The sensitization and capacity-building of the RPMU teams will be key to ensuring that field activities integrate gender and diversity concerns, and focal points should be selected in the RPMUs to assist the PMU Gender and Diversity specialist in implementing the Gender and Diversity Plan at territorial level. The TA teams will have a regular and continuous presence with the target groups and, to promote a service that meets the specific demands of the Project's target groups (women, young people, PCTs, LGBTQIAPN+ and persons with disabilities), these teams must be trained in Gender and Diversity issues.

The PMU's Gender and Diversity specialist will play a crucial role in implementing an inclusive and transformative approach in terms of diversity and gender. Some of the themes proposed in the trainings are: women's rights, fair division of domestic labor, empowerment, agroecology, LGBTphobia, gender-based violence, public policies aimed at women and PCTs, as well as the ethnic and racial dimension of collective identities.

#### Gender and diversity training for the Project's direct beneficiaries:

PROCASE I consolidated a successful Gender methodology. However, it must strengthen its ethnic-racial and generational sections and be updated to include a broad diversity perspective that includes promoting the empowerment of Afro-descendants, PCTs and the LGBTQIAPN+ community.

The main objectives of the training are: i) To develop the capacities of the target groups so that they can play an active role and be socially recognized in the economic and productive spheres of the family and community; ii) To promote voice and influence in rural institutions and organizations, both of women and of PCTs and the LGBTQIAPN+ community; and iii) Promote debate on the sexual division of labor, with a view to fostering a fairer division of the workload between men and women; iv) Value and disseminate traditional knowledge, practices and ways of life and discuss issues related to racism, sexual orientation and gender identity.

During the training sessions, the issue of Violence against Women and Domestic Violence will be addressed, providing knowledge and information about the Maria da Penha Law, how to access the Network for Combating Violence against Women and how to file complaints, with the aim of preventing violence against girls and women and supporting victims of violence in navigating legal processes, accessing protective services, and finding resources for recovery and empowerment. The training sessions will be held in the beneficiary communities. The training program will take an intersectional approach, considering how racism, patriarchy, heteronormativity, and other exclusionary structures generate dynamics between multiple axes of subordination - gender, race/ethnicity, sexual orientation, and social class.

#### Implementation of the Agroecological Logbook Methodology:

The Agroecological Logbooks (ALs) are an innovative and successful political-pedagogical instrument for women's economic empowerment, which has already been widely tested within the framework of IFAD projects in Brazil. The ALs are implemented to measure, value, and give visibility to women's fundamental contributions to the family economy and, consequently, to community development. They also aim to promote greater self-esteem among women and demonstrate how they contribute, through production in agroecological backyards, to a healthy, diversified, and safe family diet. As a result of valuing women's contributions to the family economy, the aim is to change power relations in the domestic and community spheres.

The AL is a simple-to-use tool with four columns for organizing information about women's production. It records what is sold, donated, exchanged, and consumed daily, based on everything that is grown in the spaces where women live in family and peasant farming units, from agricultural production to handicrafts and processing. During the implementation of PROCASE I, the AL proved to be an efficient tool for monitoring women's production, even allowing for the valuation of production that does not involve monetary exchange and which was previously invisible, such as that for self-consumption, which plays a fundamental role in guaranteeing food security and nutrition. The role of the TA is to mobilize the beneficiaries, train them in the use of the ALs and follow up and monitor their completion.

Therefore, as well as promoting women's socioeconomic empowerment, the ALs also play a role in qualifying TA activities as an instrument for intervening, constituting new indicators for the Project's activities. The implementation of the complete AL Methodology includes training, implementation, and M&E costs.

#### Training of facilitators of childcare circles (cirandeira(o)s):

The communities will select people from their own communities to be trained as facilitators of childcare circles, developing skills to care for and teach children during the Project's activities, allowing mothers to take part in the training and other activities proposed by the Project. The educational training of the facilitators (cirandeiro(a)) will be carried out by a qualified team of professionals from various fields, such as Pedagogy, Arts, Social Work, Anthropology and Sociology, and will last around a year.

The municipalities will be organized into training centers where 48-hour workshops will take place over 12 months, in two phases of 24 hours each, totaling 336 hours of activity. Training for cirandeiros and cirandeiros should take a multidisciplinary approach to themes that are interrelated, such as "gender relations", "environmental education" and "child development", helping to prepare facilitators for carrying out their educational activities with children. Facilitators should also be trained in dynamic methods and tools, such as storytelling, games and toy-making. A set of educational materials should also be prepared, consisting of videos, CDs, books, and memory games to increase awareness of a range of issues during the sessions with the children. One of the important aspects of this methodology is the process of training men and women, many of whom are young, to develop their leadership qualities through pedagogical methods that seek to strengthen intergenerational links.

The Project will ensure that the selection process for cirandeiros includes a methodology and prioritization criteria that guarantee gender equity and diversity, by hiring a support foundation. PCTs, PwD and LGBTQIAPN+ will have priority. At least 50% of the cirandeiros must be from these priority target groups.

#### Childcare/education activities that allow women to participate in the Project's activities:

The Project will offer childcare/education services to ensure women's participation in PROCASE II activities, such as the Gender and Diversity Trainings. The activities are conducted with children by one or two educators/facilitators in a physical space provided by the community. The costs of the activity are as follows: i) training childcare workers; ii) reserving materials and resources for activities; and iii) paying for childcare services. The activity is built on a dynamic methodological approach that strengthens relationships between generations, promotes debate on gender equality in family and community networks and conveys positive messages about the semiarid region and sustainable practices that are developed by different organizations and communities within this ecosystem. In addition, this activity helps to reduce women's workload due to childcare and encourages many communities to play a role in collectively sharing the task of caring, normally associated with the private sphere. Another positive aspect is the promotion of gender-transformative education, which allows stereotypes, attitudes, norms, and practices to be transformed, generating critical awareness of gender inequalities in both children and their educators.

#### Thematic diversity meetings (aimed at persons with disabilities and LGBTQIAPN+<sup>84</sup>):

The thematic meetings will be aimed at the beneficiaries of two specific target groups: persons with disabilities and the LGBTQIAPN+ community, will have a community approach and will be demand-driven. They will complement the Gender and Diversity training aimed at beneficiaries, addressing specific topics of interest to the communities and strategic for closing the inclusion gaps identified in the Gender and Diversity diagnoses related to persons with disabilities and LGBTQIAPN+.

In particular, persons with disabilities and the LGBTQIAPN+ community in the Project area are impacted by the combined effects of numerous forms of discrimination, including gender, race, disability, sexual orientation, and socioeconomic conditions. As a result, they face even greater obstacles to participating in decisions that affect their

---

<sup>84</sup> Give preference to trans people, when possible, because this is a group that is particularly marginalized among the LGBTQIAPN+ community, prioritizing self-recognition between the trainer and the participants in the meeting.

well-being and to the full realization of their rights. Five meetings will be held for persons with disabilities and five for the LGBTQIAPN+ community. Through these thematic meetings, guided by the demands of the target groups themselves, political mobilization will be promoted, awareness will be raised about rights, as well as issues related to sexuality, sexual orientation and the inclusion of persons with disabilities.

Whenever possible and deemed necessary, the potential for incorporating a cross-cutting and transdisciplinary agenda on food security and nutrition in these thematic training meetings should be considered. This should consider the social vulnerability, food insecurity, and malnutrition experienced by the mentioned groups, which are prioritized in Paraíba's food security and nutrition policies.

#### **Activity: Youth Plan**

A Youth Plan will be drawn up in the first few months of Project implementation by the PMU's Youth specialist to detail the general strategy and implementation methodology for all the activities in this subcomponent related to the socioeconomic and political empowerment of young people. At least the following cross-cutting activities will be developed for rural youth in the Project area:

##### Vocational training in agricultural and non-agricultural activities:

In the Project area, there is a process of exodus of young people in search of better job and income opportunities in the cities, challenging the process of rural succession. In this context, non-agricultural productive activities have become an important income-generating alternative for part of the rural population and could help young people stay in rural areas. In this sense, PROCASE II will promote vocational training for young people in activities such as: information technology, mechanics, rural tourism, maintenance of machinery and equipment, cutting and sewing, handicrafts, gastronomy, among others. For those who decide to take up agricultural activities, the Project will also offer vocational courses that will enable young people to diversify their sources of income and promote better conditions for success in agricultural production. Courses will be offered in agricultural subjects such as horticulture, beekeeping, poultry farming, and rural administration. To implement training in agricultural and non-agricultural activities, the Project will seek to build partnerships with institutions such as SENAI, SEBRAE, PRONATEC, SENAR, EMBRAPA, universities and teaching and research institutes.

##### Training Young Communicators:

PROCASE II will train young rural people to become Young Communicators. Training will be offered in subjects such as photography, audiovisual, interview techniques, *corde*<sup>85</sup>, digital marketing, project development and citizenship. With the skills developed, the Young Communicators will be able to help record and monitor Project activities, produce audiovisual and printed materials and act as social mobilizers in their communities. This initiative will also allow young people to develop their vocation and even start practicing a new profession. The activity will involve: (i) the selection process for the young people; (ii) the training course; (iii) an exchange event and a final meeting. During this process, the Young Communicators will be encouraged to produce communication materials about the Project's experiences, good practices, etc. and will be guided in their quest to have these "products" included in communication channels such as blogs, YouTube channels and community radio stations.

##### Thematic meetings with young people and the formation of Rural Youth Networks:

The Project will promote meetings on topics relevant to the full development of rural youth identified in the youth diagnosis (justification section), such as violence, the lack of public policies aimed at rural youth, limited access to specific lines of credit aimed at young people, education in rural areas, among other topics. The chosen themes will also be guided by the demands of the young people themselves. On this occasion, the formation of Rural Youth Networks will also be promoted, to strengthen the self-organization of young people and their groups and organizations, ensuring that they have greater capacity to access available public policies and advocate for new public policies aimed at rural youth.

---

<sup>85</sup> Cordel is a local musicalized poetry genre that is very traditional and specific to the Northeast region of Brazil.

### **Activity: Plan to Strengthen Traditional Peoples and Communities (PCTs)**

A Plan to Strengthen Traditional Peoples and Communities will be drawn up in the first few months of the Project's implementation.

#### Strengthening PCT networks:

PROCASE II will invest in the formation of PCT groups and the strengthening of existing groups, promoting the strengthening of ties between PCTs from different territories in Paraíba, fostering the construction of networks. The PCT diagnosis showed that these groups still have inclusion gaps in various socioeconomic and political dimensions. The formation of PCT networks and the strengthening of existing ones could help to close the existing gaps. As a strategy for scaling up promotion to strengthen the self-organization of the PCTs and their constituent groups and organizations, at least three broad meetings will be promoted to encourage the formation of PCT Networks, in which the common challenges will be debated and good practices and lessons learned will be shared. This activity, together with the PCT Policy Integration Fairs, will help articulate the partnerships needed to access public policies for existing PCTs and influence new public policies. The main agendas defined as priorities in the PCT Networking meetings can be presented at the PCT Policy Integration Fair.

#### Policy Integration Fairs for PCTs:

The Project will seek to influence public policies aimed at traditional peoples and communities, consolidating, and expanding the human rights of this target group. Despite the existence of national, state, and local policies aimed at PCTs, there is a lack of greater integration between them and a specific approach to overcoming challenges and meeting the aspirations and demands of PCTs in the Project area. To this end, six PCT Policy Integration Fairs will be held with the participation of beneficiaries and various actors from the public sector and civil society at state and local level to debate public policy proposals that meet the challenges and demands of Paraíba's PCTs. The promoted cooperation, through the exchange of information and experiences, must consider the diversity of involved agents, to build intersectoral networks that can influence the definition of public policies for PCTs.

### **Activity: Nutrition and Food Security Plan**

A Nutrition and Food Security Plan will be drawn up in the first few months of the Project's implementation.

#### Nutrition education initiative to improve nutrition and maternal and child health in the Project's most vulnerable communities:

Initially, the communities with the greatest malnutrition problems in the Project area will be identified. This should be done with the support of partners such as the Secretariat for Human Development (SEDH), which has a central role in drawing up and coordinating the various actions included in the State Plan for Food and Nutrition Security, and the Paraíba School of Public Health or another potential partner with expertise in nutrition and food security. The Project's baseline study, which will measure the percentage of women with a minimum diversified diet, could also be used as an indicator to define the target groups and obtain information on the content of the diet. Once the communities with the greatest problems of malnutrition have been identified, nutritional education courses will be given there. The beneficiaries will mainly be community health workers, women, young people, and women from PCTs.

The training will take place in communities, with selected professionals teaching. The final part of the course will include the establishment of an action plan to be developed in the community to monitor changes in practices over the long term, together with the community agents. To ensure the commitment of the participants, it will be important to consult the beneficiaries about the time of year and the hours to be given priority so that the courses can be followed up regularly.

Likewise, the content of the course will be chosen jointly, prioritizing teaching on child nutrition to combat micronutrient deficiencies and provide a balanced and proportionate diet that meets the needs of each age. The topic of promoting exclusive breastfeeding during the first 6 months of children's lives will also be part of the course, as it persists as a health problem, in addition to the topics of mothers' health (in particular to combat anemia, overweight and obesity) and reproductive health, given the high rates of teenage pregnancy. Ideally, the partnerships, course content and activity methods will be defined in the first year of the Project by the PMU's Nutrition and Food Security Specialist (and

in collaboration with the service provider) for implementation in the communities from year 2 to year 5 of Project implementation. At the end of the course, it will be important to identify and document the results at community level.

Training events on food culture and food processing to enhance local products to improve nutrition and facilitating the empowerment of women and young people:

The content of the training will be defined by the Project's nutrition specialist (in conjunction with a partner with expertise in nutrition and food safety or a service provider specializing in this area), including priority topics such as the appreciation of neglected and underutilized species (NUS), influences on eating habits to improve health, technical support for food processing to foster economic autonomy and the appreciation of family farming products. The objectives will be to promote nutrition, strengthen and value traditions related to food practices, promote the consumption of local and healthy products by teaching tasty and easily reproducible recipes.

Raising awareness of nutrition, health, and food culture among students at the Integral Citizen Schools:

Students at the Integral Citizen Schools will be made aware of food culture, healthy eating practices and gastronomy. Considering that eating habits are still developing among young people, it is hoped that the impact of the training will be significant for these students. The training is planned for around 10 schools in the Project area, prioritizing schools in poorer municipalities. The students will be divided into groups of up to 30 students, spread over the four years of the Project's implementation. The course will last one day, divided into a theoretical part (adapted for students) and a practical part (cooking class). In the process of selecting the schools, it will be necessary to investigate whether there is already some kind of nutritional teaching in the school, to propose new content. It would also be important to include all the school staff, particularly the cooks, to influence, for example, the menus and practices linked to food in schools.

**Activity: Local Development Agents (ADLs)**

The Project will hire a foundation, which will be responsible for hiring Local Development Agents (ADLs), who are young people from the communities themselves, hired by PROCASE II to carry out tasks such as mobilizing communities and organizations to actively engage in the Project. In addition to mobilization, the ADLs will have to play an important role in managing the agreements made by the community associations, supporting the holding of tenders, updating financial information, monitoring the investments made, rendering accounts and keeping the associations fiscally regular. One young person will be hired per PIR, which in turn serves 3 communities. The young ADLs will receive a series of training courses to develop their skills. By taking the role of ADL, it is hoped that the young people will be able to gain experience in leadership and management, becoming references in the communities they represent and continuing to support them even after the end of the Project. The ADLs will also play a key role in supporting the implementation of cross-cutting activities, such as gender, diversity and youth, as well as in communication between the communities, the Project and the TA teams.

**3.3.4 Execution arrangement**

To draw up the plans for this subcomponent (Gender and Diversity, Youth, PCTs and Nutrition and Food Security), it will be necessary to hire individual consultants or consultancy firms to design them in full methodological and operational detail. The activities planned and included in the plans for this subcomponent will be implemented both through activities carried out directly by the Project's technical team (PMU and RPMU) and by holding events that will be included in the terms of collaboration or promotion with the producer organizations (associations). The terms will allow for the purchase of support materials, the hiring of instructors, as well as providing for exchanges between farmers. Regarding the ADLs and cirandeiros, a foundation will be selected which will be responsible for hiring these agents.

A Gender and Diversity specialist, a Youth specialist, a Traditional Peoples and Communities specialist and a Nutrition specialist, all with exclusive dedication, should be hired to make up the Project management team. They will be responsible for drawing up and supervising the implementation of the respective plans provided for in this subcomponent according to their area of expertise. All four specialists must be trained in differentiated approaches to the inclusion of persons with disabilities and LGBTQIAPN+.

In each RPMU, there should be a focal point for cross-cutting social issues, who should work closely with the PMU specialists and the TA teams at local and regional level.

### 3.3.5 Costs

Table 5 - Costs of Subcomponent 2.3 - Diversity, gender, youth, nutrition and food security (values in US\$)

Activities	Amount	Unit Cost	Value (in US\$)
<b>Gender and Diversity line of work</b>			<b>1 025 000</b>
Drawing up a Gender and Diversity Plan	1	25 000	25 000
Gender training for Project and TA staff	18	9 000	162 000
Gender and Diversity training for beneficiaries	350	1 400	490 000
Implementation of Agroecological Logbooks	40	2 200	88 000
Training cirandeira(o)s	5	18 000	90 000

8. Vocational training for rural youth									■	■	■	■	■	■	■	■								

Project in this area will be to choose the communities and properties that will be assisted by this activity. As mentioned above, the priority will be given to quilombola communities, followed by federal and state land reform settlements.

Regarding these priority communities, it should be noted that only communities and settlements that are not in a situation of conflict or litigation can benefit from this activity. For this reason, when the Project comes into force, it will be up to the PMU, in partnership with the other relevant bodies and entities (INCRA, EMPAER<sup>87</sup> and the federal and state bodies promoting racial equality in the case of quilombola communities), to identify and validate the eligible settlements and quilombola communities based on this first criterion. Preliminarily, 33 quilombola communities (out of 47 in the state) were mapped in 21 municipalities, as well as 28 agrarian reform settlements in 27 municipalities. It is understood that there will also be the possibility of serving 'traditional' rural communities, albeit in limited numbers. The Project will have to define the prioritization criteria that will allow this choice to be made. The communities and settlements to be targeted should then be defined.

Preliminarily, it was agreed that 40% of the target would be focused on serving quilombola communities and federal agrarian reform settlers (preferably those already served with productive Projects in phase I of PROCASE, and which have already been previously mapped). The remaining 60% of the target will be focused on 9 municipalities in the state, on properties of around 25 hectares (an average of 8 ha per property) belonging to beneficiaries of the PNCF, the ECOPRODUCTIVE project, state agrarian reform settlements, the riverside population, and other groups of family farmers.

The municipalities preliminarily mapped by EMPAER are Barra de São Miguel, Boqueirão, Cabaceiras, Camalaú, Caraúbas, Congo, Monteiro, São Domingos do Cariri, and Sumé. These municipalities were worked on by PROCASE I through production projects, mechanized patrols and TA to riverside communities benefiting from the São Francisco River water transposition project. In these 9 municipalities, the plan is to work with up to 150 communities, which have already been mapped.

The municipalities are distributed in a strategic way (Figure 1), as they are contiguous territories with similar geomorphological and hydrographic characteristics, optimizing the viability of the Project from a logistical and population point of view, represented mostly by riverside communities, agrarian reform settlers, family farmers, as well as other PCTs located in the area covered by the Paraíba River in the region.

Figure 1: Municipalities to be benefited by land and environmental regularization

<sup>87</sup> In a recent administrative reform, the newly created EMPAER incorporated the function of the former EMATER-PB and INTERPA, which was the Paraíba Land Institute responsible for state settlements.

Another factor considered when choosing these municipalities is that, in general, we observed a low incidence of certification of rural properties, which corroborates the need for public policies to boost the implementation of the regularization process (Figure 2).

Figure 2: Diagnosis of certified area in the municipalities to be benefited by the project.

According to the database of the National Rural Environmental Registry System (SICAR), the 9 municipalities that are part of the project have 7,962 registered properties and represent an area of 54,376 hectares, reinforcing the hypothesis of the large presence of areas that fall under family farming.

Step 2: The implementation of the regularization roadmaps:

EMPAER's previous experience allowed it to define a roadmap or sequence of steps that must be taken for a rural property to be regularized. It is this roadmap, which covers both the land ownership dimension and that of environmental registration, that forms the methodological backbone of the Project's regularization initiative.

It should be noted that the procedure to be taken by each property to be regularized is slightly different depending on the starting situation of each property, in which case there are two possible initial scenarios: i) Properties with public deeds - areas of ownership and ii) Properties without public deeds - areas of possession. Both routes are similar, with the one for possession areas having a few additional steps. The roadmaps are presented in more detail below.

Action strategy: land regularization and environmental registration roadmaps

Initial moment: Mobilization and dissemination activity, in which the initiative is presented and explained to the beneficiary public, with the aim of identifying and confirming the family units or communities interested in participating and that meet the prioritization criteria (areas without litigation, quilombolas, settlers, family farms with less than 25 ha, etc).	
Once the potential participants have been identified, the following activity guides are applied.	
<b>Activity roadmap (i): Domain areas</b>	<b>Activity roadmap (ii) - Ownership areas</b>
1 - Diagnosis of the rural property. This aims to identify whether the property is in the ownership area (with a deed) or the possession area (without a deed).	
2 - Georeferencing rural property.	2 - Georeferencing rural property.
3 - Georeferencing inspection: 100% done by satellite image. For a selected sample, on-site inspection of properties. It checks that the landmarks are correctly	3 - Georeferencing inspection: done 100% by satellite image. For a selected sample, on-site inspection of properties. It checks that the landmarks are correctly

<p>implanted and if there are any discrepancies that need to be corrected.</p> <p>Any property that needs adjusting will be corrected by the contractor. The property that is suitable can be entered into the Land Management System (SIGEF).</p>	<p>implanted and if there are any discrepancies that need to be corrected.</p> <p>Any property that needs adjusting will be corrected by the contractor. The property that is suitable can be entered into the Land Management System (SIGEF).</p>
<p>4 - Evaluation of documentation by the Discriminatory Commission, to declare that the property is suitable for the next stages</p>	<p>4 - Evaluation of documentation by the Discriminatory Commission, to declare that the property is suitable for the next stages</p>
<p>5 - Creation or updating of the registration code in the National Rural Registration System (with issuance of the CCIR )<sup>88</sup></p>	<p>5 - Creation or updating of a registration code in the National Rural Registration System (with issuance of the CCIR)</p>
<p>6 -Approval by the agency (INCRA/EMPAER) of the georeferenced parcel/property in the Land Management System (SIGEF), which allows technical documents (plans and descriptive memorials) of the property to be generated. The delivery of these technical documents certifies land-title regularization, which is geo-referencing (in script (i) for ownership areas).</p>	<p>6 - Approval by the agency (INCRA/EMPAER) of the georeferenced parcel/property in the Land Management System (SIGEF), which allows for the generation of technical documents (plans and descriptive memorials) for the property. As this is vacant land, the documentation is issued in the state's name at this stage. With the delivery of these documents, the first stage of land regularization is completed, which is georeferencing.</p>
	<p>6.1 - Delivery of the plan and memorial to the notary's office, for the creation of the registration and collection of the wasteland.</p>
	<p>6.2 - Analysis by Discriminatory Committee</p>
	<p>6.3 - Updating the technical documents, which will then be in the name of the beneficiary squatter, and drawing up a definitive property title in their name (or that of the community in the case of collective land).</p>
<p>6.4 - Sending the updated documentation to the Registry Office for the transfer of ownership (State to beneficiary).</p>	<p>6.4 - Sending the updated documentation to the Registry Office for the transfer of ownership (State to beneficiary).</p>
<p>7 - Creating or updating the CAR (Rural Environmental Registry) register, using the data registered in SIGEF. The receipt for the rural property's registration in the CAR proves that the registration has been completed.</p>	<p>7 - Creating or updating the CAR (Rural Environmental Registry) register, using the data registered in SIGEF. The receipt for the rural property's registration in the CAR proves that the registration has been completed.</p>
<p>8 - Drawing up the title deed.</p>	<p>8 - When stage 6.4 of the notary's office is completed, the property is fit and up-to-date. With the above steps completed, the property's documentation is fully regularized and ready to be handed over to the beneficiary (individual or collective).</p>

<sup>88</sup> CCIR is the Rural Property Registration Certificate, which is issued by INCRA via the Rural Registration System.

<p>9 - The property is ready and up to date. Once the above steps have been completed, the property is ready, with recognition of ownership. The technical documents can be sent to the notary's office for registration of the area. A new, updated certificate can then be issued.</p>	
--	--

EMPAER will be responsible for coordinating this line of action for PROCASE II. Based on the previous experience mentioned above, EMPAER's partnership with INCRA will be reaffirmed, as it plays a central role throughout the process (issuing the CCIR and coordinating SIGEF). Some of the stages of this roadmap will be implemented in the field by companies hired for this purpose.

It is hoped that approximately 5,000 properties (covering around 100,000 hectares) will be able to follow this path with the Project, until the desired regularization is achieved. It should be made clear that in agrarian reform settlements (federal or state) and in the municipalities served by EMPAER, title will be granted individually, per beneficiary family. In the case of quilombola communities, the title will be collective, covering the entire georeferenced polygon and in the name of the duly registered residents' associations.

#### 3.4.4 Execution arrangement

EMPAER, through the Directorate of Agricultural Planning and Land Regularization, will be responsible for carrying out this subcomponent, conducting the entire process and following the flow of steps required until the definitive title deeds and domain recognition are issued. A specialized company will be hired through a bidding process, to carry out some stages of the roadmap presented in the previous section under EMPAER's supervision.

A specific Technical Cooperation Agreement will be signed with INCRA, with no transfer of funds, so that it can receive the georeferenced areas, carry out the inspection and approval of the technical pieces necessary for the regularization process of quilombola communities and federal land reform settlements.

The SEAFDS and EMPAER teams will also be working with ANOREG and the state's Corregedoria Geral de Justiça to sign a cooperation agreement to provide support for faster analysis by the registry offices.

The process will also include public hearings to talk to the municipalities and communities that will benefit, and priority will be given to titling on behalf of women. EMPAER will count on the support of the rural workers' unions and rural community associations in the municipalities and communities served.

#### 3.4.5 Costs

Table 7 - Costs for Subcomponent 2.4 - Land and environmental regularization <sup>89</sup>

Activity	Amount	Unit Cost US\$	Estimated value (US\$)
<b>Activity: Land and environmental regularization initiative</b>			<b>2 000 000</b>
Implementation of rural property regularization initiative	5 000 families	Estimated average cost per hectare: 20 000	2 000 000
<b>TOTAL for Subcomponent 2.4</b>			<b>2 000 000</b>

#### 3.4.6 Results

The land and environmental regularization initiative will assist approximately 5,000 rural properties and families, 40% of which will be quilombola communities in federal and state settlements.

---

<sup>89</sup> This amount includes expenses for the aforementioned registration and georeferencing services, as well as for monitoring, inspection and titling. This amount may also cover the purchase of equipment and operating costs for carrying out the activities. EMPAER will pay its civil servants from its own budget.

## 3.5 Subcomponent 2.5 - Knowledge management and south-south and triangular cooperation

### 3.5.1 Objective

Subcomponent 2.5 will develop and implement a knowledge management (KM) process capable of generating, recording, sharing, and using knowledge generated in the Project. It will also seek to feed the project implementation process with relevant information and knowledge.

Knowledge will be made available at different geographical scales: among Project participants (at community and territorial level), at state level, in the Northeast region and in other developing countries (via South-South and Triangular Cooperation, SSTC), and to different target audiences: beneficiaries, implementing partners and service providers, the project team, government entities and others. The objectives will be refined during the preparation of the KM and SSTC plan.

### 3.5.2 Strategic orientation and methodology

At the start of PROCASE II, the KM and SSTC specialist will draw up a guiding document, which will contain the entire methodology and implementation arrangement for KM and SSTC activities, known as the KM and SSTC plan. The KM and SSTC plan will be drawn up in the first year of Project implementation and will detail the general strategy and implementation methodology for all activities related to the KM and SSTC theme. The Annex *Knowledge Management (KM), South-South and Triangular Cooperation (SSTC) and Innovations in PROCASE II*, specifies what a KM and SSTC plan should contain and provides some important considerations for KM and SSTC in PROCASE.

The KM and SSTC Specialist plays a crucial role in development projects, ensuring that information and knowledge are systematically captured, shared, and used to improve project results. To foster a culture of knowledge sharing within the Project team, the specialist must emphasize that knowledge management is a collective responsibility. This involves promoting the importance of documenting experiences, good practices, lessons learned and so on, encouraging open communication and providing training to incorporate these practices into day-to-day work. In doing so, the specialist helps to build a collaborative environment where continuous learning and improvement are integral parts of the team's success.

In addition, during the initial phase and throughout the implementation of the Project, the Expert will lead the identification of strategic partners to carry out studies, research, and events. These partners will play a key role in the Project's sustainability strategy, ensuring that the knowledge generated is widely distributed and made available even after the end of the project. In particular, they will seek to ensure that the knowledge, innovations, and good practices generated in the Project can be scaled up and contribute to improving local, national, and regional public policies on rural development. The Specialist will also manage the hiring of specialized consultants to prepare technical documents and specific activities.

The specialist will also be responsible for the Project's institutional communication. Institutional communication includes creating information leaflets about the Project, managing the Project's website and social media channels, and issuing press releases, among other activities. The specialist will develop a comprehensive communication and visibility strategy. Activities related to institutional communication fall under general project management and are not part of this specific subcomponent. However, the KM and SSTC plan also includes a dissemination strategy, detailing how specific knowledge products will reach their target audiences. Effective coordination between general communication efforts and the dissemination of knowledge products will be key, as it enhances the Project's communication activities as a whole.

### **KM and SSTC plan**

This plan will define the detailed objective of the KM and SSTC activities, the products developed for each target group, the distribution channels, among others. PROCASE II will be able to draw on a wide range of resources, products and experiences from other initiatives and projects, including the lessons learned from PROCASE I. Therefore, PROCASE II's KM and SSTC activities should avoid duplicating material that already exists, while at the same time using this material in its activities, such as capacity building and training.

The detailed KM and SSTC activities and products will be defined when the plan is drawn up. The main activities and products include:

#### Systematization of experiences, good practices, results and studies of interest to the project on specialized topics:

The Project's interventions will be subject to participatory and qualitative evaluations of their results, and those with a proven impact will be selected to be systematized, using the appropriate methodology for this process, and will be disseminated as a benchmark for good practice. Systematization can lead to different products such as written documents, videos, podcasts, and others. In addition to systematization, specialized studies will be contracted. Studies and consultancies on topics relevant to the Project - such as studies about agroecology, agroforestry systems (AFSs) adapted to the Atlantic Forest and/or the semiarid region, sustainable management of natural resources, social technologies that improve access to water, or mechanization innovations - will generate inputs for improving the Project's implementation processes. They will also be key to ensuring the development of strategic, evidence-based Knowledge Management products that can serve as references for other rural development projects at various levels - state, regional, national, and international. These products are also important for the process of dialogue and influence on public policies.

In total, 25 systematizations and studies on KM will be drawn up and published during the Project.

#### Communication and Dissemination in Knowledge Management

The dissemination of accumulated knowledge is the central idea of KM. Communication activities are a means of ensuring ownership of the activities, results and knowledge generated in the implementation of the Project among stakeholders and can even lead to the creation of new knowledge. The dissemination of knowledge products allows innovative practices, lessons learned, etc. to be accessed by the Project and strategic dialogues to be established with a wide range of partners. The planning of these activities is an integral part of the KM and SSCT Plan and must be coordinated with the Project's institutional communication strategy. The Project will organize various events, such as thematic meetings, thematic exchanges (of beneficiaries, Project staff and others), round tables, webinars, among others.

The Project will also participate in and organize public policy dialogue events. Engagement and dialogue on public policy are important aspects of development projects. It is important that the knowledge generated during the Project informs policymakers, thus prioritizing the most important aspects for the Project's target groups. Involvement with policy is also key to the sustainability, replication, and expansion of projects. Annex *Knowledge Management (KM), South-South and Triangular Cooperation (SSTC) and Innovations in PROCASE II* specifies the policy dialogues in which PROCASE has been involved and describes the possibilities for involvement in PROCASE II.

South-South and Triangular Cooperation (SSTC) Activities:

Ten SSTC events will be organized, which may cover topics such as technical exchanges and policy dialogues. One or more of these events may take the form of SSTC learning routes, so that partners can learn about the experiences and lessons learned from the implementation of the Project, and so that beneficiaries, technicians, and project managers can learn from good practices implemented in other countries or regions of Brazil. The Project will maintain a close relationship with the IFAD Center for Knowledge and South-South and Triangular Cooperation, located in Brasilia and with a regional mandate for Latin America and the Caribbean, which will be able to support knowledge exchanges with other IFAD initiatives in Brazil and Latin America through SSTC activities.

**3.5.3 Execution arrangement**

The PMU will hire a foundation to carry out the Project's KM and SSTC activities, as defined in the KM and SSTC plan. This means that the foundation will prepare systematizations, conduct studies, prepare other knowledge products, and organize events, including SSTC events. The selected foundation must be a non-profit organization, preferably linked to a university, and the same foundation will be responsible for the Innovation component (1.3) and some of the contracts under subcomponent 2.3. The KM and SSTC specialist will be the focal point for KM and SSTC within the PMU and will be responsible for overseeing the contract with the foundation and coordinating its implementation.

**3.5.4 Costs**

A detailed work plan and budget must be drawn up for the implementation of the KM and SSTC Plan. This plan will be reviewed annually for proper budget execution. The following table shows a preliminary budget for general KM and SSTC activities:

Table 09 - Costs for Subcomponent 2.5 - Knowledge management and south-south and triangular cooperation

Activity	Unit	Number	C. Unit (in US\$)	Estimated value in (US\$)
Systematizations and studies in Knowledge Management prepared and published	Study	25	40 000	1 000 000
Annual phases of Communication and Dissemination in Knowledge Management implemented	Years	6	20 000	120 000
South-South and Triangular Cooperation	Exchanges	10	100 000	1 000 000
<b>TOTAL</b>				<b>2 120 000</b>

**3.5.5 Results**

Under this subcomponent, 25 systematizations and studies on Knowledge Management will be carried out, 6 annual communication and dissemination phases and 10 South-South Cooperation exchange events.

## PLAN DE RESPUESTA A LOS RIESGOS PARA EL POD<sup>2</sup>

*Este formulario debe ser revisado y actualizado en la preparación de la Propuesta de Desarrollo de la Operación (POD). La información contenida en el Apéndice I es esencial para evaluar los riesgos del proyecto y sus posibles acciones de respuesta en la reunión de la Revisión de Calidad y Riesgos (QRR).*

NÚMERO	1/ DESCRIPCIÓN DEL RIESGO	2/ ESTRATEGIA DE GESTIÓN DEL RIESGO	DESCRIPCIÓN DE LA ACTIVIDAD	RESPONSABLE	3/ FECHA O DISPARADOR
1	Si la situación fiscal del Estado empeora, el Gobierno Federal podría no otorgar la autorización final para la firma del contrato de préstamo.	Mitigar	El Banco hará junto al FIDA un monitoreo de la situación fiscal del estado y mantendrá diálogo permanente con las autoridades estatales y federales; la Representación del Banco en Brasil posee un dashboard para el monitoreo de los datos fiscales del estado.	BID, FIDA, Gobierno de Paraíba, Gobierno Federal	Tramitación de la firma del contrato de préstamo
2	Si la situación fiscal del estado empeorara, se podría reducir el presupuesto asignado al proyecto y atrasar la ejecución.	Mitigar	El Banco mantendrá junto al FIDA un diálogo y monitoreo continuo con las contrapartes del Gobierno de Paraíba, incluyendo la eventual definición de un plan de acción con las partes involucradas para mantener la priorización del proyecto.	BID, FIDA Gobierno de Paraíba	Tramitación del presupuesto en la Asamblea Legislativa estadual
4	Cambios de autoridades podrían alterar las prioridades y producir cambios en los equipos técnicos de la SAFDS, atrasando la implementación del proyecto	Mitigar	El Banco mantendrá un diálogo y monitoreo continuo con nuevas contrapartes del Gobierno de Paraíba y se realizarán capacitaciones a nuevos técnicos en temas claves, especialmente fiduciarios y aspectos ambientales y sociales.	BID, FIDA, Gobierno de Paraíba	Cambio de autoridades
5	Si las capacidades son insuficientes para la adecuada gestión del proyecto e implementar un alto número de adquisiciones, se podría generar atrasos y menor calidad de la ejecución	Mitigar	Se creará una UGP para la gestión del proyecto; se contratará a una agencia especializada de contrataciones para apoyar en las contrataciones del personal y logística de capacitaciones para la gestión del proyecto; y el Banco realizará capacitaciones en políticas y procedimientos fiduciarios.	SEAFDS	Inicio de la fase de ejecución

<sup>2</sup> Resumen de la matriz de riesgos de la operación, de conformidad con el Marco para la Gestión de Riesgos en Proyectos con Garantía Soberana (OP-1519-4) y sus Guías (OP-1699-2).

6	Si las organizaciones beneficiarias no logran presentar oportuna y adecuadamente rendiciones de cuentas por los recursos transferidos, se puede atrasar la ejecución.	Evitar	Se establecerá claramente el mecanismo de coordinación y rendición de cuentas en el ROP del Programa; se elaborará un modelo de convenio a ser firmado con las organizaciones, estableciendo claramente las responsabilidades y mecanismos a ser aplicados; y el proyecto brindará apoyo técnico a las organizaciones para una adecuada rendición de cuentas.	SEAFDS	Inicio de la fase de ejecución
7	Insuficientes capacidades y claridad en responsabilidades institucionales podrían afectar la sostenibilidad de las inversiones del programa.	Mitigar	Para los planes productivos, se financiará asistencia técnica para fortalecer las capacidades de gestión de las organizaciones y se elaborarán planes de mantenimiento.	SEAFDS	Inicio de la fase de ejecución

1/ Use uno de los dos enunciados de riesgo siguientes: i) si sucede una CAUSA, podría ocurrir un EVENTO, que generaría un IMPACTO; ii) podría ocurrir un EVENTO, que generaría un IMPACTO  
No se incluyen los riesgos con nivel medio-bajo y bajo.

2/ Estrategia del Riesgo: Evitar, Transferir, Mitigar, Explotar, Mejorar, Compartir y Aceptar.

3/ Momento en el que se desarrollará la acción de respuesta para gestionar el riesgo identificado. Puede ser una fecha o una condición disparadora, como un evento o un hito.

**COMENTARIOS<sup>3</sup>:**

<sup>3</sup> Se utiliza para destacar los principales aspectos que influyeron en la evaluación y/o las decisiones tomadas por el Jefe de Equipo de Proyecto.

PNs	Business plans
PNAE	National School Feeding Program
PROVIAR	Project to integrate small producers into the wine chain
PSM	Propensity score matching
ROP	Project Operational Regulations
SAT	Land Administration Systems
SDGs	Sustainable Development Goals
SEAFDS	State Secretariat for Family Farming and Semiarid Development
SSTC	South-South and Triangular Cooperation
STA	Specialized Technical Assistance
TA	Technical Assistance and Rural Extension
UAF	Family farming unit
VTPA	Total value of agricultural production

## I. Introduction

This document presents the aspects related to the monitoring mechanisms of the "Paraíba Rural Sustainable Development Project (PROCASE II Project)". The borrower will be the State of Paraíba and the Federative Republic of Brazil will be the guarantor of the borrower's financial obligations. The Executing Agency (EA) will be the borrower, through the State Secretariat for Family Farming and Semiarid Development (SEAFDS). SEAFDS will be responsible for the technical and fiduciary management of the Project and a Project Management Unit (PMU) will be created within its structure .

### a. Program Objectives

The overall goal of the Project is to **reduce rural poverty levels, improving food and nutritional security and adapting the rural population to climate change.**

The specific objectives are:

- I. Increase the adoption of agricultural technologies that contribute to the adaptation and mitigation of climate change;
- II. Improving the productive and social inclusion of family farmers, prioritizing women, young people, Traditional Peoples and Communities (PCT) and persons with disabilities;
- III. Improving the environmental conditions of rural communities and their surroundings

These objectives will be achieved through the implementation of interconnected actions aimed at changing the individual, organizational and inter-institutional capacities of the beneficiaries.

### b. Theory of Change

#### Problems

**General context.** Paraíba has a territory of 56,467 km<sup>2</sup>, with an estimated population of 4,059,905 inhabitants (IBGE, 2023), 23% of whom live in rural areas. Of the total, 52% are women, and 44% are under 25.

Paraíba's Human Development Index (HDI) for 2010 was 0.658, which is considered 'average'. As is the case throughout the country, this index has been improving since it was first measured in 1991. That year, it was 0.362, rising to 0.484 in 2000. In the last measurement of this index (2010), the state ranked 23rd out of the 27 Brazilian states.

In 2020, the state's Gross Domestic Product (GDP) was R\$70.2 billion, an increase of 3.9% compared to 2019. In terms of GDP per capita, the state had a value of R\$ 17,402 per inhabitant, a nominal increase of 2.9%, which resulted in an increase of 0.3 p.p. in the percentage of regional and national GDP per capita. In addition, Paraíba ranked as the 6-largest economy in the Northeast region in a universe of 9.

**Climate:** The very name semiarid highlights the climatic aspects of this region of Paraíba. As in the whole of the northeastern Sertão, in this region rainfall is the key element that characterizes the climate and determines a series of factors that express the region's potential, especially when it comes to agricultural and extractive production. There is little rainfall in the Semiarid region of Paraíba, especially when comparing rainfall to the very high evapotranspiration - 2,000 mm/year-1 (SILVA et al., 2010) or even 2,500 mm/year-1 (MONTENEGRO; MONTENEGRO, 2012) - which is characteristic of the region. This rainfall is quite variable in the semiarid region of Paraíba, with the annual average ranging from 330 to 900 mm.

These rains are concentrated in a short 'winter' period, which rarely exceeds four months a year (generally occurring between January and May in the westernmost regions of Paraíba's semiarid and later in the easternmost parts of the region). This already characterizes a very marked seasonality, and it is normal to have a drought or 'summer' of several months without rain.

**Climate change:** Current studies on the subject are predicting warming throughout the continent; thus, simulations for the Northeast region have predicted a temperature increase of 0.5°C - 2.0° C in the 2011-2040 period, compared to the 1961-1990 reference period (CHOU et al., 2014). By the end of the 21st century, the temperature increase could reach 2-3°C up to 4°C, depending on the simulation scenario. In the worst-case scenario, rainfall forecasts are quite drastic, which could significantly worsen aridity conditions in the region

(CONFALONIERI; LIMA; BRITO, 2014). Regarding rainfall, the projected annual cycle shows a reduction for the region. In addition, an increase in periods of consecutive dry days and a wide range of climatic variability are common features of these and other simulations for the Northeast of Brazil (CHOU et al., 2014).

According to recent data, some changes can already be detected in the climate of the semiarid Northeast, which confirms these predictions. For example, the European Center for Medium-Range Weather Forecasts estimates that in this region, between 1989 and 2016, the average minimum temperature increased by 0.76°C, while the average maximum temperature increased by 1.25°C. According to the University of California's Climate Risk Center, from 1981 to 2018, there was a reduction of approximately 74 mm in the average annual rainfall in the region.

**Environmental degradation:** In addition to the climate and aridity discussed in the previous section, the main characteristic of the semiarid region of Paraíba is the predominant presence of vegetation called Caatinga, a word of Tupi-Guarani origin meaning white forest - an allusion to its appearance during the dry season. This typical predominant biome of the Brazilian semiarid region comprises different flora arrangements over a mosaic of soils (TRAVASSOS, 2012). Although diverse, this vegetation has common characteristics: the Caatinga is made up of plants adapted to semiarid conditions, capable of going into long periods of dormancy, taking efficient advantage of the short and irregular periods of rain for their reproductive cycles. The Caatinga is predominantly of the hyperxerophilous type, characterized as low shrubby vegetation, very rarely arboreal, with small leaves and thorny stems, fully adapted to contain the effects of very intense evapotranspiration (BRASIL-CODEVASF, 2006).

Human occupation and the use of this vegetation in productive activities have had a degrading effect on the Caatinga in many regions, an effect that climate change is likely to exacerbate. However, the Caatinga is still present and is an important resource for farming families. When well-managed, this vegetation, which is fully adapted to the semiarid environment, can provide good quality fodder for animal husbandry (goats, sheep, and cattle) and pasture for bees and other products.

**Agricultural activities and family farming:** The 2017 Agricultural Census reports a total of 142,500 agricultural establishments in the 194 municipalities of the semiarid region of Paraíba (INSA-IBGE, 2018). Assuming that family establishments account for approximately 88% of this total, we have a contingent of 125,400 family production units working in this region to make a living.

According to the 2006 Agricultural Census (IBGE), family farming accounted for 59% of the gross value of production generated by establishments in the agricultural sector in Paraíba. Although family farming (FF) produces an important part of the overall agricultural product, the large number of family establishments means that this value is diluted among families. Paraíba's concentrated land structure is a strong indicator of the concentration of wealth in society and partly explains the high rate of rural poverty in the state. As can be seen in **Table 04** below, Paraíba's land structure reveals that the state has a high concentration of land in the hands of people who are not family farmers. In the semiarid region, 12% of establishments are non-family farms and occupy 57% of the area. Although there are several settlements in the state resulting from various land access programs (Agrarian Reform settlements, Land Credit, state land access initiative, etc.), these have not been enough to solve the problem of land concentration. This issue continues to be an important, albeit highly complex and controversial, aspect of Paraíba's rural development agenda.

**Access to technical assistance (TA):** Without the support of qualified professionals, farmers are prevented from implementing more sustainable and efficient agricultural practices, as well as adapting to climate change and the challenges of access to market and finance. Only 17% of family farming units (UAFs) have access to TA services (IBGE 2017), of which 80% say they receive TA from the government (federal, state, or municipal).

**Collective organizations:** Enterprises involved in the activities of packaging, processing, and commercializing products have also encountered many difficulties. There are around 8,700 processing units in the Project area (IBGE 2017). According to MDS 2018, 349 enterprises in Brazil were registered and able to offer their products to government buyers. Of these, only 7 are from Paraíba (2%).

**Commercialization:** Family farmers have limited commercialization channels and depend on local sales. According to FNDE data, Paraíba's PNAE received only 2% of the program's total resources in 2022. Regarding the Northeast, this result puts the state only ahead of Sergipe, Rio Grande do Norte and Alagoas. It is worth noting that the PNAE is an important means of Commercializing UAF products.

**Gender:** In the state of Paraíba, the Gender Disparity Index is 0.68%, indicating that Paraíba women are 32% less likely to have the same opportunities as men, with the biggest gaps being in the dimensions of political empowerment and economic opportunity. In rural areas, resistance to advances in women's autonomy and rights

is even greater. Gender gaps are expressed in restrictions on control and access to natural, social, and monetary resources.

One of the fundamental obstacles is the concentration of land ownership in the hands of men, leaving women in a situation of economic dependence. According to the 2017 Agricultural Census in Paraíba, 71.0% of women managers of FF establishments have land titles, compared to 73.1% of male managers - an inclusion gap of 2.1 percentage points. On the other hand, when it comes to the management of establishments, women run only 24% of family farming (FF) establishments in the Project. However, between 2006 and 2017, there was a 20.3% increase in the proportion of establishments run by women in the state. There is no data available on joint titling.

**LGBTQIAPN+:** The lack of government data on the socioeconomic and political challenges faced by the LGBTQIAPN+ community is indicative of the statistical 'invisibilization' and marginalization of this group. The lack of a social assistance policy, the rural exodus of the LGBTQIAPN+ population to urban centers, the lack of family support, limited access to income and low employability in the countryside, the difficulty of staying in the school environment due to prejudice, especially from the trans population, are some of the factors that favor maintaining the invisibility of data on the LGBTQIAPN+ population in rural areas.

Paraíba recorded a total of 68 cases of violent deaths of the LGBTQIAPN+ population between 2017 and 2022, according to data released in a report by the Secretariat for Women and Human Diversity. In total, 24 municipalities in Paraíba recorded cases. João Pessoa has the highest number of cases, with 29 crimes, followed by Campina Grande and Bayeux, with five cases each, and Patos was in third place, recording four crimes. Gay men represent the largest number of murders in Paraíba, leading with 17 of the 29 cases between 2020 and 2022, followed by cross-dresser, who represent six cases in the same period, and in third place are transgender women, with 4 crimes.

**Youth:** Brazil's Youth Statute (2013) defines young people as those between 15 and 29 years of age. In the Project area, there are 893,666 young people. Among the main challenges faced by rural youth in the Project area are: i) lack of employment and income opportunities (with little diversification of agricultural and non-agricultural activities that attract young people), ii) lack of access to and control over resources, inputs, goods, and technologies, iii) limited access to public policies and services and iv) low participation and decision-making power in rural and community organizations.

In Paraíba, among young people aged 15 to 29, approximately 35.1% were neither studying nor working in 2021, according to the Synthesis of Social Indicators 2022. Young Afro-descendant women have a higher percentage out of school and the job market. Household chores and caring for family members are among the main barriers young people face in continuing their studies or getting a paid job, and young women are the majority in this situation. Another important causal factor is the high rate of teenage pregnancy. Between 2020 and 2022, 12,830 pregnancies in children and adolescents aged 10 to 18 were recorded in Paraíba, according to the State Health Department.

**Persons with disabilities:** The Northeast is the region with the highest percentage of persons with disabilities in Brazil: 10.3% of the population or around 5.8 million people. The highest percentages of persons with disabilities are women and people of African descent. According to data from the Single Registry (November 2023), there are 144,655 persons with disabilities in the Project area, or around 5.6% of those registered.

Disability and poverty are intricately linked in Paraíba, with persons with disabilities facing significant stigma and discrimination. For example, this group has lower success rates at school and more limited access to economic activities, both of which are major factors contributing to family poverty. In the state, 88.7% of persons with disabilities do not work, and 74.4% earn less than the minimum wage.

**Agrarian Reform Settlers:** In Paraíba, there are 47 quilombola communities with recognized certificates of self-definition, with approximately 16,000 people. However, according to information released by the IBGE and the Federal Public Prosecutor's Office, only 11 have their territory officially delimited. Information provided by INCRA's Superintendence in Paraíba confirms that none of the quilombola communities in the state have land titles. In the case of agrarian reform settlers, it is worth mentioning that there are 280 federal settlements in the state, according to data collected from the INCRA Superintendence in Paraíba, with 13,535 settled families. Of these, only 1,835 (13.5%) have land titles.

#### **Traditional Peoples and Communities (PCT):**

**Indigenous people:** According to the 2022 Demographic Census, Paraíba has 30,492 indigenous people, corresponding to 0.76% of the state's total resident population. Of the total number of indigenous people in Paraíba, 50.8% are women, and 25.6% are young people aged between 15 and 29. However, only 6,842

indigenous people (18.7% of the total) live in Indigenous Territories. In the Unified Registry, there are 6,328 indigenous families registered, 73.1% of whom are in a situation of poverty or extreme poverty.

**Quilombolas:** Regarding quilombolas, according to the recently published data from the 2022 Demographic Census, there are 16,584 quilombolas in Paraíba, but only 17.6% (2,918 people) live in the state's 11 officially delimited quilombola territories. The municipalities in Paraíba with the highest number of quilombola residents were Conde (around 3,000), João Pessoa (2,260), Cacimbas (1,698), Santa Luzia (1,324) and Alagoa Grande (946). Overall, 51 municipalities in the state registered a quilombola population. When calculating the ratio between the number of quilombolas and the population of each municipality, the highlights are Cacimbas (23.5%), Conde (10.9%), Diamante (9.4%), Santa Luzia (8.9%), Riachão do Bacamarte (8.8%) and Dona Inês (7.8%).

**Roma:** It is estimated that the Roma population in the state is around 1,000 families of the Calon ethnic group, present in more than 35 municipalities, according to data collected by the Community Association of Gypsy Peoples of Condado (ASCOCIC) in 2015. According to a socioeconomic survey by the State Secretariat for Human Development, the largest Roma community in Paraíba is in the municipality of Sousa. In Sousa alone, 278 family nuclei were declared, accounting for 904 people. However, there are Roma families all over the state of Paraíba.

**Shellfish gatherers:** In Paraíba, there are three informal associations of shellfish gatherers who call themselves "Women of the Waters" communities in the municipalities of João Pessoa, Cabedelo, and Pitimbu. They bring together an average of two and a half thousand women. In Acaú/Pitimbu (Mata Sul da Paraíba), of the 316 women involved in shellfish gathering, 104 are active members of AMA - Associação de Marisqueiras de Acaú (Association of Shellfish Gatherers of Acaú). However, they are registered with the Ministry of Fisheries as artisanal fisherwomen.

## Empirical evidence

### **Agricultural extension and business plans**

Many studies have examined the economic, social, and environmental impacts of agricultural extension services. In general, the public provision of agricultural extension services is motivated by market failures, such as asymmetric information, limited access to credit, and inadequate or incomplete market infrastructures, among others (Feder et al., 1985). Evidence shows that, in many rural contexts, family farmers have more limited access to extension services and technology diffusion, even though they can extract the greatest benefits (Ragasa et al., 2012). If this is the case and there is a gap between the technology currently used and the best technology for farms in a given region, extension services can bridge this gap and speed up the process of diffusing improved technology, allowing for faster growth in rural incomes while protecting natural resources from degradation (Birkhaeuser et al., 1990).

Existing data supports the hypothesis that innovation and the adoption of more efficient agricultural technologies can effectively improve productivity and farmers' incomes. In a comprehensive review of a series of rigorous studies on the effects of agricultural research, Alston et al. (2000) found an average rate of return on investment of 58%. Fuglie and Rada (2013) evaluate the technological improvements introduced in sub-Saharan Africa by the Consultative Group on International Agricultural Research (CGIAR) and estimate that for the 34 million hectares on which these technologies were applied (representing 21% of the region's agricultural land), production increased by 65%. Other important effects of agricultural extension services are increased food security (Rosegrant and Cline, 2003; Aramburu et al., 2014) and, above all, better adaptation to climate change (Lybbert and Summer, 2012).

There is ample empirical evidence to show that promoting the adoption of technologies has significant and positive impacts on agricultural productivity and income. In Bolivia, the "Direct Support Program for the Creation of Rural Agri-Food Initiatives" (CRIAR), implemented in 2011 and co-financed by the IDB, provided financial support for the cost of adopting and implementing new agricultural technologies among small rural producers. In an evaluation of the program using the instrumental variables method, Salazar et al. (2015) found that, on average, productivity increased by 92%, households' net agricultural income increased by 36%, and the probability of having food security increased from 20 to 30%. Rossi (2013) evaluated the "Project for the Integration of Small Producers in the Wine Chain" (PROVIAR) implemented in the Argentine provinces of San Juan and Mendoza, which promoted the integration of wine value chains through the implementation of production plans and provided co-financing for the adoption of new technologies. Using the quasi-experimental

double-difference methodology, the study found significant impacts on increasing production (7.8%) and productivity (7.9%).

Another impact study carried out in Argentina used the quasi-experimental double difference methodology to evaluate the impact of a technology transfer program on dairy production and estimated a 13% increase in productivity, a 10% decrease in calf mortality, and an increase in annual net income of 39.7% from the incorporation of management technologies on dairy farms (Lema et al., 2015). Combining the double difference methodology with the Entropy Balance method, a study by Durán et al. (2018) evaluated the "Rural Productive Development Program" in Uruguay, an operation structured on financial support for the adoption of technologies, and found a significant effect on the productivity of the beneficiaries, finding increases of more than 10% in milk and meat production per hectare. Similarly, the "Natural Resource Management Project in Priority Basins" (MARENA) in Honduras provided co-financing for technological packages and technical assistance for the diversification of products and the adoption of production systems to improve the competitiveness of small farmers. Bravo-Ureta et al. (2011) evaluated the program using the double difference methodology combined with propensity score matching (PSM). They found positive and significant effects on the total value of agricultural production (VTPA) of beneficiaries, with annual increases in the range of US\$ 245 and US\$ 296 compared to non-beneficiaries.

Other extension programs focused on providing inputs and improved varieties have also obtained positive results. In the case of an extension program aimed at grape producers in Mendoza, Argentina, Cerdán-Infantes et al. (2008) used a 5-year panel with a fixed effects model and found that yields increased by 40%, but only for farmers whose production was low before the program. Using the PSM method to explain unobservable differences between adopters and non-adopters of an extension program in the Dominican Republic, González et al. (2009) detected significant positive effects on the productivity of rice and cattle producers but no other type of producer, suggesting that the effectiveness of different technologies may vary in the short term. This experience implies that it is important that the technologies, practices, and inputs proposed are carefully selected to meet the specific needs of farmers in the region and are well adapted to climatic and environmental conditions.

### **Land titling and environmental regularization**

The regularization of rural land tenure generally increases land security and thus increases agricultural producers' investment, productivity, and income (Lawry et al., 2017). Studies in Nicaragua and Peru show positive effects on agricultural investment, productivity, income and even investment in water, sanitation, and electricity in households (Aldana & Fort, 2001; Antle et al., 2003; Deininger & Chamorro, 2004; Foltz et al., 2000; Meeks, 2018; Torero & Field, 2005). Regularization programs can also facilitate access to credit by allowing the use of land as collateral; however, empirical evidence does not confirm this hypothesis, suggesting that these programs should consider the functioning of the credit market to increase their impact (M. R. Carter & Olinto, 2003). However, the empirical results fail to detect any real impact of diplomas on credit (Sanjak, 2012).

If registry and titling activities include land delimitation through georeferencing or physical demarcation, resulting in georeferenced parcel maps, it is hoped that the frequency of land conflicts will decrease and that families will be able to invest their time in more productive activities, as they can spend less time reallocating resources to land surveillance practices (Besley and Ghatak, 2010). Titling can also reduce transaction costs in the land market (e.g., rent, sale, mortgage, inheritance, etc.) by clarifying rights and making them more easily transferable. Increased tenure security through titling can also encourage rural farming families to invest in land. Titling gives landowners greater confidence that their investments will be capitalized at the price they would receive on the land market, ultimately increasing the value of their properties (Galiani and Schargrotsky, 2016). For example, Deininger and Chamorro (2002) investigated the effects of investment and income on Nicaragua's massive land titling program. Using household survey data and econometric analysis, they conclude that household beneficiaries increased investments in land security by 8% to 9%. They also experienced an increase in the value of the plots. Similarly, Torero et al. (2005) found that granting a registered title improved land values by 30% in Peru.

Land titling should be seen as an input for the formation of effective Land Administration Systems (SAT). Modern SAT fulfill four basic functions: land administration (for which it is important to have a situation of land regularity in the territory), valuation, land use planning, and land use planning (Williamson et al., 2010). Having an efficient and complete SAT is important to give sustainability to land regularization and the economic benefits that derive from it, but it is also important from a revenue point of view and to be able to meet the territorial development objectives that a country considers, such as the definition and conservation of protected natural areas, for example (Conroy et al., 2014).

Security of land tenure is generally associated with less deforestation (Barbier et al., 2011; Robinson et al., 2014), as is the case in indigenous lands in the Peruvian and Bolivian Amazon, Brazil, and Colombia (IDB, 2018). However, another study found no effects in Brazilian indigenous lands (BenYishay et al., 2017). In addition, there are cases where security of tenure increases the rate of deforestation, such as in Nicaragua (Liscow, 2013). In favor of titling, it has been found to have positive impacts on the adoption of environmental practices and technologies for soil and water conservation (Ali et al., 2014; Deininger et al., 2011; Quisumbing & Kumar, 2014). In this context, it is expected that environmental regularization through compulsory registration in the CAR will contribute to greater environmental impacts. However, evidence of this impact has so far been contradictory. For example, L'Roe et al. (2016) found that registration in the CAR in the state of Pará between 2007 and 2013 had no significant impact on the rate of deforestation, except for small properties in the 100 to 300 ha range. The authors link this effect to the interactive incentives of environmental and land regularization policies, in the sense that compliance with environmental regulations can increase land security.

### **Proposed solution**

To achieve the proposed objectives, the Project plans to finance activities and investments grouped into 2 intervention components:

**Component I: Resilient production systems to reduce rural poverty.** It will make investments to improve income, food security and nutrition, adapt production systems to climate change, and protect the natural resource base. Productive investments will be made in rural communities, as well as in processing units (cooperatives). All the actions will particularly target women, youth, persons with disabilities, LGBTQIAPN+ and families from traditional communities, with activities planned specifically for these groups.

**Subcomponent 1.1: Implementation of resilient biodiverse production systems.** Investments will be made through the Resilient Investment Plan (PIR), which will be the instrument for planning and implementing the resources of this subcomponent and will promote the recovery and implementation of polyculture areas and agricultural agroforestry systems, seeking to intensify biomass production and agricultural production itself, to reduce vulnerability to extreme climate events. At the same time, it will promote the implementation/strengthening of animal production units adapted to the context.

**Subcomponent 1.2: Strengthening and diversifying commercialization.** Business Plans (PNs) will be the main instrument for implementing this subcomponent, and will be drawn up with producer organizations, usually cooperatives. The PNs should make it possible to finance structuring investments and include producers who benefited from the PIRs as a priority.

**Subcomponent 1.3: Incentives for innovation.** Equipment, machinery, inputs, products and/or implements developed or adapted to meet the demands of family farmers.

### **Component II: Organizational strengthening, capacity building and knowledge management.**

It will invest to strengthen family production units, ensuring that activities are carried out to assist families individually and collectively, as well as presenting the main public policies available in the country. The Technical Assistance (TA) and Rural Extension services will support the preparation and implementation of the Resilient Investment Plans (PIRs). The services of Specialized Technical Assistance (STA) will be especially dedicated to the Business Plans (PNs) and to strengthening the capacities of the beneficiary organizations. There are also activities aimed at strengthening commercialization, through the creation of participatory guarantee systems (PGS) for agricultural products, and the creation of fairs and commercialization centers.

Farmers will have access to services related to land titling and environmental regularization (Rural Environmental Registry - CAR), allowing for better security of land and means of production.

The knowledge gained will be recorded and disseminated through Knowledge Management actions and publications, as well as through exchanges and South-South and Triangular Cooperation (SSTC).

All the actions will particularly target women, youth, persons with disabilities, and families of traditional communities, with activities planned specifically for these groups. Beneficiaries will receive information and investments to improve nutrition and food security.

**Subcomponent 2.1: Strengthening family farmers' capacities.** This subcomponent will work to strengthen families' capacities, considering the weaknesses identified in various areas, such as production processes; the environmental sustainability of this production and the wider landscape; the protection and recovery of threatened natural resources; organizational and governance issues; administrative and

financial management issues; commercialization and access to public policies. This subcomponent's main actions will be done by contracting TA services, including drafting and implementing the PIRs.

**Subcomponent 2.2: Strengthening organizations' commercialization capacities.** This subcomponent will work to strengthen the capacities of beneficiary organizations, such as cooperatives, prioritizing assistance for better business management, processes, and commercialization. This subcomponent's main actions will be done by contracting STA services, including the preparation and implementation of the PNs.

**Subcomponent 2.3: Diversity, gender, youth, nutrition, and food security.** The Gender, Diversity, Nutrition and PCT Plans will finance activities to promote gender equality and women's empowerment, as well as the social inclusion and empowerment of Afro-descendants, Traditional Peoples and Communities (PCTs), the LGBTQIAPN+ community and persons with disabilities. The Youth Plan will work to ensure the improvement of the living conditions of rural youth through socioeconomic empowerment, increased participation, voice and decision-making power in rural institutions and organizations and the appreciation of rural life through activities involving culture and sport.

**Subcomponent 2.4: Land and environmental regularization.** This subcomponent will finance activities to promote the guarantee of ownership and the right to property of the land occupied by farming families located in the area covered by the Project, providing legal security and access to public policies, seeking to promote social inclusion, cultural preservation and environmental sustainability of the territories occupied by these populations.

**Subcomponent 2.5: Knowledge Management and South-South and Triangular Cooperation.** This sub-component will support the organization and systematization of knowledge materials, as well as carrying out exchanges and knowledge-sharing through SSTC in semiarid regions in Brazil, Latin America, and Africa, with the aim of visiting successful experiences and sharing the methodology and results achieved during the implementation of the Project.

**Project Management, Monitoring and Evaluation (M&E).** These funds will finance Project management, monitoring and evaluation and auditing activities.

The International Fund for Agricultural Development (IFAD) will provide co-financing (parallel financing) of 10 million dollars. For the purposes of managing the execution of the activities to be financed with IFAD resources, the Bank and IFAD will sign a coordination agreement to detail the Bank's technical-operational responsibilities, such as reviewing disbursement requests, reviewing procurement documentation, and supervising the program, among others. In this context, the evaluation and impact framework should address both the IDB's institutional requirements under the Development Effectiveness Framework and IFAD's under its Strategic Framework for 2016-2025, and its Sustainable Development Goals (SDGs).

## **Expected Results and Impacts**

**Results.** In the medium term, implementing the two components are expected to contribute to achieving the following Program's specific objectives:

***Specific objective 1. Increase the adoption of agricultural technologies, including those for adapting to and mitigating climate change.***

Through the implementation of Resilient Investment Plans (PIRs) and Business Plans (PNs), farmers are expected to start using sustainable or climate-smart inputs, technologies or practices (**Outcome 1.1**). In this way, farmers are expected to have better access to agricultural investments and services (**Outcome 1.2**).

***Specific objective 2. Improve the productive and social inclusion of family farmers, prioritizing women, young people, Traditional Peoples and Communities (PCT), and persons with disabilities.***

The activities carried out through TA aim to increase the beneficiary families' access to adequate, quality information aimed at developing more profitable agricultural production that is also more resilient to climate change, seeking greater integration into the region's different value chains with initiatives to support processing and commercialization.

Thus, the percentage of family farmers who sell their products at markets is expected to increase (**Outcome 2.1**) and the organizations supported by the PN are expected to increase their sales

(**Outcome 2.2**). The Gender and Diversity Plan will address a general implementation strategy for all activities related to the theme, and is expected to increase the number of women holding managerial positions in rural organizations (**Outcome 2.3**), in addition to the change in the percentage of people who report being empowered compared to the baseline (**Outcome 2.4**). The Youth Plan aims to ensure improvements in the living conditions of rural youth through socioeconomic empowerment, increased participation, voice and decision-making power in rural institutions and organizations, and the appreciation of rural life through activities involving culture and sport. This is expected to increase the number of people with new jobs (**Outcome 2.5**).

**Specific objective 3.** *Improve the environmental conditions of rural families and their surroundings*

Land titling and environmental regularization activities with rural communities can provide an area of rural property registered in the CAR (**Outcome 3.1**), and communities with a land and environmental regularization title (**Outcome 3.2**).

**Impacts.** In the long term, the confluence of results in adapting more productive and environmentally sustainable technologies, improving the productive and social inclusion of family farmers and the legal security of property, should affect a series of impacts that are aligned with the general objective of **reducing rural poverty levels, improving food and nutritional security, and adapting the rural population to climate change**.

Therefore, the various interventions financed by PROCASE II are expected to contribute to (i) a reduction in the Multidimensional Poverty Index (**Indicator I1**); (ii) an increase in families reporting minimum dietary diversity (MDDW) (**Indicator I2**); an increase in agricultural production (**Indicator I3**); and an increase in tons of greenhouse gas emissions (CO<sub>2</sub>e) avoided and/or sequestered (**Indicator I4**);

The summary of the intervention's theory of change is shown in **Figure 1**.

**Figure 1 - Theory of Change**

PROCASE II PROJECT THEORY OF CHANGE				
<b>Objective:</b> To reduce rural poverty levels by improving food and nutritional security and adapting the rural population to climate change.				
Inputs	Activities	Products	Outcomes	Impacts
Technical support	<b>C1. Resilient production systems to reduce rural poverty</b>	<b>C1. Resilient production systems to reduce rural poverty</b>	<b>SO1. Increase the adoption of agricultural technologies, including those for adapting to and mitigating climate change</b>	Multidimensional Poverty Index (Adjusted Headcount)
	1.1 Implementation of resilient and biodiverse production systems	Resilient Investment Plans (PIRs) with agreements Resilient Investment Plans (PIRs) executed with more than 75% rendering of accounts	Percentage of households using sustainable or climate-smart inputs, technologies, or practices Farmers with better access to investments and agricultural services	
	1.2 Strengthening and diversifying commercialization	Business plans for structuring cooperatives/processing units with agreements Business plans for structuring cooperatives/processing units executed with more than 75% rendering of accounts		
	1.3 Incentives for innovation	Innovative technologies developed or adapted		
Building materials	<b>C2. Organizational strengthening, capacity building and knowledge management</b>	<b>C2. Organizational strengthening, capacity building and knowledge management</b>	<b>SO2. Improve the productive and social inclusion of family farmers, prioritizing women, young people, Traditional Peoples and Communities (PCT) and persons with disabilities.</b>	Percentage of families reporting minimal dietary diversity (MDDW)
	2.1 Strengthening family farmers' capacities	Training events for Agroecological TA and STA entities held Families assisted by Agroecological TA Training events and farmer exchanges held Training events for access to public policies and other programs	Percentage of family farmers who sell their products at markets Organizations supported by PN increase their sales	Farmers increasing their agricultural production
Financing	2.2 Strengthening organizations' commercialization capacities	Cooperatives and producer organizations assisted with STA Local fairs and commercialization centers created/improved Health inspection services in operation Participatory certification systems pilot in operation	Percentage of women in management positions in rural organizations Change in the percentage of people who report being empowered compared to the baseline People with new jobs	Number of tons of greenhouse gas emissions (CO2e) avoided and/or sequestered
	2.3 Diversity, gender, youth, nutrition and food security	Gender and diversity plan drawn up Annual phases of the Gender and Diversity Plan implemented Youth plan drawn up Annual phases of the Youth Plan implemented PCT Strengthening Plan drawn up Annual phases of the PCT Strengthening Plan implemented Nutrition and Food Safety Plan drawn up Annual phases of the Nutrition and Food Safety Plan implemented Local Development Agents hired	<b>SO3. Improve the environmental conditions of rural communities and their surroundings</b>	
Technical and IT equipment	2.4 Land and environmental regularization	Families benefiting from land and environmental regularization	Area of rural properties registered in the CAR Communities handed land and environmental regularization titles	
	2.5 Knowledge management and south-south and triangular cooperation	Systematizations and studies on Knowledge Management prepared and published Annual phases of Communication and Dissemination in Knowledge Management implemented South-South cooperation exchange events held		

### **c. Summary of monitoring and evaluation mechanisms**

The Monitoring and Evaluation Plan will be based on the following instruments or mechanisms:

- a.** Project Execution Plan (PEP), which contains the procurement plan and the indicators established in the Results Matrix;
- b.** Annual Workplan and Budgeting (AWPB), reviewed periodically by the Bank;
- c.** Progress Monitoring Reports (PMR), which will report every six months on the progress made in the AWPB and the results obtained from carrying out the activities;
- d.** Mid-term and final evaluations, carried out by independent companies hired by the PMU;
- e.** Ex-post socioeconomic evaluation and Project Completion Report (PCR) ;
- f.** Impact assessment as described later in Section III (including the necessary surveys: baseline, mid-term line and end line).

This Monitoring and Evaluation Plan specifies: (i) the methodology for measuring indicators; (ii) the methodology for evaluating impact; (iii) data requirements; and (iv) those responsible and the estimated budget for implementing the activities.

**Monitoring.** The borrower, through the PMU, will send the Bank, no later than 60 days after the end of each semester of each year during the original disbursement period or its extensions, a monitoring report on the progress of activities, which will include the information needed to complete the Progress Monitoring Report (PMR) based on the indicators in the Results Matrix. The borrower, through the PMU, will have management systems that will contain information for monitoring and following up on the RMP.

**Evaluation.** The mid-term evaluation of the entire program must be submitted to the Bank by the borrower through the PMU within 90 days of the date on which 50% of the loan resources have been disbursed or when 36 months have elapsed from the entry into force of the loan agreement, whichever comes first. This evaluation is based on a qualitative methodology and a quantitative analysis of two rounds of surveys (baseline and mid-term) following the methodology set out in Section III. The final evaluation must be submitted to the Bank within 90 days of the date on which 95% of the loan resources have been disbursed. This evaluation is based both on a qualitative methodology to prepare the necessary inputs for the Relevance, Efficiency, and Sustainability criteria of the Project Completion Report and on a quantitative analysis of three rounds of surveys (baseline, mid-term, and end line survey) in accordance with the methodology set out in Section III. The evaluation will be carried out following the guidelines of the RCP Report. Following what is indicated in the Principles and Guidelines for preparing the Project Completion Report (PCR) and given that these two operations are complementary, follow a single vertical logic and have a single results matrix, a single Project Completion Report. The PCR will be prepared when both operations reach operational closure, fully justified. The borrower will be responsible for implementing the monitoring and evaluation activities as indicated in this Monitoring and Evaluation Plan. The final evaluation report will include the results of the impact evaluation of the program (see Section III). The impact evaluation, including the three rounds of research, will be financed with loan resources of US\$ 600,000, included in the Management component.

## II. Monitoring

The Executing Agency will be responsible for monitoring all components of the Program. The execution of the program will be coordinated by the PMU. The implementation scheme, including coordination mechanisms and possible support from a management company, is detailed in the Project Operational Regulations (ROP)

The monitoring of results will be based on: (i) the Project Execution Plan (PEP) and its Annual Workplan and Budgeting (AWPB); and (ii) the Results Matrix.

The project monitoring scheme will include: (i) holding at least 2 meetings a year to technically and operationally review the progress of the Project, solve problems and mitigate risks (based on updating the Risk Matrix to be prepared at the last meeting of each year), which will be attended by the relevant players in the Executing Agency; (ii) monitoring by the PMU of the targets agreed with the Bank; (iii) the preparation by the PMU of biannual reports on the achievements of each of the components and the performance of the Project in accordance with the agreed Results Matrix at least from the 2nd year of the Project's implementation, and the hiring of the intermediary and final evaluation to independently analyze the progress achieved and fulfilled by the Program; (iv) the use of management tools agreed within the framework of the Project Inception Workshop, to have adequate instruments to plan the activities and processes necessary to achieve the physical products and intermediate and final results, as well as how to monitor them; and (v) the use of the Project Operational Regulations (ROP) as the management tool and main reference in the progress reviews carried out with the Bank.

During the original disbursement period or its extensions, the PMU will submit the AWPB, the WBS, the procurement plan and the disbursement projection to the Bank. The first AWPB will be drawn up for the first twelve (12) months from the entry into force of the loan agreement. The second and subsequent AWPBs will be submitted to the Bank by November 30th of each year, for use during the following calendar year. The AWPB will be updated based on the Project's execution needs and each update must be approved by the Bank. The other documents (WBS, procurement plan and disbursement projection) must be reviewed and updated if necessary within the same timeframes.

During the original disbursement period or its extensions, the PMU will submit the semi-annual progress reports to the Bank within sixty (60) days after the end of each semester, in accordance with the provisions of the ROP, which will include the Environmental and Social Compliance report.

The ROP includes, among other things: (a) a detailed description of the operation's execution strategy and the Project's expected outputs, both quantitatively and qualitatively; (b) the Project's organizational scheme; (c) the technical and operational arrangements for its execution; (d) the programming, monitoring and results evaluation scheme; and (e) the mechanisms for updating the ROP. A series of specific activities will also be carried out to strengthen the PMU's monitoring capacity, such as a Planning Workshop in conjunction with the Project Inception Workshop, for which the Bank will provide support.

In addition, the PMU will select and hire the services of an independent consultancy firm to carry out the work:

- i. A field survey to compile the mid-term line of the impact evaluation, the results of which must be submitted to the Bank and IFAD within 30 days of the date on which 50% of the Bank's resources have been disbursed and justified, or after 36 months of implementation;
- ii. A mid-term evaluation, which must be submitted to the Bank within 90 days of the date on which 50% of the loan resources have been disbursed and justified, or after 36 months of execution, whichever comes first. This evaluation will focus on analyzing the progress made; aspects of coordination and execution; the degree of compliance with contractual obligations; recommendations for achieving the proposed goals and the sustainability of investments;
- iii. A field survey for the final line of the impact assessment, the results of which must be submitted to the Bank and IFAD within 30 days of the date on which 95% of the loan's resources have been disbursed;
- iv. An ex-post economic evaluation, which will determine the degree of efficiency of the loan following the PCR guide and is guided by the methodology applied for the ex-ante economic evaluation;

- v. An impact assessment, which will present the results of the analysis of the three surveys, following the methodology presented in Section III of this document and consistent with the RCP guide, and the results of which must be presented to the Bank and IFAD within 45 days of the date on which 95% of the loan resources have been disbursed; and
- vi. A final evaluation, which will be based on, among other qualitative sources, the impact assessment and the ex-post economic evaluation, to determine: the degree of compliance with the targets set in the Results Matrix; the effectiveness of the loan; the performance of the executor; factors that influenced implementation; and recommendations for future operations. This evaluation must be submitted to the Bank and IFAD within 90 days of the date on which 95% of the loan's resources have been disbursed.

#### **a. M&A team**

The M&E team will be made up of two professionals assigned to the PMU, with full and exclusive dedication to PROCASE II, who will be responsible for recording beneficiaries and activities, as well as planning and conducting the Project's evaluation studies.

The M&E team will work in conjunction with the SEAFDS bodies responsible for monitoring the Secretariat's projects. In this way, PROCASE II actions will be part of the state's public policy portfolio, bringing greater visibility to these actions.

#### **b. General implementation indicators**

The monitoring indicators will measure the degree of progress in the annual achievement of each of the products, results and purposes listed in the Results Matrix. The impact indicators will be measured through the impact assessment mentioned in the next section.

**Table 1** presents the indicators at the level of impacts and results in the Program Results Matrix, while **Table 2** shows the indicators at the product level. For each indicator, a detailed description of its measurement method and frequency is included, as well as the source of verification (systems, administrative files, or surveys) and the unit within the EA that will be responsible for providing and monitoring this information.

**Table 1.** Indicators and attribution methods

Indicator	Unit of measurement	Measuring frequency	Source of verification	Allocation methodology
<b>General Objective. Reducing rural poverty levels, improving food security and nutrition and adapting the rural population to climate change.</b>				
<b>IMPACTS</b>				
I1. Multidimensional Poverty Index (MPI) (Adjusted Headcount)	MPI	2025 e 2031	Impact Assessment	Quasi-experimental (Differences-in-differences)
I2. Percentage of families reporting minimal dietary diversity (MDDW)	%	2025 e 2031	Impact Assessment	Quasi-experimental (Differences-in-differences)
I3. Farmers who increase their agricultural production	Farmer	2025 e 2031	Impact Assessment	Quasi-experimental (Differences-in-differences)
I4. Number of tons of greenhouse gas emissions (CO <sub>2</sub> e) avoided and/or sequestered	tCO <sub>2</sub> e/ha	2025 e 2031	FAO's EX-Ante Carbon-balance Tool (EX-ACT)	Simple difference (before - after, with attribution by empirical / literature evidence)
<b>RESULTS</b>				
<b>Specific Objective 1. Increase the adoption of agricultural technologies, including those for adapting to and mitigating climate change</b>				
R1.1 Percentage of households using sustainable or climate-smart inputs, technologies or practices	%	2025 e 2031	Impact Assessment	Quasi-experimental (Differences-in-differences)
R1.2 Farmers with better access to agricultural investments and services	Farmer	2025 e 2031	M&E system	Simple difference
<b>Specific Objective 2. Improve the productive and social inclusion of family farmers, prioritizing women, young people, Traditional Peoples and Communities (PCT) and persons with disabilities.</b>				
R2.1 Percentage of family farmers who sell their produce at markets	%	2025 e 2031	Impact Assessment	Quasi-experimental (Differences-in-differences)
R2.2 Organizations supported by PN increase their sales	Organizations	2025 e 2031	Impact Assessment	Quasi-experimental (Differences-in-differences)
R2.3 Percentage of women in management positions in rural organizations	%	2025 e 2031	Impact Assessment	Quasi-experimental (Differences-in-differences)

Indicator	Unit of measurement	Measuring frequency	Source of verification	Allocation methodology
R2.4 Change in the percentage of people who report being empowered from baseline	%	2025 e 2031	Impact Assessment	Quasi-experimental (Differences-in-differences)
R2.5 People with new jobs	Person	2025 e 2031	Impact Assessment	Quasi-experimental (Differences-in-differences)
<b>Specific Objective 3. Improve the environmental conditions of rural communities and their surroundings</b>				
R3.1 Area of rural properties registered in the CAR in the municipalities covered by the Project	Hectares	2025 e 2031	Monitoring of registration receipts-Insert into M&E system	Simple difference (before - after, with attribution by empirical / literature evidence)
R3.2 Communities with title delivered for land and environmental regularization	Hectares	2025 e 2031	List of communities served with certification or/titling-Insert in M&E System	Simple difference (before - after, with attribution by empirical / literature evidence)

### c. IFAD Monitoring and Evaluation Indicators

The Results Matrix contains indicators for products, outcomes, and impacts, defined in agreement with the state government, the IDB, and IFAD.

The Matrix includes the mandatory indicators of the IDB and IFAD. **Table 3** shows the correspondence between the indicator in the Matrix and the mandatory IFAD indicator (*COI - Core Outcome Indicator or CI - Core Indicator*).

**Table 3.** Correspondence between Results Matrix indicators and IFAD COIs and CIs

#	Indicator at Results Matrix	Indicator correspondence from IFAD
1	<b>I2. Percentage of families reporting minimal dietary diversity (MDDW)</b> I2a. Percentage of households headed by women I2b. Percentage of households headed by young people I2c. Percentage of families belonging to PCT I2d. Percentage of households headed by persons with disabilities	<b>COI 1.2.8: Women reporting Minimum Dietary Diversity (MDDW) (RMF 11)</b> Women (%) - Percentage (%) Women (number) - Women Households (%) - Percentage (%) Households (number) - Households Household members - Number of people Women-headed households - Households
2	<b>I3. Farmers who increase their agricultural production</b> I3a. Women-headed households I3b. Families headed by young people I3c. Families belonging to PCT I3d. Persons with disabilities	<b>COI 1.2.4 Households reporting an increase in production</b> Total number of household members - Number of people Households - Percentage (%) Households - Households
3	<b>I4. Number of tons of greenhouse gas emissions (CO<sup>2</sup> e) avoided and/or sequestered</b> I4a. Hectares of area I4b. tCO <sub>2</sub> e/ha/year	<b>COI 3.2.1 Tons of Greenhouse gas emissions (tCO<sub>2</sub>e) avoided and/or sequestered</b> Hectares of land - Area (ha) tCO <sub>2</sub> e/20 years - Number tCO <sub>2</sub> e/ha - Number tCO <sub>2</sub> e/ha/year - Number
4	<b>R1.1 Percentage of households using sustainable or climate-smart inputs, technologies, or practices</b>	<b>COI 3.2.2 Households reporting adoption of environmentally sustainable and climate-resilient technologies and practices</b> Total number of household members - Number of people Households - Percentage (%) Households - Households
5	<b>R1.2 Farmers with better access to agricultural investments and services</b> R1.2a Farmers (Women) R1.2b Farmer (Men) R1.2c Young farmer R1.2d Farmer belonging to PCT R1.2e Persons with disabilities	<b>CI 1: Persons receiving services promoted or supported by the Project</b> Total number of persons receiving services - Number of people Men - Men Women - Women Youth - Young people Indigenous people - Indigenous people Persons with disabilities - Number
6	<b>R2.2 Organizations supported by PN increase their sales</b>	<b>COI 2.2.5 Rural producers' organizations reporting an increase in sales</b> Number of Rural POs Total number of PO members Women PO members Men PO Members Young PO members Indigenous People PO members Person with disabilities PO members
7	<b>R2.4 Change in the percentage of <u>people</u> who report being empowered from baseline</b> R2.4a Percentage of women R2.4b Percentage of young people R2.4c Percentage of people belonging to PCTs R2.4d Percentage of persons with disabilities	<b>COI IE.2.1 Individuals demonstrating an improvement in empowerment</b> Indigenous people - Percentage (%) Indigenous people - Indigenous people Youth - Percentage (%) Youth - Young people Total persons - Percentage (%) Total persons - Number of people Women - Percentage (%) Women - Women

#	Indicator at Results Matrix	Indicator correspondence from IFAD
		Men - Percentage (%) Men - Men Persons with disabilities - Number Persons with disabilities - Percentage (%)
8	<b>R2.5 People with new jobs</b> R2.5a Women with new jobs R2.5b Young people with new jobs R2.5c People belonging to PCTs with new jobs R2.5d Persons with disabilities with new jobs	<b>COI 2.2.1 Persons with new jobs/employment opportunities</b> Men - Men Women - Women Indigenous people - Indigenous people Youth - Young people Total number of persons with new Jobs/employment opportunities - Number of people Persons with disabilities - Number
9	<b>Habit 6:</b> People accessing technologies that sequester carbon or reduce greenhouse gas emissions	<b>CI 3.1.3 Persons accessing technologies that sequester carbon or reduce greenhouse gas emissions</b> Men - Men Women - Women Youth - Young people Indigenous people - Indigenous people Total persons accessing technologies - Number of people Persons with disabilities - Number
10	<b>Product 1.2.2:</b> Business plans for structuring cooperatives/processing units executed with more than 75% rendering of accounts	<b>CI 2.1.3 Rural producers' organizations supported</b> Total size of POs - Organizations Rural POs supported - Organizations Men - Men Women - Women Youth - Young people Indigenous people - Indigenous people Rural POs supported that are headed by women - Organizations Persons with disabilities - Number
11	<b>Hito 1:</b> Families receive specific support to improve their nutrition	<b>CI 1.1.8 Households provided with targeted support to improve their nutrition</b> Total persons participating - Number of people Men - Men Women - Women Households - Households Household members benefitted - Number of people Indigenous people - Indigenous people Youth - Young people Number of persons with disabilities - Number
12	<b>Product 2.4.1:</b> Families benefiting from land and environmental regularization	<b>CI 1.1.1 Number of beneficiaries gaining increased secure access to land</b> Men - Men Women - Women Indigenous people - Indigenous people Youth - Young people Total number of beneficiaries with increased secure access to land - Number of people Persons with disabilities - Number

Important observations:

- **Disaggregations:** Some IFAD indicators need to present data in a more disaggregated form (Men, Women, Youth, PCT, and persons with disabilities) than presented in the Results Matrix. PROCASE II is aware of the importance of presenting these disaggregations and that the data obtained in the field and stored in the M&E system will be disaggregated. In addition, the Impact Assessment survey will have a sampling design with representative strata for women, young people, PCT, and persons with disabilities.

