosed to the public, ensuring that all parties had access to accurate and timely project data. The consultation involved a diverse group of people, including community members, local leaders, government representatives, and civil society organisations. The results of these consultations are critical in shaping the project's direction, addressing potential impacts, and fostering a more inclusive and collaborative decision-making process.

10.2 SUMMARY OF PUBLIC CONSULTATION PROCESS & RESULTS

10.2.1 The Consultation

10.2.1.1 Periods, Stakeholders and Purposes

Public consultation is a key component of CAISAR, and it was pivotal in preparation of the Environmental, Social, Climate Impact Assessment report (ESCA) Report and the Environmental, Social, Climate Management (ESCM) Plan. The consultations were conducted with relevant institutions, non-governmental organizations, local authorities, and local people during the preparation of ESCIA and ESCMP for CAISAR project. The data collection and consultations were conducted in four (4) periods:

- The first consultation was conducted between 26 and 28 July 2024 to capture information regarding biodiversity and environmental condition in the project area.
- The second consultation was conducted to consult with forestry and fishery communities, local authorities and key informants to understand the situation and concerns related to the presence of the project. The consultation was conducted between 03 and 09 August 2024.
- The third consultation was conducted at household, village, and commune level stakeholders focusing on status, concerns and feedback regarding the project implementation. This consultation was conducted between 10 and 18 August 2024.

- The last consultation was conducted between 21 and 23 August 2024 with the district and provincial stakeholders, mainly focusing on the opinion, and feedback regarding the implementation of the project.

In addition to the stated consultations, there are also continuous consultations being conducted with AIIB, IFAD, and CAISAR PMU including the PMU management, SECAP team, and engineering team to ensure that the disclosed information being aligned with the most updated information of the project.

Table 10.1: Number of participants being consulted for the ESCIA

Levels	**Household survey (Beneficiaries and Potentially Affected)**	**Focus Group Discussions**	**Key Informant Interviews**	**Total**
Village level	272 (134 Females)	309 (180 Females)	32 (3 Females)	613 (317 females)
Commune level			35 (11 Females)	35 (11 Females)
District level			28 (10 Females)	28 (10 Females)
Provincial level			51 (12 Females)	51 (12 Females)
			Total	**727 (350 Females)**

Table 10.2: Types of stakeholders, and topics of the consultations is shown below:

No.	Levels	Key topics	Methods	Timeframe	Participants	Concerns
1	Village	Beneficiary Households	Household Survey	10 - 18 August 2024	A household survey was carried out to gather information from local people living in the 31 villages neighbouring the ESCIA project area.	Refer to concerns and suggestions from consulted people in section 9.2.2.
		Potentially Affected Households				
		Rice farmers	FGDs	10 - 18 August 2024	309 persons (129 male and 180 female)	
		Vegetable producers				
		Chicken raisers				
		Duck raisers				
2	Commune	Commune Committee for Women and Children	Key Informant Interviews	26 - 28 July 2024 03 - 09 August 2024	31 persons (20 male and 11 female)	
		Agricultural Cooperatives				
		Water Farmer User Community				
		Fishermen				
		Community Forestry				
		Community Fishery				
3	District	Offices of Development and Planning, Agriculture, Environment, Women Affairs,	Key Informant Interviews	21 - 23 August 2024	28 persons (18 male and 10 female)	
4	Province	Provincial Hall,				

No.	Levels	Key topics	Methods	Timeframe	Participants	Concerns
		Departments of Land, Water, Agriculture, Environment, Women Affairs, Labour, and Culture	Key Informant Interviews	26 - 28 July 2024 21 - 23 August 2024	51 persons (39 male and 12 female)	
		Non-Governmental Organizations				
		Biodiversity Expert				

FGDs = Focus Group Discussions.

10.2.1.2 Consultation Process

The purposes of the consultation were to:

- Inform local people and interested stakeholders of the purpose of the rehabilitation and construction of the irrigation system,
- Share the project information and the design options from the draft engineering design,
- Highlight subproject's key activities that potentially associated with them, and
- Collect their opinion, concern and feedback on the project focusing on background information, project potential impacts (positive and negative), suggestions for impact mitigations, and consultation mechanism.

The consultation agenda with stakeholders included (i) the introduction of the study team, (ii) sharing project information using illustration materials, (iii) discussion and consultation on potential benefits and impacts of the project, (iv) suggestions on the mitigation measures, (v) grievance process and concerns, and (vi) final wrap up for the consultation. The study team were trained to introduce themselves about the purpose of the consultation, followed by the introduction about the project's component and activities expected to be implemented within the area. Materials including leaflet on project information and map of the command area were shared and explained to stakeholder prior to the consultation. Lastly, the consultation began with an overall discussion and specific questions as per the relevant aspect to the stakeholder. Opinions, concerns and suggestions were gathered and confirmed prior to the end of the consultation.

10.2.2 Results of the Consultations

The result of the consultation is presented below summarizing what the consulted stakeholders perceived about the project, their concerns on the risks and impacts, and their feedback and suggestions to which the project should be taken care of. The results of the consultations include general opinions, concerns and feedback on the project of stakeholders from focus group discussion, village leaders, commune councils, district authorities, provincial line departments, and provincial governments. The results from the consultations were also included in Chapter 06, and Chapter 08 to which they have been responded in the mitigation measures of the project. The synthesized results of the consultation are presented as per the identified VECs below.

10.2.2.1 Ou Ta Paong

10.2.2.1.1 Environment and Biodiversity Component

a. Pollution prevention and resource efficiency

Concerns

- The rehabilitation of irrigation canals and farm roads can disturb environmental effects.
- Large machines can generate noise and vibration pollution, which can disturb nearby residents and wildlife.
- The disposal of solid, liquid, and domestic waste from the workers at the irrigation construction site can negatively impact local air quality and surface water.

Suggestions from the consulted people

- Avoid construction at night.
- Install garbage bins and waste storage areas in the construction sites and conduct orientation workers to put the waste in the garbage bins.
- Government institutions and stakeholders should regularly conduct site inspections to inspect project activities that harm the environment and local community.

b. Biodiversity

Concerns

- CAISAR project may cause negative impacts on the environment, including changes in water quality, dust generation, air pollution, soil erosion, improper waste disposal, and hazardous waste from machinery.
- The project could disrupt the natural flow of water from upstream to Tonle Sap Lake, potentially harming the lake's biodiversity.
- Fish populations in command areas may decrease due to disrupting the natural flow of water and the impact on their habitats from the implementation of the irrigation infrastructure and canal upgrading.

Suggestions from the consulted people

- The contractors and relevant parties should conduct water quality and air quality monitoring during construction.
- Contractors must regularly monitor and inspect the living conditions of the workers, manage waste effectively, and provide adequate housing and sanitation facilities to them.
- Providing comprehensive training to workers on proper waste and oil management procedures.
- Activities such as fishing and hunting should be strictly prohibited to minimize environmental impact.
- The project should avoid construction activities and improve irrigation on fish and aquatic habitats.

- Prevent damage from the construction activities to biodiversity, habitats, and other environmental components.

c. GHG Emission

Concerns

- Climate change is negatively impacting rice production, causing problems such as insect infestations, and extended dry seasons,
- Waste and pollution may contribute to the emission of GHG

Suggestions from the consulted people

- The contractors should ensure that garbage bins are conveniently placed throughout the workers' camp and collaborates with a waste collection company to guarantee regular and efficient removal of waste.
- To minimize emissions, contractors are advised to refrain from using outdated machinery.

10.2.2.1.2 Social Component

a. Labor and Working Conditions

Concerns

- The presence of construction staff and workers at the community may lead to sexual exploitation or affecting women workers and women and children in the community.

Suggestions from the consulted people

- The construction companies should hire local workers to offer them jobs and strictly abide by laws and reduce the concerns about gender-based violence or sexual violence.
- Construction companies and relevant departments should provide training on gender issues, violence, labour laws, and social protections to their staff and workers.
- The project should allocate budget for relevant line departments to conduct relevant trainings to the companies and workers, and to monitor the construction sites

b. Community Health and Safety

Concerns

- Participants remain concerned that the presence of workers could result in sexual abuse of women and children living near the project site,
- Drug trafficking and consuming among workers may cause unsafe environment for both workers and surrounded residents,
- The construction activities may generate dust and slippery road conditions which may lead to traffic incidents,
- Waste generated from worker camps and construction activities during the project could degrade water quality, negatively impacting human health, livestock, and crops.

Suggestions from the consulted people

- The construction companies should regularly place warning signs and water the roads, as well as schedule construction times to minimize noise pollution that could disrupt the community,
- The project should promote gender awareness, enforce stricter punishments for offenders, and prevent drug trafficking in the workplace,
- The construction companies must collaborate with local authorities in all activities to make a proper management, control and monitoring during construction, and
- The project should conduct gender education at the district to prevent and address gender-based violence,

c. Land acquisition, economic and physical displacement

Concerns

- Conflicts between the project and affected families may arise, often driven by external influences rather than the families themselves.
- Land-owning farmers might lose their land for agriculture, which could compel them to migrate.

Suggestions from the consulted people

- The project should conduct a preliminary study on land issues before construction is going to be implemented, addressing specific aspects of land impact and conducting evaluations for each affected property,
- The project/construction company must collaborate with local authorities to resolve land-related issues, and compensation should be provided to landowners affected by the project,
- Farmers who own land may lose it for farming, which could force them to migrate, heightening their vulnerability to exploitation.

d. Cross–cutting risks and impacts

Concerns

- Unequal water distribution among farmers leads to conflicts.
- Institutions or companies responsible for establishing FWUCs are typically based at the national level, resulting in limited quality implementation weakening the FWUCs as PDWRAM is sidelined.
- The FWUCs struggle to generate income, making water management challenging, as there is no budget for repairs, leading to improper system operations.
- Farmers face various challenges such as pests, diseases, labor shortages, lack of capital, limited production techniques, flooding, unstable prices for vegetables and livestock, and high agricultural input costs.
- The provincial department lacks the budget to support the resolution of water user conflicts.
- Some farmers are absent from the rice fields during water distribution periods.

- Tensions between upstream and downstream villages arise when excess water released upstream during the wet season causes downstream flooding, while in the dry season, insufficient upstream water flow impacts downstream areas.
- High agricultural input costs continue to reduce farmers' profitability.
- Farmers do not follow official guidance on the size of rice fields to be cultivated, leading to inadequate water for irrigation.

Suggestions from the consulted people

- PDWRAM should be the leader in formulating the FWUCs with the support from national level,
- Water use and maintenance support should be provided including technical and management training, along with problem-solving techniques, to effectively control and manage water distribution,
- The project should thoroughly examine the water availability, technical and situational aspects of the sub-scheme before construction to prevent water shortages or flooding,
- Ensure transparent water supply to prevent disputes by holding meetings to plan water use and distribution, involving the district governor, commune council, and relevant stakeholders,
- All parties should also participate in the maintenance of the irrigation system and provide training or education on water conservation to farmers.
- Prior to starting irrigation rehabilitation, disseminate project information to people and stakeholders, and announce the construction period in advance.
- The water consumption fee should be gathered from farmers which could be used later to support caretakers and maintain the irrigation system.
- Increase the number of commune agricultural technical officers to provide training and monitor farmers' cultivation techniques.
- Build more water storages, and reservoirs such as ponds or wells and conduct training on water-saving techniques to adapt to actual water availability.
- Installing and upgrading the damaged sluice gates to improve water distribution efficiency and prevent water loss in agricultural production and irrigation systems.
- Facilitate the development of additional agricultural markets.
- Providing modern equipment and new techniques to department officers can enhance agricultural production efficiency and yield.

10.2.2.2 Lum Hach

10.2.2.2.1 Environment and Biodiversity Component

a. Pollution prevention and resource efficiency

Concerns

- During the construction stage, such as the rehabilitation of irrigation canals and farm roads, can have disturbing environmental effects.
- The disposal of liquid waste from the workers at the irrigation construction site will negatively impact local air quality and surface water.

Suggestions from the consulted people

- Government institutions and stakeholders should regularly conduct site inspections to reduce project activities that harm the environment and local community.
- Relevant ministries should conduct a visit to evaluate and address the issue of liquid waste from the construction activities in the commune.

b. Biodiversity

Concerns

- CAISAR project may cause negative impacts on the environment, including changes in water quality, and hazardous waste from machinery.
- The fish populations in command areas may decrease due to disrupting the natural flow of water and the impact on their habitats from the implementation of the irrigation infrastructure and canal upgrading.

Suggestions from consulted people

- To ensure the well-being of workers, contractors must regularly monitor and inspect the living conditions of the workers, manage waste effectively, and provide adequate housing and sanitation facilities to them.
- The contractor is responsible for providing comprehensive training to workers on proper waste management procedures.

c. GHG emission

Concerns

- Climate change is negatively impacting rice production, causing problems such as increased disease, insect infestations, and extended dry seasons,
- Waste and pollution may contribute to the emission of GHG

Suggestions from the consulted people

- Installing solar water pumps in agriculture processing facilities can reduce fuel consumption, which causes greenhouse gas emissions.

10.2.2.2.2 Social Component

a. Labor and Working Conditions

Concerns

- The presence of construction staff and workers at the community may lead to sexual exploitation or affecting women workers and women and children in the community.

- At the construction sites, some men may undervalue women's work. The gender disparities continue to exist, with some men holding the belief that women are not capable or willing to work.

Suggestions from the consulted people

- Construction companies should prioritize hiring local workers, comply strictly with laws, and take steps to mitigate concerns about gender-based and sexual violence.
- Construction companies and relevant departments should provide training on gender issues, violence prevention, labor laws, and social protections to their staff and workers.
- Additional support and monitoring measures should be put in place to prevent abuse, with any incidents being promptly addressed to avoid recurrence.
- Local authorities should regularly inspect construction sites to ensure no children are employed, taking immediate action if any issues are identified.
- The project should allocate funds to support relevant departments in providing training to companies and workers, as well as monitoring construction sites.

b. Community Health and Safety

Concerns

- The presence of workers could lead to the sexual abuse of women and children living near the project site.
- Drug trafficking and use among workers could create an unsafe environment for both workers and nearby residents.
- After construction is completed, there may be risks of people and animals falling into the canals, potentially leading to drowning incidents.
- Waste generated from worker camps and construction activities during the project could degrade water quality, negatively impacting human health, livestock, and crops.

Suggestions from the consulted people

- Construction companies should regularly place warning signs, water the roads, and schedule construction activities to minimize noise pollution that could disrupt the community.
- The project should promote gender awareness, enforce stricter penalties for offenders, and prevent drug trafficking in the workplace.
- Separate accommodations for men and women should be provided.
- Construction companies must collaborate with local authorities to ensure proper management, control, and monitoring throughout the construction phase.
- The project should conduct gender education at the district level to prevent and address gender-based violence.

- The project should establish gender outreach committees at the commune and village levels to monitor gender-related issues within the project areas, particularly during construction.

c. Land acquisition, economic and physical displacement

Concerns

- Landowners along the irrigation system without proper land registration are concerned they may not receive compensation due to the lack of title deeds.
- While the project supports agricultural production, it may not benefit poor families who do not own land for farming.
- Conflicts between the project and affected families may arise, often instigated by external parties rather than the families themselves.
- Land-owning farmers could lose their land, potentially forcing them to migrate, increasing their vulnerability to exploitation and potentially causing their children to drop out of school.

Suggestions from the consulted people

- The project should conduct a preliminary study on land issues before starting construction, addressing specific land impacts and evaluating each affected property.
- The project or construction company must work closely with local authorities to resolve land-related issues, and compensation should be provided to landowners affected by the project.

d. Cross–cutting risks and impacts

Concerns

- Construction companies might disregard concerns raised by local authorities and communities regarding the actual conditions of the area.
- The high cost of agricultural inputs continues to reduce farmers' profits,
- Farmers do not follow the guidance from authorities regarding the size of rice land areas that should be cultivated causing inadequate water for irrigation,
- Manure for fertilizer is declining due to reduced animal raising and lower cattle prices are prompting farmers to reduce livestock raising
- Besides water issues, farmers also struggle with pests, diseases, inadequate labour, lack of capital, limited production technique, flooding, unstable sale price (vegetable and animal) and high agricultural input costs,
- The provincial department lacks budget to support water user conflict resolution,

Suggestions from the consulted people

- A proper handover to local authorities upon project completion should be conducted to avoid quiet handovers,

- Women should be engaged and be promoted as the members of Water User Community to promote water distribution equality regarding water allocation from the system,
- Closed monitoring and support to FWUCs are critical and should be conducted regularly by all levels,
- Water use and maintenance support should be provided including technical and management training, along with problem-solving techniques, to effectively control and manage water distribution,
- Ensure transparent water supply to prevent disputes by holding meetings to plan water use and distribution, involving the district governor, commune council, and relevant stakeholders,
- All parties should also participate in the maintenance of the irrigation system and provide training or education on water conservation to farmers.
- Prior to starting irrigation rehabilitation, organize a public forum to gather feedback from local residents, disseminate project information to people and stakeholders, and announce the construction period in advance.
- The water consumption fee should be gathered from farmers which could be used later to support caretakers and maintain the irrigation system.
- Build more water storages, and reservoirs such as ponds or wells and conduct training on water-saving techniques to adapt to actual water availability.
- Installing and upgrading the damaged sluice gates to improve water distribution efficiency and prevent water loss in agricultural production and irrigation systems.
- Facilitate the development of additional agricultural markets.

10.2.2.3 Brambei Mom

10.2.2.3.1 Environment and Biodiversity Component

a. Pollution prevention and resource efficiency

Concerns

- Stakeholders did not express concern about the pollution caused by the rehabilitation and construction of the irrigation system.
- The construction process can release dust, which will disturb the local community and surface water quality.

Suggestions from the consulted people

- Regularly watering on the road transports construction materials and soil to reduce dust that may disturb nearby residents.

b. Biodiversity

Concerns

- Participants did not address the concerns related to the impact of construction activities on local biodiversity; instead, they highlighted the positive effects on fish and aquaculture habitant and movement.

Suggestions from the consulted people

- Prevent damage from the construction activities to biodiversity, habitats, and other environmental components.

c. GHG emission

Concerns

- Climate change is negatively impacting rice production, causing problems such as increased disease, insect infestations, and extended dry seasons,

Suggestions from the consulted people

- Installing solar water pumps in agriculture processing facilities can reduce fuel consumption, which causes greenhouse gas emissions.

10.2.2.3.2 Social Component

a. Labor and Working Conditions

Concerns

- The presence of construction staff and workers at the community may lead to sexual exploitation or affecting women workers and women and children in the community.

Suggestions from the consulted people

- The construction companies should hire local workers to offer them jobs and strictly abide by laws and reduce the concerns about gender-based violence or sexual violence.
- Construction companies and relevant departments should provide training on gender issues, violence, labour laws, and social protections to their staff and workers.
- Additional support and monitoring measures should be implemented to prevent abuse, and any incidents should be promptly addressed to prevent recurrence.
- The project should allocate budget for relevant line departments to conduct relevant trainings to the companies and workers, and to monitor the construction sites

b. Community Health and Safety

Concerns

- Participants remain concerned that the presence of workers could result in sexual abuse of women and children living near the project site,
- Drug trafficking and consuming among workers may cause unsafe environment for both workers and surrounded residents,
- The construction activities may generate dust and slippery road conditions which may lead to traffic incidents,

Suggestions from the consulted people

- The construction companies should regularly place warning signs and water the roads, as well as schedule construction times to minimize noise pollution that could disrupt the community,
- The project should promote gender awareness, enforce stricter punishments for offenders, and prevent drug trafficking in the workplace,
- The construction companies must collaborate with local authorities in all activities to make a proper management, control and monitoring during construction, and
- The project should conduct gender education at the district to prevent and address gender-based violence,
- Separate accommodations for men and women should be provided,
- The project should establish gender outreach committees at the commune and village levels to monitor the gender related issues within the project areas, especially during construction,

c. Land acquisition, economic and physical displacement

Concerns

- Conflicts between the project and affected families could emerge, often fuelled by external instigators rather than the families themselves,

Suggestions from the consulted people

- Preliminary study on land issues before construction is recommended, with each sector addressing specific aspects of land impact and conducting evaluations for each affected property.
- The project/construction company must collaborate with local authorities to resolve land-related issues, and compensation should be provided to landowners affected by the project.
- The government is requested to assist in issuing land titles to farmers with land adjacent to streams and canals.

d. Cross–cutting risks and impacts

Concerns

- Climate change is negatively impacting rice production, causing problems such as increased disease, insect infestations, and extended dry seasons,
- The high cost of agricultural inputs continues to reduce farmers' profits,
- Manure for fertilizer is declining due to reduced animal raising and lower cattle prices are prompting farmers to reduce livestock raising.
- Farmer Water User Group (FWUG) is not well-functioning.

Suggestions from the consulted people

- Providing technical and management training, materials supported to existing Farmer Water User Group (FWUG) to oversee water use and maintenance effectively control and manage water distribution.
- Restore the Brambei Mom dam to its original height to improve water storage capacity and Stueng Krang Ponley with its sub-canal to improve water distribution.
- Improving the Anlong Chrey Reservoir and upgrading the sluice gate can help prevent flooding and better manage water resources.
- Request to produce more water sources, and reservoirs which are able to store more water due to the previous canals and dams are narrow and shallow, limited effective water distribution and set up quickly which can improve agricultural production.
- Utilizing durable concrete for the canal system can improve the efficiency and longevity of the irrigation infrastructure.
- Installing and upgrading damaged sluice gates in both main and secondary canals can improve water distribution efficiency and prevent water loss in agricultural production and irrigation systems.
- Construct both side roads along the canal to enhance transportation for farmers and traders.
- The project should thoroughly examine the technical and situational aspects of the sub-scheme before construction to prevent water shortages or flooding post-construction, and it should be implemented promptly.

10.2.2.4 Krapeu Truom

10.2.2.4.1 Environment and Biodiversity Component

a. Pollution prevention and resource efficiency

Concerns

- The construction process can release dust, which will disturb the local community and surface water quality.
- The disposal of solid, liquid, and domestic waste from the workers at the irrigation construction site will negatively impact local air quality and surface water.

Suggestions from the consulted people

- Regularly watering on the road transports construction materials and soil to reduce dust that may disturb nearby residents.
- Install garbage bins and waste storage areas in the construction sites and conduct orientation workers to put the waste in the garbage bins.

b. Biodiversity

Concerns

- The fish populations in command areas may decrease due to disrupting the natural flow of water and the impact on their habitats from the implementation of the reirrigation infrastructure and canal upgrading.

Suggestions from the consulted people

- The project should avoid construction activities and improve irrigation on fish and aquatic habitats.
- Prevent damage from the construction activities to biodiversity, habitats, and other environmental components.
- Maintain existing large trees along the dam and canal within the sub-schemes during the irrigation and upgrading process.

c. GHG emission

Concerns

- Climate change is negatively impacting rice production, causing problems such as increased disease, insect infestations, and extended dry seasons,

Suggestions from the consulted people

- Installing solar water pumps in agriculture processing facilities can reduce fuel consumption, which causes greenhouse gas emissions.

10.2.2.4.2 Social Component

a. Labor and Working Conditions

Concerns

- The presence of construction staff and workers could lead to gender-based violence affecting women workers, women and children in the community.

Suggestions from the consulted people

- Should offer training to their staff and workers on gender issues, violence, and legal protections.
- Preventive support measures should also be put in place to stop abuse, and any incidents must be swiftly handled to avoid repetition. The training should be conducted by technical officers.

b. Community Health and Safety

Concerns

- Concerns about the presence of workers could cause sexual abuse of women and children living near the project site

Suggestions from the consulted people

- To prevent incidents, construction staff should regularly place warning signs and water the roads, as well as schedule construction times to minimize noise pollution that could disrupt the community and notify authorities upon project completion to avoid quiet handovers.

c. Land acquisition, economic and physical displacement

Concerns

- Landowners along the irrigation system without land registration are concerned they may not receive compensation due to the lack of title deeds.
- Conflicts between the project and affected families could emerge, often fuelled by external instigators rather than the families themselves.

Suggestions from the consulted people

- A preliminary study on land issues before construction is recommended, with each sector addressing specific aspects of land impact and conducting evaluations for each affected property.
- The project/construction company must collaborate with local authorities to resolve land-related issues, and compensation should be provided to landowners affected by the project.
- The construction company should submit quarterly monitoring reports on implementation activities to the provincial department to identify and quickly resolve any issues.
- The government is requested to assist in issuing land titles to farmers with land adjacent to streams and canals.

d. Cross–cutting risks and impacts

Concerns

- Provincial department facing of limited budget to develop and rehabilitate the existing irrigation system

Suggestions from the consulted people

- The project should thoroughly examine the technical and situational aspects of the sub-scheme before construction to prevent water shortages or flooding post-construction, and it should be implemented promptly.
- Establish a Farmer Water User Group (FWUG) to oversee water use and maintenance by providing technical and management training, materials supported to effectively control and manage water distribution.
- The water consumption fee should be gathered from farmers which could be used later to support caretakers and maintain the irrigation system.

e. Agricultural Production

Concerns

- The high cost of agricultural inputs continues to reduce farmers' profits.
- Climate change is negatively impacting rice production, causing problems such as increased disease, insect infestations, and extended dry seasons.
- Manure for fertiliser is declining due to reduced animal raising and lower cattle prices are prompting farmers to reduce livestock raising.

Suggestions from the consulted people

- Build more water storage and reservoir which able to store more water

- The irrigation should be constructed based on technical and water conditions in the area.
- Utilizing durable concrete for the canal system can improve the efficiency and longevity of the irrigation infrastructure.
- Installing and upgrading damaged sluice gates in both main and secondary canals can improve water distribution efficiency and prevent water loss in agricultural production and irrigation systems.
- Construct both side roads along the canal to enhance transportation for farmers and traders.

10.2.2.5 Yutasas

10.2.2.5.1 Environment and Biodiversity Component

a. Pollution prevention and resource efficiency

Concerns

- The construction process can release dust, which will disturb the local community and surface water quality.
- The disposal of solid, liquid, and domestic waste from the workers at the irrigation construction site will negatively impact local air quality and surface water.

Suggestions from the consulted people

- Regularly watering on the road transports construction materials and soil to reduce dust that may disturb nearby residents.
- Relevant ministries should conduct a visit to evaluate and address the issue of liquid waste from the construction activities in the commune.

b. Biodiversity

Concerns

- CAISAR project may cause changes in water quality, dust generation, air pollution, soil erosion, improper waste disposal, and hazardous waste from machinery.
- The fish populations in command areas may decrease due to disrupting the natural flow of water and the impact on their habitats from the implementation of the irrigation infrastructure and canal upgrading.

Suggestions from the consulted people

- Contractors must regularly monitor and inspect the living conditions of the workers, manage waste effectively, and provide adequate housing and sanitation facilities to them.
- The project should avoid construction activities and improve irrigation on fish and aquatic habitats.
- Prevent damage from the construction activities to biodiversity, habitats, and other environmental components.

c. GHG emission

Concerns

- Waste and pollution may contribute to the emission of GHG

Suggestions

- Contractors are advised to refrain from using outdated machinery.

10.2.2.5.2 Social Component

a. Labor and Working Conditions

Concerns

- The presence of construction staff and workers at the community may lead to sexual exploitation or affecting women workers and women and children in the community.
- Under 18 years old workers may be involved for the construction phase as they are eligible to work in factories or other companies that adhere to laws,
- At the construction sites, some men may undervalue women's work. The gender disparities continue to exist, with some men holding the belief that women are not capable or willing to work.

Suggestions from the consulted people

- The construction companies should hire local workers to offer them jobs and strictly abide by laws and reduce the concerns about gender-based violence or sexual violence.
- Construction companies and relevant departments should provide training on gender issues, violence, labour laws, and social protections to their staff and workers.
- Additional support and monitoring measures should be implemented to prevent abuse, and any incidents should be promptly addressed to prevent recurrence.
- Local authorities should regularly monitor and inspect construction sites to ensure no children are working there, taking immediate action if any issues arise.

b. Community Health and Safety

Concerns

- The presence of workers could result in sexual abuse of women and children living near the project site,
- Drug trafficking and consuming among workers may cause unsafe environment for both workers and surrounded residents,
- After the construction complete, there may also be the risks of humans and animals falling into the canals causing drowning,
- Waste generated from worker camps and construction activities during the project could degrade water quality, negatively impacting human health, livestock, and crops.

Suggestions from the consulted people

- The construction companies should regularly place warning signs and water the roads, as well as schedule construction times to minimize noise pollution that could disrupt the community,
- The project should promote gender awareness, enforce stricter punishments for offenders, and prevent drug trafficking in the workplace,
- Separate accommodations for men and women should be provided,
- The construction companies must collaborate with local authorities in all activities to make a proper management, control and monitoring during construction, and
- The project should conduct gender education at the district to prevent and address gender-based violence,
- The project should establish gender outreach committees at the commune and village levels to monitor the gender related issues within the project areas, especially during construction,
- The project should equip the solar lights along the roads to promote the safety of travellers during nighttime,

c. Land acquisition, economic and physical displacement

Concerns

- While the project supports agricultural production, it may not benefit poor families who do not have land for farming,
- Conflicts between the project and affected families could emerge, often fuelled by external instigators rather than the families themselves, and
- Farmers who own land may lose it for farming, which could force them to migrate, heightening their vulnerability to exploitation and potentially causing their children to drop out of school.

Suggestions from the consulted people

- The project should conduct a preliminary study on land issues before construction is going to be implemented, addressing specific aspects of land impact and conducting evaluations for each affected property,
- The project/construction company must collaborate with local authorities to resolve land-related issues, and compensation should be provided to landowners affected by the project,
- If business land is impacted, the government or provincial authorities should provide temporary business premises,
- Advocacy for voluntary land contributions should be encouraged, as the project benefits both the community and individuals, and the restoration of old canals is supported to improve agricultural activities, and
- The construction company should submit quarterly monitoring reports on implementation activities to the provincial department to identify and quickly resolve any issues which affect the livelihood of the community people.

d. Cross–cutting risks and impacts

Concerns

- Unequal water distribution among farmers leads to partisanship and disputes, often because farmers do not adhere to water distribution instructions or announcements from authorities,
- The FWUC could not generate income, causing the management of the water being difficult such as having no budget for repair, resulting in improper operation of the system,
- Besides water issues, farmers also struggle with pests, diseases, inadequate labour, lack of capital, limited production technique, flooding, unstable sale price (vegetable and animal) and high agricultural input costs,
- The provincial department lacks budget to support water user conflict resolution,
- Tensions arise between upstream and downstream villages when water use upstream results in flooding downstream due to excess water being released during the wet season. Conversely, during the dry season, upstream water flow to downstream areas is insufficient.
- Manure for fertiliser is declining due to reduced animal raising and lower cattle prices are prompting farmers to reduce livestock raising.

Suggestions from the consulted people

- A proper handover to local authorities upon project completion should be conducted to avoid quiet handovers,
- Women should be engaged and be promoted as the members of Water User Community to promote water distribution equality regarding water allocation from the system,
- Closed monitoring and support to FWUCs are critical and should be conducted regularly by all levels,
- Water use and maintenance support should be provided including technical and management training, along with problem-solving techniques, to effectively control and manage water distribution,
- Ensure transparent water supply to prevent disputes by holding meetings to plan water use and distribution, involving the district governor, commune council, and relevant stakeholders,
- Prior to starting irrigation rehabilitation, organize a public forum to gather feedback from local residents, disseminate project information to people and stakeholders, and announce the construction period in advance.
- Increase the number of commune agricultural technical officers to provide training and monitor farmers' cultivation techniques.
- Build more water storages, and reservoir such as ponds or wells and conduct training on water-saving techniques to adapt to actual water availability.

- Installing and upgrading the damaged sluice gates to improve water distribution efficiency and prevent water loss in agricultural production and irrigation systems.
- Facilitate the development of additional agricultural markets.

10.2.2.6 Steung Krang Bat

10.2.2.6.1 Environment and Biodiversity Component

a. Pollution prevention and resource efficiency

Concerns

- The construction process may generate dust that could disturb the local community.
- Waste from solid, liquid, and domestic sources produced by workers at the irrigation construction site may have adverse effects on local air quality and surface water.

Suggestions from the consulted people

- Regularly watering roads used for transporting construction materials and soil is recommended to minimize dust disturbance to nearby residents.
- Conduct site visits to assess and address issues related to liquid waste from construction activities within the commune.

b. Biodiversity

Concerns

- The CAISAR project may have negative environmental impacts, such as dust generation and air pollution.
- Construction activities could potentially affect fish habitats and aquaculture.

Suggestions from the consulted people

- Measures should be taken to prevent damage to biodiversity, habitats, and other environmental components due to construction activities.

c. GHG emission

Overall Opinion

- Minor greenhouse gas (GHG) emissions could contribute to global GHG levels due to activities like transportation, agricultural practices, the decomposition of agricultural waste, and its burning.

Concerns

- Waste and pollution may also contribute to GHG emissions.

Suggestions from the consulted people

- Participants did not provide any suggestion for greenhouse gas emissions.

10.2.2.6.2 Social Component

a. Labor and Working Conditions

Concerns

- The presence of construction staff and workers at the community may lead to sexual exploitation or affecting women workers and women and children in the community.
- Under 18 years old workers may be involved for the construction phase as they are illegible to work in factories or other companies that adhere to laws,
- At the construction sites, some men may undervalue women's work. The gender disparities continue to exist, with some men holding the belief that women are not capable or willing to work.

Suggestions from the consulted people

- The construction companies should hire local workers to offer them jobs and strictly abide by laws and reduce the concerns about gender-based violence or sexual violence.
- Construction companies and relevant departments should provide training on gender issues, violence, labour laws, and social protections to their staff and workers.
- Local authorities should regularly monitor and inspect construction sites to ensure no children are working there, taking immediate action if any issues arise.

b. Community Health and Safety

Concerns

- The presence of workers could result in sexual abuse of women and children living near the project site,
- Drug trafficking and consuming among workers may cause unsafe environment for both workers and surrounded residents,

Suggestions from the consulted people

- The project should promote gender awareness, enforce stricter punishments for offenders, and prevent drug trafficking in the workplace,
- Separate accommodations for men and women should be provided,
- The construction companies must collaborate with local authorities in all activities to make a proper management, control and monitoring during construction, and
- The project should conduct gender education at the district to prevent and address gender-based violence.

c. Land acquisition, economic and physical displacement

Concerns

- Conflicts between the project and affected families could emerge, often fuelled by external instigators rather than the families themselves
- Farmers who own land may lose it for farming, which could force them to migrate, heightening their vulnerability to exploitation.

Suggestions from the consulted people

- The project should conduct a preliminary study on land issues before construction is going to be implemented, addressing specific aspects of land impact and conducting evaluations for each affected property,
- The project/construction company must collaborate with local authorities to resolve land-related issues, and compensation should be provided to landowners affected by the project.
- The construction company should submit quarterly monitoring reports on implementation activities to the provincial department to identify and quickly resolve any issues which affect the livelihood of the community people.

d. Cross–cutting risks and impacts

Concerns

- Unequal water distribution among farmers leads to partisanship and disputes, often because farmers do not adhere to water distribution instructions or announcements from authorities,
- The FWUC could not generate income, causing the management of the water being difficult such as having no budget for repair, resulting in improper operation of the system,
- Besides water issues, farmers also struggle with pests, diseases, inadequate labour, lack of capital, limited production technique, flooding, unstable sale price (vegetable and animal) and high agricultural input costs,
- Construction companies might disregard concerns raised by local authorities and communities regarding the actual conditions of the area.
- The construction of the system may cause water shortages downstream of the Stung Krang Ponley area.
- Agricultural production in the Stueng Krang Bat command area is not a potential sector where land is infertile and expensive, and a garment factory is preferable.
- The provincial department lacks budget to support water user conflict resolution,

Suggestions from the consulted people

- A proper handover to local authorities upon project completion should be conducted to avoid quiet handovers,
- Women should be engaged and be promoted as the members of Water User Community to promote water distribution equality regarding water allocation from the system,
- Closed monitoring and support to FWUCs are critical and should be conducted regularly by all levels,
- Water use and maintenance support should be provided including technical and management training, along with problem-solving techniques, to effectively control and manage water distribution,

- Ensure transparent water distribution to prevent disputes by holding meetings to plan water use and distribution, involving the district governor, commune council, and relevant stakeholders,
- Prior to starting irrigation rehabilitation, organize a public forum to gather feedback from residents, disseminate project information to people and stakeholders, and announce the construction period in advance.
- Build more water storages, and reservoirs such as ponds or wells and conduct training on water-saving techniques to adapt to actual water availability.
- Installing and upgrading the damaged sluice gates to improve water distribution efficiency and prevent water loss in agricultural production and irrigation systems.

10.3 INFORMATION DISCLOSURE

The ESCIA Report and ESCMPs are required to be disclosed to the public as per respective requirements of the AIIB, IFAD and GCF. Under CAISAR, the ESCIA Report and ESCMPs will be disclosed in full text in English, and in the form of executive summary in Khmer language. In addition, a Non-Technical Summary will be prepared for the ESCIA in Khmer and will be disclosed in both English and Khmer language. The Non-Technical Summary will present briefly the meaningful information on the Project. Language will be easy to understand. The NTS may include:

a) A summary of project descriptions (purpose, project components and activities.
b) Key project implementation approach (including use of mitigation hierarchy)
c) E&S baselines;
d) E&E methods and monitoring report;
e) Key E&S risks and impacts (both positive and adverse impacts);
f) Key mitigation measures and recommended actions;
g) A summary of the stakeholder engagement process and results.
h) A summary of key Environmental and Social (E&S) instruments and monitoring reports.

10.4 GRIEVANCE REDRESS MECHANISM (GRM)

The environmental and social policies of AIIB, IFAD, and GCF require the Lead Agency to establish a Grievance Redress Mechanism (GRM) for project-affected parties. The GRM should address concerns regarding environmental and social performance and must include:

- Multiple ways to submit grievances (in person, by phone, email, etc.).
- A system to log grievances and maintain them in a database.
- Clear, publicly available procedures for acknowledging, responding to, and resolving grievances.
- Transparency about the process, decision makers, and an appeals process, including judicial options if needed.

- Mediation may be offered if users are unsatisfied with the resolution.

Contracted workers can also use the GRM for workplace-related concerns, and they will be informed about it during recruitment with assurances of protection from reprisals.

The GRM will be set up by implementing agencies before project activities begin and will provide quick resolutions at the lowest necessary level. Complaints can be lodged verbally, in writing, or electronically, and the process includes detailed logging of complaint details, actions taken, contact points, and final resolution with the complainant's acknowledgment.

The project Stakeholder Engagement Plan has prepared the GRM which will be used as the basis for the project implementation. The following is the adopted mechanism to be applied under the project.

10.4.1 Objectives of the Project GRMs

The objective of the GRM is to provide affected persons with redress procedures that can be conveniently used to raise a project related concern or grievance. The GRM guides how a complaint can be lodged, including forms and channels through which a complaint can be submitted. To facilitate the grievance resolution process, grievances received will be acknowledged in writing and solved within a specified timeframe. During the resolution process, where necessary, dialogue will be held with aggrieved people for mutual understanding and effective resolution. Once a complaint is resolved, the aggrieved person will be notified of the resolution results.

The GRM has sequential steps that an aggrieved person can use. If the aggrieved person is not satisfied with the grievance resolution result, or if their complaint is not resolved within the timeframe specified for a particular step, the aggrieved person can move on to the next step which is higher in resolution hierarchy. The project has an appeal process where complainants can resort if they are not satisfied with a resolution decision at a particular step, or their complaints are not resolved within a specified timeframe.

10.4.2 Summary of National Legislation Related to Grievance and Complaint

The RGC has various laws and sub-decrees that have been in place to guide the implementation of the complaint resolution process. These documents specify the right of the complainants as well as the responsibilities of concerned governmental agencies as to complaint resolution. Relevant legal documents include:

- Law on Expropriation (dated 26 February 2010)
- Labor Law (dated 13 March 1997, amended on 20 July 2007 and 26 June 2018)
- Law on Prevention of Domestic Violence and Protection of Victims (dated 24 October 2005)

- Sub-decree No. 22 ANK/BK (2018) on Standard Operating Procedures for Land Acquisition and Involuntary Resettlement for Externally Financed Projects in Cambodia. Guidelines for Grievance Redress Mechanism (Appendix 8)
- Law on Administrative Management of Capital, Provinces, Municipalities, Districts and Khans (dated 22 May 2008) – Section 6 on Solution of Local Conflicts
- Sub-decree No. 22 (25 March 2002) on Decentralization of Roles, Functions, and Power to Commune Councils (Article 61: duty to promote the role of conciliating disputes between citizens)
- Sub decree No 47 ANK.BK (31 May 2002) on Organization and Functioning of the Cadastral Commission (Chapter 4 – District/Khan Level Conciliation).

10.4.3 Principles of the Project GRMs

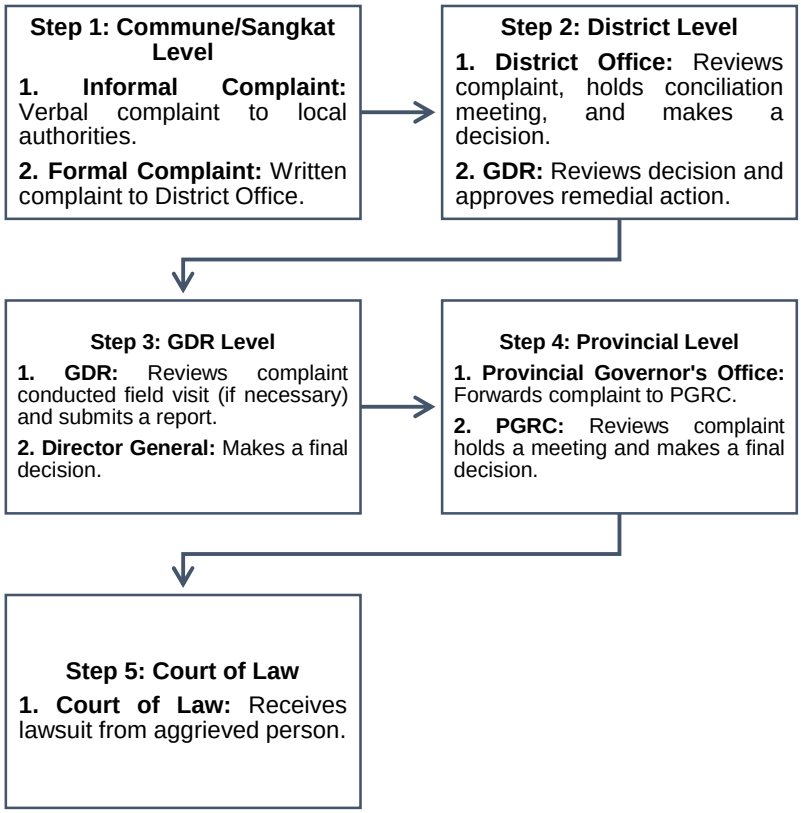
Under CAISAR, the following principles will be applied:

- **Channels.** Different channels are established to enable affected persons to submit their grievances, including submission to village committee, as well as district and provincial levels.
- **Forms.** Grievances can be submitted in writing and verbally, and either directly by the affected households, or by a person delegated by the complainant.
- **Complainant can delegate a representative who acts on their behalf. A** person lodging a grievance can ask assistance from their family or from an individual to act as their representative.
- **Disclosure.** GRM procedures are disclosed in public domain (e.g., websites of PMU, public notice board at village hall, and in front of substation).
- **Documentation.** A grievance logbook will be maintained at substation (subproject level) and at PMU level (through PMU GRM focal point).
- **Transparency.** Grievance procedures include steps, time frame for grievance resolution for each step, notification to affected person, how decision is made.
- **Acknowledgement.** The unit in charge of complaint resolution will notify the complainant upon complaint receipt and will initiate the complaint resolution process.
- **Appeal.** If the agency in charge does not resolve a grievance in a manner that is satisfactory to the affected person, a multi stakeholder committee will be established (ad-hoc) to resolve the dismissed grievance – as an alternative for the affected person going to court.
- **Monitoring.** All grievances received are recorded by PMU and relevant substations, and are processed/resolved in a given timeframe, and are monitored by PMU GRM focal point.
- **Time-limit.** Time-limit is specified for each step in the grievance resolution process.

- **Complainants bear no costs.** Complaint resolution is free of charge to aggrieved persons. However, if the complaints bring their case to court, they will bear the costs associated with their lawsuit.
- Any grievance concerning urgent health and safety issues shall be resolved immediately.

10.4.4 Project's Redress Procedures

The project has in place complaint handling procedures for three (3) types of potential grievances, including grievances related to 1) land acquisition, 2) labour and working conditions, and 3) sexual exploitation and abuse and sexual harassment (SEA/SH/GBV/GBV), and 3) general complaints. These procedures are established based on the above GRM principles and are in accordance with pertinent national legislation. The GRM for complaints related to land acquisition is provided in the project's Resettlement and Policy Framework (RPF) and that for IPs is provided in the project's IPPF. Summary for the above four (4) procedures is provided below:



10.4.4.1 Redress Procedure for Complaints related to Land Acquisition

Under this project, to facilitate the grievance redress, the informal and formal steps are combined for convenient use of affected people, as follows:

- Step 1 – Commune/Sangkat level. APs will seek assistance from commune/Sangkat chief or community elders who will discuss with the leader of the PRSC-WG to find a solution. Verbal grievances can be provided to the commune/Sangkat chief or community elders. So, no written complaint is required. It is noted that even if the complaint is made verbally, the complaint will be registered in the project's logbook, including resolution process and result for such verbal grievance for monitoring purposes. Upon receipt of the verbal complaint, the PRSC-WG will consult with the IRC-WG to ensure the complaint is addressed timely. If the grievance is not resolved to the satisfaction of the AP, or if the AP prefers, s/he may lodge their complaint through the formal route which includes the steps below.
- Step 2 – District level. AH can lodge a written complaint to the Head of the District Office (where the subproject is located). The AH can bring a community elderly or their representative to discuss their grievance at the District Office. A conciliation meeting shall be held, and a decision be made within 15 working days from the date of complaint is received by the District Office. If the complaint is resolved to the satisfaction of the AH, the IRC-WG will inform GDR's Department of Internal Monitoring and Data Management (DIMDM) who will review and seek the approval of the Director General of GDR for appropriate remedial action. GDR will inform the AF of the decision/ remedial action within 15 working days from the receipt of the grievance by the District Office. If the complaint is rejected at this step, the District Office will inform the AH of the rejection in writing. If the complainant is not satisfied with the decision/resolution result, s/he can proceed to step 3 (below).
- Step 3 – GDR level. The complainant who is not satisfied with the proposed resolution from Step 2 shall lodge a written complaint to the GDR for resolution. The

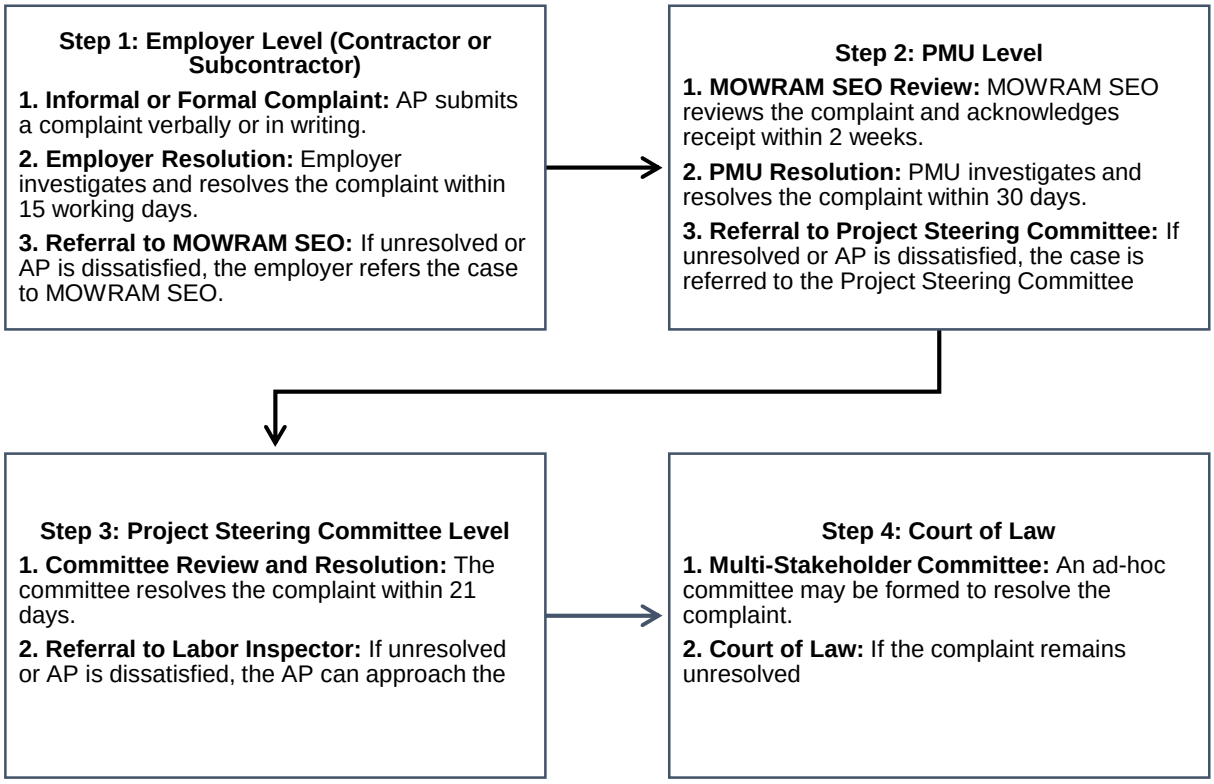
GDR, through its DIMDM, will carry out a holistic review of the complaint and submit a report on its findings with the relevant recommendations, if any, to the Director General of GDR for review and decision. GDR may conduct a field visit to meet the complaint and the IRC-WG to gather relevant information. The final report must be completed within 30 working days from the date of receipt of the complaint by GDR for submission to the Director General of GDR who will make a final decision within 5 working days of receipt of the final report. In the event that the subject matter requires a policy level intervention, it will be referred to the IRC for a decision which may require that an additional 10 working days be extended from the original deadline for final decision.

Figure 10.1: Redress Procedure for Complaints related to Land Acquisition

GDR = General Department of Resettlement, PGRC = Provincial Grievance Redress Committee.

- Step 4 – Provincial level. AH will submit a written complaint to the PGRC through the Provincial Governor's Office. The complainant or a representative will be given an opportunity to present its case during a meeting and the PGRC may consider any compelling and special circumstances of the AH to inform their decision. The GDR will send a representative, as a non-voting member, to provide an explanation to the rejection of the complaint at Step 3 with the GDR. The decision of the PGRC must be made on a consensus basis and will be final and binding except when the matter relates to the government's policy. Decisions related to government's policy matters on land acquisition and resettlement are decided by the IRC. The PGRC will have 40 working days from the date of receipt of the complaint to reach a final decision. The decision of the PGRC will be sent to the IRC (through the GDR) for endorsement before

any remedial action is taken. There are no fees or charges levied on the AH for their lodgement of complaint and for complaint resolution for the above 4 steps.



- Step 5 – Court of Law. If the aggrieved person prefers filing a lawsuit at the Provincial/Municipal Courts, as applicable, to seek a resolution, AP can do so but will bear cost related to the lawsuit as per the Expropriation Law. When the case is brought to a Court of Law, there is no involvement of the GDR, PRSC or IRC-WG unless there is a judicial order from the competent courts.

10.4.4.2 Redress Procedure for Complaints Related to Labor and Working Conditions

Project workers can lodge their grievance/complaint as follows:

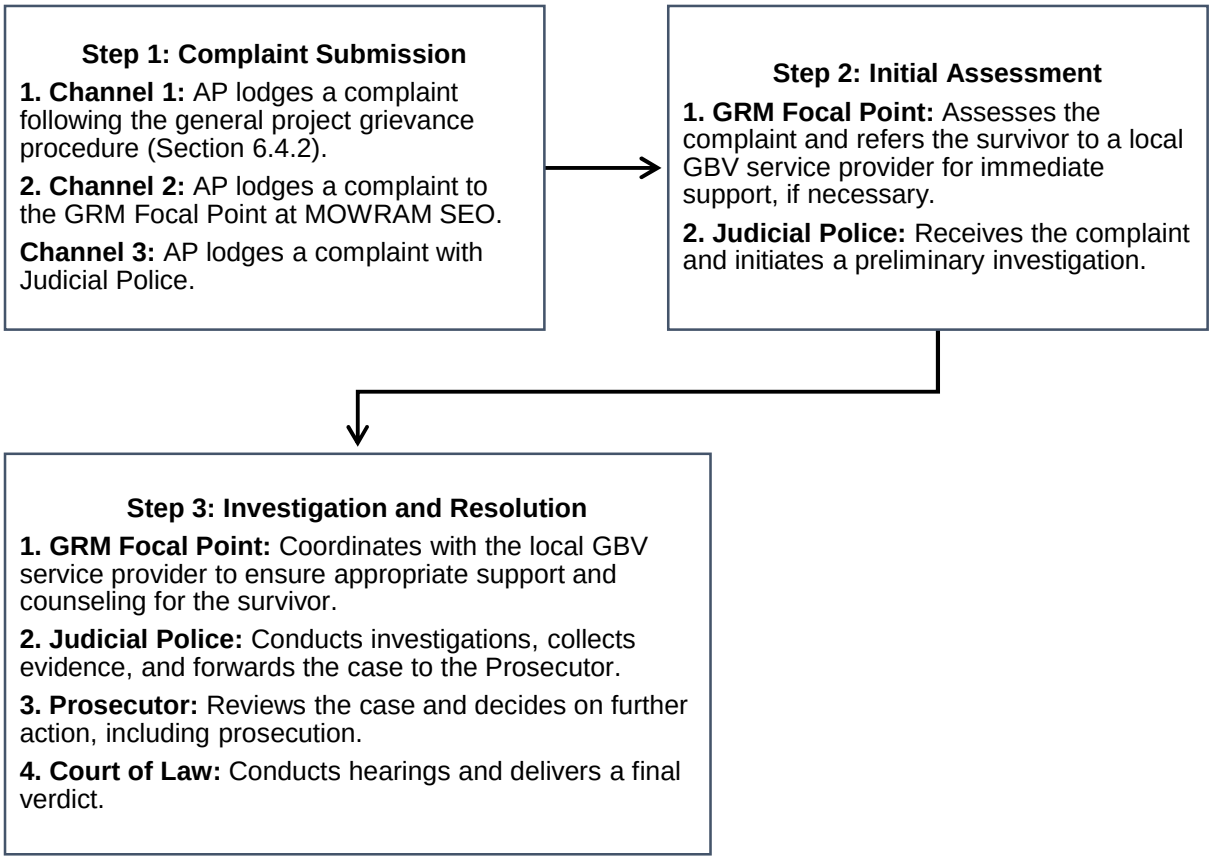
- **Step 1 – Employer Level (Contractor and Subcontractor).** Aggrieved person (AP) can submit their grievance to their Employer who serves as the first focal point for receiving and resolving grievances. Grievance can be lodged verbally or in writing, in person or by phone, text message, mail or email (anonymous complaint is accepted). The Employer involved will resolve the case no later than 15 working days. Once resolved and the AP is satisfactory, the Employer will report the case, including resolution process and results, to the SEO of the MOWRAM for information and record. If the AP is not satisfied with the resolution of their Employer, the Employer will refer the AP to the SEO of MOWRAM, if needed and inform the AP of this referral. It is noted that if a complaint concerns the safety and health of one (1) or several individuals, such a complaint shall be resolved as soon as possible – depending on the nature and urgency of the grievance.
- **Step 2 – PMU level.** MOWRAM SEO will resolve the complaint referred to by the Employer (Step 1) and acknowledge receipt of the AP's complaints within two (2) weeks from the date of complaint receipt. If the SEO of MOWRAM cannot resolve the complaint, the SEO Team will consult with the Project Manager/Director for resolution. The SEO of the MOWRAM will inform the AP (in writing) of the PMU's resolution result within 30 days from the date of complaint receipt. If the AP is not satisfied with the resolution result proposed by PMU, PMU will refer the case to the Project Steering Committee of the project and shall inform the AP (in writing) of this referral.
- **Step 3 – Project Steering Committee level.** At this level, the case will be resolved no later than 21 days. The AP will be informed of the resolution decision in writing. In case the grievance has not been solved within the specified timeframe, or the AP does not agree with the proposed resolution, the AP can approach the Labor Inspector of his/her province or municipality.
- **Step 4 – Court of Law.** If the AP is not satisfied with the resolution proposed above, a multi stakeholder committee will be established (ad-hoc) to resolve the dismissed grievance – as an alternative for the affected person going to court. If the grievance could not be resolved satisfactorily by the multistakeholder committee, the affected person may resort to the court of law. The cost associated with the lawsuit shall be borne by the AP. The decision of the Court will be final.

Figure 10.2: Redress Procedure for Complaints Related to Labor and Working Conditions

AP = Action Plan, MOWRAM = Ministry of Water Resources and Meteorology, SEO = Social and Environmental Officer, PMU = Project Management Unit.

10.4.4.3 Redress Procedure for Complaints Related to SEA/SH/GBV

Under the project, the GRM for SEA/SH/GBV mainly serves to: (i) refer complainants to a local GBV service provider; and (ii) record resolution of the complaint. In line with the above, the following principles apply to recognize SEA/SH/GBV victim as principal decision makers in their own care, and treat them with agency, dignity and respect for their needs and wishes:



- **Multiple channels** are in place for easy access and lodge complaints.
- **SEA/SH/GBV survivors will be referred to a local GBV service provider** for immediate support if they make a complaint directly to PMU.
- **Confidentiality of survivors is protected.** GM operators (at PMU and local GBV service providers) will keep confidential for SEA/SH/GBV allegation report.
- **No identifiable information on the survivor shall be collected and stored** in Project Grievance Logbook.
- **Costs of operating the SEA/SH/GBV GRM will be covered by the project.**

It is noted that under this project, GBV service provider will be engaged for subprojects that are rated “High” or “Substantial” for SEA/SH/GBV risks − as part of site-specific ESMP. based on SEA/SH/GBV risk assessment The following channels can be used to submit a grievance related to SEA/SH/GBV:

- **Channel 1 –** AP who believe the SEA/SH/GBV incidence is related to project workers can follow steps outlined in Section 6.4.2 (above) to lodge a SEA/SH/GBV complaint.

- **Channel 2** – Alternatively, AP can lodge their complaint, verbally or in writing, to the GRM's Focal Point within the SEO of MOWRAM for advice and resolution (contact of GRM Focal Point is provided in Section 5.1 (Resources).
- **Channel 3** – If AP wants to bring the case to the Court of Law, AP can follow steps below for prosecution. Prosecution related to SEA/SH/GBV is administered under the Criminal Code and the Code of Criminal Procedure and is as follows:

Figure 10.3: Redress Procedure for Complaints Related to SEA/SH/GBV

AP = Action Plan, GRM = Grievance Redress Mechanism, MOWRAM = Ministry of Water Resources and Meteorology, SEO = Social and Environmental Officer, GBV = Gender-Based Violence.

- **Step 1 – Judicial Police.** SEA/SH/GBV victim or a representative can submit their grievance to a local Judicial Police (JP) Officer. JPs include a) Commune/ Sangkat Chief, b) Commune/ Sangkat/ District/ Provincial/ National Police, and c) District/ Provincial/ National Military Police. The JP is responsible for receiving, recording complaints, and may conduct preliminary investigations to identify and arrest the perpetrator. The JP will also collect evidence to support the prosecutors. If the SEA/SH/GBV happens at home and/or falls under the domain of domestic violence (as per Law on the Prevention of Domestic Violence and Protection of Victims), the SEA/SH/GBV survivor may seek support from a local qualified Judiciary Police Officer (appointed by the Ministry of Women's Affairs) who can act as a complaining party on behalf of the SEA/SH/GBV survivor15.

- **Step 2 – Prosecutor.** Upon receiving the completed written record from the JP, the prosecutor can decide on if the prosecutor will hold a file without processing it further or conduct proceedings against the perpetrator. The prosecutor may bring the case to the Court of Law and present the evidence in Court hearings.
- **Step 3 – Investigation by Judge.** During this step, the investigating Judge will conduct interrogation of the charged person and perform other required investigation procedures.
- **Step 4 – Hearing.** After issuing an order of indictment, the investigating Judge will submit the case to the trial court president who shall arrange a date for the trial. The decision of the Court on the SEA/SH/GBV resolution is final.

10.4.4.4 Redress Procedure for General Complaints

In case individuals, households, or communities are affected by any other aspects, for instance, environmental impacts such as increased dust, noise, or lack of safety measures that increase risks of traffic accidents to road users or to local EM, various channels will be established for convenient use by affected parties, including IPs. These include:

- **PMU GRM focal point's telephone (**See Section on Resources) to Local EM leaders (in case affected individual/households are EM)
- **Contractor's hotline:** to report cases that they think contractors can solve timely (contact detail of Contractors will be posted at construction sites, and distributed to IPs (through Subproject Information Booklet) during consultation, and post at public billboard of Commune/Sangkat offices, pagodas, etc.
- Commune/Sangkat offices

10.4.5 Registration of Project Grievance

The SEO, Project 6. Managers within MOWRAM are responsible for establishing and maintaining the project grievance logbook (PGL). The PGL will be established by the SEO to record all concerns/ grievances that are submitted by project stakeholders during project implementation. In case there is a serious complaint, the World Bank should be notified of these complaints within 24 hours of complaint receipt.

The GRM is an integral project management element that intends to seek feedback from beneficiaries and resolve of complaints on project activities and performance. The GRMs for the project are based on AIIB IFAD, UN, and GCF requirements and, most importantly, national requirements for solving potential problems between project owners and residents/persons affected by the subproject(s).

CHAPTER 11 – COSTS AND BUDGET

11.1 INTRODUCTION

The chapter on Cost and Budget of the Environmental and Social Impact Assessment (ESCIA) provides a detailed breakdown of the financial requirements associated with mitigating the environmental and social impacts of the project. It outlines the projected costs for implementing mitigation measures, monitoring activities, capacity-building initiatives, and community engagement programs. The chapter also emphasizes the importance of financial planning in ensuring that resources are efficiently allocated to minimize negative impacts on the environment and affected communities while maximizing the project's long-term benefits. By presenting a clear and transparent budget, this chapter aims to guide stakeholders in understanding the financial commitments necessary to uphold environmental and social safeguards throughout the project lifecycle.

11.2 ESTIMATED COSTS FOR ESCMP IMPLEMENTATION

The costs of implementing the ESCMP listed below are related to PMU costs in addition to the dedicated safeguards PMU personnel budget line item. The main costs of implementing this ESCMP are the additional cost which have not been budgeted within the project. For example, the project component 1 focus on establishment, capacity building and strengthening the FWUCs, therefore the concern regarding water management and water distribution inequality have already covered. Moreover, the sustainable agricultural practices and agricultural value chain is the project actions. In this regard, the concern regarding GHG emission from the farming activities have been already addressed. The proposed budget therefore is the additional cost which are added to the existing (please see in table 11.1).

Table 11.1: Estimated Additional Costs for Environmental Social and Climate Change Monitoring Plan (ESCMP) Implementation

No.	Items	Unit	Instruments	Qty	Cost	Total	Sources
1	Preparation of Resettlement Plans for relevant sub-scheme(s)		Abbreviated Resettlement Plan	2	100,000	**200,000**	GDR
2	Resettlement Cost	Lumpsum	Abbreviated Resettlement Plan	1	289,064	**289,064**	GDR
3	ESCMP Implementation		ESCMP			**2,505,000**	MOWRAM
a	UXO clearance		ESCMP	1	250,000	250,000	
b	Preparation of the National EIA for each sub-scheme	Sub-scheme	EIA	6	100,000	600,000	
c	Consultation outreach	Sub-scheme		6	10,000	60,000	

No.	Items	Unit	Instruments	Qty	Cost	Total	Sources
d	Awareness raising (E&S risks and impacts) (5 times for OTP, the rest 2 times each)			15	3,000	45,000	
e	Implementing Biodiversity Plan		ESCMP			**1,550,000**	
	• Supporting protected areas in Ou Ta Paong	Year		5	200,000	1,000,000	
	• Supporting Lum Hach	Lum-sump		5	80,000	400,000	
	• Supporting biodiversity actions in Stung Krang Ponley (5 years)	Lum-sump		5	30,000	150,000	
4	E&S Monitoring Program	Lum sump				**330,000**	MOWRAM
	• Soil quality monitoring (every six (6) months* 10 locations (3 in OTP, 3 in Lum Hach, 4 in Stung Krang Ponley) * 3 years)			60	1,500	90,000	
	• Air quality, noise and vibration quality monitoring (every six (6) months* 10 locations (3 in OTP, 3 in Lum Hach, 4 in Stung Krang Ponley) * 3 years)			60	2,000	120,000	
	• Water Quality monitoring (every six (6) months* 10 locations (3 in OTP, 3 in Lum Hach, 4 in Stung Krang Ponley) * 3 years)			60	2,000	120,000	
	Total					**3,324,064**	

Qty = Quantity, GDR = General Department of Resettlement, ESCMP = Environmental, Social, and Climate Management Plans, MOWRAM = Ministry of Water Resources and Meteorology, UXO = Unexploded Ordnance, E&S = Environmental and Social, OTP = OU Ta Paong.

EXECUTIVE SUMMARY

This document is an Environmental, Social, and Climate Management Plan (ESCMP) for the Krapeu Troum Sub-scheme, a part of the Stung Krang Ponley subproject within the larger Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project in Cambodia. This sub-scheme, covering 690 hectares, is designed to provide a reliable irrigation system to support agricultural activities. The Krapeu Troum ESCMP specifically addresses investments under Component 1, focusing on farm-level climate adaptation, resilience, and water use efficiency, and Component 2, aimed at rehabilitating and modernizing irrigation systems for increased agricultural production.

The ESCMP is vital for ensuring the project's sustainability by addressing potential environmental and social risks and impacts associated with infrastructure development and intensified agricultural practices. It focuses on the responsible management of water resources, crucial for both agriculture and local livelihoods. The plan promotes efficient irrigation to optimize water use, minimize water shortages, and prevent potential conflicts between upstream and downstream users. By incorporating social considerations, the ESCMP ensures that communities are actively involved in the project's planning and implementation, addressing concerns through consultations and providing fair compensation when necessary. This inclusive approach minimizes social disruptions and fosters community support. The ESCMP also ensures compliance with national and international environmental and social standards, crucial for securing funding and aligning with sustainable development best practices. By adhering to these standards, the project mitigates both environmental and social risks while promoting long-term sustainability, ensuring that the natural environment and local communities benefit from the project's outcomes.

The Krapeu Troum sub-scheme is located in Veal Pung commune, Oudong district, Kampong Speu province, and borders Thbeng Khpos and Svay communes in the Sameakki Meanchey district of Kampong Chhnang province, impacting a total of 13 villages. The sub-scheme draws water primarily from Anlong Chrey reservoir, with Kdol Dam as a secondary source. The current irrigation system faces challenges including inadequate reservoir capacity, damaged infrastructure, and inconsistent water availability. The area has experienced frequent droughts and floods, impacting agricultural productivity.

The proposed project involves rehabilitating existing irrigation canals, constructing new tertiary canals, and implementing a pilot solar-powered pumping system. Key activities under Component 1 include introducing climate-resilient agricultural practices, strengthening mechanization service providers, and promoting market-led agricultural investments. Component 2 focuses on modernizing the irrigation system with improved water regulation structures, enhanced drainage, and training for Farmer Water User Communities (FWUCs). These improvements aim to optimize water use, increase cropping intensity, and enhance resilience to climate change impacts.

The project's implementation is planned to start with a detailed design in January 2025. Procurement will follow, and construction is expected to begin after the rainy season in 2026, aiming for completion by mid-2030.

The ESCMP identifies and assesses potential environmental and social risks during various project stages. Mitigation measures are proposed to address these risks effectively.

Before and during construction:

- Unexploded Ordnance (UXO): Requires a clearance plan using certified experts before any construction.
- Air and Noise Pollution: Dust suppression, reduced machinery hours, and regular maintenance are crucial.
- Water Pollution: Construction diversion control, proper waste disposal, and water quality monitoring are essential.
- Soil Pollution: Preventing oil and chemical spills, covering restored areas with topsoil, and re-vegetation are necessary.
- Solid and Hazardous Waste: Waste management plans, including designated dump sites and proper handling procedures for hazardous waste, are needed.
- Wastewater: Proper treatment and disposal of wastewater from construction sites and worker camps are essential.
- Biodiversity Impacts: Avoiding critical habitats, minimizing vegetation clearing, and implementing a Biodiversity Action Plan are crucial.
- GHG Emissions: Using low-carbon materials and techniques, reducing waste burning, and offsetting emissions are recommended.
- Labor influx and Potential for SEA/SH: Labor management plans, worker codes of conduct, awareness campaigns, and grievance mechanisms are crucial to mitigate social risks associated with labor influx.
- Community health and safety: Safety training, traffic management plans, and health education campaigns are needed to minimize risks to community health and safety.
- Elite Capture: Transparent and inclusive consultation processes are necessary to prevent elite capture of resources, ensuring that benefits reach vulnerable groups.
- Annual or perennial crop: Promoting and monitoring water use and energy efficiency, and promote proper soil management.

During operation:

- Water Pollution: Sustainable agricultural practices, including Integrated Pest Management (IPM), are vital to minimize agricultural runoff.
- Biodiversity Impacts: Continuous monitoring and management are needed to address potential habitat loss and fragmentation.
- GHG Emissions: Promoting energy-efficient irrigation, reducing fossil fuel reliance, and adopting climate-smart agriculture are crucial.

- Social Inequality and Water Use Conflicts: Participatory planning, equitable water allocation plans, and continued community engagement are essential to prevent social inequalities and manage potential water use conflicts.
- Community Health and Safety: Promoting sustainable agricultural practices, such as IPM, and safe pesticide use will help protect community health.

The ESCMP emphasizes a comprehensive stakeholder engagement plan, with consultations conducted at national, provincial, district, commune, and village levels. This plan ensures that communities and stakeholders are informed about the project and have opportunities to share their concerns and suggestions. The consultation process included community meetings, focus group discussions, and key informant interviews. The ESCMP will be publicly disclosed in English and Khmer, available on the websites of the Ministry of Water Resources and Meteorology (MOWRAM) as the Project Implementing Unit, as well as on the websites of AIIB, IFAD, and GCF before project appraisal and approval.

A robust grievance redress mechanism (GRM) is in place to address complaints from affected people. It outlines a structured process for resolving issues related to land acquisition, labor, SEA/SH, and other project-related concerns. Different channels are available for submitting grievances, including verbal and written complaints. The GRM ensures that all grievances are documented, acknowledged, and resolved within specific timeframes. An appeal process is available if complainants are dissatisfied with the initial resolution.

The ESCMP outlines the roles and responsibilities of various stakeholders, including government agencies, contractors, and consultants, in implementing and monitoring its provisions. This includes responsibilities related to environmental and social safeguards, labor management, community engagement, and grievance redress. Contractors are required to prepare their own environmental and social management plans (C-ESMPs) outlining how they will mitigate risks and impacts. The monitoring program includes regular assessment of soil, air, and water quality, biodiversity, and social impacts, ensuring compliance with the ESCMP and identifying any necessary corrective actions.

The estimated cost for implementing the ESCMP is USD 237,000, covering expenses such as UXO clearance, preparing national EIA report, biodiversity management, community engagement, and monitoring activities. The Executive Summary of the ESCMP will be publicly disclosed in both English and Khmer, ensuring transparency and accountability throughout the project's lifecycle.

1. INTRODUCTION

1.1 Rationale

Krapeu Truom is one of the four sub-schemes located within the larger Stung Krang Ponley subproject, covering a relatively small area of 690 hectares. The sub-scheme is designed as an irrigation system aimed at supporting agricultural activities by providing a reliable source of water for crop production. It plays a crucial role in boosting agricultural productivity in the region by ensuring that farmers have consistent access to water, especially during dry seasons. This system is an essential component of local water management, contributing to improved crop yields and enhancing the livelihoods of the farming communities dependent on it.

The primary function of the Krapeu Truom sub-scheme is to regulate and distribute surface water from nearby rivers or reservoirs to irrigate agricultural lands. The system is structured to maximize water efficiency by delivering water directly to the fields, minimizing wastage, and conserving valuable water resources. This approach is particularly important in regions prone to water shortages, ensuring that crops receive the necessary water to thrive, which ultimately contributes to food security and agricultural sustainability.

Social impacts are also a critical consideration in the preparation of the ESCMP. The irrigation system is vital to the livelihoods of local communities, particularly those engaged in farming and fishing. Infrastructure development without proper social safeguards could disrupt these livelihoods, leading to economic challenges and potential social conflict. The ESCMP ensures that communities are actively engaged in the project's planning and implementation, addressing their concerns through consultations and fair compensation where necessary. This inclusive approach minimizes social disruption and fosters stronger community support for the project.

Additionally, the ESCMP is crucial for ensuring that the CAISAR Project meets both national and international environmental and social standards. Compliance with these standards is necessary for securing funding and aligning with global best practices in sustainable development. By preparing a comprehensive ESCMP, the project mitigates both environmental and social risks while promoting long-term sustainability, ensuring that both the natural environment and local communities benefit from the project’s outcomes.

1.2 Objectives of the ESCMP

The objectives of the ESCMP for Krapeu Truom sub-scheme are:

- Identify and assess environmental and social (E&S) risks and impacts that are potentially associated with investment activities proposed under Component 1 and Component 2.
- Ensure the identification and assessment of E&S risks and impacts are in accordance with the requirements of the laws and regulation of the Royal Government of Cambodia, AIIB’s Environmental and Social Framework, IFAD’s Social, Environmental and Climate Assessment Procedures (SECAP), and GEF’s Safeguard Policies.

- Apply a mitigation hierarchy to: (a) anticipate and avoid risks and impacts; (b) where avoidance is not feasible, minimize or reduce risks and impacts to acceptable levels; (c) once risks and impacts have been minimized or reduced, mitigate them; and (d) where residual risks or impacts remain, compensate for or offset them, where technically and financially feasible.
- As part of the risk and impact identification and assessment, engage a) people potentially affected by project activities (including both project beneficiaries and those potentially affected adversely, and parties interested in project implementation and operations.
- Conduct consultation, particularly with affected people who are disadvantaged/ vulnerable.
- Propose measures to avoid/ minimize/ mitigate E&S risks and impacts and compensate for adverse impacts where residual risks or impacts remain, compensate for impacts that remain, or offset residual risks, where technically and financially feasible.

Coverage of the ESCMP Krapeu Truom

This site–specific ESCMP cover project activities proposed under Component 1 and Component 2 (See brief description of investment activities in Section 2.3 below).

2. PROJECT DESCIPTION

2.1 Background

The project has three Components (summarized below). However, the ESCMP Yutasas will covers investment activities proposed under only Component 1 and Component 2.

Component 1. *Improving farm-level climate adaptation, resilience, and water use efficiency*

The objective of this component is to build climate resilience (CR) of smallholder farmers and enhance sustainable production through evidence-based planning and context-relevant climate resilient practices at the farm level. This component is designed to address the lack of knowledge and skills to deploy technologies and practices at farm level by farmers and the lack of appropriate extension services to propagate them. It will introduce farmers with various climate resilient technologies and practices for both rice and non-rice activities such as vegetable production, poultry and aquaculture.

Sub-component 1.1 Deployment of farm-level climate adaptation and water use efficiency measures

Output 1.1: Increased capacity of farmers to deploy climate resilient (CR) practices at farm level

This output will focus on developing farmers' capacity in deploying CR technologies and practices to transform the agricultural production system to adapt to the changing climate context. Farmer's will be trained to first develop Action Plans (AP) to re-orient farmer behavior

and assist them in transforming the agriculture production system in a manner that is better adapted to factoring in the agro-ecological context and expected climate change impacts.

- Activity 1.1.1 Preparation of community-based action plans (AP) to transform agriculture with CR practices.
- Activity 1.1.2 Preparation of training materials to support implementation of the AP.
- Activity 1.1.3 Conduct trainings to create a pool of expertise to demonstrate and propagate the CR technologies and practices.
- Activity 1.1.4 Train farmers on applying CR technologies using the FFS approach.
- Activity 1.1.5 Strengthening and fostering tailored mechanization service providers for improved mechanization service delivery.
- Activity 1.1.6 community-based monitoring and evaluation (CBME) of implementation

Sub-Component 1.2 Climate adapted, value added, and market led agricultural investments

Output 1.2 CR value added, and market led agriculture investments secured.

This output involves improving and enhancing some value chains that are key for the project area and include rice, vegetable, chicken and aquaculture value chains, through the use of Public Private Producer Partnerships (4Ps) and increased access to finance, which will improve market access, climate adaptability, and ensure increased income for smallholders in the value chains.

- Activity 1.2.1 Value chain study and planning
- Activity 1.2.2 Establish District Multi-Stakeholder Platforms (MSPs)
- Activity 1.2.3 Public Private Producer Partnership Facility (4PF)

Sub-component 1.3 Improve enabling conditions, capacities and disaster risk management strategies

Output 1.3. Increased access to and use of climate information and advisory services for climate responsive agriculture planning

This sub-component will strengthen the production and dissemination of tailored agro-meteorological information to inform climate responsive management and planning of agriculture in the project target areas through ICT technologies. The aim is to ensure that agro-meteorological services are accessible and useful to farmers to manage climate risks, access to and use of water and efficient cropping systems.

- Activity 1.3.1 Establish ICT based multi-disciplinary platform at provincial level.
- Activity 1.3.2 Building the capacities of the platform to deliver services.
- Activity 1.3.3. Establish the agromet information systems and the outreach mechanisms.
- Activity 1.3.4 Awareness raising and capacity building of farmers and stakeholders in applying the *services.*

Sub-component 1.4 Rural roads

Output 1.4: Increased resilience of farm road infrastructure to climate change

- Activity 1.4.1 Initial planning and identification
- Activity 1.4.2 Technical survey and design considerations, preparation of cost estimation
- Activity 1.4.3 Improve 50 Kilometers of farm roads.
- Activity 1.4.4 Handing over of the completed works.

Component 2: Irrigation Infrastructure for increased resilience

Component 2 will focus on rehabilitating/creating and modernizing hydraulic infrastructure, including canals, ponds, flood-proof infrastructure (river, drain) and to provide high-efficiency climate-resilient irrigation systems for adapting to both increasing flood and drought conditions. It will include support and capacity building to O&M operators at both, Provincial (PdoWRAM) and scheme (FWUC) level, to ensure the sustainability of the scheme. The output will secure and increase farmer's agricultural production by improving the irrigation supply and protect crops from water-related disasters.

Component 2 is linked with Component 1 such that it facilitates the implementation of CR on farm crop and water management practices through improved field level water supply delivery and drainage. It will focus on rehabilitating and modernizing of irrigation and flood protection/drainage infrastructure in the six sub-projects, including irrigation and drainage canals, flood control embankments, and ponds, to provide high-efficiency climate-resilient irrigated agriculture systems for adapting to both increasing flood and drought conditions.

Sub-Component 2.1: Modernization of irrigation scheme and ponds

- Activity 2.1.1 Technical analysis, field surveys and preparation of plans for system upgrading.
- Activity 2.1.2 Implementation of infrastructure upgrading.
- Activity 2.1.3 Preparation of canal O&M plans including application of ICT and SCADA for operation

Sub-Component 2.2: Flood-proofing and Drainage improvements

- Activity 2.2.1 Establish flood monitoring, information, and early warning systems.
- Activity 2.2.2 Strengthening and construction of flood control and drainage infrastructures.

Sub-Component 2.3: Establishments and training of Farmers Water User Communities (FWUC)

- Activity 2.3.1 Formation of institutional strengthening of the FWUC
- Activity 2.3.2 Build technical capacities of FWCU for canal structure O&M
- Activity 2.3.3 prepare long term financing plan for O&M of the systems including the WUAS.

Sub-Component 2.4: Water information and Management (SCADA)

Component 3. Institutional Strengthening

Sub-Component 3.1 MOWRAM capacity Support.

Output 3.1 Strengthened MOWRAM Capacity

Sub-Component 3.2 Strengthening of NDA and NCDD.

Output 3.2 Improved capacities for climate action monitoring

- Activity 3.2.1 Preparation of Loss and Damage Strategy
- Activity 3.2.2 Strengthen national M&E process for climate action
- Activity 3.2.3 Enhancing Capacity of NDA and other stakeholders.

2.2 Geographical Area of the Sub–scheme

The Krapeu Truom sub-scheme is situated in Preah Sre and Veal Pong communes within Odoung Maechey district of Kampong Speu province and positioned near the boundary of Thbeng Khpos and Svay communes, in the Sameakki Meanchey district of Kampong Chhnang province. The sub-scheme can be described as located in the boundary of 3 communes: Veal Pong, Thbeng Khpos, and Svay communes, making a total of 13 villages which are home to a total household of 2,430, making a total population of 10,535 people (out of which 5,483 are females). Geographically, it is part of the Krang Ponley sub-project, which also includes the Brambei Mom, Yutasast, and Stung Krang Bat irrigation schemes. The Krang Ponley sub-project spans across Kampong Speu, Kampong Chhnang, and Kandal provinces.

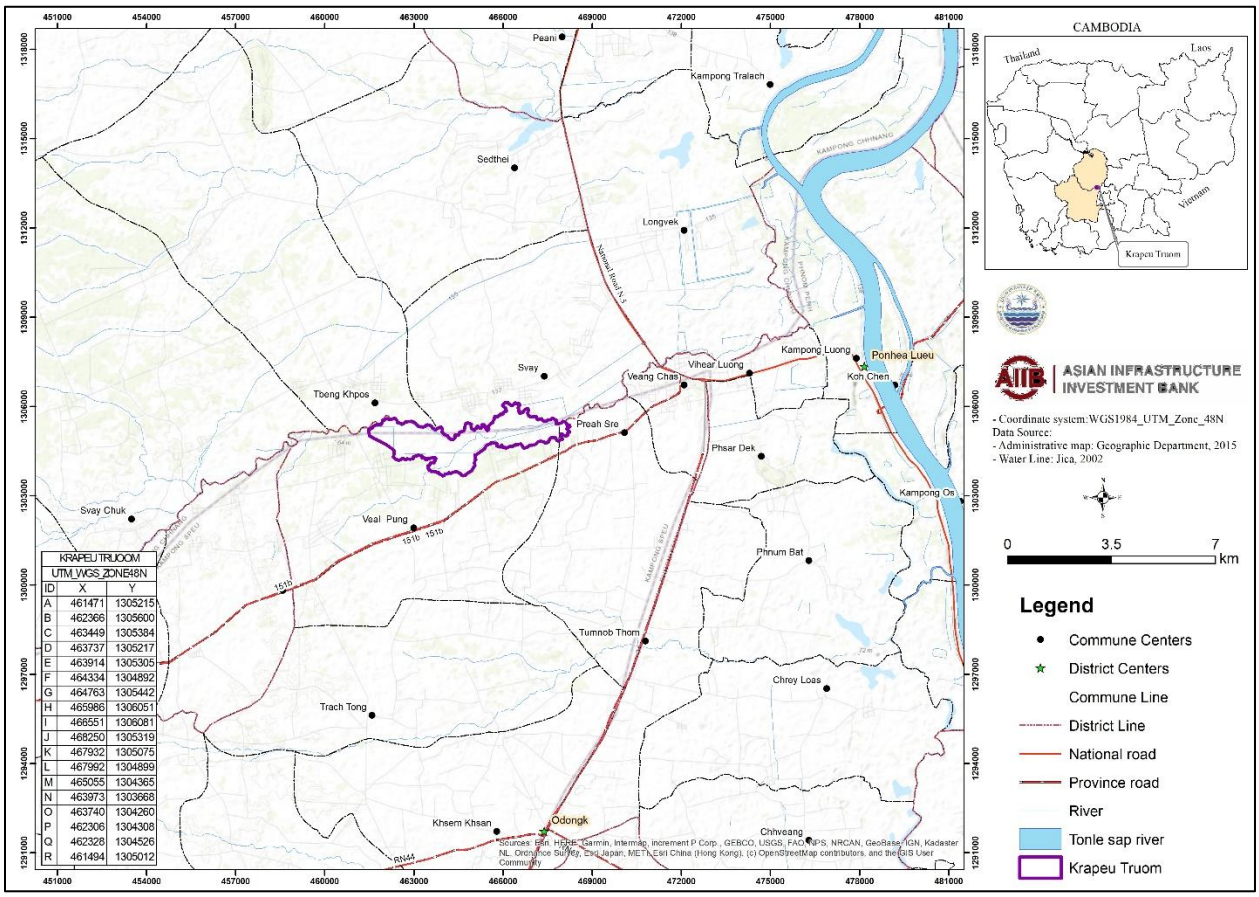
The Krapeu Truom scheme is situated along the Krang Ponley River and receives its water supply from the Anlong Chrey Dam (primary source) and the Kdol dam and river (secondary sources). The proposed target command area for the Krapeu Troum sub-scheme is 690 hectares. The Krapeu Troum sub-scheme is surrounded by the communes of Svay and Thbeng Khpos.

The Krapeu Truom sub-scheme, like other schemes within the Krang Ponley sub-project, is part of the Krang Ponley River Basin. The basin is characterized by its floodplain, situated approximately 10 meters above sea level, and is known for its low permeability due to fine soil particles, making it highly prone to flooding. The Krang Ponley River plays a vital role as the primary water source for these irrigation schemes.

Table 1: Administrative and population coverage of Krapeu Truom sub-scheme

No.	Province/ District	Communes	Number of Villages	Total HH	Total Population	Female Population
	Krapeu Truom					
1	Kampong Speu / Odoung Maechey	Veal Pong	8	932	4,165	2,201

2	Kampong Chhnang /Sameakki Meanchey	Thbeng Khpos	4	1,281	5,207	2,688
		Svay	1	217	1,163	594
	Total	**3**	**13**	**2,430**	**10,535**	**5,483**



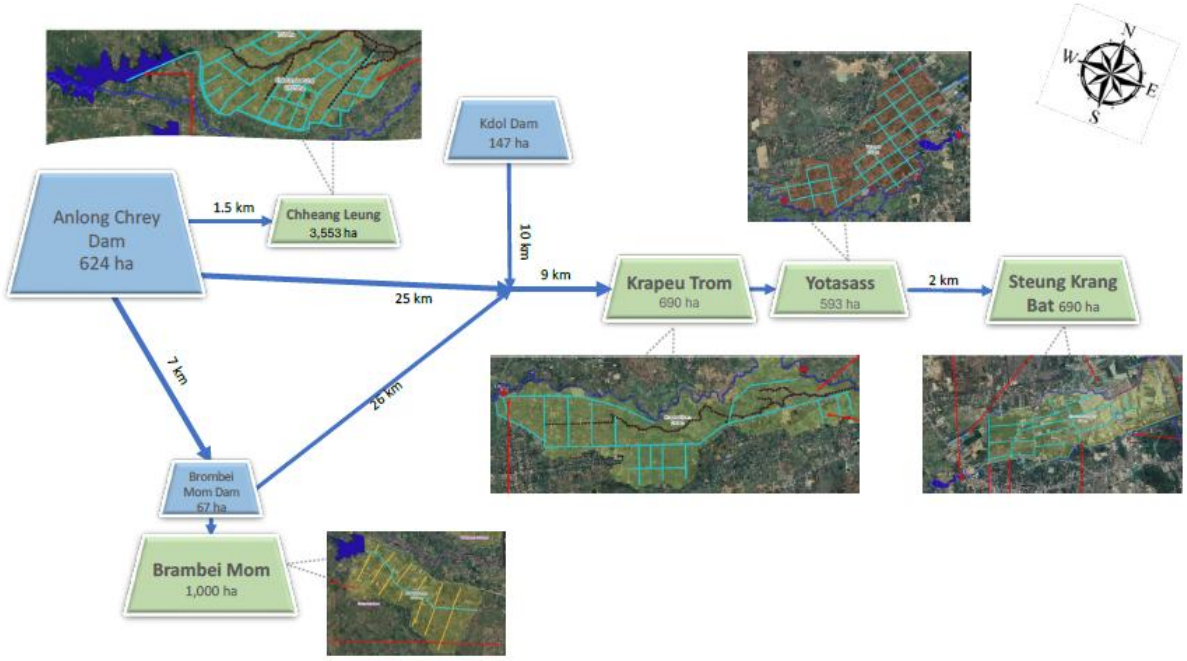
(Source: Ministry of Planning, Commune Database, 2023)

Table 2: Krapeu Troum sub-scheme under CAISAR project

No.	Scheme Name	Component 2						Beneficiaries	
		Irrigation		Rainfed area		Total			
		Area (ha)	Ratio (%)	Area (ha)	Ratio (%)	Area (ha)	Ratio (%)	HH*	Ratio
3	Krapeu Truom	690	3%	400	5%	1,090	4	1,100	3%

*HH = Household

Figure 1: Administrative map of Krapeu Truom sub-command area



2.3 Description of the Sub-Schemes

2.3.1 Location and Coverage

Krapeu Truom is part of the larger Stung Krang Ponley basin, which serves as the main water source for several irrigation sub-schemes. The basin contains three major reservoirs—Anlong

Chrey, Brambei Mom, and Kdol dam— that have improved downstream water availability for irrigation and play a key role in flood control. However, the Anlong Chrey reservoir, with a capacity of just 30 million cubic meters (Mm³), is small relative to the annual inflow of 123 Mm³ and the irrigation needs of the region. A small hydropower station was installed at the site but remains unused due to an insufficient water supply.

Figure 2: Length from Sub-Scheme to another of Krang Ponley

2.3.2 Water Availability

The Krapeu Truom sub-scheme, located within the Krang Ponley River Basin, relies primarily on the Anlong Chrey Reservoir as its principal water source. The Kdol Dam and River serve as secondary sources, supplementing water supply when needed. This integrated system is crucial for ensuring reliable irrigation for the sub-scheme's target command area of 690 hectares.

The Anlong Chrey Reservoir, while essential for the Krang Ponley sub-project's water needs, has a relatively small capacity of 30 million cubic meters (Mm³). This poses a challenge as the estimated annual inflow into the reservoir is 123 Mm³, significantly exceeding its storage capacity. This discrepancy highlights the need for efficient water management strategies to balance irrigation demands with the reservoir's limitations.

Despite efforts to manage water release for optimal crop planting during both early and late wet seasons, the reservoir's limited capacity may struggle to meet full irrigation demands, particularly during the dry season. Factors like inconsistent runoff, which could prevent the reservoir from reaching full capacity, further complicate water availability.

Table 3: Water sources for the Krapeu Truom sub-schemes

No	Irrigation scheme	Proposed target command area (ha)	Main Water source	Secondary water source
2	Kropeau Truom	690	Anlong Chrey Dam (30 MCM)	Kdol dam (4.7 MCM), Kdol river

Anlong Chrey and Kdol Dam are the main water sources for Krapeu Truom sub-scheme. Given its closed location to the two dams, the sub-scheme is at an advantageous position compared to the other sub-scheme downstream of Krang Ponley River basin.

Table 4. Water source of Krapeu Troum sub-scheme

Resource	Description
Anlong Chrey Reservoir	Primary water source for the Krang Ponley scheme
Kdol Dam	Secondary water source, providing additional water supply
Ponley River	Connects the four separate scheme areas, facilitating water transfer

2.3.3 Irrigation Management

The Kropeau Troum Irrigation Project was constructed by PDWRAM with Korean Support. By operating gates on the main canal, water can be raised and brought onto some of the fields by gravity; other fields need to pump water from the canals. The FWUC was established in 2016 and is referred to by PDWRAM as a very successful one. The main management strategy focuses on releasing water early in the wet season (May and June) to support the timely planting of Early Wet Season crops, followed by a Late Wet Season rice crop. Despite these efforts, challenges persist, including potential conflicts between hydropower and irrigation needs, unclear reservoir operating rules, and inconsistent runoff that may prevent the reservoir from reaching full capacity in some years.

2.3.4 Natural challenges

Over the past 10 years, the Krapeu Truom irrigation sub-scheme has encountered several natural challenges. Drought was the most frequently reported, affecting 58% of respondents, with an average of three occurrences over the decade. However, two of these occurrences were considered serious. Floods were the second most reported issue, noted by 36% of respondents, with an average of three events, of which one was deemed serious. Storms were the third most common natural disaster, reported by 31% of respondents and occurring three times, with one of these events considered serious. Insect outbreaks were experienced by 27% of respondents, with an average of two occurrences over the last decade, but only one event was considered serious.

Table 5: Frequency and seriousness of natural disasters in Krapeu Truom sub-scheme

Types	Figures	Percent	Times	Number of Seriousness
Drought	39	58%	3	2
Flood	24	36%	3	1
Storms	21	31%	3	1
Insect outbreak	18	27%	2	1

2.4 PROPOSED INFRASTRUCTURE

2.4.1 Activities and Timeline

Should the feasibility study for the Stung Krang Ponley subproject proceed to detailed design, then allowing for the design process, procurement process and approvals, it has been assumed the following planning as displayed in the below Table.

The following assumptions have been made:

- The detailed design will start in January 2025.
- The procurement process will not take more than three quarters.
- The work construction will start after the rainy season in Cambodia with a mobilization period (last quarter of the year);
- The work construction duration will not last more two dry seasons.

Hence the construction would be able to commence at the last quarter 2026 for the sub-schemes in Stung Krang Ponley with total completion by mid-2030 for Krapeu Truom.

Table 6: Tentative implementation schedule of Krapeu Truom sub-scheme.

COMPONENTS, SUB-COMPONENTS, OUTPUTS AND ACTIVITIES	YEAR 1				YEAR 2				YEAR 3				YEAR 4				YEAR 5				YEAR 6

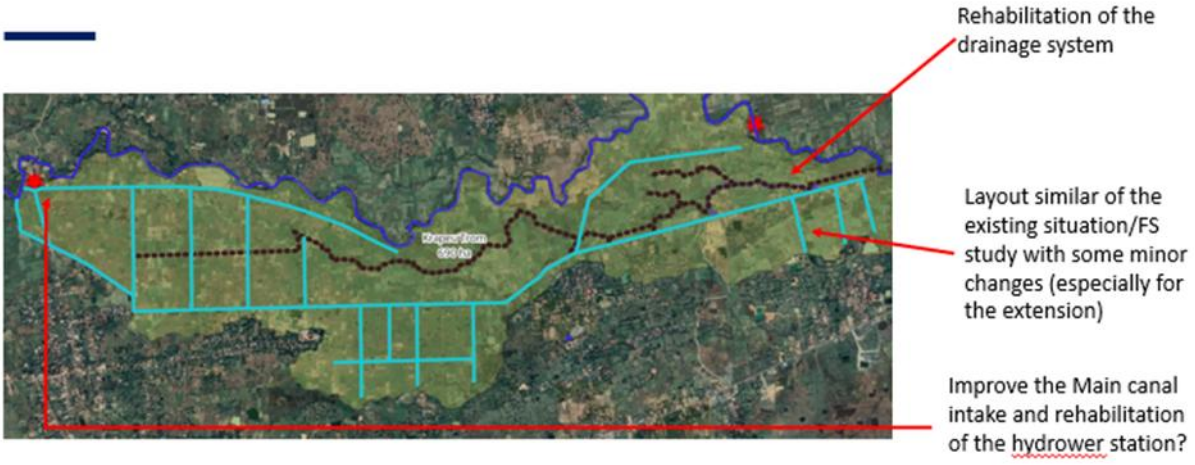
2.4.2 Design Concept and Options

The rehabilitation, construction and activities of CAISAR project in Krapeu Truom sub-scheme consist of canals, river training and drainage, improvement of water regulation and structure and tertiary systems, and installation of solar power systems.



Canal. The design of the canal system aims to serve both irrigation and drainage functions, considering the topography, limited water resources, and potential land resettlement issues. Where possible, the canals will follow existing paths to minimize social impacts. The size of the canals will be adjusted based on the irrigated area and the local topography. To ensure long-term sustainability and reduce water loss through percolation, it is recommended to construct the main canals using concrete linings or suitable alternatives. This approach will help maintain water distribution efficiency and improve the durability of the infrastructure.

River Training and Drainage: A well-designed drainage system will be a critical component of the project, intended to manage excess runoff during the rainy season and prevent waterlogging in the command area. This system will also serve as the outlet for the on-farm drainage network, which is designed to control groundwater levels and drain surplus irrigation water. The layout of the drainage system will be based on the main natural drainage channels, upstream watersheds, rainfall over the command area, and changes in water levels in the Tonle Sap. It will also consider land use, crop types, and the planned irrigation systems to ensure efficient water management.

Water Regulation and Structures: Water will be diverted from multiple sources into the main canals according to water availability and a demand schedule prepared by the FWUC and PDoWRAM, based on crop needs. Various cross structures will be installed to maintain the full supply level in the main and secondary canals where necessary. The flow of water into each canal will be controlled by operating the gates of the head regulators, ensuring efficient delivery to the tertiary canals, which will distribute water to individual fields. Farmers will have the option to irrigate their plots either through plot-to-plot irrigation or by constructing field ditches.

Tertiary System: The irrigation system design extends to the tertiary canal level, which is the final distribution point before water reaches individual plots. Two options are considered for the tertiary canals. The first option involves creating traditional tertiary canals through excavation, where farmers will individually pump water using diesel pumps based on their needs. However, this requires significant cooperation from beneficiaries, as canal alignment must be accepted without land compensation. The second option is to install collective solar pumping stations, a more sustainable and cost-effective solution that eliminates the need for diesel pumps and reduces CO_2 emissions.

Figure 2: Concept design of Krapeu Truom irrigation scheme.

Collective Solar Pumping System: The project aims to implement a solar-powered pumping system as a low-tech, sustainable alternative to diesel pumps, with a pilot test covering 30-50 hectares in each irrigation block. The solar pumping system requires minimal maintenance and has no fuel costs, making it an environmentally friendly and cost-effective solution for farmers. The southern part of Block A is particularly suitable for the implementation of this system due to

its proximity to villages and protection from floods. The solar pumping system could cover 4,198 hectares with 80-90 units, improving water efficiency by 20% and reducing the risk of land conflicts along the canal alignment. This system would ensure reliable water delivery and support sustainable agricultural practices.

2.4.3 Project Activities

The infrastructure investment of the project, as outlined in the previous section, involves several key activities during the pre-construction phase. These activities set the foundation for the successful implementation of the project's construction work and ensure that resources and personnel are well-prepared for the task.

The project is divided into two (2) key components. Component 1 focuses on improving farm-level climate adaptation, resilience, and water use efficiency. This involves planning and training activities to develop community-based action plans and build capacity among farmers. Additionally, mechanization efforts and farm road improvements will enhance agricultural productivity and accessibility. Component 2 aims to strengthen irrigation infrastructure for increased resilience. This includes a range of activities such as river dredging, canal rehabilitation, construction of small-scale structures, river training, polder system development, solar pumping system installation, feeder canal construction, and pond construction or rehabilitation. These interventions will improve water management, increase water storage capacity, and ensure efficient water distribution to agricultural fields.

2.1.1.1 Pre-construction Phase

At the pre-construction phase, there are several activities that need to be done where disturbance to local people as well as natural resources may occur. These activities are:

1. Land and Right of Way Negotiation: This initial step focuses on securing the necessary land and access rights for the construction. Negotiations with local authorities, landowners, and other stakeholders ensure that all legal and logistical requirements are met, minimizing potential delays or disputes that could arise during the project.
2. Contracting and Training of Staff: The project then engages in the recruitment and contracting of skilled personnel, including construction teams, engineers, and project management staff. This step is critical to ensure that the workforce has the necessary expertise and experience. Alongside recruitment, training programs are provided to align staff with the project's goals, safety standards, and technical requirements.
3. Mine and UXO Clearance: In areas with potential unexploded ordnance (UXO), safety is the highest priority. Before any construction begins, the project undertakes mine and UXO clearance to ensure that the site is free of hazardous materials, creating a safe environment for workers and preventing accidents.

These pre-construction activities are integral to establishing a strong foundation for the project, ensuring that the necessary infrastructure, workforce, and materials are in place to proceed smoothly with the subsequent phases of construction.

2.1.1.2 Construction Phase

The construction phase of the project involves a comprehensive set of activities aimed at establishing the required infrastructure while ensuring safety, environmental management, and efficient use of resources. Key construction activities include:

1. Mobilization of Construction Materials, Consumables, Machinery, Equipment, and Staff: Once the team is in place, the project moves into the mobilization phase, where all essential materials, machinery, and equipment are transported to the construction site. This also includes the deployment of consumables and other resources required for ongoing construction. Ensuring the timely arrival and organization of these assets is crucial for avoiding disruptions in the construction timeline. Similarly, staff are mobilized to ensure a coordinated start to the construction activities.
2. Installation and Operation of Temporary Infrastructure: Temporary facilities, such as worker camps, asphalt plants, concrete mixing stations, and ground material processing plants, are set up to support the construction process. These facilities are critical for providing on-site accommodation for workers and ensuring the continuous supply of construction materials.
3. Site Clearing and Cleaning: This phase involves clearing the construction site of any obstructions such as vegetation, debris, and existing infrastructure. It ensures that the land is prepared and ready for subsequent construction activities.
4. Demolition and Removal of Existing Infrastructure: In areas where existing structures need to be replaced or upgraded, demolition and removal are necessary. This ensures that the site is clear for the installation of new infrastructure and allows for efficient use of the available land.
5. Land Movements (Excavations, Dredging, and Fills): Major land movements, including excavations and dredging, are conducted to reshape the land and prepare it for new infrastructure. These activities also involve filling areas to achieve the required ground levels for construction stability and support.
6. Construction of Hydraulic Works (Including Occupation of Waterways): Hydraulic works, such as dams, levees, or irrigation systems, are constructed to manage water resources effectively. This stage often requires temporary occupation of waterways, making careful planning and environmental considerations critical.
7. River Training: As part of managing water flow and preventing erosion, river training is conducted to stabilize riverbanks and direct water movement, which is essential for protecting both the construction site and surrounding ecosystems.
8. Dismantling of Temporary Facilities and Camps: Once the primary construction activities are completed, temporary infrastructure such as camps and material plants are dismantled. This marks the transition toward the final stages of the construction process.

9. Final Cleanup of Intervened Areas: A thorough cleanup of the construction site is conducted to remove debris, materials, and any temporary installations.
10. Site Retoration: To ensure the aesthetic and environmental sustainability of the project, landscaping efforts are undertaken, including replanting vegetation, managing drainage, and shaping the landscape to blend with the natural surroundings.

This series of construction activities ensures that the project is completed according to design specifications, with an emphasis on safety, environmental responsibility, and efficient resource management.

2.1.1.3 Operation and Maintenance

The post-construction phase of the project involves the transition from infrastructure development to its operational use, with a focus on agricultural intensification, resource management, and long-term maintenance. The key activities during this phase include:

1. Intensifying Agricultural Production: Following the completion of the infrastructure, there is a focus on enhancing agricultural productivity. The improved infrastructure allows for more efficient farming practices, increased crop yields, and the introduction of advanced agricultural techniques. This intensification contributes to greater food security and economic development in the region.
2. Increased Use of Energy and Fuel for Agriculture Production: With the intensification of agricultural activities, there is a corresponding rise in the use of energy and fuel to power farming machinery, irrigation systems, and other agricultural equipment. This increased demand for energy supports the scaling up of production but also requires careful management to ensure sustainability and minimize environmental impacts.
3. Operation and Maintenance: To ensure the long-term functionality and durability of the newly constructed infrastructure, regular operation and maintenance activities are critical. This includes monitoring the condition of the infrastructure, performing repairs, and ensuring that the systems in place continue to function as designed. Routine maintenance helps prevent deterioration and ensures that agricultural productivity remains high.
4. Water Management: Effective water management becomes a priority in this phase, especially with the new hydraulic infrastructure in place. This includes controlling irrigation systems, managing water levels in reservoirs, and ensuring that water resources are used efficiently to support agricultural activities. Sustainable water management is crucial for balancing agricultural demands with environmental conservation.

These post-construction activities ensure the long-term success of the project, contributing to sustainable agricultural growth, resource efficiency, and the ongoing maintenance of infrastructure to support continued productivity in the agricultural sector. Summary of the project activities is provided in Table 2.20.

Table 7: Summary of the Project Activities in relation to the infrastructure investment

No.	Stage	Activities

1	Pre-Construction	Land and right of way negotiation
		Contracting and training of staff
		Mobilization of construction materials, consumables, machinery, equipment and staff
2	Construction	Mine and UXO clearance
		Installation and operation of temporary infrastructure (camps, asphalt, concrete and ground material plants)
		Site clearing and cleaning
		Demolition and removal of existing infrastructure in areas to be intervened
		Land movements (excavations, dredging and fills)
		Construction of hydraulic works (includes occupation of waterways)
		River training
		Dismantling of temporary facilities and camps
		Final cleanup of intervened areas
		Landscaping management
	After Construction	Intensifying agricultural production
		Increased use of energy and fuel for agriculture production
		Operation and maintenance
		Water management

UXO = Unexploded Ordnance.

2.4.4 Construction Equipment

To support the construction activities, the project will require a variety of construction equipment and machinery. Below is the potentially used equipment for different stages of the project:

- Earthworks and Land Preparation
  - Excavators – For digging canals, ponds, and trenches.
  - Backhoe Loaders – For smaller excavation and loading tasks.
  - Bulldozers – For clearing and leveling land.
  - Motor Graders – For grading and leveling road and embankment surfaces.
  - Scrapers – For removing and transporting soil over short distances.
  - Soil Compactors/Rollers – For compacting soil before construction.
- Water Infrastructure Construction
  - Dredgers – For clearing and deepening irrigation canals and reservoirs.
  - Trenchers – For laying underground pipelines.
  - Pipe Layers – For positioning and installing large-diameter water pipes.

    - Concrete Pumps – For pumping concrete into irrigation structures.
    - Concrete Mixers (Stationary & Mobile) – For mixing and delivering concrete.
    - Cranes – For lifting heavy pipes, gates, and pre-cast structures.
    - Pile Driving Machines – For driving piles into the ground for dam or levee construction.
- Road and Pathway Construction
    - Asphalt Pavers – For paving roads within the project.
    - Dump Trucks – For transporting materials such as gravel, sand, and asphalt.
    - Bitumen Sprayers – For road surfacing.
    - Road Rollers – For compacting asphalt or gravel surfaces.
- Drainage and Irrigation System Development
    - Water Pumps (Diesel & Electric) – For water transfer and dewatering.
    - Drilling Rigs – For well construction and deep-water extraction.
    - Channel Forming Machines – For shaping and lining irrigation channels.
    - Concrete Pipe Making Machines – For on-site production of irrigation pipes.
- Structural and Facility Construction
    - Tower Cranes – For lifting heavy materials in building sites.
    - Scaffolding Systems – For workers' access and safety.
    - Rebar Cutters and Benders – For reinforcing concrete structures.
    - Shotcrete Machines – For spraying concrete onto embankments.
- Environmental and Erosion Control
    - Hydroseeding Equipment – For erosion control and vegetation replanting.
    - Rock Crushers – For breaking stones for embankment protection.
    - Geotextile Laying Machines – For soil stabilization in embankments and canal lining.
- Power and Electrical Systems
    - Generators – For power supply in remote project sites.
    - Transformers & Substations – For irrigation pumping stations.
    - Solar Panel Installation Equipment – If renewable energy is incorporated.
- Monitoring and Surveying Equipment
    - Total Stations & GPS Survey Equipment – For site mapping and project layout.
    - Drones – For aerial surveys and project monitoring.

- Water Flow Meters – For irrigation system performance assessment.

2.5 ASSOCIATED FACILITIES

Under CAISAR, the screening for potential Associated Facilties (AF) was conducted by SECAP team. The definition for "Associated facilities" (AF) in the AIIB's Environmental and Social Framework (May 2021 version) are activities that are not included in the description of the Project set out in the Legal Agreements governing the Project, but they are qualified to the following criteria:

(a) **directly** and **materially** related to the Project.

(b) **carried** out, or **planned to be carried out**, **contemporaneously** with the Project; and

(c) necessary for the Project to be **viable** and would **not be carried out if the Project did not exist**".

Below is the summary of a) methods that was used by the team to screen for AF, and b) the results of the AF screening.

Methods

Interpretation of AF definition in the context of CAISAR project

Under CAISAR project, the key terms used in the above definition are interpreted as follows:

- **Project**: refers to CAISAR project
- **Direct**, in the context of environmental and social risk and impact assessment, refers to the **impact, which is caused by the project**, and **occurs contemporaneously in the location of the project**. This is to differentiate with an indirect impact which is an impact which is caused by the project and is later in time or farther removed in distance than a direct impact, but is still reasonably foreseeable, and will not include induced impacts. "Direct", in the context of AIIB's ESF refers to the "direct" relationship between a potential associated facilities (e.g. dam, reservoir, barrage) and its impact on the achievement of the intended project development.
- **Material**: significant, important, substantive. In the context of CAISAR, "material" refers to the strength of the above "direct" relationship between the impact of a potential AF on the intended outcome for each subproject which is indicative of **reliable and increased water access** for the target project groups – as per project plan, to achieve expected development outcome.
- **Contemporaneous**: at the same time, which is the relative overlap of time with regards to planning and actual implementation of potential AF and CAISAR project activities (defined by project planning period and project implementation life).
- **Viable**: for CAISAR sub–schemes to **achieve** mostly the **intended impacts** (expected outcome, i.e. increased irrigated area and/or number of crops per year/reliable irrigation

access).

- **Not be carried out if the Project did not exist.** Indicates the functional interdependency between the AF and CAISAR project.

Findings

As per the consultation with the CAISAR PMU and SECAP team, the document regarding the AF had already been approved. Therefore, the result from the assessment were used in this report. Further assessment will be conducted on any emerging facilities after the consultation and agreement being provided by the PMU. Based on the screening by the SECAP team, five (5) existing works have been screened and assessed if they are associated facilities (See table below). The screening results indicates that the water resources facilities met the definition of AIIB's Environmental and Social Framework on Associated Facilities. Therefore, no further actions are required in connection with the works (please see in table 7).

Table 8: Screening of potential Associated Facilities under CAISAR*

Assessment criteria	Kropeau Truom diversion work
a) **directly** and **materially** related to the Project; and	Directly and materially (substantially) related to Kropeau Truom sub–scheme
b) **carried out**, or **planned to be carried out**, **contemporaneously** with the Project; and	The Kropeau Truom Dam construction was completed in 2015 **Not carried out contemporaneously** with Kropeau Truom sub–scheme
c) **necessary** for the Project to be **viable** and **would not be carried out** if the Project did not exist.	**Necessary** for the Kropeau Truom sub–scheme to be **viable** and **still carried out** even if Kropeau Truom sub–scheme did not exist.
Initial screening	NOT AF

2.6 IMPLEMENTATION RESOURCES REQUIREMENT

2.6.1 Labour and Workforce

Table 8 outlines the estimated labor requirements for the construction of the irrigation system under the CAISAR project. Four main groups of the labor forces include: Direct Workers, Contracted Workers, Primary Supply Workers, and Other Stakeholders. The Direct Workers include individual consultants and members of the Project Implementation Unit (PIU), who are essential from the project preparation phase through to completion. The Contracted Workers, engaged by the PIU and construction contractors, consist of national specialists such as Detailed Design Consultants and Construction Supervision Consultants, as well as skilled and unskilled laborers. This group is engaged on intermittent basis. The Primary Supply Workers are mostly local workers involved in providing services to the project at local level during construction, while Other Stakeholders include civil servants from various government ministries and departments,

such as MoWRAM, NCDDS, and MEF are technical support. Krang Ponley require 40 skilled and 60 unskilled workers for implementation.

The involvement of local workers and civil servants is a key feature of the labor requirements. Local workers are heavily engaged as unskilled laborers and primary supply workers, emphasizing the project's reliance on local resources and its potential to create employment opportunities in the region. Additionally, civil servants from ministries such as MoWRAM, NCDDS, and MEF play a significant role, particularly during the construction phase, ensuring compliance with safeguards and providing technical and administrative support. The CAISAR project, requiring careful coordination among consultants, contractors, government agencies, and local communities to ensure successful implementation.

Table 9: The estimated influx labor within the sub-schemes

Type of project workers	Characteristics of project workers	Duration of Labor Requirements	Krapeu Troum
PIU's member MoWRAM & NCDDS	Individual consultants (e.g., E&S Specialists, Design Engineers, Construction Supervision Engineers, etc.	From project preparation till project completion	20
Engaged by PIU			
Detailed Design Consultant	National specialists	From project preparation until project completion	3
Construction Supervision consultant	National specialists		1
Independent E&S Monitoring Consultant		One (1) month in very six (6) months	1
Technical Assistance			3
Skilled workers	National specialists	Durations vary, depending on construction stages & needs.	10
Unskilled workers	Local workers (around subproject location)		15
Primary Supply Workers			
Workers producing materials for core project activities	Mostly local workers	Construction stage	4
Other Stakeholders Working in Connection with Project			
Civil servants of MoWRAM, PDWRAM at provincial & district level	SEO safeguard team	The construction stage of the project.	2
Civil servants of NCDDS	Staff of NCDDS	From project preparation until project completion	2
Civil servants of MEF	Staff of GDR	From project preparation until project completion	1
Civil servants of relevant Ministries	Staff	The construction stage of the project.	1

PIU = Project Implementation Units, MoWRAM = Ministry of Water Resources and Meteorology, E&S = Environmental and Social, NCDDS = National Committee for sub-National Democratic Development Secretariat, PDWRAM = Provincial Department of Water Resources and Meteorology, SEO = Social and Environmental Officer, MEF = Ministry of Economy and Finance, GDR = General Department of Resettlement.

2.6.2 Power Usage

During the construction, the project requires a reliable and sufficient power supply to support various construction activities including equipment operation, worker facilities, and site management. A significant portion of power consumption will be allocated to heavy machinery and equipment, including concrete mixers, cranes, drilling rigs, welding machines, water pumps, and earthmoving equipment such as excavators and bulldozers. These machines require high-power supply mainly from the self-propel engine using diesel or gasoline as the fuel whereas the power for lighting and security systems for general visibility on the construction site could be from the power grid as the location is accessible to power grid. Apart from machinery, electricity for worker facilities and site infrastructure can be the power grid or diesel generators. Worker camps will require power for lighting, cooking, air circulation, and mobile charging.

The overall power demand will vary based on the project's phase, the number of workers, and the type of equipment used. However, the estimate of the demand is far from actual since many information is lacking. The engineering team recommended to wait until the DED stage. A hybrid power system using a combination of grid electricity, and diesel generators. Efficient energy management strategies will help optimize power use, reduce costs, and minimize environmental impact.

2.6.3 Supporting Facilities

Several supporting facilities that are required for the construction activities include site offices and administrative facilities, worker accommodation and welfare facilities such as worker camps containing toilets, showers, handwashing stations, and kitchens to ensure proper hygiene and nutrition. A stable power supply is needed for machinery operation, lighting, and worker facilities, sourced from grid electricity, diesel generators, or solar panels can be the options. Additionally, wastewater treatment facilities are need to manage sewage and reduce environmental pollution for the camp sites.

Proper storage and material handling facilities is needed to protect construction materials such as cement, steel, and gravel. Transportation infrastructure and access roads is used to facilitate the movement of materials and personnel, with designated loading and unloading zones to streamline logistics. To ensure safety, security measures such as perimeter fencing, guard posts, and fire safety stations is needed. Furthermore, environmental management facilities such as waste segregation units, drainage systems, and recycling bins are also needed to minimize environmental impact. The specific layout and location of the facilities can only be projected at after obtaining the final design layout plan of the engineering team during the construction stage after the contract award.

2.6.4 Water Consumption

Water is needed for construction activities and domestic uses of workers. Water is essential for various activities, including material preparation, earthworks, equipment operation, worker sanitation, and site maintenance. A significant portion of water use is allocated to concrete and material preparation, where it is needed for mixing concrete, mortar preparation, curing, and soaking bricks or blocks to prevent rapid water absorption. Additionally, earthworks and dust control require water for soil compaction, suppressing dust on unpaved roads, and softening the ground during grading and levelling. Water is also crucial for equipment and machinery operations, including cooling construction machinery, cleaning tools and formworks, and conducting hydraulic testing of pipelines to check for leaks and pressure integrity. In road construction and asphalt work, water is required for wetting base layers before compaction, mixing with bitumen, and cooling asphalt equipment. Estimate the quantity of water for such activities need the figure of the facilities. As per the consultation with the engineering team, it is not feasible to make an estimate on the water need for such a work since the scope of work including volume of excavated soil, volume of concrete to be used, and so on are not available.

The estimate of water needs for domestic use of the project associated workforce use the 70 liters per day as the basis for the calculation. As the duration of engagement of staff and officials, workers, civil servants over the project life time are varied from one to another. The PMU staff engagement at the field is estimated at 3 days per month over the period of 6 years. The DED Consultant is estimated at 100 days per year for one year, following by construction supervision consultant at 250 days per year for 2.5 year, independent E&S Monitoring Consultant at 25 days per year for 3 years, technical consultant at 50 days per year for 3 years, skilled and unskilled workers at 250 days per year for 2 years, primary supply workers at 50 days per year for 2 years, officials for MOWRAM and PDoWRAM at 50 days per year for 6 years, and other officials at 40 days per year for 6 years. The result of the estimate for water demand is provided below:

Table 10: The estimated quantity of water for domestic use of the project

No.	Type of Workers	Total Workers	Number of Days at Field	Total Water Demand (liters/day)	Total Water Demand (m3)
1	PIU member MoWRAM & NCDDS	20	4,320	1,400	6,048
2	Detailed Design Consultant	3	250	175	44
3	Construction Supervision consultant	1	781	88	68
4	Independent E&S Monitoring Consultant	1	94	88	8
5	Technical Assistance	3	375	175	66
6	Skilled workers	10	5,000	700	3,500
7	Unskilled workers	15	7,500	1,050	7,875
8	Primary Supply Workers	4	469	263	123
9	Civil servants of MoWRAM, PDWRAM	2	600	140	84
10	Civil servants of NCDDS	2	480	140	67
11	Civil servants of MEF	1	300	88	26
12	Civil servants of relevant Ministries	1	300	88	26
	Total				17,936

PIU = Project Implementation Units, MoWRAM = Ministry of Water Resources and Meteorology, NCDDS = National Committee for sub–National Democratic Development Secretariat, E&S = Environmental and Social, PDWRAM = Provincial Department of Water Resources and Meteorology, MEF = Ministry of Economy and Finance.

The estimated water demand is mainly for needed during the construction period, given less than 1% of the estimated water is required for pre-construction stage

2.6.5 Expected GHG Emission and Discharge

During construction, the construction activities will generate Greenhouse Gas (GHG) emissions from various activities, primarily due to the use of fossil fuels, electricity consumption, and material production. One of the major contributors to emissions is fuel combustion in heavy machinery and construction equipment, such as excavators, bulldozers, cranes, and trucks. These machines rely mainly on diesel fuel, which releases carbon dioxide (CO_2), methane (CH_4), and nitrous oxide (N_2O) into the atmosphere. Additionally, transportation of materials such as sand, gravel, cement, and steel to the construction site will also contribute to emissions through fuel consumption by trucks and other vehicles.

Another significant source of GHG emissions is the production and use of construction materials, particularly cement, steel, and asphalt. Cement manufacturing is known for high CO_2 emissions due to the chemical process of calcination, while steel production requires significant energy, leading to further emissions. The use of electricity for site operations, including lighting, worker accommodations, water pumping, and equipment, will also add to the overall carbon footprint, depending on the energy mix used. However, the exact amount of GHG emissions can only be determined after the detailed engineering design is completed, which will provide specific information on construction scope, number and size of equipment usage, and material requirements. Future calculations should take into account project-specific data to ensure a more accurate estimation of the environmental impact.

2.6.6 Land Acquisition for Material Storage

To support construction activities, contractors will need to rent land or engage local households to store materials and vehicles. This land will be used for essential contractor facilities, such as temporary storage areas, worker accommodations, and machinery stations. Securing this land is critical for ensuring efficient operational logistics and smooth construction management throughout the project. Overall, it is projected that a total of 5 households or land units will be needed for Krapeu Truom.

2.7 ANALYSIS OF ALTERNATIVES

2.7.1 Site Selection

The Krapeu sub-project is located with Brambei Mom, Yutasas and Krang Bat in Krang Ponly catchment, covering a total area of 3,277 hectares.

2.7.2 Project Layout and Design

Rehabilitation and enhancement of the existing irrigation system is the main design option under the project opting out from the feasibility design stage as huge land area acquisition found to be critical and generate high social impacts on community people (please see in table 3.8).

Table 11: Irrigation System Options in Krapeu Truom

No.	Structures	Designed Length (km)	Existing Width (Average) m	Expansion (L) m	Expansion (R) m	Total Width (m)
Krapeu Troum						
1	Main Canal 1	2.82	30	0	0	30.00
2	Main Canal 2	6.8	30	0	0	30.00
3	Drainage Canal	6.8	5	1	1	7.00
4	Carrying Roads (MC2)	6.8	Only one (1) section of 1.5 Km canal's embankment requires expansion to be the rural road. The section of 5.3 km is already large enough to be the rural road.		1.5	

L = Left, R = Right, MC2 = Main Canal 2

Secondary Canals. The construction of new secondary canal is expected to acquire huge land areas of farmers which may result in disruption of household economy. To avoid the negative impact, the construction of the canal was agreed to remove the newly plan secondary canal while off-take structure (culverts) will be used to allow farmers to abstract water from the system as per their block command areas. Farmers who own the land within the block need to discuss and agree whether they are going to build their own water canal or use plot by plot irrigation. The risk as per this option is when farmers could come up with the agreement on the construction of a small canal on their own, they have to continue irrigating their farm through deploying plot-to-plot irrigation or using long range pumping which involve with high cost and limited water use efficiency. Since the design is trying to avoid land acquisition, this will be the option for the system which is also applied to the quaternary and fourth-level canal as well.

River Training. River training methods are designed to regulate and stabilize river flows for various purposes, including irrigation, flood control, and erosion prevention. Below are three common types of river training, along with their respective advantages and disadvantages adopted from online source to provide general overview regarding the design and possible options which should be considered for the actual practices. However, it is up to the DED team to decide as per the consultation with Social Safeguard consultant (Table 3.2).

Table 12: River Training Design Options

River Training	Description

Embankments (Levees)	Embankments are artificially raised banks made of earth, concrete, or stone along the sides of a river to prevent water from overflowing into adjacent lands.
Advantages:	• **Flood Control:** Protects agricultural lands and infrastructure from river flooding. • **Irrigation Water Regulation:** Helps direct water flow into irrigation channels efficiently. • **Erosion Prevention:** Reduces bank erosion, safeguarding nearby farmlands and structures. • **Cost-Effective:** Generally, less expensive compared to more complex river training structures.
Disadvantages:	• **Sediment Deposition Issues:** Can lead to sediment buildup within the riverbed, raising water levels and increasing flood risks over time. • **Breaching Risk:** If poorly maintained, embankments can break during extreme floods, leading to catastrophic damage. • **Ecological Impact:** Alters natural river dynamics, affecting aquatic ecosystems and wetlands.
Spurs (Groynes)	Spurs (also called groynes) are structures extending perpendicularly from the riverbank into the river. They help deflect and slow down water flow to prevent erosion and sediment deposition in key areas.
Advantages:	• **Bank Protection:** Reduces erosion by redirecting strong currents away from vulnerable banks. • **Sediment Control:** Helps accumulate sediments in specific areas, aiding in land reclamation or creating stable riverbanks. • **Improves Water Availability:** Can be strategically placed to direct water flow into irrigation systems.
Disadvantages:	• **Local Scouring:** Can cause deep erosion near the structure, affecting nearby irrigation headworks or riverbanks. • **Periodic Maintenance Required:** Sediment accumulation may require periodic dredging to maintain functionality. • **High Initial Cost:** Construction and material costs can be relatively high compared to natural erosion control measures.

Weirs and Barrages	Weirs are low dams built across a river to regulate water flow, while barrages are adjustable structures with gates that control water levels for irrigation and flood management.
Advantages:	• **Water Level Control:** Maintains steady water levels in irrigation channels, ensuring consistent supply to farmlands. • **Hydropower Potential:** Some barrages can integrate small-scale hydroelectric generation. • **Prevents Saltwater Intrusion:** Useful in coastal areas where tidal effects can introduce salinity into freshwater irrigation systems.
Disadvantages:	• **Disrupts Natural River Flow:** Can impact fish migration and aquatic ecosystems if fish passages are not incorporated. • **Expensive to Build and Maintain:** High initial investment and ongoing maintenance are required for long-term functionality. • **Flooding Risk Upstream:** Can cause water accumulation upstream, leading to potential flooding in extreme weather conditions.

Design Slope. As per the confirmation of the Engineering Team, canal slopes will either be protected or left as earthen slopes based on their condition and the available budget, which will be determined during the detailed design phase. For weak slopes, concrete lining and geosynthetic materials will be recommended for reinforcement. The feasibility of bio-engineering solutions will be assessed based on the specific site conditions of the project. The following is the comparison between the vegetated and concretized design slope:

Table 13: Slope Design Options Comparison

Concretized Canal Slopes	• Erosion Control: Concretized canal slopes provide strong erosion resistance, reducing sedimentation in water bodies downstream. This helps maintain water quality and prevents sediment-related ecological degradation. • Maintenance Needs: Concretized slopes generally require less maintenance compared to vegetated banks. They are easier to inspect and repair, reducing ongoing operational costs. • Habitat Impact: Concretized slopes typically offer limited habitat for aquatic organisms and vegetation compared to natural or vegetated banks. This can reduce biodiversity and ecological resilience in the waterway.

	• Heat Absorption: Concrete can absorb and retain heat, leading to higher water temperatures in the canal. This can affect aquatic life, especially sensitive species, and alter ecosystem dynamics. • Aesthetics: Concretized slopes may be perceived as less visually appealing compared to natural or vegetated banks. This could impact recreational use and community engagement with the water resource.
Vegetated Banks	• Erosion Control: Vegetated banks provide natural stabilization, reducing erosion by absorbing water, slowing runoff, and binding soil with root systems. They contribute to maintaining soil structure and preventing sedimentation downstream. • Biodiversity: Vegetated banks offer diverse habitats for aquatic and terrestrial species, promoting biodiversity and supporting ecological balance. They can serve as wildlife corridors and provide nesting sites for birds. • Water Quality: Vegetated banks act as buffers, filtering pollutants, and absorbing excess nutrients from runoff. This improves water quality and supports healthier aquatic ecosystems. • Temperature Regulation: Vegetation provides shade, helping to regulate water temperature and mitigate thermal pollution. This is particularly important for species sensitive to temperature fluctuations. • Community Benefits: Vegetated banks enhance the aesthetic value of the waterway, offering green spaces for recreation, relaxation, and cultural activities. They can also contribute to community engagement and ownership of the water resource.

Cross-Regulator/Off-Take Structure. The structure is required for all sub-schemes and specific size, number, and locations need to be assessed during DED stage. The calculation regarding the design specification need to consider the water requirement in each block of the sub-command areas.

Fish Passes/Sliding Gate. There is practice using fish passage in barrage or headworks across the river where environmental flow is available. The engineering team indicated that the option is not practical at the field level canal because the water flow at the hydraulic structures along the canal system need to be fully closed for some time for farmers to irrigate their system. However, the fish passage may be practical for OTP river and Svay Doun Keo river which needs to be assessed at the DED stage. Two fish passes are provided below:

Table 14: Slope Design Option Comparison

Vertical Slot Fish Passway:	• Biodiversity Risks:
	  ○ Habitat Fragmentation: Vertical slot fish passways can contribute to habitat fragmentation by interrupting the natural flow of rivers. This interruption can create barriers to fish migration, leading to isolated populations and reduced gene flow between different sections of the river.
	  ○ Species-Specific Challenges: Some fish species may face difficulties navigating through the narrow, vertical slots of the passway. Species with limited jumping abilities or specific habitat preferences may struggle to ascend or descend through the structure, limiting their access to essential spawning or feeding areas.
	• Environmental Risks:
	  ○ Sedimentation: Improperly designed vertical slot fish passways can alter flow patterns, leading to increased sedimentation downstream. Changes in flow velocity and direction can cause erosion of riverbanks and streambeds, resulting in sediment accumulation in downstream habitats. Excessive sedimentation can degrade water quality, smother benthic habitats, and reduce oxygen levels, harming aquatic life.
	  ○ Hydraulic Impacts: Vertical slot fish passways may create hydraulic conditions that are unsuitable for fish passage. High velocities and turbulent flows within the passway can impede fish movement and cause physical stress or injury. Additionally, rapid changes in water level or flow rate can disorient fish and hinder their ability to navigate through the structure.

Cone Fishway	• Biodiversity Risks
	  ○ Selective Passage: Cone fishways may not provide equal passage opportunities for all fish species. Some species may have difficulty navigating through the structure due to factors such as water depth, flow velocity, or hydraulic complexity. This selective passage can create barriers to migration for certain species, leading to reduced genetic exchange and population fragmentation.
	  ○ Altered Hydrology: Cone fishways can modify natural flow patterns within river systems, potentially altering habitat availability and quality for aquatic organisms. Changes in flow

	velocity, turbulence, and water depth can influence the distribution and abundance of fish and other aquatic species, impacting ecosystem dynamics and biodiversity.
	• Environmental Risks
	  ○ Habitat Modification: Construction of cone fishways may require alterations to river channels and banks to accommodate the structure. Channel dredging, bank stabilization, and other habitat modifications can disrupt natural riverine habitats and alter ecosystem processes. Changes in habitat structure and composition can affect the distribution of aquatic flora and fauna, leading to shifts in community composition and trophic interactions.
	  ○ Sediment Transport: Cone fishways can affect sediment transport dynamics within river systems, with potential implications for downstream habitats. Changes in flow velocity and turbulence induced by the structure can influence sediment deposition and erosion patterns, altering habitat availability and quality for benthic organisms and other aquatic life.

2.7.3 Project Technology

The feasibility study has assessed the climate vulnerabilities of the Command Areas and their communities to design suitable, sustainable, and climate-resilient irrigation systems. The scheme will make use of nature-based, adaptive, and data-driven technologies to ensure its resilience to extreme floods and climate change. Smart SCADA technology will be installed to monitor the system for leaks and flood damages, while drainage systems will also be installed to reduce waterlogging, flood impacts, and crop failures.

Solar pumping will be employed in place of costly and high-carbon diesel alternatives to create a self-sustaining system. The lining of canals is an important feature of the system's climate resilience, and a range of investment options exist depending on the extent of lining in the new network. Concrete will be used for certain sections to reduce the carbon footprint.

There are different technological options being proposed for the project activities. The key technological options are provided here:

Table 15: Irrigation System Options

Options	Component	Options	Description
Pumping	1	Diesel water pump	Traditional water pumping systems powered by diesel engines. These are commonly used in areas where electricity is unavailable but it has higher operational cost and environmental impacts.

			However, it can be used anywhere in the sub-scheme.
		Solar pumps	Sustainable and cost-effective water pumping systems that harness solar energy, suitable for remote areas with abundant sunlight. They offer lower long-term costs but may require higher initial investment.
		Electric pumps	Powered by electricity from the grid or other sources, these pumps are efficient but depend on the availability of consistent electrical supply which maybe inapplicable at farm level in most of the sub-scheme
IPM	1	Pesticide application	A conventional approach involving chemical pesticides to manage pests, often leading to quick results but with potential risks to health, environment, and biodiversity. The times of application without IPM will be up to 6 times as per the reported from the field survey.
		With IPM*	The application of pesticides will be reduced to only around 3 times, minimizing the impacts on the quality and health of water, environment, wildlife, fauna and flora, human and animal
Agromet	1	Without Agromet	Farming practices carried out without the use of weather and climate data, potentially leading to inefficiencies and higher vulnerability to climate risks.
		Agromet	Incorporates meteorological data and forecasts into agricultural decision-making, enhancing productivity, resource optimization, and resilience to climate variability. However, the major challenge is mainly the operational cost of the system.
SCADA**	2	Convention	Manual or semi-automated control systems for monitoring and managing operations, which may be labour-intensive and less efficient in handling complex systems.
		SCADA	Advanced digital systems that provide real-time monitoring, data analysis, and remote-control capabilities for improved efficiency and operational oversight.

*. IPM = Integrated Pest Management

**. SCADA = Supervisory Control and Data Acquisition

For pumping, there is a need to be case specific to each of the option. Applying these technological options are important since the technologies will facilitate the agricultural production and complimenting each other is needed. The promotion of only one (1) option would decrease

the effective farming activities. Regarding the IPM, it is quite important to promote the technologies as it will reduce the negative impacts which will be caused by the farming activities. The application of agromet will require technical skill and management capacity

2.7.4 Project Scenario Analysis

Without-project scenario, the net command area of 690 has will continue to be cultivated with a crop intensity of 100% whereas the 15% of command area (73 ha) will continue to produce vegetables with limited water sources, facing the risk of crop failure even during rainy season.

In the with-project scenario, although the net command area will remain unchanged, improvements in water availability, management, transmission efficiency, and drainage will increase cropping intensity to 115% (covering 793 hectares). This will consist of 69 hectares of late wet-season paddy, 276 hectares of medium wet-season paddy, 345 hectares of early wet-season paddy, and 103 hectares of high-value crops, including fruits and vegetables.

The project is expected to bring the following agricultural benefits for the 2,430 farming households in the Kropeau Truom scheme: i) improved yields for wet-season rice, ii) expanded cultivation area and higher yields for dry-season rice, and iii) the introduction of high-value crops like leafy vegetables and fruit vegetables for dry-season cultivation. These changes are expected to increase agricultural productivity, raise farmer incomes, and enhance farmer resilience to drought, pests, diseases, and market risks through crop diversification.

In contrast, the without-project scenario would maintain current agricultural practices, resulting in suboptimal rice yields, poor crop diversification, lower farmer incomes, and heightened vulnerability to climate risks.

The proposed Kropeau Truom sub-scheme aims to install secondary and tertiary irrigation canals and related infrastructure within the existing system, enhancing dry-season water availability for 690 hectares of nearby farmland. Additionally, the project will establish and train Farmer Water User Communities (FWUCs) to manage and maintain the irrigation infrastructure, ensuring long-term sustainability. Further agricultural extension services will be provided to local farmers, focusing on improved agricultural techniques, value chain optimization, the use of improved seed varieties, cover crop application, and optimal fertilizer and pesticide use.

3. LEGAL AND INSTITUTIONAL FRAMEWORK

Following a framework for effective project development as well as environmental sustainability, the project owner shall comply with the national legal framework and protocols ratified by the Kingdom of Cambodia. For CAISAR Project, there are national laws, agreements, guidelines and relevant legal instruments as described below:

3.1 Royal Government of Cambodia's Legal Framework

3.1.1 National legal framework

3.1.1.1 The Constitution of the Kingdom of Cambodia (1993)

The Constitution is the highest legal authority in Cambodia and establishes the fundamental rights and duties of citizens and the state. It sets the groundwork for environmental protection, governance, social inclusion, and public well-being, ensuring that environmental and social rights are integrated into national laws.

3.1.1.2 Legal Framework related to the Management and Conservation of Natural Resources and Biodiversity

This framework aims to ensure sustainable use and conservation of Cambodia's natural resources, including water, land, biodiversity, and ecosystems. Laws under this framework help guide ESCIA processes to minimize environmental degradation.

- **Royal Decree on Protected Areas (2008)** sets the standard for managing Cambodia's protected areas. It categorizes these areas into **National Parks**, **Wildlife Sanctuaries**, **Protected Landscapes**, and **Multiple-Use Areas** to conserve biodiversity, ecosystems, and cultural heritage while supporting sustainable development.
- **Law on Environmental Protection and Natural Resource Management (1996)**: Establishes principles for sustainable development and environmental protection, requiring environmental assessments for projects impacting natural resources.
- **Environmental and Natural Resources Code 2023**: Provides a comprehensive approach to natural resource governance, setting standards for the sustainable management of resources.
- **Law on Land Management, Urban Planning and Construction (1994)**: Governs land use, urban development, and construction to ensure that environmental and social impacts are mitigated.
- **Law on Water Resource Management (2007)**: Regulates water usage, conservation, and management, ensuring that development projects do not negatively impact water resources.
- **Law on Fisheries (2006)**: Focuses on sustainable fisheries management and biodiversity conservation in aquatic ecosystems, crucial for ESCIA in projects affecting water bodies.
- **Protected Areas Law (2008)**: Establishes protected areas to conserve biodiversity and natural resources, ensuring that development projects respect protected regions.
- **Land Law (2001)**: Regulates land ownership and management to promote sustainable land use practices.
- **Sub-Decree on Water Pollution Control (1999)**: Sets standards for water quality and pollution control in development projects.
- **Sub-Decree on Water Quality Standard for Public Waters for the Purpose of Biodiversity Conservation (1999):** These standards aim to maintain conditions suitable

for aquatic ecosystems by limiting pollutants, ensuring water remains safe for the survival and reproduction of aquatic life, and preventing ecological degradation.

- **Sub-Decree on Environmental Impact Assessment (1999)**: Requires EIA for development projects, ensuring environmental impacts are assessed and mitigated.
- **Sub-Decree on Air Pollution Control and Sound Disturbance (2000)**: Provides standards to control air pollution and noise disturbances from development projects.
- **Sub-Decree on Solid Waste Management (1999)**: Governs solid waste management in projects, preventing environmental harm from improper waste disposal.
- **Prakas on Environmental Impact Assessment Reports (1999)**: Offers guidelines for preparing EIA reports to ensure thorough assessment of environmental impacts.
- **Prakas on Hazardous Substances (2015)**: Sets limits on the disposal of toxic substances, preventing environmental contamination from hazardous materials.
- **Biodiversity Convention (1994)**: Focuses on conserving ecosystems, species, and genetic diversity. Promotes sustainable use of resources, establishment of protected areas, and fair benefit-sharing from genetic resources.
- **Ramsar Convention (1999)**: Aims to conserve wetlands of international importance for biodiversity, water management, and climate resilience. Encourages sustainable use and designation of Ramsar sites.
- **UNFCCC (1994)**: Provides a framework to combat climate change impacts on ecosystems. Supports sustainable land use, forest conservation, and integration of climate adaptation into conservation strategies.
- **Kyoto Protocol (1997, entered into force 2005, Cambodia accessed 2002):** Strengthens the UNFCCC by setting legally binding targets for reducing greenhouse gas emissions, promoting sustainable development and renewable energy.
- **Vienna Convention for the Protection of the Ozone Layer (1988, Cambodia accessed 2001):** Aims to protect the ozone layer through global cooperation, encouraging research, monitoring, and measures to phase out harmful substances.
- **Montreal Protocol on Substances that Deplete the Ozone Layer (1987, entered into force 1989, Cambodia accessed 2001):** A legally binding treaty to phase out ozone-depleting substances. Contributes to environmental and climate protection.
- **Basel Convention (1992, Cambodia accessed 2001**): Controls the transboundary movement of hazardous wastes and their disposal, emphasizing waste reduction and environmentally sound management.
- **United Nations Convention to Combat Desertification (1996, Cambodia ratified 1997):** Addresses land degradation and desertification through sustainable land management, conservation of soil and water resources, and restoration of degraded land.

- **CITES (1975, Cambodia ratified 1997):** Regulates trade in endangered species to ensure their survival, focusing on sustainable management and combatting illegal wildlife trade.
- **UNESCO Network of Biosphere Reserves (Cambodia joined in 1997):** Promotes the sustainable management of biodiversity, ecosystems, and cultural heritage through conservation and sustainable development practices.
- **Millennium Development Goals (MDGs) and Sustainable Development Goals (SDGs):** Cambodia committed to global goals for environmental sustainability, including biodiversity conservation, climate action, and ecosystem protection.
- **ASEAN Agreement on Transboundary Haze Pollution (2006):** Focuses on preventing and mitigating air pollution caused by forest fires through regional cooperation and sustainable forest management.
- **ASEAN Agreement on Disaster Management and Emergency Response (2009):** Strengthens disaster preparedness, risk reduction, and environmental resilience in the ASEAN region.
- **Mekong Agreement (1995):** Promotes sustainable development, equitable water use, and conservation of the Mekong River Basin’s ecosystems and resources.
- **Biodiversity Law (2009):** This foundational law provides a comprehensive legal structure for the sustainable management of biodiversity resources. It addresses habitat protection, species conservation, genetic resource management, and the sustainable use of biodiversity, outlining the government's responsibilities and promoting public participation.
- **Environmental Protection Law (1995):** This law sets general principles for environmental protection and outlines the government's role in environmental management, including pollution control, waste management, and natural resource conservation. It complements the Biodiversity Law by providing a broader environmental governance framework.
- **Forest Law (1994):** Regulating the management, use, protection, and restoration of Cambodia's forests, this law is crucial for balancing economic development with environmental conservation, particularly in biodiversity-rich ecosystems.
- **Wildlife Sanctuary and Protection Law (1993):** This law establishes wildlife sanctuaries and offers protection to wildlife species by prohibiting hunting, trapping, and other activities that threaten wildlife and their habitats.
- **Fisheries Law (1991):** This law governs the management of Cambodia's fisheries resources, setting rules for sustainable fishing practices, protecting aquatic habitats, and ensuring the long-term health of aquatic ecosystems.
- **Environmental Code (2023):** The newly introduced Environmental Code consolidates and updates Cambodia's environmental laws, introducing stricter regulations on pollution control, natural resource management, and biodiversity conservation. It emphasizes

climate change adaptation and mitigation and enhances public participation and transparency in environmental decision-making.

- **Nagoya Protocol (2010):** As a party to the Nagoya Protocol under the Convention on Biological Diversity (CBD), Cambodia commits to the fair and equitable sharing of benefits arising from the utilization of genetic resources. This protocol supports Cambodia's efforts to protect its biodiversity while ensuring that the benefits of its genetic resources are shared with local communities and stakeholders.

3.1.1.3 Legal Framework related to Labour, Public Well-Being, and Safety

This framework emphasizes the protection of workers' rights, public safety, and well-being in project development. It ensures that development projects comply with labor laws and safety standards.

- **Labor Law (1997)**: Protects workers' rights, ensuring safe and fair working conditions during project implementation.
- **Law on Roads (2014)**: Governs the construction and maintenance of roads, with provisions for minimizing environmental and social impacts.
- **Law on Road Traffic (2014)**: Addresses traffic management and safety measures to prevent accidents and disruptions during development.
- **Law on Suppression of Human Trafficking and Sexual Exploitation (2008)**: Protects vulnerable populations during project implementation from exploitation and trafficking.
- Government Occupational and Community Safety and Health (OHS) guidelines follow the OHS Program for Cambodia (2010-2013) developed by the International Labor Organization (ILO). The draft guidelines provide the framework for instituting OHS at the workplace and in the community.
- The Ministry of Labor and Vocational Training (MLVT) has the following guidelines which will be implemented during the construction phase of the Project:
    - MLVT Prakas on Sanitation at the Construction Site (March 2011). The Prakas sets to ensure that the sanitation and safety conditions are fulfilled for workers at construction sites by owners, directors, contractors or subcontractors of construction establishments or construction companies. Articles 3 and 4 ensure that workers are provided with shelter, sanitation facilities and safe potable water for drinking and washing.
    - MLVT Prakas on The Protection of Risk Resulting from Climate Change at Construction Sites (March 2011). Articles of this Prakas require safety measures and break times for workers at the construction site during extreme weather events.
    - MLVT Prakas on Providing of Information at the Construction Site (March 2011). This Prakas states requirements for owners or responsible persons of a construction site to provide information, i.e. name and address of the owner of enterprise, construction establishment, Construction Company, name and address of architect, nature of

construction, date for the start of the construction, estimated time to finish the construction works, and estimated number of workers to be employed for construction activities.

- MLVT Prakas on Stock of Materials, Waste Disposal and Clearance at Construction Site (March 2011). This Prakas provides safety guidelines and requirements for the safe storage of construction of materials and waste.

3.1.1.4 Legal Framework related to Governance and Social Inclusion

This framework ensures that development projects promote inclusive governance, respect cultural heritage, and safeguard social rights. It includes provisions for tax obligations, land acquisition, resettlement, and social protection schemes.

- **Law on Taxation (1997)**: Governs the taxation of development projects, ensuring they contribute to national revenue and economic sustainability.
- **Sub-Decree on Construction Permit (1993)**: Requires permits for construction activities, ensuring they comply with environmental standards and social safeguards.
- **Law on Protection of the Rights of Persons with Disabilities (2009)**: Ensures that development projects consider the needs and rights of people with disabilities.
- **Law on Social Security Schemes (2002)**: Provides social protection for workers, ensuring their well-being during project execution.
- **Sub-Decree on Health Care Scheme (2016)**: Extends social security and health care protection to workers involved in development projects.
- **Law on the Protection of Cultural Heritage (1996)**: Safeguards cultural heritage sites, ensuring that development projects do not damage or destroy culturally significant areas.
- **Expropriation Law (2010)**: Regulates land acquisition for public purposes, ensuring fair compensation and minimizing the impact on affected populations.
- **Sub-Decree on Land Acquisition and Resettlement (2018)**: Provides procedures for land acquisition and involuntary resettlement, particularly for externally financed projects.
- **Sub-Decree on Social Land Concession (2003)**: Allows for the allocation of state land to landless citizens, particularly when development projects displace communities.
- **Sub-Decree on State Land Management (2005)**: Regulates the management of state land, ensuring its sustainable use in development.
- **Sub-Decree on River Basin Management (2015)**: Promotes sustainable management of river basins, ensuring that development projects do not harm water systems and dependent ecosystems.

3.2 EIA Classification

In order to provide guidelines on effective implementation of sub-decree No 72 ANRK.BK on environmental impact assessment Procedures for development projects, MoE promulgated sub-decree No. 21 on Environmental Impact Assessment Classification for Development Projects.

According to this sub-decree, environmental impact assessment for projects is classified into three categories.

- Appendix 1: Projects requiring full environmental impact assessment (full ESIA)
- Appendix 2: Projects that require initial environmental impact assessment (IEIA)
- Appendix 3: Projects requiring the Contract on Environmental Protection (EPC)

The sub-decree includes an annex listing projects under various sectors and their categorization on the basis of their nature, type and size. The sector and EIA classification for irrigation project is summarized in Table 11 below.

Table 16: ESIA Classification for Development Projects relevant

No	Project Type	ESIA (Equiv. to ADB's A)	ESIA (Equiv. to ADB's B)	Env. Protection Contract	Apply to CAISAR Project
1	Irrigation systems		≥5000ha	1000-5000ha	√
2	Water diversion systems		≥5000ha	1000-5000ha	√
3	All building construction	>45000m2	15000 – 45000m2	3000-15000m2	
4	Road construction (new)	>100km	≥ 30 – 100km	10-<30km	√
5	Railroad and road expansion	>100km	≥50 – 100km	10-<50km	√
6	Road in protected areas	>30km	≥ 10-30 Km	10km	
7	Road widens or rehabilitation in protected area	>50km	≥ 10-50 km	10km	

Source: Prakas No. 021 PRK.BST dated 03 February 2020.

3.3 Applicable Ambient Quality Standards

3.3.1 Water quality standards for public health protection

Water quality standards in public water areas for biodiversity conservation are shown in Table 12 below. These are applied as the national standards on surface water quality.

Table 17: Water quality standards in public water areas for bio-diversity conservation

No	Parameter	Unit	Surface water Standard	
			River	Lake etc

1	pH	mg/l	6.5-8.5	6.5-8.5
2	Total suspended solids (TSS	mg/l	25-100	1-15
3	Dissolved oxygen (DO)	mg/l	7.5-2.0	7.5-2.0
4	Biochemical oxygen demand (BOD5)	mg/l	1-10	<30
5	Chemical oxygen demand (COD)	mg/l	<50	1-8
6	Total Nitrate (TN)	mg/l	0.1-0.6	0.1-0.6
7	Total phosphorous (TP)	mg/l	0.005-0.05	0.005-0.05
8	Arsenic (As)	mg/l	<0.01	<0.01
9	Iron (Fe)	mg/l	<1	<1
10	Total Coliform	MPN/100ml	<5,000	<1,000

Note: Standard* = Surface water quality standards for lake, reservoirs and river of the MoE's Prakas on the adoption of terms of references for infrastructure and tourism sectors (2018).

The Royal Government of Cambodia has established a comprehensive policy on National Water Supply and Sanitation for both urban and rural water supplies. Based on this policy, and to ensure access to safe drinking water to all people, quality standards for both drinking water and groundwater are developed by an inter-ministerial process initiated by the Ministry of Industry, the Mines and Energy, and other concerned ministries with support from the World Health Organization.

Table 18: Groundwater and Drinking Water Quality Standards.

No.	**Parameters**	**Unit**	**Standard**		
			River	**Lake and reservoir**	**CDWQS***
1	Depth				
2	pH	-	6.5-8.5	6.5-8.5	6.5-8.8
3	Electrode Conductivity (EC)	mg/l	500-1500	500-1500	-
4	Arsenic (AS)	mg/l	<0.01	<0.01	0.05
5	Cadmium (Cd)	mg/l	<0.003	<0.003	<0.003
6	Lead (Pb)	mg/l	<0.01	<0.01	0.01
7	Total Nitrogen (TN)	mg/l	<3	<2	-
8	Total Phosphorus (TP)	mg/l	<0.25	<0.15	-
9	Total Dissolved Solid (TDS)	mg/l	<1000	<1000	<800
10	Total Suspended Solid (TSS)	mg/l	<100	<100	-
11	Dissolved Oxygen (DO)	mg/l	>3	>4	-
12	Total Coliform	MPN/100ml	<1000	<1000	0

*. Cambodia Drinking Water Quality Standard

Ambient Air Quality Standards are presented in Table 14. Maximum permitted noise levels in public and residential areas are shown in Table 14.

Table 18. Ambient Air Quality Standards.

Parameters	Cambodia				WHO Air Quality Guideline 2021
	Period 1h Average mg/m^3	**Period 8h Average mg/m^3**	**Period 24h Average mg/m^3**	**Period 1year Average mg/m^3**	
Carbon monoxide (CO)	40	20	-	-	4mg/m^3 (24h Average)
Nitrogen dioxide (NO2)	0.3	-	0.1	-	10 ug/m^3(1 year average) 25 ug/ m^3 (24h average)
Sulfur dioxide (SO2)	0.5	-	0.3	0.1	40 ug/ m^3 (24 h average)
Ozone (O3)	0.2	-	-	-	100 ug/ m^3 (8h average)
Lead (Pb)	-	-	0.005	-	-
Particulates	-	-	0.33	0.1	5 ug/m^3 (PM2.5, 1year) 15 ug/m^3 (PM2.5, 24h average)

Table 19. Maximum permitted noise levels in public and residential areas (dB (A))

Location	Cambodia Standard			IFC-EHS Guideline	
	06:00 to 18:00	**18:00 to 22:00**	**22 to 6:00**	**Day 7:00 to 22:00**	**22:00 to 7:00**
Silence Area Hospital; Library, School, Nursery	45	40	35	55	45
Resident Area Hotel; Administration place, House	60	50	45	-	-
Commercial, Services Areas and mix	70	65	50	70	70
Small Industrial factories intermingling in residential areas	75	70	50		

Note: This is permitted noise level of any source of activity at the public and residential areas. Source: Sub-Decree on Air Pollution Control and Noise Disturbance, 2000.

3.4 AIIB'S Environmental and Social Framework (ESF)

The Asian Infrastructure Investment Bank's (AIIB) Environmental and Social Framework (ESF) (2022) outlines the principles and standards to ensure environmentally and socially sustainable development practices for projects it finances. The framework consists of several Environmental and Social Standards (ESS) that provide comprehensive guidance on managing potential impacts and risks associated with AIIB-financed projects. AIIB's Environmental and Social Framework (ESF) (2022) are summarised here.

- **Environmental and Social Standard 1: Environmental and Social Assessment and Management**: These standard guides the assessment and management of environmental and social risks, requiring projects to evaluate alternatives, mitigate impacts, and disclose information. It emphasizes protecting the natural environment, particularly biodiversity and critical habitats, while addressing pollution, resource efficiency, and climate change. Social risks, including impacts on vulnerable groups, gender, and access to resources, must be considered. The standard also covers labor conditions, community health and safety, child labor, and security, ensuring proper grievance mechanisms, monitoring, and implementation plans.
- **Environmental and Social Standard 2: Land Acquisition and Involuntary Resettlement.** The standard provides guidance to avoid Involuntary Resettlement where possible. The requirements under the standard contain 18 points of action to which the executing agency needs to follow.
- **Environmental and Social Standard 3: Indigenous Peoples.** The standard aims to design and carry out projects in a way that fully respects Indigenous Peoples' identity, dignity, human rights, economies, and cultures. This ensures that Indigenous Peoples: (a) receive social and economic benefits that are culturally appropriate; (b) do not experience negative impacts from the projects; and (c) can actively participate in projects that affect them. The standard contains 15 points to follow.

3.5 IFADs' SECAP

The International Fund for Agricultural Development's (IFAD) Social, Environmental, and Climate Assessment Procedures (SECAP) provides a framework to ensure that IFAD-financed projects are sustainable, socially inclusive, and environmentally sound. SECAP is composed of several standards that address various environmental and social considerations. Listed in the ToR, here is the summary of the applied standards:

- **Standard 1: Biodiversity Conservation**: This standard ensures the protection of biodiversity by requiring projects to assess and mitigate biodiversity risks, avoid critical habitats, and provide compensation for unavoidable damages. It promotes sustainable use of genetic resources, discourages invasive species, and emphasizes expert advice and adherence to protected area laws.

- **Standard 2: Resource Efficiency and Pollution Prevention**: Focuses on efficient use of resources and pollution control. It requires projects to reduce energy, water, and material use, manage hazardous materials safely, and prevent pollution, with an emphasis on sustainable natural resource management, including water, soil, fisheries, and forests.
- **Standard 3: Cultural Heritage**: This standard ensures the protection of tangible and intangible cultural heritage by screening and managing impacts, consulting local communities, and preserving access to cultural sites. Projects must avoid, minimize, or mitigate damage and follow legal requirements in protected areas.
- **Standard 4: Indigenous Peoples**: Supports and empowers indigenous communities by requiring free, prior, and informed consent (FPIC), promoting equitable resource access, and protecting cultural heritage. Projects must involve indigenous peoples in decision-making, ensure fair benefits, and avoid involuntary resettlement.
- **Standard 5: Labor and Working Conditions**: Sets requirements for safe, non-discriminatory workplaces, prohibiting forced and child labor. It requires the establishment of grievance mechanisms, safety protocols, and equal opportunities, with contractors and suppliers adhering to these standards.
- **Standard 6: Community Health and Safety**: Requires projects to assess and manage health risks, prevent exposure to hazards, and ensure infrastructure safety. It includes emergency preparedness, traffic and security management, and protection against gender-based violence.
- **Standard 7: Physical and Economic Resettlement**: Ensures resettlement is conducted legally and fairly, avoiding forced evictions. It requires special consideration for vulnerable groups, economic displacement, and establishing grievance mechanisms for affected communities.
- **Standard 9: Climate Change**: Ensures projects address climate risks and reduce GHG emissions. It mandates climate risk screening, adoption of climate-smart practices, and GHG accounting to guide project design towards reducing environmental impacts.

3.6 GEF'S Environmental and Social Policies

GEF adopts the interim environmental and social safeguards to identify, measure, and mitigate environmental and social risks based on IFC Performance Standards (PS). Under CAISAR, the following PSs are applied:

- Performance Standard 1 – Assessment and Management of Environmental and Social Risks and Impacts;
- Performance Standard 2 – Labor and Working Conditions
- Performance Standard 3 – Resource Efficiency and Pollution Prevention

- Performance Standard 4 – Community Health, Safety, and Security
- Performance Standard 5 – Land Acquisition and Involuntary Resettlement
- Performance Standard 6 – Biodiversity Conservation and Sustainable Management of Living Natural Resources
- Performance Standard 7 – Indigenous Peoples
- Performance Standard 8 – Cultural Heritage.

3.6.1 International Conventions and Treaties

Cambodia has ratified all eight of the ILO's fundamental conventions, which cover core labour standards recognized as human rights. These conventions focus on issues such as freedom of association, elimination of forced labour, abolition of child labour, and elimination of discrimination in employment.

- **Freedom of Association and Protection of the Right to Organise Convention, 1948 (No. 87)**: Ratified by Cambodia in 1999, this convention protects workers' and employers' rights to freely form and join organizations without interference, ensuring autonomy and safeguarding against dissolution by authorities.
- **Right to Organise and Collective Bargaining Convention, 1949 (No. 98)**: Ratified in 1999, it protects workers' rights to organize, engage in collective bargaining, and prevents discrimination for union activities, promoting fair wage negotiations and just working conditions.
- **Forced Labour Convention, 1930 (No. 29)**: Ratified in 1969, this convention aims to eliminate all forms of forced labour, including coercive work for public works or political purposes, protecting workers' rights and dignity.
- **Abolition of Forced Labour Convention, 1957 (No. 105)**: Ratified in 1999, it strengthens the prohibition of forced labour for political coercion, discipline, or discrimination, ensuring freedom and justice in the workplace.
- **Minimum Age Convention, 1973 (No. 138)**: Ratified in 1999, it sets a minimum age for employment (usually 15) to prevent child labour, promoting access to education and protection from hazardous work.
- **Worst Forms of Child Labour Convention, 1999 (No. 182)**: Ratified in 2006, this convention seeks to eliminate extreme forms of child labour like slavery, trafficking, and hazardous work, prioritizing children's safety and rehabilitation.
- **Equal Remuneration Convention, 1951 (No. 100)**: Ratified in 1999, it promotes equal pay for men and women for work of equal value, combating gender-based wage discrimination and fostering economic justice.
- **Discrimination (Employment and Occupation) Convention, 1958 (No. 111)**: Ratified in 1999, this convention addresses workplace discrimination based on race, gender, religion, and other factors, promoting equal treatment and opportunities for all workers.

- **Employment Policy Convention, 1964 (No. 122)**: Ratified in 1971, it requires active employment policies to promote full, freely chosen employment, aiming to reduce unemployment and support economic and social development.
- **Weekly Rest (Industry) Convention, 1921 (No. 14)**: Ratified in 1969, this convention guarantees a weekly rest period of at least 24 consecutive hours for workers, helping protect their health and well-being.
- **Labour Inspection Convention, 1947 (No. 81)**: Ratified by Cambodia in 1974, this convention establishes labour inspections in industrial and commercial workplaces to ensure compliance with national labour laws, promoting safe, fair, and decent working conditions.
- **Labour Inspection (Agriculture) Convention, 1969 (No. 129)**: Ratified in 1999, it extends labour inspection to agriculture, ensuring workers in this sector, including migrant and seasonal labourers, are protected by labour laws and safe working conditions are maintained.
- **Tripartite Consultation (International Labour Standards) Convention, 1976 (No. 144)**: Ratified by Cambodia in 2009, this convention promotes consultation between governments, employers, and workers on international labour standards. It ensures that all stakeholders are involved in the implementation of labour policies, enhancing social dialogue and cooperation for fair labour practices.

3.7 Good International Industry Practices (GIIP)

3.7.1 WBG General EHS Guidelines (2007)

The World Bank Group (WBG) General Environmental, Health, and Safety (EHS) Guidelines (2007) provide internationally recognized technical guidance on managing environmental, health, and safety risks. These guidelines are designed to support project developers and operators, particularly in emerging markets, by outlining best practices for environmental sustainability, worker health and safety, and community well-being.

Key sections include:

- **Environmental Guidelines:** Focus on pollution prevention and control, resource efficiency, and managing air, water, and soil impacts.
- **Occupational Health and Safety (OHS):** Address workplace hazards, accident prevention, and worker welfare.
- **Community Health and Safety:** Cover topics like traffic safety, emergency preparedness, and protecting communities from project-related risks.
- **Construction and Decommissioning:** Provide guidance on managing risks during the life cycle of a project.

The guidelines emphasize compliance with local regulations and international standards and are intended to be applied alongside sector-specific EHS guidelines.

3.7.2 WBG EHS Guidelines for Annual Crop Production (2016)

The World Bank Group (WBG) Environmental, Health, and Safety (EHS) Guidelines for Annual Crop Production (2016) provide technical guidance on sustainable practices for cultivating annual crops, such as grains, legumes, and vegetables. These guidelines aim to minimize environmental impacts, ensure worker safety, and promote efficient resource use.

Key focus areas include:

- **Environmental Management:** Guidance on soil conservation, water use efficiency, pest management, and biodiversity preservation.
- **Occupational Health and Safety (OHS):** Measures to prevent injuries, promote safe pesticide handling, and protect workers from physical and chemical hazards.
- **Community Health and Safety:** Recommendations to prevent risks like pesticide drift, water contamination, and traffic safety concerns related to agricultural operations.
- **Sustainable Practices:** Emphasis on integrated pest management (IPM), crop rotation, and efficient irrigation techniques to maintain productivity and environmental health.

These guidelines align with international standards and are designed to support sustainable agricultural development.

3.8 Gap Analysis of National Legal Framework and Policies of AIIB, IFAD and GCF

The study and analysis of the national legal framework against the requirements under the policies of AIIB, IFAD and GCF can be summarised as Table 5.

Overall, the Royal Government of Cambodia (RGC) has established various legal documents ranging from royal decrees, sub-decrees, and circulars framing the management, and implementation of all types of development projects and activities within the country at the pre-construction, construction and implementation periods. The laws cover the management and protection of the natural resources, and biodiversity including underground, inland and water bodies. These legal frameworks also contain the standards that are applicable to the country context including water quality, soil quality, air, noise quality and vibration. Regarding human well-being including health, safety, labour and sexual exploitation, the country has made significant progress over the past years promoting the working environment of workers and labour forces embracing various laws and policies for ensuring the well-being of workers as well as the compliances that employers must comply. Laws to protect sexual exploitation, and social protection guarded the public, especially the vulnerable including the poor, and people with disability. Although the country's legal frameworks cover the requirements, there are still limited report in terms of actual enforcement which need to be taken care where a proper implementation plan and resources are needed.

Table 20: Gap Analysis of National Legal Framework and Policies of AIIB, IFAD and GCF

No.	Standards/ Policies			Coverage	RGC's Corresponding Legal Framework	Gap Analysis and suggestions	Proposed measures to address the gaps
	AIIB	IFAD	GCF				
1	ESS1		PS1	Environmental and Social Assessment and Management	• Environmental Code and Natural Resource Management (2023), • Law on Water Resource Management (2007), • Law on fisheries (2026), • Sub-Decree on Water Pollution Control (1999), • Sub-Decree on Environmental Impact Assessment (1999), • Sub-Decree on Air Pollution Control and Sound Disturbance (2000), • Sub-Decree on Solid Waste Management (1999), • Prakas on the General Guideline for Preparing the Initial and Full Environmental Impact Assessment Reports (1999), • Prakas on the Launch of Standards of the Quantity of Toxins or Hazardous Substances Allowed to be Disposed (2015)	The RGC has established a wide range of regulations especially in the recent Environmental Code and Natural Resource Management (2023) that aim to environmental protection and natural resource management are well aligned to the provisions of the AIIB ESS1.	This ESCIA covers both direct, indirect, and cumulative impacts and mitigation measures, taking a holistic approach to the project and looking at impacts in an integrated way.
2	ESS2	S7	PS5	Land Acquisition and Involuntary Resettlement	• Law on Land Management, Urban Planning and Construction (1994), • Land Law (2001), • The Expropriation Law (2010), • RGC's Sub-Decree No. 22 ANK/BK (2018) on the Promulgation of the Standard Operating Procedures for Land Acquisition and Involuntary Resettlement (SOP-LAR) for Externally Financed Projects in Cambodia, • Sub-Decree No.19 on Social Land Concession of March 2003, • RGC's Sub-Decree No.118 ANK/BK (2005) on State Land Management, • RGC's Sub-Decree No.98 ANK/BK (2015) on River Basin Management	The RGC has the SOP-LAR which is well aligned with the provisions in the AIIB ESS 2. The AIIB ESS 2 on land acquisition and involuntary resettlement recognizes that project related land acquisition and land use can have impacts on communities. The RGC's SOP-LAR is consistent with the specific requirements under the AIIB ESS 2 on consultation, grievance redress, social support, resettlement assistance, standard of living of poor and vulnerable, entitlements for persons without title or legal rights except for land, information disclosure, payment of compensation and entitlements prior to	According the RGC's SOP-LAR, an income restoration program would be provided in order to re-estalbish sources of livelihoods for those affected households who have permanently lost their sources of livelihood. In this CAISAR project, the DRPs will include provisions to ensure livelihood restoration program are robust and can accurately meet the aim of livelihood restoration in line the AIIB ESS2.

No.	Standards/ Policies			Coverage	RGC's Corresponding Legal Framework	Gap Analysis and suggestions	Proposed measures to address the gaps
	AIIB	IFAD	GCF				
						physical displacement, and the supervision and monitoring of implementation of resettlement plans. However, there are gaps on negotiated settlement and livelihood restoration. The SOP-LAR does not describe procedures for negotiated settlement and lack of clear benchmark to assist monitoring and evaluation to confirm if the affected households restore their livelihood to the level prevailing prior to the beginning of the project implementation.	
3	ESS3	S4	PS7	Indigenous Peoples	• The Constitution of Cambodia (1993) • Land Law (2001)	No detailed regulations on how to avoid impacts to Indigenous Peoples or how to include them in project benefits. Lack of requirement to consult IP(s) in a manner that is culturally appropriate and special disclosure and consultation requirements as described in the AIIB ESS3.	An IPPF has been prepared on the basis of the AIIB ESS3. The IPPF details procedures on the preparation of IPP(s) and how to conduct meaningful consultation and disclose that is culturally appropriate.
4	ESS1	S1	PS6	Biodiversity conservation	• Environmental Code and Natural Resource Management (2023),	The code requires a proper consideration of biodiversity resources and payment of ecosystem services which support the conservation process. There is limited guidance on how to compensate in the ecosystem services once its pristine condition is affected.	This ESCIA include the biodiversity assessment and management plan.
5	ESS1	S2	PS3	Resource efficiency and pollution prevention	• Environmental Code and Natural Resource Management (2023), • Sub-Decree on Environmental Impact Assessment (1999), • Sub-Decree on Air Pollution Control and Sound Disturbance (2000),	The RGC has in place a set of separate provision and requirements for pollution prevention and management that are well align with the AIIB ESS 1 that aims to promote the sustainable use of	This ESCIA has included all relevant national laws and regulation as well as the requirement for AIIB ESS1.

No.	Standards/ Policies			Coverage	RGC's Corresponding Legal Framework	Gap Analysis and suggestions	Proposed measures to address the gaps
	AIIB	IFAD	GCF				
					• Sub-Decree on Solid Waste Management (1999), • Prakas on the General Guideline for Preparing the Initial and Full Environmental Impact Assessment Reports (1999), • Prakas on the Launch of Standards of the Quantity of Toxins or Hazardous Substances Allowed to be Disposed (2015)	resources and avoid or minimize the pollution from sources/project activities.	
6	ESS1	S3	PS8	Cultural heritage	• Environmental Code and Natural Resource Management (2023), • Law on the Protection of Cultural Heritage (1996)	The RGC has in place the law on protection of cultural heritage aligns with the requirement of the AIIB ESS1. However, there is lack of detail procedures for protection of the intangible cultural heritage.	This ESCIA provided details procedures and requirement to protect both tangible and intangible cultural heritage through Chance Find Procedure (Annex xx).
7	ESS1	S5	PS2	Labor and working conditions	• Labor Law (1997), • Law on Taxation (1997), • Sub-Decree on Construction Permit (1993), • Law on Social Security Schemes for Persons defined by the Provision of the Labor Law (2002), • Sub-Decree on Establishment of Social Security Scheme "Health Care Scheme" for Persons Defined by the Provisions of the Labor Law (2016)	The RGC has in place a set of law and regulations on labour and working conditions which is consistent with the requirement of the AIIB ESS1. However, the enforcement of these law and regulation is still limited. For example, regulation against forced labor and using child labor are not strictly enforced.	The ESCIA provides provisions to monitor compliance by contractor and of their primary suppliers in bidding documents and supervision contracts in order to prohibit using forced labour and child labour.
8	ESS1	S6	PS4	Community health and safety	• Law on Road Traffic (2014), • The Law on Suppression of Human Trafficking and Sexual Exploitation 2008, • Law on the Protection and the Promotion of the Rights of Persons with Disabilities 2009,	The RGC has established Labor Law the protect the health and safety of the workers. However, the concern and mitigation are more on individual rather than community as a whole. The AIIB ESS1 aims on protection of both individual and community for health and safety.	The ESCIA provides provisions to monitor compliance by contractor on community and health safety in bidding documents and supervision contracts. The requirement on raising awareness to local community on health and safety are also included in the bidding documents.

9	ESS1	S9	PS1	Climate change	• Environmental Code and Natural Resource Management 2023	The newly adopted code requires all relevant sectors to integrate climate resilient concepts into their strategic action plan along with different measures to tackle the issues. No gap being identified.	

4. Project Area of Influence

Under CAISAR, since project design is still ongoing, area of influence is anticipated based on: a) target command area of each scheme (where most proposed project activities will take place during project construction, and later during project operation), and b) the environmental footprint that are likely caused by project activities during project construction (as direct and indirect impacts due to activities under Component 2), and by project activities (mainly cumulative impacts due to intenstified crop production activities under component 1).

These above anticipated areas of influence need to be updated when more information becomes available to allow a more reliable assessment, particularly when project detailed design is completed, and construction measures proposed by construction constractors are identified. Future update on area of influence (at respective sub-scheme) will be made on the basis of updated environmental and social assessments once a) locations of construction sites, auxiliary facilities (such as borrow pits), and logistics operations are confirmed, and b) the full scope of the project's impacts (direct, indirect, and cumulative) is firmed up based on detailed engineering design (for Component 2) and project implementation approach (for Component 1).

It is noted that while direct and indirect impacts could be reasonably anticipated based on currently proposed scope of works and prior experience for similar works, cumulative impacts, particularly their spatial extent and severity (over the time) require collection of supporting scientific evidence from data collected under project's environmental and social monitoring program.

4.1 Description of Key Components that Potentially Cause the Influential Impact

4.1.1 Air, Noise and Vibration

The area of influence for air quality, noise, and vibration during the construction and rehabilitation of irrigation systems extends beyond the construction site, affecting nearby communities and the environment. Dust, emissions from machinery, and material handling can temporarily increase particulate matter and pollutants in the air. Noise from heavy equipment may disturb residents and wildlife, while vibrations from activities like dredging and excavation can affect nearby structures, potentially causing discomfort or minor damage. These impacts, though short-term, typically extend up to 100 meters from the site, with heavier activities affecting a larger area. Post-construction, greenhouse gas emissions from farming activities could have minimal long-term impacts at a global scale. Each of the sub-scheme the area of influence include:

- Surrounding the sites of the rehabilitated/dredged rivers/stream
- Surrounding the rehabilitated main and tertiary canals, and
- Surrounding the rehabilitated/upgraded structure
- Along the road used for transporting materials by the construction activities

These effects occur only during the construction period while the emission of greenhouse gas emission from farming activities. The following are maps indicating the area of influence at each sub-scheme.

4.1.2 Water Quality

The construction and operation of irrigation systems can significantly impact water quality, both in terms of surface water and groundwater.

Construction Phase:

- **Surface Water:** During the construction phase, sedimentation due to excavation, dredging, and earthworks is a primary cause of water quality degradation. Loose soil can be washed into nearby water bodies, increasing turbidity, reducing light penetration, and altering the aquatic habitat. Additionally, the use of machinery and equipment introduces risks of oil spills, fuel leaks, and chemical contamination, which can enter water sources through surface runoff, affecting aquatic life and water usability downstream.
- **Groundwater:** Construction activities, such as drilling and excavation, can disrupt the soil and rock layers, potentially allowing contaminants from surface activities, such as chemicals, to infiltrate groundwater. Chemical spills or leaching from construction materials can further degrade groundwater quality. Additionally, the disruption of natural flow patterns in the subsurface may allow pollutants to spread more easily, threatening water quality over a wide area.

Operation Phase:

- **Surface Water:** Once the irrigation system is in operation, water quality can be affected by the increased use of fertilizers and pesticides in the command areas. Runoff from agricultural fields may carry these chemicals into nearby rivers, streams, and lakes, causing nutrient pollution, algal blooms, and eutrophication, which can lead to oxygen depletion and harm aquatic ecosystems. Over-irrigation can also lead to increased runoff, carrying sediments and pollutants into surface water bodies.
- **Groundwater:** The operation of irrigation systems may result in groundwater contamination, particularly through leaching of agricultural chemicals such as nitrates and phosphates. Excessive irrigation can cause these chemicals to infiltrate the soil and reach groundwater aquifers, leading to long-term contamination. Furthermore, changes in water table levels due to extensive irrigation can alter the flow patterns of groundwater, potentially mobilizing contaminants that would otherwise remain contained.

In both phases, the key impacts on water quality include contamination of water resources with sediments, nutrients, chemicals, and reduced ecosystem health in the affected water bodies. These impacts can lead to long-term environmental damage and human health effects downstream along Stung Krang Ponley due the reduction of the availability of clean water for agricultural, and domestic uses.

4.1.3 Soil Quality

The area of influence for soil quality during the construction and operation of irrigation systems extends well beyond the immediate project site, affecting surrounding agricultural land, natural habitats, and downstream regions impacted by runoff and water movement. In both phases, the area of influence extends beyond the construction site, impacting nearby agricultural land, natural habitats, and drainage systems. Proper management is essential to minimize long-term soil degradation across the broader irrigation zone.

Construction Phase:

- **Soil Erosion:** The area of influence for soil erosion encompasses not just the construction site but also adjacent areas, as excavation, grading, and vegetation removal expose large sections of land to wind and water erosion. This can lead to topsoil loss, affecting soil fertility on-site and causing sedimentation in nearby fields and water bodies.
- **Soil Compaction:** The influence of soil compaction extends several meters beyond the worksites, particularly where heavy machinery is used for construction or access. Compacted soil reduces water infiltration and root penetration, impacting surrounding agricultural land and natural ecosystems.
- **Soil Contamination:** While soil contamination from fuel spills and construction debris is often localized, it can spread through surface runoff during rainfall or irrigation, affecting nearby fields and watercourses, potentially degrading soil quality in those areas.

Operation Phase:

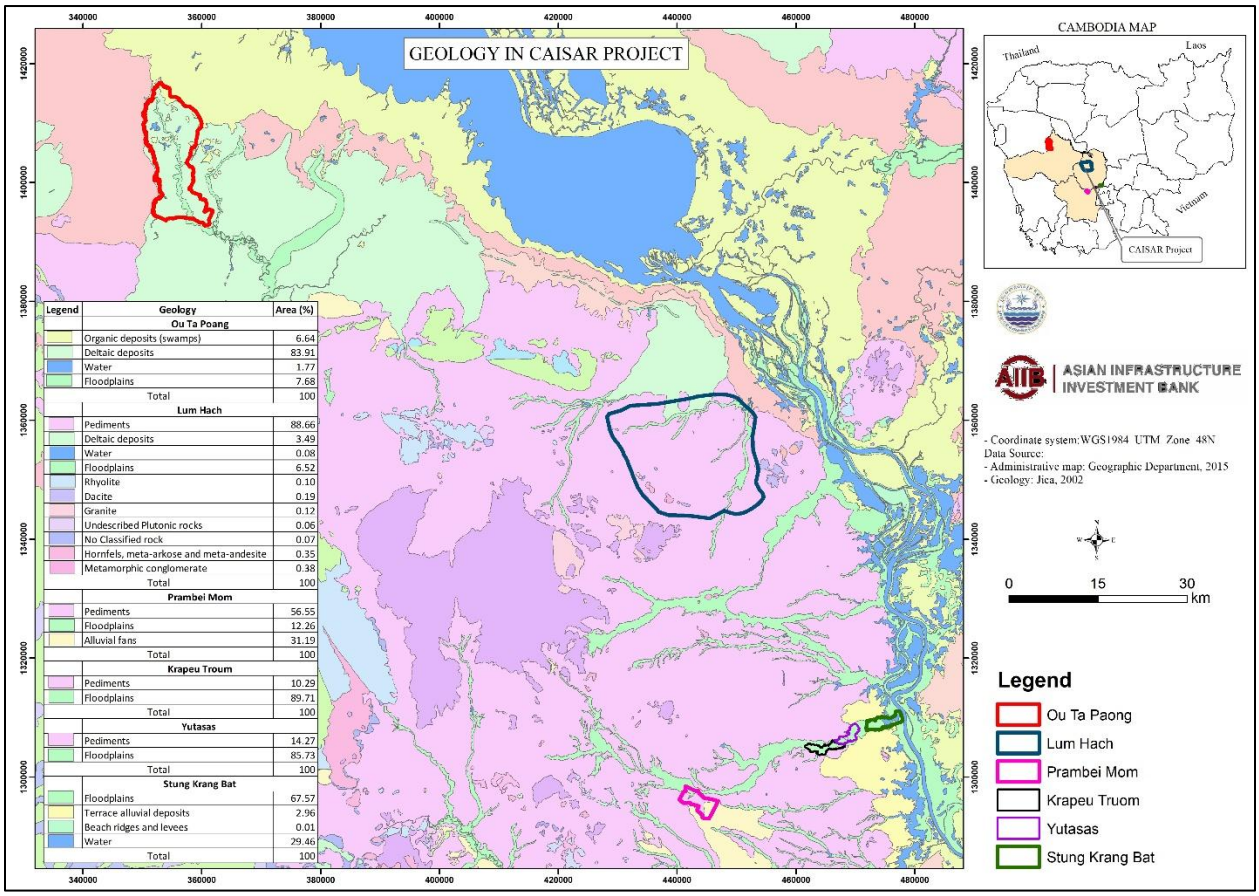
- **Salinization:** The area of influence for soil salinization covers the entire irrigated zone. Poor drainage and excessive irrigation can lead to salt buildup, particularly in low-lying areas, reducing soil productivity across large sections of the command area.
- **Nutrient Imbalance:** Nutrient leaching or accumulation affects the entire irrigated region and nearby fields. Over-irrigation can cause essential nutrients to wash away, while poor management of fertilizers can lead to nutrient buildup, creating imbalances that degrade soil quality.
- **Waterlogging:** The impact of waterlogging is concentrated in the irrigated fields but can extend to neighboring areas due to the movement of water through the soil layers. Prolonged waterlogging reduces soil aeration and affects soil structure, ultimately diminishing productivity.

4.1.4 Biodiversity

Potential areas of influence might include:

- **Downstream areas:** The lower reaches of the Stoeung Krang Ponley River and the Tonle Sap Lake, which may be affected by water quality, sediment loads, and fish migration from Krapeu Trom.
- **Upstream areas:** The upper reaches of the Stoeung Krang Ponley River and its tributaries, which may be influenced by water flow regulation and sediment transport from Krapeu Trom.

- **Adjacent ecosystems:** Forests, wetlands, and agricultural areas that are connected to Krapeu Trom through hydrological or ecological processes.



5. BASELINE CONDITIONS

5.1 Physical Conditions and Environmental Condition

5.1.1 Geological Conditions

The geology of Krapeu Troum is overwhelmingly characterized by floodplains, which cover 89.71% of the area, indicating that the region is highly influenced by periodic flooding, likely contributing to fertile soils for agricultural use. Pediments, which account for the remaining 10.29%, suggest some areas of more stable and eroded rock formations.

Figure 4: Geological Map of the sub-schemes

(Source: ESCIA Study 2024)

5.1.2 Topography

The sub-scheme, with an elevation of less than 40 meters, has a predominantly flat topography. This low-lying region is dominated by floodplains, reflecting its susceptibility to seasonal flooding and water accumulation. The low elevation also suggests proximity to rivers, lakes, or coastal areas where

sediment deposition has shaped the landscape. The flat terrain at this low elevation is likely ideal for wetland ecosystems or agriculture but may require careful water management.

5.1.3 Land Cover and Water Use

The land cover across all four sub-schemes is predominantly rice fields, with only a limited presence of bushes along streams, rivers, and the edges of the rice fields. Sharing the same water sources, farmers in this irrigation system face several key challenges, including water shortages during the dry season, limited market access, pest infestations, and conflicts arising from water scarcity. These issues are primarily driven by the lack of reliable water sources and the impacts of climate change, which have extended the duration of dry seasons. During the dry season, the canal frequently lacks sufficient water, and if there is no rainfall at the start of the wet season, the canal remains dry. Additionally, inefficient irrigation management results in water losses, while extreme heat negatively affects market conditions.

One of the most critical concerns is the water shortage during the rice reproductive stage, as there is no consistent water supply to the fields, leading to significant crop damage. Farmers are often forced to wait for water, which only reaches them after upstream farmers have secured an adequate supply. The Water User Community is responsible for managing the irrigation system, but the current canal infrastructure presents challenges, as the canals are shallow and can only store a limited amount of water. During the dry season, the canals frequently run dry, forcing villagers to take turns pumping water, a process that is both time-consuming and inefficient.

5.1.4 Soil Types

Dr. Crocker travelled across Cambodia to create a map, with a scale of 1 to 1,000,000 and it was publicly published by the Ministry of Agriculture in 1963 (Crocker, Charles D, 1962). The soil of Cambodia is classified into 16 types according to the soil taxonomy of the Ministry of Agriculture, the United States of America. Table below is the detailed information on 16 types of soil in Cambodia (please see in table 6.11).

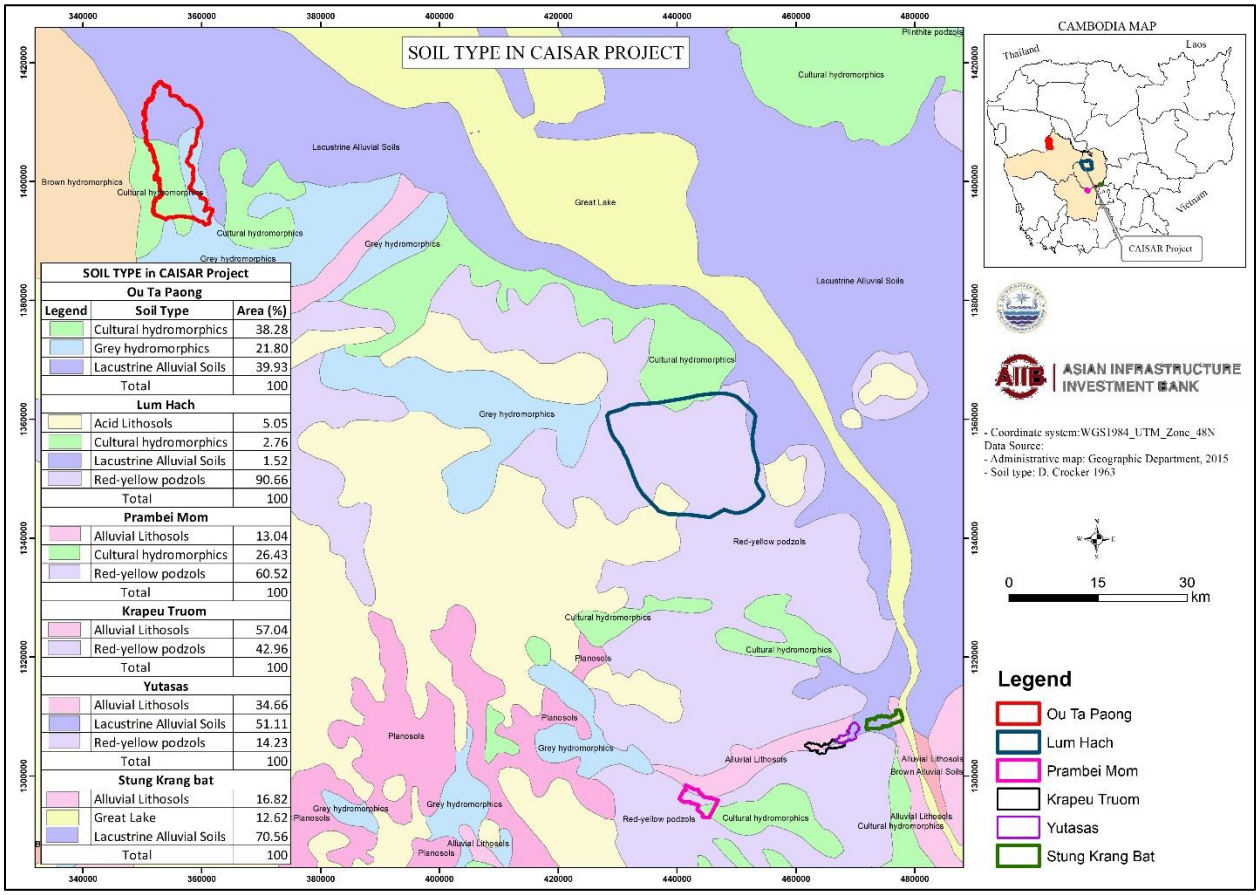

Table 21: Soil types and area in Cambodia

No.	Classification	Land area	
		Km^2	%
1	Red, yellow podzols	22,763.00	12.57%
2	Latosols	7,123.00	3.93%
3	Planosols	1,666.00	0.92%

	Total	100

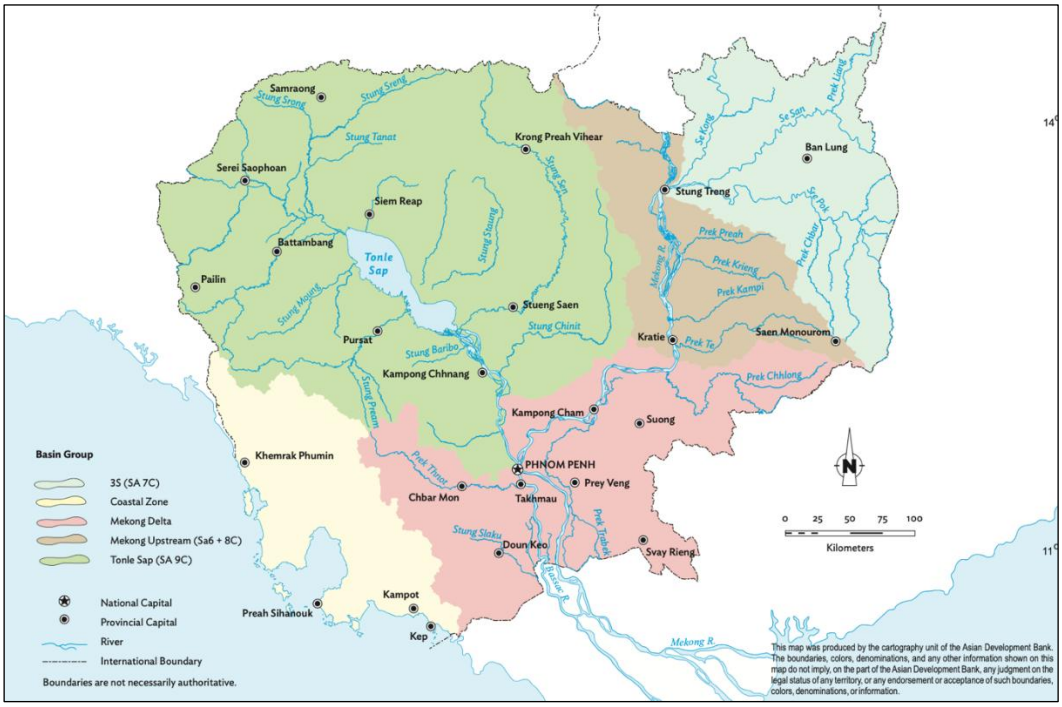
(Source: ESCIA Study 2024)



Krapeu Truom also features a two-soil type distribution but with a different balance compared to Brambei Mom. Alluvial lithosols dominate 57.04% of the area, while red-yellow podzols make up 42.96%. This balance indicates that alluvial lithosols are the more prevalent soil type, which may influence agricultural practices and land management strategies within the project area.

5.1.5 Hydrological Resources

Cambodia has considerable water resource potential, with abundant surface water and aquifers and a high level of seasonal rainfall. In spite of the abundance of water sources, many areas in the central plains and plateaus lack water in the dry season and are therefore dependent on unreliable rainfall

patterns. The country's water resources are dominated by the Mekong River system (86% of country's territory), including the catchments of the Bassac River, the Tonle Sap River, and the Lake Tonle Sap and its tributaries[1], and the river system flowing into the Gulf of Thailand (remaining 14%) as per shown in Figure 6.

Figure 6: River Basin Groups in Cambodia

(Source: Ministry of Water Resources and Meteorology, 2019)[2]

However, **75% renewable freshwater comes from upstream transboundary** sources via the Mekong River system (355.5 km^3/year of surface water), mainly from Lao PDR (91.3%), but also Thailand (8.4%) and Viet Nam (0.3%). As an intermediate basin country, up to 471.51 km^3/year of surface water flows out of the country to Vietnam through the Mekong and its tributaries. This emphasizes the critical inter-dependency of Mekong states, and their sensitivity to the actions of neighboring countries, particularly those that are upstream[3]. In terms of groundwater, 17.6 km^3/year is estimated to be produced in-country, although there is no register of transboundary for inflow or outflow of groundwater.

[1] The Mekong River and Lake Tonle Sap are connected by the Tonle Sap River, which twice a year reverses its direction of flow. From July to October, when the level of the Mekong is high, water flows into the Tonle Sap River, which fills Lake Tonle Sap, thereby increasing the size of the lake from 2,600 km^2 to about 10,500 km^2 at its maximum. The storage capacity of Lake Tonle Sap is estimated at 72 km^3. In November, when the level of the Mekong decreases, the Tonle Sap river reverses its flow, and water flows from Lake Tonle Sap to the Mekong river and thence to the Mekong Delta (https://wateractionhub.org/geos/country/37/d/cambodia/).

[2] Irrigated Agriculture Improvement Project: National Water Resources Data Management Center and Water Resources Information System Report

[3] https://tableau.apps.fao.org

Agriculture accounts for 96% of all **water use,** domestic rural use 1%, and industry, domestic urban, and aquaculture use less than 1%4. Although the amount of water used is estimated to be only about 2% of total surface water volume[5], water shortages do occur during the dry season, especially in the Tonle Sap River system—due to the lack of stored water and limited access to water. [6] Cambodia's water resources sector faces a range of multisectoral, geographical, and hydro-meteorological issues. The Mekong River, particularly the Lower Mekong Basin (LMB), has been identified as a region that is highly vulnerable to the impacts of climate change, more frequent and intense. Climate change is affecting the water cycle, bringing change in the hydrology of major rivers and tributaries as well as groundwater recharge. Recurrent floods occurred in the last decade, with important economic losses, mainly on rice crops, but also people's lives[7]. Farmers, who depend on rain-fed agriculture, will be increasingly at risk of disasters, and especially droughts and floods, causing severe damage to rice harvests[8]. In short, Cambodia faces the common climate change challenges of **too much** water in the wet season, **too little** in the dry season, and gradually **too dirty** due the increasing pollution, particularly in populated cities.

The feasibility study report indicates that Cambodia is likely to face changes in water balances and flood regimes due to projected increases in temperature and altered precipitation patterns. An increase in consecutive dry days is expected to worsen water scarcity, especially during the dry season, impacting communities in rain-fed areas around the Tonle Sap more severely than those with year-round access to the Mekong River or irrigation systems.

The Stung Krang Ponley irrigation scheme relies on various water sources to support its sub-schemes, with water availability playing a crucial role in agricultural productivity. The Brambei Mom scheme is supplied by the Ou Khley River and its reservoir, completed in 2012 as part of the Krang Ponley Project. The reservoir, covering 67 hectares, supports domestic use and small-scale agriculture, particularly during the dry season. Water is also drawn from the larger Anlong Chrey Reservoir, enhancing the scheme's capacity. However, the system is incomplete, with canals that are too short and in poor condition, requiring rehabilitation. The siltation of the 37-kilometer-long Ou Khley River further complicates water management, leading to frequent flooding and reduced irrigation capacity, especially during the wet season.

Krapeu Truom, another sub-scheme, primarily relies on the Anlong Chrey Reservoir and the Kdol Dam as secondary water sources. The system consists of two (2) main canals, 11 secondary canals, and multiple distribution and check structures. While the canals are largely functional, some design defects have led to damage in the downstream structures. Additionally, the crest elevations of some offtakes

[4] Government of Cambodia. 2019. *National Water Resources Management and Sustainable Irrigation Road Map and Investment Program 2019–2033*. Phnom Penh.

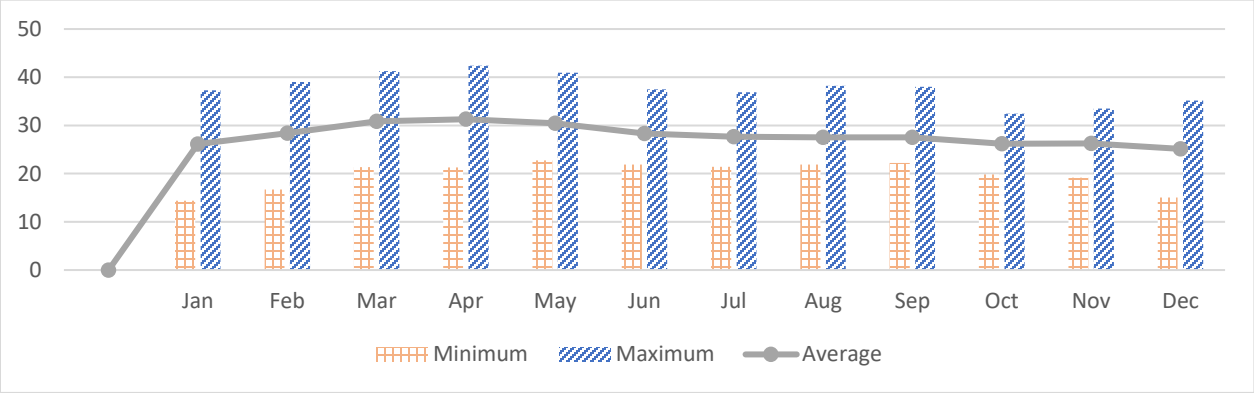
[7] i.e. Floods accounted for 70% of rice production losses between 1998 and 2002, whereas droughts accounted for 20% of those losses. The most recent report on floods showed that the country had lost 40, 45, 188, 250, and 43 lives in 2020, 2014, 2013, 2011, and 2009, respectively. In addition, the economic loss was estimated at USD 1.000, 521, 70, and 132 million due to floods in 2013, 2011, 2010, and 2009, respectively.

[8] Mak Sithirith (2017). Water Governance in Cambodia: From Centralized Water Governance to Farmer Water User Community. MDPI.



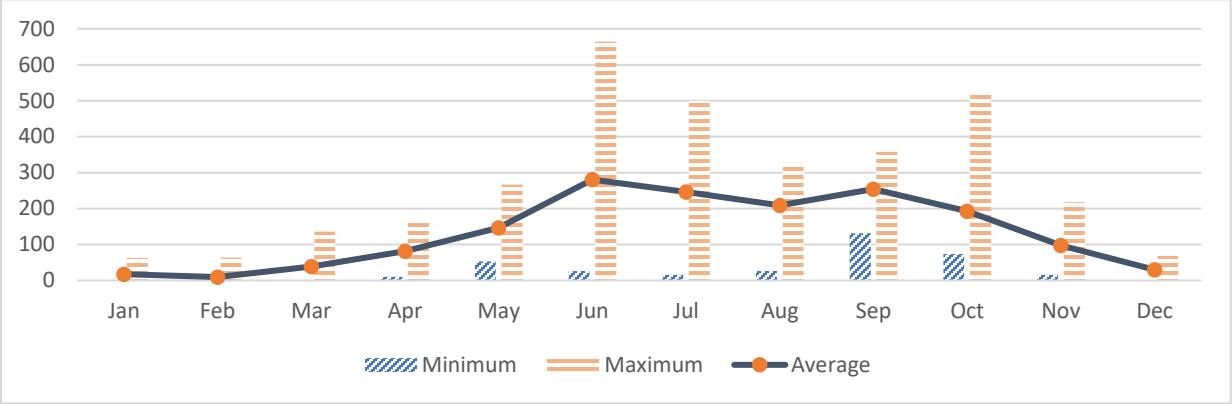
are lower than the adjacent rice fields, hindering irrigation. Despite these challenges, the Farmer Water User Community (FWUC), established in 2016, has been successful in managing water distribution, although improvements are needed to enhance overall efficiency.

5.1.6 Climate Conditions

Temperature

Temperatures in the Stung Krang Ponley scheme area for the last 10 years between 2013-2022 using NASA POWER data. According to the table below shown, the annual average temperature was 27.96 °C, the annual average minimum temperature was 14.37 °C in 2014, and the annual average maximum temperature in 2016 at 42.4 °C. Regarding monthly temperature extremes, the lowest minimum temperature of 14.37°C was observed in January, and the highest maximum temperature of 42.4°C occurred in April.

Figure 7: The maximum, average, and minimum monthly temperature for the last 10 years (°C)

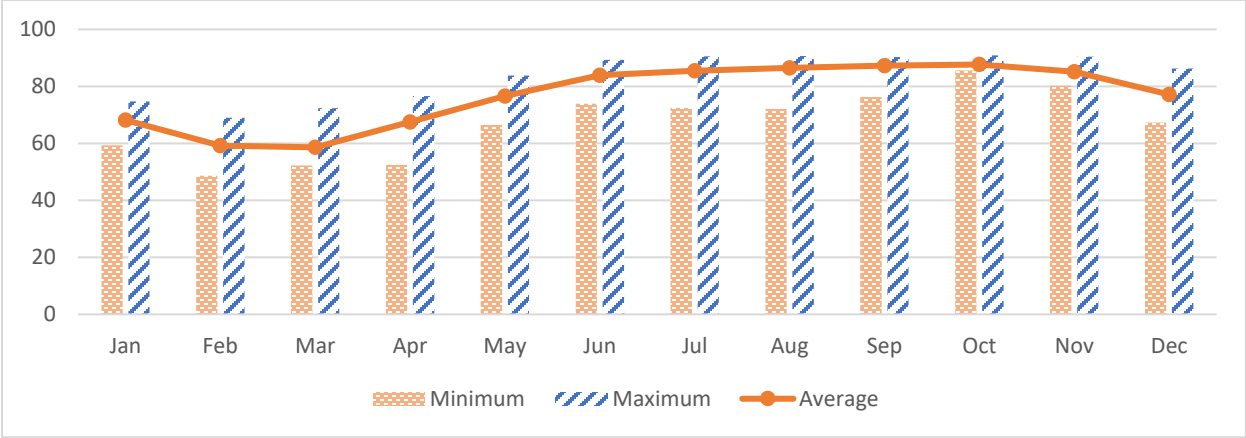


Source: NASA POWER (2024)

Precipitation

The Stung Krang Ponley scheme area shows an average annual precipitation of 1604.14 mm over the decade from 2013 to 2022. The annual minimum precipitation was recorded in 2016 at 653.91 mm, while the annual maximum precipitation occurred in 2020, reaching 2293.95 mm. The lowest minimum rainfall data were found in January, February, March, and December at 0 mm. In October, the highest average monthly rainfall was 516.6 mm.

Figure 8: The maximum, average, and minimum monthly precipitation for the last 10 years (mm)

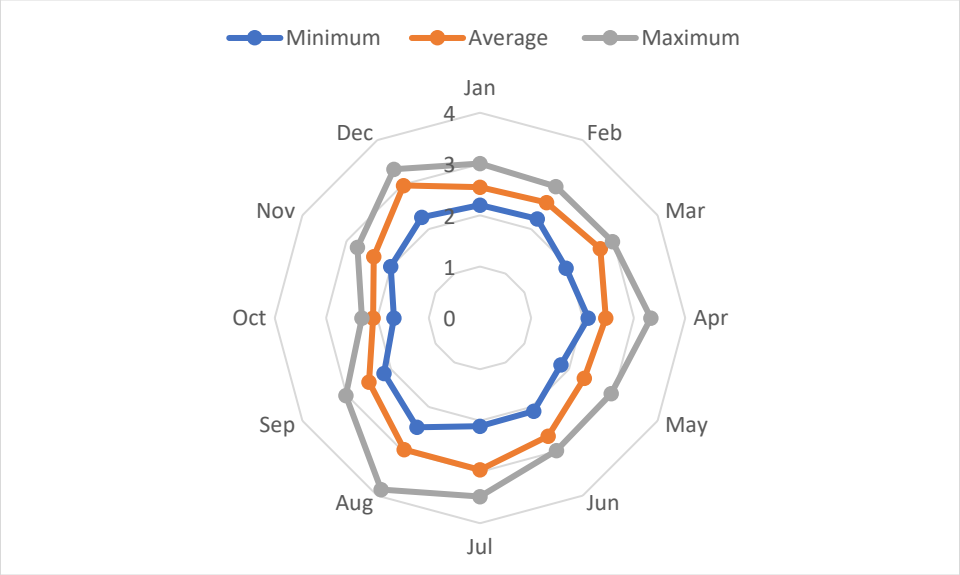


Source: NASA POWER (2024)

Humidity

The table presents monthly humidity data for the Stung Krang Ponley scheme area from 2013 to 2022. The annual minimum average humidity was 69.44% in 2016, while the maximum annual average humidity was 82.81% in 2022. In additional, the annual average humidity was 77.03% over the decade. Regarding monthly variations, the highest monthly maximum humidity was observed in October 2020 at 90.88%, and the lowest monthly minimum humidity was recorded in January 2016 at 48.69%.

Figure 9: The maximum, average, and minimum monthly humidity for the last 10 years (%)



Source: NASA POWER (2024)

Wind Speed

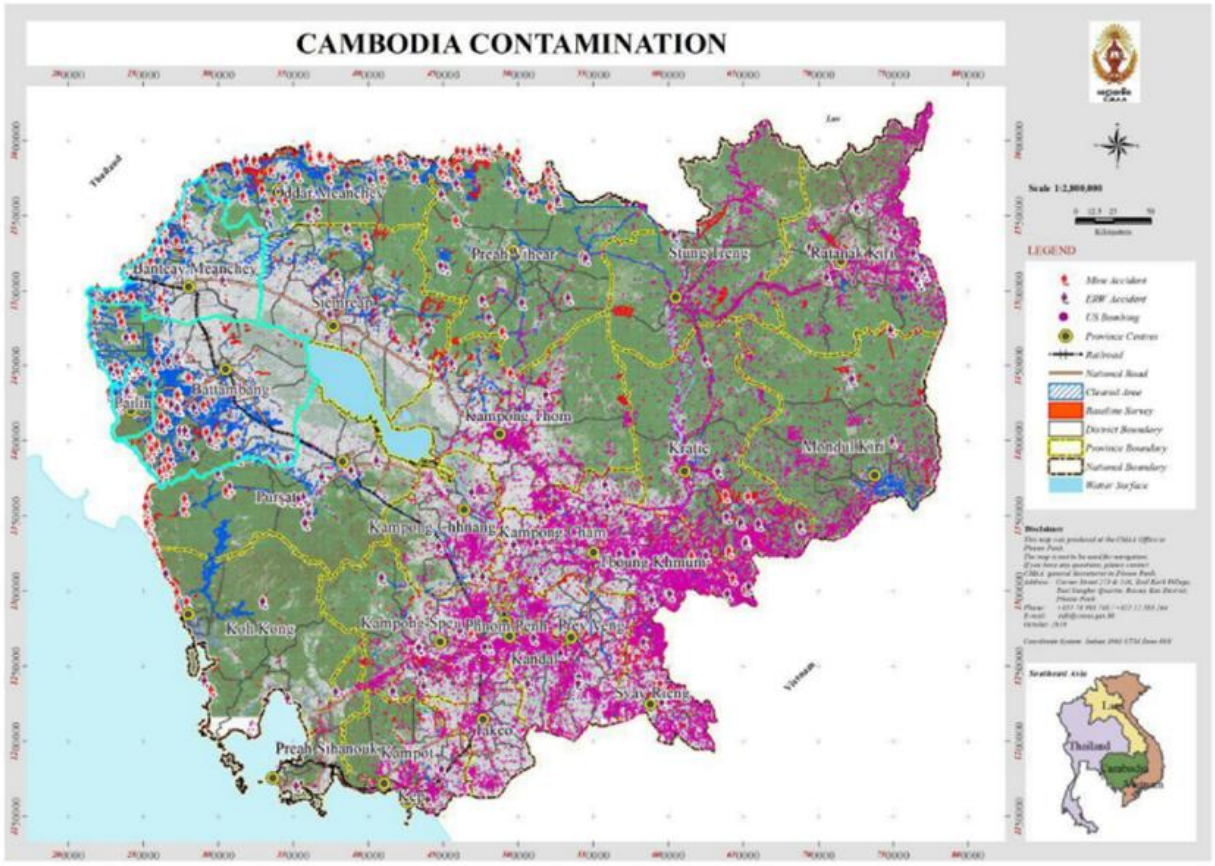
The monthly wind speed data for the Stung Krang Ponley scheme area from 2013 to 2022. The annual minimum average wind speed was 2.45 m/s in 2022, and the maximum annual average wind speed was 2.85 m/s in 2016. While the annual average wind speed was 2.60 m/s in the last 10 years. Regarding monthly variations, the highest monthly maximum wind speed was in August 2016 at 3.86 m/s, and the lowest monthly minimum wind speed was recorded in October 2013 at 1.68 m/s.

Figure 10: The maximum, average, and minimum monthly wind speed for the last 10 years (m/s)

5.2 BASELINE ENVIRONMENTAL QUALITY

5.2.1 Unexploded Ordnances (UXO)

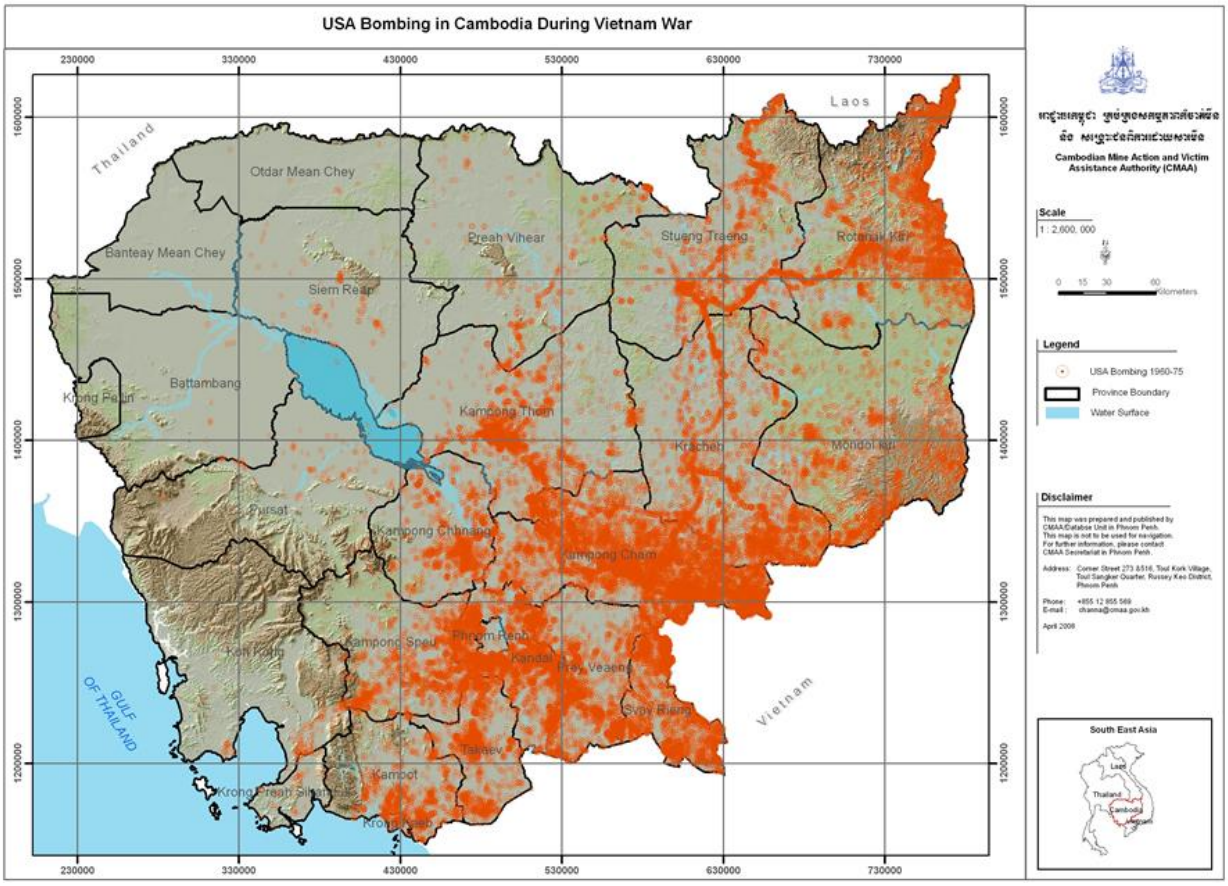
Cambodia remains one of the most heavily landmine-contaminated countries globally, a legacy of decades of conflict that has left a significant portion of its territory affected by landmines and unexploded ordnance (UXO). This contamination poses ongoing threats to safety and hinders socio-economic development, particularly in rural areas. According to the Cambodian Mine Action and Victim Assistance Authority (CMAA), as of 2023, approximately 1,854 square kilometers of land remain contaminated, affecting more than 1.1 million people.[9]



This contamination has caused thousands of casualties over the years and continues to hinder socio-economic development by restricting land use, infrastructure projects, and agricultural expansion. Among the affected provinces, Pursat, Kampong Chhnang, and Kampong Speu have been identified as high-risk areas due to their history of intense conflict and strategic military significance. While mine clearance operations have made progress in these regions, large tracts of land remain dangerous, necessitating ongoing demining efforts to ensure safety and sustainable development. These provinces are critical for agriculture and infrastructure projects, making landmine clearance an urgent priority to enable safe land use and improve local livelihoods.

For construction projects, strict adherence to mine-related regulations is essential. Before initiating any construction activities, risk assessments and clearance operations must be conducted. This includes engaging professional demining organizations to carry out detailed surveys, safely remove and

[9] Yet another Cambodian province bids farewell to landmines - UCA News



dispose of any detected UXO, and obtain official clearance certificates from recognized authorities like the CMAA. Ensuring compliance with these legal requirements is not only critical for the safety of construction personnel and future occupants but also aligns with Cambodia's national and international commitments to UXO and landmine management.

Figure 11: The landmine contamination map in Cambodia

(Source: Cambodian Mine Action and Victim Assistance Authority (CMAA) 2020)

Figure 12: Map of USA Bombing in Cambodia

Summary of the result of the landmine reports from local community is provided as Table below:

Table 22: Mine and UXO situation

No.	Sub-scheme	Mine and UXO Situation
1	Krang Ponley	The province was declared a mine-free province in October 2023 but nearby sub-scheme (Yutasas still reported the witness of mine)

UXO = Unexploded Ordnance.

5.2.2 Ambient Air quality, Noise and Vibration

5.2.2.1 Air Quality

Stung Krang Ponly located in two (2) provinces – Kampong Chhnang and Kampong Speu. At provincial level, the air pollution level in Kampong Chhnang province is considered moderate. The air pollution level in Kampong Speu province also consider moderate. The AQI is 5810, which is equivalent to 12.7 µg/m3. The Krapeu Troum, a sub-scheme within Stung Krang Ponley, is in the rural settings; therefore, the baseline ambient air quality, noise and vibration is considered generally good. Ambient air quality

[10] https://www.iqair.com/cambodia/kampong-speu, accessed on 23rd September 2024.

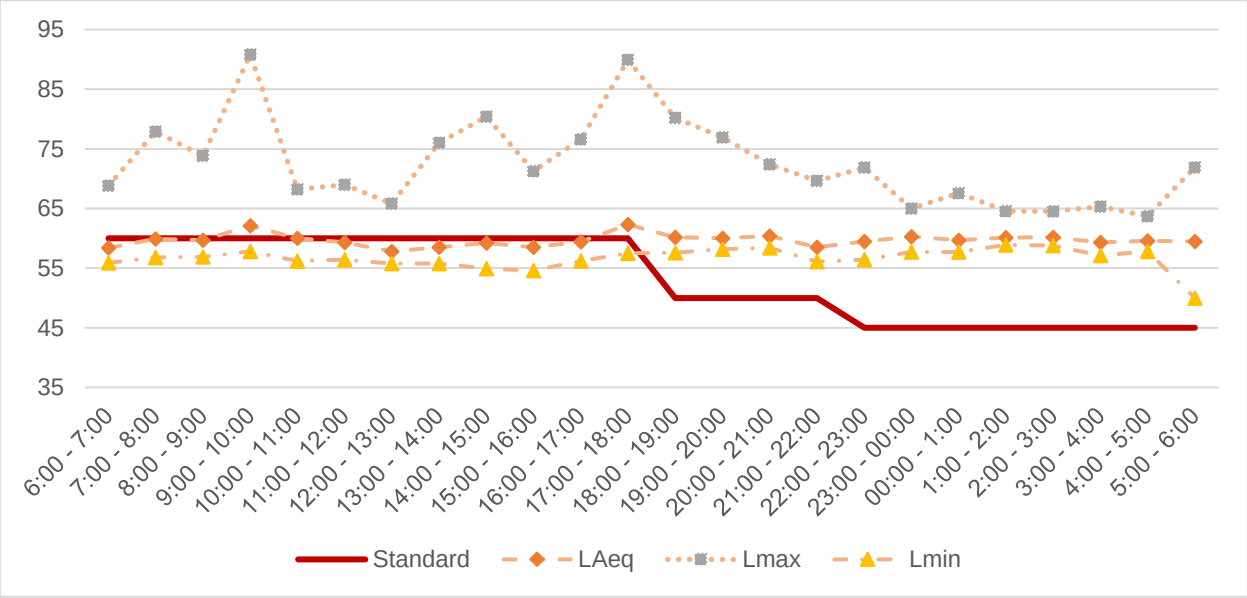
is sometime affected by dust from tillage and unpaved road users, including smoke from burning of rice stubble after harvest and burning from swidden cultivation activities. Whilst noise and vibration disturbance are sometime affected by motorist. However, the impacts are minor and short time. The air testing results from another project located about 6 km from Krapeu Troum reported that all five parameters (CO, NO2, SO2, TSP, and PM10) followed the standard of the Ministry of Environment at all durations (8 and 24 hours). The actual air quality testing prior and during construction are required to be conducted. Further air quality tests can be conducted during the preparation of the domestic EIA

Table 23: Air quality testing result

Parameters	**Unite**	**Testing Result**	**Standard (MoE)**
CO	mg/m^3	1.237	**20**
NO_2	mg/m^3	0.038	**0.1**
SO_2	mg/m^3	0.062	**0.3**
O_3	ppm	0.074	**0.2**
TSP	mg/m^3	0.018	**0.33**
PM10	mg/m^3	0.009	**0.05**
PM2.5	mg/m^3	0.007	**0.025**
Pb	mg/m^3	ND	**0.005**

Source: Laboratory of MoE (2023)

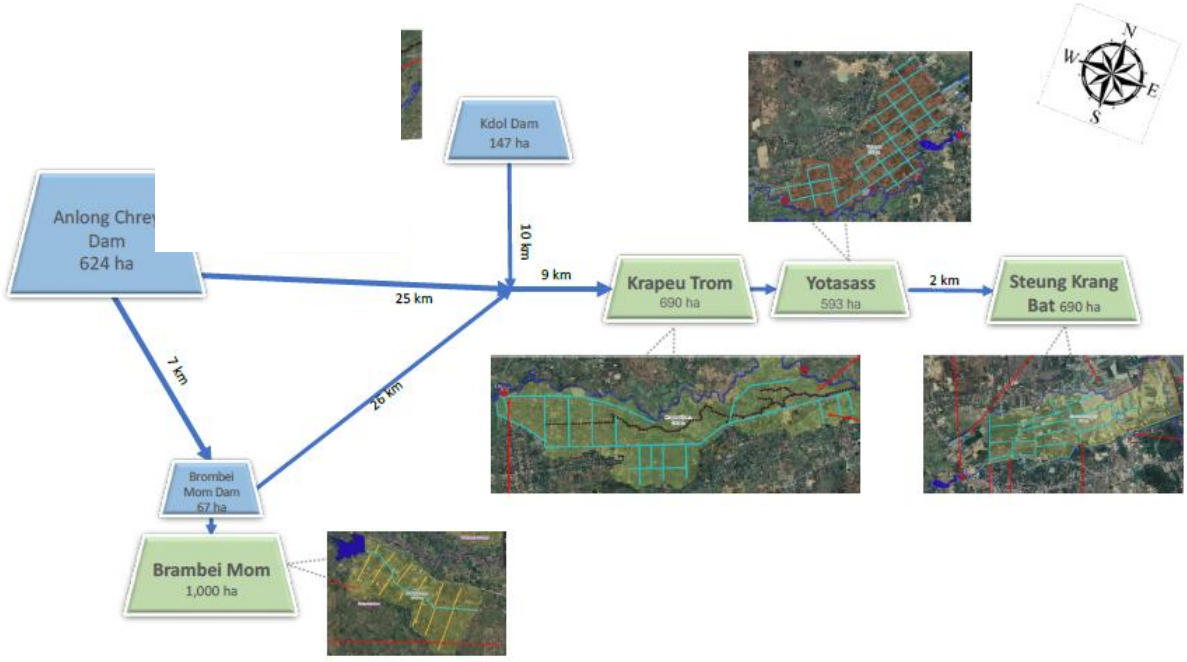
Figure 13: Krapeu Troum sub-scheme



5.2.2.2 Noise and Vibration

Noise and vibration of the project locations in each sub-scheme are currently affected mainly by the commuters mainly along the roads within the areas which can be either the national or local road. As

they are subjected to change over time, the testing of noise and vibration are required to be conducted right before the beginning of the construction.



Interviews with 14 village chiefs revealed that 64% of them perceived their villages as slightly (43%) or moderately (21%) noisy, primarily during the evening, with traffic and neighbors' activities being the main sources of disturbance. In addition, the noise testing result of the Animal Feeding Plant project in 2024 located 6 km from Krapeu Troum (shown in Figure below) can be used as the reference for the baseline of this project as it is situated within the same environmental condition as the project areas. Further noise and vibration tests can be conducted during the preparation of the domestic EIA.

Figure 14: Results of noise analysis at location 1

(Source: Laboratory of the Ministry of Environment, 2024)

Figure 15: Length from Sub-Scheme to another of Krang Ponley

5.2.2.3 Soil Quality

The Krapeu Truom sub scheme was represented by one location (SS.04). The analysis results, presented in the table below, provide valuable insights into the physical, chemical, and biological properties of the soils at these locations, which can inform agricultural management practices and decision-making.

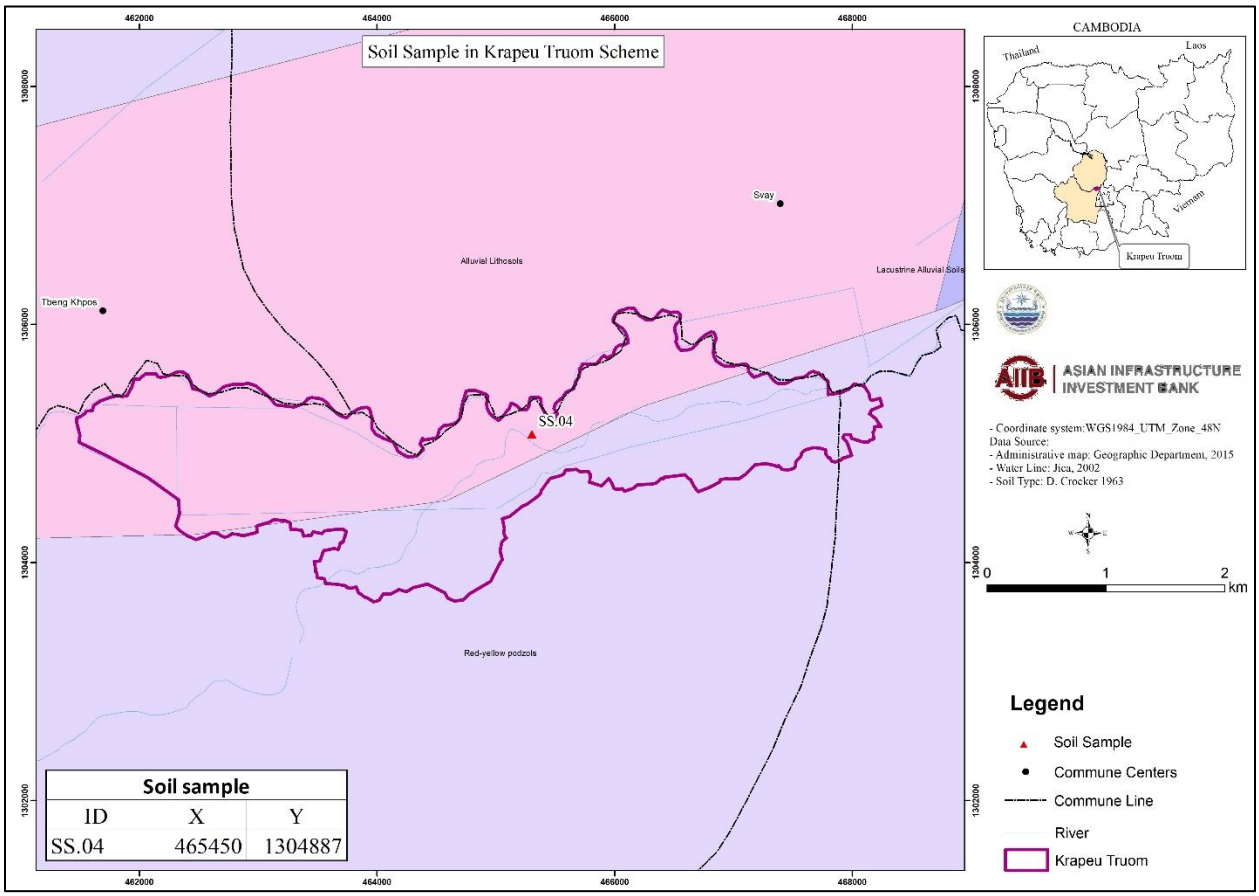


Table 24: Soil analysis results in an agricultural context

No.	Description Parameter		Result of SS.04

5.2.3 Surface Water Quality

Water quality does not seem to be a critical issue for surface water, but the overuse of fertilizers and domestic wastewater are important threads. It is known to be a black market of all sorts of fertilizers, pesticides, insecticides, rodenticides, etc. sold at the borders with Viet Nam and applied indiscriminately by farmers to increase the numbers of crops a year.

The collected water samples were measured at the premises as well as at the laboratory, commissioned by Innovation Lab which is partner of Royal University of Phnom Penh (RUPP). Summary of the water quality testing is provided in Table below:

Figure 17: Location of surface water sample selection

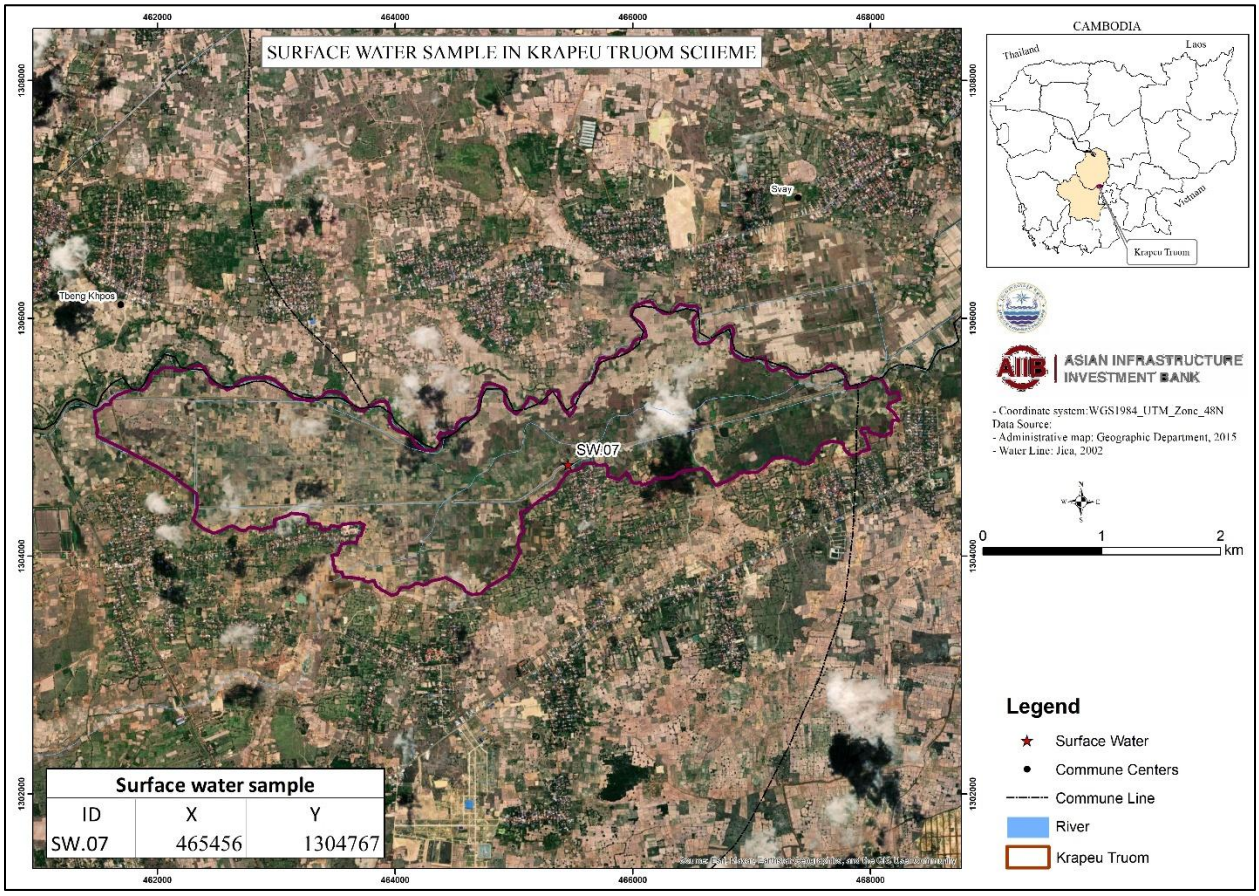

Table 25. Result of surface water quality

No	Parameter	Unit	SW.07	Standard (MoE)	
				River	Lake and reservoir
1	Arsenic	mg/l	0.005	<0.01	<0.01
2	Cadmium	mg/l	0.001	<0.003	<0.003
3	Lead	mg/l	0.005	<0.01	<0.01
4	pH	-	6.53	6.5-8.5	6.5-8.5

12	Dissolved oxygen	mg/l	6.84	>3	>4

(Source: Water Innovation Lab, 2024)

The surface water quality results for Krapeu Truom at SW.07 show a mix of acceptable and concerning findings when compared to the Cambodian Ministry of Environment's standards for rivers and lakes/reservoirs. Parameters such as arsenic (0.005 mg/l), cadmium (0.001 mg/l), lead (0.005 mg/l), pH (6.53), total dissolved solids (83.43 mg/l), electrical conductivity (167.1 µS/cm), and dissolved oxygen (6.84 mg/l) are within the acceptable limits, indicating generally good water quality with respect to these indicators. However, the water contains elevated levels of total nitrogen (4.7 mg/l) and total phosphorus (0.7 mg/l), which exceed the standards for both rivers and lakes/reservoirs. This suggests potential nutrient pollution that could lead to eutrophication, negatively affecting aquatic ecosystems. Of particular concern is the extremely high level of total coliform (92,500 CFU/100 mL), far exceeding the acceptable limit of 1,000 CFU/100 mL, indicating likely faecal or agricultural waste contamination, which poses significant health risks. While the temperature (33.7°C) is within limits, it is relatively high and could affect aquatic life if it increases further. Overall, while some parameters are within acceptable ranges, the elevated nutrient and coliform levels raise concerns about pollution and its potential impact on both the ecosystem and human health.

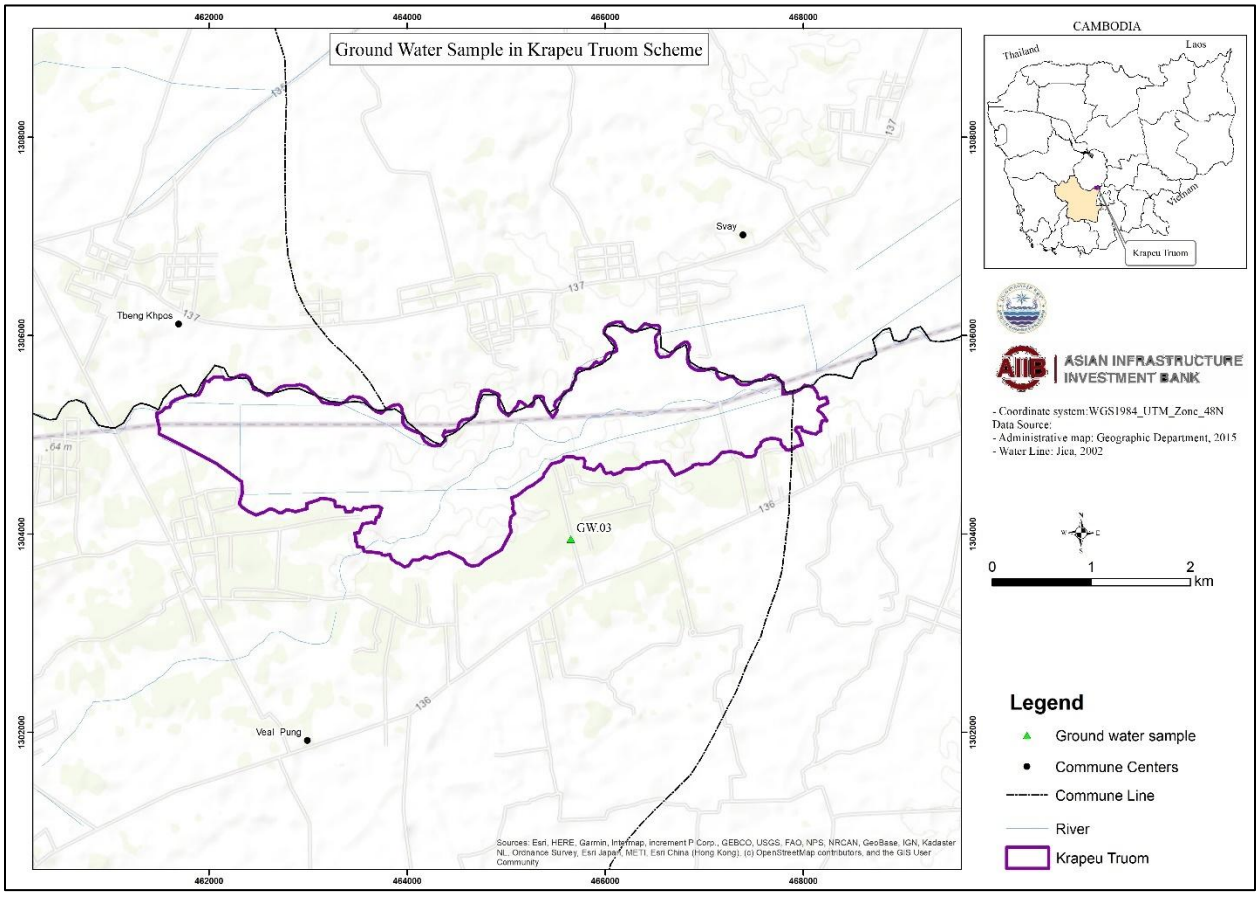
Figure 18: Krapeu Troum sub-scheme

5.2.4 Groundwater Quality

Water testing is used to determine the existing groundwater quality at the project sites before construction and operation. GW3 is a type of open well with a depth of 10 meters and can only be used during the rainy season. The water level of the well is around two meters above the surface during the rainy season. The geographical positions and descriptions of the groundwater sampling points are given in Table 9. The results of the groundwater quality analysis are summarized in Table 9.

Table 26. Groundwater sampling locations

No.	Location				UTM	
	Province	District	Commune	Village	X	Y
GW3	Kampong Speu	Odongk	Veal Pung	Khnaor Ampil	465653	1303947



The selected samples were analysed and the results of the testing both at the field and at laboratory is provided in Table 10 below.

Table 27. Result of groundwater quality

No	Parameter	Unit	GW3	CDWQS
1	Arsenic	mg/l	0.005	0.05
2	Cadmium	mg/l	0.001	0.003
3	Lead	mg/l	0.005	0.01
4	pH	-	**6.48**	6.5-8.8
5	Total dissolved solids	mg/l	325.5	800
6	Total suspended solids	mg/l	3	-
7	Total Nitrogen	mg/l	21.5	-
8	Total Phosphorus	mg/l	2.2	-
9	Total coliform	CFU/ 100mL	1,200	0
10	Electrical conductivity	µs/cm	651.6	-
11	Temperature	^{0}C	30.5	-
12	Dissolved oxygen	mg/l	1.25	-

(Source: Water Innovation Lab, 2024)

Figure 19. Map of groundwater sampling location in Krapeu Truom sub-scheme

The groundwater quality results for the Krapeu Troum irrigation sub-scheme show that several key parameters are within safe limits according to the Cambodia Drinking Water Quality Standard (CDWQS). For instance, levels of arsenic (0.005 mg/l), cadmium (0.001 mg/l), and lead (0.005 mg/l) are well within the CDWQS thresholds, indicating that these heavy metals pose no significant health risks. The pH level of 6.5 is on the lower end of the acceptable range (6.5-8.8), meaning the water is slightly acidic but still suitable for consumption. Similarly, the total dissolved solids (TDS) of 58.12 mg/l are well below the limit of 800 mg/l, suggesting that the water has a low level of dissolved salts and minerals, which is generally favorable for drinking.

However, the total coliform count of 1,600 CFU/100mL far exceeds the CDWQS standard of 0 CFU/100mL, indicating significant fecal contamination. This is a serious concern, as the presence of coliform bacteria suggests that the groundwater is potentially unsafe for direct consumption without treatment, which could pose a risk to human health. Although total nitrogen (3.5 mg/l) and total phosphorus (0.29 mg/l) do not have specified CDWQS limits, their elevated levels indicate nutrient pollution, likely from agricultural runoff or other environmental sources, which could impact water quality over time.

Overall, while the groundwater meets the required standards for heavy metals and TDS, immediate action is necessary to address microbial contamination, such as implementing disinfection methods or boiling the water before use. Regular monitoring of nitrogen and phosphorus is recommended to

ensure long-term water quality, as nutrient pollution may degrade the ecosystem. The water is suitable for drinking only after proper treatment, with a focus on addressing the high coliform levels to ensure it is safe for consumption.

5.3 Biological Resources

5.3.1 Analysis to prepare for determining CH status

5.3.1.1 Critical Habitat Area of Analysis

Critical habitat is defined as an Area of Analysis (AoA), and the project's command area is used as an AoA.

Species with Potential Occurrence within the AoA

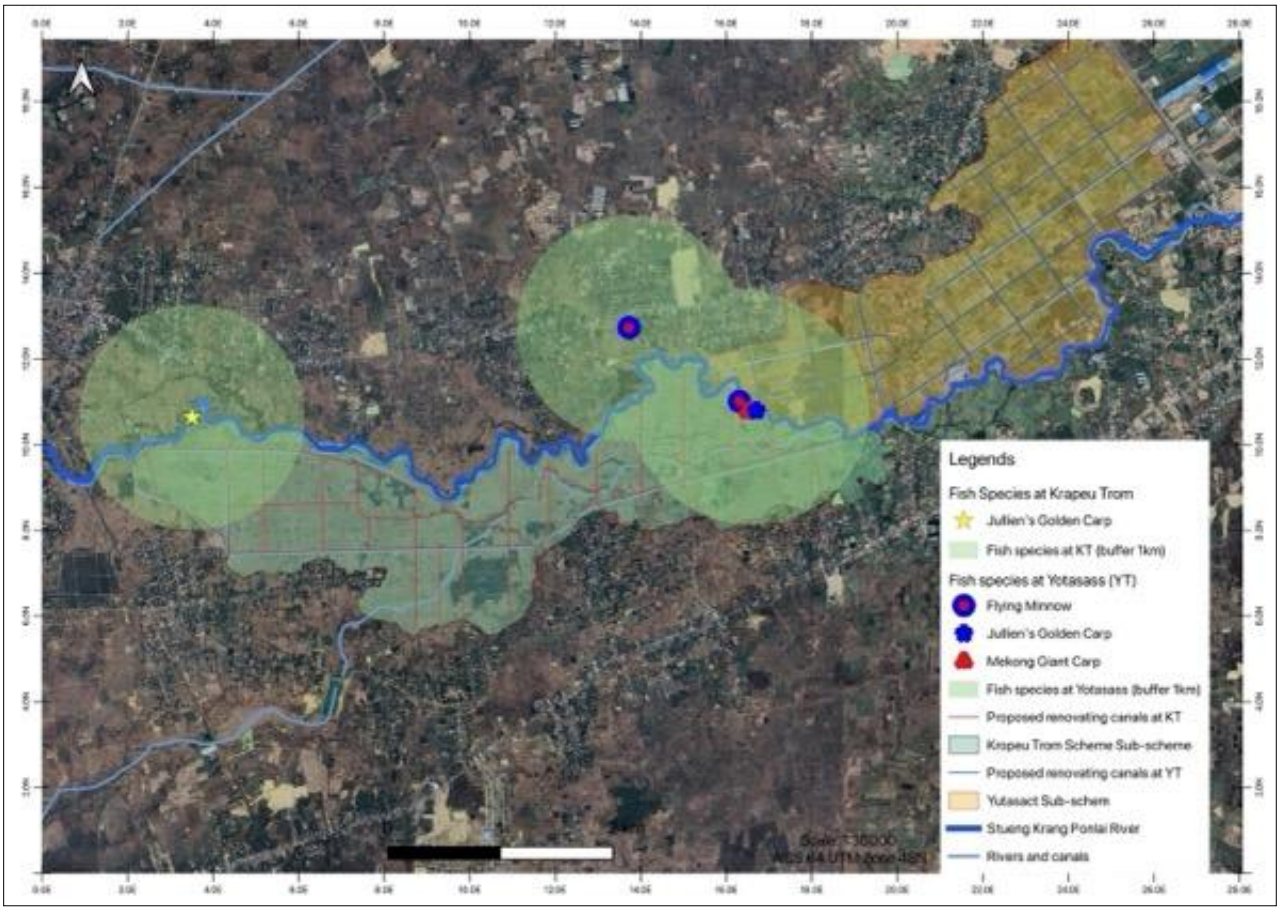
A list of threatened species with potential occurrence was generated for Krapeu Trom (KT). The coordinates of KT (via KMZ file) are used to inform the IBAT radius of screening. Since the default radius of IBAT screening is 50km, steps were taken to narrow down to the sub-scheme's area of influence to identify only EN and CR species that are potentially present in the sub-scheme area of influence. The narrowing-down aims to practically identify EN and CR species that could be found in the sub-scheme area of influence and to determine the Critical Habitat status of the identified species.

Description of screening for narrowing down

For Krapeu Trom, three rounds of screening have been conducted. The first screening (Round 1) was conducted in December 2023. Round 2 was carried out in April 2024, and Round 3 in August 2024. The purpose of repeated screening is to validate the screening results (for the same area) with a wide range of local stakeholders. The screening aims to identify only EN and CR species that are potentially present in the OTP area of influence, covering reptiles, mammals, fish, birds, amphibians, and aquatic plants. Screening was done based on the IBAT report generated and provided by the AIIB.

In the first two rounds of screening, there were two fish species (Isok barb/Jullien's Golden Carp and Leaping barb/Flying Minnow) were screened for the first two rounds. After three rounds of screening focusing on EN and CR species, only Flying Minnow is confirmed as potentially present in the sub-scheme area of influence.

Ecological State of Habitats within the AoA



Understanding of the ecological state of habitats is necessary to assess the Likelihood of occurrence (LoO) of the above 11 screened species - as part of the CHA. For this CHA, species were classified into four LoO categories: Present, Possible, Unlikely and Not Present. Species known to be Present or with a Possible LoO are further assessed in Step 3. This understanding takes into account the classification of habitats as either modified or natural based on levels of human-induced disturbance to species composition and ecological functions. In this session, a brief assessment of the one confirmed species is presented. The assessment discusses historical range, distribution, habitat conditions, current status, and potential threats identified by key informants.

The Krapeu Trom command area has been in existence since the 1970s. The KT is a mixture of paddy fields, farm roads, and residential areas. Natural rivers, such as the Stueng Krang Ponlai serve as the sole ecological and hydrological connection between its upstream watershed and the Tonle Sap River basin downstream. This river is crucial for fish migration during the flooding season. However, reservoirs, spillways, and drought conditions have disrupted these essential ecological functions.

- **Fish (1 species)**

Krapeu Trom, like Brambei Mom, is situated within the same river catchment area in the lower reaches, near the Tonle Sap's annual floodplain. Two fish species, the Isok barb/Jullien's Golden Carp (Probarbus jullieni) and Leaping barb/Flying Minnow (Laubuka caeruleostigmata), were targeted for interviews in this command area. Among ten key informants interviewed, only one reported encountering the Jullien's Golden Carp once in 2022, approximately 500 meters downstream of the reservoir facility during a flooding event (see map below). This individual stated that the species migrated upstream from the Tonle Sap during the flood season but became trapped in spillways. They added that if flooding is insufficient, fish populations decline, and rare species may no longer be present in the area.

Figure 20: A spatial distribution map was generated for four fish species at Krapeu Trom and Yotasas Command Area. 1 km buffer zones were included to approximate their minimum movement range around suitable habitats.

5.3.2 Determination of Critical Habitat Status (Step 3)

This section assesses the information (obtained from the above sub-section) vis-a-vis the criteria (presented in Section on - CH assessment method). This assessment aims to determine whether any species qualify for Critical Habitat features.

