## MEMO for Cofinancing “Type C” Projects

**TO:** OPR Secretariat

**THROUGH:** Rossana Polastri  
Regional Director, LAC

**FROM:** Arnoud Hameleers  
CPM, Brazil

Luiz Claudio Marques Campos  
PTL

**DATE:** 05/09/2024

**SUBJECT:** Paraiba Rural Sustainable Development Project

### In line with IFAD mainstreaming commitments, the project intends to qualify as:

Be gender transformative  Be youth sensitive  Be nutrition sensitive  Prioritize persons with disabilities  Prioritize indigenous peoples  Include climate finance  Build adaptive capacity

### Introduction

1. The Paraiba Rural Sustainable Development Project (PROCASE II) is a collaborative effort by IFAD and the Inter-American Development Bank (IDB), in response to a request by the Government of the State of Paraiba, Brazil, to scale up the successful Cariri and Seridó Sustainable Development Project (PROCASE), which was completed on 31/12/2020 and had an overall completion rating of 5 for the project completion report).
2. This type-C project was jointly designed and will be cofinanced by loans from IDB (US\$70 million) and IFAD (US\$10 million) under the Borrowed Resources Access Mechanism (BRAM), along with a counterpart contribution from the State of Paraiba (US\$25 million). The total investment will be US\$105 million, and the project will be implemented over six years.
3. The project's borrower will be the State of Paraiba, and the federal government will provide a sovereign guarantee. The executing agency will be the Secretariat of Family Agriculture and Semiarid Development (SEAFDS). The Rural Extension, Research and Land Regularization State Agency (EMPAER) will be the project's sub-executing agency. See specific annex 23 on the diagnosis of rural Paraiba.
4. **IFAD-IDB collaboration:** IFAD and IDB signed a memorandum of understanding on 31 May 2024 as a framework for cooperation. This will be the third type-C project cofinanced with IDB in Brazil, after the Piauí Inclusive and Sustainable Project (PSI) which entered into force in November 2023 and the Sustainable Development of the Atlantic Forest Project (Parceiros da Mata) approved by the Executive Board in June 2024. This demonstrates the strong collaboration that IFAD has built with IDB in Brazil, with a total volume of US\$402.5 million and leveraging external cofinancing from IDB of US\$270 million. All three projects are with state (subnational) governments. State governments asked IFAD for new project operations, building on previous successful projects and aiming to scale up activities with larger financial volumes. Due to limited financial resources allocated by IFAD to Brazil under BRAM and the high demand for IFAD operations in the northeast region, IFAD invited IDB to participate in the project design and cofinance the initiatives. Through these projects, IFAD has introduced IDB to rural development in northeast Brazil, as IDB had very limited operations in the country in this area.
5. In the IDB-IFAD collaboration in Brazil, IDB normally takes the lead in fiduciary aspects, water, sanitation, infrastructure and safeguards, while IFAD takes the lead in areas such as productive inclusion, mainstreaming themes and technical assistance. IDB recognizes IFAD's expertise and knowledge in rural development in northeast Brazil, which is clearly reflected in the project's design, highlighting significant IFAD influence. While the project design follows the IDB template, it fully integrates IFAD's priorities and mainstreaming themes, including core indicators and targeting methodologies. Specific gap analyses were prepared in areas related to procurement (annex 26), financial management (annex 27) and SECAP (annex 5).
6. **IFAD's programmatic approach in northeast Brazil:** IFAD is developing a large portfolio in northeast Brazil totalling US\$1 billion by leveraging considerable cofinancing from various partners. Therefore, the Fund has become a central actor in the region. These interventions range from (i) state-level (PSI in Piauí, PROCASE II in Paraiba, PPF II in Ceará, Parceiros da Mata in Bahia, and PAGES in Maranhão); (ii) regional, through PCR/P/Sertão Vivo, IFAD's first project with a national development bank, with cofinancing from the Brazilian Development Bank and the Green Climate Fund, and which will be scaled up through additional financing; (iii) federal (at the regional level) with PDHC III, mainly with technical assistance and policy dialogue; and (iv) local innovative initiatives on climate and biodiversity actions (PAGES and CompensACTION). A first non-sovereign operation is being prepared in Brazil targeting IFAD's first credit lending with a well-established cooperative bank. This programmatic approach positions IFAD as a key player in rural development in the country.

## 7. Project Description

8. The **overall objective** of the project is to reduce rural poverty levels, improving food and nutritional security and strengthening the rural population's climate change adaptation capacities.
9. The **specific objectives** are:
  - I. Increase the adoption of agricultural technologies that contribute to climate change adaptation and mitigation
  - II. Improve the productive and social inclusion of family farmers, prioritizing women, youth, traditional peoples and communities (TPCs) and persons with disabilities
  - III. Improve the environmental conditions of rural communities and their surroundings
10. These objectives will be achieved by implementing interconnected activities that aim to change the individual, organizational and inter-institutional capacities of the beneficiaries. The project will have two interrelated components:

**Component I: Resilient production systems to reduce rural poverty.** This component will make investments to improve income, food security and nutrition, adapt production systems to climate change and protect the natural resource base. Productive investments will be made in rural communities and processing units (cooperatives). All activities will especially target women, youth, persons with disabilities, LGBTQIAPN+ and families from traditional communities, with activities planned specifically for these groups. See additional annex 10 and annex 11 on component 1.

**Subcomponent 1.1: Implementation of resilient and biodiverse production systems.** Investments will be made through resilient investment plans (PIR), which will be the instrument for planning and implementing this subcomponent's resources. Resilient investment plans will promote the recovery and implementation of polyculture areas and agricultural agroforestry systems, seeking to intensify biomass production and agricultural production to reduce vulnerability to extreme climate events. At the same time, it will promote the implementation/strengthening of animal production units adapted to the context.

**Subcomponent 1.2: Strengthening and diversifying commercialization.** Business plans (PNs) will be the main instrument for implementing this subcomponent and will be drawn up with producer organizations, usually cooperatives. The business plans should make it possible to finance the structuring of investments and include producers who benefited from the resilient investment plans.

**Subcomponent 1.3: Incentives for innovation.** Equipment, machinery, inputs and products and/or implements developed or adapted to meet the demands and needs of family farmers.

**Component II: Organizational strengthening, capacity-building and knowledge management.**

11. This component will invest in strengthening family production units, ensuring that activities are carried out to assist families individually and collectively, and presenting the main public policies available in the country. Technical assistance and rural extension services will support the preparation and implementation of the resilient investment plans. Specialized technical assistance will especially target the business plans and strengthening the capacities of beneficiary organizations. This includes activities that seek to strengthen commercialization by creating participatory guarantee systems for agricultural products and establishing fairs and commercialization centers.
12. Farmers will have access to services related to land titling and environmental regularization (Rural Environmental Registry - CAR), which will improve the security of land and means of production.
13. The knowledge gained will be recorded and disseminated through knowledge management activities and publications, as well as through exchanges and South-South and triangular cooperation.
14. All the activities will particularly target women, youth, persons with disabilities, the LGBTQIAPN+ community and families of TPCs, such as Quilombolas and Indigenous Peoples, with activities planned specifically for these groups. Beneficiaries will receive information and investments to improve nutrition and food security. See additional annex 12 on component 2.

**Subcomponent 2.1: Strengthening family farmers' capacities.** This subcomponent will work to strengthen families' capacities, considering the weaknesses identified in areas such as production processes; the environmental sustainability of production and the broader landscape; the protection and recovery of threatened natural resources; organizational and governance issues; administrative and financial management issues; commercialization; and access to public policies. This subcomponent's main activities will be done by contracting agroecological technical assistance services, which will elaborate and implement the resilient investment plans under subcomponent 1.1.

**Subcomponent 2.2: Strengthening organizations' commercialization capacities.** This subcomponent will strengthen the capacities of beneficiary organizations such as cooperatives, prioritizing assistance for better business management, processes and commercialization. Its main activities will be done by contracting specialized technical assistance services, which will elaborate and implement the business plans of subcomponent 1.2.

**Subcomponent 2.3: Diversity, gender, youth, nutrition and food security.** The gender, diversity, nutrition and PCT Plans will finance activities to promote gender equality and women's empowerment, as well as the social inclusion and empowerment of Afro-descendants, TPCs, the LGBTQIAPN+ community and persons with disabilities. Activities included in each plan are summarized in the "IFAD's Mainstreaming Areas" section and detailed in annex 12 on component 2.

**Subcomponent 2.4: Land and environmental regularization.** This subcomponent will finance activities to promote the guarantee of ownership and the right to property of the land occupied by farming families and traditional communities located in the area covered by the Project, providing legal security and access to public policies, seeking to promote social inclusion, cultural preservation and environmental sustainability of the territories occupied by these populations<sup>[1]</sup>.

**Subcomponent 2.5: Knowledge management and South-South and triangular cooperation.** This sub-component will support the organization and systematization of knowledge materials, as well exchanges and knowledge-sharing through South-South and triangular cooperation in Brazil, Latin America and Africa. The aim is to visit successful experiences and share the methodology and results achieved during the project's implementation. See additional annex 25 on knowledge management, South-South and triangular cooperation and innovation.

15. The two project components are intrinsically interconnected (see also annex 9). Resilient investment plans and business plans are the main instruments that channel resources to improve production systems and adapt them to climate change, protect the natural resource base and diversify commercialization to benefit family farmers and their organizations. Component 2, in turn, will provide differentiated technical assistance services to support the preparation and correct implementation of these plans considering the specific needs and demands of the target groups. Additionally, component 2 will benefit family farmers and rural communities through capacity-building activities to better access and benefit from available public policies and services related to land titling and environmental regularization, enhancing the effectiveness of investments made in component 1.
16. **Project Management, Monitoring and Evaluation (M&E).** This component will finance project management, monitoring and evaluation, exit strategy and auditing activities. The PMU cost is included under this component and will largely rely on the capacities of the PROCASE I PMU team. The state government of Paraíba has continued to fund the PMU with its own resources since the end of PROCASE I in December 2020 which means the PROCASE PMU is fully operational. This experienced PMU team provided crucial support in the design. The state government has made a commitment to continue funding the PMU until the entry into force of PROCASE II and the team is expected to continue in PROCASE II, provided they go through a selection process based on agreed terms of reference (TdRs), for details see Annex 6 – PIM/ROP.
17. During the main design, the project design team decided to reverse the order of components 1 and 2 of the project concept note to improve the flow and clarity of activities.

## Rationale for IFAD's Engagement in Co-financing and IFAD's Value Added

18. The Project consolidates IFAD's evolving engagement with Brazil as an upper-middle-income Country, with a specific niche operation in the northeast region, maintaining IFAD's solid targeting and inclusion approaches while introducing innovative actions to differentiate IFAD as a partner. This means IFAD provides a small loan but attracts major cofinancing from external and domestic sources while directly influencing the project's overall design and scaling up its operation with a solid legacy on mainstreaming themes. IFAD also introduced a major player in rural development in northeast Brazil (IDB), which, before collaborating with IFAD, had no rural development operation in the region in rural development. As a result, IFAD has increased traction for more investments in rural development in the poorest region of Brazil. IFAD maintains its niche in northeast Brazil where it has built considerable knowledge and a network of partners while targeting the most vulnerable groups, such as women, youth, TPCs, the LGBTQIAPN+ communities and persons with disabilities. Finally, this type-C project reduces the burden on IFAD, as IDB leads support and supervision missions.
19. **Scaling IFAD operations in Paraíba:** The Project will scale up IFAD's sustainable agricultural development approach through partnerships with rural organizations in the State of Paraíba, expanding from the previous 56 municipalities in the semiarid in phase I to encompass the entire state, covering 223 municipalities in both the semiarid and Atlantic Rainforest (see additional annex 19 on lessons learned and linkages between PROCASE phases). The partnership will have the following implications for IFAD: (i) leveraging major additional resources to invest in rural people, applying its development priorities and experience to this cofinancing and consolidating its partnership with IDB; (ii) expanding IFAD's intervention and modus operandi while also benefitting from IDB in fiduciary aspects, safeguards and knowledge on water and sanitation issues; (iii) building on IFAD's experience in small-scale investments (social technologies), such as cisterns, biodigesters, fuel-efficient cookstoves and renewable energies; (iv) increasing outreach geographically and in terms of total beneficiaries; (v) increasing public investments in social inclusiveness and sustainability aligned to public programmes; (vi) reducing administrative costs for design and supervision; (vii) enhancing knowledge management and South-South and triangular cooperation; and (viii) cementing IFAD's partnership with the State of Paraíba.
20. IFAD is widely recognized as a strategic partner of the Paraíba state government. Its comparative advantage is based on (i) successful models of targeting rural communities in poverty and vulnerability, and differentiated approaches to priority groups such as youth, women and TPCs, such as Quilombolas and Indigenous Peoples; (ii) providing a wide range of proven and innovative solutions to improve the productive capacities and climate resilience of family farmers; (iii) continuous technical assistance involving public and private entities to foster resilient agroecological practices, including the adoption of digital technologies; (iv) investing in social technologies with proven effectiveness for access to water, sanitation and renewable energies suited to the conditions of vulnerable communities in the semiarid region; (v) innovative approaches with partners of the private sector and non-governmental organizations to bring commercialization innovations to cooperatives, including the use of digital technologies, and to add value to sustainable products from the semiarid region; and (vi) IFAD has been recognized in Brazil for its work and focus on mainstreaming themes, especially in the area of youth, nutrition, gender and climate finance. IFAD will apply this experience to PROCASE II to support the adoption of sustainable and resilient production practices that promote environmental conservation, food security and nutrition and income generation while reducing rural poverty. In addition, IFAD's Office in Salvador is widely recognized for its performance in project identification, design, supervision and partnerships, as demonstrated in the country portfolio.

## Lessons Learned

21. The lessons learned from IFAD's portfolio in Brazil are highly valued by the Government of Paraíba and the IDB (see additional annex 19 on lessons learned and linkage of PROCASE phases I and II):
1. **Flexibility:** During the implementation of PROCASE I, IFAD met unforeseen challenges with flexibility and proactiveness, thus allowing a timely response to the most severe drought of the last century in the project area, a profound economic recession, a reduction in public support programmes for family farming and the COVID-19 pandemic.
  2. **Implementation readiness:** An experienced team is crucial for rapid project start-up, especially for planning, procuring and preparing community plans. Enabling core PROCASE project management unit staff to continue while adding new staff with other areas of expertise will build a solid basis for the project's implementation.
  3. **Knowledge management:** The State of Paraíba highly appreciates IFAD's support for knowledge management, especially through its partnership with institutions such as the Brazilian Agricultural Research Agency (EMBRAPA) and the Semi-Arid National Institute (INSA).
  4. **South-South and triangular cooperation:** PROCASE I gathered positive experiences with exchanges with other countries, and this was incorporated in the project's design. For example, PROCASE I received technical visits from Mexico, Argentina, Bolivia and Colombia in Latin America, and from Botswana, Lesotho and Zambia in East Africa. See additional annex 25 on knowledge management, South-South and triangular cooperation and innovations.
  5. **Monitoring and evaluation:** Strong evidence-based data and information are key to shed light on the project's implementation, the identification of new operations and policy dialogue. It also serves to make the case for IFAD-type interventions and was critical for the preparation of phase II.
  6. **Policy dialogue:** IFAD's constant dialogue with state authorities and other partners such as non-governmental organizations has strengthened the relationship with policymakers and allowed many PROCASE I innovations to be applied in public support programmes, such as the agroecological logbooks. PROCASE II will also influence public policies directly through its innovations. It also facilitates the alignment of PROCASE with federal and state public programmes.
  7. **Supervision consistency:** the IFAD office in Salvador played a critical role in policy dialogue and maintaining close collaboration and supervision of projects. It was decisive in identifying PROCASE II and elaborating its design in collaboration with IDB. Maintaining a team of key consultants for project supervision and implementation support has built consistency, trust and contextualized knowledge. This ensures quality engagement and results in project implementation and responses to crises.
  8. **Locally based technical assistance:** Working with local civil society organizations with expertise and knowledge of the local reality has allowed PROCASE I to benefit from their experience and expertise, and to build local implementation capacities. This is particularly useful in agroecology, gender transformation and youth inclusion, along with the work in rural communities. It is even more important with a new project area like the Atlantic Rainforest.
  9. **Access to water resources and "social technologies":** The experience of PROCASE I and IFAD's portfolio in Brazil has shown the importance of meeting families' needs for clean water for human consumption, especially in the context of climate change. It has also proven the importance of social technologies for climate resilience, such as cisterns for rainwater catchment, biodigesters, fuel-efficient cookstoves and greywater reuse systems. PROCASE II will seek to apply these solutions and expand them with other innovative sanitation technologies that improve people's health and nutrition and reduce environmental degradation. See additional annex 11 on social technologies.
  10. **Market access:** Productive investments need to be complemented with commercialization as the project will work with products in consolidated value chains such as honey and cashews. The experience built in phase I with organic cotton, for example, and its partnership with the private sector will serve as a reference for expansion and replication.
  11. **Local development agents:** PROCASE I has employed youth from the communities as local development agents. As part of the project team, these agents supported local implementation by strengthening local organizations while ensuring community ownership, proximity and trust. This model will be enhanced and replicated through PROCASE II.
  12. **Agroecological approach:** The agroecological approach adopted by family farming in Paraíba, recognized through PROCASE I, will be further advanced by PROCASE II (see additional annex 24 agroecology in IFAD Brazil). Phase II will promote a holistic approach including practices such as agroforestry, diversification, ecosystem restoration and efficient recycling to reduce reliance on external inputs. Agroecology will help mitigate climate change's impacts and ensure a greater variety of nutritious food.
  13. **Automated Reporting System:** Implement before the start of the project a complementary automated reporting system which generates basic financial statements, required financial reporting as required by BID based on data from governmental system to reduce reliance on manual reporting in excel avoid human errors and delays in reporting.
  14. **Counterpart Funding:** Establish and document in the project implementation manual, a process for capturing beneficiaries' counterpart in conjunction with M&E data and clear criteria for recording and valuation of the same.

## Contribution to SDGs and alignment with country sector and IFAD objectives

22. PROCASE II will contribute directly to the United Nations Sustainable Development Goals (SDGs) by supporting agroecological, resilient and sustainable production systems of poor and extremely poor family farmers and promoting a consistent food security and nutrition strategy. In particular the SDGs: 1 (No poverty), 2 (Zero hunger), 4 (Quality education), 5 (Gender equality), 6 (Clean water and sanitation), 10 (Reduced inequalities), 12 (Responsible consumption and production), 13 (Climate action) and 15 (Life on land). By adopting an approach focused on climate adaptation, nutrition, gender and youth, as well as a focus on rural populations in situations of poverty and vulnerability, the project aligns with the priorities and commitments of IFAD13. The project is also aligned with the three goals of the IFAD Strategic Framework 2016-2025 and the cross-cutting priorities linked to gender, youth, indigenous peoples, persons with disabilities, nutrition and climate change.
23. The project is strongly aligned with the United Nations Decade for Family Farming 2019-2028 and the National Action Plan, recognizing the enormous contribution of family farming to the achievement of the 2030 Agenda for Sustainable Development and the role that family farming plays in improving nutrition and ensuring global food security, eradicating poverty, ending hunger, conserving biodiversity and environmental sustainability.
24. The project is also aligned with the United Nations Sustainable Development Cooperation Framework (UNSDCF) 2023-2027. The current UN cooperation framework for Brazil extends from January 2023 to December 2027. It relies on the Federal Pluriannual Plan (PPA) as a primary reference document, which enhances the alignment of the UN system's initiatives with the country's development priorities. While the framework is nationally owned and monitors the 2030 agenda at a national level, its guiding principles are reflected in PROCASE II, as well as the set of five strategic priority areas identified (i) Economic Transformation; ii) Social Inclusion; iii) Environment and Climate Change; iv) Governance and Institutional Capacity; and v) Conflict Prevention and the relation between Humanitarian actions, Development actions and Peacebuilding Efforts.
25. PROCASE II will contribute to the three strategic objectives established in IFAD's new country strategic opportunities programme (COSOP) in Brazil 2024-2029. PROCASE II was designed simultaneously with the new COSOP preparation, and it will contribute to the achievement of three strategic objectives (SOs): SO1 (Improve sustainable agricultural production, food security, nutrition and market access with a focus on environmental and climate sustainability), through component 1 and 2; SO2 (Enhance public policies and programmes through evidence-based revision and scaling of best practices), through component 2 and project management, monitoring and evaluation; and SO3 (Strengthen the capacities of government institutions and organizations of the rural poor to drive inclusive and sustainable rural development), through components 1 and 2. PROCASE II will contribute to the COSOP because it will strengthen and transform family farming systems in the northeast through approaches that are environmentally sustainable, resilient and guarantee food security and nutrition for families, especially by: (i) enhancing agricultural production, food security, nutrition and access to markets; (ii) improving rural development and rural poverty reduction public policies; and (iii) strengthening the capacities of farmers' organizations. The project took full advantage of the preparation of the new Brazil COSOP and its strategic directions, especially its preparatory thematic studies and stakeholder consultation process.
26. **Public programme linkages:** The project's proposed interventions will not be carried out in isolation. Rather, they are integrated with public programmes at the federal and state levels: The National Program for Technical Assistance and Rural Extension in Family Farming and Agrarian Reform (PRONATER), the National Program for Strengthening Family Farming (PRONAF), the Food Acquisition Program (PAA), the National School Feeding Program (PNAE), the Cistern Program, the National Policy for the Sustainable Development of Traditional Peoples and Communities, and the National Plan for the Promotion of Citizenship and Human Rights of LGBTQIA+ people. It also aligns with the National Plan for Agroecology and Organic Production (PLANAPO), which is currently being developed. IFAD has been invited by the General Secretariat of the Presidency of the Republic to participate as the only international organization.
27. In addition to the programmatic synergy, various PROCASE activities will positively influence the abovementioned programmes by, for example, developing capacity-building activities for public and private technical assistance providers on agroecology and climate change, implementing more structured and long-term technical assistance schemes for families (in a context of low coverage and sporadic actions), helping families and communities to effectively access programmes and policies, and enabling more flexible and agile investments in productive infrastructure and innovations that can be scaled up in the future.
28. Moreover, the project will use the legal frameworks of public policies (such as technical assistance and water access) and mobilize activities of other partner state secretariats.
29. The high rating for PROCASE II by the Commission for External Financing (COFIEX) is evidence of its strong alignment with federal policies. The project was approved as a number 1 priority by the federal government.
30. At the state level, the Project is fully aligned with the strategic guidelines of the Paraíba State Government and it is an integral part of the new **Pluriannual Plan (PPA)** under the Sustainable and Competitive Economy Program. The PPA 2020-2023 has defined strategic axes that guide its main lines of activity. Two axes directly relate to PROCASE II: Strategic Axis 2 - Paraíba Developed, Sustainable, and Integrated and Strategic Axis 3 - Paraíba Innovative, Creative, Intelligent, and Strategic. PPA Guidelines II and III indicate the government will support the creation of innovative regional environments in line with local vocations, assets, and productive arrangements and foster water-environment management with the improvement of essential public services. Regarding Gender, PROCASE II is aligned with the **Women's Entrepreneurship** state policy - a line of credit created by the Government of Paraíba in partnership with the State Secretariat for Women and Human Diversity to provide the dignity of women in situations of social vulnerability, promote their economic autonomy and foster women's leading role in entrepreneurship. Regarding youth, PROCASE is also aligned with the **Inclusive Paraíba Program**, coordinated by SEAFDS and run by EMPAER, whose main objective is to encourage the social and economic empowerment of family farming

households through access to rural development, aimed at implementing agricultural and/or non-agricultural rural projects, with special focus on activities carried out by young people.

31. PROCASE II will also act in a complementary and synergistic way with other IFAD investment projects in the State of Paraíba: PCR/Sertão Vivo with BNDES/GCF and PHDC III (federal) both have operations in Paraíba. It could also play a key role in policy dialogue, especially regarding its contribution to the Forum of State Secretaries of Northeast Brazil and the Consortium of Governors of Northeast.
32. The project will maintain a close relationship with IFAD's Centre for Knowledge and South-South and Triangular Cooperation (SSTC) in Brasilia, which will help to build networks and exchanges with other initiatives inside and outside the country.

## Definition of Target Groups and Targeting Strategy

33. **Geographical targeting.** In 2022, the population of Paraíba was 3.97 million inhabitants (2 per cent of Brazil's population), over 24.6 of which lived in rural areas. Moreover, 80 per cent of the population receives an income below the minimum wage, 47.4 per cent lives in poverty, 15.6 per cent lives in extreme poverty and 63.9 per cent is food insecure, with 10.6 per cent experiencing severe food insecurity. PROCASE II will cover the rural areas of all 223 municipalities of the State of Paraíba. Phase I encompassed 56 municipalities, and the expansion to the entire state is mainly to reach Indigenous communities, which are concentrated in the coastal zone and Atlantic Forest biome. The interventions will prioritize communities based on the following technical criteria: (i) incidence of rural poverty (Single Registry); (ii) presence of TPCs; (iii) incidence of food insecurity and malnutrition; (iv) concentration of rural women and youth; (v) limited access to water for human consumption and production; and (vi) the avoidance of overlap with other IFAD interventions, such as PROCASE I, Sertão Vivo and PDHC III.
34. **Social targeting.** PROCASE II will target family farming families in poverty and extreme poverty, especially in municipalities with a lower Human Development Index and more significant deprivation. The project will directly reach **60,000 families** (around 210,000 people), of which 50 per cent will be women, 20 per cent young people, 5 per cent PCTs and 2 per cent persons with disabilities. The project's main target groups are: (i) family farmers living in poverty and extreme poverty, (ii) rural women, (iii) rural youth, (iv) TPCs, (v) persons with disabilities and (v) LGBTQIABP+.<sup>[2]</sup> To close the income gap, 50 per cent of the PIR funds and 50 per cent of the business plan funds will go to women-led associations and cooperatives, and 20 per cent of the PIR funds will go to youth groups (see POD annex 1 and annex 10 on component 1).
35. **Targeting strategy.** The Single Registry (CadÚnico) will be used as the project's direct targeting mechanism. A total of 70 per cent of beneficiary families in participating rural organizations must have the Single Registry profile (poverty or extreme poverty). Direct targeting will be combined with other measures: self-targeting (e.g., working through priority groups to address their specific needs), focus on capacity-building and awareness raising to ensure the participation of the most vulnerable groups: women, youth, traditional communities (mainly Indigenous and Quilombolas) and LGBTQIAPN+, and operative measures (e.g., gender, youth and TPCs specialists in the project monitoring unit; promotion of gender parity and awareness raising within the project team and implementation partners on gender, age, race and identity issues). See annex 21 and 22 for gender and diversity diagnosis.
36. The expected impact of PROCASE II is significant. 18,000 families will benefit from resilient investment plans, 5,000 families who are members of cooperatives and other organizations will benefit from business plans, 5,000 families will benefit from land and environmental regularization and more than 32,000 will have greater capacity to access public programmes. More than 30,000 women, 12,000 young people and 1,300 TPCs will be strengthened. Women-headed families will constitute at least 50 per cent of the beneficiaries of resilient investment plans and business plans, demonstrating a clear commitment to gender equality and social inclusion.

## IFAD's Mainstreaming Areas

37. The project fulfils both IFAD's and IDB's social and environmental standards. IFAD conducted a gap analysis, which concluded that the institutions' standards are aligned and mutually reinforcing, and an identified gap was fulfilled with the preparation of a specific study on targeted adaptation assessment. Since it is a type-C project, IFAD will accept IDB's social and environmental standards. The project will adopt a youth-sensitive, nutrition-sensitive, gender-transformative and climate-centered approach, as well as prioritize Indigenous Peoples and persons with disabilities. Specific gender and diversity diagnosis reports have been prepared (see additional annexes 20 and 21).
38. **Gender-transformative:** Rural women in Paraíba are particularly vulnerable to poverty and food insecurity, reporting 31.3 per cent lower incomes than men and more limited access to food (22.7 per cent among women and 23.5 per cent among men). In this state, the Gender Disparity Index is 0.68 per cent, indicating that Paraíba women are 32 per cent less likely to have the same opportunities as men, with the most significant gaps being in political empowerment and economic opportunity. In rural areas, resistance to advances in women's autonomy and rights is even greater. Gender gaps are expressed in restrictions on control and access to natural, social and monetary resources. Women run 24 per cent of family farms but own only 15 per cent of the family farming area. Only 15 per cent of women family farmers receive technical assistance, compared to 17 per cent of men. Regarding the management of establishments, women run only 24 per cent of family farming establishments in the project area.
39. The project will use technical assistance and training methodologies, including agroecological logbooks. These are a valuable

tool for measuring, valuing and giving visibility to women's fundamental contributions to the family economy, as well as to community development, promoting women's self-esteem and confirming their important contribution to a healthy, diversified and safe family diet. The project also aims to reduce the difficulties of women's work through the introduction of social technologies, especially those related to access to water. Women's participation in project activities will be facilitated through the organization of childcare services, leadership training and the promotion of women's decision-making roles at the community or organizational levels.

40. **Youth-sensitive:** Among the main challenges faced by rural youth in the Project area are: (i) lack of employment and income opportunities (with little diversification of agricultural and non-agricultural activities that attract young people), (ii) lack of access to and control over resources, inputs, goods, and technologies, (iii) limited access to public policies and services and (iv) low participation and decision-making power in rural and community organizations. Among young people aged 15 to 29 in Paraíba, 35.1 per cent were neither studying nor working in 2021. A higher percentage of young Afro-descendant women neither study nor work. Household chores and caring for family members are among the main barriers young women face in continuing their studies or getting a paid job. Another important causal factor is the high rate of teenage pregnancy. Between 2020 and 2022, 12,830 pregnancies in children and adolescents aged 10 to 18 were recorded in Paraíba. The incidence of food insecurity is particularly high among youth, with 37.5 per cent having faced difficulties in accessing food in the last year (87 per cent gap with the older population in Paraíba) and 37.5 per cent having faced difficulties in accessing food in the last year (87 per cent gap with the older population in Paraíba).
41. The project will take an integrated approach to tackling the root causes of youth exclusion, using successful approaches from other IFAD-supported projects in Brazil. Examples of these approaches are: (i) supporting the involvement of young people in the adoption of practices, approaches and techniques based on the principles of agroecology and coexistence with semiarid zones, which encourage the sustainable use and management of natural resources; (ii) creating new income-generating opportunities (agricultural and non-agricultural); (iii) promoting social skills and involvement in processes of social transformation in the territories; (iv) training young leaders to strengthen their decision-making power at community, territorial and organizational level; (v) young communicators' program; (vi) technical assistance services adapted to the different needs of young people and incorporating them into technical assistance teams; (vii) selecting young local development agents from the communities to support the implementation of resilient investment plans; and (ix) supporting rural youth networks.
42. **Nutrition-sensitive:** Approximately 63.9 per cent of households in rural Paraíba face some degree of food insecurity, 10.6 per cent of which face severe food insecurity. The State of Paraíba faces the double burden of malnutrition: 62.5 per cent of adults in Paraíba have overnutrition (35.5 per cent overweight and 27.0 per cent obese). Stunting affects 4.9 per cent of children under 5, wasting affects 4.2 per cent, overweight affects 8.4 per cent and obesity impacts 6.8 per cent. The main causes of malnutrition in the project area are the difficult access to water for human consumption and food production, the lack of productive diversification leading to limited access to more nutritious food, and the lack of knowledge on balanced diets (nutrition education).
43. The project's activities aim to respond to these challenges, focusing on: (i) agricultural production, in particular with support for productive agroecological backyards, which will aim to increase the availability of nutritious food for the most vulnerable families, (ii) raising awareness of good nutrition and health practices (reproductive health, maternal health and child health), (iii) raising awareness of food culture, the role of neglected and underutilized species in nutrition and training in the processing of healthy local products to increase their daily consumption.
44. **Climate finance and building adaptive capacity:** The northeast region is considered one of the country's most vulnerable to climate change. It is characterized by low adaptive capacity, with a predominance of rainfed agricultural production systems. Between 2011 and 2017, the most severe drought in the last 30 years occurred, generating crop losses for six million producers and increasing food insecurity. Future climate models, regardless of the scenario and time interval analyzed, predict reduced precipitation, increased temperature and a higher probability of extreme events, especially droughts and floods, with a negative effect on the productivity of predominant crops and an increased risk of losses. For example, productivity losses in corn are estimated to be between 29 per cent and 55 per cent by 2050. Combined with the deforestation and soil degradation trends, climate change could impact the productive potential agricultural systems of local family farmers.
45. The project aims to enhance the adaptive capacity of farmers to climate changes through: (i) agroecological practices; (ii) restoring water sources and waterways through conservation of existing forests, reforestation of degraded areas, and agroecological soil conservation practices; (iii) investing in technologies for capturing, storing and treating water, as well as increasing water use efficiency; and (iv) promoting diversified agroforestry systems.
46. **Persons with disabilities:** The northeast has the highest percentage of persons with disabilities, affecting 10.3 per cent of the population or about 5.8 million persons, with the highest percentages affecting women and Afro-descendants. In Paraíba, 88.7 per cent of persons with disabilities do not work, and 74.4 per cent earn less than the minimum wage, which demonstrates the greater difficulties these persons face in earning a decent income. In addition, access to food is an issue for this group: 25.7 per cent of persons with disabilities faced difficulty in obtaining food in the last 12 months, compared to 21.7 per cent among people without disabilities.
47. PROCASE II will directly target persons with disabilities, seeking their meaningful participation by hearing their priorities and engaging them in decision-making regarding the resilient investment plans and business plans. Processing units will be adapted to ensure accessibility, and the project will foster innovations that make agricultural activities disability-inclusive. PROCASE II will also report disability-disaggregated data in many results matrix indicators. The diversity plan of subcomponent 2.3 includes activities exclusively targeting persons with disabilities, such as demand-driven thematic meetings and training.
48. **Traditional peoples and communities:** Indigenous peoples and Afro-descendants represent 64.9 per cent of family farmers in Paraíba and are particularly vulnerable due to historical dynamics of exclusion, high dependence on natural resources and poor

access to basic services. There are also other traditional populations, such as Roma and artisanal fishers.

49. **Indigenous people:** Paraíba has 30,492 indigenous people, corresponding to 0.76 per cent of the state's total resident population. Of the total number of indigenous people in Paraíba, 50.8 per cent are women, and 25.6 per cent are young people between ages 15 and 29. However, only 6,842 indigenous people (18.7 per cent of the total) live in indigenous territories. In the Single Registry, there are 6,328 indigenous families registered, 73.1 per cent of which live in poverty or extreme poverty.
50. **Quilombolas:** According to the recently published data from the 2022 Demographic Census, there are 16,584 Quilombolas in Paraíba, but only 17.6 per cent (2,918 people) live in the state's 11 officially delimited Quilombola territories. There are 47 certified Quilombola communities in Paraíba, none with titled territory, and only 11 of them demarcated. A total of 68% of the Quilombolas in Paraíba live in poverty or extreme poverty.
51. The project will adopt free, prior and informed consent (FPIC) for activities involving TPCs, considering IFAD's previous experience. This will be approached considering the multidimensionality of the territories of the TPCs, oriented towards the governance and sustainable collective management of their territories, ethnodevelopment, the sustainability of their food systems and the conservation and use of biodiversity and agrobiodiversity based on traditional knowledge, as well as access to markets for the promotion of cultural identity. The technical assistance approach will consider these sociocultural aspects, traditional knowledge and ways of life, and all technical assistance technicians will receive training in race and ethnicity. The TPCs will also benefit from greater access to water and access to renewable energy and sanitation through adapted social technologies that improve their living conditions, and they will be prioritized when receiving productive investments. The project will also contribute to the valorization and dissemination of traditional knowledge related to production (traditional agricultural systems) and nutrition through participatory nutritional education activities.
52. PROCASE II innovates covering all IFAD mainstreaming priorities and establishing specific social inclusion strategies with dedicated budgets to promote the participation of each target group: women, youth, TPCs, persons with disability and the LGBTIQAPN+ community. It is also important to highlight that an ample public stakeholder public consultation was conducted regarding the project design as part of the safeguard process, as can be seen in additional annex 8.7.

## Results Framework

53. The IDB recognized IFAD's expertise in monitoring and evaluation and adopted IFAD's logical framework and core indicators methodology. The logical framework includes several indicators defined by IFAD, namely:
  - Awareness-raising disaggregated by gender, youth, persons with disabilities and traditional peoples and communities (CI 1);
  - Women reporting minimum dietary diversity (MDDW) (1.2.8);
  - Persons with new jobs/employment opportunities (2.2.1);
  - Individuals demonstrating an improvement in empowerment (IE.2.1);
  - Households reporting an increase in production (1.2.4);
  - Rural producers' organizations reporting an increase in sales (2.2.5);
  - Persons accessing technologies that sequester carbon or reduce greenhouse gas emissions (3.1.3);
  - Rural producers' organizations supported (2.1.3);
  - Households reporting adoption of environmentally sustainable and climate-resilient technologies and practices (3.2.2);
  - Households satisfied with project-supported services (SF.2.1);
  - Households reporting they can influence decision-making of local authorities and project-supported service providers (SF.2.2);
  - Households provided with targeted support to improve their nutrition (1.1.8);
  - Number of beneficiaries gaining increased secure access to land (1.1.1); and
  - Tons of greenhouse gas emissions (tCO<sub>2e</sub>) avoided and/or sequestered (3.2.1).
54. The avoided/sequestered tCO<sub>2e</sub> data was evaluated using the FAO EX-ACT software. During project implementation, IFAD will facilitate collaboration with FAO to monitor indicators related to economic and financial analysis and carbon analysis. A dedicated monitoring and evaluation Plan (annex 14) was prepared, including the theory of change (annex 9). The ex-ante economic and financial (EFA) and ex-ante EX-ACT analysis were included as annexes 17 and 18.

## Project Cost and Financing, including IFAD contribution

55. The total project cost will be US\$105 million, of which US\$70 million (66.7 per cent) will be financed through an IDB loan, US\$10 million (9.5 per cent) through an IFAD loan (BRAM), and US\$ 25 million (23.8 per cent) as a state government counterpart contribution. Additionally, project beneficiaries would contribute around US\$10 million, which has not been included in the total costs per IDB's standard practice but will be accounted for by the PMU and monitored by IFAD. The federal government will provide its sovereign guarantee. The project will be financed proportionally by IFAD, IDB and the State of Paraíba across all components. This will ensure IFAD participation and engagement in the entire project, as well as visibility during implementation. The COSTAB was prepared as a separate annex.

**Table 1 - Project costs by component and financier(in US\$ million)**

Component	IDB	IFAD	State	Total	%
1 - Resilient production systems to reduce rural poverty	42.28	6.04	15.10	63.42	60.4
2 - Organizational strengthening, capacity building and knowledge management	20.87	2.98	7.45	31.30	29.8
Project management, monitoring and evaluation	6.85	0.98	2.45	10.28	9.80
<b>Total</b>	<b>70.0</b>	<b>10.0</b>	<b>25.0</b>	<b>105.0</b>	<b>100.0</b>

## Alignment of the Design Process

56. The project design was co-led by IFAD and IDB and jointly prepared with the Government of Paraíba, mainly through the support of the ongoing PROCASE project management unit. Although PROCASE closed in December 2020, the Government of Paraíba decided to finance the continuation of the project with its own resources so that the project is operational up until now with the project management unit and regional offices. The PROCASE team provided valuable inputs for the design and facilitated the field visits and documents review. The entire design was prepared in very close cooperation with the PROCASE team.
57. The project will be type-C and, therefore, follow the IDB template and documentation. IDB documents were prepared in Portuguese and Spanish, both recognized as official languages in IDB. IFAD translated the Portuguese documents to English. A draft coordination agreement between IFAD and IDB was prepared to ensure full alignment, and it is now being finalized.
58. SECAP - Safeguard gap analysis: IFAD has conducted a safeguard gap analysis of the social, environmental and climate policies, which identified that IDB policies and guidelines are generally aligned with IFAD's SECAP. An additional study on targeted adaptation assessment, which was required to comply with IFAD's SECAP, was prepared and is included as a separate annex (8.5). The entire safeguard documentation is included under annexes 5 and 8.1, 8.2, 8.3, 8.4, 8.5, 8.6, 8.7 and 8.8.
59. Financial management and procurement gap analysis: The financial management and procurement arrangements of the two institutions revealed almost full coverage of the IFAD requirements by IDB policies. IDB's financial reporting formats will be accepted by IFAD as equivalent to Interim Financial Reports (IFRS). The identified gaps have been filled by introducing some of IFAD's financial management and procurement requirements in the draft coordination agreement to be signed between IFAD and IDB. It will follow the model of the agreement signed in 2024 for Parceiros da Mata in Bahia. See additional annex 27 on financial management gap analysis and annex 26 on procurement gap analysis.
60. The project has a six-year implementation period. It is expected to be submitted for approval to IFAD's Executive Board through the lapse-of-time procedure in October 2024. The IDB Board is expected to approve the project in February 2025, as it is included in their pipeline for next year.

## Supervision Arrangements

61. The IFAD financing agreement would provide that IDB shall be the cooperating institution for the project, for which a coordination agreement was drafted and is under finalization. Under the draft coordination agreement, IDB will coordinate with IFAD to advance the planning and terms of reference for supervision and other missions so that IFAD may contribute to the terms of reference and directly participate in the missions. IFAD's participation in supervision missions will cover topics according to the project's needs and in coordination with IDB, and may focus on targeting, IFAD's mainstreaming themes (gender, youth, nutrition and climate change), procurement, monitoring and evaluation and knowledge management. IDB and the State of Paraíba recognize the high quality of supervision and implementation support provided by IFAD, and IDB will work closely to plan and prepare the missions to ensure the incorporation of IFAD supervision knowledge and experience. IFAD's office in Salvador will continue to play a vital role in supervision by virtue of its excellent working relationship with the State of Paraíba and northeastern states in general, and its strong linkage with the IDB team and other partners, such as civil society organizations. It will also ensure coordination with other IFAD interventions in Paraíba including PCR (GCF/BNDES) and PDHC III (MDA).

### **Estimated Cost Sharing by IFAD for Design and Implementation**

62. IDB and IFAD will share the total cost of the design based on each institution's expertise and knowledge. During the design, IFAD took the leadership in preparing components 1 and 2, while IDB took the lead in safeguards, procurement and financial management. IFAD also led the targeting and mainstreaming section while IDB led the operational aspects, such as the project implementation manual (PIM or ROP in IDB language). IDB has fully adopted IFAD's core outcome indicators, valuing IFAD's monitoring and evaluation expertise, particularly regarding mainstreaming themes.
63. The Coordination Agreement will include fees, and considering this is the third type-C in Brazil with IDB, the country team is negotiating a reduction in the annual service fee (including a preparation fee and an annual fee). The agreed supervision fee is US\$66,216 over six years (US\$11,036 annually), which is highly competitive relative to other similar cooperating institutions' costs for type-C projects within IFAD. IFAD will have a dedicated supervision and implementation support budget for the project to cover its participation in missions, which was a requirement from the government of Paraíba in order to go ahead with the project.

### **Risk**

64. **Fiscal risk (debt capacity).** Sovereign guarantees from the Federal Government of Brazil will cover the loans. A pre-condition for this will be a solid credit rating of the state by the federal government. The National Treasury monitors the states' debt capacity annually and currently rates Paraíba with its highest rating of "A" (June 2024). Only two states in northeast Brazil have such a rating: Bahia and Paraíba. The rating considers three main indicators: (a) debt by net current revenues, (b) saving and (c) liquidity. Maintaining a rating of "A" or at least "B" will be critical until the financing and guarantee agreements are signed (expected by the end of 2025) to avoid delays or even the risk of cancelling the project. Finally, IFAD RMO's is expected to prepare a dedicated risk analysis of the subnational loan to Paraíba (with a Sovereign Guarantee), as it has done for Piauí (PSI), Bahia (Parceiros da Mata) and Ceará (PPF II).
65. **Electoral and institutional risks,** mainly at municipal levels, are relevant due to the possible changes in the political scenario that may arise from the October 2024 municipal elections, which may also delay the Senate's approval of the Project and its entry into force. General elections at the federal and state levels will take place in October 2026 and could lead to changes in federal priorities. These risks would be mitigated through the involvement of several other partners in project implementation, including public state agencies, civil society, and private sector, and by continuing the excellent dialogue that IFAD maintains with state and federal counterparts as well as policy dialogue platforms such as the Forum of State Secretaries of Family Farming and the Northeast Consortium of Governors, which are strong IFAD partners. The co-financing with IDB, which has a substantive active portfolio of US\$9 billion in Brazil, will also help mitigate risks. The proactive joint IDB-IFAD supervision and implementation support arrangements will be key for reducing risks. IFAD has acquired important experience in dealing with political changes and risk situations in Brazil over the last years as can be seen by the portfolio.
66. **Federal government alignment.** The Project aligns with subnational financing arrangements in the country's federative structure, and the State of Paraíba will be responsible for implementation and loan repayment. PROCASE II fits the Federal Government's priorities according to the criteria established for external financing, as evidenced by the Commission for External Financing (COFIEX), which is comprised of the Ministry of Finance, Ministry of Planning and Ministry of Foreign Affairs. At COFIEX, the Project proposal ranked as number 1 among more than 30 proposals, highlighting its high priority and alignment with the federal government.
67. **Capacity of service providers.** For some tasks, such as technical assistance and the provision of specialized technical assistance, there is a risk of a lack of qualified personnel in the area. To mitigate this risk, the institutional strengthening of component 2 will offer training and capacity building. Grant projects, such as IFAD's DAKI-Semiárido Vivo, will also provide training to teams mainly on climate adaptation practices.
68. **Start-up delays:** PROCASE I suffered from start-up delays in its initial three years of implementation. This risk will be mitigated because PROCASE I is still ongoing and financed entirely with State of Paraíba resources and maintains the project management unit and regional offices. The staff has experience in project implementation and will be key in ensuring a rapid start-up. IFAD and IDB's previous knowledge and experience will also be instrumental in avoiding delays.
69. **Delays in reporting on use of funds investment and business plans.** Establish in the project implementation manual clear mechanisms for the approval, disbursements and reporting on the use of funds transferred in the form of investment and business plans and ensure the technical assistance provided to producer organization includes support on administrative matters and reporting on use of funds
70. **Reliance on excel for financial reporting.** Before the start of the Project and as a condition for disbursement, implementation of a complementary automated reporting system similar to the SIGMA system used within the World Bank financed COOPERAR project.
71. **Counterpart funds:** Mobilizing counterpart funds in the magnitude required by the project will be a challenge but also shows the government's high level of commitment. In addition, the counterpart funds will come from various sources, mainly from other state programmes and policies, thus diversifying the sources and reducing the risk. Nevertheless, supervision missions will need to follow the counterpart funds closely.
72. **IFAD visibility.** Being a type-C project with limited IFAD financing, PROCASE II could present visibility issues for IFAD. This risk will be mitigated mainly by: (i) the proportional financing across project components by each financier, which will ensure IFAD's participation in the financing of all project activities; (ii) IFAD's continued excellent policy dialogue with the state and other actors in the region; (iii) active participation and collaboration in supervision and other missions, as evidenced by the design mission; (iv) close dialogue with the IDB team; and (v) knowledge management, policy dialogue and South-South and triangular cooperation, which will be integrated into project implementation, supported by IFAD's South-South and Triangular Cooperation and Knowledge Centre in Brasilia.

## Footnotes

[1] Land titling is a highlighted dimension of the project as it contributes to the sustainability of investments and enables families to continue making other investments and accessing other public policies, especially those related to credit. In addition to the individual titling of properties for smallholder family farmers, the project will also support the collective titling of historic Quilombola communities, only in areas free from conflict or legal disputes.

[2] In addition to the context of high invisibility and vulnerability, there is still no census or sample data that allows, even in an exploratory way, to estimate this population, especially in rural areas. The sole data available on LGBTQIAPN+ is included in the National Health Survey (2019), in which there is an underreporting of self-declared LGBTQIAPN+ due to fear of prejudice. Thus, it was decided not to establish specific outreach targets.

<b>Esquema del Proyecto</b>				
<p><b>Objetivo/descripción del proyecto:</b> El objetivo general del proyecto es reducir los niveles de pobreza rural, mejorando la seguridad alimentaria y nutricional y la adaptación de la población rural al cambio climático. Los objetivos específicos son los siguientes: (i) aumentar la adopción de tecnologías agrícolas, incluidas las de adaptación y mitigación al cambio climático; (ii) mejorar la inclusión productiva y social de los agricultores familiares, priorizando mujeres, jóvenes, pueblos y comunidades tradicionales (PCT) y personas con discapacidad (PcD); y (iii) mejorar las condiciones ambientales de las comunidades rurales y su entorno. Esta es la cuarta operación individual de préstamo bajo la CCLIP “Programa de Agricultura y Desarrollo Sostenible” (BR O0008) aprobada por el Directorio Ejecutivo mediante Resolución DE-127/21. Contribuye al logro de los objetivos multisectoriales de la CCLIP, promoviendo la mejoría de productividad e ingresos mediante la adopción de tecnologías agropecuarias y la integración de los productores en las cadenas de valor.</p>				

**Condiciones contractuales especiales previas al primer desembolso del financiamiento:** (i) la aprobación y entrada en vigor del Reglamento Operativo del Programa (ROP), en los términos previamente acordados con el Banco; y (ii) la designación y contratación de los miembros del equipo básico de la Unidad de Gestión del Proyecto (UGP) (¶3.11).

**Condición contractual especial de ejecución:** la firma y entrada en vigor del instrumento jurídico entre el Prestatario y la EMPAER previamente al inicio de la ejecución de las actividades de regularización de tenencia de tierras en el marco del Componente II (¶3.12).

**Condiciones contractuales ambientales y sociales:** Estas condiciones están descritas en el Anexo B del Resumen de la Revisión Ambiental y Social.

**Excepciones a las políticas del Banco:** Ninguna.

**Alineación Estratégica**

- a) El préstamo del FIDA será otorgado directamente al Estado de Paraíba, con acuerdo de coordinación firmado entre BID y FIDA. Aprobación de la Junta Ejecutiva del FIDA prevista en diciembre de 2024.
- b) Bajo los términos de la Facilidad de Financiamiento Flexible (documento FN-655-1) el Prestatario tiene la opción de solicitar modificaciones en el cronograma de amortización, así como conversiones de moneda, de tasa de interés, de productos básicos y de protección contra catástrofes. En la consideración de dichas solicitudes, el Banco tomará en cuenta aspectos operacionales y de manejo de riesgos.
- c) Bajo las opciones de reembolso flexible de la Facilidad de Financiamiento Flexible (FFF), cambios en el periodo de gracia son posibles siempre que la Vida Promedio Ponderada (VPP) Original del préstamo y la última fecha de pago, documentadas en el contrato de préstamo, no sean excedidas.
- d) La comisión de crédito y la comisión de inspección y vigilancia serán establecidas periódicamente por el Directorio Ejecutivo como parte de su revisión de los cargos financieros del Banco, de conformidad con las políticas correspondientes.
- e) O1 (Reducir la pobreza y desigualdad); O2 (Abordar el cambio climático); y O3 (Impulsar un crecimiento regional sostenible).
- f) EO1 (Biodiversidad, capital natural y acción por el clima); EO2-G (Igualdad de género); EO2-D (Inclusión de grupos diversos de la población); EO3 (Capacidad institucional, estado de derecho y seguridad ciudadana); EO4 (Protección social y desarrollo del capital humano); EO5 (Desarrollo productivo e innovación por medio del sector privado); EO6 (Infraestructura sostenible, resiliente e inclusiva); EO7 (Integración regional).

## I. DESCRIPCIÓN DEL PROYECTO Y MONITOREO DE RESULTADOS

### A. Antecedentes, problemática y justificación

#### 1. Antecedentes

- 1.1 **La CCLIP “Programa de Agricultura y Desarrollo Sostenible”.** Este proyecto es la cuarta operación individual de préstamo de la Línea de Crédito Condicional para Proyectos de Inversión (CCLIP) “Programa de Agricultura y Desarrollo Sostenible” ([BR-O0008](#)) aprobada por el Directorio Ejecutivo el 8 de diciembre de 2021<sup>1</sup>. Los objetivos de la CCLIP, de tipo Multisectorial II (MM-II), son mejorar la productividad del sector agropecuario, los ingresos, y el acceso a servicios básicos en el área rural brasileña a través de: (i) mejora de la calidad y acceso de los productores a servicios de apoyo al sector agropecuario; (ii) desarrollo de infraestructura resiliente; y (iii) mejora de la gestión de los recursos naturales.
- 1.2 La CCLIP, de hasta US\$1.200 millones a ser asignados en un período de hasta diez años, cuenta con tres vías de asignación. Una de ellas es a través de estados o municipios<sup>2</sup> con capacidad de endeudamiento, que soliciten préstamos para programas que contribuyan al logro de los objetivos multisectoriales en uno o más de los sectores de la CCLIP. Los sectores son: (i) servicios agropecuarios; (ii) infraestructura básica y productiva; y (iii) medio ambiente y recursos naturales. La presente es la tercera operación individual bajo el sector de servicios agropecuarios y segunda bajo el sector infraestructura básica y productiva, siendo la segunda a ser ejecutada por una entidad subnacional (estado).
- 1.3 **Contexto nacional.** Tras aumentar un 2,9% en 2023, el crecimiento del Producto Interno Bruto (PIB) de Brasil en el primer trimestre de 2024 fue de 1,9%, y se prevé que alcance a 2,4% en el año [1]. La inflación en 2023 alcanzó a 4,62% y la expectativa es del 3,8% en 2024. El gobierno ha llevado a cabo importantes reformas, aprobando un nuevo marco fiscal y está en proceso de aprobar una reforma fiscal que simplifica el sistema tributario. Además, se puso en marcha un Plan de Aceleración del Crecimiento (PAC).
- 1.4 **Contexto sobre el estado de Paraíba.** En 2022, la población de Paraíba era de 3,97 millones de habitantes (2% de la población de Brasil), siendo rural el 24,6% [2]. El estado contribuyó con 0,9% del PIB y con 0,34% del PIB agropecuario del país en 2023. El PIB per cápita de Paraíba representa el 45% del PIB de Brasil, ocupando el penúltimo lugar en el ranking nacional. El 80% de la población recibe un ingreso inferior al salario mínimo; 47,4% está en situación de pobreza y 15,6%

---

<sup>1</sup> Resolución DE-127/21. Las otras tres operaciones son el Proyecto Piauí Sostenible e Inclusivo ([BR-L1542 / 5611/OC-BR](#)), el Programa para el Desarrollo Agropecuario en el Nordeste - Agronordeste ([BR-L1562 / 5440/OC-BR](#)) y el Proyecto para el Desarrollo Sostenible del Bosque Atlántico de Bahía ([BR-L1617 / 5891/OC-BR](#)). El primero de ellos se encuentra en ejecución, mientras que los otros se encuentran en trámite de aprobación del contrato de préstamo.

<sup>2</sup> Los otros canales son: (i) la República Federativa de Brasil, para programas que tengan como organismos ejecutores a entidades del Gobierno Federal; y (ii) bancos de desarrollo de carácter nacional o regional que realicen subpréstamos para inversiones específicas.

de extrema pobreza, y 63,9% experimenta inseguridad alimentaria, siendo severa para el 10,6% [3].

- 1.5 La mayor parte del estado (92%) pertenece al bioma Caatinga, que se caracteriza por el clima semiárido y alberga 62% de la población total y 85% de la rural. El Bosque Atlántico, localizado en el extremo este, ocupa 8% de la superficie. El estado se caracteriza por el alto grado de variabilidad de la estación de lluvias ([EEO#5 Diagnóstico PROCASE](#)).
- 1.6 **Agricultura familiar.** En 2017, existían en Paraíba 163.218 establecimientos agropecuarios, de los cuales 76,9% pertenecían a la Agricultura Familiar (AF). La AF ocupa 42% de la superficie agropecuaria del estado y aporta 47,8% del PBI sectorial. Los establecimientos de la AF se concentran en áreas de hasta 10 hectáreas (70,8%) [2], siendo los principales rubros maíz, frijol, mandioca, aves, ganadería lechera, ovinos y caprinos [4,5]. Los principales productos industrializados son los lácteos, con más del 60% del total [2].