- **Methodology for evaluating the COIs:** For the evaluation of the COIs, questions will be incorporated according to the IFAD manuals: "*Evaluation Manual, prepared by the Independent Office of Evaluation of IFAD*"; and "*Manual for measuring the COIs: Core Outcome Indicators - Measurement Guidelines (COI)*";
- **Stakeholder Feedback (SF) indicators:** The indicators "SF.2.1 Households satisfied with Project-supported services" and "SF.2.2 Households reporting they can influence the decision-making of local authorities and Project-supported service providers", although not present in the Results Matrix, will be assessed in the impact survey.

#### **d. Sending reports**

The PMU will submit progress reports with data on progress in implementation, including output indicators (and results and impacts, where applicable). These reports will be published every six months.

#### **e. Coordination, timetable, and budget for monitoring and evaluation**

The PMU will be responsible for monitoring and evaluating the Project. It will be responsible for drawing up and submitting the six-monthly reports described above, and for continuously monitoring the output indicators and measuring the final value of the results and impact indicators in the Results Matrix.

In addition to regular support for the Project, the IDB and IFAD will carry out administrative missions (supervision) annually to monitor the progress of the Project in terms of products and outcomes. Monitoring will consist of six-monthly activities (periodic updating of the database) and other annual activities (reports on products and results, IDB and IFAD management missions). The monitoring and evaluation activities will be carried out with resources from both the Project (allocated under the "Monitoring" and "Evaluation" cost heading) and the IDB administration, as detailed in Error! Reference source not found., which presents the monitoring work plan.

#### **f. M&E system**

The Project will have to keep the information management system updated, which will store disaggregated data specific to the beneficiaries, such as the composition of their family, ethnic group, and, above all, the type of benefit received. It is also crucial that this system is available to all the PMU teams so they can feed and consult the system.

To this end, PROCASE II will adopt a system capable of storing the information needed for monitoring, such as the registration of families, activities, etc.

The system should allow monitoring the progress of Logframe (LF) indicators, broken down by gender, youth, persons with disabilities, and PCTs. It should also allow the inclusion of geographical coordinates of families and activities. The M&E team will be responsible for verifying the consistency of the information entered by the partner/contracted institutions to carry out the physical activities in the field.

#### **g. Annual costs per product**

The total amount available for studies and adjustments to the M&E system is USD 1.3 million, which corresponds to 1.2% of the total cost of the Project. This budget was defined on the basis of the actual costs obtained through dialogue with the PROCASE team, and the estimated costs for carrying out the Impact Assessment survey.

**Table 5** shows the costs for the M&A, broken down by product with expected annual values. The annual costs are in addition to the expected funds of 105 million dollars for the entire operation. It should be noted that this information is consistent with the costs presented in the WBS.

**Table 4.** Schedule and budget for Monitoring and Evaluation activities

PRODUCTS BY ACTIVITY	Year 1				Year 2				Year 3				Year 4				Year 5				Year 6				Responsible	Estimated cost (US\$)	Financing

### III. Evaluation

#### e. Main evaluation questions

According to the theory of change set out above, the impact assessment proposed for PROCASE II should contribute to answering the following questions, which are closely aligned with the Project's three specific objectives and, in the long term, with the overall objective:

1. What is the impact of the Project on the adoption of agricultural technologies (including climate change adaptation and mitigation technologies) by family farmers and on the integration of their products into value chains?
2. What is the impact of the Project on inclusive issues of gender, young people, persons with disabilities, and families belonging to traditional communities?
3. What is the impact of the Project on the environmental conditions of rural families and their environment?
4. In the long term, what impact will the Project have on rural families' income, food security, access to services, and adaptation to climate change?

Given that the Program addresses the gaps identified in the state of Paraíba through various complementary interventions, the evaluation plan proposes assessing the effects of the Project as a complete package of activities since the individual effects of receiving technical assistance, land titling and other activities included in the design and execution of the Project cannot be broken down individually if they are provided in a complementary way to the same group of beneficiaries. However interesting it may be to separate these effects, we believe that the most important thing is to evaluate the package as a whole, since the complementarity between the components should make the effect of the Project greater than the simple sum of its parts.

It should be noted that the environmental and climate impacts of the Project will be measured in a complementary way using specific methodologies to capture the effects of reducing CO<sub>2</sub> emissions. See **section f** for more details on the measurement of this indicator based on a simple before-after comparison methodology.

#### b. Evaluation methodology

##### Selection of Beneficiaries

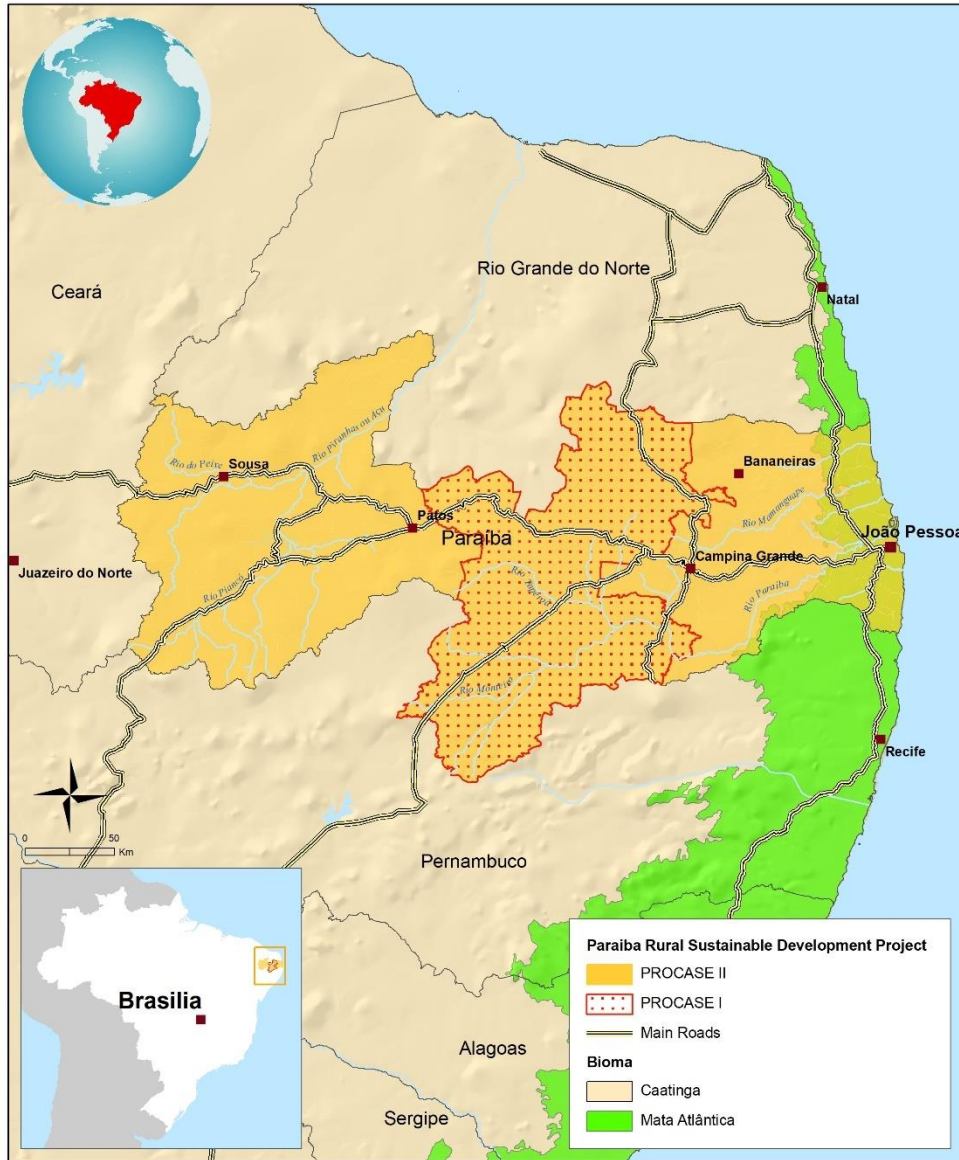

Any effective evaluation methodology must be closely linked to the design of the Project, so it is important to understand the process by which associations, producers, and other beneficiaries are selected to participate in the Project. While the first phase of the Project, PROCASE I (funded by IFAD), was implemented in 56 municipalities in the state, PROCASE II will scale up interventions to all municipalities in the state (223), as shown in Figure 2. It is worth noting that the state of Paraíba groups municipalities into fifteen rural territories (Figure 3) according to their productive, climatic, and geographical characteristics. The Secretariat for Territorial Development defines a rural territory as a group of municipalities with a population density of less than 80 inhabitants/km<sup>2</sup> and an average population per municipality of up to 50,000 inhabitants. Figure 3 shows the geographical distribution of municipalities according to rural territory. In addition, a table of municipalities according to rural territory can be found in Annex II.

The interventions will prioritize communities based on the following technical criteria: i) incidence of rural poverty (according to information from the Single Registry – Cadastro Único); ii) presence of Traditional Peoples and Communities (PCTs); iii) incidence of food and nutritional insecurity; iv) concentration of rural women and youth; v) limited access to water for human consumption and production; vi) avoidance of overlap with PROCASE I interventions, and other similar projects being implemented in the state, such as Sertão Vivo and PDHC III (IFAD projects).

Around 60,000 families (approximately 210,000 people) in the family farming sector will benefit directly from the Project, of which 50% will be women, 20% young people, 5% PCTs, and 2% persons with disabilities. The Project's main target groups are family farmers living in poverty and extreme poverty. However, the actual selection of farmers and productive organizations to be beneficiaries will occur until the Project is

implemented, which is why this evaluation plan presents a preliminary methodological proposal that will have to be updated during the Project's start-up workshop.

**Figure 2. Map of the Project Area**

The designations employed and the presentation of the material in this map do not imply the expression of any opinion whatsoever on the part of IFAD concerning the delimitation of the frontiers or boundaries, or the authorities thereof.

### Control Group (counterfactual)

To determine the impact of the Project on the outcome and impact indicators presented in **Table 1**, the evaluation must identify a counterfactual to answer the following question: "How would the productive and environmental condition of family farmers in Paraíba have developed if the Project had not been implemented?" Of course, this is a hypothetical question that can only be answered by identifying a "control group", or a group of rural families that are similar to the beneficiaries of the Project in productive and socio-demographic characteristics, but who do not have access to it. This control group then serves to estimate what would have happened to the Project participants in the absence of the Project, and allows comparisons to be made with the group of beneficiary farmers/families - the "treatment group" - to estimate the isolated causal effect of other factors that may have influenced the results. Therefore, the challenge of any impact evaluation is to identify a treatment group and a control group that are statistically identical, on average, in the absence of the Project. If the two groups are identical, with the sole exception of one group participating in the Project and the other not, then we can be sure that any difference in results must be due to the Project.

### Selection of the Control Group

To determine the impact of PROCASE II on the outcome and impact indicators presented in **Table 1**, the evaluation must identify a counterfactual to answer the following question: "**How would the productive and environmental condition of family farmers in Piauí have developed if the Project had not been implemented?**" Of course, this is a hypothetical question that can only be answered by identifying a "control group" or a group of rural families that are similar to the beneficiaries of the Project in productive and socio-demographic characteristics but do not have access to Project's activities. This control group is then used to estimate what would have happened to the Project participants in the absence of the Project, allowing comparisons with the group of beneficiary farmers/families - the "treatment group" - to estimate the isolated causal effect of other factors that may have influenced the results. Therefore, the challenge of any impact evaluation is to identify a treatment group and a control group that are statistically identical, on average, in the absence of the Project. If the two groups are identical, with the sole exception that one group

participates in the Project and the other does not, then we can be sure that any difference in results must be due to the Project.

The impact evaluation literature generally recommends evaluating programs by randomly assigning treatment. This procedure makes it possible to set up two groups of individuals: those who receive Project interventions (treatment group) and those who do not (control group). This type of allocation, called an experimental model, offers the advantage of setting up two groups which, from a statistical point of view, are strictly comparable, both from the point of view of directly observable variables and those that are not. In this way, any differences observed between the two groups after treatment can be directly attributed to the program.

The Project's geographical targeting throughout the state involves two methodological challenges for the impact evaluation: firstly, it is not possible to exclude a certain group of rural families or municipalities within the Project area for evaluation purposes beforehand since the state intends to offer PROCASE II services in an inclusive manner to the entire target population<sup>1</sup>. Although the Project will work with a subset of municipalities and beneficiaries based on the finite resources available through the loan, this selection will only be made during the first year of Project implementation and is not considered feasible for the purposes of the evaluation plan at this stage of preparation. Therefore, it will not be possible to randomize the intervention to select the municipalities or families that will receive the interventions and those that can serve as a control group. Secondly, the environmental and socioeconomic characteristics that will result in the prioritization of certain municipalities and their population are closely linked to the expected impacts that the Project intends to have; in other words, it will not be possible to select a counterfactual outside the intervention area in the same municipality, as the comparability between the treated group and the selected control group would be limited and would probably result in a biased estimate of the impact.

Given that these two methodological options have been evaluated as unfeasible in the context of PROCASE II, a third possible evaluation strategy was chosen: the decision was made together with the government team to identify those municipalities located on the border with Paraíba in the states of Pernambuco, Ceará, and Rio Grande do Norte, which exhibit the same socio-productive and geographical characteristics as certain municipalities within the state. As mentioned above, the set of potential control units is composed of the municipalities located on the border with the state of Paraíba, and the set of potential treatment units is made up of all 223 municipalities in Paraíba. To facilitate the pairing of municipalities outside and inside the state, the government team carried out a preliminary analysis to identify those municipalities on the border that met the criteria for prioritizing municipalities for the Project, including the incidence of poverty and food insecurity, the presence of indigenous peoples and traditional communities, and the type of agricultural production. As a result, 76 municipalities were selected, located in the states of Ceará (8), Pernambuco (38), and Rio Grande do Norte (30).

From this universe of municipalities inside and outside the state, it is possible to select a sample at the municipal level to constitute the treatment group for the evaluation. The impact assessment will then be based on a counterfactual located in the same geographical and socio-political area and presenting similar characteristics to the treatment group prior to the intervention, thus ensuring that the estimated impact is attributable to the Project and not to other external factors.

Another aspect to highlight is the **preliminary nature** of this identification strategy. This document selects a treatment group and a control group at the municipal level, but this sample will be revised once the prioritization process has been completed during the PROCASE II implementation stage. Therefore, close coordination between the IDB, IFAD, and the PMU will be essential to ensure that the evaluation plan is updated in coordination and coherence with the progress of the Project's implementation.

Given that there is no quantitative mechanism for prioritizing the municipalities and communities, it is not possible to apply certain criteria to arrive at a final selection of the treatment and control group. Still, we do know a series of variables that will be considered in the process. Therefore, in an effort to apply the same logic to prioritizing municipalities for their participation in the Project, we will use a Propensity Score approach to "pair" comparable municipalities inside and outside the state, thus selecting the municipalities most similar to those selected for treatment.

---

<sup>1</sup> Although there is a significant proportion of families and farmers who will not actually participate in the Project, the government did not feel comfortable explicitly excluding a group of municipalities or communities, due to the political sensitivity of this proposal.

The *Propensity Score Matching* (PSM) approach was first proposed by Rosenbaum and Rubin (1983) as a method to reduce bias in estimating treatment effects with observational data sets when randomization is not performed. This method estimates a propensity score, which is the conditional probability of being assigned to the treatment given a series of observed characteristics. Conceptually, this propensity score attempts to replicate what may have been an underlying allocation mechanism unknown to the experimenter, which depends on a series of observable characteristics. The propensity score is defined as follows:

$$p(x) = Pr[W = 1|X = x]$$

$W$  is the treatment status ( $W = 1$  if treated,  $W = 0$  otherwise), and  $X$  is a vector of observable characteristics. Thus, the propensity score indicates the conditional probability of participating in the Project, given a certain set of characteristics.

For the PSM to work, two assumptions must be met: first, it is assumed that there is some overlap, or common support, between the treated and untreated units ("*overlap condition*"). This means that the propensity score cannot perfectly predict treatment status but that there is enough similarity between treated and untreated units to allow them to be matched. Secondly, the propensity score matching method requires the assumption of no confounding (conditional independence assumption): treatment status is independent of outcomes once a set of covariates is controlled for. If these two assumptions are met, the propensity score is an efficient parameter to capture all the information from the variables used to construct it. This means that the propensity score captures all the variation coming from the allocation mechanism, and all other effects should be interpreted as differences caused by the intervention. In other words, conditioned by the propensity score, all potential outcomes should be independent of the allocation mechanism. Therefore, the resulting treatment and control groups can be interpreted as having been produced from a randomized experiment.

To calculate the propensity score, we need to select a group of variables that meet the criterion of non-confounding. Therefore, we selected a set of variables at the municipal level that are characteristics likely to determine the placement of the Project in a given municipality. As shown in **Table 6**, these variables include characteristics of the municipality that we know are relevant to the underlying allocation mechanism, such as the Human Development Index, vegetation cover and Gross Domestic Product. It also includes characteristics of farms at the municipal level that we know are relevant to eligibility at the farmer level, such as the proportion of land dedicated to different types of production, the average annual value of agricultural production, and the factors of production, including the number of agricultural workers and machinery used.

**Table 6. Source of data at the municipal level**

Source	Variables
IBGE Cities (2019)	Population, indigenous population, Gross Domestic Product (GDP)
National Census (2010)	Municipal Human Development Index (MHDI)
National Agricultural Census (2017)	Number of establishments, proportion of establishments headed by women, proportion of establishments headed by a PCT, total area used by establishments, size of agricultural establishments, proportion of land devoted to different types of production, value of annual production, total number of agricultural workers, total number of agricultural machines, number of animal heads, proportion of establishments with access to: electricity, credit, technical assistance, proportion of establishments using fertilizers.

<sup>a</sup> Standard deviation in brackets.

<sup>b</sup> Difference different from zero if the p-value is significant at the 99th confidence level (\*\*\*) , 95 (\*\*) or 90 (\*).

We followed Imbens and Rubin (2015) to select the relevant covariates for the PSM model. First, we identified a set of basic covariates selected according to their theoretical association with participation in the Project. Here, the municipal GDP, the value of agricultural production, the Human Development Index, the total and indigenous population, the geographical extension, the percentage of agricultural establishments with electricity, the irrigated area, the amount of agricultural and service labor, and the labor force earning up to 1 minimum wage are included. In a second step, we choose from the set of remaining variables, adding one variable at a time to the logistic regression and calculating the likelihood ratio statistic, which tests the null hypothesis that the coefficient of the additional covariates is equal to zero. We do this until the additional variable does not improve the model's fit.

Error! Reference source not found. shows the results of the probit estimate for the probability of being assigned to the treatment, given the specified variables. This calculation generates each municipality's propensity score ("pcscore"). This propensity score will be used to select municipalities into treatment and control groups. It should be noted that we only used the PSM to match comparable treatment and control municipalities and did not rely on this empirical methodology to estimate the impact.

**To select comparable municipalities, we used the 1:1 nearest neighbor *matching without replacement* mechanism. Each treated municipality was paired with a non-participating municipality with the smallest difference in propensity score without allowing the same non-participating municipality to be used as a pair for more than one treated municipality. This resulted in 83 pairs placed under the common support. Given the budgetary and logistical limitations of the evaluation, we cannot include all of them in our sample. Therefore, we used PSM to select 30 municipalities for our study (15 treated and 15 untreated), as this will allow for a sufficient sample size to achieve the desired statistical power, as well as being logistically feasible in terms of the field survey to be carried out (see section III.c and III.d for more details). Firstly, we limited our sample to municipalities located in the common support zone (i.e., overlap) according to the distribution of propensity scores. This means that only the municipalities in each group that received propensity scores comparable to those in the other group were considered. In the second stage, the best pair was identified for each of the 15 rural territories in the state to ensure that the sample is representative of the geographical and socio-productive variation in the state and the Project's target population. This methodology allows us to locate the closest non-participating municipality to each participating municipality. In this way, we selected the 15 treated and control municipalities that are closest, respectively, and, therefore, the most comparable for each rural territory. Table 1. Indicators and attribution methods**

<b>SULTS</b>				
<b>Specific Objective 1. Increase the adoption of agricultural technologies, including those for adapting to and mitigating climate change</b>				

Indicator	Unit of measurement	Measuring frequency	Source of verification	Allocation methodology
.1 Percentage of households using sustainable or climate-smart inputs, technologies or practices	%	2025 e 2031	Impact Assessment	Quasi-experimental (Differences-in-differences)
.2 Farmers with better access to agricultural investments and services	Farmer	2025 e 2031	M&E system	Simple difference
<b>Specific Objective 2. Improve the productive and social inclusion of family farmers, prioritizing women, young people, Traditional Peoples and Communities (PCT) and persons with disabilities.</b>				
.1 Percentage of family farmers who sell their produce at markets	%	2025 e 2031	Impact Assessment	Quasi-experimental (Differences-in-differences)
.2 Organizations supported by PN increase their sales	Organizations	2025 e 2031	Impact Assessment	Quasi-experimental (Differences-in-differences)
.3 Percentage of women in management positions in rural organizations	%	2025 e 2031	Impact Assessment	Quasi-experimental (Differences-in-differences)
.4 Change in the percentage of people who report being empowered from baseline	%	2025 e 2031	Impact Assessment	Quasi-experimental (Differences-in-differences)
.5 People with new jobs	Person	2025 e 2031	Impact Assessment	Quasi-experimental (Differences-in-differences)
<b>Specific Objective 3. Improve the environmental conditions of rural communities and their surroundings</b>				
.1 Area of rural properties registered in the CAR in the municipalities covered by the Project	Hectares	2025 e 2031	Monitoring of registration receipts-Insert into M&E system	Simple difference (before - after, with attribution by empirical / literature evidence)
.2 Communities with title delivered for land and environmental regularization	Hectares	2025 e 2031	List of communities served with certification or/titling-Insert in M&E System	Simple difference (before - after, with attribution by empirical / literature evidence)

**Table 8** shows the final selection of municipalities for the treatment and control groups.

**Table 8. Selected municipalities**

Rural Territory	Municipalities treated	Control municipalities
01 - Mata Sul	Cruz do Espírito Santo (PB)	Baixio (CE)
02 - Brejo	Guarabira (PB)	Flores (PE)
03 - Borborema	Riacho de Santo Antônio (PB)	Mauriti (CE)
04 - Curimataú	Frei Martinho (PB)	Venha-Ver (RN)
05 - Cariri	Sumé (PB)	Brejinho (PE)
06 - Middle Hinterland	Emas (PB)	Ipueira (RN)
07 - Piancó Valley	Piancó (PB)	Santana do Seridó (RN)
08 - Middle Piranhas	Brejo do Cruz (PB)	Luís Gomes (RN)
09 - Alto Sertão	Uiraúna (PB)	Goiana (PE)
10 - Piranhas Valley	Sousa (PB)	Solitude (PE)
11 - Serra do Teixeira	Princess Isabel (PB)	Campo Redondo (RN)
12 - Paraíba Valley	Juripiranga (PB)	São José do Belmonte (PE)
13 - Maringá Valley	Paulista (PB)	São José do Egito (PE)
14 - Mata Norte	Mataraca (PB)	Acari (RN)
15 - Piemont da Borborema	Tacima (PB)	Itambé (PE)

**Table 9** shows the balance of the final sample of municipalities selected for the treatment and control groups. It presents the average and standard deviation of the socio-productive characteristics of both groups and checks whether there are statistically significant differences between the average values of the treatment and control. As can be seen, there are very few significant differences between the characteristics of the municipalities allocated to the treatment and control group. Therefore, it is considered that the strategy used to determine the treatment and control municipalities has produced satisfactory results, providing sufficient comparability between the groups at baseline in terms of the relevant variables.

**Table 9. Balance of socio-productive characteristics<sup>a,b</sup>**

Variables	Treatment Group	Control Group	Difference
<b>Municipal characteristics</b>			
Gross Domestic Product (GDP, R\$)	12.03	12.02	0.01

<sup>a</sup> Mean value per treatment and control group, and the difference between the means of the two groups. Standard deviation in brackets. Unequal difference in gray if the p-value is significant at a confidence level of 99 (***) , 95 (**) or 90 (*). <sup>b</sup> Non-proportional variables are included in logarithm in the estimate.			

**Figure 4.** Distribution of the Propensity Score shows the distribution of propensity scores for pre-selected and non-selected municipalities before and after pairing, highlighting the fact that there is a substantial area of common support. The figure also shows the pairing between the municipalities selected for the treatment and control group, according to score, to confirm that close neighbors were identified for each case.

**Figure 4. Distribution of the Propensity Score**

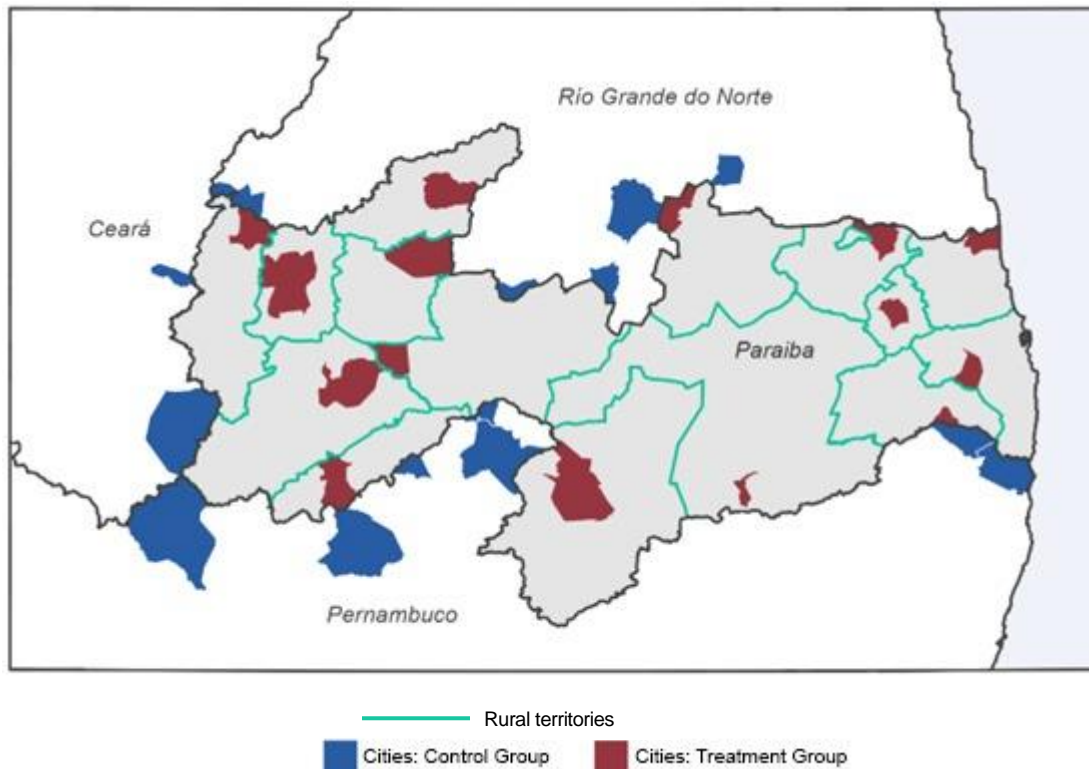

*Panel (a) - Before pairing*

*Panel (b) - After pairing*

Finally, **Figure 5** shows a map of the geographical distribution of the treatment and control municipalities in the Project area.

**Figure 5. Geographical distribution of treated and monitored municipalities**

**Source:** Authors, QGIS.

Once the sample of municipalities for the treatment and control groups have been selected, a random selection of communities must be made within each municipality, given that the community represents the main treatment unit. The producers to be sampled for evaluation within each community will then be selected. In each municipality that was selected in the first stage, several producers should be identified who are representative of the producers there and meet the profile of typical beneficiaries of the Project, either by being a beneficiary (in the treatment group) or by having the characteristics of a beneficiary (in the control group). For the municipalities to be intervened, a register of all the beneficiaries in each community will be kept, since the registration of the beneficiary population in each community forms part of the initial activities of the Project. From this list, a number (to be determined in the next section) of producers who can be interviewed must be selected at random. This selection must respect the stratification of the sample, which considers the subgroups of women (50% of beneficiaries), young people (15-29 years old, 20% of beneficiaries), and traditional peoples and communities (quilombola communities and indigenous peoples, 5% of beneficiaries)<sup>2</sup>. In the communities that form part of the control group, no such register of the beneficiary population will be prepared, so it will be necessary to apply the "snowball" strategy to comply with the sampling guidelines.

### Empirical approach

The empirical framework then proposes the use of the quasi-experimental difference-in-differences (DD or Dif-Dif) methodology, which makes it possible to control for unobservable and non-time-varying differences between the treatment and control groups, measuring the results and impacts of interest for a group of beneficiaries and a group of non-beneficiaries with similar characteristics, at a time before and after the intervention. The basic intuition of the methodology is that the impact is measured by comparing the variation in the average of the impact variable between family farmers who will receive benefits from the

---

<sup>2</sup> It will not be possible to stratify for **people with persons with disabilities** since this information will not be accessible beforehand, and because the proportion of beneficiaries (2%) will not allow us to obtain a large enough sample to estimate the impact with sufficient statistical power. In this case, the impact will be estimated as a before-after difference for the treatment group.

Project and those who will not. Thus, the estimation can isolate the following factors from the impact: (i) systematic differences in non-variable characteristics over time between treatment and control producers, and (ii) general temporal trends during the period of implementation of the intervention.

The DD methodology depends on two main assumptions being met: First, it must meet the common trend assumption ("parallel trends"), which implies that any change over time or between groups follows the same pattern as in the absence of treatment (Blundell and Dias, 2000). Unfortunately, there is no historical data available at producer level in the different municipalities in the state of Bahia to verify this assumption.

The second assumption assumes that the counterfactual scenario identified is sufficiently similar to the treatment group in all observable characteristics and that any unobservable characteristics do not vary between the two groups over time. Only if this assumption is valid can any difference between the two groups over time be attributed as an impact on the Program (Gertler et al., 2011).

The double difference is estimated using the following regression specification:

$$Y_{ict} = \beta_0 + \beta_1 B_i + \beta_2 T_t + \beta_3 \times (B_i * T_t) + \beta_4 \times X_{ict} + \epsilon_{ict} \quad (1)$$

Where:

$Y_{ict}$ : impact variable for producer  $i$  in community  $c$  at time  $t$

$B_i$ : a binary variable equal to 1 for treated producers and 0 for producers in the control group.

$T_t$ : binary variable equal to 0 for base line and 1 for end line

$X_{ict}$ : vector of characteristics at family level for producer  $i$  in community  $c$  at time  $t$

$\epsilon_{ict}$ : end of error

$\beta_0 - \beta_4$ : parameters to be estimated

While the  $\beta_1$  controls for initial differences, observable and unobservable and not variable over time, between the treatment and control group, the coefficient  $\beta_1$  controls for general trends over time that are the same for the treatment and control group. Therefore, the coefficient  $\beta_3$  represents temporal trends in the treatment group outside the general trends and thus allows the impact of the intervention to be estimated.

### c. Sample size calculations

Power calculations indicate the minimum sample size required to estimate program impacts accurately. The appropriate sample size for the estimates is essentially determined by the Minimum Detectable Effect (MDE) that will be considered statistically significant when implementing the hypothesis tests in the evaluation model. If the MDE is high, this implies that large differences in the parameter of interest (but less than this MDE) can be considered non-significant. On the other hand, the minimum sample size that would make it possible to determine the minimum detectable effect is also a function of the magnitude of Type I errors (it is concluded that the program had an impact when in fact it did not) and Type II errors (the evaluation concludes that the program did not have an impact when, in fact, it did), according to what one is willing to assume in the evaluation procedure.

According to Wassenich (2007), the following equation can be used to estimate the sample size for an evaluation:

$$N = \frac{\sigma^2(z_\alpha + z_\beta)^2}{P(1 - P) EMD^2}$$

Where:

$N$  = sample size

$EMD$  = minimum detectable effect as the mean difference between the treatment ( $\bar{Y}_{1t}$ ) and control ( $\bar{Y}_{0t}$ )

- $\sigma$  = standard deviation of the variable of interest
- $z_{\alpha}$  = z-value for the chosen significance level (type I error)
- $z_{\beta}$  = z-value for the chosen power level (type II error)
- $P$  = proportion of the sample assigned to the treatment group

In addition, to consider the intra-cluster correlation of farmers in each community, the following formula is used to estimate the final sample size:

$$N_{\text{corregido}} = N[1 + \rho(m - 1)]$$

Where  $\rho$  = intra-cluster correlation  
 $m$  = average number of farmers to be interviewed in each community

For this calculation, data from the impact evaluation of PROCASE I, the previous IFAD-funded Project that was implemented between 2012 and 2020, is used. The impact evaluation of PROCASE I was completed in 2019 (with the baseline being raised in 2015) and was conducted using the Differences-in-Differences method based on survey data from 613 families, 241 treatment and 372 control. PROCASE I's target population is considered highly comparable to PROCASE II's in terms of its geographic targeting and prioritization of family farmers.

In the context of calculating power, it is important to highlight the importance of estimating the impact for various subgroups of beneficiaries. The Project explicitly prioritizes the inclusion of certain vulnerable groups, including women, young people and indigenous peoples and traditional communities (PCT). To ensure that the impact can be estimated with sufficient statistical power for each of the subgroups, the calculation must be made for each of these stratifications.

The relevant indicator to be used for calculating the sample will be the impact indicator, i.e., total annual household income (linked to indicator I.1). According to data from the PROCASE I program's impact evaluation follow-up survey, the average total household income in the control group in 2019 was R\$15,185 (equivalent to US\$3,037). PROCASE I reported an increase in income of 31%, or an absolute value of R\$ 4,851 (MDE). The standard deviation of this variable was obtained from the same database. It should be noted that the same values were also obtained for the prioritized groups of women and young people to calculate the size of these sample stratifications. Unfortunately, PROCASE I did not focus on the PCT group, so no information is available for this substratum. Therefore, it will be assumed that 10% of the sample should represent producers belonging to the PCT group, which represents oversampling (relative to the 5% of beneficiaries targeted by the Project).

For the other parameters relevant to the calculation, the following values are assumed (see **Table 11**): The confidence level normally chosen is the z-value of a two-tailed test with a confidence level of 95% or 90%. In this case, the confidence level used was 95%, where  $z_{\alpha} = 1,96$ . In addition, for this type of evaluation, a statistical power of 10% is generally used, which implies  $z_{\beta} = 1,28$ . The proportion of treatment and control groups will be equal (50%). To consider the intra-cluster correlation of farmers within each community, the observed value of 0.12 is considered. An average of 10 farmers are chosen to be interviewed in each community, which represents the cluster level. Finally, the possible loss of sample during the final line due to not being able to interview all the farmers in the sample ("attrition"), a sample loss level of  $\tau = 10\%$ , is considered.

**Table 11.** Assumptions for determining sample size

Parameter	Sample global	Stratification women	Stratification youth
<i>EMD</i>	15.184,46	12.336,86	11.411,47
$\sigma$	4.850,96	7.079,83	6.888,80
$z_{\alpha}$	1,96 ( $\alpha = 0,05$ )		

$z_{\beta}$	1,28 ( $\beta = 0,90$ )
$P$	0,50
$\rho$	0,12
$m$	10
$\tau$	0,10

The estimated sample size based on this calculation is shown in **Table 12**. The sample size is **1,780 producers**, while 790 families are expected to be interviewed in the treatment and control group, respectively. A total of 110 communities will be sampled (55 communities in the treatment and control group respectively), and 10 producers will be surveyed in each community, which results in a ratio of approximately 60 producers surveyed per municipality/rural territory. To ensure sufficient statistical power, 27% of the households surveyed should be headed by a woman and 35% by young people (it should be noted that these stratifications are non-exclusive). 10% of the households sampled must belong to PCTs.

**Table 12. Sample size by group**

Group	Communities	General stratification	Stratification women	Stratification youth	PCT stratification
Treatment	55	240	240	310	100
Control	55	240	240	310	100
<b>Total</b>	110	480	480	620	200
<b>Total sample</b>		<b>1,780</b>			
<b>Communities by municipality</b>		3,7			
<b>Producers by municipality</b>		59,3			

The proposed evaluation strategy envisages collecting information through three successive measurements of the defined impact and outcome indicators, along with other variables that will make it possible to reinforce the quality of the estimates. The Baseline measurement should be carried out before the implementation of the Project (estimated in the second half of Year 1), the Mid-Term measurement should be conducted when approximately 50% of the disbursements and/or execution time has passed (estimated in the second half of Year 3), and the End Line measurement should be carried out at the end of the implementation of the loan, thus assessing the effective presence of the expected impacts and results (estimated in the second half of Year 5).

#### d. Evaluation coordination, workplan and budget

The aim of the survey of farmers' households in the selected municipalities is to obtain information related to the impact/outcome variables of interest (consistent with the indicators defined in the Results Matrix - see Table 1), as well as a series of conditioning variables that supposedly affect the outcome variables. The main justification for including conditioning variables is to improve the accuracy of impact estimates. **Table 13** presents a detailed list of the variables that should be captured in the questionnaire, where the indicators highlighted in red represent those that are mandatory for meeting the requirements of the development effectiveness framework.

**Table 13. Variables to be collected through the household survey**

<b>Impacts</b>
<ul style="list-style-type: none"> <li>Income for the definition of poverty and extreme poverty</li> <li>Women's food diversity</li> </ul>
<b>Productive Results</b>

<ul style="list-style-type: none"> <li>• Use of sustainable and/or climate-smart inputs, technologies, or practices</li> <li>• Areas recovered through Payments for Environmental Services (PES)</li> <li>• Access to agricultural investments and services</li> <li>• Area of rural properties registered with CAR</li> <li>• Communities with land regularization titles</li> <li>• Selling products at markets</li> <li>• Management positions in rural organizations held by women</li> </ul>
<b><i>Socioeconomic characteristics</i></b>
<ul style="list-style-type: none"> <li>• Age, gender, race/ethnicity, relationship to head of household, marital status</li> <li>• Household composition according to age</li> <li>• Literacy and years of schooling</li> <li>• Living conditions at home</li> <li>• Non-agricultural assets</li> <li>• Dimensions of women's and men's empowerment</li> <li>• People with access to new jobs</li> <li>• Access to drinking water</li> <li>• Access to sanitation</li> <li>• Access to waste collection service with proper destination</li> </ul>
<b><i>Agricultural goods</i></b>
<ul style="list-style-type: none"> <li>• Land use</li> <li>• Equipment</li> <li>• Production problems (diseases, pests, droughts, floods)</li> </ul>
<b><i>Organization/association</i></b>
<ul style="list-style-type: none"> <li>• Participation in government programs</li> <li>• Participation in producer organizations, cooperatives, etc.</li> <li>• Holding management positions in rural organizations</li> <li>• Technical assistance</li> </ul>

Based on this list of necessary variables, **Table 14** shows the general structure of the questionnaire to be applied to the sample of producers. Each module and section of the questionnaire is closely linked to the variables identified in Table 13. Naturally, the main module of the questionnaire focuses on agricultural production to detail the production system with all its costs, factors of production, and products. However, to have a comprehensive view of the producer and his sources of income and costs that will certainly affect his production decisions, modules on other economic activities are also included.

**Table 14. Questionnaire modules**

<b><i>Module 0: Basic information</i></b>
<ul style="list-style-type: none"> <li>• <b>Section A.1:</b> Identification of household/production unit (name of interviewee, location of household/farm, status of Project beneficiary, etc.)</li> <li>• <b>Section A.2:</b> Identification of the interviewee/interviewer (name of the interviewer, start and end time of the interview, etc.)</li> <li>• <b>Section A.3:</b> GPS coordinates and related information</li> </ul>
<b><i>Module 1: Information on demographics, housing, and household location</i></b>
<ul style="list-style-type: none"> <li>• <b>Section 1.1:</b> Household members (age, gender, race/ethnicity, relationship to the head of household, marital status, years of schooling, etc. of each household member)</li> <li>• <b>Section 1.2:</b> Living conditions (type and condition of housing, access to electricity, water, sanitation, waste collection service, ownership situation)</li> <li>• <b>Section 1.3:</b> Location (knowledge of and distance from various facilities, including main road, agricultural markets, etc.)</li> </ul>

<b>Module 2: Earth</b>
<ul style="list-style-type: none"> <li>• <b>Section 2.1:</b> Characteristics of property parcels (location, area, use, ownership status/guarantee, CAR registration, etc.)</li> <li>• <b>Section 2.2:</b> Tenure disputes (conflicts and resolution)</li> <li>• <b>Section 2.3:</b> Production problems (drought, flooding, etc.)</li> <li>• <b>Section 2.4:</b> Agricultural practices and technologies</li> </ul>
<b>Module 3: Property / Assets</b>
<ul style="list-style-type: none"> <li>• <b>Section 3.1:</b> Agricultural assets (type, quantity, and source)</li> <li>• <b>Section 3.2:</b> Non-agricultural assets (type, quantity, and source)</li> </ul>
<b>Module 4: Livestock production</b>
<ul style="list-style-type: none"> <li>• <b>Section 4.1:</b> Inventory (number and value of animals owned, changes in the last year - births, deaths, purchases, sales)</li> <li>• <b>Section 4.2:</b> Livestock production (sales, domestic consumption, animal products, etc.)</li> <li>• <b>Section 4.3:</b> Costs and supplies (veterinary services, food, etc.)</li> </ul>
<b>Module 5: Agricultural production</b>
<ul style="list-style-type: none"> <li>• <b>Section 5.1:</b> Temporary crops (area, sowing/harvesting time, technology used, costs of seeds, fertilizers, pesticides, equipment, sales, family consumption, storage, etc. of processed and unprocessed crops)</li> <li>• <b>Section 5.2:</b> Permanent crops (area, harvest time, technology used, costs of seeds, fertilizers, pesticides, equipment, sales, family consumption, storage, etc. of processed and unprocessed crops)</li> <li>• <b>Section 5.3:</b> Forest products (area, collection time, cost of equipment and processing, sale, consumption, storage, etc.)</li> </ul>
<b>Module 6: Technical assistance and extension</b>
<ul style="list-style-type: none"> <li>• <b>Section 6.1:</b> Type of assistance, provider, frequency, supplies</li> <li>• <b>Section 6.2:</b> Knowledge of agroecological practices and technologies</li> </ul>
<b>Module 7: Non-agricultural economic activity</b>
<ul style="list-style-type: none"> <li>• <b>Section 7.1:</b> Employment (type of occupation, days worked, salary, remittances)</li> <li>• <b>Section 7.2:</b> Loans, credits, and savings (type, amount, reason for loan)</li> </ul>

The schedule of evaluation activities is presented in **Table 15**. Assuming that the Project is signed at the end of 2025 by the State of Paraíba and that planning that Project implementation begins in the first half of 2026, it is estimated that baseline activities will begin in the last quarter of 2026 (or at the time the Program reaches eligibility), including the preparation of the list/register of beneficiary producers, so that this list serves as the sampling frame for the evaluation treatment group. The baseline is expected to be available by the end of the first quarter 2027.

Between 2028 and 2029, or approximately three years after the start of the Project, a second round of surveys will be carried out to compile the mid-term line. The timing of this activity will be similar to that carried out for the baseline, except that only the questionnaire already developed will be revised and the survey will be repeated with the same sample of farmers. The results of the mid-term line should be available 90 days after the date on which 50% of the loan resources have been disbursed and justified, or after 36 months of execution, whichever comes first.

The end line will be carried out as soon as the implementation of the program is complete, possibly at the end of 2030. It should be noted that this third round will be applied among the same sample of farmers. The results of the final evaluation, and, therefore, the final impact evaluation report, are expected to be available within 90 days of the date on which 95% of the loan resources have been disbursed and justified.

**Table 16** shows the preliminary budget for the impact evaluation. To estimate the budget for survey collection based on the sample size, several impact evaluations of comparable agricultural programs are used as a reference: (i) the baseline of the Sustainable Rural Projects in the Cerrado (BR-T1409) and the Caatinga (BR-T1378) which were collected in October 2022; (ii) the baseline of the Sustainable Rural Project in the Amazon (BR-T1462) to be collected in 2024, (iii) the end line of the Sustainable Rural Project in the Caatinga (BR-T1378) to be collected in 2024, and (iv) the end line of PROCASE I, implemented by IFAD in 2019. In these projects, the application of a survey costs an average of R\$440 or US\$88 per questionnaire applied. For the 1,780 farming families sampled in this evaluation, a total cost of US\$88 per survey round is calculated. Added to these costs are the analysis and preparation of the data collected, as well as the preparation of the mid-term and final impact evaluation reports, which add US\$10,000 to the budget respectively, resulting in a total budget of approximately US\$500,000.

**Table 16.** Preliminary impact assessment budget

Activity	Costs (US\$)
Baseline	156.640
Baseline analysis	10.000
Mid-term	156.640
Mid-term analysis and evaluation	10.000
End line	156.640
Final impact assessment	10.000
<b>Total</b>	<b>500.000*</b>

\*Rounded up from US\$499,680

Note that this budget is a preliminary estimate. The exact costs will depend on local prices for the field team, transportation to the field, etc. It is suggested that the following tool from the [IDB Evaluation Portal](#) is used to calculate the fieldwork budget more accurately. It is suggested that this tool be included in the terms of reference of baseline and end-line consultancies so that applicants can use it to propose a budget for their work.

#### **f. Responsibilities and disclosure of results**

The Project Management Unit (PMU) will be responsible for implementing and supervising the impact evaluation. The evaluation will be financed with administration and management funds from this loan (see Error! Reference source not found. for more details). The PMU team will receive technical support from the Bank and IFAD to implement the evaluation according to the design drawn up and also technical analysis

if deemed necessary. The following reports will be prepared during the implementation of the impact assessment:

- i. **Impact assessment plan:** This document provides the comprehensive design of the assessment and should be used as a reference for implementing the various stages of the assessment. Once the company responsible for conducting the baseline has been contracted, the plan should be updated with details of the sampling and survey, as well as the current timeline for the baseline. In this update, the activities of the awareness campaign should also be described in more detail.  
**Completion:** First half of year 1 of implementation (*tentatively: December 2026*)
- ii. **Questionnaire design and sampling implementation:** The preparation of the survey instrument and the implementation of the sampling will be the responsibility of the company contracted for the fieldwork, with the technical support of the Bank. Both the questionnaire and the sample must reflect the details presented in the evaluation plan.  
**Completion:** First half of year 1 of implementation (*tentatively: January 2027*)
- iii. **Baseline Report:** The report will provide details on baseline management, highlighting any adjustments made to the initial Project. It will include all documents associated with the baseline, including the questionnaire, the list of producers interviewed (with address, GPS coordinates), the field guide, the data dictionary, as well as an analysis of the data collected and comparability of the treatment and control group.  
**Completion:** Second half of year 1 of implementation (*tentatively: April 2027*)
- iv. **Mid-term report:** Like the baseline report, this will provide details on the administration of the survey, highlighting any adjustments made to the initial design. It will include all the documents associated with the survey, including the questionnaire, the list of producers interviewed (with housing, GPS coordinates), the field guide, the data dictionary, as well as an analysis of the data collected.  
**Completion:** First half of year 4 of implementation (*tentatively: February 2029*)
- v. **Mid-term assessment report:** Using the data collected in the two rounds of research, the report will present a comprehensive analysis of the Program's mid-term impact, focusing on the main outcome and impact indicators identified in the results matrix. The main aim of this report is to assess the progress of the Project and its success to date, as well as to identify any implementation problems that need to be addressed.  
**Completion:** First half of year 4 of implementation (*tentatively: April 2029*)
- vi. **Final report:** Like the baseline report, this will provide details on the administration of the research, highlighting any adjustments made to the initial design. It will include all the documents associated with the final stage, namely the questionnaire, the field guide, the data dictionary, as well as an analysis of the data collected.  
**Completion:** First half of year 6 of implementation (*tentatively: December 2030*)
- vii. **Impact assessment report:** Using the data collected in the three rounds of survey, the report will present a comprehensive analysis of the Program's impact, focusing on the main impact indicators identified for the results matrix. The main objective of this report is to answer the evaluation questions identified and provide conclusions on the effectiveness of the Program and the lessons learned. It should contribute to the preparation of the Project Completion Report in accordance with PCR guidelines.  
**Completion:** Second half of year 6 of implementation (*tentatively: June 2031*)

## f. Additional information indicators measurement

This section presents the methodological details for measuring certain results and/or impact indicators that require additional information or a complementary measurement to the data analyzed through the impact assessment presented in the previous section. **Table 16** summarizes the indicators discussed in this section.

**Table 17. Indicators whose measurement requires additional methodological details**

#	Indicator	Means of verification
1	I1. Multidimensional Poverty Index (Adjusted Headcount)	Impact Assessment
2	I2. Percentage of families reporting minimal dietary diversity for women (MDDW)	Impact Assessment
3	I3. Farmers who increase their agricultural production	Impact Assessment
4	I4. Tons of greenhouse gas emissions (CO <sub>2</sub> e) avoided and/or sequestered	<u>MapBiomass; FAO's EX-Ante Carbon-Balance Tool (EX-ACT)</u>
5	R1.1 Percentage of households using sustainable or climate-smart inputs, technologies, or practices	Impact Assessment
6	R1.2 Farmers with better access to agricultural investments and services	M&E system (simple inspection)
7	R2.1 Percentage of family farmers who sell their products at markets	Impact Assessment
8	R2.2 Organizations supported by PN increase their sales	Impact Assessment
9	R2.3 Percentage of women in management positions in rural organizations	Impact Assessment
10	R2.4 Change in the percentage of people who report being empowered from baseline	Impact Assessment
11	R2.5 People with new jobs	Impact Assessment
12	R3.1 Area of rural properties registered in the CAR	Monitoring of registration receipts-Insert into M&E system
13	R3.2 Communities with title delivered for land and environmental regularization	List of communities served with certification or/titling-Insert in M&E System

### 1. Impact 1: Multidimensional Poverty Index (adjusted headcount)

The Multidimensional Poverty Index (MPI) was developed by Alkire and Foster (2011), based on the concept of Sen (2000), who considers poverty to be a multidimensional phenomenon capable of affecting individuals in different ways. Thus, the measurement of poverty includes different types of deprivation. T

The theoretical justification for the MPI is based on the contributions of Amartya Sen. For the author, poverty cannot be explained solely by a lack of income. The lack of basic capacities to achieve adequate levels of education, health, nutrition, housing, access to natural resources, and equity must be considered. In this sense, in addition to income, other dimensions are defined to measure families' well-being.

Initially, as pointed out by Fahel, Teles, and Caminhas (2016), the poverty line cut-off must be determined. In other words, it is essential to identify the individuals - or households, which is the level of aggregation used in this study - in poverty. Thus, each household is assigned a deprivation score (from 0 to 1 or 0% to 100%) based on its deprivations in the indicators that make up the index, calculated from the weighted sum of the deprivations experienced.

The MPI will be calculated based on data from the impact assessment studies and measure poverty based on five dimensions: Income, Social Capital, Human Capital, Food Security, Housing Conditions and Sustainability. All the dimensions have the same weight and the indicators for each dimension are also equally weighted. The dimensions above and the variables that comprise them are in **Table 17**.

**Table 18.** Dimensions of the Multidimensional Poverty Index

Dimensions	Indicators
<b>1) Income dimension</b> It captures the lack of resources in households	Yield indicator Household income per capita
<b>2) Social Capital Dimension</b> It captures the capacity levels of the target institutions and individuals. This concerns both changes in individual capacities and collective actions.	Access to Agricultural Policies Indicator Benefits received, given by the average of the following benefits: (i) Cistern for production - 2nd water; (ii) Agricultural financing, PAA, PNAE, Rural insurance, SEAF, Agrarian reform and Land credit.
	Indicator Participation of young women in community actions (Inclusion and empowerment) 1. Participation of young people in community actions; and 2. Participation of women in community actions.
	Associativity indicator: 1. Number of different types of associations in which the family participates, including Community associations, neighborhood associations, etc.; Collective work, community work, joint effort, etc.; Organized social movements; Movements linked to churches; Trade unions; and Others (clubs, sports, and social associations, etc.); 2. Whether the interviewee or family member processes their production through the association; or whether the production or part of the production is marketed through the association.
	Access to Public Policies and Services Indicator 1. Benefits received, identified by access to the following benefits: Retirement, Social Security, Unemployment Insurance, Family Allowance, School Allowance, Food Card, Gas Allowance, Basic Food Basket, Education Allowance, Educa Mais Brasil, English Without Borders, Young Apprentice, Pronatec, Sisutec, Sisu, Prouni, FIES Postgraduate, Free Pass, Elderly Card, Social Driver's License, Living Without Limits, Health is Priceless, Rede cegonha, Social electricity tariff, Light in the Countryside, Light for All, Cistern for human consumption - 1st water, ATER, Brazil without Misery Plan (PBSM), Program to combat rural poverty, Individual Microentrepreneur (MEI), Refis or SEBRAE Program, Emergency aid in disasters - Bolsa Estiagem, Family Health Program (PSF) and Defense Insurance.2. Public services accessed: Health agent; PSF/presence of doctor in community/district; School transportation; Public transportation and public safety.
	Access to Credit Indicator Whether the person interviewed or a member of their family has ever accessed the following benefits: Minha Casa Minha Vida/ Minha Casa Melhor; Agricultural financing; Pronaf; Safrá Guarantee.
<b>3) Human Capital Dimension</b> It captures the level of education and training in rural households.	Education Indicator - educational level of interviewees
	Indicator of access to training programs - Whether the interviewee or a family member is part of a community business plan with Training Activities

Dimensions	Indicators
	Indicator of access to technical advice - Whether the interviewee or a family member is part of a community business plan with technical advice and assistance.
<b>4) Food Security and Nutrition Dimension</b> <b>It captures food security through the results of surveys on: i) access to food; ii) diversification of diet; iii) origin of food.</b>	Food insecurity indicator - If there was ever a time when the family found it very difficult to get food, or even went through the situation of not having enough to eat;
	Varied diet indicator - The frequency with which the family has a varied / diversified diet (vegetables, leaves, fruit, meat, beans, rice, juice)
	Indicator of food origin - If it came from donations from neighbors and relatives
<b>5) Housing and living conditions dimension</b> <b>It captures housing conditions in terms of where most of the family lives, where they spend most of their time and whether they have access to important social facilities.</b>	<b>Housing Conditions Indicator:</b> Type of home Material used for external walls Material used for the roof; Material used for the floor; Existence of bathroom/sanitary facilities in the house Existence of piped water Overcrowding in the household = Number of people per room = number of rooms / number of people in the household. Electricity in the home
	Durable Goods Indicator: Whether the household has: stove, refrigerator, stereo, telephone, TV
<b>6) Sustainability Dimension</b> <b>Captures the adoption of agroecological and sustainable practices</b>	Indicator of cultivation practices: If slash-and-burn is used; If pesticides are used; If chemical fertilizers are used; If organic compost is used; If is used; If straw is used;
	Indicator on the disposal of pesticide packaging: Packaging is returned; Whether agrochemical packaging is buried, burned, or discarded; Whether agrochemical packaging is reused;
	Indicator on waste disposal: Whether household waste is collected by the municipal system; If household waste is recycled; Whether household waste is buried/burned; If household waste is thrown into the environment; If organic waste is separated from household waste for composting.
	Indicator of the state of conservation of springs, water mirrors and riparian forest State of conservation of the water mirror; State of the springs; State of the riparian forest.

## 2. Impact 2: Percentage of households reporting minimal dietary diversity (MDDW)

This indicator will be measured to fulfill the framework of the core indicator (CI), which is IFAD's main mechanism for measuring and reporting Project results at the output and outcome levels. It was developed in 2017 and provides a simplified picture of the main outputs and outcomes achieved by IFAD-supported activities. The structure of the IC consists of 45 indicators: 3 scope indicators, 20 output indicators and 22 outcome indicators. These indicators correspond to the strategic objectives and thematic areas of IFAD's Strategic Framework for 2016-2025 and are aligned with the Sustainable Development Goals (SDGs) defined in the 2030 Agenda.

One of the outcome indicators of this framework is the percentage of women who report minimal dietary diversity. This indicator was initially developed by FAO and USAID in the context of their Food and Nutrition Technical Assistance initiative (FANTA; FAO, 2016). The Minimum Dietary Diversity for Women of

Reproductive Age (MDD-W) aims to measure the diversity of food groups that have been shown to reflect a key dimension of diet quality: micronutrient adequacy, summarized in 11 micronutrients (Martin-Prével et al., 2015). Promoting varied diets is one approach to improving micronutrient nutrition for women of reproductive age. In addition to micronutrient adequacy, high-quality diets are characterized by balance in protein, carbohydrate, and fat intake (Institute of Medicine, 2005) and moderation in the consumption of certain foods, which have low nutrient density and those associated with a higher risk of chronic diseases (George et al., 2014).

The MDD-W is a dichotomous indicator of whether women aged 15 to 49 consumed at least five of the ten defined food groups the previous day or night. The proportion of women aged 15 to 49 who meet this minimum in a population can be used as a proxy indicator of greater micronutrient adequacy, an important dimension of diet quality. The indicator is only applied when a woman between the ages of 15 and 49 is available for this part of the questionnaire.

The questionnaire should then include a classification of foods into 10 food groups. Women (aged 15-49) are asked which foods they have consumed in the last 24 hours. If a woman's diet includes foods that can be classified into a minimum of five food groups, she is expected to meet the minimum requirement for micronutrient intake. The amount of each food group should be 15 g or more.

### **3. Impact 3: Farmers increasing their agricultural production**

Beneficiary families say that the activities supported by the Project (e.g., training, provision of inputs) have helped them to increase the quantity of the main crops harvested as a result of better yields (i.e., the quantity of harvest per unit area of land) or an increase in the area cultivated, compared to the pre-project situation. For cereals, grains and pulses, production is usually measured in tons or kilograms. It can also refer to an increase in livestock production (e.g. increased milk production, reduced animal mortality, improved fertility) or in the volume of fish caught compared to the pre-Project situation.

### **4. Impact 4: Number of tons of greenhouse gas emissions (CO<sub>2</sub>e) avoided and/or sequestered**

Finally, impact indicator I.4 calculates the amount of greenhouse gas emissions avoided as a direct result of preserved vegetation cover.

The Ex-Ante Carbon Balance Tool (EX-ACT) was developed by the Food and Agriculture Organization of the United Nations (FAO) to assess the impacts of interventions in the Agriculture, Forestry and Other Land Use (AFOLU) sector on greenhouse gas (GHG) emissions.

The tool calculates changes in carbon stocks and GHG emissions, including carbon dioxide (CO<sub>2</sub>), methane (CH<sub>4</sub>), and nitrous oxide (N<sub>2</sub>O), which, once converted into CO<sub>2</sub> equivalent, are used to derive the carbon balance that indicates the impact of the Project. A positive carbon balance indicates that the Project generates higher emissions, while a negative carbon balance indicates that the Project contributes to reducing emissions.

EX-ACT distinguishes between two periods: the Project implementation phase and the capitalization phase. The six-year implementation phase is the period during which Project activities are carried out. The period covered by the analysis does not necessarily end with the end of the active Project intervention. Additional changes can occur due to interventions (Project activities), such as changes in soil carbon content or biomass. This period defines the capitalization phase. In this analysis, following the recommendations of the IPCC, a general period of 20 years was considered for the implementation and capitalization phase.

This analysis is based on the information provided by the activities described in the Project Concept Note and the models developed in the Economic and Financial Analysis (EFA). It considers the activities of Component 1 - Subcomponent 1.1, 1.2, and 1.3.

The total estimated carbon balance of PROCASE II is -1,449,802 tCO<sub>2</sub>-eq for 20 years of accounting, 6 years of implementation, and 14 years of capitalization for a total area of 13,575 hectares and 1,072,757 head of cattle. This equates to a carbon balance of -107 tCO<sub>2</sub>-eq per ha and -5 tCO<sub>2</sub>-eq per hectare per year.

### **5. Outcome 1.1: Percentage of households using sustainable or climate-smart inputs, technologies, or practices**

Project beneficiaries who receive training in environmentally sustainable practices and/or climate-related risk management, and who state that: (a) they have fully mastered these practices; and (b) they now routinely use these technologies and practices.

### **6. Outcome 1.2: Farmers with better access to agricultural investments and services**

Refers to the number of new individuals who received services or took part in activities promoted or supported by the Project during the period considered (annual report).

### **7. Result 2.1: Percentage of family farmers who sell their produce at markets**

Beneficiary families interviewed say that, compared to the pre-project situation: (a) they can now access the public or private market more easily.

### **8. Result 2.2: Organizations supported by PN increase their sales**

The producer organizations interviewed claimed to have seen an increase in the volume of production sold or in the value of sales compared to the pre-project situation, thanks to the Project's commercialization and other training support.

### **9. Result 2.3: Percentage of women in management positions in rural organizations**

The Project has the explicit aim of strengthening the empowerment of women in the area of intervention through various activities that should enable them to participate more actively in domestic decisions and production chains. Through the implementation of business plans (PN), they will benefit cooperative organizations and their members and will receive specialized technical assistance and investments to improve the conditions for storing, processing, and commercializing products. Support for the inclusion of women (as well as young people and PCT communities) will be a cross-cutting activity and must be considered when drawing up the Business Plans. To help reduce the disparity in women's participation in rural productive activities, resources allocated to the PN will be allocated exclusively to associations and cooperatives led mostly by women (see ROP for more information).

By prioritizing the inclusion of women in the management of rural organizations, it is hoped that the Project will contribute to increasing the number of management positions held by women.

The target was set in line with the Project's demands to increase the rate of management positions held by women by 30%. To confirm that the objective has been achieved at the end of the Project, it is proposed to repeat the same survey in the final year of execution to find out if the percentage of women involved in the leadership of rural organizations has increased adequately.

IFAD has a history of surveys that use this characteristic. The standard questionnaire contains 27 questions to identify both the socio-demographic characteristics of each organization's representative and the characteristics of the organization itself, including location, type of services offered by the organization, improvements incorporated through the Project (in which case the organization benefited) and the organization's access to commercial networks and public programs. The full questionnaire is presented in Annex III.

The survey can be carried out virtually, given that this format has had a high degree of success when implemented by IFAD in other projects (with a response rate of 90%) and that it represents a highly economical way of applying this simple questionnaire. Following the methodology developed by IFAD, the survey will have three elements of dissemination: a call, a card/invitation, and a link to the electronic questionnaire. The electronic questionnaire must allow the respondent's answers to be collected and transmitted automatically. The three dissemination elements will have to be shared with the Project's

Regional Units and then sent to the leaders of the identified rural organizations. It should be noted that a complete list of relevant organizations appears in Annex III. This list will be adjusted based on the review to be done before the survey is implemented.

#### **10. Result 2.4: Change in the percentage of people who report being empowered compared to the baseline**

It is proposed to measure the indicator through impact assessment, given that women's empowerment, which is considered an important dimension of this Project. To meet the requirements of IFAD's results framework, the degree of empowerment will be measured using an empowerment indicator that IFAD has developed based on the Women's Empowerment in Agriculture Index (pro-WEAI) developed by IFPRI, OPHI and USAID. Like the pro-WEAI, the indicator reflects an empowerment framework in which empowerment is a process of change in the interrelated dimensions of resources, agency, and achievements. This indicator focuses on measuring agency, i.e., the ability of individuals, who were previously unable to do so, to make strategic decisions (Malapit, et al, 2019).

IFAD's empowerment indicator aims to measure the empowerment of individuals in 10 of the 12 dimensions called for by the pro-WEAI, focusing on those that IFAD can influence through the activities it supports. Each dimension is assigned to one of the three domains of empowerment: intrinsic agency (internal power), instrumental agency (power to), and collective agency (power with), which are linked to the definition of empowerment.

The dimension map is as follows:

- i. **Intrinsic agency:** Income autonomy, self-efficacy, and attitudes towards intimate partner violence;
- ii. **Instrumental agency:** Contribution to productive decisions, Ownership of land and other assets, Access to and decisions about financial services, Control over the use of income, and Work balance.
- iii. **Collective agency:** group membership and participation in influential groups

Table A2 in the Appendix gives more details on the measurement requirements for this indicator.

#### **11. Result 2.5: People with new jobs**

Number of new seasonal, full-time, or recurring on-farm and off-farm jobs created thanks to the Project's activities since its inception, either as independent individuals (self-employed) or as employees of micro, small and medium-sized enterprises. Jobs created within the framework of farmers' organizations that have received support from the Project are also included, but temporary jobs created for a limited period (e.g., for road construction) will be excluded.

#### **12. Result 3.1: Area of rural properties registered in the CAR in the municipalities covered by the Project**

Sum of the registration of farmers' properties in the National Rural Environmental Registration System (SICAR) in the municipalities covered by the Project, as reported by INCRA.

#### **13. Outcome 3.2: Communities with land and environmental regularization titles delivered**

Number of communities that have obtained the land regularization title, with the application for registration at the registry office.

## ANNEXES

### Annex I: Methodology for measuring the women empowerment indicator

**Table A1. Measurement of the Empowerment Indicator**

EMPOWERMENT	
IE.2.1	Individuals demonstrating an improvement in empowerment
Definition	<p>IFAD's empowerment indicator is an index that IFAD has developed building on the project-level <b>Women's Empowerment in Agriculture Index (pro-WEAI)</b> developed by IFPRI, OPHI and USAID. Similarly to the pro-WEAI, IE2.1 reflects a framework of empowerment<sup>23</sup> in which empowerment is a process of change on the interrelated dimensions of resources, agency, and achievements. This indicator focuses on measuring agency, i.e. the ability of individuals, who were unable to do so previously, to make strategic choices. (Malapit, et al, 2019).</p> <p>IFAD's empowerment indicator aims at measuring individuals empowerment in the communities where IFAD's projects are implemented, in the domains relevant to IFAD's operations. IE 2.1 includes 10 out of the 12 dimensions for the pro-WEAI, focusing on those IFAD can influence through its supported activities. Each dimension is mapped to one of three domains of empowerment: <b>intrinsic agency (power within)</b>, <b>instrumental agency (power to)</b>, and <b>collective agency (power with)</b> which are linked to the definition of empowerment.</p> <p>Dimensions' mapping is as follows:</p> <ul style="list-style-type: none"> <li>▪ <b>Intrinsic agency:</b> Autonomy in income, Self-efficacy and Attitudes about intimate partner violence.</li> <li>▪ <b>Instrumental agency:</b> Input in productive decisions, Ownership of land and other assets, Access to and decisions on financial services (if any provided by IFAD supported project), Control over use of income and Work balance.</li> <li>▪ <b>Collective agency:</b> Group membership and Membership in influential groups</li> </ul> <p><i>The indicator must be disaggregated by sex in order to compare empowerment between women and men.</i></p>
Data source and collection method	<p>COI survey conducted at Baseline, Mid-Term and Completion. Data should be reflected in ORMS in these 3 points in Time.</p> <p>The survey unit corresponds to the household but the gender of the respondent matters; it is indeed important to ensure that the proportion of women (men) respondent reflect the proportion of women (men) targeted by the project.</p> <p>If the project is defined as Gender-Transformative, the COI questionnaire then includes all the questions with a <b>IE.2.1</b> (IFAD's Empowerment Indicator CI NUMBER) mention included in the modules of the COI questionnaire, as well as all the questions included in the empowerment-dedicated sub-modules of the module [H] PARTICIPATION AND EMPOWERMENT listed below:</p> <ul style="list-style-type: none"> <li>[[H2] GROUP MEMBERSHIP AND INFLUENCE</li> <li>[H3] TIME ALLOCATION</li> <li>[H4] AUTONOMY IN DECISION-MAKING</li> <li>[H5] NEW GENERAL SELF-EFFICACY SCALE</li> <li>[H6] ATTITUDES ABOUT DOMESTIC VIOLENCE</li> </ul> <p>Note that sub-module [H6] Attitudes about Domestic Violence is mandatory. However, given the sensitivity of the topic in certain contexts, project staff might contact ECG PDT and Gender Team for guidance on how to best collect the data.</p> <p>Also note that for sub-modules [H3] to [H6], the project team might consider surveying both man AND woman WITHIN the household for a specific subset of projects. It is recommended that, since this approach requires additional resources (time, budget and capacities) project staff contact ECG PDT and</p>

<sup>23</sup> Kabeer, 1990, 2005.

	Gender Team for support if required.																																							
Unit surveyed	Household survey, beneficiary individuals reflecting the proportion of women/men targeted by the project																																							
Measurement	COMPARISON of the results with baseline survey																																							
COI related questions	<p>All questions with a <b>IE.2.1</b> (CI NUMBER) mention:  <b>[B] HOUSING AND ASSETS:</b> B.1.2, B.2.1, B.2.2, B.2.3, B.2.4.  <b>[C] PRODUCTION AND NATURAL RESOURCES:</b> C.0.1, C.0.3, C.0.7, C.1.3, C.1.4, C.1.15, C.1.22, C.1.23, C.2.0, C.2.1, C.2.7, C.2.8, C.2.9, C.2.10, C.2.11, C.3.3, C.3.4, C.3.5, C.3.6.  <b>[E] FINANCIAL SERVICES:</b> E.1, E.2, E.3, E.4, E.5, E.7, E.8, E.10  <b>[F] NUTRITION :</b> F.1.2, F.1.3.  <b>[I] RURAL ENTERPRISES:</b> I.0.2, I.1.3, I.2.1.  as well as <b>Empowerment-dedicated sub-modules:</b>  <b>[H] PARTICIPATION AND EMPOWERMENT:</b>  <b>[[H2] GROUP MEMBERSHIP AND INFLUENCE</b>  <b>[H3] TIME ALLOCATION</b>  <b>[H4] AUTONOMY IN DECISION-MAKING</b>  <b>[H5] NEW GENERAL SELF-EFFICACY SCALE</b>  <b>[H6] ATTITUDES ABOUT DOMESTIC VIOLENCE</b></p>																																							
Determination of the value of the indicator	<p>The indicator only applies to individuals which benefitted from or participated to in any project-supported activity: check with Project M&amp;E system.</p> <p>Each dimension is equally weighted and is assigned a rating - 1: Adequate and 0: not adequate - according to the answers of the dimension-related questions:  See <i>Appendix II on Nutrition and Empowerment Indicators of COI measurement Guidelines for description of ADEQUACY CRITERIA and for the estimation of IE.2.1 at project level based on COI survey results.</i></p> <p>Based on the rating of each dimension, an empowerment score is calculated and is then expressed as a percentage. Each dimension is equally weighted. <i>The score then has to be compared with the baseline score to assess whether or not it has increased.</i></p> <p><i>Example 1 for 1 individual:</i></p> <table border="1"> <thead> <tr> <th>COI Survey</th> <th>Baseline</th> <th>Mid-Term</th> </tr> </thead> <tbody> <tr> <td><b>Dimensions:</b></td> <td></td> <td></td> </tr> <tr> <td><b>Intrinsic agency</b></td> <td><b>Intrinsic agency</b></td> <td><b>Intrinsic agency</b></td> </tr> <tr> <td>▪ <b>Autonomy in income:</b></td> <td>▪ <b>Adequate: 1Pt</b></td> <td>▪ <b>Adequate: 1Pt</b></td> </tr> <tr> <td>▪ <b>Self-efficacy:</b></td> <td>▪ <b>Not Adequate: 0 Pt</b></td> <td>▪ <b>Not Adequate: 0 Pt</b></td> </tr> <tr> <td>▪ <b>Attitudes about intimate partner violence:</b></td> <td>▪ <b>Adequate, 1 Pt</b></td> <td>▪ <b>Adequate, 1 Pt</b></td> </tr> <tr> <td><b>Instrumental Agency</b></td> <td><b>Instrumental agency</b></td> <td><b>Instrumental Agency</b></td> </tr> <tr> <td>▪ <b>Input in productive decisions:</b></td> <td>▪ <b>Not Adequate, 0 Pt</b></td> <td>▪ <b>Adequate, 1 Pt</b></td> </tr> <tr> <td>▪ <b>Ownership of land and other assets:</b></td> <td>▪ <b>Adequate, 1 Pt</b></td> <td>▪ <b>Adequate, 1 Pt</b></td> </tr> <tr> <td>▪ <b>Access to and decisions on financial services:</b></td> <td>▪ <b>Adequate, 1 Pt</b></td> <td>▪ <b>Adequate, 1 Pt</b></td> </tr> <tr> <td>▪ <b>Control over use of income:</b></td> <td>▪ <b>Adequate, 0 Pt</b></td> <td>▪ <b>Adequate, 1 Pt</b></td> </tr> <tr> <td>▪ <b>Work balance:</b></td> <td>▪ <b>Not Adequate, 0 Pt</b></td> <td>▪ <b>Not Adequate, 0 Pt</b></td> </tr> <tr> <td><b>Collective Agency:</b></td> <td><b>Collective agency</b></td> <td><b>Collective agency</b></td> </tr> </tbody> </table>	COI Survey	Baseline	Mid-Term	<b>Dimensions:</b>			<b>Intrinsic agency</b>	<b>Intrinsic agency</b>	<b>Intrinsic agency</b>	▪ <b>Autonomy in income:</b>	▪ <b>Adequate: 1Pt</b>	▪ <b>Adequate: 1Pt</b>	▪ <b>Self-efficacy:</b>	▪ <b>Not Adequate: 0 Pt</b>	▪ <b>Not Adequate: 0 Pt</b>	▪ <b>Attitudes about intimate partner violence:</b>	▪ <b>Adequate, 1 Pt</b>	▪ <b>Adequate, 1 Pt</b>	<b>Instrumental Agency</b>	<b>Instrumental agency</b>	<b>Instrumental Agency</b>	▪ <b>Input in productive decisions:</b>	▪ <b>Not Adequate, 0 Pt</b>	▪ <b>Adequate, 1 Pt</b>	▪ <b>Ownership of land and other assets:</b>	▪ <b>Adequate, 1 Pt</b>	▪ <b>Adequate, 1 Pt</b>	▪ <b>Access to and decisions on financial services:</b>	▪ <b>Adequate, 1 Pt</b>	▪ <b>Adequate, 1 Pt</b>	▪ <b>Control over use of income:</b>	▪ <b>Adequate, 0 Pt</b>	▪ <b>Adequate, 1 Pt</b>	▪ <b>Work balance:</b>	▪ <b>Not Adequate, 0 Pt</b>	▪ <b>Not Adequate, 0 Pt</b>	<b>Collective Agency:</b>	<b>Collective agency</b>	<b>Collective agency</b>
COI Survey	Baseline	Mid-Term																																						
<b>Dimensions:</b>

### **Paraiba Rural Sustainable Development Project**

### **Design Report**

### **Annex: 15 Fiduciary Agreements And Requirements**

Mission Dates: 20-28/05/2024

Document Date: 05/09/2024

Project No. 2000004620

Report No. 6938-BR

Latin America and the Caribbean  
Programme Management Department

Country : Brazil

Division : RND

Operation No .: BR-L1623

Year : 2024

## Fiduciary Agreements and Requirements

**Executing Agency (OE) :** State of Paraíba through the Secretariat of Family Agriculture and Semi-Arid Development (SEAFDS)

**Name of the Operation :** Sustainable Rural Development Project of the State of Paraíba - PROCASE II

### I. Fiduciary context of the Executing Agency

#### 1. Use of country system in operation

<input checked="" type="checkbox"/> Budget	<input checked="" type="checkbox"/> Reports	<input checked="" type="checkbox"/> Information System	<input type="checkbox"/> National Public Tender (LPN)
<input checked="" type="checkbox"/> Treasury	<input type="checkbox"/> Internal audit	<input checked="" type="checkbox"/> Price Comparison	<input type="checkbox"/> Others
<input checked="" type="checkbox"/> Accounting	<input checked="" type="checkbox"/> External Control	<input type="checkbox"/> Individual Consultants	

#### 2. Fiduciary execution mechanism

<input checked="" type="checkbox"/>	Co-Financing	The International Fund for Agricultural Development (IFAD) will provide joint co-financing of US\$10 million directly to the State of Paraíba. The Bank and IFAD will sign a Coordination Agreement that will detail operational responsibilities, including the Bank's technical, fiduciary, environmental and social supervision of the execution of IFAD resources, as well as the coordination of supervision missions between both institutions.
<input checked="" type="checkbox"/>	Co-executors/Sub-executors	The Paraíba Company for Research, Rural Extension and Land Regularization (EMPAER) will act as sub-executor of the land regularization activities of component II. As part of the preparation, an Institutional Capacity Analysis of the SEAFDS and the EMPAER was carried out.
<input checked="" type="checkbox"/>	Particularities of fiduciary execution	The SEAFDS will be responsible for the technical and fiduciary management of the Project, and in whose structure a Project Management Unit (UGP) will be created with the objective of guaranteeing compliance with the loan contract and that provided for in the ROP. The UGP will have, in addition to the central team in João Pessoa, territorial offices. The program will have a Management Committee, which will have a strategic planning function, including, among others, the review of annual reports and the approval of the Annual Operational Plan (POA) and Collegiates of Sustainable Territorial Development (CODETER) in the project area, organizations to the participation and local coordination of the actions of the government, social organizations and civil society, which will fulfill a consultative function, serving as a space for the communication of the actions carried out by the project and the coordination with other initiatives that occur in the territories.

### 3. Fiduciary capacity

Fiduciary capacity of the EMB	The evaluation of the institutional and fiduciary capacity of the SEAFDS and the EMPAER concluded that they have previous experience in executing similar Programs, including with resources from IFAD – PROCASE I, and a medium institutional capacity for the execution of the Program. To avoid possible difficulties and delays in execution due to weaknesses found and possible delays in the procurement processes, it is proposed: (i) nominate all members of the PMU; (ii) hire the Inter-American Institute for Cooperation on Agriculture (IICA) as a specialized agency to support procurement management, given its experience in similar projects, including PROCASE I; and (iii) the provision of training, by the Bank and IFAD, on fiduciary policies and procedures.
-------------------------------	---

### 4. Fiduciary risks and risk response

Risk Taxonomy	Risk	Risk level	Risk response
Organizational structure	Difficulties and delays in execution due to weaknesses found and possible delays in procurement processes	Medium-High	Hire IICA; Conduct training for the UGP Team.
Internal processes	Delays in the accountability of beneficiaries for the resources transferred to their organizations	Medium-High	Establish a clear accountability mechanism in the ROP; Sign a legal instrument between the UGP and each beneficiary organization, detailing responsibilities and procedures.

### 5. Policies and Guides applicable to the operation: OP-273-12

### 6. Exceptions to Policies and Guides: Does not apply

## II. Aspects to be considered in the Special Stipulations of the Loan Contract

Special conditions prior to the first disbursement: No
Exchange rate: For the purposes of the provisions of Article 4.10 of the General Standards, the Parties agree that the applicable exchange rate will be that indicated in subsection (b)(i) of said Article. For the purposes of determining the equivalence of expenses incurred in Local Currency charged to the Local Contribution or the reimbursement of expenses charged to the Loan, the agreed exchange rate will be the purchase exchange rate set by the Central Bank of Brazil in force on the date effective in which the Borrower, the Executing Agency or any other natural or legal person to whom the power to make expenses has been delegated, makes the respective payments in favor of the contractor, supplier or beneficiary.
Type of Audit: During the execution of the program, audited financial statements will be presented annually no later than 120 days after the close of each fiscal period. The external audit will be carried out by an external firm acceptable to the Bank. Final EFAs for the program will be submitted no later than 120 days after the date of the last disbursement.

## III. Agreements and Requirements for the Execution of Acquisitions

<input checked="" type="checkbox"/>	<p>Tender documents</p>	<p>For acquisitions of Works, Goods and Non-Consulting Services executed in accordance with the Procurement Policies (document GN-2349-15), subject to LPI, the Bank's Standard Bidding Documents (SEs) or those agreed between OE and the Bank for the private acquisition. Likewise, the selection and contracting of Consulting Services will be carried out in accordance with the Consultant Selection Policies (document GN-2350-15) and the Standard Request for Proposals (SEP) issued by the Bank or agreed upon between the OE will be used. and the Bank for the particular selection.</p>
<input checked="" type="checkbox"/>	<p>Use of National Systems</p>	<p>The COMPRASNET System is accepted by the Bank for the acquisition of common goods and services up to the LPI threshold.</p> <p>In addition, for the contracting and implementation of the Resilient Investment Plans and Business Plans (approximately 200 PIR and 60 PN) planned, community organizations or cooperatives will be contracted respectively, for which the SEAFDS will sign a legal instrument with each one establishing obligations and responsibilities. in the execution of the plan, as well as the conditions for disbursements to organizations, percentages and means of verification. The model of this legal instrument will be included as an annex to the ROP. This selection and contracting process is carried out based on the National Procurement Law and regulated by Law No. 12,188/10 and Regulated Decree No. 7,215/10 - National Technical Assistance and Rural Extension Program – PNATER.</p>
<input checked="" type="checkbox"/>	<p>Hiring and Direct Selection</p>	<p>The direct contracting of the Inter-American Institute for Cooperation on Agriculture (IICA) is planned as a specialized agency to manage contracts corresponding to the PMU staff and the training that is part of the administration and management costs of the program, which involves a total of US \$5.88 million. The total estimated cost of this IICA contract is US\$471,000 for the six years of execution, and payments will be made based on (percentage) of the resources executed. The main functions of IICA will be: (i) hiring of technical and administrative personnel to manage the program; and (ii) logistics contracting for the implementation of training actions planned for administration and management. This entity will receive transfers of resources from the program to carry out these contracts and acquisitions. Such contracting is justified in accordance with the provisions of GN-2350-15, 3.11 (d), due to the exceptional value experience of this institution, demonstrated by its extensive experience and track record in supporting project execution, knowledge and experience of its technical staff in procurement policies of international organizations and their experience in PROCASE I.</p>
<input checked="" type="checkbox"/>	<p>Advance Acquisitions Retroactive Financing</p>	<p>The Bank may recognize, with a charge to the local contribution, up to the sum of US\$2.5 million (10% of the estimated amount of the local contribution), eligible expenses incurred by the borrower before the date of loan approval, through the SEAFDS and EMPAER, for the hiring of PMU personnel, studies and diagnoses, and services and equipment necessary for project management and for the execution of component actions, provided that requirements substantially analogous to those have been met. established in the loan contract. These expenses must have been incurred as of July 5, 2023 (registration date of the operation), but in no case will expenses incurred more than 18 months before the loan approval date be included.</p>

<input checked="" type="checkbox"/>	<b>Procurement Supervision</b>	<p>The supervision method will be ex post, except in those cases where ex ante supervision is justified. For acquisitions that are executed through the national system, supervision will be carried out through the country's national supervision system. The method ((i) ex ante, (ii) ex post or (iii) national system) of supervision must be determined for each selection process. Ex post reviews will be carried out in accordance with the Project Supervision Plan, subject to change during execution. The ex-post review reports will include at least one visit (The inspection verifies the existence of the acquisitions, leaving the verification of quality and compliance with specifications to the sector specialist) of physical inspection, chosen from the acquisition processes subject to the review ex post. [Summary of provisions] [Link]. The threshold amounts for ex post review are the following:</p> <table border="1" data-bbox="480 647 1445 846"> <thead> <tr> <th data-bbox="480 647 719 745">Executing agency</th> <th data-bbox="719 647 962 745">Plays</th> <th data-bbox="962 647 1203 745">Goods/Services</th> <th data-bbox="1203 647 1445 745">Consulting services</th> </tr> </thead> <tbody> <tr> <td data-bbox="480 745 719 846">SEAFDS and EMPAER</td> <td data-bbox="719 745 962 846">USD 25MM</td> <td data-bbox="962 745 1203 846">USD 5MM</td> <td data-bbox="1203 745 1445 846">USD 1MM</td> </tr> </tbody> </table>	Executing agency	Plays	Goods/Services	Consulting services	SEAFDS and EMPAER	USD 25MM	USD 5MM	USD 1MM

**IV. Agreements and Requirements for Financial Management**

<input checked="" type="checkbox"/>	Programming and Budget	<p>The PMU will be responsible for coordinating the planning process for the execution of program activities. The budget allocation resources are made available through SEPLAG - Secretary of State for Planning, Budget and Management of the Government of the State of Paraíba, on the occasion of a previously sent file containing the POA instrument, prepared by PROCASE, with the respective values and actions that will be developed this year.</p> <p>After sending the file detailed above, between the period from September to November of each fiscal year, SEPLAG, by letter sent to PROCASE/SEAFDS, informs the availability of budget allocation to be inserted into the SIOP system - Integrated Planning and Management System. Budget, which feeds information for the formalization of the PLOA - Annual Budget Bill.</p> <p>Once the information has been entered into the SIOP, the SEPLAG sends the PLOA for voting in the Legislative Assembly, once finalized, the values will be internalized in the SIAF system - Integrated State Financial Administration System, a system that carries out budget management. , financial and accounting of the Government of the State of Paraíba.</p>
<input checked="" type="checkbox"/>	Treasury and Disbursement Management	<p>The State treasury system will be used where expenses will be subject to the budget and financial execution process and registered in the SOF. Disbursements will be made in United States dollars, mainly in the form of advances of funds. The value of the advances will be based on a financial execution projection of up to 180 days. For advances after the first, the rendering of accounts for at least 60% of the accumulated balance of unjustified advances will be necessary. The financing resources disbursed by the IDB will be administered through an exclusive bank account that allows receiving and managing these resources and carrying out bank reconciliations.</p> <p>The exchange rate agreed upon with the executing agency for the accounting of expenses paid with resources from the advances of loan funds will be the internalization rate. To determine the equivalence of the expenses incurred in the local contribution or the reimbursement of the expenses charged to the loan, the agreed exchange rate will be the purchase rate set by the Central Bank of Brazil in force on the effective date of payment of the expenses. eligible for the project.</p>
<input checked="" type="checkbox"/>	Accounting, information systems and reporting	<p>The SIGMA system of the Cooperar Project is an integrated computer tool to support the implementation of the Project, in which it is possible to manage information on various related topics, such as the management of contracts for goods, works, services and consultancies signed with its creditors, management of subprojects and agreements with organizations of the State of Paraíba, daily management and asset management, in addition to allowing information management and the automatic generation of various documents related to the loan contract with the World Bank, such as Acquisition Plan, POA, Budgets , SOE and IFR.</p>

		<p>SIGMA, adapted from the SMI - Information Monitoring System of the Rio Grande do Norte (RN) Project, in which the information was integrated with the Integrated Financial Administration System of the State of Rio Grande do Norte (SIAF), allowing autonomously all the financial information of the Project, eliminating the possibility of typographical errors and automating the presentation of disbursement reports to the World Bank.</p> <p>In a similar way to what happened between SMI (RN) and SIGMA (PB), PROCASE seeks to partner with the Cooperar Project, through a Protocol term for the supply of the SIGMA system with the supply of the system source codes, the data of the database structure and all connections. scripts and other accessory functions for its correct functioning. The system that will be available will receive a new name (to be defined) and will be personalized according to the characteristics of the loan agreement with the IDB/IFAD.</p>
<input checked="" type="checkbox"/>	<p>Internal Control and internal audit</p>	<p>The Bank does not rely on the internal audit function of the institutions in charge of executing the project.</p>
<input checked="" type="checkbox"/>	<p>External control and financial reporting</p>	<p>The external audit of the program will be carried out by an external audit institution eligible for the Bank, preferably the State Court of Accounts. The fiscal period of the Program is between January 1 and December 31 of each year. During the execution of the program, audited financial statements will be presented annually as of December 31 of each year, no later than 120 days after the close of each fiscal period. The final Audited Financial Statements of the program will be presented no later than 120 days after the date of the last disbursement, or its extensions.</p>
<input checked="" type="checkbox"/>	<p>Financial Supervision of the operation</p>	<p>The operation requires financial supervision that will include ex post review of disbursements, annual audit and review of disbursement requests. Under the responsibility of the fiduciary team, reviews and on-site and desktop support will also be carried out with a periodicity, subject to adjustments during execution, of an annual frequency that will consist of supervision visits.</p>

PARAIBA

PROCASE II  
BR-L1623

**COSTOS**

INFORME FINAL BORRADOR

## Introducción

1. El presente documento tiene como objetivo sintetizar las principales supuestos, hipótesis y resultados de las estimaciones de costos del Proyecto de Desarrollo Rural Sostenible de Paraíba, así como el plan de financiamiento para el período de implementación que se ha estimado en seis (6) años. La información presentada ha sido elaborada mediante la utilización del software COSTAB.
2. Los datos de costos fueron validados a partir de documentos elaborados durante el diseño del Proyecto como ser el Marco Lógico y la Matriz de Resultados y las consultas específicas al equipo de PROCASE I que ha acompañado en las misiones a los equipos del FIDA y del BID.
3. En el apéndice I se presentan las tablas detalladas de costos por componente, subcomponente y actividad con los precios unitarios utilizados en los cálculos realizados en moneda local y dólares estadounidenses con las cantidades a ejecutar durante cada año de actuación del proyecto.