Habitat of significant importance to CE and EN species

As presented in Section 4.4.3.3 (Ecological State), the species that qualifies as a critical habitat feature is the Flying Minnow. Krapeu Trom Command Area is part of Stueng Krang Ponlai River system (Tonle Sap's tributary) and situated approximately 11 km from Tonle Sap River. The area was influenced by flood-plus water from Stueng Krang Ponlai upstream and the push-up of flood water from Tonle Sap River Basic allowing fish to short distance migration for food and breeding.

Although climate change has caused dry and drought more frequently, this area still receives a good amount of flood from its upstream and downstream making a good connectivity and providing ecological function for migratory fish.

Habitat of significant importance to endemic or restricted-range species

None of the species under EN and CR classification are restricted-range species (based on IBAT report for sub-scheme).

Habitat supporting globally or nationally significant concentrations of migratory or congregation species

None of the IBA that are recognized for significant concentrations of migratory birds or other species are found within the vicinity of the sub-scheme. No other evidence of significant concentrations of migratory or congregatory species is available. The AoA for KT, therefore is expected to qualify as critical habitats under this criterion.

Highly threatened or unique ecosystems

Each of the reservoirs are modified habitat and is associated with numerous rice paddies. There is no evidence that these areas are highly threatened or unique ecosystems, and no critical habitats are recognized under this criterion.

Ecological functions or characteristics that are needed to maintain the viability of the biodiversity values described above in (a) to (d)

No ecological functions that are necessary to support biodiversity values (described under the above criteria) have been identified.

5.4 Socio-Economic and Cultural Conditions

5.4.1 Administrative and Social Structure

5.4.1.1 Administrative System

Cambodia's administrative system at sub-national level is organized into three (3) tiers: capital city/province, district/municipality/khan, and sangkat/commune. Phnom Penh, the capital, is divided into khans and further into sangkats, while provinces are divided into municipalities and districts, with municipalities subdivided into sangkats and districts into communes and sangkats. The sub-national government is guided by organic laws, including the Law on Administration of Commune/Sangkat and the Law on Administration of Capital City, Province, Municipality, District, and Khan, supporting decentralization and deconcentration. Commune/sangkat administrations operate with legal, financial, and administrative autonomy, governed by elected councils responsible for budgets, development, and public order. Higher levels, such as provinces and districts, are governed by councils (legislative) and boards of governors (executive), with council members indirectly elected by commune/sangkat councils and supported by technical committees. Boards of governors, nominated by the Ministry of Interior, implement policies and supervise ministry units in their jurisdiction. Recent legal amendments aim to expand local administrations' authority over civil servants from national bodies, awaiting implementation through sub-decrees.

5.4.1.2 None-Governmental Organizations

Another institution which are playing an important role in the development of the country at sub-national level is the civil society. The civil society in Cambodia, particularly the NGOs plays a vital role in development and democratization. These organizations address challenges such as poverty, education, human rights, gender equality, and environmental conservation, filling gaps in governance and social services. NGOs contribute by providing microfinance, vocational training, and livelihood programs to alleviate poverty; supporting education through school construction, scholarships, and inclusive learning; and improving health outcomes with maternal health programs, HIV/AIDS awareness, and mental health support. They advocate for human rights, labor rights, and good governance, engaging in election monitoring and raising awareness about corruption and land rights. Additionally, NGOs promote environmental sustainability and climate resilience while advancing gender equality by combating violence and discrimination and empowering women in leadership. Within the project area, there are a number of NGOs being identified within the area in different sectors including environment, community development, such as Wildlife Conservation Society (WCS), Adventist Development Relief Agency (ADRA), Advocacy Policy Institute (API), and People in Need (PIN).

5.4.1.3 Community-Based Organizations

Another social organization is Community-based organizations (CBOs). Cambodia, CBOs play a critical grassroots role, directly addressing local needs. Unlike NGOs, they are often less formalized and focus on mobilizing local resources for infrastructure, livelihood improvements, and strengthening community networks. CBOs contribute significantly to disaster resilience, especially in flood-prone areas, and foster cultural preservation and social cohesion through community events and initiatives. Together, NGOs and CBOs empower communities, protect rights, and promote inclusive development, offering hope for a more equitable and sustainable future despite ongoing challenges. Types of CBOs include Community Fishery, Forestry Community, Agricultural Cooperatives, and social organizations such as saving groups, old age association, etc. All of these types are reported within the project target areas.

The identified agriculture-related community-based association is provided in Table below:

Table 28. Type of Associations

No.	Types of Associations	Krapeu Troum
1	Agricultural Cooperatives	There are five agricultural cooperatives located in in Krapeu Troum which focus on rice and vegetable.
2	Farmer Water User Community	Krapeu Troum exist of farmer utilizing water, but the systems are not operational due to a lack of cooperation in paying contributions user and unstable water support.
3	Community Forestry	No community forestry in the command area.
4	Community Fishery	No community fishery within this sub-scheme

5.4.1.4 Culture and Religion

Cambodia's culture reflects its rich history and diversity, shaped by the ethnic Khmer majority (90%) and minority groups like ethnic Vietnamese, Cham Muslims, and indigenous highland communities. While Khmer is the official language, many minorities maintain unique languages and traditions. Buddhism, practiced by 95% of the population, deeply influences cultural norms, often blended with Hindu and animist elements such as ancestor worship. As per the commune database and consultation with local authorities regarding the indigenous people, there is no indigenous people being present within the target areas.

5.4.2 Social Condition

The command areas located Kampong Chhnang and Kampong Speu province, span across in Svay, Thbeng Khpos, and Veal Pong commune, giving the total of 13 villages, giving the total households of 2,430 HHs with a total population of 10,535 people (out of which 5,483 are females).

Table 29: Administrative and population coverage of Krapeu Troum sub-scheme

No.	Province/ District	Communes	Number of Villages	Total HH	Total Population	Female Population
	Krapeu Trom					
1	Kampong Speu / Odoung Maechey	Veal Pong	8	932	4,165	2,201
2	Kampong Chhnang /Sameakki Meanchey	Thbeng Khpos	4	1,281	5,207	2,688
		Svay	1	217	1,163	594
	Sub-Total	**3**	**13**	**2,430**	**10,535**	**5,483**

5.4.3 Demographic and Facilities

According to the commune database in 2023, the total number of households who are residing within and nearby the command area is 2,430 HH (out of which 379 HHs (16%) are female headed), giving the total population of 10,360 people (5,308 females). Moreover, the population are young with more than 63% of them are aging below 34 years old. More than half of the people (52%) completed education at primary school and below whereas those with secondary, high school, and higher education is only 25%, 8%, and 1%, respectively. It is noticeable that illiterate people have existed at 0.6%.

Overall, it is apparent that in the sub-schemes contain young population indicating its high potential in future development activities.

Table 30. Demographic information of the HH living within and the vicinity of the command areas

Parameters	Number	Parameters	Number
Overall		**Educational Level**	
Total HH	2,430	Kindergarten	13.2%
Female HH Head	379 (16%)	Primary school	52.1%
Total Population	10,360	Secondary school	24.8%
Female	5,308	High School	8.1%
Age		College/University	1.3%
<18 years old	36%	TVET	0.0%
18 – 34 years old	27%	Illiterate	0.6%
35 – 60 years old	25%		
> 60 years old	12%		

(Source: Ministry of Planning, Commune Database, 2023)

Energy access of the population within the target area was found to be high, giving its proportion at 98% access to electricity and only a minority of them continue using solar (2%). However, the sources of water for domestic consumption were high with 83% of them having access to water supply system while the rest continue using pump well, tube-well, pond, rainwater and river. A good sign for the people is how they are using water for drinking purposes which was found to be almost all using safe water for drinking (tape water 53%, filtered water 20%, and boiled water 26%). There is a concern, however, regarding the reliability of the tape water quality which may create significant impact on the people's health, if they are not properly monitored. Interestingly, almost all the people within the target areas own a toilet showing their understanding of the importance of water, sanitation and hygiene.

Table 31. Access to energy and water and sanitation facilities

Parameters	Percentage	Parameters	Percentage
Source of Energy		**Drinking Water**	
Electricity	98.1%	Tape water	53%
Battery	0.0%	Filtration	20%
Solar	1.9%	Boiled	26%
Biogas	0.0%

Opened Well	0%		
Pond	2%		
Rainwater	5%		
River	2%		

(Source: Ministry of Planning, Commune Database, 2023)

5.4.4 Socio–economic Conditions of the Beneficiaries

Agriculture was reported as the main occupation of the population within the command areas. While business and service are the second highest proportion (23%). As for secondary occupations, full-time workers were dominant among the population while rice and crop production accounting for the second largest proportion (24%).

Table 32. Occupation of the HHs living within and the vicinity of the command areas

Parameters	Percentage	Parameters	Percentage
Main Occupation		**Secondary Occupation**	
Rice and crop production	25.08%	Rice and crop production	14.24%
Animal production	0.62%	Animal production	4.02%
Trade	3.72%	Trade	3.10%
Service	1.55%	Service	1.86%
Handicrafts	0.62%	Handicrafts	0.31%
Government staff	4.02%	Government staff	3.72%
Workers (full-time, private sector)	23.22%	Workers (full-time, private sector)	23.53%

Other	3.10%	Other	2.79%
No job	14.55%		

(Source: ESCIA Field Survey, 2024)

A significant proportion of the population with poor 1 & 2 is reported at 4%, indicating the level of economic condition of the areas while the proportion of the people with disability (PWD) is at 1.1%. The total migration is 13% and all of them only migrated within the country (13%).

Table 33. Migration and vulnerability of the people within the sub-schemes

Parameters	Percentage	Parameters	Percentage
Vulnerability		**Migration**	
Poor 1	1%	Inside the country	13%

Poor 2	3%	Out of the country	0%
Total	**4%**	**Total**	**13%**

(Source: ESCIA Field Survey, 2024, Ministry of Planning, Commune Database, 2023)

Semi-permanent houses are the most dominated shelter of the people comprising of 49% of the total settlement. Wooden houses with thatched roof are the second most popular (36%) while the rest belong to one or more floor brick wall and temporary house. Interestingly, 3% of them live in temporary houses. The assets that people own the most are Television (81%), followed by motorbikes (71%), and bicycle (39%), and power tiller (11%) while the rest are in small proportion.

Table 34. Houses and Assets of the HHs within the Sub-Schemes

Parameters	Percentage	Parameters	Percentage
Assets		**Type of Houses**	
HH with Tractor	0.1%	One floor or more/brick wall	11.94%
Power Tiller	11%	Semi-permanent	49.25%
HH with Rice Harvester	0.0%	Wooden house, thatched	35.82%
Threshing Machine	0.2%	Temporary houses	2.99%

Tricycle	1%		
Bike cycle	39%		
Boat	0%		
TV	81%		

(Source: ESCIA Field Survey, 2024, Ministry of Planning, Commune Database, 2023)

5.4.5 Agricultural Production

5.4.5.1 Rice Production

In Kropeau Troum, most farmers cultivate paddy rice during the wet season, while some areas grow watermelon, wind gourd, and cucumber in the dry season between March and May. The average land size for rice production ranges from 0.3 to 1 hectare. Common rice varieties grown include Neang Menh, Phka Mlis, Reang Chey, and Phka Rumduol. Farmers typically use about 120 kg of rice seed per hectare during the wet season, with no rice production in the dry season due to water scarcity. Most seeds are self-produced, and farmers only purchase additional supplies when shortages arise.

Fertilizer use during the wet season averages 100 kg of chemical fertilizer and 200 kg of compost per hectare, while pesticide application is not common. Labor for rice farming is primarily household-based, but external labor is hired for tasks such as soil preparation, harvesting, and transporting rice. The average rice yield during the wet season is 4.25 tons per hectare, but production faces significant challenges due to damaged irrigation gates, which lead to water shortages, along with pests like the walker insect and weed infestations.

After harvesting, straw is typically kept for cow feed, sold, or left in the field for 2-3 months before being either burned or ploughed under. The average cost of production ranges from 1,500,000 to 2,000,000 riel, approximately 400 USD per hectare. Farmers in the area have received training on water consumption management, techniques for rice seed storage and use, as well as proper fertilizer and pesticide application techniques.

Table 35. Rice production during wet and dry season

Parameters	Percentage	Parameters	Percentage
Wet season		**Dry season**	
Land size (m^2)	6,816	Land size (m^2)	17,000
Yield (kg/year)	1,838	Yield (kg/year)	6,500
Income (USD/year)	526	Income (USD/year)	1,625

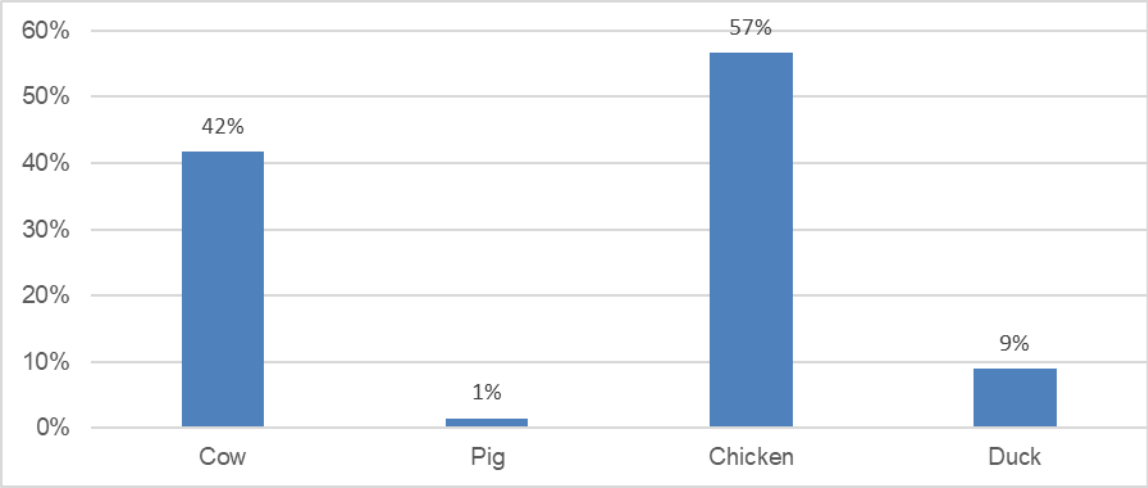
(Source: ESCIA Field Survey, 2024)

5.4.5.2 Vegetable Production

The average land size for vegetable cultivation ranges from 200 to 2,000 square meters. During the dry season, watermelon fields are situated near Stung Krang Ponley, with water accessed through short-distance pumping. In the wet season, some farmers relocate their watermelon cultivation to upland areas, relying on rainwater for irrigation. Rice fields used for watermelon in the dry season are converted back to rice paddies for the wet season. Farmers practice both chemical and organic cultivation methods. Water sources include rainwater, ponds, canals, rivers, and tap water. There are no agricultural associations in the area. Expenditures for vegetable production, including seeds, fertilizers (both chemical and manure), labor, and irrigation (pump rentals), range from USD 50 to USD 500. The average income from vegetable sales is around USD 1,000.

Vegetables are sold for household consumption and at local markets. Challenges faced include insect pests, diseases, water shortages, inadequate planting techniques, lack of materials, high temperatures, low prices, and climate change. Farmers have received agricultural services such as seed provision from the provincial department, market information, and farm demonstrations on planting techniques.

Table 36. Vegetable production during wet and dry season



Parameters	Percentage	Parameters	Percentage
Wet season		**Dry season**	
Land size (m^2)	150	Land size (m^2)	575
Yield (kg/year)	750	Yield (kg/year)	10,806
Income (USD/year)	750	Income (USD/year)	7,429

(Source: ESCIA Field Survey, 2024)

5.4.5.3 Animal Production

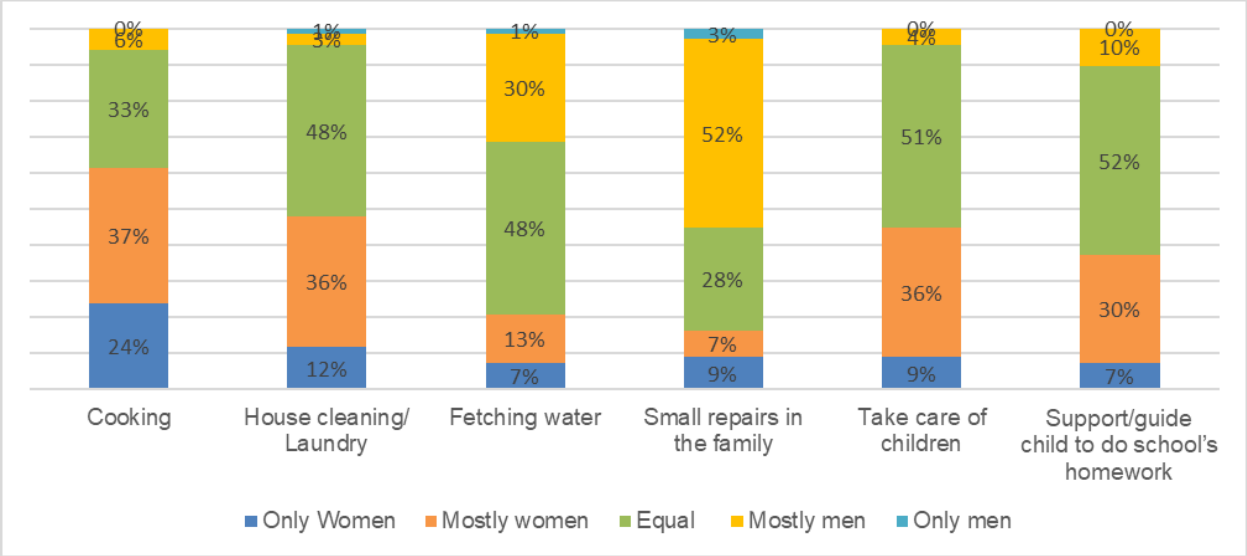
In the Krapeu Truom, a diverse range of animal production activities is prevalent among local households. Cattle farming is the most common, with 42% of households raising cows. Pig farming is practiced by 1% of households. Chicken farming is the most widespread, with 57% of households involved in raising chickens, reflecting their significant role in the local economy and diet. Ducks are the least common among the livestock options, with just 9% of households raising them. This distribution highlights the varied livestock practices within the area, with a strong emphasis on poultry farming and a notable presence of cattle and buffalo farming.

Figure 3. Type of animal in Krapeu Truom command area

(Source: ESCIA Field Survey, 2024)

5.4.6 Gender

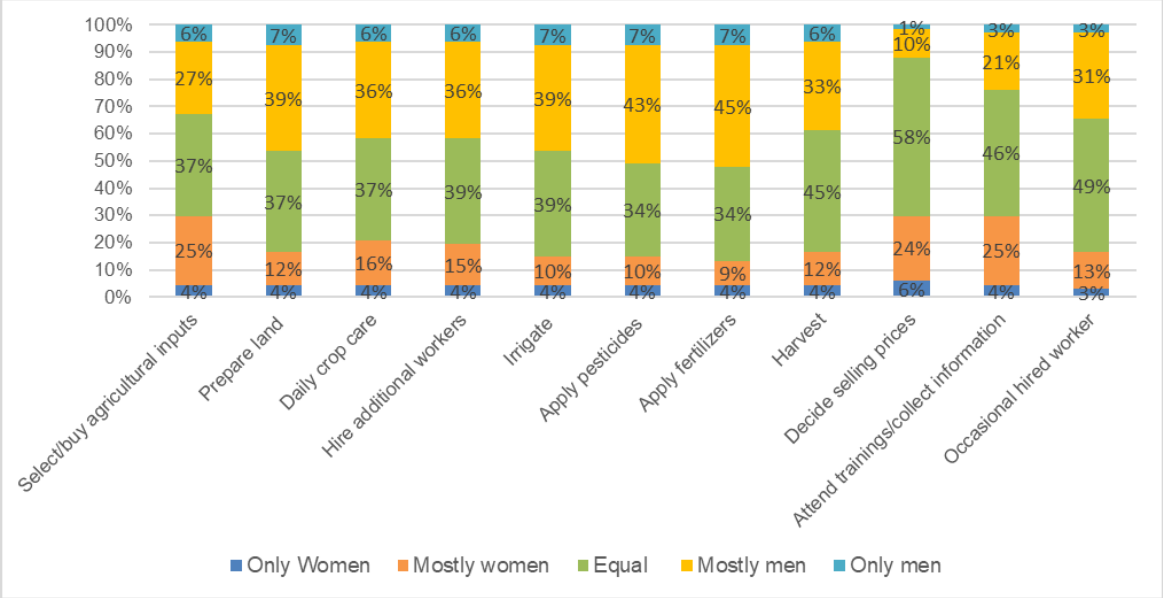
5.4.6.1 Labor Division



CAISAR Gender Assessment and Social Inclusion Plan reported that men spend on average of 59.4% of their time for farming whereas women spend only 40.5%. In traditional farming context, men involve the most during cultivation stage while women are more engaged in the later production. Heavy duty tasks such as land preparation are designated to men while seedling preparation and weeding are commonly assigned to women. Transplanting, uprooting, harvesting, and marketing are generally shared by both. However, the practices have been changed lately due to the presence of mechanization where land preparation, harvesting and threshing have been replaced by machinery.[11]

Coming to household chores; women handle 90% of the workload. During the COVID-19 outbreak, women spent even more time on domestic and caregiving tasks. Elderly family members bear the full responsibility for raising grandchildren when their mothers have migrated. In the project area, similarly, in families where women work in nearby garment factories or migrate for paid employment, domestic duties are often shifted to young girls and the elderly. [5] However, the ESCIA field survey showed that

[11] CAISARP (2024). Gender Assessment and Gender Action & Social Inclusion Plan. CAISAR Project. MoWRAM.

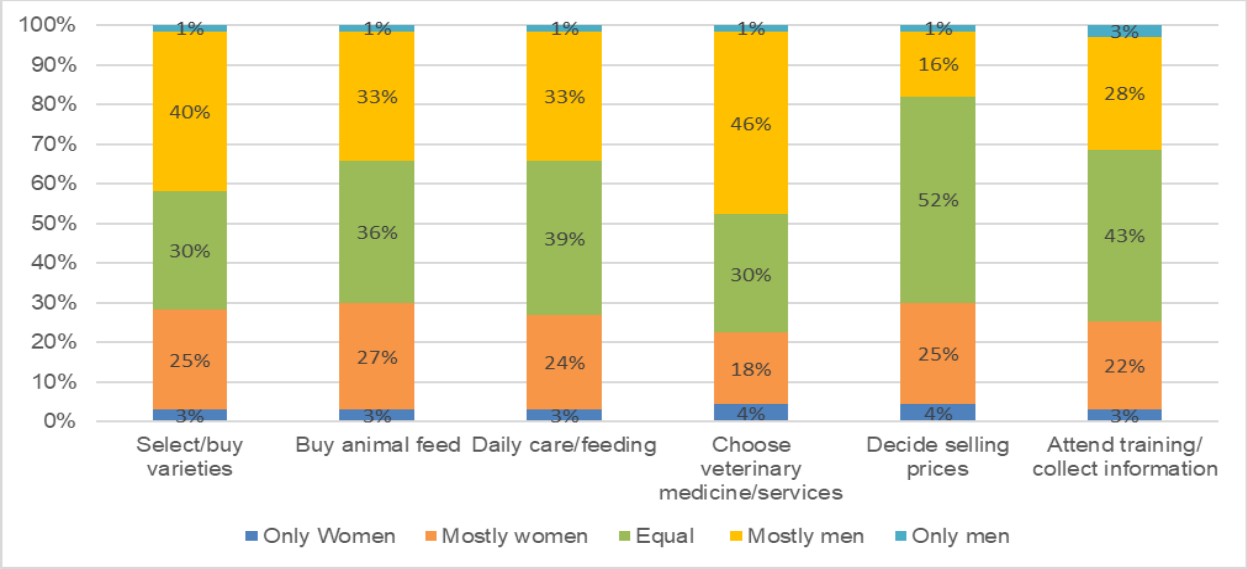


house cleaning, fetching water, child caring and schooling are mainly at the hand both men and women, except cooking mostly hand by women while repairing in the household, men involve the most (Figure 11).

Figure 22. Division of Roles in Household Chores (n=67)

(Source: ESCIA Field Survey, 2024)

Figure 23. Share of Roles in Crop Cultivation (n=67)



(Source: ESCIA Field Survey, 2024)

In crop production, the majority of tasks, particularly during the production phase, were found to be dominated both men and women except during land preparation, pesticide and fertilizer applied mostly hand by men (Figure 12).

In animal production, the distribution of labour is still found to be equally involved both male and female almost at all stage exception choose varieties and selecting veterinary medicine mostly response by male (Figure 13).

Figure 24. Share of roles in Animal Husbandry (n=67)

(Source: ESCIA Field Survey, 2024)

5.4.6.2 Income

The CAISAR Gender Assessment and Social Inclusion Plan revealed notable findings regarding income differences by gender. On an individual level, the average monthly income for female household members is $121.4 (n=238), which is lower than the $166.6 earned by male members (n=366), showing a statistically significant income gap of $45.2. However, at the household level, there is no significant difference in average income between female-headed and male-headed households, with a small mean difference of $17.3. Nationally, 48% of married men (aged 15–49) reported making joint decisions with their wives on income use, 46% said their wives mainly make these decisions, and 6% said they decide alone. Additionally, 97% of married women (aged 15–49) who earn cash from employment participate in decisions about their earnings, with 63% making these decisions mainly on their own.

5.4.6.3 Decision Making

Regarding decision-making, the matters related to children, such as education, childcare, and marriage, are typically decided by both husband and wife. However, a significant number of households have women as the sole decision-makers on child-related issues. When it comes to daily livelihoods, decisions such as household expenses, sales of home-produced goods, and visiting friends or family are usually made jointly. Still, a notable portion of respondents indicated that women alone make decisions regarding their own livelihoods, family expenses, attending trainings, and similar matters. While women tend to take the lead on child and livelihood issues, decisions concerning agricultural activities, like cultivation and animal husbandry, are mostly handled by men. This is largely

due to the physically demanding and sometimes hazardous nature of agricultural work, such as pesticide application.

6. ENVIRONMENTAL & SOCIAL RISKS, IMPACTS, AND MITIGATION

In this section, the E&S risks and impacts (that potentially arise during activity implementation and operationalization) are identified, analysed, and evaluated at project level — with regards to the nature, scope, scale, and the potential extent of activity impacts — through classification of such risks and impacts as direct, indirect, and cumulative. The assessment of E&S risks and impacts in this chapter is based on the following grounds that is fundamental to proposing measures to avoid, minimize, and mitigate for the impacts in the next chapter:

Project's original technical reports

- Feasibility Studies (August 2023)
- Feasibility Studies (updated by November 2023).
- Additional Pre–Feasibility for Krapeu Truom Sub–scheme.
- Environmental and Social Management Framework – ESMF (Updated by September 2024)
- IBAT reports for Krapeu Truom.

Stakeholder Consultations (national, provincial, district, commune, and village levels)

- Community Meetings
- Focus Group Discussions
- Key Information Interview.

Field observation, using

- Transect walks.
- Drones (for E&S screening and biodiversity assessment)

External technical reports

- Statistical reports/database.
- Publications and Technical Reports from national and internation institutions.

6.1 Risks and Impacts at Preparation and Construction Stage

6.1.1 UNEXPLODED ORDNANCES (UXO)

Construction and rehabilitation activities, particularly those involving earthworks, soil excavation, and river dredging, pose a significant risk of unexploded ordnance (UXO). Despite past demining efforts and clearance of the UXO existence in some sub-scheme as per the report in the Baseline, mortar shells, aerial bombs, and other UXO may still be present within the subproject area. This risk is particularly high in areas where deep excavation is required for structural upgrades or dredging.

The potential detonation of UXO poses a substantial threat to residents, construction workers, animals, and any other entities located near the construction sites. The risk of encountering UXO is considered moderate due to the country's long history of civil war and the limitations of past demining operations, which are often focused on surface-level clearance.

❖ **Mitigation Measures**

- Carry out UXO screening/assessment by certified UXO experts before any physical/ construction activities are allowed.
- In case UXOs are found by certified experts during on-site screening, removal of UXO will be carried out by certified experts.
- A UXO clearance certificate shall be obtained from related authority for each sub-project prior to commencing any subproject activities.
- As part of site-specific ESCMP, conduct training and awareness activities for local community with regards to UXO risks and chance finds.

6.1.2 ENVIRONMENTAL, HEALTH, AND SAFETY

6.1.2.1 Noise and Vibration

During construction phase, noise and vibration will be generated where machineries such as excavator, bulldozer, cement concrete mixing, and trucks are operated. While noise will be a nuisance to construction workers and nearby residents, these impacts are anticipated to local and intermittent during mostly during daytime. During night–time, noise may be occasionally generated from workers' camps due to living activities and occasional maintenance of machinery and equipment. These impacts are expected to have no or minimal impact on local residents as workers' camps will be located near construction site and far away from residential area. However, people who live along the national road (e.g. in Stung Krang Ponley) and small roads that project's trucks use to carry project's equipment and materials, may experience occasional traffic noise during daytime. Given the nature and scope of physical works under this scheme, impact of noise on local residents is expected to be none to minor, and temporary.

❖ **Mitigation Measures**

- Before commencing the irrigation system restoration, the Ministry is requested to organize public forums in collaboration with the commune to gather feedback from the local population, especially from residents who may be affected by the project. Moreover, training sessions for the commune

help them understand the project's processes, including the size of the infrastructure systems and the standards for excavation and construction. This will ensure that the commune is well-informed about the project

- Locate the workers' camp far away from the residential area as much as possible
- Avoid night-time construction in populated/village areas.
- Minimize project transportation through community areas where possible.
- Ensure proper maintenance and proper operation of construction machinery to minimize noise generation.
- No construction-related activities will be carried out from 21:00 hours to 06:00 hours along residential areas, hospitals, schools and during religious or cultural events near the subproject
- All construction equipment and vehicles must be well maintained, regularly inspected for noise emissions
- Impose speed limits on construction vehicles to minimize noise emission along areas where sensitive receptors are located (houses, schools, temples, hospitals, etc.
- Restrict use of vibrating rollers and operation of heavy equipment near sensitive structures.

6.1.2.2 Air pollution

During construction phase, a number of project activities may cause air pollution. These include physical activities such as movement of trucks (for transportation of materials), clearing & grubbing, grading, excavation, leveling, truck hauling, stockpiling, disposal of solid waste, dredging which may generate dust and particulate matter (PM10 and PM2.5) (if water spraying does not apply). Exhaust emissions from trucks and heavy machinery will release nitrogen oxides (NOx), carbon monoxide (CO), sulfur dioxide (SO^2), and volatile organic compounds (VOCs) which may contribute to smog formation and greenhouse effect. Burning of waste (by contractors) may release harmful pollutants into the air. While air pollution due to dust, particulate matter, and exhaust emissions from trucks and engines, are anticipated, location where pollution is generated vary and impact for one (1) location is temporary, intermittent, and minor, and are particularly for residents who live along the project's roads.

❖ **Mitigation Measures**

- Avoid burning solid waste or construction waste
- Spray or sprinkle water on the work surfaces and other piled materials to minimize dust at least 3-6 times per day in windy and dry weather and/or based on the weather condition
- Conduct proper maintenance of machineries and equipment
- Place sitting concrete mixing plants, crushing plants, quarries and other facilities far from settlement and other sensitive receptors
- Use cover for vehicles that transport all construction materials such as cements and excavated soils
- Test air quality (NO_2, SO_2, CO, TSP, PM10, PM2.5) prior and during the construction to assess the

level of impact

6.1.2.3 Impact on Water

Water pollution is anticipated, primarily due to physical activities that involves dredging and excavation near or in water course/ source. Such activities do not only cause turbulence for water but also cause increased sedimentation. Disturbed soil – caused by excavation to improve irrigation canal, for instance, may contaminate water at places where water is collected for domestic purpose. The impact is anticipated particularly for planned dredging operation at the upper along the Krang Ponley river. However, water pollution would be minimized through construction methods and time.

Wastewater (released from workers' camps) and leaks of hazardous materials (e.g., oil, diesel, chemical) could make their way into nearby water bodies and during rainy season which cause water contamination and leave varying level impacts on the receptors. The main receptors vulnerable to water pollution during construction include nearby residents and construction workers. Due to the scope and scale of physical works anticipated for each of the six schemes, project impact due to water pollution is anticipated to be minor and localized.

The Sedimentation due to excavation, dredging, and earthworks is a primary cause of water quality degradation. Loose soil can be washed into nearby water bodies, increasing turbidity, reducing light penetration, and altering the aquatic habitat. Additionally, the use of machinery and equipment introduces risks of oil spills, fuel leaks, and chemical contamination, which can enter water sources through surface runoff, affecting aquatic life and water usability downstream.

❖ **Mitigation Measures:**

- Implement a waste management plan to ensure the proper disposal of all construction waste, including wastewater
- Use environmentally friendly construction materials and techniques to reduce the amount of pollutants that are released into the environment
- Install erosion and sediment control measures, such as silt fences, and sediment basins.
- Properly manage construction chemicals, fuels, and waste to prevent water pollution.
- Regularly inspect and maintain construction equipment to prevent leaks and spills.
- Wash construction vehicles and machinery only in designated areas where runoff will not pollute natural surface water bodies.
- Train construction workers on the importance of preventing water pollution.
- Construct of retaining structures.
- Test surface water quality (Depth, pH, EC, AS, Cd, Pb, TN, TP, TDS, TSS, DO, and Total Coliform)

6.1.2.4 Solid and Hazardous Waste

During project implementation, solid wastes – both non–hazardous and hazardous, are anticipated to be generated, primarily due to rehabilitation of irrigation canals and rural roads. In particular, solid waste could be generated from operations that involved site clearing, excavation, trenching, demolition of

existing cement and earthworks structures, construction and disassembly of worker camps, maintenance of machineries, and so forth. Regarding dredged and excavated material, the construction activities can lead to surface erosion and sedimentation, particularly in water bodies. However, the estimates for the amount of dredged or excavated material per scheme do not estimate amounts for reuse or disposal. Improper handling of solid waste generated from the above operation may result environmental pollution that may include soil and water contamination, habitat disruption, visual pollution and give rise to concerns of public health.

❖ **Mitigation Measures**

- All vehicles/drivers will be provided with plastic bags for waste collection and prevent any unauthorized waste disposal with particular attention paid to prevention of littering.
- The Contractor will be required to train the workers in proper waste management.
- Recyclables will be separated at source and given/sold to recycler (plastic, metal, card, paper as a minimum).
- Non-hazardous, non-recyclable solid waste will be temporarily deposited and managed together at existing landfill/dumpsite.
- Safe temporary storage of hazardous waste as required.
- Storage facilities for fuels, oil, cement, and chemicals shall be within secured areas on impermeable surfaces, provided with bunds and cleanup installations.
- Vehicles, machinery, and equipment maintenance and re-fueling will be carried out in such a way that spilled materials do not seep into the soil.
- Oil traps will be provided for service areas and parking areas.
- Fuel storage and refilling areas will be located at least 50m from canals and channels and will be protected by temporary drainage bunds to contain spills.
- Use or reuse the dredge material on properties with a residential or recreational use (dredging material, if planned for reuse, will be subject to testing to ensure the material is safe for reuse).

6.1.2.5 Wastewater

During construction phase, generation of wastewater is expected, mainly from a) workers' camp (e.g. domestic wastewater), b) cleaning and washing of machinery, c) treatment of leakage and spill, etc. Depending how wastewater is managed, receptors of wastewater may include immediate receiving environment which may include soil, water bodies which may subsequently affect human including construction workers, residents nearby, and fauna and flora along the way wastewater goes.

❖ **Mitigation Measures**

- Reduce, recycle, and reuse waste [e.g. plastic waste, electronic waste, agricultural waste (natural, animal faces for later use as manure, plant waste)] wherever and whenever possible.
- Latrines must be built at construction sites and camp sites for appropriate domestic waste management.

- Hazardous waste, including any spills of chemicals or fuels, should be collected separately and disposed of following environmental regulations.
- Ensure construction sites have enough well-maintained sanitation facilities to prevent the direct discharge of untreated wastewater.
- Promote clean living practices, reduce plastic usage, and improve waste management.
- The construction company must regularly monitor the workers' living conditions, waste management, and ensure there are proper sanitation facilities and adequate housing for the workers.
- The company provides education and guidance on maintaining cleanliness and hygiene for the workers (such as proper waste disposal and handling of oil) and prohibits activities like fish poaching and hunting.

6.1.3 OCCUPATIONAL HEALTH AND SAFETY

6.1.3.1 Physical Hazards

The construction or rehabilitation of irrigation canals and farm roads during the construction phase of the project presents significant physical hazards to workers and those in close proximity to the construction sites. These hazards can result in a range of consequences, from minor injuries requiring medical attention to severe and potentially fatal accidents. The sources highlight several specific types of physical hazards, including Falls from Heights, Drowning and Water-Related Injuries, Falling Objects, Falls into Open Holes, and Injuries from Heavy Equipment.

The impact receptors for physical hazards are primarily construction workers, but also include inspectors, visitors, and nearby residents and children, as well as domestic animals. The sources assess the risk of physical hazards as high, acknowledging that working in the construction field can result in injuries or fatalities if safety standards are not met. The sources emphasize that unsafe practices by construction companies can lead to accidents, injuries, illnesses, and fatalities. While the overall risk might be lower due to the anticipated number of workers involved, stakeholders at the community, district, and provincial levels have expressed concerns about the potential hazards posed to both workers and community members.

❖ **Mitigation Measures**

- Prepare a health and safety plan containing site-specific precautions in accordance with relevant occupational health and safety guidelines.
- Inspect and check the relevant construction equipment to ensure that it meets the applicable mechanical and safety requirements.
- Inspect the worksite to ensure that the equipment can be safely mobilized and operated, and that there are no unmitigated risks.
- Install appropriate fencing and control access to the site.

- Install appropriate safety signage and markings.
- Provide fall protection when workers are exposed to unguarded platforms or walkways higher than 2 m.
- Ensure there are safe ways to enter and exit the excavation.
- Carry out daily toolbox meetings (safety briefings).
- Maintain an accident record book where all major or minor accidents and incidents are recorded with actions taken.
- Educate the workers on construction hazards.
- Train drivers in safe driving skills and traffic regulations.
- Appoint an Environment, Health and Safety Officer who is a qualified engineer.
- Make adequate first aid equipment available on site.
- Carry out training and awareness of the workers on HIV-AIDS prevention.
- Ensure that all workers are equipped with and use Personal Protective Equipment (PPE).

6.1.3.2 Heat Stress

The construction phase of the project, which includes rehabilitating irrigation canals and ponds, presents potential risks of heat stress to workers. This is particularly concerning given Cambodia's tropical climate, characterized by high temperatures and humidity. Construction activities are often physically demanding and performed outdoors, increasing the risk of heat-related illnesses.

Construction workers exposed to prolonged high temperatures and humidity may experience heat stress, potentially leading to heat exhaustion or heat stroke. This can result in reduced productivity, increased accidents, and even fatalities. Heat stress can also exacerbate existing health conditions. The project's Environmental and Social Management Framework (ESCMF) highlights the importance of considering temperature extremes during the construction phase, emphasizing the need for mitigation measures to ensure worker health and productivity.

❖ **Mitigation Measures**

- Providing regular breaks and shaded rest areas for workers to cool down and rehydrate.
- Ensuring access to cool drinking water throughout the workday.
- Adjusting work schedules to avoid the hottest hours of the day, if feasible.
- Providing training to workers and supervisors on recognizing the signs and symptoms of heat stress and appropriate first aid measures.
- Encouraging the use of personal protective equipment, such as light-coloured, loose-fitting clothing and wide-brimmed hats, to minimize heat absorption.
- Monitoring weather conditions and adjusting work practices accordingly.
- Developing and implementing an emergency response plan for heat-related illnesses.

- Providing adequate ventilation and cooling systems in worker accommodations.
- Encouraging workers to maintain good physical fitness and hydration levels.
- Regularly monitoring workers for signs of heat stress and taking appropriate action.

6.1.4 COMMUNITY HEALTH AND SAFETY

The construction phase, the project will rehabilitate existing irrigation canals and build new irrigation channels in an estimated six schemes located in four provinces. Construction activities may disrupt local transportation networks and increase traffic volume, including heavy trucks and machinery, impacting communities and businesses along transportation routes. Construction sites pose health and safety risks to workers and nearby communities. Accidents and exposure to construction-related hazards can have serious consequences. The influx of construction workers from different regions may increase the risk of spreading communicable diseases such as HIV/AIDS to the local community.

Open canals and ponds during rehabilitation work pose a risk of drowning, particularly to children and individuals unfamiliar with the area. Construction activities may increase the depth or alter the flow of water, further increasing the risk. Construction sites can attract curious individuals, particularly children, who may be unaware of the potential hazards. This includes the risk of falls, being struck by moving machinery or vehicles, and contact with hazardous materials. It is important to secure construction areas, implement safety awareness campaigns, and enforce hygiene and sanitation standards at construction camps.

❖ **Mitigation Measures**

- Prior to start of construction work, the contractor in cooperation with the PIU will consult with the local authorities and potentially affected residents/private landowner. Inform them about the upcoming construction work, safety precautions and how to raise concerns or file complaints (GRM).
- The contractor shall fence off the construction area and control access to the site.
- A speed limit of 30 km/h for construction related traffic through inhabited areas.
- The contractor shall install traffic signage and fluorescent bollards and warning lights to direct traffic and prevent vehicles driving into the lanes with construction activities.
- The contractor in cooperation with the local authorities shall implement traffic management to ensure a smooth traffic and prevent congestion.

6.1.5 BIODIVERSITY

6.1.5.1 Hunting, trading, and consumption of wildlife

During the construction phase of the irrigation infrastructure project, the influx of a new labor force presents a significant risk to hunting, trading, and consumption of wildlife. The arrival of workers from other regions can increase the demand for exotic local foods, including wildlife and endangered species, which are often perceived as interesting delicacies or possessing health-promoting properties. The hunting may be done for relaxation or belief that wildlife is tasty or making people healthy. This heightened demand can drive illegal hunting and trading activities, posing a severe threat to biodiversity and the

stability of local ecosystems.

The impact receptors of this risk are primarily aquatic and terrestrial species, and endangered. The potential impact on endangered species, as their rarity often increases their market value, further incentivizing unsustainable hunting and trading practices that can lead to their extinction. Regarding to biodiversity assessment in the Krapeu Trom identified the potential presence of only the endangered Flying Minnow. While another species was reported downstream, its presence within the sub-scheme was unconfirmed.

❖ **Mitigation Measures**

- Conduct thorough biodiversity inspections along access roads and at quarry sites before starting land clearing works to identify habitats or nesting sites of endangered/protected species.
- Provide mandatory training for contractors' management staff and site workers on the Code of Conduct, Standard Operating Procedures (SOP) for wildlife protection and handling, and human-wildlife conflict management.
- Incorporate a policy in the Project Administration Manual (PAM) and Worker's Agreement that prohibits employees and/or subcontractors from possessing, purchasing, trading, or collecting wildlife or forest resources that are legally protected, CITES listed, or classed as threatened by the IUCN Red List.
- Undertake regular monitoring of all access roads to prevent poaching activities.
- Properly handle and rescue wildlife encountered during land clearing and construction, following the SOP for wildlife protection and handling.
- Educate the community on local wildlife behavior, avoidance techniques, and deterrent methods.
- Report observed/recorded incidents of illegal activities to relevant authorities.
- Educate construction workers about the importance of wildlife conservation and the laws regarding hunting and trading of protected species.
- Collaborate with local communities to monitor wildlife populations and report any suspicious activities.

6.1.5.2 Loss of fauna and flora

The primary activity contributing to this risk is the construction of canals and roads, particularly in areas that require clearing vegetation and disrupting natural habitats. The construction activities can lead to both direct and indirect impacts on fauna and flora:

- Habitat loss and fragmentation due to construction activities like canal and farm road rehabilitation, land use changes, and altered water management practices can affect species survival and connectivity. These activities may involve dredging, excavation, or modification of existing water channels and infrastructure, leading to habitat destruction and disturbance to nesting and foraging sites.
- Increased vehicle movement increases the chance of collisions with wildlife.

The impact receptors for the loss of fauna and flora are diverse and include various species, particularly those dependent on the Krapeu Trom sub-scheme, which is part of the Krang Ponley River. The biodiversity study has confirmed rare fish species: Isok barb/Jullien's Golden Carp (Probarbus jullieni) and Leaping barb/Flying Minnow (Laubuka caeruleostigmata) were confirmed present from 2020 to 2024. Therefore, the construction of canal expansion and road will impact these species.

❖ **Mitigation Measures**

- Properly handle and rescue wildlife incidentally encountered or caught during land clearing and construction by relocating them to safer habitats, following the Standard Operating Procedure (SOP) for wildlife protection and handling.
- Conduct thorough biodiversity inspections along the access roads and at quarry sites before starting any land clearing works to identify any habitat and/or nesting sites of endangered/ protected species that may be affected by the clearing and identify hotspots where collisions with wildlife are likely to occur.
- Train field workers to recognize and avoid wildlife.
- Install signage to alert drivers to the presence of wildlife and require them to slow down and drive with caution, especially in hotspots where collision with wildlife is likely to occur.
- Develop a system in which drivers report locations of wildlife crossings and wildlife sightings.
- Workers will receive training on frequently encountered wildlife.
- The contractor shall install signs to ban hunting or catching wildlife in the area.
- Apply Find Chance Procedure

6.1.6 CLIMATE CHANGE

6.1.6.1 GHG emission

The main activities that contribute to this risk is the use of heavy machinery and trucks for excavation, transportation, and rehabilitation of irrigation canals and farm roads. The operation of these machineries releases carbon dioxide (CO2), methane (CH4) and nitrous oxide (N2O) into the atmosphere. Waste burning at worker campsites may also contribute to GHG emission.

❖ **Mitigation Measures**

- Construction vehicles and machinery will be maintained to a high standard to minimize emissions and ensure compliance with the National exhaust emission standards. All mobile equipment should be fitted with catalytic converters.
- Use energy-efficient machinery and equipment during construction to reduce fuel consumption and emissions.
- All open burning of construction and demolition of waste material and refuse will be prohibited.
- Implement proper maintenance programs for equipment and vehicles to ensure they operate

efficiently and with lower emissions.

- Engage with local communities and stakeholders to raise awareness of emission reduction practices and encourage their participation in sustainability efforts.

6.2 Risks and Impacts at Operation Stage

6.2.1 ENVIRONMENTAL, HEALTH AND SAFETY ASPECT/ISSUE

6.2.1.1 Water Management

During the operation phase of the irrigation infrastructure project, alterations to hydrology present potential risks. The main activity that causes these risks is increased irrigation. This can lead to the depletion of water sources if proper management practices are not implemented.

The impact receptors for these risks include the Tonle Sap Lake, upstream watersheds, wetlands, aquatic ecosystems, and downstream communities. The assessment of the impact of hydrology changes during operation is moderate. This takes into consideration the potential for both positive and negative impacts of irrigation systems. Poor water management can result in downstream water scarcity, altered hydrology, and damage to aquatic ecosystems. However, well-designed and properly managed irrigation systems can contribute to improved agricultural productivity and water resource management.

❖ **Mitigation Measures**

- A water user community should be organized prior to construction to participate in identifying key locations and ensure there are caretakers in place.
- Establish detailed water management plans that ensure equitable water distribution and allocation, considering the needs of various users and the environmental flow requirements to maintain healthy aquatic ecosystems.
- Design and construct robust irrigation infrastructure, including canals, ponds, and storage areas, capable of withstanding extreme weather events like floods and droughts. This investment should also include lining canals and refurbishing storage areas to reduce water losses and improve water storage capacity.
- Integrate natural infrastructure, such as wetlands and forests, into water management strategies. Protect and restore degraded habitats to enhance their water regulation capabilities, improve water quality, and support biodiversity.
- Establish and provide training to FWUCs on sustainable water management practices, equitable water rights, and allocation procedures. These communities play a vital role in the operation and maintenance of the irrigation system, ensuring its long-term sustainability.

6.2.1.2 Water pollution

During this phase, the primary activity that causes this risk is the intensification of agricultural production in the command areas as irrigation water becomes readily available. This intensification can lead to an increased use of chemicals, such as fertilizers and pesticides, to enhance crop yields. These chemicals

infiltrate the soil and reach groundwater aquifers, leading to long-term contamination. The excessive application of these chemicals can result in contamination of both surface and groundwater resources. Furthermore, changes in water table levels due to extensive irrigation can alter the flow patterns of groundwater, potentially mobilizing contaminants that would otherwise remain contained.

The assessment of the impact of water pollution during operation is moderate. The potential for significant water quality degradation due to the widespread use of chemical fertilizers and pesticides in rice production. High concentrations of these chemicals in water resources can harm biodiversity, not only within the KT sub-scheme but also in the downstream river systems and the Tonle Sap Lake.

❖ **Mitigation Measures**

- Conduct regular water quality test to track the change in water quality due to pesticide application using oversea laboratory testing.
- Encourage farmers to adopt IPM techniques that minimize pesticide use and rely on biological control methods, thereby reducing the increased risk of chemical contamination of water resources.
- Provide training and extension services to farmers on the judicious use of fertilizers and, ensuring they apply the correct type and amount based on soil nutrient levels.
- Promote the adoption of organic fertilizers and soil amendments, such as cover crops and green manures, which can improve soil fertility and reduce the need for chemical fertilizers.
- Implement a robust water quality monitoring program to track the levels of pesticides, nitrates, and other pollutants in surface and groundwater resources within and around the command areas.
- Encourage the adoption of water-saving irrigation methods, such as alternate wetting and drying (AWD) in rice cultivation, which can reduce water consumption and minimize the leaching of agrochemicals.

6.2.1.3 Soil pollution

During the operation phase of the irrigation infrastructure project, soil pollution/quality reduction poses a considerable risk. The primary activity contributing to this risk is the increased agricultural production facilitated by the improved irrigation infrastructure. This intensification can lead to the overuse of agri-chemicals, such as chemical pesticides and fertilizers, if farmers lack adequate training or support in adopting environmentally friendly practices.

The impact receptors for soil pollution/quality reduction are multifaceted, encompassing such as soil health, water quality, and biodiversity. The impact of soil pollution/quality reduction during the operation phase as moderate. This assessment considers the potential for increased agricultural production to lead to the overuse of agri-chemicals if sustainable farming practices are not adopted.

❖ **Mitigation Measures**

- Implement Simplified Pesticide Management Plan
- Conduct regular water quality test to track the change in water quality due to pesticide application using oversea laboratory testing

6.2.2 CLIMATE CHANGE

6.2.2.1 GHG emission

During the operation phase, the intensification of farming activities is expected to result in a rise in greenhouse gas (GHG) emissions. This increase will stem primarily from the greater energy requirements associated with boosting agricultural production. The operation of machinery and equipment for various farming tasks, including tillage, irrigation, harvesting, and transportation, will demand a substantial amount of energy. If this energy comes from fossil fuels, it will lead to higher carbon emissions. The practice of burning rice straw after harvest, a common agricultural method in the region, also releases significant amounts of GHGs, such as carbon dioxide and methane, into the atmosphere. Additionally, the intensification of farming often results in greater use of chemical fertilizers, and the production and application of these fertilizers also contribute to GHG emissions.

The main impact receptor for GHG emissions is the atmosphere. The increase in GHG emissions adds to the problem of global climate change, which can have a wide range of negative consequences. These consequences include rising temperatures, shifts in weather patterns, sea-level rise, and an increase in the frequency and intensity of extreme weather events.

❖ **Mitigation Measures**

- The project needs to introduce renewable energy sources such as solar-powered irrigation to lower the carbon footprint of rice production.
- The project needs support training farmers to use alternatives to straw burning, such as mulching or biomass energy generation, to reduce air pollution.
- The project promotes the utilization of efficient irrigation methods like alternate wetting and drying (AWD) to conserve water and minimize methane emissions.
- The project needs to advocate for policies that discourage straw burning and provide incentives for adopting sustainable agricultural practices.

6.2.3 ANNUAL CROP MANAGEMENT PLAN

6.2.3.1 Water resource efficiency

In this phase, inefficient irrigation practices can lead to a reduction in water resource efficiency. Moreover, people in community faced with flooding in wet season and drought in dry season generally. Additionally, farmers also pose with climate change issue which harm to their crop. The increased demand for irrigation, coupled with poor water management practices and lack of infrastructure, can result in the over-extraction of water resources. This over-extraction can have several detrimental effects on the surrounding environment and communities:

- Downstream Water Scarcity: Excessive withdrawal of water for irrigation can deplete water sources downstream, leading to water shortages for other users, such as communities, industries, and ecosystems.
- Altered Hydrology: Over-extraction can disrupt the natural flow patterns of rivers and other water bodies, affecting the balance of aquatic ecosystems and the services they provide.

- Damage to Aquatic Ecosystems: Reduced water flow and altered water levels can harm fish populations, other aquatic organisms, and the overall health of downstream ecosystems.

The impact receptors for inefficient water resource use are downstream communities and aquatic ecosystems, including those in the Tonle Sap Lake and its surrounding watersheds, this impact as the moderate. This assessment highlights the importance of implementing effective water management strategies to ensure the sustainable use of water resources and minimize negative impacts on downstream users and ecosystems.

❖ **Mitigation Measures**

- Water use monitoring system to track consumption and identify areas for improvement.
- implementing appropriate irrigation scheduling based on crop water requirements and weather conditions.
- Utilizing efficient irrigation systems, such as drip irrigation or sprinkler systems, to minimize water loss.
- Exploring opportunities for water reuse, such as capturing and reusing runoff water.

6.2.3.2 Soil erosion and soil erosion risk

The various agricultural activities can elevate the risk of soil erosion and contribute to the degradation of soil health. Land preparation practices, such as tillage and site clearing, along with the use of heavy machinery, can disrupt the soil structure, making it more vulnerable to erosion by wind and water. Additionally, the intensification of farming can lead to changes in vegetation cover, reducing the natural protection against erosion.

Soil erosion poses significant threats to both the environment and agricultural productivity. The loss of topsoil, the fertile upper layer of soil rich in nutrients and organic matter, is a primary concern. This loss diminishes soil fertility, impacting its ability to retain water and nutrients crucial for plant growth. Consequently, agricultural yields decline, and farmers may experience reduced productivity. Furthermore, eroded soil particles contribute to increased sedimentation in water bodies such as rivers and lakes. This sedimentation can harm aquatic ecosystems and degrade water quality, increasing the costs associated with treating water for human consumption.

The impact receptors for soil erosion are soil health, water quality, and agricultural productivity. The sources assess the impact of soil erosion during the operation phase as high, emphasizing the need for sustainable land management practices to prevent and mitigate soil erosion.

❖ **Mitigation Measures**

- Minimize soil compaction and disturbance by using appropriate machinery and timing land preparation activities.
- Consider erosion management practices such as contour planting, terracing, and grass barriers.
- Adopt reduced tillage or no-till farming practices to minimize soil disturbance.
- Establish cover crops during fallow periods or in rotation with main crops to protect the soil from

erosion.

- Practice contour farming on sloping land to reduce runoff and erosion.
- Construct terraces on steep slopes to prevent soil loss.
- Establish windbreaks or shelterbelts to reduce wind erosion.
- Install erosion control structures, such as grassed waterways or sediment basins, to manage runoff.
- Apply much to the soil surface to protect it from rainfall impact and erosion.

6.2.3.3 Nutrient application and management

The excessive or improper application of fertilizers poses a significant risk to water quality and the health of aquatic ecosystems. The intensification of agricultural production, driven by improved irrigation, can lead to an increased reliance on chemical fertilizers to enhance crop yields.

The impact receptors for nutrient runoff and leaching are water quality, aquatic ecosystems, and human health. High levels of nutrients, particularly nitrogen and phosphorus, in water bodies can lead to eutrophication, a process that causes excessive growth of algae. This algal bloom can deplete oxygen levels in the water, harming fish and other aquatic organisms. Additionally, contaminated water sources can pose risks to human health if used for drinking or recreational purposes.

The sources assess the impact of nutrient application and management during the operation phase as high, emphasizing the urgent need for sustainable farming practices that optimize fertilizer use and minimize the risks of nutrient pollution.

❖ **Mitigation Measures**

- Conduct periodic soil analysis to determine nutrient needs and avoid over-fertilization.
- Establish buffer zones near watercourses to filter nutrient runoff.
- Consider using green manures and cover crops to replenish soil nutrients and reduce leaching.

6.2.3.4 Use and effectiveness of pesticides

The use of pesticides to protect crops from pests and diseases can pose significant risks to human health, biodiversity, and the environment. The intensification of farming often leads to an increased reliance on pesticides to maintain high crop yields. However, the effectiveness of pesticides can decline over time as pests develop resistance, requiring farmers to apply higher doses or switch to more potent chemicals.

This cycle of pesticide use, and resistance can have several negative consequences. Pesticide exposure can pose health risks to both farmers who handle and apply these chemicals and consumers who ingest pesticide residues on food. Pesticides can harm non-target organisms, including beneficial insects, pollinators, and soil organisms, disrupting the balance of ecosystems. Environmental Contamination: Pesticides can contaminate soil and water resources, potentially affecting water quality and the health of aquatic ecosystems.

The sources assess the risks and impacts associated with pesticide use and effectiveness as high, highlighting the need for integrated pest management strategies that minimize reliance on chemical

pesticides.

❖ **Mitigation Measures**

- Promote Integrated Pest Management (IPM) strategies to minimize pesticide use.
- Implement training and awareness programs for farmers on the safe handling and application of pesticides.
- Providing training materials that are user-friendly and accessible to farmers with varying literacy levels.
- Including climate information and agrometeorology services in training materials when available.
- Preparing training materials for rice and other crops such as vegetables, poultry, and aquaculture.
- Organizing trainings on "climate-informed agriculture decisions and planning" and having trained individuals disseminate information.

6.2.3.5 Pesticide residues on site soil

The repeated application of pesticides, especially persistent pesticides, and the improper disposal of pesticide containers can lead to the accumulation of pesticide residues in the soil. This accumulation can have several detrimental effects on the environment such as contamination of Groundwater and impacts on Soil Organisms.

The impact receptors for pesticide residues on-site soil are soil health, biodiversity, and water quality. The sources assess the risk of pesticide residue accumulation in the soil as high, emphasizing the need for judicious pesticide use, proper disposal of pesticide containers, and integrated pest management strategies to minimize the risks associated with pesticide contamination.

❖ **Mitigation Measures**

- Promote the use of pesticides with low persistence and mobility in the environment.
- Implement a soil monitoring program to assess pesticide residue levels.
- Consider crop rotation and the use of cover crops to help break down pesticide residues.
- Minimize pesticide use by adopting IPM strategies.
- Conduct soil testing to monitor pesticide residue levels.
- Utilize cover crops to improve soil health and enhance pesticide degradation.

6.2.3.6 Pesticide residues on produce

During the operation phase of the irrigation project, the application of pesticides close to harvest, improper pesticide application techniques, and inadequate pre-harvest intervals can lead to pesticide residues on produce, posing risks to consumer health. Consuming produce with pesticide residues can have adverse effects on human health.

The main impact receptor for pesticide residues on produce is human health, specifically consumers who ingest the contaminated food. The sources assess the impact of pesticide residues on produce as

moderate. This assessment highlights the importance of implementing safe pesticide application practices, adhering to pre-harvest intervals, and promoting alternative pest control methods to minimize the risks to consumer health.

❖ **Mitigation Measures**

- Enforce pre-harvest intervals to allow for pesticide breakdown before harvest.
- Promote the use of pesticides with low toxicity to humans.
- Properly wash and handle produce to remove surface residues.
- Implement a monitoring program to test produce for pesticide residues.
- Ensure compliance with established MRLs for pesticide residues on produce.

6.3 Risks and Impacts at Preparation Stage

6.3.1 LAND ACQUISTION

6.3.1.1 Land acquisition and resettlement

The land acquisition for the construction of the irrigation system within the Krapeu Trom sub-schemes has been limitedly anticipated since the construction of the new system has been avoided the most. The land acquisition in the Krapeu Trom sub-scheme is primarily driven by the construction of infrastructure components such as the Drainage Canal and Carrying Roads (MC2). These activities are projected to affect a total land area approximately 15,850 m^2.

Consultation result addressed that they have concerns of land affected by construction near irrigation systems or the placement of construction projects, with some areas of land that people are using being close to harvest time and potentially rendered unusable but due to the project announcement the project implementation will be inform 6 months in advanced where this issue will be encounter. The affected households will feel not well due to land impact.

Consultation with the Provincial Department of Land Management, Urban Planning and Construction (PDoLMUPC) has revealed that all the land required for this sub-scheme falls under public ownership. Therefore, the land acquisition process is anticipated to proceed without impacting any private property.

❖ **Mitigation Measures**

- Abbreviated Land Resettlement Plan should be prepared to support the proper implementation of the sub-scheme.

6.3.1.2 Economic displacement

The risk of economic displacement is linked to activities like the rehabilitation of irrigation canals and farm roads, and land acquisition. These activities can disrupt existing economic activities and displace households and businesses. The upgrading of irrigation systems may result in the removal of informal farming areas due to dredging, impacting those who rely on these areas for income. Additionally, during the construction phase, local businesses and transportation routes might face disruptions due to

construction activities, affecting the community's daily life and economic activities. The Krapeu Trom Sub-scheme encompasses various infrastructure components, including Main Canals, Drainage Canals and Carrying Roads (MC2.

The impact receptors for economic displacement include households who have production land along the water bodies, informal land users, informal settlers, and nearby construction site business owners. The assessment regard this impact of economic displacement as moderate.

❖ **Mitigation Measures**

- The households who own the land along the rehabilitated canals which will be expanded at the public land should be properly informed prior to the construction to avoid their crops will be damaged at the time of construction.
- Although the acquired land is the public land, there are a need of a proper consultation and information to be conducted to inform and obtain agreement from the affected households.

6.4 Risks and Impacts at Construction Stage

6.4.1 PROTECTING THE WORKFORC

6.4.1.1 Child Labor

The risk of child labor emerges due to the demand for unskilled labor in rural areas where the use of child labor is prevalent. Contractors and subcontractors involved in the project's construction activities may employ children or youth under the legal working age due to labor shortages or the drive to minimize costs. This practice exploits vulnerable children, depriving them of education and opportunities, and perpetuates a cycle of poverty.

The risk of child labor, particularly due to the influx of labor and pre-existing societal inequalities. Vulnerable groups, such as poor and near-poor households, female-headed households with dependents. Children from these groups are often driven to work due to economic hardship, and the increased demand for labor during project construction can exacerbate this situation. Migrant workers, often facing precarious working conditions and separated from support systems, are also highly vulnerable to exploitation, including child labor. The project's Gender Assessment identifies the lack of local wage jobs and increasing migration as key challenges that could further heighten the risk of child labor.

❖ **Mitigation Measures**

- Apply LMP for age check prior to engagement of labor with regular monitoring through proper screening and registering all workforce for the work
- To mitigate the risk of child labor, the project will implement strict measures to ensure compliance with national and international labor laws. Regular monitoring and inspections will be conducted to identify and address any instances of child labor.
- Additionally, awareness-raising campaigns will be implemented to educate communities about the harmful effects of child labor and the importance of sending children to school. The project will also collaborate with local authorities and NGOs to strengthen law enforcement and provide

support services to vulnerable children and their families.

6.4.1.2 Forced Labor

In the construction phase, the risk of forced labor is anticipated, especially for vulnerable individuals who may be coerced into working against their will. Forced labor can manifest in various ways, including:

- Economic Coercion: Individuals may be forced to work due to financial pressures, such as the need to repay debts or support their families.
- Exploitation of Young People: Young people, particularly those from impoverished backgrounds, may be forced to work to contribute to family income or due to a lack of educational opportunities.
- Debt Bondage: Workers may be trapped in a cycle of debt by unscrupulous employers who advance them loans with exploitative terms, effectively binding them to work until the debt is repaid.
- The rehabilitation of irrigation canals and farm roads creates a demand for local labor which can be exploited by those who seek to profit from forced labor.

❖ **Mitigation Measures**

- Strict Code of Conduct for workers with no tolerance for physical or verbal abuse of women or children
- The Project Owner and Sub-Contractors will collaborate with the relevant Government Agency to disseminate information to local communities. This information will include the Contractor's Code of Conduct and the minimum working age as mandated by national laws and international standards.
- The Ministry of Water Resources and Meteorology (MOWRAM) will provide information to local communities about the contractor's policies and responsibilities, including the Contractor's Code of Conduct and minimum working age.

6.4.2 COMMUNITY HEALTH AND SAFETY

6.4.2.1 Disease transmission

During construction phase, the risk of disease transmission is anticipated due to the influx of construction workers, the potential for their lack of hygiene in living conditions, and their interaction with local community members. The influx of workers increases the likelihood of spreading and contracting communicable diseases, both among the workers themselves and between workers and the local community. Workers may experience poor eating habits, homesickness, stress, and unhygiene living conditions which make them susceptible to diseases.

❖ **Mitigation Measures**

- Conduct public awareness raising activities (IEC) to ensure local people and contractors know about the risks of contracting and spreading communicable diseases such as COVID-19, HIV/AIDS, and water-borne diseases (e.g., amoebiasis, giardiasis, and toxoplasmosis. etc.
- In the event of a disease outbreak (e.g. COVID-19), provide immediate training/awareness raising

to the risk groups.

- Conduct training to workers on communicable diseases prior to mobilization to construction sites.
- For water-borne diseases that arise due to polluted or contaminated water, mitigations measures may include:
- Implement filtration, chlorination, or UV disinfection to ensure safe drinking water.
- Build and maintain proper sewage systems and latrines to prevent water contamination.
- Promote handwashing, safe food preparation, and proper sanitation practices in communities.
- Control and properly dispose of waste to prevent water pollution.
- Test water sources frequently for contamination and take corrective actions promptly.

6.4.2.2 Sexual Exploitation and Abuse, Sexual Harassment

The risk of Sexual Exploitation and Abuse/ Sexual Harassment (SEA/SH) is envisaged due to several factors. The influx of workers estimated to be approximately 171 in Krang Ponleng river, as the Krapeu Trom is a part of this scheme, frequent visits by project personnel, and pre-existing SEA/SH issues in the area all contribute to this risk. This risk is primarily associated with the rehabilitation of irrigation canals and farm roads. The influx of labor includes not only construction workers but also individuals who provide logistical services, increasing the potential for exploitation.

❖ **Mitigation Measures**

- Contractors need to explicitly state zero tolerance for sexual harassment, exploitation, and abuse within the workplace.
- Require Code of Conduct (CoC) to be signed by all construction workers.
- For victims coming forward: referral to qualified SEA/SH service provider. The GRM will include a confidential channel for reporting SEA/SH.
- Strict Code of Conduct for workers with no tolerance for physical or verbal abuse of women or children
- Training on SEA/SH and VAC for community members, in particular women and girls (may be done separately for men and women).
- Ensuring workers' sites are situated (at least 500m) from schools and/or other areas where children congregate.
- Ensure access to grievance redress mechanisms for all project-affected persons, including both stakeholders and workers, to address Sexual Exploitation and Abuse, and Sexual Harassment. Support (in the form of training, awareness raising, etc.) to local law enforcement to act on community complaints regarding SEA/SH and VAC.
- Provision of information to local communities about the contractor's policies and responsibilities, including the Contractor's Code of Conduct and minimum working age.
- Provide counselling services for male and female workers, wives and other female partners of

contractors' workers.

- Build partnerships with local health providers and SEA/SH service providers to conduct community awareness activities, and referrals.
- Implement public awareness campaigns to address sexual harassment in transport services and hubs, and training of police on women's security needs when using transport.

6.4.2.3 Traffic safety & Security

During construction phase, traffic safety is among the local concerns. The rehabilitation of irrigation canals and farm roads necessitates increased transportation of construction materials and equipment, potentially leading to road accidents, especially if safety measures are not strictly enforced. Construction activities can also attract unauthorized individuals seeking to steal or vandalize equipment and materials, further compromising security. The influx of construction workers into the project area may also contribute to a perceived or actual increase in crime rates, impacting the sense of safety among residents.

People subject to risk of traffic accident include anyone which may include project workers and local people who live near the construction sites or travel on transportation routes.

❖ **Mitigation Measures**

- Arrange security guard or engage local authority to guard the construction sites
- Conduct public awareness raising activities (IEC) to ensure local people and road user are aware of road safety regulations and risks and act accordingly while using road.
- Monitor and observe speed limit.

6.4.2.4 Community Health and diseases

During the construction phase, community health and safety risks extend beyond disease transmission and include the potential for accidents and injuries related to construction activities. Rehabilitation work on canals and ponds poses drowning risks, especially for children and those unfamiliar with the altered water bodies. Trespassing in construction zones, which may contain storage areas, camps, lay down areas for construction materials, vehicles, and machinery, presents further risks of incidents and accidents for community members. Additionally, construction activities can lead to traffic and access disruptions that may cause safety issues for the community. The presence of construction workers and associated activities can also lead to potential conflicts with local communities. Construction sites also pose risks of accidents and exposure to construction related hazards.

❖ **Mitigation measures:**

- Establish clear and well-marked construction exclusion zones to prevent unauthorized access, especially to areas with open water, heavy machinery, and storage areas.
- Implement fencing and barriers to prevent trespassing and ensure community safety around construction areas.
- Provide warning signs in local languages to inform communities about the dangers and restricted access to construction areas.

- Install safety barriers around construction sites to minimize risks to the community and workers.
- Ensure proper storage of construction materials, with no materials left unsecured and scattered around the site.
- Develop and implement traffic management plans to minimize traffic and access disruptions and ensure pedestrian and vehicle safety.
- Conduct community awareness campaigns to educate the community about the potential risks and safety measures during construction.
- Establish and maintain a grievance mechanism to address community complaints and issues promptly.
- Implement safety measures around canals and ponds to prevent drowning incidents, such as installing safety barriers and providing warning signs in local languages.
- Create and enforce clear rules regarding access to canals and ponds during construction, and post those rules.
- Implement strict health and safety regulations at all construction sites to protect both workers and the nearby communities.
- Provide training to workers on safety protocols, including how to work safely around water, avoid accidents and minimize risks to the community.
- Ensure all workers are provided with necessary personal protective equipment (PPE) and enforce its use.

6.4.2.5 Personal Protective Equipment

The construction or rehabilitation of irrigation canals and farm roads during the construction phase presents significant risks to worker safety and health due to the potential lack of personal protective equipment (PPE). These activities involve Canal Rehabilitation and Construction, Structure Construction and Rehabilitation, and Drainage Improvement, which expose workers to various hazards, such as Falling Debris, Sharp Objects, and Heavy Machinery.

The absence of proper PPE significantly increases the likelihood of injuries, such as cuts, fractures, or head trauma. Workers without respiratory protection may inhale dust, fumes, or toxic substances, potentially leading to respiratory problems. Similarly, inadequate eye and hearing protection can result in vision impairment or hearing loss due to flying particles and high noise levels. Furthermore, the lack of proper footwear and gloves increases the risk of slips, trips, and falls, and exposure to hazardous materials.

The impact receptors for risks associated with the lack of PPE are primarily construction workers but also include inspectors and visitors to the construction sites. The sources assess the risk associated with inadequate PPE as high, particularly in rural construction settings where cost-cutting measures might compromise worker safety. The sources emphasize that the absence of PPE not only jeopardizes individual safety but also reduces productivity and increases liability risks for the project.

❖ **Mitigation Measures**

- Continue and active use of PPE at all time of construction.
- Identification and provision of appropriate PPE that offers adequate protection to the worker, co-workers, and occasional visitors, without incurring unnecessary inconvenience to the individual
- Proper maintenance of PPE, including cleaning when dirty and replacement when damaged or worn out.
- Proper use of PPE should be part of the recurrent training programs for employees.

6.4.2.6 Working conditions and Management of Worker

The construction or rehabilitation of irrigation canals and farm roads during the construction phase of the project carries a risk of underpaid pay and unequal treatment for local workers hired by project contractors. This risk is exacerbated by the lack of written contracts for unskilled workers, particularly those recruited locally. Without a formal contract, these workers are vulnerable to being underpaid compared to the demands and scope of their work.

The sources highlight the potential for underpayment to occur based on gender and temporary work status, further marginalizing already vulnerable groups. The absence of clear contractual terms also increases the risk of late wage payments or even non-payment, jeopardizing the workers' livelihoods and potentially delaying the project's progress.

The impact receptors for underpaid pay and unequal treatment are primarily unskilled workers (mostly local people) and construction workers, particularly women. The sources assess the risk associated with these issues as moderate.

❖ **Mitigation Measures**

- Implement a grievance mechanism for workers where workers can report issues related to underpayment or unequal treatment without fear of retaliation.
- Advise companies to provide equal opportunities for employment and promotions to all workers, regardless of gender, ethnicity, or background, to avoid discrimination.
- Regularly monitor and audit payroll and employment practices to ensure compliance with labor regulations and address any disparities.
- Offer training and capacity-building programs for all workers to enhance their skills and qualify them for higher-paying roles.
- Ensure that subcontractors and suppliers also adhere to fair wage and equal treatment policies.
- Set up worker committees or unions to allow collective bargaining and ensure workers have a voice in addressing wage and treatment issues.
- Provide accessible information to workers about their rights, entitlements, and the proper channels to address grievances through the establishment of the GRM for workers.
- Labor Rights and the Workers' Code of Conduct Regularly engage with labor rights organizations or third-party auditors to evaluate labor conditions and make improvements where necessary.

6.4.3 CULTURAL HERITAGE

There are no significant cultural sites within the sub-scheme. Krapeu Trom may have some connection and link to the ancient city of Longvek leading to the possibility that treasures or artifacts of historical significance were hidden underground. The impact receptors for cultural heritage risks are primarily underground cultural sites, and the sources assess the risk as minor.

❖ **Mitigation Measures**

- Implement Find Chance Procedure

6.4.4 CROSS-CUTTING

6.4.4.1 Loss access to land and other assets

In the construction phase, activities like upgrading existing canal, and implementing river training measures, carries a moderate risk of temporarily or permanently restricting access to natural resources for local communities. Additionally, the influx of construction workers and the establishment of temporary facilities like worker camps could strain local resources, including water sources and forest products, potentially leading to overexploitation and environmental degradation.

❖ **Mitigation Measures**

- The project will prioritize avoiding physical resettlement and minimizing land acquisition. Design adjustments will be made to avoid or reduce land requirements, especially on private land. Public land will be prioritized for any necessary acquisition.
- Where land acquisition is unavoidable, the project will employ a negotiated settlement process with affected households. This process, guided by the RGC's Standard Operating Procedures on Land Acquisition and Involuntary Resettlement (SOP-LAR), aims to ensure that affected households receive fair and adequate compensation for their losses and maintain or improve their income and livelihood status.
- All individuals with assets within the Corridor of Impact (COI) before the Cut-Off-Date (COD) will be eligible for compensation, regardless of their legal status. Compensation will be provided for various losses, including land, structures, crops, trees, and income-generating activities.
- Recognizing the potential disruption of income streams during relocation or construction, the project will provide transitional allowances to affected households. These allowances will help cover living expenses and bridge the gap until they can resume their livelihoods.
- A multi-tiered GRM will be established to address grievances from any project-affected person. The GRM will operate based on the principles of the Green Climate Fund (GCF) and be accessible at no cost to the complainant.

6.4.4.2 Loss access to natural resources

The construction phase of the irrigation project, specifically activities like upgrading existing canal, carries a moderate risk of temporarily or permanently restricting access to natural resources for local

communities. Additionally, the influx of construction workers and the establishment of temporary facilities like worker camps could strain local resources, including water sources and forest products, potentially leading to overexploitation and environmental degradation.

❖ **Mitigation Measures**

- Implement efficient water management practices during construction and operation to prevent over-extraction of water resources from reservoirs and rivers and ensure equitable distribution for downstream communities and ecosystems.
- Use environmentally friendly construction materials and techniques to reduce the risk of pollution. Properly manage construction chemicals, fuels, and waste to prevent water pollution and contamination of natural resources. Prepare and implement a waste management plan to handle waste generated from construction activities and worker camps.
- Optimize construction material use and recycle, when possible, to minimize the extraction of new resources. Implement energy-efficient construction practices and use renewable energy sources where possible.
- Maintain ongoing communication with affected communities, including farmers, fishers, and downstream communities, to address concerns about natural resource access. Provide information and education to construction workers about responsible use of local resources and respect for community access rights. This suggestion is informed by the sources but is not directly stated in them.
- Ensure the GRM is accessible to all community members to address complaints related to natural resource access.

6.4.4.3 Social inequality

The engagement and consultation processes during the design and construction phases of the irrigation project present a moderate risk of social inequality. The sources indicate that while landowners in the project areas are mainly from local communities, suggesting relatively equal access to the consultation process, vulnerable groups without farmland may have limited opportunities to participate and benefit from the rehabilitated irrigation system.

This potential for exclusion raises concerns about the fair distribution of project benefits. While the overall impact of social inequality during the construction phase is assessed as moderate.

❖ **Mitigation Measures**

- Conduct participatory planning and regular consultations with local communities, particularly marginalized groups (e.g., women, smallholder farmers, indigenous communities).
- Prioritize hiring local labor, with special provisions for disadvantaged groups (e.g., youth, women, minorities) in both skilled and unskilled positions.
- Develop and enforce water allocation plans that ensure fair access to water resources for all users, including small-scale and subsistence farmers, during and after construction.
- Implement fair and transparent compensation or resettlement plans for those displaced or affected

by construction activities, especially vulnerable households.

- Establish accessible and responsive grievance redress mechanisms, ensuring all community members can raise concerns or complaints during construction.
- Conduct regular social impact assessments, with a focus on identifying inequality trends, and adjust project strategies to mitigate negative effects.
- Provide support and training for affected communities to diversify their livelihoods, especially for those whose livelihoods may be disrupted by construction (e.g., farmers, traders).
- Ensure transparency in the contracting process, including the selection of subcontractors and suppliers, with opportunities for local businesses, especially those run by marginalized groups.

6.4.4.4 Elite capture

The risk of elite capture is anticipated given the fact these local elite could potentially influence the project to provide them project benefits. While the majority of landowners within the command areas are from the local community, which reduces the likelihood of large-scale land grabbing by powerful individuals or groups, the sources acknowledge the potential for the wealthy to use their influence, connections, or resources to encroach upon protected areas for personal gain. The risk of elite capture is assessed as moderate.

❖ **Mitigation Measures**

- Consultation will be conducted farmers in potential command area, focusing on vulnerable/disadvantaged groups
- Alternative livelihoods for vulnerable group are identified based on their needs vis-à-vis project's investment eligibility
- Conduct consultation at community level (in the command area) to achieve a consensus on how water needs are balanced between different groups in one command area.
- During subproject design, water availability, storage capacity, and water needs of upstream and downstream population are calculated to inform design, and water use coordination during project operation.
- Water user groups should be established for upstream and downstream population and should be coordinated by a higher-level committee/group to negotiate and optimize water coordination
- Guidelines/Manual should be developed to provide guideline for upstream and downstream communities at subprojects to meet, discuss, and achieve consensus on how water is distributed for equal use between upstream and downstream population

6.4.4.5 Gender inequality

The risk of gender inequality due to limited access for women to training, resources, and decision-making processes related to irrigation and agriculture. This risk stems from pre-existing gender inequalities in Cambodia, where women often face barriers in accessing resources, technology, and leadership roles. The impact receptors for this risk are women farmers and laborers, who may be excluded from the full

benefits of the project.

❖ **Mitigation Measures**

- Implement the Gender Action Plan and measures to promote women beneficiaries' improved participation in project planning and implementation, and their economic empowerment.
- Ensure women have access to training, resources, and decision-making processes related to irrigation and agriculture. This includes providing training in local languages at times and locations convenient for women. Childcare provisions can facilitate women's attendance.
- Set targets for women's participation in all project activities.
- Raise awareness of the importance of sharing household chores and farming workloads. This can give women more time to learn new skills, attend training, and participate in project activities.
- Promote women's access to skills and business development training centered around project target value chains for commodities such as rice, poultry, vegetables, and fish.
- Encourage the use of labor-saving technologies that can help reduce women's workloads in farming and household activities.
- Support women's involvement in off-farm activities, such as processing and value addition as well as investments in green products and women-led green enterprises.

6.5 Risks and Impacts at Operation Stage

6.5.1 COMMUNITY HEALTH AND SAFETY

The potential for water use conflicts during the operation phase, particularly between upstream and downstream users, and recognizes the risk of accidental drowning, especially among children. The introduction of irrigation infrastructure and increased agricultural activity may alter existing water allocation patterns, leading to disputes between upstream and downstream communities. Upstream users may prioritize their own irrigation needs, potentially reducing water availability downstream, affecting livelihoods and ecosystems. For example, the Anlong Chrey reservoir, with a limited capacity of 30 Mm^3, is insufficient to meet the dry season irrigation demands of all four proposed irrigation sub-schemes (Brambei Mom, Krapeu Trom, Yutasas, and Stueng Krang Bat) in the Krang Ponley sub-project. This situation could exacerbate competition for water resources. The construction of rehabilitation and farm road introduces open water bodies into the landscape, increasing the risk of accidental drowning, particularly for children.

❖ **Mitigation Measures:**

- The project will promote IWRM principles to ensure the equitable and sustainable allocation of water resources. This involves considering the needs of all stakeholders, including upstream and downstream communities, as well as environmental flow requirements for maintaining healthy ecosystems.
- Establishing a system for monitoring water use and enforcing water allocation regulations will help

prevent over-extraction and ensure a reliable water supply for all users. This may involve installing flow meters, conducting regular water audits, and implementing penalties for non-compliance.

- The project will strengthen the capacity of FWUCs to manage water resources at the local level. This includes training on water allocation, conflict resolution, and operation and maintenance of irrigation infrastructure. Effective FWUCs can play a crucial role in mediating disputes and ensuring fair water distribution within their communities.
- Raising awareness about water safety and the risks associated with open water bodies, especially among children, is essential. Educational campaigns, signage, and community outreach programs can help promote responsible behavior and prevent accidents. This information could be included in the training programs that will be provided to farmers and communities.
- The project will consider incorporating safety features into the design of irrigation infrastructure. This may include fencing around canals and reservoirs, installing safety ladders, and providing designated swimming areas away from irrigation structures.

6.5.2 CROSS-CUTTING

6.5.2.1 Gender inequality

The sources emphasize that women are less resilient to climate change than men and face unique vulnerabilities in terms of income, housing, and access to information and support systems. Socially defined gender roles can also hinder the adoption of climate-smart technologies among women. As a result, women may experience unequal access to water resources, limited participation in Farmer Water User Communities (FWUCs), and a disproportionate burden of negative impacts on their livelihoods.

The KT sub-scheme is a part of the CAISAR project. The social studies in this project show that, women-led households made up 15% of all sub-schemes, which is seen as a significant percentage. There is still gender disparity, which makes it difficult for them to participate in and profit from the project. Men often overestimate, which diverts women's attention from the involvement. Increased gender-based trainings for men and increased support for all vulnerable groups should be proposed by the local government and project implementer.

❖ **Mitigation Measures**

- The project should actively encourage women's participation in the formation of FWUCs, empowering them through critical decision-making roles and equipping them with the necessary skills and resources to amplify their voices.
- The project should ensure that women have equal access to training programs and resources, such as land, credit, and technology.
- The project should monitor gender equality indicators and should make adjustments as needed to ensure that women are benefiting from the project.

6.5.2.2 Social inequality

In this phase, the concerning the competition for water resources among different user groups (farmers, communities, industries) and the potential displacement or restricted access to land due to irrigation

infrastructure expansion, presents a minor risk of social inequality. Although the project aims to engage and consult with communities during the design and construction phases, vulnerable groups may still face limited access to irrigation water during the operation stage. This risk is especially relevant for farming communities, indigenous populations (if present), landless or land-poor households, and other vulnerable groups.

The vulnerable groups without farmland might have limited opportunities to benefit from the rehabilitated irrigation system. The impact of this social inequality is considered minor due to the relatively small proportion of poor people within the command area. However, it is important to note that the limited access to resources and capacity could hinder the full potential of efforts to support these vulnerable groups.

❖ **Mitigation Measures**

- Ensure Equitable Water Access: Mechanisms should be in place to support vulnerable and marginalized communities in accessing water resources.
- FWUCs will manage the irrigation systems and ensure sustainability through fee collection. The project will invest in establishing and training FWUCs, emphasizing inclusivity and capacity building for vulnerable groups.
- Implement a Simplified Integrated Pest Management (IPM) Plan.

6.5.2.3 Elite capture

The operation of the irrigation system during the operation phase creates a minor risk of elite capture due to the potential for unequal distribution of project benefits. This could result in powerful individuals or groups gaining a disproportionate share of the benefits at the expense of the intended beneficiaries. This risk is linked to the engagement and consultations conducted during the design and construction phases, as those processes might not fully prevent elite capture during the operational phase.

The main impact receptors are smallholder farmers, marginalized communities, and other vulnerable groups. Despite the project's efforts to ensure equitable access to resources, the sources highlight that wealthy individuals or groups could potentially leverage their power, connections, and resources to secure a larger share of water resources or control over irrigation infrastructure. This situation could further exacerbate existing social disparities and undermine the project's goal of improving livelihoods for all community members. The sources assess the risk of elite capture during the operation phase as minor. This assessment considers factors like the predominance of local landowners within the command areas and the current high land prices, which make large-scale land grabbing economically unfeasible.

❖ **Mitigation Measures**

- Transparent and accountable FWUC management: Clear guidelines, diverse representation, and grievance redress mechanisms are essential to prevent manipulation and ensure equitable water distribution.
- Regular monitoring and evaluation: Continuous monitoring of project impact, especially on vulnerable groups, can identify and address elite capture.
- Strengthened land tenure security: Clarifying land rights can protect smallholder farmers and marginalized communities from land grabbing.

- Community engagement: Active community participation, especially from vulnerable groups, empowers them and ensures their needs are met.

6.6 Summary of the Mitigation measures for the Environmental and Social

Based on the ESC risks and impacts identified and assessed, a summary of proposed mitigations measures is presented in the table below.

6.6.1 Mitigation Measures for the Environmental and Climate Risks and Impacts

Table 37: Preconstruction, Construction, and Operation Phase Environmental Mitigation Measures

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
Preconstruction phase				
1	Unexploded Ordnance (UXO) survey & removal			
	Risk of injuries or fatalities among workers or members of the public	• Carry out UXO screening/assessment by certified UXO experts before any physical/ construction activities are allowed. • In case UXOs are found by certified experts during on-site screening, removal of UXO will be carried out by certified experts. • A UXO clearance certificate shall be obtained from related authorities for each sub-project prior to commencing any subproject activities. • As part of site-specific ESCMP, we conduct training and awareness activities for the local community with regards to UXO risks and chance finds.	PMU Contractor	Before construction
Construction phase				
ENVIRONMENTAL, HEALTH, AND SAFETY				
1	Noise and Vibration			
	• Earthmoving activities and the operation of machinery at construction sites will generate dusts and exhaust fumes. • Construction activities, the operation of vehicular movement, excavation machinery, concrete mixing, and other construction activities will generate noise and vibration and will be a nuisance to workers and residents near the site. • Noise may be generated from workers' camp, particularly during living activities or entertainment at nighttime, or due to certain maintenance /repair of equipment, machinery, vehicles.	• Maintain all exhaust systems in good working order and undertake regular equipment maintenance to ensure compliance with applicable regulations and manufacturers' instructions. • Implementation of operating and maintenance practices of equipment and machinery to ensure that they are well-maintained. • Ensure that noise control options such as silencers and mufflers are fitted to exhausts, compressors and fans for construction equipment (such as hydraulic excavator, bulldozer, front loader, backhoe and trucks). • Provide advance warning to the community on timing of noisy activities. Seeking suggestions from community members to reduce noise annoyance and notify the communities about how to raise their concerns (if any) through the Grievance Redress Mechanism. • Undertake noise monitoring at the closest residential area and other noise sensitive receptors during times with ongoing construction work to ensure compliance with the relevant noise standards. • The contractor shall provide all construction personnel working in the vicinity of noisy construction activities (defined as those activities generating noise levels greater than 80 dB(A)), or any construction	• PMU • Contractor	Daily/ Every 06 months

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
		personnel who request hearing protection, with hearing protection equipment. • A speed limit of 30 km/h for construction related traffic through inhabited areas. • The contractor shall conduct noise testing at the sensitive locations as per the detailed engineering design comparing to the IFC EHS Guideline • Avoid night-time construction in populated/village areas. • No noisy construction-related activities will be carried out from 21:00 hours to 06:00 hours along residential areas, hospitals, schools and during religious or cultural events near the subproject • Provide temporary noise barriers (3–5-meter-high barrier can reduce 5–10 dB(A)), as necessary, if site works will generate high noise levels that could disturb nearby households, hospital, school and other sensitive receptors. • Restrict use of vibrating rollers and operation of heavy equipment near sensitive structures.		
2	**Air pollution**			
	• Dust and particulate matter (PM10 and PM2.5) generation from soil disturbances, stockpiles, and road works • Exhaust emissions from trucks and heavy machinery (NOx, CO, SO2, VOCs) • Waste disposal, particularly through burning	• Spray or sprinkle water on the work surfaces and other piled materials to minimize dust at least 3-6 times per day in windy and dry weather and/or based on the weather condition. • Select Borrow sites located as close as possible to the construction to reduce distances. • If Concrete batching facilities are in need, it will be located at least 500 m (0.5 km) downwind from the nearest dwellings to reduce the impact of dust and fumes on humans and to be fitted with necessary equipment such as bag house filters to reduce fugitive dust emissions. • Water will be regularly sprayed to suppress fugitive dust at construction sites, material handling areas, access road and borrow pits. • Trucks carrying dry construction materials such as earth or waste will be covered with tarpaulins or other suitable cover. • Construction vehicles and machinery will be maintained to a high standard to minimize emissions and ensure compliance with the National exhaust emission standards. All mobile equipment should be fitted with catalytic converters. • A speed limit of 30 km/h for construction related traffic through inhabited areas and on access road will be enforced. • All open burning of construction and demolition of waste material and refuse will be prohibited. • Testing air quality (NO_2, SO_2, CO, TSP, PM10, PM2.5)	• SEO • E&S specialist consultants • PMU	Daily/ Every 06 months
3	**Impact on Water**			
	• Dredging projects along the rivers and canals • Sedimentation can reach downstream areas, including the Tonle Sap Lake, if not properly mitigated.	• Installation of temporary non-erodible ditches or bunds at the construction site to divert clean runoff away from exposed areas and convey potentially dirty runoff to sediment control devises.	• SEO • E&S specialist consultants • PMU	Daily/ Every 06 months

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
	• Infiltration of wastewater from workers' camps can contaminate groundwater. • Leakage of hazardous materials like oil and diesel from machinery and vehicles can pollute both surface and groundwater.	• Stockpiles and materials will be stored at least 50 m from surface waters with drainage directed away from the canals and streams or water sources. • The sediment quality of the dredge spoil will need to be tested and assessed against an appropriate standard before re-use in the structure of embankments. The sediment testing results will confirm safe re-use of the material • No washing or repair of machinery within 50 m of surface waters. • Portable toilets and small wastewater treatment units will be provided at the construction site and labor camps. All sanitary facilities will be located at least 50 m from surface water bodies. All workers must be instructed to use these facilities, which should be always kept clean. • Pit latrines and septic tanks should be placed at least 2 m above the groundwater table, which must be located at least 50 m from surface water bodies and water wells and in areas of suitable soil profiles. • All hazardous materials including hazardous waste will be stored on an impervious surface, under cover, in adequate tanks or containers and within secondary containment. • Areas where spills of fuel or oil may occur will be equipped with easily accessible spill control kits to assist in prompt and effective spill control. • Hazardous waste (oil waste) shall be properly collected and stored in closed containers under shelter for recycling or disposal by a duly authorized enterprise. • Testing surface water quality (Depth, pH, EC, AS, Cd, Pb, TN, TP, TDS, TSS, DO, and Total Coliform) and pesticide residues in water (to be conducted overseas).		
4	**Solid and Hazardous Waste**			
	• Hazardous wastewater, such as oil or fuel, polluting materials used for machinery and construction processes at the construction site.	• Storage facilities for fuels, oil, cement, and chemicals shall be within secured areas on impermeable surfaces, provided with bunds and cleanup installations. • Vehicles and equipment shall be properly staged in designated areas to prevent contamination of soil and surface water. • Vehicles, machinery, and equipment maintenance and re-fueling will be carried out in such a way that spilled materials do not seep into the soil; • Oil traps will be provided for service areas and parking areas; • Fuel storage and refilling areas will be located at least 50m from canals and channels and will be protected by temporary drainage bunds to contain spills.	• PMU • Contractor	Daily
5	**Waste and Wastewater**			
	• Domestic wastewater comes from workers/staff's water consumption daily.	• Recyclables will be separated at source and given/sold to recyclers (plastic, metal, card, paper as a minimum). • Safe temporary storage of hazardous waste as required • To the extent possible, a duly authorized waste company will be contracted to recycle hazardous waste. • Non-hazardous, non-recyclable solid waste will be temporarily deposited and managed together at existing landfill/dumpsite.	• PMU • Contractor	Daily

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
		• All vehicles/drivers will be provided with plastic bags for waste collection and prevent any unauthorized waste disposal with particular attention paid to prevention of littering. • The Contractor will be required to train the workers in proper waste management.		
6	**OCCUPATIONAL HEALTH AND SAFETY**			
		• Prepare a health and safety plan containing site-specific precautions in accordance with relevant occupational health and safety guidelines. • Inspect and check the relevant construction equipment to ensure that it meets the applicable mechanical and safety requirements. • Inspect the worksite to ensure that the equipment can be safely mobilized and operated, and that there are no unmitigated risks. • Install appropriate fencing and control access to the site. • Install appropriate safety signage and markings. • Provide fall protection when workers are exposed to unguarded platforms or walkways higher than 2 m. • Ensure there are safe ways to enter and exit the excavation. • Keep excavations dry. • Provide safety precautions when using high voltage electric power tools. • Carry out daily toolbox meetings (safety briefings); • Maintain an accident record book where all major or minor accidents and incidents are recorded with actions taken. • Educate the workers on construction hazards. • Train drivers on safe driving skills and traffic regulations. • Appoint an Environment, Health and Safety Officer who is a qualified engineer. • Make adequate first aid equipment available on site. • Carry out training and awareness of the workers on HIV-AIDS prevention. • implement emergency preparedness and response procedures Response Plan as planned in the CEMP. • Ensure that all workers are equipped with and use Personal Protective Equipment (PPE). • The Contractor will set out an Emergency Response Plan	• PMU • Contractor	Daily/Weekly
7	**COMMUNITY HEALTH AND SAFETY**			
		• Prior to the start of construction work, the contractor in cooperation with the PIU will consult with the local authorities and potentially affected residents/private landowners. Inform them about the upcoming construction work, safety precautions and how to raise concerns or file complaints (GRM). • The contractor shall fence off the construction area and control access to the site. • A speed limit of 30 km/h for construction related traffic through inhabited areas.	• PMU • Contractor	Daily/Weekly

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
		• The contractor shall install traffic signage and fluorescent bollards and warning lights to direct traffic and prevent vehicles driving into the lanes with construction activities. • The contractor, in cooperation with the local authorities, shall implement traffic management to ensure smooth traffic and prevent congestion.		
BIODIVERSITY				
1	**Hunting and trading, and consumption of wildlife**			
	• The influx of a new labour force can increase demand for exotic local foods, including wildlife and endangered species, which are often seen as interesting and delicious. This may be done for relaxation or belief that wildlife is tasty or making people healthy.	• Develop and enforce a strict Code of Conduct/ethics against wildlife collection, possession, and trafficking. This includes clear policies and sanctions for employees and subcontractors. • Provide mandatory training for contractors' management staff and site workers on the Code of Conduct, Standard Operating Procedures (SOP) for wildlife protection and handling, and human-wildlife conflict management. • Incorporate a policy in the Project Administration Manual (PAM) and Worker's Agreement that prohibits employees and/or subcontractors from possessing, purchasing, trading, or collecting wildlife or forest resources that are legally protected, CITES listed, or classed as threatened by the IUCN Red List. • Educate construction workers about the importance of wildlife conservation and the laws regarding hunting and trading of protected species. • Implement strict penalties for violating wildlife protection laws. • Collaborate with local communities to monitor wildlife populations and report any suspicious activities.	• SEO • PMU • Contractor	Daily/Weekly
2	**GHG emission**			
	• The construction and operation of heavy machinery, such as excavators and bulldozers, during these projects release carbon dioxide (CO2) into the atmosphere, i.e. the energy requirements for construction works can result in increased carbon emissions • At the time of construction, there is possibility of smoke generated by burning of straw in the rice field.	• Use energy-efficient machinery and equipment during construction to reduce fuel consumption and emissions. • Optimize construction logistics to reduce the number of vehicle trips and machinery usage, minimizing fuel use and emissions. • Implement proper maintenance programs for equipment and vehicles to ensure they operate efficiently and with lower emissions. • Reduce deforestation and land-use changes that contribute to carbon emissions by preserving vegetation and replanting trees in affected areas. • Use low-carbon materials and construction techniques that reduce the embodied carbon in construction materials. • Offset unavoidable GHG emissions by investing in carbon offset projects, such as reforestation or renewable energy initiatives. • Engage with local communities and stakeholders to raise awareness of emission reduction practices and encourage their participation in sustainability efforts.	• SEO • E&S specialist consultants • PMU	Daily
DURING OPERATION				
ENVIRONMENTAL				
1	**Water Management**			

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
	• Irrigation systems have both benefits and drawbacks. • Proper design and management are crucial. • Minimizing negative impacts on the natural water cycle is essential.	• Implement water-saving irrigation technologies like drip irrigation and sprinkler systems to reduce water consumption and minimize the strain on water resources. • Encourage the adoption of the AWD technique in rice cultivation to optimize water use and reduce water withdrawals for irrigation. • Establish detailed water management plans that ensure equitable water distribution and allocation, considering the needs of various users and the environmental flow requirements to maintain healthy aquatic ecosystems. • Design and construct robust irrigation infrastructure, including canals, ponds, and storage areas, capable of withstanding extreme weather events like floods and droughts. This investment should also include lining canals and refurbishing storage areas to reduce water losses and improve water storage capacity. • Integrate natural infrastructure, such as wetlands and forests, into water management strategies. Protect and restore degraded habitats to enhance their water regulation capabilities, improve water quality, and support biodiversity. • Establish and provide training to FWUCs on sustainable water management practices, equitable water rights, and allocation procedures. These communities play a vital role in the operation and maintenance of the irrigation system, ensuring its long-term sustainability.	• PMU	Annually
2	**Water Pollution**			
	• Increased use of chemicals, such as fertilizers and pesticides, to enhance crop yields. The excessive application of these chemicals can result in contamination of both surface and groundwater resources.	• Implement Simplified Pesticide Management Plan • Conduct regular water quality tests to track the change in water quality due to pesticide application using oversea laboratory testing. • Encourage farmers to adopt IPM techniques that minimize pesticide use and rely on biological control methods, thereby reducing the risk of chemical contamination of water resources. • Provide training and extension services to farmers on the judicious use of fertilizers, ensuring they apply the correct type and amount based on soil nutrient levels. • Promote the adoption of organic fertilizers and soil amendments, such as cover crops and green manures, which can improve soil fertility and reduce the need for chemical fertilizers. • Implement a robust water quality monitoring program to track the levels of pesticides, nitrates, and other pollutants in surface and groundwater resources within and around the command areas. • Encourage the adoption of water-saving irrigation methods, such as alternate wetting and drying (AWD) in rice cultivation, which can reduce water consumption and minimize the leaching of agrochemicals.	• PMU	Annually
3	**Soil Pollution**			
	• Increased production could lead to overuse of Agri-chemicals if farmers are not adequately trained or	• Implement Simplified Pesticide Management Plan • Conduct regular water quality test to track the change in water quality due to pesticide application using oversea laboratory testing	• PMU	Annually

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
	supported in adopting environmentally friendly practices.			
BIODIVERSITY				
1	**GHG emission**			
	• Increased GHG emissions from farming activities: - Fertilizer use - Livestock production - Rice cultivation • Increased energy requirements: - Rice field preparation - Flood control systems - Transportation	• The project is to promote sustainable practices like crop rotation and agroforestry to reduce energy consumption and improve soil health. • The project needs to introduce renewable energy sources such as solar-powered irrigation to lower the carbon footprint of rice production. • The project needs support training farmers to use alternatives to straw burning, such as mulching or biomass energy generation, to reduce air pollution. • The project promotes the utilization of efficient irrigation methods like alternate wetting and drying (AWD) to conserve water and minimize methane emissions. • The project needs to advocate for policies that discourage straw burning and provide incentives for adopting sustainable agricultural practices.	• PMU • Farmer	Daily
ANNUAL CROP MANAGEMENT PLAN				
	❖ **WATER**			
1	**Water resource efficiency**			
	• Over-extraction of water resources can lead to downstream water scarcity, altered hydrology, and damage to aquatic ecosystems.	• Project needs to implement efficient water management practices to prevent over-extraction and ensure equitable water distribution. This can include: • Water uses monitoring systems to track consumption and identify areas for improvement. • implementing appropriate irrigation scheduling based on crop water requirements and weather conditions. • Utilizing efficient irrigation systems, such as drip irrigation or sprinkler systems, to minimize water loss. • Exploring opportunities for water reuse, such as capturing and reusing runoff water.	• PMU • FWUC	Daily
	❖ **SOIL AND SOIL MANAGEMENT**			
2	**Soil erosion and soil erosion risk**			
	• Soil erosion can lead to loss of topsoil, reduced soil fertility, and increased sedimentation in water bodies.	• Minimize soil compaction and disturbance by using appropriate machinery and timing land preparation activities. • Consider erosion management practices such as contour planting, terracing, and grass barriers. • Adopt reduced tillage or no-till farming practices to minimize soil disturbance. • Establish cover crops during fallow periods or in rotation with main crops to protect the soil from erosion. • Practice contour farming on sloping land to reduce runoff and erosion. • Construct terraces on steep slopes to prevent soil loss. • Establish windbreaks or shelterbelts to reduce wind erosion. • Install erosion control structures, such as grassed waterways or sediment basins, to manage runoff.	• PMU • Agricultural extension officers	After significant rainfall events Annually

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
		• Apply mulch to the soil surface to protect it from rainfall impact and erosion.		
3	**Nutrient application and management**			
	• Over-fertilization and nutrient runoff can contaminate water resources, negatively impacting aquatic ecosystems and potentially leading to eutrophication.	• Conduct periodic soil analysis to determine nutrient needs and avoid over-fertilization. • Establish buffer zones near watercourses to filter nutrient runoff. • Consider using green manures and cover crops to replenish soil nutrients and reduce leaching.	• PMU • Farmers	Before and after fertilizer application Regularly during the growing season
	❖ **PESTICIDE**			
4	**Use and effectiveness of pesticides:**			
	• Pesticide use can have adverse effects on human health, non-target organisms, and the environment. Pesticide resistance can develop, requiring increased application rates.	• Promote Integrated Pest Management (IPM) strategies to minimize pesticide use. • Implement training programs for farmers on the safe handling and application of pesticides. • Ensure proper disposal of pesticide containers and leftover products.	• PMU • Agricultural extension officers	Regularly during the growing season
5	**Pesticide residues on site soil**			
	• Pesticide residues can accumulate in the soil, potentially harming soil organisms and affecting water quality.	• Promote the use of pesticides with low persistence and mobility in the environment. • Implement a soil monitoring program to assess pesticide residue levels. • Consider crop rotation and the use of cover crops to help break down pesticide residues. • Minimize pesticide use by adopting IPM strategies. • Conduct soil testing to monitor pesticide residue levels. • Rotate crops to break pest cycles and reduce the need for repeated pesticide applications. • Utilize cover crops to improve soil health and enhance pesticide degradation. • Consider bioremediation techniques to remove pesticide residues from contaminated soil.	• PMU • Third-party laboratories	Periodically (e.g., annually or before planting sensitive crops)
6	**Pesticide residues on produce**			
	• Pesticide residues on produce can pose a risk to consumer health.	• Enforce pre-harvest intervals to allow for pesticide breakdown before harvest. • Promote the use of pesticides with low toxicity to humans. • Properly wash and handle produce to remove surface residues. • Implement a monitoring program to test produce for pesticide residues. • Ensure compliance with established MRLs for pesticide residues on produce.	• PMU • Third-party laboratories	Before harvest

UXO = Unexploded Ordnance, PMU = Project Management Unit, SEO = Social and Environmental Officer, E&S = Environmental and Social, IFC = International Finance Corporation, EHS = Environmental, Health, and Safety, GHG = Green House Gas, FWUC = Farmer Water User Communities, ESCMP = Environmental, Social, and Climate Management Plans.

6.6.2 Mitigation Measures for the Social Risks and Impacts

Table 2: Preconstruction, Construction, and Operation Phase Social Risks, Impacts and Mitigation Measures

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
BEFORE CONSTRUCTION				
LAND ACQUISITION				
1	**Land acquisition and resettlement**			
	• Krapeu Truom is expected to require minimal land acquisition due to their smaller scale and lack of planned canal system expansion.	• Conduct precise land participates to accurately determine the exact land requirements, ensuring that only necessary land is acquired. • Verify land ownership and usage rights meticulously to prevent disputes and ensure fair compensation. • Abbreviated Land Resettlement Plan should be prepared to support the proper implementation of the sub-scheme.	PMU Contractor	Before construction
2	**Economic displacement**			
	• The potentially disrupting existing economic activities and displacing households and businesses, including informal farmers and businesses. Krapeu Truom is a part of the Krang Ponley scheme. There are 1,249 households using land along the infrastructure that may be affected, with 20 households across all sub-schemes facing land acquisition.	• The households who own the land along the rehabilitated canals which will be expanded at the public land should be properly informed prior to the construction to avoid their crops will be damaged at the time of construction. • Although the acquired land is public land, there is a need of a proper consultation and information to be conducted to inform and obtain agreement from the affected households.	PMU Contractor	Before construction
DURING CONSTRUCTION				
	CHILD LABOR & FORCED LABOR			
1	**Child Labor**			
	• Project activities will occur in rural areas where child labor is prevalent. • Construction contractors and subcontractors may employ children under 18 years old for unskilled labor. • Local children may be particularly vulnerable to exploitation due to poverty and limited educational opportunities.	• Apply LMP for age check prior to engagement of labor with regular monitoring through proper screening and registering all workforce for the work • To mitigate the risk of child labor, the project will implement strict measures to ensure compliance with national and international labor laws. Regular monitoring and inspections will be conducted to identify and address any instances of child labor. • Additionally, awareness-raising campaigns will be implemented to educate communities about the harmful effects of child labor and the importance of sending children to school. The project will also collaborate with local authorities and NGOs to strengthen law enforcement and provide support services to vulnerable children and their families.	• Contractors • PMU	Daily Screening prior to engaging services of primary supplier
2	**Forced Labor**			
	• The risk of forced labor, particularly for vulnerable individuals, is due to economic coercion, exploitation of	• Strict Code of Conduct for workers with no tolerance for physical or verbal abuse of women or children.	• Contractors • Primary supplier	Daily

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
	young people, and debt bondage. The increased demand for local labor during irrigation and road rehabilitation could exacerbate this risk.	• The Project Owner and Sub-Contractors will collaborate with the relevant Government Agency to disseminate information to local communities. This information will include the Contractor's Code of Conduct and the minimum working age as mandated by national laws and international standards. • The Ministry of Water Resources and Meteorology (MOWRAM) will provide information to local communities about the contractor's policies and responsibilities, including the Contractor's Code of Conduct and minimum working age.	• PMU	Screening prior to engaging services of primary supplier
COMMUNITY HEALTH AND SAFETY				
3	**Disease transmission**			
	• Disease transmission risks are anticipated due to the influx of construction workers, potentially exacerbated by unhygienic living conditions and interaction with the local community. This influx increases the risk of spreading communicable diseases among workers and between workers and residents, with workers' susceptibility potentially increased by factors like poor diet, stress, and unhygienic conditions.	• Conduct public awareness raising activities (IEC) to ensure local people and contractors know about the risks of contracting and spreading communicable diseases such as COVID-19, HIV/AIDS, and water-borne diseases (e.g., amoebiasis, giardiasis, and toxoplasmosis. etc. • In the event of a disease outbreak (e.g. COVID-19), provide immediate training/awareness raising to the risk groups. • Conduct training to workers on communicable diseases prior to mobilization to construction sites. • For water-borne diseases that arise due to polluted or contaminated water, mitigations measures may include: o Implement filtration, chlorination, or UV disinfection to ensure safe drinking water. o Promote handwashing, safe food preparation, and proper sanitation practices in communities. o Control and properly dispose of waste to prevent water pollution. o Provide access to clean water supplies, such as bottled water or tankers, during outbreaks or disasters. o Promote immunizations against water-borne diseases like cholera and typhoid in high-risk areas.	• PMU • Contractors • Local health authorities	• Monthly • During outbreaks • Periodic community health awareness campaigns
4	**Sexual Exploitation and Abuse, Sexual Harassment**			
	• The project's influx of approximately 171 in the Krang Ponleng river, as the Krapeu Truom is a part of this scheme, including construction and logistical personnel, along with frequent project staff visits and pre-existing SEA/SH issues, creates a risk of sexual exploitation and abuse/harassment, particularly during irrigation and road rehabilitation.	• Contractors need to explicitly state zero tolerance for sexual harassment, exploitation, and abuse within the workplace. • Require Code of Conduct (CoC) to be signed by all construction workers. • For victims coming forward: referral to qualified SEA/SH service provider. The GRM will include a confidential channel for reporting SEA/SH. • Strict Code of Conduct for workers with no tolerance for physical or verbal abuse of women or children • Training on SEA/SH and VAC for community members, in particular women and girls (may be done separately for men and women). • Ensuring workers' sites are situated (at least 500m) from schools and/or other areas where children congregate. • Children are prohibited from construction sites and worker's camp.	• Contractors • PMU	• Monthly and during subproject cycle • Reported to PMU within 48 hours if occurred

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
		• Ensure access to grievance redress mechanisms for all project-affected persons, including both stakeholders and workers, to address Sexual Exploitation and Abuse, and Sexual Harassment. Support (in the form of training, awareness raising, etc.) to local law enforcement to act on community complaints regarding SEA/SH and VAC. • Build partnerships with local health providers and SEA/SH service providers to conduct community awareness activities, and referrals. • It is necessary to consider deploying specialists to educate and raise awareness about issues of violence.		
5	**Traffic safety & Security**			
	• Increased transport of materials and equipment in the construction stage raises the risk of road accidents, theft, vandalism, and a perceived or actual increase in crime, affecting project workers, community members, and those living or traveling near construction sites.	• Arrange security guard or engage local authority to guard the construction sites • Conduct public awareness raising activities (IEC) to ensure local people and road user are aware of road safety regulations and risks and act accordingly while using road. • Monitor and observe speed limit.	• PMU • Contractors	• Daily during construction • Weekly during construction • Monthly during operation
6	**Community Health and diseases**			
	• Construction activities, including canal and pond rehabilitation, pose community health and safety risks beyond disease transmission, encompassing drowning, accidents from trespassing in construction zones (including storage and laydown areas), traffic disruptions, potential community conflicts, and general construction site hazards.	• Establish clear and well-marked construction exclusion zones to prevent unauthorized access, especially to areas with open water, heavy machinery, and storage areas. • Implement fencing and barriers to prevent trespassing and ensure community safety around construction areas. • Provide warning signs in local languages to inform communities about the dangers and restricted access to construction areas. • Install safety barriers around construction sites to minimize risks to the community and workers. • Ensure proper storage of construction materials, with no materials left unsecured and scattered around the site. • Conduct community awareness campaigns to educate the community about the potential risks and safety measures during construction. • Establish and maintain a grievance mechanism to address community complaints and issues promptly. • Implement safety measures around canals and ponds to prevent drowning incidents, such as installing safety barriers and providing warning signs in local languages. • Provide training to workers on safety protocols, including how to work safely around water, avoid accidents and minimize risks to the community. • Ensure all workers are provided with necessary personal protective equipment (PPE) and enforce its use.	• PMU • Contractors	• Monthly • During outbreaks • Periodic community health awareness campaigns
7	**Personal Protective Equipment**			
	• The activities involve Canal Rehabilitation and Construction,	• Continue and active use of PPE at all times of construction.	• Contractors • PMU	• Regular inspections/training

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
	Structure Construction and Rehabilitation, and Drainage Improvement, which expose workers to various hazards, such as Falling Debris, Sharp Objects, and Heavy Machinery.	• Identification and provision of appropriate PPE that offers adequate protection to the worker, co-workers, and occasional visitors, without incurring unnecessary inconvenience to the individual • Proper maintenance of PPE, including cleaning when dirty and replacement when damaged or worn out. • Proper use of PPE should be part of the recurrent training programs for employees.		
8	**Working conditions and Management of Worker**			
	• The lack of written contracts for unskilled, especially locally recruited, workers increase their vulnerability to underpayment, unequal treatment based on gender and temporary status, and late or non-payment of wages, impacting their livelihoods and potentially hindering project progress.	- Advise companies to provide equal opportunities for employment and promotions to all workers, regardless of gender, ethnicity, or background, to avoid discrimination. - Regularly monitor and audit payroll and employment practices to ensure compliance with labor regulations and address any disparities. - Offer training and capacity-building programs for all workers to enhance their skills and qualify them for higher-paying roles. - Ensure that subcontractors and suppliers also adhere to fair wage and equal treatment policies. - Provide accessible information to workers about their rights, entitlements, and the proper channels to address grievances through the establishment of the GRM for workers. This includes training on topics such as: • Environmental and Social Safeguards • Gender Awareness and the Gender Action Plan • Sexual Exploitation, Abuse, and Harassment (SEA/SH) - Labor Rights and the Workers' Code of Conduct Regularly engage with labor rights organizations or third-party auditors to evaluate labor conditions and make improvements where necessary.	• Contractors • PMU	• Regular payroll audits • Periodic worker satisfaction surveys • Prompt investigation of any reported grievances
9	**CULTURAL HERITAGE**			
	Krapeu Truom is a part of the Krang Ponley scheme. However, it is far away from historical and cultural heritage sites. There are still potential for encountering archaeological artifacts during construction due to the history of the ancient city of Longvek.	• Implement Find Chance Procedure	• Contractors • PMU	• Daily • Reported to PMU within 48 hours
CROSS-CUTTING				
10	**Gender inequality**			
	• Women are more vulnerable to climate change impacts due to unequal access to resources, information, and decision-making	• The project should actively encourage women's participation in the formation of FWUCs, empowering them through critical decision-making roles and equipping them with the necessary skills and resources to amplify their voices.	• Contractors • PMU	• Daily/ weekly

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
	power, often hindered by social gender roles. While women-led households represent a significant portion of project sub-schemes, they still face barriers to participation and benefits. The project area includes a substantial number of vulnerable individuals, including the poor, disabled, elderly, and parentless, highlighting the need for targeted support.	• The project should ensure that women have equal access to training programs and resources, such as land, credit, and technology. • The project should monitor gender equality indicators and should adjust as needed to ensure that women are benefiting from the project.		
11	**Social inequality**			
	• Risk of being unequally engaged and treated, during the design phase and construction. The vulnerable are likely to be limitedly consulted and have limited access to available irrigation water.	• Conduct participatory planning and regular consultations with local communities, particularly marginalized groups (e.g., women, smallholder farmers, indigenous communities). • Prioritize hiring local labour, with special provisions for disadvantaged groups (e.g., youth, women, minorities) in both skilled and unskilled positions. • Implement fair and transparent compensation or resettlement plans for those displaced or affected by construction activities, especially vulnerable households. • Conduct regular social impact assessments, with a focus on identifying inequality trends, and adjust project strategies to mitigate negative effects. • Provide support and training for affected communities to diversify their livelihoods, especially for those whose livelihoods may be disrupted by construction (e.g., farmers, traders). • Ensure transparency in the contracting process, including the selection of subcontractors and suppliers, with opportunities for local businesses, especially those run by marginalized groups.	• Contractors • PMU	• Continuously
12	Elite capture			

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
	• The rich have the resources to grab both available land and water resources, creating greater social disparities	• Consultation will be conducted farmers in potential command area, focusing on vulnerable/disadvantaged groups • Alternative livelihoods for vulnerable group are identified based on their needs vis-à-vis project's investment eligibility • Conduct consultation at community level (in the command area) to achieve a consensus on how water needs are balanced between different groups in one command area. • During subproject design, water availability, storage capacity, and water needs of upstream and downstream population are calculated to inform design, and water use coordination during project operation. • Water user groups should be established for upstream and downstream population and should be coordinated by a higher-level committee/group to negotiate and optimize water coordination • Guidelines/Manual should be developed to provide guideline for upstream and downstream communities at subprojects to meet, discuss, and achieve consensus on how water is distributed for equal use between upstream and downstream population	• PMU • Contractors	• Throughout project implementation • Regular community meetings and consultations
13	**Loss access to land and other assets**			
	• Construction activities, particularly land acquisition for canals and roads, can displace communities or restrict their access to land, homes, and other assets. • Temporary restriction of irrigation access during construction may occur in some areas, potentially impacting livelihoods, even though the project area is mainly rainfed.	• The project will prioritize avoiding physical resettlement and minimizing land acquisition. Design adjustments will be made to avoid or reduce land requirements, especially on private land. Public land will be prioritized for any necessary acquisition. • Where land acquisition is unavoidable, the project will employ a negotiated settlement process with affected households. This process, guided by the RGC's Standard Operating Procedures on Land Acquisition and Involuntary Resettlement (SOP-LAR), aims to ensure that affected households receive fair and adequate compensation for their losses and maintain or improve their income and livelihood status. • All individuals with assets within the Corridor of Impact (COI) before the Cut-Off-Date (COD) will be eligible for compensation, regardless of their legal status. Compensation will be provided for various losses, including land, structures, crops, trees, and income-generating activities. • Recognizing the potential disruption of income streams during relocation or construction, the project will provide transitional allowances to affected households. • A multi-tiered GRM will be established to address grievances from any project-affected person. The GRM will operate based on the principles of the Green Climate Fund (GCF) and be accessible at no cost to the complainant.	• Contractors • PMU	• Before land acquisition • During land • After resettlement
14	**Loss access to natural resources**			

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
	• Construction activities and project operations can restrict communities' access to forests, fishing grounds, water sources, or other natural resources they depend on for livelihoods	• Implement efficient water management practices during construction and operation to prevent over-extraction of water resources from reservoirs and rivers and ensure equitable distribution for downstream communities and ecosystems. • Establish construction exclusion zones around sensitive habitats, such as wetlands and forests, to prevent disturbance and minimize impacts on fishing grounds and biodiversity. Implement habitat restoration programs in areas where construction has occurred. • Use environmentally friendly construction materials and techniques to reduce the risk of pollution. Properly manage construction chemicals, fuels, and waste to prevent water pollution and contamination of natural resources. Prepare and implement a waste management plan to handle waste generated from construction activities and worker camps. • Maintain ongoing communication with affected communities, including farmers, fishers, and downstream communities, to address concerns about natural resource access. Provide information and education to construction workers about responsible use of local resources and respect for community access rights. This suggestion is informed by the sources but is not directly stated in them. • Ensure the GRM is accessible to all community members to address complaints related to natural resource access.	• PMU • Contractors	• Regular water quality and quantity monitoring • During project implementation: Monitor the effectiveness of mitigation measures.
DURING OPERATION				
1	**COMMUNITY HEALTH AND SAFETY**			
	• Water use conflicts, especially between upstream and downstream users, are a potential risk due to altered water allocation from new irrigation infrastructure, exemplified by the Anlong Chrey reservoir's limited capacity, and increased drowning risk, particularly for children, due to new canals.	• The project will promote IWRM principles to ensure the equitable and sustainable allocation of water resources. This involves considering the needs of all stakeholders, including upstream and downstream communities, as well as environmental flow requirements for maintaining healthy ecosystems. • Establishing a system for monitoring water use and enforcing water allocation regulations will help prevent over-extraction and ensure a reliable water supply for all users. This may involve installing flow meters, conducting regular water audits, and implementing penalties for non-compliance. • The project will strengthen the capacity of FWUCs to manage water resources at the local level. This includes training on water allocation, conflict resolution, and operation and maintenance of irrigation infrastructure. Effective FWUCs can play a crucial role in mediating disputes and ensuring fair water distribution within their communities. • Raising awareness about water safety and the risks associated with open water bodies, especially among children, is essential. Educational campaigns, signage, and community outreach programs can help promote responsible behaviour and prevent accidents. This information could be included in the training programs that will be provided to farmers and communities.	• PMU • PDWRAM	• Daily for site inspections • Monthly for reports and consultations • Within 48 hours for reporting accidents, disease outbreaks.

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
CROSS-CUTTING				
2	**Gender inequality**			
	• Women are more vulnerable to climate change due to limited access to resources, information, and decision-making power, often exacerbated by gender roles, resulting in unequal access to water, limited participation in water management, and disproportionately negative impacts on their livelihoods.	• The project should actively encourage women's participation in the formation of FWUCs, empowering them through critical decision-making roles and equipping them with the necessary skills and resources to amplify their voices. • The project should ensure that women have equal access to training programs and resources, such as land, credit, and technology. • The project should monitor gender equality indicators and should adjust as needed to ensure that women are benefiting from the project.	• PMU • PDWRAM	• Monthly for data collection and reporting
3	**Social inequality**			
	• The competition for water and land displacement, and despite project consultations, vulnerable groups, particularly landless or land-poor households, may still experience limited access to irrigation benefits, though the impact is lessened by the relatively small proportion of poor within the area.	• Ensure Equitable Water Access: Mechanisms should be in place to support vulnerable and marginalized communities in accessing water resources. • FWUCs will manage the irrigation systems and ensure sustainability through fee collection. The project will invest in establishing and training FWUCs, emphasizing inclusivity and capacity building for vulnerable groups. • Implement a Simplified Integrated Pest Management (IPM) Plan.	• PMU • PDWRAM	• Monthly for data collection and reporting
4	**Elite capture**			
	• The rich have the resources to grab both available land and water resources, creating greater social disparities	• Transparent and accountable FWUC management: Clear guidelines, diverse representation, and grievance redress mechanisms are essential to prevent manipulation and ensure equitable water distribution. • Regular monitoring and evaluation: Continuous monitoring of project impact, especially on vulnerable groups, can identify and address elite capture. • Strengthened land tenure security: Clarifying land rights can protect smallholder farmers and marginalized communities from land grabbing. • Community engagement: Active community participation, especially from vulnerable groups, empowers them and ensures their needs are met.	• PMU • PDWRAM	• Regularly during FWUC meetings and project implementation • Continuously through the GRM.

PMU = Project Management Unit, LMP = Labour Management Plan, NGOs = Non-governmental Organizations, HIV/AIDS = Human immunodeficiency virus/Acquired immunodeficiency syndrome, UV = Ultraviolet, GRM = Grievance Redress Mechanism, SEA = Sexual Exploitation and Abuse, SH = Sexual Harassment, VAC = Violence Against Children, ESHS = Environmental Social Health and Safety, STDs = Sexually transmitted diseases, PPE = Personal Protective Equipment, IPM = Integrated Pest Management, PDWRAM = Provincial Department of Water Resources and Meteorology, FWUCs = Farmer Water User Communities.

7. STAKEHOLDER ENGAGEMENT AND INFORMATION DISCLOSURE

7.1 Purpose and Process of Stakeholder Engagement

Public consultation is a key component of CAISAR, and it was pivotal in preparation of the Environmental, Social, Climate Impact Assessment report (ESCA) Report and the Environmental, Social, Climate Management (ESCM) Plan. The consultations were conducted with relevant institutions, non-governmental organizations, local authorities, and local people during the preparation of ESCIA and ESCMP for CAISAR project. The data collection and consultations were conducted in four periods:

- The first consultation was conducted between 26 and 28 July 2024 to capture information regarding biodiversity and environmental condition in the project area.
- The second consultation was conducted to consult with forestry and fishery communities, local authorities and key informants to understand the situation and concerns related to the presence of the project. The consultation was conducted between 03 and 09 August 2024.
- The third consultation was conducted at household, village, and commune level stakeholders focusing on status, concerns and feedback regarding the project implementation. This consultation was conducted between 10 and 18 August 2024.
- The last consultation was conducted between 21 and 23 August 2024 with the district and provincial stakeholders, mainly focusing on the opinion, and feedback regarding the implementation of the project.

In addition to the stated consultations, there are also continuous consultations being conducted with AIIB, IFAD, and CAISAR PMU including the PMU management, SECAP team, and engineering team to ensure that the disclosed information being aligned with the most updated information of the project.

During project preparation, various stakeholders have been consulted in July and August 2024. Table below summarizes the number of people consulted by consultation techniques:

Table 38. Type of stakeholder during the consultation

Levels	Household survey (Beneficiaries and Potentially Affected)	Focus Group Discussions	Key Informant Interviews	**Total**
Village level	65	59	4	128
Commune level			3	3
District level			2	2
Provincial level			2	2
			Total	135

7.2 Consultation Process

The purposes of the consultation were to:

- Inform local people and interested stakeholders of the purpose of the rehabilitation and construction of the irrigation system,
- Share the project information and the design options from the draft engineering design,
- Highlight subproject's key activities that are potentially associated with them, and
- Collect their opinion, concern and feedback on the project focusing on background information, project potential impacts (positive and negative), suggestions for impact mitigations, and consultation mechanism.

The consultation agenda with stakeholders included (i) the introduction of the study team, (ii) sharing project information using illustration materials, (iii) discussion and consultation on potential benefits and impacts of the project, (iv) suggestions on the mitigation measures, (v) grievance process and concerns, and (vi) final wrap up for the consultation. The study team were trained to introduce themselves to the purpose of the consultation, followed by the introduction about the project's component and activities expected to be implemented within the area. Materials including leaflet on project information and map of the command area were shared and explained to stakeholders prior to the consultation. Lastly, the consultation began with an overall discussion and specific questions as per the relevant aspect to the stakeholder. Opinions, concerns and suggestions were gathered and confirmed prior to the end of the consultation.

7.3 Results of Consultation

7.3.1 Environment and Biodiversity Component

7.3.1.1 Pollution prevention and resource efficiency

Concerns

- The construction process can release dust, which will disturb the local community and surface water quality.
- The disposal of solid, liquid, and domestic waste from the workers at the irrigation construction site will negatively impact local air quality and surface water.

Feedback and Suggestions

- Regularly watering on the road transports construction materials and soil to reduce dust that may disturb nearby residents.
- Install garbage bins and waste storage areas in the construction sites and conduct orientation workers to put the waste in the garbage bins.

7.3.1.2 Biodiversity

Concerns

- The fish populations in command areas may decrease due to disrupting the natural flow of water and the impact on their habitats from the implementation of the reirrigation infrastructure and canal upgrading.

Suggestions from the consulted people

- The project should avoid construction activities and improve irrigation on fish and aquatic habitats.
- Prevent damage from the construction activities to biodiversity, habitats, and other environmental components.
- Maintain existing large trees along the dam and canal within the sub-schemes during the reirrigation and upgrading process.

7.3.1.3 GHG emission

Concerns

- Climate change is negatively impacting rice production, causing problems such as increased disease, insect infestations, and extended dry seasons,

Suggestions from the consulted people

- Installing solar water pumps in agriculture processing facilities can reduce fuel consumption, which causes greenhouse gas emissions.

7.3.2 Social Component

7.3.2.1 Labor and Working Conditions

Concerns

- The presence of construction staff and workers could lead to gender-based violence affecting women workers, women and children in the community.

Suggestions

- Should offer training to their staff and workers on gender issues, violence, and legal protections.
- Preventive support measures should also be put in place to stop abuse, and any incidents must be swiftly handled to avoid repetition. The training should be conducted by technical officers.

7.3.2.2 Community Health and Safety

Concerns

- Concerns about the presence of workers could cause sexual abuse of women and children living near the project site.

Suggestions from the consulted people

- To prevent incidents, construction staff should regularly place warning signs and water the roads, as well as schedule construction times to minimize noise pollution that could disrupt the community and notify authorities upon project completion to avoid quiet handovers.

7.3.2.3 Land acquisition, economic and physical displacement

Concerns

- Landowners along the irrigation system without land registration are concerned they may not receive compensation due to the lack of title deeds.
- Conflicts between the project and affected families could emerge, often fuelled by external instigators rather than the families themselves.

Suggestions from the consulted people

- A preliminary study on land issues before construction is recommended, with each sector addressing specific aspects of land impact and conducting evaluations for each affected property.
- The project/construction company must collaborate with local authorities to resolve land-related issues, and compensation should be provided to landowners affected by the project.
- The construction company should submit quarterly monitoring reports on implementation activities to the provincial department to identify and quickly resolve any issues.
- The government is requested to assist in issuing land titles to farmers with land adjacent to streams and canals.

7.3.2.4 Cross–cutting risks and impacts

Concerns

- Provincial department facing of limited budget to develop and rehabilitate the existing irrigation system

Suggestions from the consulted people

- The project should thoroughly examine the technical and situational aspects of the sub-scheme before construction to prevent water shortages or flooding post-construction, and it should be implemented promptly.
- Establish a Farmer Water User Group (FWUG) to oversee water use and maintenance by providing technical and management training, materials supported to effectively control and manage water distribution.
- The water consumption fee should be gathered from farmer which could be used later to support caretaker and maintenance the irrigation system.

7.3.2.5 Agricultural Production

Concerns

- The high cost of agricultural inputs continues to reduce farmers' profits.
- Climate change is negatively impacting rice production, causing problems such as increased disease, insect infestations, and extended dry seasons.
- Manure for fertilizer is declining due to reduced animal raising and lower cattle prices are prompting farmers to reduce livestock raising.

Suggestions from the consulted people

- Build more water storage and reservoir which able to store more water
- The irrigation should be constructed based on technical and water conditions in the area.
- Utilizing durable concrete for the canal system can improve the efficiency and longevity of the irrigation infrastructure.
- Installing and upgrading damaged sluice gates in both main and secondary canals can improve water distribution efficiency and prevent water loss in agricultural production and reirrigation systems.
- Construct both side roads along the canal to enhance transportation for farmers and traders.

7.4 Stakeholder Engagement during Sub–Scheme Implementation

During the implementation of the sub–scheme, particularly prior to construction, when locations of contractor's office, workers' camp, disposal sites for construction debris and construction waste, and labor management plan, etc. are identified – based on Contractor's ESMP, environmental and social risks and impacts associated with Contractor's specific construction methods and measures will be updated in C-ESMP and disclosed for continued consultation with local people and local authorities to avoid/minimize E&S risks and impacts.

7.5 Information disclosure

This ESCMP will be disclosed to the public in both English and Khmer language. The English version will be disclosed in full version whereas the Khmer version will be disclosed as Executive Summary. The documents will be disclosed on the website of MOWRAM (as Project Implementation Unit), and on the website of AIIB, IFAD and GCF before project appraisal and project approval – as per disclosure guidelines required by each donor.

8. GRIEVANCE REDRESS PROCEDURES

8.1 Objectives of the Project GRMs

The objective of the GRM is to provide affected people with redress procedures that can be conveniently used to raise a project related concern or grievance. The GRM guides how a complaint can be lodged, including forms and channels through which a complaint can be submitted. To facilitate the grievance resolution process, grievances received will be acknowledged in writing and solved within a specified timeframe. During the resolution process, where necessary, dialogue will be held with aggrieved people for mutual understanding and effective resolution. Once a complaint is resolved, the aggrieved person will be notified of the resolution results.

The GRM has sequential steps that aggrieved person can use. If the aggrieved person is not satisfactory with the grievance resolution result, or if their complaint is not resolved within the timeframe specified for a particular step, aggrieved person can move on to the next step which is higher in resolution hierarchy. The project has an appeal process where complainants can resort if they are not satisfied with a resolution decision at a particular step, or their complaints are not resolved within a specified timeframe.

8.2 Summary of National Legislation Related to Grievance and Complaint

The RGC has various laws and sub-decrees that have been in place to guide the implementation of the complaint resolution process. These documents specify the right of the complainants as well as the responsibilities of concerned governmental agencies as to complaint resolution. Relevant legal documents include:

- Law on Expropriation (dated 26 February 2010)

- Labor Law (dated 13 March 1997, amended on 20 July 2007 and 26 June 2018)
- Law on Prevention of Domestic Violence and Protection of Victims (dated 24 October 2005)
- Sub-decree No. 22 ANK/BK (2018) on Standard Operating Procedures for Land Acquisition and Involuntary Resettlement for Externally Financed Projects in Cambodia. Guidelines for Grievance Redress Mechanism (Appendix 8)
- Law on Administrative Management of Capital, Provinces, Municipalities, Districts and Khans (dated 22 May 2008) – Section 6 on Solution of Local Conflicts
- Sub-decree No. 22 (25 March 2002) on Decentralization of Roles, Functions, and Power to Commune Councils (Article 61: duty to promote the role of conciliating disputes between citizens)
- Sub decree No 47 ANK.BK (31 May 2002) on Organization and Functioning of the Cadastral Commission (Chapter 4 – District/Khan Level Conciliation).

8.3 Principles of the Project GRMs

Under CAISAR, the following principles will be applied:

- Channels. Different channels are established to enable affected person to submit their grievances, including submission to village committee, as well as district and provincial levels.
- Forms. Grievances can be submitted in writing and verbally, and either directly by the affected households, or by a person delegated by the complainant.
- Complainant can delegate a representative who acts on their behalf. A person lodging a grievance can ask assistance from their family or from individual to act as their representative.
- Disclosure. GRM procedures are disclosed in public domain (e.g., websites of PMU, public notice board at village hall, and in front of substation).
- Documentation. A grievance logbook will be maintained at substation (subproject level) and at PMU level (through PMU GRM focal point).
- Transparency. Grievance procedures include steps, time frame for grievance resolution for each step, notification to affected person, how decision is made.
- Acknowledgement. The unit in charge of complaint resolution will notify complainant upon complaint receipt and will initiate the complaint resolution process.
- Appeal. If the agency in charge does not resolve a grievance in a manner that is satisfactory to the affected person, a multistakeholder committee will be established (ad-hoc) to resolve the dismissed grievance – as an alternative for affected person going to court.
- Monitoring. All grievances received are recorded by PMU and relevant substations, and are processed/resolved in a given timeframe, and are monitored by PMU GRM focal point.

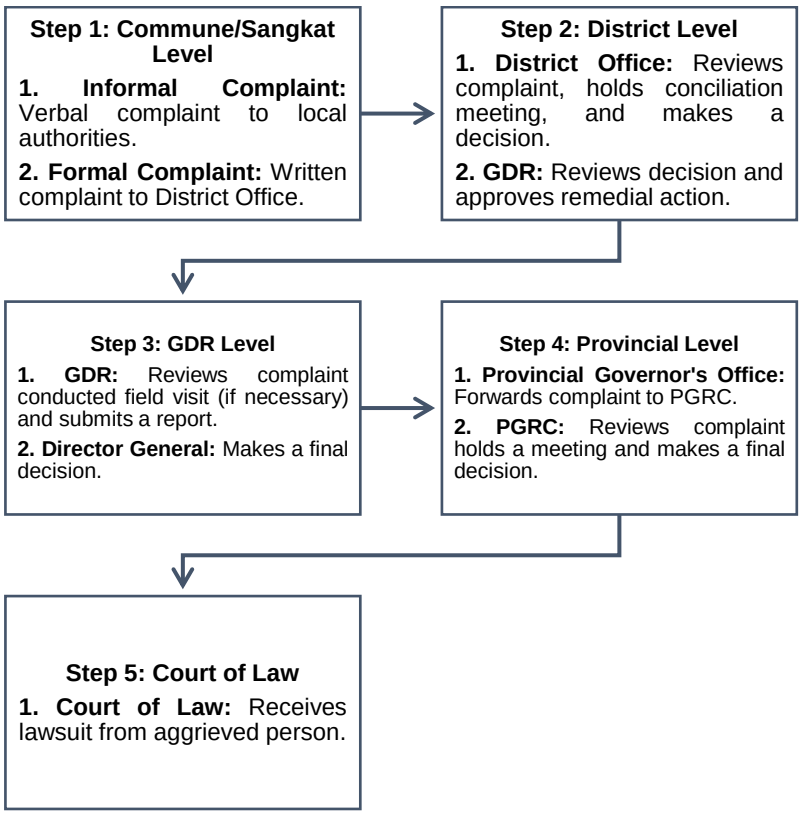
- Time-limit. Time-limit is specified for each step in the grievance resolution process.
- Complainants bear no costs. Complaint resolution is free of charge to aggrieved person. However, if the complaints bring their case to court, they will bear the costs associated with their lawsuit.
- Any grievance concerning urgent health and safety issues shall be resolved immediately.

8.4 Project's Redress Procedures

The project has in place complaint handling procedures for three types of potential grievances, including grievances related to 1) land acquisition, 2) labour and working conditions, and 3) sexual exploitation and abuse and sexual harassment (SEA/SH/GBV/GBV), and 3) general complaints. These procedures are established based on the above GRM principles and are in accordance with pertinent national legislation. The GRM for complaints related to land acquisition is provided in the project's Resettlement and Policy Framework (RPF) and that for IPs is provided in the project's IPPF. Summary for the above four procedures is provided below:

8.4.1 Redress Procedure for Complaints related to Land Acquisition

Under this project, to facilitate the grievance redress, the informal and formal steps are combined for convenient use of affected people, as follows:



- Step 1 − Commune/Sangkat level. APs will seek assistance from commune/Sangkat chief or community elderlies who will discuss with the leader of the PRSC-WG to find a solution. Verbal grievance can be provided to the commune/Sangkat chief or community elderlies. So, no written complaint is required. It is noted that even if the complaint is made verbally, the complaint will be registered in project's logbook, including resolution process and result for such verbal grievance for monitoring purpose. Upon receipt of the verbal complaint, the PRSC-WG will consult with the IRC-WG to ensure the complaint is addressed timely. If the grievance is not resolved to the satisfaction of the AP, or if the AP prefers, s/he may lodge their complaint through the formal route which includes the steps below.
- Step 2 − District level. AH can lodge a written complaint to the Head of the District Office (where the subproject is located). The AH can bring a community elderly or their representative to discuss their grievance at the District Office. A conciliation meeting shall be held, and a decision be made within 15 working days from the date of complaint is received by the District Office. If the complaint is resolved to the satisfaction of the AH, the IRC-WG will inform GDR's Department of Internal Monitoring and Data Management (DIMDM) who will review and seek the approval of the Director General of GDR for appropriate remedial action. GDR will inform the AF of the decision/ remedial action within 15 working days from the receipt of the grievance by the District Office. If the complaint is rejected at this step, District Office will inform the AH of the rejection in writing. If the complainant is not satisfied with the decision/resolution result, s/he can proceed to step 3 (below).
- Step 3 − GDR level. The complainant who is not satisfied with proposed resolution from Step 2 shall lodge a written complaint to the GDR for resolution. The GDR, through its DIMDM, will carry out a holistic review of the complaint and submit a report on its findings with the relevant recommendations, if any, to the Director General of GDR for review and

decision. GDR may conduct a field visit to meet the complaint and the IRC-WG to gather relevant information. The final report must be completed within 30 working days from the date of receipt of the complaint by GDR for submission to the Director General of GDR who will make a final decision within 5 working days of receipt of the final report. In the event that the subject matter requires a policy level intervention, it will be referred to the IRC for a decision which may require that an additional 10 working days be extended from the original deadline for final decision.

- Step 4 − Provincial level. AH will submit a written complaint to the PGRC through the Provincial Governor's Office. The complainant or a representative will be given an opportunity to present its case during a meeting and the PGRC may consider any compelling and special circumstances of the AH to inform their decision. The GDR will send a representative, as a non-voting member, to provide an explanation to the rejection of the complaint at Step 3 with the GDR. The decision of the PGRC must be made on a consensus basis and will be final and binding except when the matter relates to government's policy. Decisions related to government's policy matters on land acquisition and resettlement are decided by the IRC. The PGRC will have 40 working days from the date of receipt of the complaint to reach a final decision. The decision of the PGRC will be sent to the IRC (through the GDR) for endorsement before any remedial action is taken. There are no fees or charges levied on the AH for their lodgment of complaint and for complaint resolution for the above 4 steps.

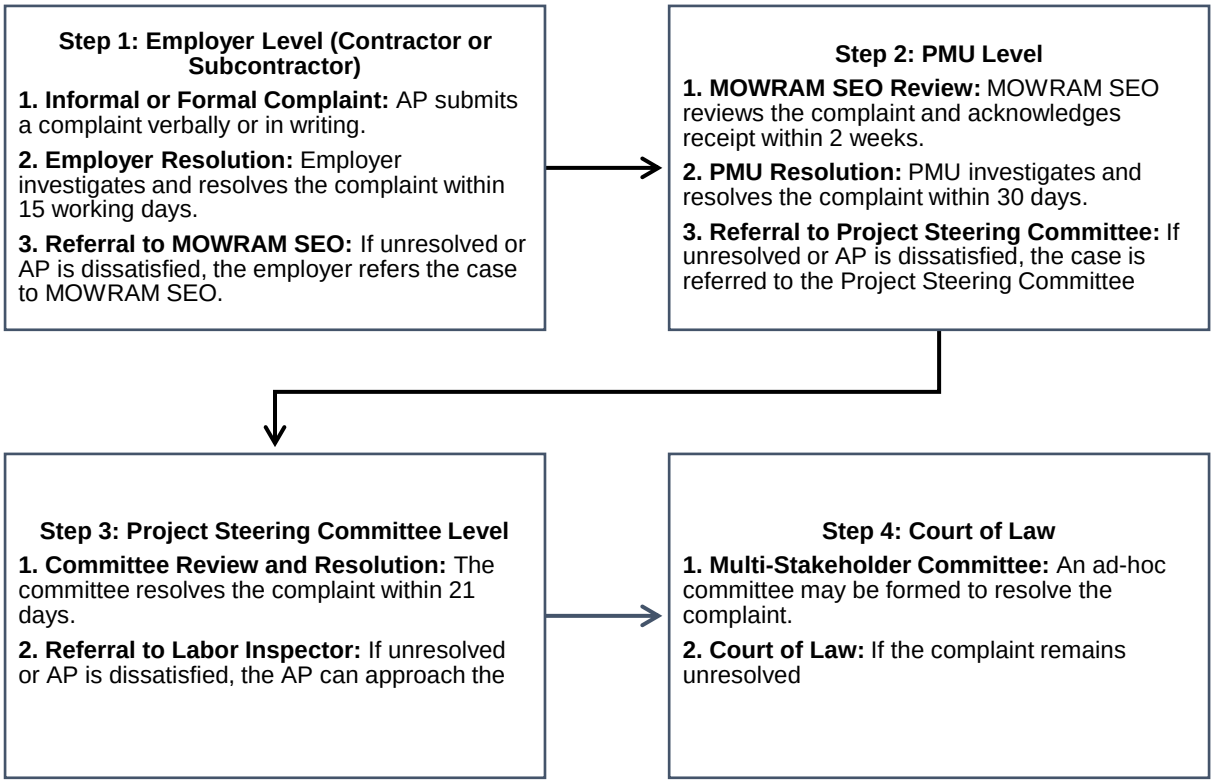
- Step 5 − Court of Law. If the aggrieved person prefers filing a lawsuit at the Provincial/Municipal Courts, as applicable, to seek a resolution, AP can do so but will bear cost related to the lawsuit as per the Expropriation Law. When the case is brought to a Court of Law, there is no involvement of the GDR, PRSC or IRC-WG unless there is a judicial order from the competent courts.

Figure 1. Redress Procedure for Complaints related to Land Acquisition

-

8.4.2 Redress Procedure for Complaints Related to Labor and Working Conditions

Project workers can lodge their grievance/complaint as follows:



- Step 1 – Employer Level (Contractor and Subcontractor). Aggrieved person (AP) can submit their grievance to their Employer who serves as the first focal point for receiving and resolving grievance. Grievance can be lodged verbally or in writing, in person or by phone, text message, mail or email (anonymous complaint is accepted). The Employer involved will resolve the case no later than 15 working days. Once resolved and the AP is satisfactory, the Employer will report the case, including resolution process and results, to the SEO of the MOWRAM for information and record. If the AP is not satisfied with the resolution of their Employer, the Employer will refer the AP to the SEO of MOWRAM, if needed and inform the AP of this referral. It is noted that if a complaint concerns the safety and health of one or several individuals, such complaint shall be resolved as soon as possible – depending on the nature and urgency of the grievance.

- Step 2 – PMU level. MOWRAM SEO will resolve the complaint referred to by the Employer (Step 1) and acknowledge receipt of the AP's complaints within two weeks from the date of complaint receipt. If the SEO of MOWRAM cannot resolve the complaint, the SEO Team will consult with the Project Manager/Director for resolution. The SEO of the MOWRAM will inform the AP (in writing) of the PMU's resolution result within 30 days from the date of complaint receipt. If the AP is not satisfied with the resolution result proposed by PMU, PMU will refer the case to the Project Steering Committee of the project and shall inform the AP (in writing) of this referral.

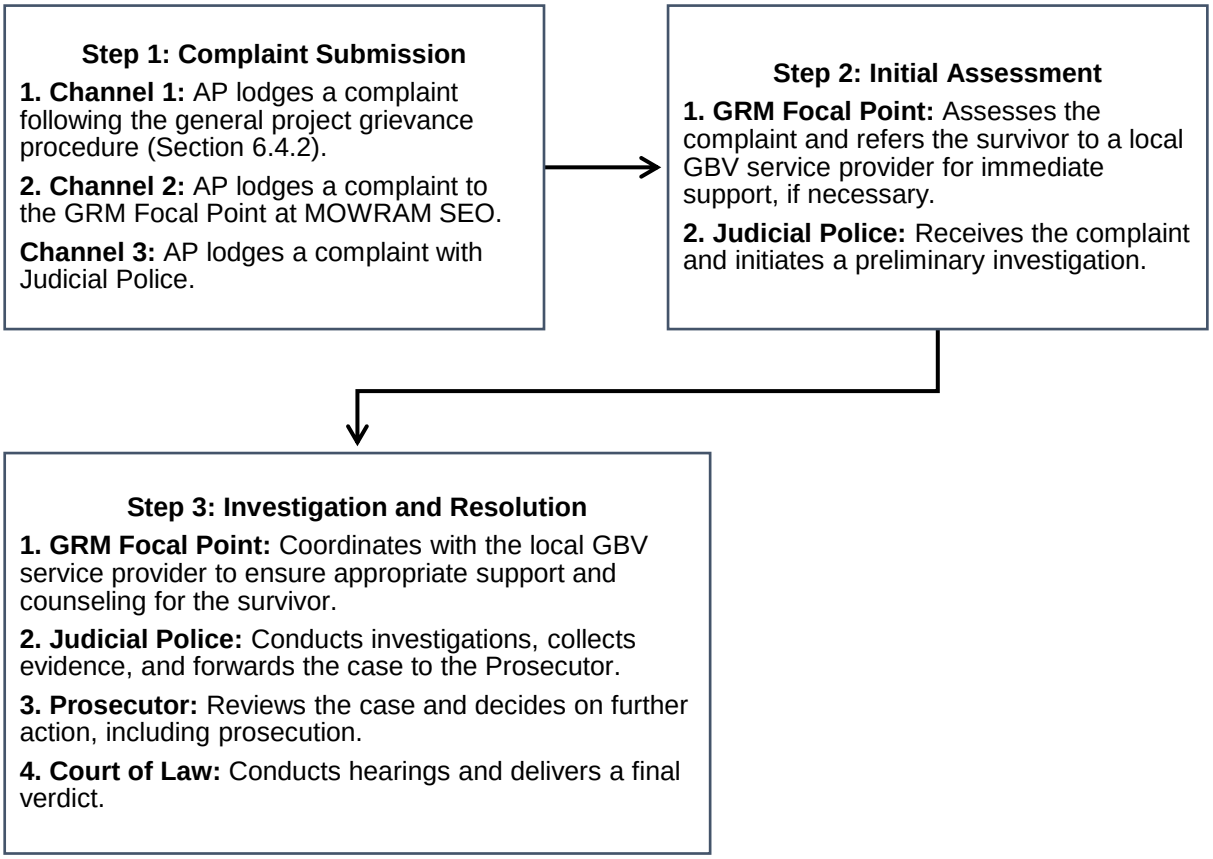
- Step 3 – Project Steering Committee level. At this level, the case will be resolved no later than 21 days. The AP will be informed of the resolution decision in writing. In case the grievance has not been solved within the specified timeframe, or the AP does not agree with the proposed resolution, the AP can approach the Labor Inspector of his/her province or municipality.

- Step 4 – Court of Law. If the AP is not satisfied with the resolution proposed above, a multistakeholder committee will be established (ad-hoc) to resolve the dismissed grievance – as an alternative for affected person going to court. If the grievance could not be resolved satisfactorily by the multistakeholder committee, the affected person may resort to the court of law. The cost associated with the lawsuit shall be borne by the AP. The decision of the Court will be final.

Figure 2. Redress Procedure for Complaints Related to Labor and Working Conditions

8.4.3 Redress Procedure for Complaints Related to SEA/SH/GBV

Under the project, the GRM for SEA/SH/GBV mainly serves to: (i) refer complainants to a local GBV service provider; and (ii) record resolution of the complaint. In line with the above, the following principles apply so as to recognize SEA/SH/GBV victim as principal decision makers in their own care, and treat them with agency, dignity and respect for their needs and wishes: § Multiple channels are in place for easy access and lodge complaints.



- SEA/SH/GBV survivors will be referred to a local GBV service provider for immediate support if they make a complaint directly to PMU.
- Confidentiality of survivors is protected. GM operator (at PMU and local GBV service providers) will keep confidential for SEA/SH/GBV allegation report.
- No identifiable information on the survivor shall be collected and stored in Project Grievance Logbook.
- Costs of operating the SEA/SH/GBV GRM will be covered by the project.

It is noted that under this project, GBV service provider will be engaged for subprojects that are rated “High” or “Substantial” for SEA/SH/GBV risks − as part of site-specific ESMP. based on SEA/SH/GBV risk assessment The following channels can be used to submit a grievance related to SEA/SH/GBV:

- Channel 1 – AP who believe the SEA/SH/GBV incidence is related to project workers can follow steps outlined in Section 6.4.2 (above) to lodge a SEA/SH/GBV complaint.
- Channel 2 – Alternatively, AP can lodge their complaint, verbally or in writing, to the GRM’s Focal Point within the SEO of MOWRAM for advice and resolution (contact of GRM Focal Point is provided in Section 5.1 (Resources).

- Channel 3 – If AP wants to bring the case to the Court of Law, AP can follow steps below for prosecution. Prosecution related to SEA/SH/GBV is administered under the Criminal Code and the Code of Criminal Procedure and is as follows:

    - Figure 3. Redress Procedure for Complaints Related to SEA/SH/GBV

-

    - Step 1 – Judicial Police. SEA/SH/GBV victim or a representative can submit their grievance to a local Judicial Police (JP) Officer. JPs include a) Commune/ Sangkat Chief, b) Commune/ Sangkat/ District/ Provincial/ National Police, and c) District/ Provincial/ National Military Police. The JP is responsible for receiving, recording complaints, and may conduct preliminary investigations to identify and arrest the perpetrator. The JP will also collect evidence to support the prosecutors. If the SEA/SH/GBV happens at home and/or falls under the domain of domestic violence (as per Law on the Prevention of Domestic Violence and Protection of Victims), the SEA/SH/GBV survivor may seek support from a local qualified Judiciary Police Officer (appointed by the Ministry of Women's Affairs) who can act as a complaining party on behalf of the SEA/SH/GBV survivor15.
    - Step 2 – Prosecutor. Upon receiving the completed written record from the JP, the prosecutor can decide on if the prosecutor will hold a file without processing it further or conduct proceedings against the perpetrator. The prosecutor may bring the case to the Court of Law and present the evidence in Court hearings.
    - Step 3 – Investigation by Judge. During this step, the investigating Judge will conduct interrogation of the charged person and perform other required investigation procedure.

- Step 4 – Hearing. After issuing an order of indictment, the investigating Judge will submit the case to the trial court president who shall arrange a date for the trial. The decision of the Court on SEA/SH/GBV resolution is final.

8.4.4 Redress Procedure for General Complaints

In case individuals, households, or communities are affected by any other aspects, for instance, environmental impacts such as increased dust, noise, or lack of safety measures that increase risks of traffic accident to road users or to local EM, various channels will be established for convenient use by affected parties, including IPs. These include:

- PMU GRM focal point's telephone (See Section 5.1 – Resources). o Local EM leaders (in case affected individual/households are EM)
- Contractor's hotline: to report cases that they think contractors can solve timely (contact detail of Contractors will be posted at construction sites, and distributed to IPs (through Subproject Information Booklet) during consultation, and post at public billboard of Commune/Sangkat offices, pagodas, etc.
- Commune/Sangkat offices

8.5 Registration of Project Grievance

The SEO, Project 6. Managers within MOWRAM is responsible to establishing and maintaining the project grievance logbook (PGL). The PGL will be established by the SEO to record all concerns/ grievance that are submitted by project stakeholders during project implementation. In case there is serious complaint, the World Bank should be notified of these complaints within 24 hours of complaint receipt (See Annex 3 for Guidance for establishing and maintaining Project Grievance Logbook).

The GRM is an integral project management element that intends to seek feedback from beneficiaries and resolve of complaints on project activities and performance. The GRMs for the project are based on IAAB, IFAD, UN, and GCF requirements and, most importantly, national requirements for solving potential problems between project owners and residents/persons affected by the subproject(s).

9. IMPLEMENTATION ARRANGEMENTS

9.1 Environmental and Social Duties of the PMU/Detail Design Consultants

9.1.1 MOWRAM'S PMU

The MOWRAM's PMU will work closely with PDWRAM in planning and implementing subprojects located within their province. The PDWRAMs will also supervise project officers at the district-level Department of Water Resource and Meteorology, and are responsible for:

- Coordinating effectively with all project stakeholders, including MOWRAM's SEO, consultants, contractors, local authorities, provincial departments, and project communities.

- Supporting provincial and district-level project officers in monitoring and evaluating progress and performance of consultants and contractors.
- Supporting MOWRAM'S SEO to conduct training on labor, gender, SEA, SH, VAC, and HIV/AIDS.
- Supporting MOWRAM'S SEO to disseminate project information and conduct consultation activities, as well as ensuring effective grievance redress resolution within their province.
- Supporting MOWRAM'S SEO to conduct screening and scoping of the subprojects, and identifying environment, social, land acquisition impacts and screening for presence of IPs in the subproject area.
- Liaising with village authorities in subproject area to encourage vulnerable groups to apply for jobs that may be offered by project's contractors.
- Collaborating with relevant departments involved in land acquisition and/or other environment or social mitigation measures.

9.1.2 NCDD'S PMU

NCDD's PMU will work closely with Provincial Cabinet in planning and implementing subproject located within their province. NCDD PMU will be responsible for day-to-day project implementation, monitoring and evaluation of Project Component 1, 2.1 and 2.2 in collaboration with MAFF. PMU will work under the oversight and guidance of NCDDS and will be responsible for all aspects of environmental and social performance, including E&S monitoring and evaluation, reporting of E&S performance, and relevant incidence during project implementation.

9.1.3 Provincial Department of Water Resources and Meteorology

PDWRAM's main responsibility includes:

During subproject preparation:

- Support design parties in their surveys and consultation to prepare Feasibility Study and Detailed Design for sub-scheme.

During construction:

- Oversee construction activities under Component 2, particularly construction of the new irrigation canal in the command area

During operation:

- Collaborate with other relevant technical departments, especially PDAFF at provincial level, farmer water user groups (FWUG) to ensure its regulators (located within the water distribution network) are operated effectively, and in a manner that minimizes water use conflicts among target water user community in the command area.
- Conduct regular maintenance of the reservoir and irrigation canals during subproject operation and maintenance stage.

9.1.4 Provincial Department of Agriculture, Forestry and Fisheries

PDAFF is responsible for implementing activities under Component 1, 2.1 & 2.2. Under this subproject, PDAFF is responsible for developing and implementing agricultural techniques that

make full use of improved water access (under Component 1) to enable farmers in the command area to produce more food in a sustainable manner which improves farmers' income and livelihoods. PDAFF will focus on the following:

- Promoting crop diversification for farmers in the command area (e.g. crop rotation for rice and horticulture production improves soil conditions whereas enhancing vegetation production for household's better nutrition and income.
- Introducing to farmers new agricultural engineering techniques to promote a) mechanization to increase productivity in crop production (e.g. mechanization in soil preparation using laser land leveling, use of combine harvester to save labor and reduce production costs, b) save water by applying alternate wet and dry (AWD) and drip irrigation for horticultural activities, c) reduce GHG.
- Scaling up Crop Production and engaging Private Sector in value chain development for specific farm product (e.g. rice, bean, and other cash crops such as vegetables…) and relevant agricultural services through agricultural cooperatives, producer groups, etc.

9.2 Contractor's Environmental and Social Management Plan (C-ESMP)

The civil works contractor is responsible for implementing the Environmental and Social (E&S) mitigation measures outlined in this ESMP for Component 2, which involves constructing the irrigation canal and related structures like gates and regulators. Based on the ESMP and the project's Labour Management Plan (LMP), the contractor will:

- Prepare and submit a Contractor's Environmental and Social Management Plan (C-ESMP) for each contract, detailing how E&S risks related to construction activities, workers, camps, machinery, and vehicles will be mitigated. The C-ESMP must also include a labor management plan (C-LMP) and be site-specific, addressing risks based on the contractor's capacity and site conditions.
- If subcontractors are engaged, they must prepare their own E&S plan aligned with the ESMP and LMP, outlining how they will manage identified risks and impacts. Reporting arrangements between the subcontractor and the main contractor must be detailed, with the main contractor consolidating subcontractor reports into monthly E&S performance reports to the PMU, with quarterly reporting potentially required.
- If changes occur to the proposed works and activities during the contract period, the contractor must update the C-ESMP to reflect these changes, including relevant subcontractor plans. The C-ESMP should include:
    - A policy statement outlining the contractor's commitment to the site-specific ESMP.
    - Document details (issue date, revision status, distribution list, and signatures).
    - Applicable laws, regulations, and required permits.
    - Plans to manage E&S risks, including mitigation measures, a Workers' Code of Conduct, and a Contractor's LMP.
    - A list of required environmental and social training for all personnel, including occupational health and safety, SEA/SH/VAC risks, and emergency response.
    - Financial resources and responsibilities for implementing the C-ESMP, including

subcontractor responsibilities and training for local workers.

- Monthly environmental reports, covering accident/incident reporting within 48 hours to MoWRAM, compliance with the C-ESMP, challenges, non-compliance issues, subcontractor activities, and meeting minutes with MoWRAM.

The contractor must ensure timely funding, human resources, and implementation of pre-construction and construction mitigation measures, along with any additional E&S mitigation required.

9.3 Contractor's Safety, Social and Environmental Officer (SSEO)

The contractor must appoint a competent on-site Safety, Social, and Environment Officer (SSEO), trained in environmental management, to oversee contractors and subcontractor personnel. The SSEO's responsibilities include:

- Supervising subcontractor compliance with the Contractor's LMP and C-ESMP.
- Submit the LMP and C-ESMP to the PMU/DDIS for approval before mobilizing staff.
- Conducting site inspections and audits to ensure compliance with environmental and social mitigation measures.
- Monitoring and reporting on E&S compliance and preparing audit reports.
- Investigating complaints, recommending corrective actions, and addressing non-compliance.
- Informing the contractor, PMU, and DDIS of any E&S issues, and maintaining detailed records.
- Collaborating on labor issues and preparing the Contractor's LMP and C-ESMP, including OHS regulations.
- Maintaining employment records, verifying minimum working age, and ensuring signed Workers' Codes of Conduct.
- Providing regular training on occupational safety, SEA/SH/VAC, and community relations.
- Ensuring primary suppliers address SEA/SH/VAC, child labor, forced labor, and OHS risks.
- Developing and implementing a grievance mechanism for contracted workers, resolving grievances promptly, and reporting to the PMU.
- Ensuring all workers sign the Code of Conduct and implement measures to prevent SEA/SH.
- Developing and enforcing COVID-19 prevention and mitigation plans.

Incident reporting

The contractors are required to inform DDIS and PMU any incidents listed below within agreed timeframe (e.g. 48 hours):

- Any violations to national laws, regulations, or international agreements.
- Any serious accidents or fatalities,
- Significant impacts that cause losses to personal property such as traffic accidents,

damages to local houses/roads and other incidents.

- Serious surface/ground water pollution.
- Failures of embankments at disposal sites that cause serious pollutions to the surroundings,
- Fire related to worker's behaviours,
- Any claims related to SEA/SH/VAC, or any other incidents related to children, and
- Receive a complaint about pollution or damages.

9.4 Contractor's obligation as to contractual requirements

The contractor and its subcontractors, if any, shall comply with the ESMP. In particular, the Contractor must prepare a Contractor's ESMP (C-ESMP) to elaborate this ESMP based on a) site condition, b) capacity of the Contractors and their subcontractors (if any), c) national regulations that are active by the time of subproject implementation.

To ensure that necessary action has been undertaken and that steps to avoid adverse impacts and/or reoccurrence have been implemented, the Project Manager, the Safeguard Focal Persons, and/or contractor must report to PMU within 48 hours of any serious incidents of non-compliance that may have serious consequence. In the event of working practices being deemed dangerous either by the subproject, the local authorities, or the other concerned agencies, immediate remedial action must be taken by the contractors. The contractor must keep records of any incidents and any corrective action taken. The records of non-compliance that could be practically addressed (not cause serious impacts) will be reported to the DDIS with a copy to PMU monthly.

The contractor will be responsible for dealing with any reports/grievance forwarded by the local communities, authorities, police or other agencies as soon as practicable, preferably within one hour but always within 48 hours. The Project Manager/Safeguard Focal Persons will monitor and ensure that the contractor has taken appropriate action. Where appropriate, approval of remedial actions may require an agreement from the local authorities and/or other government agencies. Procedures should be put in place to ensure, as far as is reasonably practical, that necessary actions can be undertaken to avoid recurrence and/or serious damage.

10. ENVIRONMENTAL AND SOCIAL MONITORING PROGRAM

10.1 Environmental Monitoring Program

To ensure the effectiveness of environmental management, the environmental monitoring program is prepared to monitor the environmental quality. The contractor and/or sub-contractor is responsible for monitoring using appropriate method, equipment and system. Details on monitoring parameters are shown in the table below:

Table 39: Environmental monitoring plan during Pre-construction, construction, and Operation phase

Monitoring Parameters	Monitoring Indicators	Location	Measurements	Frequency	Responsibility
Pre-construction phase					
UNEXPLODED ORDNANCES (UXO)	• UXO screening by certified experts required before any construction. • Found UXOs to be removed by certified experts. • UXO clearance certificate required before subproject activities. • UXO risk training and awareness for the local community.	Along the canales (construction site)	• Confirm all relevant areas are clear from UXO by consulting national military. • Obtain a certificate of UXO clearance	Before construction	PMU Contractor
During construction phase					
	ENVIRONMENTAL				
Noise and Vibration	• Avoid working during night-time from 21:00 hours to 06:00 hours • Provide ear sets for workers to prevent noise if the noise level exceeds the standard • Check and maintain construction machinery regularly to avoid noisy and high vibration • Restrict use of vibrating rollers and operation of heavy equipment near sensitive structures	Construction site Nearby sensitive structures	Site inspection Visual observation	Daily	SEO E&S specialist consultants PMU
	Measuring noise and vibration level	Construction site, there is one location for noise and vibration level sampling. ANV 7 X: 465547 Y: 1304414	Measuring equipment and/or appropriate monitoring methods	Every 06 months	SEO E&S specialist consultants PMU
Air quality	• Spray or sprinkle water on the work surfaces and other piled materials to minimize dust at least 3-6 times per day in windy and dry weather and/or based on the weather condition • Solid waste or construction waste activities • Construction machinery operation and	Construction site	Site inspection Visual observation Monitoring equipment and/or appropriate monitoring methods	Daily	SEO E&S specialist consultants PMU

Monitoring Parameters	Monitoring Indicators	Location	Measurements	Frequency	Responsibility
	maintenance • Distance of sitting concrete mixing plants, crushing • plants, quarries and other facilities to settle and other sensitive receptors • Transportation of construction materials				
	Testing air quality (NO2, SO2, CO, TSP, PM10, PM2.5)	There is one location for air quality sampling. ANV 7 X: 465547 Y: 1304414	Air quality monitoring equipment	Every 06 months	
Impact to Water	• Wastewater management • Design and capacity of septic tank • Digging of side drain at campsite • Construction of retaining structures	Construction site	Site inspection Visual observation	Daily	SEO E&S specialist consultants PMU
	• Testing surface water quality (Depth, pH, EC, AS, Cd, Pb, TN, TP, TDS, TSS, DO, and Total Coliform).	There is one location for surface water quality sampling. SW7 X:465456 Y:1307467	Water quality monitoring equipment	Every 06 months	SEO E&S specialist consultants PMU
	• Testing of soil quality is going to be analyzed in the agriculture context: - Soil classification or particle size, - Soil moisture, - Nitrogen (N), Phosphorus (P), Potassium (K), Magnesium (Mg), Sodium (Na), - Organic Metter - Ratio of the mass of carbon to the mass of nitrogen in organic residues (C/N Ratio), - Total phosphorus (P), - Cation exchange capacity (CEC), - pH,	There is one location for soil quality sampling. SS4 X: 465450 Y:1304887	Soil quality monitoring equipment	Every 06 months	SEO E&S specialist consultants PMU

Monitoring Parameters	Monitoring Indicators	Location	Measurements	Frequency	Responsibility
	- Electrode Conductivity.				
Solid and hazardous waste	• Solid and liquid waste management plan in the project construction sites. • Install septic tanks at the construction camp to prevent the discharge of polluted sewage into the outside. • Implement waste segregation of reusable construction materials, biodegradable, and non-biodegradable wastes. • Orient workers on the solid waste segregation system and prohibit them from indiscriminate throwing wastes outside of waste bins in the construction sites. • Provide sufficient waste bin and proper storage before transportation to dispose at an authorized landfill. • Fuel storage tank will be provided with retention areas to contain accidental spills.	Construction site	Site inspection Visual observation	Daily	SEO E&S specialist consultants PMU
Wastewater	• Establishment of proper wastewater management systems, including adequate sanitation facilities for workers.	Construction site/Camp	• Monitoring wastewater discharge for parameters such as temperature, pH, TSS, DO, COD, BOD_5. • Regular checks for leaks or spills from sanitation facilities.	Daily	PMU, Contractor
Physical Hazards	• Incidence of worker injuries due to physical hazards (e.g., falls, cuts, being struck by objects) • Unsafe working conditions (e.g., inadequate lighting, lack of proper safety equipment, slippery surfaces) • Compliance with safety regulations and use of personal protective equipment (PPE)	• Construction sites • Worker camps • Access roads	• Site inspections • Incident reports • Safety audits.	• Daily during construction Weekly safety meetings	Contractors PMU

Monitoring Parameters	Monitoring Indicators	Location	Measurements	Frequency	Responsibility
Chemical hazards	• Exposure of workers and communities to hazardous chemicals (e.g., pesticides, fuels, solvents) • Improper storage, handling, and disposal of chemicals • Air and water quality monitoring to detect chemical contamination	• Construction sites • Worker camps • Areas surrounding construction sites	• Site inspections • Training for workers	Regular inspections of chemical storage and handling areas	Contractors PMU
Heat Stress	• Implementation of safety measures and provision of break times for workers during extreme weather events. • Provision of adequate drinking water and shelter.	Construction site/Worker camps	• Monitoring weather conditions, including temperature and humidity. • Observation of worker breaks and access to shade and drinking water. • Records of any heat-related incidents.	Daily	Contractors PMU
	BIODIVERSITY				
Habitat Loss and Fragmentation	• Area of habitat lost or fragmented. • Changes in vegetation cover. • Number of isolated habitat patches • Presence of wildlife corridors.	Construction site	Site inspection Visual observation GIS analysis (if available) Drone surveys (if available)	Daily/Weekly	SEO E&S specialist consultants PMU
Loss of biodiversity and ecosystem services	• Changes in species abundance and diversity • Decline in water quality • Changes in soil fertility • Reduced pollination services • Alterations in hydrological processes	Construction site	Site inspection Visual observation Biodiversity surveys	Daily/Weekly	SEO E&S specialist consultants PMU
Hunting and trading, and consumption of wildlife	• Avoid cutting of trees or destruction of vegetation • No hunting, fishing, or collection of animal and plant materials • Revegetation success will be monitored, particularly surrounding riparian vegetation along area where levee is installed for flood protection and for increased water retention.	Construction site	Site inspection Visual observation Community interviews	Daily/Weekly	SEO E&S specialist consultants PMU

Monitoring Parameters	Monitoring Indicators	Location	Measurements	Frequency	Responsibility
Loss of fauna and flora	• Number of individuals of each species observed • Presence of endangered or threatened species • Changes in plant community composition	Construction site	Site inspection Visual observation Biodiversity surveys	Daily/Weekly	SEO E&S specialist consultants PMU
Destruction of farming ecosystem	• Area of farmland affected • Changes in crop yields • Impacts on livestock • Pollution of water sources used for irrigation	Construction site	Site inspection Visual observation Interviews with farmers	Daily/Weekly	SEO E&S specialist consultants PMU
Landscape and biodiversity	• Adopting good housekeeping and good construction practices. • Ensuring proper lining of canals and adequate assembling of pipes • Adopting slope stabilization techniques. • Implementing Biodiversity Action Plan (BAP)	Construction sites	Site inspection Visual observation	Daily	SEO E&S specialist consultants PMU
Protected Areas	• Exclude a subproject located in the community forestry, and Zone 3 of the protected area.	Construction sites	Site inspection	Daily	SEO
GHG emission	• Monitor the amount of fuel used by construction vehicles, heavy machinery, and generators. • Track the fuel efficiency of these machines to identify opportunities for improvement. • Assess the effectiveness of measures to control dust emissions from construction sites. • Monitor the types and quantities of waste generated and their disposal methods. • Track the amount of waste recycled or reused to reduce emissions associated with landfill disposal. • Monitor the number and types of vehicles entering and leaving the construction site. • Track the efficiency of transportation methods used to deliver materials and equipment.	Construction site Nearby sensitive structures	Site inspection Visual observation Consultation	Daily	SEO E&S specialist consultants PMU
During operation phase					

Monitoring Parameters	Monitoring Indicators	Location	Measurements	Frequency	Responsibility
Water Quality	Testing surface water quality (Depth, pH, EC, AS, Cd, Pb, TN, TP, TDS, TSS, DO, and Total Coliform) and pesticide residues in water. Biodiversity and Ecosystem Services	• Implementing Biodiversity Action Plan (BAP)	The entire sub-scheme	Site inspection Visual observation	Daily	SEO E&S specialist consultants PMU
Habitat Loss and Fragmentation	• Area of habitat converted for agricultural use • Changes in the size and connectivity of habitat patches • Number of isolated habitat fragments	The entire sub-scheme	Site inspection Visual observation	Annually	SEO E&S specialist consultants PMU
Invasive Species	• Presence and abundance of invasive species • Area affected by invasive species • Effectiveness of control measures	The entire sub-scheme	Site inspection Visual observation Vegetation surveys	Annually	SEO E&S specialist consultants PMU

Monitoring Parameters	Monitoring Indicators	Location	Measurements	Frequency	Responsibility
GHG emission	• Monitor the Knowledge, Attitude and Practices of farmers in farming activities that cause GHG emission	The entire sub-scheme	Site inspection Visual observation Consultation	Daily	SEO E&S specialist consultants PMU
	ANNUAL CROP MANAGEMENT PLAN				
Water resource efficiency	• Monitor water extraction rates from surface and groundwater sources. • Assess irrigation efficiency by measuring the amount of water applied versus the amount of water actually used by crops. • Monitor the implementation and effectiveness of water-saving irrigation methods (drip irrigation, sprinkler irrigation, AWD for rice). • Track water consumption per unit of crop yield (e.g., cubic meters of water per ton of rice produced).	Irrigation intake points Representative fields within the sub-scheme	Water flow measurements Soil moisture monitoring Crop water use assessments	Daily	PMU FWUC
Soil erosion and soil erosion risk	• Monitor soil erosion rates in different parts of the sub-scheme, particularly in sloping areas. • Assess the effectiveness of erosion control measures (contour planting, terracing, grass barriers). • Monitor soil organic matter content as an indicator of soil health and erosion resistance.	Representative fields Areas with different slopes and soil types	• Visual assessments of erosion features (gullies, rills) • Soil loss measurements using erosion plots or sediment traps • Soil organic matter analysis	After significant rainfall events Annually	PMU Agricultural extension officers
Nutrient application and management	• Monitor the types and amounts of fertilizers applied to different crops. • Conduct regular soil testing to assess nutrient levels and guide fertilizer application rates. • Monitor nutrient runoff from fields, especially near watercourses.	Representative fields Water sampling points near fields	• Fertilizer application records • Soil nutrient analysis • Water quality testing for nutrients (nitrogen, phosphorus)	Before and after fertilizer application Regularly during the growing season	PMU Farmers

Monitoring Parameters	Monitoring Indicators	Location	Measurements	Frequency	Responsibility
Use and effectiveness of pesticides	• Monitor the types and amounts of pesticides used for different crops and pests. • Assess the effectiveness of pest control measures by monitoring pest populations and crop damage. • Track the incidence of pesticide-related health issues among farmers and workers.	Representative fields Pesticide storage facilities	• Pesticide application records • Pest scouting and monitoring data • Health records	Regularly during the growing season	PMU Agricultural extension officers
Pesticide residues on site soil	• Conduct soil sampling and analysis to measure pesticide residue levels in representative fields.	Representative fields Areas near pesticide storage facilities	• Soil residue analysis	Periodically (e.g., annually or before planting sensitive crops)	PMU Third-party laboratories
Pesticide residues on produce	• Collect and analyze samples of produce to determine pesticide residue levels. • Ensure that produce meets national and international standards for maximum residue limits (MRLs).	Representative fields at harvest time	• Laboratory analysis of produce samples	Before harvest	PMU Third-party laboratories

10.2 Social Monitoring Program

To ensure the effectiveness of social management, the social monitoring program is prepared to monitor social issues. The contractor and/or sub-contractor are responsible for monitoring using appropriate methods, equipment and system. Details on monitoring parameters are shown on the table below:

Table 3: Social monitoring plan during Pre-construction, Construction, and Operation phase

Monitoring Parameters	Monitoring Indicators	Locations	Measurements	Frequency	Responsibility
Preconstruction phase					
Land acquisition/ Economic displacement	• Track the process of acquiring land for the project, ensuring fair compensation is provided to affected landowners. • Implement programs to help displaced individuals and communities restore their livelihoods.	Construction sites	• Monitor the distribution of compensation payments and address any disputes or concerns.	• Daily • Reported to PMU within 48 hours	• PMU

	• Establish effective grievance mechanisms to address complaints and concerns related to economic displacement.		• Monitor the effectiveness of these programs.		
During construction phase					
PROTECTING THE WORKFORC					
Child Labor/ Forced Labor	• Involvement of child labor/ forced labor in main contractor and subcontractors' workforce • Involvement of child labor/ forced labor among primarily supply workers	• Construction sites • Worksite of primary supplier	• Site inspection • Observation	• Daily • Screening prior to engaging services of primary supplier	
COMMUNITY HEALTH AND SAFETY					
Community Health and diseases	• Incidence of waterborne diseases • Prevalence of vector-borne diseases (e.g., malaria, dengue fever) • Respiratory illnesses related to dust and air pollution • Availability and accessibility of healthcare services • Community awareness of health risks and preventative measures	• Construction sites • Worker camps • Community and neighboring areas	• Health data collection • Site inspections • Health surveys and interviews • Consultation with workers and community members	• Monthly • During outbreaks • Periodic community health awareness campaigns	• PMU • Contractors • Local health authorities
SEA/SH	• Before mobilizing workers to construction site, conduct orientation/training on SEA/SH (using sample Code of Conduct as a minimum) for all Contractors' managers and workers mobilized to construction site • As part of the above training/orientation, ensure all workers understand SEA/SH risks, disciplines and penalty, and understand project's grievance procedures related to SEA/SH • As part of the workers and manager's work contract, require all workers engaged for project (both workers mobilized to site or work in contractors' office) to peruse and sign Workers' CoC • Ensure Contractors appoint a focal point in charge of ESHS and grievance reception, processing and resolution	• Construction sites • Relevant local communities	• Number and percentage of workers trained on SEA/SH prior to mobilization to subproject site • Number and percentage of workers signing Code of Conduct as part of Work Contract • Percentage of workers perpetrating SEA/SH	• Monthly and during subproject cycle • Reported to PMU within 48 hours if occurred	• Contractors • PMU

	• Apply all measures related to management of work camps		and percentage of cases reported to PMU and resolved • Name and contact of ESHS and grievance focal report reported in Contractor's ESMP.		
Traffic safety and Security	• Security cautions • General disease prevalence • Worker health • Communicable diseases	• Construction sites • Access roads to construction sites • Newly constructed/rehabilitated roads	• Site inspections • Incident reports • Data collection • Consultation with workers and community members • Review of contractor safety plans	• Daily during construction • Weekly during construction • Monthly during operation	• Contractors • PMU • Local authorities
Community Health and diseases	• Consultations with target communities to assess the current social situation and social impacts of sub-projects. • Recommendations and solutions from communities obtained regarding negative social impacts.	• Target communities • Workers	• Assessment of social situation and social impacts. • Collection of community recommendations and solutions.	• During consultations	• Contractors • PMU
Personal Protective Equipment	• Health and safety regulations enforced at construction sites. • Appropriate training and personal protective equipment (PPE) provided to workers.	• Construction sites and worker camps	• Monitoring that contractors provide appropriate PPE and enforce its use. • Observation of training sessions. • Review records of PPE distribution and training.	• Monthly monitoring during construction	• Contractors • PMU

Working conditions and Management of Worker	• Worker wages and benefits compared to legal requirements and industry standards • Instances of discrimination or unfair treatment based on gender, ethnicity, or other factors • Access to grievance mechanisms for workers to report unfair labor practices	• Construction sites • Worker camps	• Payroll records review: Verify worker wages and benefits. • Worker interviews: Confidential interviews to gather feedback on labor conditions and treatment. • Observation of worker interactions: Monitor for signs of discrimination or unfair treatment. • Review of contractor labor policies and practices: Ensure compliance with labor laws and ethical standards.	• Regular payroll audits • Periodic worker satisfaction surveys • Prompt investigation of any reported grievances	• Contractors • PMU
Cultural heritage	• Unexpected impacts on heritage resources	• Construction sites	• Site inspection • Observation • Report by local people/local authority	• Daily • Reported to PMU within 48 hours	• PMU • Contractors
CROSS-CUTTING					
Loss access to land and other assets	• Number of households affected by land acquisition or temporary restrictions on land use • Types of assets affected (e.g., land, houses, crops, trees) • Adequacy of compensation and resettlement measures for affected households	• Project areas where land acquisition is required • Areas affected by temporary restrictions on land use	• Land surveys and asset inventories • Consultations with affected households • Review of compensation and resettlement plans • Monitoring of resettlement implementation	• Before land acquisition • During land • After resettlement	• Contractors • PMU

Loss access to natural resources:	• Impacts on community access to water resources (e.g., for drinking, irrigation, fishing) • Impacts on access to forests and other natural resources • Measures to mitigate impacts and provide alternative access to resources	• Areas downstream of irrigation schemes • Areas surrounding project activities that may affect natural resources	• Water quality and quantity monitoring: Assess impacts on water resources downstream of project activities. • Consultations with communities: Gather feedback on impacts on natural resource access and use. • Development and implementation of mitigation plans: Address impacts and provide alternative access to resources.	• Regular water quality and quantity monitoring • During project implementation: Monitor the effectiveness of mitigation measures.	• PMU • Relevant government agencies • Contractors
Social inequality	• Any actions on the part of Contractors' workers or community member that cause social conflicts (e.g. SEA/SH, the way construction activities are carried out [pollution, restricted access, loss of local income/livelihoods, accidents…)	• Construction sites • Relevant local communities	• Number of social conflicts arising and nature and scope of conflict • Number of social conflicts resolved by contractors within 7 days • Number of social conflicts resolved by local authorities • Number of serious cases that have happened and reported to PMU within 48 hours	• Daily • Monthly	• Contractors • PMU
	• Conflicts between upstream farmers who prioritize water storage for their crops and downstream farmers who require a consistent water supply for their agricultural needs.	• Local communities are living downstream and upstream.			

Elite capture	• Equitable distribution of project benefits among community members • Transparency and accountability in decision-making processes • Mechanisms for community participation and feedback	• Project implementation areas • Community meetings and consultations	• Monitoring of benefit distribution: Track who is receiving project benefits and ensure fairness. • Observation of decision-making processes: Assess inclusivity and transparency. • Community feedback mechanisms: Establish channels for communities to voice concerns and provide input.	• Throughout project implementation • Regular community meetings and consultations	• PMU • Contractors • Community representatives
Gender inequality	• Percentage of female beneficiaries • Percentage of beneficiaries who are youth • Average percentage women consulted • Number of action plans integrating specific women's • Average percentage FWUC with women in leadership positions • Women/youth trained in O&M • Number of training on gender and social inclusion delivered to MOWRAM staff	• Project sites • Community level	• Data collected through surveys and consultations • Review of project documents, training plans, and meeting minutes	• Monthly monitoring • Quarterly • Semi-annually • Annually	• PMU • Contractors •
During operation phase					
COMMUNITY HEALTH AND SAFETY	• Number of accidents and fatalities related to construction activities • Number of disease outbreaks and environmental pollution incidents • Number of reported cases of worker health issues	• Construction sites • Camp site and Worker camps • Nearby community	• Site inspection reports • Accident/Incident reports • Medical records/reports • Consultation minutes/reports	• Daily for site inspections • Monthly for reports and consultations • Within 48 hours for reporting accidents,	• PMU • PDWRAM

				disease outbreaks.	
CROSS-CUTTING					
Gender inequality	• Percentage of female workers in different roles (skilled, unskilled) • Number of reported cases of gender-based violence or discrimination • Participation of women in FWUCs and decision-making processes related to water management.	• Construction sites • FWUC meetings • Community consultations	• Observation of worker roles and interactions. • Records of complaints and their resolution. • Attendance records and meeting minutes.	• Monthly for data collection and reporting	• PMU • PDWRAM
Social inequality	• Employment rates of vulnerable groups (poor, ethnic minorities, people with disabilities) in project activities. • Access to project benefits (training, information, resources) among different social groups.	• Construction sites • Training sessions • Community consultations	• Employment records and beneficiary lists. • Attendance records and feedback surveys. • Consultations with community members and representatives of vulnerable groups.	• Monthly for data collection and reporting	• PMU • PDWRAM
Elite capture	• Participation and representation of different social groups in decision-making bodies (FWUCs, committees). • Transparency and accountability in the allocation of project resources and benefits. • Monitoring of complaints related to favoritism or exclusion in decision-making.	• FWUC meetings • Community consultations • Project implementation records	• Observation of meeting dynamics and representation • Analysis of resource allocation records. • Records of complaints and their resolution.	• Regularly during FWUC meetings and project implementation • Continuously through the GRM.	• PMU • PDWRAM

11. ESTIMATED COSTS

11.1 Estimated Costs for ESCMP Implementation

The costs of implementing the ESCMP listed below are related to PMU costs in addition to the dedicated safeguards PMU personnel budget line item. The main costs of implementing this ESCMP are the additional cost which have not been budgeted within the project, exclusive of the actual budget for the land resettlement and land acquisition which will be estimated by the end of the year as per the newly approval on the final conceptual design. For example, the project component 1 focus on establishment, capacity building and strengthening the FWUCs, therefore the concern regarding water management and water distribution inequality have already covered. Moreover, the sustainable agricultural practices and agricultural value chain is already in the project action plans. In this regard, the concern regarding GHG emission from the farming activities have been already addressed. The proposed budget therefore is the additional cost which are added to the existing one.

Table 41: Estimated cost for ESCMP implementation

No.	Items	Qty	Unit	Cost (USD)	Total (USD)
1	UXO clearance	Lum-sump	1	50,000	50,000
2	Preparing National EIA Report	Lum-sump	1	100,000	100,000
3	Implementing Biodiversity Management Plan	Year	5	7,500	37,500
4	ESCMP awareness raising and sensitization with key stakeholders and communities (5 times)	Times	2	3,000	6,000
5	Community outreach at the project area	Sub-scheme	1	15,000	15,000
6	Consultation facilitation	Sub-scheme	1	10,000	10,000
7	Monitoring activities	Lum-sump	1	18,500	18,500
	Total				**237,000**

11.2 Estimated Costs for ESMCP Monitoring Program

The monitoring cost will be budgeted only for the activities which are supposed to be additional expenditure which are not included in the social and safeguard consultant. The cost for monitoring is mainly focused on the monitoring cost for soil, water, and air quality.

Table 44: Estimated cost for ESCMP monitoring program

No.	Items	Unit	Qty	Cost	Total
1	Soil quality monitoring (every six months* 1 location * 1.5 year)	Times	3	1,500	4,500
2	Air quality, noise and vibration quality monitoring (every six months * 1 locations * 1.5 year)	Times	3	2,000	6,000
3	Water Quality monitoring (every six months* 1 location * 1 year) and groundwater (Annually * 1 location * 1 year) for around half of the total sample for surface water	Times	4	2,000	8,000
	Total				**18,500**

Annex

Annex 1 – Screening checklist for E&S impacts for each sub-scheme

Circle screening conclusion:

- If the answers to the checklist questions are “No”, there is no need for further action.
- If the answers to the questions are “Yes”, then consult the relevant procedures /guidelines for assistance inaddressing issues of concerns.

A	Environmental and Social Impacts	No	Yes	Notes
Location				
1	Are there environmentally sensitive areas (forests, pastures, rivers, and wetlands) or threatened species that could be adversely affected by the sub-project?			
2	Does the sub-project area (or components of the project) occur within or adjacent to any protected areas designated by government (national park, national reserve, world heritage site, etc.)?			
3	If the sub-projects are outside of, but close to, any protected area, is it likely to adversely affect the ecology within the protected areas (e.g., interference with the migration routes of mammals, fish, or birds)?			
4	Will the sub-projects reduce people’s access to pasture, water, public services, or other resources that they depend on?			
5	Might the sub-projects alter any historical, archaeological, or cultural heritage site or require excavation near such a site?			
Physical and biological environment				
6	Will projects require large volumes of construction materials (e.g. gravel, stones, water, timber, firewood)?			To build rehabilitate irrigation canals and dam
7	Might the projects lead to soil degradation or erosion in the area?			
8	Might the projects affect soil salinity?			
9	Will the projects create solid or liquid waste that could adversely affect local soils, vegetation, rivers, streams, or groundwater?			
10	Might river or stream ecology be adversely and remarkably affected due to the installation of structures such as weirs, etc.?			
11	Will the projects have adverse impacts on natural habitats that will not have acceptable mitigation measures?			
12	Do the projects have human health and safety risks, during			OHS safety and Dam

	construction or later?			safety
13	Might the projects lead to migration into the area?			
Alternatives				
14	Is it possible to achieve the objectives above in a different way, with fewer environmental and social impacts?			
B	**Land Acquisition and Social Issues**			
1	Have all groups within the community been consulted about the proposed project?			
2.	Which groups have not been consulted?			
3	Will the projects require acquisition of land (public or private) and/or other assets for its development?			
4	Will anyone be prevented from using economic resources (e.g. pasture, community place, forests etc.) to which they have had regular access?			
5	Will the projects result in the involuntary resettlement of individuals or families?			
6	Will the projects result in temporary or permanent loss of crops, fruit trees and household infrastructure such as granaries, toilets, kitchens etc.?			
7	Will the projects affect the livelihoods of particular groups within the communities, especially vulnerable groups such as the landless?			
8	Will the projects affect the well-being and livelihoods of women, particularly female-headed households?			
9.	Will the projects benefit all groups within the community equally?			
10.	Are there ongoing land or water disputes within the community/with neighboring communities?			
C	**Pesticides and Waste Materials**			
1	Will the project result in the introduction of pesticides or an increase of pesticide use if use of such products currently exists?			
2	Will the project result in the production of solid or liquid waste (e.g. water, domestic or construction waste), or result in an increase in waste production during construction or operation?			
D	**Is there a probability of the presence of unexploded ordinance (UXO) at or near the proposed sub-project area?**			

1.1 Summary of Consultation with project Stakeholders

This section summarizes four consultation rounds carried out during the project preparation phase. These consultations involved discussions with relevant institutions, non-governmental organizations, local authorities, and local communities throughout the preparation process. The data collection and consultations were conducted in four periods:

1.1.1 First consultation

- The first consultation was conducted between 26 and 28 July 2024 to capture information regarding biodiversity and environmental condition in the project area.

1.1.2 Second consultation

- The second consultation was conducted to consult with forestry and fishery communities, local authorities and key informants to understand the situation and concerns related to the presence of the project. The consultation was conducted between 03 and 09 August 2024.

1.1.2.1 Result of consultation

- Krapeu Trom is situated within the same river catchment area in the lower reaches, near the Tonle Sap's annual floodplain. The reported endangered species in this sub-scheme is the Isok barb/Jullien's Golden Carp (Probarbus jullieni) being seen once in 2022, approximately 500 meters downstream of the reservoir facility during a flooding event. The community people reported that the species migrated upstream from the Tonle Sap during the flood season but became trapped in spillways. They added that if flooding is insufficient, fish populations decline, and rare species may no longer be present in the area.

1.1.2.2 Proposed project activities

Some potential project activities to address habitat conservation and species protection in Krapeu Trom:

Habitat Assessment and Monitoring:

- Baseline Survey: Conduct a comprehensive baseline survey to assess the current state of the habitat, including water quality, vegetation cover, and fish populations.
- Habitat Mapping: Create detailed maps of the sub-scheme, identifying key habitats, potential threats, and areas for conservation.
- Long-Term Monitoring: Establish a long-term monitoring program to track changes in habitat conditions, fish populations, and the effectiveness of conservation measures.

Habitat Restoration and Improvement:

- Riverine Habitat Restoration: Restore degraded riverine habitats by removing obstructions, improving water quality, and promoting riparian vegetation.
- Wetland Restoration: Create or restore wetlands to provide critical habitat for fish and other aquatic species.
- Floodplain Management: Implement measures to maintain the natural flood regime and protect floodplain habitats.
- Fish Population Assessment and Conservation:
- Fish Surveys: Conduct regular fish surveys to assess the abundance, distribution, and health of targeted fish species.
- Population Enhancement: If necessary, implement population enhancement measures, such as captive breeding and restocking.
- Habitat-Based Conservation: Focus on habitat-based conservation measures to support fish populations, including improving water quality, restoring spawning grounds, and reducing threats from fishing and pollution.

Community Engagement and Awareness:

- Community Workshops: Organize workshops to educate local communities about the

importance of habitat conservation and sustainable fishing practices.

- Community-Based Monitoring: Involve local communities in habitat monitoring and data collection.
- Alternative Livelihoods: Support the development of alternative livelihoods for local communities to reduce dependence on unsustainable fishing practices.

1.1.3 Third consultation

- The third consultation was conducted at household, village, and commune level stakeholders focusing on status, concerns and feedback regarding the project implementation. This consultation was conducted between 10 and 18 August 2024.
- Overall, it is apparent that in the sub-schemes contain young population indicating its high potential in future development activities. Agriculture was reported as the main occupation of the population within the command areas. While business and service are the second highest proportion. As for secondary occupations, full-time workers were dominant among the population while rice and crop production accounting for the second largest proportion. A notable 4% of the population falls under poor categories 1 and 2, reflecting the economic conditions of the areas. The proportion of people with disabilities (PWD) stands at 1.1%. Additionally, the total migration rate is 13%, with all migrations occurring domestically.
-

1.1.4 Fourth consultation

The last consultation was conducted between 21 and 23 August 2024 with the district and provincial stakeholders, mainly focusing on the opinion, and feedback regarding the implementation of the project.

1.1.4.1 Environment and Biodiversity Component

1.1.4.1.1 Pollution prevention and resource efficiency

Concerns

- The construction process can release dust, which will disturb the local community and surface water quality.
- The disposal of solid, liquid, and domestic waste from the workers at the irrigation construction site will negatively impact local air quality and surface water.

Feedback and Suggestions

- Regularly watering on the road transports construction materials and soil to reduce dust that may disturb nearby residents.
- Install garbage bins and waste storage areas in the construction sites and conduct orientation workers to put the waste in the garbage bins.

1.1.4.1.2 Biodiversity

Concerns

- The fish populations in command areas may decrease due to disrupting the natural flow of water and the impact on their habitats from the implementation of the reirrigation infrastructure and canal upgrading.

Feedback and Suggestions

- The project should avoid construction activities and improve irrigation on fish and aquatic habitats.
- Prevent damage from the construction activities to biodiversity, habitats, and other environmental components.
- Maintain existing large trees along the dam and canal within the sub-schemes during the reirrigation and upgrading process.

1.1.4.1.3 GHG emission

Concerns

- Climate change is negatively impacting rice production, causing problems such as increased disease, insect infestations, and extended dry seasons,

Feedback and Suggestions

- Installing solar water pumps in agriculture processing facilities can reduce fuel consumption, which causes greenhouse gas emissions.

1.1.4.2 Social Component

1.1.4.2.1 Labor and Working Conditions

Concerns

- The presence of construction staff and workers could lead to gender-based violence affecting women workers, women and children in the community.

Suggestions

- Should offer training to their staff and workers on gender issues, violence, and legal protections.
- Preventive support measures should also be put in place to stop abuse, and any incidents must be swiftly handled to avoid repetition. The training should be conducted by technical officers.

1.1.4.2.2 Community Health and Safety

Concerns

- Concerns about the presence of workers could cause sexual abuse of women and children living near the project site

Suggestions

- To prevent incidents, construction staff should regularly place warning signs and water the roads, as well as schedule construction times to minimize noise pollution that could disrupt the community and notify authorities upon project completion to avoid quiet handovers.

1.1.4.2.3 Land acquisition, economic and physical displacement

Concerns

- Landowners along the irrigation system without land registration are concerned they may not receive compensation due to the lack of title deeds.
- Conflicts between the project and affected families could emerge, often fuelled by external instigators rather than the families themselves.

Suggestions

- A preliminary study on land issues before construction is recommended, with each sector addressing specific aspects of land impact and conducting evaluations for each affected property.
- The project/construction company must collaborate with local authorities to resolve land-related issues, and compensation should be provided to landowners affected by the project.
- The construction company should submit quarterly monitoring reports on implementation activities to the provincial department to identify and quickly resolve any issues.

- The government is requested to assist in issuing land titles to farmers with land adjacent to streams and canals.

1.1.4.2.4 Cross–cutting risks and impacts

Concerns

- Provincial department facing of limited budget to develop and rehabilitate the existing irrigation system

Suggestions

- The project should thoroughly examine the technical and situational aspects of the sub-scheme before construction to prevent water shortages or flooding post-construction, and it should be implemented promptly.
- Establish a Farmer Water User Group (FWUG) to oversee water use and maintenance by providing technical and management training, materials supported to effectively control and manage water distribution.
- The water consumption fee should be gathered from farmer which could be used later to support caretaker and maintenance the irrigation system.

1.1.4.2.5 Agricultural Production

Concerns

- The high cost of agricultural inputs continues to reduce farmers' profits.
- Climate change is negatively impacting rice production, causing problems such as increased disease, insect infestations, and extended dry seasons.
- Manure for fertilizer is declining due to reduced animal raising and lower cattle prices are prompting farmers to reduce livestock raising.

Suggestions

- Build more water storage and reservoir which able to store more water
- The irrigation should be constructed based on technical and water conditions in the area.
- Utilizing durable concrete for the canal system can improve the efficiency and longevity of the irrigation infrastructure.
- Installing and upgrading damaged sluice gates in both main and secondary canals can improve water distribution efficiency and prevent water loss in agricultural production and reirrigation systems.
- Construct both side roads along the canal to enhance transportation for farmers and traders.

Annex 3 – Grievance Monitoring Logbook

1.1 Reportable Incidents

The following incident types are to be reported using the environmental and social incident response process.

- **Fatality**: Death of a person(s) that occurs within one year of an accident/incident including from occupational disease/illness (e.g., from exposure to chemicals/toxins).
- **Lost Time Injury**: Injury or occupational disease/illness (e.g., from exposure to chemicals/toxins) that results in a worker requiring 3 or more days off work, or an injury or release of substance (e.g., chemicals/toxins) that results in a member of the community needing medical treatment.
- **Acts of Violence/Protest**: Any intentional use of physical force, threatened or actual, against oneself, another person, or against a group or community, that either results in or has a high likelihood of resulting in injury, death, psychological harm, deprivation to workers or project beneficiaries, or negatively affects the safe operation of a project worksite.
- **Disease Outbreaks**: The occurrence of a disease in excess of normal expectancy of number of cases. Disease may be communicable or may be the result of unknown etiology.
- **Child Labor:** An incident of child labor occurs: (i) when a child under the age of 14 (or a higher age for employment specified by national law) is employed or engaged in connection with a project, and/or (ii) when a child over the minimum age specified in (iii) and under the age of 18 is employed or engaged in connection with a project in a manner that is likely to be hazardous or interfere with the child's education or be harmful to the child's health or physical, mental, spiritual, moral or social development.
- **Forced Labor:** An incident of forced labor occurs when any work or service not voluntarily **performed** is exacted from an individual under threat of force or penalty in connection with a project, including any kind of involuntary or compulsory labor, such as indentured labor, bonded labor, or similar labor-contracting arrangements. This also includes incidents when trafficked persons are employed in connection with a project.
- **Environmental pollution incident:** Exceedances of emission standards to land, water, or air (e.g., from chemicals/toxins) that have persisted for more than 24hrs or have resulted in harm to the environment.
- **Discrimination based on SOGI:** Discrimination means creating a distinction, exclusion, or restriction which has the purpose or effect of impairing or excluding a person based on their real or perceived sexual orientation, gender identity, gender expression, or sex characteristics from being on an equal basis with others.
- **Sexual Exploitation:** Any actual or attempted abuse of position of vulnerability, differential power, or trust, for sexual purposes, including, but not limited to, profiting monetarily, socially, or politically from the sexual exploitation of another. In Bank financed operations/projects, sexual exploitation occurs when access to or benefit from a Bank financed Goods, Works, Non-consulting Services or Consulting Services is used to extract sexual gain.
- **Sexual Abuse:** Actual or threatened physical intrusion of a sexual nature, whether by force or under **unequal** or coercive conditions. In Bank financed operations/projects, sexual abuse occurs when a project related worker (contractor staff, subcontractor staff, supervising engineer) uses force or unequal power vis a vis a community member or colleague to perpetrate or threat to perpetrate an unwanted sexual act.
- **Sexual Harassment:** Any unwelcome sexual advance, request for sexual favor, verbal or physical conduct or gesture of a sexual nature, or any other behavior of a sexual nature that might reasonably

be expected or be perceived to cause offence or humiliation to another, when such conduct interferes with work, is made a condition of employment, or creates an intimidating, hostile or offensive work environment. In Bank financed operations/projects, sexual harassment occurs within the context of a subcontractor or contractor and relates to employees of the company experiencing unwelcome sexual advances or requests for sexual favor or acts of a sexual nature that are offensive and humiliating among the same company's employees.

- **Other**: Any other incident or accident that may have a significant adverse effect on the environment, the affected communities, the public, or the workers, irrespective of whether harm had occurred on that occasion. Any repeated non-compliance or recurrent minor incidents which suggest systematic failures that PMU deems needing the attention of the WB.

1.2 For environmental and social incidents

1.2.1 Form to be completed by PMU within 48 hours

Q1: Incident Details	
1. Date of Incident:	
2. Time:	
3. Date Reported to PMU:	
4. Date Reported to WB:	
5. Reported to PMU by:	
6. Reported to WB by:	
7. Notification Type (Email/'phone call/media notice/other):	
8. Full Name of Main Contractor:	
9. Full Name of Subcontractor:	
Q2: **Type of incident (please check all that apply)**	
1. ☐ Fatality 2. ☐ Lost Time Injury 3. ☐ Displacement Without Due Process 4. ☐ Child Labor 5. ☐ Acts of Violence/Protest 6. ☐ Disease Outbreaks 7. ☐ Forced Labor 8. ☐ Unexpected impacts on heritage resources 9. ☐ Unexpected impactson biodiversity resources 10. ☐ Environmental pollution incident 11. ☐ Dam failure 12. ☐ Other	
Q3: Description/Narrative of Incident	
For example: 1. What is the incident? 2. What were the conditions or circumstances under which the incident occurred (if known)? 3. Are the basic facts of the incident clear and uncontested, or are there conflicting versions? What are those versions? 4. Is the incident still ongoing or is it contained?	

5. Have any relevant authorities been informed?

Q4: Actions taken to contain the incident

Short Description of Action	Responsible Party	Expected Date	Status

For incidents involving a contractor:

1. Have the works been suspended under Contract GCC8.9?
   a) ☐ Yes
   b) ☐ No
2. Name of Contractor: **……**

Q5: What support has been provided to affected people?

1.2.2 Form to be completed by PMU (following investigation)

Q6. Fatality/Lost time Injury information

Cause of fatality/injury for worker or member of the public (please check all that apply):

1. ☐ Caught in or between objects
2. ☐ Struck by falling objects
3. ☐ Stepping on, striking against, or struck by objects
4. ☐ Drowning
5. ☐ Chemical, biochemical, material exposure
6. ☐ Falls, trips, slips
7. ☐ Fire & explosion
8. ☐ Electrocution
9. ☐ Homicide
10. ☐ Medical Issue
11. ☐ Suicide
12. ☐ Others

Vehicle Traffic:

13. ☐ Project Vehicle Work Travel
14. ☐ Non-project Vehicle Work Travel
15. ☐ Project Vehicle Commuting
16. ☐ Non-project Vehicle Commuting
17. ☐ Vehicle Traffic Accident (Members of Public Only)

Name	Age/DOB	Date of Death/injury	Gender	Nationality	Cause of Fatality/Injury	Worker (Employer)/Public

Q7: Financial Support/Compensation Types (To be fully described in Corrective Action Plan template)

1. ☐ Contractor Direct
2. ☐ Contractor Insurance
3. ☐ Workman's Compensation/National Insurance
4. ☐ Court Determined Judicial Process
5. ☐ Others
6. ☐ No Compensation Required

Name	Compensation Type	Amount (US$)	Responsible Party

Q8: Supplementary Narrative:

1.3 For SEA/SH Incident

1.3.1 Incident Form for SEA/SH (to be completed by PMU within 48 hours)

Q9. Incident Details		
Date of incident intake by project/GM:	Date Reported to PMU:	Date Reported to WBG:
Reported to project/GM by: 1. Survivor 2. Third party 3. Others:	Reported to PMU by: 1. GM operator 2. Directly, by Survivor 3. Directly, by third party 4. Others:	Reported to WBG by: 1. PMU 2. Directly, by Survivor 3. Directly, by third party 4. Other:
Q10. Is a record of this incident in GM? a) ☐ Yes b) ☐ No		
Q11: Incident type (please check all that apply) See Appendix 1 for definitions		
c) Sexual exploitation d) Sexual abuse e) Sexual harassment		
Q12: Provide the following details from the GM record.		
1. Age of survivor (if recorded in GM):		
2. Have the national legislation or mandatory reporting requirements been followed? f) ☐ Yes g) ☐ No		
3. Sex of survivor (if recorded in GM): a) ☐ Male b) ☐ Female c) ☐ Others		
4. Was the survivor referred to service provision? a) ☐ Yes b) ☐ No		
5. Is the survivor employed by the project (as indicated by the survivor or complainant and reported in the GM)? a) ☐ Yes		

	b) ☐ No
6.	Is the alleged perpetrator employed by the project (as indicated by the survivor or complainant and reported in the GM)? a) ☐ Yes b) ☐ No
Q13: Basis for further action	
1.	Has the complainant provided informed consent to lodge a formal complaint? a) ☐Yes b) ☐ No
2.	Does the employer have a suitable administrative process and capacity in place to investigate misconduct relating to SEA/SH in a survivor-centered way? a) ☐ Yes b) ☐ No
3.	Has the survivor provided informed consent to be part of an investigation into misconduct? a) ☐ Yes b) ☐ No
4.	Has the complaint been filed anonymously or through a third party? a) ☐ Yes b) ☐ No
5.	If the answer to any of these questions is no, has the GM assessed the risks and benefits of carrying out an investigation into the alleged misconduct, taking into account the survivor's safety and wellbeing? a) ☐ Yes b) ☐ No
6.	Will an investigation into misconduct be undertaken in addition to an investigation into adequacy of project systems, processes or procedures? a) ☐ Yes b) ☐ No

1.4 Incident Form for SEA/SH (to be completed by PMU following SEA/SH investigation)

Q14: Findings of the investigation	
1.	Have sanctions against a perpetrator been recommended as part of an investigation into misconduct? a) ☐ Yes b) ☐ No
2.	Has an investigation into adequacy of project systems, processes or procedures been undertaken? a) ☐ Yes b) ☐ No

Q15: Corrective actions to be implemented (To be fully described in Corrective Action Plan)		
Short Description of Action (SEA/SH examples)	**Responsible Party**	**Timeline for completion/Status**

1.	Referral of Survivor to holistic care services		
2.	Undertake disciplinary investigation in accordance with GM timelines and confirmed process		
3.	Disciplinary actions, including sanctions, to be applied following misconduct investigation by employer		
4.	Increased training on Codes of Conduct (CoC)		
5.	Audit of implementation of SEA/SH safety mitigation		
6.	Strengthened awareness training on project-related risks, CoC and how to report incidents for project-affected community		
7.	Training for project supervisors on the need to follow guidelines of behavior in CoC and their supervisory responsibilities		
8.	Plan to improve coverage/quality of service provision		
9.	Any other system strengthening measures or corrections for system failures that are necessary		

3.1 Project's Grievance Logbook

3.1.1 Sample for Local Levels

No	Name of complainant (or anonymous)	Addresses	Sex	Age	Contact information	Date Received	Details of nature of grievance (Environmental impacts, social impacts, labor, health, etc.)	Which of the three GRM that was used?	Actions taken to resolve grievance, by whom	How many steps that have been used in the relevant GRM	Date grievance was finally resolved/closed?	Notes

3.1.2 Sample for PMU Level to be elaborated on Excel spreadsheet with filter function

No	Questions	Response
1	**Date Received:**	
2	**Name of Complaint** (or anonymous):	
3	**Sex:**	
4	**Age:**	
5	**Contact information** (Phone number/email, other channel(s):	
6	**Location of Complainants** (Province, District, commune, village):	
7	**Form of grievance received** (Writing or Verbal (face to face, telephone, online), SMS, MOWRAM and DoWRAM comment box in designated Website/Face book/What's App, etc.	

8	**Channel of Receipt** (Direct to PMU GRM Focal Point, or Relayed from other channels (Provide details)	
9	**Key topics of Grievances** a) Labor and Working Condition Resettlement (incl Voluntary Land Donation) b) SEA/SH c) Environmental impacts d) Community Health and Safety Accidents

Annex 4 – Worker's Code of Conducts

The Annex has two Code of Conduct (COC): one is for ESHS and SEA/SH/VAC, and the other is for working with local Ethnic Communities.

1.1 Code of Conduct related to ESHS and SEA/SH/VAC

Instructions:

This Code of Conduct shall be perused and signed by all individual workers who enter direct work contract with a) PMU, b) PMU's consulting firms and service providers, c) contractors who renovate existing HCFs.

I,_____, acknowledge that adhering to environmental, social, health and safety (ESHS) standards, following the project's occupational health and safety (OHS) requirements, and prevention of Sexual Exploitation & Abuse (SEA)/Sexual Harassment (SH), are important.

I understand that that failure to follow ESHS and OHS requirement, or to partake in activities constituting SEA/ SH -- be it at the project site, the surrounding area of the project site, workers' camps, or the project communities, including community members and project workers, constitute acts of gross misconduct and are therefore grounds for sanctions, penalties, or potential termination of employment. Prosecution by the Police of those who commit SEA/SH may be proceeded as applicable under relevant Laws.

I agree that while working on the project, I will:

- Carry out my duties competently and diligently.
- Comply with this Worker's Code of Conduct and all applicable laws, regulations, and other requirements, including requirements to protect the health, safety and well-being of other project workers, and any other person and community members.
- Maintain a safe working environment including by:
    - Ensure that workplaces, machinery, equipment, and processes under each person's control are safe and without minimal risk to health and safety of those involved.
    - Use appropriate measures relating to chemical, physical and biological substances, and agents; and
    - Follow applicable emergency response procedures.
- Report works situations that I believe unsafe or unhealthy to either project workers and/or community and remove myself and inform those relevant to remove themselves from a work situation which I reasonably believe imminent and dangerous to safety, life, and

health of those involved.

- Consent, if required, to a background check in any place I have worked for more than six months.
- Attend and actively partake in training courses related to ESHS, OHS, SEA/SH and VAC, as requested by my employer.
- Always wear my personal protective equipment (PPE), as required while at work or engaged in project related activities.
- Take all practical steps to implement the environmental and social management plan (ESMP), which may include OHS Management Plan.
- Abide by a zero-tolerance policy as to SEA/SH/VAC and alcohol consumption during work activities, and refrain from use of narcotics or other substances which can impair worker's expected working ability and judgement.
- Respect women, children (persons under 18 years of age), and the elderlies regardless of their ethnic background, language, religion, personal opinions, disability, and/or other socioeconomic status.
- Shall not use language or behavior that are inappropriate to community members and project workers, particularly women, children, and the elderlies,
- Shall not commit any sexual abuse and or exploit, and/or sexual harassment of any kinds to community members in the project area and any project workers.
- Shall not engage in sexual harassment of project personnel and staff — for instance, making unwelcome sexual advances, requests for sexual favors, and other verbal or physical conduct of a sexual nature (looking somebody up and down; kissing, howling or smacking sounds; hanging around somebody; whistling and catcalls; in some instances, giving personal gifts.
- Shall not engage in offering any work-related favors such as making promises of favorable treatment (i.e., promotion), or make threats of unfavorable treatment (i.e., loss of job), or make payments in kind or in cash depending on sexual acts — or other forms of humiliating, degrading or exploitative behavior.
- Shall not engage in using prostitution service -- in any form and at any time during project implementation.
- Shall not participate in sexual contact or activity with children under 18 years of age — including grooming or contact through digital media. Mistaken belief regarding the age of a child is not a defense. Consent from the child is also not considered a defense or excuse.
- Consider reporting through the project's GRM, or to my manager, any suspected or actual SEA/SH deed by a fellow worker, whether employed by my company or not, or any breaches of this Code of Conduct.
- Complete relevant training courses that will be provided related to the environmental and

social aspects of the Contract, including on health and safety matters, and Sexual Exploitation & Abuse, Sexual Harassment, and Violence Against Children (VAC).

- Report violations of this Code of Conduct; and

With respect to children under the age of 18:

- Bring to the attention of my manager the presence of any children on the construction site or engaged in hazardous activities.
- Wherever possible, ensure that another adult is present when working in proximity to children.
- Shall not invite unaccompanied children unrelated to my family into my home unless they are at immediate risk of injury or in physical danger.
- Not use any computers, mobile phones, video, and digital cameras or any other medium to exploit or harass children or to access child pornography (see also “Use of children's images for work related purposes” below).
- Avoid, in all circumstances, any verbale and/or physical punishment or discipline of children.
- No hiring of children (under 18) in any project activity.
- Comply with all relevant local regulations, including labor law in relation to child labor and forced labor.
- Take appropriate caution when photographing or filming children (see also section below). Photos or films of children should not be taken under the project, except for instances showing the benefits or impacts of road works, such as impacts to schools or school safety trainings.

Use of children's images for work related purposes

When photographing or filming a child for work related purposes, I must:

- Before photographing or filming a child, assess and endeavor to comply with local traditions or restrictions for reproducing personal images.
- Before photographing or filming a child, obtain informed consent from the child and a parent or guardian of the child. As part of this, I must explain how the photograph or film will be used.
- Ensure photographs, films, videos present children in a dignified and respectful manner and not in a manner that is vulnerable or submissive. Children should be adequately dressed up and not in poses that could be seen as sexually suggestive.
- Ensure images are honest representations of the context and the facts.
- Ensure file labels do not reveal identifying information about a child when sending images electronically.

Raising Concerns

If any person observes behavior that I believe may represent a violation of this Code of Conduct, or that otherwise concerns me, I will raise the issue promptly. This can be done in either of the following ways:

1. Contact [enter name of the Employer's Social Focal Point] to handle these incidences.
2. Call Employer's telephone number (See contact detail at Section 5 of project's Stakeholder Engagement Plan).

The person's identity will be kept confidential, unless reporting of allegations is mandated by the country law. Anonymous complaints or allegations may also be submitted and will be given all due and appropriate consideration. PMU will take all reports of possible misconduct seriously and will investigate and take appropriate action. In case of SEA/SH, PMU will provide referral to local service provider who will provide support to SEA/SH victims (See also Section 6.4 of project's Stakeholder Engagement Plan).

There will be no retaliation against any person who raises a concern in good faith about any behavior prohibited by this Code of Conduct. Such retaliation would be a violation of this Code of Conduct.

Sanctions

I understand that if I breach this Workers' Code of Conduct, my employer will take disciplinary action which could include:

- Informal warning.
- Formal warning.
- Additional Training.
- Termination of employment.
- Report to the Police if warranted.

I understand that it is my responsibility to:

Ensure that the Environmental, Social, Health and Safety requirements are met. Adhere to the Occupational Health and Safety Management Plan

Avoid actions or behaviors that could be construed as SEA/SH/VAC. Any such action will be a breach of this Workers' Code of Conduct.

I hereby acknowledge that I have perused the foregoing part of this Workers' Code of Conduct, agree to comply fully with the requirements contained therein and understand my roles and responsibilities to prevent and respond to ESHS, OHS, SEA/SH/VAC issues. I understand that any actions that are inconsistent with this Workers' Code of Conduct, or failure to act as mandated by this Workers' Code of Conduct may result in disciplinary action and may affect my ongoing employment.

1.2 Code of Conduct for Working with Local Ethnic Communities

This Code of Conduct is grounded on the objectives of the WB's ESS7, which are:

- To ensure that the development process fosters full respect for the human rights, dignity, aspirations, identity, culture, and natural resource-based livelihoods of Indigenous Peoples.
- To avoid adverse impacts of projects on Indigenous Peoples, or when avoidance is not possible, to minimize, mitigate and/or compensate for such impacts.
- To promote sustainable development benefits and opportunities for Indigenous Peoples in a manner that is accessible, culturally appropriate and inclusive.
- To improve project design and promote local support by establishing and maintaining an ongoing relationship based on meaningful consultation with the Indigenous
- To recognize, respect and preserve the culture, knowledge, and practices of Indigenous Peoples, and to provide them with an opportunity to adapt to changing conditions in a manner and in a timeframe acceptable to them.

Annex 5 – Simplified Pest Management Plan

1.1 Rationale

In Cambodia, around 90% of cultivated land is used for rice production. Rice alone accounts for about 70% of the country's total calorie supply. Rice production contributes an estimated 44% of rural household income, making the rice sector an area for strategic development in the country. Despite rice is the major crop in Cambodia, rice production is characterized by widespread misuse of pesticides. This is due to inconsistent enforcement of current regulation and a lack of information on pesticide safety and alternative pest management techniques among rice farmers. Most pesticides are imported and labelled in a foreign language incomprehensible to farmers. It is common that rice farmers mix two to five pesticides by intuition, leading to pesticide poisoning among farmers and adverse impact on environment[12]. Rice farmers tend to apply more pesticide when they see pests on their field[13]. Vegetable farmers also typically mix various types of pesticides per spray which is not good practice[14].

The CWSIP project will 1) improve overall water security for all stakeholders in the targeted basins in three provinces, 2) exploit the potential of the unused water resources and increase agricultural productivity in the targeted basin, and 3) enhance the overall capacity of the water resources management of the central government, concerned local governments, and concerned communities. Through three out of five project components, the project will improve 1) Water Service Delivery, 2) Agricultural Productivity, and 2) Water Resources Management. The project does not involve procurement of pesticides.

Under CWSIP, the project will support target farming population in irrigated area to improve their use of good agricultural practices, including integrated crop water management, climate-smart agriculture (diversification into high-value crop plantation, public-private-partnership and commercialization), as well as agribusiness and trade development. The CWSIP does not involve procurement of chemical fertilizers, pesticides, and/or other toxic agrochemicals nor promote use of chemical agricultural inputs during project implementation. However, rehabilitation /upgrading of existing reservoirs/irrigation system, etc. to be financed under the Project are expected to increase the agricultural command areas, including the number of crops per year. This increased crop may give rise to increased use of fertilizers, pesticides, and/or other toxic agrochemicals in the subproject areas which are unintended impact of the project.

1.2 Key Pesticide Management Outcomes in Cambodia

[12] https://ipmil.cired.vt.edu/our-work/projects/rice-ipm-for-cambodia/

[13] Matsukawa, M., Ito, K., Kawakita, K. et al. Current status of pesticide use among rice farmers in Cambodia. Appl Entomic Zool51, 571–579 (2016). https://doi.org/10.1007/s13355-016-0432-5.

[14] Sim Skooching, Keo Socheat and Sarom Moldiest. 2021. Pesticide Use Practices in Cambodia's Vegetable Farming. CDRI Working Paper Series No. 128. Phnom Penh: CDRI.

Pesticide Use and IPM implementation in Project Provinces: General Directorate of Agriculture (GDA)'s survey in 2014 and nation-wide inspections in 2013 of pesticide and herbicide suppliers in provincial capitals and other main distribution hubs, indicate that the most commonly sold products include: abamectin, chlorpyrifos, cypermethrin, glyphosate, imidacloprid. In the Northern provinces, where a large part of the herbicide use is on corn and rubber plantations, the main products sold are the herbicides Glyphosate, Paraquat and Atrazine. Nowadays, on Rice and Maize cultivation farmers don't use pesticide accept some vegetables. These inspections have also shown that the most problematic highly hazardous products, such as monocrotophos, methyl parathion, methamidophos, mevinphos, endosulfan, etc., are no longer found on the market with the exception of the occasional old bottle. The only banned products that still are found regularly are paraquat and methomyl. This is because these products were banned only recently (2010) and are still permitted in the neighboring countries from where they are informally brought in by users or retailers. The banning of highly hazardous pesticides in China does not seem to have led to dumping of old stocks in Cambodia. There are no known large stocks of obsolete pesticides.

Insecticides are used mainly on vegetables (such as Long Yard Bean, Chilly, Cabbage, Chinese Cabbage) marketable high-value crops and plantation crops, notably rubber. Field surveys by the national IPM program and GDA indicate there still is wide-spread abuse of pesticides among farmers. Lack of knowledge among farmers is a major constraint. Abuse includes mixing without justification (just to be sure), use of wrong pesticides, use of wrong dosages, etc. Adequate protective gear is hardly being used. Shops often have gloves and masks for sale, but these tend to be inadequate for protection against hazardous chemicals. Buyers of pesticides rarely also buy protective gear, and shops do not provide it for free. Half used pesticide bottles or packages are often stored within the house or near homesteads, often in easy reach of children. Empty pesticide containers are often discarded at the border of fields or in drainage ditches.

1.3 Government Regulation Related to Pest Management

Pest management practices in Cambodia have been promoted through the expansion of the National Integrated Pest Management (IPM) Program by both the government and NGOs. These agencies have been working together to establish a Pesticide Reduction Network to develop awareness of the risks associated with pesticide use amongst farmers.

As a key function, Ministry of Agricultural and Forestry (MAFF) has been examining and implementing various international legal guidelines and instruments relating to regulating the trade, distribution and use of pesticides in Cambodia. These include adherence to the FAO Code of Conduct on the Distribution and Use of Pesticides, the Stockholm Convention on Persistent Organic Pollutants, and the WTO sanitary and phytosanitary measures.

Following the promulgation of the Law on Management of Pesticides and Fertilizers as Royal Kram Number 0112/005 on 14th January 2012, MAFF had developed five Prakas in relation to Procedures for Registration and Business Operations, as follows:

- Prakas No. 415/MAFF dated 17 August 2012, on Procedures and Standard

Requirements for Fertilizer Registrations.

- Prakas No. 456/MAFF dated 19 October 2012, on Procedures and Standard Requirements for Pesticide Registrations.
- Prakas N. 484/MAFF dated 26 November 2012, on List of Pesticides in the Kingdom of Cambodia.
- Prakas No. 119/MAFF dated 11 April 2013, on Procedures for Management of Fertilizers for Business Operations.
- Prakas No. 120/MAFF dated 11 April 2013, on Procedures for Management of Pesticides for Business Operations.

Within MAFF, the Department of Agriculture Legislation and GDA are mandated to oversee all pesticide regulations and use.

1.4 International Code of Conduct on the Distribution and Use of Pesticides

The following rules are observed for IPM:

- The standards of conduct set forth in this Code: 1.7.6. are designed to promote Integrated Pest Management (IPM) (including integrated vector management for public health pests).
- Concerted efforts should be made by governments to develop and promote the use of IPM. Furthermore, lending institutions, donor agencies and governments should support the development of national IPM policies and improved IPM concepts and practices. These should be based on scientific and other strategies that promote increased participation of farmers (including women's groups), extension agents and on-farm researchers.
- All stakeholders, including farmers and farmer associations, IPM researchers, extension agents, crop consultants, food industry, manufacturers of biological and chemical pesticides and application equipment, environmentalists and representatives of consumer groups should play a proactive role in the development and promotion of IPM.
- Governments, with the support of relevant international and regional organizations, should encourage and promote research on, and the development of, alternatives posing fewer risks: biological control agents and techniques, non- chemical pesticides and pesticides that are, as far as possible or desirable, target-specific, that degrade into innocuous constituent parts or metabolites after use and are of low risk to humans and the environment.
- Governments should provide extension and advisory services and farmers' organizations with adequate information about practical IPM strategies and methods, as well as the range of pesticide products available for use.

- Governments should ensure that any pesticide subsidies or donations do not lead to excessive or unjustified use which may divert interest from more sustainable alternative measures.

1.5 Current Governmental Implementation Arrangements Related to Pest Management

Integrated Pest Management (IPM) refers to all pest control techniques and subsequent integration of appropriate measures that discourage the development of pest populations and keep pesticides and other interventions to levels that are economically justified and reduce or minimize risks to human health and the environment. IPM emphasizes the growth of a healthy crop with the least possible disruption to agro-ecosystems and encourages natural pest control mechanisms.

Under MAFF, Plant Protection Centers and their branches in provinces as well as Agricultural Extension Centers at district level are governmental agencies that coordinate and work on Integrated Pest Management Programs. These activities are built on the National IPM program that was initiated with assistance from the FAO, DANIDA and other donors since early 1990s which is largely being maintained using national budget.

IPM activities implemented by these local authorities and technical backstopping by experts from GDA include conducting field surveys, making forecast, monitoring and checking progress of on-field pest development. Using the forecast based on the timing, scale and level of damage that the key pests may cause, provincial plant protection authorities recommend policies, plans, and measures for pest management purposes.

Relevant authorities such as Plant Protection Centers and Agricultural Extension Centers also conduct IPM training for farmers. Farmers learn how to implement various integrated measures such as pest identification, pest control, pest analysis, pest surveillance, and apply measure to control pest, such as applying chemical and botanical control agent, promoting application of biological measures for pest management, reducing chemicals and practice sustainable IPM. Farmers are also trained on proper use of chemical pesticide and fertilizers to ensure efficiency in pest management, ensuring safety for human, natural enemy, and the environment. Communication campaigns on plant protections and quarantine legislations and advance IPM technics to the farmers are also carried out depending on budget availability, etc.

GDA's Plant Protection Center, including the national IPM program, has developed a 3-day curriculum for a Farmer Training on Pesticide Risk Reduction (FT-PRR) which is intended to raise awareness, develop capacity and help rural communities formulate and implement their own action plans for pesticide risk reduction. As of June 2014, some 4,900 Lao farmers (including 1,600 women) have participated in FT-PRR courses in 149 villages of 34 Districts in 9 provinces. Season-long Integrated Pest Management training through Farmers Field Schools (FFS) often includes these short-duration FT-PRR courses. These FFSs allow farmers to learn about and adopt Integrated Pest Management to reduce overuse of pesticides in crop production. 10. The

National IPM Program has implemented 806 season-long IPM Farmers Field Schools, with over 24,350 rice, vegetable and fruit farmers trained. More, however, remains to be done. Pesticide Risk Reduction and IPM adoption at farm level remains a priority for the Government.

Operational costs of plant protection agencies are allocated from state funds. Their staff also work on projects and programs that are financed by other international funding and conduct additional annual trainings (using international budget) for farmers.

1.6 Objective of Simplified Pest Management Plan

This Simplified Pest Management Plan (S-PMP) aim to see out plan and measures to ensure the project does not unintentionally give rise to increased overuse of chemical agricultural inputs (such as chemical pesticide, fertilizers, and plant growth regulators, etc.). This S-PMP will be integrated into on-going pest management program and effort that provincial DAFF in project provinces have been doing and make sure pest management efforts target areas where water access is improved through project investment activities.

To mitigate this potential impacts as a 'good practice', the subproject owner will prepare and implement a S-PMP aiming to increase famers knowledge on Government regulations, policies, and/or technical guidelines related to safe use (application, storage, and disposal) of pesticides and toxic agrochemicals likely to be used by farmers as well as promote the application of an Integrated Pest Management (IPM) practice that are appropriate for the agriculture productions in the subproject area through training and other capacity building activities.

Key Elements - The elements of the S-PMP include the followings:

- Preventing pest problems.
- Monitoring for the presence of pests and pest damage.
- Establishing the density of pest population, which may be set at zero, that can be tolerated or corrected with a damage level sufficient to warrant treatment of the problem based on health, public safety, economic or aesthetic threshold.
- Treating pest problems to reduce population below those levels established by damage thresholds using strategies that may include biological, cultural, mechanical and pesticidal control methods and that shall consider human health, ecological impact, feasibility and cost effectiveness; and
- Evaluating the effects and efficacy of pest treatments.

Decision Making

Detecting a single pest under the Project will not always mean control is needed. A decision to use pesticides will be taken only as the very last resort and will also be based on conclusions reached from an agroecosystem analysis and trials. The decision will also depend on the number of pests and diseases found in the respective crop and the level of damage they are doing. If it is

necessary to spray crops with pesticides, use of selective rather than broad-spectrum pesticides shall be strictly observed.

Pest Monitoring and Surveillance

A process for the reporting and identification of unusual plants, animals and pests will be established to

track and document all pest cases, be it minor or major in a pest inventory register. Pest surveys will be conducted on a regular basis to detect new infestations and will include the types, abundance, location of pest plants, date when first spotted or seen, and date when reported. This information will be

gathered from surveillance or monitoring system to be put in place, periodic surveys to be conducted and feedback from farmers/farm assistants. The data will be managed in a standardized way so that trends can be established. A rapid response process for the management of new infestations will be established to treat and manage new pest infestations as soon as they are identified.

Table 1. Potential impacts and proposed mitigation for pest

Potential Impacts	Proposed Mitigation
Contamination of ground water resources	Conducting trials on relatively flat land with less than 2% slope reducing the possibility of run off and at more than 500m away from water sources
Effect of pesticides on non-target species	Use pesticides that are systemic and narrow range and specific to sucking insects.
Effect of pesticides on grazing areas, settlements	Spraying in the morning hours when the weather is cool and less windy to reduce spray drifts. Locating trials or plots at distance of between 500-1000m away grazing areas or human settlements
Possibility of increasing resistance of pests to the pesticide	Training of field staff responsible on recommended usage of the pesticide
Harmful effects on staff applying pesticides	Provision and usage of safety clothing and working gear to staff
Harm to people within the homestead where the chemical is stored	Designation of a separate and secured storage room for pesticide Warnings and notices to increase awareness

1.7 Mitigation Measures

It is expected that there will be no procurement of pesticides under the project and that pesticide use, overall, will decline as a result with the introduction of good agricultural practices. To ensure the tendency of increased overuse of pesticide does not happen with subproject where project intervention take place, the project will prohibit procurement of large pesticides using the “negative list” and provide training to key staff and farmers on integrated pest management, safe use of pesticides, and organic farming practices. This will be integrated as part of the safeguard training. This S-PMP will be applied to the project activities that involve:

a) Any rehabilitation/upgrading of weirs/reservoirs/dams/existing irrigation schemes that are likely to prompt farmers to increase their use of pesticides:

b) Change/introduction of best agricultural practices such as integrated crop water management, Climate-smart agriculture, and

c) Promotion of agribusiness and trade related to farm products produced from target command area, and neighboring areas.

The plan is comprised of three parts:

(i) Application of government regulation on pesticide control.

(ii) Training of the integrated pesticides concept and/or other approaches for the safe use of pesticides; and

(iii) Monitoring.

Annex 6. Biodiversity Assessment Findings for Krapeu Truom Sub-scheme

1.1 Proposed project activities and potential risks and impacts

By carefully considering the ecological implications of the project, it is possible to balance the needs of agriculture with the environment and ecosystem functions. Under Krapeu Trom, various activities will be carried out that cause the following E&S risks and impacts:

Table 1: Projection activities that may cause potential impacts on the environment and social aspects at Krapeu Trom sub-scheme

No.	Project activities that cause impacts	E&S Risks & Impacts
1	Construction activities (rehabilication of canal and farm roads), land use changes, and water management practices	**Habitat loss and fragmentation** could lead to habitat loss and fragmentation, affecting species' survival and connectivity. This activity may involve dredging, excavation, or modification of existing water channels and infrastructure. These activities can lead to habitat destruction, disturbance to nesting and foraging sites, disruption of natural water flow patterns, and alteration of hydrological regimes. This can directly impact both terrestrial and aquatic biodiversity.
2	Increased agricultural activities, sedimentation, and pollution	**Water quality degradation** could impact aquatic ecosystems and species that rely on clean water.
3	Dredging of waterways and Alteration of water levels	Changes in water levels within the command area due to irrigation system renovation may negatively impact wildlife dependent on specific habitats for breeding or foraging purposes. Changes in water levels and habitat quality could force endangered species to relocate, potentially leading to competition with other species or exposure to new threats.
4	Use of chemicals and nutrient loading	If pesticides/fertilizers are used during agricultural practices within the command area as part of irrigation system renovation projects, it could lead to contamination of soil and water resources affecting both terrestrial and aquatic biodiversity.
5	Biodiversity degradation, and soil erosion	The **potential** impacts of the project on water flow, water quality, and sedimentation patterns. The changes in microclimate.

6	Blockage of migration routes by dams or other structures	Irrigation structures, such as dams and weirs, can create physical barriers that prevent fish from migrating upstream or downstream. This can disrupt their reproductive cycles and reduce their survival rates.

1.2 Areas of Influence

Potential areas of influence might include:

- Downstream areas: The lower reaches of the Stoeung Krang Ponley River and the Tonle Sap Lake, may be affected by water quality, sediment loads, and fish migration from Krapeu Trom.
- Upstream areas: The upper reaches of the Stoeung Krang Ponley River and its tributaries, which may be influenced by water flow regulation and sediment transport from Krapeu Trom.
- Adjacent ecosystems: Forests, wetlands, and agricultural areas that are connected to Krapeu Trom through hydrological or ecological processes.

1.3 Analysis to prepare for determining CH status

1.3.1 Critical Habitat Area of Analysis

Critical habitat is defined as an Area of Analysis (AoA), and the project's command area is used as an AoA.

1.3.2 Species with Potential Occurrence within the AoA

A list of threatened species with potential occurrence was generated for Krapeu Trom (KT). The coordinates of KT (via KMZ file) are used to inform the IBAT radius of screening. Since the default radius of IBAT screening is 50km, steps were taken to narrow down to the sub-scheme's area of influence to identify only EN and CR species that are potentially present in the sub-scheme area of influence. The narrowing-down aims to practically identify EN and CR species that could be found in the sub-scheme area of influence and to determine the Critical Habitat status of the identified species.

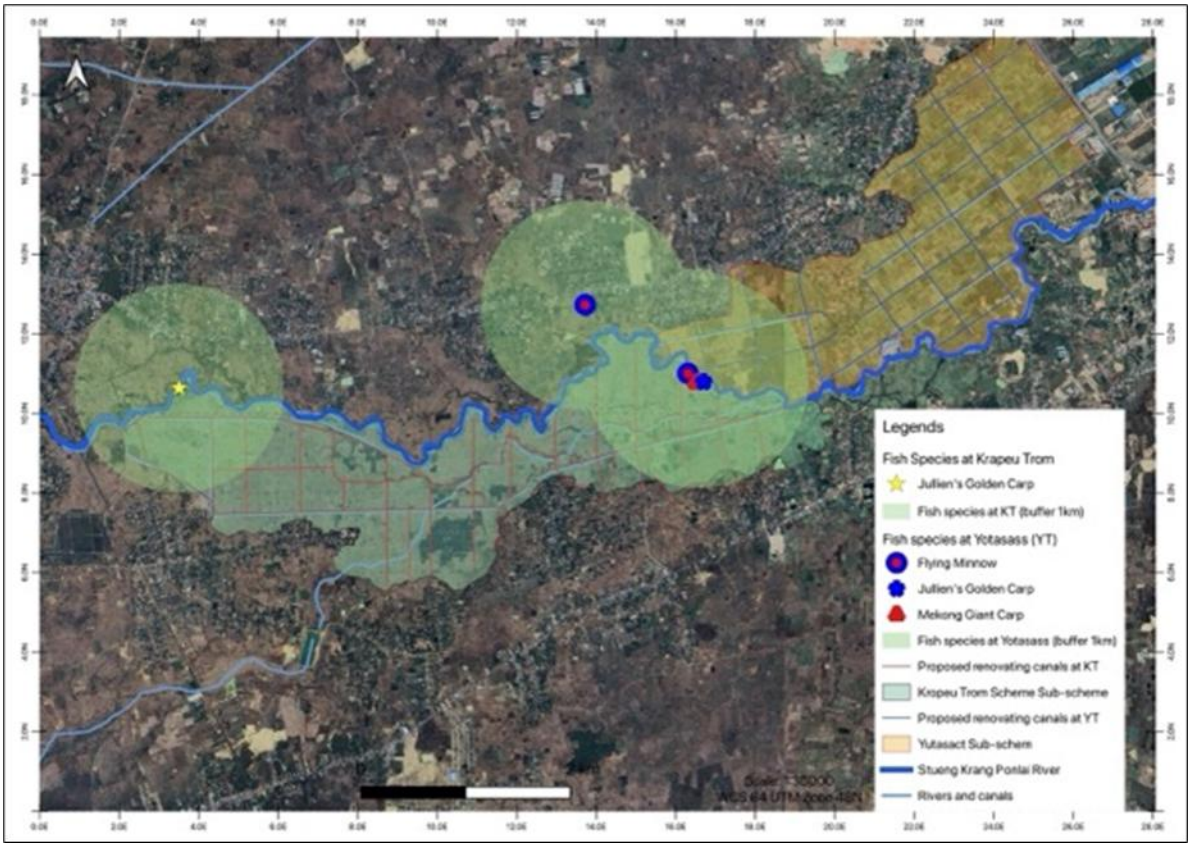
Description of screening for narrowing down

For Krapeu Trom, three rounds of screening have been conducted. The first screening (Round 1) was conducted in December 2023. Round 2 was carried out in April 2024, and Round 3 in August 2024. The purpose of repeated screening is to validate the screening results (for the same area) with a wide range of local stakeholders. The screening aims to identify only EN and CR species that are potentially present in the OTP area of influence, covering reptiles, mammals, fish, birds, amphibians, and aquatic plants. Screening was done based on the IBAT report generated and provided by the AIIB.

In the first two rounds of screening, there were two fish species (Isok barb/Jullien's Golden Carp and Leaping barb/Flying Minnow) were screened for the first two rounds. After three rounds of

screening focusing on EN and CR species, only Flying Minnow is confirmed as potentially present in the sub-scheme area of influence.

1.3.3 Ecological State of Habitats within the AoA



Understanding of the ecological state of habitats is necessary to assess the Likelihood of occurrence (LoO) of the above 11 screened species - as part of the CHA. For this CHA, species were classified into four LoO categories: Present, Possible, Unlikely and Not Present. Species known to be Present or with a Possible LoO are further assessed in Step 3. This understanding takes into account the classification of habitats as either modified or natural based on levels of human-induced disturbance to species composition and ecological functions. In this session, a brief assessment of the one confirmed species is presented. The assessment discusses historical range, distribution, habitat conditions, current status, and potential threats identified by key informants.

The Krapeu Trom command area has been in existence since the 1970s. The KT is a mixture of paddy fields, farm roads, and residential areas. Natural rivers, such as the Stueng Krang Ponlai serve as the sole ecological and hydrological connection between its upstream watershed and the Tonle Sap River basin downstream. This river is crucial for fish migration during the flooding season. However, reservoirs, spillways, and drought conditions have disrupted these essential ecological functions.

1.3.4 Fish (1 species)

Krapeu Trom, like Brambei Mom, is situated within the same river catchment area in the lower reaches, near the Tonle Sap's annual floodplain. Two fish species, the Isok barb/Jullien's Golden Carp (Probarbus jullieni) and Leaping barb/Flying Minnow (Laubuka caeruleostigmata), were targeted for interviews in this command area. Among ten key informants interviewed, only one reported encountering the Jullien's Golden Carp once in 2022, approximately 500 meters downstream of the reservoir facility during a flooding event (see map below). This individual stated that the species migrated upstream from the Tonle Sap during the flood season but became trapped in spillways. They added that if flooding is insufficient, fish populations decline, and rare species may no longer be present in the area.

Figure 23: A spatial distribution map was generated for four fish species at Krapeu Trom and Yutasas Command Area. 1 km buffer zones were included to approximate their minimum movement range around suitable habitats.

1.4 Determination of Critical Habitat Status (Step 3)

This section assesses the information (obtained from the above sub-section) vis-a-vis the criteria (presented in Section 3.4 - CH assessment method). This assessment aims to determine whether any species qualify for Critical Habitat features.

1.4.1 Habitat of significant importance to CE and EN species

As presented in Section 4.4.3.3 (Ecological State), the species that qualifies as a critical habitat feature is the Flying Minnow. Krapeu Trom Command Area is part of Stueng Krang Ponlai River system (Tonle Sap's tributary) and situated approximately 11 km from Tonle Sap River. The area was influenced by flood-plus water from Stueng Krang Ponlai upstream and the push-up of flood water from Tonle Sap River Basic allowing fish to short distance migration for food and breeding.

Although climate change has caused dry and drought more frequently, this area still receives a good amount of flood from its upstream and downstream making a good connectivity and providing ecological function for migratory fish.

1.4.2 Habitat of significant importance to endemic or restricted-range species

None of the species under EN and CR classification are restricted-range species (based on IBAT report for sub-scheme).

1.4.3 Habitat supporting globally or nationally significant concentrations of migratory or congregation species

None of the IBA that are recognized for significant concentrations of migratory birds or other species are found within the vicinity of the sub-scheme. No other evidence of significant concentrations of migratory or congregatory species is available. The AoA for KT, therefore is expected to qualify as critical habitats under this criterion.

1.4.4 Highly threatened or unique ecosystems

Each of the reservoirs are modified habitat and is associated with numerous rice paddies. There is no evidence that these areas are highly threatened or unique ecosystems, and no critical habitats are recognized under this criterion.

1.4.5 Ecological functions or characteristics that are needed to maintain the viability of the biodiversity values described above in (a) to (d)

No ecological functions that are necessary to support biodiversity values (described under the above criteria) have been identified.

1.5 Mitigation Measures for all sub-schemes

1.5.1 Overviews

Krapeu Trom: this sub-scheme confirmed the potential presence of only the endangered Flying Minnow. While another species was reported downstream, its presence within the sub-scheme was unconfirmed. Existing water infrastructure and drought have already impacted fish migration. Construction activities may further threaten the Flying Minnow and its habitat. Mitigation measures are recommended across all project phases, including habitat avoidance, buffer zones, pollution control, water quality and fish population monitoring, and public awareness.

1.4.6 Trigger of Implementation

Overall: The reports emphasize the urgent need for careful project planning and mitigation measures, including habitat restoration and sustainable water management, to minimize negative impacts on vulnerable species and their critical habitats. The project's area of influence extends beyond immediate command areas, requiring a holistic approach to conservation. Collecting and trafficking protected species are prohibited as described in the *Cambodia law/regulation:*

- Forestry Law (2002): This law provides the framework for the management and protection of forests, including wildlife. It prohibits hunting, capturing, and trading protected wildlife species without permission.
- Fisheries Law (2006): This law governs the management and protection of fisheries resources, including aquatic wildlife. It prohibits illegal fishing methods and the trade in endangered aquatic species.

- Protected Areas Law (2008): This law establishes and manages protected areas, such as national parks and wildlife sanctuaries, to conserve biodiversity, including threatened species. It restricts activities that could harm wildlife within these areas.
- Sub-decree on International Trade in Endangered Animals and Plant Species (2006): This sub-decree implements the Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES) in Cambodia. It regulates the import, export, and re-export of CITES-listed species.
- Penal code: he Cambodian Penal Code includes provisions that criminalize wildlife trafficking, with penalties including imprisonment and fines.

P1.1. Impact: Illegal wildlife collection, possession, and trafficking by site workers/ personnel.

Mitigation Measures:

<u>Pre-construction</u>:

- Develop a:
  a. Code of Conduct/ethics against wildlife collection, possession, and trafficking,
  b. SOP for wildlife protection and handling, and
  c. Training and awareness materials on human-wildlife conflict management. This should include biodiversity awareness training to raise their awareness on the:
     (i) ecological sensitivity of the site, importance of forest habitats, protected and threatened plants and animals within the Project area;
     (ii) proper protocols to adopt when wildlife is encountered;
     (iii) need to be cautious when operating machinery to avoid injury/mortality to fauna; and
     (iv) zero tolerance policy to possession of wildlife and forest resources. This should be applicable to both staff and contractors. These materials will also be used for Phase 2 and Phase 3 of the Project.