## 2. Problemática y Justificación

- 1.7 **Bajos ingresos, baja productividad e inseguridad alimentaria de la AF.** La AF en Paraíba se caracteriza por bajos ingresos y productividad y alta incidencia de pobreza e inseguridad alimentaria. El 49,8% de los agricultores familiares fueron beneficiarios del programa Bolsa Familia<sup>3</sup> en 2021 [6]. Existen brechas importantes de productividad para los principales productos agrícolas: la AF alcanzó rendimientos de 4,5 ton/ha en yuca y 1.813 kg/ha en maíz, comparado con promedios nacionales de 8,18 ton/ha (brecha de 45%) y 1.813 kg/ha (brecha de 69%) [4]. Los bajos ingresos y productividad contribuyen a una alta incidencia de inseguridad alimentaria. Sólo 44% de los productores familiares tuvieron una diversidad alimentaria mínima [7,8]. Según una encuesta realizada en 2020<sup>4</sup>, el 21,8% experimentó en los últimos 12 meses dificultades en obtener alimentos o no pudo alimentarse [7].
- 1.8 A continuación, se analizan los principales factores que contribuyen a la problemática que enfrenta la AF de Paraíba:
  - a. **Cambio climático.** La región Nordeste es una de las más vulnerables de Brasil por incluir una de las zonas semiáridas más pobladas del mundo (22 millones de habitantes), siendo Paraíba uno de los estados más vulnerables [9,10]. Se caracteriza por la baja capacidad de adaptación, predominando los sistemas de producción agrícola de secano [10-12]. Entre 2011 y 2017, ocurrió la sequía más grave en los últimos 30 años, generando pérdida de cosechas en 6 millones de productores y aumento de la inseguridad alimentaria [10]. Los modelos predicen reducción de precipitaciones, aumento de temperatura y mayor probabilidad de eventos extremos, especialmente sequías e inundaciones [10], con efecto negativo en la productividad de los

---

<sup>3</sup> Bolsa Familia es un programa federal de asistencia social que provee transferencias condicionadas a familias de bajo ingreso.

<sup>4</sup> Las estadísticas reportadas hacen referencia a la muestra de 372 productores entrevistados que constituyeron el grupo control para la evaluación de impacto, en el momento de la línea final.

cultivos predominantes y aumento del riesgo de pérdidas. Por ejemplo, se estiman pérdidas de productividad en maíz entre 29% y 55% hasta 2050<sup>5</sup> [13]. Un estudio reciente del BID resalta el impacto de la vulnerabilidad al cambio climático sobre la inseguridad alimentaria en América Latina y el Caribe (LAC) [14].

- b. **Degradación ambiental.** La Caatinga y el Bosque Atlántico en Paraíba experimentan una degradación a largo plazo. Entre 1985 y 2022, el uso de sistemas tradicionales de producción contribuyó a convertir 281.000 hectáreas de área forestada al uso agropecuario [15]. Actualmente, se conserva el 54% de la vegetación original de la Caatinga ([EEO#5 Diagnóstico PROCASE II](#)), habiendo sido los bosques sustituidos principalmente por producción agropecuaria. Entre 1985 y 2020, 45 de los 223 municipios de Paraíba pasaron a clasificarse como Área Susceptible a la Desertificación en estado grave o muy grave [16], con predominio de pasturas degradadas por sobrepastoreo [17]. Además, el uso excesivo de herbicidas, fungicidas e insecticidas contamina aguas y suelos y afecta la biodiversidad [4]. En 2017, un 33,2% de los AF utilizaron agroquímicos sintéticos [4].
- c. **Limitado acceso a conocimiento y recursos financieros.** Entre las principales barreras que enfrenta la AF del estado se encuentran: (i) limitado acceso a conocimientos y asistencia técnica para aplicar nuevas técnicas de producción (sólo 16,8% de los productores recibieron asistencia técnica en 2017) [4], y un 38,7% no utilizaba ninguna práctica de producción sostenible<sup>6</sup> [7]; (ii) escaso acceso a agua para producción (11,5% poseía sistema de riego con sólo 1,4% del área irrigada [18]); (iii) dificultades de acceso a financiamiento para realizar inversiones (16,9% recibió financiamiento productivo en 2017 [18]).
- d. **Limitada integración en cadenas de valor.** El 59,7% de la AF produce exclusivamente para autoconsumo familiar [7]. La escasa participación en cooperativas y organizaciones similares para la comercialización y procesamiento de la producción contribuye a la baja integración en cadenas de valor. Solo 7,2% de los productores en Paraíba son miembros de cooperativas o asociaciones, comparado con 17,1% a nivel nacional [18]. Entre tales miembros, sólo 2,9% y 1,8% procesó o vendió su producción por medio de la organización, respectivamente [7]. En las regiones Sur, Sudeste y Centro-Oeste de Brasil, las cadenas de valor agropecuarias se caracterizan por la integración de los productores a cooperativas agropecuarias y uso de contratos con empresas agroindustriales y comerciales, que cumplen un rol fundamental en proveer tecnología y servicios (asistencia técnica, financiamiento, comercialización)<sup>7</sup>. En contraste, cooperativas bien estructuradas son escasas en Paraíba y cuentan con limitado acceso a

---

<sup>5</sup> Con referencia a los escenarios (adoptados por IPCC) RCP4,5 y 8,5, respectivamente.

<sup>6</sup> En esta estadística se consideran las siguientes prácticas: uso de abono orgánico, estiércol, rastrojos, agroquímicos naturales.

<sup>7</sup> Según Forbes Brasil, el ranking de las 100 mayores empresas del agronegocio brasileño en 2020 incluyó a 22 cooperativas, ubicadas todas en las regiones Sur, Sudeste y Centro-Oeste.

recursos para proveer servicios a los productores y mejorar infraestructura y equipamientos que permitan, por ejemplo, cumplir con normas fitosanitarias [18], lo que afecta negativamente la seguridad alimentaria.

- e. **Limitadas capacidades técnicas y organizativas.** El 83,2% de los agricultores familiares en Paraíba no tienen asistencia técnica, lo que deriva en dificultades de acceso a conocimientos sobre nuevas tecnologías y mal uso de insumos. Por ejemplo, el 33,2% utilizan plaguicidas, frecuentemente en exceso. La mayoría de las organizaciones de productores tiene debilidades de gestión empresarial [18]. La encuesta realizada en el contexto del PROCASE I reveló que solo 15% de las asociaciones productivas realizaba eventos de capacitación y conocimiento, mientras que 29% facilitaba acceso a crédito para inversiones productivas [7].
  - f. **Inseguridad en la tenencia de la tierra.** La inseguridad en la tenencia de la tierra limita el acceso a crédito, la adopción de tecnologías, el aumento de la productividad y la conservación de los recursos naturales a largo plazo en la AF. El 77,7% de los agricultores familiares en Paraíba posee un título de tenencia [4]. Además, una alta proporción de productores no cumple con las normas ambientales del Catastro Ambiental Rural (CAR), registro público electrónico nacional obligatorio para todo inmueble rural para demostrar el cumplimiento de obligaciones ambientales y control de la deforestación, lo que limita su acceso a crédito y programas públicos<sup>8</sup>.
- 1.9 **Brechas de género.** Las mujeres rurales en Paraíba son particularmente vulnerables a la pobreza e inseguridad alimentaria, reportando ingresos 31,3% menores que los hombres y más limitado acceso a alimento (22,7% entre mujeres y 23,5 entre hombres) [7,18]. Estas vulnerabilidades se deben a restricciones en el control y acceso a recursos naturales, sociales y financieros (ver Cuadro 1).

**Cuadro 1. Brechas de acceso a recursos y servicios entre mujeres y hombres de la AF en Paraíba [4,7]**

Indicador	Mujeres	Hombres	Brecha
Acceso a tierra (% de superficie agrícola)	15%	85%	- 70 p.p.
Acceso a tierra (tamaño medio en hectáreas)	7,1 ha	12,9 ha	- 5,8 ha
Acceso a asistencia técnica	15%	17%	- 2 p.p.
Acceso a riego	6,7%	13%	- 6,3 p.p.
Asociación a organizaciones productivas	15,8%	13,6%	2.2 p.p.
Asociación a cooperativas	1.2%	2.0%	- 0,8 p.p.

---

<sup>8</sup> Creado por la Ley 12.651/2012 y reglamentado por la Instrucción Normativa MMA No. 2 del 6 de mayo de 2014,

- 1.10 **Barreras para jóvenes rurales.** Los jóvenes rurales (entre 15 y 29 años) en Paraíba enfrentan desafíos importantes. La incidencia de inseguridad alimentaria es particularmente alta, habiendo el 37,5% enfrentado dificultades de acceso a alimento en el último año (brecha de 87% con la población de mayor edad en Paraíba [7]). El Cuadro 2 presenta las principales brechas que enfrenta la juventud rural, relativo al promedio nacional.

**Cuadro 2. Brechas de acceso a recursos y servicios entre jóvenes rurales en Paraíba y el país [4]**

Indicador	Paraíba	Brasil	Brecha
Dificultad de conseguir alimento durante el último año [7]	37,5%	20,1%	17,4 p.p.
Acceso a tierra (% de superficie agrícola)	6,5%	7,4%	- 0,9 p.p.
Acceso a tierra (tamaño medio en hectáreas)	7,6 ha	14,4 ha	- 6,8 ha
Acceso a asistencia técnica	18,5%	9,8%	8,7 p.p.
Acceso a riego	11,3%	12,0%	- 0,7 p.p.

- 1.11 **Barreras para pueblos y comunidades tradicionales (PCT).** Los indígenas y afrodescendientes representan el 64,9% de la AF en Paraíba, y son particularmente vulnerables debido a dinámicas históricas de exclusión, alta dependencia de los recursos naturales y escaso acceso a los servicios básicos. Existen 47 comunidades quilombolas certificadas en Paraíba, ninguna de ellas con territorio titulado, y solo 11 de ellos demarcadas ([EEO#2 Diagnostico Genero y Diversidad](#)). El 68% de los quilombolas y un 73% de los pueblos indígenas viven en situación de pobreza o extrema pobreza ([EEO#2 Diagnostico Genero y Diversidad](#)). También hay otras poblaciones tradicionales como gitanos y pescadores artesanales. El Cuadro 3 presenta las principales brechas en comparación a la población no perteneciente a PCT.

**Cuadro 3. Brechas de acceso a recursos y servicios entre PCT y personas no pertenecientes a PCT<sup>9</sup> en Paraíba [4,7]**

Indicador	PCT	No PCT	Brecha
Acceso a tierra (tamaño medio en hectáreas)	10,0 ha	14,6 ha	-4.6 ha
Acceso a asistencia técnica	16,3%	17,7%	-1.4 p.p.

- 1.12 **Barreras para personas con discapacidad (PcD).** El Nordeste tiene el mayor porcentaje de personas con discapacidad (PcD), con el 10,3% de la población o

---

<sup>9</sup> Las estadísticas presentadas refieren a la población indígena y afrodescendiente según identificado en el Censo Agropecuario 2017 [4].

cerca de 5,8 millones de personas [20], siendo los mayores porcentajes mujeres y afrodescendientes. En Paraíba, el 88,7% de las PcD no trabaja y el 74,4% gana menos del salario mínimo, por lo que enfrentan mayores dificultades de acceso a alimento. El 25,7% de PcD enfrentó dificultad de conseguir alimento en los últimos 12 meses, en comparación con 21,7% entre personas sin discapacidad [7].

- 1.13 **Barreras para personas LGBTQIAPN+.** La información disponible sobre población LGBTQIAPN+ en Paraíba es limitada (lo que en parte refleja su marginalización); sin embargo, los datos existentes indican emigración a centros urbanos, dificultad para permanecer en el ambiente escolar debido a prejuicios, ingresos y oportunidades de empleo limitados en áreas rurales. La región Nordeste tiene el mayor número de muertes violentas de personas LGBTQIAPN+. En el Nordeste, el 1,5% de la población declaró ser homo- o bisexual, siendo la menor proporción en el país ([EEO#2 Diagnóstico Genero y Diversidad](#)).
- 1.14 **Evidencia empírica.** Diversos estudios respaldan las problemáticas abordadas en el proyecto, fundamentando la necesidad de recursos no reembolsables para inversiones y asistencia técnica a productores familiares que corrijan fallas de mercado vinculadas a restricciones de liquidez de productores de bajos ingresos, asimetría de información sobre tecnologías de frontera e internalización del costo de impactos ambientales en los sistemas de producción<sup>10</sup>. Además, una evaluación de impacto del PROCASE I, financiado por el FIDA, resalta los efectos positivos del proyecto sobre mayor acceso a asistencia técnica, agua para usos productivos y participación en asociaciones productivas [7]. Estos efectos contribuyeron a aumentar los ingresos (22,6%), reducir la pobreza (13,2%) y mejorar la seguridad alimentaria (14,2%) entre 2015 y 2019 [7]. También aumentó la percepción de empoderamiento entre mujeres y jóvenes.
- 1.15 **Experiencia del Banco y lecciones aprendidas.** El BID tiene una larga historia de promover el desarrollo rural sostenible a través del financiamiento de bienes públicos rurales<sup>11</sup>. La evidencia internacional muestra consistentemente que la provisión de bienes públicos rurales proporciona condiciones esenciales para el desarrollo de mercados y producción agrícola de agricultores familiares y tiende a ser más efectiva y rentable que el financiamiento de bienes privados, impulsando la productividad agrícola [21], reduciendo la pobreza rural y disminuyendo los efectos adversos en el manejo de los recursos naturales [22-24]. Evaluaciones de impacto del BID de proyectos en [Argentina](#), [Bolivia](#), [Ecuador](#), [Haití](#), [Nicaragua](#), [Paraguay](#), [Perú](#) y [República Dominicana](#) demuestran que las políticas de desarrollo rural sostenible pueden tener impacto significativo en la productividad agrícola, seguridad alimentaria, y sostenibilidad ambiental.
- 1.16 El Cuadro 4 resume las principales lecciones aprendidas por la experiencia de proyectos en el Nordeste financiados por el Banco ([1633/OC-BR](#), [5440/OC-BR](#), [4723/OC-BR](#), [4732/OC-BR](#), [ATN/LC-17432-BR](#)), así como con proyectos

---

<sup>10</sup> La evidencia empírica para esta operación se resume en la sección 1.B del Plan de Monitoreo y Evaluación ([EER#2](#)).

<sup>11</sup> Son bienes o servicios cuyos beneficios están disponibles sin costo para todos los usuarios posibles. Incluye, entre otros, infraestructura rural (caminos, electrificación); investigación, desarrollo e innovación; sanidad animal y vegetal e inocuidad de alimentos; e información y estadísticas.

financiados por el FIDA en el Nordeste y en Paraíba, tomando en cuenta que el FIDA financió la fase I del PROCASE.

**Cuadro 4. Lecciones aprendidas**

Lecciones aprendidas	Reflejo en el diseño del proyecto
<p><b>1. Planes de desarrollo</b> integradores, con objetivos de productividad, fortalecimiento sociocultural y negocios, permiten canalizar inversiones en comunidades para cooperativas y organizaciones rurales, mejorando procesamiento y comercialización, a la vez que contribuyen a mejorar su productividad y seguridad alimentaria.</p>	<p>Las inversiones del proyecto en comunidades rurales financiadas por el componente I serán realizadas a través de Planes de Inversión Resiliente (PIR). La comercialización será apoyada por Planes de Negocios (PN) con cooperativas y organizaciones similares.</p>
<p><b>2. Gestión de recursos por las organizaciones de los beneficiarios.</b> Transferir fondos a organizaciones comunitarias y cooperativas para contrataciones en planes productivos reduce costos, empodera e involucra a los beneficiarios, mejorando resultados de los planes. Sin embargo, es crucial proporcionarles apoyo para garantizar adquisiciones y rendiciones de cuentas oportunas y efectivas.</p>	<p>Las organizaciones beneficiarias (OB) serán responsables por gestionar los recursos del proyecto para PIR y PN financiados por el Componente I, y realizarán las adquisiciones y contrataciones previstas. La SEAFDS transferirá recursos a las OB y les proporcionará asistencia técnica para apoyarlas en adquisiciones y rendiciones de cuenta. La Secretaría de Agricultura Familiar y Desarrollo del Semiárido (SEAFDS) y las OB firmarán instrumentos jurídicos estableciendo obligaciones mutuas (¶3.7).</p>
<p><b>3. Capacidades locales y asistencia técnica.</b> Entidades locales de asistencia técnica han demostrado buen desempeño debido a su conocimiento y experiencia con las comunidades rurales, probando ser un vehículo adecuado para brindar AT a los agricultores familiares.</p>	<p>El Componente II contempla la contratación de entidades locales de asistencia técnica para apoyar el diseño y la ejecución de los PIR en las comunidades.</p>
<p><b>4. Género e inclusión.</b> Se identificó la importancia de establecer estrategias de género e inclusión con presupuesto específico, a fin de promover la participación de mujeres, jóvenes, PCT y miembros de la comunidad LGBTQIAPN+.</p>	<p>El proyecto focalizará sus acciones en PCT. Además, los PIR financiados por el componente I proporcionarán recursos para iniciativas de grupos de interés en las comunidades, priorizando mujeres, jóvenes y personas de la comunidad LGBTQIAPN+. El Componente II financiará capacitaciones en metodologías inclusivas para las entidades de asistencia técnica que apoyarán el diseño y ejecución de PIR. El ROP prevé porcentajes mínimos de recursos en los PIR que deben destinarse a</p>

Lecciones aprendidas	Reflejo en el diseño del proyecto
	grupos con mayoría de mujeres y jóvenes.
<p><b>5. Gestión del conocimiento, cooperación sur-sur y triangular y comunicación.</b> La experiencia del FIDA ha identificado la importancia de generar, intercambiar y comunicar conocimientos sobre resultados y metodologías aplicadas por los proyectos, incluyendo intercambios con otros proyectos en países de la región. También se identificó la importancia de acciones específicas de comunicación a nivel del proyecto y las comunidades, con potencial de actuación de los jóvenes.</p>	<p>El Componente II financiará estudios, evaluaciones e intercambios, así como acciones de comunicación.</p>
<p><b>6. Plazo de ejecución y desembolsos.</b> La experiencia de proyectos similares, con acciones multisectoriales y procesos complejos con familias rurales para la adopción de tecnologías, fortalecimiento organizativo y sociocultural, muestran la necesidad de mayores tiempos para lograr los resultados previstos.</p>	<p>Fue definido un período de desembolsos de los préstamos de seis años.</p>

- 1.17 **Valor agregado y aspectos innovadores de la operación.** El Banco, junto con el FIDA, aportarán un valor agregado no limitado al aporte de recursos del financiamiento, destacándose: (i) acciones multisectoriales para atacar la pobreza e inseguridad alimentaria, incluyendo mejoras en producción y productividad agropecuaria, comercialización y acceso a mercados, regularización de tenencia de tierras, fortalecimiento de capacidades de los beneficiarios y sus organizaciones; (ii) foco en tecnologías de adaptación y mitigación del cambio climático; (iii) focalización en poblaciones vulnerables (mujeres, jóvenes, PCT, comunidad LGBTQIAPN+ y PcD); (iv) políticas ambientales y sociales y su contribución al fortalecimiento del sistema de gestión ambiental y social en Paraíba; y (v) monitoreo de resultados e impactos. Como aspectos innovadores, se destacan las propuestas de apoyo a la inserción de la comunidad LGBTQIAPN+ y las acciones de gestión del conocimiento, cooperación sur-sur y triangular. En estos temas, se aprovechará a colaborar con otros proyectos e iniciativas que trabajan estos temas, tanto del Banco (por ej., [GRT/FM-14550-BR](#)) como del FIDA.
- 1.18 **Experiencia de cofinanciamiento con el FIDA.** Esta será la tercera operación cofinanciada con el FIDA en Brasil, siendo la primera el Proyecto Integrado de Seguridad Hídrica, Sostenibilidad Ambiental y Desarrollo Socio Productivo de la Cuenca de los Ríos Piauí y Canindé, Estado de Piauí - Piauí Sostenible e Inclusivo ([5611/OC-BR](#)), aprobado en octubre de 2022, y la segunda el Proyecto de Desarrollo Sostenible del Bosque Atlántico de Bahía ([5891/OC-BR](#)), aprobado en junio de 2024. El cofinanciamiento permitirá promover sinergias y complementariedades en el diseño de las operaciones, que surgen de su

experiencia en Paraíba y otros estados del Nordeste y la región. Además, se acordaron mecanismos de coordinación entre ambas instituciones que incluyen la aplicación de políticas fiduciarias y ambientales y sociales del Banco para los recursos de financiamiento del FIDA, reduciendo complejidades y duplicaciones para la SEAFDS.

- 1.19 **Complementariedad con otras operaciones del Grupo BID.** En particular, se prevén complementariedades con el Programa de Apoyo al Desarrollo Agropecuario del Nordeste ([5440/OC-BR](#)), primera operación aprobada en el marco de la CCLIP Programa de Agricultura y Desarrollo Sostenible (BR-O0008), ejecutada por el Ministerio de Agricultura y Pecuaria, que podrá apoyar acciones en zonas del bioma semiárido no atendidas por el proyecto; con el Programa de Modernización y Fortalecimiento de los Servicios de Sanidad Agropecuaria e Inocuidad de Alimentos ([4723/OC-BR](#) y [4732/OC-BR](#)), que financia programas de sanidad animal y vegetal, y con el Proyecto Piauí Sostenible e Inclusivo ([5611/OC-BR](#); [5612/OC-BR](#)) y el Proyecto de Desarrollo Sostenible del Bosque Atlántico de Bahía ([5891/OC-BR](#)), cofinanciados por el BID y el FIDA. Además, se aprovecharán lecciones de operaciones implementadas en el Bosque Atlántico ([GRT/FM-14550-BR](#)) en la región Nordeste ([ATN/LC-17432-BR](#)), y en otros países de la región, así como de proyectos en Bahía financiados por el FIDA y por el Banco Mundial.
- 1.20 **Coordinación con el FIDA y otros donantes.** La operación será cofinanciada por el FIDA, representando su segunda operación consecutiva en Paraíba, ya que la fase I del PROCASE fue financiada por el FIDA. Se coordinará acciones con otros proyectos del FIDA en el país: el Proyecto Dom Helder Câmara (PDHC) Fases II y III (actualmente en aprobación), ejecutado por el Ministerio de Desarrollo Agrario y Agricultura Familiar (MDA), que podrá apoyar en el acceso a políticas públicas, innovaciones tecnológicas y sistemas de producción biodiversos y resistentes al clima; el proyecto Sembrando Resiliencia Climática en Comunidades Rurales del Nordeste de Brasil (PCRCP – Sertão Vivo), implementado por el Banco Nacional de Desarrollo Económico y Social (BNDES) y cofinanciado por el Fondo Verde del Clima (GCF), que podrá apoyar acciones complementarias de resiliencia climática; y el Proyecto Cooperar, financiado por el Banco Mundial, que podrá apoyar agroindustrias y mejoramiento de caminos rurales.
- 1.21 **Alineación estratégica.** El Programa es consistente con la Estrategia Institucional del Grupo BID: Transformación para una Mayor Escala e Impacto (CA-631) y se alinea con los objetivos de: (i) reducir la pobreza y la desigualdad; (ii) abordar el cambio climático; e (iii) impulsar un crecimiento regional sostenible, dado que contribuye a aumentar los ingresos y la productividad agropecuaria en comunidades rurales pobres (productores familiares, mujeres, PCT, y PcD) y a apoyar a organizaciones económicas de los productores para mejorar la comercialización en mercados nacionales e internacionales. El Programa también se alinea con las siguientes áreas de enfoque operativo: (i) biodiversidad, capital natural y acción por el clima, al financiar tecnologías de conservación de los recursos naturales y adaptación y mitigación de los efectos del cambio climático (CC); (ii) igualdad de género e inclusión de grupos diversos de la población, por contribuir a la seguridad alimentaria, empoderamiento y liderazgo de las productoras femeninas, los PCT y las PcD, así como la mayor inclusión de

personas LGBTQIAPN+; (iii) protección social y desarrollo del capital humano, al proveer capacitaciones productivas e inclusivas a la población objetivo del proyecto con el objetivo de generar nuevos empleos y fuentes de ingreso; y (iv) desarrollo productivo e innovación por medio del sector privado, al apoyar la competitividad comercial de las organizaciones económicas de los productores. La operación se alinea con el Marco de Acción de Empleo con Perspectiva de Género (GN-3057) al mejorar la integración de los productores a las cadenas de valor, priorizando mujeres, jóvenes, PCT y PcD.

- 1.22 **Cambio Climático y Alineación con el Acuerdo de París (AP).** Esta operación fue analizada utilizando el Marco Conjunto de los BMD para Análisis de Alineación con París y el PAIA del Grupo BID (GN-3142-1). Se determinó que: (i) está alineada con la meta de adaptación del Acuerdo de París, ya que es congruente con las prioridades de adaptación establecidas en la NDC, el Plan Nacional de Adaptación y el Plan ABC+ de Brasil, mediante la adopción de tecnologías que reducen las vulnerabilidades climáticas de los biomas de Paraíba (Caatinga y Bosque Atlántico); y (ii) está alineada con la meta de mitigación del Acuerdo de París, puesto que las intervenciones financiadas por PIRs y PNs son coherentes con la meta de reducción de emisiones de la NDC del país y con el Plan ABC+. La operación busca apoyar la transición hacia un modelo agrícola más sostenible, promoviendo la recuperación y protección de los recursos naturales de la Caatinga y el Bosque Atlántico, mejorando así las condiciones ambientales de las comunidades rurales y su entorno.
- 1.23 Según la metodología conjunta de los BMD de financiamiento climático, se estima que 86,91% de los recursos del BID se invierten en apoyo a la adaptación y mitigación climática. Estos recursos contribuyen a la meta de financiamiento climático del Grupo BID (30% del volumen de aprobaciones). Asimismo, de acuerdo con la metodología de Seguimiento de Finanzas Verdes del Grupo BID (GN-3101), considerando que la financiación climática de la operación se destina exclusivamente a la agricultura de bajo carbono y a tecnologías de adaptación climática, es posible afirmar que el 86.91% de los recursos de la operación contribuyen al objetivo de sostenibilidad ambiental de “Protección, uso sostenible y restauración de la biodiversidad y los ecosistemas”, según GN-3101. Esta metodología establece que la contribución a este objetivo incluye actividades que “desarrollan o implementan soluciones basadas en la naturaleza, acciones para preservar, proteger, gestionar de manera sostenible y restaurar ecosistemas naturales o modificados, y simultáneamente, proporcionar bienestar humano y beneficios para la biodiversidad”. Dado que esta contribución se considera simultáneamente financiamiento climático, el financiamiento verde y climático total de la operación es del 86.91%.
- 1.24 **Estrategia del Banco en el país.** La operación está alineada con la Estrategia de País del Grupo BID con Brasil (GN-2973-2) en sus objetivos estratégicos de: (i) promover mayor competitividad, por medio de la adopción de tecnologías por los beneficiarios que mejoran la productividad; y (ii) integrar las regiones menos desarrolladas, por medio del incremento de la producción y productividad agropecuarias. También está alineada a los temas transversales de género y diversidad y de sostenibilidad y cambio climático. Además, es consistente con: la Estrategia Integrada del BID de Mitigación y Adaptación al Cambio Climático y de Energía Sostenible y Renovable (GN-2609-1), al promover adopción de

tecnologías que contribuyen con la adaptación al cambio climático y a reducir la deforestación; con el Marco Sectorial de Agricultura (GN-2709-10), por apoyar el aumento de la productividad agropecuaria; el Marco Sectorial de Seguridad Alimentaria (GN-2825-8), por promover aumento de la producción de alimentos, tanto para autoconsumo como venta; y el Marco Sectorial de Género y Diversidad (GN-2800-8), por promover generación de ingresos y participación de mujeres, PCT, PcD y LGBTQIAPN+.

- 1.25 **Lógica de la intervención.** El Gobierno de Paraíba implementa programas contra la pobreza rural con apoyo del Banco Mundial desde 1978 (Cooperar) y del FIDA desde el año 2012 (PROCASE I) centrado en la región semiárida. Esta operación expande las acciones del PROCASE I a todo el estado de Paraíba, promoviendo cambios técnicos en la producción y construcción de capacidades en las familias y sus organizaciones para aumentar la seguridad alimentaria, mejorar la comercialización de excedentes y fortalecer la adaptación al cambio climático. Se focalizará en comunidades pobres, priorizando a mujeres, jóvenes, PCT y PcD, brindando recursos no reembolsables para financiar inversiones productivas, ambientales y sociales. Además, adoptará un enfoque transversal para promover transformaciones en relaciones de género e inclusión de PCT, la comunidad LGBTQIAPN+ y PcD.

## **B. Objetivos, componentes y costo**

- 1.21 **Objetivos de la cuarta operación individual bajo la CCLIP.** El objetivo general del proyecto es reducir los niveles de pobreza rural, mejorando la seguridad alimentaria y nutricional y la adaptación de la población rural al cambio climático. Los objetivos específicos son los siguientes: (i) aumentar la adopción de tecnologías agrícolas, incluidas las de adaptación y mitigación al cambio climático; (ii) mejorar la inclusión productiva y social de los agricultores familiares, priorizando mujeres, jóvenes, PCT y PcD; y (iii) mejorar las condiciones ambientales de las comunidades rurales y su entorno. Contribuye al logro de los objetivos multisectoriales de la CCLIP, promoviendo la mejoría de productividad e ingresos mediante la adopción de tecnologías agropecuarias y la integración de los productores en las cadenas de valor.
- 1.22 **Componente I. Sistemas productivos resilientes para reducir la pobreza rural (BID US\$42,8 millones (de los cuales Inversión Directa en Género US\$20.80 millones, Diversidad US\$2.91 millones), FIDA US\$6,04 millones, Local US\$15,10 millones).** El componente se vincula a los objetivos específicos (i), (ii) y (iii) de la operación. Financiará planes para mejorar la producción y comercialización de los beneficiarios, fortalecer su capacidad de adaptación al cambio climático y recuperar áreas ambientalmente degradadas. Incluirá dos tipos de planes: Planes de Inversión Resiliente (PIR) y Planes de Negocios (PN). Ambos planes serán complementarios, promoviendo los PIR mejoras en la producción, acceso a servicios y condiciones ambientales en las comunidades rurales, mientras que los PN beneficiarán a cooperativas de mayor escala. Además, el componente financiará el desarrollo de innovaciones que resuelvan limitaciones de la AF, en particular maquinaria y equipos.
- 1.23 **Los PIR** beneficiarán a grupos de comunidades rurales, que serán priorizadas por: mayor proporción de familias con bajos ingresos y de familias encabezadas

por mujeres, jóvenes, PCT, PcD y LGBTQIAPN+; dificultades de acceso a servicios (asistencia técnica, agua y saneamiento); con procesos de degradación ambiental. Los beneficiarios de los PIR serán seleccionados entre los miembros de esas comunidades que tengan interés y compromiso en participar en las actividades técnicas, siendo priorizados mujeres, jóvenes, miembros de PCT, PcD y LGBTQIAPN+. Financiarán inversiones en tres ejes: (i) productivo, incluyendo insumos, herramientas, equipamientos y otras inversiones necesarias para viabilizar la adopción de tecnologías para mejorar la seguridad alimentaria, la producción sostenible y la adaptación al cambio climático. (ii) social, incluyendo tecnologías sociales de recolección y almacenamiento de agua para consumo humano y sistemas familiares para el tratamiento y reutilización de aguas negras y grises; y (iii) ambiental, incluyendo inversiones para la gestión y restauración ambiental, como viveros, producción de semillas nativas, reforestación y recuperación de áreas degradadas, y protección de suelos y aguas. La propuesta productiva y tecnológica de los PIR se basará en la agroecología, con uso de insumos biológicos en lugar de sintéticos. Podrán apoyar también actividades no agrícolas, como artesanías y turismo de base comunitaria.

- 1.24 **Los PN** beneficiarán a cooperativas y organizaciones similares, y financiarán inversiones y asistencia técnica especializada para fortalecer capacidades de gestión, promover agregación de valor, mejorar la comercialización y la adaptación al cambio climático. Incluirá, entre otros, modernización de equipamientos e instalaciones para mejorar calidad de productos y atender normas sanitarias y ambientales, costos de certificación orgánica y sellos colectivos que valorizan productos sostenibles. Tanto los PIR como los PN podrán incluir equipamiento de energía renovable y conectividad rural. Se seleccionarán prioritariamente cooperativas que: son exitosas y poseen potencial y disposición de aumentar su membresía o tienen potencial de desarrollo pero precisan fortalecer su capacidad de gestión; más del 50% de sus miembros son mujeres o jóvenes.
- 1.25 Requisitos clave de los planes, como criterios de elegibilidad, inversiones financiables y no financiables, montos máximos, mecanismos de gestión y rendición de cuentas de los recursos, y tratamiento de los aspectos ambientales y sociales, se detallan en el ROP. Cada PIR financiará hasta US\$335.000 por plan y cada PN hasta US\$250.000 por plan.<sup>12</sup> Los recursos aportados por el proyecto no serán reembolsables para los beneficiarios, que deberán aportar una contrapartida mínima del 10% (PIR) o 20% (PN) del valor del plan. Para cerrar la brecha de ingresos, se destinará el 50% de los fondos para PIR y el 50% para PN a asociaciones y cooperativas lideradas por mujeres, y el 20% de los fondos de PIR a grupos mayoritariamente jóvenes. Se establecerán criterios de priorización para favorecer grupos mixtos con más mujeres, jóvenes y productores de PCT. Específicamente, serán priorizados los planes para PCT, así como aquellos en los que más de 50% de los beneficiarios sean mujeres y más del 20% jóvenes.
- 1.26 **Componente II. Fortalecimiento organizacional y de capacidades y gestión del conocimiento (BID US\$20,87, FIDA US\$2,98 millones, Local US\$7,45**

---

<sup>12</sup> Cada PIR financiará hasta US\$2.800 por familia y cada PN hasta US\$800 por miembro de cooperativa.

**millones).** El componente se vincula a los objetivos específicos (i) y (ii) de la operación. Financiará: (i) fortalecimiento de capacidades de los agricultores familiares, incluyendo contratación de servicios de asistencia técnica agroecológica permanente para apoyar el diseño y ejecución de PIR, capacitación de agricultores y de entidades de asistencia técnica que prestarán servicios a los beneficiarios; (ii) fortalecimiento de capacidades de las organizaciones de agricultores familiares, incluyendo asistencia técnica especializada para apoyar el diseño y ejecución de PN, fortalecimiento de ferias locales y centros de comercialización, estructuración de servicios de inspección sanitaria y experiencias piloto de certificación orgánica participativa; (iii) planes específicos para promover equidad de género, participación de jóvenes, de PCT, personas LGBTQIAPN+ y PcD, así como la seguridad alimentaria y nutricional; (iv) capacitación de familias sobre políticas públicas para la AF y sus modalidades de acceso y sobre temas ambientales claves en el área rural; (v) regularización de tierras y ambiental, con foco en comunidades tradicionales y asentamientos de reforma agraria que se encuentran en proceso avanzado y sin situaciones de conflicto; y (vi) gestión del conocimiento y cooperación sur-sur y triangular, que financiará estudios, sistematización de experiencias, comunicación y difusión, e intercambios con experiencias relevantes en otros países de la región.

- 1.27 **Gestión, seguimiento y evaluación del proyecto (BID US\$6,85 millones, FIDA US\$0,98 millones, Local US\$2,45 millones).** Financiará equipos, consultorías y otros gastos necesarios para: (i) administración y gestión del proyecto; (ii) seguimiento, monitoreo y evaluación (M&E); (iii) capacitaciones para el personal de la UGP; y (iv) auditorías del proyecto.

### **C. Indicadores clave de resultados**

- 1.28 **Beneficiarios directos.** Serán aproximadamente 60.000 familias (210.000 personas) en comunidades rurales, especialmente en municipios con menor Índice de Desarrollo Humano y mayores carencias. Incluye 18.000 familias con PIR, 5.000 familias socias de cooperativas y otras organizaciones con PN, 5.000 familias beneficiadas con regularización de tierras y ambiental y más de 32.000 con mayor capacidad para acceder a programas públicos. Se fortalecerán más de 30.000 mujeres, 12.000 jóvenes y 1.300 de PCT. Se prevé que las familias encabezadas por mujeres constituirán al menos el 50% de los beneficiarios en PIR y PN.
- 1.29 **Resultados esperados.** Al fin del programa, se prevé: (i) reducción de 34% en la incidencia de pobreza o extrema pobreza en los beneficiarios directos; (ii) aumento de 45% en la diversidad alimentaria mínima en los beneficiarios directos; (iii) aumento de la producción agropecuaria; y (iv) reducción de 1.449.802 tCO<sub>2</sub>-eq (toneladas de emisiones de gases de efecto invernadero) en 20 años. Los impactos, resultados y productos se detallan en el Anexo II.
- 1.30 **Viabilidad económica.** El análisis costo-beneficio (EEO#1) evalúa los beneficios del préstamo, incluyendo el aumento de ingresos agrícolas y la reducción de emisiones de gases de efecto invernadero asociadas a mejoras en el sistema productivo de los beneficiarios. Los resultados confirman la viabilidad económica del proyecto, con VAN de US\$52.563.531 millones y TIR de 26,6% en un período de 20 años.

## II. ESTRUCTURA DE FINANCIAMIENTO Y PRINCIPALES RIESGOS

### A. Instrumentos de financiamiento

- 2.1 El financiamiento del Banco para esta cuarta operación individual bajo la CCLIP “Programa de Agricultura y Desarrollo Sostenible” (BRO0008) asciende a US\$70 millones, el cual será financiado por un préstamo de inversión específica con cargo a los recursos del Capital Ordinario del Banco. El FIDA aportará US\$10 millones a través de un cofinanciamiento conjunto directamente al Estado de Paraíba. El Banco y el FIDA suscribirán un Acuerdo de Coordinación que detallará responsabilidades operativas, incluyendo la supervisión técnica, fiduciaria, ambiental y social del Banco de la ejecución de los recursos del FIDA, así como la coordinación de las misiones de supervisión entre ambas instituciones. El Banco cobrará una tasa de servicios a FIDA para cubrir parcialmente el costo de preparación, supervisión y monitoreo del proyecto. Se espera la aprobación del financiamiento del FIDA en diciembre de 2024.
- 2.2 El plazo para desembolsos será de seis años, definido en función de las características de las actividades previstas para el proyecto en virtud de la propuesta aprobada por el Gobierno Federal<sup>13</sup>.

**Cuadro 5. Costos estimados del Proyecto (en millones de US\$)<sup>14</sup>**

Componente	BID	FIDA*	Local**	Total	%
<b>Componente I – Sistemas productivos resilientes para reducir la pobreza rural</b>	<b>42,28</b>	<b>6,04</b>	<b>15,10</b>	<b>63,42</b>	<b>60,4</b>

<b>Gestión, seguimiento y evaluación del proyecto</b>	<b>6,85</b>	<b>0,98</b>	<b>2,45</b>	<b>10,28</b>	<b>9,8</b>
<b>Total</b>	<b>70,00</b>	<b>10,00</b>	<b>25,00</b>	<b>105,00</b>	<b>100,0</b>

\* Recursos de cofinanciamiento.

\*\* Corresponde a contrapartida local de US\$21,875 millones en relación con el contrato de préstamo entre el Banco y el Estado de Paraíba y de US\$3,125 millones relativo al contrato de préstamo entre el FIDA y el Estado de Paraíba.

**Cuadro 6. Cronograma tentativo de desembolsos (US\$ millones)**

Fuente	Año 1	Año 2	Año 3	Año 4	Año 5	Año 6	Total
BID	1,50	3,70	14,41	24,17	17,77	8,45	70,00
FIDA	0,21	0,53	2,06	3,45	2,54	1,21	10,00
Local	0,54	1,32	5,15	8,63	6,34	3,02	25,00
<b>Total</b>	<b>2,25</b>	<b>5,55</b>	<b>21,62</b>	<b>36,25</b>	<b>26,65</b>	<b>12,68</b>	<b>105,00</b>
<b>% por año</b>	<b>2,14</b>	<b>5,28</b>	<b>20,59</b>	<b>34,52</b>	<b>25,39</b>	<b>12,08</b>	<b>100,00</b>

2.3 **Análisis fiscal.** La Clasificación de Capacidad de Pago (CAPAG) actual del Estado de Paraíba es "A", que es la mejor clasificación. Para autorizar la firma del contrato de préstamo, el Gobierno Federal de Brasil analizará nuevamente la situación fiscal del Estado de Paraíba a fin de otorgar su aprobación final.

## **B. Riesgos ambientales y sociales**

2.4 Según el Marco de Política Ambiental y Social (MPAS) , y en base a la información disponible en este momento, la operación está clasificada como Categoría B debido a que las actividades y planes financiados por los Componentes I y II pueden generar impactos ambientales y sociales negativos moderados a significativos a medio y largo plazo, gestionables y mitigables con medidas conocidas, que estarán previstas en los planes de gestión ambiental y social (PGAS) y planes de comunicación e involucramiento de las partes interesadas (PPPI). Estos impactos están vinculados a actividades agrícolas y actividades puntuales de construcción civil que financiará el proyecto, incluyendo generación de ruido, de residuos de la construcción civil y agrícolas y de polvo, emisiones, erosión y sedimentación de cursos de agua, presión sobre las hábitats

modificados y naturales. No se espera que las actividades orientadas a mejorar la productividad y los ingresos de los grupos de productores afecten negativamente ni contribuyan con la degradación de áreas y hábitats críticos. Se espera que la titulación de tierras promoverá el desarrollo económico y el mejor uso y conservación. Sin embargo, algunas situaciones conllevan riesgos de que generen conflictos entre potenciales beneficiarios y actores que reclaman la propiedad de la tierra.

- 2.5 La Clasificación de Riesgo Socioambiental es Sustancial, asociado a impactos ambientales y sociales negativos, temporales, gestionables y mitigables, a riesgos de intervención e impactos en hábitats modificados con un valor significativo para la biodiversidad, y riesgos de impacto indirecto para hábitats naturales y críticos.
- 2.6 El Riesgo de Desastres y Cambio Climático se clasificó como Moderado debido a la exacerbación de los riesgos de desastres naturales durante eventos extremos de sequías, precipitación e inundaciones e incendios en bioma sensible. La infraestructura que se va a construir es de criticidad moderada, ya que es de tamaño medio, lo que deberá confirmarse cuando se definan los proyectos y las áreas de implementación a través de una Evaluación de Riesgo de Desastres, a incluirse en el PGAS previo a la ejecución. Estas clasificaciones se confirmaron a través de los resultados de los estudios en la Evaluación Ambiental y Social Estratégica (EASE) realizados durante la debida diligencia. Los criterios de elegibilidad establecidos para la operación excluyen actividades que conlleven desplazamientos involuntarios (físicos o económicos), impactos negativos en los medios de subsistencia, impactos negativos en las comunidades tradicionales y/o pueblos indígenas, así como impactos en los recursos ecosistémicos de los que dependen los pueblos indígenas y en su patrimonio cultural. Tampoco serán elegibles inversiones que generen impactos adversos en hábitats críticos.
- 2.7 Para tratar adecuadamente estos riesgos y con el fin de atender los requerimientos establecidos en las Normas de Desempeño Ambiental y Social (NDAS), fue desarrollada una: (i) Evaluación Ambiental/Social Estratégica (EASE); (ii) un Plan de Gestión Ambiental/Social Estratégico (PGASE); (iii) un Análisis Sociocultural centrado en las poblaciones indígenas, las comunidades *quilombolas* y otras comunidades tradicionales, previo a las intervenciones que se llevarán a cabo; y (iv) un Plan de Participación de las Partes Interesadas Específico (PPPI). Los riesgos referentes a las Comunidades Indígenas fueron evaluados durante la Debida Diligencia y se identificó la necesidad de una Consulta Libre Previa e Informada para las comunidades indígenas y tradicionales que pueden ser afectadas por el proyecto. Además, la UGP implementará un Sistema de Gestión Ambiental y Social (SGAS) consistente con la Norma de Desempeño Ambiental y Social (NDAS 1).
- 2.8 Los estudios ambientales y sociales fueron divulgados en su versión preliminar, en la página web del Banco previo a la Misión de Análisis, y se llevará a cabo un proceso de consulta pública para todo el proyecto, teniendo en cuenta los mecanismos culturalmente apropiados y el avance de los estudios y planes de gestión, previo a la fecha de Directorio de la operación.
- 2.9 La sostenibilidad socioambiental del programa debe estar garantizada por el cumplimiento de los estándares de desempeño del MPAS a través de la

implementación del SGAS y sus lineamientos (MGAS), presencia de un equipo específico – de un especialista ambiental y un especialista social – responsables de la gestión socioambiental en la UGP, que además coordinará la comunicación activa con las poblaciones afectadas.

### **C. Riesgos fiduciarios**

- 2.10 Para evitar posibles dificultades y atrasos en la ejecución por debilidades de la SEAFDS y demoras en los procesos de adquisiciones, se propone: (i) utilizar una Unidad de Gestión del Programa (UGP) para la administración y gestión del proyecto; (ii) contratar al Instituto Interamericano de Cooperación para la Agricultura (IICA) como agencia especializada para apoyar la gestión de contrataciones del personal de la UGP y de capacitaciones de apoyo a la gestión del proyecto, dada su experiencia en proyectos similares<sup>3.6</sup>, incluyendo el PROCASE I (¶3.6); y (iii) realizar capacitaciones en políticas y procedimientos fiduciarios del BID. Además, será contratada por medio de un proceso competitivo una fundación relacionada a una universidad o centro de investigación para realizar: (i) la contratación bajo la modalidad de becarios de jóvenes rurales que apoyarán a la asistencia técnica y otras tareas del proyecto en sus comunidades; (ii) identificación y pagos a desarrolladores de innovaciones seleccionados; (iii) consultorías especializadas necesarias para la preparación y ejecución de Planes de Negocios en organizaciones que no tengan la capacidad de contratarlas y gestionar sus contratos en forma directa; y (iv) contrataciones necesarias para estudios, intercambios y otras acciones de gestión de conocimiento, cooperación sur-sur y triangular.
- 2.11 Para evitar riesgo de retrasos en las rendiciones de cuentas de los beneficiarios por los recursos transferidos a sus organizaciones, el ROP establecerá un mecanismo claro de rendición y la SEAFDS firmará un instrumento jurídico con cada organización beneficiaria, detallando responsabilidades y mecanismos. Además, la SEAFDS les brindará apoyo técnico para garantizar una rendición de cuentas adecuada.

### **D. Otros riesgos y temas clave**

- 2.12 **Entorno de ejecución económico y financiero.** Se considera un riesgo medio-alto la posibilidad de reducciones presupuestales durante el período de ejecución debido a deterioro fiscal. Para mitigarlo, se mantendrá un diálogo continuo con las contrapartes y monitoreo conjunto con el FIDA, incluyendo definir un plan de acción para mantener la priorización del programa, en caso de ser necesario.
- 2.13 **Entorno político.** Posibles cambios en la SEAFDS que retrasen la ejecución representan un riesgo medio-alto. Se mitigará mediante un diálogo continuo con nuevas autoridades, destacando la importancia del proyecto, y capacitación del personal técnico en áreas clave.
- 2.14 **Sostenibilidad de las inversiones.** Insuficientes capacidades y claridad en responsabilidades institucionales que afecten la sostenibilidad de las inversiones del programa representan un riesgo alto. Se mitigará mediante asistencia técnica a los beneficiarios, financiada bajo el Componente II, para fortalecer las

capacidades de gestión de las organizaciones de los beneficiarios responsables por los planes productivos.

### III. PLAN DE IMPLEMENTACIÓN Y GESTIÓN

#### A. Resumen de los arreglos de implementación

- 3.1 **Prestatario, Organismo Ejecutor y Garante.** El prestatario será el Estado de Paraíba y la República Federativa de Brasil será garante de las obligaciones financieras del prestatario en virtud del contrato de préstamo. El OE será el prestatario, por medio de la Secretaría de Agricultura Familiar y Desarrollo del Semiárido (SEAFDS), que será responsable por la gestión técnica y fiduciaria del Proyecto, y en cuya estructura fue creada una Unidad de Gestión del Proyecto (UGP). La Empresa Paraibana de Investigación, Extensión Rural y Regularización de Tierras (EMPAER) actuará como sub-ejecutora de las actividades de regularización de tierras del Componente II. Como parte de la preparación, se realizó un Análisis de la Capacidad Institucional de la SEAFDS y de la EMPAER, y fueron identificadas las áreas con oportunidades de mejora. Los resultados indican que la SEAFDS posee experiencia en ejecución de programas financiados por organismos internacionales, destacándose el recientemente finalizado PROCASE I, financiado por un préstamo de US\$18 millones del FIDA. No obstante, precisará utilizar una UGP para asegurar una adecuada capacidad para la gestión del programa en las áreas técnica, de adquisiciones, financiera, ambiental y social.
- 3.2 **Mecanismos de ejecución, administración y coordinación.** La SEAFDS, que actuará a través de la UGP, será responsable por la gestión y coordinación general del programa, y garantizará el cumplimiento del contrato de préstamo y del ROP. Entre otras tareas, se encargará de: (i) mantener comunicación formal con el Banco; (ii) presentar solicitudes de desembolso y rendición de cuentas; (iii) gestionar la auditoría externa; (iv) coordinar actividades de monitoreo y evaluación; (v) presentar al Banco la planificación operativa consolidada, Plan Financiero y Plan de Ejecución Plurianual (PEP) e informes de progreso; (vi) ejecutar las actividades; y (vii) monitorear la ejecución presupuestal y los insumos para los registros financieros y la adecuada rendición de cuentas al Banco. La UGP tendrá como equipo mínimo: (i) un coordinador general; (ii) un coordinador técnico; (iii) un gerente financiero; (iv) un gerente en adquisiciones; (v) un gerente del Componente I; (vi) un gerente del Componente II; (vii) un especialista en género y diversidad; (viii) un especialista en PCT; y (ix) un especialista en salvaguardas ambientales y sociales; y (x) un especialista en monitoreo y evaluación. La UGP contará, además del equipo central en João Pessoa, con oficinas territoriales, que contarán con un equipo técnico financiado por el proyecto y tendrán responsabilidades de difusión de informaciones, supervisión de las acciones del proyecto y apoyo en la rendición de cuentas de los planes con las organizaciones, entre otros. El número y localización de las oficinas serán definidos según la disposición geográfica y territorial de los planes.
- 3.3 El proyecto contará con un Comité Gestor, que tendrá una función de planeamiento estratégico, incluyendo entre otros la revisión de informes anuales y la aprobación del Plan Operativo Anual (POA). Además, los Colegiados de

Desarrollo Territorial Sostenible (CODETER), organismos para la participación y coordinación local de las acciones de gobierno, organizaciones sociales y de la sociedad civil, cumplirán una función consultiva, sirviendo como espacio para la comunicación de las acciones realizadas por el proyecto y la coordinación con otras iniciativas que ocurren en los territorios.

- 3.4 **Gestión de desembolsos.** Los desembolsos del préstamo serán efectuados en dólares americanos, bajo la modalidad de anticipo de fondos, en conformidad con lo previsto en la Guía de Gestión Financiera para Proyectos Financiados por el BID (OP-273-12). Las solicitudes de anticipos deberán satisfacer las necesidades de liquidez del programa, documentadas dentro del plan financiero por un período de hasta seis meses. Para cada anticipo (con excepción del primero), será necesaria la rendición de cuentas de al menos 60% del saldo acumulado de anticipos pendientes de justificar (ver Anexo III).
- 3.5 **Adquisición de obras y servicios.** Las adquisiciones y contrataciones financiadas total o parcialmente con recursos del préstamo se realizarán conforme a las Políticas para la Adquisición de Obras y Bienes Financiados por el BID (GN2349-15) y las Políticas para la Selección y Contratación de Consultores Financiados por el BID (GN-2350-15) y con las previsiones del contrato de préstamo y el Plan de Adquisiciones (PA). Las adquisiciones podrán ser supervisadas de manera ex-ante o ex-post según lo establecido en el PA. Cuando se ejecuten utilizando el sistema nacional, la supervisión se llevará a cabo aplicando el sistema del país.
- 3.6 **Contrataciones directas.** Se realizará la contratación directa del Instituto Interamericano de Cooperación para la Agricultura (IICA) como agencia especializada para administrar contrataciones relacionadas con la gestión del proyecto. Las funciones principales del IICA serán: (i) contratación del personal técnico y administrativo para la gestión del proyecto; y (ii) contrataciones logísticas para implementar acciones de capacitación previstas para la administración y gestión. El IICA recibirá transferencias de recursos del proyecto para realizar esas contrataciones y adquisiciones, lo que involucra en total US\$5,88 millones. El costo estimado total de esta contratación del IICA es de US\$471.000 para los seis años de ejecución, y los pagos serán realizados en función (porcentaje) de los recursos ejecutados. Tal contratación está justificada de acuerdo con lo previsto en la GN-2350-15, 3.11 (d), por la experiencia de valor excepcional de esta institución, demostrada por su amplia experiencia y trayectoria en el apoyo a la ejecución de proyectos, el conocimiento y experiencia de su personal técnico en políticas de adquisiciones de organismos internacionales y su experiencia en el PROCASE I.
- 3.7 **Planes de Inversión Resiliente y Planes de Negocio.** Los aproximadamente 200 PIR y 60 PN previstos serán implementados cada uno de ellos por una organización comunitaria o cooperativa respectivamente, para lo cual la SEAFDS firmará con cada una un instrumento jurídico estableciendo obligaciones y responsabilidades en la ejecución del plan, así como las condiciones para los desembolsos a las organizaciones, porcentajes y medios de verificación. El modelo de este instrumento jurídico se incluirá como anexo del ROP.

- 3.8 **Asistencia técnica.** La SEAFDS contratará por medio de proceso competitivo servicios de asistencia técnica para encargarse de la elaboración de diagnósticos participativos y la elaboración y apoyo a la ejecución de los PIR, mientras que las cooperativas beneficiarias de los PN podrán contratar con el apoyo del proyecto, la asistencia técnica especializada para su diseño y ejecución. En base a la amplia experiencia del PROCASE I y otros proyectos, se aplicará el marco jurídico federal<sup>15</sup> existente para implementar las inversiones en tecnologías sociales (e.g., cisternas) previstas en los PIR, siendo contratadas, por medio de procesos competitivos, organizaciones de la sociedad civil con experiencia en esas tecnologías que se encargarán también de proporcionar capacitación sobre su uso y mantenimiento.
- 3.9 **Reglamento Operativo del Programa (ROP).** El ROP aprobado por el Banco incluirá criterios para diseño y ejecución de PIR y PN, cuestiones ambientales y sociales, y aspectos de integridad, entre otros temas.
- 3.10 **Auditoría externa.** Los estados financieros del programa serán auditados anualmente por el Tribunal de Cuentas del Estado de Paraíba o por una Firma de Auditoría Independiente elegible para el Banco, contratada por la SEAFDS. Los estados financieros auditados serán presentados por el prestatario al Banco hasta 120 días después del cierre de cada ejercicio fiscal. Los estados financieros auditados finales serán presentados hasta 120 días después de la fecha del último desembolso del proyecto o de sus extensiones.
- 3.11 Serán condiciones contractuales especiales previas al primer desembolso del financiamiento: **(i) la aprobación y entrada en vigor del ROP, en los términos previamente acordados con el Banco; (ii) la designación y contratación de los miembros del equipo mínimo de la UGP.** La aprobación previa del ROP antes del primer desembolso, basada en la experiencia regional del Banco, es esencial. La segunda condición garantiza que la SEAFDS tenga un equipo listo para iniciar la ejecución.
- 3.12 **Será condición contractual especial de ejecución:** la firma y entrada en vigor del instrumento jurídico entre el Prestatario y la EMPAER previamente al inicio de la ejecución de las actividades de regularización de tenencia de tierras en el marco del Componente II.
- 3.13 **Reconocimiento de gastos.** El Banco podrá reconocer con cargo al aporte local, hasta por la suma de US\$2,5 millones (10% del monto estimado del aporte local), gastos elegibles efectuados por el prestatario antes de la fecha de aprobación del préstamo, por medio de la SEAFDS y de la EMPAER, para la contratación del personal de la UGP, estudios y diagnósticos, y servicios y equipamientos necesarios para la gestión del proyecto y para la ejecución de acciones de los componentes, siempre que se hayan cumplido con requisitos sustancialmente análogos a los establecidos en el contrato de préstamo. Dichos gastos deberán haberse efectuado a partir del 5 de julio de 2023 (fecha de registro de la

---

<sup>15</sup> Ley nº 12.873/13, Decreto nº 9.606/18 e [instrucciones normativas específicas para cada una de las tecnologías sociales, por ejemplo, la de la cisterna de calzada.](#)

operación), pero en ningún caso se incluirán gastos efectuados más de 18 meses antes de la fecha de aprobación del préstamo.