### *Principales supuestos e hipótesis*

4. **Duración del Proyecto.** La duración del proyecto se ha planeado a seis (6) años, previendo su inicio para 1 de junio de 2025 y finalizando, en consecuencia, el 30 mayo de 2031.
5. **Cofinanciamiento.** El valor total del Proyecto consiste en un préstamo del Fondo Internacional de Desarrollo Agrícola (FIDA) por un monto total de USD 10 millones de dólares estadounidenses y un préstamo del Banco Interamericano de Desarrollo (BID) equivalente a USD 70 millones, sumando en total USD 80 millones como financiamiento externo (76 % de los costos totales). El Gobierno del Estado de Paraíba contribuirá con recursos propios por un valor de USD 25 millones de dólares estadounidenses que representan el 24% de los costos totales para la realización del presente Proyecto.
6. **Tasa de cambio.** La tasa de cambio proyectada para la estimación de costos fue de R\$ 5,00/USD 1,00, valor en conformidad con la variación media de cambio actual propuesta por el Banco Central de Brasil, según el Informe de Mercado Focus (Abr/24).
7. **Contingencias de precios.** La contingencia de precios no se llevó a cabo para la operación, ya que el principal agente financiador (BID) informó que no utiliza esta metodología para la provisión de recursos ante el riesgo de inversión a los cambios en los precios a lo largo del tiempo.

8. **Costos unitarios.** La estimación de costos unitarios se basa en las actividades de recolección de datos realizadas por el equipo del FIDA y el BID durante las misiones de diseño con la colaboración del equipo del proyecto PROCASE I para elaborar las hojas de cálculo iniciales y alimentar el software COSTAB. También se utilizó como referencia el marco lógico del proyecto y documentos complementarios.

9. **Impuestos y tarifas.** Los costos se presentan con todos los impuestos incluidos según las referencias disponibles y en el cálculo se incorporaron diferentes tasas, tarifas e impuestos que eventualmente inciden sobre las actividades financiadas por el Proyecto dentro de Brasil.

***Resumen de las principales tablas de costos del proyecto.***

10. **Costos Totales.** El costo total del proyecto para un período de implementación de seis (6) años se calculó en USD 105 millones de costo base. Los costos de inversión ascienden a un total USD 96,5 millones (91.9% del total de Recursos), mientras que los costos recurrentes en salarios y costos operativos son equivalentes a USD 8,5 millones. (8,1 %). En el Grafico I se observa la proporción de forma ilustrativa:

**Gráfico I. Costos de Inversión vs Costos Recurrentes**

11. **Costos por componente.** El Proyecto Desarrollo Rural Sostenible de Paraíba -PROCASE II- se estructura mediante 2 componentes de inversión y un componente para la gestión, seguimiento y evaluación del proyecto. El Componente 1: Sistemas productivos resilientes para reducir la pobreza rural tiene un valor calculado de USD 63,416 millones (60,4 % de los costos totales). El Componente 2: Fortalecimiento organizacional y de capacidades y gestión del conocimiento cuenta con aproximadamente USD 31,3 millones que representa el 29.8 % de los costos totales presupuestados. Los costos del Componente 3, “Gestión, seguimiento y evaluación del proyecto” se estimaron en USD 10,2 millones (9,8 % de los costos totales) como se observa en la Tabla 1.

**Tabla 1. Costos totales por Componente en divisa estadounidenses (USD) y en moneda local (R\$)**

<b>Total PROJECT COSTS</b>	<b>63,416,000</b>	<b>60.4%</b>	<b>31,302,800</b>	<b>30%</b>	<b>10,281,200</b>	<b>9.8%</b>	<b>105,000,000</b>	<b>100.0%</b>

13. Los costos totales se han categorizado como grafica la Tabla 2 donde se observa que el 22,2% de ellos se destinará a la inversión en Asistencia Técnica -ATER-, el 61% en Subsidios (PIR y PN), el 5 % en Insumos y Servicios y el 3,7% en Capacitación, talleres y reuniones. No se invertirá en Obras Civiles en el marco de los costos de inversión planificados. Respecto a los costos recurrentes los salarios representan el 5% y los costos operativos un 3,1% del total de los gastos, totalizando un 8,1% del total. El Grafico II ilustra esta descripción:

**Gráfico II. Costos Totales del proyecto por Categoría de Gasto (USD).**

14. La ejecución del presupuesto presenta una forma acampanada para sus seis (6) años planificados, en los cuales durante el año 1 se planea ejecutar solo el 2% del presupuesto, incrementándose levemente hasta un 5% para el

año dos (2), pasando una alta demanda del 21% al año de tres (3) de iniciada la actividad del proyecto, para alcanzar durante el año cuatro (4) su máxima demanda de fondos y pico de ejecución con USD 36,2 millones que representan el 34% del presupuesto total.

15. Para el año cinco la demanda se reduce y se estima será del 25% de los fondos para llegar al año seis (6) con la necesidad presupuestaria de USD 12,663 millones (12%) para realizar las últimas actividades de inversión y el cierre del proyecto. En la tabla 3 se observan las demandas de fondo por año y componente.

**Tabla 3. Costos totales por Componente y año de implementación (USD)**

Project Components by Year -- Totals Including Contingencies	Totals Including Contingencies (u\$d)

2. Fortalecimiento organizacional y de capacidades y gestión del conocimiento	222,500	1%	4,348,800	14%	10,770,000	34%	12,650,000	40%	1,916,000	6%	1,395,500	4%	31,302,800
3. Gestión, seguimiento y evaluación del proyecto	2,131,204	21%	1,163,996	11%	1,610,000	16%	1,860,000	18%	1,660,000	16%	1,856,000	18%	10,281,200
<b>Total PROJECT COSTS</b>	<b>2,353,704</b>	<b>2%</b>	<b>5,552,796</b>	<b>5%</b>	<b>21,622,400</b>	<b>21%</b>	<b>36,205,600</b>	<b>34%</b>	<b>26,601,600</b>	<b>25%</b>	<b>12,663,900</b>	<b>12%</b>	<b>105,000,000</b>

16. En el Grafico III se ilustra la curva de la demanda de fondos del Proyecto, mostrando gráficamente su forma de “campana”, llegando al pico de demanda para el año cuatro (4), comenzando durante los primeros años con necesidades menores, cambiando la pendiente al año tres (3), llegando al pico al año cuatro (4) donde cambia la tendencia y comienza la reducción de demanda de fondos, aunque permanece muy elevada durante el año cinco (5) y desciende para el año seis (6).

17. Para una eficaz y eficiente ejecución de las actividades del proyecto, es fundamental que los organismos financiadores y el Gobierno de Paraíba tomen las medidas necesarias para poder atender esas demandas respecto a los techos presupuestarios y los topes máximos para los adelantos de fondos.

### Gráfico III. Curva de ejecución por año de implementación

18. En el Gráfico IV se ilustra la demanda de fondos del proyecto desagregada por año y por componente, dejando en claro los diferentes periodos de solicitudes que presenta cada componente para cumplimentar con sus objetivos específicos y poder cumplir con el objetivo general del proyecto.

19. El componente 3, presenta su máxima demanda al año uno (1), destinada a la compra de equipamiento, estudios de base y puesta en marcha del proyecto y luego una demanda homogénea a lo largo del proyecto; el componente 2 congruente con sus objetivos de mejoras en las capacidades de los beneficiarios y sus organizaciones, incrementa proporcionalmente desde el año uno al año cuatro donde se reduce su demanda; y, finalmente las barras del componente 1 ilustran que la totalidad de sus fondos destinados a la inversión productiva y a la mejora comercial mediante los PNs y los PIRs y al apoyo en innovación de tecnologías, comienza su ejecución recién al año tres (3), con las capacidades de los beneficiarios fortalecidas e incrementa sus demandas hasta el año cinco(5) inclusive, colocando fondos durante el último año del proyecto inclusive.

## Gráfico IV. Costos por año por componente

20. **Plan de financiamiento.** El Proyecto Desarrollo Rural Sostenible de Paraíba será financiado mediante un préstamo del BID, por el valor de USD 70 millones (66,7 % de los costos totales); un préstamo del FIDA, por el valor de USD 10 millones (9,5 % de los costos totales) y un aporte del Gobierno de Paraíba equivalente a USD 25 millones (23,8%).

21. El plan de financiamiento fue elaborado según lo acordado entre los representantes de los organismos financiadores, de modo que los recursos se distribuyan de manera proporcional entre los tres (3) componentes según participación de cada financiador sobre el valor total del Proyecto. La distribución de recursos para cada componente resultó la siguiente:

**Tabla 4. Distribución de recursos por componente según organismo financiador. (USD)**

## INTRODUCCIÓN

El presente documento tiene como objetivo exponer la metodología y resultados del análisis económico ex-ante del Proyecto PROCASE II, financiado por el Banco Interamericano de Desarrollo (BID) y por el Fondo Internacional de Desarrollo Agrícola (FIDA) y el Estado de Paraíba de la República Federal de Brasil.

El objetivo de este documento es el de analizar los potenciales efectos de los recursos presupuestados para la financiación del proyecto y la estimación de los impactos deseados a partir de la evaluación de los potenciales beneficios que generarían las inversiones planificadas.

Para ello, el análisis se realiza, por un lado, desde la perspectiva de los participantes individuales (los beneficiarios) a través de un análisis financiero, y por otro, a partir de su agregación total de los beneficios, evaluando el impacto del Proyecto en la economía de Brasil y de Paraíba en su conjunto (análisis económico) al que se le adicionan las externalidades entre las cual se le incluyeron las estimaciones de los impactos sociales y ambientales.

El presupuesto total estimado del Proyecto asciende a US\$ 105 millones y contará con la financiación del BID por US\$ 70 millones (66,7 %), del FIDA, por valor de US\$ 10 millones (9,5%), y del Estado de Paraíba como contraparte por un total de US\$ 25 millones.

El objetivo general del proyecto es: “Reducir los niveles de pobreza rural, mejorar la seguridad alimentaria y nutricional y adaptar a la población rural al cambio climático”.

Los objetivos específicos son: (i) Aumentar la adopción de tecnologías agrícolas, incluidas las de adaptación y mitigación del cambio climático; (ii) Mejorar la inclusión productiva y social de los agricultores familiares, dando prioridad a las mujeres, los jóvenes, los Pueblos y Comunidades Tradicionales (PCT) y las personas con discapacidad (PcD) y (iii) Mejorar las condiciones medioambientales de las comunidades rurales y su entorno.

El presente documento se divide en tres secciones fundamentales: (i) el análisis financiero, donde se calcula la rentabilidad privada de los participantes y se desarrollan las principales hipótesis para su cálculo; (ii) el análisis económico, sobre la rentabilidad global del proyecto y sus respectivos beneficios sociales y ambientales; y (iii) el análisis de sensibilidad de los resultados globales obtenidos para evaluar los potenciales riesgos de la presente inversión, tanto para los organismos financiadores como para los Gobiernos interesados.

Este análisis fue realizado utilizando con un enfoque de Análisis Económica y Financiera (AEF) por ser interpretarla como la herramienta más adecuada para evaluar la conveniencia de ejecutar un proyecto con estas características, tanto para sus beneficiarios directos como para la economía nacional brasileña en su conjunto.

La metodología utilizada fue un Análisis Costo Beneficio (ACB) mediante el cual se determinó la alternativa del “mantenimiento del statu quo” (SQ) o situación “sin el proyecto” de los

potenciales beneficiarios del proyecto y a continuación se la comparó con las opciones de intervención propuestas por el proyecto. Se analizó el valor agregado (enfoque incremental) del proyecto aplicando a las respectivas “técnicas de descuento” y se cuantificaron los potenciales beneficios que resultarían en la implementación.

En paralelo se estimaron los costos de todos los recursos necesarios para la efectiva ejecución del proyecto (Inversiones en Planes de Inversión Resilientes (PIRs) y Planes de Negocio para Estructuración de Cooperativas (PNs), Asistencia Técnica Especializada (ATER), Capacitación, Fortalecimiento organizacional y/o comercial, compra de insumos operativos, costos administrativos, operacionales, de gestión, personal y recurrentes) y los costos necesarios para la sostenibilidad de los beneficios durante un período consistente con las inversiones planificadas.

Luego se convirtieron los flujos de beneficios y costos totales a precios económico y se calcularon los indicadores para la toma de decisiones, para finalmente someter estas hipótesis a un análisis de sensibilidad adaptado a las condiciones del entorno en el cual se desarrollaría el proyecto.

Los resultados obtenidos fueron positivos respecto a la potencialidad de llevar a cabo el presente proyecto, resultando en una tasa interna de retorno económico (TIRe) de **26,6%**, un valor actual neto económico (VANE) de **R\$ 262.817.658** equivalente a **USD 52.563.531** y una ratio beneficio-costos (B/C) equivalente a **2,5**. El análisis de sensibilidad mostró fuerte estabilidad de los indicadores frente a los diferentes escenarios planteados.

#### Componentes del Proyecto

Para alcanzar los objetivos planteados se prevé el financiamiento de actividades e inversiones agrupadas bajo dos (2) componentes de inversión e intervención y un componente de gestión, administración y seguimiento. Los mismos se describen a continuación:

#### **Componente I: Sistemas productivos resilientes para reducir la pobreza rural (USD 63,416,000).**

Este componente financiará la preparación e implementación de los 200 Planes de Inversión Resilientes (PIRs) que facilitarán a los beneficiarios el incremento en sus ingresos mediante el aumento de la productividad, la calidad y/o acceso a mejores mercados para la producción que impacten en la mejora de la calidad de vida en el ámbito rural mediante la adopción de tecnologías agrícolas adecuadas utilizando tecnologías para la adaptación y la mitigación del cambio climático; fomentando la inclusión productiva y social de los agricultores familiares, dando prioridad a mujeres, jóvenes, pueblos y comunidades tradicionales (PCT) y personas con discapacidad, mejorando las condiciones medioambientales de las comunidades rurales y su entorno. En el mismo sentido, mediante la financiación de 60 Planes de Negocio para estructurar cooperativas y/o unidades de transformación para reforzar y diversificar la comercialización de productos con valor agregado. Los PIRs y los PNs incluirán asistencia técnica especializada e inversiones para facilitar la adopción de tecnologías y mejorar las condiciones de comercialización de los productos de la agricultura familiar.

Adicionalmente, mediante estos instrumentos, el componente financiará tecnologías sociales para mejorar el acceso al agua para consumo humano como ser cisternas domiciliarias, pozos equipados, sistemas para la reutilización de aguas residuales, unidades de producción de energías renovables, ecotecnologías de gestión de la energía doméstica, hornos ecoeficientes y/o biodigestores. Este componente también financiará el fomento a la innovación mediante el apoyo al desarrollo de tecnologías innovadoras y/o adaptaciones de tecnología existente al medio específico de intervención del proyecto.

**Componente II: Fortalecimiento organizacional y de capacidades y gestión del conocimiento: (USD 31,302,800)** Este componente financiará inversiones para el fortalecimiento de las capacidades de los agricultores familiares mediante la realización de eventos de formación para organizaciones Agroecológicas ATER y CTE y asistencia directa de ATER Agroecológico para el apoyo a las familias beneficiarias. En el mismo sentido se han planeado actividades de capacitación e intercambios entre agricultores con la intención de ampliar redes de relaciones y aprender de experiencias entre pares. Mediante actividades del componente se capacitará en formas para el acceso a las políticas públicas vigentes y otros programas de desarrollo rural, con el objetivo de reducir las barreras de acceso a estos instrumentos.

Con el objetivo de fortalecer las capacidades de comercialización de las organizaciones de la agricultura familiar se asistirán a 60 cooperativas y/o organizaciones de productores en técnicas para el desarrollo comercial de sus organizaciones. Asimismo, se ha planeado dar apoyo para en la creación de nuevas ferias y/o el mejoramiento de cincuenta (50) estructuras/espacios comerciales existentes. Se apoyará la mejora de los servicios de inspección sanitaria para su correcto funcionamiento y se realizará un piloto de certificación participativa para los productores beneficiarios como experiencia para la generación de valor agregado.

Mediante el Subcomponente 2.3 del proyecto se llevarán adelante las acciones orientadas a el apoyo a la diversidad, género, juventud, nutrición y seguridad alimentaria y se apoyarán la creación y ejecución de un plan de género y diversidad, un plan para la juventud y su correcta ejecución, un plan para el Fortalecimiento del PCT y un plan de nutrición y seguridad alimentaria. Parte del presupuesto del subcomponente será utilizado para contratar a Agentes de Desarrollo Local que acompañaran desde el segundo año de ejecución a los beneficiarios del proyecto. Se plantea comenzar con treinta agentes (30) y arribar al año seis con doscientos (200) agentes trabajando en el territorio. Otro tema fundamental a ser apoyado por el subcomponente 2.4 es el apoyo a la regularización de la tenencia de la tierra de los beneficiarios. Se estima poder apoyar a aproximadamente 5000 familias en tenencia de la tierra informacion medioambiente. Finalmente, mediante las actividades planeadas en el componente se apoyará la elaboración y publicación de sistematizaciones y estudios sobre gestión del conocimiento, se realizarán acciones y reuniones anuales de comunicación y difusión en la gestión del conocimiento y se financiarán acciones de intercambio de Cooperación Sur-Sur que se evalúen de alto impacto para el público objetivo del proyecto.

**Componente III: Gestión, seguimiento y evaluación del proyecto (USD 10,281,200)** Financiará las necesidades de equipamientos, personal y otros gastos de administración y gestión del Proyecto. Representará el 9,8% de los fondos totales a ser invertidos por el Proyecto. Mediante este componente se financiarán las oficinas territoriales que generarán capilaridad en el territorio para mejorar la llegada del proyecto a los beneficiarios. Asimismo, se financiarán las actividades de Seguimiento y Evaluación (SyE) y los estudios de línea de base, revisión de medio término (RMT) e impacto del proyecto y sus respectivas auditorías.

Objetivos del análisis económico-financiero ex ante

El objetivo del análisis económico y financiero (AEF) fue el de asegurar la asignación eficiente del gasto público. El AEF de los proyectos de inversión como el analizado mediante este documento resulta esencial para la toma de decisiones tanto por parte de los inversionistas (BID, FIDA y el Gobierno de Paraíba, en este caso) como por parte de los beneficiarios del proyecto para incorporarse al mismo.

Resulta una herramienta crítica para tomar una decisión sobre si es prioritaria la financiación de un proyecto e imparten directrices en ese sentido a los gobiernos beneficiarios. Este análisis es indispensable para una correcta evaluación ex ante del valor global de un proyecto e incluso puede estimar la probabilidad de que los beneficiarios adopten las intervenciones propuestas.

Un buen AEF proporciona información fundamental para comprender la conveniencia de las inversiones privadas desde el punto de vista de los beneficiarios objetivo (Análisis Financiero) y a su vez mostrar a los gobiernos como se asignarán los recursos públicos, su eficiencia y su eficacia para el logro de los impactos buscados (Análisis Económico). El AEF proporciona indicadores claros y sencillos para asegurar que las inversiones de un proyecto generen los beneficios previstos en los hogares y en la zona de influencia de un proyecto.

A partir de esta premisa, para la realización del presente AEF, lo primero que se hizo fue determinar cuál es la alternativa del “mantenimiento del statu quo” (SQ) o situación “sin el proyecto” de los potenciales beneficiarios del proyecto, y a continuación compararla con las opciones propuestas mediante el diseño de diferentes modelos de intervención que representen las actividades más frecuentes y con potencialidad de desarrollo en el territorio definido y a partir de ahí se analizó el valor agregado (enfoque incremental) del proyecto.

El AEF utiliza el análisis de costo – beneficio y dado que los costos y los beneficios no tienen lugar al mismo tiempo (por lo general, los costos preceden y sobrepasan a los beneficios durante los primeros años del proyecto y los beneficios se materializan gradualmente durante un período más largo) la comparación no es directa por lo tanto se aplican “técnicas de

descuento” para poder realizar el análisis.

A partir de este enfoque se han llevado a cabo el presente AEF mediante la identificación y cuantificación de los potenciales beneficios que resultarían en la implementación del Proyecto. Con este objetivo se estimaron los costos de todos los recursos necesarios para llevar adelante las actividades planeadas (inversiones, asistencia técnica, insumos operativos, costos administrativos, operacionales, de gestión, mano de obra, etc.) que serán necesarios durante la ejecución y para la continuidad de los beneficios del Proyecto durante el período de análisis.

En los siguientes apartados se resume la teoría de cambio del proyecto y cómo se han monetizado los resultados esperados del Proyecto. Asimismo, se describe la metodología empleada para llevar a cabo el análisis económico ex-ante del Proyecto, los principales supuestos contemplados, así como las estimaciones de los beneficios y costos incrementales y el cálculo de los indicadores de desempeño y los resultados obtenidos en su escenario base y en los escenarios alternativos del análisis de sensibilidad.

#### Teoría del cambio de la intervención

El Proyecto pretende reducir la pobreza y la inseguridad alimentaria y nutricional mediante inversiones en agricultura familiar, garantizando el desarrollo y fortalecimiento de sistemas alimentarios sostenibles. Esto mejorará la resiliencia y los ingresos de los agricultores, tratando de reducir así las desigualdades del grupo objetivo en relación con el resto de la población. El Proyecto ampliará las iniciativas de éxito y las soluciones innovadoras llevadas a cabo mediante el PROCASE I y con el objetivo de extenderlas a todo el estado de Paraíba.

Actualmente, los sistemas de producción locales se caracterizan por su baja productividad, escasa diversificación, baja adopción de prácticas agroecológicas, altos niveles de degradación de los recursos naturales y elevados niveles de vulnerabilidad al cambio climático, especialmente a las sequías. Existen pocas oportunidades de acceso a la tierra, los servicios y los mercados adaptados que fomenten la producción sostenible de alimentos y la creación de nuevos empleos.

Para abordar estos retos, el Proyecto trabajará en dos líneas de actuación. En la primera, el resultado esperado es garantizar que las familias y comunidades rurales mejoren sus sistemas alimentarios y de producción accediendo a nuevos mercados y aumentando las ventas con soluciones sostenibles adaptadas y resilientes al clima. Estos resultados se lograrán a través de: Inversiones a través de los Planes de Inversión Resilientes, para mejorar los sistemas de producción diversificados, resilientes y nutritivos con una gestión sostenible de los recursos naturales, orientados a la intensificación de la producción y al aumento de los ingresos; Tecnologías Sociales para la captación y almacenamiento de agua de lluvia; Infraestructuras de

saneamiento doméstico a pequeña escala; Tecnologías e innovaciones en maquinaria, herramientas o estructuras para producir energía renovable y/o más eficiente; Inversiones a través de los Planes de Negocio (PNs) para mejoras/adaptaciones de pequeñas unidades de procesamiento para diversificar y fortalecer el acceso al mercado. Un enfoque territorial participativo integrado con asistencia técnica adaptada a los grupos destinatarios será la base para lograr un impacto más significativo y permitir una restauración más amplia de los recursos naturales y los servicios ecosistémicos. Esto, a su vez, contribuirá a una producción agroecológica diversificada y productiva, mejorando la nutrición y el empoderamiento de los beneficiarios. La asistencia técnica y el apoyo a las organizaciones de productores tienen como objetivo mejorar el acceso a mercados agroecológicos y crear más oportunidades para el incremento en las ventas de los beneficiarios.

En la segunda línea de acción se mejorarán las capacidades de las familias rurales, en particular de los grupos destinatarios y de sus organizaciones, para que adopten prácticas climáticas resilientes y amplíen su acceso a la tierra y a otras políticas públicas. Se fortalecerán los servicios y las capacidades de los técnicos, extensionistas y se prestará Asistencia Técnica Especializada (ATER) para difundir las mejores prácticas para la producción agroecológica que mejor se adapten al cambio climático y fortalezcan la seguridad alimentaria de las familias beneficiarias.

Se apoyarán metodologías participativas que respondan a las necesidades específicas de los grupos destinatarios, valorando la biodiversidad, la generación de innovaciones y/o adaptaciones de tecnologías al entorno, el uso de tecnologías sociales que mejoren la calidad de vida rural y las acciones claves para facilitar el acceso a mejores mercados.

Se trabajará en la promoción del empoderamiento transversal, especialmente con los grupos destinatarios del proyecto, mediante sesiones de formación, información, sensibilización e intercambios. El apoyo a la titulación de tierras y a la regularización medioambiental estará en la agenda del Proyecto, así como la difusión de las políticas públicas existentes para promover y garantizar el acceso a las mismas.

Otro factor clave será la identificación e implementación de innovaciones tecnológicas para maquinaria adaptada a la agricultura familiar. El proyecto pretende ir generando materiales de Gestión del Conocimiento a lo largo de su ejecución y realizar actividades para ampliar el intercambio de conocimientos en los países del Sur Global a través de intercambios entre sus protagonistas.

Los beneficios estimados del proyecto vendrán asociados al incremento directo de los ingresos de las familias beneficiarias de los PIRs y los PNs que se han estimado en aproximadamente 23.040 familias, las cuales generarán incrementos en la actividad económica de sus comunidades generando impactos indirectos. Entre las externalidades producidas por estas actividades, contemplando el enfoque de la asistencia técnica del proyecto se prevé una reducción de las emisiones CO<sub>2</sub> y un incremento en el secuestro de los gases de efecto

invernadero. Este es uno de los beneficios esperados y fue cuantificados en el presente trabajo. En el cuadro 1 se representa esquemáticamente la teoría de cambio del proyecto:

**Cuadro 1: Esquema de la Teoría del cambio PROCASE II**

PROYECTO PROCASE II TEORÍA DEL CAMBIO				
Objetivo: Reducir los niveles de pobreza rural, mejorando la seguridad alimentaria y nutricional, y la adaptación de la población rural al cambio climático.				
Insumos	Actividades	Productos	Resultados	Impactos
Apoyo técnico	<b>C1. Sistemas productivos resilientes para reducir la pobreza rural</b>	<b>C1. Sistemas productivos resilientes para reducir la pobreza rural</b>	<b>OE1. Incrementar la adopción de tecnologías agrícolas, incluidas aquellas para la adaptación y mitigación del cambio climático.</b>	Índice de Pobreza Multidimensional (Headcount ajustado)
	1.1. Implantación de sistemas de producción biodiversos resilientes	Planes de Inversión Resiliente (PIR) acordados Planes de Inversión Resiliente (PIR) ejecutados con más del 75% de rendición de cuentas	Porcentaje de familias que utilizan insumos, tecnologías o prácticas sostenibles o climáticamente inteligentes Agricultores con mejor acceso a inversiones y servicios agrícolas	
	1.2. Fortalecimiento y diversificación de la comercialización	Planes de negocios para la estructuración de cooperativas/unidades de procesamiento acordadas Planes de Negocios para la estructuración de cooperativas/unidades de procesamiento ejecutados con más del 75% de responsabilidad		
1.3. Incentivos a la innovación	Tecnologías innovadoras desarrolladas o adaptadas			
Materiales de construcción	<b>C2. Fortalecimiento organizacional y de capacidades y gestión del conocimiento</b>	<b>C2. Fortalecimiento organizacional y de capacidades y gestión del conocimiento</b>	<b>OE2. Mejorar la inclusión productiva y social de los agricultores familiares, priorizando a las mujeres, los jóvenes, los Pueblos y Comunidades Tradicionales (PCT) y las personas con discapacidad (PcD)</b>	Agricultores que aumentan su producción agrícola
Financiamiento	2.1. Fortalecimiento de las capacidades de los agricultores familiares	Eventos de capacitación realizados para entidades ATER Agroecológicas y CTE Familias atendidas por ATER Agroecológica Se realizaron eventos de capacitación e intercambios de agricultores. Eventos de capacitación para el acceso a Políticas Públicas y Otros Programas	Porcentaje de agricultores familiares que venden su producción en los mercados Organizaciones apoyadas por PN aumentan sus ventas	Número de toneladas de emisiones de gases de efecto invernadero (CO2e) evitadas y/o secuestradas
	2.2. Fortalecimiento de las capacidades de las organizaciones para comercialización	Cooperativas y organizaciones de productores atendidas con CTE Ferias locales y centros de marketing creados/mejorados. Servicios de Inspección Sanitaria en funcionamiento Piloto de sistemas participativos de certificación en funcionamiento	Porcentaje de mujeres que ocupan puestos directivos en organizaciones rurales Cambio en el porcentaje de personas que reportaron estar empoderadas en relación con la línea de base Personas con nuevos trabajos	
Equipamiento técnico e informático	2.3. Diversidad, género, juventud, nutrición y seguridad alimentaria	Plan de género y diversidad elaborado Fases anuales del Plan de Género y Diversidad implementadas Plan de juventud elaborado Fases anuales del Plan Juventud implementadas Plan de Fortalecimiento del PCT elaborado Fases anuales del Plan de Fortalecimiento del PCT implementadas Plan de Nutrición y Seguridad Alimentaria elaborado Fases anuales del Plan de Nutrición y Seguridad Alimentaria implementadas Agentes de Desarrollo Local contratados	<b>OE3. Mejorar las condiciones ambientales de las comunidades rurales y su entorno.</b>	
	2.4 Regularización de tierra y ambiental	Familias beneficiadas por la regularización fundiaria y ambiental	Superficie de propiedades rurales registradas en el CAR Comunidades con título de regularización territorial y ambiental entregado	
	2.5 Gestión del conocimiento y cooperación sur-sur y triángula	Sistematizaciones y estudios en Gestión del Conocimiento elaborados y publicados Implementadas fases anuales de Comunicación y Difusión en Gestión del Conocimiento Realizados eventos de intercambio de Cooperación Sur-Sur		

## Beneficiarios del Proyecto

El PROCASE II abarcará las áreas rurales de los doscientos veintitrés (223) municipios del Estado de Paraíba, sin embargo las intervenciones priorizarán las comunidades en función de los criterios técnicos definidos, a saber: i) incidencia de la pobreza rural (Registro Único); ii) presencia de Pueblos y Comunidades Tradicionales (PCTs); iii) incidencia en la inseguridad alimentaria y nutricional; iv) concentración de mujeres y jóvenes rurales; v) acceso limitado al agua para consumo humano y producción; vii) evitar solapamientos con otras intervenciones de desarrollo como el PROCASE I, Sertão Vivo y PDHC III.

Se ha estimado que unas 60.000 familias (210.000 personas) de la agricultura familiar se beneficiarán directamente con el Proyecto, de las cuales el 50% serán mujeres, el 20% jóvenes, el 5% PCT y el 2% personas con discapacidad.

Los principales grupos destinatarios del Proyecto son: i) agricultores familiares en situación de pobreza y extrema pobreza, ii) mujeres rurales, iii) jóvenes rurales, iv) PCTs, v) Personas con Discapacidad (PcD), y v) LGBTQIABP+.

El principal grupo objetivo está formado por agricultores familiares en situación de pobreza y vulnerables a la inseguridad alimentaria y nutricional, cuyos sistemas de producción se caracterizan por una baja productividad y vulnerabilidad medioambiental y climática.

Las mujeres rurales se enfrentan hoy a restricciones en el control y el acceso a los recursos naturales, sociales y monetarios. Las mujeres dirigen el 24% de las unidades de agricultura familiar, pero sólo poseen el 15% de la superficie total de las zonas de agricultura familiar. Sólo el 15% de las agricultoras familiares reciben asistencia técnica, frente al 17% de los hombres.

Los principales retos a los que se enfrenta la juventud rural son: i) la falta de oportunidades de empleo e ingresos, ii) la falta de acceso y control sobre los recursos, insumos, bienes y tecnologías, y iii) la escasa participación y poder de decisión en las organizaciones rurales y comunitarias. Esta situación promueve un intenso proceso de migración de la juventud rural a las zonas urbanas.

Los pueblos indígenas y otras comunidades tradicionales (PCT) son especialmente vulnerables debido a dinámicas históricas de exclusión (incluso en la formulación de políticas públicas), a la gran dependencia de los recursos naturales, a la marginación de las formas de vida y al escaso acceso a los servicios esenciales. Un 68% de las quilombolas y un 73% de los pueblos indígenas de la zona del Proyecto viven en la pobreza o en la extrema pobreza.

Las personas LGBTQIAPN+ emigran a zonas urbanas y tienen dificultades para permanecer en el entorno escolar debido a los fuertes prejuicios de la sociedad, tienen ingresos y oportunidades de empleo muy limitados y son víctimas de discriminación y violencia.

Las personas con discapacidad (PCD) tienen menores tasas de éxito escolar y un acceso más

limitado a las actividades económicas, factores importantes que contribuyen a la pobreza familiar. En Paraíba, el 89% de las personas con discapacidad no trabajan, y el 74% ganan menos del salario mínimo.

El Registro Único se utilizará como mecanismo de focalización directa del proyecto. Alrededor del 70% de las familias beneficiarias de cualquier organización rural participante deberán tener “perfil” en el Registro Único (pobreza y/o pobreza extrema). La focalización directa se combinará con otras medidas: la auto focalización (por ejemplo, trabajando a través de grupos para abordar necesidades específicas), la focalización en el desarrollo de capacidades y las medidas operativas (por ejemplo, especialista en género e inclusión social; promoción de la paridad de género y sensibilización del equipo del Proyecto y de los socios ejecutores en cuestiones de género, edad, raza e identidad).

Se ha calculado que el Proyecto, mediante sus diferentes actividades y estrategias de intervención, tendrá un alcance para 60.000 familias de la agricultura familiar mediante la ejecución de sus componentes de inversión. Mediante el cuadro 2 que se adjunta a continuación se representa la distribución de los mismos por actividad reservando cuando los beneficiarios pueden encontrarse duplicados, ósea, ser beneficiarios de más de una de las actividades del Proyecto:

**Cuadro 2: Estimación de los beneficiarios del proyecto por actividad**

## METODOLOGIA Y SUPUESTOS DEL ANÁLISIS

### Aspectos Generales Metodológicos

El análisis realizado ha adoptado la metodología del ACB ajustada a dos factores condicionantes: (i) la información primaria y secundaria disponible en relación con las actividades e inversiones dentro del ámbito del Proyecto debido a su experiencia previa y (ii) la cadena causal o teoría del cambio generada por las intervenciones de cada uno de los componentes que producirá impactos socioeconómicos cuantificables.

En primera instancia se ha realizado un análisis estructural del diseño del proyecto y su teoría del cambio de la cual se desprende que sus componentes presentan una intensa interacción y complementariedad siendo extremadamente complejo y arbitrario dividir los beneficios estimados de manera independiente y aislada por componente. El Componente I, a través de los modelos de intervención diseñados, presenta facilidad para el cálculo de los retornos monetizables, cuantificables y mensurables pero su impacto total está fuertemente solapado con los impactos de las acciones del componente II pudiendo afirmar que el análisis de los modelos de inversión captura los beneficios de ambos componentes.

Las actividades de apoyo directo y de asistencia técnica y formación del Componente II resultan fundamentales para el “éxito” del Componente I y son absolutamente necesarias para que sean alcanzados los efectos deseados. Por esta razón, para el análisis de beneficios totales del proyecto se realizó un análisis integral del proyecto y no se un análisis discriminando los beneficios por componente y/o subcomponente.

Con esta finalidad se han realizado los cálculos para el presente ACB tomando como beneficios incrementales los ingresos de los PIRs y de los Planes de Negocio para estructurar cooperativas/unidades de transformación, cuantificando a los costos de asistencia técnica, capacitación, formación y administración y gestión del proyecto como costos integrales del Proyecto, lo cual equivale a restarle al Costo Total del proyecto los fondos destinados al financiamiento de los PIRs y los PNs y definir ese resultado como el Costo del Proyecto incrementales en el flujo de caja económico del mismo.

De conformidad con la metodología habitualmente utilizada en los ACB de proyectos de desarrollo rural, se han planteado dos alternativas o escenarios comparables: (i) Alternativa Sin Proyecto y (ii) Alternativa Con Proyecto. La primera alternativa corresponde a las proyecciones económicas futuras de no llevarse a cabo el Proyecto, es decir, un escenario de continuidad en la situación actual o business as usual (BAU) de las familias de Agricultores Familiares beneficiarios; la misma será “comparada” con la segunda alternativa que incluye los impactos económicos estimados que serían generados por la ejecución eficaz del Proyecto.

Con la información recogida mediante fuentes altamente confiables y el apoyo de técnicos del equipo que ejecutó el PROCASE I se modelizaron cinco (5) Planes de inversión resilientes (PIRs) y dos (2) Planes de Negocios para la estructuración de cooperativas/unidades de

transformación con el objeto de estimar los beneficios potenciales que generaría la ejecución del proyecto. Con este horizonte, los modelos fueron diseñados representando las actividades con potencialidad de desarrollo en el territorio en el cual se ejecutaría el Proyecto.

Con el equipo técnico del PROCASE I se ha evaluado que los modelos representan las actividades con mayor moda y simbolizan aproximadamente el 60% del total de actividades que desarrollan efectivamente los agricultores familiares en estos territorios. Para cada uno de los modelos se realizaron estimaciones y cálculos de los impactos financieros de las potenciales inversiones y se calcularon los indicadores claves para concluir sobre la capacidad y la voluntad de los productores rurales para participar e implicarse en los riesgos del proyecto. Se trata de verificar el impacto positivo de las actividades de las familias rurales modeladas mediante el cálculo de (i) la producción física; (ii) el empleo o mano de obra solicitada; (iii) el flujo de caja; (iv) el beneficio; (v) el ingreso neto familiar (beneficio + valor de la mano de obra familiar), (vi) la tasa interna de retorno (TIRf); y (vii) el valor actualizado de los beneficios (VANf).

A continuación, se realizó el Análisis Económico del Proyecto para lo cual fue necesario realizar un ajuste a valores de precios económico de los costos de insumos, mano de obra, utilización de factor de conversión a precio sombra del tipo de cambio y el valor de la tasa social de descuento correspondiente. Se realizó la agregación de los beneficios de las inversiones y se adicionaron los beneficios sociales y ambientales monetizables del proyecto, para realizar el flujo de caja económico del Proyecto y calcular el Valor Actual Neto económico ("VANe"), la Tasa Interna de Retorno económica ("TIRE") y la ratio Beneficio-Costo (B/C) del Proyecto.

Finalmente se realizó un análisis de sensibilidad de los retornos económicos del Proyecto ante cambios en las variables críticas del Análisis costo Beneficio (ACB) y en su caso las variables sujetas a un mayor grado de variabilidad. El análisis económico-financiero tiene como base los objetivos y supuestos plasmados en la teoría de cambio y en la matriz de resultados, monetizando los resultados esperados y cuantificando los costos en que se incurrirá para alcanzarlos.

#### Supuestos Generales

El horizonte temporal considerado para el análisis corresponde al ciclo económico o de vida útil de las inversiones o activos más relevantes que irían a implementarse mediante la ejecución de los PIRs y los PNs y que han sido objeto del análisis cuantitativo de beneficios. La duración de este ciclo se determina considerando las proyecciones durante la cual se espera que se generen los beneficios económicos incrementales del Proyecto y se ha estimado en veinte (20) años.

La tasa de descuento utilizada de referencia tanto para el análisis financiero como para el análisis económico fue del 12%, ya que es la tasa usada habitualmente en este tipo de evaluaciones y es consistente con la actual tasa de interés del Banco Central de Brasil. Esta tasa es una referencia como factor temporal de los impactos socioeconómicos esperados en

el futuro, sin embargo, no pretende reflejar el costo temporal de los recursos, sino un costo de oportunidad comparativamente homogéneo de los fondos empleados en el desarrollo del Proyecto.

Se han analizado las inversiones productivas agroecológicas y de tecnologías sociales, así como las pequeñas mejoras en infraestructura y se ha considerado conveniente contemplar un periodo de análisis máximo de 20 años para evaluar el retorno de la inversión del proyecto.

Para la cuantificación de los impactos socioeconómicos, la unidad de medida ha sido el Dólar Americano, en términos constantes de 2024, es decir, deflactado de cualquier efecto generado por la inflación de precios corrientes.

Las hipótesis estimadas inicialmente fueron tomadas en moneda local, el Real Brasileño (BRL) en función de la metodología de levantamiento de precios y se ha convertido a USD a una tasa de cambio constante de 5 BRL por USD, la tasa vigente al momento de diseño del proyecto (mayo de 2024).

Para la conversión de los modelos financieros al flujo de caja económicos los costos han sido ponderados, en su caso, de acuerdo con el porcentaje impositivo de 17% correspondiente al Impuesto sobre la Circulación de Mercancías y Servicios en Brasil (ICMS). Este impuesto indirecto no supone un costo incremental para la economía del país sino una transferencia de recursos entre sus distintos actores. Asimismo, se ha corregido los valores de la mano de obra usando el factor de conversión 0,68 para trabajo de baja calificación y de 0,78 para trabajo especializado. Estos coeficientes han sido calculados para el noreste de Brasil por el Instituto de Investigación Económica Aplicada en un estudio con el objetivo de subsidiar análisis de costo beneficio de proyectos de inversión en Brasil.

Outputs del ACB: parámetros de rentabilidad financiera y económica

Para cada uno de los siete (7) modelo ilustrativo de posibles inversiones (cinco (5) PIR y dos (2) PNs del proyecto se han calculado indicadores de desempeño financiero: como el margen neto, el incremento del ingreso familiar, el rendimiento del trabajo por familia y el aumento de la ocupación generada. Asimismo, se han construido sus respectivos flujos de caja incremental a 10 años para cada modelo analizando la situación sin y con proyecto y se calcularon la tasa interna de retorno (TIRf), valor actual neto (VANf) a precios de mercado y el benéfico costo (B/C) de cada posible intervención.

**Para el análisis económico** se han calculado la TIRe, la VANE y el índice de beneficio/costo (B/C) de la agregación de los flujos de caja de todos los modelos a precios económicos ponderados a una tasa de adopción del 67% que fue la tasa de adopción efectiva PROCASE I<sup>1</sup>. La agregación se ha realizado teniendo en cuenta el año estimado de incorporación de los beneficiarios al Proyecto.

<sup>1</sup> AVALIAÇÃO DO PROJETO DE DESENVOLVIMENTO RURAL SUSTENTÁVEL DO CARIRI, SERIDÓ E CURIMATAÚ: LIÇÕES APRENDIDAS E PERSPECTIVAS PARA O FUTURO DA GESTÃO AMBIENTAL NO ÂMBITO DA AGRICULTURA FAMILIAR DO SEMIÁRIDO PARAIBANO À LUZ DA CONCERTAÇÃO Autor: Thiago Cesar Farias da Silva Orientador: Professor Dr. Bartolomeu Israel de Sousa, Universidade Federal da Paraíba (UFPB) Buscar la bibliografía del análisis ex post del PROCASE I

**El Valor Actual Neto (“VAN”)** también conocido como valor actualizado neto o valor presente neto corresponde al valor presente de los flujos de caja netos (ingresos - egresos) originados por una inversión<sup>2</sup>. Su valor se calcula de la siguiente forma:

$$VAN = \sum_{t=1}^n \frac{F_t}{(1+d)^t} - I_0$$

Donde:

$F_t$  representa los flujos de caja en cada periodo t.

$I_0$  es el valor del desembolso inicial de la inversión.

$n$  es el número de periodos considerado.

$d$  es la tasa de descuento.

Para el análisis de PROCASE II:

$F_t$  = Beneficios anuales incrementales agregados de los modelos financieros a precios económicos

$I_0$  = Costos anuales futuros en términos constantes

$n$  = horizonte de tiempo del análisis (20 años)

$d$  = Tasa de descuento (12%).

Mediante el cuadro 4 se ilustra una matriz para la toma de decisiones en función del valor de la VAN de un Proyecto de Desarrollo Rural:

**Cuadro 4: Tabla de decisión en base a la VAN**

Tabla de decisión en base a la VAN		
Valor	Significado	Decisión a tomar
VAN > 0	La inversión produciría ingresos por encima de la rentabilidad exigida por la tasa de descuento .	El proyecto puede aceptarse
VAN = 0	La inversión no produciría ingresos superiores a una inversión alternativa con una rentabilidad exigida por la tasa de descuento. Punto de indiferencia.	Dado que el proyecto no agrega valor monetario por encima de la rentabilidad exigida ( $r=d=TIR$ en este caso), la decisión debería basarse en otros criterios que evalúen otro tipo de beneficio que no han sido incorporados en el análisis.
VAN < 0	La inversión produciría ingresos por debajo de la rentabilidad exigida por la tasa de descuento o incluso puede generar pérdidas.	El proyecto debería rechazarse

**Tasa Interna de Retorno (“TIR”)** Es la tasa de descuento que permite que el VAN de los impactos socioeconómicos netos a lo largo del horizonte temporal del análisis, se iguale a 0. Para que un proyecto sea recomendable, se espera que dicha tasa supere a la tasa de descuento de referencia del 12%, tal y como se ha señalado anteriormente.

<sup>2</sup> <https://economipedia.com/definiciones/valor-actual-neto.html>

**Ratio Beneficio/Costo** se define como el cociente de los valores actuales de beneficios y costos del Proyecto. Si la ratio Beneficio/Costo es superior a la unidad, los beneficios esperados son superiores a los costos en valor actual o actualizados lo que indica la viabilidad socioeconómica del Proyecto, y el grado de cobertura general de sus beneficios incrementales esperados por sobre los costos incrementales anticipados.

**Análisis de sensibilidad** se realiza partiendo del escenario base del ACB calculado, al cual se lo “somete” a potenciales cambio en las variables utilizadas a los efectos de analizar los movimientos de los indicadores calculados en dicho escenario. Se realiza con el objetivo de analizar la performance del proyecto ante potenciales cambios en el contexto general macroeconómico, climático, social y/o de gestión del proyecto. Se realiza un análisis de sensibilidad de los parámetros de rentabilidad y viabilidad descritos más arriba, ante cambios en las variables clave del ACB para el proyecto. Se analizaron las siguientes variables:

- a. Combinación de riesgos que afectan los precios de los productos, los rendimientos y las tasas de adopción
- b. Aumento de los precios de los costos de inversión.
- c. Atrasos o lenta capacidad de implementación del proyecto.
- d. Baja capacidad de gestión y negociación de los grupos de agricultores.
- e. Fluctuaciones de precios de mercado.
- f. El alcance del servicio del proyecto es limitado, baja en la tasa de adopción.

Beneficios Cuantificados:

(i) Beneficios económicos

Para la realización del análisis descripto se modelizaron dos (2) tipos de intervención planificados, a saber:

Los Planes de Inversión Resiliente (PIR) que consistirán en procesos de transferencia de tecnologías agropecuarias con enfoque agroecológico, inversiones sociales para la mejora en la calidad de vida en el ámbito de la agricultura familiar e inversiones ambientales específicas. Estos planes se canalizarán mediante asociaciones y/u organizaciones de productores. Esta intervención generará beneficios socioeconómicos a través de los siguientes impactos monetizables (cuantificables en moneda de curso legal): (i) incremento de los ingresos agropecuarios de los agricultores familiares (AF) derivados de una mejora en la productividad, aumento del valor de sus productos debido a mejoras en la calidad y mejor integración en las distintas cadenas de valor que catalicen un mejor acceso a mercados y la reducción de pérdidas que generen sistemas productivos más eficientes; (ii) mejora del balance de carbono generada por la recuperación de pastizales y la implantación de Sistemas Agrícola Forestales (SAF) y de conservación ambiental de las actividades desarrolladas con la mejora de uso de insumos en la producción hortícolas, (iii) mejora del balance de carbono generada por la instalación de hornos ecoeficientes que reducirán el consumo de leña de las

familias, la instalación de viveros comunitarios y la construcción de biodigestores que reducirán las emisiones de gases a la atmosfera y la instalación de cisternas para mejorar la administración y gestión del recurso agua. (impacto de las tecnologías sociales y ambientales)

Para que se pudiera cuantificar los beneficios y los costos incrementales generado por esta intervención, se han considerado cinco (5) modelos de PIR y dos (2) modelos de PN con sus respectivas inversiones, costes, beneficios esperados. Estos modelos son; (i) un modelo de “Horticultura e fruticultura irrigada” para una asociación de 90 familias; (ii) un modelo de “Crianza de Cabras en Sistema Agroforestal” para la venta de cabras en pie de 3 organizaciones que agrupan a 90 familias, (iii) un modelo para la “Avicultura Capira con SAF forrajero” para la mejora en la producción aviar de carne y huevo, que nuclea a tres organizaciones de 30 familias aproximadamente para un total de 90 familias beneficiarias. (iv) Un modelo para 90 familias que producen leche de bovinos en un sistema SAF forrajero y (v) un modelo para la mejora del sistema productivo caprino de leche también vinculado a un sistema Agro Forestal con producción forrajera.

Los dos PN para la potencialización comercial de cooperativas y/o unidades de transformación que se han modelados se vinculan uno al procesamiento de algodón agroecológico, su acopio y la generación de valor agregado para una asociación de 90 socios. El otro PN se orienta a una cooperativa más pequeña que realiza el procesamiento y fraccionamiento de miel para incrementar el valor agregado del producto. Beneficiaría a 81 familias socias de la Cooperativa.

Las referencias utilizadas en la realización del ACB para estas inversiones ha sido el proyecto PROCASE I que se ha ejecutado en el estado de Paraíba y ha sido financiado por el FIDA en la cual se han acompañado y apoyando intervenciones muy similares a las propuestas en esta modelación las cuales son altamente representativas del entorno.

Esto queda reflejado en el documento “Pesquisa de Seguimento da Avaliação de Impacto do Projeto” donde los CBA realizadas para el informe de cierre de ese proyecto a partir de encuestas aplicadas a una muestra de organizaciones de productores y de hogares que ilustraban la representatividad del esquema del análisis de este documento.<sup>3</sup> En el trabajo se tomaron los resultados promedios de costos y beneficios de estas encuestas y se construyeron modelos financieros detallados (CBA) para cada una de las principales actividades apoyadas (caprino, ovino, fruticultura, artesanías, etc.)

Los resultados de estos análisis financieros por actividad han sido comparados con los incrementos reales de producción y ventas reportados en las evaluaciones de impacto del PROCASE I y en los sistemas de monitoreo del proyecto para confirmar que los modelos producidos eran representativos del promedio de las inversiones en las cuales hubo adopción por parte de los beneficiarios.

Los resultados de estos modelos han posteriormente sido extrapolados para el total de inversión en actividades productivas, tomando en cuenta la tasa de adopción reportada por

---

<sup>3</sup> <chrome-extension://efaidnbmnnnibpcajpcglclefindmkaj/https://aksaam.ufv.br/ToolSys/Download/Publicacao/173/265>

el sistema de monitoreo de los proyectos. Este estudio ha sido de vital importancia a la hora de diseñar los modelos de intervención del presente Proyecto, generando información clave, verificable y representativa de las actividades que demanda efectivamente el territorio de intervención.

Los Planes de Negocio (PN), promovidos a través de cooperativas de productores, podrán incluir una gama de actividades en torno principalmente a la implementación de infraestructuras e instalaciones de apoyo productivo, procesamiento y valor agregado y a la asistencia técnica especializada en comercialización y conexión a mercados.

Su diseño responderá al diagnóstico de la cadena de valor identificada como prioritaria en cada una de las cooperativas beneficiarias. Los beneficios generados monetizables, así como los costos de inversión y operación de esta intervención son de la misma naturaleza que los identificados para los PIRs (con excepción de la instalación de hornos a gas que no ocurre en estos casos). Para su cuantificación se ha recurrido a dos (2) modelos de PNs a los cuales se le realizó su respectivo análisis de costo beneficio, un modelo fue diseñado para el procesamiento y adecuación post cosecha de algodón agroecológico y el otro para el procesamiento y fraccionamiento de productores de miel o con variedades mejoradas e inversión en postcosecha gestionada por una cooperativa que será la responsable de las por la venta.

#### (ii) Beneficios ambientales

Para el cálculo monetizables de los beneficios ambientales del Proyecto, se deben realizar estimaciones sobre el balance de carbono atribuible al proyecto. Este balance genera un número que nos indicará, entre todas las actividades que lleva a cabo el proyecto, cuantas secuestran o reducen las emisiones y cuantas producen elementos que perjudican el medio ambiente.

Este balance se realizó mediante la herramienta Ex Ante Carbon-Balance Tool (EXACT), basada en la metodología del Grupo Intergubernamental de Expertos sobre el Cambio Climático (IPCC) de las Naciones Unidas.

La herramienta calcula los cambios en las reservas de carbono y las emisiones de GEI, incluidos el dióxido de carbono (CO<sub>2</sub>), el metano (CH<sub>4</sub>) y el óxido nitroso (N<sub>2</sub>O), que una vez convertidos en CO<sub>2</sub> equivalente se utilizan para derivar el balance de carbono que indica el impacto del proyecto.

Así como el análisis económico en general, el EX-ACT diferencia entre fase de implementación del proyecto y fase de capitalización. La fase de implementación es de seis años, pero el período cubierto por el análisis es de 20 años (implementación y capitalización), siguiendo las recomendaciones del IPCC. En el anexo III del presente trabajo se observan los resultados expresados por la herramienta y su valuación monetaria correspondiente.

La evaluación valoró los impactos de las intervenciones en comparación con el escenario habitual (BAU) para los tres (3) Sistemas Agroforestales (SAF), el modelo de producción frutihortícola en parcelas de 1000m<sup>2</sup> por beneficiario y la instalación de 500m<sup>2</sup> de riego por

goteo por beneficiario, y otra evaluación para la producción de aves para huevos y carne en sistemas SAF, en los cuales se implantan 1000m<sup>2</sup> en cada hogar beneficiario para mejorar la dieta de las aves criadas de manera agroecológica.

El análisis también se aplica a ambos PNs modelos, en los cuales, a pesar de hacer foco en el acopio, procesamiento y generación de valor agregado de la producción y en el desarrollo de una estrategia de desarrollo comercial, es posible realizar balances analizando las formas de funcionamiento del sistema productivo y los impactos en el entorno que pueden generar la instalación de nuevos espacios de valor agregado.

Los supuestos establecidos para la cuantificación de los beneficios ambientales son los mismos que han sido considerados para la cuantificación de los beneficios económicos. Estos sistemas generan cambios a nivel de biomasa aérea y subterránea (sistemas agroforestales y regeneración de manantiales) y de emisiones por el uso de insumos en 10.260 hectáreas relativas a los sistemas agrícolas y agroforestales apoyados por el proyecto. Los cambios en el stock de carbono derivados de las acciones sociales, productivas y ambientales derivadas de la instalación de 135 pozos de agua equipados con bombas solares, 750 cisternas de 56.000 litros para la mejora en el almacenamiento de agua de lluvia, la instalación de 3485 sistemas de reciclaje de aguas grises, la instalación de 8680 hornos ecológicos, 3485 biodigestores y 600 viveros comunitarios para la producción de plantines con doble propósito; la sostenibilidad de los SAF y la producción de plantines para las huertas familiares, diversificando las variedades de alimentos y mejorando la nutrición de las familias beneficiarias.

Este balance de carbono se ha monetizado siguiendo las directrices más recientes del Banco Mundial<sup>4</sup> con un supuesto conservador utilizando como costo social del carbono el más bajo (LCP) (51 USD/tCO<sub>2</sub>-eq) (ver ANEXO III).

En el Cuadro 3 a continuación se desagregan las inversiones sociales y ambientales a llevar adelante por cada uno de los PIR modelizados.

**Cuadro 3: Inversiones Sociales y Ambientales de los PIRs**

PIRs	Inversiones Sociales y ambientales por PIR												
	Cantidad de PIRs	Pozos equipados	Total	Cisternas de producción	Total	Sistemas de reuso de aguas cinzas	Total	Hornos Ecológicos	Total	Biodigestor	Total	Vivero para producción de plantines (colectivo)	Total
Horticultura y Fruticultura Bajo Riego	45	3	135	3	135	12	540	54	2430	12	540	3	135

<sup>4</sup> Guidance note on shadow price of carbon in economic analysis. World Bank, September, 2017

## Beneficios no cuantificados

La evaluación económica realizada no consideró beneficios intangibles o de compleja medición como son determinados beneficios sociales que se generarán por la gran cantidad de inversiones que se realizarán en este sentido, pero se quieren dejar explicitados mediante este apartado.

Los beneficios de las actividades de regularización de la tenencia de tierras y algunos ambiental suele diferir según los casos y países, siendo el catastro ambiental una particularidad en la República de Brasil. Por este motivo no ha sido posible encontrar una referencia pertinente que se pudiera usar para estimar los beneficios económicos atribuibles a algunas de estas inversiones. Sin embargo, dada su participación dentro del conjunto de actividades y el hecho de que es una motivación concreta para la generación/conservación ambiental – tierras con catastro ambiental son monitoreadas y penalizadas con multas si no cumplen con las áreas mínimas de preservación ambiental definidas por ley – se considera como una inversión complementaria a la adopción de las nuevas prácticas y tecnologías promovidas para la adaptación al cambio climático.

La titulación de tierras puede también servir de incentivo a invertir en Sistemas Agroforestales y en mantenimiento de pasturas naturales y cultivos perenes.

Otros ejemplos evidentes son la mejora del acceso al agua y tratamiento de efluentes, que generan mejoras en la salud de las familias, con sus consecuentes impactos en ahorros por movilidad a los nosocomios y la compra de medicamentos.

La implantación de viveros para el mantenimiento de las SAF, pero con el doble propósito de generar plantines para las huertas familiares también son relevantes pero difícil de mensurar. En el mismo sentido el incremento de la oferta de diferentes productos saludables, acompañados de formación nutricional, seguramente irán mejorando la nutrición y alimentación de los beneficiarios directos e indirectos, generando empleo genuino y apoyando la inclusión social de los usuarios del proyecto.

Es clara la alta probabilidad de que las inversiones sociales generen beneficios monetarios como el incremento en el valor de la vivienda anualizados, incrementos en el rendimiento del trabajo del hogar y (disminuciones de costos de internamiento hospitalario atribuibles al abastecimiento de agua de calidad y en mayor volumen, así como a la existencia de saneamiento básico.

Otro ejemplo es el caso del PN para el valor agregado de algodón agroecológico, no fue posible estimar con precisión el impacto potencial de los proveedores de la planta que probablemente podrían realizarían la transición agroecológica en sus parcelas productivas debido a la instalación de la planta, con el objeto de incorporarse a la nueva cadena de valor generada por el PN. Para el modelo de la miel los impactos positivos a nivel ambiental serían más complejos de capturar mediante la herramienta utilizada, aunque sus beneficios son evidentes, no es posible cuantificar variables de manera confiable.

## ESTIMACIÓN DE BENEFICIOS DEL PROYECTO

De acuerdo con la teoría del cambio y el marco lógico del proyecto, los impactos contemplados en la estimación de los beneficios económicos se han cuantificado como se describe a continuación.

### BENEFICIOS NETOS

Como se ha indicado anteriormente, los beneficios socioeconómicos de las inversiones y actividades del proyecto han sido cuantificados mediante el impacto monetario de 2 tipos de intervención: (i) Los Planes de Inversión Resilientes (PIR) y (ii) Los Planes de Negocio (PN). Se han producido cinco (5) modelos ilustrativos de PIR y dos de PN, basado básicamente en la experiencia del PROCASE I y de acciones similares en el estado de Paraíba y nordeste de Brasil<sup>5</sup>. Las mismas fueron adaptables al incremento en la extensión del territorio del PROCASE II respecto al PROCASE I y a características diferenciales de suelo, clima y régimen hídrico de la heterogénea región nordestina. Todos los casos ilustrativos han obtenido resultados financieros positivos, producen un incentivo a la adopción de las prácticas y tecnologías promocionadas por el proyecto demostrando así que la estrategia técnica propuesta para el proyecto es sostenible. A continuación, se hacen breves descripciones de los casos ilustrativos considerados. En el cuadro 4 se observan los flujos de fondos financieros de los modelos.

**Cuadro 4: Beneficios Incrementales de los modelos de PIR y PN analizados**

ESTADO DE PARAIBA- BRASIL -PROCASE II-								
A N A L I S I S		Beneficios incrementales netos de los modelos						
		Horticultura y Fruticultura Bajo Riego	Crianza de Cabras en Sistema Agroforestal	Avicultura Campera con SAF forrajero	Bovino para Leche con SAF Forrajero	Caprinos para leche con SAF Forrajero	Algodón Agroecológico	Apicultura

	PY10	605862	619937	691370	1574309	809672	207750	158098
	VAN (f)	2,064,283	1,146,461	1,108,249	3,715,431	2,084,791	757,407	387,957
	TIR (f)	68%	29%	31%	46%	42%	85%	38%

A continuación, se realiza una descripción de los modelos y sus resultados como casos ilustrativos y ejemplificadores de la potencialidad de desarrollo e impacto que presenta el proyecto en el territorio de intervención.

**Modelo I -PIR-: “Horticultura e fruticultura irrigada”** mediante el cual se beneficiarían a 90

<sup>5</sup> Notas de otros proyectos en el NordEste brasileiro

familias de una comunidad que producen hortalizas con muy escasa tecnología y sin asesoramiento técnico adecuado. El plan contempla la instalación de estructuras de riego eficientes (500m<sup>2</sup>/beneficiario) que permitan desarrollar la actividad sin derrochar agua; introducir prácticas de producción agroecológicas que conserven el suelo, preserven la biodiversidad y se adapten al cambio climático, sobre todo para reducir las pérdidas por evapotranspiración.

Asimismo, se van a implantar tecnologías sociales que garanticen un ahorro económico a las familias, así como una mejora del bienestar y calidad de vida permitiendo un menor impacto en el medio ambiente.

Las inversiones se orientan a la construcción de sistemas de plataformas de hormigón como tecnología para cosecha de agua con desagüe dirigido a cisterna (reutilización), se piensa instalar seis (6) estructura con sus respectivos depósitos de agua de 10.000 litros a en altura para presurizar riego, se planea la provisión de Kit de riego por goteo para las noventa familias (500 m<sup>2</sup>/familia), por gravedad, con depósito de agua de 1.000 L y Tubería completa. Se van a instalar de tres (3) sistemas de energía solar fotovoltaica, un (1) kit de herramientas hortícolas para los beneficiarios, seis (6) depósito de agua de 10.000 litros, compra de 12 pulverizadores manuales de 20 litros de uso cooperativo, 720 contenedores de plástico para transportar cuidado de verduras, la compra de seis (6) remolques para moto, la compra de 21 puesto de mercado plegable (2,0 x 1,0 m), seis (6) moto cultivadores de unos comunitario.

Como inversiones sociales se van a situar tres (3) pozos equipados con sus bombas, sus respectivas cisternas para producción, doce (12) sistemas de reutilización de aguas grises en casas de familias beneficiarias, cincuenta y cuatro (54) cocinas ecoeficientes para reducir el consumo de leña y tres (3) biodigestores en los predios de los (3) viveros comunitarios que se instalarán para el sostenimiento de la producción de plantines de hortalizas y frutales.

Los ingresos incrementales provendrán del incremento en el volumen de las ventas de lechugas, cebollín, cilantro, guindilla, bananos y acerolas con presencia en ferias asesorados en producción AgroEcológica. La inversión total estimada es de R\$ 1,486,657 equivalente a USD 297331, generando los siguientes indicadores:

Retorno del trabajo Familiar	92.84
Discount rate	0.12
NPV @ 0.12	2,064,282.57
IRR	68%
NPVb	9,209,370.12
NPVc	8,019,910.06
<b>B/C ratio</b>	<b>1.15</b>

Las familias beneficiarias incrementaran sus ingresos anuales en R\$ 6,732.

**Modelo II -PIR- “Crianza de Cabras en Sistema Agroforestal”** se ha diseñado para organizaciones de 90 familias que son productores de cabras con elementos y capacidades

rudimentarias. Se espera mediante el PIR reforzar y profesionalizará la cría familiar de cabras para carne mediante la estructuración de unidades de producción familiares, la promoción de la adopción de prácticas de convivencia con la región semiárida y el fomento de la transición agroecológica, con el objetivo de garantizar la seguridad alimentaria del rebaño, conservar el medio ambiente y mejorar los ingresos familiares.

La profesionalización genera mejora en la calidad de la carne producida que se verá reflejado en el precio/ cabeza estimado. Para esto se plantea promover la implantación de sistemas agroforestales para la producción de forraje adaptados a la región semiárida que se ha estimado en una (1) hectárea por familia y generar un banco de proteínas para complementar la alimentación animal y se proporcionará orientación para mejorar la calidad genética del rebaño existente.

La asistencia técnica trabajará en mejorar las capacidades de los beneficiarios en prácticas de manejo sanitario y nutricional de las cabras y gestión de sistemas agroforestales. Se asistirá en la mejora para el acceso a mercados de forma más directa, acortando la cadena de intermediarios. Se fomentará la aplicación de tecnologías sociales adecuadas para mejorar la coexistencia con la región semiárida y desarrollar acciones encaminadas a la conservación del medio ambiente.

Con esta finalidad se va a invertir en Servicios de preparación del suelo en aproximadamente 122 ha, la adquisición de 4 moto ensiladoras, 3 picadoras de forraje, 3 mezcladores de pienso de 1000 kg, y 3 enfardadoras. Se invertirá en la compra de material para la implantación del SAF como Palma resistente a la cochinilla del carmín, Gliricidia, Leucena, Moringa, Abono orgánico - Estiércol bovino (1 ha SAF-F), material para alambrado de 5 hilos y la adquisición de materiales e insumos colectivos como forraje, 9 cortadora colectivas, la adquisición de perforadora colectiva de palmeras. En cuanto a las inversiones sociales se ha planteado la compra de 9 cisternas para producción y bebida de los animales, la instalación de 26 cocina ecoeficiente y la instalación de 16 sistemas de reutilización de aguas grises. Como recurso básico para la sostenibilidad de las SAF, se administrarán e instalarán 3 viveros para la provisión de plantines de material para uso tanto en forrajes como para la diversificación nutricional (frutas y verduras) de las familias beneficiarias. Los ingresos incrementales provendrán del incremento en el precio de las cabras criadas en un ambiente de producción AgroEcológica. La inversión total estimada es de R\$ 1.242.028 equivalente a USD 240.237, generando los siguientes indicadores de impacto:

Retorno del trabajo Familiar	184
Discount rate	12%
NPV @ 0.12	1,146,461
IRR	29%
NPVb	7,616,936
NPVc	5,747,585
B/C ratio	1.33

Se ha estimado que las familias beneficiarias incrementaran sus ingresos anuales en R\$ 9,633.

**Modelo III -PIR- “Avicultura Capira con SAF forrajero”** se ha diseñado para organizaciones de 90 familias que se dedican a la producción de pollos de campo para carne y huevos. El modelo simula un refuerzo y apoyo a la cría familiar de aves de corral al aire libre mediante la estructuración de unidades de producción familiares individuales y colectivas, con el objetivo de criar aves de corral para el consumo y para la venta de huevos y carne. Con esta finalidad se van a establecer estructuras adecuadas para el desarrollo de la cría, que permitan llevar a cabo una gestión alimentaria y sanitaria adecuada, formar a los beneficiarios en prácticas de manejo de aves de corral e introducir prácticas de producción, conservación de pastos y forraje para la producción de pollos. Se estimó que esta actividad tendrá una alta tasa de absorción d emano de obra de mujeres y jóvenes.

Se plantea un trabajo de ATER no solo en la mirada colectiva sino también apuntando a que los beneficiarios acceder a mejores oportunidades para comercializar sus productos, tanto de manera individual como colectivamente. Para cumplir con estos objetivos se realizarán inversiones que fortalezcan el funcionamiento de la asociación con vistas a mejorar los servicios y el apoyo a los miembros y diversificar y mejorar la alimentación y la nutrición de las familias implicadas. Mediante el PIR accederían a la adquisición de material para instalar gallineros rústicos de 20 m<sup>2</sup> en cada hogar familiar y un espacio de cría de pollitos BB y la implantación de un sistema agro forestal para las aves. Se comprarán 45 incubadores para 48 huevos, bebederos infantiles de 5 litros, bebedero automático, comedero infantil (5 kg) Comedero tubular (20 kg), láminas de zinc para proteger y calentar a los pollitos (0,5 x 4,0 m), campana de pollitos de aluminio con varilla de soporte en todas las viviendas familiares.

En el mismo sentido, y para uso colectivo se comprarán 3 picadora de forraje diésel de 7 CV con arranque eléctrico y tres (3) mezcladoras trifásicas, motor de 2 CV, capacidad de 500 kg con los cuales se podrán fabricar alimentos de forma comunitaria para todas las familias vinculadas a la asociación. Se comprarán 3 lanzallamas, 3 garrafas de gas, 6 balanza con capacidad de 150 kg y 3 remolque para moto para agilizar el transporte y la logística de alimentos.

En paralelo a estas inversiones y la asistencia técnica planteada se adquirirá pollitos camperos de 1 día de edad para mejora de la genética, se comprarán vacunas para mejorar el aspecto sanitario y alimento específico para abordar el aspecto nutricional (raciones pre- iniciales, soja, maíz) y plantines y semillas para implantar un SAF de 900 m<sup>2</sup> que provea de nutrientes en cada unidad productiva familiares. Respecto a las inversiones sociales se prevé la instalación de 30 sistemas de reutilización de aguas grises, 63 cocinas ecoeficientes y 3 viveros para la producción de plantines de uso colectivo con el doble propósito de sostener las SAF y ampliar las variedades y las calidades de las huertas familiares. Los ingresos incrementales provendrán del incremento en la cantidad y calidad de pollos caipira producidos, la cantidad de huevo y la reducción de pérdidas y roturas gracias a las mejoras en el manejo y el equipamiento adquirido para la producción.

La inversión total estimada es de R\$ 1,209,207 equivalente a USD 241,841, generando los siguientes indicadores de impacto:

Retorno del trabajo Familiar	306
Discount rate	12%
NPV @ 0.12	1,108,249
IRR	31%
NPVb	5,266,455
NPVc	3,554,310
B/C ratio	1.48

Se ha estimado que las familias beneficiarias incrementaran sus ingresos anuales en R\$ 9,842

**Modelo IV -PIR- “Bovino de leche con SAF forrajero”** contempla el apoyo a una organización de 90 familias que producen leche de bovinos. El modelo propone fortalecer la cadena de ganado lechero a través de la producción de leche sostenible, eficaz y rentable, promoviendo alternativas para la conservación y recuperación del medio ambiente y el desarrollo socioeconómico de los productores involucrados en las actividades. Además, busca fomentar la acción en las explotaciones lecheras mediante el uso de nuevas tecnologías para mejorar y facilitar las actividades de manejo del rodeo y garantizar el apoyo forrajero mediante la implantación de un Sistema Forrajero Agroforestal (SAF-F) que agrupe especies con valor proteínico y energético, con el fin de aumentar la producción de forraje y mejorar la dieta y nutrición de los animales. La asistencia técnica especializada fomentará el uso de las prácticas de conservación y la recuperación de zonas degradadas mediante la reforestación y la construcción de un vivero para producir plantines autóctonos, forrajeros y frutales.

Se apoyará con asistencia técnica comercial a las familias tanto de la leche como de sus derivados. En paralelo, con la finalidad de mejorar la calidad de vida en el ámbito rural se aplicarán tecnologías sociales adecuadas para mejorar la coexistencia con la región semiárida.

Para cumplir con estos objetivos el PIR plantea realizar las siguientes inversiones como la adquisición de 3 moto ensiladora con remolque, 6 enfardadoras, 18 moto guadañas, Kit de vacunación para todos los rodeos, 15 tanque de refrigeración de leche de 1.500 litros y adquisición de material verde para la implantación de 1 hectárea de SAF consolidada con palma resistente a la cochinilla del carmín, Gliricidia, Leucena, Hierba elefante, Abono orgánico y alambrado con valla de 5 hilos. Para mejorar el acceso al agua para producción se invertirá en la compra de 3 Cisternas de producción y se instalarán 18 sistemas de reutilización de aguas grises y 3 biodigestores. En el mismo sentido se plantea la instalación de 3 viveros para la producción de platines con doble propósito: sostenibilidad de los SAF y mejora de la calidad de las huertas familiares y por ende de la nutrición de sus integrantes. Los ingresos incrementales provendrán del incremento en la cantidad y calidad de leche producida debido a las mejoras en el manejo y el equipamiento y a asistencia técnica para la mejora en el manejo del rodeo y la comercialización de la leche.

La inversión total estimada es de R\$ 1.314.425 equivalente a USD 262.885 generando los

siguientes indicadores de impacto:

Retorno del trabajo Familiar	93
Discount rate	12%

Se ha estimado que las familias beneficiarias incrementaran sus ingresos anuales en R\$ 17.492

**Modelo V -PIR- “Caprino de leche con SAF forrajero”** contempla el apoyo a una alianza de tres (3) organizaciones de productores de leche caprina, conformadas por 30 familias cada una, que se asocian para el diseño de una PIR beneficiándose así las 90 familias.

El modelo se propone fortalecer la cría familiar de cabras lecheras mediante la estructuración de unidades de producción familiares, la promoción de la adopción de prácticas de convivencia con la región semiárida y el fomento de la transición agroecológica, con el objetivo de garantizar la seguridad alimentaria del rebaño, conservar el medio ambiente y mejorar los ingresos familiares. Para mejorar la seguridad alimentaria del ganado se plantea la producción de forrajes adaptados a la región semiárida y el apoyo a la formación de un banco de proteínas para complementar la alimentación animal.

La asistencia técnica se orientará a la promoción para la gestión reproductiva y la mejora de la calidad genética del rebaño existente. Se plantea importante capacitar a los beneficiarios en prácticas de manejo del rodeo y gestión de sistemas agroforestales. La asistencia técnica también generará orientación para facilitar el acceso a los mercados públicos y privados. El PIR contendrá inversiones para la aplicación de tecnologías sociales adecuadas para mejorar la coexistencia con la región semiárida y desarrollar acciones y conciencia entre los beneficiarios para la conservación del medio ambiente y promover la generación de ingresos en la comunidad especialmente para jóvenes y mujeres.

Para cumplir con estos objetivos el PIR plantea realizar inversiones críticas como la adquisición de 6 moto ensiladoras con remolque, 3 picadoras de forraje, 3 mezcladoras de ración para 1000Kg, 6 tanques de refrigeración para la leche de 1.500 litros y la adquisición de material verde para la implantación de 1 hectárea de SAF consolidada por familia beneficiaria. Con este fin se financiará la implantación de palma resistente a la cochinilla del carmín, Gliciridia, Leucena, moringa y abono orgánico. Se adquirirán los materiales para realizar un alambrado de la parcela de 5 hilos. Para mejorar el acceso al agua para producción se invertirá en la compra de 3 Cisternas de producción y se instalarán 15 sistemas de

reutilización de aguas grises y 45 hornos ecoeficientes y 3 biodigestores.

En el mismo sentido se plantea la instalación de 3 viveros para la producción de platines con doble propósito: sostenibilidad de los SAF y mejora de la calidad de las huertas familiares y por ende de la nutrición de sus integrantes.

Los ingresos incrementales provendrán del incremento en la cantidad y calidad de leche producida debido a las mejoras en el manejo y el equipamiento y a asistencia técnica para la mejora en el manejo del rodeo y la comercialización de la leche.

La inversión total estimada ronda los R\$ 1.311.525 equivalente a USD 262.305. El análisis del PIR ha generado los siguientes indicadores de impacto:

Retorno del trabajo Familiar	181.96
Discount rate	0.1200
NPV @ 0.12	2,084,791
IRR	42%
NPVb	24,785,567.21
NPVc	15,609,406.83
B/C ratio	1.59

Se ha estimado que cada una de las familias beneficiarias del PIR incrementarían sus ingresos anuales en R\$ 8,996.

**Modelo VI -PN- “Algodón Agroecológico”** este modelo contempla el apoyo a una cooperativa constituida por 90 socios de la agricultura familiar con el objetivo de promover el fortalecimiento del cultivo de algodón agroecológico en la zona y entre sus asociados para mejorar los ingresos de los agricultores familiares.

El PN se enfocará en la promoción de la adopción de prácticas de producción y gestión sostenibles. Con esta finalidad propone la creación de una minicentral de transformación de algodón agroecológico que acopie y procese el algodón de los asociados y de productores del entorno productivo.

Se capacitará en buenas prácticas de gestión adecuadas en la minifábrica garantizando que tenga acceso a ella el mayor número posible de agricultores. Se estimó que la mini fábrica irá ampliando su capacidad de procesamiento de algodón y aumentando la escala de producción, optimizando su coste de explotación, incrementando su potencial de servicio al mercado y logrando su sostenibilidad.

Se capacitará en gestión de negocios responsables (RBA) mediante asesoramiento técnico especializado, en particular fomentando una mayor participación de las mujeres y los jóvenes. En ese sentido, se aplicará una estrategia para reforzar la estructura institucional y comercial del -RBA- y llevar a cabo medidas sostenibles eficaces para reducir los efectos

medioambientales y climáticos que interfieren en la producción de algodón y otros cultivos intercalados.

Con estos objetivos se espera poder ampliar y mejorar la generación de mano de obra e ingresos de las familias beneficiarias.

La puesta en marcha de la minifábrica contribuirá a aumentar el volumen de algodón a procesar, por lo que será la principal herramienta que determinará el potencial de expansión de la actividad en la región.

Las inversiones para la mejora de la infraestructura de transformación y el valor agregado se centrarán en la instalación de un mini molino compuesto por una desmotadora y una prensa que permitirá controlar la planificación de la actividad, tanto en el campo como en el proceso de transformación, mejorando así los servicios ofrecidos a los socios.

También permitirá controlar todas las etapas del proceso de transformación, desde el transporte de las ramas hasta el almacenamiento de la pelusa, garantizando así la calidad del producto final y una mejora en la remuneración del mismo (precio).

Un mejor control de la producción de semilla de algodón ayudará a los agricultores a obtener ingresos directos e indirectos de su utilización, ya sea vendiéndola o utilizándola como semilla. El PN contribuirá a la planificación del uso y mantenimiento de la minicentral, así como a la identificación de herramientas (software) que ayuden a llevar a cabo las actividades previstas de manera profesional.

El PN llevará a cabo las siguientes inversiones para poder cumplir con los objetivos planteados, comenzando con la mejora del espacio físico para poder almacenar en condiciones y transformar el algodón con la compra de una desmotadora y prensa, un kit de herramientas para el mantenimiento, la adquisición de paletas de plástico para zonas de almacenamiento (1,0 x 1,2 m), un kit de EPI (gafas, protectores auditivos, casco, mascarilla, etc.), un kit informático (computadora, impresora, proyector y pantalla), juego de muebles de oficina (mesa, sillas, archivador, armario), una balanza digital con capacidad para 200 kg, un medidor de humedad para el algodón, el desarrollo de un sitio web y de las redes sociales para la promoción y comercialización, así como la creación de un fondo para la mejora de maquinaria y herramientas agrícolas de los asociados.

Se ha estimado que la inversión total será de aproximadamente R\$ 355.607 equivalente a USD 71.121, generando los siguientes indicadores de impacto:

Retorno del trabajo Familiar	1,173
Discount rate	0.1200
NPV @ 0.12	757,407
IRR	85%
NPVb	5,058,359
NPVc	4,300,952
B/C ratio	1.18

Se ha realizado un cálculo que estimó que los ingresos anuales de las familias beneficiarias del PN se incrementarán aproximadamente en R\$ 2.477.

**Modelo VII -PN- “Apicultura Sostenible”** contempla el apoyo a una cooperativa constituida por 81 socios de la agricultura familiar con el objetivo de promover el fortalecimiento de la cadena productiva apícola en la zona de cobertura del Proyecto y de esta manera mejorar los ingresos de los apicultores mediante la adopción de prácticas sostenibles de producción y manejo. Se busca garantizar que las operaciones de la cooperativa cumplan con toda la normativa sanitaria, garantizando la legalidad y calidad de la miel que comercializa.

El PN promocionará la introducción de acciones innovadoras en la cadena apícola, con la instalación de una mielera móvil. Se plantea incrementar la absorción de más miel de los cooperativistas y productores cercanos para incrementar la escala de producción y procesamiento, y de esta manera poder optimizar sus costes de explotación, aumentando sus ventas y ampliando el mercado. Con esta estrategia se espera conseguir la sostenibilidad de la cooperativa.

El asesoramiento técnico especializado se realizará para todos los cooperativistas interesados, especialmente mujeres y jóvenes que deseen llevar a cabo la profesionalización para la gestión de la cooperativa en todas sus dimensiones y así fortalecer a la cooperativa institucional y comercialmente.

Todo el desarrollo del negocio se realizaría aplicando medidas sostenibles eficaces para reducir los efectos medioambientales y climáticos que interfieren en la producción apícola. De esta manera se plantea poder ampliar y mejorar la generación de mano de obra e ingresos de los asociados.

El PN busca mejorar y facilitar el acceso a volúmenes significativos de miel de calidad, cuya extracción esté garantizada en apiarios regulados. La mayor parte de la miel es producida por pequeños apicultores que no disponen de medios para recorrer largas distancias para extraer la miel en estructuras adecuadas, ni siquiera para invertir en tales estructuras.

Se elaborará un diagnóstico para identificar los principales problemas relacionados con la transformación primaria de la miel y se propondrá un plan a corto y medio plazo para reducir los problemas e impactos en la cadena de producción (abandono de la actividad, bajos precios, fuerte implicación de intermediarios, baja calidad, etc.) y, en consecuencia, aumentar el flujo de mayores volúmenes de miel a través del almacén de la cooperativa.

La propuesta del PN se relaciona con la mejora de la infraestructura de transformación y la adición de valor mediante el fraccionamiento y la mejora de la presentación del producto. La instalación de una mielera móvil con equipos de extracción que cumplan las normas sanitarias tiene importantes ventajas sobre el modelo tradicional, entre ellas una menor inversión inicial, menor complejidad y tiempo de puesta en marcha y no requerir

documentación del terreno al no tratarse de un edificio fijo, sino de un equipo que puede trasladarse a otro lugar.

Invertir en equipos para producir cera de panal dará a los apicultores acceso a este importante insumo de producción a un precio muy inferior al del mercado. Se mejorará el control de calidad de la miel invirtiendo en instrumentos y reactivos, modernizando el laboratorio del almacén y contribuyendo a que los análisis sean más fiables.

Se estima llevar adelante las siguientes inversiones para poder cumplir con los objetivos del PN las cuales se basan en financiar la construcción de base de mampostería con tejado (10 x 10 m), la compra de dos cisterna de mampostería de 16.000 litros (conectada al tejado), la instalación en el almacén de la unidad de extracción de miel formada por dos contenedores acoplados, cada uno de 6x2,44x2,59 m con paredes internas revestidas; conexiones hidráulicas y eléctricas; depósito de agua; tabiques internos, la compra de 30 baldes para miel de acero inoxidable de 25 kg, dos (2) centrifugadora eléctrica 32/48 cuadros, dos mesa de descascarillado con 48 bastidores, dos tamices para decantador 350 kg, dos tamices para baldes de acero inoxidable de 25 kg, dos decantadores de 350 kg, compra de alfombrilla sanitaria, equipo para procesar la miel en el almacén, kits de papel, dispensador de jabón líquido y cubo de basura, kit informático (2 computadoras portátiles y una impresora).