Responsible for Implementation:

- The PMC-Ecologist/Biodiversity Specialist to develop a) Code of Conduct/ethics against wildlife collection, possession and trafficking, b) an SOP for wildlife protection and handling, and c) training and awareness materials on human-wildlife conflict management.
- The PMC-Ecologist/Biodiversity Specialist to coordinate with the government agencies on wildlife conservation (MoE, MoAFF) and may seek technical assistance from NGO that has strong experience in wildlife protection, collection, possession, and trafficking, such as WCS, CI, and WA in developing the Code of Conduct, SOP

for wildlife protection and handling and awareness and training materials on human wildlife conflict management.

- **Provide mandatory training for Contractors management staff and site worker on:**
  a. Code of Conduct/ethics against wildlife collection, possession and trafficking,
  b. SOP for wildlife protection and handling, and
  c. Human-wildlife conflict management.

Responsible for Implementation:

- The PMC is responsible in providing Training of Trainers to the CSCs and the CSCs are responsible to provide training on the Code of Conduct, SOP for wildlife protection and handling and awareness and training materials on human wildlife conflict management to all Contractors management staff and field workers prior to construction and operational Phases of the CAISAR project.
- The NGO and Cambodia conservation agency (WCS, CI, ANKO) staff can provide human resource in delivering the training.
- All management and field staff of the Construction Contractor are mandatory to attend the training on a) Code of Conduct/ethics against wildlife collection, possession and trafficking, b) SOP for wildlife protection and handling, and human-wildlife conflict management.

- Incorporate policy and associated systems and procedures inclusive of appropriate sanctions/contract termination actions that prohibit employees and/or subcontractors from possession, purchase, trade or collection of wildlife or forest resources that are legally protected, CITES listed, or classed as threatened by the IUCN Red List, in the Project Administration Manual (PAM) and Worker's Agreement.

Responsible for Implementation:

- The PMU and PIU to incorporate the policy and associated systems and procedures in the PAM.
- The CAISAR Contractors and CAISAR Operators to incorporate the policy and associated systems and procedures in the Worker's Agreement.

Construction:

1. Minimize forest encroachment, wildlife poaching, and tree cutting due to improved access from new roads, a community-based management plan will be developed and implemented.
   a. Minimize the increased potential for forest encroachment and wildlife poaching by people who could use new roads to access forest areas.
   b. Avoid forest and land encroachment.

c. Minimize the intensity of poaching.

d. Tree cutting by the people, due to improved access to the area

Responsible to implement:

- Plan Development: Jointly develop a practical management plan with local communities and landowners.
- Guard Posts: Establish and maintain guard posts on temporary access and inspection roads near residential areas and priority biodiversity areas. (Include guard post construction costs in contractor agreements.)
- Surveillance: Conduct routine surveillance inspections on roads and in priority biodiversity areas (with landowner cooperation) to remove traps and deter hunting, logging, and plant removal.
- Signage**:** Install and maintain signs:
  - Banning unauthorized access on temporary roads.
  - Prohibiting hunting, snaring, and other harmful activities, especially near priority biodiversity areas and working zones.
- Reporting**:** Report observed/recorded incidents of illegal activities to FiA, FA or other authorized agencies.

2. Undertake regular monitoring of all access roads (including all quarries and the cement batching plant) to secure them from poaching activities.

Responsible to implementation.

- The Contractor is responsible in undertaking regular monitoring of all access roads (including all quarries and the cement batching plant) to secure them from poaching activity.

3. Implement the PAM and Worker's Agreement which includes policy and associated systems and procedures inclusive of appropriate sanctions/contract termination actions that prohibit employees and/or subcontractors from poaching, possession, purchase, trade or collection of wildlife or forest resources that are legally protected, CITES listed, or classed as threatened by the IUCN Red List. Corrective measures should be taken where necessary including appropriate actions against infringements.

Responsible for Implementation:

- The Contractor to implement the policy and associated systems and procedures.
- PIU should develop appropriate levels of penalisation against degree of infringement ranging from fines, suspension, and employment termination, and reporting to local authorities for prosecution (for most severe cases).

4. Check if feasible to control access road users during construction through use of security gates. If yes, security gates are to be manned by at least one (1) security officer 24 hours per day who will record the particulars (name, address, vehicle registration number, personal identification number) of all vehicles who are allowed into the access road. Visitors must also be always accompanied by a company representative. The security officers should be trained to identify behaviour associated with poachers and vehicle searches. The security gate should be equipped with 24-hour CCTV cameras. Evidence of such inspections/ vehicle searches to be recorded and available for review.

   Responsible to implement:

   - The CAISAR Contractor.

5. Properly handle and rescue wildlife incidentally encountered or caught during land clearing and construction Phase by to safer habitats. Handling and rescuing wild fauna will follow the SOP for wildlife protection and handling.

   Responsible for Implementation:

   - The is responsible handling, rescuing, and reporting encountered or caught wildlife during land clearing and construction works.
   - The Contractor needs to coordinate with Cambodia conservation agency (FA, Phnom Tamao Wildlife Rescue Centre, or ACCB) in handling or rescuing the wildlife.
   - Wildlife Encounter Protocols & Training: Implement protocols for wildlife encounters and train workers on appropriate responses, emphasizing non-interference and prohibiting harmful actions.
   - Rapid Response Wildlife Unit: Establish a rapid response unit (potentially through a third party) to address human-wildlife conflict effectively.
   - Community Information: Educate the community on local wildlife behavior, avoidance techniques, and deterrent methods.

Residual Impact: Minimal residual impact.

P1.2. Impact: Wildlife collisions with construction and quarry vehicles.

Trigger of Implementation:

The increase in vehicle movements such as trucks and excavators, particularly in quarry areas and access roads, will likely lead to increased chances of collisions with wildlife such as mammals and reptiles.

Mitigation measures:

Design/Pre-construction:

1. Conduct thorough biodiversity inspections along the access roads and at quarry sites before starting any land clearing works. The inspections should be conducted to identify any habitat and/or nesting sites of endangered/ protected species that may be affected by the clearing and identify hotspots where collisions with wildlife are likely to occur.

Responsible to implement:

- The Contractor is responsible to conduct the inspections and identify hotspots where collisions with wildlife are likely to occur.
- The CSC- Project Ecologist to provide technical assistance and guidance to the Construction Contractor in in conducting the inspections.

2. Provide general guidance to land clearance (refer to Appendix XX on Land Clearance SOP):

   a. When planning for expansion, ensure land clearance is undertaken in a Phased approach such that it complements wildlife shepherding activities.

   b. All proposed clearance areas will be marked in the field prior to any vegetation being cleared. The marking can use spray paint or marking tape. A briefing is to occur with personnel to outline the area proposed for clearing.

   c. An inspection is to occur following clearing to determine if clearing has been limited to the identified clearance area. Any clearing outside of the marked area is to be reported to the HSE Manager.

Responsible to implement:

- The Project Ecologist of CSC is responsible in providing guidance.

3. Prior to wildlife shepherding activities, undertake briefing with all involved personnel so they are aware of their roles and responsibilities; measures to deal with injured wildlife; occupational health and safety requirements; and requirements regarding the prohibition of hunting/ catching/ taking of fauna and flora. This will include incident reporting measures to relevant forestry authorities and stakeholders, and the reporting of any individual suspected or caught with fauna and flora to the relevant authority. Random inspections of personnel arriving and leaving the Project area can be considered. Refresher training is to occur with new employees.

Responsible to implement:

- The CSC- Project ecologist to train field workers to recognize and avoid wildlife.
- The field workers to report to the CSC HSE Manager of any wildlife sightings or collisions.

4. Provide features such as tunnels or rope bridges along temporary roads to enable wildlife movement and to reduce potential traffic incidents.

Responsible to implement:

- Design & Engineering Team: Responsible for incorporating wildlife crossing features (tunnels, rope bridges) into temporary road designs.
- Construction Contractor: Responsible for the physical implementation and construction of these features.

Construction:

1. Install signage to alert drivers to the presence of wildlife and require them to slow down and drive with caution, especially in hotspots where collision with wildlife is likely to occur.

Responsible to implement:

- The Contractor to install the signage to alert drivers to the presence of wildlife and encourage them to slow down and drive with caution.

2. Implement speed limit (less than 40km/hour), to reduce the likelihood of collisions and give drivers more time to react to wildlife on the road.

Responsible to implement:

- The Contractor to implement the speed limit.

Residual impact: Minimal Residual Impact

P1.3. To prevent wildlife deaths and minimize disturbance to wildlife along access and inspection roads.

Management Actions: To prevent negative impacts of vehicle traffic on wildlife (animal collisions, disturbance etc.) the following actions will be implemented by Contractors:

Mitigation measures:

Design/Pre-construction:

1. Develop a system in which drivers report locations of wildlife crossing and wildlife sightings**.**

Responsible to implement:

- Project Environmental Team: Responsible for designing and implementing the wildlife sighting/crossing reporting system.
- Drivers/Transport Staff: Responsible for reporting observed wildlife crossings and sightings.
- Site Supervisors/Foremen: Responsible for collecting and relaying driver reports to the Project Environmental Team.

2. Information campaigns to explain to drivers about the biodiversity management objectives that seek to avoid wildlife collisions and disturbance, including:

Responsible to implement:

- Wildlife Awareness: Workers will receive training on frequently encountered wildlife (e.g., snakes, turtles, tortoises, nocturnal animals) and appropriate roadkill avoidance measures.
- Speed Limit Enforcement: Training will emphasize adherence to speed limits and the consequences of violations.
- Roadkill Reporting: A clear reporting system for animal collisions will be established, including reporting locations and designated recipients.

Construction:

3. Install and maintain signs in areas of frequent wildlife crossings, saying "beware of animal crossing" (complete with pictures of animals) in language understandable to all.

Responsible to implement:

- Environmental/Safeguards Team: Responsible for identifying high-risk crossing areas and designing appropriate signage.
- Construction Contractor: Responsible for the physical installation and maintenance of the signs.

Residual impact: Minimal Residual Impact

EXECUTIVE SUMMARY

This document is an Environmental, Social, and Climate Management Plan (ESCMP) for the Ou Ta Paong sub-scheme, part of the Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project in Cambodia. The project aims to improve farm-level climate adaptation, water use efficiency, and agricultural productivity. The Ou Ta Paong sub-scheme is the largest investment focus of the CAISAR project and will rehabilitate existing irrigation infrastructure and enhance agricultural practices, focusing on the Ou Ta Paong River ecosystem and surrounding communities.

The ESCMP is crucial for ensuring the project's sustainability by addressing potential environmental and social impacts. It outlines measures to mitigate risks associated with water resource management, infrastructure development, and agricultural intensification. The plan recognizes the Ou Ta Paong River's importance for both agriculture and local livelihoods and promotes efficient irrigation practices to optimize water use and minimize the risk of water shortages. The ESCMP ensures that communities are actively engaged in the project's planning and implementation, addressing their concerns through consultations and fair compensation where necessary.

The ESCMP's objectives include:

- Identifying and assessing environmental and social risks and impacts.
- Applying a mitigation hierarchy to avoid, minimize, or mitigate risks and impacts.
- Engaging affected communities and vulnerable groups in the assessment and mitigation process.
- Ensuring compliance with both national and international environmental and social standards.

The project's geographical area is the Bakan District, Pursat Province. The existing sub-scheme is characterized by a complex water supply system drawing from the Pursat River, Ou Ta Paong River, and Svay Don Keo River. This system creates distinct hydraulic zones within the scheme, each with specific water availability levels, impacting agricultural output. The area has faced natural challenges like droughts and floods over the past decade.

The proposed investments include:

- Rehabilitation and improvement of existing irrigation canals.
- Construction of new tertiary canals.
- Installation of solar power systems.
- Training and capacity building for Farmer Water User Communities (FWUCs).
- Agricultural extension services for improved farming practices and value chain development.

The tentative implementation schedule includes detailed design starting in January 2025, followed by procurement and construction. The construction is expected to start after the rainy season in 2026 and be completed by mid-2030.

The ESCMP identifies potential environmental and social risks and impacts during different project stages and proposes mitigation measures.

Before and during construction, potential risks include:

- Unexploded ordnance (UXO): The presence of UXO requires a clearance plan and expert assessment before any construction activity.
- Air and noise pollution: Dust suppression measures, reduced operating hours for machinery, and regular maintenance are proposed to mitigate air pollution and noise.
- Water pollution: Construction diversion control, restrictions on filling canals, and proper waste disposal are crucial to prevent water pollution.
- Solid and hazardous waste: Waste management plans, including designated dump sites, are needed to handle various types of waste generated during construction.
- Wastewater: Proper handling and disposal of hazardous wastewater, such as oil or fuel, are essential.
- Biodiversity impacts: Measures to minimize habitat loss and fragmentation, prevent the spread of invasive species, and raise awareness about wildlife protection are necessary.
- GHG Emissions: Construction and operation of heavy machinery, waste burning, and agricultural burning can increase GHG emissions. Mitigation measures include using low-carbon materials, offsetting emissions, and raising awareness.
- Social impacts: These include labor influx, community health and safety, potential for SEA/SH (Sexual Exploitation, Abuse, and Harassment), and traffic accidents. Mitigation measures involve labor management plans, awareness campaigns, safety training, and grievance redress mechanisms.

During operation, potential risks include:

- Water pollution: The ESCMP emphasizes the need for sustainable agricultural practices, including Integrated Pest Management (IPM), to minimize the risk of water pollution from agricultural runoff.
- Biodiversity impacts: Continued monitoring and management are necessary to address the potential for long-term habitat loss and fragmentation.
- Invasive Species: Changes in land use and water management can introduce invasive plant and animal species.
- Climate change: Promoting energy-efficient irrigation, reducing reliance on fossil fuels, and adopting climate-smart agricultural practices are key to mitigating GHG emissions.
- Social impacts: Continued attention must be paid to elite capture, water use conflict, social inequalities, and potential overuse of pesticides.

The ESCMP outlines a comprehensive stakeholder engagement plan, including consultations with various stakeholders during project preparation and implementation. This plan ensures that local communities and other stakeholders are informed about the project and have opportunities to voice their concerns and suggestions. The ESCMP also includes a grievance redress mechanism to address complaints and grievances from affected people. The mechanism provides a structured process for resolving issues related to land acquisition, labor, SEA/SH, and other project-related concerns.

The plan details implementation arrangements, outlining the roles and responsibilities of various stakeholders, including government agencies, contractors, and consultants, in implementing and monitoring the ESCMP. The monitoring program will include regular monitoring of soil, air, and water quality, and biodiversity.

The financial resources allocated for implementing the ESCMP amount to USD 1,510,119. This budget encompasses a range of expenses, including UXO clearance, assessment for land acquisition and resettlement planning, biodiversity management, community engagement, and essential monitoring activities. Transparency and accountability are paramount throughout the project's lifecycle. To this end, the ESCMP will be made publicly available in both English and Khmer, ensuring accessibility and fostering informed participation.

1. INTRODUCTION

1.1 Rationale of Ou Ta Paong Sub-scheme

Ou Ta Paong sub-scheme is one of the six sub-schemes supported under the CAISAR project, with the largest command area covering over 14,000 hectares. This makes it the largest investment focus of the project, with concentrated activities required. In this context, the preparation of the Environmental, Social, and Climate Management Plan (ESCMP) for Ou Ta Paong is essential to ensure that the project's infrastructure development aligns with sustainable environmental practices. Given the sensitivity of the Ou Ta Paong River ecosystem and its importance to surrounding communities, the ESCMP is designed to identify potential environmental risks early and provide clear guidelines for mitigating them. Without a structured plan, irrigation construction activities could degrade water quality, harm biodiversity, and disrupt the river's natural balance.

Social impacts are also a critical consideration in the preparation of the ESCMP. The Ou Ta Paong River is vital to the livelihoods of local communities, particularly those engaged in farming and fishing. Infrastructure development without proper social safeguards could disrupt these livelihoods, leading to economic challenges and potential social conflict. The ESCMP ensures that communities are actively engaged in the project's planning and implementation, addressing their concerns through consultations and fair compensation where necessary. This inclusive approach minimizes social disruption and fosters stronger community support for the project.

Additionally, the ESCMP is crucial for ensuring that the CAISAR Project meets both national and international environmental and social standards. Compliance with these standards is necessary for securing funding and aligning with global best practices in sustainable development. By preparing a comprehensive ESCMP, the project mitigates both environmental and social risks while promoting long-term sustainability, ensuring that both the natural environment and local communities' benefit from the project's outcomes.

1.2 Objectives of the ESCMP

The objectives of the ESCMP for Ou Ta Paong sub-scheme are:

- Identify and assess environmental and social (E&S) risks and impacts that are potentially associated with investment activities proposed under Component 1 and Component 2.
- Ensure the identification and assessment of E&S risks and impacts are in accordance with the requirements of the laws and regulation of the Royal Government of Cambodia, AIIB's Environmental and Social Framework, IFAD's Social, Environmental and Climate Assessment Procedures (SECAP), and GEF's Safeguard Policies.
- Apply a mitigation hierarchy to: (a) anticipate and avoid risks and impacts; (b) where avoidance is not feasible, minimize or reduce risks and impacts to acceptable levels; (c) once risks and impacts have been minimized or reduced, mitigate them; and (d) where

residual risks or impacts remain, compensate for or offset them, where technically and financially feasible.

- As part of the risk and impact identification and assessment, engage a) people potentially affected by project activities (including both project beneficiaries and those potentially affected adversely, and parties interested in project implementation and operations.
- Conduct consultation, particularly with affected people who are disadvantaged/ vulnerable.
- Propose measures to avoid/ minimize/ mitigate E&S risks and impacts and compensate for adverse impacts where residual risks or impacts remain, compensate for impacts that remain, or offset residual risks, where technically and financially feasible.

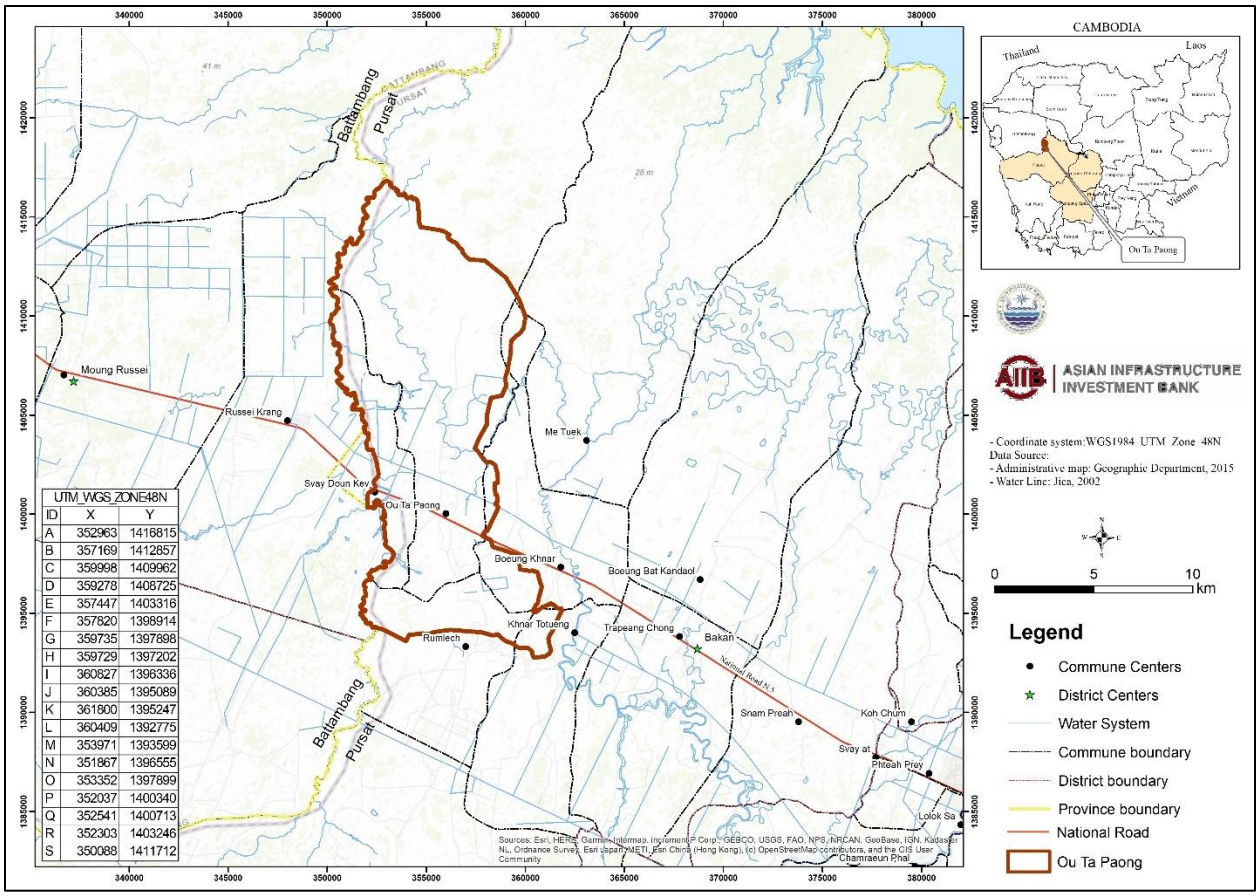
Coverage of the ESCMP Ou Ta Paong

This site–specific ESCMP cover project activities proposed under Component 1 and Component 2 (See brief description of investment activities in Section 2.3 below).

2. PROJECT DESCIPTION

2.1 Geographical Area of the Sub–scheme

Geographically, Ou Ta Paong command area is located inside a larger Pursat Flood Plain. The flood plain covers a gross area of 63,000 ha, of which 20,500 ha South and 42,500 ha North of National Road No 5. Roughly two thirds (about 10,000 ha) of the OTP scheme area are located North of the road and is part of the flood zone of the Tonle Sap Lake.



The OTP command area, located in Bakan District, Pursat Province, spans approximately 16,074 hectares and is a crucial rice-producing region. The Ou Ta Paong scheme encompasses five communes within Bakan district, Pursat province: Ou Ta Paong, Boeung Khnar, Svay Duon Kev, Khnar Totueng, and Rulech. Additionally, three surrounding communes affect the scheme: Me Tuek commune in Bakan district, Pursat province, Russei Krang Moung in Russei district, and Prey Tralach in Rokkiri district, Battambang province.

Table 1: Administrative coverage of Ou Ta Paong sub-scheme

Category	Commune Name	District	Province
Within the Scheme	Ou Ta Paong	Bakan	Pursat
	Boeung Khnar	Bakan	Pursat

	Khnar Totueng	Bakan	Pursat
	Rulech	Bakan	Pursat

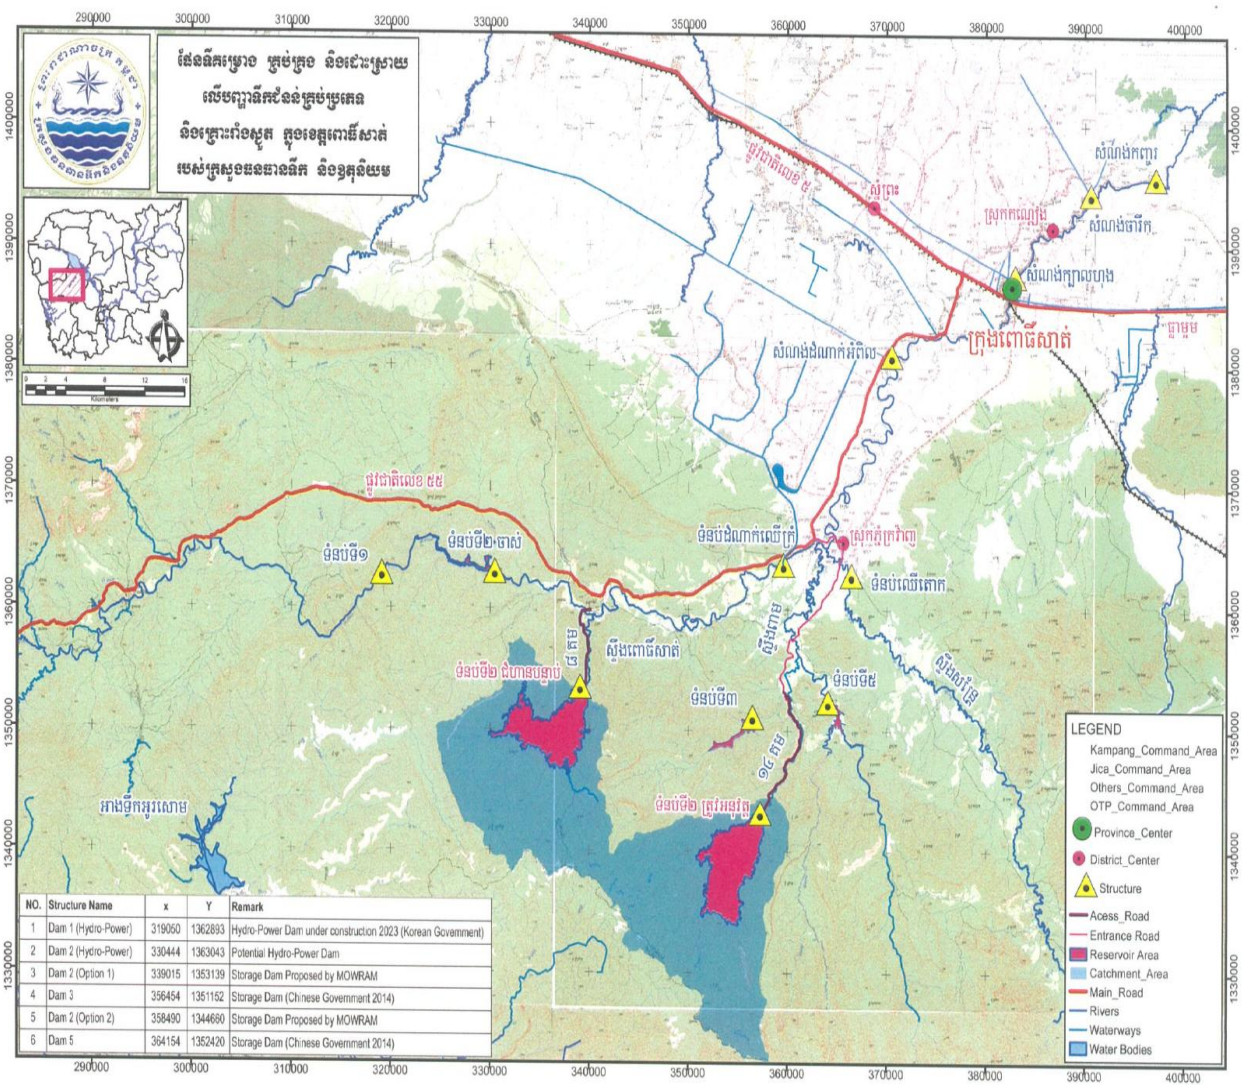
Surrounding the scheme	Me Tuek	Bakan	Pursat
	Russei Krang Moung	Russei	Battambang
	Prey Tralach	Rokkiri	Battambang

Figure 1: Administrative map of Ou Ta Paong sub-command area

2.2 Characteristics of the Existing Sub–scheme

2.2.1 Water Availability

The Ou Ta Poang (OTP) irrigation scheme, located in the Bakan District of Pursat Province, Cambodia, depends on a complex network of water sources and infrastructure to support agricultural activities. The primary water sources for the OTP scheme are the Pursat River, Svay Donkeo River, and Ou Ta Paong River, each contributing to distinct hydraulic zones with varying water availability and agricultural productivity.



The upper part of the scheme, situated south of National Road 5, relies mainly on the Pursat River, feeding the Damnak Apil Canal and its network of irrigation canals. Gravity-fed irrigation is possible in this area due to the natural slope from south to north, but existing infrastructure requires improvements to optimize water distribution. Enhancements to the canal network and

the construction of additional regulating structures are necessary to enhance water availability in this zone.

The eastern part of the scheme, nestled between the Ou Ta Paong River to the west, the Wat Chre scheme to the east, and National Road 5 to the north, draws water from a mix of sources. These include infrastructure in the south, such as the Damnak Apil and Kbal Hong hydraulic systems, as well as the Wat Loung canal and sections of the Svay Donkeo and Ou Ta Paong rivers. The low hydraulic gradient in this area necessitates one-stage pumping and the development of more efficient distribution networks to ensure adequate water availability for irrigation.

Similarly, the western section of the scheme, situated between the Svay Donkeo River to the west and the Ou Ta Paong River to the east, requires pumping due to the low gradient, with Svay Donkeo serving as the primary water source.

Figure 2: Map with Illustration of Dam No. 2

NO.	Structure Name	x	Y	Remark
1	Dam 1 (Hydro-Power)	319050	1362893	Hydro-Power Dam under construction 2023 (Korean Government)
2	Dam 2 (Hydro-Power)	330444	1363043	Potential Hydro-Power Dam
3	Dam 2 (Option 1)	339015	1353139	Storage Dam Proposed by MOWRAM
4	Dam 3	356454	1351152	Storage Dam (Chinese Government 2014)
5	Dam 2 (Option 2)	358490	1344680	Storage Dam Proposed by MOWRAM
6	Dam 5	364154	1352420	Storage Dam (Chinese Government 2014)

The CAISAR project reported that water availability was adequate at the time Dam No. 1 was completed, provided there was proper coordination among the stated dams. However, at the current stage, Pursat PDoWRAM has reported that the available water is insufficient for irrigation purposes within the province, with a shortfall of approximately 700 MCM. Additionally, PDoWRAM acknowledged that the water from Dam No. 1 is designated solely for hydroelectric purposes, which may limit the amount available for agriculture or irrigation. There is, however, another dam, Dam No. 2, which was approved by the government in late June 2024. PDoWRAM also reported that the construction is in the process of mobilizing equipment to the site. The reservoir for this dam covers 4,016 hectares, with a storage capacity of 861.75 MCM. The dam is expected to be completed by the end of 2026 (Figure 2). Earlier projections indicated that the combined water supply from Dam No. 1, Dam No. 3, and Dam No. 5 would likely be sufficient. With the addition of Dam No. 2, it is highly likely that the province's water needs will be fully met.

The current discussion with farmers on water availability at Ou Ta Paong showed that during the periods that the crop requires irrigation, conflicts about water tend to arise. The available water along the river was diverted into the rice field via secondary canals along the river. The limited availability of water regulated from the upstream, mainly the Damnak Ampil canal cannot flow until the end of the river where the river has become a string of ponds, causing some locations of the rivers to have been turned into backyard garden of the residents along the river. As water is limited, water shortage has become the main cause for financial losses. This causes much stress, because of the risk of drought damage to the crops, and the cost of pumping from low water levels. The risks reduce farmers' motivation to invest in new technologies and climate-smart agriculture.

2.2.2 Irrigation Management

The water distribution system for Ou Ta Pong is managed by the Farmer Water User Community (FWUC), which coordinates with the Provincial Department of Water Resources and Meteorology (PDWRAM) in Pursat. The FWUC handles requests from local farmers and oversees the allocation of water to the various villages within the command area. Water from the Damnak Apil Headwork is diverted into the OTP scheme based on these requests. Additionally, the Damnak Cheukrom barrage, which manages a 16,100-hectare command area, will receive priority water supply from Dam 1, potentially affecting the water availability downstream to the OTP area.

2.2.3 Cropping Patterns

The OTP sub–scheme has a great agricultural potential, particularly for paddy production. However, currently, the monoculture cultivation of paddy prevails in almost all fields. More than 90% of farmers apply manual direct seeding. Grain kept from the previous harvest is used as seed and the varieties have different maturities. Very few households engage in vegetable production for the market. Small scale horticulture activities take place in the dry season around the homestead, where water can be used from wells and ponds. Such activities were observed in two 'Agriculture Cooperatives (AC): Psar Andeth AC and Chamkar Khluy AC. Also, in neighboring Rumlech Commune, farmers cultivate horticulture crops, such as watermelon on their dry paddies. Ou Ta Paong is traversed by Highway 5 on the northern side with a major road running

eastward towards Tonle Sap Lake. This major road is significant to the farmers since it makes it easy to transport goods and agricultural products to the market shared by the 6 communes.

Farmers grow two early-maturing paddy crops annually: one in the wet season (May-August) and the other in the early dry season (November-February). Where water for irrigation is available in February-April, farmers can grow a third crop, which is harvested in May-June. February-April is the driest period of the year and water is extremely scarce in the Pursat plain. Thus, the size of the third cropping area is inherently minor. In parts of the plain where water is available from local storage ponds/reservoirs, farmers grow horticulture crops in the dry season.

Table 2: OTP - Paddy cultivation areas.

Commune	Cropped area	
	Total in commune (1)	In OTP command area (2)
Beung Khnar	3,966	1,209
Khnar Toteung	2,824	152
Me Tuek	4,332	108
Ou Ta Pong	6,344	5,616
Rom Lech	4,650	578
Svay Dounkeo	2,557	1,702
Total		**9,365**

Notes
[1] As per 2021 Statistics from Bakan District Bureauof Agriculture, Natural Resources and Environment.
(2) As measured on map by CAISAR FS Consultant

In the wet season (WS), when rainfall is generally abundant, all the areas cultivate paddy. Currently, about 40% of the crop area is fully rain-dependent and some 60% is irrigated, namely where water can be accessed (pumped) from adjacent canals of ponds. The varieties used are either early maturing (<100 days) or medium maturing varieties (110-150 days). Land preparation is conducted in early May when rainfall has been enough to soften the soil.

For the common wet season crops, plowing starts in May, the seeding is in May-June, and the harvest falls in in September, yielding 2.0-2.5 t/ha. About 5% of the farmers plant a long duration variety, 150-160 days. They prefer to use these traditional fragrant/aromatic, photo-period sensitive varieties. These crops typically yield 2.5-3 t/ha. Their experience is that the traditional varieties can survive better any dry-spells and explain this from the root systems penetrating deeper into the soil where there is still moisture retained and nutrients reside.

Photo-period sensitive varieties need to be planted in late May and June, in order to be synchronized with the short-day period required for flowering. These varieties include Somaly, Phka Romdoul, and Pkha Malis for the medium maturing varieties, and Sen Kro Ob, OM 5451, and Sra Ngae for the early maturing varieties.

Where at least some irrigation water is available and there is no annual flood, fields can produce two WS crops: an early WS crop planted very early on or even shortly before the rains start, and a late WS crop which is planted during the rainy season but will still have to stand on the field for some weeks after the rains have stopped. For this, varieties with a short growth period (120 days

or less) need to be used. Popular are 'OM varieties. For example, OM 5451 is a high-yielding long-grain cultivar of fragrant rice grown in the Mekong Delta. It has good pests and disease resistance. A DS paddy crop of the same variety may be grown as a third crop, as possible near to natural stream or ponds which usually provide a bit of water.

Some farmers plant a dry season paddy crop, which is typically a short-maturing variety (Sen Kro Ob and OM5451). Some 5% of farmers plant non-rice crops during the dry season including watermelon and sweet corn. Rice yields during dry season are slightly higher than the wet season crop. It has been confirmed from the discussions with the commune representatives that production of non-rice crops may be expanded when irrigation comes. If reliable irrigation water supply becomes available, Ou Ta Pong farmers could grow crops which can be exported to Thailand such as soybeans, mungbean, maize, and sesame in sequence with early-maturing rice crop which can be planted in May.

Where there is no irrigation, the fields can produce just one crop, which is planted when the rains are well on their way. For this, varieties with a medium growth period (120 -150 days) are used. These are commonly photo-sensitive and typically can be harvested in early November. Medium maturity rice has better local marketability and does not face the risk of drought damage, because it flowers in mid-October, when rainwater is still readily available.

Where the area tends to flood to a low level only, farmers may plant just one paddy crop, with preference for a long growth duration paddy (more than 150 days; flowering after mid-November) which can stand flooding better. However, the crop variety used has deep roots, so that they have a better chance of surviving the higher risk of drought damage during the last stage, especially when moisture from preceding rainfall has been retained in the deeper soil layers.

Where the area annually floods to a high level, the farmers still try to grow two crops, but with a higher risk: an early short-duration rain- dependent crop (non- photo-sensitive) can be planted before the flood. These fields may (need to) enjoy some minimum flood protection by a system of low dikes/elevated roads/natural riverbanks, which delays the water during the very early stage of the flood rise from entering the area early, to provide sufficient time to harvest the crop. When the flood has come down sufficiently, they plant - usually in October November - a second short growth duration paddy crop (non- photo-sensitive) "flood recession rice". This crop will run well into the dry season and is indeed classified in the statistics as dry-season paddy (DS rice). When there is no rain or irrigation water, this crop runs a high risk of drought damage. This flood recession rice is widespread in the large tail-end area of the Ou Ta Pong scheme.

2.2.4 Crop Productivity

According to the statistics, WS rice yield in OTP is 4.02 Tons/Ha which is relatively higher than in the other CAISAR schemes (which is possibly related to an increase in soil fertility due to the flooding). DS rice cultivation yielded on average about 7.5 T/Ha (which seems very high for what generally is non- irrigated recession rice; this can be verified from the household survey). Both of these estimates have not accounted for significant crop losses due to droughts in recent years. There has been reported large scale debt incurred by local farmers as a result. Some have even reported family members departing to Thailand to find more secure work. These climate change

induced losses of livelihoods are what the CAISAR scheme is aiming to address. Yields used in further calculations are lower than these figures (especially the dry season yield) to consider these drought crop failures in recent years. This serves as a significant justification for the scheme.

2.2.5 Natural challenges

Droughts and floods are among two major challenges for paddy production in OTP. These ongoing challenges reduce the farmers' interest in investing in their crop and result in average yields being on the low side.

- In terms of drought, the threats are most severe North of the National Road. Droughts, in particular, is a problem because the area is very difficult to reach for irrigation water supply. Infamous is the 'short dry season' that occurs during the wet season. So far, the main route for irrigation water supply throughout the Pursat Flood Plain has been from Damnak Ampil Head Works (DAHW) on Pursat River, via Damnak Ampil Main Canal (DAMC, 23 km length) and its secondary canals. The secondary canals typically end in the Pursat River's former flood-spill route roughly East West, relatively near (4-9 km) to DAMC. The flood route is made up of interconnected creeks/rivers/river sections, of which the main ones are Kambot, Bakan, Boeng Khnar, and ultimately Ou Ta Paong. Pursat River does not overtop its banks anymore and there are no largeflood discharges to be conveyed via this zone of natural drains. All sections have silted up and are dammed off at intervals. The zone forms a formidable obstacle for bringing DAMC water further North. Most water ends up in the river sections, from which much of gets diverted for irrigation.
- As for floods, this problem is particularly in the low terrain North of the road/rail way. Most of the areas there is vulnerable to inundation, be it caused by accumulation of surface run-off or by the upcoming lake flood. Nowadays, farmers plant early maturing paddy crops, and these are not as inundation and heavy-rainfall tolerant as the traditional medium- and late-maturing varieties. Most critical for the crops are the months September - October. To minimize the risk, farmers do not grow crops during that period. Also, on higher terrain where there is no thread of inundation, fields are left fallow, to avoid crop damage by high intensity rainstorms. Farmers are aware of the positive impact of the inundations on soil fertility and there are few if any efforts to improve drainage. Drains are intensively used for collecting and storing water for supplementary irrigation and therefore widely regarded as irrigation canals.

2.3 Analysis of Alternatives

2.3.1 Site Selection

The number of hectares of Ou Ta Paong is approximately 14,000 hectares. This command area will be the same regardless of any options being proposed.

2.3.2 Project Layout and Design

The design layout of the irrigation system in OTP remains the same as per the project description (please see in table 3). However, a number of design options have been finalized and removed

from the design options. The (i) Polder improvements (20.1 Km); (ii) “new” secondary canal (8.78 Km), (iii) “new” tertiary canal (19.3 Km); and (iv) “new” quaternary canal (4.2 km) in the previous design of PPTA Team had been agreed to remove to minimize the impacts from land acquisition and resettlement. To supplement the removals, off-take structures will be installed leaving farmers to abstract water as per their internal agreement on the conveyor type to be built within their block command area. The off-take structures that will be installed and locations to install will be identified during the DED.

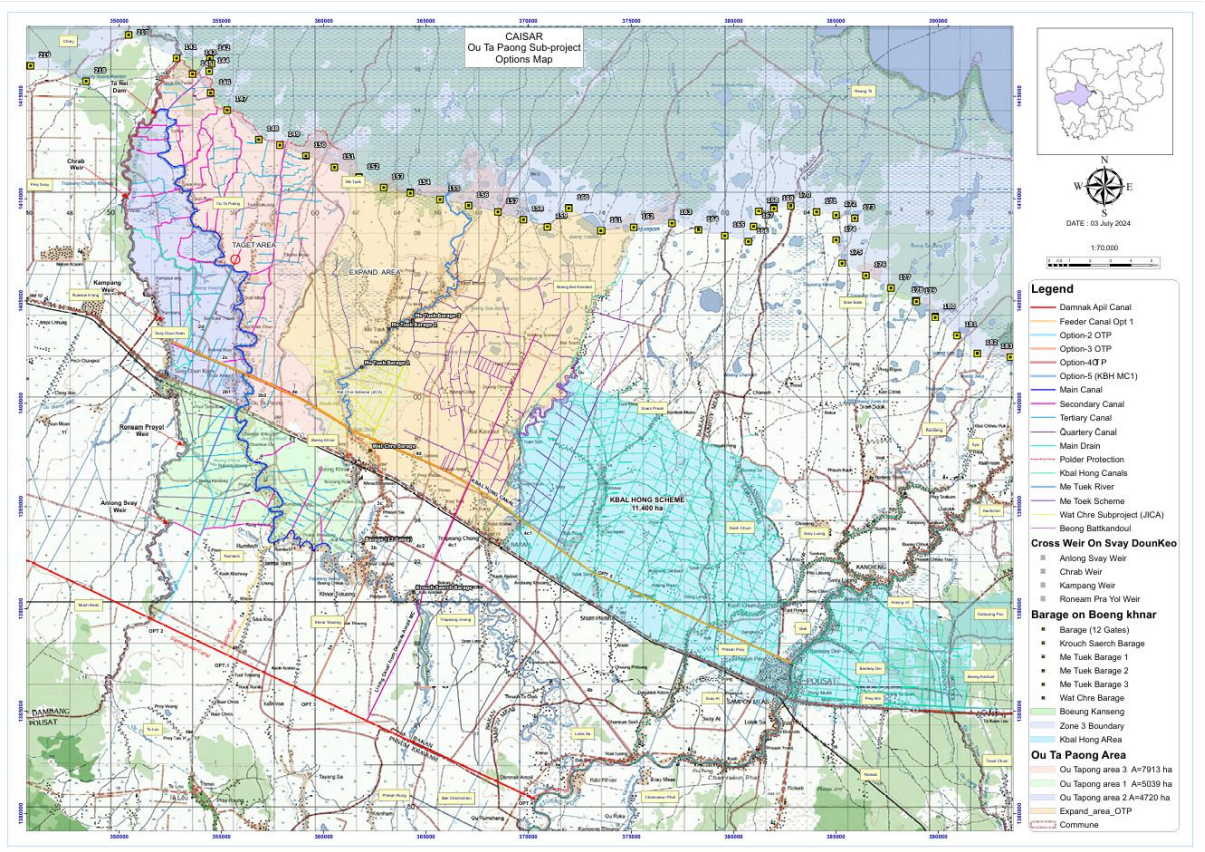
Table 3: Irrigation System Design and Options

No	Structures	Design Length (km)	Existing Width (Average) (m)	Expansion (L) (m)	Expansion (R) (m)	Total Width (m)
1	Feeder 1	8.80	16.00	7.00	7.00	**30.00**
2	Feeder 2	6.10	29.10	1.50	1.50	**32.10**
3	Main Canals	37.50	37.10	5.00	5.00	**47.10**
5	Creek Re-shape	27.60	61.00	0.00	0.00	**42.00**
6	Main Drainage	11.70	52.00	Reshape	Reshape	**42.00**
7	Secondary Canals	60.12	16.10	2.50	2.50	**21.10**

L = Left, R = Right.

Feeder Canals. The feasibility study of Ou Ta Paong indicated no other design layout except the construction of the feeder canals to abstract water to feed the irrigation system. All options have its own specific strengths and shortage as describe below:

Option 1: Water is extracted from Pursat River through Damnak Ampil Main canal with a length of 6.5 km extended from the main canal feeding into Ou Ta Paong River. The option is one (1) of the best choices, given its shortest length from the main canal to reach command area. However, expanding only the feeder canal reaching a width that can carry adequate water to the sub-scheme will acquire a huge land area along the canal for canal expansion, and side road.



Option 2: The feeder canal is parallel to Option 1 but it extends further down. Prior to releasing water into Ou Ta Paong River, the canal releases water into Boeng Kanseng, flowing across the block allowing the irrigation to take place at this area. With the extension, the canal is about 12 km in length. Once again, the issue of land acquisition along the canal will be encountered due to the expansion.

Option 3: Similar to Option 1, the feeder canal extends further, allowing the water to flow into Kbal Hong main canal prior to the connection to Ou Ta Paong River at further downstream at the middle part of the catchment, making the total length of the canal at about 14 km from Damnak Ampil to Kbal Hong. This option may cause the water availability at the upper part of the sub-scheme being concerned while water will be fed into another area prior to Ou Ta Paong. The option, therefore, requires the budget for excavation to be around twice as much as Option 1.

Option 4: The option carries water from Wat Loang canal, flowing through the barrage at Damnak Ampil. The option will require the expansion of the canal to ensure that an adequate volume of water can be carried to Ou Ta Paong. The canal length to reach Ou Ta Paong is approximately 30 km. The expansion of the canal would result in huge acquisitions of land areas along the main canal.

Option 5: The option begins at Kbal Hong barrage at Pursat provincial town involving the enhancement of the Watergate height and the distance of carrying water will be approximately like Option 4. However, the increase in the height of the Watergate will cause inundation of the upper area of the Pursat River which may cause flooding in the town. This may bring in huge discontentment of the people in the city as height water level may cause in delay of storm water flow during raining period.

Figure 3: Ou Ta Paong Sub-project Options Map

(Source: CAISAR Project, 2024)

Evaluation of Options:

Evaluating the OTP Options is not easy as there are many factors that need to be considered, which makes the matter complex. So, the approach below are proposed for adoption:

- Reduce the number of cross regulators on OTP River
- Focus on improving the existing distribution system

- No new canals (in principle)
- No lining of canals
- No construction of the tertiary canals
- No pump stations, and
- No canals in fill

With the above approach, which aims to maximize water distribution (to support prefered crop patterns) while minimizing investment costs (including potential social and environmental impacts, three options (Option 1, Option 3 and Option 5) were extensively discussed, agreed, and finally selected by MOWRAM and AIIB. The combination of these three options does not only complement each other (minimizing costs related to construction and land acquisition) but also water use efficiency is enahnced through improved water distribution across thre three blocks within the command area.

Polder System. The polder system is expected to play a role as an embankment for protecting flood and invasive species from the Tonle Sap during early raining season. The discussion on the system agreed to remove the system as the operation of the system may face challenges. Firstly, the land areas for the construction are needed since it is the new system which may cause a lot of land impact. Secondary, managing challenge may lead to delay in draining function during flooding period for the command area while flooding protection function would affect a lot of biodiversity exchange between the command area and zone 3 fauna and flora. Lastly, the meeting with engineering team decided not to include the system within the project design.

Secondary Canals. The construction of new secondary canal is expected to acquire huge land areas of farmers which may result in disruption of household economy. To avoid the negative impact, the construction of the canal was agreed to remove the newly plan secondary canal while off-take structure (culverts) will be used to allow farmers to abstract water from the system as per their block command areas. Farmers who own the land within the block need to discuss and agree whether they are going to build their own water canal or use plot by plot irrigation. The risk as per this option is when farmers could come up with the agreement on the construction of a small canal on their own, they have to continue irrigating their farm through deploying plot-to-plot irrigation or using long range pumping which involve with high cost and limited water use efficiency. Since the design is trying to avoid land acquisition, this will be the option for the system which is also applied to the quaternary and fourth-level canal as well.

River Training. River training methods are designed to regulate and stabilize river flows for various purposes, including irrigation, flood control, and erosion prevention. Below are three common types of river training, along with their respective advantages and disadvantages adopted from online source to provide general overview regarding the design and possible options which should be considered for the actual practices. However, it is up to the DED team to decide as per the consultation with Social Safeguard consultant (Table 4).

Table 4: River Training Design Options

River Training	Description

Embankments (Levees)	Embankments are artificially raised banks made of earth, concrete, or stone along the sides of a river to prevent water from overflowing into adjacent lands.
Advantages:	• **Flood Control:** Protects agricultural lands and infrastructure from river flooding. • **Irrigation Water Regulation:** Helps direct water flow into irrigation channels efficiently. • **Erosion Prevention:** Reduces bank erosion, safeguarding nearby farmlands and structures. • **Cost-Effective:** Generally, less expensive compared to more complex river training structures.
Disadvantages:	• **Sediment Deposition Issues:** Can lead to sediment buildup within the riverbed, raising water levels and increasing flood risks over time. • **Breaching Risk:** If poorly maintained, embankments can break during extreme floods, leading to catastrophic damage. • **Ecological Impact:** Alters natural river dynamics, affecting aquatic ecosystems and wetlands.
Spurs (Groynes)	Spurs (also called groynes) are structures extending perpendicularly from the riverbank into the river. They help deflect and slow down water flow to prevent erosion and sediment deposition in key areas.
Advantages:	• **Bank Protection:** Reduces erosion by redirecting strong currents away from vulnerable banks. • **Sediment Control:** Helps accumulate sediments in specific areas, aiding in land reclamation or creating stable riverbanks. • **Improves Water Availability:** Can be strategically placed to direct water flow into irrigation systems.
Disadvantages:	• **Local Scouring:** Can cause deep erosion near the structure, affecting nearby irrigation headworks or riverbanks. • **Periodic Maintenance Required:** Sediment accumulation may require periodic dredging to maintain functionality. • **High Initial Cost:** Construction and material costs can be relatively high compared to natural erosion control measures.

Weirs and Barrages	Weirs are low dams built across a river to regulate water flow, while barrages are adjustable structures with gates that control water levels for irrigation and flood management.
Advantages:	• **Water Level Control:** Maintains steady water levels in irrigation channels, ensuring consistent supply to farmlands. • **Hydropower Potential:** Some barrages can integrate small-scale hydroelectric generation. • **Prevents Saltwater Intrusion:** Useful in coastal areas where tidal effects can introduce salinity into freshwater irrigation systems.
Disadvantages:	• **Disrupts Natural River Flow:** Can impact fish migration and aquatic ecosystems if fish passages are not incorporated. • **Expensive to Build and Maintain:** High initial investment and ongoing maintenance are required for long-term functionality. • **Flooding Risk Upstream:** Can cause water accumulation upstream, leading to potential flooding in extreme weather conditions.

Design Slope. As per the confirmation of the Engineering Team, canal slopes will either be protected or left as earthen slopes based on their condition and the available budget, which will be determined during the detailed design phase. For weak slopes, concrete lining and geosynthetic materials will be recommended for reinforcement. The feasibility of bio-engineering solutions will be assessed based on the specific site conditions of the project. The following is the comparison between the vegetated and concretized design slope:

Table 5: Slope Design Options Comparison

Concretized Canal Slopes	• Erosion Control: Concretized canal slopes provide strong erosion resistance, reducing sedimentation in water bodies downstream. This helps maintain water quality and prevents sediment-related ecological degradation. • Maintenance Needs: Concretized slopes generally require less maintenance compared to vegetated banks. They are easier to inspect and repair, reducing ongoing operational costs. • Habitat Impact: Concretized slopes typically offer limited habitat for aquatic organisms and vegetation compared to natural or vegetated banks. This can reduce biodiversity and ecological resilience in the waterway.

	• Heat Absorption: Concrete can absorb and retain heat, leading to higher water temperatures in the canal. This can affect aquatic life, especially sensitive species, and alter ecosystem dynamics. • Aesthetics: Concretized slopes may be perceived as less visually appealing compared to natural or vegetated banks. This could impact recreational use and community engagement with the water resource.
Vegetated Banks	• Erosion Control: Vegetated banks provide natural stabilization, reducing erosion by absorbing water, slowing runoff, and binding soil with root systems. They contribute to maintaining soil structure and preventing sedimentation downstream. • Biodiversity: Vegetated banks offer diverse habitats for aquatic and terrestrial species, promoting biodiversity and supporting ecological balance. They can serve as wildlife corridors and provide nesting sites for birds. • Water Quality: Vegetated banks act as buffers, filtering pollutants, and absorbing excess nutrients from runoff. This improves water quality and supports healthier aquatic ecosystems. • Temperature Regulation: Vegetation provides shade, helping to regulate water temperature and mitigate thermal pollution. This is particularly important for species sensitive to temperature fluctuations. • Community Benefits: Vegetated banks enhance the aesthetic value of the waterway, offering green spaces for recreation, relaxation, and cultural activities. They can also contribute to community engagement and ownership of the water resource.

Cross-Regulator/Off-Take Structure. The structure is required for all sub-schemes and specific size, number, and locations need to be assessed during DED stage. The calculation regarding the design specification need to consider the water requirement in each block of the sub-command areas.

Fish Passes/Sliding Gate. There is practice using fish passage in barrage or headworks across the river where environmental flow is available. The engineering team indicated that the option is not practical at the field level canal because the water flow at the hydraulic structures along the canal system need to be fully closed for some time for farmers to irrigate their system. However, the fish passage may be practical for OTP river and Svay Doun Keo river which needs to be assessed at the DED stage. Two fish passes are provided below:

Table 6: Slope Design Option Comparison

Vertical Slot Fish Passway:	• Biodiversity Risks:
	  ○ Habitat Fragmentation: Vertical slot fish passways can contribute to habitat fragmentation by interrupting the natural flow of rivers. This interruption can create barriers to fish migration, leading to isolated populations and reduced gene flow between different sections of the river.
	  ○ Species-Specific Challenges: Some fish species may face difficulties navigating through the narrow, vertical slots of the passway. Species with limited jumping abilities or specific habitat preferences may struggle to ascend or descend through the structure, limiting their access to essential spawning or feeding areas.
	• Environmental Risks:
	  ○ Sedimentation: Improperly designed vertical slot fish passways can alter flow patterns, leading to increased sedimentation downstream. Changes in flow velocity and direction can cause erosion of riverbanks and streambeds, resulting in sediment accumulation in downstream habitats. Excessive sedimentation can degrade water quality, smother benthic habitats, and reduce oxygen levels, harming aquatic life.
	  ○ Hydraulic Impacts: Vertical slot fish passways may create hydraulic conditions that are unsuitable for fish passage. High velocities and turbulent flows within the passway can impede fish movement and cause physical stress or injury. Additionally, rapid changes in water level or flow rate can disorient fish and hinder their ability to navigate through the structure.

Cone Fishway	• Biodiversity Risks
	  ○ Selective Passage: Cone fishways may not provide equal passage opportunities for all fish species. Some species may have difficulty navigating through the structure due to factors such as water depth, flow velocity, or hydraulic complexity. This selective passage can create barriers to migration for certain species, leading to reduced genetic exchange and population fragmentation.
	  ○ Altered Hydrology: Cone fishways can modify natural flow patterns within river systems, potentially altering habitat availability and quality for aquatic organisms. Changes in flow

	velocity, turbulence, and water depth can influence the distribution and abundance of fish and other aquatic species, impacting ecosystem dynamics and biodiversity.
	• Environmental Risks
	  ○ Habitat Modification: Construction of cone fishways may require alterations to river channels and banks to accommodate the structure. Channel dredging, bank stabilization, and other habitat modifications can disrupt natural riverine habitats and alter ecosystem processes. Changes in habitat structure and composition can affect the distribution of aquatic flora and fauna, leading to shifts in community composition and trophic interactions.
	  ○ Sediment Transport: Cone fishways can affect sediment transport dynamics within river systems, with potential implications for downstream habitats. Changes in flow velocity and turbulence induced by the structure can influence sediment deposition and erosion patterns, altering habitat availability and quality for benthic organisms and other aquatic life.

2.3.3 Project Technology

There are different technological options being proposed for the project activities. The key technological options are provided here:

Table 7: Irrigation System Options

Options	Component	Options	Description
Pumping	1	Diesel water pump	Traditional water pumping systems powered by diesel engines. These are commonly used in areas where electricity is unavailable but it has higher operational cost and environmental impacts. However, it can be used anywhere in the sub-scheme.
		Solar pumps	Sustainable and cost-effective water pumping systems that harness solar energy, suitable for remote areas with abundant sunlight. They offer lower long-term costs but may require higher initial investment.
		Electric pumps	Powered by electricity from the grid or other sources, these pumps are efficient but depend on the availability of consistent electrical supply which maybe inapplicable at farm level in most of the sub-scheme

IPM	1	Pesticide application	A conventional approach involving chemical pesticides to manage pests, often leading to quick results but with potential risks to health, environment, and biodiversity. The times of application without IPM will be up to 6 times as per the reported from the field survey.
		With IPM*	The application of pesticides will be reduced to only around 3 times, minimizing the impacts on the quality and health of water, environment, wildlife, fauna and flora, human and animal
Agromet	1	Without Agromet	Farming practices carried out without the use of weather and climate data, potentially leading to inefficiencies and higher vulnerability to climate risks.
		Agromet	Incorporates meteorological data and forecasts into agricultural decision-making, enhancing productivity, resource optimization, and resilience to climate variability. However, the major challenge is mainly the operational cost of the system.
SCADA**	2	Convention	Manual or semi-automated control systems for monitoring and managing operations, which may be labour-intensive and less efficient in handling complex systems.
		SCADA	Advanced digital systems that provide real-time monitoring, data analysis, and remote-control capabilities for improved efficiency and operational oversight.

*. IPM = Integrated Pest Management

**. SCADA = Supervisory Control and Data Acquisition

For pumping, there is a need to be case specific to each of the option. Applying these technological options are important since the technologies will facilitate the agricultural production and complimenting each other is needed. The promotion of only one (1) option would decrease the effective farming activities. Regarding the IPM, it is quite important to promote the technologies as it will reduce the negative impacts which will be caused by the farming activities. The application of agromet will require technical skill and management capacity

2.3.4 Project Scenario Analysis

In the without-project scenario, the net command area in OTB (14,874 ha), will continue to be cultivated with a cropping intensity of 155% (23,055 ha). This includes 14,131 ha of wet-season paddy and 8,924 ha of dry-season paddy. In addition, the land area for vegetable production within the sub-scheme is reported to be approximately 141 ha, approximately 1% of the total command area.[1] The without-project scenario suggests that continuation of ongoing agricultural

[1] MoP (2023). Commune Database 2023. Ministry of Planning.

practices in the project area, with suboptimal yields for rice cultivation and poor crop diversification resulting in low farmer income and high vulnerability to climate risk. With poor rice yield and agricultural productivity, there is the possibility that farmers will alternate their livelihood options to seeking for additional sources of income such as illegal fishing, hunting, and migrating to other areas for income making to feed their families. Without adequate water, their livelihood is highly depending on climate which tends to be highly variated over the past years with series of climate occurrence at a high level of severity and frequency, reported to be approximately occurred every two (2) years both drought and flood and 29% of migration rate. This would be likely to be accelerated when the level of climate impact continues to increase.

In the with-project scenario, it is anticipated that the net command area will be cultivated with greater intensity, increasing from one (1) cropping cycle to two (2) or three (3) cycles per year. This improvement is attributed to enhanced water availability, better water management, higher water transmission efficiency, and improved drainage as a result of the project's investments. The rehabilitation of existing irrigation canals and the construction of new ones will enable an increase in cropping intensity of up to 270%, covering 40,161 hectares. This will yield a net increase of up to 17,106 hectares with reliable irrigation access, including 26,776 hectares of wet-season paddy, 11,899 hectares of dry-season paddy, and 1,488 hectares of high-value crops, such as fruits and leafy vegetables.

The project is expected to deliver the following agricultural outcomes for the 8,130 farming households in the OTP scheme: i) improved yields for wet-season rice, ii) expanded cultivation area and increased yields for dry-season rice, and iii) the introduction of high-value crops like leafy and fruit vegetables for dry-season cultivation. These changes are projected to boost agricultural production, raise farmer incomes, and enhance farmer resilience to drought, pests, diseases, and market risks through crop diversification.

2.4 Proposed Investment

2.4.1 Key activities by Project Component

The project has three Components (summarized below). However, the ESCMP Ou Ta Paong will covers investment activities proposed under only Component 1 and Component 2.

Component 1. ***Improving farm-level climate adaptation, resilience, and water use efficiency***

The objective of this component is to build climate resilience (CR) of smallholder farmers and enhance sustainable production through evidence-based planning and context-relevant climate resilient practices at the farm level. This component is designed to address the lack of knowledge and skills to deploy technologies and practices at farm level by farmers and the lack of appropriate extension services to propagate them. It will introduce farmers with various climate resilient technologies and practices for both rice and non-rice activities such as vegetable production, poultry and aquaculture.

Sub-component 1.1 Deployment of farm-level climate adaptation and water use efficiency measures

Output 1.1: Increased capacity of farmers to deploy climate resilient (CR) practices at farm level

This output will focus on developing farmers' capacity in deploying CR technologies and practices to transform the agricultural production system to adapt to the changing climate context. Farmer's will be trained to first develop Action Plans (AP) to re-orient farmer behaviour and assist them in transforming the agriculture production system in a manner that is better adapted to factoring in the agro-ecological context and expected climate change impacts.

- Activity 1.1.1 Preparation of community-based action plans (AP) to transform agriculture with CR practices.
- Activity 1.1.2 Preparation of training materials to support implementation of the AP.
- Activity 1.1.3 Conduct trainings to create a pool of expertise to demonstrate and propagate the CR technologies and practices.
- Activity 1.1.4 Train farmers on applying CR technologies using the FFS approach.
- Activity 1.1.5 Strengthening and fostering tailored mechanization service providers for improved mechanization service delivery.
- Activity 1.1.6 community-based monitoring and evaluation (CBME) of implementation

Sub-Component 1.2 Climate adapted, value added, and market led agricultural investments

Output 1.2 CR value added, and market led agriculture investments secured.

This output involves improving and enhancing some value chains that are key for the project area and include rice, vegetable, chicken and aquaculture value chains, through the use of Public Private Producer Partnerships (4Ps) and increased access to finance, which will improve market access, climate adaptability, and ensure increased income for smallholders in the value chains.

- Activity 1.2.1 Value chain study and planning
- Activity 1.2.2 Establish District Multi-Stakeholder Platforms (MSPs)
- Activity 1.2.3 Public Private Producer Partnership Facility (4PF)

Sub-component 1.3 Improve enabling conditions, capacities and disaster risk management strategies

Output 1.3. Increased access to and use of climate information and advisory services for climate responsive agriculture planning

This sub-component will strengthen the production and dissemination of tailored agro-meteorological information to inform climate responsive management and planning of agriculture in the project target areas through ICT technologies. The aim is to ensure that agro-meteorological services are accessible and useful to farmers to manage climate risks, access to and use of water and efficient cropping systems.

- Activity 1.3.1 Establish ICT based multi-disciplinary platform at provincial level.
- Activity 1.3.2 Building the capacities of the platform to deliver services.
- Activity 1.3.3. Establish the agromet information systems and the outreach mechanisms.
- Activity 1.3.4 Awareness raising and capacity building of farmers and stakeholders in applying the *services.*

Sub-component 1.4 Rural roads

Output 1.4: Increased resilience of farm road infrastructure to climate change

- Activity 1.4.1 Initial planning and identification
- Activity 1.4.2 Technical survey and design considerations, preparation of cost estimation
- Activity 1.4.3 Improve 50 Kilometers of farm roads.
- Activity 1.4.4 Handing over of the completed works.

Component 2: Irrigation Infrastructure for increased resilience

Component 2 will focus on rehabilitating/creating and modernizing hydraulic infrastructure, including canals, ponds, flood-proof infrastructure (river, drain) and to provide high-efficiency climate-resilient irrigation systems for adapting to both increasing flood and drought conditions. It will include support and capacity building to O&M operators at both, Provincial (PdoWRAM) and scheme (FWUC) level, to ensure the sustainability of the scheme. The output will secure and increase farmer's agricultural production by improving the irrigation supply and protect crops from water-related disasters.

Component 2 is linked with Component 1 such that it facilitates the implementation of CR on farm crop and water management practices through improved field level water supply delivery and drainage. It will focus on rehabilitating and modernizing of irrigation and flood protection/drainage infrastructure in the six sub-projects, including irrigation and drainage canals, flood control embankments, and ponds, to provide high-efficiency climate-resilient irrigated agriculture systems for adapting to both increasing flood and drought conditions.

Sub-Component 2.1: Modernization of irrigation scheme and ponds

- Activity 2.1.1 Technical analysis, field surveys and preparation of plans for system upgrading.
- Activity 2.1.2 Implementation of infrastructure upgrading.

Activity 2.1.3 Preparation of canal O&M plans including application of ICT and SCADA for operation***Sub-Component 2.2: Flood-proofing and Drainage improvements***

- Activity 2.2.1 Establish flood monitoring, information, and early warning systems.

Activity 2.2.2 Strengthening and construction of flood control and drainage infrastructures.***Sub-Component 2.3: Establishments and training of Farmers Water User Communities (FWUC)***

- Activity 2.3.1 Formation of institutional strengthening of the FWUC

- Activity 2.3.2 Build technical capacities of FWCU for canal structure O&M
- Activity 2.3.3 prepare long term financing plan for O&M of the systems including the WUAS.

Sub-Component 2.4: Water information and Management (SCADA)

Component 3. Institutional Strengthening

Sub-Component 3.1 MOWRAM capacity Support.

Output 3.1 Strengthened MOWRAM Capacity

- Activity 3.1.1 Preparation of climate resilient design manuals for irrigation and train staff.
- Activity 3.1.2 Building capacities on application of ICT and RS technologies, data management.
- Activity 3.1.3 Capacity building in water Accounting and Auditing.

Sub-Component 3.2 Strengthening of NDA and NCDD.

Output 3.2 Improved capacities for climate action monitoring

- Activity 3.2.1 Preparation of Loss and Damage Strategy
- Activity 3.2.2 Strengthen national M&E process for climate action
- Activity 3.2.3 Enhancing Capacity of NDA and other stakeholders.

2.4.2 Tentative Schedule for Sub–scheme Implementation

By this time, the feasibility study for the Ou Ta Paong is under finalization to allow for the design process, procurement process and approvals. To implementation of the sub–scheme, the following assumptions have been made:

- The detailed design will start in January 2025; it will take two years to get a better understanding of the upstream hydraulic infrastructure, conduct additional survey and propose the best solution for a sustainable water supply of the scheme.
- The procurement process will not take more than three quarters.
- The work construction will start after the rainy season in Cambodia with a mobilization period (last quarter of the year);
- The work construction duration will not last more three dry seasons.

Hence the construction would be able to commence at the last quarter 2027, with completion by mid-2030.

Table 8: Tentative implementation schedule of Ou Ta Paong irrigation scheme.

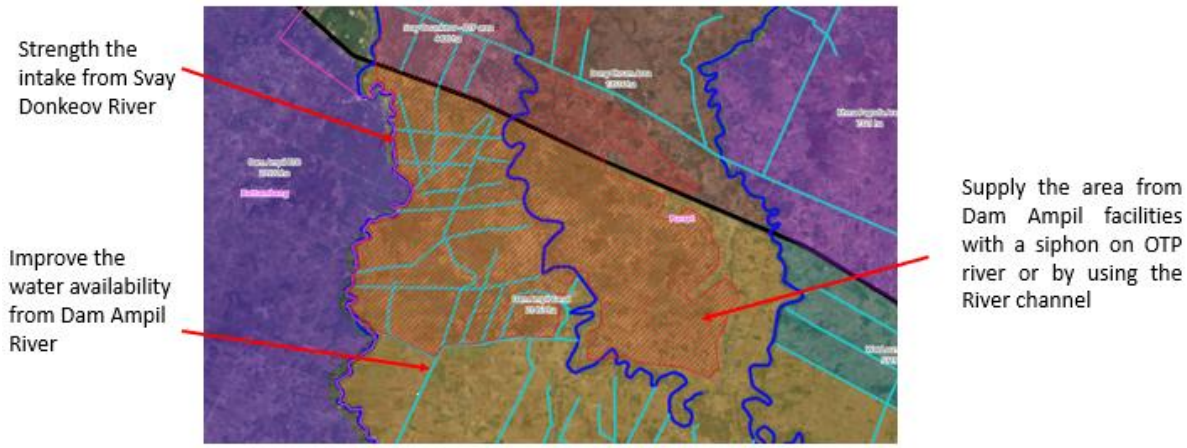
2.5 Proposed Infrastructure

2.5.1 Design Concepts and Options

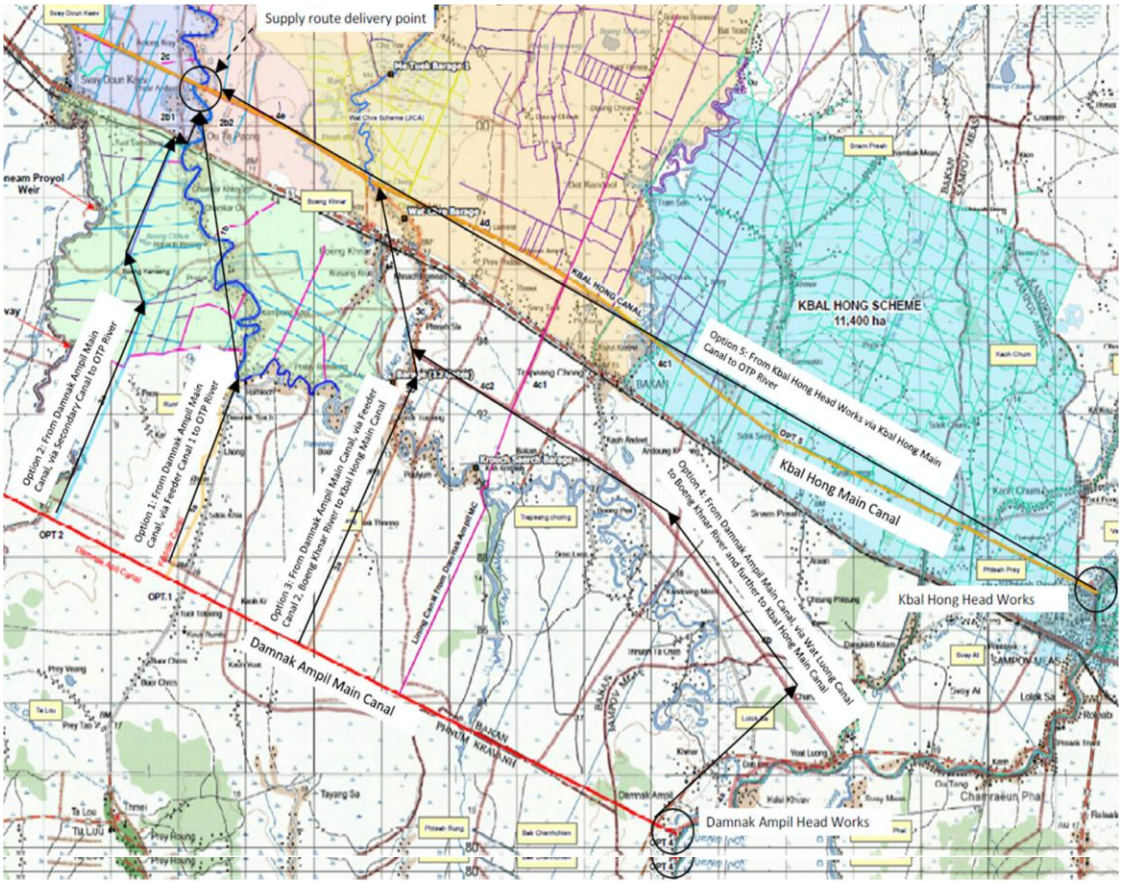


The Ou Ta Paong River system is divided into three (3) distinct blocks for irrigation purposes as per the block colour in Figure below. Block A, located south of National Road shaded in light yellow colour, is supplied by the Pursat River through the Dam Ampil Canal and upstream infrastructure, covering an area of 4,198 hectares. Some of the upstream infrastructure may require rehabilitation to increase its hydraulic capacity and fully irrigate the area. Block B, situated in the northwest and covering approximately 4,400 hectares shaded in light green colour, is currently supplied by the Svay Donkeov River. It relies on existing canals, which require upgrades to improve water delivery, with additional overflow from Block A and drainage from National Road 5 also contributing to water supply. Block C, in the northeast, covers around 6,276 hectares shaded in light blue colour and is the most challenging area to irrigate, as it depends on multiple sources of water, including the Svay Donkeov River, Kbal Canal, and Dam Ampil Canal, all of which require rehabilitation and upgrades to meet irrigation needs.

Figure 4: Three (3) blocks (sub-scheme) of Ou Ta Pong sub-project

(Source: CAISAR Project, 2024)

Figure 5: Concept design of Block A of Ou Ta Pa Ong Scheme



In addition, existing infrastructure along the Svay Donkeov river should be investigated at the design study to see if the western side can still be irrigated partially from the stream or directly from Dam Ampil Canal which intercept the river upstream. The eastern part is more difficult to be irrigated by Dam Ampil existing infrastructures as the Ou Ta Paong River creates a natural upstream barrier. Five options were proposed and considered (described bellow). But only three options were finally selected to proceed with detailed design: including Option 1, Option 3 and Option 5 (See Figure 6):

- **Option 1**: The option will release part of the required water of the Damnak Ampil secondary canal to the Ou Ta Paong River and create necessary work rehabilitation/ construction to divert the extra flow to the eastern area (river rehabilitation under component 2.2 and river diversion). The canal is routed from Damnak Ampil Headwater (DAHW), via Damnak Ampil Main Canal (DAMC) (18.7 km), via the Secondary Canal (‘Feeder Canal 1’, 8.8 km), into OTP River, and via OTP River’s section (13.8 km) South of the National Road to the supply point. The totaltotaltotal length of this route is 41.3 km.
- **Option 3**: Parallel to Option 1, the canal will additionally release water from Damnak Ampil but extended further reaching Kbal Hong Canal, then continues to Ou Ta Paong River. **Route description:** From DAHW, via DAMC (16.7 km), via the Secondary Canal at km 16.7 (‘Feeder Canal 2’, 6.1 km), into Boeng Khnar River’s section (9.9 km) South of the National Road to Wat Chrey Head Works, and via link canal (0.5 km) into KHMC, and via KHMC (7.2 km) to the supply point. Total length of this route is 40.4 km.
- **Option 5:** The option begins at Kbal Hong barrage at Pursat provincial town involving the enhancement of the Watergate height and the distance of carrying water will be approximately like Option 4. However, the increase in the height of the Watergate will cause inundation of the upper area of the Pursat River which may cause flooding in the town. This may bring in huge discontentment of the people in the city as height water level may cause in delay of storm water flow during raining period. The route is from Kbal Hong Head Water (KHHW), via Integrated Water Resources Management (IWRM) Kbal Hong

Main Canal (KHMC) (17.0 km) into KHMC Extension (17.0 km) to the supply point on OTP River. The total length of this route is 34.0 km.

Figure 6: The Selected 3 Options

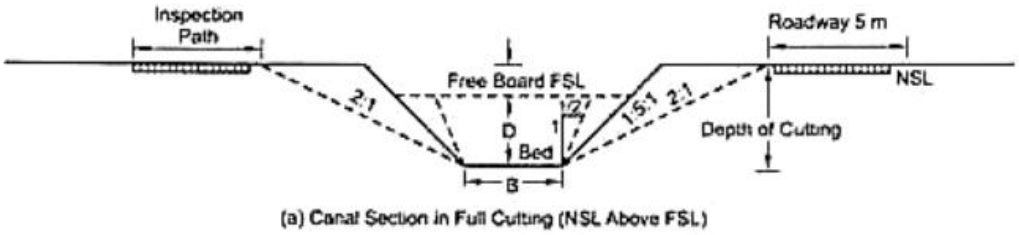
(Source: CAISAR Project, 2024)

2.5.2 Types of Infrastructure and Design

The Ou Ta Paong sub-project utilize water from the Pursat River and Svay Don Keo. It integrates nature-based solutions such as the restoration of the Ou Ta Paong River, fish passages on Don Keo and OTP, and natural management of Tonle Sap floods. The project includes 35 solar pump installations. Canal infrastructure development comprises a main/feeder canal of 8 km with 29 structures, secondary canals totalling 65.8 km with 121 structures, and tertiary canals extending 198.5 km with 1,591 structures. Additionally, there are 36.3 km of drains and 21 km of flood embankments with five (5) structures. Storage solutions include local ponds, fish refuges, and two (2) existing reservoirs within the Pursat catchment, with the Pursat Dam 1 hydropower project under construction and Dam 2 water storage. Please see also Table 9.

Table 9: Ou Ta Paong Sub-Project Key Characteristics

Sub Project	Ou Ta Paong
Area Cultivated (ha)	13,000
Water Source	Pursat River and Svay Don Keo



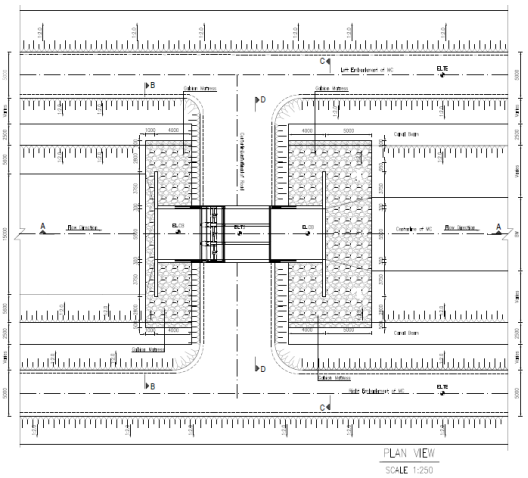
Nature Based Solution[2]	Restoration of Ou Ta Paong River, fish passage on Donkeo and OTP, Natural Management of TS floods.
Solar Pump Installations	35 (Not suitable in flood areas)
Main/Feeder Canals C/L(km)/N	1_8.0km_29
Secondary Canal C/L (km)/N (Existing)	8_30.0km_ 13_35.8km_108
Tertiary Canal C/L (km)/N Exist	34_47.5km 139_151.0km_1452
Main/Secondary Drains (C/L km/N)	7_36.3km_15
Storages	Local Ponds and fish refuge. Storage within OTP river. 2 Existing reservoirs in Pursat catchment, Pursat 1 hydropower under construction
Land Area of Canals (Existing proposed Ha)	299_575
Cost Estimate (USD/m)	70.8
Cost/ha $	5,450

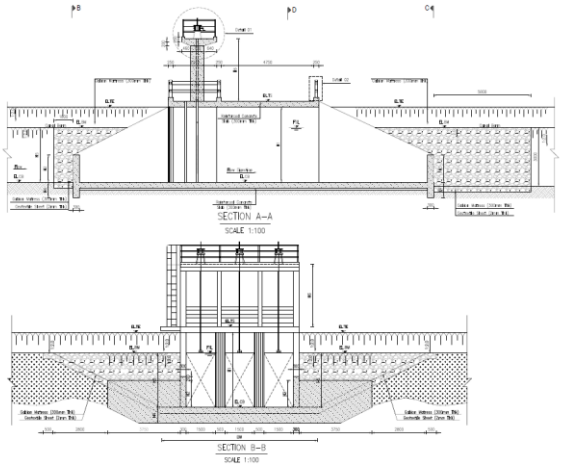
The latest decision on the infrastructure in OTP confirmed that the polder system is no longer needed, and the focus is given to the existing canal system only. The key components of OTP include a canal system with concrete linings, and water regulation structures. Two (2) tertiary canal options are proposed, one (1) using diesel pumps and another employing solar-powered pumps for improved sustainability. Expansion of existing feeder canals is also planned, though specifics remain subject to change. The following are the conceptual design for each of the design where the detail design is supposed to be considered:

Canal. The design of the canal system (Figure 7) aims to serve both irrigation and drainage functions, considering the topography, limited water resources, and potential land resettlement issues. Where possible, the canals will follow existing paths to minimize social impacts. The size of the canals will be adjusted based on the irrigated area and the local topography. To ensure long-term sustainability and reduce water loss through percolation, it is recommended to construct the main canals using concrete linings or suitable alternatives. This approach will help maintain water distribution efficiency and improve the durability of the infrastructure.

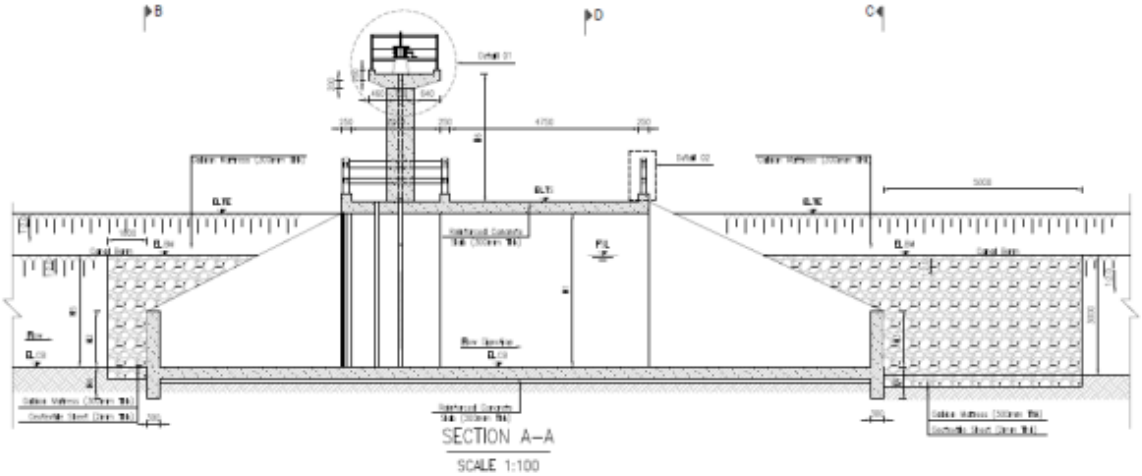
[2] Nature-Based Solution, in this case is the restoration of the river system through dredging, is applied to contribute to the recovery of the natural condition of the Ou Ta Paong as the system has already been deteriorated due to over water abstraction and blockage of the river system while the restoration of fish passage/sliding gate is going to be decided at the time of DED since no specific design being considered at this stage.

Figure 7: Typical canal section in full cutting





River Training and Drainage: A well-designed drainage system will be a critical component of the project, intended to manage excess runoff during the rainy season and prevent waterlogging in the command area. This system will also serve as the outlet for the on-farm drainage network, which is designed to control groundwater levels and drain surplus irrigation water. The layout of the drainage system will be based on the main natural drainage channels, upstream watersheds, rainfall over the command area, and changes in water levels in the Tonle Sap. It will also consider land use, crop types, and the planned irrigation systems to ensure efficient water management.



Water Regulation and Off-Take Structures: Water will be diverted from multiple sources into the main canals according to water availability and a demand schedule prepared by the FWUC and PDoWRAM, based on crop needs. Various cross structures (off-take structures) will be installed to maintain the full supply level in the main and secondary canals where necessary. The flow of water into each canal will be controlled by operating the gates of the head regulators, ensuring efficient delivery to the tertiary canals, which will distribute water to individual fields. Farmers will have the option to irrigate their plots either through plot-to-plot irrigation or by constructing field ditches through the diversion of water using these off-take structure (See also Figure 8).

Tertiary System: The irrigation system design extends to the tertiary canal level, which is the final distribution point before water reaches individual plots. Two (2) options are considered for the tertiary canals. The first option involves creating traditional tertiary canals through excavation, where farmers will individually pump water using diesel pumps based on their needs. However, this requires significant cooperation from beneficiaries, as canal alignment must be accepted

without land compensation. The second option is to install collective solar pumping stations, a more sustainable and cost-effective solution that eliminates the need for diesel pumps and reduces CO2 emissions.

Collective Solar Pumping System: The project aims to implement a solar-powered pumping system as a low-tech, sustainable alternative to diesel pumps, with a pilot test covering 30-50 hectares in each irrigation block. The solar pumping system requires minimal maintenance and has no fuel costs, making it an environmentally friendly and cost-effective solution for farmers. The southern part of Block A is particularly suitable for the implementation of this system due to its proximity to villages and protection from floods. The solar pumping system could cover 4,198 hectares with 80-90 units, improving water efficiency by 20% and reducing the risk of land conflicts along the canal alignment. This system would ensure reliable water delivery and support sustainable agricultural practices.

2.6 Implementation Resources Requirement

2.6.1 Labour and Workforce

Table 10 outlines the estimated labor requirements for the construction of the irrigation system under the CAISAR project. Four main groups of the labor forces include: Direct Workers, Contracted Workers, Primary Supply Workers, and Other Stakeholders. The Direct Workers include individual consultants and members of the Project Implementation Unit (PIU), who are essential from the project preparation phase through to completion. The Contracted Workers, engaged by the PIU and construction contractors, consist of national specialists such as Detailed Design Consultants and Construction Supervision Consultants, as well as skilled and unskilled laborers. This group is engaged on intermittent basis. The Primary Supply Workers are mostly local workers involved in providing services to the project at local level during construction, while Other Stakeholders include civil servants from various government ministries and departments, such as MoWRAM, NCDDS, and MEF are technical support. Ou Ta Paong has the highest number of workers in most categories as it is the largest sub-scheme, given 80 skilled workers and 150 unskilled workers while only 40 skilled and 60 unskilled workers.

The involvement of local workers and civil servants is a key feature of the labor requirements. Local workers are heavily engaged as unskilled laborers and primary supply workers, emphasizing the project's reliance on local resources and its potential to create employment opportunities in the region. Additionally, civil servants from ministries such as MoWRAM, NCDDS, and MEF play a significant role, particularly during the construction phase, ensuring compliance with safeguards and providing technical and administrative support. The total estimated labor requirement of 393 workers demonstrates the scale and complexity of the CAISAR project, requiring careful coordination among consultants, contractors, government agencies, and local communities to ensure successful implementation.

Table 10: The estimated influx labor within the sub-schemes

Type of project workers	Characteristics of project workers	Duration of Labor Requirements	Total
Direct Workers			
PIU's member MoWRAM & NCDDS	Individual consultants (e.g., E&S Specialists, Design Engineers, Construction Supervision Engineers, etc.	From project preparation till project completion	20
Contracted Worker			
Engaged by PIU			
Detailed Design Consultant	National specialists	From project preparation until project completion	15
Construction Supervision consultant	National specialists		15
Independent E&S Monitoring Consultant		One (1) month in very six (6) months	10
Technical Assistance			15
Engaged by construction contractors			
Skilled workers	National specialists	Durations vary, depending on construction stages & needs.	80
Unskilled workers	Local workers (around subproject location)		150
Primary Supply Workers			
Workers producing materials for core project activities	Mostly local workers	Construction stage	30
Other Stakeholders Working in Connection with Project			
Civil servants of MoWRAM, PDWRAM at provincial & district level	SEO safeguard team	The construction stage of the project.	18
Civil servants of NCDDS	Staff of NCDDS	From project preparation until project completion	15
Civil servants of MEF	Staff of GDR	From project preparation until project completion	10
Civil servants of relevant Ministries	Staff	The construction stage of the project.	15
Total			**393**

PIU = Project Implementation Units, MoWRAM = Ministry of Water Resources and Meteorology, E&S = Environmental and Social, NCDDS = National Committee for sub-National Democratic Development Secretariat, PDWRAM = Provincial Department of Water Resources and Meteorology, SEO = Social and Environmental Officer, MEF = Ministry of Economy and Finance, GDR = General Department of Resettlement.

2.6.2 Power Usage

During the construction, the project requires a reliable and sufficient power supply to support various construction activities including equipment operation, worker facilities, and site management. A significant portion of power consumption will be allocated to heavy machinery and equipment, including concrete mixers, cranes, drilling rigs, welding machines, water pumps, and earthmoving equipment such as excavators and bulldozers. These machines require high-power supply mainly from the self-propel engine using diesel or gasoline as the fuel whereas the power for lighting and security systems for general visibility on the construction site could be from the power grid as the location is accessible to power grid. Apart from machinery, electricity for worker facilities and site infrastructure can be the power grid or diesel generators. Worker camps will require power for lighting, cooking, air circulation, and mobile charging.

The overall power demand will vary based on the project's phase, the number of workers, and the type of equipment used. However, the estimate of the demand is far from actual since many information is lacking. The engineering team recommended to wait until the DED stage. A hybrid power system using a combination of grid electricity, and diesel generators. Efficient energy management strategies will help optimize power use, reduce costs, and minimize environmental impact.

2.6.3 Supporting Facilities

Several supporting facilities that are required for the construction activities include site offices and administrative facilities, worker accommodation and welfare facilities such as worker camps containing toilets, showers, handwashing stations, and kitchens to ensure proper hygiene and nutrition. A stable power supply is needed for machinery operation, lighting, and worker facilities, sourced from grid electricity, diesel generators, or solar panels can be the options. Additionally, wastewater treatment facilities are need to manage sewage and reduce environmental pollution for the camp sites.

Proper storage and material handling facilities is needed to protect construction materials such as cement, steel, and gravel. Transportation infrastructure and access roads is used to facilitate the movement of materials and personnel, with designated loading and unloading zones to streamline logistics. To ensure safety, security measures such as perimeter fencing, guard posts, and fire safety stations is needed. Furthermore, environmental management facilities such as waste segregation units, drainage systems, and recycling bins are also needed to minimize environmental impact. The specific layout and location of the facilities can only be projected at after obtaining the final design layout plan of the engineering team during the construction stage after the contract award.

2.6.4 Water Consumption

Water is needed for construction activities and domestic uses of workers. Water is essential for various activities, including material preparation, earthworks, equipment operation, worker sanitation, and site maintenance. A significant portion of water use is allocated to concrete and material preparation, where it is needed for mixing concrete, mortar preparation, curing, and soaking bricks or blocks to prevent rapid water absorption. Additionally, earthworks and dust

control require water for soil compaction, suppressing dust on unpaved roads, and softening the ground during grading and levelling. Water is also crucial for equipment and machinery operations, including cooling construction machinery, cleaning tools and formworks, and conducting hydraulic testing of pipelines to check for leaks and pressure integrity. In road construction and asphalt work, water is required for wetting base layers before compaction, mixing with bitumen, and cooling asphalt equipment. Estimate the quantity of water for such activities need the figure of the facilities. As per the consultation with the engineering team, it is not feasible to make an estimate on the water need for such a work since the scope of work including volume of excavated soil, volume of concrete to be used, and so on are not available.

The estimate of water needs for domestic use of the project associated workforce use the 70 liters per day[3] as the basis for the calculation. As the duration of engagement of staff and officials, workers, civil servants over the project life time are varied from one to another. The PMU staff engagement at the field is estimated at 3 days per month over the period of 6 years. The DED Consultant is estimated at 100 days per year for one year, following by construction supervision consultant at 250 days per year for 2.5 year, independent E&S Monitoring Consultant at 25 days per year for 3 years, technical consultant at 50 days per year for 3 years, skilled and unskilled workers at 250 days per year for 2 years, primary supply workers at 50 days per year for 2 years, officials for MOWRAM and PDoWRAM at 50 days per year for 6 years, and other officials at 40 days per year for 6 years. The result of the estimate for water demand is provided below:

Table 11: The estimated quantity of water for domestic use of the project

No.	Type of Workers	Total Workers	Number of Days at Field	Total Water Demand (liters/day)	Total Water Demand (m3)
1	PIU member MoWRAM & NCDDS	20	4,320	1,400	6,048
2	Detailed Design Consultant	15	1,500	1,050	1,575
3	Construction Supervision consultant	15	9,375	1,050	9,844
4	Independent E&S Monitoring Consultant	10	750	700	525
5	Technical Assistance	15	2,250	1,050	2,363
6	Skilled workers	80	40,000	5,600	224,000
7	Unskilled workers	150	75,000	10,500	787,500
8	Primary Supply Workers	30	3,750	2,100	7,875
9	Civil servants of MoWRAM, PDWRAM	18	5,400	1,260	6,804
10	Civil servants of NCDDS	15	3,600	1,050	3,780
11	Civil servants of MEF	10	2,400	700	1,680
12	Civil servants of relevant Ministries	15	3,600	1,050	3,780
	Total	**393**			1,055,773

[3] water-quantity.pmd

PIU = Project Implementation Units, MoWRAM = Ministry of Water Resources and Meteorology, NCDDS = National Committee for sub–National Democratic Development Secretariat, E&S = Environmental and Social, PDWRAM = Provincial Department of Water Resources and Meteorology, MEF = Ministry of Economy and Finance.

The estimated water demand is mainly for needed during the construction period, given less than 1% of the estimated water is required for pre-construction stage.

2.6.5 Expected GHG Emission and Discharge

During construction, the construction activities will generate Greenhouse Gas (GHG) emissions from various activities, primarily due to the use of fossil fuels, electricity consumption, and material production. One of the major contributors to emissions is fuel combustion in heavy machinery and construction equipment, such as excavators, bulldozers, cranes, and trucks. These machines rely mainly on diesel fuel, which releases carbon dioxide (CO_2), methane (CH_4), and nitrous oxide (N_2O) into the atmosphere. Additionally, transportation of materials such as sand, gravel, cement, and steel to the construction site will also contribute to emissions through fuel consumption by trucks and other vehicles.

Another significant source of GHG emissions is the production and use of construction materials, particularly cement, steel, and asphalt. Cement manufacturing is known for high CO_2 emissions due to the chemical process of calcination, while steel production requires significant energy, leading to further emissions. The use of electricity for site operations, including lighting, worker accommodations, water pumping, and equipment, will also add to the overall carbon footprint, depending on the energy mix used. However, the exact amount of GHG emissions can only be determined after the detailed engineering design is completed, which will provide specific information on construction scope, number and size of equipment usage, and material requirements. Future calculations should take into account project-specific data to ensure a more accurate estimation of the environmental impact.

2.6.6 Land Acquisition for Material Storage

To support construction activities, contractors will need to rent land or engage local households to store materials and vehicles. This land will be used for essential contractor facilities, such as temporary storage areas, worker accommodations, and machinery stations. Securing this land is critical for ensuring efficient operational logistics and smooth construction management throughout the project. Ou Ta Paong, being the largest sub-scheme, is estimated to require the highest allocation. Overall, it is projected that a total of 10 households or land units will be needed for Ou Ta Paong.

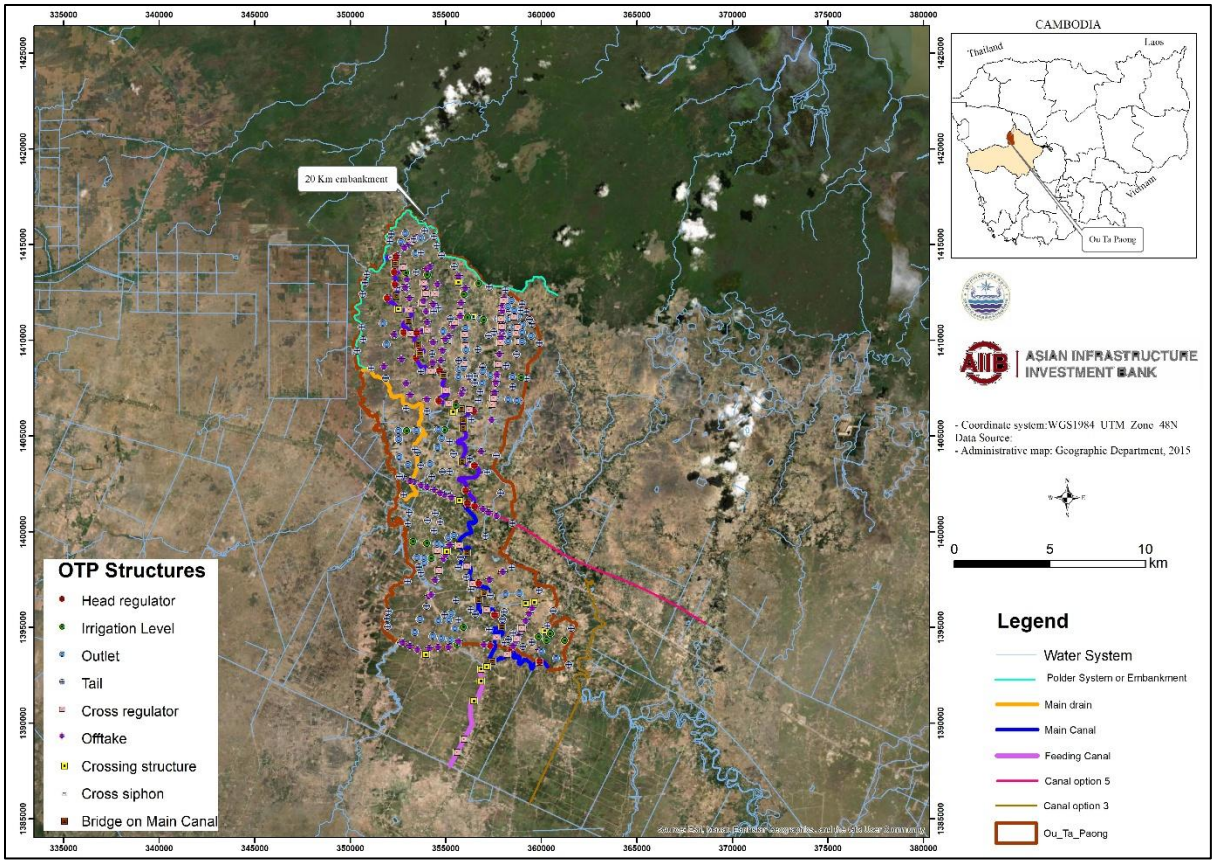
2.7 Project Area of Influence

2.7.1 Definitions

Under Ou Ta Paong sub–scheme, term "Areas of Influence" (AoI) comprise, as appropriate, areas that are likely to be affected by the following:

(i) **Project activities**, including i) project activities and the facilities under Component 1 and Component 1 that are directly owned, operated or managed (including by contractors) and; ii) the impacts from unplanned but predictable developments caused by the project that may occur later or at a different location; or indirect project impacts on biodiversity, or on ecosystem services upon which affected communities' livelihoods are dependent;

(ii) **Cumulative impacts**[4] that result from the incremental impacts (direct and indirect) from a) project activities proposed under Ou Ta Paoing sub–scheme on the project command area, and b) Ou Ta Paoing sub–scheme, and combined cumulative effect from Ou Ta Paoing sub–scheme, past and planned projects, on the area downstream the Ou Ta Paoing sub–scheme, and other relevant projects; and



(iii) **Associated facilities** are facilities not included in the Project set out in the Legal Agreements governing the Project, but they are: (a) **directly** and **materially** related to the Project, (b) **carried** out, or **planned to be carried out**, **contemporaneously** with the Project; and **(c) necessary** for the Project to be **viable** and would **not be carried out if the Project did not exist**".

2.7.2 Areas of Influence of Ou Ta Paong Sub–scheme

Under CAISAR, since project design for Ou Ta Paoing is still ongoing, the area of influence for Ou Ta Paoing is anticipated based on: a) target command area of each scheme (where most proposed project activities will take place during project construction, and later during project operation), and b) the environmental footprint that are likely caused by project activities during project construction (as direct and indirect impacts due to activities under Component 2), and by project activities (mainly cumulative impacts due to intenstified crop production activities under component 1).

Figure 9: Locations of irrigation structures in Ou Ta Paong

[4] Cumulative impacts are limited to those impacts generally recognized as important on the basis of scientific concerns and/or concerns from Affected Communities.

Based on investment activities proposed under project component 1 (improved crop production) and component 2 (improved irrigation access), the sub-scheme's area of influence is defined by the following investment activities:

- **Command area:**
  - Areas with increased number of crops per years (under Component 1)
  - Specific location where existing irrigation canals are repaired/improved, extended (at selected location at tertiary level), new small-scaled water gates
- **Construction areas** (mostly inside command areas)
  - Workers' camps
  - Areas where construction materials are stockpiled and machineries and construction vehicles are parked, repaired, operated during construction process.
  - All routes used by contractors and subcontractors for operation of vehicles and machinery for construction (e.g. access roads, communal roads)
- **Road networks**
  - All roads, routes that connect the construction sites and the sites that are used as a) disposal site, b) construction material supply site, c) borrow pits, d) quarries, etc.

- **Disposal site(s), borrow pit(s)**
- **Any area affected by environmental footprint**
    - As defined by the area subject to noise, vibration, air, soil, water pollution due to project activities.
- **Land impacts**
    - Any land area that are acquired for the purpose of expansion of irrigation canals (Compopent 2) and/or farm roads (Component 1).

It is noted that while direct and indirect impacts could be reasonably anticipated based on currently proposed scope of works and prior experience for similar works, cumulative impacts, particularly their spatial extent and severity (over the time) require collection of supporting scientific evidence from data collected under project's environmental and social monitoring program.

These above anticipated areas of influence need to be updated when more information becomes available to allow a more reliable assessment, particularly when project detailed design is completed, and construction measures proposed by construction constractors are identified. Future update on area of influence (at respective sub-scheme) will be made on the basis of updated environmental and social assessments once a) locations of construction sites, auxiliary facilities, and logistics operations are confirmed, and b) the full scope of the project's impacts (direct, indirect, and cumulative) is firmed up based on detailed engineering design (for Component 2) and project implementation approach (for Component 1).

3. LEGAL AND INSTITUTIONAL FRAMEWORK

Following a framework for effective project development as well as environmental sustainability, the project owner shall comply with the national legal framework and protocols ratified by the Kingdom of Cambodia. For CAISAR Project, there are national laws, agreements, guidelines and relevant legal instruments as described below:

3.1 Royal Government of Cambodia's Legal Framework

3.1.1 National legal framework

3.1.1.1 The Constitution of the Kingdom of Cambodia (1993)

The Constitution is the highest legal authority in Cambodia and establishes the fundamental rights and duties of citizens and the state. It sets the groundwork for environmental protection, governance, social inclusion, and public well-being, ensuring that environmental and social rights are integrated into national laws.

3.1.1.2 Legal Framework on the Management and Conservation of Natural Resources and Biodiversity

This framework aims to ensure sustainable use and conservation of Cambodia's natural resources, including water, land, biodiversity, and ecosystems. Laws under this framework help guide ESCIA processes to minimize environmental degradation.

- **Royal Decree on Protected Areas (2008)** sets the standard for managing Cambodia's protected areas. It categorizes these areas into **National Parks**, **Wildlife Sanctuaries**, **Protected Landscapes**, and **Multiple-Use Areas** to conserve biodiversity, ecosystems, and cultural heritage while supporting sustainable development.
- **Law on Environmental Protection and Natural Resource Management (1996)**: Establishes principles for sustainable development and environmental protection, requiring environmental assessments for projects impacting natural resources.
- **Environmental and Natural Resources Code 2023**: Provides a comprehensive approach to natural resource governance, setting standards for the sustainable management of resources.
- **Law on Land Management, Urban Planning and Construction (1994)**: Governs land use, urban development, and construction to ensure that environmental and social impacts are mitigated.
- **Law on Water Resource Management (2007)**: Regulates water usage, conservation, and management, ensuring that development projects do not negatively impact water resources.
- **Law on Fisheries (2006)**: Focuses on sustainable fisheries management and biodiversity conservation in aquatic ecosystems, crucial for ESCIA in projects affecting water bodies.
- **Protected Areas Law (2008)**: Establishes protected areas to conserve biodiversity and natural resources, ensuring that development projects respect these protected regions.
- **Land Law (2001)**: Regulates land ownership and management to promote sustainable land use practices.
- **Forest Law (1994):** Regulating the management, use, protection, and restoration of Cambodia's forests, this law is crucial for balancing economic development with environmental conservation, particularly in biodiversity-rich ecosystems.
- **Biodiversity Law (2009):** This foundational law provides a comprehensive legal structure for the sustainable management of biodiversity resources. It addresses habitat protection, species conservation, genetic resource management, and the sustainable use of biodiversity, outlining the government's responsibilities and promoting public participation.
- **Sub-Decree on Water Pollution Control (1999)**: Sets standards for water quality and pollution control in development projects.

- **Sub-Decree on Water Quality Standard for Public Waters for the Purpose of Biodiversity Conservation (1999):** These standards aim to maintain conditions suitable for aquatic ecosystems by limiting pollutants, ensuring water remains safe for the survival and reproduction of aquatic life, and preventing ecological degradation.
- **Sub-Decree on Environmental Impact Assessment (1999)**: Requires EIA for development projects, ensuring environmental impacts are assessed and mitigated.
- **Sub-Decree on Air Pollution Control and Sound Disturbance (2000)**: Provides standards to control air pollution and noise disturbances from development projects.
- **Sub-Decree on Solid Waste Management (1999)**: Governs solid waste management in projects, preventing environmental harm from improper waste disposal.
- **Prakas on Environmental Impact Assessment Reports (1999)**: Offers guidelines for preparing EIA reports to ensure thorough assessment of environmental impacts.
- **Prakas on Hazardous Substances (2015)**: Sets limits on the disposal of toxic substances, preventing environmental contamination from hazardous materials.
- **Biodiversity Convention (1994)**: Focuses on conserving ecosystems, species, and genetic diversity. Promotes sustainable use of resources, establishment of protected areas, and fair benefit-sharing from genetic resources.
- **Nagoya Protocol (2010):** As a party to the Nagoya Protocol under the Convention on Biological Diversity (CBD), Cambodia commits to the fair and equitable sharing of benefits arising from the utilization of genetic resources. This protocol supports Cambodia's efforts to protect its biodiversity while ensuring that the benefits of its genetic resources are shared with local communities and stakeholders.
- **Ramsar Convention (1999)**: Aims to conserve wetlands of international importance for biodiversity, water management, and climate resilience. Encourages sustainable use and designation of Ramsar sites.
- **UNFCCC (1994)**: Provides a framework to combat climate change impacts on ecosystems. Supports sustainable land use, forest conservation, and integration of climate adaptation into conservation strategies.
- **Kyoto Protocol (1997, entered into force 2005, Cambodia accessed 2002)**: Strengthens the UNFCCC by setting legally binding targets for reducing greenhouse gas emissions, promoting sustainable development and renewable energy.
- **Vienna Convention for the Protection of the Ozone Layer (1988, Cambodia accessed 2001)**: Aims to protect the ozone layer through global cooperation, encouraging research, monitoring, and measures to phase out harmful substances.
- **Montreal Protocol on Substances that Deplete the Ozone Layer (1987, entered into force 1989, Cambodia accessed 2001)**: A legally binding treaty to phase out ozone-depleting substances. Contributes to environmental and climate protection.

- **Basel Convention (1992, Cambodia accessed 2001)**: Controls the transboundary movement of hazardous wastes and their disposal, emphasizing waste reduction and environmentally sound management.
- **United Nations Convention to Combat Desertification (1996, Cambodia ratified 1997)**: Addresses land degradation and desertification through sustainable land management, conservation of soil and water resources, and restoration of degraded land.
- **CITES (1975, Cambodia ratified 1997)**: Regulates trade in endangered species to ensure their survival, focusing on sustainable management and combatting illegal wildlife trade.
- **UNESCO Network of Biosphere Reserves (Cambodia joined in 1997)**: Promotes the sustainable management of biodiversity, ecosystems, and cultural heritage through conservation and sustainable development practices.
- **Millennium Development Goals (MDGs) and Sustainable Development Goals (SDGs)**: Cambodia committed to global goals for environmental sustainability, including biodiversity conservation, climate action, and ecosystem protection.
- **ASEAN Agreement on Transboundary Haze Pollution (2006)**: Focuses on preventing and mitigating air pollution caused by forest fires through regional cooperation and sustainable forest management.
- **ASEAN Agreement on Disaster Management and Emergency Response (2009)**: Strengthens disaster preparedness, risk reduction, and environmental resilience in the ASEAN region.
- **Mekong Agreement (1995)**: Promotes sustainable development, equitable water use, and conservation of the Mekong River Basin's ecosystems and resources.

3.1.1.3 Legal Framework on Labour, Public Well-Being, and Safety

This framework emphasizes the protection of workers' rights, public safety, and well-being in project development. It ensures that development projects comply with labor laws and safety standards.

- **Labor Law (1997)**: Protects workers' rights, ensuring safe and fair working conditions during project implementation.
- **Law on Roads (2014)**: Governs the construction and maintenance of roads, with provisions for minimizing environmental and social impacts.
- **Law on Road Traffic (2014)**: Addresses traffic management and safety measures to prevent accidents and disruptions during development.
- **Law on Suppression of Human Trafficking and Sexual Exploitation (2008)**: Protects vulnerable populations during project implementation from exploitation and trafficking.

- Government Occupational and Community Safety and Health (OHS) guidelines follow the OHS Program for Cambodia (2010-2013) developed by the International Labor Organization (ILO). The draft guidelines provide the framework for instituting OHS at the workplace and in the community.
- The Ministry of Labor and Vocational Training (MLVT) has the following guidelines which will be implemented during the construction phase of the Project:
    - MLVT Prakas on Sanitation at the Construction Site (March 2011). The Prakas sets to ensure that the sanitation and safety conditions are fulfilled for workers at construction sites by owners, directors, contractors or subcontractors of construction establishments or construction companies. Articles 3 and 4 ensure that workers are provided with shelter, sanitation facilities and safe potable water for drinking and washing.
    - MLVT Prakas on The Protection of Risk Resulting from Climate Change at Construction Sites (March 2011). Articles of this Prakas require safety measures and break times for workers at the construction site during extreme weather events.
    - MLVT Prakas on Providing of Information at the Construction Site (March 2011). This Prakas states requirements for owners or responsible persons of a construction site to provide information, i.e. name and address of the owner of enterprise, construction establishment, Construction Company, name and address of architect, nature of construction, date for the start of the construction, estimated time to finish the construction works, and estimated number of workers to be employed for construction activities.
    - MLVT Prakas on Stock of Materials, Waste Disposal and Clearance at Construction Site (March 2011). This Prakas provides safety guidelines and requirements for the safe storage of construction of materials and waste.

3.1.1.4 Legal Framework on Governance and Social Inclusion

This framework ensures that development projects promote inclusive governance, respect cultural heritage, and safeguard social rights. It includes provisions for tax obligations, land acquisition, resettlement, and social protection schemes.

- **Law on Taxation (1997)**: Governs the taxation of development projects, ensuring they contribute to national revenue and economic sustainability.
- **Sub-Decree on Construction Permit (1993)**: Requires permits for construction activities, ensuring they comply with environmental standards and social safeguards.
- **Law on Protection of the Rights of Persons with Disabilities (2009)**: Ensures that development projects consider the needs and rights of persons with disabilities.
- **Law on Social Security Schemes (2002)**: Provides social protection for workers, ensuring their well-being during project execution.
- **Sub-Decree on Health Care Scheme (2016)**: Extends social security and health care protection to workers involved in development projects.

- **Law on the Protection of Cultural Heritage (1996)**: Safeguards cultural heritage sites, ensuring that development projects do not damage or destroy culturally significant areas.
- **Expropriation Law (2010)**: Regulates land acquisition for public purposes, ensuring fair compensation and minimizing the impact on affected populations.
- **Sub-Decree on Land Acquisition and Resettlement (2018)**: Provides procedures for land acquisition and involuntary resettlement, particularly for externally financed projects.
- **Sub-Decree on Social Land Concession (2003)**: Allows for the allocation of state land to landless citizens, particularly when development projects displace communities.
- **Sub-Decree on State Land Management (2005)**: Regulates the management of state land, ensuring its sustainable use in development.
- **Sub-Decree on River Basin Management (2015)**: Promotes sustainable management of river basins, ensuring that development projects do not harm water systems and dependent ecosystems.

3.1.1.5 EIA Classification

In order to provide guidelines on effective implementation of sub-decree No 72 ANRK.BK on environmental impact assessment Procedures for development projects, MoE promulgated sub-decree No. 21 on Environmental Impact Assessment Classification for Development Projects.

According to this sub-decree, environmental impact assessment for projects is classified into three categories.

- Appendix 1: Projects requiring full environmental impact assessment (full ESIA)
- Appendix 2: Projects that require initial environmental impact assessment (IEIA)
- Appendix 3: Projects requiring the Contract on Environmental Protection (EPC)

The sub-decree includes an annex listing projects under various sectors and their categorization on the basis of their nature, type and size. The sector and EIA classification for irrigation project is summarized in Table 12 below.

Table 12: ESIA Classification for Development Projects relevant

No	Project Type	ESIA (Equiv. to ADB's A)	ESIA (Equiv. to ADB's B)	Env. Protection Contract	Apply to CAISAR Project
1	Irrigation systems		≥5000ha	1000-5000ha	√
2	Water diversion systems		≥5000ha	1000-5000ha	√
3	All building construction	>45000m2	15000 – 45000m2	3000-15000m2	
4	Road construction (new)	>100km	≥ 30 – 100km	10-<30km	√
5	Railroad and road expansion	>100km	≥50 – 100km	10-<50km	√

6	Road in protected areas	>30km	≥ 10-30 Km	10km	
7	Road widens or rehabilitation in protected area	>50km	≥ 10-50 km	10km	

Source: Prakas No. 021 PRK.BST dated 03 February 2020.

3.1.1.6 Applicable Ambient Quality Standards

Water quality standards in public water areas for biodiversity conservation are shown in Table 13 below. These are applied as the national standards on surface water quality.

Table 13: Water quality standards in public water areas for bio-diversity conservation

No	Parameter	Unit	Surface water Standard	
			River	Lake etc
1	pH	mg/l	6.5-8.5	6.5-8.5
2	Total suspended solids (TSS)	mg/l	25-100	1-15
3	Dissolved oxygen (DO)	mg/l	7.5-2.0	7.5-2.0
4	Biochemical oxygen demand (BOD5)	mg/l	1-10	<30
5	Chemical oxygen demand (COD)	mg/l	<50	1-8
6	Total Nitrate (TN)	mg/l	0.1-0.6	0.1-0.6
7	Total phosphorous (TP)	mg/l	0.005-0.05	0.005-0.05
8	Arsenic (As)	mg/l	<0.01	<0.01
9	Iron (Fe)	mg/l	<1	<1
10	Total Coliform	MPN/100ml	<5,000	<1,000

Note: Standard* = Surface water quality standards for lake, reservoirs and river of the MoE's Prakas on the adoption of terms of references for infrastructure and tourism sectors (2018).

The Royal Government of Cambodia has established a comprehensive policy on National Water Supply and Sanitation for both urban and rural water supplies. Based on this policy, and to ensure access to safe drinking water to all people, quality standards for both drinking water and groundwater are developed by an inter-ministerial process initiated by the Ministry of Industry, the Mines and Energy, and other concerned ministries with support from the World Health Organization (please see in table 14).

Table 14: Groundwater and Drinking Water Quality Standards.

No.	Parameters	Unit	Standard		
			River	Lake and reservoir	CDWQS*
1	Depth				
2	pH	-	6.5-8.5	6.5-8.5	6.5-8.8
3	Electrode Conductivity (EC)	mg/l	500-1500	500-1500	-
4	Arsenic (AS)	mg/l	<0.01	<0.01	0.05
5	Cadmium (Cd)	mg/l	<0.003	<0.003	<0.003
6	Lead (Pb)	mg/l	<0.01	<0.01	0.01
7	Total Nitrogen (TN)	mg/l	<3	<2	-
8	Total Phosphorus (TP)	mg/l	<0.25	<0.15	-
9	Total Dissolved Solid (TDS)	mg/l	<1000	<1000	<800
10	Total Suspended Solid (TSS)	mg/l	<100	<100	-
11	Dissolved Oxygen (DO)	mg/l	>3	>4	-
12	Total Coliform	MPN/100ml	<1000	<1000	0

*. Cambodia Drinking Water Quality Standard

Ambient Air Quality Standards are presented in Table 15. Maximum permitted noise levels in public and residential areas are shown in Table 16.

Table 15: Ambient Air Quality Standards.

Parameters	Cambodia				WHO Air Quality Guideline 2021
	Period 1h Average mg/m^3	Period 8h Average mg/m^3	Period 24h Average mg/m^3	Period 1year Average mg/m^3	
Carbon monoxide (CO)	40	20	-	-	4mg/m^3 (24h Average)
Nitrogen dioxide (NO2)	0.3	-	0.1	-	10 ug/m^3(1 year average) 25 ug/ m^3 (24h average)
Sulfur dioxide (SO2)	0.5	-	0.3	0.1	40 ug/ m^3 (24 h average)
Ozone (O3)	0.2	-	-	-	100 ug/ m^3 (8h average)
Lead (Pb)	-	-	0.005	-	-
Particulates	-	-	0.33	0.1	5 ug/m^3 (PM2.5, 1year) 15 ug/m^3

					(PM2.5, 24h average)

3.2 AIIB'S ENVIRONMENTAL AND SOCIAL FRAMEWORK (ESF)

The Environmental and Social Framework (ESF) of the AIIB outlines the principles and standards to ensure environmentally and socially sustainable development practices for projects it finances. The framework consists of several Environmental and Social Standards (ESS) that provide comprehensive guidance on managing potential impacts and risks associated with AIIB-financed projects. The following AIIB's Environmental and Social Framework (ESF) apply to CAISAR.

- **Environmental and Social Standard 1: Environmental and Social Assessment and Management**: This ESS guides the assessment and management of environmental and social risks, requiring projects to evaluate alternatives, mitigate impacts, and disclose information. It emphasizes protecting the natural environment, particularly biodiversity and critical habitats, while addressing pollution, resource efficiency, and climate change. Social risks, including impacts on vulnerable groups, gender, and access to resources, must be considered. The standard also covers labor conditions, community health and safety, child labor, and security, ensuring proper grievance mechanisms, monitoring, and implementation plans.
- **Environmental and Social Standard 2: Land Acquisition and Involuntary Resettlement.** The ESS provides guidance to avoid Involuntary Resettlement where

possible. The requirements under the standard contain 18 points of action to which the executing agency needs to follow.

- **Environmental and Social Standard 3: Indigenous Peoples.** The ESS aims to design and carry out projects in a way that fully respects Indigenous Peoples' identity, dignity, human rights, economies, and cultures. This ensures that Indigenous Peoples: (a) receive social and economic benefits that are culturally appropriate; (b) do not experience negative impacts from the projects; and (c) can actively participate in projects that affect them. The standard contains 15 points to follow.

3.3 IFADs' SECAP

The International Fund for Agricultural Development's (IFAD) Social, Environmental, and Climate Assessment Procedures (SECAP) provide a framework to ensure that IFAD-financed projects are sustainable, socially inclusive, and environmentally sound. The following Standards apply to CAISAR:

- **Standard 1: Biodiversity Conservation**: This standard ensures the protection of biodiversity by requiring projects to assess and mitigate biodiversity risks, avoid critical habitats, and provide compensation for unavoidable damages. It promotes sustainable use of genetic resources, discourages invasive species, and emphasizes expert advice and adherence to protected area laws.
- **Standard 2: Resource Efficiency and Pollution Prevention**: Focuses on efficient use of resources and pollution control. It requires projects to reduce energy, water, and material use, manage hazardous materials safely, and prevent pollution, with an emphasis on sustainable natural resource management, including water, soil, fisheries, and forests.
- **Standard 3: Cultural Heritage**: This standard ensures the protection of tangible and intangible cultural heritage by screening and managing impacts, consulting local communities, and preserving access to cultural sites. Projects must avoid, minimize, or mitigate damage and follow legal requirements in protected areas.
- **Standard 4: Indigenous Peoples**: Supports and empowers indigenous communities by requiring free, prior, and informed consent (FPIC), promoting equitable resource access, and protecting cultural heritage. Projects must involve indigenous peoples in decision-making, ensure fair benefits, and avoid involuntary resettlement.
- **Standard 5: Labor and Working Conditions**: Sets requirements for safe, non-discriminatory workplaces, prohibiting forced and child labor. It requires the establishment of grievance mechanisms, safety protocols, and equal opportunities, with contractors and suppliers adhering to these standards.
- **Standard 6: Community Health and Safety**: Requires projects to assess and manage health risks, prevent exposure to hazards, and ensure infrastructure safety. It includes emergency preparedness, traffic and security management, and protection against gender-based violence.

- **Standard 7: Physical and Economic Resettlement**: Ensures resettlement is conducted legally and fairly, avoiding forced evictions. It requires special consideration for vulnerable groups, economic displacement, and establishing grievance mechanisms for affected communities.
- **Standard 9: Climate Change**: Ensures projects address climate risks and reduce GHG emissions. It mandates climate risk screening, adoption of climate-smart practices, and GHG accounting to guide project design towards reducing environmental impacts.

3.4 GEF'S ENVIRONMENTAL AND SOCIAL SAFEGUARDS POLICIES

GEF adopts the interim environmental and social safeguards to identify, measure, and mitigate environmental and social risks based on IFC Performance Standards (PS). Under CAISAR, the following PSs are applied:

- Performance Standard 1 – Assessment and Management of Environmental and Social Risks and Impacts;
- Performance Standard 2 – **Labor and Working Conditions**
- Performance Standard 3 – **Resource Efficiency and Pollution Prevention**
- Performance Standard 4 – Community Health, Safety, and Security
- Performance Standard 5 – Land Acquisition and Involuntary Resettlement
- Performance Standard 6 – Biodiversity Conservation and Sustainable Management of Living Natural Resources
- Performance Standard 7 – Indigenous Peoples
- Performance Standard 8 – Cultural Heritage

3.5 International Conventions and Treaties

Cambodia has ratified all eight (8) of the International Labor Organisation (ILO)'s conventions which cover core labour standards recognized as human rights. These conventions focus on issues such as freedom of association, elimination of forced labour, abolition of child labour, and elimination of discrimination in employment.

- **Freedom of Association and Protection of the Right to Organise Convention, 1948 (No. 87)**: Ratified by Cambodia in 1999, this convention protects workers' and employers' rights to freely form and join organizations without interference, ensuring autonomy and safeguarding against dissolution by authorities.
- **Right to Organise and Collective Bargaining Convention, 1949 (No. 98)**: Ratified in 1999, it protects workers' rights to organize, engage in collective bargaining, and prevents discrimination for union activities, promoting fair wage negotiations and just working conditions.

- **Forced Labour Convention, 1930 (No. 29)**: Ratified in 1969, this convention aims to eliminate all forms of forced labour, including coercive work for public works or political purposes, protecting workers' rights and dignity.
- **Abolition of Forced Labour Convention, 1957 (No. 105)**: Ratified in 1999, it strengthens the prohibition of forced labour for political coercion, discipline, or discrimination, ensuring freedom and justice in the workplace.
- **Minimum Age Convention, 1973 (No. 138)**: Ratified in 1999, it sets a minimum age for employment (usually 15) to prevent child labour, promoting access to education and protection from hazardous work.
- **Worst Forms of Child Labour Convention, 1999 (No. 182)**: Ratified in 2006, this convention seeks to eliminate extreme forms of child labour like slavery, trafficking, and hazardous work, prioritizing children's safety and rehabilitation.
- **Equal Remuneration Convention, 1951 (No. 100)**: Ratified in 1999, it promotes equal pay for men and women for work of equal value, combating gender-based wage discrimination and fostering economic justice.
- **Discrimination (Employment and Occupation) Convention, 1958 (No. 111)**: Ratified in 1999, this convention addresses workplace discrimination based on race, gender, religion, and other factors, promoting equal treatment and opportunities for all workers.
- **Employment Policy Convention, 1964 (No. 122)**: Ratified in 1971, it requires active employment policies to promote full, freely chosen employment, aiming to reduce unemployment and support economic and social development.
- **Weekly Rest (Industry) Convention, 1921 (No. 14)**: Ratified in 1969, this convention guarantees a weekly rest period of at least 24 consecutive hours for workers, helping protect their health and well-being.
- **Labour Inspection Convention, 1947 (No. 81)**: Ratified by Cambodia in 1974, this convention establishes labour inspections in industrial and commercial workplaces to ensure compliance with national labour laws, promoting safe, fair, and decent working conditions.
- **Labour Inspection (Agriculture) Convention, 1969 (No. 129)**: Ratified in 1999, it extends labour inspection to agriculture, ensuring workers in this sector, including migrant and seasonal labourers, are protected by labour laws and safe working conditions are maintained.
- **Tripartite Consultation (International Labour Standards) Convention, 1976 (No. 144)**: Ratified by Cambodia in 2009, this convention promotes consultation between governments, employers, and workers on international labour standards. It ensures that all stakeholders are involved in the implementation of labour policies, enhancing social dialogue and cooperation for fair labour practices.

3.6 Good International Industry Practices (GIIP)

3.6.1 WBG General EHS Guidelines (2007)

The World Bank Group (WBG) General Environmental, Health, and Safety (EHS) Guidelines (2007) provide internationally recognized technical guidance on managing environmental, health, and safety risks. These guidelines are designed to support project developers and operators, particularly in emerging markets, by outlining best practices for environmental sustainability, worker health and safety, and community well-being.

Key sections include:

- **Environmental Guidelines:** Focus on pollution prevention and control, resource efficiency, and managing air, water, and soil impacts.
- **Occupational Health and Safety (OHS):** Address workplace hazards, accident prevention, and worker welfare.
- **Community Health and Safety:** Cover topics like traffic safety, emergency preparedness, and protecting communities from project-related risks.
- **Construction and Decommissioning:** Provide guidance on managing risks during the life cycle of a project.

The guidelines emphasize compliance with local regulations and international standards and are intended to be applied alongside sector-specific EHS guidelines.

3.6.2 WBG EHS Guidelines for Annual Crop Production (2016)

The World Bank Group (WBG) Environmental, Health, and Safety (EHS) Guidelines for Annual Crop Production (2016) provide technical guidance on sustainable practices for cultivating annual crops, such as grains, legumes, and vegetables. These guidelines aim to minimize environmental impacts, ensure worker safety, and promote efficient resource use.

Key focus areas include:

- **Environmental Management:** Guidance on soil conservation, water use efficiency, pest management, and biodiversity preservation.
- **Occupational Health and Safety (OHS):** Measures to prevent injuries, promote safe pesticide handling, and protect workers from physical and chemical hazards.
- **Community Health and Safety:** Recommendations to prevent risks like pesticide drift, water contamination, and traffic safety concerns related to agricultural operations.
- **Sustainable Practices:** Emphasis on integrated pest management (IPM), crop rotation, and efficient irrigation techniques to maintain productivity and environmental health.

These guidelines align with international standards and are designed to support sustainable agricultural development.

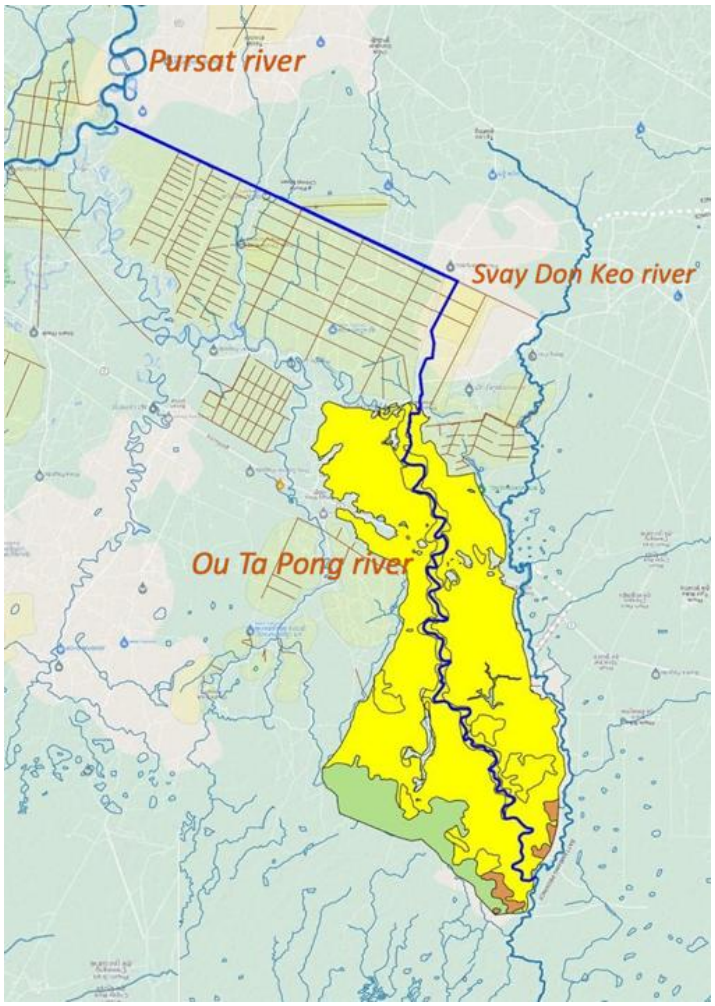
Table 17: Gap Analysis of National Legal Framework and Policies of AIIB, IFAD and GCF

No.	Standards/ Policies			Coverage	RGC's Corresponding Legal Framework	Gap Analysis and suggestions	Proposed measures to address the gaps
	AIIB	IFAD	GCF				
1	ESS1		PS1	Environmental and Social Assessment and Management	• Environmental Code and Natural Resource Management (2023), • Law on Water Resource Management (2007), • Law on fisheries (2026), • Sub-Decree on Water Pollution Control (1999), • Sub-Decree on Environmental Impact Assessment (1999), • Sub-Decree on Air Pollution Control and Sound Disturbance (2000), • Sub-Decree on Solid Waste Management (1999), • Prakas on the General Guideline for Preparing the Initial and Full Environmental Impact Assessment Reports (1999), • Prakas on the Launch of Standards of the Quantity of Toxins or Hazardous Substances Allowed to be Disposed (2015)	The RGC has established a wide range of regulations especially in the recent Environmental Code and Natural Resource Management (2023) that aim to environmental protection and natural resource management are well aligned to the provisions of the AIIB ESS1.	This ESCIA covers both direct, indirect, and cumulative impacts and mitigation measures, taking a holistic approach to the project and looking at impacts in an integrated way.
2	ESS2	S7	PS5	Land Acquisition and Involuntary Resettlement	• Law on Land Management, Urban Planning and Construction (1994), • Land Law (2001), • The Expropriation Law (2010), • RGC's Sub-Decree No. 22 ANK/BK (2018) on the Promulgation of the Standard Operating Procedures for Land Acquisition and Involuntary Resettlement (SOP-LAR) for Externally Financed Projects in Cambodia, • Sub-Decree No.19 on Social Land Concession of March 2003, • RGC's Sub-Decree No.118 ANK/BK (2005) on State Land Management, • RGC's Sub-Decree No.98 ANK/BK (2015) on River Basin Management	The RGC has the SOP-LAR which is well aligned with the provisions in the AIIB ESS 2. The AIIB ESS 2 on land acquisition and involuntary resettlement recognizes that project related land acquisition and land use can have impacts on communities. The RGC's SOP-LAR is consistent with the specific requirements under the AIIB ESS 2 on consultation, grievance redress, social support, resettlement assistance, standard of living of poor and vulnerable, entitlements for persons without title or legal rights except for land, information disclosure, payment of compensation and entitlements prior to	According the RGC's SOP-LAR, an income restoration program would be provided in order to re-estalbish sources of livelihoods for those affected households who have permanently lost their sources of livelihood. In this CAISAR project, the DRPs will include provisions to ensure livelihood restoration program are robust and can accurately meet the aim of livelihood restoration in line the AIIB ESS2.

No.	Standards/ Policies			Coverage	RGC's Corresponding Legal Framework	Gap Analysis and suggestions	Proposed measures to address the gaps
	AIIB	IFAD	GCF				
						physical displacement, and the supervision and monitoring of implementation of resettlement plans. However, there are gaps on negotiated settlement and livelihood restoration. The SOP-LAR does not describe procedures for negotiated settlement and lack of clear benchmark to assist monitoring and evaluation to confirm if the affected households restore their livelihood to the level prevailing prior to the beginning of the project implementation.	
3	ESS3	S4	PS7	Indigenous Peoples	• The Constitution of Cambodia (1993) • Land Law (2001)	No detailed regulations on how to avoid impacts to Indigenous Peoples or how to include them in project benefits. Lack of requirement to consult IP(s) in a manner that is culturally appropriate and special disclosure and consultation requirements as described in the AIIB ESS3.	An IPPF has been prepared on the basis of the AIIB ESS3. The IPPF details procedures on the preparation of IPP(s) and how to conduct meaningful consultation and disclose that is culturally appropriate.
4	ESS1	S1	PS6	Biodiversity conservation	• Environmental Code and Natural Resource Management (2023),	The code requires a proper consideration of biodiversity resources and payment of ecosystem services which support the conservation process. There is limited guidance on how to compensate in the ecosystem services once its pristine condition is affected.	This ESCIA include the biodiversity assessment and management plan.
5	ESS1	S2	PS3	Resource efficiency and pollution prevention	• Environmental Code and Natural Resource Management (2023), • Sub-Decree on Environmental Impact Assessment (1999), • Sub-Decree on Air Pollution Control and Sound Disturbance (2000),	The RGC has in place a set of separate provision and requirements for pollution prevention and management that are well align with the AIIB ESS 1 that aims to promote the sustainable use of	This ESCIA has included all relevant national laws and regulation as well as the requirement for AIIB ESS1.

No.	Standards/ Policies			Coverage	RGC's Corresponding Legal Framework	Gap Analysis and suggestions	Proposed measures to address the gaps
	AIIB	IFAD	GCF				
					• Sub-Decree on Solid Waste Management (1999), • Prakas on the General Guideline for Preparing the Initial and Full Environmental Impact Assessment Reports (1999), • Prakas on the Launch of Standards of the Quantity of Toxins or Hazardous Substances Allowed to be Disposed (2015)	resources and avoid or minimize the pollution from sources/project activities.	
6	ESS1	S3	PS8	Cultural heritage	• Environmental Code and Natural Resource Management (2023), • Law on the Protection of Cultural Heritage (1996)	The RGC has in place the law on protection of cultural heritage aligns with the requirement of the AIIB ESS1. However, there is lack of detail procedures for protection of the intangible cultural heritage.	This ESCIA provided details procedures and requirement to protect both tangible and intangible cultural heritage through Chance Find Procedure (Annex xx).
7	ESS1	S5	PS2	Labor and working conditions	• Labor Law (1997), • Law on Taxation (1997), • Sub-Decree on Construction Permit (1993), • Law on Social Security Schemes for Persons defined by the Provision of the Labor Law (2002), • Sub-Decree on Establishment of Social Security Scheme "Health Care Scheme" for Persons Defined by the Provisions of the Labor Law (2016)	The RGC has in place a set of law and regulations on labour and working conditions which is consistent with the requirement of the AIIB ESS1. However, the enforcement of these law and regulation is still limited. For example, regulation against forced labor and using child labor are not strictly enforced.	The ESCIA provides provisions to monitor compliance by contractor and of their primary suppliers in bidding documents and supervision contracts in order to prohibit using forced labour and child labour.
8	ESS1	S6	PS4	Community health and safety	• Law on Road Traffic (2014), • The Law on Suppression of Human Trafficking and Sexual Exploitation 2008, • Law on the Protection and the Promotion of the Rights of Persons with Disabilities 2009,	The RGC has established Labor Law the protect the health and safety of the workers. However, the concern and mitigation are more on individual rather than community as a whole. The AIIB ESS1 aims on protection of both individual and community for health and safety.	The ESCIA provides provisions to monitor compliance by contractor on community and health safety in bidding documents and supervision contracts. The requirement on raising awareness to local community on health and safety are also included in the bidding documents.

No.	Standards/ Policies			Coverage	RGC's Corresponding Legal Framework	Gap Analysis and suggestions	Proposed measures to address the gaps
	AIIB	IFAD	GCF				
9	ESS1	S9	PS1	Climate change	• Environmental Code and Natural Resource Management 2023	The newly adopted code requires all relevant sectors to integrate climate resilient concepts into their strategic action plan along with different measures to tackle the issues. No gap being identified.	



4. BASELINE CONDITIONS

4.1 Physical Conditions

4.1.1 Existing Infrastructure (Irrigation and drainage facilities)

The Ou Ta Paong scheme draws its water supply from various sources. These sources comprise the Pursat River, Svay Donkeov River, and several other rivers that traverse the scheme, including the Ou Ta Paong River itself. This complex water supply system results in the creation of distinct hydraulic zones within the scheme, each characterized by specific water availability levels, which in turn have a direct impact on agricultural output.

Figure 10: Damnak Ampil Main canal and Ou Ta Paong Sub-scheme

The Pursat river is located on the right side (river flow) while Svay Don Keo river on the left side. Water from Pursat river is diverted into the OTP through the Damnak Apil main canal, then feed into a smaller river called Ou Ta Pong. Both Ou Ta Pong River and Svay Don Keo river run down through the OTP command area in almost parallel until they meet at lower downstream part of the OTP command area (see picture below). A more description of the above rivers is provided below. The OTP is a mixture of both irrigated and rainfed areas (mostly is irrigated). Areas irrigated obtain water from the current network of 46 km of secondary canals and 27 km of tertiary canals (based on WAPCOS asset survey in 2023).

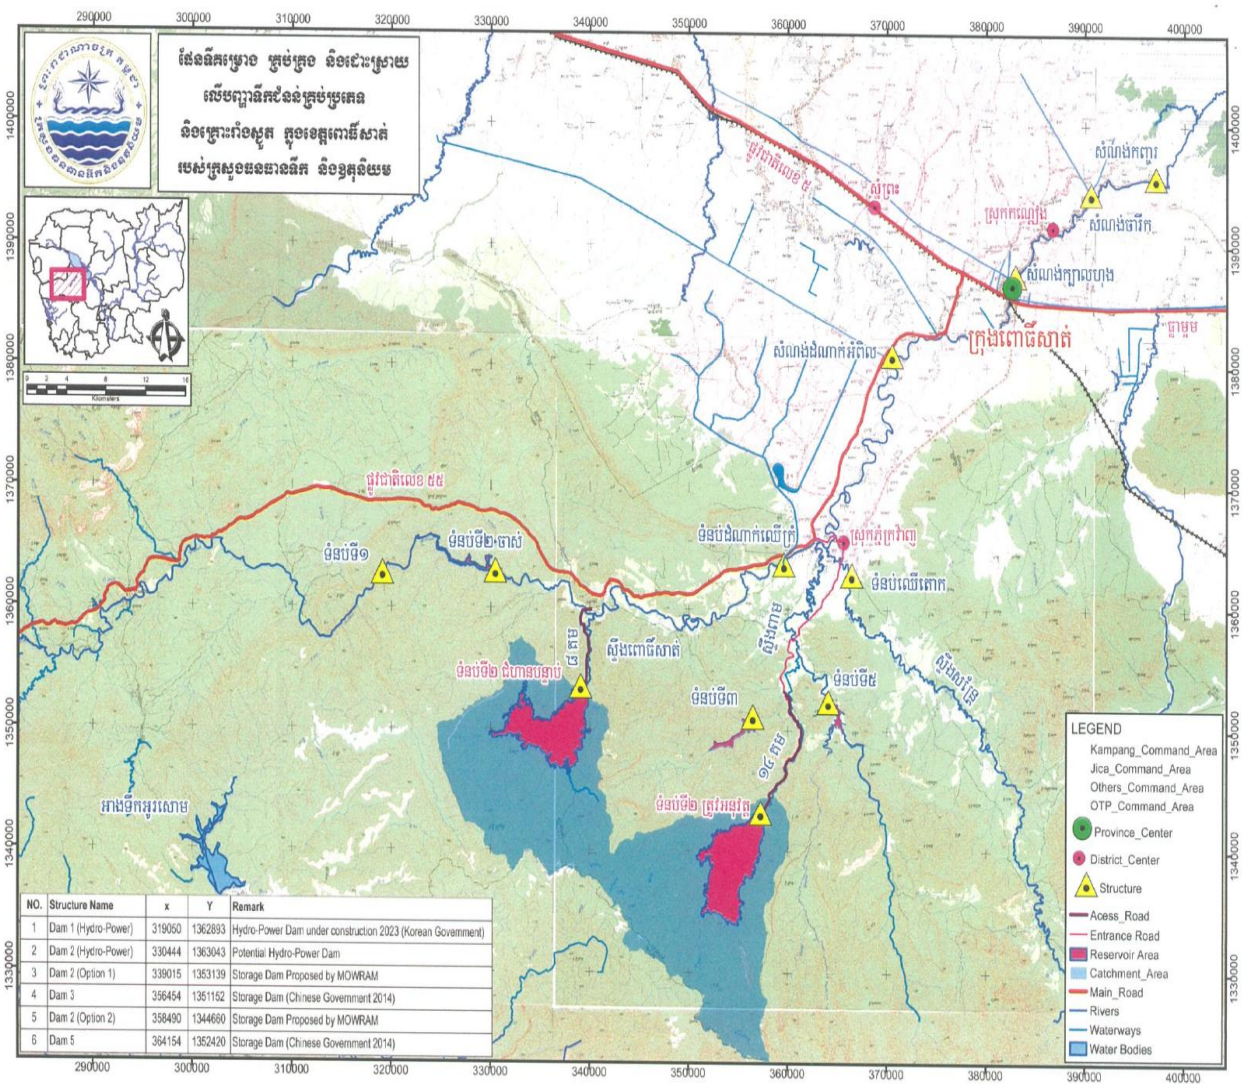
Water for irrigation is mainly collected from two main rivers: Pursat river and Svay Don Keo river (Figure 10). The Pursat river is located on the right side (river flow) while Svay Don Keo river on the left side. Water from Pursat river is diverted into the OTP through the Damnak Apil main canal, then feed into a smaller river called Ou Ta Pong. Both Ou Ta Pong River and Svay Don Keo river run down through the OTP command area in almost parallel until they meet at lower downstream part of the OTP command area (see picture below). A more description of the above rivers is provided below.

Boeng Khnar River is the principal natural drain for the area under command of the first 17 km of DAMC and an important water source for the area North of the road. The National Road and railway are the second and rather forbidding obstacles for irrigation water from DAMC to reach the Northern areas. Water can only pass to the other side under the bridges. The third problem is that farmers of upstream villages divert as much water as they can manage from the canals, so that little of nothing remains for the downstream villages.

4.1.2 Rivers and Hydrology

For Pursat river, water in this river constituted from three main tributaries — located about 25–35 km to the upstream. Water collected for these attributes are from a combined three catchments area of about 4,245 km^2). Water released downstream from these three tributaries are controlled by three dams: Dam No. 3 and Dam No. 5 (which is under the management of MOWRAM), and Dam No.1 (an 80MW hydropower plant being built by a private company and is under the management of the Ministry of Mines and Energy[5]). The storage capacity of Dam No. 3 and Dam No. 5 is almost similar: 24.5 MCM and 25.5 MCM, respectively. Dam 1 (Hydropower) is expected to store 1,014 MCM (max) once completed but the purpose is for hydropower plant. It is noted the Dam 3 and No.5 have been put into operation since 2013 while Dam 1 is still under construction and is scheduled to operate in 2026. According to the report prepared by WAPCOS for AIIB (dated 8 March 2023), neither of the above reservoirs pose a flood risk to the OTP as it is far from the Pursat river. However, dam failure could decrease water availability to the OTP.

For Ou Ta Pong (OTP) river. OTP river is located within the OTP command area. Originally, the Ou Ta Pong River drained the Pursat River's flood plain. However, currently, this river is mainly a string of ponds. The river has lost its original conveyance function for both water drainage and supply function. The OTP River is estimated to be 38 km, counting from Danmak Apil Headwork to Ta Nai dam – in a straight line. However, the waterway from Damnak Apil Headwork to Ta Nai Dam is as far as 56 km. Water that feed the OTP is mainly from Pursat river which goes into the river through Damnak Apil Headwork.



For Svay Don Keo river, the water is fed by a catchment of 322km^2 located upstream. The river is about 61.7 km long in total. The river makes its way into OTP at the point where (orange dot) where it intersects the Damnak Apil Main Canal (See picture below). The Svay Don Keo river runs roughly parallel to OTP river – to the West (See picture below) that depict water flow from Dam 1,3, 5 to form Pursat river.

[5] The project is being developed by Asia Energy Power, Erex, ISDN Holdings and SPHP (Cambodia). Erex, Asia Energy Power and ISDN Holdings are currently owning the project having ownership stake of 34%, 33% and 33% respectively.

The CAISAR Feasibility Study reported that water availability will be adequate at the time that Dam No. 1 is completed, provided there is proper coordination among the stated dams. At the current stage, Pursat PDoWRAM has reported that the available water is insufficient for irrigation purposes within the province, with a shortfall of approximately 700 MCM. Additionally, PDoWRAM acknowledged that the water from Dam No. 1 is designated solely for hydroelectric purposes, which may limit the amount available for agriculture or irrigation. There is, however, another dam, Dam No. 2, which was approved by the government in late June 2024. PDoWRAM also reported that the construction is in the process of mobilizing equipment to the site. The reservoir for this dam covers 4,016 hectares, with a storage capacity of 861.75 MCM. The dam is expected to be completed by the end of 2026 (Figure 11). Earlier projections indicated that the combined water supply from Dam No. 1, Dam No. 3, and Dam No. 5 would likely be sufficient. With the addition of Dam No. 2, it is highly likely that the province's water needs will be fully met.

The current discussion with farmers on water availability at Ou Ta Paong showed that during the periods that the crop requires irrigation, conflicts about water tend to arise. The available water along the river was diverted into the rice field via secondary canals along the river. The limited availability of water regulated from the upstream, mainly the Damnak Ampil canal cannot flow until the end of the river where the river has become a string of ponds, causing some locations of the rivers to have been turned into backyard garden of the residents along the river. As water is limited, water shortage has become the main cause for financial losses. This causes much stress, because of the risk of drought damage to the crops, and the cost of pumping from low water levels. The risks reduce farmers' motivation to invest in new technologies and climate-smart agriculture.

Figure 11: Map with Illustration of Dam No. 2

(Source: Pursat PDoWRAM, 2024)

4.2 Environmental Conditions

4.2.1 Air Quality and Noise

At provincial level, the air pollution level is considered moderate[6]. The AQI is 58, which is equivalent to 13.1 µg/m^3. The ambient air quality, noise, and vibration is being linked to increases in industrial development, and the rapid urbanization. However, the Ou Ta Paong sub-scheme is located in the rural settings and about 35km from the major population centers and industrial areas in Pursat town. The baseline ambient air quality, noise and vibration in Ou Ta Paong scheme is considered generally good. Ambient air quality is sometime affected by dust from tillage and unpaved road users, including smoke from burning of rice stubble after harvest. Whilst noise and vibration disturbance are sometime affected by motorist. However, the impacts are minor and short time. In addition, the air testing results from the Damnak Chheu Krom irrigation system in Ta Lou commune, Bakan district, Pursat province located about 15 km from Ou Ta Paong reported that all five parameters (CO, NO2, SO2, TSP, and

[6] https://www.iqair.com/cambodia/pursat, accessed on 23rd September 2024

PM10) followed the standard of the Ministry of Environment at all durations (8 and 24 hours) (See Table below). The result can be referenced as the baseline for the sub-scheme since it is located within the same district and the environment of the area is the same. Further air quality tests can be conducted during the preparation of the domestic EIA.

Table 18: Air quality testing result of Damnak Chheu Krom project

No.	Parameter	Unit	Result	Standard
1	Carbon Monoxide (CO)	mg/m^3	0.35	<20 (8 hrs)
2	Nitrogen Dioxide (NO2)	mg/m^3	0.028	<0.1 (24 hrs)
3	Sulfur Dioxide (SO2)	mg/m^3	0.020	<0.3 (24 hrs)
4	Total Suspended Particles (TSP)	mg/m^3	0.088	<0.33 (24 hrs)
5	PM10	mg/m^3	0.044	<0.05 (24 hrs)

(Source: Ministry of Environment, June 2020)

4.2.2 Soil Quality

The soil quality study for this sub-scheme was represented by two sites (SS.01 & SS.02). The analysis results, presented in the table below, provide valuable insights into the physical, chemical, and biological properties of the soils at these locations, which can inform agricultural management practices and decision-making.

Soils in Ou Ta Paong can be classified as loam, a texture ideal for agriculture due to its balanced mix of sand, silt, and clay. The relatively high proportion of fine silt and fine sand further enhances water retention and nutrient availability, supporting plant growth. The soils are slightly acidic, with pH levels ranging from 4.12 to 5.36, which may affect nutrient availability. However, this acidity is manageable for crop production with proper soil management. Organic matter content is moderate (3.16% to 3.82%), benefiting soil structure, water retention, and nutrient cycling. This level helps sustain long-term agricultural productivity by improving soil health.

Table 19: Soil analysis results in an agricultural context

No.	**Description Parameter**		**Result**	
			SS.01	**SS.02**
1	Particle Size (Pipette Method)	(<0.002mm), Clay %	9.90	14.01
		(0.002-0.02 mm), Fine Silt, %	37.65	35.55
		(0.02-0.05 mm), Coase Silt, %	21.71	22.69
		(0.05-0.2 mm), Fine Sand, %	30.59	32.75
		(0.2-2 mm), Coase Sand, %	3.22	2.32
2	Ninnu Moisture %, (Oven dry at 105 °C and 24 hours)		1.67	1.73
3	Total Carbon (Black & Walkey Method), C%		2.22	1.84
4	Total Nitrogen (Kjeldal Sulfuric Method),N%		0.19	0.17
5	C/N Ratio (Unit)		12	11
6	Organic Matter (0M) %		3.82	3.16
7	Total Phosphorus (Nitric Digestion) P %		0.051	0.043
8	Available Phosphorus (Bray II), P (ppm)		51	41
9	Cation Exchange Capacity C.E.C meq/100g Soil (Method,1M Ammonium Acetate at pH=7 & Leach with 10% NaCl)		13.00	12.40
10	Exchangeable Cation (meq/100g Soil), (Method, 1 M	Calcium (Ca)	3.06	3.77
		Magnesium (Mg)	1.28	1.38
		Sodium (Na)	1.42	0.75

No.	Description Parameter		Result	
			SS.01	SS.02
	Ammonium Acetate at H=7)	Potassium (K)	0.77	0.27
	Total Exchangeable Bases (meq/100g soil)		6.53	6.17
11	Bass Saturation %		50	50
12	Exchange Acidity meq/100g Soil, (1 M KCl Method)		20.00	15.00
13	Exchange Al meq/100g Soll, (1 M KCl Method)		0.20	0.12
14	Electrode Conductivity µS/cm, (1:5 Soil: water)		96.80	36.10
15	pH H2O (1:5 Soil: water)		5.36	5.29
16	pl KCL (1:5 (Soil: IN KCl)		4.21	4.12

(Source: Laboratory of the General Directorate of Agriculture, MAFF, 2024)

Nutrient analysis shows low nitrogen content (0.17% to 0.19%), which may limit plant growth. Phosphorus is low in total content (0.043% to 0.051%) but moderately available (41 ppm to 51 ppm), suggesting it's not a limiting factor. Potassium levels range from low to moderate (0.27 to 0.77 meq/100g), indicating that some locations may need supplementation. Calcium, magnesium, and sodium levels are adequate for plant growth. The soils have a moderate Cation Exchange Capacity (CEC) (12.40 to 13.00 meq/100g), indicating good nutrient retention, and the base saturation is balanced at 50%.

Overall, while the soils from all three locations are generally suitable for agriculture, there are areas that need attention, such as the low nitrogen and potassium levels in some samples and the slightly acidic pH. These factors suggest that, with proper nutrient management and soil amendments, the soils can effectively support healthy crop production.

4.2.3 Surface Water Quality

Water quality does not seem to be a critical issue for surface water, but the overuse of fertilizers and domestic wastewater are important threads. It is known to be a black market of all sorts of fertilizers, pesticides, insecticides, rodenticides, etc. sold at the borders with Viet Nam and applied indiscriminately by farmers to increase the numbers of crops a year[7].

The collected water samples were measured at the premises as well as at the laboratory, commissioned by Innovation Lab which is partner of Royal University of Phnom Penh (RUPP). Summary of the water quality testing is provided in Table below:

Table 20: Result of surface water quality

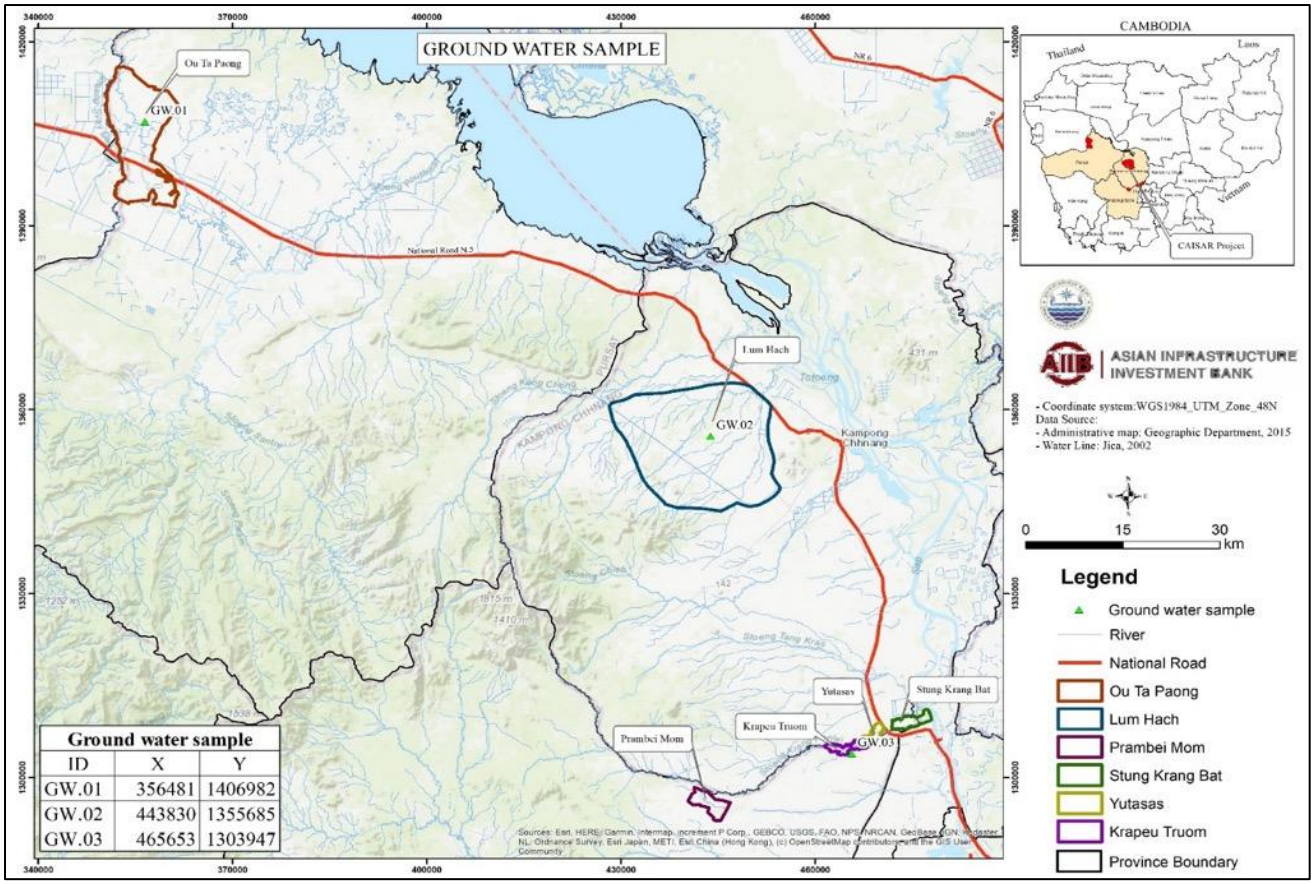
No	Parameter	Unit	Ou Ta Paong			Standard (MoE)	
			SW1	SW2	SW3	River	Lake and reservoir
1	Arsenic	mg/l	0.005	0.005	0.005	<0.01	<0.01
2	Cadmium	mg/l	0.001	0.001	0.001	<0.003	<0.003
3	Lead	mg/l	0.005	0.005	0.005	<0.01	<0.01
4	pH	-	6.32	6.2	6.44	6.5-8.5	6.5-8.5
5	Total dissolved solids	mg/l	30.76	38.07	40.71	<1000	<1000
6	Total suspended solids	mg/l	11	29	39	<100	<100
7	Total Nitrogen	mg/l	4.8	3.8	3.5	<3	<2
8	Total Phosphorus	mg/l	0.8	0.6	0.4	<0.25	<0.15

[7] The sustainable rice platform, supported by MAFF, is working towards controlling this market and training farmers on proper use (products' labels are not translated to Khmer). https://sustainablerice.org

No	Parameter	Unit	Ou Ta Paong			Standard (MoE)	
			SW1	SW2	SW3	River	Lake and reservoir
9	Total coliform	CFU/ 100mL	50,200	38,750	31,650	<1000	<1000
10	Electrical conductivity	µs/cm	61.4	76.12	81.43	500-1500	500-1500
11	Temperature	^{0}C	31.3	30.8	30.9	<45	<45
12	Dissolved oxygen	mg/l	5.34	5.6	5.7	>3	>4

(Source: Water Innovation Lab, 2024)

The water quality data of Ou Ta Paong compared to the Ministry of Environment (MoE) standards reveals several concerns. Key parameters such as arsenic, cadmium, lead, pH, total dissolved solids, and electrical conductivity are within acceptable limits, meeting the MoE standards for rivers and lakes/reservoirs. However, total nitrogen, total phosphorus, and total coliform levels exceed the standard limits, with nitrogen levels (3.5-4.8 mg/l) surpassing the river and lake limits (<3 and <2 mg/l, respectively), and total phosphorus (0.4-0.8 mg/l) significantly higher than the allowed levels (<0.25 and <0.15 mg/l). Additionally, total coliform levels are alarmingly high, far exceeding the permissible limit of 1000 CFU/100mL. Dissolved oxygen levels are adequate, remaining above the minimum requirement (>3 and >4 mg/l). These results indicate potential nutrient pollution and microbial contamination in the water.



4.2.4 Groundwater Quality

Groundwater quality was collected from various locations within the project sites. Water testing is used to determine the existing groundwater quality at the project sites before construction and operation. Note that the GW1 is a dug well with a depth of up to 40 meters that can be used in both dry and wet seasons. In the dry season, the water level is about 25 meters, while in the rainy season, the water level is about 7 meters above the surface. The geographical positions and descriptions of the groundwater sampling points are given in Table 20. The results of the groundwater quality analysis are summarized in Table 21.

Table 21: Groundwater sampling locations

No.	Location				UTM	
	Province	District	Commune	Village	X	Y
GW1	Pursat	Bakan	Ou Ta Paong	Oknha Moan	356481	1406982

Figure 12: Map of groundwater sampling locations

The selected samples were analysed and the results of the testing both at the field and at laboratory is provided in Table 9 below.

Table 22: Result of groundwater quality

No	Parameter	Unit	GW1	CDWQS
1	Arsenic	mg/l	0.005	0.05
2	Cadmium	mg/l	0.003	0.003
3	Lead	mg/l	0.0004	0.01
4	pH	-	**6.01**	6.5-8.8
5	Total dissolved solids	mg/l	345.8	800
6	Total suspended solids	mg/l	13	-
7	Total Nitrogen	mg/l	6.4	-
8	Total Phosphorus	mg/l	0.3	-
9	Total coliform	CFU/ 100mL	14,065	0
10	Electrical conductivity	µs/cm	691.4	-
11	Temperature	^{0}C	30.4	-
12	Dissolved oxygen	mg/l	1.92	-

(Source: Water Innovation Lab, 2024)

The groundwater quality test for Ou Ta Paong (GW1) reveals mixed results when compared to the Cambodian Drinking Water Quality Standards (CDWQS). The levels of arsenic, cadmium, lead, and total dissolved solids (TDS) all fall within the acceptable national limits, ensuring that these parameters pose no immediate health risks. However, the slightly acidic pH of 6.01 is below the recommended range (6.5–8.8), indicating that the water is somewhat

corrosive, which could affect its taste and the condition of piping systems over time. Though the total suspended solids are not regulated by the CDWQS, their presence might affect water clarity, requiring filtration.

One of the most concerning findings is the high total coliform count, which reaches 14,065 CFU/100 mL, far exceeding the standard of 0 CFU/100 ml. This result indicates significant bacterial contamination, making the groundwater unsafe for direct human consumption without proper treatment. Immediate measures, such as disinfection, are necessary to eliminate pathogens and ensure the water meets health safety standards. Additionally, while there are no specific standards for total nitrogen and phosphorus, the moderate levels recorded could pose a risk if left unchecked, particularly in terms of environmental impacts.

Other parameters, such as electrical conductivity, temperature, and dissolved oxygen, though not regulated by CDWQS, also provide insights into water quality. The electrical conductivity and moderate temperature suggest the presence of dissolved ions and potential microbial growth. The low dissolved oxygen level may further indicate organic contamination, suggesting the need for continued monitoring. Overall, while certain aspects of the groundwater quality are within safe limits, significant attention is required to address bacterial contamination and pH levels to make the water suitable for human use.

Figure 13: Groundwater sampling activities

4.3 Biological Resources

The result of the biodiversity assessment which are used as the baseline information is presented in below sub-sections. The baseline information covers three steps of the biodiversity assessment including the analysis for determining Critical Habitat status (Steps 1 & 2); and Determining Critical Habitat status (Step 3) of the biodiversity assessment.

4.3.1 Analysis to prepare for determining CH status

4.3.1.1 Species with Potential Occurrence within the AoA

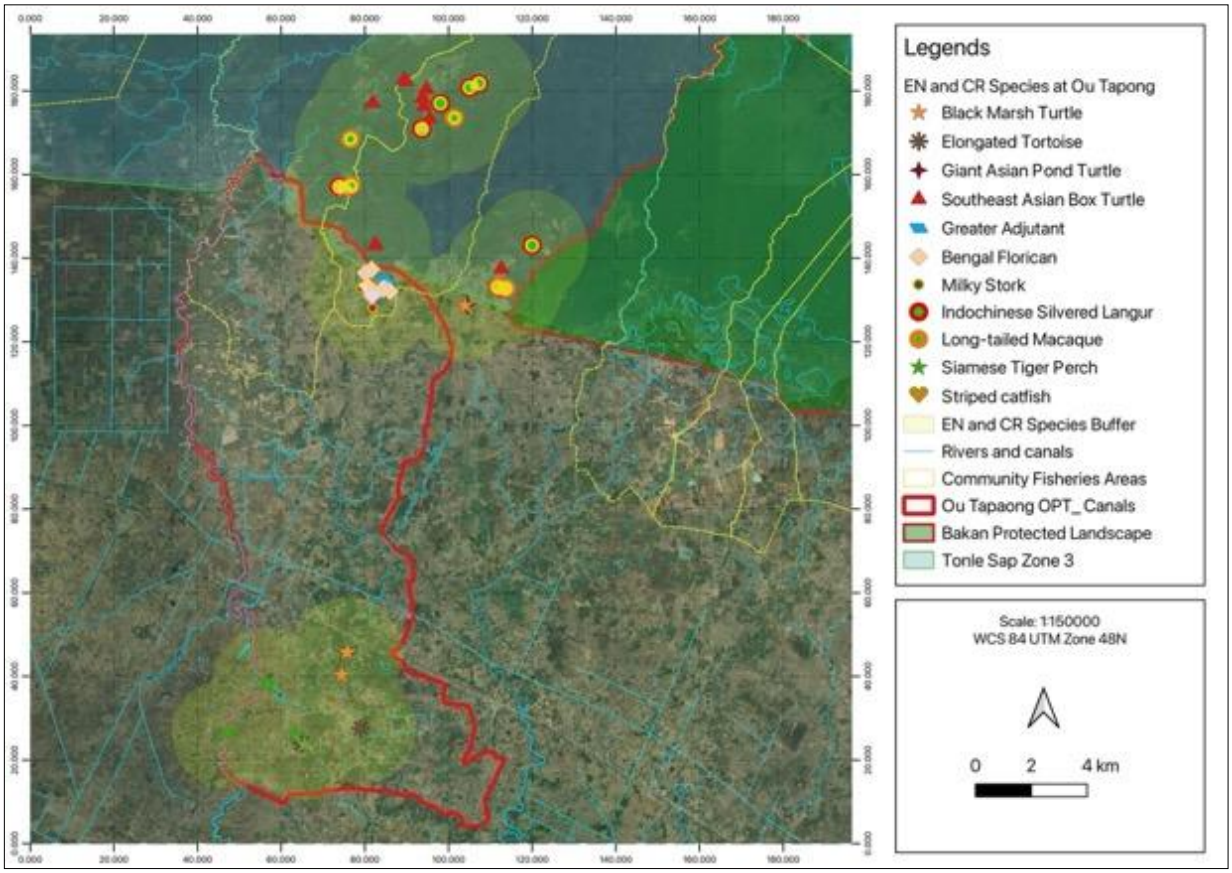
A list of threatened species with potential occurrence was generated for OTP. The coordinates of OTP (via KMZ file) are used to inform the IBAT radius of screening. Since the default radius of IBAT screening is 50km, steps were taken to narrow down to the sub-scheme's area of influence to identify only EN and CR species that are potentially present in the sub-scheme

area of influence. The narrowing-down aims to practically identify EN and CR species that could be found in the sub-scheme area of influence and to determine the Critical Habitat status of the identified species. After three rounds of screening focusing on EN and CR species, 11 EN and CR species are found as potentially present in the sub-scheme area of influence. These species include 4 reptile species, 2 mammals, 2 fishes, and 3 birds (See list of 11 EN and CR species in Table 6.19 below).

4.3.1.2 Description of screening for narrowing down

For Ou Ta Paong, three rounds of screening have been conducted. The first screening (Round 1) was conducted in December 2023. Round 2 was carried out in April 2024, and Round 3 in August 2025. The purpose of repeated screening is to validate the screening results (for the same area) with a wide range of local stakeholders. The screening aims to identify only EN and CR species that are potentially present in the OTP area of influence, covering reptiles, mammals, fish, birds, amphibians, and aquatic plants. Screening was done based on the IBAT report generated and provided by the AIIB.

In the first two rounds of screening, 17 EN and CR species were identified in the OTP area of influence (See Table below). In the 3rd round of screening (in August 2024), however, 11 (out of a total of 17 species) were confirmed as “potentially present” in the OTP’s area of influence.



So, the assessment for Ou Ta Paong focuses on the confirmed list of **11 species** that are categorized by IUCN as EN and CR species, including 4 reptile species (Black Marsh Turtle, Giant Asian Pond Turtle, Southeast Asian Box Turtle, and Elongated Tortoise), 2 mammals (Indochinese Silvered Langur and Long-tailed Macaque), and 2 fishes (Striped catfish and Siamese Tiger Perch), and 3 birds (Greater Adjutant, Milky Stork, and Bengal Florican) See Table 22 below for the list of confirmed species and see Figure 14 for potential locations of these species in the projects are of influence.

Table 23: Confirmed List of endangered and critically endangered species for the Ou Ta Paong sub-scheme

No.	Local Name	English Name	Scientific Name	IUCN Cat	Screened Species from Round 1&2 (Total=17)	Confirmed Species in Round 3 (Total = 11)

4.3.1.3 Ecological State of Habitats within the Area of Analysis (AoA)

Understanding of the ecological state of habitats is necessary to assess the Likelihood of occurrence (LoO) of the above 11 screened species - as part of the CHA. For this CHA, species were classified into four LoO categories: Present, Possible, Unlikely and Not Present. Species known to be Present or with a Possible LoO are further assessed in Step 3. This understanding takes into account the classification of habitats as either modified or natural based on levels of human-induced disturbance to species composition and ecological functions. In this session, a brief assessment of the 11 confirmed species are presented. The assessment discusses historical range, distribution, habitat conditions, current status, and potential threats identified by key informants[8].

The OTP command area, therefore, the ecosystem within the OTP command area has been subject to human-induced changes over the past several decades. Previously, the zoning areas of OTP contains Zone 1 (transition zone), Zone 2 (buffer zone) and Zone 3 (core zone)

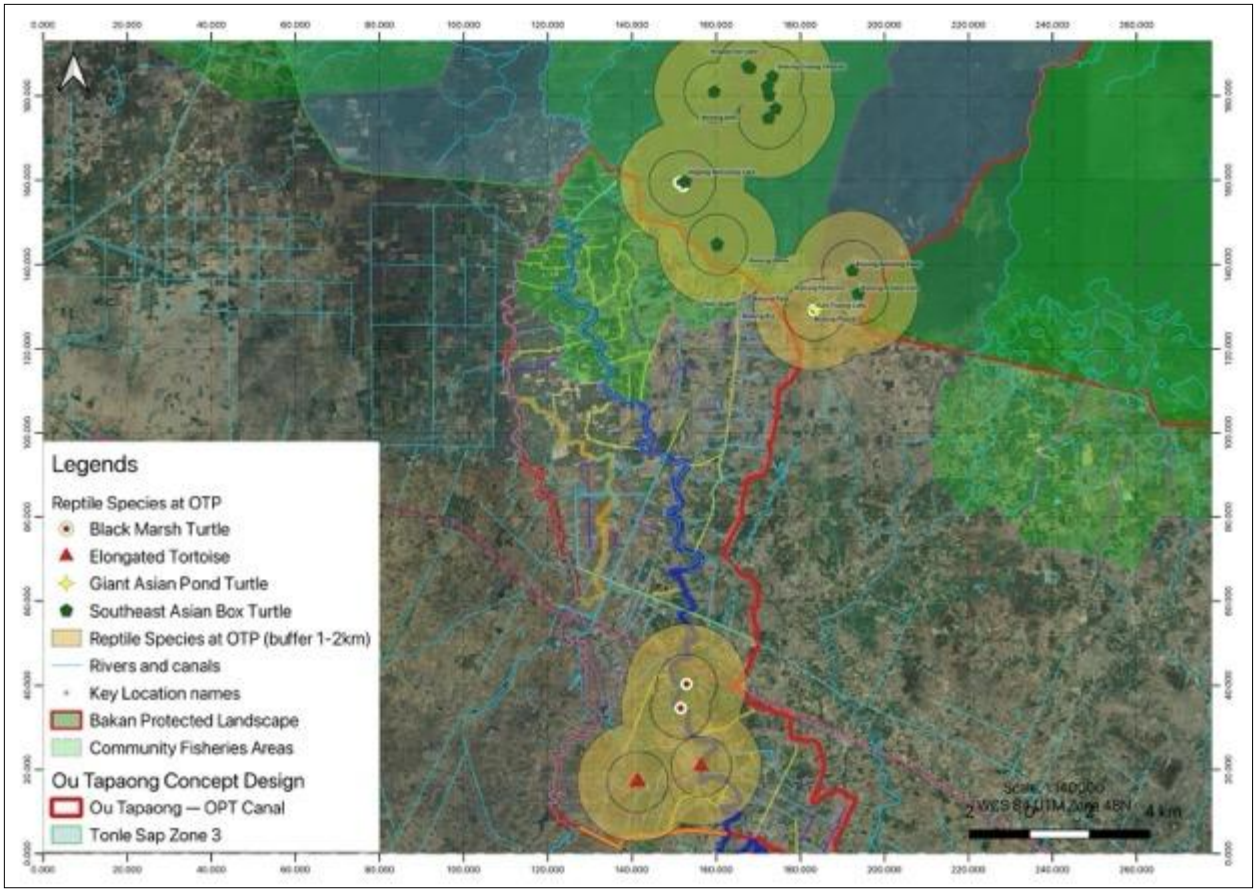
[8] Community councils and committees, including community fisheries (CFi) and farmer water user community (FWUC), were convened on July 25 and August 4, 2024. These meetings aimed to identify potential field assessment areas and select individuals with deep local ecological knowledge and experience for interviews. A total of 13 key informants were interviewed in Ou Topaong. Five of these individuals were from the upper command area, while seven were from the lower command area. Additionally, one representative from Punleu Komar Organization, which supports the Samraong Muk Yeik Community Forest Initiative, was included. Notably, the Samraong Muk Yeik and Sdok Khlouk Community Fisheries locations overlaps with portions of the Lower Ou Tapaong Command Area.

which does not exist anymore for Zone 2 and Zone 1. As such, the OTP command area is a modified habitat.

❖ **Reptiles (4 species)**

The Black Mash Turtle was observed in both upper and lower sections of the command area, as well as along the main Ou Ta Paong River (which is being used as a key canal feeding irrigation water for the command area). Conversely, the Elongated Tortoise was only found in the upper reaches while the Giant Asian Pond Turtle and Southeast Asian Box Turtle were found only in the lower section within Tonle Sap Zone 3 (figure 15). Details are below:

- **The Black Mashed Turtle *(Cuora galbinifrons)*** was confirmed to be present in the area of influence based on the accounts of four local informants. Residents from the upper reaches of Ou Tapaong reported historical sightings of this species within the past 10-20 years although recent spotting has been scarce. Key informants who live in the lower part of the command area and had livelihoods closely intertwined with the Tonle Sap Management Zone indicated that there have been ongoing efforts to bring the **Black Mashed Turtle back** to the region albeit its rarity. One informant successfully captured a Black Mashed Turtle just before the interview. This species is highly valued in the local market, particularly among middlemen, and is often used for traditional medicinal purposes. The Black Mashed Turtle is listed as Critically Endangered by the IUCN Red List, and its presence in the area of influence indicates that the habitat is essential for its survival and reproduction. Therefore, the habitat meets the criterion of being significant for a Critically Endangered species of criteria 1a of IFC PS6.
- **Elongated Tortoise:** This species wasn't initially screened for the interview, but it was identified and spotted by two key informants at the upper section of the Ou Tapaong based on the turtle images that were shown to facilitate the identification of species. No such sightings have been documented in the lower portions of the command area. One informant, a local resident near Ou Tapaong, provided a firsthand account of capturing this species. After a thorough examination of the accompanying photographs and a comparison with verified identifying features, this species is confirmed present as reported by the local informant. The Elongated Tortoise is listed as Critically Endangered by the IUCN Red List. The presence of this species within the project area indicates that the habitat is essential for its survival and reproduction, meeting the requirements of Criterion 1a.
- **Giant Asian Pond Turtle:** Three local informants who were interviewed in the lower Ou Tapaong River region confirmed the presence of the Giant Asian Pond Turtle. One informant reported spotting this species in Boeung Kum Traeng, a wetland within Tonle Sap Zone 3 while the other two informants indicated their encounters with this species in the mountainous regions of Kravanh District. Asian Pond Turtle is listed as Critically Endangered by the IUCN Red List. The reported sightings in Boeung Kum Traeng and the mountainous regions of Kravanh District indicate that these areas may be important habitats for the survival and reproduction of this species, meeting the requirements of Criterion 1a.
- **Southeast Asian Box Turtle:** During our survey in the lower section of the Ou Ta Paong, we obtained valuable information about the Southeast Asian Box Turtle. All



seven informants in this area confirmed the presence of this species in nearby wetlands and flooded forest areas within Tonle Sap Zone 3, which is close to the command area boundary. While three informants reported recent encounters with this species, the remaining four mentioned that they had encountered it 10 to 20 years ago. They explained that the turtle was once abundant but has become very rare in recent years.
Similarly, all turtle species, including the Southeast Asian Box Turtle, are threatened by ongoing illegal hunting for trading purposes. Some people were hesitant to share recent information about these species.

Mr. Pheoun Moeun, Deputy Chief of Samraong Muk Yeik Community Fishery (SMY-CFi) is exceptionally knowledgeable about wildlife species in his Cfi area. He has been actively participating in forest patrols and community activities. He mentioned that some people who go fishing in the forest occasionally bring back one or two turtles with them, but he preferred not to disclose this information.

One key informant admitted that they captureed a turtle from a nearby forest and sold it for income. Income was shared among the four individuals. While informants were willing to share their past incidents, they were reluctant to provide details about the recent events because these activities are illegal.

the Southeast Asian Box Turtle, a Critically Endangered species, is present in the lower section of the Ou Tapaong and nearby wetlands. These unique ecosystems are highly threatened. Therefore, Criteria 1a and 4 of IFC PS6. Additionally, Criteria 1b may also apply due to the high threat level and declining population. are potentially met.

Figure 15: Distribution of identified turtle and tortoise species in and outside the OTP Command Area

❖ **Birds (3 species)**

Despite extensive interviews with key informants residing in the upper reaches of Ou Ta Paong, numerous endangered or critically endangered bird species were reported within their community. Conversely, only three of six bird species were confirmed by both key informants and CFi committees in the lower section. The following paragraphs summarize the primary findings and justifications for each species' presence, along with the associated level of confidence. These conclusions are based on in-depth interviews, technical expertise, and consultations with relevant units, which provided valuable assistance in verifying species of high conservation significance. Several species were initially identified by local residents.

- **Bengal Florican:** Five informants confirmed the presence of the Bengal Florican in the area of influence. Two individuals reported sightings within the past 10-20 years while three others have observed the species within the last five years and in the past. Notably, one informant witnessed a pair (male and female) as recently as March 2024 (see Figure 16). The lower reaches of Ou Tapaong exhibit a diverse mosaic of habitats, including open wetlands, grasslands, flooded forests, and minimally intensified paddy fields, creating a relatively undisturbed environment that is potentially conducive to Bengal Florican populations. Notably, the Ou Tapaong Command Area is situated only 1 kilometre from the Bakan Protected Landscape (BPL), a region characterized by similar ecological conditions (figure 16).

Established in July 2023 through a joint effort by the Ministry of Environment and the Wildlife Conservation Society (WCS), the BPL aims to safeguard the southernmost Bengal Florican subpopulation within the Tonle Sap Great Floodplain. Moreover, the BPL serves as a critical wintering habitat for the Yellow-breasted Bunting, Manchurian Reedwarbler, and Cambodia's unique population of the Chinese Grassbird, along with other globally threatened avian and wildlife species (WCS 2023).

The project area likely meets Criterion 1a (habitat of significant importance to Critically Endangered species) due to the presence of the Bengal Florican. Additionally, it may meet Criterion 4 (highly threatened and/or unique ecosystems) given the diverse habitat mosaic. However, a detailed ecological assessment is crucial to confirm these findings and identify any other relevant criteria.

- **Greater Adjutant:** During field assessments within the study area, multiple informants reported sightings of Greater Adjutants. While most individuals were unable to definitively distinguish between the Greater Adjutant and the similar-looking bird, which is Lesser Adjutant), one informant positively identified a Greater Adjutant within the Ou Tapaong Command area. This sighting occurred in recent years (figure 16). Unfortunately, due to the time of the observation, the Greater Adjutant had likely already migrated to its breeding grounds at Prek Toal Ramsar Site, a protected wetland area situated in Koh Chiveang community, Ek Phnom District, Battambang province (MoE 2012).

  Prek Toal Ramsar Site is the sole known breeding habitat for the greater adjutant in Southeast Asia and is recognized as the second-largest breeding colony for this species globally, following Assam, India. In December 2015, the Royal Government of Cambodia and the Ramsar Convention Secretariat designated the Prek Toal Core Area as a Wetland of International Importance due to its exceptional biological, social, and economic value. This designation solidified Prek Toal's status as Cambodia's fourth Ramsar Site (WCS 2016). Following the breeding season, greater adjutants migrate across the Tonle Sap Floodplain to their foraging habitats, with the lower section of Ou Tapaong serving as a critical foraging ground.

  Despite the challenges faced during the field observation due to the time of year, the confirmed sighting of a Greater Adjutant in the study area is a significant finding. It suggests that the species may still be present in the region and that a suitable habitat may exist for its continued survival.

  The findings indicate that the project area meets IFC PS6 Criteria 1a and 3. This is due to the presence of the Critically Endangered Greater Adjutant, a migratory species that utilizes the area as a critical foraging habitat, particularly during the non-breeding season.

Figure 16: A spatial distribution map was generated for three bird species—the Bengal Florican, Greater Adjutant, and Milky Stork—within the lower Ou Tapaong Command Area.

1-2 km buffer zones were included to approximate their minimum movement range around suitable habitats.

- **Milky Stork:** Despite repeated attempts to elicit accurate information, many key informants were unable to distinguish between the Painted Stork and the Milky Stork, two similar-looking bird species. This confusion is a common challenge in bird identification, especially for non-experts. While the Milky Stork is considered extremely rare in Cambodia, with sightings typically limited to 1-3 individuals, some informants claimed to have encountered larger groups. This discrepancy can be attributed to misidentification and the difficulty of accurately counting birds in the field.

  Based on my experience in bird identification and conservation, I was able to evaluate the credibility of the information provided. Two informants offered the most reliable accounts, describing sightings of 2-3 Milky Storks feeding alongside numerous Painted Storks in seasonal wetland areas near flooded forests (figure 17). These observations align with the limited available data on Milky Stork distribution and behavior in Cambodia. When the flooding season arrives, they migrate to degraded forest areas in the uplands. Milky Stork and Great Adjutant are migratory birds that move both locally and across international borders. The Prek Toal Ramsar Site serves as the only known breeding ground for Milky Stork and Greater Adjutant in Southeast Asia; after breeding, they migrate to other wetland areas throughout the country.

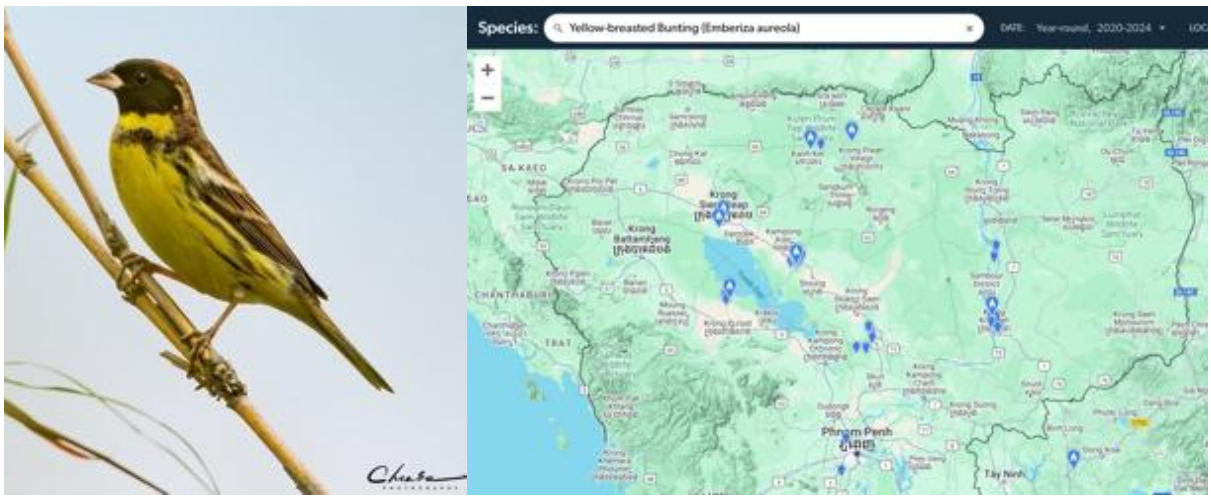
The Milky Stork's situation appears to align with several IFC PS6 criteria:

- **Species Level:** Endangered Species (Criterion 1a): The Milky Stork's rarity and the challenges in accurately assessing its population make it a strong candidate for this criterion. Its limited distribution and potential threats further emphasize its vulnerability.

  Migratory Species (Criterion 3): The migratory nature of the Milky Stork, particularly its reliance on the Prek Toal Ramsar Site as a breeding ground and its movements to other wetland areas, highlights its dependence on various habitats throughout its range.

  Ecosystem Level: Highly Threatened and/or Unique Ecosystems (Criterion 4): The wetland habitats used by the Milky Stork, especially the flooded forests and seasonal wetlands, are often threatened by human activities like deforestation, agriculture, and pollution. These ecosystems are essential for the survival of the species and other biodiversity.

Figure 17: Photograph of a Milky Stork foraging alongside a flock of Painted Storks (credit: Sang Mony, Sam Veasna Conservation Tour), and a map illustrating the distribution of Milky Stork sightings in Cambodia from 2020 to 2024, extracted from eBird data.



- **Yellow-breasted Bunting**: The Yellow-breasted Bunting is a small, migratory songbird found in Southeast Asia, including Cambodia. It is characterized by its bright yellow breast and throat, contrasting with its olive-green upperparts. The Yellow-breasted Bunting is a winter visitor and spring passage migrant in Cambodia, often found in rice fields, scrub, grasslands, and marshes in the lowlands. In Cambodia November to May, the species has been recorded in the Tonle Sap Floodplain and the Lower Mekong Delta. Yellow-breasted Buntings are typically observed in rice fields, scrublands, grasslands, and marshes in the lowlands of Cambodia (Ly et al. 2022).

  The local population often mistakenly identifies this species as a sparrow or a weaver due to their similar size, appearance, and shared habitats. After conducting inquiries, none of the locals could confirm whether they had observed this species in the area. This highlights a common gap in local ecological knowledge regarding small bird species like this one. Identifying such species typically requires individuals with advanced birdwatching experience, who can locate them in the appropriate habitat at the right time.

Based on an overall assessment of the habitat conditions in the lower part of Ou Ta Paong, we can confirm that this area has the potential to serve as a wintering habitat for this species. Additionally, the boundary of the Ou Tapaong Command Area is just 1 km away from the Bakan Protected Landscape.

The Yellow-breasted Bunting's Critically Endangered status and the Ou Tapaong area's potential as a wintering habitat potentially meet IFC PS6 Criteria 1a. Additionally, the species' restricted range and migratory behavior align with Criteria 2 and 3. The Yellow-breasted Bunting, a CR species, is known to inhabit such areas during its winter migration.

Figure 18: Photo of Yellow-breasted Bunting (Emberiza aureola) and its distribution map from eBird data (2020-2024) recorded by birdwatcher and wildlife overserves.

- **Wild-winged Duck:** Regarding the Wild-winged Duck, there was some confusion among informants who mistakenly identified it as the Knob-billed Duck (Sarkidiornis melanotos). However, after discussing key identification features and ecological characteristics, such as breeding and nesting habitats, we determined that none of them had actually encountered the Wild-winged Duck before. Due to it's tiny population, Wild-winged Duck is very sensitive, and live in the forest close to the lake, wetland, river and waterhold with less disturbance. Due to its limited population, the Wild-winged Duck is particularly sensitive to disturbances and prefers to reside in relatively undisturbed forests adjacent to lakes, wetlands, rivers, and watering holes. This preference for quieter, less populated areas help to ensure the survival of this vulnerable species.

❖ **Mammals/ primates (2 species)**

No suitable habitats or sightings of three mammal species were identified in the upper section of Ou Ta Paong. Two primate species (Indochinese Silvered Langur and Long-tail Macaque) were confirmed at the lower section in the Flooded Forest habitat of the Tonle Sap Zone 3 and CFi Areas. Additionally, multiple reports indicated the presence of Hiary-nosed Otters in the region, particularly in the deep waters of the flooded forest near the Tonle Sap Great Lake's mouth. The following paragraphs summarize the key findings and justifications for the presence of these two primate species, along with their associated confidence levels. These

conclusions are based on comprehensive interviews, technical expertise, and consultations with relevant units, which contributed to the verification of species with high conservation importance.

- **Indochinese Silvered Langur:** Six local informants (86%) reported frequent encounters with Indochinese Silvered Langurs within the flooded forests of Tonle Sap Zone 3 which is outside of the OTP command area. These sightings, primarily near natural lakes, have been confirmed by multiple individuals engaged in livelihood activities within these areas. While the population of Indochinese Silvered Langur was once plentiful, informants noted a significant decline in recent decades, with only smaller troops now being observed. The species is known to inhabit areas near rivers and large bodies of water.

  Mr. Chem Sophal from Punleu Komar Organization highlighted that his organization provides support for the Samraong Muk Yeik Community Fishery (SMY-CFi) and Sdok Khlouk Community Fishery (SK-CFi) in managing and protecting fisheries resources and flooded forests within their Community Fishery Area (figure 19). Portions of these CFi Areas overlap with the Lower section of Ou Tapaong Command Area. This effort is part of the EU “Our Tonle Sap” Project, led by the Wildlife Conservation Society and funded by the European Union. Mr Sophal emphasized the presence of numerous endangered and critically endangered species, including the Indochinese Silvered Langur, within this CFi Area. To confirm the presence of any Community Fisheries (CFIs) within the specified area, we interviewed the Chief of Pursat Fishery Administration Cantonment. Our inquiry revealed that two CFi areas overlap with the designated region, as illustrated in the accompanying map (see map below).

  Based on the provided information, the following IFC PS6 criteria are potentially met regarding the Indochinese Silvered Langur and the flooded forests of Tonle Sap Zone 3:

  Species Level:

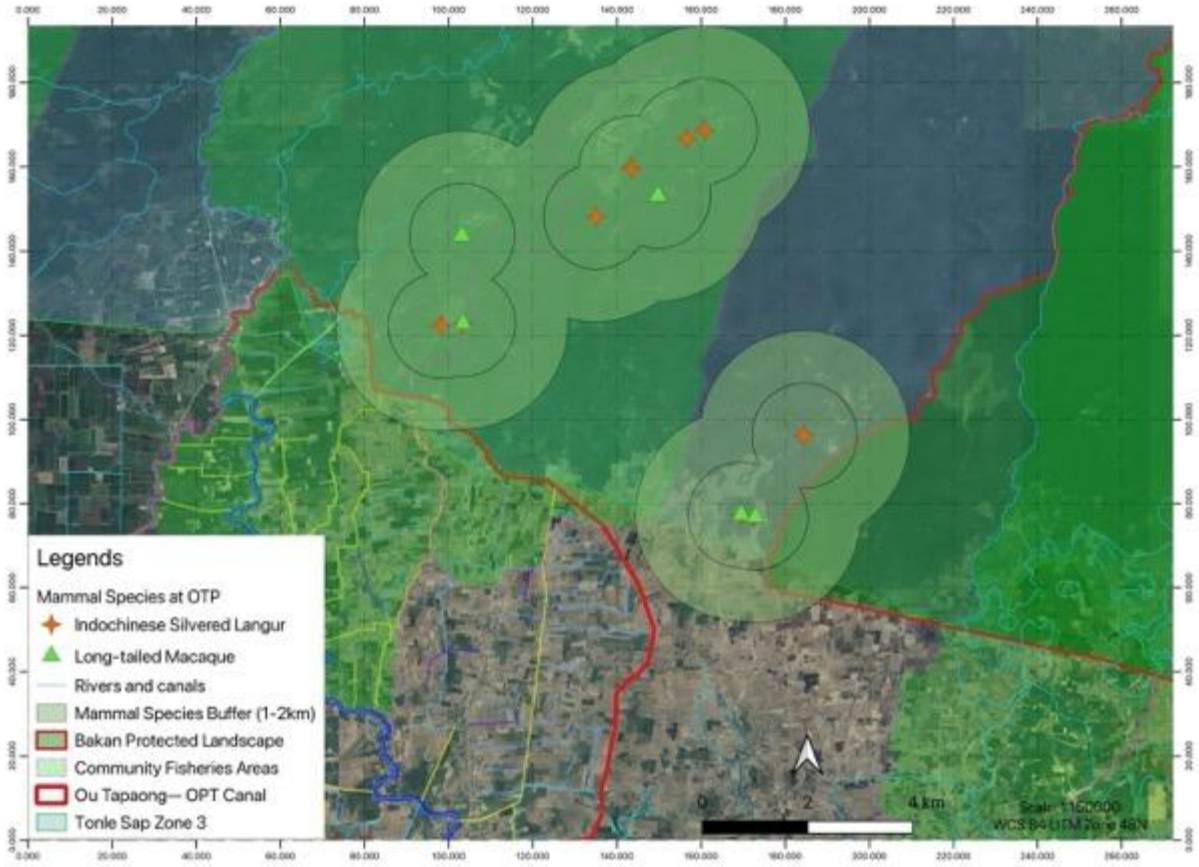
  - Criterion 1: Critically Endangered and Endangered Species: The Indochinese Silvered Langur is an endangered species, making its habitat a potential candidate for this criterion. Criterion 2: Highly Threatened Species: Given the observed decline in the population and potential threats to its habitat, the species could be considered highly threatened.

  Ecosystem Level:

  - Criterion 5: Highly Threatened and Unique Ecosystems: The flooded forests of Tonle Sap Zone 3 represent a unique and threatened ecosystem, particularly due to factors such as habitat loss and degradation.

- **Long-tailed Macaque:** Indochinese Silvered Langurs and Long-tailed Macaques were commonly reported by key informants residing within the Tonle Sap Zone 3. These informants, who frequently engaged in fishing activities in the surrounding forests, encountered Long-tailed Macaques regularly. They added that these primates, known for their social nature, live in troops and communicate vocally to alert their group

members of potential threats or discoveries. Some troops inhabit flooded forests situated close near the command area.



However, informants expressed deep concern over the significant decline in the population of Long-tailed Macaques over the past several years. This alarming trend has prompted urgent action from conservation organizations. In response to the deteriorating situation, the primate specialist group upgraded the conservation status of this species from Vulnerable to Endangered in March 2022. This elevated status underscores the urgent need for increased protection measures to mitigate the species' decline, which is primarily driven by the high demand for these primates in the illegal pet trade (*Primate Conservation Alliance. 2022)*

The provided information strongly suggests that the Tonle Sap Zone 3 adjacent to the OTP meets multiple IFC PS6 criteria related to the Critically Endangered Long-tailed Macaque:

- Criteria 1a: The recent uplisting of the Long-tailed Macaque to Endangered status by the IUCN Red List underscores the habitat's critical importance for the species' survival and reproduction. The frequent sightings of these primates by local informants, especially in the flooded forests, highlight the area's significance as a key habitat.
- Criteria 4: The flooded forests of the Tonle Sap Zone 3 represent a highly threatened and unique ecosystem. They face significant threats from habitat loss, pollution, and climate change. These forests provide a crucial habitat for the Long-tailed Macaque and other potentially threatened species.

Figure 19: A spatial distribution map was generated for two primate species—the Indochinese Silvered Langur and Long-tailed Macaque—within the lower Ou Tapaong

Command Area. 1-2 km buffer zones were included to approximate their minimum movement range around suitable habitats.

❖ **Fishes (2 species)**

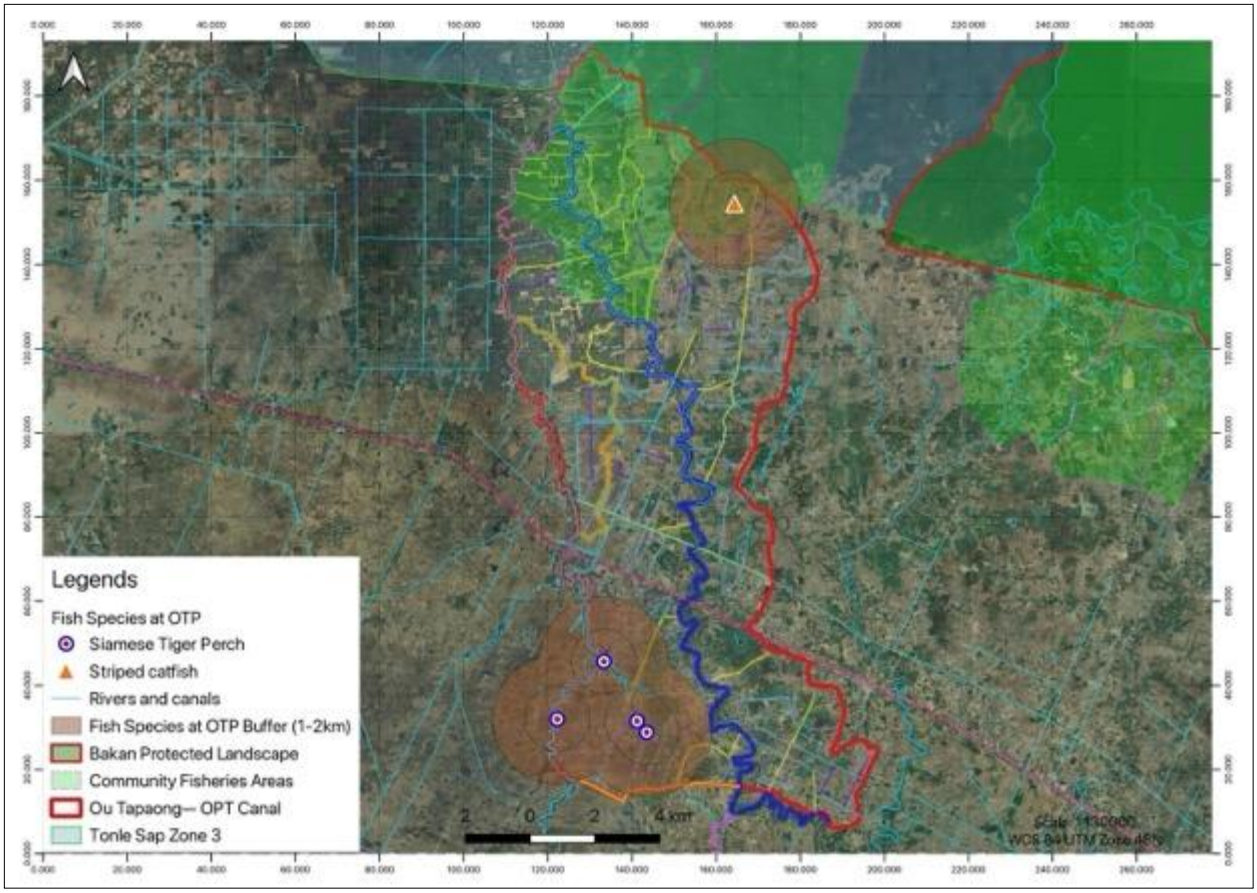
Overall, these statements provide valuable insights into sightings and knowledge about Siamese Tiger Perch and Striped Catfish within different sections of the Ou Tapaong Command area. The following paragraphs summarize the key findings and justifications for the presence of these two fish species confirmed by key informants, along with their associated confidence levels and their ecological knowledge of fish diversity and migration.

- **Siamese Tiger Perch:** According to four key informants in the upper section of the Ou Tapaong Command area, Siamese Tiger Perch has been consistently observed in Boeng Kansaeng Lake, located in the southwest part of the Ou Tapaong Command Area. Three of them reported encountering a few individuals of this fish species in 2023 and 2024 (figure 20), while another informant saw them about 20 years ago during the fully flooded period. This particular informant stopped fishing for many years after becoming older.

  The Siamese Tiger Perch is believed to migrate from Tonle Sap Great Lake to the upstream through Svay Daun Kav River (along the western boundary of command area) and then move into Boeng Kansaeng through its tributary canal during flooding periods. Common fishing gear used includes line nets, cast nets, and small fish traps. The informants mentioned that catching this species is extremely rare, with only one to two individuals caught per season using line nets. They possess extensive knowledge about fish and make a living through fishing.

On the other hand, two key informants from the lower Ou Tapaong section stated that although they are familiar with Siamese Tiger Perch, they have never seen them in their area. One informant mentioned having seen this species in 1979 but not recently. Similarly, Mr. Chem Sophal from Punleu Komar Organization confirmed his awareness of this species but stated that it is not present in the lower Ou Tapaong Area.

The Criterion 1a of IFC Performance Standard 6 (PS6) is potentially met. The Siamese Tiger Perch, a Critically Endangered species, has been observed in Boeng Kansaeng Lake, a habitat within the Ou Tapaong Command Area. However, the frequency of sightings is low and historical, suggesting that further investigation is necessary to definitively establish the habitat's significance for the species' survival and reproduction.



- **Striped catfish**: One informant recalled seeing the Striped Catfish approximately 7 years ago in a small wetland area during the peak of flooding. This species is exceptionally rare, and it is known to migrate to this specific area when the entire region becomes submerged in floodwater.

  Based on what we know, the habitat for the Critically Endangered Striped Catfish likely meets two of the IFC PS6 criteria:

  - Criterion 1a: This habitat is super important for the survival of this super rare fish. It's like their special breeding ground during floods.
  - Criterion 3: The fish migrates to this specific area when it floods, making it a key spot for this travelling species.

Figure 20: A spatial distribution map was generated for two fish species—the Siamese Tiger Perch, and Striped Catfish (old record-7 years ago)—within the lower Ou Tapaong

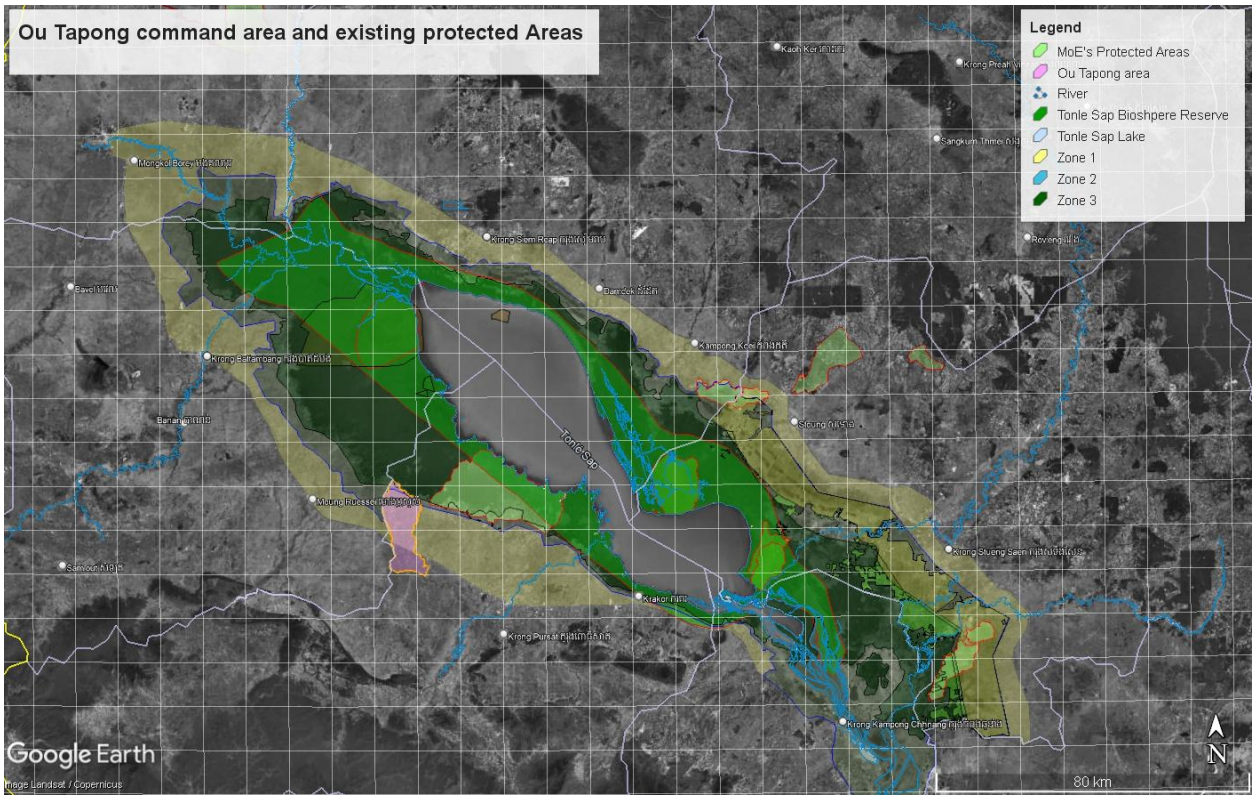
Command Area. 1-2 km buffer zones were included to approximate their minimum movement range around suitable habitats.

4.3.1.4 Occurrence of Protected Areas near the Sub-scheme Area

A review of protected areas in the vicinity of the sub-scheme has been conducted as a preparatory step before proceeding with Step 3 of the CHA. There are four areas located near and downstream of the OTP sub-scheme (See Table below). The preliminary assessment focuses on the two that are closest to the OTB: Flood Forest Conservation, b) Bakan Grassland Protected Area[9].

No.	Name of Protected Area	Designated by	Main target and requirement	Distance (km) to OTP sub-scheme
1	Flooded Forest Conservation	Royal Government of Cambodia: Sub-decree No. 197 dated 29 August 2011	The Tonle Sap's flooded forests are a vital part of its unique ecosystem. During the wet season, the Mekong River's waters back up into the Tonle Sap, flooding vast areas and creating a rich habitat for diverse wildlife. This dynamic	0 (share the border)

[9] Bakan grassland is a protected area for birds designated by sub-decree No. 144 in 2023.



No.	Name of Protected Area	Designated by	Main target and requirement	Distance (km) to OTP sub-scheme
			ecosystem supports a multitude of fish species, waterbirds, and other wildlife. However, it faces threats like deforestation, overfishing, and pollution, necessitating conservation efforts to protect this vital resource.	
2	Bakan Grassland protected area	Royal Government of Cambodia: Sub-decree No. 144, dated 04 July 2023	Bakan Grassland, a 38,430-hectare protected area in Cambodia, is a vital part of the Tonle Sap ecosystem. It's home to endangered bird species like the Bengal Florican and Chinese Grassbird. The Wildlife Conservation Society (WCS) and local communities are working together to protect this unique habitat.	2
3	Dei Roneat Important Bird Area (IBA)	BirdLife Internation	The IBA supports breeding colonies of important birds like the Darter, Lesser Adjutant, and Greater Adjutant. Its diverse habitat supports various bird species, but faces threats from human activities. Conservation efforts include monitoring, community engagement, habitat restoration, and policy advocacy to protect this crucial site.	12
4	Tonle Sap Biosphere Reserve (TSBR)	Royal Government of Cambodia: Royal Decree in 2001[10]	The Tonlé Sap Biosphere Reserve is a distinctive ecological region encompassing the Tonlé Sap, or Great Lake of Cambodia. The reserve was successfully designated a UNESCO Biosphere Reserve in 1997 and subsequently enshrined in the Cambodian Royal Decree in 2001.	16

[10] https://www.unesco.org/en/articles/national-conference-tonle-sap-biosphere-reserve-brings-together-stakeholders-discuss-sustainable

No.	Name of Protected Area	Designated by	Main target and requirement	Distance (km) to OTP sub-scheme
5	Prek Toal Important Bird and Biodiversity Area (IBA), then designated at the core area of TSBR in 2001, and then promoted Prek Toal Ramsar Site in 2015	BirdLife Internation Royal Government of Cambodia: Royal Decree in 2001[11] Sub-decree in 2015	The area is well known as the largest waterbird breeding colonies in Southeast Asia, support a congregation of may globally threatened birds, fish and other wildlife specicis. It's the second world largest breeding habiatat for Greater Adjutant, and the only breeding habitat for Spot-billed Pelican, and Milky Stork in Southeast Asia. Prek Toal is only inland breeding population for Milky Stork in the world.	24

Figure 21: Map of Ou Tapong Command Area and other existing protected areas under administered of the Ministry of Environment, Ministry of Agriculture, Forestry, and Fisheries, and Ministries of Water Resources and Meteorology

4.3.2 Determination of Critical Habitat Status (Step 3)

This section assesses the information (obtained from the above sub-section) vis-a-vis the criteria (presented in Section 3.4 - CH assessment method). This assessment aims to determine whether any species (identified in the list of 11 EN and CR species) qualify for Critical Habitat features.

All information presented in this study report has been meticulously verified against reliable sources, including key government research institutes, national and international organizations, and expert consultations. To ensure accuracy, fish, bird, mammal, and reptile species identification at Ou Ta Paong, Lum-Hach, Brambei Mom, Kraeu Trom, and Yutasas was confirmed through consultations as below:

Table 24: List of international and national key expert was consulted to check and verify each all target EN and CR species

Name	Position and institution	Key Area of expertise/ consultation	Contact
Dr. Ea Chitra	Head of the Aquaculture Faculty at the Kampong Speu Institute of Technologies	Key fish species were released by his faculty at Anlong Chrey and Brambei Mum Reserviors.	+855 14 388 694

Mr. Robert Tizard	Senior Project Lead for Tonle Sap Landscape, WCS Camodia	Confirmation and historical sighting data of Bengal Florican and other key bird species around Ou Ta Pang sub-scheme	rtizard@wcs.or
Mr. Tach Sovannara	Head of the Fisheries Lab at the Inland Freshwater Research and Development Institute of the Fisheries Administration	Identification and clarification of EN and CR species of fish and reptiles across all sub-schemes	
Mr. Khim Sokha	Chief of office of the Fisheries Conservation Department	Identification and clarification of EN and CR species of fish and reptiles across all sub-schemes	+855 12 784 687
Mr. Chuem Sophal	Program Manager, Punleu Komar Organization	Confirm present of birds and key wildlife species at Ou Ta Paong Sub-scheme	
Mr. Morn Ravy	Bakan Protected Landscape Project Coordination, WCS Cambodia	Confirm present of birds and key wildlife species at Ou Ta Paong Sub-scheme	morn@wcs.org
Mr. Somony Thay	Direct of Aquaculture Department, FiA	Fish identification, key fish species releasing data, and distribution range across all schemes	+855 12 829 971
Mr. Neang Ty	Conservation Program Manager, Wild Earth Allies	Internation and national expert on reptile	+855 12 864 409
Mr. Hong Chamnan	Director of the Freshwater Wetland Conservation Department, MoE	Confirmation and historical sighting data of Bengal Florican and other key bird species around Ou Ta Pang sub-scheme, national protected area data	+855 12 922 429
Mr. Sun Visal	Deputy Director of the Freshwater Wetland Conservation Department, MoE	Confirmation and historical sighting data of Bengal Florican and other key bird species around Ou Ta Pang sub-scheme, national protected area data	+855 12 708 836

All information concerning avian and other key wildlife species, including their behavioral patterns, was corroborated through sighting data verified by relevant experts from the Wildlife Conservation Society (WCS), a long-standing partner of the Ministry of Environment (MoE), Fisheries Administration, and Forestry Administration in conservation efforts spanning over 25 years. Additionally, consultations were held with Mr. Hong Chamnan, Director of the Freshwater Wetland Conservation Department, and Mr. Sun Visal, his Deputy Director and the head of the Tonle Sap Biosphere Reserve. Both individuals possess extensive experience,

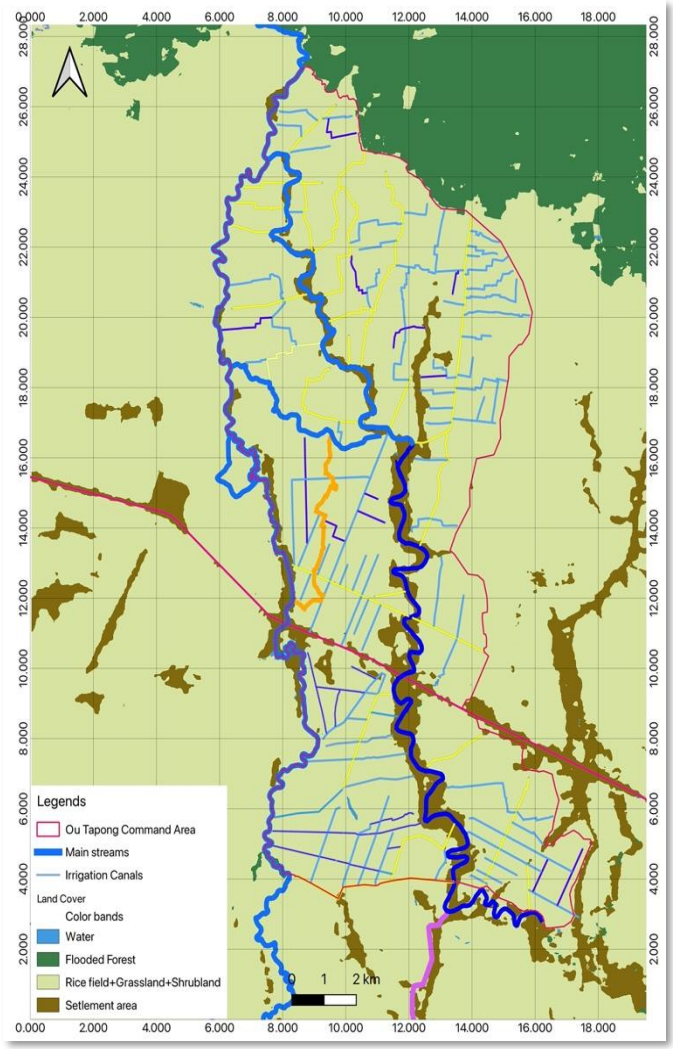
ranging from 20 to 30 years, in avian ecology and protected area management within the Tonle Sap Lake region.

Finally, information related to reptiles and amphibians was validated through consultations with Mr. Neang Ty and his team from Wild Earth Allies, renowned experts who have made significant contributions to the discovery of new reptile and amphibian species in Cambodia, including the Cardamon Shrub Frog (Philautus cardamonus).

4.3.2.1 Overview of the current land use and land cover at OPT

The map below features the current land and use and land cover at Ou Tapaong Command Area in late 2023. The colour bands failed to distinguish between rice fields, grassland and shrubland areas. However, based on field assessment, the command area is dominated by existing rice fields and some modified habitats. There are some small and fragmented natural habitats like shrubland, and grassland along the natural streams, seasonal ponds and wetland habitat creating a mosaic habitat for many wildlife species to strive as the area is situated within the Tonle Sap Floodplain close to many protected areas and IBBAs. Residential areas are situated along the main roads, rivers, and streams.

The northern portion of the OTP Command Area is a dynamic landscape characterized by a varied mosaic of habitats. Here, agricultural lands coexist with modified habitats, wetlands, shrublands, and remnants of grassland, seamlessly transitioning into the vast expanse of the Tonle Sap Zone 3 flooded forest.



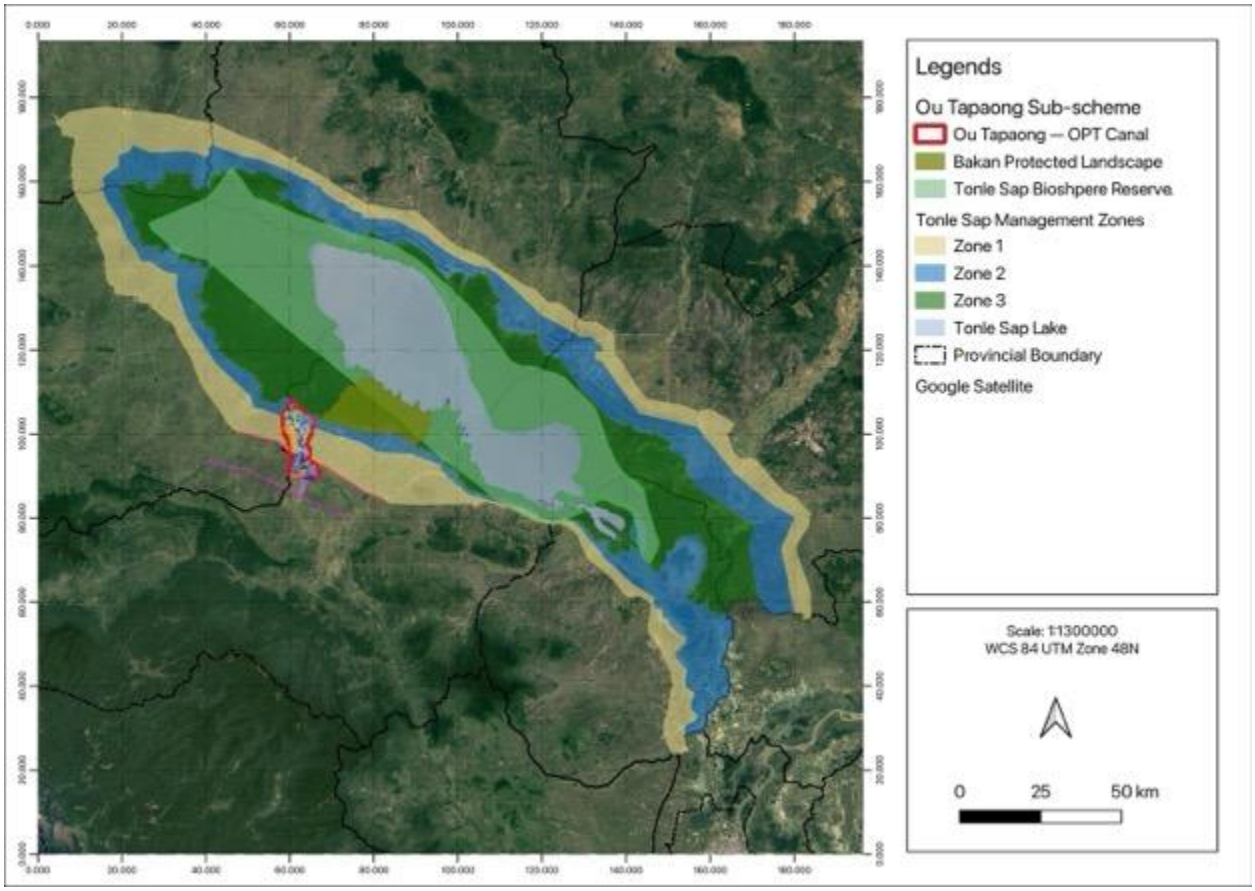
This diverse ecological mosaic plays a crucial role in supporting a rich array of biodiversity. The area serves as a vital foraging ground for numerous migratory bird species, providing them with abundant food resources. Additionally, it functions as a critical refuge and breeding ground for fish during the wet season, when the flooded forests and wetlands offer ideal conditions for spawning and juvenile development.

The intricate interplay of these habitats sustains a diverse community of wildlife, including birds, mammals, fish, and reptiles. These species rely on the unique characteristics of the flooded forest and wetland ecosystems for essential life cycle activities such as breeding, nesting, and foraging. The area's significance as a biodiversity hotspot is underscored by its role in supporting a wide range of Habitat of significant importance to CE and EN species

As presented in Section on Ecological State earlier, species that qualify as critical habitat features include:

- **Reptile** (4 species): Black Marsh Turtle, Giant Asian Pond Turtle, Southeast Asian Box Turtle, and Elongated Tortoise,
- **Mammals** (2 species): Indochinese Silvered Langur and Long-tailed Macaque),
- **Fishes** (2 species): Striped catfish and Siamese Tiger Perch, and
- **Birds** (3 species): Greater Adjutant, Milky Stork, and Bengal Florican.

Figure 22: Land use and land cover map based on the satellite image from Sentinel-2 with 10m resolution.



First of all, the Ou Tapaong command area was assessed as a modified habitat because the command area which is around 14,000 hectares is a mixture of paddy fields, rivers, shrubland, seasonal ponds, farmers, and houses. Rivers such as Ou Ta Paong River and Svay Donkeo River have been substantially modified at various locations of the river for water collection, storage, as well as for other living and farming purposes.

In this assessment, we divided Ou Tapaong Command Area into three parts: 1) the upper part to the south, 2) the middle part along National Road 5, and 3) the lower part to the north which is situated within the floodplain of Tonle Sap Zones 2 and adjacent to Tonle Sap Zone 3 for key informant interview and habitat assessment purposes as this command area is large and maintain different demographic and natural habitat conditions. On August 7, 2024, the Cambodian government discussed the decision to register two zones (Zone 2 and Zone 3) of the Tonle Sap Lake Basin as state land to protect the natural resources of the lake. This decision will prohibit any further requests for land concessions in these zones. The Ministry of Land Management, Urban Planning and Construction hopes that this will help to preserve the biodiversity of the lake[12]. The assessment focused on the upper and lower parts because these areas are known to have a diverse biodiversity landscape. While the survey revealed variations in knowledge about wildlife among local communities, it also highlighted the need for increased awareness and understanding across all areas.

[12] Land Management, Urban Planning and Construction, Cambodia (2024). Zones 2 and 3 of the Tonle Sap Lake will be registered as state land to preserve this precious natural resource for inheritance for all generations.

Figure 23: Map of Ou Ta Paong command area and other existing protected area within the Tonle Sap Basin

The southern part of the command area is predominantly agricultural, with limited remaining natural habitats. Boeng Kansaeng, the largest seasonal wetland, faces challenges in water retention during the dry season. While the command area mostly gets water for irrigation from the Svay Daunkaev and Pursat rivers, the water volume is insufficient to maintain natural flows (e.g. Ou Tapaung River). Additionally, human interventions such as earth dams and conversion of waterways into fishponds have fragmented the natural habitats and as such hindered the movement of aquatic species (Figures 24 and 25).

The northeastern part of the command area, though dominated by agriculture, includes a significant area of flooded forests. This diverse habitat supports a range of endangered and critically endangered species. However, the entire water system faces challenges that limit its suitability for species requiring extensive, interconnected habitats. The lowest part of this area is connected to a very healthy flooded forest habitat, consisting of many small and large waterholes, and wetland areas, creating a mosaic habitat that provides suitable ecological niches for many endangered and critical species in the area. This huge, flooded forest habitat is part of the Tonle Sap Multiple Use Area, Tonle Sap Biosphere Reserve under the Ministry of Environment, and Tonle Sap Management Zone under the administration mandate of the Tonle Sap Authority, and Flooded Forest Protected Area under the Fisheries Administration. Additionally, a portion of Ou Ta Paong's lower command area overlaps with two Community Fisheries (CFIs) areas.

The critical habitat for these bird species within the Ou Ta Paong Irrigation sub-scheme includes flooded forests, wetlands, lakes, rivers, grassland, abandoned and fellow rice fields, and waterways. The flooded forests in Tonle Sap Zone 3 serve as crucial habitats for several endangered and critically endangered primate species like the Indochinese Silvered Langur and Long-tailed Macaque and are characterised with lakes and wetlands inside that are crucial foraging habitats for birds. Based on this key finding we can identify and characterise critical habitats of various EN and CR species presence within and close the command area as below:

- Flooded forests, particularly those in Tonle Sap Zone 3, are particularly significant for biodiversity. These forests provide crucial habitat for endangered primates such as the Indochinese Silvered Langur and Long-tailed Macaque. Additionally, the lakes and wetlands within these forested areas offer essential foraging grounds for various bird species including Greater Adjutant and Milky Stork.
- Wetlands, such as Boeung Kansaeng, play a vital role in supporting aquatic and terrestrial biodiversity. These areas provide essential food, shelter, and breeding grounds for a variety of species including birds, reptiles, and fish.
- Rivers and waterways, like the Svay Daun Kav River, serve as important corridors for fish migration and connectivity between different habitats. This can indirectly benefit birds by providing a healthy aquatic ecosystem.
- Grasslands and open areas, while less diverse than forested habitats, can still support certain Bengal Florican, Yellow-breasted Bunting and other bird species. Abandoned and fallow rice fields may also offer temporary refuge for many bird birds including the Florican. The Bengal Florican utilizes this habitat for nesting and feeding during the dry season. The Yellow-breasted Bunting winters in this region before returning to its breeding ground in Siberia, Russia, from May to November

Based on the biodiversity assessment conducted at Ou Tapaong Irrigation Sub-scheme, several critical habitats have been identified, and described below. These habitats support a range of endangered and critically endangered species, highlighting their ecological significance. The critical habitat assessment activities that should be taken for the Ou Tapaong Command area, considering IFC PS 6 guidance on biodiversity conservation and sustainable management of living natural resources, are as follows:

1. Baseline Studies: Conduct comprehensive baseline studies to identify and understand the biodiversity values in the area. This should include a literature review, stakeholder engagement and consultation, field surveys, and other relevant assessments. The focus should be on identifying key species (such as Greater Adjutant, Milky Stork, Bengal Florican), fish (Siamese Tiger Perch and Striped Catfish), reptiles (Black Marsh Turtle, Southeast Asian Box Turtle, Giant Asian Pond Turtle, Elongated Tortoise), mammals (Indochinese Silvered Langur and Long-tailed Macaque), and their habitats.
2. Habitat Mapping: Map out the different habitats present within the Ou Tapaong Command area. This should include flooded forests, lakes (such as Boeung Kamsaeng Lake), rivers (Svay Daunkav River), waterholes, grasslands, and fellowed rice fields used by bird species for foraging.

3. Threat Assessment: Assess potential threats to critical habitats identified in step 2. Consider factors such as habitat loss due to infrastructure development or land-use changes related to irrigation system renovation.
4. Stakeholder Engagement: Engage with relevant stakeholders including local communities living in or around critical habitats to gather their knowledge about biodiversity values in the area.
5. Mitigation Measures: Develop mitigation measures specific to each identified critical habitat that aligns with IFC PS 6 guidance on avoidance of impacts whenever possible; implementation of measures to minimize habitat fragmentation; restoration activities during operations or after project completion; implementation of set-asides for protection; consideration of biodiversity offsets where appropriate based on no net loss principle.
6. Environmental and Social Impact Assessment (ESIA): Conduct an ESIA that considers all potential impacts on critical habitats identified through steps 1-5 above.
7. Monitoring Plan: Develop a comprehensive monitoring plan that includes regular monitoring of key species populations within critical habitats identified in step 2 above.

Figure 24: Boeung Kansaeng located in Ou Tampaong's upper reaches, offers sighted records of Siamese Tiger Parch. The area's upper part in this photo is a settlement along the Svay Daunkav River.

Figure 25: Overview of Boeung Kansaeng, located upstream of Ou Tapaong Command Area. A canal connects to Stueng Svay Daunkav River (left) and Ou Tapaong (right), a potential fish migration route during floods.

Figure 26: Aerial photograph depicting the Ou Tapaong Stream/canal fragmented by earth dams, roads, and ponds, illustrating its diversion for non-intended purposes.

Figure 27: Aerial photograph of intake flooded forest habitat within Tonle Sap Zone 3 and the continuous land encroachment, converting forest land for rice cultivation.

4.3.2.1.1 Habitat of significant importance to endemic or restricted-range species

None of the species under EN and CR classification are restricted-range species (based on IBAT report for Ou Ta Paong).

4.3.2.1.2 Habitat supporting globally or nationally significant concentrations of migratory or congregation species

None of the IBA that are recognized for significant concentrations of migratory birds or other species are found within the vicinity of the sub-scheme. No other evidence of significant concentrations of migratory or congregatory species is available. The AoA for OTP, therefore is expected to qualify as critical habitats under this criterion.

4.3.2.1.3 Highly threatened or unique ecosystems

Each of the reservoirs are modified habitat and is associated with numerous rice paddies. There is no evidence that these areas are highly threatened or unique ecosystems, and no critical habitats are recognized under this criterion.

4.3.2.1.4 Ecological functions or characteristics that are needed to maintain the viability of the biodiversity values described above in (a) to (d)

Boeung Kansaeng Lake still maintains hydrological connectivity for fish migration from Stueng Svay Daunkav River through its canals, where the Siamese Tiger Perch was confirmed. Some small wetland areas at the lower part of the OTP command area support ecological functions and connectivity for confirmed birds, reptiles and fish species for their local movement, nesting, and foraging ground. So, that is necessary to support biodiversity values that require applying biodiversity mitigation measures and protection efforts (described under the above criteria) have been identified. Pumping, drainage, and discharge of chemical inputs into that

wetland can have a significant impact on the biodiversity and survival rate of EN and CR species present in that area.

4.4 Socio-Economic and Cultural Conditions

4.4.1 Administrative and Social Structure

4.4.1.1 Administrative System

Cambodia's administrative system at sub-national level is organized into three (3) tiers: capital city/province, district/municipality/khan, and sangkat/commune. Phnom Penh, the capital, is divided into khans and further into sangkats, while provinces are divided into municipalities and districts, with municipalities subdivided into sangkats and districts into communes and sangkats. The sub-national government is guided by organic laws, including the Law on Administration of Commune/Sangkat and the Law on Administration of Capital City, Province, Municipality, District, and Khan, supporting decentralization and deconcentration. Commune/sangkat administrations operate with legal, financial, and administrative autonomy, governed by elected councils responsible for budgets, development, and public order. Higher levels, such as provinces and districts, are governed by councils (legislative) and boards of governors (executive), with council members indirectly elected by commune/sangkat councils and supported by technical committees. Boards of governors, nominated by the Ministry of Interior, implement policies and supervise ministry units in their jurisdiction. Recent legal amendments aim to expand local administrations' authority over civil servants from national bodies, awaiting implementation through sub-decrees.

4.4.1.2 None-Governmental Organizations

Another institution which are playing an important role in the development of the country at sub-national level is the civil society. The civil society in Cambodia, particularly the NGOs plays a vital role in development and democratization. These organizations address challenges such as poverty, education, human rights, gender equality, and environmental conservation, filling gaps in governance and social services. NGOs contribute by providing microfinance, vocational training, and livelihood programs to alleviate poverty; supporting education through school construction, scholarships, and inclusive learning; and improving health outcomes with maternal health programs, HIV/AIDS awareness, and mental health support. They advocate for human rights, labor rights, and good governance, engaging in election monitoring and raising awareness about corruption and land rights. Additionally, NGOs promote environmental sustainability and climate resilience while advancing gender equality by combating violence and discrimination and empowering women in leadership. Within the project area, there are a number of NGOs being identified within the area in different sectors including environment, community development, such as Wildlife Conservation Society (WCS), and Adventist Development Relief Agency (ADRA).

4.4.1.3 Community-Based Organizations

Another social organization is Community-based organizations (CBOs). Cambodia, CBOs play a critical grassroots role, directly addressing local needs. Unlike NGOs, they are often less formalized and focus on mobilizing local resources for infrastructure, livelihood improvements, and strengthening community networks. CBOs contribute significantly to

disaster resilience, especially in flood-prone areas, and foster cultural preservation and social cohesion through community events and initiatives. Together, NGOs and CBOs empower communities, protect rights, and promote inclusive development, offering hope for a more equitable and sustainable future despite ongoing challenges. Types of CBOs include Community Fishery, Forestry Community, Agricultural Cooperatives, and social organizations such as saving groups, old age association, etc. All of these types are reported within the project target areas.

The identified agriculture-related community-based association is provided in Table below:

Table 25: Status of relevant CBOs within the project area

No.	Types of Associations	OTP
1	Agricultural Cooperatives	There are three (3) agricultural cooperatives in OTP focusing on vegetables, and rice.
2	Farmer Water User Community	There is a farmer water users' community. However, it is nonfunctional due to insufficient water supply for farmers.
3	Community Forestry	No community forestry in the command area.
4	Community Fishery	There is one community fishery in Ou Ta Paong sub-scheme, located in this sub-command area covering a total area of 60 hectares.

4.4.2 Demographic and Facilities

According to the commune database in 2023, the total number of households who are residing within and nearby Ou Ta Paong command area is 8,310 HH (out of which 1,397 HHs (17%) are female headed), giving the total population of 34,189 people (17,602 females). Moreover, the population are young with 62% of them are aging below 34 years old. More than half of the people (45%) completed education at primary school and below whereas those with secondary, high school, and higher education is only 22%, 16%, and 6%, respectively. It is noticeable that illiterate people have still existed at 10%.

Table 26: Administrative and population coverage of Ou Ta Paong sub-scheme

No.	Province/ District	Communes	Number of Villages	Total HH	Total Population	Female Population
1	Pursat/ Bakan	Beung Khnar	1	254	1040	516
		Ou Ta Paong	19	3,973	17,263	8,949
		Rumlech	1	263	960	503
		Svay Doun Keo	6	1,178	2,691	5,143
		Me Teok	8	2,176	4,385	8,686
		Khnar Torteung	3	286	1,097	558
	Total	**6**	**38**	**8,130**	**34,189**	**17,602**

(Source: Ministry of Planning, Commune Database, 2023)

Overall, it is apparent that the Ou Ta Paong sub-schemes contain young population indicating its high potential in future development activities. However, it is a concern as the population have very limited higher education.

Table 27: Demographic information of the HH living within and the vicinity of the command areas

Parameters	Percentage	Parameters	Percentage
Overall		**Educational Level**	
Total HH	8,130	Kindergarten	23%
Female HH Head	1,397 (17%)	Primary school	22%
Total Population	34,189	Secondary school	22%
Female	17,602	High School	16%
Age		College/University	6%
<18 years old	37%	TVET	2%
18 – 34 years old	25%	Illiterate	10%
35 – 60 years old	26%		
> 60 years old	12%		

(Source: Ministry of Planning, Commune Database, 2023)

Energy access of the population within the target area was found to be high, giving its proportion at 99.8% access to electricity and only a minority of them continue using battery (0.1%), and biogas (0.1%). However, the sources of water for domestic consumption were low with only 19% of them having access to water supply system while the rest continue using pump well, tube-well, opened-well, pond, rainwater and river, indicating the access to clean water continue to be a huge constraint within the project target areas. A good sign for the people is how they are using water for drinking purposes which was found to be almost all using safe water for drinking (tape water 30%, filtered water 61%, and boiled water 9%). There is a concern, however, regarding the reliability of the tape water quality which may create a significant impact on people's health, if they are not properly monitored. Interestingly, almost all the people within the target areas own a toilet showing their understanding of the importance of water, sanitation and hygiene.

Table 28: Access to energy and water and sanitation facilities

Parameters	Percentage	Parameters	Percentage
Source of Energy		**Drinking Water**	
Electricity	99.8%	Tape water	30%
Battery	0.1%	Filtration	61%
Solar	0%	Boiled	9%
Biogas	0.1%		
Water Source for HH consumption		**Toilet**	
Tape water	19%	Pour Toilet	99%
Pump well	13%	Flush toilet	1%
Wells	4%	Total toilet	100%
Opened Well	3%		
Pond	27%		
Rainwater	22%		
River	11%		

(Source: Ministry of Planning, Commune Database, 2023)

4.4.3 Socio–economic Conditions of the Beneficiaries

Agriculture is reported as the primary occupation for the population within the command areas, with full-time private sector employment accounting for the second largest proportion (10%).

As for secondary occupations, rice and crop production remains the most common, followed by full-time private sector work.

Table 29: Occupation of the HHs living within and the vicinity of the Ou Ta Paong

Parameters	Percentage	Parameters	Percentage
Main Occupation		**Secondary Occupation**	
Rice and crop production	37.82%	Rice and crop production	22.42%
Animal production	0.30%	Animal production	5.08%
Fishing/aquaculture	0.30%	Fishing/aquaculture	0.75%
Trade	4.48%	Trade	3.89%
Service	1.94%	Service	3.29%
Government staff	2.24%	Handicrafts	0.45%
Workers (full-time, private sector)	10.01%	Government staff	1.79%
Workers, (seasonal, private sector)	1.35%	Workers (full-time, private sector)	9.87%
Housewife	2.39%	Workers, (seasonal, private sector)	3.14%
Student	24.36%	Housewife	3.14%
Other	1.20%	Student	24.36%
No job	13.60%	Other	2.24%

(Source: ESCIA Field Survey, 2024)

A significant proportion of the population with poor 1 & 2 is reported at 9%, indicating the level of economic condition of the areas while the proportion of the people with disability (PWD) is at 1.1%. People are migrated to both inside and outside the country with the highest one is within the country (16%) while 13% migrated to abroad. This makes the total migration of 29%.

Table 30: Migration and vulnerability of the people within the sub-schemes

Parameters	Percentage	Parameters	Percentage
Vulnerability		**Migration**	
Poor 1	1%	Inside the country	16%
Poor 2	9%	Out of the country	13%
Total	**9%**	**Total**	**29%**
Disable person	1.1%		
Old people	0.2%		
Orphan	0.2%		
Total	**1.5%**		

(Source: ESCIA Field Survey, 2024, Ministry of Planning, Commune Database, 2023)

Wooden houses are the most dominated shelter of the people comprising of 57% of the total settlement. Semi-permanent is the second most popular (30%) while the rest belong to one floor or more brick walls, temporary houses and others. Interestingly, about 4% of them live in temporary houses. The assets that people own the most are Television (80%), followed by motorbike (59%), and bicycle (51%), and power tiller (25%) while the rest are in small proportion.

Table 31: Houses and Assets of the HHs within Ou Ta Paong

Parameters	Percentage	Parameters	Percentage
Assets		**Type of Houses**	
HH with Tractor	1.4%	One floor or more/brick wall	8.6%
Power Tiller	25.4%	Semi-permanent	30%
HH with Rice Harvester	0.8%	Wooden house, thatched	57%
Threshing Machine	0.0%	Temporary houses	3.6%
Harvest and Threshing Machine	0.2%	Other	0.7%
Mobile rice mill	0.0%		
Car	6.2%		
Other Machinery	0.3%		
Motorbike	59.2%		
Tricycle	0.2%		
Bike cycle	51.0%		
Boat	7.0%		
TV	80%		

(Source: ESCIA Field Survey, 2024, Ministry of Planning, Commune Database, 2023)

The data highlights family violence (0.71%) and drug use (0.36%) as the most pressing issues, followed by land disputes (0.28%). In contrast, sexual harassment, human trafficking, and crime report no cases, suggesting potential areas for further investigation into reporting mechanisms or community dynamics.

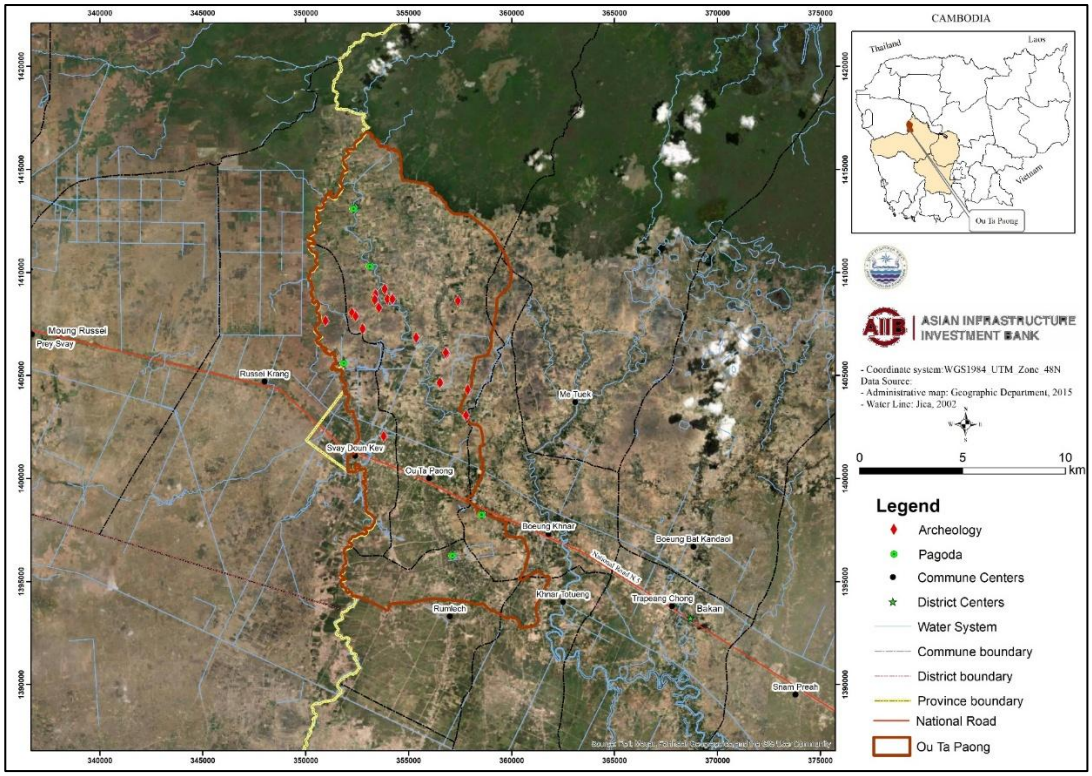


Table 32: Issues in the project communities

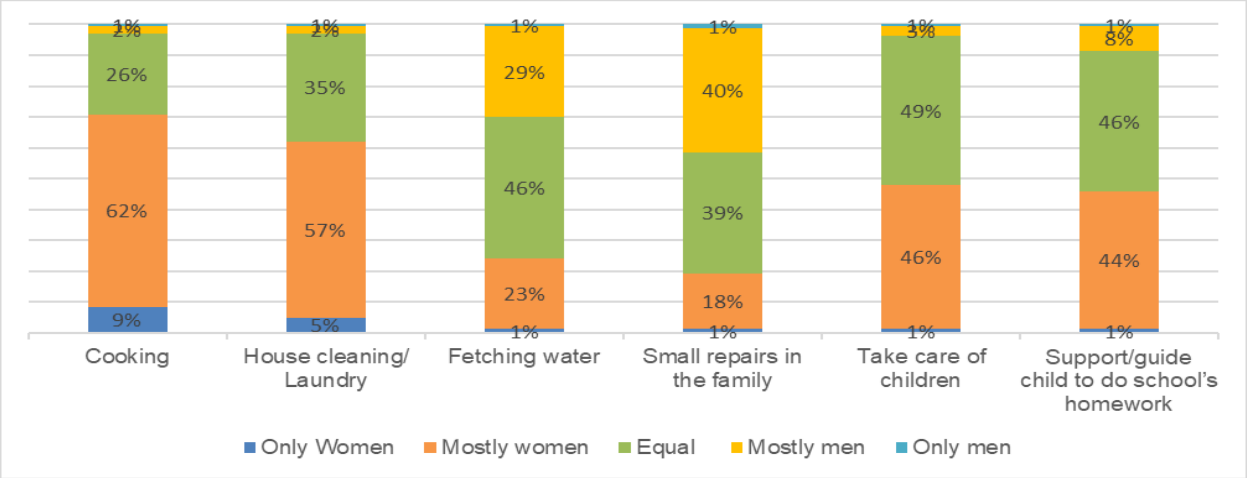
Parameters	Ou Ta Paong	Total
Sexual Harassment	0.00%	0.0%
Human Trafficking	0.00%	0.0%
Violence in the family	0.71%	0.71%
Drug using	0.36%	0.36%
Crime	0.00%	0.0%
Stolen Cases	0.02%	0.2%
Land Issues	0.28%	0.28%

4.4.4 Cultural Sites

A key aspect of the environmental and social safeguards assessment (SECAP) includes the consideration of sites of cultural importance and heritage. Cultural heritage is an important component of the cultural identity of local communities, groups and individuals. It is key to social cohesion and therefore cultural heritage sites, structures and values should be protected, where possible, from construction of project components which could cause disturbance or disruption. Sites of cultural and heritage importance within the Ou Ta Paong command areas shall be not affected during or after the irrigation system design and construction phases.