## **B. Resumen de los arreglos para el monitoreo de resultados**

- 3.14 El proyecto cuenta con un Plan de Monitoreo y Evaluación ([EER#2](#)) que presenta: (i) la metodología de medición de indicadores; (ii) la metodología de evaluación de impacto; (iii) los requerimientos de datos; y (iv) los responsables y presupuesto estimado.
- 3.15 **Monitoreo.** El prestatario, a través de la UGP, presentará al Banco informes semestrales, a más tardar 60 días después del fin de cada semestre. Estos informes incluirán datos para el Informe de Avance y Monitoreo (PMR) basado en indicadores de la Matriz de Resultados. El prestatario utilizará sistemas gerenciales para monitorear y seguir el PMR.
- 3.16 **Evaluación.** La evaluación de medio término será presentada al Banco dentro de los 90 días desde la fecha en que se haya desembolsado el 50% de los recursos del préstamo o cuando hayan transcurrido 36 meses desde la entrada en vigor del contrato de préstamo, lo que ocurra primero. La evaluación final, que tendrá como referencia, entre otras fuentes cualitativas, la evaluación de impacto y la evaluación económica ex post, será presentada dentro de los 90 días desde la fecha en que se desembolsó el 95% de los recursos del préstamo. Estas evaluaciones se realizarán siguiendo la guía del Informe de Terminación de Proyecto del Banco. El prestatario será responsable por implementar las actividades del Plan de Monitoreo y Evaluación. La evaluación final incluirá los resultados de la evaluación de impacto, que se financiará con recursos del préstamo, y utilizará el método cuasi experimental de diferencias en diferencias con “Propensity Score Matching” para evaluar el impacto del programa sobre los principales indicadores de impacto y resultado.

## **IV. CRITERIOS DE ELEGIBILIDAD**

- 3.17 La cuarta operación individual bajo la CCLIP “Programa de Agricultura y Desarrollo Sostenible” ([BR O0008](#)) cumple con los requisitos establecidos en la Política del Instrumento CCLIP (GN-2246-13) y Guías Operativas (OP-1622-3), dado que: (i) se realizó una evaluación completa de la capacidad institucional de la SEAFDS, y se identificó que tiene la capacidad de ejecución, así como áreas de mejora; (ii) el objetivo de la operación contribuye al logro de los objetivos multisectoriales de la CCLIP, al promover la adopción de tecnologías agropecuarias y la integración de los productores en las cadenas de valor; (iii) la operación está contemplada en los sectores de servicios agropecuarios bajo la CCLIP; y (iv) se incluyen las acciones que deben emprenderse relacionados a mejoras identificadas en la evaluación de capacidad institucional. En cuanto a la CCLIP: (i) sus objetivos figuran entre las prioridades definidas en la Estrategia de País del Grupo BID con Brasil 2019-2022 (GN-2973); y (ii) la SEAID, organismo de enlace de la CCLIP, tiene autoridad para cumplir ese papel dado su mandato

institucional de coordinar, dar seguimiento y evaluar operaciones con financiamiento internacional.<sup>16</sup>

---

<sup>16</sup> SEAID actúa como organismo de enlace también de las CCLIPs Pro-Segurança (BR-O0011), Programa de Modernización del Gasto Social en Brasil (BR-O0009), y Brasil Mais Digital (BR-O0010), aprobadas respectivamente el 18 de noviembre de 2020, el 16 de diciembre de 2020 y el 7 de abril de 2021.

### MATRIZ DE RESULTADOS - EXTENDIDA

<b>Objetivo del Proyecto:</b>	<p>Los objetivos específicos de esta operación serán:</p> <ul style="list-style-type: none"> <li>(i) Aumentar la adopción de tecnologías agropecuarias que contribuyan a la adaptación y mitigación del cambio climático;</li> <li>(ii) Mejorar la inclusión productiva y social de los agricultores familiares, priorizando mujeres, jóvenes, PCT y PcD;</li> <li>(iii) Mejorar las condiciones ambientales de las comunidades rurales y su entorno;</li> </ul> <p>El logro de estas metas contribuirá al objetivo general de reducir los niveles de pobreza rural, mejorando la seguridad alimentaria y nutricional y la adaptación de la población rural al cambio climático.</p>

<b>R1.2d</b> Agricultores pertenecientes a PCT		0	2025	2031	3.000		AD+IP flags
<b>R1.2e</b> PcD		0	2025	2031	1.200		PwD flag
<b>Objetivo específico 2. Mejorar la inclusión productiva y social de los agricultores familiares, priorizando mujeres, jóvenes, PCT y PcD.</b>							
<b>R2.1</b> Porcentaje de agricultores familiares que venden su producción en mercados	%	61	2020	2031	72	EI	LB y Meta: Silva, 2023
<b>R2.1a</b> Porcentaje de mujeres agricultoras		57	2020	2031	71		Gender flag
<b>R2.1b</b> Porcentaje de jóvenes agricultores		61	2020	2031	72		
<b>R2.1c</b> Porcentaje de hogares pertenecientes al PCT		61	2020	2031	72		AD+IP flags

Resultados esperados	Unidad de medida	Línea de base		Meta		Medio de verificación	Observaciones
		Valor	Año	Valor	Año		
<b>R2.1d</b> Porcentaje de PCD		64	2020	2031	79		PwD flag
<b>R2.2</b> Organizaciones apoyadas por PN, aumentan sus ventas	Organizaciones	0	2020	2031	12	EI; Consulta evaluativa específica sobre comercialización en cooperativas apoyadas	FIDA COI 2.2.5
<b>R2.3</b> Porcentaje de mujeres que ocupan puestos directivos en organizaciones rurales	%	5	2020	2031	12	EI; Consulta evaluativa sobre el empoderamiento de las mujeres en las organizaciones apoyadas	LB y Meta: Silva, 2023
<b>R2.3a</b> Porcentaje de mujeres jóvenes		8	2020	2031	11		Gender flag
<b>R2.3b</b> Porcentaje de mujeres pertenecientes a PCT		5	2020	2031	12		Gender+AD+IP flags
<b>R2.3c</b> Porcentaje de mujeres con discapacidad		7	2020	2031	13		Gender+PWD flags
<b>R2.4</b> Cambio en el porcentaje de personas que informan estar empoderadas relativo a la línea de base	%	0	2020	2031	5	EI	Referencia para meta: <a href="#">Salazar et al (2018)</a>
<b>R2.4a</b> Porcentaje de mujeres		0	2024	2031	5		FIDA COI IE.2.1 (transformador en materia de género) Gender flag
<b>R2.4b</b> Porcentaje de jóvenes		0	2024	2031	5		
<b>R2.4c</b> Porcentaje de personas PCT		0	2024	2031	5		AD+IP flags
<b>R2.4d</b> Porcentaje de personas con discapacidad (PcD)		0	2024	2031	5		PwD flag
<b>R2.5</b> Personas con nuevos empleos	Persona	0	2024	2031	200	EI; seguimiento de los nuevos empleos generados en las organizaciones apoyadas	Se considera cualquier nueva generación de ingreso, incluidos la resultante de puestos de trabajo estacionales, trabajo dentro y fuera de la finca, y como persona independiente o empleado/a de MIPyMEs.

Resultados esperados	Unidad de medida	Línea de base		Meta		Medio de verificación	Observaciones
		Valor	Año	Valor	Año		
<b>R2.5a</b> Mujeres con nuevos empleos		0	2024	2031	100		Gender flag
<b>R2.5b</b> Jóvenes con nuevos empleos		0	2024	2031	150		FIDA COI 2.2.1 (sensible a jóvenes)
<b>R2.5c</b> Personas pertenecientes al PCT con nuevos empleos		0	2024	2031	50		AD+IP flags
<b>R2.5d</b> PcD con nuevos puestos de trabajo		0	2024	2031	50		PwD flag
<b>Objetivo específico 3. Mejorar las condiciones ambientales de las comunidades rurales y su entorno.</b>							
<b>R3.1</b> Superficie de propiedades rurales registradas en el CAR dentro de los municipios objeto del Proyecto	Hectárea	68.804	2024	2031	168.804	Seguimiento de los recibos de registro CAR	Cumplimiento de la primera etapa de registro en el CAR. El registro de una propiedad en el CAR depende de la participación activa del propietario en la provisión de los documentos y certificados necesarios para realizar el trámite técnico y legal. Además, deben acompañar a los equipos encargados de la georreferenciación de su(s) parcela(s).
<b>R3.2</b> Comunidades con título de regularización territorial y ambiental entregado	Comunidad	0	2024	2031	150	Lista de comunidades atendidas con certificación y/o titulación	El otorgamiento del título comunitario depende de la participación activa de la asociación comunitaria en la provisión de los documentos y certificados necesarios para realizar el trámite técnico y legal. Además, debe acompañar a los equipos encargados de la georreferenciación de su(s) parcela(s).
<b>R3.2a:</b> Comunidades quilombolas con título de regularización territorial y ambiental entregado		0	2024	2031	47		AD flag

## INDICADORES DE PRODUCTO

Producto	Unidad de medida	Línea de Base		Año 1	Año 2	Año 3	Año 4	Año 5	Año 6	Fin del proyecto	Medio de verificación	Observaciones
		Valor	Año									
<b>Componente I: Sistemas productivos resilientes para reducir la pobreza rural</b>												
<b>Subcomponente 1.1: Implantación de sistemas productivos resilientes con biodiversidad</b>												
<b>Producto 1.1.1</b> Planes de Inversión Resiliente (PIR) conveniados	Planes	0	2025	0	30	80	90	0	0	200	Sistema de monitoreo y evaluación (M&E)	
<b>Hito 1:</b> Familias beneficiadas	Familias	0	2025	0	2.700	7.200	8.100	0	0	18.000		
<b>Hito 2:</b> Familias encabezadas por mujeres beneficiadas		0	2025	0	1.350	3.600	4.050	0	0	9.000		Cuota: 50% Gender flag
<b>Hito 3:</b> Familias encabezadas por jóvenes beneficiadas		0	2025	0	540	1.440	1.620	0	0	3.600		Cuota: 20%
<b>Hito 4:</b> Familias de PCT beneficiadas		0	2025	0	135	360	405	0	0	900		Cuota: 5% AD+IP flags
<b>Hito 5:</b> PcD beneficiadas	Personas	0	2025	0	54	144	162	0	0	360		Cuota: 2% PwD flag
<b>Hito 6:</b> Personas que acceden a tecnologías que secuestran carbono o reducen las emisiones de gases de efecto invernadero		0	2025	0	564	1.504	1.692	0	0	3.760		FIDA COI 3.1.3 (financiamiento de mitigación)
<b>Producto 1.1.2</b> Planes de Inversión Resiliente (PIR) ejecutados con más del 75% de rendición de cuentas	Planes	0	2025	0	0	30	70	70	30	200	Sistema M&E	

Producto	Unidad de medida	Línea de Base		Año 1	Año 2	Año 3	Año 4	Año 5	Año 6	Fin del proyecto	Medio de verificación	Observaciones
		Valor	Año									
<b>Subcomponente 1.2: Fortalecimiento y diversificación de la comercialización</b>												
<b>Producto 1.2.1</b> Planes de Negocio (PN) para la estructuración de cooperativas/unidades de procesamiento conveniados	Planes	0	2025	0	5	20	30	5	0	60	Sistema M&E	
<b>Hito 1:</b> Familias beneficiadas	Familias	0	2025	0	420	1.680	2.520	420	0	5.040		
<b>Hito 2:</b> Familias encabezadas por mujeres beneficiadas		0	2025	0	210	840	1.260	210	0	2.520		Cuota: 50% Gender flag
<b>Hito 3:</b> Familias encabezadas por jóvenes beneficiadas		0	2025	0	84	336	504	84	0	1.008		Cuota: 20%
<b>Hito 4:</b> Familias de PCT beneficiadas		0	2025	0	21	84	126	21	0	252		Cuota: 5% AD+IP flags
<b>Hito 5:</b> PcD beneficiadas		Personas	0	2025	0	8	34	50	8	0		100
<b>Producto 1.2.2</b> Planes de Negocios (PN) para la estructuración de cooperativas/unidades de procesamiento ejecutados con más del 75% de rendición de cuentas	Planes	0	2025	0	0	5	15	30	10	60	Sistema M&E	FIDA COI 2.1.3
<b>Subcomponente 1.3: Incentivos a la innovación</b>												
<b>Producto 1.3.1</b> Tecnologías innovadoras desarrolladas o adaptadas	Unidades	0	2025	0	0	5	10	10	0	25	Sistema M&E	Equipos, maquinaria, insumos, implementos, productos, etc.

Producto	Unidad de medida	Línea de Base		Año 1	Año 2	Año 3	Año 4	Año 5	Año 6	Fin del proyecto	Medio de verificación	Observaciones
		Valor	Año									
<b>Componente II: Fortalecimiento organizacional y de capacidades y gestión del conocimiento</b>												
<b>Subcomponente 2.1: Fortalecimiento de las capacidades de los agricultores familiares</b>												
<b>Producto 2.1.1:</b> Eventos de capacitación para entidades ATER Agroecológicas y CTE realizados	Eventos	0	2025	6	10	2	2	0	0	20	Registro de participantes e inscripción de la actividad y participantes en el Sistema M&E	CTE = Asesoramiento técnico especializado
<b>Hito 1:</b> Técnicos de ATER y CTE capacitados	Técnico	0	2025	90	150	30	30	0	0	300		
<b>Producto 2.1.2</b> Familias atendidas por ATER Agroecológica	Familias	0	2025	0	2.700	9.900	18.000	15.300	8.100	18.000	Registro de las familias atendidas en el Sistema M&E	Considerando la permanencia de las familias por 3 años
<b>Hito 1:</b> Familias encabezadas por mujeres beneficiadas		0	2025	0	1.350	4.950	9.000	7.650	4.050	9.000		Cuota: 50% Gender flag
<b>Hito 2:</b> Familias encabezadas por jóvenes beneficiadas		0	2025	0	540	1.980	3.600	3.060	1.620	3.600		Cuota: 20%

<i>Project External Audit</i>	<i>Moderate</i>	<i>Moderate</i>
<b>Project Procurement</b>	<b>Moderate</b>	<b>Moderate</b>
<i>A.1 Legal, Regulatory and Policy Framework</i>	<i>Moderate</i>	<i>Moderate</i>
<i>A.2 Institutional Framework and Management Capacity</i>	<i>Low</i>	<i>Low</i>
<i>A.3 Public Procurement Operations and Market Practices.</i>	<i>Low</i>	<i>Low</i>
<i>A.4 Accountability, Integrity and Transparency of the Public Procurement System</i>	<i>Substantial</i>	<i>Substantial</i>
<i>B.1 Assessment of Project Complexity</i>	<i>Substantial</i>	<i>Substantial</i>
<i>B.2 Assesment of Implementing Agency Capacity</i>	<i>Moderate</i>	<i>Moderate</i>
<i>Project Procurement Overall</i>	<i>Moderate</i>	<i>Moderate</i>
<b>Environment, Social and Climate Impact</b>	<b>Substantial</b>	<b>Moderate</b>
<i>Biodiversity Conservation</i>	<i>Moderate</i>	<i>Moderate</i>
<i>Resource Efficiency and Pollution Prevention</i>	<i>Moderate</i>	<i>Moderate</i>
<i>Cultural Heritage</i>	<i>Low</i>	<i>Low</i>
<i>Indigenous People</i>	<i>Low</i>	<i>Low</i>
<i>Labour and Working Conditions</i>	<i>Moderate</i>	<i>Moderate</i>
<i>Community health, safety and security</i>	<i>Moderate</i>	<i>Moderate</i>

<b>Risk Category / Subcategory</b>	<b>Inherent risk</b>	<b>Residual risk</b>
<i>Physical and Economic Resettlement</i>	<i>Low</i>	<i>Low</i>
<i>Greenhouse Gas Emissions</i>	<i>Moderate</i>	<i>Moderate</i>
<i>Vulnerability of target populations and ecosystems to climate variability and hazards</i>	<i>Substantial</i>	<i>Substantial</i>
<b>Stakeholders</b>	<b>Moderate</b>	<b>Moderate</b>
<i>Stakeholder Engagement/Coordination</i>	<i>Low</i>	<i>Low</i>
<i>Stakeholder Grievances</i>	<i>Moderate</i>	<i>Moderate</i>
<b>Overall</b>	<b>Moderate</b>	<b>Moderate</b>

<b>Country Context</b>	<b>Moderate</b>	<b>Moderate</b>
<b>Political Commitment</b>	<b>Low</b>	<b>Low</b>
<p><b>Risk:</b></p> <p>There will be elections for state and federal governments throughout the implementation, which may alter the degree of political priority given to the Project, leading to changes in technical teams, implementation delays, discontinuity of correlated rural development public policies, and budgetary restrictions.</p>	Low	Low
<p><b>Mitigations:</b></p> <p>The Project directly responds to the priorities and interests of the state government. Phase II of PROCASE will be one of the main instruments for combating rural poverty in the state, mobilizing more territories and local actors. PROCASE is included in the state's Pluriannual Plan, which ensures programmatic and budgetary stability for at least the next three years and is aligned with the Pluriannual Plan and priorities of the federal government. The SEAFDS team actively participated in the Project's design and the consultation process involving local farmers and civil society organizations. IDB and IFAD will closely follow up on the evolving political situation and keep a continuous dialogue with state and federal counterparts to inform new authorities of Project characteristics and benefits, as well as keep participating in policy dialogue platforms such as the Forum of State Secretaries and Northeast Consortium. The IFAD Office in Salvador will play a critical role in monitoring changes in the political scenario.</p>		
<b>Governance</b>	<b>Moderate</b>	<b>Moderate</b>
<p><b>Risk:</b></p> <p>The Project Management Unit and partner institutions may not possess all the knowledge and capacities necessary for the geographic expansion of the Project and implementation of new activities. The design of the structure, positions, and competencies of the PMU may not be the most suitable for Project implementation.</p>	Moderate	Moderate
<p><b>Mitigations:</b></p> <p>The challenges and lessons learned from the implementation of phase I have been considered in the design of phase II, minimizing, or pre-emptively addressing future implementation risks. Similarly, the design of the new PMU and institutional arrangements with key partners will be defined considering these lessons learned and challenges to improve the governance and the effective implementation of activities. The Project design also includes capacity-building and institutional strengthening activities for partner organizations with the same objective. IFAD systematic monitoring will also identify potential governance issues in the Project and contribute to finding timely solutions.</p>		
<b>Macroeconomic</b>	<b>Low</b>	<b>Low</b>

<p><b>Risk:</b></p> <p>There may be difficulty mobilizing the counterpart funding from the State Government for the Project. A downturn in economic activity could lead to a decrease in tax revenue and, consequently, budgetary constraints on public policies complementary to the Project.</p>	Low	Low
<p><b>Mitigations:</b></p> <p>The design of phase II is incorporated into the Pluriannual Plan 2024-2027, ensuring a minimum level of programmatic and budgetary stability. The State of Paraíba has a well-evaluated fiscal management by the federal government due to low indebtedness, current savings, and a favorable liquidity index. The state has been evolving in its macroeconomic context post-COVID, and the projections for the coming years are favorable.</p>		
<p><b>Fragility and Security</b></p>	<b>Moderate</b>	<b>Moderate</b>
<p><b>Risk:</b></p> <p>Brazil as a whole, and especially the poorest states, still suffer from the effects of the country's political and economic crisis and the global health crisis of COVID-19, which have caused high unemployment rates, an exponential increase in the population living below the poverty line, as well as food insecurity. Food insecurity has increased throughout the pandemic, especially in the North and Northeast regions. Additionally, data reveals the growing negative effects of climate change in Project areas, especially the concentration and spatial and temporal irregularity of rainfall, increased temperatures, and more frequent, longer, and more severe droughts. This could require expansion and/or reformulation of interventions to achieve the planned objectives.</p>	Moderate	Moderate
<p><b>Mitigations:</b></p> <p>Since 2023, the country's economic and fiscal situation has improved, with an increase in GDP and a significant decrease in unemployment and food insecurity rates. The forecasts for the national macroeconomic scenario are favorable for the coming years. PROCASE II will contribute to this scenario by seeking to increase the income and food security of beneficiary families, especially women, youth, traditional communities, and Indigenous people. The Project will seek to implement an integrated resilience approach to assist family farmers in adapting to, coping with, and/or recovering more rapidly from future climatic, economic, and environmental shocks, prioritizing, for example, social technologies for water access, technical assistance with an agroecological approach, as well as marketing strategies for family agriculture products.</p>		
<p><b>Sector Strategies and Policies</b></p>	Low	Low
<p><b>Policy alignment</b></p>	Low	Low
<p><b>Risk:</b></p> <p>Non-alignment of PROCASE II with the main public policies of the Government of Paraíba and/or the Federal Government.</p>	Low	Low
<p><b>Mitigations:</b></p> <p>Since phase I, PROCASE has been included in the state's Pluriannual Plan and is aligned with the main federal government programs to support family farming and fight rural poverty and hunger (including topics such as food security, water, rural women, youth, and PCTs empowerment, agroecology, and sustainable natural resources management). The current and new IFAD COSOPs were formulated considering this alignment with the federal government and the state governments of the Northeast (through close coordination and collaboration with the Governors' Northeast Consortium). The Project was also designed considering IDB's development goals and strategy for Brazil.</p>		
<p><b>Policy Development and Implementation</b></p>	Low	Low

<p><b>Risk:</b></p> <p>Considering the design process involving the state government and local organizations and focused on the continuity of actions to combat rural poverty, there is no identified risk that it will not represent or be in conflict with such priorities, targeted beneficiary population, and the main programs to combat rural poverty.</p>	Low	Low
<p><b>Mitigations:</b></p> <p>The Project design envisages collaboration and complementary activities with other state agencies and partners. The Project will have knowledge management activities and will seek to strengthen the monitoring and evaluation system. IFAD's systematic monitoring will track proper implementation and timely corrective actions when needed.</p>		
<p><b>Environment and Climate Context</b></p>	<b>Substantial</b>	<b>Substantial</b>
<p><b><i>Project vulnerability to environmental conditions</i></b></p>	<b><i>Moderate</i></b>	<b><i>Moderate</i></b>
<p><b>Risk:</b></p> <p>The Project will be executed in two biomes: the Caatinga and the Atlantic Forest (Portuguese: Mata Atlântica or Zona da Mata). The challenges family farmers face, however, are similar in both biomes. These include adverse soil conditions (shallow, with little organic matter and subject to erosion and desertification processes) and restrictions on water availability (quality and quantity), which can affect the productive activities supported by the Project. Some traditional practices of clear-cutting, slash and burn, and overgrazing are exacerbating deforestation and desertification trends, accentuating the negative effects of any environmental restrictions on the Project's activities.</p>	Moderate	Moderate
<p><b>Mitigations:</b></p> <p>The Project will promote agroecological farming practices, with a focus on agroforestry systems, combined with restoration projects of degraded areas. In combination and at the landscape level, these practices can improve air and water quality and mitigate extreme events such as floods and droughts. In addition, agroecological practices can improve the productivity of agricultural areas, thereby reducing the pressure on existing natural areas. Native species will be prioritized during the implementation of productive systems, increasing climate resilience. The Project will also promote social technologies for water resource management to improve communities' resilience during drought periods, including cisterns for human consumption and agricultural production, gray water reuse, and subterranean dams.</p>		
<p><b><i>Project vulnerability to climate change impacts</i></b></p>	<b><i>Substantial</i></b>	<b><i>Substantial</i></b>
<p><b>Risk:</b></p> <p>Using the ThinkHazard tool reveals the incidence of floods, droughts, landslides, fires, and extreme heat events. Climate models point to a significant increase in temperature and higher variability of precipitation events. They also predict a drop in precipitation, although it is not significant. Such changes will affect crop and animal production, as well as local biodiversity and supply chains. The tendency is for family income to deteriorate, contributing to an increase in inequality and exacerbating existing conflicts and migratory flows.</p>	Substantial	Substantial

<p><b>Mitigations:</b></p> <p>The Project aims to develop climate-resilient agroecological agriculture in synergy with environmental recovery and preservation through the adoption of agroecological practices, such as restoration of degraded lands (pastures, agricultural soils, and riparian areas), agroforestry systems, integrated pest management (IPM), species diversification and adoption of green fertilizers. The Project will promote the adoption of native species adapted to the local climate and strengthen the production chains of family farming products, increasing marketing and processing capacity. The Project also aims to increase access to agroecological, climate-resilient technical assistance (TA). PROCASE II will also provide access to better quality water for the community, promoting social technologies such as cisterns for human consumption and agricultural production, subterranean dams, and water tanks. Water treatment and recycling solutions will be adopted to ensure that part of the communities have access to basic sanitation and, as a result, reduce soil, land, and water contamination, in addition to preventing diseases associated with waste produced in family units.</p>		
<b>Project Scope</b>	<b>Moderate</b>	<b>Moderate</b>
<b>Project Relevance</b>	<b>Low</b>	<b>Low</b>
<p><b>Risk:</b></p> <p>There is no significant risk that the Project's objectives and relevance are not fully aligned with the development priorities of the IDB, IFAD (new COSOP 2024-2032), or the state government. The Project addresses the central challenges of rural development, and its design is also aligned with Paraíba's policies and priorities.</p>	Low	Low
<p><b>Mitigations:</b></p> <p>Nonetheless, mitigation measures will be taken through permanent dialog between the IDB, IFAD, and the State Government. The full involvement of stakeholders during preparation and implementation, including civil society and farmers' organizations, should allow adjustments to be made in an aligned and early manner.</p>		
<b>Technical Soundness</b>	<b>Moderate</b>	<b>Moderate</b>
<p><b>Risk:</b></p> <p>The area of operation will be much larger than during the first phase, which presents the risk of dispersion of the Project's activities as well as greater complexity for operational management.</p>	Moderate	Moderate
<p><b>Mitigations:</b></p> <p>The Project's intervention will follow a plan based on the definition of priority areas, which will consider the location of the target group and the interventions of other projects (Sertão Vivo, PDHC III, COOPERAR). The Project's intervention will also consider the priorities defined for each of the state's 15 Rural Territories.</p>		
<b>Institutional Capacity for Implementation and Sustainability</b>	<b>Substantial</b>	<b>Substantial</b>
<b>Implementation Arrangements</b>	<b>Substantial</b>	<b>Substantial</b>
<p><b>Risk:</b></p> <p>i) The risk that the Project executing agency's capacities are insufficient for adequate and effective Project management, leading to delays and lower quality of execution. ii) EMPAER should take on the role of sub-executor and be in charge of land and environmental regularization activities, as well as being responsible for part of the TA services that will be provided to beneficiary families, with a methodology and intensity that is quite different from what the institution's technical staff is used to. In PROCASE I, EMPAER only took on the provision of TA on a limited scale. iii) The risk related to two multilateral actors (IFAD and IDB) involved in the project supervision and implementation.</p>	Substantial	Substantial

<p><b>Mitigations:</b></p> <p>i) PROCASE II will establish a Project Management Unit (PMU) in SEAFDS that has extensive experience in project execution, including from International Financial Institutions, such as IFAD, and keep key staff with vast experience in executing the previous phase. ii) Based on the institutional capacity assessment carried out in the final design phase, the needs to be considered can be identified to define an operational mode and a project management organization that considers the most fragile areas and plans mitigation actions. A training program for TA teams and evaluations will also be implemented. iii) The Coordination Agreement drafted and to be signed between IFAD and IDB clearly sets roles and responsibilities. This is the third Type C project with IDB and the PSI in Piauí has entered into force in November 2023 and the “implementation arrangements” between IFAD and IDB are working well with both agencies well-coordinated.</p>		
<p><b>Monitoring and Evaluation Arrangements</b></p>	<b>Moderate</b>	<b>Moderate</b>
<p><b>Risk:</b></p> <p>PROCASE has not adopted an information management system that could monitor activities and account for beneficiaries efficiently. PROCASE I's current M&amp;E team is reduced.</p>	Moderate	Moderate
<p><b>Mitigations:</b></p> <p>PROCASE II will have resources for developing or acquiring an M&amp;E system to monitor all Project information. Regarding management, there are resources for hiring 2 M&amp;E professionals exclusively for the Project, as well as resources for attending courses to strengthen the team's capacities.</p>		
<p><b>Project Financial Management</b></p>	<b>Substantial</b>	<b>Moderate</b>
<p><b>Project Organization and Staffing</b></p>	<b>Substantial</b>	<b>Moderate</b>
<p><b>Risk:</b></p> <p>i) risk of implementation delays if dedicated finance staff PMU is not hired in a timely manner; ii) Incompliance with finance policies and procedures and financing agreements if requirements are not well understood by PMU Finance Staff</p>	Substantial	Moderate
<p><b>Mitigations:</b></p> <p>(i) include budget for PMU finance staff in project budget and recruitment and appointment of key finance staff as a condition for first disbursement in FA; ii) During start up phase training on IDB and IFAD finance policies and procedures.</p>		
<p><b>Project Budgeting</b></p>	<b>Substantial</b>	<b>Substantial</b>
<p><b>Risk:</b></p> <p>If the state's fiscal situation worsens, the budget allocated to the project could be reduced with as a result delays in implementation.</p>	Substantial	Substantial
<p><b>Mitigations:</b></p> <p>Close coordination with SEFAZ to ensure the availability of a sufficient budget from the start date of the Project.</p>		
<p><b>Project Funds Flow/Disbursement Arrangements</b></p>	<b>Substantial</b>	<b>Substantial</b>
<p><b>Risk:</b></p> <p>Implementation delays if counterpart funds are not transferred on time to the Project to cover salaries and operating costs, which are fully funded by the government of Paraíba</p>	Substantial	Substantial

<p><b>Mitigations:</b></p> <p>Close coordination with SEFAZ to ensure the availability of a sufficient budget from the start date of the Project.</p>		
<p><b>Project Internal Controls</b></p>	<b>Substantial</b>	<b>Moderate</b>
<p><b>Risk:</b></p> <p>i) Use of funds transferred to farmers organizations under investment or business plans not used for intended purposes. ii) Lack of segregation of duties, in particular during the start-up phase, if the hiring of finance staff is delayed</p>	Substantial	Moderate
<p><b>Mitigations:</b></p> <p>i) Establish in the Program's Operational Regulations (ROP) clear mechanisms for the approval, disbursements and reporting on the use of funds transferred in the form of investment and business plan and include in agreements signed with producer organizations details of responsibilities and procedures. The approval of the Program's Operational Regulations (ROP), by IDB and IFAD as a condition for first disbursement; ii) Hiring of key finance staff as a condition for disbursement in FA; segregation of duties incorporated in the ROP.</p>		
<p><b>Project Accounting and Financial Reporting</b></p>	<b>Substantial</b>	<b>Moderate</b>
<p><b>Risk:</b></p> <p>(i) Reliance on Excel for preparation of Interim Financial Reports in Excel, resulting in human errors and delays in submission; ii) Delays or inadequate quality of reporting on use of funds from investment and business plans by farmers organizations and/or cooperatives; iii) Incomplete or delayed reporting of counterpart funding in particular since, as per IDB's standard practice, beneficiary contributions are not included in total project.</p>	Substantial	Moderate
<p><b>Mitigations:</b></p> <p>(i) Before the start of the Project and as a condition for disbursement in FA, implementation of a complementary automated reporting system similar to the SIGMA system used within the Worldbank financed Cooperar project, that generates basic financial statements and financial reports as required by IDB and accepted by IFAD as equivalent to IFRS and allows for budget monitoring by component and categories based on data from the governmental SIAF system.ii) The ROP and agreements signed with farmers organization and cooperatives will establish a clear procedures for reporting on the use of funds transferred under investment and business plans (iii) Establish and document in the ROP a process for capturing beneficiaries' contributions in conjunction with M&amp;E data, training of technicians, and clear criteria for recording and valuation of the same and ensure the technical assistance provided to producer organization includes support on administrative matters and reporting on use of funds.</p>		
<p><b>Project External Audit</b></p>	<b>Moderate</b>	<b>Moderate</b>
<p><b>Risk:</b></p> <p>Accounting standards used for preparation of audited financial statements not disclosed in audit opinion and/or notes</p>	Moderate	Moderate
<p><b>Mitigations:</b></p> <p>In coordination with BID ensure accounting standard to be used and disclosure of the same is included in TdR for external audits.</p>		
<p><b>Project Procurement</b></p>	<b>Moderate</b>	<b>Moderate</b>
<p><b>A.1 Legal, Regulatory and Policy Framework</b></p>	<b>Moderate</b>	<b>Moderate</b>

<p><b>Risk:</b></p> <ul style="list-style-type: none"> <li>- This limitation of methods can lead to inefficient procurement if it does not take into account the different Priority Elements that may be involved in determining the need for procurement (quality, time, etc);</li> <li>- Absence of a consolidated instrument, in the format of a manual, that contains detailed information about the procedures and content of the documents required for the contracting process;</li> <li>- National law does not contain express prohibitions regarding the disclosure of information during the evaluation phase;</li> <li>- National Law does not provide for an autonomous review body for procurement activities;</li> <li>- Lack of standard contractual conditions;</li> </ul>	Moderate	Moderate
<p><b>Mitigations:</b></p> <ul style="list-style-type: none"> <li>- Development training and capacity building program on the procurement procedures for the entire procurement cycle;</li> <li>- Define in the PIM clear rules on: a) the content of bidding documents; b) evaluation stage; c) main management and monitoring documents; d) document storage and their respective deadlines; e) security protocols;</li> <li>- Consider the full use or adoption of international standards with their manuals and standardized instruments;</li> <li>- Intensify planning and preparation of consultancy procurement activities, taking into account the complexity of the object;</li> <li>- Evaluate the possibility of using international methods defined in clear policies and detailed in specific manuals;</li> <li>- Adopt a review committee and/or alternative conflict resolution methods;</li> <li>- Adopt a regulation proposed by an official body as a reference for good procedural practices;</li> <li>- Prepare standard bidding documents or use existing models that have been duly adapted;</li> <li>- Drawn up general clauses for the main types of contracts celebrated by the Project. IFAD GCC may be adopted with appropriate adaptations;</li> <li>- Standard contractual conditions should include provisions on Alternative Dispute Resolution (ADR), specifically through arbitration, in alignment with international standards;</li> <li>- Develop an acquisition procedures manual aligned with national laws and international good practices;</li> <li>- Capacity building on use of sustainable contracting criteria in the Project's procurement cycle;</li> <li>- Adhering to IFAD SECAP and IFAD policies.</li> </ul>		
<p><b>A.2 Institutional Framework and Management Capacity</b></p>	<b>Low</b>	<b>Low</b>
<p><b>Risk:</b></p> <ul style="list-style-type: none"> <li>- Low priority for planning.;</li> <li>- Absence of extratified statistical information on procurement can make it difficult to evaluate policies and identify the efficiency of the system.</li> </ul>	Low	Low
<p><b>Mitigations:</b></p> <ul style="list-style-type: none"> <li>- Facilitate capacity building on strategic planning;</li> <li>- Adopt procurement management systems that allow evaluation through statistical information, as well as market planning and analysis</li> </ul>		
<p><b>A.3 Public Procurement Operations and Market Practices.</b></p>	<b>Low</b>	<b>Low</b>
<p><b>Risk:</b></p> <ul style="list-style-type: none"> <li>- Fragility in the integration between procurement planning and technical areas;</li> <li>- Use of contracts templates with General Clauses is still not frequently used;</li> <li>- The rules to ensure the confidentiality of the evaluation procedure are not present in a clear way and a single manual;</li> <li>- Punctual delays in the execution of contracts.</li> </ul>	Low	Low

<p><b>Mitigations:</b></p> <ul style="list-style-type: none"> <li>- Internal flows must promote the integration and participation of the procurement area in the planning cycle of Project activities;</li> <li>- Training on Project and IFAD's policies;</li> <li>- Adopt standard bid documents whenever possible;</li> <li>- Use of contractual clauses containing the general conditions of the contract is encouraged. (IFAD standard documents as well as their CGC can be adapted for use by the project);</li> <li>- The evaluation rules must be clearly defined in the Project implementation manual;</li> <li>- Use of IFAD's Contract Monitoring Tool (CMT) to gather information about the contracts implementation.</li> </ul>		
<p><b>A.4 Accountability, Integrity and Transparency of the Public Procurement System</b></p>	<b>Substantial</b>	<b>Substantial</b>
<p><b>Risk:</b></p> <ul style="list-style-type: none"> <li>- The sharing of teams for technical assistance in different decision-making bodies;</li> <li>- The inclusion of standard contract clauses that provide for prohibited practices is not mandatory;</li> <li>- Low perception about the application of laws on fraud, corruption and other prohibited practices with the application of penalties declared;</li> <li>- Lack of information about special integrity training programs offered to procurement teams;</li> <li>- Stakeholders are not actively participating in promoting good practices and actions for integrity and ethics;</li> <li>- lack of standardized forms for archiving conflict of interest information;</li> </ul>	Substantial	Substantial
<p><b>Mitigations:</b></p> <ul style="list-style-type: none"> <li>- Define an independent appeals body or entity;</li> <li>- Clearly and expressly define in its compliance/integrity documents and policies what are considered prohibited practices and how to avoid them;</li> <li>- Development of Internal communication plans and training programs on the Project's fundamental policies and values;</li> <li>- Include clauses and policies that address prohibited practices in the main contractual documents;</li> <li>- Implement integrity and anti-corruption training as part of the project;</li> <li>- Establish clear documents on ethics and integrity as a requirement in the project;</li> <li>- Include IFAD's mandatory policies in all contractual documents, including for subcontractors;</li> <li>- Conduct comprehensive due diligence before formalizing any contracts;</li> <li>- Include evaluation criteria that recognize the adoption and appreciation of good practices and innovative practices by bidders;</li> <li>- Adopt clauses and policies that address prohibited practices in the main contractual documents;</li> <li>- Adopt forms of declaration on conflict of interest and property information and keep them filed in the procurement processes (IFAD standard forms can be adapted).</li> </ul>		
<p><b>B.1 Assessment of Project Complexity</b></p>	<b>Substantial</b>	<b>Substantial</b>

<p><b>Risk:</b></p> <p>This is a type C project where IDB Procurement rules will be followed. The state of Paraíba's legislation allows for the use of IFIs procurement rules. Moreover, the State Comptroller's Office (CGE) has a system where all project procurements are entered, and this system includes all the procurement methods of these financing organizations, in accordance with the Loan Agreement. IICA - Inter-American Institute for Cooperation on Agriculture will also be an implementing partner and they already work on several projects using the rules of the World Bank and IFAD, which are similar to those of the IDB. IICA has also an online system storing all the procurement documents, which can be made available to lenders. This system has already been inspected by IFAD without any problems. Procurement that may be carried out directly by the Project will have all their documents registered in the CGE system. The procurement that will be carried out by the beneficiary farmers' associations will also be monitored by the Project's technicians and registered in the agreement control system, which reduces risk and promotes greater transparency.</p> <p>Another complexity of the Project is due to the fact that procurement will be done by both the PMU and the associations and farmers.</p> <p>The procurement done by farmers' associations will be of low complexity, but with a large number of acquisitions, as the project will cover the entire semi-arid region of the State, with 194 municipalities. This may require a great effort of coordination and monitoring.</p>	Substantial	Substantial
<p><b>Mitigations:</b></p> <ul style="list-style-type: none"> <li>• Provide training on IDB procurement rules to the project teams: including teams of potential implementers, the Attorney General's Office, and the State Comptroller's Office, to strengthen the understanding of the agreed rules.</li> <li>• PMU's procurement activities do not present highly complex selections or acquisitions and the Project team already has experience with the methods of international financial organizations, having carried out IFAD and IBRD projects. They also intend to hire IICA to carry out the selection and hiring of individual consultants, as occurred in phase 1 of PROCASE. Consider the support of civil servants who have worked in the previous phase and inviting consultants who have worked in the previous phase or who have worked on projects with similar procurement rules to take part in the selection process.</li> <li>• Farmer associations will have bidding committees and they will execute the "Request for Quotation" method for planned purchases. These commissions will be trained by the PROJECT and will have the support of technical experts in purchasing. The complexity of the project is high, but with full conditions for risk mitigation and adequate management.</li> </ul>		
<p><b>B.2 Assessment of Implementing Agency Capacity</b></p>	<b>Moderate</b>	<b>Moderate</b>
<p><b>Risk:</b></p> <p>The State of Paraíba has the technical capacity in both national and international public procurement, and the Project will be executed in accordance with the IDB's procurement regulations but there is the risk that the capacity of the implementing agency is insufficient to adequately manage the Project, causing delays in execution.</p> <p>The public procurement processes used by the state of Paraíba are generally carried out using the Electronic Auction modality, which is also accepted by the IDB with the suppression of the negotiation clause after the award of the lowest price. This modality could also be used in the Project's procurements.</p>	Moderate	Moderate

<p><b>Mitigations:</b></p> <p>The implementation of the project will be centralized in the Secretariat of Family Agriculture, with the partnership of EMPAER as technical sub-executor. Due to the good execution of phase 1 of PROCASE, the PMU acquired successful experience with this type of arrangement. Control and monitoring of the execution of the Investment Plans of producer organizations will be carried out through an agreement (convênio) system. The technical assistance teams will monitor the bid process, the receipt of goods and services and the rendering of accounts. The implementing agency will have the support of IICA for the selection and hiring of consultants, which is an institution experienced in implementing rural projects and applying the financing partners procurement rule and operates with an adequate and transparent system. The implementing Agency has good execution capacity but will need to maintain good coordination of the actors involved to avoid delays in implementation.</p> <ul style="list-style-type: none"> <li>• Involve procurement staff with experience in public procurement of IFIs that have rules similar to those of the IDB and provide training to project staff involved in procurement on the rules established in the Loan Agreement.</li> <li>• Train the auctioneer on the Electronic Auction method adapted to IDB's procurement policy as agreed in the Loan Agreement.</li> </ul>		
<p><b>Project Procurement Overall</b></p>	<p><b>Moderate</b></p>	<p><b>Moderate</b></p>
<p><b>Risk:</b></p> <p>With a moderate risk at both the country and projects levels, it can be mitigated by implementing the actions defined during design. Mainly, the use of IDB rules as the implementing partner and adjusting any gap determined in the gap analysis.</p>	<p>Moderate</p>	<p>Moderate</p>
<p><b>Mitigations:</b></p> <p>Provide training on IDB procurement rules to the project teams: including teams of potential implementers, the Attorney General's Office, and the State Comptroller's Office, to strengthen the understanding of the agreed rules.</p>		
<p><b>Environment, Social and Climate Impact</b></p>	<p><b>Substantial</b></p>	<p><b>Moderate</b></p>
<p><b>Biodiversity Conservation</b></p>	<p><b>Moderate</b></p>	<p><b>Moderate</b></p>
<p><b>Risk:</b></p> <p>The agricultural components of the Project will be developed in an already altered landscape on landholdings with an average area of 10 hectares. The risk of conversion or degradation of biodiversity, habitats, ecosystems, and ecosystem services resulting from Project activities is thus limited. Furthermore, the Project will invest in the environmental restoration of critical habitats, such as riparian forests, and promote agroforestry systems, thus increasing biodiversity in the beneficiary's farms.</p> <p>Animal farming systems, which are historically linked to deforestation and desertification trends, will be strengthened by PROCASE II with agroecological productive systems, environmental monitoring, and land restoration activities, among others, limiting their potential negative impact and increasing the region's vegetation cover.</p> <p>The Project will not promote the planting of invasive species, but independent introduction by farmers may occur.</p>	<p>Moderate</p>	<p>Moderate</p>

<p><b>Mitigations:</b></p> <p>Investment plans at plot or farmers' association levels will be required to observe Brazilian Law guidelines regarding the conservation of biodiversity and native vegetation. Those will be reflected in the Project's ESMF and ESMP. Moreover, the Project will implement a variety of measures that will limit the impact of animal husbandry activities, including agroforestry, diversification of fodder trees including native forage trees, optimal rotation, agroecological Technical Assistance, genetic improvement of animal breeds, participatory management of natural habitats, sustainable use of protected areas, project-level monitoring of deforestation, construction of nurseries and expansion of processing and marketing capacities, increasing the profitability of production systems. The gain in productivity brought by agroforestry systems will also serve as a deterrent to deforestation since degraded pasture lands have much lower yields. Regarding invasive species, the Project will only promote productive systems that use native species and non-invasive exotic species, avoiding species with invasive potential, such as Neem, Algaroba, and Leucaena.</p>		
<p><b>Resource Efficiency and Pollution Prevention</b></p>	<p><b>Moderate</b></p>	<p><b>Moderate</b></p>
<p><b>Risk:</b></p> <p>The Project will not seek or support the use of hazardous substances nor the significant extraction of natural resources. Nonetheless, pesticides may be needed in the case of pest outbreaks. Extraction of water resources for human use and irrigation will observe best practices and national regulations and will not jeopardize the sustainability or quality of water stocks. Most water infrastructures will be rainfed cisterns and dams, with limited impact on groundwater and surface water resources. The Project will also promote the installation of efficient stoves that will reduce the need for firewood in the region, reducing deforestation trends. The Project will focus on green fertilizers and will not encourage the purchase of chemical fertilizers. It will also support small livestock production, so there may be an increase in herd size.</p>	<p>Moderate</p>	<p>Moderate</p>
<p><b>Mitigations:</b></p> <p>The risk associated with the eventual use of pesticides will be mitigated through the judicious assessment of the need for their use, and the WHO guidelines will be followed regarding handling, application, disposal, and risk class. No WHO Ia and Ib class toxicity hazard substances will be allowed to be used. The Project will support environmentally sustainable practices and help farmers modify their production systems if they have unsustainable practices (for example, overgrazing or cutting and burning native vegetation). It will also contribute to increasing forest coverage through reforestation practices and the restoration of degraded areas, especially near animal husbandry activities.</p>		
<p><b>Cultural Heritage</b></p>	<p><b>Low</b></p>	<p><b>Low</b></p>
<p><b>Risk:</b></p> <p>The Project will not cause significant degradation of cultural or physical resources, including threats to or loss of resources of historical, religious, or cultural importance. The Project will only work on land already being used for agriculture and will not implement activities in recognized cultural heritage sites.</p>	<p>Low</p>	<p>Low</p>
<p><b>Mitigations:</b></p> <p>The Project will ensure that cultural considerations are made during the implementation of the proposed activities. Project activities will foster the respect and preservation of traditional culture, knowledge, and practices of Indigenous Peoples and Traditional Communities.</p>		
<p><b>Indigenous People</b></p>	<p><b>Low</b></p>	<p><b>Low</b></p>

<p><b>Risk:</b></p> <p>Indigenous peoples will not be adversely impacted by Project activities, but there is a risk that there will be no effective participation of Indigenous peoples in Project decisions that affect them.</p>	Low	Low
<p><b>Mitigations:</b></p> <p>i) The Project strengthens the protection of indigenous people's cultural and physical resources, promotes economic development through productive investments, values traditional agricultural systems, and recognizes and rescues indigenous food culture. Thus, Project interventions are expected to increase incomes, food security, and improved nutrition for IPs. ii) Project eligibility/exclusion criteria prohibit the acquisition or restriction of land use in areas of indigenous and traditional communities. iii) The Environmental, Social, and Climate Management Plan (ESCMP) will include a Plan for Disclosure and Public Consultations, contemplating the participation of quilombola, Indigenous, and other traditional communities, informing about the Project and location of proposed interventions in the communities, reporting on the activities and location of any intervention in the area bordering the demarcated Territory. iv) The ESCMP will also include a Social Communication and Community Participation program that respects and includes forms of documentation and means of communication that are accessible and adequate to the cultural specificities of Indigenous peoples and traditional communities of the Project area. v) The Project's methodology is participatory and demand-driven, with indigenous and traditional communities presenting their development plans and co-creating the Project's activities in a process of self-determined development. vi) The Project will ensure the Free, Prior, and Informed Consent (FPIC) of the Project-affected Communities of Indigenous Peoples. vii) The Project will elaborate a socio-cultural analysis of indigenous populations and traditional communities living in the project area.</p>		
<p><b>Labour and Working Conditions</b></p>	<b>Moderate</b>	<b>Moderate</b>
<p><b>Risk:</b></p> <p>Employment conditions in impoverished rural areas of Brazil, as is the case in the Project's intervention area, may not be fully compliant with national and international labor and working regulations. This can lead to risks of payment below the minimum wage, child labor, unsafe conditions, or excessive hours, among others.</p>	Moderate	Moderate
<p><b>Mitigations:</b></p> <p>i) All contracts with contractors, suppliers, and third parties to be financed with IFAD resources will include provisions that prohibit child labor and promote decent working conditions. ii) The PMU (Project Management Unit) will establish a mechanism to supervise and monitor the Project's activities, considering working condition issues. iii) Through the Project's complaints and grievances mechanism (GRM), stakeholders or society, in general, will be able to submit anonymous complaints regarding abusive labor practices (e.g., forced or child labor), cases of gender-based violence, discriminatory working conditions, and unsafe/unsanitary working conditions, which will be addressed and resolved as indicated in the mechanism. iv) The Executing Agency will prepare and maintain an Environmental and Social Management System (ESMS) for the operation with specific elements related to Labor and Working Conditions under ESPS 2 of IDB. Therefore, the Project will lead to an improvement in labor and working conditions.</p>		
<p><b>Community health, safety and security</b></p>	<b>Moderate</b>	<b>Moderate</b>

<p><b>Risk:</b></p> <p>There is no risk that the Project activities will have adverse effects on the physical, mental, nutritional, or social health and safety of an individual, group, or population. However, recurrent gender-based violence in the Project area may have potential adverse effects on the physical, mental, or social well-being of individuals or groups. Works to be carried out under the Project may entail a limited influx of project workers from outside the beneficiary's communities. As proposed works, such as building cisterns, are small, the duration of such an influx and the quantities of works are expected to be small with no adverse impacts. Another potential risk relates to the piloting project approach to new target groups (e.g. LGBTQIAPN+ and persons with disabilities), which may involve some complexities.</p>	Moderate	Moderate
<p><b>Mitigations:</b></p> <p>The Project will contribute to improving the health and nutrition of rural populations, promoting agroecological practices, supporting access to water and sanitation, and improving food and nutrition security.</p> <p>In accordance with IFAD's Policy on Preventing and Responding to Sexual Harassment, Sexual Exploitation, and Abuse (2020), the Project will ensure that adequate safeguard measures are in place for a safe and harassment-free working environment, including sexual harassment and free from sexual exploitation and abuse in its activities and operations. All Project implementation teams, partners, and Project participants will receive training on preventing and responding to sexual harassment and SEA. Any complaint of sexual harassment, exploitation, or abuse received through the Project's complaint procedure will be referred immediately to the IFAD Ethics Office for further action. Project interventions focusing on gender will include orientations to beneficiaries on the different forms of violence against women, available protective measures safeguarded by the Maria da Penha Law, and how to report it.</p> <p>The Project works involve the implementation of social technologies (ST) with the active mobilization and participation of communities, whose members will receive capacity-building on how to implement and maintain STs with the support of a few outside trainers.</p> <p>The Project will partner with civil society organizations and movements representative of the LGBTQIAPN+ community and with experience working with this target group to ensure transformational approaches are implemented and that the LGBTQIAPN+ are effectively included in project activities.</p>		
<p><b><i>Physical and Economic Resettlement</i></b></p>	<b><i>Low</i></b>	<b><i>Low</i></b>
<p><b>Risk:</b></p> <p>The Project's intervention should not cause the physical resettlement of families or significant adverse economic effects, especially to marginalized groups.</p>	Low	Low
<p><b>Mitigations:</b></p> <p>The Project will have a solid targeting strategy and will promote positive social, physical, cultural, and economic impacts, especially for marginalized groups.</p>		
<p><b><i>Greenhouse Gas Emissions</i></b></p>	<b><i>Moderate</i></b>	<b><i>Moderate</i></b>
<p><b>Risk:</b></p> <p>Emissions from Project activities are likely to be negligible as the Project will focus on activities that should increase biomass on farms through the promotion of agroforestry systems, reduction in the use of fire as an agricultural management tool, improved pasture management and better soil conservation practices. Such an increase in biomass and adoption of agricultural practices may offset eventual emissions of other project activities, such as support to small agro-industries (that consume energy in processing, packaging, and transport). A detailed EX-ACT assessment prepared confirms the above.</p>	Moderate	Moderate

<p><b>Mitigations:</b></p> <p>The Project will most likely have negative emissions (carbon sequestration). It will contribute to increasing forest coverage with reforestation practices, sustainable use of riparian areas, recovery of degraded areas, and introduction of energy-efficient stoves.</p>		
<p><b>Vulnerability of target populations and ecosystems to climate variability and hazards</b></p>	<b>Substantial</b>	<b>Substantial</b>
<p><b>Risk:</b></p> <p>The target population and ecosystems are vulnerable to climate variability and extreme events, notably droughts and hot spells, especially in the Caatinga biome. In the Zona da Mata region (Atlantic Forest), the risks are more related to extreme rainfall events, such as floods and landslides. These problems are compounded by poverty and limited access of the targeted population to public policies geared towards reducing their vulnerability to climate change.</p>	Substantial	Substantial
<p><b>Mitigations:</b></p> <p>A Targeted Adaptation Assessment was prepared to provide guidance on adaptation measures that farmers and rural extension agents can implement. Since climate resilience is a focus of PROCASE II, many project activities will have adaptive potential, such as social technologies that increase access to water (cisterns, subterranean dams) and climate-resilient agriculture (agroecological TA, agroforestry based on native species, etc.).</p>		
<p><b>Stakeholders</b></p>	<b>Moderate</b>	<b>Moderate</b>
<p><b>Stakeholder Engagement/Coordination</b></p>	<b>Low</b>	<b>Low</b>
<p><b>Risk:</b></p> <p>There is a risk that the relevant stakeholders are not identified, that there is inadequate/insufficient disclosure of information, and that the key stakeholders invited to be part of the Project show little interest in or commitment to the Project's objectives and activities.</p>	Low	Low
<p><b>Mitigations:</b></p> <p>At the community and family level, the Project will implement a participatory and demand-driven process in defining activities that meet the needs and aspirations of the beneficiaries. The Project will also establish continuous communication, awareness-raising, and coordination with the various partners at different levels (local, regional, and state), starting at the Project preparation stage. It will foster visibility activities to publicize and clarify doubts about the Project activities' results, both for the target groups and the partners involved in implementation. Promoting awareness and participation among local communities, farmers, and other key players is essential to ensure adherence and commitment to the proposed activities. A stakeholder engagement plan for the lifetime of the Project (including equal participation of women and men and considering Indigenous Peoples and vulnerable groups) will be prepared. The Project will also conduct a public consultation process, considering culturally appropriate mechanisms and the progress of studies and management plans.</p>		
<p><b>Stakeholder Grievances</b></p>	<b>Moderate</b>	<b>Moderate</b>
<p><b>Risk:</b></p> <p>The implementation of the Project may lead to the submission of complaints by various stakeholders involved in or impacted by the Project's activities, thus affecting the continuity of activities and the established schedule. There is a risk that the Project will have ineffective grievance redress processes, leading to unaddressed grievances that jeopardize the achievement of the Project's development objectives.</p>	Moderate	Moderate

**Mitigations:**

The Project will incorporate a clear and effective Grievance Redress Mechanism (GRM) in accordance with IDB's Safeguard Policy and IFAD's guidance documents - Framework for Operational Feedback from Stakeholders and IFAD Guidelines 2021 on Engagement, Feedback and Redress of Project Target Group Grievances. The procedure includes mechanisms for expressing the complaint or grievance, the response time, and the resolution spheres. This mechanism should be easily accessible to the population and have a rapid resolution, ensuring that the submitted complaints are quickly analyzed and that the situations are mutually agreed upon to satisfy the parties involved. The Project will also raise awareness among stakeholders about the available GRM. It will also include this information as part of IFAD/IDB missions and part of the training of the technical assistance teams that will work with the beneficiaries.

## Introduction

1. The goal of this assessment is to compare the safeguard performance standards and procedures of both IFAD (table 1) and IDB (table 2) and to highlight eventual differences or gaps<sup>1</sup> relevant to the implementation of the Paraíba Rural Sustainable Development Project -PROCASE II. The Project is to be jointly financed by both institutions and IFAD has agreed to adopt the IDB's procedures and documents for Project preparation. According to IDB's Risk Assessment, the Project has received a "B" Environmental and Social Impact Categorization (ESIC), a "High" Disaster and Climate Change Risk (DCCRC) and a "Substantial" Environmental and Social Risk Rating (ESRR). Following the SECAP screening exercise the Project has received a "moderate" E&S rating and a "substantial" climate risk rating. No gaps that would result in noncompliance with IFAD's SECAP were found in the assessment presented below, except for the one regarding Climate Change, which is not an IDB safeguard policy. Hence, to meet the requirements of both institutions for this Project, and to adhere to IFAD's requirements for this level of climatic risk a Targeted Adaptation Assessment (TAA) is required and has been prepared. An assessment of how each IFAD standard is addressed in the study being carried out following IDB's policies is presented at the end of this text.