Asimismo, se financiará la compra de kits de instrumentos para el laboratorio de control de calidad que es fundamental para e control y la mejora del producto, dos fundidores de cera eléctrico de acero inoxidable, una laminadora, un cilindro eléctrico de panal y un aire acondicionado para la casa de la miel.

Para el desarrollo comercial se plantea invertir en la una página web y promoción de las actividades mediante el uno de redes sociales para la comercialización. Se ha estimado que la inversión total será de aproximadamente R\$ 440.085 equivalente a USD 88.017, generando los siguientes indicadores de impacto:

Retorno del trabajo Familiar	2,668
Discount rate	12%
NPV @ 0.12	387,957.09
IRR	38%
NPVb	2,761,676
NPVc	2,054,069
B/C ratio	1.34

Se ha realizado un cálculo que estimó que los ingresos anuales de las familias beneficiarias del PN se incrementarán aproximadamente en R\$ 1.970.

Si bien la descripción de estos modelos hipotéticos se han descriptos en detalle mediante el presente apartado, con el objetivo de profundizar la comprensión de los mismos, junto al presente documento se envía el anexo IV “EFA\_PROCASEII\_2024.xls” en el cual se encuentran

los cálculos de todos los flujos de caja, incrementos en productividad y/o precio y sus respectivos indicadores. A modo de resumen y subrayando la importancia de visualizar los beneficios en los usuarios del Proyecto mediante el cuadro 5 se resumen los beneficios socioeconómicos claves para la mejora de la calidad de vida de los agricultores familiares en el ámbito rural Parabaiense:

**Cuadro 5: Resumen de los Beneficios Socioeconómicos de los siete (7) Modelos de PIR y PN**

Modelos	Beneficio neto (R\$)				Ingreso neto familiar (R\$)				TIRf	VANf (R\$)
	SP	CP	Dif	%	SP	CP	Dif	%	%	%

Apicultura	56,573	214,671	158,098	<b>279%</b>	698	2,668	1,970	<b>282%</b>	<b>38%</b>	387,957

Para la realización del flujo económico del Proyecto, en primera instancia, se aplican los coeficientes de corrección descriptos en el apartado metodológico para adaptar los modelos financieros a los precios económicos para continuar con su análisis.

En segunda instancia se trabaja sobre un supuesto de combinación posible de número de PIR y PN que serían financiados por el Proyecto, con base en la representatividad de cada una de las actividades principales desarrolladas en la región de intervención y el perfil de beneficiario y presupuesto total disponible. Es fundamental asegurándose de que los números de los planes a ejecutar y de beneficiarios son equivalentes a la meta correspondiente a la matriz de resultados.

Una vez estimada la proporción de cada modelo, se realiza una suposición sobre el período de ingreso de los beneficiarios al proyecto, ya que el flujo de fondos de cada PIR o PN comenzará a generar su impacto en el flujo agregado a partir del año en el cual se realice dicho ingreso.

No resulta equivalente el ingreso de un PIR al año 2 de inicio del proyecto, ya que el mismo, analizado a un horizonte de 20 años, generaría beneficios durante 18 años. Eso impactaría diferente si el PIR o PN ingresara al proyecto durante el año 6 ya que para los cálculos sus beneficios incrementales impactarían solo durante 14 años.

En el siguiente cuadro 6 se ilustra el ingreso estimado en el cálculo de los potenciales

beneficiarios del proyecto. Es fundamental la coherencia entre el año de ingreso de los beneficiarios al proyecto y la disponibilidad presupuestaria del ciclo financiero/presupuestario que se encuentra en el presupuesto del Proyecto

**Cuadro 6: Simulación de portafolio del proyecto**

Ingreso de Beneficiarios									
	Año 1	Año 2	Año 3	Año 4	Año 5	Año 6	Total Modelos	Total Ben/Mod	Total Ben
Horticultura y Fruticultura Bajo Riego	0	0	5	18	17	5	45	90	4050
Crianza de Cabras en Sistema Agroforestal	0	0	8	17	18	7	50	90	4500

Bovino para Leche con SAF Forrajero	0	0	3	5	5	2	15	90	1350
Caprinos para leche con SAF Forrajero	0	0	7	12	13	8	40	90	3600
Algodón Agroecológico	0	0	1	5	10	4	20	90	1800
Apicultura	0	0	4	10	20	6	40	81	3240
<b>Totales</b>	<b>0</b>	<b>0</b>	<b>35</b>	<b>85</b>	<b>100</b>	<b>40</b>	<b>260</b>		<b>23040</b>

Una vez considerado el ingreso de los beneficiarios por modelo y por año, se debe aplicar la tasa de adopción tecnológica, la cual indica la expectativa de que efectivamente los PIR y/o PN sean adoptados por la población objetivo beneficiaria del Proyecto.

En el cuadro 7 se observan los modelos que se han estimado que efectivamente generarán beneficio a partir de la tasa de adopción utilizada (67%). Las inversiones de los PIR y PN que finalmente no adopten las tecnologías promocionadas se incluirán en el flujo de caja del proyecto en la línea de costos sin adicionar beneficios al flujo de fondos del proyecto.

En el cuadro 7 se observa los PIR y PN que efectivamente han impactado en el flujo agregado de beneficios, luego de aplicada la tasa de adopción de 67%.

**Cuadro 7: Portfolio con tasa de adopción aplicada (67%)**

BENEFICIARIOS, TASAS DE ADOPCIÓN Y FASES de INGRESO								Tasa de Adopción
	PY1	PY2	PY3	PY4	PY5	PY6	Total	67%
Horticultura y Fruticultura Bajo Riego	0	0	5	18	17	5	45

Apicultura	0	0	4	10	20	6	40	
<i>Ajustado (tasa de adopción)</i>	<i>0</i>	<i>0</i>	<i>3</i>	<i>7</i>	<i>13</i>	<i>4</i>	<i>27</i>	67%

Posteriormente, con los flujos ya convertido a precios económicos, se multiplican la cantidad de modelos por año neto de ingreso por los flujos de beneficios netos incrementales de cada modelo a lo largo de la vida útil del proyecto. Se adicionan los agregados de cada modelo y se obtiene el flujo de beneficios de la modelación que se debe proyectar a veinte 20 años.

A este flujo de Beneficios se le deberá restar el flujo de costos económicos totales del proyecto para obtener el flujo neto incremental del Proyecto.

En los costos económicos debieron incluir todas las acciones de asistencia técnica no incorporados en los PN y PIR , los costos de los PN y PIR que no adopten las tecnologías propuestas, las actividades de fortalecimiento de capacidades de los agricultores y de sus organizaciones para la mejora comercial, las actividades para el apoyo de la diversidad de género, nutrición y seguridad alimentaria, tareas para la regularización de tierras y ambiental, la gestión de conocimiento y la cooperación Sur-Sur y triangular, que son los costos/inversiones del componente II. En el mismo sentido se debe adicionar al flujo de costos todos aquellos gastos operativos y recurrentes del componente III que son necesarios para la correcta ejecución del proyecto, con la finalidad de ser efectivo y eficiente.

En este punto, nos encontramos con un flujo de beneficios monetarios del proyecto provenientes de los PIR y os PN a los cuales se les debe adicionar los beneficios sociales y ambientales relativos al balance de carbono de las actividades que se han podido monetizar. Respecto al flujo de costos totales económicos se le debe realizar un cálculo para su proyección a 20 años con el objeto de mantener la sostenibilidad de las inversiones llevadas adelante. Una vez consolidados los flujos, se realiza la operación para obtener el beneficio incremental mediante el cual se obtienen los indicadores de resultados finales, que deberán servir para la toma de decisiones de los organismos financiadores y/o del Gobierno beneficiario de los préstamos.

## **COSTOS DEL PROYECTO**

En este apartado se sintetizan los principales supuestos, hipótesis y resultados de las estimaciones de costos del Proyecto de Desarrollo Rural Sostenible de Paraíba, así como el plan de financiamiento para el período de implementación que se ha estimado en seis (6) años. La información presentada ha sido elaborada mediante la utilización del software COSTAB.

Los datos de costos fueron validados a partir de documentos elaborados durante el diseño del Proyecto como ser el Marco Lógico y la Matriz de Resultados y las consultas específicas al equipo de PROCASE I que ha acompañado en las misiones a los equipos del FIDA y del BID.

Principales supuestos e hipótesis

**Duración del Proyecto.** La duración del proyecto se ha planeado a seis (6) años, previendo su inicio para 1 de junio de 2025 y finalizando, en consecuencia, el 30 mayo de 2031.

**Cofinanciamiento.** El valor total del Proyecto consiste en un préstamo del Fondo

Internacional de Desarrollo Agrícola (FIDA) por un monto total de USD 10 millones de dólares estadounidenses y un préstamo del Banco Interamericano de Desarrollo (BID) equivalente a USD 70 millones, sumando en total USD 80 millones como financiamiento externo (76 % de los costos totales). El Gobierno del Estado de Paraíba contribuirá con recursos propios por un valor de USD 25 millones de dólares estadounidenses que representan el 24% de los costos totales para la realización del presente Proyecto.

**Tasa de cambio.** La tasa de cambio proyectada para la estimación de costos fue de R\$ 5,00/USD 1,00, valor en conformidad con la variación media de cambio actual propuesta por el Banco Central de Brasil, según el Informe de Mercado Focus (Abr/24).

**Contingencias de precios.** La contingencia de precios no se llevó a cabo para la operación, ya que el principal agente financiador (BID) informó que no utiliza esta metodología para la provisión de recursos ante el riesgo de inversión a los cambios en los precios a lo largo del tiempo.

**Costos unitarios.** La estimación de costos unitarios se basa en las actividades de recolección de datos realizadas por el equipo del FIDA y el BID durante las misiones de diseño con la colaboración del equipo del proyecto PROCASE I para elaborar las hojas de cálculo iniciales y alimentar el software COSTAB. También se utilizó como referencia el marco lógico del proyecto y documentos complementarios.

**Impuestos y tarifas.** Los costos se presentan con todos los impuestos incluidos según las referencias disponibles y en el cálculo se incorporaron diferentes tasas, tarifas e impuestos que eventualmente inciden sobre las actividades financiadas por el Proyecto dentro de Brasil.

Resumen de las principales tablas de costos del proyecto.

**Costos Totales.** El costo total del proyecto para un período de implementación de seis (6) años se calculó en USD 105 millones de costo base. Los costos de inversión ascienden a un total USD 96,5 millones (91.9% del total de Recursos), mientras que los costos recurrentes en salarios y costos operativos son equivalentes a USD 8,5 millones. (8,1 %). En el Grafico I se observa la proporción de forma ilustrativa:

**Gráfico I. Costos de Inversión vs Costos Recurrentes**

**Costos por componente.** El Proyecto Desarrollo Rural Sostenible de Paraíba -PROCASE II- se estructura mediante 2 componentes de inversión y un componente para la gestión, seguimiento y evaluación del proyecto. El Componente I: Sistemas productivos resilientes para reducir la pobreza rural tiene un valor calculado de USD 63,416 millones (60,4 % de los costos totales). El Componente II: Fortalecimiento organizacional y de capacidades y gestión del conocimiento cuenta con aproximadamente USD 31,3 millones que representa el 29.8 % de los costos totales presupuestados. Los costos del Componente III, “Gestión, seguimiento y evaluación del proyecto” se estimaron en USD 10,2 millones (9,8 % de los costos totales) como se observa en la Tabla 1.

**Tabla 1. Costos totales por Componente en divisa estadounidenses (USD) y en moneda local (R\$)**

<b>Total PROJECT COSTS</b>	<b>63,416,000</b>	<b>60.4%</b>	<b>31,302,800</b>	<b>30%</b>	<b>10,281,200</b>	<b>9.8%</b>	<b>105,000,000</b>	<b>100.0%</b>

Los costos totales se han categorizado como grafica la Tabla 2 donde se observa que el 22,2% de ellos se destinará a la inversión en Asistencia Técnica -ATER-, el 61% en Subsidios (PIR y PN), el 5 % en Insumos y Servicios y el 3,7% en Capacitación, talleres y reuniones. No se invertirá en Obras Civiles en el marco de los costos de inversión planificados. Respecto a los costos recurrentes los salarios representan el 5% y los costos operativos un 3,1% del total de los gastos, totalizando un 8,1% del total. El Grafico II ilustra esta descripción:

**Gráfico II. Costos Totales del proyecto por Categoría de Gasto (USD).**

La ejecución del presupuesto presenta una forma acampanada para sus seis (6) años planificados, en los cuales durante el año 1 se planea ejecutar solo el 2% del presupuesto, incrementándose levemente hasta un 5% para el año dos (2), pasando una alta demanda del 21% al año de tres (3) de iniciada la actividad del proyecto, para alcanzar durante el año cuatro (4) su máxima demanda de fondos y pico de ejecución con USD 36,2 millones que representan el 34% del presupuesto total.

Para el año cinco la demanda se reduce y se estima será del 25% de los fondos para llegar al año seis (6) con la necesidad presupuestaria de USD 12,663 millones (12%) para realizar las últimas actividades de inversión y el cierre del proyecto. En la tabla 3 se observan las demandas de fondo por año y componente.

**Tabla 3. Costos totales por Componente y año de implementación (USD)**

Project Components by Year -- Totals Including Contingencies	Totals Including Contingencies (u\$d)												
	AÑO 1	%	AÑO 2	%	AÑO 3	%	AÑO 4	%	AÑO 5	%	AÑO 6	%	Total
1. Sistemas productivos resilientes para reducir la pobreza rural	-	0%	40,000	0%	9,242,400	15%	21,695,600	34%	23,025,600	36%	9,412,400	15%	63,416,000
2. Fortalecimiento organizacional y de capacidades y gestión del conocimiento	222,500	1%	4,348,800	14%	10,770,000	34%	12,650,000	40%	1,916,000	6%	1,395,500	4%	31,302,800
3. Gestión, seguimiento y evaluación del proyecto	2,131,204	21%	1,163,996	11%	1,610,000	16%	1,860,000	18%	1,660,000	16%	1,856,000	18%	10,281,200
<b>Total PROJECT COSTS</b>	<b>2,353,704</b>	<b>2%</b>	<b>5,552,796</b>	<b>5%</b>	<b>21,622,400</b>	<b>21%</b>	<b>36,205,600</b>	<b>34%</b>	<b>26,601,600</b>	<b>25%</b>	<b>12,663,900</b>	<b>12%</b>	<b>105,000,000</b>

En el Grafico III se ilustra la curva de la demanda de fondos del Proyecto, mostrando gráficamente su forma de “campana”, llegando al pico de demanda para el año cuatro (4), comenzando durante los primeros años con necesidades menores, cambiado la pendiente al año tres (3), llegando al pico al año cuatro (4) donde cambia la tendencia y comienza la reducción de demanda de fondos, aunque permanece muy elevada durante el año cinco (5) y desciende para el año seis (6).

Para una eficaz y eficiente ejecución de las actividades del proyecto, es fundamental que los organismos financiadores y el Gobierno de Paraíba tomen las medidas necesarias para poder atender esas demandas respecto a los techos presupuestarios y los topes máximos para los adelantos de fondos.

**Gráfico III. Curva de ejecución por año de implementación**

En el Grafico IV se ilustra la demanda de fondos del proyecto desagregada por año y por componente, dejando en claro los diferentes periodos de solicitudes que presenta cada componente para cumplimentar con sus objetivos específicos y poder cumplir con el objetivo general del proyecto.

El componente 3, presenta su máxima demanda al año uno (1), destinada a la compra de equipamiento, estudios de base y puesta en marcha del proyecto y luego una demanda homogénea a lo largo del proyecto; el componente 2 congruente con sus objetivos de mejoras en las capacidades de los beneficiarios y sus organizaciones, incrementa proporcionalmente desde el año uno al año cuatro donde se reduce su demanda; y, finalmente las barras del componente 1 ilustran que la totalidad de sus fondos destinados a la inversión productiva y a la mejora comercial mediante los PNs y los PIRs y al apoyo en innovación de tecnologías, comienza su ejecución recién al año tres (3), con las capacidades de los beneficiarios fortalecidas e incrementa sus demandas hasta el año cinco(5) inclusive, colocando fondos durante el último año del proyecto inclusive.

**Gráfico IV. Costos por año por componente**

**Plan de financiamiento.** El Proyecto Desarrollo Rural Sostenible de Paraíba será financiado mediante un préstamo del BID, por el valor de USD 70 millones (66,7 % de los costos totales); un préstamo del FIDA, por el valor de USD 10 millones (9,5 % de los costos totales) y un aporte del Gobierno de Paraíba equivalente a USD 25 millones (23,8%).

El plan de financiamiento fue elaborado según lo acordado entre los representantes de los organismos financiadores, de modo que los recursos se distribuyan de manera proporcional entre los tres (3) componentes según participación de cada financiador sobre el valor total del Proyecto. La distribución de recursos para cada componente resultó la siguiente:

**Tabla 4. Distribución de recursos por componente según organismo financiador. (USD)**

Components by Financiers (u\$d)	Fida		BID		Governo do Estado do Paraiba		Total	
	Amount	%	Amount	%	Amount	%	Amount	%
	1. Sistemas productivos resilientes para reducir la pobreza rural	6,024,520	9.5	42,235,056	66.6	15,156,424	23.9	63,416,000
2. Fortalecimiento organizacional y de capacidades y gestión del conocimiento	2,973,766	9.5	20,847,665	66.6	7,481,369	23.9	31,302,800	29.8
3. Gestión, seguimiento y evaluación del proyecto	1,001,714	9.7	6,917,280	67.3	2,362,207	23.0	10,281,200	9.8

<b>Total Recurrent Costs</b>	832,500	9.8	5,731,000	67.4	1,936,500	22.8	8,500,000	8.1
<b>Total PROJECT COSTS</b>	10,000,000	9.5	70,000,000	66.7	25,000,000	23.8	105,000,000	100.0

En el anexo de Costos del documento de diseño del Proyecto se encuentran las tablas detalladas que se ilustran los costos de cada uno de los tres (3) Componentes que estructuran el proyecto, donde se describen las líneas de gasto, la demanda por cantidad anual, los precios unitarios en Reales Brasileños y Dólares estadounidenses, los costos totales por año, la categoría de gasto de cada línea y el organismo financiador.

En la estimación de los costos económicos diferenciales del ACB, se han tenido en cuenta los costos que, asociados a la ejecución del Proyecto (Alternativa Con Proyecto), permitirán generar y mantener los beneficios esperados, cuantificados en el Apartado III anterior. Esto implica que se han contemplado tanto los costos

financiados por el Proyecto como los costos de carácter privado que deberán asumir los distintos actores implicados, incluyendo los beneficiarios y también los costos de operación y mantenimiento, posteriores a la ejecución, de los activos y capacidades que serán implementados.

La estimación de costos para el cálculo del ACB se ha realizado en términos de precios de eficiencia o precios sombra, por tanto, habiendo excluido los efectos distorsionadores en los precios de mercado de factores como los impuestos indirectos que gravan los bienes y servicios presupuestados, así como los mismos subsidios asociados a la ejecución del Proyecto.

Es decir, se ha considerado el costo de toda la inversión en el Componente I independientemente de que el 80% de la misma será subsidiada por el Proyecto, e incluyendo el 10% y 20% restantes a cargo de las asociaciones y cooperativas de productores beneficiarias de los PIR y los PN, respectivamente. Por otra parte, a los importes de mercado de bienes y servicios que previsiblemente serán adquiridos por el Proyecto, se les ha deducido como transferencia el 17%, correspondiente al Impuesto sobre Circulación de Mercancías y Servicios (ICMS).

Por otra parte, se han considerado los costos recurrentes anuales asociados a la operación y mantenimiento de la funcionalidad de las inversiones, así como el mantenimiento de los elementos materiales provistos a través de los mecanismos de transferencia financiados por el Proyecto como son las tecnologías productivas y agroecológicas, y las instalaciones y equipos relacionados con el procesamiento de productos agropecuarios.

Todos los costos en insumos, gastos de mantenimiento y operativos de los modelos de los PIRs y los PNs se incluyen en los flujos respectivos analizados y fueron incorporados mediante el análisis de los modelos. En este sentido y con la finalidad de acompañar la sostenibilidad de las acciones apoyadas por el proyecto, se incorporaron al flujo de caja económico del Proyecto a partir del año seis (6) y hasta el año veinte (20) del flujo, los costos de asistencia técnica residual que fue calculado mediante el equivalente al 50% de lo invertido en promedio por cada año durante la ejecución del proyecto. Este monto puede ver reflejado en el anexo II del presente documento dentro del flujo de caja del proyecto.

Todos estos costos recurrentes serán necesarios, posteriormente a la ejecución del Proyecto, para que se mantengan los beneficios diferenciales cuantificados a lo largo del periodo del ACB.

Beneficio económico neto incremental total del Proyecto

Para realizar el cálculo del beneficio neto incremental del Proyecto, se han utilizado los beneficios monetizables de los modelos ilustrativos de los cinco (5) PIR y de los dos (2) PN descriptos financieramente en el apartado ut supra y se ha realizado una extrapolación con el fin de calcular el beneficio total del Proyecto.

De toda la hipótesis desarrollada mediante el presente ejercicio y sus correspondientes proyecciones descritas anteriormente el Proyecto a resultado con una TIR de un 26,6 %, una VANe de R\$ 262.817.658 equivalente a USD 52.563.531 y un B/C equivalente a 2,5.

## RESULTADOS DE VIABILIDAD SOCIOECONÓMICA

Resultados del conjunto del ACB

Observando los indicadores socioeconómicos se observa claramente que la VANe de R\$ 262.817.658 equivalente a USD 52.563.531 es > 0 y la TIR del Proyecto de 26,6% es holgadamente superior a la tasa de descuento utilizada del 12%. Por tanto, podemos confirmar que el Proyecto es viable desde un punto de vista socioeconómico. En el mismo sentido, la ratio Beneficio/Costo, cociente de los valores actuales de beneficios y costos del Proyecto, es mayor a 1 (uno) e igual a 2,5 para el escenario de carbono a USD 51 /ton CO<sub>2</sub>eq, siendo otro indicador positivo para la evaluación socioeconómica del proyecto. En el Grafico V se observan las curvas de beneficios incrementales y costos económicos del Proyecto.

**Gráfico V Beneficios del Proyecto PROCASE II**

El Grafico V ilustra los beneficios incrementales económicos, los costos económicos y los beneficios totales del proyecto con un horizonte a 20 años. En el siguiente cuadro 8 se

observan los valores que generaron el gráfico citado con los beneficios económicos de los siete (7) modelos y de los servicios ambientales del proyecto.

**Cuadro 8: Flujos de beneficios de los modelos agregados, costos económicos y beneficios incrementales del Proyecto PROCASE II**

## ANÁLISIS DE SENSIBILIDAD

El análisis de sensibilidad ha consistido en repetir las proyecciones del ACB realizando variaciones en determinadas hipótesis o supuestos clave para poder evaluar el potencial impacto de dichas variables en los indicadores respecto a la hipótesis de base.

El análisis de sensibilidad muestra que los indicadores de factibilidad económica del Proyecto son muy sólidos respecto a diferentes variaciones del contexto ya que en ninguno de los casos en los cuales se han realizado variaciones de diferente intensidad de las hipótesis los indicadores se han presentado con VAN negativa y/o con TIR menor a la tasa de descuento utilizada. (12%)

El análisis se ha realizado previendo diferentes riesgos de variables independientes como las reducciones de los beneficios, los incrementos en los costes de producción, los posibles atrasos en la implementación de los PIR y los PN o la baja capacidad de negociación de las OPP para fijar precios justos, o las fluctuaciones de precios “naturales” de mercado y finalmente las variaciones posibles en las tasas de adopción tecnológica por parte de los productores y productoras organizados.

Los indicadores económicos calculados suministran tanto a los organismos financiadores como al Gobierno de Paraíba los valores de referencia necesarios para comparar la inversión en el Proyecto con otras inversiones posibles llevar a cabo.

El presente documento presenta un anexo I con el flujo de fondos agregado de los modelos

y un anexo con el archivo EFA\_PROCASEII\_2024.xls en el cual se incorporan todos los modelos con los detalles de las inversiones, los costos operativos y los precios tanto financieros como económicos.

En el cuadro 9 podemos observar la tabla con los indicadores y sus respectivas variaciones de las hipótesis de escenario base:

# EX-ACT Rationale

## GHG accounting for PROCASE II

### Methodology for GHG accounting

The Ex-Ante Carbon-balance Tool (EX-ACT) has been developed by the Food and Agriculture Organization of the United Nations (FAO) to evaluate impacts of the interventions in the Agriculture, Forestry and Other Land Use (AFOLU) sector on greenhouse gas (GHG) emissions. EX-ACT provides estimates of the mitigation potential of public or private investment projects, policies, and national level programs. It helps the decision makers to understand whether the planned agricultural interventions contribute to meeting climate change mitigation objectives. The EX-ACT appraisals, initially designed for ex-ante analysis, can also be conducted during the project implementation as well as ex-post for comprehensive monitoring and evaluation, both at a project and at a country level. EX-ACT calculations are based on land use data.

The current version of EX-ACT is primarily based on *the IPCC 2019 Refinement to the 2006 Guidelines for National Greenhouse Gas Inventories* (IPCC 2019) and *IPCC 2013, 2013 Supplement to the 2006 IPCC Guidelines for National Greenhouse Gas Inventories: Wetlands* (IPCC 2014), complemented by other scientific research. GHG emissions for farm operations, inputs, transport, and irrigation systems implementation are based on Lal (2004). Emissions factors for the fishery sector are derived from Parker & Tyedmers (2014), Sciortino (2010), Winther et al. (2009) and Irribaren et al. (2010 & 2011). Soil carbon stock in mangroves is complemented by the review from Atwood et al. (2017). These references provide EX-ACT with recognized default values for emission factors and carbon values, the so-called Tier 1 level of precision.

The tool has nine topic modules that analyze a range of agricultural and forestry activities including crop production, land rehabilitation, forest management, livestock, and grassland production systems, among others. The tool calculates changes in carbon stocks and GHG emissions including carbon dioxide (CO<sub>2</sub>), methane (CH<sub>4</sub>) and nitrous oxide (N<sub>2</sub>O), which once converted to CO<sub>2</sub> equivalent are used to derive the carbon balance that indicates the impact of the project: positive carbon balance indicates that the project leads to greater emissions, while negative carbon balance indicates that project contributes to emissions reduction.

The evaluation assesses how the impacts of an intervention compared to the business as usual (BAU) scenario. The calculator requires data for 3 specific points in time: initial situation, with project scenario and without project or BAU. In preparing this data, much work is required up front to determine the adequate modeling of activities/interventions in the tool. This considers technical specificities, conversations with national staff to determine current and future projections, literature reviews to assess availability of tier 2 or 3 coefficients to improve the assessment's accuracy. Once all this information is gathered, a plan based on technical expertise is generated on how to best model the intervention in the tool along with the assumptions made. This is a crucial step as this is what really determines the measurement of the impact. All these aspects are discussed below to ensure a clear and transparent understanding of the assessment done for this Project.

## Project boundaries and data sources

The Project seeks “to reduce poverty and food and nutrition insecurity by investing in family farming, ensuring the development and strengthening of sustainable and climate-resilient local food systems”<sup>1</sup>. The Project aims “to contribute to the sustainable rural development of family farming, strengthening actions to adapt to and mitigate climate change”<sup>1</sup>.

The GHG analysis made use of data on activities from the Concept Note (CN) and the Economic and Financial Analysis (EFA), as well as consultations with technical experts in the field and part of the Project design team. The assumptions and data used are presented in consecutive sections. Table 1 collects the activities represented in the analysis.

Table 1: Project activities considered under EX-ACT analysis.

<b>Component 1 - Resilient production systems to reduce rural poverty</b>		
<b>Subcomponent 1.1: Implementation of resilient and biodiverse production systems</b>	<b>Reference</b>	<b>Ex-ACT Module</b>
Irrigated horticulture and Fruticulture	Economic and Financial	2.LUC
Goat farming in Agroforestry systems	Assessment	3.Cropland
Free-range poultry in Agroforestry systems		4.Grassland
Dairy goats in Agroforestry systems		
Dairy cattle in agroforestry systems		
<b>Subcomponent 1.2: Strengthening and diversifying commercialization</b>	<b>Reference</b>	<b>Ex-ACT Module</b>
<b>Agroecological cotton</b>	Economic and Financial Assessment	3.Cropland
<b>Subcomponent 1.3: Incentives for innovation</b>	<b>Reference</b>	<b>Ex-ACT Module</b>
<b>Ecostoves</b>	Economic and financial assessment	9. Inputs

The estimation of emissions for this Project considers the sequestration, reduction and or avoidance that result from the implementation of the activities summarized in Table 1. EX-ACT differentiates between two time periods: Project implementation phase and capitalization phase. The implementation phase is the period during which the Project activities are carried out. Yet, the period covered by the analysis does not necessarily end with the termination of the active project intervention. Further changes may occur from interventions (Project activities) such as changes in soil organic carbon content or biomass. This period defines the capitalization phase. In this analysis, following recommendations of the IPCC<sup>2</sup>, we consider an overall 20-year period for implementation and capitalization phase.

In the current analysis the physical implementation of the Project consists of 6 years, the benefits generated by the Project will continue to capitalize for 14 more years to reach the 20-year period. In the specific case of soil organic carbon, a constant rate over 20 years from the year of planting to reach

<sup>1</sup> Project Concept Note, May 2024

<sup>2</sup> IPCC recommends considering the timeframe between transitions states of natural systems and the period necessary to reach a new equilibrium for carbon stocks and suggest applying a 20 year long time frame. [IPCC, 2019 \(chapter 2\)](#) and [IPCC, 2003](#)

the new equilibrium is assumed. The analysis further assumes the dynamics of change (from without (BAU) to “with Project”) to be linear over the duration of the Project.

The Project will take place in the State of Paraiba in Brazil. Paraiba contains two biomes: Caatinga and Mata Atlantica with differentiated climates and soil characteristics. The main data to describe both areas are presented in table 2.

Table 2: Key descriptors of areas in the Project area (Paraiba)

	Caatinga	Mata Atlantica
Climate	Tropical Dry	Tropical moist
Soil type (dominant)	High Activity Clay (HAC)	Low Activity Clay (LAC)
Reference SOC (tC/ha)	22.61	36.97

Sources: All necessary data to define the descriptors was acquired via eartmap.org<sup>3</sup>

## Results of the EX-ACT analysis:

### General results:

The estimated total carbon balance of PROCASE II is -1,504,095 tCO<sub>2</sub>-eq for 20 years of accounting, 6 years of implementation and 14 years of capitalization, for a total area of 25,245 hectares and 1,072,757 heads of livestock. This amounts to a carbon balance of -60 tCO<sub>2</sub>-eq per ha and -3 tCO<sub>2</sub>-eq per hectare per year. The Project take place in two distinct biomes, Mata Atlantica and Caatinga, at the current stage the final allocation of hectares of the activities between biomes is not clear. Therefore, the carbon balance is an average of two analyses using the same activity data parameters but with variations in the key biome descriptors (table 2). The estimated carbon balance represents an expected balance ranging between -1,530,659 tCO<sub>2</sub>-eq (tropical moist) and -1,477,531 tCO<sub>2</sub>-eq (tropical dry) (figure 1). For detailed results for each analysis see EX-ACT disaggregated Results (figures 2 and 3).

## Disaggregated results:

The project implementation is structured around Resilient Investment Plans (PIR, by the Portuguese acronym) and Business Plans (BP) corresponding to subcomponents 1.1 and 1.2. Figure 4 shows the carbon balance of each of the plans analyzed. It also includes the distribution of ecostoves under component 1.3. A more detailed disaggregation of actions is in an appendix at the end of the document (Figure 5).

## Computation of data in EX-ACT:

The GHG analysis followed the investment models and description from the Economic and Financial Analysis (EFA) to determine the hectares and livestock heads targeted. The analysis considered 6 models:

### Subcomponent 1.1: Resilient Investment Plans:

1. **Irrigated horticulture and Fruticulture:** Implementation of hedgerows systems and adoption of agroecological management practices in existing annual and perennial croplands.
2. **Goat farming in Agroforestry systems:** Replacing degraded grasslands with an agroforestry system for forage production under agroecological practices. In addition, livestock improves nutrition and health.
3. **Free-range poultry in Agroforestry systems:** Replacing annual croplands with an agroforestry system for forage production under agroecological practices. In addition, poultry improves nutrition and health.
4. **Dairy goats in Agroforestry systems:** Replacing degraded grasslands with an agroforestry system for forage production under agroecological practices. In addition, dairy goats improve nutrition and health.
5. **Dairy cattle in agroforestry systems:** Replacing degraded grasslands with an agroforestry system for forage production under agroecological practices. In addition, dairy goats improve nutrition and health.

### Subcomponent 1.2: Business plans:

6. **Agroecological cotton in small cooperatives:** Existing areas of cotton production are brought under agroecological management practices improving cotton production. In addition, cotton areas are incremented.

### Resilient Investment plans:

Table 3 and 4 summarize PIR models according to the number of beneficiaries and investment targets. Following the assumptions of the EFA, the GHG analysis considered a 67% adoption rate.

*Table 3. Key data on Land targeted and impacted as per EFA model in PIRs*

PIRs	Families	Hectares		
		Per family	Targeted	Impacted <sup>a</sup>
Irrigated horticulture and Fruticulture	4050	3	12,150	8,140
Goat farming in Agroforestry systems	4500	1	4,500	3,015
Free-range poultry in Agroforestry systems	4500	0.09	405	271
Dairy goats in Agroforestry systems	3600	1	3,600	2,412
Dairy cattle in Agroforestry systems	1350	1	1,350	980
<b>TOTAL</b>	<b>18000</b>		<b>22,005</b>	<b>14,818</b>

<sup>a</sup> Impacted areas factor in the adoption rate of 67% and correspond to areas where change will be achieved and capitalized. Dairy cattle also include extra restoration activities.

Table 4. Key data on Livestock targeted and not impacted as per EFA model in PIRs

PIRs	Families	Livestock Heads (Scenarios)				
		Start & Without		With		
		Per family	Total	Not impacted	AFS	AFS + BD
Goat farming in Agroforestry systems	4500	80	360,000	118,000	188,978	68,254
Free-range poultry in Agroforestry systems	4500	-	100,000	33,000	272,909	270,207
Dairy goats in Agroforestry systems	3600	30	108,000	35,640	54,360	18,000
Dairy cattle in agroforestry systems	1350	8	10,800	3,564	8,595	450

AFS: Livestock heads in Agroforestry systems; AFS + BD: Livestock heads in Agroforestry systems and biodigesters

**Irrigated horticulture and Fruticulture:** Currently, 80% of the existing lands to be targeted are under annual crops (9,720 ha). Currently, planted with horticultural crops (*based on EFA*) under full tillage and low carbon inputs and residues are used to feed livestock or other uses (exported) (*based on project team*). 20% of the land targeted are perennial croplands (2,430 ha). Currently, planted with Acerola (*based on EFA*) under full tillage and low carbon inputs and crop residues are not burnt (*based on project team*). The impacted annual croplands (6,512 ha) will introduce no tillage practices, increase the input of organic material and crop residues will be retained on the ground following agroecological practices. In parallel, it will introduce tree planting in the perimeter of the fields (203 ha). In the newly implemented hedgerows (land use change), the project will introduce: no tillage practices, an increase in the input of organic material, retention of crop residues and trickle irrigation systems. The existing perennial system will introduce the same management practices as annual croplands.

**Goat farming in Agroforestry systems:** The agroforestry system (forage) (3,015 ha) will be introduced in existing grazed grasslands (land use change). Existing grasslands show signs of degradation (high intensity grazing). The project will introduce forage banks with Palma, Gliricidia, Moringa and Leucena (*based on EFA*) and implement no tillage practices and include the use of organic amendments on the soil (*based on project team*), crop biomass will be fed to animals. Tier 2 values for the forage banks were not located so an agroforestry default system was chosen (Henrique et al., 2023)<sup>4</sup>. Grasslands not impacted will maintain the same level of degradation<sup>5</sup>. Due to an increase in the feed quality and quantity and nutrition, higher pregnancy rates and reduced mortality are expected to reduce mortality. Therefore, it is assumed that farmers implementing forage banks will select and retain goats and the herd will increase slowly (6.6 % in 6 years, *based on EFA*). Investment without an increase on the herd loses profitability. Farmers not implementing agroforestry systems will maintain the same number of goats. In addition, 800 biodigesters will be purchased benefiting 18% of total families or 26% of families implementing agroforestry systems. Change in diet is expected to reduce emissions from enteric fermentation (see Table 5 and Table 6)

**Free-range poultry in Agroforestry systems:** The agroforestry system (forage) (271 ha) will be introduced in existing annual croplands (land use change). Currently, cultivated under full tillage and low carbon

<sup>4</sup> Henrique et al, 2023: Estimativa da emissão de gases de efeito estufa provenientes de rebanhos de caprinos e ovinos: no bioma Caatinga, Semiárido brasileiro, em cenários de atuação do FIDA. Based on the publication, forage bank are considered medium technology system while the current situation corresponds to low technology systems, however, no biomass values were given.

<sup>5</sup> To maintain a conservative approach on the soil organic carbon since no indication of improvement is defined.

inputs and residues exported (to feed animals) (*based on project team*). The agroforestry systems consist of Palma, Gliricidia, Moringa and Leucena (*based on EFA*). Forage banks will be managed following no tillage practices, the use of organic amendments on the soil (*based on project team*) and the crop biomass will be fed to animals. Tier 2 values for the forage banks were not located so an agroforestry default system was chosen. Annual croplands not adopting agroforestry systems will maintain current practices. The project will provide chicks and the population will increase considerably (Table 4) thanks to higher feed quality and quantity. In addition, 1,500 biodigesters will be distributed corresponding to 33% of the families or 49% of the families implementing agroforestry systems.

**Dairy Goat in Agroforestry systems:** The agroforestry system (forage) (2,412 ha) will be introduced in existing grazed grasslands (land use change). Existing grasslands show signs of degradation (high intensity grazing). The project will introduce forage banks with Palma, Gliricidia, Moringa and Leucena (*based on EFA*) and implement no tillage practices and include the use of organic amendments on the soil (*based on project team*), crop biomass will be fed to animals. Tier 2 values for the forage banks were not located so an agroforestry default system was chosen (Henrique et al., 2023). Grasslands not impacted will maintain the same level of degradation<sup>5</sup>. Due to an increase in the feed quality and quantity and nutrition, higher productivity is expected, increasing the amount of milk per goat. Therefore, it is assumed that farmers implementing forage banks will maintain the same number of goats but with higher productivity level (default)<sup>6</sup>. Farmers not implementing agroforestry systems will maintain the same number of goats and low productivity levels. In addition, 600 biodigesters will be purchased benefiting 17% of total families or 25% of families implementing agroforestry systems. Change in diet is expected to reduce emissions from enteric fermentation (see Table 5 and Table 6).

**Dairy cattle in Agroforestry systems:** The agroforestry system (forage) (905 ha) will be introduced in existing grazed grasslands (land use change). Existing grasslands show signs of degradation (high intensity grazing). The project will introduce forage banks with Palma, Gliricidia, Moringa and Leucena (*based on EFA*) and implement no tillage practices and include the use of organic amendments on the soil (*based on project team*), crop biomass will be fed to animals. Tier 2 values for the forage banks were not located so an agroforestry default system was chosen (Henrique et al., 2023). Grasslands not impacted will maintain the same level of degradation<sup>5</sup>. Due to an increase in the feed quality and quantity and nutrition higher productivity is expected increasing the amount of milk per cattle and increase the number of cows per family by 25% during the 6 years of implementation. Therefore, it is assumed that farmers implementing forage banks will keep more productive cows (default). Farmers not implementing agroforestry systems will maintain the same number of cattle and low productivity levels. In addition, 45 biodigesters will be purchased benefiting 3% of total families or 4.5% of families implementing agroforestry systems. The plans also include the restoration of degraded areas, estimated at 5 hectares per plan (75 hectares in total) to be conservative (*based on project team*). Therefore, some of the grasslands where agroforestry will be restored to a level of no degradation.

Table 5: Tier 2 values for enteric fermentation for goats under grasslands<sup>7</sup>:

Animal type	Goat farming		Dairy goats	
	Enteric fermentation (kg CH4/animal year) (Henrique et al., 2023)	% animal type (herd)	TIER 2 (weighted average) (kg CH4/animal year)	% animal type (herd)

<sup>6</sup> Default it is used to represent a level intermediate between low and high productivity according to the IPCC definitions that govern EX-ACT.

<sup>7</sup> According to Henrique et al., 2023 current systems in Caatinga correspond to low technology systems indicating degraded areas without trees.

### **Business plans:**

Table 6 summarizes BPs models according to the number of beneficiaries and investment targets. Following the assumptions of the EFA, the GHG analysis considered a 67% adoption rate.

Table 6: Key data on Land targeted and impacted as per EFA model in PIRs

BPs	Members	Hectares		
		Per family	Targeted	Impacted <sup>a</sup>
Agroecological cotton in small cooperatives (existing)	900	2.5	2,250	1,508
Agroecological cotton in small cooperatives (new)	396	2.5	990	663
TOTAL	1,296		3,204	2,171

<sup>a</sup> Impacted areas factor in the adoption rate of 67% and correspond to areas where change will be achieved and capitalized.

**Agroecological cotton in small cooperatives:** Currently, 83% of the existing lands of members of cotton producing cooperatives are growing cotton (1,875 ha) (*based on EFA*) under traditional practices: full tillage and low carbon inputs and residues exported (*based on project team*). The impacted existing cotton (1,256 ha) will introduce no tillage practices, increase the input of organic material and crop residues will be retained on the ground following agroecological practices. In parallel, 251 ha of existing members not producing cotton, out of 375 ha, will be put under agroecological cotton production. Finally, the activities of the project are expected to increase the membership of these cooperatives by 44% (*based on EFA*) incrementing the potential area to be brought to agroecological cotton production by 663 ha. It will introduce tree planting in the perimeter of the fields (203 ha). In the newly

<sup>8</sup> According to Henrique et al., 2023 systems in Caatinga to be implemented correspond to medium technology systems indicating agroforestry systems under transformation.

implemented hedgerows (land use change), the project will introduce: no tillage practices, an increase in the input of organic material, retention of crop residues and trickle irrigation systems. The existing perennial system will introduce the same management practices as annual croplands.

**Ecostoves:** The project will distribute 8,680 ecostoves. The ecostoves are expected to reduce wood consumption by 50% from the current 4.78 t wood/hh year (IFAD,2019)<sup>9</sup>. The ecostoves have a lifespan of 10 years. After considering moisture content (40%) it is expected that the wood burned will be reduced from 24,921 tdm/ year to 18,690 tdm/ year considering a 20-year period.

#### **Activities not considered:**

The PIR models under subcomponent 1.1 will require regular inputs to sustain production (fertilizers) and current annual systems might be using agricultural inputs. No use of inputs is considered in the assessment due to not available data.

The BP models under subcomponent 1.2 include agroecological cotton for medium and big cooperatives. At the time of the analysis projections were not available. In addition, BPs will require investments in equipment and potentially infrastructure which has not been included and can increase the energy used currently.

Subcomponent 1.3: Incentives for Innovation gathers investments in mechanization. The energy consumption from machinery has not been considered.

#### **Refinement of the analysis:**

Activities not considered are described in the previous point. The addition of these activities can improve the analysis when data is available.

Additionally, given the relevance of the introduction of perennial systems (forage banks), biomass growth values can be adjusted to provide a more precise assessment, especially considering the periodical pruning.

Once the activities to be implemented per biome, the percentage of land and livestock impacted by climate, the analysis could be revised.

---

### **Paraiba Rural Sustainable Development Project**

### **Design Report**

### **Annex: 19 Lessons Learned And Linkage Between The Two Phases**

Mission Dates: 20-28/05/2024

Document Date: 05/09/2024

Project No. 2000004620

Report No. 6938-BR

Latin America and the Caribbean  
Programme Management Department

## Lessons learned and linkage between the two phases of PROCASE

This annex addresses the crucial question of how the lessons learned from the first phase of PROCASE have been integrated into the design of the second phase. These lessons encompass positive outcomes and successful strategies from phase I that will be continued or scaled up in phase II, and areas where improvements are necessary to avoid repeating past mistakes. The annex is organized into a table format: the first column lists the lessons learned as documented in the Project Completion Report (PCR) from PROCASE I, marked with an asterisk, along with additional insights. The second column outlines the specific measures and strategies implemented in phase II to address each lesson, ensuring a more robust and informed project execution.

Lessons learned	How phase II will apply the lesson learned
<b>Start-up delays</b>	
<p><b>The first phase of PROCASE experienced a significant start-up delay</b> that subsequently required an extension. The contracting of the Inter-American Institute for Cooperation on Agriculture (IICA) for supporting contracting activities meant an important gain in speed and efficiency.</p>	<p>PROCASE II will establish a Project Management Unit (PMU) in the State Secretariat for Family Farming and Semiarid Development (SEAFDS) that has extensive experience in project execution, including from International Financial Institutions, such as IFAD, and keep key staff with intensive training and vast experience in executing the previous phase.</p> <p>A Technical Cooperation Project agreement between SEAFDS and the Inter-American Institute for Cooperation on Agriculture (IICA) will be signed to support PROCASE II procurement/contracting activities.</p>
<b>Target Groups</b>	
<p>PROCASE I significantly exceeded the targeting goals for priority groups, such as women (160%), young people (202%), and quilombola communities (160%). Several types of activities were held, including training and exchanges, with the technical teams, partner entities, and managers seeking to ensure that priority groups were included in interventions and technical assistance services.</p>	<p>PROCASE II will include important new target groups: indigenous peoples, LGBTQIAPN+, and persons with disability. The second phase establishes gender, youth, PCTs, and social inclusion strategies with specific budgets to promote the participation of women, youth, PCTs, persons with disability, and members of the LGBTQIAPN+ community.</p>

<p><i>Gender:</i> An important instrument in this dimension was the gender equity workshops held in all communities, led by TA focal points and some participation from the Unified Social Assistance System, coordinated by the local government. Another important lesson learned was the use of the Agroecological Logbooks.</p> <p><i>Youth:</i> PROCASE I work with youth could have been stronger and led to more relevant results regarding youth socioeconomic and political empowerment.</p> <p><i>Quilombola:</i> In the intervention with quilombolas, within the five PROCASE territories, 14 communities were incorporated into the race and ethnicity equity activities promoted by the Project, covering a total of 319 families.</p> <p><i>Persons with disabilities:</i> PROCASE I was the first Project in Brazil to innovate implementing a socioeconomic diagnosis targeting persons with disabilities (more details in the lesson regarding M&amp;E).</p>	<p>Diagnosing the inclusion gaps of persons with disabilities has been instrumental in shaping the activities targeting this group in phase II. Persons with disabilities will not only benefit as a key project target group but also from specific activities designed to empower them, such as demand-driven thematic training. This is a testament to PROCASE II's commitment to their inclusion and empowerment.</p> <p>Regarding <i>gender</i>, PROCASE II will continue to scale up the capacity-building on gender and diversity directed to beneficiary communities and the work with the agroecological logbooks. Still, it will also include new activities, such as childcare circles and awareness-raising on gender-based violence. Minimum percentages of the Resilient Investment Plans (PIR, using the Portuguese acronym) resources are foreseen to be allocated to groups with a majority of women.</p> <p>PROCASE II will strengthen the work with <i>youth</i> with a dedicated budget and specialist at the PMU and a strategy that includes activities such as vocational training, training for Young Communicators, demand-driven thematic meetings, and strengthening youth networks. Besides <i>quilombolas</i>, who will be a priority target group in land titling activities, other traditional peoples and communities will be targeted in phase II, such as indigenous peoples, riverine communities, and gypsies. PROCASE II will also have a specific budget and dedicated specialist for activities involving traditional peoples and communities (PCTs), including strengthening PCT Networks and policy engagement.</p>
--	--

**Agroecological approach**

<p><b>*The adoption of the agroecological approach by family farming has been widely recognized in Paraíba and with the work of PROCASE I.</b> It has been proven to increase resilience, especially in highly degraded and vulnerable biomes such as the semiarid region. From the IFAD Stocktake report on agroecology in IFAD operations, IFAD projects in Brazil are considered agroecologically based. IFAD</p>	<p>PROCASE II will have a holistic agroecological approach that promotes a set of agricultural practices, including diversification, utilization, and restoration of ecosystem services. It will also promote efficiency and recycling, reducing dependence on external inputs. Agroecology will support mitigating the risks of climate change and guarantee a greater variety of nutritious food. This approach will be based on the co-creation of knowledge and practices, resulting in more</p>
--	--

<p>has consistently supported the government and invested in communities shifting to agroecological practices for the management of farms and landscapes. Remarkably, these projects contributed to innovative ways of connecting producers to markets, e.g., through public procurement or linkages with local tourist services rediscovering and serving local food. The PROCASE I in Paraíba represents a reference to a fully agroecological project implemented in the semiarid context.</p>	<p>effective adoption of innovations and practices adapted to the local context, the environment, and the needs and realities of the people and communities of Paraíba. The Project will develop Technical Assistance (TA) capacities to provide family farmers with agroecological practices, such as diversifying plant breeds and crops with multi-crop/consortia systems, increasing the organic matter content of the soil, using green fertilizers and Integrated Pest Management (IPM) with practices aimed at increasing the structural and functional diversity of the agroecosystem.</p>
---	--

**Agroforestry Systems**

<p>PROCASE I implemented approximately 900 agroforestry systems, such as Crop-Livestock-Forest Integration (CLFI) with forage palm and productive yards, among other sustainable techniques for the management of the Caatinga biome. With the implementation of Emergency Plans, the Project further installed 31 agroforestry systems, with an average size of 0.5 ha, containing arrangements of tree and shrub plants and herbaceous for food and fodder production, mitigating environmental impacts and desertification trends. The successful implementation of these systems and high acceptance by farmers led to the expansion of these initiatives in phase 2.</p>	<p>Agroforestry systems will be the main elements of PROCASE II's production systems, focusing on different crops adapted to the local biomes of the semiarid and the Atlantic Rainforest. In the semiarid, the systems based on fodder production will support goat farming for milk and meat, dairy cattle farming, and free-range poultry farming. Other systems will focus on the production of fruits and vegetables, including Neglected and underutilized species (NUS) and medicinal plants.</p>
---	--

**Innovation**

<p>The Project identified innovation initiatives led by farmers during phase 1, such as new mechanization tools for agroecological systems or adaptation of existing equipment. However, there was no mechanism in place to scale such initiatives and spread such tools to other farmers.</p>	<p>PROCASE II will foster innovation initiatives with the incubation of small businesses, providing funding and technical assistance to identified innovators, helping them scale their initiative to reach other farmers. Selected projects will receive funding and will be supported by a team of experts in the scaling process.</p>
--	--

## Technical assistance

**\*Technical assistance is important for the successful implementation of a rural development project such as PROCASE.** Technical Assistance (TA) has been a highlight of sustainable development projects supported by IFAD in Northeast Brazil, being an element that should characterize their intervention strategy. PROCASE, in its original design, was fully aligned with this principle or guideline. However, for several reasons, the implementation of PROCASE took place for a long time without a TA on the field. Indeed, the work with the Productive Plans (PP) started in the first year of implementation of the Project in 2013, but the TA for this line of work was only contracted in 2017. In the case of Emergency Plans, which started in 2015, there was the initial contracting, which was very insufficient and lasted from February to December 2016. It was only in 2018 that the TA service for these initiatives was again contracted, this time in an appropriate format. In both cases, the Project's own teams (PMU - RPMU) covered the initial advisory work to the extent of their reduced possibilities. All those involved in the implementation of PROCASE were able to verify that a satisfactory TA service fostered outstanding progress in the implementation of PPs and PEs, both in quantitative and qualitative terms (in execution). These improvements have led to results in terms of more production, more training, and more water security. Thus, PROCASE's experience with this TA matter is a confirmation of the correctness of the original guideline, which attributed a very important role to the provision of this service in a sustainable rural development project. At the same time, it serves as a warning to managers that failing to provide this service can lead to very important losses for the implementation of a project of this type.

PROCASE II aims to provide high-quality technical assistance based on a participatory approach, which has proven to be essential to meeting the real needs and demands of the beneficiaries, maximizing the Project's impact, and ensuring greater sustainability. Component II contemplates contracting local technical assistance entities to support the design and implementation of the PIR in the communities, including good agricultural practices, sustainable water and soil management, and good use and care of infrastructure investments.

<b>Resource management by beneficiary organizations</b>	
<p>The experience of PROCASE I shows that transferring funds to community organizations and cooperatives for contracting in productive schemes reduces costs, empowers, and involves beneficiaries, improving scheme outcomes. However, providing strong support to these organizations is crucial to ensure timely and effective procurement and accountability.</p>	<p>Beneficiary organizations will be responsible for the management of project resources for Component I-funded PIR and Business Plans (BPs) and will carry out planned procurement and contracting. To this end, SEAFDS will sign agreements with them, establish obligations, transfer resources, and provide technical assistance to support them in procurement and accountability.</p>
<b>Water access social technologies</b>	
<p><b>*The integration of water activities with productive projects</b> (mainly for a region such as the Brazilian semiarid region). The 2012-2019 'great drought' crisis made it very clear what could be considered underestimating the 'water issue' in the Project's design. In the original document, the theme was mentioned, but it was a sub-component of a subcomponent with a very small budget. PROCASE I's response to the crisis was an important readjustment of the design, which significantly expanded the budget dedicated to the issue and incorporated a series of technologies/investments that had not been initially foreseen, such as tubular wells (as a proposal for wide application) small irrigated areas (with appropriate irrigation systems), medium-sized dams. The work done by PROCASE in the context of the 'water issue' has shown that this type of investment can have a very important impact not only on 'quality of life' (providing more water for human consumption, for example) but also on the productive activities of families served (with more water for herds and the possibility of installing small, irrigated areas, citing another example).</p>	<p>PROCASE II will build on the build-up on the lessons from phase 1, investing in a series of water and energy access social technologies, such as cisterns for production, greywater reuse systems, underground dams, biodigesters, and efficient cookstoves, which play a fundamental role in building and strengthening more resilient production systems and improving the basic living conditions of beneficiary families. It will also innovate in implementing social technologies for basic rural sanitation. These activities will be implemented by entities contracted by the PMU. In addition to implementation, these organizations will carry out all the training to ensure the proper appropriation, use, and maintenance of the technologies by the families.</p>

For public policy/project managers and formulators, this PROCASE experience had repercussions on two levels. Firstly, it provoked a review of the way of analyzing the 'water problem' when thinking about 'projects' for contexts like the northeastern semi-arid. Concomitantly, it also modified the range of 'available' responses for inclusion in policies/projects. The conclusion of this perspective change has been the recognition that it is indispensable and technically and economically possible to make more investments in terms of harvesting, storing, accessing, and sustainably using water resources in this type of Project.

### Gender

**\*The establishment of women's groups as a methodological strategy for the strengthening of a collective identity of female farmer-entrepreneurs and female farmer-activists.** In the communities supported by PROCASE I, where groups of women existed, they became more active social and political subjects and were involved in organizational processes. When women's groups are articulated, they strengthen and expand organizational capacities in several aspects: self-organization, training, marketing, and the conquest of public policies and social rights. The results are visible: women can have more democracy in community associations and take up decision-making positions, such as the presidency and treasury of associations. In the PP of groups of women, they manage to be protagonists participating in the production and commercialization. In contrast, in mixed PPs where these groups do not exist, the participation of women only occurs in an adjuvant way. In the public policy domain, these groups of women are more active in the demands for their community, such as health centers and regular doctors,

PROCASE II will take a holistic approach to transforming gender relations, which focuses on the environmental, economic, political, and cultural causes of women's social vulnerability. This perspective aims to transform unequal power relations shaped by patriarchal structures, norms, and practices and empower women to be more resilient. To this end, the Project will: i) promote economic empowerment and equal access to and control over resources and assets, ii) address the issue of women's overload due to domestic and care work, iii) empower women and men to have equal voice and decision-making power in rural institutions and organizations (see details in the Annex on Gender Diagnosis). One key entry point regarding women's political empowerment will be strengthening existing women's groups, seeking to articulate them among each other and other women's organizations in the territories. This process will favor the formation of a collective identity of female farmer activists and leaders.

schools, school transportation for children, and community participation in the Orçamento Cidadão (Participatory Budget), among others. In this perspective, the lesson to highlight here is that developing a strategy of forming groups in the communities that are intended to support to discuss specific issues of women, such as health, violence, democratic participation in the management of associations, and productive Project for women, is of paramount importance as a tool for women's empowerment.

**\*Project management can become a mechanism for the transversality of rural development policies.** In 2017, PROCASE created its Targeting Working Group (WG), composed of representatives of the PMU and the Regional Project Management Units (RPMUs), and also made up of representatives of contracted technical assistance organizations and with the participation of farmers and young people, to support and monitor the gender activities carried out by the TA and, at the same time, developing strategies and instruments to ensure the mainstreaming of the gender focus in the set of the Project's activities. This Targeting WG, with systematic meetings, reflective and operative, served as a space for learning and analyzing practices related to the execution of productive projects and the level of inclusion of priority groups, that is, women, quilombolas, and youths, in the interventions carried out. Based on the successful experience of the PROCASE Targeting WG, in March 2021, the State's Council for Sustainable Rural Development (CEDRS) permanently instituted the **Gender Equality, Generations, Race, Ethnicity, and Peoples Working Group (WG)**. This new WG, with a broader scope, has as its main competencies the follow-up to the formulation and the monitoring of the implementation of official programs for these groups, the promotion of studies and debates on relevant themes for the

PROCASE II will continue with the Targeting Working Group to support and monitor the gender activities carried out by the TA but will incorporate a broader strategy to reach other new target groups, such as persons with disabilities and the LGBTQIAPN+.

Phase II will continue actively participating in the **Gender Equality, Generations, Race, Ethnicity, and Peoples Working Group (WG)**, permanently instituted by the State's Council for Sustainable Rural Development (CEDRS).

<p>implementation of activities aimed at these groups, and propose guidelines for monitoring policies for gender equity, generations, race, ethnicity and for traditional peoples, in the sustainable rural development of the State, among others, enriched by the participation of technical teams and later expanded with the presence of multiplying farmers and young scholarship holders, it is no longer a merely operative instrument to transform itself into a strategic mechanism for the transversality of gender activities in the State's rural development policies.</p>	
<p>The <b>Agroecological Logbook (AL)</b>, a methodological tool based on the principles of feminism and agroecology, helped to create a counterpoint to the conventional economic view, which does not measure the non-market economic contribution of women. The use of AL allowed women to keep an excellent record of the farmers' work results, quantifying what they used for consumption, donation, exchange, and sale and giving greater visibility to the production of wealth they generated. With this tool, the 55 participating women expanded their ability to identify and give visibility to the importance of their work. The ALs' evaluations highlighted their valuable contribution to the families' food and nutrition security. They also empower women as guardians of agrobiodiversity.</p>	<p>In phase II, the implementation of the Agroecological Logbooks will be scaled up. Subcomponent 2.3 allocates a specific budget line for this activity within the Gender and Diversity Plan.</p>
<p><b>Monitoring and Evaluation (M&amp;E)</b></p>	
<p>* <b>Inclusion of persons with disabilities in the impact evaluation study.</b> PROCASE I was the first IFAD project in Brazil to include a specific analysis of the results obtained regarding persons with disabilities. The methodology was structured and successfully applied by the M&amp;E team.</p>	<p>Based on the research done during PROCASE I, it was possible to include target values in the PROCASE II Logical Framework.</p> <p>It was also possible to provide information to better characterize persons with disabilities in the territory and suggest specific activities to close this target group's identified social inclusion gaps.</p>

	<p>The knowledge gained from phase I will be applied to the impact evaluation study of phase II.</p>
<p><b>Knowledge Management (KM) and South-South and Triangular Cooperation (SSTC)</b></p>	
<p>In the first phase of PROCASE, the concept of knowledge management was introduced towards the Project's end and managed primarily by the Monitoring and Evaluation (M&amp;E) department. Despite this late integration, PROCASE I succeeded in systematizing and producing valuable knowledge products and facilitated knowledge exchange activities.</p>	<p>In PROCASE II, the critical importance of KM is recognized from the outset. Effective KM is crucial for a development project as it ensures that valuable insights and lessons are systematically captured, shared, and utilized to enhance project outcomes and sustainability. PROCASE II has a specific subcomponent (2.5) for KM and SSTC activities, with a corresponding budget allocation. A KM and SSTC specialist will be hired to manage this subcomponent and ensure its implementation.</p> <p>By embedding KM and SSTC into the Project's core structure from the beginning, PROCASE II aims to ensure a more systematic and impactful approach to capturing, organizing, and disseminating knowledge. Additionally, phase II will incorporate South-South and Triangular Cooperation (SSTC), enabling the exchange of project activities and the generated knowledge within Brazil and with other countries in the Global South. This broader cooperation will not only enhance the Project's effectiveness but also contribute to a global pool of shared knowledge and best practices.</p>

**Project Design Report**

**Exit Strategy**

Document Date: 25.06.2024

Project No. 2000004316

Latin America and the Caribbean  
Programme Management Department

The Project is closely aligned with the priorities of Secretariat of Family Agriculture and Semiarid Development (SEAFDS) and the Government of Paraíba, which were considered and integrated throughout the design process. This should create favorable conditions for strong ownership and continuity of PROCASE II activities, both during and after implementation. In addition to these priorities, the Project design also considered the lessons learned during PROCASE's first phase, as well as other ongoing interventions in similar areas of activity conducted with the federal government or international resources (e.g. COOPERAR, PDHC II and PCR).

The sustainability of the Project's investments beyond its lifetime was an important concern during design and should be a priority over the implementation phase. From the third year of implementation, a strategic sustainability plan will be drawn up through an iterative process with the different stakeholders. This plan will be monitored during IFAD and IDB supervision missions.

PROCASE II's exit strategy will seek to scale up Project activities with good performance and ownership, leading to greater impacts after the Project ends.

The plan's preparation will follow the guidelines of IFAD's reference documents, in particular, the Operational framework for scaling up results. Below, there is a description of several elements that will contribute to the long-term sustainability of the investments and activities implemented during the Project. The following contributing factors will be considered:

**At state level:**

- Collaboration with bodies linked to SEAFDS, such as the Rural Extension, Research and Land Regularization State Agency (EMPAER), Project sub-executor, will be a strategic factor for integrating beneficiary families and their organizations with other governmental actions and policies;
- The effective participation of various secretariats and government bodies, such as the National Institute for Colonization and Agrarian Reform (INCRA), the State Secretariat for the Environment, the Secretariat for Human Development (SEDH), which plays a central role in drawing up and coordinating the various actions included in the State Plan for Food and Nutritional Security, the Paraíba School of Public Health, the National Rural Learning Service (SENAR), the Brazilian Micro and Small Business Support Service (SEBRAE), the National institute for the Semiarid (INSA), the Brazilian Agricultural Research Corporation (EMBRAPA) and local universities, will be crucial for the appropriation of the Project's methodology and direct contribution during the implementation period. This involvement will enable these institutions to continue and expand Project's activities;
- The integration of PROCASE II activities in the state's 15 Rural Territories, in particular through the Democratic Budget hearings, will be strategic channels for finding complementarities and guaranteeing the continuity of activities after the

- Project ends. The activities of the Territories through the collegiate bodies will also be strategic for disseminating and expanding innovations and successful practices;
- Strengthening and diversifying the capacities of Technical Assistance (TA) organizations in terms of new approaches and the use of new tools related to PROCASE II strategic priorities (e.g. climate resilience, agroecology and gender-transformative approaches) will be fundamental to guaranteeing good continuity of the Project's activities. It will also be a way for organizations to apply the good practices acquired under PROCASE II to other projects;

**At community and family level:**

- The Project aims to strengthen the capacities of the beneficiary population and their community organizations through TA, so that they can access and implement other projects and activities on resilient productive systems;
- Beneficiary families and organizations will be involved in all stages of elaborating the Rural Investment Plans (PIR), defining the activities to be carried out together with TA teams. In addition, beneficiaries and their organizations will also be involved and responsible for acquiring and accounting for the financial resources related to the PIRs. This practice, used in several other IFAD-supported projects in the Northeast, contributes greatly to the ownership of the investments and enables new skills to be acquired that can be used for other projects;
- Improving skills and knowledge in nutrition, together with participatory methods of social, ethnic-racial, gender, youth, and persons with disabilities inclusion, will contribute to better ownership and social inclusion;
- Training activities and support for access to various public policies should create favorable conditions for beneficiaries, thus allowing them greater autonomy and capacities to expand and maintain the activities initiated with PROCASE II, in particular with access to rural credit and institutional purchasing programs;
- The land titling activities will play a crucial role in ensuring the sustainability of the Project's productive and environmental activities for the benefiting family farming properties.

Regarding the **environmental dimension of the sustainability of PROCASE II's** activities, it is important to note that the approach aims to make production systems and, consequently, the livelihoods of family farmers more sustainable and resilient. These include:

- PROCASE II will promote an agroecological transition to diversify and intensify production systems, integrating a specific approach to environmental issues. This is expected to lead to greater resilience to climate change, as well as greater capacity to maintain productive practices with the potential to increase and diversify yields;
- The construction of PIRs with a specific environmental focus and with resources earmarked for this purpose should make it possible to carry out collective activities

around environmental problems, generating mobilization and concrete actions from the beneficiary population;

- Social technology investments via PIRs should improve environmental sustainability by reducing water and soil contamination through the installation of family grey water treatment and reuse technologies, improving families' living conditions.

The crucial elements of the **economic dimension** that contribute to the sustainability of the project are:

- Capacity-building activities for farmers' organizations and their processing units will be key to improving access to markets on a more continuous and regular basis, allowing for a better valuation of products and an improvement in producers' incomes.
- Beneficiaries will receive TA to improve market access, an essential factor for the sustainability of the investments. Although all types of market opportunities are covered, the institutional market, such as the National School Feeding Program (PNAE) and the Food Acquisition Program (PAA), is very accessible to small producers at a local level if they have TA support;
- The introduction of agroecological practices will help to reduce the use of commercial inputs and, consequently, production costs. Together with improved mechanization, this is expected to increase the economic sustainability of family systems significantly;
- Technicians from the Project and TA organizations will be trained to use a tool to draw up PIRs and Business Plans (PN) that uses profitability calculation principles. As all the PIRs and PNs will be elaborated this way, the Project will contribute to strengthening these new capacities to generalize this methodological approach;
- Social technologies for energy production will guarantee a reduction and efficient use of natural resources in the long term, as well as monetary savings for families;
- The construction of small infrastructures for collecting, storing, and accessing water for production will be fundamental to guaranteeing the economic sustainability of production activities.

Finally, the elements of the **Project's overall approach and strategy that contribute to its sustainability** are:

- Strengthening the knowledge and expertise of the in-person and remote public and private TA teams working in the state will be a strategic contribution to the continuity of the activities implemented by PROCASE II and their replication in other projects and programs;
- Encouraging social participation at all stages of the Project through the use of specific methodologies and tools for women, young people, traditional peoples and communities and persons with disabilities should encourage ownership and sustainability of the Project's activities;

- The methodology for identifying, drawing up and implementing the RIPs and PNs, including the procurement and accountability processes, based on participatory processes and with the support of TA should allow for strong ownership of the activities and organizational dynamics promoted by the Project, a fundamental factor for its sustainability;
- The various innovations that the Project will help develop will aim to provide adapted solutions and strengthen the adaptation and resilience of productive activities and families, and their impact will go beyond the Project area, with repercussions in the medium and long term;
- The work of Knowledge Management and South-South and Triangular Cooperation will constitute a fundamental methodological reference for the continuation and expansion of the Project's activities. This will be an opportunity to ensure that the results, as well as successful innovations and approaches, are shared with the government (both at state and federal level), with other IFAD projects and with the relevant stakeholders in Brazil and in other countries, to facilitate their acceptance, support and scaling up;
- The overall sustainability of the interventions will depend on increased production of healthy food, productive diversification, improved nutrition, and increased incomes (by reducing costs and improving prices and sales conditions), and greater resilience to climate change and shocks.

**Budget:** USD 200,000 was allocated to cover the costs of carrying out the activities under component Management and M&A.

## Terminology and Definitions

*Traditional Peoples and Communities (PCTs):* are culturally differentiated groups that recognize themselves as such, have their own forms of social organization, occupy, and use territories and natural resources as a condition for their cultural, social, ancestral, and economic reproduction, using knowledge, innovations and practices generated and transmitted by tradition<sup>1</sup>. These groups include: indigenous peoples, quilombolas, people of African descent or terreiros, communities that collect non-timber forest products, riverine communities, and artisanal fishers, babassu coconut breakers, shellfish gatherers, caboclos, among others. There may be overlap between these social segments.

*Indigenous Peoples:* Indigenous Peoples are distinct social and cultural groups who share collective ancestral ties with the lands and natural resources where they live, occupy or have been displaced from. The land and natural resources they depend on are inextricably linked to their identities, cultures, livelihoods, as well as their physical and spiritual well-being. They often turn to their leaders and customary organizations for representation that is distinct or separate from the dominant society or culture.

*Quilombola communities:* According to Decree No. 4887 of November 20, 2003, quilombola communities are ethnic-racial groups according to criteria of self-attribution, cultural identity, and their own historical trajectory, endowed with specific territorial relations, with a presumption of black ancestry related to resistance to slavery<sup>2</sup>.

*Vulnerable groups:* people belonging to a minority who are prevented or denied access, participation and/or equal opportunities to universal goods and services available to the population<sup>3</sup>. These groups suffer materially, socially, and psychologically from the effects of exclusion for various reasons, such as health, sexual orientation, ethnicity, race, physical or mental disability, gender, among others.

*Sexual Orientation:* This can be understood as the identity attributed to an individual according to their sexual desire and conduct, whether towards another person of the same gender (homosexuality), of a different gender (heterosexuality) or towards people of both genders (bisexuality).

*Intersectionality:* "Intersectionality is a concept that seeks to capture the structural and dynamic consequences of the interaction between two or more axes of subordination. It deals specifically with the way in which racism, patriarchy, class oppression and other discriminatory systems create basic inequalities that structure the relative positions of women, races, ethnicities, classes, and others. In addition, intersectionality deals with how specific actions and policies generate oppressions that flow along these axes, constituting dynamic or active aspects of disempowerment."<sup>4</sup>

*Good Practice:* a successful experience and initiative in any area, which is linked to innovation or is a reference for a particular group, community, or territory. It is an action that generates positive impacts on improving living conditions. It is an exemplary experience that presents good initiatives, innovations and lessons learned that can be disseminated and replicated in other contexts and similar conditions or needs<sup>5</sup>.

*Capacity Development:* is understood as a process by which individuals, groups and organizations strengthen their abilities to perform functions, mobilize and use resources efficiently to achieve objectives in a sustainable way, in the following dimensions: individual, organizational, inter-institutional and social/contextual<sup>6</sup>.

*Multidimensional Approach to Poverty:* People in poverty face a range of deprivations, from social exclusion to barriers to accessing a stable income, quality education or health care. Poverty is multifaceted and therefore one-dimensional metrics, such as monetary poverty measures, are limited<sup>7</sup>.

## Diversity diagnosis methodology

Poverty and inequality are rooted in socio-economic, political, and cultural structures that perpetuate the exclusion of groups belonging to certain social categories. From this perspective, inequality is recognized as a historical-structural, heterogeneous phenomenon, emanating from a culture of privilege that has excluded various social groups, such as people living in poverty, women, young people, rural populations, the LGBTQIAPN+ population and persons with disabilities, and, in the case of traditional peoples and communities (PCTs), has arbitrarily and violently expropriated them of their means of life, production and natural resources.

The gap approach is in line with the IDB's Gender and Diversity Sector Framework and the bank's Gender Action Plan and Diversity Action Plan. A *gap* implies inequality and is understood as a bottleneck that prevents the sustainable and inclusive development of a certain group in terms of social and economic equality. The *gap approach* seeks to identify these bottlenecks as a means of prioritizing certain public policies in favor of greater horizontal and vertical equity.

This socio-economic diversity diagnosis is based above all on recognizing and analyzing vertical structural gaps, i.e., disparities within the state of Paraíba and the municipalities of the PROCASE II project region. It also seeks to identify how social categorizations such as race, ethnicity, generation, and gender may create overlapping and interdependent systems of discrimination, oppression, or disadvantage.

Historically, traditional peoples and communities (PCTs), like other groups in situations of vulnerability, have suffered a process of statistical invisibility, which is reflected in the scarcity of official data dealing specifically with these groups, disaggregated by gender, race and ethnicity. These populations have specific needs, which should shape the types of actions and interventions needed to promote rural development that respects diversity and favors inclusion<sup>8</sup>.

*Data collection methodology.* Evidence - mainly quantitative - of multiple socio-economic dimensions of poverty (education, access to land, income, among others) is collected and analyzed using information from official databases<sup>9</sup>. Whenever possible, we tried to access micro-data from the 223 municipalities in the Project's area of intervention and data disaggregated by race/ethnicity and gender. In addition, when official statistics were not available, articles from academic literature were used. From February 20 to 23, 2024, a mission was conducted in communities in the Project's intervention area to gather additional information on the socio-economic situation and demands of the target groups.

*Data analysis methodology.* The first method aims to analyze the socio-economic challenges of the initial situation (baseline) and the structural conditions in which the Project will develop at the local level (municipalities) of the intervention area. A second exercise is to map public policies and programs on issues relevant to the Project, such as: family farming, access to water, sanitation and traditional peoples and communities. A third scope consists of examining the problems and cause and effect relationships identified and the associated constraints and opportunities. This effort stems from addressing the needs from the perspective of the direct beneficiaries (women, young people, family farmers, traditional peoples, and communities). This analysis will be used to highlight, from a differential approach, the discrimination and social exclusion of groups in situations of vulnerability and to propose actions to close the gaps identified.

---

<sup>8</sup> IADB. *Diversity Action Plan for Operations* (2019-2021).

<sup>9</sup> The following databases were consulted: Agricultural Census (20017); Demographic Census (2010); Single Registry for Social Programs (March 2023); Continuous PNAD (2019), PNS (2019); SISVAN (2023).

## Introduction

The **general objective of** the Paraíba Rural Sustainable Development Project (PROCASE II) is to reduce rural poverty levels, improving food and nutritional security and adapting the rural population to climate change. The **specific objectives** are as follows: (i) Increasing the adoption of agricultural technologies, including those for adapting to and mitigating climate change, (ii) Improving the productive and social inclusion of family farmers, prioritizing women, young people, Traditional Peoples and Communities (PCT) and persons with disabilities, and (iii) Improving the environmental conditions of rural communities and their surroundings.

The Project's *intervention area* covers all 223 municipalities in the state of Paraíba, but the intervention will prioritize communities based on the following technical criteria: i) incidence of rural poverty (Single Registry, Cadastro Único); ii) presence of traditional peoples and communities (PCTs); iii) incidence of food and nutritional insecurity; iv) concentration of rural women and young people; v) limited or no access to water for human consumption and production; vii) avoidance of overlap with the PROCASE I, Sertão Vivo and PDHC III interventions.

The Project aims to directly benefit 60,000 families (around 210,000 people) in the family farming sector, of which 50% will be women, 20% young people, 5% Traditional Peoples and Communities (PCTs) and 2% will be Persons with Disabilities. The Project's main target groups are: i) family farmers living in poverty and extreme poverty, ii) rural women, iii) rural youth, iv) PCTs, v) Persons with disabilities and v) LGBTQIAPN+.

The *overall objective of* the diversity diagnosis is to ensure the inclusion of historically marginalized groups living in the PROCASE II area, in particular traditional peoples, and communities, Afrodescendants, young people, persons with disabilities and LGBTQIAPN+, ensuring that "no one is left behind". Its *specific objective* is to enhance the effectiveness of the Project's interventions by collecting and analyzing information that will serve as input for recommending activities that improve participation and benefits for marginalized communities in the Project area.

*Structure of the diagnosis.* Section 1 identifies the general and specific figures for the Project's main target groups, with emphasis on Afrodescendants, quilombolas and indigenous people. Section 2 is based on an analysis of the socio-economic characteristics of family farmers (broken down by race/ethnicity) and traditional communities in the Project's area of intervention, highlighting the *gaps* in social inclusion. Section 3 analyzes the specific challenges faced by the following vulnerable groups: young people, persons with disabilities and LGBTQIAPN+. Next (section 4), federal public policies aimed at priority groups are mapped to identify possible synergies and complementarities. Finally (section 5), based on the evidence collected, activities, targets and indicators are recommended that are appropriate for tackling existing inequalities, both in the productive sphere and in issues linked to organization and representation in spaces for dialogue, defense, and protection of their rights.

## 1. Identification

According to the 2022 Demographic Census, the population of the 223 municipalities in the intervention area is 3,974,687, of which 2,055,832 are women (51.7%) and 893,666 young people aged 15 to 29 (22.5%)<sup>10</sup> and 2,524,452 are of Afrodescendants (63.5%) (Figure 1).

**Figure 1** - Total population by race/ethnicity and age (Demographic Census, 2022).

According to the 2017 Agricultural Census<sup>11</sup>, in the Project's intervention area (223 municipalities), 76.9% of total establishments are family farms, totaling 125,489. Among the family farms, 24.0% are run by women, 64.0% by Afrodescendants<sup>12</sup>, 11.3% by young people under 35 and 0.9% by indigenous people. The table below summarizes the percentages of female and male heads of family farms by race/ethnicity and age groups.

Among the establishments run by people of African descent (Afrodescendants), 24.4% are run by women and 75.6% by men. Among those run by indigenous people, 37.9% of establishments are run by women and 62.1% by men.

**Figure 2** - Heads of FF establishments by gender and distribution of men and women by race and ethnicity (IBGE, Agricultural Census, 2017).

<sup>10</sup> Among young people aged 15 to 29, 120,114 (26.5%) are young women and 129,666 (27.3%) are young men. Source: Demographic Census 2022.

<sup>11</sup> This is the most recent Agricultural Census available with microdata for the municipalities in the project's area of intervention.

<sup>12</sup> Among the establishments run by people of African descent, 24.4% are run by women and 75.6% by men.

In the Project area, 2,574,204 people are registered in the Single Registry, of which 1,154,067 are women (44.8%) and 1,420,137 are men (data from November 2023). The total population living in rural households registered in the Single Registry is 713,277 people, making up approximately 301,455 families.

#### *Traditional Peoples and Communities:*

*Indigenous people:* According to the 2022 Demographic Census, Paraíba has 30,492 indigenous people, which corresponds to 0.76% of the state's total resident population. Of the total number of indigenous people in Paraíba, 50.8% are women and 25.6% are young people aged between 15 and 29. However, only 6,842 indigenous people (18.7% of the total) live in Indigenous Territories. In the Single Registry, there are 6,328 indigenous families registered, 73.1% of whom are in a situation of poverty or extreme poverty.

*Quilombolas:* Regarding quilombolas, according to the recently published data from the 2022 Demographic Census, there are 16,584 quilombolas in Paraíba, but only 17.6% (2,918 people) live in the state's 11 officially delimited quilombola territories. The municipalities in Paraíba with the highest number of quilombola residents were Conde (around 3,000), João Pessoa (2,260), Cacimbas (1,698), Santa Luzia (1,324) and Alagoa Grande (946). Overall, 51 municipalities in the state registered a quilombola population. When calculating the ratio between the number of quilombolas and the population of each municipality, the highlights are Cacimbas (23.5%), Conde (10.9%), Diamante (9.4%), Santa Luzia (8.9%), Riachão do Bacamarte (8.8%) and Dona Inês (7.8%)<sup>13</sup>.

According to the MPF, there are 47 certified quilombola communities in the state, none of which have titled territory<sup>14</sup>. However, data from the State Coordination of Black and Quilombola Communities of Paraíba (CECNEQ/PB) indicates that there are 49 quilombola communities in 28 municipalities in the state, 2 of which have not yet been certified<sup>15</sup>. The CECNEQ/PB survey also shows that of the 49, only 4 have been demarcated. There are 4,295 quilombola families registered in the Single Registry, 67.9% of whom live in poverty or extreme poverty.

*Gypsies:* The Gypsy population is estimated at around 1,000 families of the Calon ethnic group, present in more than 35 municipalities, according to data collected by the Community Association of Gypsy Peoples of Condado (ASCOCIC) in 2015. According to a socio-economic survey carried out by the State Secretariat for Human Development, the largest gypsy community in the state of Paraíba is in the municipality of Sousa. In Sousa alone, 278 family nuclei were declared, accounting for 904 people<sup>16</sup>. However, there are gypsy families all over the state of Paraíba.

*Shellfish gatherers:* In Paraíba, there are three informal associations of shellfish gatherers who call themselves "Women of the Waters" communities, in the municipalities of João Pessoa, Cabedelo and Pitimbu. They bring together an average of 2,500 women. In Acaú/Pitimbu (Mata Sul da Paraíba), of the 316 women involved in shellfish gathering, 104 are active members of AMA - Associação de Marisqueiras de Acaú. However, they are registered with the Ministry of Fisheries as artisanal fisherwomen.

*Agrarian Reform Settlers:* In the project area, 5,966 agrarian reform settler families are registered in the Single Registry, 3,646 (61.1%) of whom are in extreme poverty and 192 (3.2%) poverty<sup>17</sup>. In Paraíba, there are around 322 settlements which represents 15,000 settled families, or around 100,000 people<sup>18</sup>.

---

## 2. Socio-economic characterization

### 2.1 Education

**Figure 4** - Indicators of illiteracy and never attending school (Agricultural Census, 2017).

*Illiteracy.* According to the 2017 Agricultural Census, 56,699 of those responsible for family farming establishments were illiterate, 45.2% of the total. Among the population of white family farmers, illiteracy reached 39.9% of those responsible for establishments, while among indigenous people illiteracy reached 37.8% and among Afrodescendants 48.1%. Considering only Afrodescendants, illiteracy is considerably higher among men (51.3%) than among women (38.3%).

*Never attended school.* The same database shows that 30,410 heads of family farms have never been to school (24.2% of the total). Among white family farmers, 9,466 (21.8%) have never been to school, among Afrodescendants, 20,474 (25.5%) and among indigenous people, the gap is even wider: 341 or 31.2% have never been to school. Considering only Afrodescendant family farmers, the indicators for men are higher: 27.1% of them have never been to school, while the rate for women is 20.4%.

### 2.2 Economic activities

In the Project area, according to the 2017 Agricultural Census, the agricultural economic activities of the heads of family farm (FF) establishments, broken down by race and ethnicity, are shown in Figure 5 below:

**Figure 5** - Main production of FF establishments (Agricultural Census, 2017).

For family farmers in general, livestock farming is prevalent (55.3%), followed by temporary crops (33.9%) and permanent crops (4.0%). Horticulture/fruit growing (3.6%) and forestry (3.0%) account for 5.6% of the activities of family farms. The Afrodescendant population devotes proportionally more time than the white population to temporary and permanent crops, forestry production and horticulture/fruit growing. For their part, the indigenous population's main farming activity is temporary crops (55.1%), followed by livestock (17.8%) and forestry (15.5%) - a percentage well above the other subgroups.

### 2.3 Income

*Multidimensional Poverty Index (MPI):* In 2023, the MPI for the Northeast region was calculated at 47%, while for the rural areas of the Northeast it was 66%: 29 percentage points higher than the population of urban areas<sup>19</sup>. This indicator is not available disaggregated by state or municipality.

*Household income per capita:* Nominal monthly household income per capita in 2023 was R\$1,320, eighteenth place among the 27 federation units<sup>20</sup>. However, this data is not available broken down by race/ethnicity.

**Figure 6** - Families in poverty - rural families, family farmers, quilombolas, indigenous people, artisanal fishers, riverine and agrarian reform settlers (Single Registry - Cadastro Único, 2024).

*Poverty* (figure 6). According to a study by the Paraíba State Human Development Secretariat, based on data from the Single Registry, the percentage of poverty in the state is 53.95%, considering the average of the rates of the 223 municipalities<sup>21</sup>.

Among rural families in the Single Registry, 66.1% are in extreme poverty.

Among the family farmers in the Single Registry, 69.9% are in poverty or extreme poverty - a gap of 3.8% in relation to the total number of registered rural families.

Among indigenous people, 73.1% are in a situation of poverty and extreme poverty, i.e., registered indigenous people have a rate of extreme poverty and poverty 5.6 percentage points higher than the average for all registered rural families.

Among the quilombolas, extreme poverty reaches 67.9% of those registered in poverty and extreme poverty, which indicates a gap of 6.4 percentage points in the extreme poverty and poverty situation in relation to the general average of those registered.

<sup>19</sup> UFV (2023). Study of Multidimensional Poverty in the North and Northeast of Brazil. Study commissioned by IFAD in preparation for COSOP.

<sup>20</sup> IBGE (2018). <https://cidades.ibge.gov.br/brasil/pb/panorama>.

<sup>21</sup> SEDH. Overview of the poverty conditions of families in the state of Paraíba.

Considering artisanal fishing families, 80.7% of them are in extreme poverty or poverty. This is a gap of 12.4 percentage points in relation to the poverty/extreme poverty situation of all registered rural families.

Finally, among riverine families, 72.6% are in poverty or extreme poverty, a gap of 6.5 percentage points compared to rural families in the project area.

## 2.4 Technical assistance and access to finance

**Figure 7** – Total access to Financing and access to Technical Assistance by race and ethnicity (Agricultural Census, 2017).

*Technical Assistance (TA).* The 2017 Agricultural Census shows that 21,123 heads of family farms had access to TA, 16.8% of the total. Among white family farmers, 7,694 had access to TA (17.7%), among indigenous people, 349 or 31.9%, and among Afrodescendants, 12,961 or 16.1% of the total. The gap between white and Afrodescendant leaders is 0.7 percentage points and between whites and indigenous people 3.9 percentage points.