Figure 28: Maps of archaeological and cultural sites in and near Ou Ta Paong Sub-scheme

4.4.5 Gender



4.4.5.1 Labor Division

CAISAR Gender Assessment and Social Inclusion Plan reported that men spend on average of 59.4% of their time for farming whereas women spend only 40.5%. In traditional farming context, men involve the most during cultivation stage while women are more engaged in the later production. Heavy duty tasks such as land preparation are designated to men while seedling preparation and weeding are commonly assigned to women. Transplanting, uprooting, harvesting, and marketing are generally shared by both. However, the practices have been changed lately due to the presence of mechanization where land preparation, harvesting and threshing have been replaced by machinery.[13]

Coming to household chores; women handle 90% of the workload. During the COVID-19 outbreak, women spent even more time on domestic and caregiving tasks. Elderly family members bear the full responsibility for raising grandchildren when their mothers have migrated. In the project area, similarly, in families where women work in nearby garment factories or migrate for paid employment, domestic duties are often shifted to young girls and the elderly. [14]The ESCIA field survey showed that cooking, housing and cleaning, child caring and schooling are mainly at the hand of women, except repairing in the household and fetching water where men involve the most (Figure 29).

Figure 29: Division of Roles in Household Chores (n=140)

(Source: ESCIA Field Survey, 2024)

In crop production, the majority of tasks, particularly during the production phase, were found to be dominated by men. However, men and women were more equally involved in attending trainings and deciding the selling price of their produce. Interesting, women only are less participation in the cultivation at all stage. This reduced participation of women in agricultural production may be attributed to their employment in factories (Figure 30).

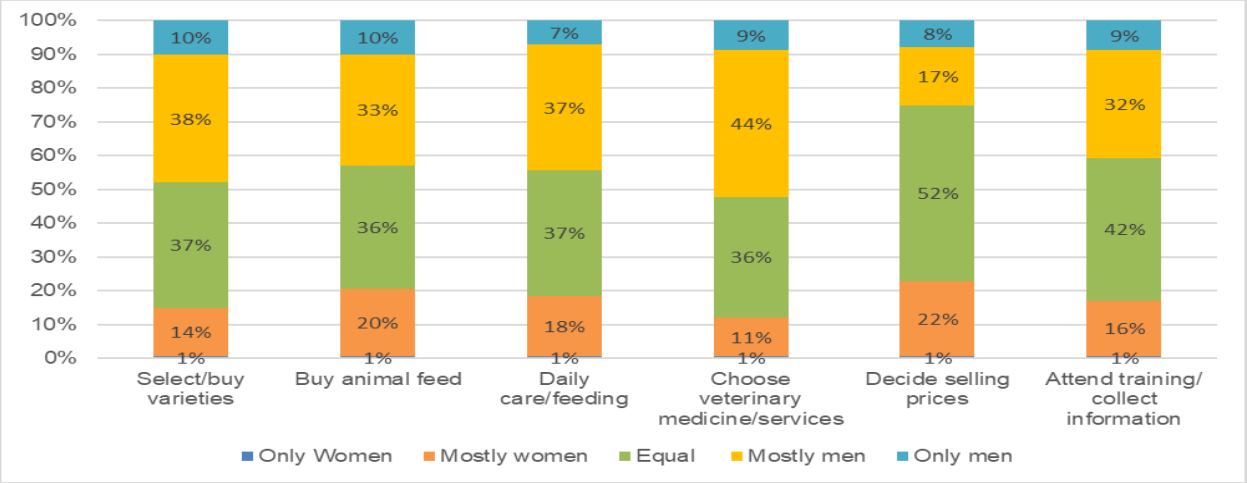

Figure 30: Share of Roles in Crop Cultivation (n=140)

(Source: ESCIA Field Survey, 2024)

In animal production, labor distribution is relatively balanced between mostly men and equally shared. However, tasks such as selecting animal breeds and choosing treatments for curing are predominantly handled by men, while the rest of the production tasks are done collaboratively. Women were found to have a slight dominance in animal raising, likely due to the same reason mentioned earlier_their greater involvement in factory employment (Figure 31).

Figure 31: Share of roles in Animal Husbandry (n=140)

(Source: ESCIA Field Survey, 2024)

4.4.5.2 Income

The CAISAR Gender Assessment and Social Inclusion Plan revealed notable findings regarding income differences by gender. On an individual level, the average monthly income for female household members is $121.4 (n=238), which is lower than the $166.6 earned by male members (n=366), showing a statistically significant income gap of $45.2. However, at the household level, there is no significant difference in average income between female-headed and male-headed households, with a small mean difference of $17.3. Nationally, 48% of married men (aged 15–49) reported making joint decisions with their wives on income use, 46% said their wives mainly make these decisions, and 6% said they decide alone. Additionally, 97% of married women (aged 15–49) who earn cash from employment participate in decisions about their earnings, with 63% making these decisions mainly on their own.[15]

4.4.5.3 Decision Making

Regarding decision-making, the matters related to children, such as education, childcare, and marriage, are typically decided by both husband and wife. However, a significant number of households have women as the sole decision-makers on child-related issues. When it comes to daily livelihoods, decisions such as household expenses, sales of home-produced goods, and visiting friends or family are usually made jointly. Still, a notable portion of respondents indicated that women alone make decisions regarding their own livelihoods, family expenses, attending trainings, and similar matters. While women tend to take the lead on child and livelihood issues, decisions concerning agricultural activities, like cultivation and animal husbandry, are mostly handled by men. This is largely due to the physically demanding and sometimes hazardous nature of agricultural work, such as pesticide application.[16]

4.4.6 Agricultural Production

4.4.6.1 Rice Production

A significant portion of the Ou Ta Paong is flooded by waters from the Tonle Sap Lake for about three months each year, requiring farmers to adapt their agricultural activities to this

[15] CAISARP (2024). Gender Assessment and Gender Action & Social Inclusion Plan. CAISAR Project. MoWRAM.
[16] CAISARP (2024). Gender Assessment and Gender Action & Social Inclusion Plan. CAISAR Project. MoWRAM.

seasonal flooding. In areas prone to shallow flooding, farmers often plant long-duration varieties that can withstand flooding better, relying on deep-rooted crops to survive potential droughts. In areas experiencing more severe flooding, farmers may still attempt to two crops, but with higher risk. An early, short-duration, rain-fed crop is planted before the flood, with fields benefiting from minimal flood protection, such as low dikes or natural riverbanks, to delay floodwater and allow harvest. When rainfall is abundant, all areas are used for paddy cultivation. After the flood recedes, typically in October or November, a second, short-duration crop (non-photo-sensitive) is planted. This "flood recession rice" grows into the dry season, but without irrigation, it is vulnerable to drought. Flood recession rice cultivation is common in the tail-end areas of the Ou Ta Paong scheme.

Monoculture rice cultivation dominates almost all fields with an average production area of about 2.15 hectares per household. Typically, farmers grow one short-duration rice variety before the floods arrive and another after the waters recede, using grain from the previous harvest as seed while some households also reported buying seed from other farmers. Currently, about 40% of the area relies entirely on rain, while 60% benefits from irrigation, with water sourced from adjacent canals or ponds. Varieties planted are either early maturing approximately 90 days or medium maturing (110–150 days), with land preparation starting in early May once the soil softens with the rain.

Farmers in Ou Ta Paong typically plow in May, seed between May and June, and harvest in September. The FGD confirmed that wet season rice yield per hectare is between 4 and 5.5 tons per hectare a slightly higher than dry season which yield between 4 and 5 tons per hectare. However, some parts of the command area reported the yield of dry season around 4 tons per hectare whereas wet season yielded around 3.5 tons per hectare.

About 5% of farmers plant long-duration varieties (150–160 days), favoring traditional fragrant and aromatic rice types that are photo-period sensitive, yielding around 2.5 to 3 tons per hectare. These traditional varieties are more drought-tolerant, with deeper root systems that tap into residual moisture and nutrients. Photo-period sensitive varieties, such as Somaly, Phka Romdoul, and Pkha Malis for medium maturing rice, and Sen Kro Ob, OM50-54, OM 5451, and Sra Ngae for early maturing rice, must be planted in late May or June to match the short-day flowering period.

In areas with irrigation access and no annual flooding, farmers can produce two wet-season crops. An early WS crop is planted just before or at the start of the rainy season, followed by a late WS crop that remains in the field for a few weeks after the rain stops. For this, short-growth varieties like OM 5451 are popular. OM 5451, a high-yielding fragrant rice variety with strong pest and disease resistance, is also cultivated in the dry season (DS), particularly in areas near streams or ponds. Some farmers also grow dry-season paddy crops, usually short-maturing varieties like Sen Kro Ob and OM 5451. As farmers apply direct seeding, the volume of seeds being used is relatively high, giving the amount between 200 to 300 kg per hectare. The sources of seeds that farmers practice is both from keeping from the previous harvesting and buying from external sources.

The focus group discussion with rice farmers reported that the rate of fertilizer application for wet season rice is slightly below the dry season rice giving the rate of fertilizer application is between 100 and 150 kg/ha whereas the pesticide application is provided around 3 to 4 times based on pest and disease condition. The application of fertilizer and pesticides during dry

season is slightly higher as the rate of fertilizer is between 180 and 250 kg/ha while the application of pesticide is around 3 to 5 times. According to the AF screening report of CAISAR, the common fertilizers include urea and di-ammonium phosphate (DAP, 16-48-0), applied at rates of 100 kg/ha and 50 kg/ha, respectively. Although muriate of potash (KCl) is unavailable locally, farmers understand the need for occasional potassium supplementation. In non-irrigated areas, only one crop is grown, with medium-growth rice varieties (120–150 days), which are photo-sensitive and typically harvested in early November. These varieties have a better local market value and are less prone to drought damage, as they flower in mid-October when rainwater is still abundant.

The main challenges that farmers reported are lack of water during dry season where the irrigation water cannot meet the demand of rice production. In addition, the riverbed became very shallow and could not facilitate water flow at some sections of the river. Water conflicts were also reported as the demand rose. In addition, high input costs including fertilizers, seeds and pesticides were also reported while labor shortage has also been an issue for them. Generally, farmers use the labor within their household but there are still households that hired people to help in seeding, pesticide spraying while soil preparation, harvesting and threshing, and transporting rice to home depending on the services of machinery. The total expenditure of rice production was reported to be approximately 615$ per hectare. The remaining straw is left in the field while some farmers take animal feed. Some farmers continue to burn the straw as it helps reduce the strength that is required during the ploughing. Farmers reported receiving limited agricultural extension and technical services.

In addition to paddy rice, around 5% of farmers diversify into non-rice crops such as watermelon and sweet corn during the dry season, with plans to expand non-rice crop production once irrigation systems improve. Ou Ta Paong farmers have the potential to grow exportable crops such as soybeans, mung beans, maize, and sesame, planted sequentially with early maturing rice in May, provided that reliable irrigation becomes in place.

Table 33: Rice production during wet and dry season

Parameters	Number	Parameters	Number
Wet season		**Dry season**	
Land size (m^2)	29,529	Land size (m^2)	32,945
Yield (kg/year)	11,517	Yield (kg/year)	14,304
Income (USD/year)	3,233	Income (USD/year)	3,467

(Source: ESCIA Field Survey, 2024)

4.4.6.2 Vegetable Production

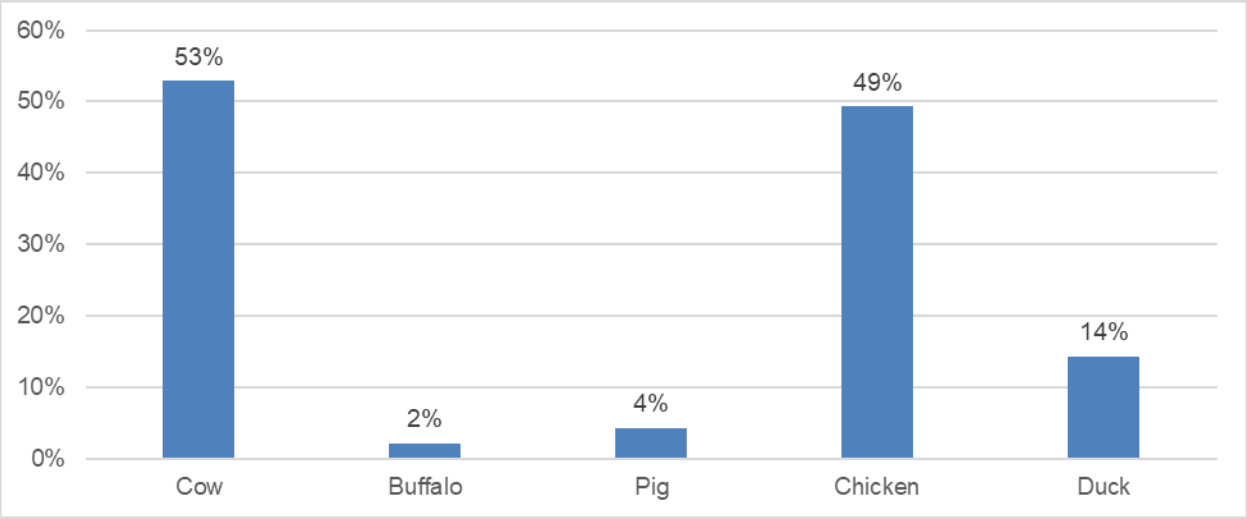
In the area, very few households are involved in vegetable production for the market, with small-scale horticulture activities taking place around homesteads during the dry season. These activities are supported by water from wells and ponds and are observed in two 'Agriculture Communities' (AC): Psar Andeth AC and Chamkar Khluy AC, as well as in the neighboring Rumlech Commune, where farmers grow crops like watermelon on dry paddies.

The most popular vegetables grown in the area include pumpkin, cucumber, eggplant, wax gourd, long bean, luffa gourd, morning glory, mustard, and green onion. The average land size for vegetable cultivation ranges from 450 to 600 square meters. Farmers use both organic and chemical cultivation practices, applying compost and chemical fertilizers. Seeds are typically

purchased from the market, and water sources for irrigation include canals, ponds, rainwater, and rivers.

Farmers spend between 250$ and 450$ on vegetable production, covering expenses for seeds, pesticides, water, fertilizers, labor, and land preparation. The income from vegetable sales is approximately 500 USD per year, which constitutes about 10% to 30% of their total income. The main markets for these vegetables are local markets and brokers. Key challenges faced include a lack of water during the dry season, extreme heat, insect pests, low prices, poor soil fertility, diseases, and climate change. Farmers have received agricultural services related to seed variety selection, nursery management, crop irrigation, and the use of fertilizers and pesticides.

Table 34: Rice production during wet and dry season



Parameters	Number	Parameters	Number
Wet season		**Dry season**	
Land size (m^2)	948	Land size (m^2)	1,617
Yield (kg/year)	473	Yield (kg/year)	497
Income (USD/year)	247	Income (USD/year)	174

(Source: ESCIA Field Survey, 2024)

4.4.6.3 Animal Production

In Ou Ta Paong, animal production is common among local households, with over half raising cows (53%), followed by chickens (49%) and ducks (14%). Buffaloes and pigs are raised in smaller numbers. This distribution reflects the diversity of livestock practices in the area, with a particular focus on cattle and poultry (Figure 32).

Figure 32: Type of animal in Ou Ta Paong command area

(Source: ESCIA Field Survey, 2024)

Please see Annex 6 – Biodiversity Assessment and Management Plan for details.

5. ASSESSMENT OF ENVIRONMENTAL & SOCIAL RISKS, IMPACTS, AND MITIGATION

In this section, the E&S risks and impacts (that potentially arise during activity implementation and operationalization) are identified, analysed, and evaluated at project level — with regards to the nature, scope, scale, and the potential extent of activity impacts — through classification of such risks and impacts as direct, indirect, and cumulative. The assessment of E&S risks and impacts in this chapter is based on the following grounds that is fundamental to proposing measures to avoid, minimize, and mitigate for the impacts in the next chapter:

Project's original technical reports

- Feasibility Studies (August 2023)
- Feasibility Studies (updated by November 2023).
- Additional Pre–Feasibility for Ou Ta Pong Sub–scheme.
- Environmental and Social Management Framework – ESMF (Updated by September 2024)
- IBAT reports for Ou Ta Pong.

Stakeholder Consultations (national, provincial, district, commune, and village levels)

- Community Meetings
- Focus Group Discussions
- Key Information Interview.

Field observation, using

- Transect walks.
- Drones (for E&S screening and biodiversity assessment)

External technical reports

- Statistical reports/database.
- Publications and Technical Reports from national and internation institutions.

5.1 Environmental Risks, Impacts, and proposed Mitigation Measures at the Preparation and Construction Stage

Prior to the implementation of the construction, National EIA is required to be conducted to ensure the compliance with the national legal framework.

5.1.1 UNEXPLODED ORDNANCES (UXO)

Construction and rehabilitation activities, particularly those involving earthworks, soil excavation, and river dredging, pose a significant risk of unexploded ordnance (UXO). Despite past demining efforts and clearance of the UXO existence in some sub-scheme as per the report in the Baseline, mortar shells, aerial bombs, and other UXO may still be present within the subproject area. This risk is particularly high in areas where deep excavation is required for structural upgrades or dredging.

The potential detonation of UXO poses a substantial threat to residents, construction workers, animals, and any other entities located near the construction sites. The risk of encountering

UXO is considered moderate due to the country's long history of civil war and the limitations of past demining operations, which are often focused on surface-level clearance. While consultations with local authorities and communities on the incidents and presence of UXO were reported in Ou Ta Paong, the case should be put on alert.

❖ **Mitigation Measures**

- Carry out UXO screening/assessment by certified UXO experts before any physical/ construction activities are allowed.
- In case UXOs are found by certified experts during on-site screening, removal of UXO will be carried out by certified experts.
- A UXO clearance certificate shall be obtained from related authority for each sub-project prior to commencing any subproject activities.

5.1.2 ENVIRONMENTAL, HEALTH, AND SAFETY

5.1.2.1 Noise and Vibration

During construction phase, noise and vibration will be generated where machineries such as excavator, bulldozer, cement concrete mixing, and trucks are operated. While noise will be a nuisance to construction workers and nearby residents, these impacts are anticipated to local and intermittent during mostly during daytime. During nighttime, noise may be occasionally generated from workers' camps due to living activities and occasional maintenance of machinery and equipment. These impacts are expected to have no or minimal impact on local residents as workers' camps will be located near construction site and far away from residential area. The construction of small-scale hydraulic structures is mostly located in the cultivation area and as such far away from residential areas (except for construction work along the main canals, which have many residential areas). Given the nature and scope of physical works under the OTP scheme, impact of noise on local residents is expected to be none to minor, and temporary.

❖ **Mitigation Measures**

- Before commencing the irrigation system restoration, the Ministry is requested to organize public forums in collaboration with the commune to gather feedback from the local population, especially from residents who may be affected by the project. Moreover, training sessions for the commune help them understand the project's processes, including the size of the infrastructure systems and the standards for excavation and construction. This will ensure that the commune is well-informed about the project
- Right before the construction, conduct noise testing at the sensitive locations as per the detail engineering design comparing to the national and IFC EHS Guideline
- Locate the workers' camp far away from the residential area as much as possible
- Avoid night-time construction in populated/village areas.
- Minimize project transportation through community areas where possible.
- Ensure proper maintenance and proper operation of construction machinery to minimize noise generation.

- No construction-related activities will be carried out from 21:00 hours to 06:00 hours along residential areas, hospitals, schools and during religious or cultural events near the subproject
- All construction equipment and vehicles must be well maintained, regularly inspected for noise emissions
- Impose speed limits on construction vehicles to minimize noise emission along areas where sensitive receptors are located (houses, schools, temples, hospitals, etc.
- Restrict use of vibrating rollers and operation of heavy equipment near sensitive structures.

5.1.2.2 Air pollution

During construction phase, a number of project activities may cause air pollution. These include physical activities such as movement of trucks (for transportation of materials), clearing & grubbing, grading, excavation, leveling, truck hauling, stockpiling, disposal of solid waste, dredging which may generate dust and particulate matter (PM10 and PM2.5) (if water spraying does not apply). Exhaust emissions from trucks and heavy machinery will release nitrogen oxides (NOx), carbon monoxide (CO), sulfur dioxide (SO2), and volatile organic compounds (VOCs) which may contribute to smog formation and greenhouse effect. Burning of waste (by contractors) may release harmful pollutants into the air. While air pollution due to dust, particulate matter, and exhaust emissions from trucks and engines, are anticipated, location where pollution is generated vary and impact for one (1) location is temporary, intermittent, and minor, and are particularly for residents who live along the project's roads.

❖ **Mitigation Measures**

- Avoid burning solid waste or construction waste
- Spray or sprinkle water on the work surfaces and other piled materials to minimize dust at least 3-6 times per day in windy and dry weather and/or based on the weather condition
- Conduct proper maintenance of machineries and equipment
- Place sitting concrete mixing plants, crushing plants, quarries and other facilities far from settlement and other sensitive receptors
- Use cover for vehicles that transport all construction materials such as cements and excavated soils
- Test air quality (NO2, SO2, CO, TSP, PM10, PM2.5) prior and during the construction to assess the level of impact

5.1.2.3 Impact on Water

Water pollution is anticipated, primarily due to physical activities that involves dredging and excavation near or in water course/ source. Such activities do not only cause turbulence for water but also cause increased sedimentation. Disturbed soil – caused by excavation to improve irrigation canal, for instance, may contaminate water at places where water is collected for domestic purpose (e.g. along Ou Ta Paong river which serves as the main canal). The impact is anticipated particularly for planned dredging operation at the upper part of Ou Ta Paong canal. However, water pollution would be minimized through construction methods

and time. For example, dredging operation of Ou Ta Paong river could be concentrated during dry season when water on Ou Ta Paong and other canals are minimal, and some Ou Ta Paong river sections are completely dry.

Wastewater (released from workers' camps) and leaks of hazardous materials (e.g., oil, diesel, chemical) could make their way into nearby water bodies and during rainy season which cause water contamination and leave varying level impacts on the receptors. The main receptors vulnerable to water pollution during construction include nearby residents and construction workers. Due to the scope and scale of physical works anticipated for OTP scheme, project impact due to water pollution is anticipated to be minor and localized.

Surface Water: During the construction phase, sedimentation due to excavation, dredging, and earthworks is a primary cause of water quality degradation. Loose soil can be washed into nearby water bodies, increasing turbidity, reducing light penetration, and altering the aquatic habitat. Additionally, the use of machinery and equipment introduces risks of oil spills, fuel leaks, and chemical contamination, which can enter water sources through surface runoff, affecting aquatic life and water usability downstream.

Groundwater: Construction activities, such as drilling and excavation, can disrupt the soil and rock layers, potentially allowing contaminants from surface activities, such as chemicals, to infiltrate groundwater. Chemical spills or leaching from construction materials can further degrade groundwater quality. Additionally, the disruption of natural flow patterns in the subsurface may allow pollutants to spread more easily, threatening water quality over a wide area.

❖ **Mitigation Measures:**

- Implement a waste management plan to ensure the proper disposal of all construction waste, including wastewater
- Use environmentally friendly construction materials and techniques to reduce the amount of pollutants that are released into the environment
- Install erosion and sediment control measures, such as silt fences, sediment basins, and check dams
- Properly manage construction chemicals, fuels, and waste to prevent water pollution.
- Regularly inspect and maintain construction equipment to prevent leaks and spills.
- Wash construction vehicles and machinery only in designated areas where runoff will not pollute natural surface water bodies.
- Train construction workers on the importance of preventing water pollution.
- Construct of retaining structures.
- Test surface water quality (Depth, pH, EC, AS, Cd, Pb, TN, TP, TDS, TSS, DO, and Total Coliform)

5.1.2.4 Solid and Hazardous Waste

During project implementation, solid wastes – both non–hazardous and hazardous, are anticipated to be generated, primarily due to rehabilitation of irrigation canals and rural roads. In particular, solid waste could be generated from operations that involved site clearing, excavation, trenching, demolition of existing cement and earthworks structures, construction

and disassembly of worker camps, maintenance of machineries, and so forth. Regarding dredged and excavated material, the construction activities can lead to surface erosion and sedimentation, particularly in water bodies. However, the estimates for the amount of dredged or excavated material per scheme do not estimate amounts for reuse or disposal. Improper handling of solid waste generated from the above operation may result environmental pollution that may include soil and water contamination, habitat disruption, visual pollution and give rise to concerns of public health.

❖ **Mitigation Measures**

- All vehicles/drivers will be provided with plastic bags for waste collection and prevent any unauthorized waste disposal with particular attention paid to prevention of littering.
- The Contractor will be required to train the workers in proper waste management.
- Recyclables will be separated at source and given/sold to recycler (plastic, metal, card, paper as a minimum).
- Non-hazardous, non-recyclable solid waste will be temporarily deposited and managed together at existing landfill/dumpsite.
- Safe temporary storage of hazardous waste as required.
- Storage facilities for fuels, oil, cement, and chemicals shall be within secured areas on impermeable surfaces, provided with bunds and cleanup installations.
- Vehicles, machinery, and equipment maintenance and re-fueling will be carried out in such a way that spilled materials do not seep into the soil.
- Oil traps will be provided for service areas and parking areas.
- Fuel storage and refilling areas will be located at least 50m from canals and channels and will be protected by temporary drainage bunds to contain spills.
- Use or reuse the dredge material on properties with a residential or recreational use (dredging material, if planned for reuse, will be subject to testing to ensure the material is safe for reuse).

5.1.2.5 Wastewater

During construction phase in OTP, generation of wastewater is expected, mainly from a) workers' camp (e.g. domestic wastewater), b) cleaning and washing of machinery, c) treatment of leakage and spill, etc. Depending how wastewater is managed, receptors of wastewater may include immediate receiving environment which may include soil, water bodies which may subsequently affect human including construction workers, residents nearby, and fauna and flora along the way wastewater goes.

❖ **Mitigation Measures**

- Reduce, recycle, and reuse waste [e.g. plastic waste, electronic waste, agricultural waste (natural, animal faces for later use as manure, plant waste)] wherever and whenever possible.
- Latrines must be built at construction sites and camp sites for appropriate domestic waste management.
- Hazardous waste, including any spills of chemicals or fuels, should be collected separately and disposed of following environmental regulations.

- Ensure construction sites have enough well-maintained sanitation facilities to prevent the direct discharge of untreated wastewater.
- Promote clean living practices, reduce plastic usage, and improve waste management.
- The company provides education and guidance on maintaining cleanliness and hygiene for the workers (such as proper waste disposal and handling of oil) and prohibits activities like fish poaching and hunting.

5.1.3 OCCUPATIONAL HEALTH AND SAFETY

5.1.3.1 Physical Hazards

The construction or rehabilitation of irrigation canals and farm roads during the construction phase of the project presents significant physical hazards to workers and those in close proximity to the construction site. These hazards can result in a range of consequences, from minor injuries requiring medical attention to severe and potentially fatal accidents. The sources highlight several specific types of physical hazards, including Falls from Heights, Drowning and Water-Related Injuries, Falling Objects, Falls into Open Holes, and Injuries from Heavy Equipment.

The impact receptors for physical hazards are primarily construction workers, but also include inspectors, visitors, and nearby residents and children, as well as domestic animals. The sources assess the risk of physical hazards as high, acknowledging that working in the construction field can result in injuries or fatalities if safety standards are not met. The sources emphasize that unsafe practices by construction companies can lead to accidents, injuries, illnesses, and fatalities. While the overall risk might be lower due to the anticipated number of workers involved, stakeholders at the community, district, and provincial levels have expressed concerns about the potential hazards posed to both workers and community members.

❖ **Mitigation Measures**

- Prepare a health and safety plan containing site-specific precautions in accordance with relevant occupational health and safety guidelines.
- Inspect and check the relevant construction equipment to ensure that it meets the applicable mechanical and safety requirements.
- Inspect the worksite to ensure that the equipment can be safely mobilized and operated, and that there are no unmitigated risks.
- Install appropriate fencing and control access to the site.
- Install appropriate safety signage and markings.
- Provide fall protection when workers are exposed to unguarded platforms or walkways higher than 2 m.
- Ensure there are safe ways to enter and exit the excavation.
- Provide safety precautions when using high voltage electric power tools.
- Carry out daily toolbox meetings (safety briefings).

- Maintain an accident record book where all major or minor accidents and incidents are recorded with actions taken.
- Educate the workers on construction hazards.
- Train drivers in safe driving skills and traffic regulations.
- Appoint an Environment, Health and Safety Officer who is a qualified engineer.
- Make adequate first aid equipment available on site.
- Carry out training and awareness of the workers on HIV-AIDS prevention.
- implement emergency preparedness and response procedures Response Plan as planned in the CEMP.
- Ensure that all workers are equipped with and use Personal Protective Equipment (PPE).
- The Contractor will set out an Emergency Response Plan

5.1.3.2 Heat Stress

The construction phase in OTP, presents potential risks of heat stress to workers. This is particularly concerning given Cambodia's tropical climate, characterized by high temperatures and humidity. Construction activities are often physically demanding and performed outdoors, increasing the risk of heat-related illnesses.

Construction workers exposed to prolonged high temperatures and humidity may experience heat stress, potentially leading to heat exhaustion or heat stroke. This can result in reduced productivity, increased accidents, and even fatalities. Heat stress can also exacerbate existing health conditions. The project's Environmental and Social Management Framework (ESCMF) highlights the importance of considering temperature extremes during the construction phase, emphasizing the need for mitigation measures to ensure worker health and productivity.

❖ **Mitigation Measures**

- Providing regular breaks and shaded rest areas for workers to cool down and rehydrate.
- Ensuring access to cool drinking water throughout the workday.
- Adjusting work schedules to avoid the hottest hours of the day, if feasible.
- Providing training to workers and supervisors on recognizing the signs and symptoms of heat stress and appropriate first aid measures.
- Encouraging the use of personal protective equipment, such as light-colored, loose-fitting clothing and wide-brimmed hats, to minimize heat absorption.
- Monitoring weather conditions and adjusting work practices accordingly.
- Developing and implementing an emergency response plan for heat-related illnesses.
- Providing adequate ventilation and cooling systems in worker accommodations.
- Encouraging workers to maintain good physical fitness and hydration levels.
- Regularly monitoring workers for signs of heat stress and taking appropriate action.

5.1.4 COMMUNITY HEALTH AND SAFETY

The construction activities on rehabilitating existing irrigation canals in OTP may disrupt local transportation networks and increase traffic volume, including heavy trucks and machinery, impacting communities and businesses along transportation routes. Construction sites pose health and safety risks to workers and nearby communities. Accidents and exposure to construction-related hazards can have serious consequences. The influx of construction workers from different regions may increase the risk of spreading communicable diseases such as HIV/AIDS to the local community.

Open canals and ponds during rehabilitation work pose a risk of drowning, particularly to children and individuals unfamiliar with the area. Construction activities may increase the depth or alter the flow of water, further increasing the risk. Construction sites can attract curious individuals, particularly children, who may be unaware of the potential hazards. This includes the risk of falls, being struck by moving machinery or vehicles, and contact with hazardous materials. It is important to secure construction areas, implement safety awareness campaigns, and enforce hygiene and sanitation standards at construction camps.

❖ **Mitigation Measures**

- Prior to start of construction work, the contractor in cooperation with the PIU will consult with the local authorities and potentially affected residents/private landowner. Inform them about the upcoming construction work, safety precautions and how to raise concerns or file complaints (GRM).
- The contractor shall fence off the construction area and control access to the site.
- A speed limit of 30 km/h for construction related traffic through inhabited areas.
- The contractor shall install traffic signage and fluorescent bollards and warning lights to direct traffic and prevent vehicles driving into the lanes with construction activities.
- The contractor in cooperation with the local authorities shall implement traffic management to ensure a smooth traffic and prevent congestion.

5.1.5 BIODIVERSITY

5.1.5.1 Habitat Loss and Fragmentation

During the construction phase of the irrigation infrastructure project, habitat loss and fragmentation pose some risk to biodiversity. The primary activity contributing to this risk is the rehabilitation of irrigation canals and farm roads. This process often necessitates the clearance of bushes and vegetation along the areas designated for rehabilitation, leading to the direct removal of farm-level habitats. Additionally, activities like river dredging and rehabilitation, as well as the construction and upgrading of Main Canals along the Ou Ta Paong River, can further contribute to habitat loss and fragmentation.

In the Ou Ta Paong (OTP), the receptors include avian species such as the Greater Adjutant, Milky Stork, and Bengal Florican. Construction activities such as canal rehabilitation and farm road development, as well as land use changes and altered water management practices, may lead to habitat loss and fragmentation. These activities involve digging, dredging, or changing existing waterways and infrastructure. This can destroy habitats, make it harder for animals to find places to nest and eat, and mess up the natural flow of water, which can have an effect on life on land and in water.

❖ **Mitigation Measures**

- Establishing and maintaining guard posts on access roads near residential and biodiversity priority areas.
- Implementing measures such as habitat restoration, creating wildlife corridors, and ensuring that water management practices are sustainable and supportive of biodiversity.
- Creation of fish passageways, wetland restoration, and reforestation of riparian areas to facilitate fish migration and provide suitable habitats for endangered species.
- Installing signage to restrict access and prohibit harmful activities.
- Reporting illegal activities to the appropriate authorities.
- Implementing and enforcing policies against poaching and illegal collection of wildlife by workers and subcontractors, with appropriate penalties.
- Implement erosion control measures to prevent sedimentation in water bodies and downstream impacts.
- Rescuing and properly handling wildlife encountered during land clearing and construction, following SOPs.
- Implement habitat management measures to improve the quality and suitability of habitats for species.
- Consider restoration of the Boeng Kanseng, Boeung Pak Dong, and Boeung Chhouk for Ou Ta Paong to enhance ecological condition of the areas as well as increasing water storage of the area
- Please see Annex 6 – Biodiversity Assessment and Management Plan for details.

5.1.5.2 Hunting, trading, and consumption of wildlife

During the construction phase of the irrigation infrastructure project, the influx of a new labor force presents a significant risk to hunting, trading, and consumption of wildlife. The arrival of workers from other regions can increase the demand for exotic local foods, including wildlife and endangered species, which are often perceived as interesting delicacies or possessing health-promoting properties. The hunting may be done for relaxation or belief that wildlife is tasty or making people healthy. This heightened demand can drive illegal hunting and trading activities, posing a severe threat to biodiversity and the stability of local ecosystems.

The impact receptors of this risk are primarily aquatic and terrestrial species, particularly those already threatened or endangered. The potential impact on rare and endangered species, as their rarity often increases their market value, further incentivizing unsustainable hunting and trading practices that can lead to their extinction. The lower section of the Ou Ta Paong sub-scheme and adjacent Tonle Sap Zone 3 support diverse endangered and critically endangered species, including:

- Reptiles: Black Marsh Turtle, Elongated Tortoise, Giant Asian Pond Turtle, Southeast Asian Box Turtle
- Mammals: Indochinese Silvered Langur, Long-tailed Macaque
- Fish: Siamese Tiger Perch, Striped Catfish
- Birds: Greater Adjutant, Milky Stork, Bengal Florican

❖ **Mitigation Measures**

- Develop and enforce a strict Code of Conduct/ethics against wildlife collection, possession, and trafficking. This includes clear policies and sanctions for employees and subcontractors.
- Conduct thorough biodiversity inspections along access roads and at quarry sites before starting land clearing works to identify habitats or nesting sites of endangered/protected species.
- Provide mandatory training for contractors' management staff and site workers on the Code of Conduct, Standard Operating Procedures (SOP) for wildlife protection and handling, and human-wildlife conflict management.
- Incorporate a policy in the Project Administration Manual (PAM) and Worker's Agreement that prohibits employees and/or subcontractors from possessing, purchasing, trading, or collecting wildlife or forest resources that are legally protected, CITES listed, or classed as threatened by the IUCN Red List.
- Undertake regular monitoring of all access roads to prevent poaching activities.
- Properly handle and rescue wildlife encountered during land clearing and construction, following the SOP for wildlife protection and handling.
- Establish a rapid response unit to address human-wildlife conflict effectively.
- Educate the community on local wildlife behavior, avoidance techniques, and deterrent methods.
- Report observed/recorded incidents of illegal activities to relevant authorities.
- Educate construction workers about the importance of wildlife conservation and the laws regarding hunting and trading of protected species.
- Implement strict penalties for violating wildlife protection laws.
- Collaborate with local communities to monitor wildlife populations and report any suspicious activities.

5.1.5.3 Loss of fauna and flora

Construction activities (rehabilitation of canals and farm roads), land use changes, and water management practices can lead to habitat loss and fragmentation, affecting species' survival and connectivity. This may involve dredging, excavation, or modification of existing water channels. Increased human activities during project construction can disrupt wildlife behavior (nesting/foraging) and increase poaching or predation risks if not properly managed. There is a potential for wildlife collisions with construction and quarry vehicles due to increased vehicle movements, especially in quarry areas and access roads.

The impact receptors for the loss of fauna and flora are avian species, such as the Greater Adjutant, Milky Stork, and Bengal Florican, rely on seasonal wetlands, lakes, waterholes, grasslands, and rice fields for foraging. Critically endangered Siamese Tiger Perch and Black Mash Turtle inhabit Boeung Kamsaeng Lake and Svay Daunkav River, respectively. Four critically endangered reptile species (Black Mash Turtle, Southeast Asian Box Turtle, Giant Asian Pond Turtle, and Elongated Tortoise) reside in the flooded forest habitat and natural lakes. Two critically endangered mammal species, the Indochinese Silvered Langur and Long-tailed Macaque, are also found in the area.

❖ **Mitigation Measures**

- Develop a code of conduct against wildlife collection, possession, and trafficking.
- Provide biodiversity awareness training to site workers to raise awareness of the ecological sensitivity of the site.
- Minimize forest encroachment, wildlife poaching, and tree cutting by developing and implementing a community-based management plan.
- Establish and maintain guard posts on temporary access and inspection roads near residential areas and priority biodiversity areas.
- Install and maintain signs banning unauthorized access and prohibiting hunting near priority biodiversity areas and working zones.
- Regularly monitor all access roads to secure them from poaching activities.
- Implement speed limits (less than 40km/hour) to reduce the likelihood of collisions.
- Develop a system in which drivers report locations of wildlife crossing and wildlife sightings.
- Install and maintain signs in areas of frequent wildlife crossings, saying "beware of animal crossing".
- Properly handle and rescue wildlife encountered during land clearing and construction by relocating them to safer habitats, following the SOP for wildlife protection and handling.
- Conduct thorough biodiversity inspections along the access roads and at quarry sites before commencing construction.
- Provide features such as tunnels or rope bridges along temporary roads to enable wildlife movement and to reduce potential traffic incidents.
- Prior to wildlife shepherding activities, undertake briefing with all involved personnel so they are aware of their roles and responsibilities.
- Clearly demarcate areas that will not be cleared.
- Mark any trees with endangered or protected wildlife.
- Apply Find Chance Procedure

5.1.6 CLIMATE CHANGE

5.1.6.1 GHG emission

The main activities that contribute to this risk is the use of heavy machinery and trucks for excavation, transportation, and rehabilitation of irrigation canals and farm roads. The operation of these machineries releases carbon dioxide (CO_2), methane (CH_4) and nitrous oxide (N_2O) into the atmosphere. Waste burning at worker campsites may also contribute to GHG emission.

❖ **Mitigation Measures**

- Construction vehicles and machinery will be maintained to a high standard to minimize emissions and ensure compliance with the National exhaust emission standards. All mobile equipment should be fitted with catalytic converters.

- Use energy-efficient machinery and equipment during construction to reduce fuel consumption and emissions.
- All open burning of construction and demolition of waste material and refuse will be prohibited.
- Implement proper maintenance programs for equipment and vehicles to ensure they operate efficiently and with lower emissions.
- Engage with local communities and stakeholders to raise awareness of emission reduction practices and encourage their participation in sustainability efforts.

5.2 Environmental Risks and Impacts at Operation Stage

5.2.1 ENVIRONMENTAL, HEALTH AND SAFETY ASPECT/ISSUE

5.2.1.1 Water Management

During the operation phase of the irrigation infrastructure project, alterations to hydrology present potential risks. The main activity that causes these risks is increased irrigation. This can lead to the depletion of water sources if proper management practices are not implemented.

The impact receptors for these risks include the Tonle Sap Lake, upstream watersheds, wetlands, aquatic ecosystems, and downstream communities. The assessment of the impact of hydrology changes during operation is moderate. This takes into consideration the potential for both positive and negative impacts of irrigation systems. Poor water management can result in downstream water scarcity, altered hydrology, and damage to aquatic ecosystems. However, well-designed and properly managed irrigation systems can contribute to improved agricultural productivity and water resource management.

❖ **Mitigation Measures**

- A water user community should be organized prior to construction to participate in identifying key locations and ensure there are caretakers in place.
- Establish detailed water management plans that ensure equitable water distribution and allocation, considering the needs of various users and the environmental flow requirements to maintain healthy aquatic ecosystems.
- Design and construct robust irrigation infrastructure, including canals, ponds, and storage areas, capable of withstanding extreme weather events like floods and droughts. This investment should also include lining canals and refurbishing storage areas to reduce water losses and improve water storage capacity.
- Establish and provide training to FWUCs on sustainable water management practices, equitable water rights, and allocation procedures. These communities play a vital role in the operation and maintenance of the irrigation system, ensuring its long-term sustainability.

5.2.1.2 Water pollution

The primary activity in the operation stage that causes the water pollution is the intensification of agricultural production in the OTP scheme as irrigation water becomes readily available. This intensification can lead to an increased use of chemicals, such as fertilizers and

pesticides, to enhance crop yields. These chemicals infiltrate the soil and reach groundwater aquifers, leading to long-term contamination. The excessive application of these chemicals can result in contamination of both surface and groundwater resources. Furthermore, changes in water table levels due to extensive irrigation can alter the flow patterns of groundwater, potentially mobilizing contaminants that would otherwise remain contained. The impact receptors for water pollution include farmers, nearby residents who rely on water resources for domestic use, and aquatic ecosystems within the command areas and downstream, including the Tonle Sap Lake. The assessment of the impact of water pollution during operation is moderate.

❖ **Mitigation Measures**

- Implement Simplified Pesticide Management Plan
- Conduct regular water quality test to track the change in water quality due to pesticide application using oversea laboratory testing.
- Encourage farmers to adopt IPM techniques that minimize pesticide use and rely on biological control methods, thereby reducing the increased risk of chemical contamination of water resources.
- Provide training and extension services to farmers on the judicious use of fertilizers and, ensuring they apply the correct type and amount based on soil nutrient levels.
- Promote the adoption of organic fertilizers and soil amendments, such as cover crops and green manures, which can improve soil fertility and reduce the need for chemical fertilizers.
- Implement a robust water quality monitoring program to track the levels of pesticides, nitrates, and other pollutants in surface and groundwater resources within and around the command areas.
- Encourage the adoption of water-saving irrigation methods, such as alternate wetting and drying (AWD) in rice cultivation, which can reduce water consumption and minimize the leaching of agrochemicals.

5.2.1.3 Soil pollution

During the operation phase of the irrigation infrastructure project, soil pollution/quality reduction poses a considerable risk. The primary activity contributing to this risk is the increased agricultural production facilitated by the improved irrigation infrastructure. This intensification can lead to the overuse of agri-chemicals, such as chemical pesticides and fertilizers, if farmers lack adequate training or support in adopting environmentally friendly practices. The excessive application of these chemicals can lead to various detrimental effects on soil health:

- Nutrient Depletion: Over-reliance on chemical fertilizers can disrupt the natural nutrient cycle in the soil, leading to nutrient imbalances and depletion of essential elements necessary for plant growth.
- Salinization: In areas where irrigation water is not properly managed, the accumulation of salts in the soil can occur, leading to soil salinization. This condition makes it difficult for crops to absorb water and nutrients, reducing productivity.

- Pollution from Chemical Residues: The persistent use of chemical pesticides can result in the accumulation of harmful residues in the soil. These residues can contaminate food crops, pose risks to human health, and disrupt the balance of soil microorganisms essential for soil fertility.
- In the lowland regions, soil erosion is prevalent, and rice yields decrease annually due to rising temperatures and water shortages.

The impact receptors for soil pollution/quality reduction are multifaceted, encompassing such as soil health, water quality, and biodiversity.

❖ **Mitigation Measures**

- Implement Simplified Pesticide Management Plan
- Conduct regular water quality test to track the change in water quality due to pesticide application using oversea laboratory testing

5.2.2 BIODIVERSITY

- Potential Impacts & Feasibility of Net Gain Requirements

The species that are assessed as “Present” or “Possible” in sub-scheme AoI are included in the impact assessment. These include the following 8 species: 1) Four reptiles (Black Marsh Turtle, Giant Asian Pond Turtle, Southeast Asian Box Turtle, Elongated Tortoise), 2) Three birds (Greater Adjutant, Milky Stork, and Bengal Florican), and 3) One fish (Siamese Tiger Perch).

- Potential impacts

Reptiles (Substantial risk)

All four species of reptiles are found in the upper and lower part of the OTP command area, particularly in areas near natural water courses (rivers and streams). During construction, these reptiles are potentially affected directly due to a) disturbances from noise and vibration due to increased vehicle activity and human presence, b) being hit by vehicles, equipment from increased traffic movement and river dredging/training at Ou Ta Paong river, excavating of the extended canal of Kbal Hong and other relevant canals, c) caught by workers, local people, and hunters. During project operation, these reptiles may be directly affected, including a) being caught by local people and hunters, and b) pesticide residues from intensified crop production.

Birds (Moderate risk)

Greater Adjutant, Milky Stork, and Bengal Florican are found seasonally in the command area, mainly in the lower/downstream part which is subject to annual flooding. These birds are migratory and as such are rare. Local people don’t catch these birds for food. However, since these birds feed on aquatic species available from the command area, they may be affected by the feeds that are contaminated with pesticide residues.

- Net gain assessment

Additionally, during construction activities, these birds may be indirectly affected through disturbance and habitat loss caused by increased human activity and changes in water levels. It is important to note that the Ou Tapaong Command Area serves as a critical habitat for these endangered bird species, making it crucial to minimize any potential negative impacts.

Based on the potential impacts identified above, it is evident that measures need to be implemented to achieve a net gain in biodiversity within the Ou Tapaong Command Area. These measures should focus on minimizing direct disturbances and habitat loss during construction activities, as well as implementing sustainable agricultural practices to prevent pesticide contamination of food sources for these bird species.

In conclusion, based on the assessment results, it is recommended that comprehensive actions be taken to protect critical habitats for species such as reptiles (Black Marsh Turtle, Giant Asian Pond Turtle, Southeast Asian Box Turtle Elongated Tortoise), birds (Greater Adjutant, Milky Stork, Bengal Florican), ensuring their survival alongside irrigation system renovation projects.

5.2.2.1 Habitat loss and fragmentation

During the operation phase of the irrigation infrastructure project, habitat loss and fragmentation are significant risks to biodiversity. The primary activity that drives this risk is the intensification of farming made possible by the increased availability of irrigation water. This often leads to the conversion of land for agricultural purposes. Flooded forests and wetlands, or Zone 3 in Ou Ta Paong sub-scheme, which provide crucial habitats for various species, may be deforested, drained or filled to create more arable land.

The impact receptors for habitat loss and fragmentation are aquatic and terrestrial species, particularly those that rely on flooded forests and wetlands for their survival. The sources specifically mention the potential for habitat conversion to extend beyond the local level and impact on the region, particularly with the possible expansion of agricultural land into protected areas. In Ou Ta Paong, a mix of paddy fields, rivers, and shrubland provides foraging habitat for avian species such as the Greater Adjutant, Milky Stork, and Bengal Florican.

The assessment of the impact of habitat loss and fragmentation during the operation phase is considered moderate. There is also concern that the increased accessibility to water for irrigation provided by the new infrastructure could encourage further encroachment into the protected areas, potentially leading to more extensive habitat loss in the long term.

❖ **Mitigation Measures**

- Identify and protect critical habitats, such as flooded forests and wetlands, ensuring their preservation against conversion for agricultural land.
- Implement measures to restore degraded habitats and improve their suitability for biodiversity.
- Promote sustainable agricultural practices to minimize negative impacts on biodiversity and water quality. This can include encouraging practices that reduce the need for land conversion.
- Implement sustainable water management practices to ensure adequate water availability for both human needs and ecological functions, avoiding excessive water extraction that could harm wetland habitats.
- Establish a long-term monitoring program to track changes in habitat quality, species populations, and the effectiveness of mitigation measures.
- Raise awareness and educate the community on the importance of protecting fish populations and aquatic ecosystems.

5.2.2.2 Invasive Species

The activity that causes this risk is the intensification of farming, which can lead to changes in land use and water management practices. The key change in land use is the increased cropping intensity and the introduction of dry-season irrigated crops made possible by the rehabilitated irrigation infrastructure. The project aims to increase the cropping intensity up to 270% in the Ou Ta Paong scheme and introduce a second irrigated rice crop during the dry season in other areas. This shift from rain-fed or flood recession agriculture to irrigated cultivation will significantly alter water management practices and create conditions that may be favorable to invasive species. These changes can create favorable conditions for non-native plant and animal species to establish themselves in the command areas. For instance, altered water flow and flooding patterns due to the new irrigation infrastructure can disrupt the natural balance of wetlands, making them more susceptible to invasion. Moreover, Introduction of invasive species through irrigation canals Irrigation canals may facilitate the introduction of invasive plant or animal species into native aquatic ecosystems. Examples of invasive species mentioned in the Biodiversity Impact Assessment report are Water Hyacinth, Mimosa Pigra, and Tilapia. These invasives can outcompete native species for resources such as food and habitat space. Invasive species can introduce plant and animal species that outcompete native species and alter ecosystem dynamics.

The impact receptors for invasive species are aquatic and terrestrial species, particularly those native to the affected ecosystems. The risk of invasive species spreading through waterways in the Ou Ta Paong, where water flows in both directions from and to the Tonle Sap Lake.

The assessment of the impact of invasive species during the operation phase is considered minor overall. However, the sources note that the scale of the impact can vary depending on the specific location and the types of invasive species introduced. The impact is expected to be more significant in Ou Ta Paong due to the larger scale of the irrigation infrastructure and the increased risk of invasive species spreading through the connected waterways.

❖ **Mitigation Measures**

- Implement a robust monitoring system, including regular surveys of waterways and terrestrial habitats, to detect invasive species early. Train personnel to identify and map invasive species, and establish rapid response protocols for eradication or control, such as manual removal, targeted pesticide application, or biological control agents.
- Implement specific water management practices to minimize the risk of invasive species spreading through waterways.
- Foster collaboration among government agencies, research institutions, local communities, and NGOs for effective invasive species management. Facilitate information sharing, coordinate efforts, and leverage resources for maximum impact.
- Educate farmers, local communities, and other stakeholders about the risks of invasive species, their identification, and prevention measures.
- Establish a system for reporting suspected invasive species to enable rapid response and prevent spread. Set up a hotline or a reporting mechanism accessible to all stakeholders

- Collaboration with the Department of Environmental.

5.2.3 CLIMATE CHANGE

5.2.3.1 GHG emission

During the operation phase, the intensification of farming activities is expected to result in a rise in greenhouse gas (GHG) emissions. This increase will stem primarily from the greater energy requirements associated with boosting agricultural production. The operation of machinery and equipment for various farming tasks, including tillage, irrigation, harvesting, and transportation, will demand a substantial amount of energy. If this energy comes from fossil fuels, it will lead to higher carbon emissions. The practice of burning rice straw after harvest, a common agricultural method in the region, also releases significant amounts of GHGs, such as carbon dioxide and methane, into the atmosphere. Additionally, the intensification of farming often results in greater use of chemical fertilizers, and the production and application of these fertilizers also contribute to GHG emissions.

The main impact receptor for GHG emissions is the atmosphere. The increase in GHG emissions adds to the problem of global climate change, which can have a wide range of negative consequences. These consequences include rising temperatures, shifts in weather patterns, sea-level rise, and an increase in the frequency and intensity of extreme weather events. The impact of GHG emissions during the operation phase as minor.

❖ **Mitigation Measures**

- The project needs to introduce renewable energy sources such as solar-powered irrigation to lower the carbon footprint of rice production.
- The project needs support training farmers to use alternatives to straw burning, such as mulching or biomass energy generation, to reduce air pollution.
- The project promotes the utilization of efficient irrigation methods like alternate wetting and drying (AWD) to conserve water and minimize methane emissions.
- The project needs to advocate for policies that discourage straw burning and provide incentives for adopting sustainable agricultural practices.

5.2.4 ANNUAL CROP MANAGEMENT PLAN

5.2.4.1 Water resource efficiency

In this phase, inefficient irrigation practices can lead to a reduction in water resource efficiency. Moreover, people in community faced with flooding in wet season and drought in dry season generally. Additionally, farmers also pose with climate change issue which harm to their crop. The increased demand for irrigation, coupled with poor water management practices and lack of infrastructure, can result in the over-extraction of water resources. This over-extraction can have several detrimental effects on the surrounding environment and communities:

- Downstream Water Scarcity: Excessive withdrawal of water for irrigation can deplete water sources downstream, leading to water shortages for other users, such as communities, industries, and ecosystems.
- Altered Hydrology: Over-extraction can disrupt the natural flow patterns of rivers and other water bodies, affecting the balance of aquatic ecosystems and the services they provide.

- Damage to Aquatic Ecosystems: Reduced water flow and altered water levels can harm fish populations, other aquatic organisms, and the overall health of downstream ecosystems.

The impact receptors for inefficient water resource use are downstream communities and aquatic ecosystems, including those in the Tonle Sap Lake and its surrounding watersheds, this impact as the moderate.

❖ **Mitigation Measures**

- Project need to implement efficient water management practices to prevent over-extraction and ensure equitable water distribution. This can include:
- Water use monitoring system to track consumption and identify areas for improvement.
- implementing appropriate irrigation scheduling based on crop water requirements and weather conditions.
- Utilizing efficient irrigation systems, such as drip irrigation or sprinkler systems, to minimize water loss.
- Exploring opportunities for water reuse, such as capturing and reusing runoff water.

5.2.4.2 Soil erosion and soil erosion risk

The various agricultural activities can elevate the risk of soil erosion and contribute to the degradation of soil health. Land preparation practices, such as tillage and site clearing, along with the use of heavy machinery, can disrupt the soil structure, making it more vulnerable to erosion by wind and water. Additionally, the intensification of farming can lead to changes in vegetation cover, reducing the natural protection against erosion.

Soil erosion poses significant threats to both the environment and agricultural productivity. The loss of topsoil, the fertile upper layer of soil rich in nutrients and organic matter, is a primary concern. This loss diminishes soil fertility, impacting its ability to retain water and nutrients crucial for plant growth. Consequently, agricultural yields decline, and farmers may experience reduced productivity. Furthermore, eroded soil particles contribute to increased sedimentation in water bodies such as rivers and lakes. This sedimentation can harm aquatic ecosystems and degrade water quality, increasing the costs associated with treating water for human consumption. The impact receptors for soil erosion are soil health, water quality, and agricultural productivity.

❖ **Mitigation Measures**

- Minimize soil compaction and disturbance by using appropriate machinery and timing land preparation activities.
- Consider erosion management practices such as contour planting, terracing, and grass barriers.
- Adopt reduced tillage or no-till farming practices to minimize soil disturbance.
- Establish cover crops during fallow periods or in rotation with main crops to protect the soil from erosion.
- Practice contour farming on sloping land to reduce runoff and erosion.
- Construct terraces on steep slopes to prevent soil loss.
- Establish windbreaks or shelterbelts to reduce wind erosion.

- Install erosion control structures, such as grassed waterways or sediment basins, to manage runoff.
- Apply much to the soil surface to protect it from rainfall impact and erosion.

5.2.4.3 Nutrient application and management

The excessive or improper application of fertilizers poses a significant risk to water quality and the health of aquatic ecosystems. The intensification of agricultural production, driven by improved irrigation, can lead to an increased reliance on chemical fertilizers to enhance crop yields. However, if these fertilizers are not applied judiciously and managed effectively, they can have detrimental effects on the environment:

- Nutrient Runoff: When fertilizers are applied in excess or at inappropriate times, such as before heavy rainfall, a significant portion of the nutrients can be washed away from the fields and carried into nearby water bodies.
- Nutrient Leaching: Fertilizers can also leach through the soil and contaminate groundwater resources.

The impact receptors for nutrient runoff and leaching are water quality, aquatic ecosystems, and human health. High levels of nutrients, particularly nitrogen and phosphorus, in water bodies can lead to eutrophication, a process that causes excessive growth of algae. This algal bloom can deplete oxygen levels in the water, harming fish and other aquatic organisms. Additionally, contaminated water sources can pose risks to human health if used for drinking or recreational purposes.

❖ **Mitigation Measures**

- Conduct periodic soil analysis to determine nutrient needs and avoid over-fertilization.
- Establish buffer zones near watercourses to filter nutrient runoff.
- Consider using green manures and cover crops to replenish soil nutrients and reduce leaching.

5.2.4.4 Use and effectiveness of pesticides

The use of pesticides to protect crops from pests and diseases can pose significant risks to human health, biodiversity, and the environment. The intensification of farming often leads to an increased reliance on pesticides to maintain high crop yields. However, the effectiveness of pesticides can decline over time as pests develop resistance, requiring farmers to apply higher doses or switch to more potent chemicals.

This cycle of pesticide use, and resistance can have several negative consequences. Pesticide exposure can pose health risks to both farmers who handle and apply these chemicals and consumers who ingest pesticide residues on food. Pesticides can harm non-target organisms, including beneficial insects, pollinators, and soil organisms, disrupting the balance of ecosystems. Environmental Contamination: Pesticides can contaminate soil and water resources, potentially affecting water quality and the health of aquatic ecosystems.

❖ **Mitigation Measures**

- Promote Integrated Pest Management (IPM) strategies to minimize pesticide use.

- Implement training and awareness programs for farmers on the safe handling and application of pesticides.
- Providing training materials that are user-friendly and accessible to farmers with varying literacy levels.
- Including climate information and agrometeorology services in training materials when available.
- Preparing training materials for rice and other crops such as vegetables, poultry, and aquaculture.
- Organizing trainings on "climate-informed agriculture decisions and planning" and having trained individuals disseminate information.

5.2.4.5 Pesticide residues on site soil

The repeated application of pesticides, especially persistent pesticides, and the improper disposal of pesticide containers can lead to the accumulation of pesticide residues in the soil. This accumulation can have several detrimental effects on the environment such as contamination of Groundwater and impacts on Soil Organisms.

The impact receptors for pesticide residues on-site soil are soil health, biodiversity, and water quality. The sources assess the risk of pesticide residue accumulation in the soil as high, emphasizing the need for judicious pesticide use, proper disposal of pesticide containers, and integrated pest management strategies to minimize the risks associated with pesticide contamination.

❖ **Mitigation Measures**

- Promote the use of pesticides with low persistence and mobility in the environment.
- Implement a soil monitoring program to assess pesticide residue levels.
- Consider crop rotation and the use of cover crops to help break down pesticide residues.
- Minimize pesticide use by adopting IPM strategies.
- Conduct soil testing to monitor pesticide residue levels.
- Utilize cover crops to improve soil health and enhance pesticide degradation.

5.2.4.6 Pesticide residues on produce

During the operation phase of the irrigation project, the application of pesticides close to harvest, improper pesticide application techniques, and inadequate pre-harvest intervals can lead to pesticide residues on produce, posing risks to consumer health. Consuming produce with pesticide residues can have adverse effects on human health.

The main impact receptor for pesticide residues on produce is human health, specifically consumers who ingest the contaminated food. The assess the impact of pesticide residues on produce as moderate. This assessment highlights the importance of implementing safe pesticide application practices, adhering to pre-harvest intervals, and promoting alternative pest control methods to minimize the risks to consumer health.

❖ **Mitigation Measures**

- Enforce pre-harvest intervals to allow for pesticide breakdown before harvest.

- Promote the use of pesticides with low toxicity to humans.
- Properly wash and handle produce to remove surface residues.
- Implement a monitoring program to test produce for pesticide residues.
- Ensure compliance with established MRLs for pesticide residues on produce

5.3 Social Risks, Impacts, and proposed Mitigation Measures at the Preparation Stage

5.3.1 LAND ACQUISTION

5.3.1.1 Land acquisition and resettlement

The rough estimate of land acquisition and resettlement were conducted in four steps. Firstly, the assessment was based mainly on the result of the consultations between the AIIB Social Development Specialist and the PMU engineering team to come up with more practical and latest conceptual design options to use as the basis for the land acquisition and land resettlement estimations. Then, rough calculations of the scale of the impacts were conducted using the agreed engineering designs to obtain the impacted figures. At the same time, google earth with the specific types of infrastructure locations were also used to indicatively determine the affected areas at each subproject location along the canals. Thirdly, the estimates were also consulted with relevant Provincial Departments of Land Management Urban Planning and Construction (PDLMUPC) and local authority representatives to confirm the estimated land titling at the impacted project sites. Lastly, the results were then brought back to consult with the PMU engineering team to verify the estimated figures. Although the consultation and the process had covered various aspects, the estimates were considered as a rough figure subjected to the final detailed engineering design (DEDs) outcomes. In addition, the estimation based on the google earth has its limitation on the accuracy, and the impact may differ from the actual impacts resulting from the upcoming DEDs to be carried out at a later stage.

The rough estimation of the land acquisition impacts was encountered mainly at Ou Ta Paong, as there are the canals being planned to expand. The impact of the land acquisition is expected to encounter mostly at the Ou Ta Paong sub-scheme within the proposed Feeder canal 1, feeder canal 2, main canals (mainly from Kbal Hong to Ou Ta Paong, and the secondary canals due to possible expansion of the design width in order to adequately provide water distribution and water carrying capacity to feed the entire irrigation system (Table 34). The impact includes the expansion of the canal body as well as the rural road along the canals. However, due to limited number of households living along these planned expanding canals, the affected number of households are few.

Table 35: Indicative figure of canal expansion at Ou Ta Paong

No	Structures	Designed Length (km)	Existing Width (Average) (m)	Expansion (L) (m)	Expansion (R) (m)	Total Width (m)
1	Feeder 1	8.80	16.00	7.00	7.00	30.00
2	Feeder 2	6.10	29.10	1.50	1.50	32.10
3	Main Canals	37.50	37.10	5.00	5.00	47.10
4	Creek Re-shape	27.60	61.00	0.00	0.00	42.00

5	Main Drainage	11.70	52.00	Reshape	Reshape	42.00

L = Left, R = Right.

Using this figure, the land acquisition is estimated at 516,500m^2. The consultations with Provincial Departments of Land Management, Urban Planning and Construction (PDoLMUPC) indicated that with this size, all of the acquired land are the public land. There are, however, 50 households and 288 trees apparently to be affected due to the irrigation expansion as the households have been located within the expended locations (Figure 7.4). There are seven (7) households along the Ou Ta Poung River observed to be affected entirely which may require displacement or a full resettlement. The cost for compensation to the affected households are projected at 121,119 USD as per the government rate, derived from official rate at the PDoLMUPC website. The seven (7) entirely affected households may need to be resettled. Specific measures and solutions needed may include reconsideration of the canal design width at the spots (Table 35). However, the PMU engineering team confirmed that technical and strategic consideration can only be provided at the time of the DED stage since possible reduction of the irrigation infrastructure design width will result in the reduction of water flow and water carrying capacity of the canal which may affect the required water distribution and requirements to effectively and efficiently deliver the irrigation purpose and project objective.

Table 36: Land Acquisition and Asset Impacts in the Ou Ta Paong sub-scheme

No	Structures	Affected public land (m^2)	Affected Assets (Tree)	Affected Households	Physical Displacement (HHs)
1	Feeder 1	123,200	5	7	-
2	Feeder 2	18,300	-	-	-
3	Main Canals	375,000	130	9	-
5	Creek Re-shape	-	100	34	7
6	Main Drainage	-	-	-	-
Total		516,500	235	50	7

HHs = Households.

❖ **Mitigation Measures**

- Since the affected households are only 50 in Ou Ta Paong, Abbreviated Land Resettlement Plan is required to be prepared.

5.3.1.2 Economic displacement

The risk of economic displacement is linked to activities like the rehabilitation of irrigation canals and farm roads, and land acquisition. These activities can disrupt existing economic activities and displace households and businesses. The upgrading of irrigation systems may result in the removal of informal farming areas due to dredging, impacting those who rely on these areas for income. Additionally, during the construction phase, local businesses and transportation routes might face disruptions due to construction activities, affecting the community's daily life and economic activities.

The impact receptors for economic displacement include households in Ou Ta Paong who have production land along the water bodies, informal land users, informal settlers, and nearby construction site business owners. The sources assess the impact of economic displacement

as moderate, recognizing that while it is a significant concern, the scale of the impact is still uncertain. The upgrading of irrigation systems may lead to the removal of informal farming areas, impacting the livelihoods of households who rely on these areas for food and income

The Ou Ta Paong Sub-scheme includes various infrastructure components such as Feeders, Main Canals, Creek Re-shaping, and Main Drainage. These structures span a total length of 91.7 km. A total of 41 households estimated as the shop owners and 1,012 households use the land along these infrastructure components while the other 10 households are estimated to be engaged for land acquiring for contractors' operation. The proper informing to these households is required to ensure that their production and economic activities will not be severely affected (Table 36).

Table 37: Affected and Vulnerable Households in Ou Ta Paong Sub-scheme

Structures	Number of households own the affected rice field	Vulnerable HHs	Total Households temporarily affected during construction	Land acquisition for contractors' operation
Feeder 1	346	48	3	
Feeder 2	174	24	4	
Main Canals	492	71	6	10
Creek Re-shape	-	6	28	
Main Drainage	-	-	-	
Total	**1,012**	**149**	**41**	**10**

HHs = Households.

The proper informing to these households is required to ensure that their production and economic activities will not be severely affected.

❖ **Mitigation Measures**

- The households who own the land along the rehabilitated canals which will be expanded at the public land should be properly informed prior to the construction to avoid their crops will be damaged at the time of construction.
- Although the acquired land are the public land, there are a need of a proper consultation and information to be conducted to inform and obtain agreement from the affected households.

5.4 Social Risks and Impacts and Mitigation Measure at Construction Stage

5.4.1 ROTECTING THE WORKFORC

5.4.1.1 Child Labor

The risk of child labor emerges due to the demand for unskilled labor in rural areas where the use of child labor is prevalent. Contractors and subcontractors involved in the project's construction activities may employ children or youth under the legal working age due to labor shortages or the drive to minimize costs. This practice exploits vulnerable children, depriving them of education and opportunities, and perpetuates a cycle of poverty.

The risk of child labor, particularly due to the influx of labor and pre-existing societal inequalities. Vulnerable groups, such as poor and near-poor households, female-headed households with dependents. Children from these groups are often driven to work due to economic hardship, and the increased demand for labor during project construction can exacerbate this situation. Migrant workers, often facing precarious working conditions and separated from support systems, are also highly vulnerable to exploitation, including child labor. The project's Gender Assessment identifies the lack of local wage jobs and increasing migration as key challenges that could further heighten the risk of child labor.

❖ **Mitigation Measures**

- Apply LMP for age check prior to engagement of labor with regular monitoring through proper screening and registering all workforce for the work
- To mitigate the risk of child labor, the project will implement strict measures to ensure compliance with national and international labor laws. Regular monitoring and inspections will be conducted to identify and address any instances of child labor.
- Additionally, awareness-raising campaigns will be implemented to educate communities about the harmful effects of child labor and the importance of sending children to school. The project will also collaborate with local authorities and NGOs to strengthen law enforcement and provide support services to vulnerable children and their families.

5.4.1.2 Forced Labor

In the construction phase, the risk of forced labor is anticipated, especially for vulnerable individuals who may be coerced into working against their will. Forced labor can manifest in various ways, including:

- Economic Coercion: Individuals may be forced to work due to financial pressures, such as the need to repay debts or support their families.
- Exploitation of Young People: Young people, particularly those from impoverished backgrounds, may be forced to work to contribute to family income or due to a lack of educational opportunities.
- Debt Bondage: Workers may be trapped in a cycle of debt by unscrupulous employers who advance them loans with exploitative terms, effectively binding them to work until the debt is repaid.
- The rehabilitation of irrigation canals and farm roads creates a demand for local labor which can be exploited by those who seek to profit from forced labor.

❖ **Mitigation Measures**

- Strict Code of Conduct for workers with no tolerance for physical or verbal abuse of women or children
- The Project Owner and Sub-Contractors will collaborate with the relevant Government Agency to disseminate information to local communities. This information will include the Contractor's Code of Conduct and the minimum working age as mandated by national laws and international standards.
- The Ministry of Water Resources and Meteorology (MOWRAM) will provide information to local communities about the contractor's policies and responsibilities, including the Contractor's Code of Conduct and minimum working age.

5.4.2 COMMUNITY HEALTH AND SAFETY

5.4.2.1 Disease transmission

During construction phase, the risk of disease transmission is anticipated due to the influx of construction workers, the potential for their lack of hygiene in living conditions, and their interaction with local community members. The influx of workers increases the likelihood of spreading and contracting communicable diseases, both among the workers themselves and between workers and the local community. Workers may experience poor eating habits, homesickness, stress, and unhygiene living conditions which make them susceptible to diseases.

❖ **Mitigation Measures**

- Conduct public awareness raising activities (IEC) to ensure local people and contractors know about the risks of contracting and spreading communicable diseases such as COVID-19, HIV/AIDS, and water-borne diseases (e.g., amoebiasis, giardiasis, and toxoplasmosis. etc.
- In the event of a disease outbreak (e.g. COVID-19), provide immediate training/awareness raising to the risk groups.
- Conduct training to workers on communicable diseases prior to mobilization to construction sites.
- For water-borne diseases that arise due to polluted or contaminated water, mitigations measures may include:
- Implement filtration, chlorination, or UV disinfection to ensure safe drinking water.
- Build and maintain proper sewage systems and latrines to prevent water contamination.
- Promote handwashing, safe food preparation, and proper sanitation practices in communities.
- Control and properly dispose of waste to prevent water pollution.
- Test water sources frequently for contamination and take corrective actions promptly.

5.4.2.2 Sexual Exploitation and Abuse, Sexual Harassment

The risk of Sexual Exploitation and Abuse/ Sexual Harassment (SEA/SH) is envisaged due to several factors. The influx of workers estimated to be approximately 393 (Table 37), frequent visits by project personnel, and pre-existing SEA/SH issues in the area all contribute to this risk. This risk is primarily associated with the rehabilitation of irrigation canals and farm roads. The influx of labor includes not only construction workers but also individuals who provide logistical services, increasing the potential for exploitation. The sources highlight that approximately 238 workers are estimated to be involved, and their isolation and potential loneliness may increase their vulnerability to SEA/SH. However, the figure varies based on actual arrangement of the contraction companies.

Table 38: The estimated influx labor within the sub-schemes

Type of project workers	Characteristics of project workers	Duration of Labor Requirements	Ou Ta Paong
Direct Workers			

PIU's member MoWRAM & NCDDS	Individual consultants (e.g., E&S Specialists, Design Engineers, Construction Supervision Engineers, etc.	From project preparation till project completion	20
Contracted Worker			
Engaged by PIU			
Detailed Design Consultant	National specialists	From project preparation until project completion	15
Construction Supervision consultant	National specialists		15
Independent E&S Monitoring Consultant		One (1) month in very six (6) months	10
Technical Assistance			15
Skilled workers	National specialists	Durations vary, depending on construction stages & needs.	80
Unskilled workers	Local workers (around subproject location)		150
Primary Supply Workers			
Workers producing materials for core project activities	Mostly local workers	Construction stage	30
Other Stakeholders Working in Connection with Project			
Civil servants of MoWRAM, PDWRAM at provincial & district level	SEO safeguard team	The construction stage of the project.	18
Civil servants of NCDDS	Staff of NCDDS	From project preparation until project completion	15
Civil servants of MEF	Staff of GDR	From project preparation until project completion	10
Civil servants of relevant Ministries	Staff	The construction stage of the project.	15
Total			**393**

PIU = Project Implementation Units, MoWRAM = Ministry of Water Resources and Meteorology, E&S = Environmental and Social, NCDDS = National Committee for sub-National Democratic Development Secretariat, PDWRAM = Provincial Department of Water Resources and Meteorology, SEO = Social and Environmental Officer, MEF = Ministry of Economy and Finance, GDR = General Department of Resettlement.

People prone to the risk of SEA/SH are anyone but the most vulnerable group are women and children.

❖ **Mitigation Measures**

- Contractors need to explicitly state zero tolerance for sexual harassment, exploitation, and abuse within the workplace.
- Require Code of Conduct (CoC) to be signed by all construction workers.
- For victims coming forward: referral to qualified SEA/SH service provider. The GRM will include a confidential channel for reporting SEA/SH.

- Strict Code of Conduct for workers with no tolerance for physical or verbal abuse of women or children
- Training to workers on maintaining good community relations, with emphasis on proper conduct around women and children.
- Training on SEA/SH and VAC for community members, in particular women and girls (may be done separately for men and women).
- Ensuring workers' sites are situated (at least 500m) from schools and/or other areas where children congregate.
- Children are prohibited from construction sites and worker's camp.
- Ensure access to grievance redress mechanisms for all project-affected persons, including both stakeholders and workers, to address Sexual Exploitation and Abuse, and Sexual Harassment. Support (in the form of training, awareness raising, etc.) to local law enforcement to act on community complaints regarding SEA/SH and VAC.
- Provision of information to local communities about the contractor's policies and responsibilities, including the Contractor's Code of Conduct and minimum working age.
- Provide counselling services for male and female workers, wives and other female partners of contractors' workers.
- Build partnerships with local health providers and SEA/SH service providers to conduct community awareness activities, and referrals.
- Implement public awareness campaigns to address sexual harassment in transport services and hubs, and training of police on women's security needs when using transport. This is included on GRM:
    - Accessibility for Workers
    - Multiple Reporting Channels
    - Confidentiality and Support
    - Contractor Accountability

5.4.2.3 Traffic safety & Security

The traffic safety in construction stage is among the local concerns. The rehabilitation of irrigation canals and farm roads necessitates increased transportation of construction materials and equipment, potentially leading to road accidents, especially if safety measures are not strictly enforced. Construction activities can also attract unauthorized individuals seeking to steal or vandalize equipment and materials, further compromising security. The influx of construction workers into the project area may also contribute to a perceived or actual increase in crime rates, impacting the sense of safety among residents.

People subject to risk of traffic accident include anyone which may include project workers and local people who live near the construction sites or travel on transportation routes.

❖ **Mitigation Measures**

- Arrange security guard or engage local authority to guard the construction sites
- Conduct public awareness raising activities (IEC) to ensure local people and road user are aware of road safety regulations and risks and act accordingly while using road.
- Monitor and observe speed limit.

5.4.2.4 Community Health and diseases

The community health and safety risks extend beyond disease transmission and include the potential for accidents and injuries related to construction activities. Rehabilitation work on canals and ponds poses drowning risks, especially for children and those unfamiliar with the altered water bodies. Trespassing in construction zones, which may contain storage areas, camps, lay down areas for construction materials, vehicles, and machinery, presents further risks of incidents and accidents for community members. Additionally, construction activities can lead to traffic and access disruptions that may cause safety issues for the community. The presence of construction workers and associated activities can also lead to potential conflicts with local communities. Construction sites also pose risks of accidents and exposure to construction related hazards.

❖ **Mitigation measures:**

- Establish clear and well-marked construction exclusion zones to prevent unauthorized access, especially to areas with open water, heavy machinery, and storage areas.
- Provide warning signs in local languages to inform communities about the dangers and restricted access to construction areas.
- Install safety barriers around construction sites to minimize risks to the community and workers.
- Develop and implement traffic management plans to minimize traffic and access disruptions and ensure pedestrian and vehicle safety.
- Conduct community awareness campaigns to educate the community about the potential risks and safety measures during construction.
- Establish and maintain a grievance mechanism to address community complaints and issues promptly.
- Implement safety measures around canals and ponds to prevent drowning incidents, such as installing safety barriers and providing warning signs in local languages.
- Create and enforce clear rules regarding access to canals and ponds during construction and post those rules.
- Implement strict health and safety regulations at all construction sites to protect both workers and the nearby communities.
- Provide training to workers on safety protocols, including how to work safely around water, avoid accidents and minimize risks to the community.
- Ensure all workers are provided with necessary personal protective equipment (PPE) and enforce its use.

5.4.2.5 Personal Protective Equipment

The construction or rehabilitation of irrigation canals and farm roads during the construction phase presents significant risks to worker safety and health due to the potential lack of personal protective equipment (PPE). These activities involve Canal Rehabilitation and Construction, Structure Construction and Rehabilitation, and Drainage Improvement, which expose workers to various hazards, such as Falling Debris, Sharp Objects, and Heavy Machinery.

The absence of proper PPE significantly increases the likelihood of injuries, such as cuts, fractures, or head trauma. Workers without respiratory protection may inhale dust, fumes, or toxic substances, potentially leading to respiratory problems. Similarly, inadequate eye and hearing protection can result in vision impairment or hearing loss due to flying particles and high noise levels. Furthermore, the lack of proper footwear and gloves increases the risk of slips, trips, and falls, and exposure to hazardous materials.

The impact receptors for risks associated with the lack of PPE are primarily construction workers but also include inspectors and visitors to the construction sites. The risk associated with inadequate PPE as high, particularly in rural construction settings where cost-cutting measures might compromise worker safety.

❖ **Mitigation Measures**

- Continue and active use of PPE at all time of construction.
- Identification and provision of appropriate PPE that offers adequate protection to the worker, co-workers, and occasional visitors, without incurring unnecessary inconvenience to the individual
- Proper maintenance of PPE, including cleaning when dirty and replacement when damaged or worn out.
- Proper use of PPE should be part of the recurrent training programs for employees.

5.4.2.6 Working conditions and Management of Worker

The construction or rehabilitation of irrigation canals and farm roads during the construction phase of the project carries a risk of underpaid pay and unequal treatment for local workers hired by project contractors. This risk is exacerbated by the lack of written contracts for unskilled workers, particularly those recruited locally. Without a formal contract, these workers are vulnerable to being underpaid compared to the demands and scope of their work.

The potential for underpayment to occur based on gender and temporary work status, further marginalizing already vulnerable groups. The absence of clear contractual terms also increases the risk of late wage payments or even non-payment, jeopardizing the workers' livelihoods and potentially delaying the project's progress.

The impact receptors for underpaid pay and unequal treatment are primarily unskilled workers (mostly local people) and construction workers, particularly women. This risk associated with these issues is moderate.

❖ **Mitigation Measures**

- Implement a grievance mechanism for workers where workers can report issues related to underpayment or unequal treatment without fear of retaliation.
- Advise companies to provide equal opportunities for employment and promotions to all workers, regardless of gender, ethnicity, or background, to avoid discrimination.
- Regularly monitor and audit payroll and employment practices to ensure compliance with labor regulations and address any disparities.
- Offer training and capacity-building programs for all workers to enhance their skills and qualify them for higher-paying roles.

- Ensure that subcontractors and suppliers also adhere to fair wage and equal treatment policies.
- Set up worker committees or unions to allow collective bargaining and ensure workers have a voice in addressing wage and treatment issues.
- Provide accessible information to workers about their rights, entitlements, and the proper channels to address grievances through the establishment of the GRM for workers. This includes training on topics such as:
    - Environmental and Social Safeguards
    - Gender Awareness and the Gender Action Plan
    - Sexual Exploitation, Abuse, and Harassment (SEA/SH)
- Labor Rights and the Workers' Code of Conduct Regularly engage with labor rights organizations or third-party auditors to evaluate labor conditions and make improvements where necessary.

5.4.3 CULTURAL HERITAGE

The potential risk of the project during the construction phase to cultural heritage sites located within the project area. While the initial assessments indicate that the identified cultural sites in Ou Ta Paong are minimally associated with the construction areas, there is still a risk that smaller, undocumented sacred places within the command areas could be inadvertently damaged or destroyed during construction. Even though construction is expected to focus on existing canals, there is a possibility that construction activities might unearth archaeological artifacts buried deep in the soil.

The impact receptors for cultural heritage risks are primarily underground cultural sites, and the sources assess the risk as minor. However, the sources emphasize that the detailed design plans have not yet been released or discussed with the community, leaving a degree of uncertainty about the potential impact on these sites. The lack of detailed information and community consultation underscores the need for careful consideration and mitigation measures to ensure the protection of cultural heritage during the construction phase.

❖ **Mitigation Measures**

- Conduct archaeological surveys before construction in culturally sensitive areas.
- Implement Find Chance Procedure

5.4.4 CROSS-CUTTING

5.4.4.1 Loss access to land and other assets

In the construction phase, activities like upgrading existing main canal, Main Drainage, and Feeding canal, carries a moderate risk of temporarily or permanently restricting access to natural resources for local communities. This restriction will likely affect farmers and fishers along the main river of Ou Ta Paong, as well as feeder canals in Ou Ta Paong. Additionally, the influx of construction workers and the establishment of temporary facilities like worker camps could strain local resources, including water sources and forest products, potentially leading to overexploitation and environmental degradation.

❖ **Mitigation Measures**

- The project will prioritize avoiding physical resettlement and minimizing land acquisition. Design adjustments will be made to avoid or reduce land requirements, especially on private land. Public land will be prioritized for any necessary acquisition.
- Where land acquisition is unavoidable, the project will employ a negotiated settlement process with affected households. This process, guided by the RGC's Standard Operating Procedures on Land Acquisition and Involuntary Resettlement (SOP-LAR), aims to ensure that affected households receive fair and adequate compensation for their losses and maintain or improve their income and livelihood status.
- All individuals with assets within the Corridor of Impact (COI) before the Cut-Off-Date (COD) will be eligible for compensation, regardless of their legal status. Compensation will be provided for various losses, including land, structures, crops, trees, and income-generating activities.
- Recognizing the potential disruption of income streams during relocation or construction, the project will provide transitional allowances to affected households. These allowances will help cover living expenses and bridge the gap until they can resume their livelihoods.
- A multi-tiered GRM will be established to address grievances from any project-affected person. The GRM will operate based on the principles of the Green Climate Fund (GCF) and be accessible at no cost to the complainant.

5.4.4.2 Loss access to natural resources

The activities like upgrading existing canals and implementing river training measures, carries a moderate risk of temporarily or permanently restricting access to natural resources for local communities. This restriction will likely affect farmers and fishers along the main streams of Ou Ta Paong as well as feeder canals. Additionally, the influx of construction workers and the establishment of temporary facilities like worker camps could strain local resources, including water sources and forest products, potentially leading to overexploitation and environmental degradation.

❖ **Mitigation Measures**

- Implement efficient water management practices during construction and operation to prevent over-extraction of water resources from reservoirs and rivers and ensure equitable distribution for downstream communities and ecosystems.
- Use environmentally friendly construction materials and techniques to reduce the risk of pollution. Properly manage construction chemicals, fuels, and waste to prevent water pollution and contamination of natural resources. Prepare and implement a waste management plan to handle waste generated from construction activities and worker camps.
- Optimize construction material use and recycle, when possible, to minimize the extraction of new resources. Implement energy-efficient construction practices and use renewable energy sources where possible.
- Maintain ongoing communication with affected communities, including farmers, fishers, and downstream communities, to address concerns about natural resource

access. Provide information and education to construction workers about responsible use of local resources and respect for community access rights.

- Ensure the GRM is accessible to all community members to address complaints related to natural resource access.

5.4.4.3 Social inequality

The engagement and consultation processes during the design and construction phases of the irrigation project present a moderate risk of social inequality. The sources indicate that while landowners in the project areas are mainly from local communities, suggesting relatively equal access to the consultation process, vulnerable groups without farmland may have limited opportunities to participate and benefit from the rehabilitated irrigation system.

OTP is one of the other sub-schemes in CAISAR. According to the total number of households and vulnerable individuals in the sub-scheme was reported at 6,863 (25.4%), of which 3,523 are headed by women, 2,048 are classified as poor families (9%), 986 are disabled (1%), 151 are elderly (0.2%), and 155 are living without parents (0.2%). These individuals were thought to have little direct access to the project's benefits. Therefore, the local government should provide for these individuals and assign them to construction projects if they are capable. Project implementation should also consider avoiding areas where vulnerable homes or land are fully impacted. In line with the project component, this move might enable them to continue receiving water or other benefits from the irrigation system.

This potential for exclusion raises concerns about the fair distribution of project benefits. While the overall impact of social inequality during the construction phase is assessed as moderate.

❖ **Mitigation Measures**

- Conduct participatory planning and regular consultations with local communities, particularly marginalized groups (e.g., women, smallholder farmers, indigenous communities).
- Prioritize hiring local labor, with special provisions for disadvantaged groups (e.g., youth, women, minorities) in both skilled and unskilled positions.
- Develop and enforce water allocation plans that ensure fair access to water resources for all users, including small-scale and subsistence farmers, during and after construction.
- Implement fair and transparent compensation or resettlement plans for those displaced or affected by construction activities, especially vulnerable households.
- Establish accessible and responsive grievance redress mechanisms, ensuring all community members can raise concerns or complaints during construction.
- Conduct regular social impact assessments, with a focus on identifying inequality trends, and adjust project strategies to mitigate negative effects.
- Provide support and training for affected communities to diversify their livelihoods, especially for those whose livelihoods may be disrupted by construction (e.g., farmers, traders).
- Ensure transparency in the contracting process, including the selection of subcontractors and suppliers, with opportunities for local businesses, especially those run by marginalized groups.

5.4.4.4 Elite capture

The risk of elite capture is anticipated given the fact these local elite could potentially influence the project to provide them project benefits. While the majority of landowners within the command areas are from the local community, which reduces the likelihood of large-scale land grabbing by powerful individuals or groups, the sources acknowledge the potential for the wealthy to use their influence, connections, or resources to encroach upon protected areas for personal gain. The risk of elite capture is assessed as moderate.

❖ **Mitigation Measures**

- Consultation will be conducted farmers in potential command area, focusing on vulnerable/disadvantaged groups
- Alternative livelihoods for vulnerable group are identified based on their needs vis-à-vis project's investment eligibility
- Conduct consultation at community level (in the command area) to achieve a consensus on how water needs are balanced between different groups in one command area.
- During subproject design, water availability, storage capacity, and water needs of upstream and downstream population are calculated to inform design, and water use coordination during project operation.
- Water user groups should be established for upstream and downstream population and should be coordinated by a higher-level committee/group to negotiate and optimize water coordination
- Guidelines/Manual should be developed to provide guideline for upstream and downstream communities at subprojects to meet, discuss, and achieve consensus on how water is distributed for equal use between upstream and downstream population

5.4.4.5 Gender inequality

The risk of gender inequality due to limited access for women to training, resources, and decision-making processes related to irrigation and agriculture. This risk stems from pre-existing gender inequalities in Cambodia, where women often face barriers in accessing resources, technology, and leadership roles. The impact receptors for this risk are women farmers and laborers, who may be excluded from the full benefits of the project.

Regarding the A gender analysis was conducted in the CAISAR. Most income from project target group are generated from rice production, followed by animal husbandry, including chicken, cow, duck, and buffalo. Home-based fish farming and vegetable are rare: 1.7% (n=11) and 0.9% (n=6), respectively. Five key barriers are identified as current gender gap and potential constraint to promoting new technology adoption for improved adaptation. These include: 1) Traditional gender norms, 2) Burden of household chores, 3) Limited education and skills, 4) Lack of local wage jobs and increasing migration. Gender norms shape the gender division of labour in household chores, farming and income generation. Men generally take care of heavy works (physically heavy and poisonous) in farming and participate in social activities. Women bear the primary responsibility for child bearing and domestic works. Yet, they also play an important role in farming including home gardening, animal husbandry and rice production alongside men. Many women take care of rice during cropping season and

participate in harvesting in case they do not have access to machinery. This is particularly the case for women headed households who face chronic lack of labour and more limited access to machinery and equipment. From project survey (n=630), Overall, it is estimated that male workers spend, on average, 59.4% of their time for farming vis-à-vis female counterpart who spend 40.5% of their time. However, most women participate jointly with their husband in decision making related to finance and play a dominant role (over their husband) when it comes to daily home expense and child care. However, since rice is mainly considered to be a male crop, this can have negative implication to promoting sustainable adoption of new rice farming techniques for rice farming households for an estimated 40,000 hectare across six irrigation schemes in four project provinces. Indeed, men typically dominate decision making in rice farming such as selection of rice variety, use of pesticide and fertilizers as well as on-farm irrigation management. For instance, women tend to be under-represented in FWAC where key decisions on water management and irrigation use are made. This also means that extension activities targeting rice production are typically focused on male farmers.

❖ **Mitigation Measures**

- Implement the Gender Action Plan and measures to promote women beneficiaries' improved participation in project planning and implementation, and their economic empowerment.
- Ensure women have access to training, resources, and decision-making processes related to irrigation and agriculture. This includes providing training in local languages at times and locations convenient for women. Childcare provisions can facilitate women's attendance.
- Set targets for women's participation in all project activities.
- Raise awareness of the importance of sharing household chores and farming workloads. This can give women more time to learn new skills, attend training, and participate in project activities.
- Promote women's access to skills and business development training centered around project target value chains for commodities such as rice, poultry, vegetables, and fish.
- Encourage the use of labor-saving technologies that can help reduce women's workloads in farming and household activities.
- Support women's involvement in off-farm activities, such as processing and value addition as well as investments in green products and women-led green enterprises.

5.5 Social Risks and Impacts and Mitigation Measure at Operation Stage

5.5.1 COMMUNITY HEALTH AND SAFETY

The potential for water use conflicts during the operation phase, particularly between upstream and downstream users, and recognizes the risk of accidental drowning, especially among children. The introduction of irrigation infrastructure and increased agricultural activity may alter existing water allocation patterns, leading to disputes between upstream and downstream communities. Upstream users may prioritize their own irrigation needs, potentially reducing water availability downstream, affecting livelihoods and ecosystems. The construction

upgrading of main canals along the OTP river introduces open water bodies into the landscape, increasing the risk of accidental drowning, particularly for children.

❖ **Mitigation Measures:**

- The project will promote IWRM principles to ensure the equitable and sustainable allocation of water resources. This involves considering the needs of all stakeholders, including upstream and downstream communities, as well as environmental flow requirements for maintaining healthy ecosystems.
- Establishing a system for monitoring water use and enforcing water allocation regulations will help prevent over-extraction and ensure a reliable water supply for all users. This may involve installing flow meters, conducting regular water audits, and implementing penalties for non-compliance.
- The project will strengthen the capacity of FWUCs to manage water resources at the local level. This includes training on water allocation, conflict resolution, and operation and maintenance of irrigation infrastructure. Effective FWUCs can play a crucial role in mediating disputes and ensuring fair water distribution within their communities.
- Raising awareness about water safety and the risks associated with open water bodies, especially among children, is essential. Educational campaigns, signage, and community outreach programs can help promote responsible behaviour and prevent accidents. This information could be included in the training programs that will be provided to farmers and communities.

5.5.2 CROSS-CUTTING

5.5.2.1 Gender inequality

The sources emphasize that women are less resilient to climate change than men and face unique vulnerabilities in terms of income, housing, and access to information and support systems. Socially defined gender roles can also hinder the adoption of climate-smart technologies among women. As a result, women may experience unequal access to water resources, limited participation in Farmer Water User Communities (FWUCs), and a disproportionate burden of negative impacts on their livelihoods.

The OTP sub-scheme is one of the other sub-schemes in the CAISAR project. The social studies in this project show that, Women-led households made up 15% of all sub-schemes, which is seen as a significant percentage. There is still gender disparity, which makes it difficult for them to participate in and profit from the project. Men often overestimate, which diverts women's attention from the involvement. Increased gender-based trainings for men and increased support for all vulnerable groups should be proposed by the local government and project implementer. There are 6,863 households and vulnerable people in the sub-scheme overall (25.4%), 2048 poor families (9%), 986 disabled people (1%), 151 elderly people (0.2%), and 155 parentless people (0.2%).

❖ **Mitigation Measures**

- The project should actively encourage women's participation in the formation of FWUCs, empowering them through critical decision-making roles and equipping them with the necessary skills and resources to amplify their voices.

- The project should ensure that women have equal access to training programs and resources, such as land, credit, and technology.
- The project should monitor gender equality indicators and should make adjustments as needed to ensure that women are benefiting from the project.

5.5.2.2 Social inequality

In this phase, the concern the competition for water resources among different user groups (farmers, communities, industries) and the potential displacement or restricted access to land due to irrigation infrastructure expansion, presents a minor risk of social inequality. Although the project aims to engage and consult with communities during the design and construction phases, vulnerable groups may still face limited access to irrigation water during the operation stage. This risk is especially relevant for farming communities, indigenous populations (if present), landless or land-poor households, and other vulnerable groups.

The vulnerable groups without farmland might have limited opportunities to benefit from the rehabilitated irrigation system. The impact of this social inequality is considered minor due to the relatively small proportion of poor people within the command area. However, it is important to note that the limited access to resources and capacity could hinder the full potential of efforts to support these vulnerable groups.

❖ **Mitigation Measures**

- Ensure Equitable Water Access: Mechanisms should be in place to support vulnerable and marginalized communities in accessing water resources.
- FWUCs will manage the irrigation systems and ensure sustainability through fee collection. The project will invest in establishing and training FWUCs, emphasizing inclusivity and capacity building for vulnerable groups.
- Implement a Simplified Integrated Pest Management (IPM) Plan.

5.5.2.3 Elite capture

The operation of the irrigation system during the operation phase creates a minor risk of elite capture due to the potential for unequal distribution of project benefits. This could result in powerful individuals or groups gaining a disproportionate share of the benefits at the expense of the intended beneficiaries. This risk is linked to the engagement and consultations conducted during the design and construction phases, as those processes might not fully prevent elite capture during the operational phase.

The main impact receptors are smallholder farmers, marginalized communities, and other vulnerable groups. Despite the project's efforts to ensure equitable access to resources, the sources highlight that wealthy individuals or groups could potentially leverage their power, connections, and resources to secure a larger share of water resources or control over irrigation infrastructure. This situation could further exacerbate existing social disparities and undermine the project's goal of improving livelihoods for all community members. The sources assess the risk of elite capture during the operation phase as minor. This assessment considers factors like the predominance of local landowners within the command areas and the current high land prices, which make large-scale land grabbing economically unfeasible.

❖ **Mitigation Measures**

- Transparent and accountable FWUC management: Clear guidelines, diverse representation, and grievance redress mechanisms are essential to prevent manipulation and ensure equitable water distribution.
- Regular monitoring and evaluation: Continuous monitoring of project impact, especially on vulnerable groups, can identify and address elite capture.
- Strengthened land tenure security: Clarifying land rights can protect smallholder farmers and marginalized communities from land grabbing.
- Community engagement: Active community participation, especially from vulnerable groups, empowers them and ensures their needs are met.

Summary of the impact mitigation measures is provided in the Table below. However, prior to the implementation of the construction, **National EIA** for the sub-scheme is required to ensure the compliance with the national legal framework.

Table 39: Preconstruction, Construction, and Operation Phase Environmental Mitigation Measures

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
Preconstruction phase				
1	Unexploded Ordnance (UXO) survey & removal			
	Risk of injuries or fatalities among workers or members of the public	• Carry out UXO screening/assessment by certified UXO experts before any physical/ construction activities are allowed. • In case UXOs are found by certified experts during on-site screening, removal of UXO will be carried out by certified experts. • A UXO clearance certificate shall be obtained from related authority for each sub-project prior to commencing any subproject activities. • As part of site-specific ESCMP, conduct training and awareness activities for local community with regards to UXO risks and chance finds.	PMU Contractor	Before construction
Construction phase				
ENVIRONMENTAL, HEALTH, AND SAFETY				
1	Noise and Vibration			
	• Earthmoving activities and operation of machineries at construction sites will generate dusts and exhaust fumes. • Construction activities, operation of vehicular movement, excavation machineries, concrete mixing, and other construction activities will generate noise and vibration and will be a nuisance to workers and residents near the site. • Noise may be generated from workers' camp, particularly during living activities or entertainment at nighttime, or due to certain maintenance /repair of equipment, machinery, vehicles.	• Maintain all exhaust systems in good working order and undertake regular equipment maintenance to ensure compliance with applicable regulations and manufacturers' instructions. • Implementation of operating and maintenance practices of equipment and machinery to ensure that they are well-maintained. • Ensure that noise control options such as silencers and mufflers are fitted to exhausts, compressors and fans for construction equipment (such as hydraulic excavator, bulldozer, front loader, backhoe and trucks). • Provide advance warning to the community on timing of noisy activities. Seeking suggestions from community members to reduce noise annoyance and notify the communities about how to raise their concerns (if any) through the Grievance Redress Mechanism. • Undertake noise monitoring at the closest residential area and other noise sensitive receptor during times with ongoing construction work to ensure compliance with the relevant noise standards. • The contractor shall provide all construction personnel working in the vicinity of noisy construction activities (defined as those activities generating noise levels greater than 80 dB(A)), or any construction personnel who requests hearing protection, with hearing protection equipment. • A speed limit of 30 km/h for construction related traffic through inhabited areas. • The contractor shall conduct noise testing at the sensitive locations as per the detail engineering design comparing to the IFC EHS Guideline	• PMU • Contractor	Daily/ Every 06 months

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
		• Avoid night-time construction in populated/village areas. • No noisy construction-related activities will be carried out from 21:00 hours to 06:00 hours along residential areas, hospitals, schools and during religious or cultural events near the subproject • Provide temporary noise barriers (3–5-meter-high barrier can reduce 5–10 dB(A)), as necessary, if site works will generate high noise levels that could disturb nearby households, hospital, school and other sensitive receptors. • Restrict use of vibrating rollers and operation of heavy equipment near sensitive structures.		
2	**Air pollution**			
	• Dust and particulate matter (PM10 and PM2.5) generation from soil disturbances, stockpiles, and road works • Exhaust emissions from trucks and heavy machinery (NOx, CO, SO2, VOCs) • Waste disposal, particularly through burning	• Spray or sprinkle water on the work surfaces and other piled materials to minimize dust at least 3-6 times per day in windy and dry weather and/or based on the weather condition. • Select Borrow sites located as close as possible to the construction to reduce distances. • If Concrete batching facilities are in need, it will be located at least 500 m (0.5 km) downwind from the nearest dwellings to reduce the impact of dust and fumes on humans and to be fitted with necessary equipment such as bag house filters to reduce fugitive dust emissions. • Water will be regularly sprayed to suppress fugitive dust at construction sites, material handling areas, access road and borrow pits. • Trucks carrying dry construction materials such as earth or waste will be covered with tarpaulins or other suitable cover. • Construction vehicles and machinery will be maintained to a high standard to minimize emissions and ensure compliance with the National exhaust emission standards. All mobile equipment should be fitted with catalytic converters. • A speed limit of 30 km/h for construction related traffic through inhabited areas and on the access, road will be enforced. • All open burning of construction and demolition waste material and refuse will be prohibited. • Testing air quality (NO2, SO2, CO, TSP, PM10, PM2.5)	• SEO • E&S specialist consultants • PMU	Daily/ Every 06 months
3	**Impact on Water**			
	• Dredging and excavation can significantly increase sedimentation in water bodies. • Disturbed soil can enter rivers and lakes, potentially polluting domestic water sources. • Large-scale dredging projects, like the 30km Ou Ta Paong dredging, pose a	• Installation of temporary non-erodible ditches or bunds at the construction site to divert clean runoff away from exposed areas, and convey potentially dirty runoff to sediment control devises. • Stockpiles and materials will be stored at least 50 m from surface waters with drainage directed away from the canals and streams or water sources. • The sediment quality of the dredge spoil will need to be tested and assessed against an appropriate standard before re-use in the structure of	• SEO • E&S specialist consultants • PMU	Daily/ Every 06 months

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
	significant risk to water quality throughout the excavation period. • Sedimentation can reach downstream areas, including the Tonle Sap Lake, if not properly mitigated. • Infiltration of wastewater from workers' camps can contaminate groundwater. • Leakage of hazardous materials like oil and diesel from machinery and vehicles can pollute both surface and groundwater.	embankments. The sediment testing results will confirm safe re-use of the material • No washing or repair of machinery within 50 m of surface waters. • Construction working areas will be clearly demarcated and encroachment onto adjacent areas avoided. • Portable toilets and small wastewater treatment units will be provided at the construction site and labour camps. All sanitary facilities will be located at least 50 m from surface water bodies. All workers must be instructed to use these facilities, which shall be kept clean at all times. • Pit latrines and septic tanks should be placed at least 2 m above the groundwater table must be located at least 50 m from surface water bodies and water wells and in areas of suitable soil profiles. • All hazardous materials including hazardous waste will be stored on an impervious surface, under cover, in adequate tanks or containers and within secondary containment. A bund will be provided around any above ground fuel storage tank with capacity of 110% of the largest single tank. Storage of hazardous materials shall be at least 50 m from surface water bodies with no direct drainage to surface water. • Areas where spills of fuel or oil may occur will be equipped with easily accessible spill control kits to assist in prompt and effective spill control. • Refueling of machineries by service vehicles will be conducted with measures preventing oil spillage during refueling including placement of buckets under refueling nozzles. • Runoff accumulating at the bottom of excavation pits during construction will be pumped out, reused where practicable or otherwise conveyed to appropriate sediment retention devises before being discharged to the environment. • Hazardous waste (oil waste) shall be properly collected and stored in closed containers under shelter for recycling or disposal by a duly authorizes enterprise. • Regularly inspect and maintain construction equipment to prevent leaks and spills. • Testing surface water quality (Depth, pH, EC, AS, Cd, Pb, TN, TP, TDS, TSS, DO, and Total Coliform) and pesticide residues in water (to be conducted overseas).		
4	**Solid and Hazardous Waste**			
	• Hazardous wastewater, such as oil or fuel, polluting materials used for machinery and construction process at the construction site.	• Storage facilities for fuels, oil, cement, and chemicals shall be within secured areas on impermeable surfaces, provided with bunds and cleanup installations; • Vehicles and equipment shall be properly staged in designated areas to prevent contamination of soil and surface water;	• PMU • Contractor	Daily

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
		• Vehicles, machinery, and equipment maintenance and re-fueling will be carried out in such a way that spilled materials do not seep into the soil; • Oil traps will be provided for service areas and parking areas; • Fuel storage and refilling areas will be located at least 50m from canals and channels and will be protected by temporary drainage bunds to contain spills.		
5	**Waste and Wastewater**			
	• Domestic wastewater comes from workers/staff's water consumption daily.	• Recyclables will be separated at source and given/sold to recycler (plastic, metal, card, paper as a minimum). • Safe temporary storage of hazardous waste as required • To the extent possible, a duly authorized waste company will be contracted to recycle hazardous waste. • Non-hazardous, non-recyclable solid waste will be temporarily deposited and managed together at existing landfill/dumpsite. • All vehicles/drivers will be provided with plastic bags for waste collection and prevent any unauthorized waste disposal with particular attention paid to prevention of littering. • The Contractor will be required to train the workers in proper waste management.	• PMU • Contractor	Daily
6	**OCCUPATIONAL HEALTH AND SAFETY**			
		• Prepare a health and safety plan containing site-specific precautions in accordance with relevant occupational health and safety guidelines; • Inspect and check the relevant construction equipment to ensure that it meets the applicable mechanical and safety requirements; • Inspect the worksite to ensure that the equipment can be safely mobilized and operated, and that there are no unmitigated risks; • Install appropriate fencing and control access to the site; • Install appropriate safety signage and markings; • Provide fall protection when workers are exposed to unguarded platforms or walkways higher than 2 m; • Ensure there are safe ways to enter and exit the excavation; • Keep excavations dry; • Provide safety precautions when using high voltage electric power tools; • Carry out daily toolbox meetings (safety briefings); • Maintain an accident record book where all major or minor accidents and incidents are recorded with actions taken; • Educate the workers on construction hazards; • Train drivers on safe driving skills and traffic regulations; • Appoint an Environment, Health and Safety Officer who is a qualified engineer; • Make adequate first aid equipment available on site; • Carry out training and awareness of the workers on HIV-AIDS prevention;	• PMU • Contractor	Daily/Weekly

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
		• implement emergency preparedness and response procedures Response Plan as planned in the CEMP. • Ensure that all workers are equipped with and use Personal Protective Equipment (PPE). • The Contractor will set out an Emergency Response Plan		
7	**COMMUNITY HEALTH AND SAFETY**			
		• Prior to the start of construction work, the contractor in cooperation with the PIU will consult with the local authorities and potentially affected residents/private landowner. Inform them about the upcoming construction work, safety precautions and how to raise concerns or file complaints (GRM). • The contractor shall fence off the construction area and control access to the site. • A speed limit of 30 km/h for construction related traffic through inhabited areas. • The contractor shall install traffic signage and fluorescent bollards and warning lights to direct traffic and prevent vehicles driving into the lanes with construction activities. • The contractor, in cooperation with the local authorities shall implement traffic management to ensure a smooth traffic and prevent congestion.	• PMU • Contractor	Daily/Weekly
BIODIVERSITY				
1	**Habitat Loss and Fragmentation:**			
	• Conversion of forests and wetlands at micro or large may be needed for canal construction.	• Minimize the negative impact from land clearing on habitat connectivity by minimizing fragmentation and maintaining canopy connectivity across cleared areas. • Establishing and maintaining guard posts on access roads near residential and biodiversity priority areas. • Implementing measures such as habitat restoration, creating wildlife corridors, and ensuring that water management practices are sustainable and supportive of biodiversity. • Rescuing and properly handling wildlife encountered during land clearing and construction, following SOPs. • Identify and avoid sensitive areas, such as known habitat for Green Peafowl or other endangered species. • Implement habitat management measures to improve the quality and suitability of habitats for species. • Consider restoration of the Boeng Kanseng, Boeung Pak Dong, and Boeung Chhouk for Ou Ta Paong to enhance ecological condition of the areas as well as increasing water storage of the area	• SEO • PMU • Contractor	Daily/Weekly
2	**Hunting and trading, and consumption of wildlife**			

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
	• The influx of a new labour force can increase demand for exotic local foods, including wildlife and endangered species, which are often seen as interesting and delicious. This may be done for relaxation or belief that wildlife is tasty or making people healthy.	• Develop and enforce a strict Code of Conduct/ethics against wildlife collection, possession, and trafficking. This includes clear policies and sanctions for employees and subcontractors. • Provide mandatory training for contractors' management staff and site workers on the Code of Conduct, Standard Operating Procedures (SOP) for wildlife protection and handling, and human-wildlife conflict management. • Incorporate a policy in the Project Administration Manual (PAM) and Worker's Agreement that prohibits employees and/or subcontractors from possessing, purchasing, trading, or collecting wildlife or forest resources that are legally protected, CITES listed, or classed as threatened by the IUCN Red List. • Educate construction workers about the importance of wildlife conservation and the laws regarding hunting and trading of protected species. • Implement strict penalties for violating wildlife protection laws. • Collaborate with local communities to monitor wildlife populations and report any suspicious activities.	• SEO • PMU • Contractor	Daily/Weekly
3	**Loss of fauna and flora**			
	• Construction activities can impact micro-wildlife habitats. • New canals and roads require vegetation clearance, further fragmenting habitats. • Habitat loss poses a serious threat to endangered species like the Black Marsh Turtle, Giant Asian Pond Turtle, Southeast Asian Box Turtle, and Elongated Tortoise.	• Properly handle and rescue wildlife incidentally encountered or caught during land clearing and construction by relocating them to safer habitats, following the Standard Operating Procedure (SOP) for wildlife protection and handling. • Conduct thorough biodiversity inspections along the access roads and at quarry sites before starting any land clearing works to identify any habitat and/or nesting sites of endangered/ protected species that may be affected by the clearing and identify hotspots where collisions with wildlife are likely to occur. • Train field workers to recognize and avoid wildlife. • Install signage to alert drivers to the presence of wildlife and require them to slow down and drive with caution, especially in hotspots where collision with wildlife is likely to occur. • Develop a system in which drivers report locations of wildlife crossings and wildlife sightings. • Workers will receive training on frequently encountered wildlife. • The contractor shall install signs to ban hunting or catching wildlife in the area. • Apply Find Chance Procedure	• SEO • E&S specialist consultants • PMU	Daily/Weekly
	• The activity contributing to this risk is the rehabilitation of irrigation canals and farm roads.	• Implement Biodiversity Action Plan • Apply Find Chance Procedure	• PMU • Contractor	Daily/Weekly
4	**GHG emission**			
	• The construction and operation of heavy machinery, such as excavators and bulldozers, during these projects	• Use energy-efficient machinery and equipment during construction to reduce fuel consumption and emissions.	• SEO	Daily

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
	release carbon dioxide (CO2) into the atmosphere, i.e. the energy requirements for construction works can result in increased carbon emissions • At the time of construction, there are possibility of smoke generated by burning of straw in the rice field.	• Optimize construction logistics to reduce the number of vehicle trips and machinery usage, minimizing fuel use and emissions. • Implement proper maintenance programs for equipment and vehicles to ensure they operate efficiently and with lower emissions. • Reduce deforestation and land-use changes that contribute to carbon emissions by preserving vegetation and replanting trees in affected areas. • Use low-carbon materials and construction techniques that reduce the embodied carbon in construction materials. • Offset unavoidable GHG emissions by investing in carbon offset projects, such as reforestation or renewable energy initiatives. • Engage with local communities and stakeholders to raise awareness of emission reduction practices and encourage their participation in sustainability efforts.	• E&S specialist consultants • PMU	
DURING OPERATION				
ENVIRONMENTAL				
1	**Water Management**			
	• Irrigation systems have both benefits and drawbacks. • Proper design and management are crucial. • Minimizing negative impacts on the natural water cycle is essential.	• Implement water-saving irrigation technologies like drip irrigation and sprinkler systems to reduce water consumption and minimize the strain on water resources. • Encourage the adoption of the AWD technique in rice cultivation to optimize water use and reduce water withdrawals for irrigation. • Establish detailed water management plans that ensure equitable water distribution and allocation, considering the needs of various users and the environmental flow requirements to maintain healthy aquatic ecosystems. • Design and construct robust irrigation infrastructure, including canals, ponds, and storage areas, capable of withstanding extreme weather events like floods and droughts. This investment should also include lining canals and refurbishing storage areas to reduce water losses and improve water storage capacity. • Integrate natural infrastructure, such as wetlands and forests, into water management strategies. Protect and restore degraded habitats to enhance their water regulation capabilities, improve water quality, and support biodiversity. • Establish and provide training to FWUCs on sustainable water management practices, equitable water rights, and allocation procedures. These communities play a vital role in the operation and maintenance of the irrigation system, ensuring its long-term sustainability.	• PMU	Annually
2	**Water Pollution**			
	• Increased use of chemicals, such as fertilizers and pesticides, to enhance crop yields. The excessive application	• Implement Simplified Pesticide Management Plan • Conduct regular water quality test to track the change in water quality due to pesticide application using oversea laboratory testing.	• PMU	Annually

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
	of these chemicals can result in contamination of both surface and groundwater resources.	• Encourage farmers to adopt IPM techniques that minimize pesticide use and rely on biological control methods, thereby reducing the risk of chemical contamination of water resources. • Provide training and extension services to farmers on the judicious use of fertilizers, ensuring they apply the correct type and amount based on soil nutrient levels. • Promote the adoption of organic fertilizers and soil amendments, such as cover crops and green manures, which can improve soil fertility and reduce the need for chemical fertilizers. • Implement a robust water quality monitoring program to track the levels of pesticides, nitrates, and other pollutants in surface and groundwater resources within and around the command areas. • Encourage the adoption of water-saving irrigation methods, such as alternate wetting and drying (AWD) in rice cultivation, which can reduce water consumption and minimize the leaching of agrochemicals.		
3	**Soil Pollution**			
	• Increased production could lead to overuse of agri-chemicals if farmers are not adequately trained or supported in adopting environmentally friendly practices.	• Implement Simplified Pesticide Management Plan • Conduct regular water quality test to track the change in water quality due to pesticide application using oversea laboratory testing	• PMU	Annually
BIODIVERSITY				
1	**Habitat Loss and Fragmentation**			
	• Conversion of land: Flooded forests and wetlands may be drained or filled to create more arable land for agriculture, leading to significant loss of habitat. • Fragmentation: Remaining natural habitats may become isolated patches, making it difficult for species to migrate, find mates, and maintain healthy populations. • However, key biodiversity areas/species/habitats are not affected by the project but have been improved instead. Biodiversity areas are primarily located in the Tonle Sap region, which could face impacts if construction workers improperly dispose of waste.	• Identify and protect critical habitats, such as flooded forests and wetlands, ensuring their preservation against conversion for agricultural land. • Implement measures to restore degraded habitats and improve their suitability for biodiversity. • Promote sustainable agricultural practices to minimize negative impacts on biodiversity and water quality. This can include encouraging practices that reduce the need for land conversion. • Implement sustainable water management practices to ensure adequate water availability for both human needs and ecological functions, avoiding excessive water extraction that could harm wetland habitats. • Involve local communities in decision-making, monitoring, and conservation efforts to build ownership and support for protecting natural habitats. • Promote sustainable livelihoods that are compatible with biodiversity conservation, offering alternatives to activities that lead to habitat loss. • Establish a long-term monitoring program to track changes in habitat quality, species populations, and the effectiveness of mitigation measures.	• PMU	Annually

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
		• Minimize forest encroachment and wildlife poaching by developing and implementing a community-based management plan. This includes establishing guard posts, conducting surveillance, and installing signage. • Implement and enforce policies against poaching and illegal collection of wildlife by workers and subcontractors, with appropriate penalties. • Raise awareness and educate the community on the importance of protecting fish populations and aquatic ecosystems.		
2	**Invasive Species**			
	• Changes in land use and water management can introduce invasive plant and animal species that outcompete native species and alter ecosystem dynamics	• Implement a robust monitoring system, including regular surveys of waterways and terrestrial habitats, to detect invasive species early. Train personnel to identify and map invasive species, and establish rapid response protocols for eradication or control, such as manual removal, targeted pesticide application, or biological control agents. • Implement specific water management practices to minimize the risk of invasive species spreading through waterways. • Foster collaboration among government agencies, research institutions, local communities, and NGOs for effective invasive species management. Facilitate information sharing, coordinate efforts, and leverage resources for maximum impact. • Public Awareness and Education: Raise awareness among all stakeholders. • Educate farmers, local communities, and other stakeholders about the risks of invasive species, their identification, and prevention measures. • Establish a system for reporting suspected invasive species to enable rapid response and prevent spread. Set up a hotline or a reporting mechanism accessible to all stakeholders.	• PMU	Annually
3	**GHG emission**			
	• Increased GHG emissions from farming activities: - Fertilizer use - Livestock production - Rice cultivation • Increased energy requirements: - Rice field preparation - Flood control systems - Other infrastructure	• The project is to promote sustainable practices like crop rotation and agroforestry to reduce energy consumption and improve soil health. • The project needs to introduce renewable energy sources such as solar-powered irrigation to lower the carbon footprint of rice production. • The project needs to support on training farmers to use alternatives to straw burning, such as mulching or biomass energy generation, to reduce air pollution. • The project promotes the utilization of efficient irrigation methods like alternate wetting and drying (AWD) to conserve water and minimize methane emissions. • The project needs to advocate for policies that discourage straw burning and provide incentives for adopting sustainable agricultural practices.	• PMU • Farmer	Daily
ANNUAL CROP MANAGEMENT PLAN				
	❖ **WATER**			
1	**Water resource efficiency**			

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
	• Over-extraction of water resources can lead to downstream water scarcity, altered hydrology, and damage to aquatic ecosystems.	• Project need to implement efficient water management practices to prevent over-extraction and ensure equitable water distribution. This can include: • water use monitoring system to track consumption and identify areas for improvement. • implementing appropriate irrigation scheduling based on crop water requirements and weather conditions. • Utilizing efficient irrigation systems, such as drip irrigation or sprinkler systems, to minimize water loss. • Exploring opportunities for water reuse, such as capturing and reusing runoff water.	• PMU • FWUC	Daily
	❖ **SOIL AND SOIL MANAGEMENT**			
2	**Soil erosion and soil erosion risk**			
	• Soil erosion can lead to loss of topsoil, reduced soil fertility, and increased sedimentation in water bodies.	• Minimize soil compaction and disturbance by using appropriate machinery and timing land preparation activities. • Consider erosion management practices such as contour planting, terracing, and grass barriers. • Adopt reduced tillage or no-till farming practices to minimize soil disturbance. • Establish cover crops during fallow periods or in rotation with main crops to protect the soil from erosion. • Practice contour farming on sloping land to reduce runoff and erosion. • Construct terraces on steep slopes to prevent soil loss. • Establish windbreaks or shelterbelts to reduce wind erosion. • Install erosion control structures, such as grassed waterways or sediment basins, to manage runoff. • Apply mulch to the soil surface to protect it from rainfall impact and erosion.	• PMU • Agricultural extension officers	After significant rainfall events Annually
3	**Nutrient application and management**			
	• Over-fertilization and nutrient runoff can contaminate water resources, negatively impacting aquatic ecosystems and potentially leading to eutrophication.	• Conduct periodic soil analysis to determine nutrient needs and avoid over-fertilization. • Establish buffer zones near watercourses to filter nutrient runoff. • Consider using green manures and cover crops to replenish soil nutrients and reduce leaching.	• PMU • Farmers	Before and after fertilizer application Regularly during the growing season
	❖ **PESTICIDE**			
4	**Use and effectiveness of pesticides:**			
	• Pesticide use can have adverse effects on human health, non-target organisms, and the environment. Pesticide resistance can develop, requiring increased application rates.	• Promote Integrated Pest Management (IPM) strategies to minimize pesticide use. • Implement training programs for farmers on the safe handling and application of pesticides. • Ensure proper disposal of pesticide containers and leftover products.	• PMU • Agricultural extension officers	Regularly during the growing season
5	**Pesticide residues on site soil**			

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
	• Pesticide residues can accumulate in the soil, potentially harming soil organisms and affecting water quality.	• Promote the use of pesticides with low persistence and mobility in the environment. • Implement a soil monitoring program to assess pesticide residue levels. • Consider crop rotation and the use of cover crops to help break down pesticide residues. • Minimize pesticide use by adopting IPM strategies. • Conduct soil testing to monitor pesticide residue levels. • Rotate crops to break pest cycles and reduce the need for repeated pesticide applications. • Utilize cover crops to improve soil health and enhance pesticide degradation. • Consider bioremediation techniques to remove pesticide residues from contaminated soil.	• PMU • Third-party laboratories	Periodically (e.g., annually or before planting sensitive crops)
6	**Pesticide residues on produce**			
	• Pesticide residues on produce can pose a risk to consumer health.	• Enforce pre-harvest intervals to allow for pesticide breakdown before harvest. • Promote the use of pesticides with low toxicity to humans. • Properly wash and handle produce to remove surface residues. • Implement a monitoring program to test produce for pesticide residues. • Ensure compliance with established MRLs for pesticide residues on produce.	• PMU • Third-party laboratories	Before harvest

UXO = Unexploded Ordnance, PMU = Project Management Unit, SEO = Social and Environmental Officer, E&S = Environmental and Social, IFC = International Finance Corporation, EHS = Environmental, Health, and Safety, GHG = Green House Gas, FWUC = Farmer Water User Communities, ESCMP = Environmental, Social, and Climate Management Plans.

Summary of Mitigation Measures for the Social Risks and Impacts is provided in Below Table.

Table 40: Social Risks, Impacts and Mitigation Measures

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
BEFORE CONSTRUCTION				
LAND ACQUISITION				
1	**Land acquisition and resettlement**			
	• Land acquisition requirements differ significantly across the six sub-schemes. • Ou Tapaong is projected to have the highest land acquisition needs. • The specific land acquisition needs for each scheme will be determined by the final concept design.	• Since the affected households are 50 HHs, therefore Abbreviated Land Resettlement Plan is required to be prepared.	PMU Contractor	Before construction

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
2	**Economic displacement**			
	• The potentially disrupting existing economic activities and displacing households and businesses, including informal farmers and businesses. In Ou Ta Paong, 1,012 households using land along the infrastructure and 41 shop owners may be affected, with 10 households facing land acquisition.	• The households who own the land along the rehabilitated canals which will be expanded at the public land should be properly informed prior to the construction to avoid their crops will be damaged at the time of construction. • Although the acquired land is the public land, there are a need of a proper consultation and information to be conducted to inform and obtain agreement from the affected households.	PMU Contractor	Before construction
DURING CONSTRUCTION				
	CHILD LABOR & FORCED LABOR			
1	**Child Labor**			
	• Project activities will occur in rural areas where child labor is prevalent. • Construction contractors and subcontractors may employ children under 18 years old for unskilled labor. • Local children may be particularly vulnerable to exploitation due to poverty and limited educational opportunities.	• Apply LMP for age check prior to engagement of labor with regular monitoring through proper screening and registering all workforce for the work • To mitigate the risk of child labor, the project will implement strict measures to ensure compliance with national and international labor laws. Regular monitoring and inspections will be conducted to identify and address any instances of child labor. • Additionally, awareness-raising campaigns will be implemented to educate communities about the harmful effects of child labor and the importance of sending children to school. The project will also collaborate with local authorities and NGOs to strengthen law enforcement and provide support services to vulnerable children and their families.	• Contractors • PMU	Daily Screening prior to engaging services of primary supplier
2	**Forced Labor**			
	• The risk of forced labor, particularly for vulnerable individuals, due to economic coercion, exploitation of young people, and debt bondage. The increased demand for local labor during irrigation and road rehabilitation could exacerbate this risk.	• Strict Code of Conduct for workers with no tolerance for physical or verbal abuse of women or children • The Project Owner and Sub-Contractors will collaborate with the relevant Government Agency to disseminate information to local communities. This information will include the Contractor's Code of Conduct and the minimum working age as mandated by national laws and international standards. • The Ministry of Water Resources and Meteorology (MOWRAM) will provide information to local communities about the contractor's policies and responsibilities, including the Contractor's Code of Conduct and minimum working age.	• Contractors • Primary supplier • PMU	Daily Screening prior to engaging services of primary supplier
COMMUNITY HEALTH AND SAFETY				
3	**Disease transmission**			

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
	• Disease transmission risks are anticipated due to the influx of construction workers, potentially exacerbated by unhygienic living conditions and interaction with the local community. This influx increases the risk of spreading communicable diseases among workers and between workers and residents, with workers' susceptibility potentially increased by factors like poor diet, stress, and unhygienic conditions.	• Conduct public awareness raising activities (IEC) to ensure local people and contractors know about the risks of contracting and spreading communicable diseases such as COVID-19, HIV/AIDS, and water-borne diseases (e.g., amoebiasis, giardiasis, and toxoplasmosis. etc. • In the event of a disease outbreak (e.g. COVID-19), provide immediate training/awareness raising to the risk groups. • Conduct training to workers on communicable diseases prior to mobilization to construction sites. • For water-borne diseases that arise due to polluted or contaminated water, mitigations measures may include: o Implement filtration, chlorination, or UV disinfection to ensure safe drinking water. o Build and maintain proper sewage systems and latrines to prevent water contamination. o Promote handwashing, safe food preparation, and proper sanitation practices in communities. o Control and properly dispose of waste to prevent water pollution. o Test water sources frequently for contamination and take corrective actions promptly. o Provide access to clean water supplies, such as bottled water or tankers, during outbreaks or disasters. o Promote immunizations against water-borne diseases like cholera and typhoid in high-risk areas.	• PMU • Contractors • Local health authorities	• Monthly • During outbreaks • Periodic community health awareness campaigns
4	**Sexual Exploitation and Abuse, Sexual Harassment**			
	• The project's influx of approximately 393 workers, including construction and logistical personnel, along with frequent project staff visits and pre-existing SEA/SH issues, creates a risk of sexual exploitation and abuse/harassment, particularly during irrigation and road rehabilitation. These workers may be especially vulnerable due to potential isolation.	• Contractors need to explicitly state zero tolerance for sexual harassment, exploitation, and abuse within the workplace. • Require Code of Conduct (CoC) to be signed by all construction workers. • For victims coming forward: referral to qualified SEA/SH service provider. The GRM will include a confidential channel for reporting SEA/SH. • Strict Code of Conduct for workers with no tolerance for physical or verbal abuse of women or children • Training to workers on maintaining good community relations, with emphasis on proper conduct around women and children.	• Contractors • PMU	• Monthly and during subproject cycle • Reported to PMU within 48 hours if occurred

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
		• Training on SEA/SH and VAC for community members, in particular women and girls (may be done separately for men and women). • Ensuring workers' sites are situated (at least 500m) from schools and/or other areas where children congregate. • Children are prohibited from construction sites and worker's camp. • Ensure access to grievance redress mechanisms for all project-affected persons, including both stakeholders and workers, to address Sexual Exploitation and Abuse, and Sexual Harassment. Support (in the form of training, awareness raising, etc.) to local law enforcement to act on community complaints regarding SEA/SH and VAC. • Provision of information to local communities about the contractor's policies and responsibilities, including the Contractor's Code of Conduct and minimum working age. • Provide counselling services for male and female workers, wives and other female partners of contractors' workers. • Build partnerships with local health providers and SEA/SH service providers to conduct community awareness activities, and referrals. • Implement public awareness campaigns to address sexual harassment in transport services and hubs, and training of police on women's security needs when using transport. This is included on GRM: - Accessibility for Workers - Multiple Reporting Channels - Confidentiality and Support - Contractor Accountability • It is necessary to consider deploying specialists to educate and raise awareness about issues of violence. • Project should provide budget support to women affair provincial department during the project activities for sexual exploitation and abuse, sexual harassment monitoring.		
5	**Traffic safety & Security**			
	• Increased transport of materials and equipment in the construction stage raises the risk of road accidents, theft, vandalism, and a perceived or actual increase in crime, affecting project workers, community	• Arrange security guard or engage local authority to guard the construction sites • Conduct public awareness raising activities (IEC) to ensure local people and road user are aware of road safety regulations and risks and act accordingly while using road. • Monitor and observe speed limit.	• PMU • Contractors	• Daily during construction • Weekly during construction • Monthly during operation

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
	members, and those living or traveling near construction sites.			
6	**Community Health and diseases**			
	• Construction activities, including canal and pond rehabilitation, pose community health and safety risks beyond disease transmission, encompassing drowning, accidents from trespassing in construction zones (including storage and laydown areas), traffic disruptions, potential community conflicts, and general construction site hazards.	• Establish clear and well-marked construction exclusion zones to prevent unauthorized access, especially to areas with open water, heavy machinery, and storage areas. • Implement fencing and barriers to prevent trespassing and ensure community safety around construction areas. • Provide warning signs in local languages to inform communities about the dangers and restricted access to construction areas. • Install safety barriers around construction sites to minimize risks to the community and workers. • Ensure proper storage of construction materials, with no materials left unsecured and scattered around the site. • Develop and implement traffic management plans to minimize traffic and access disruptions and ensure pedestrian and vehicle safety. • Conduct community awareness campaigns to educate the community about the potential risks and safety measures during construction. • Establish and maintain a grievance mechanism to address community complaints and issues promptly. • Implement safety measures around canals and ponds to prevent drowning incidents, such as installing safety barriers and providing warning signs in local languages. • Create and enforce clear rules regarding access to canals and ponds during construction, and post those rules. • Implement strict health and safety regulations at all construction sites to protect both workers and the nearby communities. • Provide training to workers on safety protocols, including how to work safely around water, avoid accidents and minimize risks to the community. • Ensure all workers are provided with necessary personal protective equipment (PPE) and enforce its use.	• PMU • Contractors	• Monthly • During outbreaks • Periodic community health awareness campaigns
7	**Personal Protective Equipment**			
	• The activities involve Canal Rehabilitation and Construction, Structure Construction and Rehabilitation, and Drainage Improvement, which expose workers	• Continue and active use of PPE at all time of construction. • Identification and provision of appropriate PPE that offers adequate protection to the worker, co-workers, and occasional visitors, without incurring unnecessary inconvenience to the individual	• Contractors • PMU	• Regular inspections/training

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
	to various hazards, such as Falling Debris, Sharp Objects, and Heavy Machinery.	• Proper maintenance of PPE, including cleaning when dirty and replacement when damaged or worn out. • Proper use of PPE should be part of the recurrent training programs for employees.		
8	**Working conditions and Management of Worker**			
	• The lack of written contracts for unskilled, especially locally recruited, workers increase their vulnerability to underpayment, unequal treatment based on gender and temporary status, and late or non-payment of wages, impacting their livelihoods and potentially hindering project progress.	- Implement a grievance mechanism for workers where workers can report issues related to underpayment or unequal treatment without fear of retaliation. - Advise companies to provide equal opportunities for employment and promotions to all workers, regardless of gender, ethnicity, or background, to avoid discrimination. - Regularly monitor and audit payroll and employment practices to ensure compliance with labor regulations and address any disparities. - Offer training and capacity-building programs for all workers to enhance their skills and qualify them for higher-paying roles. - Ensure that subcontractors and suppliers also adhere to fair wage and equal treatment policies. - Set up worker committees or unions to allow collective bargaining and ensure workers have a voice in addressing wage and treatment issues. - Provide accessible information to workers about their rights, entitlements, and the proper channels to address grievances through the establishment of the GRM for workers. This includes training on topics such as: • Environmental and Social Safeguards • Gender Awareness and the Gender Action Plan • Sexual Exploitation, Abuse, and Harassment (SEA/SH) - Labor Rights and the Workers' Code of Conduct Regularly engage with labor rights organizations or third-party auditors to evaluate labor conditions and make improvements where necessary.	• Contractors • PMU	• Regular payroll audits • Periodic worker satisfaction surveys • Prompt investigation of any reported grievances
9	**CULTURAL HERITAGE**			

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
	• Some cultural sites may be minimally impacted. • Risk of overlooking and destroying smaller sacred places. • Detailed design is crucial to assess the full impact.	• Conduct archaeological surveys before construction in culturally sensitive areas. • Implement Find Chance Procedure	• Contractors • PMU	• Daily • Reported to PMU within 48 hours
CROSS-CUTTING				
10	**Gender inequality**			
	• Women are more vulnerable to climate change impacts due to unequal access to resources, information, and decision-making power, often hindered by social gender roles. While women-led households represent a significant portion of project sub-schemes, they still face barriers to participation and benefits. The project area includes a substantial number of vulnerable individuals, including the poor, disabled, elderly, and parentless, highlighting the need for targeted support.	• The project should actively encourage women's participation in the formation of FWUCs, empowering them through critical decision-making roles and equipping them with the necessary skills and resources to amplify their voices. • The project should ensure that women have equal access to training programs and resources, such as land, credit, and technology. • The project should monitor gender equality indicators and should make adjustments as needed to ensure that women are benefiting from the project.	• Contractors • PMU	• Daily/ weekly
11	**Social inequality**			
	• Risk of being unequally engaged and treated, during the design phase and construction. The vulnerable are likely to be limitedly consulted and having limited access to available irrigation water.	• Conduct participatory planning and regular consultations with local communities, particularly marginalized groups (e.g., women, smallholder farmers, indigenous communities). • Prioritize hiring local labour, with special provisions for disadvantaged groups (e.g., youth, women, minorities) in both skilled and unskilled positions. • Develop and enforce water allocation plans that ensure fair access to water resources for all users, including small-scale and subsistence farmers, during and after construction. • Implement fair and transparent compensation or resettlement plans for those displaced or affected by construction activities, especially vulnerable households. • Establish accessible and responsive grievance redress mechanisms, ensuring all community members can raise concerns or complaints during construction.	• Contractors • PMU	• Continuously

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
		• Conduct regular social impact assessments, with a focus on identifying inequality trends, and adjust project strategies to mitigate negative effects. • Provide support and training for affected communities to diversify their livelihoods, especially for those whose livelihoods may be disrupted by construction (e.g., farmers, traders). • Ensure transparency in the contracting process, including the selection of subcontractors and suppliers, with opportunities for local businesses, especially those run by marginalized groups.		
12	Elite capture			
	• The rich have the resources to grab both available land and water resources, creating greater social disparities	• Consultation will be conducted farmers in potential command area, focusing on vulnerable/disadvantaged groups • Alternative livelihoods for vulnerable group are identified based on their needs vis-à-vis project's investment eligibility • Conduct consultation at community level (in the command area) to achieve a consensus on how water needs are balanced between different groups in one command area. • During subproject design, water availability, storage capacity, and water needs of upstream and downstream population are calculated to inform design, and water use coordination during project operation. • Water user groups should be established for upstream and downstream population and should be coordinated by a higher-level committee/group to negotiate and optimize water coordination • Guidelines/Manual should be developed to provide guideline for upstream and downstream communities at subprojects to meet, discuss, and achieve consensus on how water is distributed for equal use between upstream and downstream population	• PMU • Contractors	• Throughout project implementation • Regular community meetings and consultations
13	**Loss access to land and other assets**			
	• Construction activities, particularly land acquisition for canals and roads, can displace communities or restrict their access to land, homes, and other assets. • Temporary restriction of irrigation access during construction may occur in some areas, potentially impacting livelihoods, even though the project area is mainly rainfed.	• The project will prioritize avoiding physical resettlement and minimizing land acquisition. Design adjustments will be made to avoid or reduce land requirements, especially on private land. Public land will be prioritized for any necessary acquisition. • Where land acquisition is unavoidable, the project will employ a negotiated settlement process with affected households. This process, guided by the RGC's Standard Operating Procedures on Land Acquisition and Involuntary Resettlement (SOP-LAR), aims to ensure that affected households receive fair and adequate	• Contractors • PMU	• Before land acquisition • During land • After resettlement

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
		compensation for their losses and maintain or improve their income and livelihood status. • All individuals with assets within the Corridor of Impact (COI) before the Cut-Off-Date (COD) will be eligible for compensation, regardless of their legal status. Compensation will be provided for various losses, including land, structures, crops, trees, and income-generating activities. • Recognizing the potential disruption of income streams during relocation or construction, the project will provide transitional allowances to affected households. These allowances will help cover living expenses and bridge the gap until they can resume their livelihoods. • A multi-tiered GRM will be established to address grievances from any project-affected person. The GRM will operate based on the principles of the Green Climate Fund (GCF) and be accessible at no cost to the complainant.		
14	**Loss access to natural resources**			
	• Construction activities and project operations can restrict communities' access to forests, fishing grounds, water sources, or other natural resources they depend on for livelihoods	• Implement efficient water management practices during construction and operation to prevent over-extraction of water resources from reservoirs and rivers and ensure equitable distribution for downstream communities and ecosystems. • Establish construction exclusion zones around sensitive habitats, such as wetlands and forests, to prevent disturbance and minimize impacts on fishing grounds and biodiversity. Implement habitat restoration programs in areas where construction has occurred. • Use environmentally friendly construction materials and techniques to reduce the risk of pollution. Properly manage construction chemicals, fuels, and waste to prevent water pollution and contamination of natural resources. Prepare and implement a waste management plan to handle waste generated from construction activities and worker camps. • Optimize construction material use and recycle when possible, to minimize the extraction of new resources. Implement energy-efficient construction practices and use renewable energy sources where possible. • Maintain ongoing communication with affected communities, including farmers, fishers, and downstream communities, to address concerns about natural resource access. Provide information and education to construction workers about responsible use of local resources and respect for community	• PMU • Contractors	• Regular water quality and quantity monitoring • During project implementation: Monitor the effectiveness of mitigation measures.

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
		access rights. This suggestion is informed by the sources but is not directly stated in them. • Ensure the GRM is accessible to all community members to address complaints related to natural resource access.		
DURING OPERATION				
1	**COMMUNITY HEALTH AND SAFETY**			
	• Water use conflicts, especially between upstream and downstream users, are a potential risk due to altered water allocation from the new irrigation infrastructure.	• The project will promote IWRM principles to ensure the equitable and sustainable allocation of water resources. This involves considering the needs of all stakeholders, including upstream and downstream communities, as well as environmental flow requirements for maintaining healthy ecosystems. • Establishing a system for monitoring water use and enforcing water allocation regulations will help prevent over-extraction and ensure a reliable water supply for all users. This may involve installing flow meters, conducting regular water audits, and implementing penalties for non-compliance. • The project will strengthen the capacity of FWUCs to manage water resources at the local level. This includes training on water allocation, conflict resolution, and operation and maintenance of irrigation infrastructure. Effective FWUCs can play a crucial role in mediating disputes and ensuring fair water distribution within their communities. • Raising awareness about water safety and the risks associated with open water bodies, especially among children, is essential. Educational campaigns, signage, and community outreach programs can help promote responsible behavior and prevent accidents. This information could be included in the training programs that will be provided to farmers and communities. • The project will consider incorporating safety features into the design of irrigation infrastructure. This may include fencing around canals and reservoirs, installing safety ladders, and providing designated swimming areas away from irrigation structures.	• PMU • PDWRAM	• Daily for site inspections • Monthly for reports and consultations • Within 48 hours for reporting accidents, disease outbreaks.
CROSS-CUTTING				
2	**Gender inequality**			
	• Women are more vulnerable to climate change due to limited access to resources, information, and	• The project should actively encourage women's participation in the formation of FWUCs, empowering them through critical	• PMU • PDWRAM	• Monthly for data collection and reporting

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
	decision-making power, often exacerbated by gender roles, resulting in unequal access to water, limited participation in water management, and disproportionately negative impacts on their livelihoods.	decision-making roles and equipping them with the necessary skills and resources to amplify their voices. • The project should ensure that women have equal access to training programs and resources, such as land, credit, and technology. • The project should monitor gender equality indicators and should make adjustments as needed to ensure that women are benefiting from the project.		
3	**Social inequality**			
	• The competition for water and land displacement, and despite project consultations, vulnerable groups, particularly landless or land-poor households, may still experience limited access to irrigation benefits, though the impact is lessened by the relatively small proportion of poor within the area.	• Ensure Equitable Water Access: Mechanisms should be in place to support vulnerable and marginalized communities in accessing water resources. • FWUCs will manage the irrigation systems and ensure sustainability through fee collection. The project will invest in establishing and training FWUCs, emphasizing inclusivity and capacity building for vulnerable groups. • Implement a Simplified Integrated Pest Management (IPM) Plan.	• PMU • PDWRAM	• Monthly for data collection and reporting
4	**Elite capture**			
	• The rich have the resources to grab both available land and water resources, creating greater social disparities	• Transparent and accountable FWUC management: Clear guidelines, diverse representation, and grievance redress mechanisms are essential to prevent manipulation and ensure equitable water distribution. • Regular monitoring and evaluation: Continuous monitoring of project impact, especially on vulnerable groups, can identify and address elite capture. • Strengthened land tenure security: Clarifying land rights can protect smallholder farmers and marginalized communities from land grabbing. • Community engagement: Active community participation, especially from vulnerable groups, empowers them and ensures their needs are met.	• PMU • PDWRAM	• Regularly during FWUC meetings and project implementation • Continuously through the GRM.

PMU = Project Management Unit, LMP = Labour Management Plan, NGOs = Non-governmental Organizations, HIV/AIDS = Human immunodeficiency virus/Acquired immunodeficiency syndrome, UV = Ultraviolet, GRM = Grievance Redress Mechanism, SEA = Sexual Exploitation and Abuse, SH = Sexual Harassment, VAC = Violence Against Children, ESHS = Environmental Social Health and Safety, STDs = Sexually transmitted diseases, PPE = Personal Protective Equipment, IPM = Integrated Pest Management, PDWRAM = Provincial Department of Water Resources and Meteorology, FWUCs = Farmer Water User Communities.

6. STAKEHOLDER ENGAGEMENT AND INFORMATION DISCLOSURE

6.1 Purpose and Process of Stakeholder Engagement

Public consultation is a key component of CAISAR, and it was pivotal in preparation of the Environmental, Social, Climate Impact Assessment report (ESCA) Report and the Environmental, Social, Climate Management (ESCM) Plan. The consultations were conducted with relevant institutions, non-governmental organizations, local authorities, and local people during the preparation of ESCIA and ESCMP for CAISAR project. The data collection and consultations were conducted in four periods:

- The first consultation was conducted between 26 and 28 July 2024 to capture information regarding biodiversity and environmental condition in the project area.
- The second consultation was conducted to consult with forestry and fishery communities, local authorities and key informants to understand the situation and concerns related to the presence of the project. The consultation was conducted between 03 and 09 August 2024.
- The third consultation was conducted at household, village, and commune level stakeholders focusing on status, concerns and feedback regarding the project implementation. This consultation was conducted between 10 and 18 August 2024.
- The last consultation was conducted between 21 and 23 August 2024 with the district and provincial stakeholders, mainly focusing on the opinion, and feedback regarding the implementation of the project.

In addition to the stated consultations, there are also continuous consultations being conducted with AIIB, IFAD, and CAISAR PMU including the PMU management, SECAP team, and engineering team to ensure that the disclosed information being aligned with the most updated information of the project.

During project preparation, various stakeholders have been consulted in July and August 2024. Table below summarizes the number of people consulted by consultation techniques:

Table 41: Number of participants being consulted for Ou Ta Paong Sub-scheme

Levels	Household survey (Beneficiaries and Potentially Affected)	Focus Group Discussions	Key Informant Interviews	Total
Village level	140	61	9	210
Commune level			9	9
District level			5	5
Provincial level			21	21
			Total	**245**

6.2 Consultation Process

The purposes of the consultation were to:

- Inform local people and interested stakeholders of the purpose of the rehabilitation and construction of the irrigation system,

- Share the project information and the design options from the draft engineering design,
- Highlight subproject's key activities that are potentially associated with them, and
- Collect their opinion, concern and feedback on the project focusing on background information, project potential impacts (positive and negative), suggestions for impact mitigations, and consultation mechanism.

The consultation agenda with stakeholders included (i) the introduction of the study team, (ii) sharing project information using illustration materials, (iii) discussion and consultation on potential benefits and impacts of the project, (iv) suggestions on the mitigation measures, (v) grievance process and concerns, and (vi) final wrap up for the consultation. The study team were trained to introduce themselves to the purpose of the consultation, followed by the introduction about the project's component and activities expected to be implemented within the area. Materials including leaflet on project information and map of the command area were shared and explained to stakeholders prior to the consultation. Lastly, the consultation began with an overall discussion and specific questions as per the relevant aspect to the stakeholder. Opinions, concerns and suggestions were gathered and confirmed prior to the end of the consultation.

6.3 Stakeholder Engagement during Sub–Scheme Preparation

6.3.1 Environment, Biodiversity and Climate Change Impact

6.3.1.1 Pollution prevention and resource efficiency

Under the physical and environment aspects, the consultations discussed to gather opinion of stakeholders regarding the air quality, noise and vibration, surface and ground water quality, soil pollution, solid waste, domestic waste, wastewater. The consultations showed that stakeholders showed some opinions, concerns, and suggestions regarding the risks and impacts that CAISAR project may cause as below:

Overall Opinion

- There seems to be no concern regarding the quality of air or other disturbing factors as the community people and relevant stakeholders indicated the impacts are far below the other risks and impacts which they used to face. For example, the one caused by local factories and enterprises which shown to be at a higher level.
- The surface water quality seems to be impacted by various sources of pollution, including agricultural runoff from fertilizers and pesticides, factory waste, livestock waste, and human activities such as domestic waste and solid waste. While the project's activities are planned to conduct construction in the dry season and include their waste management plan, there's likely less impact on the water quality.

Concerns

- During the construction stage, such as the rehabilitation of irrigation canals and farm roads, can have disturbing environmental effects.
- Large machines used in the irrigation system construction generate noise and vibration pollution, which can disturb nearby residents and wildlife.

- The disposal of solid, liquid, and domestic waste from the workers at the irrigation construction site will negatively impact local air quality and surface water.

Suggestions from the consulted people

- Avoid canal rehabilitation and upgrading of the canal being conducted at night.
- Install garbage bins and waste storage areas in the construction sites and conduct orientation workers to put the waste in the garbage bins.
- Government institutions and stakeholders should regularly conduct site inspections to reduce project activities that harm the environment and local community.
- Relevant ministries should conduct a visit to evaluate and address the issue of liquid waste from the construction activities in the commune.

6.3.1.2 Biodiversity

Regarding biodiversity, consultations have been conducted with local people, local authorities, and relevant institutions, focusing on habitat loss and fragmentation, alteration of water regimes, and loss of biodiversity in the command areas. The summary of the results is provided here:

Overall Opinion

- The CAISAR project's construction activities will have a minimal impact on biodiversity within the sub-schemes. By improving irrigation infrastructure, farmers can cultivate their land more frequently, and during the project operation, this may lead to increased biodiversity and ecological benefits.
- Improved irrigation systems will enable farmers to supplement their income by engaging in aquaculture, such as fish farming.
- Fish and other aquaculture will increase due to expanding habitat and space for moving, and farmers will be able to fish for household consumption and income.
- Less impact to biodiversity, however it has more benefit to biodiversity itself and farmers in the community.
- The project will significantly enhance the landscape by generating a livelier farming activities and water availability.

Concerns

- CAISAR project may cause negative impact on the environment, including changes in water quality, dust generation, air pollution, soil erosion, improper waste disposal, and hazardous waste from machinery.
- Additionally, the project's construction could disrupt the natural flow of water from upstream to Tonle Sap Lake, potentially harming the lake's biodiversity.
- The fish populations in command areas may decrease due to disrupting the natural flow of water and the impact on their habitats from the implementation of the reirrigation infrastructure and canal upgrading.

Suggestions from the consulted people

- The contractors and relevant parties should conduct on water quality and air quality monitoring during construction.
- To ensure the well-being of workers, contractors must regularly monitor and inspect of living conditions of the workers, manage waste effectively, and provide adequate housing and sanitation facilities to them.
- The contractor is responsible for providing comprehensive training to workers on proper waste oil management procedures.
- Activities such as fishing and hunting should be strictly prohibited to minimize environmental impact.
- The project should avoid construction activities and improve irrigation on fish and aquatic habitats.
- Prevent damage from the construction activities to biodiversity, habitats, and other environmental components.

6.3.1.3 GHG Emission

There seems to be limited awareness and knowledge regarding the construction and farming activities which will contribute to the GHG emission. Only a few stakeholders reported the opinions were recorded which are mainly the line departments.

Overall Opinion

- The contribution of the project in terms of GHG emission may add into the global GHD emission due to activities like transportation, agricultural practices, the decomposition of agricultural waste, and the burning of agricultural waste.
- The use of trucks and heavy machinery during the construction process will inevitably release greenhouse gases into the atmosphere.

Concerns

- Climate change is negatively impacting rice production, causing problems such as increased disease, insect infestations, and extended dry seasons,
- Waste and pollution may contribute to the emission of GHG, and
- The impact maybe small such as waste burning at the construction sites and the increased use of machinery

Suggestions from the consulted people

- The contractors should ensure that garbage bins are conveniently placed throughout the workers' camp and collaborates with a waste collection company to guarantee regular and efficient removal of waste.
- To minimize emissions, contractors are advised to refrain from using outdated machinery.
- Installing solar water pumps in agriculture processing facilities can reduce fuel consumption, which causes greenhouse gas emissions.

6.3.2 Social Aspects

6.3.2.1 Labor and Working Conditions

Overall Opinion

Common impacts of labour and working condition, provided by relevant stakeholder during the consultation including:

- The project's benefits outweigh the negative impacts, as it is anticipated to improve the availability of workspaces for both men and women and enabling farmers to boost agricultural production.
- People without land may find labour opportunities, potentially reducing migration.
- Even though women may be occupied with factory work, they can still engage in agricultural activities.

Concerns

- The presence of construction staff and workers at the community may lead to sexual exploitation or affecting women workers and women and children in the community.

Suggestions from the consulted people

In response to the common issues outlined above, participants have also offered suggestions to address these concerns as the following:

- The construction companies should hire local workers to offer them jobs and strictly abide to laws and reducing the concerns about gender-based violence or sexual violent.
- Construction companies and relevant departments should provide training on gender issues, violence, labour laws, and social protections to their staff and workers.
- The project should allocate budget for relevant line departments to conduct relevant trainings to the companies and workers, and to monitor the construction sites

6.3.2.2 Community Health and Safety

Overall Opinion

- The construction and rehabilitation of the irrigation system is unlikely to generate any significant impact on community health, as no harmful chemicals are used, aside from some noise and vibrations.

Concerns

- Participants remain concerned that the presence of workers could result in sexual abuse of women and children living near the project site,
- Drug trafficking and consuming among workers may cause unsafe environment for both workers and surrounded residents,
- The construction activities may generate dust and slippery road conditions which may lead to traffic incidents,

- Waste generated from worker camps and construction activities during the project could degrade water quality, negatively impacting human health, livestock, and crops.

Suggestions from the consulted people

- The construction companies should regularly place warning signs and water the roads, as well as schedule construction times to minimize noise pollution that could disrupt the community,
- The project should promote gender awareness, enforce stricter punishments for offenders, and prevent drug trafficking in the workplace,
- The construction companies must collaborate with local authorities in all activities to make a proper management, control and monitoring during construction, and
- The project should conduct gender education at the district to prevent and address gender-based violence,
- The project should equip the solar lights along the roads to promote the safety of travellers during nighttime,

6.3.2.3 Land acquisition, economic and physical displacement

Overall Opinion

Perspective on land acquisition, economic and physical displacement impact from all the sub-scheme organizations is stated below:

- The rehabilitation or restoration of the irrigation system does not appear to directly impact rice farming, but it is crucial for enhancing rice and agricultural production and improving transportation infrastructure for agricultural products,
- Currently, farmers face water shortages for rice cultivation during the dry season and excess water during the wet season, due to insufficient sub-canals, reservoirs, and water sources,
- The irrigation system contributes to improving livelihoods for both general and vulnerable groups by boosting rice production, increasing local businesses and vendors, supporting water-related enterprises (such as water filtration), facilitating labor sales, and promoting local tourism. However, the irrigation system alone will not reduce migration unless there is a market for agricultural products,
- The project is believed to have minimal impact on farmers' land and private companies as it is planned to mainly rehabilitate the existing system,
- People tend to have positive views and welcome such a kind of project and normally they are willing to voluntary contribute the land,
- The provincial, district, and relevant institutions are capable solving the issues well and people are willing to cooperate,
- The roles and structure of the relevant authorities in dealing with the land acquisition and resettlement are well-prepared and ready to address the concern,
- Law on expropriation will be complied and compensation will be made as per the legislation of the country, so it is not generally a big problem for such a project,

Concerns

- Conflicts between the project and affected families may arise, often driven by external influences rather than the families themselves.
- Land-owning farmers might lose their land for agriculture, which could compel them to migrate, increasing their risk of exploitation and potentially leading to their children dropping out of school.

Suggestions from the consulted people

- The project should conduct a preliminary study on land issues before construction is going to be implemented, addressing specific aspects of land impact and conducting evaluations for each affected property,
- The project/construction company must collaborate with local authorities to resolve land-related issues, and compensation should be provided to landowners affected by the project,
- Farmers who own land may lose it for farming, which could force them to migrate, heightening their vulnerability to exploitation and potentially causing their children to drop out of school.

6.3.2.4 Cross–cutting risks and impacts

Regarding to cross-cutting risks and impact focus on social inequalities, and elite capture which influenced by the project, all the participants illustrate their perspectives, concerns and provide some idea and feedback as per their location as the following:

Overall Opinion

- The management of the system is quite challenging which is based on the actual situation of the system,
- The back-and-forth arguments may cause the delay of the construction of the irrigation system,
- The rising price of rice has led farmers to produce more rice than the available water supply can support, despite warnings from PDWRAM,

Concerns

- Unequal water distribution among farmers leads to favoritism and conflicts, often because farmers do not follow water distribution guidelines or announcements from authorities.
- Institutions or companies responsible for establishing FWUCs are typically based at the national level, resulting in limited quality of implementation, which weakens the FWUCs, while PDWRAM is sidelined, leading to wasted resources.
- The FWUCs struggle to generate income, making water management challenging, as there is no budget for repairs, leading to improper system operations.
- In addition to water issues, farmers face challenges such as pests, diseases, labor shortages, lack of capital, limited production techniques, flooding, unstable prices for vegetables and livestock, and high agricultural input costs.

- The provincial department lacks the budget to support the resolution of water user conflicts.
- Some farmers are absent from the rice fields during water distribution periods.
- Tensions between upstream and downstream villages arise when excess water released upstream during the wet season causes downstream flooding, while in the dry season, insufficient upstream water flow impacts downstream areas.
- High agricultural input costs continue to reduce farmers' profitability.
- Farmers do not follow official guidance on the size of rice fields to be cultivated, leading to inadequate water for irrigation.
- Manure availability for fertilizer is declining due to reduced livestock raising, and falling cattle prices are prompting farmers to further decrease livestock production.

Suggestions from the consulted people

- Women should be engaged and be promoted as the members of Water User Community to promote water distribution equality regarding water allocation from the system,
- PDWRAM should be the leader in formulating the FWUCs with the support from national level,
- Closed monitoring and support to FWUCs are critical and should be conducted regularly by all levels,
- Water use and maintenance support should be provided including technical and management training, along with problem-solving techniques, to effectively control and manage water distribution,
- The project should thoroughly examine the water availability, technical and situational aspects of the sub-scheme before construction to prevent water shortages or flooding,
- Ensure transparent water supply to prevent disputes by holding meetings to plan water use and distribution, involving the district governor, commune council, and relevant stakeholders,
- All parties should also participate in the maintenance of the irrigation system and provide training or education on water conservation to farmer.
- The Environment Department should allow dam or canal restoration activities of private companies, as these activities benefit both the community and agricultural production.
- Prior to starting irrigation rehabilitation, organize a public forum to gather feedback from local residents, disseminate project information to people and stakeholders, and announce the construction period in advance.
- The water consumption fee should be gathered from farmer which could be used later to support caretaker and maintenance the irrigation system.
- Increase the number of commune agricultural technical officers to provide training and monitor farmers' cultivation techniques.

- Build more water storages, and reservoir such as ponds or wells and conduct training on water-saving techniques to adapt to actual water availability.
- Installing and upgrading the damaged sluice gates to improve water distribution efficiency and prevent water loss in agricultural production and irrigation systems.
- Facilitate the development of additional agricultural markets.
- Provide crop seeds to farmer and implement crop rotation techniques to improve yields.
- Providing modern equipment and new techniques to department officers can enhance agricultural production efficiency and yield.

6.4 Stakeholder Engagement during Sub–Scheme Implementation

During the implementation of the sub–scheme, particularly prior to construction, when locations of contractor's office, workers' camp, disposal sites for construction debris and construction waste, and labor management plan, etc. are identified – based on Contractor's ESMP, environmental and social risks and impacts associated with Contractor's specific construction methods and measures will be updated in C-ESMP and disclosed for continued consultation with local people and local authorities to avoid/minimize E&S risks and impacts.

6.5 Information disclosure

This ESCMP will be disclosed to the public in both English and Khmer language. The English version will be disclosed in full version whereas the Khmer version will be disclosed as Executive Summary. The documents will be disclosed on the website of MOWRAM (as Project Implementation Unit), and on the website of AIIB, IFAD and GCF before project appraisal and project approval – as per disclosure guidelines required by each donors.

7. GRIEVANCE REDRESS PROCEDURES

7.1 Objectives of the Project GRMs

The objective of the GRM is to provide affected persons with redress procedures that can be conveniently used to raise a project related concern or grievance. The GRM guides how a complaint can be lodged, including forms and channels through which a complaint can be submitted. To facilitate the grievance resolution process, grievances received will be acknowledged in writing and solved within a specified timeframe. During the resolution process, where necessary, dialogue will be held with aggrieved people for mutual understanding and effective resolution. Once a complaint is resolved, the aggrieved person will be notified of the resolution results.

The GRM has sequential steps that aggrieved person can use. If the aggrieved person is not satisfactory with the grievance resolution result, or if their complaint is not resolved within the timeframe specified for a particular step, aggrieved person can move on to the next step which is higher in resolution hierarchy. The project has an appeal process where complainants can

resort if they are not satisfied with a resolution decision at a particular step, or their complaints are not resolved within a specified timeframe.

7.2 Summary of National Legislation Related to Grievance and Complaint

The RGC has various laws and sub-decrees that have been in place to guide the implementation of the complaint resolution process. These documents specify the right of the complainants as well as the responsibilities of concerned governmental agencies as to complaint resolution. Relevant legal documents include:

- Law on Expropriation (dated 26 February 2010)
- Labor Law (dated 13 March 1997, amended on 20 July 2007 and 26 June 2018)
- Law on Prevention of Domestic Violence and Protection of Victims (dated 24 October 2005)
- Sub-decree No. 22 ANK/BK (2018) on Standard Operating Procedures for Land Acquisition and Involuntary Resettlement for Externally Financed Projects in Cambodia. Guidelines for Grievance Redress Mechanism (Appendix 8)
- Law on Administrative Management of Capital, Provinces, Municipalities, Districts and Khans (dated 22 May 2008) – Section 6 on Solution of Local Conflicts
- Sub-decree No. 22 (25 March 2002) on Decentralization of Roles, Functions, and Power to Commune Councils (Article 61: duty to promote the role of conciliating disputes between citizens)
- Sub decree No 47 ANK.BK (31 May 2002) on Organization and Functioning of the Cadastral Commission (Chapter 4 – District/Khan Level Conciliation).

7.3 Principles of the Project GRMs

Under CAISAR, the following principles will be applied:

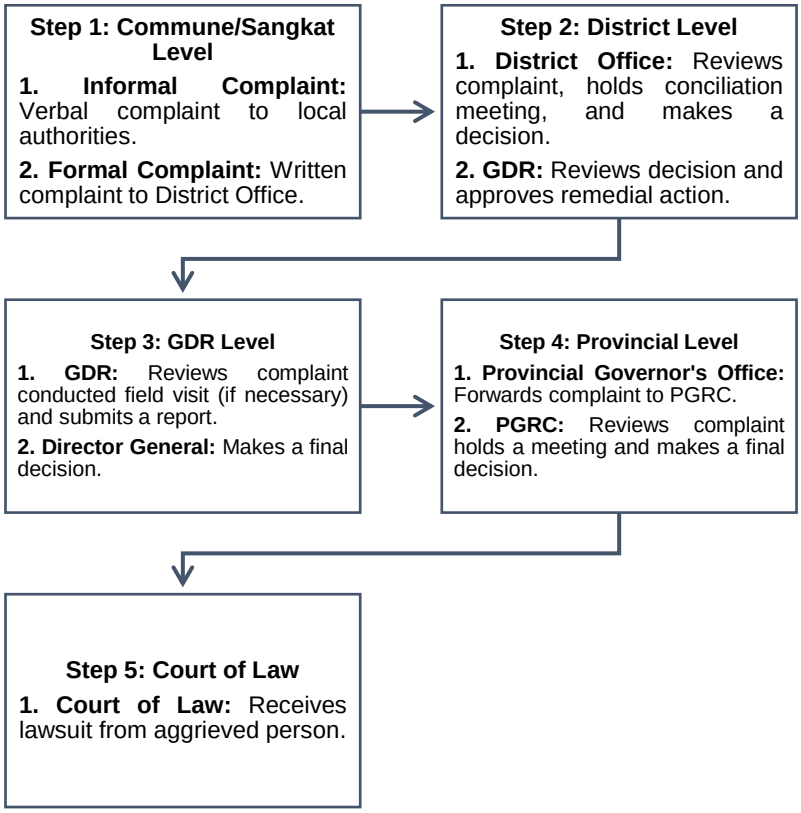
- Channels. Different channels are established to enable affected person to submit their grievances, including submission to village committee, as well as district and provincial levels.
- Forms. Grievances can be submitted in writing and verbally, and either directly by the affected households, or by a person delegated by the complainant.
- Complainant can delegate a representative who acts on their behalf. A person lodging a grievance can ask assistance from their family or from individual to act as their representative.
- Disclosure. GRM procedures are disclosed in public domain (e.g., websites of PMU, public notice board at village hall, and in front of substation).

- Documentation. A grievance logbook will be maintained at substation (subproject level) and at PMU level (through PMU GRM focal point).
- Transparency. Grievance procedures include steps, time frame for grievance resolution for each step, notification to affected person, how decision is made.
- Acknowledgement. The unit in charge of complaint resolution will notify complainant upon complaint receipt and will initiate the complaint resolution process.
- Appeal. If the agency in charge does not resolve a grievance in a manner that is satisfactory to the affected person, a multistakeholder committee will be established (ad-hoc) to resolve the dismissed grievance – as an alternative for affected person going to court.
- Monitoring. All grievances received are recorded by PMU and relevant substations, and are processed/resolved in a given timeframe, and are monitored by PMU GRM focal point.
- Time-limit. Time-limit is specified for each step in the grievance resolution process.
- Complainants bear no costs. Complaint resolution is free of charge to aggrieved person. However, if the complaints bring their case to court, they will bear the costs associated with their lawsuit.
- Any grievance concerning urgent health and safety issues shall be resolved immediately.

7.4 Project's Redress Procedures

The project has in place complaint handling procedures for three types of potential grievances, including grievances related to 1) land acquisition, 2) labour and working conditions, and 3) sexual exploitation and abuse and sexual harassment (SEA/SH/GBV/GBV), and 3) general complaints. These procedures are established based on the above GRM principles and are in accordance with pertinent national legislation. The GRM for complaints related to land acquisition is provided in the project's Resettlement and Policy Framework (RPF) and that for IPs is provided in the project's IPPF. Summary for the above four procedures is provided below:

7.4.1 Redress Procedure for Complaints related to Land Acquisition



Under this project, to facilitate the grievance redress (Figure 17), the informal and formal steps are combined for convenient use of affected people, as follows:

- Step 1 − Commune/Sangkat level. APs will seek assistance from commune/Sangkat chief or community elderlies who will discuss with the leader of the PRSC-WG to find a solution. Verbal grievance can be provided to the commune/Sangkat chief or community elderlies. So, no written complaint is required. It is noted that even if the complaint is made verbally, the complaint will be registered in project's logbook, including resolution process and result for such verbal grievance for monitoring purpose. Upon receipt of the verbal complaint, the PRSC-WG will consult with the IRC-WG to ensure the complaint is addressed timely. If the grievance is not resolved to the

satisfaction of the AP, or if the AP prefers, s/he may lodge their complaint through the formal route which includes the steps below.

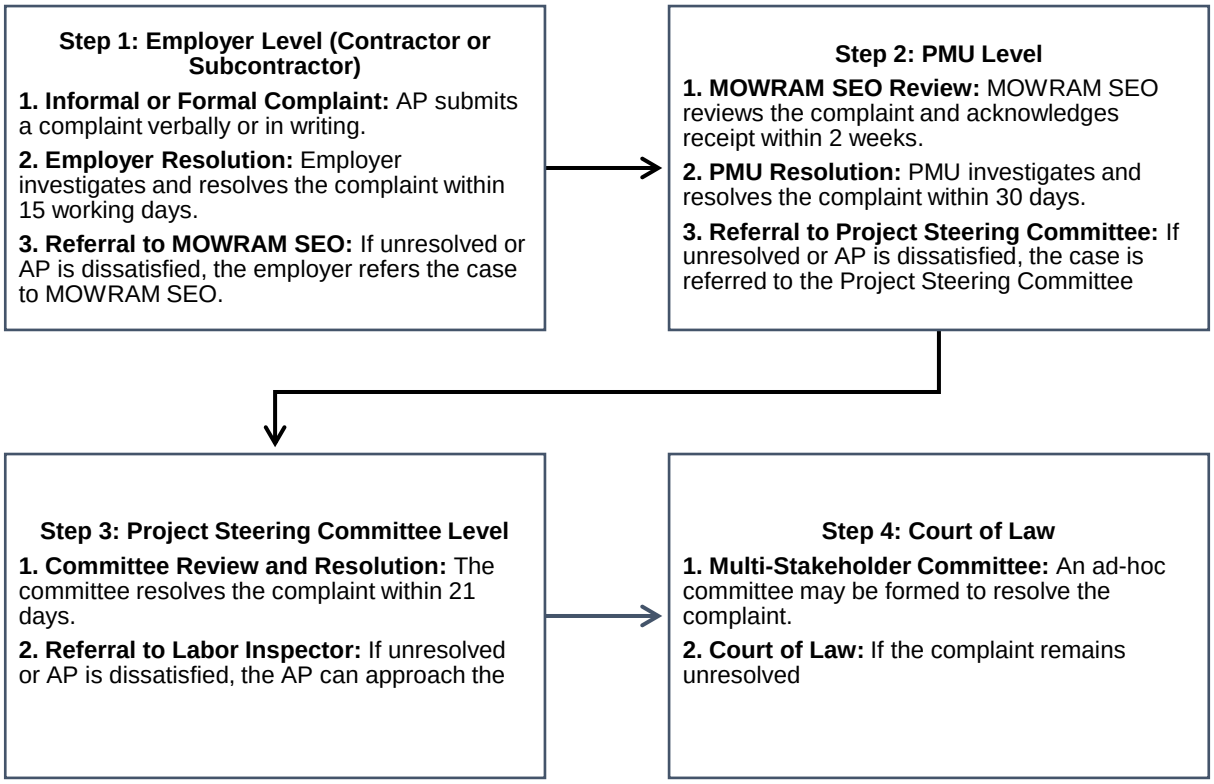
- Step 2 − District level. AH can lodge a written complaint to the Head of the District Office (where the subproject is located). The AH can bring a community elderly or their representative to discuss their grievance at the District Office. A conciliation meeting shall be held, and a decision be made within 15 working days from the date of complaint is received by the District Office. If the complaint is resolved to the satisfaction of the AH, the IRC-WG will inform GDR's Department of Internal Monitoring and Data Management (DIMDM) who will review and seek the approval of the Director General of GDR for appropriate remedial action. GDR will inform the AF of the decision/ remedial action within 15 working days from the receipt of the grievance by the District Office. If the complaint is rejected at this step, District Office will inform the AH of the rejection in writing. If the complainant is not satisfied with the decision/resolution result, s/he can proceed to step 3 (below).
- Step 3 − GDR level. The complainant who is not satisfied with proposed resolution from Step 2 shall lodge a written complaint to the GDR for resolution. The GDR, through its DIMDM, will carry out a holistic review of the complaint and submit a report on its findings with the relevant recommendations, if any, to the Director General of GDR for review and decision. GDR may conduct a field visit to meet the complaint and the IRC-WG to gather relevant information. The final report must be completed within 30 working days from the date of receipt of the complaint by GDR for submission to the Director General of GDR who will make a final decision within 5 working days of receipt of the final report. In the event that the subject matter requires a policy level intervention, it will be referred to the IRC for a decision which may require that an additional 10 working days be extended from the original deadline for final decision.
- Step 4 − Provincial level. AH will submit a written complaint to the PGRC through the Provincial Governor's Office. The complainant or a representative will be given an opportunity to present its case during a meeting and the PGRC may consider any compelling and special circumstances of the AH to inform their decision. The GDR will send a representative, as a non-voting member, to provide an explanation to the rejection of the complaint at Step 3 with the GDR. The decision of the PGRC must be made on a consensus basis and will be final and binding except when the matter relates to government's policy. Decisions related to government's policy matters on land acquisition and resettlement are decided by the IRC. The PGRC will have 40 working days from the date of receipt of the complaint to reach a final decision. The decision of the PGRC will be sent to the IRC (through the GDR) for endorsement before any remedial action is taken. There are no fees or charges levied on the AH for their lodgment of complaint and for complaint resolution for the above 4 steps.
- Step 5 − Court of Law. If the aggrieved person prefers filing a lawsuit at the Provincial/Municipal Courts, as applicable, to seek a resolution, AP can do so but will bear cost related to the lawsuit as per the Expropriation Law. When the case is brought to a Court of Law, there is no involvement of the GDR, PRSC or IRC-WG unless there is a judicial order from the competent courts.

Figure 33: Redress Procedure for Complaints related to Land Acquisition

7.4.2 Redress Procedure for Complaints Related to Labor and Working Conditions

Project workers can lodge their grievance/complaint as follows:

- Step 1 – Employer Level (Contractor and Subcontractor). Aggrieved person (AP) can submit their grievance to their Employer who serves as the first focal point for receiving and resolving grievance. Grievance can be lodged verbally or in writing, in person or by phone, text message, mail or email (anonymous complaint is accepted). The Employer involved will resolve the case no later than 15 working days. Once resolved and the AP is satisfactory, the Employer will report the case, including resolution process and results, to the SEO of the MOWRAM for information and record. If the AP is not satisfied with the resolution of their Employer, the Employer will refer the AP to the SEO of MOWRAM, if needed and inform the AP of this referral. It is noted that if a complaint concerns the safety and health of one or several individuals, such complaint shall be resolved as soon as possible – depending on the nature and urgency of the grievance.



- Step 2 – PMU level. MOWRAM SEO will resolve the complaint referred to by the Employer (Step 1) and acknowledge receipt of the AP's complaints within two weeks from the date of complaint receipt. If the SEO of MOWRAM cannot resolve the complaint, the SEO Team will consult with the Project Manager/Director for resolution. The SEO of the MOWRAM will inform the AP (in writing) of the PMU's resolution result within 30 days from the date of complaint receipt. If the AP is not satisfied with the

resolution result proposed by PMU, PMU will refer the case to the Project Steering Committee of the project and shall inform the AP (in writing) of this referral.

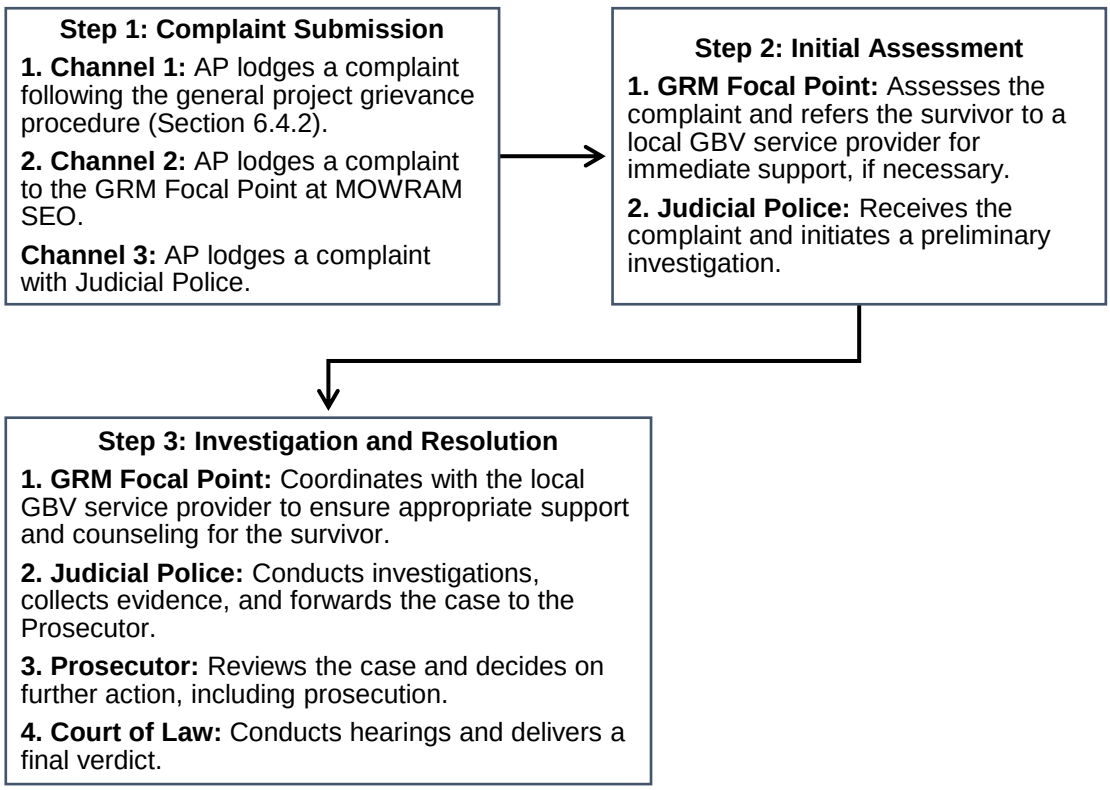
- Step 3 – Project Steering Committee level. At this level, the case will be resolved no later than 21 days. The AP will be informed of the resolution decision in writing. In case the grievance has not been solved within the specified timeframe, or the AP does not agree with the proposed resolution, the AP can approach the Labor Inspector of his/her province or municipality.

- Step 4 – Court of Law. If the AP is not satisfied with the resolution proposed above, a multistakeholder committee will be established (ad-hoc) to resolve the dismissed grievance – as an alternative for affected person going to court. If the grievance could not be resolved satisfactorily by the multistakeholder committee, the affected person may resort to the court of law. The cost associated with the lawsuit shall be borne by the AP. The decision of the Court will be final.

Figure 34: Redress Procedure for Complaints Related to Labor and Working Conditions

7.4.3 Redress Procedure for Complaints Related to SEA/SH/GBV

Under the project, the GRM for SEA/SH/GBV mainly serves to: (i) refer complainants to a local GBV service provider; and (ii) record resolution of the complaint. In line with the above, the following principles apply so as to recognize SEA/SH/GBV victim as principal decision makers in their own care, and treat them with agency, dignity and respect for their needs and wishes: § Multiple channels are in place for easy access and lodge complaints.



- SEA/SH/GBV survivors will be referred to a local GBV service provider for immediate support if they make a complaint directly to PMU.

- Confidentiality of survivors is protected. GM operator (at PMU and local GBV service providers) will keep confidential for SEA/SH/GBV allegation report.
- No identifiable information on the survivor shall be collected and stored in Project Grievance Logbook.
- Costs of operating the SEA/SH/GBV GRM will be covered by the project.

It is noted that under this project, GBV service provider will be engaged for subprojects that are rated “High” or “Substantial” for SEA/SH/GBV risks − as part of site-specific ESMP. based on SEA/SH/GBV risk assessment The following channels can be used to submit a grievance related to SEA/SH/GBV:

- Channel 1 – AP who believe the SEA/SH/GBV incidence is related to project workers can follow steps outlined in Section 6.4.2 (above) to lodge a SEA/SH/GBV complaint.
- Channel 2 – Alternatively, AP can lodge their complaint, verbally or in writing, to the GRM’s Focal Point within the SEO of MOWRAM for advice and resolution (contact of GRM Focal Point is provided in Section 5.1 (Resources).
- Channel 3 – If AP wants to bring the case to the Court of Law, AP can follow steps below for prosecution. Prosecution related to SEA/SH/GBV is administered under the Criminal Code and the Code of Criminal Procedure and is as follows:

Figure 35: Redress Procedure for Complaints Related to SEA/SH/GBV

- Step 1 – Judicial Police. SEA/SH/GBV victim or a representative can submit their grievance to a local Judicial Police (JP) Officer. JPs include a) Commune/ Sangkat Chief, b) Commune/ Sangkat/ District/ Provincial/ National Police, and c) District/ Provincial/ National Military Police. The JP is responsible for receiving, recording complaints, and may conduct preliminary investigations to identify and arrest the perpetrator. The JP will also collect evidence to support the prosecutors. If the SEA/SH/GBV happens at home and/or falls under the domain of domestic violence (as per Law on the Prevention of Domestic Violence and Protection of Victims), the SEA/SH/GBV survivor may seek support from a local qualified Judiciary Police Officer (appointed by the Ministry of Women's Affairs) who can act as a complaining party on behalf of the SEA/SH/GBV survivor15.
- Step 2 – Prosecutor. Upon receiving the completed written record from the JP, the prosecutor can decide on if the prosecutor will hold a file without processing it further or conduct proceedings against the perpetrator. The prosecutor may bring the case to the Court of Law and present the evidence in Court hearings.
- Step 3 – Investigation by Judge. During this step, the investigating Judge will conduct interrogation of the charged person and perform other required investigation procedure.
- Step 4 – Hearing. After issuing an order of indictment, the investigating Judge will submit the case to the trial court president who shall arrange a date for the trial. The decision of the Court on SEA/SH/GBV resolution is final.

7.4.4 Redress Procedure for General Complaints

In case individuals, households, or communities are affected by any other aspects, for instance, environmental impacts such as increased dust, noise, or lack of safety measures that increase risks of traffic accident to road users or to local EM, various channels will be established for convenient use by affected parties, including IPs. These include:

- PMU GRM focal point's telephone (See Section 5.1 – Resources). o Local EM leaders (in case affected individual/households are EM)
- Contractor's hotline: to report cases that they think contractors can solve timely (contact detail of Contractors will be posted at construction sites, and distributed to IPs (through Subproject Information Booklet) during consultation, and post at public billboard of Commune/Sangkat offices, pagodas, etc.
- Commune/Sangkat offices

7.5 Registration of Project Grievance

The SEO, Project 6. Managers within MOWRAM is responsible to establishing and maintaining the project grievance logbook (PGL). The PGL will be established by the SEO to record all concerns/ grievance that are submitted by project stakeholders during project implementation. In case there is serious complaint, the World Bank should be notified of these complaints within 24 hours of complaint receipt (See Annex 3 for Guidance for establishing and maintaining Project Grievance Logbook).

The GRM is an integral project management element that intends to seek feedback from beneficiaries and resolve of complaints on project activities and performance. The GRMs for the project are based on IAAB, IFAD, UN, and GCF requirements and, most importantly, national requirements for solving potential problems between project owners and residents/persons affected by the subproject(s).

8. IMPLEMENTATION ARRANGEMENTS

8.1 Environmental and Social Duties of the PMU/Detail Design Consultants

8.1.1 MOWRAM'S PMU

The MOWRAM's PMU will work closely with PDWRAM in planning and implementing subprojects located within their province. The PDWRAMs will also supervise project officers at the district-level Department of Water Resource and Meteorology, and are responsible for:

- Coordinating effectively with all project stakeholders, including MOWRAM's SEO, consultants, contractors, local authorities, provincial departments, and project communities.
- Supporting provincial and district-level project officers in monitoring and evaluating progress and performance of consultants and contractors.
- Supporting MOWRAM'S SEO to conduct training on labor, gender, SEA, SH, VAC, and HIV/AIDS.
- Supporting MOWRAM'S SEO to disseminate project information and conduct consultation activities, as well as ensuring effective grievance redress resolution within their province.
- Supporting MOWRAM'S SEO to conduct screening and scoping of the subprojects, and identifying environment, social, land acquisition impacts and screening for presence of IPs in the subproject area.
- Liaising with village authorities in subproject area to encourage vulnerable groups to apply for jobs that may be offered by project's contractors.
- Collaborating with relevant departments involved in land acquisition and/or other environment or social mitigation measures.

8.1.2 NCDD'S PMU

NCDD's PMU will work closely with Provincial Cabinet in planning and implementing subproject located within their province. NCDD PMU will be responsible for day-to-day project implementation, monitoring and evaluation of Project Component 1, 2.1 and 2.2 in collaboration with MAFF. PMU will work under the oversight and guidance of NCDDS and will be responsible for all aspects of environmental and social performance, including E&S monitoring and evaluation, reporting of E&S performance, and relevant incidence during project implementation.

8.1.3 Provincial Department of Water Resources and Meteorology

PDWRAM's main responsibility includes:

During subproject preparation:

- Support design parties in their surveys and consultation to prepare Feasibility Study and Detailed Design for sub-scheme.

During construction:

- Oversee construction activities under Component 2, particularly construction of the new irrigation canal in the command area

During operation:

- Collaborate with other relevant technical departments, especially PDAFF at provincial level, farmer water user groups (FWUG) to ensure its regulators (located within the water distribution network) are operated effectively, and in a manner that minimizes water use conflicts among target water user community in the command area.
- Conduct regular maintenance of the reservoir and irrigation canals during subproject operation and maintenance stage.

8.1.4 Provincial Department of Agriculture, Forestry and Fisheries

PDAFF is responsible for implementing activities under Component 1, 2.1 & 2.2. Under this subproject, PDAFF is responsible for developing and implementing agricultural techniques that make full use of improved water access (under Component 1) to enable farmers in the command area to produce more food in a sustainable manner which improves farmers' income and livelihoods. PDAFF will focus on the following:

- Promoting crop diversification for farmers in the command area (e.g. crop rotation for rice and horticulture production improves soil conditions whereas enhancing vegetation production for household's better nutrition and income.
- Introducing to farmers new agricultural engineering techniques to promote a) mechanization to increase productivity in crop production (e.g. mechanization in soil preparation using laser land leveling, use of combine harvester to save labor and reduce production costs, b) save water by applying alternate wet and dry (AWD) and drip irrigation for horticultural activities, c) reduce GHG.
- Scaling up Crop Production and engaging Private Sector in value chain development for specific farm product (e.g. rice, bean, and other cash crops such as vegetables…) and relevant agricultural services through agricultural cooperatives, producer groups, etc.

8.2 Contractor's Environmental and Social Management Plan (C-ESMP)

The civil works contractor is responsible for implementing the Environmental and Social (E&S) mitigation measures outlined in this ESMP for Component 2, which involves constructing the irrigation canal and related structures like gates and regulators. Based on the ESMP and the project's Labour Management Plan (LMP), the contractor will:

- Prepare and submit a Contractor's Environmental and Social Management Plan (C-ESMP) for each contract, detailing how E&S risks related to construction activities, workers, camps, machinery, and vehicles will be mitigated. The C-ESMP must also include a labor management plan (C-LMP) and be site-specific, addressing risks based on the contractor's capacity and site conditions.
- If subcontractors are engaged, they must prepare their own E&S plan aligned with the ESMP and LMP, outlining how they will manage identified risks and impacts. Reporting arrangements between the subcontractor and the main contractor must be detailed, with the main contractor consolidating subcontractor reports into monthly E&S performance reports to the PMU, with quarterly reporting potentially required.
- If changes occur to the proposed works and activities during the contract period, the contractor must update the C-ESMP to reflect these changes, including relevant subcontractor plans. The C-ESMP should include:
    - A policy statement outlining the contractor's commitment to the site-specific ESMP.
    - Document details (issue date, revision status, distribution list, and signatures).
    - Applicable laws, regulations, and required permits.
    - Plans to manage E&S risks, including mitigation measures, a Workers' Code of Conduct, and a Contractor's LMP.
    - A list of required environmental and social training for all personnel, including occupational health and safety, SEA/SH/VAC risks, and emergency response.
    - Financial resources and responsibilities for implementing the C-ESMP, including subcontractor responsibilities and training for local workers.
    - Monthly environmental reports, covering accident/incident reporting within 48 hours to MoWRAM, compliance with the C-ESMP, challenges, non-compliance issues, subcontractor activities, and meeting minutes with MoWRAM.

The contractor must ensure timely funding, human resources, and implementation of pre-construction and construction mitigation measures, along with any additional E&S mitigation required.

8.3 Contractor's Safety, Social and Environmental Officer (SSEO)

The contractor must appoint a competent on-site Safety, Social, and Environment Officer (SSEO), trained in environmental management, to oversee contractors and subcontractor personnel. The SSEO's responsibilities include:

- Supervising subcontractor compliance with the Contractor's LMP and C-ESMP.
- Submit the LMP and C-ESMP to the PMU/DDIS for approval before mobilizing staff.
- Conducting site inspections and audits to ensure compliance with environmental and social mitigation measures.

- Monitoring and reporting on E&S compliance and preparing audit reports.
- Investigating complaints, recommending corrective actions, and addressing non-compliance.
- Informing the contractor, PMU, and DDIS of any E&S issues, and maintaining detailed records.
- Collaborating on labor issues and preparing the Contractor's LMP and C-ESMP, including OHS regulations.
- Maintaining employment records, verifying minimum working age, and ensuring signed Workers' Codes of Conduct.
- Providing regular training on occupational safety, SEA/SH/VAC, and community relations.
- Ensuring primary suppliers address SEA/SH/VAC, child labor, forced labor, and OHS risks.
- Developing and implementing a grievance mechanism for contracted workers, resolving grievances promptly, and reporting to the PMU.
- Ensuring all workers sign the Code of Conduct and implement measures to prevent SEA/SH.
- Developing and enforcing COVID-19 prevention and mitigation plans.

Incident reporting

The contractors are required to inform DDIS and PMU any incidents listed below within agreed timeframe (e.g. 48 hours):

- Any violations to national laws, regulations, or international agreements.
- Any serious accidents or fatalities,
- Significant impacts that cause losses to personal property such as traffic accidents, damages to local houses/roads and other incidents.
- Serious surface/ground water pollution.
- Failures of embankments at disposal sites that cause serious pollutions to the surroundings,
- Fire related to worker's behaviours,
- Any claims related to SEA/SH/VAC, or any other incidents related to children, and
- Receive a complaint about pollution or damages.

8.4 Contractor's obligation as to contractual requirements

The contractor and its subcontractors, if any, shall comply with the ESMP. In particular, the Contractor must prepare a Contractor's ESMP (C-ESMP) to elaborate this ESMP based on a)

site condition, b) capacity of the Contractors and their subcontractors (if any), c) national regulations that are active by the time of subproject implementation.

To ensure that necessary action has been undertaken and that steps to avoid adverse impacts and/or reoccurrence have been implemented, the Project Manager, the Safeguard Focal Persons, and/or contractor must report to PMU within 48 hours of any serious incidents of non-compliance that may have serious consequence. In the event of working practices being deemed dangerous either by the subproject, the local authorities, or the other concerned agencies, immediate remedial action must be taken by the contractors. The contractor must keep records of any incidents and any corrective action taken. The records of non-compliance that could be practically addressed (not cause serious impacts) will be reported to the DDIS with a copy to PMU monthly.

The contractor will be responsible for dealing with any reports/grievance forwarded by the local communities, authorities, police or other agencies as soon as practicable, preferably within one hour but always within 48 hours. The Project Manager/Safeguard Focal Persons will monitor and ensure that the contractor has taken appropriate action. Where appropriate, approval of remedial actions may require an agreement from the local authorities and/or other government agencies. Procedures should be put in place to ensure, as far as is reasonably practical, that necessary actions can be undertaken to avoid recurrence and/or serious damage.

9. ENVIRONMENTAL AND SOCIAL MONITORING PROGRAM

9.1 Environmental Monitoring Program

To ensure the effectiveness of environmental management, the environmental monitoring program is prepared to monitor the environmental quality. The contractor and/or sub-contractor is responsible for monitoring using appropriate method, equipment and system. Details on monitoring parameters are shown in the table below:

Table 42: Environmental monitoring plan during pre-construction, construction, and operation phase

Monitoring Parameters	Monitoring Indicators	Location	Measurements	Frequency	Responsibility
Pre-construction phase					
UNEXPLODED ORDNANCES (UXO)	• UXO screening by certified experts required before any construction. • Found UXOs to be removed by certified experts. • UXO clearance certificate required before subproject activities. • UXO risk training and awareness for the local community.	Along the canales (construction site)	• Confirm all relevant areas are clear from UXO by consulting national military. • Obtain a certificate of UXO clearance	Before construction	PMU Contractor
During construction phase					
	ENVIRONMENTAL				
Noise and Vibration	• Avoid working during night-time from 21:00 hours to 06:00 hours • Provide ear sets for workers to prevent noise if the noise level exceeds the standard • Check and maintain construction machinery regularly to avoid noisy and high vibration • Restrict use of vibrating rollers and operation of heavy equipment near sensitive structures	Construction site Nearby sensitive structures	Site inspection Visual observation	Daily	SEO E&S specialist consultants PMU
	Measuring noise and vibration level	Construction site, there are 2 locations for noise and vibration level sampling. ANV1 X: 356908 Y: 1395649	Measuring equipment and/or appropriate monitoring methods	Every 06 months	SEO E&S specialist consultants PMU

Monitoring Parameters	Monitoring Indicators	Location	Measurements	Frequency	Responsibility
		ANV2 X: 355879 Y: 1404046			
Air quality	• Spray or sprinkle water on the work surfaces and other piled materials to minimize dust at least 3-6 times per day in windy and dry weather and/or based on the weather condition • Solid waste or construction waste activities • Construction machinery operation and maintenance • Distance of sitting concrete mixing plants, crushing • plants, quarries and other facilities to settle and other sensitive receptors • Transportation of construction materials	Construction site	Site inspection Visual observation Monitoring equipment and/or appropriate monitoring methods	Daily	SEO E&S specialist consultants PMU
	Testing air quality (NO2, SO2, CO, TSP, PM10, PM2.5)	There are 2 locations for air quality sampling. ANV1 X: 356908 Y: 1395649 ANV2 X: 355879 Y: 1404046	Air quality monitoring equipment	Every 06 months	
Impact to Water	• Wastewater management • Design and capacity of septic tank • Digging of side drain at campsite • Construction of retaining structures	Construction site	Site inspection Visual observation	Daily	SEO E&S specialist consultant s PMU
	• Testing surface water quality (Depth, pH, EC, AS, Cd, Pb, TN, TP, TDS, TSS, DO, and Total Coliform).	There are 3 locations for surface water quality sampling. SW1 X:356706 Y:139619	Water quality monitoring equipment	Every 06 months	SEO E&S specialist consultants PMU

Monitoring Parameters	Monitoring Indicators	Location	Measurements	Frequency	Responsibility
Habitat Loss and Fragmentation	• Area of habitat converted for agricultural use • Changes in the size and connectivity of habitat patches • Number of isolated habitat fragments	The entire sub-scheme	Site inspection Visual observation	Annually	SEO E&S specialist consultants PMU
Invasive Species	• Presence and abundance of invasive species • Area affected by invasive species • Effectiveness of control measures	The entire sub-scheme	Site inspection Visual observation Vegetation surveys	Annually	SEO E&S specialist consultants PMU
GHG emission	• Monitor the Knowledge, Attitude and Practices of farmers in farming activities that cause GHG emission	The entire sub-scheme	Site inspection Visual observation Consultation	Daily	SEO E&S specialist consultants PMU
	ANNUAL CROP MANAGEMENT PLAN				
Water resource efficiency	• Monitor water extraction rates from surface and groundwater sources. • Assess irrigation efficiency by measuring the amount of water applied versus the amount of water actually used by crops. • Monitor the implementation and effectiveness of water-saving irrigation methods (drip irrigation, sprinkler irrigation, AWD for rice). • Track water consumption per unit of crop yield (e.g., cubic meters of water per ton of rice produced).	Irrigation intake points Representative fields within the sub-scheme	Water flow measurements Soil moisture monitoring Crop water use assessments	Daily	PMU FWUC
Soil erosion and soil erosion risk	• Monitor soil erosion rates in different parts of the sub-scheme, particularly in sloping areas. • Assess the effectiveness of erosion control measures (contour planting, terracing, grass barriers). • Monitor soil organic matter content as an indicator of soil health and erosion resistance.	Representative fields Areas with different slopes and soil types	• Visual assessments of erosion features (gullies, rills) • Soil loss measurements using erosion	After significant rainfall events Annually	PMU Agricultural extension officers

Monitoring Parameters	Monitoring Indicators	Location	Measurements	Frequency	Responsibility
			plots or sediment traps • Soil organic matter analysis		
Nutrient application and management	• Monitor the types and amounts of fertilizers applied to different crops. • Conduct regular soil testing to assess nutrient levels and guide fertilizer application rates. • Monitor nutrient runoff from fields, especially near watercourses.	Representative fields Water sampling points near fields	• Fertilizer application records • Soil nutrient analysis • Water quality testing for nutrients (nitrogen, phosphorus)	Before and after fertilizer application Regularly during the growing season	PMU Farmers
Use and effectiveness of pesticides	• Monitor the types and amounts of pesticides used for different crops and pests. • Assess the effectiveness of pest control measures by monitoring pest populations and crop damage. • Track the incidence of pesticide-related health issues among farmers and workers.	Representative fields Pesticide storage facilities	• Pesticide application records • Pest scouting and monitoring data • Health records	Regularly during the growing season	PMU Agricultural extension officers
Pesticide residues on site soil	• Conduct soil sampling and analysis to measure pesticide residue levels in representative fields.	Representative fields Areas near pesticide storage facilities	• Soil residue analysis	Periodically (e.g., annually or before planting sensitive crops)	PMU Third-party laboratories
Pesticide residues on produce	• Collect and analyze samples of produce to determine pesticide residue levels. • Ensure that produce meets national and international standards for maximum residue limits (MRLs).	Representative fields at harvest time	• Laboratory analysis of produce samples	Before harvest	PMU Third-party laboratories

9.2 Social Monitoring Program

To ensure the effectiveness of social management, the social monitoring program is prepared to monitor social issues. The contractor and/or sub-contractor are responsible for monitoring using appropriate methods, equipment and system. Details on monitoring parameters are shown on the table below:

Table 43: Social monitoring plan during pre-construction, construction, and operational phase

Monitoring Parameters	Monitoring Indicators	Locations	Measurements	Frequency	Responsibility
Preconstruction phase					
Land acquisition/ Economic displacement	• Track the process of acquiring land for the project, ensuring fair compensation is provided to affected landowners. • Implement programs to help displaced individuals and communities restore their livelihoods. Establish effective grievance mechanisms to address complaints and concerns related to economic displacement.	Construction sites	• Monitor the distribution of compensation payments and address any disputes or concerns. • Monitor the effectiveness of these programs.	• Daily • Reported to PMU within 48 hours	• PMU
During construction phase					
PROTECTING THE WORKFORC					
Child Labor/ Forced Labor	• Involvement of child labor/ forced labor in main contractor and subcontractors' workforce • Involvement of child labor/ forced labor among primarily supply workers	• Construction sites • Worksite of primary supplier	• Site inspection • Observation	• Daily • Screening prior to engaging services of primary supplier	
COMMUNITY HEALTH AND SAFETY					
Community Health and diseases	• Incidence of waterborne diseases • Prevalence of vector-borne diseases (e.g., malaria, dengue fever) • Respiratory illnesses related to dust and air pollution • Availability and accessibility of healthcare services	• Construction sites • Worker camps • Community and neighboring areas	• Health data collection • Site inspections • Health surveys and interviews • Consultation with	• Monthly • During outbreaks • Periodic community health awareness	• PMU • Contractors • Local health authorities

	• Community awareness of health risks and preventative measures		workers and community members	campaigns	
SEA/SH	• Before mobilizing workers to construction site, conduct orientation/training on SEA/SH (using sample Code of Conduct as a minimum) for all Contractors' managers and workers mobilized to construction site • As part of the above training/orientation, ensure all workers understand SEA/SH risks, disciplines and penalty, and understand project's grievance procedures related to SEA/SH • As part of the workers and manager's work contract, require all workers engaged for project (both workers mobilized to site or work in contractors' office) to peruse and sign Workers' CoC • Ensure Contractors appoint a focal point in charge of ESHS and grievance reception, processing and resolution • Apply all measures related to management of work camps	• Construction sites • Relevant local communities	• Number and percentage of workers trained on SEA/SH prior to mobilization to subproject site • Number and percentage of workers signing Code of Conduct as part of Work Contract • Percentage of workers perpetrating SEA/SH and percentage of cases reported to PMU and resolved • Name and contact of ESHS and grievance focal report reported in Contractor's ESMP.	• Monthly and during subproject cycle • Reported to PMU within 48 hours if occurred	• Contractors • PMU
Traffic safety and Security	• Security cautions • General disease prevalence • Worker health • Communicable diseases	• Construction sites • Access roads to construction sites • Newly constructed/rehabilitated roads	• Site inspections • Incident reports • Data collection • Consultation with workers and community members • Review of contractor safety plans	• Daily during construction • Weekly during construction • Monthly during operation	• Contractors • PMU • Local authorities
Community Health and diseases	• Consultations with target communities to assess the current social situation and social impacts of sub-projects. • Recommendations and solutions from communities obtained regarding negative social impacts.	• Target communities • Workers	• Assessment of social situation and social impacts. • Collection of community	• During consultations	• Contractors • PMU

			recommendations and solutions.		
Personal Protective Equipment	• Health and safety regulations enforced at construction sites. • Appropriate training and personal protective equipment (PPE) provided to workers.	• Construction sites and worker camps	• Monitoring that contractors provide appropriate PPE and enforce its use. • Observation of training sessions. • Review records of PPE distribution and training.	• Monthly monitoring during construction	• Contractors • PMU
Working conditions and Management of Worker	• Worker wages and benefits compared to legal requirements and industry standards • Instances of discrimination or unfair treatment based on gender, ethnicity, or other factors • Access to grievance mechanisms for workers to report unfair labor practices	• Construction sites • Worker camps	• Payroll records review: Verify worker wages and benefits. • Worker interviews: Confidential interviews to gather feedback on labor conditions and treatment. • Observation of worker interactions: Monitor for signs of discrimination or unfair treatment. • Review of contractor labor policies and practices: Ensure compliance with labor laws and ethical standards.	• Regular payroll audits • Periodic worker satisfaction surveys • Prompt investigation of any reported grievances	• Contractors • PMU
Cultural heritage	• Unexpected impacts on heritage resources	• Construction sites	• Site inspection • Observation • Report by local people/local authority	• Daily • Reported to PMU within 48 hours	• PMU • Contractors

CROSS-CUTTING					
Loss access to land and other assets	• Number of households affected by land acquisition or temporary restrictions on land use • Types of assets affected (e.g., land, houses, crops, trees) • Adequacy of compensation and resettlement measures for affected households	• Project areas where land acquisition is required • Areas affected by temporary restrictions on land use	• Land surveys and asset inventories • Consultations with affected households • Review of compensation and resettlement plans • Monitoring of resettlement implementation	• Before land acquisition • During land • After resettlement	• Contractors • PMU
Loss access to natural resources:	• Impacts on community access to water resources (e.g., for drinking, irrigation, fishing) • Impacts on access to forests and other natural resources • Measures to mitigate impacts and provide alternative access to resources	• Areas downstream of irrigation schemes • Areas surrounding project activities that may affect natural resources	• Water quality and quantity monitoring: Assess impacts on water resources downstream of project activities. • Consultations with communities: Gather feedback on impacts on natural resource access and use. • Development and implementation of mitigation plans: Address impacts and provide alternative access to resources.	• Regular water quality and quantity monitoring • During project implementation: Monitor the effectiveness of mitigation measures.	• PMU • Relevant government agencies • Contractors
Social inequality	• Any actions on the part of Contractors' workers or community member that cause social conflicts (e.g. SEA/SH, the way construction activities are carried out [pollution, restricted access, loss of local income/livelihoods, accidents…)	• Construction sites • Relevant local communities	• Number of social conflicts arising and nature and scope of conflict	• Daily • Monthly	• Contractors • PMU

	• Conflicts between upstream farmers who prioritize water storage for their crops and downstream farmers who require a consistent water supply for their agricultural needs.	• Local communities are living downstream and upstream.	• Number of social conflicts resolved by contractors within 7 days • Number of social conflicts resolved by local authorities • Number of serious cases that have happened and reported to PMU within 48 hours		
Elite capture	• Equitable distribution of project benefits among community members • Transparency and accountability in decision-making processes • Mechanisms for community participation and feedback	• Project implementation areas • Community meetings and consultations	• Monitoring of benefit distribution: Track who is receiving project benefits and ensure fairness. • Observation of decision-making processes: Assess inclusivity and transparency. • Community feedback mechanisms: Establish channels for communities to voice concerns and provide input.	• Throughout project implementation • Regular community meetings and consultations	• PMU • Contractors • Community representatives
Gender inequality	• Percentage of female beneficiaries • Percentage of beneficiaries who are youth • Average percentage women consulted • Number of action plans integrating specific women's • Average percentage FWUC with women in leadership positions • Women/youth trained in O&M • Number of training on gender and social inclusion	• Project sites • Community level	• Data collected through surveys and consultations • Review of project documents, training plans, and meeting minutes	• Monthly monitoring • Quarterly • Semi-annually • Annually	• PMU • Contractors •

	delivered to MOWRAM staff				
During operation phase					
COMMUNITY HEALTH AND SAFETY	• Number of accidents and fatalities related to construction activities • Number of disease outbreaks and environmental pollution incidents • Number of reported cases of worker health issues	• Construction sites • Camp site and Worker camps • Nearby community	• Site inspection reports • Accident/Incident reports • Medical records/reports • Consultation minutes/reports	• Daily for site inspections • Monthly for reports and consultations • Within 48 hours for reporting accidents, disease outbreaks.	• PMU • PDWRAM
CROSS-CUTTING					
Gender inequality	• Percentage of female workers in different roles (skilled, unskilled) • Number of reported cases of gender-based violence or discrimination • Participation of women in FWUCs and decision-making processes related to water management.	• Construction sites • FWUC meetings • Community consultations	• Observation of worker roles and interactions. • Records of complaints and their resolution. • Attendance records and meeting minutes.	• Monthly for data collection and reporting	• PMU • PDWRAM
Social inequality	• Employment rates of vulnerable groups (poor, ethnic minorities, people with disabilities) in project activities. • Access to project benefits (training, information, resources) among different social groups.	• Construction sites • Training sessions • Community consultations	• Employment records and beneficiary lists. • Attendance records and feedback surveys. • Consultations with community members and representatives of vulnerable groups.	• Monthly for data collection and reporting	• PMU • PDWRAM
Elite capture	• Participation and representation of different social groups in decision-making bodies (FWUCs, committees). • Transparency and accountability in the allocation of project resources and benefits. • Monitoring of complaints related to favoritism or exclusion	• FWUC meetings • Community consultations • Project implementation	• Observation of meeting dynamics and representation • Analysis of resource allocation records.	• Regularly during FWUC meetings and project implementation • Continuously through the GRM.	• PMU • PDWRAM

	in decision-making.	records	• Records of complaints and their resolution.		

10. ESTIMATED COSTS

10.1 Estimated Costs for ESCMP Implementation

The costs of implementing the ESCMP listed below are related to PMU costs in addition to the dedicated safeguards PMU personnel budget line item. The main costs of implementing this ESCMP are the additional cost which have not been budgeted within the project, exclusive of the actual budget for the land resettlement and land acquisition which will be estimated by the end of the year as per the newly approval on the final conceptual design. For example, the project component 1 focus on establishment, capacity building and strengthening the FWUCs, therefore the concern regarding water management and water distribution inequality have already covered. Moreover, the sustainable agricultural practices and agricultural value chain is one the project actions. In this regard, the concern regarding GHG emission from the farming activities have been already addressed. The proposed budget therefore is the additional cost which are added to the existing one.

Table 44: Estimated cost for ESCMP implementation

No.	Items	Qty	Unit	Cost (USD)	Total (USD)
1	UXO clearance	1	Lum-sump	150,000	150,000
2	Preparation of the National EIA for the sub-scheme	1	Lum-sump	100,000	100,000
3	Land Acquisition and Land Impact Assessment and the preparation of the Land Acquisition and Land Resettlement Plan	1	Lum-sump	121,119	120,000
4	Implementing Biodiversity Management Plan	5	Year	200,000	1,000,000
5	ESMP awareness raising and sensitization with key stakeholders and communities (5 times)	5	Times	3,000	15,000
6	Community outreach at the project area	1	Sub-scheme	15,000	15,000
7	Consultation facilitation	1	Sub-scheme	10,000	10,000
8	E&S monitoring activities	1	Lum-sump	99,000	99,000
	Total				**1,510,119**

10.2 Estimated Costs for ESMCP Monitoring Program

The monitoring cost will be budgeted only for the activities which are supposed to be additional expenditure which are not included in the social and safeguard consultant. The cost for monitoring is mainly focused on the monitoring cost for soil, water, and air quality.

Table 45: Estimated cost for ESCMP monitoring program

No.	Items	Unit	Qty	Cost	Total
1	Soil quality monitoring (every six months* 3 locations * 3 years)	Times	18	1,500	27,000
2	Air quality, noise and vibration quality monitoring (every six months* 3 locations * 3 years)	Times	18	2,000	36,000

3	Water Quality monitoring (every six months* 3 locations * 3 years)	Times	18	2,000	36,000
	Total				**99,000**

Annex

Annex 1: Screening checklist for E&S impacts for Ou Ta Paong Sub-scheme

Circle screening conclusion:

- If the answers to the checklist questions are “No”, there is no need for further action.
- If the answers to the questions are “Yes”, then consult the relevant procedures /guidelines for assistance in addressing issues of concerns.

A	Environmental and Social Impacts	No	Yes	Notes
Location				
1	Are there environmentally sensitive areas (forests, pastures, rivers, and wetlands) or threatened species that could be adversely affected by the sub-project?		√	
2	Does the sub-project area (or components of the project) occur within or adjacent to any protected areas designated by government (national park, national reserve, world heritage site, etc.)?		√	
3	If the sub-projects are outside of, but close to, any protected area, is it likely to adversely affect the ecology within the protected areas (e.g., interference with the migration routes of mammals, fish, or birds)?		√	
4	Will the sub-projects reduce people’s access to pasture, water, public services, or other resources that they depend on?	√		
5	Might the sub-projects alter any historical, archaeological, or cultural heritage site or require excavation near such a site?	√		
Physical and biological environment				
6	Will projects require large volumes of construction materials (e.g. gravel, stones, water, timber, firewood)?	√		
7	Might the projects lead to soil degradation or erosion in the area?		√	
8	Might the projects affect soil salinity?		√	

9	Will the projects create solid or liquid waste that could adversely affect local soil, vegetation, rivers, streams, or groundwater?	√		
10	Might river or stream ecology be adversely and remarkably affected due to the installation of structures such as weirs, etc.?	√		
11	Will the projects have adverse impacts on natural habitats that will not have acceptable mitigation measures?	√		
12	Do the projects have human health and safety risks, during construction or later?		√	OHS safety and Dam safety
13	Might the projects lead to migration into the area?		√	
Alternatives				
14	Is it possible to achieve the objectives above in a different way, with fewer environmental and social impacts?	√		
B	**Land Acquisition and Social Issues**			
1	Have all groups within the community been consulted about the proposed project?		√	
2.	Which groups have not been consulted?	√		
3	Will the projects require acquisition of land (public or private) and/or other assets for its development?		√	Need to re-assess when the final design being made available
4	Will anyone be prevented from using economic resources (e.g. pasture, community places, forests etc.) to which they have had regular access?		√	Need to re-assess when the final design being made available
5	Will the projects result in the involuntary resettlement of individuals or families?		√	Need to re-assess when the final design being made available
6	Will the projects result in temporary or permanent loss of crops, fruit trees and household infrastructure such as granaries, toilets, kitchens etc.?		√	Need to re-assess when the final design being made available
7	Will the projects affect the livelihoods of particular groups within the communities, especially vulnerable groups such as the landless?	√		
8	Will the projects affect the well-being and livelihoods of women, particularly female-headed households?		√	Need to re-assess when the final design being made available
9.	Will the projects benefit all groups within the		√	

	community equally?			
10.	Are there ongoing land or water disputes within the community/with neighboring communities?		√	
C	**Pesticides and Waste Materials**			
1	Will the project result in the introduction of pesticides or an increase in pesticide use if the use of such products exists?		√	
2	Will the project result in the production of solid or liquid waste (e.g. water, domestic or construction waste), or will it result in an increase in waste production during construction or operation?		√	Need to reassess when the final design and needs in construction being made available
D	**Is there a probability of the presence of unexploded ordinance (UXO) at or near the proposed sub-project area?**		√

Annex 3: Grievance Monitoring

1.1 Reportable Incidents

The following incident types are to be reported using the environmental and social incident response process.

- **Fatality**: Death of a person(s) that occurs within one year of an accident/incident including from occupational disease/illness (e.g., from exposure to chemicals/toxins).
- **Lost Time Injury**: Injury or occupational disease/illness (e.g., from exposure to chemicals/toxins) that results in a worker requiring 3 or more days off work, or an injury or release of substance (e.g., chemicals/toxins) that results in a member of the community needing medical treatment.
- **Acts of Violence/Protest**: Any intentional use of physical force, threatened or actual, against oneself, another person, or against a group or community, that either results in or has a high likelihood of resulting in injury, death, psychological harm, deprivation to workers or project beneficiaries, or negatively affects the safe operation of a project worksite.
- **Disease Outbreaks**: The occurrence of a disease in excess of normal expectancy of number of cases. Disease may be communicable or may be the result of unknown etiology.
- **Child Labor:** An incident of child labor occurs: (i) when a child under the age of 14 (or a higher age for employment specified by national law) is employed or engaged in connection with a project, and/or (ii) when a child over the minimum age specified in (iii) and under the age of 18 is employed or engaged in connection with a project in a manner that is likely to be hazardous or interfere with the child's education or be harmful to the child's health or physical, mental, spiritual, moral or social development.
- **Forced Labor:** An incident of forced labor occurs when any work or service not voluntarily **performed** is exacted from an individual under threat of force or penalty in connection with a project, including any kind of involuntary or compulsory labor, such as indentured labor, bonded labor, or similar labor- contracting arrangements. This also includes incidents when trafficked persons are employed in connection with a project.
- **Environmental pollution incident:** Exceedances of emission standards to land, water, or air (e.g., from chemicals/toxins) that have persisted for more than 24hrs or have resulted in harm to the environment.
- **Discrimination based on SOGI:** Discrimination means creating a distinction, exclusion, or restriction which has the purpose or effect of impairing or excluding a person based on their real or perceived sexual orientation, gender identity, gender expression, or sex characteristics from being on an equal basis with others.
- **Sexual Exploitation:** Any actual or attempted abuse of position of vulnerability, differential power, or trust, for sexual purposes, including, but not limited to, profiting monetarily, socially, or politically from the sexual exploitation of another. In Bank

financed operations/projects, sexual exploitation occurs when access to or benefit from a Bank financed Goods, Works, Non-consulting Services or Consulting Services is used to extract sexual gain.

- **Sexual Abuse:** Actual or threatened physical intrusion of a sexual nature, whether by force or under **unequal** or coercive conditions. In Bank financed operations/projects, sexual abuse occurs when a project related worker (contractor staff, subcontractor staff, supervising engineer) uses force or unequal power vis a vis a community member or colleague to perpetrate or threat to perpetrate an unwanted sexual act.
- **Sexual Harassment:** Any unwelcome sexual advance, request for sexual favor, verbal or physical conduct or gesture of a sexual nature, or any other behavior of a sexual nature that might reasonably be expected or be perceived to cause offence or humiliation to another, when such conduct interferes with work, is made a condition of employment, or creates an intimidating, hostile or offensive work environment. In Bank financed operations/projects, sexual harassment occurs within the context of a subcontractor or contractor and relates to employees of the company experiencing unwelcome sexual advances or requests for sexual favor or acts of a sexual nature that are offensive and humiliating among the same company's employees.
- **Other**: Any other incident or accident that may have a significant adverse effect on the environment, the affected communities, the public, or the workers, irrespective of whether harm had occurred on that occasion. Any repeated non-compliance or recurrent minor incidents which suggest systematic failures that PMU deems needing the attention of the WB.

1.2 For environmental and social incidents

1.2.1 Form to be completed by PMU within 48 hours

Q1: Incident Details	
1. Date of Incident:	
2. Time:	
3. Date Reported to PMU:	
4. Date Reported to WB:	
5. Reported to PMU by:	
6. Reported to WB by:	
7. Notification Type (Email/'phone call/media notice/other):	
8. Full Name of Main Contractor:	
9. Full Name of Subcontractor:	
Q2: **Type of incident (please check all that apply)**	
1. ☐ Fatality 2. ☐ Lost Time Injury 3. ☐ Displacement Without Due Process 4. ☐ Child Labor	

5. ☐ Acts of Violence/Protest
6. ☐ Disease Outbreaks
7. ☐ Forced Labor
8. ☐ Unexpected impacts on heritage resources
9. ☐ Unexpected impacts on biodiversity resources
10. ☐ Environmental pollution incident
11. ☐ Dam failure
12. ☐ Other

Q3: Description/Narrative of Incident

For example:

1. What is the incident?
2. What were the conditions or circumstances under which the incident occurred (if known)?
3. Are the basic facts of the incident clear and uncontested, or are there conflicting versions? What are those versions?
4. Is the incident still ongoing or is it contained?
5. Have any relevant authorities been informed?

Q4: Actions taken to contain the incident

Short Description of Action	Responsible Party	Expected Date	Status

For incidents involving a contractor:

1. Have the works been suspended under the Contract GCC8.9?
   a) ☐ Yes
   b) ☐ No
2. Name of Contractor: **……**

Q5: What support has been provided to affected people?

1.2.2 Form to be completed by PMU (following investigation)

Q6. Fatality/Lost time Injury information

Cause of fatality/injury for worker or member of the public (please check all that apply):	*Vehicle Traffic:*
1. ☐ Caught in or between objects 2. ☐ Struck by falling objects 3. ☐ Stepping on, striking against, or struck by objects 4. ☐ Drowning 5. ☐ Chemical, biochemical, material exposure 6. ☐ Falls, trips, slips 7. ☐ Fire & explosion 8. ☐ Electrocution 9. ☐ Homicide	13. ☐ Project Vehicle Work Travel 14. ☐ Non-project Vehicle Work Travel 15. ☐ Project Vehicle Commuting 16. ☐ Non-project Vehicle Commuting 17. ☐ Vehicle Traffic Accident (Members of Public Only)

10. ☐ Medical Issue 11. ☐ Suicide 12. ☐ Others	

Name	Age/DOB	Date of Death/injury	Gender	Nationality	Cause of Fatality/Injury	Worker (Employer)/Public

Q7: Financial Support/Compensation Types (To be fully described in Corrective Action Plan template)

1. ☐ Contractor Direct
2. ☐ Contractor Insurance
3. ☐ Workman's Compensation/National Insurance
4. ☐ Court Determined Judicial Process
5. ☐ Others
6. ☐ No Compensation Required

Name	Compensation Type	Amount (US$)	Responsible Party

Q8: Supplementary Narrative:

1.3 For SEA/SH Incident

1.3.1 Incident Form for SEA/SH (to be completed by PMU within 48 hours)

Q9. Incident Details		
Date of incident intake by project/GM:	Date Reported to PMU:	Date Reported to AIIB:
Reported to project/GM by: 1. Survivor 2. Third party 3. Others:	Reported to PMU by: 1. GM operator 2. Directly, by Survivor 3. Directly, by third party 4. Others:	Reported to AIIB by: 1. PMU 2. Directly, by Survivor 3. Directly, by third party 4. Other:
Q10. Is a record of this incident in GM?		

a) ☐ Yes b) ☐ No
Q11: Incident type (please check all that apply) See Appendix 1 for definitions
c) Sexual exploitation d) Sexual abuse e) Sexual harassment
Q12: Provide the following details from the GM record.
1. Age of survivor (if recorded in GM):
2. Have the national legislation or mandatory reporting requirements been followed? f) ☐ Yes g) ☐ No
3. Sex of survivor (if recorded in GM): a) ☐ Male b) ☐ Female c) ☐ Others
4. Was the survivor referred to service provision? a) ☐ Yes b) ☐ No
5. Is the survivor employed by the project (as indicated by the survivor or complainant and reported in the GM)? a) ☐ Yes b) ☐ No
6. Is the alleged perpetrator employed by the project (as indicated by the survivor or complainant and reported in the GM)? a) ☐ Yes b) ☐ No
Q13: Basis for further action
1. Has the complainant provided informed consent to lodge a formal complaint? a) ☐Yes b) ☐ No
2. Does the employer have a suitable administrative process and capacity in place to investigate misconduct relating to SEA/SH in a survivor-centered way? a) ☐ Yes b) ☐ No
3. Has the survivor provided informed consent to be part of an investigation into misconduct? a) ☐ Yes b) ☐ No
4. Has the complaint been filed anonymously or through a third party? a) ☐ Yes b) ☐ No
5. If the answer to any of these questions is no, has the GM assessed the risks and benefits of carrying out an investigation into the alleged misconduct, taking into account the survivor's safety and wellbeing? a) ☐ Yes b) ☐ No

6. Will an investigation into misconduct be undertaken in addition to an investigation into adequacy of project systems, processes or procedures? a) ☐ Yes b) ☐ No

1.4 Incident Form for SEA/SH (to be completed by PMU following SEA/SH investigation)

Q14: Findings of the investigation
1. Have sanctions against a perpetrator been recommended as part of an investigation into misconduct? a) ☐ Yes b) ☐ No
2. Has an investigation into adequacy of project systems, processes or procedures been undertaken? a) ☐ Yes b) ☐ No

Q15: Corrective actions to be implemented (To be fully described in Corrective Action Plan)		
Short Description of Action (SEA/SH examples)	**Responsible Party**	**Timeline for completion/Status**
1. Referral of Survivor to holistic care services		
2. Undertake disciplinary investigation in accordance with GM timelines and confirmed process		
3. Disciplinary actions, including sanctions, to be applied following misconduct investigation by employer		
4. Increased training on Codes of Conduct (CoC)		
5. Audit of implementation of SEA/SH safety mitigation		
6. Strengthened awareness training on project-related risks, CoC and how to report incidents for project-affected community		
7. Training for project supervisors on the need to follow guidelines of behavior in CoC and their		

	supervisory responsibilities		
8.	Plan to improve coverage/quality of service provision		
9.	Any other system strengthening measures or corrections for system failures that are necessary		

3.1 Project's Grievance Logbook

3.1.1 Sample for Local Levels

No	Name of complainant (or anonymous)	Addresses	Sex	Age	Contact information	Date Received	Details of nature of grievance (Environmental impacts, social impacts, labor, health, etc.)	Which of the three GRM that was used?	Actions taken to resolve grievance, by whom	How many steps that have been used in the relevant GRM	Date grievance was finally resolved/closed?	Notes

3.1.2 Sample for PMU Level to be elaborated on Excel spreadsheet with filter function

No	Questions	Response
1	**Date Received:**	
2	**Name of Complaint** (or anonymous):	
3	**Sex:**	
4	**Age:**	
5	**Contact information** (Phone number/email, other channel(s):	
6	**Location of Complainants** (Province, District, commune, village):	
7	**Form of grievance received** (Writing or Verbal (face to face, telephone, online), SMS, MOWRAM and DoWRAM comment box in designated Website/Face book/What's App, etc.	

8	**Channel of Receipt** (Direct to PMU GRM Focal Point, or Relayed from other channels (Provide details)	
9	**Key topics of Grievances** a) Labor and Working Condition Resettlement (incl Voluntary Land Donation) b) SEA/SH c) Environmental impacts d) Community Health and Safety Accidents	
10	**Nature of complaints?** a) Resolution required b) Clarification required c) Suggestion n only (for project improvement) d) General Concerns

14	**Notes:**	

Annex 4: Worker's Code of Conducts

The Annex has two Code of Conduct (COC): one is for ESHS and SEA/SH/VAC, and the other is for working with local Ethnic Communities.

1.1 Code of Conduct related to ESHS and SEA/SH/VAC

Instructions:

This Code of Conduct shall be perused and signed by all individual workers who enter direct work contract with a) PMU, b) PMU's consulting firms and service providers, c) contractors who renovate existing HCFs.

I,_____, acknowledge that adhering to environmental, social, health and safety (ESHS) standards, following the project's occupational health and safety (OHS) requirements, and prevention of Sexual Exploitation & Abuse (SEA)/Sexual Harassment (SH), are important.

I understand that that failure to follow ESHS and OHS requirement, or to partake in activities constituting SEA/SH -- be it at the project site, the surrounding area of the project site, workers' camps, or the project communities, including community members and project workers, constitute acts of gross misconduct and are therefore grounds for sanctions, penalties, or potential termination of employment. Prosecution by the Police of those who commit SEA/SH may be proceeded as applicable under relevant Laws.

I agree that while working on the project, I will:

- Carry out my duties competently and diligently.
- Comply with this Worker's Code of Conduct and all applicable laws, regulations, and other requirements, including requirements to protect the health, safety and well-being of other project workers, and any other person and community members.
- Maintain a safe working environment including by:
    - Ensure that workplaces, machinery, equipment, and processes under each person's control are safe and without minimal risk to health and safety of those involved.
    - Use appropriate measures relating to chemical, physical and biological substances, and agents; and
    - Follow applicable emergency response procedures.
- Report works situations that I believe unsafe or unhealthy to either project workers and/or community and remove myself and inform those relevant to remove themselves from a work situation which I reasonably believe imminent and dangerous to safety, life, and health of those involved.

- Consent, if required, to a background check in any place I have worked for more than six months.
- Attend and actively partake in training courses related to ESHS, OHS, SEA/SH and VAC, as requested by my employer.
- Always wear my personal protective equipment (PPE), as required while at work or engaged in project related activities.
- Take all practical steps to implement the environmental and social management plan (ESMP), which may include OHS Management Plan.
- Abide by a zero-tolerance policy as to SEA/SH/VAC and alcohol consumption during work activities, and refrain from use of narcotics or other substances which can impair worker's expected working ability and judgement.
- Respect women, children (persons under 18 years of age), and the elderlies regardless of their ethnic background, language, religion, personal opinions, disability, and/or other socioeconomic status.
- Shall not use language or behavior that are inappropriate to community members and project workers, particularly women, children, and the elderlies,
- Shall not commit any sexual abuse and or exploit, and/or sexual harassment of any kinds to community members in the project area and any project workers.
- Shall not engage in sexual harassment of project personnel and staff — for instance, making unwelcome sexual advances, requests for sexual favors, and other verbal or physical conduct of a sexual nature (looking somebody up and down; kissing, howling or smacking sounds; hanging around somebody; whistling and catcalls; in some instances, giving personal gifts.
- Shall not engage in offering any work-related favors such as making promises of favorable treatment (i.e., promotion), or make threats of unfavorable treatment (i.e., loss of job), or make payments in kind or in cash depending on sexual acts — or other forms of humiliating, degrading or exploitative behavior.
- Shall not engage in using prostitution service -- in any form and at any time during project implementation.
- Shall not participate in sexual contact or activity with children under 18 years of age — including grooming or contact through digital media. Mistaken belief regarding the age of a child is not a defense. Consent from the child is also not considered a defense or excuse.
- Consider reporting through the project's GRM, or to my manager, any suspected or actual SEA/SH deed by a fellow worker, whether employed by my company or not, or any breaches of this Code of Conduct.
- Complete relevant training courses that will be provided related to the environmental and social aspects of the Contract, including on health and safety matters, and Sexual Exploitation & Abuse, Sexual Harassment, and Violence Against Children (VAC).
- Report violations of this Code of Conduct; and

With respect to children under the age of 18:

- Bring to the attention of my manager the presence of any children on the construction site or engaged in hazardous activities.
- Wherever possible, ensure that another adult is present when working in proximity to children.
- Shall not invite unaccompanied children unrelated to my family into my home unless they are at immediate risk of injury or in physical danger.
- Not use any computers, mobile phones, video, and digital cameras or any other medium to exploit or harass children or to access child pornography (see also “Use of children's images for work related purposes” below).
- Avoid, in all circumstances, any verbale and/or physical punishment or discipline of children.
- No hiring of children (under 18) in any project activity.
- Comply with all relevant local regulations, including labor law in relation to child labor and forced labor.
- Take appropriate caution when photographing or filming children (see also section below). Photos or films of children should not be taken under the project, except for instances showing the benefits or impacts of road works, such as impacts to schools or school safety trainings.

Use of children's images for work related purposes

When photographing or filming a child for work related purposes, I must:

- Before photographing or filming a child, assess and endeavor to comply with local traditions or restrictions for reproducing personal images.
- Before photographing or filming a child, obtain informed consent from the child and a parent or guardian of the child. As part of this, I must explain how the photograph or film will be used.
- Ensure photographs, films, videos present children in a dignified and respectful manner and not in a manner that is vulnerable or submissive. Children should be adequately dressed up and not in poses that could be seen as sexually suggestive.
- Ensure images are honest representations of the context and the facts.
- Ensure file labels do not reveal identifying information about a child when sending images electronically.

Raising Concerns

If any person observes behavior that I believe may represent a violation of this Code of Conduct, or that otherwise concerns me, I will raise the issue promptly. This can be done in either of the following ways:

1. Contact [enter name of the Employer’s Social Focal Point] to handle these incidences.
2. Call Employer’s telephone number (See contact detail at Section 5 of project’s

Stakeholder Engagement Plan).

The person's identity will be kept confidential, unless reporting of allegations is mandated by the country law. Anonymous complaints or allegations may also be submitted and will be given all due and appropriate consideration. PMU will take all reports of possible misconduct seriously and will investigate and take appropriate action. In case of SEA/SH, PMU will provide referral to local service provider who will provide support to SEA/SH victims (See also Section 6.4 of project's Stakeholder Engagement Plan).

There will be no retaliation against any person who raises a concern in good faith about any behavior prohibited by this Code of Conduct. Such retaliation would be a violation of this Code of Conduct.

Sanctions

I understand that if I breach this Workers' Code of Conduct, my employer will take disciplinary action which could include:

- Informal warning.
- Formal warning.
- Additional Training.
- Termination of employment.
- Report to the Police if warranted.

I understand that it is my responsibility to:

Ensure that the Environmental, Social, Health and Safety requirements are met. Adhere to the Occupational Health and Safety Management Plan

Avoid actions or behaviors that could be construed as SEA/SH/VAC. Any such action will be a breach of this Workers' Code of Conduct.

I hereby acknowledge that I have perused the foregoing part of this Workers' Code of Conduct, agree to comply fully with the requirements contained therein and understand my roles and responsibilities to prevent and respond to ESHS, OHS, SEA/SH/VAC issues. I understand that any actions that are inconsistent with this Workers' Code of Conduct, or failure to act as mandated by this Workers' Code of Conduct may result in disciplinary action and may affect my ongoing employment.

1.2 Code of Conduct for Working with Local Ethnic Communities

This Code of Conduct is grounded on the objectives of the WB's ESS7, which are:

- To ensure that the development process fosters full respect for the human rights, dignity, aspirations, identity, culture, and natural resource-based livelihoods of Indigenous Peoples.
- To avoid adverse impacts of projects on Indigenous Peoples, or when avoidance is not possible, to minimize, mitigate and/or compensate for such impacts.
- To promote sustainable development benefits and opportunities for Indigenous Peoples in a manner that is accessible, culturally appropriate and inclusive.
- To improve project design and promote local support by establishing and maintaining an ongoing relationship based on meaningful consultation with the Indigenous
- To recognize, respect and preserve the culture, knowledge, and practices of Indigenous Peoples, and to provide them with an opportunity to adapt to changing conditions in a manner and in a timeframe acceptable to them.

Annex 5: Simplified Pest Management Plan

1.1 Rationale

In Cambodia, around 90% of cultivated land is used for rice production. Rice alone accounts for about 70% of the country's total calorie supply. Rice production contributes an estimated 44% of rural household income, making the rice sector an area for strategic development in the country. Despite rice is the major crop in Cambodia, rice production is characterized by widespread misuse of pesticides. This is due to inconsistent enforcement of current regulation and a lack of information on pesticide safety and alternative pest management techniques among rice farmers. Most pesticides are imported and labelled in a foreign language incomprehensible to farmers. It is common that rice farmers mix two to five pesticides by intuition, leading to pesticide poisoning among farmers and adverse impact on environment[17]. Rice farmers tend to apply more pesticide when they see pests on their field[18]. Vegetable farmers also typically mix various types of pesticides per spray which is not good practice[19].

The CAISAR project will 1) improve overall water security for all stakeholders in the targeted basins in the four provinces, 2) exploit the potential of unused water resources and increase agricultural productivity in the targeted basin, and 3) enhance the overall capacity of the water resources management of the central government, concerned local governments, and concerned communities. Through all of the three project components, the project will improve 1) Water Service Delivery, 2) Agricultural Productivity, and 2) Water Resources Management. The project does not involve procurement of pesticides.

Under CAISAR, the project will support target farming population in irrigated areas to improve their use of good agricultural practices, including integrated crop water management, climate-smart agriculture (diversification into high-value crop plantation, public-private-partnership and commercialization), as well as agribusiness and trade development. CAISAR does not involve procurement of chemical fertilizers, pesticides, and/or other toxic agrochemicals nor promote use of chemical agricultural inputs during project implementation. However, rehabilitation /upgrading of existing reservoirs/irrigation system, etc. to be financed under the Project are expected to increase the agricultural command areas, including the number of crops per year. This increased crop may give rise to increased use of fertilizers, pesticides, and/or other toxic agrochemicals in the subproject areas which are unintended impact of the project.

1.2 Key Pesticide Management Outcomes in Cambodia

Pesticide Use and IPM implementation in Project Provinces: The General Directorate of Agriculture (GDA)'s survey in 2014 and nation-wide inspections in 2013 of pesticide and herbicide suppliers in provincial capitals and other main distribution hubs, indicate that the most commonly sold products include: abamectin, chlorpyrifos, cypermethrin, glyphosate,

[18] Matsukawa, M., Ito, K., Kawakita, K. et al. Current status of pesticide use among rice farmers in Cambodia. Appl Entomic Zool51, 571–579 (2016). https://doi.org/10.1007/s13355-016-0432-5.

[19] Sim Skooching, Keo Socheat and Sarom Moldiest. 2021. Pesticide Use Practices in Cambodia's Vegetable Farming. CDRI Working Paper Series No. 128. Phnom Penh: CDRI.

imidacloprid. In the Northern provinces, where a large part of the herbicide use is on corn and rubber plantations, the main products sold are the herbicides Glyphosate, Paraquat and Atrazine. Nowadays, on Rice and Maize cultivation farmers don't use pesticide accept some vegetables. These inspections have also shown that the most problematic highly hazardous products, such as monocrotophos, methyl parathion, methamidophos, mevinphos, endosulfan, etc., are no longer found on the market with the exception of the occasional old bottle. The only banned products that still are found regularly are paraquat and methomyl. This is because these products were banned only recently (2010) and are still permitted in the neighboring countries from where they are informally brought in by users or retailers. The banning of highly hazardous pesticides in China does not seem to have led to dumping of old stocks in Cambodia. There are no known large stocks of obsolete pesticides.

Insecticides are used mainly on vegetables (such as Long Yard Bean, Chilly, Cabbage, Chinese Cabbage) marketable high-value crops and plantation crops, notably rubber. Field surveys by the national IPM program and GDA indicate there still is wide-spread abuse of pesticides among farmers. Lack of knowledge among farmers is a major constraint. Abuse includes mixing without justification (just to be sure), use of wrong pesticides, use of wrong dosages, etc. Adequate protective gear is hardly being used. Shops often have gloves and masks for sale, but these tend to be inadequate for protection against hazardous chemicals. Buyers of pesticides rarely also buy protective gear, and shops do not provide it for free. Half used pesticide bottles or packages are often stored within the house or near homesteads, often in easy reach of children. Empty pesticide containers are often discarded at the border of fields or in drainage ditches.

1.3 Government Regulation Related to Pest Management

Pest management practices in Cambodia have been promoted through the expansion of the National Integrated Pest Management (IPM) Program by both the government and NGOs. These agencies have been working together to establish a Pesticide Reduction Network to develop awareness of the risks associated with pesticide use amongst farmers.

As a key function, Ministry of Agricultural and Forestry (MAFF) has been examining and implementing various international legal guidelines and instruments relating to regulating the trade, distribution and use of pesticides in Cambodia. These include adherence to the FAO Code of Conduct on the Distribution and Use of Pesticides, the Stockholm Convention on Persistent Organic Pollutants, and the WTO sanitary and phytosanitary measures.

Following the promulgation of the Law on Management of Pesticides and Fertilizers as Royal Kram Number 0112/005 on 14th January 2012, MAFF had developed five Prakas in relation to Procedures for Registration and Business Operations, as follows:

- Prakas No. 415/MAFF dated 17 August 2012, on Procedures and Standard Requirements for Fertilizer Registrations.
- Prakas No. 456/MAFF dated 19 October 2012, on Procedures and Standard Requirements for Pesticide Registrations.
- Prakas N. 484/MAFF dated 26 November 2012, on List of Pesticides in the Kingdom of Cambodia.

- Prakas No. 119/MAFF dated 11 April 2013, on Procedures for Management of Fertilizers for Business Operations.
- Prakas No. 120/MAFF dated 11 April 2013, on Procedures for Management of Pesticides for Business Operations.

  Within MAFF, the Department of Agriculture Legislation and GDA are mandated to oversee all pesticide regulations and use.

1.4 International Code of Conduct on the Distribution and Use of Pesticides

The following rules are observed for IPM:

- The standards of conduct set forth in this Code: 1.7.6. are designed to promote Integrated Pest Management (IPM) (including integrated vector management for public health pests).
- Concerted efforts should be made by governments to develop and promote the use of IPM. Furthermore, lending institutions, donor agencies and governments should support the development of national IPM policies and improved IPM concepts and practices. These should be based on scientific and other strategies that promote increased participation of farmers (including women's groups), extension agents and on-farm researchers.
- All stakeholders, including farmers and farmer associations, IPM researchers, extension agents, crop consultants, food industry, manufacturers of biological and chemical pesticides and application equipment, environmentalists and representatives of consumer groups should play a proactive role in the development and promotion of IPM.
- Governments, with the support of relevant international and regional organizations, should encourage and promote research on, and the development of, alternatives posing fewer risks: biological control agents and techniques, non- chemical pesticides and pesticides that are, as far as possible or desirable, target-specific, that degrade into innocuous constituent parts or metabolites after use and are of low risk to humans and the environment.
- Governments should provide extension and advisory services and farmers' organizations with adequate information about practical IPM strategies and methods, as well as the range of pesticide products available for use.
- Governments should ensure that any pesticide subsidies or donations do not lead to excessive or unjustified use which may divert interest from more sustainable alternative measures.

1.5 Current Governmental Implementation Arrangements Related to Pest Management

Integrated Pest Management (IPM) refers to all pest control techniques and subsequent integration of appropriate measures that discourage the development of pest populations and keep pesticides and other interventions to levels that are economically justified and reduce or minimize risks to human health and the environment. IPM emphasizes the growth of a healthy crop with the least possible disruption to agro-ecosystems and encourages natural pest control mechanisms.

Under MAFF, Department of Plant Protection, Sanitary and Phytosanitary and their branches in provinces as well as Agricultural Offices at district level are governmental agencies that coordinate and work on Integrated Pest Management Programs. These activities are built on the National IPM program that was initiated with assistance from the FAO, DANIDA and other donors since early 1990s which is largely being maintained using national budget.

IPM activities implemented by these local authorities and technical backstopping by experts from GDA include conducting field surveys, making forecast, monitoring and checking progress of on-field pest development. Using the forecast based on the timing, scale and level of damage that the key pests may cause, provincial plant protection authorities recommend policies, plans, and measures for pest management purposes.

Farmers learn how to implement various integrated measures such as pest identification, pest control, pest analysis, pest surveillance, and apply measure to control pest, such as applying chemical and botanical control agent, promoting application of biological measures for pest management, reducing chemicals and practice sustainable IPM. Farmers are also trained on proper use of chemical pesticide and fertilizers to ensure efficiency in pest management, ensuring safety for human, natural enemy, and the environment. Communication campaigns on plant protections and quarantine legislations and advance IPM technics to the farmers are also carried out depending on budget availability, etc.

GDA's Plant Protection Center, including the national IPM program, has developed training programs intended to raise awareness, develop capacity and help rural communities formulate and implement their own action plans for pesticide risk reduction. As of 2018, some 300,000 Cambodian farmers have participated in IPM courses. Season-long Integrated Pest Management training through Farmers Field Schools (FFS) often includes these short-duration IPM courses. These FFSs allow farmers to learn about and adopt Integrated Pest Management to reduce overuse of pesticides in crop production. Pesticide Risk Reduction and IPM adoption at farm level remains a priority for the Government.

Operational costs of plant protection agencies are allocated from state funds. Their staff also work on projects and programs that are financed by other international funding and conduct additional annual trainings (using international budget) for farmers.

1.6 Objective of Simplified Pest Management Plan

This Simplified Pest Management Plan (S-PMP) aim to see out plan and measures to ensure the project does not unintentionally give rise to increased overuse of chemical agricultural inputs (such as chemical pesticide, fertilizers, and plant growth regulators, etc.). This S-PMP will be integrated into on-going pest management program and effort that provincial DAFF in

project provinces have been doing and make sure pest management efforts target areas where water access is improved through project investment activities.

To mitigate this potential impacts as a 'good practice', the subproject owner will prepare and implement a S-PMP aiming to increase famers knowledge on Government regulations, policies, and/or technical guidelines related to safe use (application, storage, and disposal) of pesticides and toxic agrochemicals likely to be used by farmers as well as promote the application of an Integrated Pest Management (IPM) practice that are appropriate for the agriculture productions in the subproject area through training and other capacity building activities.

Key Elements - The elements of the S-PMP include the followings:

- Preventing pest problems.
- Monitoring for the presence of pests and pest damage.
- Establishing the density of pest population, which may be set at zero, that can be tolerated or corrected with a damage level sufficient to warrant treatment of the problem based on health, public safety, economic or aesthetic threshold.
- Treating pest problems to reduce population below those levels established by damage thresholds using strategies that may include biological, cultural, mechanical and pesticidal control methods and that shall consider human health, ecological impact, feasibility and cost effectiveness; and
- Evaluating the effects and efficacy of pest treatments.

Decision Making

Detecting a single pest under the Project will not always mean control is needed. A decision to use pesticides will be taken only as the very last resort and will also be based on conclusions reached from an agroecosystem analysis and trials. The decision will also depend on the number of pests and diseases found in the respective crop and the level of damage they are doing. If it is necessary to spray crops with pesticides, use of selective rather than broad-spectrum pesticides shall be strictly observed.

Pest Monitoring and Surveillance

A process for the reporting and identification of unusual plants, animals and pests will be established to track and document all pest cases, be it minor or major in a pest inventory register. Pest surveys will be conducted on a regular basis to detect new infestations and will include the types, abundance, location of pest plants, date when first spotted or seen, and date when reported. This information will be gathered from surveillance or monitoring systems to be put in place, periodic surveys to be conducted and feedback from farmers/ farm assistants. The data will be managed in a standardized way so that trends can be established. A rapid response process for the management of new infestations will be established to treat and manage new pest infestations as soon as they are identified.

Table 1: Potential impacts and proposed mitigation for pest

Potential Impacts	Proposed Mitigation

Contamination of ground water resources	Conducting trials on relatively flat land with less than 2% slope reducing the possibility of run off and at more than 500m away from water sources
Effect of pesticides on non-target species	Use pesticides that are systemic and narrow range and specific to sucking insects.
Effect of pesticides on grazing areas, settlements	Spraying in the morning hours when the weather is cool and less windy to reduce spray drifts. Locating trials or plots at distance of between 500-1000m away grazing areas or human settlements
Possibility of increasing resistance of pests to the pesticide	Training of field staff responsible on recommended usage of the pesticide
Harmful effects on staff applying pesticides	Provision and usage of safety clothing and working gear to staff
Harm to people within the homestead where the chemical is stored	Designation of a separate and secured storage room for pesticide Warnings and notices to increase awareness

1.7 Mitigation Measures

It is expected that there will be no procurement of pesticides under the project and that pesticide use, overall, will decline as a result with the introduction of good agricultural practices. To ensure the tendency of increased overuse of pesticide does not happen with subproject where project intervention take place, the project will prohibit procurement of large pesticides using the “negative list” and provide training to key staff and farmers on integrated pest management, safe use of pesticides, and organic farming practices. This will be integrated as part of the safeguard training. This S-PMP will be applied to the project activities that involve:

a) Any rehabilitation/upgrading of weirs/reservoirs/dams/existing irrigation schemes that are likely to prompt farmers to increase their use of pesticides:

b) Change/introduction of best agricultural practices such as integrated crop water management, Climate-smart agriculture, and

c) Promotion of agribusiness and trade related to farm products produced from target command area, and neighboring areas.

The plan is comprised of three parts:

(i) Application of government regulation on pesticide control.

(ii) Training of the integrated pesticides concept and/or other approaches for the safe use of pesticides; and

(iii) Monitoring.

Annex 6: Biodiversity Assessment Findings for Ou Ta Paong

Proposed project activities and potential risks and impacts

Avian species such as the Greater Adjutant, Milky Stork, and Bengal Florican have been documented in the lower section. These birds rely on seasonal wetlands, lakes, waterholes, grasslands, and rice fields for foraging. Additionally, the critically endangered Siamese Tiger Perch and Black Mash Turtle inhabit Boeung Kamsaeng Lake and Svay Daunkav River, respectively, in the upper portion of the command area.

The flooded forest habitat and natural lakes adjacent to the lower section support a diverse array of wildlife, including four critically endangered reptile species: the Black Mash Turtle, Southeast Asian Box Turtle, Giant Asian Pond Turtle, and Elongated Tortoise. These species play crucial roles in the ecosystem, contributing to nutrient cycling, seed dispersal, and maintaining ecological balance. Furthermore, the region is home to two critically endangered mammal species: the Indochinese Silvered Langur and Long-tailed Macaque. These primates are essential for forest regeneration and seed dispersal, helping to maintain the health and resilience of the forest ecosystem. This area, particularly its lower section, serves as a critical habitat for a diverse array of endangered and critically endangered species.

Given the significant ecological value of the Ou Tapaong Command Area, any irrigation system renovations must be carried out with utmost care to minimize negative impacts on biodiversity. This may involve implementing measures such as habitat restoration, creating wildlife corridors, and ensuring that water management practices are sustainable and supportive of biodiversity. By carefully considering the ecological implications of the project, it is possible to balance the needs of agriculture with the conservation of endangered species and their habitats. Under OTP, various activities will be carried out that cause the following E&S risks and impacts:

Table 1: Projection activities that may cause potential impacts on the environment and social aspects at Ou Tapaong sub-scheme

No.	Project activities that cause impacts	E&S Risks & Impacts
1	Construction activities (rehabilication of canal and farm roads), land use changes, and water management practices	**Habitat loss and fragmentation** could lead to habitat loss and fragmentation, affecting species' survival and connectivity. This activity may involve dredging, excavation, or modification of existing water channels and infrastructure. These activities can lead to habitat destruction, disturbance to nesting and foraging sites, disruption of natural water flow patterns, and alteration of hydrological regimes. This can directly impact both terrestrial and aquatic biodiversity.