2. *Table 1: IFAD's performance standards (PS).*

IFAD –SECAP/PS
<b>Standard 1: Biodiversity conservation</b>
<b>Standard 2: Resource efficiency and pollution prevention</b>
<b>Standard 3: Cultural heritage</b>
<b>Standard 4: Indigenous peoples</b>
<b>Standard 5: Labour and working conditions</b>
<b>Standard 6: Community health and safety</b>
<b>Standard 7: Physical and economic resettlement</b>
<b>Standard 8. Financial intermediaries and direct investments</b>
<b>Standard 9: Climate change</b>

3. As mentioned above, according to the IDB's Environmental and Social Policy Framework (ESFP), and based on the information collected during the Project's design phase, the operation is classified as Category B because the activities and plans financed by Components I and II may generate moderate to significant negative environmental and social impacts in the medium to long term that are manageable and mitigable with known measures, which will be provided for in the environmental and social management plans (ESMPs), the stakeholder engagement and communication plans. These impacts are linked to agricultural activities and one-off civil construction activities to be financed by the Project, including noise generation, civil and agricultural construction waste and dust, emissions,

---

<sup>1</sup> As per the SECAP in co-financed projects, the IFAD will conduct a SECAP-aligned gap analysis to identify whether additional studies, audits, environmental and social documentation, or mitigation measures are required to meet SECAP requirements. When the requirements of a borrower/recipient/partner differ from those aligned with SECAP, the borrower/recipient/partner will be required to implement whichever is more stringent. For projects involving multiple subprojects that are identified, designed and implemented during the project cycle, the borrower/recipient/partner will carry out appropriate environmental and social assessments of these subprojects, and include measures to strengthen capacity for conducting environmental and social due diligence.

erosion and sedimentation of watercourses, pressure on modified and natural habitats. Activities aimed at improving the productivity and income of producer groups are not expected to adversely affect or contribute to the degradation of critical areas and habitats, given the adoption of agroecological practices. It is expected that land titling will promote economic development and improved land use and conservation. However, some situations carry risks of conflict between potential beneficiaries and actors claiming ownership of the land. These conclusions are in line with IFAD's risk assessment for the Project.

4. The Socio-Environmental Risk Classification is Substantial, associated with negative, temporary, manageable and mitigable environmental and social impacts, intervention risks and impacts on modified habitats with significant biodiversity value, and indirect impact risks to natural and critical habitats. The result of such assessment is more stringent than the one performed by the IFAD team which resulted in a Moderated Socio-Environmental Risk Classification.

5. The IFAD Project Development Team (PDT) noticed during the last mission that the IDB's Environmental and Social Management Programs were designed for activities with major environmental impacts reflecting the IDB overall more stringent approach to safeguards. Many of these programs may be challenging to implement for a rural development project with localized and dispersed impacts. The IFAD PDT, therefore, requested the reformulation and adjustment of some of the Programs to facilitate their implementation aligned with the realities of the rural milieu in which the Project will be implemented.

6. Disaster and Climate Change Risk was classified as Moderate due to the exacerbation of natural disaster risks during extreme events of drought, rainfall and flooding and fire in a sensitive biome. The IFAD climate risk screening however rated the Project's climate risk as Substantial. Consequently, a Targeted Adaptation Assessment was prepared to ensure that the IFAD's safeguard policy requirements are met and that additional guidance is provided to the Borrower during the Project's implementation phase.

7. The infrastructure to be built is of moderate criticality, as it is of medium size, which should be confirmed when defining projects and implementation areas through a Disaster Risk Assessment, to be included in the ESMP prior to implementation. These classifications were confirmed through the results of the Strategic Environmental and Social Assessment (SEA) studies conducted during due diligence.

8. The eligibility criteria established for the operation exclude activities that lead to involuntary displacement (physical or economic), negative impacts on livelihoods, negative impacts on traditional communities and/or Indigenous peoples, as well as impacts on the ecosystem resources on which Indigenous peoples depend and on their cultural heritage. Investments that generate adverse impacts on critical habitats will also be ineligible.

9. Climate Change and Alignment with the Paris Agreement (PA). This operation was analyzed using the MDB Joint Framework for Paris Alignment Analysis and the IDB Group's PAIA (GN-3142-1). It was determined that: (i) it is aligned with the adaptation goal of the Paris Agreement, as it is congruent with the adaptation priorities set out in the Nationally Determined Contributions (NDC), the National Adaptation Plan and Brazil's ABC+ Plan through the adoption of technologies that reduce the climate vulnerabilities of the Paraíba biomes (Caatinga and Atlantic Forest); and (ii) is aligned with the mitigation target of the Paris Agreement, as the interventions financed by Resilient Investment Plans (PIRs) and Business Plans (PNs) are consistent with the country's NDC emissions reduction target and the ABC+ Plan. The operation seeks to support the transition to a more sustainable agricultural model, promoting the recovery and protection of the natural resources of the Caatinga and Atlantic Forest, thus improving the environmental conditions of rural communities and their surroundings.

10. To adequately address these risks and meet the requirements set out in the Environmental and Social Performance Standards (ESPS), the PDT developed a (i) Strategic Environmental/Social Assessment (SEA); (ii) a

Strategic Environmental/Social Management Plan (ESMP); (iii) a Socio-Cultural Analysis focused on Indigenous peoples, Quilombola and other traditional communities, prior to the interventions to be carried out; and (iv) a Specific Stakeholder Participation Plan (SSPP). Risks concerning Indigenous Communities were assessed during the due diligence and the need for a Free, Prior and Informed Consultation for Indigenous and traditional communities that may be affected by the Project was identified. In addition, the PMU will implement an Environmental and Social Management System (ESMS) consistent with the IDB’s Environmental and Social Performance Standard (ESPS 1).

11. The environmental and social studies were disclosed in their preliminary version on the Bank’s website prior to the Review Mission, and a public consultation process was carried out for the entire Project, considering culturally appropriate mechanisms and the progress of the studies and management plans, prior to the date of the IDB’s Board of Directors for the operation.

12. The socio-environmental sustainability of the Project will be guaranteed by compliance with the Environmental and Social Policy Framework (ESPF) performance standards and the SECAP through the implementation of the ESMS and its guidelines. For that purpose, a specific team, with an environmental specialist and a social specialist, will be responsible for socio-environmental management and safeguards implementation (procedures and instruments) at the PMU and will ensure an active coordination and communication with the beneficiaries, stakeholders, implementation partners and donors.

**Table 2: IDB’s Environmental and social performance standards (ESPS).**

IDB – ESPF/ESPS
<b>ESPS 1: Assessment and Management of Environmental and Social Risks and Impacts</b>
<b>ESPS 2: Labour and Working Conditions</b>
<b>ESPS 3: Resource Efficiency and Pollution Prevention</b>
<b>ESPS 4: Community Health, Safety, and Security</b>
<b>ESPS 5: Land Acquisition and Involuntary Resettlement</b>
<b>ESPS 6: Biodiversity Conservation and Sustainable Management of Living Natural Resources</b>
<b>ESPS 7: Indigenous Peoples</b>
<b>ESPS 8: Cultural Heritage</b>
<b>ESPS 9: Gender Equality</b>
<b>ESPS 10: Stakeholder Engagement and Information Disclosure</b>

13. The study is based on a desk review of IDB Environmental and Social Policy Framework (ESPF) and IFADs’ Updated Social, Environmental and Climate Assessment Procedures (SECAP) of 2021 and respective guidance documents (Guidelines for the environmental and social performance standards and Updated Social, Environmental and Climate Assessment Procedures, volumes 2 and 3). Furthermore, the Project’s Social and Environmental Strategic Assessment and Project IDB Profile were consulted. Other documents consulted for this assessment are mentioned in the paper’s final section.

14. The comparison analyzes how social, environmental and climate change themes are treated in terms of coverage and stringency. It provides a recommendation as to which standards are either more stringent or comprehensive, and, therefore, recommended to be used, fully or in combination with one another, to ensure that all issues are adequately managed and comply with IFAD’s norms. The analysis covers standards, but also requirements, processes, rules and policies. In some cases, IFAD’s and IDB standards may not cover a theme through a standard, but rather in related policies and guidelines, such as in the cases of gender, youth, and mainstreaming. For example, the SECAP is applied not only to cover risk management but also mainstreaming whilst IDB’s current

ESPF refers to its older operational policies (OP-703, OP-765, OP-704 and OP-761<sup>2</sup>) that remain in effect for all matters related to IDB’s mainstreaming work on such policies and themes.

15. **Table 3: IFAD’s and IDB’s safeguard standards and themes.**

IFAD – PS	IDB - ESPS
SECAP (policy statement)	ESPS 1: Assessment and Management of Environmental and Social Risks and Impacts
Standard 1: Biodiversity conservation	ESPS 6: Biodiversity Conservation and Sustainable Management of Living Natural Resources
Standard 2: Resource efficiency and pollution prevention	ESPS 3: Resource Efficiency and Pollution Prevention
Standard 3: Cultural heritage	ESPS 8: Cultural Heritage
Standard 4: Indigenous peoples	ESPS 7: Indigenous Peoples
Standard 5: Labour and working conditions	ESPS 2: Labour and Working Conditions
Standard 6: Community health and safety	ESPS 4: Community Health, Safety, and Security
Standard 7: Physical and economic resettlement	ESPS 5: Land Acquisition and Involuntary Resettlement
Standard 8. Financial intermediaries and direct investments	<b>IDB does not have a standard.</b>
Standard 9: Climate change	<b>IDB does not have a stand-alone standard for this theme.</b>
<b>IFAD does not have a stand-alone safeguard standard for this theme.</b>	ESPS 9: Gender Equality
<b>IFAD does not have a stand-alone safeguard standard to cover this theme.</b>	ESPS 10: Stakeholder Engagement and Information Disclosure

16. In broad terms, the IFAD and IDB safeguard policies are equivalent concerning the themes covered. However, IFAD does not have stand-alone standards on Gender Equality, and Stakeholder Engagement and Disclosure. In the same token, IDB does not have stand-alone standards for financial intermediaries and direct investments and for Climate Change (possibly the most relevant difference in the context of this analysis and regarding the Project). This does not mean that these issues are not considered elsewhere in both institution's documents and that there is a lack of guidance on how to handle these specific issues<sup>3</sup>.

17. The emphasis on certain concerns or topics and whether they are treated as stand-alone safeguard standards or subsumed under specific standards is at the core of the differences in approach between the two institutions. The differences in approach between both institutions lie in the where the different concerns are addressed and in the specific safeguards instruments (i.e. assessments, studies, frameworks and management plans) that are needed for formal compliance with policy requirements.

<sup>2</sup> OP-703 Environmental and Safeguards Compliance Policy, OP-765 Indigenous People, OP-704 Disaster Risk Management Policy, OP-761 Women in Development.

<sup>3</sup> As for example IFAD’s Policy on the Disclosure of Documents (2010), [CC9F0FE9 \(ifad.org\)](http://www.ifad.org), and the Policy on Gender Equality and Women’s Empowerment (2012) or in regard to stakeholder engagement covered by paragraphs 29 and 30 of the SECAP. Also covered on standard 3, 4, 5, 6 and 7, related to consultations of targeted groups, depending on the social theme.

## **Corporate level approach**

18. At the corporate level, both institutions share a similar approach to managing social, environmental, and climate change impacts. The principles of “doing no harm” (i.e. managing eventual social, environmental, and climate change impacts following a mitigation hierarchy) and “doing good” (i.e. mainstreaming social, environmental, and climate change concerns) pervade both institutions’ frameworks. “Do no harm” is mandatory whilst “doing good” refers to introducing measures to mainstream: gender, youth and nutrition, persons with disabilities, climate change and Indigenous people according to the possibilities presented by each project in alignment with the SDGs and making sure no one is left behind are encouraged on a case by case basis, according to the possibilities presented by each project.

19. The overall approach consists of an initial project screening and risk categorization in accordance with the magnitude, probability and complexity of impacts, and discussion of studies to be prepared by the Borrower. It is important to highlight that IFAD has a specific risk assessment and classification for Climate Change risks. Following project preparation, a review of borrower’s social and environmental impact studies and mitigation frameworks or plans and the proposed environmental and social management system (EMS) is prepared. The EMS has to be adequately staffed and time-bound mitigation and monitoring plans have to be adequately budgeted.

20. Both institutions use a risk-based approach that invests in increased oversight and resources of complex projects and promotes increased responsiveness to changes in adaptive risk management and stakeholder engagement. Agreements regarding safeguard implementation are part of the Project’s legal covenants. Lack of compliance with those are subject to remedies.

21. They also share a common approach concerning distributing roles and responsibilities between the institutions, borrowers, and executing agencies in safeguards implementation. The requirement of Management Systems to be put in place and operated by the Borrowers with transparency and inclusiveness, ensuring that eventual grievances may escalate to the attention of the senior management level at both institutions, is also common.

22. Finally, both institutions have lists of activities and items that cannot be financed in their operations (cf. exclusion lists at the end of this document). They largely cover the same topics. However, IFAD has specific provisions on the prohibition of Genetically Modified Organisms (GMOs) that may be relevant to the Project if drought-resistant GMOs are ever considered in agricultural adaptation project-funded activities.

## **Findings and conclusion**

23. Overall IFAD’s social, environmental and climate change commitments will be adequately fulfilled with the use of IDB’s ESPF and corresponding performance standards (including exclusion list with the caveat above on the prohibition of GMO – not found in the ESPF). Only in the case of IFAD’s requirements regarding Climate Change IFAD’s risk review and ensuing instruments would not be adequately covered by IDB’s standards.

24. Using IFAD’s Climate Change standard (9) could add value to assessing Project risks and ensuring provisions for managing risks and impacts. A climate risk screening would be necessary to meet IFAD’s safeguard objectives and requirements. A Climate Impact and Vulnerability Assessment would be required if the climate risk is high or substantial.

25. Additionally, some themes like nutrition and vulnerable target groups (women, youth, persons with disabilities and Indigenous peoples) which are analyzed in the SECAP assessment notes, could be strengthened in

the project's Social and Environmental Strategic Assessment prepared for the project in order to better align the ESPF and SECAP's objectives, requirements and procedures.

26. The following table summarizes findings of the comparison of the standards regarding eventual gaps and suggests which standards may be used and eventual measures to address minor gaps to ensure compliance with IFAD's policies and commitments. The following table presents both institutions' performance standards side by side in more detail, looking at their respective objectives, requirements, and instruments. In its last column, it presents an opinion as to whether or not IFAD can accept IDB's standards in the case of this Project.

IFAD –PS	IDB -ESPS	Recommendation
SECAP (policy statement)	ESPS 1: Assessment and Management of Environmental and Social Risks and Impacts	Overall, both statements are equivalent in objectives, goals, procedures, and requirements.
Standard 1: Biodiversity conservation	ESPS 6: Biodiversity Conservation and Sustainable Management of Living Natural Resources	Overall, IDB’s standard is equivalent to IFAD’s in terms of coverage and stringency. Nonetheless, IDB seems to have more detailed guidance that can support the Borrower in preparing a strong assessment and biodiversity management plan. Using IDB’s standard will also result in compliance with IFAD’s requirements.
Standard 2: Resource efficiency and pollution prevention	ESPS 3: Resource Efficiency and Pollution Prevention	IDB’s standard is equivalent to IFAD’s in coverage and stringency. There are no gaps or significant differences. Therefore, using IDB’s standard will also result in adherence to IFAD’s requirements.
Standard 3: Cultural heritage	ESPS 8: Cultural Heritage	IDB’s standard is more detailed and has more requirements. Therefore, its use will also result in adherence to IFAD’s requirements.
Standard 4: Indigenous peoples	ESPS 7: Indigenous Peoples	Both standards are quite similar in terms of objectives and requirements and overall adhere to the same set of goals and principles. IDB’s standard is more detailed and has more requirements and instruments. Therefore, its use will also result in compliance with IFAD’s requirements.
Standard 5: Labour and working conditions	ESPS 2: Labour and Working Conditions	There are no gaps or significant differences between IFAD and IDB’s standards on labour and working conditions. IDB’s standard is more detailed and has more requirements. Therefore, its use will also result in adherence to IFAD’s requirements.
Standard 6: Community health and safety	ESPS 4: Community Health, Safety, and Security	There are no gaps or significant differences between IFAD and IDB’s standards on labour and working conditions. IDB’s standard is more detailed and has more requirements. Therefore, its use will also result in adherence to IFAD’s requirements.
Standard 7: Physical and economic resettlement	ESPS 5: Land Acquisition and Involuntary Resettlement	IDB’s standard is more detailed and has more requirements. However, IFAD requires that <b>potential impacts from changes in land use should be examined as an integral aspect of the Project’s social and environmental assessment.</b> Therefore, should IDB’s standard be triggered, an eventual adjustment to Project impact assessments may be necessary to comply with IFAD’s commitments and requirements.
Standard 8. Financial intermediaries and direct investments	<b>IDB does not have a standard.</b>	<b>Not applicable to the Project.</b>
Standard 9: Climate change	<b>IDB does not have a stand-alone standard for this theme.</b>	IDB’s objectives and requirements regarding climate change (mitigation and adaptation) are found in different ESPS and documents other than the ESPF. IFAD’s standard consolidates such requirements and objectives in a single guidance statement and mandates specific analyses. It requires a specific climate risk screening and instruments for their management. It is recommended that adjustments to IDB’s

		<p>instruments are made to satisfy IFAD's requirements regarding this standard. This could include:</p> <ol style="list-style-type: none"> <li>1. Apply a climate screening questionnaire.</li> <li>2. Include the climate aspects in the Project's ESMP since this is a good way to include adaptation and mitigation measures as well.</li> </ol> <p>If the Project has a high or substantial climate risk, preparing a Climate Change Impact and Vulnerability Assessment or Target Climate Change Impact Assessment is necessary.</p>
<b>IFAD does not have a stand-alone safeguard standard for this theme.</b>	ESPS 9: Gender Equality	<p>IFAD has no specific gender standard, while IDB's standards are detailed and comprehensive in their objectives and requirements.. Nonetheless, to comply with IFAD's commitments, baseline assessments to measure the WEAI progress should be integrated into the gender analysis and in the Projects' risk and impact management instruments.</p>
<b>IFAD does not have a stand-alone safeguard standard to cover this theme.</b>	ESPS 10: Stakeholder Engagement and Information Disclosure	<p>IDB's standard is comprehensive and detailed, sharing the same principles and goals as IFAD's policy. Therefore its use will also result in compliance with IFAD's requirements.</p>

\*\*\*

IFAD-SECAP	IDB-ESPS	Project level evaluation
IFAD's Social, Environmental, and Climate Assessment Procedures (SECAP) <sup>4</sup>	ESPS1. Assessment and Management of Environmental and Social Risks and Impacts.	
<p>The SECAP provides a blanket statement for IFAD's approach to handling social, environmental and climate change risks and impacts of its projects. In aim and content, it is equivalent to IDB's overall policy statement on its ESPF. It draws on the United Nations Model Approach to Environmental and Social Standards for United Nations Programming, which in turn is based on the United Nations Environmental Management Framework for Advancing Environmental and Social Sustainability in the United Nations System.</p> <p><b>Standards objectives:</b></p> <p>Thus, the SECAP establishes that all projects undergo an <b>environmental, social, and climate assessment</b>. The SECAP indicates the screening procedures and delineates the specific assessments and impact management plans needed to ensure that the risks and impacts (<b>both those that affect the project and those caused by the project</b>) are addressed and managed throughout the project cycle transparently and inclusively. More specifically, it aims to:</p> <ol style="list-style-type: none"> <li>1. To identify and evaluate the project's environmental, social and climate change risks and impacts.</li> </ol>	<p><b>Content:</b> this PS provides a blanket statement for IDB's overall approach to handling projects' social and environmental impacts. It is equivalent to IFAD's SECAP document (volume 1) as it outlines principles and guidance on the objectives, procedures, and requirements to identify, avoid, mitigate or compensate for projects' social, environmental and climate change impacts.</p> <p><b>Standards objectives:</b></p> <ol style="list-style-type: none"> <li>1. To identify and evaluate environmental and social risks and impacts of the project.</li> <li>2. To adopt a <b>mitigation hierarchy and a precautionary approach</b> to anticipate and avoid, or where avoidance is not possible, minimize, and, where residual impacts remain, compensate/offset for risks and impacts to workers, project-affected people, and the environment.</li> <li>3. To promote Borrowers' improved environmental and social performance</li> </ol>	<p>The fundamentals and overall approach for managing social and environmental risks and impacts of investment projects are equivalent in the aims (do no harm – do good), attribution of risk categories, due-diligence procedures, mitigation hierarchy, definition of roles and responsibilities between the banks and borrowers and in terms of accountability by setting systems for stakeholder engagement and participatory processes and grievance redress<sup>5</sup>. However, only IFAD has a consolidated document containing the assessments and proposed risk and impact management measures – the SECAP assessment note, which the PDT prepares.</p> <p>IDB's Environmental and Social Management Programs were designed for activities with major environmental impacts reflecting the IDB overall more stringent approach to safeguards. Many of these programs may be challenging to implement for a rural</p>

<sup>4</sup> The updated SECAP 2021 comprises three volumes. Volume 1 sets out IFAD's aspirations regarding environmental, social, and climate adaptation, mitigation and sustainability, and describes its approach to addressing environmental, social and climate risks and impacts throughout the project cycle. It highlights IFAD's mainstreaming requirements (including for **mainstreaming themes youth, gender, environment and climate change, and nutrition**) and includes nine environmental, social and climate standards, which set out the mandatory requirements that borrowers/recipients/partners must apply to IFAD-supported projects. Volume 2 includes ten non-mandatory guidance notes to assist the borrowers/recipients/partners in implementing the updated SECAP and Volume 3 provides supporting materials including templates and checklists.

<sup>5</sup> IDB has established the Independent Consultation and Investigation Mechanism (MICI) to address the complaints from communities harmed by projects funded by any of the institutions that make up the Inter-American Development Bank Group related to non-compliance with the Group's social and environmental standards.

IFAD-SECAP	IDB-ESPS	Project level evaluation
<p>2. To adopt a <b>mitigation hierarchy and a precautionary approach</b> to anticipate and avoid, or where avoidance is not possible, minimize, and, where residual impacts remain, compensate/offset for risks and impacts to workers, project-affected people, and the environment.</p> <p>3. To promote Borrowers' improved environmental and social performance through the effective use of management systems.</p> <p>4. To promote and provide means for adequate engagement with project-affected people and other stakeholders throughout the project cycle on issues that could potentially affect them and to ensure that relevant environmental and social information is disclosed and disseminated.</p> <p>5. To ensure that grievances from project-affected people and external communications from other stakeholders are responded to and managed appropriately. This includes a grievance mechanism.</p> <p>The degree of risk is determined on a case-by-case basis, with measures to manage risk appropriate to the project's nature and scale, and its level of environmental, social, and climate risk.</p> <p><b>Requirements and instruments:</b> the SECAP establishes that the Borrower is the primary responsible for preparing environmental, social and climate assessments, conducting climate risk analysis and managing project-related risks and impacts. Hence, it requires the due diligence of the Borrower's capacity and commitment to implement the project and posits the eventual institutional strengthening measures needed to ensure a smooth safeguards implementation.</p> <p>Following the screening and risk and impact categorization the Borrower may be required to prepare the following instruments: i) ESIA; ii) abbreviated ESIA; iv) abbreviated</p>	<p>through the effective use of management systems.</p> <p>4. To ensure that grievances from project-affected people and external communications from other stakeholders are responded to and managed appropriately.</p> <p>5. To promote and provide means for adequate engagement with project-affected people and other stakeholders throughout the project cycle on issues that could potentially affect them and to ensure that relevant environmental and social information is disclosed and disseminated.</p> <p>As with IFAD the degree of risk is determined on a case-by-case basis, with measures to manage risk appropriate to the nature and scale of the project, and its level of environmental, social and climate risk.</p> <p><b>Requirements and instruments:</b> the ESPF establishes that the Borrower is the primary responsible for preparing environmental, social, and climate assessments, conducting climate risk analysis and managing project-related risks and impacts. Hence, it requires the due diligence of the Borrower's capacity and commitment to implement the project and posits the eventual institutional strengthening measures needed to ensure a smooth safeguards implementation.</p> <p>Following the screening and risk and impact categorization, the Borrower may be required to prepare the following instruments: Environmental and Social Impact Assessment (ESIA); Environmental and Social Audit; Hazard or Risk Assessment; Cumulative Impact Assessment; Social and Conflict Analysis; Environmental and Social Management Plan (ESMP); Environmental and Social Management</p>	<p>development project with localized and dispersed impacts. The IFAD PDT requested the reformulation and adjustment of some of the Programs to facilitate their implementation aligned with the realities of the rural milieu in which the Project will be implemented.</p>

IFAD-SECAP	IDB-ESPS	Project level evaluation
<p>environmental, social and climate management framework (ESMF); v) resettlement action plan/framework (RAP/RAF); vi) abbreviated resettlement action plan/framework (ARAP/ARF); vii) biodiversity action plan (BAP); viii) cultural heritage management plan (CHMP); ix) guidance and outline for Cumulative Impact Assessment; x) Pest Management Plan (PMP); xi) Targeted adaptation assessment; xii) Transboundary Impact assessment; and xiii) Vulnerability Impact and Adaptation Assessment. Additional instruments are mandatory according to the standards triggered by each project (e.g. biodiversity management plans, Indigenous peoples plans, cultural heritage management plans).</p> <p>Based on these assessments and also in the due diligence findings the IFAD's PDT will prepare a SECAP assessment note for project appraisal and board submission.</p>	<p>Framework (ESMF); Regional ESIA; Sectoral ESIA; Strategic Environmental and Social Assessment (SESA).</p> <p>Additional instruments are mandatory according to the standards triggered by each project (e.g. biodiversity management plans, Indigenous peoples plan, cultural heritage management plans).</p>	

<b>Standard 1: Biodiversity conservation</b>	<b>ESPS 6: Biodiversity Conservation and Sustainable Management of Living Natural Resources</b>		Project level assessment
<p>This standard seeks to protect biodiversity in the context of natural, modified or critical habitats.</p> <p><b>Standard’s objectives:</b></p> <ul style="list-style-type: none"> <li>● Maintain and conserve biodiversity;</li> <li>● Preserve ecosystems’ integrity;</li> <li>● Maintain and enhance the benefits of ecosystem services;</li> <li>● Adopt the use of a precautionary approach to biodiversity conservation and ensure opportunities for environmentally sustainable development;</li> <li>● Ensure the fair and equitable sharing of the benefits from the utilization of genetic resources; and</li> <li>● Respect, preserve, and maintain knowledge, innovations and practices of Indigenous peoples, and local communities relevant to the conservation and sustainable use of biodiversity and their customary use of biological resources.</li> </ul> <p><b>Requirements and instruments:</b> For substantial- and high-risk projects, the</p>	<p>This standard seeks to protect biodiversity in the context of natural, modified or critical habitats and ensure the sustainable use of living natural resources.</p> <p><b>Standard’s objectives:</b></p> <ul style="list-style-type: none"> <li>● To protect and conserve terrestrial, freshwater, coastal, and marine biodiversity.</li> <li>● To maintain the ecosystem functions to ensure the benefits from ecosystem services.</li> <li>● To promote the sustainable management of living natural resources through the adoption of practices that integrate conservation needs and development priorities.</li> </ul> <p><b>Requirements and instruments:</b> As per the ESPF guidance the Borrower’s environmental and social risks and impacts identification process is required to include a sequence of</p>	<p>Both standards seek to protect biodiversity in the context of natural, modified or critical habitats and ensure the sustainable use of living natural resources. IFAD’s provisions for the sustainable management of living natural resources are included in its Standard 2: Resource efficiency and pollution prevention. When compared with the ESPF guidance on the development of biodiversity management plans, they are more detailed in the SECAP (volume 3). However, IDB has a comprehensive and detailed guidance document for assessing and managing biodiversity impacts and risks at the operational level<sup>7</sup> and that may be used by the project.</p> <p>Overall IDB’s standard is equivalent to IFADs in terms of coverage and stringency. Nonetheless, IDB has more detailed guidance that can support the Borrower in preparing a strong assessment and biodiversity management plan. The use of IDB’s standard will result also in compliance to IFAD’s requirements.</p>	<p>The IDB’s screening has triggered its ESPS 1, 2, 3, 4, 6, 7, 8, 9 and 10. The IDB has requested to the Borrower to prepare an Environmental and Social Impact assessment (ESIA), on which the Project’s Environmental and Social Management Framework (ESMF) will be based to address the questions and carry out detailed analyses of the social and environmental risks, in accordance with the triggered standards. The ESMF will propose an Environmental and Social Management Plan (ESMP). Furthermore, it required the Borrower to constitute and maintain an Environmental, and Social Management System (EMS) throughout Project implementation. Based on the analysis of the terms of reference and preliminary version of the studies we understand that IFAD’s SECAP requirements are fully met except for the requirements for climate change. Given the “substantial” risk rating obtained in the IFAD’s SECAP screening tool a Targeted Climate Change Adaptation assessment (TAA) was prepared to fill this policy gap.</p>

<sup>7</sup> Guidance for Assessing and Managing Biodiversity Impacts and Risks in Inter-American Development Bank Supported Operations. Technical Note N° IDB-TN-93. November 2015. <https://publications.iadb.org/publications/english/document/Guidance-for-Assessing-and-Managing-Biodiversity-Impacts-and-Risks-in-Inter-American-Development-Bank-Supported-Operations.pdf>

<p>Borrower must assess direct and indirect adverse impacts on biodiversity. For moderate-risk projects, the Borrower will prepare an environmental and social management plan (ESMP). Low-risk projects do not require a formal assessment but may need to meet the requirements of codes of practice. If screening has triggered this standard, then a <b>Biodiversity Impact Assessment</b> or enhanced considerations of Biodiversity in the EIA will be required. The Borrower will develop a <b>Biodiversity Action Plan</b><sup>6</sup> that reflects relevant requirements of standard 1. The scale of the plan will vary depending on the nature and magnitude of potential risks and impacts. Where specific details and sites of proposed projects are not yet fully defined, the Borrower will develop a <b>management framework</b>.</p>	<p>tasks adapted to the specific circumstances of the project, its risk profile and location, such as: delimitation of area of influence and study area; Development of the biodiversity baseline; Identification of risks and impacts; Assessment of risks and impacts; Identification of avoidance, minimization, and mitigation measures. This should lead to the development of a <b>Biodiversity Management Plan</b>.</p>		
<p><b>Standard 2: Resource efficiency and pollution prevention</b></p>	<p><b>ESPS 3: Resource Efficiency and Pollution Prevention</b></p>		
<p>The standard seeks to promote the sustainable and efficient use of resources and to prevent pollution. It covers specific guidance for projects that include: GHG, fisheries, aquaculture, soils, forest resources, pesticide use and management.</p> <p><b>Standards objectives:</b></p> <ul style="list-style-type: none"> <li>● Avoid, minimize and manage the risks and impacts associated with hazardous substances and materials, including pesticides;</li> <li>● Avoid or minimize project-related emissions of short and long-lived climate-change-related pollutants;</li> </ul>	<p>The standard seeks to promote the sustainable efficient use of resources and to prevent pollution. The standard covers specific guidance for projects that include: water consumption, pollution prevention, wastes, hazardous materials, GHG, pesticide use and management.</p> <p><b>Standards objectives:</b></p> <ul style="list-style-type: none"> <li>● To avoid or minimize adverse impacts on human health and the environment by avoiding or minimizing pollution from project activities.</li> </ul>	<p>IDB's standard is equivalent to IFAD's in terms of coverage and stringency. There are no gaps or significant differences. Both performance standards rely on <b>appropriate industry best management practices</b> such as those furnished by the World Bank Group Environmental, Health and Safety Guidelines (EHSG). Those guidelines are comprehensive and cover a wide range of industry sectors (including agribusiness and food production). Therefore, using IDB's standard will also result in adherence to IFAD's requirements.</p>	<p>The IDB standard is more specific and detailed and has more in-depth guidance on this topic. Therefore, IFAD's policy objectives regarding GHG emissions can be adequately met.</p>

<sup>6</sup> See Biodiversity Action Plan: Annotated Outline. SECAP volume 3.

<ul style="list-style-type: none"> <li>• Promote sustainable use of resources, including energy, land and water; and</li> <li>• Identify, where feasible, project-related opportunities for resource-use efficiency.</li> </ul> <p><b>Requirements and instruments:</b> If the standard is triggered, the Borrower must produce a full <b>environmental and social management framework (ESMF) or an environmental impact and social assessment (ESIA)</b> for potential high-risk projects. For substantial-risk projects, produce an abbreviated environmental and social management framework or abbreviated Environmental impact and social assessment. For moderate-risk projects, the Borrower may prepare an environmental and social management plan (ESMP). Low-risk projects do not require formal assessment, but may need to meet the requirements of codes of practice. The standard mandates the use of relevant expertise and that resource use and pollution-related impacts are assessed at appropriate geographic scale. Furthermore, the Borrower must ensure that the level of stakeholder engagement is at a scale appropriate to potential risks/impacts.</p>	<ul style="list-style-type: none"> <li>• To promote more sustainable use of resources, including energy and water.</li> <li>• To avoid or minimize project-related emissions of GHG.</li> <li>• To avoid or minimize generation of waste.</li> <li>• To minimize and manage the risks and impacts associated with pesticide use.</li> </ul> <p><b>Requirements and instruments:</b> when the standard is triggered the Borrower will consider ambient conditions and apply technically and financially feasible resource efficiency and pollution prevention principles and techniques that are best suited to avoid, or where avoidance is not possible, minimize adverse impacts on human health and the environment. The principles and techniques applied during the project life cycle will be tailored to the hazards and risks associated with the nature of the project and consistent with good international industry practice (GIIP)<sup>8</sup>.</p>		
---	--	--	--

<sup>8</sup> As reflected in various internationally recognized sources, including the World Bank Group Environmental, Health and Safety Guidelines (EHS). [https://www.ifc.org/wps/wcm/connect/topics\\_ext\\_content/ifc\\_external\\_corporate\\_site/sustainability-at-ifc/policies-standards/ehs-guidelines](https://www.ifc.org/wps/wcm/connect/topics_ext_content/ifc_external_corporate_site/sustainability-at-ifc/policies-standards/ehs-guidelines). The Borrower will refer to the EHS or other internationally recognized sources, as appropriate, when evaluating and selecting resource efficiency and pollution prevention and control techniques for the project. When applicable regulations differ from the levels and measures presented in the EHS, Borrowers will be required to achieve whichever is more stringent.

<p><b>Resource efficiency.</b> The borrower/recipient/partner is required to implement technically and financially feasible measures for improving the efficient consumption of energy, water, raw materials, and other resources.</p> <p><b>Pollution prevention.</b> The assessment process identifies technically and financially feasible pollution prevention and control techniques to avoid or minimize adverse impacts on human health and the environment.</p> <p>The borrower/recipient/partner should consider alternatives and implement actions to avoid or minimize project-related air emissions during project design and implementation.</p> <p><b>Historical pollution.</b> If project activities will generate significant emissions in previously polluted or degraded areas, the borrower/recipient/partner will adopt measures that avoid and minimize potential negative effects, potentially finding alternative locations.</p> <p><b>Hazardous materials.</b> IFAD-supported projects must seek to avoid or minimize the potential for community exposure to hazardous materials and substances that may be released through a project. Where there is potential for the public to be exposed to hazards, projects need to make special efforts to avoid or minimize their exposure by modifying, substituting or eliminating the conditions or materials causing the potential hazards.</p> <p>IFAD also requires its borrowers/recipients/partners to adopt appropriate measures to promote animal welfare, control the potential invasion or escape of animal species, and minimize antimicrobial resistance</p>	<p>The Borrower will implement technically and financially feasible and cost-effective measures for improving efficiency in its consumption of energy, water, and other resources and material inputs, with a focus on core areas of project activities. Such measures will integrate the principles of cleaner production into project development with the objective of conserving raw materials, energy, and water. Where best practice benchmarking data are available, the Borrower will make a comparison to establish the relative level of efficiency.</p> <p>In addition to the resource efficiency measures described above, the Borrower will consider alternatives and implement technically and financially feasible and cost-effective options to avoid or minimize project related GHG emissions during the design and operation of the project.</p> <p>The Borrower will avoid the release of pollutants or, when avoidance is not feasible, minimize and/or control the intensity and mass flow of their release.</p> <p>The Borrower will avoid the generation of hazardous and non-hazardous waste materials. Where waste generation cannot be avoided, the Borrower will reduce the generation of waste and recover and reuse waste in a manner that is safe for human health and the environment.</p> <p>The Borrower will, where appropriate, formulate and implement an</p>		
--	--	--	--

<p><b>Sustainable management of living natural resources.</b> All IFAD-supported projects must ensure the sustainable management of living natural resources (e.g. forests, agriculture, fisheries, livestock) in line with article 10 of the CBD. In doing so, they must apply <b>appropriate industry best management practices</b> and, whenever possible, credible certification and verification systems.</p>	<p><b>integrated pest management (IPM)</b> and/or <b>integrated vector management (IVM)</b> approach in targeting economically significant pest infestations and disease vectors of public health significance.</p> <p>If less stringent levels or measures than those provided in the EHS are appropriate in view of specific project circumstances, the Borrower will provide full and detailed justification for any proposed alternatives through the environmental and social risks and impacts identification and assessment process. This justification must demonstrate that the choice for any alternate performance levels is consistent with the objectives of this ESPS.</p>		
<p><b>Standard 3: Cultural heritage</b></p>	<p><b>ESPS 8: Cultural Heritage</b></p>		
<p>This Standard is designed to preserve, protect, and promote cultural heritage in IFAD-supported projects in consistency with UNESCO cultural heritage conventions<sup>9</sup>.</p> <p><b>Standard's objectives:</b></p> <ul style="list-style-type: none"> <li>● Preserve and safeguard cultural heritage.</li> <li>● Ensure that active efforts are made to prevent IFAD-supported projects from altering, damaging, or removing any tangible or intangible cultural heritage;</li> </ul>	<p>This standard seeks to protect tangible and intangible cultural heritage, from the adverse impacts of project activities and support its preservation.</p> <p><b>Standard's objectives:</b></p> <ul style="list-style-type: none"> <li>● To protect cultural heritage from the adverse impacts of project activities and support its preservation.</li> <li>● To promote the equitable sharing of</li> </ul>	<p>IDB's standard is more detailed and has more requirements. One important highlight regards the consultation processes: IDB's ESPF mentions that the Borrower will conduct an Informed Consultation and Participation (ICP) process with project-affected people. Therefore, its use will also result in adherence to IFAD's requirements.</p>	<p>Although the theme is treated at different places in the IDB and IFAD policy objectives, are equivalent and should be addressed in the Borrower ESA, as the IDB has triggered this policy. It should be noticed that IDB has also requested the Borrower to prepare a Biodiversity Action Plan for the Project.</p>

<sup>9</sup> <https://whc.unesco.org/archive/convention-en.pdf>.

<ul style="list-style-type: none"> <li>● Promote the equitable sharing of benefits from the use of cultural heritage; and</li> <li>● Promote meaningful consultation on matters related to cultural heritage.</li> </ul> <p><b>Requirements and instruments:</b> For moderate, substantial and high-risk projects, it is necessary to assess direct and indirect adverse impacts on cultural heritage. The Borrower shall utilize relevant expertise and ensure cultural-heritage-related impacts are assessed at appropriate geographic scale. Ensure that the level of stakeholder engagement is at a scale appropriate to potential risks/impacts.</p> <ul style="list-style-type: none"> <li>(i) measures for avoiding, minimizing or mitigating any adverse impacts on the cultural heritage;</li> <li>(ii) provisions for managing “chance finds” of cultural heritage during implementation;</li> <li>(iii) necessary measures for strengthening institutional capacity with respect to protection of the cultural heritage; and</li> <li>(iv) a monitoring system to track the progress of these activities.</li> </ul> <p>Furthermore, the Borrower must develop a management plan (<b>CHMP/ESCMP</b>) that reflects relevant requirements of standard 3. Where specific details and sites of proposed projects are not yet fully defined, develop a <b>management framework</b>. The scale of the plan</p>	<p>benefits from the use of cultural heritage.</p> <p><b>Requirements and instruments:</b> When deemed necessary, the Borrower shall integrate a cultural heritage assessment into the project’s environmental and social risk and the impact identification process should include an <b>adequate pre-project cultural heritage baseline study</b> and information gathering process, which can be field or desk-based, depending on the nature of the project risks and impacts and likely presence of known or unknown cultural heritage. The nature of the survey should comply with national and local cultural heritage laws and regulations. If no such laws and regulations exist, it should be based on the relevant characteristics within the project’s area of influence, including geomorphology, as determined by a cultural heritage professional. The assessment should address risks and potential adverse impacts to cultural heritage. When possible, opportunities for the enhancement of cultural heritage should be highlighted in the assessment process.</p> <p>Where a project may affect cultural heritage, the Borrower will consult with the project-affected people who use, or have used within living memory, the cultural heritage for long-standing cultural purposes. The Borrower will consult with the project-affected people to identify cultural</p>		
--	---	--	--

<p>will vary depending on the nature and magnitude of potential risks and impacts.</p> <p>The Borrower will also develop a stakeholder engagement plan and start early consultation to identify options to avoid potential adverse impacts and risks to cultural heritage (substantial- and high-risk projects). Assess whether confidentiality of cultural heritage items may need to be included as part of information disclosure.</p> <p>The consultative process for the cultural heritage component will normally include project-affected groups, relevant government authorities and interested NGOs. These groups will assist the Borrower and IFAD project development team in documenting the presence and significance of physical cultural resources (PCR), assessing potential impacts and exploring avoidance and mitigation options through a consultation process.</p> <p>Where a project involves the commercial use of cultural heritage of Indigenous peoples, the requirements of <b>FPIC</b> and Standard 4: Indigenous peoples are to be applied.</p>	<p>heritage of importance, and to incorporate into the Borrower's decision-making process the views of the project-affected people on such cultural heritage. Consultation will also involve the relevant national or local regulatory agencies that are entrusted with the protection of cultural heritage.</p> <p>For projects where impacts and risks on cultural heritage are deemed a significant issue, a focused <b>Cultural Heritage Impact Assessment (CHIA)</b> may be necessary even if a full-scale Environmental and Social Impact Assessment (ESIA) is not required. In other cases, the consideration of cultural heritage impacts should be fully integrated into the ESIA or part of a <b>sociocultural analysis (SCA)</b>, particularly if the project site is located on or close to Indigenous People's land or the area has had a previous history of cultural significance, as evidenced by engagement of potentially affected communities or past findings. For projects with potentially significant adverse impacts on project-affected people, the Borrower will conduct an <b>Informed Consultation and Participation (ICP)</b> process.</p> <p>For projects with potentially significant adverse impacts on project-affected people, the Borrower will conduct an ICP process in accordance with ESPS 1. For projects with adverse impacts to Indigenous Peoples, the Borrower is required to engage them in an ICP process and in certain</p>		
--	--	--	--

	circumstances to obtain their FPIC, in accordance with ESPS 1 and 7.		
<b>Standard 4: Indigenous peoples</b>	<b>ESPS 7: Indigenous Peoples</b>		
<p>IFAD's work with Indigenous peoples is guided by its Policy on Engagement with Indigenous Peoples<sup>10</sup>. IFAD-supported projects will ensure that meaningful consultation and full and effective participation of Indigenous peoples are undertaken for all (investment) projects that may affect or involve Indigenous peoples and will ensure that a free prior and informed consent (FPIC) is applied in projects that:</p> <ul style="list-style-type: none"> <li>i. May have an impact on the land access and use rights of rural communities; and</li> <li>ii. Target Indigenous peoples or rural areas that are home to indigenous and tribal peoples and ethnic minorities.</li> </ul> <p><b>Standard's objectives:</b></p> <ul style="list-style-type: none"> <li>● Promote Indigenous peoples' ability to determine and develop priorities and strategies for exercising their right to development.</li> <li>● Ensure that programming is designed in partnership with Indigenous peoples, with their full effective and meaningful consultation and participation, with the objective of seeking their free, prior and informed consent (FPIC).</li> <li>● Ensure indigenous peoples obtain fair and equitable benefits and opportunities from supported</li> </ul>	<p>Environmental and Social Performance Standard (ESPS) 7 recognizes that Indigenous Peoples, as distinct social and cultural peoples, are often among the most marginalized and vulnerable segments of the population. Projects can also create opportunities for Indigenous Peoples to participate in and benefit from project-related activities that may help them achieve their aspirations for economic and social development with identity. The provisions for mainstreaming Indigenous Peoples of the OP-765 remain valid.</p> <p><b>Standard's objectives:</b></p> <ul style="list-style-type: none"> <li>● To ensure that the development process fosters full respect for the human rights, collective rights, dignity, aspirations, culture, and natural resource-based livelihoods of Indigenous Peoples.</li> <li>● To anticipate and avoid adverse impacts of projects on communities of Indigenous Peoples, or when avoidance is not possible, to minimize and/or compensate for such impacts.</li> </ul>	<p>Both standards are quite similar in terms of objectives and requirements and overall adhere to the same set of goals and principles- notably in terms of acknowledging the rights and dignity of Indigenous peoples even in the cases when this may not be fully incorporated into local legal and institutional frameworks. IDB's standard is more detailed and has more requirements and instruments. Therefore, its use will also result in compliance with IFAD's requirements.</p>	<p>IDB requires the Borrower to obtain the FPIC of the Project-Affected Communities of Indigenous Peoples in certain circumstances (including documented and traditional use lands, including seasonal or cyclical use, for their livelihoods, or cultural, ceremonial, and spiritual purposes, in case of relocation of Indigenous People; cultural heritage including knowledge, innovations, or practices of Indigenous Peoples for commercial purposes.</p>

<sup>10</sup> [https://www.ifad.org/documents/38711624/39417924/ip\\_policy\\_e.pdf/a7cd3bc3-8622-4302-afdf-6db216ad5feb?t=1507215253000](https://www.ifad.org/documents/38711624/39417924/ip_policy_e.pdf/a7cd3bc3-8622-4302-afdf-6db216ad5feb?t=1507215253000)

<p>activities in a culturally appropriate and inclusive manner.</p> <ul style="list-style-type: none"> <li>• Recognize and respect the rights of Indigenous peoples to their lands, territories, waters and coastal seas and other resources that they have traditionally owned or otherwise occupied and used.</li> <li>• Assess direct and indirect, positive and negative impacts of project activities on Indigenous peoples, their rights, lands, territories and resources, social, cultural and economic status, livelihood systems, etc.</li> <li>• Ensure Indigenous peoples are actively involved in project design, risk identification and analysis.</li> </ul> <p><b>Requirements and instruments:</b> the Borrower will screen, mitigate, manage, and monitor risks and impacts. The requirements of Standard 4 should be considered and addressed in an integrated manner during the screening process, using the SECAP screening questions to identify if there are potentially significant impacts and risks related to Indigenous peoples. The Borrower will:</p> <ul style="list-style-type: none"> <li>• Apply the precautionary principle and follow the mitigation hierarchy.</li> <li>• Develop and implement an indigenous peoples plan and an FPIC implementation plan with appropriate mitigation and management measures, with the active participation of indigenous peoples.</li> <li>• Monitor affected Indigenous peoples using participatory approaches.</li> </ul>	<ul style="list-style-type: none"> <li>• To promote sustainable development benefits and opportunities for Indigenous Peoples in a culturally appropriate manner.</li> <li>• To establish and maintain an ongoing relationship based on Informed Consultation and Participation (ICP) in a culturally appropriate manner with the Indigenous Peoples affected by a project throughout the project's life cycle.</li> <li>• To ensure the FPIC of the Project-Affected Communities of Indigenous Peoples when the circumstances described in this ESPS are present.</li> <li>• To respect and preserve the culture, knowledge, traditional knowledge, and practices of Indigenous Peoples.</li> <li>• The term "Indigenous Peoples" is used in a generic sense to refer to distinct social and cultural peoples possessing some of the following characteristics in varying degrees: Self-identification as members of a distinct Indigenous cultural group and recognition of this identity by others.</li> <li>• Collective attachment to geographically distinct habitats or ancestral</li> </ul>		
---	---	--	--

<p>If moderate, substantial, or high risks are identified during screening, then relevant standard 4 requirements need to be addressed in project design and implementation, including as part of overall impact assessment, management, and mitigation and monitoring activities. However, even for projects categorized as low risk, IFAD's commitments to partnership and respect for the right to FPIC apply.</p> <p>If screening indicates that the project targets or affects Indigenous peoples, this triggers standard 4 and the project must examine the potential risks of impacts on Indigenous peoples, their rights, lands, territories, resources, livelihoods, etc. as an integral part of assessing the project's full range of potential adverse social and environmental risks and impacts.</p> <p>IFAD-supported projects will ensure that meaningful consultation and full and effective participation of indigenous peoples are undertaken for all (investment) projects that may affect or involve indigenous peoples and will ensure that <b>free prior and informed consent (FPIC)</b> is applied in projects that:</p> <ol style="list-style-type: none"> <li>i. May have an impact on the land access and use rights of rural communities; and</li> <li>ii. Target indigenous peoples or rural areas that are home to indigenous and tribal peoples and ethnic minorities.</li> </ol> <p>The assessment provides data and analysis for preparing mitigation and management measures, which for indigenous peoples issues generally takes the form of an indigenous peoples plan (IPP).</p>	<p>territories in the project area and to the natural resources in these habitats and territories.</p> <ul style="list-style-type: none"> <li>• Customary cultural, economic, social, or political laws and institutions that are separate from those of the mainstream society or culture</li> <li>• A distinct language or dialect, often different from the official language or languages of the country or region in which they reside.</li> </ul> <p><b>Requirements and instruments:</b> The requirements set out in this ESPS have been guided in part by international conventions and instruments, including those of the International Labour Organization (ILO) and the United Nations (UN). ESPS 7 requires the Borrower to engage early during project design in a process of <b>informed consultation and participation (ICP) in a culturally appropriate manner</b>. The Borrower's engagement process will ensure the <b>Free, Prior and Informed Consent (FPIC)</b> of the Project-Affected Communities of Indigenous Peoples. If risks and impacts are identified, the Borrower should prepare an <b>Indigenous Peoples Plan (IPP)</b>, with the ICP of the Project-Affected Communities of Indigenous Peoples, outlining the actions to minimize and/or compensate for adverse impacts in a culturally appropriate</p>		
--	--	--	--

	<p>manner. The SCA and IPP can be two parts of the same document. A Sociocultural Analysis (SCA) should be carried out to identify risks and potential adverse impacts on Indigenous Peoples.</p> <p>Among other elements, the SCA should include baseline data on affected Indigenous Peoples, covering key environmental (including climate change scenarios, when appropriate), socioeconomic, and cultural aspects that may be impacted by the project. The analysis should also identify positive impacts and potential benefits of the project to Indigenous Peoples and consider ways to enhance them. An IPP may be prepared, or it may be a component of a broader Community Development Plan (CDP). The SCA/ IPP/CDP may be developed as components of the ESIA/ESMP.</p>		
<b>Standard 5: Labour and working conditions</b>	<b>ESPS 2: Labour and Working Conditions</b>		
<p>IFAD's Standard 5: Labour and working conditions aims to ensure that IFAD investments promoting rural employment respect the fundamental rights of workers. The Fund's commitment to inclusive and sustainable economic growth, full and productive employment, and decent work for all includes protecting the rights of project workers, ensuring their fair treatment and providing them with safe and healthy working conditions. The following requirements reflect this commitment, guided by international agreements, conventions and instruments, including those of the International Labour Organization (ILO) and the United Nations.</p>	<p>Environmental and Social Performance Standard (ESPS) 2 recognizes that pursuit of economic growth through employment creation and income generation should be accompanied by protection of the fundamental rights of workers. The requirements set out in this ESPS have been in part guided by a number of international conventions and instruments, including those of the International Labour organization (ILO) and the United Nations (UN).</p> <p><b>Standards objectives:</b></p>	<p>There are no gaps or significant differences between IFAD's and IDB's standard on labour and working conditions. IDB's standard is more detailed and has more requirements. Therefore, its use will also result in adherence to IFAD's requirements.</p>	<p>Overall, IFAD's policy objectives are well covered in the proposed IDB ESIA. Specific analyses on labour and working conditions were requested to be carried out by the Borrower's on its ESIA. The IDB has requested the Borrower to prepare and operate a Grievance Redress Mechanism for all workers (direct and contracted).</p> <p>IDB's Project documentation indicates that this concern will be addressed in Project components design, and in the Project's ESMP. IFAD's policy concerns and objectives can be well addressed</p>

<p><b>Standards objectives:</b></p> <ul style="list-style-type: none"> <li>● Promote direct action to foster decent rural employment.</li> <li>● Promote, respect, and realize fundamental principles and rights by: <ul style="list-style-type: none"> <li>- Preventing discrimination and promoting equal opportunities for workers;</li> <li>- Supporting freedom of association and the right to collective bargaining; and</li> <li>- Preventing the use of child labour and forced labour;</li> </ul> </li> <li>● Protect and promote the safety and health of workers.</li> <li>● Ensure that projects comply with national employment and labour laws, and international commitments.</li> <li>● Leave no one behind by protecting and supporting workers in disadvantaged and vulnerable situations, including women (e.g. maternity protection), young workers, migrant workers, workers in the informal economy and workers with disabilities.</li> </ul> <p><b>Requirements and instruments:</b> The Borrower will:</p> <ul style="list-style-type: none"> <li>● Screen proposed projects using the SECAP screening questions to identify potential adverse risks and impacts of the project on labour and working conditions. Such risks and impacts may relate to, inter alia, unsafe working conditions, violations</li> </ul>	<ul style="list-style-type: none"> <li>● To respect and protect the fundamental principles and rights of workers.</li> <li>● To promote the fair treatment, non-discrimination, and equal opportunity of workers.</li> <li>● To establish, maintain, and improve the worker-employer relationship.</li> <li>● To ensure compliance with national employment and labour laws.</li> <li>● To protect workers, including workers</li> <li>● in vulnerable situations such as women, people of diverse sexual orientations and gender identities, persons with disabilities, children (of working age, in accordance with this ESPS) and migrant workers, workers engaged by third parties, and primary supply workers.</li> <li>● To promote safe and healthy working conditions, and the health of workers.</li> <li>● To prevent the use of child labour and forced labour (as defined by the ILO).</li> <li>● To support the principles of freedom of association and collective bargaining of project workers.</li> <li>● To ensure that accessible and effective means to raise and address workplace</li> </ul>		<p>under this approach, as employment promotion and equal opportunities (cf. below) can be pursued in Project's components and activities and work conditions of contractor's personnel monitored.</p>
---	--	--	--

<p>of labour rights, use of forced labour and child labour, and labour risks associated with the use of contractors and primary suppliers.</p> <ul style="list-style-type: none"> <li>● Categorize project risk (low/moderate/substantial/high).</li> <li>● Develop a stakeholder engagement plan and start early consultation to identify options to avoid potential adverse risks and impacts and risks regarding labour and working conditions (substantial/high).</li> <li>● Assess potential risks and impacts.</li> <li>● For moderate, substantial and high-risk projects, undertake appropriately scaled environmental and social assessment to assess risks and impacts on labour and working conditions.</li> <li>● Include review of relevant national employment and labour laws and regulations and identification of areas that require further attention and gap filling to ensure implementation of standard 5 requirements.</li> <li>● Where significant labour risks are present, employ qualified and experienced social experts with direct knowledge of local conditions and national labour and employment regulations.</li> <li>● Mitigate, manage, and monitor risks and impacts.</li> <li>● Apply the precautionary principle and mitigation hierarchy.*</li> <li>● Develop and implement appropriately scaled labour-management procedures to ensure</li> </ul>	<p>concerns are available to workers.</p> <p><b>Requirements and instruments:</b> The Borrower will adopt and implement labour management policies and procedures appropriate to the nature and size of the project and its workforce. These policies and procedures will set out its approach to managing workers consistent with the requirements of this ESPS and national law. The Borrower will provide workers with documented information that is clear and understandable regarding their rights under national labour and employment law and any applicable collective agreements, including their rights related to hours of work, wages, overtime, compensation, pension, and other benefits upon beginning the working relationship and when any material changes occur.</p> <p>Where the Borrower is a party to a collective bargaining agreement with a workers' organization, such agreement will be respected. The Borrower will identify migrant workers and ensure that they are engaged on substantially equivalent terms and conditions to non-migrant workers carrying out similar work. Where accommodation services are provided to workers covered by the scope of this ESPS, the Borrower will put in place and implement policies on the quality and management of the accommodation and provision of basic services.</p>		
---	---	--	--