*Access to financing.* According to the 2017 Agricultural Census, 21,151 PA establishments in the Project area had access to some kind of financing (16.9% of the total). Of those that received financing, 9,899 came from public credit programs, 72.8% from PRONAF. Details of which credit programs were accessed can be found in table 1. This data is not available disaggregated by race and ethnicity.

**Table 1**

Funds from Government Credit Programs	Total	Percentage
From credit programs	9 899	100.0%
Implementation and installation of settlements (INCRA)	54	0.5%
Promotion Program	31	0.3%
National Support Program for Medium-sized Rural Producers (PRONAMP)	92	0.9%
National Program to Strengthen Family Farming (PRONAF)	7 210	72.8%
Terra Forte e Terra Sol Program	5	0.1%
Program to Support Infrastructure Projects and Services in Rural Territories (PROINF)	59	0.6%
Other programs (federal, state, or municipal)	2 448	24.7%

## 2.5 Land security and access to land

*Property title.* According to the 2017 Agricultural Census, in the Project area, 88,383 heads of family farms have land titles, or 70.4% of the total. Among white family farmers, 77.7% have a title, among indigenous farmers, only 44.6% and among Afrodescendants, 70.3%. Figure 8 shows the inclusion gaps in access to land titles.

**Figure 8** – Land ownership: Property title by race and ethnicity (Agricultural Census, 2017).

*Area of establishments.* The highest percentage of establishments with a small area - 0 to 1 ha and 1 to 5 ha - corresponds to the Afrodescendant population. Among establishments with an area of between 5 and 50 ha and over 50 ha, the highest percentage is accounted for by the white population. For family farming establishments with an area of over 50 ha, there is a gap of 3.4% between white and Afrodescendant managers. The differences in the areas of establishments by race/ethnicity are illustrated in Figure 9.

**Figure 9** - Area of FF establishments (Agricultural Census, 2017).

## 2.7 Water resources, access to water and basic sanitation

*Establishments with access to water resources:* According to the 2017 Agricultural Census, 106,764 family farming establishments (85.1%) have access to water resources, while 18,725 do not (14.9%).

*Access to water for irrigation:* 14,394 FF establishments in the Project area (11.8% of the total) have access to water for irrigation. *Access to cisterns:* 78,824 FF establishments in the Project area (62.8%) have access to cisterns. However, this data is not available disaggregated by race/ethnicity.

*Sanitation.* In the Project area, according to the Single Registry 39.4% of households are connected to the public sewage system, 13.4% have septic tanks and 31.1% have rudimentary tanks (Figure 10). This data is not available broken down by race/ethnicity.

**Figure 10** - Forms of basic sanitation drainage in the Single Registry for the Project area (Single Registry - Cadastro Único, 2024).

*Forms of water supply.* According to data from the Single Registry (November 2023), 63.2% of households in the Project area are connected to the public water supply network, 11.0% have wells or springs and 9.7% have cisterns (see Figure 11). This data is not available disaggregated by race/ethnicity.

**Figure 11** - Forms of water supply for the Project area (Single Registry - Cadastro Único), 2023).

## 2.8 Food Security, Nutrition and Health

*Food Insecurity:* According to the II VIGISAN<sup>22</sup>, food insecurity (FI) in 2021/2022 affected 58.7% of Brazilian households (125.2 million people); in the Northeast, it reached 68% of households, where 12.1 million people are going hungry, i.e., at a level of severe food insecurity. The family farming sector has been hit hardest by the economic crisis of recent years, with small farmers particularly affected. In the Northeast, 83.6% of family farming families face some degree of food insecurity in 2021/2022. The worst levels of FI were observed in family farming families who had not yet been able to return to pre-pandemic

<sup>22</sup> II National Survey on Food Insecurity in the Context of the COVID-19 Pandemic in Brazil [II VIGISAN: final report]. Brazilian Research Network on Food Sovereignty and Security - PENSSAN. São Paulo, SP: Friedrich Ebert Foundation. PENSSAN Network, 2022.

conditions, especially those who had not been able to fully re-establish their production and marketed quantities. The most recent survey by the PENSSAN Network (2022) points to the current worsening of food insecurity, which affects 63.9% of households in Paraíba, of which 10.6% face severe food insecurity (hunger).

**Nutrition.** Despite the process of nutritional transition, the state of Paraíba follows the national trend, and the rest of the Northeast region faces a double burden of malnutrition, marked by both undernutrition and an increase in the prevalence of overweight. 62.5% of adults in Paraíba are overweight (35.5% overweight and 27.0% obese)<sup>23</sup>. Growth retardation affects 4.9% of children under 5, thinness and marked thinness 4.2%, overweight 8.4% and obesity 6.8% (figure 12).

The situation is exacerbated among the most vulnerable groups, such as quilombola communities, which continue to suffer from socio-economic disadvantages that are reflected in higher morbidity profiles, especially in relation to nutritional disorders. In addition, women of reproductive age have greater nutritional needs than men and for this reason usually have worse nutritional indicators than men of the same age, and therefore need differentiated attention. Research shows that in the Northeast, the prevalence of underweight among pregnant women is as high as 18%, compared to 6.7% for the rest of Brazil<sup>24</sup>.

**Figure 12 – Nutritional Status of Children up to 5 years old (SISVAN, 2023).**

The main root causes of food and nutritional insecurity in the Project area are the declining quality of and difficult access to water for human consumption and food production; the limited capacity for food production and productive diversification; the low quality of the food consumed; the lack of productive infrastructure; and the low levels of food and nutritional education. It is worth highlighting the direct correlation between food insecurity and malnutrition and poverty rates (69.9% of family farmers registered in the Single Registry in the Project area live in poverty or extreme poverty)<sup>25</sup> and environmental restrictions (such as lack of basic sanitation, interruptions in water flows and poor quality

<sup>23</sup> Ministry of Health. Food and nutrition situation in Brazil: overweight and obesity in the adult population in Primary Health Care. [https://bvsmms.saude.gov.br/bvs/publicacoes/atlas\\_situacao\\_alimentar\\_nutricional\\_populacao\\_adulta.pdf](https://bvsmms.saude.gov.br/bvs/publicacoes/atlas_situacao_alimentar_nutricional_populacao_adulta.pdf).

<sup>24</sup> MELO, Maria Inês Bezerra de et al (2011). "Nutritional status of pregnant women assessed by three different anthropometric classification methods." *Revista de Nutrição* 24 (2011): 585-592.

<sup>25</sup> Single Registry, November 2023. Available at: <https://aplicacoes.cidadania.gov.br/vis/data3/data-explorer.php>.

of water sources). Access to quality water and sanitation plays a fundamental role in combating different forms of malnutrition. Only 39.4% of households in the Project area have access to a public sewage system and 63.2% are connected to a public water supply system<sup>26</sup>.

*Health.* The Ministry of Health understands the situation of inequality and vulnerability affecting the health of the Afrodescendant population - early deaths, high maternal and infant mortality rates, higher prevalence of chronic and infectious diseases and high rates of violence - and recognizes that the racism experienced by the black population has a negative impact on these indicators, compromising this population's access to public health services<sup>27</sup>. According to the PNS/2013, 10.6% of Brazilians over the age of 18 have felt discriminated by health service. These include: women (11.6%); black (11.9%) and brown (port. *parda*) (11.4%) people, and people with no education or incomplete primary education (11.8%).

According to data from the National Health Survey (PNS) 2019, Afrodescendants are more dependent on public health services. The vast majority of Afrodescendants do not have health insurance (78.8%) and less access to complementary healthcare means greater exposure to risks. In comparison, 38.8% of white people have private health insurance. The PNS 2019 estimates also point to a direct relationship between race, level of education and health insurance coverage. In this sense, white people or those with higher education have the highest proportions of coverage. There is also a clear regional disparity in health insurance coverage; in the Northeast, it is only 16.6%.

Quilombos do not have a structured health system. In this context, one of the most striking structural difficulties for Paraíba's quilombola communities in accessing health care is the physical distance from health centers and hospitals.

The incidence of diseases such as malaria, tuberculosis, and sexually transmitted diseases (STDs) has advanced among indigenous peoples in different regions of the country, revealing the decay of care and the dismantling of the health infrastructure. Faced with the abandonment and neglect of the indigenous population, APIB and other organizations representing the indigenous movement have been advocating for the replacement of the current model of health care for indigenous peoples with a system that is appropriate to the different and complex realities<sup>28</sup>.

### 3. Other vulnerable groups in rural Paraíba

#### 3.1 Young people

**Figure 13** - Age of heads of FF establishments by race and ethnicity (Agricultural Census, 2017).

<sup>26</sup> Idem.

<sup>27</sup> BRAZIL. Ministry of Health. [National Comprehensive Health Policy for the Black Population Department of Management Support Participatory and Social Control](#). 3. ed. - Brasília: Editora do Ministério da Saúde, 2017.

<sup>28</sup> ISA. [Indigenous Health](#).

Brazil's Youth Statute (2013)<sup>29</sup> defines young people as those between 15 and 29 years of age. In the Project area, there are 893,666 young people<sup>30</sup>. Among the main challenges faced by rural youth in the Project area are: i) lack of employment and income opportunities (with little diversification of agricultural and non-agricultural activities that attract young people), ii) lack of access to and control over resources, inputs, goods and technologies, iii) limited access to public policies and services and iv) low participation and decision-making power in rural and community organizations.

25% of young Brazilians are considered vulnerable to poverty because they neither study nor work<sup>31</sup>, the majority of whom are black men and women. In Paraíba, the rates are even higher among young people aged 15 to 29. Approximately 35.1% neither studied nor worked in 2021, according to the Synthesis of Social Indicators 2022. Young Afrodescendant women have a higher percentage of out of school and the labor market. Household chores and caring for family members are among the main barriers young people face in continuing their studies or getting a paid job, especially young women. Another important causal factor is the high rate of teenage pregnancy. Between 2020 and 2022, 12,830 pregnancies in children and adolescents aged 10 to 18 were recorded in Paraíba, according to the State Health Department<sup>32</sup>.

Paraíba's rural environment does not offer attractive employment opportunities for young people, as it combines low-income generation capacity, precarious and strenuous working conditions, and a lack of basic services. Because of the lack of sustainable study and formal work opportunities for young rural people, there is a process of migration to urban centers, mainly of young women with more schooling, which causes the rural population to age (the largest group of migrants is between 16 and 35 years old) and the proportion and number of women to decrease<sup>33</sup>. The trend of young women leaving rural areas more frequently is driven not only by a lack of opportunities but also by their reluctance to assume the traditional roles of their mothers and grandmothers in the family production unit<sup>34</sup>. Comparing the 2006 Agricultural Census and the 2017 Census, the young rural population under the age of 25 fell by 49.7%<sup>35</sup>.

Among the factors that influence staying in rural areas are access to financial resources, education/training suited to the characteristics of rural areas, appreciation of rural lifestyles, the availability of services and conditions that can offer the possibility of success in agricultural production<sup>36</sup>. However, in the PROCASE II area, young people who decide to stay in the rural area have limited access to and control over resources, inputs, goods, and technologies. The indicators for access to land and credit confirm this.

In the Project area, only 9.9% of FF farms are run by young people under 35 years of age<sup>37</sup>, indicating low access to land. When they get married, few of them can acquire new properties, and what often happens is that the family property is divided into smaller plots for the children, which further reduces the productive potential and profitability of agricultural activities. It should be noted that there are gender tensions in inheritance patterns, which disadvantage young rural women.

Access to credit is very limited in the Project area. Only 21,123 FF establishments in the Project area have accessed some kind of financing (16.8% of the total), the largest of which is PRONAF. Although this data is not available disaggregated by generation, it can be inferred that access to credit by young people is even more limited. The PRONAF youth program, which was created to facilitate young rural people's access to credit, creating the conditions to enable rural succession processes in FF, still has a very small number of contracts signed in relation to the proportion of the young rural population. Among the root causes of this lack of access is misinformation, the lack of institutions for training young farmers, the difficult bureaucratic requirements that restrict the signing of credit contracts, and the fact that bank agents often assume that young people's inexperience in managing resources will lead them to default<sup>38</sup>.

MARIN,

However, access to technical knowledge is higher among young people under 35 than the average among family farmers in the project area. The quantitative evidence available from the 2017 Agricultural Census indicates that, among young FA managers (under 35), 2,283 (18.5%) received TA - while 16.8% of all family farmer managers did. Despite the higher percentage of access, it can still be said that access to TA among young people is limited. Broken down by gender, access to TA was 18.1% among young women and 18.6% among young men. There is therefore an access gap of 0.1 percentage points between young male and female leaders.

During the PROCASE II design field mission, an additional problem faced by rural youth was identified - vulnerability to violence associated with drug trafficking.

### 3.2 Persons with Disabilities<sup>39</sup>

The Northeast is the region with the highest percentage of persons with disabilities in Brazil, 10.3% of the population or around 5.8 million people<sup>40</sup>. The highest percentages of persons with disabilities are women and people of African descent. According to data from the Single Registry (November 2023), there are 144,655 persons with disabilities in the project area, or around 5.6% of those registered.

Disability and poverty are intricately linked in Brazil, with persons with disabilities facing significant stigma and discrimination. For example, this group has lower success rates at school and more limited access to economic activities, both of which are major factors contributing to family poverty. Persons with disabilities face a number of challenges throughout the life cycle. Children with disabilities dropping out of school is a serious problem in Brazil. There is a relatively high number of female-headed households receiving the main tax-funded disability benefit in Brazil, the Continuous Social Assistance Benefit, and this may be related to the high rate of parental abandonment by families that have a child with disabilities as a member. The data highlights that persons with disabilities do not achieve parity with their non-disabled peers at any level of education. This puts them at a significant disadvantage in a competitive job market.

There are some additional gender dimensions that impact the challenges that persons with disabilities face. For example, women and girls with some form of disability are at high risk of abuse, and this is especially the case for those with cognitive disabilities. Furthermore, until the Brazilian Inclusion Law (2015) was enacted, it was still routine for women with cognitive disabilities to be sterilized without consent. Caring for persons with disabilities also has a significant gender dimension. In general, women face the double burden of needing to both earn money and provide care, but this burden is only exacerbated when family members are also disabled. It should also be noted that women with disabilities can also have a disproportionate burden of care placed on them, as they can still be expected to care for other members of their family.

In Paraíba, disability is concentrated among the older population: 24.8% of people aged 60 and over had some kind of disability, while among people aged two to 59 this percentage drops to 5.1%. In Paraíba, 88.7% of persons with disabilities do not work and 74.4% earn less than the minimum wage<sup>41</sup>.

### 3.3 LGBTQIAPN+

The lack of government data on the socio-economic and political challenges faced by the LGBTQIAPN+ community is indicative of the statistical invisibility and marginalization of this group. The lack of a social assistance policy, the rural exodus of the LGBTQIAPN+ population to urban centers, the lack of family support, the limited access to income and low employability in the countryside, the difficulty of staying in the school environment due to prejudice, especially from the trans population, are some of the factors that maintain the invisibility of data on the LGBTQIAPN+ population in rural areas.

Data on this LGBTQIAPN+ population was collected experimentally in the 2019 National Health Survey (PNS). Around 2.9 million people in the country declared themselves to be homosexual or bisexual in 2019, which corresponded to around 1.8% of the adult population over the age of 18<sup>42</sup>. On the other

---

Joel Orlando Bevilacqua. Pronaf Jovem: the disjunctions between the ideal and the real. *Revista de Economia e Sociologia Rural*, 2020, 58: e187438. Available at: <https://www.scielo.br/j/resr/a/PTkqtrffmF3Pq4cWvwmBhxR/>.

<sup>39</sup> Disability is considered to be any loss or abnormality of a psychological, physiological or anatomical structure or function that generates an incapacity to perform an activity within the standard considered normal for human beings.

<sup>40</sup> IBGE (2022). Continuous National Household Sample Survey.

<sup>41</sup> PCD CENSUS (2023). Available at: <https://wemp.com.br/censo/#>.

<sup>42</sup> Among people aged 18 and over, 94.8% declared themselves heterosexual; 1.2% homosexual; 0.7% bisexual; 1.1% didn't know their sexual orientation; 2.3% didn't want to answer; and 0.1% declared another sexual orientation.

hand, 1.7 million did not know their sexual orientation and 3.6 million did not want to answer<sup>43</sup>. There was a higher declaration of homosexuality or bisexuality in the Southeast, at 2.1%, compared to 1.9% in the South and North, 1.7% in the Midwest and just 1.5% in the Northeast. Other relevant data collected by the PNS show that:

- Self-identification is higher in urban areas (2%) than in rural areas (0.8%)<sup>44</sup>;
- Self-identification as homosexual or bisexual is higher among those with higher education (3.2%) and higher incomes - more than 5 minimum wages per capita (3.5%);
- The proportion of "don't know" or "refused to answer" responses was higher among those with a lower level of education;
- The proportion of homosexuals and bisexuals is slightly lower among whites (1.8%) than among blacks (1.9%) and browns (1.9%);
- The 18-29 age group has the highest proportion of self-declared homosexuals or bisexuals (4.8%);
- The youngest age group also has the highest proportion of people who did not know or did not want to answer (5.3%).

Based on data from the PNS 2019, the analysis of the level of education of the LGBTQIAPN+ population in Brazil reveals a diverse panorama. The figures reflect a wide range of educational levels within this community (Table 2).

**Table 2 - Level of education of the LGBTQIAPN+ population in Brazil**

Level	Absolute value	Percentage value
No education	35.400	1,18%
Elementary school incomplete or equivalent	239.400	7,98%
Complete primary school or equivalent	184.500	6,15%
Incomplete high school or equivalent	403.200	13,44%
High school diploma or equivalent	955.500	31,85%
Incomplete university degree or equivalent	377.700	12,59%
Complete university degree	804.300	26,81%

The distribution of per capita household income among the LGBTQIAPN+ population in Brazil reveals significant economic diversity (Table 3).

**Table 3 - Per capita household income of the LGBTQIAPN+ population in Brazil**

Track	Absolute value	Percentage value
Up to ¼ minimum wage	200.100	6,67%
More than ¼ to ½ minimum wage	273.000	9,10%
More than ½ to 1 minimum wage	761.400	25,38%
More than 1 to 2 minimum wages	800.100	26,67%
More than 2 to 3 minimum wages	362.400	12,08%
More than 3 to 5 minimum wages	320.100	10,67%
More than 5 minimum wages	282.900	9,43%

Throughout Brazil, the LGBTQIAPN+ population has been victimized by different forms of LGBTIphobia, placing this group in a situation of vulnerability because they do not fit into a socially referenced heteronormative pattern. Brazil is an extremely unsafe country for this population, as indicated by the upward trend in the number of violent deaths of LGBTQIAPN+ people over the last two decades. Between

<sup>43</sup> IBGE, 2019. National Health Survey (PNS). Available at: <https://www.ibge.gov.br/estatisticas/sociais/saude/9160-pesquisa-nacional-de-saude.html>.

<sup>44</sup> Self-declared homosexuality and bisexuality were also higher in the capital cities.

2000 and 2022, 5,635 (five thousand six hundred and thirty-five) people died because of gender prejudice and intolerance. In 2022, there were a total of 273 deaths of LGBTQIAPN+ people, a national average of 1.31 deaths per million people<sup>45</sup>. Most of the deaths occurred among young people aged between 20 and 29 and the Northeast region had the highest absolute number of violent deaths. It is possible to relate the number of LGBTQIAPN+ deaths in each Brazilian macro-region to the social, economic, and cultural conditions of these spatial units. The Northeast and North, for example, are historically marked by lower socio-economic indicators, such as income, schooling, access to public services and life expectancy, than the rest of the country, including a significant population in a situation of vulnerability. Among the states, those with the highest number of deaths were Ceará (34), São Paulo (28) and Pernambuco (19). According to the Observatory of LGBTI Deaths and Violence in Brazil, 8 violent deaths of LGBTQIAPN+ people were recorded in Paraíba in 2022.

Paraíba recorded 68 cases of violent deaths of the LGBTQIAPN+ population between 2017 and 2022, according to data released in a report by the Secretariat for Women and Human Diversity. In total, 24 municipalities in Paraíba recorded cases. João Pessoa has the highest number of cases, with 29 crimes, followed by Campina Grande and Bayeux, with five cases each, and Patos was in third place, recording four crimes. Gay men represent the largest number of murders in Paraíba, leading with 17 of the 29 cases between 2020 and 2022, followed by transvestites who represent six cases in the same period, and in third place are transgender women, with 4 crimes.

Partial data for 2023 from the Observatory of LGBT Deaths and Violence in Brazil, from January to April, totaled 80 deaths. To date, transvestites and trans women account for 62.50% of the total deaths (50); gay men account for 32.50% of the cases (26 deaths); trans men and transmasculine people, 2.50% of the cases (2 deaths); lesbian women account for 2.50% of the deaths (2 deaths); no cases against bisexual people and people identified as other segments have been identified<sup>46</sup>.

#### **4. Programs and public policies aimed at PROCASE II priority groups and themes**

To help identify possible synergies and complementarities with the project's interventions, the federal public programs and policies that apply to the project's relevant themes and target groups are mapped below.

##### **Youth**

- The National Youth Inclusion Program (ProJovem) has the mission of raising the educational level of young people between the ages of 18 and 29 who, despite being literate, have not yet completed elementary school. This commitment materialized through the Youth and Adult Education (EJA) modality, which integrates professional skills and civic involvement". The "Campo" program is aimed at young farmers excluded from the formal education system. It lasts 24 months and integrates Youth and Adult Education (EJA) with social and professional skills, strengthening the agricultural base.
- PRONAF Youth: supports agricultural and non-agricultural activities, through a specific line of credit aimed at young rural people, with easy payment conditions.
- The National Agrarian Reform Education Program (PRONERA): presents and supports educational projects aimed at developing agrarian reform areas. The public policy is aimed at young people and adults living in settlements created or recognized by INCRA, quilombolas, teachers and educators who carry out educational activities aimed at beneficiary families, as well as people assisted by the National Land Credit Programme (PNCF).
- Youth Land" line of the National Land Credit Program (PNCF) - offers subsidized credit for the acquisition of land by rural workers under the age of 30.
- The Young Entrepreneur Program was designed to provide professional training and subsequent financing for young people at the technical level who were graduating or had recently graduated, were aged between 18 and 29 and were interested in running their own business. It had a regional focus, limited to the areas where Banco Nordeste operates (northern Espírito Santo, Minas Gerais, and the Northeastern states), which was responsible for its development.
- Young Brazil Program, which includes the establishment of Youth Centers and the training of young people aged 15 to 17 as Youth Agents for Social and Human Development through the granting of scholarships.

<sup>45</sup> Observatory of LGBTI+ deaths and violence in Brazil. Dossier 2022: Deaths and violence against LGBTI+ people in Brazil. Available at: [Dossie-de-Mortes-e-Violencias-Contra-LGBTI-no-Brasil-2022-ACONTECE-ANTRA-ABGLT.pdf](#).

<sup>46</sup> <https://observatoriomorteseviolenciaslgbtibrasil.org/dossie/mortes-lgbt-2022/>.

- The Youth Agent Program for Social and Human Development aims to prepare young people for intergenerational work, training them for the job market and to work in their communities in the areas of health, culture, the environment, citizenship, sport, and tourism.

#### Health, Food Security and Nutrition<sup>47</sup>:

- he National Policy for the Integral Health of the Black Population (PNSIPN) is a commitment to combat inequalities in the Unified Health System (SUS) and to promote the health of the black population in an integral way, considering that health inequalities are a consequence of unjust socio-economic and cultural processes - in particular, current racism - which corroborate the morbidity and mortality of Brazil's black populations.
- The National Policy for the Health Care of Indigenous Peoples<sup>48</sup> aims to guarantee indigenous peoples access to comprehensive health care, in accordance with the principles and guidelines of the SUS, taking into account social, cultural, geographical, historical and political diversity in order to overcome the factors that make this population more vulnerable to health problems of greater magnitude and transcendence among Brazilians, recognizing the effectiveness of their medicine and the right of these peoples to their culture<sup>49</sup>.
- The National Food and Nutrition Security Policy (PNSAN) aims to promote and guarantee access to adequate food and food and nutrition security as a fundamental human right.
- The Food Acquisition Program (PAA)<sup>50</sup> includes the acquisition of agricultural products from FA, their distribution to people in situations of food insecurity and the formation of strategic stocks. Quilombola communities and other social groups of Afrodescendants, identified as family farmers, can participate in the PAA, which includes specific targets for serving quilombola communities.
- The National School Feeding Program (PNAE) is a strategy to promote FNS for public school students and a public procurement program that encourages the local purchase of food from family farming (a minimum of 30% of FNDE resources) and prioritizes agrarian reform settlements, indigenous people and quilombolas. Quilombola organizations have historically demanded that food for public schools and their students be in line with the customs, diet, ways of life and production of the communities.
- Food Guidelines for the Brazilian Population (Ministry of Health - MoH, 2015) and Food Guide for the Brazilian Population (MoH, 2019): present a set of information, analyses, recommendations and guidelines on the choice, combination, preparation, and consumption of food aimed at promoting the health of individuals, families and communities and Brazilian society.
- The Brazil Without Hunger Plan (2023): There are 80 actions and programs, with more than 100 goals proposed by the 24 Ministries that make up the Interministerial Chamber for Food and Nutritional Security - CAISAN, organized into 3 axes: Access to income, poverty reduction and promotion of citizenship; Adequate and healthy food, from production to consumption; Mobilization to combat hunger.

#### Family Farming:

- The National Program to Strengthen Family Farming (PRONAF) provides credit for the costing of the harvest or agro-industrial activity, or for investment in machinery, equipment, or production infrastructure and agricultural or non-agricultural services. Pronaf has specific credit lines for young people and women. The Declaration of Aptitude to Pronaf (DAP)<sup>51</sup> is a mandatory document for accessing rural credit lines and other public policies to encourage family agricultural production. Quilombolas, indigenous peoples, collectors of non-timber forest product, artisanal fishers, Agrarian Reform settlers and beneficiaries of the National Land Credit Program (PNCF) and Agrarian Reform can obtain the DAP.
- The National Land Credit Program (PNCF) is currently called Terra Brasil<sup>52</sup> and offers conditions for farmers who do not have access to land or who own property with an area that is demonstrably insufficient to support their families to buy rural property through financing. As well as buying land, the funds can be used to structure the property, implement a production project, or hire technical assistance services.

<sup>47</sup> According to CONAQ, the federal public policies for family farming most accessed by the communities are the PNAE and the PAA. Source: ECAM. [Diagnosis of public policies aimed at quilombola family farming](#). 2021.

<sup>48</sup> Legal basis: Law No. 9.836 of September 23, 1999; Ministry of Health Ordinance No. 254 of January 31, 2002; Decree No. 3.156 of August 27, 1999.

<sup>49</sup> Brazil. Ministry of Health. [National Policy for the Health Care of Indigenous Peoples](#). 2002.

<sup>50</sup> Legal basis: Law no. 10.696, of July 2, 2003; 2. Decree no. 4.772, of July 2, 2003; amended by Decree no. 5.873, of August 15, 2006.

<sup>51</sup> Legal basis: Ordinance No. 24 of May 29, 2009; Ordinance No. 12 of June 25, 2010; Ordinance No. 102 of December 6, 2012; Normative Instruction No. 001 of May 14, 2010.

<sup>52</sup> Legal basis: Complementary Law No. 93, of February 4, 1998; Decree No. 10.126/2019; SAF/MAPA Ordinance No. 123, of March 23, 2021.

- The National Policy for Technical Assistance and Rural Extension for Family Farming and Agrarian Reform (PNATER)<sup>53</sup> is aimed at families in situations of social vulnerability, such as PCTs. Its twelve objectives include: i) promoting sustainable rural development; ii) increasing the production, quality and productivity of agricultural and non-agricultural activities and services, including collection of non-timber forest products, forestry, and craft activities; iii) advising on the various phases of economic activities, business management, organization, production, market insertion and supply, observing the peculiarities of the different production chains
- Digital Ater Program - The aim of this program is to strengthen the Brazilian Technical Assistance and Rural Extension System (Sibrater), to expand the reach of extension workers in all regions of Brazil, using Information and Communication Technologies (ICTs), increasing farmers' access to modern, agile, and efficient services, increasing their competitiveness.
- Brasil Mais Cooperativo Program<sup>54</sup> was set up to support Brazilian rural cooperatives and associations by offering specialized assistance, promoting inter-cooperation, technical training and qualifying management, production, and commercialization processes in institutional and private markets.
- National Seal of Family Farming (SENAF) - Identifies the origin and provides the characteristics of family farming products, with the aim of strengthening it in the eyes of the consumer public. It is awarded to agro-industries and cooperatives/associations that have a Declaration of Aptitude to Pronaf (DAP). There are seven types of the National Family Farming Seal: Senaf, Senaf Mulher, Senaf Juventude, Senaf Quilombola, Senaf Indígena, Senaf Sociobiodiversidade and Senaf Empresas.

#### Access to water and sanitation:

- The National Health Foundation (FUNASA) provides technical and financial support for sanitation actions<sup>55</sup> in rural areas and traditional communities (quilombo remnants) in all Brazilian municipalities, with resources executed directly or through agreements signed with municipalities, states, and the Federal District.
- The Water for All Program aims to assist families living in rural areas with precarious access to water, who are registered with the Single Registry of Social Programs (CadÚnico). All municipalities in the Brazilian semi-arid region where there are families living in extreme poverty on the CadÚnico and who have precarious access to water are automatically included in the Program.
- The Cistern Program, which aims to promote universal access to water in rural areas for human consumption and agriculture<sup>56</sup>, has already implemented more than 1 million water technologies. However, the program has reached its lowest level in 17 years after a 94% reduction in its budget over the last 6 years<sup>57</sup>. The Agua Doce Program, aimed at implementing well water desalination systems to promote access to water for low-income populations in the semi-arid region, has the goal of installing 1,727 desalination systems in the state and setting up 103 biosaline agricultural production units, to benefit around 1.2 million people.
- The Agua Doce Program (PAD), aimed at setting up well water desalination systems to promote access to water for low-income populations in the semi-arid region, has the goal of installing 1,727 desalination systems in the state and setting up 103 biosaline agricultural production units, to benefit around 1.2 million people.

#### Traditional Peoples and Communities:

- The main objective of the National Policy for the Sustainable Development of Traditional Peoples and Communities<sup>58</sup> is to promote the sustainable development of Traditional Peoples and Communities, with an emphasis on recognizing, strengthening, and guaranteeing their territorial, social, environmental, economic, and cultural rights, while respecting and valuing their identity, their forms of organization and their institutions.
- The National Policy for the Territorial and Environmental Management of Indigenous Lands (PNGATI)<sup>59</sup> has the general objective of guaranteeing and promoting the protection, recovery, conservation and sustainable use of the natural resources of indigenous lands and territories,

<sup>53</sup> Legal basis: Law No. 12.188 of January 11, 2010.

<sup>54</sup> Legal basis: MAPA Ordinance No. 129, of July 4, 2019.

<sup>55</sup> Basic sanitation actions encompass three types of intervention: i) implementation and/or expansion of public water supply systems; ii) implementation and/or expansion of public sewage systems; iii) implementation of small-scale household and/or collective sanitation improvements, including cisterns.

<sup>56</sup> The program is organized into three types of technologies: water for human consumption, water for production and cisterns in schools. Legal basis: Law No. 12,873 of October 24, 2013 and Decree No. 9,606 of December 10, 2018.

<sup>57</sup> According to [Articulação Semiárido Brasileiro \(ASA\)](#), there are at least 350,000 families waiting in line for cisterns and more than 800,000 still lack the technology.

<sup>58</sup> Legal basis: Federal Decree No. 6.040/2007.

<sup>59</sup> Legal basis: Decree No. 7.747 of June 5, 2012.

ensuring the integrity of indigenous heritage, the improvement of quality of life and the full conditions for the physical and cultural reproduction of current and future generations of indigenous peoples, respecting their socio-cultural autonomy.

- The National Policy for the Sustainable Development of Traditional Peoples and Communities (PNPCT)<sup>60</sup>'s main objective is to promote the sustainable development of Traditional Peoples and Communities, with an emphasis on recognizing, strengthening, and guaranteeing their territorial, social, environmental, economic, and cultural rights, while respecting and valuing their identity, their forms of organization and their institutions.
- The National Policy for the Promotion of Racial Equality (PNPIR)<sup>61</sup>, whose central objective is to reduce ethnic inequalities in Brazil, especially among the black population, through programs and projects to be implemented in the long, medium, and short term. The following management principles are laid down in this national policy: a) transversality, in which various bodies participate in the execution and management of actions to combat racial inequalities; b) decentralized management, in which the federative entities are articulated; c) democratic management, through dialogue with civil society participating in the quilombola struggle.
- The Brazil Quilombola Program (PBQ)<sup>62</sup> is aimed at certified CRQs and has four thematic axes: a) access to land; b) infrastructure and quality of life; c) local development and productive inclusion; d) rights and citizenship.
- Aquilomba Brasil Program - is an expansion of Brasil Quilombola (Decree 6.261, 2007) and consists of a set of intersectoral measures aimed at promoting the rights of the quilombola population, with emphasis on four thematic axes: Access to Land; Infrastructure and Quality of Life; Productive Inclusion and Local Development; Rights and Citizenship.
- The "Quilombolas do Brasil" and "Indígenas do Brasil" stamps are essential tools for identifying the origin of agricultural, craft and food products from quilombola and indigenous communities, and necessary instruments for adding value.

Persons with disabilities:

- National Policy for the Integration of Persons with Disabilities<sup>63</sup> comprises a set of normative guidelines aimed at ensuring the full exercise of the individual and social rights of persons with disabilities.

LGBTQIAPN+ population

- The National Plan for the Promotion of LGBT Citizenship and Human Rights<sup>64</sup> (Lesbians, Gays, Bisexuals, Transvestites and Transsexuals) sets out the guidelines and actions for the development of public policies aimed at this segment, mobilizing public authorities, and organized civil society to consolidate a democratic pact.

## 5. Conclusions and recommendations

The diversity diagnosis shows that PCTs and Afrodescendants are severely disadvantaged in several of the socio-economic dimensions studied. Inserted in exclusionary and unequal structures, these groups face poverty, food insecurity, lack of access to technical assistance, and poor coverage of public services and policies, such as health and education. However, the PCTs play a fundamental role in environmental preservation and rural development as guardians of ancestral food and production knowledge and practices. Other vulnerable groups in the project area are young people, persons with disabilities and the LGBTQIAPN+ community.

The recommendations were drawn up considering the gaps identified in the diagnosis, the lessons learned from PROCASE as expressed in the PROCASE *Impact Assessment Report* and IFAD's *mainstreaming guidelines*<sup>65</sup>.

<sup>60</sup> Legal basis: Decree no. 6.040, of 2007.

<sup>61</sup> Legal basis: Federal Decree No. 4886/2003.

<sup>62</sup> Legal basis: Federal Decree No. 6.261/2007.

<sup>63</sup> Legal basis: Decree No. 3.298 of December 20, 1999 regulates Law No. 7.853 of October 24, 1989.

<https://www2.mppa.mp.br/sistemas/gcsubsites/upload/39/LGBTI/Plano%20Nacional%20de%20Promo%C3%A7%C3%A3o%20da%20Cidadania%20e%20Direitos%20Humanos%20LGBTI.pdf>

<sup>65</sup> IFAD12: *Deepening Impact and Building Resilience through mainstreaming*. 2020.

**Recommendation 1:** It is recommended that the project focus on rural youth and on closing the social inclusion gaps for this group identified in this diagnosis, such as the lack of access to employment and income opportunities. Specifically, the project should have a youth specialist in the PMU (Project Management Unit) and its own budget for activities with rural youth.

**Recommendation 2:** It is recommended that one of the project's main target groups should be persons with disabilities, given the multiple exclusions faced by this group and the fact that this is a priority for the government of Paraíba. PROCASE must ensure that persons with disabilities are prioritized beneficiaries of the various productive activities proposed by the Project, but that there are also specific activities aimed at the inclusion and accessibility of this public, as well as the promotion of debate on the experience of sexuality. A specific budget must be guaranteed for activities aimed at persons with disabilities and the PMU team must have the capacity to meet the specific demands of working with this public.

**Recommendation 3:** In environmental and land regularization activities, priority should be given to ensuring that traditional communities receive collective titles, particularly quilombolas.

**Recommendation 4:** As a facilitating measure, PROCASE II should include awareness-raising training on race and ethnicity, gender, sexuality, and generation for all the project's technical assistance professionals, as well as the Project Management Unit (PMU) teams, the decentralized management units, and partner entities, with a focus on different methodological approaches for quilombola communities and other traditional communities.

**Recommendation 5:** The investments (both Productive Development Plans and Business Plans) and services provided by the project must respond to the demands, potential and capacities of the beneficiary families, valuing traditional knowledge, cultural differences, and the diversity of their ways of life, social and productive organization. In this sense, IFAD's experience in the participatory preparation of investment plans and the participatory rural diagnosis methodology should be a relevant reference.

**Recommendation 6:** Establish partnerships with NGOs, social organizations, and movements of quilombolas and other traditional communities, or that work with these target groups (for example, the LGBTQIAPN+ community and persons with disabilities). Expanding the project's alliance strategies will enhance its benefits and results.

**Recommendation 7:** At the start of implementation, the project should draw up a Gender, Diversity, Youth and Nutrition Strategy and Action Plan to ensure that these themes are addressed across the board in all project components and activities. In subcomponent 1.3, there will be a budget for the Plans, which will include specific activities for each of these thematic areas.

**Recommendation 8:** A recommended operational measure is for the Project Management Unit (PMU) to include in its team a consultant who specializes in gender and diversity, another who specializes in youth and a third who specializes in traditional peoples and communities. These professionals must be fully dedicated to the project and, preferably, must be Afrodescendants or members of traditional communities. They should also oversee the implementation of the Gender, Diversity, Youth and Nutrition Strategy and Action Plan, supporting the project in addressing gender and social inclusion issues in its operations, including in Knowledge Management and M&E.

**Recommendation 9: Hold opening events in traditional communities to present the project's components and the activities planned, to formulate an adherence and commitment agreement.** When the activities involve indigenous peoples and traditional communities, Free, Prior and Informed Consent (FPIC) must be ensured.

**Recommendation 10:** Information about the project, including the Complaints and Redress Mechanism, should be presented to stakeholders in a culturally appropriate way, paying attention to the specific needs of the target groups that may be affected by the implementation of the project. Issues such as illiteracy, gender, language differences, access to technical information and digital connectivity should be considered.

**Recommendation 11:** Include the overall outreach target for families of PCTs, but ensure that throughout implementation, the project monitors this outreach target disaggregated by target

subgroups, such as indigenous people, quilombolas, artisanal fishers and shellfish gatherers. This target should be monitored annually in the context of supervision missions. An outreach target for young people, persons with disabilities and LGBTQIAPN+ should also be included.

LNOB	<i>[leave no one behind] Leave no one behind</i>
NEAM	Women's Service Center
PRONAF	National Program to Strengthen Family Farming
PSA	Pro-Semiarid Project
FNS	Food and Nutrition Security
SISVANS	Food and Nutrition Surveillance System
SPM	State Secretariat for Women's Policies
SUS	Unified Health System
TI	Indigenous Lands

## Terminology and Definitions

*Gender:* "gender is a constitutive element of social relations based on the perceived differences between the sexes and is therefore a way of giving meaning to power relations"<sup>1</sup>. Through these established power relations, it is essential to recognize the multiple forms of oppression and discrimination that affect women according to their gender identity, race, class, ethnicity, sexuality, disability and other social or identity categories.

*Intersectionality:* "Intersectionality is a concept that seeks to capture the structural and dynamic consequences of the interaction between two or more axes of subordination. It deals specifically with the way in which racism, patriarchy, class oppression and other discriminatory systems create basic inequalities that structure the relative positions of women, races, ethnicities, classes, and others. In addition, intersectionality deals with how specific actions and policies generate oppressions that flow along such axes, constituting dynamic or active aspects of disempowerment."<sup>2</sup>

*Food and Nutrition Security (FNS):* is an integrated approach that combines two underlying concepts: food security and nutrition security. The concept of food security has evolved from *freedom from hunger*<sup>3</sup> to a broad concept, achieved when individuals have access to sufficient and nutritious food in adequate quantities. Today, it encompasses four dimensions: i) availability, ii) access, iii) utilization, and iv) stability. Nutrition security, in turn, evolved from UNICEF's multisectoral nutrition planning approach and conceptual framework, assessing the quality of food intake, and implying constant and equitable access to healthy, safe, sustainable, and affordable food, essential for a healthy life. Nutritional security has three determinants: i) access to adequate food, ii) care and feeding practices, and iii) sanitation and health.

*Multidimensional Approach to Poverty:* People in poverty face a range of deprivations, from social exclusion to barriers to accessing a stable income, quality education or health care. Poverty is multifaceted and therefore one-dimensional metrics, such as monetary poverty measures, are limited<sup>4</sup>.

*Leave no one behind [LNOB].* The idea of "leaving no one behind" challenges the conventional understanding of growth-based development and aims to guide policy decisions to address the 2030 sustainable development agenda in its 17 goals and 169 targets. Considering deprivation and social exclusion in their multiple forms, LNOB helps redirect the focus and efforts of development interventions towards improving the conditions of the most deprived and vulnerable people, such as those at risk and below the poverty line, supporting the closing of inequality gaps<sup>5</sup>.

## Gender diagnosis methodology

Poverty and inequality are rooted in socio-economic, political, and cultural structures that perpetuate the exclusion of groups belonging to certain social categories. From this perspective, inequality is recognized as a historical-structural phenomenon, heterogeneous and emanating from a culture of privilege that has excluded various social groups, such as people living in poverty, women, young people, rural populations, people with disabilities and the Lesbian, Gay, Bi, Trans, Queer, Intersex, Asexual/Aromantic/Genderqueer, Pan/Poly, Non-binary population and more (LGBTQIAPN+).

The approach to gaps is in line with the IDB's Gender and Diversity Sector Framework, as well as the bank's Gender Action Plan and Diversity Action Plan. A *gap* implies inequality and is understood as a bottleneck that prevents the sustainable and inclusive development of a certain group in terms of social and economic equality. The gap approach seeks to identify these bottlenecks as a means of prioritizing certain public policies in favor of greater horizontal and vertical equity.

This socio-economic gender diagnosis is based above all on recognizing and analyzing vertical structural gaps, i.e. the disparities within the state of Paraíba that make up the PROCASE II Project region. It also seeks to identify how social categorizations such as gender and race/ethnicity may be creating overlapping and interdependent systems of discrimination, oppression, or disadvantage.

*Data collection methodology.* Evidence was collected and analyzed - mainly quantitative data - on multiple socio-economic dimensions of poverty (education, income, work, access to land, among others). The diagnosis is fed by secondary information and data sets from official databases<sup>6</sup>. Whenever possible, we tried to access micro-data from the 223 municipalities in the project's area of intervention and data disaggregated by gender. In addition, when official statistics were not available, articles from academic literature were used. Between February 20 and 23, 2024, a mission was carried out to communities in the project's area of intervention to gather additional information on the socio-economic situation and demands of the target groups.

*Data analysis methodology.* A first method aims to analyze the socio-economic challenges of the initial situation (baseline) and the structural conditions in which the Project will develop at the local level (municipalities) of the intervention area. A second exercise consists of examining the problems and cause and effect relationships identified and the associated constraints and opportunities. This effort starts from an approach to needs from the perspective of the direct beneficiaries (in particular women family farmers). This analysis will be used to make discrimination and social exclusion visible from a differential approach and to propose actions to close the gaps identified.

---

<sup>6</sup> The following databases were consulted: Agricultural Census (2006 and 20017); Demographic Census (2022); Single Registry for Social Programs (2024); SISVAN (2023); Continuous PNAD (2019); IBGE (2024) - Gender Statistics: social indicators of women in Brazil - 3rd edition.

## Introduction

The **general objective** of the Paraíba Sustainable Rural Development Project (PROCASE II) is to reduce rural poverty levels by improving the productivity of agricultural activities, access to basic services and the adaptation of the rural population to climate change. The **specific objectives** are as follows: (i) improve access to water for human consumption and productive use; (ii) improve the environmental conditions of rural families and their environment; (iii) increase the adoption of agricultural technologies, including those for adapting to and mitigating climate change; (iv) improve the integration of rural producers into value chains; and (v) strengthen the capacities of government and civil society organizations working towards sustainable rural development.

The project's *intervention area* covers all 223 municipalities in the state of Paraíba, but the intervention will prioritize communities based on the following technical criteria: i) incidence of rural poverty (CadÚnico); ii) presence of traditional peoples and communities (PCTs); iii) incidence of food and nutritional insecurity; iv) concentration of rural women and young people; v) limited or no access to water for human consumption and production; vii) avoidance of overlap with the PROCASE I, Sertão Vivo and PDHC III interventions.

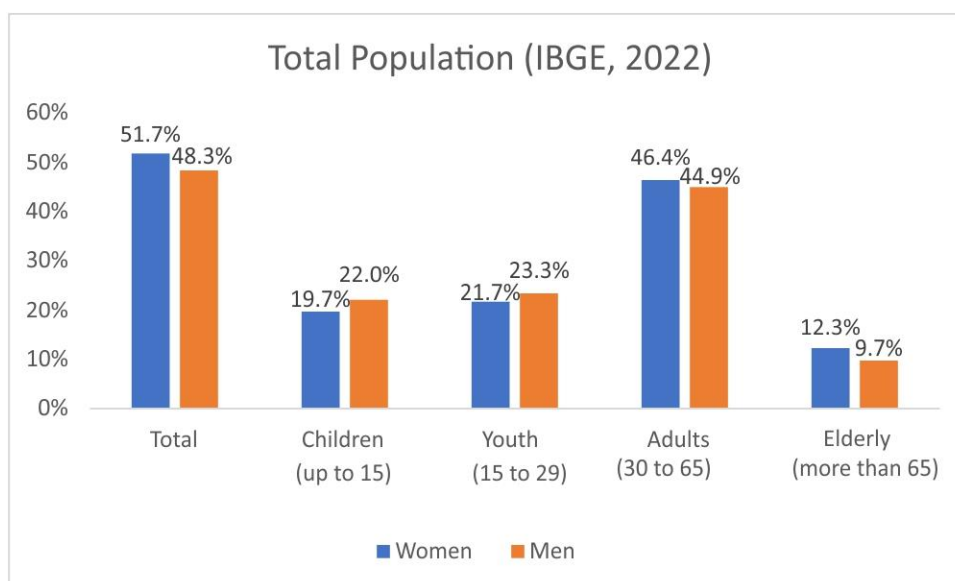

The project aims to directly benefit 60,000 families (around 210,000 people) in the family farming sector, of which 50% will be women, 20% young people, 5% Traditional Peoples and Communities (PCTs) and 2% will be People with Disabilities (PwD). The project's main target groups are: i) family farmers living in poverty and extreme poverty, ii) rural women, iii) rural youth, iv) PCTs, v) PWD and v) LGBTQIAPN+.

The *general objective* of the gender diagnosis is to analyze the gaps in women's inclusion in different socio-economic themes to support the design of PROCASE II Project activities to close the gaps identified. Its *specific objective* is to enhance the effectiveness of the project's interventions by collecting and analyzing information that will serve as input for recommending activities that improve the participation and benefits of women in the PROCASE II area.

*Structure of the diagnosis.* Section 1 identifies the general and specific figures for the project's main target groups, with particular attention to women. Section 2 is based on a quantitative analysis of the socio-economic characteristics of family farmers disaggregated by gender in the project's area of intervention, highlighting the *gaps in* women's social inclusion. In section 3, based on the evidence collected, a gender strategy is proposed, recommending appropriate activities, targets, and indicators for tackling existing inequalities, both in the productive sphere and in issues related to organization and representation in spaces for dialogue, defense, and protection of women's rights. Finally, in section 4, recommendations are made.

## 1. Identification

According to the 2022 Demographic Census, the population of the 223 municipalities in the intervention area is 3,974,687, of which 2,055,832 are women (51.7%) and 893,666 young people aged 15 to 29 (22.5%)<sup>7</sup> (Figure 1).

**Figure 1** - Total population by sex and age (Demographic Census, 2022).

According to the 2017 Agricultural Census<sup>8</sup>, in the project's area of intervention (223 municipalities), 76.9% of total establishments are family farms (125,489). Regarding those responsible for these establishments, there is a significant gender gap of 52% (Figure 2 - left). 76.0% of family farms are run by men (95,363) and only 24.0% by women (30,126).

**Figure 2 - Right:** Rural Population by gender (Demographic Census, 2010); **Left:** direction of FF establishments by gender (Agricultural Census, 2017).

In the Project area, 2,574,204 people are registered in the Unified Registry, of which 1,154,067 are women and 1,420,137 are men (data from November 2023). The total

<sup>7</sup> Among young people aged 15 to 29, 445,900 (21.7%) are young women and 447,766 (23.3%) are young men.

<sup>8</sup> This is the most recent Agricultural Census available with microdata for the municipalities in the project's area of intervention.

population living in rural households registered on the Unified Registry is 713,277 people, making up approximately 301,455 families.

## 2. Socio-economic characterization

### 2.1 Education

**Figure 3 - Left:** illiteracy rate by gender; **Right:** never attended school by gender (Agricultural Census, 2017).

*Illiteracy.* According to the 2017 Agricultural Census, 56,699 of the heads of family farming establishments were illiterate, 45.2% of the total. Among female family farmers, illiteracy reached 10,785 heads of establishments (35.8%), while among men illiteracy reached 45,914 heads (48.1%) - a positive gap of 12.3 percentage points (Figure 3 - left).

*Never attended school.* The same database shows that 30,410 heads of family farms have never attended school (24.2% of the total). Among female family farmers, 5,862 (or 19.5%) have never been to school, while among men, 24,548 (or 25.7%) have never been to school. There is therefore an exclusion gap for women of -6.2 percentage points (Figure 3 - right).

In this context, the selected indicators show that men are worse educated than women.

## 2.2 Economic activities

**Figure 4** - Main agricultural production by gender (Agricultural Census, 2017).

Data from the 2017 Agricultural Census shows that the main agricultural activities carried out in the project's area of intervention are livestock farming and cultivation of temporary crops. Figure 4 shows that, proportionally, women spend more time than men on temporary crops (37.1% versus 32.9%) and the production of planted/native forests, while men spend more time on permanent crops, livestock production (56.2% versus 52.4%) and horticulture/fruit growing (3.9% versus 2.8%).

## 2.3 Work and income

*Average usual monthly income:* The IBGE's gender statistics survey<sup>9</sup> shows that the lowest average usual incomes for all jobs are those received by women in the Northeast region, below BRL 1500.00. However, wage inequalities are smaller than those in the South, Southeast and Midwest regions.

In 2018, in the Northeast, women received an average of 86.5% of men's income, while in the South, for example, women received only 72.8% of men's income<sup>10</sup>.

*Average number of hours per week dedicated to caring for people and/or household chores.* In Brazil in 2022, women devoted almost twice as much time to caring for people and/or household chores as men (21.3 hours compared to 11.7 hours)<sup>11</sup>. In the Northeast, women devoted more hours to these activities (23.5 hours), and it is also the region with the greatest inequality in relation to men (11.8 hours), i.e. women have devoted almost twice as much time. The greater dedication to caring for people and/or household chores ends up restricting women's wider participation in the labor market.

<sup>9</sup> IBGE (2021). [Gender Statistics: Social indicators of women in Brazil](#). 2nd edition.

<sup>10</sup> Idem.

<sup>11</sup> IBGE (2024). Gender Statistics: social indicators of women in Brazil - 3rd edition. [https://biblioteca.ibge.gov.br/visualizacao/livros/liv102066\\_informativo.pdf](https://biblioteca.ibge.gov.br/visualizacao/livros/liv102066_informativo.pdf).

*Household income per capita:* Paraíba's nominal monthly household income per capita in 2023 was R\$ 1,320, eighteenth place among the 27 federation units<sup>12</sup>. However, this data is not available disaggregated by gender.

*Proportion of people in part-time work in the reference week:* In 2022, 28.0% of women were in part-time work (up to 30 hours a week), almost twice as many (14.4%) as men in Brazil. In the spatial breakdown, the Northeast is one of the regions with the highest proportions of women in part-time work, 36.5% (versus 22.3% of men)<sup>13</sup>.

In the 2017 Agricultural Census, the following data is available on the destination of agricultural production:

**Figure 5 - Left:** production for self-consumption by gender; **Right:** production for commercialization by gender (Agricultural Census, 2017).

*Production for own consumption.* In the Project area, the 2017 Agricultural Census shows that 91,792 PA establishments produce for their own consumption (73.1% of the total). Among the establishments run by women, 24,332 produce for self-consumption (80.8%), while in relation to those run by men, 67,460 produce for self-consumption (70.7%), a difference of 10.1 percentage points (Figure 5 - left).

*Production for marketing.* 33,697 PA establishments in the Project area (26.9% of the total) produce for marketing. Among those run by women, 5,794 produce for marketing (19.2%) and among those run by men, 27,903 (29.3%) - a gap of 10.1 percentage points (Figure 5 - right).

<sup>12</sup> IBGE (2018). <https://cidades.ibge.gov.br/brasil/pb/panorama>.

<sup>13</sup> IBGE (2024). Gender Statistics: social indicators of women in Brazil - 3rd edition. [https://biblioteca.ibge.gov.br/visualizacao/livros/liv102066\\_informativo.pdf](https://biblioteca.ibge.gov.br/visualizacao/livros/liv102066_informativo.pdf).

## 2.4 Technical assistance and access to finance

**Figure 6 - Left:** Access to financing (total); **Center:** access to Technical Assistance by gender (total); **Right:** access to Technical Assistance by gender and youth below 35 (Agricultural Census, 2017).

*Technical Assistance.* The 2017 Agricultural Census shows that 21,123 managers of FA establishments had access to technical assistance (TA), 16.8% of the total. Among female family farmers, 4,486 received TA (14.9% of the total), while 16,637 male family farmers (or 17.4% of the total) received TA, which represents a gender gap of 2.5 percentage points (Figure 6 - center).

According to the same data source, among young female managers<sup>14</sup> (under 35), 2,283 (or 18.5% of the total) received TA - a positive difference of 1.7% for the total number of family farmer managers. Broken down by gender, access to TA was 18.1% among young women and 18.6% among young men. There is therefore a gap in access to TA of 0.1 percentage points between young male and female managers (Figure 6 - right).

*Access to financing.* According to the 2017 Agricultural Census, 21,151 PA establishments in the project area had access to some kind of financing (16.9% of the total). Of those that received financing, 9,899 came from public credit programs, 72.8% from PRONAF. Details of which programs were accessed can be found in table 1. This data is not available broken down by gender.

**Table 1**

<b>Funds from Government Credit Programs</b>	Total	Percentage
They come from credit programs	9899	100.0%
Implementation and installation of settlements (INCRA)	54	0.5%
Promotion Program	31	0.3%
National Support Program for Medium-sized Rural Producers (PRONAMP)	92	0.9%
National Program to Strengthen Family Farming (PRONAF)	7210	72.8%
Terra Forte and Terra Sol Program	5	0.1%
Program to Support Infrastructure Projects and Services in Rural Territories (PROINF)	59	0.6%
Other programs (federal, state, or municipal)	2448	24.7%

<sup>14</sup> Although for PROCASE, young people between the ages of 15 and 29 are considered in accordance with the Youth Statute (Law No. 12.852/2013).

## 2.5 Land security and access to land

**Figure 7 - Left:** producers with land title by gender; **Right:** concessionaires and settlers awaiting land title by gender (Agricultural Census, 2017).

*Property title.* According to the 2017 Agricultural Census, in the project area, 88,383 managers of family farms have land titles, or 70.4% of the total. Among female family farmers, 21,379 or 71.0% have title deeds, while among men, 69,750 have title deeds or 73.1% of the total. It can therefore be seen that women have 2.1 percentage points less access to land titles (Figure 7 - left).

*Concessionaire or settler awaiting definitive title.* There is a total of 8,724 managers of PA establishments who are concessionaires or awaiting definitive title (7.0%), of which 2,452 are women (8.1%) and 7,098 (7.4%) are men.

*Index of perceived security of land tenure.* In Brazil, 23% of the adult population feels insecure about their land and property in general. Among women, 23% feel insecure, among men, 24%<sup>15</sup>.

22% of the adult population feel insecure about their housing rights, with men and women having the same percentage of perceived housing insecurity (22%). The landlord or tenant asking the individual to leave was the main reason cited for this insecurity (in 71% of cases).

<sup>15</sup> <https://www.prindex.net/data/brazil/>.

**Figure 8 – Left:** Total establishments, **Center:** percentage of total area (ha); **Right:** average area (ha) by gender (Agricultural Census, 2017).

*Area of establishments.* The total area in hectares of PA establishments run by men is significantly larger than those run by women. The total area of PA establishments run by women is 214,500 ha (14.9%), while that of men totals 1,226,714 ha (85.1%). In terms of average area (ha), establishments run by men are 80.6% larger than those run by women. While establishments run by women have an average of 7.12 hectares, those run by men have an average of 12.86 hectares.

## 2.6 Water resources, access to water and basic sanitation

Research by the Trata Brasil Institute (2018) indicated that one in four women in Brazil did not have adequate access to sanitation infrastructure in 2018. In the North and Northeast regions, regular water service reached 53.2% of women. In addition, 70% of women who do not have a toilet at home live in the Northeast<sup>16</sup>. The lack of adequate sanitary facilities not only exposes women to a range of diseases, but also increases their vulnerability to violence, hindering their ability to move freely, earn income and learn. Furthermore, in the context of pregnancy and childbirth, a hygienic environment, including sanitation and drinking water, is fundamental to guaranteeing the health of the woman and her child<sup>17</sup>.

The 2017 Agricultural Census provides relevant indicators on access to water resources by family farmers in the PROCASE II area, broken down by gender.

<sup>16</sup> Trata Brasil Institute (2018). [Sanitation and the lives of Brazilian women 2018](#).

<sup>17</sup> ECLAC (2022). [Gaps, challenges and opportunities in water and gender in Latin America and the Caribbean](#).

**Figure 9** - Water resources by type and gender (Agricultural Census, 2017).

*Establishments with access to water resources* (Figure 9). According to the 2017 Agricultural Census, 106,764 PA establishments (85.1%) have access to water resources, while 18,725 do not (14.9%). Among the establishments run by women, 24,967 (82.9%) have water resources compared to 81,797 of those run by men (85.8%) - a gap of 2.9 percentage points.

*Access to water for irrigation.* 14,394 PA establishments in the Project area (11.8% of the total) have access to water for irrigation. Among those run by women, 2,028 have access to irrigation water (6.7%); among those run by men, 12,366 (or 13.0%) do - a gap of 6.3 percentage points.

*Access to cisterns.* 78,824 PA establishments in the project area (62.8%) have access to cisterns. Among those run by women, 20,043 have access to cisterns (66.5%) and among those run by men, 58,781 (61.6%) - a gap of -4.9 percentage points.

## 2.7 Associative Activities

**Figure 10** - Associated producers by type of association and gender (Agricultural Census, 2017)

*Members of associations/trade unions.* In the Project area, 41,508 managers of PA establishments were members of professional associations (33.1% of the total) in 2017. Among female managers, 11,205 were members (37.2% of the total) and among men, 30,303 (31.8%) - a difference of 5.4 percentage points in favor of women.

*Cooperative members.* According to the 2017 Agricultural Census, 2,244 managers of PA establishments were associated with cooperatives (1.8%) in the project area. Among women managers, 361 were members (1.2%) and among men, 1,883 (2.0%) - a gap of 0.8 percentage points.

*Members of a producers' association/movement.* 17,734 managers of FA establishments were members of a producers' association or movement in 2017 (14.1%). Among female managers, 4,754 were members (15.8%) and among men, 12,980 (13.6%) - a gap of -2.2 percentage points.

## **2.8 Food and Nutrition Security (FNS)**

*Food Insecurity:* According to the II VIGISAN<sup>18</sup>, food insecurity (FI) in 2021/2022 affected 58.7% of Brazilian households (125.2 million people); in the Northeast, it reached 68% of households, where 12.1 million people are going hungry, i.e. at a level of severe food insecurity. The family farming sector has been hit hardest by the economic crisis of recent years, with small farmers particularly hard hit. In the Northeast, 83.6% of family farming families face some degree of food insecurity in 2021/2022. The worst levels of FI were observed in family farming families who have not yet been able to return to pre-pandemic conditions, especially those who have not been able to fully re-establish their production and marketed quantities. The most recent survey by the PENSSAN Network (2022) points to the current worsening of food insecurity, which affects 63.9% of households in Paraíba, of which 10.6% face severe food insecurity (hunger). Food insecurity figures disaggregated by gender are not available.

*Nutrition.* Despite the process of nutritional transition, the state of Paraíba follows the national trend and the rest of the Northeast region and faces a double burden of malnutrition, marked by both undernutrition and an increase in the prevalence of overweight. 62.5% of adults in Paraíba are overweight (35.5% overweight and 27.0% obese)<sup>19</sup>. Growth retardation affects 4.9% of children under 5, thinness and marked thinness 4.2%, overweight 8.4% and obesity 6.8% (figure 11).

The situation is exacerbated among the most vulnerable groups, such as quilombola communities, which continue to suffer from socio-economic disadvantages that are reflected in higher morbidity profiles, especially in relation to nutritional disorders. In addition, women of reproductive age have greater nutritional needs than men and for this reason usually have worse nutritional indicators than men of the same age, and therefore need differentiated attention. Research shows that in the Northeast, the prevalence of underweight among pregnant women is as high as 18%, compared to 6.7% for the rest of Brazil<sup>20</sup>.

---

<sup>18</sup> [II National Survey on Food Insecurity in the Context of the COVID-19 Pandemic in Brazil](#) [II VIGISAN: final report]. Brazilian Research Network on Food Sovereignty and Security - PENSSAN. São Paulo, SP : Friedrich Ebert Foundation. PENSSAN Network, 2022.

<sup>19</sup> Ministry of Health. Food and nutrition situation in Brazil: overweight and obesity in the adult population in Primary Health Care. [https://bvsms.saude.gov.br/bvs/publicacoes/atlas\\_situacao\\_alimentar\\_nutricional\\_populacao\\_adulta.pdf](https://bvsms.saude.gov.br/bvs/publicacoes/atlas_situacao_alimentar_nutricional_populacao_adulta.pdf).

<sup>20</sup> MELO, Maria Inês Bezerra de et al (2011). "Nutritional status of pregnant women assessed by three different anthropometric classification methods." *Revista de Nutrição* 24 (2011): 585-592.

**Figure 11** – Nutritional Status of children up to 5 years old (SISVAN, 2023).

The main root causes of food and nutritional insecurity in the Project area are the declining quality of and difficult access to water for human consumption and food production; the limited capacity for food production and productive diversification; the low quality of the food consumed; the lack of productive infrastructure; and low levels of food and nutritional education. It is worth highlighting the direct correlation between food and nutritional insecurity and poverty rates (69.9% of family farmers registered in the Single Registry in the Project area live in poverty or extreme poverty)<sup>21</sup> and environmental restrictions (such as lack of basic sanitation, interruptions in water flows and poor quality of water sources). Access to quality water and sanitation plays a fundamental role in combating different forms of malnutrition. Only 39.4% of households in the Project area have access to a public sewage system and 63.2% are connected to a public water supply system<sup>22</sup>.

## 2.9 Gender-based violence and domestic violence

Violence in rural areas is increasing every year, as shown by the growing number of murders of rural workers. The Report "Conflicts in the Countryside Brazil 2022" by the Pastoral Land Commission (CPT) shows that the number of conflicts in the countryside has increased from 804 cases in 2013 to 1500 in 2022; in 2022 alone 47 murders were recorded compared to 35 in 2013.

IPEA data for Paraíba indicates a femicide death rate of 3.9 women per 100,000 in 2018<sup>23</sup>. In 2023, 4,630 police inquiries were opened in Paraíba to investigate cases of domestic and

<sup>21</sup> Single Registry, November 2023. Available at: <https://aplicacoes.cidadania.gov.br/vis/data3/data-explorer.php>.

<sup>22</sup> Idem.

<sup>23</sup> IPEA (2020). Atlas of Violence. Available at: <https://forumseguranca.org.br/wp-content/uploads/2020/08/atlas-da-violencia-2020.pdf>.

sexual violence against women, according to the Coordination of Women's Police Stations in Paraíba (Coordeam)<sup>24</sup>.

In Paraíba, you can find the following networks through the Paraíba state government via the Women's Secretariat; the Maria da Penha Integrated Patrol Program - PIPMP; the State Women's Reference Centers; the Shelter House; and the Temporary Shelter House.

The lack of facilities in the Network to Combat Violence against Women makes rural women more vulnerable to violence and restricts their access to protection.

### 3. Gender strategy

Based on the diagnosis prepared in the previous sections, a preliminary Gender strategy was drawn up, which will be presented below and represents the main recommendation of this report.

#### 3.1 Strategic Transformation Pathways

PROCASE II will take a holistic approach to transforming gender relations, which focuses on the environmental, economic, political, and cultural causes of women's social vulnerability. This perspective aims to transform unequal power relations shaped by patriarchal structures, norms and practices and empower women to be more resilient. To this end, the project will: i) promote economic empowerment and equal access to and control over resources and assets, ii) address the issue of women's overload due to domestic and care work, iii) empower women and men to have equal voice and decision-making power in rural institutions and organizations<sup>25</sup>.

Through gender sensitization workshops, the project will work on important concepts in the formation of structural inequality in the state, with emphasis on intersectional discrimination based on race, gender, and class. The actions of the three strategic trajectories, detailed in the table below, will highlight the contributions of women, acting as important tools in restoring self-esteem and recognizing the work of women in Paraíba beyond the domestic sphere, stressing patriarchal values that place them only as the keepers of the home, in a position of subalternity. By having a positive impact on the lives of women, especially black women from the countryside and traditional peoples and communities (PCTs), the project has an impact on transforming the structure of society as a whole, as these target groups form the base of the social pyramid.

#### 3.2 Gender policies with which the project is aligned

The **Plano Nacional de Políticas para as Mulheres – PNPM (National Women's Policy Plan)**: is organized into 11 axes that represent priority themes and areas of concern raised by women at the National Conferences on Policies for Women:

- I. Economic autonomy and equality in the world of inclusion;
- II. Inclusive, non-sexist, non-racist, non-homophobic and non-lesbophobic education;
- III. Women's health, sexual rights and reproductive rights;

<sup>24</sup> <https://g1.globo.com/pb/paraiba/noticia/2024/03/09/violencia-contra-a-mulher-na-pb-acontece-principalmente-em-casa-por-pessoas-conhecidas.ghtml>.

<sup>25</sup> Each of these 3 trajectories is aligned with one of the 3 objectives of IFAD's policy on gender equity and women's empowerment, available at: <https://www.ifad.org/ja/-/document/ifad-policy-on-gender-equality-and-women-s-empowerment-new>.

- IV. Combating all forms of violence against women;
- V. Women's participation in spaces of power and decision-making;
- VI. Sustainable development in rural areas, the city and the forest, guaranteeing environmental justice, sovereignty and food security;
- VII. The right to land, decent housing and social infrastructure in rural and urban areas, considering traditional communities;
- VIII. Equal culture, democratic and non-discriminatory communication and media;
- IX. Combating racism, sexism and lesbophobia;
- X. Combating generational inequalities affecting women, with special attention to young and elderly women;
- XI. Managing and monitoring the plan.

The **Pronaf Mulheres (Pronaf Women)**: supports agricultural and non-agricultural activities through a specific line of credit for rural women, with facilitated payment conditions.

The **Política Nacional de Enfrentamento à Violência contra a Mulher (National Policy to Combat Violence against Women)**: aims to establish concepts, principles, guidelines and actions to prevent and combat violence against women, as well as to assist and guarantee the rights of women in situations of violence, in accordance with international human rights standards and instruments and national legislation.

The **Programa de Defesa dos Direitos das Mulheres Jovens Vulneráveis ao Abuso e à Exploração Sexual no Brasil (Program for the Defense of the Rights of Young Women Vulnerable to Sexual Abuse and Exploitation in Brazil)**: is part of the Program for the Defense of the Rights of Children and Adolescents and aims to promote the rights of girls, especially those at risk, in order to eliminate violence against them.

The **Programa Organização Produtiva e Econômica das Mulheres Rurais (Rural Women's Productive and Economic Organization Program)**: establishes the integration of public policies aimed at qualifying productive and economic processes and the production of healthy food.

The **Programa Nacional de Cidadania e Bem Viver (National Program for Citizenship and Good Living)**: one of its main actions is the Rural Workers' Documentation Workshops, which aim to raise awareness about the usefulness of civil and labor documentation, as well as providing guidance on access to public policies for women in agrarian reform and family farming and social security, issuing civil and labor documents and access to social security rights free of charge.

The **Programa Quintal Produtivo (Productive Backyard Program)**: aims to promote food and nutritional security and the economic autonomy of rural women. Initially, 10,000 productive backyard gardens will be created, benefiting thousands of women through access to the inputs, equipment, and tools needed to structure and manage the gardens. The action consists of associating backyard gardens with development, technical assistance, cisterns, and commercialization. By 2026, there will be 90,000 productive backyard gardens throughout Brazil. The action involves the Ministry of Agrarian Development (MDA), the Ministry of Development and Social Assistance, the Family and Fight against Hunger (MDS), and the BNDES.

**Empreender Mulher (Women's entrepreneurship)**: This line of credit was created by the Government of Paraíba and is run through a partnership between the Empreender PB Program and the State Secretariat for Women and Human Diversity, with the aim of rescuing the dignity of women in situations of social vulnerability, promoting economic autonomy and fostering female protagonism in entrepreneurship.

### 3.3 Theory of Change

<b>General Objective</b>	Increasing the impact of PROCASE II on gender equality and empowering women in Paraíba.		
<b>General goal</b>	At least 50% of the beneficiaries will be women.		
<b>Specific objectives</b>	Economic empowerment	Decision-making and representation	Balancing the workload
<b>Activities</b>	<ul style="list-style-type: none"> <li>- Increasing women's access to and control over resources - inputs, technologies, finances, and economic services - such as extension and training.</li> <li>- Generate new income opportunities for women emerging from the project's investments in agricultural and non-agricultural activities.</li> <li>- Create new opportunities for rural women's products to access the market.</li> <li>- Raising awareness among men and boys as a strategy to support women's economic engagement.</li> <li>- Strengthening women's right to land.</li> <li>- Promoting the use of agroecological notebooks as a feminist political pedagogical tool for empowerment.</li> </ul>	<ul style="list-style-type: none"> <li>- Ensure the involvement of women in the development of Productive Investment Plans (PIP) and Business Plans (PN).</li> <li>- Encouraging and empowering women to take on leadership roles in rural and community organizations.</li> <li>- Promote and strengthen women's groups, networks, and organizations.</li> <li>- Increase dialogue on gender-specific policies.</li> </ul>	<ul style="list-style-type: none"> <li>- Implementing social technologies that reduce domestic work time.</li> <li>- Increasing access to water and basic sanitation.</li> <li>- Implement the childcare circles (cirandas) initiative to ensure that the children are looked after during the project's activities.</li> <li>- Promote mixed and thematic territorial meetings of women (guided by community demand) to raise awareness about the fair division of domestic labor.</li> </ul>
	Political engagement and raising awareness about gender-based violence through prevention campaigns. Awareness-raising campaigns on gender issues and women's rights, highlighting the specific challenges faced by rural women.		
<b>M&amp;A</b>	<ul style="list-style-type: none"> <li>- Women with income-generating opportunities in agriculture and non-agriculture.</li> <li>- Women farmers receiving productive investments and/or technologies.</li> <li>- Rural women trained.</li> </ul>	<ul style="list-style-type: none"> <li>- Women participating equally in rural and community organizations.</li> <li>- Women's networks formed and/or strengthened.</li> </ul>	<ul style="list-style-type: none"> <li>- Trained Cirandeira(o)s.</li> <li>- Territorial women's, mixed and thematic meetings on gender issues held.</li> </ul>

	- Women ATER technicians trained		
	- Women with gender equality and empowerment systematically addressed and ensured in the project. - Gender and Diversity Strategy and Action Plan drawn up and implemented.		

#### 4. Recommendations

To overcome the gaps identified in the diagnosis, the following actions are recommended:

**General recommendation:** It is recommended that the preliminary gender strategy described in the previous section serve as an initial basis for drawing up the PROCASE II Gender Strategy. This document should serve as a guide for the implementation of the project but should be updated whenever necessary to adapt to the different realities, challenges and opportunities found in the territories.

#### Recommendation of Implementation Measures:

- Setting targets for women as a percentage of beneficiaries, as well as ensuring that relevant indicators for all components are disaggregated by gender. This data should be collected and analyzed systematically throughout implementation.
- The project must have a specific budget line for the execution of specific Gender Equity and Women's Empowerment (GEWE) activities, which will be included in subcomponent 1.3.
- It is recommended that PROCASE I's good practices on gender be maintained and scaled up during PROCASE II, in particular the use of Agroecological Logbooks<sup>26</sup> and the maintenance of the Working Group on Gender, Generation, Race and Ethnicity Equality.
- A gender and diversity specialist should be hired to join the Project Management Unit team on an exclusive basis. This person will be responsible for gender and social inclusion issues (overseeing the implementation of the gender and diversity strategy and action plan, training staff, and helping colleagues to address gender equality and women's empowerment issues in the Project's operations, including knowledge management, M&E indicators, and results measurement. This specialist should be supported by gender focal points in each of the decentralized offices.
- Responsibility for gender mainstreaming should be included in service providers' terms of reference.
- In the event of low involvement of women in the project or unqualified participation, corrective actions should be promoted. Supervision missions, implementation support and the Mid-Term Review will play a key role in monitoring and evaluating the progress and bottlenecks in the implementation of the Gender and Diversity Strategy and Action Plan, as well as the achievement of the Project's goals related to gender and diversity.
- The studies carried out by the project, within the scope of Knowledge Management, must include a gender and diversity perspective

#### Specific recommendations by thematic area:

Theme	Recommendation
-------	----------------

<sup>26</sup> The agroecological report cards are a unique methodological tool that makes it possible to measure, value and give visibility to women's fundamental contributions to the family economy and community development, promote women's self-esteem and demonstrate how they contribute to healthy, diversified and safe family meals.

Social technologies	<p>Introduce social technologies for access to water that save women's time and work (e.g. cisterns, graywater reuse systems and renewable energies).</p> <p>Encouraging rural women's access to innovative social technologies that can increase productivity and efficiency, such as: drip irrigation, agroforestry systems, the development of crop varieties resistant to pests and diseases, nurseries, access to photovoltaic energy.</p> <p>Ensure that rural women take on greater social participation in water resource management.</p> <p>Training so that the social technologies are implemented by the women themselves.</p> <p>Integrate basic notions of hygiene, sanitation, and health by providing technical assistance to the target groups, adapted to the reality of rural women.</p>
Access to land	<p>Ensure that the project's environmental and land regularization activities prioritize rural women and PCTs, setting specific outreach targets for these priority groups.</p>
Access to credit	<p>Through Technical Assistance (TA), support rural women's access to civil documentation, to meet the requirements for access to credit and other public policies. This could be done through</p> <ul style="list-style-type: none"> <li>- Specific training on how to access public and private credit systems.</li> <li>- Promoting coordination between rural women, the technical advisory team and credit operators.</li> <li>- Encouraging the creation of revolving funds among women as an alternative way of accessing credit.</li> </ul>
Access to qualified AT	<p>Offer technical assistance that provides training and skills for family farming, financial management, entrepreneurship, and agricultural technology specifically for rural women.</p> <p>Ensure that the TA team has experience in working with rural women and is trained in gender-related issues to ensure that they meet the specific demands of this group.</p> <p>Create a Gender Working Group made up of all the TA entities contracted to discuss content and methodologies for working with women, strengthening the quality of the project's gender interventions, and ensuring ongoing training.</p> <p>Create minimum quotas for women technical assistants in the hiring notices of TA organizations.</p>
Expanding employment and income generation	<p>Train women in agricultural and non-agricultural subjects, so that they have greater and more diversified opportunities to generate income and occupations.</p> <p>Strengthen existing agroecological experiences in the project's area of operation and promote exchanges in agroecology between farmers, prioritizing women.</p> <p>Ensuring that the project's productive investments reach women by setting specific outreach targets for this group and ensuring that they participate in the drafting, implementation and monitoring of Investment Plans and Business Plans.</p>
Access to markets	<p>Training women to access the market, including public purchases such as the PNAE and PAA and the basics of online purchases.</p> <p>Promoting feminist agroecological fairs.</p>
Participation and decision-making	<p>Encourage the participation of women in leadership positions in associations, cooperatives, and local government bodies.</p> <p>Train women in associativism, cooperativism and leadership so</p>

	<p>that they have an equal voice and decision-making power in economic and community organizations.</p> <p>Encourage an affirmative quota policy in cooperatives (e.g. number of women in leadership positions), as these are spaces where there is less participation by women.</p> <p>Strengthening existing women's groups and networks in Paraíba, many of which are still informal.</p> <p>Establish support networks between rural women, where they can share knowledge, experiences, and resources. This can be done through exchanges between groups of women farmers, cooperatives, and local associations.</p>
<p>Reducing the workload and valuing women's unpaid work</p>	<p>Carry out work that involves men and women in recognizing and valuing the unpaid work of rural women, which often includes looking after the family, the house, and the animals, as well as farming. This could involve promoting actions that encourage the redistribution of family responsibilities and the recognition of domestic work as an economic contribution (e.g. agroecological passbooks).</p> <p>To ensure women's full participation in the project's activities, we recommend offering childcare services through "Cirandas das Crianças" (Children's Circles). This initiative allows the trainers to address educational topics with the children, such as agroecology, gender, health, environmental education, and coexistence with the semi-arid region.</p> <p>Introducing social technologies that save women's time and work (e.g. cisterns, graywater reuse systems and eco-efficient stoves).</p>
<p>Improving Food and Nutrition Security</p>	<p>Communication and Knowledge Management (KM): integrate the topic of nutrition into the KM materials to be developed by the project and disseminate them among rural women. Promote an awareness campaign on issues related to gender equality and nutrition (early pregnancy, sexual and reproductive health).</p> <p>Promoting nutritional education and food diversification through TA (an activity that should be tailored to the characteristics of the target groups, such as women).</p> <p>Valuing and increasing the dissemination of relevant traditional knowledge related to nutrition.</p> <p>Increasing the production of nutrient-rich crops and diversifying the production of nutritious food in agroecological backyards (a space where rural women often play a leading role) for the family's own consumption.</p> <p>Create partnerships with actors working on nutrition-related issues, such as the Pastoral Health Ministry and Municipal Health Departments.</p>
<p>Strengthening Institutional Capacity</p>	<p>It is recommended that the project support the institutional strengthening of TA organizations by training their teams in gender and diversity issues.</p> <p>Offer specific support to strengthen women's associations and groups through the activities of subcomponent 1.3.</p> <p>Business plan investments in women-led enterprises, such as community kitchens.</p>
<p>Access to public policies</p>	<p>Prioritize women's access to public policies, such as access to land regularization, access to water (cisterns for production and consumption, wells, desalination plants, underground dams), seed banks, credit, and agricultural inputs. This can</p>

	involve policies that promote gender equality in access to microcredit programs aimed specifically at women (e.g., Empreender Mulher).

## PARAIBA RURAL SUSTAINABLE DEVELOPMENT PROJECT - PROCASE II

### Annex - Context / Diagnosis of Rural Paraíba

#### General information about Paraíba

The state of Paraíba has an area<sup>1</sup> of 56,467 km<sup>2</sup>, occupying 4% of the area of the Northeast region and 0.7% of that of the country. According to data from the 2022 Demographic Census, the state's total population is 3,974,687 inhabitants, 51.7% of whom are women. It is estimated that the rural population represents 24.6% of the total (approximately 977,000 inhabitants). Paraíba's population density is 70.4 inhabitants/km<sup>2</sup>, which is twice the density of the Northeast region and almost three times the national population density. The 2010 Census portrayed a relatively young population, 44% of which was under the age of 25 and the average age was 29<sup>2</sup>. In the 2022 Census, the average age of the population of Paraíba rose to 34, which is very close to the national average. This evolution in the average age shows that there was a significant aging process in the period.

According to the Regional Accounts of Brazil 2021 (IBGE), in terms of GDP size, Paraíba ranks 19th among the 27 units of the Federation, and 6th in the Northeast. In the same year, Paraíba's GDP represented 0.9% of the national GDP<sup>3</sup>. In terms of GDP per capita, with a value of R\$ 19,181 per inhabitant (for the year 2021), Paraíba ranks 26th (second last) in the national ranking or hierarchy<sup>4</sup>. This GDP per capita figure represents 45% of Brazil's GDP per inhabitant for the same year, which was R\$ 42,247.

Paraíba's Human Development Index (HDI) for 2021 was 0.698<sup>5</sup>, which is considered 'average'<sup>6</sup>. As has been the case throughout the country, this index has been improving since it was first measured in 1991. That year it was 0.362, rising to 0.484 in 2000 and 0.658 in 2010. In the last measurement of this index (2021), the state ranked 21st out of the 27 Brazilian federative units. However, the better 'scores' of the state's larger cities somewhat mask the situation of the smaller and more eminently rural municipalities. Thus, the MHDÍ of 152 of Paraíba's 223 municipalities (68.2%) is considered 'low' (i.e., between 0.5 and 0.599)<sup>7</sup>.

Data from the IBGE's 2022 PNAD indicates that Paraíba is the third state in Brazil with the highest illiteracy rate among people aged at least 15. There are 13.6% illiterate people in the state, ahead of only Piauí (14.8%) and Alagoas (14.4%) and worse than the national (5.6%) and regional (11.7%) averages<sup>8</sup>.

#### – Paraíba's major regions

---

<sup>2</sup> The median age is an indicator for monitoring the ageing of a population, which means the age at which a population can be divided into two groups: the youngest 50% and the oldest 50%. **In practice:** half (50%) of the population is below the median age and the other half (50%) is above the median age. The higher the median age, the older the population. Cf. <https://jornaldaparaiba.com.br/economia/censo-2022-paraiba>

<sup>5</sup> Source: <https://cidades.ibge.gov.br/brasil/pb/pesquisa/37/30255?tipo=ranking&ano=2021>.

<sup>6</sup> Average' HDI values are those between 0.600 and 0.699. The information cited in this paragraph is from the 'Atlas of Human Development in Brazil'. Cf.: [http://atlasbrasil.org.br/2013/pt/perfil\\_uf/paraiba](http://atlasbrasil.org.br/2013/pt/perfil_uf/paraiba) (Source: UNDP - João Pinheiro Foundation - IPEA)

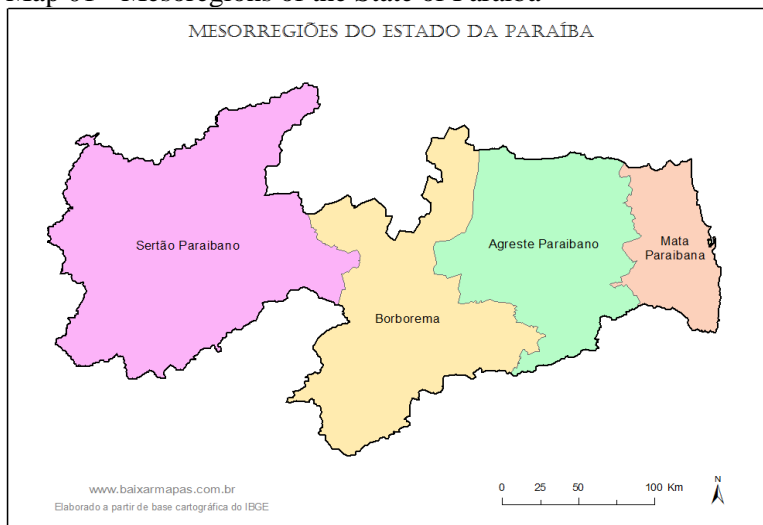

<sup>7</sup> Source: <http://www.atlasbrasil.org.br/perfil/uf/25>.

<sup>8</sup> Data released by the website: <https://g1.globo.com/pb/paraiba/noticia/2023/06/07/paraiba-tem-o-terceiro-maior-indice-de-analfabetismo-do-brasil-aponta-estudo-do-ibge.ghtml>.

The state of Paraíba is divided into four mesoregions: Mata Paraibana, Agreste, Borborema and Sertão. The last three, which include 193 of the state's 223 municipalities, covering 92% of the state's area<sup>9</sup> (the equivalent of approximately 51,900 km<sup>2</sup>), are considered to be part of the semiarid region of the Brazilian Northeast, generally dominated by the Caatinga biome<sup>10</sup>. These 193 semiarid municipalities comprise around 62% of the state's total population. This region is more rural than the coast: 85% of the state's rural population lives here<sup>11</sup>. In addition to these characteristics, the semiarid region has social indicators that point to its greater vulnerability. One example is the municipal HDI. An analysis of 2010 data showed that of the 193 municipalities in the Semiarid region, 129 have an index significantly lower than the general index, with values between 0.500 and 0.599, which places them in the 'low human development' category<sup>12</sup>.

In contrast, the Mata Paraibana mesoregion, located in the far east, which covers only 30 of the state's 223 municipalities, is the domain of the Atlantic Forest biome. Even though it covers only 8% of the state's surface area, the Mata Paraibana region is home to 38% of its population (approximately 1,510,000 inhabitants).

Map 01 - Mesoregions of the State of Paraíba

Source: <http://www.baixarmapas.com.br/mapa-da-paraiba-mesorregioes/>

#### - *The weather*

Given its proximity to the Equator, the state of Paraíba has a tropical climate. However, the rainfall factor is the key element that characterizes the climate and determines a series of factors that express the region's potential, especially when it comes to agricultural and extractive production. Based on this parameter, it is possible to distinguish two climatic sub-types: the humid tropical climate in the coastal Zona da Mata and the semiarid tropical climate that covers the other westernmost mesoregions of the state: Agreste, Borborema and Sertão. The isopleth map below shows this characteristic of Paraíba's climate. It shows that in the eastern part the annual averages range from 1,100 to over 1,700 mm. At the same time, it shows that the driest region of the state is the central region, where annual averages vary from 300 to 700 mm.