2	Increased agricultural activities, sedimentation, and pollution	**Water quality degradation** could impact aquatic ecosystems and species that rely on clean water.
3	**Hydrological changes due to m**odifications to water flows and regimes	**Altered habitat** conditions that disrupt ecological processes.
4	**Increased human activities**	**Labor influx (during project construction) and Increased** human activities (during project operations pose additional threats to biodiversity. Increased human activity within the command area which could potentially disrupt wildlife behavior (nesting/foraging), increase poaching or predation risks if not properly managed.
5	Dredging of waterways and Alteration of water levels	Changes in water levels within the command area due to irrigation system renovation may negatively impact wildlife dependent on specific habitats for breeding or foraging purposes. For example, changes in seasonal wetlands or lakes' floodplains can disrupt breeding patterns for avian. Changes in water levels and habitat quality could force endangered species to relocate, potentially leading to competition with other species or exposure to new threats.
6	Use of chemicals and nutrient loading	**If pesticides/fertilizers are used during agricultural practices within the command area as part of irrigation system renovation projects, it could lead to contamination of soil and water resources affecting both terrestrial and aquatic biodiversity.**
7	Species displacement and disruption of foraging and breeding habits	Changes in water levels and habitat quality could force endangered species to relocate, potentially leading to competition with other species or exposure to new threats. Additionally, alterations to the irrigation system could disrupt the foraging and breeding habits of endangered birds and other wildlife.
8	**Land Use Changes**	The changes in land use that may occur as a result of the project, such as agricultural expansion or deforestation.
9	**Biodiversity**	The potential impacts of the project on water flow, water quality, and sedimentation patterns.
10	Introduction of invasive species through irrigation canals	Irrigation canals may facilitate the introduction of invasive plant or animal species into native aquatic ecosystems like Water Hyacinth, Mimosa Pigra, Tilapia etc. These invasives can outcompete native species for resources such as food and habitat space

Areas of Influence

The Ou Tapaong Irrigation Sub-scheme's estimated area of influence encompasses a) the entire command area (some 14,000 hectares, including the upper, middle, and lower parts), and b) any other areas outside the command area where project activities leave an environmental footprint during project implementation and sub-scheme operations. While the first is clear in terms of the boundary, the latter needs additional information based on the final project engineering design and environment monitoring data to establish the additional area of influence that is outside of the command area (due to the project's environmental footprint).

In line with the methods set forth under Section 3.2 (above), a detailed assessment was conducted for the OTP command area (as Modified Habitat) while a preliminary assessment was carried out for the area located immediately outside and to downstream of the OTP command area. It is noted within the OTP command area, that there is a lake called Boeng Kanseang or Kanseang Lake which is home to fish and birds. Analysis to determine critical habitat (Steps 1 and 2 of the CHA method)

Analysis to prepare for determining CH status

Critical Habitat Area of Analysis

Critical habitat is defined as an Area of Analysis (AoA), and the project's command area is used as an AoA.

Species with Potential Occurrence within the AoA

A list of threatened species with potential occurrence was generated for OTP. The coordinates of OTP (via KMZ file) are used to inform the IBAT radius of screening. Since the default radius of IBAT screening is 50km, steps were taken to narrow down to the sub-scheme's area of influence to identify only EN and CR species that are potentially present in the sub-scheme area of influence. The narrowing-down aims to practically identify EN and CR species that could be found in the sub-scheme area of influence and to determine the Critical Habitat status of the identified species. After three rounds of screening focusing on EN and CR species, 11 EN and CR species are found as potentially present in the sub-scheme area of influence. These species include 4 reptile species, 2 mammals, 2 fishes, and 3 birds (See list of 11 EN and CR species in Table 3 below).

Description of screening for narrowing down

For Ou Ta Paong, three rounds of screening have been conducted. The first screening (Round 1) was conducted in December 2023. Round 2 was carried out in April 2024, and Round 3 in August 2025. The purpose of repeated screening is to validate the screening results (for the same area) with a wide range of local stakeholders. The screening aims to identify only EN and CR species that are potentially present in the OTP area of influence, covering reptiles, mammals, fish, birds, amphibians, and aquatic plants. Screening was done based on the IBAT report generated and provided by the AIIB.

In the first two rounds of screening, 17 EN and CR species were identified in the OTP area of influence (See Table below). In the 3rd round of screening (in August 2024), however, 11 (out of a total of 17 species) were confirmed as "potentially present" in the OTP's area of influence.

So, the assessment for Ou Ta Paong focuses on the confirmed list of **11 species** that are categorized by IUCN as EN and CR species, including 4 reptile species (Black Marsh Turtle, Giant Asian Pond Turtle, Southeast Asian Box Turtle, and Elongated Tortoise), 2 mammals (Indochinese Silvered Langur and Long-tailed Macaque), and 2 fishes (Striped catfish and

Siamese Tiger Perch), and 3 birds (Greater Adjutant, Milky Stork, and Bengal Florican) (See Table below for the list of confirmed species and see Figure 2 for potential locations reported by key informers of these species in the project's area of influence).

Table 2: Confirmed List of endangered and critically endangered species for the Ou Tapaong sub-scheme

No.	Local Name	English Name	Scientific Name	IUCN Cat	Screened Species from Round 1&2 (Total=17)	Confirmed Species in Round 3 (Total = 11)
	I. Reptile spices					
1	អណ្តើកក្អែក	Black Marsh Turtle	*Siebenrockiella crassicollis*	EN	Yes	Yes
2	អណ្តើកសោម	Giant Asian Pond Turtle	*Heosemys grandis*	CR	Yes	Yes

Ecological State of Habitats within the AoA

Understanding of the ecological state of habitats is necessary to assess the Likelihood of occurrence (LoO) of the above 11 screened species - as part of the CHA. For this CHA, species were classified into four LoO categories: Present, Possible, Unlikely and Not Present. Species known to be Present or with a Possible LoO are further assessed in Step 3. This understanding takes into account the classification of habitats as either modified or natural based on levels of human-induced disturbance to species composition and ecological functions. In this session, a brief assessment of the 11 confirmed species are presented. The assessment discusses historical range, distribution, habitat conditions, current status, and potential threats identified by key informants[20].

[20] Community councils and committees, including community fisheries (CFi) and farmer water user community (FWUC), were convened on July 25 and August 4, 2024. These meetings aimed to identify potential field assessment areas and select individuals with deep local ecological knowledge and experience for interviews. A total of 13 key informants were interviewed in Ou Topaong. Five of these individuals were from the upper command area, while seven were from the lower command area. Additionally, one representative from Punleu Komar Organization, which supports the Samraong Muk Yeik Community Forest Initiative, was included. Notably, the Samraong Muk Yeik and Sdok Khlouk Community Fisheries locations overlaps with portions of the Lower Ou Tapaong Command Area.

The OTP command area has been in existence since the 1970s. The OTP is a mixture of paddy fields, farm roads, and residential areas. Natural rivers, such as the OTP river, have been changed and various sections by local people to support living and farming activities. The OTP command area, therefore, the ecosystem within the OTP command area has been subject to human-induced changes over the past several decades. As such, the OTP command area is a modified habitat.

Reptiles (4 species)

The Black Mash Turtle was observed in both upper and lower sections of the command area, as well as along the main Ou Tapaong river (which is being used as a key canal feeding irrigation water for the command area). Conversely, the Elongated Tortoise was only found in the upper reaches while the Giant Asian Pond Turtle and Southeast Asian Box Turtle were found only in the lower section within Tonle Sap Zone 3 (figure 2 above). Details are below:

- **The Black Mashed Turtle *(Cuora galbinifrons)*** was confirmed to be present in the area of influence based on the accounts of four local informants. Residents from the upper reaches of Ou Tapaong reported historical sightings of this species within the past 10-20 years although recent spotting has been scarce. Key informants who live in the lower part of the command area and had livelihoods closely intertwined with the Tonle Sap Management Zone indicated that there have been ongoing efforts to bring the **Black Mashed Turtle back** to the region albeit its rarity. One informant successfully captured a Black Mashed Turtle just before the interview. This species is highly valued in the local market, particularly among middlemen, and is often used for traditional medicinal purposes. The Black Mashed Turtle is listed as Critically Endangered by the IUCN Red List, and its presence in the area of influence indicates that the habitat is essential for its survival and reproduction. Therefore, the habitat meets the criterion of being significant for a Critically Endangered species of criteria 1a of IFC PS6.
- **Elongated Tortoise:** This species wasn't initially screened for the interview, but it was identified and spotted by two key informants at the upper section of the Ou Tapaong based on the turtle images that were shown to facilitate the identification of species. No such sightings have been documented in the lower portions of the command area. One informant, a local resident near Ou Tapaong, provided a firsthand account of capturing this species. After a thorough examination of the accompanying photographs and a comparison with verified identifying features, this species is confirmed present as reported by the local informant. The Elongated Tortoise is listed as Critically Endangered by the IUCN Red List. The presence of this species within the project area indicates that the habitat is essential for its survival and reproduction, meeting the requirements of Criterion 1a.
- **Giant Asian Pond Turtle:** Three local informants who were interviewed in the lower Ou Tapaong River region confirmed the presence of the Giant Asian Pond Turtle. One informant reported spotting this species in Boeung Kum Traeng, a wetland within Tonle Sap Zone 3 while the other two informants indicated their encounters with this species in the mountainous regions of Kravanh District. Asian Pond Turtle is listed as Critically Endangered by the IUCN Red List. The reported sightings in Boeung Kum Traeng and the mountainous regions of Kravanh District indicate that these areas may be important habitats for the survival and reproduction of this species, meeting the requirements of Criterion 1a.
- **Southeast Asian Box Turtle:** During our survey in the lower section of the Ou Tapaong, we obtained valuable information about the Southeast Asian Box Turtle. All seven informants in this area confirmed the presence of this species in nearby

wetlands and flooded forest areas within Tonle Sap Zone 3, which is close to the command area boundary. While three informants reported recent encounters with this species, the remaining four mentioned that they had encountered it 10 to 20 years ago. They explained that the turtle was once abundant but has become very rare in recent years.
Similarly, all turtle species, including the Southeast Asian Box Turtle, are threatened by ongoing illegal hunting for trading purposes. Some people were hesitant to share recent information about these species.

Mr. Pheoun Moeun, Deputy Chief of Samraong Muk Yeik Community Fishery (SMY-CFi) is exceptionally knowledgeable about wildlife species in his Cfi area. He has been actively participating in forest patrols and community activities. He mentioned that some people who go fishing in the forest occasionally bring back one or two turtles with them but he preferred not to disclose this information.

One key informant admitted that they captured a turtle from a nearby forest and sold it for income. Income was shared among the four individuals. While informants were willing to share their past incidents, they were reluctant to provide details about the recent events because these activities are illegal.

the Southeast Asian Box Turtle, a Critically Endangered species, is present in the lower section of the Ou Tapaong and nearby wetlands. These unique ecosystems are highly threatened. Therefore, Criteria 1a and 4 of IFC PS6. Additionally, Criteria 1b may also apply due to the high threat level and declining population. are potentially met.

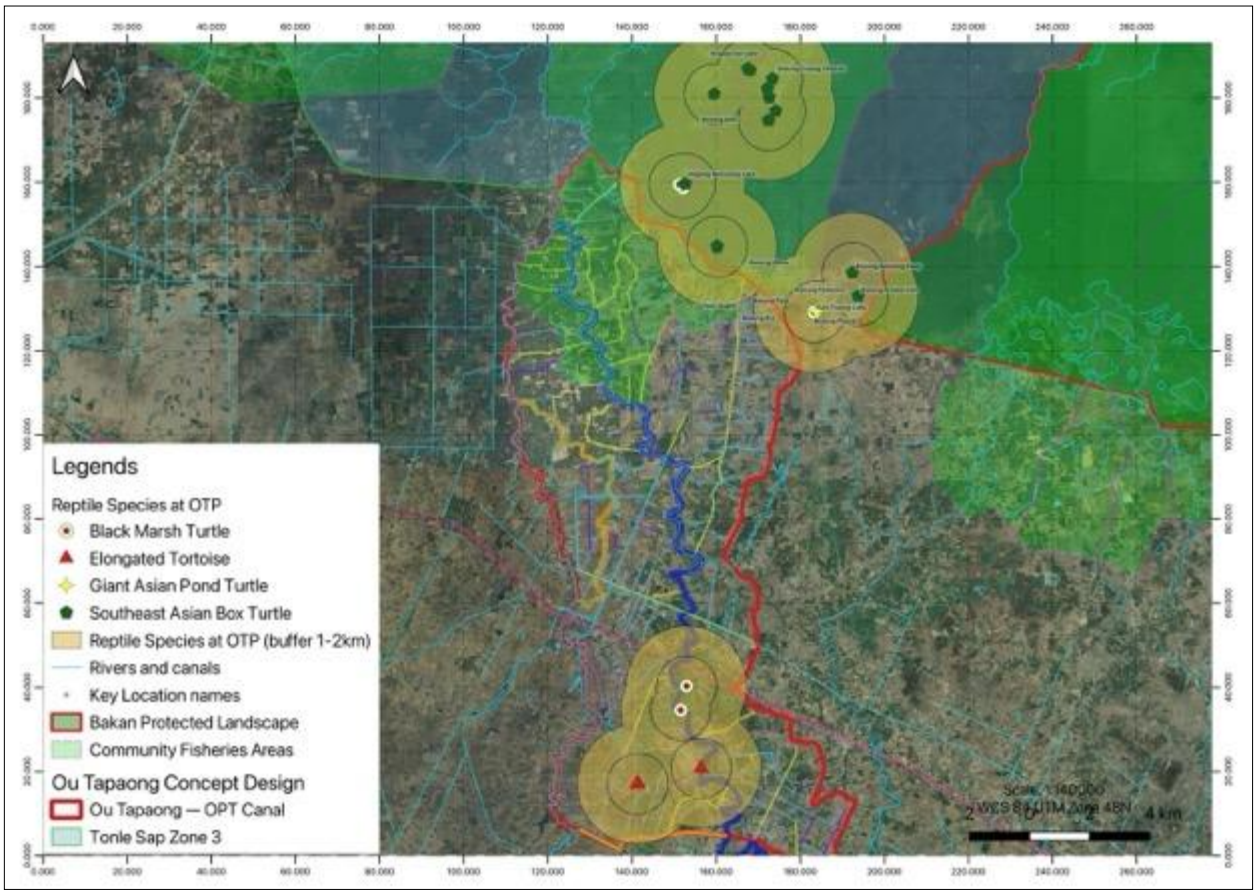

Figure 2: Distribution of identified turtle and tortoise species in and outside the OTP Command Area

Birds (3 species)

Despite extensive interviews with key informants residing in the upper reaches of Ou Tapaong, numerous endangered or critically endangered bird species were reported within their community. Conversely, only three of six bird species were confirmed by both key informants and CFi committees in the lower section. The following paragraphs summarize the primary findings and justifications for each species' presence, along with the associated level of confidence. These conclusions are based on in-depth interviews, technical expertise, and consultations with relevant units, which provided valuable assistance in verifying species of high conservation significance. Several species were initially identified by local residents.

- **Bengal Florican:** Five informants confirmed the presence of the Bengal Florican in the area of influence. Two individuals reported sightings within the past 10-20 years while three others have observed the species within the last five years and in the past. Notably, one informant witnessed a pair (male and female) as recently as March 2024 (see Figure 3). The lower reaches of Ou Tapaong exhibit a diverse mosaic of habitats, including open wetlands, grasslands, flooded forests, and minimally intensified paddy fields, creating a relatively undisturbed environment that is potentially conducive to Bengal Florican populations. Notably, the Ou Tapaong Command Area is situated only 1 kilometre from the Bakan Protected Landscape (BPL), a region characterized by similar ecological conditions (figure 3).

  Established in July 2023 through a joint effort by the Ministry of Environment and the Wildlife Conservation Society (WCS), the BPL aims to safeguard the southernmost Bengal Florican subpopulation within the Tonle Sap Great Floodplain. Moreover, the BPL serves as a critical wintering habitat for the Yellow-breasted Bunting, Manchurian Reed-warbler, and Cambodia's unique population of the Chinese Grassbird, along with other globally threatened avian and wildlife species (WCS 2023).

  The project area likely meets Criterion 1a (habitat of significant importance to Critically Endangered species) due to the presence of the Bengal Florican. Additionally, it may meet Criterion 4 (highly threatened and/or unique ecosystems) given the diverse habitat mosaic. However, a detailed ecological assessment is crucial to confirm these findings and identify any other relevant criteria.

- **Greater Adjutant:** During field assessments within the study area, multiple informants reported sightings of Greater Adjutants. While most individuals were unable to definitively distinguish between the Greater Adjutant and the similar-looking bird, which is Lesser Adjutant), one informant positively identified a Greater Adjutant within the Ou Tapaong Command area. This sighting occurred in recent years (figure 3). Unfortunately, due to the time of the observation, the Greater Adjutant had likely already migrated to its breeding grounds at Prek Toal Ramsar Site, a protected wetland area situated in Koh Chiveang community, Ek Phnom District, Battambang province (MoE 2012).

  Prek Toal Ramsar Site is the sole known breeding habitat for the greater adjutant in Southeast Asia and is recognized as the second-largest breeding colony for this species globally, following Assam, India. In December 2015, the Royal Government of Cambodia and the Ramsar Convention Secretariat designated the Prek Toal Core Area as a Wetland of International Importance due to its exceptional biological,

social, and economic value. This designation solidified Prek Toal's status as Cambodia's fourth Ramsar Site (WCS 2016). Following the breeding season, greater adjutants migrate across the Tonle Sap Floodplain to their foraging habitats, with the lower section of Ou Tapaong serving as a critical foraging ground.

Despite the challenges faced during the field observation due to the time of year, the confirmed sighting of a Greater Adjutant in the study area is a significant finding. It suggests that the species may still be present in the region and that a suitable habitat may exist for its continued survival.

The findings indicate that the project area meets IFC PS6 Criteria 1a and 3. This is due to the presence of the Critically Endangered Greater Adjutant, a migratory species that utilizes the area as a critical foraging habitat, particularly during the non-breeding season.

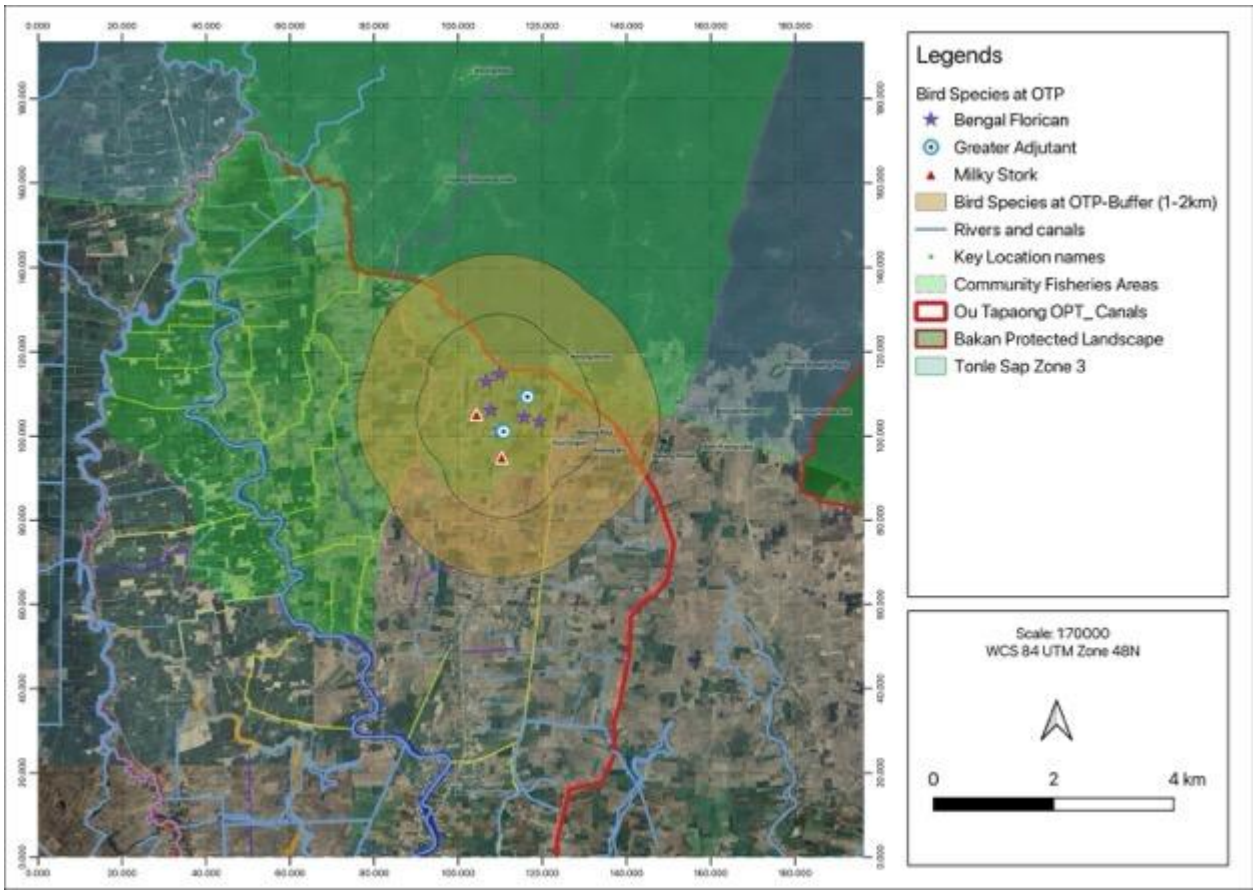

Figure 3: A spatial distribution map was generated for three bird species—the Bengal Florican, Greater Adjutant, and Milky Stork—within the lower Ou Tapaong Command Area. 1-2 km buffer zones were included to approximate their minimum movement range around suitable habitats.

- **Milky Stork:** Despite repeated attempts to elicit accurate information, many key informants were unable to distinguish between the Painted Stork and the Milky Stork, two similar-looking bird species. This confusion is a common challenge in bird identification, especially for non-experts. While the Milky Stork is considered extremely rare in Cambodia, with sightings typically limited to 1-3 individuals, some informants claimed to have encountered larger groups. This discrepancy can be attributed to misidentification and the difficulty of accurately counting birds in the field.

Based on my experience in bird identification and conservation, I was able to evaluate the credibility of the information provided. Two informants offered the most reliable accounts, describing sightings of 2-3 Milky Storks feeding alongside numerous Painted Storks in seasonal wetland areas near flooded forests (figure #3). These observations align with the limited available data on Milky Stork distribution and behavior in Cambodia. When the flooding season arrives, they migrate to degraded forest areas in the uplands. Milky Stork and Great Adjutant are migratory birds that move both locally and across international borders. The Prek Toal Ramsar Site serves as the only known breeding ground for Milky Stork and Greater Adjutant in Southeast Asia; after breeding, they migrate to other wetland areas throughout the country.

The Milky Stork's situation appears to align with several IFC PS6 criteria:

Species Level:

Endangered Species (Criterion 1a): The Milky Stork's rarity and the challenges in accurately assessing its population make it a strong candidate for this criterion. Its limited distribution and potential threats further emphasize its vulnerability.

Migratory Species (Criterion 3): The migratory nature of the Milky Stork, particularly its reliance on the Prek Toal Ramsar Site as a breeding ground and its movements to other wetland areas, highlights its dependence on various habitats throughout its range.

Ecosystem Level:

Highly Threatened and/or Unique Ecosystems (Criterion 4): The wetland habitats used by the Milky Stork, especially the flooded forests and seasonal wetlands, are often threatened by human activities like deforestation, agriculture, and pollution. These ecosystems are essential for the survival of the species and other biodiversity.

Figure 4: Photograph of a Milky Stork foraging alongside a flock of Painted Storks (credit: Sang Mony, Sam Veasna Conservation Tour), and a map illustrating the distribution of Milky Stork sightings in Cambodia from 2020 to 2024, extracted from eBird data.

- **Yellow-breasted Bunting**: The Yellow-breasted Bunting is a small, migratory songbird found in Southeast Asia, including Cambodia. It is characterized by its bright yellow breast and throat, contrasting with its olive-green upperparts. The Yellow-breasted Bunting is a winter visitor and spring passage migrant in Cambodia, often found in rice fields, scrub, grasslands, and marshes in the lowlands. In Cambodia November to May, the species has been recorded in the Tonle Sap Floodplain and the Lower Mekong Delta. Yellow-breasted Buntings are typically observed in rice fields, scrublands, grasslands, and marshes in the lowlands of Cambodia (Ly et al. 2022).

  The local population often mistakenly identifies this species as a sparrow or a weaver due to their similar size, appearance, and shared habitats. After conducting inquiries, none of the locals could confirm whether they had observed this species in the area. This highlights a common gap in local ecological knowledge regarding small bird species like this one. Identifying such species typically requires individuals with advanced birdwatching experience, who can locate them in the appropriate habitat at the right time.

  Based on an overall assessment of the habitat conditions in the lower part of Ou Tapaong, we can confirm that this area has the potential to serve as a wintering habitat for this species. Additionally, the boundary of the Ou Tapaong Command Area is just 1 km away from the Bakan Protected Landscape.

  The Yellow-breasted Bunting's Critically Endangered status and the Ou Tapaong area's potential as a wintering habitat potentially meet IFC PS6 Criteria 1a. Additionally, the species' restricted range and migratory behavior align with Criteria 2 and 3. The Yellow-breasted Bunting, a CR species, is known to inhabit such areas during its winter migration.

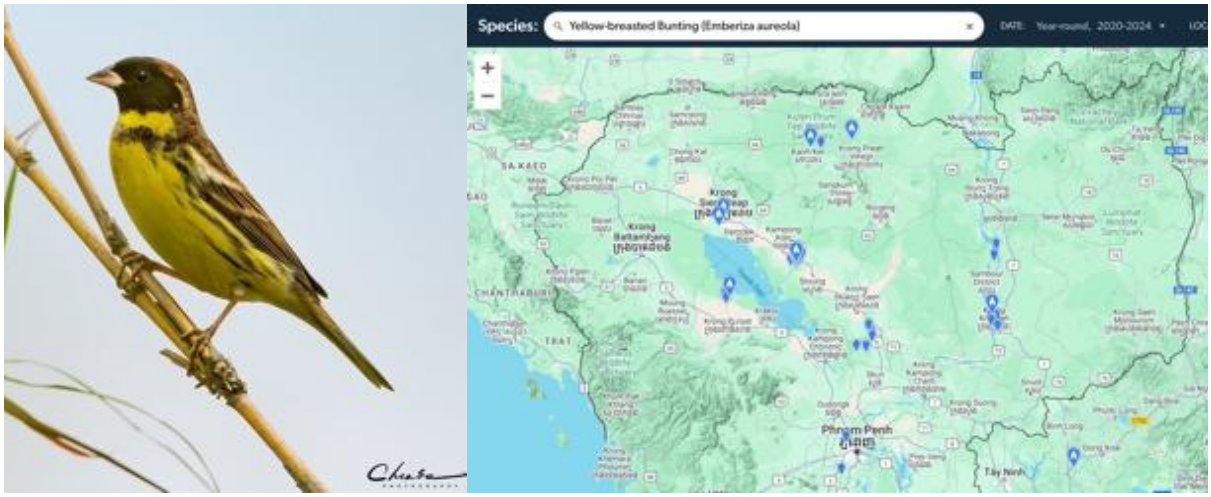

Figure 5: Photo of Yellow-breasted Bunting (Emberiza aureola) and its distribution map from eBird data (2020-2024) recorded by birdwatcher and wildlife overserves.

- **Wild-winged Duck:** Regarding the Wild-winged Duck, there was some confusion among informants who mistakenly identified it as the Knob-billed Duck (Sarkidiornis melanotos). However, after discussing key identification features and ecological characteristics, such as breeding and nesting habitats, we determined that none of them had actually encountered the Wild-winged Duck before. Due to it's tiny population, Wild-winged Duck is very sensitive, and live in the forest close to the lake, wetland, river and waterhold with less disturbance. Due to its limited population, the Wild-winged Duck is particularly sensitive to disturbances and prefers to reside in relatively undisturbed forests adjacent to lakes, wetlands, rivers, and watering holes.

This preference for quieter, less populated areas helps to ensure the survival of this vulnerable species.

Mammals/ primates (2 species)

No suitable habitats or sightings of three mammal species were identified in the upper section of Ou Tapaong. Two primate species (Indochinese Silvered Langur and Long-tail Macaque) were confirmed at the lower section in the Flooded Forest habitat of the Tonle Sap Zone 3 and CFi Areas. Additionally, multiple reports indicated the presence of Hiary-nosed Otters in the region, particularly in the deep waters of the flooded forest near the Tonle Sap Great Lake's mouth. The following paragraphs summarize the key findings and justifications for the presence of these two primate species, along with their associated confidence levels. These conclusions are based on comprehensive interviews, technical expertise, and consultations with relevant units, which contributed to the verification of species with high conservation importance.

- **Indochinese Silvered Langur:** Six local informants (86%) reported frequent encounters with Indochinese Silvered Langurs within the flooded forests of Tonle Sap Zone 3 which is outside of the OTP command area. These sightings, primarily near natural lakes, have been confirmed by multiple individuals engaged in livelihood activities within these areas. While the population of Indochinese Silvered Langur was once plentiful, informants noted a significant decline in recent decades, with only smaller troops now being observed. The species is known to inhabit areas near rivers and large bodies of water.

  Mr. Chem Sophal from Punleu Komar Organization highlighted that his organization provides support for the Samraong Muk Yeik Community Fishery (SMY-CFi) and Sdok Khlouk Community Fishery (SK-CFi) in managing and protecting fisheries resources and flooded forests within their Community Fishery Area (figure 6). Portions of these CFi Areas overlap with the Lower section of Ou Tapaong Command Area. This effort is part of the EU “Our Tonle Sap” Project, led by the Wildlife Conservation Society and funded by the European Union. Mr Sophal emphasized the presence of numerous endangered and critically endangered species, including the Indochinese Silvered Langur, within this CFi Area. To confirm the presence of any Community Fisheries (CFIs) within the specified area, we interviewed the Chief of Pursat Fishery Administration Cantonment. Our inquiry revealed that two CFi areas overlap with the designated region, as illustrated in the accompanying map (see map below).

  Based on the provided information, the following IFC PS6 criteria are potentially met regarding the Indochinese Silvered Langur and the flooded forests of Tonle Sap Zone 3:

  Species Level:
  Criterion 1: Critically Endangered and Endangered Species: The Indochinese Silvered Langur is an endangered species, making its habitat a potential candidate for this criterion.
  Criterion 2: Highly Threatened Species: Given the observed decline in the population and potential threats to its habitat, the species could be considered highly threatened.

  Ecosystem Level:

Criterion 5: Highly Threatened and Unique Ecosystems: The flooded forests of Tonle Sap Zone 3 represent a unique and threatened ecosystem, particularly due to factors such as habitat loss and degradation.

- **Long-tailed Macaque:** Indochinese Silvered Langurs and Long-tailed Macaques were commonly reported by key informants residing within the Tonle Sap Zone 3. These informants, who frequently engaged in fishing activities in the surrounding forests, encountered Long-tailed Macaques regularly. They added that these primates, known for their social nature, live in troops and communicate vocally to alert their group members of potential threats or discoveries. Some troops inhabit flooded forests situated close near the command area.

  However, informants expressed deep concern over the significant decline in the population of Long-tailed Macaques over the past several years. This alarming trend has prompted urgent action from conservation organizations. In response to the deteriorating situation, the primate specialist group upgraded the conservation status of this species from Vulnerable to Endangered in March 2022. This elevated status underscores the urgent need for increased protection measures to mitigate the species' decline, which is primarily driven by the high demand for these primates in the illegal pet trade (*Primate Conservation Alliance. 2022)*

  The provided information strongly suggests that the Tonle Sap Zone 3 adjacent to the OTP meets multiple IFC PS6 criteria related to the Critically Endangered Long-tailed Macaque:
  - Criteria 1a: The recent uplisting of the Long-tailed Macaque to Endangered status by the IUCN Red List underscores the habitat's critical importance for the species' survival and reproduction. The frequent sightings of these primates by local informants, especially in the flooded forests, highlight the area's significance as a key habitat.
  - Criteria 4: The flooded forests of the Tonle Sap Zone 3 represent a highly threatened and unique ecosystem. They face significant threats from habitat loss, pollution, and climate change. These forests provide a crucial habitat for the Long-tailed Macaque and other potentially threatened species.

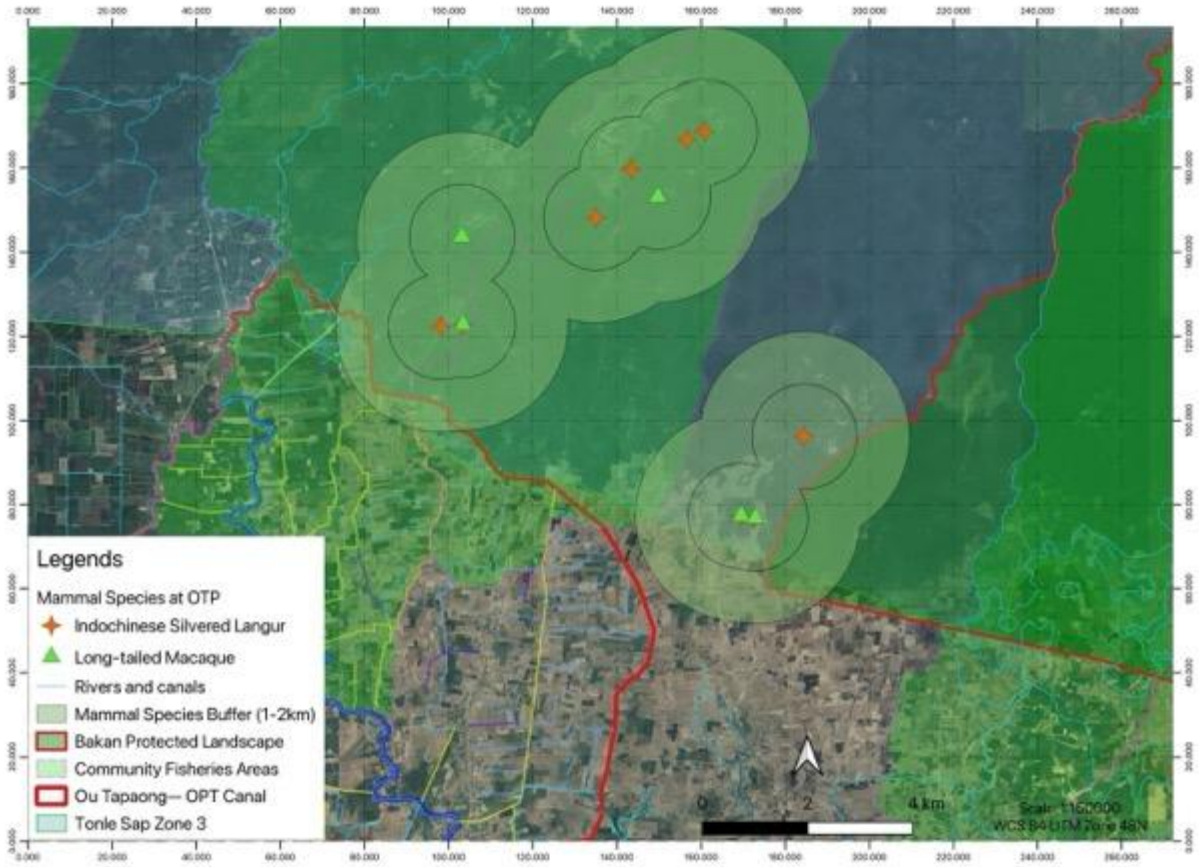

Figure 6: A spatial distribution map was generated for two primate species—the Indochinese Silvered Langur and Long-tailed Macaque—within the lower Ou Tapaong Command Area. 1-2 km buffer zones were included to approximate their minimum movement range around suitable habitats.

Fishes (2 species)

Overall, these statements provide valuable insights into sightings and knowledge about Siamese Tiger Perch and Striped Catfish within different sections of the Ou Tapaong Command area. The following paragraphs summarize the key findings and justifications for the presence of these two fish species confirmed by key informants, along with their associated confidence levels and their ecological knowledge of fish diversity and migration.

- **Siamese Tiger Perch:** According to four key informants in the upper section of the Ou Tapaong Command area, Siamese Tiger Perch has been consistently observed in Boeng Kansaeng Lake, located in the southwest part of the Ou Tapaong Command Area. Three of them reported encountering a few individuals of this fish species in 2023 and 2024 (figure #7), while another informant saw them about 20 years ago during the fully flooded period. This particular informant stopped fishing for many years after becoming older.

  The Siamese Tiger Perch is believed to migrate from Tonle Sap Great Lake to the upstream through Svay Daun Kav River (along the western boundary of command area) and then move into Boeng Kansaeng through its tributary canal during flooding periods. Common fishing gear used includes line nets, cast nets, and small fish traps. The informants mentioned that catching this species is extremely rare, with only one to two individuals caught per season using line nets. They possess extensive knowledge about fish and make a living through fishing.

On the other hand, two key informants from the lower Ou Tapaong section stated that although they are familiar with Siamese Tiger Perch, they have never seen them in their area. One informant mentioned having seen this species in 1979 but not recently. Similarly, Mr. Chem Sophal from Punleu Komar Organization confirmed his awareness of this species but stated that it is not present in the lower Ou Tapaong Area.

The Criterion 1a of IFC Performance Standard 6 (PS6) is potentially met. The Siamese Tiger Perch, a Critically Endangered species, has been observed in Boeng Kansaeng Lake, a habitat within the Ou Tapaong Command Area. However, the frequency of sightings is low and historical, suggesting that further investigation is necessary to definitively establish the habitat's significance for the species' survival and reproduction.

- **Striped catfish**: One informant recalled seeing the Striped Catfish approximately 7 years ago in a small wetland area during the peak of flooding. This species is exceptionally rare, and it is known to migrate to this specific area when the entire region becomes submerged in floodwater.

  Based on what we know, the habitat for the Critically Endangered Striped Catfish likely meets two of the IFC PS6 criteria:
  - Criterion 1a: This habitat is super important for the survival of this super rare fish. It's like their special breeding ground during floods.
  - Criterion 3: The fish migrates to this specific area when it floods, making it a key spot for this travelling species.

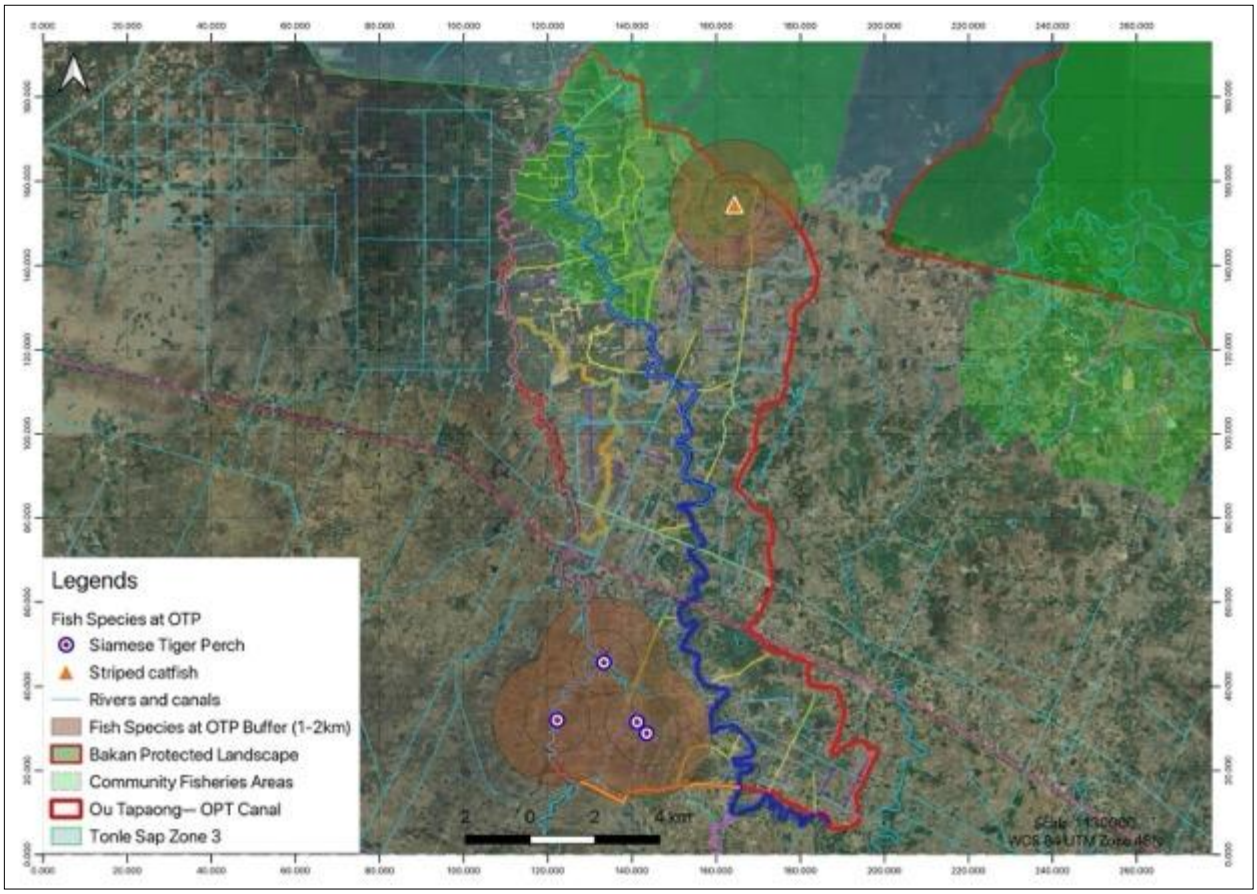

Figure 7: A spatial distribution map was generated for two fish species—the Siamese Tiger Perch, and Striped Catfish (old record-7 years ago)—within the lower Ou Tapaong Command Area. 1-2 km buffer zones were included to approximate their minimum movement range around suitable habitats.

Occurrence of Protected Areas near the Sub-scheme Area

A review of protected areas in the vicinity of the sub-scheme has been conducted as a preparatory step before proceeding with Step 3 of the CHA. There are four areas located near and downstream of the OTP sub-scheme (See Table below). The preliminary assessment focuses on the two that are closest to the OTB: Flood Forest Conservation, b) Bakan Grassland Protected Area[21].

No.	Name of Protected Area	Designated by	Main target and requirement	Distance (km) to OTP sub-scheme
1	Flooded Forest Conservation	Royal Government of Cambodia: Sub-decree No. 197 dated 29 August 2011	The Tonle Sap's flooded forests are a vital part of its unique ecosystem. During the wet season, the Mekong River's waters back up into the Tonle Sap, flooding vast areas and creating a rich habitat for diverse wildlife. This dynamic ecosystem supports a multitude of fish species, waterbirds, and other wildlife. However, it faces threats like deforestation, overfishing, and pollution, necessitating conservation efforts to protect this vital resource.	0 (share the border)
2	Bakan Grassland protected area	Royal Government of Cambodia: Sub-decree No. 144, dated 04 July 2023	Bakan Grassland, a 38,430-hectare protected area in Cambodia, is a vital part of the Tonle Sap ecosystem. It's home to endangered bird species like the Bengal Florican and Chinese Grassbird. The Wildlife Conservation Society (WCS) and local communities are working together to protect this unique habitat.	2
3	Dei Roneat Important Bird Area (IBA)	BirdLife Internation	The IBA supports breeding colonies of important birds like the Darter, Lesser Adjutant, and Greater Adjutant. Its diverse habitat supports various bird species, but faces threats from human activities. Conservation efforts include monitoring, community engagement, habitat restoration, and policy advocacy to protect this crucial site.	12

[21] Bakan grassland is a protected area for birds designated by sub-decree No. 144 in 2023.

No.	Name of Protected Area	Designated by	Main target and requirement	Distance (km) to OTP sub-scheme
4	Tonle Sap Biosphere Reserve (TSBR)	Royal Government of Cambodia: Royal Decree in 2001[22]	The Tonlé Sap Biosphere Reserve is a distinctive ecological region encompassing the Tonlé Sap, or Great Lake of Cambodia. The reserve was successfully designated a UNESCO Biosphere Reserve in 1997 and subsequently enshrined in the Cambodian Royal Decree in 2001.	16
5	Prek Toal Important Bird and Biodiversity Area (IBA), then designated at the core area of TSBR in 2001, and then promoted Prek Toal Ramsar Site in 2015	BirdLife Internation Royal Government of Cambodia: Royal Decree in 2001[23] Sub-decree in 2015	The area is well known as the largest waterbird breeding colonies in Southeast Asia, support a congregation of may globally threatened birds, fish and other wildlife specicis. It's the second world largest breeding habiatat for Greater Adjutant, and the only breeding habitat for Spot-billed Pelican, and Milky Stork in Southeast Asia. Prek Toal is only inland breeding population for Milky Stork in the world.	24

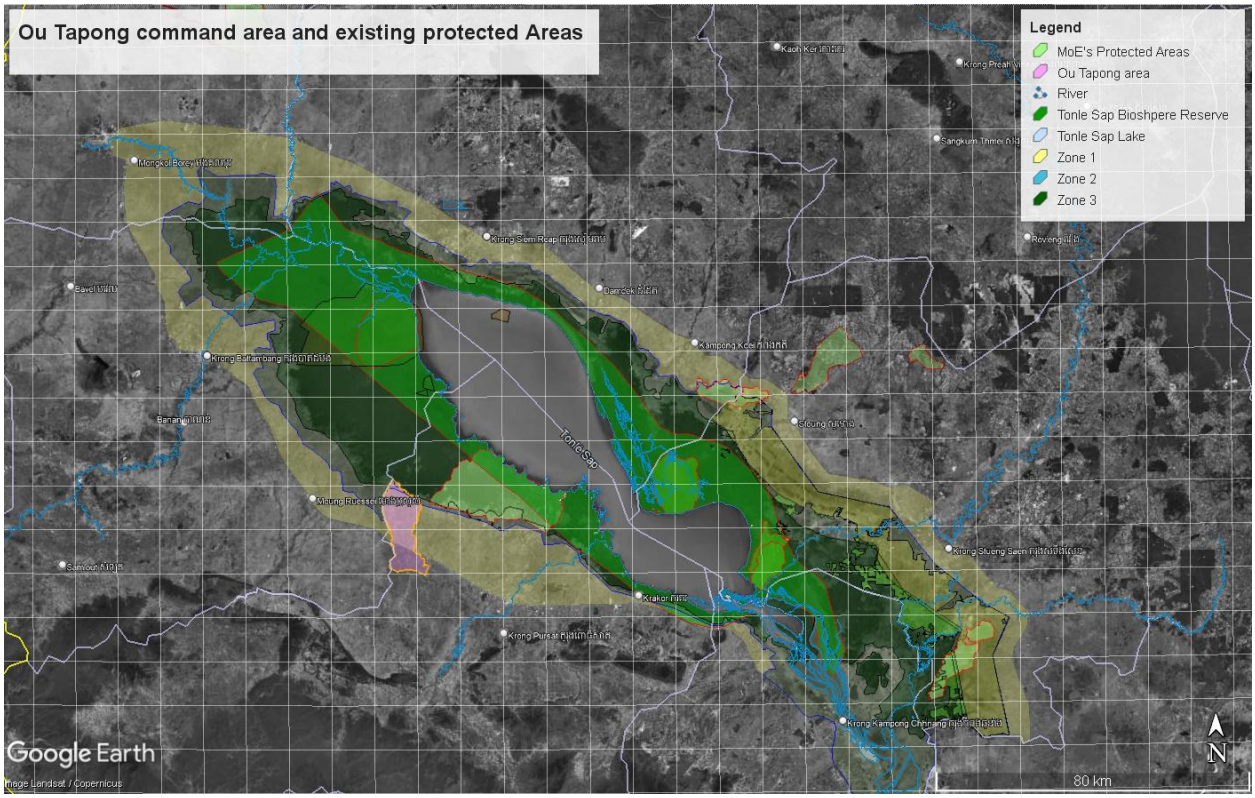

Figure 8: Map of Ou Tapong Command Area and other existing protected areas under administered of the Ministry of Environment, Ministry of Agriculture, Forestry, and Fisheries, and Ministries of Water Resources and Meteorology

Determination of Critical Habitat Status (Step 3)

This section assesses the information (obtained from the above sub-section) vis-a-vis the criteria (presented in Section 3.4 - CH assessment method). This assessment aims to determine whether any species (identified in the list of 11 EN and CR species) qualify for Critical Habitat features.

All information presented in this study report has been meticulously verified against reliable sources, including key government research institutes, national and international organizations, and expert consultations. To ensure accuracy, fish, bird, mammal, and reptile species identification at Ou Ta Paong, Lum-Hach, Brambei Mom, Kraeu Trom, and Yottasass was confirmed through consultations as below:

Table 3: list of internation and nation key expert were consulted to check and verify each all target EN and CR species

Name	Position and institution	Key Area of expertise/ consultation	Contact
Dr. Ea Chitra	Head of the Aquaculture Faculty at the Kampong Speu Institute of Technologies	Key fish species were released by his faculty at Anlong Chrey and Brambei Mum Reserviors.	+855 14 388 694
Mr. Robert Tizard	Senior Project Lead for Tonle Sap Landscape, WCS Camodia	Confirmation and historical sighting data of Bengal Florican and other key bird species around Ou Ta Pang sub-scheme	rtizard@wcs.or

Mr. Tach Sovannara	Head of the Fisheries Lab at the Inland Freshwater Research and Development Institute of the Fisheries Administration	Identification and clarification of EN and CR species of fish and reptiles across all sub-schemes	
Mr. Khim Sokha	Chief of office of the Fisheries Conservation Department	Identification and clarification of EN and CR species of fish and reptiles across all sub-schemes	+855 12 784 687
Mr. Chuem Sophal	Program Manager, Punleu Komar Organization	Confirm present of birds and key wildlife species at Ou Ta Paong Sub-scheme	
Mr. Morn Ravy	Bakan Protected Landscape Project Coordination, WCS Cambodia	Confirm present of birds and key wildlife species at Ou Ta Paong Sub-scheme	morn@wcs.org
Mr. Somony Thay	Direct of Aquaculture Department, FiA	Fish identification, key fish species releasing data, and distribution range across all schemes	+855 12 829 971
Mr. Neang Ty	Conservation Program Manager, Wild Earth Allies	Internation and national expert on reptile	+855 12 864 409
Mr. Hong Chamnan	Director of the Freshwater Wetland Conservation Department, MoE	Confirmation and historical sighting data of Bengal Florican and other key bird species around Ou Ta Pang sub-scheme, national protected area data	+855 12 922 429
Mr. Sun Visal	Deputy Director of the Freshwater Wetland Conservation Department, MoE	Confirmation and historical sighting data of Bengal Florican and other key bird species around Ou Ta Pang sub-scheme, national protected area data	+855 12 708 836

All information concerning avian and other key wildlife species, including their behavioral patterns, was corroborated through sighting data verified by relevant experts from the Wildlife Conservation Society (WCS), a long-standing partner of the Ministry of Environment (MoE), Fisheries Administration, and Forestry Administration in conservation efforts spanning over 25 years. Additionally, consultations were held with Mr. Hong Chamnan, Director of the Freshwater Wetland Conservation Department, and Mr. Sun Visal, his Deputy Director and the head of the Tonle Sap Biosphere Reserve. Both individuals possess extensive experience, ranging from 20 to 30 years, in avian ecology and protected area management within the Tonle Sap Lake region.

Finally, information related to reptiles and amphibians was validated through consultations with Mr. Neang Ty and his team from Wild Earth Allies, renowned experts who have made significant contributions to the discovery of new reptile and amphibian species in Cambodia, including the Cardamon Shrub Frog (Philautus cardamonus).

Overview of the current land use and land cover at OPT

The map below features the current land and use and land cover at Ou Tapaong Command Area based on the satellite image captured by Sentinel 2 with 10m resolution in late 2023. The color bands failed to distinguish between rice fields, grassland and shrubland areas. However, based on field assessment, the command area is dominated by existing rice fields and some modified habitats. There are some small and fragmented natural habitats like shrubland, and grassland along the natural streams, seasonal ponds and wetland habitat creating a mosaic habitat for many wildlife species to strive as the area is situated within the Tonle Sap Floodplain close to many protected areas and IBBAs. Residential areas are situated along the main roads, rivers, and streams.

The northern portion of the OTP Command Area is a dynamic landscape characterized by a varied mosaic of habitats. Here, agricultural lands coexist with modified habitats, wetlands, shrublands, and remnants of grassland, seamlessly transitioning into the vast expanse of the Tonle Sap Zone 3 flooded forest.

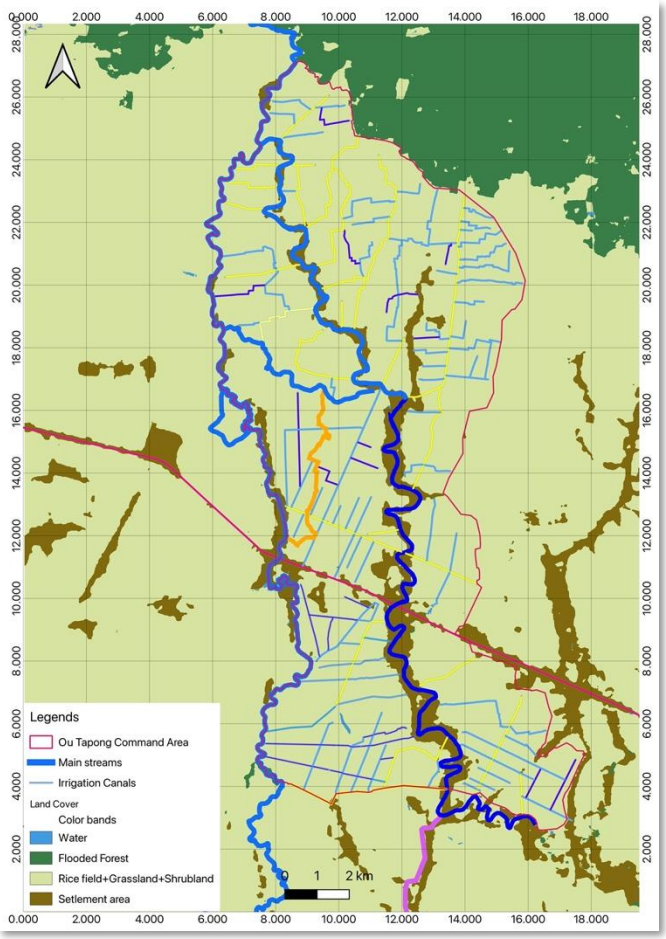

Figure 9: Land use and land cover map based on

This diverse ecological mosaic plays a crucial role in supporting a rich array of biodiversity. The area serves as a vital foraging ground for numerous migratory bird species, providing them with abundant food resources. Additionally, it functions as a critical refuge and breeding ground for fish during the wet season, when the flooded forests and wetlands offer ideal conditions for spawning and juvenile development.

The intricate interplay of these habitats sustains a diverse community of wildlife, including birds, mammals, fish, and reptiles. These species rely on the unique characteristics of the flooded forest and wetland ecosystems for essential life cycle activities such as breeding, nesting, and foraging. The area's significance as a biodiversity hotspot is underscored by its role in supporting a wide range of Habitat of significant importance to CE and EN species

As presented in Section 4.1.3.3 (Ecological State), species that qualify as critical habitat features include:

- **Reptile** (4 species): Black Marsh Turtle, Giant Asian Pond Turtle, Southeast Asian Box Turtle, and Elongated Tortoise,
- **Mammals** (2 species): Indochinese Silvered Langur and Long-tailed Macaque),
- **Fishes** (2 species): Striped catfish and Siamese Tiger Perch, and
- **Birds** (3 species): Greater Adjutant, Milky Stork, and Bengal Florican.

First of all, the Ou Tapaong command area was assessed as a modified habitat because the command area which is around 14,000 hectares is a mixture of paddy fields, rivers, shrubland, seasonal ponds, farmers, and houses. Rivers such as Ou Ta Paong River and Svay Donkeo River have been substantially modified at various

locations of the river for water collection, storage, as well as for other living and farming purposes.

In this assessment, we divided Ou Tapaong Command Area into three parts: 1) the upper part to the south, 2) the middle part along National Road 5, and 3) the lower part to the north which is situated within the floodplain of Tonle Sap Zones 2 and adjacent to Tonle Sap Zone 3 for key informant interview and habitat assessment purposes as this command area is large and maintain different demographic and natural habitat conditions. On August 7, 2024, the Cambodian government discussed the decision to register two zones (Zone 2 and Zone 3) of the Tonle Sap Lake Basin as state land to protect the natural resources of the lake. This decision will prohibit any further requests for land concessions in these zones. The Ministry of Land Management, Urban Planning and Construction hopes that this will help to preserve the biodiversity of the lake[24]. The assessment focused on the upper and lower parts because these areas are known to have a diverse biodiversity landscape. While the survey revealed variations in knowledge about wildlife among local communities, it also highlighted the need for increased awareness and understanding across all areas.

[24] Land Management, Urban Planning and Construction, Cambodia (2024). Zones 2 and 3 of the Tonle Sap Lake will be registered as state land to preserve this precious natural resource for inheritance for all generations.

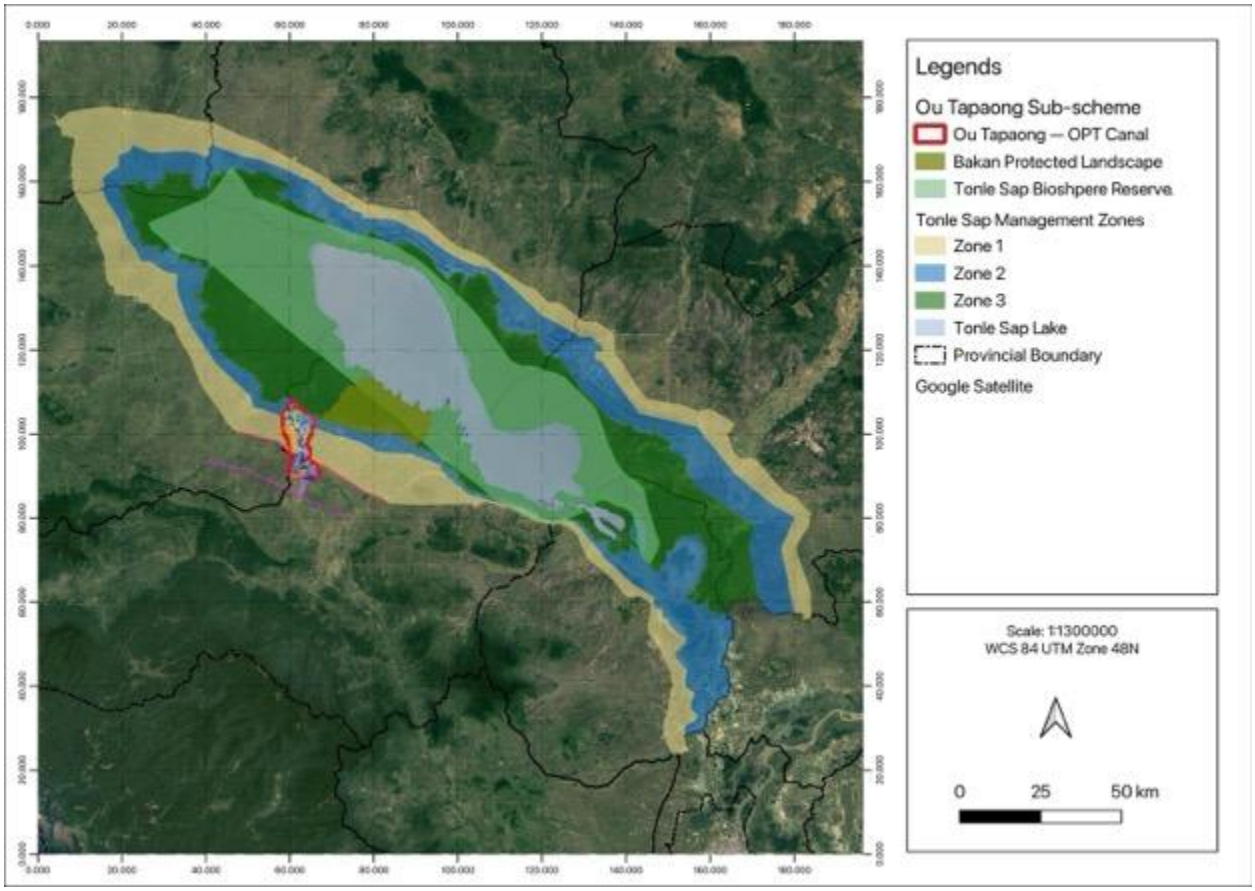

Figure 10: Map of Ou Tapaong command area and other existing protected area within the Tonle Sap Basin

The southern part of the command area is predominantly agricultural, with limited remaining natural habitats. Boeng Kansaeng, the largest seasonal wetland, faces challenges in water retention during the dry season. While the command area mostly gets water for irrigation from the Svay Daunkaev and Pursat rivers, the water volume is insufficient to maintain natural flows (e.g. Ou Tapaung River). Additionally, human interventions such as earth dams and conversion of waterways into fish ponds have fragmented the natural habitats and as such hindered the movement of aquatic species (Figures 8 and 9).

The northeastern part of the command area, though dominated by agriculture, includes a significant area of flooded forests. This diverse habitat supports a range of endangered and critically endangered species. However, the entire water system faces challenges that limit its suitability for species requiring extensive, interconnected habitats. The lowest part of this area is connected to a very healthy flooded forest habitat, consisting of many small and large waterholes, and wetland areas, creating a mosaic habitat that provides suitable ecological niches for many endangered and critical species in the area. This huge flooded forest habitat is part of the Tonle Sap Multiple Use Area, Tonle Sap Biosphere Reserve under the Ministry of Environment, and Tonle Sap Management Zone under the administration mandate of the Tonle Sap Authority, and Flooded Forest Protected Area under the Fisheries Administration. Additionally, a portion of Ou Tapaong's lower command area overlaps with two Community Fisheries (CFIs) areas.

The critical habitat for these bird species within the Ou Tapaong Irrigation sub-scheme includes flooded forests, wetlands, lakes, rivers, grassland, abandoned and fellow rice fields, and waterways. The flooded forests in Tonle Sap Zone 3 serve as crucial habitats for several endangered and critically endangered primate species like the Indochinese Silvered Langur and Long-tailed Macaque and are charaterised with lakes and wetlands inside that are crucial foraging habitats for birds. Based ont this key finding we can identify and cacharaterise critical habitats of various EN and CR species presence within and close thie command area as below:

- Flooded forests, particularly those in Tonle Sap Zone 3, are particularly significant for biodiversity. These forests provide crucial habitat for endangered primates such as the Indochinese Silvered Langur and Long-tailed Macaque. Additionally, the lakes and wetlands within these forested areas offer essential foraging grounds for various bird species including Greater Adjutant and Milky Stork.
- Wetlands, such as Boeung Kansaeng, play a vital role in supporting aquatic and terrestrial biodiversity. These areas provide essential food, shelter, and breeding grounds for a variety of species including birds, reptiles, and fish.
- Rivers and waterways, like the Svay Daun Kav River, serve as important corridors for fish migration and connectivity between different habitats. This can indirectly benefit birds by providing a healthy aquatic ecosystem.
- Grasslands and open areas, while less diverse than forested habitats, can still support certain Bengal Florican, Yellow-breasted Bunting and other bird species. Abandoned and fallow rice fields may also offer temporary refuge for many bird birds including the Florican. The Bengal Florican utilizes this habitat for nesting and feeding during the dry season. The Yellow-breasted Bunting winters in this region before returning to its breeding ground in Siberia, Russia, from May to November

Based on the biodiversity assessment conducted at Ou Tapaong Irrigation Sub-scheme, several critical habitats have been identified, and described below. These habitats support a range of endangered and critically endangered species, highlighting their ecological significance. **The critical habitat assessment activities that should be taken for the Ou Tapaong Command area, considering IFC PS 6 guidance on biodiversity conservation and sustainable management of living natural resources, are as follows:**

1. Baseline Studies: Conduct comprehensive baseline studies to identify and understand the biodiversity values in the area. This should include a literature review, stakeholder engagement and consultation, field surveys, and other relevant assessments. The focus should be on identifying key species (such as Greater Adjutant, Milky Stork, Bengal Florican), fish (Siamese Tiger Perch and Striped Catfish), reptiles (Black Marsh Turtle, Southeast Asian Box Turtle, Giant Asian Pond Turtle, Elongated Tortoise), mammals (Indochinese Silvered Langur and Long-tailed Macaque), and their habitats.
2. Habitat Mapping: Map out the different habitats present within the Ou Tapaong Command area. This should include flooded forests, lakes (such as Boeung Kamsaeng Lake), rivers (Svay Daunkav River), waterholes, grasslands, and fellowed rice fields used by bird species for foraging.
3. Threat Assessment: Assess potential threats to critical habitats identified in step 2. Consider factors such as habitat loss due to infrastructure development or land-use changes related to irrigation system renovation.
4. Stakeholder Engagement: Engage with relevant stakeholders including local communities living in or around critical habitats to gather their knowledge about biodiversity values in the area.

5. Mitigation Measures: Develop mitigation measures specific to each identified critical habitat that aligns with IFC PS 6 guidance on avoidance of impacts whenever possible; implementation of measures to minimize habitat fragmentation; restoration activities during operations or after project completion; implementation of set-asides for protection; consideration of biodiversity offsets where appropriate based on no net loss principle.
6. Environmental and Social Impact Assessment (ESIA): Conduct an ESIA that considers all potential impacts on critical habitats identified through steps 1-5 above.
7. Monitoring Plan: Develop a comprehensive monitoring plan that includes regular monitoring of key species populations within critical habitats identified in step 2 above.

Figure 11: Boeung Kansaeng located in Ou Tampaong's upper reaches, offers sighted records of Siamese Tiger Parch. The area's upper part in this photo is a settlement along the Svay Daunkav River.

Figure 12: Overview of Boeung Kansaeng, located upstream of Ou Tapaong Command Area. A canal connects to Stueng Svay Daunkav River (left) and Ou Tapaong (right), a potential fish migration route during floods.

Figure 13: Aerial photograph depicting the Ou Tapaong Stream/canal fragmented by earth dams, roads, and ponds, illustrating its diversion for non-intended purposes.

Figure 14: Aerial photograph of intake flooded forest habitat within Tonle Sap Zone 3 and the continuous land encroachment, converting forest land for rice cultivation.

Habitat of significant importance to endemic or restricted-range species

None of the species under EN and CR classification are restricted-range species (based on IBAT report for Ou Ta Paong).

Habitat supporting globally or nationally significant concentrations of migratory or congregation species

None of the IBA that are recognized for significant concentrations of migratory birds or other species are found within the vicinity of the sub-scheme. No other evidence of significant concentrations of migratory or congregatory species is available. The AoA for OTP, therefore is expected to qualify as critical habitats under this criterion.

Highly threatened or unique ecosystems

Each of the reservoirs are modified habitat and is associated with numerous rice paddies. There is no evidence that these areas are highly threatened or unique ecosystems, and no critical habitats are recognized under this criterion.

Ecological functions or characteristics that are needed to maintain the viability of the biodiversity values described above in (a) to (d)

Boeung Kansaeng Lake still maintains hydrological connectivity for fish migration from Stueng Svay Daunkav River through its canals, where the Siamese Tiger Perch was confirmed. Some small wetland areas at the lower part of the OTP command area support ecological functions and connectivity for confirmed birds, reptiles and fish species for their local movement, nesting, and foraging ground. So, that is necessary to support biodiversity values that require applying biodiversity mitigation measures and protection efforts (described under the above criteria) have been identified. Pumping, drainage, and discharge of chemical inputs into that wetland can have a significant impact on the biodiversity and survival rate of EN and CR species present in that area.

Potential Impacts & Feasibility of Net Gain Requirements (Step 4)

Step 4 (as described in the above CHA method) requires a high-level assessment of the potential for critical habitat features to be affected by the investment activities of the sub-scheme (both construction and operation). This step is necessary to determine if Net Gain measures need to be demonstrated and whether the necessary measures are feasible.

In the section below, species that are assessed as “Present” or “Possible” in sub-scheme AoI (as shown in the above table) are included in the impact assessment. These include the following 8 species: 1) Four reptiles (Black Marsh Turtle, Giant Asian Pond Turtle, Southeast Asian Box Turtle, Elongated Tortoise), 2) Three birds (Greater Adjutant, Milky Stork, and Bengal Florican), and 3) One fish (Siamese Tiger Perch).

Potential impacts

Reptiles *(Substantial risk)*

All four species of reptiles are found in the upper and lower part of the OTP command area, particularly in areas near natural water courses (rivers and streams). During construction,

these reptiles are potentially affected directly due to a) disturbances from noise and vibration due to increased vehicle activity and human presence, b) being hit by vehicles, equipment from increased traffic movement and river dredging/training at Ou Ta Paong river, excavating of the extended canal of Kbal Hong and other relevant canals, c) caught by workers, local people, and hunters. During project operation, these reptiles may be directly affected, including a) being caught by local people and hunters, and b) pesticide residues from intensified crop production.

Birds *(Moderate risk)*

Greater Adjutant, Milky Stork, and Bengal Florican are found seasonally in the command area, mainly in the lower/downstream part which is subject to annual flooding. These birds are migratory and as such are rare. Local people don't catch these birds for food. However, since these birds feed on aquatic species available from the command area, they may be affected by the feeds that are contaminated with pesticide residues.

Net gain assessment

Additionally, during construction activities, these birds may be indirectly affected through disturbance and habitat loss caused by increased human activity and changes in water levels. It is important to note that the Ou Tapaong Command Area serves as a critical habitat for these endangered bird species, making it crucial to minimize any potential negative impacts.

Based on the potential impacts identified above, it is evident that measures need to be implemented to achieve a net gain in biodiversity within the Ou Tapaong Command Area. These measures should focus on minimizing direct disturbances and habitat loss during construction activities, as well as implementing sustainable agricultural practices to prevent pesticide contamination of food sources for these bird species.

In conclusion, based on the assessment results, it is recommended that comprehensive actions be taken to protect critical habitats for species such as reptiles (Black Marsh Turtle, Giant Asian Pond Turtle, Southeast Asian Box Turtle Elongated Tortoise), birds (Greater Adjutant, Milky Stork, Bengal Florican), ensuring their survival alongside irrigation system renovation projects.

Table 4: Initial Screening of CH-qualifying Species Confirmed or Likely to Occur in the Ou Ta Paong sub-scheme of the Project Area

English Name	Scientific Name	IUCN Status	Global population	Cambodia population	Migratory/ Congregatory	Habitat and Distribution	Likelihood of Occurrence	Rationale for Critical Habitat Screening	Screened In or Out
Reptile									
Black Marsh Turtle	*Siebenrockiella crassicollis*	EN	Unknown (suspected to have decreased by about 80% in SEA)	Unknown-kept declining	N/A	Thrive in the Tonle Sap Floodplain's slow-moving waters and abundant vegetation, shrubland, wetland, and ponds; 5-20 masl.	Moderate - Confirmed in AoI in 2024	While much suitable habitat is present downstream of the project and along the Ou Ta Paong River and is therefore likely to occur in the project AoI. Likely to qualify as CH under Criterion 1& 4 threshold.	**IN**
Giant Asian Pond Turtle	*Heosemys grandis*	CR	Unknown (suspected to have decreased by about 80%)	Unknown-kept declining	N/A	Thrive in the Tonle Sap Floodplain's slow-moving waters and abundant vegetation, shrubland, wetland, and ponds	Moderate - Confirmed in AoI in 2024	While much suitable habitat is present downstream of the project and along the Ou Ta Paong River and is therefore likely to occur in the project AoI. Likely to qualify as CH under Criterion 1& 4 threshold.	**IN**
Southeast Asian Box Turtle	*Cuora amboinensis*	EN	Unknown-kept declining	Unknown-kept declining	N/A	Thrive in the Tonle Sap Floodplain's slow-moving waters and abundant vegetation, shrubland, wetland, and ponds; 5-20 masl.	Moderate - Confirmed in AoI in 2024	While much suitable habitat is present downstream of the project and along the Ou Ta Paong River and is therefore likely to occur in the project AoI. Likely to qualify as CH under Criterion 1& 4 threshold.	**IN**
Elongated Tortoise	*Indotestudo elongata*	CR	Unknown-kept declining	Unknown-kept declining	N/A	Thrive in the Tonle Sap Floodplain's slow-moving waters and abundant vegetation, shrubland, wetland, and ponds; 5-20 masl.	Moderate - Confirmed in AoI in 2024	Reported at the upper part of Ou Ta Paong with possibly moving between upstream and downstream during wet season via Ou Ta Paong and Svay Daunkev rivers. While much suitable habitat, itis therefore likely to occur in the project AoI. Likely to qualify as CH under Criterion 1& 4 threshold.	**IN**
Fishes									
Striped catfish	*Pangasianodon hypophthalmus*	EN	Unknown	Unknown	Yes	This freshwater fish is native to the Mekong River Basin in Southeast Asia, including countries like Thailand, Laos, Cambodia, and Vietnam	Low	List as EN in the IUCN red list, this species migrates upstream and Tonle Sap Floodplain area during flooding season. Due to the climate change, and dam construction, there's not enough flood plus with the last several years. Likely to qualify as CH under Criterion 1& 3 threshold.	**IN**
Siamese Tiger Perch	*Datnioides pulcher*	CR	Unknown	Unknown	Yes	This freshwater fish species is native to the Mekong and	Moderate - Confirmed	List as EN in the IUCN red list, this species migrates upstream and	**IN**

						Chao Phraya River basins in Southeast Asia, including Thailand, Cambodia, Laos, and Vietnam.	in AoI in 2024	Tonle Sap Floodplain area during flooding season. This species navigates through rivers and canals to upstream to reach some lake and wetland areas. It's confirmed to present in the project AoI. Likely to qualify as CH under Criterion 1& 3 threshold.	
Mammal									
Hairy-nosed Otter	*Lutra sumatrana*	EN	Unknown-kept declining	Unknown-kept declining	No	Endangered and elusive, inhabit the Tonle Sap Floodplain's diverse wetlands, including flooded forests and marshes. Their survival is threatened by habitat loss, hunting, and bycatch.	Very Low	Despite there's some habitat but the species was confirmed present around 15 to 12 km way downstream. Therefore, It's likely absent in the project AoI.	**Out**
Indochinese Silvered Langur	*Trachypithecus germaini*	EN	Unknown-kept declining	> 3,000 individuals[25]	*No*	Inhabit the diverse forests of the Tonle Sap Floodplain, including flooded areas. Habitat loss and hunting threaten their populations.	Confirmed in AoI in 2024	While much suitable habitat is present downstream of the project and along the Ou Ta Paong River and is therefore likely to occur in the project AoI. Likely to qualify as CH under Criterion 1& 6 threshold.	**IN**
Long-tailed Macaque	*Macaca fascicularis*	EN	Unknown-kept declining	Unknown-kept declining	No	Inhabit the diverse forests of the Tonle Sap Floodplain, including flooded areas. Habitat loss and hunting threaten their populations.	Moderate - Confirmed in AoI in 2024	While much suitable habitat is present downstream of the project and along the Ou Ta Paong River and is therefore likely to occur in the project AoI. Likely to qualify as CH under Criterion 1& 6 threshold.	**IN**
Birds									
Greater Adjutant	*Leptoptilos dubius*	EN	1,000–1,200 individuals[26]	100–150 individuals	N/A	Has a very restricted range in Cambodia. Its primary stronghold is the Tonle Sap Biosphere Reserve, where it favors flooded forests and wetlands.	Moderate - Confirmed in AoI in 2024	IUCN listed as EN and although restricted range across the Tonle Sap Floodplain. It is likely to occur in Project AoI at some suitable habitats. Likely to qualify as CH under Criterion 1& 6 threshold.	**IN**
Milky Stork	*Mycteria cinerea*	EN	> 1,500 mature individuals	≥ 100 and 150 individuals	Yes	Primarily inhabit and breed around the Tonle Sap Lake, particularly its flooded forests and surrounding wetlands, shrubland, grassland making it their most crucial habitat in the country; 5-10 masl.	Low - Confirmed in AoI in 2024	The project area's lakes, rivers, and wetlands within the lower command area provide suitable habitat, although the Milky Stork population is small and local awareness of the species is limited. Likely to qualify as CH under Criterion 1& 3 threshold.	**IN**

[25] https://www.phnompenhpost.com/national/silvered-langur-endangered-plentiful-kingdom

[26] BirdLife International. (2023). *Leptoptilos dubius*. The IUCN Red List of Threatened Species 2023: e.T22697721A220483715.

Yellow-breasted Bunting	*Emberiza aureola*	CR	< 10,000 individuals *(80-90% decline since 1980s)*[27]	Unknown	Yes	This CR species is a rare winter visitor and passage migrant in Cambodia. It prefers open habitats such as wetlands, grasslands, and agricultural areas like rice paddies, which provide food and shelter. It has been observed in key areas including the Tonle Sap Floodplain, Mekong River Basin, Northern Plains, and coastal regions. However, its presence is declining due to habitat loss, hunting, and degradation.	Moderate - but didn't confirm in AoI in 2024 due to seasonal preference	While much suitable habitat is present downstream of the project and along the Ou Ta Paong and the species is therefore likely to occur in the project AoI. Likely to qualify as CH under Criterion 1& 3 threshold.	**IN**
Bengal Florican	*Houbaropsis bengalensi*	CR	250-1,000 individuals	150–700 individual	N/A	Primarily found in the floodplain grasslands of the Tonle Sap Floodplain, particularly in the Siem Reap, Kampong Thom, and Pursat provinces. This area provides the critical grassland habitat that the species depends on for breeding and foraging	Moderate - Confirmed in AoI in 2024	IUCN listed as CR and although restricted range with the Tonle Sap Grassland. WCS and MoE established a new protected area to conserve this species of where it's boundary is just 1km from the command area. It is likely to occur in Project AoI at some suitable habitats. Likely to qualify as CH under Criterion 1& 6 threshold.	**IN**
Masked Finfoot	*Heliopais personatus*	CR	600 - 1,700 individuals	< 100 individuals	No	Inhabits forested wetlands, slow-moving rivers, and flooded forests, especially around Tonle Sap Lake, Stung Treng Ramsar Site, and the Mekong River with dense vegetation for nesting and foraging.	Not confirmed	IUCN listed as CR and although it is a restricted-range species it is found mainly in the dense vegetation and flooded forest close the open lake and therefore it has been screened out	**Out**
White-winged Duck	*Asarcornis scutulata*	EN	250-100 individuals	< 50 individuals	No	Survives in fragmented populations within protected lowland evergreen and semi-evergreen forests, favoring forested wetlands and slow-moving rivers. With fewer than 50 mature individuals remaining, habitat loss, hunting, and human disturbance pose severe	Not confirmed	IUCN listed as EN and although it is a restricted range withing dry forest and semi-evergreen habitats. There's no suitable habitat within AoI and therefore it has been screened out	**Out**

[27] **IUCN Red List**: BirdLife International. (2020). *Emberiza aureola*. The IUCN Red List of Threatened Species 2020: e.T22720966A180040113

						threats, making habitat protection crucial for the species' survival.			
Fauna									
Cardamon Shrub Frog	*Philautus cardamonus*	EN	Unknown (very small and declining)	Unknown (very small and declining)	No (endemic)	This small and critically endangered frog species is endemic to the Cardamom Mountains in southwestern Cambodia. Due to its restricted range and the ongoing threats of habitat loss and degradation, its population size is believed to be very small and declining	Not confirmed	IUCN listed as EN and as the Endemic to the Cardamom Mountains between 1,000 and 1,700 meters above sea level. There's no suitable habitat within AoI and therefore it has been screened out	**Out**
River-weed	*Terniopsis chanthaburiensis*	EN	Unknown	Unknown	No	Rare and poorly studied aquatic plant species endemic to Thailand, specifically found in the Chanthaburi Province.	Not confirmed	IUCN listed as EN and as the Endemic to the Thailand and therefore it has been screened out	**Out**

Table 5: Results of the prioritisation exercise to support BAP planning: priority biodiversity for BAP actions for Ou Tapong

Action Category (AC)	Group	Priority Biodiversity	Mitigation and monitoring approach
AC 1 High Priority for habitat mitigation and/or species-specific measures	Mammal	Indochinese Silvered Langur and Long-tailed Macaque	The highest priority for achieving net gain (offset targets) lies in the implementation of both species-specific and habitat-focused mitigation and offset actions.
	Reptiles	Black Marsh Turtle, Elongated Tortoise	
	Birds	Bengal Florican	
	Natural Habitats	Riverine habitat along the main canal where turtles present	
	Protected Areas and Internationally Recognized Areas	Tonle Sap Zone 3, Bakan Protected Landscape	
AC 2	Birds	Greater Adjutant, Milky Stork, Yellow-breasted Bunting	While the likelihood of significant impacts is considered low, the potential consequences are

Contingency planning	Reptiles	Black Marsh Turtle, Giant Asian Pond Turtle, Southeast Asian Box Turtle	substantial. Proactive mitigation measures should be implemented across the board as a matter of best practice. If impacts are observed, the situation should be escalated to the highest level of concern (Category 1) and species-specific mitigation strategies should be developed and implemented
	Natural Habitat	Somraong Muk-yiek Community Fisheries and Sdok Khloak Community Fisheries	
	Freshwater fish	Siamese Tiger-perch	
	Mammal	Indochinese Silvered Langur and Long-tailed Macaque	
AC 3 General habitat mitigation measures	Freshwater fishes	Siamese Tiger Perch	To minimize anticipated impacts, implement best practices for habitat mitigation. Monitor habitat (or species-specific factors if necessary) to assess the actual impact scale. If monitoring indicates a high likelihood of significant impacts, reclassify the project to Category 1.
	Reptiles		
	Mammals	Hairy-nosed Otter,	
AC 4 Remain aware	Aquatic plant	River-weed *Terniopsis chanthaburiensis*	Potential impacts are anticipated to be minimal. Proactive mitigation measures should be implemented across the project area. Habitat monitoring can serve as an effective indicator to assess the project's actual impact scale.
	Birds	Masked Finfoot, White-winged Duck	

Biodiversity Action Plan (OTP), (if relevant, to achieve net gain)

A comprehensive Biodiversity Action Plan (BAP) should be developed to achieve net gain in biodiversity with a clear outline below:

Biodiversity Action Plan for Ou Tapaong Irrigation Sub-scheme

Executive Summary

This conservation action plan outlines strategies to mitigate potential negative impacts on biodiversity within the Ou Tapaong irrigation scheme. The plan is based on a critical habitat assessment that identified significant biodiversity values in the area, particularly for endangered and critically endangered species. The proposed actions align with the International Finance Corporation's Performance Standard 6 (PS6) on biodiversity conservation and sustainable management of living natural resources.

Key Objectives

Protect critical habitats: Identify and conserve areas crucial for biodiversity, such as flooded forests, wetlands, and rivers.

- Minimize negative impacts: Implement measures to reduce the adverse effects of irrigation scheme development on wildlife and their habitats.
- Enhance biodiversity: Promote habitat restoration and conservation activities to support species recovery.
- Engage with stakeholders: Foster collaboration with local communities and relevant government agencies to ensure effective conservation efforts.

Habitat Mapping

- Map out the different habitats present within the Ou Tapaong Command area. This should include flooded forests, lakes, rivers, waterholes, grasslands, fellows rice fields used by bird species for foraging.

Threat Assessment

- Assess potential threats to critical habitats identified in step 2. Consider factors such as habitat loss due to infrastructure development or land-use changes related to irrigation system renovation.

Mitigation Measures

- Develop mitigation measures specific to each identified critical habitat that align with IFC PS 6 guidance on avoidance of impacts whenever possible; implementation of measures to minimize habitat fragmentation; restoration activities during operations or after project completion; implementation of set-asides for protection; consideration of biodiversity offsets where appropriate based on no net loss principle.
- Carefully design project activities to avoid direct impacts on critical habitats.
- Identify alternative project locations or routes that avoid sensitive areas.
- Modify project designs to minimize the footprint and disturbance of critical habitats.
- Implement temporary measures to protect critical habitats during construction.

Minimization:

- Implement responsible construction practices to minimize adverse effects on critical habitats, such as avoiding unnecessary clearing of vegetation and minimizing soil disturbance.
- Establish effective waste management systems to prevent pollution.
- Implement erosion control measures to prevent sedimentation in aquatic habitats.
- Develop pollution prevention strategies to reduce water and air pollution.

- Habitat Protection and Restoration:
- Establish measures to protect and restore flooded forests, wetlands, and other natural habitats within and around the command area.
- Promote sustainable land use practices like agroforestry, conservation agriculture, and sustainable forest management.

Species Conservation:

- Develop species-specific conservation plans for endangered and threatened species identified in the area.
- Monitor populations of these species regularly and assess their habitat needs
- Consider implementing captive breeding programs or reintroduction efforts if necessary
- Implement habitat management measures that improve the quality and suitability of their habitats

Carbon Sequestration:

- Carbon Sequestration is the process of capturing and storing atmospheric carbon dioxide (CO2). It's a crucial strategy in mitigating climate change by reducing the amount of greenhouse gas in the atmosphere.
- Forest and wetland restoration: Re-establishing or enhancing forest and wetland areas can significantly increase carbon sequestration. These ecosystems act as carbon sinks, absorbing carbon dioxide from the atmosphere.
- Soil carbon enhancement: Implementing agricultural practices that improve soil organic matter content can increase carbon storage in the soil.
- Blue carbon: Protecting and restoring wetland and flooded forest ecosystem, can contribute to carbon sequestration.

Community Engagement:

- ***Involve local communities in biodiversity conservation efforts through participatory planning, monitoring, and implementation***
- ***Educate communities about the importance of biodiversity i nthe sub-scheme area***
- ***Foster community awareness about endangered species present within their vicinity***
- ***Promote sustainable livelihoods that support conservation, such as community-based ecotourism, sustainable*** rice cultivation (eg. Sustainable Rice Flatform, and Organic Rice***, and fisheries management***

Research and Monitoring:

- ***Conduct further research assessing biodiversity and ecological processes within Ou Tapaong Irrigation Sub-Scheme***
- ***Establish long-term monitoring programs to track changes in biodiversity and habitat conditions which will provide valuable data for evaluating the effectiveness of ongoing conservation efforts***

Sustainable Water Management:

- Ensure irrigation systems and water use practices do not harm critcal haibitats. Optimise irrigation efficiency, reducing water pollution and protecting water sources.

Biodiversity Offsets:

- If significant residual impacts are expected despite avoidance and minimisation measures, biodiversity.

Budget for the Implementation of the Biodiversity Action Plan for Ou Ta Paong

No.	Items	Unit	Qty	Cost	Total
3	Implementing Biodiversity Management Plan	Year			1,000,000
3.1	**Restoration:** Implement the restoration of damaged or degraded critical habitats including reforestation, wetland restoration, habitat connectivity initiatives, and soil remediation measures over 5 years	Times	10	5,000	50,000
3.2	**Habitat Protection**				
3.2.1	Conduct continuous patrolling activities (1 time per months)	Times	60	500	30,000
3.2.2	Demarcation for the boundary of the critical habitats and nearby protected areas and community fisheries boundaries (mapping, pole posting, conflict resolution, etc.)	Poles	200	250	50,000
3.2.3	Support community patrols (2 community fisheries)	Year	5	15,000	75,000
3.2.4	Support ranger join patrol within zone 3	Year	5	18,000	90,000
3.3	**Species Conservation**				
3.3.1	Set up and train community-based biodiversity monitoring teams (1 training/year x 5 years)	Training	5	1,000	5,000
3.3.2	Conduct monthly biodiversity monitoring and protection	Year	5	14,000	70,000
3.3.3	Monitor populations of these species regularly and assess their habitat needs for 5 years	Lum-sump	5	10,000	50,000
3.3.4	Implement captive breeding programs or reintroduction efforts if necessary	Year	5	15,000	75,000
3.3.5	Implement habitat management measures that improve the quality and suitability of their habitats	Lum-sump	5	18,000	90,000
3.4	Implementing Community Based Carbon Sequestration program for community people for 5 years	Lum-sump	5	10,000	50,000
3.5	**Community Engagement**				
3.5.1	Conduct community awareness raising about the importance of biodiversity in the sub-scheme area for 5 years and 10 locations in OTP	Times	50	1,500	75,000
3.5.2	Involve local communities in biodiversity conservation efforts through participatory planning, monitoring, and implementation	Lum-sump	5	10,000	50,000
3.5.3	Promote sustainable livelihoods that support conservation, such as community-based ecotourism, handicraft, and fisheries management for 5 years 1. Train and provide capacity building to farmer on agroforestry, and SMART agriculture pratices 2. Provide training on community-based ecotourism and natural resource protection	Lum-sump	5	18,000	90,000

No.	Items	Unit	Qty	Cost	Total
	3. Promote wildlife friendly products and community market				
3.6	Establish long-term monitoring programs to track changes in biodiversity and habitat conditions 1. Forest fire monitoring and firefighting 2. Remote sensing analysis-based satellite image data 3. Conduct annual land used and land cover study	Lum-sump	5	15,000	75,000
3.7	Promote biodiversity offsets for conservation activities to community people (5 years) 1. Tree nursery preparation 2. Tree planting, maintaining and monitoring	Lum-sump	5	15,000	75,000
	Total cost for over 5-year period				**1,000,000**

Annex 7: Chance Find Procedure

1. Purpose, Objectives and Scope

Construction of small infrastructure and facilities as well as livelihood supports related activities under the CAISAR project has the potential to alter tangible or intangible cultural heritages, unknown or unrecorded cultural and archaeological sites. The project will develop Chance Finds Procedure to define the steps on how Chance Finds will be managed once they have been discovered. MOWRAM PMU will ensure contractors and livelihood experts to be familiar with the possibility that they may discover unknown finds and know how to manage them.

The objectives of the Chance Finds Procedure are to:

- Define the steps which must be followed to manage the discovery of previously unknown sites, including the preservation and appropriate treatment of these finds, while minimizing any disruption to the construction schedule
- Enable compliance with all relevant national laws and regulations and other requirements.

MOWRAM PMU will make sure that the Chance Finds Procedure will be applied by all CAISAR contractors/ subcontractors at subproject sites.

2. Procedure and Implementation

Consultation. MOWRAM PMU will consult with all relevant parties, including relevant ministries at national level, provincial line technical departments, and district authority, in order to agree to the Chance Finds Procedure.

Laboratory and Other Support. MOWRAM PMU, with technical support from the Ministry of Culture and Fine Art and its provincial departments, will make arrangements for suitable laboratory test and other necessary facilities at provincial level or national level for identifying the find objects.

Training and Awareness. Where necessary, MOWRAM PMU, with support from cultural expert, will develop and implement a Cultural Heritage Training and Awareness. The training and awareness will include basic training in the identification of sites and objects relevant to the subproject sites, including the cultural significance of IC communities. The training and awareness shall be delivered to all relevant project implementation agencies at sub-national level, contractor, and subcontractor prior to their participation in subproject activities.

3. Implementation & Monitoring

Monitoring shall require the appropriately trained personnel to determine the significance of a chance find in accordance with the definitions provided in the CAISAR project's Cultural Heritage Management Framework and follow the Chance Find Flowchart provided in

Attachment 1.

Attachment 1 - Chance Find Flowchart

- Bound copy of Chance Finds Report Forms presented to MOWRAM PMU and provincial representative
- Verification of each Chance Find Report Forms to Chance Finds items completed
- Chance finds appropriately packed and labelled
- Inventory of Chance Finds Items placed inside packed boxes
- Outstanding issues relating to any or all of the above have been resolved
- MOWRAM PMU or provincial representative accepts transfer of Chance Finds items from contractor to relevant provincial department of Culture and Fine Art.

Contractor Representative	MOWRAM PMU Representative	Provincial Representative
Name	Name	Name
Signature	Signature	Signature
Date	Date	Date

4. Stop Work

a) Once cultural heritage objects sites are identified, contractor or sub-contractor shall immediately stop work within an approximate distance of the site.

b) Contractor/sub-contractor shall call MOWRAM PMU and provincial level to the location to make a rapid determination of the significance of the find.

c) Contractor/sub-contractor shall, in the event that a site of potentially high significance is discovered, demarcate, and secure the area.

d) MOWRAM PMU, provincial Department of Culture and Fine Arts and contractor shall evaluate sites or objects in accordance with the procedure required by the Ministry of Culture and Fine Arts.

e) If threated species such as animal and trees are found, these species must be kept intact, protected, and immediately reported to relevant site managers for appropriate handling. Wild animals spotted on the construction sites must not be caught for sale and/or consumption in any way.

5. Management of Chance Finds

In case the chance find site is a highly significant cultural sites, contractor and MOWRAM PMU shall work together to determine any requirements for community engagement accordance to ESS10. The team will seek out and consult with the affected stakeholders and establish the appropriate action.

Management Options. The following management options will be considered:

- **Avoidance** to minimizes the impact to the site through partial or complete project redesign or relocation, should be the preferred option for cultural resource management perspective.
- **In-situ Management** This option includes the application of site protection measures. Appropriate protection measures will be identified and agreed between MOWRAM PMU, contractor, provincial department of culture and fine arts, and the local authority on a site-specific basis.
- **Destruction** If a site is assessed as having limited cultural significance, it may be destroyed once a complete photographic record has been made and the Chance Finds Report Form has been completed.

6. Reporting

All cultural heritage sites will be reported to MOWRAM PMU and provincial level and national level as part of contractor's monthly report, and will include a summary of:

- An update of the Key Performance Indicators
- Incidents of disturbance to known cultural heritage sites
- All cultural heritage sites identified, distinguishing between known and chance finds
- All Chance Finds, etc.

Annex 8: Summary of Stakeholder Consultation

This section summarizes four consultation rounds carried out during the project preparation phase. These consultations involved discussions with relevant institutions, non-governmental organizations, local authorities, and local communities throughout the preparation process. The data collection and consultations were conducted over four periods:

1. First consultation

- The first consultation was conducted between 26 and 28 July 2024 to capture information regarding biodiversity and environmental condition in the project area.

2. Second consultation

- The second consultation was conducted to consult with forestry and fishery communities, local authorities and key informants to understand the situation and concerns related to the presence of the project. The consultation was conducted between 03 and 09 August 2024.

3. Result of consultation

- The information gathered from the key informant interviews highlighted several confirmed species present within Ou Ta Paong Irrigation Sub-scheme's command area. These included a variety of reptiles such as Black Marsh Turtle, Giant Asian Pond Turtle, Southeast Asian Box Turtle along with Elongated Tortoise amongst others. Additionally Indochinese Silvered Langur and Long-tailed Macaque were among those mammal speices confirmed to be present by informants while striped catfish and Siamese Tiger Perch stood as confirmed fish species recorded in this area. Furthermore, among bird speices Greater Adjutant, Milky Stork, Bengal Florican were also amongst others that have been successfully verified to be living in this region.
- Proposed project activities: Given the critical habitats identified and the biodiversity assessment results, proposed project activities must prioritize conservation measures.

4. Third consultation

- The third consultation was conducted at household, village, and commune level stakeholders focusing on status, concerns and feedback regarding the project implementation. This consultation was conducted between 10 and 18 August 2024.
- The Ou Ta Paong sub-schemes have a predominantly young population, which suggests strong potential for future development, though higher education levels are low. Agriculture is the main occupation, with 10% engaged in full-time private sector work. For secondary jobs, rice and crop production are most common. About 9% of the population falls under poor categories 1 and 2, indicating economic challenges, while 1.1% are people with disabilities. Migration is notable, with 16% moving within the country and 13% abroad, totaling 29% of the population.
- Moreover, both men and women share together for household chore, agricultural

involvement and decision making.

5. Fourth Consultation

The last consultation was conducted between 21 and 23 August 2024 with the district and provincial stakeholders, mainly focusing on the opinion, and feedback regarding the implementation of the project.

6. Consultation Results

6.1 Environment and Biodiversity Component

6.1.1 Pollution prevention and resource efficiency

Concerns

- The rehabilitation of irrigation canals and farm roads can disturb environmental effects.
- Large machines can generate noise and vibration pollution, which can disturb nearby residents and wildlife.
- The disposal of solid, liquid, and domestic waste from the workers at the irrigation construction site can negatively impact local air quality and surface water.

Suggestions

- Avoid construction at night.
- Install garbage bins and waste storage areas in the construction sites and conduct orientation workers to put the waste in the garbage bins.

- Government institutions and stakeholders should regularly conduct site to inspect project activities that harm the environment and local community.

6.1.2 Biodiversity

Concerns

- The CAISAR project may cause negative impact on the environment, including changes in water quality, dust generation, air pollution, soil erosion, improper waste disposal, and hazardous waste from machinery.
- The project could disrupt the natural flow of water from upstream to Tonle Sap Lake, potentially harming the lake's biodiversity.
- Fish populations in command areas may decrease due to disrupting the natural flow of water and the impact on their habitats from the implementation of the reirrigation infrastructure and canal upgrading.

Suggestions

- The contractors and relevant parties should conduct water quality and air quality monitoring during construction.
- Contractors must regularly monitor and inspect the living conditions of the workers, manage waste effectively, and provide adequate housing and sanitation facilities to them.
- Providing comprehensive training to workers on proper waste and oil management procedures.
- Activities such as fishing and hunting should be strictly prohibited to minimize environmental impact.
- The project should avoid construction activities and improve irrigation on fish and aquatic habitats.
- Prevent damage from the construction activities to biodiversity, habitats, and other environmental components.

6.1.3 GHG Emission

Concerns

- Climate change is negatively impacting rice production, causing problems such as insect infestations, and extended dry seasons,
- Waste and pollution may contribute to the emission of GHG

Suggestions

- The contractors should ensure that garbage bins are conveniently placed throughout the workers' camp and collaborates with a waste collection company to guarantee regular and efficient removal of waste.
- To minimize emissions, contractors are advised to refrain from using outdated machinery.

6.2 Social Component

6.2.1 Labor and Working Conditions

Concerns

- The presence of construction staff and workers at the community may lead to sexual exploitation or affecting women workers and women and children in the community.

Suggestions

- The construction companies should hire local workers to offer them jobs and strictly abide to laws and reducing the concerns about gender-based violence or sexual violent.
- Construction companies and relevant departments should provide training on gender issues, violence, labour laws, and social protection to their staff and workers.
- The project should allocate the budget for relevant line departments to conduct relevant trainings to the companies and workers, and to monitor the construction sites

6.2.2 Community Health and Safety

Concerns

- Participants remain concerned that the presence of workers could result in sexual abuse of women and children living near the project site,
- Drug trafficking and consumption among workers may cause unsafe environment for both workers and surrounded residents,
- The construction activities may generate dust and slippery road conditions which may lead to traffic incidents,
- Waste generated from worker camps and construction activities during the project could degrade water quality, negatively impacting human health, livestock, and crops.

Suggestions

- The construction companies should regularly place warning signs and water the roads, as well as schedule construction times to minimize noise pollution that could disrupt the community,
- The project should promote gender awareness, enforce stricter punishments for offenders, and prevent drug trafficking in the workplace,
- The construction companies must collaborate with local authorities in all activities to make a proper management, control and monitoring during construction, and
- The project should conduct gender education at the district to prevent and address gender-based violence,

6.2.3 Land acquisition, economic and physical displacement

Concerns

- Conflicts between the project and affected families may arise, often driven by external influences rather than the families themselves.

- Land-owning farmers might lose their land for agriculture, which could compel them to migrate.

Suggestions

- The project should conduct a preliminary study on land issues before construction is going to be implemented, addressing specific aspects of land impact and conducting evaluations for each affected property,
- The project/construction company must collaborate with local authorities to resolve land-related issues, and compensation should be provided to landowners affected by the project,
- Farmers who own land may lose it for farming, which could force them to migrate, heightening their vulnerability to exploitation.

6.2.4 Cross–cutting risks and impacts

Concerns

- Unequal water distribution among farmers leads to conflicts.
- Institutions or companies responsible for establishing FWUCs are typically based at the national level, resulting in limited quality implementation weakening the FWUCs as PDWRAM is sidelined.
- The FWUCs struggle to generate income, making water management challenging, as there is no budget for repairs, leading to improper system operations.
- Farmers face various challenges such as pests, diseases, labor shortages, lack of capital, limited production techniques, flooding, unstable prices for vegetables and livestock, and high agricultural input costs.
- The provincial department lacks the budget to support the resolution of water user conflicts.
- Some farmers are absent from the rice fields during water distribution periods.
- Tensions between upstream and downstream villages arise when excess water released upstream during the wet season causes downstream flooding, while in the dry season, insufficient upstream water flow impacts downstream areas.
- High agricultural input costs continue to reduce farmers' profitability.
- Farmers do not follow official guidance on the size of rice fields to be cultivated, leading to inadequate water for irrigation.

Suggestions

- PDWRAM should be the leader in formulating the FWUCs with the support from national level,
- Water use and maintenance support should be provided including technical and management training, along with problem-solving techniques, to effectively control and manage water distribution,
- The project should thoroughly examine the water availability, technical and situational aspects of the sub-scheme before construction to prevent water shortages or flooding,

- Ensure transparent water supply to prevent disputes by holding meetings to plan water use and distribution, involving the district governor, commune council, and relevant stakeholders,
- All parties should also participate in the maintenance of the irrigation system and provide training or education on water conservation to farmer.
- Prior to starting irrigation rehabilitation, disseminate project information to people and stakeholders, and announce the construction period in advance.
- The water consumption fee should be gathered from farmers which could be used later to support caretaker and maintenance the irrigation system.
- Increase the number of commune agricultural technical officers to provide training and monitor farmers' cultivation techniques.
- Build more water storage, and reservoir such as ponds or wells and conduct training on water-saving techniques to adapt to actual water availability.
- Installing and upgrading the damaged sluice gates to improve water distribution efficiency and prevent water loss in agricultural production and irrigation systems.
- Facilitate the development of additional agricultural markets.
- Providing modern equipment and new techniques to department officers can enhance agricultural production efficiency and yield.

EXECUTIVE SUMMARY

The document is an Environmental, Social, and Climate Management Plan (ESCMP) for the Yutasas sub-scheme, a part of the Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project in Cambodia. The project aims to improve farm-level climate adaptation, water use efficiency, and agricultural productivity while promoting sustainable practices. The Yutasas sub-scheme focuses on rehabilitating existing irrigation infrastructure and enhancing agricultural practices in the Stung Krang Ponley basin.

The ESCMP plays a crucial role in ensuring the project's sustainability by addressing potential environmental and social impacts. It outlines measures to mitigate risks associated with water resource management, infrastructure development, and agricultural intensification. One of the key aspects of the ESCMP is its focus on water resource management, as the Yutasas River is vital for both agriculture and local livelihoods. The plan promotes efficient irrigation practices to optimize water use and minimize the risk of water shortages, especially in drought-prone regions.

The ESCMP recognizes the potential social impacts of infrastructure development. It emphasizes community engagement throughout the project's lifecycle to address concerns and ensure that local livelihoods, particularly those dependent on farming and fishing, are not negatively affected. This includes consultations, fair compensation for any land acquisition, and measures to minimize disruption to existing social structures. The plan also highlights the importance of complying with national and international environmental and social standards, which is essential for securing funding and aligning with global best practices in sustainable development.

The ESCMP's objectives include:

- Identifying and assessing environmental and social risks and impacts.
- Applying a mitigation hierarchy to avoid, minimize, or mitigate risks and impacts**.**
- Engaging affected communities and vulnerable groups in the assessment and mitigation process.

The ESCMP for the Yutasas sub-scheme covers project activities under Component 1 (Improving farm-level climate adaptation, resilience, and water use efficiency) and Component 2 (Improving irrigation access and water management). The project's geographical area is in the Stung Krang Ponley basin, with the Yutasas scheme situated on the left bank of the Krang Ponley River. The area has faced natural challenges like droughts and floods over the past decade. The proposed investments include:

- Rehabilitation and improvement of existing irrigation canals.
- Construction of new tertiary canals.
- Installation of solar power systems.
- Training and capacity building for Farmer Water User Communities (FWUCs).

- Agricultural extension services for improved farming practices and value chain development.

The tentative implementation schedule includes detailed design starting in January 2025, followed by procurement and construction. The construction is expected to start in the last quarter of 2026 and be completed by mid-2030. The ESCMP identifies potential environmental and social risks and impacts during different project stages and proposes mitigation measures.

Before and during construction, potential risks include:

- Unexploded ordnance (UXO): The presence of UXO requires a clearance plan and expert assessment before any construction activity.
- Air and noise pollution: Dust suppression measures, reduced operating hours for machinery, and regular maintenance are proposed to mitigate air pollution and noise.
- Water pollution: Construction diversion control, restrictions on filling canals, and proper waste disposal are crucial to prevent water pollution.
- Solid and hazardous waste: Waste management plans, including designated dump sites, are needed to handle various types of waste generated during construction.
- Wastewater: Proper handling and disposal of hazardous wastewater, such as oil or fuel, are essential.
- Biodiversity impacts: Measures to minimize habitat loss and fragmentation, prevent the spread of invasive species, and raise awareness about wildlife protection are necessary.
- Social impacts: These include labor influx, community health and safety, potential for SEA/SH (Sexual Exploitation, Abuse, and Harassment), and traffic accidents. Mitigation measures involve labor management plans, awareness campaigns, safety training, and grievance redress mechanisms.

During operation, potential risks include:

- Water pollution: The ESCMP emphasizes the need for sustainable agricultural practices, including Integrated Pest Management (IPM), to minimize the risk of water pollution from agricultural runoff.
- Biodiversity impacts: Continued monitoring and management are necessary to address the potential for long-term habitat loss and fragmentation.
- Climate change: Promoting energy-efficient irrigation, reducing reliance on fossil fuels, and adopting climate-smart agricultural practices are key to mitigating GHG emissions.

The ESCMP also outlines a comprehensive stakeholder engagement plan, including consultations with various stakeholders during project preparation and implementation. This plan ensures that local communities and other stakeholders are informed about the project and have opportunities to voice their concerns and suggestions.

The ESCMP also includes a grievance redress mechanism to address complaints and grievances from affected people. The mechanism provides a structured process for resolving issues related to land acquisition, labor, SEA/SH, and other project-related concerns. The plan also details implementation arrangements, outlining the roles and responsibilities of various stakeholders, including government agencies, contractors, and consultants, in implementing and monitoring the ESCMP.

The estimated cost for implementing the ESCMP is USD 237,000, including expenses for UXO clearance, preparation of national EIA report, biodiversity management, community outreach, and monitoring activities. The monitoring program, which includes regular monitoring of soil, air, and water quality, is estimated to cost USD 18,500. The Executive Summary of the ESCMP will be publicly disclosed in both English and Khmer, ensuring transparency and accountability throughout the project's lifecycle.

1. INTRODUCTION

1.1 Rationale of Yutasas Sub-scheme

Yutasas is one of the four sub-schemes located within the larger Stung Krang Ponley subproject, covering a relatively small area of 593 hectares. The Yutasas sub-scheme is designed as an irrigation system aimed at supporting agricultural activities by providing a reliable water source for crop production. It plays a crucial role in boosting agricultural productivity in the region by ensuring that farmers have consistent access to water, especially during dry seasons. This system is an essential component of local water management, contributing to improved crop yields and enhancing the livelihoods of the farming communities dependent on it.

The primary function of the Yutasas sub-scheme is to regulate and distribute surface water from nearby rivers or reservoirs to irrigate agricultural lands. The system is structured to maximize water efficiency by delivering water directly to the fields, minimizing wastage, and conserving valuable water resources. This approach is particularly important in regions prone to water shortages, ensuring that crops receive the necessary water to thrive, which ultimately contributes to food security and agricultural sustainability.

Social impacts are also a critical consideration in the preparation of the ESCMP. The Yutasas River is vital to the livelihoods of local communities, particularly those engaged in farming and fishing. Infrastructure development without proper social safeguards could disrupt these livelihoods, leading to economic challenges and potential social conflict. The ESCMP ensures that communities are actively engaged in the project's planning and implementation, addressing their concerns through consultations and fair compensation where necessary. This inclusive approach minimizes social disruption and fosters stronger community support for the project.

Additionally, the ESCMP is crucial for ensuring that the CAISAR Project meets both national and international environmental and social standards. Compliance with these standards is necessary for securing funding and aligning with global best practices in sustainable development. By preparing a comprehensive ESCMP, the project mitigates both environmental and social risks while promoting long-term sustainability, ensuring that both the natural environment and local communities benefit from the project’s outcomes.

1.2 Objectives of the ESCMP

The objectives of the ESCMP for Yutasas sub-scheme are:

- Identify and assess environmental and social (E&S) risks and impacts that are potentially associated with investment activities proposed under Component 1 and Component 2.
- Ensure the identification and assessment of E&S risks and impacts are in accordance with the requirements of the laws and regulation of the Royal Government of Cambodia, AIIB’s Environmental and Social Framework, IFAD’s Social, Environmental and Climate Assessment Procedures (SECAP), and GEF’s Safeguard Policies.

- Apply a mitigation hierarchy to: (a) anticipate and avoid risks and impacts; (b) where avoidance is not feasible, minimize or reduce risks and impacts to acceptable levels; (c) once risks and impacts have been minimized or reduced, mitigate them; and (d) where residual risks or impacts remain, compensate for or offset them, where technically and financially feasible.
- As part of the risk and impact identification and assessment, engage a) people potentially affected by project activities (including both project beneficiaries and those potentially affected adversely, and parties interested in project implementation and operations.
- Conduct consultation, particularly with affected people who are disadvantaged/ vulnerable.
- Propose measures to avoid/ minimize/ mitigate E&S risks and impacts and compensate for adverse impacts where residual risks or impacts remain, compensate for impacts that remain, or offset residual risks, where technically and financially feasible.

Coverage of the ESCMP Yutasas

This site–specific ESCMP cover project activities proposed under Component 1 and Component 2 (See brief description of investment activities in Section 2.3 below).

2. PROJECT DESCIPTION

2.1 Background

The project has three Components (summarized below). However, the ESCMP Yutasas will covers investment activities proposed under only Component 1 and Component 2.

Component 1. *Improving farm-level climate adaptation, resilience, and water use efficiency*

The objective of this component is to build climate resilience (CR) of smallholder farmers and enhance sustainable production through evidence-based planning and context-relevant climate resilient practices at the farm level. This component is designed to address the lack of knowledge and skills to deploy technologies and practices at farm level by farmers and the lack of appropriate extension services to propagate them. It will introduce farmers with various climate resilient technologies and practices for both rice and non-rice activities such as vegetable production, poultry and aquaculture.

Sub-component 1.1 Deployment of farm-level climate adaptation and water use efficiency measures

Output 1.1: Increased capacity of farmers to deploy climate resilient (CR) practices at farm level

This output will focus on developing farmers' capacity in deploying CR technologies and practices to transform the agricultural production system to adapt to the changing climate context. Farmer's will be trained to first develop Action Plans (AP) to re-orient farmer behavior

and assist them in transforming the agriculture production system in a manner that is better adapted to factoring in the agro-ecological context and expected climate change impacts.

- Activity 1.1.1 Preparation of community-based action plans (AP) to transform agriculture with CR practices.
- Activity 1.1.2 Preparation of training materials to support implementation of the AP.
- Activity 1.1.3 Conduct trainings to create a pool of expertise to demonstrate and propagate the CR technologies and practices.
- Activity 1.1.4 Train farmers on applying CR technologies using the FFS approach.
- Activity 1.1.5 Strengthening and fostering tailored mechanization service providers for improved mechanization service delivery.
- Activity 1.1.6 community-based monitoring and evaluation (CBME) of implementation

Sub-Component 1.2 Climate adapted, value added, and market led agricultural investments

Output 1.2 CR value added, and market led agriculture investments secured.

This output involves improving and enhancing some value chains that are key for the project area and include rice, vegetable, chicken and aquaculture value chains, through the use of Public Private Producer Partnerships (4Ps) and increased access to finance, which will improve market access, climate adaptability, and ensure increased income for smallholders in the value chains.

- Activity 1.2.1 Value chain study and planning
- Activity 1.2.2 Establish District Multi-Stakeholder Platforms (MSPs)
- Activity 1.2.3 Public Private Producer Partnership Facility (4PF)

Sub-component 1.3 Improve enabling conditions, capacities and disaster risk management strategies

Output 1.3. Increased access to and use of climate information and advisory services for climate responsive agriculture planning

This sub-component will strengthen the production and dissemination of tailored agro-meteorological information to inform climate responsive management and planning of agriculture in the project target areas through ICT technologies. The aim is to ensure that agro-meteorological services are accessible and useful to farmers to manage climate risks, access to and use of water and efficient cropping systems.

- Activity 1.3.1 Establish ICT based multi-disciplinary platform at provincial level.
- Activity 1.3.2 Building the capacities of the platform to deliver services.
- Activity 1.3.3. Establish the agromet information systems and the outreach mechanisms.
- Activity 1.3.4 Awareness raising and capacity building of farmers and stakeholders in applying the *services.*

Sub-component 1.4 Rural roads

Output 1.4: Increased resilience of farm road infrastructure to climate change

- Activity 1.4.1 Initial planning and identification
- Activity 1.4.2 Technical survey and design considerations, preparation of cost estimation
- Activity 1.4.3 Improve 50 Kilometers of farm roads.
- Activity 1.4.4 Handing over of the completed works.

Component 2: Irrigation Infrastructure for increased resilience

Component 2 will focus on rehabilitating/creating and modernizing hydraulic infrastructure, including canals, ponds, flood-proof infrastructure (river, drain) and to provide high-efficiency climate-resilient irrigation systems for adapting to both increasing flood and drought conditions. It will include support and capacity building to O&M operators at both, Provincial (PdoWRAM) and scheme (FWUC) level, to ensure the sustainability of the scheme. The output will secure and increase farmer's agricultural production by improving the irrigation supply and protect crops from water-related disasters.

Component 2 is linked with Component 1 such that it facilitates the implementation of CR on farm crop and water management practices through improved field level water supply delivery and drainage. It will focus on rehabilitating and modernizing of irrigation and flood protection/drainage infrastructure in the six sub-projects, including irrigation and drainage canals, flood control embankments, and ponds, to provide high-efficiency climate-resilient irrigated agriculture systems for adapting to both increasing flood and drought conditions.

Sub-Component 2.1: Modernization of irrigation scheme and ponds

- Activity 2.1.1 Technical analysis, field surveys and preparation of plans for system upgrading.
- Activity 2.1.2 Implementation of infrastructure upgrading.
- Activity 2.1.3 Preparation of canal O&M plans including application of ICT and SCADA for operation

Sub-Component 2.2: Flood-proofing and Drainage improvements

- Activity 2.2.1 Establish flood monitoring, information, and early warning systems.
- Activity 2.2.2 Strengthening and construction of flood control and drainage infrastructures.

Sub-Component 2.3: Establishments and training of Farmers Water User Communities (FWUC)

- Activity 2.3.1 Formation of institutional strengthening of the FWUC
- Activity 2.3.2 Build technical capacities of FWCU for canal structure O&M
- Activity 2.3.3 prepare long term financing plan for O&M of the systems including the WUAS.

Sub-Component 2.4: Water information and Management (SCADA)

Component 3. Institutional Strengthening

Sub-Component 3.1 MOWRAM capacity Support.

Output 3.1 Strengthened MOWRAM Capacity

Sub-Component 3.2 Strengthening of NDA and NCDD.

Output 3.2 Improved capacities for climate action monitoring

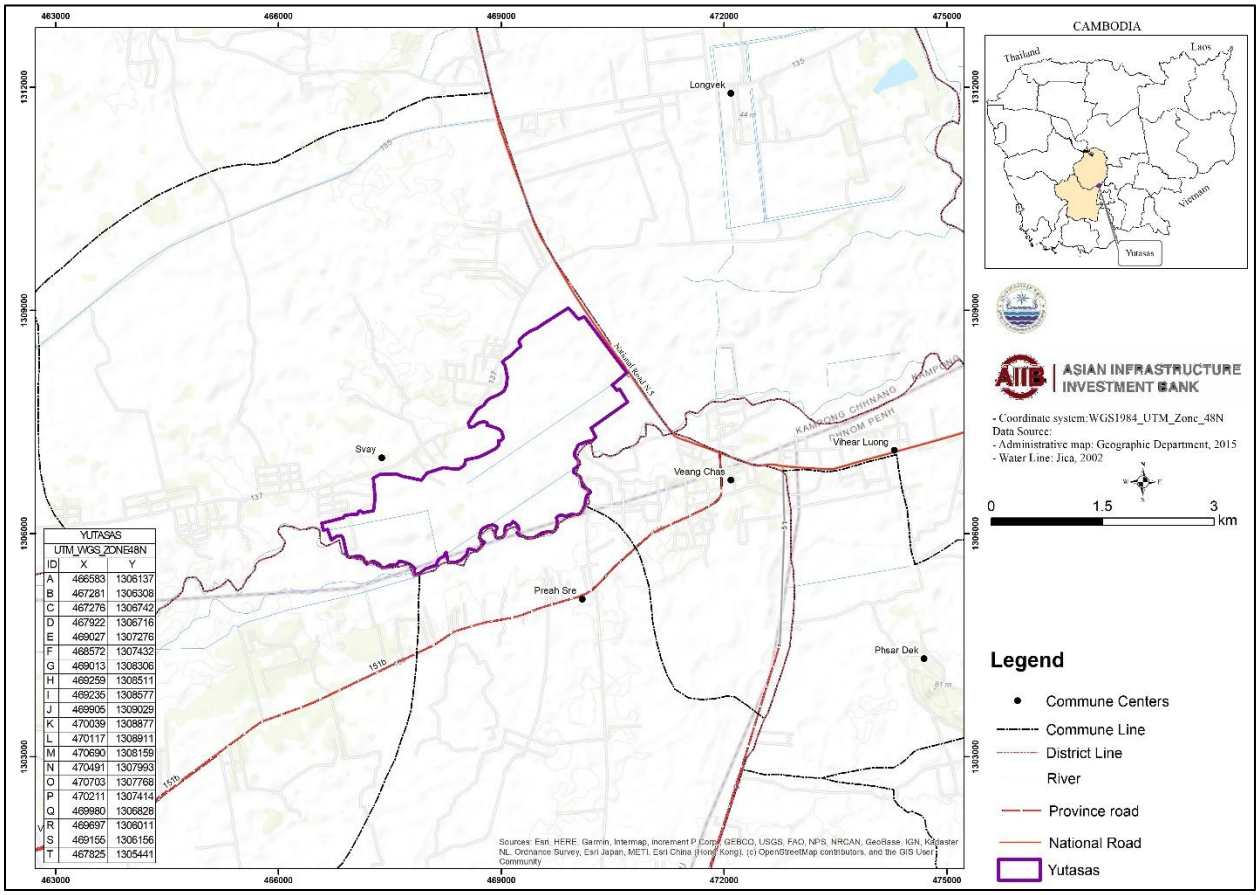
- Activity 3.2.1 Preparation of Loss and Damage Strategy
- Activity 3.2.2 Strengthen national M&E process for climate action
- Activity 3.2.3 Enhancing Capacity of NDA and other stakeholders.

2.2 Project Area and Beneficiaries

The Yutasas sub-scheme is located in Svay commune within the Sameakki Mean Chey district of Kampong Chhnang province, solely stretching within the boundary of Svay commune shared by a total of 5 villages which are home to a total household of 1,339, making a total population of 5,330 people (out of which 2,773 are females). This sub-scheme is one of four that make up the Krang Ponley sub-project, alongside Brambei Mom, Krapeu Troum, and Stung Krang Bat. The Krang Ponley sub-project spans Kampong Speu, Kampong Chhnang, and Kandal provinces.

Table 1: Administrative and population coverage of Yutasas sub-scheme

No.	Province/ District	Communes	Number of Villages	Total HH	Total Population	Female Population
1	Sameakki Meanchey (Kampong Chhnang)	Svay	5	1,339	5,330	2,773
	Total	**1**	**5**	**1,339**	**5,330**	**2,773**



(Source: Ministry of Planning, Commune Database, 2023)

Table 2: List of Yutasas sub-schemes under CAISAR

No.	Scheme Name	Component 2						Beneficiaries	
		Irrigation		Rainfed area		Total			
		Area (ha)	Ratio (%)	Area (ha)	Ratio (%)	Area (ha)	Ratio (%)	HH*	Ratio
4	Yutasas	593	3%	600	8%	1,193	4	700	3%

*HH = Household

Figure 1: Administrative map of Yutasas sub-command area

2.3 Description of the Sub-Schemes

2.3.1 Water Availability

Considering that a river-basin-wide water resources management plan will be needed to regulate water resources utilization for optimal supply to all schemes/water uses along the river, the Yutasas scheme was added on the CAISAR project in October 2023. The Yutasas sub-scheme is geographically situated along the Krang Ponley River. It draws its main water supply from the Anlong Chrey Dam, while the Kdol Dam and River act as secondary water sources. The proposed irrigation target for the Yutasas sub-scheme is 593 hectares. The communes surrounding Yutasas include Veang Chas, Preah Sre, Veal Pung, and Longvek.

Like the other sub-schemes in the Krang Ponley sub-project, the Yutasas sub-scheme is situated within the Krang Ponley River Basin. The basin's floodplain lies approximately 10 meters above sea level and is characterized by low permeability due to the presence of fine soil particles. This characteristic makes the area highly susceptible to flooding. The Krang Ponley River serves as the primary water source for the irrigation schemes within this basin.

Yet, it is noted its intake downstream of Kropeau Troum and upstream of Steung Krang Bat.

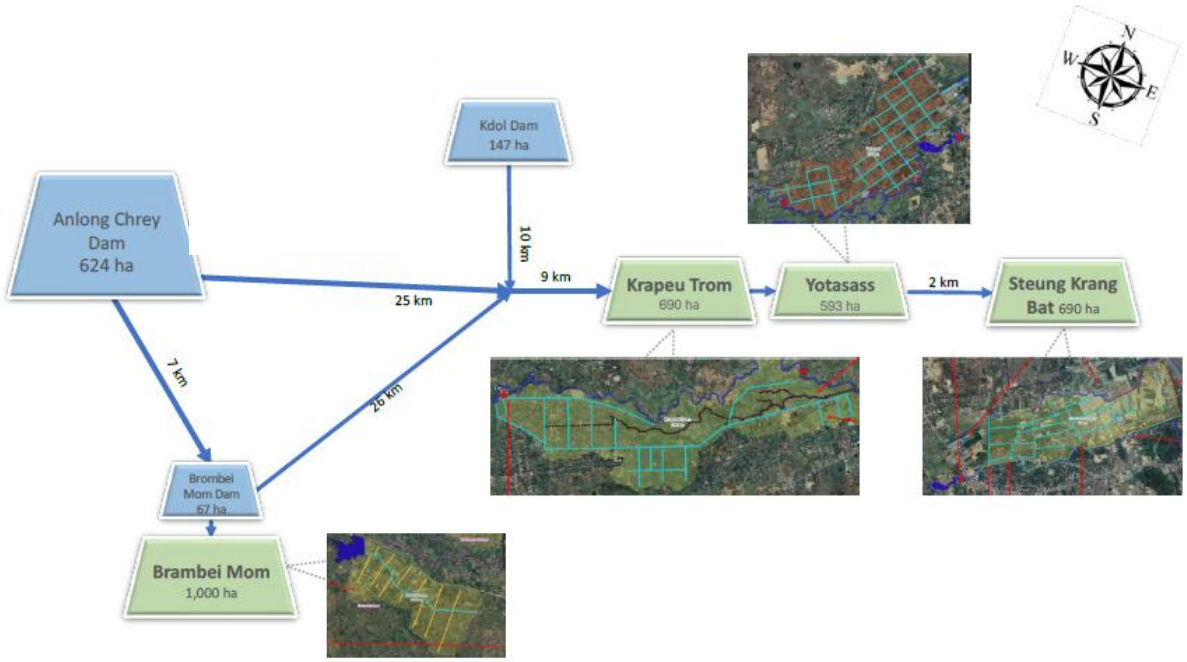


Table 3: Water sources for the Krang Ponley Sub-scheme

Resource	Description
Anlong Chrey Reservoir	Primary water source for the Krang Ponley scheme
Kdol Dam	Secondary water source, providing additional water supply
Ponley River	Connects the four separate scheme areas, facilitating water transfer

Table 4: Water sources for the Yutasas sub-schemes

No	Irrigation scheme	Proposed target command area (ha)	Main Water source	Secondary water source
1	Yutasas	593	Anlong Chrey Dam (30 MCM)	Kdol dam (4.7 MCM), Kdol river

Figure 2: Length from Sub-Scheme to Another of Krang Ponley

2.3.2 Irrigation Management

The water distribution system for Yutasas is managed by the Farmer Water User Community (FWUC), which coordinates with the Provincial Department of Water Resources and Meteorology (PDWRAM) in Kampong Chhnang province. The FWUC handles requests from local farmers and oversees the allocation of water to the various villages within the command area. However, the field interview revealed that the FWUC is not working as the water is only available during the wet

season. The situation is worse as the Watergate at Kdol dam is currently malfunctioning and the committee cannot respond to the water needs or requests of farmers.

2.3.3 Natural challenges

Over the past 10 years, the Yutasas irrigation sub-scheme has encountered several natural challenges. Drought was the most frequently reported, affecting 65% of respondents, with an average of three occurrences over the decade. However, only one of these occurrences was considered serious. Floods were the second most reported issue, noted by 54% of respondents, with an average of three events, of which two were deemed serious. Storms were the third most common natural challenge, reported by 35% of respondents and occurring four times, with two of these events considered serious. Insect outbreaks were experienced by 43% of respondents, with an average of three occurrences over the last decade, but only one event was considered serious.

Table 5: Frequency and seriousness of natural disasters in Yutasas sub-scheme

Types	Figures	Percent	Times	Number of Seriousness
Drought	42	65%	3	1
Flood	35	54%	3	2
Storms	23	35%	4	2
Insect outbreak	28	43%	3	1
None	10	15%		

2.4 Proposed Investment under Yutasas Sub–scheme

2.4.1 Activities and Timeline

Should the feasibility study for the Krang Ponley subproject proceed to detailed design, then allowing for the design process, procurement process and approvals, it has been assumed the following planning as displayed in the following Table.

The following assumptions have been made:

- The detailed design will start in January 2025.
- The procurement process will not take more than three quarters.
- The work construction will start after the rainy season in Cambodia with a mobilization period (last quarter of the year);
- The work construction duration will not last more two dry seasons.

Hence the construction would be able to commence at the last quarter 2026 with total completion by mid-2030 for Yutasas irrigation scheme.

Table 6: Tentative implementation schedule of Yutasas irrigation scheme.

2.4.2 Design Concept and Options

The current planning coverage area of Krang Ponley sub-project is around 3,000 hectares, drawing water from the Krang Ponley River, with existing storage at Anlong Chrey and Brambei Mom. Nature-based solutions include controlling the flood regime at Krang Bat for flood recession and fisheries, alongside the rehabilitation of 31 major ponds. Solar pump installations total 184 units distributed across Brambei Mom (110), Chrey Loeu (47), and Krang Ponley Teuk (27). Canal infrastructure includes 31.3 km of main/feeder canals, 29.2 km of secondary canals, and 63.5 km of tertiary canals. Drainage infrastructure comprises 42.8 km of main and secondary drains, while flood embankments and channels are planned for flood management, with raised canal banks in Krang Ponley Teuk. Storage facilities include the upgrade and safety improvement of the Anlong Chrey Reservoir, 31 rehabilitated ponds at Brambei Mom, and support for local storages and fish refuges. The land area for canals is 383 hectares, comprising 144 existing and 239 proposed hectares (Table 2.19).

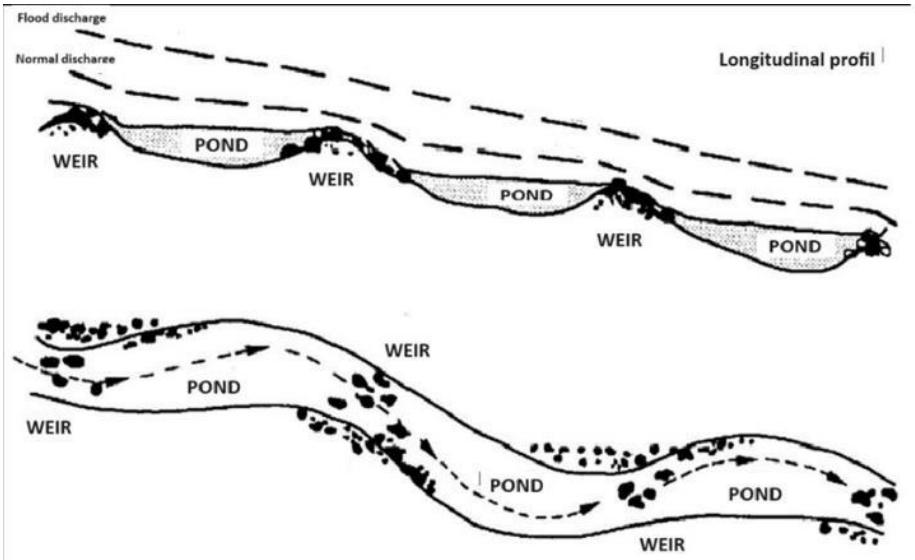
Table 7: Key Features of the Krang Ponley Sub-Project

Sub-Project	**Krang Ponley**
Area Cultivated (ha)	3,000
Water Source	Krang Ponley River with existing storage at Anlong Chrey and Brambei Mom
Nature Based Solution[1]	Control of flood regime at Krang Bat for flood recession and fisheries. Rehabilitate 31 major ponds.
Solar Pump Installations	110 (BBM) + 27(KPT)
Main Canals C/L(km)/N	6_31.3km
Secondary Canal C/L (km)/N (Exist)	35_29.2km
Tertiary Canal C/L (km)/N Existing	77_ 63.5km
Main/Secondary Drains (C/L km/N)	17_42.8km
Flood Embankments /structures (Km/N)	Storage/Operation in AC reservoir for flood, Raised canal bank on KPT, flood channels in KPT and embankment on TS
Storages	Existing Anlong Chrey Reservoir to be upgraded and safety improvements. 31 major ponds on Barambei Mom. Support local storages and fish refuge.
Land Area of Canals (Existing proposed Ha)	144/239

BBM = Brambei Mom, CL= Chrey Loeu, KPT = Krang Ponley Teuk.

[1] Nature-Based Solution, in this case is the improvement of water storage capacity including canal enhancement and pond restoration, is applied to contribute to the recovery of the natural condition of the water system within the command area.

The Yutasas irrigation system as per the design layout in Figure 3 consists of:



- The rehabilitation of the intake structure on Anlong Chrey stream.
- The rehabilitation of the irrigation distributary canals to irrigate 593 ha. It is envisaged to have canal lining for the main infrastructures (main and secondary canal)
- The development of sub-distributary canals (tertiary). Investigation will be performed to envisage the possibility of collective solar pumping system at the tertiary level.
- The rehabilitation of the Anlong Chrey and existing main drainage system to prevent flooding and water disaster.

These combined efforts seek to elevate irrigation capabilities, refine water distribution, and alleviate potential water-related risks within the project area.

Figure 3: Conceptual design layout of Yutasas irrigation scheme

Figure 4: Principles of river rehabilitation for Yutasas scheme

2.4.3 Project Activities

The infrastructure investment of the project, as outlined in the previous section, involves several key activities during the pre-construction phase. These activities set the foundation for the successful implementation of the project's construction work and ensure that resources and personnel are well-prepared for the task.

The project is divided into two (2) key components. Component 1 focuses on improving farm-level climate adaptation, resilience, and water use efficiency. This involves planning and training activities to develop community-based action plans and build capacity among farmers. Additionally, mechanization efforts and farm road improvements will enhance agricultural productivity and accessibility. Component 2 aims to strengthen irrigation infrastructure for increased resilience. This includes a range of activities such as river dredging, canal rehabilitation, construction of small-scale structures, river training, polder system development, solar pumping system installation, feeder canal construction, and pond construction or rehabilitation. These interventions will improve water management, increase water storage capacity, and ensure efficient water distribution to agricultural fields.

2.4.3.1 Pre-construction Phase

At the pre-construction phase, there are several activities that need to be done where disturbance to local people as well as natural resources may occur. These activities are:

1. Land and Right of Way Negotiation: This initial step focuses on securing the necessary land and access rights for the construction. Negotiations with local authorities, landowners, and other stakeholders ensure that all legal and logistical requirements are met, minimizing potential delays or disputes that could arise during the project.
2. Contracting and Training of Staff: The project then engages in the recruitment and contracting of skilled personnel, including construction teams, engineers, and project management staff. This step is critical to ensure that the workforce has the necessary expertise and experience. Alongside recruitment, training programs are provided to align staff with the project's goals, safety standards, and technical requirements.
3. Mine and UXO Clearance: In areas with potential unexploded ordnance (UXO), safety is the highest priority. Before any construction begins, the project undertakes mine and UXO clearance to ensure that the site is free of hazardous materials, creating a safe environment for workers and preventing accidents.

These pre-construction activities are integral to establishing a strong foundation for the project, ensuring that the necessary infrastructure, workforce, and materials are in place to proceed smoothly with the subsequent phases of construction.

2.4.3.2 Construction Phase

The construction phase of the project involves a comprehensive set of activities aimed at establishing the required infrastructure while ensuring safety, environmental management, and efficient use of resources. Key construction activities include:

1. Mobilization of Construction Materials, Consumables, Machinery, Equipment, and Staff: Once the team is in place, the project moves into the mobilization phase, where all essential materials, machinery, and equipment are transported to the construction site. This also includes the deployment of consumables and other resources required for ongoing construction. Ensuring the timely arrival and organization of these assets is crucial for avoiding disruptions in the construction timeline. Similarly, staff are mobilized to ensure a coordinated start to the construction activities.
2. Installation and Operation of Temporary Infrastructure: Temporary facilities, such as worker camps, asphalt plants, concrete mixing stations, and ground material processing plants, are set up to support the construction process. These facilities are critical for providing on-site accommodation for workers and ensuring the continuous supply of construction materials.
3. Site Clearing and Cleaning: This phase involves clearing the construction site of any obstructions such as vegetation, debris, and existing infrastructure. It ensures that the land is prepared and ready for subsequent construction activities.
4. Demolition and Removal of Existing Infrastructure: In areas where existing structures need to be replaced or upgraded, demolition and removal are necessary. This ensures that the site is clear for the installation of new infrastructure and allows for efficient use of the available land.
5. Land Movements (Excavations, Dredging, and Fills): Major land movements, including excavations and dredging, are conducted to reshape the land and prepare it for new infrastructure. These activities also involve filling areas to achieve the required ground levels for construction stability and support.
6. Construction of Hydraulic Works (Including Occupation of Waterways): Hydraulic works, such as dams, levees, or irrigation systems, are constructed to manage water resources effectively. This stage often requires temporary occupation of waterways, making careful planning and environmental considerations critical.
7. River Training: As part of managing water flow and preventing erosion, river training is conducted to stabilize riverbanks and direct water movement, which is essential for protecting both the construction site and surrounding ecosystems.
8. Dismantling of Temporary Facilities and Camps: Once the primary construction activities are completed, temporary infrastructure such as camps and material plants are dismantled. This marks the transition toward the final stages of the construction process.
9. Final Cleanup of Intervened Areas: A thorough cleanup of the construction site is conducted to remove debris, materials, and any temporary installations.
10. Site Restoration: To ensure the aesthetic and environmental sustainability of the project, landscaping efforts are undertaken, including replanting vegetation, managing drainage, and shaping the landscape to blend with the natural surroundings.

This series of construction activities ensures that the project is completed according to design specifications, with an emphasis on safety, environmental responsibility, and efficient resource management.

2.4.3.3 Operation and Maintenance

The post-construction phase of the project involves the transition from infrastructure development to its operational use, with a focus on agricultural intensification, resource management, and long-term maintenance. The key activities during this phase include:

1. Intensifying Agricultural Production: Following the completion of the infrastructure, there is a focus on enhancing agricultural productivity. The improved infrastructure allows for more efficient farming practices, increased crop yields, and the introduction of advanced agricultural techniques. This intensification contributes to greater food security and economic development in the region.
2. Increased Use of Energy and Fuel for Agriculture Production: With the intensification of agricultural activities, there is a corresponding rise in the use of energy and fuel to power farming machinery, irrigation systems, and other agricultural equipment. This increased demand for energy supports the scaling up of production but also requires careful management to ensure sustainability and minimize environmental impacts.
3. Operation and Maintenance: To ensure the long-term functionality and durability of the newly constructed infrastructure, regular operation and maintenance activities are critical. This includes monitoring the condition of the infrastructure, performing repairs, and ensuring that the systems in place continue to function as designed. Routine maintenance helps prevent deterioration and ensures that agricultural productivity remains high.
4. Water Management: Effective water management becomes a priority in this phase, especially with the new hydraulic infrastructure in place. This includes controlling irrigation systems, managing water levels in reservoirs, and ensuring that water resources are used efficiently to support agricultural activities. Sustainable water management is crucial for balancing agricultural demands with environmental conservation.

These post-construction activities ensure the long-term success of the project, contributing to sustainable agricultural growth, resource efficiency, and the ongoing maintenance of infrastructure to support continued productivity in the agricultural sector. Summary of the project activities is provided in Table 6.

Table 8: Summary of the Project Activities in relation to the infrastructure investment

No.	Stage	Activities
1	Pre-Construction	Land and right of way negotiation
		Contracting and training of staff
		Mobilization of construction materials, consumables, machinery, equipment and staff
2	Construction	Mine and UXO clearance

		Installation and operation of temporary infrastructure (camps, asphalt, concrete and ground material plants)
		Site clearing and cleaning
		Demolition and removal of existing infrastructure in areas to be intervened
		Land movements (excavations, dredging and fills)
		Construction of hydraulic works (includes occupation of waterways)
		River training
		Dismantling of temporary facilities and camps
		Final cleanup of intervened areas
		Landscaping management
	After Construction	Intensifying agricultural production
		Increased use of energy and fuel for agriculture production
		Operation and maintenance
		Water management

UXO = Unexploded Ordnance.

2.4.4 Construction Equipment

To support the construction activities, the project will require a variety of construction equipment and machinery. Below is the potentially used equipment for different stages of the project:

- Earthworks and Land Preparation
  - Excavators – For digging canals, ponds, and trenches.
  - Backhoe Loaders – For smaller excavation and loading tasks.
  - Bulldozers – For clearing and leveling land.
  - Motor Graders – For grading and leveling road and embankment surfaces.
  - Scrapers – For removing and transporting soil over short distances.
  - Soil Compactors/Rollers – For compacting soil before construction.
- Water Infrastructure Construction
  - Dredgers – For clearing and deepening irrigation canals and reservoirs.
  - Trenchers – For laying underground pipelines.
  - Pipe Layers – For positioning and installing large-diameter water pipes.
  - Concrete Pumps – For pumping concrete into irrigation structures.
  - Concrete Mixers (Stationary & Mobile) – For mixing and delivering concrete.
  - Cranes – For lifting heavy pipes, gates, and pre-cast structures.
  - Pile Driving Machines – For driving piles into the ground for dam or levee construction.
- Road and Pathway Construction
  - Asphalt Pavers – For paving roads within the project.
  - Dump Trucks – For transporting materials such as gravel, sand, and asphalt.
  - Bitumen Sprayers – For road surfacing.

- Road Rollers – For compacting asphalt or gravel surfaces.

- Drainage and Irrigation System Development
  - Water Pumps (Diesel & Electric) – For water transfer and dewatering.
  - Drilling Rigs – For well construction and deep-water extraction.
  - Channel Forming Machines – For shaping and lining irrigation channels.
  - Concrete Pipe Making Machines – For on-site production of irrigation pipes.
- Structural and Facility Construction
  - Tower Cranes – For lifting heavy materials in building sites.
  - Scaffolding Systems – For workers' access and safety.
  - Rebar Cutters and Benders – For reinforcing concrete structures.
  - Shotcrete Machines – For spraying concrete onto embankments.
- Environmental and Erosion Control
  - Hydroseeding Equipment – For erosion control and vegetation replanting.
  - Rock Crushers – For breaking stones for embankment protection.
  - Geotextile Laying Machines – For soil stabilization in embankments and canal lining.
- Power and Electrical Systems
  - Generators – For power supply in remote project sites.
  - Transformers & Substations – For irrigation pumping stations.
  - Solar Panel Installation Equipment – If renewable energy is incorporated.
- Monitoring and Surveying Equipment
  - Total Stations & GPS Survey Equipment – For site mapping and project layout.
  - Drones – For aerial surveys and project monitoring.
  - Water Flow Meters – For irrigation system performance assessment.

2.5 Associated Facilities

Under CAISAR, the screening for potential Associated Facilties (AF) was conducted by SECAP team. The definition for “Associated facilities” (AF) in the AIIB’s Environmental and Social Framework (May 2021 version) are activities that are not included in the description of the Project set out in the Legal Agreements governing the Project, but they are qualified to the following criteria:

(a) **directly** and **materially** related to the Project.

(b) **carried** out, or **planned to be carried out**, **contemporaneously** with the Project; and

(c) necessary for the Project to be **viable** and would **not be carried out if the Project did not exist**”.

Below is the summary of a) methods that was used by the team to screen for AF, and b) the results of the AF screening.

Methods

Interpretation of AF definition in the context of CAISAR project

Under CAISAR project, the key terms used in the above definition are interpreted as follows:

- **Project**: refers to CAISAR project
- **Direct**, in the context of environmental and social risk and impact assessment, refers to the **impact, which is caused by the project**, and **occurs contemporaneously in the location of the project**. This is to differentiate with an indirect impact which is an impact which is caused by the project and is later in time or farther removed in distance than a direct impact, but is still reasonably foreseeable, and will not include induced impacts. "Direct", in the context of AIIB's ESF refers to the "direct" relationship between a potential associated facilities (e.g. dam, reservoir, barrage) and its impact on the achievement of the intended project development.
- **Material**: significant, important, substantive. In the context of CAISAR, "material" refers to the strength of the above "direct" relationship between the impact of a potential AF on the intended outcome for each subproject which is indicative of **reliable and increased water access** for the target project groups – as per project plan, to achieve expected development outcome.
- **Contemporaneous**: at the same time, which is the relative overlap of time with regards to planning and actual implementation of potential AF and CAISAR project activities (defined by project planning period and project implementation life).
- **Viable**: for CAISAR sub–schemes to **achieve** mostly the **intended impacts** (expected outcome, i.e. increased irrigated area and/or number of crops per year/reliable irrigation access).
- **Not be carried out if the Project did not exist.** Indicates the functional interdependency between the AF and CAISAR project.

Findings

As per the consultation with the CAISAR PMU and SECAP team, the document regarding the AF had already been approved. Therefore, the result from the assessment were used in this report. Further assessment will be conducted on any emerging facilities after the consultation and agreement being provided by the PMU. Based on the screening by the SECAP team, five (5) existing works have been screened and assessed if they are associated facilities (See table below). The screening results indicates that the water resources facilities met the definition of AIIB's Environmental and Social Framework on Associated Facilities. Therefore, no further actions are required in connection with the works (please see in table 7).

Table 9: Screening of potential Associated Facilities under CAISAR*

Assessment criteria	Yutasas barrage
a) **directly** and **materially** related to the Project; and	Directly and materially (substantially) related to Yutasas sub–scheme

b) **carried out**, or **planned to be carried out**, **contemporaneously** with the Project; and	The Yutasas Dam construction was completed in 2015 **Not carried out contemporaneously** with Yutasas sub–scheme
c) **necessary** for the Project to be **viable** and **would not be carried out** if the Project did not exist.	**Necessary** for the Yutasas sub–scheme to be **viable** and **still carried out** even if Yutasas sub–scheme did not exist.
Initial screening	NOT AF

2.6 Implementation Resources Requirement

2.6.1 Labour and Workforce

Table 8 outlines the estimated labor requirements for the construction of the irrigation system under the CAISAR project. Four main groups of the labor forces include: Direct Workers, Contracted Workers, Primary Supply Workers, and Other Stakeholders. The Direct Workers include individual consultants and members of the Project Implementation Unit (PIU), who are essential from the project preparation phase through to completion. The Contracted Workers, engaged by the PIU and construction contractors, consist of national specialists such as Detailed Design Consultants and Construction Supervision Consultants, as well as skilled and unskilled laborers. This group is engaged on intermittent basis. The Primary Supply Workers are mostly local workers involved in providing services to the project at local level during construction, while Other Stakeholders include civil servants from various government ministries and departments, such as MoWRAM, NCDDS, and MEF are technical support. Yutasas require 40 skilled and 60 unskilled workers for implementation.

The involvement of local workers and civil servants is a key feature of the labor requirements. Local workers are heavily engaged as unskilled laborers and primary supply workers, emphasizing the project's reliance on local resources and its potential to create employment opportunities in the region. Additionally, civil servants from ministries such as MoWRAM, NCDDS, and MEF play a significant role, particularly during the construction phase, ensuring compliance with safeguards and providing technical and administrative support. The CAISAR project, requiring careful coordination among consultants, contractors, government agencies, and local communities to ensure successful implementation.

Table 10: The estimated influx labor within the sub-schemes

Type of project workers	Characteristics of project workers	Duration of Labor Requirements	Yutasas
PIU's member MoWRAM & NCDDS	Individual consultants (e.g., E&S Specialists, Design Engineers, Construction Supervision Engineers, etc.	From project preparation till project completion	20

Type of project workers	Characteristics of project workers	Duration of Labor Requirements	Yutasas
Engaged by PIU			
Detailed Design Consultant	National specialists	From project preparation until project completion	3
Construction Supervision consultant	National specialists		1
Independent E&S Monitoring Consultant		One (1) month in very six (6) months	1
Technical Assistance			3
Skilled workers	National specialists	Durations vary, depending on construction stages & needs.	10
Unskilled workers	Local workers (around subproject location)		15
Primary Supply Workers			
Workers producing materials for core project activities	Mostly local workers	Construction stage	4
Other Stakeholders Working in Connection with Project			
Civil servants of MoWRAM, PDWRAM at provincial & district level	SEO safeguard team	The construction stage of the project.	2
Civil servants of NCDDS	Staff of NCDDS	From project preparation until project completion	2
Civil servants of MEF	Staff of GDR	From project preparation until project completion	1
Civil servants of relevant Ministries	Staff	The construction stage of the project.	1

PIU = Project Implementation Units, MoWRAM = Ministry of Water Resources and Meteorology, E&S = Environmental and Social, NCDDS = National Committee for sub-National Democratic Development Secretariat, PDWRAM = Provincial Department of Water Resources and Meteorology, SEO = Social and Environmental Officer, MEF = Ministry of Economy and Finance, GDR = General Department of Resettlement.

2.6.2 Power Usage

During the construction, the project requires a reliable and sufficient power supply to support various construction activities including equipment operation, worker facilities, and site management. A significant portion of power consumption will be allocated to heavy machinery and equipment, including concrete mixers, cranes, drilling rigs, welding machines, water pumps, and earthmoving equipment such as excavators and bulldozers. These machines require high-power supply mainly from the self-propel engine using diesel or gasoline as the fuel whereas the power for lighting and security systems for general visibility on the construction site could be from the power grid as the location is accessible to power grid. Apart from machinery, electricity for

worker facilities and site infrastructure can be the power grid or diesel generators. Worker camps will require power for lighting, cooking, air circulation, and mobile charging.

The overall power demand will vary based on the project's phase, the number of workers, and the type of equipment used. However, the estimate of the demand is far from actual since many information is lacking. The engineering team recommended to wait until the DED stage. A hybrid power system using a combination of grid electricity, and diesel generators. Efficient energy management strategies will help optimize power use, reduce costs, and minimize environmental impact.

2.6.3 Supporting Facilities

Several supporting facilities that are required for the construction activities include site offices and administrative facilities, worker accommodation and welfare facilities such as worker camps containing toilets, showers, handwashing stations, and kitchens to ensure proper hygiene and nutrition. A stable power supply is needed for machinery operation, lighting, and worker facilities, sourced from grid electricity, diesel generators, or solar panels can be the options. Additionally, wastewater treatment facilities are need to manage sewage and reduce environmental pollution for the camp sites.

Proper storage and material handling facilities is needed to protect construction materials such as cement, steel, and gravel. Transportation infrastructure and access roads is used to facilitate the movement of materials and personnel, with designated loading and unloading zones to streamline logistics. To ensure safety, security measures such as perimeter fencing, guard posts, and fire safety stations is needed. Furthermore, environmental management facilities such as waste segregation units, drainage systems, and recycling bins are also needed to minimize environmental impact. The specific layout and location of the facilities can only be projected at after obtaining the final design layout plan of the engineering team during the construction stage after the contract award.

2.6.4 Water Consumption

Water is needed for construction activities and domestic uses of workers. Water is essential for various activities, including material preparation, earthworks, equipment operation, worker sanitation, and site maintenance. A significant portion of water use is allocated to concrete and material preparation, where it is needed for mixing concrete, mortar preparation, curing, and soaking bricks or blocks to prevent rapid water absorption. Additionally, earthworks and dust control require water for soil compaction, suppressing dust on unpaved roads, and softening the ground during grading and levelling. Water is also crucial for equipment and machinery operations, including cooling construction machinery, cleaning tools and formworks, and conducting hydraulic testing of pipelines to check for leaks and pressure integrity. In road construction and asphalt work, water is required for wetting base layers before compaction, mixing with bitumen, and cooling asphalt equipment. Estimate the quantity of water for such activities need the figure of the facilities. As per the consultation with the engineering team, it is not feasible to make an estimate on the water need for such a work since the scope of work including volume of excavated soil, volume of concrete to be used, and so on are not available.

The estimate of water needs for domestic use of the project associated workforce use the 70 liters per day as the basis for the calculation. As the duration of engagement of staff and officials, workers, civil servants over the project life time are varied from one to another. The PMU staff engagement at the field is estimated at 3 days per month over the period of 6 years. The DED Consultant is estimated at 100 days per year for one year, following by construction supervision consultant at 250 days per year for 2.5 year, independent E&S Monitoring Consultant at 25 days per year for 3 years, technical consultant at 50 days per year for 3 years, skilled and unskilled workers at 250 days per year for 2 years, primary supply workers at 50 days per year for 2 years, officials for MOWRAM and PDoWRAM at 50 days per year for 6 years, and other officials at 40 days per year for 6 years. The result of the estimate for water demand is provided below:

Table 11: The estimated quantity of water for domestic use of the project

No.	Type of Workers	Total Workers	Number of Days at Field	Total Water Demand (liters/day)	Total Water Demand (m3)
1	PIU member MoWRAM & NCDDS	20	4,320	1,400	6,048
2	Detailed Design Consultant	3	250	175	44
3	Construction Supervision consultant	1	781	88	68
4	Independent E&S Monitoring Consultant	1	94	88	8
5	Technical Assistance	3	375	175	66
6	Skilled workers	10	5,000	700	3,500
7	Unskilled workers	15	7,500	1,050	7,875
8	Primary Supply Workers	4	469	263	123
9	Civil servants of MoWRAM, PDWRAM	2	600	140	84
10	Civil servants of NCDDS	2	480	140	67
11	Civil servants of MEF	1	300	88	26
12	Civil servants of relevant Ministries	1	300	88	26
	Total				17,936

PIU = Project Implementation Units, MoWRAM = Ministry of Water Resources and Meteorology, NCDDS = National Committee for sub–National Democratic Development Secretariat, E&S = Environmental and Social, PDWRAM = Provincial Department of Water Resources and Meteorology, MEF = Ministry of Economy and Finance.

The estimated water demand is mainly for needed during the construction period, given less than 1% of the estimated water is required for pre-construction stage.

2.6.5 Expected GHG Emission and Discharge

During construction, the construction activities will generate Greenhouse Gas (GHG) emissions from various activities, primarily due to the use of fossil fuels, electricity consumption, and material production. One of the major contributors to emissions is fuel combustion in heavy machinery and construction equipment, such as excavators, bulldozers, cranes, and trucks. These machines rely

mainly on diesel fuel, which releases carbon dioxide (CO_2), methane (CH_4), and nitrous oxide (N_2O) into the atmosphere. Additionally, transportation of materials such as sand, gravel, cement, and steel to the construction site will also contribute to emissions through fuel consumption by trucks and other vehicles.

Another significant source of GHG emissions is the production and use of construction materials, particularly cement, steel, and asphalt. Cement manufacturing is known for high CO_2 emissions due to the chemical process of calcination, while steel production requires significant energy, leading to further emissions. The use of electricity for site operations, including lighting, worker accommodations, water pumping, and equipment, will also add to the overall carbon footprint, depending on the energy mix used. However, the exact amount of GHG emissions can only be determined after the detailed engineering design is completed, which will provide specific information on construction scope, number and size of equipment usage, and material requirements. Future calculations should take into account project-specific data to ensure a more accurate estimation of the environmental impact.

2.6.6 Land Acquisition for Material Storage

To support construction activities, contractors will need to rent land or engage local households to store materials and vehicles. This land will be used for essential contractor facilities, such as temporary storage areas, worker accommodations, and machinery stations. Securing this land is critical for ensuring efficient operational logistics and smooth construction management throughout the project. Overall, it is projected that a total of 5 households or land units will be needed for Yutasas.

2.7 Project Alternatives Analysis

2.7.1 Site Selection

Yutasas is a sub-scheme, located within the Krang Ponely catchment made of four (4) sub-areas: Brambei Mom, Krapeu Troum, Yutasas and Krang Bat covering a total area of 3,277 hectares.

2.7.2 Project Layout and Design

Rehabilitation and enhancement of the existing irrigation system is the main design option under the project opting out from the feasibility design stage as huge land area acquisition found to be critical and generate high social impacts on community people.

Table 12: Irrigation System Options in Yutasas

No.	Structures	Designed Length (km)	Existing Width (Average) m	Expansion (L) m	Expansion (R) m	Total Width (m)
Yutasas						
1	Embankment	1	18.4	1.6	0.8	20.80
2	Main canal	6.6	21.3	2.2	1.1	24.60
3	Main Drain	7.4	59	0	0	59.00
4	Secondary Drain	2.2	21.3	0	0	21.30

L = Left, R = Right

Secondary Canals. The construction of new secondary canal is expected to acquire huge land areas of farmers which may result in disruption of household economy. To avoid the negative impact, the construction of the canal was agreed to remove the newly plan secondary canal while off-take structure (culverts) will be used to allow farmers to abstract water from the system as per their block command areas. Farmers who own the land within the block need to discuss and agree whether they are going to build their own water canal or use plot by plot irrigation. The risk as per this option is when farmers could come up with the agreement on the construction of a small canal on their own, they have to continue irrigating their farm through deploying plot-to-plot irrigation or using long range pumping which involve with high cost and limited water use efficiency. Since the design is trying to avoid land acquisition, this will be the option for the system which is also applied to the quaternary and fourth-level canal as well.

River Training. River training methods are designed to regulate and stabilize river flows for various purposes, including irrigation, flood control, and erosion prevention. Below are three common types of river training, along with their respective advantages and disadvantages adopted from online source to provide general overview regarding the design and possible options which should be considered for the actual practices. However, it is up to the DED team to decide as per the consultation with Social Safeguard consultant (Table 13).

Table 13: River Training Design Options

River Training	Description
Embankments (Levees)	Embankments are artificially raised banks made of earth, concrete, or stone along the sides of a river to prevent water from overflowing into adjacent lands.
Advantages:	• **Flood Control:** Protects agricultural lands and infrastructure from river flooding. • **Irrigation Water Regulation:** Helps direct water flow into irrigation channels efficiently. • **Erosion Prevention:** Reduces bank erosion, safeguarding nearby farmlands and structures. • **Cost-Effective:** Generally, less expensive compared to more complex river training structures.
Disadvantages:	• **Sediment Deposition Issues:** Can lead to sediment buildup within the riverbed, raising water levels and increasing flood risks over time. • **Breaching Risk:** If poorly maintained, embankments can break during extreme floods, leading to catastrophic damage. • **Ecological Impact:** Alters natural river dynamics, affecting aquatic ecosystems and wetlands.

Spurs (Groynes)	Spurs (also called groynes) are structures extending perpendicularly from the riverbank into the river. They help deflect and slow down water flow to prevent erosion and sediment deposition in key areas.
Advantages:	• **Bank Protection:** Reduces erosion by redirecting strong currents away from vulnerable banks. • **Sediment Control:** Helps accumulate sediments in specific areas, aiding in land reclamation or creating stable riverbanks. • **Improves Water Availability:** Can be strategically placed to direct water flow into irrigation systems.
Disadvantages:	• **Local Scouring:** Can cause deep erosion near the structure, affecting nearby irrigation headworks or riverbanks. • **Periodic Maintenance Required:** Sediment accumulation may require periodic dredging to maintain functionality. • **High Initial Cost:** Construction and material costs can be relatively high compared to natural erosion control measures.
Weirs and Barrages	Weirs are low dams built across a river to regulate water flow, while barrages are adjustable structures with gates that control water levels for irrigation and flood management.
Advantages:	• **Water Level Control:** Maintains steady water levels in irrigation channels, ensuring consistent supply to farmlands. • **Hydropower Potential:** Some barrages can integrate small-scale hydroelectric generation. • **Prevents Saltwater Intrusion:** Useful in coastal areas where tidal effects can introduce salinity into freshwater irrigation systems.
Disadvantages:	• **Disrupts Natural River Flow:** Can impact fish migration and aquatic ecosystems if fish passages are not incorporated. • **Expensive to Build and Maintain:** High initial investment and ongoing maintenance are required for long-term functionality. • **Flooding Risk Upstream:** Can cause water accumulation upstream, leading to potential flooding in extreme weather conditions.

Design Slope. As per the confirmation of the Engineering Team, canal slopes will either be protected or left as earthen slopes based on their condition and the available budget, which will

be determined during the detailed design phase. For weak slopes, concrete lining and geosynthetic materials will be recommended for reinforcement. The feasibility of bio-engineering solutions will be assessed based on the specific site conditions of the project. The following is the comparison between the vegetated and concretized design slope:

Table 14: Slope Design Options Comparison

Concretized Canal Slopes	• Erosion Control: Concretized canal slopes provide strong erosion resistance, reducing sedimentation in water bodies downstream. This helps maintain water quality and prevents sediment-related ecological degradation. • Maintenance Needs: Concretized slopes generally require less maintenance compared to vegetated banks. They are easier to inspect and repair, reducing ongoing operational costs. • Habitat Impact: Concretized slopes typically offer limited habitat for aquatic organisms and vegetation compared to natural or vegetated banks. This can reduce biodiversity and ecological resilience in the waterway. • Heat Absorption: Concrete can absorb and retain heat, leading to higher water temperatures in the canal. This can affect aquatic life, especially sensitive species, and alter ecosystem dynamics. • Aesthetics: Concretized slopes may be perceived as less visually appealing compared to natural or vegetated banks. This could impact recreational use and community engagement with the water resource.
Vegetated Banks	• Erosion Control: Vegetated banks provide natural stabilization, reducing erosion by absorbing water, slowing runoff, and binding soil with root systems. They contribute to maintaining soil structure and preventing sedimentation downstream. • Biodiversity: Vegetated banks offer diverse habitats for aquatic and terrestrial species, promoting biodiversity and supporting ecological balance. They can serve as wildlife corridors and provide nesting sites for birds. • Water Quality: Vegetated banks act as buffers, filtering pollutants, and absorbing excess nutrients from runoff. This improves water quality and supports healthier aquatic ecosystems. • Temperature Regulation: Vegetation provides shade, helping to regulate water temperature and mitigate thermal pollution. This is particularly important for species sensitive to temperature fluctuations.

	• Community Benefits: Vegetated banks enhance the aesthetic value of the waterway, offering green spaces for recreation, relaxation, and cultural activities. They can also contribute to community engagement and ownership of the water resource.

Cross-Regulator/Off-Take Structure. The structure is required for all sub-schemes and specific size, number, and locations need to be assessed during DED stage. The calculation regarding the design specification need to consider the water requirement in each block of the sub-command areas.

2.7.3 Project Technology

The feasibility study has assessed the climate vulnerabilities of the Command Areas and their communities to design suitable, sustainable, and climate-resilient irrigation systems. The scheme will make use of nature-based, adaptive, and data-driven technologies to ensure its resilience to extreme floods and climate change. Smart SCADA technology will be installed to monitor the system for leaks and flood damages, while drainage systems will also be installed to reduce waterlogging, flood impacts, and crop failures.

Solar pumping will be employed in place of costly and high-carbon diesel alternatives to create a self-sustaining system. The lining of canals is an important feature of the system's climate resilience, and a range of investment options exist depending on the extent of lining in the new network. Concrete will be used for certain sections to reduce the carbon footprint.

There are different technological options being proposed for the project activities. The key technological options are provided here:

Table 15: Irrigation System Options

Options	Component	Options	Description
Pumping	1	Diesel water pump	Traditional water pumping systems powered by diesel engines. These are commonly used in areas where electricity is unavailable but it has higher operational cost and environmental impacts. However, it can be used anywhere in the sub-scheme.
		Solar pumps	Sustainable and cost-effective water pumping systems that harness solar energy, suitable for remote areas with abundant sunlight. They offer lower long-term costs but may require higher initial investment.
		Electric pumps	Powered by electricity from the grid or other sources, these pumps are efficient but depend on the availability of consistent electrical supply which maybe inapplicable at farm level in most of the sub-scheme
IPM	1	Pesticide application	A conventional approach involving chemical pesticides to manage pests, often leading to quick

			results but with potential risks to health, environment, and biodiversity. The times of application without IPM will be up to 6 times as per the reported from the field survey.
		With IPM*	The application of pesticides will be reduced to only around 3 times, minimizing the impacts on the quality and health of water, environment, wildlife, fauna and flora, human and animal
Agromet	1	Without Agromet	Farming practices carried out without the use of weather and climate data, potentially leading to inefficiencies and higher vulnerability to climate risks.
		Agromet	Incorporates meteorological data and forecasts into agricultural decision-making, enhancing productivity, resource optimization, and resilience to climate variability. However, the major challenge is mainly the operational cost of the system.
SCADA**	2	Convention	Manual or semi-automated control systems for monitoring and managing operations, which may be labour-intensive and less efficient in handling complex systems.
		SCADA	Advanced digital systems that provide real-time monitoring, data analysis, and remote-control capabilities for improved efficiency and operational oversight.

*. IPM = Integrated Pest Management

**. SCADA = Supervisory Control and Data Acquisition

For pumping, there is a need to be case specific to each of the option. Applying these technological options are important since the technologies will facilitate the agricultural production and complimenting each other is needed. The promotion of only one (1) option would decrease the effective farming activities. Regarding the IPM, it is quite important to promote the technologies as it will reduce the negative impacts which will be caused by the farming activities. The application of agromet will require technical skill and management capacity

2.7.4 Project Scenario Analysis

In the without-project scenario, the net command area of 593 ha will continue to be cultivated with a cropping intensity of 100% (593 ha). This includes 119 ha of late wet-season paddy and 474 ha of medium wet season paddy. This is the same to the land area of 1% (6 ha) continue to grow vegetable with the risk of crop failure due to limited water sources.

In the with-project scenario, while the net command area will remain unchanged, improvements in water availability, water management, transmission efficiency, and drainage will increase cropping intensity to 117% (covering 693 hectares). This will include 59 hectares of late wet-

season paddy, 237 hectares of medium wet-season paddy, 297 hectares of early wet-season paddy, and 100 hectares dedicated to high-value crops such as fruits and vegetables.

The proposed Yutasas scheme aims to install secondary and tertiary irrigation canals along with related infrastructure within the existing scheme, enhancing water availability during the dry season for 593 hectares of nearby agricultural fields. The project will also establish and train Farmer Water User Communities (FWUCs) to manage and maintain the irrigation infrastructure, ensuring its long-term sustainability. Additional agricultural extension services will be offered to local farmers, focusing on improved agricultural practices and value chain development, the use of improved seed varieties, cover crop application, and optimal fertilizer and pesticide use.

The project is expected to deliver the following agricultural benefits for the 1,339 targeted farming households: i) higher yields for wet-season rice, ii) expanded cultivated areas and increased yields for dry-season rice, and iii) the introduction of high-value crops like leafy and fruit vegetables for dry-season farming. These improvements are projected to enhance agricultural productivity, increase farmer incomes, and boost farmer resilience against drought, pests, diseases, and market risks through crop diversification.

In the without-project scenario, ongoing agricultural practices would persist, leading to suboptimal rice yields, limited crop diversification, low farmer incomes, and increased vulnerability to climate risks.

3. LEGAL AND INSTITUTIONAL FRAMEWORK

Following a framework for effective project development as well as environmental sustainability, the project owner shall comply with the national legal framework and protocols ratified by the Kingdom of Cambodia. For CAISAR Project, there are national laws, agreements, guidelines and relevant legal instruments as described below:

3.1 Royal Government of Cambodia's Legal Framework

3.1.1 National legal framework

3.1.1.1 The Constitution of the Kingdom of Cambodia (1993)

The Constitution is the highest legal authority in Cambodia and establishes the fundamental rights and duties of citizens and the state. It sets the groundwork for environmental protection, governance, social inclusion, and public well-being, ensuring that environmental and social rights are integrated into national laws.

3.1.1.2 Legal Framework related to the Management and Conservation of Natural Resources and Biodiversity

This framework aims to ensure sustainable use and conservation of Cambodia's natural resources, including water, land, biodiversity, and ecosystems. Laws under this framework help guide ESCIA processes to minimize environmental degradation.

- **Royal Decree on Protected Areas (2008)** sets the standard for managing Cambodia's protected areas. It categorizes these areas into **National Parks**, **Wildlife Sanctuaries**, **Protected Landscapes**, and **Multiple-Use Areas** to conserve biodiversity, ecosystems, and cultural heritage while supporting sustainable development.
- **Law on Environmental Protection and Natural Resource Management (1996)**: Establishes principles for sustainable development and environmental protection, requiring environmental assessments for projects impacting natural resources.
- **Environmental and Natural Resources Code 2023**: Provides a comprehensive approach to natural resource governance, setting standards for the sustainable management of resources.
- **Law on Land Management, Urban Planning and Construction (1994)**: Governs land use, urban development, and construction to ensure that environmental and social impacts are mitigated.
- **Law on Water Resource Management (2007)**: Regulates water usage, conservation, and management, ensuring that development projects do not negatively impact water resources.
- **Law on Fisheries (2006)**: Focuses on sustainable fisheries management and biodiversity conservation in aquatic ecosystems, crucial for ESCIA in projects affecting water bodies.
- **Protected Areas Law (2008)**: Establishes protected areas to conserve biodiversity and natural resources, ensuring that development projects respect these protected regions.
- **Land Law (2001)**: Regulates land ownership and management to promote sustainable land use practices.
- **Sub-Decree on Water Pollution Control (1999)**: Sets standards for water quality and pollution control in development projects.
- **Sub-Decree on Water Quality Standard for Public Waters for the Purpose of Biodiversity Conservation (1999):** These standards aim to maintain conditions suitable for aquatic ecosystems by limiting pollutants, ensuring water remains safe for the survival and reproduction of aquatic life, and preventing ecological degradation.
- **Sub-Decree on Environmental Impact Assessment (1999)**: Requires EIA for development projects, ensuring environmental impacts are assessed and mitigated.
- **Sub-Decree on Air Pollution Control and Sound Disturbance (2000)**: Provides standards to control air pollution and noise disturbances from development projects.
- **Sub-Decree on Solid Waste Management (1999)**: Governs solid waste management in projects, preventing environmental harm from improper waste disposal.
- **Prakas on Environmental Impact Assessment Reports (1999)**: Offers guidelines for preparing EIA reports to ensure thorough assessment of environmental impacts.

- **Prakas on Hazardous Substances (2015)**: Sets limits on the disposal of toxic substances, preventing environmental contamination from hazardous materials.
- **Biodiversity Convention (1994)**: Focuses on conserving ecosystems, species, and genetic diversity. Promotes sustainable use of resources, establishment of protected areas, and fair benefit-sharing from genetic resources.
- **Ramsar Convention (1999)**: Aims to conserve wetlands of international importance for biodiversity, water management, and climate resilience. Encourages sustainable use and designation of Ramsar sites.
- **UNFCCC (1994)**: Provides a framework to combat climate change impacts on ecosystems. Supports sustainable land use, forest conservation, and integration of climate adaptation into conservation strategies.
- **Kyoto Protocol (1997, entered into force 2005, Cambodia accessed 2002):** Strengthens the UNFCCC by setting legally binding targets for reducing greenhouse gas emissions, promoting sustainable development and renewable energy.
- **Vienna Convention for the Protection of the Ozone Layer (1988, Cambodia accessed 2001):** Aims to protect the ozone layer through global cooperation, encouraging research, monitoring, and measures to phase out harmful substances.
- **Montreal Protocol on Substances that Deplete the Ozone Layer (1987, entered into force 1989, Cambodia accessed 2001):** A legally binding treaty to phase out ozone-depleting substances. Contributes to environmental and climate protection.
- **Basel Convention (1992, Cambodia accessed 2001**): Controls the transboundary movement of hazardous wastes and their disposal, emphasizing waste reduction and environmentally sound management.
- **United Nations Convention to Combat Desertification (1996, Cambodia ratified 1997):** Addresses land degradation and desertification through sustainable land management, conservation of soil and water resources, and restoration of degraded land.
- **CITES (1975, Cambodia ratified 1997):** Regulates trade in endangered species to ensure their survival, focusing on sustainable management and combatting illegal wildlife trade.
- **UNESCO Network of Biosphere Reserves (Cambodia joined in 1997):** Promotes the sustainable management of biodiversity, ecosystems, and cultural heritage through conservation and sustainable development practices.
- **Millennium Development Goals (MDGs) and Sustainable Development Goals (SDGs):** Cambodia committed to global goals for environmental sustainability, including biodiversity conservation, climate action, and ecosystem protection.

- **ASEAN Agreement on Transboundary Haze Pollution (2006):** Focuses on preventing and mitigating air pollution caused by forest fires through regional cooperation and sustainable forest management.
- **ASEAN Agreement on Disaster Management and Emergency Response (2009):** Strengthens disaster preparedness, risk reduction, and environmental resilience in the ASEAN region.
- **Mekong Agreement (1995):** Promotes sustainable development, equitable water use, and conservation of the Mekong River Basin's ecosystems and resources.
- **Biodiversity Law (2009):** This foundational law provides a comprehensive legal structure for the sustainable management of biodiversity resources. It addresses habitat protection, species conservation, genetic resource management, and the sustainable use of biodiversity, outlining the government's responsibilities and promoting public participation.
- **Environmental Protection Law (1995):** This law sets general principles for environmental protection and outlines the government's role in environmental management, including pollution control, waste management, and natural resource conservation. It complements the Biodiversity Law by providing a broader environmental governance framework.
- **Forest Law (1994):** Regulating the management, use, protection, and restoration of Cambodia's forests, this law is crucial for balancing economic development with environmental conservation, particularly in biodiversity-rich ecosystems.
- **Wildlife Sanctuary and Protection Law (1993):** This law establishes wildlife sanctuaries and offers protection to wildlife species by prohibiting hunting, trapping, and other activities that threaten wildlife and their habitats.
- **Fisheries Law (1991):** This law governs the management of Cambodia's fisheries resources, setting rules for sustainable fishing practices, protecting aquatic habitats, and ensuring the long-term health of aquatic ecosystems.
- **Environmental Code (2023):** The newly introduced Environmental Code consolidates and updates Cambodia's environmental laws, introducing stricter regulations on pollution control, natural resource management, and biodiversity conservation. It emphasizes climate change adaptation and mitigation and enhances public participation and transparency in environmental decision-making.
- **Nagoya Protocol (2010):** As a party to the Nagoya Protocol under the Convention on Biological Diversity (CBD), Cambodia commits to the fair and equitable sharing of benefits arising from the utilization of genetic resources. This protocol supports

Cambodia's efforts to protect its biodiversity while ensuring that the benefits of its genetic resources are shared with local communities and stakeholders.

3.1.1.3 Legal Framework related to Labour, Public Well-Being, and Safety

This framework emphasizes the protection of workers' rights, public safety, and well-being in project development. It ensures that development projects comply with labor laws and safety standards.

- **Labor Law (1997)**: Protects workers' rights, ensuring safe and fair working conditions during project implementation.
- **Law on Roads (2014)**: Governs the construction and maintenance of roads, with provisions for minimizing environmental and social impacts.
- **Law on Road Traffic (2014)**: Addresses traffic management and safety measures to prevent accidents and disruptions during development.
- **Law on Suppression of Human Trafficking and Sexual Exploitation (2008)**: Protects vulnerable populations during project implementation from exploitation and trafficking.
- Government Occupational and Community Safety and Health (OHS) guidelines follow the OHS Program for Cambodia (2010-2013) developed by the International Labor Organization (ILO). The draft guidelines provide the framework for instituting OHS at the workplace and in the community.
- The Ministry of Labor and Vocational Training (MLVT) has the following guidelines which will be implemented during the construction phase of the Project:
    - MLVT Prakas on Sanitation at the Construction Site (March 2011). The Prakas sets to ensure that the sanitation and safety conditions are fulfilled for workers at construction sites by owners, directors, contractors or subcontractors of construction establishments or construction companies. Articles 3 and 4 ensure that workers are provided with shelter, sanitation facilities and safe potable water for drinking and washing.
    - MLVT Prakas on The Protection of Risk Resulting from Climate Change at Construction Sites (March 2011). Articles of this Prakas require safety measures and break times for workers at the construction site during extreme weather events.
    - MLVT Prakas on Providing of Information at the Construction Site (March 2011). This Prakas states requirements for owners or responsible persons of a construction site to provide information, i.e. name and address of the owner of enterprise, construction establishment, Construction Company, name and address of architect, nature of construction, date for the start of the construction, estimated time to finish the construction works, and estimated number of workers to be employed for construction activities.

- MLVT Prakas on Stock of Materials, Waste Disposal and Clearance at Construction Site (March 2011). This Prakas provides safety guidelines and requirements for the safe storage of construction of materials and waste.

3.1.1.4 Legal Framework related to Governance and Social Inclusion

This framework ensures that development projects promote inclusive governance, respect cultural heritage, and safeguard social rights. It includes provisions for tax obligations, land acquisition, resettlement, and social protection schemes.

- **Law on Taxation (1997)**: Governs the taxation of development projects, ensuring they contribute to national revenue and economic sustainability.
- **Sub-Decree on Construction Permit (1993)**: Requires permits for construction activities, ensuring they comply with environmental standards and social safeguards.
- **Law on Protection of the Rights of Persons with Disabilities (2009)**: Ensures that development projects consider the needs and rights of people with disabilities.
- **Law on Social Security Schemes (2002)**: Provides social protection for workers, ensuring their well-being during project execution.
- **Sub-Decree on Health Care Scheme (2016)**: Extends social security and health care protection to workers involved in development projects.
- **Law on the Protection of Cultural Heritage (1996)**: Safeguards cultural heritage sites, ensuring that development projects do not damage or destroy culturally significant areas.
- **Expropriation Law (2010)**: Regulates land acquisition for public purposes, ensuring fair compensation and minimizing the impact on affected populations.
- **Sub-Decree on Land Acquisition and Resettlement (2018)**: Provides procedures for land acquisition and involuntary resettlement, particularly for externally financed projects.
- **Sub-Decree on Social Land Concession (2003)**: Allows for the allocation of state land to landless citizens, particularly when development projects displace communities.
- **Sub-Decree on State Land Management (2005)**: Regulates the management of state land, ensuring its sustainable use in development.
- **Sub-Decree on River Basin Management (2015)**: Promotes sustainable management of river basins, ensuring that development projects do not harm water systems and dependent ecosystems.

3.2 EIA Classification

In order to provide guidelines on effective implementation of sub-decree No 72 ANRK.BK on environmental impact assessment Procedures for development projects, MoE promulgated sub-decree No. 21 on Environmental Impact Assessment Classification for Development Projects.

According to this sub-decree, environmental impact assessment for projects is classified into three categories.

- Appendix 1: Projects requiring full environmental impact assessment (full ESIA)
- Appendix 2: Projects that require initial environmental impact assessment (IEIA)
- Appendix 3: Projects requiring the Contract on Environmental Protection (EPC)

The sub-decree includes an annex listing projects under various sectors and their categorization on the basis of their nature, type and size. The sector and EIA classification for irrigation project is summarized in Table 11 below.

Table 16: ESIA Classification for Development Projects relevant

No	Project Type	ESIA (Equiv. to ADB's A)	ESIA (Equiv. to ADB's B)	Env. Protection Contract	Apply to CAISAR Project
1	Irrigation systems		≥5000ha	1000-5000ha	√
2	Water diversion systems		≥5000ha	1000-5000ha	√
3	All building construction	>45000m2	15000 – 45000m2	3000-15000m2	
4	Road construction (new)	>100km	≥ 30 – 100km	10-<30km	√
5	Railroad and road expansion	>100km	≥50 – 100km	10-<50km	√
6	Road in protected areas	>30km	≥ 10-30 Km	10km	
7	Road widens or rehabilitation in protected area	>50km	≥ 10-50 km	10km	

Source: Prakas No. 021 PRK.BST dated 03 February 2020.

3.3 Applicable Ambient Quality Standards

3.3.1 Water quality standards for public health protection

Water quality standards in public water areas for biodiversity conservation are shown in Table 17 below. These are applied as the national standards on surface water quality.

Table 17: Water quality standards in public water areas for bio-diversity conservation

No	Parameter	Unit	Surface water Standard	
			River	Lake etc
1	pH	mg/l	6.5-8.5	6.5-8.5
2	Total suspended solids (TSS	mg/l	25-100	1-15
3	Dissolved oxygen (DO)	mg/l	7.5-2.0	7.5-2.0
4	Biochemical oxygen demand (BOD5)	mg/l	1-10	<30

5	Chemical oxygen demand (COD)	mg/l	<50	1-8
6	Total Nitrate (TN)	mg/l	0.1-0.6	0.1-0.6
7	Total phosphorous (TP)	mg/l	0.005-0.05	0.005-0.05
8	Arsenic (As)	mg/l	<0.01	<0.01
9	Iron (Fe)	mg/l	<1	<1
10	Total Coliform	MPN/100ml	<5,000	<1,000

Note: Standard* = Surface water quality standards for lake, reservoirs and river of the MoE's Prakas on the adoption of terms of references for infrastructure and tourism sectors (2018).

The Royal Government of Cambodia has established a comprehensive policy on National Water Supply and Sanitation for both urban and rural water supplies. Based on this policy, and to ensure access to safe drinking water to all people, quality standards for both drinking water and groundwater are developed by an inter-ministerial process initiated by the Ministry of Industry, the Mines and Energy, and other concerned ministries with support from the World Health Organization.

Table 18: Groundwater and Drinking Water Quality Standards.

No.	**Parameters**	**Unit**	**Standard**		
			River	**Lake and reservoir**	**CDWQS***
1	Depth				
2	pH	-	6.5-8.5	6.5-8.5	6.5-8.8
3	Electrode Conductivity (EC)	mg/l	500-1500	500-1500	-
4	Arsenic (AS)	mg/l	<0.01	<0.01	0.05
5	Cadmium (Cd)	mg/l	<0.003	<0.003	<0.003
6	Lead (Pb)	mg/l	<0.01	<0.01	0.01
7	Total Nitrogen (TN)	mg/l	<3	<2	-
8	Total Phosphorus (TP)	mg/l	<0.25	<0.15	-
9	Total Dissolved Solid (TDS)	mg/l	<1000	<1000	<800
10	Total Suspended Solid (TSS)	mg/l	<100	<100	-
11	Dissolved Oxygen (DO)	mg/l	>3	>4	-
12	Total Coliform	MPN/100ml	<1000	<1000	0

*. Cambodia Drinking Water Quality Standard

Ambient Air Quality Standards are presented in Table 14. Maximum permitted noise levels in public and residential areas are shown in Table 14.

Table 19. Ambient Air Quality Standards

Parameters	**Cambodia**	**WHO Air Quality Guideline 2021**

	Period 1h Average mg/m^3	Period 8h Average mg/m^3	Period 24h Average mg/m^3	Period 1year Average mg/m^3	
Carbon monoxide (CO)	40	20	-	-	4mg/m^3 (24h Average)
Nitrogen dioxide (NO2)	0.3	-	0.1	-	10 ug/m^3(1 year average) 25 ug/ m^3 (24h average)
Sulfur dioxide (SO2)	0.5	-	0.3	0.1	40 ug/ m^3 (24 h average)
Ozone (O3)	0.2	-	-	-	100 ug/ m^3 (8h average)
Lead (Pb)	-	-	0.005	-	-
Particulates	-	-	0.33	0.1	5 ug/m^3 (PM2.5, 1year) 15 ug/m^3 (PM2.5, 24h average)

Table 20. Maximum permitted noise levels in public and residential areas (dB (A))

Location	Cambodia Standard			IFC-EHS Guideline	
	06:00 to 18:00	18:00 to 22:00	22 to 6:00	Day 7:00 to 22:00	22:00 to 7:00
Silence Area Hospital; Library, School, Nursery	45	40	35	55	45
Resident Area Hotel; Administration place, House	60	50	45	-	-
Commercial, Services Areas and mix	70	65	50	70	70
Small Industrial factories intermingling in residential areas	75	70	50		

Note: This is permitted noise level of any source of activity at the public and residential areas. Source: Sub-Decree on Air Pollution Control and Noise Disturbance, 2000.

3.4 AIIB'S Environmental and Social Framework (ESF)

The Asian Infrastructure Investment Bank's (AIIB) Environmental and Social Framework (ESF) (2022) outlines the principles and standards to ensure environmentally and socially sustainable

development practices for projects it finances. The framework consists of several Environmental and Social Standards (ESS) that provide comprehensive guidance on managing potential impacts and risks associated with AIIB-financed projects. AIIB's Environmental and Social Framework (ESF) (2022) are summarised here.

- **Environmental and Social Standard 1: Environmental and Social Assessment and Management**: These standard guides the assessment and management of environmental and social risks, requiring projects to evaluate alternatives, mitigate impacts, and disclose information. It emphasizes protecting the natural environment, particularly biodiversity and critical habitats, while addressing pollution, resource efficiency, and climate change. Social risks, including impacts on vulnerable groups, gender, and access to resources, must be considered. The standard also covers labor conditions, community health and safety, child labor, and security, ensuring proper grievance mechanisms, monitoring, and implementation plans.
- **Environmental and Social Standard 2: Land Acquisition and Involuntary Resettlement.** The standard provides guidance to avoid Involuntary Resettlement where possible. The requirements under the standard contain 18 points of action to which the executing agency needs to follow.
- **Environmental and Social Standard 3: Indigenous Peoples.** The standard aims to design and carry out projects in a way that fully respects Indigenous Peoples' identity, dignity, human rights, economies, and cultures. This ensures that Indigenous Peoples: (a) receive social and economic benefits that are culturally appropriate; (b) do not experience negative impacts from the projects; and (c) can actively participate in projects that affect them. The standard contains 15 points to follow.

3.5 IFADs' SECAP

The International Fund for Agricultural Development's (IFAD) Social, Environmental, and Climate Assessment Procedures (SECAP) provides a framework to ensure that IFAD-financed projects are sustainable, socially inclusive, and environmentally sound. SECAP is composed of several standards that address various environmental and social considerations. Listed in the ToR, here is the summary of the applied standards:

- **Standard 1: Biodiversity Conservation**: This standard ensures the protection of biodiversity by requiring projects to assess and mitigate biodiversity risks, avoid critical habitats, and provide compensation for unavoidable damages. It promotes sustainable use of genetic resources, discourages invasive species, and emphasizes expert advice and adherence to protected area laws.
- **Standard 2: Resource Efficiency and Pollution Prevention**: Focuses on efficient use of resources and pollution control. It requires projects to reduce energy, water, and material use, manage hazardous materials safely, and prevent pollution, with an

emphasis on sustainable natural resource management, including water, soil, fisheries, and forests.

- **Standard 3: Cultural Heritage**: This standard ensures the protection of tangible and intangible cultural heritage by screening and managing impacts, consulting local communities, and preserving access to cultural sites. Projects must avoid, minimize, or mitigate damage and follow legal requirements in protected areas.
- **Standard 4: Indigenous Peoples**: Supports and empowers indigenous communities by requiring free, prior, and informed consent (FPIC), promoting equitable resource access, and protecting cultural heritage. Projects must involve indigenous peoples in decision-making, ensure fair benefits, and avoid involuntary resettlement.
- **Standard 5: Labor and Working Conditions**: Sets requirements for safe, non-discriminatory workplaces, prohibiting forced and child labor. It requires the establishment of grievance mechanisms, safety protocols, and equal opportunities, with contractors and suppliers adhering to these standards.
- **Standard 6: Community Health and Safety**: Requires projects to assess and manage health risks, prevent exposure to hazards, and ensure infrastructure safety. It includes emergency preparedness, traffic and security management, and protection against gender-based violence.
- **Standard 7: Physical and Economic Resettlement**: Ensures resettlement is conducted legally and fairly, avoiding forced evictions. It requires special consideration for vulnerable groups, economic displacement, and establishing grievance mechanisms for affected communities.
- **Standard 9: Climate Change**: Ensures projects address climate risks and reduce GHG emissions. It mandates climate risk screening, adoption of climate-smart practices, and GHG accounting to guide project design towards reducing environmental impacts.

3.6 GEF'S Environmental and Social Policies

GEF adopts the interim environmental and social safeguards to identify, measure, and mitigate environmental and social risks based on IFC Performance Standards (PS). Under CAISAR, the following PSs are applied:

- Performance Standard 1 – Assessment and Management of Environmental and Social Risks and Impacts;
- Performance Standard 2 – **Labor and Working Conditions**
- Performance Standard 3 – **Resource Efficiency and Pollution Prevention**
- Performance Standard 4 – Community Health, Safety, and Security
- Performance Standard 5 – Land Acquisition and Involuntary Resettlement

- Performance Standard 6 – Biodiversity Conservation and Sustainable Management of Living Natural Resources
- Performance Standard 7 – Indigenous Peoples
- Performance Standard 8 – Cultural Heritage.

3.6.1 International Conventions and Treaties

Cambodia has ratified all eight of the ILO's fundamental conventions, which cover core labour standards recognized as human rights. These conventions focus on issues such as freedom of association, elimination of forced labour, abolition of child labour, and elimination of discrimination in employment.

- **Freedom of Association and Protection of the Right to Organise Convention, 1948 (No. 87)**: Ratified by Cambodia in 1999, this convention protects workers' and employers' rights to freely form and join organizations without interference, ensuring autonomy and safeguarding against dissolution by authorities.
- **Right to Organise and Collective Bargaining Convention, 1949 (No. 98)**: Ratified in 1999, it protects workers' rights to organize, engage in collective bargaining, and prevents discrimination for union activities, promoting fair wage negotiations and just working conditions.
- **Forced Labour Convention, 1930 (No. 29)**: Ratified in 1969, this convention aims to eliminate all forms of forced labour, including coercive work for public works or political purposes, protecting workers' rights and dignity.
- **Abolition of Forced Labour Convention, 1957 (No. 105)**: Ratified in 1999, it strengthens the prohibition of forced labour for political coercion, discipline, or discrimination, ensuring freedom and justice in the workplace.
- **Minimum Age Convention, 1973 (No. 138)**: Ratified in 1999, it sets a minimum age for employment (usually 15) to prevent child labour, promoting access to education and protection from hazardous work.
- **Worst Forms of Child Labour Convention, 1999 (No. 182)**: Ratified in 2006, this convention seeks to eliminate extreme forms of child labour like slavery, trafficking, and hazardous work, prioritizing children's safety and rehabilitation.
- **Equal Remuneration Convention, 1951 (No. 100)**: Ratified in 1999, it promotes equal pay for men and women for work of equal value, combating gender-based wage discrimination and fostering economic justice.
- **Discrimination (Employment and Occupation) Convention, 1958 (No. 111)**: Ratified in 1999, this convention addresses workplace discrimination based on race, gender, religion, and other factors, promoting equal treatment and opportunities for all workers.

- **Employment Policy Convention, 1964 (No. 122)**: Ratified in 1971, it requires active employment policies to promote full, freely chosen employment, aiming to reduce unemployment and support economic and social development.
- **Weekly Rest (Industry) Convention, 1921 (No. 14)**: Ratified in 1969, this convention guarantees a weekly rest period of at least 24 consecutive hours for workers, helping protect their health and well-being.
- **Labour Inspection Convention, 1947 (No. 81)**: Ratified by Cambodia in 1974, this convention establishes labour inspections in industrial and commercial workplaces to ensure compliance with national labour laws, promoting safe, fair, and decent working conditions.
- **Labour Inspection (Agriculture) Convention, 1969 (No. 129)**: Ratified in 1999, it extends labour inspection to agriculture, ensuring workers in this sector, including migrant and seasonal labourers, are protected by labour laws and safe working conditions are maintained.
- **Tripartite Consultation (International Labour Standards) Convention, 1976 (No. 144)**: Ratified by Cambodia in 2009, this convention promotes consultation between governments, employers, and workers on international labour standards. It ensures that all stakeholders are involved in the implementation of labour policies, enhancing social dialogue and cooperation for fair labour practices.

3.7 Good International Industry Practices (GIIP)

3.7.1 WBG General EHS Guidelines (2007)

The World Bank Group (WBG) General Environmental, Health, and Safety (EHS) Guidelines (2007) provide internationally recognized technical guidance on managing environmental, health, and safety risks. These guidelines are designed to support project developers and operators, particularly in emerging markets, by outlining best practices for environmental sustainability, worker health and safety, and community well-being.

Key sections include:

- **Environmental Guidelines:** Focus on pollution prevention and control, resource efficiency, and managing air, water, and soil impacts.
- **Occupational Health and Safety (OHS):** Address workplace hazards, accident prevention, and worker welfare.
- **Community Health and Safety:** Cover topics like traffic safety, emergency preparedness, and protecting communities from project-related risks.
- **Construction and Decommissioning:** Provide guidance on managing risks during the life cycle of a project.

The guidelines emphasize compliance with local regulations and international standards and are intended to be applied alongside sector-specific EHS guidelines.

3.7.2 WBG EHS Guidelines for Annual Crop Production (2016)

The World Bank Group (WBG) Environmental, Health, and Safety (EHS) Guidelines for Annual Crop Production (2016) provide technical guidance on sustainable practices for cultivating annual crops, such as grains, legumes, and vegetables. These guidelines aim to minimize environmental impacts, ensure worker safety, and promote efficient resource use.

Key focus areas include:

- **Environmental Management:** Guidance on soil conservation, water use efficiency, pest management, and biodiversity preservation.
- **Occupational Health and Safety (OHS):** Measures to prevent injuries, promote safe pesticide handling, and protect workers from physical and chemical hazards.
- **Community Health and Safety:** Recommendations to prevent risks like pesticide drift, water contamination, and traffic safety concerns related to agricultural operations.
- **Sustainable Practices:** Emphasis on integrated pest management (IPM), crop rotation, and efficient irrigation techniques to maintain productivity and environmental health.

These guidelines align with international standards and are designed to support sustainable agricultural development.

3.8 Gap Analysis of National Legal Framework and Policies of AIIB, IFAD and GCF

The study and analysis of the national legal framework against the requirements under the policies of AIIB, IFAD and GCF can be summarised as Table 5.

Overall, the Royal Government of Cambodia (RGC) has established various legal documents ranging from royal decrees, sub-decrees, and circulars framing the management, and implementation of all types of development projects and activities within the country at the pre-construction, construction and implementation periods. The laws cover the management and protection of the natural resources, and biodiversity including underground, inland and water bodies. These legal frameworks also contain the standards that are applicable to the country context including water quality, soil quality, air, noise quality and vibration. Regarding human well-being including health, safety, labour and sexual exploitation, the country has made significant progress over the past years promoting the working environment of workers and labour forces embracing various laws and policies for ensuring the well-being of workers as well as the compliances that employers must comply. Laws to protect sexual exploitation, and social protection guarded the public, especially the vulnerable including the poor, and people with disability. Although the country's legal frameworks cover the requirements, there are still limited

report in terms of actual enforcement which need to be taken care where a proper implementation plan and resources are needed.

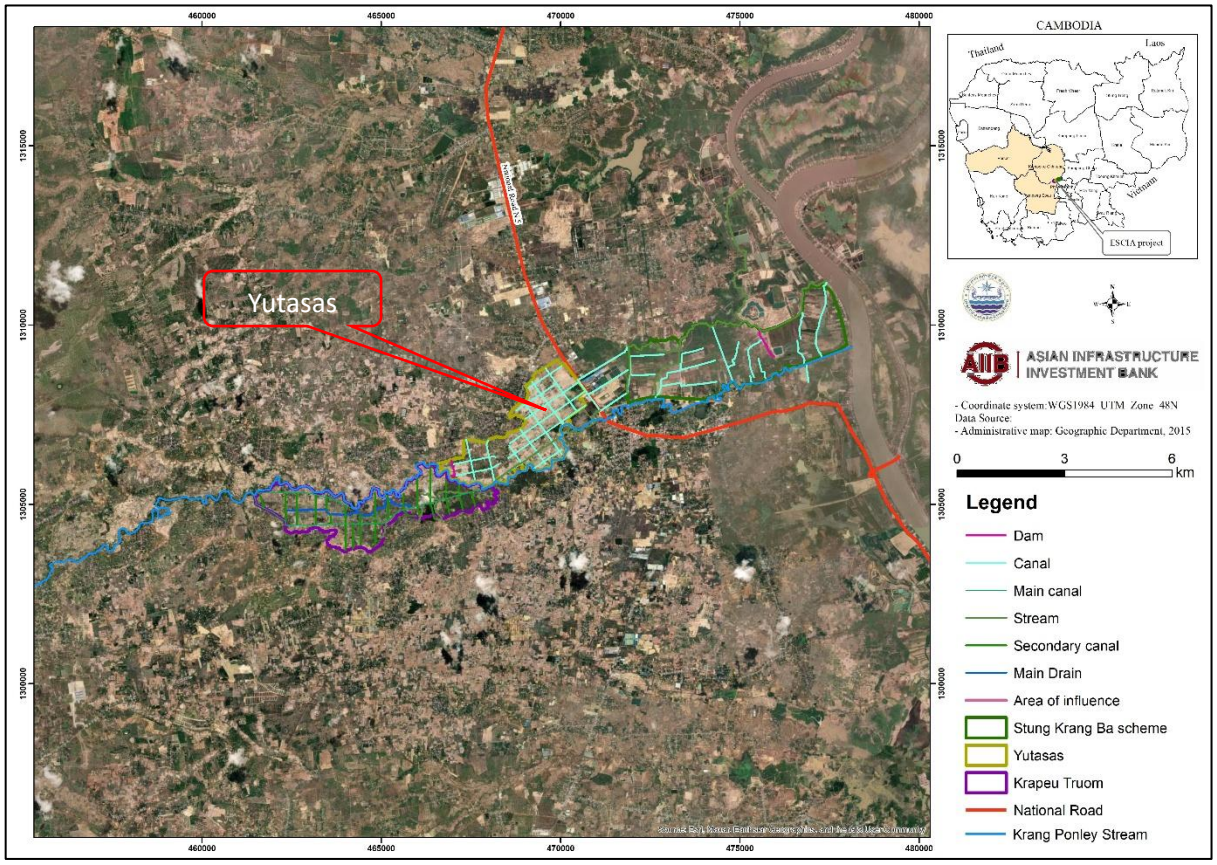
Table 21: Gap Analysis of National Legal Framework and Policies of AIIB, IFAD and GCF

No.	Standards/ Policies			Coverage	RGC's Corresponding Legal Framework	Gap Analysis and suggestions	Proposed measures to address the gaps
	AIIB	IFAD	GCF				
1	ESS1		PS1	Environmental and Social Assessment and Management	• Environmental Code and Natural Resource Management (2023), • Law on Water Resource Management (2007), • Law on fisheries (2026), • Sub-Decree on Water Pollution Control (1999), • Sub-Decree on Environmental Impact Assessment (1999), • Sub-Decree on Air Pollution Control and Sound Disturbance (2000), • Sub-Decree on Solid Waste Management (1999), • Prakas on the General Guideline for Preparing the Initial and Full Environmental Impact Assessment Reports (1999), • Prakas on the Launch of Standards of the Quantity of Toxins or Hazardous Substances Allowed to be Disposed (2015)	The RGC has established a wide range of regulations especially in the recent Environmental Code and Natural Resource Management (2023) that aim to environmental protection and natural resource management are well aligned to the provisions of the AIIB ESS1.	This ESCIA covers both direct, indirect, and cumulative impacts and mitigation measures, taking a holistic approach to the project and looking at impacts in an integrated way.
2	ESS2	S7	PS5	Land Acquisition and Involuntary Resettlement	• Law on Land Management, Urban Planning and Construction (1994), • Land Law (2001), • The Expropriation Law (2010), • RGC's Sub-Decree No. 22 ANK/BK (2018) on the Promulgation of the Standard Operating Procedures for Land Acquisition and Involuntary Resettlement (SOP-LAR) for Externally Financed Projects in Cambodia, • Sub-Decree No.19 on Social Land Concession of March 2003, • RGC's Sub-Decree No.118 ANK/BK (2005) on State Land Management, • RGC's Sub-Decree No.98 ANK/BK (2015) on River Basin Management	The RGC has the SOP-LAR which is well aligned with the provisions in the AIIB ESS 2. The AIIB ESS 2 on land acquisition and involuntary resettlement recognizes that project related land acquisition and land use can have impacts on communities. The RGC's SOP-LAR is consistent with the specific requirements under the AIIB ESS 2 on consultation, grievance redress, social support, resettlement assistance, standard of living of poor and vulnerable, entitlements for persons without title or legal rights except for land, information disclosure, payment of compensation and entitlements prior to	According the RGC's SOP-LAR, an income restoration program would be provided in order to re-estalbish sources of livelihoods for those affected households who have permanently lost their sources of livelihood. In this CAISAR project, the DRPs will include provisions to ensure livelihood restoration program are robust and can accurately meet the aim of livelihood restoration in line the AIIB ESS2.

No.	Standards/ Policies			Coverage	RGC's Corresponding Legal Framework	Gap Analysis and suggestions	Proposed measures to address the gaps
	AIIB	IFAD	GCF				
						physical displacement, and the supervision and monitoring of implementation of resettlement plans. However, there are gaps on negotiated settlement and livelihood restoration. The SOP-LAR does not describe procedures for negotiated settlement and lack of clear benchmark to assist monitoring and evaluation to confirm if the affected households restore their livelihood to the level prevailing prior to the beginning of the project implementation.	
3	ESS3	S4	PS7	Indigenous Peoples	• The Constitution of Cambodia (1993) • Land Law (2001)	No detailed regulations on how to avoid impacts to Indigenous Peoples or how to include them in project benefits. Lack of requirement to consult IP(s) in a manner that is culturally appropriate and special disclosure and consultation requirements as described in the AIIB ESS3.	An IPPF has been prepared on the basis of the AIIB ESS3. The IPPF details procedures on the preparation of IPP(s) and how to conduct meaningful consultation and disclose that is culturally appropriate.
4	ESS1	S1	PS6	Biodiversity conservation	• Environmental Code and Natural Resource Management (2023),	The code requires a proper consideration of biodiversity resources and payment of ecosystem services which support the conservation process. There is limited guidance on how to compensate in the ecosystem services once its pristine condition is affected.	This ESCIA include the biodiversity assessment and management plan.
5	ESS1	S2	PS3	Resource efficiency and pollution prevention	• Environmental Code and Natural Resource Management (2023), • Sub-Decree on Environmental Impact Assessment (1999), • Sub-Decree on Air Pollution Control and Sound Disturbance (2000),	The RGC has in place a set of separate provision and requirements for pollution prevention and management that are well align with the AIIB ESS 1 that aims to promote the sustainable use of	This ESCIA has included all relevant national laws and regulation as well as the requirement for AIIB ESS1.

No.	Standards/ Policies			Coverage	RGC's Corresponding Legal Framework	Gap Analysis and suggestions	Proposed measures to address the gaps
	AIIB	IFAD	GCF				
					• Sub-Decree on Solid Waste Management (1999), • Prakas on the General Guideline for Preparing the Initial and Full Environmental Impact Assessment Reports (1999), • Prakas on the Launch of Standards of the Quantity of Toxins or Hazardous Substances Allowed to be Disposed (2015)	resources and avoid or minimize the pollution from sources/project activities.	
6	ESS1	S3	PS8	Cultural heritage	• Environmental Code and Natural Resource Management (2023), • Law on the Protection of Cultural Heritage (1996)	The RGC has in place the law on protection of cultural heritage aligns with the requirement of the AIIB ESS1. However, there is lack of detail procedures for protection of the intangible cultural heritage.	This ESCIA provided details procedures and requirement to protect both tangible and intangible cultural heritage through Chance Find Procedure (Annex xx).
7	ESS1	S5	PS2	Labor and working conditions	• Labor Law (1997), • Law on Taxation (1997), • Sub-Decree on Construction Permit (1993), • Law on Social Security Schemes for Persons defined by the Provision of the Labor Law (2002), • Sub-Decree on Establishment of Social Security Scheme "Health Care Scheme" for Persons Defined by the Provisions of the Labor Law (2016)	The RGC has in place a set of law and regulations on labour and working conditions which is consistent with the requirement of the AIIB ESS1. However, the enforcement of these law and regulation is still limited. For example, regulation against forced labor and using child labor are not strictly enforced.	The ESCIA provides provisions to monitor compliance by contractor and of their primary suppliers in bidding documents and supervision contracts in order to prohibit using forced labour and child labour.
8	ESS1	S6	PS4	Community health and safety	• Law on Road Traffic (2014), • The Law on Suppression of Human Trafficking and Sexual Exploitation 2008, • Law on the Protection and the Promotion of the Rights of Persons with Disabilities 2009,	The RGC has established Labor Law the protect the health and safety of the workers. However, the concern and mitigation are more on individual rather than community as a whole. The AIIB ESS1 aims on protection of both individual and community for health and safety.	The ESCIA provides provisions to monitor compliance by contractor on community and health safety in bidding documents and supervision contracts. The requirement on raising awareness to local community on health and safety are also included in the bidding documents.

No.	Standards/ Policies			Coverage	RGC's Corresponding Legal Framework	Gap Analysis and suggestions	Proposed measures to address the gaps
	AIIB	IFAD	GCF				
9	ESS1	S9	PS1	Climate change	• Environmental Code and Natural Resource Management 2023	The newly adopted code requires all relevant sectors to integrate climate resilient concepts into their strategic action plan along with different measures to tackle the issues. No gap being identified.	



4. PROJECT AREA OF INFLUENCE

Under CAISAR, since project design is still ongoing, area of influence is anticipated based on: a) target command area of each scheme (where most proposed project activities will take place during project construction, and later during project operation), and b) the environmental footprint that are likely caused by project activities during project construction (as direct and indirect impacts due to activities under Component 2), and by project activities (mainly cumulative impacts due to intenstified crop production activities under component 1).

These above anticipated areas of influence need to be updated when more information becomes available to allow a more reliable assessment, particularly when project detailed design is completed, and construction measures proposed by construction constractors are identified. Future update on area of influence (at respective sub-scheme) will be made on the basis of updated environmental and social assessments once a) locations of construction sites, auxiliary facilities (such as borrow pits), and logistics operations are confirmed, and b) the full scope of the project's impacts (direct, indirect, and cumulative) is firmed up based on detailed engineering design (for Component 2) and project implementation approach (for Component 1).

It is noted that while direct and indirect impacts could be reasonably anticipated based on currently proposed scope of works and prior experience for similar works, cumulative impacts, particularly their spatial extent and severity (over the time) require collection of supporting scientific evidence from data collected under project's environmental and social monitoring program.

Figure 5: Locations of irrigation structures in Yutasas,

4.1 Description of Key Components that Potentially Cause the Influential Impact

4.1.1 Air, Noise and Vibration

The area of influence for air quality, noise, and vibration during the construction and rehabilitation of irrigation systems extends beyond the construction site, affecting nearby communities and the environment. Dust, emissions from machinery, and material handling can temporarily increase particulate matter and pollutants in the air. Noise from heavy equipment may disturb residents and wildlife, while vibrations from activities like dredging and excavation can affect nearby structures, potentially causing discomfort or minor damage. These impacts, though short-term, typically extend up to 100 meters from the site, with heavier activities affecting a larger area. Post-construction, greenhouse gas emissions from farming activities could have minimal long-term impacts at a global scale. Each of the sub-scheme the area of influence include:

- Surrounding the sites of the rehabilitated/dredged rivers/stream
- Surrounding the rehabilitated main and tertiary canals, and
- Surrounding the rehabilitated/upgraded structure
- Along the road used for transporting materials by the construction activities

These effects occur only during the construction period while the emission of greenhouse gas emission from farming activities. The following are maps indicating the area of influence at each sub-scheme.

4.1.2 Water Quality

The construction and operation of irrigation systems can significantly impact water quality, both in terms of surface water and groundwater.

Construction Phase:

- **Surface Water:** During the construction phase, sedimentation due to excavation, dredging, and earthworks is a primary cause of water quality degradation. Loose soil can be washed into nearby water bodies, increasing turbidity, reducing light penetration, and altering the aquatic habitat. Additionally, the use of machinery and equipment introduces risks of oil spills, fuel leaks, and chemical contamination, which can enter water sources through surface runoff, affecting aquatic life and water usability downstream.
- **Groundwater:** Construction activities, such as drilling and excavation, can disrupt the soil and rock layers, potentially allowing contaminants from surface activities, such as chemicals, to infiltrate groundwater. Chemical spills or leaching from construction materials can further degrade groundwater quality. Additionally, the disruption of natural flow patterns in the subsurface may allow pollutants to spread more easily, threatening water quality over a wide area.

Operation Phase:

- **Surface Water:** Once the irrigation system is in operation, water quality can be affected by the increased use of fertilizers and pesticides in the command areas. Runoff from agricultural fields may carry these chemicals into nearby rivers, streams, and lakes, causing nutrient pollution, algal blooms, and eutrophication, which can lead to oxygen depletion and harm aquatic ecosystems. Over-irrigation can also lead to increased runoff, carrying sediments and pollutants into surface water bodies.
- **Groundwater:** The operation of irrigation systems may result in groundwater contamination, particularly through leaching of agricultural chemicals such as nitrates and phosphates. Excessive irrigation can cause these chemicals to infiltrate the soil and reach groundwater aquifers, leading to long-term contamination. Furthermore, changes in water table levels due to extensive irrigation can alter the flow patterns of groundwater, potentially mobilizing contaminants that would otherwise remain contained.

In both phases, the key impacts on water quality include contamination of water resources with sediments, nutrients, chemicals, and reduced ecosystem health in the affected water bodies. These impacts can lead to long-term environmental damage and human health effects downstream along Stung Krang Ponley due the reduction of the availability of clean water for agricultural, and domestic uses.

4.1.3 Soil Quality

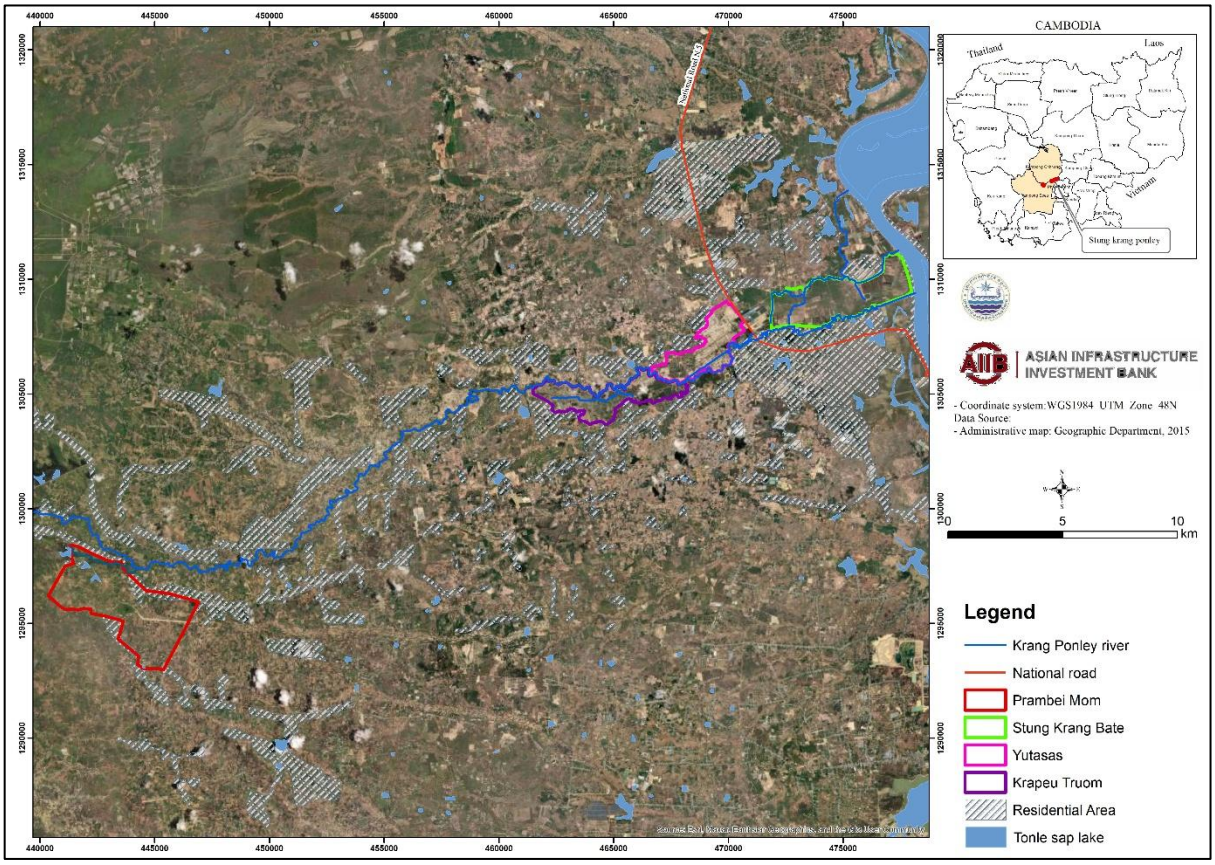
The area of influence for soil quality during the construction and operation of irrigation systems extends well beyond the immediate project site, affecting surrounding agricultural land, natural habitats, and downstream regions impacted by runoff and water movement. In both phases, the area of influence

extends beyond the construction site, impacting nearby agricultural land, natural habitats, and drainage systems. Proper management is essential to minimize long-term soil degradation across the broader irrigation zone.

Construction Phase:

- **Soil Erosion:** The area of influence for soil erosion encompasses not just the construction site but also adjacent areas, as excavation, grading, and vegetation removal expose large sections of land to wind and water erosion. This can lead to topsoil loss, affecting soil fertility on-site and causing sedimentation in nearby fields and water bodies.
- **Soil Compaction:** The influence of soil compaction extends several meters beyond the worksites, particularly where heavy machinery is used for construction or access. Compacted soil reduces water infiltration and root penetration, impacting surrounding agricultural land and natural ecosystems.
- **Soil Contamination:** While soil contamination from fuel spills and construction debris is often localized, it can spread through surface runoff during rainfall or irrigation, affecting nearby fields and watercourses, potentially degrading soil quality in those areas.

Operation Phase:



- **Salinization:** The area of influence for soil salinization covers the entire irrigated zone. Poor drainage and excessive irrigation can lead to salt buildup, particularly in low-lying areas, reducing soil productivity across large sections of the command area.
- **Nutrient Imbalance:** Nutrient leaching or accumulation affects the entire irrigated region and nearby fields. Over-irrigation can cause essential nutrients to wash away, while poor management of fertilizers can lead to nutrient buildup, creating imbalances that degrade soil quality.
- **Waterlogging:** The impact of waterlogging is concentrated in the irrigated fields but can extend to neighboring areas due to the movement of water through the soil layers. Prolonged waterlogging reduces soil aeration and affects soil structure, ultimately diminishing productivity.

4.1.4 Biodiversity

The area of influence for the Yutasas irrigation renovation scheme encompasses the direct and indirect impacts of the project. This includes:

- **Direct Impacts:** The immediate area where the irrigation infrastructure will be constructed and operated, including canals, pumping stations, and reservoirs.
- **Indirect Impacts:** The surrounding areas that may be affected by changes in water flow, land use, or other project-related activities. This includes the Stueng Krang Ponlai River, the Tonle River, and the habitats of endangered species within the Yutasas command area.

Figure 6: Map of Construction Sites and Residential Area in Stung Krang Ponley

(Source: ESCIA Study, 2024)

4.1.5 Extent of Social Impacts

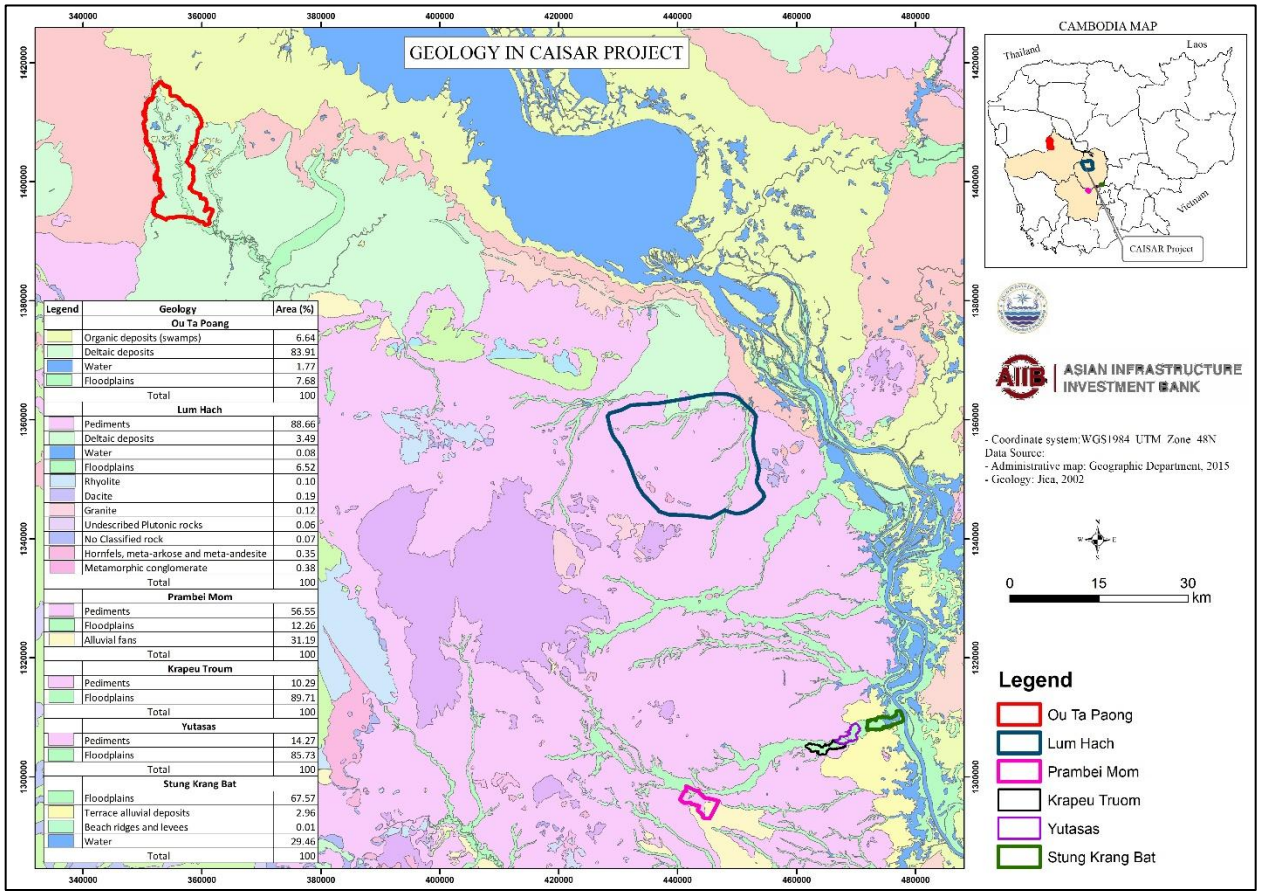
The Project's Area of Influence for social aspects extends beyond the immediate project site to include the broader region where the project's effects will be felt throughout its implementation phases. This area encompasses not only the physical location of the project but also regions affected by environmental, physical, and biological changes resulting from project activities. Social interactions in this area of influence may involve communities and stakeholders impacted by changes in land use, water availability, employment opportunities, and local infrastructure development. These interactions might include shifts in livelihoods, migration patterns, or community dynamics because of project-related opportunities and disruptions, land acquisition and resettlement along the main canals, feeder canal, polder system, and farm roads, ethnic minority, gender, and loss of access to natural resources. Additionally, the area of influence considers the indirect impacts on health, education, and social services, as local populations respond to new economic and environmental conditions brought about by the project's operations. The social area of influence often aligns with the environmental footprint but also includes areas affected by induced socio-economic changes and community adaptations to these footprints. In addition, although the construction activities are at the existing systems, the impacts on cultural sites need to be carefully considered at the surrounding area ranging up to 500 m from the identified cultural sites.

4.1.6 Summary of the Project Areas of Influence

As per the description above, the Project Area of Influence can be summarized as Table 22 Below.

Table 22: Summary of the project area of influence

No	Sub-Scheme	Direct/Indirect Impact Areas	Receptors and Scale of Impacts
1	**Yutasas**	Main canals in sub-scheme, drainage canals in Yutasas where construction occurs. Noise, vibration, and air quality from construction activities and noise from worker camps are potential occur along the transport roads while water quality impact can go directly at the site as well as beyond the areas such as downstream water body.	• Residential, school, pagoda and hospital areas along the river, streams, canals where construction occurs and camp site. • Downstream water body where water can carry pesticides and other contaminated substances to downstream.



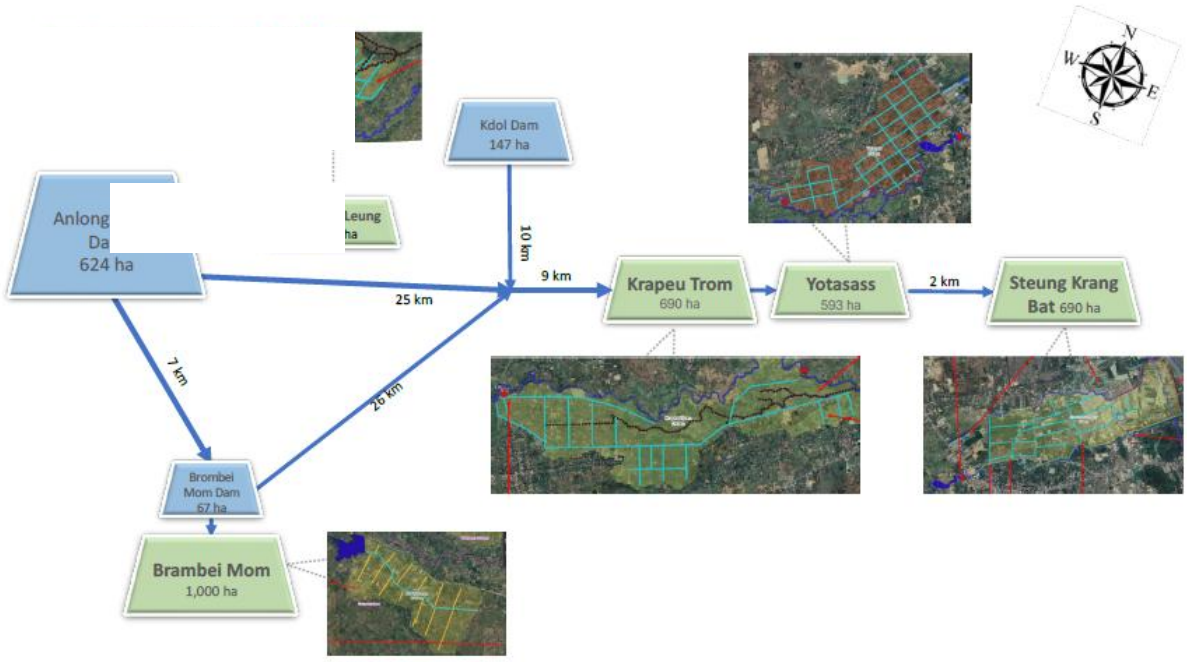
5. BASELINE CONDITIONS

5.1 Physical Conditions and Environmental Condition

5.1.1 Geological Conditions

Yutasas is dominated by floodplains, which constitute 85.73% of the area, indicating frequent flooding and fertile soil suitable for agricultural practices. Pediments cover 14.27% of the area, suggesting some eroded rock formations. This geological composition highlights the importance of water management in this sub-scheme due to the extensive floodplain areas.

Figure 7: Geological Map of the sub-schemes



Legend	Geology	Area (%)
	Ou Ta Poang	
	Organic deposits (swamps)	6.64
	Deltaic deposits	83.91
	Water	1.77

	Beach ridges and levees	0.01
	Water	29.46
	Total	100

Yutasas is part of the larger Stung Krang Ponley basin, as the basin serves as the primary water source for a number of sub-schemes. Within the basin, there are three main reservoirs—Anlong Chrey, Brambei Mom, and Kdol dam. These reservoirs have improved water availability for downstream irrigation and play a significant role in flood protection. However, the Anlong Chrey reservoir, with a capacity of only 30 million cubic meters (Mm^3), is small compared to the estimated annual inflow of 123 Mm^3 and the irrigation demands of the area. A small hydropower station was installed at the site, but it remains unused due to insufficient water supply.

Water availability for Yutasas sub-scheme is dependent largely on the water supplying from Anlong Chrey reservoir. However, the reservoir's capacity is insufficient to meet full irrigation demands during the dry season. The primary management goal is to release water early in the wet season (May and June) to allow for the timely planting of Early Wet Season crops, followed by a Late Wet Season paddy crop. Nevertheless, challenges remain, including potential conflicts between hydropower generation and irrigation needs, a lack of clarity in reservoir operating rules, and inconsistent runoff that may prevent the reservoir from reaching full capacity in some years.

Figure 8: Length from Sub-Scheme to Another of Krang Ponley

5.1.2 Topography

The area is another low-elevation sub-scheme with terrain less than 40 meters. The topography here is mostly flat, with large expanses of floodplains. The presence of pediments suggests there may be minor elevations or gentle slopes within the otherwise flat landscape. However, the general topography is primarily low-lying, prone to seasonal floods, and likely situated near river systems. This type of terrain is typically fertile but may face waterlogging challenges.

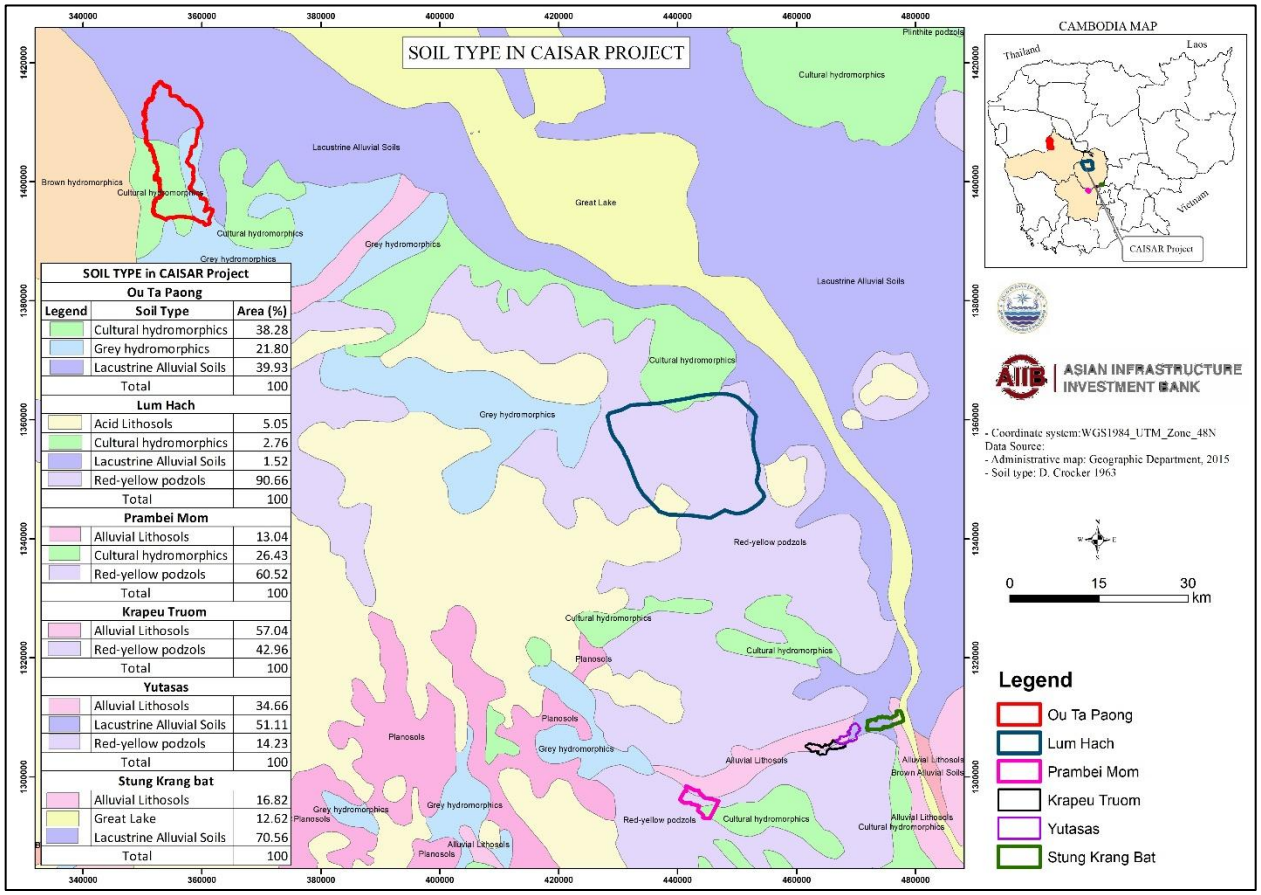
5.1.3 Land Cover and Water Use

The land cover across all four sub-schemes is predominantly rice fields, with only a limited presence of bushes along streams, rivers, and the edges of the rice fields. Sharing the same water sources, farmers in this irrigation system face several key challenges, including water shortages during the dry season, limited market access, pest infestations, and conflicts arising from water scarcity. These issues are primarily driven by the lack of reliable water sources and the impacts of climate change, which have extended the duration of dry seasons. During the dry season, the canal frequently lacks sufficient water, and if there is no rainfall at the start of the wet season, the canal remains dry. Additionally, inefficient irrigation management results in water losses, while extreme heat negatively affects market conditions.

One of the most critical concerns is the water shortage during the rice reproductive stage, as there is no consistent water supply to the fields, leading to significant crop damage. Farmers are often forced to wait for water, which only reaches them after upstream farmers have secured an adequate supply. The Water User Community is responsible for managing the irrigation system, but the current canal infrastructure presents challenges, as the canals are shallow and can only store a limited amount of water. During the

dry season, the canals frequently run dry, forcing villagers to take turns pumping water, a process that is both time-consuming and inefficient.

5.1.4 Soil Types



Dr. Crocker travelled across Cambodia to create a map, with a scale of 1 to 1,000,000 and it was publicly published by the Ministry of Agriculture in 1963 (Crocker, Charles D, 1962). The soil of Cambodia is classified into 16 types according to the soil taxonomy of the Ministry of Agriculture, the United States of America. Table below is the detailed information on 16 types of soil in Cambodia (please see in table 23).

Table 23: Soil types and area in Cambodia

No.	Classification	Land area	
		Km^2	%
1	Red, yellow podzols	22,763.00	12.57%
2	Latosols	7,123.00	3.93%
3	Planosols	1,666.00	0.92%
4	Plinthite podzols	17,147.00	9.47%
5	Cultural hydromorphics	12,896.00	7.12%
6	Grey hydromorphics	17,252.00	9.53%

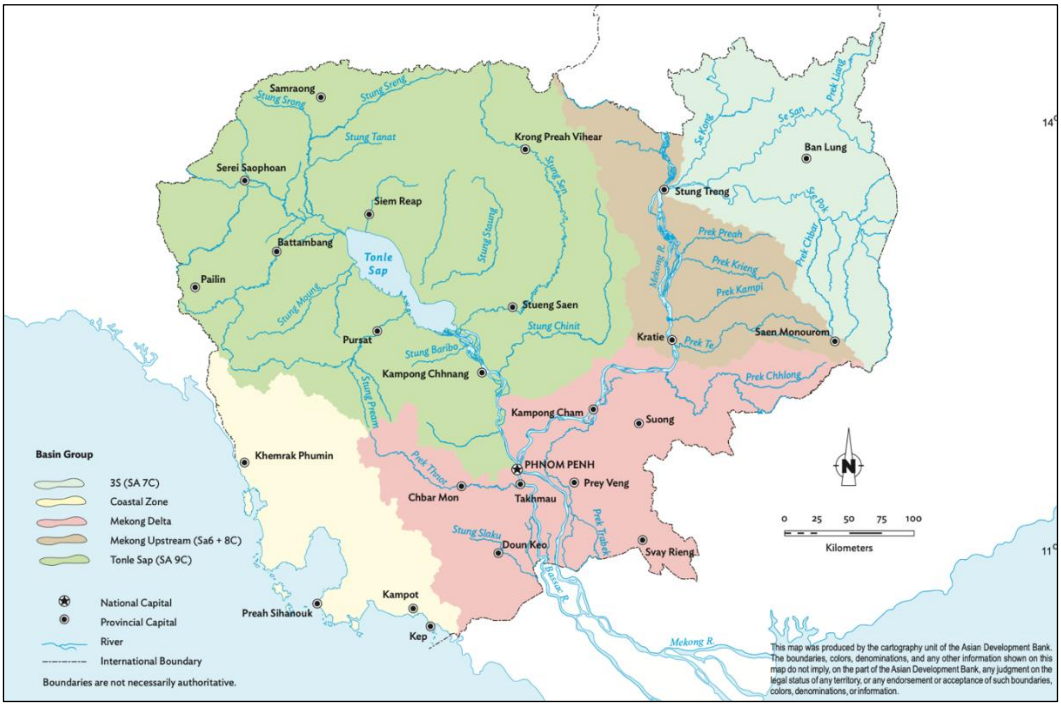
	Lacustrine Alluvial Soils	51.11
	Red-yellow podzols	14.23
	Total	100
Stung Krang bat		
	Alluvial Lithosols	16.82
	Great Lake	12.62
	Lacustrine Alluvial Soils	70.56
	Total	100

(Source: ESCIA Study 2024)



Yutasas presents a diverse soil composition with three (3) types present. Lacustrine alluvial soils are the most common, covering 51.11% of the area, followed by alluvial lithosols at 34.66%. Red-yellow podzols are less common, comprising 14.23% of the site. The predominance of lacustrine alluvial soils suggests their significant role in shaping agricultural and land use practices in the Yutasas area.

5.1.5 Hydrological Resources

Cambodia has considerable water resource potential, with abundant surface water and aquifers and a high level of seasonal rainfall. In spite of the abundance of water sources, many areas in the central plains and plateaus lack water in the dry season and are therefore dependent on unreliable rainfall patterns. The country's water resources are dominated by the Mekong River system (86% of country's territory), including the catchments of the Bassac River, the Tonle Sap River, and the Lake Tonle Sap and its tributaries[2], and the river system flowing into the Gulf of Thailand (remaining 14%) as per shown in Figure 6.8.

[2] The Mekong River and Lake Tonle Sap are connected by the Tonle Sap River, which twice a year reverses its direction of flow. From July to October, when the level of the Mekong is high, water flows into the Tonle Sap River, which fills Lake Tonle Sap, thereby increasing the size

Figure 10: River Basin Groups in Cambodia

(Source: Ministry of Water Resources and Meteorology, 2019)[3]

However, **75% renewable freshwater comes from upstream transboundary** sources via the Mekong River system (355.5 km^3/year of surface water), mainly from Lao PDR (91.3%), but also Thailand (8.4%) and Viet Nam (0.3%). As an intermediate basin country, up to 471.51 km^3/year of surface water flows out of the country to Vietnam through the Mekong and its tributaries. This emphasizes the critical inter-dependency of Mekong states, and their sensitivity to the actions of neighboring countries, particularly those that are upstream[4]. In terms of groundwater, 17.6 km^3/year is estimated to be produced in-country, although there is no register of transboundary for inflow or outflow of groundwater.

Agriculture accounts for 96% of all **water use,** domestic rural use 1%, and industry, domestic urban, and aquaculture use less than 1%5. Although the amount of water used is estimated to be only about 2% of total surface water volume[6], water shortages do occur during the dry season, especially in the Tonle Sap River system—due to the lack of stored water and limited access to water. [7] Cambodia's water resources sector faces a range of multisectoral, geographical, and hydro-meteorological issues. The Mekong River,

of the lake from 2,600 km^2 to about 10,500 km^2 at its maximum. The storage capacity of Lake Tonle Sap is estimated at 72 km^3. In November, when the level of the Mekong decreases, the Tonle Sap river reverses its flow, and water flows from Lake Tonle Sap to the Mekong river and thence to the Mekong Delta (https://wateractionhub.org/geos/country/37/d/cambodia/).

[6] ADB. 2014. Cambodian National Water Status Report 2014. Phnom Penh.

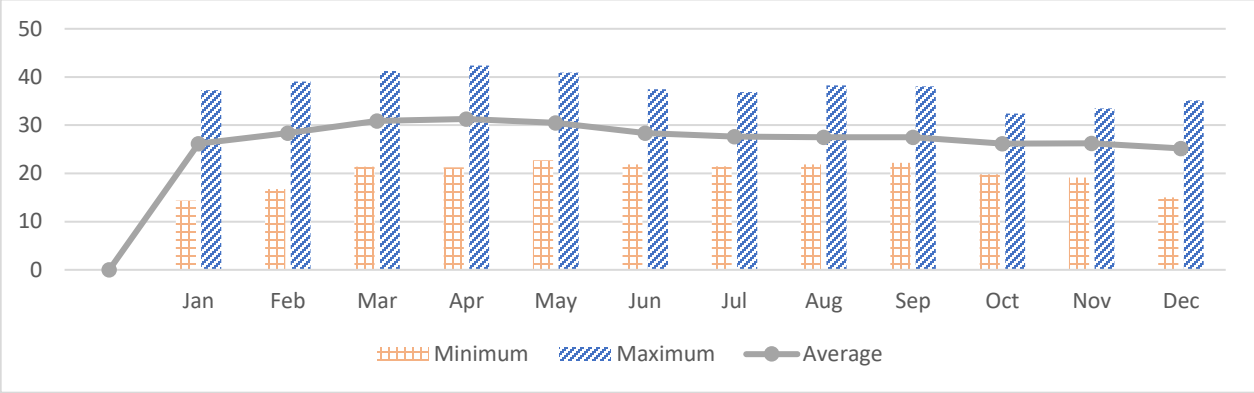
[7] https://MoWRAM.adb.org/sites/default/files/publication/689106/adb-brief-171-surface-water-resouces-rbgs-cambodia.pdf

particularly the Lower Mekong Basin (LMB), has been identified as a region that is highly vulnerable to the impacts of climate change, more frequent and intense. Climate change is affecting the water cycle, bringing change in the hydrology of major rivers and tributaries as well as groundwater recharge. Recurrent floods occurred in the last decade, with important economic losses, mainly on rice crops, but also people's lives[8]. Farmers, who depend on rain-fed agriculture, will be increasingly at risk of disasters, and especially droughts and floods, causing severe damage to rice harvests[9]. In short, Cambodia faces the common climate change challenges of **too much** water in the wet season, **too little** in the dry season, and gradually **too dirty** due the increasing pollution, particularly in populated cities.

The feasibility study report indicates that Cambodia is likely to face changes in water balances and flood regimes due to projected increases in temperature and altered precipitation patterns. An increase in consecutive dry days is expected to worsen water scarcity, especially during the dry season, impacting communities in rain-fed areas around the Tonle Sap more severely than those with year-round access to the Mekong River or irrigation systems.

Yutasas, the remaining sub-schemes, also depend heavily on water from Anlong Chrey Dam and Kdol Dam. Yutasas, added to the CAISAR project in 2023, is located between Krapeu Truom and Steung Krang Bat, and shares a similar layout with its neighboring schemes. Steung Krang Bat, with an extensive canal network, includes over 13 kilometers of main canals and over 20 kilometers of drainage canals. While functional, the scheme requires repairs to its crosscheck and offtake structures and extensions to its drainage system. Both schemes face infrastructure challenges but remain vital to the region's irrigation system, with ongoing efforts needed to ensure sustainable water availability.

5.1.6 Climatic Conditions



Temperature

Temperatures in the Stung Krang Ponley scheme area for the last 10 years between 2013-2022 using NASA POWER data. According to the table below shown, the annual average temperature was 27.96 °C, the annual average minimum temperature was 14.37 °C in 2014, and the annual average maximum temperature in 2016 at 42.4 °C. Regarding monthly temperature extremes, the lowest minimum temperature of 14.37°C was observed in January, and the highest maximum temperature of 42.4°C occurred in April.

[8] i.e. Floods accounted for 70% of rice production losses between 1998 and 2002, whereas droughts accounted for 20% of those losses. The most recent report on floods showed that the country had lost 40, 45, 188, 250, and 43 lives in 2020, 2014, 2013, 2011, and 2009, respectively. In addition, the economic loss was estimated at USD 1.000, 521, 70, and 132 million due to floods in 2013, 2011, 2010, and 2009, respectively.

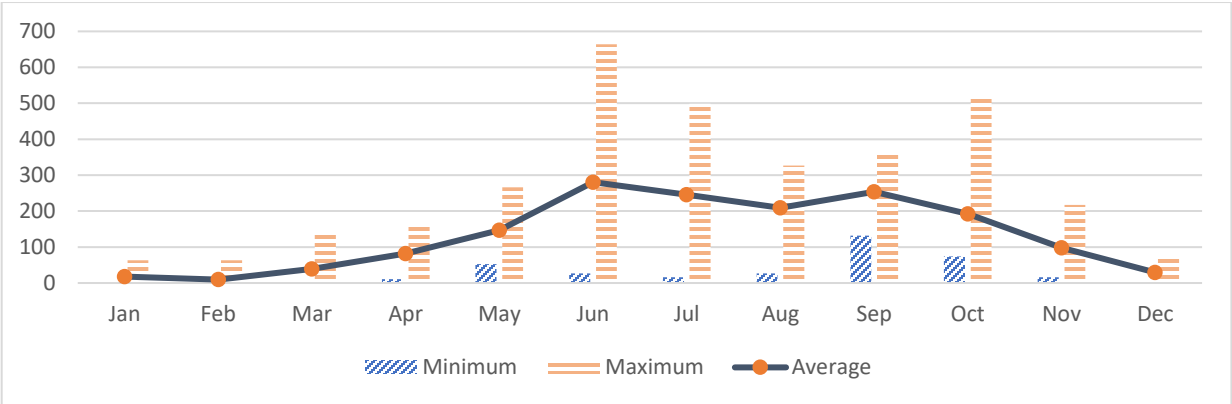
Figure 11: The maximum, average, and minimum monthly temperature for the last 10 years (°C)

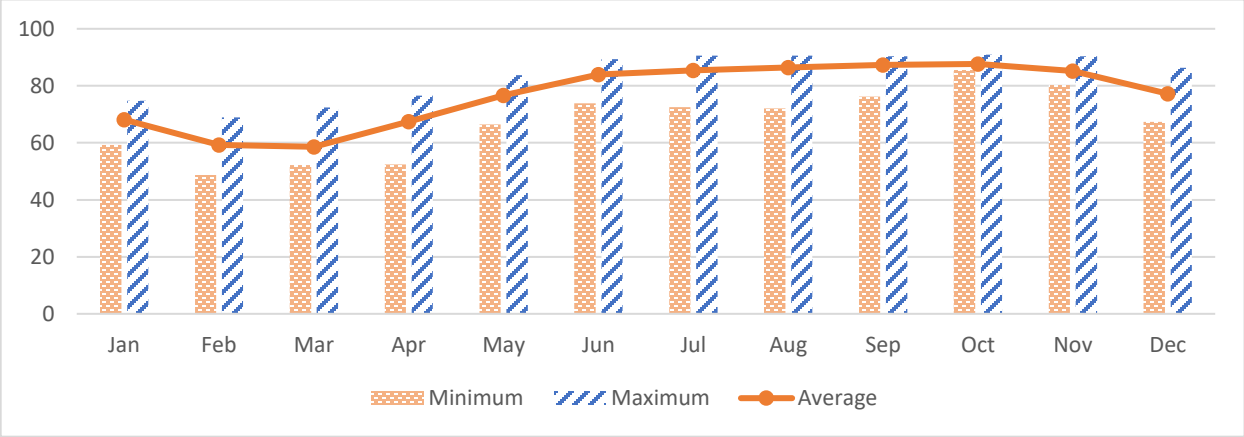


Source: NASA POWER (2024)

Precipitation

The Stung Krang Ponley scheme area shows an average annual precipitation of 1604.14 mm over the decade from 2013 to 2022. The annual minimum precipitation was recorded in 2016 at 653.91 mm, while the annual maximum precipitation occurred in 2020, reaching 2293.95 mm. The lowest minimum rainfall data were found in January, February, March, and December at 0 mm. In October, the highest average monthly rainfall was 516.6 mm.

Figure 12: The maximum, average, and minimum monthly precipitation for the last 10 years (mm)

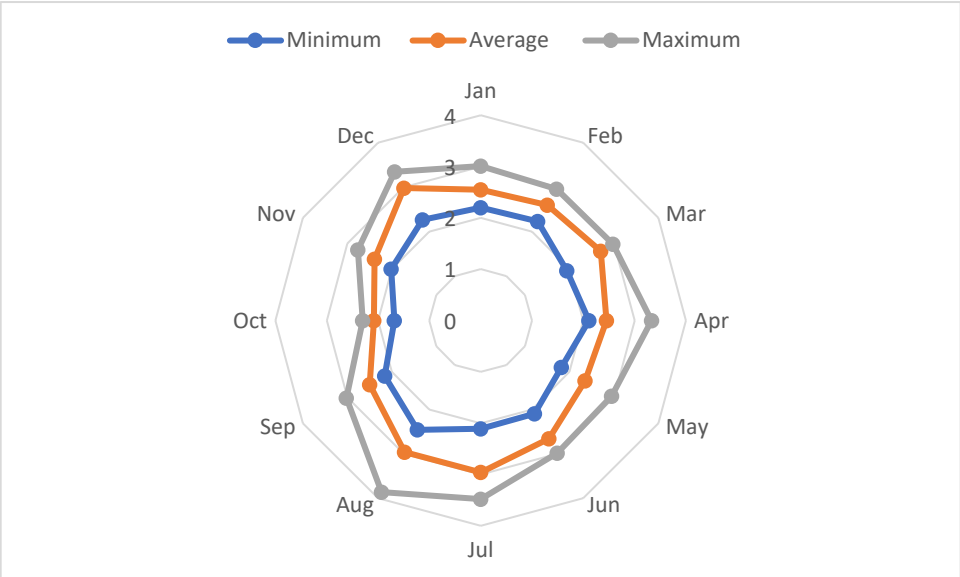


Source: NASA POWER (2024)

Humidity

The table presents monthly humidity data for the Stung Krang Ponley scheme area from 2013 to 2022. The annual minimum average humidity was 69.44% in 2016, while the maximum annual average humidity was 82.81% in 2022. In additional, the annual average humidity was 77.03% over the decade. Regarding monthly variations, the highest monthly maximum humidity was observed in October 2020 at 90.88%, and the lowest monthly minimum humidity was recorded in January 2016 at 48.69%.