<p>labour-management practices that meet standard 5 requirements are followed.</p> <ul style="list-style-type: none"> <li>• Monitor all management and mitigation measures.</li> </ul> <p>These requirements apply to all project workers directly engaged by borrowers/recipients/partners to work on a project or perform work essential to the project, and to people employed or engaged through third parties (e.g. contractors, subcontractors, brokers, agents and intermediaries) to perform work essential to a project. When a project engages community workers, relevant provisions of the requirements will be applied in a proportionate manner, recognizing the potential risks and impacts. The full requirements apply to full-time, part-time, temporary, seasonal, and migrant workers. Government civil servants working in connection with IFAD-supported projects remain subject to the terms and conditions of their existing public-sector employment arrangements.</p>	<p>The Borrower will not make employment decisions on the basis of personal characteristics unrelated to inherent job requirements.</p> <p>The Borrower will provide special measures of protection and assistance to address the vulnerabilities of project workers, such as women, people of diverse sexual orientations, and gender identity.</p> <p>The Borrower will provide a grievance mechanism for workers (and their organizations, where they exist) to raise workplace concerns and provisions for special protection for reports of sexual and gender-based violence.</p> <p>The Borrower will not employ forced labour, which consists of any work or service not voluntarily performed that is exacted from an individual under threat of force or penalty.</p> <p>The Borrower will provide a safe and healthy work environment, considering inherent risks related to the project and specific classes of hazards, including physical, chemical, biological, and radiological hazards, and specific threats to women, people of diverse sexual orientations and gender identities, persons with disabilities, children (of working age, in accordance with this ESMS), and migrant workers.</p> <p>The Borrower will take reasonable efforts to ascertain that the third parties who engage these workers are reputable and legitimate entities and have an appropriate ESMS that will</p>		
---	---	--	--

	allow them to operate in a manner consistent with the requirements of this ESPS.		
<b>Standard 6: Community health and safety</b>	<b>ESPS 4: Community Health, Safety, and Security</b>		
<p>This Standard stresses avoiding – and where avoidance is not possible, minimizing and mitigating – health and safety-related risks and impacts that may arise from IFAD-supported projects, with special attention to marginalized and disadvantaged groups.</p> <p><b>Standards objectives:</b></p> <p>To anticipate and avoid adverse impacts on the health and safety of project-affected communities during the project life cycle from both routine and non-routine circumstances, the standard objectives are:</p> <ul style="list-style-type: none"> <li>• To ensure that measures are taken to avoid or minimize community exposure to hazardous materials that will be used during project activities.</li> <li>• <b>To promote quality and safety, and considerations relating to climate change, in the design and construction of infrastructure, including dams.</b></li> <li>• To avoid or minimize community exposure to project-related traffic and road safety risks.</li> <li>• To minimize community exposure to diseases.</li> <li>• To ensure that projects abide by the principles of “do no harm to nutrition”.</li> </ul>	<p>Environmental and Social Performance Standard (ESPS) 4 recognizes that project activities, equipment, and infrastructure can increase community exposure to risks and impacts, including those caused by natural hazards and climate change. In addition, communities that are already subjected to adverse impacts from natural hazards and climate change may also experience an acceleration and/or intensification of adverse impacts due to project activities.</p> <p><b>Standards objectives:</b></p> <ul style="list-style-type: none"> <li>• To anticipate and avoid adverse impacts on the health and safety of the project-affected people during the project life cycle from both routine and non-routine circumstances.</li> <li>• To ensure that the safeguarding of personnel and property is carried out in accordance with relevant human rights principles and in a manner that avoids or minimizes risks to the project-affected people.</li> <li>• To anticipate and avoid adverse impacts on the</li> </ul>	<p>There are no gaps or significant differences between IFAD’s and IDB’s standard on labour and working conditions. IDB’s standard is more detailed and has more requirements. Therefore, its use will also result in adherence to IFAD’s requirements.</p>	<p>The IFAD standard requirements are adequately covered in the IDB studies and proposed safeguard management instruments.</p>

<ul style="list-style-type: none"> <li>● To avoid risks of project-related gender-based violence, including risks of sexual harassment, sexual exploitation and abuse, and human trafficking to project-affected people and communities.</li> <li>● To avoid or minimize adverse impacts on ecosystem services that may arise from project activities.</li> <li>● To have in place effective measures to address emergency events.</li> <li>● To ensure that the safeguarding of personnel and property is carried out in a manner that avoids or minimizes risks to the project-affected communities.</li> </ul> <p><b>Requirements and instruments:</b> the Borrower will:</p> <ul style="list-style-type: none"> <li>● Screen proposed projects using the SECAP screening questions/tool to identify potential adverse impacts on community health, safety, and security.</li> <li>● Categorize project risk (low/moderate/substantial/high).</li> <li>● Develop a stakeholder engagement plan and start early consultation to identify options to avoid potential adverse impacts (substantial and high-risk projects).</li> <li>● For substantial and high-risk projects, assess direct and indirect adverse impacts on community health, safety, and security.</li> <li>● Produce a full environmental, social, and climate management framework or environmental impact and social assessment for potential high-risk projects. For substantial-risk projects, produce an abbreviated</li> </ul>	<p>project itself from natural hazards and climate change during the project life cycle.</p> <p><b>Requirements and instruments:</b> the Borrower will evaluate the risks and impacts to the health and safety of project affected people during the project lifecycle and will establish preventive and control measures consistent with good international industry practice (GIIP), such as in the World Bank Group Environmental, Health and Safety Guidelines (EHSG) or other internationally recognized sources.</p> <p>Where there are specific risks that could result in adverse effects on the health, safety, and well-being of people with sensitivities such as age, gender, disability, or short- or long-term health conditions, the Borrower will carry out a more detailed risk assessment and adjust to prevent injury and ill health.</p> <p>The Borrower will design, construct, operate, monitor, and decommission the structural elements or components of the project in accordance with GIIP, considering safety risks to third parties and the project-affected people, including traffic and road safety, and transferred risks.</p> <p>The Borrower will avoid or minimize the potential for community exposure to hazardous materials and substances that may be released by</p>		
---	--	--	--

<p><b>environmental, social and climate management framework or abbreviated environmental impact and social assessment.</b></p> <ul style="list-style-type: none"> <li>• For moderate-risk projects, prepare an <b>environmental, social and climate management plan.</b></li> <li>• Low-risk projects do not require formal assessment, but may need to meet the requirements of <b>codes of practice.</b></li> <li>• Utilize relevant expertise and ensure impacts are assessed at appropriate geographic scale.</li> <li>• Ensure that the level of stakeholder engagement is at a scale appropriate to potential risks/impacts.</li> <li>• Develop a management plan that reflects relevant requirements of standard 6. Where specific details and sites of proposed projects are not yet fully defined, develop a management framework. The scale of the plan will vary depending on the nature, magnitude and significance of potential risks and impacts.</li> <li>• Monitor all mitigation measures and actions.</li> </ul> <p>As a general rule, projects that are categorized by IFAD as high risk or substantial risk will require comprehensive forms of assessment, meaning either an environmental, social and climate management framework (ESCMFs) or an environmental and social impact assessment (ESIA). Moderate-risk projects will not require the production of an ESIA but will need to prepare an environmental, social and climate management plan (ESCMP). Low-risk projects do not require detailed environmental or social assessment although, depending on</p>	<p>the project. Where there is potential for the public (including workers and their families) to be exposed to hazards, particularly those that may be life threatening, the Borrower will exercise special care to avoid or minimize their exposure by modifying, substituting, or eliminating the condition or material causing the potential hazards.</p> <p>The Borrower will avoid or minimize the potential for community exposure to water-related (i.e., waterborne, water-based, and vector-borne diseases) and communicable diseases that could result from, or exacerbated by, project activities, taking into consideration differentiated exposure to and higher sensitivity of vulnerable groups. Where specific diseases are endemic in communities in the project area of influence, the Borrower is encouraged to explore opportunities during the project life cycle to improve environmental conditions that could help minimize their incidence. In the case of non-endemic disease outbreaks, the Borrower must take precautionary measures to avoid community exposure.</p> <p>The Borrower will avoid or minimize transmission of communicable diseases that may be associated with the influx of temporary or permanent project labour force.</p> <p>The Borrower’s environmental and social risks and impacts identification process should identify and assess project-related health risks caused by, or exacerbated by, climate change</p>		
--	---	--	--

<p>the type of project, they may need to conform to relevant sector codes of practice.</p>	<p>In addition to the emergency preparedness and response requirements described in ESPS 1, the Borrower will also assist and collaborate with the project-affected people, local government agencies, and other relevant parties, in their preparations to respond effectively to emergency situations, especially when their participation and collaboration are necessary to respond to such emergency situations. The Borrower should establish an <b>Emergency Preparedness and Response Plan (EPRP)</b> that is appropriate for each phase of the project.</p> <p><b>The Borrower will identify and assess the potential risks caused by natural hazards, such as earthquakes, droughts, landslides, or floods, including those caused or exacerbated by climate change, as these relate to the project.</b> This may require the Borrower to undertake an <b>assessment of the risk of the project to natural hazards and climate change. Necessary disaster and climate change resilience and adaptation measures are documented in a DRMP.</b></p> <p>When the Borrower retains direct or contracted workers to provide security to safeguard its personnel and property, it will assess risks posed by its security arrangements to those within and outside the project site. In making such arrangements, the Borrower will be guided by the principles of proportionality and good international practice in relation to hiring, rules of conduct, training,</p>		
--	---	--	--

	<p>equipping, and monitoring of such workers, and by applicable law.</p> <p>The Borrower will not sanction any use of force except when used for preventive and defensive purposes in proportion to the nature and extent of the threat.</p> <p>The Borrower will engage experienced and competent professionals, acceptable to the Bank, for the design and supervision of the construction of new dams and require the owner of the dam to develop and implement a Dam Safety Report covering the design, bid tendering, construction, operation, maintenance, and decommissioning of the dam and associated works.</p> <p>In developing the design criteria for new dams, the Borrower shall consider the climate that the dam is likely to experience over its operational life. <b>The Borrower will conduct a climate change risk assessment to establish the range of climate projections for the area of the project associated with the dam.</b> For water retention structures, changing hydrology and changing probable maximum flows under climate change scenarios should be evaluated in order to inform the Dam Safety Report.</p>		
<b>Standard 7: Physical and economic resettlement</b>	<b>ESPS 5: Land Acquisition and Involuntary Resettlement</b>		This particular IFAD standard is not applicable to the Project.
Standard 7 is aimed at ensuring that displacement is avoided whenever possible. It also recognizes that when displacement cannot be avoided its scale must be minimized and that this must be done in a way that does	Environmental and Social Performance Standard (ESPS) 5 addresses impacts of project-related land acquisition, including restrictions on land use and access to assets and	IDB's standard is more detailed and has more requirements. However, IFAD requires that <b>potential impacts from changes in land use should be examined as an integral aspect of the project's</b>	This standard is not applicable to the Project.

<p>not increase socio-economic risks or otherwise negatively impact a community, ensuring that affected persons are compensated fairly prior to any displacement.</p> <p><b>Standards objectives:</b></p> <p>Avoid involuntary resettlement or, when unavoidable, minimize involuntary resettlement by exploring feasible alternative project designs and sites;</p> <p>Avoid forced eviction;</p> <p>Ensure that resettlement activities are planned and implemented collaboratively, with meaningful participation of those affected;</p> <p>Enhance and restore the livelihoods of all displaced people who may be affected by project/programme activities; and</p> <p>Provide explicit guidance to borrower/recipient/partner on the conditions that need to be met regarding involuntary resettlement issues.</p> <p><b>Requirements and instruments:</b> the requirements contained in standard 7 seek to further these objectives and should be carefully reviewed in order to inform project screening and development. The guidance note provides further guidance on the various standard 7 requirements. The Borrower will consider feasible alternative project designs to avoid or minimize physical and/or economic displacement, while balancing environmental, social, and financial costs and benefits, paying particular attention to impacts on the poor and vulnerable.</p> <p>For moderate-, substantial- and high-risk projects, conduct an appropriately <b>scaled environmental and social assessment</b>. Identify</p>	<p>natural resources, which may cause physical displacement (relocation, loss of land or shelter), and/or economic displacement (loss of land, assets, or restrictions on land use, assets, and natural resources leading to loss of income sources or other means of livelihood. The term “involuntary resettlement” refers to both of these impacts and the processes to mitigate and compensate for these impacts.</p> <p><b>Standards objectives:</b></p> <ul style="list-style-type: none"> <li>● To avoid, and when avoidance is not possible, minimize displacement by exploring alternative project designs.</li> <li>● To avoid forced eviction.</li> <li>● To anticipate and avoid, or where avoidance is not possible, minimize adverse social and economic impacts from land acquisition or restrictions on land use by (i) providing compensation for loss of assets at replacement cost and transitional hardships; (ii) minimizing disruption to their social networks and other intangible assets; and (iii) ensuring that resettlement activities are implemented with appropriate disclosure of information, consultation, and the informed participation of those affected.</li> </ul>	<p><b>social and environmental assessment.</b> Therefore should the IDB standard be used, an eventual adjustment to project impact assessments may be necessary to comply with IFAD’s commitments and requirements.</p>	
--	---	---	--

<p>displaced persons directly and indirectly impacted by the project and <b>evaluate risks to food security</b>.</p> <p>Develop a (abbreviated) <b>resettlement action plan (RAP) or framework (RAF)</b>, including a census and socio-economic survey, that specifies the procedures and actions to mitigate adverse effects, compensate losses and provide development benefits to affected persons and communities.</p> <p>Apply the precautionary principle and mitigation hierarchy.</p> <p>For moderate-, substantial- and high-risk projects develop a (abbreviated) RAP/RAF that stipulates entitlements, compensation and assistance designed to improve or at least restore livelihoods of displaced persons.</p> <p>Ensure an accessible, effective grievance redress mechanism is available and responsive.</p> <p>Implement a monitoring framework.</p> <p>The above elements should be reflected and elaborated in a (abbreviated) <b>resettlement action plan (RAP)</b> (where the specific project activities and sites are known at appraisal) or in a <b>resettlement action framework (RAF)</b>.</p> <p><b>If screening indicates that standard 7 is applicable for the project, potential impacts from changes in land use should be examined as an integral aspect of the project’s social and environmental assessment.</b></p> <p>IFAD requires borrower/recipient/partner to undertake FPIC processes for investment projects that have an impact on the land access and use rights of rural communities (as well as for projects that may affect Indigenous peoples ). Land acquisition that results in displacement (physical or economic) will likely trigger this requirement.</p>	<ul style="list-style-type: none"> <li>• To improve or restore the livelihoods and standards of living of displaced persons. To improve living conditions among physically displaced persons through the provision of adequate housing with security of tenure, and safety at resettlement sites</li> </ul> <p><b>Requirements and instruments:</b> the Borrower will consider feasible alternative project designs to avoid or minimize physical and/or economic displacement, while balancing environmental, social, and financial costs and benefits, paying particular attention to impacts on the poor and vulnerable.</p> <p>Compensation and Benefits for Displaced Persons: When displacement cannot be avoided, the Borrower will offer project-affected people compensation for loss of assets at full replacement cost and other assistance to help them improve or restore their standards of living or livelihoods, as provided in this ESPS. Compensation standards will be transparent and applied consistently to all project-affected people. Where livelihoods of displaced persons are land-based, or where land is collectively owned, the Borrower will, where feasible, offer land-based compensation to the displaced. The Borrower will take possession of acquired land and related assets only after compensation has been made available and, where applicable, resettlement sites and moving</p>		
--	--	--	--

<p>IFAD seeks to avoid involuntary resettlement or, when unavoidable, minimize involuntary resettlement by exploring feasible alternative project designs and sites. As part of the social and environmental assessment, IFAD requires consideration of all feasible project alternatives and measures to avoid displacement, including the “no action” option.</p>	<p>allowances have been provided to the displaced persons in addition to compensation. The Borrower will also provide opportunities to displaced communities and people to derive appropriate development benefits from the project and will provide support to restore social networks and other intangible assets.</p> <p>The Borrower will establish procedures to monitor and evaluate the implementation of a <b>Resettlement Action Plan or Livelihood Restoration Plan</b>.</p> <p>Where the exact nature or magnitude of the land acquisition or restrictions on land use related to a project with potential to cause physical and/or economic displacement is unknown due to the stage of project development, the Borrower will develop a <b>Resettlement and/or Livelihood Restoration Framework</b> outlining general principles compatible with this ESPS. Once the individual project components are defined and the necessary information becomes available, such a framework will be expanded into a specific Resettlement Action Plan or Livelihood Restoration. Economically displaced persons who face loss of assets or access to assets will be compensated for such loss at full replacement cost.</p>		
<p><b>Standard 8. Financial intermediaries and direct investments</b></p>	<p><b>IDB does not have a stand-alone standard. Requirements and</b></p>		

	objectives for dealing with this theme are included in the ESPS 1.		
<p>This standard is guided by the Rural Finance Policy and Framework for IFAD non-Sovereign Private Sector Operations and Establishment of a Private Sector Trust Fund (NSO Framework). Direct investments include lending and equity stakes in private-sector companies (including corporate and project financing), and guarantee facilities. In line with IFAD’s mandate, beneficiaries are expected to be poor, vulnerable small producers and rural households.</p> <p><b>Standards objectives:</b></p> <ul style="list-style-type: none"> <li>• Promote sound environmental, social and climate practices and sound human resources management within FIs and direct investees.</li> <li>• Ensure FIs and direct investees will assess and manage environmental and social risks and impacts of subprojects.</li> <li>• Promote good environmental and social management practices by direct investees and in the subprojects financed by FIs.</li> </ul> <p><b>Requirements and instruments:</b> the Borrower will screen and categorize potential environmental and social risks</p> <ul style="list-style-type: none"> <li>• Screen the proposed FI or direct investee using the screening procedure outlined in volume 1 of SECAP and reject the projects with activities on the IFAD exclusion list (see below).</li> <li>• Categorize the risk of the FI or direct investee using SECAP risk assessment tools.</li> </ul>	<p>The nature of intermediated financing means that the FIs will assume delegated responsibility for environmental and social risk and impact assessment, risk and impact management, and monitoring, as well as overall portfolio management. The delegation may take various forms depending upon different factors, such as the type of financing provided.</p> <p>The effectiveness of the FIs’ environmental and social risk and impact management will be evaluated and monitored regularly throughout the project cycle.</p> <p>For FI projects, the IDB will conduct due diligence on the FI and its portfolio to assess</p> <p>(i) existing environmental and social policies and procedures and the FI’s commitment, capacity, and track record to implement them;</p> <p>(ii) environmental and social issues associated with the current and likely future portfolio that could expose the IDB to environmental, social, and associated risks; and</p> <p>(iii) measures necessary to strengthen the FI’s existing environmental and social risk and impact management system. The IDB’s requirements and the scope of their application for FI clients depend on the nature of the investment and the level of environmental and social risk associated with the FI’s activities. To appropriately identify and measure</p>	<p><b>This standard will not be applied to the Project as it is only applied to private sector loans.</b> Although IDB does not have a stand-alone standard for this theme it has a comprehensive set of objectives and requirements to ensure that potential risks and impacts are adequately addressed. IDB’s guidance on this theme is detailed and has more requirements. Therefore its use could also result in adherence to IFAD’s requirements.</p>	<p>This standard is not applicable to the Project.</p>

<ul style="list-style-type: none"> <li>• The E&amp;S risks of the FI depend on the E&amp;S categories of subprojects and portfolio exposure.</li> <li>• Moreover, it will assess the environmental and social management system of the FI or direct investee. It will assess whether the FI or direct investee meets the requirements of a high-quality environmental and social management system. This typically has the following components:</li> <li>• An environmental and social policy that includes a requirement for subprojects to meet the ESS requirements</li> <li>• Identification of risks (environmental and social due diligence)</li> <li>• Management programmes</li> <li>• Internal organizational capacity and competency</li> <li>• Monitoring and reporting systems</li> <li>• Emergency preparedness and response</li> </ul> <p>The Borrower will conduct environmental and social due diligence (ESDD) for direct-investment projects. For high- and substantial-risk projects:</p> <ul style="list-style-type: none"> <li>• Conduct ESDD in accordance with IFAD’s requirements as defined in SECAP, <b>including environmental and social impact assessment (ESIA) or abbreviated ESIA and a compliance summary table with IFAD’s Social, Environmental and Climate Standards;</b></li> <li>• <b>Prepare a draft consultation and participation plan, grievance</b></li> </ul>	<p>these risks, the IDB will review a sample of the FI’s activities as well as its implementation capacity and ESMS. In particular, the following requirements apply:</p> <ul style="list-style-type: none"> <li>a. FIs must develop and operate an ESMS that is commensurate with the level of environmental and social risks in its portfolio and prospective activities. The ESMS should incorporate relevant principles of ESPS 1.</li> <li>b. FIs must apply relevant aspects of ESPS 2 to their workers.</li> <li>c. The portfolio financed with resources from the IDB must comply with the IDB Exclusion list.</li> <li>d. FIs with portfolios, and/or prospective subprojects that present moderate to high environmental or social risks will require high or substantial risk subprojects that they support to apply relevant standards of the ESPF, for those FIs to be eligible for financing with resources from the IDB. Where a specific subproject includes activities with high environmental and social risks, the FI will refer that subproject to the IDB for review before including it in the financed portfolio.</li> </ul>		
--	---	--	--

<p><b>redress mechanism and environmental, social and climate management plan (ESCMP);</b></p> <ul style="list-style-type: none"> <li>● Include relevant indicators (outcome and milestone) in the ESCMP for monitoring of climate, environmental, health, safety and social issues; and</li> <li>● Ensure that the relevant provisions of ESCMPs (Environment, Social and Climate Management Plan), including costs of implementation, are fully included in bid and contract documents.</li> <li>● For moderate-risk projects the Borrower will develop an <b>ESCMP</b>.</li> </ul>	<p>As part of the monitoring and supervision activities, the IDB will periodically review the process and the results of the environmental and social due diligence conducted by the FI and the overall effectiveness of the FI's environmental and social management system. IDB supervision may include visits at the FI level, as well as to recipients of FI loans, particularly in the case of high or substantial-risk subprojects. The frequency and focus of supervision visits will be commensurate with the identified risks. For supervision purposes, the IDB will require access to all relevant documents and sites for any project in the FI's financed portfolio.</p>		
<p><b>Standard 9: Climate change</b></p>	<p><b>IDB does not have a stand-alone standard for climate change.</b></p>		
<p>The requirements set out in Standard 9: Climate change are designed to achieve the following objectives:</p> <ul style="list-style-type: none"> <li>● Ensure alignment of IFAD-supported projects with targets and priorities of countries' Nationally Determined Contributions and the goals of the Paris Agreement and other international frameworks;</li> <li>● Ensure that proposed activities are screened and assessed for climate change and disaster risks and impacts both of and on projects;</li> <li>● Apply the SECAP risk mitigation hierarchy principle of applying a hierarchy of risk management measures in project design;</li> </ul>	<p>ESPS 1 stipulates that the "Borrower will consider risks and impacts related to human rights, gender, and natural hazards and climate change throughout the assessment process. Where appropriate, the Borrower will complement its environmental and social assessment with further studies focusing on those specific risks and impacts." Specific requirements and guidance on natural hazards and climate change can be found in ESPS 4 on <i>Community Health, Safety and Security</i> and its Guideline.</p> <p><b>Standards objectives:</b></p> <ul style="list-style-type: none"> <li>● To anticipate and avoid adverse impacts on the</li> </ul>	<p>IDB's objectives and requirements regarding climate change (mitigation and adaptation) are found in different ESPS and also in documents other than the ESPF. IFAD's standard consolidates such requirements and objectives in a single guidance statement and mandates specific analyses. In particular it requires a specific climate risk screening and instruments for their management.</p> <p>It is recommended that adjustments to IDB's instruments are made to satisfy IFADs requirements regarding this standard. This should include:</p> <p>3. Apply climate screening tools.</p>	<p>The IDB does not have a stand-alone environmental and social standard related to climate change. In order to comply with IFADs standard, given the "substantial" risk rating a targeted climate adaptation assessment.</p>

<ul style="list-style-type: none"> <li>Strengthen the climate resilience of communities and their adaptive capacity to address risks of climate change impacts and climate-related disasters;</li> <li>Increase the ability of communities to adapt to the adverse impacts of climate change, and foster climate resilience and low GHG-emitting projects that do not threaten without compromising food production.</li> </ul> <p><b>2. Assess potential risks and impacts</b></p> <ul style="list-style-type: none"> <li>For substantial and high-risk projects, assess direct and indirect adverse climate-related impacts.</li> <li>Produce a vulnerability impact and adaptation assessment for potential high-risk projects.</li> <li>Produce a targeted adaptation assessment for substantial-risk projects.</li> <li>For moderate-risk projects, undertake a literature review of climate assessments and propose adaptive/mitigation measures in the ESCMP.</li> <li>For low-risk projects, no climate assessment is required.</li> <li>Utilize relevant expertise and ensure impacts are assessed at appropriate geographic scale.</li> <li>Ensure that the level of stakeholder engagement is at a scale appropriate to potential risks/impacts.</li> </ul> <p><b>Requirements and instruments:</b>  <b>Climate change risk (impact of climate change on projects):</b> through the climate risk</p>	<p>health and safety of the project-affected people during the project life cycle from both routine and non-routine circumstances.</p> <ul style="list-style-type: none"> <li>To ensure that the safeguarding of personnel and property is carried out in accordance with relevant human rights principles and in a manner that avoids or minimizes risks to the project-affected people.</li> <li>To anticipate and avoid adverse impacts on the project itself from natural hazards and climate change during the project life cycle.</li> </ul> <p>A project's vulnerability to natural hazards and climate change and its potential to increase the vulnerability of ecosystems and communities to natural hazards and climate change should dictate the extent of natural hazards and climate change considerations in the Borrower's E&amp;S risks and impacts identification process.</p>	<ol style="list-style-type: none"> <li>Include the climate aspects in the ESMP of the project, since it is a good way to also include adaptation and mitigation measures.</li> <li>If the project has a high or substantial climate risk prepare a Climate Change Impact and Vulnerability Assessment or Target Climate Change Impact Assessment.</li> </ol>	
---	--	--	--

<p>screening procedure, IFAD requires that all projects be screened to determine their exposure and sensitivity to climate-related risks (and given ratings of High, Substantial, Moderate or Low Risk). This screening procedure also estimates impacts based on information about historic climate hazard occurrences, current climate trends and future climate change scenarios.</p> <p>In addition, the screening assesses the likelihood of the project increasing the target population's vulnerability to climate hazards (e.g. maladaptation). Borrowers/recipients/partners should analyze physical, social, economic and environmental factors and processes that increase communities' susceptibility and vulnerability to potential climate change impacts and hazards – with a focus on marginalized and disadvantaged people. Specific gender, age and social vulnerabilities – and potential differentiated impacts – should also be considered.</p> <p>The need for clear and robust risk identification and mitigation measures is critically important, especially given the pivotal role of SECAP in supporting targeting during project design (in line with the recently approved Targeting Strategy). As the list of potential project locations and investment options is narrowed down, a more detailed climate analysis should be undertaken. This can not only inform the nature and types of investments, but also their design (e.g. in response to the need for climate-proofing of infrastructure). Such design decisions have cost implications that should be reflected in the project budget.</p>			
---	--	--	--

<p><b>IFAD does not have a stand-alone standard on Gender Equality. Nonetheless IFAD has a Policy on Gender Equality and Women’s Empowerment.</b></p>	<p><b>ESPS 9: Gender Equality</b></p>		
<p>IFAD does not have a stand-alone standard on Gender Equality. Nonetheless IFAD has a Policy on Gender Equality and Women’s Empowerment. This cross cutting theme is object of consideration in project’s social analyses and guidance for planning measures to address gender related themes (e.g. inclusion, participation and leadership, benefit sharing, redistribution of the workload ,economic empowerment, gender-based violence) found in the SECAP in different places and standards (e.g. labour, Indigenous peoples). IFAD promotes gender mainstreaming and transformative approaches depending of the context, as well as gender gap analysis as basis for the Gender and Social inclusion strategies. Furthermore, IFAD is committed to track progress through its core gender transformative indicator (WEAI – Women Empowerment in Agriculture Index).</p>	<p>This ESPS aims at identifying potential gender-based risks and impacts and introducing effective measures to avoid, prevent, or mitigate such risks and impacts, thereby eliminating the possibility of reinforcement of pre-existing inequalities or creating new ones. For purposes of this ESPS, affirmative action specifically aimed at closing existing gender gaps, meeting specific gender-based needs, or ensuring the participation of people of all genders in consultations will not constitute discrimination or exclusion.</p> <p><b>Standards objectives:</b></p> <ul style="list-style-type: none"> <li>● To anticipate and prevent adverse risks and impacts based on gender, sexual orientation, and gender identity, and when avoidance is not possible, to mitigate and compensate for such impacts.</li> <li>● To establish actions to prevent or mitigate risks and impacts due to gender throughout the project cycle.</li> <li>● To achieve inclusion in project-derived benefits of people of all genders, sexual orientations, and gender identities.</li> <li>● To prevent SGBV, including sexual harassment,</li> </ul>	<p>IFAD has no specific standard on gender. IDB’s standard is detailed and comprehensive in its objectives and requirements. Nonetheless, in order to comply with IFAD’s commitments this theme’s baseline assessments to measure the WEAI progress should be integrated in the gender analysis and on the project’s risk and impact management instruments.</p>	<p>IFAD’s safeguard standard requirements are adequately met by the IDB studies and proposed safeguard management instruments.</p>

	<p>exploitation and abuse, and when incidents of SGBV occur, to respond promptly.</p> <ul style="list-style-type: none"> <li>● To promote safe and equitable participation in consultation and stakeholder engagement processes regardless of gender, sexual orientation, and/or gender identity.</li> <li>● To meet the requirements of applicable national legislation and international commitments relating to gender equality, including actions to mitigate and prevent gender-related impacts.</li> </ul> <p><b>Requirements and instruments:</b> The Borrower will screen the project for potential gender-based risks and impacts that may disproportionately affect women, girls, and sexual and gender minorities. If potential gender-based risks and impacts are identified, the Borrower will conduct a gender analysis (GA) as part of environmental and social due diligence. The GA will assess how gender relations in the project's area of influence may lead to disproportionate impacts by gender. Disproportionate impacts may be caused directly by project activities, and/or by excluding people from project benefits due to their gender, and what resources they can access to recover from the negative impacts and benefit from the positive ones. The GA must also assess the measures that are best suited to manage gender-based</p>		
--	--	--	--

	<p>risks and impacts, per the mitigation hierarchy.</p> <p>If the screening indicates any gender-based risk, the Borrower should carry out a <b>Gender Analysis (GA)</b> to determine the likelihood and severity of those pre-identified risks, and define the appropriate measures to prevent, reduce, mitigate and/or compensate for them. The GA should be carried out within the frame of the project's environmental and social risks and impacts assessment process. The breadth and depth of the GA should be proportional to the nature and scale of the risks and impacts. In most cases, the GA can be integrated into the general Environmental and Social Impact Assessment (EIAS) and Environmental and Social Management Plan (ESMP) of the project. In other cases, and depending on the type of impacts identified, it may be integrated into relevant management plans (e.g., Resettlement Action Plan and/or Livelihood Restoration Plan, Social Cultural Analysis/Indigenous Peoples Plan, Stakeholder Engagement Plan). Finally, projects with significant gender-based risks might require a stand-alone GA.</p> <p>The GA should be an integral component of the project's environmental and social risks and impacts assessment process and its results should be incorporated into its Environmental and Social Management System (ESMS). The GA should include the following elements:</p>		
--	--	--	--

	(i) Situation Analysis; (ii) Stakeholder Analysis; (iii) Project's gender-based risks and potential impacts; (iv) Mitigation Measures; (v) Monitoring and Evaluation mechanisms; and (vi) Institutional Capacity.		
<b>IFAD does not have a stand-alone standard on Stakeholder Engagement. Guidance on the theme is found in different places in the SECAP.</b>	<b>ESPS 10: Stakeholder Engagement and Information Disclosure</b>		
<b>IFAD does not have a stand-alone standard on Stakeholder Engagement. Guidance on the theme is found in different places in the SECAP. Nevertheless, IFAD has a Framework for Operational Feedback from Stakeholders: Enhancing Transparency, Governance and Accountability<sup>11</sup> (2019).</b> This framework provides a comprehensive and integrated way to strengthen IFAD's efforts to engage key stakeholders and mobilize their feedback in the country's strategic opportunities programme (COSOPs). More specifically, the objectives of the framework are to: (i) Increase governments' and partners' commitment to engage key stakeholders, especially local and national representatives of IFAD's target groups, and respond to their feedback; (ii) Improve the quality and inclusiveness of stakeholder engagement and feedback processes, particularly at project level; (iii) Improve monitoring and results reporting on stakeholder feedback, particularly from project target groups; and (iv) Strengthen capacities of project target groups and other stakeholders	<p>This ESPS guides the engagement between the Borrower and project stakeholders, especially project-affected people as a means to improve social and environmental sustainability, enhance project acceptance and contribute to smooth project implementation.</p> <p>It must be read in conjunction with ESPS 1 and ESPS 9. Specific requirements regarding engagement with workers are found in ESPS 2. Special provisions on emergency preparedness and response are covered in ESPS 4. In the case of projects involving involuntary resettlement, Indigenous Peoples, or cultural heritage, the Borrower will also apply the specific disclosure and consultation requirements set out in ESPSs 5, 7, and 8, respectively.</p> <p><b>Standard's objectives:</b></p>	IDB's standard is comprehensive and detailed and shares the same principles and goal of IFAD's policy. Therefore its application will also result in compliance with IFAD's requirements.	IFAD's safeguard standard requirements are adequately met by the IDB studies and proposed safeguard management instruments.

<sup>11</sup> <https://webapps.ifad.org/members/eb/128/docs/EB-2019-128-R-13.pdf?attach=1>

<p>to meaningfully and sustainably participate in and manage feedback processes.</p>	<ul style="list-style-type: none"> <li>● To establish a systematic approach to stakeholder engagement that will help the Borrower identify stakeholders, especially project-affected people, and build and maintain a constructive relationship with them.</li> <li>● To assess the level of stakeholder interest in and support for the project and to enable stakeholders' views to be considered in project design and environmental and social performance.</li> <li>● To promote and provide the means for effective and inclusive engagement with project-affected people throughout the project's life cycle on issues that could potentially affect or benefit them from the project.</li> <li>● To ensure that appropriate information on environmental and social risks and impacts of the project is disclosed to stakeholders in a timely, understandable, accessible, and appropriate manner and format.</li> <li>● To provide stakeholders with accessible and inclusive means to raise questions, proposals, concerns, and grievances and allow</li> </ul>		
--	---	--	--

	<p>Borrowers to respond and manage them appropriately.</p> <p><b>Requirements and instruments:</b></p> <ul style="list-style-type: none"> <li>● The Borrower will engage with stakeholders throughout the project life cycle. It will commence such engagement as early as possible in the project development process and in a timeframe that enables meaningful consultations with stakeholders on project design and development. The nature, scope, and frequency of stakeholder engagement will be proportionate to the nature and scale of the project, its development and implementation timeline, and its potential risks and impacts.</li> <li>● The Borrower will engage in meaningful consultations with stakeholders. It will provide stakeholders with timely, relevant, understandable, and accessible information, and will consult them in a culturally appropriate manner, free of manipulation, interference, coercion, discrimination, and intimidation.</li> <li>● <b>Stakeholder engagement will involve the following steps: (i) stakeholder identification and analysis,</b></li> </ul>		
--	---	--	--

	<p>(ii) planning how the engagement with stakeholders will take place, (iii) disclosure of information, (iv) consultation with stakeholders, (v) addressing and responding to grievances, and (vi) reporting to stakeholders.</p> <ul style="list-style-type: none"> <li>• The Borrower will maintain and disclose, as part of the environmental and social assessment, a documented record of stakeholder engagement, including a description of the stakeholders consulted, a summary of the feedback received, and a brief explanation of how the feedback was considered or the reasons why it was not.</li> </ul>		
--	--	--	--

### **IFAD environmental and social exclusion list**

IFAD will not knowingly finance, directly or indirectly, projects involving the following:

- (i) Production or activities involving harmful or exploitative forms of forced labour, or practices which prevent employees from lawfully exercising their rights of association and collective bargaining;
- (ii) Production or activities involving harmful or exploitative forms of child labour;
- (iii) Production or activities that impinge on the lands owned, or claimed under adjudication, by Indigenous peoples, without fully documented consent of such peoples;
- (iv) Activities prohibited by host-country legislation or international conventions relating to the protection of biodiversity resources, cultural heritage or other legally protected areas;
- (v) The production, trade in or use of any product or activity deemed illegal under host country (i.e. national) laws or regulations, international conventions and agreements, or subject to international phase-out or bans, such as:
  - (a) Products containing polychlorinated biphenyls (PCBs);
  - (b) Pharmaceuticals, pesticides, herbicides and other hazardous substances subject to international phase-outs or bans;
  - (c) Ozone-depleting substances subject to international phase-outs regulated by the Montreal Protocol;
  - (d) Wildlife products regulated under the Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES); and
  - (e) Transboundary trade in waste or waste products as defined by the Basel Convention;
- (vi) Commercial logging operations or the purchase of logging equipment for use in primary tropical moist forests or old-growth forests;
- (vii) Production or trade in wood or other forestry products other than from sustainably managed forests;
- (viii) Production or trade in alcoholic beverages (excluding beer and wine), tobacco or drugs;
- (ix) Marine and coastal fishing practices such as blast fishing, large-scale pelagic drift net fishing using nets in excess of 2.5 km in length or fine mesh net fishing harmful to vulnerable and protected species in large numbers and damaging to marine biodiversity and habitats;
- (x) Trade in goods without required export or import licenses or other evidence of authorization of transit from the relevant countries of export, import and, if applicable, transit;
- (xi) Production of, trade in or use of unbounded asbestos fibers;
- (xii) **All mining, mineral processing and extraction activities;**
- (xiii) Production or trade in radioactive materials;
- (xiv) Gambling, casinos and equivalent enterprises, trade related to pornography or prostitution;
- (xv) Contribute to money laundering, terrorism financing, tax avoidance, tax fraud and tax evasion;
- (xvi) **Production and distribution, or investment in media that are racist, antidemocratic or that advocate discrimination against an individual, group or part of the population;**
- (xvii) **Activities prohibited by host country legislation or other legally binding agreements regarding genetically modified organisms (GMOs);**
- (xviii) **Production of or trade in palm oil unless from growers and companies with internationally recognized certification, or undergoing certification.**
- (xix) Production of soy in the Amazon region or trade in soy produced in the Amazon region, unless from growers with internationally recognized certification.

**IDB's list of prohibited activities<sup>12</sup>:** IDB will not knowingly finance, directly, or indirectly through FIs, projects involved in the production, trade, or use of the products, substances, or activities listed below.

### **1. PROHIBITED ACTIVITIES**

a. Activities that are illegal under host country laws, regulations, or ratified international conventions and agreements or subject to international phase out or bans, such as:

- i. Polychlorinated biphenyl compounds (PCBs).
- ii. Pharmaceuticals, pesticides/herbicides, and other hazardous substances subject to international phaseouts or bans.
- iii. Persistent Organic Pollutants (POPs).
- iv. Ozone-depleting substances subject to international phase-out.
- v. Wildlife or wildlife products regulated under Convention on International Trade in Endangered Species of Wild Fauna and Flora.
- vi. Transboundary trade in waste or waste products, except for nonhazardous waste destined for recycling.
- vii. **Lead paint or coatings in the construction of structures and roads.**

b. Activities that are illegal under host country laws, regulations, or ratified international conventions and agreements relating to protecting biodiversity resources or cultural heritage.

### **1. OTHER ACTIVITIES**

a. Activities that, although consistent with a country's legal and/or regulatory framework, may generate particularly significant adverse impacts on people and/or the environment, such as:

- i. Weapons, ammunitions, and other military goods/technology.
- ii. Tobacco.
- iii. Gambling, casinos, and equivalent enterprises.
- iv. Radioactive materials.
- v. Unbonded asbestos fibers or asbestos-containing products.
- vi. Drift net fishing in the marine environment using nets over 2.5 km in length.

b. Activities that are inconsistent with the IDB's commitments to address the challenges of climate change and promote environmental and social sustainability, such as:

- viii. Thermal coal mining or coal-fired power generation and associated facilities.
- ix. Upstream oil exploration and development projects.
- x. Upstream gas exploration and development projects. Under exceptional circumstances and on a case-by-case basis, consideration will be given to financing upstream gas infrastructure where there is a clear benefit in terms of energy access for people experiencing poverty and where GHG emissions are minimized, projects are consistent with national goals on climate change, and risks of stranded assets are properly analyzed.

Annex 14	Terms of Reference Key Functions of the PMU

# **1 PRESENTATION**

The purpose of this Project Operational Regulation (ROP) is to present and establish the terms, conditions and procedures that will govern the execution of the activities of the Paraíba Sustainable Rural Development Project (PROCASE II). The Project has a total cost of US\$ 105 million, of which US\$ 70.0 million is from a loan from the Inter-American Development Bank (IDB), US\$ 10.0 million from the International Fund for Agricultural Development (IFAD) and US\$ 25.0 million from the state of Paraíba. The executing agency (OE) will be the borrower, through the State Secretariat for Family Farming and Semi-Arid Development (SEAFDS). In turn, SEAFDS will sign a subsidiary agreement with the Paraíba Technical Assistance and Rural Extension Company (EMPAER), which will act as a sub-executing body, specifically in carrying out land and environmental regularization activities and part of the Technical Assistance (TA) for the beneficiaries of the Productive Investment Plans (PIRs, according to the Portuguese acronym). Definitions of responsibilities and the availability of resources will be set out in a Cooperation Agreement and respective Work Plan to be drawn up between the two government bodies.

- 1.1. In the event of a conflict between the provisions of these Operational Regulations (ROP) and the provisions of the Loan Agreements signed by the Government of the State of Paraíba with the IDB (OC-xxxx) and IFAD (FD-xxxx) and their respective Annexes, the provisions of these Agreements and their Annexes shall prevail.

## **1.1 Purpose of the Regulation**

- 1.2. These Regulations are intended to define the rules and procedures for carrying out PROCASE II and must be followed by all those involved in its execution, including employees and managers of public or private entities, organizations and institutions. Any activity or use of resources that is not supported by these Regulations will be considered unauthorized and the resources used will not be counted as eligible expenses for the Project. In addition, the person responsible for such expenditure will be subject to administrative or civil sanctions for non-compliance, fraud or any other offense provided for in current legislation.

## **1.2 B. Organization of the Regulation**

- 1.3. The ROP is organized into eight chapters with the following content:
  - a) The first chapter gives a brief overview of the Operational Regulations (ROP) and their organization.
  - b) The second chapter presents a contextualization of PROCASE II.
  - c) Chapter 3 contains the general and specific objectives of PROCASE II and describes the components, their costs with the financing matrix, the execution timeframe and the results and impacts expected from their implementation.
  - d) The fourth chapter details PROCASE II's management system, describing the institutional arrangement, the procedures for purchasing goods and services to be applied to the use of the Project's resources and retroactive financing for expenses already incurred.

- e) Chapter 5 details the rules that must be followed when purchasing goods and services (not consultancy services), contracting works and consultancy services under PROCASE II.
- f) Chapter 6 defines the environmental and social management procedures to be followed when carrying out PROCASE II-related activities.
- g) Chapter 7 presents the requirements for the budgetary and financial administration of PROCASE II.
- h) Chapter 8 sets out the procedures for planning, monitoring and evaluating PROCASE II, including archiving documents, preparing reports and auditing activities.
- i) Chapter 9 indicates the code of ethics and policies on fraud and corruption, which must be followed by all PROCASE II stakeholders.

## 2 CONTEXTUALIZATION

### 2.1 Background

- 2.1 The Paraíba State Government has applied for a loan to finance a project to invest in multiple projects to promote sustainable development in the rural areas of Paraíba State. The Project will cover all the Planning Regions and the 223 municipalities.
- 2.2 The state of Paraíba is located in the Northeast region of Brazil, the poorest region and with the worst social indicators in the country. However, the state ranks 20th among the 27 Brazilian states in terms of GDP per capita, poverty and extreme poverty have reached the highest rates in the last 10 years: 47.4% of the state's population is in poverty, 15.6% in extreme poverty and 63.9% is food insecure, with 10.6% experiencing severe food insecurity.
- 2.3 Agriculture is the main rural economic activity in the state. The predominant crops in the Project area (cassava, rice, corn, beans) have low productivity. For example, cassava yields less than 50% of its potential. Cocoa, a relevant crop in the Atlantic Forest region since the first half of the 20th century, reaches only 15% of its potential.
- 2.4 Limited access to technical assistance and funding. Family farmers represent around 80% and 33% of the surface area of rural establishments in the Project area. They face difficulties in increasing their productivity due to their limited access to financing and technical assistance (12.4% of producers have access to credit and 6.1% to technical assistance).
- 2.5 Rural Paraíba, the Project's intervention area, faces a series of limiting factors that were taken into account when elaborating this Project's intervention proposal.

#### 2.1.1 Rural Poverty and Extreme Poverty

- 2.6 According to data from the Single Registry (Cadastro Único) from March 2024 (MDS), there are 191,000 families in rural Paraíba classified as being in poverty or extreme poverty (CadÚnico bands 1 and 2). Considering that there are 250,000 households in the rural area of the state, according to IBGE 2010, it can be said that 76% of rural families are in a situation of poverty and extreme poverty<sup>1</sup>. In 2010, 39% of rural households were in poverty (2010), and 20% were considered extremely poor. In the state, only 36% of the population is food secure, while the rest are classified as mild, moderate or severe food insecure (II VIGISAN, 2021).
- 2.7 The HDI in 146 municipalities is considered low (70%), medium in 62 (29%) and high in 2 (1%). According to IBGE 2010, around 28% of the population has some kind of disability (visual, hearing, motor or mental).

---

<sup>1</sup> The 2022 Census did not disclose the number of rural households. For this reason, the figure from the 2010 Census was used in this study, considering that there are no significant changes between censuses. It is also considered that one household is equivalent to one family.

### **2.1.2 Paraíba's biomes**

- 2.8 Paraíba is characterized by the presence of two major regions and biomes: (i) the semiarid region, characterized by the Caatinga biome, which includes 193 of the state's 223 municipalities, covering 92% of the area and 62% of the state's population, and (ii) the Mata Paraibana region, characterized by the Atlantic Forest biome, located in the far east, which includes 30 municipalities, representing 8% of the state's surface area and home to 38% of the population.
- 2.9 The semiarid region is a rural region, home to 85% of the state's rural population and with the worst social indicators. The average annual rainfall in the semiarid region ranges from 330 to 900 mm, with rainfall concentrated in a short period that rarely exceeds four months. The caatinga was deforested at a rate of 0.28% per year (2,352 km<sup>2</sup> /year) between 2002 and 2008. Another problem that increases the vulnerability of family farming in the semiarid region is desertification. This is a complex phenomenon whose causes involve interactions between biophysical, socio-economic and demographic variables and which could be accelerated by projected climate change. Depending on the climate scenario considered, areas with high susceptibility to desertification could increase by between 12.3% and 19.6% by 2045.
- 2.10 Rainfall totals are higher in the Atlantic Forest, ranging from 1,300 to 1,800 mm per year. There is also a seasonality to the rainfall in the Atlantic Forest, with the wettest or 'winter' season generally extending from February to August. It is estimated that Paraíba's Atlantic Forest currently occupies only 13.8% of its original area in the region. The technical report "Atlas of Atlantic Forest Remnants - Period 2021-2022", published by the organization SOS Mata Atlântica, shows that deforestation is continuing in this biome (SOS-MATA-ATLÂNTICA, 2023). During this period, 20,075 hectares of this type of vegetation were lost, equivalent to 0.1% of its current area<sup>2</sup>. At the level of the Brazilian Atlantic Forest, current deforestation varies between 11,000 and 25,000 hectares per year, which is equivalent to an annual deforestation rate of between 0.05 and 0.125%. Although this may seem relatively small and is considerably less than that which occurred in the period from 1985 to 2000, it is still a cause for great concern.

### **2.1.3 Inefficient production systems**

- 2.11 According to the 2017 Agricultural Census, there were 163,218 agricultural establishments in the state. Of these, 125,489 (76.9%) were family farms, while 37,729 (23.1%) were non-family or patronal. Approximately 12% of family units belong to Agrarian Reform settlers. Family farming occupies 42% of the state's agricultural area and is responsible for 47.8% of the total value of agricultural production, which is the second highest proportion in the Northeast and the sixth highest nationally. In the Atlantic Forest region, 20.16% of the area is occupied by family farms, while it reaches 50.75% in the Semiarid region of Paraíba.
- 2.12 Agricultural production is the main economic activity of most of the rural population in general and, in particular, of family farming. The 2017 Agricultural Census highlights the

---

<sup>2</sup> Currently, there are approximately 20 million hectares of Atlantic Forest in Brazil, according to the SOS Atlantic Forest Atlas 2017. (SOS-MATA-ATLÂNTICA, 2017).

following productions for their contributions to the value of production: i) poultry, cattle, goats and sheep account for 92% of the value of livestock; ii) of the permanent crops, bananas, passion fruit, Paraíba coconut and tangerines are the main productions in terms of value, and iii) pineapple, corn, cassava and sugar cane are the most important temporary crops. Family farming in Paraíba faces very severe and challenging conditions, especially in the semiarid region, which include low income, low productivity in farming activities, difficulties in accessing water for human consumption and production, and high risk related to climatic events. To increase the production, productivity and income of family farming, it is necessary to resolve obstacles related to the lack of access to financing to make the necessary investments, technical assistance and rural extension that supports the learning of new technologies, difficulty in accessing markets and inserting producers into value chains, which in turn is related to the weakness of rural organizations. According to the 2017 Agricultural Census, only 11.7% of agricultural establishments have access to water for irrigation. In addition to the low productivity of agricultural activities that depend on the availability of water, there is the use of unsuitable production techniques. For example, 32% of family farming establishments use pesticides, and 39% do not adopt any conservation practices (IBGE 2017). In the case of mechanization, for every 130 farmers, 1 has the support of a tractor, seed drill, etc (IBGE 2017). Less than 1% of the family farming establishments applied lime or another soil pH corrector (IBGE, 2017). 67.4% of family farming establishments have implemented soil preparation systems.

- 2.13 The data from the 2017 Census shows that the majority (53%) of the producers responsible for the establishments are over 55 years old. Less than 10% are under the age of 35. These figures follow a national trend of a shrinking percentage of young people in rural areas, while the rural population is getting older. This situation highlights the challenges of providing opportunities and prospects for young people and, at the same time, conditions for the older population to maintain an agricultural activity and quality of life. This data, when added to the data on very low mechanization (see data below), can create obstacles to achieving greater productivity.

#### **2.1.4 Land structure**

- 2.14 In the state, 54% of establishments have up to 5 hectares and of these, 13% have less than one hectare, which characterizes extremely small areas for agricultural production, especially when considering the semiarid climate. Furthermore, around 15% of family farming establishments do not have guaranteed access to land (IBGE 2017).

#### **2.1.5 Climate change and environmental degradation**

- 2.15 Climate change is causing significant losses in the productivity of some important crops for family farmers, such as cassava, beans, bananas and corn. Paraíba is among the states most at risk of losses, along with Ceará, Piauí and Pernambuco.
- 2.16 Production systems are largely not adapted to the increasing scarcity of water or to the context of climate change. The combination of expectations of high drought risks, increased desertification and more heat extremes could jeopardize agricultural activities, especially those of family farmers, and disrupt local and regional food markets.

- 2.17 In the Atlantic Forest region, climate risks are more related to extreme rainfall events, such as floods and landslides. Agricultural production will be affected by reduced product quality, crop losses due to increased occurrence of diseases and soil erosion. These problems are compounded by poverty and the target population's limited access to public policies aimed at reducing their vulnerability to climate change.
- 2.18 There is also a major problem of soil degradation, due to the use of unsustainable practices on cultivated land, such as the systematic use of slash and burn, which have resulted in greater exposure of soils to the elements (SOS-MATA-ATLÂNTICA; INPE, 2015). In turn, the intense antropozonization of the environment mentioned here has had a significant impact on the water cycle. Thus, deforestation leads to a decrease in water infiltration and greater erosion. This has reduced the flow of water and led to the silting up of the region's watercourses (BRASIL-MDA-SDT, 2010), reducing the availability of water in the region (SILVA; BRUNO; AGUIAR; SOUSA FILHO *et al.*, 2020). In addition, the combination of the processes mentioned here has a significant negative impact on biodiversity. In a long-term perspective, the sum of these factors (including predicted climate change) is expected to lead to more frequent "extreme" events (e.g. droughts and floods), which could trigger a significant loss of environmental quality. This, in turn, will have a direct effect on the productive potential of agricultural systems and on the population's quality of life.

#### **2.1.6 Inadequate and insufficient TA system**

- 2.19 Only 17% of family farming establishments in Paraíba have access to the TA service (IBGE 2017); 83.4% report that they receive it from the government (federal, state or municipal). In addition to this low coverage rate, there is a lack of preparation and qualification of technicians from the point of view of knowledge of agroecological practices, which allow production systems to adapt to climate change, among other aspects (Information gathered during the field design mission). Without the support of qualified professionals, farmers are prevented from implementing more intensive, sustainable and efficient agricultural practices, as well as adapting to climate change and the challenges of market access and access to finance. It is important to relate this data to the profile of the producers, since in 2017 (IBGE), in 47.4% of the establishments that reported applying pesticides: the person responsible could not read and write and in 80.4% of the cases, the pesticide applications were carried out without any technical guidance. Regarding credit, 17% of family farming establishments reported having had access to it in 2017.

#### **2.1.7 Mechanization**

- 2.20 In the family farming establishments, most agricultural operations are carried out manually. Data from the 2017 Agricultural Census shows that only 0.8% of the farms in Paraíba have at least one type of machinery. The machinery used and implements are not always adequate or used appropriately. This lack of mechanization and the low availability of labour constitute a set of limiting factors for developing more efficient and relevant practices.

### **2.1.8 The challenge of digital inclusion**

- 2.21 Access to rural telephony and, above all, the Internet is scarce in rural areas. According to studies by the Ministry of Agriculture and Livestock (MAPA), currently more than 70% of rural areas nationwide do not have access to the Internet<sup>3</sup>.

### **2.1.9 Low participation Specific difficulties for vulnerable groups (women, young people, LGBT people and residents of traditional communities)**

- 2.22 Data from the latest Agricultural Census of 2017 (IBGE) shows gaps in relation to vulnerable groups:
- 2.23 Of all the family farming (FF) establishments in Paraíba, 76.0% are run by men and only 24.0% by women. Among family farming FF establishments, 64.0% are run by people who say they are black or brown, 11.3% by young people under 35 and 0.9% by indigenous people.
- 2.24 Regarding average area (ha), establishments run by men are 80.6% larger than those run by women. While establishments run by women have an average of 7.12 hectares, those run by men have an average of 12.86 hectares. Of the family farming establishments in the Project area that have access to water for irrigation, 6.7% are run by women, while 13% are run by men.
- 2.25 Among female family farmers, 4,486 received TA (14.9% of the total), while 16,637 male family farmers (or 17.4% of the total) received TATA.
- 2.26 In the Single Registry, there are 6,328 indigenous families registered, 73.1% of whom live in poverty or extreme poverty, and there are 4,295 quilombola families registered, 67.9% of whom live in poverty or extreme poverty.
- 2.27 Considering the families of artisanal fishers, 80.7% of them are in extreme poverty or poverty. This is a gap of 12.4% in relation to the poverty/extreme poverty situation of all registered rural families.
- 2.28 Finally, among riverine families, 72.6% are in poverty or extreme poverty, a gap of 6.5% compared to rural families in the Project area.

### **2.1.10 Limited participation in collective organizations**

- 2.29 Only 3.7% of rural producers in the state are members of a cooperative and 29.4% are members of an association (IBGE 2017).
- 2.30 Enterprises for packaging, processing and marketing the products have also encountered many difficulties. There are around 8,700 processing units in the Project area (IBGE 2017). According to MDS 2018, there were 77 enterprises registered in the northeastern region of Brazil and able to offer their products to government buyers. Of these, only 7 are from Paraíba (10%).

---

<sup>3</sup> Source: Link - <https://www.gov.br/agricultura/pt-br/assuntos/inovacao/agrohub-brasil/produtores-rurais/internet-no-campo-1/internet-no-campo>.