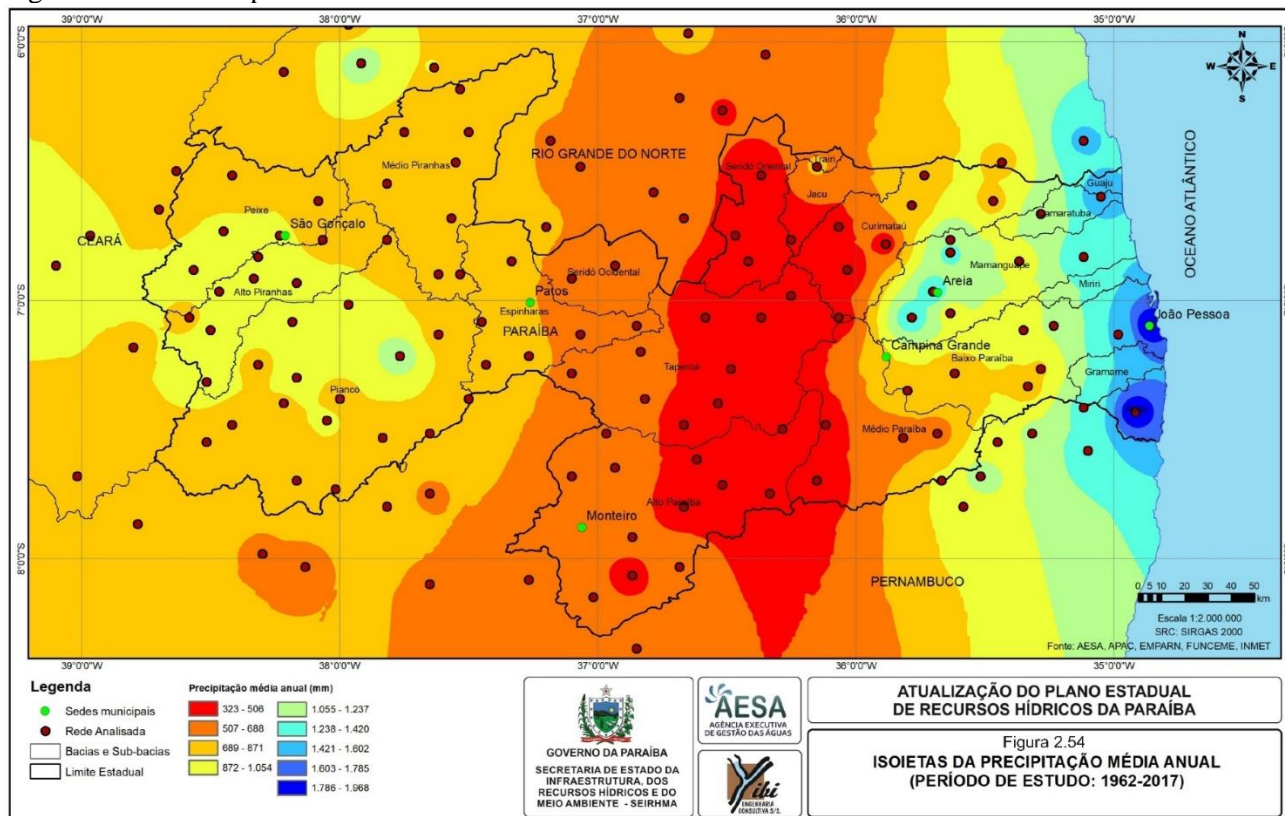

<sup>9</sup> Source: IBGE - Link: [IBGE | Brazil in brief | territory](http://www.ibge.gov.br/territorio/). See Table 02.

<sup>10</sup> Even though it officially belongs to the semiarid region, the Agreste Paraibano mesoregion, being a climate transition region between the humid coast and the drier semiarid, is a very diverse region. There are some municipalities - for example, in the Brejo Paraibano micro-region - where the natural conditions are more favorable and the predominant natural vegetation is the Atlantic Forest.

<sup>11</sup> Percentage calculated using data from the 2010 Demographic Census (IBGE).

Figure 01 - Isoiet map for the state of Paraíba

Source: (PARAÍBA.GOVERNO-DO-ESTADO, 2022) (<http://www.aesa.pb.gov.br/aesa-website/wp-content/uploads/2022/10/RF-02-A-DIAGN%C3%93STICOS-vol-1.pdf>)

Although rainfall is variable in the region, it is possible to state that there is little rainfall in the Semiarid Region of Paraíba, especially when comparing rainfall to the very high evapotranspiration - which can reach more than  $2,000 \text{ mm/year}^{-1}$  (MONTENEGRO; MONTENEGRO, 2012) - which is characteristic of the region. In the semiarid region, average annual rainfall ranges from 330 to 1,000 mm. This rainfall is concentrated in a short 'winter' period, which rarely exceeds four months a year (generally occurring between January and May in the westernmost of the Paraíba Semiarid regions, and a little later in the easternmost parts of the region). This already characterizes a very marked seasonality, and it is absolutely normal to have a drought or 'summer' of several months without rain. But the most important climatic factor is certainly the variability of the rainy season. The average deviation (compared to the average annual rainfall) reaches, in certain regions of the Semiarid region of Paraíba, rates of over 50%, which is one of the most significant in the world (NIMER, 1989). This means that rainfall in this region is **scarce** and, above all, **irregular**.

### Droughts

The semiarid region usually experiences a shortage of rainfall, which takes different forms. Unlike the drought or 'summer' without rain that normally occurs each year, a 'drought' is configured when the rainfall in the rainy months is lower than the rates recorded in years of rainfall considered normal (i.e., close to the historical average annual rainfall) (DUARTE; FARIAS; SOUSA; SOUZA *et al.*, 2018). The greater the deficit, the more severe the year's drought. But it can also happen that drought years (as defined here) follow one another. This leads to a 'great drought'. There are historical records of periods of this type in the northeastern semiarid regions as far back as the 16th century. The 'great drought' of 1877-79, which wiped out almost half of the region's population and practically the entire herd, is famous (CGEE; WORLD BANK, 2016). However, although these 'droughts' and 'great droughts' are not a new phenomenon, there are indications that this type of phenomenon is happening more frequently, especially since 1970 (MARENGO, 2007). It is worth noting that, in the recent period - 2012 to 2017, the worst drought in many decades occurred throughout the northeast hinterland. We will talk about this event in a subsequent section.

Rainfall totals are higher in the Zona da Mata, ranging from 1,100 to 1,800 mm per year. There is also a seasonality to the rainfall in the Zona da Mata, with the rainfall or 'winter' season generally lasting from February to August. The average temperature is high, but lower than in the Semiarid regions and, conversely, the relative humidity is higher on the coast than in the Semiarid regions, making evaporation important but lower than in the Semiarid region, at around 1,350 mm/year<sup>13</sup>.

#### - *Climate change*

Currently, there are many studies working on climate change. In general, an analysis of these studies indicates that in the Northeast there will be an increase in temperature extremes (minimum and maximum)<sup>14</sup>, a reduction in the volume of average rainfall and a greater number and frequency of dry days (CHOU; LYRA; MOURÃO; DEREZYNSKI *et al.*, 2014; CONFALONIERI; LIMA; BRITO, 2014; CUNHA; OLIVEIRA, 2023; INTERGOVERNMENTAL-PANEL-ON-CLIMATE-CHANGE-IPCC, 2013) (INTERGOVERNMENTAL-PANEL-ON-CLIMATE-CHANGE-IPCC, 2021; MARENGO; CUNHA; NOBRE, 2020). The effects are expected to be more intense from the second half of the 21st century onwards. It should be noted that these effects have great spatial variability. In the case of the Northeast, for example, coastal areas are less impacted; the Semiarid region is expected to experience greater extremes of heat and, above all, much lower rainfall volumes (CUNHA; OLIVEIRA, 2023). Additionally, there is an increase in consecutive dry days and a much wider range of climate variability (including an increase in extreme rainfall (50 to 80 mm.day<sup>-1</sup>) on the coast of the Northeast and a significant reduction in the Semiarid region), including an increase in extreme rainfall (50 to 80 mm.day<sup>-1</sup>) on the coast of the Northeast and a significant reduction in the Semiarid region, common characteristics found in various simulations for the macro-region of Northeast Brazil (CHOU; LYRA; MOURÃO; DEREZYNSKI *et al.*, 2014; CORTEZ; PIRES; AVILA-DIAZ; PAIVA *et al.*, 2022).

The agricultural sector is one of those suffering the greatest negative impacts from climate change. The main conclusion of the research is that droughts, greater rainfall variability, rising average temperatures and heat extremes, as well as high atmospheric concentrations of carbon dioxide, are already causing crop losses and reduced agricultural productivity and food and water security, as well as various health problems. These problems are likely to intensify in future climate change scenarios (JÄGERMEYR; MÜLLER; RUANE, 2021; MÜLLER; FRANKE; JÄGERMEYR, 2016). Such damage makes it difficult to overcome other major global challenges, especially poverty, income inequality, food insecurity and hunger.

There is a large and growing body of literature on the impacts of climate change on Brazilian agriculture. Although there are major differences in modeling and, consequently, uncertainties about the magnitudes of the effects, these studies agree that Brazilian agriculture will be negatively affected (ASSUNÇÃO; CHEIN, 2016). The study by Nazareth, Cunha, and Gurgel (2020), for example, demonstrates how Brazilian regions can be

---

<sup>13</sup> Source: GEOCONSULT. Environmental Impact Study - EIA, Environmental Impact Report - RIMA: Elizabeth Cimentos - Alhandra/PB. Available at: <http://sudema.pb.gov.br/consultas/downloads/arquivos-eia-rima/elizabeth-cimentos>. 2011.

<sup>14</sup> In relation to the present, in the Northeast region, the models predict increases in maximum temperature, which could vary from 0.92°C to 2.74°C by 2050 and from 1.98°C to 4.51°C by 2100 ('intermediate' - SSP2-4.5 and 'pessimistic' - SSP5-8.5 scenarios, respectively). (CUNHA; OLIVEIRA, 2023).

affected differently, accentuating the socioeconomic disparities that already exist. The results of this study confirm that the North and Northeast will suffer significant negative impacts, while the South could even benefit.

The work of Tanure and colleagues (TANURE; DOMINGUES; MAGALHÃES, 2023; 2024) present a very detailed overview of the impacts of climate change on family farming in Brazil, as well as in the North and Northeast regions. Unlike the majority of studies dealing with Brazil, which focus only on the main export *commodities*, without distinguishing the type of producer, the authors mentioned consider a wide range of agricultural activities, which represent the diversity of national production, and have broken it down into family farming (FF) and employer agriculture. In these studies, climate change was represented by two IPCC-AR scenario 5 (INTERGOVERNMENTAL-PANEL-ON-CLIMATE-CHANGE-IPCC, 2013) - RCP 4.5 ("intermediate") and RCP 8.5 ("pessimistic") - with simulations of productivity shocks and economic impacts for the period from 2021 to 2050. Among the main conclusions of these studies are:

- (i) Some crops important for feeding FF (cassava, corn, beans, bananas, for example) will suffer major productivity losses in both scenarios;
- (ii) The negative impacts are greater in Family Farming than in Patronal Farming;
- (iii) (iii) The losses in terms of agricultural economic activity are approximately four times greater in FF than in Patronal - for the intermediate scenario. Patronal - for the intermediate scenario.

These same studies calculated the possible impacts for the different states of the Northeast. In Paraíba, in the 'intermediate' scenario, a loss of productivity of 40% is expected by 2050. This figure rises to 45% in the 'pessimistic' scenario (TANURE; DOMINGUES; MAGALHÃES, 2024) apud (CUNHA; OLIVEIRA, 2023).

Recent data indicates that changes in average temperatures and precipitation can already be detected, especially in the semiarid region, which confirms the forecasts mentioned here. In addition, other more specific studies corroborate these major trends of increasing maximum temperatures and decreasing precipitation for the region (RIBEIRO NETO; ROLIMA DA PAZ; DA SILVA, 2016) and, above all, of increasing climate variability (MACHADO FILHO; MORAES; BENNATI; DE et al., 2016b), with a greater frequency of extreme events (essentially more pronounced and prolonged droughts and, sometimes, the occurrence of floods). An analysis of drought events in the northeastern semiarid region from 1981 to 2016 confirms these predictions, revealing that the intensity of droughts over the last 36 years has increased and that recent droughts have been more frequent, more severe and have affected a larger area with significant impacts on economic activities and the population in general (BRITO; CUNHA; CUNNINGHAM; ALVALÁ *et al.*, 2017). As a consequence of this larger scenario, a significant reduction in the availability of surface and groundwater is also being predicted. From 2012 to 2017, Paraíba experienced a 'great drought'. This event can be categorized as one of those 'extreme events' that climate scientists say are likely to happen with increasing frequency because of climate change. More information on the effects of this 'great drought' on the state of Paraíba will be presented in a later section.

#### - *Hydrological and geological factors*

We saw in the previous section that the water issue is crucial for the semiarid region. But it is important to emphasize that the availability of water is not solely a result of the climate. It also depends on hydrological factors which, in turn, depend on two major geological situations (MOLLE; CADIER, 1992). Given the hydrological and geological conditions of the region, the semiarid region of Paraíba has only temporary rivers, through which water flows during the rainy season. To summarize, in the areas of sedimentary bedrock (more present in the coastal region and in some restricted areas in the Semiarid - such as the Sousa and Pombal regions in the Alto Sertão), there is good quality groundwater, which is generally difficult to access, but the permeable soils make it difficult to store water on the surface (in reservoirs, etc.). In the crystalline basement regions (most of the semiarid region of Brazil), the situation is different. On the one hand, the soils are generally shallow, which makes drainage difficult. In this context, it is essential to take advantage of surface runoff by building water collection and storage structures (weirs, dams, etc.). On the other hand, as far as groundwater is concerned, due to the geological characteristics of crystalline rocks, the aquifer systems are of the fissure-type and have low flow rates, generally well below 3,000 liters/hour, with very high salt contents (SILVA; MOURA; KILL; BRITO *et al.*, 2010). In the semiarid region of Paraíba, areas of crystalline bedrock predominate, although there are some areas where sedimentary basins occur - for example, in the aforementioned region of Sousa and Pombal (LIMA; NASCIMENTO; BRANDÃO; GUILERA *et al.*, 2007).

The situation is different in the Zona da Mata. The watercourses (streams, creeks, rivers, etc.) are often perennial, providing a permanent source of water for the population. In addition, the geology of this region allows water to infiltrate and accumulate in water tables, making it possible to drill wells in many places. (AESAs, 2006).

- *The original vegetation and deforestation*

In addition to the climate and aridity aspects discussed in the previous section, the main characteristic of the semiarid region of Paraíba is the predominant presence of vegetation known as *Caatinga*. This typical predominant biome of the Brazilian semiarid region is made up of different arrangements of flora, arranged over a mosaic of soils (TRAVASSOS, 2012). Although diverse, this vegetation has common characteristics: the Caatinga is made up of plants adapted to semiarid conditions, capable of going into long periods of dormancy, taking efficient advantage of the short and irregular periods of rain for their reproductive cycles. The Caatinga is predominantly of the hyper xerophilous type, characterized as a low shrubby vegetation, rarely arboreal, with small leaves and thorny stems, fully adapted to contain the effects of very intense evapotranspiration (BRASIL-CODEVASF, 2006). Human occupation and the use/replacement of this vegetation in productive activities have had a degrading effect on the Caatinga in many regions, an effect that climate change is likely to exacerbate. Currently, 54% of the original vegetation of the Paraíba Caatinga is preserved, having lost more than 46%, equivalent to around 2.4 million hectares. This part has been significantly altered by human activities, i.e., transformed into pastures, farmland, roads, rural properties, towns, and cities (BRASIL-MMA, 2010; COELHO JR.; MEDEIROS; NUNES; MACIEIRA *et al.*, 2020). A study by the MMA estimated that the Caatinga was deforested at a rate of 0.28% per year (2,352 km<sup>2</sup> / year) between 2002 and 2008, a rate comparable to that of deforestation in the Amazon. (BRASIL-MMA, 2010). Currently, the remnants of the Caatinga's most preserved native vegetation are quite fragmented. Today there are vast areas of capoeira. Riparian forests and dry forests have been largely replaced by open vegetation formations, which have affected local and regional rainfall and resulted in the silting up of rivers and streams. However, the Caatinga is still present and is a resource crucial for family farming families. When well-managed, this vegetation is fully adapted to the semiarid environment and can provide good quality fodder for animal farming (goats, sheep, and cattle) and pasture for bees, as well as other products.

Paraíba's Zona da Mata is the domain of the Atlantic Forest. The original vegetation of the Atlantic Forest (with its various forms, including ombrophilous forest, restingas, mangroves and semi-deciduous and deciduous forest formations) covered practically all of this area. However, since colonial times it has been cleared for forestry and, above all, to make way for agricultural and, in some cases, livestock use. A survey on the coverage of the Atlantic Forest in Brazil (SOS-MATA-ATLÂNTICA, 2023), which is based on the year 2021-2022, can be used as an approximate indicator of the current state of the Atlantic Forest vegetation in the Project area. This study detected deforestation of approximately 45 hectares per year for the period 2016 to 2022. This same survey shows that in the state of Paraíba, of the almost 600,000 hectares that this vegetation originally covered (11% of the state's total area)<sup>15</sup>, currently only 54,200 hectares remain (counting areas of forest, sandbanks, mangroves, and other vegetation), which represents only 9% of the original area.

- *Income, Poverty, and Inequality*

There is a consensus among scholars of the social issue in Brazil that the economic and social conditions of the population improved in the two decades between 1995 and 2015. As an indicator of this process, between 2000 and 2010, monthly per capita income rose significantly in the state of Paraíba, from R\$ 299.09 to R\$ 474.94. This means a growth of almost 59% over a decade.

However, even with this process, Brazil is still a country in which poverty persists, particularly in the North and Northeast regions. For example, data from the 2010 Demographic Census (IBGE) shows that 28.9% of

---

<sup>15</sup> Considering here the area of the state included in the delimitation made with reference to the Atlantic Forest Law.

the population of Paraíba was in poverty<sup>16</sup>, while at the other extreme, in Santa Catarina the percentage of poor people is 3.9% and the same rate at the national level was 10.4%<sup>17</sup>.

The process of socioeconomic progress that began at the end of the last century was interrupted by the various crises in Brazil since 2015. Thus, the proportion of poor people (with a per capita household income of less than R\$140.00, at August 2010 prices), which had fallen from 28.93% in 2010 to 15.92% in 2020, rose sharply in 2021, to 24.91%. To cite a second example, between the years 2020-2021, according to data from the PNAD Continuous, monthly per capita income experienced a decrease in the state of Paraíba, from R\$497.15 to R\$465.74 (at August 2010 prices), which is equivalent to a variation of -6.32% in the period, in real terms. These figures show a stagnation and even regression in the per capita income of the population of Paraíba.

Unfortunately, data from the latest Demographic Census (2022) is not available for the rural population of Paraíba. Considering the 2010 data, we can see that the proportion of the rural population living in poverty (48.5%) is considerably higher than that of the urban population (22.5%), which confirms that poverty in Paraíba has a strong rural connotation.

In terms of inequality, Paraíba's situation has been improving. According to IBGE data, in 2000, the Gini index was 0.63. It fell to 0.61 in 2010. In 2021, Paraíba's Gini Index was 0.562. Although this index has improved, the state's situation on the national stage is not the best. With this value, Paraíba was in 7th place in the national ranking of greatest inequality, with a value higher than the national average (0.544) and the regional average of 0.556<sup>18</sup>.

The table below summarizes the main data from this section on Income, Poverty, and Inequality.

Table 01 - Households and poor households in Brazil, Paraíba, and the Semiarid Region of Paraíba

	2000 (a)	2010 (b)	2021 (c)	
Per capita income (in R\$ 2010)	299,09	474,94	465,74	
Gini index	0,63	0,61	0,56	
Proportion of extremely poor population (in %)	25,17	13,39	12,95	
Proportion of poor population (in %)	49,61	28,93	24,91

#### - *Family Farming in Paraíba*

Agricultural production is the main economic activity for the vast majority of the rural population in general and, in particular, family farming. According to the 2017 Agricultural Census, there were 163,218 agricultural establishments in the state. Of these, 125,489 (76.9%) were family farms, while 37,729 (23.1%) were non-family or patronal<sup>19</sup>. A significant proportion of the family units (15,050 establishments, or 12%) are Agrarian Reform settlers (SANTOS; FORTINI; BRAGA, 2021). It should be noted that, despite being the vast majority, family farms as a whole occupy only 42.1% of the state's agricultural area, with this proportion being even lower in the Zona da Mata (20.2%) and slightly higher (50.7%) in the Semiarid region of Paraíba (SANTOS; FORTINI; BRAGA, 2021). It should be noted that Family Farming in Paraíba is responsible for 47.8% of the total value of agricultural production in the state, which is the second highest proportion in the Northeast and the sixth highest in the country.<sup>20</sup>

<sup>16</sup> The (official) definition of 'state of poverty' used in the 2010 Census was as follows: a family with a monthly *per capita* income of less than ¼ of the Minimum Wage is 'poor'. The monthly value of the MW in 2010 was R\$ 510.00. So, this threshold was a per capita income of R\$128.00 per month. At the value of the US dollar at the time, this corresponded to US\$ 73.00 / month or US\$ 2.40 / day. Note: this definition of 'state of poverty' also includes families in 'extreme poverty' (those with a monthly per capita income of up to 1/8 of the Minimum Wage).

- *Environmental degradation and a growing susceptibility to desertification*

As we saw in the previous section, the deforestation of the Caatinga and the Atlantic Forest is quite intense.

According to the United Nations Conference to Combat Desertification (UNCCD), when environmental degradation occurs in the semiarid regions of the world, it often creates desert-like conditions. Environmental degradation occurs everywhere but it is defined as desertification when it occurs in semiarid regions. It is the result of several factors, including climatic variations and human activities (UNCCD, 1994). Researchers have observed that more than 50% of the Brazilian semiarid region is already in the process of desertification and 94% of the Northeast region is under moderate to high susceptibility (VIEIRA; TOMASELLA; ALVALÁ; SESTINI *et al.*, 2015).

As is the case in other regions of the Northeastern semiarid, anthropogenic action on the Caatinga in Paraíba is quite intense, and there are now significant areas of degraded pastureland where the Caatinga once existed. This action on the original vegetation is quite pronounced, reaching 63% of the total area. This figure is high when compared to the general figure for deforestation in the Caatinga, which is around 45% (SEIMARH, 2011). The causes of the degradation in many areas of Paraíba are excessive deforestation, overgrazing and other more specific causes, such as the inappropriate use of irrigation or mining activities (SEIMARH, 2011). All production units in the region have contributed to this process to a greater or lesser extent.

We can consider the Areas Susceptible to Desertification (ASD) to be indicative of the intensity of degradation that can be found in the semiarid region of Paraíba. It is possible to stratify this degradation into different levels, depending on various criteria, such as the degree of vegetation cover, level of soil cover, etc. The following table shows the distribution of ASDs in Paraíba. It is noteworthy that there are areas with distinct levels of desertification in the Mata Paraibana region, which is an indication of the existence of areas with a high degree of degradation in this biome as well.

Table 03 - Levels of desertification in the Mesoregions of Paraíba

Mesoregion	Area (in km ) <sup>2</sup>	Low (%)	Average (%)	High (%)	No risk (%)
Semiarid region of Paraíba	22.720	2,62	38,65	57,43	0
Borborema	15.573	3,14	27,84	68,26	0
Agreste Paraibano	12.914	22,80	21,59	55,36	0
Mata Paraibana	5.232	15,31	5,20	20,05	59,44
State of Paraíba	56.439	8,56	28,66	56,48	5,51

Source: (SEIMARH, 2011)

***Sustainable rural development: the main problems and challenges of the semiarid region of Paraíba***

- *Poverty and food insecurity: manifestations of the rural population's vulnerability*

As we saw earlier, Paraíba has many people living in poverty and extreme poverty. Approximately 80% of the population had a per capita income of less than one minimum wage in 2021. At the same time, 63.9% of households face some degree of food insecurity in Paraíba, with 10.6% of them facing severe food insecurity (REDE-PENSSAN, 2022a). The state also faces the double burden of malnutrition. 62.5% of Paraíba's adults

<sup>21</sup> Semiarid Paraíba in this table includes the mesoregions of Agreste Paraibano, Borborema and Sertão Paraibano.

are over nourished (35.8% overweight and 32.8% obese). Dwarfism affects 4.9% of children under 5, emaciation 4.2%, overweight 8.4% and obesity 6.8%<sup>22</sup>.

Family farming, the largest rural social group in Paraíba, faces very harsh and challenging conditions for the development of their livelihoods. This is most clear in the family farming units of the semi-arid region. A large part of the population living in rural areas is directly linked to farming activities and seeks its livelihood from the natural resource base existing on or around their properties. The production from these activities - which provides food and income for these families - depends on various factors. In particular, the product of the activity is highly dependent on rainfall and due to climatic adversities, with cycles of severe droughts, this results in strong vulnerability for families (SILVA; MOURA; KILL; BRITO *et al.*, 2010). The livelihoods of these farming families are already severely stressed due to the historical degradation of the productive and ecological functions of their agro-ecosystems. This situation is the result of a series of factors, including the increasing scarcity of land resources and climate variability (especially drought events). It is possible to say that, in general terms and with existing production systems, the smaller the area available to the farming family, the greater their vulnerability. In many cases, the lack of documents certifying land ownership also contributes to further weakening family units in the region. At the same time, the very characteristics of family systems and their evolution have generally increased their fragility.

But the vulnerability of rural society has another dimension, which was clearly evident during the last great drought: all rural social groups - from family farmers to the rest of the population - have encountered difficulties in simply supplying water, an essential requirement for survival, and this condition is most acute in the semi-arid region. This difficulty has threatened not only the domestic life of families living in the semi-arid (both in rural areas and urban settlements), but also, to a greater or lesser extent, all the productive activities that take place in the region.

This vulnerability, which we can call intrinsic, has been significantly increased by ongoing climate change. According to Confalonieri *et al.*, family farmers in the semi-arid northeastern region are highly vulnerable to the impacts of climate change (CONFALONIERI *et al.*, 2014). According to Mesquita *et al.*, this region is considered to be the most susceptible to the impacts of climate change due to the high levels of vulnerability that already exist. As mentioned above, the predicted consequences of changes in precipitation (including greater frequency and severity of droughts) and temperature in the region will cause a loss of food crops and degradation of agricultural areas. Increased migration from rural to urban areas is also predicted for this region, mainly due to the failure of agricultural systems and the lack of water in rural areas (MESQUITA; WITTMAN; MOTA, 2016).

The vulnerability of rural Paraíba, and more particularly the semi-arid region, to climate change is directly related to two mutually reinforcing factors, described below: a) water problems and b) the growing unsustainability of production systems. Other factors, such as the high incidence of poverty, deforestation, and desertification, also contribute to the high vulnerability found in the region.

- *Illustration of a crucial dimension of rural vulnerability: the impacts of the extreme weather event of the last 'great drought' - 2012 to 2017*

As explained earlier, Paraíba experienced a 'great drought' from 2012 to 2017. It had a particularly important impact on the semi-arid region, although it was felt all the way to the state's coast. In the state of Paraíba, the last 'winter' considered 'good' before this 'drought' was that of 2011. According to data compiled by AESA<sup>23</sup>, there were high rainfall deficits between 2012 and 2016 (see Table 02 below). This drought had a negative impact on the climate in all of the state's mesoregions, although it was more intense in the semi-arid regions. The greatest rainfall deficits were recorded in the Borborema mesoregion, which is, in fact, the driest region in the state. In 2012, Borborema had its biggest deficit, when it was 69.0% below average. That same year, the Semi-arid region of Paraíba mesoregion in Paraíba had a deficit of 56.3% (MEDEIROS; BRITO, 2017). The data presented in this table confirms that the Borborema mesoregion, besides having the lowest 'normal' rainfall, was the region that suffered the most in this 'great drought'. At the same time, they confirm that the drought was felt in the Zona da Mata but was less intense.

<sup>23</sup> AESA - Executive Agency for Water Management (of the Government of Paraíba).

Table 04 - Precipitation deficits recorded in the mesoregions of Paraíba from 2012 to 2016 (in %, compared to 'normal' historical averages)

Mesoregion	2012	2013	2014	2015	2016
Semiarid region of Paraíba	- 56,3	- 20,2	- 12,9	- 38,3	- 30,4
Borborema	- 69,0	- 46,2	- 23,3	- 45,3	- 42,4
Agreste Paraibano	- 33,4	- 11,9	- 13,6	- 21,1	- 16,6
Mata Paraibana	- 23,6	+ 0,9	- 18,2	- 15,8	- 19,8

Source: (MEDEIROS; BRITO, 2017) based on data from AESA.

Other information gathered from various sources suggests that 2017 still had below-average rainfall, while 2018 was close to normal. It is therefore possible to say that this last major drought lasted six years (2012 to 2017).

It is worth mentioning that recent studies carried out by researchers from the National Center for Natural Disaster Monitoring and Alerts (CEMADEN) confirm the severity of this latest 'great drought', not just for Paraíba, but for the entire Semiarid region. The results of these surveys show that the last 5-year period (2011 to 2016) was in fact the most intense drought in a long time, in terms of duration, severity and geographical range of occurrence, which extended to the entire Semiarid region of Brazil NE (BRITO; CUNHA; CUNNINGHAM; ALVALÁ *et al.*, 2017). Seen as the worst drought in the last hundred years, it is considered representative of the extreme weather events that are likely to become more frequent with climate change.

Although it is a recent event, the effects of the 'great drought' 2012 - 2017 are already beginning to be measured. Referring to the semiarid region of the state, Medeiros and Brito (MEDEIROS; BRITO, 2017) have recorded significant impacts in several areas: agriculture, livestock, and the availability of water for the population. Regarding rainfed agriculture, there was a very significant drop in the production of the main crops in the semiarid region of Paraíba: corn, beans, and cassava. Production fell significantly and remained at very low levels for six consecutive years. This has certainly had a negative impact on families' diets and incomes, especially those of the Family Farming social group. This drought has also had a significant impact on livestock. It is estimated that there were losses amounting to approximately 40% of ruminant herds, recorded mainly in the first two years of the event - 2012 and 2013. Paraíba also suffered a significant drop in milk production (which essentially comes from the semiarid region) (MEDEIROS; BRITO, 2017).

This same study also highlights the effect of the 'drought' on water resources, an issue that goes beyond the agricultural sector and the strictly rural population, to affect the entire population (MEDEIROS; BRITO, 2017). In the rural areas of practically the entire state, water sources for more everyday use (such as first-water cisterns) dry up every year, but there are usually other sources (such as dams, cisterns, or wells) in or near the communities, which allow for supply when this happens. But in this 'great drought', these 'secondary' sources have dried up and it has been necessary to wait for the arrival of water tankers, which have brought water from increasingly distant sources. And this situation of great hardship has highlighted the fact that first-water cisterns, although widespread, are still not present in all rural households in Paraíba.

The succession of several bad rainfall years meant that the region's 'strategic' springs (basically the region's largest reservoirs) could not be recharged, which meant that the stored water capacity became critical in 2015, 2016 and 2017. In December 2016, the region's water storage systems fell to alarming levels, ranging from 1.1% to, at best, 14.4% of total water capacity (MEDEIROS; BRITO, 2017). According to AESA, this problematic situation with the level of the larger reservoirs lasted until at least 2019, even after two years of 'reasonable' rainfall<sup>24</sup>. In addition to the enormous difficulties experienced in rural areas, there has been a 'collapse' in several urban water supply systems. Many municipalities have declared themselves in a state of emergency. For example, the Boqueirão reservoir, which supplies water to the city of Campina Grande (a city of more than 300,000 inhabitants) reached its lowest level in history, with 3% of its water volume, in 2017. In this case, the total collapse of the supply was only avoided with the arrival of the waters from the transposition of the São Francisco River, which took place in April of the same year<sup>25</sup>. It is worth noting that this impossibility of recharging the water sources has other effects, in addition to affecting the supply to homes in

<sup>24</sup> Cf.: <http://www.aesa.pb.gov.br/aesa-website/monitoramento/volume-diario/?tipo=atual>

the hinterland. For example, in several municipalities, irrigated agricultural production had to be halted. At the same time, the lack of water has also significantly affected livestock.

– *The productive trajectories and challenges of Family Farming in Paraíba*

*An overview of the production challenges facing Paraíba's agricultural sector.* Agricultural production is the main economy of the vast majority of the rural population in general, and family farming in particular. As can be seen, data from the IBGE's municipal surveys (for the year 2022) highlight the following productions by planted area and herd size: i) poultry, cattle, goats and sheep account for 92% of the value of livestock; ii) of permanent crops, bananas, passion fruit, Bahia's coconut and tangerines are the main productions in terms of value, and iii) pineapple, corn, cassava and sugar cane are the most important temporary crops.

Table 05 - Distribution of herds in the state's mesoregions - Year 2022

Flocks	Hinterland		Borborema		Agreste		Mata Paraibana		Total	
	Cab.	%	Cab.	%	Cab.	%	Ha.	%	Ha.	%

The tables above show, for the year 2022: (i) the distribution by mesoregion, using the planted area criterion, of Paraíba's 16 main agricultural products; (ii) the distribution, by mesoregion, of Paraíba's herds. As we will see below, this data highlights the more agricultural vocation of the Zona da Mata. On the other hand, it is also possible to observe some characteristics of the Semiarid systems (which will be discussed later), such as the relative importance of ruminant herds, the strong presence of corn and bean fields and the tiny presence of cotton.

Family farming in Paraíba faces very severe and challenging conditions, especially in the semiarid region, which include low income, low productivity in farming activities, difficulties in accessing to water for human consumption and production and high risk related to climatic events. To increase the production, productivity and family farming income, it is necessary to resolve obstacles related to the lack of access to financing to make the necessary investments, technical assistance and rural extension that supports the learning of new technologies, difficulty in accessing markets and inserting producers into value chains, which in turn is related to the weakness of rural organizations. An important element is the scant presence of irrigation: according to

the 2017 Agricultural Census (IBGE, 2019) only 11.7% of agricultural establishments have access to water for irrigation. In addition to the low productivity of agricultural activities that depend on the availability of water, there is the use of unsuitable production techniques. For example, 32% of Family Farming Units (UAF) use agrochemicals, and 39% do not adopt any conservation practices. In the case of mechanization, for every 130 farmers, 1 has the support of a tractor, seed drill, etc. Less than 1% of family farms apply lime or other soil pH correctors.

In an effort to better understand the challenges facing FF (Family Farming) in Paraíba, a brief analysis of this issue in the different regions of the state is presented.

*In the eastern region of the Atlantic Forest*, agrarian systems were built up from the 16th century onwards around the cultivation of sugar cane in a 'plantation' system (on large estates with enslaved labor until the end of the 19th century and wage labor from the 20th century onwards). For many years, the food crops (such as manioc, corn, beans) that existed in the marginal areas between the sugarcane plantations were cultivated by peasantry on very small plots, using rudimentary methods. Sugar production has experienced cycles of expansion and retraction since colonial times. When it expanded, it occupied more land, competing more intensely with peasant plantations. In the downturn, the opposite occurred<sup>26</sup> (PALACIOS, 2004). Sugarcane cultivation went into decline towards the end of the last century, (CUENCA; MANDARINO, 2007) but the introduction of ethanol production has given it an important survival. The area dedicated to sugarcane in the state at the beginning of the 21st century has ranged from 100,000 to 120,000 hectares, and (CONAB, 2023). However, the crises at the end of the last century facilitated the establishment of several Agrarian Reform settlements in the Zona da Mata. As a result, the number of family farms grew, adding to those previously existing.

The agricultural production data from the IBGE<sup>27</sup> confirms that the 30 municipalities in the Zona da Mata are a region of strong agricultural production. If we consider planted area data, the Zona da Mata, which has only 13% of agricultural establishments (family and non-family), accounts for 34.5% of the agricultural production area. Considering the parameter of the value of agricultural production, these same municipalities account for 59.8% of the total value. The main agricultural products in the region are (in descending order): sugar cane, pineapple, cassava, beans, sweet potatoes, coconut, other fruits (guava, citrus, papaya, etc.).

On the other hand, the figures show that animal farming is less important in the Zona da Mata. The exception here is the significant number of chickens in the Zona da Mata and Agreste, which refers to the existence of 'integrated' poultry farms<sup>28</sup> in these regions.

Returning to the discussion of agricultural production, particularly in the Zona da Mata, it is true that a significant part of the agricultural production mentioned in the paragraph above is carried out on large non-family farms. This is the case with sugar cane production, for example. But, in general, this data also confirms that family farming systems in this region are dominated by agricultural production. They are dedicated to food production - tubers (cassava, yams, sweet potatoes), beans and corn, permanent fruit trees (guava, acerola, banana) and temporary fruit trees (pineapple) and vegetables. Some of these crops can be irrigated. It should be noted that there are also family establishments that produce sugar cane and sell it to mills in the region. Family units in the Zona da Mata also raise animals more as a complementary activity, often poultry and pigs.

This productive structure of family units, which favors the agricultural component over the livestock component, is evidenced by the composition of the income collected by families: according to data from the 2017 Agricultural Census, crop production accounts for 80% of the total value of family production, while the share of livestock production is 20%. It is worth mentioning that this type of predominantly agricultural family unit can be found in some of the wetter micro-regions of Agreste Paraibano (such as Brejo Paraibano and Guarabira, for example). Because they are small units, farming systems of this type are quite intensive, in the sense that the same areas are cultivated year after year. So, in this context, the main challenge is to find systems

---

<sup>26</sup> PALACIOS, G. **Campesinato e escravidão no Brasil: agricultores livres e pobres na capitania Geral de Pernambuco (1700 - 1817)**. Brasília: Ed. UNB, 2004.

<sup>27</sup> IBGE. Municipal Agricultural Production, 2022. Link: <https://www.ibge.gov.br/estatisticas/economicas/agricultura-e-pecuaria/9117-producao-agricola-municipal-culturas-temporarias-e-permanentes.html>.

<sup>28</sup> Integrated poultry farming is where the producer establishes an agreement/contract with a company/industry whereby the latter provides the producer with all the inputs and technical assistance and buys all the production.

that allow production to be maintained or increased without degrading (or restoring, where necessary) the natural resources that sustain them.

*Family agro-ecosystems in the semiarid region* generally combine livestock and agricultural production. They almost always include a plot or field of intercropped rainfed crops (the 'roçado'), which produces corn, beans<sup>29</sup> and can often include other crops, chosen from pumpkin, watermelon, maxixe, cassava, fava beans, peanuts, sesame, etc. The systems also include a herd, usually mixed, of goats, sheep and sometimes cattle. The data presented in Tables 04 and 05 corroborate this structure of production systems. It should be noted that the configuration of ruminant herds is slightly different in the three semiarid mesoregions: the herds in the semiarid region have a higher proportion of cattle, while goats, for example, are more characteristic of Borborema.

In colonial times, the main agricultural activity in the semiarid region was livestock farming. The swiddens of this colonial era were of little importance, dedicated exclusively to producing subsistence food for the sparse population of the semiarid region. But although livestock farming remained important, agricultural production in the semiarid region grew a lot throughout the 20th century, mainly due to cotton. However, this crop went into crisis from the 1980s onwards, which led to a significant decrease in its productivity and, ultimately, in the areas under cultivation. Today, cotton production in the semiarid region of Paraíba is extremely low. Corn and bean fields in general have decreased in importance, although it is still very common for families that live in the semiarid region of Brazil to have such fields. Although the arrival of a pest insect (the 'cotton bollworm')<sup>30</sup> played a very important role in the cotton crisis, it is important to note here that other factors also played a part in the crisis. Among these factors was the decrease in the price paid for cotton<sup>31</sup> as well as other factors such as the growing population density and the consequent decrease in agricultural land available to families, combined with other causes such as the growth of livestock and the end of 'free land'. In this context, it should be noted that various traditional practices, especially soil preparation (including the use of the slash and burn system), played a role in the aforementioned process of decline of the roçados. Neither the inventiveness of the farmers nor the conventional system of production/dissemination of agricultural innovations has been able to produce an adequate solution to the problems of the rainfed crops in the semiarid ("roçado sertanejo").

As a result of the trajectory described here, the family units in the hinterland are currently more dedicated to animal farming. As a result, animal production accounts for most of the produce of peasant family units in the semiarid region of Paraíba. Data from the 2017 Agricultural Census proves this when it shows that between 69 and 93% of the total production value of family production units in the Semiarid region of Paraíba comes from animal production<sup>32</sup>.

As we have seen above, the agro-ecosystems of the semiarid region are in crisis. But on the other hand, even though traditional livestock farming has always been their main productive bulwark, it has always been quite extensive and low productivity. Let us cite the example of goat milk production. A study carried out by researchers from EMBRAPA Goats and Sheep analyzed systems of this type in various regions of the country. In the case of the Northeast region, the herds are characterized by being mixed herds, worked in a semi-intensive system that keeps the animals in the field in areas of native pasture, with a low degree of intervention and herd management, associated with supplementation at the trough during the driest time of the year. A number of problems were identified in the areas of health, food and reproductive management. These factors are manifested in an individual productivity per animal of 0.556 kg.day<sup>-1</sup>, considered low by the authors of the study (PERDIGÃO; OLIVEIRA; CORDEIRO, 2016).

As we have seen above, in the semiarid region both farmland and animal production systems have problems. This situation has called for innovations in production systems, since many of the usual agricultural practices

---

<sup>29</sup> These are almost always macassar or string beans (*Vigna unguiculata*), not common beans (*Phaseolus vulgaris*).

<sup>30</sup> The boll weevil's scientific name is *Anthonomus grandis*.

<sup>31</sup> On the price paid for cotton. From the 1930s onwards, there was a significant growth in cotton production in the states of São Paulo and Paraná. By the 1940s, cotton production in this new producing region had already far surpassed that of the Northeast (GONÇALVES; GONÇALVES, 2008). This had an impact on the price of the product, which began to be influenced by the parameters established in this new producing region. But the evolution of the fall in the international price of cotton in the 1980s and the opening up of the national economy to imports, which became very significant in the early 1990s, also began to weigh on the economic equation (BELTRÃO, 2003). In this scenario, the price obtained for cotton from the sertanejo became less and less attractive.

<sup>32</sup> IBGE data. 2017 Agricultural Census. Prepared by DIEESE. These percentages vary between 69% and 93% according to the different micro-regions of the state's semiarid region.

have become increasingly inappropriate, and the most recent problems (such as the weevil) have not been solved.

Although the conventional solutions tested in the semiarid region to the problem of cotton plantations have not worked to their satisfaction, there are currently several promising experiences in Paraíba of growing organic cotton through 'agroecological consortium' systems. Although the number of families involved is still small, it is growing year on year<sup>33</sup> (SANTIAGO; BLACKBURN; SIDERSKY; MELO *et al.*, 2022a; b; c; SILVA, 2015).

But in general, the innovations introduced into the Semiarid agro-ecosystems have been characterized by their 'simplification', with a marked reduction in biodiversity. Cultivated areas are, in this context, areas in which the vegetation cover has been drastically reduced. This happens both in the areas of traditional food crops and in the cultivated areas more directly related to animal farming. At the same time, the poultry areas, although a little more 'complex' than the cultivated areas, are also impoverished, and there are processes of alteration in the species composition, generally to the detriment of the most valued plants. This trend towards 'simplification' makes production systems in the hinterland increasingly vulnerable to climatic crises, particularly droughts. In this context, the rather gloomy predictions about possible losses in food crop production in the region due to climate change make even more sense (MACHADO FILHO; MORAES; BENNATI; DE *et al.*, 2016).

Taking the example of ruminant rearing systems, given their growing importance in recent times, there have been efforts to improve the performance of this activity (see the Annex to this Diagnosis for more details on the subject). One line of work has been the dissemination of forage processing practices (hay and silage) and an expansion in the cultivation of species for this purpose. Work is also being done to introduce the cultivation of perennial forage species that are resistant to semiarid conditions (ARAÚJO; ALBUQUERQUE; GUIMARÃES FILHO, 2006) and innovative ways of managing the Caatinga (ARAÚJO FILHO, 2013) to increase its forage productivity and, at the same time, preserve it. Other innovations, such as the introduction of trampling grasses to replace the Caatinga, have been less successful. Efforts are also being made to improve herd management to avoid the animal overcrowding that is so common today.

It is hoped that, with the various innovative practices being introduced, it will be possible to halt the processes of environmental impoverishment, which end up leading to a vicious circle of unsustainability, aggravated by ongoing climate change. The aim is to avoid a situation in which production systems collapse, leading to an acute crisis in the livelihoods of the people of the hinterland.

– *Deforestation and a growing susceptibility to desertification: problems related to environmental degradation*

The deforestation of large areas for agricultural use or as pasture is the most visible environmental problem throughout the state of Paraíba. As mentioned earlier, it is estimated that in the Zona da Mata, natural vegetation currently occupies only 9% of its original area.

In the regions of the Caatinga biome, it is estimated that today deforestation has reached approximately 50% of the original area. In addition, the use of unsustainable soil management practices, such as burning, the removal of vegetation cover and the use of unsustainable soil preparation techniques, has resulted in increased exposure of soils to atmospheric agents, which has accentuated their degradation.

It has already been said that, as in other regions of the country, anthropogenic action on Paraíba's native vegetation is intense. In the case of the Caatinga, for example, anthropogenic action has reached 63% of the total area, which is high when compared to the general figure for deforestation in the Caatinga, which is around 45% (SEIMARH, 2011). In the Atlantic Forest, the remaining native vegetation covers only 9% of the area.

---

<sup>33</sup> For more information on organic cotton production in Paraíba, see the links below: (a) ACEPAC: <https://www.algodaoagroecologico.com/cultivo-do-algodao-em-consorcios-agroecologicos-na-prata-pb-tem-promovido-a-geracao-de-renda-e-riqueza-circulante-na-regiao/>; (b) Polo da Borborema / AS-PTA: <https://www.brasildefato.com.br/2022/10/13/algodao-agroecologico-na-paraiba-respeita-a-natureza-e-favorece-sustentabilidade-da-moda>; (c) Rede Borborema de Agroecologia: <https://www.embrapa.br/busca-de-projetos/-/projeto/219667/sistemas-integrados-organicos-para-cultivo-de-algodao-sisal-e-culturas-alimentares-nos-territorios-da-borborema-agreste-e-curimatau-na-paraiba>.

The causes of the degradation found in many areas of both biomes in Paraíba are, firstly, excessive deforestation - motivated by the opening of new areas for agriculture and livestock and, in certain regions, by the extraction of firewood for commercial purposes. Overgrazing and other more specific causes, such as the inappropriate use of irrigation or mining activities, also play a role (SEIMARH, 2011). Practically all agricultural establishments in the region have contributed to this process to a greater or lesser extent.

Considering that the Areas Susceptible to Desertification (ASD)<sup>34</sup> can be considered indicators of the intensity of degradation found in Paraíba, we would point out that, according to various sources, only 6% of the state is not classified as 'susceptible to desertification' to some degree (COSTA, 2021; SEIMARH, 2011). It is striking that this phenomenon is also present in 40% of the Atlantic Forest region.

- *The problem of water resources*

Access to quality water for domestic consumption is a rare service in rural areas of the state of Paraíba. Data from the National Sanitation Information System (SNIS) indicates that, in this state, the proportion of the population without access to water for domestic consumption is almost 24%<sup>35</sup>. This proportion reaches 60% in rural areas<sup>36</sup>. But for family farming, the issue of water is not limited to domestic supply. In reality, peasant family units in the Brazilian Northeast, and especially in the semiarid region, have a significant demand for water, which goes far beyond drinking water to include other 'domestic' water (for personal hygiene, washing clothes, etc.) and water for various productive uses (livestock, small irrigation, etc.). To meet this wide-ranging demand, families generally need access to more than one "source" of water and, often, to transport and store this water so that it can be used in the appropriate place and at the appropriate time. This set of demands, sources of supply and the tools and mechanisms that allow the family to accumulate, access and use water constitute what can be called the family unit's 'water system'. Wells, ponds, small dams and also domestic water cisterns are the fundamental parts that make up family water systems. Most of them are structures (of different sizes, shapes, and ways of working) that allow rainwater to be collected and stored. (For more details, see Annex B - On the 'water systems' of Family Farming in the Northeastern Semiarid Region).

Paraíba's peasant families are constantly working to set up and then improve their 'water systems', trying to obtain more and better-quality water and get it to where it will be used (the house, the yard, the corral, the small irrigated plot, etc.). However, strengthening the water system requires investment. For a long time, families had little or no support for this effort. As a result, given the precarious economic situation of most of these families, progress in structuring family water systems was very slow. Fortunately, from the end of the 1990s onwards, the view that it was possible to create better conditions for 'living with the semiarid' was affirmed, and that this better living implied strengthening families' water systems. After some experimental initiatives at the end of the 1990s, public policies aimed at strengthening these systems emerged at the beginning of the 21st century. The first and best known of these policies is the 1 Million Cisterns Program (P1MC), or more simply, the Cisterns Program. Officially set up in 2003<sup>37</sup>, it focused its efforts on setting up cisterns for domestic consumption (the so-called '1st water' cistern) (CASTRO, 2021). This was followed by other programs, such as P1+2 (Programa 1 Terra e 2 Águas), dedicated to building complementary structures to capture and store water for production (for livestock and irrigation of small areas). Other initiatives have also emerged, such as the drilling of wells, the installation of desalination equipment, support for the implementation of small dams, etc.

Many families joined the first initiatives of this kind. Progress has been made with these programs, especially regarding domestic consumption cisterns: according to the 2017 Agricultural Census, 73.8% of family establishments in the state of Paraíba reported having a cistern<sup>38</sup>. But despite the progress made, the work done

---

<sup>34</sup> According to the United Nations Conference to Combat Desertification (UNCCD), when environmental degradation occurs in the semiarid regions of the world, it often creates desert-like conditions. Environmental degradation occurs everywhere, but it is defined as desertification when it occurs in semiarid regions. It is the result of several factors, including climatic variations and human activities (UNCCD, 1994).

<sup>35</sup> Sources: a) <https://www.painelsaneamento.org.br/localidade?id=29>; b) <http://www.snis.gov.br>.

<sup>36</sup> Sources: a) 2010 Demographic Census, IBGE; b) (Cf. <http://www.meioambiente.ba.gov.br/modules/conteudo/conteudo.php?conteudo=190>).

<sup>37</sup> According to Castro, "in 2003, the National Program to Support Rainwater Harvesting and Other Social Technologies (Cistern Program) was created by the federal government to finance the construction of cisterns throughout the semiarid region" (CASTRO, 2021).

<sup>38</sup> Source: IBGE. **Agricultural Census 2017**. Rio de Janeiro, IBGE, 2019. Available at: <https://bit.ly/3DE6hsY>.

to date is only a start. The proportion of family units with other sources of water is much lower<sup>39</sup>. This is undoubtedly the main reason only 11.5% of family units in the state manage to work with some kind of irrigated area<sup>40</sup>. There is still a lot of work to be done in this area of strengthening family water systems in rural Paraíba.

– *Family farming organizations and their weaknesses*

Often, tackling the problems posed by Paraíba's rural population's vulnerability is difficult at the individual or family level. Generally, actions of this kind require a capacity for joint or collective action. One of the issues that reinforces the processes of unsustainability mentioned above, which accentuate vulnerabilities, concerns local organizations (SIDERSKY; JALFIM; RUFINO; SANTIAGO *et al.*, 2013).

Traditional rural communities are characterized by the existence of a system of social institutions that organize local social life. These mechanisms - such as kinship networks and traditional mechanisms of reciprocity - enable several types of collective action to take place, covering issues such as the management of common resources, the holding of community festivals, the organization of religious events, etc. (SABOURIN, 2009). However, today these structures do not work well in all communities, and in many cases, there is an 'erosion' of traditions<sup>41</sup>. This has led to a weakening of traditional social structures. On the other hand, reality has presented new demands for community organization, mainly related to the actions of other social actors with whom families/communities establish relations. This situation has stimulated the creation of new forms of organization, generally more formalized, which may take on responsibility for old practices, but are essentially created to take on new functions. Among these new forms of organization, community associations stand out first and foremost.

There are currently many community associations in rural Paraíba. However, it must be recognized that they have shortcomings. One of the barriers reinforcing the *status quo* of unsustainability involves the role of the 'community association' as an effective means of representation and, above all, of organizing collective action at the local level. As various studies have shown, the creation of associations is not enough. It has been found that it is very difficult for these associations to play their potential positive role in the processes of promoting more resilient development spontaneously (UPHOFF, 1993). Previous experience of various IFAD-supported rural development projects has shown that the role of representing the group of families vis-à-vis government agencies has posed major challenges for community associations, as far as these new relationships require associations to perform tasks that are entirely unknown to them. In the case of associations assisted by development projects, one such task is that of managing community 'projects'.

On the other hand, there is the case of economic organizations, which were created (usually in the institutional format of cooperatives) with the aim of carrying out activities that seek to promote access to markets (such as packaging, processing and marketing local products), which have also encountered many difficulties in establishing themselves in this role. These organizations have significant shortcomings in terms of capacity on issues such as i) administration and finance (including access to sources of funding for working capital), ii) the ability to design and implement marketing strategies, both the more conventional ones and those that work with more innovative and diversified options, iii) the composition of teams with little representation of women and young people, among other diverse groups. They also often have significant limitations from the point of view of their production infrastructures, which do not always allow them to diversify their products, comply with health and environmental legislation, use renewable energy sources in their processes or treat their waste properly. These factors end up limiting the ability of these organizations to function, as well as their own sustainability, including economic sustainability. As a result, producers access the market precariously and at low prices, with difficulties in adding value to their production. In this context, intermediaries are predominant.

The situation outlined here indicates that most of the existing local organizations - especially community associations and family farmers' cooperatives - will need support, especially in terms of capacity building, if

---

<sup>39</sup> For example, in the same 2017 Census, the proportion of Paraíba family units with access to a tube well was 20.7%.

<sup>40</sup> Source: IBGE. **Agricultural Census 2017**. Rio de Janeiro, IBGE, 2019. Available at: <https://bit.ly/3DE6hsY>.

<sup>41</sup> For example, it's not uncommon to hear from farmers in various regions of the northeast of Brazil that collective action instruments such as 'mutirões' (joint work) worked much better before than they do today. Sabourin mentions other symptoms of this "erosion": some farmers go so far as to pay a day laborer "instead of guaranteeing the service directly. They thus assume their material duty but, according to the community, do not respect their social duty" (SABOURIN, 2003).

they are to play an active and effective role in implementing the various sustainable development initiatives they are called upon to carry out.

On the other hand, the existing organizations mentioned above only group together and represent a fraction of Paraíba's Family Farmers, and there is still a significant part of this population that does not belong to any organization. Data from the 2017 Agricultural Census indicates that only 48% of farmers are members of some kind of organization (association, union, movement, etc.) Considering only the members of cooperatives, this proportion drops to just 3.7% (SANTOS; FORTINI; BRAGA, 2021). This is then a second major front for action, which deals with expanding the coverage of existing organizations and creating new ones of this type.

– *Problems linked to land and environmental regularization*

Land and environmental regularization of rural properties is a significant challenge faced by family farmers, especially regarding properties in priority groups. Since at least the 19th century, the instrument that attested to the regularization of a rural property was the title registered at a notary's office. Many of Paraíba's peasant communities have occupied land for generations. In some cases, the properties may even have had a registered title in the past, but the inheritance/inventory processes did not go through the notary's office. Furthermore, in countless other cases, purchase-sale transactions, and other forms of access to land have never gone through the regularization process. There are also other cases, such as federal and state settlements, made up of families who are in the process of accessing land, but who have not completed the regularization process.

In this same context, the case of land owned by quilombola communities<sup>42</sup> deserves special mention - which formally would be vacant land and is awaiting state action to be regularized, as is the case with Agrarian Reform settlers. As mentioned in the previous section, in Paraíba there are 47 quilombola communities with recognized certificates of self-definition with approximately 16,000 people. However, according to information released by the IBGE and the Federal Public Prosecutor's Office, only 11 have their territory officially delimited. Information provided by INCRA's Superintendence in Paraíba confirms that none of the quilombola communities in the state has a property title<sup>43</sup>. In the case of the Agrarian Reform settlers, it is worth mentioning that there are 280 federal settlements in the state, according to data collected from the INCRA Superintendence in Paraíba, with 13,535 settled families. Of these, only 1,835 (13.5%) have land titles.

In addition to these more common problems, a recent law - the Georeferencing Law (Law 10.267/01) in force since 2001 - changed the formal requirements for land regularization, requiring the owner of rural property to inform the National Institute for Colonization and Agrarian Reform (INCRA) of its exact position, characteristics and extension, as well as its adjoining landowners, for registration in the National Rural Registration System (SNCR) and inclusion in the Land Management System (SIGEF), which became requirements for full regularization. With this, a general and unique land registry was created in Brazil for the first time, with the intention of better organizing a dimension of the rural world that presents major difficulties.

This whole situation means that, at present, a large number of family units in Paraíba do not have full legal documentation and there is a lack of formal recognition of these properties. In many cases, not even the owners are fully aware of this situation. The lack of land-title regularization weakens the situation of farming families/communities in the event of agrarian disputes and conflicts. It also prevents the issuance of grants and water licenses necessary for the exploitation of wells or the use of springs and can hinder access to credit and pensions. The lack of land regularization can lead to legal insecurity, social vulnerability, and limitations on access to rights and benefits. This situation directly harms the quality of life of these communities, hindering sustainable socioeconomic development.

---

<sup>42</sup> The sources referring to quilombola communities used in this paragraph/text box are as follows: (a) IBGE. **Demographic Census 2022. Quilombolas. First results of the universe**. Rio de Janeiro: IBGE, 2023. 99 p. + Appendices. Available at: <https://biblioteca.ibge.gov.br/visualizacao/livros/liv102016.pdf> and (b) Link: <https://www.mpf.mp.br/pb/sala-de-imprensa/noticias-pb/mpf-incra-e-comunidades-quilombolas-discutem-desafios-na-regularizacao-de-suas-areas-na-paraiba>

<sup>43</sup> Sources: (i) : IBGE. Demographic Census 2022. Quilombolas. First results of the universe. Rio de Janeiro: IBGE, 2023. 99 + Appendices p. On the other hand, there are also problems in the environmental regulatory dimension. The Rural Environmental Registry (CAR), established by the Brazilian Forest Code of 2012 (Law 12.651/2012), is an important instrument for monitoring and environmentally regularizing rural properties. In Paraíba, the CAR has been widely implemented since it was made compulsory in 2012. However, this instrument still faces important challenges, mainly related to the lack of precision in the delimitation of rural properties, compromising the reliability of the information recorded. Thus, in Paraíba there are just over 181,000 establishments registered with the CAR<sup>44</sup> agencies and in defining responsibilities and environmental preservation actions. These problems hinder decision-making and the implementation of appropriate environmental preservation in [00]. These problems hinder decision-making and the implementation of appropriate environmental policies in the context of the CAR preservation actions. – *Limited access to support services - technical assistance and financing*

Family farmers in Paraíba also face difficulties in minimally structuring their agricultural activities, as well as incorporating innovations to be able to intensify their production in a sustainable way due to limited access to technical assistance and credit.

*Technical Assistance (TA)*. After millennia in which knowledge of agricultural and livestock practices was only passed down between generations of the population dedicated to agriculture, modern rural education and extension services emerged in Europe and the United States in the 19th century to work on new agricultural technologies and practices (CASTRO, 2015). In Brazil, TA services began to be implemented after the Second World War, expanding nationally as a public service over several decades. Despite the crises experienced by this TA, the expectation remains that a quality Technical Assistance and Rural Extension (TA) service can play a fundamental role in Brazilian rural development, with emphasis on strengthening family farming, access to public policies, the social organization of farmers, the management of properties and enterprises, the marketing and certification of products, production management, the transition to organic or agroecological systems, the training of farmers, among other issues (DELGROSSI; VIEIRA; AVILA; PERAFÁN *et al.*, 2024; VARGAS; AQUINO; CARVALHO, 2022). These positive expectations related to TA<sup>45</sup> were confirmed in a recent study, which proved the positive impact - mainly due to the increase in agricultural production and income - of the provision of TA services by the Dom Hélder Câmara II Project in various territories of the Brazilian Northeast (DELGROSSI; VIEIRA; AVILA; PERAFÁN *et al.*, 2024).

However, despite this widely accepted positive outlook, and even though there was significant investment by the federal government in TA between 2003 and 2015, the 2017 Agricultural Census records that in Brazil only 19,9% of family farms had access to some form of TA (SANTOS; FORTINI; BRAGA, 2021). In Paraíba, 16.8% of establishments had access to TA. Although this figure is higher than that for the Northeast region (which is 7.4%), this proportion is still considered small (LUIZ, 2019).

As of 2017, federal funding for the TA service has been severely cut again, leaving millions of Brazilian family farmers without any kind of guidance (LUIZ, 2019; VARGAS; AQUINO; CARVALHO, 2022). With this redirection of the national TA policy from 2017-18 onwards, there have been further resources available to finance TA services between 2018 and 2022 (DIESEL; NEUMANN; DIAS; FROEHLICH, 2022; VARGAS; AQUINO; CARVALHO, 2022). Given this situation, it is very likely that the proportion of family farms served by TA will be much lower than it was at the time of the 2017 Agricultural Census.

---

<sup>44</sup> BRAZIL-MMA. **Environmental Regularization. Newsletter. Data declared up to October 3, 2023.** Brasília, DF: Brazilian Forest Service - Ministry of the Environment, 2023. 37 p. Available at: [https://www.gov.br/mma/pt-br/composicao/servico-florestal-brasileiro/regularizacao-ambiental/boletins-informativos-car/BoletimCAR\\_OUT03\\_2023.pdf](https://www.gov.br/mma/pt-br/composicao/servico-florestal-brasileiro/regularizacao-ambiental/boletins-informativos-car/BoletimCAR_OUT03_2023.pdf)

<sup>45</sup> Internationally, there are also studies that attest to the added value of providing ATER services. Here we will mention a study carried out by the IDB's *Office of Evaluation and Oversight*, entitled "*Does Technical Assistance Matter? An Impact Evaluation Approach to Estimate its Value Added*" (MARCANO; RUPRAH, 2009).

In addition, this low coverage rate, information gathered during field visits during the design mission indicates that there is a lack of preparation and qualification of the technicians from the point of view of knowledge of agroecological practices, which allows production systems to adapt to climate change, among other aspects. Without the support of qualified professionals, farmers cannot implement more intensive, sustainable, and efficient agricultural practices, as well as adapt to climate change and the challenges of market access and access to finance. Correlating this information with the profile of the producers, data from the 2017 Agricultural Census (IBGE, 2019), show that in 47.4% of the establishments that reported applying pesticides, the person responsible cannot read and write and that in 80.4% of cases, pesticide applications were carried out without any technical guidance.

On the other hand, in recent years (especially since 2020), there have been important methodological innovations in the field of TA. Traditionally, TA actions took place face-to-face, in direct interaction between the TA agent and their audience (the farmers). With the advance and popularization of information technology and the Internet, and mainly stimulated and conditioned by the moment of mandatory social isolation imposed by the Covid-19 pandemic, forms of remote and digital interaction and communication have been gaining ground and importance in TA processes, driving a broad process of innovation and learning in the use of instruments for dialogue, interaction and exchange of knowledge at a distance or remotely (CARVALHO; XENOFONTE; ROCHA; DIAS, 2021; ROCHA JR.; GARCÍA; BARRETO; CHAMMA *et al.*, 2021).

In this process, TA actions have combined the remote tools already in use (such as TV and especially radio) with a whole range of digital tools such as instant messaging applications/platforms (WhatsApp, Telegram), social networks (Instagram, Facebook), institutional websites, YouTube channels (for broadcasting videos). There has also been an increase in the use of meeting/live/videoconferencing apps, such as Google Meet, Zoom, as well as tools such as platforms specially designed for training events, and themed 'chats' on institutional websites. (EMATER-MG, 2020; LOPES; ZUIN; OLIVEIRA, 2022).

Thus, the use and application of digital resources in the activities of the technical assistance and rural extension service, which has been called 'digital TA' in some institutional, political, and academic circles, has enabled farmers to expand their ways of accessing information and technical assistance, constituting an excellent complementary means to the face-to-face TA service (DE DEUS; MACHADO; FERRAZ; LOPES *et al.*, 2024; LOPES; ZUIN; OLIVEIRA, 2022).

*Access to credit.* According to the 2017 Agricultural Census, in the state of Paraíba, only 21,151 family establishments (16.9% of all such establishments) accessed some form of financing (IBGE, 2019; SANTOS; FORTINI; BRAGA, 2021). According to Santos et al. *better access to financing for family farmers means contributing to greater dynamism in the agricultural sector in the state of Paraíba. The existence of a significant percentage of family farmers without an efficient financing system, both in terms of the quantity of monetary resources and the technical quality of the projects, reflects the extent to which public policies (financing) policies need to progress to get closer to universal access"* (SANTOS; FORTINI; BRAGA, 2021).

It is interesting to note that 76,5% of the families received financing for investment purposes. Furthermore, only 46.8% of these establishments received funding from government credit programs, PRONAF being the main one (same source).

– *Deficit in access to other public policies to support Family Farming*

Since the last few years of the last century, an important set of public policies to support Family Farming has been built up in Brazil. This process was led by the federal government and many states followed suit with similar state policies. It is worth mentioning the following programs: PRONAF (funding and investment credit), Seguro Safra (agricultural insurance), PAA, PAA Leite and PNAE (public food purchases), P1MC and P1+2 (support for Social Technologies for water storage), PNCF (land credit) and the Rural Development Program. In Paraíba, the State Seed Distribution Program should be mentioned. The expansion of this set of policies lasted until 2015, when some of these programs saw a reduction in resources. This process intensified significantly from 2017 onwards, with a significant reduction in federal funding for practically all of these policies, leading some of them to be paralyzed (such as P1MC and P1+2). However, this trend has been reversed since the beginning of 2023, with the prospect of PA once again being able to count on a fairly wide range of incentive policies.

The existence of these policies, however, does not guarantee access for families. On the contrary, many families find themselves on the margins. Various sources show that few family establishments access them, as shown above in relation to the percentage of family farmers who regularly receive technical assistance services or manage to access credit (especially via PRONAF lines). Access to the PNAE is also limited. According to data from the FNDE, in 2022 Paraíba received only 2% of the Program's total resources, while the number of family farming establishments in Paraíba represents just over 3% of the country's total.

Surveys carried out in the field and also with policy managers indicate that there are several causes for this situation. The main one is a lack of more detailed and consistent information about the policies themselves, including aspects such as eligibility rules and access mechanisms. Weaknesses have also been identified in the technical teams that are responsible for making the policies work in the field.

#### *Food security and nutrition*

*Food Insecurity:* According to the II VIGISAN<sup>46</sup>, food insecurity (FI) in 2021/2022 affected 58.7% of Brazilian households (125.2 million people); in the Northeast, it reached 68% of households, where 12.1 million people are going hungry, i.e., at a level of severe food insecurity. The family farming sector has been hit hardest by the economic crisis of recent years, with small farmers particularly hard hit. In the Northeast, 83.6% of family farming families face some degree of food insecurity in 2021/2022. The worst levels of FI were observed in the families of family farmers who were still unable to return to pre-pandemic conditions, especially those who were unable to fully re-establish their production and marketed quantities. More recent research by the PENSSAN Network (2022) points to the current worsening of food insecurity, which affects 63.9% of households in Paraíba, of which 10.6% face severe food insecurity (hunger).

*Nutrition.* Despite the process of nutritional transition, with increased access to food, the state of Paraíba follows the national trend and the rest of the Northeast region and faces a double burden of malnutrition, marked by both malnutrition and an increase in the prevalence of overweight. Among adults in Paraíba, 62.5% are overweight (35.5% overweight and 27.0% obese)<sup>47</sup>. Growth retardation affects 4.9% of children under 5 in the state, thinness and marked thinness 4.2%, overweight 8.4% and obesity 6.8%.

The situation in Paraíba is exacerbated among the most vulnerable groups, such as quilombola communities, which continue to have socioeconomic disadvantages that are reflected in higher morbidity profiles, especially in relation to nutritional disorders. In addition, women of reproductive age have greater nutritional needs than men and for this reason usually have worse nutritional indicators than men of the same age, and therefore need differentiated attention. Research shows that in the Northeast, the prevalence of underweight among pregnant women is as high as 18%, compared to 6.7% in the rest of Brazil (MELO; SOUZA; FIGUEIROA; CABRAL FILHO *et al.*, 2011).

The main root causes of food and nutritional insecurity in the Project area are the declining quality of and difficult access to water for human consumption and food production; the limited capacity for food production and productive diversification; the low quality of the food consumed; the lack of productive infrastructure; and the low levels of food and nutritional education. It is worth highlighting the direct correlation between food and nutritional insecurity and poverty rates (69.9% of family farmers registered in the Single Registry in the Project area live in poverty or extreme poverty)<sup>48</sup> and environmental restrictions (such as lack of basic sanitation, interruptions in water flows and poor quality of water sources). Access to quality water and sanitation play a fundamental role in combating different forms of malnutrition. According to data from the Water and Sanitation Institute in 2019, the rural water service rate in Paraíba is 24.2% compared to 92.2% in

---

<sup>46</sup> II National Survey on Food Insecurity in the Context of the COVID-19 Pandemic in Brazil [II VIGISAN: final report]. Brazilian Research Network on Food Sovereignty and Security - PENSSAN. São Paulo, SP : Friedrich Ebert Foundation. PENSSAN Network, 2022.

<sup>47</sup> Ministry of Health. Food and nutrition situation in Brazil: overweight and obesity in the adult population in Primary Health Care. [https://bvsms.saude.gov.br/bvs/publicacoes/atlas\\_situacao\\_alimentar\\_nutricional\\_populacao\\_adulta.pdf](https://bvsms.saude.gov.br/bvs/publicacoes/atlas_situacao_alimentar_nutricional_populacao_adulta.pdf).

<sup>48</sup> Single Registry, November 2023. Available at: <https://aplicacoes.cidadania.gov.br/vis/data3/data-explorer.php>.

the state's urban areas. In relation to sanitation, the rural sewage collection service rate is 2.7% in Paraíba compared to 50.1% in urban areas<sup>49</sup>.

To tackle the causes of malnutrition and food insecurity, PROCASE II will support agroecological gardens, the valorization of Neglected and Underutilized Species (NUS) and support for access to water. Among the most common UFPs in the state are the cactaceae, which include species such as Mandacaru, Quipá, Xique-xique, Palmatória, Facheiro and Coroa-de-frade. These plants are characterized by the presence of thorns and slimy stems, which allow them to survive dry climates and high temperatures. This will aim to increase the availability of food for the most vulnerable families, increase the availability of water for human consumption and thus improve their food security and nutrition, while also limiting the diseases responsible for the malabsorption of micronutrients.

In addition, the Project will have a cross-cutting sub-component, in which a Food Security and Nutrition Plan will be designed and implemented, focusing on exchanges and training. These actions will enable adults and young people to learn about healthy food practices, culinary practices, and gastronomic culture, and will respond to the needs of families and target groups in terms of processing and promoting their products, particularly those from family farming. All these practices will be integrated into the design and implementation of the Resilient Investment Plans, thus seeking effective implementation and results in terms of food and nutritional sovereignty.

#### – Gender gaps<sup>50</sup>

In the state of Paraíba, the Gender Disparity Index is 0.68%, indicating that Paraíba women are 32% less likely to have the same opportunities as men, with the biggest gaps being in the dimensions of political empowerment and economic opportunity (BENIGNO; VIEIRA; OLIVEIRA, 2021). In rural areas, resistance to advances in women's autonomy and rights is even greater. Gender gaps are expressed in restrictions on control and access to natural, social, and monetary resources.

One of the fundamental obstacles is the concentration of land ownership in the hands of men, leaving women in a situation of economic dependence. According to the 2017 Agricultural Census in Paraíba, 71.0% of female managers of PA establishments have land titles, compared to 73.1% of male managers - an inclusion gap of 2.1 percentage points. On the other hand, when it comes to the management of establishments, we find that, in the Project area, only 24% of family farming (FFA) establishments are run by women (IBGE, 2019). However, between 2006 and 2017, there was a 20.3% increase in the proportion of establishments run by women in the state (SANTOS; FORTINI; BRAGA, 2021). There is no data available on joint ownership.

In Paraíba, according to the same source, the total area of family farming establishments run by women is 214,500 ha (14.9%), while that of men totals 1,226,714 ha (85.1%). In terms of average area (ha), establishments run by men are 80.6% larger than those run by women. While establishments run by women have an average of 7.1 hectares, those run by men have an average of 12.9 hectares. Among the multiple legal, cultural, and structural barriers that exclude women from land rights are patriarchal ideologies about the gender division of labor in the public and private spheres and the practice of assigning land rights only to one representative of the family - the man. For this reason, the Project will seek to prioritize women in the land regularization work it will promote.

One strategy for rural women to increase their autonomy has been education, with higher levels of education compared to men. According to data from the 2017 Agricultural Census, among female family farmers, illiteracy reached 35.8% of those responsible for establishments, while among men, illiteracy reached 48.1% - a gap in favor of women of 12.3 percentage points (equivalent to 34.4%) (SANTOS; FORTINI; BRAGA, 2021). Among female family farmers, 19.5% have never been to school, and among men, this proportion is 25.7% (IBGE, 2019). Despite better educational indicators, women's average income is lower. In Paraíba,

---

<sup>49</sup> Water and Sanitation Institute. Sanitation Legal Framework Panel. Available at: <https://aguasaneamento.shinyapps.io/painel-marco-legal/#section-cobertura>. 2019.

<sup>50</sup> For more information on Gender, see the annex "Technical Report. Gender Diagnosis in the PROCASE II Project Implementation Area" (Alexandra Teixeira, March 2024).

women earn, on average, 10% less than men and account for 72.5% of people earning up to one minimum wage, according to data from the Inter-Union Department of Statistics and Socioeconomic Studies (Dieese).<sup>51</sup>

Despite rural women's significant contribution to the family economy and community development, their work is often overlooked because they are not part of the formal labor market and do not generate monetary income from activities such as self-consumption. Among the establishments run by women, 80.8% produce for self-consumption, while for those run by men, the same proportion is 70.7%, a difference of 10.1 percentage points (equivalent to 14.2 percentage points). percentage points (equivalent to 14.3%). To change this reality, the Project will promote the Agroecological Logbook Methodology, which makes it possible to measure, value and give visibility to women's fundamental contributions to the family economy and, consequently, to community development.

The main agricultural activities of women in the Project area differ from those of men, requiring that any public support have a differentiated approach to meet the specific demands of women. Proportionally, women are more involved than men in temporary crops (37.1% versus 32.9%) and the production of planted/native forests (4.3% versus 2.6%), while men are proportionally more involved in permanent crops, livestock production (56.2% versus 52.4%) and horticulture/fruit growing (3.9% versus 2.8%).

Rural women in the Project area also have less access to Technical Assistance (TA). Among female family farmers, 14.9% received TA, while 17.4% of male family farmers received this service, which represents a gender gap of 2.5 percentage points (equivalent to 16.8%) (IBGE, 2019). In this context, the Project will offer continuous TA to beneficiaries, establishing a specific target for women (50%), in addition to other measures aimed at developing women's capacities in areas such as leadership, management, access to public policies, agricultural and non-agricultural activities.

When you look at the data on machinery, gender inequality is clearly evident. Throughout country, including in the Northeast, women have less access to tractors, planters, and harvesters. In Family Farming, establishments run by men (80.3%) have 93.1% (511,727) of the tractors for this producer segment, while women have 6.9% (37,845) of the tractors nationwide (HORA; NOBRE; BUTTO). These characteristics make women's daily lives tougher, thus impacting on various dimensions of their existence, and even on their willingness to migrate from the countryside to the cities.<sup>52</sup>

As far as associations are concerned, there is a higher proportion of women who are members of trade associations/trade unions and producer associations/movements. Among women family farmers, 37.2% were members of associations/trade unions and among men, 31.8% - a difference of 5.4 percentage points, equivalent to 17%. percentage points, equivalent to 17%, in favor of women. Regarding producer associations/movements, 15.8% of women family farmers were members in 2017, compared to just 13.6% of men. However, even with greater participation, women often do not have an equal voice because they are not equally represented in positions of power.

It is in this context that the Project will promote Gender Training to develop the capacities of rural women to play an active role, have a voice and decision-making power in Rural Organizations. In addition, the strengthening of Women's Networks will be supported, thus strengthening the self-organization of rural women and their groups and organizations.

Rural women in the Project area also suffer from double working hours. They have a workload that exceeds that of men, including a higher proportion of unpaid domestic responsibilities related to preparing food and collecting firewood and water<sup>53</sup>. In the Northeast, women devote more hours to these activities (23.5 hours), and it is also the region with the greatest inequality in relation to men. The greater dedication to caring for people and/or household chores ends up restricting women's wider participation in the labor market. In Paraíba,

<sup>53</sup> FAO. The role of women in Agriculture. ESA Working Paper No. 11-02, March 2021, <https://www.fao.org/3/am307e/am307e00.pdf>.

women devote an average of 23.9 hours a week to domestic work; 11.5 more than men - above the average difference in the rest of the country<sup>54</sup>.

The activity to be promoted by the Project to provide early childcare and education services (Ciranda das Crianças) will help to reduce women's work overload due to childcare and ensure their participation in the training activities promoted by PROCASE II. The fair division of domestic labor will also be the subject of gender training for beneficiaries. In addition, rural women are more vulnerable than men to environmental and climate challenges because of their social roles, for example as the main collectors of water, food, and firewood in a context where increasing pressure on natural resources and environmental degradation are negatively affecting water and food supplies, because of the discrimination they suffer and their poverty rates<sup>55</sup>. In this context, the Project's investments in social technologies for access to water will also help to reduce the time women spend collecting water.

Violence in rural areas is increasing every year, as shown by the growing number of murders of rural workers<sup>56</sup>. Domestic violence is also dramatic in rural areas and the number of femicides has increased. IPEA data for Paraíba indicates a death rate by femicide of 3.9 women per 100,000 in 2018<sup>57</sup>. In 2023, 4,630 police inquiries were opened in Paraíba to investigate cases of domestic and sexual violence against women, according to the Coordination of Women's Police Stations in Paraíba (Coordeam)<sup>58</sup>. Violence indices show that black women suffer much more physical and psychological violence and are the biggest victims of female murder (femicide)<sup>59</sup>. The lack of facilities in the Network to Combat Violence against Women makes rural women more vulnerable to violence and restricts their access to protection. The prevention of violence against women will be a theme addressed in all the gender training offered by the Project.

#### - Youth<sup>60</sup>

Brazil's Youth Statute (2013)<sup>61</sup> defines young people as those between 15 and 29 years of age. In the Project area, there are 893,666 young people<sup>62</sup>. Among the main challenges faced by rural youth in the Project area are: i) lack of employment and income opportunities (with little diversification of agricultural and non-agricultural activities that attract young people), ii) lack of access to and control over resources, inputs, goods and technologies, iii) limited access to public policies and services and iv) low participation and decision-making power in rural and community organizations.

In Paraíba, among young people aged 15 to 29, approximately 35.1% were neither studying nor working in 2021, according to the Synthesis of Social Indicators 2022. Young women of African descent have a higher percentage out of school and the job market. Household chores and caring for family members are among the main barriers young people face in continuing their studies or getting a paid job, and young women are the

<sup>61</sup> Available at: <https://www.gov.br/mdh/pt-br/navegue-por-temas/juventude/publicacoes/estatuto-da-juventude-2022-defeso.pdf>.

<sup>62</sup> IBGE, 2022. Demographic Census.

majority in this situation. Another important causal factor is the high rate of teenage pregnancy. Between 2020 and 2022, 12,830 pregnancies in children and adolescents aged 10 to 18 were recorded in Paraíba, according to the State Health Department<sup>63</sup>.

As a consequence of the lack of sustainable study and formal work opportunities for young rural people, there is a process of migration to urban centers, mainly of young women with more schooling, which causes the aging of the rural population (the largest group of migrants is between 16 and 35 years old) and a decrease in the proportion and number of women (CAMARANO; ABRAMOVAY, 1999). The phenomenon of young women being the ones who leave the countryside the most is related not only to a lack of opportunities, but also to a refusal to take on the same roles played by their mothers and grandmothers in the family production unit<sup>64</sup>. In the case of young women, the invisibility and devaluation of the workforce, in caring for children and household chores, and in family farming, are also among the factors that encourage the desire of younger women to leave the countryside and will therefore be addressed during the Project's Gender Training sessions. Comparing the 2006 Agricultural Census and the 2017 Census, the young rural population under the age of 25 fell by 49.7%<sup>65</sup>.

Among the factors that influence staying in rural areas are access to financial resources, education/training suited to the characteristics of rural areas, appreciation of rural lifestyles, the availability of services and conditions that can offer the possibility of success in agricultural production (LIMA, 2013). However, in rural Paraíba, young people who decide to stay in the countryside have limited access to and control over resources, inputs, goods, and technologies. The indicators for access to land and credit confirm this.

In the Project area, only 9.9% of family farms are run by young people under the age of 35<sup>66</sup>, indicating low access to land. When they marry, few of them are able to acquire a new property and what often happens is that the family property is divided into smaller plots for the children, which further reduces the productive potential and profitability of agricultural activities. It should be noted that there are gender tensions in inheritance patterns, which disadvantage young rural women.

Access to credit is very limited in the Project area (see paragraph on the subject, above). Although data on access to credit is not available disaggregated by generation, it can be inferred that access to credit by young people is even more limited. The PRONAF Youth program, which was created to facilitate young rural people's access to credit, creating the conditions to enable rural succession processes in FF, still has a very small number of contracts signed in relation to the proportion of the young rural population. Among the causes of this low level of access is misinformation, the lack of institutions for training young farmers, the difficult bureaucratic requirements that restrict the signing of credit contracts, and the fact that bank agents often assume that young people's inexperience in managing resources will lead them to default<sup>67</sup>.

However, access to technical knowledge is higher among young people under 35 than the average among family farmers in the Project area. The quantitative evidence available from the 2017 Agricultural Census indicates that, among young FF managers (under 35), 18.5% received TA compared to 16.8% of all family farmer managers. Despite the higher percentage of access, it can still be said that access to TA among young people is limited. Breaking it down by gender, access to TA was 18.1% among young women and 18.6% among young men, so there was a small access gap of 0.1% between young male and female managers.

During the field visits carried out during the PROCASE II design mission, an additional growing problem faced by rural youth was identified - vulnerability to violence associated with drug trafficking.

- *Diversity*<sup>68</sup>

*Indigenous Peoples and Traditional Communities.* Indigenous peoples and quilombola communities<sup>69</sup> are particularly vulnerable due to the historical dynamics of exclusion, high dependence on natural resources, marginalization of their ways of life, exclusion from the formulation of and access to public policies and poor access to services, including health, education, sanitation, infrastructure, and technical assistance services.

In Paraíba, the Indigenous Lands (TI) are located in the coastal region. The Potiguara, with a population of approximately 19,000, are concentrated in three TIs (CARDOSO; GUIMARÃES, 2012) located in 3 municipalities in the Mata Norte region<sup>70</sup>. In the Mata Sul region, there is a population of approximately 750 Tabajara indigenous people, but there are still no Indigenous Lands in this region. On the other hand, the 2022 Demographic Census recorded a population of 16,584 quilombola inhabitants in 6,127 households in the entire state of Paraíba. These population figures include all the inhabitants recognized as quilombolas - both those who live and those who do not live in officially delimited Quilombola Territories (IBGE, 2023).

According to data provided by INCRA's state superintendence, there are 47 quilombola communities in Paraíba with recognized certificates of self-definition. However, according to information released by the IBGE and the Federal Public Prosecutor's Office, only 11 have officially delimited territory and none have title deeds<sup>71</sup>. There are also traditional Romani populations, artisanal fishers, and shellfish gatherers in the state.

This population is impacted by the combined effects of various forms of discrimination, including gender, race, and socioeconomic conditions. Root causes of this exclusion are the marginalization of traditional ways of life and structural racism. Afro-descendant and PCT populations face even greater obstacles than family farmers in participating in decisions that affect their territories and in fully realizing their rights, with significant gaps in inclusion in terms of poverty, food insecurity, access to education, technical assistance, and land<sup>72</sup>.

In 2023, 67.9% of quilombolas and 73.1% of indigenous people were in poverty or extreme poverty<sup>73</sup>, an average higher than the average percentage of poverty in Paraíba (53.9%). In 2022, 33 million Brazilians were hungry (severe food insecurity), and food insecurity was more prevalent among people of African descent (reaching 6 out of every 10 households whose heads of household identify as black or brown), with Afro-descendant women being the most vulnerable (REDE-PENSSAN, 2022b). In terms of education, among the population of white family farmers in the Project area, illiteracy reached 39.9% of those responsible for FF establishments, while among Afro-descendants, it reached 48.1%<sup>74</sup>. Regarding access to Technical Assistance, among white family farmers, 7,694 accessed TA (17.7%), and among Afro-descendants, 12,961 or 16.1% of the total. The gap between white and Afro-descendant leaders in access to TA is 1.6 percentage points, equivalent to 9.9%. Furthermore, among white family farmers, 77.7% have title deeds, among indigenous

---

<sup>68</sup> For more information on the topic of Diversity, see the annex "Technical Report. Diversity Diagnosis of the PROCASE II Project Implementation Area" (Alexandra Teixeira, March 2024).

<sup>69</sup> Quilombolas are descendants of slaves who resisted the slave regime and have their own cultural identity and values, religious beliefs and means of subsistence.