Figure 13: The maximum, average, and minimum monthly humidity for the last 10 years (%)



Source: NASA POWER (2024)

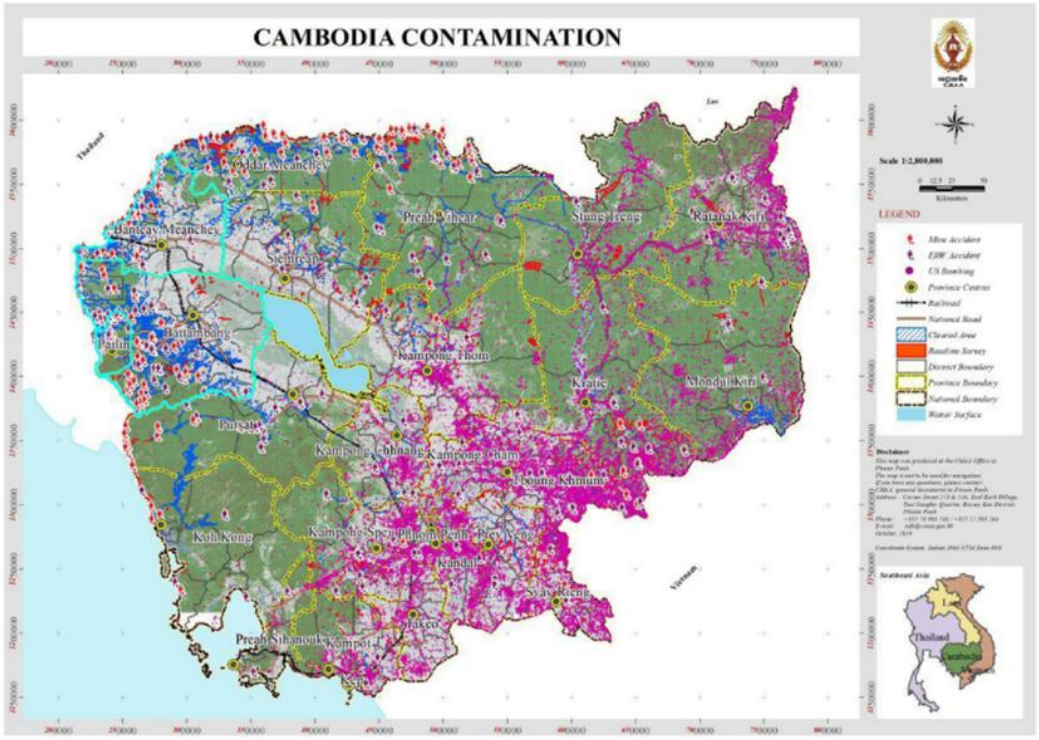
Wind Speed

The monthly wind speed data for the Stung Krang Ponley scheme area from 2013 to 2022. The annual minimum average wind speed was 2.45 m/s in 2022, and the maximum annual average wind speed was 2.85 m/s in 2016. While the annual average wind speed was 2.60 m/s in the last 10 years. Regarding monthly variations, the highest monthly maximum wind speed was in August 2016 at 3.86 m/s, and the lowest monthly minimum wind speed was recorded in October 2013 at 1.68 m/s.

Figure 14: The maximum, average, and minimum monthly wind speed for the last 10 years (m/s)

5.2 Baseline Environmental Quality

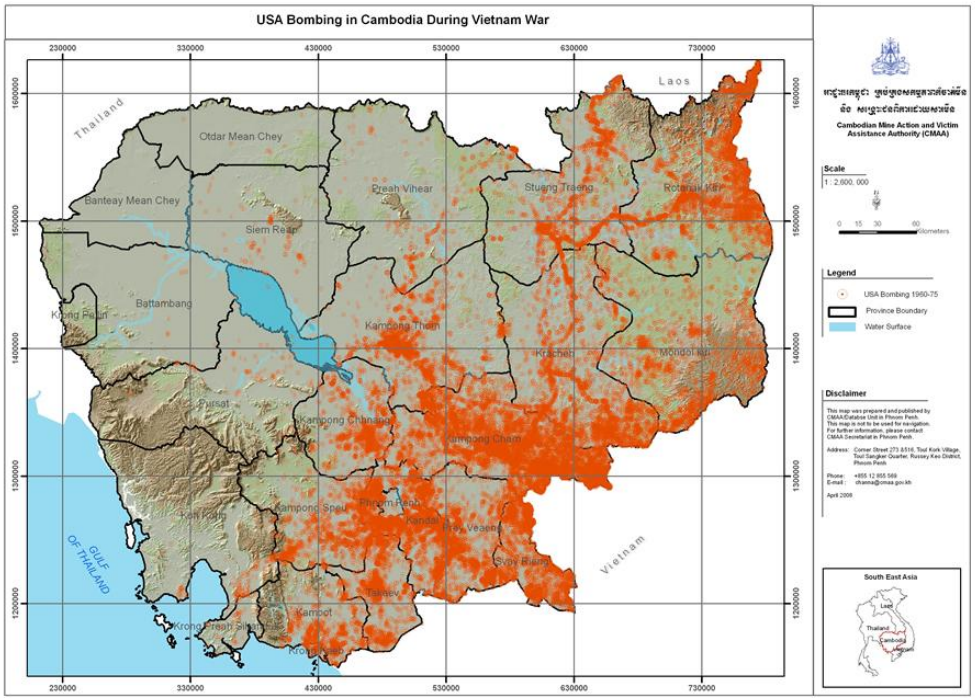
5.2.1 Unexploded Ordnances (UXO)



Cambodia remains one of the most heavily landmine-contaminated countries globally, a legacy of decades of conflict that has left a significant portion of its territory affected by landmines and unexploded ordnance (UXO). This contamination poses ongoing threats to safety and hinders socio-economic development, particularly in rural areas. According to the Cambodian Mine Action and Victim Assistance Authority (CMAA), as of 2023, approximately 1,854 square kilometers of land remain contaminated, affecting more than 1.1 million people.[10]

This contamination has caused thousands of casualties over the years and continues to hinder socio-economic development by restricting land use, infrastructure projects, and agricultural expansion. Among the affected provinces, Pursat, Kampong Chhnang, and Kampong Speu have been identified as high-risk areas due to their history of intense conflict and strategic military significance. While mine clearance operations have made progress in these regions, large tracts of land remain dangerous, necessitating ongoing demining efforts to ensure safety and sustainable development. These provinces are critical for agriculture and infrastructure projects, making landmine clearance an urgent priority to enable safe land use and improve local livelihoods.

For construction projects, strict adherence to mine-related regulations is essential. Before initiating any construction activities, risk assessments and clearance operations must be conducted. This includes engaging professional demining organizations to carry out detailed surveys, safely remove and dispose of any detected UXO, and obtain official clearance certificates from recognized authorities like the CMAA. Ensuring compliance with these legal requirements is not only critical for the safety of construction personnel and future occupants but also aligns with Cambodia's national and international commitments to UXO and landmine management.



[10] Yet another Cambodian province bids farewell to landmines - UCA News

Figure 15: The landmine contamination map in Cambodia

(Source: Cambodian Mine Action and Victim Assistance Authority (CMAA) 2020)

Figure 16: Map of USA Bombing in Cambodia

(Source: Cambodian Mine Action and Victim Assistance Authority (CMAA) 2020)

Summary of the result of the landmine reports from local community is provided as Table below:

Table 24: Mine and UXO situation

No.	Sub-scheme	Mine and UXO Situation
1	Yutasas	The province was declared a mine-free province in October 2023. However, there was a report of mine-discovered in the 2024 in Yutasas sub-scheme.

UXO = Unexploded Ordnance.

5.2.2 Ambient Air quality, Noise and Vibration

5.2.2.1 Air Quality

Stung Krang Ponly located in two (2) provinces – Kampong Chhnang and Kampong Speu. At provincial level, the air pollution level in Kampong Chhnang province is considered moderate. The air pollution level in Kampong Speu province also consider moderate. The AQI is 5811, which is equivalent to 12.7 µg/m3. The Yutasas, a sub-scheme within Stung Krang Ponley, is in the rural settings; therefore, the baseline ambient air quality, noise and vibration is considered generally good. Ambient air quality is sometime affected by dust from tillage and unpaved road users, including smoke from burning of rice stubble after harvest and burning from swidden cultivation activities. Whilst noise and vibration disturbance are sometime affected by motorist. However, the impacts are minor and short time. The air testing results from another project located about 6 km from Yotasas reported that all five parameters (CO, NO2, SO2, TSP, and PM10) followed the standard of the Ministry of Environment at all durations (8 and 24 hours). The actual air quality testing prior and during construction are required to be conducted. Further air quality tests can be conducted during the preparation of the domestic EIA

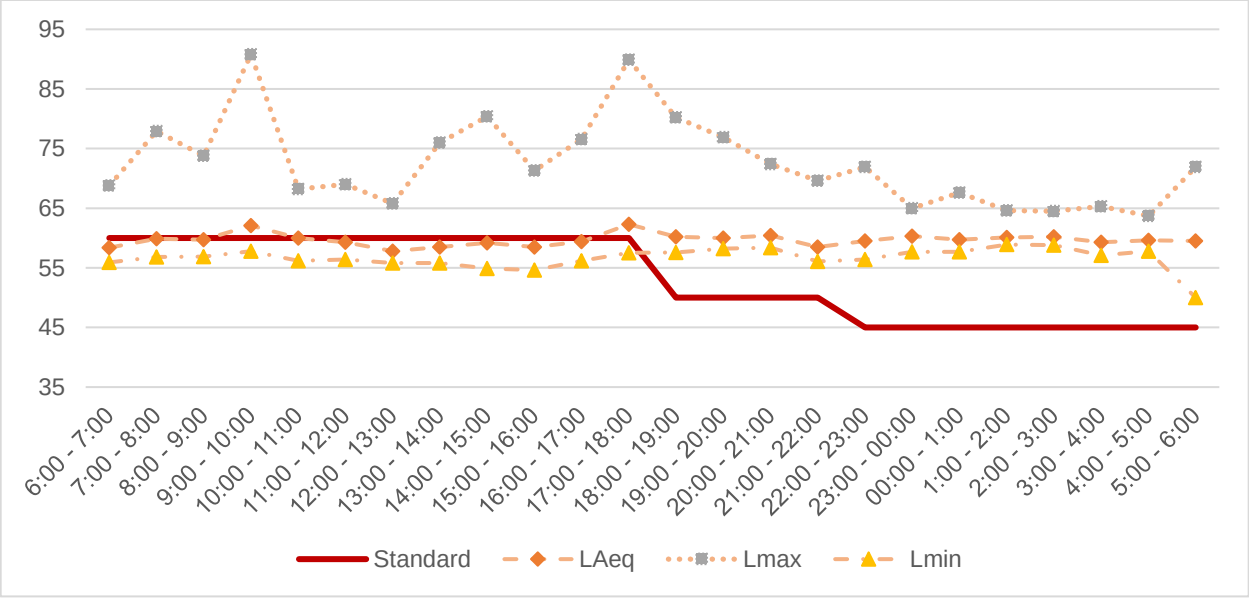
Table 25: Air quality testing result

Parameters	**Unite**	**Testing Result**	**Standard (MoE)**
CO	mg/m^3	1.237	**20**
NO_2	mg/m^3	0.038	**0.1**
SO_2	mg/m^3	0.062	**0.3**
O_3	ppm	0.074	**0.2**
TSP	mg/m^3	0.018	**0.33**
PM10	mg/m^3	0.009	**0.05**
PM2.5	mg/m^3	0.007	**0.025**
Pb	mg/m^3	ND	**0.005**

Source: Laboratory of MoE (2023)

Figure 17: Yutasas sub-scheme

[11] https://www.iqair.com/cambodia/kampong-speu, accessed on 23rd September 2024.



5.2.2.2 Noise and Vibration

Noise and vibration of the project locations in each sub-scheme are currently affected mainly by the commuters mainly along the roads within the areas which can be either the national or local road. As they are subjected to change over time, the testing of noise and vibration are required to be conducted right before the beginning of the construction.

Interviews with 14 village chiefs revealed that 64% of them perceived their villages as slightly (43%) or moderately (21%) noisy, primarily during the evening, with traffic and neighbors' activities being the main sources of disturbance. In addition, the noise testing result of the Animal Feeding Plant project in 2024 located 6 km from Yutasas (shown in Figure below) can be used as the reference for the baseline of this project as it is situated within the same environmental condition as the project areas. Further noise and vibration tests can be conducted during the preparation of the domestic EIA.

Figure 18: Results of noise analysis at location 1

(Source: Laboratory of the Ministry of Environment, 2024)

5.2.3 Soil Quality

The soil quality study for this project took soil samples from five agricultural locations across different schemes in the region. The Yutasas sub-scheme was represented by soil sampling (SS.05). The analysis results, presented in the table below, provide valuable insights into the physical, chemical, and biological properties of the soils at these locations, which can inform agricultural management practices and decision-making.

Table 26: Soil analysis results in an agricultural context

No.	Description Parameter		Result of SS.05
1	Particle Size (Pipette Method)	(<0.002mm), Clay %	7.30
		(0.002-0.02 mm), Fine Silt, %	21.10
		(0.02-0.05 mm), Coase Silt, %	11.70
		(0.05-0.2 mm), Fine Sand, %	30.29
		(0.2-2 mm), Coase Sand, %	28.78
2	Ninnu Moisture %, (Oven dry at 105 °C and 24 hours)		2.62
3	Total Carbon (Black & Walkey Method), C%		1.87
4	Total Nitrogen (Kjeldal Sulfuric Method), N%		0.17
5	C/N Ratio (Unit)		11
6	Organic Matter (OM) %		3.22
7	Total Phosphorus (Nitric Digestion) P %		0.094
8	Available Phosphorus (Bray II), P (ppm)		37
9	Cation Exchange Capacity C.E.C meq/100g Soil (Method,1M Ammonium Acetate at pH=7 & Leach with 10% NaCl)		16.30
10	Exchangeable Cation (meq/100g Soil), (Method,	Calcium (Ca)	5.43
		Magnesium (Mg)	1.48
		Sodium (Na)	1.50

No.	Description Parameter		Result of SS.05
	IM Ammonium Acetate at H=7)	Potassium (K)	0.35
	Total Exchangeable Bases (meq/100g soil)		8.76
11	Bass Saturation %		54
12	Exchange Acidity meq/100g Soil, (1 M KCI Method)		10.00
13	Exchange Al meq/100g Soll, (1 M KCI Method)		0.12
14	Electrode Conductivity µS/cm, (1:5 Soil: water)		63.00
15	pH H2O (1:5 Soil: water)		5.66
16	pl KCL (1:5 (Soil: IN KCL)		4.47

(Source: Laboratory of the General Directorate of Agriculture, MAFF, 2024)

Soils in Krang Ponley are also sandy loam, with similar challenges of low water retention due to the high sand content. The pH ranges from slightly acidic to neutral (4.47-7.41), and nutrient analysis shows low nitrogen and potassium levels. Despite these limitations, the soil is generally suitable for agriculture with careful nutrient and water management.

Overall, in the area show potential for agriculture, but improvements in nitrogen, potassium, and organic matter, along with proper irrigation, are necessary for sustained productivity.

5.2.4 Surface Water Quality

Water quality does not seem to be a critical issue for surface water, but the overuse of fertilizers and domestic wastewater are important threads. It is known to be a black market of all sorts of fertilizers, pesticides, insecticides, rodenticides, etc. sold at the borders with Viet Nam and applied indiscriminately by farmers to increase the numbers of crops a year[12]. The collected water samples were measured at the premises as well as at the laboratory, commissioned by Innovation Lab which is partner of Royal University of Phnom Penh (RUPP).

Table 27: Result of surface water quality

No	Parameter	Unit	Yutasas	Standard (MoE)	
			SW6	River	Lake and reservoir
1	Arsenic	mg/l	0.005	<0.01	<0.01
2	Cadmium	mg/l	0.001	<0.003	<0.003
3	Lead	mg/l	0.005	<0.01	<0.01
4	pH	-	6.91	6.5-8.5	6.5-8.5
5	Total dissolved solids	mg/l	91.58	<1000	<1000
6	Total suspended solids	mg/l	43	<100	<100
7	Total Nitrogen	mg/l	17.7	<3	<2
8	Total Phosphorus	mg/l	0.9	<0.25	<0.15
9	Total coliform	CFU/ 100mL	157,500	<1000	<1000
10	Electrical conductivity	µs/cm	183.4	500-1500	500-1500

[12] The sustainable rice platform, supported by MAFF, is working towards controlling this market and training farmers on proper use (products' labels are not translated to Khmer). https://sustainablerice.org

12	Dissolved oxygen	mg/l	5.65	>3	>4

(Source: Water Innovation Lab, 2024)

Figure 19: Yutasas sub-scheme

5.2.5 Groundwater Quality

5.2.5.1 Sampling Locations

Groundwater quality was collected from various locations within the project sites. Water testing is used to determine the existing groundwater quality at the project sites before construction and operation. Note that the GW1 is a dug well with a depth of up to 40 meters that can be used in both dry and wet seasons. In the dry season, the water level is about 25 meters, while in the rainy season, the water level is about 7 meters above the surface. GW2 and GW2 is a type of open well with a depth of 10 meters and can only be used during the rainy season. In both wells, the water level is around two meters above the surface during the rainy season.

The geographical positions and descriptions of the groundwater sampling points are given in Table 28. The results of the groundwater quality analysis are summarized in Table 29.

Table 28: Groundwater sampling locations

No.	Location				UTM	
	Province	District	Commune	Village	X	Y
GW2	Kampong chhnang	Rolea Bíer	Prasneb	Prey Sampov	443830	1355685

3.2.4.1 Results of the Groundwater Quality Testing

The selected samples were analysed and the results of the testing both at the field and at laboratory is provided in Table 29 below. In addition to the selected samples, another groundwater quality testing result

from another ESIA was also included to compare the groundwater quality of the sites. The reference sample was named “GWR1” and only some of the parameters are available for comparison due to the purpose of the ESIA was different.

Table 29: Result of groundwater quality

No	Parameter	Unit	GW2	CDWQS
1	Arsenic	mg/l	0.005	0.05
2	Cadmium	mg/l	0.001	0.003
3	Lead	mg/l	0.005	0.01
4	pH	-	**6.5**	6.5-8.8
5	Total dissolved solids	mg/l	58.12	800
6	Total suspended solids	mg/l	5	-
7	Total Nitrogen	mg/l	3.5	-
8	Total Phosphorus	mg/l	0.29	-
9	Total coliform	CFU/ 100mL	1,600	0
10	Electrical conductivity	µs/cm	116.1	-
11	Temperature	^{0}C	30.3	-
12	Dissolved oxygen	mg/l	1.45	-

(Source: Water Innovation Lab, 2024)

Test results show that almost all parameters are below Cambodia's drinking water quality standards of the Ministry of Industry, Science, Technology, and Innovation (MISTI) in 2004, except pH parameters are below the standard range and the total coliform exceeds the standard. Total coliforms are a common group of related bacteria found in soil, vegetation, and water. Boiling or filtering groundwater before drinking is required. Overall, the quality of groundwater in the project sites are safe for daily use, such as cooking, bathing, as well as laundry but not for drinking.

5.3 Biological Resources

5.3.1 Existing Species

A comprehensive biodiversity assessment, utilizing the Integrated Biodiversity Assessment Tool (IBAT) and a thorough literature review, the identified endangered and critically endangered species across reptiles, mammals, birds, fish, amphibians, plants, and fungi in Yutasas sub-scheme is provided in Table below:

Table 30: Screening list of Endangered and Critically Endangered Species in Yutasas

No.	Local Name	English Name	Scientific Name	IUCN Cat	Screened Species from Round 1&2 (Total=5)	Confirmed Species in Round 3 (Total = 3)
I. Reptile species						

1	អណ្តើកព្រាច	Elongated Tortoise	Indotestudo elongata	CR	Yes	Yes
II. Fish species						
2	ត្រីក្រសក់ក្រហម	Jullien's Golden Carp	Probarbus jullieni	CR	Yes	Yes
3	ត្រីចង្វាស្ទឹង	Leaping barb/Flying Minnow	Laubuka caeruleostigmata	EN	Yes	Yes
4	ត្រីកាហោ /ត្រីគុលរ៉ាង	Mekong giant barb/Giant Carp	Catlocarpio siamensis	CR	Yes	Yes
II. Bird species						
5	ទាព្រៃស្លាបស	White-winged Duck	Asarcornis scutulata	EN	Yes	No

5.3.2 EN and CR Species Confirmation

The Yutasas area supports several endangered species. Confirmations were made for Elongated Tortoise (Indotestudo elongata), Jullien's Golden Carp (Probarbus jullieni), Leaping barb/Flying Minnow (Laubuka caeruleostigmata), and Mekong giant barb/Giant Carp (Catlocarpio siamensis). These species were confirmed after three rounds of screening, which aimed to identify EN and CR species potentially present in the Yutasas area. The screening process involved consultations with local stakeholders and was based on the IBAT (Integrated Biodiversity Assessment Tool) report.

5.4 Socio-Economic and Cultural Conditions

5.4.1 Administrative and Social Structure

5.4.1.1 Administrative System

Cambodia's administrative system at sub-national level is organized into three (3) tiers: capital city/province, district/municipality/khan, and sangkat/commune. Phnom Penh, the capital, is divided into khans and further into sangkats, while provinces are divided into municipalities and districts, with municipalities subdivided into sangkats and districts into communes and sangkats. The sub-national government is guided by organic laws, including the Law on Administration of Commune/Sangkat and the Law on Administration of Capital City, Province, Municipality, District, and Khan, supporting decentralization and deconcentration. Commune/sangkat administrations operate with legal, financial, and administrative autonomy, governed by elected councils responsible for budgets, development, and public order. Higher levels, such as provinces and districts, are governed by councils (legislative) and boards of governors (executive), with council members indirectly elected by commune/sangkat councils and supported by technical committees. Boards of governors, nominated by the Ministry of Interior, implement policies and supervise ministry units in their jurisdiction. Recent legal amendments aim to expand local administrations' authority over civil servants from national bodies, awaiting implementation through sub-decrees.

5.4.1.2 *None-Governmental Organizations*

Another institution which are playing an important role in the development of the country at sub-national level is the civil society. The civil society in Cambodia, particularly the NGOs plays a vital role in development and democratization. These organizations address challenges such as poverty, education, human rights, gender equality, and environmental conservation, filling gaps in governance and social services. NGOs contribute by providing microfinance, vocational training, and livelihood programs to alleviate poverty; supporting education through school construction, scholarships, and inclusive learning; and improving health outcomes with maternal health programs, HIV/AIDS awareness, and mental health support. They advocate for human rights, labor rights, and good governance, engaging in election monitoring and raising awareness about corruption and land rights. Additionally, NGOs promote environmental sustainability and climate resilience while advancing gender equality by combating violence and discrimination and empowering women in leadership. Within the project area, there are a number of NGOs being identified within the area in different sectors including environment, community development, such as Wildlife Conservation Society (WCS), Adventist Development Relief Agency (ADRA), Advocacy Policy Institute (API), and People in Need (PIN).

5.4.1.3 *Community-Based Organizations*

Another social organization is Community-based organizations (CBOs). Cambodia, CBOs play a critical grassroots role, directly addressing local needs. Unlike NGOs, they are often less formalized and focus on mobilizing local resources for infrastructure, livelihood improvements, and strengthening community networks. CBOs contribute significantly to disaster resilience, especially in flood-prone areas, and foster cultural preservation and social cohesion through community events and initiatives. Together, NGOs and CBOs empower communities, protect rights, and promote inclusive development, offering hope for a more equitable and sustainable future despite ongoing challenges. Types of CBOs include Community Fishery, Forestry Community, Agricultural Cooperatives, and social organizations such as saving groups, old age association, etc. All of these types are reported within the project target areas.

The identified agriculture-related community-based association is provided in Table below:

Table 31. Type of Associations

No.	Types of Associations	Krang Ponley
1	Agricultural Cooperatives	One agricultural cooperative located in Yutasas which focus on rice and vegetable.
2	Farmer Water User Community	Yutasas exist of farmer utilizing water, but the systems are not operational due to a lack of cooperation in paying contributions user and unstable water support.
3	Community Forestry	No community forestry in the command area.
4	Community Fishery	No community fishery within this sub-scheme

5.4.1.4 Culture and Religion

Cambodia's culture reflects its rich history and diversity, shaped by the ethnic Khmer majority (90%) and minority groups like ethnic Vietnamese, Cham Muslims, and indigenous highland communities. While Khmer is the official language, many minorities maintain unique languages and traditions. Buddhism, practiced by 95% of the population, deeply influences cultural norms, often blended with Hindu and animist elements such as ancestor worship. As per the commune database and consultation with local authorities regarding the indigenous people, there is no indigenous people being present within the target areas.

5.4.2 Social Conditions

The command area of Yutasas is 650 ha. Administratively, the command areas located Kampong Chhnang province, span across in Svay commune, giving the total of 5 villages, giving the total households of 1,229 HHs with a total population of 5,330 people (out of which 2,773 are females).

Table 32: Administrative and population coverage of Yutasas sub-scheme

No.	Province/ District	Communes	Number of Villages	Total HH	Total Population	Female Population
	Yutasas					
1	Sameakki Meanchey (Kampong Chhnang)	Svay	5	1,339	5,330	2,773
	Sub-Total	**1**	**5**	**1,339**	**5,330**	**2,773**

HH = Household.

(Source: Ministry of Planning, Commune Database, 2023)

5.4.3 Demographic and Facilities

As per the description from above section on sociological condition, the ESCIA extracted the data from Commune Database, Ministry of Planning to obtain the statistics of all villages located within and nearby the command areas. It is noticeable that not all households hold the land assets within the command areas whereas it is possible that villagers from the other residential locations can also own the land within the command areas. The later population are not included in this information describes in the following section. It is noted that the commune database in 2023 is the full recorded information of village chief in every village across the country being submitted to commune further submitted to district, province and national level for compilation. Annually the data is collected during June or July and the release will be around 6 to 8 months later.

According to the commune database in 2023, the total number of households who are residing within and nearby the command area is 1,339 HH (out of which 247 HHs (18%) are female headed), giving the total population of 5,330 people (2,773 females). Moreover, the population are young with 69% of them are aging below 34 years old. Less than half of the people (31%) completed education at primary school and below whereas those with secondary, high school, and higher education are 42%, 21%, and 2%, respectively. It is noticeable that illiterate people have still existed at 4%.

Table 33: Demographic information of the HH living within and the vicinity of the command areas

Parameters	Number	Parameters	Number
Overall		**Educational Level**	
Total HH	1,339	Kindergarten	20.7%
Female HH Head	247 (18%)	Primary school	10.5%
Total Population	5,330	Secondary school	41.6%
Female	2,773	High School	21.0%
Age		College/University	1.7%
<18 years old	37%	TVET	0.2%
18 – 34 years old	32%	Illiterate	4.2%
35 – 60 years old	24%		
> 60 years old	7%		

(Source: Ministry of Planning, Commune Database, 2023)

Energy access of the population within the target area was found to be high, giving its proportion at 100% access to electricity. Moreover, the sources of water for domestic consumption were high 64% of them having access to water supply system while the rest continue using pump well, tube-well, rainwater, pond and river, indicating the access to clean water continue to be a huge amount within the project target areas. A good sign for the people is how they are using water for drinking purposes which was found to be almost all using safe water for drinking (tape water 39%, filtered water 40%, and boiled water 21%). There is a concern, however, regarding the reliability of the tape water quality which may create a significant impact on people's health, if they are not properly monitored. Interestingly, almost all the people within the target areas own a toilet showing their understanding of the importance of water, sanitation and hygiene.

Table 34: Access to energy and water and sanitation facilities

Parameters	Percentage	Parameters	Percentage
Source of Energy		**Drinking Water**	
Electricity	100%	Tape water	39%
Battery	0%	Filtration	40%
Solar	0%	Boiled	21%
Biogas	0%		
Water Source for HH consumption		**Toilet**

5.4.4 Socio–economic Conditions of the Beneficiaries

In the command area, full-time workers in the private sector were reported as the main occupation of the population. While rice and crop production are the second highest proportion (22%) for all command areas. For the secondary occupation, a full-time worker in the private sector maintains its dominance among the population while rice and crop production account for the second largest proportion (13%).

Table 35: Occupation of the HHs living within and the vicinity of the command areas

Parameters	Percentage	Parameters	Percentage
Main Occupation		**Secondary Occupation**	
Rice and crop production	22.34%	Rice and crop production	12.77%
Trade	2.13%	Animal production	6.74%
Service	3.55%	Trade	1.77%
Handicrafts	0.71%	Service	2.13%
Government staff	4.96%	Handicrafts	0.71%
Workers (full-time, private sector)	23.05%	Government staff	3.55%
Workers, (seasonal, private sector)	3.55%	Workers (full-time, private sector)	21.99%
Housewife	3.19%	Workers, (seasonal, private sector)	3.55%
Student	19.15%	Housewife	3.90%
Other	3.55%	Student	19.15%
No job	13.83%	Other	2.84%
		No job	20.92%

(Source: ESCIA Field Survey, 2024)

A significant proportion of the population with poor 1 & 2 is reported at 14%, indicating the level of economic condition of the areas while the proportion of the people with disability (PWD) is only 0.5%. People are migrated to both inside and outside the country with the highest one is within the country (7.7%) while only 1.5% migrated to abroad. This makes the total migration of 9.2%.

Table 36: Migration and vulnerability of the people within the sub-schemes

Parameters	Percentage	Parameters	Percentage
Vulnerability		**Migration**	
Poor 1	5%	Inside the country	7.69%
Poor 2	9%	Out of the country	1.54%
Total	**14%**	**Total**	**9.23%**
Disable person	0.36%		
Old people	0.13%		
Orphan	0.06%		
Total	**0.54%**

Semi-permanent houses are the most dominant shelter of the people comprising 49% of the total settlement. Wooden house with thatched roof is the second most popular (43%) while the rest is one or more floor brick wall and. The assets that people own the most are Television (95%), followed by motorbike (73%), and bicycle (49%), and power tiller (8%) while the rest are in small proportion.

Table 37: Houses and Assets of the HHs within the Sub-Schemes

Parameters	Percentage	Parameters	Percentage
Assets		**Type of Houses**	
Power Tiller	8.1%	One floor or more/brick wall	7.69%
Threshing Machine	0.1%	Semi-permanent	49.23%
Car	8.4%	Wooden house, thatched	43.08%
Motorbike	73.0%		
Tricycle	0.7%		
Bike cycle	48.9%		
TV	95.2%		

(Source: ESCIA Field Survey, 2024, Ministry of Planning, Commune Database, 2023)

The table reveals a 0.5% rate of family violence, followed by drug use (0.2%) and land issues (0.3%), while stolen cases and crime each occur at 0.1%. Importantly, no cases of sexual harassment or human trafficking were reported within the Yutasas sub-scheme.

Table 38: Issues in the project communities

Parameters	Yutasas sub-scheme	Total
Sexual Harassment	0.0%	0.0%
Human Trafficking	0.0%	0.0%
Violence in the family	0.5%	0.5%
Drug using	0.2%	0.2%
Crime	0.0%	0.0%
Stolen Cases	0.1%	0.1%
Land Issues	0.3%	0.3%

5.4.5 Cultural Sites

In Yutasas, there is no cultural sites will be impact by the project.

5.4.6 Agricultural Production

5.4.6.1 Rice Production

In Yutasas, rice is the main crop cultivated by most farmers, with a small number of households also growing cash crops like watermelon and vegetables. The average land size for rice production ranges from 1 to 1.5 hectares. Common rice varieties include Reang Chey, Changkuah Ampeak, Angka No 55, and Angka No 85. Farmers use between 70 to 200 kg of rice seeds per hectare, with traditional varieties being self-produced, while Angka No 55 and 85 are purchased from the market.

Fertilizer use varies between the wet and dry seasons, with 100-300 kg of chemical fertilizer and 40-60 kg of compost applied per hectare during the wet season, and 100-320 kg of chemical fertilizer during the dry season. Pesticide usage is focused on controlling pests and weeds, with application occurring 2-4 times for pests and 1-2 times for weeds in the wet season, and 4-5 times for pests and 1-2 times for weeds in the dry season. Labor for rice farming is primarily sourced from households, but rented labor is used for soil preparation, pesticide spraying, harvesting, and transporting rice.

The average rice yield ranges from 2.5 to 5 tons per hectare in the wet season and about 3 tons per hectare in the dry season. Farmers face several challenges, including water scarcity for both rice and crop production, with canals often lacking water and no inflow sources. Other issues include limited capital, pest infestations (such as the walker pest during the boosting stage), and weed management.

After harvesting, straw is either kept for cow feed or sold, while stubble is typically left in the field for 2-3 months before being burned or plowed under. The average cost of rice production is between 1,500,000 and 2,000,000 riel (US$325 and US$ 500) per hectare. In terms of capacity building, some groups have received training on rice production (three times) and crop production (once), but one group has not received any training.

Table 39. Rice production during wet and dry season

Parameters	Percentage	Parameters	Percentage
Wet season		**Dry season**	
Land size (m2)	5,691	Land size (m2)	4,157
Yield (kg/year)	1,478	Yield (kg/year)	1,197
Income (USD/year)	492	Income (USD/year)	337

(Source: ESCIA Field Survey, 2024)

5.4.6.2 Vegetable Production

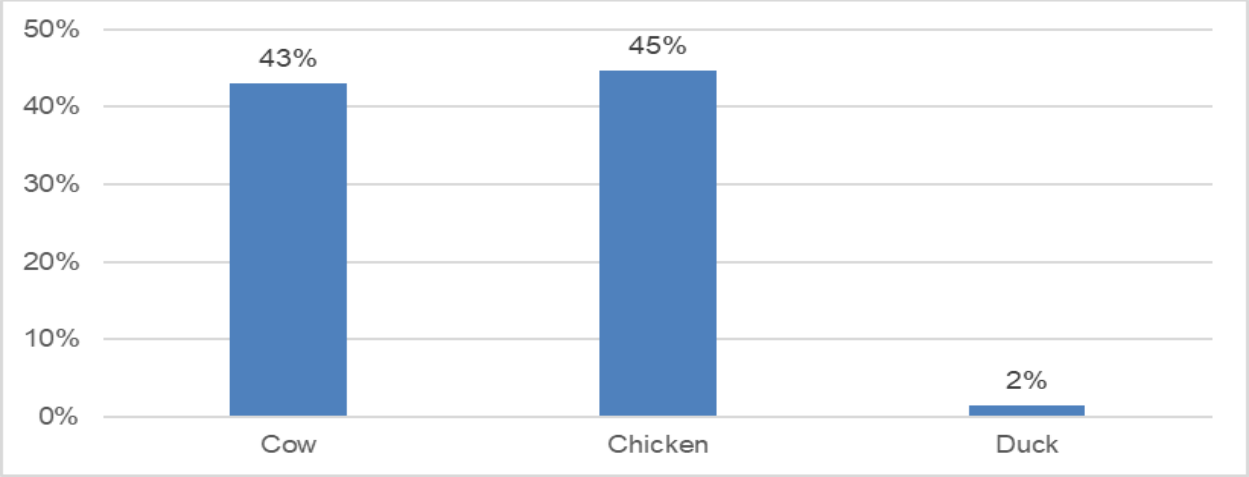
In the area, vegetable cultivation includes a variety of crops such as cucumber, watermelon, curly cabbage, luffa gourd, wax gourd, morning glory, long bean, and peanut. The average land size for vegetable farming ranges from 1,000 to 10,000 square meters. Farmers employ both traditional and chemical cultivation practices, using water sourced from canals, ponds, and wells from the Yutasas scheme. Some areas have agricultural associations.

Expenditures for vegetable farming per household range from USD 250 to USD 3,500, covering seeds, manure, fertilizers, pesticides, pump machines, petroleum, straw, nets, drip systems, and soil covering materials. Income varies between USD 500 and USD 6,000, with higher earnings in areas that use land covering and irrigation systems.

Vegetables are sold at local markets, through brokers for Phsar Doem Kor, Phsar Odoung, and supermarkets. Key challenges include insect pests, diseases, low soil fertility, and water shortages. Farmers have received agricultural services such as growing techniques, compost making, market information from social media, and support from trainers and agriculture district officers.

Table 40: Vegetable production during wet and dry season

Parameters	Percentage	Parameters	Percentage



Wet season		Dry season	
Land size (m2)	1,039	Land size (m2)	995
Yield (kg/year)	385	Yield (kg/year)	477
Income (USD/year)	169	Income (USD/year)	209

(Source: ESCIA Field Survey, 2024)

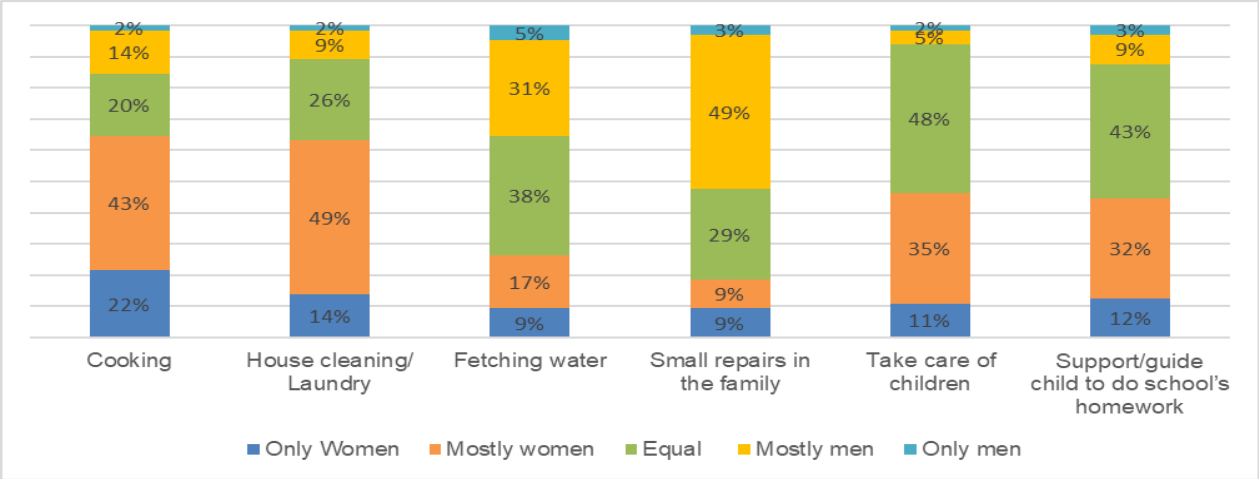
5.4.6.3 Animal Production

In Yutasas, a diverse range of animal production activities is prevalent among local households. Chicken farming is the most widespread, with 45% of households while 43% raise cows. reflecting their significant role in the local economy and diet. Ducks are the least common among the livestock options, with just 2% of households raising them. This distribution highlights the varied livestock practices within the area, with a strong emphasis on poultry farming and a notable presence of cattle farming.

Figure 20: Type of animal in command area

(Source: ESCIA Field Survey, 2024)

5.4.7 Gender



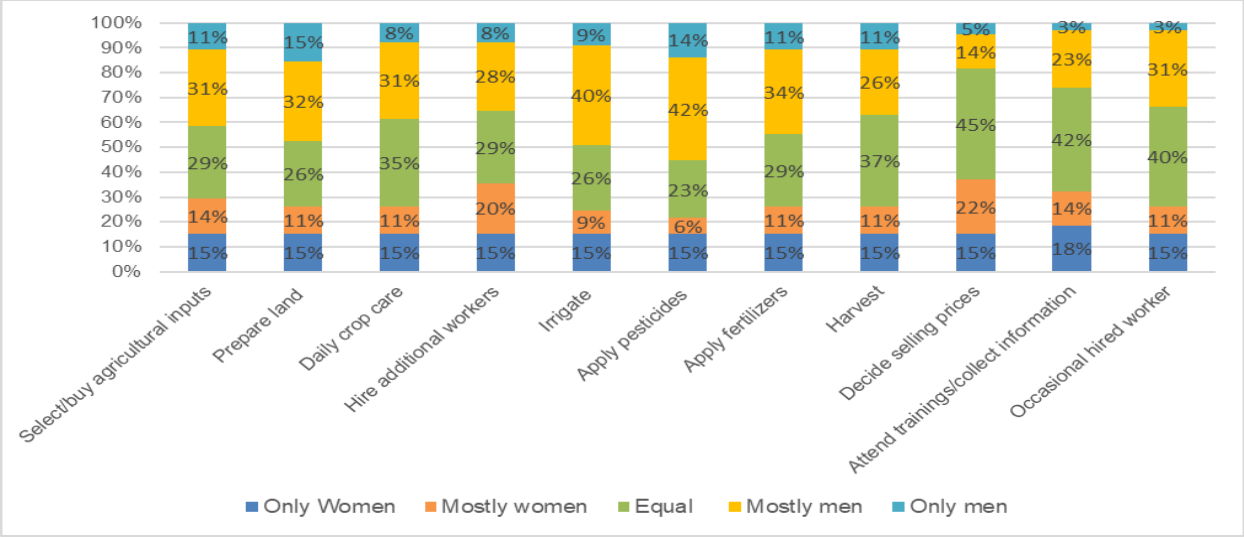
5.4.7.1 Labor Division

CAISAR Gender Assessment and Social Inclusion Plan reported that men spend on average of 59.4% of their time for farming whereas women spend only 40.5%. In traditional farming context, men involve the most during cultivation stage while women are more engaged in the later production. Heavy duty tasks such as land preparation are designated to men while seedling preparation and weeding are commonly assigned to women. Transplanting, uprooting, harvesting, and marketing are generally shared by both. However, the practices have been changed lately due to the presence of mechanization where land preparation, harvesting and threshing have been replaced by machinery.[13]

[13] CAISARP (2024). Gender Assessment and Gender Action & Social Inclusion Plan. CAISAR Project. MoWRAM.

Coming to household chores; women handle 90% of the workload. During the COVID-19 outbreak, women spent even more time on domestic and caregiving tasks. Elderly family members bear the full responsibility for raising grandchildren when their mothers have migrated. In the project area, similarly, in families where women work in nearby garment factories or migrate for paid employment, domestic duties are often shifted to young girls and the elderly.[14] The ESCIA field survey showed that cooking, housing and cleaning, are mainly at the hand of women, except repairing in the household, men involve the most while fetching water, child caring, and schooling men and women involved equally (Figure 13).

Figure 23: Division of Roles in Household Chores (n=65)



(Source: ESCIA Field Survey, 2024)

In crop production, the distribution of labor was found to be male dominated for majority of the tasks, especially at production level. However, both men and women were found to be a joint together during harvesting and decide to sell. As the result, male and women cooperate to each other in plant cultivation (Figure 14).

[14] CAISARP (2024). Gender Assessment and Gender Action & Social Inclusion Plan. CAISAR Project. MoWRAM.

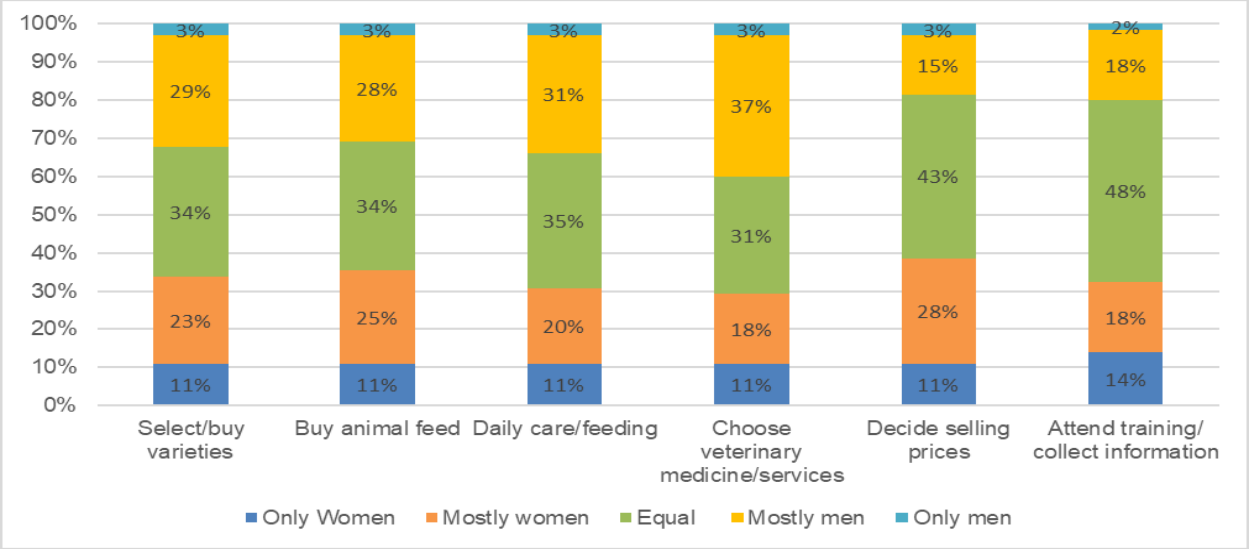


Figure 22: Share of Roles in Crop Cultivation (n=65)

(Source: ESCIA Field Survey, 2024)

In animal production, the distribution of labour is found to be equally involved both male and female almost at all stage exception choose varieties and selecting veterinary medicine mostly response by male.

Figure 23: Share of roles in Animal Husbandry (n=65)

(Source: ESCIA Field Survey, 2024)

5.4.7.2 Income

The CAISAR Gender Assessment and Social Inclusion Plan revealed notable findings regarding income differences by gender. On an individual level, the average monthly income for female household members is $121.4 (n=238), which is lower than the $166.6 earned by male members (n=366), showing a statistically significant income gap of $45.2. However, at the household level, there is no significant difference in average income between female-headed and male-headed households, with a small mean difference of $17.3. Nationally, 48% of married men (aged 15–49) reported making joint decisions with

their wives on income use, 46% said their wives mainly make these decisions, and 6% said they decide alone. Additionally, 97% of married women (aged 15–49) who earn cash from employment participate in decisions about their earnings, with 63% making these decisions mainly on their own.[15]

5.4.7.3 Decision Making

Regarding decision-making, the matters related to children, such as education, childcare, and marriage, are typically decided by both husband and wife. However, a significant number of households have women as the sole decision-makers on child-related issues. When it comes to daily livelihoods, decisions such as household expenses, sales of home-produced goods, and visiting friends or family are usually made jointly. Still, a notable portion of respondents indicated that women alone make decisions regarding their own livelihoods, family expenses, attending trainings, and similar matters. While women tend to take the lead on child and livelihood issues, decisions concerning agricultural activities, like cultivation and animal husbandry, are mostly handled by men. This is largely due to the physically demanding and sometimes hazardous nature of agricultural work, such as pesticide application.[4]

6. ENVIRONMENTAL & SOCIAL RISKS, IMPACTS, AND MITIGATION

In this section, the E&S risks and impacts (that potentially arise during activity implementation and operationalization) are identified, analysed, and evaluated at project level — with regards to the nature, scope, scale, and the potential extent of activity impacts — through classification of such risks and impacts as direct, indirect, and cumulative. The assessment of E&S risks and impacts in this chapter is based on the following grounds that is fundamental to proposing measures to avoid, minimize, and mitigate for the impacts in the next chapter:

Project's original technical reports

- Feasibility Studies (August 2023)
- Feasibility Studies (updated by November 2023).
- Additional Pre–Feasibility for Ou Ta Pong Sub–scheme.
- Environmental and Social Management Framework – ESMF (Updated by September 2024)
- IBAT reports for Ou Ta Pong.

Stakeholder Consultations (national, provincial, district, commune, and village levels)

- Community Meetings
- Focus Group Discussions
- Key Information Interview.

[15] CAISARP (2024). Gender Assessment and Gender Action & Social Inclusion Plan. CAISAR Project. MoWRAM.

Field observation, using

- Transect walks.
- Drones (for E&S screening and biodiversity assessment)

External technical reports

- Statistical reports/database.
- Publications and Technical Reports from national and internation institutions.

6.1 Environmental Risks and Impacts on Preparation and Construction Stage

6.1.1 Unexploded Ordnances (UXO)

Construction and rehabilitation activities, particularly those involving earthworks, soil excavation, and river dredging, pose a significant risk of unexploded ordnance (UXO). Despite past demining efforts and clearance of the UXO existence in some sub-scheme as per the report in the Baseline, mortar shells, aerial bombs, and other UXO may still be present within the subproject area. This risk is particularly high in areas where deep excavation is required for structural upgrades or dredging.

The potential detonation of UXO poses a substantial threat to residents, construction workers, animals, and any other entities located near the construction sites. The risk of encountering UXO is considered moderate due to the country's long history of civil war and the limitations of past demining operations, which are often focused on surface-level clearance.

❖ **Mitigation Measures**

- Carry out UXO screening/assessment by certified UXO experts before any physical/ construction activities are allowed.
- In case UXOs are found by certified experts during on-site screening, removal of UXO will be carried out by certified experts.
- A UXO clearance certificate shall be obtained from related authority for each sub-project prior to commencing any subproject activities.
- As part of site-specific ESCMP, conduct training and awareness activities for local community with regards to UXO risks and chance finds.

6.1.2 Environmental, Health, And Safety

6.1.2.1 Noise and Vibration

During construction phase, noise and vibration will be generated where machineries such as excavator, bulldozer, cement concrete mixing, and trucks are operated. While noise will be a nuisance to construction workers and nearby residents, these impacts are anticipated to local and intermittent during mostly during

daytime. During night–time, noise may be occasionally generated from workers' camps due to living activities and occasional maintenance of machinery and equipment. These impacts are expected to have no or minimal impact on local residents as workers' camps will be located near construction site and far away from residential area. However, people who live along the national road (e.g. in Stung Krang Ponley) and small roads that project's trucks use to carry project's equipment and materials, may experience occasional traffic noise during daytime. Given the nature and scope of physical works under this scheme, impact of noise on local residents is expected to be none to minor, and temporary.

❖ **Mitigation Measures**

- Before commencing the irrigation system restoration, the Ministry is requested to organize public forums in collaboration with the commune to gather feedback from the local population, especially from residents who may be affected by the project. Moreover, training sessions for the commune help them understand the project's processes, including the size of the infrastructure systems and the standards for excavation and construction. This will ensure that the commune is well-informed about the project
- Locate the workers' camp far away from the residential area as much as possible
- Avoid night-time construction in populated/village areas.
- Minimize project transportation through community areas where possible.
- Ensure proper maintenance and proper operation of construction machinery to minimize noise generation.
- No construction-related activities will be carried out from 21:00 hours to 06:00 hours along residential areas, hospitals, schools and during religious or cultural events near the subproject
- All construction equipment and vehicles must be well maintained, regularly inspected for noise emissions
- Impose speed limits on construction vehicles to minimize noise emission along areas where sensitive receptors are located (houses, schools, temples, hospitals, etc.
- Restrict use of vibrating rollers and operation of heavy equipment near sensitive structures.

6.1.2.2 Air pollution

During construction phase, a number of project activities may cause air pollution. These include physical activities such as movement of trucks (for transportation of materials), clearing & grubbing, grading, excavation, levelling, truck hauling, stockpiling, disposal of solid waste, dredging which may generate dust and particulate matter (PM10 and PM2.5) (if water spraying does not apply). Exhaust emissions from trucks and heavy machinery will release nitrogen oxides (NOx), carbon monoxide (CO), sulfur dioxide (SO^2), and volatile organic compounds (VOCs) which may contribute to smog formation and greenhouse effect. Burning of waste (by contractors) may release harmful pollutants into the air. While air pollution due to dust, particulate matter, and exhaust emissions from trucks and engines, are anticipated, location where pollution is generated vary and impact for one (1) location is temporary, intermittent, and minor, and are particularly for residents who live along the project's roads.

❖ **Mitigation Measures**

- Avoid burning solid waste or construction waste
- Spray or sprinkle water on the work surfaces and other piled materials to minimize dust at least 3-6 times per day in windy and dry weather and/or based on the weather condition
- Conduct proper maintenance of machineries and equipment
- Place sitting concrete mixing plants, crushing plants, quarries and other facilities far from settlement and other sensitive receptors
- Use cover for vehicles that transport all construction materials such as cements and excavated soils
- Test air quality (NO_2, SO_2, CO, TSP, PM10, PM2.5) prior and during the construction to assess the level of impact

6.1.2.3 Impact on Water

Water pollution is anticipated, primarily due to physical activities that involves dredging and excavation near or in water course/ source. Such activities do not only cause turbulence for water but also cause increased sedimentation. Disturbed soil – caused by excavation to improve irrigation canal, for instance, may contaminate water at places where water is collected for domestic purpose. The impact is anticipated particularly for planned dredging operation. However, water pollution would be minimized through construction methods and time.

Wastewater (released from workers' camps) and leaks of hazardous materials (e.g., oil, diesel, chemical) could make their way into nearby water bodies and during rainy season which cause water contamination and leave varying level impacts on the receptors. The main receptors vulnerable to water pollution during construction include nearby residents and construction workers. Due to the scope and scale of physical works anticipated for each of the six schemes, project impact due to water pollution is anticipated to be minor and localized.

The Sedimentation due to excavation, dredging, and earthworks is a primary cause of water quality degradation. Loose soil can be washed into nearby water bodies, increasing turbidity, reducing light penetration, and altering the aquatic habitat. Additionally, the use of machinery and equipment introduces risks of oil spills, fuel leaks, and chemical contamination, which can enter water sources through surface runoff, affecting aquatic life and water usability downstream.

❖ **Mitigation Measures:**

- Implement a waste management plan to ensure the proper disposal of all construction waste, including wastewater.
- Use environmentally friendly construction materials and techniques to reduce the amount of pollutants that are released into the environment
- Install erosion and sediment control measures, such as silt fences, and sediment basins.
- Properly manage construction chemicals, fuels, and waste to prevent water pollution.

- Regularly inspect and maintain construction equipment to prevent leaks and spills.
- Wash construction vehicles and machinery only in designated areas where runoff will not pollute natural surface water bodies.
- Train construction workers on the importance of preventing water pollution.
- Construct of retaining structures.
- Test surface water quality (Depth, pH, EC, As, Cd, Pb, TN, TP, TDS, TSS, DO, and Total Coliform)

6.1.2.4 Solid and Hazardous Waste

During project implementation, solid wastes – both non–hazardous and hazardous, are anticipated to be generated, primarily due to rehabilitation of irrigation canals and rural roads. In particular, solid waste could be generated from operations that involved site clearing, excavation, trenching, demolition of existing cement and earthworks structures, construction and disassembly of worker camps, maintenance of machineries, and so forth. Regarding dredged and excavated material, the construction activities can lead to surface erosion and sedimentation, particularly in water bodies. However, the estimates for the amount of dredged or excavated material per scheme do not estimate amounts for reuse or disposal. Improper handling of solid waste generated from the above operation may result environmental pollution that may include soil and water contamination, habitat disruption, visual pollution and give rise to concerns of public health.

❖ **Mitigation Measures**

- All vehicles/drivers will be provided with plastic bags for waste collection and prevent any unauthorized waste disposal with particular attention paid to prevention of littering.
- The Contractor will be required to train the workers in proper waste management.
- Recyclables will be separated at source and given/sold to recycler (plastic, metal, card, paper as a minimum).
- Non-hazardous, non-recyclable solid waste will be temporarily deposited and managed together at existing landfill/dumpsite.
- Safe temporary storage of hazardous waste as required.
- Storage facilities for fuels, oil, cement, and chemicals shall be within secured areas on impermeable surfaces, provided with bunds and cleanup installations.
- Vehicles, machinery, and equipment maintenance and re-fueling will be carried out in such a way that spilled materials do not seep into the soil.
- Oil traps will be provided for service areas and parking areas.
- Fuel storage and refilling areas will be located at least 50m from canals and channels and will be protected by temporary drainage bunds to contain spills.
- Use or reuse the dredge material on properties with a residential or recreational use (dredging material, if planned for reuse, will be subject to testing to ensure the material is safe for reuse).

6.1.2.5 Wastewater

During construction phase, generation of wastewater is expected, mainly from a) workers' camp (e.g. domestic wastewater), b) cleaning and washing of machinery, c) treatment of leakage and spill, etc. Depending how wastewater is managed, receptors of wastewater may include immediate receiving environment which may include soil, water bodies which may subsequently affect human including construction workers, residents nearby, and fauna and flora along the way wastewater goes.

❖ **Mitigation Measures**

- Reduce, recycle, and reuse waste [e.g. plastic waste, electronic waste, agricultural waste (natural, animal faces for later use as manure, plant waste)] wherever and whenever possible.
- Latrines must be built at construction sites and camp sites for appropriate domestic waste management.
- Hazardous waste, including any spills of chemicals or fuels, should be collected separately and disposed of following environmental regulations.
- Ensure construction sites have enough well-maintained sanitation facilities to prevent the direct discharge of untreated wastewater.
- Promote clean living practices, reduce plastic usage, and improve waste management.
- The construction company must regularly monitor the workers' living conditions, waste management, and ensure there are proper sanitation facilities and adequate housing for the workers.
- The company provides education and guidance on maintaining cleanliness and hygiene for the workers (such as proper waste disposal and handling of oil) and prohibits activities like fish.

6.1.3 Occupational Health and Safety

6.1.3.1 Physical Hazards

The construction or rehabilitation of irrigation canals and farm roads during the construction phase of the project presents significant physical hazards to workers and those in close proximity to the construction sites. These hazards can result in a range of consequences, from minor injuries requiring medical attention to severe and potentially fatal accidents. The sources highlight several specific types of physical hazards, including Falls from Heights, Drowning and Water-Related Injuries, Falling Objects, Falls into Open Holes, and Injuries from Heavy Equipment.

The impact receptors for physical hazards are primarily construction workers, but also include inspectors, visitors, and nearby residents and children, as well as domestic animals. The sources assess the risk of physical hazards as high, acknowledging that working in the construction field can result in injuries or fatalities if safety standards are not met. The sources emphasize that unsafe practices by construction companies can lead to accidents, injuries, illnesses, and fatalities. While the overall risk might be lower due to the anticipated number of workers involved, stakeholders at the community, district, and provincial levels have expressed concerns about the potential hazards posed to both workers and community

members.

❖ **Mitigation Measures**

- Prepare a health and safety plan containing site-specific precautions in accordance with relevant occupational health and safety guidelines.
- Inspect and check the relevant construction equipment to ensure that it meets the applicable mechanical and safety requirements.
- Inspect the worksite to ensure that the equipment can be safely mobilized and operated, and that there are no unmitigated risks.
- Provide fall protection when workers are exposed to unguarded platforms or walkways higher than 2 m.
- Carry out daily toolbox meetings (safety briefings).
- Maintain an accident record book where all major or minor accidents and incidents are recorded with actions taken.
- Educate the workers on construction hazards.
- Train drivers in safe driving skills and traffic regulations.
- Appoint an Environment, Health and Safety Officer who is a qualified engineer.
- Make adequate first aid equipment available on site.
- Carry out training and awareness of the workers on HIV-AIDS prevention.
- Ensure that all workers are equipped with and use Personal Protective Equipment (PPE).

6.1.3.2 Heat Stress

The construction phase of the project, which includes rehabilitating irrigation canals and ponds, presents potential risks of heat stress to workers. This is particularly concerning given Cambodia's tropical climate, characterized by high temperatures and humidity. Construction activities are often physically demanding and performed outdoors, increasing the risk of heat-related illnesses.

Construction workers exposed to prolonged high temperatures and humidity may experience heat stress, potentially leading to heat exhaustion or heat stroke. This can result in reduced productivity, increased accidents, and even fatalities. Heat stress can also exacerbate existing health conditions. The project's Environmental and Social Management Framework (ESCMF) highlights the importance of considering temperature extremes during the construction phase, emphasizing the need for mitigation measures to ensure worker health and productivity.

❖ **Mitigation Measures**

- Providing regular breaks and shaded rest areas for workers to cool down and rehydrate.
- Ensuring access to cool drinking water throughout the workday.
- Adjusting work schedules to avoid the hottest hours of the day, if feasible.

- Providing training to workers and supervisors on recognizing the signs and symptoms of heat stress and appropriate first aid measures.
- Encouraging the use of personal protective equipment, such as light-colored, loose-fitting clothing and wide-brimmed hats, to minimize heat absorption.
- Monitoring weather conditions and adjusting work practices accordingly.
- Developing and implementing an emergency response plan for heat-related illnesses.
- Providing adequate ventilation and cooling systems in worker accommodations.
- Encouraging workers to maintain good physical fitness and hydration levels.
- Regularly monitoring workers for signs of heat stress and taking appropriate action.

6.1.4 Community Health and Safety

Construction activities may disrupt local transportation networks and increase traffic volume, including heavy trucks and machinery, impacting communities and businesses along transportation routes. Construction sites pose health and safety risks to workers and nearby communities. Accidents and exposure to construction-related hazards can have serious consequences. The influx of construction workers from different regions may increase the risk of spreading communicable diseases such as HIV/AIDS to the local community.

Open canals and ponds during rehabilitation work pose a risk of drowning, particularly to children and individuals unfamiliar with the area. Construction activities may increase the depth or alter the flow of water, further increasing the risk. Construction sites can attract curious individuals, particularly children, who may be unaware of the potential hazards. This includes the risk of falls, being struck by moving machinery or vehicles, and contact with hazardous materials. It is important to secure construction areas, implement safety awareness campaigns, and enforce hygiene and sanitation standards at construction camps.

❖ **Mitigation Measures**

- Prior to start of construction work, the contractor in cooperation with the PIU will consult with the local authorities and potentially affected residents/private landowner. Inform them about the upcoming construction work, safety precautions and how to raise concerns or file complaints (GRM).
- The contractor shall fence off the construction area and control access to the site.
- A speed limit of 30 km/h for construction related traffic through inhabited areas.
- The contractor shall install traffic signage and fluorescent bollards and warning lights to direct traffic and prevent vehicles driving into the lanes with construction activities.
- The contractor in cooperation with the local authorities shall implement traffic management to ensure a smooth traffic and prevent congestion.

6.1.5 Biodiversity

6.1.5.1 Hunting, trading, and consumption of wildlife

During the construction phase of the irrigation infrastructure project, the influx of a new labor force presents a significant risk to hunting, trading, and consumption of wildlife. The arrival of workers from other regions can increase the demand for exotic local foods, including wildlife and endangered species, which are often perceived as interesting delicacies or possessing health-promoting properties. The hunting may be done for relaxation or belief that wildlife is tasty or making people healthy. This heightened demand can drive illegal hunting and trading activities, posing a severe threat to biodiversity and the stability of local ecosystems.

The impact receptors of this risk are primarily aquatic and terrestrial species, and endangered. The potential impact on endangered species, as their rarity often increases their market value, further incentivizing unsustainable hunting and trading practices that can lead to their extinction.

❖ **Mitigation Measures**

- Conduct thorough biodiversity inspections along access roads and at quarry sites before starting land clearing works to identify habitats or nesting sites of endangered/protected species.
- Provide mandatory training for contractors' management staff and site workers on the Code of Conduct, Standard Operating Procedures (SOP) for wildlife protection and handling, and human-wildlife conflict management.
- Incorporate a policy in the Project Administration Manual (PAM) and Worker's Agreement that prohibits employees and/or subcontractors from possessing, purchasing, trading, or collecting wildlife or forest resources that are legally protected, CITES listed, or classed as threatened by the IUCN Red List.
- Undertake regular monitoring of all access roads to prevent poaching activities.
- Properly handle and rescue wildlife encountered during land clearing and construction, following the SOP for wildlife protection and handling.
- Educate the community on local wildlife behavior, avoidance techniques, and deterrent methods.
- Report observed/recorded incidents of illegal activities to relevant authorities.
- Educate construction workers about the importance of wildlife conservation and the laws regarding hunting and trading of protected species.
- Collaborate with local communities to monitor wildlife populations and report any suspicious activities.

6.1.5.2 Loss of fauna and flora

The primary activity contributing to this risk is the construction of canals expansion and roads, particularly in areas that require clearing vegetation and disrupting natural habitats. The construction activities can lead to both direct and indirect impacts on fauna and flora:

- Habitat loss and fragmentation due to construction activities like canal and farm road rehabilitation,

land use changes, and altered water management practices can affect species survival and connectivity. These activities may involve dredging, excavation, or modification of existing water channels and infrastructure, leading to habitat destruction and disturbance to nesting and foraging sites.

- Increased vehicle movement increases the chance of collisions with wildlife.

The impact receptors for the loss of fauna and flora are diverse and include various species in the Yutasas sub-scheme. The biodiversity study has confirmed species include: Elongated Tortoise, Jullien's Golden Carp, leaping barb/Flying Minnow, and Mekong giant barb/Giant Carp.

❖ **Mitigation Measures**

- Properly handle and rescue wildlife incidentally encountered or caught during land clearing and construction by relocating them to safer habitats, following the Standard Operating Procedure (SOP) for wildlife protection and handling.
- Conduct thorough biodiversity inspections along the access roads and at quarry sites before starting any land clearing works to identify any habitat and/or nesting sites of endangered/ protected species that may be affected by the clearing and identify hotspots where collisions with wildlife are likely to occur.
- Install signage to alert drivers to the presence of wildlife and require them to slow down and drive with caution, especially in hotspots where collision with wildlife is likely to occur.
- Develop a system in which drivers report locations of wildlife crossings and wildlife sightings.
- The contractor shall install signs to ban hunting or catching wildlife in the area.
- Apply Find Chance Procedure

6.1.6 Climate Change

6.1.6.1 GHG emission

The main activities that contribute to this risk is the use of heavy machinery and trucks for excavation, transportation, and rehabilitation of irrigation canals and farm roads. The operation of these machineries releases carbon dioxide (CO2), methane (CH4) and nitrous oxide (N2O) into the atmosphere. Waste burning at worker campsites may also contribute to GHG emission.

❖ **Mitigation Measures**

- Construction vehicles and machinery will be maintained to a high standard to minimize emissions and ensure compliance with the National exhaust emission standards. All mobile equipment should be fitted with catalytic converters.
- Use energy-efficient machinery and equipment during construction to reduce fuel consumption and emissions.
- All open burning of construction and demolition of waste material and refuse will be prohibited.
- Implement proper maintenance programs for equipment and vehicles to ensure they operate efficiently and with lower emissions.

- Engage with local communities and stakeholders to raise awareness of emission reduction practices and encourage their participation in sustainability efforts.

6.2 Environmental Risks and Impacts on Operation Stage

6.2.1 Environmental, Health and Safety Aspect/Issue

6.2.1.1 Water Management

During the operation phase of the irrigation infrastructure project, alterations to hydrology present potential risks. The main activity that causes these risks is increased irrigation. This can lead to the depletion of water sources if proper management practices are not implemented.

The impact receptors for these risks include the Tonle Sap Lake, upstream watersheds, wetlands, aquatic ecosystems, and downstream communities. The assessment of the impact of hydrology changes during operation is moderate. This takes into consideration the potential for both positive and negative impacts of irrigation systems. Poor water management can result in downstream water scarcity, altered hydrology, and damage to aquatic ecosystems. However, well-designed and properly managed irrigation systems can contribute to improved agricultural productivity and water resource management.

❖ **Mitigation Measures**

- A water user community should be organized prior to construction to participate in identifying key locations and ensure there are caretakers in place.
- Establish detailed water management plans that ensure equitable water distribution and allocation, considering the needs of various users and the environmental flow requirements to maintain healthy aquatic ecosystems.
- Integrate natural infrastructure, such as wetlands and forests, into water management strategies. Protect and restore degraded habitats to enhance their water regulation capabilities, improve water quality, and support biodiversity.
- Establish and provide training to FWUCs on sustainable water management practices, equitable water rights, and allocation procedures. These communities play a vital role in the operation and maintenance of the irrigation system, ensuring its long-term sustainability.

6.2.1.2 Water pollution

The primary activity that causes this risk is the intensification of agricultural production in the command areas as irrigation water becomes readily available. This intensification can lead to an increased use of chemicals, such as fertilizers and pesticides, to enhance crop yields. These chemicals infiltrate the soil and reach groundwater aquifers, leading to long-term contamination. The excessive application of these chemicals can result in contamination of both surface and groundwater resources. Furthermore, changes in water table levels due to extensive irrigation can alter the flow patterns of groundwater, potentially mobilizing contaminants that would otherwise remain contained.

The assessment of the impact of water pollution during operation is moderate. The potential for significant water quality degradation due to the widespread use of chemical fertilizers and pesticides in rice

production. High concentrations of these chemicals in water resources can harm biodiversity, not only within the Yutasas sub-scheme but also in the downstream river systems and the Tonle Sap Lake.

❖ **Mitigation Measures**

- Conduct regular water quality test to track the change in water quality due to pesticide application using oversea laboratory testing.
- Encourage farmers to adopt IPM techniques that minimize pesticide use and rely on biological control methods, thereby reducing the increased risk of chemical contamination of water resources.
- Provide training and extension services to farmers on the judicious use of fertilizers and, ensuring they apply the correct type and amount based on soil nutrient levels.
- Promote the adoption of organic fertilizers and soil amendments, such as cover crops and green manures, which can improve soil fertility and reduce the need for chemical fertilizers.
- Implement a robust water quality monitoring program to track the levels of pesticides, nitrates, and other pollutants in surface and groundwater resources within and around the command areas.
- Encourage the adoption of water-saving irrigation methods, such as alternate wetting and drying (AWD) in rice cultivation, which can reduce water consumption and minimize the leaching of agrochemicals.

6.2.1.3 Soil pollution

During the operation phase of the irrigation infrastructure project, soil pollution/quality reduction poses a considerable risk. The primary activity contributing to this risk is the increased agricultural production facilitated by the improved irrigation infrastructure. This intensification can lead to the overuse of agri-chemicals, such as chemical pesticides and fertilizers, if farmers lack adequate training or support in adopting environmentally friendly practices.

The impact receptors for soil pollution/quality reduction are multifaceted, encompassing such as soil health, water quality, and biodiversity. The impact of soil pollution/quality reduction during the operation phase as moderate. This assessment considers the potential for increased agricultural production to lead to the overuse of agri-chemicals if sustainable farming practices are not adopted.

❖ **Mitigation Measures**

- Implement Simplified Pesticide Management Plan
- Conduct regular water quality test to track the change in water quality due to pesticide application using oversea laboratory testing

6.2.2 Climate Change

6.2.2.1 GHG emission

During the operation phase, the intensification of farming activities is expected to result in a rise in greenhouse gas (GHG) emissions. This increase will stem primarily from the greater energy requirements associated with boosting agricultural production. The operation of machinery and equipment for various

farming tasks, including tillage, irrigation, harvesting, and transportation, will demand a substantial amount of energy. If this energy comes from fossil fuels, it will lead to higher carbon emissions. The practice of burning rice straw after harvest, a common agricultural method in the region, also releases significant amounts of GHGs, such as carbon dioxide and methane, into the atmosphere. Additionally, the intensification of farming often results in greater use of chemical fertilizers, and the production and application of these fertilizers also contribute to GHG emissions.

The main impact receptor for GHG emissions is the atmosphere. The increase in GHG emissions adds to the problem of global climate change, which can have a wide range of negative consequences. These consequences include rising temperatures, shifts in weather patterns, sea-level rise, and an increase in the frequency and intensity of extreme weather events.

❖ **Mitigation Measures**

- The project needs to introduce renewable energy sources such as solar-powered irrigation to lower the carbon footprint of rice production.
- The project needs support training farmers to use alternatives to straw burning, such as mulching or biomass energy generation, to reduce air pollution.
- The project promotes the utilization of efficient irrigation methods like alternate wetting and drying (AWD) to conserve water and minimize methane emissions.
- The project needs to advocate for policies that discourage straw burning and provide incentives for adopting sustainable agricultural practices.

6.2.3 Annual Crop Management Plan

6.2.3.1 Water resource efficiency

In this phase, inefficient irrigation practices can lead to a reduction in water resource efficiency. Moreover, people in community faced with flooding in wet season and drought in dry season generally. Additionally, farmers also pose with climate change issue which harm to their crop. The increased demand for irrigation, coupled with poor water management practices and lack of infrastructure, can result in the over-extraction of water resources. This over-extraction can have several detrimental effects on the surrounding environment and communities:

- Downstream Water Scarcity: Excessive withdrawal of water for irrigation can deplete water sources downstream, leading to water shortages for other users, such as communities, industries, and ecosystems.
- Altered Hydrology: Over-extraction can disrupt the natural flow patterns of rivers and other water bodies, affecting the balance of aquatic ecosystems and the services they provide.
- Damage to Aquatic Ecosystems: Reduced water flow and altered water levels can harm fish populations, other aquatic organisms, and the overall health of downstream ecosystems.

The impact receptors for inefficient water resource use are downstream communities and aquatic ecosystems, including those in the Tonle Sap Lake and its surrounding watersheds, this impact as the moderate. This assessment highlights the importance of implementing effective water management

strategies to ensure the sustainable use of water resources and minimize negative impacts on downstream users and ecosystems.

❖ **Mitigation Measures**

- Water use monitoring system to track consumption and identify areas for improvement.
- implementing appropriate irrigation scheduling based on crop water requirements and weather conditions.
- Utilizing efficient irrigation systems, such as drip irrigation or sprinkler systems, to minimize water loss.
- Exploring opportunities for water reuse, such as capturing and reusing runoff water.

6.2.3.2 Soil erosion and soil erosion risk

The various agricultural activities can elevate the risk of soil erosion and contribute to the degradation of soil health. Land preparation practices, such as tillage and site clearing, along with the use of heavy machinery, can disrupt the soil structure, making it more vulnerable to erosion by wind and water. Additionally, the intensification of farming can lead to changes in vegetation cover, reducing the natural protection against erosion.

Soil erosion poses significant threats to both the environment and agricultural productivity. The loss of topsoil, the fertile upper layer of soil rich in nutrients and organic matter, is a primary concern. This loss diminishes soil fertility, impacting its ability to retain water and nutrients crucial for plant growth. Consequently, agricultural yields decline, and farmers may experience reduced productivity. Furthermore, eroded soil particles contribute to increased sedimentation in water bodies such as rivers and lakes. This sedimentation can harm aquatic ecosystems and degrade water quality, increasing the costs associated with treating water for human consumption.

The impact receptors for soil erosion are soil health, water quality, and agricultural productivity. The sources assess the impact of soil erosion during the operation phase as high, emphasizing the need for sustainable land management practices to prevent and mitigate soil erosion.

❖ **Mitigation Measures**

- Minimize soil compaction and disturbance by using appropriate machinery and timing land preparation activities.
- Consider erosion management practices such as contour planting, terracing, and grass barriers.
- Adopt reduced tillage or no-till farming practices to minimize soil disturbance.
- Establish cover crops during fallow periods or in rotation with main crops to protect the soil from erosion.
- Practice contour farming on sloping land to reduce runoff and erosion.
- Construct terraces on steep slopes to prevent soil loss.
- Establish windbreaks or shelterbelts to reduce wind erosion.

- Install erosion control structures, such as grassed waterways or sediment basins, to manage runoff.
- Apply much to the soil surface to protect it from rainfall impact and erosion.

6.2.3.3 Nutrient application and management

The excessive or improper application of fertilizers poses a significant risk to water quality and the health of aquatic ecosystems. The intensification of agricultural production, driven by improved irrigation, can lead to an increased reliance on chemical fertilizers to enhance crop yields.

The impact receptors for nutrient runoff and leaching are water quality, aquatic ecosystems, and human health. High levels of nutrients, particularly nitrogen and phosphorus, in water bodies can lead to eutrophication, a process that causes excessive growth of algae. This algal bloom can deplete oxygen levels in the water, harming fish and other aquatic organisms. Additionally, contaminated water sources can pose risks to human health if used for drinking or recreational purposes.

The sources assess the impact of nutrient application and management during the operation phase as high, emphasizing the urgent need for sustainable farming practices that optimize fertilizer use and minimize the risks of nutrient pollution.

❖ **Mitigation Measures**

- Conduct periodic soil analysis to determine nutrient needs and avoid over-fertilization.
- Establish buffer zones near watercourses to filter nutrient runoff.
- Consider using green manures and cover crops to replenish soil nutrients and reduce leaching.

6.2.3.4 Use and effectiveness of pesticides

The use of pesticides to protect crops from pests and diseases can pose significant risks to human health, biodiversity, and the environment. The intensification of farming often leads to an increased reliance on pesticides to maintain high crop yields. However, the effectiveness of pesticides can decline over time as pests develop resistance, requiring farmers to apply higher doses or switch to more potent chemicals.

This cycle of pesticide use, and resistance can have several negative consequences. Pesticide exposure can pose health risks to both farmers who handle and apply these chemicals and consumers who ingest pesticide residues on food. Pesticides can harm non-target organisms, including beneficial insects, pollinators, and soil organisms, disrupting the balance of ecosystems. Environmental Contamination: Pesticides can contaminate soil and water resources, potentially affecting water quality and the health of aquatic ecosystems.

The sources assess the risks and impacts associated with pesticide use and effectiveness as high, highlighting the need for integrated pest management strategies that minimize reliance on chemical pesticides.

❖ **Mitigation Measures**

- Promote Integrated Pest Management (IPM) strategies to minimize pesticide use.
- Implement training and awareness programs for farmers on the safe handling and application of

pesticides.

- Providing training materials that are user-friendly and accessible to farmers with varying literacy levels.
- Including climate information and agrometeorology services in training materials when available.
- Preparing training materials for rice and other crops such as vegetables, poultry, and aquaculture.
- Organizing trainings on "climate-informed agriculture decisions and planning" and having trained individuals disseminate information.

6.2.3.5 Pesticide residues on site soil

The repeated application of pesticides, especially persistent pesticides, and the improper disposal of pesticide containers can lead to the accumulation of pesticide residues in the soil. This accumulation can have several detrimental effects on the environment such as contamination of Groundwater and impacts on Soil Organisms.

The impact receptors for pesticide residues on-site soil are soil health, biodiversity, and water quality. The sources assess the risk of pesticide residue accumulation in the soil as high, emphasizing the need for judicious pesticide use, proper disposal of pesticide containers, and integrated pest management strategies to minimize the risks associated with pesticide contamination.

❖ **Mitigation Measures**

- Promote the use of pesticides with low persistence and mobility in the environment.
- Implement a soil monitoring program to assess pesticide residue levels.
- Consider crop rotation and the use of cover crops to help break down pesticide residues.
- Minimize pesticide use by adopting IPM strategies.
- Conduct soil testing to monitor pesticide residue levels.
- Utilize cover crops to improve soil health and enhance pesticide degradation.

6.2.3.6 Pesticide residues on produce

During the operation phase of the irrigation project, the application of pesticides close to harvest, improper pesticide application techniques, and inadequate pre-harvest intervals can lead to pesticide residues on produce, posing risks to consumer health. Consuming produce with pesticide residues can have adverse effects on human health.

The main impact receptor for pesticide residues on produce is human health, specifically consumers who ingest the contaminated food. The sources assess the impact of pesticide residues on produce as moderate. This assessment highlights the importance of implementing safe pesticide application practices, adhering to pre-harvest intervals, and promoting alternative pest control methods to minimize the risks to consumer health.

❖ **Mitigation Measures**

- Enforce pre-harvest intervals to allow for pesticide breakdown before harvest.

- Promote the use of pesticides with low toxicity to humans.
- Properly wash and handle produce to remove surface residues.
- Implement a monitoring program to test produce for pesticide residues.
- Ensure compliance with established MRLs for pesticide residues on produce.

6.3 Social Risks and Impacts on Preparation Stage

6.3.1 Land Acquisition

6.3.1.1 Land acquisition and resettlement

The land acquisition for the construction of the irrigation system within the Yutasas sub-schemes has been limitedly anticipated since the construction of the new system has been avoided the most. The land acquisition in the Yutasas sub-scheme is primarily driven by the construction of infrastructure components such as Embankment, Main Canal, Main Drain, and second drain. These activities are projected to affect a total land area approximately 24,180 m^2. Consultation result addressed that they have concerns of land affected by construction near irrigation systems or the placement of construction projects, with some areas of land that people are using being close to harvest time and potentially rendered unusable but due to the project announcement the project implementation will be inform 6 months in advanced where this issue will be encounter. The affected households will feel not well due to land impact.

Consultation with the Provincial Department of Land Management, Urban Planning and Construction (PDoLMUPC) has revealed that all the land required for this sub-scheme falls under public ownership. Therefore, the land acquisition process is anticipated to proceed without impacting any private property.

❖ **Mitigation Measures**

- The preparation of Land Impact and Land Acquisition Assessment Screening Report or Checklist to confirm the impact is required or the Abbreviated Land Resettlement Plan.

6.3.1.2 Economic displacement

The risk of economic displacement is linked to activities like the rehabilitation of irrigation canals and farm roads, and land acquisition. These activities can disrupt existing economic activities and displace households and businesses. The upgrading of irrigation systems may result in the removal of informal farming areas due to dredging, impacting those who rely on these areas for income. Additionally, during the construction phase, local businesses and transportation routes might face disruptions due to construction activities, affecting the community's daily life and economic activities. The Yutasas Sub-scheme encompasses various infrastructure components, including Embankment, Main Canal, Main Drain, and second drain.

The impact receptors for economic displacement include households who have production land along the water bodies, informal land users, informal settlers, and nearby construction site business owners. The assessment regard this impact of economic displacement as moderate.

❖ **Mitigation Measures**

- The households who own the land along the rehabilitated canals which will be expanded at the public land should be properly informed prior to the construction to avoid their crops will be damaged at the time of construction.
- Although the acquired land is the public land, there are a need of a proper consultation and information to be conducted to inform and obtain agreement from the affected households.

6.4 Risks and Impacts at Construction Stage

6.4.1 Protecting The Workforce

6.4.1.1 Child Labor

The risk of child labor emerges due to the demand for unskilled labor in rural areas where the use of child labor is prevalent. Contractors and subcontractors involved in the project's construction activities may employ children or youth under the legal working age due to labor shortages or the drive to minimize costs. This practice exploits vulnerable children, depriving them of education and opportunities, and perpetuates a cycle of poverty.

The risk of child labor, particularly due to the influx of labor and pre-existing societal inequalities. Vulnerable groups, such as poor and near-poor households, female-headed households with dependents. Children from these groups are often driven to work due to economic hardship, and the increased demand for labor during project construction can exacerbate this situation. Migrant workers, often facing precarious working conditions and separated from support systems, are also highly vulnerable to exploitation, including child labor. The project's Gender Assessment identifies the lack of local wage jobs and increasing migration as key challenges that could further heighten the risk of child labor.

❖ **Mitigation Measures**

- Apply LMP for age check prior to engagement of labor with regular monitoring through proper screening and registering all workforce for the work
- To mitigate the risk of child labor, the project will implement strict measures to ensure compliance with national and international labor laws. Regular monitoring and inspections will be conducted to identify and address any instances of child labor.
- Additionally, awareness-raising campaigns will be implemented to educate communities about the harmful effects of child labor and the importance of sending children to school. The project will also collaborate with local authorities and NGOs to strengthen law enforcement and provide support services to vulnerable children and their families.

6.4.1.2 Forced Labor

In the construction phase, the risk of forced labor is anticipated, especially for vulnerable individuals who may be coerced into working against their will. Forced labor can manifest in various ways, including:

- Economic Coercion: Individuals may be forced to work due to financial pressures, such as the need to repay debts or support their families.

- Exploitation of Young People: Young people, particularly those from impoverished backgrounds, may be forced to work to contribute to family income or due to a lack of educational opportunities.
- Debt Bondage: Workers may be trapped in a cycle of debt by unscrupulous employers who advance them loans with exploitative terms, effectively binding them to work until the debt is repaid.
- The rehabilitation of irrigation canals and farm roads creates a demand for local labor which can be exploited by those who seek to profit from forced labor.

❖ **Mitigation Measures**

- Strict Code of Conduct for workers with no tolerance for physical or verbal abuse of women or children
- The Project Owner and Sub-Contractors will collaborate with the relevant Government Agency to disseminate information to local communities. This information will include the Contractor's Code of Conduct and the minimum working age as mandated by national laws and international standards.
- The Ministry of Water Resources and Meteorology (MOWRAM) will provide information to local communities about the contractor's policies and responsibilities, including the Contractor's Code of Conduct and minimum working age.

6.4.2 Community Health and Safety

6.4.2.1 Disease transmission

During construction phase, the risk of disease transmission is anticipated due to the influx of construction workers, the potential for their lack of hygiene in living conditions, and their interaction with local community members. The influx of workers increases the likelihood of spreading and contracting communicable diseases, both among the workers themselves and between workers and the local community. Workers may experience poor eating habits, homesickness, stress, and unhygiene living conditions which make them susceptible to diseases.

❖ **Mitigation Measures**

- Conduct public awareness raising activities (IEC) to ensure local people and contractors know about the risks of contracting and spreading communicable diseases such as COVID-19, HIV/AIDS, and water-borne diseases (e.g., amoebiasis, giardiasis, and toxoplasmosis. etc.
- In the event of a disease outbreak (e.g. COVID-19), provide immediate training/awareness raising to the risk groups.
- Conduct training to workers on communicable diseases prior to mobilization to construction sites.
- For water-borne diseases that arise due to polluted or contaminated water, mitigations measures may include:
- Implement filtration, chlorination, or UV disinfection to ensure safe drinking water.
- Build and maintain proper sewage systems and latrines to prevent water contamination.

- Promote handwashing, safe food preparation, and proper sanitation practices in communities.
- Control and properly dispose of waste to prevent water pollution.
- Test water sources frequently for contamination and take corrective actions promptly.

6.4.2.2 Sexual Exploitation and Abuse, Sexual Harassment

The risk of Sexual Exploitation and Abuse/ Sexual Harassment (SEA/SH) is envisaged due to several factors. The influx of workers estimated to be approximately 171 in Krang Ponleng river, as the Yutasas is a part of this scheme, frequent visits by project personnel, and pre-existing SEA/SH issues in the area all contribute to this risk. This risk is primarily associated with the rehabilitation of irrigation canals and farm roads. The influx of labor includes not only construction workers but also individuals who provide logistical services, increasing the potential for exploitation.

❖ **Mitigation Measures**

- Contractors need to explicitly state zero tolerance for sexual harassment, exploitation, and abuse within the workplace.
- Require Code of Conduct (CoC) to be signed by all construction workers.
- For victims coming forward: referral to qualified SEA/SH service provider. The GRM will include a confidential channel for reporting SEA/SH.
- Strict Code of Conduct for workers with no tolerance for physical or verbal abuse of women or children
- Training on SEA/SH and VAC for community members, in particular women and girls (may be done separately for men and women).
- Ensuring workers' sites are situated (at least 500m) from schools and/or other areas where children congregate.
- Ensure access to grievance redress mechanisms for all project-affected persons, including both stakeholders and workers, to address Sexual Exploitation and Abuse, and Sexual Harassment. Support (in the form of training, awareness raising, etc.) to local law enforcement to act on community complaints regarding SEA/SH and VAC.
- Provision of information to local communities about the contractor's policies and responsibilities, including the Contractor's Code of Conduct and minimum working age.
- Provide counselling services for male and female workers, wives and other female partners of contractors' workers.
- Build partnerships with local health providers and SEA/SH service providers to conduct community awareness activities, and referrals.
- Implement public awareness campaigns to address sexual harassment in transport services and hubs, and training of police on women's security needs when using transport.

6.4.2.3 Traffic safety & Security

During construction phase, traffic safety is among the local concerns. The rehabilitation of irrigation canals and farm roads necessitates increased transportation of construction materials and equipment, potentially leading to road accidents, especially if safety measures are not strictly enforced. Construction activities can also attract unauthorized individuals seeking to steal or vandalize equipment and materials, further compromising security. The influx of construction workers into the project area may also contribute to a perceived or actual increase in crime rates, impacting the sense of safety among residents.

People subject to risk of traffic accident include anyone which may include project workers and local people who live near the construction sites or travel on transportation routes.

❖ **Mitigation Measures**

- Arrange security guard or engage local authority to guard the construction sites
- Conduct public awareness raising activities (IEC) to ensure local people and road user are aware of road safety regulations and risks and act accordingly while using road.
- Monitor and observe speed limit.

6.4.2.4 Community Health and diseases

During the construction phase, community health and safety risks extend beyond disease transmission and include the potential for accidents and injuries related to construction activities. Rehabilitation work on canals and ponds poses drowning risks, especially for children and those unfamiliar with the altered water bodies. Trespassing in construction zones, which may contain storage areas, camps, lay down areas for construction materials, vehicles, and machinery, presents further risks of incidents and accidents for community members. Additionally, construction activities can lead to traffic and access disruptions that may cause safety issues for the community. The presence of construction workers and associated activities can also lead to potential conflicts with local communities. Construction sites also pose risks of accidents and exposure to construction related hazards.

❖ **Mitigation measures:**

- Establish clear and well-marked construction exclusion zones to prevent unauthorized access, especially to areas with open water, heavy machinery, and storage areas.
- Implement fencing and barriers to prevent trespassing and ensure community safety around construction areas.
- Provide warning signs in local languages to inform communities about the dangers and restricted access to construction areas.
- Install safety barriers around construction sites to minimize risks to the community and workers.
- Ensure proper storage of construction materials, with no materials left unsecured and scattered around the site.
- Develop and implement traffic management plans to minimize traffic and access disruptions and ensure pedestrian and vehicle safety.

- Conduct community awareness campaigns to educate the community about the potential risks and safety measures during construction.
- Establish and maintain a grievance mechanism to address community complaints and issues promptly.
- Implement safety measures around canals and ponds to prevent drowning incidents, such as installing safety barriers and providing warning signs in local languages.
- Create and enforce clear rules regarding access to canals and ponds during construction, and post those rules.
- Implement strict health and safety regulations at all construction sites to protect both workers and the nearby communities.
- Provide training to workers on safety protocols, including how to work safely around water, avoid accidents and minimize risks to the community.
- Ensure all workers are provided with necessary personal protective equipment (PPE) and enforce its use.

6.4.2.5 Personal Protective Equipment

The construction or rehabilitation of irrigation canals and farm roads during the construction phase presents significant risks to worker safety and health due to the potential lack of personal protective equipment (PPE). These activities involve Embankment, Main Canal, Main Drain, and second drain, which expose workers to various hazards, such as Falling Debris, Sharp Objects, and Heavy Machinery.

The absence of proper PPE significantly increases the likelihood of injuries, such as cuts, fractures, or head trauma. Workers without respiratory protection may inhale dust, fumes, or toxic substances, potentially leading to respiratory problems. Similarly, inadequate eye and hearing protection can result in vision impairment or hearing loss due to flying particles and high noise levels. Furthermore, the lack of proper footwear and gloves increases the risk of slips, trips, and falls, and exposure to hazardous materials.

The impact receptors for risks associated with the lack of PPE are primarily construction workers but also include inspectors and visitors to the construction sites. The sources assess the risk associated with inadequate PPE as high, particularly in rural construction settings where cost-cutting measures might compromise worker safety. The sources emphasize that the absence of PPE not only jeopardizes individual safety but also reduces productivity and increases liability risks for the project.

❖ **Mitigation Measures**

- Continue and active use of PPE at all times of construction.
- Identification and provision of appropriate PPE that offers adequate protection to the worker, co-workers, and occasional visitors, without incurring unnecessary inconvenience to the individual
- Proper maintenance of PPE, including cleaning when dirty and replacement when damaged or worn out.

- Proper use of PPE should be part of the recurrent training programs for employees.

6.4.2.6 Working conditions and Management of Worker

The construction or rehabilitation of irrigation canals and farm roads during the construction phase of the project carries a risk of underpaid pay and unequal treatment for local workers hired by project contractors. This risk is exacerbated by the lack of written contracts for unskilled workers, particularly those recruited locally. Without a formal contract, these workers are vulnerable to being underpaid compared to the demands and scope of their work.

The potential for underpayment to occur based on gender and temporary work status, further marginalizing already vulnerable groups. The absence of clear contractual terms also increases the risk of late wage payments or even non-payment, jeopardizing the workers' livelihoods and potentially delaying the project's progress. The impact receptors for underpaid pay and unequal treatment are primarily unskilled workers (mostly local people) and construction workers, particularly women.

❖ **Mitigation Measures**

- Implement a grievance mechanism for workers where workers can report issues related to underpayment or unequal treatment without fear of retaliation.
- Advise companies to provide equal opportunities for employment and promotions to all workers, regardless of gender, ethnicity, or background, to avoid discrimination.
- Regularly monitor and audit payroll and employment practices to ensure compliance with labor regulations and address any disparities.
- Offer training and capacity-building programs for all workers to enhance their skills and qualify them for higher-paying roles.
- Ensure that subcontractors and suppliers also adhere to fair wage and equal treatment policies.
- Set up worker committees or unions to allow collective bargaining and ensure workers have a voice in addressing wage and treatment issues.
- Provide accessible information to workers about their rights, entitlements, and the proper channels to address grievances through the establishment of the GRM for workers.
- Labor Rights and the Workers' Code of Conduct Regularly engage with labor rights organizations or third-party auditors to evaluate labor conditions and make improvements where necessary.

6.4.3 Cultural Heritage

No significant cultural sites being presented within the sub-scheme. However, there is a possibility that construction activities might unearth archaeological artifacts buried deep in the soil as the sub-scheme is nearby to Longvek leading to the possibility that treasures or artifacts of historical significance were hidden underground. The impact receptors for cultural heritage risks are primarily underground cultural sites, and the sources assess the risk as minor.

❖ **Mitigation Measures**

- Implement Find Chance Procedure

6.4.4 Cross-Cutting

6.4.4.1 Loss access to land and other assets

In the construction phase, activities like upgrading existing canal, and implementing river training measures, carries a moderate risk of temporarily or permanently restricting access to natural resources for local communities. Additionally, the influx of construction workers and the establishment of temporary facilities like worker camps could strain local resources, including water sources and forest products, potentially leading to overexploitation and environmental degradation.

❖ **Mitigation Measures**

- The project will prioritize avoiding physical resettlement and minimizing land acquisition. Design adjustments will be made to avoid or reduce land requirements, especially on private land. Public land will be prioritized for any necessary acquisition.
- Where land acquisition is unavoidable, the project will employ a negotiated settlement process with affected households. This process, guided by the RGC's Standard Operating Procedures on Land Acquisition and Involuntary Resettlement (SOP-LAR), aims to ensure that affected households receive fair and adequate compensation for their losses and maintain or improve their income and livelihood status.
- All individuals with assets within the Corridor of Impact (COI) before the Cut-Off-Date (COD) will be eligible for compensation, regardless of their legal status. Compensation will be provided for various losses, including land, structures, crops, trees, and income-generating activities.
- Recognizing the potential disruption of income streams during relocation or construction, the project will provide transitional allowances to affected households. These allowances will help cover living expenses and bridge the gap until they can resume their livelihoods.
- A multi-tiered GRM will be established to address grievances from any project-affected person. The GRM will operate based on the principles of the Green Climate Fund (GCF) and be accessible at no cost to the complainant.

6.4.4.2 Loss access to natural resources

The construction phase of the irrigation project, specifically activities like upgrading existing canal, carries a moderate risk of temporarily or permanently restricting access to natural resources for local communities. Additionally, the influx of construction workers and the establishment of temporary facilities like worker camps could strain local resources, including water sources and forest products, potentially leading to overexploitation and environmental degradation.

❖ **Mitigation Measures**

- Implement efficient water management practices during construction and operation to prevent over-extraction of water resources from reservoirs and rivers and ensure equitable distribution for downstream communities and ecosystems.
- Use environmentally friendly construction materials and techniques to reduce the risk of pollution. Properly manage construction chemicals, fuels, and waste to prevent water pollution and

contamination of natural resources. Prepare and implement a waste management plan to handle waste generated from construction activities and worker camps.

- Optimize construction material use and recycle, when possible, to minimize the extraction of new resources. Implement energy-efficient construction practices and use renewable energy sources where possible.
- Maintain ongoing communication with affected communities, including farmers, fishers, and downstream communities, to address concerns about natural resource access. Provide information and education to construction workers about responsible use of local resources and respect for community access rights. This suggestion is informed by the sources but is not directly stated in them.
- Ensure the GRM is accessible to all community members to address complaints related to natural resource access.

6.4.4.3 Social inequality

The engagement and consultation processes during the design and construction phases of the irrigation project present a moderate risk of social inequality. The sources indicate that while landowners in the project areas are mainly from local communities, suggesting relatively equal access to the consultation process, vulnerable groups without farmland may have limited opportunities to participate and benefit from the rehabilitated irrigation system.

This potential for exclusion raises concerns about the fair distribution of project benefits. While the overall impact of social inequality during the construction phase is assessed as moderate.

❖ **Mitigation Measures**

- Conduct participatory planning and regular consultations with local communities, particularly marginalized groups (e.g., women, smallholder farmers, indigenous communities).
- Prioritize hiring local labor, with special provisions for disadvantaged groups (e.g., youth, women, minorities) in both skilled and unskilled positions.
- Develop and enforce water allocation plans that ensure fair access to water resources for all users, including small-scale and subsistence farmers, during and after construction.
- Implement fair and transparent compensation or resettlement plans for those displaced or affected by construction activities, especially vulnerable households.
- Establish accessible and responsive grievance redress mechanisms, ensuring all community members can raise concerns or complaints during construction.
- Conduct regular social impact assessments, with a focus on identifying inequality trends, and adjust project strategies to mitigate negative effects.
- Provide support and training for affected communities to diversify their livelihoods, especially for those whose livelihoods may be disrupted by construction (e.g., farmers, traders).
- Ensure transparency in the contracting process, including the selection of subcontractors and

suppliers, with opportunities for local businesses, especially those run by marginalized groups.

6.4.4.4 Elite capture

The risk of elite capture is anticipated given the fact these local elite could potentially influence the project to provide them project benefits. While the majority of landowners within the command areas are from the local community, which reduces the likelihood of large-scale land grabbing by powerful individuals or groups, the sources acknowledge the potential for the wealthy to use their influence, connections, or resources to encroach upon protected areas for personal gain. The risk of elite capture is assessed as moderate.

❖ **Mitigation Measures**

- Consultation will be conducted farmers in potential command area, focusing on vulnerable/disadvantaged groups
- Alternative livelihoods for vulnerable group are identified based on their needs vis-à-vis project's investment eligibility
- Conduct consultation at community level (in the command area) to achieve a consensus on how water needs are balanced between different groups in one command area.
- During subproject design, water availability, storage capacity, and water needs of upstream and downstream population are calculated to inform design, and water use coordination during project operation.
- Water user groups should be established for upstream and downstream population and should be coordinated by a higher-level committee/group to negotiate and optimize water coordination
- Guidelines/Manual should be developed to provide guideline for upstream and downstream communities at subprojects to meet, discuss, and achieve consensus on how water is distributed for equal use between upstream and downstream population

6.4.4.5 Gender inequality

The risk of gender inequality due to limited access for women to training, resources, and decision-making processes related to irrigation and agriculture. This risk stems from pre-existing gender inequalities in Cambodia, where women often face barriers in accessing resources, technology, and leadership roles. The impact receptors for this risk are women farmers and laborers, who may be excluded from the full benefits of the project.

❖ **Mitigation Measures**

- Implement the Gender Action Plan and measures to promote women beneficiaries' improved participation in project planning and implementation, and their economic empowerment.
- Ensure women have access to training, resources, and decision-making processes related to irrigation and agriculture. This includes providing training in local languages at times and locations convenient for women. Childcare provisions can facilitate women's attendance.
- Set targets for women's participation in all project activities.

- Raise awareness of the importance of sharing household chores and farming workloads. This can give women more time to learn new skills, attend training, and participate in project activities.
- Promote women's access to skills and business development training centered around project target value chains for commodities such as rice, poultry, vegetables, and fish.
- Encourage the use of labor-saving technologies that can help reduce women's workloads in farming and household activities.
- Support women's involvement in off-farm activities, such as processing and value addition as well as investments in green products and women-led green enterprises.

6.5 Risks and Impacts at Operation Stage

6.5.1 Community Health and Safety

The potential for water uses conflicts during the operation phase, particularly between upstream and downstream users, and recognizes the risk of accidental drowning, especially among children. The introduction of irrigation infrastructure and increased agricultural activity may alter existing water allocation patterns, leading to disputes between upstream and downstream communities. Upstream users may prioritize their own irrigation needs, potentially reducing water availability downstream, affecting livelihoods and ecosystems. This situation could exacerbate competition for water resources. The construction of rehabilitation and farm road introduces open water bodies into the landscape, increasing the risk of accidental drowning, particularly for children.

❖ **Mitigation Measures:**

- The project will promote IWRM principles to ensure the equitable and sustainable allocation of water resources. This involves considering the needs of all stakeholders, including upstream and downstream communities, as well as environmental flow requirements for maintaining healthy ecosystems.
- Establishing a system for monitoring water use and enforcing water allocation regulations will help prevent over-extraction and ensure a reliable water supply for all users. This may involve installing flow meters, conducting regular water audits, and implementing penalties for non-compliance.
- The project will strengthen the capacity of FWUCs to manage water resources at the local level. This includes training on water allocation, conflict resolution, and operation and maintenance of irrigation infrastructure. Effective FWUCs can play a crucial role in mediating disputes and ensuring fair water distribution within their communities.
- Raising awareness about water safety and the risks associated with open water bodies, especially among children, is essential. Educational campaigns, signage, and community outreach programs can help promote responsible behavior and prevent accidents. This information could be included in the training programs that will be provided to farmers and communities.
- The project will consider incorporating safety features into the design of irrigation infrastructure. This may include fencing around canals and reservoirs, installing safety ladders, and providing

designated swimming areas away from irrigation structures.

6.5.2 Cross-Cutting

6.5.2.1 Gender inequality

The sources emphasize that women are less resilient to climate change than men and face unique vulnerabilities in terms of income, housing, and access to information and support systems. Socially defined gender roles can also hinder the adoption of climate-smart technologies among women. As a result, women may experience unequal access to water resources, limited participation in Farmer Water User Communities (FWUCs), and a disproportionate burden of negative impacts on their livelihoods.

The Yutasas sub-scheme is a part of the CAISAR project. The social studies in this project show that, women-led households made up 15% of all sub-schemes, which is seen as a significant percentage. There is still gender disparity, which makes it difficult for them to participate in and profit from the project. Men often overestimate, which diverts women's attention from the involvement. Increased gender-based trainings for men and increased support for all vulnerable groups should be proposed by the local government and project implementer.

❖ **Mitigation Measures**

- The project should actively encourage women's participation in the formation of FWUCs, empowering them through critical decision-making roles and equipping them with the necessary skills and resources to amplify their voices.
- The project should ensure that women have equal access to training programs and resources, such as land, credit, and technology.
- The project should monitor gender equality indicators and should make adjustments as needed to ensure that women are benefiting from the project.

6.5.2.2 Social inequality

In this phase, the concerning the competition for water resources among different user groups (farmers, communities, industries) and the potential displacement or restricted access to land due to irrigation infrastructure expansion, presents a minor risk of social inequality. Although the project aims to engage and consult with communities during the design and construction phases, vulnerable groups may still face limited access to irrigation water during the operation stage. This risk is especially relevant for farming communities, indigenous populations (if present), landless or land-poor households, and other vulnerable groups.

The vulnerable groups without farmland might have limited opportunities to benefit from the rehabilitated irrigation system. The impact of this social inequality is considered minor due to the relatively small proportion of poor people within the command area. However, it is important to note that the limited access to resources and capacity could hinder the full potential of efforts to support these vulnerable groups.

❖ **Mitigation Measures**

- Ensure Equitable Water Access: Mechanisms should be in place to support vulnerable and marginalized communities in accessing water resources.

- FWUCs will manage the irrigation systems and ensure sustainability through fee collection. The project will invest in establishing and training FWUCs, emphasizing inclusivity and capacity building for vulnerable groups.
- Implement a Simplified Integrated Pest Management (IPM) Plan.

6.5.2.3 Elite capture

The operation of the irrigation system during the operation phase creates a minor risk of elite capture due to the potential for unequal distribution of project benefits. This could result in powerful individuals or groups gaining a disproportionate share of the benefits at the expense of the intended beneficiaries. This risk is linked to the engagement and consultations conducted during the design and construction phases, as those processes might not fully prevent elite capture during the operational phase.

The main impact receptors are smallholder farmers, marginalized communities, and other vulnerable groups. Despite the project's efforts to ensure equitable access to resources, the sources highlight that wealthy individuals or groups could potentially leverage their power, connections, and resources to secure a larger share of water resources or control over irrigation infrastructure. This situation could further exacerbate existing social disparities and undermine the project's goal of improving livelihoods for all community members. The sources assess the risk of elite capture during the operation phase as minor. This assessment considers factors like the predominance of local landowners within the command areas and the current high land prices, which make large-scale land grabbing economically unfeasible.

❖ **Mitigation Measures**

- Transparent and accountable FWUC management: Clear guidelines, diverse representation, and grievance redress mechanisms are essential to prevent manipulation and ensure equitable water distribution.
- Regular monitoring and evaluation: Continuous monitoring of project impact, especially on vulnerable groups, can identify and address elite capture.
- Strengthened land tenure security: Clarifying land rights can protect smallholder farmers and marginalized communities from land grabbing.
- Community engagement: Active community participation, especially from vulnerable groups, empowers them and ensures their needs are met.

6.6 Summary of the Mitigation measures for the Environmental and Social

Based on the ESC risks and impacts identified and assessed, a summary of proposed mitigations measures is presented in table below.

6.6.1 Mitigation Measures for the Environmental and Climate Risks and Impacts

Table 41: Preconstruction, Construction, and Operation Phase Environmental Mitigation Measures

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
Preconstruction phase				
1	Unexploded Ordnance (UXO) survey & removal			
	Risk of injuries or fatalities among workers or members of the public	• Carry out UXO screening/assessment by certified UXO experts before any physical/ construction activities are allowed. • In case UXOs are found by certified experts during on-site screening, removal of UXO will be carried out by certified experts. • A UXO clearance certificate shall be obtained from related authorities for each sub-project prior to commencing any subproject activities. • As part of site-specific ESCMP, we conduct training and awareness activities for local community with regards to UXO risks and chance finds.	PMU Contractor	Before construction
Construction phase				
ENVIRONMENTAL, HEALTH, AND SAFETY				
1	Noise and Vibration			
	• Earthmoving activities and the operation of machineries at construction sites will generate dusts and exhaust fumes. • Construction activities, operation of vehicular movement, excavation machinery, concrete mixing, and other construction activities will generate noise and vibration and will be a nuisance to workers and residents near the site. • Noise may be generated from workers' camp, particularly during living activities or entertainment at nighttime, or due to certain maintenance /repair of equipment, machinery, vehicles.	• Maintain all exhaust systems in good working order and undertake regular equipment maintenance to ensure compliance with applicable regulations and manufacturers' instructions. • Implementation of operating and maintenance practices of equipment and machinery to ensure that they are well-maintained. • Ensure that noise control options such as silencers and mufflers are fitted to exhausts, compressors and fans for construction equipment (such as hydraulic excavator, bulldozer, front loader, backhoe and trucks). • Provide advance warning to the community on timing of noisy activities. Seeking suggestions from community members to reduce noise annoyance and notify the communities about how to raise their concerns (if any) through the Grievance Redress Mechanism. • Undertake noise monitoring at the closest residential area and other noise sensitive receptor during times with ongoing construction work to ensure compliance with the relevant noise standards. • The contractor shall provide all construction personnel working in the vicinity of noisy construction activities (defined as those activities generating noise levels greater than 80 dB(A)), or any construction	• PMU • Contractor	Daily/ Every 06 months

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
		personnel who request hearing protection, with hearing protection equipment. • A speed limit of 30 km/h for construction related traffic through inhabited areas. • The contractor shall conduct noise testing at the sensitive locations as per the detail engineering design comparing to the IFC EHS Guideline • Avoid night-time construction in populated/village areas. • No noisy construction-related activities will be carried out from 21:00 hours to 06:00 hours along residential areas, hospitals, schools and during religious or cultural events near the subproject • Provide temporary noise barriers (3–5-meter-high barrier can reduce 5–10 dB(A)), as necessary, if site works will generate high noise levels that could disturb nearby households, hospital, school and other sensitive receptors. • Restrict use of vibrating rollers and operation of heavy equipment near sensitive structures.		
2	**Air pollution**			
	• Dust and particulate matter (PM10 and PM2.5) generation from soil disturbances, stockpiles, and road works • Exhaust emissions from trucks and heavy machinery (NOx, CO, SO2, VOCs) • Waste disposal, particularly through burning	• Spray or sprinkle water on the work surfaces and other piled materials to minimize dust at least 3-6 times per day in windy and dry weather and/or based on the weather condition. • Select Borrow sites located as close as possible to the construction to reduce distances. • If Concrete batching facilities are in need, it will be located at least 500 m (0.5 km) downwind from the nearest dwellings to reduce the impact of dust and fumes on humans and to be fitted with necessary equipment such as bag house filters to reduce fugitive dust emissions. • Water will be regularly sprayed to suppress fugitive dust at construction sites, material handling areas, access road and borrow pits. • Trucks carrying dry construction materials such as earth or waste will be covered with tarpaulins or other suitable cover. • Construction vehicles and machinery will be maintained to a high standard to minimize emissions and ensure compliance with the National exhaust emission standards. All mobile equipment should be fitted with catalytic converters. • A speed limit of 30 km/h for construction related traffic through inhabited areas and on the access road will be enforced. • All open burning of construction and demolition waste material and refuse will be prohibited. • Testing air quality (NO_2, SO_2, CO, TSP, PM10, PM2.5)	• SEO • E&S specialist consultants • PMU	Daily/ Every 06 months
3	**Impact on Water**			
	• Dredging projects along the rivers and canals • Sedimentation can reach downstream areas, including the Tonle Sap Lake, if not properly mitigated.	• Installation of temporary non-erodible ditches or bunds at the construction site to divert clean runoff away from exposed areas and convey potentially dirty runoff to sediment control devises. • Stockpiles and materials will be stored at least 50 m from surface waters with drainage directed away from the canals and streams or water sources.	• SEO • E&S specialist consultants • PMU	Daily/ Every 06 months

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
	• Infiltration of wastewater from workers' camps can contaminate groundwater. • Leakage of hazardous materials like oil and diesel from machinery and vehicles can pollute both surface and groundwater.	• The sediment quality of the dredge spoil will need to be tested and assessed against an appropriate standard before re-use in the structure of embankments. The sediment testing results will confirm safe re-use of the material • No washing or repair of machinery within 50 m of surface waters. • Portable toilets and small wastewater treatment units will be provided at the construction site and labour camps. All sanitary facilities will be located at least 50 m from surface water bodies. All workers must be instructed to use these facilities, which should be always kept clean. • Pit latrines and septic tanks should be placed at least 2 m above the groundwater table, which must be located at least 50 m from surface water bodies and water wells and in areas of suitable soil profiles. • All hazardous materials including hazardous waste will be stored on an impervious surface, under cover, in adequate tanks or containers and within secondary containment.. • Areas where spills of fuel or oil may occur will be equipped with easily accessible spill control kits to assist in prompt and effective spill control. • Hazardous waste (oil waste) shall be properly collected and stored in closed containers under shelter for recycling or disposal by a duly authorized enterprise. • Testing surface water quality (Depth, pH, EC, AS, Cd, Pb, TN, TP, TDS, TSS, DO, and Total Coliform) and pesticide residues in water (to be conducted overseas).		
4	**Solid and Hazardous Waste**			
	• Hazardous wastewater, such as oil or fuel, polluting materials used for machinery and construction processes at the construction site.	• Storage facilities for fuels, oil, cement, and chemicals shall be within secured areas on impermeable surfaces, provided with bunds and cleanup installations. • Vehicles and equipment shall be properly staged in designated areas to prevent contamination of soil and surface water. • Vehicles, machinery, and equipment maintenance and re-fueling will be carried out in such a way that spilled materials do not seep into the soil; • Oil traps will be provided for service areas and parking areas; • Fuel storage and refilling areas will be located at least 50m from canals and channels and will be protected by temporary drainage bunds to contain spills.	• PMU • Contractor	Daily
5	**Waste and Wastewater**			
	• Domestic wastewater comes from workers/staff's water consumption daily.	• Recyclables will be separated at source and given/sold to recycler (plastic, metal, card, paper as a minimum). • Safe temporary storage of hazardous waste as required • To the extent possible, a duly authorized waste company will be contracted to recycle hazardous waste. • Non-hazardous, non-recyclable solid waste will be temporarily deposited and managed together at existing landfill/dumpsite. • All vehicles/drivers will be provided with plastic bags for waste collection and prevent any unauthorized waste disposal with particular attention paid to prevention of littering.	• PMU • Contractor	Daily

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
		• The Contractor will be required to train the workers in proper waste management.		
6	**OCCUPATIONAL HEALTH AND SAFETY**			
		• Prepare a health and safety plan containing site-specific precautions in accordance with relevant occupational health and safety guidelines; • Inspect and check the relevant construction equipment to ensure that it meets the applicable mechanical and safety requirements; • Inspect the worksite to ensure that the equipment can be safely mobilized and operated, and that there are no unmitigated risks; • Install appropriate fencing and control access to the site; • Install appropriate safety signage and markings; • Provide fall protection when workers are exposed to unguarded platforms or walkways higher than 2 m; • Ensure there are safe ways to enter and exit the excavation; • Keep excavations dry; • Provide safety precautions when using high voltage electric power tools; • Carry out daily toolbox meetings (safety briefings); • Maintain an accident record book where all major or minor accidents and incidents are recorded with actions taken; • Educate the workers on construction hazards; • Train drivers on safe driving skills and traffic regulations; • Appoint an Environment, Health and Safety Officer who is a qualified engineer; • Make adequate first aid equipment available on site; • Carry out training and awareness of the workers on HIV-AIDS prevention; • implement emergency preparedness and response procedures Response Plan as planned in the CEMP. • Ensure that all workers are equipped with and use Personal Protective Equipment (PPE). • The Contractor will set out an Emergency Response Plan	• PMU • Contractor	Daily/Weekly
7	**COMMUNITY HEALTH AND SAFETY**			
		• Prior to the start of construction work, the contractor in cooperation with the PIU will consult with the local authorities and potentially affected residents/private landowners. Inform them about the upcoming construction work, safety precautions and how to raise concerns or file complaints (GRM). • The contractor shall fence off the construction area and control access to the site. • A speed limit of 30 km/h for construction related traffic through inhabited areas. • The contractor shall install traffic signage and fluorescent bollards and warning lights to direct traffic and prevent vehicles driving into the lanes with construction activities.	• PMU • Contractor	Daily/Weekly

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
		• The contractor, in cooperation with the local authorities, shall implement traffic management to ensure a smooth traffic and prevent congestion.		
BIODIVERSITY				
1	**Hunting and trading, and consumption of wildlife**			
	• The influx of a new labor force can increase demand for exotic local foods, including wildlife and endangered species, which are often seen as interesting and delicious. This may be done for relaxation or belief that wildlife is tasty or making people healthy.	• Develop and enforce a strict Code of Conduct/ethics against wildlife collection, possession, and trafficking. This includes clear policies and sanctions for employees and subcontractors. • Provide mandatory training for contractors' management staff and site workers on the Code of Conduct, Standard Operating Procedures (SOP) for wildlife protection and handling, and human-wildlife conflict management. • Incorporate a policy in the Project Administration Manual (PAM) and Worker's Agreement that prohibits employees and/or subcontractors from possessing, purchasing, trading, or collecting wildlife or forest resources that are legally protected, CITES listed, or classed as threatened by the IUCN Red List. • Educate construction workers about the importance of wildlife conservation and the laws regarding hunting and trading of protected species. • Implement strict penalties for violating wildlife protection laws. • Collaborate with local communities to monitor wildlife populations and report any suspicious activities.	• SEO • PMU • Contractor	Daily/Weekly
2	**Loss of fauna and flora**			
	• Construction activities, particularly in areas like Lum Hach with community forestry, can significantly impact wildlife habitats. • New canals and roads require vegetation clearance, further fragmenting habitats. • Habitat loss poses a serious threat to endangered species like the Elongated Tortoise, Giant Asian Pond Turtle, and Hairy-nosed Otter.	• Properly handle and rescue wildlife incidentally encountered or caught during land clearing and construction by relocating them to safer habitats, following the Standard Operating Procedure (SOP) for wildlife protection and handling. • Conduct thorough biodiversity inspections along the access roads and at quarry sites before starting any land clearing works to identify any habitat and/or nesting sites of endangered/ protected species that may be affected by the clearing and identify hotspots where collisions with wildlife are likely to occur. • Train field workers to recognize and avoid wildlife. • Install signage to alert drivers to the presence of wildlife and require them to slow down and drive with caution, especially in hotspots where collision with wildlife is likely to occur. • Develop a system in which drivers report locations of wildlife crossings and wildlife sightings. • Workers will receive training on frequently encountered wildlife. • The contractor shall install signs to ban hunting or catching wildlife in the area. • Apply Find Chance Procedure	• SEO • E&S specialist consultants • PMU	Daily/Weekly
3	**GHG emission**			
	• The construction and operation of heavy machinery, such as excavators	• Use energy-efficient machinery and equipment during construction to reduce fuel consumption and emissions.	• SEO	Daily

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
	and bulldozers, during these projects release carbon dioxide (CO2) into the atmosphere, i.e. the energy requirements for construction works can result in increased carbon emissions • At the time of construction, there are possibility of smoke generated by burning of straw in the rice field.	• Optimize construction logistics to reduce the number of vehicle trips and machinery usage, minimizing fuel use and emissions. • Implement proper maintenance programs for equipment and vehicles to ensure they operate efficiently and with lower emissions. • Reduce deforestation and land-use changes that contribute to carbon emissions by preserving vegetation and replanting trees in affected areas. • Use low-carbon materials and construction techniques that reduce the embodied carbon in construction materials. • Offset unavoidable GHG emissions by investing in carbon offset projects, such as reforestation or renewable energy initiatives. • Engage with local communities and stakeholders to raise awareness of emission reduction practices and encourage their participation in sustainability efforts.	• E&S specialist consultants • PMU	
DURING OPERATION				
ENVIRONMENTAL				
1	**Water Management**			
	• Irrigation systems have both benefits and drawbacks. • Proper design and management are crucial. • Minimizing negative impacts on the natural water cycle is essential.	• Implement water-saving irrigation technologies like drip irrigation and sprinkler systems to reduce water consumption and minimize the strain on water resources. • Encourage the adoption of the AWD technique in rice cultivation to optimize water use and reduce water withdrawals for irrigation. • Establish detailed water management plans that ensure equitable water distribution and allocation, considering the needs of various users and the environmental flow requirements to maintain healthy aquatic ecosystems. • Design and construct robust irrigation infrastructure, including canals, ponds, and storage areas, capable of withstanding extreme weather events like floods and droughts. This investment should also include lining canals and refurbishing storage areas to reduce water losses and improve water storage capacity. • Integrate natural infrastructure, such as wetlands and forests, into water management strategies. Protect and restore degraded habitats to enhance their water regulation capabilities, improve water quality, and support biodiversity. • Establish and provide training to FWUCs on sustainable water management practices, equitable water rights, and allocation procedures. These communities play a vital role in the operation and maintenance of the irrigation system, ensuring its long-term sustainability.	• PMU	Annually
2	**Water Pollution**			
	• Increased use of chemicals, such as fertilizers and pesticides, to enhance crop yields. The excessive application of these chemicals can result in	• Implement Simplified Pesticide Management Plan • Conduct regular water quality test to track the change in water quality due to pesticide application using oversea laboratory testing.	• PMU	Annually

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
	contamination of both surface and groundwater resources.	• Encourage farmers to adopt IPM techniques that minimize pesticide use and rely on biological control methods, thereby reducing the risk of chemical contamination of water resources. • Provide training and extension services to farmers on the judicious use of fertilizers, ensuring they apply the correct type and amount based on soil nutrient levels. • Promote the adoption of organic fertilizers and soil amendments, such as cover crops and green manures, which can improve soil fertility and reduce the need for chemical fertilizers. • Implement a robust water quality monitoring program to track the levels of pesticides, nitrates, and other pollutants in surface and groundwater resources within and around the command areas. • Encourage the adoption of water-saving irrigation methods, such as alternate wetting and drying (AWD) in rice cultivation, which can reduce water consumption and minimize the leaching of agrochemicals.		
3	**Soil Pollution**			
	• Increased production could lead to overuse of Agri-chemicals if farmers are not adequately trained or supported in adopting environmentally friendly practices.	• Implement Simplified Pesticide Management Plan • Conduct regular water quality test to track the change in water quality due to pesticide application using oversea laboratory testing	• PMU	Annually
CLIMATE CHANGE				
1	**GHG emission**			
	• Increased GHG emissions from farming activities: - Fertilizer use - Livestock production - Rice cultivation • Increased energy requirements: - Rice field preparation - Flood control systems - Transportation	• The project is to promote sustainable practices like crop rotation and agroforestry to reduce energy consumption and improve soil health. • The project needs to introduce renewable energy sources such as solar-powered irrigation to lower the carbon footprint of rice production. • The project needs to support on training farmers to use alternatives to straw burning, such as mulching or biomass energy generation, to reduce air pollution. • The project promotes the utilization of efficient irrigation methods like alternate wetting and drying (AWD) to conserve water and minimize methane emissions. • The project needs to advocate for policies that discourage straw burning and provide incentives for adopting sustainable agricultural practices.	• PMU • Farmer	Daily
ANNUAL CROP MANAGEMENT PLAN				
	❖ **WATER**			
1	**Water resource efficiency**			
	• Over-extraction of water resources can lead to downstream water scarcity, altered hydrology, and damage to aquatic ecosystems.	• Project needs to implement efficient water management practices to prevent over-extraction and ensure equitable water distribution. This can include: • Water uses monitoring systems to track consumption and identify areas for improvement. • implementing appropriate irrigation scheduling based on crop water requirements and weather conditions.	• PMU • FWUC	Daily

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
		• Utilizing efficient irrigation systems, such as drip irrigation or sprinkler systems, to minimize water loss. • Exploring opportunities for water reuse, such as capturing and reusing runoff water.		
	❖ **SOIL AND SOIL MANAGEMENT**			
2	**Soil erosion and soil erosion risk**			
	• Soil erosion can lead to loss of topsoil, reduced soil fertility, and increased sedimentation in water bodies.	• Minimize soil compaction and disturbance by using appropriate machinery and timing land preparation activities. • Consider erosion management practices such as contour planting, terracing, and grass barriers. • Adopt reduced tillage or no-till farming practices to minimize soil disturbance. • Establish cover crops during fallow periods or in rotation with main crops to protect the soil from erosion. • Practice contour farming on sloping land to reduce runoff and erosion. • Construct terraces on steep slopes to prevent soil loss. • Establish windbreaks or shelterbelts to reduce wind erosion. • Install erosion control structures, such as grassed waterways or sediment basins, to manage runoff. • Apply mulch to the soil surface to protect it from rainfall impact and erosion.	• PMU • Agricultural extension officers	After significant rainfall events Annually
3	**Nutrient application and management**			
	• Over-fertilization and nutrient runoff can contaminate water resources, negatively impacting aquatic ecosystems and potentially leading to eutrophication.	• Conduct periodic soil analysis to determine nutrient needs and avoid over-fertilization. • Establish buffer zones near watercourses to filter nutrient runoff. • Consider using green manures and cover crops to replenish soil nutrients and reduce leaching.	• PMU • Farmers	Before and after fertilizer application Regularly during the growing season
	❖ **PESTICIDE**			
4	**Use and effectiveness of pesticides:**			
	• Pesticide use can have adverse effects on human health, non-target organisms, and the environment. Pesticide resistance can develop, requiring increased application rates.	• Promote Integrated Pest Management (IPM) strategies to minimize pesticide use. • Implement training programs for farmers on the safe handling and application of pesticides. • Ensure proper disposal of pesticide containers and leftover products.	• PMU • Agricultural extension officers	Regularly during the growing season
5	**Pesticide residues on site soil**			
	• Pesticide residues can accumulate in the soil, potentially harming soil organisms and affecting water quality.	• Promote the use of pesticides with low persistence and mobility in the environment. • Implement a soil monitoring program to assess pesticide residue levels. • Consider crop rotation and the use of cover crops to help break down pesticide residues. • Minimize pesticide use by adopting IPM strategies. • Conduct soil testing to monitor pesticide residue levels. • Rotate crops to break pest cycles and reduce the need for repeated pesticide applications. • Utilize cover crops to improve soil health and enhance pesticide degradation.	• PMU • Third-party laboratories	Periodically (e.g., annually or before planting sensitive crops)

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
		• Consider bioremediation techniques to remove pesticide residues from contaminated soil.		
6	**Pesticide residues on produce**			
	• Pesticide residues on produce can pose a risk to consumer health.	• Enforce pre-harvest intervals to allow for pesticide breakdown before harvest. • Promote the use of pesticides with low toxicity to humans. • Properly wash and handle produce to remove surface residues. • Implement a monitoring program to test produce for pesticide residues. • Ensure compliance with established MRLs for pesticide residues on produce.	• PMU • Third-party laboratories	Before harvest

UXO = Unexploded Ordnance, PMU = Project Management Unit, SEO = Social and Environmental Officer, E&S = Environmental and Social, IFC = International Finance Corporation, EHS = Environmental, Health, and Safety, GHG = Green House Gas, FWUC = Farmer Water User Communities, ESCMP = Environmental, Social, and Climate Management Plans.

6.6.2 Mitigation Measures for the Social Risks and Impacts

Table 42: Preconstruction, Construction, and Operation Phase Social Risks, Impacts and Mitigation Measures

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
BEFORE CONSTRUCTION				
LAND ACQUISITION				
1	**Land acquisition and resettlement**			
	• Yutasas is expected to require minimal land acquisition due to their smaller scale and lack of planned canal system expansion.	• Conduct precise land participates to accurately determine the exact land requirements, ensuring that only necessary land is acquired. • Verify land ownership and usage rights meticulously to prevent disputes and ensure fair compensation.	PMU Contractor	Before construction
2	**Economic displacement**			
	• The potentially disrupting existing economic activities and displacing households and businesses, including informal farmers and businesses. Yutasas is a part of the Krang Ponley scheme. There are 1,249 households using land along the infrastructure that may be affected, with 20 households across all sub-schemes facing land acquisition.	• The households who own the land along the rehabilitated canals which will be expanded at the public land should be properly informed prior to the construction to avoid their crops will be damaged at the time of construction. • Although the acquired land is public land, there are a need of a proper consultation and information to be conducted to inform and obtain agreement from the affected households.	PMU Contractor	Before construction
DURING CONSTRUCTION				
	CHILD LABOR & FORCED LABOR			
1	**Child Labor**			

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
	• Project activities will occur in rural areas where child labor is prevalent. • Construction contractors and subcontractors may employ children under 18 years old for unskilled labor. • Local children may be particularly vulnerable to exploitation due to poverty and limited educational opportunities.	• Apply LMP for age check prior to engagement of labor with regular monitoring through proper screening and registering all workforce for the work • To mitigate the risk of child labor, the project will implement strict measures to ensure compliance with national and international labor laws. Regular monitoring and inspections will be conducted to identify and address any instances of child labor. • Additionally, awareness-raising campaigns will be implemented to educate communities about the harmful effects of child labor and the importance of sending children to school. The project will also collaborate with local authorities and NGOs to strengthen law enforcement and provide support services to vulnerable children and their families.	• Contractors • PMU	Daily Screening prior to engaging services of primary supplier
2	**Forced Labor**			
	• The risk of forced labor, particularly for vulnerable individuals, is due to economic coercion, exploitation of young people, and debt bondage. The increased demand for local labor during irrigation and road rehabilitation could exacerbate this risk.	• Strict Code of Conduct for workers with no tolerance for physical or verbal abuse of women or children • The Project Owner and Sub-Contractors will collaborate with the relevant Government Agency to disseminate information to local communities. This information will include the Contractor's Code of Conduct and the minimum working age as mandated by national laws and international standards. • The Ministry of Water Resources and Meteorology (MOWRAM) will provide information to local communities about the contractor's policies and responsibilities, including the Contractor's Code of Conduct and minimum working age.	• Contractors • Primary supplier • PMU	Daily Screening prior to engaging services of primary supplier
COMMUNITY HEALTH AND SAFETY				
3	**Disease transmission**			
	• Disease transmission risks are anticipated due to the influx of construction workers, potentially exacerbated by unhygienic living conditions and interaction with the local community. This influx increases the risk of spreading communicable diseases among workers and between workers and residents, with workers' susceptibility potentially increased by factors like poor diet, stress, and unhygienic conditions.	• Conduct public awareness raising activities (IEC) to ensure local people and contractors know about the risks of contracting and spreading communicable diseases such as COVID-19, HIV/AIDS, and water-borne diseases (e.g., amoebiasis, giardiasis, and toxoplasmosis. etc. • In the event of a disease outbreak (e.g. COVID-19), provide immediate training/awareness raising to the risk groups. • Conduct training to workers on communicable diseases prior to mobilization to construction sites. • For water-borne diseases that arise due to polluted or contaminated water, mitigations measures may include: o Implement filtration, chlorination, or UV disinfection to ensure safe drinking water. o Promote handwashing, safe food preparation, and proper sanitation practices in communities. o Control and properly dispose of waste to prevent water pollution. o Provide access to clean water supplies, such as bottled water or tankers, during outbreaks or disasters. o Promote immunizations against water-borne diseases like cholera and typhoid in high-risk areas.	• PMU • Contractors • Local health authorities	• Monthly • During outbreaks • Periodic community health awareness campaigns

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
4	**Sexual Exploitation and Abuse, Sexual Harassment**			
	• The project's influx of approximately 171 in the Krang Ponleng river, as the Yutasas is a part of this scheme, including construction and logistical personnel, along with frequent project staff visits and pre-existing SEA/SH issues, creates a risk of sexual exploitation and abuse/harassment, particularly during irrigation and road rehabilitation.	• Contractors need to explicitly state zero tolerance for sexual harassment, exploitation, and abuse within the workplace. • Require Code of Conduct (CoC) to be signed by all construction workers. • For victims coming forward: referral to qualified SEA/SH service provider. The GRM will include a confidential channel for reporting SEA/SH. • Strict Code of Conduct for workers with no tolerance for physical or verbal abuse of women or children • Training on SEA/SH and VAC for community members, in particular women and girls (may be done separately for men and women). • Ensuring workers' sites are situated (at least 500m) from schools and/or other areas where children congregate. • Children are prohibited from construction sites and worker's camp. • Ensure access to grievance redress mechanisms for all project-affected persons, including both stakeholders and workers, to address Sexual Exploitation and Abuse, and Sexual Harassment. Support (in the form of training, awareness raising, etc.) to local law enforcement to act on community complaints regarding SEA/SH and VAC. • Build partnerships with local health providers and SEA/SH service providers to conduct community awareness activities, and referrals. • It is necessary to consider deploying specialists to educate and raise awareness about issues of violence.	• Contractors • PMU	• Monthly and during subproject cycle • Reported to PMU within 48 hours if occurred
5	**Traffic safety & Security**			
	• Increased transport of materials and equipment in the construction stage raises the risk of road accidents, theft, vandalism, and a perceived or actual increase in crime, affecting project workers, community members, and those living or traveling near construction sites.	• Arrange security guard or engage local authority to guard the construction sites • Conduct public awareness raising activities (IEC) to ensure local people and road user are aware of road safety regulations and risks and act accordingly while using road. • Monitor and observe speed limit.	• PMU • Contractors	• Daily during construction • Weekly during construction • Monthly during operation
6	**Community Health and diseases**			
	• Construction activities, including canal and pond rehabilitation, pose community health and safety risks beyond disease transmission, encompassing drowning, accidents from trespassing in construction zones (including storage and laydown areas), traffic disruptions, potential community conflicts, and general construction site hazards.	• Establish clear and well-marked construction exclusion zones to prevent unauthorized access, especially to areas with open water, heavy machinery, and storage areas. • Implement fencing and barriers to prevent trespassing and ensure community safety around construction areas. • Provide warning signs in local languages to inform communities about the dangers and restricted access to construction areas. • Install safety barriers around construction sites to minimize risks to the community and workers. • Ensure proper storage of construction materials, with no materials left unsecured and scattered around the site.	• PMU • Contractors	• Monthly • During outbreaks • Periodic community health awareness campaigns

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
		• Conduct community awareness campaigns to educate the community about the potential risks and safety measures during construction. • Establish and maintain a grievance mechanism to address community complaints and issues promptly. • Implement safety measures around canals and ponds to prevent drowning incidents, such as installing safety barriers and providing warning signs in local languages. • Provide training to workers on safety protocols, including how to work safely around water, avoid accidents and minimize risks to the community. • Ensure all workers are provided with necessary personal protective equipment (PPE) and enforce its use.		
7	**Personal Protective Equipment**			
	• The activities involve Canal Rehabilitation and Construction, Structure Construction and Rehabilitation, and Drainage Improvement, which expose workers to various hazards, such as Falling Debris, Sharp Objects, and Heavy Machinery.	• Continue and active use of PPE at all times of construction. • Identification and provision of appropriate PPE that offers adequate protection to the worker, co-workers, and occasional visitors, without incurring unnecessary inconvenience to the individual • Proper maintenance of PPE, including cleaning when dirty and replacement when damaged or worn out. • Proper use of PPE should be part of the recurrent training programs for employees.	• Contractors • PMU	• Regular inspections/training
8	**Working conditions and Management of Worker**			
	• The lack of written contracts for unskilled, especially locally recruited, workers increase their vulnerability to underpayment, unequal treatment based on gender and temporary status, and late or non-payment of wages, impacting their livelihoods and potentially hindering project progress.	- Advise companies to provide equal opportunities for employment and promotions to all workers, regardless of gender, ethnicity, or background, to avoid discrimination. - Regularly monitor and audit payroll and employment practices to ensure compliance with labor regulations and address any disparities. - Offer training and capacity-building programs for all workers to enhance their skills and qualify them for higher-paying roles. - Ensure that subcontractors and suppliers also adhere to fair wage and equal treatment policies. - Provide accessible information to workers about their rights, entitlements, and the proper channels to address grievances through the establishment of the GRM for workers. This includes training on topics such as: • Environmental and Social Safeguards • Gender Awareness and the Gender Action Plan • Sexual Exploitation, Abuse, and Harassment (SEA/SH) - Labor Rights and the Workers' Code of Conduct Regularly engage with labor rights organizations or third-party auditors to evaluate labor conditions and make improvements where necessary.	• Contractors • PMU	• Regular payroll audits • Periodic worker satisfaction surveys • Prompt investigation of any reported grievances
9	**CULTURAL HERITAGE**			

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
	Yutasas is a part of the Krang Ponley scheme, situated nearby the historical and cultural heritage with potential for encountering archaeological artifacts during construction due to the history of the ancient city of Longvek.	• Implement Find Chance Procedure	• Contractors • PMU	• Daily • Reported to PMU within 48 hours
CROSS-CUTTING				
10	**Gender inequality**			
	• Women are more vulnerable to climate change impacts due to unequal access to resources, information, and decision-making power, often hindered by social gender roles. While women-led households represent a significant portion of project sub-schemes, they still face barriers to participation and benefits. The project area includes a substantial number of vulnerable individuals, including the poor, disabled, elderly, and parentless, highlighting the need for targeted support.	• The project should actively encourage women's participation in the formation of FWUCs, empowering them through critical decision-making roles and equipping them with the necessary skills and resources to amplify their voices. • The project should ensure that women have equal access to training programs and resources, such as land, credit, and technology. • The project should monitor gender equality indicators and should adjust as needed to ensure that women are benefiting from the project.	• Contractors • PMU	• Daily/ weekly
11	**Social inequality**			
	• Risk of being unequally engaged and treated, during the design phase and construction. The vulnerable are likely to be limitedly consulted and have limited access to available irrigation water.	• Conduct participatory planning and regular consultations with local communities, particularly marginalized groups (e.g., women, smallholder farmers, indigenous communities). • Prioritize hiring local labor, with special provisions for disadvantaged groups (e.g., youth, women, minorities) in both skilled and unskilled positions. • Implement fair and transparent compensation or resettlement plans for those displaced or affected by construction activities, especially vulnerable households. • Conduct regular social impact assessments, with a focus on identifying inequality trends, and adjust project strategies to mitigate negative effects. • Provide support and training for affected communities to diversify their livelihoods, especially for those whose livelihoods may be disrupted by construction (e.g., farmers, traders). • Ensure transparency in the contracting process, including the selection of subcontractors and suppliers, with opportunities for local businesses, especially those run by marginalized groups.	• Contractors • PMU	• Continuously
12	Elite capture			

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
	• The rich have the resources to grab both available land and water resources, creating greater social disparities	• Consultation will be conducted farmers in potential command area, focusing on vulnerable/disadvantaged groups • Alternative livelihoods for vulnerable group are identified based on their needs vis-à-vis project's investment eligibility • Conduct consultation at community level (in the command area) to achieve a consensus on how water needs are balanced between different groups in one command area. • During subproject design, water availability, storage capacity, and water needs of upstream and downstream population are calculated to inform design, and water use coordination during project operation. • Water user groups should be established for upstream and downstream population and should be coordinated by a higher-level committee/group to negotiate and optimize water coordination • Guidelines/Manual should be developed to provide guideline for upstream and downstream communities at subprojects to meet, discuss, and achieve consensus on how water is distributed for equal use between upstream and downstream population	• PMU • Contractors	• Throughout project implementation • Regular community meetings and consultations
13	**Loss access to land and other assets**			
	• Construction activities, particularly land acquisition for canals and roads, can displace communities or restrict their access to land, homes, and other assets. • Temporary restriction of irrigation access during construction may occur in some areas, potentially impacting livelihoods, even though the project area is mainly rainfed.	• The project will prioritize avoiding physical resettlement and minimizing land acquisition. Design adjustments will be made to avoid or reduce land requirements, especially on private land. Public land will be prioritized for any necessary acquisition. • Where land acquisition is unavoidable, the project will employ a negotiated settlement process with affected households. This process, guided by the RGC's Standard Operating Procedures on Land Acquisition and Involuntary Resettlement (SOP-LAR), aims to ensure that affected households receive fair and adequate compensation for their losses and maintain or improve their income and livelihood status. • All individuals with assets within the Corridor of Impact (COI) before the Cut-Off-Date (COD) will be eligible for compensation, regardless of their legal status. Compensation will be provided for various losses, including land, structures, crops, trees, and income-generating activities. • Recognizing the potential disruption of income streams during relocation or construction, the project will provide transitional allowances to affected households. • A multi-tiered GRM will be established to address grievances from any project-affected person. The GRM will operate based on the principles of	• Contractors • PMU	• Before land acquisition • During land • After resettlement

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
		the Green Climate Fund (GCF) and be accessible at no cost to the complainant.		
14	**Loss access to natural resources**			
	• Construction activities and project operations can restrict communities' access to forests, fishing grounds, water sources, or other natural resources they depend on for livelihoods	• Implement efficient water management practices during construction and operation to prevent over-extraction of water resources from reservoirs and rivers and ensure equitable distribution for downstream communities and ecosystems. • Establish construction exclusion zones around sensitive habitats, such as wetlands and forests, to prevent disturbance and minimize impacts on fishing grounds and biodiversity. Implement habitat restoration programs in areas where construction has occurred. • Use environmentally friendly construction materials and techniques to reduce the risk of pollution. Properly manage construction chemicals, fuels, and waste to prevent water pollution and contamination of natural resources. Prepare and implement a waste management plan to handle waste generated from construction activities and worker camps. • Maintain ongoing communication with affected communities, including farmers, fishers, and downstream communities, to address concerns about natural resource access. Provide information and education to construction workers about responsible use of local resources and respect for community access rights. This suggestion is informed by the sources but is not directly stated in them. • Ensure the GRM is accessible to all community members to address complaints related to natural resource access.	• PMU • Contractors	• Regular water quality and quantity monitoring • During project implementation: Monitor the effectiveness of mitigation measures.
DURING OPERATION				
1	**COMMUNITY HEALTH AND SAFETY**			
	• Water use conflicts, especially between upstream and downstream users, are a potential risk due to altered water allocation from new irrigation infrastructure, exemplified by the Anlong Chrey reservoir's limited capacity, and increased drowning risk, particularly for children, due to new canals.	• The project will promote IWRM principles to ensure the equitable and sustainable allocation of water resources. This involves considering the needs of all stakeholders, including upstream and downstream communities, as well as environmental flow requirements for maintaining healthy ecosystems. • Establishing a system for monitoring water use and enforcing water allocation regulations will help prevent over-extraction and ensure a reliable water supply for all users. This may involve installing flow meters, conducting regular water audits, and implementing penalties for non-compliance. • The project will strengthen the capacity of FWUCs to manage water resources at the local level. This includes training on water allocation, conflict resolution, and operation and maintenance of irrigation infrastructure. Effective FWUCs can play a crucial role in mediating disputes and ensuring fair water distribution within their communities. • Raising awareness about water safety and the risks associated with open water bodies, especially among children, is essential. Educational campaigns, signage, and community outreach programs can help promote responsible behaviour and prevent accidents. This information could be	• PMU • PDWRAM	• Daily for site inspections • Monthly for reports and consultations • Within 48 hours for reporting accidents, disease outbreaks.

No.	Resources/Area	Mitigation Measures	Responsibility	Timeline/Frequency of monitoring
		included in the training programs that will be provided to farmers and communities.		
CROSS-CUTTING				
2	**Gender inequality**			
	• Women are more vulnerable to climate change due to limited access to resources, information, and decision-making power, often exacerbated by gender roles, resulting in unequal access to water, limited participation in water management, and disproportionately negative impacts on their livelihoods.	• The project should actively encourage women's participation in the formation of FWUCs, empowering them through critical decision-making roles and equipping them with the necessary skills and resources to amplify their voices. • The project should ensure that women have equal access to training programs and resources, such as land, credit, and technology. • The project should monitor gender equality indicators and should adjust as needed to ensure that women are benefiting from the project.	• PMU • PDWRAM	• Monthly for data collection and reporting
3	**Social inequality**			
	• The competition for water and land displacement, and despite project consultations, vulnerable groups, particularly landless or land-poor households, may still experience limited access to irrigation benefits, though the impact is lessened by the relatively small proportion of poor within the area.	• Ensure Equitable Water Access: Mechanisms should be in place to support vulnerable and marginalized communities in accessing water resources. • FWUCs will manage the irrigation systems and ensure sustainability through fee collection. The project will invest in establishing and training FWUCs, emphasizing inclusivity and capacity building for vulnerable groups. • Implement a Simplified Integrated Pest Management (IPM) Plan.	• PMU • PDWRAM	• Monthly for data collection and reporting
4	**Elite capture**			
	• The rich have the resources to grab both available land and water resources, creating greater social disparities	• Transparent and accountable FWUC management: Clear guidelines, diverse representation, and grievance redress mechanisms are essential to prevent manipulation and ensure equitable water distribution. • Regular monitoring and evaluation: Continuous monitoring of project impact, especially on vulnerable groups, can identify and address elite capture. • Strengthened land tenure security: Clarifying land rights can protect smallholder farmers and marginalized communities from land grabbing. • Community engagement: Active community participation, especially from vulnerable groups, empowers them and ensures their needs are met.	• PMU • PDWRAM	• Regularly during FWUC meetings and project implementation • Continuously through the GRM.

PMU = Project Management Unit, LMP = Labour Management Plan, NGOs = Non-governmental Organizations, HIV/AIDS = Human immunodeficiency virus/Acquired immunodeficiency syndrome, UV = Ultraviolet, GRM = Grievance Redress Mechanism, SEA = Sexual Exploitation and Abuse, SH = Sexual Harassment, VAC = Violence Against Children, ESHS = Environmental Social Health and Safety, STDs = Sexually transmitted diseases, PPE = Personal Protective Equipment, IPM = Integrated Pest Management, PDWRAM = Provincial Department of Water Resources and Meteorology, FWUCs = Farmer Water User Communities.

7. STAKEHOLDER ENGAGEMENT AND INFORMATION DISCLOSURE

7.1 Purpose and Process of Stakeholder Engagement

Public consultation is a key component of CAISAR, and it was pivotal in preparation of the Environmental, Social, Climate Impact Assessment report (ESCA) Report and the Environmental, Social, Climate Management (ESCM) Plan. The consultations were conducted with relevant institutions, non-governmental organizations, local authorities, and local people during the preparation of ESCIA and ESCMP for CAISAR project. The data collection and consultations were conducted over four periods:

- The first consultation was conducted between 26 and 28 July 2024 to capture information regarding biodiversity and environmental condition in the project area.
- The second consultation was conducted to consult with forestry and fishery communities, local authorities and key informants to understand the situation and concerns related to the presence of the project. The consultation was conducted between 03 and 09 August 2024.
- The third consultation was conducted at household, village, and commune level stakeholders focusing on status, concerns and feedback regarding the project implementation. This consultation was conducted between 10 and 18 August 2024.
- The last consultation was conducted between 21 and 23 August 2024 with the district and provincial stakeholders, mainly focusing on the opinion, and feedback regarding the implementation of the project.

In addition to the stated consultations, there are also continuous consultations being conducted with AIIB, IFAD, and CAISAR PMU including the PMU management, SECAP team, and engineering team to ensure that the disclosed information being aligned with the most updated information of the project.

During project preparation, various stakeholders have been consulted in July and August 2024. Table below summarizes the number of people consulted by consultation techniques:

Table 43. Type of stake holder during consultation

Levels	Househouse survey	Focus Group Discussions	Key Informant Interviews	**Total**
Village level	65	42	3	110
Commune level			1	1
District level			2	2
Provincial level			22	22
			Total	135

7.2 Consultation Process

The purposes of the consultation were to:

- Inform local people and interested stakeholders of the purpose of the rehabilitation and construction of the irrigation system,
- Share the project information and the design options from the draft engineering design,

- Highlight subproject's key activities that are potentially associated with them, and
- Collect their opinion, concern and feedback on the project focusing on background information, project potential impacts (positive and negative), suggestions for impact mitigations, and consultation mechanism.

The consultation agenda with stakeholders included (i) the introduction of the study team, (ii) sharing project information using illustration materials, (iii) discussion and consultation on potential benefits and impacts of the project, (iv) suggestions on the mitigation measures, (v) grievance process and concerns, and (vi) final wrap up for the consultation. The study team were trained to introduce themselves to the purpose of the consultation, followed by the introduction about the project's component and activities expected to be implemented within the area. Materials including leaflet on project information and map of the command area were shared and explained to stakeholders prior to the consultation. Lastly, the consultation began with an overall discussion and specific questions as per the relevant aspect to the stakeholder. Opinions, concerns and suggestions were gathered and confirmed prior to the end of the consultation.

7.3 Stakeholder Engagement during Sub–Scheme Preparation

7.3.1 Environment, Biodiversity and Climate Change Impact

7.3.1.1 Pollution prevention and resource efficiency

Concerns

- The construction process can release dust, which will disturb the local community and surface water quality.
- The disposal of solid, liquid, and domestic waste from the workers at the irrigation construction site will negatively impact local air quality and surface water.

Suggestions from the consulted people

- Regularly watering on the road transports construction materials and soil to reduce dust that may disturb nearby residents.
- Relevant ministries should conduct a visit to evaluate and address the issue of liquid waste from the construction activities in the commune.

7.3.1.2 Biodiversity

Concerns

- CAISAR project may cause changes in water quality, dust generation, air pollution, soil erosion, improper waste disposal, and hazardous waste from machinery.
- The fish populations in command areas may decrease due to disrupting the natural flow of water and the impact on their habitats from the implementation of the reirrigation infrastructure and canal upgrading.

Suggestions from the consulted people

- Contractors must regularly monitor and inspect of living conditions of the workers, manage waste effectively, and provide adequate housing and sanitation facilities to them.
- The project should avoid construction activities and improve irrigation on fish and aquatic habitats.

- Prevent damage from the construction activities to biodiversity, habitats, and other environmental components.

7.3.1.3 GHG Emission

Concerns

- Waste and pollution may contribute to the emission of GHG

Suggestions from the consulted people

- Contractors are advised to refrain from using outdated machinery.

7.3.2 Social Aspects

7.3.2.1 Labor and Working Conditions

Concerns

- The presence of construction staff and workers at the community may lead to sexual exploitation or affecting women workers and women and children in the community.
- Under 18 years old workers may be involved for the construction phase as they are illegible to work in factories or other companies that adhere to laws,
- At the construction sites, some men may undervalue women's work. The gender disparities continue to exist, with some men holding the belief that women are not capable or willing to work.

Suggestions from the consulted people

- The construction companies should hire local workers to offer them jobs and strictly abide to laws and reducing the concerns about gender-based violence or sexual violent.
- Construction companies and relevant departments should provide training on gender issues, violence, labour laws, and social protections to their staff and workers.
- Additional support and monitoring measures should be implemented to prevent abuse, and any incidents should be promptly addressed to prevent recurrence.
- Local authorities should regularly monitor and inspect construction sites to ensure no children are working there, taking immediate action if any issues arise.

7.3.2.2 Community Health and Safety

Concerns

- The presence of workers could result in sexual abuse of women and children living near the project site,
- Drug trafficking and consuming among workers may cause unsafe environment for both workers and surrounded residents,
- After the construction complete, there may also be the risks of humans and animals falling into the canals causing drowning,
- Waste generated from worker camps and construction activities during the project could degrade water quality, negatively impacting human health, livestock, and crops.

Suggestions from the consulted people

- The construction companies should regularly place warning signs and water the roads, as well as schedule construction times to minimize noise pollution that could disrupt the community,
- The project should promote gender awareness, enforce stricter punishments for offenders, and prevent drug trafficking in the workplace,
- Separate accommodations for men and women should be provided,
- The construction companies must collaborate with local authorities in all activities to make a proper management, control and monitoring during construction, and
- The project should conduct gender education at the district to prevent and address gender-based violence,
- The project should establish gender outreach committees at the commune and village levels to monitor the gender related issues within the project areas, especially during construction,
- The project should equip the solar lights along the roads to promote the safety of travellers during nighttime

7.3.2.3 Land acquisition, economic and physical displacement

Concerns

- While the project supports agricultural production, it may not benefit poor families who do not have land for farming,
- Conflicts between the project and affected families could emerge, often fuelled by external instigators rather than the families themselves, and
- Farmers who own land may lose it for farming, which could force them to migrate, heightening their vulnerability to exploitation and potentially causing their children to drop out of school.

Suggestions from the consulted people

- The project should conduct a preliminary study on land issues before construction is going to be implemented, addressing specific aspects of land impact and conducting evaluations for each affected property,
- The project/construction company must collaborate with local authorities to resolve land-related issues, and compensation should be provided to landowners affected by the project,
- If business land is impacted, the government or provincial authorities should provide temporary business premises,
- Advocacy for voluntary land contributions should be encouraged, as the project benefits both the community and individuals, and the restoration of old canals is supported to improve agricultural activities, and
- The construction company should submit quarterly monitoring reports on implementation activities to the provincial department to identify and quickly resolve any issues which affecting the livelihood of the community people.

7.3.2.4 Cross–cutting risks and impacts

Concerns

- Unequal water distribution among farmers leads to partisanship and disputes, often because farmers do not adhere to water distribution instructions or announcements from authorities,
- The FWUC could not generate income, causing the management of the water being difficult such as having no budget for repair, resulting in unproper operation of the system,
- Besides water issues, farmers also struggle with pests, diseases, inadequate labour, lack of capital, limited production technique, flooding, unstable sale price (vegetable and animal) and high agricultural input costs,
- The provincial department lacks budget to support water user conflict resolution,
- Tensions arise between upstream and downstream villages when water use upstream results in flooding downstream due to excess water being released during the wet season. Conversely, during the dry season, upstream water flow to downstream areas is insufficient.
- Manure for fertilizer is declining due to reduced animal raising and lower cattle prices are prompting farmers to reduce livestock raising.

Suggestions from the consulted people

- A proper handover to local authorities upon project completion should be conducted to avoid quiet handovers,
- Women should be engaged and be promoted as the members of Water User Community to promote water distribution equality regarding water allocation from the system,
- Closed monitoring and support to FWUCs are critical and should be conducted regularly by all levels,
- Water use and maintenance support should be provided including technical and management training, along with problem-solving techniques, to effectively control and manage water distribution,
- Ensure transparent water supply to prevent disputes by holding meetings to plan water use and distribution, involving the district governor, commune council, and relevant stakeholders,
- Prior to starting irrigation rehabilitation, organize a public forum to gather feedback from local residents, disseminate project information to people and stakeholders, and announce the construction period in advance.
- Increase the number of commune agricultural technical officers to provide training and monitor farmers' cultivation techniques.
- Build more water storages, and reservoir such as ponds or wells and conduct training on water-saving techniques to adapt to actual water availability.
- Installing and upgrading the damaged sluice gates to improve water distribution efficiency and prevent water loss in agricultural production and irrigation systems.
- Facilitate the development of additional agricultural markets.

7.4 Stakeholder Engagement during Sub–Scheme Implementation

During the implementation of the sub–scheme, particularly prior to construction, when locations of contractor's office, workers' camp, disposal sites for construction debris and construction waste, and labor management plan, etc. are identified – based on Contractor's ESMP, environmental and social risks and impacts associated with Contractor's specific construction methods and measures will be updated in C-ESMP and disclosed for continued consultation with local people and local authorities to avoid/minimize E&S risks and impacts.

7.5 Information disclosure

This ESCMP will be disclosed to the public in both English and Khmer language. The English version will be disclosed in full version whereas the Khmer version will be disclosed as Executive Summary. The documents will be disclosed on the website of MOWRAM (as Project Implementation Unit), and on the website of AIIB, IFAD and GCF before project appraisal and project approval – as per disclosure guidelines required by each donors.

8. GRIEVANCE REDRESS PROCEDURES

8.1 Objectives of the Project GRMs

The objective of the GRM is to provide affected people with redress procedures that can be conveniently used to raise a project related concern or grievance. The GRM guides how a complaint can be lodged, including forms and channels through which a complaint can be submitted. To facilitate the grievance resolution process, grievances received will be acknowledged in writing and solved within a specified timeframe. During the resolution process, where necessary, dialogue will be held with aggrieved people for mutual understanding and effective resolution. Once a complaint is resolved, the aggrieved person will be notified of the resolution results.

The GRM has sequential steps that aggrieved person can use. If the aggrieved person is not satisfactory with the grievance resolution result, or if their complaint is not resolved within the timeframe specified for a particular step, aggrieved person can move on to the next step which is higher in resolution hierarchy. The project has an appeal process where complainants can resort if they are not satisfied with a resolution decision at a particular step, or their complaints are not resolved within a specified timeframe.

8.2 Summary of National Legislation Related to Grievance and Complaint

The RGC has various laws and sub-decrees that have been in place to guide the implementation of the complaint resolution process. These documents specify the right of the complainants as well as the responsibilities of concerned governmental agencies as to complaint resolution. Relevant legal documents include:

- Law on Expropriation (dated 26 February 2010)
- Labor Law (dated 13 March 1997, amended on 20 July 2007 and 26 June 2018)

- Law on Prevention of Domestic Violence and Protection of Victims (dated 24 October 2005)
- Sub-decree No. 22 ANK/BK (2018) on Standard Operating Procedures for Land Acquisition and Involuntary Resettlement for Externally Financed Projects in Cambodia. Guidelines for Grievance Redress Mechanism (Appendix 8)
- Law on Administrative Management of Capital, Provinces, Municipalities, Districts and Khans (dated 22 May 2008) – Section 6 on Solution of Local Conflicts
- Sub-decree No. 22 (25 March 2002) on Decentralization of Roles, Functions, and Power to Commune Councils (Article 61: duty to promote the role of conciliating disputes between citizens)
- Sub decree No 47 ANK.BK (31 May 2002) on Organization and Functioning of the Cadastral Commission (Chapter 4 – District/Khan Level Conciliation).

8.3 Principles of the Project GRMs

Under CAISAR, the following principles will be applied:

- Channels. Different channels are established to enable affected person to submit their grievances, including submission to village committee, as well as district and provincial levels.
- Forms. Grievances can be submitted in writing and verbally, and either directly by the affected households, or by a person delegated by the complainant.
- Complainant can delegate a representative who acts on their behalf. A person lodging a grievance can ask assistance from their family or from individual to act as their representative.
- Disclosure. GRM procedures are disclosed in public domain (e.g., websites of PMU, public notice board at village hall, and in front of substation).
- Documentation. A grievance logbook will be maintained at substation (subproject level) and at PMU level (through PMU GRM focal point).
- Transparency. Grievance procedures include steps, time frame for grievance resolution for each step, notification to affected person, how decision is made.
- Acknowledgement. The unit in charge of complaint resolution will notify complainant upon complaint receipt and will initiate the complaint resolution process.
- Appeal. If the agency in charge does not resolve a grievance in a manner that is satisfactory to the affected person, a multistakeholder committee will be established (ad-hoc) to resolve the dismissed grievance – as an alternative for affected person going to court.
- Monitoring. All grievances received are recorded by PMU and relevant substations, and are processed/resolved in a given timeframe, and are monitored by PMU GRM focal point.
- Time-limit. Time-limit is specified for each step in the grievance resolution process.

- Complainants bear no costs. Complaint resolution is free of charge to aggrieved person. However, if the complaints bring their case to court, they will bear the costs associated with their lawsuit.

- Any grievance concerning urgent health and safety issues shall be resolved immediately.

8.4 Project's Redress Procedures

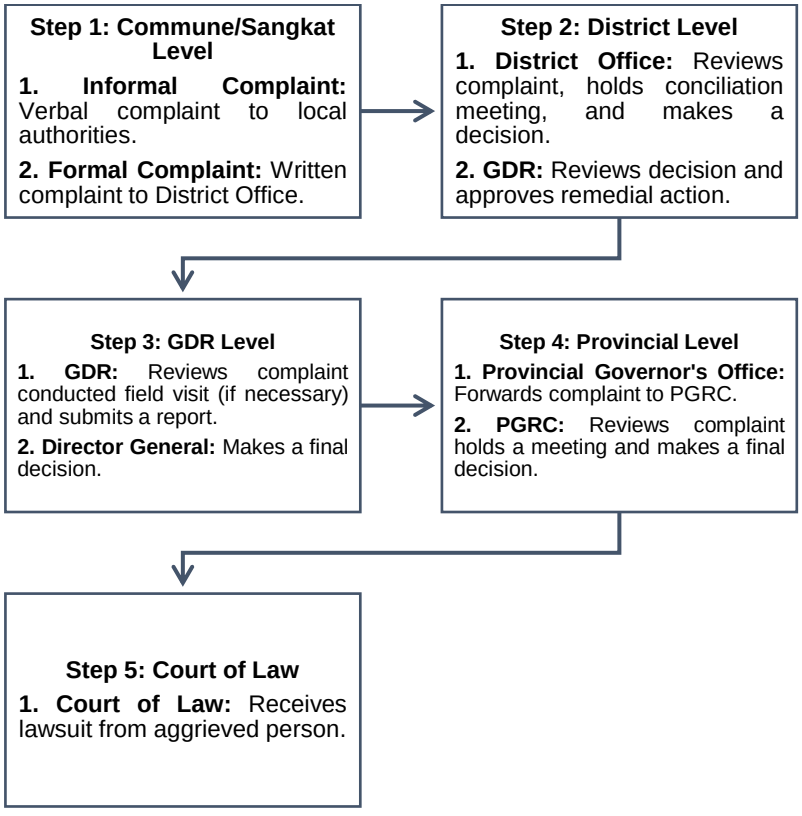
The project has in place complaint handling procedures for three types of potential grievances, including grievances related to 1) land acquisition, 2) labour and working conditions, and 3) sexual exploitation and abuse and sexual harassment (SEA/SH/GBV/GBV), and 3) general complaints. These procedures are established based on the above GRM principles and are in accordance with pertinent national legislation. The GRM for complaints related to land acquisition is provided in the project's Resettlement and Policy Framework (RPF) and that for IPs is provided in the project's IPPF. Summary for the above four procedures is provided below:

8.4.1 Redress Procedure for Complaints related to Land Acquisition

Under this project, to facilitate the grievance redress, the informal and formal steps are combined for convenient use of affected people, as follows:

- Step 1 − Commune/Sangkat level. APs will seek assistance from commune/Sangkat chief or community elderlies who will discuss with the leader of the PRSC-WG to find a solution. Verbal grievance can be provided to the commune/Sangkat chief or community elderlies. So, no written complaint is required. It is noted that even if the complaint is made verbally, the complaint will be registered in project's logbook, including resolution process and result for such verbal grievance for monitoring purpose. Upon receipt of the verbal complaint, the PRSC-WG will consult with the IRC-WG to ensure the complaint is addressed timely. If the grievance is not resolved to the satisfaction of the AP, or if the AP prefers, s/he may lodge their complaint through the formal route which includes the steps below.

- Step 2 − District level. AH can lodge a written complaint to the Head of the District Office (where the subproject is located). The AH can bring a community elderly or their representative to discuss their grievance at the District Office. A conciliation meeting shall be held, and a decision be made within 15 working days from the date of complaint is received by the District Office. If the complaint is resolved to the satisfaction of the AH, the IRC-WG will inform GDR's Department of Internal Monitoring and Data Management (DIMDM) who will review and seek the approval of the Director General of GDR for appropriate remedial action. GDR will inform the AF of the decision/ remedial action within 15 working days from the receipt of the grievance by the District Office. If the complaint is rejected at this step, District Office will inform the AH of the rejection in writing. If the complainant is not satisfied with the decision/resolution result, s/he can proceed to step 3 (below).



- Step 3 − GDR level. The complainant who is not satisfied with proposed resolution from Step 2 shall lodge a written complaint to the GDR for resolution. The GDR, through its DIMDM, will carry out a holistic review of the complaint and submit a report on its findings with the relevant recommendations, if any, to the Director General of GDR for review and decision. GDR may conduct a field visit to meet the complaint and the IRC-WG to gather

relevant information. The final report must be completed within 30 working days from the date of receipt of the complaint by GDR for submission to the Director General of GDR who will make a final decision within 5 working days of receipt of the final report. In the event that the subject matter requires a policy level intervention, it will be referred to the IRC for a decision which may require that an additional 10 working days be extended from the original deadline for final decision.

- Step 4 − Provincial level. AH will submit a written complaint to the PGRC through the Provincial Governor's Office. The complainant or a representative will be given an opportunity to present its case during a meeting and the PGRC may consider any compelling and special circumstances of the AH to inform their decision. The GDR will send a representative, as a non-voting member, to provide an explanation to the rejection of the complaint at Step 3 with the GDR. The decision of the PGRC must be made on a consensus basis and will be final and binding except when the matter relates to government's policy. Decisions related to government's policy matters on land acquisition and resettlement are decided by the IRC. The PGRC will have 40 working days from the date of receipt of the complaint to reach a final decision. The decision of the PGRC will be sent to the IRC (through the GDR) for endorsement before any remedial action is taken. There are no fees or charges levied on the AH for their lodgment of complaint and for complaint resolution for the above 4 steps.

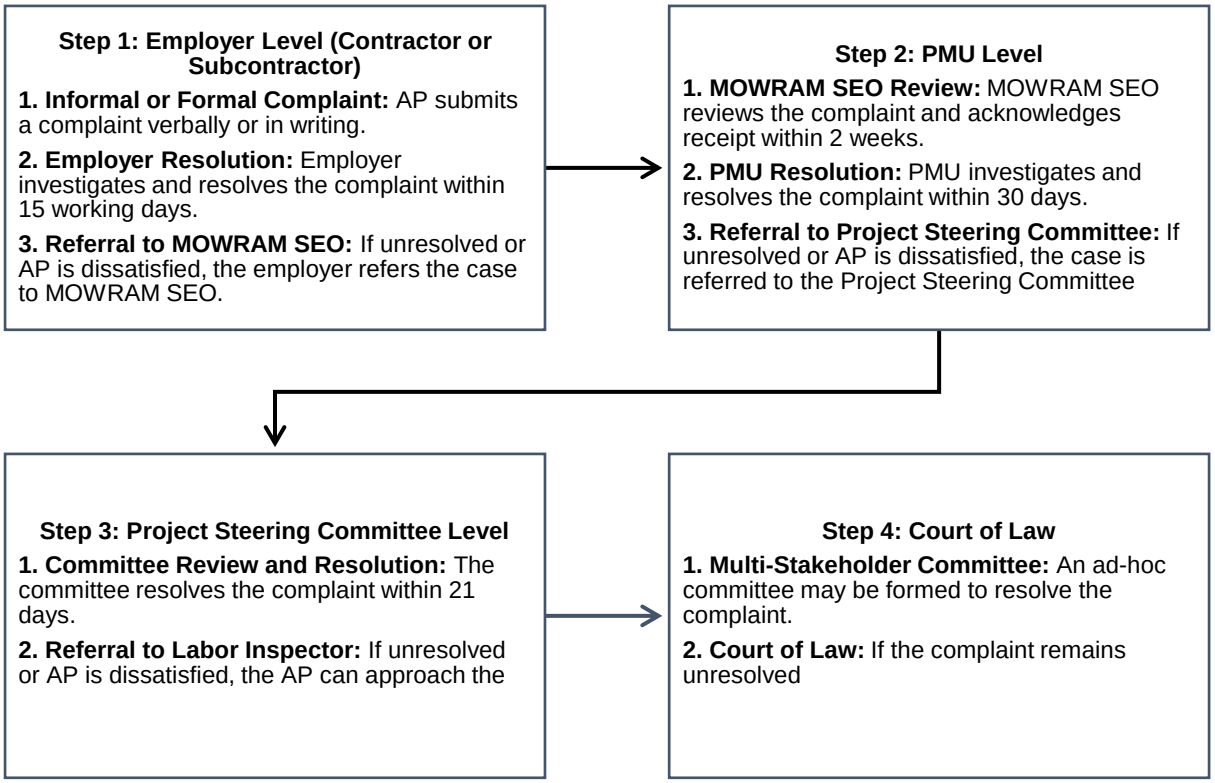
- Step 5 − Court of Law. If the aggrieved person prefers filing a lawsuit at the Provincial/Municipal Courts, as applicable, to seek a resolution, AP can do so but will bear cost related to the lawsuit as per the Expropriation Law. When the case is brought to a Court of Law, there is no involvement of the GDR, PRSC or IRC-WG unless there is a judicial order from the competent courts.

Figure 4. Redress Procedure for Complaints related to Land Acquisition

-

8.4.2 Redress Procedure for Complaints Related to Labor and Working Conditions

Project workers can lodge their grievance/complaint as follows:



- Step 1 – Employer Level (Contractor and Subcontractor). Aggrieved person (AP) can submit their grievance to their Employer who serves as the first focal point for receiving and resolving grievance. Grievance can be lodged verbally or in writing, in person or by phone, text message, mail or email (anonymous complaint is accepted). The Employer involved will resolve the case no later than 15 working days. Once resolved and the AP is satisfactory, the Employer will report the case, including resolution process and results, to the SEO of the MOWRAM for information and record. If the AP is not satisfied with the resolution of their Employer, the Employer will refer the AP to the SEO of MOWRAM, if needed and inform the AP of this referral. It is noted that if a complaint concerns the safety and health of one or several individuals, such complaint shall be resolved as soon as possible – depending on the nature and urgency of the grievance.

- Step 2 – PMU level. MOWRAM SEO will resolve the complaint referred to by the Employer (Step 1) and acknowledge receipt of the AP's complaints within two weeks from the date of complaint receipt. If the SEO of MOWRAM cannot resolve the complaint, the SEO Team will consult with the Project Manager/Director for resolution. The SEO of the MOWRAM will inform the AP (in writing) of the PMU's resolution result within 30 days from the date of complaint receipt. If the AP is not satisfied with the resolution result proposed by PMU, PMU will refer the case to the Project Steering Committee of the project and shall inform the AP (in writing) of this referral.

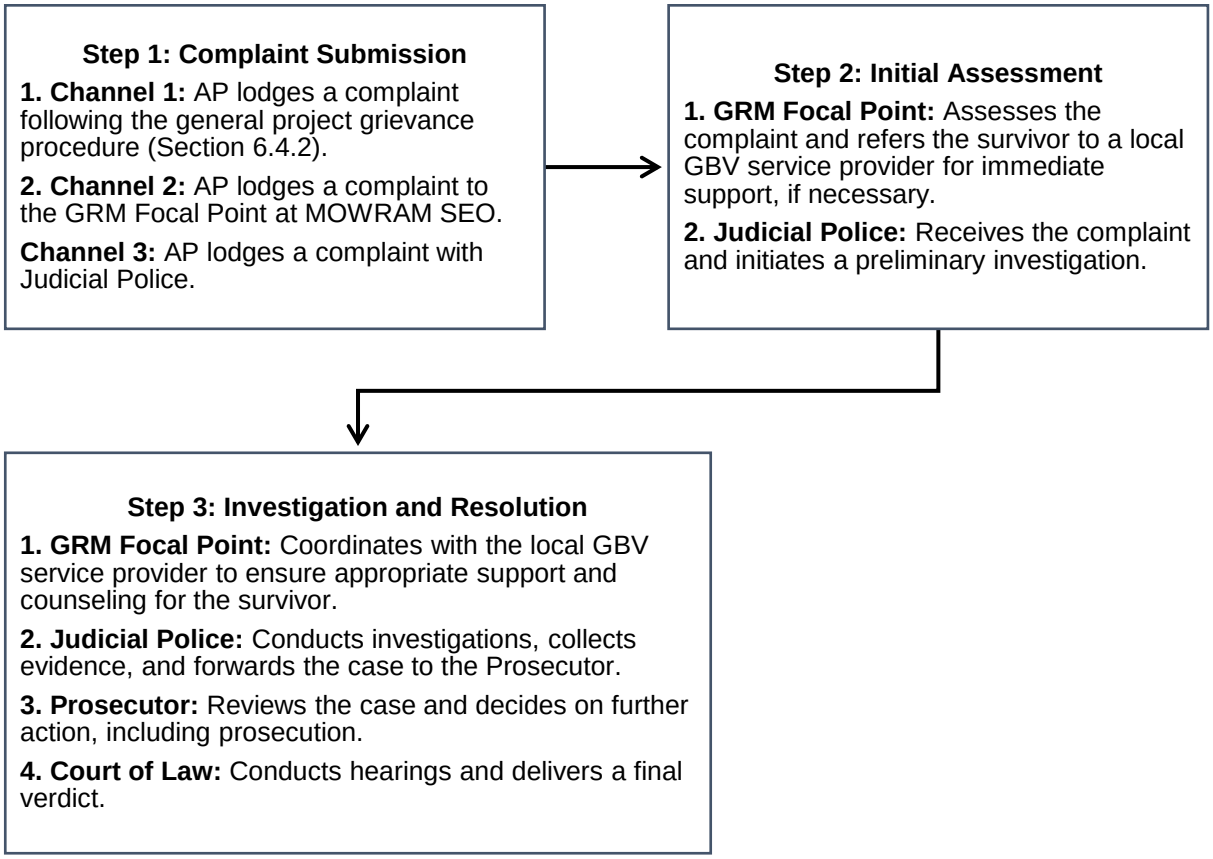
- Step 3 – Project Steering Committee level. At this level, the case will be resolved no later than 21 days. The AP will be informed of the resolution decision in writing. In case the grievance has not been solved within the specified timeframe, or the AP does not agree with the proposed resolution, the AP can approach the Labor Inspector of his/her province or municipality.

- Step 4 – Court of Law. If the AP is not satisfied with the resolution proposed above, a multistakeholder committee will be established (ad-hoc) to resolve the dismissed grievance – as an alternative for affected person going to court. If the grievance could not be resolved satisfactorily by the multistakeholder committee, the affected person may resort to the court of law. The cost associated with the lawsuit shall be borne by the AP. The decision of the Court will be final.

Figure 5. Redress Procedure for Complaints Related to Labor and Working Conditions

8.4.3 Redress Procedure for Complaints Related to SEA/SH/GBV

Under the project, the GRM for SEA/SH/GBV mainly serves to: (i) refer complainants to a local GBV service provider; and (ii) record resolution of the complaint. In line with the above, the following principles apply so as to recognize SEA/SH/GBV victim as principal decision makers in their own care, and treat them with agency, dignity and respect for their needs and wishes: § Multiple channels are in place for easy access and lodge complaints.



- SEA/SH/GBV survivors will be referred to a local GBV service provider for immediate support if they make a complaint directly to PMU.
- Confidentiality of survivors is protected. GM operator (at PMU and local GBV service providers) will keep confidential for SEA/SH/GBV allegation report.
- No identifiable information on the survivor shall be collected and stored in Project Grievance Logbook.
- Costs of operating the SEA/SH/GBV GRM will be covered by the project.

It is noted that under this project, GBV service provider will be engaged for subprojects that are rated “High” or “Substantial” for SEA/SH/GBV risks − as part of site-specific ESMP. based on SEA/SH/GBV risk assessment The following channels can be used to submit a grievance related to SEA/SH/GBV:

- Channel 1 – AP who believe the SEA/SH/GBV incidence is related to project workers can follow steps outlined in Section 6.4.2 (above) to lodge a SEA/SH/GBV complaint.
- Channel 2 – Alternatively, AP can lodge their complaint, verbally or in writing, to the GRM’s Focal Point within the SEO of MOWRAM for advice and resolution (contact of GRM Focal Point is provided in Section 5.1 (Resources).

- Channel 3 – If AP wants to bring the case to the Court of Law, AP can follow steps below for prosecution. Prosecution related to SEA/SH/GBV is administered under the Criminal Code and the Code of Criminal Procedure and is as follows:

Figure 6. Redress Procedure for Complaints Related to SEA/SH/GBV

- Step 1 – Judicial Police. SEA/SH/GBV victim or a representative can submit their grievance to a local Judicial Police (JP) Officer. JPs include a) Commune/ Sangkat Chief, b) Commune/ Sangkat/ District/ Provincial/ National Police, and c) District/ Provincial/ National Military Police. The JP is responsible for receiving, recording complaints, and may conduct preliminary investigations to identify and arrest the perpetrator. The JP will also collect evidence to support the prosecutors. If the SEA/SH/GBV happens at home and/or falls under the domain of domestic violence (as per Law on the Prevention of Domestic Violence and Protection of Victims), the SEA/SH/GBV survivor may seek support from a local qualified Judiciary Police Officer (appointed by the Ministry of Women's Affairs) who can act as a complaining party on behalf of the SEA/SH/GBV survivor15.
- Step 2 – Prosecutor. Upon receiving the completed written record from the JP, the prosecutor can decide on if the prosecutor will hold a file without processing it further or conduct proceedings against the perpetrator. The prosecutor may bring the case to the Court of Law and present the evidence in Court hearings.
- Step 3 – Investigation by Judge. During this step, the investigating Judge will conduct interrogation of the charged person and perform other required investigation procedure.

- Step 4 – Hearing. After issuing an order of indictment, the investigating Judge will submit the case to the trial court president who shall arrange a date for the trial. The decision of the Court on SEA/SH/GBV resolution is final.

8.4.4 Redress Procedure for General Complaints

In case individuals, households, or communities are affected by any other aspects, for instance, environmental impacts such as increased dust, noise, or lack of safety measures that increase risks of traffic accident to road users or to local EM, various channels will be established for convenient use by affected parties, including IPs. These include:

- PMU GRM focal point's telephone (See Section 5.1 – Resources). o Local EM leaders (in case affected individual/households are EM)

- Contractor's hotline: to report cases that they think contractors can solve timely (contact detail of Contractors will be posted at construction sites, and distributed to IPs (through Subproject Information Booklet) during consultation, and post at public billboard of Commune/Sangkat offices, pagodas, etc.

- Commune/Sangkat offices

8.5 Registration of Project Grievance

The SEO, Project 6. Managers within MOWRAM is responsible to establishing and maintaining the project grievance logbook (PGL). The PGL will be established by the SEO to record all concerns/ grievance that are submitted by project stakeholders during project implementation. In case there is serious complaint, the World Bank should be notified of these complaints within 24 hours of complaint receipt (See Annex 3 for Guidance for establishing and maintaining Project Grievance Logbook).

The GRM is an integral project management element that intends to seek feedback from beneficiaries and resolve of complaints on project activities and performance. The GRMs for the project are based on IAAB, IFAD, UN, and GCF requirements and, most importantly, national requirements for solving potential problems between project owners and residents/persons affected by the subproject(s).

9. IMPLEMENTATION ARRANGEMENTS

9.1 Environmental and Social Duties of the PMU/Detail Design Consultants

9.1.1 MOWRAM'S PMU

The MOWRAM's PMU will work closely with PDWRAM in planning and implementing subprojects located within their province. The PDWRAMs will also supervise project officers at the district-level Department of Water Resource and Meteorology, and are responsible for:

- Coordinating effectively with all project stakeholders, including MOWRAM's SEO, consultants, contractors, local authorities, provincial departments, and project communities.
- Supporting provincial and district-level project officers in monitoring and evaluating progress and performance of consultants and contractors.

- Supporting MOWRAM'S SEO to conduct training on labor, gender, SEA, SH, VAC, and HIV/AIDS.
- Supporting MOWRAM'S SEO to disseminate project information and conduct consultation activities, as well as ensuring effective grievance redress resolution within their province.
- Supporting MOWRAM'S SEO to conduct screening and scoping of the subprojects, and identifying environment, social, land acquisition impacts and screening for presence of IPs in the subproject area.
- Liaising with village authorities in subproject area to encourage vulnerable groups to apply for jobs that may be offered by project's contractors.
- Collaborating with relevant departments involved in land acquisition and/or other environment or social mitigation measures.

9.1.2 NCDD'S PMU

NCDD's PMU will work closely with Provincial Cabinet in planning and implementing subproject located within their province. NCDD PMU will be responsible for day-to-day project implementation, monitoring and evaluation of Project Component 1, 2.1 and 2.2 in collaboration with MAFF. PMU will work under the oversight and guidance of NCDDS and will be responsible for all aspects of environmental and social performance, including E&S monitoring and evaluation, reporting of E&S performance, and relevant incidence during project implementation.

9.1.3 Provincial Department of Water Resources and Meteorology

PDWRAM's main responsibility includes:

During subproject preparation:

- Support design parties in their surveys and consultation to prepare Feasibility Study and Detailed Design for sub-scheme.

During construction:

- Oversee construction activities under Component 2, particularly construction of the new irrigation canal in the command area

During operation:

- Collaborate with other relevant technical departments, especially PDAFF at provincial level, farmer water user groups (FWUG) to ensure its regulators (located within the water distribution network) are operated effectively, and in a manner that minimizes water use conflicts among target water user community in the command area.
- Conduct regular maintenance of the reservoir and irrigation canals during subproject operation and maintenance stage.

9.1.4 Provincial Department of Agriculture, Forestry and Fisheries

PDAFF is responsible for implementing activities under Component 1, 2.1 & 2.2. Under this subproject, PDAFF is responsible for developing and implementing agricultural techniques that make full use of improved water access (under Component 1) to enable farmers in the command area to produce more food in a sustainable manner which improves farmers' income and livelihoods. PDAFF will focus on the following:

- Promoting crop diversification for farmers in the command area (e.g. crop rotation for rice and horticulture production improves soil conditions whereas enhancing vegetation production for household's better nutrition and income.
- Introducing to farmers new agricultural engineering techniques to promote a) mechanization to increase productivity in crop production (e.g. mechanization in soil preparation using laser land leveling, use of combine harvester to save labor and reduce production costs, b) save water by applying alternate wet and dry (AWD) and drip irrigation for horticultural activities, c) reduce GHG.
- Scaling up Crop Production and engaging Private Sector in value chain development for specific farm product (e.g. rice, bean, and other cash crops such as vegetables…) and relevant agricultural services through agricultural cooperatives, producer groups, etc.

9.2 Contractor's Environmental and Social Management Plan (C-ESMP)

The civil works contractor is responsible for implementing the Environmental and Social (E&S) mitigation measures outlined in this ESMP for Component 2, which involves constructing the irrigation canal and related structures like gates and regulators. Based on the ESMP and the project's Labour Management Plan (LMP), the contractor will:

- Prepare and submit a Contractor's Environmental and Social Management Plan (C-ESMP) for each contract, detailing how E&S risks related to construction activities, workers, camps, machinery, and vehicles will be mitigated. The C-ESMP must also include a labor management plan (C-LMP) and be site-specific, addressing risks based on the contractor's capacity and site conditions.
- If subcontractors are engaged, they must prepare their own E&S plan aligned with the ESMP and LMP, outlining how they will manage identified risks and impacts. Reporting arrangements between the subcontractor and the main contractor must be detailed, with the main contractor consolidating subcontractor reports into monthly E&S performance reports to the PMU, with quarterly reporting potentially required.
- If changes occur to the proposed works and activities during the contract period, the contractor must update the C-ESMP to reflect these changes, including relevant subcontractor plans. The C-ESMP should include:
    - A policy statement outlining the contractor's commitment to the site-specific ESMP.
    - Document details (issue date, revision status, distribution list, and signatures).
    - Applicable laws, regulations, and required permits.
    - Plans to manage E&S risks, including mitigation measures, a Workers' Code of Conduct, and a Contractor's LMP.
    - A list of required environmental and social training for all personnel, including occupational health and safety, SEA/SH/VAC risks, and emergency response.
    - Financial resources and responsibilities for implementing the C-ESMP, including subcontractor responsibilities and training for local workers.
    - Monthly environmental reports, covering accident/incident reporting within 48 hours to MoWRAM, compliance with the C-ESMP, challenges, non-compliance issues,

subcontractor activities, and meeting minutes with MoWRAM.

The contractor must ensure timely funding, human resources, and implementation of pre-construction and construction mitigation measures, along with any additional E&S mitigation required.

9.3 Contractor's Safety, Social and Environmental Officer (SSEO)

The contractor must appoint a competent on-site Safety, Social, and Environment Officer (SSEO), trained in environmental management, to oversee contractors and subcontractor personnel. The SSEO's responsibilities include:

- Supervising subcontractor compliance with the Contractor's LMP and C-ESMP.
- Submit the LMP and C-ESMP to the PMU/DDIS for approval before mobilizing staff.
- Conducting site inspections and audits to ensure compliance with environmental and social mitigation measures.
- Monitoring and reporting on E&S compliance and preparing audit reports.
- Investigating complaints, recommending corrective actions, and addressing non-compliance.
- Informing the contractor, PMU, and DDIS of any E&S issues, and maintaining detailed records.
- Collaborating on labor issues and preparing the Contractor's LMP and C-ESMP, including OHS regulations.
- Maintaining employment records, verifying minimum working age, and ensuring signed Workers' Codes of Conduct.
- Providing regular training on occupational safety, SEA/SH/VAC, and community relations.
- Ensuring primary suppliers address SEA/SH/VAC, child labor, forced labor, and OHS risks.
- Developing and implementing a grievance mechanism for contracted workers, resolving grievances promptly, and reporting to the PMU.
- Ensuring all workers sign the Code of Conduct and implement measures to prevent SEA/SH.
- Developing and enforcing COVID-19 prevention and mitigation plans.

Incident reporting

The contractors are required to inform DDIS and PMU any incidents listed below within agreed timeframe (e.g. 48 hours):

- Any violations to national laws, regulations, or international agreements.
- Any serious accidents or fatalities,
- Significant impacts that cause losses to personal property such as traffic accidents, damages to local houses/roads and other incidents.
- Serious surface/ground water pollution.

- Failures of embankments at disposal sites that cause serious pollutions to the surroundings,
- Fire related to worker's behaviours,
- Any claims related to SEA/SH/VAC, or any other incidents related to children, and
- Receive a complaint about pollution or damages.

9.4 Contractor's obligation as to contractual requirements

The contractor and its subcontractors, if any, shall comply with the ESMP. In particular, the Contractor must prepare a Contractor's ESMP (C-ESMP) to elaborate this ESMP based on a) site condition, b) capacity of the Contractors and their subcontractors (if any), c) national regulations that are active by the time of subproject implementation.

To ensure that necessary action has been undertaken and that steps to avoid adverse impacts and/or reoccurrence have been implemented, the Project Manager, the Safeguard Focal Persons, and/or contractor must report to PMU within 48 hours of any serious incidents of non-compliance that may have serious consequence. In the event of working practices being deemed dangerous either by the subproject, the local authorities, or the other concerned agencies, immediate remedial action must be taken by the contractors. The contractor must keep records of any incidents and any corrective action taken. The records of non-compliance that could be practically addressed (not cause serious impacts) will be reported to the DDIS with a copy to PMU monthly.

The contractor will be responsible for dealing with any reports/grievance forwarded by the local communities, authorities, police or other agencies as soon as practicable, preferably within one hour but always within 48 hours. The Project Manager/Safeguard Focal Persons will monitor and ensure that the contractor has taken appropriate action. Where appropriate, approval of remedial actions may require an agreement from the local authorities and/or other government agencies. Procedures should be put in place to ensure, as far as is reasonably practical, that necessary actions can be undertaken to avoid recurrence and/or serious damage.

10. ENVIRONMENTAL AND SOCIAL MONITORING PROGRAM

Based on the ESC risks and impacts identified and assessed (in sector 6), a summary of proposed mitigations measures is presented below.Environmental Monitoring Program

10.1 Environmental Monitoring Program

To ensure the effectiveness of environmental management, the environmental monitoring program is prepared to monitor the environmental quality. The contractor and/or sub-contractor are responsible for monitoring using appropriate method, equipment and system. Details on monitoring parameters are shown on the table below:

Table 44: Environmental monitoring plan during Pre-construction, Construction, and Operation phase

Monitoring Parameters	Monitoring Indicators	Location	Measurements	Frequency	Responsibility
Pre-construction phase					
UNEXPLODED ORDNANCES (UXO)	• UXO screening by certified experts required before any construction. • Found UXOs to be removed by certified experts. • UXO clearance certificate required before subproject activities. • UXO risk training and awareness for the local community.	Along the canales (construction site)	• Confirm all relevant areas are clear from UXO by consulting national military. • Obtain a certificate of UXO clearance	Before construction	PMU Contractor
During construction phase					
	ENVIRONMENTAL				
Noise and Vibration	• Avoid working during night-time from 21:00 hours to 06:00 hours • Provide ear sets for workers to prevent noise if the noise level exceeds the standard • Check and maintain construction machinery regularly to avoid noisy and high vibration • Restrict use of vibrating rollers and operation of heavy equipment near sensitive structures	Construction site Nearby sensitive structures	Site inspection Visual observation	Daily	SEO E&S specialist consultants PMU
	Measuring noise and vibration level	Construction site, there is one location for noise and vibration level sampling. ANV 6 X: 470186 Y: 1305388	Measuring equipment and/or appropriate monitoring methods	Every 06 months	SEO E&S specialist consultants PMU

Monitoring Parameters	Monitoring Indicators	Location	Measurements	Frequency	Responsibility
Air quality	• Spray or sprinkle water on the work surfaces and other piled materials to minimize dust at least 3-6 times per day in windy and dry weather and/or based on the weather condition • Solid waste or construction waste activities • Construction machinery operation and maintenance • Distance of sitting concrete mixing plants, crushing • plants, quarries and other facilities to settle and other sensitive receptors • Transportation of construction materials	Construction site	Site inspection Visual observation Monitoring equipment and/or appropriate monitoring methods	Daily	SEO E&S specialist consultants PMU
	Testing air quality (NO2, SO2, CO, TSP, PM10, PM2.5)	There is one location for air quality sampling. ANV 6 X: 470186 Y: 1305388	Air quality monitoring equipment	Every 06 months	
Impact to Water	• Wastewater management • Design and capacity of septic tank • Digging of side drain at campsite • Construction of retaining structures	Construction site	Site inspection Visual observation	Daily	SEO E&S specialist consultants PMU
	• Testing surface water quality (Depth, pH, EC, AS, Cd, Pb, TN, TP, TDS, TSS, DO, and Total Coliform).	There is one location for surface water quality sampling. SW6 X:469642 Y:1306016	Water quality monitoring equipment	Every 06 months	SEO E&S specialist consultants PMU
	• Testing of soil quality is going to be analyzed in the agriculture context: - Soil classification or particle size, - Soil moisture, - Nitrogen (N), Phosphorus (P), Potassium (K),	There is one location for soil quality sampling. S5 X: 469602 Y: 1306117	Soil quality monitoring equipment	Every 06 months	SEO E&S specialist consultants PMU

Monitoring Parameters	Monitoring Indicators	Location	Measurements	Frequency	Responsibility
	Magnesium (Mg), Sodium (Na), - Organic Metter - Ratio of the mass of carbon to the mass of nitrogen in organic residues (C/N Ratio), - Total phosphorus (P), - Cation exchange capacity (CEC), - pH, - Electrode Conductivity.				
Solid and hazardous waste	• Solid and liquid waste management plan in the project construction sites. • Install septic tanks at the construction camp to prevent the discharge of polluted sewage into the outside. • Implement waste segregation of reusable construction materials, biodegradable, and non-biodegradable wastes. • Orient workers on the solid waste segregation system and prohibit them from indiscriminate throwing wastes outside of waste bins in the construction sites. • Provide sufficient waste bin and proper storage before transportation to dispose at an authorized landfill. • Fuel storage tank will be provided with retention areas to contain accidental spills.	Construction site	Site inspection Visual observation	Daily	SEO E&S specialist consultants PMU
Wastewater	• Establishment of proper wastewater management systems, including adequate sanitation facilities for workers.	Construction site/Camp	• Monitoring wastewater discharge for parameters such as temperature, pH, TSS, DO, COD, BOD_5. • Regular checks for leaks or spills from sanitation facilities.	Daily	PMU, Contractor

Monitoring Parameters	Monitoring Indicators	Location	Measurements	Frequency	Responsibility
Physical Hazards	• Incidence of worker injuries due to physical hazards (e.g., falls, cuts, being struck by objects) • Unsafe working conditions (e.g., inadequate lighting, lack of proper safety equipment, slippery surfaces) • Compliance with safety regulations and use of personal protective equipment (PPE)	• Construction sites • Worker camps • Access roads	• Site inspections • Incident reports • Safety audits.	• Daily during construction Weekly safety meetings	Contractors PMU
Chemical hazards	• Exposure of workers and communities to hazardous chemicals (e.g., pesticides, fuels, solvents) • Improper storage, handling, and disposal of chemicals • Air and water quality monitoring to detect chemical contamination	• Construction sites • Worker camps • Areas surrounding construction sites	• Site inspections • Training for workers	Regular inspections of chemical storage and handling areas	Contractors PMU
Heat Stress	• Implementation of safety measures and provision of break times for workers during extreme weather events. • Provision of adequate drinking water and shelter.	Construction site/Worker camps	• Monitoring weather conditions, including temperature and humidity. • Observation of worker breaks and access to shade and drinking water. • Records of any heat-related incidents.	Daily	Contractors PMU
	BIODIVERSITY				
Habitat Loss and Fragmentation	• Area of habitat lost or fragmented. • Changes in vegetation cover. • Number of isolated habitat patches • Presence of wildlife corridors.	Construction site	Site inspection Visual observation GIS analysis (if available) Drone surveys (if available)	Daily/Weekly	SEO E&S specialist consultants PMU
Loss of biodiversity and ecosystem services	• Changes in species abundance and diversity • Decline in water quality • Changes in soil fertility • Reduced pollination services • Alterations in hydrological processes	Construction site	Site inspection Visual observation Biodiversity surveys	Daily/Weekly	SEO E&S specialist consultants PMU

Monitoring Parameters	Monitoring Indicators	Location	Measurements	Frequency	Responsibility
Hunting and trading, and consumption of wildlife	• Avoid cutting of trees or destruction of vegetation • No hunting, fishing, or collection of animal and plant materials • Revegetation success will be monitored, particularly surrounding riparian vegetation along area where levee is installed for flood protection and for increased water retention.	Construction site	Site inspection Visual observation Community interviews	Daily/Weekly	SEO E&S specialist consultants PMU
Loss of fauna and flora	• Number of individuals of each species observed • Presence of endangered or threatened species • Changes in plant community composition	Construction site	Site inspection Visual observation Biodiversity surveys	Daily/Weekly	SEO E&S specialist consultants PMU
Destruction of farming ecosystem	• Area of farmland affected • Changes in crop yields • Impacts on livestock • Pollution of water sources used for irrigation	Construction site	Site inspection Visual observation Interviews with farmers	Daily/Weekly	SEO E&S specialist consultants PMU
Landscape and biodiversity	• Adopting good housekeeping and good construction practices. • Ensuring proper lining of canals and adequate assembling of pipes • Adopting slope stabilization techniques. • Implementing Biodiversity Action Plan (BAP)	Construction sites	Site inspection Visual observation	Daily	SEO E&S specialist consultants PMU
Protected Areas	• Exclude a subproject located in the community forestry, and Zone 3 of the protected area.	Construction sites	Site inspection	Daily	SEO
GHG emission	• Monitor the amount of fuel used by construction vehicles, heavy machinery, and generators. • Track the fuel efficiency of these machines to identify opportunities for improvement. • Assess the effectiveness of measures to control dust emissions from construction sites. • Monitor the types and quantities of waste generated and their disposal methods. • Track the amount of waste recycled or reused to reduce emissions associated with landfill disposal.	Construction site Nearby sensitive structures	Site inspection Visual observation Consultation	Daily	SEO E&S specialist consultants PMU

Monitoring Parameters	Monitoring Indicators	Location	Measurements	Frequency	Responsibility
	• Monitor the number and types of vehicles entering and leaving the construction site. • Track the efficiency of transportation methods used to deliver materials and equipment.				
During operation phase					
Water Quality	Testing surface water quality (Depth, pH, EC, AS, Cd, Pb, TN, TP, TDS, TSS, DO, and Total Coliform) and pesticide residues in water. 	ANNUAL CROP MANAGEMENT PLAN				
Water resource efficiency	• Monitor water extraction rates from surface and groundwater sources. • Assess irrigation efficiency by measuring the amount of water applied versus the amount of water actually used by crops. • Monitor the implementation and effectiveness of water-saving irrigation methods (drip irrigation, sprinkler irrigation, AWD for rice). • Track water consumption per unit of crop yield (e.g., cubic meters of water per ton of rice produced).	Irrigation intake points Representative fields within the sub-scheme	Water flow measurements Soil moisture monitoring Crop water use assessments	Daily	PMU FWUC
Soil erosion and soil erosion risk	• Monitor soil erosion rates in different parts of the sub-scheme, particularly in sloping areas. • Assess the effectiveness of erosion control measures (contour planting, terracing, grass barriers). • Monitor soil organic matter content as an indicator of soil health and erosion resistance.	Representative fields Areas with different slopes and soil types	• Visual assessments of erosion features (gullies, rills) • Soil loss measurements using erosion plots or sediment traps • Soil organic matter analysis	After significant rainfall events Annually	PMU Agricultural extension officers
Nutrient application and management	• Monitor the types and amounts of fertilizers applied to different crops. • Conduct regular soil testing to assess nutrient	Representative fields Water sampling points near fields	• Fertilizer application records • Soil nutrient analysis • Water quality testing for	Before and after fertilizer application	PMU Farmers

Monitoring Parameters	Monitoring Indicators	Location	Measurements	Frequency	Responsibility
	levels and guide fertilizer application rates. • Monitor nutrient runoff from fields, especially near watercourses.		nutrients (nitrogen, phosphorus)	Regularly during the growing season	
Use and effectiveness of pesticides	• Monitor the types and amounts of pesticides used for different crops and pests. • Assess the effectiveness of pest control measures by monitoring pest populations and crop damage. • Track the incidence of pesticide-related health issues among farmers and workers.	Representative fields Pesticide storage facilities	• Pesticide application records • Pest scouting and monitoring data • Health records	Regularly during the growing season	PMU Agricultural extension officers
Pesticide residues on site soil	• Conduct soil sampling and analysis to measure pesticide residue levels in representative fields.	Representative fields Areas near pesticide storage facilities	• Soil residue analysis	Periodically (e.g., annually or before planting sensitive crops)	PMU Third-party laboratories
Pesticide residues on produce	• Collect and analyze samples of produce to determine pesticide residue levels. • Ensure that produce meets national and international standards for maximum residue limits (MRLs).	Representative fields at harvest time	• Laboratory analysis of produce samples	Before harvest	PMU Third-party laboratories

10.2 Social Monitoring Program

To ensure the effectiveness of social management, the social monitoring program is prepared to monitor social issues. The contractor and/or sub-contractor are responsible for monitoring using appropriate methods, equipment and system. Details on monitoring parameters are shown on the table below:

Table 452: Social monitoring plan during Pre-construction, Construction, and operation phase

Monitoring Parameters	Monitoring Indicators	Locations	Measurements	Frequency	Responsibility
Preconstruction phase					
Land acquisition/ Economic displacement	• Track the process of acquiring land for the project, ensuring fair compensation is provided to affected landowners. • Implement programs to help displaced individuals and communities restore their livelihoods. • Establish effective grievance mechanisms to address complaints and concerns related to economic displacement.	Construction sites	• Monitor the distribution of compensation payments and address any disputes or concerns. • Monitor the effectiveness of these programs.	• Daily • Reported to PMU within 48 hours	• PMU
During construction phase					
PROTECTING THE WORKFORC					
Child Labor/ Forced Labor	• Involvement of child labor/ forced labor in main contractor and subcontractors' workforce • Involvement of child labor/ forced labor among primarily supply workers	• Construction sites • Worksite of primary supplier	• Site inspection • Observation	• Daily • Screening prior to engaging services of primary supplier	
COMMUNITY HEALTH AND SAFETY					
Community Health and diseases	• Incidence of waterborne diseases • Prevalence of vector-borne diseases (e.g., malaria, dengue fever) • Respiratory illnesses related to dust and air pollution • Availability and accessibility of healthcare services • Community awareness of health risks and preventative measures	• Construction sites • Worker camps • Community and neighboring	• Health data collection • Site inspections • Health surveys and interviews • Consultation with	• Monthly • During outbreaks • Periodic community	• PMU • Contractors • Local health authorities

		areas	workers and community members	health awareness campaigns	
SEA/SH	• Before mobilizing workers to construction site, conduct orientation/training on SEA/SH (using sample Code of Conduct as a minimum) for all Contractors' managers and workers mobilized to construction site • As part of the above training/orientation, ensure all workers understand SEA/SH risks, disciplines and penalty, and understand project's grievance procedures related to SEA/SH • As part of the workers and manager's work contract, require all workers engaged for project (both workers mobilized to site or work in contractors' office) to peruse and sign Workers' CoC • Ensure Contractors appoint a focal point in charge of ESHS and grievance reception, processing and resolution • Apply all measures related to management of work camps	• Construction sites • Relevant local communities	• Number and percentage of workers trained on SEA/SH prior to mobilization to subproject site • Number and percentage of workers signing Code of Conduct as part of Work Contract • Percentage of workers perpetrating SEA/SH and percentage of cases reported to PMU and resolved • Name and contact of ESHS and grievance focal report reported in Contractor's ESMP.	• Monthly and during subproject cycle • Reported to PMU within 48 hours if occurred	• Contractors • PMU
Traffic safety and Security	• Security cautions • General disease prevalence • Worker health • Communicable diseases	• Construction sites • Access roads to construction sites • Newly constructed/rehabilitated roads	• Site inspections • Incident reports • Data collection • Consultation with workers and community members • Review of contractor safety plans	• Daily during construction • Weekly during construction • Monthly during operation	• Contractors • PMU • Local authorities
Community Health and diseases	• Consultations with target communities to assess the current social situation and social impacts of sub-projects. • Recommendations and solutions from communities obtained regarding negative social impacts.	• Target communities • Workers	• Assessment of social situation and social impacts. • Collection of	• During consultations	• Contractors • PMU

			community recommendations and solutions.		
Personal Protective Equipment	• Health and safety regulations enforced at construction sites. • Appropriate training and personal protective equipment (PPE) provided to workers.	• Construction sites and worker camps	• Monitoring that contractors provide appropriate PPE and enforce its use. • Observation of training sessions. • Review records of PPE distribution and training.	• Monthly monitoring during construction	• Contractors • PMU
Working conditions and Management of Worker	• Worker wages and benefits compared to legal requirements and industry standards • Instances of discrimination or unfair treatment based on gender, ethnicity, or other factors • Access to grievance mechanisms for workers to report unfair labor practices	• Construction sites • Worker camps	• Payroll records review: Verify worker wages and benefits. • Worker interviews: Confidential interviews to gather feedback on labor conditions and treatment. • Observation of worker interactions: Monitor for signs of discrimination or unfair treatment. • Review of contractor labor policies and practices: Ensure compliance with labor laws and ethical standards.	• Regular payroll audits • Periodic worker satisfaction surveys • Prompt investigation of any reported grievances	• Contractors • PMU
Cultural heritage	• Unexpected impacts on heritage resources	• Construction sites	• Site inspection • Observation • Report by local people/local authority	• Daily • Reported to PMU within 48 hours	• PMU • Contractors

CROSS-CUTTING					
Loss access to land and other assets	• Number of households affected by land acquisition or temporary restrictions on land use • Types of assets affected (e.g., land, houses, crops, trees) • Adequacy of compensation and resettlement measures for affected households	• Project areas where land acquisition is required • Areas affected by temporary restrictions on land use	• Land surveys and asset inventories • Consultations with affected households • Review of compensation and resettlement plans • Monitoring of resettlement implementation	• Before land acquisition • During land • After resettlement	• Contractors • PMU
Loss access to natural resources:	• Impacts on community access to water resources (e.g., for drinking, irrigation, fishing) • Impacts on access to forests and other natural resources • Measures to mitigate impacts and provide alternative access to resources	• Areas downstream of irrigation schemes • Areas surrounding project activities that may affect natural resources	• Water quality and quantity monitoring: Assess impacts on water resources downstream of project activities. • Consultations with communities: Gather feedback on impacts on natural resource access and use. • Development and implementation of mitigation plans: Address impacts and provide alternative access to resources.	• Regular water quality and quantity monitoring • During project implementation: Monitor the effectiveness of mitigation measures.	• PMU • Relevant government agencies • Contractors
Social inequality	• Any actions on the part of Contractors' workers or community member that cause social conflicts (e.g. SEA/SH, the way construction activities are carried out [pollution, restricted access, loss of local income/livelihoods, accidents…)	• Construction sites • Relevant local communities	• Number of social conflicts arising and nature and scope of conflict	• Daily • Monthly	• Contractors • PMU

	• Conflicts between upstream farmers who prioritize water storage for their crops and downstream farmers who require a consistent water supply for their agricultural needs.	• Local communities are living downstream and upstream.	• Number of social conflicts resolved by contractors within 7 days • Number of social conflicts resolved by local authorities • Number of serious cases that have happened and reported to PMU within 48 hours		
Elite capture	• Equitable distribution of project benefits among community members • Transparency and accountability in decision-making processes • Mechanisms for community participation and feedback	• Project implementation areas • Community meetings and consultations	• Monitoring of benefit distribution: Track who is receiving project benefits and ensure fairness. • Observation of decision-making processes: Assess inclusivity and transparency. • Community feedback mechanisms: Establish channels for communities to voice concerns and provide input.	• Throughout project implementation • Regular community meetings and consultations	• PMU • Contractors • Community representatives
Gender inequality	• Percentage of female beneficiaries • Percentage of beneficiaries who are youth • Average percentage women consulted • Number of action plans integrating specific women's • Average percentage FWUC with women in leadership positions • Women/youth trained in O&M • Number of training on gender and social inclusion delivered to	• Project sites • Community level	• Data collected through surveys and consultations • Review of project documents, training plans, and meeting minutes	• Monthly monitoring • Quarterly • Semi-annually • Annually	• PMU • Contractors •

	MOWRAM staff				
During operation phase					
COMMUNITY HEALTH AND SAFETY	• Number of accidents and fatalities related to construction activities • Number of disease outbreaks and environmental pollution incidents • Number of reported cases of worker health issues	• Construction sites • Camp site and Worker camps • Nearby community	• Site inspection reports • Accident/Incident reports • Medical records/reports • Consultation minutes/reports	• Daily for site inspections • Monthly for reports and consultations • Within 48 hours for reporting accidents, disease outbreaks.	• PMU • PDWRAM
CROSS-CUTTING					
Gender inequality	• Percentage of female workers in different roles (skilled, unskilled) • Number of reported cases of gender-based violence or discrimination • Participation of women in FWUCs and decision-making processes related to water management.	• Construction sites • FWUC meetings • Community consultations	• Observation of worker roles and interactions. • Records of complaints and their resolution. • Attendance records and meeting minutes.	• Monthly for data collection and reporting	• PMU • PDWRAM
Social inequality	• Employment rates of vulnerable groups (poor, ethnic minorities, people with disabilities) in project activities. • Access to project benefits (training, information, resources) among different social groups.	• Construction sites • Training sessions • Community consultations	• Employment records and beneficiary lists. • Attendance records and feedback surveys. • Consultations with community members and representatives of vulnerable groups.	• Monthly for data collection and reporting	• PMU • PDWRAM
Elite capture	• Participation and representation of different social groups in decision-making bodies (FWUCs, committees). • Transparency and accountability in the allocation of project resources and benefits. • Monitoring of complaints related to favoritism or exclusion in decision-making.	• FWUC meetings • Community consultations • Project implementation records	• Observation of meeting dynamics and representation • Analysis of resource allocation records. • Records of complaints	• Regularly during FWUC meetings and project implementation	• PMU • PDWRAM

			and their resolution.	• Continuously through the GRM.	

11. ESTIMATED COSTS

11.1 Estimated Costs for ESCMP Implementation

The costs of implementing the ESCMP listed below are related to PMU costs in addition to the dedicated safeguards PMU personnel budget line item. The main costs of implementing this ESCMP are the additional cost which have not been budgeted within the project, exclusive of the actual budget for the land resettlement and land acquisition which will be estimated by the end of the year as per the newly approval on the final conceptual design. For example, the project component 1 focus on establishment, capacity building and strengthening the FWUCs, therefore the concern regarding water management and water distribution inequality have already covered. Moreover, the sustainable agricultural practices and agricultural value chain is already in the project action plans. In this regard, the concern regarding GHG emission from the farming activities have been already addressed. The proposed budget therefore is the additional cost which are added to the existing one.

Table 46: Estimated cost for ESCMP implementation

No.	Items	Qty	Unit	Cost (USD)	Total (USD)
1	UXO clearance	Lum-sump	1	50,000	50,000
2	Preparing National EIA Report	Lum-sump	1	100,000	100,000
3	Implementing Biodiversity Management Plan	Year	5	7,500	37,500
4	ESCMP awareness raising and sensitization with key stakeholders and communities (5 times)	Times	2	3,000	6,000
5	Community outreach at the project area	Sub-scheme	1	15,000	15,000
6	Consultation facilitation	Sub-scheme	1	10,000	10,000
7	Monitoring activities	Lum-sump	1	18,500	18,500
	Total				**237,000**

11.2 Estimated Costs for ESMCP Monitoring Program

The monitoring cost will be budgeted only for the activities which are supposed to be additional expenditure which are not included in the social and safeguard consultant. The cost for monitoring is mainly focused on the monitoring cost for soil, water, and air quality.

Table 47: Estimated cost for ESCMP monitoring program

No.	Items	Unit	Qty	Cost	Total
1	Soil quality monitoring (every six months* 1 location * 1.5 year)	Times	3	1,500	4,500
2	Air quality, noise and vibration quality monitoring (every six months * 1 locations * 1.5 year)	Times	3	2,000	6,000
3	Water Quality monitoring (every six months* 1 location * 1 year) and groundwater (Annually * 1 location * 1 year) for around half of the total sample for surface water	Times	4	2,000	8,000
	Total				**18,500**

Annex

Annex 1. Screening checklist for E&S impacts for Yutasas Sub-scheme

Circle screening conclusion:

- If the answers to the checklist questions are “No”, there is no need for further action.
- If the answers to the questions are “Yes”, then consult the relevant procedures /guidelines for assistance in addressing issues of concerns.

A	Environmental and Social Impacts	No	Yes	Notes
Location				
1	Are there environmentally sensitive areas (forests, pastures, rivers, and wetlands) or threatened species that could be adversely affected by the sub-project?		√	
2	Does the sub-project area (or components of the project) occur within or adjacent to any protected areas designated by government (national park, national reserve, world heritage site, etc.)?	√		
3	If the sub-projects are outside of, but close to, any protected area, is it likely to adversely affect the ecology within the protected areas (e.g., interference with the migration routes of mammals, fish, or birds)?	√		
4	Will the sub-projects reduce people’s access to pasture, water, public services, or other resources that they depend on?	√		
5	Might the sub-projects alter any historical, archaeological, or cultural heritage site or require excavation near such a site?	√		
Physical and biological environment				
6	Will projects require large volumes of construction materials (e.g. gravel, stones, water, timber, firewood)?	√		
7	Might the projects lead to soil degradation or erosion in the area?		√	
8	Might the projects affect soil salinity?		√	
9	Will the projects create solid or liquid waste that could adversely affect local soil,	√		

	vegetation, rivers, streams, or groundwater?			
10	Might river or stream ecology be adversely and remarkably affected due to the installation of structures such as weirs, etc.?	√		
11	Will the projects have adverse impacts on natural habitats that will not have acceptable mitigation measures?	√		
12	Do the projects have human health and safety risks, during construction or later?		√	OHS safety and Dam safety
13	Might the projects lead to migration into the area?		√	
Alternatives				
14	Is it possible to achieve the objectives above in a different way, with fewer environmental and social impacts?	√		
B	**Land Acquisition and Social Issues**			
1	Have all groups within the community been consulted about the proposed project?		√	
2.	Which groups have not been consulted?	√		
3	Will the projects require acquisition of land (public or private) and/or other assets for its development?		√	Need to re-assess when the final design being made available
4	Will anyone be prevented from using economic resources (e.g. pasture, community places, forests etc.) to which they have had regular access?		√	Need to re-assess when the final design being made available
5	Will the projects result in the involuntary resettlement of individuals or families?		√	Need to re-assess when the final design being made available
6	Will the projects result in temporary or permanent loss of crops, fruit trees and household infrastructure such as granaries, toilets, kitchens etc.?		√	Need to re-assess when the final design being made available
7	Will the projects affect the livelihoods of particular groups within the communities, especially vulnerable groups such as the landless?	√		
8	Will the projects affect the well-being and livelihoods of women, particularly female-headed households?		√	Need to re-assess when the final design being made available
9.	Will the projects benefit all groups within the community equally?		√	
10.	Are there ongoing land or water disputes within the community/with neighboring communities?		√	

C	**Pesticides and Waste Materials**			
1	Will the project result in the introduction of pesticides or an increase in pesticide use if the use of such products exists?		√	
2	Will the project result in the production of solid or liquid waste (e.g. water, domestic or construction waste), or will it result in an increase in waste production during construction or operation?		√	Need to reassess when the final design and needs in construction being made available
D	**Is there a probability of the presence of unexploded ordinance (UXO) at or near the proposed sub-project area?**		√

Annex 3. Grievance Monitoring

1.1 Reportable Incidents

The following incident types are to be reported using the environmental and social incident response process.

- **Fatality**: Death of a person(s) that occurs within one year of an accident/incident including from occupational disease/illness (e.g., from exposure to chemicals/toxins).
- **Lost Time Injury**: Injury or occupational disease/illness (e.g., from exposure to chemicals/toxins) that results in a worker requiring 3 or more days off work, or an injury or release of substance (e.g., chemicals/toxins) that results in a member of the community needing medical treatment.
- **Acts of Violence/Protest**: Any intentional use of physical force, threatened or actual, against oneself, another person, or against a group or community, that either results in or has a high likelihood of resulting in injury, death, psychological harm, deprivation to workers or project beneficiaries, or negatively affects the safe operation of a project worksite.
- **Disease Outbreaks**: The occurrence of a disease in excess of normal expectancy of number of cases. Disease may be communicable or may be the result of unknown etiology.
- **Child Labor:** An incident of child labor occurs: (i) when a child under the age of 14 (or a higher age for employment specified by national law) is employed or engaged in connection with a project, and/or (ii) when a child over the minimum age specified in (iii) and under the age of 18 is employed or engaged in connection with a project in a manner that is likely to be hazardous or interfere with the child's education or be harmful to the child's health or physical, mental, spiritual, moral or social development.
- **Forced Labor:** An incident of forced labor occurs when any work or service not voluntarily **performed** is exacted from an individual under threat of force or penalty in connection with a project, including any kind of involuntary or compulsory labor, such as indentured labor, bonded labor, or similar labor- contracting arrangements. This also includes incidents when trafficked persons are employed in connection with a project.
- **Environmental pollution incident:** Exceedances of emission standards to land, water, or air (e.g., from chemicals/toxins) that have persisted for more than 24hrs or have resulted in harm to the environment.
- **Discrimination based on SOGI:** Discrimination means creating a distinction, exclusion, or restriction which has the purpose or effect of impairing or excluding a person based on their real or perceived sexual orientation, gender identity, gender expression, or sex characteristics from being on an equal basis with others.
- **Sexual Exploitation:** Any actual or attempted abuse of position of vulnerability, differential power, or trust, for sexual purposes, including, but not limited to, profiting monetarily, socially, or politically from the sexual exploitation of another. In Bank financed operations/projects, sexual exploitation occurs when access to or benefit from a Bank financed Goods, Works, Non-consulting Services or Consulting Services is used to extract sexual gain.
- **Sexual Abuse:** Actual or threatened physical intrusion of a sexual nature, whether by force or under **unequal** or coercive conditions. In Bank financed operations/projects, sexual abuse

occurs when a project related worker (contractor staff, subcontractor staff, supervising engineer) uses force or unequal power vis a vis a community member or colleague to perpetrate or threat to perpetrate an unwanted sexual act.

- **Sexual Harassment:** Any unwelcome sexual advance, request for sexual favor, verbal or physical conduct or gesture of a sexual nature, or any other behavior of a sexual nature that might reasonably be expected or be perceived to cause offence or humiliation to another, when such conduct interferes with work, is made a condition of employment, or creates an intimidating, hostile or offensive work environment. In Bank financed operations/projects, sexual harassment occurs within the context of a subcontractor or contractor and relates to employees of the company experiencing unwelcome sexual advances or requests for sexual favor or acts of a sexual nature that are offensive and humiliating among the same company's employees.
- **Other**: Any other incident or accident that may have a significant adverse effect on the environment, the affected communities, the public, or the workers, irrespective of whether harm had occurred on that occasion. Any repeated non-compliance or recurrent minor incidents which suggest systematic failures that PMU deems needing the attention of the WB.

1.2 For environmental and social incidents

1.2.1 Form to be completed by PMU within 48 hours

Q1: Incident Details	
1. Date of Incident:	
2. Time:	
3. Date Reported to PMU:	
4. Date Reported to WB:	
5. Reported to PMU by:	
6. Reported to WB by:	
7. Notification Type (Email/'phone call/media notice/other):	
8. Full Name of Main Contractor:	
9. Full Name of Subcontractor:	
Q2: **Type of incident (please check all that apply)**	
1. ☐ Fatality 2. ☐ Lost Time Injury 3. ☐ Displacement Without Due Process 4. ☐ Child Labor 5. ☐ Acts of Violence/Protest 6. ☐ Disease Outbreaks 7. ☐ Forced Labor 8. ☐ Unexpected impacts on heritage resources 9. ☐ Unexpected impacts on biodiversity resources 10. ☐ Environmental pollution incident 11. ☐ Dam failure 12. ☐ Other	

Q3: Description/Narrative of Incident
For example: 1. What is the incident? 2. What were the conditions or circumstances under which the incident occurred (if known)? 3. Are the basic facts of the incident clear and uncontested, or are there conflicting versions? What are those versions? 4. Is the incident still ongoing or is it contained? 5. Have any relevant authorities been informed?

Q4: Actions taken to contain the incident			
Short Description of Action	**Responsible Party**	**Expected Date**	**Status**

For incidents involving a contractor:

1. Have the works been suspended under the Contract GCC8.9?
   a) ☐ Yes
   b) ☐ No
2. Name of Contractor: **……**

Q5: What support has been provided to affected people?

1.2.2 Form to be completed by PMU (following investigation)

Q6. Fatality/Lost time Injury information	
Cause of fatality/injury for worker or member of the public (please check all that apply): 1. ☐ Caught in or between objects 2. ☐ Struck by falling objects 3. ☐ Stepping on, striking against, or struck by objects 4. ☐ Drowning 5. ☐ Chemical, biochemical, material exposure 6. ☐ Falls, trips, slips 7. ☐ Fire & explosion 8. ☐ Electrocution 9. ☐ Homicide 10. ☐ Medical Issue 11. ☐ Suicide 12. ☐ Others	*Vehicle Traffic:* 13. ☐ Project Vehicle Work Travel 14. ☐ Non-project Vehicle Work Travel 15. ☐ Project Vehicle Commuting 16. ☐ Non-project Vehicle Commuting 17. ☐ Vehicle Traffic Accident (Members of Public Only)

Name	**Age/DOB**	**Date of Death/injury**	**Gender**	**Nationality**	**Cause of Fatality/Injury**	**Worker (Employer)/Public**

Q7: Financial Support/Compensation Types (To be fully described in Corrective Action Plan template)

1. ☐ Contractor Direct
2. ☐ Contractor Insurance
3. ☐ Workman's Compensation/National Insurance
4. ☐ Court Determined Judicial Process
5. ☐ Others
6. ☐ No Compensation Required

Name	Compensation Type	Amount (US$)	Responsible Party

Q8: Supplementary Narrative:

1.3 For SEA/SH Incident

1.3.1 Incident Form for SEA/SH (to be completed by PMU within 48 hours)

Q9. Incident Details		
Date of incident intake by project/GM:	Date Reported to PMU:	Date Reported to AIIB:
Reported to project/GM by: 1. Survivor 2. Third party 3. Others:	Reported to PMU by: 1. GM operator 2. Directly, by Survivor 3. Directly, by third party 4. Others:	Reported to AIIB by: 1. PMU 2. Directly, by Survivor 3. Directly, by third party 4. Other:

Q10. Is a record of this incident in GM?

a) ☐ Yes
b) ☐ No

Q11: Incident type (please check all that apply) See Appendix 1 for definitions

c) Sexual exploitation
d) Sexual abuse
e) Sexual harassment

Q12: Provide the following details from the GM record.

1. Age of survivor (if recorded in GM):

2. Have the national legislation or mandatory reporting requirements been followed?

f) ☐ Yes
g) ☐ No

3. Sex of survivor (if recorded in GM):

a) ☐ Male
b) ☐ Female
c) ☐ Others

4. Was the survivor referred to service provision?

	a) ☐ Yes b) ☐ No
5.	Is the survivor employed by the project (as indicated by the survivor or complainant and reported in the GM)? a) ☐ Yes b) ☐ No
6.	Is the alleged perpetrator employed by the project (as indicated by the survivor or complainant and reported in the GM)? a) ☐ Yes b) ☐ No
Q13: Basis for further action	
1.	Has the complainant provided informed consent to lodge a formal complaint? a) ☐Yes b) ☐ No
2.	Does the employer have a suitable administrative process and capacity in place to investigate misconduct relating to SEA/SH in a survivor-centered way? a) ☐ Yes b) ☐ No
3.	Has the survivor provided informed consent to be part of an investigation into misconduct? a) ☐ Yes b) ☐ No
4.	Has the complaint been filed anonymously or through a third party? a) ☐ Yes b) ☐ No
5.	If the answer to any of these questions is no, has the GM assessed the risks and benefits of carrying out an investigation into the alleged misconduct, taking into account the survivor's safety and wellbeing? a) ☐ Yes b) ☐ No
6.	Will an investigation into misconduct be undertaken in addition to an investigation into adequacy of project systems, processes or procedures? a) ☐ Yes b) ☐ No

1.4 Incident Form for SEA/SH (to be completed by PMU following SEA/SH investigation)

Q14: Findings of the investigation	
1.	Have sanctions against a perpetrator been recommended as part of an investigation into misconduct? a) ☐ Yes b) ☐ No
2.	Has an investigation into adequacy of project systems, processes or procedures been undertaken? a) ☐ Yes b) ☐ No
Q15: Corrective actions to be implemented (To be fully described in Corrective Action Plan)	

Short Description of Action (SEA/SH examples)	Responsible Party	Timeline for completion/Status
1. Referral of Survivor to holistic care services		
2. Undertake disciplinary investigation in accordance with GM timelines and confirmed process		
3. Disciplinary actions, including sanctions, to be applied following misconduct investigation by employer		
4. Increased training on Codes of Conduct (CoC)		
5. Audit of implementation of SEA/SH safety mitigation		
6. Strengthened awareness training on project-related risks, CoC and how to report incidents for project-affected community		
7. Training for project supervisors on the need to follow guidelines of behavior in CoC and their supervisory responsibilities		
8. Plan to improve coverage/quality of service provision		
9. Any other system strengthening measures or corrections for system failures that are necessary		

3.1 Project's Grievance Logbook

3.1.1 Sample for Local Levels

No	Name of complainant (or anonymous)	Addresses	Sex	Age	Contact information	Date Received	Details of nature of grievance (Environmental impacts, social impacts, labor, health, etc.)	Which of the three GRM that was used?	Actions taken to resolve grievance, by whom	How many steps that have been used in the relevant GRM	Date grievance was finally resolved/closed?	Notes

3.1.2 Sample for PMU Level to be elaborated on Excel spreadsheet with filter function

No	Questions	Response
1	**Date Received:**	
2	**Name of Complaint** (or anonymous):	
3	**Sex:**	
4	**Age:**	
5	**Contact information** (Phone number/email, other channel(s):	
6	**Location of Complainants** (Province, District, commune, village):	
7	**Form of grievance received** (Writing or Verbal (face to face, telephone, online), SMS, MOWRAM and DoWRAM comment box in designated Website/Face book/What's App, etc.	

8	**Channel of Receipt** (Direct to PMU GRM Focal Point, or Relayed from other channels (Provide details)	
9	**Key topics of Grievances** a) Labor and Working Condition Resettlement (incl Voluntary Land Donation) b) SEA/SH c) Environmental impacts d) Community Health and Safety Accidents	
10	**Nature of complaints?** a) Resolution required b) Clarification required c) Suggestion n only (for project improvement) d) General Concerns	
11	**Step 1 of GRM Procedure:**	
	a) Date receipted:	
	b) Date solved/transferred:	
	c) Duration spent (in days):	
12	**Step 2,3,4** (Replicated in Excel spreadsheet):	
13	**Closing of Case** (At which Steps, date of case closing):	
14	**Notes:**	

Annex 4 – Worker's Code of Conducts

The Annex has two Code of Conduct (COC): one is for ESHS and SEA/SH/VAC, and the other is for working with local Ethnic Communities.

1.1 Code of Conduct related to ESHS and SEA/SH/VAC

Instructions:

This Code of Conduct shall be perused and signed by all individual workers who enter direct work contract with a) PMU, b) PMU's consulting firms and service providers, c) contractors who renovate existing HCFs.

I,_____, acknowledge that adhering to environmental, social, health and safety (ESHS) standards, following the project's occupational health and safety (OHS) requirements, and prevention of Sexual Exploitation & Abuse (SEA)/Sexual Harassment (SH), are important.

I understand that that failure to follow ESHS and OHS requirement, or to partake in activities constituting SEA/ SH -- be it at the project site, the surrounding area of the project site, workers' camps, or the project communities, including community members and project workers, constitute acts of gross misconduct and are therefore grounds for sanctions, penalties, or potential termination of employment. Prosecution by the Police of those who commit SEA/SH may be proceeded as applicable under relevant Laws.

I agree that while working on the project, I will:

- Carry out my duties competently and diligently.
- Comply with this Worker's Code of Conduct and all applicable laws, regulations, and other requirements, including requirements to protect the health, safety and well-being of other project workers, and any other person and community members.
- Maintain a safe working environment including by:
    - Ensure that workplaces, machinery, equipment, and processes under each person's control are safe and without minimal risk to health and safety of those involved.
    - Use appropriate measures relating to chemical, physical and biological substances, and agents; and
    - Follow applicable emergency response procedures.
- Report works situations that I believe unsafe or unhealthy to either project workers and/or community and remove myself and inform those relevant to remove themselves from a work situation which I reasonably believe imminent and dangerous to safety, life, and health of those involved.

- Consent, if required, to a background check in any place I have worked for more than six months.
- Attend and actively partake in training courses related to ESHS, OHS, SEA/SH and VAC, as requested by my employer.
- Always wear my personal protective equipment (PPE), as required while at work or engaged in project related activities.
- Take all practical steps to implement the environmental and social management plan (ESMP), which may include OHS Management Plan.
- Abide by a zero-tolerance policy as to SEA/SH/VAC and alcohol consumption during work activities, and refrain from use of narcotics or other substances which can impair worker's expected working ability and judgement.
- Respect women, children (persons under 18 years of age), and the elderlies regardless of their ethnic background, language, religion, personal opinions, disability, and/or other socioeconomic status.
- Shall not use language or behavior that are inappropriate to community members and project workers, particularly women, children, and the elderlies,
- Shall not commit any sexual abuse and or exploit, and/or sexual harassment of any kinds to community members in the project area and any project workers.
- Shall not engage in sexual harassment of project personnel and staff — for instance, making unwelcome sexual advances, requests for sexual favors, and other verbal or physical conduct of a sexual nature (looking somebody up and down; kissing, howling or smacking sounds; hanging around somebody; whistling and catcalls; in some instances, giving personal gifts.
- Shall not engage in offering any work-related favors such as making promises of favorable treatment (i.e., promotion), or make threats of unfavorable treatment (i.e., loss of job), or make payments in kind or in cash depending on sexual acts — or other forms of humiliating, degrading or exploitative behavior.
- Shall not engage in using prostitution service -- in any form and at any time during project implementation.
- Shall not participate in sexual contact or activity with children under 18 years of age — including grooming or contact through digital media. Mistaken belief regarding the age of a child is not a defense. Consent from the child is also not considered a defense or excuse.
- Consider reporting through the project's GRM, or to my manager, any suspected or actual SEA/SH deed by a fellow worker, whether employed by my company or not, or any breaches of this Code of Conduct.
- Complete relevant training courses that will be provided related to the environmental and social aspects of the Contract, including on health and safety matters, and Sexual Exploitation & Abuse, Sexual Harassment, and Violence Against Children (VAC).

- Report violations of this Code of Conduct; and

With respect to children under the age of 18:

- Bring to the attention of my manager the presence of any children on the construction site or engaged in hazardous activities.
- Wherever possible, ensure that another adult is present when working in proximity to children.
- Shall not invite unaccompanied children unrelated to my family into my home unless they are at immediate risk of injury or in physical danger.
- Not use any computers, mobile phones, video, and digital cameras or any other medium to exploit or harass children or to access child pornography (see also “Use of children's images for work related purposes” below).
- Avoid, in all circumstances, any verbale and/or physical punishment or discipline of children.
- No hiring of children (under 18) in any project activity.
- Comply with all relevant local regulations, including labor law in relation to child labor and forced labor.
- Take appropriate caution when photographing or filming children (see also section below). Photos or films of children should not be taken under the project, except for instances showing the benefits or impacts of road works, such as impacts to schools or school safety trainings.

Use of children's images for work related purposes

When photographing or filming a child for work related purposes, I must:

- Before photographing or filming a child, assess and endeavor to comply with local traditions or restrictions for reproducing personal images.
- Before photographing or filming a child, obtain informed consent from the child and a parent or guardian of the child. As part of this, I must explain how the photograph or film will be used.
- Ensure photographs, films, videos present children in a dignified and respectful manner and not in a manner that is vulnerable or submissive. Children should be adequately dressed up and not in poses that could be seen as sexually suggestive.
- Ensure images are honest representations of the context and the facts.
- Ensure file labels do not reveal identifying information about a child when sending images electronically.

Raising Concerns

If any person observes behavior that I believe may represent a violation of this Code of Conduct, or that otherwise concerns me, I will raise the issue promptly. This can be done in either of the following ways:

1. Contact [enter name of the Employer's Social Focal Point] to handle these incidences.
2. Call Employer's telephone number (See contact detail at Section 5 of project's Stakeholder Engagement Plan).

The person's identity will be kept confidential, unless reporting of allegations is mandated by the country law. Anonymous complaints or allegations may also be submitted and will be given all due and appropriate consideration. PMU will take all reports of possible misconduct seriously and will investigate and take appropriate action. In case of SEA/SH, PMU will provide referral to local service provider who will provide support to SEA/SH victims (See also Section 6.4 of project's Stakeholder Engagement Plan).

There will be no retaliation against any person who raises a concern in good faith about any behavior prohibited by this Code of Conduct. Such retaliation would be a violation of this Code of Conduct.

Sanctions

I understand that if I breach this Workers' Code of Conduct, my employer will take disciplinary action which could include:

- Informal warning.
- Formal warning.
- Additional Training.
- Termination of employment.
- Report to the Police if warranted.

I understand that it is my responsibility to:

Ensure that the Environmental, Social, Health and Safety requirements are met. Adhere to the Occupational Health and Safety Management Plan

Avoid actions or behaviors that could be construed as SEA/SH/VAC. Any such action will be a breach of this Workers' Code of Conduct.

I hereby acknowledge that I have perused the foregoing part of this Workers' Code of Conduct, agree to comply fully with the requirements contained therein and understand my roles and responsibilities to prevent and respond to ESHS, OHS, SEA/SH/VAC issues. I understand that any actions that are inconsistent with this Workers' Code of Conduct, or failure to act as mandated by this Workers' Code of Conduct may result in disciplinary action and may affect my ongoing employment.

1.2 Code of Conduct for Working with Local Ethnic Communities

This Code of Conduct is grounded on the objectives of the WB's ESS7, which are:

- To ensure that the development process fosters full respect for the human rights, dignity, aspirations, identity, culture, and natural resource-based livelihoods of Indigenous Peoples.
- To avoid adverse impacts of projects on Indigenous Peoples, or when avoidance is not possible, to minimize, mitigate and/or compensate for such impacts.
- To promote sustainable development benefits and opportunities for Indigenous Peoples in a manner that is accessible, culturally appropriate and inclusive.
- To improve project design and promote local support by establishing and maintaining an ongoing relationship based on meaningful consultation with the Indigenous
- To recognize, respect and preserve the culture, knowledge, and practices of Indigenous Peoples, and to provide them with an opportunity to adapt to changing conditions in a manner and in a timeframe acceptable to them.

Annex 5 – Simplified Pest Management Plan

1.1 Rationale

In Cambodia, around 90% of cultivated land is used for rice production. Rice alone accounts for about 70% of the country's total calorie supply. Rice production contributes an estimated 44% of rural household income, making the rice sector an area for strategic development in the country. Despite rice is the major crop in Cambodia, rice production is characterized by widespread misuse of pesticides. This is due to inconsistent enforcement of current regulation and a lack of information on pesticide safety and alternative pest management techniques among rice farmers. Most pesticides are imported and labelled in a foreign language incomprehensible to farmers. It is common that rice farmers mix two to five pesticides by intuition, leading to pesticide poisoning among farmers and adverse impact on environment[16]. Rice farmers tend to apply more pesticide when they see pests on their field[17]. Vegetable farmers also typically mix various types of pesticides per spray which is not good practice[18].

The CWSIP project will 1) improve overall water security for all stakeholders in the targeted basins in three provinces, 2) exploit the potential of the unused water resources and increase agricultural productivity in the targeted basin, and 3) enhance the overall capacity of the water resources management of the central government, concerned local governments, and concerned communities. Through three out of five project components, the project will improve 1) Water Service Delivery, 2) Agricultural Productivity, and 2) Water Resources Management. The project does not involve procurement of pesticides.

Under CWSIP, the project will support target farming population in irrigated area to improve their use of good agricultural practices, including integrated crop water management, climate-smart agriculture (diversification into high-value crop plantation, public-private-partnership and commercialization), as well as agribusiness and trade development. The CWSIP does not involve procurement of chemical fertilizers, pesticides, and/or other toxic agrochemicals nor promote use of chemical agricultural inputs during project implementation. However, rehabilitation /upgrading of existing reservoirs/irrigation system, etc. to be financed under the Project are expected to increase the agricultural command areas, including the number of crops per year. This increased crop may give rise to increased use of fertilizers, pesticides, and/or other toxic agrochemicals in the subproject areas which are unintended impact of the project.

1.2 Key Pesticide Management Outcomes in Cambodia

[16] https://ipmil.cired.vt.edu/our-work/projects/rice-ipm-for-cambodia/

[17] Matsukawa, M., Ito, K., Kawakita, K. et al. Current status of pesticide use among rice farmers in Cambodia. Appl Entomic Zool51, 571–579 (2016). https://doi.org/10.1007/s13355-016-0432-5.

[18] Sim Skooching, Keo Socheat and Sarom Moldiest. 2021. Pesticide Use Practices in Cambodia's Vegetable Farming. CDRI Working Paper Series No. 128. Phnom Penh: CDRI.

Pesticide Use and IPM implementation in Project Provinces: General Directorate of Agriculture (GDA)'s survey in 2014 and nation-wide inspections in 2013 of pesticide and herbicide suppliers in provincial capitals and other main distribution hubs, indicate that the most commonly sold products include: abamectin, chlorpyrifos, cypermethrin, glyphosate, imidacloprid. In the Northern provinces, where a large part of the herbicide use is on corn and rubber plantations, the main products sold are the herbicides Glyphosate, Paraquat and Atrazine. Nowadays, on Rice and Maize cultivation farmers don't use pesticide accept some vegetables. These inspections have also shown that the most problematic highly hazardous products, such as monocrotophos, methyl parathion, methamidophos, mevinphos, endosulfan, etc., are no longer found on the market with the exception of the occasional old bottle. The only banned products that still are found regularly are paraquat and methomyl. This is because these products were banned only recently (2010) and are still permitted in the neighboring countries from where they are informally brought in by users or retailers. The banning of highly hazardous pesticides in China does not seem to have led to dumping of old stocks in Cambodia. There are no known large stocks of obsolete pesticides.

Insecticides are used mainly on vegetables (such as Long Yard Bean, Chilly, Cabbage, Chinese Cabbage) marketable high-value crops and plantation crops, notably rubber. Field surveys by the national IPM program and GDA indicate there still is wide-spread abuse of pesticides among farmers. Lack of knowledge among farmers is a major constraint. Abuse includes mixing without justification (just to be sure), use of wrong pesticides, use of wrong dosages, etc. Adequate protective gear is hardly being used. Shops often have gloves and masks for sale, but these tend to be inadequate for protection against hazardous chemicals. Buyers of pesticides rarely also buy protective gear, and shops do not provide it for free. Half used pesticide bottles or packages are often stored within the house or near homesteads, often in easy reach of children. Empty pesticide containers are often discarded at the border of fields or in drainage ditches.

1.3 Government Regulation Related to Pest Management

Pest management practices in Cambodia have been promoted through the expansion of the National Integrated Pest Management (IPM) Program by both the government and NGOs. These agencies have been working together to establish a Pesticide Reduction Network to develop awareness of the risks associated with pesticide use amongst farmers.

As a key function, Ministry of Agricultural and Forestry (MAFF) has been examining and implementing various international legal guidelines and instruments relating to regulating the trade, distribution and use of pesticides in Cambodia. These include adherence to the FAO Code of Conduct on the Distribution and Use of Pesticides, the Stockholm Convention on Persistent Organic Pollutants, and the WTO sanitary and phytosanitary measures.

Following the promulgation of the Law on Management of Pesticides and Fertilizers as Royal Kram Number 0112/005 on 14th January 2012, MAFF had developed five Prakas in relation to Procedures for Registration and Business Operations, as follows:

- Prakas No. 415/MAFF dated 17 August 2012, on Procedures and Standard Requirements for Fertilizer Registrations.

- Prakas No. 456/MAFF dated 19 October 2012, on Procedures and Standard Requirements for Pesticide Registrations.
- Prakas N. 484/MAFF dated 26 November 2012, on List of Pesticides in the Kingdom of Cambodia.
- Prakas No. 119/MAFF dated 11 April 2013, on Procedures for Management of Fertilizers for Business Operations.
- Prakas No. 120/MAFF dated 11 April 2013, on Procedures for Management of Pesticides for Business Operations.

  Within MAFF, the Department of Agriculture Legislation and GDA are mandated to oversee all pesticide regulations and use.

1.4 International Code of Conduct on the Distribution and Use of Pesticides

The following rules are observed for IPM:

- The standards of conduct set forth in this Code: 1.7.6. are designed to promote Integrated Pest Management (IPM) (including integrated vector management for public health pests).
- Concerted efforts should be made by governments to develop and promote the use of IPM. Furthermore, lending institutions, donor agencies and governments should support the development of national IPM policies and improved IPM concepts and practices. These should be based on scientific and other strategies that promote increased participation of farmers (including women's groups), extension agents and on-farm researchers.
- All stakeholders, including farmers and farmer associations, IPM researchers, extension agents, crop consultants, food industry, manufacturers of biological and chemical pesticides and application equipment, environmentalists and representatives of consumer groups should play a proactive role in the development and promotion of IPM.
- Governments, with the support of relevant international and regional organizations, should encourage and promote research on, and the development of, alternatives posing fewer risks: biological control agents and techniques, non- chemical pesticides and pesticides that are, as far as possible or desirable, target-specific, that degrade into innocuous constituent parts or metabolites after use and are of low risk to humans and the environment.
- Governments should provide extension and advisory services and farmers' organizations with adequate information about practical IPM strategies and methods, as well as the range of pesticide products available for use.
- Governments should ensure that any pesticide subsidies or donations do not lead to excessive or unjustified use which may divert interest from more sustainable alternative measures.

1.5 Current Governmental Implementation Arrangements Related to Pest Management

Integrated Pest Management (IPM) refers to all pest control techniques and subsequent integration of appropriate measures that discourage the development of pest populations and keep pesticides and other interventions to levels that are economically justified and reduce or minimize risks to human health and the environment. IPM emphasizes the growth of a healthy crop with the least possible disruption to agro-ecosystems and encourages natural pest control mechanisms.

Under MAFF, Plant Protection Centers and their branches in provinces as well as Agricultural Extension Centers at district level are governmental agencies that coordinate and work on Integrated Pest Management Programs. These activities are built on the National IPM program that was initiated with assistance from the FAO, DANIDA and other donors since early 1990s which is largely being maintained using national budget.

IPM activities implemented by these local authorities and technical backstopping by experts from GDA include conducting field surveys, making forecast, monitoring and checking progress of on-field pest development. Using the forecast based on the timing, scale and level of damage that the key pests may cause, provincial plant protection authorities recommend policies, plans, and measures for pest management purposes.

Relevant authorities such as Plant Protection Centers and Agricultural Extension Centers also conduct IPM training for farmers. Farmers learn how to implement various integrated measures such as pest identification, pest control, pest analysis, pest surveillance, and apply measure to control pest, such as applying chemical and botanical control agent, promoting application of biological measures for pest management, reducing chemicals and practice sustainable IPM. Farmers are also trained on proper use of chemical pesticide and fertilizers to ensure efficiency in pest management, ensuring safety for human, natural enemy, and the environment. Communication campaigns on plant protections and quarantine legislations and advance IPM technics to the farmers are also carried out depending on budget availability, etc.

GDA's Plant Protection Center, including the national IPM program, has developed a 3-day curriculum for a Farmer Training on Pesticide Risk Reduction (FT-PRR) which is intended to raise awareness, develop capacity and help rural communities formulate and implement their own action plans for pesticide risk reduction. As of June 2014, some 4,900 Lao farmers (including 1,600 women) have participated in FT-PRR courses in 149 villages of 34 Districts in 9 provinces. Season-long Integrated Pest Management training through Farmers Field Schools (FFS) often includes these short-duration FT-PRR courses. These FFSs allow farmers to learn about and adopt Integrated Pest Management to reduce overuse of pesticides in crop production. 10. The National IPM Program has implemented 806 season-long IPM Farmers Field Schools, with over 24,350 rice, vegetable and fruit farmers trained. More, however, remains to be done. Pesticide Risk Reduction and IPM adoption at farm level remains a priority for the Government.

Operational costs of plant protection agencies are allocated from state funds. Their staff also work on projects and programs that are financed by other international funding and conduct additional annual trainings (using international budget) for farmers.

1.6 Objective of Simplified Pest Management Plan

This Simplified Pest Management Plan (S-PMP) aim to see out plan and measures to ensure the project does not unintentionally give rise to increased overuse of chemical agricultural inputs (such as chemical pesticide, fertilizers, and plant growth regulators, etc.). This S-PMP will be integrated into on-going pest management program and effort that provincial DAFF in project provinces have been doing and make sure pest management efforts target areas where water access is improved through project investment activities.

To mitigate this potential impacts as a 'good practice', the subproject owner will prepare and implement a S-PMP aiming to increase famers knowledge on Government regulations, policies, and/or technical guidelines related to safe use (application, storage, and disposal) of pesticides and toxic agrochemicals likely to be used by farmers as well as promote the application of an Integrated Pest Management (IPM) practice that are appropriate for the agriculture productions in the subproject area through training and other capacity building activities.

Key Elements - The elements of the S-PMP include the followings:

- Preventing pest problems.
- Monitoring for the presence of pests and pest damage.
- Establishing the density of pest population, which may be set at zero, that can be tolerated or corrected with a damage level sufficient to warrant treatment of the problem based on health, public safety, economic or aesthetic threshold.
- Treating pest problems to reduce population below those levels established by damage thresholds using strategies that may include biological, cultural, mechanical and pesticidal control methods and that shall consider human health, ecological impact, feasibility and cost effectiveness; and
- Evaluating the effects and efficacy of pest treatments.