### 2.1.11 Family Farming Cooperatives

- 2.31 The cooperative-type economic organizations present in the state focus on the collection, processing and marketing of production, with milk (bovine and caprine) and fruit being the main chains involved.
- 2.32 These organizations have weaknesses in terms of the capacities of their management teams, on issues such as i) administrative and financial, including access to sources of working capital funding, ii) the ability to design and implement innovative and diversified marketing strategies, iii) the composition of teams with little representation of women and young people, among other weaknesses. These organizations also have important limitations from the point of view of their production infrastructures, which do not always allow them to diversify their products, comply with health and environmental legislation and do not use renewable energy sources in their processes, nor do they carry out adequate waste treatment.
- 2.33 This set of factors ends up limiting these organizations' ability to function and their viability. As a result, producers access the market precariously and at low prices, with difficulties in adding value to their production. In this context, intermediaries predominate. Family farmers have limited marketing channels, dependent on local sales. According to FNDE data, Paraíba's PNAE received only 2% of the program's total resources in 2022. In relation to the Northeast, this result puts the state only ahead of Sergipe, Rio Grande do Norte and Alagoas. It is worth noting that the PNAE is an important means of marketing UAF products.

### 2.1.12 Basic Sanitation

- 2.34 Article 3 of Law no. 14.026/2020 considers Basic Sanitation to be a set of public services, infrastructures and operational facilities for: i) drinking water supply, consisting of the activities and the provision and maintenance of infrastructures and operational facilities necessary for the public supply of drinking water, from collection to building connections and their measuring instruments ; ii) sanitary sewage (collection, transportation, treatment and adequate final disposal of sanitary sewage) and iii) urban cleaning and solid waste management (collection, transportation, transshipment, treatment and environmentally appropriate final disposal of household solid waste).
- 2.35 Regarding drinking water supply in the state, the Water and Sanitation Institute reports that in 2019, the rural service rate reached 24.16 % (in Brazil, the rate is 30.77%), through the implementation of systems with a distribution network and simplified chlorine disinfection treatment, guaranteeing the potability of the water. In other situations, fountain-type systems are implemented, without a distribution network, with chlorine disinfection treatment. Finally, when there is no possibility of implementing one of the above solutions, the construction of cisterns for human consumption becomes the only alternative.
- 2.36 As for the sanitary sewage situation, the rural service rate in Paraíba is 18.82% (Instituto Água e Saneamento, 2020), significantly below the national average of 42.54%. It is worth mentioning that this percentage is 1.04% in the costal micro-region, showing the great precariousness of this region of the state. Most of the sewage is covered by septic tanks and/or sinks, but the treatment units have no control over the disposal of sewage effluent, either on the ground or in water bodies, making it yet another polluter of the environment

and contributing to the factors that increase climate change. In addition, some of these septic tanks are of the black tank type, where the sewage is dumped directly under ground. In these areas it is common to find sewage running out into the open and houses without toilets.

- 2.37 This set of vulnerabilities, coupled with climate change, puts the region's production systems in crisis and in a vicious circle, in which the processes of social and environmental degradation fuel the impoverishment of rural families and increased migration to urban areas.

## **2.2 Project Strategy**

- 2.38 Project strategy. The challenges of environmental deterioration and deforestation in Paraíba's Atlantic Forest, the predominance of inadequate and low-productivity agricultural production models, low income, food insecurity and rural families' inadequate access to public services and institutional weaknesses are strongly interlinked. The Project will focus its activities on poor communities, prioritizing women, young people and traditional communities, and will apply a multidimensional approach, promoting the adoption of sustainable production technologies based on agroecology and improving food production, adaptation to climate change, access for families to technical assistance, drinking water services and adequate sanitation and better accessibility for communities, as well as strengthening institutional capacities.

### **3 PROCASE II (PROJECT)**

#### **3.1 Objectives**

##### **3.1.1 General Objective**

- 3.1 The general objective of the Project is to reduce rural poverty levels by improving food security and nutrition and adapting the rural population to climate change.

##### **3.1.2 Specific objectives**

- 3.2 The specific objectives are: (i) to increase the adoption of agricultural technologies, including those for adapting to and mitigating climate change; (ii) to improve the productive and social inclusion of family farmers, prioritizing women, young people, Traditional Peoples and Communities (PCT) and persons with disabilities; and (iii) to improve the environmental conditions of rural communities and their surroundings.

##### **3.1.3 Project description<sup>4</sup>**

###### **3.1.3.1 COMPONENT I - RESILIENT PRODUCTION SYSTEMS TO REDUCE RURAL POVERTY.**

- 3.3 The purpose of this component is to improve income, food security and nutrition and the adaptation of production systems to climate change, as well as protecting the natural resource base. To achieve the expected results, it will finance plans to improve the production and marketing of beneficiaries, recover environmentally degraded areas and strengthen the capacities of families and their organizations, as well as technical assistance for their preparation and implementation.

###### **a) Subcomponent 1.1 Implementation of resilient and biodiverse production systems**

- 3.4 The subcomponent seeks to strengthen and adapt production systems based on the use of agroecological practices and low GHG, seeking greater resilience and allowing for improved and diversified production of healthy food for self-consumption and the market.
- 3.5 Preparing the PIR begins with choosing the communities (see process in Annex 1) that will be part of the Rural Territories (TR) and carrying out the Rapid Participatory Rapid Diagnosis (RPD) in the selected communities, with the support of TA hired by the PMU. These events should be planned in advance together with the community to facilitate the participation of women, young people, PCTs and other stakeholders at local, municipal, regional and state level who can collaborate with the preparation of the Plan (data, information, etc.) since this document will be the reference for the actions that PROCASE II will implement in the community.

---

<sup>4</sup> The communities that will participate in components 1 and 2 of the project will be selected in three stages as detailed in Annex 1

- 3.6 The diagnosis should lead to the preparation of a PIR containing, among other things: (i) a detailed diagnosis of existing natural and human resources; (ii) a diagnosis of productive and social infrastructure (strengths and deficiencies); (iii) a diagnosis of social organization, associations and production and marketing cooperatives; and (iv) strategies and activities proposed to contribute to PROCASE II goals; (v) prioritization of proposed activities and their estimated costs. The PIR finances three areas of intervention: i) Production and commercialization ii) Environmental and iii) Social Technologies.
- 3.7 **Production and commercialization axis:** The aim will be to develop productive systems at the family level, always based on the use of agroecological practices and with a low impact on greenhouse gas emissions, such as: (i) agroforestry systems (AFSs) for diversified production; (ii) agroecological backyard gardens for the production of fruit, vegetables including NUCs and medicinal plants; (iii) beekeeping and meliponiculture; (iv) agroecological consortia for organic production including cotton; (v) goat farming for milk and meat with fodder AFSs; (vi) dairy cattle farming with fodder AFSs; and (vii) free-range poultry farming with fodder AFSs. The list is not exhaustive and other activities may be considered if they are in line with the demands of the beneficiaries and the objectives and criteria of the Project. It is important to mention that in the case of support for cattle breeding, the Project's strategy will be to support dairy production exclusively (it will not be possible to support breeding for meat production), to improve productivity from the existing herd and will not finance the purchase of animals, except for the purchase to replace breeding stock. This axis will also strengthen the capacity to market production in the various channels accessible to families (local fairs, PAA, PNAE, local commerce, etc.) and relevant to the beneficiaries.
- 3.8 **Environmental Axis:** Focuses on managing and restoring the environment in the Local Territories, whether or not associated with the activities of the PIR's Production Axis, to encourage the implementation of territorial environmental activities, by financing activities such as: i) Casas de Sementes da Paixão <sup>5</sup> ; ii) setting up nurseries with a focus on the production of native species; iii) reforestation, recovery of permanent preservation areas (such as springs, riparian forests, areas with a slope of more than 45°, etc.); iv) recovery of degraded areas; v) soil protection activities; vi) recycling or composting plans, etc.; vii) environmental education activities and new practices.). The activities of the Environmental Axis may derive from the Environmental and Social Management Plans (ESMP), which will be drawn up at the same time as the diagnosis of each PIR. Synergies and complementarities will be sought with the activities and competencies of SEMAS (Secretariat for the Environment and Sustainability), AESA (Executive Agency for Water Management), the State Environment Superintendence (SUDEMA), the National Semi-

---

<sup>5</sup> In Paraíba, several civil society organizations have organized themselves in recent years to support community initiatives around the preservation and dissemination of transgenic-free Creole seeds, known as Sementes da Paixão (Seeds of Passion).

Arid Institute (INSA), Empresa Brasileira de Pesquisa Agropecuária (EMBRAPA), Empresa Paraibana de Pesquisa, Extensão Rural e Regularização Fundiária (EMPAER), Universidade Federal de Campina Grande (UFCG), Universidade Estadual da Paraíba (UEPB), and Universidade Federal da Paraíba (UFPB), among other institutions.

- 3.9 **Social Technology Axis:** Focuses on implementing social technologies at the family level by financing activities such as: i) second-water cisterns (agricultural production); ii) grey water reuse systems; and iii) trench dams (underground dams); iv) first-water cisterns (human consumption) and other household sanitation solutions; v) evapotranspiration basins; vi) access to energy for more sustainable domestic use, such as biodigesters; and (vii) eco-efficient stoves.
- 3.10 To be eligible for funding, the PIR must demonstrate economic viability<sup>6</sup> (internal rate of return equal to or greater than 12%). It must also demonstrate financial, technical, institutional and environmental viability. Finally, it must identify the Project's risks and the corrective measures to be adopted. Annex 2 details the process of preparing and carrying out the PIR.

#### **b) Subcomponent 1.2: Strengthening and diversifying commercialization**

- 3.11 This subcomponent aims to improve commercialization and the inclusion of families in value chains by improving the management and production structures of family farmers' cooperatives. To this end, the selected organizations will have to prepare their respective Business Plans (PN) with the support of a Specialized Technical Assistance (STA).
- 3.12 To be eligible, the association or cooperative must be legally constituted and active for at least one year. Members/cooperators must be up to date with their obligations as set out in the organization's (association's/cooperative's) by laws. In addition, the cooperative member/member must: (i) be a rural producer with the profile established by PRONAF; (ii) exploit the land as an owner, squatter, lessee, partner or concessionaire under the National Agrarian Reform Program; (iii) live on the property or nearby; (iv) have an area of no more than 4 fiscal modules (06 fiscal modules in the case of livestock activities); and (v) have family work as the basis for exploiting the establishment.
- 3.13 Preparation of the Plan will begin with a diagnosis of the organization (productive, organizational, financial, human resources, relations with members, etc.). In addition, the *Participatory Rapid Diagnosis* methodology will be applied with the direct participation of rural producers and their representatives, the Project's technical team, the organization's leaders and other local stakeholders. At this event and throughout the activity planning process, SEAFDS will make available a set of systematized secondary information from the Project area on predominant production activities, available infrastructure, projects

---

<sup>6</sup> For economic analysis purposes, self-consumption can be considered as a benefit.

underway that can complement the activities, associations and cooperatives operating in the vicinity, existing civil society organizations, quilombola communities, the number of families participating in federal and state social assistance programs and other information relevant to the development of the PN. In this rapid and participatory diagnosis, rural producers working in the community will be identified, looking mainly at: the production activities carried out, ways of organizing production and marketing, whether or not they participate in associations and cooperatives, the geographical area in which they operate, the infrastructure available, technical assistance and support from governmental and non-governmental programs.

- 3.14 The gathered information will serve as input for prioritizing investments. When drawing up the Plan, the weaknesses and strengths of the organization and its members should be taken into account, including aspects such as: existing potential in the region/community and possibilities for using the products identified; problems primarily associated with production (quality and quantity), causes and solutions; predominant production arrangement(s) among members, in the municipality and in the region (number of rural producers involved with a focus on the priority public, organizations, infrastructure and marketing); production activities carried out by women, young people, quilombolas and PCT. The PNs should enable the implementation of competitive mechanisms, geared towards innovative and environmentally sustainable solutions, to strengthen marketing in networks and cooperative centers. Whenever possible, cooperation and alliances with the private sector should be sought.
- 3.15 The Business Plan (PN) can finance: (i) the establishment of producer organizations, including producer associations, cooperatives or cooperative centers based on production chains; (ii) the creation of appropriate skills for structuring primary production to meet market requirements, the physical structuring of processing units; (iii) the construction and/or adaptation of existing physical storage, processing and/or processing structures (fruit processing, honey, cassava processing houses, cocoa processing, slaughterhouses, etc.); (iv) investments to comply with current health and environmental legislation; (v) support for the development of strategies, efficient and transparent management processes and other economic organizations.); (iv) investments to comply with current health and environmental legislation; (v) support for efficient and transparent management processes in cooperatives and other economic organizations; (vi) support for drawing up strategies, marketing plans and their implementation; (vii) strengthening marketing at local and regional level through participation in municipal fairs, mini-markets, etc.(viii) support for strengthening marketing in the municipal and state institutional market; (ix) support for organic and agroecological certification processes, labels of origin, the Atlantic Forest Zone sustainable products label, the Family Farming label, the Brazil Indigenous label and the Quilombola label. Support for the inclusion of young people, women and quilombola

and traditional communities will be a cross-cutting activity and should be considered when preparing Business Plans.

- 3.16 The PN may include, among other things, the purchase of materials, equipment and inputs; the hiring of STA) and/or TA for production, management and sales for up to 3 years; the hiring of specialized consultants on specific topics; small works (up to a maximum of 15% of the total cost of the PN).
- 3.17 To be eligible for funding, the PN must demonstrate economic viability<sup>7</sup> (internal rate of return equal to or greater than 12%). It must also demonstrate financial, technical, institutional and environmental viability. Finally, it must identify the Project's risks and the corrective measures to be adopted. Annex 3 details the process of preparing and implementing the NP.

### **c) Subcomponent 1.3: Incentives for Innovation**

- 3.18 The Subcomponent will finance innovation initiatives developed specifically for family farming systems, such as tools for agroecological practices, machinery for small-scale agro-industries, biotechnologies aligned with the concept of resilient or low-carbon production systems, etc.
- 3.19 PROCASE will fund the development of initiatives (which could be small 'backyard' companies, research groups, experimenting farmers, among others) aimed at creating products and technologies tailored to the local context, such as machinery adapted to small producers and equipment for processing and adding value (priority themes). The Project will also fund innovations in secondary themes, such as products derived from native/traditional species, bio-inputs (soil nutrition, bio-insecticides), efficient water management technologies, solid waste treatment, etc.
- 3.20 The choice of innovation initiatives should take into account a number of factors such as:
  - i) Social Criteria: The innovation should seek to have a positive social and environmental impact, for example by aiming for low prices for farmers and fair pay for workers;
  - ii) Right to repair: Machinery, implements and equipment must be designed in such a way that they are easily repairable using accessible technologies and with easy replacement of parts, thus preventing the user from being forced to buy a new copy;
  - iii) Economic Sustainability: The entity must prove that there is a demand for its service/product in the long term;
  - iv) Environmental Sustainability: The entity must show that its product/service does not generate significant environmental impacts (GHG emissions, waste, etc.);
  - v) Local Impact: Team members come from the Project regions;
  - vi) Traditional/Ancestral Knowledge: Valuing and integrating indigenous and traditional/ancestral knowledge and technologies;

---

<sup>7</sup> For economic analysis purposes, self-consumption can be considered as a benefit.

and vii) Focus on young people and women: 50% quotas for women and 50% quotas for young people are suggested, with 50% of youth places reserved for women.

- 3.21 The selected projects will receive: i) non-reimbursable funding of up to US\$ 50,000 (R\$ 300,000); ii) technical assistance; iii) business and market-oriented mentoring; iv) development of business plans; v) support with Design and Visual Communication; and vi) networking and partnership opportunities. Annex 4 details the preparation and execution process for the subcomponent Incentives for innovation .

### **3.1.3.2 COMPONENT 2: ORGANIZATIONAL STRENGTHENING, CAPACITY BUILDING AND KNOWLEDGE MANAGEMENT**

- 3.22 The purpose of this Component is to strengthen the individual and collective capacities of family farmers and their organizations, necessary to increase the adoption of agricultural technologies that promote greater resilience in their systems, to improve productive and social inclusion, as well as the environmental and land conditions of rural communities and their surroundings.

#### **a) Subcomponent 2.1 - Strengthening family farmers' capacities**

- 3.23 The component is focused on strengthening the capacities of beneficiary families and community organizations, considering the weaknesses identified in various areas, with adequate knowledge to implement production systems that are more resilient to climate change and more productive, as well as to improve the management of community organizations.
- 3.24 It will finance the hiring of agroecological technical assistance services (TA) to carry out activities aimed at increasing the beneficiary families' access to adequate, quality information. The main themes to be addressed by TA will be the development of more profitable, diversified and resilient agricultural production, the protection and recovery of environmental resources and the improvement of organizational management. It will also seek to integrate them more closely into different value chains in the region, with initiatives to support processing and marketing. And finally, the subcomponent will seek to strengthen the TA teams contracted to ensure the good quality of this service.
- 3.25 **Provision of agroecological TA services in the communities.** With a focus on strengthening family units and communities, this will be done by providing agroecological TA services in the communities selected to benefit from the Project. All PIR beneficiary families and the corresponding organizations will receive TA services. At the same time, the TA teams will have to assist the families on access to public policies, starting with access to the CAF (National Family Farming Register)<sup>8</sup> , which is the basic instrument without which farming families cannot access any public policy intended for them, and

---

<sup>8</sup> The CAF replaces the previous equivalent document, the old DAP (Declaration of Aptitude to PRONAF).

access to or regularization of the Single Registry, which is also the entry point for other complementary public policies. They will also have to support the registration regularization needed to access other programs such as PNAE and PAA. The communities/families will be encouraged to look for other sources of funding and service providers to complement the resources allocated by PROCASE II and to meet demands not included in the work plans and business plans it supports. The process described will also seek to create opportunities for cooperation with the private sector, the S System<sup>9</sup>, the third sector and municipalities.

- 3.26 **Complementary training/exchange events for farmers, including association leaders.** Funds the organization of training events that are complementary to the capacity-building work carried out by TA entities in the communities. In particular, it will be essential to hold a series of training events on management, with an emphasis on the management of collaboration or development agreements, for the management teams of community associations, with the aim of ensuring that these agreements are properly executed and accounted for. There will also be training events in environmental education, focused on reinforcing agroecological practices, climate resilience, community management of natural resources and sustainable use of conservation areas, as well as knowledge exchange activities between farmers from the communities benefiting from the Project.
- 3.27 **Events to improve TA teams.** This includes the training of existing TA providers, which will need to be addressed<sup>10</sup>. Thus, all the technical teams contracted under PROCASE II will have to undergo training throughout the implementation of the Project to ensure that they have the necessary knowledge to achieve the desired objectives.
- 3.28 **Training family farmers in public policies.** The main instrument of this line of action will be 400 training events in the different territories of the state. These events will deal with the main existing public policies for Family Farming, including PRONAF, Low Carbon Agriculture and Crop Insurance, rural worker documentation and civil birth registration programs, public procurement programs such as PNAE, PAA, PAA Milk, land access programs for young people (PNCF), access to water (P1MC and P1+2), the Rural Development program and state programs, such as the State Seed Distribution Program.

---

<sup>9</sup> The S System is a group of 9 Brazilian private companies (all of which start with S) that provide services in the public interest related to the main sectors of the economy.

<sup>10</sup> We will highlight the shortcomings identified in the following areas: i) in the methodological dimension, it will be necessary to improve the participatory approach in the planning and implementation of investment plans and in the processes of acquiring new knowledge on the part of the families served; ii) in the technical dimension, improving the knowledge of TA entities and teams about innovations designed under the agroecological approach to improve production performance, environmental sustainability and adaptability to climate change of the production systems of families in the different regions of the state; iii) in the economic sphere, expanding knowledge about markets and the processes for accessing them; iv) in operational terms, in general the teams need to develop greater mastery of and use of digital tools in the practice of ATER, with an emphasis on carrying out the tasks of monitoring and evaluating the work carried out.

These events will provide more detailed information on the characteristics of each of these policies, including aspects such as eligibility rules and access mechanisms and, where relevant, the accountability process. In addition, specific events will be held to facilitate access to public policies, such as documentation drives, updating the Single Register, etc. Local teams from town halls, NGOs, public rural extension agencies, rural workers' unions and other social movements, etc. will also be trained. Annex 5 details the process of preparing and implementing this Subcomponent.

**b) Subcomponent 2.2 - Strengthening organizations' commercialization capacities**

3.29 The focus of this subcomponent is to strengthen the capacities of the teams of the economic organizations (mainly cooperatives) served by the Project. Groups/organizations of farmers will also be worked with to create or strengthen local fairs and small marketing centers. In the context of improving marketing conditions, the Project could also support the creation and/or strengthening of health inspection services at municipal level or for groups of municipalities organized into territories / 'consortia of municipalities'.

3.30 To achieve these objectives, the subcomponent will use the following main instruments: (i) the provision of STA, focused mainly on preparing and monitoring the implementation of Business Plans; (ii) various types of training events will be organized (workshops, training courses, technical visits, exchanges, etc.) which will strengthen the capacities of the organizations in areas such as management (including Project management), good production, marketing and commercialization practices, environmental compliance and other topics. Work will also be organized to encourage access to short marketing chains (street markets, Solidarity Economy Centers) and another to strengthen organizations on the subject of creating and/or strengthening health inspection services. Annex 6 details the preparation and implementation process for this Subcomponent 2.2.

**c) Subcomponent 2.3 - Diversity, gender, youth, nutrition and food security**

3.31 This sub-component will focus on promoting the empowerment of women, young people, PCTs, LGBTQIABP+ and Persons with Disabilities, as well as improving the nutrition and food security of beneficiary families. The activities will work with the Project's cross-cutting themes, strengthening and supporting the integration of these themes in all the components.

3.32 It will fund activities aimed at transforming unequal power relations shaped by patriarchal and exclusionary structures, norms and practices, as well as empowering women, Afro-descendants and PCTs, the LGBTQIAPN+ community and persons with disabilities. The following transformation paths will be followed: i) promote economic empowerment and equality by valuing women's contributions to the family economy and community development, ii) address the issue of women's overload due to domestic and care work by promoting a fairer division of the workload between men and women, iii) empower target groups to have a greater voice and decision-making power in rural institutions and

organizations, iv) promoting advocacy in policies for women, youth and PCTs, v) preventing gender-based violence, v) valuing traditional knowledge, practices and ways of life in production, food and natural resource management and vi) promoting the inclusion of the LGBTQIAPN+ community and people with disabilities, seeking to strengthen them, promote their leadership and respect for their rights. Annex 7 details the preparation and implementation process for this Subcomponent 2.3.

**d) Subcomponent 2.4 - Land and Environmental Regularization**

- 3.33 This subcomponent focuses on land and environmental regularization of rural properties to mitigate the scenario of legal insecurity and the possibility of state sanctions or difficulties in accessing productive inputs due to non-compliance with legislation.
- 3.34 This sub-component will be carried out by the Paraiba Research, Rural Extension and Land Regularization Company (EMPAER). It will finance all the costs associated with regularization, such as aerophotogrammetry, surveying and measuring services, notary fees, etc. Annex 8 details the process of preparing and implementing the Land and Environmental Regularization Subcomponent.

**e) Subcomponent 2.5 - Knowledge Management and South-South and Triangular Cooperation**

- 3.35 The sub-component focuses on developing and implementing a knowledge management process capable of generating, recording, sharing and using the knowledge generated in the Project. It will also seek to feed the Project implementation process with relevant information and knowledge. To this end, the following activities will be financed:
- 3.36 **Systematization of experiences, good practices and results and studies of interest to the Project on specialized topics:** The Project's interventions will be subject to participatory and qualitative evaluations of their results and those with a proven impact will be selected to be systematized, with the appropriate methodology for this process, and will be disseminated as a reference for good practices. Systematization can lead to different products such as written documents, videos, podcasts and others. In addition to systematization, specialized studies will be commissioned.
- 3.37 **Communication and Dissemination in Knowledge Management.** The dissemination of accumulated knowledge is the central idea of KM. Communication activities are a means of ensuring ownership of the activities, results and knowledge generated in the implementation of the project among stakeholders and can even lead to the creation of new knowledge. The dissemination of knowledge products allows innovative practices, lessons learned, etc., to be accessed by the public.
- 3.38 **South-South and Triangular Cooperation Actions (SSTC):** Ten SSTC events will be organized, which may cover topics such as technical exchanges and policy dialogues. One or more of these events may take the form of SSTC learning routes, so that partners can

learn about the experiences and lessons learned from the implementation of the Project, and so that beneficiaries, technicians and project managers can learn from good practices implemented in other countries or in other regions of Brazil. The Project will maintain a close relationship with the IFAD Center for Knowledge and South-South and Triangular Cooperation, located in Brasilia and with a regional mandate for Latin America and the Caribbean, which will be able to support knowledge exchanges with other IFAD initiatives in Brazil and Latin America through SSTC activities. Annex 9 details the preparation and implementation process for Subcomponent 2.4.

### **3.1.3.3 PROJECT MANAGEMENT, MONITORING AND EVALUATIONS**

#### **a) Project Management**

- 3.39 It will finance equipment, consultancies and other expenses for (i) project administration and management, (ii) monitoring and evaluation (M&E) activities and (iii) audits.
- 3.40 The Project will finance the management, monitoring, evaluation and auditing costs incurred in carrying out the Project.
- i) Project execution management. This includes the costs of administration, management and supervision of Project execution incurred by the PMU and the Project's Regional Units in the territories. It also includes hiring consultants to make up the PMU and other non-consultancy services, payment of per diems and travel, rental of vehicles and premises, among others.
  - ii) Project Management Support. It is planned to hire IICA to provide contracting and administration services for the human resources allocated to the PMU, as well as to carry out some contracting of services and acquisitions related to Project management.
  - iii) Materials and Equipment. This covers the cost of purchasing materials, equipment, vehicles, furniture and computer systems (software and hardware) and contracting small office fit-out works to accommodate the teams working on the project.

#### **b) Monitoring implementation**

- 3.41 This includes the cost of hiring a company to provide IT services to improve the SIGMA system currently used by SEPLAN.

#### **c) Auditing**

- 3.42 Project audit. Considering that the audit of the Project execution would be carried out by the Court of Auditors of the State of Paraíba (TCE), as in other projects, no funds were allocated for the hiring of an auditing firm required by the Financing Organizations. In the event that the TCE is not acceptable to the Bank (after assessing its capacity), the PMU will have to hire a consultancy firm in accordance with the Bank's standards and will be paid from the Project's management support resources.

## 4 Costs and Financing

3.43 The total cost of PROCASE will be US\$ 105 million, of which US\$ 70 million will be financed by an IDB Ordinary Capital (OC) loan, US\$ 10 million by an IFAD loan and the remaining US\$ 25 million will come from local contributions. Table 2 below shows the PROCASE II financing matrix by Component and Subcomponent.

**Table 2**  
**Project Budget by Component (US\$ 000)**

<b>Project Cost by Component</b>					
<b>(Values in thousand dollars)</b>					
Component/Subcomponent	IDB	IFAD	LOCAL	Total	(%)
1. Resilient production systems to reduce rural poverty	42 277.3	6 039.6	15 099.1	63 416.0	60.4%
1.1: Implementation of resilient and biodiverse production systems	37 610.7	5 373.0	13 432.3	56 416.0	53.7%
1.2: Strengthening and diversifying commercialization	4 000.0	571.4	1 428.6	6 000.0	5.7%
1.3: Incentives for innovation	666.6	95.2	238.2	1 000.0	1.0%
2. Organizational strengthening, capacity building and knowledge management	20 868.6	2 981.2	7 453.0	31 302.8	29.8%
2.1: Strengthening family farmers' capacities	13 501.9	1 928.8	4 822.1	20 252.8	19.3%
2.2: Strengthening organizations' commercialization capacities	1 553.3	221.9	554.8	2 330.0	2.2%
2.3: Diversity, gender, youth, nutrition and food security	3 066.7	438.1	1 095.2	4 600.0	4.4%
2.4: Land and environmental regularization	1 333.3	190.5	476.2	2 000.0	1.9%
2.5: Knowledge Management (KM), South-South and Triangular Cooperation (SSTC)	1 413.3	201.9	504.8	2 120.0	2.0%
3: Project management, monitoring and evaluation	6 854.1	979.2	2 447.9	10 281.2	9.8%
3.1: Project management unit	5 987.4	855.4	2 138.4	8 981.2	8.6%
3.2: Monitoring and Evaluation	866.7	123.8	309.5	1 300.0	1.2%
<b>TOTAL</b>	<b>70 000.0</b>	<b>10 000.0</b>	<b>25 000.0</b>	<b>105 000.0</b>	<b>100.0%</b>
(%)	66.7%	9.5%	23.8%	100.0%	

### 4.1 Deadline

3.44 The execution period (last disbursement) for PROCASE will be six years from the signing of the Loan Agreement with the IDB and IFAD. To meet this deadline, the resources earmarked for subcomponents 1.1.2 (PIR), 1.2.2 (PN) and 2.1.2 (TA) must be committed within the first 3 years of the Loan Agreement. This deadline must be met so that the

families benefiting from the **PIR, PN** and TA can complete the relevant works and have at least 3 years of TA support. The deadline for financial closure of the operation will be 90 days from the date of the last disbursement. On this date, the final accounts must be submitted and/or the loan funds disbursed and not justified must be returned. The deadline for submitting the final audit report will be 120 days from the date of the last disbursement.

#### **4.2 Direct beneficiaries of PROCASE II**

- 3.45 The Project's beneficiaries will be approximately 60,000 families (210,000 people) living in rural communities (24% of the total in the Project area), especially in municipalities with a lower Human Development Index (HDI) and greater deprivation. This number includes: i) 18,000 families benefiting from Resilient Investment Plans (PIR); ii) 5,000 families who are members of cooperatives and other economic organizations benefiting from Business Plans (PN); iii) 5,000 families benefiting from land and environmental regularization of their properties; and iv) more than 32,000 people with greater capacity to access public policies and programs. More than 30,000 women, 12,000 young people and 1,300 PCTs will be strengthened. It is expected that women-headed families will make up at least 50% of the beneficiaries in the PIR and PN.

#### **4.3 Impacts and Expected Results**

- 3.46 In the long term, the Project foresees: (i) a 20% reduction in the incidence of poverty or extreme poverty among the direct beneficiaries; (ii) a 20% increase in the minimum dietary diversity of the direct beneficiaries; (iii) the preservation of biodiversity in an area of 547 hectares. It also provides for a reduction of 749,637 tCO<sub>2</sub>-eq (tons of greenhouse gas emissions) over 20 years. The impacts, results and expected products are detailed in the Results Matrix (Annex xx) of this ROP.

## 5 PROJECT IMPLEMENTATION

### 5.1 General Execution Scheme

- 4.1 The State of Paraíba will be the Borrower of the loans to be taken out with the IDB (Contract No. xxxxx/OC-BR) and IFAD (Contract No. xxxxxx) for the purpose of financing the Paraíba Rural Sustainable Development Project (PROCASE II). The Federative Republic of Brazil will be the guarantor of both financial obligations contracted by the State of Paraíba (Borrower). The Executing Agency (EA) will be the Borrower, through the State Secretariat for Family Farming and Semiarid Development (SEAFDS). The Paraíba Research, Rural Extension and Land Regularization Company (EMPAER) will act as sub-executor, specifically in carrying out the land and environmental regularization activities of Subcomponent 2.4. SEAFDS will be responsible for the technical and fiduciary management of the Project through a Project Management Unit (PMU) to be created within its organizational structure by means of an Ordinance. The PMU will have a central office in João Pessoa and five territorial offices. The execution of PROCASE will be governed by the respective Loan Agreements (IDB and IFAD) and the Project Operational Regulations (ROP).
- 4.2 The PMU will receive the support of a specialized agency to carry out the hiring and administration of human resources and other services required to manage the Project. The Inter-American Institute for Cooperation on Agriculture (IICA) will be contracted for this purpose, in accordance with the IDB's procurement and contracting policy. This agency has supported the state executing other similar projects. SEAFDS will establish development agreements, cooperation agreements or other appropriate legal mechanisms with municipalities, Paraíba state agencies and other partners participating in the execution of the Project. Annex 13 shows the Project's organizational chart.
- 4.3 PROCASE will have a Management Committee (CGT) whose function will be carried out by the Productive Investment Executive Management Committee (CEGIP) in accordance with its Internal Regulations (See Annex XXX). The CEGIP will, among other things, be responsible for strategic planning, reviewing annual reports and approving the AWPB, approving Business Plans (PN) and Resilient Investment Plans (PIR) previously approved by the PMU's Project Analysis Committee (CAP). In addition, PROCASE will have Sustainable Territorial Development Committees (CODETER) in each Project territory, which will be a local body for the participation and local coordination of government actions with the participation of government and civil society organizations. They will fulfill an advisory role, serving as spaces for communicating the actions carried out by the Project and coordinating with other public or private sector actions taking place in the respective territories.

#### 4.4 Responsibility Matrix of the PROCASE II Implementation Bodies

##### **5.2 Project Management Unit (PMU)**

The PMU will be responsible for the general management and coordination of PROCASE II and will ensure faithful compliance with the Loan Agreements (BIDxxx and IFADxx) and the ROP. Among other things, the PMU will have the following responsibilities within the scope of Project execution:

- i. To be the sole interlocutor in formal communications with the Bank and IFAD;
- ii. Submit requests for disbursement and accountability (IDB and IFAD);
- iii. Present the Bank and IFAD with the Project's consolidated operational planning - Multi-Year Project Execution Plan (PEP), Annual Workplan and Budgeting (AWPB) and Financial Plan (FP);
- iv. Submit Progress Reports to the funders by the required deadlines;
- v. Carrying out supervision and monitoring and evaluation activities;
- vi. Monitor budget execution and obtain the necessary documents for financial records and proper accountability to the Bank and IFAD;
- vii. Ensure that the Project Operational Regulations (ROP) are fully applied;
- viii. Coordinate, manage and supervise the Project execution;
- ix. Ensure compliance with the conditions and agreements contained in the Project document and in the IDB Loan Agreement No. XXX and IFAD Loan Agreement No. XXXX and its Annexes, which finance part of the Project;
- x. Ensure compliance with the targets for gender equity, cultural diversity and inclusion of young people, PCTs and persons with disabilities, agreed with the Project's funders;
- xi. Guide and support beneficiary cooperatives and community associations in the implementation of their projects and plans (support for tenders, accountability, etc.)
- xii. Promote the Project in the area in which it operates;
- xiii. Having the planned Project activities carried out efficiently;
- xiv. Administering development agreements, contracts and similar instruments;
- xv. Drawing up the Project's Annual Workplan and Budgeting (AWPB) and submitting it to the CEGIP for approval; as well as the evaluation work and the submission of reports and reports required and
- xvi. Draw up the Project Procurement Plan (PP) and keep it permanently updated on the PMU website;
- xvii. Before starting the procurement process, ensure that it is included in the PP;
- xviii. Coordinating the preparation of the Project's annual budget proposal and following up on the approval process;

- xix. Collect and keep up-to-date physical, accounting, financial and internal control information related to the management of Project resources;
- xx. Keep adequate financial and accounting records to enable proper control of Project funding and counterpart funds and their use;
- xxi. Carry out all the necessary and sufficient activities for the procurement involved in the execution of the Project, applying the relevant IDB/IFAD and/or Public Administration policies and standards;
- xxii. Carry out, together with SEFAZ, all the activities necessary and sufficient to carry out the disbursement requests, applying the relevant IDB/IFAD and/or Public Administration policies and standards.
- xxiii. Monitor compliance with service contracts to identify any occurrences that may cause delays or distortions in the physical and financial progress of the Project and take or have taken the appropriate measures to correct the problems identified, within the scope of its competence;
- xxiv. Monitor and ensure the implementation of the socio-environmental measures included in the Project's Environmental and Social Management Plan (ESMP).
- xxv. Reporting to internal and external auditors;
- xxvi. Receiving, coordinating, monitoring and advising on external audit missions;
- xxvii. Identify problems, opportunities and corrective actions or improvements that ensure the efficient use of Project resources, the effective achievement of planned results and the effective attainment of expected impacts;
- xxviii. Prepare and submit all the required reports set out in this ROP (Chapter VI) by the deadlines set;
- xxix. Promote the participation of stakeholders in the evaluation of the partial results of the projects and progress during implementation;
- xxx. Always follow or enforce the procedures and policies agreed with the IDB and IFAD regarding procurement and others that may apply.
- xxxi. Hold regular quarterly meetings with the CEGIP to update them on the progress of PROCASE II. The PMU or a member of the CEGIP may request extraordinary meetings.
- xxxii. Analyze and approve the PIRs and PNs through the Project Analysis Committee (CAP); and
- xxxiii. Other activities linked to the general administration of the Project.

4.5 **Organizational structure of the PMU.** To fulfill its functions, the PMU will have a General Project Coordination (**CGE**), with two Coordination Offices: (i) Administration and Finance Coordination (**CAF**) for issues related to financial administration, preparation and signing of agreements or other legal instruments with the various stakeholders, procurement and contracting, accounting, information technology, general administration

and human resources; (ii) Technical Coordination (**CTE**) on issues related to the technical execution of the Project, including planning, supervision and monitoring; (iii) Operational Coordination 1 (**COP1**); (iii) Operational Coordination 2 (**COP2**). The Technical Coordination Office (**CTE**) will include: Legal Department (**AJU**); Environmental and Social Department (**AMS**); Gender, Youth and Diversity Department (**AGJD**); Communications Department (**ACO**); and Monitoring and Evaluation Department (**AM&A**). The PMU will also have 5 Territorial Units (**UTR**), located in the territories where the Project will be developed. The State Department of Finance (SEFAZ) will be in charge of issues related to loan disbursements (see organization chart in Annex xxx).

- 4.6 The **General Coordination of the PMU (CGE)** will be responsible for all the PMU's activities, including directing, organizing, supervising, monitoring, harmonizing the work of the various coordination bodies, seeking support from the SEAFDS structure when required, controlling management information and representing other state bodies and PROCASE stakeholders. It will be the Borrower's sole interlocutor with the IDB and IFAD on issues related to project execution.
- 4.7 The **Technical Coordination Office (CTE)** will be responsible for coordinating planning, including drafting/consolidating the AWPB proposals and updating the Procurement Plan (PP), supervising the works, monitoring and evaluating the Project and preparing periodic reports to be submitted to the Bank. In addition to these specific activities, the CTE will be responsible for providing specialized technical assistance to the participating entities and institutions; advising on missions from national and international entities or bodies; advising on inter-institutional issues and other matters necessary for the implementation of the Project. It will also be responsible for monitoring implementation and controlling the achievement of results based on the AWPB and the Results Matrix and for carrying out periodic evaluations, as well as evaluating the economic, social and environmental results and recording and making available to the public the successful and innovative experiences of the Project. In addition, it will be responsible for monitoring gender equity, cultural diversity and the inclusion of young people, quilombolas and traditional peoples carried out in the Project.
- 4.8 The Environmental and Social Coordination (CAS) will be responsible for monitoring and complying with environmental and social safeguards issues and organizing and reporting on PROCASE's environmental and social plans. The multidisciplinary team must ensure that technicians are trained, and that the project's Environmental and Social Management Framework (ESMF) is implemented.
- 4.9 **The Gender, Youth and Diversity Office (AGJD):** responsible for: drawing up a Gender and Diversity strategy and action plan; ensuring a gender and diversity approach in all areas

of the development of Project activities; training Project teams and others involved in gender and diversity issues; and strengthening an environment for debate in communities on the role of men and women in agriculture, among other things.

- 4.10 **Communications Office (ACO):** responsible for defining, together with the managers of each component, the strategic goals and objectives for the communication areas; formulating the integrated communication management plan with special attention to the aspects of sustainability, visibility, dissemination and scaling of successful actions; training the Project team to ensure the correct sharing of knowledge and good practices; planning and coordinating the layout and dissemination of studies and publications, with special attention to results, impacts and strategic partnerships; leading the preparation (content and design) of communication materials, such as press releases, blogs, booklets, infographics and content for social networks; maintaining an up-to-date calendar of events and formulating dissemination materials, etc.
- 4.11 **Monitoring and Evaluation Department (AM&A):** responsible for planning and monitoring the design and implementation of a system for managing information on execution; monitoring the implementation of the AWPB and the progress of the indicators in the Results Matrix; coordinating the execution of evaluations (baseline, mid-term and final); preparing Progress Monitoring Reports (PMR) and the Project Completion Report (PCR), among others
- 4.12 **Legal Advisory Office (AJU):** responsible for providing legal support for the Project implementation, including: drafting ordinances, decrees, agreements and other normative documents; liaising with other government bodies (PGE, CGE, TCE) to resolve legal doubts; drafting legal opinions, etc.
- 4.13 The **Administration and Finance Coordination Office (CAF)** will be responsible, among other things, for: (i) managing financial, budgetary and administrative resources; (ii) maintaining personnel records; (iii) identifying the needs for materials and transportation services and others; (iv) carrying out accounting in accordance with the standards of the Financiers; (v) carrying out bidding and contract administration; (vi) controlling the release of amounts and rendering of accounts; (vii) making payments for eligible expenses, previously approved by the CTE; (viii) releasing funds to the executing organizations, according to the previously agreed disbursement schedule and with the prior approval of the CTE; (ix) maintaining the bank accounts; (x) drawing up financial and accountability reports for the Project. It will also be responsible for submitting the Audited Financial Statements (DFAS) to the IDB in accordance with the deadlines established in the Loan Agreements.

- 4.14 **Minimum PMU team:** The PMU must maintain a minimum team consisting of: (i) a general Project coordinator; (ii) a technical coordinator; (iii) a financial administrative coordinator; (iv) a component 1 operational coordinator; (v) a component 2 operational coordinator; (vi) a gender and diversity specialist; (vii) a specialist in traditional peoples and communities (PCT); (viii) a youth specialist; (ix) a specialist in nutrition; (x) a specialist in knowledge management, SSTC and communication; (xi) a specialist in social and environmental safeguards; (xii) a specialist in procurement and contracts; (xiii) a financial specialist; (xiv) a specialist in Monitoring and Evaluation (M&E); and (xv) a legal advisor (lawyer). As PROCASE progresses, some of these specialists may be replaced or removed, always with the IDB's non-objection. Annex 14 indicates the Terms of Reference of the personnel who will occupy key posts in the PMU.
- 4.15 At the decentralized level, the Sustainable Territorial Development Collective (**CODETER**) located in the 5 PROCASE territories will be equipped with physical space, equipment, mobility and competent personnel to support the central unit in carrying out the Project's management activities. It should have 3 professionals: an agricultural specialist, a socio-environmental specialist and an administrative-financial specialist. This composition may vary according to the specificities of each territory.
- 4.16 **Project Management Committee (CGP).** The Executive Committee for the Management of Productive Investments (CEGIP) is already up and running in the state. Within the scope of PROCASE II, it will perform the functions of the Project Management Committee (CEGIP). This Executive Committee, created by SEAFDS Ordinance, is organized as follows: i) Presidency, exercised by the secretary of SEAFDS, who will be responsible, among other things, for calling Committee meetings, presiding over Meetings and the work of the Committee; signing minutes, resolutions, recommendations and other acts and proceedings of the Committee; ii) A collegiate body made up of representatives of the state secretariats and other participating organizations, who will be responsible for, among other things, participating in and voting at Committee meetings; proposing or requesting steps and clarifications that may be useful to them to better judge the matters on the meeting agenda; iii) Secretariat, carried out by the general coordinator of the PMU. preparing the meeting agendas; acting as secretary for the Committee meetings, taking the respective minutes; sending the members the call for meetings with the respective agenda; carrying out all the administrative services that are relevant to them; publicizing the Committee's resolutions and implementing them; and carrying out other activities assigned to them by the President.
- 4.17 The CGP/CEGIP will hold ordinary meetings every four months and extraordinary meetings, when necessary, at the extraordinary call of the Chair or Alternate of the

Committee, or the Coordination of the PROCASE Management Unit (PMU), or at the request of at least one third of the members. The meeting agenda and supporting material must be distributed by the CGP/CEGIP secretariat at least five (5) working days in advance.

- 4.18 The main functions of the CGP/CEGIP are, among others: i) define strategic and institutional guidelines for the Project implementation; ii) facilitate coordination between different units of the Government of Paraíba and other partners in Project planning and execution actions; iii) approve the Annual Workplan and Budgeting (AWPB) and Progress Reports, prior to their submission to the Bank and IFAD; (iv) monitor the progress of the execution of the AWPB and compliance with the contractual conditions of the loans, including the targets agreed (Results Matrix) with the Financing Organizations; (v) monitor and evaluate the actions of the PMU and other Project stakeholders; (vi) approve the Resilient Investment Plans (PIR) analyzed by the CAP and the Business Plans (PN).
- 4.19 **Project Analysis Committee (CAP).** The CAP, set up by order of SEAFDS and made up of an interdisciplinary team involving various areas of the PMU, will be responsible for analyzing and recommending whether or not to approve the Business Plans and Productive Development Plans to be implemented by cooperatives and community organizations, as well as other projects under PROCASE II.
- 4.20 **Ombudsman's Office.** The Ombudsman's Office is responsible for (i) receiving and examining complaints from citizens via the State Ombudsman's Office, through requests for information, suggestions, complaints and denunciations relating to the activities carried out by SEAFDS within the scope of PROCASE II, identifying them and sending them to the responsible Coordination for analysis, investigation and response; (ii) respond to interested parties, within the legal deadlines, about the complaints, claims, suggestions, opinions, questions, compliments, information and clarifications requested and monitor the process until the final solution; (iii) prepare and submit periodic consolidated reports of SEAFDS/Project manifestations.

### **5.3 State Department of Finance (SEFAZ)**

- 4.21 The **State Secretariat for Finance (SEFAZ)**. SEFAZ will be responsible for (i) including the Project in SIAFE, (ii) managing the Project's single bank accounts (Project/IDB and Project/IFAD).

### **5.4 Paraíba Research, Rural Extension and Land Regularization Company (EMPAER)**

- 4.22 EMPAER is a special direct administration body linked to the structure of the State Secretariat for the Development of Agriculture and Fisheries (SEDAP) and will act as sub-

executor of sub-component 2.4 - Land and Environmental Regularization. EMPAER will conduct the entire process and follow the flow of the necessary steps until the definitive title of ownership and recognition of domains is issued (see Annex 8). EMPAER will have to sign a specific Technical Cooperation Agreement with INCRA, without transferring funds, to receive the georeferenced areas, carry out the inspection and approval of the technical documents necessary for the regularization process of quilombola communities and federal land of agrarian reform settlements. EMPAER will have to open a specific account to handle PROCASE funds and follow the ROP for purchasing, contracting, rendering accounts, etc.

## **5.5 Community Associations and Producer Cooperatives**

4.22 Community associations and producer cooperatives will have the following responsibilities:

- a) Participate in the diagnosis and preparation of their respective plans;
- b) Sign an Agreement with PMU/SEAFDS for the implementation of their respective Plans;
- c) Open and administer specific PROCASE II accounts to manage IDB and IFAD resources;
- d) With the support of TA contracted by PMU/ SEAFDS:
  - Draw up the Investment Plan (PN or PIR) in a participatory manner;
  - Prepare and keep up to date the AWPB and the corresponding Procurement Plan;
  - Actively carry out your Plan;
  - Carry out the Plan's purchases in accordance with good practices on the subject and in accordance with IDB standards and the regulations of this ROP;
  - Request an advance on funds;
  - Justify the use of resources and request their replacement;
  - Prepare and send the periodic reports according to the model and deadlines indicated by the PMU/SEAFDS;
  - Make any corrections to the execution at the request of the PMU/ SEAFDS;
  - Provide all the information requested by the PMU/ SEAFDS.
- e) Facilitate all the information required by the PMU/ SEAFDS to carry out the Plan's mid-term and final evaluations and any audits;
- f) Actively participate in the Evaluation of the Plan.

## **6 PROCUREMENT RULES AND PROCEDURES**

### **6.1 Introduction**

- 5.1 By mutual agreement between the parties, the IDB's Procurement Rules and Procedures will be adopted in the execution of PROCASE II.
- 5.2 Funds from the Bank's and IFAD's loan instrument may only be used for the purchase of goods, and the contracting of works, services and consultancy services from companies or individuals from countries that are members of the Bank. The following will be ineligible for contracts financed in whole or in part with Bank and IFAD loans: (i) individuals or companies from and other countries that are not members of the Bank; and (ii) individuals or companies included in the IDB's Ineligible Register; and (iii) individuals or companies included in Ineligible/Exclusion Lists managed by multilateral organizations linked to the United Nations (UN) system.
- 5.3 Procurement and contracting will be carried out in accordance with the provisions of Loan Agreement # and #####. To prevent prohibited practices, the Executing Agency will verify that the suppliers of services and goods related to the activities included in the execution of these components are not on the list of companies and individuals sanctioned by the IDB and multilateral organizations linked to the UN system. PROCASE II suppliers will sign the declaration of integrity included in the Annex to this ROP, undertaking to comply with it in its entirety.
- 5.4 All purchases and contracts to be carried out under PROCASE II must be included in the Project's Annual Workplan and Budgeting (AWPB) and Procurement Plan (PP), previously approved by the Bank. If they are not included in the Project's AWPB and PP, they may be included subject to the Bank's non-objection.
- 5.5 All contracts and similar instruments entered into within the scope of the Project must be registered in IFAD's Contract Monitoring System (CMT/ICP). Without excluding other contract management systems, the execution of contracts must also be monitored through the CMT. The Project must periodically update the contractual data registered in the system, observing a maximum interval of two months between updates.

### **6.2 Acquisition of Goods and Contracting of Works and Services (except consultancies)**

- 5.6 The procurement of goods and contracting of works and services (except consultancy) will follow the provisions set out in the IDB's policies contained in document GN - 2349-15 - Policies for the procurement of goods and contracting of works financed by the IDB, dated January 2020. Available at: <https://projectprocurement.iadb.org/pt/politicas>.
- 5.7 Table 3 summarizes the procurement methods envisaged for goods and services (except consultancies) and the cost limits for selecting the procurement method.

<b>Table 3 - Procurement Methods for Goods and Contracting Works and Services (Except Consultancies) According to Procurement/Contract ValuesPENDING CATEGORY</b>	<b>HIRING METHOD</b>	<b>VALUE (USD)</b>	<b>ADVERTISING</b>	<b>DOCUMENT TO BE USED</b>
<b>WORKS</b>	LPI	Over 25.0 million	UNDP, National Newspaper	IDB Standard Tender
	LPN	From 0.5 to 25.0 million	National newspaper	National Bidding Document agreed with the IDB
	CP - 3 valid and comparable proposals	Up to 0.5 million or up to USD 25 million for simple works	Publication is not mandatory	IDB model document
<b>GOODS AND SERVICES</b>	LPI	Above 5.0 million	UNDP, National Newspaper	IDB Standard Tender
	LPN	From 100 thousand to 5.0 million	National newspaper	National Bidding Document agreed with the IDB
	CP - 3 Valid and comparable proposals, Or electronic auction	Up to 100,000 or up to 5 million US dollars for simple goods	Publication is not mandatory	IDB model document

### 6.3 Selection and Hiring of Consultants

- 5.8 The consulting services to which these Policies apply are those of an intellectual and advisory nature. The selection and hiring of consultants will be carried out in accordance with the provisions established in document - GN2350-15 Policies for the Selection and Hiring of Consultants Financed by the Inter-American Development Bank, dated January 2020. The document is available on the website: <https://projectprocurement.iadb.org/en/policies>.
- 5.9 Table4 summarizes the methods for selecting and contracting consultancy services.

**Table 4 - Methods for Selecting and Hiring Consultants.**

NATURE OF EXPENDITURE	METHOD FOR SELECTING AND HIRING CONSULTANTS
<b>CONSULTING</b>	<p><b><u>Quality-Based Selection (QBS)</u></b></p> <p>Complex, highly specialized or difficult to specify services, with a scope defined in the Terms of Reference (TOR);</p> <p>Services with a major impact on the future, with the need to have the best specialists;</p> <p>Services that can be carried out with a defined objective, but can be executed in substantially different ways, thus making it impossible to compare proposals based on the combination of quality and price.</p>
	<p><b><u>Selection Based on a Fixed Budget (SOF)</u></b></p> <p>Only for simple services that can be defined precisely and for which the budget is reliable.</p>
	<p><b><u>Selection Based on Lowest Cost (SBMC)</u></b></p> <p>Standard" services, with conventional methodologies.</p>
	<p><b><u>Selection Based on Consultant Qualifications (SOC)</u></b></p> <p>Services with an estimated cost of less than the equivalent of USD200,000 for which the preparation and evaluation of competitive bids is not justified.</p>
	<p><b><u>Direct Contracting (DC)</u></b></p> <p>(a) for services involving the continuation of previous work already carried out by the same company; (b) in emergencies, such as: to respond to situations arising from disasters and for consultancy services required during the period immediately following the emergency; (c) for services up to US\$ x00,000 or (d) when only one company proves to be qualified or has experience of exceptional value for carrying out the service.</p>
	<p><b><u>Individual Consultant Selection</u></b></p> <p>Services involving a single discipline or requiring specialist work, to be developed in the short term.</p>

5.10 Table 5 below shows the methods of selecting and contracting consultancy services according to the value of the contract.

**Table 5- Methods for Selecting and Hiring Consultants**  
**Second Contract Value**

SPENDING CATEGORY	HIRING METHOD	VALUE (USD)	ADVERTISING	DOCUMENT TO BE USED
<b>CONSULTING</b>	SBQC <sup>11</sup> , SBQ, SOF, SBMC	Above 1.0 million	UNDP, National Newspaper	IDB Standard Tender
	SBQC, SBQ, SOF, SBMC	From 200 to 1.0 million	UNDP, National Newspaper	IDB Standard Tender
	SQC	Up to 200 thousand	National newspaper	IDB Standard Tender

**6.4 Retroactive Financing with Charge to Financing and Local Counterpart**

5.11 The Bank may recognize, as part of the Local Counterpart resources, expenses that have been incurred between xxxxxxxxxxxxxxxxxxxx and \_xxxxxxxxxxxxxxxxxxxxx\_ (date of approval of the Loan Proposal) with consultancies and services other than consultancy, equipment and materials up to the equivalent of US\$ 2,500,000.00), which result from conditions substantially similar to those established in the IDB xxxxxx/OC-BR Contract.

5.12 In no case will expenses incurred more than 18 months before the date of approval of the Loan by the Bank's Board of Executive Directors be included. Eligible expenses for the purposes of retroactive financing and recognition of expenses include consultancy services (for carrying out studies and diagnoses, as well as for PMU staff), services and equipment necessary for Project management, and works that make up the representative sample of PROCASE II.

---

<sup>11</sup>Selection Based on Cost and Quality (SBCQ), Selection Based on Quality (SBQ), Selection Based on Fixed Budget (SOF), Selection Based on Lowest Cost (SBMC), Selection Based on Consultant Qualifications (SQC) and Direct Contracting (DC).