<sup>70</sup> The Potiguara villages make up three contiguous Indigenous Lands (TI), which total 33,757 hectares: i) TI Potiguara (population 8,109), ii) TI Jacaré de São Domingos (population 449) and iii) TI Potiguara de Monte Mór (population 4,447). These TIs are located in the municipalities of Baía da Traição, Rio Tinto and Marcação. [Ref. CARDOSO, T. M.; GUIMARÃES, G. C. (ed.). Etnomapeamento dos Potiguara da Paraíba. Brasília: FUNAI/CGMT/CGETNO/CGGAM, 2012. 107 p.

<sup>72</sup> Conclusions from the analysis of data from the Diversity Diagnosis drawn up during the design of PROCASE II.

<sup>73</sup> Single Registry, November 2023.

<sup>74</sup> IBGE (2017). Agricultural Census.

farmers, only 44.6% and among Afro-descendants, 70.3%<sup>75</sup>. It should be noted that none of the quilombola communities in Paraíba have land titles<sup>76</sup>.

*Persons with disabilities.* The Northeast is the region with the highest percentage of persons with disabilities in Brazil: 10.3% of the population or around 5.8 million people<sup>77</sup>. The highest percentages of persons with disabilities are women and people of African descent. According to data from the Single Registry (November 2023), there are 144,655 persons with disabilities in the Project area, or around 5.6% of those registered.

Disability and poverty are intricately linked in Paraíba, with persons with disabilities facing significant stigma and discrimination. For example, this group has lower success rates at school and more limited access to economic activities, both of which are major factors contributing to family poverty. In the state, 88.7% of persons with disabilities do not work and 74.4% earn less than the minimum wage<sup>78</sup>.

Persons with disabilities face many challenges throughout their lives. Children with disabilities dropping out of school is a serious problem across the country. There is a relatively high number of female-headed households receiving the main tax-funded disability benefit in Brazil, the Continuous Social Assistance Benefit, and this may be related to the high drop-out rate of fathers/husbands in families that have a child with a disability as a member. The data highlights that persons with disabilities do not achieve parity with their non-disabled peers at any level of education. This puts them at a significant disadvantage in a competitive job market. In Paraíba, 24.92% of persons with disabilities are not literate, 37.48% have only primary education and only 4.07% have higher education<sup>79</sup>.

There are some additional gender dimensions that have an impact on the challenges that persons with disabilities face. For example, women and girls with some forms of disability are at high risk of abuse, and this is especially the case for those with cognitive disabilities. Furthermore, until the Brazilian Inclusion Law (2015) was enacted, it was still routine for women with cognitive disabilities to be sterilized without consent. Caring for persons with disabilities also has a significant gender dimension. In general, women face the double burden of needing to both earn money and provide care, but this burden is only exacerbated when family members are also disabled. It should also be noted that disabled women can also have a disproportionate burden of care placed on them, as they can still be expected to care for other members of their family.

*LGBTQIAPN+ population*<sup>80</sup>. The absence of government data on the socioeconomic and political challenges faced by the LGBTQIAPN+ community is indicative of the statistical invisibility and marginalization of this group. The lack of a social assistance policy, the rural exodus of the LGBTQIAPN+ population to urban centers, the lack of family support, limited access to income and low employability in the countryside, the difficulty of staying in the school environment due to prejudice, especially from the trans population, are some of the factors that favor maintaining the invisibility of data on the LGBTQIAPN+ population in rural areas.

Throughout Brazil, the LGBTQIAPN+ population has been victimized by different forms of LGBTIphobia, placing this group in a situation of vulnerability because they do not fit into a socially referenced heteronormative pattern. Brazil is an extremely unsafe country for this population, as indicated by the upward trend in the number of violent deaths of LGBTQIAPN+ people over the last two decades. Between 2000 and 2022, 5,635 (five thousand six hundred and thirty-five) people died as a result of gender prejudice and intolerance. In 2022, there were a total of 273 deaths of LGBTQIAPN+ people, a national average of 1.31 deaths per million people<sup>81</sup>.

<sup>81</sup> Observatory of LGBTI+ deaths and violence in Brazil. Dossier 2022: Deaths and violence against LGBTI+ people in Brazil. Available at: [Dossie-de-Mortes-e-Violencias-Contra-LGBTI-no-Brasil-2022-ACONTECE-ANTRA-ABGLT.pdf](https://www.observatorio.org.br/dossie-de-mortes-e-violencias-contra-lgbti-no-brasil-2022-acontece-antra-abgl.pdf).

Most deaths occurred among young people aged between 20 and 29 and the Northeast region had the highest absolute number of violent deaths. It is possible to relate the number of LGBTQIAPN+ deaths in each Brazilian macro-region to the social, economic, and cultural conditions of these spatial units. The Northeast, for example, has historically had lower socioeconomic indicators, such as income, schooling, access to public services and life expectancy, than the rest of the country, and has a significantly vulnerable population. Among the states, those with the highest number of deaths were Ceará (34), São Paulo (28) and Pernambuco (19). According to the Observatory of LGBTI Deaths and Violence in Brazil, 8 violent deaths of LGBTQIAPN+ people were recorded in Paraíba in 2022.

Paraíba registered a total of 68 cases of violent deaths of the LGBTQIAPN+ population between 2017 and 2022, according to data released in a report by the Secretariat for Women and Human Diversity. In total, 24 municipalities in Paraíba recorded cases. João Pessoa has the highest number of cases, with 29 crimes, followed by Campina Grande and Bayeux, with five cases each, and Patos was in third place, recording four crimes. Gay men represent the largest number of murders in Paraíba, leading with 17 of the 29 cases between 2020 and 2022, followed by transvestites who represent six cases in the same period, and in third place are transgender women, with 4 crimes.

Partial data for 2023 from the Observatory of LGBT Deaths and Violence in Brazil, from January to April, totaled 80 deaths. To date, transvestites and trans women account for 62.50% of the total deaths (50); gay men account for 32.50% of the cases (26 deaths); trans men and transmasculine people, 2.50% of the cases (2 deaths); lesbian women account for 2.50% of the deaths (2 deaths); no cases against bisexual people and people identified as other segments have been identified<sup>82</sup>.

– *The shortcomings and potential of Knowledge Management, South-South and Triangular Cooperation actions.*

When it comes to designing policies, programs or projects aimed at tackling the challenges of poverty, environmental sustainability and resilience to climate change, there is a lack of relevant information available on experiences of promoting/supporting inclusive sustainable rural development. In recent years, in Paraíba, PROCASE I began systematizing experiences in an attempt to compensate for this lack, with the production and subsequent circulation of a set of products (documents, audio pieces, etc.) which recorded and disseminated relevant knowledge about the work carried out in the Cariri, Curimataú and Seridó territories in the semi-arid region of Paraíba. In parallel, other IFAD-supported projects in the Brazilian Northeast have also begun to work in the same direction.

The idea of South-South cooperation<sup>83</sup> and triangular cooperation<sup>84</sup> is part of this set of initiatives related to the circulation of knowledge between countries in the South, including the funding bodies themselves.

In this context, a Knowledge Management initiative transversally strengthens the implementation of all project components, ensures that knowledge gaps are closed and that good practices, lessons learned, and innovations are disseminated and scaled up, as well as facilitating the impact on public policies. To be effective, PROCASE II must make use of the best and most relevant knowledge available on strategic topics for the implementation and achievement of its objectives, based on evidence and practical experience from sources both internal and external to the Project.

Thus, Knowledge Management (KM) should play a key role in building individual and institutional capacities so that the actors supported learn and can adapt their interventions when necessary. It is also a key tool for

---

<sup>82</sup> See link: <https://observatoriomorteseviolenciaslgbtibrasil.org/dossie/mortes-lgbt-2022>

<sup>83</sup> The United Nations defines **South-South Cooperation (SSC)** as "a process by which two or more developing countries pursue their individual and/or shared capacity development objectives through the exchange of knowledge, skills, resources and technical expertise, and through collective regional and inter-regional actions, including partnerships involving governments, regional organizations, civil society, academia and the private sector, for their individual and/or mutual benefit within and between regions". Cf. Link: <https://www.ilo.org/brasilia/temas/south-south/lang-pt/index.htm>.

<sup>84</sup> **Triangular South-South Cooperation (TSSC)** is defined in the same document by the United Nations as South-South cooperation supported by a developed country or a multilateral organization. Today, TSSC is an important form of development cooperation. See same link as above

measuring and demonstrating the relationship between learning and better development results. KM is also justified as a means of ensuring that beneficiaries, technicians, Project staff and other actors involved in implementation access, use, and share the knowledge, good practices and innovations needed for greater impact in promoting sustainable and inclusive rural development.

– *Crucial challenges*

The socioeconomic and environmental vulnerability portrayed here, coupled with the climate changes that are looming for the semiarid region, aggravate the negative cycle caused by the deficiencies pointed out in production systems and, especially in the semiarid region, in the management of water resources. This process puts the water supply of the population as a whole at risk, as well as jeopardizing the production of both crops and livestock. In this respect, it can be said that many family production systems in Paraíba are in crisis and that this process feeds social and environmental degradation processes, which induces or reinforces the impoverishment of rural families and ecosystem services.

Breaking this vicious circle is a central challenge. Tackling it will require decisive and urgent action on a scale that makes it possible, through the implementation of investments and the development of the capacities of beneficiary families, to introduce new practices and guarantee support services, with the aim of transforming current systems with the implementation of systems that are both more productive and more resilient.

– *Lessons from previous projects*

In the experience of previous sustainable rural development projects, including PROCASE I, the development of new capacities was key to the success and sustainability of the actions supported (PROCASE, 2021). It has made it possible to strengthen social and productive organizations, increase the visibility and inclusion of young people, women, PCTs and indigenous people, and implement investments that have enabled the incorporation of technological innovations and the expansion of the productive capacity of family units and supported associative and cooperative ventures. It has also made it possible to start new activities, manage family production units more efficiently and reach markets in better conditions. It has also made it possible to better manage environmental resources, as well as to expand interaction with the state via increased access to public policies or political advocacy, using new skills that remain after the projects have ended. We will cite here the example of the Dom Hélder Câmara II Project, implemented by the Federal Government, with financial participation from IFAD, from 2014 to 2022. This project served people living in extreme poverty in several states in the Northeast region. The PDHC succeeded in bringing technical assistance to these farmers, generating a positive and significant impact on their production, both in terms of the portion destined for the family's livelihood and the marketed surpluses (DELGROSSI; VIEIRA; AVILA; PERAFÁN *et al.*, 2024). PROCASE II will take all this experience into account.

## Diagnosis - PROCASE II

### ANNEX A

#### **On goat and sheep farming in the northeastern semiarid region and the need to increase forage availability and improve feed management for these herds**

Pablo Sidersky

Goat and sheep farming in the Brazilian semiarid region relies mainly on two central pillars: the herd and the fodder resources that will support it. In general, during the field visits, the latter theme came up constantly, almost always as a major problem, in conversations with all the actors. The issue of the 'great drought' that has punished the region so much in recent years has a direct correlation with this issue.

According to regional studies on goat and sheep farming, the scarcity of food - especially in the period from the second or third month of dry weather until the vegetation fully regrows with the arrival of the rains - is the main problem for family goat and sheep farming systems throughout the semiarid northeastern region of Brazil (ANA-FBB-BNDES, 2018; SEBRAE/PI, 2002; SIDERSKY, 2017). This is fully confirmed in various regional studies<sup>85</sup>: among the various problems identified, the problem of feeding the herd is particularly prominent.

As a starting point, it is important to note that in family farming, goat farming is only viable if all or at least a substantial part of the herd's feed is produced on the farm itself. This statement stems from another premise, which says that raising animals (mainly ruminants) is the only way to transform the biomass produced on the property into a useful product (i.e., energy and protein, food, and income) (SEBRAE/PI, 2002). In this context, we can say that practically all production units have an urgent need to increase fodder production and improve the use of this resource.

Let us remember that production units use different sources of fodder, including areas of Caatinga / native pasture, grass cultivated for trampling and various types of fodder crops (which can be annual or multi-annual). We understand that through the work of various social actors involved in the subject - among which we will highlight the contributions of research as well as technicians and breeders - ideas/proposals are emerging that should make it possible to increase forage production in many ways. We will discuss some of them below.

#### – On the various sources of fodder

Traditionally, the natural vegetation of the northeastern semiarid region forms the food base for goats and sheep. Firstly, mention should be made of the 'raw' Caatinga, i.e., the flora native to these regions, which is arboreal and shrubby, predominantly xerophilous and therefore well adapted to the region's characteristic water deficit (ARAÚJO FILHO, 2013). However, capoeira - which is the vegetation of the Caatinga in the process of natural regeneration - is also widely used, and can be in various stages, from initial to advanced, in which the natural vegetation once again approaches climax<sup>86</sup>.

It is worth remembering that the Caatinga has an uneven supply of fodder throughout the year, with the most in the watery season and decreasing for a while after the end of the rains until it becomes very scarce at the end of the dry season. From the time when agricultural cultivation spread across the Semiarid (a process that

---

<sup>85</sup> For example, in addition to the aforementioned study on Piauí, we will mention the study of the Sertão do São Francisco Territory in Bahia (ANA-FBB-BNDES, 2018).

<sup>86</sup> Farmers and technicians often refer to areas of 'native pasture' as a source of fodder. In reality, this 'native pasture' is nothing more than more or less open grassland, usually at an early stage of regeneration.

was largely stimulated by the expansion of cotton cultivation), the sertanejo farmer began to use the swidden (mainly crop remains) to provide supplementary food for the herd during the dry season.

More recently, fodder crops have appeared, with the aim of increasing the overall production of food for the herd in the production unit. Among the first of these is the forage palm<sup>87</sup>, a cactaceous plant that came from Mexico over a century ago and can be found in many corners of the Semiarid. Over time, and with a growing demand for fodder, other fodder crops appeared. Grasslands began to be planted for the sole purpose of producing fodder: maize came to serve this purpose in some cases, and new crops such as sorghum or millet were introduced. Wetter areas began to be planted with cutting grasses, such as elephant grass<sup>88</sup> or napier and fodder cane. The most recent idea, in this quest to maximize forage availability, is the installation of cultivated trampling grasses. In the latter case, the prevailing practice is to completely replace the Caatinga with a monoculture of species that produce (or should produce) good quality fodder in quantity. One of the most common species for this type of use is buffel grass<sup>89</sup>.

– The search for intensification<sup>90</sup> of forage production

This development is closely related to the broader process of intensification of production units in the hinterland, linked to the increase in the density of occupation, the size of the herds and the spread of fenced areas appropriated on an individual basis, with the concomitant disappearance of the old system of open space farming. This intensification is already having an impact on animal farming, including changing the composition of herds, with a significant increase in sheep farming to the detriment of goat farming (GUIMARÃES FILHO; GAMA DA SILVA; AZEVEDO, 2011).

Thus, in many municipalities in the northeastern semiarid region, the areas of 'raw' Caatinga are almost gone, with areas of (often very poor) capoeira in their place. In some municipalities, there are large areas planted with buffel grass, in a monoculture model. The algaroba<sup>91</sup>, a tree from Peru that produces a pod much appreciated by animals, has also been introduced to the region. Perhaps this was not the initial plan, but this species has spread throughout the region thanks to its invasive habit. Although some consider it a 'pest', many breeders have the highest regard for algaroba, precisely because of its fodder production. On the other hand, in many regions, farmers have managed to plant areas of forage palm. But in vast areas of the northeast, this palm has been decimated by the carmine cochineal. What is more, it is increasingly common to find an irrigated area in production units used to produce 'food for the animals', usually planted with elephant grass.

– The crisis of the last drought

In recent years, the very scarce rainfall has highlighted various problems in the forage system of goat and sheep farmers. For example, the drought has shown that palm is sorely lacking. For this reason, in the regions where the palm has been decimated, many farmers are looking for 'rackets' of varieties resistant to the carmine mealybug and are working to reconstitute their areas planted with this crop. Some have started growing this species with irrigation. Of course, this process of revitalizing oil palm areas is slow.

The importance of an irrigated or 'wet' area has also become even clearer, and it can be seen that these areas are multiplying, based on different types of water source. Tubular wells are multiplying on the properties, but not all of them have this possibility. On the other hand, many of the 'wet' areas (such as those created from reservoirs or underground dams) are also sensitive to very dry years, in which they produce little or nothing.

Finally, there is the situation of areas planted (exclusively) with trampling grass, usually buffel grass. Although this species is quite drought-resistant, the combination of its continued use and the scarcity of rainfall has

---

<sup>87</sup> Fodder palm: *Opuntia sp.*

<sup>88</sup> Elephant grass: *Pennisetum purpureum* Schum

<sup>89</sup> Buffel grass: *Cenchrus ciliaris* (L)

<sup>90</sup> In this context, we understand this term to mean greater forage production per unit area, or even greater forage production in the production unit.

<sup>91</sup> The algaroba found in the region is the *Prosopis juliflora* species.

meant that many of these areas are intensely degraded. Seeing these areas in a critical situation raises some questions about the proposal itself. Quoting the testimony of a farmer from Piauí, who said that his areas of Caatinga produce more food for his animals than a similar area of buffel grass (SIDERSKY, 2017). The question arises: can this opinion have a solid scientific basis? Even without going to the extreme of questioning the choice of buffel grass itself, it is worth asking whether it was necessary to adopt the monoculture model, when it has been known for a long time that maintaining a tree cover of, for example, 20% (approximately 200 trees per hectare) does nothing to reduce the production of the herbaceous layer, even when it is a cultivated species (ARAÚJO FILHO, 2013).

- Recent innovations: more production and, hopefully, more sustainability

### Management of the Caatinga

As already mentioned, the Caatinga is, and will continue to be, an important food resource for raising goats and sheep in the northeastern hinterlands. It contains a large number of forage species, many of which have a good nutritional content. However, the availability of forage in the Caatinga is relatively low for various reasons, both in winter and during the dry season. It is also known from the research carried out and the experience gained by various breeders that it is possible to change this situation. By using various techniques to manipulate the Caatinga - thinning, lowering, enrichment - it is possible to significantly increase the availability of useful forage in the Caatinga. We would also stress that these techniques for managing the Caatinga are not just ideas or proposals from researchers. They have been successfully applied in various communities, including the Moacir Lucena settlement in Rio Grande do Norte<sup>92</sup>.

As the search for ways to increase forage production on goat and sheep farms is currently crucial, we believe that it would be extremely useful to introduce these practices for manipulating the Caatinga where this is not yet the case, to assess their adaptability in the region studied. If they prove useful, an effort should be made to support their dissemination.

#### The caatinga as a forage resource

In the words of Professor João Ambrósio, the Caatinga "is characterized by a biodiversity that is surprising for the floras of semiarid areas, and stands out for having a large contingent of botanical forage species in its herbaceous, shrub and tree strata. However, the availability of fodder in any season is low, either because of the height of the tree canopy in the rainy season or because of the low nutritional value of the fodder available in the dry season". However, the extensive research carried out on this resource, as well as the actions of various farmers, show that it is possible to change this situation. To do so, it is possible to intervene with "vegetation management techniques, with alterations to the architecture and/or changes to its floristic composition, enrichment of the herbaceous, shrub and tree strata and changes to increase and stabilize the floristic composition of the herbaceous layer, with a view to increasing the availability and improving the quality of the forage produced" (ARAÚJO FILHO, 2013) (p. 130). The use of these techniques to manipulate the vegetation of the caatinga makes it possible to modify the availability of useful fodder substantially, as can be seen in the table below.

Table A. Dry matter production at the different levels of Caatinga manipulation

Level of manipulation	Production (Kg. DM/ha/year)	Phytomass distribution		Grazable phytomass (%)	Wood cover (%)
		Woody %	Herbaceous (%)		
C. Native	4.000	90	10	10 (400 kg)	30 - 100
C. lowered	4.000	60	40	40 (1,600 kg)	50 - 60
C. grated	4.000	20	80	60 (2,400 kg)	30 - 40
C. enriched	4.000	10	90	90 (3,600 kg)	10 - 15

### Pasture grasses: seeking alternatives to monoculture

<sup>92</sup> For more information on the Moacir Lucena settlement, see (SIDERSKY; JALFIM; RUFINO, 2008).

As has been said, in many regions of the semiarid region there is a strong presence of trampled grass<sup>93</sup>. Although this type of pasture can provide good forage production (under favorable soil and climate conditions), it often has a strong tendency to degrade, largely due to its installation as a monoculture. There is an alternative, which consists of installing a different design of trampling grasses, which is being worked on by researchers at EMBRAPA Goats and Sheep: the "Caatinga enrichment" method. The backbone of this proposal is diversification. It comprises an arboreal layer (including native Caatinga species, but also exotic legumes such as leucena<sup>94</sup> and gliricidia<sup>95</sup>) and a 'multi-species' herbaceous layer (with native species, buffel grass, gramão grass<sup>96</sup> and others). It is said that it is possible to obtain fodder yields similar to those of buffel monoculture under privileged conditions with this method, and the presence of several species reinforces its sustainability.

Similarly, to the case of Caatinga management in the previous section, it would be very important to begin work on setting up test areas for this type of trampled grass area. If successful, these test areas will serve as a reference for broader work to renovate old buffel areas and install new areas of trampled grass that are more diverse and sustainable.

#### **Looking for alternatives to buffel grass monoculture**

In many regions of the north-eastern semiarid region, there is a strong presence of buffel grass. This grass produces a significant amount of dry matter (DM) - from 3.7 to 6.7 tons per hectare (OLIVEIRA, 1993; OLIVEIRA, 2012) - but it has tended to degrade, largely due to its installation as a monoculture.

Researchers at EMBRAPA Goats and Sheep propose an interesting alternative for installing trampling grasses, which they call "caatinga enrichment". In this case, the "*application of the method begins in the dry season with the thinning of the woody vegetation, preserving 150 to 200 trees per hectare, which will correspond to a cover of 15% to 20%. This percentage of shading will not interfere with the growth and development of the exotic or highly productive native species to be introduced*" (ARAÚJO FILHO, 2013) (p. 141).

Enrichment can be done with grasses such as buffel grass. Leguminous trees such as leucena and gliricidia can also be introduced. Enrichment can change total DM production, increasing it from 4,000 to 8,000 kg/ha/year (in a caatinga enriched with buffel grass). Of this phytomass, 6,400 kg becomes available fodder. This allows for a carrying capacity of 10 head of goats and sheep/hectare/year, which is a dramatic change from the starting point of the carrying capacity of the caatinga without manipulation (Idem, p. 142).

#### *Fodder crops*

It has already been said that it is becoming increasingly common to grow forage species, often for the purpose of making hay or silage, or to cut and feed animals in the trough. Sometimes these 'forage fields' are irrigated. In these cases, as already mentioned, the production of cutting grasses such as elephant grass or fodder cane is frequent. Recently, the use of irrigation (or 'sub-irrigation') has become more frequent with oil palm<sup>97</sup>.

In other cases, these 'forage fields' are rainfed, often cultivated with corn and/or sorghum. However, the question is whether these are the best options for the various Semiarid regions. It is in this context that the choice of forage species for cultivation becomes an important strategy, aiming for greater forage production per unit of available water (ARAÚJO; VOLTOLINI; NOGUEIRA TURCO; RIBEIRO PEREIRA, 2011). Some researchers have introduced the concept of "water use efficiency of different forage crops". Measured in kg of DM (dry matter) per mm. per year or by water consumption per unit of DM produced, studies show that sorghum, for example, is twice as efficient as corn in terms of water consumption per unit of DM produced.

---

<sup>93</sup> Buffel grass is a common species. But there are others. For example, in the Senhor do Bonfim region of Bahia, the preferred grass for trampling seems to be urochloa grass (*Urochloa mosambicensis* (Hack.) Dandy).

<sup>94</sup> *Leucaena* (*Leucaena leucocephala*)

<sup>95</sup> Gliricidia (*Gliricidia sepium*)

<sup>96</sup> Crabgrass (*Cynodon dactylon* cv Callie)

<sup>97</sup> By the way, since the palm doesn't need much water, it could be very interesting to try planting this crop together with a production cistern (for example, a 52-meter cistern<sup>3</sup>, a sidewalk cistern or a rainwatercistern).

(SILVA; REGITANO NETO, 2019). In turn, other references indicate that there are other species, such as agave (or sisal) and palm, which are even more efficient than sorghum in terms of water use (DE KOCK, 2001) apud (ARAÚJO; VOLTOLINI; NOGUEIRA TURCO; RIBEIRO PEREIRA, 2011).

The characteristics of the region - limited water, marked seasonality - mean that the search for efficient food sources is a major challenge. Finding native or adapted species that can become economically viable sources of cultivated fodder is an important objective to strengthen goat and sheep production systems. Here we will mention a number of species - several of which are native to the Caatinga - that could play a role in this process<sup>98</sup>: maniçoba, manioc, pornunça, silk wool, wild beans, jureminha, faveleira, forage palm, forage watermelon, leucena, glicirídia, sisal<sup>99</sup>. Species such as pustumeira, catingueira, camaratuba<sup>100</sup> and others could also be used as native plants with good fodder potential for cultivation in dryland conditions<sup>101</sup>. The cultivation of native species with high fodder value has only been tested for a short time, but it appears to be a promising idea, considering both the need to produce more fodder and the aforementioned logic of being as efficient as possible in the use of water. There are even farmers who are implementing the practice of harvesting material from native trees and shrub species for storage in the form of hay or silage (BAKKE; PEREIRA FO.; BAKKE; CORDÃO, 2010).

We believe that these innovative 'forage plots' and these new uses of the Caatinga can be extremely useful for all farmers. These innovations should be especially important for production units with little available land. Therefore, when thinking about ways to improve family systems for raising goats and sheep, it would be important to start work on installing alternative 'fodder plots' where this does not exist, which can be added to those that already exist (for example, corn or sorghum). At the same time, it is extremely important that farmers significantly expand the area dedicated to forage crops.

#### *Fodder conservation*

In the Semi-arid, it is during the rainy season that green mass is produced. Increasing this production, as discussed in the paragraphs above, is important. But it is also crucial to conserve some of the forage produced to provide food for the herd when it is scarcer in the dry season. For this, the practices of haymaking and silage are very important.

In fact, these practices are already well known in the region. But it is important to encourage their wider use, and the existence of more raw material (green fodder) being produced in the family unit should be an incentive for this. A wider dissemination of these practices will allow an important part of the additional forage produced in the rainy season with the above-mentioned proposals to be supplied to the herd in the dry season.

#### – Finally

Returning to the introductory paragraph and the theme of this short document, we can conclude here that, among the various problems experienced by goat and sheep farmers in the region, the issue of feeding the flock is particularly important. In this sense, Guimarães Filho summarizes this issue when he states that, "*the scarcity of food for the flocks during dry periods is the main technical limiting factor for family-based goat and sheep farming systems in the semi-arid region*" (GUIMARÃES FILHO, 2011). The pages written here are intended to provide food for thought as well as practical solutions to this issue.

## Diagnosis - PROCASE II

### ANNEX B

## On the 'water systems' of family farming in the northeastern semiarid region

Pablo Sidersky

Peasant family units in the semiarid region have a significant water demand, which includes water for various uses. To meet this demand, families need access to one or more water 'sources' and, generally, to transport and store this water so that it can be used when the time comes. This set of demands, sources of supply and the instruments and mechanisms that allow the family to accumulate, access and use water is what we call the 'water system' of the family units of the semiarid. This document seeks to characterize these 'water systems', identifying their parts and describing how they work. It also seeks to stimulate reflection on how to strengthen these systems, which are a key part of the resilience of farming families in the northeastern semiarid region.

### *1. The 'demand' for water in family units in the semiarid*

Water demand is considered to be the quantity of water to be abstracted/accessed, expressed in units of volume, to satisfy the various uses that, depending on its quality and quantity.

#### *1.1 The demand for human consumption or domestic consumption*

The first dimension to be considered in the demand of family units in the hinterland is that of human consumption or domestic consumption. This dimension includes the amount of water needed to carry out each person's main daily activities. It should be noted that the family unit of the semiarid region has a second type of demand, often referred to as 'productive', which includes the demand for water for the various animal herds and for irrigation.

When calculating average consumption parameters for urban water supply systems, we often work with an average daily per capita consumption of 200 to 270 liters (AGÊNCIA-NACIONAL-DE-ÁGUAS-(ANA), 2010). These values, calculated on the basis of the water consumption patterns recorded in the municipalities, refer to the type of human or domestic consumption mentioned in the previous paragraph.

In rural areas, it is estimated that the average demand for human or domestic consumption is between 70 and 100 liters per inhabitant per day. This amount is intended to meet the various needs of this type of consumption, as detailed in Table 1 below. In the case of communities where water and resources are scarce, 60 liters/inhabitant/day would be enough to meet the main demands of human consumption. In rural areas of the semiarid region, access to water, which is very rarely piped via a general network, often requires families to travel long distances to the nearest source. This issue has been identified as an important factor in determining lower demand parameters for domestic supply in rural areas (ARSKY; SANTANA, 2013). In general terms, the parameter of 70 to 100 L per capita per day is also supported by other studies. For example, in the document "**Availability and demands of water resources in Brazil**", published by the ANA, it is stated that "rural demand refers to the water consumption of rural communities, not including services related to animal farming and irrigation, both calculated separately, (...) ranged from 70 to 120 l/inhab/day, according to the state" (CONEJO; MATOS, 2007) (p. 21). On the other hand, the United Nations (UN) states that the average daily *per capita* consumption of 110 liters is enough to carry out a person's main daily activities. Meanwhile, according to the World Health Organization (WHO), between 50 and 100 liters of water per person per day are needed to ensure that the most basic needs are met, and health problems are minimized (ARSKY; SANTANA, 2013).

Table 01 - Estimated daily water demand for human or domestic consumption *per capita* of the rural population (Semiarid region)

Discrimination	Daily water requirement (in liters)
Drinking water	2 a 3
Food preparation	3 a 5
1st hygiene (washing hands, face, small children)	3 a 6
General hygiene (bathing - young people and adults)	22 a 26
Cleaning the house and kitchen utensils (dishes)	20 a 30
Laundry	20 a 30
<b>TOTAL</b>	<b>70 a 100</b>

Source: Adapted from (SUDENE, 1980; VIEIRA, 1996) apud (ARSKY; SANTANA, 2013)

The table above shows that water demand for human consumption can be subdivided into several other subtypes. This subdivision is important because the water quality requirements for all the subtypes are not the same. Thus, for the first 3 types, the requirement is for drinking water. In terms of food security and nutrition, there are studies that show that the amount of water a person needs just to drink, cook, and perform minimal first hygiene (such as washing their face, hands and brushing their teeth, plus bathing small children) is approximately 14 liters per day (SILVA *et al.*, 1984). (BRITO; SILVA; D'ALVA, 2007). In general, it has not been considered technically or economically viable to connect rural households to the household supply network. As a result, around 70% of the population in Brazil has access to water only through wells, cisterns, dams, and reservoirs, which is often precarious and potentially quite unhealthy. In the semiarid region, this proportion rises to 78% (MDS; AECID; IABS; FAURGS *et al.*, 2013).

## 1.2 Water for production

Family production systems in the semiarid region generally include rainfed swiddens, animal farming and backyard production. The production of rain-fed gardens, by definition, depends exclusively on rainwater. There are practices that can make the use of rain more efficient, but this type of farm does not rely on the constitution of water stocks or an abundant source to function. We will not consider in this document the case of farming families who have an irrigated plot of a certain scale which, also by definition, depends on the existence on the property, or very close to it, of an abundant source of water (dam of a certain size, well with fresh water and good flow, etc.), which is relatively rare.

The case of animal farming, on the other hand, is different. This activity is present, to a greater or lesser extent, in the vast majority of family units in the hinterland. Its operation depends on the availability of fodder and, from the perspective of the water system, the supply of a daily volume of water for desiccation for each of the animals in the different herds in the family unit. This type of activity can therefore be sized based on the average water consumption of each type of animal, as shown in Table 02. The choice of which type of livestock is important, given the low availability of water and the importance of the activity for the region's economy. A goat, for example, consumes almost nine times less water than a cow, while a bird consumes around 30 times less than a goat or a pig. Each family therefore needs to provide a stock of water that will allow their livestock to thrive. The table below shows an estimate of the average consumption (daily, monthly, and annual) per head of the different types of animals. The total daily, monthly, and annual stock of water needed will depend on the size of the family's herd(s).

Table 02 - Water consumption for animal farming in the semiarid region (L. per head)

Species	Consumption per day (L.)	Monthly consumption (L.)	Annual consumption (L.)
Cattle	53	1.590	19.080
Horse / donkey	41	1.230	14.760
Goat / sheep	5	150	1.800
Pork	6	180	2.160
Poultry (chicken)	0.2 (200 ml)	6	72

Sources: (GNADLINGER, 2011 (2017); SANDOVAL JR.; OLIVEIRA; XIMENES; MENDES *et al.*, 2011)

Backyard production, unlike larger-scale irrigated production, is present in many family units in the semiarid region. This space or 'subsystem' involves growing vegetables, tubers and fruit, but also medicinal and ornamental plants. It can also include fodder crops. Generally, backyard production involves some form of irrigation, often through watering cans. In some cases, families install small drip irrigation systems. To give the reader an idea of what this means in terms of water demand, Tables xxx and yyy refer to experiments carried out at EMBRAPA Semiarid in Petrolina (PE). They estimate the water consumption of fruit trees and vegetables, respectively, which are common in family backyard production in the Semiarid. In the case of the fruit trees presented in this table, it is specifically a situation with minimal water availability (a cistern, in which "salvation irrigation" was carried out, administering a volume of water just to prevent the plant from reaching "water stress", guaranteeing its survival. In the same experiment, a larger amount of water was given to other fruit trees, which made it possible to overcome the 'salvation' situation mentioned here, with a greater production of fruit. Table xx is intended to give the reader an idea of the volume of water needed to maintain an orchard at a minimum level of production.

Table 03 - Volume of water applied to fruit trees in one year (for two orchard sizes)

Water application period (in weeks)	Volume of water applied (in liters)		Water application period (in weeks)	Volume of water applied (in liters)	
	Per week	Period		Per week	Period
30 fruit trees			50 fruit trees		
14 (rainy season)	2 L. x 3 times x 30 plants	2.520 L.	--		
18 (intermed. period)	3 L. x 3 times x 30 plants	4.860 L.	18 (intermed. period)	2 L. x 3 times x 50 plants	5.400 L.
20 ('summer' dry)	4 L. x 3 times x 30 plants	7.200 L.	20 ('summer' dry)	3.5 L x 3 times x 50 plants	10.500 L.
TOTAL		14.580 L.			15.900 L.

Source: (BRITO; CAVALCANTI; PEREIRA; GNADLINGER *et al.*, 2010)

In the case of growing vegetables, the EMBRAPA Semiarid (EMBRAPA semiarid) experiment worked with 4 beds of 4 m<sup>2</sup> each, in which coriander, peppers, carrots, eggplants, lettuce, chayote, peppers and medicinal species were planted. Each bed was irrigated with 32 liters of water per day. The table below shows the volume of water needed for this garden to function for 9 months of the year (excluding the rainy months). This experiment allows us to estimate the water requirement of a vegetable bed at 8 liters per day per m<sup>2</sup>. In this case, there was no question of 'life-saving irrigation'.

Table 04 - Water consumption in a vegetable garden.

	Consumption per day (L.)	Monthly consumption (L.)	Consumption over 9 months (L.)
4 vegetable beds - total of 16 m <sup>2</sup>	128	3.840	34.560

### 1.3 The rural family in the hinterland and its water demand - an overview

Below is an example (Table 05) which shows the general demand or consumption of a farming family, for which the family will have to forecast a stock/source by adding up the different demands. This calculation is made for a period of 9 months, since it is assumed that during the rainy season (3 months), water availability is not a problem. This consumption is estimated for a family of 4, and includes the demand of a small animal farm, plus a backyard with fruit trees and vegetable beds. For the 'human or domestic consumption' demand, the parameter of 70 liters per person/day was considered (according to the parameters presented above), of which **8** liters are related to food security and nutrition (drinking and cooking), **6** liters for 'first hygiene water' (washing face, hands and brushing teeth, plus bathing small children) and **56** liters for other domestic uses, while consumption for animal farming and the backyard was estimated based on the parameters presented above in Tables 02, 03 and 04.

Table 05: Estimated water stock requirements for a family's consumption, in liters.

Consumption	Units	No. of consumption units	Consumption /L. x day	Consumption / month (in L.)	Cons. 9 months (in L.)	Type of consumption
Food safety*	Residents of the household	4 people	56	1.680	15.120	House consumption: 75,600 L.
Home use		4 people	224	6.720	60.480	
<i>Total</i>			<i>280</i>	<i>8.400</i>	<i>75.600</i>	
Animal farming	Goats	8 cab.	40	1.200	10.800	Animal consumption: 20,520 L.
	Chickens	20 cab.	4	120	1.080	
	Pigs	2 cab.	12	360	3.240	
	Sheep	4 cab.	20	600	5.400	
<i>Total</i>			<i>76</i>	<i>2.280</i>	<i>20.520</i>	
Backyard	Vegetables	1 cant. - 10 m <sup>2</sup>	80	2.400	21.600	Backyard consumption: 32,400 L.
	Fruit trees	30 feet	40	1.200	10.800	
<i>Total</i>			<i>120</i>	<i>3.600</i>	<i>32.400</i>	
<b>TOTAL</b>			<b>476</b>	<b>14.280</b>	<b>128.520</b>	

(\*) This amount includes drinking and cooking water, plus water for first hygiene.

Although this calculation exercise is only hypothetical, as far as in real life the values tend to vary a lot, even depending on the greater or lesser availability of water at the time, it has the merit of giving an idea of the quantities of water that a family unit can consume in a certain period of time. The quantities that appear in this table will take on greater concrete meaning when we discuss the issue of water supply.

## **2. On the availability or 'supply' of water in the northeastern semiarid region**

According to the literature on the subject, water availability in any environmental system refers to surface water and groundwater (ARSKY; ASSIS, 2013). However, it is necessary to qualify this definition by pointing out that the main primary supply of water in ecosystems is precipitation, which in the semiarid northeastern region is scarce and irregular. Considering this situation, it is then possible to consider that, for the purposes of environmental assessment, the general water sources to be considered are (i) direct precipitation (rainfall); (ii) rivers, streams, ponds, lakes, springs (indirect precipitation); (iii) phreatic aquifers (indirect precipitation) and (iv) confined aquifers (MATTOS, 1996).

In the context of the semiarid region in question, the main way to reconcile family demand (see previous section) with the main general water supply - which is the very irregular and uncertain natural supply of rainfall - is to store water, seeking to 'stabilize' this supply. (PETERSEN; SILVEIRA; ALMEIDA, 2002).

The natural storage of water resources in regional ecosystems is insufficient to equalize supply with demand. In addition to the characteristics of the rainfall regime in the semiarid region, this issue is also defined by the attributes of the soils (texture, porosity, depth), as well as the geological substrate. Although the water storage capacity of semiarid soils is still an aspect that has been little studied (MENEZES; SAMPAIO, 2000) it is easy to understand that the regional ecosystem, in general terms, is not very water-conservative. The absence of perennial rivers is perhaps the best indicator of this. In the context of the region's own rainfall regime, a pedological pattern that combines shallow soils or poorly permeable subsurface horizons with a gently undulating to undulating topography favors a dense but intermittent drainage network, which practically makes it impossible to provide a regular supply of surface water to meet the multiple demands of families (PETERSEN; SILVEIRA; ALMEIDA, 2002) (p. 60). On the other hand, areas of crystalline formation account for around 70% of the semiarid region, with fissure aquifers of restricted potential (average flow rates of around 4 m<sup>3</sup> /hour) and often with brackish or saline waters (VIEIRA, 2003).

### ***2.1 The various water sources that can make up the water systems of families in the hinterland***

In the context defined here, the regularization of families' water supply, both in the domestic sphere and for animal farming and even small irrigation, is carried out through the implementation of different intermediate structures / instruments - which Mattos calls 'mediators' - that 'connect' the sources of supply and the demands for water in family systems. These structures allow for the collection, accumulation, storage, and distribution of water (since, very often, the source is not in the place where the water will be used). The main 'mediators'

of supply are those for collection, storage, and access: reservoirs, dams, cacimbas, wells, cisterns, stone tanks, etc. To make use of this water supply, distribution 'mediators' may also be needed - canals, gutters, buckets, barrels, and means of transportation, hoses, pumping systems, etc. (MATTOS, 1996). The main sources of water used in the northeastern semiarid region are listed below.

\* *Barreiro*

The diversity of terms used in the Northeast for surface water reservoirs (barreiro, tanque, açudeco, açude, barragem, represa, outros) and the wide range of storage capacity of these works - from a few hundred m<sup>3</sup> to billions of m<sup>3</sup> stored in large dams, requires a definition of some terms (MOLLE; CADIER, 1992). The smallest of these reservoirs is the **barreiro, which** is a small earthen dam with a rudimentary lateral cistern, the purpose of which is to capture and store water that flows from a 'catchment area' located upstream. It varies greatly in size, usually storing several thousand m<sup>3</sup>. Just for reference, we will mention a study carried out in the semiarid region of Bahia by researchers from EMBRAPA Semiarid. They estimated that the 29 dams found in 3 communities investigated had an average capacity of approximately 3,000 m<sup>3</sup> (CAVALCANTI; RESENDE, 2001). The water stored in them is generally muddy. Given its shallowness and the conditions that favor intense evaporation, the barreiro usually dries out every year. The main use of the barreiro is to water the family's livestock. Although in the past the dam could be dug by hand (often by joint efforts), this practice is now very rare. Nowadays, it is usually done with a tracked tractor. It can take up to 50 machine hours to set up a barreiro. Brito and colleagues estimated this cost at US\$2,200.00 (BRITO; PORTO; ANJOS, 1997) although it is quite possible that this cost is greatly underestimated<sup>102</sup>.

Figure 01 - Loading water from a dam<sup>103</sup>

Dugout Trench (barreiros trincheira) can be considered a special case of barreiro. They are narrow, deep reservoirs dug underground, and this format is a recent innovation that has earned the qualification of Social Technology<sup>104</sup>. The reference trench yard must be able to store at least 500 m<sup>3</sup> of water and must be between 3 and 5 meters deep. The narrow, deep shape is designed to reduce evaporation and keep water stored for longer. It collects water that runs off the surface of the soil, often with the help of gullies or trenches. It requires compacted soils to reduce infiltration. To reduce losses through evaporation and infiltration, when the distance allows, the water from the pond can be pumped to a production cistern. In the construction process, a backhoe must be used to reach the beginning of the rock layer.

<sup>102</sup> A quick search on the Internet indicates that currently the cost of an hour on a bulldozer is approximately US\$85.00. If this is correct, 50 hours/machine would cost US\$4,250.00.

Figure 02 - Barreiro trench<sup>105</sup>

\* Weirs

A weir can be defined as a reservoir that arises from the interception of a current of water, causing it to accumulate. It comprises both the dam - an artificial structure made of earth, concrete, or stone masonry - and the lake formed by it (the accumulation basin or hydraulic basin of the weir). In addition, every weir also includes a spillway. The vazante is part of the weir, which is a strip of land located around the reservoir, where the sertanejo grow their crops as the water level drops on the riverbank or dam, after the rainy season. Açude corresponds to the physical space that also includes the land immediately downstream, favored by the emergences ('revenças') (GUIDICINI; JARDIM, 2021) and (Decree No. 52931 of 07/03/2026). The small weir serves mainly to ensure human supply during the dry season, to bridge the gap between two rainy periods, although it is of little use in the event of prolonged droughts. An average reservoir allows you to get through a year of drought, which means 20 months without receiving water. In terms of storage capacity, small and medium-sized dams correspond to volumes ranging from 10,000 m<sup>3</sup> to 200,000 m<sup>3</sup> (MOLLE; CADIER, 1992). As with ordinary dams, the weir loses a lot of water through evaporation as well as infiltration. A detailed study carried out by F. Molle on 6 large dams in various states in the North-East of Brazil states that annual evaporation amounts to 2,100 mm, with evaporation in the June/December period amounting to 1,365 mm. The same author says that, on average, infiltration represents an increase of 34% of evaporation (MOLLE, 1989) This would bring the losses to just over 2,800 mm per year. Finally, Molle and Cadier estimated that the construction of a small weir of approximately 100,000 m<sup>3</sup> requires some 540 hours/machine, for the wall/baldo part and the spillway ('sangradouro'). (MOLLE; CADIER, 1992).

\* *Stone tank or cauldron*

<sup>105</sup> Source: IRPAA image bank. Link: <https://irpaa.org/galeria/5>

<sup>106</sup> Photo: Pablo Sid.

The stone tank or cauldron is a natural cavity or receptacle, carved out of rock, which is an excellent natural reservoir for satisfying human consumption, household 'waste' (e.g., washing clothes) and livestock demand. In regions where there are significant rocky outcrops, there are places with round-shaped rocks, which make for reservoirs where water can naturally accumulate. The surrounding rocks form an excellent catchment area for rainwater. The deepest parts of these reservoirs are always filled with earth, sand, gravel, etc. By clearing these natural cavities, efficient water deposits are obtained. Often, farmers raise a wall on one side, thus increasing the reservoir's capacity (GNADLINGER, 2015). In some cases, it is possible to create a reservoir capable of storing thousands of liters of water. Thus, with proper preparation/cleaning and maintenance, the stone tank or cauldron is a 'mediator' capable of producing fairly good quality water. The deeper the 'cauldrons' in which this water is stored, the lower the proportional loss due to evaporation. In general, a tank or cauldron is a family initiative; however, there are cases in which the construction and maintenance of a tank or cauldron can be a collective / community initiative. The monetary cost of a tank of this type is relatively modest, although the work of cleaning the cauldrons can be heavy. However, given

Figure 04 - Stone tank in a family unit in Sertão do Pajeú, PE<sup>107</sup>

\* *Cisterns*

- *The drinking water cistern (or first water cistern)*

The slab cistern is a reservoir for collecting rainwater, built with pre-molded cement slabs, whose purpose is to store water for the basic consumption of rural families living in the semiarid region during the dry season or when quality water is not available for residential consumption. The slab cistern has a cylindrical or rounded shape, is covered to prevent pollution and evaporation of the stored water and is semi-underground for approximately two thirds of its height to ensure the safety of its structure. The water collected in the cistern comes from the roof of the house, led by zinc or PVC gutters, which direct the water to the cistern's storage tank, whose capacity can be adjusted according to the number of people who will use it and the size of the roof of the house. However, in practice, the most common size of plate cistern for basic domestic consumption is 16,000 liters.

Although the cistern for collecting and storing rainwater is an old practice in the Semiarid, the model of the plate cistern began to be used at the end of the last century. This 'social technology' began to be implemented experimentally at the end of the 1990s. In the early 2000s, it was taken up by the Semiarid Articulation (ASA), which proposed the 1 Million Cisterns Program. The federal government began to fully fund this program in 2003 (CASTRO, 2021). Data from the Ministry of Development and Social Assistance, Family and Fight against Hunger show that, by December 2022, the Cisterns Program had implemented 971,741 household 'drinking water' cisterns. This figure probably does not include household cisterns set up by other initiatives,

---

<sup>107</sup> Photo: Pablo Sid.

such as state rural development programs<sup>108</sup>. The experience of the last two decades in the northeastern semiarid region has shown that the slab cistern is a highly satisfactory alternative for supplying water for human consumption, whose cheap, practical, and safe technology has been disseminated throughout the region, through in-service training, enabling the community itself to make use of rainwater collected from roofs. Regarding the benefits brought about by home cisterns, it can be said that they have improved the water consumed, reduced the occurrence of waterborne diseases, improved health conditions, reduced the time and effort spent by the family fetching water every day, especially women and children (EMBRAPA, 2009; TCU-TRIBUNAL-DE-CONTAS-DA-UNIÃO, 2006) apud (ARSKY, 2020).

Figure 05 - House with first-water cistern<sup>109</sup>

#### - Production cisterns (2nd water)

Production cisterns are water storage tanks with a significantly larger capacity than a first-water cistern, with a rainwater harvesting system. The most widespread model of this type of technology is the boardwalk cistern, which consists of a 200m cemented space<sup>2</sup> (the 'boardwalk ') for collecting rainwater, coupled to a reservoir or cistern with a capacity of 52,000 liters of water. The catchment area is delimited by a curb and is on a higher level than the reservoir. It has a slight slope to convey the water to a settling box and from there to the reservoir. This cistern is a type of cylindrical water reservoir usually made of cement slabs, covered and semi-underground, which allows rainwater to be collected and stored from the 'sidewalk'. The cemented sidewalk allows relatively clean water to be collected. As it is covered and enclosed, the water stored in it is protected from evaporation and contamination caused by animal waste and other impurities carried by the wind. The 'boardwalk ' cistern was designed as a reservoir whose purpose is to capture and store water for food production, medicinal plants and raising small animals, thus enhancing productive backyards<sup>110</sup>. The estimated cost of implementing a cistern

<sup>108</sup> For example, the Gente de Valor, Pró-semiárido and Bahia Produtiva programs in Bahia, Procasa and Cooperar in Paraíba, São José and Paulo Freire in Ceará, etc.

<sup>109</sup> Source: IRPAA image bank. Link: <https://irpaa.org/galeria/5>

<sup>110</sup> The P1+2 Program, implemented by a group of civil society organizations under the coordination of ASA - Articulação do Semiárido (Semiarid Articulation), has worked insistently on the implementation of 'production cisterns', which are 52 m<sup>3</sup> cisterns, the main one being the "calçada" cistern. P1+2 has proved very successful in terms of implementing effective techniques for collecting and storing water for production, and also in training farmers to better manage this precious resource. By September 2021, P1+2 had installed more than 103,000 production cisterns in the various states of the semiarid region. There are studies on the results obtained from the implementation of this social technology. For example, a study carried out jointly by INSA and ASA showed that the installation of cisterns for domestic use and, above all, production cisterns (the 'boardwalk' cisterns) had a positive effect on families' economies, as demonstrated by an economic analysis in Cariri, Paraíba. This analysis compared families' economies before and after accessing water infrastructure. It found that, with the presence of DC (domestic cisterns) and PC (production cisterns), families obtained 3.3 and 9 times greater profitability respectively than without the technologies, in terms of gross and agricultural income (ASA-BRASIL, 2016; PÉREZ-MARTIN; ROGÉ; ALTIERI; ULLOA FORERO *et al.*, 2017). A second study, carried out in the municipality of Jardim, in the Cariri region of Ceará, reached similar conclusions. It found that there was a significant difference in favor of the group of P1+2 Program beneficiaries compared to non-beneficiaries, both in terms of a Quality of Life index and in family income. When considering the average annual farming income for beneficiaries and non-beneficiaries, a difference of almost 60% was found in favor of the former (ALENCAR; JUSTO; ALVES, 2017).

is approximately US\$ 2,000.00. This includes the cost of construction materials, the contribution made by the beneficiary family to pay the bricklayer and the materials to enhance the productive backyards<sup>111</sup>.

\* *Underground dam*

Even though Guimarães Duque identified it as a very promising technology from as early as 1950 (GUIMARÃES DUQUE, 1980) until recently, underground dams were little known to the population of the hinterland. In the last two decades, this type of dam has begun to spread throughout the Northeast. The underground dam - built on an alluvial terrace, perpendicular to the stream bed - is designed to stop the subsurface flow of the alluvial aquifer. The use of underground dams in the semiarid region is justified by the climate and hydrological regimes of the semiarid region. Almost all the rivers in the semiarid region are temporary and remain dry for most of the year. However, after a period of short-term flooding (a few days), subsurface runoff continues for several weeks or even months, depending on the size of the catchment area, until it is exhausted in the dry season. Under these conditions, the installation of underground dams - installing an impermeable wall across the direction of the water flow - makes it possible to stop the flow and, consequently, raise the piezometric level of the water table. The farmer can then make use of this groundwater in two ways: on the one hand, through cisterns or shallow wells and, on the other hand, through the plants grown there. Thus, as water is withdrawn from the soil of the underground reservoir ('cacimbão') (through the cacimbão, the plants or evaporation), the flow continues, and the alluvial aquifer is constantly replenished by the water flowing from the basin upstream of the dam. The system thus behaves like a sponge, from which water is gradually drawn downstream. Under ideal soil conditions, with a catchment area of sufficient size and, of course, with a satisfactory amount of rainfall, this system should make it possible to get through the dry season with water in the soil for plants and water in the wells for other types of consumption (BRITO; SILVA; MACIEL; MONTEIRO, 1989; MELO; ANJOS; SILVA; PEREIRA *et al.*, 2013; SILVA; ANJOS; BRITO; SILVA *et al.*, 2006; SILVA; LIMA; MOREIRA; FERREIRA *et al.*, 2019).

An important effect of the underground dam is the possibility of making economic use of it. In many cases, beneficiary families have been able to produce fodder, as well as harvest food such as beans, corn, cassava and various fruit crops in these areas. But despite all these advantages, it is important to remember that the benefit of the underground dam for the farming family is directly dependent on the amount of rainfall in a given cycle. Thus, in the last major drought (2012 - 2018), many of these dams were unable to produce for several years on end.

The cost of installing an underground dam is extremely variable, depending on the size (length and depth of the dam), as well as the way the work is done and even the form of financing. In a survey carried out in Mirandiba (PE) in 2000, costs ranged from US\$ 500.00 to US\$ 1,000.00. The cheapest dams were, of course,

<sup>111</sup> Source: <http://tecnologiasocial.fbb.org.br/tecnologiasocial/banco-de-tecnologias-sociais/pesquisar-tecnologias/cisterna-calcadao-para-potencializacao-de-quintais-produtivos.htm>

<sup>112</sup> Photo: Pablo Sid.

the smallest, shallowest and did not have a cistern. The most expensive were the dams that required a large amount of excavation (more than 40 meters long and more than 3 meters deep) (GRIMAUD, 2002). A second survey, based on a BS construction policy of the government of Pernambuco, which ran from 2010 to 2015, arrived at higher values per dam built, ranging from US\$ 1,500.00 to US\$ 3,800.00 (COSTA; COSTA, 2015).

Figure 07 - Laying the waterproof tarpaulin of an underground dam under construction (MELO; ANJOS; SILVA; PEREIRA *et al.*, 2013)

\* *Grey water reuse system*

In the semiarid northeast of Brazil, the availability of water is always a cause for intense concern. However, it is quite common in the rural hinterland to see that gray water<sup>113</sup> is being wasted. It can be seen in backyards in the semiarid interior that this water is being thrown out into the open, even in homes that have some kind of treatment for some of the domestic effluent, such as septic tanks. As a result, untreated gray water contaminates the soil and water, as well as causing diseases in the animals that ingest it (DOS SANTOS FILHA; ARAÚJO, 2018). There is therefore a need to adopt measures for the proper use and reuse of water and to control the pollution of water resources - and greywater in particular - as a way of guaranteeing its current and future availability.

In this context, graywater reuse systems fill a fundamental gap, as it is a low-cost technology and takes advantage of local capacities for its implementation, management, and maintenance. It is worth remembering here that this technology works with a supply of water that has already been used by the family. Basically, it is a way of increasing the efficiency of the water system. There are several graywater treatment systems available. Here, we will mention the Family BioWater system (SANTIAGO; JALFIM; BLACKBURN; DOMBROSKI *et al.*, 2015). In this case, the wastewater reuse technology consists of a filtering process using physical and biological impediment mechanisms for the waste present in the graywater, with the organic matter being biodegraded by a population of microorganisms and earthworms (*Eisenia foetida*). The main pollutants found in these waters are removed through the digestion and absorption of the organic matter retained in the water by the earthworms (POBLETE, 2010). Reuse water is used in a closed irrigation system for the production of vegetables, fruit, medicinal plants and other types of food. At the time of its publication, the Manual for the Implementation and Management of the Family Bio-water System estimated the cost of a complete system at approximately US\$ 2,600.00 (SANTIAGO; JALFIM; BLACKBURN; DOMBROSKI *et al.*, 2015). There are also other models of grey water reuse systems, in which the filters used to treat the water have been simplified, favoring the use of physical mechanisms for filtering (layers of pebbles, gravel, sand, sombrite screen). A study carried out by a team from INSA (Instituto Nacional do Semiárido - National Semiarid Institute) and PATAC in the semiarid region of Paraíba, using systems with a simplified filter, measured the production of treated water for reuse in irrigation: the average generation per family was 43,000 liters per year (BARBOSA; MAYER; MEDEIROS; MELO *et al.*, 2019).

<sup>113</sup> Grey water is defined as all the sewage generated in a dwelling, except that coming from the toilet bowl. It therefore includes effluent from the shower, washbasin, kitchen sink, tank and/or washing machine (BORGES, 2003).

Figure 08 - Biological filters of the Family Bio-water System, with the pipes bringing the gray water from the house.<sup>114</sup>

Figure 09 - Photo B - 3 parts of a RAC system: grease trap, filter and filtered water tank, in the background<sup>115</sup>.

\* *Shallow wells*

- *Cacimba*

During the rainy season, the stream or watercourse experiences surface water runoff. As it flows through the drainage network, part of this runoff seeps into the sandy bed. A *cacimba*, which is a shallow excavation made manually with simple tools (shovel, pickaxe, etc.) in the main bed of rivers and temporary streams, allows access to the water stored in the alluvium of the bed. The *cacimba* can be just one excavation made each year when the stream dries up. As the dry season continues, the hole gets deeper. During the rainy season, the *cacimba* is usually filled with sand brought in by the rainwater (EMBRAPA-SEMIARID, 2004). In some cases, a rustic covering can be made by the farmers' families. It guarantees water in the dry season, which is mainly used for animals, although it can also be used for household consumption.

- *Cacimbão or Amazon well*

The Amazon well or *cacimbão* is widely used in the Semiarid. It is a rounded well, dug in lowland terrain, and can reach a depth of up to 20 meters and a width of about 3 meters (CARDOSO, 2016). These shallow soils are called alluvial fans and are close to the beds of rivers and streams. The *cacimbão* is built manually with the help of hoes, mattocks, shovels, and picks. You do not need machines to dig it. The wall of the Amazon well is lined with bricks or cement rings, always leaving a few gaps for the water to flow into the well. This lining prevents the walls of the well from collapsing. The bottom of the well does not need to be cemented, which makes it easier to 'mine' the water. A good well can supply rural property or small communities, especially if the water is only used for drinking. To ensure that the well water is always clean and to avoid accidents with children, a wooden, zinc or even concrete cover should be fitted. In wells with a good flow rate, it is common to use a motor pump to extract the water, which can then be pumped to a water tank located a good distance away.

\* *Tube well*

A deep tube well is a geological engineering project to access underground water, carried out with a drilling rig, through vertical drilling with a diameter that can vary from 4" to 36" and a depth that can reach up to 2000 meters. (CARDOSO, 2016). However, it is rare for a well drilled in a crystalline basement to reach a depth of 300 meters, although the depth can be much greater in sedimentary basement regions.

<sup>114</sup> Photo by Pablo Sid.

<sup>115</sup> Idem.

In the Brazilian semiarid region, it is very common for groundwater to be brackish or salty. This happens more frequently in regions where the substrate is crystalline, which represents approximately 80% of the area of the Semiarid region (CIRILO, 2008). The result of this is that a very significant percentage of the wells dug in the semiarid region has brackish or salty water, which is unsuitable for human consumption. This was confirmed by a study carried out by the CPRM / Geological Service of Brazil in 450 municipalities in the semiarid region, which collected samples from 15,338 wells. This study revealed that only 25% of the wells registered in this area had fresh water ( $< 500$  mg/L STD)<sup>116117</sup>. It also revealed that 33% had brackish water (501 to 1500 mg/L STD), while the remaining 42% had salty water ( $> 1500$  mg/L STD) (MME-CPRM-SERVIÇO-GEOLÓGICO-DO-BRASIL, 2003). In some locations, the proportion of salty wells is even higher. In the municipality of Boa Vista, in the state of Paraíba, in a sample of 78 wells surveyed, only 17% had water of small to moderate salinity. The remaining 83% had severe salinity (FARIAS; FARIAS; DANTAS NETO, 2016). On the other hand, the flow rates of the tubular wells in the crystalline are often low: according to Feitosa and Diniz, the median flow rate distribution of the wells in the crystalline ranges between 1 and 2 m<sup>3</sup>/h (FEITOSA; DINIZ, 2011). There are many cases of flow rates below 1,000 liters/hour. But even with these figures, the number of tube wells being drilled is growing, and in many circumstances a well with a small flow rate and brackish water is an important source for a community's family water systems, providing water for demands that tolerate a certain salinity (such as water for livestock and various domestic uses). But there are cases in which the well becomes the only source available.

This critical situation created by the last 'great drought' (2011 - 2017-18) has left many communities and families in an extremely delicate situation in terms of access to water, starting with water for human consumption ('fresh' water). This context formed the basis for the action of the Fresh Water Program (PAD), which seeks to promote "*access to good quality water for human consumption, incorporating technical, environmental, and social care in the management of desalination systems, primarily in diffuse rural communities in the Brazilian semiarid region*" (BRAZIL-MMA-SECRETARIAT-OF-WATER-RESOURCES-AND-URBAN-ENVIRONMENT, 2015). These systems work with water extracted from tube wells. By May 2022, the PAD had already installed 905 desalination plants in as many communities in Brazil's semiarid region<sup>118</sup>. As a result, the wells are now a source of water for household 'expenses' and for watering livestock.

The installation of a desalination plant in a community creates a special, sui generis situation in which this equipment produces, in addition to a certain amount of drinking water (good for human consumption), a relatively large amount of 'concentrate' (or 'reject'), which is water with a high concentration of salts. Although the salinity of the 'concentrate' logically depends on the salt content of the original well water, the salinity of the tailings will always be higher than that of the well water. A study carried out in the municipality of Pentecost in the state of Ceará showed that the increase in salinity of the 'tailings', when compared to that of the original well water, can vary from 20 to 41% (NEVES; ALVES; LACERDA; GHEYI, 2017). This situation makes it important to use this 'concentrate' to maximize the use of a scarce resource (water) and, at the same time, minimize the problems that its accumulation (of the 'concentrate' or 'tailings') and improper disposal could cause<sup>119</sup>. In these circumstances, the PAD recommends that the tailings be used in various ways, seeking to make use of them as a resource and thus preventing them from becoming an agent of environmental degradation. It proposes that the 'concentrate' be used for (i) animal watering; (ii) irrigation with halophyte plants (bio saline agriculture *strictu sensu*); (iii) fish farming and (iv) domestic use (or household waste, such as flushing toilets) (BRASIL-MMA-SECRETARIA-DE-RECURSOS-HÍDRICOS-E-AMBIENTE-URBANO, 2015). In practice, families served by a brackish water well with a desalination plant are supplied with a limited amount of fresh water for human consumption, but also with water for livestock, for 'household use' and even to water some plants that tolerate salinity well.

---

<sup>116</sup> STD - Total Dissolved Solids.

<sup>117</sup> Fresh water thus defined coincides with the category of 'unrestricted water' for irrigation (AYERS; WESTCOT, 1994). It is worth remembering that the Fresh Water Program stipulated that water with up to 1000 mg/L of STD was considered fit for human consumption (BRASIL-MMA-SECRETARIA-DE-RECURSOS-HÍDRICOS-E-AMBIENTE-URBANO, 2015).

<sup>118</sup> The overall goal of this program is to install just over 1,620 desalination plants, of which 1,200 will be in the first phase and 426 in the second. (See <https://www.gov.br/mdr/pt-br/noticias/governo-federal-investe-mais-r-130-3-milhoes-para-ampliar-acesso-a-agua-no-semiarido-brasileiro#:~:text=Among%20the%20C3%A7%C3%B5es%2C%20est%C3%A3o%20a.Pa%C3%ADs%2C%20al%C3%A9m%20of%20Minas%20Gerais.>)

<sup>119</sup> For example, the high levels of salinity mean that this tailings can be a potential agent of soil salinization.

\* *Large reservoirs, dams, and the water tanker*

There are situations in which the sources (mediators) that exist in the family unit or those in its surroundings (the community itself and neighboring communities) to which the family has access are unable to meet demand. In these cases, families make use of the water truck resource ('carro-pipa'), which is a service that transports available water from some distant source (usually a large dam, or a perennial or perennialized river). This service can be financed by the government (the 'Carro-Pipa Operation', funded by the Federal Government), but it also happens that the family has to 'buy a pipa' with their own resources.

### 3. The water systems of family farming in the hinterland

Sertanejo water systems are organized around the family farm, although this does not mean that all the sources are within the physical space of the property<sup>120</sup>. Thus, each family constitutes its own water supply 'system', with a combination of 'mediating structures'. Table 01 below attempts to summarize the possible options in the relationship between supply, mediators, and family water demand.

Chart 01 - Relationship between supply, mediators, and water demand in the Semiarid Region

Offer	Mediators		Demand
	Collection, storage	Distribution	
Rain	Soil <sup>121</sup>		Grazed Pastures
	Barreiro		Animal watering
		Manual transport <sup>122</sup>	Domestic consumption Human consumption
		Lifesaving irrigation	Vegetable garden, orchard, swidden area
	Stone tank / 'caixio'	Manual transport	Human consumption Domestic consumption Backyard (vegetable garden, poultry, etc.)
	Weir		Animal watering Domestic consumption (bathing, laundry) <i>on site</i> Fallow and/or 'revença' cultivation
		Manual transport	Animal watering Human consumption Domestic consumption Backyard (vegetables, poultry, etc.)
		Supply system	Human consumption Domestic consumption Backyard (vegetables, poultry, etc.)
		Irrigation system	Vegetable garden, orchard
	Water tanker system	Human consumption Domestic consumption	
Surface supplies (rivers, lakes, etc.)	Rivers, dams; large reservoirs		Fishing
		Treatment and distribution systems	Supplying cities (town centers, villages, etc.)
		Water tanker system	Human consumption

<sup>120</sup> Non-family farms also need to organize/manage their water systems. It's not uncommon for a 'source' (for example, a dam) on a nearby farm to play a role in the water system of one or more families in the community. In other cases, there are public reservoirs nearby that are used by families from the surrounding communities.

<sup>121</sup> The soil does capture and store rainwater, which is used by the vegetation that grows on it, including the crops grown in the garden. But unlike the other mediators, the soil is not implanted by humans. In the case of swiddens, soil management can enhance the soil's natural ability to capture and store moisture.

<sup>122</sup> Manual' transportation here refers to transportation done by the family with cans, buckets, barrels. This transportation can be 'helped' by animals, carts, motorcycles, etc.

			Domestic consumption
Groundwater aquifers	Lowland Amazon wells	Pumping / storage system, irrigation	Animal watering Human consumption Domestic consumption Backyard (vegetables, poultry, etc.)

	Cacimbas	Manual transport	Human consumption Domestic consumption Backyard (small animals, etc.)
	Underground dam		Grazed Orchard
	Underground dam	Pumping / irrigation system	Animal watering Human consumption Domestic consumption Backyard (vegetables, poultry, etc.)
Confined aquifers	Tube wells	Pumping, access structures (fountains), transportation	Human consumption Domestic consumption Backyard (small animals, etc.) Animal watering
		Irrigation system	Vegetable gardens, gardens

Source: Adapted from (MATTOS, 1996)

Rare are the cases in which a single source supplies all the family's water needs (always considering the nuances in terms of quality depending on the different demands). Even rarer is the case where this source is located on the property. Therefore, as we saw earlier, each family needs to guarantee its water supply through access to a combination of 'mediating structures'.

But in the semiarid region, these structures are neither natural nor do they appear spontaneously<sup>123</sup>. The first observation about these 'mediating structures' is that they are generally the result of a 'favorable situation', to which a material investment must be added. So, to give an example, to set up a cistern you need to have access to a lowland with a water table and then make the investment of digging, covering, capping, setting up a water extraction system, etc. To implement a first-water cistern, you need to have a suitable roof, then build the cistern and install the gutter system to conduct the water collected to the cistern.

### 3.1 The water system of Cícero's family

To exemplify this issue of the constitution of the water system and its management, we will use the example of Cícero's family, from the Sertão do São Francisco region in Bahia. (MORAES; BELÉM; OLIVEIRA, 2015). Cícero's family, which belongs to a Fundo de Pasto community, has five members. Their main productive activity is goat farming, with a herd of 400 head. With this herd, the family produces meat, milk, cheese, skins and manure for self-consumption and sale. The family also cultivates a rainfed field with food crops and fodder, as well as growing vegetables and keeping chickens. This family and production configuration allow us to characterize the demands of the family unit. We can highlight the demand for water for human consumption and household expenses. There is also the demand from the yard, with vegetables and poultry. Finally, there is the demand from the goat herd, which is very significant. From the point of view of water supply, the family has a 52,000-liter production cistern (acquired in 2011, via P1+2) and a 16,000-liter first-water cistern (from 2008, via P1MC). It also has two dams and a tube well with a flow rate of 2,000 l/hour, but with saline water and therefore unsuitable for human consumption and irrigation. These last 'mediating structures' were set up using their own resources. The family also set up a system of 'distribution mediators' with tanks or water tanks, a pump, and hoses / pipes to help manage the system.

<sup>123</sup> Contrary to what happens, for example, in regions where there are permanent watercourses and many springs, where some water sources may be spontaneous.

Table 06 - Identification, origin, and characteristics of the water system.

Technology / Mediating structure	Origin	Features	Water use
Cistern for consumption (1st water)	P1MC	16.000 l.	Human consumption
Production cistern (2nd water)	P1+2	52.000 l.	Water for production - backyard
Tube well	Own resources	2,000 l./hour	Goat herds and household expenses
Barreiros	Own resources	100.000 l.	Goats, yard, and house expenses
Water tanker	Public authorities	20,000 l./year	Human consumption / expenditure

Source: (MORAES; BELÉM; OLIVEIRA, 2015)

In the case of Cícero's family, most of the sources or 'mediating structures' are on the property and can be considered 'internal' to the family system. However, there is one important exception: the water tanker brings the family water for human consumption from a distant source. This amalgamation of own sources or 'mediating structures' with other 'external' sources is a common feature of practically all family water systems. In many cases, the 'external' sources may be in the community (for example, a dam or weir on a neighbor's property, or a community desalination plant installed at the association's headquarters by a government development project). In other cases, these external source(s) may be further away.

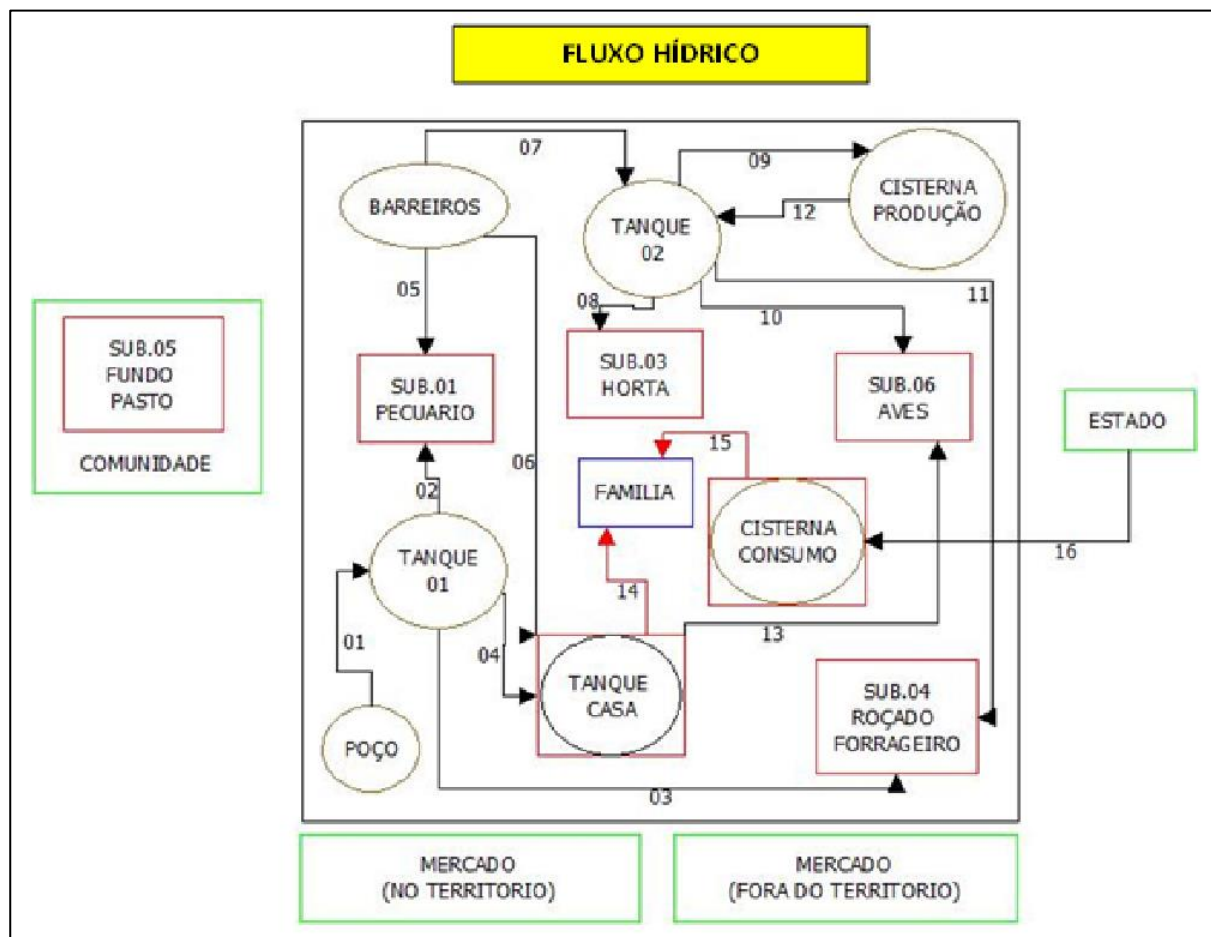

Figure 10 - Water flows in the 'system' of Cícero's family. Source: (MORAES; BELÉM; OLIVEIRA, 2015)

In the Water Flow diagram presented here, it is interesting to see that the family carefully organizes the relationship between the different sources and the different demands, as far as the quality of the water from each source is different and adapted to the intended use. It can be seen, for example, that the water from the cistern is used exclusively by the family, while the water from the tube well goes to the livestock subsystem (the goats) and for household expenses. It can also be seen that the water from the water tankers, which bring water from a distant drinking water source, supplies the household's consumption, which suggests that the 16,000-liter cistern is not meeting this demand.

### ***3.2 On sources and the possibility of strengthening water systems***

The example cited here of Cícero's family is one of several hundred thousand rural family units in the semiarid region. Every peasant family unit in the semiarid region has its own water system, which combines various 'sources', whether close or more distant. In some cases, it is precarious, providing minimal amounts of water at the cost of enormous effort on the part of the family. At times of crisis (a drought, for example), these systems can collapse, and the family may have to leave.

Family farmers in the semiarid work tirelessly to improve this system, seeking to obtain water in greater quantity and better quality. But, as we saw above, strengthening the water system requires investment. For a long time, families had little or no support for this endeavor, and progress was slow. Fortunately, from the late 1990s onwards, the general perception changed. The view that it was possible to create better conditions for "living with the semiarid region" and that this better coexistence meant strengthening families' water systems.

The 21st century has seen the emergence of public policies aimed at strengthening cisterns. Among them is the Cisterns Program (P1MC, P1+2). But other initiatives such as the drilling of wells, desalination plants, support for the implementation of water reservoirs, etc. have been added to the first initiatives. But the work done is only the beginning. There is still a lot of work to be done in this area of family water systems in the northeastern semiarid region.

### ***3.3 On the role of the grey water reuse system in sertanejo family water systems***

As we saw earlier (see section 1.3), peasant family units in the semiarid region have an important water demand, which includes water for various uses. To meet this demand, families need access to one or more water 'sources' and, generally, to transport and store this water so that it can be used when the time comes. This set of demands, sources of supply and the instruments and mechanisms that allow the family to accumulate, access and use water is what we call the 'water system' of the sertanejo family units.

Based on various bibliographical references, an estimate was made of a family's hypothetical water demand, taking into account water for domestic consumption and a demand for water for the yard and livestock. To make this calculation, some assumptions were made about the size of the family, and about the yard and livestock, which means that the result is a hypothetical demand, conditioned, of course, by the parameters chosen. However, we believe that the example is valid for showing how family water systems in the sertanejos work.

Table 05 in section 1 of this document shows the results of this calculation. Summing them up, we can say that the household's demand is around 75,000 liters (for the 9-month period in which families depend on the 'mediating sources' system for their water supply). To this amount, we can add about 20,000 liters to maintain the small herd and another 32,000 liters to maintain the yard.

Despite the hypothetical nature of this exercise, as far as in real life values tend to vary a lot, even depending on the greater or lesser availability of water at the time, it has the merit of giving an idea of the quantities of water that a family unit can consume in a certain period of time. The quantities mentioned here will take on greater concrete meaning when we discuss the issue of water supply.

As already mentioned, families get their water through the implementation of structures / instruments - the 'mediators' - that connect supply and demand. These structures allow for the collection, accumulation, storage, and distribution of water (since, very often, the source is not in the place where the water will be used). There are therefore various types of supply 'mediators' that are instruments for collection, accumulation, and access. Here we will first mention first-water cisterns and second-water production cisterns, as these are the 'mediators' that have been worked on the most by civil society organizations (including C. Sabiá and CAATINGA). We have also seen that, in addition to the two cisterns, there can be other types of 'mediators', such as: barreiros, açudes, cacimbas, wells, stone tanks, etc.

As an exercise in reasoning, let us imagine the case of a family whose immediately available mediating sources are a first-water cistern and a cistern. Assuming that these T. Social Tanks are working properly, the family would have a 'stock' of 68,000 liters of water (16,000 l. + 52,000 l.) to meet the demand for the 9 months of 'summer'. Looking at the table of the family's demands, it can be seen that the demand for 'food security' water (which includes water for drinking, cooking and other special hygiene uses) could be covered by the first-water cistern. But assuming that there is no other nearby source available, in this case it is more than likely that the cistern will be used to provide the household's 'spending' water, which is a significant demand (60,000 l.). Logically, if the water from the 'sidewalk' cistern is used for the house's 'expenses', it will not be available for the yard or the livestock. Looking now at the use of the 'waste' water, it is necessary to mention that a very significant part of these 60,000 liters will be discharged into the yard after use, with a good part of it being lost through evaporation and infiltration.

Looking at the case presented here, it is easy to see the usefulness of a RAC/SAF system. The gray water treatment unit would recover the 'leftover' wastewater from the house, making it available for irrigating a yard / agroforestry system. In this way, a good part of the water from the 'sidewalk' would return to its initial use/destination, which is production (mainly of food) in a diversified backyard. The data collected on the volume of water 'produced' by a RAC system in real life (around 48,000 liters/year on average) shows that it is, in fact, very close to the volume of a 'sidewalk' cistern. Continuing to reflect on the case cited here, we can say that a RAC system can increase water availability for the family considered in this example by approximately 70%, from 68,000 to 116,000 liters. This increase is the equivalent of practically one (another) full production cistern. Based on this reflection, it is possible to state that, in addition to being efficient in providing the family with usable water for irrigation, the RAC system can have the capacity to make the water system itself more efficient, by reducing waste and increasing the actual supply of water available for use in an agroforestry yard, for example.

## **Annex x: Promoting Agroecological Transitions in Brazilian IFAD Projects**

### **What is Agroecology?**

Agroecology (AE) is a dynamic, transdisciplinary approach that has gained prominence recently. It combines science, practice, and social dynamics while addressing the economy, ecology, and society within food systems. Agroecology is concurrently a science, a set of practices and a social movement that encompasses the ecological, socio-cultural, technological, economic, and political dimensions of food systems, from production to consumption (FAO, 2024)<sup>1</sup>. The AE transition is understood as a gradual and multilinear process of change, which occurs over time in the forms of management of agroecosystems.

### **Agroecology at IFAD**

For having a systemic approach, agroecology brings solutions to many areas in which IFAD operates, including Food Sovereignty, Poverty alleviation, Gender Equality, Climate Resilience, and Market Access. To identify and promote agroecology-related support in its portfolio, IFAD has developed the IFAD Agroecology Framework, considering the 10 Elements of Agroecology. In this framework, agroecology-relevant interventions are grouped into four levels: i) farm level, ii) landscape level, iii) markets supporting agroecology, and iv) policies and instruments enabling agroecology and sustainable food systems (IFAD, 2021).

### **Agroecology in Brazil**

Here, we highlight returns of experience in agroecological interventions for each level, considering the context of northeastern Brazil, but not limited to IFAD projects. Family farmers have applied agroecology principles in this region for a long time, and the concept has gained importance through grassroots and civil society movements and organizations. This becomes apparent as IFAD projects work with organizations that already have important expertise in promoting agroecology, strengthening existing initiatives.

#### **i) Farm level**

At the farm level, agroecology combines several agronomic practices such as synergistic soil conservation, crop diversification, green fertilizers, nutrient cycling, and integrated pest management (INRAE, 2022), to maximize farmers' resilience and access to nutritious food. At the same time, agroecology brings several environmental benefits for farmers practicing it and the communities surrounding them. Hence, agroecology assumes family farming (FF) is also a unit of production, consumption, and conservation.

**Soil conservation** practices like mulching, hedgerows and intercropping help control erosion processes and increase water availability, reducing the need for irrigation (INRAE, 2022). Agroforestry, one of the best-known agroecological practices, is widely used to restore degraded water sources and to help protect existing ones, to the point that many refer to this practice as "water planting" (Brazilian Education

---

<sup>1</sup> Within the global United Nations system, agroecology is framed by the interlinked and interdependent 10 Elements of Agroecology, approved by the FAO Council in 2019, including: i) diversity; ii) synergies; iii) efficiency; iv) resilience; v) recycling; vi) co-creation and sharing of knowledge; vii) human and social values; viii) culture and food traditions; ix) responsible governance; and x) circular and solidarity economy (FAO,2018).

Ministry, 2019). It also provides local climate regulation, improving the microclimate for plants and animals (Gomes et al., 2020).

**Crop diversification** is inherent to family farming, as agriculture is a source of income and subsistence. Diversification is a natural hedging mechanism that makes production less vulnerable to climate conditions, price variations, diseases, and pests (Piedra-Bonilla et al., 2020, INRAE, 2022). When comparing agroecological and conventional systems, monocultures sometimes have a higher yield of their main crop, but diversified systems more than compensate with the yields of additional crops, resulting in higher yields overall (Santos, 2023). Crop diversification also brings nutritional benefits to agricultural families, facilitating their access to diversified diets, reducing their dependence on ultra-processed foods, and increasing the availability of micronutrients, improving Food and Nutrition Security (Pradhan et al, 2021, Luna-Gonzalez & Sørensen, 2018, Kabir et al., 2022). Using native species in agroecological systems also increases climate resilience and agrobiodiversity, as these species are more adapted to the local climate.

**Integrated Pest Management** significantly reduces the need for insecticides, bringing benefits to water quality, local pollinators, and human health. Green fertilizers and nutrient cycling help reduce the need for chemical fertilizers, while soil conservation practices help reduce erosion processes, further increasing water quality (INRAE, 2022). The reduced adoption of biocides also brings health benefits to farmers, who are by far the most affected by the negative consequences associated with these products (Ribeiro et al. 2016, Bortolotto et al., 2020). Using green and organic fertilizers further reduces farmer's dependence on imported chemical fertilizers, whose supply is vulnerable to exchange rates and geopolitical conflicts (INRAE, 2022). These agroecological practices also reduce the associated costs with chemical fertilizers and biocides, increasing profits.

Farmers who transition to agroecological systems feel the advantages in productivity and risk management, environmental quality, and social relations (Figueiredo, 2021).

## **ii) Landscape level**

Beyond the farm level, agroecological practices also contribute to public goods by producing external benefits (ecosystem services), such as water provision. With increased water availability, source preservation, and vegetation cover, agroecological practices contribute to the water cycle and increase water access to populations far away from the farm. For example, preserving water sources in the Brazilian Cerrado can maximize river flows that will go through the Northeast region. Moreover, the loss of vegetation in the Amazon region can negatively affect rain patterns in Southeastern Brazil (FAPESP, 2009 and Paltan et al., 2017). For this reason, several programs have been developed in recent years in Brazil and abroad to provide Payments for Environmental Services (PES) as retribution for farmers adopting agroecological practices, bridging the gap between water producers and consumers (Forest News, 2023).

Beyond the generation of ecosystem services, agroecology promotes landscape land-use planning, governance, and co-learning techniques, such as: participatory land-use planning, building/strengthening community institutions for natural resource governance, community-owned research and learning agenda (co-creation and sharing), and traditional knowledge. It also encourages the adoption of landscape and shared resources management, including community/local seed systems, community gardens/cultivation, community pasture, rangeland/fodder management, community forest/woodland management, community land & water management,

community weather monitoring for climate change adaptation actions and community renewable energy (IFAD, 2021).

Agroecology also has impacts on a global scale, for example, through carbon mitigation. Using green and organic fertilizers reduces N<sub>2</sub>O emissions from chemical nitrogen fertilizers, which contribute to 6 percent of global GHG emissions (C2ES, 2024). Soil conservation practices increase soil carbon, and agroforestry systems sequester carbon in the form of woody biomass, making agroecology a powerful set of tools for carbon mitigation (INRAE, 2022).

### **iii) Markets supporting Agroecology**

At the market level, agroecological interventions happen on two main fronts: value-addition and market access. Simple value-addition measures at the farm, farmer group, or cooperative can lead to higher income for producers. Along the same line, establishing Participatory Guarantee Systems (PGS), community-based certification mechanisms in which farmers guarantee the quality of their agroecological and/or organic produce by applying protocols agreed on with consumers, can also generate higher income.

As for market access, agroecology seeks to connect producers and consumers, prioritizing local markets and supporting local economic development. However, such specialized markets are not (yet) widely established. Despite the limited spread of specialized markets, Agroecological products have dynamic access to markets since they are commercialized in both conventional and agroecological markets. The conventional market is the largest in Brazil, and family farmers (smallholders) produce 70% of all food consumed in the country (Câmara dos Deputados, 2023). Even when sold as conventional products, agroecological farming generally has profit levels similar to or higher than conventional farming, since they are often more productive and have lower costs (Santos, 2023 & INSA, 2022).

In addition to the conventional markets, other important distribution channels exist for agroecological products, such as fairs and markets, solidarity marketing networks, specialized stores, and buying clubs. Diversified and shortened marketing chains and cooperatives have also strengthened the development of this value chain.