Decision Making

Detecting a single pest under the Project will not always mean control is needed. A decision to use pesticides will be taken only as the very last resort and will also be based on conclusions reached from an agroecosystem analysis and trials. The decision will also depend on the number of pests and diseases found in the respective crop and the level of damage they are doing. If it is necessary to spray crops with pesticides, use of selective rather than broad-spectrum pesticides shall be strictly observed.

Pest Monitoring and Surveillance

A process for the reporting and identification of unusual plants, animals and pests will be established to

track and document all pest cases, be it minor or major in a pest inventory register. Pest surveys will be conducted on a regular basis to detect new infestations and will include the types, abundance, location of pest plants, date when first spotted or seen, and date when reported. This information will be

gathered from surveillance or monitoring system to be put in place, periodic surveys to be conducted and feedback from farmers/farm assistants. The data will be managed in a standardized way so that trends can be established. A rapid response process for the management of new infestations will be established to treat and manage new pest infestations as soon as they are identified.

Table 1. Potential impacts and proposed mitigation for pest

Potential Impacts	Proposed Mitigation
Contamination of ground water resources	Conducting trials on relatively flat land with less than 2% slope reducing the possibility of run off and at more than 500m away from water sources
Effect of pesticides on non-target species	Use pesticides that are systemic and narrow range and specific to sucking insects.
Effect of pesticides on grazing areas, settlements	Spraying in the morning hours when the weather is cool and less windy to reduce spray drifts. Locating trials or plots at distance of between 500-1000m away grazing areas or human settlements
Possibility of increasing resistance of pests to the pesticide	Training of field staff responsible on recommended usage of the pesticide
Harmful effects on staff applying pesticides	Provision and usage of safety clothing and working gear to staff
Harm to people within the homestead where the chemical is stored	Designation of a separate and secured storage room for pesticide Warnings and notices to increase awareness

1.7 Mitigation Measures

It is expected that there will be no procurement of pesticides under the project and that pesticide use, overall, will decline as a result with the introduction of good agricultural practices. To ensure the tendency of increased overuse of pesticide does not happen with subproject where project intervention take place, the project will prohibit procurement of large pesticides using the “negative list” and provide training to key staff and farmers on integrated pest management, safe use of pesticides, and organic farming practices. This will be integrated as part of the safeguard training. This S-PMP will be applied to the project activities that involve:

a) Any rehabilitation/upgrading of weirs/reservoirs/dams/existing irrigation schemes that are likely to prompt farmers to increase their use of pesticides:

b) Change/introduction of best agricultural practices such as integrated crop water management, Climate-smart agriculture, and

c) Promotion of agribusiness and trade related to farm products produced from target command area, and neighboring areas.

The plan is comprised of three parts:

(i) Application of government regulation on pesticide control.

(ii) Training of the integrated pesticides concept and/or other approaches for the safe use of pesticides; and

(iii) Monitoring.

Annex 6. Biodiversity Assessment Findings for Yutasas Sub-scheme

1. Proposed project activities and potential risks and impacts

Given the presence of endangered and critically endangered species and the sensitive habitat in the Yotasas command area, the proposed irrigation renovation scheme must be implemented with careful consideration to minimize negative impacts on biodiversity. By carefully considering the ecological implications of the project, it is possible to balance the needs of agriculture with the conservation of endangered species and their habitats. Under Yutasas, various activities will be carried out that cause the following E&S risks and impacts:

Table 1: Projection activities that may cause potential impacts on the environment and social aspects at Yutasas sub-scheme

No.	Project activities that cause impacts	E&S Risks & Impacts
1	Construction activities (rehabilication of canal and farm roads), land use changes, and water management practices	**Habitat loss and fragmentation** could lead to habitat loss and fragmentation, affecting species' survival and connectivity. This activity may involve dredging, excavation, or modification of existing water channels and infrastructure. These activities can lead to habitat destruction, disturbance to nesting and foraging sites, disruption of natural water flow patterns, and alteration of hydrological regimes. This can directly impact both terrestrial and aquatic biodiversity.
2	Increased agricultural activities, sedimentation, and pollution	**Water quality degradation** could impact aquatic ecosystems and species that rely on clean water.
3	Dredging of waterways and Alteration of water levels	Changes in water levels within the command area due to irrigation system renovation may negatively impact wildlife dependent on specific habitats for breeding or foraging purposes. Changes in water levels and habitat quality could force endangered species to relocate,

		potentially leading to competition with other species or exposure to new threats.
4	Use of chemicals and nutrient loading	**If pesticides/fertilizers are used during agricultural practices within the command area as part of irrigation system renovation projects, it could lead to contamination of soil and water resources affecting both terrestrial and aquatic biodiversity.**
5	**Biodiversity degradation, and soil erosion**	The **potential** impacts of the project on water flow, water quality, and sedimentation patterns. The changes in microclimate.
6	Barriers to fish migration routs	Irrigation structures, such as dams and weirs, can obstruct fish migration, preventing them from accessing critical spawning grounds or nursery areas. This disruption of their natural life cycles can lead to reduced populations and species decline. To mitigate these negative impacts, it's essential to design and operate irrigation systems with fish-friendly considerations. Addressing this issue may includes incorporating measures like fish passage facilities[19], such as fish ladders or fish lifts, to enable safe movement upstream and downstream. Additionally, implementing effective water quality management practices and raising public awareness about the importance of protecting fish populations, particularly near fish passage areas, can contribute to the conservation of aquatic ecosystems.

2. Areas of Influence

The area of influence for the Yatasas Yotasas irrigation renovation scheme encompasses the direct and indirect impacts of the project. This includes:

- **Direct Impacts:** The immediate area where the irrigation infrastructure will be constructed and operated, including canals, pumping stations, and reservoirs.
- **Indirect Impacts:** The surrounding areas that may be affected by changes in water flow, land use, or other project-related activities. This includes the Stueng Krang Ponlai River,

[19] Fish passage is essential for fish to navigate water systems and access diverse habitats. Fish passage technologies, like fish ladders, help preserve fish populations and aquatic ecosystems. Fish need to migrate 10 miles or 1,000 miles to access different habitats, food, and environments that support their life cycles.

the Tonle River, and the habitats of endangered species within the Yotasas Yotasas command area.

3. Analysis to prepare for determining CH status

1.8 Critical Habitat Area of Analysis

Critical habitat is defined as an Area of Analysis (AoA), and the project's command area is used as an AoA.

1.9 Species with Potential Occurrence within the AoA

A list of threatened species with potential occurrence was generated for Yutasas. The coordinates of Yutasas (via KMZ file) are used to inform the IBAT radius of screening. Since the default radius of IBAT screening is 50km, steps were taken to narrow down to the sub-scheme's area of influence to identify only EN and CR species that are potentially present in the sub-scheme area of influence. The narrowing-down aims to practically identify EN and CR species that could be found in the sub-scheme area of influence and to determine the Critical Habitat status of the identified species. After three rounds of screening focusing on EN and CR species, 6 EN and CR species are found as potentially present in the sub-scheme area of influence. These species include 3 reptile species, and 3 fishes (See list of 11 EN and CR species in Table below).

Description of screening for narrowing down

For Yutasas, three rounds of screening have been conducted. The first screening (Round 1) was conducted in December 2023. Round 2 was carried out in April 2024, and Round 3 in August 2024. The purpose of repeated screening is to validate the screening results (for the same area) with a wide range of local stakeholders. The screening aims to identify only EN and CR species that are potentially present in the Yutasas area of influence, covering reptiles and fish. Screening was done based on the IBAT report generated and provided by the AIIB.

In the first two rounds of screening, 5 EN and CR species were identified in the Yutasas area of influence (See Table 9 below). In the 3rd round of screening (in August 2024), however, 3 (out of a total of 5 species) were confirmed as "potentially present" in the Yutasas's area of influence.

So, the assessment for Yutasas focuses on the confirmed list of **3 species of fish** that are categorized by IUCN as EN and CR species (see map in Krapeu Trom section above).

Table 2: Confirmed List of endangered and critically endangered species for the Yutasas sub-scheme

No.	Local Name	English Name	Scientific Name	IUCN Cat	Screened Species from Round 1&2 (Total=5)	Confirmed Species in Round 3 (Total = 3)
I. Reptile species						
1	អណ្តើកព្រាច	Elongated Tortoise	Indotestudo elongata	CR	Yes	Yes

II. Fish species						
2	ត្រីត្រសក់ក្រហម	Jullien's Golden Carp	Probarbus jullieni	CR	Yes	Yes
3	ត្រីជង្ហាស្ទឹង	Leaping barb/Flying Minnow	Laubuka caeruleostigmata	EN	Yes	Yes
4	ត្រីកាហោ /ត្រីគុលរ៉ាង	Mekong giant barb/Giant Carp	Catlocarpio siamensis	CR	Yes	Yes
II. Bird species						
5	ទាព្រៃស្លាបស	White-winged Duck	Asarcornis scutulata	EN	Yes	No

4. Ecological State of Habitats within the AoA

Understanding of the ecological state of habitats is necessary to assess the Likelihood of occurrence (LoO) of the above 3 screened species - as part of the CHA. For this CHA, species were classified into four LoO categories: Present, Possible, Unlikely and Not Present. Species known to be Present or with a Possible LoO are further assessed in Step 3. This understanding takes into account the classification of habitats as either modified or natural based on levels of human-induced disturbance to species composition and ecological functions. In this session, a brief assessment of the 3 confirmed species are presented. The assessment discusses historical range, distribution, habitat conditions, current status, and potential threats identified by key informants.

The Yutasas command area has been in existence since the 1970s. This command area is a mixture of paddy fields, farm roads, and residential areas. Natural rivers, such as the Stueng Krang Ponlai, are the sole ecological and hydrological connection between its upstream watershed and the downstream Tonle Sap River basin. This river is crucial for fish migration during the flooding season. However, reservoirs, spillways, and drought conditions have disrupted these essential ecological functions.

5. Determination of Critical Habitat Status (Step 3)

This section assesses the information (obtained from the above sub-section) vis-a-vis the criteria (presented in Section 3.4 - CH assessment method). This assessment aims to determine whether any species (identified in the list of 3 EN and CR species) qualify for Critical Habitat features.

5.1 Habitat of significant importance to CE and EN species

As presented in Section 4.1.3.3 (Ecological State), species that qualify as critical habitat features include:

Based on the interviews and habitat assessments, three of the five endangered species were confirmed to be present in the Krapeu Trom section: Jullien's Golden Carp, Flying Minnow, and Mekong Giant Barb (see map above in Krapeu Trom section).

- **Jullien's Golden Carp:** A female fisher reported encountering this rare species in the lower part of the reservoir during a flood in 2022. She caught five individuals using a fishing net. The other informants had not seen this species in several years. After careful verification, it was determined that the fishers were familiar with the species and had not mistaken it for another.
- **Flying Minnow:** Two informants reported encountering this small fish species in 2022 and 2023. One caught them in the lower part of the Yotasass reservoir, where they had migrated from a downstream area. The other found them in her natural fish pond after pumping it. Both informants were confirmed to be familiar with the species.
- **Mekong giant Barb**: A key informant reported catching five individuals of this species in July 2022 after heavy rains. The fish were small, approximately 1.5 kilograms each, and were found in the lower part of the reservoir. The informant was familiar with the species and believed that they were attempting to migrate upstream but were trapped by the reservoir..

5.2 Habitat of significant importance to endemic or restricted-range species

None of the species under EN and CR classification are restricted-range species (based on IBAT report for Yutasas).

5.3 Habitat supporting globally or nationally significant concentrations of migratory or congregation species

None of the IBA that are recognized for significant concentrations of migratory birds or other species are found within the vicinity of the sub-scheme. No other evidence of significant concentrations of migratory or congregatory species is available. The AoA for Yutasas, therefore is expected to qualify as critical habitats under this criterion.

5.4 Highly threatened or unique ecosystems

Each of the reservoirs are modified habitat and is associated with numerous rice paddies. There is no evidence that these areas are highly threatened or unique ecosystems, and no critical habitats are recognized under this criterion.

5.5 Ecological functions or characteristics that are needed to maintain the viability of the biodiversity values described above in (a) to (d)

No ecological functions that are necessary to support biodiversity values (described under the above criteria) have been identified.

Table 3: Initial Screening of CH-qualifying Species Confirmed or Likely to Occur in the Yutassas sub-scheme of the Project Area

English Name	Scientific Name	IUCN Status	Global population	Cambodia population	Migratory/ Congregatory	Habitat and Distribution	Likelihood of Occurrence	Rationale for Critical Habitat Screening	Screened In or Out
Reptile									
Elongated Tortoise	Indotestudo elongata	CR	Unknown-kept declining	Unknown-kept declining	No	Endangered and elusive, inhabit the Tonle Sap Floodplain's diverse wetlands, including flooded forests and marshes. Their survival is threatened by habitat loss, hunting, and bycatch.	Not confirmed	There's some qualified habitat but lack of permanent and deep-water body. The species was confirmed present around 15 to 12 km way downstream far from the project area. Therefore, It's likely absent in the project AoI.	**Out**
Fish									
Jullien's Golden Carp	Probarbus jullieni	CR	Unknown-kept declining	Unknown-kept declining > 80% over three generations	Yes	*Probarbus jullieni* inhabits Cambodia's Mekong tributaries and large rivers, favoring deep, flowing lowland pools. Once widespread in the Mekong and Tonle Sap systems, its range is now fragmented and drastically reduced.	Low - Confirmed in AoI in 2024	Critically endangered due to overfishing, dams, and habitat loss, it is now extremely rare in Cambodian waters. This species migrates from Tonle Sap River system into the AoI through Stueng Krang Ponlai river system (Tonle Sap tributary). Likely to qualify the Yutasas as CH under Criterion 1, 3, and 4threshold.	**IN**
Leaping barb/Flying Minnow	Laubuka caeruleostigmata	EN	Unknown-kept declining	Unknown-kept declining	Yes	This species prefers clear, forested streams and tributaries across Cambodia's river systems. While likely widespread in suitable freshwater habitats, its precise distribution remains poorly documented.	Low - Confirmed in AoI in 2024	Endangered due to overfishing, dams, and habitat loss, it is now extremely rare. This species migrates from Tonle Sap River system into the AoI through Stueng Krang Ponlai river system (Tonle Sap tributary). Likely to qualify the Yutasas as CH under Criterion 1, 3, and 4 threshold.	**IN**
Mekong giant barb/ Giant Carp	Catlocarpio siamensis	CR	Unknown-declined over 90% in the last three generations	Unknown-kept declining	Yes	*Catlocarpio siamensis* once lived in deep Mekong pools and tributaries but are now extremely rare and restricted to isolated spots due to overfishing and habitat loss.	Very Low - Confirmed in AoI in 2024	Critically endangered, with severe population declines attributed to overfishing, dam construction, and habitat degradation, rendering it exceptionally rare. It's reported that only juvenile individuals migrate from the Tonle Sap River system into the Area of Influence (AoI) via the Stueng Krang Ponlai River, a Tonle Sap tributary. Likely to qualify the Yutasas as CH under Criterion 1, 3, and 4t hreshold.	**IN**
Bird									
White-winged Duck	Asarcornis scutulata	EN	Unknown	Unknown	No	Rare and poorly studied aquatic plant species endemic to Thailand, specifically found in the Chanthaburi Province.	Not confirmed	IUCN listed as EN and as the Endemic to the Thailand and therefore it has been screened out	**Out**

6. Mitigation Measures

To minimize the negative impacts of the irrigation renovation scheme on biodiversity, the following mitigation measures should be implemented:

6.1 Overviews

Yutasas: This sub-scheme has confirmed sightings of the critically endangered Jullien's Golden Carp, Leaping Barb (Flying Minnow), and Mekong Giant Barb. Construction activities, particularly worker presence, risk habitat disturbance and increased access for illegal fishing and capture, threatening these vulnerable species. Mitigation measures, including sensitive area avoidance, sustainable design, fish passageways, erosion control, and community-based conservation, are essential during all project phases.

6.2 Trigger of Implementation

Overall: The reports emphasize the urgent need for careful project planning and mitigation measures, including habitat restoration and sustainable water management, to minimize negative impacts on vulnerable species and their critical habitats. The project's area of influence extends beyond immediate command areas, requiring a holistic approach to conservation. Collecting and trafficking protected species are prohibited as described in the *Cambodia law/regulation:*

- Forestry Law (2002): This law provides the framework for the management and protection of forests, including wildlife. It prohibits hunting, capturing, and trading protected wildlife species without permission.
- Fisheries Law (2006): This law governs the management and protection of fisheries resources, including aquatic wildlife. It prohibits illegal fishing methods and the trade in endangered aquatic species.
- Protected Areas Law (2008): This law establishes and manages protected areas, such as national parks and wildlife sanctuaries, to conserve biodiversity, including threatened species. It restricts activities that could harm wildlife within these areas.
- Sub-decree on International Trade in Endangered Animals and Plant Species (2006): This sub-decree implements the Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES) in Cambodia. It regulates the import, export, and re-export of CITES-listed species.
- Penal code: he Cambodian Penal Code includes provisions that criminalize wildlife trafficking, with penalties including imprisonment and fines.

6.3 P1.1. Impact: Illegal wildlife collection, possession, and trafficking by site workers/ personnel.

Mitigation Measures:

<u>Pre-construction</u>:

- Develop a:
    a. Code of Conduct/ethics against wildlife collection, possession, and trafficking,
    b. SOP for wildlife protection and handling, and
    c. Training and awareness materials on human-wildlife conflict management. This should include biodiversity awareness training to raise their awareness on the:
        (i) ecological sensitivity of the site, importance of forest habitats, protected and threatened plants and animals within the Project area;
        (ii) proper protocols to adopt when wildlife is encountered;
        (iii) need to be cautious when operating machinery to avoid injury/mortality to fauna; and
        (iv) zero tolerance policy to possession of wildlife and forest resources. This should be applicable to both staff and contractors. These materials will also be used for Phase 2 and Phase 3 of the Project.

Responsible for Implementation:

- The PMC-Ecologist/Biodiversity Specialist to develop a) Code of Conduct/ethics against wildlife collection, possession and trafficking, b) an SOP for wildlife protection and handling, and c) training and awareness materials on human-wildlife conflict management.
- The PMC-Ecologist/Biodiversity Specialist to coordinate with the government agencies on wildlife conservation (MoE, MoAFF) and may seek technical assistance from NGO that has strong experience in wildlife protection, collection, possession, and trafficking, such as WCS, CI, and WA in developing the Code of Conduct, SOP for wildlife protection and handling and awareness and training materials on human wildlife conflict management.

- **Provide mandatory training for Contractors management staff and site worker on:**
    a. Code of Conduct/ethics against wildlife collection, possession and trafficking,
    b. SOP for wildlife protection and handling, and
    c. Human-wildlife conflict management.

Responsible for Implementation:

- The PMC is responsible in providing Training of Trainers to the CSCs and the CSCs are responsible to provide training on the Code of Conduct, SOP for wildlife protection and handling and awareness and training materials on human wildlife conflict management to all Contractors management staff and field workers prior to construction and operational Phases of the CAISAR project.

- The NGO and Cambodia conservation agency (WCS, CI, ANKO) staff can provide human resource in delivering the training.
- All management and field staff of the Construction Contractor are mandatory to attend the training on a) Code of Conduct/ethics against wildlife collection, possession and trafficking, b) SOP for wildlife protection and handling, and human-wildlife conflict management.

- Incorporate policy and associated systems and procedures inclusive of appropriate sanctions/contract termination actions that prohibit employees and/or subcontractors from possession, purchase, trade or collection of wildlife or forest resources that are legally protected, CITES listed, or classed as threatened by the IUCN Red List, in the Project Administration Manual (PAM) and Worker's Agreement.

Responsible for Implementation:

- The PMU and PIU to incorporate the policy and associated systems and procedures in the PAM.
- The CAISAR Contractors and CAISAR Operators to incorporate the policy and associated systems and procedures in the Worker's Agreement.

Construction:

1. Minimize forest encroachment, wildlife poaching, and tree cutting due to improved access from new roads, a community-based management plan will be developed and implemented.

a. Minimize the increased potential for forest encroachment and wildlife poaching by people who could use new roads to access forest areas.
b. Avoid forest and land encroachment.
c. Minimize the intensity of poaching.
d. Tree cutting by the people, due to improved access to the area

Responsible to implement:

- Plan Development: Jointly develop a practical management plan with local communities and landowners.
- Guard Posts: Establish and maintain guard posts on temporary access and inspection roads near residential areas and priority biodiversity areas. (Include guard post construction costs in contractor agreements.)
- Surveillance: Conduct routine surveillance inspections on roads and in priority biodiversity areas (with landowner cooperation) to remove traps and deter hunting, logging, and plant removal.
- Signage**:** Install and maintain signs:
  - Banning unauthorized access on temporary roads.

- Prohibiting hunting, snaring, and other harmful activities, especially near priority biodiversity areas and working zones.

- Reporting**:** Report observed/recorded incidents of illegal activities to FiA, FA or other authorized agencies.

2. Undertake regular monitoring of all access roads (including all quarries and the cement batching plant) to secure them from poaching activities.

Responsible to implementation.

- The Contractor is responsible in undertaking regular monitoring of all access roads (including all quarries and the cement batching plant) to secure them from poaching activity.

3. Implement the PAM and Worker's Agreement which includes policy and associated systems and procedures inclusive of appropriate sanctions/contract termination actions that prohibit employees and/or subcontractors from poaching, possession, purchase, trade or collection of wildlife or forest resources that are legally protected, CITES listed, or classed as threatened by the IUCN Red List. Corrective measures should be taken where necessary including appropriate actions against infringements.

Responsible for Implementation:

- The Contractor to implement the policy and associated systems and procedures.
- PIU should develop appropriate levels of penalisation against degree of infringement ranging from fines, suspension, and employment termination, and reporting to local authorities for prosecution (for most severe cases).

4. Check if feasible to control access road users during construction through use of security gates. If yes, security gates are to be manned by at least one (1) security officer 24 hours per day who will record the particulars (name, address, vehicle registration number, personal identification number) of all vehicles who are allowed into the access road. Visitors must also be always accompanied by a company representative. The security officers should be trained to identify behaviour associated with poachers and vehicle searches. The security gate should be equipped with 24-hour CCTV cameras. Evidence of such inspections/ vehicle searches to be recorded and available for review.

Responsible to implement:

- The CAISAR Contractor.

5. Properly handle and rescue wildlife incidentally encountered or caught during land clearing and construction Phase by to safer habitats. Handling and rescuing wild fauna will follow the SOP for wildlife protection and handling.

Responsible for Implementation:

- The is responsible handling, rescuing, and reporting encountered or caught wildlife during land clearing and construction works.

- The Contractor needs to coordinate with Cambodia conservation agency (FA, Phnom Tamao Wildlife Rescue Centre, or ACCB) in handling or rescuing the wildlife.
- Wildlife Encounter Protocols & Training: Implement protocols for wildlife encounters and train workers on appropriate responses, emphasizing non-interference and prohibiting harmful actions.
- Rapid Response Wildlife Unit: Establish a rapid response unit (potentially through a third party) to address human-wildlife conflict effectively.
- Community Information: Educate the community on local wildlife behavior, avoidance techniques, and deterrent methods.

Residual Impact: Minimal residual impact.

6.4 P1.2. Impact: Wildlife collisions with construction and quarry vehicles.

Trigger of Implementation:

The increase in vehicle movements such as trucks and excavators, particularly in quarry areas and access roads, will likely lead to increased chances of collisions with wildlife such as mammals and reptiles.

Mitigation measures:

Design/Pre-construction:

1. Conduct thorough biodiversity inspections along the access roads and at quarry sites before starting any land clearing works. The inspections should be conducted to identify any habitat and/or nesting sites of endangered/ protected species that may be affected by the clearing and identify hotspots where collisions with wildlife are likely to occur.

Responsible to implement:

- The Contractor is responsible to conduct the inspections and identify hotspots where collisions with wildlife are likely to occur.
- The CSC- Project Ecologist to provide technical assistance and guidance to the Construction Contractor in in conducting the inspections.

2. Provide general guidance to land clearance (refer to Appendix XX on Land Clearance SOP):
    a. When planning for expansion, ensure land clearance is undertaken in a Phased approach such that it complements wildlife shepherding activities.
    b. All proposed clearance areas will be marked in the field prior to any vegetation being cleared. The marking can use spray paint or marking tape. A briefing is to occur with personnel to outline the area proposed for clearing.
    c. An inspection is to occur following clearing to determine if clearing has been limited to the identified clearance area. Any clearing outside of the marked area is to be reported to the HSE Manager.

Responsible to implement:

- The Project Ecologist of CSC is responsible in providing guidance.

3. Prior to wildlife shepherding activities, undertake briefing with all involved personnel so they are aware of their roles and responsibilities; measures to deal with injured wildlife; occupational health and safety requirements; and requirements regarding the prohibition of hunting/ catching/ taking of fauna and flora. This will include incident reporting measures to relevant forestry authorities and stakeholders, and the reporting of any individual suspected or caught with fauna and flora to the relevant authority. Random inspections of personnel arriving and leaving the Project area can be considered. Refresher training is to occur with new employees.

Responsible to implement:

- The CSC- Project ecologist to train field workers to recognize and avoid wildlife.
- The field workers to report to the CSC HSE Manager of any wildlife sightings or collisions.

4. Provide features such as tunnels or rope bridges along temporary roads to enable wildlife movement and to reduce potential traffic incidents.

Responsible to implement:

- Design & Engineering Team: Responsible for incorporating wildlife crossing features (tunnels, rope bridges) into temporary road designs.
- Construction Contractor: Responsible for the physical implementation and construction of these features.

<u>Construction</u>:

1. Install signage to alert drivers to the presence of wildlife and require them to slow down and drive with caution, especially in hotspots where collision with wildlife is likely to occur.

Responsible to implement:

- The Contractor to install the signage to alert drivers to the presence of wildlife and encourage them to slow down and drive with caution.

2. Implement speed limit (less than 40km/hour), to reduce the likelihood of collisions and give drivers more time to react to wildlife on the road.

Responsible to implement:

- The Contractor to implement the speed limit.

Residual impact: Minimal Residual Impact

6.5 P1.3. To prevent wildlife deaths and minimize disturbance to wildlife along access and inspection roads.

Management Actions: To prevent negative impacts of vehicle traffic on wildlife (animal collisions, disturbance etc.) the following actions will be implemented by Contractors:

Mitigation measures:

<u>Design/Pre-construction</u>:

1. Develop a system in which drivers report locations of wildlife crossing and wildlife sightings**.**

Responsible to implement:

- Project Environmental Team: Responsible for designing and implementing the wildlife sighting/crossing reporting system.
- Drivers/Transport Staff: Responsible for reporting observed wildlife crossings and sightings.
- Site Supervisors/Foremen: Responsible for collecting and relaying driver reports to the Project Environmental Team.

2. Information campaigns to explain to drivers about the biodiversity management objectives that seek to avoid wildlife collisions and disturbance, including:

Responsible to implement:

- Wildlife Awareness: Workers will receive training on frequently encountered wildlife (e.g., snakes, turtles, tortoises, nocturnal animals) and appropriate roadkill avoidance measures.
- Speed Limit Enforcement: Training will emphasize adherence to speed limits and the consequences of violations.
- Roadkill Reporting: A clear reporting system for animal collisions will be established, including reporting locations and designated recipients.

Construction:

3. Install and maintain signs in areas of frequent wildlife crossings, saying "beware of animal crossing" (complete with pictures of animals) in language understandable to all.

Responsible to implement:

- Environmental/Safeguards Team: Responsible for identifying high-risk crossing areas and designing appropriate signage.
- Construction Contractor: Responsible for the physical installation and maintenance of the signs.

Residual impact: Minimal Residual Impact

Annex 7. Chance Find Procedure

1. Purpose, Objectives and Scope

Construction of small infrastructure and facilities as well as livelihood supports related activities under the CAISAR project has the potential to alter tangible or intangible cultural heritages, unknown or unrecorded cultural and archaeological sites. The project will develop Chance Finds Procedure to define the steps on how Chance Finds will be managed once they have been discovered. MOWRAM PMU will ensure contractors and livelihood experts to be familiar with the possibility that they may discover unknown finds and know how to manage them.

The objectives of the Chance Finds Procedure are to:

- Define the steps which must be followed to manage the discovery of previously unknown sites, including the preservation and appropriate treatment of these finds, while minimizing any disruption to the construction schedule
- Enable compliance with all relevant national laws and regulations and other requirements.

MOWRAM PMU will make sure that the Chance Finds Procedure will be applied by all CAISAR contractors/ subcontractors at subproject sites.

2. Procedure and Implementation

Consultation. MOWRAM PMU will consult with all relevant parties, including relevant ministries at national level, provincial line technical departments, and district authority, in order to agree to the Chance Finds Procedure.

Laboratory and Other Support. MOWRAM PMU, with technical support from the Ministry of Culture and Fine Art and its provincial departments, will make arrangements for suitable laboratory test and other necessary facilities at provincial level or national level for identifying the find objects.

Training and Awareness. Where necessary, MOWRAM PMU, with support from cultural expert, will develop and implement a Cultural Heritage Training and Awareness. The training and awareness will include basic training in the identification of sites and objects relevant to the subproject sites, including the cultural significance of IC communities. The training and awareness shall be delivered to all relevant project implementation agencies at sub-national level, contractor, and subcontractor prior to their participation in subproject activities.

3. Implementation & Monitoring

Monitoring shall require the appropriately trained personnel to determine the significance of a chance find in accordance with the definitions provided in the CAISAR project's Cultural Heritage Management Framework and follow the Chance Find Flowchart provided in

Attachment 1.

Attachment 1 - Chance Find Flowchart

- Bound copy of Chance Finds Report Forms presented to MOWRAM PMU and provincial representative
- Verification of each Chance Find Report Forms to Chance Finds items completed
- Chance finds appropriately packed and labelled
- Inventory of Chance Finds Items placed inside packed boxes
- Outstanding issues relating to any or all of the above have been resolved
- MOWRAM PMU or provincial representative accepts transfer of Chance Finds items from contractor to relevant provincial department of Culture and Fine Art.

Contractor Representative	MOWRAM PMU Representative	Provincial Representative
Name	Name	Name
Signature	Signature	Signature
Date	Date	Date

4. Stop Work

a) Once cultural heritage objects sites are identified, contractor or sub-contractor shall immediately stop work within an approximate distance of the site.

b) Contractor/sub-contractor shall call MOWRAM PMU and provincial level to the location to make a rapid determination of the significance of the find.

c) Contractor/sub-contractor shall, in the event that a site of potentially high significance is discovered, demarcate, and secure the area.

d) MOWRAM PMU, provincial Department of Culture and Fine Arts and contractor shall evaluate sites or objects in accordance with the procedure required by the Ministry of Culture and Fine Arts.

e) If threated species such as animal and trees are found, these species must be kept intact, protected, and immediately reported to relevant site managers for appropriate handling. Wild animals spotted on the construction sites must not be caught for sale and/or consumption in any way.

5. Management of Chance Finds

In case the chance find site is a highly significant cultural sites, contractor and MOWRAM PMU shall work together to determine any requirements for community engagement

accordance to ESS10. The team will seek out and consult with the affected stakeholders and establish the appropriate action.

Management Options. The following management options will be considered:

- **Avoidance** to minimizes the impact to the site through partial or complete project redesign or relocation, should be the preferred option for cultural resource management perspective.
- **In-situ Management** This option includes the application of site protection measures. Appropriate protection measures will be identified and agreed between MOWRAM PMU, contractor, provincial department of culture and fine arts, and the local authority on a site-specific basis.
- **Destruction** If a site is assessed as having limited cultural significance, it may be destroyed once a complete photographic record has been made and the Chance Finds Report Form has been completed.

6. Reporting

All cultural heritage sites will be reported to MOWRAM PMU and provincial level and national level as part of contractor's monthly report, and will include a summary of:

- An update of the Key Performance Indicators
- Incidents of disturbance to known cultural heritage sites
- All cultural heritage sites identified, distinguishing between known and chance finds
- All Chance Finds, etc.

Annex 8 – Summary of Stakeholder Consultation

This section summarizes four consultation rounds carried out during the project preparation phase. These consultations involved discussions with relevant institutions, non-governmental organizations, local authorities, and local communities throughout the preparation process. The data collection and consultations were conducted over four periods:

1. First consultation

- The first consultation was conducted between 26 and 28 July 2024 to capture information regarding biodiversity and environmental condition in the project area.

2. Second consultation

- The second consultation was conducted to consult with forestry and fishery communities, local authorities and key informants to understand the situation and concerns related to the presence of the project. The consultation was conducted between 03 and 09 August 2024.

3. Result of consultation

- Based on the interviews and habitat assessments, three of the five endangered of fish species were confirmed to be present in the Yutasas sub-scheme: Jullien's Golden Carp, Flying Minnow, and Mekong Giant Barb.
- Proposed project activities: Given the critical habitats identified and the biodiversity assessment results, proposed project activities must prioritize conservation measures.

4. Third consultation

- The third consultation was conducted at household, village, and commune level stakeholders focusing on status, concerns and feedback regarding the project implementation. This consultation was conducted between 10 and 18 August 2024.
- The Yutasas sub-schemes have a predominantly young population, which suggests strong potential for future development, though higher education levels are low. Full-time private sector work is the main occupation, with 22% engaged in agriculture. For secondary jobs, full-time private sector work is the most common. About 14% of the population falls under poor categories 1 and 2, indicating economic challenges, while less percent of people with disabilities. Migration is notable, with 7.8% moving within the country and 1.5% abroad, totaling 9.3% of the population.
- Moreover, both men and women share together for household chore, agricultural involvement and decision making.

Table 1. List of participants of KII and FGD in Yutasas Command area

No	Name	Sex	Position	Commune	District

42	Ek Yiem	F	Duck Farmer	Svay	Sameakki Mean Chey

Figure 1: Household survey in Svay commune

5. Fourth Consultation

The last consultation was conducted between 21 and 23 August 2024 with the district and provincial stakeholders, mainly focusing on the opinion, and feedback regarding the implementation of the project.

6. Consultation Results

6.1 Environment, Biodiversity and Climate Change Impact

6.1.1 Pollution prevention and resource efficiency

Concerns

- The construction process can release dust, which will disturb the local community and surface water quality.
- The disposal of solid, liquid, and domestic waste from the workers at the irrigation construction site will negatively impact local air quality and surface water.

Suggestions

- Regularly watering on the road transports construction materials and soil to reduce dust that may disturb nearby residents.
- Relevant ministries should conduct a visit to evaluate and address the issue of liquid waste from the construction activities in the commune.

6.1.2 Biodiversity

Concerns

- CAISAR project may cause changes in water quality, dust generation, air pollution, soil erosion, improper waste disposal, and hazardous waste from machinery.
- The fish populations in command areas may decrease due to disrupting the natural flow of water and the impact on their habitats from the implementation of the reirrigation infrastructure and canal upgrading.

Suggestions

- Contractors must regularly monitor and inspect of living conditions of the workers, manage waste effectively, and provide adequate housing and sanitation facilities to them.
- The project should avoid construction activities and improve irrigation on fish and aquatic habitats.
- Prevent damage from the construction activities to biodiversity, habitats, and other environmental components.

6.1.3 GHG Emission

Concerns

- Waste and pollution may contribute to the emission of GHG

Suggestions

- Contractors are advised to refrain from using outdated machinery.

6.2 Social Aspects

6.2.1 Labor and Working Conditions

Concerns

- The presence of construction staff and workers at the community may lead to sexual exploitation or affecting women workers and women and children in the community.
- Under 18 years old workers may be involved for the construction phase as they are illegible to work in factories or other companies that adhere to laws,
- At the construction sites, some men may undervalue women’s work. The gender disparities continue to exist, with some men holding the belief that women are not capable or willing to work.

Suggestions

- The construction companies should hire local workers to offer them jobs and strictly abide to laws and reducing the concerns about gender-based violence or sexual violent.
- Construction companies and relevant departments should provide training on gender issues, violence, labour laws, and social protections to their staff and workers.

- Additional support and monitoring measures should be implemented to prevent abuse, and any incidents should be promptly addressed to prevent recurrence.
- Local authorities should regularly monitor and inspect construction sites to ensure no children are working there, taking immediate action if any issues arise.

6.2.2 Community Health and Safety

Concerns

- The presence of workers could result in sexual abuse of women and children living near the project site,
- Drug trafficking and consuming among workers may cause unsafe environment for both workers and surrounded residents,
- After the construction complete, there may also be the risks of humans and animals falling into the canals causing drowning,
- Waste generated from worker camps and construction activities during the project could degrade water quality, negatively impacting human health, livestock, and crops.

Suggestions

- The construction companies should regularly place warning signs and water the roads, as well as schedule construction times to minimize noise pollution that could disrupt the community,
- The project should promote gender awareness, enforce stricter punishments for offenders, and prevent drug trafficking in the workplace,
- Separate accommodations for men and women should be provided,
- The construction companies must collaborate with local authorities in all activities to make a proper management, control and monitoring during construction, and
- The project should conduct gender education at the district to prevent and address gender-based violence,
- The project should establish gender outreach committees at the commune and village levels to monitor the gender related issues within the project areas, especially during construction,
- The project should equip the solar lights along the roads to promote the safety of travelers during nighttime.

6.2.3 Land acquisition, economic and physical displacement

Concerns

- While the project supports agricultural production, it may not benefit poor families who do not have land for farming,
- Conflicts between the project and affected families could emerge, often fuelled by external instigators rather than the families themselves, and

- Farmers who own land may lose it for farming, which could force them to migrate, heightening their vulnerability to exploitation and potentially causing their children to drop out of school.

Suggestions

- The project should conduct a preliminary study on land issues before construction is going to be implemented, addressing specific aspects of land impact and conducting evaluations for each affected property,
- The project/construction company must collaborate with local authorities to resolve land-related issues, and compensation should be provided to landowners affected by the project,
- If business land is impacted, the government or provincial authorities should provide temporary business premises,
- Advocacy for voluntary land contributions should be encouraged, as the project benefits both the community and individuals, and the restoration of old canals is supported to improve agricultural activities, and
- The construction company should submit quarterly monitoring reports on implementation activities to the provincial department to identify and quickly resolve any issues which affecting the livelihood of the community people.

6.2.4 Cross–cutting risks and impacts

Concerns

- Unequal water distribution among farmers leads to partisanship and disputes, often because farmers do not adhere to water distribution instructions or announcements from authorities,
- The FWUC could not generate income, causing the management of the water being difficult such as having no budget for repair, resulting in unproper operation of the system,
- Besides water issues, farmers also struggle with pests, diseases, inadequate labour, lack of capital, limited production technique, flooding, unstable sale price (vegetable and animal) and high agricultural input costs,
- The provincial department lacks budget to support water user conflict resolution,
- Tensions arise between upstream and downstream villages when water use upstream results in flooding downstream due to excess water being released during the wet season. Conversely, during the dry season, upstream water flow to downstream areas is insufficient.
- Manure for fertilizer is declining due to reduced animal raising and lower cattle prices are prompting farmers to reduce livestock raising.

Suggestions

- A proper handover to local authorities upon project completion should be conducted to avoid quiet handovers,

- Women should be engaged and be promoted as the members of Water User Community to promote water distribution equality regarding water allocation from the system,
- Closed monitoring and support to FWUCs are critical and should be conducted regularly by all levels,
- Water use and maintenance support should be provided including technical and management training, along with problem-solving techniques, to effectively control and manage water distribution,
- Ensure transparent water supply to prevent disputes by holding meetings to plan water use and distribution, involving the district governor, commune council, and relevant stakeholders,
- Prior to starting irrigation rehabilitation, organize a public forum to gather feedback from local residents, disseminate project information to people and stakeholders, and announce the construction period in advance.
- Increase the number of commune agricultural technical officers to provide training and monitor farmers' cultivation techniques.
- Build more water storages, and reservoir such as ponds or wells and conduct training on water-saving techniques to adapt to actual water availability.
- Installing and upgrading the damaged sluice gates to improve water distribution efficiency and prevent water loss in agricultural production and irrigation systems.
- Facilitate the development of additional agricultural markets.

Table 2. List of participants during the fourth consultation meeting

No	Name	Sex	Position	Organization
1	Pich Keomony	M	Deputy Provincial Governor	Provincial Hall
2	Un Sotha	M	Deputy Head of Admin Office	Provincial Hall
3	Kim Vanny	M	Head of Interdisciplinary Legal Affairs office	Provincial Hall
4	Heng Kimsreang	F	Deputy Director of Department	DAFF
5	Chum Maochandara	M	Officer	DAFF
6	Meach Phearith	M	Deputy Head of Office	DAFF
7	Yim Nimol	F	Deputy Director of Department	DoLVT
8	Rim Samang	M	Head of Office	DoLVT
9	Rouern Channa	M	Officer	DoLVT

DEFINITIONS

Modified habitat. Areas that may contain a large proportion of plant and/or animal species of non-native origin, and/or where human activity has substantially modified an area's primary ecological functions and species composition. 5 Modified habitats may include areas managed for agriculture, forest plantations, reclaimed6 coastal zones, and reclaimed wetlands.

Natural habitats. Areas that are composed of viable assemblages of plant and/or animal species of largely native origin, and/or where human activity has not essentially modified an area's primary ecological functions and species composition.

1. Introduction

The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project in Cambodia is designed to support the Royal Government of Cambodia's National Water Resources Management and Sustainable Irrigation Road Map and Investment Program (2019-2023). The project's primary objective is to enhance the irrigation sector's resilience to climate change while promoting sustainable agricultural practices that also reduce greenhouse gas emissions. CAISAR focuses on improving smart irrigation systems, incorporating renewable energy, and advancing farming techniques to address climate change impacts such as altered rainfall patterns and water-related disasters.

The project's strategy is based on a Theory of Change that posits that upgrading irrigation infrastructure, disseminating knowledge of energy-efficient agricultural technologies, and strengthening agricultural value chains will foster a more resilient and sustainable agricultural sector in Cambodia. This approach is expected to improve crop production, reduce greenhouse gas emissions, enhance climate adaptation, and reinforce the institutional framework for managing these changes.

Financially supported by international organizations such as the Asian Infrastructure Investment Bank (AIIB), the International Fund for Agricultural Development (IFAD), and the Green Climate Fund (GCF), the project targets climate adaptation and livelihood improvement in four Cambodian provinces: Pursat, Kampong Chhnang, Kampong Speu, and Kandal. It is structured around three main components: enhancing farm-level climate resilience, upgrading water infrastructure, and strengthening institutional capacities.

To ensure that environmental, social, and climate considerations are effectively addressed, the Ministry of Water Resources and Meteorology (MOWRAM) will conduct Environmental, Social, and Climate Impact Assessments (ESCIA) and Environmental, Social, and Climate Management Plans (ESCMP), collectively referred to as the “E&S study.” This assessment report focuses primarily on Component 2 of the project and aims to align with relevant standards, contributing to the project's goals of climate resilience and sustainable development.

Furthermore, this study is fully aligned with the International Finance Corporation's Guidance Note 6 (IFC Guidance 6), a comprehensive framework for biodiversity conservation and sustainable management of living natural resources in business operations. IFC Guidance 6 offers guidance on avoiding, minimizing, and mitigating impacts on biodiversity and ecosystems. This biodiversity assessment prioritizes the protection of endangered and critically endangered species and their habitats, promotes sustainable natural resource management, and ensures that development activities adhere to international conservation standards. It also outlines best practices for preserving ecosystem services and fosters stakeholder engagement and equitable benefit-sharing from natural resource use.

The "area of influence" was defined as the geographical region, encompassing globally threatened species or ecosystems, potentially affected, directly or indirectly, by the proposed project. This initial assessment was crucial for identifying and evaluating potential environmental impacts beyond the immediate project site. The area of influence includes the physical and biological environment that could be affected by the project, such as air quality, water resources, soil quality, flora and fauna, human settlements, and cultural heritage. It also considers potential indirect impacts on surrounding areas, including noise pollution, traffic patterns, and socioeconomic conditions.

Renovation of irrigation systems within the Tonle Sap Floodplains offers significant potential benefits to a wide range of stakeholders. Primarily, farmers who rely on these systems for their livelihoods will experience improved water management, increased crop yields, and reduced water wastage. Additionally, the project can contribute to broader ecological benefits by enhancing water quality, reducing soil erosion, and supporting biodiversity

conservation. Furthermore, revitalized irrigation systems can contribute to food security, rural development, and poverty reduction in the region.

1.1 Cambodia's Laws Protecting Environment and Biodiversity

Cambodia's government has made significant efforts to protect biodiversity through the establishment of a comprehensive legal framework. Key legislations include the Biodiversity Law (2009), which governs sustainable biodiversity management, and the Environmental Protection Law (1995), which sets broad principles for environmental management. Additionally, the Forest Law (1994) and Wildlife Sanctuary and Protection Law (1993) safeguard critical habitats and species, while the Fisheries Law (1991) ensures sustainable aquatic resource management. The recently introduced Environmental Code (2023) further strengthens regulations on pollution control and biodiversity conservation. Cambodia also participates in international agreements like the Nagoya Protocol, aligning its conservation efforts with global standards. Despite these advancements, effective implementation and enforcement remain essential to achieving long-term biodiversity protection. Below are short sumary of several key national legislations and international agreements:

- **Biodiversity Law (2009):** This foundational law provides a comprehensive legal structure for the sustainable management of biodiversity resources. It addresses habitat protection, species conservation, genetic resource management, and the sustainable use of biodiversity, outlining the government's responsibilities and promoting public participation.
- **Environmental Protection Law (1995):** This law sets general principles for environmental protection and outlines the government's role in environmental management, including pollution control, waste management, and natural resource conservation. It complements the Biodiversity Law by providing a broader environmental governance framework.
- **Forest Law (1994):** Regulating the management, use, protection, and restoration of Cambodia's forests, this law is crucial for balancing economic development with environmental conservation, particularly in biodiversity-rich ecosystems.
- **Wildlife Sanctuary and Protection Law (1993):** This law establishes wildlife sanctuaries and offers protection to wildlife species by prohibiting hunting, trapping, and other activities that threaten wildlife and their habitats.
- **Fisheries Law (1991):** This law governs the management of Cambodia's fisheries resources, setting rules for sustainable fishing practices, protecting aquatic habitats, and ensuring the long-term health of aquatic ecosystems.
- **Environmental Code (2023):** The newly introduced Environmental Code consolidates and updates Cambodia's environmental laws, introducing stricter regulations on pollution control, natural resource management, and biodiversity conservation. It emphasizes climate change adaptation and mitigation and enhances public participation and transparency in environmental decision-making.
- **Nagoya Protocol (2010):** As a party to the Nagoya Protocol under the Convention on Biological Diversity (CBD), Cambodia commits to the fair and equitable sharing of benefits arising from the utilization of genetic resources. This protocol supports Cambodia's efforts to protect its biodiversity while ensuring that the benefits of its genetic resources are shared with local communities and stakeholders.

1.2 Project Objectives, Components, and Activities

The project objective is to increase climate adaptation, mitigate the negative impact of extreme climate events, and improve the livelihoods of smallholder farmers and vulnerable rural communities in four provinces of Cambodia, including Pursat, Kampong Chhnang, Kampong Speu, and Kandal provinces (see map below).

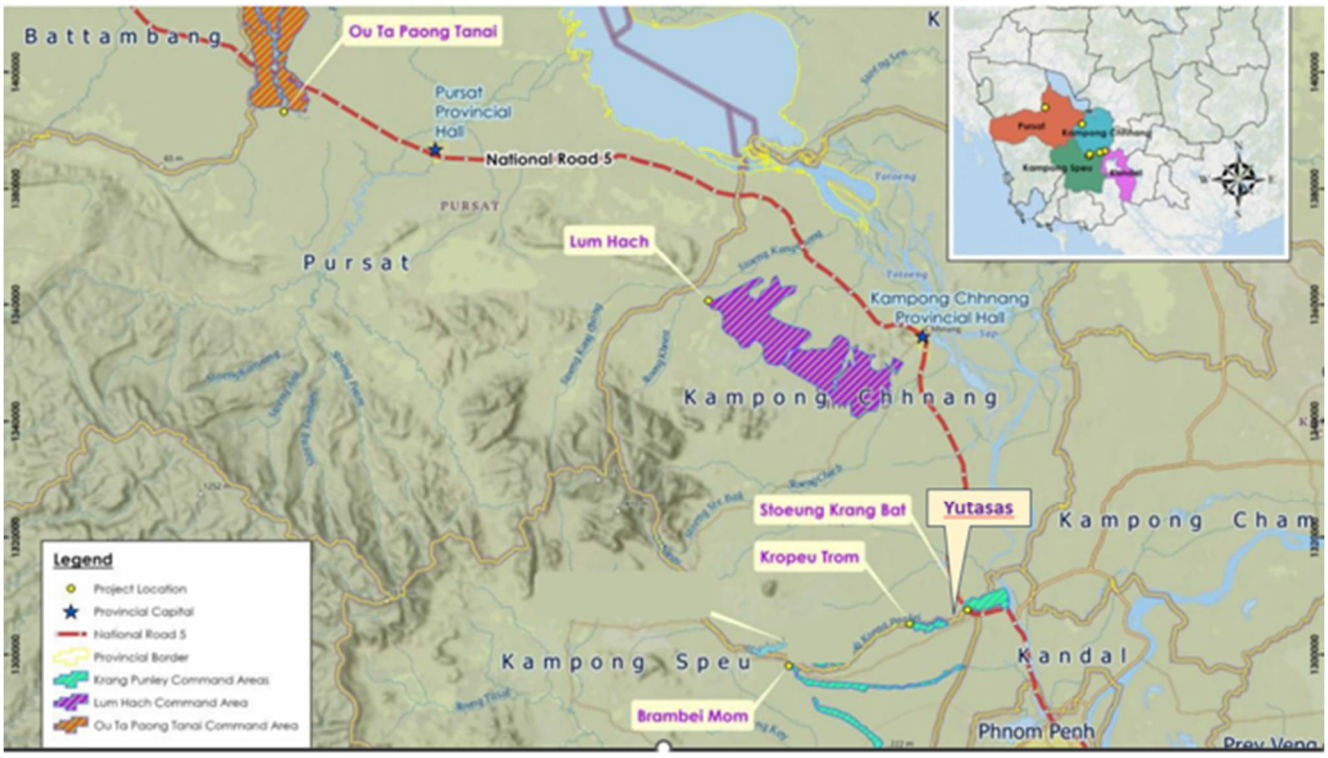

Figure 1 – Locations of six irrigation sub-schemes located in four provinces

The project will be implemented through various activities organized under the following three components:

Component 1. *Improving farm-level climate adaptation, resilience, and water use efficiency*

The objective of this component is to build climate resilience (CR) of smallholder farmers and enhance sustainable production through evidence-based planning and context-relevant climate resilient practices at the farm level. This component is designed to address the lack of knowledge and skills to deploy technologies and practices at the farm level to farmers and the lack of appropriate extension services to propagate them. It will introduce farmers to various climate-resilient technologies and practices for both rice and non-rice activities such as vegetable production, poultry and aquaculture.

Sub-component 1.1 Deployment of farm-level climate adaptation and water use efficiency measures

Output 1.1: Increased capacity of farmers to deploy climate resilient (CR) practices at farm level

This output will focus on developing farmer's capacity to deploy CR technologies and practices to transform the agricultural production system to adapt to the changing climate context. Farmers will be trained to first develop Action Plans (AP) to re-orient farmer behaviour and assist them in transforming the agriculture production system in a manner that is better adapted to factoring in the agroecological context and expected climate change impacts.

- Activity 1.1.1 Preparation of community-based action plans (AP) to transform agriculture with CR practices.
- Activity 1.1.2 Preparation of training materials to support implementation of the AP.
- Activity 1.1.3 Conduct training to create a pool of expertise to demonstrate and propagate the CR technologies and practices.

- Activity 1.1.4 Train farmers on applying CR technologies using the FFS approach.
- Activity 1.1.5 Strengthening and fostering tailored mechanization service providers for improved mechanization service delivery.
- Activity 1.1.6 community-based monitoring and evaluation (CBME) of implementation

Sub-Component 1.2 Climate-adapted, value-added, and market-led agricultural investments

Output 1.2 CR value-added, and market-led agriculture investments secured.

This output involves improving and enhancing some value chains that are key for the project area and include rice, vegetable, chicken and aquaculture value chains, through the use of Public Private Producer Partnerships (4Ps) and increased access to finance, which will improve market access, climate adaptability, and ensure increased income for smallholders in the value chains.

- Activity 1.2.1 Value chain study and planning
- Activity 1.2.2 Establish District Multi-Stakeholder Platforms (MSPs)
- Activity 1.2.3 Public Private Producer Partnership Facility (4PF)

Sub-component 1.3 Improve enabling conditions, capacities and disaster risk management strategies

Output 1.3. Increased access to and use of climate information and advisory services for climate-responsive agriculture planning

This sub-component will strengthen the production and dissemination of tailored agro-meteorological information to inform climate-responsive management and planning of agriculture in the project target areas through ICT technologies. The aim is to ensure that agro-meteorological services are accessible and useful to farmers to manage climate risks, access to and use of water and efficient cropping systems.

- Activity 1.3.1 Establish an ICT-based multi-disciplinary platform at the provincial level.
- Activity 1.3.2 Building the capacities of the platform to deliver services.
- Activity 1.3.3. Establish the agromet information systems and the outreach mechanisms.
- Activity 1.3.4 Awareness raising and capacity building of farmers and stakeholders in applying the *services.*

Sub-component 1.4 Rural roads

Output 1.4: Increased resilience of farm road infrastructure to climate change

- Activity 1.4.1 Initial planning and identification
- Activity 1.4.1 Initial planning and identification
- Activity 1.4.2 Technical survey and design considerations, preparation of cost estimation
- Activity 1.4.3 Improve 90 Kilometers of farm roads.
- Activity 1.4.4 Handing over the completed works.

Component 2: Irrigation Infrastructure for increased resilience

Component 2 is linked with Component 1 such that it facilitates the implementation of CR on-farm crop and water management practices through improved field-level water supply delivery and drainage. It will focus on rehabilitating and modernizing irrigation and flood protection/drainage infrastructure in the six sub-projects, including irrigation and drainage canals, flood control embankments, and ponds, to provide high-efficiency climate-resilient irrigated agriculture systems for adapting to both increasing flood and drought conditions.

Sub-Component 2.1: Modernization of irrigation scheme and ponds

Sub-Component 2.2: Flood-proofing and Drainage improvements

Sub-Component 2.3: Establishments and Training of Farmers Water User Communities (FWUC)

- Activity 2.3.1 Formation of institutional strengthening of the FWUC
- Activity 2.3.2 Build technical capacities of FWCU for canal structure O&M
- Activity 2.3.3 Prepare long-term financing plan for O&M of the systems including the WUAS.

Sub-Component 2.4: Water Information and Management (SCADA)

Component 3. Institutional Strengthening

Sub-Component 3.1 MOWRAM capacity Support.

Output 3.1 Strengthened MOWRAM Capacity

Sub-Component 3.2 Strengthening of NDA and NCDD.

Output 3.2 Improved capacities for climate action monitoring

- Activity 3.2.1 Preparation of Loss and Damage Strategy
- Activity 3.2.2 Strengthen national M&E process for climate action
- Activity 3.2.3 Enhancing Capacity of NDA and other stakeholders.

1.3 Environmental Risks and Impacts

Renovation of irrigation systems within the Tonle Sap Floodplains could have significant environmental consequences. Altering water flow patterns can disrupt the delicate ecological balance of the floodplain, affecting fish migration, breeding, and spawning. Increased water extraction for irrigation may lower water levels, impacting aquatic ecosystems and wetland habitats. Additionally, the use of chemical fertilizers and pesticides in agriculture can contaminate water bodies, harming biodiversity. Furthermore, construction activities associated with the renovation can lead to soil erosion, sedimentation, and habitat destruction for both aquatic and terrestrial species.

1.4 Social Risks and Impacts

The social implications of renovating irrigation systems in the Tonle Sap Floodplains are complex. While the project aims to improve agricultural productivity, it may also lead to land-use changes and displacement of local communities. Small-scale farmers may face challenges in accessing and competing for water resources, potentially exacerbating socioeconomic inequalities. Moreover, the introduction of new technologies and farming practices may require additional training and support for local communities, which could create new demands on existing resources. Conflict over water rights and access may arise, impacting social cohesion and livelihoods.

2. Objective of the Biodiversity Assessment

Based on a comprehensive biodiversity screening conducted by the E&S screening team, in conjunction with consultations with the ESCIA team, twenty-four potentially present endangered (EN) and critically endangered (CR) species were identified within the project's area of influence. To validate this initial assessment and identify additional species, a thorough literature review was conducted, and consultations were held with key government agencies and civil society organizations, including the Fisheries Administration (FiA), Wildlife Conservation Society (WCS Cambodia),

and Punleu Komar Organization (PKO). These organizations specialize in the protection of endangered and critically endangered species, empowering community-based organizations in protecting natural resources and possessing valuable knowledge of their distribution within the project's region.

The specific purpose of the Priority Biodiversity Values is to confirm the status of key wildlife species presenting in the area to ensure the protection and sustainable management of natural resources and livelihood improvement. This includes evaluating current conditions and potential impacts and developing mitigation and compensation measures. The identification and evaluation of Priority Biodiversity Values help prioritise areas with exceptional biodiversity or crucial ecological functions. These include unique habitats, key ecological processes, biodiversity hotspots, endangered species, keystone species, flagship species, cultural significance, and ecosystem services. Identifying these values involves desk-based research, field surveys, and expert consultation, considering global/regional significance, threats, vulnerability, and irreplaceability. Prioritizing conservation actions focuses on threat levels, vulnerability, irreplaceability, and cost-effectiveness to maximize impact

As part of the biodiversity assessment, the following key activities were undertaken:

1. Desk-Based Assessment: Conduct a comprehensive desk-based assessment to identify potential critical habitats and sensitive species using secondary data, and IFC PS6 criteria. Classify habitats based on ecological characteristics and sensitivity.
2. Field-Based Surveys: Conduct targeted field surveys to validate desk-based findings, assess species diversity, abundance, and habitat quality, and collect data on environmental parameters.
3. Expert consultation: Consult and verify all key findings with relevant national and international experts from key government agency, local NGOs, International NGOs, and researching institutions.
4. Critical Habitat Assessment and Mitigation: Conduct detailed assessments of potential critical habitats, develop mitigation measures to minimize impacts, and establish a monitoring program to track effectiveness.

A comprehensive biodiversity assessment, utilizing the Integrated Biodiversity Assessment Tool (IBAT) and a thorough literature review, identified a total of 25 endangered and critically endangered species across reptiles, mammals, birds, fish, amphibians, plants, and fungi. Sixteen of these species were concentrated in the Ou Tapong (OT) sub-scheme, while five were screened in Lum Hach (LC), two in Prambei Mom (BM) and Krapeu Truom (KT), and five in Yutasas (YT) and Stung Krang Bat (SKB), see Table 1.

The Southern Tonle Sap Floodplain (STSF), a critical component of Cambodia's biodiversity and socio-economic landscape, is a dynamic wetland ecosystem characterized by seasonal inundation. This intricate interplay of water and land supports a diverse array of flora and fauna (fish, bird, mammal, reptile, fungi, plant), contributing to significant agricultural production. However, the region faces increasing threats from development, climate change, and overexploitation.

The STSF's watershed, encompassing portions of Pursat, Kampong Chhnang, Kandal, and Kampong Speu provinces, is a complex hydrological system influenced by the Tonle Sap River, Mekong River, and their tributaries. This intricate network regulates water flow, nutrient transport, and seasonal fluctuations in water levels. The STSF catchment area, comprising diverse land cover types, directly influences water quality and quantity entering the floodplain. Factors such as topography, soil type, and land use practices within the catchment significantly impact sedimentation, nutrient loading, and overall water quality (Chua et al. 2022).

The interconnectedness of the watershed and catchment is essential for the ecological health of the STSF. The flow of water from the catchment into the floodplain through the river system drives various ecological processes. However, human activities such as deforestation, agriculture, and urbanization within the watershed and catchment pose significant threats to the STSF's biodiversity and ecosystem services. To ensure the long-term sustainability of the STSF, it is imperative to implement sustainable land use practices, prioritize forest conservation, and effectively manage water resources. These measures will help mitigate the impacts of human activities and protect the ecological integrity of this vital ecosystem (MoE; TSA).

3. Methodology

This assessment employed a comprehensive, multi-faceted approach to evaluate the potential environmental and social impacts of the CAISAR project across six sub-schemes, with a primary focus on biodiversity and ecosystem services. This methodology aligns with international best practices, including the International Finance Corporation's (IFC) Performance Standard 6 (PS6) on Biodiversity Conservation and Sustainable Management of Living Natural Resources.

3.1 Literature review

A thorough literature review was conducted at three distinct levels to establish a robust knowledge base:

- National Level: This review aimed to establish the overarching legal and policy framework governing biodiversity management and conservation in Cambodia. It also sought to provide a comprehensive overview of the current status of biodiversity within the country, including key challenges and trends. (Relevant Cambodian environmental laws, national biodiversity strategies, reports from the Ministry of Environment, etc.)
- Regional Level: Given the project's location upstream of the Tonle Sap Lake, this review focused on the status of biodiversity and management within the Tonle Sap Floodplain. It explored the unique ecological characteristics of this region and the existing management strategies in place. (Reports from the Tonle Sap Authority, academic studies on the Tonle Sap ecosystem, regional environmental assessments, etc.)
- Sub-Scheme Level: Utilizing data from reputable sources such as the Integrated Biodiversity Assessment Tool (IBAT) and eBird, this review focused on identifying species listed as Endangered (EN) or Critically Endangered (CR) by the International Union for Conservation of Nature (IUCN). It also assessed the potential impacts of project activities on these species, as well as the cumulative impacts from other relevant projects within the project's area of influence. This review was conducted to understand the precarius state of Cambodia's endangered species, and the multiple threats that they face. (IUCN Red List, IBAT data, eBird data, relevant scientific publications, etc.)

This comprehensive review illuminated the multifaceted threats facing Cambodia's critically endangered species, including habitat degradation, illegal hunting, pollution, and other anthropogenic pressures. The diversity of taxa represented, spanning animals, birds, fish, plants, and fungi, highlights the intricate tapestry of Cambodia's ecosystems.

3.2 Baseline Data Collection

3.2.1 Data Synthesis

- Biodiversity Mapping: Spatial distribution of biodiversity was visualized by integrating field data, stakeholder interviews, and existing administrative maps (e.g., Community Forests (CF), Community Fisheries (Cfi), Key Biodiversity Areas (KBAs)).
- Species Prioritization: Focused on IUCN-listed EN/CR species with verified sightings within 1–5 years to ensure relevance for risk assessment. Historical data (>5 years) informed trend analysis relative to habitat changes.
- Critical Habitat Identification: High-value habitats were delineated using field surveys and geospatial analysis, emphasizing ecological functions and EN/CR species presence.

3.2.2 Community Engagement

- Stakeholder Consultations: Semi-structured interviews and focus group discussions (FGDs) were conducted with CF/CFi representatives, local authorities, and fishers to document wildlife presence, movement patterns, and historical population trends.
- Local Ecological Knowledge: Species data were cross-verified using morphological descriptions, behavioral traits, and habitat preferences provided by informants.

3.2.3 Aquatic Biodiversity Assessment

Endangered fish populations were evaluated through field surveys, interviews with fishers, and collaboration with government agencies. Data on migration connectivity, ecological niches, and historical catch records were analyzed to mitigate identification challenges.

3.3 Impact Assessment

3.3.1 Area of Influence (AoI)

The AoI for each sub-scheme was defined by:

1. Command Area: Geographic scope of project activities (e.g., canal rehabilitation, crop intensification).
2. Environmental Footprints: Indirect and cumulative impacts (e.g., pesticide runoff, habitat fragmentation) guided by the AIIB Environmental and Social Framework (ESF). Boundaries were iteratively refined as construction sites, logistics plans, and cultivation targets were finalized.

3.3.2 Field Surveys

Two wet-season surveys (July 25–27 and August 3–9, 2024) employed:

- Drone Surveillance: For inaccessible terrain and aerial boundary and habitat assessments.
- Transect Walks: Ground-level species and habitat monitoring.
- Hotspot Prioritization: GIS-based habitat modeling identified high-risk zones within and adjacent to the AoI for targeted data collection.

3.3.3 Risk Evaluation

Impacts were assessed against IFC Performance Standard 6 (PS6) criteria for critical habitats, emphasizing:

- Direct/Indirect Effects: Habitat loss, hydrological disruption, invasive species, and pollution.
- Cumulative Impacts: Synergistic threats from adjacent development projects.
- Ecosystem Services: Dependence of local livelihoods on biodiversity.

3.4 Adaptive Management Framework

An iterative approach was adopted to address data gaps and dynamic conditions:

- Mitigation Hierarchy: Prioritize impact avoidance, followed by minimization and restoration.
- Monitoring Protocols: Periodic evaluations to adjust mitigation measures (e.g., habitat buffers, pollution controls).
- Stakeholder Feedback: Continuous integration of community insights into conservation strategies.

3.5 Data Validation and Reporting

- Species Verification: All sightings were cross-referenced with IUCN databases and peer-reviewed literature.
- Cartographic Outputs: A3-sized maps delineated administrative boundaries, landscape features, and EN/CR species distributions.
  Expert Collaboration: Findings were validated with government agencies and research institutions to ensure methodological rigor.

3.6 Key Informant Interviews and Scope of Work

- IFC Performance Standard 6 (PS6): PS6 was applied to identify and assess critical habitats, considering irreplaceability, vulnerability, biodiversity, ecosystem services, and cultural significance.
- Key Informant Selection: 10-12 individuals per sub-scheme were selected based on local wildlife knowledge, using semi-structured and structured questionnaires with visual aids.

3.7 Methods used for Critical Habitat Assessment

IFC PS6 presented the following criteria to assess for projects in Critical Habitat. These were as follows:

- Criterion 1: Critically Endangered (CR)and Endangered (E) species;

- Criterion 2: Restricted-range/Endemic species;
- Criterion 3: Migratory/congregatory species;
- Criterion 4: Highly threatened and/or unique ecosystems; and
- Criterion 5: Key Evolutionary Processes.

In addition to the above five biological criteria, there were further circumstances in which an area might be recognised as Critical Habitat. For simplicity, there were two further criteria:

- Criterion 6: Most Legally Protected Areas (particularly IUCN Categories I-IV) and Internationally Recognised Areas (e.g., KBAs and IBAs);
- Criterion 7: Other areas of high biodiversity value, such as areas of high scientific value or areas of old growth forest.

Criteria 1-3 have quantitative thresholds which help determine whether an area is Critical Habitat. Criteria 4 and 5 are qualitatively defined at present and so require consultation with experts. Criterion 4 covers rare and threatened habitats which might not necessarily hold species triggering Criteria 1-3. Criterion 5 is particularly identified by physical landscape features promoting evolution (e.g. islands, mountains, ecotones), or by groups of species with distinct evolutionary history.

Table 1 provides the formal quantitative thresholds for species Criteria 1-3. Discreet Management Units (DMUs) may be ecologically-defined (e.g. a whole patch of a certain habitat type or a watershed) or politically-defined (e.g. a protected area, property or local political unit). This table can be reduced to five relatively simple rules to cover most eventualities. Note, however, that these alone should not be relied upon for a comprehensive Critical Habitat assessment.

- DMUs with ≥10% global population of a CR or EN species (or, generally, the equivalent in terms of known sites for that species, e.g. if the DMU is one of only 10 sites globally) = Tier 1 (Sub-criteria 1a+1b)
- DMUs with a single regularly occurring individual of a CR species = Tier 2 (Sub-criterion 1c)
- DMUs with regionally important concentrations of a EN species = Tier 2 (Sub-criterion 1c)
- DMUs with ≥95% of the global population of a restricted-range, endemic or migratory/congregatory species (effectively site endemics) = Tier 1 (Sub-criteria 2a+3a)
- DMUs with ≥1% of the global population of a restricted-range, endemic or migratory/congregatory species (this is the easiest category in which to trigger CH) = Tier 2 (Sub- criteria 2b+3b)

Table 2: Quantitative thresholds for criteria 1-3 relating to tier 1 and tier 2 critical habitat

Criteria	Tier 1	Tier 2
1. Critically Endangered (CR)/ Endangered (EN) Specie	(a) Habitat required to sustain ≥ 10 percent of the global population of a CR or EN species/subspecies where there are known, regular occurrences of the species and where that habitat could be	c) Habitat that supports the regular occurrence of a single individual of a CR species and/or habitat containing regionally-important concentrations of a Red-listed EN species where that habitat could be considered a discrete management unit for that species/subspecies. (d) Habitat of significant importance to CR or EN species that are wide-ranging and/or

Criteria	Tier 1	Tier 2
	considered a discrete management unit for that species. (b) Habitat with known, regular occurrences of CR or EN species where that habitat is one of 10 or fewer discrete management sites globally for that species.	whose population distribution is not well understood and where the loss of such a habitat could potentially impact the long-term survivability of the species. (e) As appropriate, habitat containing nationally/regionally important concentrations of an EN, CR or equivalent national/regional listing.
2. Endemic/ Restricted Range Species	(a) Habitat known to sustain ≥ 95 percent of the global population of an endemic or restricted-range species where that habitat could be considered a discrete management unit for that species (e.g., a single-site endemic).	(b) Habitat known to sustain ≥ 1 percent but < 95 percent of the global population of an endemic or restricted-range species/subspecies where that habitat could be considered a discrete management unit for that species, where data are available and/or based on expert judgement.
3. Migratory/ Congregatory Species	(a) Habitat known to sustain, on a cyclical or otherwise regular basis, ≥ 95 percent of the global population of a migratory or congregatory species at any point of the species lifecycle where that habitat could be considered a discrete management unit for that species.	b) Habitat known to sustain, on a cyclical or otherwise regular basis, ≥ 1 percent but < 95 percent of the global population of a migratory or congregatory species at any point of the species lifecycle and where that habitat could be considered a discrete management unit for that species, where data are available and/or based on expert judgement. (c) For birds, habitat that meets BirdLife International's Criterion A4 for congregations and/or Ramsar Criteria 5 or 6 for Identifying Wetlands of International Importance. (d) For species with large but clumped distributions, a provisional threshold is set at ≥ 5 percent of the global population for both terrestrial and marine species. (e) Source sites that contribute ≥ 1 percent of the global population of recruits.

4. Assessment Results

Under this chapter, assessment will be done separately for each of the six sub-schemes under the CAISAR project. The assessment for OTP will be presented first, followed by Lum Hach, Brambei Mon, Krapeau Trom, Yutasass, and Steung Krang Bat. It is noted to ensure the assessment method is consistently applied for each sub-scheme, the presentation of each assessment will be structured around the following sub-sections:

- Proposed project activities in each sub-scheme and potential risks and impacts;
- Area of Influence of the sub-scheme;
- Analysis to prepare for determining Critical Habitat status (Steps 1 & 2);
- Determining Critical Habitat status (Step 3);
- Potential Impacts and Feasibility of net gain requirements (Step 4); and
- Mitigation measures.

5. Ou Ta Paong

5.1 Proposed project activities and potential risks and impacts

Avian species such as the Greater Adjutant, Milky Stork, and Bengal Florican have been documented in the lower section. These birds rely on seasonal wetlands, lakes, waterholes, grasslands, and rice fields for foraging. Additionally, the critically endangered Siamese Tiger Perch and Black Mash Turtle inhabit Boeung Kamsaeng Lake and Svay Daunkav River, respectively, in the upper portion of the command area.

The flooded forest habitat and natural lakes adjacent to the lower section support a diverse array of wildlife, including four critically endangered reptile species: the Black Mash Turtle, Southeast Asian Box Turtle, Giant Asian Pond Turtle, and Elongated Tortoise. These species play crucial roles in the ecosystem, contributing to nutrient cycling, seed dispersal, and maintaining ecological balance. Furthermore, the region is home to two critically endangered mammal species: the Indochinese Silvered Langur and Long-tailed Macaque. These primates are essential for forest regeneration and seed dispersal, helping to maintain the health and resilience of the forest ecosystem. This area, particularly its lower section, serves as a critical habitat for a diverse array of endangered and critically endangered species.

Given the significant ecological value of the Ou Tapaong Command Area, any irrigation system renovations must be carried out with utmost care to minimize negative impacts on biodiversity. This may involve implementing measures such as habitat restoration, creating wildlife corridors, and ensuring that water management practices are sustainable and supportive of biodiversity. By carefully considering the ecological implications of the project, it is possible to balance the needs of agriculture with the conservation of endangered species and their habitats. Under OTP, various activities will be carried out that cause the following E&S risks and impacts:

Table 3: Projection activities that may cause potential impacts on the environment and social aspects at Ou Tapaong sub-scheme

No.	Project activities that cause impacts	E&S Risks & Impacts
1	Construction activities (rehabilication of canal and farm roads), land use changes,	**Habitat loss and fragmentation** could lead to habitat loss and fragmentation, affecting species' survival and connectivity. This activity may involve dredging, excavation, or modification of existing

	and water management practices	water channels and infrastructure. These activities can lead to habitat destruction, disturbance to nesting and foraging sites, disruption of natural water flow patterns, and alteration of hydrological regimes. This can directly impact both terrestrial and aquatic biodiversity.
2	Increased agricultural activities, sedimentation, and pollution	**Water quality degradation** could impact aquatic ecosystems and species that rely on clean water.
3	**Hydrological changes due to m**odifications to water flows and regimes	**Altered habitat** conditions that disrupt ecological processes.
4	**Increased human activities**	**Labor influx (during project construction) and Increased** human activities (during project operations pose additional threats to biodiversity. Increased human activity within the command area which could potentially disrupt wildlife behavior (nesting/foraging), increase poaching or predation risks if not properly managed.
5	Dredging of waterways and Alteration of water levels	Changes in water levels within the command area due to irrigation system renovation may negatively impact wildlife dependent on specific habitats for breeding or foraging purposes. For example, changes in seasonal wetlands or lakes' floodplains can disrupt breeding patterns for avian. Changes in water levels and habitat quality could force endangered species to relocate, potentially leading to competition with other species or exposure to new threats.
6	Use of chemicals and nutrient loading	**If pesticides/fertilizers are used during agricultural practices within the command area as part of irrigation system renovation projects, it could lead to contamination of soil and water resources affecting both terrestrial and aquatic biodiversity.**
7	Species displacement and disruption of foraging and breeding habits	Changes in water levels and habitat quality could force endangered species to relocate, potentially leading to competition with other species or exposure to new threats. Additionally, alterations to the irrigation system could disrupt the foraging and breeding habits of endangered birds and other wildlife.
8	**Land Use Changes**	The changes in land use that may occur as a result of the project, such as agricultural expansion or deforestation.
9	**Biodiversity**	The potential impacts of the project on water flow, water quality, and sedimentation patterns.
10	Introduction of invasive species through irrigation canals	Irrigation canals may facilitate the introduction of invasive plant or animal species into native aquatic ecosystems like Water Hyacinth, Mimosa Pigra, Tilapia etc. These invasives can

		outcompete native species for resources such as food and habitat space

5.2 Areas of Influence

The Ou Tapaong Irrigation Sub-scheme's estimated area of influence encompasses a) the entire command area (some 14,000 hectares, including the upper, middle, and lower parts), and b) any other areas outside the command area where project activities leave an environmental footprint during project implementation and sub-scheme operations. While the first is clear in terms of the boundary, the latter needs additional information based on the final project engineering design and environment monitoring data to establish the additional area of influence that is outside of the command area (due to the project's environmental footprint).

In line with the methods set forth under Section 3.2 (above), a detailed assessment was conducted for the OTP command area (as Modified Habitat) while a preliminary assessment was carried out for the area located immediately outside and to downstream of the OTP command area. It is noted within the OTP command area, that there is a lake called Boeng Kanseang or Kanseang Lake which is home to fish and birds. Analysis to determine critical habitat (Steps 1 and 2 of the CHA method)

5.3 Analysis to prepare for determining CH status

5.3.1 Critical Habitat Area of Analysis

Critical habitat is defined as an Area of Analysis (AoA), and the project's command area is used as an AoA.

5.3.2 Species with Potential Occurrence within the AoA

A list of threatened species with potential occurrence was generated for OTP. The coordinates of OTP (via KMZ file) are used to inform the IBAT radius of screening. Since the default radius of IBAT screening is 50km, steps were taken to narrow down to the sub-scheme's area of influence to identify only EN and CR species that are potentially present in the sub-scheme area of influence. The narrowing-down aims to practically identify EN and CR species that could be found in the sub-scheme area of influence and to determine the Critical Habitat status of the identified species. After three rounds of screening focusing on EN and CR species, 11 EN and CR species are found as potentially present in the sub-scheme area of influence. These species include 4 reptile species, 2 mammals, 2 fishes, and 3 birds (See list of 11 EN and CR species in Table 3 below).

Description of screening for narrowing down

For Ou Ta Paong, three rounds of screening have been conducted. The first screening (Round 1) was conducted in December 2023. Round 2 was carried out in April 2024, and Round 3 in August 2025. The purpose of repeated screening is to validate the screening results (for the same area) with a wide range of local stakeholders. The screening aims to identify only EN and CR species that are potentially present in the OTP area of influence, covering reptiles, mammals, fish, birds, amphibians, and aquatic plants. Screening was done based on the IBAT report generated and provided by the AIIB.

In the first two rounds of screening, 17 EN and CR species were identified in the OTP area of influence (See Table below). In the 3rd round of screening (in August 2024), however, 11 (out of a total of 17 species) were confirmed as "potentially present" in the OTP's area of influence.

So, the assessment for Ou Ta Paong focuses on the confirmed list of **11 species** that are categorized by IUCN as EN and CR species, including 4 reptile species (Black Marsh Turtle,

Giant Asian Pond Turtle, Southeast Asian Box Turtle, and Elongated Tortoise), 2 mammals (Indochinese Silvered Langur and Long-tailed Macaque), and 2 fishes (Striped catfish and Siamese Tiger Perch), and 3 birds (Greater Adjutant, Milky Stork, and Bengal Florican) (See Table below for the list of confirmed species and see Figure 2 for potential locations reported by key informers of these species in the project's area of influence).

Table 4: Confirmed List of endangered and critically endangered species for the Ou Tapaong sub-scheme

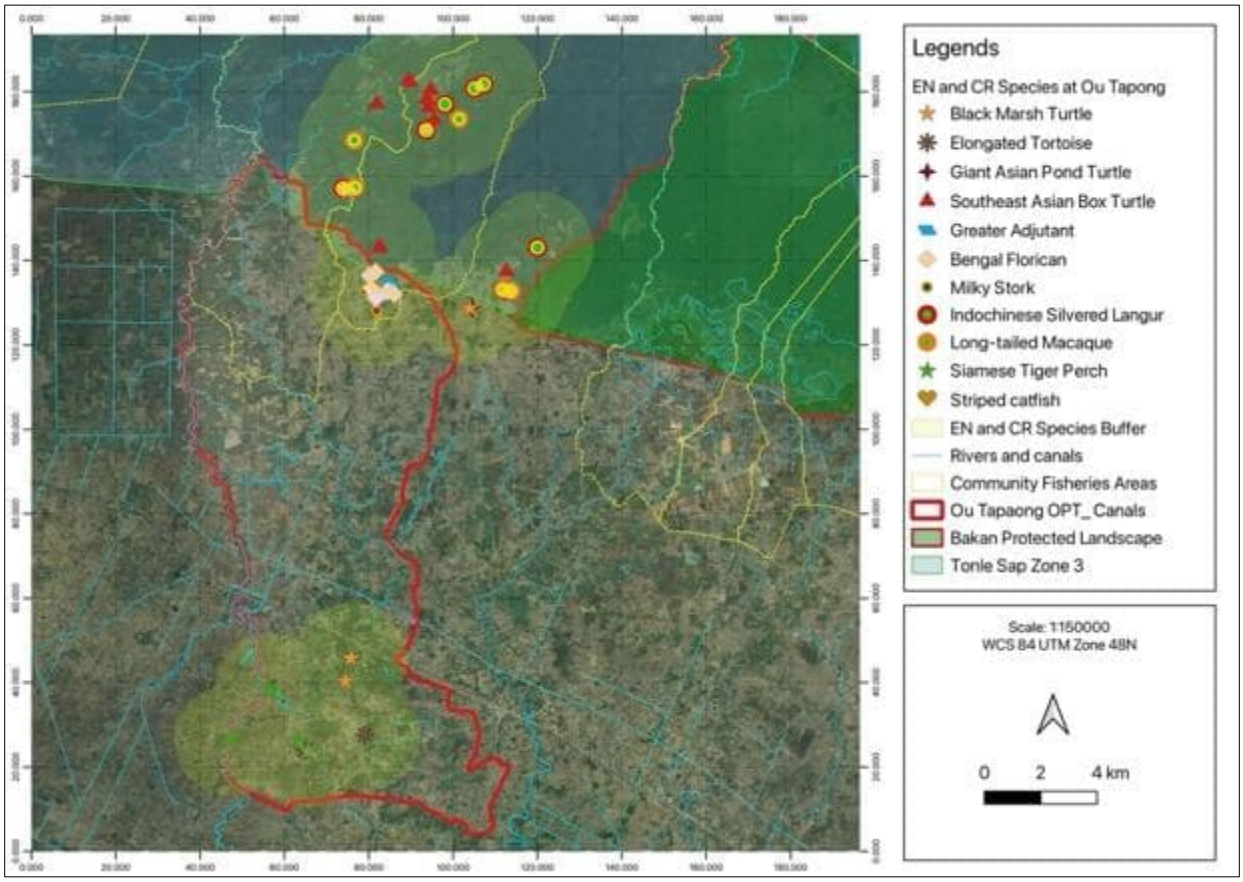

Figure 2: Map showing the observed distribution of identified EN and CR species (with the potential movement of 1-2 km within and around suitable habitats (2020 to 2024)

5.3.3 Ecological State of Habitats within the AoA

Understanding of the ecological state of habitats is necessary to assess the Likelihood of occurrence (LoO) of the above 11 screened species - as part of the CHA. For this CHA, species were classified into four LoO categories: Present, Possible, Unlikely and Not Present. Species known to be Present or with a Possible LoO are further assessed in Step 3. This understanding takes into account the classification of habitats as either modified or natural based on levels of human-induced disturbance to species composition and ecological functions. In this session, a brief assessment of the 11 confirmed species are

presented. The assessment discusses historical range, distribution, habitat conditions, current status, and potential threats identified by key informants[1].

The OTP command area has been in existence since the 1970s. The OTP is a mixture of paddy fields, farm roads, and residential areas. Natural rivers, such as the OTP river, have been changed and various sections by local people to support living and farming activities. The OTP command area, therefore, the ecosystem within the OTP command area has been subject to human-induced changes over the past several decades. As such, the OTP command area is a modified habitat.

5.3.3.1 Reptiles (4 species)

The Black Mash Turtle was observed in both upper and lower sections of the command area, as well as along the main Ou Tapaong river (which is being used as a key canal feeding irrigation water for the command area). Conversely, the Elongated Tortoise was only found in the upper reaches while the Giant Asian Pond Turtle and Southeast Asian Box Turtle were found only in the lower section within Tonle Sap Zone 3 (figure 2 above). Details are below:

- **The Black Mashed Turtle *(Cuora galbinifrons)*** was confirmed to be present in the area of influence based on the accounts of four local informants. Residents from the upper reaches of Ou Tapaong reported historical sightings of this species within the past 10-20 years although recent spotting has been scarce. Key informants who live in the lower part of the command area and had livelihoods closely intertwined with the Tonle Sap Management Zone indicated that there have been ongoing efforts to bring the **Black Mashed Turtle back** to the region albeit its rarity. One informant successfully captured a Black Mashed Turtle just before the interview. This species is highly valued in the local market, particularly among middlemen, and is often used for traditional medicinal purposes. The Black Mashed Turtle is listed as Critically Endangered by the IUCN Red List, and its presence in the area of influence indicates that the habitat is essential for its survival and reproduction. Therefore, the habitat meets the criterion of being significant for a Critically Endangered species of criteria 1a of IFC PS6.
- **Elongated Tortoise:** This species wasn't initially screened for the interview, but it was identified and spotted by two key informants at the upper section of the Ou Tapaong based on the turtle images that were shown to facilitate the identification of species. No such sightings have been documented in the lower portions of the command area. One informant, a local resident near Ou Tapaong, provided a firsthand account of capturing this species. After a thorough examination of the accompanying photographs and a comparison with verified identifying features, this species is confirmed present as reported by the local informant. The Elongated Tortoise is listed as Critically Endangered by the IUCN Red List. The presence of this species within the project area indicates that the habitat is essential for its survival and reproduction, meeting the requirements of Criterion 1a.
- **Giant Asian Pond Turtle:** Three local informants who were interviewed in the lower Ou Tapaong River region confirmed the presence of the Giant Asian Pond Turtle. One informant reported spotting this species in Boeung Kum Traeng, a wetland within Tonle Sap Zone 3 while the other two informants indicated their encounters

[1] Community councils and committees, including community fisheries (CFi) and farmer water user community (FWUC), were convened on July 25 and August 4, 2024. These meetings aimed to identify potential field assessment areas and select individuals with deep local ecological knowledge and experience for interviews. A total of 13 key informants were interviewed in Ou Topaong. Five of these individuals were from the upper command area, while seven were from the lower command area. Additionally, one representative from Punleu Komar Organization, which supports the Samraong Muk Yeik Community Forest Initiative, was included. Notably, the Samraong Muk Yeik and Sdok Khlouk Community Fisheries locations overlaps with portions of the Lower Ou Tapaong Command Area.

with this species in the mountainous regions of Kravanh District. Asian Pond Turtle is listed as Critically Endangered by the IUCN Red List. The reported sightings in Boeung Kum Traeng and the mountainous regions of Kravanh District indicate that these areas may be important habitats for the survival and reproduction of this species, meeting the requirements of Criterion 1a.

- **Southeast Asian Box Turtle:** During our survey in the lower section of the Ou Tapaong, we obtained valuable information about the Southeast Asian Box Turtle. All seven informants in this area confirmed the presence of this species in nearby wetlands and flooded forest areas within Tonle Sap Zone 3, which is close to the command area boundary. While three informants reported recent encounters with this species, the remaining four mentioned that they had encountered it 10 to 20 years ago. They explained that the turtle was once abundant but has become very rare in recent years.
  Similarly, all turtle species, including the Southeast Asian Box Turtle, are threatened by ongoing illegal hunting for trading purposes. Some people were hesitant to share recent information about these species.

  Mr. Pheoun Moeun, Deputy Chief of Samraong Muk Yeik Community Fishery (SMY-CFi) is exceptionally knowledgeable about wildlife species in his Cfi area. He has been actively participating in forest patrols and community activities. He mentioned that some people who go fishing in the forest occasionally bring back one or two turtles with them but he preferred not to disclose this information.

  One key informant admitted that they captured a turtle from a nearby forest and sold it for income. Income was shared among the four individuals. While informants were willing to share their past incidents, they were reluctant to provide details about the recent events because these activities are illegal.

  the Southeast Asian Box Turtle, a Critically Endangered species, is present in the lower section of the Ou Tapaong and nearby wetlands. These unique ecosystems are highly threatened. Therefore, Criteria 1a and 4 of IFC PS6. Additionally, Criteria 1b may also apply due to the high threat level and declining population. are potentially met.

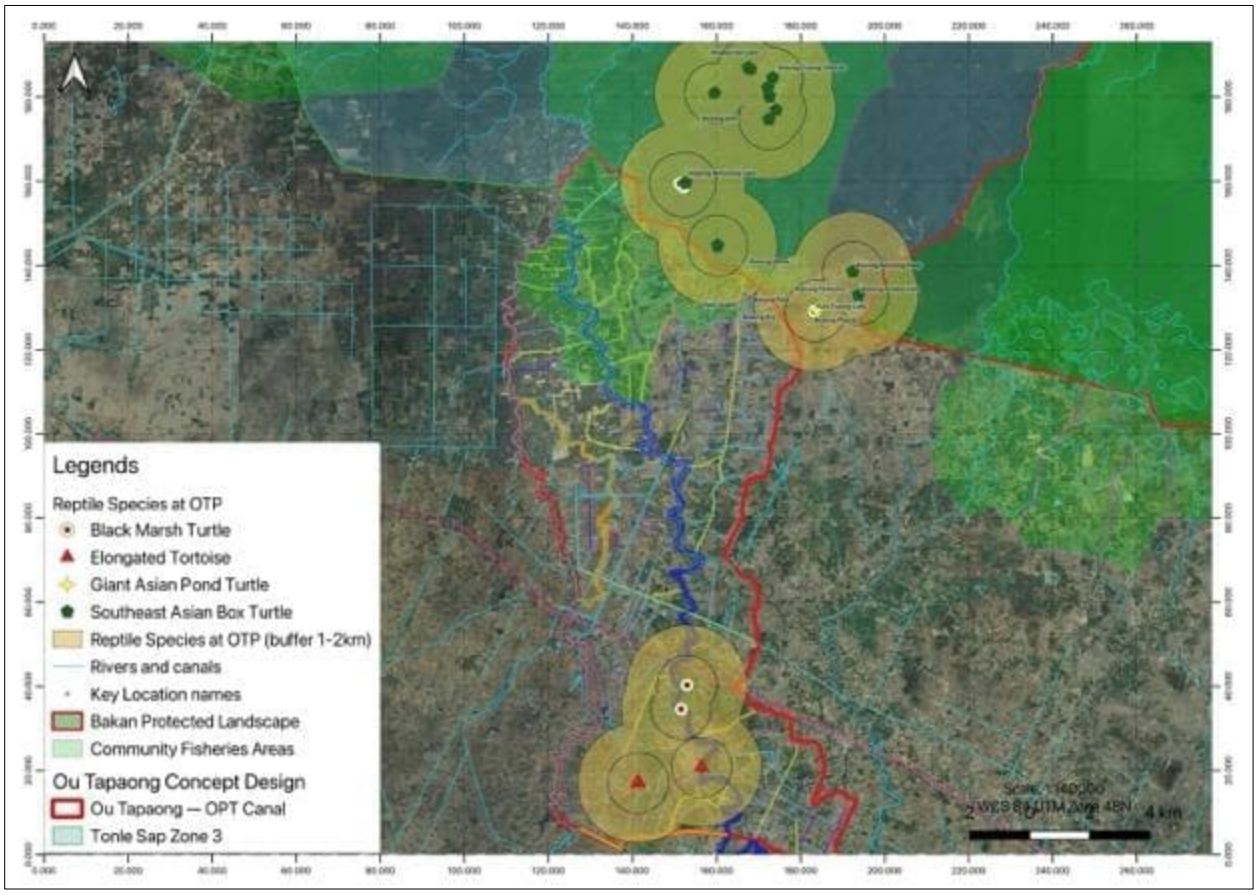

Figure 3: Distribution of identified turtle and tortoise species in and outside the OTP Command Area

5.3.3.2 Birds (3 species)

Despite extensive interviews with key informants residing in the upper reaches of Ou Tapaong, numerous endangered or critically endangered bird species were reported within their community. Conversely, only three of six bird species were confirmed by both key informants and CFi committees in the lower section. The following paragraphs summarize the primary findings and justifications for each species' presence, along with the associated level of confidence. These conclusions are based on in-depth interviews, technical expertise, and consultations with relevant units, which provided valuable assistance in verifying species of high conservation significance. Several species were initially identified by local residents.

- **Bengal Florican:** Five informants confirmed the presence of the Bengal Florican in the area of influence. Two individuals reported sightings within the past 10-20 years while three others have observed the species within the last five years and in the past. Notably, one informant witnessed a pair (male and female) as recently as March 2024 (see Figure 3). The lower reaches of Ou Tapaong exhibit a diverse mosaic of habitats, including open wetlands, grasslands, flooded forests, and minimally intensified paddy fields, creating a relatively undisturbed environment that is potentially conducive to Bengal Florican populations. Notably, the Ou Tapaong Command Area is situated only 1 kilometre from the Bakan Protected Landscape (BPL), a region characterized by similar ecological conditions (figure 3).

  Established in July 2023 through a joint effort by the Ministry of Environment and the Wildlife Conservation Society (WCS), the BPL aims to safeguard the southernmost Bengal Florican subpopulation within the Tonle Sap Great Floodplain. Moreover, the BPL serves as a critical wintering habitat for the Yellow-breasted Bunting,

Manchurian Reed-warbler, and Cambodia's unique population of the Chinese Grassbird, along with other globally threatened avian and wildlife species (WCS 2023).

The project area likely meets Criterion 1a (habitat of significant importance to Critically Endangered species) due to the presence of the Bengal Florican. Additionally, it may meet Criterion 4 (highly threatened and/or unique ecosystems) given the diverse habitat mosaic. However, a detailed ecological assessment is crucial to confirm these findings and identify any other relevant criteria.

- **Greater Adjutant:** During field assessments within the study area, multiple informants reported sightings of Greater Adjutants. While most individuals were unable to definitively distinguish between the Greater Adjutant and the similar-looking bird, which is Lesser Adjutant), one informant positively identified a Greater Adjutant within the Ou Tapaong Command area. This sighting occurred in recent years (figure 3). Unfortunately, due to the time of the observation, the Greater Adjutant had likely already migrated to its breeding grounds at Prek Toal Ramsar Site, a protected wetland area situated in Koh Chiveang community, Ek Phnom District, Battambang province (MoE 2012).

  Prek Toal Ramsar Site is the sole known breeding habitat for the greater adjutant in Southeast Asia and is recognized as the second-largest breeding colony for this species globally, following Assam, India. In December 2015, the Royal Government of Cambodia and the Ramsar Convention Secretariat designated the Prek Toal Core Area as a Wetland of International Importance due to its exceptional biological, social, and economic value. This designation solidified Prek Toal's status as Cambodia's fourth Ramsar Site (WCS 2016). Following the breeding season, greater adjutants migrate across the Tonle Sap Floodplain to their foraging habitats, with the lower section of Ou Tapaong serving as a critical foraging ground.

  Despite the challenges faced during the field observation due to the time of year, the confirmed sighting of a Greater Adjutant in the study area is a significant finding. It suggests that the species may still be present in the region and that a suitable habitat may exist for its continued survival.

  The findings indicate that the project area meets IFC PS6 Criteria 1a and 3. This is due to the presence of the Critically Endangered Greater Adjutant, a migratory species that utilizes the area as a critical foraging habitat, particularly during the non-breeding season.

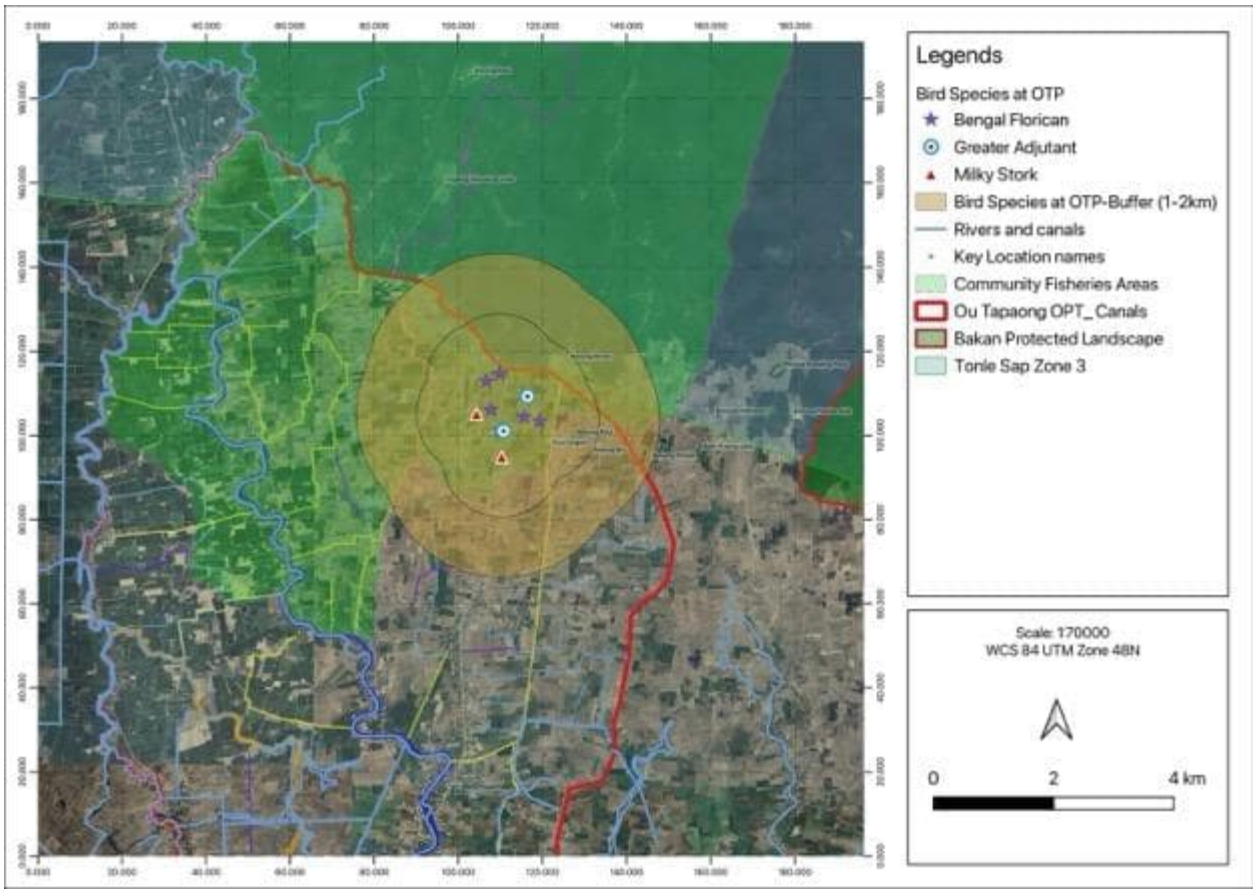

Figure 4: A spatial distribution map was generated for three bird species—the Bengal Florican, Greater Adjutant, and Milky Stork—within the lower Ou Tapaong Command Area. 1-2 km buffer zones were included to approximate their minimum movement range around suitable habitats.

- **Milky Stork:** Despite repeated attempts to elicit accurate information, many key informants were unable to distinguish between the Painted Stork and the Milky Stork, two similar-looking bird species. This confusion is a common challenge in bird identification, especially for non-experts. While the Milky Stork is considered extremely rare in Cambodia, with sightings typically limited to 1-3 individuals, some informants claimed to have encountered larger groups. This discrepancy can be attributed to misidentification and the difficulty of accurately counting birds in the field.

  Based on my experience in bird identification and conservation, I was able to evaluate the credibility of the information provided. Two informants offered the most reliable accounts, describing sightings of 2-3 Milky Storks feeding alongside numerous Painted Storks in seasonal wetland areas near flooded forests (figure #3). These observations align with the limited available data on Milky Stork distribution and behavior in Cambodia. When the flooding season arrives, they migrate to degraded forest areas in the uplands. Milky Stork and Great Adjutant are migratory birds that move both locally and across international borders. The Prek Toal Ramsar Site serves as the only known breeding ground for Milky Stork and Greater Adjutant in Southeast Asia; after breeding, they migrate to other wetland areas throughout the country.

  The Milky Stork's situation appears to align with several IFC PS6 criteria:

  Species Level:

Endangered Species (Criterion 1a): The Milky Stork's rarity and the challenges in accurately assessing its population make it a strong candidate for this criterion. Its limited distribution and potential threats further emphasize its vulnerability.

Migratory Species (Criterion 3): The migratory nature of the Milky Stork, particularly its reliance on the Prek Toal Ramsar Site as a breeding ground and its movements to other wetland areas, highlights its dependence on various habitats throughout its range.

Ecosystem Level:

Highly Threatened and/or Unique Ecosystems (Criterion 4): The wetland habitats used by the Milky Stork, especially the flooded forests and seasonal wetlands, are often threatened by human activities like deforestation, agriculture, and pollution. These ecosystems are essential for the survival of the species and other biodiversity.

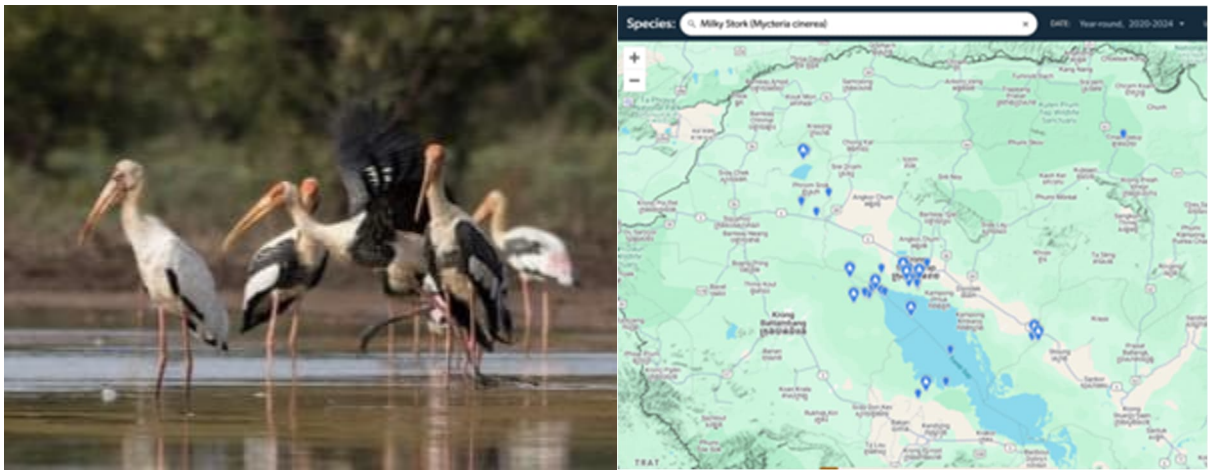

Figure 5: Photograph of a Milky Stork foraging alongside a flock of Painted Storks (credit: Sang Mony, Sam Veasna Conservation Tour), and a map illustrating the distribution of Milky Stork sightings in Cambodia from 2020 to 2024, extracted from eBird data.

- **Yellow-breasted Bunting**: The Yellow-breasted Bunting is a small, migratory songbird found in Southeast Asia, including Cambodia. It is characterized by its bright yellow breast and throat, contrasting with its olive-green upperparts. The Yellow-breasted Bunting is a winter visitor and spring passage migrant in Cambodia, often found in rice fields, scrub, grasslands, and marshes in the lowlands. In Cambodia November to May, the species has been recorded in the Tonle Sap Floodplain and the Lower Mekong Delta. Yellow-breasted Buntings are typically observed in rice fields, scrublands, grasslands, and marshes in the lowlands of Cambodia (Ly et al. 2022).

  The local population often mistakenly identifies this species as a sparrow or a weaver due to their similar size, appearance, and shared habitats. After conducting inquiries, none of the locals could confirm whether they had observed this species in the area. This highlights a common gap in local ecological knowledge regarding small bird species like this one. Identifying such species typically requires individuals with advanced birdwatching experience, who can locate them in the appropriate habitat at the right time.

Based on an overall assessment of the habitat conditions in the lower part of Ou Tapaong, we can confirm that this area has the potential to serve as a wintering habitat for this species. Additionally, the boundary of the Ou Tapaong Command Area is just 1 km away from the Bakan Protected Landscape.

The Yellow-breasted Bunting's Critically Endangered status and the Ou Tapaong area's potential as a wintering habitat potentially meet IFC PS6 Criteria 1a. Additionally, the species' restricted range and migratory behavior align with Criteria 2 and 3. The Yellow-breasted Bunting, a CR species, is known to inhabit such areas during its winter migration.

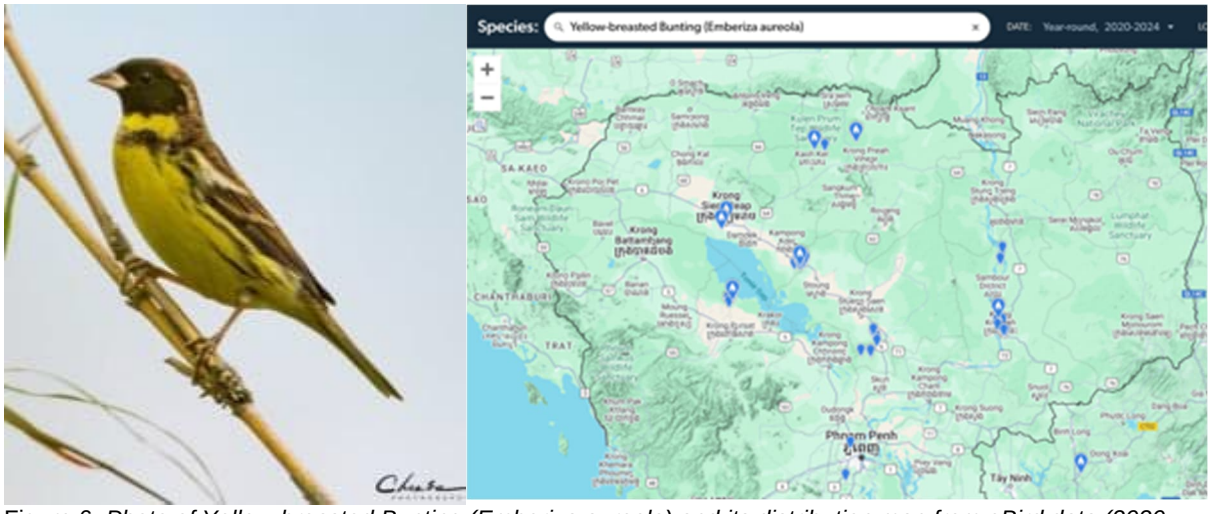

Figure 6. *Photo of Yellow-breasted Bunting (Emberiza aureola) and its distribution map from eBird data (2020-2024)recorded by birdwatcher and wildlife overserves.*

- **Wild-winged Duck:** Regarding the Wild-winged Duck, there was some confusion among informants who mistakenly identified it as the Knob-billed Duck (Sarkidiornis melanotos). However, after discussing key identification features and ecological characteristics, such as breeding and nesting habitats, we determined that none of them had actually encountered the Wild-winged Duck before. Due to it's tiny population, Wild-winged Duck is very sensitive, and live in the forest close to the lake, wetland, river and waterhold with less disturbance. Due to its limited population, the Wild-winged Duck is particularly sensitive to disturbances and prefers to reside in relatively undisturbed forests adjacent to lakes, wetlands, rivers, and watering holes. This preference for quieter, less populated areas helps to ensure the survival of this vulnerable species.

5.3.3.3 Mammals/ primates (2 species)

No suitable habitats or sightings of three mammal species were identified in the upper section of Ou Tapaong. Two primate species (Indochinese Silvered Langur and Long-tail Macaque) were confirmed at the lower section in the Flooded Forest habitat of the Tonle Sap Zone 3 and CFi Areas. Additionally, multiple reports indicated the presence of Hiary-nosed Otters in the region, particularly in the deep waters of the flooded forest near the Tonle Sap Great Lake's mouth. The following paragraphs summarize the key findings and justifications for the presence of these two primate species, along with their associated confidence levels. These conclusions are based on comprehensive interviews, technical expertise, and consultations with relevant units, which contributed to the verification of species with high conservation importance.

- **Indochinese Silvered Langur:** Six local informants (86%) reported frequent encounters with Indochinese Silvered Langurs within the flooded forests of Tonle Sap Zone 3 which is outside of the OTP command area. These sightings, primarily near natural lakes, have been confirmed by multiple individuals engaged in livelihood

activities within these areas. While the population of Indochinese Silvered Langur was once plentiful, informants noted a significant decline in recent decades, with only smaller troops now being observed. The species is known to inhabit areas near rivers and large bodies of water.

Mr. Chem Sophal from Punleu Komar Organization highlighted that his organization provides support for the Samraong Muk Yeik Community Fishery (SMY-CFi) and Sdok Khlouk Community Fishery (SK-CFi) in managing and protecting fisheries resources and flooded forests within their Community Fishery Area (figure 6). Portions of these CFi Areas overlap with the Lower section of Ou Tapaong Command Area. This effort is part of the EU “Our Tonle Sap” Project, led by the Wildlife Conservation Society and funded by the European Union. Mr Sophal emphasized the presence of numerous endangered and critically endangered species, including the Indochinese Silvered Langur, within this CFi Area. To confirm the presence of any Community Fisheries (CFIs) within the specified area, we interviewed the Chief of Pursat Fishery Administration Cantonment. Our inquiry revealed that two CFi areas overlap with the designated region, as illustrated in the accompanying map (see map below).

Based on the provided information, the following IFC PS6 criteria are potentially met regarding the Indochinese Silvered Langur and the flooded forests of Tonle Sap Zone 3:

Species Level:
Criterion 1: Critically Endangered and Endangered Species: The Indochinese Silvered Langur is an endangered species, making its habitat a potential candidate for this criterion.
Criterion 2: Highly Threatened Species: Given the observed decline in the population and potential threats to its habitat, the species could be considered highly threatened.

Ecosystem Level:
Criterion 5: Highly Threatened and Unique Ecosystems: The flooded forests of Tonle Sap Zone 3 represent a unique and threatened ecosystem, particularly due to factors such as habitat loss and degradation.

- **Long-tailed Macaque:** Indochinese Silvered Langurs and Long-tailed Macaques were commonly reported by key informants residing within the Tonle Sap Zone 3. These informants, who frequently engaged in fishing activities in the surrounding forests, encountered Long-tailed Macaques regularly. They added that these primates, known for their social nature, live in troops and communicate vocally to alert their group members of potential threats or discoveries. Some troops inhabit flooded forests situated close near the command area.

  However, informants expressed deep concern over the significant decline in the population of Long-tailed Macaques over the past several years. This alarming trend has prompted urgent action from conservation organizations. In response to the deteriorating situation, the primate specialist group upgraded the conservation status of this species from Vulnerable to Endangered in March 2022. This elevated status underscores the urgent need for increased protection measures to mitigate the species' decline, which is primarily driven by the high demand for these primates in the illegal pet trade (*Primate Conservation Alliance. 2022)*

The provided information strongly suggests that the Tonle Sap Zone 3 adjacent to the OTP meets multiple IFC PS6 criteria related to the Critically Endangered Long-tailed Macaque:

- Criteria 1a: The recent uplisting of the Long-tailed Macaque to Endangered status by the IUCN Red List underscores the habitat's critical importance for the species' survival and reproduction. The frequent sightings of these primates by local informants, especially in the flooded forests, highlight the area's significance as a key habitat.
- Criteria 4: The flooded forests of the Tonle Sap Zone 3 represent a highly threatened and unique ecosystem. They face significant threats from habitat loss, pollution, and climate change. These forests provide a crucial habitat for the Long-tailed Macaque and other potentially threatened species.

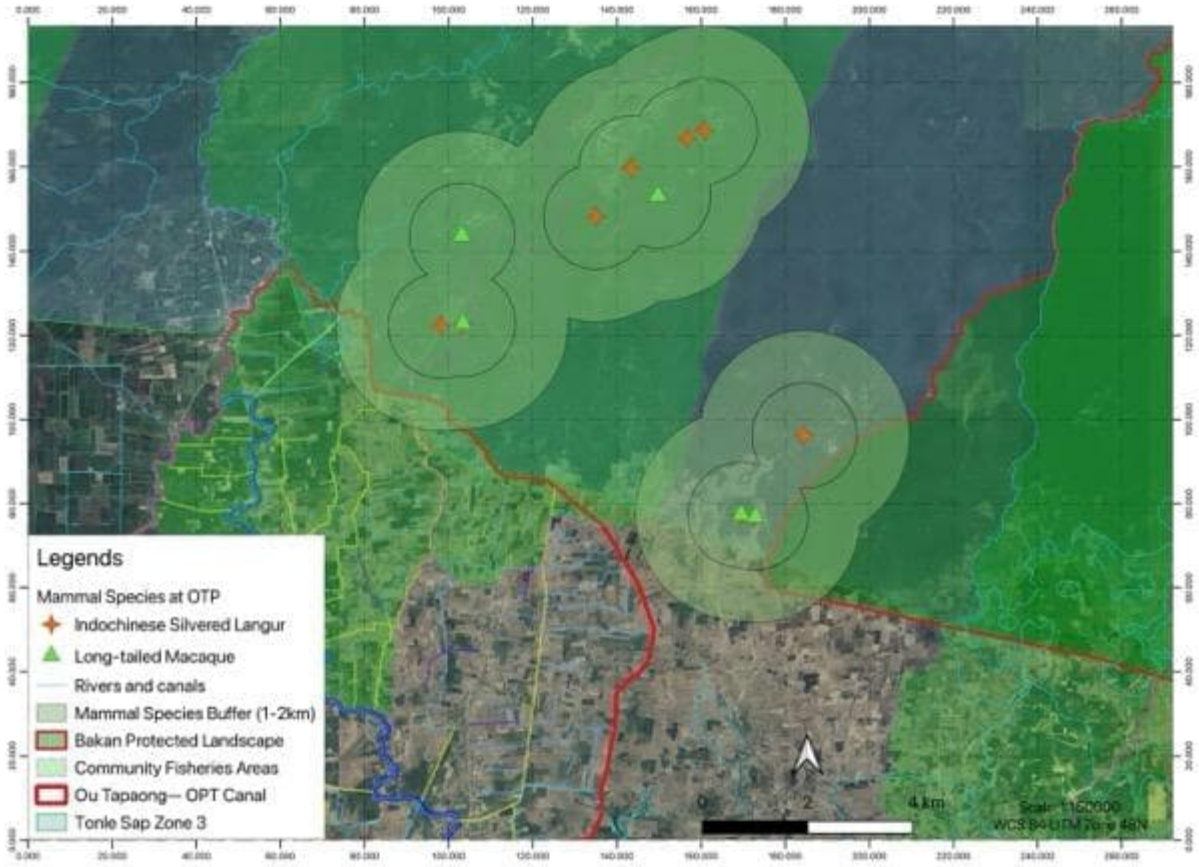

Figure 7: A spatial distribution map was generated for two primate species—the Indochinese Silvered Langur and Long-tailed Macaque—within the lower Ou Tapaong Command Area. 1-2 km buffer zones were included to approximate their minimum movement range around suitable habitats.

5.3.3.4 Fishes (2 species)

Overall, these statements provide valuable insights into sightings and knowledge about Siamese Tiger Perch and Striped Catfish within different sections of the Ou Tapaong Command area. The following paragraphs summarize the key findings and justifications for the presence of these two fish species confirmed by key informants, along with their associated confidence levels and their ecological knowledge of fish diversity and migration.

- **Siamese Tiger Perch:** According to four key informants in the upper section of the Ou Tapaong Command area, Siamese Tiger Perch has been consistently observed in Boeng Kansaeng Lake, located in the southwest part of the Ou Tapaong Command Area. Three of them reported encountering a few individuals of this fish

species in 2023 and 2024 (figure #7), while another informant saw them about 20 years ago during the fully flooded period. This particular informant stopped fishing for many years after becoming older.

The Siamese Tiger Perch is believed to migrate from Tonle Sap Great Lake to the upstream through Svay Daun Kav River (along the western boundary of command area) and then move into Boeng Kansaeng through its tributary canal during flooding periods. Common fishing gear used includes line nets, cast nets, and small fish traps. The informants mentioned that catching this species is extremely rare, with only one to two individuals caught per season using line nets. They possess extensive knowledge about fish and make a living through fishing.

On the other hand, two key informants from the lower Ou Tapaong section stated that although they are familiar with Siamese Tiger Perch, they have never seen them in their area. One informant mentioned having seen this species in 1979 but not recently. Similarly, Mr. Chem Sophal from Punleu Komar Organization confirmed his awareness of this species but stated that it is not present in the lower Ou Tapaong Area.

The Criterion 1a of IFC Performance Standard 6 (PS6) is potentially met. The Siamese Tiger Perch, a Critically Endangered species, has been observed in Boeng Kansaeng Lake, a habitat within the Ou Tapaong Command Area. However, the frequency of sightings is low and historical, suggesting that further investigation is necessary to definitively establish the habitat's significance for the species' survival and reproduction.

- **Striped catfish**: One informant recalled seeing the Striped Catfish approximately 7 years ago in a small wetland area during the peak of flooding. This species is exceptionally rare, and it is known to migrate to this specific area when the entire region becomes submerged in floodwater.

  Based on what we know, the habitat for the Critically Endangered Striped Catfish likely meets two of the IFC PS6 criteria:
  - Criterion 1a: This habitat is super important for the survival of this super rare fish. It's like their special breeding ground during floods.
  - Criterion 3: The fish migrates to this specific area when it floods, making it a key spot for this travelling species.

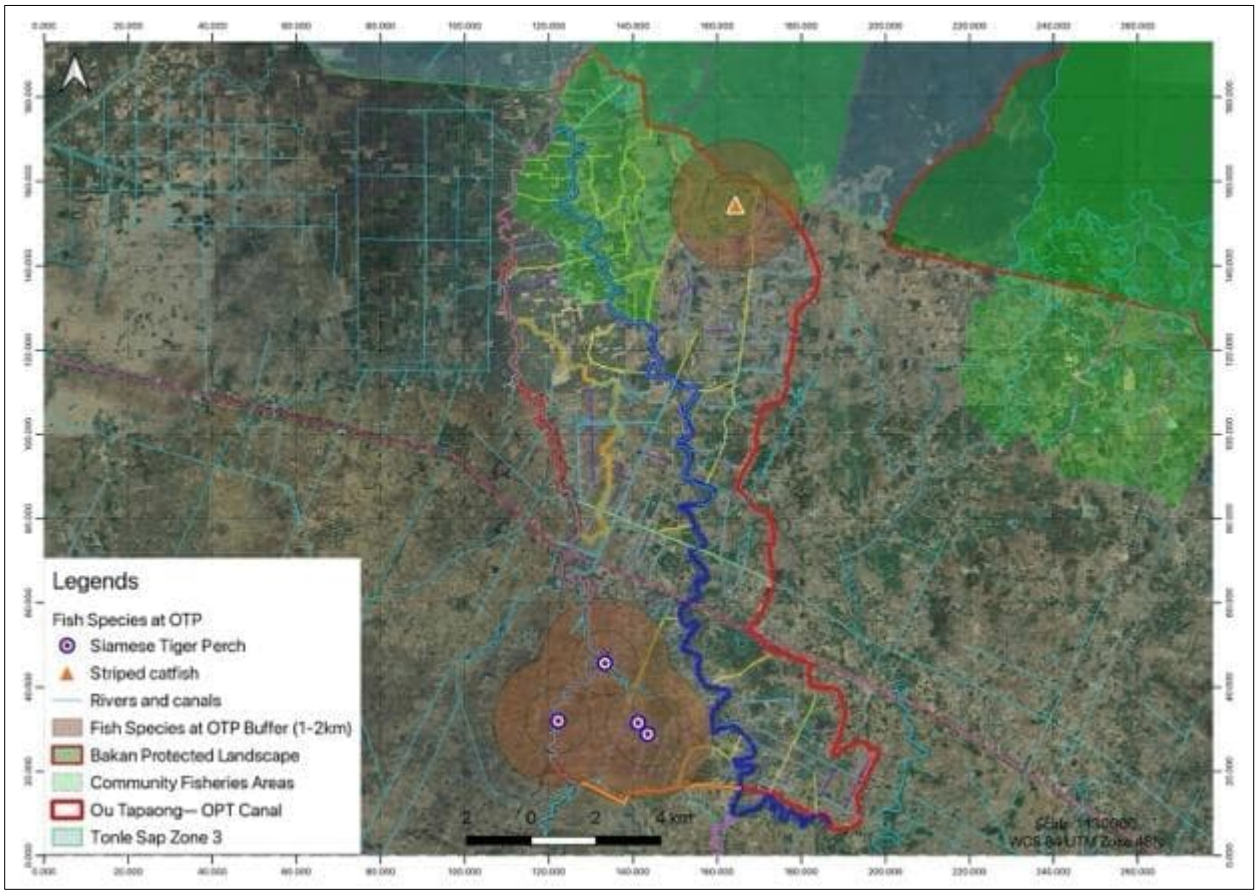

Figure 8: A spatial distribution map was generated for two fish species—the Siamese Tiger Perch, and Striped Catfish (old record-7 years ago)—within the lower Ou Tapaong Command Area. 1-2 km buffer zones were included to approximate their minimum movement range around suitable habitats.

5.3.4 Occurrence of Protected Areas near the Sub-scheme Area

A review of protected areas in the vicinity of the sub-scheme has been conducted as a preparatory step before proceeding with Step 3 of the CHA. There are four areas located near and downstream of the OTP sub-scheme (See Table below). The preliminary assessment focuses on the two that are closest to the OTB: Flood Forest Conservation, b) Bakan Grassland Protected Area[2].

No.	Name of Protected Area	Designated by	Main target and requirement	Distance (km) to OTP sub-scheme
1	Flooded Forest Conservation	Royal Government of Cambodia: Sub-decree No. 197 dated 29 August 2011	The Tonle Sap's flooded forests are a vital part of its unique ecosystem. During the wet season, the Mekong River's waters back up into the Tonle Sap, flooding vast areas and creating a rich habitat for diverse wildlife. This dynamic ecosystem supports a multitude of fish species, waterbirds, and other wildlife. However, it faces threats like deforestation, overfishing, and pollution,	0 (share the border)

[2] Bakan grassland is a protected area for birds designated by sub-decree No. 144 in 2023.

No.	Name of Protected Area	Designated by	Main target and requirement	Distance (km) to OTP sub-scheme
			necessitating conservation efforts to protect this vital resource.	
2	Bakan Grassland protected area	Royal Government of Cambodia: Sub-decree No. 144, dated 04 July 2023	Bakan Grassland, a 38,430-hectare protected area in Cambodia, is a vital part of the Tonle Sap ecosystem. It's home to endangered bird species like the Bengal Florican and Chinese Grassbird. The Wildlife Conservation Society (WCS) and local communities are working together to protect this unique habitat.	2
3	Dei Roneat Important Bird Area (IBA)	BirdLife Internation	The IBA supports breeding colonies of important birds like the Darter, Lesser Adjutant, and Greater Adjutant. Its diverse habitat supports various bird species, but faces threats from human activities. Conservation efforts include monitoring, community engagement, habitat restoration, and policy advocacy to protect this crucial site.	12
4	Tonle Sap Biosphere Reserve (TSBR)	Royal Government of Cambodia: Royal Decree in 2001[3]	The Tonlé Sap Biosphere Reserve is a distinctive ecological region encompassing the Tonlé Sap, or Great Lake of Cambodia. The reserve was successfully designated a UNESCO Biosphere Reserve in 1997 and subsequently enshrined in the Cambodian Royal Decree in 2001.	16
5	Prek Toal Important Bird and Biodiversity Area (IBA), then designated at the core area of TSBR in 2001, and then promoted Prek Toal Ramsar Site in 2015	BirdLife Internation Royal Government of Cambodia: Royal Decree in 2001[4] Sub-decree in 2015	The area is well known as the largest waterbird breeding colonies in Southeast Asia, support a congregation of may globally threatened birds, fish and other wildlife specicis. It's the second world largest breeding habiatat for Greater Adjutant, and the only breeding habitat for Spot-billed Pelican, and Milky Stork in Southeast Asia. Prek Toal is only inland breeding population for Milky Stork in the world.	24

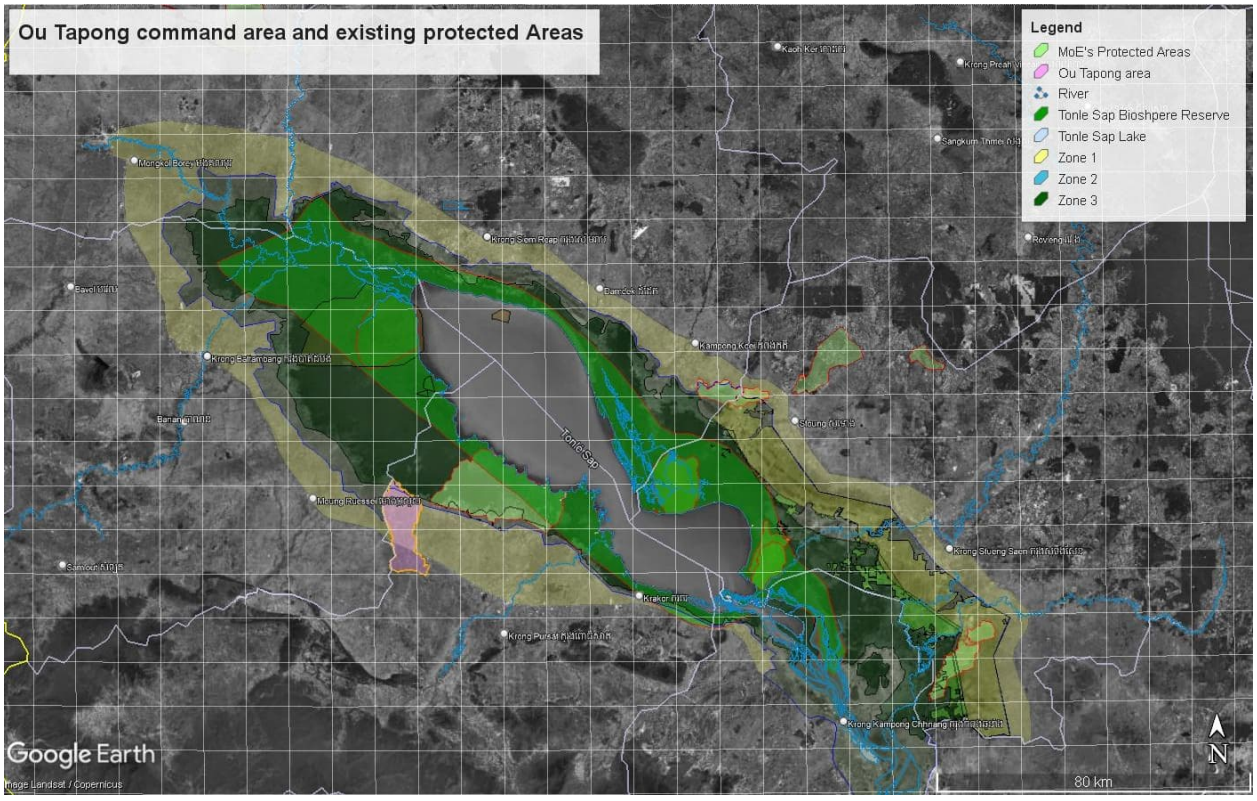

Figure 9: Map of Ou Tapong Command Area and other existing protected areas under administered of the Ministry of Environment, Ministry of Agriculture, Forestry, and Fisheries, and Ministries of Water Resources and Meteorology

5.4 Determination of Critical Habitat Status (Step 3)

This section assesses the information (obtained from the above sub-section) vis-a-vis the criteria (presented in Section 3.4 - CH assessment method). This assessment aims to determine whether any species (identified in the list of 11 EN and CR species) qualify for Critical Habitat features.

All information presented in this study report has been meticulously verified against reliable sources, including key government research institutes, national and international organizations, and expert consultations. To ensure accuracy, fish, bird, mammal, and reptile species identification at Ou Ta Paong, Lum-Hach, Brambei Mom, Kraeu Trom, and Yottasass was confirmed through consultations as below:

Table 5: list of internation and nation key expert were consulted to check and verify each all target EN and CR species

Name	Position and institution	Key Area of expertise/ consultation	Contact
Dr. Ea Chitra	Head of the Aquaculture Faculty at the Kampong Speu Institute of Technologies	Key fish species were released by his faculty at Anlong Chrey and Brambei Mum Reserviors.	+855 14 388 694
Mr. Robert Tizard	Senior Project Lead for Tonle Sap Landscape, WCS Camodia	Confirmation and historical sighting data of Bengal Florican and other key bird species around Ou Ta Pang sub-scheme	rtizard@wcs.or

Mr. Tach Sovannara	Head of the Fisheries Lab at the Inland Freshwater Research and Development Institute of the Fisheries Administration	Identification and clarification of EN and CR species of fish and reptiles across all sub-schemes	
Mr. Khim Sokha	Chief of office of the Fisheries Conservation Department	Identification and clarification of EN and CR species of fish and reptiles across all sub-schemes	+855 12 784 687
Mr. Chuem Sophal	Program Manager, Punleu Komar Organization	Confirm present of birds and key wildlife species at Ou Ta Paong Sub-scheme	
Mr. Morn Ravy	Bakan Protected Landscape Project Coordination, WCS Cambodia	Confirm present of birds and key wildlife species at Ou Ta Paong Sub-scheme	morn@wcs.org
Mr. Somony Thay	Direct of Aquaculture Department, FiA	Fish identification, key fish species releasing data, and distribution range across all schemes	+855 12 829 971
Mr. Neang Ty	Conservation Program Manager, Wild Earth Allies	Internation and national expert on reptile	+855 12 864 409
Mr. Hong Chamnan	Director of the Freshwater Wetland Conservation Department, MoE	Confirmation and historical sighting data of Bengal Florican and other key bird species around Ou Ta Pang sub-scheme, national protected area data	+855 12 922 429
Mr. Sun Visal	Deputy Director of the Freshwater Wetland Conservation Department, MoE	Confirmation and historical sighting data of Bengal Florican and other key bird species around Ou Ta Pang sub-scheme, national protected area data	+855 12 708 836

All information concerning avian and other key wildlife species, including their behavioral patterns, was corroborated through sighting data verified by relevant experts from the Wildlife Conservation Society (WCS), a long-standing partner of the Ministry of Environment (MoE), Fisheries Administration, and Forestry Administration in conservation efforts spanning over 25 years. Additionally, consultations were held with Mr. Hong Chamnan, Director of the Freshwater Wetland Conservation Department, and Mr. Sun Visal, his Deputy Director and the head of the Tonle Sap Biosphere Reserve. Both individuals possess extensive experience, ranging from 20 to 30 years, in avian ecology and protected area management within the Tonle Sap Lake region.

Finally, information related to reptiles and amphibians was validated through consultations with Mr. Neang Ty and his team from Wild Earth Allies, renowned experts who have made significant contributions to the discovery of new reptile and amphibian species in Cambodia, including the Cardamon Shrub Frog (Philautus cardamonus).

5.4.1 Overview of the current land use and land cover at OPT

The map below features the current land and use and land cover at Ou Tapaong Command Area based on the satellite image captured by Sentinel 2 with 10m resolution in late 2023. The color bands failed to distinguish between rice fields, grassland and shrubland areas. However, based on field assessment, the command area is dominated by existing rice fields and some modified habitats. There are some small and fragmented natural habitats like shrubland, and grassland along the natural streams, seasonal ponds and wetland habitat creating a mosaic habitat for many wildlife species to strive as the area is situated within the Tonle Sap Floodplain close to many protected areas and IBBAs. Residential areas are situated along the main roads, rivers, and streams.

The northern portion of the OTP Command Area is a dynamic landscape characterized by a varied mosaic of habitats. Here, agricultural lands coexist with modified habitats, wetlands,

shrublands, and remnants of grassland, seamlessly transitioning into the vast expanse of the Tonle Sap Zone 3 flooded forest.

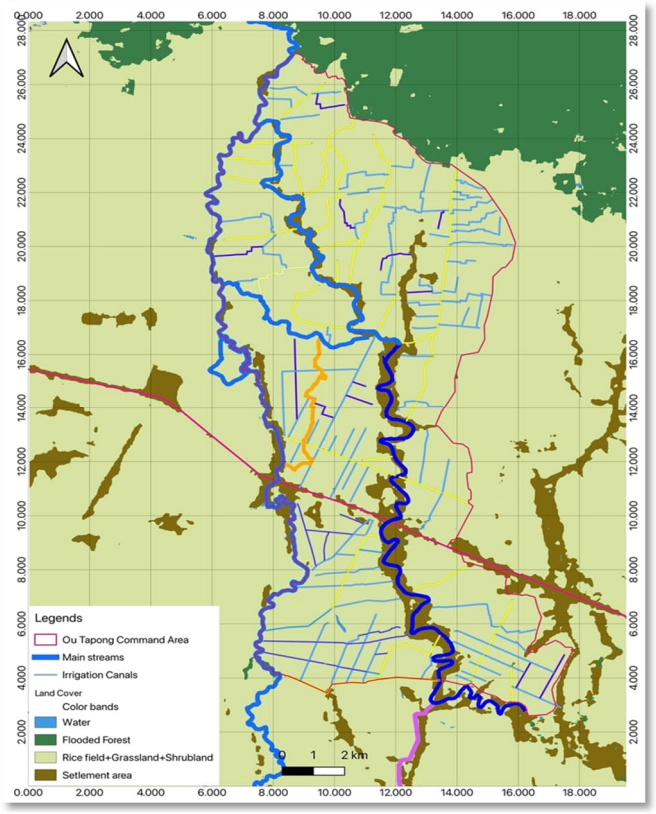

Figure SEO Figure * ARABIC 10:

This diverse ecological mosaic plays a crucial role in supporting a rich array of biodiversity. The area serves as a vital foraging ground for numerous migratory bird species, providing them with abundant food resources. Additionally, it functions as a critical refuge and breeding ground for fish during the wet season, when the flooded forests and wetlands offer ideal conditions for spawning and juvenile development.

The intricate interplay of these habitats sustains a diverse community of wildlife, including birds, mammals, fish, and reptiles. These species rely on the unique characteristics of the flooded forest and wetland ecosystems for essential life cycle activities such as breeding, nesting, and foraging. The area's significance as a biodiversity hotspot is underscored by its role in supporting a wide range of Habitat of significant importance to CE and EN species

As presented in Section 4.1.3.3 (Ecological State), species that qualify as critical habitat features include:

- **Reptile** (4 species): Black Marsh Turtle, Giant Asian Pond Turtle, Southeast Asian Box Turtle, and Elongated Tortoise,
- **Mammals** (2 species): Indochinese Silvered Langur and Long-tailed Macaque),
- **Fishes** (2 species): Striped catfish and Siamese Tiger Perch, and
- **Birds** (3 species): Greater Adjutant, Milky Stork, and Bengal Florican.

First of all, the Ou Tapaong command area was assessed as a modified habitat because the command area which is around 14,000 hectares is a mixture of paddy fields, rivers, shrubland, seasonal ponds, farmers, and houses. Rivers such as Ou Ta Paong River and Svay Donkeo River have been substantially modified at various locations of the river for water collection, storage, as well as for other living and farming purposes.

In this assessment, we divided Ou Tapaong Command Area into three parts: 1) the upper part to the south, 2) the middle part along National Road 5, and 3) the lower part to the north which is situated within the floodplain of Tonle Sap Zones 2 and adjacent to Tonle Sap Zone 3 for key informant interview and habitat assessment purposes as this command area is large and maintain different demographic and natural habitat conditions. On August 7, 2024, the Cambodian government discussed the decision to register two zones (Zone 2 and Zone

3) of the Tonle Sap Lake Basin as state land to protect the natural resources of the lake. This decision will prohibit any further requests for land concessions in these zones. The Ministry of Land Management, Urban Planning and Construction hopes that this will help to preserve the biodiversity of the lake[5]. The assessment focused on the upper and lower parts because these areas are known to have a diverse biodiversity landscape. While the survey revealed variations in knowledge about wildlife among local communities, it also highlighted the need for increased awareness and understanding across all areas.

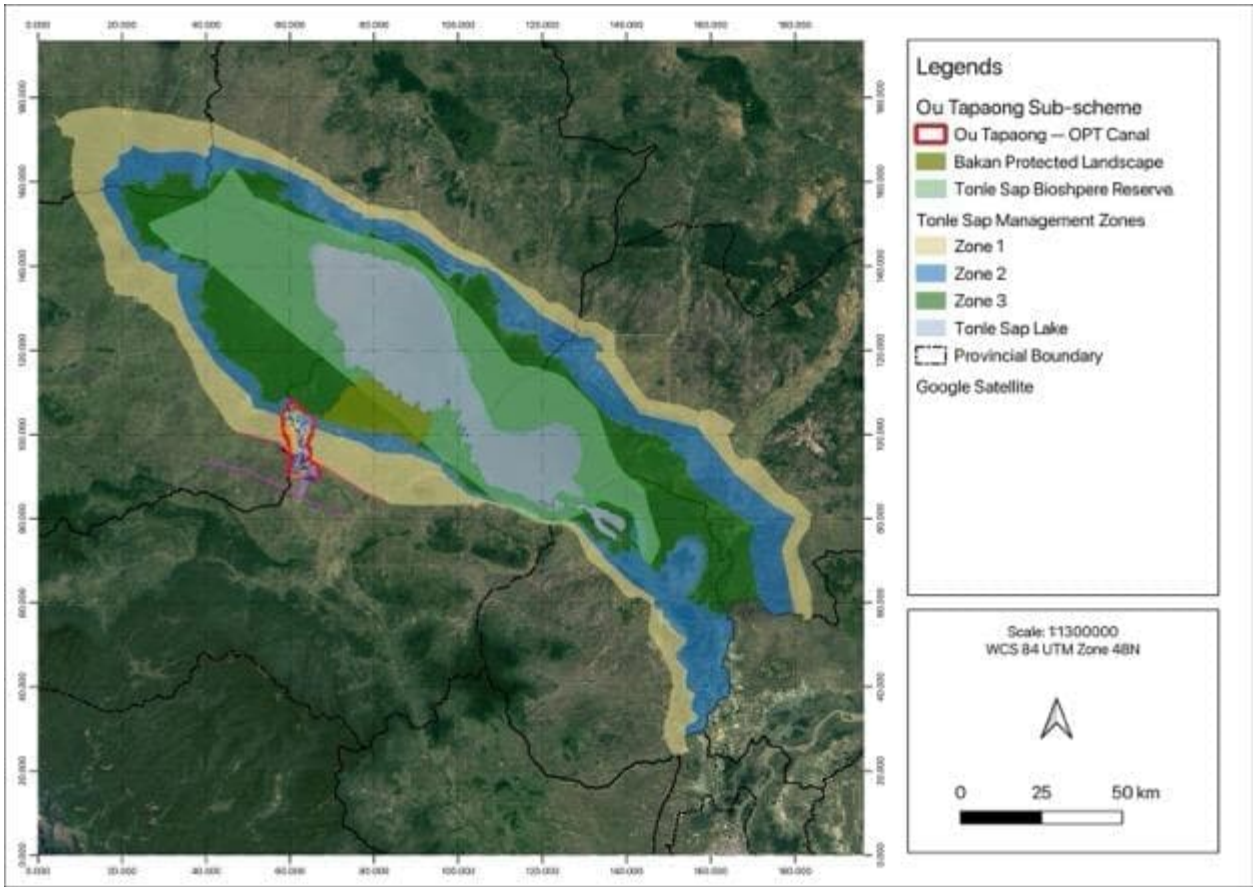

Figure 11: Map of Ou Tapaong command area and other existing protected area within the Tonle Sap Basin

The southern part of the command area is predominantly agricultural, with limited remaining natural habitats. Boeng Kansaeng, the largest seasonal wetland, faces challenges in water retention during the dry season. While the command area mostly gets water for irrigation from the Svay Daunkaev and Pursat rivers, the water volume is insufficient to maintain natural flows (e.g. Ou Tapaung River). Additionally, human interventions such as earth dams and conversion of waterways into fish ponds have fragmented the natural habitats and as such hindered the movement of aquatic species (Figures 8 and 9).

The northeastern part of the command area, though dominated by agriculture, includes a significant area of flooded forests. This diverse habitat supports a range of endangered and critically endangered species. However, the entire water system faces challenges that limit its suitability for species requiring extensive, interconnected habitats. The lowest part of this area is connected to a very healthy flooded forest habitat, consisting of many small and large waterholes, and wetland areas, creating a mosaic habitat that provides suitable ecological niches for many endangered and critical species in the area. This huge flooded forest habitat is part of the Tonle Sap Multiple Use Area, Tonle Sap Biosphere Reserve

[5] Land Management, Urban Planning and Construction, Cambodia (2024). Zones 2 and 3 of the Tonle Sap Lake will be registered as state land to preserve this precious natural resource for inheritance for all generations.

under the Ministry of Environment, and Tonle Sap Management Zone under the administration mandate of the Tonle Sap Authority, and Flooded Forest Protected Area under the Fisheries Administration. Additionally, a portion of Ou Tapaong's lower command area overlaps with two Community Fisheries (CFIs) areas.

The critical habitat for these bird species within the Ou Tapaong Irrigation sub-scheme includes flooded forests, wetlands, lakes, rivers, grassland, abandoned and fellow rice fields, and waterways. The flooded forests in Tonle Sap Zone 3 serve as crucial habitats for several endangered and critically endangered primate species like the Indochinese Silvered Langur and Long-tailed Macaque and are charaterised with lakes and wetlands inside that are crucial foraging habitats for birds. Based ont this key finding we can identify and cacharaterise critical habitats of various EN and CR species presence within and close thie command area as below:

- Flooded forests, particularly those in Tonle Sap Zone 3, are particularly significant for biodiversity. These forests provide crucial habitat for endangered primates such as the Indochinese Silvered Langur and Long-tailed Macaque. Additionally, the lakes and wetlands within these forested areas offer essential foraging grounds for various bird species including Greater Adjutant and Milky Stork.
- Wetlands, such as Boeung Kansaeng, play a vital role in supporting aquatic and terrestrial biodiversity. These areas provide essential food, shelter, and breeding grounds for a variety of species including birds, reptiles, and fish.
- Rivers and waterways, like the Svay Daun Kav River, serve as important corridors for fish migration and connectivity between different habitats. This can indirectly benefit birds by providing a healthy aquatic ecosystem.
- Grasslands and open areas, while less diverse than forested habitats, can still support certain Bengal Florican, Yellow-breasted Bunting and other bird species. Abandoned and fallow rice fields may also offer temporary refuge for many bird birds including the Florican. The Bengal Florican utilizes this habitat for nesting and feeding during the dry season. The Yellow-breasted Bunting winters in this region before returning to its breeding ground in Siberia, Russia, from May to November

Based on the biodiversity assessment conducted at Ou Tapaong Irrigation Sub-scheme, several critical habitats have been identified, and described below. These habitats support a range of endangered and critically endangered species, highlighting their ecological significance. **The critical habitat assessment activities that should be taken for the Ou Tapaong Command area, considering IFC PS 6 guidance on biodiversity conservation and sustainable management of living natural resources, are as follows:**

1. Baseline Studies: Conduct comprehensive baseline studies to identify and understand the biodiversity values in the area. This should include a literature review, stakeholder engagement and consultation, field surveys, and other relevant assessments. The focus should be on identifying key species (such as Greater Adjutant, Milky Stork, Bengal Florican), fish (Siamese Tiger Perch and Striped Catfish), reptiles (Black Marsh Turtle, Southeast Asian Box Turtle, Giant Asian Pond Turtle, Elongated Tortoise), mammals (Indochinese Silvered Langur and Long-tailed Macaque), and their habitats.
2. Habitat Mapping: Map out the different habitats present within the Ou Tapaong Command area. This should include flooded forests, lakes (such as Boeung Kamsaeng Lake), rivers (Svay Daunkav River), waterholes, grasslands, and fellowed rice fields used by bird species for foraging.
3. Threat Assessment: Assess potential threats to critical habitats identified in step 2. Consider factors such as habitat loss due to infrastructure development or land-use changes related to irrigation system renovation.

4. Stakeholder Engagement: Engage with relevant stakeholders including local communities living in or around critical habitats to gather their knowledge about biodiversity values in the area.
5. Mitigation Measures: Develop mitigation measures specific to each identified critical habitat that aligns with IFC PS 6 guidance on avoidance of impacts whenever possible; implementation of measures to minimize habitat fragmentation; restoration activities during operations or after project completion; implementation of set-asides for protection; consideration of biodiversity offsets where appropriate based on no net loss principle.
6. Environmental and Social Impact Assessment (ESIA): Conduct an ESIA that considers all potential impacts on critical habitats identified through steps 1-5 above.
7. Monitoring Plan: Develop a comprehensive monitoring plan that includes regular monitoring of key species populations within critical habitats identified in step 2 above**.**

Figure 12: *Boeung Kansaeng located in Ou Tampaong's upper reaches, offers sighted records of Siamese Tiger Parch. The area's upper part in this photo is a settlement along the Svay Daunkav River.*

Figure 13: Overview of Boeung Kansaeng, located upstream of Ou Tapaong Command Area. A canal connects to Stueng Svay Daunkav River (left) and Ou Tapaong (right), a potential fish migration route during floods.

Figure 14: Aerial photograph depicting the Ou Tapaong Stream/canal fragmented by earth dams, roads, and ponds, illustrating its diversion for non-intended purposes.

Figure 15: Aerial photograph of intake flooded forest habitat within Tonle Sap Zone 3 and the continuous land encroachment, converting forest land for rice cultivation.

5.4.2 Habitat of significant importance to endemic or restricted-range species

None of the species under EN and CR classification are restricted-range species (based on IBAT report for Ou Ta Paong).

5.4.3 Habitat supporting globally or nationally significant concentrations of migratory or congregation species

None of the IBA that are recognized for significant concentrations of migratory birds or other species are found within the vicinity of the sub-scheme. No other evidence of significant concentrations of migratory or congregatory species is available. The AoA for OTP, therefore is expected to qualify as critical habitats under this criterion.

5.4.4 Highly threatened or unique ecosystems

Each of the reservoirs are modified habitat and is associated with numerous rice paddies. There is no evidence that these areas are highly threatened or unique ecosystems, and no critical habitats are recognized under this criterion.

5.4.5 Ecological functions or characteristics that are needed to maintain the viability of the biodiversity values described above in (a) to (d)

Boeung Kansaeng Lake still maintains hydrological connectivity for fish migration from Stueng Svay Daunkav River through its canals, where the Siamese Tiger Perch was confirmed. Some small wetland areas at the lower part of the OTP command area support ecological functions and connectivity for confirmed birds, reptiles and fish species for their local movement, nesting, and foraging ground. So, that is necessary to support biodiversity values that require applying biodiversity mitigation measures and protection efforts (described under the above criteria) have been identified. Pumping, drainage, and discharge of chemical inputs into that wetland can have a significant impact on the biodiversity and survival rate of EN and CR species present in that area.

5.5 Potential Impacts & Feasibility of Net Gain Requirements (Step 4)

Step 4 (as described in the above CHA method) requires a high-level assessment of the potential for critical habitat features to be affected by the investment activities of the sub-scheme (both construction and operation). This step is necessary to determine if Net Gain measures need to be demonstrated and whether the necessary measures are feasible.

In the section below, species that are assessed as “Present” or “Possible” in sub-scheme AoI (as shown in the above table) are included in the impact assessment. These include the following 8 species: 1) Four reptiles (Black Marsh Turtle, Giant Asian Pond Turtle, Southeast Asian Box Turtle, Elongated Tortoise), 2) Three birds (Greater Adjutant, Milky Stork, and Bengal Florican), and 3) One fish (Siamese Tiger Perch).

5.5.1 Potential impacts

5.5.1.1 Reptiles (Substantial risk)

All four species of reptiles are found in the upper and lower part of the OTP command area, particularly in areas near natural water courses (rivers and streams). During construction, these reptiles are potentially affected directly due to a) disturbances from noise and vibration due to increased vehicle activity and human presence, b) being hit by vehicles, equipment from increased traffic movement and river dredging/training at Ou Ta Paong river, excavating of the extended canal of Kbal Hong and other relevant canals, c) caught by workers, local people, and hunters. During project operation, these reptiles may be directly affected, including a) being caught by local people and hunters, and b) pesticide residues from intensified crop production.

5.5.1.2 Birds (Moderate risk)

Greater Adjutant, Milky Stork, and Bengal Florican are found seasonally in the command area, mainly in the lower/downstream part which is subject to annual flooding. These birds are migratory and as such are rare. Local people don't catch these birds for food. However, since these birds feed on aquatic species available from the command area, they may be affected by the feeds that are contaminated with pesticide residues.

5.5.2 Net gain assessment

Additionally, during construction activities, these birds may be indirectly affected through disturbance and habitat loss caused by increased human activity and changes in water levels. It is important to note that the Ou Tapaong Command Area serves as a critical habitat for these endangered bird species, making it crucial to minimize any potential negative impacts.

Based on the potential impacts identified above, it is evident that measures need to be implemented to achieve a net gain in biodiversity within the Ou Tapaong Command Area. These measures should focus on minimizing direct disturbances and habitat loss during construction activities, as well as implementing sustainable agricultural practices to prevent pesticide contamination of food sources for these bird species.

In conclusion, based on the assessment results, it is recommended that comprehensive actions be taken to protect critical habitats for species such as reptiles (Black Marsh Turtle, Giant Asian Pond Turtle, Southeast Asian Box Turtle Elongated Tortoise), birds (Greater Adjutant, Milky Stork, Bengal Florican), ensuring their survival alongside irrigation system renovation projects.

Table 6: Initial Screening of CH-qualifying Species Confirmed or Likely to Occur in the Ou Ta Paong sub-scheme of the Project Area

English Name	Scientific Name	IUCN Status	Global population	Cambodia population	Migratory/ Congregatory	Habitat and Distribution	Likelihood of Occurrence	Rationale for Critical Habitat Screening	Screened In or Out
Reptile									
Black Marsh Turtle	*Siebenrockiella crassicollis*	EN	Unknown (suspected to have decreased by about 80% in SEA)	Unknown-kept declining	N/A	Thrive in the Tonle Sap Floodplain's slow-moving waters and abundant vegetation, shrubland, wetland, and ponds; 5-20 masl.	Moderate - Confirmed in AoI in 2024	While much suitable habitat is present downstream of the project and along the Ou Ta Paong River and is therefore likely to occur in the project AoI. Likely to qualify as CH under Criterion 1& 4 threshold.	**IN**
Giant Asian Pond Turtle	*Heosemys grandis*	CR	Unknown (suspected to have decreased by about 80%)	Unknown-kept declining	N/A	Thrive in the Tonle Sap Floodplain's slow-moving waters and abundant vegetation, shrubland, wetland, and ponds	Moderate - Confirmed in AoI in 2024	While much suitable habitat is present downstream of the project and along the Ou Ta Paong River and is therefore likely to occur in the project AoI. Likely to qualify as CH under Criterion 1& 4 threshold.	**IN**
Southeast Asian Box Turtle	*Cuora amboinensis*	EN	Unknown-kept declining	Unknown-kept declining	N/A	Thrive in the Tonle Sap Floodplain's slow-moving waters and abundant vegetation, shrubland, wetland, and ponds; 5-20 masl.	Moderate - Confirmed in AoI in 2024	While much suitable habitat is present downstream of the project and along the Ou Ta Paong River and is therefore likely to occur in the project AoI. Likely to qualify as CH under Criterion 1& 4 threshold.	**IN**
Elongated Tortoise	*Indotestudo elongata*	CR	Unknown-kept declining	Unknown-kept declining	N/A	Thrive in the Tonle Sap Floodplain's slow-moving waters and abundant vegetation, shrubland, wetland, and ponds; 5-20 masl.	Moderate - Confirmed in AoI in 2024	Reported at the upper part of Ou Ta Paong with possibly moving between upstream and downstream during wet season via Ou Ta Paong and Svay Daunkev rivers. While much suitable habitat, itis therefore likely to occur in the project AoI. Likely to qualify as CH under Criterion 1& 4 threshold.	**IN**
Fishes									
Striped catfish	*Pangasianodon hypophthalmus*	EN	Unknown	Unknown	Yes	This freshwater fish is native to the Mekong River Basin in Southeast Asia, including countries like Thailand, Laos, Cambodia, and Vietnam	Low	List as EN in the IUCN red list, this species migrates upstream and Tonle Sap Floodplain area during flooding season. Due to the climate change, and dam construction, there's not enough flood plus with the last several years. Likely to qualify as CH under Criterion 1& 3 threshold.	**IN**
Siamese Tiger Perch	*Datnioides pulcher*	CR	Unknown	Unknown	Yes	This freshwater fish species is native to the Mekong and Chao Phraya River basins in Southeast Asia, including	Moderate - Confirmed in AoI in 2024	List as EN in the IUCN red list, this species migrates upstream and Tonle Sap Floodplain area during flooding season. This species navigates	**IN**

						Thailand, Cambodia, Laos, and Vietnam.		through rivers and canals to upstream to reach some lake and wetland areas. It's confirmed to present in the project AoI. Likely to qualify as CH under Criterion 1& 3 threshold.	
Mammal									
Hairy-nosed Otter	*Lutra sumatrana*	EN	Unknown-kept declining	Unknown-kept declining	No	Endangered and elusive, inhabit the Tonle Sap Floodplain's diverse wetlands, including flooded forests and marshes. Their survival is threatened by habitat loss, hunting, and bycatch.	Very Low	Despite there's some habitat but the species was confirmed present around 15 to 12 km way downstream. Therefore, It's likely absent in the project AoI.	**Out**
Indochinese Silvered Langur	*Trachypithecus germaini*	EN	Unknown-kept declining	> 3,000 individuals[6]	*No*	Inhabit the diverse forests of the Tonle Sap Floodplain, including flooded areas. Habitat loss and hunting threaten their populations.	Confirmed in AoI in 2024	While much suitable habitat is present downstream of the project and along the Ou Ta Paong River and is therefore likely to occur in the project AoI. Likely to qualify as CH under Criterion 1& 6 threshold.	**IN**
Long-tailed Macaque	*Macaca fascicularis*	EN	Unknown-kept declining	Unknown-kept declining	No	Inhabit the diverse forests of the Tonle Sap Floodplain, including flooded areas. Habitat loss and hunting threaten their populations.	Moderate - Confirmed in AoI in 2024	While much suitable habitat is present downstream of the project and along the Ou Ta Paong River and is therefore likely to occur in the project AoI. Likely to qualify as CH under Criterion 1& 6 threshold.	**IN**
Birds									
Greater Adjutant	*Leptoptilos dubius*	EN	1,000–1,200 individuals[7]	100–150 individuals	N/A	Has a very restricted range in Cambodia. Its primary stronghold is the Tonle Sap Biosphere Reserve, where it favors flooded forests and wetlands.	Moderate - Confirmed in AoI in 2024	IUCN listed as EN and although restricted range across the Tonle Sap Floodplain. It is likely to occur in Project AoI at some suitable habitats. Likely to qualify as CH under Criterion 1& 6 threshold.	**IN**
Milky Stork	*Mycteria cinerea*	EN	> 1,500 mature individuals	≥ 100 and 150 individuals	Yes	Primarily inhabit and breed around the Tonle Sap Lake, particularly its flooded forests and surrounding wetlands, shrubland, grassland making it their most crucial habitat in the country; 5-10 masl.	Low - Confirmed in AoI in 2024	The project area's lakes, rivers, and wetlands within the lower command area provide suitable habitat, although the Milky Stork population is small and local awareness of the species is limited. Likely to qualify as CH under Criterion 1& 3 threshold.	**IN**
Yellow-breasted Bunting	*Emberiza aureola*	CR	< 10,000 individuals *(80-90% decline*	Unknown	Yes	This CR species is a rare winter visitor and passage migrant in Cambodia. It prefers open	Moderate - but didn't confirm in	While much suitable habitat is present downstream of the project and along the Ou Ta Paong and the species is	**IN**

[6] https://www.phnompenhpost.com/national/silvered-langur-endangered-plentiful-kingdom

			since 1980s)[8]			habitats such as wetlands, grasslands, and agricultural areas like rice paddies, which provide food and shelter. It has been observed in key areas including the Tonle Sap Floodplain, Mekong River Basin, Northern Plains, and coastal regions. However, its presence is declining due to habitat loss, hunting, and degradation.	AoI in 2024 due to seasonal preference	therefore likely to occur in the project AoI. Likely to qualify as CH under Criterion 1& 3 threshold.	
Bengal Florican	*Houbaropsis bengalensi*	CR	250-1,000 individuals	150–700 individual	N/A	Primarily found in the floodplain grasslands of the Tonle Sap Floodplain, particularly in the Siem Reap, Kampong Thom, and Pursat provinces. This area provides the critical grassland habitat that the species depends on for breeding and foraging	Moderate - Confirmed in AoI in 2024	IUCN listed as CR and although restricted range with the Tonle Sap Grassland. WCS and MoE established a new protected area to conserve this species of where it's boundary is just 1km from the command area. It is likely to occur in Project AoI at some suitable habitats. Likely to qualify as CH under Criterion 1& 6 threshold.	**IN**
Masked Finfoot	*Heliopais personatus*	CR	600 - 1,700 individuals	< 100 individuals	No	Inhabits forested wetlands, slow-moving rivers, and flooded forests, especially around Tonle Sap Lake, Stung Treng Ramsar Site, and the Mekong River with dense vegetation for nesting and foraging.	Not confirmed	IUCN listed as CR and although it is a restricted-range species it is found mainly in the dense vegetation and flooded forest close the open lake and therefore it has been screened out	**Out**
White-winged Duck	*Asarcornis scutulata*	EN	250-100 individuals	< 50 individuals	No	Survives in fragmented populations within protected lowland evergreen and semi-evergreen forests, favoring forested wetlands and slow-moving rivers. With fewer than 50 mature individuals remaining, habitat loss, hunting, and human disturbance pose severe threats, making habitat protection crucial for the species' survival.	Not confirmed	IUCN listed as EN and although it is a restricted range withing dry forest and semi-evergreen habitats. There's no suitable habitat within AoI and therefore it has been screened out	**Out**
Fauna									
Cardamon Shrub Frog	*Philautus cardamonus*	EN	Unknown (very small and	Unknown (very small and	No (endemic)	This small and critically endangered frog species is	Not confirmed	IUCN listed as EN and as the Endemic to the Cardamom Mountains between	**Out**

8 **IUCN Red List**: BirdLife International. (2020). *Emberiza aureola*. The IUCN Red List of Threatened Species 2020: e.T22720966A180040113

			declining)	declining)		endemic to the Cardamom Mountains in southwestern Cambodia. Due to its restricted range and the ongoing threats of habitat loss and degradation, its population size is believed to be very small and declining		1,000 and 1,700 meters above sea level. There's no suitable habitat within AoI and therefore it has been screened out	
River-weed	*Terniopsis chanthaburiensis*	EN	Unknown	Unknown	No	Rare and poorly studied aquatic plant species endemic to Thailand, specifically found in the Chanthaburi Province.	Not confirmed	IUCN listed as EN and as the Endemic to the Thailand and therefore it has been screened out	**Out**

Table 7: Results of the prioritisation exercise to support BAP planning: priority biodiversity for BAP actions for Ou Tapong

Action Category (AC)	Group	Priority Biodiversity	Mitigation and monitoring approach
AC 1 High Priority for habitat mitigation and/or species-specific measures	Mammal	Indochinese Silvered Langur and Long-tailed Macaque	The highest priority for achieving net gain (offset targets) lies in the implementation of both species-specific and habitat-focused mitigation and offset actions.
	Reptiles	Black Marsh Turtle, Elongated Tortoise	
	Birds	Bengal Florican	
	Natural Habitats	Riverine habitat along the main canal where turtles present	
	Protected Areas and Internationally Recognized Areas	Tonle Sap Zone 3, Bakan Protected Landscape	
AC 2 Contingency planning	Birds	Greater Adjutant, Milky Stork, Yellow-breasted Bunting	While the likelihood of significant impacts is considered low, the potential consequences are substantial. Proactive mitigation measures should be implemented across the board as a matter of best practice. If impacts are observed, the situation should be escalated to the highest level of concern (Category 1) and species-specific mitigation strategies should be developed and implemented
	Reptiles	Black Marsh Turtle, Giant Asian Pond Turtle, Southeast Asian Box Turtle	
	Natural Habitat	Somraong Muk-yiek Community Fisheries and Sdok Khloak Community Fisheries	
	Freshwater fish	Siamese Tiger-perch	
	Mammal	Indochinese Silvered Langur and Long-tailed Macaque	

AC 3 General habitat mitigation measures	Freshwater fishes	Siamese Tiger Perch	To minimize anticipated impacts, implement best practices for habitat mitigation. Monitor habitat (or species-specific factors if necessary) to assess the actual impact scale. If monitoring indicates a high likelihood of significant impacts, reclassify the project to Category 1.
	Reptiles		
	Mammals	Hairy-nosed Otter,	
AC 4 Remain aware	Aquatic plant	River-weed *Terniopsis chanthaburiensis*	Potential impacts are anticipated to be minimal. Proactive mitigation measures should be implemented across the project area. Habitat monitoring can serve as an effective indicator to assess the project's actual impact scale.
	Birds	Masked Finfoot, White-winged Duck	

5.6 Biodiversity Action Plan (OTP), (if relevant, to achieve net gain)

A comprehensive Biodiversity Action Plan (BAP) should be developed to achieve net gain in biodiversity with a clear outline below:

Biodiversity Action Plan for Ou Tapaong Irrigation Sub-scheme

Executive Summary

This conservation action plan outlines strategies to mitigate potential negative impacts on biodiversity within the Ou Tapaong irrigation scheme. The plan is based on a critical habitat assessment that identified significant biodiversity values in the area, particularly for endangered and critically endangered species. The proposed actions align with the International Finance Corporation's Performance Standard 6 (PS6) on biodiversity conservation and sustainable management of living natural resources.

Key Objectives

Protect critical habitats: Identify and conserve areas crucial for biodiversity, such as flooded forests, wetlands, and rivers.

- Minimize negative impacts: Implement measures to reduce the adverse effects of irrigation scheme development on wildlife and their habitats.
- Enhance biodiversity: Promote habitat restoration and conservation activities to support species recovery.
- Engage with stakeholders: Foster collaboration with local communities and relevant government agencies to ensure effective conservation efforts.

Habitat Mapping

- Map out the different habitats present within the Ou Tapaong Command area. This should include flooded forests, lakes, rivers, waterholes, grasslands, fellows rice fields used by bird species for foraging.

Threat Assessment

- Assess potential threats to critical habitats identified in step 2. Consider factors such as habitat loss due to infrastructure development or land-use changes related to irrigation system renovation.

Mitigation Measures

- Develop mitigation measures specific to each identified critical habitat that align with IFC PS 6 guidance on avoidance of impacts whenever possible; implementation of measures to minimize habitat fragmentation; restoration activities during operations or after project completion; implementation of set-asides for protection; consideration of biodiversity offsets where appropriate based on no net loss principle.
- Carefully design project activities to avoid direct impacts on critical habitats.
- Identify alternative project locations or routes that avoid sensitive areas.
- Modify project designs to minimize the footprint and disturbance of critical habitats.
- Implement temporary measures to protect critical habitats during construction.

Minimization:

- Implement responsible construction practices to minimize adverse effects on critical habitats, such as avoiding unnecessary clearing of vegetation and minimizing soil disturbance.
- Establish effective waste management systems to prevent pollution.
- Implement erosion control measures to prevent sedimentation in aquatic habitats.
- Develop pollution prevention strategies to reduce water and air pollution.
- Habitat Protection and Restoration:

- Establish measures to protect and restore flooded forests, wetlands, and other natural habitats within and around the command area.
- Promote sustainable land use practices like agroforestry, conservation agriculture, and sustainable forest management.

Species Conservation:

- Develop species-specific conservation plans for endangered and threatened species identified in the area.
- Monitor populations of these species regularly and assess their habitat needs
- Consider implementing captive breeding programs or reintroduction efforts if necessary
- Implement habitat management measures that improve the quality and suitability of their habitats

Carbon Sequestration:

- Carbon Sequestration is the process of capturing and storing atmospheric carbon dioxide (CO2). It's a crucial strategy in mitigating climate change by reducing the amount of greenhouse gas in the atmosphere.
- Forest and wetland restoration: Re-establishing or enhancing forest and wetland areas can significantly increase carbon sequestration. These ecosystems act as carbon sinks, absorbing carbon dioxide from the atmosphere.
- Soil carbon enhancement: Implementing agricultural practices that improve soil organic matter content can increase carbon storage in the soil.
- Blue carbon: Protecting and restoring wetland and flooded forest ecosystem, can contribute to carbon sequestration.

Community Engagement:

- Involve local communities in biodiversity conservation efforts through participatory planning, monitoring, and implementation
- Educate communities about the importance of biodiversity i nthe sub-scheme area
- Foster community awareness about endangered species present within their vicinity
- Promote sustainable livelihoods that support conservation, such as community-based ecotourism, sustainable rice cultivation (eg. Sustainable Rice Flatform, and Organic Rice, and fisheries management

Research and Monitoring:

- Conduct further research assessing biodiversity and ecological processes within Ou Tapaong Irrigation Sub-Scheme
- Establish long-term monitoring programs to track changes in biodiversity and habitat conditions which will provide valuable data for evaluating the effectiveness of ongoing conservation efforts

Sustainable Water Management:

- Ensure irrigation systems and water use practices do not harm critcal haibitats. Optimise irrigation efficiency, reducing water pollution and protecting water sources.

Biodiversity Offsets:

- If significant residual impacts are expected despite avoidance and minimisation measures, biodiversity.

6. Lum Hach

6.1 Proposed project activities and potential risks and impacts

Green Peafowl have been observed year-round in all three community forests; both their offspring and adults were sighted by community patrol teams there. However, they face heightened vulnerability due to habitat degradation, fragmentation issues, land encroachment concerns, and hunting pressures from human activities. By carefully considering the ecological implications of the project, it is possible to balance the needs of agriculture with the conservation of endangered species and their habitats. Under Lum Hach, various activities will be carried out that cause the following E&S risks and impacts:

Table 8: Projection activities that may cause potential impacts on the environment and social at the Lum Hach sub-scheme

No.	Project activities that cause impacts	E&S Risks & Impacts
1	Construction activities (rehabilication of canal and farm roads), land use changes, and water management practices	**Habitat loss and fragmentation** could lead to habitat loss and fragmentation, affecting species' survival and connectivity. This activity may involve dredging, excavation, or modification of existing water channels and infrastructure. These activities can lead to habitat destruction, disturbance to nesting and foraging sites, disruption of natural water flow patterns, and alteration of hydrological regimes. This can directly impact both terrestrial and aquatic biodiversity.
2	Increased agricultural activities, sedimentation, and pollution	**Water quality degradation** could impact aquatic ecosystems and species that rely on clean water.
4	**Increased human activities**	**Labor influx (during project construction) and Increased** human activities (during project operations pose additional threats to biodiversity. Increased human activity within the command area which could potentially disrupt wildlife behavior (nesting/foraging), increase poaching or predation risks if not properly managed.
5	Dredging of waterways and Alteration of water levels	Changes in water levels within the command area due to irrigation system renovation may negatively impact wildlife dependent on specific habitats for breeding or foraging purposes. For example, changes in seasonal wetlands or lakes' floodplains can disrupt breeding patterns for avian. Changes in water levels and habitat quality could force endangered species to relocate, potentially leading to competition with other species or exposure to new threats.
6	Use of chemical inputs and nutrient loading	**If pesticides/fertilizers are used during agricultural practices within the command area as part of irrigation system renovation projects, it could lead to contamination of soil and water resources affecting both terrestrial and aquatic biodiversity.**

7	Species displacement and disruption of foraging and breeding habits	Changes in water levels and habitat quality could force endangered species to relocate, potentially leading to competition with other species or exposure to new threats. Additionally, alterations to the irrigation system could disrupt the foraging and breeding habits of endangered birds and other wildlife.
8	**Land Use Changes**	The changes in land use that may occur as a result of the project, such as agricultural expansion or deforestation and habitat fragmentation.
9	**Biodiversity degradation, edge eddects, and soil erosion**	The potential impacts of the project on water flow, water quality, and sedimentation patterns. The changes in microclimate and increased disturbance at forest edges can negatively impact forest ecosystems and wildlife species.

6.2 Areas of Influence

The Lum Hach Irrigation Sub-scheme has a limited area of influence due to its small size and the surrounding farmland. The critical habitats identified within the area include Toul Samraong, Phnom Banon, and Chan Trak Community Forests. These areas are characterized by small, fragmented, and degraded dry deciduous forests (DDFs). However, these forests are crucial for the conservation of Green Peafowl, which have been confirmed to be present in these areas. The protection and restoration of these community forests should be a priority in the biodiversity action plan.

6.3 Analysis to prepare for determining CH status

6.3.1 Critical Habitat Area of Analysis

Critical habitat is defined as an Area of Analysis (AoA), and the project's command area is used as an AoA.

6.3.2 Species with Potential Occurrence within the AoA

A list of threatened species with potential occurrence was generated for the LH Command Area. The coordinates of this command area (via KMZ file) are used to inform the IBAT radius of screening. Since the default radius of IBAT screening is 50km, steps were taken to narrow down to the sub-scheme's area of influence to identify only EN and CR species that are potentially present in the sub-scheme area of influence. The narrowing-down aims to practically identify EN and CR species that could be found in the sub-scheme area of influence and to determine the Critical Habitat status of the identified species. After three rounds of screening focusing on EN and CR, only one endangered bird species of Green Peafowl was confirmed see table 5 below.

Description of screening for narrowing down

For Lum Hach, three rounds of screening have been conducted. The first screening (Round 1) was conducted in December 2023. Round 2 was carried out in April 2024, and Round 3 in August 2024. The purpose of repeated screening is to validate the screening results (for the same area) with a wide range of local stakeholders. The screening aims to identify only EN and CR species that are potentially present in the Lum Hach area of influence, covering reptiles, mammals, fish, birds, and mushrooms. Screening was done based on the IBAT report generated and provided by the AIIB.

In the first two rounds of screening, 5 EN and CR species were identified in this area of influence (see Table below). In the 3rd round of screening (in August 2024), however, one of five species was confirmed as “potentially present” in the LH’s area of influence. So, the assessment for Lum Hach focuses on the confirmed list of **1 species** that are categorized by IUCN as Endangered species.

Table 9: Confirmed List of endangered and critically endangered species for the Lum Hach sub-scheme

No.	Local Name	English Name	Scientific Name	IUCN Cat	Screened Species from Round 1&2 (Total=5)	Confirmed Species in Round 3 (Total = 1)
I. Mammal species						
1	ឆ្កែព្រៃ	Dhole	Cuon alpinus	EN	Yes	No
2	ជ្រុំងធំ	Large Flying-fox	Pteropus vampyrus	EN	Yes	No
II. Fish species						
3	ត្រីកន្ត្រៀប់ខ្លា	Siamese Tiger Perch	*Datnioides pulcher*	CR	Yes	No
III. Bird species						
4	ក្អែក	Green Peafowl	Pavo muticus	EN	Yes	Yes
IV. Mashroom						
5	ផ្សិតកែវ	Puffball mushrooms	Calostoma insigne	EN	Yes	No

6.3.3 Ecological State of Habitats within the AoA

Understanding of the ecological state of habitats is necessary to assess the likelihood of occurrence (LoO) of Green Peafowl - as part of the CHA. For this CHA, species was classified into four LoO categories: Present, Possible, Unlikely and Not Present. Species known to be Present or with a Possible LoO are further assessed in Step 3. This understanding takes into account the classification of habitats as either modified or natural based on levels of human-induced disturbance to species composition and ecological functions. In this session, a brief assessment of the one confirmed species is presented. The assessment discusses historical range, distribution, habitat conditions, current status, and potential threats identified by key informants.

The remaining forest patches within the Lum Hach Irrigation Sub-scheme are characterized by small size, fragmentation, and degradation. They are classified as very open and degraded Dry deciduous forests (DDFs), which are not suitable for many species, including Long-tailed Macaques, Large Flying-fox, and Puffball mushrooms. The limited availability of suitable habitats is a significant factor contributing to the scarcity of biodiversity in the area.

The biodiversity assessment at Lum Hach Irrigation Sub-scheme initially identified several potential endangered (EN) or critically endangered (CR) species using the Integrated Biodiversity Assessment (IBAT) and key informant interviews. However, further investigation revealed that only Green Peafowl was confirmed to be present within the Toul Samraong, Phnom Banon, and Chan Trak Community Forests (see map in Figure 14 below).

Species Distribution:

- **Green Peafowl:** Found in all three community forests, indicating their adaptability to the local environment and the importance of these habitats for their conservation.

- **Dhole:** Despite initial screenings, no confirmed sightings were made within the study area. This may be attributed to factors such as habitat fragmentation, human disturbance, or low population densities.
- **Flying-fox:** The survey result is similar to the dhole, no flying-fox was confirmed within the study area. This could be due to habitat loss, hunting pressure, or other factors affecting their survival.
- **Siamese Tiger Perch:** This species was not found within the study area, likely due to its preference for larger water bodies like the Tonle Sap Great Lake. Three KII reportd that they countered this specie when they went for fishing at Tonle Sap every year but they had never seen this species within this area (Lum Hach).
- **Puffball mushrooms:** Although not confirmed within the study area, there is potential for their presence in higher elevations of the Cardamom Mountains.

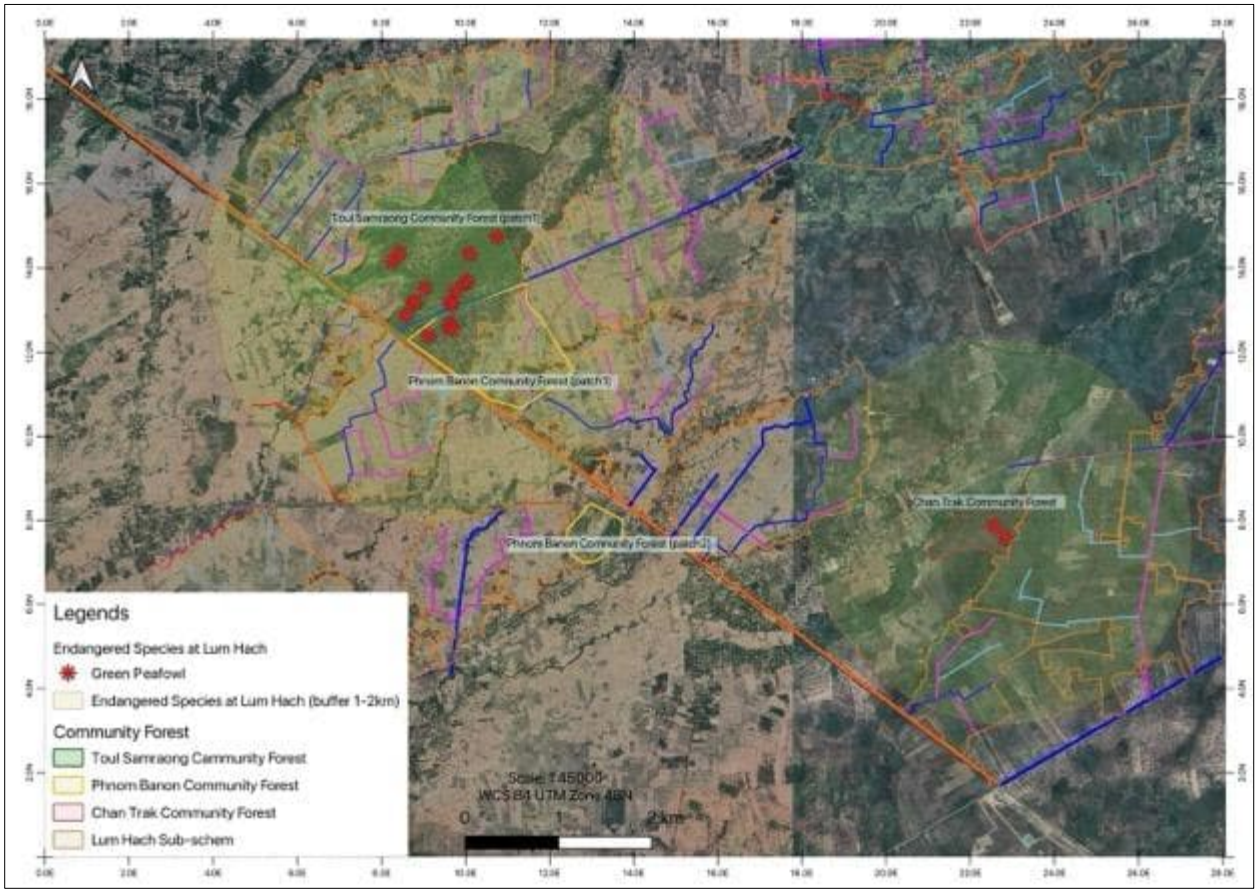

Figure 16: Green Peafowl distribution in Toul Samraong, Phnom Banon, and Chan Trak Community Forests, as confirmed by local sources from 2020 to 204.

6.4 Determination of Critical Habitat Status (Step 3)

A habitat assessment was conducted in key areas known for endangered species within the region. Interviews with local authorities, community committees, and key informants confirmed the presence of Green Peafowl in three community forest areas.

Two of these forests, Toul Samraong and Phnom Banon (a large patch), share a boundary and are primarily composed of dry, open dipterocarp forests with some closed dipterocarp areas along the natural canal. These three community forests are small, fragmented, and surrounded by farmland, with some remaining degraded forest land nearby. Despite their poor ecological connectivity, they are crucial for supporting the small remaining Green Peafowl population.

During a meeting, it was discovered that two community forest boundaries had been revised, and one had changed its name from Trapeang Mlu to Phnom Banon. All forest representatives confirmed that their areas were undergoing registration with the Ministry of Land Management, Urban Planning, and Construction (PLMUPC). However, some key informants expressed

concerns about ongoing land encroachment into their community areas. Despite previous complaints, the offenders continue to use and sell the land without any repercussions.

Figure 17: The upperpart of Hum Hack next to Boribou river catchment area

Figure 18: Overview from the above of the general condition of Toul Samroang and Phnom Banon Community Forests

Figure 19: Overview from the above of the general condition of Chan Trak Community Forest

Figure 20: An expert consulted with the Toul Samraong CF management committee to verify the identification of a canine species, ensuring it was correctly identified as either a dhole or a jackal.

6.4.1 Habitat of significant importance to CE and EN species

As presented in Section 4.2.3.3 (Ecological State), species that qualify as critical habitat features for Green Peafowl is listed as Endangered Species in the IUCN RedList. The natural dry forest habitats within the community forests of the Lum Hach Irrigation Sub-Scheme are critical for the survival of the Green Peafowl population. These forests provide essential resources for Green Peafowl, including food, shelter, and breeding sites. However, the quality and extent of these habitats can vary significantly, affecting their suitability for the species (Figures 16 and 17).

6.4.2 Habitat of significant importance to endemic or restricted-range species

None of the species under EN and CR classification are restricted-range species (based on IBAT report for Ou Ta Paoing).

6.4.3 Habitat supporting globally or nationally significant concentrations of migratory or congregatory species

None of the IBA that are recognized for significant concentrations of migratory birds or other species are found within the vicinity of the sub-scheme. No other evidence of significant concentrations of migratory or congregatory species is available. The AoA for LH, therefore is expected to qualify as critical habitats under this criterion.

6.4.4 Highly threatened or unique ecosystems

Each of the reservoirs are modified habitat and is associated with numerous rice paddies of there the three community forest areas are trimmed out from the command area. There is no evidence that these areas are highly threatened or unique ecosystems, and no critical habitats are recognized under this criterion. However, the concern of illegal agriculture expansion into the community forest areas was questioned by some key informants (management committee and patrol members of community forests).

6.4.5 Ecological functions or characteristics that are needed to maintain the viability of the biodiversity values described above in (a) to (d)

No ecological functions that are necessary to support biodiversity values (described under the above criteria) have been identified.

6.5 Potential Impacts & Feasibility of Net Gain Requirements (Step 4)

Step 4 (as described in the above CHA method) requires a high-level assessment of the potential for critical habitat features to be affected by the investment activities of the sub-scheme (both construction and operation). This step is necessary to determine if Net Gain measures need to be demonstrated and whether the necessary measures are feasible. In the section below, species that are assessed as “Present” or “Possible” in sub-scheme AoI (as shown in the above table) are included in the impact assessment on one bird (Green Peafowl).

6.5.1 Potential impacts on Green Peaflow (Substantial risk)

The Green Peafowl is found in three community forest areas located within the vicinity of Lum Hach command area. During construction, these species is potentially affected directly due to a) disturbances from noise and vibration due to increased vehicle activity and human presence, b) caught by workers, local people, and hunters.

6.5.2 Net gain assessment

Based on the assessment conducted for the Lum Hach Irrigation Sub-scheme, it has been determined that there is a net loss of biodiversity and ecological value within its area of influence. The critical habitat analysis identified only one endangered species, the Green Peafowl, with a confirmed presence in the sub-scheme's area of influence. The ecological state of habitats within this area is classified as very open and highly susceptible to human disturbances, posing potential threats to the Green Peafowl population.

It is evident that despite efforts to balance agricultural needs with conservation, there are significant risks and impacts on biodiversity within this project. Therefore, measures must be taken to mitigate these risks and minimize further loss of ecological value in order to achieve a net gain for biodiversity in the long term. This may include prioritizing protection and restoration efforts for critical habitats such as Toul Samraong, Phnom Banon, and Chan Trak Community Forests within the sub-scheme's area of influence.

Table 10: Initial Screening of CH-qualifying Species Confirmed or Likely to Occur in the Lum Hach sub-scheme of the Project Area

English Name	Scientific Name	IUCN Status	Global population	Cambodia population	Migratory/ Congregatory	Habitat and Distribution	Likelihood of Occurrence	Rationale for Critical Habitat Screening	Screened In or Out
Mammal									
Dhole	Cuon alpinus	EN	< 2,500	< 200	No	Inhabits dry and semi-evergreen forests, and grasslands near water, primarily in the Eastern Plains Landscape and Cardamom Mountains, with rare sightings in the north. With fewer than 200 individuals.	Not confirmed	Listed as EN species with very restricted range. There's no suitable habitat and it's likely absent in the project AoI.	**Out**
Large Flying-fox	Pteropus vampyrus	EN	Unknown	Unknown	*No*	The Largest fox species in the world inhabits a variety of forested and coastal habitats, including primary and secondary forests, mangroves, swamps, and orchards widely distributed across Southeast Asia.	Not confirmed	Listed as EN species with very restricted range. There's no suitable habitat and it's likely absent in the project AoI.	**Out**
Birds									
Green Peafowl	Pavo muticus	EN	Btw 15,000–30,000	Btw 2,00 - 3,000[9]	N/A	Green Peafowl live in lowland forests, open woodlands, and grasslands, especially near water. They are now mostly found in protected areas of the Northern and Eastern Plains, and Cardamom. Habitat loss and hunting severely threaten their fragmented populations.	Moderate - Confirmed in AoI in 2024	IUCN listed as EN and live in the fragmented dry forest habitat in Toul Samraong and Phnom Banon, and Chan Trak Community Forests. it's present in the project AoI. Likely to qualify the Lum Harch as CH under Criterion 1& 4 threshold.	**IN**
Fish									
Siamese Tiger Perch	*Datnioides pulcher*	CR	Unknown	Unknown	Yes	This freshwater fish species is native to the Mekong and Chao Phraya River basins in Southeast Asia, including Thailand, Cambodia, Laos, and Vietnam.	Very Low – Not Confirmed in AoI in 2024	List as EN in the IUCN red list, this species migrates upstream and Tonle Sap Floodplain area during flooding season. It's likely absence in the project AoI	**Out**
Fauna									
Puffball mushrooms	Calostoma insigne	EN	Unknown	Unknown	No	It occurs in deciduous or mixed forests, particularly in moist, well-drained soils with acidic conditions. Its distribution may align with undisturbed forest regions, such as the Cardamom Mountains or Eastern Plains, where similar fungi are documented.	Not confirmed	Listed as EN species with very restricted range and health ecosystem. There's no suitable habitat and it's likely absent in the project AoI.	**Out**

9 Bird Conservation International , Volume 27 , Issue 1: DOI: https://doi.org/10.1017/S0959270916000083

Table 11: Results of the prioritisation exercise to support BAP planning: priority biodiversity for BAP actions for Lum Hach

Action Category (AC)	Group	Priority Biodiversity	Mitigation and monitoring approach
AC 1 High Priority for habitat mitigation and/or species-specific measures	Birds	Green Peafowl	The highest priority for achieving net gain (offset targets) lies in the implementation of both species-specific and habitat-focused mitigation and offset actions.
	Protected Areas and Internationally Recognized Areas	Chan Trak Community Forest, Toul Samraong Community Forest, and Phnom Banon Community Forest	
AC 2 Contingency planning	Mammal	Dhole	While the likelihood of significant impacts is considered low, the potential consequences are substantial. Proactive mitigation measures should be implemented across the board as a matter of best practice. If impacts are observed, the situation should be escalated to the highest level of concern (Category 1) and species-specific mitigation strategies should be developed and implemented
	Freshwater fish	Siamese Tiger-perch	
AC 3 General habitat mitigation measures	N/A	N/A	
AC 4 Remain aware	Mammal	Large Flying-fox	Potential impacts are anticipated to be minimal. Proactive mitigation measures should be implemented across the project area. Habitat monitoring can serve as an effective indicator to assess the project's actual impact scale.
	Mushroom	Puffball mushrooms *Calostoma insigne*	

6.6 Biodiversity Action Plan for Lum Hach

Below is an outline of a biodiversity action plan for this sub-scheme.

Biodiversity Action Plan for Lum Hach Command Area

1. Habitat Restoration and Conservation

- **Reforestation:** Plant native tree species to restore degraded forest areas, focusing on areas with high ecological value and potential for species recovery.
- **Habitat Connectivity:** Create corridors or buffer zones between fragmented forest patches to facilitate species movement and gene flow.
- **Land Use Planning:** Develop and implement sustainable land use plans that prioritize biodiversity conservation and minimize negative impacts on habitats.

2. Species Conservation

- **Green Peafowl:**
  - Develop a specific conservation plan for Green Peafowl, including habitat management, population monitoring, and community-based conservation initiatives.
  - Implement measures to reduce human-wildlife conflict, such as habitat modification and education programs.
  - Consider establishing a captive breeding program as a last resort.
- **Other Species:**
  - Conduct surveys to determine the presence of other potential endangered or critically endangered species.
  - Develop species-specific conservation plans based on survey results.

3. Community Engagement

- **Capacity Building:** Provide training and education to local communities on biodiversity conservation and sustainable practices.
- **Community-Based Conservation:** Support community-led initiatives, such as community forestry and wildlife monitoring.
- **Sustainable Livelihoods:** Promote sustainable livelihoods that support biodiversity conservation, such as ecotourism, sustainable agriculture, or community-based enterprises.

4. Research and Monitoring

- **Biodiversity Surveys:** Conduct regular biodiversity surveys to monitor species distribution, abundance, and population trends.
- **Ecological Monitoring:** Establish long-term monitoring programs to track changes in ecosystems and species populations.

7. Brambei Mom

7.1 Proposed project activities and potential risks and impacts

By carefully considering the ecological implications of the project, it is possible to balance the needs of agriculture with the environment and ecosystem functions. Under Brambei Mom, various activities will be carried out that cause the following E&S risks and impacts:

Table 12: Projection activities that may cause potential impacts on the environment and social aspects at Brambei Mom sub-scheme

No.	Project activities that cause impacts	E&S Risks & Impacts
1	Construction activities (rehabilication of canal and farm roads), land use changes, and water management practices	**Habitat loss and fragmentation** could lead to habitat loss and fragmentation, affecting species' survival and connectivity. This activity may involve dredging, excavation, or modification of existing water channels and infrastructure. These activities can lead to habitat destruction, disturbance to nesting and foraging sites, disruption of natural water flow patterns, and alteration of hydrological regimes. This can directly impact both terrestrial and aquatic biodiversity.
2	Increased agricultural activities, sedimentation, and pollution	Water quality degradation could impact aquatic ecosystems and species that rely on clean water.
3	Dredging of waterways and Alteration of water levels	Changes in water levels within the command area due to irrigation system renovation may negatively impact wildlife dependent on specific habitats for breeding or foraging purposes. Changes in water levels and habitat quality could force endangered species to relocate, potentially leading to competition with other species or exposure to new threats.
4	Use of chemicals and nutrient loading	If pesticides/fertilizers are used during agricultural practices within the command area as part of irrigation system renovation projects, it could lead to contamination of soil and water resources affecting both terrestrial and aquatic biodiversity.
5	Biodiversity degradation, edge effects, and soil erosion	The potential impacts of the project on water flow, water quality, and sedimentation patterns. The changes in microclimate and increased disturbance at forest edges can negatively impact forest ecosystems and wildlife species.
6	Blockage of migration routes by dams or other structures	Dams or other structures can block migratory pathways used by fishes during specific seasons or life stages, preventing them from

		accessing their preferred habitats or breeding grounds.

7.2 Areas of Influence

The Brambei Mom Irrigation Innovation sub-scheme has an extensive area of influence that includes adjacent communities and ecosystems dependent on its water resources. The areas directly affected by the project's activities include agricultural lands within a certain radius from irrigation canals or reservoirs.

7.3 Analysis to prepare for determining CH status

7.3.1 Critical Habitat Area of Analysis

Critical habitat is defined as an Area of Analysis (AoA), and the project's command area is used as an AoA.

7.3.2 Species with Potential Occurrence within the AoA

A list of threatened species with potential occurrence was generated for Brambei Mom. The coordinates of BM (via KMZ file) are used to inform the IBAT radius of screening. Since the default radius of IBAT screening is 50km, steps were taken to narrow down to the sub-scheme's area of influence to identify only EN and CR species that are potentially present in the sub-scheme area of influence. The narrowing-down aims to practically identify EN and CR species that could be found in the sub-scheme area of influence and to determine the Critical Habitat status of the identified species. After three rounds of screening, there's on EN and CR species confirmed.

Description of screening for narrowing down

For Brambei Mom, three rounds of screening have been conducted. The first screening (Round 1) was conducted in December 2023. Round 2 was carried out in April 2024, and Round 3 in August 2024. The purpose of repeated screening is to validate the screening results (for the same area) with a wide range of local stakeholders. The screening aims to identify only EN and CR species that are potentially present in the Brambei Mom area of influence, covering reptiles, mammals, fish, birds, and mushrooms. Screening was done based on the IBAT report generated and provided by the AIIB.

The four sub-schemes (Brambei Mom, Krapeu Truom, Yotasas, and Stueng Kang Bat) are integral components of the Stoeung Krang Ponley River catchment system, a tributary of the Tonle Sap. These areas share geographic connectivity and ecological functions. Semi-structured and structured interviews were conducted to collect data on species information, distribution, and fisheries ecosystems. In the first two rounds of screening, 2 EN and CR species including 1) one reptile (Black Marsh Turtle), and 2) one fish species (Striped Catfish) were identified in this area of influence. In the 3rd round of screening (in August 2024), however, none of these species was confirmed" in the Brambei Mom's area of influence.

7.3.3 Ecological State of Habitats within the AoA

Understanding of the ecological state of habitats is necessary to assess the likelihood of occurrence (LoO) of the above 2 screened species - as part of the CHA. For this CHA, species were classified into four LoO categories: Present, Possible, Unlikely and Not Present. Species known to be Present or with a Possible LoO are further assessed in Step 3. This understanding takes into account the classification of habitats as either modified or natural based on levels of human-induced disturbance to species composition and ecological functions. In this session, a brief assessment of the 11 confirmed species are presented. The assessment discusses historical range, distribution, habitat conditions, current status, and potential threats identified by key informants.

The four sub-schemes (Brambei Mom, Krapeu Truom, Yotasas, and Stueng Kang Bat) are integral components of the Stoeung Krang Ponley River catchment system, a tributary of the Tonle Sap. These areas share geographic connectivity and ecological functions. Semi-structured and structured interviews were conducted to collect data on species information, distribution, and fisheries ecosystems. Two National Fisheries Day ceremonies were held at Kbol and Anlong Chrey Reservoirs, during which millions of fish were released by the former prime minister. The aquaculture department of the Technology Institute of Kampong Speu also releases fish into these reservoirs. Investigations with relevant government departments confirmed that no endangered or critically endangered species were released during these events.

7.3.4 Habitat Assessment

Brambei Mom Command Area is located within the Stoeung Krang Ponley River catchment system, a tributary of the Tonle Sap. These areas are geographically and ecologically interconnected. The habitat is characterized by three large reservoirs (Anlong Chrey, Brambei Mom, and Kdol) in the upper reaches, while the lower areas consist of riverine, wetland, and agricultural landscapes. The water quality, vegetation density, and soil composition vary across these habitats. However, the hydrological functions of the system are disrupted by numerous dams and spillways along the main canal and irrigation canals, hindering fish migration from downstream to upstream. This may be one factor contributing to the absence of the targeted species in the area.

Semi-structured interviews were conducted with multiple fishermen at Anlong Chrey and Brambei Mom reservoirs. Many claimed to have seen or caught Striped Catfish, Mekong Giant Barb, and Isok barb/Jullien's Golden Carp. To verify their claims, we sent photographs of the fish to Thach Panara, head of the Inland Fisheries Research and Development Institute. It was determined that all of the fishermen had mistakenly identified Mekong Giant Barb as Rohu (Labeo rohita). Additionally, none of the fishermen reported encountering any turtles or tortoises in their fishing area. Despite consulting visual aids, we were unable to confirm the reported sightings of Jullien's Golden Carp and Striped Catfish due to a lack of clear identification evidence.

Ten key informants were interviewed with the support of commune councils. None reported encountering the targeted species within the command area. Discussions with the Chief of Brambei Mom commune revealed a history of large-scale fish farming in the area, including Pangasianodon sp. and Hypsibarbu sp. A flood event years ago led to the release of these fish into the Anlong Chrey reservoir, resulting in increased catches by local fishermen. However, it remains uncertain whether the Pangasianodon sp. was indeed Striped Catfish.

Figure 21: Interviewing and verifying Mekong Giant Barb with similar look of other fish species and their ecological niches

Figure 22: Local fishermen in Brabei Mom mistakenly identified their catch of Rohu (Labeo rohita) as Mekong Giant Barb.

7.4 Determination of Critical Habitat Status (Step 3)

This section assesses the information (obtained from the above sub-section) vis-a-vis the criteria (presented in Section 3.4 - CH assessment method). Based on the assessment result there are no EN and CR with their critical habitat confirmed for this sub-scheme.

7.4.1 Habitat of significant importance to CE and EN species

As presented in Section 4.3.3.2 (Ecological State), no EN and CR species confirmed.

7.4.2 Habitat of significant importance to endemic or restricted-range species

None of the species under EN and CR classification are restricted-range species (based on IBAT report for for Brambei Mom).

7.4.3 Habitat supporting globally or nationally significant concentrations of migratory or congregation species

None of the IBA that are recognized for significant concentrations of migratory birds or other species are found within the vicinity of the sub-scheme. No other evidence of significant concentrations of migratory or congregatory species is available. The AoA for Brambei Mom, therefore is expected to qualify as critical habitats under this criterion.

7.4.4 Highly threatened or unique ecosystems

Each of the reservoirs are modified habitat and is associated with numerous rice paddies. There is no evidence that these areas are highly threatened or unique ecosystems, and no critical habitats are recognized under this criterion.

7.4.5 Ecological functions or characteristics that are needed to maintain the viability of the biodiversity values described above in (a) to (d)

No ecological functions that are necessary to support biodiversity values (described under the above criteria) have been identified.

8. Krapeu Trom

8.1 Proposed project activities and potential risks and impacts

By carefully considering the ecological implications of the project, it is possible to balance the needs of agriculture with the environment and ecosystem functions. Under Krapeu Trom, various activities will be carried out that cause the following E&S risks and impacts:

Table 13: Projection activities that may cause potential impacts on the environment and social aspects at Krapeu Trom sub-scheme

No.	Project activities that cause impacts	E&S Risks & Impacts
1	Construction activities (rehabilication of canal and farm roads), land use changes, and water management practices	**Habitat loss and fragmentation** could lead to habitat loss and fragmentation, affecting species' survival and connectivity. This activity may involve dredging, excavation, or modification of existing water channels and infrastructure. These activities can lead to habitat destruction, disturbance to nesting and foraging sites, disruption of natural water flow patterns, and alteration of hydrological regimes. This can directly impact both terrestrial and aquatic biodiversity.
2	Increased agricultural activities, sedimentation, and pollution	**Water quality degradation** could impact aquatic ecosystems and species that rely on clean water.
3	Dredging of waterways and Alteration of water levels	Changes in water levels within the command area due to irrigation system renovation may negatively impact wildlife dependent on specific habitats for breeding or foraging purposes. Changes in water levels and habitat quality could force endangered species to relocate, potentially leading to competition with other species or exposure to new threats.
4	Use of chemicals and nutrient loading	**If pesticides/fertilizers are used during agricultural practices within the command area as part of irrigation system renovation projects, it could lead to contamination of soil and water resources affecting both terrestrial and aquatic biodiversity.**
5	**Biodiversity degradation, and soil erosion**	The **potential** impacts of the project on water flow, water quality, and sedimentation patterns. The changes in microclimate.
6	Blockage of migration routes by dams or other structures	Irrigation structures, such as dams and weirs, can create physical barriers that prevent fish from migrating upstream or downstream. This can disrupt their reproductive cycles and reduce their survival rates.

8.2 Areas of Influence

Potential areas of influence might include:

- **Downstream areas:** The lower reaches of the Stoeung Krang Ponley River and the Tonle Sap Lake, may be affected by water quality, sediment loads, and fish migration from Krapeu Trom.

- **Upstream areas:** The upper reaches of the Stoeung Krang Ponley River and its tributaries, which may be influenced by water flow regulation and sediment transport from Krapeu Trom.
- **Adjacent ecosystems:** Forests, wetlands, and agricultural areas that are connected to Krapeu Trom through hydrological or ecological processes.

8.3 Analysis to prepare for determining CH status

8.3.1 Critical Habitat Area of Analysis

Critical habitat is defined as an Area of Analysis (AoA), and the project's command area is used as an AoA.

8.3.2 Species with Potential Occurrence within the AoA

A list of threatened species with potential occurrence was generated for Krapeu Trom (KT). The coordinates of KT (via KMZ file) are used to inform the IBAT radius of screening. Since the default radius of IBAT screening is 50km, steps were taken to narrow down to the sub-scheme's area of influence to identify only EN and CR species that are potentially present in the sub-scheme area of influence. The narrowing-down aims to practically identify EN and CR species that could be found in the sub-scheme area of influence and to determine the Critical Habitat status of the identified species.

Description of screening for narrowing down

For Krapeu Trom, three rounds of screening have been conducted. The first screening (Round 1) was conducted in December 2023. Round 2 was carried out in April 2024, and Round 3 in August 2024. The purpose of repeated screening is to validate the screening results (for the same area) with a wide range of local stakeholders. The screening aims to identify only EN and CR species that are potentially present in the OTP area of influence, covering reptiles, mammals, fish, birds, amphibians, and aquatic plants. Screening was done based on the IBAT report generated and provided by the AIIB.

In the first two rounds of screening, there were two fish species (Isok barb/Jullien's Golden Carp and Leaping barb/Flying Minnow) were screened for the first two rounds. After three rounds of screening focusing on EN and CR species, only Flying Minnow is confirmed as potentially present in the sub-scheme area of influence.

8.3.3 Ecological State of Habitats within the AoA

Understanding of the ecological state of habitats is necessary to assess the Likelihood of occurrence (LoO) of the above 11 screened species - as part of the CHA. For this CHA, species were classified into four LoO categories: Present, Possible, Unlikely and Not Present. Species known to be Present or with a Possible LoO are further assessed in Step 3. This understanding takes into account the classification of habitats as either modified or natural based on levels of human-induced disturbance to species composition and ecological functions. In this session, a brief assessment of the one confirmed species is presented. The assessment discusses historical range, distribution, habitat conditions, current status, and potential threats identified by key informants.

The Krapeu Trom command area has been in existence since the 1970s. The KT is a mixture of paddy fields, farm roads, and residential areas. Natural rivers, such as the Stueng Krang Ponlai serve as the sole ecological and hydrological connection between its upstream watershed and the Tonle Sap River basin downstream. This river is crucial for fish migration during the flooding season. However, reservoirs, spillways, and drought conditions have disrupted these essential ecological functions.

8.3.3.1 *Fish (1 species)*

Krapeu Trom, like Brambei Mom, is situated within the same river catchment area in the lower reaches, near the Tonle Sap's annual floodplain. Two fish species, the Isok barb/Jullien's Golden Carp (Probarbus jullieni) and Leaping barb/Flying Minnow (Laubuka caeruleostigmata), were targeted for interviews in this command area. Among ten key informants interviewed, only one reported encountering the Jullien's Golden Carp once in 2022, approximately 500 meters downstream of the reservoir facility during a flooding event (see map below). This individual stated that the species migrated upstream from the Tonle Sap during the flood season but became trapped in spillways. They added that if flooding is insufficient, fish populations decline, and rare species may no longer be present in the area.

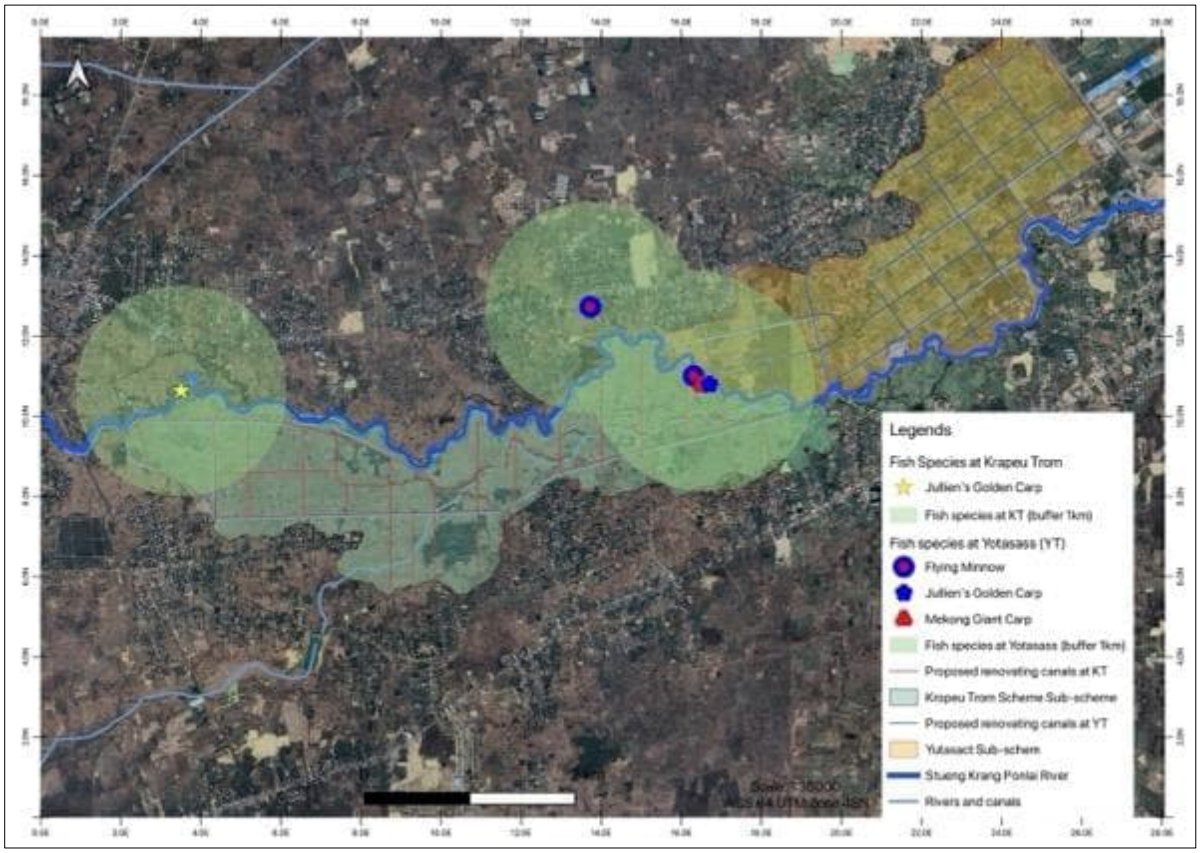

Figure 23: A spatial distribution map was generated for four fish species at Krapeu Trom and Yotasas Command Area. 1 km buffer zones were included to approximate their minimum movement range around suitable habitats.

8.4 Determination of Critical Habitat Status (Step 3)

This section assesses the information (obtained from the above sub-section) vis-a-vis the criteria (presented in Section 3.4 - CH assessment method). This assessment aims to determine whether any species qualify for Critical Habitat features.

8.4.1 Habitat of significant importance to CE and EN species

As presented in Section 4.4.3.3 (Ecological State), the species that qualifies as a critical habitat feature is the Flying Minnow. Krapeu Trom Command Area is part of Stueng Krang Ponlai River system (Tonle Sap's tributary) and situated approximately 11 km from Tonle Sap River. The area was influenced by flood-plus water from Stueng Krang Ponlai upstream and the push-up of flood water from Tonle Sap River Basic allowing fish to short distance migration for food and breeding.

Although climate change has caused dry and drought more frequently, this area still receives a good amount of flood from its upstream and downstream making a good connectivity and providing ecological function for migratory fish.

8.4.2 Habitat of significant importance to endemic or restricted-range species

None of the species under EN and CR classification are restricted-range species (based on IBAT report for sub-scheme).

8.4.3 Habitat supporting globally or nationally significant concentrations of migratory or congregation species

None of the IBA that are recognized for significant concentrations of migratory birds or other species are found within the vicinity of the sub-scheme. No other evidence of significant concentrations of migratory or congregatory species is available. The AoA for KT, therefore is expected to qualify as critical habitats under this criterion.

8.4.4 Highly threatened or unique ecosystems

Each of the reservoirs are modified habitat and is associated with numerous rice paddies. There is no evidence that these areas are highly threatened or unique ecosystems, and no critical habitats are recognized under this criterion.

8.4.5 Ecological functions or characteristics that are needed to maintain the viability of the biodiversity values described above in (a) to (d)

No ecological functions that are necessary to support biodiversity values (described under the above criteria) have been identified.

9. Yutasas

9.1 Proposed project activities and potential risks and impacts

Given the presence of endangered and critically endangered species and the sensitive habitat in the Yotasas Yotasas command area, the proposed irrigation renovation scheme must be implemented with careful consideration to minimize negative impacts on biodiversity. By carefully considering the ecological implications of the project, it is possible to balance the needs of agriculture with the conservation of endangered species and their habitats. Under Yutasas, various activities will be carried out that cause the following E&S risks and impacts:

Table 14: Projection activities that may cause potential impacts on the environment and social aspects at Yutasas sub-scheme

No.	Project activities that cause impacts	E&S Risks & Impacts
1	Construction activities (rehabilication of canal and farm roads), land use changes, and water management practices	**Habitat loss and fragmentation** could lead to habitat loss and fragmentation, affecting species' survival and connectivity. This activity may involve dredging, excavation, or modification of existing water channels and infrastructure. These activities can lead to habitat destruction, disturbance to nesting and foraging sites, disruption of natural water flow patterns, and alteration of hydrological regimes. This can directly impact both terrestrial and aquatic biodiversity.
2	Increased agricultural activities, sedimentation, and pollution	**Water quality degradation** could impact aquatic ecosystems and species that rely on clean water.

3	Dredging of waterways and Alteration of water levels	Changes in water levels within the command area due to irrigation system renovation may negatively impact wildlife dependent on specific habitats for breeding or foraging purposes. Changes in water levels and habitat quality could force endangered species to relocate, potentially leading to competition with other species or exposure to new threats.
4	Use of chemicals and nutrient loading	**If pesticides/fertilizers are used during agricultural practices within the command area as part of irrigation system renovation projects, it could lead to contamination of soil and water resources affecting both terrestrial and aquatic biodiversity.**
5	**Biodiversity degradation, and soil erosion**	The **potential** impacts of the project on water flow, water quality, and sedimentation patterns. The changes in microclimate.
6	Barriers to fish migration routs	Irrigation structures, such as dams and weirs, can obstruct fish migration, preventing them from accessing critical spawning grounds or nursery areas. This disruption of their natural life cycles can lead to reduced populations and species decline. To mitigate these negative impacts, it's essential to design and operate irrigation systems with fish-friendly considerations. Addressing this issue may includes incorporating measures like fish passage facilities[10], such as fish ladders or fish lifts, to enable safe movement upstream and downstream. Additionally, implementing effective water quality management practices and raising public awareness about the importance of protecting fish populations, particularly near fish passage areas, can contribute to the conservation of aquatic ecosystems.

9.2 Areas of Influence

The area of influence for the Yatasas Yotasas irrigation renovation scheme encompasses the direct and indirect impacts of the project. This includes:

- **Direct Impacts:** The immediate area where the irrigation infrastructure will be constructed and operated, including canals, pumping stations, and reservoirs.
- **Indirect Impacts:** The surrounding areas that may be affected by changes in water flow, land use, or other project-related activities. This includes the Stueng Krang Ponlai River, the Tonle River, and the habitats of endangered species within the Yotasas Yotasas command area.

[10] Fish passage is essential for fish to navigate water systems and access diverse habitats. Fish passage technologies, like fish ladders, help preserve fish populations and aquatic ecosystems. Fish need to migrate 10 miles or 1,000 miles to access different habitats, food, and environments that support their life cycles.

9.3 Analysis to prepare for determining CH status

9.3.1 Critical Habitat Area of Analysis

Critical habitat is defined as an Area of Analysis (AoA), and the project's command area is used as an AoA.

9.3.2 Species with Potential Occurrence within the AoA

A list of threatened species with potential occurrence was generated for Yutasas. The coordinates of Yutasas (via KMZ file) are used to inform the IBAT radius of screening. Since the default radius of IBAT screening is 50km, steps were taken to narrow down to the sub-scheme's area of influence to identify only EN and CR species that are potentially present in the sub-scheme area of influence. The narrowing-down aims to practically identify EN and CR species that could be found in the sub-scheme area of influence and to determine the Critical Habitat status of the identified species. After three rounds of screening focusing on EN and CR species, 6 EN and CR species are found as potentially present in the sub-scheme area of influence. These species include 3 reptile species, and 3 fishes (See list of 11 EN and CR species in Table below).

Description of screening for narrowing down

For Yutasas, three rounds of screening have been conducted. The first screening (Round 1) was conducted in December 2023. Round 2 was carried out in April 2024, and Round 3 in August 2024. The purpose of repeated screening is to validate the screening results (for the same area) with a wide range of local stakeholders. The screening aims to identify only EN and CR species that are potentially present in the Yutasas area of influence, covering reptiles and fish. Screening was done based on the IBAT report generated and provided by the AIIB.

In the first two rounds of screening, 5 EN and CR species were identified in the Yutasas area of influence (See Table 9 below). In the 3rd round of screening (in August 2024), however, 3 (out of a total of 5 species) were confirmed as "potentially present" in the Yutasas's area of influence.

So, the assessment for Yutasas focuses on the confirmed list of **3 species of fish** that are categorized by IUCN as EN and CR species (see map in Krapeu Trom section above).

Table 15: Confirmed List of endangered and critically endangered species for the Yutasas sub-scheme

No.	Local Name	English Name	Scientific Name	IUCN Cat	Screened Species from Round 1&2 (Total=5)	Confirmed Species in Round 3 (Total = 3)
I. Reptile species						
1	អណ្តើកព្រេច	Elongated Tortoise	Indotestudo elongata	CR	Yes	Yes
II. Fish species						
2	ត្រីត្រសក់ក្រហម	Jullien's Golden Carp	Probarbus jullieni	CR	Yes	Yes
3	ត្រីចង្វាស្នឹង	Leaping barb/Flying Minnow	Laubuka caeruleostigmata	EN	Yes	Yes

4	ត្រីកាហោ /ត្រីគុលរាំង	Mekong giant barb/Giant Carp	Catlocarpio siamensis	CR	Yes	Yes
II. Bird species						
5	ទាព្រៃស្លាបស	White-winged Duck	Asarcornis scutulata	EN	Yes	No

9.3.3 Ecological State of Habitats within the AoA

Understanding of the ecological state of habitats is necessary to assess the Likelihood of occurrence (LoO) of the above 3 screened species - as part of the CHA. For this CHA, species were classified into four LoO categories: Present, Possible, Unlikely and Not Present. Species known to be Present or with a Possible LoO are further assessed in Step 3. This understanding takes into account the classification of habitats as either modified or natural based on levels of human-induced disturbance to species composition and ecological functions. In this session, a brief assessment of the 3 confirmed species are presented. The assessment discusses historical range, distribution, habitat conditions, current status, and potential threats identified by key informants.

The Yutasas command area has been in existence since the 1970s. This command area is a mixture of paddy fields, farm roads, and residential areas. Natural rivers, such as the Stueng Krang Ponlai, are the sole ecological and hydrological connection between its upstream watershed and the downstream Tonle Sap River basin. This river is crucial for fish migration during the flooding season. However, reservoirs, spillways, and drought conditions have disrupted these essential ecological functions.

9.4 Determination of Critical Habitat Status (Step 3)

This section assesses the information (obtained from the above sub-section) vis-a-vis the criteria (presented in Section 3.4 - CH assessment method). This assessment aims to determine whether any species (identified in the list of 3 EN and CR species) qualify for Critical Habitat features.

9.4.1 Habitat of significant importance to CE and EN species

As presented in Section 4.1.3.3 (Ecological State), species that qualify as critical habitat features include:

Based on the interviews and habitat assessments, three of the five endangered species were confirmed to be present in the Krapeu Trom section: Jullien's Golden Carp, Flying Minnow, and Mekong Giant Barb (see map above in Krapeu Trom section).

- **Jullien's Golden Carp:** A female fisher reported encountering this rare species in the lower part of the reservoir during a flood in 2022. She caught five individuals using a fishing net. The other informants had not seen this species in several years. After careful verification, it was determined that the fishers were familiar with the species and had not mistaken it for another.
- **Flying Minnow:** Two informants reported encountering this small fish species in 2022 and 2023. One caught them in the lower part of the Yotasass reservoir, where they had migrated from a downstream area. The other found them in her natural fish pond after pumping it. Both informants were confirmed to be familiar with the species.
- **Mekong giant Barb**: A key informant reported catching five individuals of this species in July 2022 after heavy rains. The fish were small, approximately 1.5 kilograms each, and were found in the lower part of the reservoir. The informant was familiar with the species and believed that they were attempting to migrate upstream but were trapped by the reservoir..

9.4.2 Habitat of significant importance to endemic or restricted-range species

None of the species under EN and CR classification are restricted-range species (based on IBAT report for Yutasas).

9.4.3 Habitat supporting globally or nationally significant concentrations of migratory or congregation species

None of the IBA that are recognized for significant concentrations of migratory birds or other species are found within the vicinity of the sub-scheme. No other evidence of significant concentrations of migratory or congregatory species is available. The AoA for Yutasas, therefore is expected to qualify as critical habitats under this criterion.

9.4.4 Highly threatened or unique ecosystems

Each of the reservoirs are modified habitat and is associated with numerous rice paddies. There is no evidence that these areas are highly threatened or unique ecosystems, and no critical habitats are recognized under this criterion.

9.4.5 Ecological functions or characteristics that are needed to maintain the viability of the biodiversity values described above in (a) to (d)

No ecological functions that are necessary to support biodiversity values (described under the above criteria) have been identified.

Table 16: Initial Screening of CH-qualifying Species Confirmed or Likely to Occur in the Yutassas sub-scheme of the Project Area

English Name	Scientific Name	IUCN Status	Global population	Cambodia population	Migratory/ Congregatory	Habitat and Distribution	Likelihood of Occurrence	Rationale for Critical Habitat Screening	Screened In or Out
Reptile									
Elongated Tortoise	Indotestudo elongata	CR	Unknown-kept declining	Unknown-kept declining	No	Endangered and elusive, inhabit the Tonle Sap Floodplain's diverse wetlands, including flooded forests and marshes. Their survival is threatened by habitat loss, hunting, and bycatch.	Not confirmed	There's some qualified habitat but lack of permanent and deep-water body. The species was confirmed present around 15 to 12 km way downstream far from the project area. Therefore, It's likely absent in the project AoI.	**Out**
Fish									
Jullien's Golden Carp	Probarbus jullieni	CR	Unknown-kept declining	Unknown-kept declining > 80% over three generations	Yes	*Probarbus jullieni* inhabits Cambodia's Mekong tributaries and large rivers, favoring deep, flowing lowland pools. Once widespread in the Mekong and Tonle Sap systems, its range is now fragmented and drastically reduced.	Low - Confirmed in AoI in 2024	Critically endangered due to overfishing, dams, and habitat loss, it is now extremely rare in Cambodian waters. This species migrates from Tonle Sap River system into the AoI through Stueng Krang Ponlai river system (Tonle Sap tributary). Likely to qualify the Yutasas as CH under Criterion 1, 3, and 4threshold.	**IN**
Leaping barb/Flying Minnow	Laubuka caeruleostigmata	EN	Unknown-kept declining	Unknown-kept declining	Yes	This species prefers clear, forested streams and tributaries across Cambodia's river systems. While likely widespread in suitable freshwater habitats, its precise distribution remains poorly documented.	Low - Confirmed in AoI in 2024	Endangered due to overfishing, dams, and habitat loss, it is now extremely rare. This species migrates from Tonle Sap River system into the AoI through Stueng Krang Ponlai river system (Tonle Sap tributary). Likely to qualify the Yutasas as CH under Criterion 1, 3, and 4 threshold.	**IN**
Mekong giant barb/ Giant Carp	Catlocarpio siamensis	CR	Unknown-declined over 90% in the last three generations	Unknown-kept declining	Yes	*Catlocarpio siamensis* once lived in deep Mekong pools and tributaries but are now extremely rare and restricted to isolated spots due to overfishing and habitat loss.	Very Low - Confirmed in AoI in 2024	Critically endangered, with severe population declines attributed to overfishing, dam construction, and habitat degradation, rendering it exceptionally rare. It's reported that only juvenile individuals migrate from the Tonle Sap River system into the Area of Influence (AoI) via the Stueng Krang Ponlai River, a Tonle Sap tributary. Likely to qualify the Yutasas as CH under Criterion 1, 3, and 4t hreshold.	**IN**
Bird									
White-winged Duck	Asarcornis scutulata	EN	Unknown	Unknown	No	Rare and poorly studied aquatic plant species endemic to Thailand, specifically found in the Chanthaburi Province.	Not confirmed	IUCN listed as EN and as the Endemic to the Thailand and therefore it has been screened out	**Out**

10. Stueng Krang Bat

10.1 Proposed project activities and potential risks and impacts

Many endangered and critically endangered species of fish and reptiles inhabit the Inandared area, a vital fish migration habitat within the Tonle Sap River Basin. The proposed Stueng Krang Bat irrigation sub-scheme aims to balance agricultural development with biodiversity conservation. Key components include the construction of irrigation canals, water storage facilities, and drainage systems to enhance water management. These infrastructure improvements will support increased agricultural productivity while minimizing negative impacts on the area's rich biodiversity.

Given the ecological significance of the Stueng Krang Bat irrigation sub-scheme and the presence of endangered and critically endangered species, any proposed project activities must be carefully planned and implemented to minimize negative impacts on biodiversity. Under Stueng Krang Bat, various activities will be carried out that cause the following E&S risks and impacts:

Table 17: Projection activities that may cause potential impacts on the environment and social aspects at Stueng Krang Bat sub-scheme

No.	Project activities that cause impacts	E&S Risks & Impacts
1	Construction activities (rehabilication of canal and farm roads), land use changes, and water management practices	**Habitat loss and fragmentation** could lead to habitat loss and fragmentation, affecting species' survival and connectivity. This activity may involve dredging, excavation, or modification of existing water channels and infrastructure. These activities can lead to habitat destruction, disturbance to nesting and foraging sites, disruption of natural water flow patterns, and alteration of hydrological regimes. This can directly impact both terrestrial and aquatic biodiversity.
2	Increased agricultural activities, sedimentation, and pollution	**Water quality degradation** could impact aquatic ecosystems and species that rely on clean water.
3	Dredging of waterways and Alteration of water levels	Changes in water levels within the command area due to irrigation system renovation may negatively impact wildlife dependent on specific habitats for breeding or foraging purposes. Changes in water levels and habitat quality could force endangered species to relocate, potentially leading to competition with other species or exposure to new threats.
4	Use of chemicals and nutrient loading	**If pesticides/fertilizers are used during agricultural practices within the command area as part of irrigation system renovation projects, it could lead to contamination of soil and water resources affecting both terrestrial and aquatic biodiversity.**
5	**Biodiversity degradation, and soil erosion**	The **potential** impacts of the project on water flow, water quality, and sedimentation patterns. The changes in microclimate.

6	Blockage of migration routes by dams or other structures	Irrigation structures, such as dams and weirs, can obstruct fish migration, preventing them from accessing critical spawning grounds or nursery areas. This disruption of their natural life cycles can lead to reduced populations and species decline. To mitigate these negative impacts, it's essential to design and operate irrigation systems with fish-friendly considerations. Addressing this issue may includes incorporating measures like fish passage facilities, such as fish ladders or fish lifts, to enable safe movement upstream and downstream. Additionally, implementing effective water quality management practices and raising public awareness about the importance of protecting fish populations, particularly near fish passage areas, can contribute to the conservation of aquatic ecosystems.
7	**Biodiversity**	The potential impacts of the project on water flow, water quality, and sedimentation patterns.
8	Introduction of invasive species through irrigation canals	Irrigation canals may facilitate the introduction of invasive plant or animal species into native aquatic ecosystems like Water Hyacinth, Mimosa Pigra, Tilapia etc. These invasives can outcompete native species for resources such as food and habitat space.
9	Habitat loss or degradation due to land use changes	Land use changes associated with agricultural expansion or infrastructure development can lead to habitat loss or degradation of critical areas such as wetlands or floodplain ecosystems that support diverse fish populations.

10.2 Areas of Influence

The area of influence for the Stueng Krang Bat irrigation sub-scheme encompasses both modified and natural habitats within its command area. It extends along the Tonle Sap River, encompassing floodplains, wetlands, and associated ecosystems. The project activities have the potential to directly or indirectly impact biodiversity within this region.

The area of influence for the Stueng Krang Bat irrigation sub-scheme includes both direct and indirect impacts. Direct impacts may occur within the project area itself, such as construction sites and irrigation canals. Indirect impacts may extend to surrounding areas, including the Tonle Sap River, wetlands, and adjacent ecosystems.

10.3 Analysis to prepare for determining CH status

Critical Habitat Area of Analysis

Critical habitat is defined as an Area of Analysis (AoA), and the project's command area is used as an AoA.

10.3.1 Species with Potential Occurrence within the AoA

A list of threatened species with potential occurrence was generated for Stueng Krang Bat (SKB). The coordinates of SKB (via KMZ file) are used to inform the IBAT radius of screening. Since the default radius of IBAT screening is 50km, steps were taken to narrow down to the sub-scheme's area of influence to identify only EN and CR species that are potentially present in the sub-scheme area of influence. The narrowing-down aims to

practically identify EN and CR species that could be found in the sub-scheme area of influence and to determine the Critical Habitat status of the identified species. After three rounds of screening focusing on EN and CR species, 5 EN and CR species are found as potentially present in the sub-scheme area of influence. These species include 3 reptile species, and 2 fishes (see a list of 6 EN and CR species in Table 13 below).

Description of screening for narrowing down

For Ou Ta Paong, three rounds of screening have been conducted. The first screening (Round 1) was conducted in December 2023. Round 2 was carried out in April 2024, and Round 3 in August 2024. The purpose of repeated screening is to validate the screening results (for the same area) with a wide range of local stakeholders. The screening aims to identify only EN and CR species that are potentially present in the SKB area of influence, covering reptiles, mammals, fish, birds, amphibians, and aquatic plants. Screening was done based on the IBAT report generated and provided by the AIIB.

In the first two rounds of screening, 5 EN and CR species were identified in the SKB area of influence (See Table below). In the 3rd round of screening (in August 2024), however, 6 (one additional critically endangered species) were confirmed as “potentially present” in the OTP’s area of influence.

So, the assessment for SKB focuses on the confirmed list of 6 species that are categorized by IUCN as EN and CR species including 3 reptile species (Asian giant softshell turtle, Black Marsh Turtle and Southeast Asian Box Turtle) and 3 fish species (Striped catfish, Mekong Giant Barb and Siamese Tiger Perch). See Table below for the list of confirmed species and see Figure 1 for potential locations of these species in the project’s area of influence.

Table 18: List of endangered and critically endangered species based on the IBAT Screening result vs. key informant interview at Stueng Krang Bat Sub-scheme

No.	Local Name	English Name	Scientific Name	IUCN Cat	Screened Species from Round 1&2 (Total=5)	Confirmed Species in Round 3 (Total = 3)
I.	**Reptile spices**					
1	កន្ធាយក្បាលកង្កែប	Asian giant softshell turtle	Pelochelys cantorii	CR	No	Yes
2	អណ្តើកឆ្អែក	Black Marsh Turtle	Siebenrockiella crassicollis	EN	Yes	Yes
3	អណ្តើកបិទមុខ	Southeast Asian Box Turtle	Cuora amboinensis	EN	Yes	Yes
III.	**Fish species**					
4	ត្រីប្រាធំ	Striped catfish	Pangasianodon hypophthalmus	EN	Yes	Yes

5	ត្រីកាហោ /ត្រីគុលរាំង	Mekong Giant Barb	Catlocarpio siamensis	CR	Yes	Yes
6	ត្រីកន្ត្រៃប់ខ្លា	Siamese Tiger Perch	Datnioides pulcher	CR	Yes	Yes

10.3.2 Ecological State of Habitats within the AoA

Understanding of the ecological state of habitats is necessary to assess the Likelihood of occurrence (LoO) of the above 11 screened species - as part of the CHA. For this CHA, species were classified into four LoO categories: Present, Possible, Unlikely and Not Present. Species known to be Present or with a Possible LoO are further assessed in Step 3. This understanding takes into account the classification of habitats as either modified or natural based on levels of human-induced disturbance to species composition and ecological functions. In this session, a brief assessment of the 11 confirmed species are presented. The assessment discusses historical range, distribution, habitat conditions, current status, and potential threats identified by key informants.

The SKB command area has been in existence since the 1970s. The SKB is a mixture of paddy fields, farm roads, and residential areas. The Stueng Krang Bat (SKB) irrigation sub-scheme was initially screened for a biodiversity assessment, utilizing the Integrated Biodiversity Assessment (IBAT) approach and key informant interviews. Located on the edge of the Tonle Sap River and annual floodplains of the Tonle Sap and Mekong Rivers, this area holds significant ecological importance. The initial screening identified six EN and CR of reptiles and fish species for this command area. These included the Black Marsh Turtle, Southeast Asia Box Turtle, Striped catfish, Mekong giant barb/Giant Carp, and Siamese Tiger Perch.

Upon conducting key informant interviews (KII), it was confirmed that several endangered (EN) and critically endangered (CR) species inhabit SKB. These included reptiles such as the Black Marsh Turtle, Southeast Asia Box Turtle, and Asian giant softshell turtle along with fish species like Striped catfish, Mekong giant barb/Giant Carp, and Siamese Tiger Perch. The confirmation of these vulnerable species underscores the ecological significance of SKB's command area (see map below).

This information emphasizes the importance of further biodiversity surveys in this region to comprehensively document all wildlife present. Furthermore, these findings highlight potential conservation efforts needed to protect these threatened or endangered species identified through initial screening at SKB.

Ten key informants were selected in collaboration with the commune council and village chiefs for interviews. These individuals were chosen based on their extensive local ecological knowledge and experience in fishing within their communities. The following paragraphs summarize the key information gathered from interviews regarding each confirmed species.

10.3.2.1 Reptiles (3 species)

Asian giant softshell turtle: This species was not initially screened for interviews at this sub-scheme but was confirmed during the interview process. Only one informant reported encountering the Asian Giant Softshell Turtle in 2024 at Boeung Thom. This extremely rare species was last sighted by this informant many years ago. It prefers large lakes and river systems with abundant vegetation and flooded forests. The remaining key informants had not seen this species in many years, and some had never encountered it in their lifetimes.

Black Marsh Turtle: Two key informants confirmed their familiarity with this species. One informant reported encountering the Black Marsh Turtle in the area over a decade ago but

has not seen it since then. A second informant also recalled encountering the species more than ten years ago, but not within the specific command area.

Southeast Asian Box Turtle: Five key informants confirmed their familiarity with the Southeast Asian Box Turtle. Two of these informants reported encountering the species in the Boeung Thom and Rek Trors areas in 2022. Another two informants encountered the turtle 7 years ago near the spillway close to the village and in Reahny Longvaek, which has since been converted into a real estate development project. One informant reported seeing the species in the same location for over a decade but has not observed it recently.

10.3.2.2 Fish Species

Striped Catfish: The local fishermen in the Stueng Kran Bat Command Area have consistently encountered the Striped Catfish species during the flooding season for several years. However, they have noticed a rapid decline in population size, with individuals being caught at much smaller sizes. The estimated catch by comparison to previous years is only around 30%. The fishermen report encountering these fish annually during full flooding and receding periods, with sightings randomly occurring within approximately 900m distance surrounding the village area. These fish typically migrate from the Tonle Sap Lake to the Stueng Kraing Ponlai River in August or September, depending on flood levels. Once in the Stueng Kraing Ponlai River, they disperse throughout the floodplain during the flooding season. All key informants reported consistently catching this species in the following areas for all reported fish species: Veal Braing (the floodplain area around the village), Trek Tor, Boeung Kralor Meach, Boeung Braing, Stueng Krang Ponlay River, Boeung Thom, and Boeung Toek La-ork.

Mekong Giant Barb: Local fishermen in the Stueng Kran Bat Command Area have consistently encountered the Mekong Giant Barb species during the flooding season for several years. However, they have noticed a rapid decline in population size, with individuals being caught at much smaller sizes. The fishermen do not intentionally target these fish species they are at the fingerling stage, but they often become trapped in line nets. Two of the fishermen mentioned that they had encountered this species around a decade ago but stopped going out for fishing for many years. Seven fishermen reported encountering them every year during flooding and early receding periods near the village and within the floodplain area.

The catch sizes are small during flooding season but grow significantly (2 to 3 km per individual) during receding periods. Another fisherman noted that there has been a decrease in both catch amounts and size of these fish over time, with fewer being caught with nets each year. They also mentioned that some of these fish get stuck in large lakes near the Tonle Sap River when floods occur. Overall, it is estimated that there has been a significant decline of more than 70% in catch amounts, and today's Mekong Giant Barb are much smaller compared to previous years at this time of year due to their rarity and the delay and not enough floods.

Striped Catfish: The information provided by the local fishermen regarding the Striped Catfish species in the command area is varied. Two of them reported recent sightings in 2022 and 2023 between 3 to 5 individuals per catch, while one informant mentioned their last encounter was 7 years ago, and two others stated that they haven't seen this species in over a decade. The encounters typically occurred during flooding and receding periods. The number of individuals caught has been very low, and the size of the fish has been decreasing year by year. One fisherman mentioned that he encountered this species in the Tonle Sap River but not around the village area.

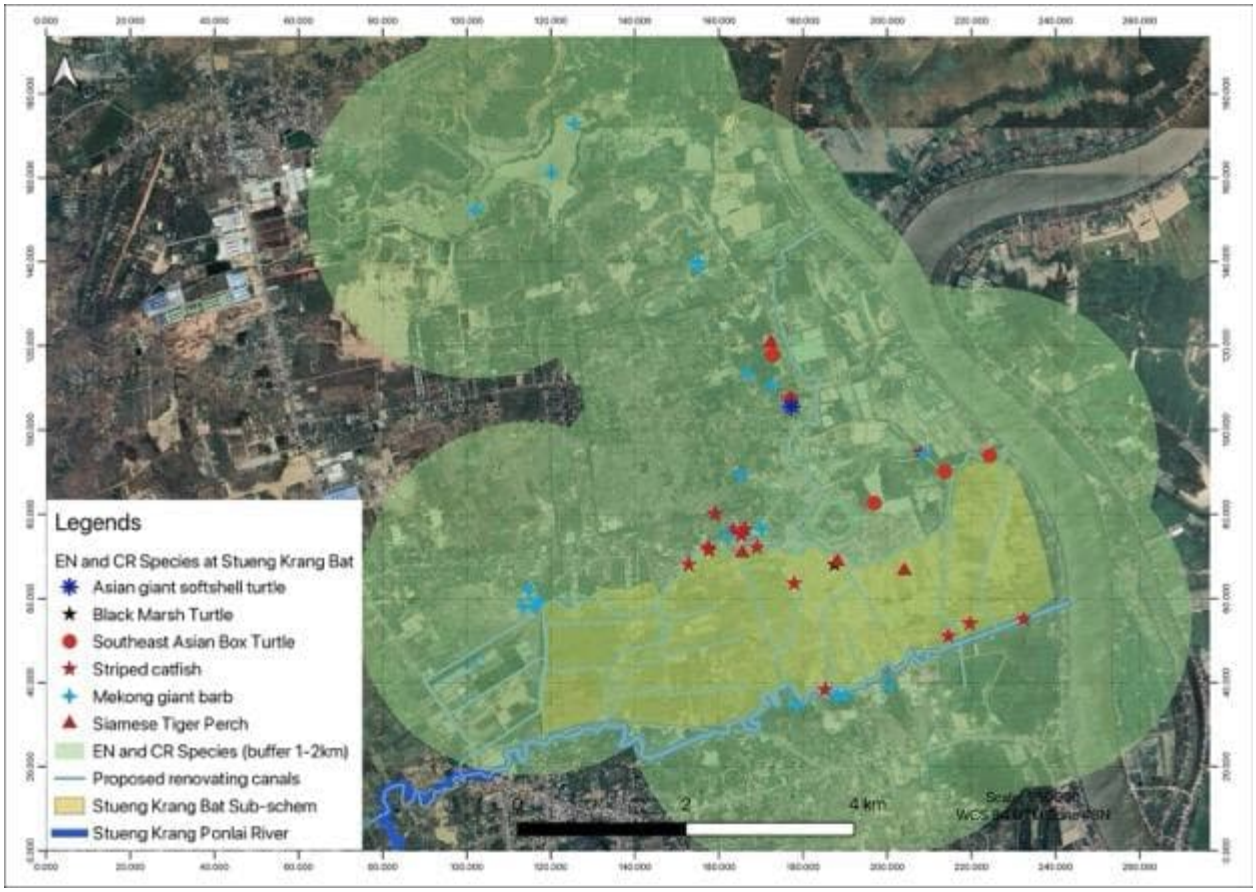

Figure 24: *Map showing the distribution of endangered (EN) and critically endangered (CR) species, with 1-2 km buffers indicating their potential movement ran ge within and around suitable habitats as identified by key informants sighted from 2020 to 2024.*

10.4 Determination of Critical Habitat Status (Step 3)

This section assesses the information (obtained from the above sub-section) vis-a-vis the criteria (presented in Section 3.4 - CH assessment method). This assessment aims to determine whether any species (identified in the list of 11 EN and CR species) qualify for Critical Habitat features.

10.4.1 Habitat of significant importance to CE and EN species

As presented in Section 4.6.3.3 (Ecological State), species that qualify as critical habitat features include:

The habitat assessment identified both modified and natural habitats within the command area. Modified habitats include areas substantially altered by human activity, such as agricultural land, natural lakes, wetlands, and river systems. Natural habitats consist of viable assemblages of native plants and animals, where primary ecological functions and species composition remain largely intact. Identifying critical habitats is essential for understanding the ecological requirements of different fish species within the project areas. The critical habitats identified in the assessment are diverse and support a range of endangered and critically endangered species. These habitats include:

- **Floodplains:** The floodplains, particularly those connected to the Tonle Sap Lake and Mekong River, provide important habitats for fish species during the flooding season. These areas are periodically inundated, creating a dynamic ecosystem that supports fish migration, spawning, and feeding.

- **Rivers and Streams:** The rivers and streams within the sub-schemes serve as crucial habitats for fish migration and spawning. The Stueng Krang Ponlai River in Krapeu Trom sub-scheme plays a vital role in connecting upstream watersheds to the Tonle Sap River basin.
- **Wetlands:** Wetlands such as marshes, swamps, lakes, and ponds are critical for supporting aquatic biodiversity. They provide breeding grounds for fish species and serve as important habitats for reptiles like Black Marsh Turtle and Southeast Asia Box Turtle.
- **Aquatic Vegetation:** Aquatic plants play a key role in providing food, shelter, and spawning sites for various fish species. They contribute to the overall health of aquatic ecosystems by improving water quality through nutrient uptake.

10.4.2 Habitat of significant importance to endemic or restricted-range species

None of the species under EN and CR classification are restricted-range species (based on IBAT report for SKB).

10.4.3 Habitat supporting globally or nationally significant concentrations of migratory or congregation species

This command area lies on the heart of Tonle Sap River Basin (TSRB) receiving annual flooding and submerging under the water seasonally. The whole floodplain area provides a signification congregation under the water during the wet season from August or September to January or February (depending on the flood situation) creating significant habitat for migratory fish, congregating downstream to upstream and vice versa..

10.4.4 Highly threatened or unique ecosystems

The Stueng Krang Bat irrigation sub-scheme is located in an area of high ecological importance within the Tonle Sap River system. The area is characterized by its proximity to the Tonle Sap Lake, the Mekong River, and their connecting channels, which provide a diverse range of habitats for fish species. This complex network of waterways supports a diverse range of fish species, making it a global hotspot for aquatic life. The confirmed presence of endangered and critically endangered species in the sub-scheme area highlights its ecological significance..

10.4.5 Ecological functions or characteristics that are needed to maintain the viability of the biodiversity values described above in (a) to (d)

Stueng Kang Ponlai or Krang Bat and its floodplain area serve as critical habitat for EN and CR species of fish and reptiles. These ecological functions are necessary to support biodiversity values (described under the above criteria). Protecting flooded forest habitats and maintaining hydrological functions and connectivity are key to securing the free movement of these rare species.

Table 19: Initial Screening of CH-qualifying Species Confirmed or Likely to Occur in the Stueng Krang Bat sub-scheme of the Project Area

English Name	Scientific Name	IUCN Status	Global population	Cambodia population	Migratory/ Congregatory	Habitat and Distribution	Likelihood of Occurrence	Rationale for Critical Habitat Screening	Screened In or Out
Reptile									
Giant Asian Pond Turtle	*Heosemys grandis*	CR	Unknown (suspected to have decreased by about 80%)	Unknown-kept declining	N/A	Thrive in the Tonle Sap Floodplain's slow-moving waters and abundant vegetation, shrubland, wetland, and ponds; 5-20 masl.	Very Low - Confirmed in AoI in 2024	There're large proportion of suitable habitats comprise of permanent wetland, ponds, flooded forest, complex river system lie on the mouth of Tonle Sap River and receive regular season flood of the Tonle Sap Basin. It's confirmed the present of this species. Likely to qualify as CH under Criterion 1& 4 threshold.	**IN**
Black Marsh Turtle	*Siebenrockiella crassicollis*	EN	Unknown (suspected to have decreased by about 80% in SEA)	Unknown-kept declining	N/A	Inhabits slow-moving shallow wetlands (marshes, swamps, ponds) in Cambodian lowlands. Historically widespread, its range remains broad but fragmented due to habitat loss, though it persists in some degraded areas.	Moderate - Confirmed in AoI in 2024	There're large proportion of suitable habitats comprise of permanent wetland, ponds, flooded forest, complex river system lie on the mouth of Tonle Sap River and receive regular season flood of the Tonle Sap Basin. It's confirmed the present of this species. Likely to qualify as CH under Criterion 1& 4 threshold.	**IN**
Southeast Asian Box Turtle	*Cuora amboinensis*	EN	Unknown-kept declining	Unknown-kept declining	N/A	The species inhabits lowland still-water environments such as ponds, marshes, and rice paddies. Their distribution is considered widespread across suitable wetland habitats in Cambodia, with a higher concentration likely in southern and western regions.	Moderate - Confirmed in AoI in 2024	There're large proportion of suitable habitats comprise of permanent wetland, ponds, flooded forest, complex river system lie on the mouth of Tonle Sap River and receive regular season flood of the Tonle Sap Basin. It's confirmed the present of this species. Likely to qualify as CH under Criterion 1& 4 threshold.	**IN**
Fish									
Striped catfish	*Pangasianodon hypophthalmus*	EN	Unknown	Unknown	Yes	This freshwater fish is native to the Mekong River Basin in Southeast Asia, including countries like Thailand, Laos, Cambodia, and Vietnam	Moderate - Confirmed in AoI in 2024	There're large proportion of suitable habitats comprise of permanent wetland, ponds, flooded forest, complex river system lie on the mouth of Tonle Sap River and receive regular season flood of the Tonle Sap Basin. It's confirmed the present of this species. Likely to qualify as CH under Criterion 1& 3 threshold.	**IN**
Mekong giant barb/ Giant Carp	Catlocarpio siamensis	CR	Unknown-declined over 90% in the last three	Unknown-kept declining	Yes	*Catlocarpio siamensis* once lived in deep Mekong pools and tributaries but are now extremely rare and restricted to isolated spots due to overfishing and habitat loss.	Very Low - Confirmed in AoI in 2024	Critically endangered, with severe population declines attributed to overfishing, dam construction, and habitat degradation, rendering it	**IN**

			generations					exceptionally rare. It's reported that only juvenile individuals migrate from the Tonle Sap River system into the Area of Influence (AoI) via the Stueng Krang Ponlai River, a Tonle Sap tributary. Likely to qualify as CH under Criterion 1& 3 threshold.	
Siamese Tiger Perch	*Datnioides pulcher*	CR	Unknown	Unknown	Yes	This freshwater fish species is native to the Mekong and Chao Phraya River basins in Southeast Asia, including Thailand, Cambodia, Laos, and Vietnam.	Moderate - Confirmed in AoI in 2024	There're large proportion of suitable habitats comprise of permanent wetland, ponds, flooded forest, complex river system lie on the mouth of Tonle Sap River and receive regular season flood of the Tonle Sap Basin. It's confirmed the present of this species. Likely to qualify as CH under Criterion 1& 3 threshold.	**IN**

Table 20: Results of the prioritisation exercise to support BAP planning: priority biodiversity for BAP action for Stueng Krang Bat

Action Category (AC)	Group	Priority Biodiversity	Mitigation and monitoring approach
AC 1 High Priority for habitat mitigation and/or species-specific measures	Freshwater Fishes	Striped catfish, Mekong Giant Barb, Siamese Tiger Perch	The highest priority for achieving net gain (offset targets) lies in the implementation of both species-specific and habitat-focused mitigation and offset actions.
	Reptiles	Asian giant softshell turtle, Black Marsh Turtle, Southeast Asian Box Turtle	
	Natural Habitats	Remaining flooded forest, and natural ponds/lakes	
AC 2 Contingency planning			
AC 3 General habitat mitigation measures			
AC 4 Remain aware			

10.5 Conservation action for Stueng Krang Bat Sub-scheme

A comprehensive Biodiversity Action Plan (BAP) should be developed to achieve net gain in biodiversity with clear outline below:

Proposed Conservation Action Plan for Stueng Krang Bat Irrigation Sub-Scheme

Executive Summary

This conservation action plan outlines strategies to mitigate potential negative impacts on biodiversity within the Stueng Krang Bat irrigation sub-scheme. The plan is based on a thorough assessment of the area's biodiversity, including the identification of endangered and critically endangered species. The proposed actions align with the International Finance Corporation's Performance Standard 6 (PS6) on biodiversity conservation and sustainable management of living natural resources.