## 7 PROJECT ENVIRONMENTAL AND SOCIAL MANAGEMENT

### 7.1 Management Framework

- 6.1 These Operational Regulations include an Environmental and Social Management Framework (ESMF) that includes the environmental control and socio-environmental impact mitigation programs for the interventions envisaged in the PROCASE II components (Annex XXX), arising from the impacts identified during the preparation of the Strategic Environmental and Social Assessment (ESA) for the Project.
- 6.2 To ensure the environmental quality of the interventions through the implementation of socio-environmental programs, the ESMF has the following specific objectives:
- (i) ensure that the planned impact control and mitigation measures are implemented;
  - (ii) monitoring interventions and the implementation of environmental control programs;
  - (iii) systematize information on socio-environmental issues in the periodic reports sent to the IDB and IFAD;
  - (iv) setting up and operating construction sites in an environmentally appropriate manner;
  - (v) ensure that the labor used does not contribute to environmental degradation;
  - (vi) ensure that the activities of construction sites and workers interfere as little as possible with the daily lives of local communities;
  - (vii) avoid, minimize, control or mitigate potential significant impacts during the implementation period;
  - (viii) ensure the health and safety of workers on the Project's construction sites; and
  - (ix) ensure continued compliance with the country's environmental and labor legislation and the IDB's Environmental and Safeguards Compliance Policy (OP-703).
- 6.3 To guarantee the implementation of the social and environmental programs defined in the ESMF, the PMU will have an environmental and social management team (ESMT) made up of environmental and social action specialists from its own staff or those hired externally, working under the coordination of the PMU. The ESMT will have the following specific responsibilities:
- (i) coordinate, manage and execute, directly or with the support of third parties, the work related to the implementation of the actions of the ESMP programs;
  - (ii) provide technical support in the initial planning of the socio-environmental actions planned for the projects and in the periodic evaluation of the Project's environmental and social performance;
  - (iii) ensure that socio-environmental specifications are included in the Project description;
  - (iv) prepare the environmental eligibility criteria to be included in the bidding documents for the interventions;
  - (v) adopt procedures and monitor the granting of the environmental licenses required for the implementation of the interventions;

- (vi) identify and recommend actions and procedures for interventions to avoid, minimize, control or mitigate potential negative impacts or disaster risks;
- (vii) carry out periodic visits to the works and other activities of the Project, to verify and certify that all activities relating to socio-environmental issues are being carried out within the recommended quality standards and in accordance with the conditions of the environmental authorizations and licenses and the Regulatory Standards of the Ministry of Labor;
- (viii) approve the measurement of services related to environmental conservation and recovery, as well as activities related to interventions that may cause environmental damage;
- (ix) periodically present to the PMU Coordination the performance evaluation of the implementation of socio-environmental projects related to the planned physical interventions and the necessary adjustments;
- (x) recommend to the PMU penalties for construction contractors in the event of non-compliance with socio-environmental requirements and specifications, i.e. in the event of significant non-conformities that are not resolved during construction planning meetings; and
- (xi) maintain documentation of compliance with social and environmental management plans and records of compliance with indicators. These requirements must be presented in the half-yearly reports sent to the IDB and IFAD.
- (xii) The PMU's environmental and social action specialists must liaise with the various institutions directly and indirectly involved in the Project, as well as the contracted companies. Their work must ensure:
  - a. the adoption of concepts of sustainability, conservation and rural environmental management in the preparation or review of PROCASE's projects;
  - b. the environmental planning of physical interventions.
- (xiii) liaising with environmental control bodies in the search for solutions regarding environmental licensing processes during the implementation and operation phases of the Project's interventions;
- (xiv) prior assessment and approval, within the PMU, of the interventions proposed for the areas covered by the Project, ensuring that the environmental dimension is included in Project decision-making;
- (xv) the adoption of administrative measures that guarantee the implementation of social communication actions related to coexistence with the works, duly articulated with their planning;
- (xvi) the monitoring of environmental recovery and requalification works and services in the area where the projects are being implemented;
- (xvii) recommending actions and construction procedures to avoid, minimize, control or mitigate potential impacts;

- (xviii) periodic evaluation of the efficiency of socio-environmental programs and indication of the necessary adjustments;
  - (xix) the approval, together with the PMU, of penalties for construction companies in the event of non-compliance with environmental requirements;
  - (xx) the approval, together with the PMU, the intervention stops in the case of actions that have significant environmental impacts, so as to enable the adoption of corrective measures in good time;
  - (xxi) preparing and submitting periodic environmental supervision reports to the PMU Coordination Office and to the IDB and IFAD; and
  - (xxii) responding to questions from civil society, including NGOs and other parties interested in the interventions and socio-environmental programs consolidated in the ESMF.
- 6.4 For effective environmental management and control of the interventions, the socio-environmental programs must follow the same schedule as these interventions. Their costs should be incorporated into the intervention costs, with the exception of Environmental Management, which should be the responsibility of the PMU. The contracts for carrying out the interventions must include clauses requiring the company to comply with all the environmental, social and worker health and safety measures set out in the ESMP and in the legislation. This obligation should be made explicit through mechanisms for measuring and paying for activities related to quality and social and environmental control.
- 6.5 In the case of construction work (**honey houses, sales outlets, etc.**), a Construction Environmental Control Plan (CECP) will be drawn up. The CECP must be a contractual obligation of the construction company and must be approved by the PMU before work begins. The construction company must hire a socio-environmental specialist who will be responsible for managing the environmental quality of the work and the related ESMP programs. All the socio-environmental activities planned must be included in the same cost spreadsheet as the engineering and construction activities.
- 6.6 The ESMP programs presented below were developed on the basis of the activities required to control the environment and mitigate the socio-environmental impacts of the PROCASE II interventions.
- 6.7 The environmental and social procedures are detailed in the Environmental and Social Management Plan (Annex 11). The following is a summary of the most relevant regulations, including activities prohibited for financing by PROCASE II.

## 7.2 Prohibited activities

- 6.8 **Activities that are illegal according to laws**, regulations or ratified international conventions and agreements, or subject to international interruptions or prohibitions, such as: (i) Polychlorinated biphenyl compounds (PCBs), (ii) Pharmaceuticals, pesticides/herbicides and other hazardous substances subject to international interruptions or bans<sup>13</sup>; (iii) Persistent Organic Pollutants (POPs); (iv) Ozone-depleting substances subject to international elimination; (v) Wildlife or wildlife products regulated by the Convention on International Trade in Endangered Species of Wild Fauna and Flora; (vi)

Transboundary trade in waste or waste products<sup>1</sup>, except non-hazardous waste destined for recycling; and (vii) Lead-based paints or coatings in the construction of structures and roads.

- 6.9 Activities illegal according to the country's laws and regulations, or ratified international conventions and agreements, related to the protection of biodiversity resources or cultural heritage.
- 6.10 **Other prohibited activities:** The reference documents are: Council Regulation EEC No. 2455/92 of July 23, 1992 concerning the export and import of certain dangerous chemicals, as amended from time to time; United Nations Consolidated List of products whose consumption and/or sale have been banned, withdrawn from the market, have had their circulation "severely restricted" or have not been approved by government bodies; Rotterdam Convention on the Prior Informed Consent Procedure for Certain Pesticides and Hazardous Chemicals in International Trade (Rotterdam Convention); Stockholm Convention on Persistent Organic Pollutants; World Health Organization's Recommended Classification of Pesticides by Risk; World Health Organization's Restrictions on the Use and Availability of Medicines; Stockholm Convention on Persistent Organic Pollutants, as amended in 2009. Ozone-depleting substances (ODSs) are chemical compounds that react with and destroy the stratospheric ozone layer, resulting in the so-called "holes in the ozone layer". The Montreal Protocol lists ODSs and their reduction and elimination target dates. The chemical compounds regulated by the Montreal Protocol include aerosols, refrigerants, blowing agents in the manufacture of foams, solvents and fire protection agents (<https://ozone.unep.org/treaties/montreal-protocol/>)/www.cites.org. According to the Basel Convention ([www.basel.int](http://www.basel.int)), paints and coatings with a total lead concentration greater than 90ppm or the limit concentration determined by the host country, whichever is lower.
- 6.11 **Activities that, although consistent with the country's legal and/or regulatory framework, may generate particularly significant adverse impacts on people and/or the environment,** such as: (i) Weapons, ammunition and other military goods/technologies; (ii) Tobacco; (iii) Gambling, casinos and equivalent businesses; (iv) Radioactive materials; (v) Unbound asbestos fibers or products containing asbestos; (vi) Fishing nets drifting in the marine environment, using nets of more than 2.5 km in length.
- 6.12 **Activities incompatible with IDB and IFAD commitments to address the challenges of climate change and promote environmental and social sustainability,** such as: (i) Coal mining and coal-fired power plants and associated facilities; (ii) Upstream oil exploration and development projects; and (iii) Upstream gas exploration and development projects. In exceptional circumstances and on a case-by-case basis, financing of upstream gas structures will be considered where there is a clear benefit in terms of access to energy for the poor and reduction of greenhouse gas (GHG) emissions, projects consistent with national climate change objectives, and where the risks of retained assets are adequately analyzed.

## **8 BUDGET AND FINANCIAL MANAGEMENT**

### **8.1 IDB and IFAD disbursement procedures and expense acknowledgments**

- 7.1 Disbursements will be made in US dollars, mainly under the advance payment method, and may also use the method of reimbursement of payments to the executor, in agreement with the Bank. The advance on the financing will be determined based on a financial projection of up to 180 days. For advances after the first disbursement, at least 60% of the accumulated balance of the unjustified advance will have to be accounted for.
- 7.2 The Executing Agency will request disbursements of Loan resources from the Bank and/or IFAD using the standard Disbursement *Request* form, via the Electronic System - Online Disbursement (OD), in accordance with the delegation of authorized signatures communicated to the IDB and IFAD.
- 7.3 The financing resources disbursed by the Bank and IFAD will be deposited in the respective bank accounts in dollars (US\$). These accounts will be administered by SEFAZ-PB and used exclusively to receive and manage the funds from the IDB and IFAD loans, respectively. In addition, a bank account in reais (R\$) will be opened, also for the exclusive use of loan funds, where the funds received in dollars will be internalized, according to the Project's financial flow needs, with the aim of minimizing the loss due to exchange rate differentials.
- 7.4 For the disbursement of advances subsequent to the first, the Bank and IFAD will require justification of at least 60% of the accumulated balance of the unjustified advance.
- 7.5 For the purposes of justifying expenses, the exchange rate used to convert expenses incurred in reais (R\$) into dollars (US\$) will be the exchange rate effective on the date of conversion of the currency of disbursement into the local currency (internalization rate).
- 7.6 For the purposes of determining the equivalence of expenses incurred in local currency as a debit to the local counterpart or for the purposes of reimbursing expenses as a debit to the Loan(s), the agreed exchange rate shall be the buying exchange rate established by the Central Bank of Brazil on the day prior to the date of submission of the disbursement request by the Borrower to the Bank and/or IFAD.

### **8.2 Procedures for transferring resources for implementation**

- 7.7 Resources will be transferred to community organizations and cooperatives that will carry out the PIRs and PNs. These organizations will have to open specific accounts to handle the resources from the IDB and IFAD. The transfers will be authorized by the PMU and will not exceed 20% of the value of the respective plans. Reimbursements to these organizations will be made as the expenses are justified and approved by the PMU. All transfers of resources, reimbursements and payment of invoices related to the execution of the Project will be carried out by the PMU.

### **8.3 Internal and external audits**

- 7.8 During the Project execution period, the Borrower must submit audited financial statements to the IDB and IFAD within 120 days of the end of each fiscal year. The fiscal period of the

Project comprises January 1 and December 31 of each year. The Final Audited Financial Statements for the Project must be submitted to the IDB and IFAD no later than 120 days after the date of the last disbursement, or extensions thereof.

- 7.9 The external audit of the Project will be carried out by the Court of Auditors of the State of Paraíba (TCE), provided it has the non-objection of the IDB, or by an independent audit firm acceptable to the IDB and contracted in accordance with IDB Standards.
- 7.10 The audit will be carried out in accordance with the terms of reference, to be previously approved by the IDB, and in accordance with the procedures established with the Audited Financial Reports and External Audit Management Instruction.
- 7.11 The final financial statements will include an analysis of the possible differences between the actual costs of the components and the disbursements by results realized.

#### **8.4 Records, Inspections and Reports.**

- 7.12 Regarding internal control and registration, it is established that:
  - 1. The PMU must maintain an adequate system of internal accounting and administrative controls;
  - 2. The accounting system must be organized in such a way as to provide the necessary documentation to verify transactions, with IDB, IFAD and Counterpart resources, and to facilitate the timely preparation of financial statements and reports;
  - 3. Project records must be kept for a minimum period of three (3) years from the date of the last disbursement of the Loan, so as to:
    - a. Allow the identification of the amounts received from the different sources;
    - b. Consign, in accordance with the Project accounts register;
    - c. Contain the details necessary to identify the goods purchased and the services contracted, as well as the use of said goods and services;
    - d. Include the documentation related to the bidding process and execution of the contracts financed by the Project, which includes, but is not limited to, bid notices, bid packages, summaries, bid evaluations, contracts, correspondence, work products and drafts and invoices, including documents related to the payment of commissions and payments to representatives, consultants and contractors; and
    - e. Demonstrate the cost of investments in each category and the progress of acquisitions.
- 7.13 The IDB and/or IFAD will be able to inspect the execution of the Project in accordance with the provisions of the IDB Loan Agreement and the *Financial Management Guide for Projects Financed by the IDB* - OP-273-12 (according to the Cooperation Agreement signed, IFAD will follow the IDB's procedures on the matter). SEAFDS and COPAIR shall cooperate fully in the supervision process that the IDB and/or IFAD deem necessary during the term of the IDB xxx IFAD xxx Loan Agreements. Cooperation includes access to documentation by the Project Financiers, their representatives, consultants or designated

auditors, subject to legal requirements, giving full access to facilities and personnel, including consultants, related to the Project. The executing agency shall also ensure that bidders and contractors cooperate fully with any inspection or audit by the IDB and/or IFAD.

## 9 PLANNING, MONITORING AND EVALUATION

- 8.1 To carry out the Project, the PMU will use a series of planning, monitoring and evaluation instruments provided for in the Loan Agreement and the Bank's operational manuals.
- 8.2 The PMU will carry out planning, monitoring and evaluation activities and present them to the Bank, in the form and at the intervals established in this ROP.
- 8.3 The PMU must implement and maintain an adequate and reliable information system on the management of the Project in all its aspects, including technical, administrative, financial and socio-environmental aspects, to facilitate the monitoring of Project execution and the fulfillment of all procedures and the collection of Project data and information necessary for the preparation or updating of the various instruments described below.

### 9.1 Project Execution Plan (PEP)

- 8.4 This instrument sets out all the investments planned for the duration of the Project, breaking down the costs by components, sub-components, products, activities and source of funds. It should also include the physical and financial timetable for each product/activity and the overall budget.
- 8.5 The PEP will serve as the basis for the other planning instruments and will not need to be modified during the Project. However, the Annual Workplan and Budgeting (AWPB) and Procurement Plan (PP) derived from this instrument must be updated periodically, as indicated in this ROP.

### 9.2 Annual Workplan and Budgeting (AWPB)

- 8.6 The AWPB is the planning instrument that aims to draw up a proposed plan for implementing the Project each year. The AWPB consolidates all the activities that will be carried out during a given period of execution, per funded project, and its physical and financial timetable.
- 8.7 The AWPB includes: the execution schedule; the detailed budget; the expected products and their respective targets; the expected results with their respective indicators; the terms of reference for contracting consultancy services, specifications for acquiring goods and basic/executive projects and bidding documents.
- 8.8 The first AWPB covers a period of 12 months from the Project start.
- 8.9 The subsequent AWPB will cover the period immediately following the first review, until December 31st of the respective year. Thereafter, an AWPB will be presented for each calendar year (January 1 to December 31).
- 8.10 To this end, the PMU will prepare the AWPB in a participatory manner to obtain input from the various actors involved in the Project execution, including the Sub-executing Unit. The AWPB must be submitted for the IDB's non-objection by **November 30th of each calendar year** prior to its entry into force.

### 9.3 Project Procurement Plan (PP)

- 8.11 The Procurement Plan (PP) is the instrument whose purpose is to make public the details of all the procurement and contracting that will be carried out during a given period of Project execution. These must comply with the provisions of Loan Agreement xxxx/OC-BR and its Annexes.
- 8.12 All areas involved in the execution of the Project, including the Sub-executing Unit, must support the PMU in the preparation of the PP, using the IDB's own form (<http://iadbccccc>), which includes information such as categories of expenditure (works, goods, consultancy, non-consultancy services, etc.), the modality to be used for procurement (LPI, LPN, CP, SBQC, Electronic Bidding, etc.), the sources of funding, and the Bank's review procedures (ex-ante or ex-post). The PP must cover all procurement of goods and contracting of works, consultancy services and non-consultancy services planned for the next 18 months of execution. The PP must be updated annually, covering the period from January 1 to December 31 of each calendar year, and must be submitted to the IDB by **November 30 of each calendar year**, for its No Objection.
- 8.13 The PP must be updated at any time when it becomes apparent that the execution of the Project presents important changes that are reflected in this planning instrument. Whenever there are any changes, the PP must be sent to the Bank for its no objection before any purchase is made. The IDB's submission and non-objection to the Procurement Plan for the first 18 months of Project execution will be a precondition for the first disbursement of Loans.

### 9.4 Results Matrix

- 8.14 The Results Matrix is the tool used to design interventions, facilitating their planning, execution and impact assessment. It involves identifying the strategic elements (inputs, outputs, outcomes and results), their causal relationships, the indicators to measure these elements and the assumptions or risks that may influence the success or failure of the Project. This Matrix sets out PROCASE II's general objective, the intervention logic and the product and result indicators, with a baseline (year zero of the Project) and annual targets (intermediate targets) and final targets, in accordance with the estimated timetable for the Project's implementation.

### 9.5 Monitoring and Evaluation Plan

- 8.15 Plan on the management, monitoring and evaluation of PROCASE II as well as the system to be implemented for this are described in the Monitoring and Evaluation System (see separate annex, M&E Plan).
- 8.16 This planning document defines the parameters for monitoring and evaluating the Project, including the methodologies to be used, inspection visits, the budget for carrying out the activities and those responsible for carrying them out, and the periodicity of reporting.
- 8.17 The aim of management is to provide the necessary tools and procedures for planning and executing the Project's actions, based on the objectives and targets set, and enabling decisions to be taken in good time. This management also includes the financial management of PROCASE II implementation.

- 8.18 The purpose of monitoring is to track the performance of the execution process in terms of: (i) carrying out the programmed activities; and (ii) the physical and financial execution of the products.
- 8.19 The purpose of the evaluation is to report on the achievement of the annual results targets, measured by the respective indicators, which have been defined in the Results Matrix. The evaluation also reports on the behavior of the risks identified in the risk management system
- 8.20 The management, monitoring and evaluation system is based on the output, outcome and impact indicators in the Results Matrix.
- 8.21 The PMU will be responsible for collecting statistical information and other data for measuring these indicators, using the execution databases, through checks, according to the Results Matrix.
- 8.22 The PMU is also responsible for keeping all Project documentation on file, at the disposal of the IDB, IFAD and auditors.
- 8.23 To monitor and control the Project implementation, two basic strategies are planned: Project Management, Monitoring and Evaluation System, and Dissemination of Results.

## **9.6 Reports**

### **9.6.1 Semi-annual Progress Report (RSP)**

- 8.24 The purpose of this report is to present to the IDB and IFAD the results achieved by the Borrower in the execution of the AWPB and the PP, as well as the expenses incurred and the request for and release of
- 8.25 The Progress Report for the second half of the calendar year should summarize the results achieved by Component and Subcomponent (partial and total, where applicable), and analyze the risks identified. It should also present a consolidated view of the difficulties and lessons learned, as well as conclusions and recommendations aimed at feeding back into the project. These reports will be drawn up in a format agreed with the Bank and must be submitted no later than 60 days after the end of the corresponding six-month period.

### **9.6.2 Progress Monitoring Reports (RMP )**

- 8.26 The RMP is the main instrument used by the IDB to monitor Project performance.
- 8.27 Based on the time forecasts for spending and meeting the physical targets established in the planning (Results Matrix), the RMP makes it possible to identify delays or other implementation difficulties and thus take the appropriate corrective measures.
- 8.28 The initial RMP, built during Project preparation, will be updated twice a year. The update should reflect the status of the project's execution.
- 8.29 This type of report will be the basis for the portfolio evaluation, an event held twice a year in the presence of the Executing Agency, the Bank's Representation and Management and IFAD.
- 8.30 The IDB will be responsible for feeding the RMP. However, the PMU must submit the necessary inputs as part of the Half-Yearly Progress Report.

### **9.6.3 Financial Statements Audited**

- 8.31 SEAFDS/PMU will submit the following reports to the Bank by the deadlines set for each of them:
1. Within 60 (sixty) days of the end of each calendar year, reports on the execution of the Project, prepared in accordance with the rules agreed with the Bank;
  2. Such other reports as the Bank may reasonably request in relation to the investments made, the use of the assets acquired with the respective amounts, and the performance of the execution of the Project; and
  3. Financial statements corresponding to the Project, at the close of the fiscal year, accompanied by other related supplementary information. The financial statements will be presented during the years in which the Project is being carried out, within 120 (one hundred and twenty) days following the end of each fiscal year (January 1 to December 31). The first statement will be the one corresponding to the fiscal year in which the execution of the Project began.
- 8.32 The financial statements and documents described above must be prepared in accordance with the Financial Management Guide for IDB-financed projects - OP-273-12 and the Audited Financial Reports and External Audit Management Instruction.
- 8.33 Regarding the compilation of data and the "ex-post" evaluation report, the PMU will make available to the Bank, at the end of the second year, counting from the date of the last disbursement of the financing, the data, indicators and parameters relating to the Project performance, as well as all the documentation corresponding to the baseline data, necessary for the future realization of the "ex-post" evaluation to be carried out by the Lenders, if they deem it necessary.
- 8.34 Annual and final reports issued by the PMU and audited by the TCE-PB or an independent auditing firm should contain: (i) Cash Flow Statement; (ii) Statement of Accumulated Investments; (iii) Notes to the Program's Financial Reports; (iv) Program's Internal Control Report. In accordance with the Instruction on Audited Financial Reports and External Audit Management.

## **9.7 Report content**

### **9.7.1 Progress Reports**

- 8.35 These reports must contain at least the following information:
1. Presentation (or Introduction);
  2. Semester progress (by component and sub-components);
  3. Progress in meeting development goals;
  4. Analysis of the product and result indicators contained in the results framework;
  5. Evolution of assumptions;
  6. Purchases of goods and services;
  7. Information on financial execution;

8. Operation plan for the next six-month period, including the operation and maintenance plan for works and equipment financed with the loan funds;
9. Management successes or problems, lessons learned, and corrective measures taken;
10. Actions to follow and other issues;
11. Annexes.

### **9.8 Mid-term Evaluation Reports and Final**

8.36 Both the mid-term and the final reports must contain:

1. Detailed indication of the financial execution of the Project, by component, sub-component and regions;
2. Analysis, in relation to the baseline, of the results, products and impacts of the Project, according to the indicators of the Results Matrix and the Project's logical framework;
3. The institutional organization and its capacity to carry out the Project;
4. Summary of the results of monitoring impacts and risks;
5. Summary of the results of the audits on the financial statements, procurement process, disbursement requirements.

8.37 Once accepted by SEAFDS, the reports will be published by the PMU on the Project's Internet Portal.

8.38 Both the database and the supporting documentation used to prepare the reports must be available, after the end of the Operation and for a period of 5 years, for any ex-post consultation by the Bank, with SEAFDS being responsible for the safekeeping of all relevant documentation

### **9.9 Risk Management Matrix (RMM)**

8.39 Information on risk management is detailed in the Annex. This instrument classifies the risks identified for the execution of the Project over a given period (usually annually), and defines the mitigation measures for each of them, establishing actions and the resources that will have to be deployed to implement them, as well as the risk monitoring indicators.

8.40 The RMM will be drawn up at the Project Risk Management Seminars, an event attended by the main players involved in the Project, the Bank and IFAD.

8.41 The PMU must report to the Bank on the implementation of the mitigating measures within the agreed deadlines.

8.42 This instrument may be updated by holding a new Seminar, when circumstances require and in agreement with the Bank.

### **9.10 Mid-term evaluation**

8.43 After three years (36 months) from the entry into force of the Loan Agreement or when 50% (fifty percent) of the Loan amount has been disbursed and justified, whichever comes first, the PMU and the Bank will carry out a mid-term evaluation of the Project with the

aim of: (i) verifying the results achieved; (ii) estimating whether the expected results, not yet achieved, can be achieved; and (iii) reviewing whether the process, methodology, and person responsible for collecting information for the evaluation is still relevant, and adjusting it if necessary.

- 8.44 Based on this evaluation, and if necessary, corrective measures to improve the Project implementation can be agreed between the Bank, IFAD and the Executing Agency.
- 8.45 Prior to carrying out this mission, an independent consultancy will be hired under Terms of Reference previously agreed with the IDB. The report must cover, among other things: the relevance of the Project's activities and products to achieving the established objectives; progress in carrying out the activities (physical and financial progress) and achieving the previously established targets; the main problems encountered and proposed mitigation measures; the role of community organizations in carrying out and maintaining the infrastructure built and their weaknesses and strengths, the functional and operational capacity of the Executing Agency to carry out the administration and execution of the Project. The Terms of Reference for this consultancy will be prepared by the IDB.

### **9.11 Final evaluation**

- 8.46 The final evaluation of the Project will be contracted when 95% of the funds have been spent or 90 (ninety) days remain before the last disbursement date, whichever comes first.
- 8.47 The Final Evaluation Report will be prepared by an independent consultancy, hired under Terms of Reference previously agreed between the PMU, the Bank and IFAD.
- 8.48 The report should contain, among other things: the degree to which the Project specific objectives were met; the goals achieved at the component, product and activity level; the difficulties and positive points of the Project's design and execution; lessons learned that could benefit future projects/programs. It will be submitted to the IDB within 30 days of the justification of expenditure of the last disbursement of loan funds.

## **10 RISK TO INTEGRITY AND REPUTATIONAL IMPACT**

### **10.1 Introduction**

- 9.1 The purpose of this section is to provide guidance to the Executing Agency on the actions and measures it can put in place to manage the risks to integrity during the implementation of the programs under its responsibility in the areas of conflict of interest management, due diligence for integrity and the formation of evaluation committees. The Office of Institutional Integrity (OII) suggests that all the mechanisms described below be considered and incorporated into the operational regulations of the programs to be financed by the IDB.

### **10.2 Conflict of Interest Management**

- 9.2 This section describes the process for managing conflicts of interest in activities financed with IDB funds. The aim is to guide program participants on how to proceed in such situations.
- 9.3 The steps described below do not replace national legislation on the subject. The procedure for identifying, managing and mitigating integrity risks comprises five stages: identification, assessment, mitigation, disclosure and archiving.

#### **10.2.1 Definition**

- 9.4 For the purposes of the Project, a conflict of interest arises when private interests (of whatever nature) run counter to the interests of the programs, as agreed between the Borrower and the Bank.
- 9.5 The private interests referred to include personal, pecuniary or financial interests that may generate a direct or indirect personal benefit (not necessarily economic). Family and personal relationships, personal and political affiliations/associations, and previous and subsequent employment can generate a conflict of interest when they unduly influence the decisions and/or actions of the parties responsible for the programs or for carrying out the activities financed by the Bank.
- 9.6 A conflict of interest can arise at any stage of the Project cycle, from the preparation of the contract to its execution. Conflicts can arise both on the side of the bidder/contractor and on the side of the members of the team in charge of implementing and managing the Project within the Executing Agency, including the Evaluation Committees.
- 9.7 At all times when a possible conflict of interest arises, the interests of the program must take precedence over private interests. Moreover, an apparent conflict of interest can be just as serious as a real one.

#### **10.2.2 Identification**

- 9.8 The following are some situations which, in the absence of mitigation measures, could constitute a conflict of interest for a bidder, candidate, consultant, contractor or PMU official. The following list is not exhaustive, and it is recommended to be aware of all possible circumstances that could generate a real or apparent conflict of interest.

- 9.10 In accordance with the Bank's Procurement Policies, the parties involved in an activity financed by the Bank are obliged to disclose situations that could generate a conflict of interest. Therefore, when a bidder, candidate, consultant or contractor is faced with this type of situation, they must officially notify the PMU. In the case of a PMU member, the PMU director must be notified of any potential conflict of interest. In the case of the PMU Director, he or she must report this situation directly to the Project Team Leader. Disclosed conflicts of interest must be reported to the Bank so that it can be determined whether they have been resolved to its satisfaction.

### **10.3 Individual bidders, tenderers, contractors or consultants**

- 9.11 Individual consultants, bidders and contractors must disclose situations that may present a conflict of interest during all stages of the procurement process, from the submission of bids or proposals to execution and evaluation.
- 9.12 Individual consultants must complete the Bank's Eligibility and Integrity Certification. This declaration must be updated if a conflict of interest (real or apparent) arises at any stage during the execution of the contract.

#### **10.3.1 Individual consultants<sup>12</sup>**

- 9.13 A consultant or candidate consultant will have a real or apparent conflict of interest if:
- a. Simultaneously maintains more than one contract financed with different sources of program funding (for example, resources from the Bank, from a program contractor, from the Executing Unit).
  - b. Has participated or will participate directly in an operation linked to the contracting of the consultancy services that are the subject of the contract.
  - c. You have a professional or family relationship with a member of the staff of the PMU; the staff of the Borrower; the Project Executing Agency or the beneficiary of a technical cooperation who is directly or indirectly involved in any way with (i) the drafting of the terms of reference of the contract; (ii) the selection process under the contract or (iii) the supervision of the contract.

#### **10.3.2 Companies**

- 9.14 Companies awarded a contract for the execution of works, supply of goods or provision of services will have a real or apparent conflict of interest if:
- a. They, their affiliates or the key personnel indicated have provided consultancy services for the preparation of the Project in question or their object is directly related to the consultancy services for the preparation.
  - b. Have been consulted during the diagnosis and identification of needs phase for the preparation of the technical specifications and other documents used in the bidding documents.
  - c. Some of its majority shareholders, employees in key positions or staff indicated in the proposal have a family relationship with PMU, Executive Agency or Borrower staff.

---

<sup>12</sup> If the consultant has been employed by the Bank in the four years prior to the date of the consultancy in question, the Project Team Leader should be informed to consult the Bank's Ethics Office and check whether the consultancy could result in a conflict of interest.

- d. Are or have been associated with a company or any of its affiliates that has been contracted by the PMU, the Executing Agency, the Borrower or the Bank to provide consultancy services related to the preparation of the design, technical specifications and other documents to be used in the tender for the acquisition of the goods that are the subject of the tender, or submit more than one bid in the said tender process.
- e. Have majority shareholders in common and/or the same legal representative as other participants in the bidding process, receive or have received any direct or indirect subsidy from any of the other bidders, or have a mutual relationship, directly or through third parties in common, that allows them to have access to information about another bidder's proposal.
- f. Are or have been associated, directly or indirectly, with a company or any of its affiliates that has been contracted by the Employer to provide consultancy services for the preparation of the design, specifications and other documents to be used in the bidding process for the contracting of the works that are the subject of the invitations to tender.
- g. Could influence the bidding process in question or the Employer's decisions with respect to that bidding process.
- h. Participate in more than one tender in the bidding process.
- i. Have been affiliated with a company or entity that the Contractor or the Borrower has engaged or has proposed to engage as an engineer or supervisor under the contract.
- j. Subsequently, they will participate as a bidder for goods, works or services resulting from or directly related to the contract in question.
- k. Subsequently, they plan to hire a PMU member in any capacity.
- l. In the case of a contract for services other than consultancy or goods, any of its majority shareholders, key employees or personnel indicated in the proposal has a family relationship with any direct beneficiary of those goods or services.

### **10.3.3 Project Management Unit (PMU)**

- 9.15 An PMU member, including members of the Evaluation Committees, has a real or apparent conflict of interest if:
  - a. You have or have had a family, personal, work or financial relationship with a bidder, one of its majority shareholders or one of its key personnel who is competing in a given bidding process.
  - b. Have or have had a family, personal, work or financial relationship with a contractor, one of its majority partners or one of its key personnel who is executing a project financed with program resources.
  - c. Have a working, close personal or family relationship with any other PMU staff member, Project Executing Agency or Borrower staff member who has influence over program decisions.
  - d. Have a family relationship with a direct beneficiary of the goods, works or services other than consultancy that are the subject of a contract financed with program funds.
  - e. After becoming a member of the PMU, you are hired by a company that receives funding from the program.
- 9.16 It is important to mention that deliberately lying, misrepresenting or concealing a situation that could generate a conflict of interest may constitute a prohibited practice (i.e. fraud), as

defined in the Bank's Procurement Policies, and may be subject to sanction by the IDB Group's Sanctions System.

#### **10.4 Evaluation**

- 9.17 At this stage, it must be determined whether the situation revealed may adversely affect the quality of the works, goods or services financed with program resources or adversely affect the principle of competition established in the Bank's Procurement Policies.
- 9.18 The assessment of the situation should be carried out by a group of people to be convened for this purpose. Ideally, the PMU Coordinator, the Financial Specialist and the Procurement Specialist should participate. If one of these is the person in a potential conflict situation, the group can be formed to include staff from the Implementing Body unrelated to the circumstances.
- 9.19 The group should assess the impact that the situation revealed may have on the programs and consider the effects that the conflict of interest may have on the decision to hire a consultant or contractor, decisions involving changes to the contract in question, the approval of payments, the certification of the delivery of goods or the progress or completion of works, the selection of beneficiaries, among others.
- 9.20 In carrying out this analysis, the group may, in addition to using its professional judgment, be guided by the provisions of Section 1.11 of the [Policies for the Selection and Hiring of Consultants Financed by the Inter-American Development Bank](#) and the [standard bidding documents](#) approved by the Bank.
- 9.21 When doing the analysis, it can be useful to ask yourself the following questions: What is the purpose of the contract? Did the company or consultant have access to information that is not available to all bidders or candidates? Would their personal relationship affect the impartiality of their evaluation of the proposal/offer? Would the type of supervision of the company be affected by their relationship with person X? Does this consultant have an advantage over other candidates because they are related to X? Are these beneficiaries more likely to have access to the good or receive the service because they are related to PMU staff? Would company X receive a more favorable report if it were audited by a relative of the majority shareholder? Is there a likelihood that if a contractor financed by the Program offers a job to PMU official X, he/she will receive preferential treatment during the execution of the contract?
- 9.22 When assessing the situation, it is important to consider the specific details and timing/duration of the events giving rise to the conflict of interest. For example, the PMU technical expert had been an employee of company X for 15 years compared to having worked for that company until two years ago.

#### **10.5 Mitigation**

- 9.23 In most situations, the risk to integrity and the impact on reputation arising from a conflict of interest can be mitigated by recusal of the parties involved or, sometimes, by the sale of assets. However, it is important to ensure that this recusal or the sale of assets has the necessary effect in practice.
- 9.24 In the event of the refusal of an PMU member, the employee's supervisor and/or the members of the Evaluation Committee must ensure that the employee who has refused to participate in the process has restricted access to any information from the decision-making

process during the award and supervision of the contract. In the case of a sale of assets or transfer of decision-making power in a company, it is necessary to ensure that the controlling interest or command of the company is transferred to an independent person or entity.

- 9.25 In some cases, such as the participation of a company in the drafting of the terms of reference or in the generation of employment or business opportunities in the future, it is not possible to mitigate the conflict and therefore the company will not be able to participate in the bidding process.

## **10.6 Disclosure**

- 9.26 The nature of the conflicts of interest revealed, as well as their assessment and mitigation, must be communicated to the Bank so that it can determine whether they have been resolved to its satisfaction.

## **10.7 Filing**

- 9.27 Declarations and resolutions on conflicts of interest must be made in writing and kept as part of the respective contract file so that they can be consulted when necessary.

## **10.8 Implementation of due diligence measures**

- 9.28 Integrity due diligence is understood as the process of gathering information to confirm the technical and financial capacity of the bidder or tenderer and to monitor the warning signs related to the contractor to reduce the likelihood of a prohibited practice occurring, as well as to reduce the impact on the achievement of program development objectives or on the reputation of the Bank or program.
- 9.29 Before recommending the award of a contract, the members of the Evaluation Committee must confirm that the bidder does indeed have the technical and financial capacity indicated in its bid, by verifying its experience and the validity of the bid documents and/or guarantees. These measures will allow the PMU to get to know and monitor the potential contractor with the aim of reducing the likelihood of prohibited practices occurring during the performance of the contract.
- 9.30 The Evaluation Committee should also check the [Inter-American Development Bank's List of Sanctioned Companies and Individuals](#) to verify that the company or consultant recommended for award, as well as its legal representatives, directors and key personnel, is not sanctioned by the Bank or by other multilateral development banks.<sup>13</sup> Information on sanctioned companies and individuals, as well as all the guidelines on how to report a possible prohibited practice, can be found at <https://www.iadb.org/pt/sobre-o-bid/departamentos/oii>.
- 9.31 Any irregularity detected during the due diligence procedure must be reported to the Project Team so that measures to mitigate and manage the risk to integrity can be discussed. In

---

<sup>13</sup> If the company or individual does not appear as sanctioned on the IDB's list, but on that of another multilateral development bank, this sanction should be taken as a risk factor for integrity that should be analyzed, but does not constitute a cause for ineligibility.

addition, the process must be documented to facilitate accountability, respond to possible challenges and ensure the Bank's audit and inspection rights.

9.32 Below are some examples of information that should be checked before recommending the award of works, goods or consultancy contracts to a company, especially if these contracts are complex or of high value.

- Check the **company's website** for their logos, address, telephone numbers, management team and general information about their background and/or experience;
- Check the information and history of the entity or individual **in the state's register of suppliers** and assess whether any past non-compliance or disqualification represents a risk factor for the proper execution of the contract;
- If the company has already been contracted by the Executing Agency or any public institution, it is advisable to **check the available records and compare the information presented** for other similar processes, in terms of experience and financial information, to confirm the consistency of the information presented;
- **Confirm the deposit or guarantee of the bid** with the financial institution that issued it by telephone or other rapid means of communication;
- In the case of the purchase of goods, if the bidder is not the manufacturer of the goods, **confirm with the manufacturer** that the bidder is an authorized distributor.
- If the company is new to the market and comes from another country, check **its experience and financial certifications with one of the issuers of these certifications**. In addition, it is a good idea to do an internet search on the company's history in its country of origin and in other markets where it operates, checking for possible disqualifications and disputes and consulting the press to assess possible risk indicators for the award and execution of the contract;
- **Search the name of the company or individual with keywords** [corruption, additional costs, irregularities, fraud, delays, penalties] using online search engines to obtain information on possible investigations, ties to senior government officials or contracting authority, recent changes in legislation that may benefit the company in relation to the contract, sanctions or fines that may have an impact on the execution of the contract or the reputation of the Bank and the Executing Agency.
- In the case of selection processes for consultancy firms, **it is advisable to check directly with key personnel** their availability to work for the duration of the contract;
- **Check that there are no conflicts of interest** between the potential contractor and the staff of the Executing Unit who participate or will participate in decision-making about this contract. This verification can be done through the information provided by both parties in their respective conflict of interest declaration certifications;
- If the **beneficial ownership form** is used, check that the final beneficiary is not on the Bank's list of sanctioned parties and that this company or individual has no conflict of interest with the staff of the executing agency.
- Specifically in the case of **verifying financial information**, **it is recommended** that the following procedures be adopted, especially in the case of essential purchases for the program:

- i. **Do a vertical analysis of the balance sheet and income statement** to check their consistency. For example, present the components of the balance sheet and/or income statement as percentages (the sum must be 100%).
- ii. If the bidder is required to prove its technical experience through invoicing, ask the bidder to present the invoicing **for each completed year** (not including future invoicing) and that the bidder duly considers **revenue recognition policies**;
- iii. Check that the financial statements correspond to the **accounting periods already completed and audited**. Financial statements for partial periods should not be accepted;
- iv. Check that the financial position reflects **the situation of the bidder** and not that of a subsidiary or parent company;
- v. Check that there is **a tender guarantee and a guarantee issued by a commercial bank**. In other words, the bidder must duly indicate its available sources of financing to meet its cash needs (liquidity) to carry out the work or supply the goods. For example, liquid assets (cash and bank), assets not subject to any reservation of title, credit lines;
- vi. Check/calculate that the **financial ratios** are compatible with the financial information presented;
- vii. The Evaluation Committees can call on the Financial Expert if they need support in the financial evaluation of the proposals.

## 10.9 Definitions of prohibited practices under the IDB's Procurement Policies

9.33 The definitions of prohibited practices under the Bank's Procurement Policies are set out below:

- i) A "corrupt practice" consists of offering, giving, receiving or soliciting, directly or indirectly, anything of value to unduly influence the actions of another party;
- ii) A "fraudulent practice" is any act or omission, including the misrepresentation of facts or circumstances, that deliberately or recklessly deceives or attempts to deceive a party to obtain a financial or other benefit or to avoid an obligation;
- iii.) A "collusive practice" is an agreement made between two or more parties to achieve an improper purpose, including inappropriately influencing the actions of another party;
- i) A "coercive practice" consists of harming or causing harm or threatening to harm or cause harm, directly or indirectly, to any party or its property to unduly influence the actions of a party;
- ii) An "obstructive practice" consists of (i) destroying, falsifying, altering or concealing evidence significant to an IDB Group investigation or making false statements to investigators for the purpose of obstructing an IDB Group investigation; (ii) threatening, harassing or intimidating any party to prevent the disclosure of its knowledge of matters that are material to an IDB Group investigation or the continuation of the investigation or (iii) any act intended to materially impede the exercise of the IDB Group's contractual audit and inspection rights or its rights of access to information;

- iii) "Misappropriation" is the use of IDB Group funds or resources for an improper purpose or for an unauthorized purpose, committed intentionally or through gross negligence.

#### **10.10 Report possible prohibited practices**

- 9.34 The Bank requires that the highest ethical standards be observed by all Borrowers, executing agencies and contracting agencies, as well as by all companies, entities or individuals that act as bidders to participate or are participating in activities financed by the Bank, including, but not limited to, applicants, bidders, contractors, consulting firms and individual consultants, employees, subcontractors, subconsultants, suppliers of goods and service providers (including their respective officers, employees and representatives, whether their duties are express or implied).
- 9.35 The staff of the Project Management Unit have an obligation to report to the Bank any act that they suspect may constitute a prohibited practice of which they become aware, i.e. informed during the process of selection, negotiation or execution of a contract. It is important that the staff of the PMU also communicate to their internal and external control bodies the importance of notifying the Bank if they become aware of a report of a prohibited practice related to the programs.
- 9.36 All information related to a possible occurrence of prohibited practices in the programs must be communicated as soon as possible to the OII by e-mail ([ooi-reportfraud@iadb.org](mailto:ooi-reportfraud@iadb.org)) or via the Internet (<https://cuentame.iadb.org>). Other communication channels can be found on the IDB's website ([www.iadb.org/integridad](http://www.iadb.org/integridad)).

#### **10.11 Integrity clauses in individual consultancy contracts or contracts awarded by the price comparison method**

- 9.37 The Procurement Specialist of the PMU must ensure that all contracts, including those for individual consultancy or awarded by the price comparison method, contain the Bank's integrity clauses.
- 9.38 Requests for quotations must refer at least to the fact that the process is being financed with the resources of the loan agreement signed with the IDB and that the Bank's Procurement Policies will be applied.
- 9.39 Contracts signed as a result of price comparisons or that do not use the documents previously agreed with the IDB<sup>14</sup> must contain the following information:
  - i) The contractor/consultant agrees to abide by the Bank's rules and policies regarding prohibited practices as defined under Article 1.16, item "a", of the Policies for the Procurement of Goods and Contracting of Works Financed by the Inter-American Development Bank (document GN-2349-15) (or, as the case may be, Article 1.23, item "a" in document GN-2350-15, Policies for the Selection and Contracting of Consultants Financed by the Inter-American Development Bank).

---

<sup>14</sup> The Bank's standard documents and the contracts agreed between the Executing Agency and the Bank refer to the prohibited practices clauses.

- ii) The contractor/consultant undertakes to observe the highest ethical standards and to report to the Bank any act suspected of constituting a prohibited practice of which he/she becomes aware or is informed during the process of selection, negotiation or execution of the contract.
- iii) The contractor/consultant declares to be aware that the Bank may sanction the party that has engaged in a prohibited practice (any company, entity or individual acting as a bidder or participating in an activity financed by the Bank, including, but not limited to, applicants, bidders, suppliers of goods, in accordance with the stipulations of Article 1.16, item "e", of the Policies for the Procurement of Goods and Contracting of Works Financed by the Inter-American Development Bank (document GN-2349-15) (or Article 1.23, item "e" in document - GN23509-, Policies for the Selection and Contracting of Consultants Financed by the Inter-American Development Bank).
- iv) The contractor/consultant, including members of its key staff and subcontractors, declares that it does not have a conflict of interest with any member of the staff of the PMU who has a connection with the contract.

#### **10.12 Formation of evaluation committees**

- 9.40 The members of the Evaluation Committee who represent the technical side must be fully aware of the process being evaluated. To prove their ability, the person appointed to the Committee must present their CV to demonstrate that they meet the minimum profile required.
- 9.41 Persons will not be allowed to participate in the Evaluation Committee who have a conflict of interest with any of the bidders to be evaluated. All members of the Evaluation Committee must sign a declaration stating that they have no conflict of interest at the time of starting the evaluation and that they undertake to disclose and manage any conflict of interest that may arise during the evaluation process, as stipulated in the chapter on Conflicts of Interest in these Regulations.
- 9.42 The members of the Evaluation Committee must also sign a declaration of confidentiality of the evaluation process which ensures that all information relating to the tender evaluation process will be kept confidential until the publication of the contract award.
- 9.43 It is recommended that the members of the Evaluation Committee document their deliberations in minutes to form part of the archive. These minutes must be signed by all the members of the Evaluation Committee and filed with the documents in the file.
- 9.44 The PMU Procurement Specialist shall train all members of the Evaluation Committee on the applicability of the Bank's Procurement Policies and on how these policies should be reflected in the drafting of the PMU Procurement Policy.
- 9.45 The Evaluation Committees may refer to the Procurement Specialist and/or the PMU Financial Specialist if doubts arise in the evaluation process regarding the applicability of the Bank's policies.
- 9.46 In the case of the procurement and selection processes for individual consultants who will be part of the PMU staff, it is recommended to include an independent observer from civil society who will not have voting rights, but will be able to make observations on the process which should be recorded in the minutes of the Committee's deliberations. Participants

taking part as observers must also sign a declaration of confidentiality of the evaluation process.

## ANNEX 1

### Identification, prioritization and selection of communities

#### A. Identifying communities

- 1.1 To identify and select the communities, a field survey will be carried out by a state agency, coordinated and supervised by the PMU and with the support of the Regional Project Management Units (RPMU), to survey the characteristics of the communities based on a list of criteria and the methodology defined in the ROP.

#### B. Eligibility criteria for communities

- 1.2 To be eligible, communities must meet the following criteria:
- i) Be rural communities of family farmers who develop agricultural or non-agricultural activities aligned with the productive activities of the Project;
  - ii) High percentage of families registered in the Single Registry (**CadÚnico**);
- 1.3 Based on this survey, a list of communities with the profile and characteristics to receive investment and support from the two components will be drawn up in each Rural Territory<sup>15</sup>.

#### C. Prioritizing and selecting communities

- 1.4 Based on this list of identified communities, the Project team will visit the communities (some between five and ten per municipality) to validate the data provided during the identification.
- a) Criteria for prioritizing communities:
    - i) Being a traditional and original community (quilombola, Indigenous, artisanal fishersfishermen, others);
    - ii) High rate of families registered in the Single Registry (**CadÚnico**);
    - iii) Higher proportion of families needing a cistern for drinking water and sanitation;
    - iv) Prioritize families that have not benefited from other projects to finance activities like those that the PIR will finance;
    - v) A higher proportion of families represented by women and young people and families with persons with disabilities;
    - vi) Evidence of environmental degradation (using the appropriate platform); and
    - vii) No or low level of access to TA services.

- 1.5 Once the field assessment has been completed, the PMU team will draw up a prioritized list of communities by Rural Territory, which will be presented at a plenary meeting in

---

<sup>15</sup> Rural Territory: Paraíba is divided into rural territories, which choose their priority demands, working on common policies between the municipalities in each territory and forwarding them to the state government. The aim is for public policies for family farming to reach the rural population more effectively.

each Territorial Council, to be validated and thus guarantee the legitimacy of the selection process in the eyes of other local actors.

- 1.6 The entire process of identifying, prioritizing and selecting communities will be carried out under the supervision of the PMU team during the first few months of implementation, and can preferably be prepared and started before the start of implementation (valuing the possibility of retroactive financing) to avoid possible delays in the initial phase of the Project.
- 1.7 At this stage's end, all the communities where the Project will do some activity will be selected. It has been estimated that the Project will be able to work in approximately 600 communities.
- 1.8 For reasons related to implementation, the work of TA, the ADLs and the creation of local dynamics and synergies, these 600 communities will be organized into small groups of up to three surrounding communities (or the equivalent of approximately 100 families), thus constituting a Local Territory (TL). As part of the Project design process, three communities were considered per TL, thus reaching around 200 Local Territories, and consequently 200 PIRs. This form of organization in TLs has been used in other projects (particularly in Bahia with the Gente de Valor and Pró-semiárido projects), with very positive results both from the point of view of implementation and strengthening the beneficiaries' organizational dynamics.
- 1.9 Each PIR will be prepared and implemented with an existing community association that is able to make this commitment to the Project. This formalized association will represent all the communities that make up the Local Territory and will be selected based on its organizational capacity and experience.

## ANNEX 2

### Implementation of resilient and biodiverse production systems

#### A. General aspects of PIRs

- 1.1 During the implementation of the PIRs, in addition to close and permanent synergy with TA actions (including specialized TA where justified), strengthening community organizations and supporting innovation, complementarities will be established with other Component 2 activities, such as: land and environmental regularization; actions related to diversity, gender, youth, PCT and families with persons with disabilities.
- 1.2 The PIR will benefit groups of families, prioritizing women, young people, traditional communities and the persons with disabilities, and will finance inputs, tools, equipment and other investments needed to enable the adoption of technologies to improve productivity, adapt to climate change, and improve food and nutritional security.
- 1.3 In all cases, the activities selected will come from the Rapid Participatory Diagnosis (RPD), which will identify not only the demands, but also the problems, priorities and potential demands of the beneficiary communities and families. These activities must meet the eligibility criteria that will be detailed in the Project Operational Regulations (ROP) and: i) be highly consistent with the production methods characteristic of the biome, region and community, ii) allow for production intensification based on the principles of agroecology, as well as adaptation to climate change, and iii) have the full agreement of the families involved.
- 1.4 The same PIR can support more than one productive activity or environmental axis and include the implementation of various types of Social Technologies, thus seeking coherence with the reality of family farming to meet the demands of the communities in a diversified way and can guarantee the inclusion of various profiles of beneficiaries, particularly women and young people. In these cases, the beneficiaries will be organized into interest groups around the activities selected to make up the PIRs.
- 1.5 During the process of drawing up the PIRs, the integration of new members and partners into existing organizations will be encouraged, giving priority to women, young people and families with Persons with Disabilities.

#### B. Provision of Agroecological Technical Assistance and Rural Extension (ATER) services

- 1.6 All PIR beneficiaries and their organizations will receive agroecological TA services for a period of three and a half years (Annex "Promoting Agroecological Transitions in Brazilian IFAD Projects"<sup>16</sup>), contracted by the PMU through a competitive process that meets IDB/IFAD standards. These services will be financed by Subcomponent 2.1, in which they are presented in detail. They will strengthen the capacities and advise the beneficiaries to design, implement, monitor the operation of and complete the PIRs. This includes advice on production from an agroecological perspective and adaptation to climate change, management, organization, access to public policies and marketing, ensuring compliance with current health and environmental legislation. The support provided by the TA entities

---

<sup>16</sup> The annex describes how the concept of agroecology is applied in IFAD projects in Brazil, and specifically in the PROCASE II project.

should include support for the beneficiaries to carry out the procurement and accountability processes related to the implementation of the PIRs, considering that the financial resources will be transferred to the beneficiary associations through a procedure defined in the ROP. In the selection of TA services, criteria will be applied that allow for the inclusion of women technicians in the teams, with a view to being as adherent as possible to the specific needs of women and to proposing more appropriate solutions for the women beneficiaries of the Project's actions. For example, it will be a selection criterion for TA organizations to have a minimum percentage of 30% women on their teams.

- 1.7 In the case of monitoring the implementation of Social Technologies, a specific TA will be contracted for this purpose, and which complies with the legal framework for contracting services for this modality. The entities contracted in this way will be responsible for acquiring materials, providing specialized services for the construction of the Social Technologies and training beneficiaries to apply good use and maintenance practices.

**C. Process for drawing up Resilient Investment Plans (PIRs)**

- 1.8 In each selected community, the TA entity will draw up the PIR together with the communities, taking as its starting point the carrying out of a Participatory Rapid Diagnosis (PRD), with a view to characterizing the problems and obstacles (productive, environmental and social) affecting the communities and rural families, identifying the investments needed to solve them, and gathering all the data and information needed to draw up all the actions that the Project will implement through the PIRs.

- 1.9 The first stage of drawing up the PIR consists of carrying out a detailed diagnosis using the DRP methodology with a focus on:

- i. Assess the characteristics of the community from the point of view of the productive activities to be supported (availability of natural resources, potential adaptation to climate change, viability, etc.);
- ii. Gather technical data on production capacity and market access, identifying potential and related risks;
- iii. Analyze the state of conservation of vegetation cover, biodiversity, soil and water resources and the ways in which these natural resources are used for productive purposes;
- iv. Survey the social characteristics of the beneficiaries, their previous experiences and forms of organization, collective management capacity and level of social organization;
- v. To collect data on obtaining DAP and registering families in the Rural Environmental Registry (CAR);
- vi. Identify the needs of the families and the association from the point of view of TA, to strengthen capacities relating to productive issues, adaptation to climate change, organizational capacities, management and governance;
- vii. Identify the characteristics and socio-productive needs of each group, and in particular the priority groups - PCT, women, young people and families with persons with disabilities;
- viii. Identify the needs, relevance and modalities for carrying out environmental recovery actions;

- ix. Identify the demand from the point of view of access to water for production (52,000-liter cisterns and reuse of grey water);
  - x. Identify the need for and situation regarding access to other social technologies for collecting, storing and reusing water, sanitation, improving energy consumption, such as biodigesters, access to renewable energies and waste management;
  - xi. Identify the connectivity situation in terms of internet access;
  - xii. Identify the land ownership situation of the association's members;
  - xiii. Identify access to public policies;
  - xiv. Identify the environmental and social risks of the production activities supported, in accordance with social and environmental safeguards;
  - xv. In the case of traditional communities, the specific forms of organization (collective work and production, for example) and management of natural resources, characteristics of socio-cultural habits, will be surveyed; and
  - xvi. The potential for coordination with other local players will also be assessed.
- 1.10 Drawing up the diagnosis will be a participatory process, with consultations carried out through successive collective meetings with all the members of the association and specific meetings with women and young people, thus enabling demands to be identified. These consultations will be supplemented by visits to the farms and production areas. It is estimated that it will take a maximum of two months to prepare the diagnosis.
- 1.11 The diagnosis should point to the activities that could be carried out in the community and will therefore be the basis for drawing up the PIR, as well as gender, diversity and youth activities and land and environmental regularization.
- 1.12 Once the diagnosis has been drawn up (within a maximum of 2 months), it will be validated by all the beneficiaries in a collective meeting.
- D. Drawing up PIRs**
- 1.13 Once the diagnosis has been completed, the PIRs will be drawn up. This process will be participatory and conducted by TA entities previously contracted and trained by the PMU to draw up and implement the PIRs (see details in subcomponent 2.1 on capacity building). Throughout the drafting process, the RPMUs will play an important support and quality control role. Each PIR will be drawn up and implemented with technical support from the same TA organization, thus ensuring greater commitment, quality and continuity throughout the process.
- 1.14 The scope of the PIR is the territory(ies) of the selected community(ies) that make up the Local Territory and the group of families in these communities. During the preparation process, the integration of new families into the associations will be encouraged, particularly those represented by young women and families with Persons with Disabilities, to expand the scale of work and encourage the integration of this public.
- 1.15 For the design of the Project, it was estimated that each PIR will cover an average of 90 families from the Project's target groups, selected according to the criteria presented above and detailed in the ROP. The PIR will support productive activities in the community (new or consolidating existing activities) with potential for commercialization, incorporating concepts of sustainability and agroecology, good production practices and environmental resilience, nutritional education and food and nutritional security for families, encouraging

- nutritious and diversified diets, expanding agri-food diversity, as well as ensuring integration with social technologies.
- 1.16 Agricultural activities with the region's main production systems and non-agricultural activities (such as handicrafts, community-based rural tourism, etc.) can be supported. The same PIR may support more than one productive activity, provided it is justified and has the potential to be viable. In these cases, the beneficiaries will be organized into interest groups around each activity, and the same beneficiary may not participate in more than one group. The Project's methodology will be based on strengthening and establishing synergies and complementarities with existing dynamics developed with other actors and projects present in the Rural Territories (COOPERAR Project, Dom Helder III Project and Sertão Vivo Project).
  - 1.17 The PIR (see attached roadmap) will be drawn up based on the data collected during the diagnosis. The same TA technical team that carried out the diagnosis will conduct this work, following the methodology defined in the ROP, (with reference to the methodology of the System for Financial Analysis of Productive Projects<sup>17</sup> (SAF-PP) developed by IFAD/Semear project and applied in various projects). The SAF-PP used in other IDB/IFAD-funded projects, such as in Piauí, and currently under the tutelage of the Federal University of Viçosa (UFV), could be acquired by PROCASE II and customized to suit its characteristics.
  - 1.18 The PIR should describe the initial situation of the families, the investments to be made and the expected results for the three axes (productive, environmental and social technologies). Investments should always consider the integration of innovative practices for the sustainable use and management of natural resources appropriate to the local context, conservation practices for each biome and other low GHG emission agricultural techniques that maximize the provision of ecosystem services.
  - 1.19 The PIR will be able to finance, for example, inputs, tools, small livestock (it will not be possible to finance cattle livestock), equipment and small machinery, and include investments in renewable energy and rural connectivity.
  - 1.20 The PIR's strategy and methodology will be based on agroecological practices, combining sustainable production intensification with the conservation of natural resources and promoting a paradigm shift to transform current practices into adaptive and resilient models, increasing diversity (biological and productive) and resulting in an improvement in the quality of life of beneficiary families. The Project will not be able to finance the purchase of pesticides and other synthetic inputs, but only inputs aligned with the principles of agroecology.
  - 1.21 Due to the importance of supporting marketing, the PIRs will define and support market access strategies and may also allow for the purchase of the necessary material (stalls for fairs, scales, boxes for transporting products, visual identity material, etc.). In these marketing strategies, access to the PNAE and PAA will be considered. Given the importance of valuing access to markets for agroecological products and those produced in traditional communities, courses and workshops will be held by TA entities for the beneficiaries, to present the conditions for obtaining the Quilombos and Family Farming

---

<sup>17</sup> The system allows you to enter all the information relating to the investments made and the projections of costs and results, in order to calculate the main economic and financial evaluation indicators.

seals, among other possibilities. With the participation of representatives of the beneficiaries and the TA teams, these courses should help to structure the productive activities of the PIRs, contributing to their economic viability. The PIRs' market access actions should be linked to the actions envisaged under subcomponent 2.2 - strengthening the organizations' marketing capacities.