Outside conventional and agroecological markets, another channel to be considered for the sale of agroecological production is institutional purchases by government organizations. Programs such as the Food Acquisition Program (PAA) and the National School Feeding Program (PNAE) aim to acquire production from family farming, giving value to agroecological production. Data from IPEA shows that programs like PAA and PNAE have contributed to an increase in the average income and the diversification of the production of family farmers, benefiting the poorest farmers in greater magnitude (IPEA, 2022)

### **iv) Policies and Instruments enabling Agroecology and Sustainable Food Systems**

At last, the systemic approach of agroecology was made stronger by social movements that integrated important aspects of the food system, such as access to land, gender equality, and the rights of Traditional Peoples and Communities (including indigenous and quilombolas). These social movements are responsible for making agroecology go beyond a toolset of productive practices to include crucial parts of rural populations' quality of life and autonomy.

Several grassroots organizations have emerged in Brazil in the past decades, to promote agroecology at a national level, including the Brazilian Agroecology Association (ABA) and the National Agroecology Articulation (ANA). They organize workshops, conferences, and working groups, providing resources to support farmers in the agroecological transition. The Brazilian Government built on these efforts to create its own agroecological policies, such as the National Commission for Agroecology and Organic Production (CNAPO) and National Agroecology and Organic Production Plan (PLANAPO). One of the main contributors to the advance of the agroecological transition in Brazil are the institutional purchases programs mentioned above (PNAE and PAA).

### **Agroecology in Brazil's IFAD Projects**

Several IFAD projects in Brazil, such as those in Ceará and Bahia States, have demonstrated how the participatory nature of the project fosters robust collaboration between beneficiaries and technical experts. This collaboration spans planning, implementation, evaluation, and adjustment of actions, leading to the development of numerous innovations tailored to specific needs and contexts.

The IFAD stock-take report on agroecology further highlights the high incorporation of agroecology in IFAD's portfolio in Brazil. Out of the 8 projects classified as AE-based in the LAC region, 6 are from the North-East of Brazil portfolio, where IFAD has consistently supported the Government and invested in communities shifting to agroecological practices for managing farms and landscapes. These projects contributed to creating innovative ways of connecting producers to markets, e.g., through public procurement or through linkages with local tourist services rediscovering and serving local food. Agroecological innovations also included the engagement of small-scale producers and their communities through multi-stakeholder territorial platforms to discuss solving systemic barriers to income generation and agroecological transition (IFAD, 2021).

One of the main projects in this regard is Project Dom Helder Câmara III, which has a large intervention area. The project will take a demand-driven and participatory territorial approach, engaging marginalized local communities in promoting sustainable and diversified agricultural production and responsible natural resource utilization. It will advocate for decentralized strategies that align with ecological conditions and incorporate cultural values, reflecting the historical relationship between social groups and their ecosystems. This approach will be realized through participatory territorial planning, aiming to identify interest groups and develop rural territorial development plans and associated investments. This ensures a holistic and systemic approach to project activities, addressing the communities' priorities, issues, and needs. This illustrates the comparative advantage of integrating agroecological approaches within IFAD's operations.

### **Agroecology in PROCASE II**

PROCASE II will have a holistic agroecological approach. Regarding agricultural practices, it will promote a set of practices that increase the structural and functional diversity of the agroecosystem, such as increasing crop diversity with multicrop/consortia systems, improving plant breeds and crop varieties, and implementing agroforestry systems. Agroforestry systems will be the main elements of PROCASE II's production systems, focusing on different crops, adapted to the local biomes of the semiarid and the Atlantic Rainforest. In the semiarid, the systems based on fodder production will support goat farming for milk and meat; dairy cattle farming; and free-range poultry farming. Other agroforestry systems will focus on producing fruits and vegetables, including neglected and underutilized species (NUS)

and medicinal plants. The Project will also promote practices like green fertilizers and Integrated Pest Management (IPM), reducing dependence on external inputs, mitigating climate change risks, and guaranteeing a greater variety of nutritious food.

This approach will be based on the co-creation of knowledge and practices, resulting in more effective adoption of innovations and practices adapted to the local context, the environment, and the needs and realities of the people and communities of Paraíba. The Project will develop Technical Assistance (TA) capacities to provide family farmers with agroecological practices. As a concrete example, the PROCASE II diagnostic tool (Annex A) contains different levels and types of Caatinga management for fodder production, that can be adapted to different contexts as an alternative to fodder monocultures. The Project will also implement activities to increase human and social values, especially activities addressing gender inequalities by creating opportunities for women.

Promoting activities of diversifying agricultural production, PROCASE II strengthens ecological resilience and improves farmers' independence in providing inputs and creates new market opportunities for outputs. The Project will improve market access, promote value-adding activities, and facilitate certifications such as the labels *Quilombola* and *Family Farming* or Participatory Guarantee Systems (PGS).

# ANNEX – KNOWLEDGE MANAGEMENT (KM), SOUTH-SOUTH AND TRIANGULAR COOPERATION (SSTC) AND INNOVATIONS IN PROCASE II

## 1. Introduction

**Knowledge Management (KM)** is an important part of IFAD-supported projects. In its Knowledge Management Strategy<sup>1</sup> IFAD defines KM as “a set of processes, tools and behaviours that connect and motivate people to generate, use and share good practices, learning and expertise to improve projects’ efficiency and development effectiveness”.<sup>2</sup>

Additionally, **South-South and Triangular Cooperation (SSTC)** provides a unique opportunity to leverage the strengths and experiences of diverse stakeholders, including other developing countries and international organizations. SSTC is an important approach for IFAD, which has set out its commitments in the SSTC Strategy 2022-2027<sup>3</sup>.

According to the World Bank, Brazil is classified as an upper middle-income country (UMIC), with a gross national income per capita (GNI) of USD 8,140 in 2022. It is also one of the biggest food exporters in the world. However, it is one of the countries with the greatest inequalities in income distribution, with a Gini index of 0.518 in 2022. These disparities are most pronounced in the Northeast region, which has large pockets of rural poverty mainly concentrated in an environmentally sensitive region. This context puts Brazil in a privileged position to set the stage for innovations in programs and policies that reduce poverty and inequality and increase food security and sovereignty. KM and SSTC play a crucial role in this effort, as many of these programs are built on the results of previous experiences in Brazil or elsewhere. Recognizing this importance, IFAD has made efforts in Brazil to identify, share and promote good practices and solutions aimed at sustainable rural development, with special attention to agricultural practices, rural organizations, and marketing. The Brasilia SSTC and Knowledge Centre, opened in 2018, has played a strategic role in expanding this agenda in Latin America and the Caribbean and in consolidating partnerships with Brazilian and regional institutions.

Recognizing the importance of these approaches, PROCASE II entails a subcomponent dedicated to implementing a comprehensive Knowledge Management Strategy and related activities and fostering robust South-South and Triangular Cooperation initiatives: *Subcomponent 2.5 - Knowledge Management (KM) and South-South and Triangular Cooperation (SSTC)*. **Innovations** are an important part of the Project (sub-component 1.3), mainly focusing on the topic of mechanization (see Chapter 5). The systematization, documentation, and dissemination of past and new experiences – in short, the knowledge management of innovations – will be crucial for the uptake and scaling of new technologies.

---

<sup>1</sup> <https://www.ifad.org/en/-/document/knowledge-management-strategy>

<sup>2</sup> See also IFAD’s explanation video SPANISH IFAD Knowledge Explained

<sup>3</sup> <https://www.ifad.org/en/-/documents/sstc-strategy-2022-2027>

IFAD's leadership role in KM and SSCT has positively impacted the partnership with the InterAmerican Development Bank (IDB)<sup>4</sup>, opening new cooperation channels in these topics, which will be strengthened and expanded during PROCASE 2. As the partnership continues to evolve and increase, IDB investments in KM and SSTC are expected to complement and scale IFAD's agenda in the region. The relevant experiences from IDB will also serve as basis and be included as references in the detailed PROCASE II KM and SSTC plan.

This annex intends to be an exploratory summary on the topics of KM and SSTC, providing an overview of IFAD initiatives and projects in northeast Brazil on which PROCASE II can build on. The annex also presents a first draft of what the overall objective of the KM and SSTC strategy in PROCASE II could look like, and outlines important considerations based on which a detailed KM and SSTC plan will be elaborated during the first year of project implementation. The annex also highlights specific considerations about policy engagement and finally provides details on the innovations that will be supported by PROCASE II, which will be systematized and shared through KM and SSCT activities.

## 2. Previous Project Phase and other IFAD projects / initiatives

There are many important experiences in the region and beyond from which PROCASE II can profit and build on, especially in terms of knowledge products that have been produced. A selected set of relevant projects and initiatives are shortly described in the following paragraphs (non-exhaustive list).

The Cariri, Seridó, and Curimataú Sustainable Development, **PROCASE**, project was a loan project from IFAD implemented between 2012 and 2020 in the state of Paraíba. It was implemented in 56 communities in the Semiárido region of the state, in the Caatinga biome and contributed, amongst others, to improving agricultural productivity, increasing income, and enhancing access to water for production and consumption. The monitoring and evaluation (M&E) Department of the Project Management Unit (PMU) was responsible for the KM of the Project. The main objective was to systematize the knowledge generated in the project, with a thematic focus on agricultural and non-agricultural production chains, renewable energies, gender equality and youth. In collaboration with the programmes Semear Internacional (see below) and PROCASUR<sup>5</sup>, a variety of knowledge products were elaborate, including booklets and audio-visual products. These products were disseminated to various stakeholders. The main publications relating to this systematization of PROCASE experiences are: "Richness of the Semiárido", "Agroecological Logbooks and the Women of the Semiárido Region", "Seeds of hope - good practices for living in the semiárido region: Tourism and rural youth", "Women who flourish in the northeastern semiárido region", "A young pulse in the semiárido region" and "Systematization of Good Practices from PROCASE activities"<sup>6</sup>. PROCASE also has several

---

<sup>4</sup> underlining the important role of KM and an active dissemination of project results to raise the visibility of IFAD's projects and impact, to foster partnership and ultimately scaling IFAD's investments as highlighted in [IFAD's operational framework for scaling results](#), Oct. 2023

<sup>5</sup> <https://procasur.org/en/nosotros-eng/>

<sup>6</sup> [Riquezas do Semiárido](#), [Cadernetas Agroecológicas e as Mulheres do Semiárido](#), [Sementes da esperança - boas práticas de convivência com o semiárido: Turismo e juventude rural](#), [Mulheres que florescem no Semiárido Nordestino](#), [Pulsar jovem no semiárido](#), Sistematização de Boas Práticas das ações do PROCASE

dissemination channels, such as a website<sup>7</sup>, Facebook page, Instagram and YouTube channel which remain active until today.

The two programmes Semear and Semear Internacional are IFAD funded programmes specifically working on the topic of knowledge management in the semiarid areas of northeastern Brazil. **Semear** was co-financed by AECID<sup>8</sup> and implemented between 2011 and 2017 by the Inter-American Institute for Cooperation on Agriculture (IICA). This programme was the first knowledge management grant programme of IFAD in Brazil. The overall objective of the program was to build the capacity of the rural population to have a set of knowledge, experiences, innovations, and good practices that contribute to improving their living conditions, coexist with the living conditions of semiarid regions and take full advantage of the development potential of the Northeast region of Brazil. Based on the success of Semear, a follow-up programme was launched. **Semear Internacional**<sup>9</sup> was also implemented by IICA. Its aim was to facilitate access to knowledge, innovations and good practices that can be adopted and replicated by the rural population to improve their living conditions and promote sustainable and equitable development in the region. As a new component, compared to the first Semear programme, SSTC played an important role in Semear international, fostering knowledge exchange with countries of the Mercosur and Africa. The project was active from 2017 until 2022. For the purpose of this annex, it is important to highlight the publication of “Strategies, Good Practices and Lessons Learned from Semear international - Knowledge Management for Rural Development”<sup>10</sup>.

**AKSAAM**<sup>11</sup>, Adapting Knowledge for Sustainable Agriculture and Market Access, was an IFAD grant executed by the Institute of Public Policies and Sustainable Development - IPPDS, linked to the Federal University of Viçosa – UFV. The project was active from 2016 to 2024, working to alleviate rural poverty with a focus on sustainable agricultural development to promote food and nutrition security in line with the Sustainable Development Goals (SDGs). Its main objective was to improve the access of family farmers to technologies and knowledge, increase their productivity and improve the conditions of access to markets, with Latin America and the Caribbean as operating locations. Important products of this project to mention here are the *Biblioteca Semiáridos América Latina (SAL)*<sup>12</sup>, an online platform with knowledge products about the semiarid, and the online training course Agroforestry Systems Extension Course in semiarid regions<sup>13</sup>.

**DAKI - Semiárido Vivo** was another IFAD grant aimed at contributing to tackle climate change in three semiarid regions of Latin America: the Central American Dry Corridor (CSC), the Great American Chaco (GCA) and the Brazilian Semiarid (SAB). The project started in 2020 and will be running until the second half of 2024. It is carried out by a network of civil society organizations working in these regions: ASA (Brazil), FUNDAPAZ (Argentina) and FUNDE (El Salvador). The project’s main activity was to identify and systematize experiences, training

<sup>11</sup> <https://aksaam.ufv.br/en-US/>

<sup>12</sup> <https://bibliotecasemiarios.ufv.br/>

<sup>13</sup> <https://aksaam.ufv.br/pt-BR/curso-saf>

processes and knowledge exchanges that contribute to farmers, technicians, and their respective institutions in Climate Resilient Agriculture (CRA) practices and strategies. Through its activities, it gave visibility to experiences and trained multipliers in Climate Resilient Agriculture based on Agroecology and Coexistence with the Semiarid.

The **INNOVA-AF**<sup>14</sup> - Knowledge Management for the Adaptation of Family Agriculture to Climate Change - Project was funded by IFAD and implemented by IICA between 2018 and 2022. The objective of the grant was to strengthen the capacities of family farmers with low resilience to the impacts of climate change in semiarid territories and mountain systems to actively participate in rural transformation processes in Latin America and the Caribbean and to disseminate good practices for adapting family farming to climate change. To this end, subprojects (work experiences) were designed and implemented in rural communities from which innovative practices were disseminated and new knowledge generated to strengthen the resilience of local producers. These subprojects were carried out in 8 countries - Bolivia, Brazil, Colombia, Ecuador, Guatemala, Honduras, Mexico, and the Dominican Republic.

In addition to PROCASE, IFAD has also been implementing other projects in the state of Paraíba, with KM and SSTC initiatives that are worth mentioning here. These are the **Project Dom Helder Câmara II (PDHC II)**<sup>15</sup>, in partnership with EMBRAPA and INSA, and the Project **PCR/P/Sertão Vivo** (Planting Climate Resilience in Rural Communities of the Northeast). Furthermore, two new IFAD grant projects are in the pipeline, the tri-national (Brazil, Argentina, Bolivia) project **Raízes Agroecológicas (GP-SAEP)**<sup>16</sup> and a new **initiative to reduce methane emissions**<sup>17</sup>. PROCASE II will benefit from cooperation and coordination with these projects in terms of knowledge generation and exchange.

In terms of SSTC, IFAD's **Centre for Knowledge and South-South and Triangular Cooperation, Latin America and the Caribbean Division**, created in 2018 and located in Brasília, has been helping to disseminate a vast array of interventions and social technologies with proven effectiveness and potential to be scaled up throughout new investment projects and public policies. The Centre is part of the wider SSTC and KM network, acting as a link between IFAD and a wide range of external partners (research institutions, academia, civil society, private sector, other UN agencies, etc.). The Centre has also brought new impetus to non-lending activities, especially at the regional level, enabling IFAD to expand its capacity to engage in policy dialogue, specifically through participation in forums and events. The contributions to the work of the Consortium of the Northeast illustrate this. These successful experiences arising from IFAD and partner operations have been disseminated through learning routes, field visits, technical exchanges, workshops, and technical publications.

### 3. KM and SSTC Plan for PROCASE II

KM and SSTC will be a fundamental and strategic approach during the implementation of PROCASE II. The Project will hire a cross-functional specialist (**KM and SSTC Specialist**, here after the specialist) who will be responsible for KM and SSTC<sup>18</sup>. During the first year of the Project, this specialist will elaborate a KM and SSTC Plan.

The KM and CSST Specialist plays a crucial role in development projects, ensuring that information and knowledge are systematically captured, shared, and used to improve project results. To foster a culture of knowledge sharing within the project team, the specialist must emphasize that knowledge management is a collective responsibility. This involves promoting the importance of documenting experiences, good practices, lessons learned and so on, encouraging open communication and providing training to incorporate these practices into day-to-day work. In doing so, the specialist helps to build a collaborative environment where continuous learning and improvement are integral parts of the team's success.

In addition, during the initial phase and throughout the implementation of the project, the Specialist will lead the identification of strategic partners to carry out studies, research, and events. These partners will play a key role in the project's sustainability strategy, ensuring that the knowledge generated is widely distributed and made available even after the project has ended. The Expert will also manage the hiring of specialized consultants to prepare technical documents and specific activities.

The KM and SSTC specialist will elaborate a KM and SSTC plan for PROCASE II during the first year of the project. Key elements to be included in the plan are outlined below, together with important considerations specific to the PROCASE II context.<sup>19</sup> The plan will be regularly updated throughout project implementation.

At the outset of the elaboration of the KM Plan, the **current situation and background** in terms of KM and SSTC should be analysed. As mentioned in chapter 2, PROCASE II can draw on a wide range of resources, products and experiences from other initiatives and projects, including the lessons learned from PROCASE I. The KM and SSTC activities of PROCASE II should therefore avoid the duplication of already existing material. To do so, a comprehensive review of already existing material, initiatives and experiences must be carried out at project inception. This review should also assess whether the existing material meets the requirements of the Projects target audience (including illiterate people) and whether it can be used in activities of PROCASE II. For the identified products, strategies should be developed to broaden the reach of the existing materials, ensuring wider accessibility and relevance (scaling up and out). This can also include the use of new innovative formats, such as apps and social media. The existing materials that can be used for activities of PROCASE II, including for trainings of the PMU or technical staff, should be systematized, and made easily available, in a database or similar.

---

<sup>18</sup> A sample ToR for a KM and SSTC Specialist is included as Annex I to this document. This sample ToR was provided by the IFAD KM Resource Centre and was adapted to the specific requirements.

<sup>19</sup> this section is based on the template for a basic KM plan provided by IFAD's KM resource center: <https://ifadkmcentre.weebly.com/knowledge-management-plan.html>

The KM and SSTC activities of PROCASE II should focus on new topics that either have not yet been covered in other initiatives, or that are new thematic areas in PROCASE II. This includes the topic of the Atlantic Forest (Portuguese: *Mata Atlântica* or *Zona da Mata*), physically disabled people and artisanal fisherwomen/shellfish gatherers, amongst others. The IDB has also developed several projects in this biome, which could be used here. Consequently, KM products and SSTC activities elaborated during PROCASE II will focus on themes that are central to the project, (identified below in Chapter 4. Thematic Focus) and therefore support the **overall project objectives**.

In the next step, the **purpose, objectives and expected results** of the KM and SSTC plan must be defined. At this stage, the overall goal is defined as to improve the project's ability to generate, use and share knowledge at different levels: among project participants, at state level, in the Northeast region, and in other developing countries (via SSTC). This goal will be refined during the elaboration of the KM and SSTC plan.

The specific **objectives** of the KM and SSTC plan could be:

- To engage with and inform rural people about project activities
- To support learning, adaptation, and improved project performance during implementation;
- To capture, use and share lessons learned;
- To influence policy processes and scale up successes;
- To raise awareness of project activities and results, and publicize successful experiences;
- To boost the project profile among decision makers;
- To improve the design of new projects based on the lessons learned

The **target audience** will have to be defined. At this stage, it includes:

- Family Farmers
- Technical Assistance Staff, Project Staff
- Local policy makers and wider public

The KM and SSTC plan will define detailed activities. The **activities** will be implemented in the following broad action areas:

- Systematisation of Experience and specialized Studies
- Communication and Dissemination in Knowledge management;
- South-South and Triangular Cooperation;

Expected **outcomes** could include:

- Operational effectiveness and efficiency are improved;
- Best practices and lessons learned are consistently used in project implementation, and disseminated to other projects and partners - at the state level, in the Northeast region, and countries in the Southern Cone and Africa;
- Needs and priorities of target groups more consistently addressed through knowledge and learning initiatives;
- Successful experiences are scaled up based on solid evidence-based and technical knowledge on what works and why;
- Project knowledge products are used in policy engagement;

- Information management supports efficiency in operations;

Expected **outputs** could include:

- Documented lessons (both successful and non-successful);
- Knowledge products to support policy dialogue, advocacy, and visibility;
- Regular learning events (for example, project learning days; country programme team meetings; country programme implementation reviews; knowledge events to support policy engagement, etc.);
- Information materials and training for target groups based on needs assessments;
- Thematic networks/communities;
- Learning routes, trainings and policy exchanges organized with other countries
- Knowledge partnerships;
- KM capacity building initiatives;

The KM and SSTC plan will also define the **knowledge sharing and knowledge products** that will be developed. It is important that products are developed tailored to the defined target audience, and that the purpose and the dissemination and communication channels are clearly defined. It will be important to include lessons learned from other projects, especially from the PROCASE I (which products worked well and why? Which dissemination strategies worked best and why?). As a guide, the table below lists examples of KM products and dissemination channels or events for different KM objectives and target groups, provided by the IFAD KM resource center<sup>20</sup>.

Examples of KM objective	Stakeholders/ target audiences	Knowledge products	Dissemination channels/events	Useful partnerships
Influence policy	Government bodies Key decision makers Donors/ development partners	Studies Policy briefs Evidence-based lessons learned on successful approaches Pictures and videos	Seminars Roundtable discussions Policy working groups Social media Expert blogs	Universities Relevant NGOs National-level associations of interest groups

<sup>20</sup> <https://ifadkmcentre.weebly.com/knowledge-products.html> (with more details)

Strengthen project implementation	Project team  Staff of implementing agency and of other similar projects  Implementing partners and service providers	Lessons learned  Documented good practice & innovations  How-to-do-notes  Guidelines  Local knowledge briefs	Project learning days/workshop  Share fairs  Project website  Training sessions	Project staff  Technical experts (consultants or staff of line ministries / extension centers)  Local people
Contribute to body of knowledge on project themes	Government  Ministries and agencies  Decision makers  Academics	Studies  Journal articles  Lessons learned  How-to-do-notes	Thematic websites  Communities of practice  Learning events, seminars, conferences  Academic journals  Expert blogs	Universities  National and international research centers
Share project knowledge with local community	Local communities  Target groups	Newsletters/circulars  Posters/leaflets/maps  Video, animations, cartoons  Facebook pages/project website  Project briefs	Start-up workshops  Interactive awareness-raising events  Local media/social media  Field visits  Mailing lists	Local journalists  Project staff  Community organizations  Local NGOs  Local schools

For the KM and SSTC activities to be successful, it is crucial to have clearly defined roles and responsibilities (**KM in project management**). As already mentioned above, it will be important to establish and foster a culture of knowledge documentation and sharing within the whole PMU, to allow for a good KM implementation. For this, it must be defined how data and information from the project M&E system will be used for KM and SSTC and what other information will be collected, such as qualitative information and information from the innovation activities.

For the implementation of the KM and SSTC Plan, a detailed **work plan and budget** must be elaborated. This plan will be reviewed annually and reflected in the Project's AWPB for proper

budget execution. The following table presents a preliminary budget of the KM and SSTC activities.

<b>2.5 - Knowledge Management (KM) and South-South and Triangular Cooperation (SSTC)</b>	<b>Unite</b>	<b>#</b>	<b>Value / Unit</b>	<b>Total Value in USD</b>
P - Systematizations and studies in Knowledge Management prepared and published	Studies	25	40 000,00	1 000 000
P - Annual phases of Communication and Dissemination in Knowledge Management implemented	Years	6	20 000	120 000
P - South-South and Triangular Cooperation	Exchanges	10	100000	1000000

Finally, it must be defined how the KM and SSTC Plan will be evaluated (**evaluating success**). A clear monitoring method must be established at the outset of the project, including the definition of indicators to track results.

#### **4. Thematic Focus**

PROCASE's KM and SSTC activities will focus on, but not be limited to, the following themes:

##### **Agroecology and Agroforestry Systems (AFS)**

Agroecology and Agroforestry systems will be the main element of PROCASE II's productive systems, focused on different crops. The Project will build Technical Assistance (TARE) capacity for delivering Agroecological practices to family farmers, such as diversification of plant varieties and crops with multicrop / intercrop systems, increasing soil organic matter content, utilization of green fertilizers, and Integrated Pest Management (IPM) with practices geared toward increasing agroecosystem structural and functional diversity.

Agroforestry is the intentional integration of trees or shrubs with crops and/or livestock at the plot, farm, and/or landscape scale for developing agroecosystems that mimic natural ecosystems in terms of nutrient cycling and biodiversity (structurally and functionally). Agroforestry Systems (AFS) are a climate change adaptation strategy to increase the resilience of farmers and agricultural systems against climate risk, providing a range of biophysical and socioeconomic benefits through the taxonomic and spatial diversification of agricultural outputs and microclimates, therefore, reducing farmer vulnerability to climate variability and their dependence on external outputs (e.g. fertilizers and biocides).

A few agroecological systems and agroforestry systems are already present and well diffused in the Project region, such as Agroecological Cotton and Fodder AFS. PROCASE II will promote different variations of these systems that could prove successful in other parts of

Brazil and the globe and should therefore be systematized and shared through KM and SSCT, especially in biomes with similar climate and vegetation. In that regard, the Project will promote agricultural systems that use native species with commercial potential and foster industrialization and commercialization of products from the local biodiversity. Some of these species are already compiled and could serve as a basis to identify other regions with similar species, where the knowledge generated by PROCASE II would be the most useful.

One of the main topics related to agricultural development in Brazil that also affects PROCASE II design is the prevalence of animal farming systems for milk and meat and their impact on deforestation and desertification trends, directly or indirectly. As PROCASE II will have a strong animal component, several measures will be implemented to make sure these productive activities will not contribute to the degradation of natural habitats. Such measures will also be worth sharing for implementation in other regions facing the same problems.

### **Social Technologies**

PROCASE II will invest in social technologies that improve access to water, such as cisterns for human consumption and agricultural production, subterranean dams, and water tanks. It will also fund grey water recycling technologies and sewage treatment activities using green septic tanks and filtering gardens. Water access and storage technologies have a great potential to be used in other regions that are affected by water scarcity and their widespread use during PROCASE II will serve to consolidate and expand this potential through KM and SSCT.

### **The Zona da Mata biome (Atlantic Forest)**

PROCASE II will also cover the Zona da Mata (Atlantic Forest) region in the eastern part of the state, consolidating IFAD's expansion beyond the semiarid region, and aligning with IFAD's Parceiros da Mata and CompensACTION projects, which are also in the Atlantic Forest biome. PROCASE will foster exchanges and knowledge construction with these projects and other initiatives in similar biomes.

Along with the expansion to the new biomes, PROCASE II will also reach populations rarely benefited by IFAD and IDB projects in Brazil: artisanal fisherwomen and shellfish gatherers. The outcomes of this experience will guide upcoming IFAD interventions in areas such as natural resource management and could also be a valuable source of information for other regions where fishing and shellfish harvesting are the main economic activities.

## **5. Policy engagement**

Policy engagement and knowledge management activities often go hand in hand. As mentioned above, one objective of a KM and SSTC plan can be to influence policy processes and scale up successes. Policy engagement and dialog is a crucial aspect in IFAD's project as it is key for project sustainability and replication and scale up. For this reason, the topic is discussed here in some more detail.

During the first phase, PROCASE has worked in many different policy engagement activities, despite reduced federal funding for family farming. PROCASE strengthened various institutions involved in rural development, it collaborated with government agencies, facilitated

policy dialogue between Brazil and Mexico in agroforestry, participated in various spaces for public policy discussions and created initiatives like a Women Farm Council. Project staff have also been recruited for leadership roles in rural development programs, ensuring continued policy engagement and knowledge exchange.<sup>21</sup>

These successful activities will be an important part of PROCASE phase II. The project will engage in important government policies, such as the Cistern Programme, Technical Assistance, land, and environmental regularization Programs. Phase II will continue to strengthen state and local technical assistance organizations and intra-governmental coordination to expand beneficiaries' policy access and stimulate the participation of farmers' leaders and project staff in various spaces for public policy discussions (such as state councils and working groups). Furthermore, the coordination among different secretariats will play a key role in driving the project's activities. Similarly, through the systematization of experiences, best practices, and innovations, KM and SSTC activities will seek to generate significant improvements in current public policies, such as water access, sanitation, and climate-resilient agriculture, scaling them to other government programs and actions.

There are many policy platforms that are relevant to the Project's goals. It will be important for the project to elaborate a strategy on which platforms it makes sense to get involved and in what way. Some important platforms are: ASA (Articulação Semiárido Brasileiro), ABA (Associação Brasileira de Agroecologia), ANA (Articulação Nacional de Agroecologia), CNAPO (Comissão Nacional de Agroecologia e Produção Orgânica), the Forum of Secretaries and the Northeast Consortium (Consórcio do Nordeste), the Northeast ATER Network, the ILPF Network (Crop-Livestock-Forest Integration) headed by EMBRAPA, and the Family Farming Regional Information System (SIRAF).

## **6. Innovation and Mechanization**

PROCASE II will promote innovation initiatives by incubating small businesses, providing funding and technical assistance to identified innovators and helping them scale up their initiatives to reach other farmers. It will promote innovations developed specifically for family farming systems, such as tools for agroecological practices, machinery for small-scale agro-industries, biotechnologies aligned with the concept of resilient production systems, among others. Some examples include small tractors, pruning tools, forage cutting machines and oilseed processing engines. Many of these innovative initiatives already exist in the project area. They will need to be identified, assessed in terms of their suitability for strengthening resilient family systems, improved (where appropriate), and/or disseminated. In several cases, it will be a question of promoting tests of new equipment in the real conditions of family units in Paraíba. Promising innovative initiatives that need resources to consolidate themselves and get disseminated will be financed by an investment fund that will provide between US\$ 10,000 and 60,000 (R\$ 50,000 to 300,000) to each initiative, depending on their financing needs. The selected projects will be accompanied by a team of experts in the expansion process (the cost of support activities is included in the amount of funding received by each initiative).

---

<sup>21</sup> a complete description of the policy engagement of PROCASE can be found in the Project Completion Report

The project will fund the development of initiatives (which could be small 'backyard' companies, research groups, experimenting farmers, among others) aimed at creating products and technologies tailored to the local context, such as machinery adapted to small producers and equipment for processing and adding value (priority themes). The project will also fund innovations in secondary themes, such as products derived from native/traditional species, bio-inputs (soil nutrition, bio-insecticides), efficient water management technologies, solid waste treatment, etc. The investment dedicated to this subcomponent will allow up to 25 of these initiatives to be financed (with amounts of up to R\$300,000 each).

### **Benefits expected for each micro-enterprise**

Selected companies or teams will receive the following benefits:

1. Funding of R\$50,000 up to R\$300,000 (including support activities mentioned below)
2. Technical consultancies,
3. Business and market-oriented mentoring,
4. Development of business plans,
5. Support with Design and Visual Communication,
6. Networking and Partnership opportunities

The PMU will designate innovation officers or a foundation that will search for existing prototypes in the project area and select innovators according to predefined criteria. The Project will fund the expansion of these initiatives, providing guidance, refining the prototypes, and facilitating market access. The selection can be made through a competitive process (calls for tenders) or through a direct search in the project area, with the help of Local Development Agents (ADL) and ATER technicians. The direct search for existing innovations will involve the local PROCASE II offices and focus on Federal Institutes (IFs), Agricultural Family Schools (EFAs), Universities, Rural Schools, and local artisans. The work developed by SERTA<sup>22</sup> serves as an example of how the innovations identified by the Project could be supported.

The incubation and monitoring of innovations can be done directly by the designated innovation officers, by the appointed foundation (if it has experience in this area) or in partnership with a social entrepreneurship incubator, such as IACOC (incubator of the Paraíba Technology Park).

### **Priority Themes**

- 1) **Mechanization for small producers:** Mechanization adapted for agroecological and agroforestry family farming, such as motor cultivators, forage palm chopper and feeder, long-arm pruning shears, woodchipper and other small implements. Companies that share or rent<sup>23</sup> machines and implements will also be supported.

---

<sup>22</sup> <https://serta.org.br/>

<sup>23</sup> <https://www.sciencedirect.com/science/article/pii/S0308521X18314914> ,  
<https://repository.cimmyt.org/xmlui/bitstream/handle/10883/22429/65927.pdf?sequence=1&isAllowed=y>

- 2) **Technologies for Cooperatives and Associations:** machines and implements for cooperatives and associations, such as pulpers, dehydrators, dryers, mills, packaging machines and processing plants in general, as well as recycling machines such as waste separators and processors.
- 3) **Mechanization for Persons with Disabilities:** fund at least 2 projects developing machines, tools, or equipment for persons with disabilities.

### **Secondary Innovative Themes**

- 4) **Agroecological Markets and Local Biodiversity:** Promote nutrition from local biodiversity, through development of products derived from native/traditional species, extraction of oils and essences, creation of agroecological fairs, greengrocers, restaurants, etc.
- 5) **Adaptation to Climate Change:** water capture technologies and water use efficiency, climate comfort, etc.
- 6) **Access to renewable energy:** Financing and Installation of solar panels for small producers, heat pumps, energy efficiency works, reduction in the use of firewood, biodigesters, etc.
- 7) **Soil nutrition and integrated management of pests/weeds:** manufacture of organic fertilizers and products used in the biological control of pests and weeds, such as production of green manure seedlings and seeds, inoculation of natural enemies, production of compost, *biocaldas* and other bioinputs.
- 8) **Studies and research projects:** small research projects that can be considered innovative, for example new variants of agroforestry systems.
- 9) **Digital tools for small producers:** Access to digital technical assistance (including plant and insect identification, recommendations for organic/ green fertilization or weed/pest control), Information services (prices, logistics, soil conditions, weather information and early warning systems), Financial services (financial management tools and access to credit and insurance), Supply chain digitalization (recording information, planning tools, sharing implements, shared transport of products and inputs, etc. ) and Market access and e-commerce (selling family farming products, buying inputs, etc.).
- 10) **Digital tools for cooperatives and associations:** Resource sharing (machinery, implements, processing equipment/facilities, etc.), Market access and e-commerce, Planning and management tools (recording information, organizing inventories, etc.) and Certification and legal compliance tools, (checklists for obtaining licenses or preparing for health inspections, etc.).

### **Selection Criteria**

#### *Possible criteria for funding and support*

- 1) **Social Criteria:** The company must have Social and Environmental Impacts as its main objectives, aiming for low prices for farmers and fair payment for workers.

- 2) **Right to repair:** Machines, implements and equipment must be designed in such a way that they are easily repairable using accessible technologies and with easy replacement of parts, thus avoiding the user being forced to buy a new copy.
- 3) **Economic Sustainability:** The company must prove that there is a demand for its service/product in the long term
- 4) **Environmental Sustainability:** The company must show that its product/service does not generate significant environmental impacts (GHG emissions, waste, etc.)
- 5) **Local Impact:** Team members come from the project regions.
- 6) **Traditional/ancestral knowledge:** Valuing and integrating indigenous and traditional/ancestral knowledge and technologies.
  
- 7) **Focus on young audiences and young women:** 50% quotas for women and 50% for young people are suggested, with 50% of young people's places reserved for women.
  
- 8) **Focus on Persons with Disabilities:** fund at least 2 projects led by persons with disability.

The results and lessons learned from the innovation projects will be systematized and shared through KM and SSCT initiatives, such as booklets, workshops, field visits, exchange programs, and others.

## **Annex I - Sample ToR for KM and SSTC and Specialist**

### Examples of TOR for KM and SSTC Specialist

The following TOR could be used for a cross-functions Specialist position that will be responsible to cover KM and SSTC activities.

The overall purpose of the position is to improve project management processes and results by fully integrating KM and SSTC into all aspects of project management, including M&E, financial management, supervision, and reporting.

Specific responsibilities will include:

#### KM

1. Lead development and implementation of the project's KM and SSTC Plan.
2. Define the project's KM goals and strategic objectives, and the main areas of KM-related work with clear linkages to improving programme performance, promoting innovations, scaling up success, sharing lessons learned, and influencing policy.
3. Ensure there is sufficient integration between programme learning systems (Progress Reports, Stakeholders meetings, Knowledge Products) and the project's AWPB to close the circle of participatory, demand-driven planning and implementation.
4. Develop the annual KM work plan and budget, outlining KM activities, budget, and timeline.
5. Develop a range of Knowledge Products that document lessons learned, best practices and success stories and define the most adequate dissemination and communication method for each product
6. Identify knowledge partners from which to draw relevant knowledge or to develop and share knowledge generated by the project.
7. Build the capacity of the project staff to enhance knowledge sharing within the project and support project management to create incentives for knowledge sharing.
8. Identify indicators and monitoring methods, which should be reflected in the Program M&E system to track results and impact of KM activities.

#### Communications & Advocacy in Knowledge Management

1. Lead the preparation (content and design) of communication and advocacy materials about project knowledge products and related documents and publications (factsheets, posters, press releases, online articles, blog posts, infographics, PowerPoint presentations, brochures, human interest stories, success stories, videos, etc. as required), and ensure they are published on the webpage of the project and other relevant channels.
2. Support publishing of Knowledge Products through IFAD communications networks (webpage and social media, regional portals, etc.)
3. In collaboration with the institutional communication responsible of the project, project implementing organizations and partners, identify, develop, and maintain a calendar of events; develop and manage messages and information material to ensure the success of these events.

4. In collaboration with the institutional communication responsible of the project, develop and maintain a project mailing list, prepare, and conduct interviews with selected stakeholders, as needed, and maintain relations with IFAD's communications focal point.

## SSTC

1. Detail specific SSTC activities and their goal in the project's KM and SSTC plan.
2. Facilitate concrete SSTC activities such as study missions and learning workshops in collaboration with IFAD and external partners.
3. Contribute to establishing a systemic approach to the SSTC activities to make the SSTC activities efficient and effective.
4. Support the compilation of best practices and assess demands for exchanges and SSTC initiatives with other projects and selected partners.
5. Liaise with IFAD SSTC and Knowledge Centre, located in Brasilia, to assess opportunities for SSTC and learning events.

## **REGULATORY FIDUCIARY ASSESSMENT: PROCUREMENT**

### **I. INTRODUCTION**

The Sustainable Rural Development Project for more Resilience and Adaptation to Climate Change in the Semiarid Paraibano – PROCASE 2, is being financed by IDB and IFAD, with IDB being the largest contributor and lead agency. IDB is already a partner with the state in other credit operations. IFAD will bring its expertise already applied and consolidated in the development of poor and extremely poor rural areas in the State of Paraíba after the execution of PROCASE 1.

IFAD and the IDB signed a Partnership Agreement in 1978 as a framework for their cooperation. This partnership between IDB and IFAD is established by ICO Brasil to leverage financing for agricultural development projects in the country. The Inter-American Development Bank (IDB) is a multilateral development bank (MDB) linked to the Organization of American States (OAS).

PROCASE 2 is a Type C project with a total financing US\$ 148 million, with US\$ 108 million from the IDB, US\$ 10 million from IFAD, and a counterpart contribution from the State of Paraíba of US\$ 30 million.

As this is a Type C project with the lead agency being IDB, the Project will use IDB's design documents, policies and procurement standards, to the extent that they are compatible with IFAD Guidelines.

The objective of this document is to compare IFAD's and IDB's procurement frameworks, predict conflict mitigation strategies and ensure complementarity and coherence between the two systems.

**Legal and regulatory basis.** In this assessment, the following legal instruments of the procurement regulatory framework were used:

**IFAD Project Procurement Framework**

- IFAD Project Procurement Guidelines
- IFAD General Conditions for Agricultural Development Financing
- IFAD Procurement Manual (for IFAD staff and consultants)
- IFAD Procurement Handbook (for Borrowers/Recipients)
- Project-specific procurement provisions incorporated in the Financing Agreement and the Letter to the Borrower (LTB)/Project Procurement Arrangements (PPA)
- IFAD Standard Procurement/Bidding Documents (incorporate procurement-related provisions of IFAD's undermentioned policies)
- The revised IFAD Policy on Preventing Fraud and Corruption in its Activities and Operations
- IFAD Policy on Preventing and Responding to Sexual Harassment, Sexual Exploitation and Abuse
- IFAD Anti-Money Laundering and Countering the Financing of Terrorism Policy
- IFAD's Social, Environmental and Climate Assessment Procedures (SECAP).

#### **IDB Project Procurement Framework**

- Policies for acquiring goods and procurement works financed by the IDB (GN 2349 15)
- Policies for the selection and hiring of consultants financed by the IDB (GN 2350 15)
- Criteria for Determining Eligibility (GN 2375)
- Policy for Use of National Public Procurement Systems
- Project-specific procurement provisions incorporated in the Financing Agreement and Coordination Agreements implementing alternative procurement arrangements
- IDB Standard Procurement/Bidding Documents
- Financial Management Guidelines for IDB financed Projects (OP-273-12)
- Project Operating Regulations (ROP).

## **II. COMPATIBILITY BETWEEN THE REGULATORY FRAMEWORKS**

In general, there are no incompatibilities between IDB fiduciary management standards and IFAD procurement guidelines. The main differences between the two regulatory frameworks reside in concepts and terminologies, in addition to definitions of deadlines, financial limits, penalties, and the language of technical instruments.

The normative and regulatory arrangements of the two institutions also present some formal differences. IFAD has its main policies in its own specific instruments whose contents are reflected in technical documents. The IDB, on the other hand, deals with strategic themes relating to procurement as part of its general procurement policies (GN 2349-15 and GN 2350-15). In this sense, some themes and/or policies approved by the IDB in 2019 and already incorporated into the updated versions of the institution's procurement policies: Innovative purchasing; Sustainable purchasing; Gender, diversity, and climate

change; in addition to the importance of market knowledge in the procurement strategy developed by borrowers.

At the end of this document, some measures and actions are indicated that can mitigate possible differences and generate complementarity between the information.

### **III. ANALYSIS OF PROCUREMENT ARRANGEMENTS**

#### **A. Fiduciary Aspects (Procurement and Financial Management)**

The fiduciary principles and objectives of the IDB and IFAD are aligned to ensure that the financial resources managed by the respective institutions are used exclusively for the purposes for which the loan was granted, with due attention to economy and efficiency.

##### ***IDB Financial Management Principles and Guidelines***

*The Constitutive Agreement of the Inter-American Development Bank (IDB) establishes, among other things, that the Bank “shall take the necessary measures to ensure that the proceeds of any loan granted, guaranteed or participated in by the Bank are used only for the purposes for which they were granted, taking due account of considerations of economy and efficiency.*

*For the Bank, the term “project financial management” covers several systems, including budget, treasury, accounting and financial reports and internal and external controls. The guiding principles of financial management are legality, integrity, economy, efficiency, effectiveness and transparency.*

*The Bank understands that an adequate financial management system, among other things:*

- I. ensures that funds are used for their intended purposes, in accordance with the principles of economy and efficiency*
- II. ensures the accountability of the people and institutions responsible for its administration*
- III. produces reliable and timely information for decision making*
- IV. is subject to independent review and supervision by independent internal and external controls*

*Source: OP 273-12*

## B. Procurement Principles

The following are considered basic express principles that guide procurement policies:

By IFAD	By IDB
<ul style="list-style-type: none"> <li>• Ethics</li> <li>• Accountability</li> <li>• Competition</li> <li>• Fairness</li> <li>• Transparency</li> <li>• Efficiency, effectiveness and economy</li> <li>• Best value for money</li> </ul>	<ul style="list-style-type: none"> <li>• Value for money</li> <li>• Economy</li> <li>• Efficiency</li> <li>• Equality</li> <li>• Transparency</li> <li>• Integrity</li> </ul>

By analyzing the procurement policies of IFAD and the IDB, it is possible to infer that, expressly or tacitly, both institutions advocate equivalent principles that are fully aligned with each other.

The IDB adopts all IFAD principles and adds two more, which are Competition and Responsibility.

## C. Assessment of Fiduciary Management in Projects

**Concept Note and Design Phases.** Both Organizations carry out an assessment of Fiduciary Risk during the development phase in order to validate the updated inherent risk of the borrower and the Implementing Agency in various aspects: macroeconomic, institutional, political, taking as a reference a strategic institutional planning for the country.

- IDB: the bank proposes measures to mitigate procurement risks identified based on a general assessment of institutional capabilities.

- IFAD: carries out a risk assessment based on the OECD MAPS II Methodology, which covers both the national regulatory framework and institutional capacities at the project level.

**Implementation Phase.** Based on the risks identified during the design of the project (inherent risk) both Organizations propose an annual review of the established fiduciary management requirements. A new assessment is carried out based on Fiduciary Risk to understand the risk situation at the time of supervision, considering the full adoption of the proposed mitigation measures (residual risk).

**Review of Procurement activities.** During the implementation of projects, both Organizations review the Procurement Plan (PP) proposed by the Borrower to ensure that they are in accordance with the provisions of the Loan Agreement and respective Policies. The first Procurement Plan must cover an initial period of at least 18 months. The Borrower shall update the Procurement Plan annually as required. For the IDB, annual PPs must always cover the following 18 months of the project execution period. For both the IDB and IFAD, any proposal to revise the Procurement Plan must be approved by the respective institution. Some differences observed regarding reviews regarding procurement:

- IFAD: establishes criteria and value limits based on which documents and procurement activities must be submitted for prior review to IFAD, with its execution conditional on a statement of No Objection by the Organization. In addition, IFAD annually carries out on-site supervision missions to verify compliance with its requirements and policies in the implementation of the procurement cycle in project activities. For procurement, in particular, IFAD verifies in post review a sample of at least 10% of current contracts.
- IDB: for countries with a level of risk such as Brazil, the Bank generally works with supervision based on *ex post* reviews of procurement activities, except for specific cases such as direct contracting. In the IDB Manual, however, the obligation for supervision with a minimum sample was not identified.

#### **D. Analysis of requirements demanded by organizations**

In general, there is alignment on the main aspects to be observed in the implementation of procurement activities by the borrower. The preparation of previously approved Procurement Plans (initial 18-month PP and subsequent annual PPs) is required, which must be considered living instruments to be reviewed whenever necessary. The PP must be consistent with the Annual Workplan and Budget (AWPB). The main procurement methods follow the international standards. Alternative procurement methods are equivalent. The eligibility criteria are similar and carrying out due diligence for the conclusion and/or execution of contracts is required by both Organizations. An annual audit carried out by independent auditors is required within a defined deadline for delivery of the report, with severe sanctions applied in case of non-delivery. Supervision and prior review may be required in cases of identified risk. The use of national procurement systems are acceptable to the extent that they are consistent with the procurement guidelines of each organization. Specifically for Brazil, however, subnational projects are authorized to use only the national electronic method known as *Pregão*. Both IFAD and the IDB have their own computerized systems for monitoring procurement activities, which, however, have different management levels.

#### **IV. CONCLUSION**

Based on the above, it is possible to conclude that, in general terms, the procurement frameworks of IFAD and IDB are compatible. There is no substantial procurement regulatory gap between the two institutions. IDB's procurement standards and policies are consistent with IFAD's Procurement Guidelines. However, it is possible to adopt some complementary measures in order to mitigate the activity inherent risks, as well as strengthen the procurement strategy for the Project.

## **V. ADDITIONAL RECOMMENDATIONS AND ACTIONS**

### **A. Supervision:**

- **Strategic review by sampling.** Alignment with the IDB is recommended to ensure that IFAD annually carries out strategic supervision that includes a sample of at least 10% of contracts in implementation, with an emphasis on the main project contracts (big tickets). This supervision may be in person or virtual, to be defined later.

### **B. Align legal and normative instruments on:**

- **Obligation to preserve documents.** FIDA requires custody for ten (10) years after the last disbursement and IDB requires custody for three (3) years. Therefore, the custody of documents that are financed in whole or in part by IFAD will need to be kept for 10 years.
- **Self-certification on integrity and absence of conflict of interests.** IFAD requires the inclusion of the Integrity Self-Certification Form among the bidding documents required from bidders to enter into contracts under the Project. This document will be analyzed in the due diligence stage carried out by both institutions. It was agreed that the form will be inserted as an annex to the IDB notices, when the bid has FIDA resources in whole or in part.

### **C. Additional actions:**

- It is recommended that IFAD's channels for receiving and handling complaints (Ethics and AUO) are indicated in the Project's operational manuals and equivalent documents.

Report No. 6938-BR

Latin America and the Caribbean  
Programme Management Department

## Annex 27 PDR PROCASE II

## **I. Summary of Financial Management arrangements**

PROCASE II is a type C project with BID as the Cooperating Institution. IFAD participated in cooperation with BID design team, in the financial management assessment of the State Secretariat for Family Farming and Semiarid Development (SEAFDS) of the government of Paraiba, as implementing agency based in Jao Pessao. the State Agency for Research, Rural Extension and Land Regularization (EMPAER) will act as sub-implementer for activities under component 2 for activities related to land tenure. Within SEAFDS a dedicated PMU will be established in Joa Pessao with territorial offices. Fiduciary evaluation was carried out for both SEAFADS and EMAER which were shared and reviewed by Finance Officer IFAD.

The project is a second phase of the PROCASE I project. PROCASE I is still operational with financing from Government of Paraiba more than three years after its completion in December 2020 and maintains an active PMU and five field offices.

SEAFDS has an adequate structure for the Project with staff with experience in similar projects in particular the IFAD Financed PROCASE I and world bank financed COOPERAR project which is currently ongoing. The implementation approach for the project is decentralized with a large portion of financing used towards farmers organizations and cooperatives through the financing of Investment plans and business plans. Established manuals and standards are available for the financial management which include anti-corruption measures.

The overall conclusion is that the Project's financial management arrangements are satisfactory, but there is a need to increase the capacity of the finance team with two dedicated finance staff in the PMU to be established for the project, Training to finance staff on BID financial policies and procedures, ensure sufficient resources are allocated to the accompanying and monitoring the implementation and reporting on Investment plans and business plans and establish and document in the ROP clear criteria for recording and valuing government counterpart financing and producer organizations contributions.

The inherent Financial Management Risk was classified as Substantial with a residual risk of oderate with hiring as key staff, the no Objection to the PIM and the implementation of an automated reporting system as a condition for first disbursement included in the FA. Fiduciary risks were identified, and mitigation measures were proposed, as can be seen in item IV

## **II. Project financial profile**

The Project's estimated total cost is USD 100 million for a six-year implementation period. The financing plan comprises an IFAD loan (BRAM) of USD 10 million (9.5%), an IDB loan of USD 70 million (66.7%), and a contribution of USD 25 million (23.8%) from the Government of the State of Paraiba, covered by a Sovereign Guarantee from the Federal Government. IFAD financing will be applied proportionally to all components and subcomponents applying the parri passu mechanism in equal percentages.

## Annex 27 to the Project Design Report (PDR) PROCASE II

To avoid delays in project implementation it is important dates of entry force of IDB and IFAD financings are aligned.

Additionally, Project beneficiaries would contribute around USD 10 million, which has not been included in the total costs per IDB's standard practice but will be accounted for by the PMU as per the provision in the PIM and monitored by IFAD.

**Eligible disbursement categories:** The following table presents the eligible disbursement categories to be financed by the IFAD loan and the allocation of loan amounts to each category and the percentages of expenditure of the elements to be financed in each category. As this is a type "C" project, which will be administered by IDB, allocation will be by components same as financing agreement IDB to facilitate reporting and in accordance with the IFAD-IDB Coordination Agreement.

<b>Component</b>	<b>IDB</b>	<b>IFAD</b>	<b>State</b>	<b>Total</b>	<b>%</b>
1 - Resilient production systems to reduce rural poverty	42.28	6.04	15.10	63.42	60.4
2 - Organizational strengthening, capacity building and knowledge management	20.87	2.98	7.45	31.30	29.8
Project management, monitoring and evaluation	6.85	0.98	2.45	10.28	9.80
<b>Total</b>	<b>70.0</b>	<b>10.0</b>	<b>25.0</b>	<b>105.0</b>	<b>100.0</b>

Project management costs, including M&E, amount to USD 10.2 million, representing 9.8%. Every component will be financed proportionally by IFAD, IDB and the State of Paraiba. The recurrent cost for the project amount to USD 8.4 million which corresponds to 9.5% of total projects costs

IDB and IFAD may recognize as counterpart funding , up to US\$2.5 million (10% of the estimated total amount), eligible expenditures incurred prior to the date of loan approval, through SEAFDS and EMPAER, for the hiring of PMU staff, studies and appraisals, and services and equipment necessary for project management and implementation of component actions, provided that substantially similar requirements to those established in the loan agreement have been met. Such expenditures must have been incurred on or after July 5, 2023 (date of registration of the operation), but in no case shall expenditures be included that were incurred more than 18 months prior to the date of loan approval.

**Conditions for disbursement to be included in the FA:** i) opening of the designated account in US dollars; ii) appointment/selection of the PMU finance team; iii ) approved Project Operating Regulations (ROP); and iv ) signed contract with the IDB for the entire project execution.

### **III. Implementation Arrangements**

**IFAD-IDB collaboration:** The project is type C project with IDB as a cooperating institution. The IDB will be responsible for the fiduciary oversight of the project. The IFAD Financing Agreement (FA) will stipulate that IDB shall be the Cooperating Institution for the Project. A draft Coordination Agreement between IFAD and IDB has been prepared to ensure full alignment. Under the draft Coordination Agreement, IDB will coordinate with IFAD in advance the plans and TOR for supervision and other missions so that IFAD may contribute to the TOR and directly participate in the missions.

As for the other 2 Type C project in cooperation with BID in Brazil (PSI and PARCEIROS DA MATA) the following has been agreed:

- IFAD will accept IDB formats as equivalent to IFRs (detailed comparison of IDB format versus IFR template has been carried out)
- The project will upload the IDB reporting formats as IFRs in the Financial Execution Module in IFAD Client Portal (ICP)
- As per IDB procedures, reporting formats are not presented on a quarterly or semi-annual schedule. Instead, projects submit reporting formats when 60% of the advance has been utilized so timing depends on level of execution in the project. Advances are based on a 6-months forecast so that would mean reporting every 4-5 months. The project will submit IFRs in the Financial Execution module choosing the closest quarter.
- Details on reporting requirements as described above will be included in the ROP.
- A format has been developed in cooperation with FCD through which IDB will confirm advances are ready for disbursement / justification to be reflected in the IFAD finance system with the IDB financial reporting formats attached.

**Project Lead Agency:** The borrower of the Project will be the State of Paraíba, and the federal government will provide a sovereign guarantee. The executing agency will be SEAFD. The State Agency for Research, Rural Extension and Land Regularization (EMPAER) will be a sub-implementation agency and coordination will be ensured through a specific subsidiary agreement. A PMU will be set up at an identified separate public building and will be exclusively dedicated to the PMU. It will have a multidisciplinary team responsible for project implementation. The Project will also have 8 dedicated Regional Management Field Units (RMUs), on average one per 2 or 3 territories, to be defined during design. 3.1 The PMU will have, in addition to the central team in João Pessoa, territorial offices, which will have a technical team financed by the project and will be responsible for disseminating information, monitoring project actions and supporting the accountability of the plans with the organizations, among others. The number and location of the offices will be defined according to the geographical and territorial layout of the plans. The territorial offices will use the space available in the field units field units of EMPAER to build synergies and reduce administrative costs.

**Experience of the Project's Lead Agency:** Detailed Fiduciary assessment was of SEAFDS was carried out by the BID. The results of the fiduciary evaluation carried out by BID combines with experience from PROCASE Phase I are documents and summarized in the FMAQ. The BID design reports concludes indicate that that SEAFDS has experience in implementing programs financed by international agencies, most notably the recently completed PROCASE I, financed by an \$18 million loan from IFAD, however, it will need to use a PMU to ensure adequate capacity for financial management of the project.

**Description of implementation arrangements:** A dedicated PMU will be established for the project as a continuation of the PMU of the PROCASE I project. A dedicated finance team of two staff within the PMU will be responsible for financial management and ensure compliance with the financing agreement and the ROP. The unit will be responsible for: (i) maintaining formal communication with IDB on financial matters; (ii) Maintaining accurate and complete accounting records (iii) submitting justifications of expenditure disbursement requests; (iii) Preparation of annual financial statements and coordinating timely submission of external audit; (iv) coordinating monitoring and evaluation activities; (v) submitting documents required by IDB, such as: the consolidated program operational planning, the Financial Plan (FP), the Multi-Year Execution Plan (MIP), and financial and progress reports (vi) monitor execution and submit required reporting to IDB and IFAD. The PMU staff will include a dedicated financial specialist and an additional finance staff.

**Farmers Organizations** For the contracting and implementation of the Resilient Investment Plans and Business Plans (approximately 200 RIPs and 60 NPs), community organizations or cooperatives will be contracted respectively, for which SEAFDS will sign a legal instrument with each one establishing obligations and responsibilities in the execution of the plan, as well as the conditions for disbursements to the organizations, percentages and means of verification. The model of this legal instrument will be included as an annex to the ROP.

The SEAFDS will contract, through a competitive process, technical assistance services for the preparation of participatory diagnoses and the preparation and support for the implementation of the PIRs, while the cooperatives benefiting from the NP may contract specialized technical assistance for their design and implementation with project support.

**Other agencies involved:** The State Agency for Research, Rural Extension and Land Regularization (EMPAER) will land tenure regularization activities under Component II

#### IV. Financial Management Risk Assessment<sup>3</sup>

**Inherent risk.** The inherent risk is the risk that the project FM system does not operate as intended due to factors related to the environment in which the project is being implemented and that IFAD has a limited ability to control. At design stage, the inherent risk is assessed in respect of the inherent risk assessment pillars (three pillars) and project control risk assessment pillars (six pillars).

##### A. Project Control Risks

i. Project level	Timing Differences between signing of Financing Agreements BID and IFAD  Large amount of project funds used for financing of non-reimbursable investment and business plans  Decentralized implementation with third party entities involved in design and implementation and reporting on investment and business plans	S	Close Coordination between BID and IFAD during negotiations and on signing and approval of respective financing agreements.  PIM which includes clear provision around approval, disbursements and reporting on Investment and Business plans	M	
<b>A. Control risk assessment pillars</b>					
1. Organization and Staffing	i) risk of implementation delays if dedicated finance staff PMU is not hired in a timely manner; ii) Incompliance with finance policies and procedures and financing agreements if requirements are not well understood by PMU Finance Staff	S	Recruitment and appointment of key finance staff as a condition for fist disbursement in FA's BID and IFAD	M	(i) include budget for PMU finance staff in project budget; ii) During start up phase training on IDB and IFAD finance policies and procedures.
2. Budgeting	If the state's fiscal situation worsens, the budget allocated to the project could be reduced with as a result delays in implementation.	S	.	S	Close coordination with SEFAZ to ensure the availability of a sufficient budget from the start date of the Project.
3. Funds flow and Disbursement Arrangements	(i) Use of funds transferred to farmers organizations of funds under investment or business plans not for intended purposes. ii) Lack	S		S	Close coordination with SEFAZ to ensure the availability of a sufficient budget from the start date of the Project.

Annex 27 to the Project Design Report (PDR) PROCASE II

	of segregation of duties, in particular during the start-up phase, if the hiring of finance staff is delayed				
4. Internal Controls	i) Use of funds transferred to farmers organizations under investment or business plans not used for intended purposes. ii) Lack of segregation of duties, in particular during the start-up phase, if the hiring of finance staff is delayed	S	) Establish in the Program's Operational Regulations (ROP) clear mechanisms for the approval , disbursements and reporting on the use of funds transferred in the form of investment and business plan and include in agreements signed with producer organizations details of responsibilities and procedures. The approval of the Program's Operational Regulations (ROP), by IDB and IFAD as a condition for first disbursement; ii) Hiring of key finance staff as a condition for disbursement in FA; segregation of duties incorporated in the ROP.	M	
5. Accounting and Financial Reporting	(i) Reliance on Excel for preparation of Interim Financial Reports in Excel, resulting in human errors and delays in submission; ii) Delays or inadequate quality of reporting on use of funds from investment and business plans by farmers organizations and/or cooperatives; iii) Incomplete or delayed reporting of counterpart funding in particular since, as per IDB's standard practice, beneficiary contributions are not included in total project.	S	(i) Before the start of the Project and as a condition for disbursement in FA, implementation of a complementary automated reporting system similar to the SIGMA system used within the Worldbank financed Cooperar project, that generates basic financial statements and financial reports as required by IDB and accepted by IFAD as equivalent to IFRS and allows for budget monitoring	M	The ROP and agreements signed with farmers organization and cooperatives will establish a clear procedures for reporting on the use of funds transferred under investment and business plans (iii) Establish and document in the ROP a process for capturing beneficiaries' contributions in conjunction with M&E data, training of technicians, and clear criteria for recording and valuation of the same and ensure the technical assistance provided to producer organization includes support on administrative matters and reporting on use of funds.

			by component and categories based on data from the governmental SIAF system		
6. External Audit	Accounting standards used for preparation of audited financial statements not disclosed in audit opinion and/or notes	M		M	In coordination with BID ensure accounting standard to be used and disclosure of the same is included in TdR for external audits.
<b>Overall FM Risk @ design<sup>1</sup></b>		S		M	

## V. Financial Management and Disbursement Arrangements

### 1) **Financial management organization and staffing**

The SEAFDS finance team consists of qualified staff with extensive experience and knowledge of IFAD's policies and procedures from PROCASE Phase I. The PMU finance team will consist of at least 2 (two) professionals and will work in conjunction with the existing administrative structure of the SEAFDS. The team will require addition training on BID specific policies and procedures and the use of ICP for submission of financial reporting to IFAD. Budgeting

The PMU will be responsible for coordinating the planning process for the execution of program activities. The budget allocation resources are made available through SEPLAG - State Secretariat of Planning, Budget and Management of the Government of the State of Paraíba, based on a budget submission which includes the Annual Operating Plan (AOP) prepared by the project, detailing planned program activities and corresponding values for the year year.

After sending the budget submission, between September and November of each fiscal year, SEPLAG, through a letter sent to PROCASE/SEAFDS, informs the availability of budget allocation to be inserted in the SIOP system - Integrated Planning and Budget System, which feeds information for the formalization of the PLOA - Annual Budget Bill.

Once the information is entered into SIOP, SEPLAG sends the PLOA to the Legislative Assembly for its vote. Once finalized, the values will be entered in the SIAF system - Sistema Integrado de Administración Financiera del Estado, the system that manages the budget. This system is the financial and accounting system of the Government of the State of Paraíba.

SEAFDS will be responsible for securing the necessary resources in the Annual Budget Law (LOA) and the State's Multi-Year Plan (PPA) and the corresponding contribution of counterpart resources, throughout the duration of the project.. For each year, the SEAFDS will submit to the IDB, up to 60 days prior to its start, an Annual Operating Plan (AOP) containing the activities to be carried out, description of expenditures by component, category, sources of resources and implementation deadlines.

### 2) **Disbursement Arrangements and Flow of Funds**

<sup>1</sup> The Final Risk at design should reflect a combined consideration of inherent and control risks for the project.

## Annex 27 to the Project Design Report (PDR) PROCASE II

Disbursement arrangements and flow of funds: In accordance with the IFAD-IDB Coordination Agreement under a Type "C" project, financial management will be the responsibility of the IDB. Disbursements will be made in U.S. dollars, mainly in advance of funds, with the possibility of using the modality of reimbursement of payments to the executing agency, in agreement with IFAD and IDB. The value of advances of financing resources will be determined on the basis of a financial projection of 2 quarters and will be made in pari passu proportion of IFAD and IDB funds. For advances subsequent to

---

<sup>4</sup>The Final Risk at design should reflect a combined consideration of inherent and control risks for the project.

the first, it will be necessary to account for at least 60% of the accumulated balance of the currently unjustified advance.

The PMU will request disbursements of Loan resources through standard Disbursement Request forms, through the IDB's Electronic System - Online Disbursement (OD) and IFAD's Client Portal (ICP), in accordance with the delegation of authorized signatures communicated to the financiers. The financing resources disbursed by the IDB and IFAD will be deposited in a bank account in dollars (USD) for each financier, which will be managed by SEFAZ-BA and used exclusively to receive and manage the loan resources. In addition, a bank account in Brazilian reais (BRL) will also be opened for each financier, also for exclusive use of the loan resources, where the resources received in dollars will be internalized in Brazilian reais, in accordance with the Project's financial flow needs, with the objective of minimizing the loss due to exchange rate differential.

Payments to suppliers and producer organizations will follow the normal expenditure execution routines (commitment, liquidation, and payments), segregated with respect to IFAD and counterpart financing sources. These procedures will be carried out by SEAFDS's Financial Management in conjunction with the Financial Unit of the PMU

For purposes of justification of expenditures, the exchange rate used to convert expenditures incurred in reais (BRL) to dollars (USD) will be the exchange rate effective on the date of conversion from the currency of disbursement to the local currency (internalization rate).

Justifications will be provided through the presentation of Statements of Expenditures agreed with the IDB, which will contain, in addition to the description of the expenditure, date, value in local currency and value in USD, columns with the amounts in USD due to the IDB, IFAD and the counterpart. The expenditure ratio of IDB and IFAD funds must be maintained throughout project execution, unless formally determined otherwise. The same accountability forms shall be submitted to IFAD and IDB in the following form.

IDB will review all documentation relating to expenditures and movements in IDB's and IFAD's accounts, and following this review, IDB will notify IFAD, by letter, or other means agreed with IFAD, to confirm that it has reviewed and is satisfied that the request complies with the provisions of the Loan Agreements with the Borrower. Thereupon, both financiers will make disbursements to their respective designated accounts.

Transfers of resources to the RFOs will be made to specific accounts to manage the Project's resources. Each transfer will be authorized by the PMU and will not exceed 20% of the value of the respective plans. Replenishment of resources for the PRLs will be made as expenditures are incurred justified by approved the PMU. All resource transfers, replenishments and payment of invoices related to the execution of the Project will be made by the SEAFDS, subject to approval by the PMU.

### **3) Internal Controls and Internal audit arrangements**

All projects implemented by government entities including those at state level are subject to Law No. 4.320 which establishes the norms and principles for budgeting, accounting, and financial management within the public sector.

Internal Control will be ensured by establishing segregation of duties, reconciliation of accounts,

## Annex 27 to the Project Design Report (PDR) PROCASE II

approval levels for expenditures supported by opinions or other documents. Process flows are clear and well understood by SEAFDS staff. All budgetary and accounting transactions for the project will be carried out in the state public accounting system. All payments will follow routine commitment, settlement and payment. All project costs are recorded in accordance with SEAFDS's Chart of Accounts and are linked to a Project-specific revenue stream account, which allows for comparison and reconciliation with the project's own records recorded in the Government System. Internal Control is continuously complemented by the activities of the Comptroller General's Office (CGE). The PMU will provide details of roles, responsibilities and procedures in the ROP, which should also highlight the processes to be carried out by the RPOs, detailed procedures and guidelines for disbursements, transfers, approvals, commitments, payments and reports.

The internal audit is carried out directly by CEM through annual inspections by lot and indirectly by the legal department of SEAFDS and PGE, which reviews the contracts to be signed by the entity. IDB does not rely on the internal audit function of the institutions in charge of project implementation.

#### **4) Accounting Systems and Financial Reporting mechanisms**

Accounting Systems and Financial Reporting Mechanism: According to Decree Law 9.295/46, as amended by Law 12.249/10, the Federal Accounting Council (CFC) is authorized to establish accounting standards for the public sector. Federal, state and municipal governments are ultimately responsible for implementing public sector accounting standards, which currently follow a hybrid approach (accrual and cash basis). In 2015, the CFC reconstituted the Convergence Management Committee - which had already made the decision to converge Brazilian public sector standards with IPSASs issued by the IPSASB - through Law 112/2015 with the objective of further driving the convergence process. The convergence process started in 2017 and should be completed by 2024 (Source IFAC 2023).

The budget and accounting of the Project and SEAFDS are incorporated in the state of Paraiba SIAF system. All transactions will be processed SIAF system. The use of the SIAFI system is obligatory for payment processing and incorporates adequate measures to control user access based on user roles and responsibilities. The SIAFI system generates reports and financial statements that provide insights into the financial status and performance of government agencies but does not allow for monitoring of budgeting based on components and categories as is a requirement for IFAD and other external financing. The SIAFI system is designed to be interoperable with other government systems.

The accounting records of the Project's operations will be recorded separately and apart from other records that do not involve loan resources, through the Integrated Accounting and Financial Planning System - FIPLAN, The Project's Chart of Accounts will follow the one used in SEAFDS

The accounts will be rendered through the submission of Financial Reporting Formats as per IDB which have been reviewed and will be accepted by IFAD as equivalent to IFRS and will be submitted both to BID for review and to IFAD through the Financial Execution Module in ICP.

During the period of Project implementation, the Borrower shall submit to audited financial statements to IDB and IFAD, indicating the respective accounting standard adopted (within 120 days after the end of each fiscal year. The fiscal period of the Project comprises the period from January 1 to December 31 of each year.

Within SEAFZ, the SIGMA system was developed for the COOPERAR project financed by the Wordbank. This system is integrated with the SIAF system and allows for the automated generation of financial reports as required by the Workdbank PROCASE aims to cooperate with the COOPERAR project to build on the experience to build on the experience of the SIGMA system and develop a dedicated system for the PROCASE system to generate reporting required by BID/IFAD.

### 5) External Audit

In accordance with the IDB procedures set forth in the Instruction on Audited Financial Reports and External Audit Management, audited financial statements shall be submitted annually, no later than 120 days after the close of each fiscal period. The external audit will be conducted by an external firm acceptable to the Bank. Final EFAs for the program will be submitted no later than 120 days after the date of the last disbursement.

IDB aims to for the use of the Paraiba State Court of Account for the external audit of the project. The audit will be conducted in accordance with the ToR, which must also highlight the accounting standards adopted and include on-site visits to the PRLs .

TCE/BA normally performs audits in the scope of external projects with the State of Paraiba in accordance with INTOSAI. TCE/BA is accredited by the World Bank to conduct audits of its funded projects and therefore also qualifies for audits of IFAD projects.

During the period of execution of the Project, the Borrower must submit to the IDB and IFAD the audited financial statements, indicating the accounting standard adopted. (Implementation

## Readiness

**Table 3: FM Actions Summary: The actions needed to mitigate FM risks are summarised below:**

	<b>Action</b>	<b>Responsible Party / Person</b>	<b>Target Date / Covenants<sup>5</sup></b>
<b>1</b>	Final review and approval bby IFAD/BID of the Program's Operating Regulations (ROP)	SEAFDS	Condition for first disbursement as per POD- BID

Annex 27 to the Project Design Report (PDR) PROCASE II

<b>1A</b>	Establish and document in the ROP clear criteria for recording and valuation of government counterpart financing.	SEAFDS	Prior to entry into force
<b>2</b>	Hiring of finance specialist as part of the PMU established for the project	SEAFDS	Condition for first disbursement as per POD- BID
<b>3</b>	Training for SEAFDS and PMU staff on IDP financial policies and by IFAD on use of the ICP	BID IFAD FMD	During start-up
<b>5</b>	Before the start of the Project and as a condition for disbursement in FA, implementation of a complementary automated reporting system similar to the SIGMA system used within the Worldbank financed Cooperar project, that generates basic financial statements and financial reports as required by IDB and accepted by IFAD as equivalent to IFRS	SEAFDS	Condition for first disbursement or special covenant in Fa FIDA
<b>6</b>	Ensure that SEPLAN is firmly committed to ensuring the allocation of sufficient counterpart financial resources for project implementation. SEAFADS will ensure timely submission of request for fiscal space and counterpart funds to ensure sufficient and timely resources for Project implementation.	BID IFAD	Ongoing
<b>7</b>	Confirm appointment of State Court of Audit for external audits of the project and regular coordination with State Court of audit on planning of audit and Terms of Reference	BID	Annually

**FM Supervision plan**

Project supervision will be carried out by the IDB and will consist of assessing the implementation of financial management and performance mechanisms, identifying corrective actions, where appropriate, and monitoring fiduciary risks. IFAD supervision will be conducted on a desktop basis through review of IFRS (BID Formats accepted) BID Supervision Reports and audited Financial Statements. Based on results of desk reviews, IFAD may arrange for FMS/FO participation in on-site missions carried out by BID.

## Documento de trabajo

### I. INTRODUCCIÓN

ICO Brasil ha estado estableciendo alianzas institucionales con el fin de apalancar el financiamiento agrícola en beneficio de su público objetivo en Brasil. Entre estas alianzas se encuentra la alineación con la oficina local del Banco Interamericano de Desarrollo, un banco multilateral de desarrollo (BMD) vinculado a la Organización de los Estados Americanos (OEA).

El objetivo de este documento es identificar comparativamente los puntos asociados a la Gestión Financiera del FIDA y el BID y vislumbrar estrategias de mitigación de conflictos y asegurar su complementariedad. Este documento de trabajo pondrá especial énfasis en la compatibilidad de las normas de gestión financiera del FIDA y el BID.

**Base legal y normativa.** En esta evaluación se utilizaron los siguientes documentos que documentan los requisitos de gestión financiera:

FIDA
<ul style="list-style-type: none"><li>• Condiciones Generales para la Financiación del Desarrollo Agrícola</li><li>• Manual de gestión y control financieros de proyectos para prestatarios 2022</li><li>• Formato Carta sobre la gestión financiera del proyecto y las disposiciones relativas al control financiero</li><li>• Marco Conceptual relativo a la información Financiera y la Auditoría de los Proyectos financiados por el FIDA</li><li>• Manual operacional relativo a la información financiera y la auditoría de los proyectos financiados por el FIDA</li></ul>
BID
<ul style="list-style-type: none"><li>• Financial Management Guidelines for IDB-financed Projects (OP-273-12)</li><li>• BID Audited Financial Reports and External Audit Management Handbook – May 2018</li><li>• Instructivo de Desembolsos – Diciembre 2021</li></ul>

### II. COMPATIBILIDAD ENTRE GUÍAS

En general, no existen mayores contradicciones ni mayores incompatibilidades entre las normas de gestión financiera del BID y las directrices del FIDA, salvo algunos aspectos que mencionaremos en el punto D de este documento. Las principales diferencias entre las dos regulaciones radican más en términos de tiempo, gastos de cierre y sanciones, algunos

arreglos de auditoría, idioma del contrato. Al final del documento se encuentran las recomendaciones y acciones que se consideran necesarias.

### **III. ANÁLISIS DE ARREGLOS DE GF ENTRE AMBOS ORGANISMOS**

#### **A. Objeto del FM entre ambos órganos**

En relación con los objetivos y principios del FM del BID y el FIDA, están alineados y el enfoque principal es garantizar que los recursos de financiamiento se utilicen solo para los fines para los que se otorgó el préstamo, teniendo debidamente en cuenta la economía y la eficiencia.

##### **Caja #1**

##### **Principios y Directrices de Gestión Financiera del BID**

*El Convenio Constitutivo del Banco Interamericano de Desarrollo (BID) establece, entre otras cosas, que el Banco "tomará las medidas necesarias para asegurar que los recursos de cualquier préstamo otorgado, garantizado o participado por el Banco se utilicen únicamente para fines para el cual se concedió el préstamo, teniendo debidamente en cuenta consideraciones de economía y eficiencia.*

*Para el Banco, el término "gestión financiera de proyectos" abarca varios sistemas, incluidos el presupuesto, la tesorería, la información contable y financiera y los controles internos y externos. Los principios rectores de la gestión financiera son la legalidad, la integridad, la economía, la eficiencia, la eficacia y la transparencia.*

*El Banco entiende que un adecuado sistema de gestión financiera, entre otras cosas:*

- I. vela por que los fondos se utilicen para los fines a los que están destinados, de conformidad con los principios de economía y eficiencia*
- II. asegura la rendición de cuentas de las personas e instituciones responsables de su administración*
- III. produce información confiable y oportuna para la toma de decisiones*
- IV. está sujeto a revisión y supervisión independientes por parte de controles internos y externos independientes*

*Fuente: OP 273-12*

#### **B. Principios fundamentales de la FG entre ambos órganos**

Los principios rectores que rigen la gestión financiera del BID son: legalidad, integridad, economía, eficiencia, eficacia y transparencia.

Y del FIDA ; rendición de cuentas; competencia; capital propio; transparencia; eficiencia, eficacia y economía y aprovechamiento óptimo de los recursos.

Tenga en cuenta que, en realidad, los principios de ambas regulaciones son altamente equivalentes entre sí.

#### **C. Evaluación de GF en Proyectos realizada por ambas organizaciones**

**En el dibujo** Ambos Organismos realizan una gran cantidad de Evaluación Basada en Riesgo Fiduciario durante la fase de diseño con el fin de evaluar el riesgo inherente actualizado del prestatario y del Organismo Ejecutor en diversos aspectos: macroeconómico, institucional, político, tomando como referencia un plan estratégico institucional para el país.

**En Supervisión** . Con base en los riesgos identificados en el diseño y aplicación de medidas mitigadoras, ambas Organizaciones realizan una revisión anual de los requerimientos de gestión financiera establecidos. Se realiza una Evaluación Basada en Riesgo Fiduciario con el fin de conocer la situación de riesgo actual al momento de la supervisión. El FIDA realiza anualmente misiones presenciales de supervisión para verificar sus requerimientos y, en particular, verifica el 30% de la documentación de respaldo de los gastos justificados en el período anterior. De acuerdo con el Manual del BID, la supervisión se realiza generalmente sobre escritorio (\* por confirmar), siendo presencial únicamente en los casos en que el nivel de riesgo no sea satisfactorio.

A continuación se detallan los requisitos exigidos por cada institución:

LICITACIÓN	FIDA
<p>Elegibilidad de los gastos</p> <p>desembolsos</p> <p><i>Responsabilidad</i> _</p> <p>Supervisión financiera del proyecto</p> <p>Sistemas de información financiera de proyectos</p> <p>Controles internos</p> <p>auditores externos independientes</p> <p>Proyecto de Auditoría Financiera Externa (oportuna y anual)</p> <p>practicadas prohibidas</p> <p>Transparencia</p>	<p>Organización y Personal:</p> <p>Desembolsos y Flujo de Fondos:</p> <p>Contabilidad</p> <p>Sistemas Contables</p> <p>Reportes financieros</p> <p>Controles internos</p> <p>Auditoría</p> <p>Transparencia y Anticorrupción.</p>

#### **D. Análisis de los requerimientos de ambos organismos**

Hay un alineamiento general en varios aspectos que comentamos a continuación: Hay un requisito de una UGP, para puestos clave dedicados, un Manual de Procedimientos Financieros para el Proyecto, El requisito de un POA para guiar la implementación del proyecto está presente en ambos estándares. Los arreglos de desembolso son bastante similares: depósito en una cuenta designada; mismos métodos de desembolso; y también, como destaque, el nuevo mecanismo de desembolso del FIDA a realizarse en base a la IFR está en línea con la práctica adoptada por el BID. Los criterios de elegibilidad son similares y se permite la financiación retroactiva. Requerimiento de un Sistema de Contabilidad aceptable que permita el registro de las operaciones contables de planificación y reporte. El contenido de los informes es compatible entre ambas instituciones y la necesidad de justificar oportunamente los gastos

incurridos. Los controles internos requeridos son similares, en particular el cumplimiento de los requisitos legales. Se exige la realización de una auditoría anual por parte de auditores independientes y en un plazo definido para la entrega del informe, con aplicación de severas sanciones en caso de no entrega. Supervisión y actuaciones *ex ante* en los casos de riesgo identificado.

**Caja No. 2**

**Requisitos de gestión financiera del proyecto del BID**

**Requisito 1. Elegibilidad de los gastos**

Los gastos financiados con recursos de la operación (bancos o fondos de contrapartida) son elegibles siempre que: i) sean necesarios para el proyecto y estén de acuerdo con sus objetivos; ii) cumplir con las políticas y acuerdos legales aplicables del Banco; y iii) estén debidamente registrados y soportados adecuadamente en los sistemas del prestatario y/o del EA.

**Requisito 2. Desembolsos**

El Banco aceptará las solicitudes de desembolso realizadas por el prestatario, OE y/o co-ejecutores de acuerdo con el plan financiero del proyecto, con base en un plan operativo que sea consistente con las actividades, tiempos y costos necesarios para alcanzar las metas y resultados que asegurará que se alcancen los objetivos del proyecto. La necesidad de recursos económicos vendrá determinada por un plazo máximo a convenir entre las partes.

**Solicitud 3. Rendición de cuentas**

El banco requerirá periódicamente una justificación del uso de los recursos del proyecto, lo que, en el caso específico del anticipo de recursos, involucra un alto porcentaje de los recursos acumulados pendientes de justificación. El Banco no otorgará más anticipos de fondos hasta que se presente tal justificación.

**Requisito 4. Supervisión Financiera del Proyecto**

Las operaciones financiadas por el BID están sujetas a la supervisión del Banco, a través de diferentes mecanismos de seguimiento y evaluación, en cualquier etapa de su ejecución, ya sea por personal propio o por terceros aceptados por el Banco.

**Requisito 5. Sistemas de información financiera del proyecto**

El prestatario y/o la EA deberán mantener un sistema de información financiera aceptable para el Banco que permita el registro contable y financiero, la gestión del presupuesto y la información financiera y de otro tipo relacionada con el uso de los recursos financiados por el Banco y otras fuentes de financiamiento del proyecto.

**Requisito 6. Controles Internos**

El prestatario y/o el EA identificarán, evaluarán y gestionarán los riesgos asociados con el proyecto. Así, el prestatario y/o el EA se comprometen a que los fondos del proyecto se gestionen en un entorno de control.

internos y aceptables para el Banco, incluyendo: i) el uso efectivo de los recursos del proyecto; ii) confiabilidad de los informes financieros; y iii) el cumplimiento de los requisitos legales

**Requisito 7. Auditores Externos Independientes**

El Banco identificará auditores externos calificados para realizar auditorías de proyectos financiados por el BID, y el prestatario y/o el OE seleccionará y contratará auditores, según corresponda, de conformidad con los términos de referencia previamente acordados entre el prestatario y/o el EA y el Banco, que establecen el tipo de revisión, su plazo y alcance. El Banco también podrá seleccionar y/o contratar a los auditores externos cuando: i) los beneficios de esta decisión superen los costos para el prestatario y/o la EA en la realización de este proceso y la gestión del servicio correspondiente; hay acceso limitado a los servicios de auditoría externa en el país; o iii) circunstancias especiales que justifiquen la selección y contratación de auditores por parte del Banco.

**Requisito 8: Auditoría financiera externa del proyecto.**

*El informe de auditoría financiera externa deberá ser presentado al Banco dentro del plazo acordado entre las partes, contado a partir de la fecha acordada de cierre del ejercicio fiscal del proyecto. La falta de presentación de los informes de auditoría externa requeridos da lugar a la suspensión de los desembolsos para el*

*transacción correspondiente, de acuerdo con los procedimientos del Banco.*

**Requisito 9: Prácticas Prohibidas.** *Las prácticas prohibidas incluyen prácticas corruptas, fraudulentas, coercitivas, colusorias y obstructivas, tal como se definen en los Procedimientos de Sanciones del Banco.*

**Requisito 10: Transparencia.** *El Banco está comprometido con la transparencia en todos los aspectos de sus operaciones y divulga documentos e información que produce o tiene en su poder que no están incluidos en la lista de excepciones a la Política de Acceso a la Información.*

#### **IV. RECOMENDACIONES Y ACCIONES**

Con base en lo anterior, es posible generar las siguientes recomendaciones y acciones a observar:

##### **A. Alinear los instrumentos contractuales sobre:**

1. **la obligación de conservar los documentos** . FIDA requiere custodia por diez (10) años después del último desembolso y BID requiere custodia por tres (3) años.
2. **realización de la RMT.** El FIDA se desempeña a la mitad del tiempo de ejecución y el BID se desempeña después del 50% del uso de los fondos .
3. **Periodo de cierre:** 4 meses para el BID y 6 meses para el FIDA . Cabe señalar que este alineamiento se refleja en la entrega del Informe de Auditoría Final y el Informe de Terminación del Proyecto.
4. **Financiamiento retroactivo** . El BID permite gastos incurridos hasta 18 meses antes de la aprobación de su Directorio Ejecutivo. FIDA permite la financiación retroactiva siempre que se refleje como tal en el Acuerdo Financiero desde el momento de la aprobación del diseño por parte de QAG.
5. **TdR de auditoría** . El FIDA normalmente requiere que los auditores visiten a los beneficiarios y las organizaciones de productores rurales que ejecutan fondos descentralizados.
6. **Sobre el idioma del acuerdo de financiación** . Normalmente, el BID adopta el convenio de financiamiento en portugués, que no es el idioma oficial del FIDA, como documento original.
7. Se recomienda que en los manuales de ejecución del Proyecto se incluyeb los medios de comunicación con los sectores del FIDA relacionados con ombudsman y anticorrupción.

##### **B. Acciones adicionales:**

1. **Se recomienda al FIDA que se abstenga de permitir gastos en el período de cierre.** Excepto gastos de auditoría y pago de gastos incurridos durante el período de ejecución del proyecto. Para ello no es necesario ningún ajuste contractual, prevaleciendo el recomendado por el BID.

#### F. Reports

##### 1. Semi-annual Progress Report (RSP)

- 8.26 The purpose of this report is to present to the IDB and IFAD the results achieved by the Borrower in the execution of the AWPB and the PP, as well as the expenses incurred and the request for and release of funds.
- 8.27 The Progress Report for the second half of the calendar year should summarize the results achieved by Component and Subcomponent (partial and total, where applicable) and analyze the risks identified. It should also present a consolidated view of the difficulties and lessons learned, as well as conclusions and recommendations aimed at feeding back into the project. These reports will be drawn up in a format agreed with the Bank and must be submitted no later than 60 days after the end of the corresponding six-month period.