Key Objectives

Protect endangered species: Implement measures to conserve the Black Marsh Turtle, Southeast Asian Box Turtle, Striped Catfish, Mekong Giant Barb, and Siamese Tiger Perch.

Maintain habitat quality: Preserve and restore critical habitats, including floodplains, rivers, wetlands, and aquatic vegetation.

Minimize negative impacts: Reduce the adverse effects of irrigation activities on biodiversity through careful planning and implementation.

Engage with stakeholders: Foster collaboration with local communities, government agencies, and other stakeholders to ensure effective conservation efforts.

Action Plan

1. Biodiversity Assessment and Monitoring

- Conduct comprehensive biodiversity surveys: Regularly assess the distribution and abundance of endangered and critically endangered species within the sub-scheme.
- Monitor habitat conditions: Track changes in water quality, sedimentation patterns, and habitat fragmentation.
- Evaluate the effectiveness of mitigation measures: Assess the impact of conservation actions on biodiversity and adjust strategies as needed.

2. Habitat Protection and Restoration

- Identify and protect critical habitats: Delineate and conserve areas of high ecological significance, such as floodplains, wetlands, and river systems.
- Restore degraded habitats: Implement habitat restoration measures, including reforestation, wetland restoration, and removal of invasive species.
- Maintain ecological flows: Ensure that irrigation practices do not compromise the natural flow regimes of rivers and streams.
- Protect fish passage: Incorporate fish-friendly structures and practices to facilitate fish migration and connectivity.

3. Mitigation Measures

- Avoidance and minimization: During project planning and design, prioritize avoidance of sensitive habitats and minimize impacts through careful site selection and engineering.

- Habitat protection: Implement measures to protect critical habitats during construction and operation, such as establishing buffer zones and avoiding disturbance of nesting sites.
- Water quality management: Control pollution and sedimentation to maintain water quality for aquatic species.
- Invasive species control: Prevent the introduction and spread of invasive species through appropriate management practices.
- Community-based conservation: Engage local communities in conservation efforts, such as habitat restoration and monitoring.

4. Stakeholder Engagement

- Involve local communities: Collaborate with residents and stakeholders to understand their concerns and knowledge about biodiversity.
- Establish participatory platforms: Create mechanisms for ongoing dialogue and decision-making.
- Promote awareness: Raise public awareness about the importance of biodiversity conservation and the potential impacts of irrigation schemes.

5. Collaboration with Conservation Organizations:

- Collaborate with recognized conservation organizations or academic institutions specializing in reptile/fish research for technical support in monitoring activities and best practices for habitat management.

6. Environmental Education Programs:

- Implement environmental education programs targeting local communities aimed at raising awareness about the importance of protecting critical habitats and promoting sustainable agricultural practices that minimize negative impacts on wildlife.

7. Fish-friendly Infrastructure Design:

- Ensure that all infrastructure development (such as canals, weirs) is designed with fish-friendly features like fish ladders or bypass channels to allow safe fish migration upstream/downstream during different seasons.

8. Invasive Species Control Measures:

- Develop invasive species control measures specific to irrigation canals to prevent the introduction/spread of invasive plant or animal species into native aquatic ecosystems like water hyacinth or tilapia fish.

Conclusion

This conservation action plan provides a framework for protecting biodiversity within the Stueng Krang Bat irrigation sub-scheme. By implementing these strategies, the plan aims to contribute to the long-term conservation of endangered species and the maintenance of healthy ecosystems in the Tonle Sap River Basin.

11. Mitigation Measures for all sub-schemes

11.1 Overviews

Ou Ta Paong: This sub-scheme and its surrounding area, particularly the lower section and adjacent Tonle Sap Zone 3, support diverse EN and CR species: reptiles

(Black Marsh Turtle, Elongated Tortoise, Giant Asian Pond Turtle, Southeast Asian Box Turtle), mammals (Indochinese Silvered Langur, Long-tailed Macaque), fish (Siamese Tiger Perch, Striped Catfish), and birds (Greater Adjutant, Milky Stork, Bengal Florican). Construction activities, including increased worker presence and improved access, risk habitat disturbance and facilitate illegal hunting and wildlife trafficking, driven by demand for traditional medicine and pets.

Lum Hach: This sub-scheme, encompassing several community forests, has confirmed Green Peafowl sightings. Construction activities, especially worker presence, pose substantial risks to this endangered species through direct disturbance, habitat degradation, and increased access for illegal hunting and trapping, compounding existing threats of habitat loss and encroachment.

Brambei Mom: After three screening rounds, no EN or CR species were confirmed in this sub-scheme. While initial screenings suggested potential presence of some species, these were not confirmed. Despite this, construction activities require careful planning to minimize ecosystem impacts, including dust and waste control, and post-construction habitat monitoring.

Krapeu Trom: this sub-scheme confirmed the potential presence of only the endangered Flying Minnow. While another species was reported downstream, its presence within the sub-scheme was unconfirmed. Existing water infrastructure and drought have already impacted fish migration. Construction activities may further threaten the Flying Minnow and its habitat. Mitigation measures are recommended across all project phases, including habitat avoidance, buffer zones, pollution control, water quality and fish population monitoring, and public awareness.

Yutasas: This sub-scheme has confirmed sightings of the critically endangered Jullien's Golden Carp, Leaping Barb (Flying Minnow), and Mekong Giant Barb. Construction activities, particularly worker presence, risk habitat disturbance and increased access for illegal fishing and capture, threatening these vulnerable species. Mitigation measures, including sensitive area avoidance, sustainable design, fish passageways, erosion control, and community-based conservation, are essential during all project phases.

Stueng Krang Bat: This sub-scheme supports several EN and CR species: reptiles (Asian giant softshell turtle, Black Marsh Turtle, Southeast Asian Box Turtle) and fish (Striped catfish, Mekong Giant Barb, Siamese Tiger Perch). Construction activities risk habitat disturbance and increased access for illegal hunting and capture, potentially worsening existing threats to declining fish populations. The project's area of influence requires careful mitigation during all phases, including fish-friendly infrastructure, habitat restoration, erosion control, and community engagement.

11.2 Trigger of Implementation

Overall: The reports emphasize the urgent need for careful project planning and mitigation measures, including habitat restoration and sustainable water management, to minimize negative impacts on vulnerable species and their critical habitats. The project's area of influence extends beyond immediate command areas, requiring a holistic approach to conservation. Collecting and trafficking protected species are prohibited as described in the *Cambodia law/regulation:*

- Forestry Law (2002): This law provides the framework for the management and protection of forests, including wildlife. It prohibits hunting, capturing, and trading protected wildlife species without permission.
- Fisheries Law (2006): This law governs the management and protection of fisheries resources, including aquatic wildlife. It prohibits illegal fishing methods and the trade in endangered aquatic species.
- Protected Areas Law (2008): This law establishes and manages protected areas, such as national parks and wildlife sanctuaries, to conserve biodiversity, including threatened species. It restricts activities that could harm wildlife within these areas.
- Sub-decree on International Trade in Endangered Animals and Plant Species (2006): This sub-decree implements the Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES) in Cambodia. It regulates the import, export, and re-export of CITES-listed species.
- Penal code: he Cambodian Penal Code includes provisions that criminalize wildlife trafficking, with penalties including imprisonment and fines.

11.3 P1.1. Impact: Illegal wildlife collection, possession, and trafficking by site workers/ personnel.

Mitigation Measures:

Pre-construction:

- Develop a:
  a. Code of Conduct/ethics against wildlife collection, possession, and trafficking,
  b. SOP for wildlife protection and handling, and
  c. Training and awareness materials on human-wildlife conflict management. This should include biodiversity awareness training to raise their awareness on the:
     (i) ecological sensitivity of the site, importance of forest habitats, protected and threatened plants and animals within the Project area;
     (ii) proper protocols to adopt when wildlife is encountered;
     (iii) need to be cautious when operating machinery to avoid injury/mortality to fauna; and
     (iv) zero tolerance policy to possession of wildlife and forest resources. This should be applicable to both staff and contractors. These materials will also be used for Phase 2 and Phase 3 of the Project.

Responsible for Implementation:

- The PMC-Ecologist/Biodiversity Specialist to develop a) Code of Conduct/ethics against wildlife collection, possession and trafficking, b) an SOP for wildlife protection and handling, and c) training and awareness materials on human-wildlife conflict management.
- The PMC-Ecologist/Biodiversity Specialist to coordinate with the government agencies on wildlife conservation (MoE, MoAFF) and may seek technical assistance from NGO that has strong experience in wildlife protection, collection, possession, and trafficking, such as WCS, CI, and WA in developing the Code of Conduct, SOP for wildlife protection and handling and awareness and training materials on human wildlife conflict management.

- **Provide mandatory training for Contractors management staff and site worker on:**
  a. Code of Conduct/ethics against wildlife collection, possession and trafficking,
  b. SOP for wildlife protection and handling, and

c. Human-wildlife conflict management.

Responsible for Implementation:

- The PMC is responsible in providing Training of Trainers to the CSCs and the CSCs are responsible to provide training on the Code of Conduct, SOP for wildlife protection and handling and awareness and training materials on human wildlife conflict management to all Contractors management staff and field workers prior to construction and operational Phases of the CAISAR project.
- The NGO and Cambodia conservation agency (WCS, CI, ANKO) staff can provide human resource in delivering the training.
- All management and field staff of the Construction Contractor are mandatory to attend the training on a) Code of Conduct/ethics against wildlife collection, possession and trafficking, b) SOP for wildlife protection and handling, and human-wildlife conflict management.

- Incorporate policy and associated systems and procedures inclusive of appropriate sanctions/contract termination actions that prohibit employees and/or subcontractors from possession, purchase, trade or collection of wildlife or forest resources that are legally protected, CITES listed, or classed as threatened by the IUCN Red List, in the Project Administration Manual (PAM) and Worker's Agreement.

Responsible for Implementation:

- The PMU and PIU to incorporate the policy and associated systems and procedures in the PAM.
- The CAISAR Contractors and CAISAR Operators to incorporate the policy and associated systems and procedures in the Worker's Agreement.

Construction:

1. Minimize forest encroachment, wildlife poaching, and tree cutting due to improved access from new roads, a community-based management plan will be developed and implemented.

a. Minimize the increased potential for forest encroachment and wildlife poaching by people who could use new roads to access forest areas.
b. Avoid forest and land encroachment.
c. Minimize the intensity of poaching.
d. Tree cutting by the people, due to improved access to the area

Responsible to implement:

- Plan Development: Jointly develop a practical management plan with local communities and landowners.
- Guard Posts: Establish and maintain guard posts on temporary access and inspection roads near residential areas and priority biodiversity areas. (Include guard post construction costs in contractor agreements.)
- Surveillance: Conduct routine surveillance inspections on roads and in priority biodiversity areas (with landowner cooperation) to remove traps and deter hunting, logging, and plant removal.
- Signage**:** Install and maintain signs:
  - Banning unauthorized access on temporary roads.
  - Prohibiting hunting, snaring, and other harmful activities, especially near priority biodiversity areas and working zones.
- Reporting**:** Report observed/recorded incidents of illegal activities to FiA, FA or other authorized agencies.

2. Undertake regular monitoring of all access roads (including all quarries and the cement batching plant) to secure them from poaching activities.

Responsible to implementation.

- The Contractor is responsible in undertaking regular monitoring of all access roads (including all quarries and the cement batching plant) to secure them from poaching activity.

3. Implement the PAM and Worker's Agreement which includes policy and associated systems and procedures inclusive of appropriate sanctions/contract termination actions that prohibit employees and/or subcontractors from poaching, possession, purchase, trade or collection of wildlife or forest resources that are legally protected, CITES listed, or classed as threatened by the IUCN Red List. Corrective measures should be taken where necessary including appropriate actions against infringements.

Responsible for Implementation:

- The Contractor to implement the policy and associated systems and procedures.
- PIU should develop appropriate levels of penalisation against degree of infringement ranging from fines, suspension, and employment termination, and reporting to local authorities for prosecution (for most severe cases).

4. Check if feasible to control access road users during construction through use of security gates. If yes, security gates are to be manned by at least one (1) security officer 24 hours per day who will record the particulars (name, address, vehicle registration number, personal identification number) of all vehicles who are allowed into the access road. Visitors must also be always accompanied by a company representative. The security officers should be trained to identify behaviour associated with poachers and vehicle searches. The security gate should be equipped with 24-hour CCTV cameras. Evidence of such inspections/ vehicle searches to be recorded and available for review.

Responsible to implement:

- The CAISAR Contractor.

5. Properly handle and rescue wildlife incidentally encountered or caught during land clearing and construction Phase by to safer habitats. Handling and rescuing wild fauna will follow the SOP for wildlife protection and handling.

Responsible for Implementation:

- The is responsible handling, rescuing, and reporting encountered or caught wildlife during land clearing and construction works.
- The Contractor needs to coordinate with Cambodia conservation agency (FA, Phnom Tamao Wildlife Rescue Centre, or ACCB) in handling or rescuing the wildlife.
- Wildlife Encounter Protocols & Training: Implement protocols for wildlife encounters and train workers on appropriate responses, emphasizing non-interference and prohibiting harmful actions.
- Rapid Response Wildlife Unit: Establish a rapid response unit (potentially through a third party) to address human-wildlife conflict effectively.
- Community Information: Educate the community on local wildlife behavior, avoidance techniques, and deterrent methods.

Residual Impact: Minimal residual impact.

11.4 P1.2. Impact: Wildlife collisions with construction and quarry vehicles.

Trigger of Implementation:

The increase in vehicle movements such as trucks and excavators, particularly in quarry areas and access roads, will likely lead to increased chances of collisions with wildlife such as mammals and reptiles.

Mitigation measures:

Design/Pre-construction:

1. Conduct thorough biodiversity inspections along the access roads and at quarry sites before starting any land clearing works. The inspections should be conducted to identify any habitat and/or nesting sites of endangered/ protected species that may be affected by the clearing and identify hotspots where collisions with wildlife are likely to occur.

Responsible to implement:

- The Contractor is responsible to conduct the inspections and identify hotspots where collisions with wildlife are likely to occur.
- The CSC- Project Ecologist to provide technical assistance and guidance to the Construction Contractor in in conducting the inspections.

2. Provide general guidance to land clearance (**refer to Section 12 Below for Land Clearance SOP**):
   a. When planning for expansion, ensure land clearance is undertaken in a Phased approach such that it complements wildlife shepherding activities.
   b. All proposed clearance areas will be marked in the field prior to any vegetation being cleared. The marking can use spray paint or marking tape. A briefing is to occur with personnel to outline the area proposed for clearing.
   c. An inspection is to occur following clearing to determine if clearing has been limited to the identified clearance area. Any clearing outside of the marked area is to be reported to the HSE Manager.

Responsible to implement:

- The Project Ecologist of CSC is responsible in providing guidance.

3. Prior to wildlife shepherding activities, undertake briefing with all involved personnel so they are aware of their roles and responsibilities; measures to deal with injured wildlife; occupational health and safety requirements; and requirements regarding the prohibition of hunting/ catching/ taking of fauna and flora. This will include incident reporting measures to relevant forestry authorities and stakeholders, and the reporting of any individual suspected or caught with fauna and flora to the relevant authority. Random inspections of personnel arriving and leaving the Project area can be considered. Refresher training is to occur with new employees.

Responsible to implement:

- The CSC- Project ecologist to train field workers to recognize and avoid wildlife.
- The field workers to report to the CSC HSE Manager of any wildlife sightings or collisions.

4. Provide features such as tunnels or rope bridges along temporary roads to enable wildlife movement and to reduce potential traffic incidents.

Responsible to implement:

- Design & Engineering Team: Responsible for incorporating wildlife crossing features (tunnels, rope bridges) into temporary road designs.
- Construction Contractor: Responsible for the physical implementation and construction of these features.

Construction:

1. Install signage to alert drivers to the presence of wildlife and require them to slow down and drive with caution, especially in hotspots where collision with wildlife is likely to occur.

Responsible to implement:
- The Contractor to install the signage to alert drivers to the presence of wildlife and encourage them to slow down and drive with caution.

2. Implement speed limit (less than 40km/hour), to reduce the likelihood of collisions and give drivers more time to react to wildlife on the road.

Responsible to implement:
- The Contractor to implement the speed limit.

Residual impact: Minimal Residual Impact

11.5 P1.3. To prevent wildlife deaths and minimize disturbance to wildlife along access and inspection roads.

Management Actions: To prevent negative impacts of vehicle traffic on wildlife (animal collisions, disturbance etc.) the following actions will be implemented by Contractors:

Mitigation measures:

Design/Pre-construction:

1. Develop a system in which drivers report locations of wildlife crossing and wildlife sightings**.**

Responsible to implement:
- Project Environmental Team: Responsible for designing and implementing the wildlife sighting/crossing reporting system.
- Drivers/Transport Staff: Responsible for reporting observed wildlife crossings and sightings.
- Site Supervisors/Foremen: Responsible for collecting and relaying driver reports to the Project Environmental Team.

2. Information campaigns to explain to drivers about the biodiversity management objectives that seek to avoid wildlife collisions and disturbance, including:

Responsible to implement:
- Wildlife Awareness: Workers will receive training on frequently encountered wildlife (e.g., snakes, turtles, tortoises, nocturnal animals) and appropriate roadkill avoidance measures.
- Speed Limit Enforcement: Training will emphasize adherence to speed limits and the consequences of violations.
- Roadkill Reporting: A clear reporting system for animal collisions will be established, including reporting locations and designated recipients.

Construction:

3. Install and maintain signs in areas of frequent wildlife crossings, saying "beware of animal crossing" (complete with pictures of animals) in language understandable to all.

Responsible to implement:
- Environmental/Safeguards Team: Responsible for identifying high-risk crossing areas and designing appropriate signage.
- Construction Contractor: Responsible for the physical installation and maintenance of the signs.

Residual impact: Minimal Residual Impact

12. Standard Operating Procedures (SOP) for Land Clearing and Rehabilitation[11]

12.1 Roles and Responsibilities

This SOP applies for PMU, CSC, contractors, subcontractors, and any other associated organizations.

1. **PMU:** Oversees the implementation of this SOP, ensures compliance with environmental regulations and lender requirements, and facilitates inter-agency coordination.
2. **CSC:** Provides technical supervision and guidance to the contractor, monitors compliance with this SOP, and ensures environmental safeguards are implemented effectively.
3. **Contractor:** Responsible for executing land clearing and rehabilitation activities in accordance with this SOP and relevant contracts.
4. **Subcontractors:** Responsible for performing specific tasks as delegated by the contractor and in compliance with this SOP.
5. **CSC Project Ecologist/Biodiversity Expert:** Provides expert advice on biodiversity protection, habitat restoration, and wildlife management.
6. **Wildlife Expert:** Conducts wildlife surveys, identifies sensitive areas, and provides guidance on wildlife relocation and protection.
7. **Botanist:** Identifies and assesses plant species for potential use in rehabilitation efforts and oversees plant propagation and transplanting.

12.2 Background

This implementation procedure for land clearing and rehabilitation provides direction for avoiding and if cannot be avoided, for minimizing negative impacts on biodiversity during the construction Phase. The clearing procedures take into account the types of wildlife that exist in the project site and in surrounding areas, the key species that the project aims to protect, and the impacts anticipated from vegetation clearing. In addition, the procedures consider the features of existing vegetation in the route, specifically on key areas identified in the Biodiversity Baseline Survey (2023).

12.3 Objective

This SOP aims to:

1. Ensure that the implementation of land clearing is in accordance with the requirements of environmental management required by the Lender in accordance with Cambodian Regulations.
2. Minimize the negative impacts of land clearing on biodiversity, particularly the reduction in the number of species and number of individuals of protected wildlife (see Table 3 in section 4.2.3 of the biodiversity report).
3. Minimize the negative impact from land clearing on habitat connectivity by minimizing fragmentation where possible maintaining canopy connectivity across cleared areas.

[11] This SOP has been adapted from good international industry practices such as the *Biodiversity Management Plan (BMP) Upper Cisokan Pumped Storage Hydropower, PT PLN (Persero), Master Development Unit – UIP JBT I, April 2021*, among others.

4. Maximize the use of various types of seedlings and saplings of plants that exist in areas prior to land clearing to be planted back in areas that need to be rehabilitated (e.g., spoil banks).

12.4 Phasing of land clearing SOP

Land clearing procedures are divided into several distinct Phases:

- **Preparation Phase**: Intended for land clearing planning, notification of clearing procedures to the contractors/subcontractors, and training for contractors/subcontractors and workers to ensure SOP is fully understood. The location and management of tree nurseries also need to be determined at this stage.
- **Pre-clearing Phase**. Areas that will not be cleared are clearly demarcated on the ground to ensure that no forest areas or trees are damaged beyond what has been planned. Within the areas scheduled for clearing, any trees with endangered or protected wildlife (e.g., nesting birds) are marked, as well as underground burrows or other places currently used by wildlife. Input from the Project Management Consultant's (PMC) Ecologist/Biodiversity Expert is required to determine next steps regarding the safe relocation of these animals. At this stage, seedlings, and saplings with the potential for habitat enrichment will be collected, moved to the tree nurseries and properly maintained.
- **Clearing Phase**: Intended to ensure that the felling of trees will not damage vegetation bordering on clearing areas by careful directional felling. This coincides with PMU and contractors what refer to as the land clearing, clearing and grubbing, and excavation works.
- **Post-clearing Phase:** Seedlings and saplings that have been maintained in tree nurseries are planted back in areas designated for rehabilitation (e.g., spoil banks) or reforestation (temporary access roads, worker camps, quarry areas, etc.). Wildlife monitoring programs are implemented both in areas adjacent to land clearing sites and in rehabilitation/reforestation zones.

12.5 Preparation Phase Management Actions

PMU shall establish a land clearing project team responsible for land clearing implementation. This project team consists of environmental inspectors, wildlife experts, plant experts, ecological/conservation experts.

Task of the land clearing project team are:

1. The Contracted Service Construction (SCS)-Project Ecologists determine the priority of the clearing block (at all locations across the project site, but especially when land clearing will happen in or near the forest and natural habitat area) and determine which trees will be cleared. Also, the CSC-Project Ecologists can temporarily stop clearing activities when negative impacts on wildlife could occur. The CSC-Project Ecologists generally provides direction to the contractor regarding the rules that must be obeyed.
2. A wildlife expert is tasked to observe whether or not the clearing block is being used by wildlife. The results of these inspections are reported to the CSC-Project Ecologists.
3. A botanist is tasked to note the presence of plant seedlings and saplings which have the potential for habitat rehabilitation. The results of these observations are reported to the CSC-Project Ecologists, and decisions are then made about which plants need to be taken to the tree nursery.
4. The contractor shall prepare a local tree nursery site for keeping the seedlings and saplings of plants, hire people to maintain plants in the nursery, and provide means to water plants to maximize survival.
5. The contractor shall set up a central information center for dealing with any human-wildlife conflict issues, as well as a place for public complaints about clearing. The center should be placed in a strategic location near the closest settlement, for example

in the Village Hall, local school, health centers, etc.) and can be the same center as used for managing project grievances.

6. The contractor is responsible for preparing and installing signs on animals crossing points, and providing information to workers about a total ban on hunting or collecting. PMU, PMC, PSC will all support the contractor to do this.
7. The CSC-Project Ecologists shall conduct an evaluation to ensure that the preparation stage has been properly implemented.

12.6 Pre – Clearing Phase Management Actions

1. The wildlife expert marks all trees that are used by wildlife with yellow paint. This includes trees with hollows or ground burrows used for nesting or sleeping. Active ground burrows are marked by yellow stakes. Marked trees are not cut down before it can be ascertained with confidence that the animals have left. Similarly no clearing or soil works are allowed in a radius of five (5) meters from an active burrow until the animal has left it.
2. The contractor is responsible for the collection of seedlings and saplings of potential for habitat enrichment as identified by the botanist in the preparation Phase. Training will be given as required to ensure that there is maximum success rate with translocated plants. Seedlings and saplings will be moved in polybags with minimal disturbance of root systems. The plants are moved to a local nursery site, equipped with shade cloth and close to a permanent water source from where the plants can be easily watered. Sufficient competent workers are hired to ensure plants are kept alive until the time of planting. In the reservoir area (area to be inundated) nurseries are established close to the river to facilitate watering. Once the location of the greenbelt has been determined, seedling and saplings are planted at the start of the rainy season when survival chances are highest.
3. The contractor shall prepare the project area and physically demarcate clearing block boundaries with clear stakes at an interval of 25 meters to avoid unnecessary damage to soils and trees in the area adjacent to work sites.
4. The contractor shall install signs to ban hunting or catching of wildlife in the area.
5. Wildlife experts need to identify places where culverts, rope bridges and other structures are to be installed.
6. The CSC-Project Ecologists and wildlife expert need to ensure that all action items scheduled for the pre-clearing Phase have been carried out.

Clearing Phase Management Actions (i.e., land clearing, clearing and grubbing, and excavation)

1. The CSC-Project Ecologists must ensure that the contractor and workers (local supervisor level) have received clearance and guidance or training on clearing procedures that should be implemented.
2. Trees marked with yellow are not felled before a wildlife expert has ensured that the tree is not being used by animals. Similarly, trees or burrows that are used by animals need to be protected from clearing activities until a wildlife expert has confirmed that no animals remain.
3. Felling of trees should be directed towards the clearing area to prevent damage to trees that will remain standing.
4. Hollow tree that have been felled (and have no commercial value), should be left in the remaining forest area as these provide important microhabitats for a range of wildlife species.
5. Any animals hurt during the land clearing process (despite the above precautions) should be

handed over to the rapid response wildlife management unit (Forestry Administration, Phnom Tamao Wildlife Rescue Centre, or Angkor Centre for Biodiversity Conservation). After the animal has been brought back to health, it is released back into the area. If they are endangered or critically endangered species then the individual will be monitored.

6. After each block is completed, a wildlife expert should make a clearing report which contains:
   - The type and number of individual seedlings and saplings of plants taken to be maintained in a nursery.
   - The type and number of animals found during clearing, as well as the direction of movement of animals. Including the number of bird's nest containing eggs or young birds.
   - The type and number of animals to be treated.
   - The number of suspected hollow tree inhabited by wildlife.
   - The number of locations used by ground animals (as nests or shelter).
   - The number of damaged trees located in the area adjacent to the block clearing and embankment areas.
7. To prevent bush fires, any activities that could potentially cause a fire are prohibited including making a fire or discarding cigarette butts. The contractor is responsible for training staff regarding fire risk, and maintaining a trained firefighting squad.
8. The CSC-Project Ecologists and wildlife expert need to ensure that all action items scheduled for the clearing Phase have been carried out.

12.7 Post-clearing Phase Management Actions

1. The CSC-Project Ecologists ensures that wildlife monitoring takes place (refer to **Section 9.2.3 of the ESCIA Report**).
2. All exposed areas (roadsides, cuttings, laydown areas, spoil banks, etc.) shall be replanted as soon as practical following earthworks / construction / end of temporary use. The contractor shall follow the BMP, and seek input from wildlife and botanical experts, with respect to the types of plants that should be replanted (based on the location, slope, and long-term land use).
3. With input from wildlife and botanical experts areas for habitat enrichment planting or reforestation are selected and at the right time of the year (start of the rainy season) trees from tree nurseries are transplanted to new areas.
4. For at least the first and second year, all planted trees need to be monitored (and replaced if dead), watered (if needed) and kept free from weeds, climbers and other plants that inhibit their growth. This work is best done in collaboration with local authority, NGOs, and local communities, as needed.
5. The CSC-Project Ecologists and wildlife expert need to ensure that all action items scheduled for the post-clearing Phase have been carried out.

13. Key Considerations

The low section of this area is rich in biodiversity. Some endangered and critically endangered bird species like Greater Adjutant, Milky Stork, and Bengal Florican are confirmed at the lower section of this area, and critically endangered fish of Siamese Tiger Perch and Critically Endangered Black Mash Turtle are confirmed at the upper part of this area at Boeung Kamsaeng Lake and Svay Daunkav River. Furthermore, four other EN and CR species of reptile including the Black Mash Turtle, Southeast Asian Box Turtle, Giant Asian Pond Turtle, and Elongated tortoise and two CR mammal species including the Indochinese Silvered Langur and Long-tailed Macaque are confirmed in the flooded forest habitat and natural lack in adjacent to the lower section of this command area's boundary. Those bird species are using seasonal wetlands, lakes, waterholes, grasslands, and fellow

rice fields as their foraging habitat. Lum Hach is especially important for Green Peafowl. These species have small populations and are highly dependent on their habitats.

The fish surveys conducted in Krapeu Trom and Stueng Krang Bat irrigation sub-schemes have revealed the presence of various fish species, including endangered and critically endangered ones. The information gathered from key informant interviews provides insights into the abundance and distribution of these species within the project areas. Based on assessment results for Krapeu Trom sub-scheme at least two rare fish species have been confirmed present from 2020 to 2024 - Isok barb/Jullien's Golden Carp (Probarbus jullieni)and Leaping barb/Flying Minnow (Laubuka caeruleostigmata). On Yotasas Irrigation subscheme at least three endangered species had been confirmed present - Jullien's Golden Carp; Flying Minnow; and Mekong Giant Barb. And finally at Stueng Krang Bat Subscheme three EN/CR fish species –the Striped catfish; Mekong Giant barb; Siamese Tiger Perch

The key considerations from these findings are the importance of prioritizing ecological considerations during the design phase, implementing strict environmental safeguards during construction, and engaging in ongoing monitoring and adaptive management during the operation phase. Additionally, educating staff on biodiversity concerns, involving local communities in conservation efforts, promoting sustainable land use practices, establishing habitat protection measures, considering biodiversity offsets for significant residual impact, cultivating community-based conservation initiatives should also be prioritized. These actions are essential for mitigating potential impacts on biodiversity and maximizing the benefits of both OTP, LH and ather 4 sub-schems. Bellow are key interventions should considered and adopted for sustainable development an protection for biodivesity and ecosytem.

Habitat Conservation and Restoration:

- **Critical Habitats:** Identify and protect critical habitats, such as flooded forests, wetlands, and areas important for endangered species.
- **Habitat Restoration:** Implement measures to restore degraded habitats and improve their suitability for biodiversity.

Sustainable Resource Management:

- Fishing Practices: Promote sustainable fishing practices to prevent overfishing and protect fish populations.
- Agriculture: Encourage sustainable agricultural practices that minimize negative impacts on biodiversity and water quality.
- Water Management: Implement sustainable water management practices to ensure adequate water availability for both human needs and ecological functions.

Community Engagement and Participation:

- **Involvement:** Involve local communities in decision-making, monitoring, and conservation efforts to build ownership and support.
- **Sustainable Livelihoods:** Promote sustainable livelihoods that are compatible with biodiversity conservation.

Monitoring and Evaluation

- **Regular Monitoring:** Establish a long-term monitoring program to track changes in habitat quality, species populations, and the effectiveness of mitigation measures.
- **Adaptive Management:** Be prepared to adjust conservation strategies based on monitoring results and changing conditions.

Policy and Governance

- **Strengthened Policies:** Ensure that existing policies and regulations are adequate for protecting biodiversity and promoting sustainable resource management.
- **Enforcement:** Enforce environmental laws and regulations to prevent illegal activities that harm biodiversity.
- **Institutional Capacity:** Strengthen the capacity of government agencies and NGOs to effectively implement conservation measures.

A quick conclusion from this first assessment and observation, these healthy flooded forest and wetland ecosystem are exposed to high risk to more land encroachment and conversion for agricultural expansion when the water are available in the area. The expansion of irrigation and agricultural intensification can pose significant threats to flooded forest habitats, wetlands, and critically endangered species. Here are some of the major threats associated with these activities: anticipated

a. Habitat Loss and Fragmentation

- **Conversion of Land:** Flooded forests and wetlands may be drained or filled to create more arable land for agriculture, leading to significant loss of habitat.
- **Fragmentation:** Remaining natural habitats may become isolated patches, making it difficult for species to migrate, find mates, and maintain healthy populations.

b. Alteration of Water Regimes

- **Water Extraction:** Increased irrigation often involves the extraction of large volumes of water from rivers and aquifers, altering natural water flows and drying out wetlands.
- **Flood Control Measures:** The construction of dams and levees for irrigation can disrupt the natural flooding cycles that many species depend on for breeding and feeding.

c. Pollution

- **Nutrient Runoff:** Fertilizers used in agriculture can run off into water bodies, causing eutrophication, which leads to algal blooms and decreased oxygen levels that can harm aquatic life.
- **Pesticides and Herbicides:** These chemicals can contaminate water sources, posing risks to aquatic species and entering the food chain, affecting predators.

d. Invasive Species

- **Introduction of Non-Native Species:** Changes in land use and water management can introduce invasive plant and animal species that outcompete native species and alter ecosystem dynamics.

e. Loss of Biodiversity

- **Species Decline:** Habitat loss and degradation can lead to declines in species populations, particularly those already classified as critically endangered.

  Disruption of Ecosystem Services: The loss of biodiversity can disrupt ecosystem services such as water purification, flood control, and carbon storage.

ANNEX 6: CHANCE FIND PROCEDURE

The following *"chance find"* procedures must be included in all third-party contracts (e.g. Letters of Agreement) in instances where the contracted party is assisting with project implementation and/or construction activities.

Provincial PMUs will ensure that the bidding documents and work contracts for civil works contractors include clauses on chance find procedures. Specifically, the clause will stipulate that if the Contractor discovers archeological sites, historical sites, remains and objects, including graveyards and/or individual graves during project implementation, the Contractor shall:

- Stop the activities in the area of the chance find.
- Delineate the discovered site or area;
- Secure the site to prevent any damage or loss of removable objects. In cases of removable antiquities or sensitive remains, a night guard shall be arranged until the responsible local or provincial authorities take over.
- Notify the supervisory Safeguards Specialist within the PMU who, in turn, will notify the responsible local and provincial authorities immediately (within 24 hours or less);
- Responsible local and/or provincial authorities would oversee protecting and preserving the site before deciding on subsequent appropriate procedures. This would require a preliminary evaluation of the findings to be performed by government approved archeologists. The significance and importance of the findings should be assessed according to the various criteria relevant to cultural heritage; those include the aesthetic, historic, scientific or research, social and economic values.
- Decisions on how to handle the finding shall be taken by the responsible local and provincial authorities. This could include changes in the layout (such as when finding an irremovable remain of cultural or archeological importance) conservation, preservation, restoration and salvage.
- Implementation for the authority decision concerning the management of the finding shall be communicated in writing by relevant local authorities; and
- Project activities could resume only after permission is given from the responsible local or provincial authorities concerning safeguard of the heritage.

Note that the reporting of chance finds only occurs when an item/area/etc. of cultural significance is found and is only carried out insofar as what is detailed above (i.e. reporting the find, reporting how the item/area will be treated moving forward). Reporting begins with the local level implementer (e.g. staff tasked to the implement the project within a village) notifying the Safeguards Specialist, after which, the Safeguards Specialist guides the process according to the instructions above (e.g. notifying the relevant government authorities).

ANNEX 7: LIST OF ARCHEOLOGICAL AND CULTURAL SITES

The following are the list of the archeological and cultural sites within the command areas as per the statistics given by Provincial Department of Culture and Fine Arts in 2024.

ANNEX 8.1: RESULTS OF THE CONSULTATIONS IN PURSAT PROVINCE

Consultation Level	Provincial
Date	August 21st, 2024
Sub-Scheme	Ou Ta Paong
Organization	Pursat Provincial Hall
Participants	Mr. Lay Viseth
Moderator	1. Mr. Chun Nimul 2. Miss Tuon Somphorsdavin
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The sectors with potential for development in the province include agriculture (rice, cassava, corn, and oranges) and mining (stone and sand). Notably, reservoirs No. 1, No. 3, and No. 5 are supplying the province, while Reservoir No. 2 is under construction. - In the agricultural sector, 78% of the province's population are farmers, which emphasizes the importance of agriculture in development plans. - Challenges in implementing the CAISAR project include difficulties in sourcing water from Dam Ampeul due to its distance from O Ta Pong and its potential impact on the population. Conversely, sourcing water from Kbal Hong, which is closer and has existing canals, would avoid population displacement. - The environmental and biodiversity impacts in the area are minimal. Regarding the livelihoods of residents, the project benefits farmers by providing irrigation during the dry season, creating agricultural jobs, and addressing poverty in priority areas 1, 2, and 3, though these areas still require significant attention. - There are no major issues with resettlement in the province due to the existence of clear policies and active participation from relevant institutions, including departments, communes, and villages, along with scheduled compensation from the government. - The General Department responsible for mitigating impacts is working to secure land for project implementation by coordinating meetings with affected residents, officials, and banks to collectively resolve disputes. -
Requests	- Strengthen livelihood capacities - The project should be implemented quickly - Prepare to participate in project work, cooperate, and implement - Work together to face and resolve challenges

Consultation Level	Provincial
Date	August 21st, 2024
Sub-Scheme	Ou Ta Paong
Organization	Department of Agriculture Forestry and Fisheries, Pursat province
Participants	1. Mr. Hun Sovan 2. Mr. Meas Set
Moderator	Mr. Keo Sony
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- Each household owns an average of 3 hectares of farmland. - Farmers use an average of 250 kg of seeds per hectare during the dry season and 300 kg per hectare during the wet season. - Seeds are purchased from companies (OM seeds from Vietnam and local varieties) and saved for 2–3 generations. Seeds for mung beans and cucumbers are also purchased. - Fertilizer is applied to rice twice per season and to other crops three times. - Insecticides are applied to rice five times per season and to other crops 5–6 times per season. - Farmers hire labor for plowing, harvesting, and spraying pesticides. - Rice is sold directly in the fields, while other crops are sold at home. - Challenging of farming are flooding, water shortages, and climate change (currently facing water scarcity). - Farmers purchase seeds and also save their own. - Chemical fertilizers are currently suitable for the area. - Pesticide: While not ideal, there are no better options.

	- Insufficient water availability due to poor water management and lack of infrastructure. - There are no fees as there is no community-based water management system. - Rice is harvested by machine, and other crops are harvested manually. - Production Cost: Include plowing, fertilizers, pesticides, seeds, harvesting, and transportation. - Quick-harvesting crops like mung beans, cucumbers, and cabbages are grown popularity in the area. - Along the Ou Ta Pong stream is suitable areas for vegetable cultivation. - Vegetable Crop Benefits: Quick harvest time and broad market opportunities. - The Department organizes meetings between buyers and farmers to secure markets. - Fish Species Recommended: Catfish, silver barb, and tilapia. - Fish Farming Areas: Along the O Ta Pong stream near households. - Market Opportunities for Fish: Expected to thrive quickly, with the Department facilitating market access for farmers. - Challenges in Fish Farming: Insufficient water availability. - Training Provided: The Department conducts 20 training sessions per year for rice farmers (twice annually in the O Ta Pong area) on cultivation techniques and awareness. - 2023 Training Topics: Focused on rice production and the promotion of other crops. - Average Rice Cultivation: Farmers cultivate rice twice per year on average. - Additional Training Sources: Farmers receive training from partner organizations and fertilizer and pesticide companies. - Support from the Department: Committed to supporting projects by providing training, technical guidance on water conservation, and promoting solar-powered systems. - Water Availability and Management: Improved water accessibility enhances agricultural productivity, mitigates natural disasters (floods and droughts), and ensures water availability when needed. - Areas for Improvement: Establish agricultural technical officers at the commune level to train farmers, address challenges, find markets for agricultural products, and provide training on seed selection.
Requests	- Study technical methods for constructing irrigation systems properly to avoid water shortages or flooding in nearby areas. - Canals must have a consistent water supply. - Ensure stable water distribution and avoid conflicts over water usage. - Raise awareness among the population and stakeholders about the existence and benefits of the project.

	- Solutions: Adjust planting schedules and adopt intercropping methods; build reservoirs, ponds, and wells; educate and train people on water conservation; and encourage farming practices that do not exceed the area's available water resources.

Consultation Level	Provincial
Date	August 21st, 2024
Sub-Scheme	Ou Ta Paong
Organization	Department of Water Resources and Meteorology, Pursat province
Participants	1. Mr. Kit Phal 2. Mr. Lao Sokha 3. Mr. Ra Sovanret 4. Mr. Mao Mina
Moderator	Miss Sek Liny
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The current water sources are sufficient for the rainy season but inadequate for the dry season. This is because the agricultural land spans 110,000 hectares, while water can only supply 20,000 hectares. Presently, farmers cultivate 70,000 hectares, with a water shortage affecting about 10%. (Farmers use water reserved for livestock for their fields, leaving no water in ponds or other reservoirs.) Farmers exceed recommended cultivation levels due to the high market value of rice and observing others doing the same. - The rainy season’s water supply is generally sufficient for rice farming, making water shortages uncommon. However, the dry season still faces water scarcity issues. - Developing water resources in the province presents challenges and obstacles that impact farmland and residents' settlements, though the impact is minimal if development occurs using existing systems.

	- In the Ou Ta Paong area, there is a water users' community with a committee, but it is nonfunctional due to insufficient water supply for farmers. - The CAISAR Project aims to improve water access for farmers, establish efficient community operations, provide technical knowledge, and train communities on conflict resolution since many residents do not follow instructions or announcements from authorities. - Other challenges in water management include: ● Providing inaccurate data on cultivation areas (underreporting actual numbers). ● Water shortages due to farmers cultivating more fields than recommended (ignoring guidelines and the water department's supply limitations). ● Insufficient water sources for rice farming. ● Conflicts in water allocation caused by noncompliance with distribution rules. ● Farmers neglecting field maintenance and not participating in water distribution or monitoring. ● Farmers leaving water gates open, causing water loss (with insufficient community representatives monitoring usage). ● Unauthorized water usage during off-hours by individuals while community representatives are unavailable (e.g., stealing water between 10 p.m. and midnight). - The state of water resources and management in target areas involves discussions on water allocation. However, cases of water theft persist, and some residents refuse to adhere to recommended water levels (reluctant to share with downstream users). Water is sourced from key areas, such as the Stung Thom (Promaoy), Stung Areng (Dams #3 and #5), and Stung Prek Khlong (via Stung Pursat). - Management: Contract officers manage water sources upstream, while local authorities oversee water usage at the village, commune, and district levels. Annual meetings are held to plan water use and allocation. - Importance of irrigation systems in the livelihoods of citizens: ● Provide water for farming (rice fields, vegetable cultivation, and livestock). ● Reduce migration by encouraging farmers to increase rice farming. ● Maintain a higher population in villages (limiting migration). ● Enable more local business activities due to increased buyers and consumers in the area. ● Boost water-related businesses (e.g., purified water production).
Requests	- Provide additional training on water management and technical skills to the water user communities.

	- Supply modern equipment and new technologies to the officials within the department. - A farmer in Romlech commune expressed happiness about the establishment of the irrigation system but dissatisfaction with the construction company. The issue stems from uneven land excavation, leaving deep pits that make the remaining land near the canal unusable for farming. (The farmer has also demanded $200 in compensation from the company.)
Photo	

Consultation Level	Provincial
Date	August 21st, 2024
Sub-Scheme	Ou Ta Paong
Organization	Department of Labour and Vocational Training, Pursat province
Participants	Kol Buntheuorn
Moderator	1. Mr. Chun Nimul 2. Miss Tuon Somphorsdavin
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The employment and vocational training in the project area focus on agriculture, tourism, industry, and agro-industry. - The department's role in managing and monitoring project activities includes providing guidance to workers in the area, collaborating with company owners, and ensuring worker safety. - The department provides vocational skills training to farmers in the community, focusing on crop cultivation and livestock rearing. - Female migration does not significantly impact the labor force needed for rice production, as farming activities are partially automated. - The CAISAR project has minimal impacts on the community and work environment, as it is located downstream, in areas previously prone to seasonal flooding.

	- Migration occurs mainly after agricultural and household work, contributing to increased household economic stability. - In terms of health, the project has no significant adverse effects since the irrigation system does not involve chemical usage. Minor disturbances include occasional noise or vibrations.
Requests	- Support the project because it is in Zone 2.
Photo	

Consultation Level	Provincial
Date	August 21st, 2024
Sub-Scheme	Ou Ta Paong
Organization	Department of Women's Affairs, Pursat province
Participants	1. Mr. Morn Kimsoeurn 2. Ms. Teou Sonary 3. Ms. Kruoch Bunly
Moderator	1. Mr. Chun Nimul 2. Miss Tuon Somphorsdavin
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The participation of women in agricultural work has declined due to low market prices for agricultural products (e.g., vegetables), high input costs, limited water availability for irrigation during the dry season, and low participation in community meetings. - Incidents of violence have decreased in both mild and moderate cases. - Mild cases: Victims report to the commune-level officials.

	- Moderate cases: Complaints are filed with the local police or judiciary, potentially leading to mediation, separation orders, or arrests. - The department collaborates with local authorities at all levels to monitor, identify pro bono lawyers, and report cases to the National Council and Ministry of Women's Affairs. - Resolutions are coordinated with local authorities at the commune and district levels. - Support is provided to help victims find pro bono legal representation. - Reports are prepared and submitted to the National Council and Ministry of Women's Affairs. - Resolutions for minor cases are handled at the village, commune, and district levels through education, mediation, and agreements. Moderate cases may involve separation orders, arrests, divorce petitions, or formal mediation. - Government mechanisms, including the six-point Neary Rattanak Policy and plans for women, are effective. Relevant departments collaborate with the Department of Social Affairs and Women's Affairs to track victims and arrest or detain perpetrators. - There is concern about gender-based violence (GBV) risks linked to the presence of project staff in the area. - Projects aimed at reducing GBV risks must enforce policies, ensure worker discipline, and hold companies accountable for staff conduct. - GBV risks in the area depend on individual behavior and interpersonal relationships. - Construction companies must coordinate and implement measures to protect the community from sexual exploitation and abuse/sexual harassment (SEA/SH). - All project staff operating in the area must participate in awareness campaigns, receive guidance, and adhere to strict discipline. Strengthening judicial systems and providing training on legal issues related to complaints are also necessary.
Requests	- The department's staff lacks financial support, relying only on the department's own mission budget. - It is necessary to consider deploying specialists to educate and raise awareness about issues of violence. - Expedite the construction and restoration of this irrigation system project.

Photo	

Consultation Level	Provincial
Date	August 21st, 2024
Sub-Scheme	Ou Ta Paong
Organization	Department of Environment, Pursat province
Participants	1. Mr. Dang Rady 2. Mr. Lay Vannak
Moderator	Miss Sek Liny
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The general situation in the province includes areas with multi-use nature conservation zones (Tonle Sap region) and national parks. - The department is responsible for monitoring and inspecting various locations, with some locations requiring daily inspections. - The department's role involves regular project monitoring in three phases: pre-project, operational, and post-completion (managing waste and construction debris). It also raises public awareness about hygiene among the affected population and the general public, although hygiene issues persist. The department will continue its awareness campaigns. - Major challenges include insufficient public participation, requiring regular monitoring. Approximately 40% of urban residents have not yet participated in sanitation efforts (previously, more residents were involved in municipal waste disposal, but participation has declined due to economic issues, as residents must pay monthly waste collection fees). The ministry has a campaign to reduce plastic usage, with factories participating more actively and improving management compared to before. However, there is a lack of technical staff, and a

	significant portion of the population continues to dump waste indiscriminately rather than using designated bins. - The department has contributed materials to the project but has not yet established other forms of collaboration. - Key biodiversity areas/species/habitats are not affected by the project but have been improved instead. Biodiversity areas are primarily located in the Tonle Sap region, which could face impacts if construction workers improperly dispose of waste. - Positive environmental and biodiversity impacts: The project improves fish habitats, allowing aquatic species to migrate and increasing fish production due to larger waterways. Residents benefit from higher fish catches, reduced costs, expanded agricultural production, and livestock farming. The project also helps clean the environment by reducing unauthorized constructions and indiscriminate waste dumping by the community. - Negative environmental and biodiversity impacts: Construction and project activities may cause water and air pollution, soil erosion, waste from workers and machinery, noise pollution, and impacts on residential and commercial lands. Wastewater and debris could enter conservation zones and multi-use areas (Tonle Sap), polluting water and affecting fish in the Tonle Sap area. - Solutions: o Provide compensation or alternative arrangements for affected families regarding land issues. o Schedule construction to avoid noise pollution during residents' rest times. o Offer temporary business locations for those affected by partial loss of commercial land. o Restrict the use of outdated machinery, allowing them only in rural areas. o Promote clean living practices, reduce plastic usage, and improve waste management. o Conduct air quality tests to prevent water pollution.
Requests	- Request to conduct water and air quality tests before starting construction in order to compare the conditions during and after construction. - The construction company must regularly monitor the workers' living conditions, waste management, and ensure there are proper sanitation facilities and adequate housing for the workers. - The company provides education and guidance on maintaining cleanliness and hygiene for the workers (such as proper waste disposal and handling of oil) and prohibits activities like fish poaching and hunting.

Consultation Level	Provincial
Date	August 21st, 2024
Sub-Scheme	Ou Ta Paong
Organization	Department of Land Management, Urban Planning and Construction, Pursat province
Participants	Mr. Suong Se
Moderator	1. Mr. Chun Nimul 2. Miss Tuon Somphorsdavin
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The land use and land ownership registration in the Ou Ta Paong area are fully documented in the system. - The general issues related to land use are that conflicts may arise on an individual basis. - The system's land certificates is existing, but there have been difficulties in issuing certificates for citizens concerning land cultivation. - The impact of the CAISAR project on the community and land use is not a concern, as there is a registered irrigation plan in place. - There are no concerns about the restoration of the irrigation system, as it benefits the local population.
Requests	- Conduct a study on the impacts on the irrigation system. - Request shapefiles to clearly define boundaries and prevent opportunistic individuals from causing issues with land value or exploiting profits through speculation.

	- Request proper land parcel delineation or ensure that all citizens with land ownership certificates are accounted for.
Photo	

Consultation Level	Provincial
Date	August 21st, 2024
Sub-Scheme	Ou Ta Paong
Organization	Department of Culture and Fine Arts, Pursat province
Participants	1. Mr. Ut Raksa 2. Mr. Chea Sophea 3. Mr. Teng Phearum
Moderator	Miss Sek Liny
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- In the province, there are no complete temple structures, only the foundations and ancient mounds that were once inhabited. There are 9 temple foundations, 91 ancient mounds, 15 small mounds, 11 ponds, and 34 other features. - The status and characteristics of the temples in the CAISAR project area are as follows: in Bakan District, there are 6 temple foundations, 50 ancient mounds, 1 pond; in Ou Ta Paong Commune, there is 1 temple foundation and 16 mounds. - The role and activities of the department include the preservation, protection, and promotion of the value of national cultural heritage, organizing conservation, registration of ancient objects to prevent loss, registering the inventory of ancient buildings and historical sites, collaborating with authorities to prevent crimes related to cultural

	heritage assets, conducting archaeological surveys and determining ancient locations, and promoting the awareness of historical sites. - Potential impacts and changes to the heritage site area due to the project may affect the water channels and the base of the ancient temple, Phnom An.
Requests	- Request that the project be relocated or diverted away from the temple site. - If the project cannot be avoided, request project funding for mitigation efforts and preservation activities to protect the cultural heritage.

Consultation Level	Provincial
Date	August 21st, 2024
Sub-Scheme	Ou Ta Paong
Organization	Sustainable Cambodia Organization, Pursat province
Participants	1. Phang Polin 2. Ok Seab
Moderator	Mr. Nhoeb Phearun
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- Involvement with clean water and sanitation for poor households, providing rainwater collection tanks with a capacity of 400 liters. If possible, also provide small portions of help such as digging latrines, building sanitary latrines, teaching vegetable gardening, creating compost, community ponds for animal farming to increase income, and forming groups of 10-15 people per group. Additionally, provide sewing lessons to make souvenirs (bags, phone cases, washable sanitary pads, etc.) and maintain sanitation for women.

	- Concerns and challenges include high migration rates, and group formation is often influenced by political affiliation, with the village chief selecting members based on their political party alignment.
Requests	- If the project affects citizens' land, please provide them with appropriate compensation. - If possible, preserve large trees.
Photo	

Consultation Level	Provincial
Date	August 21st, 2024
Sub-Scheme	Ou Ta Paong
Organization	Lutheran Hope Cambodia Organization, Pursat province
Participants	Ms. Ruon Phorn
Moderator	Mr. Nhoeb Phearun
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- Activities related to clean water, sanitation, agriculture (vegetable farming, animal husbandry), drip irrigation systems, and greenhouses for vegetable farming, strengthening community activities with committees to promote awareness among youth. - Providing sanitation training to communities and schools, resolving disputes outside the judicial system with the community, and raising awareness about migration. - The project has been progressing well, with enough funds to implement the plan, but the main difficulty is finding money for continued project implementation. This has led to reducing staff, and community participation has been slow due to high migration rates.

	Many people are in debt and are focused on earning money, leaving no time to participate in the project. - Concerns and challenges include potential impacts on agricultural land around the irrigation systems and disputes between project implementers and beneficiaries, causing delays in farming. - Impact, benefits, and changes from the CAISAR project: After completion, the irrigation system was sufficient, leading to increased production. Migration was reduced as people worked on farms four times a year, and animal husbandry and fish farming were incorporated to create a more sustainable environment. - People with less land may lose their land, and there is a lack of farming land. Children are not able to attend school because they must follow their mothers to work in distant areas.
Requests	- Provide appropriate compensation when construction takes place, or allow them to exchange land where they can farm.
Photo	

Consultation Level	Provincial
Date	August 21st, 2024
Sub-Scheme	Ou Ta Paong
Organization	HEKS - EPER Cambodia Organization, Pursat province
Participants	Ms. Khorn Sokluk
Moderator	Mr. Nhoeb Phearun
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project

Perceptions and concerns	- The registered land is limited; the project will assist in improving the living conditions of the people. - The needs of the people have been addressed, and they can participate in the responsibility of maintaining and using water. - Organized discussions with agents to encourage them to be operators. - The relationship between the CAISAR project and organizations can help address household or farming needs and ensure the sustainability of water irrigation for a long time. - Study the necessary requirements to ensure farming can be done in both seasons with adequate water supply. - Concerns and challenges include land affected by construction near irrigation systems or the placement of construction projects, with some areas of land that people are using being close to harvest time and potentially rendered unusable. - Reduce migration by strengthening capabilities in farming and livestock management (government should allocate leadership and manage water distribution). - Reduce impacts and conduct more studies; the risks and benefits of water flooding in villages should be shared. - Minimize negative effects and discuss with people whether irrigation restoration is indeed a need. - Establish teams for maintaining irrigation systems and water gates, and add trees when preparing the irrigation areas.
Requests	- Set a specific deadline to prevent negatively affecting the people's increased productivity. - Minimize the impact on both people and the environment as much as possible. - Trees along the irrigation channels should be preserved and not cut down. Irrigation workers should be instructed to love and protect the environment. - Study the needs of the people before making decisions and ensure clarity. - The irrigation system should be capable of storing a large amount of water. - The community level should be small, from 10 to 20 hectares. - The community should own the irrigation systems and not consider them as state property. - Implement a water usage fee model to fund maintenance and further improvements. - Villages or districts should collaborate with the irrigation system or help maintain it.

	- A village-level management committee should be established to manage water resources, especially for areas with 100 or 80 hectares of land.

Consultation Level	District
Date	August 21st, 2024
Sub-Scheme	Ou Ta Paong
Organization	Bakan District Hall, Pursat province
Participants	1. Ms. Khiev Raning 2. Mr. Chea Heng 3. Ms. Sam Sophun 4. Ms. Vann Sokhon 5. Ms. Him Makara
Moderator	Mr. Keo Sony
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The sectors with potential and priority for rural development are agriculture and handicrafts (bricks and tiles). - The project will create water storage sites and infrastructure systems. - The impact on wildlife habitats during construction. - Create wildlife habitats and corridors. - Local people have migrated to work in Thailand, South Korea, Japan, and Phnom Penh. - The role of local authorities is to enforce clear policies on water resource management, and the government has already measured and registered land. As a result, the working team has also preserved land near water sources. - Key issues and challenges may arise from land-related problems, but the local population is aware of the project and its presence. - The capacity and human resources of local authorities include a district administrative committee to resolve conflicts outside the judicial system. - The biggest challenge for farmers is the lack of irrigation water, insufficient infrastructure systems, and competition for water resources among migrants. - The solution is that local authorities distribute water from sources (such as wells) to each village, and the people contribute funds for irrigation and water distribution in cooperation with local authorities. - Seeds: In the first year, people buy seeds from the market; in subsequent years, they keep their own seeds (seeds can be kept for only 2-3 years). The types of seeds include OM51, OM54, Cambodian varieties, and Sarang.

	- Fertilizer: Fertilizers must be used for agriculture (types include urea, granular fertilizer, and DAB fertilizer). - Pesticides: Use herbicides, insecticides, and fungicides. - Infrastructure systems: There is insufficient water for farming due to a lack of infrastructure, water storage ponds, and over-farming during the dry season. - Post-harvest: Harvesting is done using machines. - Production costs: Preparing the land, buying seeds, fertilizers, pesticides, and harvesting. - Government initiatives should be efficient to reduce and address gender-based violence through awareness campaigns on reducing violence at the grassroots level and collaborating with educational organizations on gender issues. - To prevent and respond to gender-based violence, gender education should be integrated into local programs. - Concerns about the risks of gender-based violence due to an increase in the number of workers in the CAISAR project, which may lead to violence within workers' families, as well as sexual assault from male workers on women and children living near the project sites. - To reduce the risk of gender-based violence that may arise from the project, the company should collaborate with local authorities to provide gender training for workers. - Risks in the area include traffic accidents and substance abuse. - The company should cooperate with local authorities to provide gender education for workers.
Requests	- The company collaborates with local authorities. - The company informs local authorities and the community about the project's presence. - The project development is requested to proceed as quickly as possible.

Photo	

ANNEX 8.2: RESULTS OF THE CONSULTATIONS WITH COMMUNE COUNCILS IN PURSAT PROVINCE

Consultation Level	Commune
Date	August 16th, 2024
Sub-Scheme	Ou Ta Paong
Organization	Svay Doun Keo Commune Hall, Bakan District, Pursat Province
Participants	1. Mr. Deuk Kimhean 2. Mr. Un Samart 3. Mr. Moung Moeun 4. Mr. Sok Chanthy 5. Mr. Long Tang
Moderator	Miss Hak Leakhina
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The commune has developed concrete and dirt roads in each village. About 95% of the population engages in agriculture, with a total of 2,550 hectares of farmland, 60% of which is dedicated to rice cultivation. - Residents practice rice farming, grow vegetables at the household level, and raise livestock, relying on wells as a water source. The commune also has a poultry farm. Other livelihood activities include trading, handicrafts, and small businesses. - Farmers near the Svay Doun Keo stream use water from the reservoir for irrigating rice fields, raising livestock, and fishing. - Drinking Water: Residents use tap water and purified bottled water. However, those living in villages along dirt roads rely on well water, which is filtered using household filtration systems. - Most farmers cultivate rice twice a year, while some do so once annually. Common rice varieties include OM, Somaly, and Sra Ngae. - The wet-season rice is cultivated from June to December, while dry-season rice is planted from January to March. Average yields range from 4 to 5 tons per hectare. - Most households grow vegetables on small plots of land around their homes, primarily cultivating leafy greens and fruiting vegetables. - Family-based livestock farming includes raising chickens, ducks, pigs, cows, and buffaloes. - Two villages, Kampout Ang and Svay Doun Keo, benefit from the restoration of the Ou Ta Pong sub-scheme. - The commune coordinates and consults with families affected by land issues, aiming to explain the project's benefits and gain their understanding.

	- The commune will assist in facilitating and collaborating with the project to address any issues and obstacles that may arise. - The project will provide water for rice farming, household use, and livestock rearing, benefiting approximately 90% of the population. It will also enhance the local aquatic ecosystem, especially increasing fish populations. - There are no cultural heritage sites in the project area that would be affected. - The project will affect land owned by some residents. - The commune also plans to restore the Domnak Ampil Canal, Svay Doun Keo Stream, and Ou Boeng Krapeu in certain areas.
Requests	- Restore secondary irrigation canals, install box culverts to facilitate water flow and drainage. - Repair and reinforce embankments, improve canals and streams, and install water gates. - Compensation should be considered if the irrigation project significantly impacts the land of any farmer.
Photo	

Consultation Level	Commune
Date	August 16th, 2024
Sub-Scheme	Ou Ta Paong
Organization	Rumlech Commune Hall, Bakan District, Pursat Province
Participants	Ms. Chhum Phally
Moderator	Miss Hak Leakhina
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The commune has constructed canals, roads, rubber-paved roads, concrete roads, and internal village roads. - Rumlech Commune has a total land area of 6,000 hectares, of which 4,650 hectares are used for agriculture. - Most residents engage in rice farming, vegetable cultivation, and livestock rearing at the household level. The commune also has one poultry farm. - Residents living near canals, streams, and rivers use water for household needs, rice farming, livestock rearing, and fishing. - Rice farming and vegetable cultivation rely heavily on water from the canals. However, water is insufficient during the dry season. - Each household uses tap water and well water, which is filtered through individual household filtration systems. - Most farmers cultivate rice three times a year. The common rice varieties grown are OM and light rice varieties.

	- Most residents grow vegetables on household plots and land surrounding their homes, often planting mixed crops. - Family-based livestock farming includes raising chickens, ducks, pigs, cows, and buffaloes. - The canal restoration benefits two villages include Rumlech and Kampong Kdei. - The commune has informed the population about the benefits and potential impacts of the project. - The commune will cooperate with the project team to resolve issues with affected residents if assistance from the commune is required. - The project will provide water for rice farming, household use, and support diverse crop cultivation, livestock rearing, and fishing. This will increase agricultural productivity, creating more job opportunities and boosting household incomes. Additionally, the aquatic ecosystem will thrive, with an increase in fish populations. - The project does not impact cultural heritage sites but may affect land owned by residents. - The commune plans to restore Rumlech Canal and 107 secondary canals, including: 4 branch canals, 3 drainage canals, 3 water gates, 100 small irrigation canals, and 52 main canals.
Requests	- Please restore and repair shallow canals within the commune to improve water management and accessibility. - Accelerate the construction process to ensure timely completion and minimize disruption to local livelihoods. - Before commencing the irrigation system restoration, the Ministry is requested to organize public forums in collaboration with the commune to gather feedback from the local population, especially from residents who may be affected by the project.

Photo	

Consultation Level	Commune
Date	August 16th, 2024
Sub-Scheme	Ou Ta Paong
Organization	Boeng Khnar Commune Hall, Bakan District, Pursat Province
Participants	Ms. Tang Rebanglay
Moderator	Miss Hak Leakhina
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The commune has developed concrete roads and dirt roads in each village, improving connectivity and access. - The commune has constructed drainage channels to manage water flow from canals. Additionally, key infrastructure has been built, including a temple, commune office, hospital, schools, and two community centers. - Most of the population engages in rice farming, vegetable cultivation, and family-based livestock farming, including chickens, ducks, pigs, and cattle. However, large-scale farms are not yet established. - Residents living near rivers use water for household consumption, farming, livestock, and fishing. Farming and vegetable growing depend on rainfall and river water, but during the dry season, water availability is insufficient. - For drinking, the population uses tap water and collects river water for irrigation. Each household has a water storage tank for individual use. - Farmers typically cultivate rice three times a year. The favoured rice varieties are OM and lowland rice. In the first two seasons, the

	average yield is 4-5 tons per hectare, while the third season yields about 1 ton per hectare. - The villages benefiting from the canal restoration project include Srakar, Chamkar Leu, Voat Chreae, and Trach Kraol. - The commune will actively raise awareness among residents about the benefits and impacts of the project. It will collaborate with the project to resolve any issues faced by affected individuals, especially if assistance is needed from the commune. - The commune has a limited capacity to contribute to the project but is committed to providing support where possible. - The project will provide water for agricultural activities, household use, livestock farming, and fishing, contributing to improved public health. It will help diversify crops, improve livelihoods, and increase agricultural employment. With sufficient water access, farmers will spend less and earn more, boosting income. Additionally, aquatic animals, particularly fish, will thrive in the restored water systems. - The project will not affect cultural heritage sites but will have an impact on land owned by local citizens. - The commune currently lacks the technical knowledge and sufficient budget to implement a large-scale restoration project. If restoration occurs, it will be on a smaller scale. - If the project proves feasible, the commune plans to learn from it and, with increased funding, will include such projects in future investment plans for subsequent locations.
Requests	- Please restore and repair Ou in the commune to improve water management and accessibility. - The project should organize training sessions for the commune to help them understand the project's processes, including the size of the infrastructure systems and the standards for excavation and construction. This will ensure that the commune is well-informed about the project. - Before the restoration begins, the Ministry should organize public consultations and work with the commune to gather feedback from the local population, especially those directly affected by the project. This will ensure transparency and community involvement. - In cases where the project disrupts residents living along the waterway, the project should offer compensation to those affected. This will address the impact on their livelihoods and property.
Photo	

Consultation Level	Commune

Date	August 16th, 2024
Sub-Scheme	Ou Ta Paong
Organization	Ou Ta Paong Commune Hall, Bakan District, Pursat Province
Participants	1. Ms. Meng Chhorn 2. Ms. Hul Sereyvathana
Moderator	Mr. Ly Visoth
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The commune of Ota Pong consists of 18 villages, with 14 villages being served by the irrigation system. - Villages along National Road 5 primarily engage in business activities, while those located along the secondary roads depend largely on agriculture. These farming households typically cultivate rice once or twice a year, depending on soil conditions and proximity to water sources. - Some farmers plant vegetables after harvesting their rice, while others maintain vegetable gardens around their homes. Common vegetables grown include squash, beans, and cucumbers. - Livestock farming is common across the commune, with most households raising animals such as cattle, pigs, ducks, and chickens. One family, located near the river mouth, raises over 500 ducks for eggs. - Many young people, seeking work, migrate to other provinces or to Thailand for employment opportunities. - Water for rice cultivation comes from the Ota Pong canal and the feeder canals connected to it. - Water for irrigating vegetables and for livestock is sourced from local ponds and the water reservoirs around the homes of farming households. - For households along the main road, drinking water is supplied via a tap water system. However, people living along secondary roads in rural villages rely on water from channels filtered through household water containers. - While crop damage from pests is minimal, water scarcity remains a significant issue for farmers, especially during the dry season. - Watermelons are typically grown on rice fields near water sources after the rice has been harvested. - Due to the low market prices for cattle, many farmers in the area have reduced cattle farming. However, they continue to raise smaller numbers of pigs, chickens, and ducks for household consumption. - It is important to educate and raise awareness about the potential impacts of the project and prevent people from encroaching on irrigation land.

	- There should be public campaigns to prevent pollution in the water systems, including both the Ota Pong canal and the smaller feeder canals. - The project will ensure a sufficient water supply for both rice farming and vegetable cultivation. If farming production increases, it may reduce migration, improve fish stock levels, and boost local fishing activities. - With the project, fish populations will grow, and local farmers will have the opportunity to engage in fishing, providing additional income for their families. - Families will have sufficient food through access to fish, vegetables, and meat, which they can either cultivate or raise themselves. - The project will affect the land ownership of the local community. - This project aligns with the village's development plans. The village regularly submits proposals for investment projects, but due to limited funding and more urgent infrastructure needs, funding has been redirected to road development. - Currently, the village only has a plan for maintaining and protecting the irrigation system.
Requests	- Requesting the ministry's assistance to restore the Ou Ta Pong and side drainage channels to ensure water availability for farmers during the dry season. - Requesting support to restore three Boeng include, Boeng Konseng, Boeng Peak Dong, and Boeng Chouk to serve as water reservoirs for the local population in the surrounding areas. - Requesting the construction of water gates and dams along the irrigation channels and side drains, ensuring precise water level measurements to prevent both flooding and water shortages. - Compensation for Affected Landowners: If any farmland is severely impacted, requesting the ministry to study the possibility of compensation for the affected farmers.

Photo	

ANNEX 8.3: RESULTS OF THE CONSULTATIONS WITH VILLAGE CHEFS IN PURSAT PROVINCE

Consultation Level	Village Chef
Date	August 16th, 2024
Sub-Scheme	Ou Ta Paong
Farmer Group	Svay Doun Keo Village, Svay Doun Keo Commune, Bakan District, Pursat Province
Participants	Mr. Chhut Vandy
Moderator	Miss Tuon Somphorsdavin
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The factors contributing to frequent diseases in the village are caused by chemicals in food, consumption of canned beverages, and the use of chemical pesticides. - 30 households receive water from the irrigation system. - The main issue is water scarcity during the dry season and the distance from large water sources. - The commune chief manages the irrigation system in the village. - The water quality in the irrigation system is poor due to chemicals and pesticides flowing in, and livestock farming is commonly done in water ponds. - This project will not impact the farmland of the farmers. - The project will help farmers have water for three growing seasons, which can be used for livestock farming, helping to increase additional income.
Requests	- Request to construct a pond with adequate water storage. - Request to help build proper roads in the village.
Photo	

Consultation Level	Village Chef
Date	August 16th, 2024
Sub-Scheme	Ou Ta Paong
Farmer Group	Kampang Village, Svay Doun Keo Commune, Bakan District, Pursat Province
Participants	Mr. Vann Sorng
Moderator	Miss Chhim Sreytouch
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project

Perceptions and concerns	- The factors contributing to frequent diseases in the village are due to the dense forests and the abundance of mosquitoes, which lead to malaria. - 223 households receive water from the irrigation system. - The main issue is water scarcity during the dry season. - The sub-district is the manager of the irrigation system in the village. - The water quality in the irrigation system is poor due to waste clogging the mouths of the ponds. - This project will not impact the farmland of the farmers. - The project will help farmers have water for both the dry and rainy seasons, increasing household income and reducing the number of family members who migrate abroad or to distant provinces for work.
Requests	- Assist in restoring water drainage ponds. - Please expedite the implementation of this irrigation system restoration project.
Photo	

Consultation Level	Village Chef
Date	August 16th, 2024
Sub-Scheme	Ou Ta Paong
Farmer Group	Prasat Village, Rumlech Commune, Bakan District, Pursat Province
Participants	Mr. Hach Pat
Moderator	Miss Chhim Sreytouch
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The factors contributing to frequent diseases in the village are due to - The factors contributing to frequent diseases in the village are due to poor hygiene practices, consumption of food rich in chemicals, and climate change. - 150 households receive water from the irrigation system. - The main issue is the water being too distant, and there is insufficient water during the dry season. - There is currently no manager for the irrigation system in the village. - The water quality in the irrigation system is good for about 50% of the supply. - This project will not impact the farmland of the farmers. - The project will help provide water for the entire community.
Requests	- Please help restore the ponds to a deeper level. - Kindly provide technical support for growing rice and vegetables to the farmers, as their knowledge is still at a basic level.

Photo	

Consultation Level	Village Chef
Date	August 16th, 2024
Sub-Scheme	Ou Ta Paong
Farmer Group	Voat Chreae Village, Boeng Khnar Commune, Bakan District, Pursat Province
Participants	Mr. Kae Vanna
Moderator	Miss Yeab Dalin
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The factors contributing to frequent diseases in the village are due to the abundance of mosquitoes during the rainy season, chemicals from pesticide use in agriculture, and dietary factors. - 254 households receive water from the irrigation system. - The main issue is the lack of sufficient water for farming during the dry season, as well as conflicts between the upper and lower villagers over water sources. - The village water resource group plays a role in coordinating water usage for the community during times of water scarcity. - The water quality in the irrigation system is good. - This project will not affect the farmers' land, as the land has been planned and cleared for expanding or restoring the irrigation system. - The project will help farmers grow crops year-round, provide additional water for livestock, and reduce migration.
Requests	- Request to restore the main pond and build secondary ponds in the village. - Help construct water gates to control the water flow from the irrigation system's five-phase ponds.
Photo	

Consultation Level	Village Chef
Date	August 16th, 2024
Sub-Scheme	Ou Ta Paong
Farmer Group	Srah Run Village, Ou Ta Paong Commune, Bakan District, Pursat Province
Participants	Mr. Yaet Horn
Moderator	Miss Chhim Sreytouch
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project

Perceptions and concerns	- The factors contributing to frequent diseases in the village are due to climate change, poor hygiene in food preparation, and the consumption of food containing chemicals. - 186 households receive water from the irrigation system. - The main issue is that the large irrigation system cannot reach the village due to its distance, and the residents only use pond and irrigation water. - The village chief, sub-chief, and community members play a role in coordinating the use of water. - The water quality in the irrigation system is poor. - This project will not impact the farmers' land. - The project will help farmers have an irrigation system that reaches all farmers in the village, allowing them to fully engage in agriculture. Farmers will be able to grow crops in both the rainy and dry seasons, helping to improve household economies.
Requests	- Request that the Ministry of Agriculture help restore the pond, dig additional ponds, and expand irrigation canals.
Photo	

Consultation Level	Village Chef
Date	August 16th, 2024
Sub-Scheme	Ou Ta Paong
Farmer Group	Ou Ta Paong Village, Ou Ta Paong Commune, Bakan District, Pursat Province
Participants	Mr. Voa Saren
Moderator	Miss Sothy Chantana
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The factors contributing to frequent diseases in the village are due to climate change. - 253 households receive water from the irrigation system. - The main issue is water scarcity. - The village chief plays a role in coordinating the irrigation system in the village. - The water quality in the irrigation system is good. - This project will impact the farmland of about 35 households living near the mouths of the irrigation canals. - The affected households feel sad about losing their land. - The project will help farmers create livelihoods, such as engaging in fishing to support family needs, and allow them to grow crops in both

	the dry and rainy seasons, increasing household income and reducing migration to foreign countries or distant provinces for work.
Requests	- Request that the community have sufficient water for use during the rainy season.
Photo	

Consultation Level	Village Chef
Date	August 16th, 2024
Sub-Scheme	Ou Ta Paong
Farmer Group	Bat Kokir Chas Village, Ou Ta Paong Commune, Bakan District, Pursat Province
Participants	Mr. Tol Nhib
Moderator	Miss Yeab Dalin
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The factors contributing to frequent diseases in the village are due to the consumption of food without considering its nutritional value and climate change. - 80% of households in the village receive water from the irrigation system, while 20% work outside the village. - The main issues are the distance to the water source, difficulties in managing water, water scarcity, and conflicts over water use with neighbouring villages along the water stream. - The village chief plays a role in coordinating the irrigation system in the village and ensuring adequate water distribution to the community. - The water quality in the irrigation system is good. - The project will impact some farmers' land, but this is not considered a problem, as farmers understand that expanding the irrigation canals benefits agriculture. The affected land has already been planned and cleared for the canals and roads. - The project will ensure sufficient water for the community to increase rice production and provide clean, accessible roads for easy entry and exit.
Requests	- Request the restoration of the main pond and construction of additional secondary ponds in the irrigation system. - Encourage the restoration and construction process to be completed as quickly as possible.
Photo	

Consultation Level	Village Chef
Date	August 16th, 2024
Sub-Scheme	Ou Ta Paong
Farmer Group	Oknha Moan Village, Ou Ta Paong Commune, Bakan District, Pursat Province
Participants	Mr. Doung Savy
Moderator	Miss Yeab Dalin
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The factors contributing to frequent diseases in the village are due to - The factors contributing to frequent diseases in the village are due to climate change (Flu) and poor hygiene (diarrhea, dysentery). - 251 households receive water from the irrigation system. - The main issues are the lack of irrigation canals, canals being too far from the farmland, and the canals being shallow. - The village authorities and community members are involved in maintaining the irrigation system in the village. - The water in the irrigation system is usable, but the groundwater contains a lot of salt and clay. - The project will affect the farmland of about 7 households, but they are willing because they will have water for vegetable farming. - The project will help the community have sufficient water for irrigation, improve roads within the village, and provide more housing.
Requests	- Request to restore the main irrigation canal and deepen the secondary canals. - It is recommended to construct water gates at the outlet of the irrigation system to control water flow.
Photo	

ANNEX 9.1: RESULT OF CONSULTATION: KAMPONG CHHNANG PROVINCE

Focus Group Discussion	Provincial Level
Date	August, 22 2024
Sub-scheme	1. Lum Hach 2. Yutasas 3. Stueng Krang Bat
Organization	Kampong Chhnang Province Hall
Participants	1. Mr. Pich Keomony 2. Mr. Un Sotha 3. Mr. Kim Vanny
Coordinators	1. Mr. Chun Nimul 2. Ms. Toun Samphorsdavin
Topic	CAISAR
Perception and Concern	- The agricultural sector holds significant development potential in the province, and the project plays a critical role in ensuring water storage during the dry season. - The primary goal of provincial development is to enhance family livelihoods, boost the national economy, and improve the transportation system supporting agriculture. - Risks include insufficient water supplies from existing projects, failure to study abundant river sources, potential water loss, and flooding during the rainy season, which could lead to financial losses. - Negative impacts may involve disruptions to water access and encroachments on private land. - Positive impacts include benefits to farming activities, particularly for both wet and dry rice cultivation and mixed crops. - The project should prioritize vulnerable populations, clearly identify beneficiary families, and conduct thorough studies on water usage. - The provincial administration possesses the legal authority to collaborate with the judiciary. - Budget-related challenges need to be addressed by the working group. - The sub-committee is responsible for addressing project impacts and ensuring effective communication with the public. - Experience required includes expertise in land area assessment, land valuation, construction planning, cost estimation, and crop studies. - Challenges may include space constraints, concerns over water distribution, impacts on private land, and non-compliance by companies with local authorities and communities. - The action plan for resolution emphasizes avoiding private land impacts, preparing adequate materials and signage, determining

	usage boundaries, informing the public beforehand, and setting clear policies and timelines. - Most problems arise from external instigators rather than directly from affected communities.
Request	- Strengthen livelihood skills - The project should be implemented promptly - Prepare to participate in project activities, collaborate, and implement - Work together to face challenges and find solutions
Photo	

Focus Group Discussion	Provincial Level
Date	August, 22 2024
Sub-scheme	1. Lum Hach 2. Yutasas 3. Stueng Krang Bat
Organization	DAFF
Participants	1. Mrs. Heng Kimsreang 2. Mr. Chum Maochandara 3. Mr. Mech Phearom
Coordinators	Mr. Keo Sony
Topic	CAISAR
Perceptions and Concerns	- Farmland owned by farmers typically ranges from 3 to 5 hectares. - Average seed usage is 200kg during the dry season and 500kg during the rainy season. - Most farmers in the region purchase seeds in the first year and use self-produced seeds in the second and third years. - Fertilizers are applied 2 to 3 times per growing cycle, using 4 to 6 sacks. - Pesticides are used 1 to 2 times per growing cycle to protect crops. - Farmers generally do not hire labor but instead rely on machinery. - Farmers in the area usually sell their harvested crops directly from the fields.

	Challenges: - The most common issue is the lack of irrigation systems and insufficient water for farming. Solutions: - Restore and build additional irrigation systems. - Perform land preparation 1 to 2 times per season. - Practice farming during rainy seasons. - Purchase seeds in the first year and select seeds in subsequent years. - - Use fertilizers to enhance productivity (e.g., urea, DAP, 20-20-15). - Apply pesticides to safeguard crops against threats. - Address irrigation shortages by establishing reservoirs and canals. - Post-harvest, farmers use machinery for harvesting. - Production costs include land preparation, fertilizer, water pumping, pesticides, and harvesting. Recommended vegetable crops for sub-systems: - Sugarcane, watermelon, beans, cucumbers. - Suitable areas for cultivation span the district, especially during the dry season. - These crops meet market demands. - The department will partner with stakeholders to establish markets for farmers. Challenges in vegetable production: - Low prices and limited markets (often restricted to local sales). Recommended fish species for sub-systems: - Catfish, tilapia, snakehead fish, and carp. - Areas suitable for fish farming include locations near rivers. - There is significant market demand, making fish farming potentially successful. - The department will collaborate with partners and markets to support market access. Challenges in promoting fish farming under CAISAR: - Lack of infrastructure, inadequate locations, limited technical expertise, and restricted market access. - Farmer training initiatives: - Farmers have received training on rice production five times per year. - Key training topics in 2023 focused on climate change and rice production. - On average, farmers cultivate rice twice a year. Training support and collaboration: - - Farmers have been trained on rice production by various service providers, including civil society organizations (VSU, LWD, World Vision, WSP) and pesticide companies. Current agricultural support:

	- Support is being provided through the construction of irrigation systems and water reservoirs. To improve agricultural productivity: - Modernized community projects (e.g., cooperative land use, coordinated production, and marketing). - Training on production planning to prevent crop overlap.
Request	- Construct additional small canals (tributary canals). - Build irrigation systems to ensure a consistent water supply.
Photo	

Focus Group Discussion	Provincial Level
Date	August, 22 2024
Sub-scheme	1. Lum Hach 2. Yutasas 3. Stueng Krang Bat
Organization	WORAM
Participants	Mr. Oeur Samreun
Coordinators	1. Mr. Chun Nimul 2. Ms. Toun Samphorsdavin
Topic	CAISAR
Perceptions and Concerns	- The current water sources for agricultural supply are insufficient, with only 60% availability. - The development of water resources in the province faces challenges and obstacles due to limited funding, traditional water usage practices by local communities, and market dependence on private traders. - In the lowland areas, there are farmer communities utilizing water, but these systems are not operational due to a lack of cooperation in paying contributions. - In the lowland regions, soil erosion is prevalent, and rice yields decrease annually due to rising temperatures and water shortages.

	- The importance of irrigation systems is critical to the livelihoods of the population, providing water for agriculture and enabling multi-season rice cultivation.
Request	- A water user community should be organized prior to construction to participate in identifying key locations and ensure there are caretakers in place.
Photo	

Focus Group Discussion	Provincial Level
Date	August, 22 2024
Sub-scheme	1. Lum Hach 2. Yutasas 3. Stueng Krang Bat
Organization	Department of Labor and Vocational Training
Participants	1. Mrs. Yim Nimul 2. Mr. Rim SamAng 3. Mr. Reun Channa
Coordinators	Ms. Sek Liny
Topic	CAISAR
Perceptions and Concerns	- The employment situation and vocational training in the project area benefit from the presence of numerous factories, which help reduce migration. - Common issues in factories and enterprises include air pollution, factory heat, technical problems (electric shocks), personal disputes within factories, and conflicts between workers and employers (related to wages, working hours, health and poor workplace safety). - The role of the provincial department includes disseminating labor laws to factories and workers, assisting in resolving disputes, conducting regular inspections to prevent concentration of violations, and promoting laws prohibiting the use of child labor under 18 years old.

	- Job training opportunities for farmers are lacking because the department focuses on non-agricultural skills (e.g., auto and motorcycle mechanics). - The department can contribute to providing training and job creation for the CAISAR project in non-agricultural fields (e.g., auto and motorcycle mechanics) and offer training in food processing (e.g., tamarind processing, pickling vegetables). The deputy provincial governor has suggested training in fish farming as well. - Women's migration for work has a minor impact due to the reduced labor force for farming. However, modern farming methods currently require less labor. - The employment framework and agriculture in the province and target areas are mainly centered on factory work and farming. - The industrial sector has greater potential than agriculture due to its geographic proximity to urban areas, the availability of labor, and strong relationships between the department and employers. - The agricultural sector requires further strengthening and significant technical support. - The department can help mitigate negative impacts and improve the agricultural sector by providing more agricultural jobs. - Factory workers with social security schemes (NSSF) have benefited from reduced health burdens, though health issues persist frequently.
Request	- Help promote sufficient irrigation systems and water availability for farmers to cultivate their fields.
Photo	

Focus Group Discussion	Provincial Level
Date	August, 22 2024

Sub-scheme	1. Lum Hach 2. Yutasas 3. Stueng Krang Bat
Organization	Department of Women's Affairs
Participants	1. Mrs. Pich Sophea 2. Mrs. Phin Phalla
Coordinators	Ms. Sek Liny
Topic	CAISAR
Perceptions and Concerns	- There is not complete agreement with the idea, as most women work in factories in the area but still assist with family farming tasks during their days off. Men and women contribute equally to agriculture, with men participating during the initial stages, and women helping with tasks like fertilizer application. - Violence incidents occur at a rate of 1-2 cases per month, and sexual assaults happen every 1-2 months, often linked to media influence, mobile phone use, alcohol, or drug abuse. - Reports of violence have increased as women have become more courageous, confident, and financially independent. - Psychological violence is more prevalent than physical violence. - Some victims remain hesitant and embarrassed, unable to speak out immediately. Counselors recommend employing specific techniques for probing and providing victims with a supportive and compassionate environment. - The role of the Women's Affairs Department includes providing advice for decision-making, assisting with filing complaints to the court, offering temporary shelter and some material and food support to victims during the resolution or litigation process, educating and promoting information on gender equality, attending court sessions when requested by victims, and coordinating with volunteer lawyers for legal representation (for the victims). - The department assists in resolving, mediating, and referring cases to relevant institutions. - The department provides minimal financial assistance, temporary shelter, and works to find centers for child victims of violence and sexual assault. - Immediate reports are made to the deputy provincial governor responsible, with daily updates provided. - The department resolves and closes cases by filing them in court, at the provincial office, or preparing documentation for referral to centers and the judiciary. - Government mechanisms include the Ratanak VI Women's Plan, the Legal Protection Office, and collaboration with the police, the Department of Social Affairs, the Department of Health, and the judiciary. - To improve the prevention and response to gender-based violence, efforts focus on promoting and educating about gender equality, punishing offenders, imposing penalties, and reducing drug trafficking.

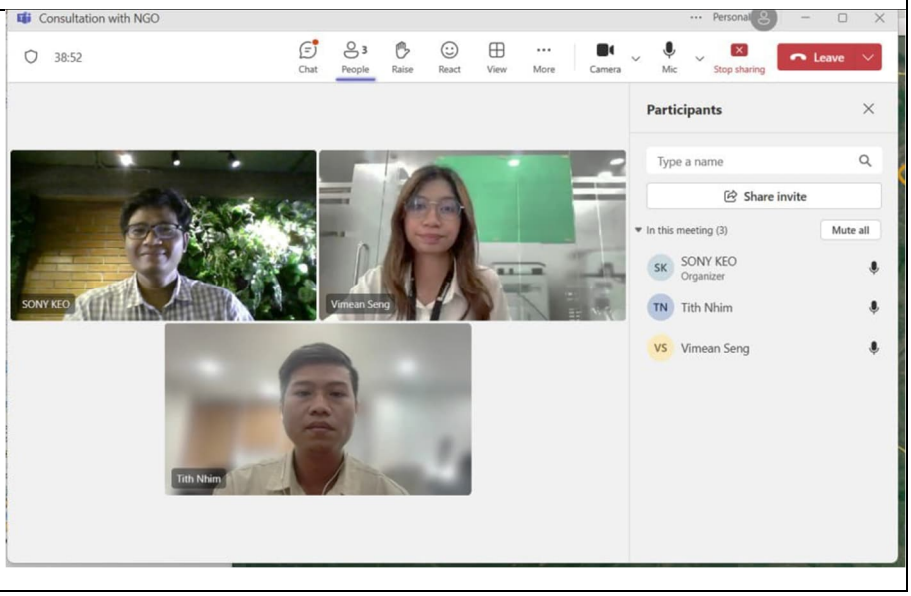
	- The increase in personnel under the CAISAR project is not a concern, as there have been no prior issues with site workers, and local communities and companies are attentive to preventing problems. - Risks in the area include violence and sexual assault. - Construction companies should prioritize hiring local workers to provide employment opportunities, reduce concerns about newcomers, and create opportunities for the Women's Affairs Department to contribute additional recommendations on gender and women's issues, as well as increasing job opportunities for women capable of working in construction.
Request	- The provincial level provides minimal opportunities for women in construction work. - Some men working at the provincial level still undervalue women's contributions in the workplace.
Photo	

Focus Group Discussion	Provincial Level
Date	August, 22 2024
Sub-scheme	1. Lum Hach 2. Yutasas 3. Stueng Krang Bat
Organization	Department of Environment
Participants	1. Mr. Leng Sameth 2. Mrs. Meas Sovanna 3. Mr. Khoun Chantheng
Coordinators	Mr. Keo Sony
Topic	CAISAR
Perceptions and Concerns	- The general situation regarding environmental management involves project owners collaborating with the department and being encouraged to comply with legal requirements.

	- The role of the department includes conducting inspections of project activities twice a year. - Major challenges include project owners failing to comply with laws, such as discharging liquid waste, a lack of cooperation from project owners, and shortages of funds and materials for enforcement. - The work of the Environmental Department related to the CAISAR project's environmental management program includes resolving land impact issues with local communities, watering dirt roads to reduce dust, monitoring the transport of soil, ensuring legal compliance, and managing fuel and oil waste to prevent contamination of water sources. - Negative impacts: Changes in biodiversity, loss of habitats, and feeding grounds. - Positive impacts: Access to water is ensured throughout all seasons. - Solutions: Restore degraded reservoirs or canals and preserve areas that serve as feeding grounds for wildlife.
Request	- Minimize environmental impacts from project activities. - Address impacts through peaceful methods. - Collaborate with the Environmental Department.
Photo	

Focus Group Discussion	Provincial Level
Date	August, 22 2024
Sub-scheme	1. Lum Hach 2. Yutasas 3. Stueng Krang Bat
Organization	Department of Land Management Urban Planning & Construction

Participants	Mr. Chhun Sokongpheak
Coordinators	1. Mr. Chun Nimul 2. Ms. Toun Samphordavin
Topic	CAISAR
Perceptions and Concerns	- Areas with registered land systems are already listed. - For land disputes involving registered land, resolution must follow legal procedures through the courts and applicable laws, ensuring fair and just compensation. - For land disputes involving unregistered land, resolutions are to be pursued through collaboration under provincial administration, supported by reports from residents highlighting common reasons for disagreement, such as the complete demolition of homes, refusal to accept compensation, or increased land values. - Technical work involves measuring and delineating land plots, waterways, and property boundaries of residents. - There are no concerns regarding land that has already been systematically registered.
Request	- Pre-study is beneficial for solving land issues. - Supporting the restoration of old irrigation systems is good for agricultural work.
Photo	



Focus Group Discussion	Provincial Level
Date	August, 22 2024
Sub-scheme	1. Lum Hach 2. Yutasas 3. Stueng Krang Bat
Organization	Department of Culture & Fine Arts
Participants	Mrs. Oun Yada

Coordinators	1. Mr. Chun Nimul 2. Ms. Toun Samphordavin
Topic	CAISAR
Perceptions and Concerns	- The province has 110 registered locations of ancient sites, including temples, monuments, historical sites, ponds, and ancient reservoirs. - The land system includes one temple mound in Pongro Village, Rolabear District. - The project area does not affect any temples or temple mounds. - The department's role is to protect and maintain these sites, provide information, and report to the Ministry. - There are no indigenous ethnic minorities, distinct cultures, religions, or special areas in the project area, as most of the land consists of old irrigation systems. - There are no temple mounds located within the project area. If any impact occurs, it will be reported to the Ministry of Culture and Fine Arts, which is the decision-making authority.
Request	- Request for set up irrigation system quickly
Photo	

Focus Group Discussion	Provincial Level
Date	August, 22 2024
Sub-scheme	1. Lum Hach 2. Yutasas 3. Stueng Krang Bat
Organization	Community Hope Organization
Participants	1. Mr. Rech Panha 2. Mrs. Munh LangHeang
Coordinators	Mr. Nheb Phirun

Topic	CAISAR
Perceptions and Concerns	- The key roles and activities of the organization in the province include mental health, education through the construction of schools, development, installation of solar panels along the roads, sanitation facilities, installation of water wells in villages, teaching sewing and coffee-making (open to anyone interested, without discrimination), covering all 8 districts of the province. - Awareness and perceptions about the project indicate difficulties in reaching the community, especially along water routes. There are high costs for the community to participate in training without fees (such as coffee-making and sewing), and those living near the schools are either unwilling to learn or do not value the training. The community has provided scholarships to 21 students from grades 6 to 12, with amounts ranging from $25 to $35, and one student is receiving $100 per month for studies at a university. - Concerns and potential challenges include the risk of animals or people falling into water and drowning after flooding, loss of farmland, and the destruction of residents' homes. - The impact on aquatic biodiversity may result in the loss or extinction of species, and residents may lose land for farming. If there is an impact, compensation should be addressed properly, including for lost trees. If farmland is lost, people may migrate, making them vulnerable to exploitation, and their children may have to abandon their education.
Request	- Provide appropriate compensation, protect biodiversity and the environment well
Photo	

Focus Group Discussion	Provincial Level
Date	August, 22 2024
Sub-scheme	1. Lum Hach 2. Yutasas 3. Stueng Krang Bat

Organization	Rural Water Supply and Sanitation Organization
Participants	1. Mr. Vann Sambath 2. Ms. Seng Vimean 3. Mr. Nhem Tith
Coordinators	Mr. Keo Sony
Topic	CAISAR
- Perceptions and Concerns	- The key roles and activities of the organization in the province include providing clean water and sanitation systems to rural populations and implementing projects that help communities adapt to climate change. - The project will help the population increase agricultural production several times a year. - The relationship between the CAISAR project and the organization ensures that the population receives sufficient water and is resilient to climate change. - Concerns and potential challenges include impacts on infrastructure. - The benefits of increasing agricultural production help reduce migration.
Request	- The project should cooperate with local authorities and partner organizations - Educate people's attitudes about using water sparingly - Establish a water management committee for this irrigation system.
Photo	

Focus Group Discussion	Provincial Level
Date	August, 22 2024
Sub-scheme	1. Lum Hach 2. Yutasas 3. Stueng Krang Bat
Organization	World Vision Cambodia

Participants	Mrs. Lay Lineang
Coordinators	Ms. Sek Liny
Topic	CAISAR
Perceptions and Concerns	- The key roles and activities of the organization in the province include education (primary school), health, nutrition, clean water, sanitation, food security, child protection (youth), Sponsor Child, social accounting (in collaboration with partners), and family welfare activities. These efforts include promoting gender awareness in the project and engaging with people with disabilities. The organization has also worked on irrigation systems and roads, and generally, there have been no issues, as everything has been properly planned and cleared. - The implementation of previous projects has not encountered any problems, as all activities adhered to established guidelines. - The organization and authorities consistently participate in child protection and legal age regulations. - Families without land face fewer issues if their needs are not land-related. - The project has helped improve biodiversity, with more livestock farming, increased water availability, more trees planted, reduced costs, water storage facilities, and an increased number of crop planting cycles.
Request	- All sectors must be involved technically - Can not help reduce migration completely until there is a market

Focus Group Discussion	District Level
Date	August, 22 2024
Sub-scheme	1. Lum Hach 2. Yutasas 3. Stueng Krang Bat
Organization	Rolea Bier District Hall, Kampong Chhnang province
Participants	1. Mr. Mey Sophally 2. Ms. Chan Sokly
Coordinators	Mr. Keo Sony
Topic	CAISAR
Perceptions and Concerns	- The sector with potential and a priority for rural development is the agricultural sector. - Awareness and perceptions about the project indicate that the local administration of Rolabear District has previously participated in meetings about the watershed system project at the district and provincial levels. - The benefits of the project include the creation of habitats and corridors for biodiversity, and ensuring the population has sufficient water for agricultural production. - The role of the district administration is to collaborate with specialized institutions to identify potential issues and address them.

	- The main challenges include populations dependent on agricultural resources along waterways or water systems located within the project area. - The district's capacity and human resources include a committee for resolving land disputes outside the judicial system. - The general challenge for farmers is the lack of irrigation water during the dry season and the absence of water infrastructure and reservoirs. - Solutions from the district administration involve restoring irrigation systems and pumping water from sources (watershed areas), constructing systems funded by the district's budget, and involving community participation. - Seedlings: In the first year, people buy seeds from the market, and in the following years, they use their own seeds (seeds can only be saved for 2-3 years). - Fertilizer: Farming requires the use of chemical fertilizers (such as urea and phosphate fertilizers) and compost. - Pesticides: The use of herbicides, insecticides, and fungicides. - Water systems: There is a lack of water for irrigation in agricultural areas due to the absence of infrastructure and water storage reservoirs. - Post-harvest: Farmers harvest using machinery. - Production costs: Preparing the land, buying seeds, fertilizer, pesticides, and harvesting. - The situation regarding domestic violence: Domestic violence incidents occur within families. - Victims of violence have filed complaints with village and commune authorities. - The government operates a committee related to violence at the commune and district levels. - To prevent and respond to gender-based violence, awareness campaigns and educational programs on gender are organized at the commune and village levels. - There is concern about the potential for sexual violence against women and children in the area due to the increase in staff for the CAISAR project. - To reduce the risks of gender-based violence potentially caused by the project, project owners must educate and train staff about gender knowledge and rights. - Risks in the area include land disputes and drug use. - Construction companies should prioritize hiring local workers from the area.
Request	- Please ensure the project operates as quickly as possible. - The company collaborates with local authorities. - The project provides significant benefits to the local population in the agricultural sector. - The company is requested to hire local staff and workers for the project.

Photo	

Focus Group Discussion	District Level
Date	August, 22 2024
Sub-scheme	1. Lum Hach 2. Yutasas 3. Stueng Krang Bat
Organization	Teuk Phos District Hall, Kampong Chhnang Province
Participants	1. Mr. Mot Novavi 2. Mrs. Chim Chot 3. Mrs. Ung Sophy 4. Mr. Bit Sary
Coordinators	Ms Sek Liny
Topic	CAISAR
Perceptions and Concerns	- The sectors with potential and priority for local development are agriculture and tourism. - The district is aware of the project to restore and expand the existing irrigation system, which will help provide water for agricultural land. - The benefits of the project include enhancing biodiversity due to more water availability, creating a tourism area, allowing farmers to cultivate year-round (2 to 4 times per year), reducing migration, reducing poverty, and offering labor for sale. - The role of the district level is to assist in coordinating the project activities, help resolve issues with affected stakeholders, request solutions from higher levels for the population, ensure affected people receive compensation, and monitor air pollution (informing the company to manage water spray). - There are no more land issues, as the land has already been registered.

	- The district's human resource capacity is sufficient to address issues according to land law. - The main challenges for farmers in this irrigation system are water shortages during the dry season, market access, pests, and conflicts due to water scarcity. - The causes of these challenges are a lack of water sources and climate change, leading to longer dry seasons. Farmers are losing some irrigation water due to management constraints, and markets are not functioning well because of excessive heat. - Solutions include creating water sources, providing water usage techniques, promoting water conservation, and establishing water resources while helping with coordination. - Seeds: Farmers save 80% of seeds and buy 20%. - Fertilizers: Farmers use chemical fertilizers, organic fertilizers, and natural fertilizers. The use is not ideal yet, and they want regulations or training on fertilizer use according to soil types. - Pesticides: The use of herbicides is considered effective since they kill the grass quickly, and there are only a few pest problems. - Irrigation system: During the dry season, water availability is insufficient. - Post-harvest: 95% of harvesting is done by machine, and 5% is done manually. - The situation of domestic violence in families is about 2%, mainly due to alcohol and gambling, but it has decreased significantly, and drug abuse is about 1%. - The victims of violence are not well-known because issues are being resolved at the commune level. The district has not yet participated, as most land-related issues are being resolved at the commune level. - Government actions include laws related to solving violence issues, promoting gender awareness, and ensuring safety in villages and communes. - To prevent and respond to gender-based violence, efforts are being made to involve more men in training programs, as most problems are caused by men. Continued gender awareness campaigns, reducing drug and alcohol abuse, and addressing social media-related issues are also part of the approach. - The increase in personnel in the CAISAR project has not raised concerns about gender-based violence risks, as there have been no incidents involving construction workers in the past. - To reduce the risks of gender-based violence that may arise from the project, relevant parties will conduct site inspections, separate accommodation for men and women, and continue public awareness and gender campaigns. - The risks in this area include violence and drug use. - The company must verify the names, identification numbers, and contact details of workers, inform workers about laws and penalties for wrongdoers, promote gender equality, and ensure that the company has someone responsible for reporting issues to local authorities.

Request	- When construction is taking place, the company or relevant parties must notify the local authorities. - Upon completion of the construction project, notification must be given, and there must be a formal handover, avoiding any secrecy. - Clear work distribution and assignment of responsibilities must be made. - Compensation should be provided to the local population, and the company must cooperate with local authorities. - Provide water storage facilities and ensure an adequate water supply for agricultural purposes.
Photo	

Focus Group Discussion	District Level
Date	August, 22 2024
Sub-scheme	1. Lum Hach 2. Yutasas 3. Stueng Krang Bat
Organization	Samaki Meanchey District Hall, Kampong Chhnang Province
Participants	1. Mrs. Se Kem 2. Mrs. Hem Saveth
Coordinators	Mr. Nheb Phirun
Topic	CAISAR
Perceptions and Concerns	- The sectors with potential and priority for rural development are agriculture, the garment industry, seasonal farming, and paddy cultivation. - Awareness and perception of the project include community participation, especially during the dry season, encouraging local communities to grow vegetables in rotation. During the rainy season, there is no issue with water, but during the dry season, sufficient water is available to grow crops throughout the year. The village and commune areas have access to irrigation systems.

	- The impacts and benefits of the project should be studied and minimized, especially when expanding the planting area, dealing with the death of livestock due to irrigation, or contamination of fish and aquatic animals. The community benefits from improved livelihoods due to employment opportunities, which helps vulnerable and indigenous populations without any significant issues. - The role of local authorities is to cooperate with citizens regularly and ensure the protection of the community once the project is operational. - Key challenges in land acquisition for the project include finding ways to balance the benefits to the community, ensuring they can continue to benefit from irrigation activities in the future. - The capacity and human resources at the local level need to be used extensively and persistently, with the district governor playing a key role by being regularly involved in overseeing the project. - The main challenges for farmers in the irrigation system include a lack of rainfall, limited water in some irrigation systems, or excessive water that may flood crops and cause conflicts. - Solutions include better water conservation practices, effective water distribution, and ensuring water is not wasted. - Seed varieties: Farmers purchase seed varieties and also store some of their own seeds as a habit, particularly those for flooding-prone rice strains. - Pest control: Farmers use pesticides as recommended for pest management. - Irrigation systems: The irrigation systems can be used based on their availability and how they were studied in the harvested areas. - Production costs: The cost of buying seed varieties. - The situation regarding domestic violence is still a concern, with an occurrence rate of about 3% in the last three years, involving domestic disputes, violence, and economic instability, which leaves victims fearful for their future. - Government interventions include annual action plans to raise awareness among the public, particularly during crises, imposing penalties when necessary, and supporting coordination with organizations to address violence and provide appropriate solutions. - To prevent and address gender-based violence more effectively, efforts should be made to encourage male participation in awareness programs, with perpetrators of violence directly involved in public campaigns. These should be organized at least once a year in 9 communes. - If there is an increase in the number of project personnel, the project should not proceed if there are concerns about gender-based violence. - To reduce the risks of gender-based violence arising from the project, efforts should focus on ensuring proper communication and understanding about the project and fostering family unity. - The risks in this area must be addressed promptly to prevent violence from recurring.

	- Local leadership in villages and communes must meet to address challenges and resolve issues impacting those directly affected or opposed to the project.
Request	- Help provide crop seeds to families in the community.
Photo	

Focus Group Discussion	District Level
Date	August, 22 2024
Sub-scheme	1. Lum Hach 2. Yutasas 3. Stueng Krang Bat
Organization	Kampong Tralach District Hall, Kampong Chhnang Province
Participants	1. Mr. Ker Mat 2. Mrs. Nuon Hong 3. Mr. Kao Viriya 4. Mrs. Nem Chanthea
Coordinators	Mr. Nheb Phirun
Topic	CAISAR
Perceptions and Concerns	- The sectors with potential and priority for rural development are agriculture (72.2%), handicrafts (0.6%), and factories (27.2%). - The project could enable our population to produce rice two to three times a year. If we can connect the irrigation systems from the deep reservoirs, we may have the potential to grow more vegetables. If there is enough water, we can plant rice three times a year, and some farmers may even use the land for industrial crops like chili cultivation. When private individuals restore the area, they must consider the environmental impacts as they rebuild reservoirs and irrigation systems. - Potential impacts may include the loss of fish habitats and environmental degradation, such as soil erosion.

	- The benefits of the project include reducing rural migration by allowing farmers to cultivate rice two to three times per year. - Land loss due to the project can be minimized by reducing negative impacts through proper boundary demarcation. - The role of local authorities is to facilitate multiple meetings (ideally two or three) to ensure smooth implementation and, if necessary, resolve any conflicts by achieving consensus with at least 70% participation from local stakeholders. - If consensus is not reached, additional meetings should be organized to find common ground. If there are only a few opponents, the project should still proceed. - The local authorities have strong capacity and resources, with district or deputy district governors directly addressing issues. - Challenges include farmers who rely on agriculture but face water shortages for rice cultivation and chili farming. - Solutions include restoring irrigation systems and building reservoirs. - Seeds: Rice seeds are purchased with 90% used for the dry season and 40% for the rainy season. - Fertilizer: The use of organic fertilizers is encouraged, with training on how to use them in local villages, as well as the use of chemical fertilizers such as DAP and Urea. - Irrigation system: The current irrigation system is insufficient, as the amount of agricultural land exceeds the available water resources. - Harvesting: A rice harvester machine is used for harvesting. - The situation regarding violence is unclear, but regular meetings are held in the communes, ensuring safety for all participants. - Authorities help facilitate and educate citizens on their rights, encouraging participation through legal and procedural methods. - Government actions include disseminating 13 key points through regular community-based meetings, spreading information directly to local populations through commune councils. - To prevent and respond to gender-based violence, efforts should be made to raise awareness in communes by holding multiple sessions and directly addressing areas where violence is occurring. - Public meetings should be organized three times to ensure appropriate compensation and government authorities should remain engaged with the local stakeholders. - To reduce the risks of gender-based violence arising from the project, authorities should maintain consistent communication with local groups to address concerns. - Communication efforts should include three awareness campaigns, ensuring that the involved individuals participate directly in the process.
Request	- Should not catch the machine when he digs a pond to dry rice - If affected, should move to another place that is not affected or compensate appropriately.

Photo	

ANNEX 9.2: RESULTS OF THE CONSULTATIONS WITH COMMUNE COUNCILS IN KAMPONG CHHNANG PROVINCE

Consultation Level	Commune
Date	August 16th, 2024
Sub-Scheme	1. Lum Hach 2. Stoeung Krang Bat 3. Yutasas
Organization	Krang Leav Commune Hall, Rolea B'ier District, Kampong Chhnang Province
Participants	1. Mr. Pho Sok 2. Ms. Kae Hoeurn 3. Ms. Men Chenda
Moderator	Miss Chhim Sreytouch
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The commune has developed key achievements such as roads, bridges, and reservoirs. However, agricultural development has not progressed well due to a lack of water. - Growing rice, cultivating vegetables, and raising livestock are very challenging for farmers in the commune because of water scarcity. They are willing to cultivate, but without water, their agricultural activities rely solely on rainfall. - The commune's role is to help coordinate and manage project activities. - The residents are pleased with the project because, in the future, the entire commune will have sufficient water for cultivation and livestock, enabling them to expand production and improve their livelihoods, which will reduce migration to other areas. - The project also contributes to environmental protection and will create biodiversity, potentially turning the area into a recreational site for residents. - Negative impacts include the displacement of residents affected by land loss, as they previously grew more rice, but now their production has decreased. - This project aligns with the commune's development plan, as the commune had planned to restore the canals but lacked sufficient funding.
Requests	- They want the project to help restore the canals and additional reservoirs.

	- They request to expedite the project implementation to quickly provide water for the residents, enabling them to increase agricultural productivity. - They wish for the ministry to frequently visit, study, and monitor the project closely.
Photo	

Consultation Level	Commune
Date	August 15th, 2024
Sub-Scheme	1. Lum Hach 2. Stoeung Krang Bat 3. Yutasas
Organization	Banteay Preal Commune Hall, Rolea B'ier District, Kampong Chhnang Province
Participants	1. Mr. Prum Thorn 2. Mr. Khoem Chham 3. Mr. Suos Saret
Moderator	Mr. Ly Visoth
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The commune has a total agricultural land area of 5,313 hectares, including more than 2,587 hectares of rice fields. Other areas consist of mixed-crop land and forest land that has not yet been allocated to the residents. - Most of the farmers are over 50 years old, while younger, able-bodied individuals have migrated to work in Thailand. - Livelihoods in the commune include agriculture, collecting forest products, handicrafts (such as making baskets and mats), trading, and labour work. - Key agricultural activities include rice farming, home gardening of vegetables, and raising chickens, ducks, cattle, buffaloes, and pigs at

	the household level. There is also one farmer in the commune who raises ducks for egg production on a farm. - Rice farming depends entirely on seasonal rainfall (from June to December). Water flows into the Lum Hach irrigation system and eventually drains into local canals in the village only when it rains. - Vegetable farmers use well water for irrigation. Some farmers living near reservoirs can irrigate their crops using reservoir water, but during the dry season, severe drought can lead to water shortages in the reservoirs. - For drinking water, most farmers rely on well water. Some households have filtration tanks, while others use the water directly. However, the water quality is poor due to arsenic contamination. - A portion of the population living in urbanized areas uses clean water from 20-litter containers, but even this water has limited quality. - Most farmers can only grow rice once a year due to water shortages during the dry season. - Vegetable cultivation is done at the household level on land surrounding their homes, and the produce is sold only within the village. No companies have yet established large-scale purchase contracts. - Livestock farming is still limited and small-scale. - Of the 10 villages, 4 receive water from the irrigation system: Trapeang Phkoam, Toap Srov, and Ou Leach. - The commune will collaborate with the project to assess its impacts and mediate with residents whose land is affected by the project. - The benefits of the project include enabling farmers to cultivate rice 2 to 3 times a year, having sufficient water for vegetable farming, and increasing biodiversity with fish and other aquatic animals. Additionally, it will boost household income through integrated farming. - There are no heritage sites within the commune. - The project may impact agricultural land and pose a risk of drowning for children. - The project aligns with the commune's three-year rolling development plan. Although the commune has submitted a proposal, there has been no response regarding the restoration of the irrigation system. The three-year rolling plan also includes a request to construct check dams (water gates) in Ruessei Duoch, Trapeang Phkoamg, and Toap Srov villages.
Requests	- Before implementing the restoration of the irrigation system, the ministry should organize a public forum to gather feedback from residents, especially those directly affected by the project. - The restoration and reconstruction of the Ou Koal should be prioritized. - The irrigation system should be constructed using durable structures (concrete) to prevent soil erosion, canal narrowing, and unauthorized access by the community in the future.

	- Build check dams along damaged or deteriorated canals and streams, as well as new ones in locations where they are currently lacking. Check dams regulate water levels, allowing excess water to overflow into canals or streams situated at lower elevations.
Photo	

Consultation Level	Commune
Date	August 15th, 2024
Sub-Scheme	1. Lum Hach 2. Stoeung Krang Bat 3. Yutasas
Organization	Krang Skear Commune Hall, Teuk Phos District, Kampong Chhnang Province
Participants	1. Ms. Keo Yan 2. Ms. Phan Sophalla 3. Mr. Bearn Porn
Moderator	Mr. Ly Visoth
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The commune has constructed gravel roads connecting each village, and some village roads have been paved with concrete. - Most of the able-bodied youth have migrated to work in Thailand, in factories across various provinces, or as labourers on plantations. - Krang Skear Commune is a remote rural area, with 99% of the population engaged in agriculture, primarily rice farming and small-scale vegetable gardening at the household level.

	- There is a growing trend of cultivating fruit trees (such as mangoes, coconuts, and longans) as plantations. - Livestock farming is conducted on a household scale, including cattle, buffaloes, pigs, chickens, and ducks. - Irrigation water comes from reservoirs and rainwater that flows into dug canals (such as Prek 1 Makara, a canal from the Pol Pot era) and streams. However, during the dry season, water is insufficient for rice farming. - In some areas, wells must be dug to support rice farming and vegetable gardening around homes, with depths ranging from 10 to 50 meters. - For domestic use, residents rely on filtered water from shallow wells and tube wells. - Many farmers in Krang Skear Commune cultivate rice once a year, specifically during the wet season, which spans up to six months. - Vegetable cultivation, primarily leafy greens, remains a household-level activity, typically grown on land surrounding homes. - Livestock rearing is still predominantly practiced at the family level, including cattle, buffaloes, pigs, chickens, and ducks. - In addition, the commune has small-scale livestock farms for pigs, chickens, and ducks, which have their own established markets. - Five villages stand to benefit from the canal restoration project: Chan Trak, Trapeang Mlu, Tuol Samraong, Krang Skear, Chambak Prasat. - The project aims to provide: Adequate water for rice cultivation and other crops. Sufficient water for household use. Water resources for livestock farming, particularly for cattle, buffaloes, and pigs. Enhanced aquatic biodiversity, especially fish, in the area. - The project will impact land owned by residents, especially agricultural land. - There are no cultural heritage sites within the commune that will be affected. - The commune has proposed plans to restore the Prek Chi and the small canal tributary in specific locations to enhance water distribution. - The commune is ready to assist and collaborate in implementing the irrigation system restoration project. This includes: - Facilitating communication between project stakeholders and affected farmers. - Coordinating with residents to address concerns and ensure smooth project implementation.
Requests	- Before construction, it is necessary to collect data on the land of farmers affected by the project, consult with the residents for their opinions, disseminate information, and notify the community. Coordination with farmers is essential during the project implementation process.

	- We request the Ministry to urgently assist in raising the dam and restoring the Prek Chi and small canal tributary as soon as possible, to enable farmers to increase rice production for a full year. - Compensation should be considered if the implementation of the irrigation project severely impacts the land of any farmer.

Consultation Level	Commune
Date	August 14th, 2024
Sub-Scheme	1. Lum Hach 2. Stoeung Krang Bat 3. Yutasas
Organization	Longveak Commune Hall, Kompong Tralach District, Kampong Chhnang Province
Participants	1. Mr. Ou Chanmony 2. Mr. Thim Thouern 3. Mr. Srey Saret 4. Mr. Choem Bunthoeurn 5. Mr. Uch Virak 6. Mr. Tok Bunna 7. Miss Sot Tonsreypov 8. Mr. Chhoem Chhoan
Moderator	Mr. Ly Visoth
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project

Perceptions and concerns	- Some of the agricultural land owned by the villagers has been sold to companies. - Most of the working-age population works as factory workers or migrates to Phnom Penh for employment. - The commune has paved roads, and some villages are currently constructing concrete roads as part of the commune's development budget, with additional dirt roads providing access to farmers' fields. - Within the commune, there are textile factories, shoe factories, and beer factories, among others, which discharge wastewater into the streams and canals. - Regarding agricultural potential, all eight villages have 90% of the population engaged in dry-season rice cultivation, which is done only once per year, starting in November when the water recedes, with harvesting in April. - As for vegetable cultivation and livestock raising, these activities are mostly on a household scale, but only a small number of households grow vegetables. They rely on water from wells, ponds, or canals. There are no commercial farms in the commune. - Dry-season rice farming depends on the remaining water in the canals after the river water recedes. - In some villages near the canals that receive wastewater from factories, farmers pump water from the canals for a second cycle of dry-season rice cultivation. - For household use, they rely on clean water from authority. - During the water recession season, farmers begin dry-season rice cultivation. Some farmers grow heavy rice varieties (cultivated only once a year), while others grow light rice varieties to harvest twice a year. - Livestock raised at the household level includes cattle, chickens, ducks, and pigs. - The commune will participate in studying, promoting, and facilitating project activities. - The benefits of the project include helping residents increase their income through double cropping per year, growing vegetables for additional income, fishing to sell fish, increasing fish populations, and ensuring sufficient water for agriculture. - There are no cultural heritage sites in the area. - The project may impact small remaining forested areas along the canal banks and result in the loss of some agricultural land. - The commune’s development plan highlights the restoration of canals and ponds to support the agricultural sector. In 2024, the commune requested district authorities to restore a pond (Boeng Tuek La’k), but the restoration project was not completed as the company awarded the contract withdrew from the agreement.

Requests	- If the canal restoration is carried out, we request the Ministry to create water gates along the remaining canals to store water for use. - For the Pol Pot-era irrigation system, we ask to maintain its original size and deepen it more than before. - We request that the canal banks be raised to create a two-lane road, approximately 5 meters wide, to allow farmers to drive vehicles to their fields and to provide access for rice buyers. - We request that the Ministry conduct an inspection and address the issue of wastewater discharge from certain factories in the commune. - We request the installation of solar lamps on bridges crossing the canals (such as Krang Punlai Bridge, Ta Hor Bridge, and Kampong Chamlor Bridge) to ensure safety for night travel and to assist residents transporting harvested rice. - We request the construction of a new gate at the Ou-Sleng dam because the old gate is difficult to open and close.
Photo	

Consultation Level	Commune
Date	August 13rd, 2024
Sub-Scheme	1. Lum Hach 2. Stoeung Krang Bat 3. Yutasas
Organization	Svay Commune Hall, Sameakki Mean Chey District, Kampong Chhnang Province
Participants	Mr. Chum Sam Ol

Moderator	Mr. Ly Visoth
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- People living along the road have shifted to business activities. - Most of the youth with working age leave the village to work in factories or move to Phnom Penh. - Most of the population engages in wet-season rice farming, while dry-season rice farming is done only in small areas near the river or on land with its own water resources. - Regarding livestock farming, nearly all households in the commune raise cattle, chickens, and ducks on a household scale, selling only within the village. There are also agricultural farms cooperating with CP Company, with two farms raising broiler chickens and one farm raising pigs. Additionally, there is a private farm raising about 200 to 300 ducks. - The water used for wet-season irrigation comes from the river, while dry-season irrigation uses water from canals and ponds. Household water comes from clean water supplied by the authorities. - In the past, people would thresh rice by hand, but now there is a shortage of local labour, so mechanized methods are used, which leads to a higher need for agricultural inputs. - There are two vegetable farms in the commune, and in addition, vegetable cultivation is carried out on a household level. - Six villages benefit from the project, including Chamkar Village, Ang Chhuk Village, Trapeang Boun Village, Trapeang Thma Village, Tuol Pongro Village, and Svay Pok Village. - The commune will participate in promoting and facilitating the restoration project. Currently, the commune has its own fund to support the maintenance of the dam. - The benefits of the project include providing farmers with sufficient water for irrigation, reducing fuel costs, enabling vegetable cultivation, and supporting the raising of ducks, fish, and crabs. It will also reduce the need to buy water and improve the health of both animals and people, as well as provide food and fish breeding grounds that people can fish from. - The commune does not have any cultural heritage sites. - The potential impact could affect some of the agricultural land. - The commune has a plan for the project, but no funding has been secured for the restoration yet. Currently, there is a development plan for the irrigation infrastructure, but it has not been implemented due to the priority need to construct concrete roads into the village and repair existing dirt roads first.
Requests	- For the irrigation system restoration project, if it impacts agricultural land that is severely affected, please consider appropriate

	compensation measures to prevent discouragement among the local population. - Please study methods to preserve or store more water during the dry season in each area and expedite the implementation of the project, as the local population is currently facing water shortages. - Please collaborate with agricultural experts if the water distribution project is implemented. - We request the Ministry to assist in constructing a handrail on the side of the water gate dam, as this area is frequently crossed by residents daily.
Photo	

Consultation Level	Commune
Date	August 14th, 2024
Sub-Scheme	1. Lum Hach 2. Stoeung Krang Bat 3. Yutasas
Organization	Kampong Luong Commune Hall, Ponhea Lueu District, Kandal Province
Participants	1. Mr. Nhem Punleur 2. Mr. Chim Chhen 3. Mr. Prak Pao
Moderator	Mr. Ly Visoth
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The commune has developed concrete roads and dirt roads to each village. - Most of the agricultural land in this area has already been sold to companies, with only about 20% of the land remaining under the ownership of the local population. This land requires water from the Stoeung Krang Punlei for irrigation, while the rest is located farther from the river mouth. - In terms of agriculture, the population engages in rice farming, vegetable cultivation on a household scale, and raising ducks, cattle, chickens, and ducks. One household also raises fish in their own pond. - Farmers near the Stoeung Krang Punlei use its water for irrigation on their fields. - The clean water system has been extended along the national roads for residents, while those living in villages farther from the roads rely on well water.

	- For consumption, the population uses purified water (from 20-litter containers), water from hand-dug wells that is filtered with a mesh, and piped water from pumps, which is filtered before consumption. - Most farmers in the area manage to cultivate two rice crops per year, specifically light rice. The first crop is from January to March, and the second crop is from April to June. - Some farmers grow only one crop per year, but after harvesting the rice, they plant vegetables on the same land, using well water for irrigation. - Livestock farming requires minimal resources in the area. - To address issues, the commune will collaborate with the Ministry to coordinate the project, communicate updates to the public, and raise awareness about the environmental impact, especially water pollution in the area. - The benefits of the project include providing water for some farmers, allowing drainage for flooded areas during the rainy season, supporting local fisheries, and offering habitats for fish to thrive and reproduce. - The Rajanilongvek Eco-tourism site might benefit from additional views of the river mouth. - Over 500 farming households live along the river mouth and rely on river water for irrigation. - There is potential to cultivate mixed vegetables for additional household income. - The project could affect some farmland, particularly for families with land along the river mouth. - It might also impact some trees growing along the river mouth. - The project would affect the farmland of over 100 farming households and land owned by companies near the river mouth. Notably, it severely impacts the land of one household who built their home right on the river mouth (in Kla Tram village). - The commune has previously requested the Ministry of Water Resources to restore this river. - The commune does not have sufficient budget plans for this project now.
Requests	- A request is made to deepen the river to improve water drainage for areas affected by flooding during the rainy season. - A request is made to repair a water gate at the intersection of Prek Chrov and Lao Khav, as the current gate is too small and cannot adequately release water during the rainy season. - A request is made to study the situation at the Rajani Bridge, located near the Ta Chan dam, because there is a small gap for water flow that needs to be addressed.

	- A request is made to construct a head dam in the Peam Chinik village to help retain water for agricultural use.
Photo	

ANNEX 9.3: RESULTS OF THE CONSULTATIONS WITH VILLAGE CHEFS IN KAMPONG CHHNANG PROVINCE

Consultation Level	Village Chef
Date	August 13rd, 2024
Sub-Scheme	Yutasas
Farmer Group	Svay Pok Village, Svay Commune, Sameakki Mean Chey District, Kampong Chhnang Province
Participants	Nhem Non
Moderator	Miss Chhim Sreytouch
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The villagers face issues with poor-quality animal feed, unhygienic conditions, and food that is overly chemically processed. - Some villagers are struggling with limited access to water and lack the means to buy water pumps. Renting water pumps is expensive, making it difficult for them to meet their needs. - The village has 223 households that rely on the irrigation system for their water supply. - There are community officials managing the water distribution system, such as the dam gatekeeper. - The quality of water in the irrigation area is good. - The construction of the irrigation system has not caused any harm to the people's assets or cultural sites. - The project will provide water for both agricultural work during the rainy and dry seasons, as well as for animal husbandry. It is expected to boost the local economy and could help create a tourism area, providing additional income for villagers.
Requests	- Request assistance from the Ministry of Public Works to repair the dam embankment. - Ask the Ministry to install metal gates for the water dam (Ta Pring) and the embankment (Ta Nang). - Help to repair the embankment (Pou Sim), which is currently at risk of damage. - Request to install solar panels for lighting the road to the Yutasas dam
Photo	

Consultation Level	Village Chef
Date	August 13rd, 2024
Sub-Scheme	Yutasas
Farmer Group	Svay Pok Village, Svay Commune, Sameakki Mean Chey District, Kampong Chhnang Province
Participants	Mr. Dik Hakk
Moderator	Miss Yeab Dalin
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The factors contributing to frequent illnesses in the village include climate change (extreme heat) and mosquito bites, which cause diseases such as malaria and dengue fever, with higher occurrences during the rainy season. - Approximately 70% of the villagers use water from the irrigation system, while the remaining 30% rely on river water. - There is a shortage of water, especially during the rice reproductive stage, as there is no water supply to the fields, causing crop damage. Farmers must wait for water from Svay Pok, which only flows to them after farmers in that area have sufficient water. - The Water User Community is responsible for managing the irrigation system. - The current canals are shallow, storing only a limited amount of water. - The project will provide sufficient water for agricultural activities, increase water storage capacity, allow for additional rice cultivation during the dry season, and support vegetable farming.
Requests	- Compensation will be provided to the affected households for the farmland impacted by the construction. - A water reservoir and gates will be constructed to retain water.
Photo	

Consultation Level	Village Chef
Date	August 13rd, 2024
Sub-Scheme	Yutasas
Farmer Group	Krasang Pul Village, Svay Commune, Sameakki Mean Chey District, Kampong Chhnang Province
Participants	Mr. Chea Sary
Moderator	Miss Yeab Dalin
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The factors contributing to frequent illnesses in the village include a lack of water for daily use and pollution from factory emissions. - Approximately 310 households in the village rely on water from the irrigation system. - During the dry season, the canals do not have enough water, and villagers must take turns pumping water, which is time-consuming. - There is currently no designated authority managing the irrigation system; instead, everyone in the village has equal access to it. However, those with land adjacent to the irrigation system participate in its maintenance. - The water quality in the irrigation system is poor, characterized by a murky and heavily turbid appearance. - The project will help villagers increase productivity and access water for irrigation beyond rice farming, such as growing vegetables and raising livestock. - Approximately 50 households will be affected by the project. They feel concerned and regretful about losing their farmland, but they acknowledge that the project must proceed, and the land has already been excavated.
Requests	- The project will restore and improve the irrigation system within the village.
Photo	

Consultation Level	Village Chef
Date	August 13rd, 2024
Sub-Scheme	Stoeung Krang Bat
Farmer Group	Oknha Pang Village, Longveak Commune, Kompong Tralach District, Kampong Chhnang Province
Participants	Mr. Chhoem Chhorn
Moderator	Mr. Ly Visoth
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project

Perceptions and concerns	- The factors contributing to frequent illnesses in the village include mosquito bites causing dengue fever among children and dietary habits leading to diseases like diabetes and hypertension. - The canal lacks water during the dry season, and if there is no rainfall at the beginning of the wet season, the canal remains dry. - Villagers with land adjacent to the canal are responsible for maintaining it. - The water quality in the canal is poor due to polluted wastewater discharged from a nearby bag manufacturing factory. - Approximately 50 households in the village rely on water from the irrigation system. - The construction project on this canal will affect approximately 100 plots of land belonging to the villagers. - The villagers will not agree to the restoration of the irrigation system unless appropriate compensation is provided. - The project will help address the water shortage for dry-season rice farming and crop cultivation.
Requests	- The ministry should consider providing fair compensation for the land affected by the project.

Moderator	Miss Chhim Sreytouch
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The factors contributing to frequent illnesses in the village include poor sanitation, lack of access to clean water, limited knowledge, and food containing excessive chemicals. - If the irrigation system reaches the village, 90 households will benefit from it. - The main challenge faced by farmers is the lack of water, as the current irrigation system has not yet reached the village. - Villagers will have access to water for irrigating their agricultural fields.
Requests	- They request the department to conduct technical training sessions on agricultural practices.

	- They also wish for the canal to be deepened and for the construction of branch canals to reach the village.

Consultation Level	Village Chef
Date	August 15th, 2024
Sub-Scheme	Lumhach
Farmer Group	Trapeang Mlu Village, Krang Skear Commune, Teuk Phos District, Kampong Chhnang Province
Participants	Ms. Chey Puthy
Moderator	Miss Sothy Chantana
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The main factor contributing to frequent illnesses in the village is climate change. - Approximately 50 households in the village rely on water from the irrigation system. - A major challenge is the insufficient water supply during the dry season. - The canal in the village currently has no designated management authority; all farmers share the responsibility for its maintenance. - The water quality in the irrigation system is good. - The project will impact the land of around 50 households living near the canal. - Affected households initially feel upset, but the commune has organized outreach sessions to explain the project's benefits. Since they have land within the village for resettlement, they can relocate if necessary. - The project will provide sufficient water for crop cultivation and rice farming in both the dry and wet seasons. It will also enable villagers to engage in fishing, supporting their livelihoods and increasing household income. - The project will help reduce the number of family members migrating to work abroad or in distant provinces.
Requests	- Request the restoration project to be completed as quickly as possible.

Farmer Group	Krang Skear Khang Tboung Village, Krang Skear Commune, Teuk Phos District, Kampong Chhnang Province
Participants	Mr. Soam Sary
Moderator	Miss Hak Leakhina
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The primary factor causing frequent illnesses in the village is frequent climate change, which affects the health of the population. - Only 7 households in the village rely on water from the irrigation system, while the rest use their own wells and ponds. - A key challenge is the insufficient water supply for pumping, as the water in the stream often runs out after each pump cycle. - The canal in the village currently has no management authority. - The water quality in the canal is poor, as fallen leaves contaminate the stream, making the water muddy and suitable only for livestock consumption. - The project will not affect cultural heritage sites but will impact farmland and plantations near the stream. - Affected households feel disappointed about losing some of their land near the canal and will demand compensation if their land is excavated. - The project will provide the community with a reliable irrigation system, ensuring sufficient water for various needs, including rice field irrigation, vegetable cultivation, and farming. - Additionally, the villagers will be able to fish in the water system, enhancing food security and income.
Requests	- Requests the restoration of the old stream within the village.
Photo	

Consultation Level	Village Chef
Date	August 15th, 2024

Farmer Group	Andoung Preng Village, Krang Leav Commune, Rolea B'ier District, Kampong Chhnang Province
Participants	Mr. Keo Heng
Moderator	Miss Yeab Dalin
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project

Perceptions and concerns	- The main factors causing frequent illnesses in the village are poor nutrition, climate change, and an increase in mosquitoes during the rainy season. - Currently, there is no irrigation system in the village. - The quality of the water (from wells) is poor due to the presence of heavy metals. - The project will impact the land of villagers, and affected households are demanding compensation. - Once completed, the project will provide water for household use, support additional livestock farming, and enable rice cultivation in both the wet and dry seasons. - The villagers support the construction of the irrigation system.
Requests	- They request the immediate construction of the irrigation system and the restoration of the canal.
Photo	

Consultation Level	Village Chef

Farmer Group	Krang Leav Village, Krang Leav Commune, Rolea B'ier District, Kampong Chhnang Province
Participants	Mr. Hem Sarom
Moderator	Miss Sothy Chantana
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The primary factor contributing to frequent illnesses in the village is climate change, which often causes flu outbreaks. - Approximately 222 households in the village rely on water from the irrigation system. - The main challenge is the insufficient water supply during both the dry and wet seasons. - Currently, the irrigation system is managed by the abbot of the local pagoda. - The quality of the canal water is suboptimal, while the groundwater contains a high level of minerals, particularly lime. - Regarding land impacts, the commune has already allocated land for canal restoration. - Affected households, around 10 to 15 families, feel regretful about losing their land. - The project will provide sufficient water for crop cultivation and rice farming in both the dry and wet seasons, helping to increase household income.

	- Villagers will also be able to fish, contributing to their family's food security. - The project is expected to reduce the need for family members to migrate for work to other provinces or abroad.
Requests	- The restoration of the irrigation system to be completed as soon as possible.

Participants	Ms. Phen Chanthorn
Moderator	Miss Yeab Dalin
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The frequent illnesses in the village are caused by the consumption of chemically treated vegetables and climate change. - Only 5 households in the village use water from the irrigation system, while others rely on groundwater and rainwater for farming. - The main challenge is the lack of sufficient water to increase crop yields and rice production. - There is no management authority overseeing the village's irrigation system. - The quality of canal water is poor, and the groundwater contains a high level of contaminants. - The project will have minimal impact on the land of households near the irrigation system, and no significant problems are expected when restoring the system. - Affected families have no objections to the construction or restoration of the irrigation system, and they are satisfied with the project. - The project will help provide adequate water for expanding rice cultivation and increasing other crop production.
Requests	- Requests assistance in restoring or constructing the irrigation system.
Photo	

Consultation Level	Village Chef
Date	August 15th, 2024

Sub-Scheme	Lumhach
Farmer Group	Preal Village, Banteay Preal Commune, Rolea B'ier District, Kampong Chhnang Province
Participants	Ms. Nim Sarith
Moderator	Miss Yeab Dalin
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The frequent illnesses in the village are caused by many mosquitoes during the rainy season, leading to an increase in malaria cases, as well as climate change factors. - Only 16 households in the village use water from the irrigation system; the rest rely solely on rainwater for farming. - The main challenge is the lack of sufficient water for irrigation. - There is no management authority overseeing the village's irrigation system. - The quality of canal water is poor, and the groundwater is contaminated with a lot of salts. - The project will impact the land of about 25 households, but it is not expected to cause significant issues. - Affected households are requesting compensation for the loss of land. - The project will help ensure sufficient water for irrigation, enabling multiple cropping seasons and providing more water for better rice yields and crop production. - The community can also fish from the irrigation system.
Requests	- Compensation is requested for the households affected by the land loss. - The project aims to restore and improve the quality of the irrigation canals.
Photo	

Consultation Level	Village Chef
Date	August 15th, 2024
Sub-Scheme	Lumhach
Farmer Group	Sdok Kabbas Village, Banteay Preal Commune, Rolea B'ier District, Kampong Chhnang Province
Participants	Ms. Nov Saoky
Moderator	Miss Hak Leakhina
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The cause of the frequent illnesses in the village is unclear.

	- Only 4 households in the village use water from the irrigation system, sourced from canals, ponds, and rainwater. Other households do not have land for farming. - The villagers do not engage in dry season (winter) rice cultivation. - The main problem is that the canals are dry during the dry season, and both the pond and stream lack sufficient water. - There is no management authority overseeing the village's irrigation system. - The project will not affect the cultural areas of the village, but it will impact the agricultural land of the villagers. - Affected households are disappointed about losing their land, but they still support the project. - The project will help the villagers by providing a functional irrigation system, allowing them to cultivate crops and irrigate fields during both the rainy and dry seasons.
Requests	- There is a request to restore the pond and canal systems to meet the village's irrigation needs.
Photo	

Consultation Level	Village Chef

Farmer Group	Sdok Kabbas Village, Banteay Preal Commune, Rolea B'ier District, Kampong Chhnang Province
Participants	Ms. Nov Saoky
Moderator	Miss Hak Leakhina
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The frequent illnesses in the village are caused by a lack of sanitation (Diarrhea, fever, stomach diseases), climate change leading to epidemics, and mosquito bites causing malaria. - Only 20 households in the village use water from the irrigation system. - The villagers do not practice dry-season rice farming. - The main issue is the absence of water storage ponds for agricultural use during the dry season. - The government manages three large reservoirs (0.35 hectares) and a cattle pond (2 hectares), while farmers manage other smaller ponds. - The water quality from the irrigation system is not good, and the underground water contains many pollutants. - The project will not affect cultural areas or the agricultural land of the villagers.

	- The project will provide a water storage pond that can support the villagers' fishing activities.
Requests	- A study is requested to examine the possibility of placing water sediment in the streams to allow the water to flow into the fields. - The project will include the restoration of a new irrigation canal from the water sediment storage area. - The construction of the new canal will involve using the land to form an irrigation canal entrance.
Photo	

Consultation Level	Village Chef
Date	August 15th, 2024
Sub-Scheme	Stoeung Krang Bat
Farmer Group	Trapeang Chambak Village, Longveak Commune, Kompong Tralach District, Kampong Chhnang Province
Participants	Ms. Kong Samut
Moderator	Miss Hak Leakhina
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The frequent illnesses in the village are caused by the lack of proper sleep for the population, and parents do not have time to properly care for their young children. Elderly people often suffer from diabetes due to consuming excessive amounts of sweet foods. - Only 60 households in the village use water from the irrigation system. - The main issue is the inability to grow crops in the dry season due to a lack of rain and insufficient water in the irrigation canals. In addition, fishers in the area have blocked the water gates, preventing water from flowing into the village's irrigation systems. - The village irrigation system does not have any management. - The water quality is poor, as it is polluted by waste runoff from factories, and it can only be used for farming and livestock purposes. - The project will not affect cultural areas but will impact the land of villagers living near the irrigation canals. - Families whose land is affected feel disappointed about losing their land and will demand compensation if their land is damaged during construction. - Once the project restores the old canal in the village, it will allow water from the surrounding irrigation systems to flow in, providing enough water for farming and crop cultivation.

Requests	- The project will help restore the irrigation canals in the village, making it easier to receive water and connect the main canal to the village's irrigation systems.
Photo	

ANNEX 10.1: RESULTS OF THE CONSULTATIONS IN KAMPONG SPEU PROVINCE

Consultation Level	Provincial
Date	August 23rd, 2024
Sub-Scheme	1. Krapeu Truom 2. Brambei Mom
Organization	Kampong Speu Provincial Hall
Participants	1. Mr. Chet Dom 2. Ms. Prak Leakkhina
Moderator	3. Mr. Chun Nimul 4. Miss Tuon Somphorsdavin
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The agricultural sector in both regions has fertile land suitable for growing rice and other crops. - There are no major concerns as the local population is willing to cooperate, though there may be issues with land disputes. - Negative impacts mostly occur during construction (such as difficult terrain and challenging travel) and land impact. - Positive outcomes post-construction includes better roads, water distribution systems, and access to water in the area. - There are no environmental or natural impacts, and biodiversity can improve once the project is completed. - The living conditions of the local population have improved overall, benefiting both landowners involved in agriculture and non-landowners through wage labor, offering jobs to the poor in manual labor roles (wage labor and physical work). - The general situation of resettlement issues and management solutions in the province largely involves conflicts between private land project companies and local populations, with some grassroots movements opposing regional development. - Technical issues arise in various aspects of resolution, and there are financial resource challenges.
Requests	- Request to construct a concrete system for long-term use (with a focus on quality) for both the irrigation channels and the main canal. - Request to improve and enhance the quality of the water reservoirs, drainage ditches, making them more efficient and modern, as well as to repair the current water gates due to flooding issues. - Consideration for the local population during the construction phase and after the completion of the project.

	- Request for the project to proceed quickly.
Photo	

Consultation Level	Provincial
Date	August 23rd, 2024
Sub-Scheme	3. Krapeu Truom 4. Brambei Mom
Organization	Department of Agriculture Forestry and Fisheries, Kampong Speu province
Participants	Mr. Chea Hokly
Moderator	1. Mr. Chun Nimul 2. Miss Tuon Somphorsdavin
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The use of medium-sized rice seeds for the dry season (150kg-200kg for male and 20kg-30kg for female) and wet season (150kg-200kg for male and 20kg-30kg for female). - Five communes have rice farming areas: 1860ha for the wet season and 30-50ha for the dry season. - Most farmers in this region purchase rice seeds from companies and community seed producers. Local land beans are saved by the farmers, and vegetable seeds are bought from companies.

	- Fertilizer usage: 70%-80% of farmers use fertilizer twice, and 20%-30% use fertilizer three times. - Most farmers do not use pesticide; they only use herbicides and insecticides. - Labor hiring is rare; most work is done manually or with machines. - Farmers here sell rice depending on the type. For fragrant rice (e.g., jasmine), they sell it immediately at a high price (wet 1100 Riel), while for regular rice, they store it at home until it dries, then sell it at a higher price (wet 800-900 Riel, dry 1500 Riel). - Issues faced include water scarcity, agricultural inputs, and the lack of livestock to produce fertilizer. - Pesticide use is minimal, and bans on usage are not enforced. - Irrigation systems are inadequate; storage reservoirs are limited to upper sections such as the Tasal, Talong dam, and the Tonle Prek river. The province has areas that are flooded or dry. - Harvesting is done using machines. - Production costs: Fertilizers, pesticides, and fuel are expensive. - Vegetable production that should be promoted focuses on the market, depending on farmers and farming communities. - The region is suitable for farming, especially when farmers gather according to community plans. - The vegetable market relies on the community's connection to traders and other local networks. - Fish species are unclear, and farmers often lack time, as most work in factories. - Labor issues include a shortage of workers and irregular income. - There are 31 training courses in 31 communes, equal to 31 villages. - Training topics include vegetable and rice farming techniques. - Farmers typically cultivate rice three times a year. - Besides the ministry, farmers receive training on rice production through some programs from World Vision and government projects.
Requests	- Assist in properly organizing the irrigation system.

Photo	

Consultation Level	Provincial
Date	August 23rd, 2024
Sub-Scheme	1. Krapeu Truom 2. Brambei Mom
Organization	Department of Water Resources and Meteorology, Kampong Speu province
Participants	Mr. Huong Eksamnang
Moderator	1. Mr. Chun Nimul 2. Miss Tuon Somphorsdavin
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The current water sources are insufficient due to most of the dams in the province being small dams. - The development of water resources in the province faces issues and obstacles, particularly a lack of financial resources. - The 35 communes have farming communities using water, but the systems are not yet operational. There are human resources, but no materials available. - The management of the department is the best coordinator for connecting with the communities. - However, most of the farming communities using water have failed due to the entry of industrial investment companies into the region. - The total irrigated area in the province is 65,000ha for both dry and wet seasons, with 75% of the irrigation systems being in poor condition (most systems are damaged). - The importance of irrigation systems in improving living conditions is that they reduce poverty and improve the lives of the people in the

	region, helping landowners with farming and providing work opportunities for landless individuals.
Requests	- Do not take too long to conduct the study for the project. - Request for the project to proceed quickly.
Photo	

Consultation Level	Provincial
Date	August 23rd, 2024
Sub-Scheme	1. Krapeu Truom 2. Brambei Mom
Organization	Department of Women's Affairs, Kampong Speu province
Participants	Ms. Phun Phin
Moderator	Mr. Keo Sony
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- Industrial development has led to female family members working in garment factories, resulting in a lack of water for agricultural use. - There is violence within families and cases of sexual assault. - Victims are concerned about personal safety and fear that pursuing legal action could result in retaliation from the perpetrator's family. - The Women's Affairs Department works with institutions and partner organizations to provide legal services and vocational training for victims. - The department has addressed incidents through public awareness programs on gender in collaboration with local authorities and communes, working with partner organizations such as CSC (legal aid organization), CWCC (organization helping women in crisis), and LWD (Life with Dignity).

	- The department provides support to victims through legal and social services. - The department prepares monthly gender reports for submission to the Ministry. - The department resolves cases by preparing complaints for the court and providing psychological and legal counseling. - Government initiatives include the "Rattanak Women's Strategy Plan," the "National Action Plan to Combat Violence Against Women and Children," and collaboration with partner organizations. - To prevent and better respond to gender-based violence, efforts include increasing public awareness of gender issues and legal challenges faced by offenders, creating gender-related community networks at the grassroots level, and ensuring regular gender report collection at local levels (district, commune, village). - The increasing number of personnel in the CAISAR project has raised concerns about company workers engaging in violence against people (sexual assault). - To mitigate the risk of gender-based violence associated with the project, the company must train staff on gender issues and collaborate with local authorities and relevant institutions to provide personnel data. - The primary risk in this area is sexual assault. - Construction companies involved in coordinating and providing living and restroom facilities must separate accommodations and restrooms for men and women. They must also provide gender training to staff and workers, collaborate, and report incidents at project sites, ensuring public awareness of the project's presence to local authorities and the community.
Requests	- The project will reduce migration. - The project will increase agricultural production. - It is requested that women be included in the management committee of the irrigation system.

Photo	

Consultation Level	Provincial
Date	August 23rd, 2024
Sub-Scheme	1. Krapeu Truom 2. Brambei Mom
Organization	Department of Environment, Kampong Speu province
Participants	Mr. Koy Sonin
Moderator	1. Mr. Keo Sony 2. Mr. Nhoeb Phirun
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The general situation of environmental management by the Department of Environment for development projects in the province involves coordinating with local authorities and communities to ensure the smooth implementation of the project and encouraging companies to comply with the law. - The role of the Department of Environment includes preparing agreements (for areas under one hectare) and collaborating with ministries. - The work of the Department of Environment related to the environmental management program for the CAISAR project involves preparing the Environmental Impact Assessment (EIA) in collaboration with the Ministry of Environment. For any project funded by ADB, World Bank, or similar organizations, an EIA must be prepared.

	- There are no significant areas of biodiversity resources, only agricultural land. - The project provides benefits to biodiversity resources by providing habitats and relocation opportunities for species. - Solutions include placing hazard signs and water irrigation along transportation routes. The company collaborates with local authorities to address the impacts of project activities on land use.
Requests	- The company implements its own plan. - Collaborates with local authorities. - Prepares a report to monitor project activities every 3 months.
Photo	

Consultation Level	Provincial
Date	August 23rd, 2024
Sub-Scheme	1. Krapeu Truom 2. Brambei Mom
Organization	Svay Kravan Disabled People's Federation Organization, Kampong Speu province
Participants	Mr. Vann Sambath
Moderator	Mr. Keo Sony
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The role and key activities of the organization in the province involve advocating for persons with disabilities, protecting the rights of persons with disabilities, promoting disability rights to private partners, and providing assistance to persons with disabilities.

	- The project will help the population increase agricultural production multiple times per year. - The relationship between the CAISAR project and the organization is to improve agricultural production. - The impacts, benefits, and changes brought by the CAISAR project include creating shelter and pathways for biodiversity resources, providing opportunities for the population to increase agricultural production or participate in reducing migration.
Requests	- Provides opportunities for farmers to engage in agriculture multiple times per year. - Reduces the risks of floods and droughts.

Consultation Level	Provincial
Date	August 23rd, 2024
Sub-Scheme	1. Krapeu Truom 2. Brambei Mom
Organization	Kong Pisei Integrated Agricultural Community, Kampong Speu province
Participants	Mr. Chea Ratha
Moderator	Mr. Nhoeb Phirun
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The community has participated in the election process and the declaration of the provincial district council. A training session for the community has been organized, covering livestock farming, fish farming, and vegetable cultivation for all districts throughout Kampong Spue province. - Farmers are knowledgeable about fish farming, livestock farming, and vegetable cultivation, but currently, these projects have been discontinued. - There is limited communication due to the farming-related issues they are involved in. - There are no impacts as long as the project starts quickly; the benefits and environmental improvements will continue to improve. - Living conditions and migration are not an issue if land measurement and planning are carried out correctly. - Vulnerable groups, including women, children, ethnic minorities, and communities with cultural backgrounds, face no issues if the impacts have already been addressed or if land exchange has been completed.
Requests	- Accelerate construction to ensure it is completed in time for the planting season of the population.

	- Establish a community to protect water usage or pay fees for construction and repairs.
Consultation Level	Provincial
Date	August 23rd, 2024
Sub-Scheme	1. Krapeu Truom 2. Brambei Mom
Organization	Oudong Me Chey Town Hall, Kampong Speu province
Participants	1. Mr. Kong Sophannak 2. Mr. Keo Borey 3. Mr. Yoeng Soyen 4. Mr. Mak Samoeurn 5. Mr. Sok Khanit 6. Mr. Um Vann
Moderator	Miss Sek Liny
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The sector with potential and a priority for rural development is agriculture (75%) (rice, vegetables, groundnuts, watermelons, Chinese broccoli, and cabbage), followed by handicrafts (10-20%), tourism, and industry (factories). - The district is aware of the project to restore and expand the existing irrigation system, which helps facilitate water delivery to agricultural land. Once land prices drop, farmers return to farming. - The impact is the dry season causing water shortages. - The benefits of the project include providing water for livestock and fish, reducing migration, improving the livelihoods of the population, increasing agricultural production, providing additional jobs for landless people through selling labor, and starting small businesses because there are many people in the district (reducing migration). - The role of the district is to facilitate project activities and advise the company on how to reduce pollution (water and air pollution). - There are no more land issues because the land has already been registered. - Meetings are held to find solutions and provide compensation to those affected. - The district's capacity and human resources for those with land titles: resolve through legal channels; for those without land titles: assist in facilitating solutions. - The main challenges for farmers are water shortages, lack of water storage, pests, crop diseases, lack of capital, lack of labor, and poor crop growth due to climate change and flooding.

	- Challenges include insufficient irrigation systems (water has to be taken from dikes and reservoirs). The dry season lasts too long, and the water level of dams is too high, preventing the flow of water. In the plan, there is no land allocation for rice cultivation, but farmers have cultivated 20 hectares. When there is heavy rain and high water, they open the dam, which causes water to overflow and damage fields. - Solutions include using chemical and organic pesticides, borrowing money from banks, planting vegetables in small greenhouses, providing agricultural training to farmers, and issuing emergency alerts when water exceeds 3 meters. - Seed retention: keep 90% and buy 10%. - Fertilizer: use chemical fertilizers, which are required annually, and compost (chicken, pig, and duck manure). Some farmers use both, but sometimes only chemical fertilizers. - Pest control: No use of insecticides, only weed killers. - Irrigation system: There is enough water in the rainy season; some years, about 500 hectares of rice land may be flooded for 3-7 days. The dry season does not have enough water, and there is a shortage of water storage. - Service fees for the irrigation system: The community pays 40,000 KHR/ha for water in the village area, 20,000 KHR/ha for drained land, and 10,000 KHR/ha for pumped land. - Harvesting: 90% is machine harvested, and 10% is hand-harvested (for seed selection). - The situation regarding violence includes 2 cases of sexual abuse and 1 case of physical violence. - Victims, particularly women, may still be hesitant to speak out but have become braver in reporting and filing complaints. - Government operations include existing laws for resolving and publicizing gender issues. - To prevent and respond to gender-based violence, efforts include continued gender awareness campaigns, strict punishment for perpetrators, and efforts to reduce the spread of drugs. - The increase in the number of staff in the CAISAR project poses no problems, as no issues have been caused by construction workers so far. - To reduce the risk of gender-based violence, the project involves allocating separate accommodation for men and women, advising workers on laws and punishments for violations, and promoting gender equality. - Risks in the area include violence and sexual harassment. - The construction company facilitates and completes work by allocating separate accommodation for men and women, advising workers about laws and punishments for violators, and promoting gender equality.

Requests	- Increase water sources to help reduce migration, which in turn helps reduce sexual violence through living together with family. - Request the water resources department to expedite construction. - Provide water storage facilities and ensure sufficient water for agricultural activities.
Photo	

Consultation Level	Provincial
Date	August 23rd, 2024
Sub-Scheme	1. Krapeu Truom 2. Brambei Mom
Organization	Thpong District Hall, Kampong Speu province
Participants	1. Ms. Say Sean 2. Ms. Seng Samrong 3. Mr. Sao Vat 4. Mr. Sem Chea 5. Mr. Long kakada
Moderator	Miss Sek Liny
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The sector with the potential and priority for rural development includes agriculture, agro-industry, industries (such as garment factories and sugar factories), and tourism. - It is known that there are plans to restore and expand existing irrigation systems, helping to facilitate water supply to agricultural land. - Areas with high biodiversity, habitats for various species, and a conducive environment help increase fish flow if developed in stages, without negatively impacting the environment, while also creating tourist destinations in the region.

	- The living conditions of the population and migration could impact some lands, but it can increase yields through the availability of water, and farmers need agricultural techniques and good market access. - Vulnerable groups and indigenous peoples can sell their labor. - The role of the district is to assist in coordinating the project activities, resolving issues with affected populations who are beneficiaries, and promoting participation in water system conservation. - There are no further issues as land titles have already been registered. - The district's capacity and human resources can resolve some issues at the local level through legal land rights and requests for additional support from the provincial level in case of more serious problems. - The main challenges for farmers include flooding, water scarcity (during the dry season), pests, labor shortages, animal diseases, and unstable markets. - The reasons for the issues stem from heavy rains, dam construction, the draining of some ponds, climate change leading to longer dry seasons, water management issues, pest outbreaks due to drought, cross-border movement, increased factory operations, and declining livestock breeding and trust in the population. - Solutions include emergency relief movements, establishing water storage facilities, promoting water usage, collaboration with relevant ministries and agencies to educate on water conservation, and introducing modern agricultural methods. - Seedstock: 90% are kept by farmers (who select seeds for planting) and 10% are purchased. - Fertilizers: 50% chemical fertilizers and 50% organic fertilizers (from poultry, pigs, and ducks), used according to vendor advice. - Irrigation system: Insufficient water during the dry season. - Irrigation service fees: No fees have been collected yet due to insufficient water supply to meet demand, and the infrastructure is not yet adequately organized. - Harvesting: 90% is done by machine, and 10% by hand (for seed selection or when machinery is not available). - Violence situation: Cases of sexual assault and violence. - Vulnerable families have filed complaints, and more people are coming forward to file complaints than before. - Government interventions include the Ratanak Women's Book, which provides legal resolutions, public awareness campaigns, and gender education to the public, with a GBV team to assist in resolving issues. The team provides confidential assistance, including counseling, without exposing the identities of victims, and consultation groups are formed to resolve and offer psychological support. - To prevent and respond to gender-based violence, continued awareness campaigns on gender are needed, along with strong

	penalties for perpetrators, efforts to reduce drug use and alcohol, and addressing social media issues. There should also be campaigns promoting safe communities in rural areas. - There has been no issue with the increased number of staff in the CAISAR project because there have been no issues caused by construction workers in the past. - To reduce the risk of gender-based violence that could arise from the project, related parties should conduct site checks, separate accommodations for men and women, provide legal guidance to workers, and impose penalties for offenders. - Risks include issues related to violence and sexual assault. - Construction companies coordinating and completing their work should provide workers with information on laws, penalties for offenders, and promote gender equality.
Requests	- Request for the construction project to hire workers from the local area. - Accelerate construction. - Provide water storage facilities and ensure there is enough water for agriculture.
Photo	

ANNEX 10.2: RESULTS OF THE CONSULTATIONS WITH COMMUNE COUNCILS IN KAMPONG SPEU PROVINCE

Consultation Level	Commune
Date	August 12th, 2024
Sub-Scheme	1. Brambei Mom 2. Krapeu Truom
Organization	Sangkat Preah Sre Hall, Oudong Me Chey District, Kampong Speu Province
Participants	1. Mr. Tim Sanou 2. Mr. Chhay Aem 3. Mr. In Thy 4. Mr. Huy Seng
Moderator	1. Mr. Chun Nimul 2. Mr. Ly Visoth
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- Most of the development in the district focuses on the construction of road infrastructure. - The district's population mainly consists of farmers, with some individuals along the roads engaged in businesses, and youth migrating for employment. - Agricultural activities mainly involve rice cultivation, vegetable farming, and livestock raising. - For the wet season irrigation, water is sourced from the reservoir and canals connected to it. However, during the dry season, there is a shortage of water, and irrigation for crops is unavailable. Household water use is dependent on tap water. - Farmers typically cultivate rice once a year during the wet season. - Vegetables are grown around homes, utilizing canal or pond water. In some areas, after rice harvesting, melon farming is practiced. There is also one farmer cultivating cucumbers in a well-organized setup with a market in Phnom Penh. - Livestock farming includes raising cattle, chickens, and ducks for household consumption. Additionally, there are two farms for chicken and two for pigs currently operational in the district, with some farmers also raising ducks on farmland after harvesting crops. - There are four villages that benefit from this irrigation system: Angk Sandan, Pou Kaong, Ta Chiel, and Chhuk Sar. - The commune will facilitate resolving conflicts related to impacts and cooperate during project implementation.

	- The benefits of the project include a sufficient water supply for rice farming and vegetable cultivation, a habitat for fish, irrigation for crops, and the potential for integrated vegetable farming to generate additional household income. - There are no heritage sites within this commune. - The potential impact includes affecting some parts of the rice fields. - The restoration of this canal aligns with the commune's implementation plan, but the commune currently lacks sufficient funding to carry it out.
Requests	- Please implement the restoration project according to the system plan. If the restoration deviates from the designated system plan provided by the land surveyor and affects private land, appropriate compensation should be provided to the landowners. - A water gate should be constructed at the stream to divert water into the secondary canals, as the stream level is lower than the canal. - Please conduct a thorough impact assessment and public consultation before implementing the project. - The project will help establish a road along the canal, which will increase the land value in the area after construction is completed.
Photo	

Consultation Level	Commune
Date	August 14th, 2024
Sub-Scheme	1. Brambei Mom 2. Krapeu Truom

Organization	Sangkat Veal Pong Hall, Oudong Me Chey District, Kampong Speu Province
Participants	3. Mao Mon 4. Sorn Sem
Moderator	Miss Chhim Sreytouch
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The commune consists of 16 villages, all of which use water from the irrigation system, which supports farmers in growing rice and vegetables during the rainy season. However, this year, there was a shortage of water during the dry season. - The irrigation system covers three communes, providing water from the lower Krapeu Irrigation System for use in these areas. Water for irrigation and domestic use within the communes is generally sufficient. - If water is available during both the dry and rainy seasons, it will greatly assist farmers in cultivating rice, growing vegetables, and raising livestock (which typically requires adequate water for farming). - The entire community benefits from the Krapeu Truom Irrigation System, supporting rice cultivation and various crops. Migration also contributes to improving livelihoods. - The construction of the irrigation system does not harm the environment. On the contrary, it increases fish diversity, and the local population can fish and enjoy recreational activities on weekends. - During the dry season, the economic situation of the community is challenging due to insufficient water, leading to some residents migrating. - If the irrigation project is implemented but fish are scarce in the canals, it may affect the landscape negatively, which could discourage residents from visiting. - The project is in line with the commune's 5-year plan and a 3-year investment plan, which includes necessary repairs as part of the implementation.
Requests	- Request for the department to assist in repairing the automated water gate that has been damaged, to restore its functionality as before. - Request to help repair the water intake pipes for both the main and secondary canals. - If possible, request assistance in constructing concrete structures in the canals.

Photo	

Consultation Level	Commune
Date	August 14th, 2024
Sub-Scheme	1. Brambei Mom 2. Krapeu Truom
Organization	Brambei Mom Commune Hall, Thpong District, Kampong Speu Province
Participants	Ms. Kao Sokea
Moderator	Miss Sothy Chantana
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- Key developments in the commune include the construction of concrete roads and earthen roads in each village. - Agricultural land in the area, owned by residents, requires water from the Five-Mum dam for irrigation, and some residents also use clean water from the Anlong Chrey reservoir. - In terms of agriculture, people in the commune grow rice and vegetables at a family level, and raise cattle, chickens, and ducks. One family even practice aquaculture in a pond. - Farmers near the Brambei Mom dam use water from the dam for irrigation. Some farmers also grow vegetables near the dam's mouth to conveniently access water for use. - Drinking water is sourced from tap water, well water filtered with a strainer, and machine-filtered water, with a proper cleaning process before consumption. - Most farmers cultivate rice once a year, growing light rice and OM rice varieties, from May to November. They plant vegetables on the same land after harvesting. Most farming relies on rainwater, while livestock farming requires minimal water usage. - To address the issues that arise, the commune will collaborate with the Ministry to coordinate the project activities and disseminate information to the public about potential impacts, particularly environmental concerns such as water pollution in the region.

	- The benefits of constructing the irrigation system include providing water to farmers, helping to mitigate flooding during the rainy season, enabling farmers to cultivate crops year-round, and supporting fishery activities. This will also allow farmers to grow mixed vegetables for additional family income and reduce rural-urban migration. - Over 600 families living along the riverbanks will have access to river water for irrigation. - The project will impact agricultural land owned by farmers, land held by companies, and some trees along the Brambei Mom dam's embankment. - The commune has previously submitted a request to the Ministry of Water Resources to restore the Brambei Mom dam. - Currently, the commune does not have sufficient funds to implement the project, but it will participate in disseminating information to the local population.
Requests	- A request is made to assist in restoring the dam to its original depth to effectively drain the rainwater and alleviate flooding.

Consultation Level	Commune
Date	August 14th, 2024
Sub-Scheme	1. Brambei Mom 2. Krapeu Truom
Organization	Roung Roeang Commune Hall, Thpong District, Kampong Speu Province
Participants	Ms. Soun Sarith
Moderator	Mr. Ly Visoth
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The commune is crossed by a paved road and is developing various village roads by constructing concrete roads, which are part of the commune's budgeted projects. - Most of the working-age population migrates to work in factories outside the district or in Phnom Penh. - Farmers can only cultivate rice during the rainy season due to the availability of water from community reservoirs or ponds within the commune. The canal located east of the Brambei Mom irrigation system also provides sufficient water, but during the dry season, there is not enough water for agricultural activities. - Farmers engage in small-scale livestock raising, such as cattle, buffaloes, chickens, and ducks. Pig farming is less common. - Rice farming relies on rainwater collected in reservoirs, ponds, and canals connected to the Brambei Mom irrigation system. From January to July, water for agriculture is no longer available.

	- Water usage at the household level varies: rural farmers use water from community reservoirs, ponds, and hand-dug wells, while those in urban areas use clean water (tap water). For drinking water, some residents consume purified water, while others boil or filter water from taps and wells. - Farmers typically grow rice, but only during the rainy season. - Vegetable cultivation is limited to small-scale gardening around households. For larger-scale farming, it is only feasible on land along the banks of Krang Punley Stream during the dry season. - Livestock is raised at the household level, with well water used during the dry season and water from reservoirs and ponds during the rainy season. - The commune will assist in disseminating information about the canal restoration, inspecting and maintaining the restored canal, and coordinating with the ministry during project implementation. - The project will provide water to enhance rice and vegetable production, increasing household income, and boosting the aquatic ecosystem. - The project may negatively impact privately-owned land. - There are no heritage sites within the commune. - The commune had proposed a development plan related to dam restoration, but due to high costs, the budget was redirected to road construction instead. - The commune has plans to restore small canals in the area and install culverts to prevent water from flowing across roads.
Requests	- Restore Krang Punley Stream and the canals connected to the Brambei Mom irrigation dam to provide water for residents during the dry season. - Reconstruct the Brambei Mom dam to its original height, as it has deteriorated and can now only store a limited amount of water. - Improve the irrigation system in the commune by elevating and deepening the Lorng Dam and Lang Dam to increase water storage capacity, ensuring sufficient water supply for residents around both dams during the dry season.

Photo	

ANNEX 10.3: RESULTS OF THE CONSULTATIONS WITH VILLAGE CHEFS IN KAMPONG SPEU PROVINCE

Consultation Level	Village Chef
Date	August 12th, 2024
Sub-Scheme	Krapeu Truom
Farmer Group	Angk Sandan Village, Preah Srae Commune, Oudong Me Chey District, Kampong Speu Province
Participants	Mr. Kuy Cheun
Moderator	Miss Hak Leakhina
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The frequent occurrence of diseases in the village is caused by the abundance of forests and heavy rainfall, which create conditions for a large mosquito population. Villagers work hard during their youth, which leads to deteriorating health as they age. - A total of 196 families receive water from the irrigation system. However, the remaining families face water shortages because when others pump water first, the water source runs dry before they can access it. - The main challenges include a lack of water, failed well drilling, and competition among villagers for limited water, especially during the dry season when water is scarce. - The village chief, deputy village chief, and other community members are responsible for managing and regulating the use of the irrigation system. - Air quality in the village is poor due to residents burning waste, resulting in harmful smoke. - The water quality is excellent, suitable for drinking and supporting both human consumption and livestock farming. - The project will not impact cultural heritage sites but may affect approximately 20 families whose farmland is located near streams, rivers, and canals, causing some discontent among the affected residents. - Some villagers who own land near streams, rivers, and canals do not have official land titles, meaning they lack legal ownership of the land. - The project aims to establish an irrigation system for the community, providing sufficient water for various uses such as rice farming, vegetable cultivation, livestock rearing, fish farming, and extending the growing season.
Requests	- Request the government issue land titles for their properties near streams, rivers, and canals.

	- Propose the construction of water reservoirs and gates within the village to collect and store water from the Krapeu Trom area.
Photo	

Consultation Level	Village Chef
Date	August 13th, 2024
Sub-Scheme	Krapeu Truom
Farmer Group	Khchas Village, Veal Pong Commune, Oudong Me Chey District, Kampong Speu Province
Participants	Mr. Thoy Voan
Moderator	Miss Sothy Chantana
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The frequent occurrence of diseases in the village is caused by improper food consumption, leading to diarrhea, and by the abundance of forests, which creates a large mosquito population, resulting in dengue fever. - A total of 24 families receive water from the irrigation system. - The primary challenge is the lack of sufficient water for use. - The village has selected a leader to manage the irrigation system. - The water in the irrigation system is of good quality. - The project will have a minor impact on the farmland of approximately 30-40 families. - The families affected by the loss of their farmland initially felt upset, but the village and commune authorities have worked to communicate and mediate with them. - The project will provide sufficient water for crop cultivation and rice farming during both the dry and rainy seasons, helping to increase household income.
Requests	- There is a desire for the irrigation system to be restored quickly and constructed according to the geographical conditions of the area.
Photo	

Consultation Level	Village Chef
Date	August 14th, 2024
Sub-Scheme	Krapeu Truom
Farmer Group	Souvongs Leu Village, Veal Pong Commune, Oudong Me Chey District, Kampong Speu Province
Participants	Mr. Oam Phorn

Moderator	Miss Sothy Chantana
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The frequent occurrence of diseases in the village is caused by climate change, leading to an increase in cases of the common cold. - A total of 134 families receive water from the irrigation system. - The main challenge is the difficulty in pumping water for use, which requires a significant financial cost. - The village chief and members of the water user community are responsible for managing the irrigation system. - The water quality in the irrigation system is not very good, and the groundwater is also not very clear. - During the construction period, there may be noise disturbances from heavy machinery and road damage during the rainy season. - The project will not impact farmers' rice fields. - The project will help ensure sufficient water for crop cultivation and rice farming during both the dry and rainy seasons, contributing to increased household income.
Requests	- Request to restore the irrigation system as soon as possible to facilitate easier water access for the villagers.
Photo	

Consultation Level	Village Chef
Date	August 14th, 2024
Sub-Scheme	Krapeu Truom
Farmer Group	Thlea Chas Village, Veal Pong Commune, Oudong Me Chey District, Kampong Speu Province
Participants	Mr. Kroun Thiem
Moderator	Miss Yeab Dalin
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The frequent occurrence of diseases in the village is caused by poor hygiene in food consumption, children eating unhealthy food, and climate change, leading to illnesses such as the common cold and skin diseases. - A total of 133 families, accounting for 100% of the households in the village, receive water from the irrigation system. - The main challenges are water shortages, lack of a water storage system, and difficulties in coordinating with upstream villages to request water when needed. - The village chief, deputy village chief, and the head of the water user group are responsible for maintaining the water gates and

	coordinating with other villages to provide water for agriculture during shortages. - The water quality in the irrigation system is good. - The construction of the irrigation system does not pose any issues for the community, as the affected landowners have supported the project and prepared the necessary land plans. Twenty families are directly affected by the project. - The project will help store sufficient water to allow rice farming two to three times per year and expand crop cultivation, reducing concerns about water shortages.
Requests	- The project will assist in restoring the irrigation system to increase water storage capacity. - It will also address and restore parts of the system that lack adequate water supply.
Photo	

Consultation Level	Village Chef
Date	August 14th, 2024
Sub-Scheme	Brambei Mom
Farmer Group	Lar Village, Brambei Mom Commune, Thpong District, Kampong Speu Province
Participants	Mr. Bun Samnang
Moderator	Miss Chhim Sreytouch
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The frequent occurrence of diseases in the village is caused by consuming unhygienic food containing chemical substances and by climate change. - A total of 87 families receive water from the irrigation system. - The main challenge is insufficient water, and the irrigation system is not yet operational. - Farmers in the village have never used water from the Brambei Mom irrigation system. - The project will have a minor impact on the farmland of approximately 20 families. - The families affected by the loss of farmland are generally indifferent, as their main concern is having sufficient water for use. - The project will help provide water for irrigation during both the rainy and dry seasons, supporting rice farming, crop cultivation, and other agricultural activities.

Requests	- There is a request to expedite the construction of the Brambei Mom irrigation system so that the villagers can benefit from it as soon as possible.
Photo	

Consultation Level	Village Chef
Date	August 14th, 2024
Sub-Scheme	Brambei Mom
Farmer Group	Prey Veng Village, Brambei Mom Commune, Thpong District, Kampong Speu Province
Participants	Mr. Khoen Sou
Moderator	Miss Sothy Chantana
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The frequent occurrence of diseases in the village is caused by climate-related factors. - A total of 75 families receive water from the irrigation system. - The main challenge is the lack of sufficient water for use. - The village's irrigation system currently has no designated management. - The water in the irrigation system is of good quality and suitable for use. - The project will have some impact on farmers' rice fields. - The project will help ensure sufficient water for crop cultivation and rice farming during both the dry and rainy seasons, contributing to increased household income.
Requests	- There is a request to construct secondary canals branching from the Brambei Mom irrigation system.
Photo	

Consultation Level	Village Chef
Date	August 14th, 2024
Sub-Scheme	Brambei Mom
Farmer Group	Tang Pou Village, Brambei Mom Commune, Thpong District, Kampong Speu Province
Participants	Mr. Hun Dara
Moderator	Miss Hak Leakhina

Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The frequent occurrence of diseases in the village is caused by climate-related factors. - A total of 263 families receive water from the irrigation system. - The main challenge is the lack of sufficient water, especially during the dry season when the canals have no water supply. - The village's irrigation system currently has no designated management. - The water quality in the irrigation system is poor due to heavy sedimentation. - There are no impacts on cultural heritage sites; however, approximately 10 families with farmland near the canal will be affected. - The affected families feel some distress but continue to support the project. - The project will ensure sufficient water for crop irrigation, fish farming, livestock rearing, and extended rice farming seasons. For the families affected by the loss of farmland, they will be able to cultivate their crops once the project is completed.
Requests	- There is a request to restore the reservoir. - In case of reservoir excavation, roads should be constructed around the area to facilitate transportation.
Photo	

Consultation Level	Village Chef
Date	August 14th, 2024
Sub-Scheme	Brambei Mom
Farmer Group	Tuek Long Ti Muoy Village, Roung Roeang Commune, Thpong District, Kampong Speu Province
Participants	Mr. Touch Yan
Moderator	Mr. Ly Visoth
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The frequent occurrence of diseases in the village is caused by poor hygiene and mosquito bites, which lead to diseases such as malaria or dengue fever. - A total of 290 families receive water from the irrigation system. - The village has a community pond, but water cannot be pumped into the rice fields because, during the dry season, the pond has a small capacity and stores limited water.

	- The main challenge is that during the dry season, both the Loleng reservoir and the community pond do not have enough water for agricultural activities, and there is no secondary canal connecting the reservoir to the village. - The village chief is responsible for managing the water in the community pond. - The water quality in the irrigation system is poor. - Construction will impact the farmland of local farmers. In cases of minor impacts, the affected families will be understanding. - The project will help villagers access water for dry-season rice farming, grow vegetables, and improve road access to the fields.
Requests	- Requests the ministry to assist in deepening and expanding the Loleng reservoir, as the surrounding land belongs to the government. - Requests the creation of secondary canals from the Lorng reservoir. - Additionally, there is a request for a canal connection from the Brambei Mom reservoir to the Loleng reservoir.
Photo	

Consultation Level	Village Chef
Date	August 14th, 2024
Sub-Scheme	Brambei Mom
Farmer Group	Chambak Sar Village, Roung Roeang Commune, Thpong District, Kampong Speu Province
Participants	Ms. Koh Phirum
Moderator	Mr. Ly Visoth
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The primary cause of frequent diseases in the village is mosquito bites, which lead to dengue fever. - A total of 200 families receive water from the irrigation system. - The main challenge is that the canal in the southern part of the village (connected to Anlong Chrey) does not have water and does not flow back into the Brambei Mom reservoir. - The local authorities manage the village's irrigation system. - The water quality in the irrigation system is poor because the upstream stream in a neighbouring village is contaminated by pig farming, with waste discharged into the stream. - Construction will affect approximately 50 families whose farmland is located along the banks of the stream and canal. - Some affected farmers with small plots of land are unwilling to participate in the project.

	- The project will help villagers access water for dry-season rice farming and vegetable cultivation during the dry season.
Requests	- It is requested that compensation be provided to the families whose farmland is affected by the project.
Photo	

ANNEX 11: RESULTS OF THE CONSULTATIONS WITH RICE FARMERS

Results of the Consultations with Rice Farmer Group in Kampong Chhnang Province

Consultation Level	Rice Farmer Group
Date	August 13th, 2024
Sub-Scheme	Yutasas
Farmer Group	Krasang Teab Village, Svay Commune, Sameakki Mean Chey District, Kampong Chhnang Province
Participants	1. Mr. Iem An 2. Mr. Van Sarun 3. Ms. Aor Sat 4. Ms. Paok Raksmey 5. Ms. Sun Sreypov 6. Ms. Uoch Saren
Moderator	Miss Hak Leakhina
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- Challenges include brown planthopper, invasion of stem borers during the tillering stage, and high production costs. - Farmers in the village have received training on rice cultivation techniques, including land preparation, seed selection, and fertilizer application. - After canal restoration, rice cultivation could be extended to up to three growing seasons per year.
Requests	- Establish a new irrigation system in the village and restore the old canals.
Photo	

Consultation Level	Rice Farmer Group
Date	August 13th, 2024
Sub-Scheme	Yutasas
Farmer Group	Svay Pok Village, Svay Commune, Sameakki Mean Chey District, Kampong Chhnang Province
Participants	1. Ms. Tum Siem 2. Ms. Mao Koeurng 3. Mr. Khut Vorng 4. Mr. Bel Soy 5. Ms. Sam Phorn 6. Mr. Poul Nhoeb

	7. Mr. Phal Pheap
Moderator	Mr. Ly Visoth
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- Challenges include insufficient water in the canals. - The rising cost of fertilizers and pesticides. - Rice cultivation heavily relies on chemical fertilizers, while pesticide usage is minimal. - High expenses for labour, land preparation, and harvesting. - Farmers in the village have never received training specifically on rice cultivation.
Requests	- We request the ministry to increase the height of the strategic water gate by 30 centimetres to ensure sufficient water storage for year-round rice farming. Additionally, please help install water gates at the Ta Pring and Ta Nang dams to store water for the dry season. - Kindly assist in restoring the "Yay Soy" canal from the Ta Pring dam to the mouth of the stream. Also, please help repair the damaged Ta Sim dam. - We request assistance in addressing the cost of agricultural fertilizers and maintaining favourable rice prices. - Please arrange for solar-powered lighting along the embankment roads to improve accessibility for farmers during rice cultivation and sales.
Photo	

Consultation Level	Rice Farmer Group
Date	August 13th, 2024
Sub-Scheme	Yutasas
Farmer Group	Kyang Khang Tboung Village, Svay Commune, Sameakki Mean Chey District, Kampong Chhnang Province
Participants	1. Ms. Prak Bopha 2. Ms. Pak Maly 3. Ms. Chea Thy 4. Ms. Phorn Samley 5. Ms. Phoung Kroem 6. Ms. Seng Chanthy 7. Ms. Dum Korng
Moderator	Miss Sothy Chantana
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project

Perceptions and concerns	- There is a shortage of water for rice farming and crop cultivation due to insufficient water in the canals. - There is a high infestation of pests that damage rice, requiring the use of many pesticides to control them. - The cost of production is increasing, especially for land preparation, pesticide application, and harvesting. - In general, farmers use organic manure mixed with chemical fertilizers, and all pest control is done using chemical pesticides. - Farmers have received training on rice cultivation techniques only once a year from agricultural cooperatives.
Requests	- There is a desire to have an adequate irrigation system for rice farming. - Build a central reservoir dam for agricultural use and water storage. - Construct water gates for the canals to facilitate water storage.
Photo	

Consultation Level	Rice Farmer Group
Date	August 13th, 2024
Sub-Scheme	Stoeung Krang Bat
Farmer Group	Oknha Pang Village, Longveak Commune, Kompong Tralach District, Kampong Chhnang Province
Participants	1. Mr. Rith Sarath 2. Ms. Chab Nem 3. Ms. Chab Niem 4. Ms. oun Chanry 5. Mr. Kol Vannak
Moderator	Mr. Ly Visoth
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- Lack of an irrigation system and flooding issues caused by runoff from nearby hills. - The price of fertilizers continues to rise. - High costs for labour, land preparation, and harvesting. - Rice cultivation relies almost entirely on chemical fertilizers, but insecticides are rarely used. - Farmers in the village have never received any training on rice cultivation.
Requests	- It is necessary to construct secondary canals to supply water to the village's rice fields, ensuring at least two cropping seasons and potentially enabling dry-season rice cultivation.

Photo	

Consultation Level	Rice Farmer Group
Date	August 15th, 2024
Sub-Scheme	Lum Hach
Farmer Group	Chan Trak Village, Krang Skear Commune, Teuk Phos District, Kampong Chhnang Province
Participants	1. Ms. Ma Chantha 2. Ms. Nuy Sina 3. Ms. Sem Mao 4. Ms. Sim Sarom 5. Ms. Kai Eang 6. Mr. Prak Heurn 7. Ms. Nhean Sarat 8. Ms. Seng Da
Moderator	Miss Chhim Sreytouch
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The main challenge is water scarcity, which limits farmers to cultivating only one rice crop during the rainy season, relying entirely on rainwater. - A lack of capital to purchase inputs forces them to borrow money or buy on credit, which further reduces their profit margins. - Farmers primarily use chemical fertilizers rather than combining them with compost fertilizers, and pest management is mostly done with chemical pesticides. - The costs for labour, land preparation, pesticide application, and harvesting are increasingly high. - Farmers have never received any training on rice cultivation.
Requests	- Please provide training on rice cultivation techniques to the farmers in the village. - Assist in establishing an irrigation system, as the area is currently facing severe water shortages.
Photo	

Consultation Level	Rice Farmer Group
Date	August 15th, 2024

Moderator	Miss Sothy Chantana
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The village canals currently have sufficient water. - Production costs, including land preparation, fertilizers, pesticide application, and harvesting, remain high.

	- Farmers in the village have never received any training on rice cultivation.
Requests	- Assist in urgently restoring the irrigation system to maintain water availability. - Organize training programs focused on rice cultivation techniques for the farmers.
Photo	

Consultation Level	Rice Farmer Group
Date	August 15th, 2024
Sub-Scheme	Lum Hach
Farmer Group	Sdok Kabbas Village, Banteay Preal Commune, Rolea B'ier District, Kampong Chhnang Province
Participants	1. Mr. Satt Thet 2. Ms. Non Noa 3. Mr. Chum Vuthy 4. Mr. Oeur Savry
Moderator	Miss Hak Leakhina
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The village canals have no water because there is no main canal to supply them, limiting farmers to cultivating rice only during the rainy season, relying solely on rainwater. - The fields face severe weed problems, and the soil has low fertility. - Most farmers in the village grow rice primarily for household consumption. - The costs for labour, land preparation, and harvesting remain high. - Farmers have previously received training on single-seedling rice transplanting techniques.
Requests	- Restore the old canals in the village and develop additional irrigation systems to ensure sufficient water supply for rice production, potentially increasing the cropping seasons to up to three per year. - If implemented, the community is likely to provide additional support and participation.
Photo	

Consultation Level	Rice Farmer Group
Date	August 15th, 2024

Farmer Group	Andoung Preng Village, Krang Leav Commune, Rolea B'ier District, Kampong Chhnang Province
Participants	1. Mr. Phoem Sarun 2. Mr. Horn Sambol 3. Ms. Hong Chanthorn 4. Ms. Om Sam 5. Mr. Sok Ratha
Moderator	Miss Yeab Dalin
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- There is a water shortage, and an irrigation system is needed to store and manage water for agricultural use. - Farmers face a lack of capital. - Rice cultivation relies on chemical fertilizers and animal manure, but very few farmers use chemical pesticides. - The costs for labour, land preparation, pesticide application, and harvesting are high. - Farmers in the village have never received training on rice cultivation.
Requests	- An irrigation system is essential in the village to increase rice and vegetable production. - Urgent action is needed to build or restore the irrigation system as soon as possible.
Photo	

Consultation Level	Rice Farmer Group
Date	August 15th, 2024
Sub-Scheme	Lum Hach
Farmer Group	Krang Leav Village, Krang Leav Commune, Rolea B'ier District, Kampong Chhnang Province
Participants	1. Ms. Chhun Channa 2. Mr. Sao Hong 3. Ms. Soam Youn 4. Ms. Meas Sruoy
Moderator	Miss Sothy Chantana
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The village canals have sufficient water supply. - There is an issue with weeds affecting rice crops. - Production costs include land preparation, fertilizers, and harvesting.

	- Farmers in the village have received training on land preparation for rice fields.
Requests	- Request assistance in restoring the irrigation system in the village. - Increase training programs and techniques for vegetable cultivation. - Seek support for acquiring quality seeds.
Photo	

Consultation Level	Rice Farmer Group
Date	August 18th, 2024
Sub-Scheme	Stoeung Krang Bat
Farmer Group	Trapeang Chambak Village, Longveak Commune, Kompong Tralach District, Kampong Chhnang Province

Moderator	Miss Yeab Dalin
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The main challenge is the lack of water and the absence of a dam for water storage. - There is a shortage of water pumps, and farmers must rent them from others, but there are not enough pumps available and often not in time. - Farmers have previously received training from the APSARA company on the use of seeds, fertilizers, and pesticides.
Requests	- There is a desire to build a water reservoir to capture water from the runoff, which could help ensure farmers have water for rice cultivation during the dry season.
Photo	

Consultation Level	Rice Farmer Group
Date	August 14th, 2024
Sub-Scheme	Krapeu Truom
Farmer Group	Thlea Chas Village, Veal Pong Commune, Oudong Me Chey District, Kampong Speu Province
Participants	1. Ms. Thiem Lida 2. Ms. Soung Lang 3. Ms. Nom Sarorn 4. Mr. Khut Chou 5. Mr. Mith Rien 6. Mr. Kroun Theam 7. Mr. Soung Som 8. Ms. Soung Sophal
Moderator	Miss Chhim Sreytouch
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The issue of water scarcity during the rainy season is caused by damaged gates in the irrigation system, along with climate change affecting the timing of the rainy season. - The community must pay for water usage to pump into the rice fields.

	- Farmers have previously received training on the use of rice seeds.
Requests	- Request assistance in restoring the irrigation system to a deeper level and constructing water storage structures to ensure sufficient water for rice cultivation during the dry season as well.
Photo	

Consultation Level	Rice Farmer Group
Date	August 14th, 2024
Sub-Scheme	Krapeu Truom
Farmer Group	Souvongs Leu Village, Veal Pong Commune, Oudong Me Chey District, Kampong Speu Province
Participants	1. Ms. Phat Rorn 2. Ms. Soy Chandy 3. Ms. Rin Channeang 4. Mr. Soy Ny 5. Ms. Khem Yeun
Moderator	Miss Hak Leakhina
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The irrigation system is too deep, making it difficult to pump water into the rice fields. - Invasion of stem borers during the tillering stage - Farmers in the village have never received any training.
Requests	- Request assistance to make the canals deeper and more manageable for easier water pumping into the rice fields. - Propose constructing a water storage reservoir to store water for use during both the rainy and dry seasons.
Photo	

Consultation Level	Rice Farmer Group
Date	August 14th, 2024
Sub-Scheme	Brambei Mom
Farmer Group	Chambak Sar Village, Roung Roeang Commune, Thpong District, Kampong Speu Province
Participants	1. Ms. Vann Ry 2. Ms. Soun Leang 3. Ms. Kong Sophal

	4. Ms. Soth Kol 5. Ms. Phoung Pet 6. Ms. Ngam Torn
Moderator	Mr. Ly Visoth
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- There is no water in the canals during the dry season (February). - The cost of labour for land preparation, fertilizers, and pesticides is increasing. - Farmers have never received any training on rice. - Rebuilding the canals could negatively impact the farmers' land, and they may not agree with the plan.
Requests	- It would be better to restore the old canals from the nearby swamp area that are already in place, rather than constructing new ones.
Photo	

Consultation Level	Rice Farmer Group
Date	August 14th, 2024
Sub-Scheme	Brambei Mom
Farmer Group	Tuek Long Ti Muoy Village, Roung Roeang Commune, Thpong District, Kampong Speu Province

Moderator	Miss Sothy Chantana
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- There is a water shortage for rice cultivation; although there are canals, they do not provide sufficient water. - Farmers have never received any training on rice.

Requests	- Request assistance in creating a canal system connected to the main reservoir to supply water to the village, as the village currently has no usable irrigation system.
Photo	

Results of the Consultations with Rice Farmer Group in Pursat Province

Consultation Level	Rice Farmer Group
Date	August 16th, 2024
Sub-Scheme	Ou Ta Paong
Farmer Group	Prasat Village, Rumlech Commune, Bakan District, Pursat Province
Participants	1. Ms. Soeurng Soeurn 2. Mr. Boem Hil 3. Ms. Soeurng Seng 4. Mr. Kon Chantha 5. Mr. Kann Noeurn 6. Mr. Sien Hean
Moderator	Miss Chhim Sreytouch
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- There is a shortage of water for rice cultivation during the dry season due to irrigation issues. - Seeds and fertilizers have become more expensive, and counterfeit pesticides are widespread in the market. - There is a lack of capital. - Famers have previously received many training sessions.
Requests	- Request additional technical training on planting techniques. - Request assistance in restoring irrigation to ensure sufficient water during the dry season. - Ask for help in solving the issue of fluctuating rice prices and how to stabilize them. - Request that the Ministry conducts inspections of fertilizers and pesticides in the market to address counterfeit products.
Photo	

Consultation Level	Rice Farmer Group
Date	August 16th, 2024
Sub-Scheme	Ou Ta Paong

Farmer Group	Svay Doun Keo Village, Svay Doun Keo Commune, Bakan District, Pursat Province
Participants	1. Mr. Em Kong 2. Mr. Chhut Bunchhai 3. Mr. Kov Keo 4. Ms. Uk Chenda
Moderator	Miss Hak Leakhina
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The irrigation channels are dry and there is no water because the gate to the water source from the Svay Doun Keo irrigation system is not opened to allow water to flow into the village's irrigation system. - Famers have never received training on rice cultivation.
Requests	- Reviving the old irrigation system in the village would provide sufficient water for rice production, enabling up to three planting seasons per year. - Request the construction of a water gate connecting to the Svay Doun Keo irrigation system to ensure sufficient water for the village.
Photo	

Consultation Level	Rice Farmer Group
Date	August 16th, 2024
Sub-Scheme	Ou Ta Paong
Farmer Group	Bat Kokir Thmey Village, Ou Ta Paong Commune, Bakan District, Pursat Province
Participants	1. Mr. Kim Sophal 2. Ms. Tuy Savoeurn 3. Mr. Kim Sak Sakhorn 4. Mr. Khim Soeurn 5. Mr. Net Borey 6. Mr. Meng Chhaoet
Moderator	Miss Yeab Dalin
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The main issue is the lack of water because the village irrigation system has low water storage, and during the dry season, we must rely on water flowing from the upstream village.

	- There is a lack of capital, as we must purchase seeds and fertilizers on credit, with repayment made after harvest, including an additional 10% interest, which reduces the profit margins. - I have never received training on rice cultivation.
Requests	- To establish a proper water entry and exit system in the village, restore the main irrigation system, and develop a secondary irrigation system to support rice cultivation.
Photo	

Consultation Level	Rice Farmer Group
Date	August 16th, 2024
Sub-Scheme	Ou Ta Paong
Farmer Group	Voat Chreae Village, Boeng Khnar Commune, Bakan District, Pursat Province
Participants	1. Mr. Em Pa 2. Mr. Nhim Sophal 3. Mr. Kae Sophal
Moderator	Miss Yeab Dalin
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The issue is the lack of water because the village's irrigation system has shallow water storage that is insufficient. - There is a lack of capital, as we must purchase seeds and fertilizers on credit, with repayment made after harvest along with interest, which reduces profit margins. - Farmers in the village have never received training on rice cultivation.
Requests	- Restore the old irrigation system from the upper region down to the village and to construct a water dam.
Photo	

Consultation Level	Rice Farmer Group

Moderator	Miss Sothy Chantana
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The issue is the lack of water for rice and crop cultivation due to the shallow water storage in the village's irrigation system. - The price of chemical fertilizers continues to rise. - I have never received training on rice cultivation. - Farmers support the restoration of the irrigation system in the village.
Requests	- To request urgent assistance in restoring the irrigation system and water infrastructure.
Photo	

ANNEX 12: RESULTS OF THE CONSULTATIONS WITH VEGETABLE FARMERS

Results of the Consultations with the Vegetable Farmer Group in Kampong Chhnang Province

Consultation Level	Vegetable Farmer Group
Date	August 13rd, 2024
Sub-Scheme	Yutasas
Farmer Group	Svay Pok Village, Svay Commune, Sameakki Mean Chey District, Kampong Chhnang Province
Participants	1. Ms. Sieng Kunthy 2. Ms. Phorn Sron 3. Ms. Sea Lakk 4. Ms. Sim Kun 5. Ms. Hin Yeurn
Moderator	Mr. Ly Visoth
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- Challenges include insufficient rainfall, fungal diseases affecting vegetables, and various pests. - The soil in the village is low in nutrients because it is sandy loam. - The water quality is average, but the irrigation water supply is insufficient during the dry season. - Farmers have received training on vegetable cultivation techniques and composting from the district agricultural office, while some have also learned from online sources. - If water were available in the canal, farmers could pump it into reservoirs, allowing for more cultivation cycles and enabling them to grow a wider variety of vegetables.
Requests	- Please study the height of the Yutasas dam. If it is raised by an additional 30 centimetres, it could ensure an adequate water supply to the canal. - We request the ministry to install metal water gates along canals AB, such as Ta Pring Canal, Ta Nang Canal, and Svay Commune Canal. - Please assist in repairing the roads along both sides of the dam. - If the project implementation affects privately owned land, we request the ministry to consider appropriate compensation. - We also request training on modern agricultural techniques and assistance in finding markets for farmers.
Photo	

Consultation Level	Vegetable Farmer Group
Date	August 13rd, 2024
Sub-Scheme	Yutasas
Farmer Group	Kyang Tboung Village, Svay Commune, Sameakki Mean Chey District, Kampong Chhnang Province

Moderator	Miss Yeab Dalin
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- Leafy vegetables are significantly affected by diseases, while fruiting vegetables are impacted by pests and climate variability, with diseases spreading from one farm to another. - The soil quality is good, allowing for high yields, as farmers regularly use cow manure to enrich the soil's nutrients. - The producer group is not heavily impacted by water shortages and can manage the situation effectively. - Market information for agricultural products is provided by vegetable-buying communities. - Previously, the village had a community that collected vegetables from farmers and sold them to supermarkets under clear contractual agreements. However, this was discontinued because farmers believed the prices were too low, and supermarkets required only high-quality vegetables. Now, ordinary traders purchase these vegetables instead. - Farmers have received training on vegetable cultivation techniques, the use of pesticides and fertilizers, drip irrigation systems, composting, and the implementation of good agricultural practices (GAP). - Farmers in the village have substantial knowledge of smart agriculture but practice it to a limited extent. - If additional water systems are available, the producer group plans to expand cultivation areas and grow a wider variety of vegetables.
Requests	- Please restore additional canals and construct water gates to retain water for agricultural use.
Photo	

Consultation Level	Vegetable Farmer Group
Date	August 15th, 2024
Sub-Scheme	Lum Hach
Farmer Group	Chan Trak Village, Krang Skear Commune, Teuk Phos District, Kampong Chhnang Province
Participants	9. Ms. Ma Chantha 10. Ms. Nuy Sina 11. Ms. Sem Mao 12. Ms. Sim Sarom 13. Ms. Kai Eang 14. Mr. Prak Heurn 15. Ms. Nhean Sarat 8. Ms. Seng Da
Moderator	Miss Chhim Sreytouch
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- Challenges include insect pests, low market prices, and climate change issues. - Insufficient water for irrigating vegetable fields, as the irrigation system only reaches about 20% of the village. - Lack of access to modern agricultural techniques due to limited participation in training programs. - If sufficient water is available, farmers are willing to expand their vegetable cultivation area.
Requests	- Request for more wells to be dug or ponds to be constructed, as water scarcity is a significant issue, with most vegetable farming relying on rainwater. - Request to restore canals for water storage.
Photo	

Consultation Level	Vegetable Farmer Group
Date	August 15th, 2024
Sub-Scheme	Lum Hach
Farmer Group	Trapeang Phkoam Village, Banteay Preal Commune, Rolea B'ier District, Kampong Chhnang Province
Participants	1. Ms. Doung Net 2. Mr. Chhoem Sambath 3. Ms. Leng Sopha 4. Mr. Lach Tong 5. Ms. Neang Soeurn

Moderator	Mr. Ly Visoth
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The main challenge is the various worm that damage vegetables. - The quality of well water is acceptable, but the quantity may be insufficient in particularly hot months, especially during May and June. - Farmers have previously participated in training on vegetable cultivation techniques, such as seedling production and crop care. However, they have not received any training on smart agriculture. - If sufficient water is available, it would encourage farmers to grow more vegetables during the dry season and enable year-round cultivation.
Requests	- Request the ministry to restore the canal and conduct a study on how to maintain a consistent water supply in the canal throughout all seasons, as currently, during the dry season, there is no more runoff from the upland areas. - If excavation or construction affects privately owned land, it is requested to consider appropriate compensation for the affected landowners.
Photo	

Consultation Level	Vegetable Farmer Group
Date	August 15th, 2024
Sub-Scheme	Lum Hach
Farmer Group	Srae Veal Village, Krang Leav Commune, Rolea B'ier District, Kampong Chhnang Province
Participants	1. Ms. Phen Saoroeurng 2. Ms. Sen Sreymom 3. Ms. Phen Vanna 4. Ms. Hun Von 5. Mr. Hun Kear 6. Mr. Hong Thong 7. Ms. Sao Thon
Moderator	Miss Yeab Dalin
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The main challenges in cultivation are the presence of fall armyworms and some diseases, but these can be managed using self-made organic pesticides. - Water scarcity during the dry season is a significant issue, and the well water used for irrigation contains high levels of sediment.

	- The soil in the area is fertile, leading to good crop growth and high yields. - Farmers have never participated in any formal training programs. - The project could help farmers expand vegetable cultivation from a subsistence level to a commercial scale, thereby increasing agricultural activities and reducing migration to work abroad. - If sufficient water is available, farmers plan to grow new types of vegetables that meet market demands and practice year-round crop rotation.
Requests	- Request the construction of a secondary canal extending into the village, connected to the main canal from the upland area, to provide a shared water resource for the community.
Photo	

Results of the Consultations with the Vegetable Farmer Group in Kampong Speu Province

Consultation Level	Vegetable Farmer Group
Date	August 12nd, 2024
Sub-Scheme	Krapeu Truom
Farmer Group	Angk Sandan Village, Preah Srae Commune, Oudong Me Chey District, Kampong Speu Province
Participants	9. Ms. Youn Pao 10. Ms. Phan Sary 11. Ms. Sin Sophanny 12. Ms. Sieng Chanthol 13. Ms. Chan Orn 14. Ms. Chan Ngorn 15. Ms. Oun Srey 16. Mr. Uong Muon
Moderator	Miss Sothy Chantana
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The challenges include insect pests damaging vegetables, low market prices, lack of buyers, and climate change issues. - There is a lack of irrigation water, and water sources are far away. - Farmers have received market information. - The project will help farmers grow vegetables in both the dry and rainy seasons.

	- If sufficient water is available, they plan to farm during the dry season, as it offers quick yields, higher income, and opportunities to expand vegetable cultivation.
Requests	- Construct a water gate from the Krapeu Truom irrigation system - Offer additional training programs related to agriculture.
Photo	

Consultation Level	Vegetable Farmer Group
Date	August 13rd, 2024
Sub-Scheme	Krapeu Truom
Farmer Group	Khchas Village, Veal Pong Commune, Oudong Me Chey District, Kampong Speu Province
Participants	1. Ms. Soun Sokny 2. Ms. Muth Chanthoeurn 3. Ms. Khloeng Sophann 4. Ms. Khon Soeurn 5. Ms. Penh Sary
Moderator	Miss Sothy Chantana
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The challenges include insects damaging vegetables and climate change. - Farmers grow a small quantity of vegetables, mostly using organic fertilizers. - There is no issue with irrigation water, as they use clean water from the nearby Krapeu Truom dam. - The government has previously distributed vegetable seeds to famers for cultivation. - If the irrigation system is restored and sufficient water is available, farmers in the village currently have no plans to expand vegetable cultivation but prefer to focus on rice farming during both the dry and rainy seasons due to higher income from rice compared to vegetables.
Requests	- There is a request for the construction of a secondary canal connected to the swamp irrigation system to reach their village.
Photo	

Consultation Level	Vegetable Farmer Group

Date	August 14th, 2024
Sub-Scheme	Krapeu Truom
Farmer Group	Thlea Chas Village, Veal Pong Commune, Oudong Me Chey District, Kampong Speu Province

Moderator	Miss Chhim Sreytouch
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The challenges include pests, diseases, mealy bugs, extreme heat, lack of farming techniques, and insufficient planting materials. - The soil is generally good, but some areas have poor soil quality due to excessive use of chemical fertilizers. - This year, there is a water shortage during the dry season, whereas in previous years, water was sufficient, and the quality improved when the water level rose. - The provincial department has visited to promote and distribute seeds. - If the Krapeu Truom irrigation system is restored and water is available, farmers may expand vegetable cultivation.
Requests	- A request is made to restore the Krapeu Truom irrigation system and improve the water gate to prevent water leakage. - A request for technical support on farming practices and the proper use of chemical fertilizers.
Photo	

Consultation Level	Vegetable Farmer Group
Date	August 14th, 2024
Sub-Scheme	Brambei Mom
Farmer Group	Lar Village, Brambei Mom Commune, Thpong District, Kampong Speu Province

	5. Mr. Kry Treang
Moderator	Miss Chhim Sreytouch
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The challenges include an abundance of pests and diseases, extreme heat, and poor soil quality for cultivation. - Water is scarce both during the rainy and dry seasons, and there is high sediment content in the available water. - Vegetable production in the village has limited potential due to the lack of resources, but if sufficient water is available, farmers will expand their production areas.
Requests	- Request for technical training and the provision of seeds. - Request for the provision of organic fertilizers to the community.
Photo	

Consultation Level	Vegetable Farmer Group
Date	August 14th, 2024
Sub-Scheme	Brambei Mom
Farmer Group	Chambak Thum Village, Brambei Mom Commune, Thpong District, Kampong Speu Province
Participants	1. Mr. Rith Sovan 2. Ms. Sang Sokhim
Moderator	Miss Yeab Dalin
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The challenges include extreme hot weather, diseases affecting vegetables, especially cucumbers, and pest problems during certain months, which have not been solved. - The soil used for vegetable cultivation in the village is rich in nutrients. - There is no issue with water scarcity because the farmland of the production group is adjacent to an irrigation canal that flows from the main canal. - Information about popular and high-value vegetables is obtained through traders who purchase them. - The production group has previously participated in study tours on various crops in other provinces. They have also received training related to smart agriculture, which is now being widely implemented. - The farmers do not yet have plans for expanding the cultivated land area.

Requests	- Encouragement is needed for the quick restoration of irrigation canals.
Photo	

Consultation Level	Vegetable Farmer Group

Moderator	Mr. Ly Visoth
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The challenges include leaf curl disease and pests, and the soil is not very fertile. - The quality of the water used is good, but the amount of irrigation water is insufficient during the dry season, from February to May. - Farmers learn techniques from other farmers in the village and nearby villages. Additionally, they have received training in poultry farming and vegetable cultivation four times from the Life with Dignity (LWD) organization several years ago. - If there is sufficient water, farmers can grow more vegetables in multiple cycles, expand the cultivated land during the dry season, and attract other farmers from the village to cultivate as well.
Requests	- Help is needed to establish a water storage system in the region to ensure adequate irrigation water during the dry season.

Results of the Consultations with the Vegetable Farmer Group in Pursat Province

Consultation Level	Vegetable Farmer Group
Date	August 16th, 2024
Sub-Scheme	Ou Ta Paong

Farmer Group	Srah Run Village, Ou Ta Paong Commune, Bakan District, Pursat Province
Participants	1. Ms. Nhim Roeurn 2. Ms. Vann Sary 3. Ms. Phin Siem 4. Ms. Huy Soy 5. Mr. Nhen Sol 6. Ms. Chum Khorn 7. Ms. Chhean Sang 8. Ms. Soun Sitha
Moderator	Miss Chhim Sreytouch
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The challenges include hot weather, pest disturbances, and fluctuating market prices depending on the traders. - Water scarcity occurs during the dry season. - The farmers' vegetable cultivation land is fertile. - They have never received agricultural information or training on various topics. - If there is sufficient water, the farmers plan to expand their vegetable cultivation.
Requests	- A request is made for the project to provide training on vegetable cultivation techniques, natural pest control methods, and to supply vegetable seeds. Additionally, they are requesting capital if possible.
Photo	

Consultation Level	Vegetable Farmer Group
Date	August 16th, 2024
Sub-Scheme	Ou Ta Paong
Farmer Group	Prasat Village, Rumlech Commune, Bakan District, Pursat Province
Participants	1. Ms. Sean Soeurn 2. Ms. Bo Sokban 3. Ms. Lorn thy 4. Mr. Kann Noeurn 5. Ms. Chhin Rou
Moderator	Miss Chhim Sreytouch
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The challenges include fungal diseases, pests, irregular market prices, and climate change. - Water scarcity occurs during the dry season.

	- The farmers' vegetable cultivation land is fertile. - The agricultural information they have received includes seedling propagation, crop care, and irrigation techniques. - The farmers have previously received one training session on vegetable cultivation techniques. - If there is sufficient water, the farmers will expand their cultivation during both the rainy and dry seasons.
Requests	- Provide training in cultivation techniques. - A proposal is made for the project to deepen the water channels to store more water for irrigation. - A request is made for the project to help find markets with reasonable prices.
Photo	

Consultation Level	Vegetable Farmer Group
Date	August 16th, 2024
Sub-Scheme	Ou Ta Paong
Farmer Group	Voat Chreae Village, Boeng Khnar Commune, Bakan District, Pursat Province
Participants	1. Mr. Moung Touch 2. Ms. Chou Rath
Moderator	Miss Chhim Sreytouch
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The challenges include diseases that cannot be treated, causing total crop failure, fluctuating vegetable market prices, and climate change leading to vegetable diseases. - In the dry season, there is insufficient water for irrigating the vegetables. - The soil quality is not very good, and growing crops requires a lot of fertilizer. However, the soil can be improved by using cow manure. - They have received information about using fertilizers, pesticides, and seeds, but have never participated in any training sessions. - If there is sufficient water, the farmers will expand their cultivation, especially during the dry season.
Requests	- Assistance is needed to restore the main canal and build a water reservoir to store water from the headwaters to ensure water availability throughout the year.

ANNEX 13: RESULTS OF THE CONSULTATIONS WITH CHICKEN FARMERS

Results of the Consultations with Chicken Farmer Group in

Kampong Chhnang Province

Consultation Level	Chicken Farmer Group
Date	August 13th, 2024
Sub-Scheme	Yutasas
Farmer Group	Krasang Pul Village, Svay Commune, Sameakki Mean Chey District, Kampong Chhnang Province
Participants	1. Mr. Reun Rith 2. Mr. Chan Sothei
Moderator	Miss Chhim Sreytouch
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- Poultry farming has been successful because it follows proper techniques and has never failed. - Farmers in the village have a reasonable understanding of poultry health care and can mix natural feed on their own. - Farmers are very satisfied with this type of poultry farming because it is easy and there is ample space for raising chickens. Currently, around 100 households in the village are engaged in poultry farming. - Poultry farming contributes approximately 600,000 riels per month to household income, and farmers intend to continue this activity in the future. - Challenges include extreme heat, occasional chicken illnesses, and missing chickens when left free-range. - It is difficult to find and purchase feed, and feed prices are rising. - The market price for chicken meat is low and depends heavily on middlemen.
Requests	- Farmers request the project to provide poultry farming equipment and materials. - They also request additional technical training. - Farmers would like to have access to high-quality chicken breeds.
Photo	

Consultation Level	Chicken Farmer Group
Date	August 13th, 2024
Sub-Scheme	Yutasas
Farmer Group	Svay Pok Village, Svay Commune, Sameakki Mean Chey District, Kampong Chhnang Province
Participants	1. Mr. Im Van 2. Mr. Meng Dara 3. Mr. Tom Nan 4. Mr. Sam Nim 5. Ms. Nim Ro 6. Mr. Pov Kroeurn 7. Ms. Sam Tha 8. Mr. Hin Voeurn
Moderator	Miss Chhim Sreytouch
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The reasons for raising chickens are that it is easy to manage, they are disease-resistant, and they grow quickly, making them ready for sale in a short time. - The types of chicken breeds being raised are Sampov and Skouy chicken varieties. - Poultry farming can contribute approximately 1 million riels per month to household income. - Farmers in the village are satisfied with this poultry farming, with 219 households currently engaged in it, and they intend to continue in the future. - The challenges include a lack of technical knowledge in poultry farming. - Extreme heat causes the chickens to scratch the ground excessively and fall ill. - Sometimes it is difficult to find markets, and the price of chickens heavily depends on middlemen.
Requests	- A request is made for the department to conduct more frequent technical training, provide vaccines, poultry farming equipment, and high-quality chicken breeds for raising.

Moderator	Miss Hak Leakhina
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- Poultry farming is going well because it is easy to manage, the breeds are readily available, they grow quickly, and the breeds are reasonably priced. - Poultry farming contributes approximately 600,000 to 800,000 riels per month to household income and helps support children's education. - Poultry farming is not very popular among farmers in the village, with only about 10 households currently engaged in it. The main reason for its low popularity is the perception that chickens often get sick and die quickly, the selling price is low, and there is limited market demand, except during festive seasons. - Challenges include frequent illnesses and high mortality rates among chickens, a lack of high-value chicken breeds, and the absence of a poultry farming community in the area.
Requests	- A request is made for the government to help establish a poultry farming community in the region. - They also request training in poultry farming techniques, the provision of farming materials and supplies, and access to high-value chicken breeds for better market opportunities.

Consultation Level	Chicken Farmer Group
Date	August 15th, 2024
Sub-Scheme	Lum Hach
Farmer Group	Trapeang Mlu Village, Krang Skear Commune, Teuk Phos District, Kampong Chhnang Province
Participants	1. Mr. Kim Huot 2. Ms. Hem Nary 3. Ms. Lang Mom 4. Ms. Em Sophearath 5. Mr. Pon Thouch 6. Mr. Yim Chea 7. Mr. Seb Oeurn
Moderator	Mr. Ly Visoth

Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- Poultry farming is successful because it is easy to manage, can be done within the household premises, requires minimal labour, and provides both food for the family and an income from sales. - Poultry farming contributes about 30% to household income. - Poultry farming is not very popular among villagers, with only about 10 to 15 households currently engaged in it. - Most villagers are not interested in poultry farming because large-scale farming requires close supervision, and those who raise chickens are mostly elderly people with limited physical capacity. - The main challenge is chicken diseases.
Requests	- They request the CAISAR project to be established to ensure sufficient water supply for rice cultivation and for raising ducks and chickens by the farmers.
Photo	

Consultation Level	Chicken Farmer Group
Date	August 15th, 2024
Sub-Scheme	Lum Hach
Farmer Group	Trapeang Phkoam Village, Banteay Preal Commune, Rolea B'ier District, Kampong Chhnang Province
Participants	1. Ms. Leas Vean 2. Ms. Kaoet Sae 3. Ms. Thuch Sarin 4. Mr. Phann Sarath 5. Mr. Boeur Sinat
Moderator	Mr. Ly Visoth
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- Most of the poultry farming in the village is free-range, with chickens raised both for sale and for household consumption. - Poultry farming contributes only a small amount to household income. - Almost all households in the village raise chickens, but the majority do so mainly for their own consumption. - Challenges include chickens catching colds and dying in large numbers during the rainy season, and extreme heat causing illness and mortality as well.
Requests	- A request is made for additional technical training and access to better chicken breeds.

Photo	

Results of the Consultations with Chicken Farmer Group in Kampong Speu Province

Consultation Level	Chicken Farmer Group
Date	August 13th, 2024
Sub-Scheme	Krapeu Truom
Farmer Group	Khchas Village, Veal Pong Commune, Oudong Me Chey District, Kampong Speu Province
Participants	1. Ms. Roeurn Siem 2. Mr. Khen Sokha 3. Ms. Son Saoly 4. Ms. Kann Tonglim
Moderator	Miss Yeab Dalin
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The reasons for raising chickens include ease of care, low susceptibility to diseases, minimal maintenance requirements, and convenience in feeding. - Raising chickens can somewhat improve household livelihoods by supporting children's education and providing food. However, villagers are not fully satisfied with the income generated. - Farmers in the village are not keen on raising chickens due to a lack of labour force, as most chicken raisers are elderly. - Challenges include chicken diseases, lack of technical knowledge, and limited market access.
Requests	- Request for technical training programs on chicken raising in the village. - Restore the Krapeu Truom irrigation system to ensure sufficient water supply.
Photo	

Consultation Level	Chicken Farmer Group
Date	August 14th, 2024
Sub-Scheme	Krapeu Truom
Farmer Group	Thlea Chas Village, Veal Pong Commune, Oudong Me Chey District, Kampong Speu Province
Participants	1. Mr. Phorn Sophal 2. Mr. Sorn Siengly

	3. Mr. Dong Duy 4. Mr. Hai Venghong 5. Ms. Chey Say
Moderator	Miss Yeab Dalin
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- Most villagers raise chickens naturally, with minimal care, primarily for consumption and occasional sales. - Income from chicken raising is modest, and there are no clear future for expanding this activity. - Only about 50 households in the village are currently raising chickens. - Challenges include limited market access, low selling prices, and the absence of buyers. Additionally, when raising many chickens, the lack of technical knowledge leads to high mortality rates. - Climate change has caused chickens to become sick and die. - The chicken breeds being raised are slow growing, have low body weight, and are prone to diseases.
Requests	- There is a need for technical training on chicken farming and breeds that are more resilient to climate change. - Reduce water costs from the Krapeu Truom irrigation system.
Photo	

Consultation Level	Chicken Farmer Group
Date	August 14th, 2024
Sub-Scheme	Brambei Mom
Farmer Group	Chambak Thum Village, Brambei Mom Commune, Thpong District, Kampong Speu Province
Participants	1. Ms. Sorn Sreymom 2. Ms. Hon Davy 3. Ms. Muong Vansorn 4. Ms. Vann Sreymom 5. Ms. Huon Hai
Moderator	Miss Yeab Dalin
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- Raising chickens contributes to the household economy by helping pay for utilities, covering some school expenses for children, and purchasing feed for the chickens. - However, villagers are not satisfied with the income because of low selling prices and a lack of buyers, leading to unclear plans for expanding chicken farming in the future.

	- Approximately 100 households in the village engage in chicken farming due to its ease of management, with chickens raised for both consumption and sale. - During the dry season, chicken farming faces fewer challenges, but in the rainy season, issues arise such as outbreaks of avian influenza and increased mortality due to heavy rains.
Requests	- Additional technical training on chicken farming is requested.
Photo	

Consultation Level	Chicken Farmer Group
Date	August 14th, 2024
Sub-Scheme	Brambei Mom
Farmer Group	Lar Village, Brambei Mom Commune, Thpong District, Kampong Speu Province
Participants	1. Mr. Ya Yan 2. Mr. Pin Nak 3. Ms. Ek Hun 4. Mr. Ek Horn 5. Mr. Soeng
Moderator	Miss Chhim Sreytouch
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The reasons for raising chickens include ease of care, non-selective feeding, fast growth for quicker sales, disease resistance, easy access to breeds, and abundant market opportunities. - Chicken farming can significantly improve household livelihoods and occasionally provides food for the family. Farmers plan to continue raising chickens in the future. - The average income from chicken farming is around 200,000 riels per month. - Approximately 150 households in the village engage in chicken farming. - Challenges include a lack of capital to purchase additional chicken breeds, insufficient technical knowledge, and difficulty in sourcing necessary farming materials.
Requests	- The villagers request the relevant department to conduct technical training on chicken farming in the village. - They also seek project support for providing feed, vaccines, quality chicken breeds, coops, and other essential farming materials.

Results of the Consultations with Chicken Farmer Group in Pursat Province

Consultation Level	Chicken Farmer Group
Date	August 16th, 2024
Sub-Scheme	Ou Ta Paong
Farmer Group	Srah Run Village, Ou Ta Paong Commune, Bakan District, Pursat Province
Participants	9. Ms. Nhim Roeurn 10. Ms. Vann Sary 11. Ms. Phin Siem 12. Ms. Huy Soy 13. Mr. Nhen Sol 14. Ms. Chum Khorn 15. Ms. Chhean Sang 16. Ms. Soun Sitha
Moderator	Miss Chhim Sreytouch
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- The reasons for raising chickens include ease of care, fast growth, non-selective feeding, and abundant market opportunities. - Chicken farming has contributed to household income, and farmers plan to continue it in the future to improve their livelihoods. - Approximately 150 households in the village are engaged in chicken farming. - Challenges include extreme heat, which causes high chicken mortality. - The market price is unstable, and farmers lack the capital to buy chicken breeds and have limited technical knowledge.
Requests	- Additional technical training on chicken farming is requested. - Support is needed in the form of capital, farming materials, and quality chicken breeds.
Photo	

Consultation Level	Chicken Farmer Group
Date	August 16th, 2024
Sub-Scheme	Ou Ta Paong
Farmer Group	Oknha Moan Village, Ou Ta Paong Commune, Bakan District, Pursat Province
Participants	1. Ms. Hun Chan

	2. Ms. Voeurn Phal 3. Ms. Thy Channa 4. Ms. Khin Niem 5. Mr. Thoeng Chantha
Moderator	Mr. Ly Visoth
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- Chicken farming in the village follows a family-based, traditional approach, with insufficient feed, no vaccinations, and occasional outbreaks of disease (in December-January and June). - Chicken farming is easy to manage, leads to fast growth, has high demand, requires low initial investment, and minimal maintenance. - Almost every household in the village raises chickens, as it contributes to household income and provides food. - Challenges include chicken diseases, extreme weather (both hot and cold), which cause high mortality rates. - There is a lack of technical knowledge and experience, which discourages farmers from raising larger numbers of chickens. - Farmers face a shortage of capital to expand their poultry farming. - If the Ou Ta Paong irrigation system is implemented and sufficient water is available, farmers could pump water into ponds at home to ensure a steady supply of drinking water for chickens and other animals.
Requests	- Assistance is requested to provide more training in chicken farming techniques and to supply quality chicken breeds.
Photo	

ANNEX 14: RESULTS OF THE CONSULTATIONS WITH DUCK FARMERS

Results of the Consultations with Duck Farmer Group in Kampong Chhnang Province

Consultation Level	Duck Farmer Group
Date	August 13th, 2024
Sub-Scheme	Yutasas
Farmer Group	Krasang Pul Village, Svay Commune, Sameakki Mean Chey District, Kampong Chhnang Province
Participants	1. Mr. Vann Chhai 2. Mr. Pou Art 3. Mr. Chann Sothei
Moderator	Miss Chhim Sreytouch
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- Duck farming is easy to manage, with ducks eating almost any feed, being resistant to diseases, growing quickly for sale, having a short production cycle, and being easier to raise than chickens. - Farmers are satisfied with duck farming as it helps solve some livelihood issues in the present, and they plan to continue if there is access to better markets with higher prices in the future. - The average monthly income from duck farming is 500,000 riels. - Only 4 households in the village are currently raising ducks. - Challenges include falling market prices, difficulty in receiving payment from buyers, and a lack of capital.
Requests	- Farmers request the project to help find better markets for their products. - The project is also requested to provide additional technical training on duck farming.
Photo	

Consultation Level	Duck Farmer Group
Date	August 18th, 2024
Sub-Scheme	Yutasas
Farmer Group	Svay Pok Village, Svay Commune, Sameakki Mean Chey District, Kampong Chhnang Province
Participants	1. Mr. Norn Thoeurn 2. Mr. Norn Kroun

Moderator	Miss Chhim Sreytouch
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- Duck farming operates well and is easy to sell the products. - Duck farming helps address some livelihood issues in the present, and farmers plan to continue raising ducks in the future. - The average monthly income from duck farming is 300,000 riels. - There are not many farmers in the village engaged in duck farming, with only 5 households involved. - Challenges include high mortality rates and a lack of technical knowledge on duck farming. - Farmers face a shortage of capital and lack the means to purchase more ducks for farming. - Market prices are low, and traders set the prices.
Requests	- Provide technical training on duck farming, as the farmers' knowledge is still limited.
Photo	

Consultation Level	Duck Farmer Group
Date	August 13th, 2024
Sub-Scheme	Yutasas
Farmer Group	Kyang Khang Tboung Village, Svay Commune, Sameakki Mean Chey District, Kampong Chhnang Province
Participants	1. Ms. Pak Maly 2. Ms. Ek Yiem
Moderator	Miss Yeab Dalin
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- Duck farming operates well with low disease incidence, is easy to manage, and produces heavy ducks. It requires fewer vaccinations and low feed costs. - Duck farming helps improve livelihoods to some extent, but in the future, farmers may stop raising ducks due to a lack of labor to care for them. - There are only 9 households in the village raising ducks, as most farmers are busy with crop farming, and some families face a shortage of labour. - Challenges include the lack of market access and traders defaulting on payments.

	- When diseases affect the ducks, they are hard to treat, and the disease spreads quickly, leading to high mortality rates. However, outbreaks are not frequent.
Requests	- Restoration of the main canal connected to the irrigation system is needed. - Restoration the irrigation system as soon as possible.
Photo	

Consultation Level	Duck Farmer Group
Date	August 15th, 2024
Sub-Scheme	Lumhach
Farmer Group	Krang Leav Village, Krang Leav Commune, Rolea B'ier District, Kampong Chhnang Province
Participants	1. Ms. Prak Borany 2. Ms. Um Theary 3. Ms. Ing Thy 4. Ms. Min Siphoan 5. Ms. Soam Youn
Moderator	Miss Chhim Sreytouch
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- Duck farming is easy to manage and sell. - Farmers are satisfied with duck farming as it helps solve some livelihood issues in the present, and they plan to continue in the future. - Only 37 households in the village are raising ducks. - Challenges include a shortage of water sources, limited market prices, lack of technical knowledge, and low levels of expertise. - Ducks are prone to diseases and high mortality rates due to extreme heat. - Efforts to care for ducks are challenging, especially during the rainy season. - Traditional medicines can be used to treat sick ducks.
Requests	- Farmers request the restoration of irrigation ponds to provide water for agriculture and animal husbandry. - They also ask the Ministry to help find markets and increase stable prices. - Farmers request technical assistance for duck farming, vaccines, and quality duck breeds.
Photo	

Consultation Level	Duck Farmer Group
Date	August 15th, 2024
Sub-Scheme	Lumhach
Farmer Group	Krang Skear Khang Tboung Village, Krang Skear Commune, Teuk Phos District, Kampong Chhnang Province
Participants	1. Ms. Chann Ngorn 2. Ms. Ul Chanthoeurn 3. Mr. Seng Hak
Moderator	Miss Hak Leakhina
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- Duck farming operates well, is easy to manage, and ducks grow quickly, making them easy to sell. - Villagers raise ducks on a family basis, which allows them to earn about 25% of their household income compared to other livelihoods. - Duck farming in the village is considered a supplementary activity. - Most farmers in the village do not prefer raising many ducks due to the need for more breeds, large fields, and daily care. Currently, young people tend to work in factories or other jobs, leaving only women and elderly people to manage farming activities like vegetable cultivation and family-based duck farming. - Challenges include a lack of market access, with buyers taking a long time to purchase, especially during the holiday season. - Ducks are sold at very low prices. - There is a lack of technical knowledge in duck farming.
Requests	- Training on duck disease treatment methods and providing farming materials such as pens, nets, and assistance in finding markets for selling ducks is needed.
Photo	

Consultation Level	Duck Farmer Group
Date	August 18th, 2024
Sub-Scheme	Stoeung Krang Bat
Farmer Group	Trapeang Chambak Village, Longveak Commune, Kompong Tralach District, Kampong Chhnang Province
Participants	1. Mr. Korng Sarin 2. Ms. Soun Sopheap 3. Mr. Hit Sophin

	4. Mr. Khoem Savuth
Moderator	Miss Sothy Chantana
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- Duck farming is successful, easy to manage, and can be done around the household. It requires little labour, is easy to raise, and the ducks eat a variety of food with low expenses. - Villagers raise ducks on a family basis, for both consumption and sale, with about 25% of their household income coming from this activity compared to other livelihoods. - Duck farming in the village is considered a supplementary activity. - Most farmers in the village do not prefer raising many ducks due to the need for large areas of land and intensive care. Nowadays, the younger generation tends to work in factories, while only women and the elderly remain at home for farming and family-based duck farming. - Challenges include the high temperatures causing diseases in ducks and a lack of technical knowledge on duck farming and disease treatment methods.
Requests	- The community hopes that the CAISAR project will be implemented to provide sufficient water for irrigation and duck farming, benefiting farmers in the area.
Photo	

Results of the Consultations with Duck Farmer Group in Kampong Speu Province

Consultation Level	Duck Farmer Group
Date	August 13th, 2024
Sub-Scheme	Krapeu Truom
Farmer Group	Khchas Village, Veal Pong Commune, Oudong Me Chey District, Kampong Speu Province
Participants	1. Ms. Loeurn Samhak 2. Mr. Tut Chanthoeurn 3. Mr. Khon Sroeun 4. Ms. Khloeng Sophan 5. Ms. Penh Sary 6. Ms. Soun Sokny
Moderator	Miss Sothy Chantana
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- Duck farming is successful with no significant problems, as it is easy to manage and can be done in the backyard with minimal labour.

	Ducks are resistant to diseases, and feed costs are low because they do not require selective feeding. - Villagers raise ducks on a family basis, for both consumption and sale. They can generate about 15% of their household income from duck farming compared to other livelihoods. - Villagers are satisfied with duck farming because it requires minimal expenditure, and the ducks can be sold for a decent profit. - Duck farming in the village is seen as a supplementary activity for villagers. - Currently, only 10 households in the village raise ducks out of more than 200 farming households. Most villagers prefer to work in factories, and only women and the elderly stay at home to engage in farming and duck raising. - Challenges include heat causing diseases like avian cholera, as well as a lack of technical knowledge in duck farming and disease treatment methods.
Requests	- Provide more training on duck farming techniques in the village to improve knowledge and skills.
Photo	

Consultation Level	Duck Farmer Group
Date	August 14th, 2024
Sub-Scheme	Krapeu Truom
Farmer Group	Souvongs Leu Village, Veal Pong Commune, Oudong Me Chey District, Kampong Speu Province
Participants	1. Ms. Phat Rorn 2. Ms. Soy Chandy 3. Ms. Rin Channeang 4. Mr. Soy Ny 5. Ms. Khem Yeun
Moderator	Miss Hak Leakhina
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- Duck farming is not very successful due to the lack of a market; it is difficult to sell ducks, and the buying process takes a long time. - Villagers are not satisfied with the income from duck farming because they are not making much profit. - Duck farming is done on a family basis in the village for both consumption and sale, generating about 5% of household income compared to other livelihoods.

	- Most villagers are not interested in raising ducks because it requires large space, multiple breeds, and daily care. Currently, younger adults work in factories or other jobs, while only elderly people and women stay at home to engage in farming and raising ducks. - Challenges include ducks getting sick (such as avian cholera) and a lack of technical knowledge on duck farming and treatment methods.
Requests	- Provide training on duck farming techniques in the village to improve knowledge and skills.
Photo	

Consultation Level	Duck Farmer Group
Date	August 14th, 2024
Sub-Scheme	Brambei Mom
Farmer Group	Chambak Sar Village, Roung Roeang Commune, Thpong District, Kampong Speu Province
Participants	1. Ms. Yun Savoeurn 2. Mr. Von Sambath 3. Mr. Mom Pov 4. Ms. Soth Korn 5. Mr. Hem So 6. Mr. Phon Soth
Moderator	Mr. Ly Visoth
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- Duck farming is going well, easy to manage, and can be done in a small space such as a backyard. It requires minimal labour, is disease-resistant, and has low feed costs since ducks are not picky eaters. The ducks are raised both for consumption and sale. - Villagers practice small-scale family-based duck farming, keeping some for-home consumption and selling the rest, which contributes around 10% of household income compared to other sources. - However, they are not fully satisfied with the income from duck farming as it provides limited profit. - Most farmers in the village are not interested in large-scale duck farming, as it requires a lot of space, daily care, and is challenging to manage disease outbreaks when they occur. Farmers prefer clean areas for gardening, and they don't want to mix livestock farming with crop cultivation. - Currently, younger adults work in factories, while elderly people and housewives are mainly responsible for farming and duck raising at home.

	- The challenges include frequent disease outbreaks, especially during hot and rainy seasons, and a lack of technical knowledge on duck farming and treatment methods.
Requests	- A request is made for training on duck farming techniques to help improve skills and manage diseases more effectively.
Photo	

Consultation Level	Duck Farmer Group
Date	August 14th, 2024
Sub-Scheme	Brambei Mom
Farmer Group	Tuek Long Ti Muoy Village, Roung Roeang Commune, Thpong District, Kampong Speu Province
Participants	1. Ms. Sok Sarom 2. Mr. Thai Siem 3. Mr. Soy Lang 4. Mr. Mes Thoeurn
Moderator	Mr. Ly Visoth
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- Duck farming is going well, easy to manage, grows quickly, ducks are not picky eaters, and are disease resistant. Ducks can be sold regularly, and it requires minimal time for care. - There are few villagers interested in raising ducks, with only 6 families doing so. This is mainly because duck farming requires large spaces for them to roam, so farmers with small plots of land do not engage in it. - The farmers are not fully satisfied with the income from duck farming, as it still provides limited returns. - The main challenges are the lack of a consistent market and no buyers willing to guarantee purchases. - When disease outbreaks occur, they result in the loss of all ducks. - There is a lack of technical knowledge on duck farming and treatment methods.
Requests	- Provide more training on duck farming techniques to improve knowledge and address disease management.
Photo	

Results of the Consultations with the Duck Farmer Group in Pursat Province

Consultation Level	Duck Farmer Group
Date	August 16th, 2024
Sub-Scheme	Ou Ta Paong
Farmer Group	Kampang Village, Svay Doun Keo Commune, Bakan District, Pursat Province
Participants	1. Mr. Pat Pov 2. Ms. Chin Voeurn 3. Ms. Loat Phung
Moderator	Miss Sothy Chantana
Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- Duck farming is going well, it is easy to manage, grows quickly, ducks are not picky eaters, and are disease resistant. It is possible to raise them in the backyard. - However, the income is not satisfying because of high expenses and low selling prices. Duck farming contributes only 5% to the household income. - There are few villagers involved in duck farming, with only 4 families participating. - Most farmers in the village are not interested in raising ducks because it requires a large area of land and daily care. - Currently, most of the young people with strength are working in factories, while only housewives and the elderly stay at home for farming and raising ducks on a family scale. - The main challenge is that diseases arise during the hot months. - There is no treatment method, and ducks that fall ill often die. - There is a shortage of funds to buy feed.
Requests	- Provide more additional training on duck farming techniques.
Photo	

Consultation Level	Duck Farmer Group
Date	August 16th, 2024
Sub-Scheme	Ou Ta Paong
Farmer Group	Ou Ta Paong Village, Ou Ta Paong Commune, Bakan District, Pursat Province
Participants	1. Mr. Nhim Nhenh 2. Ms. Chorn Nan 3. Ms. Nhenh Channy 4. Mr. Sao Bunthoeurn
Moderator	Miss Sothy Chantana

Consultation Topics	The Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) project
Perceptions and concerns	- Duck farming is going well, it is easy to manage, ducks are not picky eaters, disease-resistant, and can be raised in the backyard with minimal labour. Ducks are raised both for consumption and for sale. - However, the income from duck farming is not satisfactory due to high expenses, low selling prices, and the income only contributing about 15% to the household. - There are not many villagers involved in duck farming, with only 12 families participating. This is because raising more ducks requires a lot of care, and most of those who farm ducks are elderly and do not have much strength. - The main challenges include diseases (such as duck plague) occurring during the hot and rainy months, as well as the ducks' damaging crops in the yard. - There is no treatment method available, and sick ducks often die.
Requests	- The villagers would like the CAISAR project to be implemented to ensure sufficient water for agriculture and duck farming.
Photo	

ANNEX 15: STANDARD OPERATION PROCEDURE (SOP) FOR LAND CLEARING AND REHABILITATION

Standard Operating Procedures (SOP) for Land Clearing and Rehabilitation[12]

Roles and Responsibilities

This SOP applies for PMU, CSC, contractors, subcontractors, and any other associated organizations.

8. **PMU:** Oversees the implementation of this SOP, ensures compliance with environmental regulations and lender requirements, and facilitates inter-agency coordination.
9. **CSC:** Provides technical supervision and guidance to the contractor, monitors compliance with this SOP, and ensures environmental safeguards are implemented effectively.
10. **Contractor:** Responsible for executing land clearing and rehabilitation activities in accordance with this SOP and relevant contracts.

[12] This SOP has been adapted from good international industry practices such as the *Biodiversity Management Plan (BMP) Upper Cisokan Pumped Storage Hydropower, PT PLN (Persero), Master Development Unit – UIP JBT I, April 2021*, among others.

11. **Subcontractors:** Responsible for performing specific tasks as delegated by the contractor and in compliance with this SOP.
12. **CSC Project Ecologist/Biodiversity Expert:** Provides expert advice on biodiversity protection, habitat restoration, and wildlife management.
13. **Wildlife Expert:** Conducts wildlife surveys, identifies sensitive areas, and provides guidance on wildlife relocation and protection.
14. **Botanist:** Identifies and assesses plant species for potential use in rehabilitation efforts and oversees plant propagation and transplanting.

Background

This implementation procedure for land clearing and rehabilitation provides direction for avoiding and if cannot be avoided, for minimizing negative impacts on biodiversity during the construction Phase. The clearing procedures take into account the types of wildlife that exist in the project site and in surrounding areas, the key species that the project aims to protect, and the impacts anticipated from vegetation clearing. In addition, the procedures consider the features of existing vegetation in the route, specifically on key areas identified in the Biodiversity Baseline Survey (2023).

Objective

This SOP aims to:

5. Ensure that the implementation of land clearing is in accordance with the requirements of environmental management required by the Lender in accordance with Cambodian Regulations.
6. Minimize the negative impacts of land clearing on biodiversity, particularly the reduction in the number of species and number of individuals of protected wildlife (see Table 3 in section 4.2.3 of the biodiversity report).
7. Minimize the negative impact from land clearing on habitat connectivity by minimizing fragmentation where possible maintaining canopy connectivity across cleared areas.
8. Maximize the use of various types of seedlings and saplings of plants that exist in areas prior to land clearing to be planted back in areas that need to be rehabilitated (e.g., spoil banks).

Phasing of land clearing SOP

Land clearing procedures are divided into several distinct Phases:

- **Preparation Phase**: Intended for land clearing planning, notification of clearing procedures to the contractors/subcontractors, and training for contractors/subcontractors and workers to ensure SOP is fully understood. The location and management of tree nurseries also need to be determined at this stage.
- **Pre-clearing Phase**. Areas that will not be cleared are clearly demarcated on the ground to ensure that no forest areas or trees are damaged beyond what has been planned. Within the areas scheduled for clearing, any trees with endangered or protected wildlife (e.g., nesting birds) are marked, as well as underground burrows or other places currently used by wildlife. Input from the Project Management Consultant's (PMC) Ecologist/Biodiversity Expert is required to determine next steps regarding the safe relocation of these animals. At this stage, seedlings, and saplings with the potential for habitat enrichment will be collected, moved to the tree nurseries and properly maintained.

- **Clearing Phase**: Intended to ensure that the felling of trees will not damage vegetation bordering on clearing areas by careful directional felling. This coincides with PMU and contractors what refer to as the land clearing, clearing and grubbing, and excavation works.
- **Post-clearing Phase:** Seedlings and saplings that have been maintained in tree nurseries are planted back in areas designated for rehabilitation (e.g., spoil banks) or reforestation (temporary access roads, worker camps, quarry areas, etc.). Wildlife monitoring programs are implemented both in areas adjacent to land clearing sites and in rehabilitation/reforestation zones.

Preparation Phase Management Actions

PMU shall establish a land clearing project team responsible for land clearing implementation. This project team consists of environmental inspectors, wildlife experts, plant experts, ecological/conservation experts.

Task of the land clearing project team are:

8. The Contracted Service Construction (SCS)-Project Ecologists determine the priority of the clearing block (at all locations across the project site, but especially when land clearing will happen in or near the forest and natural habitat area) and determine which trees will be cleared. Also, the CSC-Project Ecologists can temporarily stop clearing activities when negative impacts on wildlife could occur. The CSC-Project Ecologists generally provides direction to the contractor regarding the rules that must be obeyed.
9. A wildlife expert is tasked to observe whether or not the clearing block is being used by wildlife. The results of these inspections are reported to the CSC-Project Ecologists.
10. A botanist is tasked to note the presence of plant seedlings and saplings which have the potential for habitat rehabilitation. The results of these observations are reported to the CSC-Project Ecologists, and decisions are then made about which plants need to be taken to the tree nursery.
11. The contractor shall prepare a local tree nursery site for keeping the seedlings and saplings of plants, hire people to maintain plants in the nursery, and provide means to water plants to maximize survival.
12. The contractor shall set up a central information center for dealing with any human-wildlife conflict issues, as well as a place for public complaints about clearing. The center should be placed in a strategic location near the closest settlement, for example in the Village Hall, local school, health centers, etc.) and can be the same center as used for managing project grievances.
13. The contractor is responsible for preparing and installing signs on animals crossing points and providing information to workers about a total ban on hunting or collecting. PMU, PMC, PSC will all support the contractor to do this.
14. The CSC-Project Ecologists shall conduct an evaluation to ensure that the preparation stage has been properly implemented.

Pre – Clearing Phase Management Actions

7. The wildlife expert marks all trees that are used by wildlife with yellow paint. This includes trees with hollows or ground burrows used for nesting or sleeping. Active ground burrows are marked by yellow stakes. Marked trees are not cut down before it can be ascertained with confidence that the animals have left. Similarly no clearing or

soil works are allowed in a radius of five (5) meters from an active burrow until the animal has left it.

8. The contractor is responsible for the collection of seedlings and saplings of potential for habitat enrichment as identified by the botanist in the preparation Phase. Training will be given as required to ensure that there is maximum success rate with translocated plants. Seedlings and saplings will be moved in polybags with minimal disturbance of root systems. The plants are moved to a local nursery site, equipped with shade cloth and close to a permanent water source from where the plants can be easily watered. Sufficient competent workers are hired to ensure plants are kept alive until the time of planting. In the reservoir area (area to be inundated) nurseries are established close to the river to facilitate watering. Once the location of the greenbelt has been determined, seedling and saplings are planted at the start of the rainy season when survival chances are highest.
9. The contractor shall prepare the project area and physically demarcate clearing block boundaries with clear stakes at an interval of 25 meters to avoid unnecessary damage to soils and trees in the area adjacent to work sites.
10. The contractor shall install signs to ban hunting or catching of wildlife in the area.
11. Wildlife experts need to identify places where culverts, rope bridges and other structures are to be installed.
12. The CSC-Project Ecologists and wildlife expert need to ensure that all action items scheduled for the pre-clearing Phase have been carried out.

Clearing Phase Management Actions (i.e., land clearing, clearing and grubbing, and excavation)

9. The CSC-Project Ecologists must ensure that the contractor and workers (local supervisor level) have received clearance and guidance or training on clearing procedures that should be implemented.
10. Trees marked with yellow are not felled before a wildlife expert has ensured that the tree is not being used by animals. Similarly, trees or burrows that are used by animals need to be protected from clearing activities until a wildlife expert has confirmed that no animals remain.
11. Felling of trees should be directed towards the clearing area to prevent damage to trees that will remain standing.
12. Hollow tree that have been felled (and have no commercial value), should be left in the remaining forest area as these provide important microhabitats for a range of wildlife species.
13. Any animals hurt during the land clearing process (despite the above precautions) should be
    handed over to the rapid response wildlife management unit (Forestry Administration, Phnom Tamao Wildlife Rescue Centre, or Angkor Centre for Biodiversity Conservation). After the animal has been brought back to health, it is released back into the area. If they are endangered or critically endangered species then the individual will be monitored.
14. After each block is completed, a wildlife expert should make a clearing report which contains:
    - The type and number of individual seedlings and saplings of plants taken to be maintained in a nursery.
    - The type and number of animals found during clearing, as well as the direction of movement of animals. Including the number of bird's nest containing eggs or young birds.
    - The type and number of animals to be treated.
    - The number of suspected hollow tree inhabited by wildlife.
    - The number of locations used by ground animals (as nests or shelter).

- The number of damaged trees located in the area adjacent to the block clearing and embankment areas.

15. To prevent bush fires, any activities that could potentially cause a fire are prohibited including making a fire or discarding cigarette butts. The contractor is responsible for training staff regarding fire risk, and maintaining a trained firefighting squad.
16. The CSC-Project Ecologists and wildlife expert need to ensure that all action items scheduled for the clearing Phase have been carried out.

Post-clearing Phase Management Actions

6. The CSC-Project Ecologists ensures that wildlife monitoring takes place (refer to **Section 9.2.3 of the ESCIA Report**).
7. All exposed areas (roadsides, cuttings, laydown areas, spoil banks, etc.) shall be replanted as soon as practical following earthworks / construction / end of temporary use. The contractor shall follow the BMP, and seek input from wildlife and botanical experts, with respect to the types of plants that should be replanted (based on the location, slope, and long-term land use).
8. With input from wildlife and botanical experts areas for habitat enrichment planting or reforestation are selected and at the right time of the year (start of the rainy season) trees from tree nurseries are transplanted to new areas.
9. For at least the first and second year, all planted trees need to be monitored (and replaced if dead), watered (if needed) and kept free from weeds, climbers and other plants that inhibit their growth. This work is best done in collaboration with local authority, NGOs, and local communities, as needed.
10. The CSC-Project Ecologists and wildlife expert need to ensure that all action items scheduled for the post-clearing Phase have been carried out.

Re: Climate Adaptive Irrigation and Sustainable Agriculture for Resilience Project (CAISAR) in Cambodia

To whom it may concern:

The Asian Infrastructure Investment Bank (AIIB) understands that the International Fund for Agricultural Development (IFAD) is currently contemplating the CAISAR Project in Cambodia (the "Project") that was proposed to the Green Climate Fund (GCF) for funding.

The Asian Infrastructure Investment Bank ("we" or "AIIB") is pleased to confirm its interest in participating in the financing of the Project in an amount of up to one hundred million United States Dollars (USD 100,000,000).

This letter does not constitute a promise to finance, including without limitation, an offer or commitment to provide financing to the Project, and does not create (and it shall not be deemed to have created) any binding or enforceable obligations of AIIB. Any financing to be provided by AIIB remains conditional on the findings of the project appraisal and satisfactory due diligence, and subject to review and approval processes of AIIB, and arrangements or agreement to be concluded with the Kingdom of Cambodia (the Borrower).

The disclosure of the information with respect to the Project contemplated herein will be made in accordance with AIIB's policies on access to information.

Nothing in this letter shall be construed as a waiver, renunciation or other modification of any privileges, immunities or exemptions of AIIB accorded under the Articles of Agreement of AIIB, the Headquarters Agreement between the Government of the People's Republic of China and AIIB, international convention or any applicable law.

Subject: Co-financing Commitment Letter for the Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) Project in Cambodia

Dear Ms. Reehana Rifat Raza and the Green Climate Fund,

The Ministry of Economy and Finance is pleased to express our commitment to support the CAISAR Project in Cambodia that has been proposed to the GCF for funding.

With this, we hereby confirm the in-kind contribution of USD 15,000,000.00 to co-finance the CAISAR Project, should the proposal be approved by the Asian Infrastructure Investment Bank, IFAD, and the GCF.

Nonetheless, this letter does not constitute a legally binding commitment of any kind, as the final approval of the co-financing is subject to the Government of the Kingdom of Cambodia's legal, budgetary and policy considerations, as per applicable procedures.

Please accept, Ms. Reehana Rifat Raza and the GCF, the assurances of our consideration.

Sincerely yours,

Dr. Aun Pornmoniroth
Deputy Prime Minister
Minister of Economy and Finance

Re: Co-financing Commitment Letter for the Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) Project

Excellency and Representative of the Green Climate Fund,

I am writing to you to express our commitment to support the Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) Project that was proposed to the Green Climate Fund (GCF) for funding.

This is to confirm the loan contribution of the International Fund for Agricultural Development (IFAD) to co-finance the Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR), will be approved, with a total value of 45 million USD (forty-five million US Dollars).

Kindly note that this letter does not constitute a legally binding commitment of any kind, as the final approval of the co-financing is subject to IFAD's legal, budgetary and policy considerations, including that of IFAD's Executive Board or President, as per applicable procedures.

Accept, Excellency, the assurances of my highest consideration.

15 July 2025

Excellency,

The International Fund for Agricultural Development (IFAD) is very pleased to inform you about the ongoing negotiation on the term sheet for the Project ***Climate Adaptive Irrigation and Sustainable Agriculture for Resilience (CAISAR) in Cambodia*** with the Green Climate Fund (GCF) for the forty-second meeting of the Board (B.42).

As part of this negotiation, it was agreed between the GCF and IFAD that the Project will not be subjected to step-in rights from the GCF. Under this arrangement, in case IFAD decides not to continue the project implementation, the GCF will not have recourse to take over the Project, and the only alternative would be its cancellation. However, we assure you that IFAD does not envisage this scenario.

IFAD would like to reiterate its full support and continuous collaboration to the Royal Government of Cambodia and its sustainable development agenda.

Accept, Excellency, the assurances of my highest consideration.