1.22 When drawing up the PIRs, prioritization criteria will be applied so that women, young people and persons with disabilities can be involved and be direct beneficiaries of the Project's actions, particularly in the processing processes, access to markets and the use of new technologies, including virtual commerce and other digital solutions.

1.23 A feasibility and financial profitability study will be carried out using the SAF-PP system by TA (who will have received training for this) on a realistic projection basis, assessing the expected increase in income per family and considering self-consumption of production. The PIRs selected must demonstrate technical, economic, financial and environmental viability and sustainability.

**E. Parameters for drawing up PIRs**

1.24 The PIRs will be drawn up considering the following parameters:

- i) Number of families: a PIR can serve no fewer than 30 families and no more than 120;
- ii) The name and CPF of each representative member of the beneficiary family will be attached to the PIR;
- iii) The amount of funding from the project cannot exceed: USD 1,900 per family for the productive axis, USD 100 per family for the environmental axis and USD 786/ family for the Social Technologies axis, totaling USD 2,786/family as the maximum investment;
- iv) The minimum amount of Project resources per PIR is USD 83,580 and the ceiling is USD 334,320;
- v) The funds from the Project will be non-reimbursable. The beneficiaries must provide a counterpart of at least 10% of the amount financed by the PIR, which can be either financial or economic, such as labor, goods and services directly related to the implementation of the PIR;
- vi) Priority will be given to PIRs for associations and/or interest groups in which more than 50% of the beneficiaries are women, or which are led by women;
- vii) Priority will be given to PIRs for associations and/or interest groups with at least 20% young beneficiaries of the activities funded;
- viii) Priority will be given to PIRs for associations and/or interest groups with at least 5% of PCT beneficiaries;
- ix) The funds allocated to the PIR can finance goods for collective use (e.g. a milk cooling tank or a forage motorcycle) or for family use (setting up a forage production field or pruning tools, etc.);
- x) The PIR should define the rules for the use, maintenance and management of collective assets;
- xi) The forms and modalities of access to the market for production from the PIR and the connection with processing units, in particular those financed by the Project;

- xii) The needs and points of attention in terms of TA and strengthening the capacities of the association and its members;
  - xiii) To highlight the investments and activities carried out with a view to adapting production systems and organizations to climate change, as climate investments;
  - xiv) Beneficiaries who have not registered with the CAR at the drafting stage must undertake to do so with the support of TA and the PMU team during the initial phase of implementing the PIR.
  - xv) The community must be represented by an entity that has been legally constituted for at least two years;
  - xvi) Entities must be in good standing with the Federal, State and Municipal Revenue Service.
- 1.25 The preparation of the PIR and the definition of productive activities should be carried out in accordance with the guidelines of the Strategic Environmental and Social Analysis (SEESA).
- 1.26 In the case of PIRs drawn up with traditional communities, it will be necessary to meet the requirements of the Informed Consultation and Participation (ICP) process.
- 1.27 To prepare the Project, four PIRs were drawn up to form a sample for the Economic and Financial Assessment. Based on field visits and analysis of secondary data, the following production activities were selected: i) Improving bovine milk production by implementing SAF, ii) Improving goat milk production by implementing SAF, iii) Implementing irrigated backyard gardens for fruit and vegetable production and iv) raising poultry for egg and meat production. As mentioned, these activities were selected because they have strong potential, present good integration in the socio-economic and agri-environmental context and can be in individual or collective areas. It is important to mention that during implementation, based on the demands identified, other agricultural and non-agricultural productions can be developed through PIRs, provided they meet the Project's criteria and objectives. The same PIR can support more than one productive activity.
- 1.28 It is important to note that the 04 PIRs that were drawn up as a sample during the design of the Project will have to be updated (mainly in the financial part, to take account of changes in procurement costs, and to update the list of intended beneficiaries, which may change between the design and the start of implementation).
- 1.29 The conditions under which this sample was drawn up during the design phase meant that it was not possible to draw up PIRs for a group of communities organized in a Local Territory, as will be the case during implementation. For this reason, the PIRs drawn up during the Project design phase as a sample only include one community.
- F. Investments eligible for PIR funding:**
- 1.30 PROCASE will finance the investments needed to make the PIRs viable. These investments can be classified into three groups. The extended list of eligible investments is available in the ROP:
- i) **Group 1 - Non-Consulting Services.** This group includes investments associated with hiring technical-operational services, such as transportation, application of inputs, installation of equipment, vehicle rental, technical assistance and rural extension (ATER) to producers, among others;

- ii) **Group 3 - Assets.** This group includes investments associated with the purchase of inputs, such as seedlings or seeds, and equipment for the production, processing, marketing and distribution of the products of the PIR to be promoted;
- iii) **Group 4 - Works.** This group includes investments associated with the provision or renovation of productive structures and/or economic infrastructure, such as drilling wells and processing units, with a maximum of 20% of the value of each PIR. If this percentage is exceeded, a no-objection request must be made to the IDB and IFAD, which will analyze each specific case.

**a) Types of Climate Adaptation investments that can be financed by investments in the PIRs:**

- Implementation of good ecological fertilization practices (such as biocaldas and green manures) in areas vulnerable to climate change;
- Implementation of erosion and soil loss management technologies in areas vulnerable to climate change,
- Implementation of crop protection technologies in critical areas, with SBN concepts, nature-based solutions;
- Implementation of technologies to recover soils degraded by salinization in areas vulnerable to climate change. The use of correctors such as organic matter and the insertion of microorganisms to accelerate processes will be supported;
- Productive diversification in crops and livestock in areas most vulnerable to climate change. Avoid monoculture and invasive exotic species (particularly in SAFs). Encourage crop rotation, permanent vegetation cordons, among other techniques;
- Integrated pest and disease management in areas most vulnerable to climate change, considering restrictions on the use of pesticides and genetic manipulation (transgenics);
- Management of natural pastures to guarantee animal feed and reduce vulnerability to climate change. The ESMP will consider monitoring to prevent undue deforestation to establish pastures;
- Improvement and transfer of genetic resources in plantations and genetic improvement to increase their resilience to climate change;
- In situ and ex situ conservation of biodiversity to increase resilience to climate change;
- Added value of agricultural products in value chains vulnerable to climate change;
- Irrigation or use of water in the agricultural sector, considering the source of the resource (wells, for example) and the restrictions or conditions to be respected;
- Improving existing water reservoirs for agricultural use;
- Implementation of "seeding" and water harvesting interventions;
- Implementation of intra-property infrastructure for the conduction, distribution and application of irrigation water;
- Implementation of irrigation systems with water-efficient technologies;
- Technical assistance for the sustainable use of water;

- Conservation and recovery of natural infrastructure in basins vulnerable to climate change;
- Implementation of early warning systems for floods, droughts and alluvial floods in basins vulnerable to climate change;
- Implementation of water quality monitoring systems in basins vulnerable to climate change.

**b) Types of Climate Mitigation Investments that can be financed by investments in PIRs**

**(i) Agricultural production**

- Improving the industrial energy efficiency of projects in operation (e.g. photovoltaic systems);
- Reduced energy consumption in operations;
- Agricultural projects that contribute to increasing soil carbon stocks or preventing soil carbon loss through erosion control measures;
- Reduction of GHG emissions from low-carbon agricultural practices or technologies;
- Projects that reduce methane or other GHG emissions;
- Projects that improve carbon sequestration through land management;
- Forestry or agroforestry projects that sequester carbon through sustainable forest management, avoid deforestation or prevent land degradation;
- Projects that reduce food loss or waste or promote low-carbon diets;
- Projects that contribute to the reduction of GHG emissions through the production of biomaterials / bioenergy from biomass; and
- Improving the energy efficiency of existing irrigation system projects, implementing technologies or equipment with low energy consumption, promoting good control practices, or reducing water losses (drip irrigation).

**(ii) Solid Waste and Effluent Management in Processing and Marketing Units**

- Anaerobic digestion of bio-waste collected separately;
- Composting bio-waste collected separately;
- Other types of bio-waste recovery;
- Mechanical or biological treatment of mixed waste;
- Care and handling in operation, use of PPE and accident response systems; and
- Effluent treatment systems.

**(iii) Buildings in the agricultural sector**

- Measures that reduce energy consumption, resource consumption or CO2 emissions and or increase carbon sinks by using vegetation in new and existing buildings and associated land;
- Measures that reduce energy consumption, resource consumption or CO2 emissions and, or measures that increase carbon sinks by using vegetation in new or refurbished buildings and associated land, thus meeting certification standards;
- Measures that reduce energy consumption, resource consumption or CO2 emissions and or increase carbon sinks using vegetation in public areas or facilities; and
- New or low-consumption appliances or equipment;
- Pilot experiments to introduce renewable energy sources, such as biogas or solar energy.

**(iv) Investments not eligible for PIR funding:**

- 1.31 Some types of investment will not be financed by the Project. Among other things, they cannot be financed:
- i) Purchase of real estate of any kind;
  - ii) Spending on land and environmental regularization;
  - iii) Current expenses (salaries and social charges for existing staff, water, electricity, internet, telephone);
  - iv) Operating and maintenance costs, construction, expansion, modernization, renovation and construction of civil or water works on real estate that does not have title to the land, but can present a declaration of ownership, a declaration of purchase and sale or a loan agreement;
  - v) Purchase of bovine matrices;
  - vi) Purchase of agrochemicals such as herbicides, fungicides and insecticides;
  - vii) Construction or refurbishment of processing plants that use firewood as a source of energy, in whole or in part.
- 1.32 In addition, **below is as** list of investments that cannot be financed and are prohibited from being financed under PROCASE.
- G. PIR approval process:**
- 1.33 Throughout its preparation, the PIR will be entered into the Project's management system, to make the information accessible and available for wide consultation.
- 1.34 During the preparation process, the teams from the RPMUs will make an important contribution to validating and verifying the information in the PIR. Once finalized, the PIR will be submitted to an evaluation by CEGIP (Executive Committee for the Management of Productive Investments), made up of the PMU and representatives of Paraíba state agencies (detailed composition is in the ROP). CEGIP will draw up an opinion covering the technical, economic, social and environmental areas.
- H. Criteria for evaluating and prioritizing PIRs**
- 1.35 The evaluation will follow the criteria defined in the ROP, including:

- i) Proof of economic and financial viability
- ii) Integration of technological innovations with environmental benefits (on water, biodiversity, soils, native vegetation, riparian forests, recovery of springs, etc.);
- iii) Prove the ability to integrate and adopt techniques for the recovery and protection of environmental resources;
- iv) Proof of the adoption of technological proposals based on the principles of agroecology;
- v) Proof of technical, economic and financial viability and sustainability;
- vi) Potential for strengthening family capacities and community organization;
- vii) Prove the integration and relevance of the use of social technologies;
- viii) Achieving the required 10% match, whether monetary or non-monetary;
- ix) Representation of groups of women, young people and families with persons with disabilities;
- x) Belong to traditional communities and socially vulnerable family farming communities.

1.36 The criteria mentioned in the table below have been drawn up with a view to transparency and will be used to analyze and prioritize the PIRs.

Table 01: Criteria for prioritizing and evaluating PIRs

	VARIABLE (K)	MEASUREMENT (1-10)	WEIGHTING (1-5)	SCORE
	Analysis of the contextualization (Reference Framework) of the Project (Points from 1 to 5)	1 a 5	5	25
	Analysis of the Results Matrix (feasibility, level of risks) Notes from 1 to 5	1 a 5	3	15
P R O P O S A L	Profitability (%) of PIR: classes ( $X \leq 5$ = 3 points; $(5.1 \leq X \leq 10) = 5$ ; $(10.1 \leq X \leq 20) = 7$ ; $(X \geq 21) = 10$ )	10	2	20
	Economic internal rate of return (EIRR)(%) of the PIR (classes $(12 \leq X \leq 17) = 3$ points; $(17.1 \leq X \leq 25) = 5$ ; $(X \geq 25.1) = 10$ ).	10	5	50
	Lowest cost per beneficiary, (USD1.00/producer) (classes $(X \leq 2,000) = 10$ points; $(2,001 \leq X \leq 2,500) = 7$ ;	10	5	50

(2,501≤X≤3,000) =5; (3,001≤X≤4,000) =3; (X>4,000) = 0).			
Percentage of women direct beneficiaries, (women direct beneficiaries/total beneficiaries) (classes (X≤10% = 0 points; (10%≤X≤50%) =3; (50≤X≤75%) =7; (X≥75%) = 10).	10	5	50
Percentage of PCT direct beneficiaries, (PCT direct beneficiaries/total beneficiaries) (classes (X=0% = 0 points; (1%≤X≤25%) =3; (25≤X≤65%) =5; (X≥65%) = 10).	10	5	50
Expectation of annual growth in production activity (< 10%=1 point, 10.1% to 20%= 2 points, > 20.1%= 3 points)	3	3	9
Percentage of young people (up to 35 years old) who are direct beneficiaries, (young direct beneficiaries/total beneficiaries) (classes (X≤10% = 0 points; (10%≤X≤50%) =3; (50≤X≤75%) =7; (X≥75%) = 10).	10	5	50
Expected increase in income for beneficiary producers (up to 20% = 1 point, > 20% = 2 points)	2	5	10
Market risks <sup>(3)</sup> (None or NA=10; Small= 8; Medium= 5; Large- 2; Uncertain= 1)	10	3	30
Counterpart mobilized (from 10.1 to 20 %=1, > 20.1 % =2 points)	2	3	6
Proportion of resources allocated to environmental adaptation including social technologies (< 20% = 2 points; from 20.1% to 50% = 5 points; from 50.1% to 80% = 7 points; > 80% = 10 points)	10	5	50
Technical capacity to generate water security compatible with the Project	10	5	10
Ability to guarantee food security for beneficiary families.	10	5	10

TOTAL TENDER	
--------------	--

- 1.37 Once the Committee's no-objection has been received, a Memorandum of Understanding based on the PIR will be signed by the president and one other representative of the proposing association and SEAFDS, thus allowing the transfer of funds and the start of the PIR's implementation.
- 1.38 The Project includes a compulsory social inclusion measure and must guarantee that 50% of the resources from all PIRs benefit women, 20% benefit young people, 5% benefit PCTs and 2% benefit families with persons with disabilities. The PMU must monitor and enable the achievement of this target throughout the process of evaluating and validating PIR proposals.
- I. Running arrangement**
- 1.39 SEAFDS, through the PMU, will be the executor of this subcomponent and will contract through a competitive process, in accordance with the IDB's procurement policies, civil society organizations and service cooperatives to provide TA in the selected communities. The teams from the Regional Offices will be mobilized to supervise the implementation of the PIRs and to establish synergies and complementarities between the Project and other interventions.
- 1.40 The implementation of the investments defined in the PIRs will be carried out through the Terms of Development, signed with SEAFDS and an association representing the Local Territory that drew up and submitted the PIR for approval.
- 1.41 As Local Territories are generally made up of several communities (up to three communities), there may be more than one association in the Territory that can sign a Development Agreement with PROCASE II/SEAFDS. In these circumstances, it will be necessary to choose the one that will sign the Agreement (Termo de Fomento), which will be defined at a general assembly of the communities that make up the Local Territory. At this assembly, the various criteria that are relevant to making this choice are discussed (such as the existence of a legally constituted association in good fiscal standing, openness to incorporating new members, previous experience of managing resources, and others).
- 1.42 The beneficiary organizations that have signed the Agreement will be responsible, through the training process to strengthen them and with the support of TA (cf. Subcomponent 2.1), for purchasing goods and services with the funds received through the Terms of Agreement and then for accounting for these funds.
- 1.43 The state of Paraíba requested this methodology of making beneficiary organizations accountable through the transfer of funds to associations, based on the good results obtained during the implementation of PROCASE I, among other projects monitored by the IDB and IFAD in other states. Other projects supported by the IDB, such as PDSA II in the state of Acre, have also achieved good results, both in terms of implementing activities and strengthening beneficiaries' capacities to collectively manage resources to implement activities. This strengthening contributes to sustainability and the ability to replicate the activities once the projects have been completed.
- 1.44 The funds will be passed on to the Community Association, which will have to open a specific account to manage the PROCASE funds. Disbursements will be made according to the execution schedule and may not exceed 20% of the total cost of the PIR. To receive

additional amounts, the Community Association must justify at least 60% of the advance received.

- 1.45 The aspects and modalities that will have to be applied for financial implementation, the procurement processes and the accounting of the beneficiaries' counterparts will be detailed in the ROP.
- 1.46 Based on these aspects, there will be a training process led by the PMU to create the necessary capacities to manage the implementation of the PIR. The TA entity responsible for drafting and monitoring its implementation will train the heads of the associations involved and provide the necessary support to the beneficiaries to comply with the rules defined.
- 1.47 For the implementation of the PIR and with the support of TA, the partner associations will organize thematic committees (such as procurement, accountability and transparency) to support management, in which the participation of women and young people will be a composition criterion. The participation of young people will be encouraged, in particular to develop the use of digital technology, for the implementation and monitoring of the PIRs.

**J. Costs and outreach**

- 1.48 The Project will work in up to 600 communities, through 200 Resilient Investment Plans, considering that each PIR will be drawn up by around 3 communities, thus constituting a Local Territory. The PIR of a Local Territory will be equivalent to the accumulation of 3 community PIRs, such as the models drawn up in the design (sample for the Economic and Financial Assessment), considering that it was not possible to draw up a PIR for a Local Territory during this phase.

Costs and scope of Subcomponent 1.1

Discrimination	Unit	Qty.	Costs (US\$)		Reach
			Unit	Total	
Resilient Investment Plan (PIR)	PIR	200	281 080	56 216 000	18 000 Families

**c) Achievement of targets**

- 1.49 The PIRs will benefit approximately 18,000 families, of which 50% should be represented by women, 20% by young people and 5% by Traditional Peoples and Communities and 2% for families with persons with disabilities.

**K. Timetable for the 6 years of implementation**

6-year timetable for the implementation of Subcomponent 1.1

Stages	Year 1	Year 2	Year 3	Year 4	Year 5	Year 6

	1	2	3	4	1	2	3	4	1	2	3	4	1	2	3	4	1	2	3	4	1	2	3	4	
Action 1: Resilient Investment Plans drawn up					█	█	█	█	█	█	█	█													
Action 2: Resilient Investment Plans executed (>75%)									█	█	█	█	█	█	█	█	█	█	█	█					

## **Appendix 1:**

### **(Suggested) content roadmap for the PIR**

1. **SUMMARY OF THE PLAN.**
  - 1.1 General Data.
  - 1.2 Beneficiaries.
  - 1.3 Type of community.
2. **PRESENTATION.**
  - 2.1 Local context and characterization of the municipality and region.
  - 2.2 Characterization of the community.
    - 2.2.1 Organizational and social aspects.
    - 2.2.2 Basic and productive infrastructures.
    - 2.2.3 Environmental and economic aspects.
    - 2.2.4 Access to public policies.
3. **PLAN PROPOSAL.**
  - 3.1 Justification.
  - 3.2 General Objective.
  - 3.3 Specific Objectives.
  - 3.4 Targets, costs and timetable
  - 3.5. **STRUCTURAL ELEMENTS OF THE PROJECT.**
    - 3.5.1 Environmental aspects.
    - 3.5.2 Technical aspects.
    - 3.5.3 Support through social technologies.
    - 3.5.4 Technical Assistance.
    - 3.5.5 Access to public policies.
    - 3.5.6 Economic and financial aspects.
  - 3.6. **INVESTMENTS**
    - 3.6.2 Revenue projections.
    - 3.6.3 Statement of production costs.
    - 3.6.4 Statement of fixed costs and expenses.
    - 3.6.5 Investment viability.
    - 3.6.6 Outcome Measures and Feasibility Indicators: IRR, NPV
  - 3.7. Organizational, administrative and managerial aspects.

3.8. Environmental and social protection.

3.9 **FEASIBILITY**

3.9.1 Technical

3.9.2 Economic (Cost-Benefit)

3.9.3 Financial

3.9.4 Socio-environmental

3.9.5 Institutional

3.10 **PROJECT RISKS**

4. **ANNEXES.**

4.1 Nominal list of beneficiaries.

4.2 Environmental and social verification form.

4.3 Plans of the infrastructure to be implemented.

4.4 List of equipment and their respective prices

4.4 Breakdown of investments by product and schedule.

## ANNEX 3

### Strengthening and Diversifying Commercialization

#### A. Objective

- 1.1 This sub-component aims to improve marketing and the inclusion of families in value chains by improving the management and production structures of family farmers' cooperatives.

#### B. Strategic orientation and methodology

- 1.2 It aims to strengthen cooperatives by means of a Business Plan (PN), with a view to consolidating their management capacities, adding value, diversifying their commercial offer and accessing markets under better conditions. Rather than seeking to create new cooperatives, priority will be given to existing cooperatives to improve their management capacities and those with operational weaknesses.
- 1.3 The elaboration of these PNs will consider the strengthening of production carried out in subcomponent 1.1 through the PIRs, with the aim of integrating producers into these cooperatives to access the market.
- 1.4 The development of the PN will seek to diversify the markets accessed. In addition to institutional markets, such as PNAE and PAA, other players will be sought, mainly from the private sector. The Project will seek to include the organizations in the Regional Information System for Family Farming in the Northeast (SIRAF), created by the Northeast consortium and which has been offering a new channel for establishing contact between producers and buyers.
- 1.5 Business Plans (PNs) will be the main instrument for implementing the subcomponent and will be drawn up with producers' economic organizations, usually cooperatives. The PNs should make it possible to finance structuring investments that could benefit family farmers, including the producers benefiting from the PIRs. Specialized Technical Assistance (STA) Services specially dedicated to the PNs and to strengthening the capacities of the beneficiary organizations will also be financed by the PNs.
- 1.6 The PNs should allow for the implementation of competitive mechanisms, geared towards innovative and environmentally sustainable solutions, to strengthen network marketing and cooperative centers.
- 1.7 Investments will be focused on existing organizations that have weaknesses in their management processes, that are unable to achieve sufficient levels of commercialization, that find it difficult to comply with environmental and health legislation, or that operate below their capacity. In these cases, the Project will strengthen the capacities of the management teams, support the improvement and modernization of equipment and facilities, improving the processing and diversification of products, with a focus on adapting and/or expanding the physical infrastructure (such as processing and storage areas), with the aim of also meeting the health and environmental standards for obtaining certifications (SIF, organic certification, distinctive collective seals, valuing sustainable products from the Caatinga and Atlantic Forest biomes, etc.). Where relevant, the development of participatory guarantee systems (PGS) geared towards certification processes will also be supported.

Subcomponent 2.2 will make an important contribution to these activities and complementarities will be built.

- 1.8 In exceptional cases, the Project's support may be aimed at structuring the productive capacity of a cooperative, operating within the supported production chains. These cases will be specific and subject to prior feasibility analysis, considering in particular the existence of other similar ventures in the Project area.
- 1.9 Strengthening the capacities of the cooperatives' teams will be a key point of the PNs, which will address the issue of best processing practices and others, such as administrative and financial management. In this case, courses are planned on good management practices and the organization of production, processing, adding value, financial management, institutional strengthening, marketing strategies, etc. The management teams of these enterprises will be the main beneficiaries. These courses will mainly be carried out through specialized consultancies (such as individual consultants, EMPAER, EMBRAPA, SEBRAE, SENAR, etc.).
- 1.10 Preparing the Business Plans will include a diagnosis of the organization's situation, clearly identifying the most important problems and difficulties encountered and the opportunities that can be seized. The PNs may include agricultural activities of primary production, processing and marketing of this production. Other economic initiatives can also be included, such as handicrafts and community-based tourism, among others, provided they have the potential to generate income in a sustainable way. As the object of these Plans will be 'business' related, involving production and market issues, it is necessary to include more detailed information such as a 'map' of the production chain identifying flows and actors, an analysis of the products demanded by the market and their trends (volumes, prices), an analysis of the competition, a strategy for operating in the market, a sales plan and an investment management strategy. The Business Plan will identify the material investments that will have to be made (construction/refurbishment, machinery, equipment, etc.). In addition, it should point out the training needs (which may cover production, marketing, administrative and financial management, or other dimensions) that the implementation of the Business Plan will require.

### **C. Provision of Specialized Technical Assistance (STA) services**

- 1.11 Considering the capacities found in the organizations in the region served by the Project, it will be necessary to contract STA services for the preparation and implementation of all the Plans. These services will be contracted by the PMU, through a competitive process that meets IDB/IFAD standards, with funds provided in the budget for Subcomponent 2.2. However, in certain cases and when the beneficiary organization shows experience and capacity, it could take on the responsibility of contracting the STA directly.
- 1.12 Individuals or legal entities may be contracted to provide these services. The criteria for selecting providers will include: i) experience in providing consultancy services to family farming cooperatives; ii) technical capacity related to the specific problem(s) identified by the cooperative, such as improving processing processes, developing a strategy and identifying new marketing channels, developing a certification system, etc.; iii) technical capacity to deal with and integrate environmental issues related to the activities carried out by the cooperatives being assisted; iv) capacity to work remotely (using digital tools); v) experience with access to public policies.

- 1.13 STA services should encourage supported organizations to look for other sources of funding and service providers to complement the resources allocated by PROCASE II and also to meet demands not included in the business plans it supports. Opportunities for cooperation and alliances with the private sector will also be sought whenever possible.

#### **D. Identification and selection of beneficiary organizations**

- 1.14 Considering the heterogeneity between the cooperatives in the Project area in terms of structure, capacities and experience, the process of selecting and drawing up the PNs will be different depending on the size of the organizations.
- 1.15 **For small organizations**, with an annual turnover of up to USD 100,000 (average of the last 3 years), which are generally inexperienced organizations with more limited capacities in particular for drawing up a PN, the Project team will carry out a direct survey of these organizations in the area of operation and conduct a selection process. Once the organization has been selected, the PMU will contract the services of a specialized technical assistance (STA), either an individual or a legal entity, to begin drafting the PN and its subsequent implementation.
- 1.16 For larger organizations with annual turnover of over USD 100,000 (average of the last 3 years), which generally have greater capacity, the identification and selection process will be done through publishing calls for proposals. In the first years of implementation, a broad dissemination and information process will be carried out by the PMU to ensure that interested organizations are aware of this selection procedure. Proposals (Expressions of Interest, presenting a project proposal) will be drawn up directly by the proposing organizations and sent to the PMU, which will be evaluated by the Evaluation Committee.
- 1.17 In both cases (small organizations and larger organizations), proposals will be selected based on the following criteria: i) Productive activity with the potential for technical, economic, financial and environmental viability; ii) Not having received benefits from other grant projects for similar items; iii) Inclusion of new members in the cooperative through the investment, with priority given to women, young people and persons with disabilities; iv) Ability to provide a counterpart (monetary and non-monetary) above the floor of 20% of the NP's value; v) Making innovative environmental investments and climate adaptation and mitigation.
- 1.18 To provide STA, the Project could seek partnerships with experienced organizations, such as SEBRAE, so that an integrated technical consultancy plan can be drawn up.

#### **E. Preparation of the PNs**

- 1.19 Once the PN proposals have been selected (criteria defined in the ROP), the drafting process will begin, which will be identical in format for both modalities (small and large organizations), being adapted to the level of complexity of each organization.
- 1.20 The first stage of the preparation will be to carry out a diagnosis (within a maximum of 3 months), focusing on:
  - i. Validate the organization's demand from the point of view of the processing process and market access to be supported;
  - ii. Evaluate the organization's capacity to manage the requested PN and assess its experience in similar areas to carry out procurement, production, commercial and accounting management, etc.;

- iii. Carrying out specific and pragmatic studies to provide information on the characteristics, bottlenecks and potential of each product and identifying innovative and differentiated markets that can add value to the sustainable production initiatives supported by the Project;
- iv. Carry out local demand studies (inputs and production for sale) detailing key factors such as volumes sold, prices, quality, ease of access, competition, weaknesses and deficiencies;
  - v. A survey of the availability of raw materials, considering, among other factors, the production planning of the PIRs supported by the Project, to guarantee the operation of these units and the disposal of the production of the families benefiting from the PIRs;
  - vi. Gather technical data on the evolution of production and marketing capacity, identifying potentials and risks;
  - vii. Identify the main competition and other similar units in the region;
- viii. Gather information and lessons learned about previous support received to strengthen the organization;
- ix. Survey the social characteristics of the members, the capacity for collective management and the level of social organization, which will include the participation of women and young people in decision-making processes;
- x. Compliance with aspects related to environmental and health management and in accordance with the relevant legislation;
- xi. Identify the needs from the STA's point of view to strengthen capacities relating to the production process, marketing, management and governance;
- xii. Identify the need for adaptations for persons with disabilities;
- xiii. Identify technical proposals with a view to introducing technologies such as biodigesters, solar energy and internet access;
- xiv. Identify the points of attention related to social and environmental safeguards;
- xv. Identifying the ability to access public policies;
- xvi. Articulate with other local actors and in particular with COOPERAR, which has developed similar actions;
- xvii. Complying with aspects related to Health and Safety at Work in accordance with the relevant legislation.

1.21 Based on the diagnosis, the PN will define the resources needed to invest in infrastructure, equipment and goods, as well as to finance ETC services to implement and strengthen management capacities (considering that the resources to finance ETC are allocated to Component 2).

1.22 The main items that can be financed by the PN are:

- i. Adapting and/or expanding existing processing units and adjusting comply with health and environmental legislation, as well as ensuring accessibility for the disabled;
- ii. The investments made should enable cooperatives to adapt to climate change, such as the use of solar energy, water collection and reuse systems, etc. These investments could include social technologies such as production cisterns or grey water reuse systems;
- iii. Support from STA for the development of marketing strategies, including the definition of strategies for reaching the municipal and state institutional market, as well as access to the private market. This could include the development of printed material or electronic media (website, Instagram, etc.) for the dissemination of information and e-commerce;
- iv. Support for obtaining organic and agroecological certifications and seals of origin;
- v. Construction, adaptation or renovation of processing units with producer organizations in compliance with environmental and health legislation;
- vi. Improvement of management processes (through technical support, acquisition of a program/system to improve process management, etc.) with a focus on efficiency and transparency;
- vii. Investment in the installation of renewable energy and rural connectivity, investment in product development and packaging;
- viii. Investments that enable greater participation by young people, women and the disabled.

1.23 All the activities financed in the PNs will be in accordance with the Environmental and Social Management Plan (ESMP) for each one and with the Project's Strategic Environmental and Social Management Plan (ESMP).

1.24 During the process of drawing up the PN, the following criteria should be considered:

- i. NP for small cooperatives: The minimum amount per PN (without counterpart from the beneficiary organization) is USD 40,000 and the ceiling amount will be up to USD 80,000. PNs with fewer than 30 members cannot be financed. The amount of funding from PROCASE II cannot exceed USD 700 per cooperative member to finance investments;
- ii. NP for medium and large cooperatives: The minimum amount per PN (without counterpart from the beneficiary organization) is USD 120,000 and the ceiling amount will be up to USD 250,000. PNs with fewer than 80 members cannot be financed. The amount of funding from PROCASE II cannot exceed USD 800 per cooperative member to finance investments;
- iii. The funds from the Project will be non-reimbursable. A counterpart contribution must be made by the beneficiary organization, equivalent to at least 20% of the amount financed by the Project, and may be monetary or proven in goods and services related to the implementation of the PN;

- iv. There must be a commitment for organizations to increase the number of new members, especially women and young people;
- v. The resources allocated to the PN should make it possible to finance goods for collective use (such as processing equipment);
- vi. Planning proposed within the framework of marketing to include additional production from the PN (and related PIRs);
- vii. Definition of the STA services that will be carried out for the main themes such as management, governance, good practices in production and marketing processes, environmental and social management;
- viii. Evidence of investments in activities carried out with a view to adapting processes and adhering to climate change (which can be described as climate investments);
- ix. Facilitate dialogues with financial institutions to access PRONAF and other sources of credit;
- x. The list of fundable and non-fundable items is shown below and is detailed in the ROP.

#### **F. Investments eligible for funding**

1.25 PROCASE II will finance the investments needed to make the PNs viable. These investments can be classified into three groups:

- i) **Group 1 - Non-Consulting Services.** This group includes investments associated with hiring technical-operational services, such as transportation, application of inputs, financing of working capital for the first year of operation, installation of equipment, rental of vehicles, among others;
- ii) **Group 2 - Assets.** This group includes investments associated with the purchase of inputs for the cooperative, such as seedlings or seeds, and equipment for the production, processing, marketing and distribution of the products of the NP to be promoted;
- iii) **Group 3 - Works.** This group includes investments associated with the provision or renovation of production structures and/or economic infrastructure, such as road rehabilitation, well drilling and processing units, with a maximum of 20% of the value of each business plan.

#### **G: Types of Climate Adaptation investments that can be financed by investments in the PNs:**

- i. Implementing good agroecological fertilization practices in areas vulnerable to climate change;
- ii. Implementation of erosion and soil loss management technologies in areas vulnerable to climate change;
- iii. Implementation of crop protection technologies in critical areas;
- iv. Implementation of technologies to recover soils degraded by salinization in areas vulnerable to climate change;
- v. Productive diversification in crops and livestock in areas most vulnerable to climate change;
- vi. Integrated pest and disease management in areas most vulnerable to climate change;

- vii. Management of natural pastures to guarantee food for young animals and reduce vulnerability to climate change;
- viii. Improvement and transfer of genetic resources in plantations and genetic improvement to increase their resilience to climate change;
- ix. In situ and ex situ conservation of biodiversity to increase resilience to climate change;
- x. Strengthening risk transfer systems in the event of adverse climatic events;
- xi. Implementation of strategic agro-climatic information services to adapt to the effects of climate change;
- xii. Implementation of adaptive technological innovation services in the face of climate change in agricultural value chains;
- xiii. Added value of agricultural products in value chains vulnerable to climate change;
- xiv. Irrigation or water use in the agricultural sector;
- xv. Improving existing water reservoirs for agricultural use;
- xvi. Implementation of "seeding" and water harvesting interventions;
- xvii. Implementation of intra-property infrastructure for the conduction, distribution and application of irrigation water;
- xviii. Implementation of irrigation systems with water-efficient technologies;
- xix. Technical assistance for the sustainable use of water;
- xx. Conservation and recovery of natural infrastructure in basins vulnerable to climate change;
- xxi. Implementation of early warning systems for floods, droughts and alluvial floods in basins vulnerable to climate change;
- xxii. Implementation of water quality monitoring systems in basins vulnerable to climate change; and
- xxiii. Implementation of information systems to improve the planning and management of water resources in basins vulnerable to climate change.

## **H: Types of Climate Mitigation Investments that can be financed by investments in the PNs**

### a) Agricultural production

- i. Improving the industrial energy efficiency of projects in operation;
- ii. Reduced energy consumption in operations;
- iii. Agricultural projects that contribute to increasing soil carbon stocks or preventing soil carbon loss through erosion control measures;
- iv. Reduction of GHG emissions and low-carbon agricultural practices or technologies;
- v. Projects that reduce methane or other GHG emissions;
- vi. Projects that improve carbon sequestration through land management;
- vii. Forestry or agroforestry projects that sequester carbon through sustainable forest management, avoid deforestation or prevent land degradation;
- viii. Projects that reduce food loss or waste or promote low-carbon diets;
- ix. Projects that contribute to the reduction of GHG emissions through the production of biomaterials / bioenergy from biomass; and

- x. Improving the energy efficiency of existing irrigation system projects, implementing technologies or equipment with low energy consumption, promoting good control practices, or reducing water losses (drip irrigation).
- b) Solid waste and effluent management in processing and marketing units
  - i. Anaerobic digestion of bio-waste collected separately;
  - ii. Composting bio-waste collected separately;
  - iii. Other types of recovery and recovery of bio-waste; and
  - iv. Mechanical or biological treatment of mixed waste.
- c) Buildings in the agricultural sector
  - i. Measures that reduce energy consumption, resource consumption or CO<sub>2</sub>e emissions, or increase carbon sinks by using vegetation in new and existing buildings and associated land;
  - ii. Measures that reduce energy consumption, resource consumption or CO<sub>2</sub>e emissions, or measures that increase carbon sinks by using vegetation in new or refurbished buildings and associated land, thus meeting certification standards;
  - iii. Measures that reduce energy consumption, resource consumption or CO<sub>2</sub> emissions and or increase carbon sinks using vegetation in public areas or facilities; and
  - iv. New or low-consumption appliances or equipment;
  - v. Pilot trials of processing plants using renewable energy sources, such as biogas or solar energy.

### **I: Investments Not Eligible for Financing**

- 1.26 Some types of investment will not be financed by the Project, even if they are necessary to make the PNs viable. Among other things, they cannot be financed:
- i) Purchase of real estate of any kind, spending on land regularization;
  - ii) Current expenses (salaries and social charges for existing staff, water, electricity, internet, telephone);
  - iii) Operating and maintenance costs, construction, expansion, modernization, renovation and construction of civil or water works in properties with a lending agreement;
  - iv) Activities related to raising cattle for meat production;
  - v) Purchase of agrochemicals such as herbicides, fungicides, insecticides and synthetic fertilizer;
  - vi) Construction or renovation of flour mills and other processing units that use firewood as a source of energy.
- 1.27 In addition, there is a list of investments that are prohibited from being financed under PROCASE (see Annex XXXX). During the process of drawing up the PNs, the Project and

ETC teams will be responsible for checking that the type of investment complies with these conditions.

**J: Criteria for evaluating and prioritizing PNs**

- 1.28 Once the ROP has been drawn up, it will be presented to the Council of Territories for consultation and then submitted for evaluation by CEGIP (Executive Committee for Productive Investment Management), made up of the PMU and representatives of Paraíba state bodies. The evaluation will follow the criteria defined in the ROP. These include:
- i. Potential for adding value;
  - ii. Technical, economic, financial and environmental feasibility;
  - iii. Achieving the required counterpart level;
  - iv. Percentage of the PN earmarked for financing environmental investments;
  - v. Proof of the adoption of technological proposals based on the principles of agroecology;
  - vi. Integration of new members into cooperatives, particularly women, young people and families with Persons with Disabilities;
  - vii. Participation of women and young people as members and in positions of responsibility on the board of the beneficiary organization;
  - viii. Creation of new jobs;
  - ix. Absorption capacity of production from PIRs financed by Subcomponent 1.1;
  - x. Ability to contribute to accessing new markets;
  - xi. Ability to help integrate new producers as raw material suppliers.
- 1.29 The Project includes a mandatory social inclusion measure and must guarantee that 50% of the resources from all the PNs benefit women and 20% benefit young people, 5% benefit PCTs and 2% benefit families with persons with disabilities. The Project Committee must monitor and enable the achievement of this target throughout the process of evaluating and validating the proposals for the PNs.
- 1.30 The criteria mentioned in the table below have been drawn up with a view to transparency and will be used as a reference during the evaluation process.

**Table 04: PN evaluation criteria**

	<b>VARIABLE (K)</b>	<b>MEASUREMENT (1-10)</b>	<b>WEIGHTING (1-10)</b>	<b>SCORE</b>
	Analysis of the contextualization (Reference Framework) of the Project (Points from 1 to 10)	1 a 10	5	50

	<b>VARIABLE (K)</b>	<b>MEASUREMENT (1-10)</b>	<b>WEIGHTING (1-10)</b>	<b>SCORE</b>
	Analysis of the Results Matrix (feasibility, level of risks) Notes from 1 to 10	1 a 10	5	50
P R O P O S A L 8	Profitability (%) of agribusiness estimated in PN (classes ( $X \leq 5$ ) =3 points; ( $5.1 \leq X \leq 10$ ) =5; ( $10.1 \leq X \leq 20$ ) =7; ( $X \geq 21$ ) =10)	10	2	20
	Economic internal rate of return (EIRR) <sup>18</sup> (%) of the Business Plan (classes ( $12 \leq X \leq 17$ ) =3 points; ( $17.1 \leq X \leq 25$ ) =5; ( $X \geq 25.1$ ) =10).	10	5	50
	Lowest cost per beneficiary, (USD1.00/producer) (classes ( $X \leq 2,000$ ) =10 points; ( $2,001 \leq X \leq 2,500$ ) =7; ( $2,501 \leq X \leq 3,000$ ) =5; ( $3,001 \leq X \leq 4,000$ ) =3; ( $X > 4,000$ ) =0).	10	5	50
	Percentage of women direct beneficiaries, (women direct beneficiaries/total beneficiaries) (classes ( $X \leq 10\%$ ) = 0 points; ( $10\% \leq X \leq 50\%$ ) =3; ( $50 \leq X \leq 75\%$ ) =7; ( $X \geq 75\%$ ) =10).	10	10	100
	Percentage of PCT direct beneficiaries, (PCT direct beneficiaries/total beneficiaries) (classes ( $X=0\%$ ) = 0 points; ( $1\% \leq X \leq 25\%$ ) =3; ( $25 \leq X \leq 65\%$ ) =5; ( $X \geq 65\%$ ) =10).	10	10	100
	Percentage of young direct beneficiaries, (young direct beneficiaries/total	10	7	70

<sup>18</sup> Business plans with a IRR of less than 12% will not be eligible to receive funds from the Project.

	<b>VARIABLE (K)</b>	<b>MEASUREMENT (1-10)</b>	<b>WEIGHTING (1-10)</b>	<b>SCORE</b>
	beneficiaries) (classes (X=0% = 0 points; (1%≤X≤25%) =3; (25≤X≤65%) =5; (X≥65%) = 10).			
	No. of producers benefiting from the Business Plan (classes: up to 100 =3; 100 up to 150 =7; > 150=10 points)	10	2	20
	Expected increase in income for beneficiary producers (up to 20% = 1 point, > 20% = 2 points)	5	2	10
	Market risks (None or NA=10; Small= 8; Medium= 5; Large- 2; Uncertain= 1)	10	3	30
	Proponent's maturity ((2≤X≤3 years) = 2 points; (3≤X≤5 years) =5 points; (6≤X≤10 years) =7 (X≥10 years) = 10 points)	10	5	50
	Technical capacity to generate water security compatible with the Project	10	5	10
	Ability to guarantee food security for beneficiary families	10	5	10
	<b>TOTAL Proposal</b>			

- 1.31 Once the ROP has been approved, a Memorandum of Understanding will be signed between the beneficiary organization and SEAFDS. The funds will be transferred according to the criteria defined by the fiduciary sector and mentioned in the ROP.
- 1.32 To prepare the Project, two PNs were drawn up to form a sample for the Economic and Financial Assessment. Based on field visits and analysis of secondary data, the following economic organizations and productive activities were selected: i) Primary production and processing of honey, and ii) Strengthening of production capacities and primary processing of organic cotton. These activities were selected because they have strong potential and are well integrated into the socio-economic and agro-environmental context. It is important to mention that during implementation, based on the demands and economic organizations

identified, other agricultural and non-agricultural chains may be supported through PNs, as long as they meet the Project's criteria and objectives.

### **K: Implementation of PNs**

- 1.33 Implementation of the PN will begin once the Development Agreement has been signed and the funds have been made available to the organization. The use of the PN amount will follow the rules defined in the ROP, through installments, proof and validation of spending, provided that at least 60% of the amount already disbursed is accounted for.
- 1.34 The implementation phase will follow the timetable set during the preparation of the PN. In general, in the first year of implementation, priority will be given to investments in infrastructure and equipment.
- 1.35 Capacity building in management, marketing and market access will be carried out over the two years with the support of TA.
- 1.36 During this phase, STA will be looking to establish agreements and partnerships between the cooperatives and associations benefiting from the PIR, with a view to acquiring, processing and marketing production.

### **L: Running arrangement**

- 1.37 SEAFDS, through the PMU, will be responsible for implementing this sub-component. In each Rural Territory of the state, the teams from the Regional Offices will be mobilized and will contribute to establishing synergies and complementarities between the implemented NP and other interventions (COOPERAR in particular).
- 1.38 The implementation of the PNs will be carried out through the Terms of Support signed by SEAFDS with each beneficiary organization.

### **M: Costs and reach**

#### Costs and scope of subcomponent 1.2

Discrimination	Unit	Qty.	Costs (US\$)		Reach
			Unit	Total	
<b>Business plans for large and medium-sized cooperatives</b>	PN	20	198 000	3 960 000	3 000 families
<b>Business plans for small cooperatives</b>	PN	40	48 000	1 920 000	2 000 families
<b>Total</b>	PN	60		6 000 000	5 000 families

### **N: Timetable for the 6 years of implementation**

#### 6-year timetable for the implementation of Subcomponent 1.2

Stages	Year 1				Year 2				Year 3				Year 4				Year 5				Year 6			
	1	2	3	4	1	2	3	4	1	2	3	4	1	2	3	4	1	2	3	4	1	2	3	4
Economic organizations with agreed Business Plans																								
Economic organizations with executed business plans (>75%)																								

## **Appendix 3.1**

### **Suggested content roadmap for preparing the PN**

#### **Appendix 1: Content roadmap for the PN**

1. **SUMMARY OF THE BUSINESS PLAN**
  - 1.1 General Data.
  - 1.2 Public Beneficiaries.
  - 1.3 Type of community.
2. **PRESENTATION**
  - 2.1 Local context and characterization of the municipality and region.
  - 2.2 Characterization of the community.
    - 2.2.1 Organizational and social aspects.
    - 2.2.2 Basic and productive infrastructures.
    - 2.2.3 Environmental and economic aspects.
    - 2.2.4 Access to public policies.
3. **BUSINESS PLAN PROPOSAL**
  - 3.1 Justification.
  - 3.2 General Objective.
  - 3.3 Specific Objectives.
  - 3.4 Targets, costs and timetable
  - 3.5. **STRUCTURAL ELEMENTS OF THE PROJECT**
    - 3.5.1 Environmental aspects.
    - 3.5.2 Technical aspects.
    - 3.5.3 Support through social technologies.
  - 3.6. **COMMERCIALIZATION**

- 3.7. Technical Assistance.
  - 3.8. Access to public policies.
  - 3.9. Economic and financial aspects.
    - 3.9.1. **INVESTMENTS**
    - 3.9.2 Revenue projections.
    - 3.9.3 Statement of production costs.
    - 3.9.4 Statement of fixed costs and expenses.
    - 3.9.5 Investment viability.
    - 3.9.6 Outcome Measures and Feasibility Indicators: IRR, NPV
  - 3.10. Organizational, administrative and managerial aspects.
  - 3.11. Environmental and social protection.
  - 3.12 **FEASIBILITY**
    - 3.12.1 Technical
    - 3.12.2 Economic (Cost-Benefit)
    - 3.12.3 Finance
    - 3.12.4 Socio-environmental
    - 3.12.5 Institutional
  - 3.13 **PROJECT RISKS (PN)**
- 
- 4. **ANNEXES.**
    - 4.1 Nominal list of beneficiaries.
    - 4.2 Environmental and social verification form.
    - 4.3 Plans for the infrastructure to be implemented.
    - 4.4 List of equipment and their respective prices
    - 4.4 Breakdown of investments by product and schedule.

## ANNEX 4

### Incentives for Innovation

#### A: Objective

- 1.1 Innovations are an important part of this component, focusing mainly on the topic of mechanization (see also Annex "Knowledge Management (KM), South South and Triangular Cooperation (SSTC) and Innovations in PROCASE II"). PROCASE II will promote innovation initiatives by providing funding and technical assistance to identified innovators, helping them to scale up their initiatives to reach other farmers.

#### B: Strategic orientation and methodology

- 1.2 PROCASE II will promote innovations developed specifically for family farming systems, such as tools for agroecological practices, machinery for small-scale agro-industries, biotechnologies aligned with the concept of resilient production systems, among others. Some examples include small tractors, pruning tools, forage cutting machines and oilseed processing engines. Many of these innovative initiatives already exist in the Project area. They will need to be identified, assessed in terms of their suitability for strengthening resilient family systems, improved (where appropriate), and/or disseminated. In several cases, it will be a question of promoting tests of the use of new equipment in the real conditions of family units in Paraíba. Promising innovative initiatives that need resources to consolidate themselves as a benchmark for innovation to be disseminated may be financed by an investment fund that will provide between US\$ 10,000 and 60,000 (R\$ 50,000 and 300,000) for each one, depending on their financing needs. The selected projects will be accompanied by a team of experts in the expansion process (the costs of the support activities are included in the amount of funding received by each initiative).

#### C: Actions and expected results

- 1.3 The Project will fund the development of initiatives (which could be small 'backyard' companies, research groups, experimenting farmers, among others) aimed at creating products and technologies tailored to the local context, such as machinery adapted to small producers and equipment for processing and adding value (priority themes). The Project will also fund innovations in secondary themes, such as products derived from native/traditional species, bio-inputs (soil nutrition, bio-insecticides), efficient water management technologies, solid waste treatment, etc.
- 1.4 The investment dedicated to this sub-component will enable up to 25 initiatives of this nature to be funded. The selected initiatives will receive the following benefits:
  - i) Funding from R\$ 50,000 to R\$ 300,000 (including support activities mentioned below);
  - ii) Technical consultancy;
  - iii) Mentoring focused on the business and the market;
  - iv) Development of business plans;
  - v) Support with design and visual communication;
  - vi) Networking and partnership opportunities.

#### D: Themes for the initiatives

- 1.5 To qualify, innovation initiatives must fall into the following types:
  - a) **Priority Innovative Themes**

- i) Mechanization for small producers/organizations: Adapted mechanization for agroecological and agroforestry family farming, such as motor cultivators, forage palm choppers and feeders, long-arm pruning shears, woodchippers and other small implements. Companies that share or rent<sup>19</sup> machines and implements will also be supported.
- ii) Technologies for Cooperatives and Associations: machines and implements for cooperatives and associations, such as pulpers, dehydrators, dryers, mills, packaging machines and processing machines in general, as well as recycling machines such as waste separators and processors.

**b) Secondary Innovative Themes**

- i) Agroecological Markets and Local Biodiversity: Promoting nutrition based on local biodiversity, through the development of products derived from native/traditional species, the extraction of oils and essences, the creation of agroecological fairs, greengrocers, restaurants and snack bars, etc.
- ii) Adapting to Climate Change: water harvesting and efficiency technologies, climate comfort, etc.
- iii) Access to renewable energies: Financing and installation of photovoltaic panels for small producers, heat pumps, energy efficiency works, reduction in the use of firewood, biodigesters, etc.
- iv) Soil nutrition and integrated pest/weed management: manufacture of organic fertilizers and products used in the biological control of pests and weeds, such as the production of green manure seedlings and seeds, inoculation of natural enemies, production of compost, bio-slurries and other bio-inputs.
- v) Studies and research projects: small research projects that can be classified as innovative projects, for example new variants of agroforestry systems.
- vi) Digital tools for small producers: Access to digital technical assistance (including plant and insect identification, recommendations for fertilization or weed or pest control), Information services (prices, logistics, soil conditions, weather information and early warning systems), Financial services (financial management tools and access to credit and insurance), Digitization of the supply chain (recording information, planning tools, sharing implements, shared transport of products and inputs, etc.) and Access to markets and inputs (Sale of family farming products, purchase of inputs, etc.) and Access to markets and e-commerce (sale of family farming products, purchase of inputs, etc.).
- vii) Digital tools for cooperatives and associations: Resource sharing (machinery, implements, processing equipment/facilities, etc.), Market access and e-commerce, Planning and management tools (recording information, organizing inventories, etc.) and Certification and legal compliance tools, (checklists for obtaining licenses or preparing for health inspections, etc.).

**E: Execution Arrangement**

---

<sup>19</sup> Cf.: <https://www.sciencedirect.com/science/article/pii/S0308521X18314914> and <https://repository.cimmyt.org/xmlui/bitstream/handle/10883/22429/65927.pdf?sequence=1&isAllowed=y>

- 1.6 The Project Management Unit (PMU) will appoint a foundation responsible for innovation that will examine existing prototypes in the Project area and select innovators according to predefined criteria. The Project will finance the expansion of these initiatives, providing guidance, refining the prototypes and facilitating access to the market. The selection can be done through a competitive process (calls for tenders) or through a direct search in the Project area, with the help of the Project team and TA technicians. The direct search for existing innovations will involve the local PROCASE II offices and will focus on Federal Institutes (IFs), Agricultural Family Schools (EFAs), Universities, Rural Schools and local artisans. The work carried out by local institutions such as SERTA (<https://serta.org.br/>) serves as an example of how the innovations identified by the Project could be supported.
- 1.7 The foundation selected must be a non-profit organization and preferably linked to a university, with the same foundation being responsible for the Knowledge Management and South-South Cooperation component (2.5). The incubation and monitoring of innovations can be done directly by the Foundation (if it has experience in this area) or in partnership with a social entrepreneurship incubator, such as IACOC (incubator of the Paraíba Technology Park).

#### **F: Possible criteria for funding and support**

- 1.8 Below are some criteria that could be considered when choosing the innovative initiatives to be supported by the Project. These criteria will be further detailed in the PIM (ROP).
- i) Social Criterion: The innovation must seek to have a positive social and environmental impact, for example by aiming for low prices for farmers and fair pay for workers.
  - ii) Right to repair: Machinery, implements and equipment must be designed in such a way that they are easily repairable using accessible technologies and with easy parts replacement, thus avoiding the user being forced to buy a new copy.
  - iii) Economic sustainability: The entity must prove that there is a demand for its service/product in the long term.
  - iv) Environmental sustainability: The entity must show that its product/service does not generate significant environmental impacts (GHG emissions, waste, etc.).
  - v) Local Impact: Team members come from the Project regions.
  - vi) Traditional/ancestral knowledge: Valuing and integrating indigenous and traditional/ancestral knowledge and technologies.
  - vii) Focus on young people and women: 50% quotas for women and 50% for young people are suggested, with 50% of young people's places reserved for women.

#### **G: Costs**

<b>Actions</b>	<b>Unit</b>	<b>Number</b>	<b>C. Unit (in US\$)</b>	<b>Estimated value in (US\$)</b>
Incentives for Innovation	Unit	25	40 000,00	1 000 000,00

Support for Innovative Initiatives																								

## ANNEX 5

### Strengthening family farmers' capacities

#### A. Objective

- 1.1 O component will focus on strengthening the capacities of beneficiary families and community organizations, considering the weaknesses identified in various areas, with adequate knowledge to implement production systems that are more resilient to climate change and more productive, as well as to improve the management of community organizations.
- 1.2 It will finance the contracting of Technical Assistance Services (TA) Agroecological to carry out activities aimed at increasing beneficiary families' access to adequate, quality information. The main themes to be addressed by TA will be the development of more profitable agricultural production profitable diversified and more resilient, a protection and recovery of environmental resources and improving the management of organizations. It will also seek to better integrate them into different value chains in the region with initiatives to support processing and commercialization. And finally, the subcomponent will seek to strengthen the TA teams contracted to ensure the good quality of this service.

#### B. Strategic orientation and methodology

- 1.3 There are a number of barriers in the Project area that reinforce the unsustainable *status quo*. Of particular relevance is the lack of knowledge about resilient and better performing production systems, for various reasons, including the lack of access to agroecological services. Also noteworthy is the limited capacity for collective action found in the communities, mainly due to the fragility of the local population's organizations. This situation needs to be overcome to pave the way for transformations that will help overcome the vulnerabilities that characterize this unsustainability.
- 1.4 To carry out this task satisfactorily, the contracted TA entities will follow a training program on topics related to building resilient production systems and associative management. The first task of the contracted technical teams will be to advise on the participatory drafting/design process of the Resilient Investment Plans and then on their implementation.
- 1.5 There are also significant shortcomings in terms of access to public policies to support Family Farming, whether due to a lack of information about the rules governing access to and operation of government programs, or the lack of or outdated documentation, which diminishes the potential and benefits of the investments made directly by the Project. For this reason, the subcomponent will also aim to develop the skills of the Family Farming public on the subject of these public policies.
- 1.6 This subcomponent will also use other instruments to develop the capacities of the target groups. It will be able to hire specialized consultants, hold training events designed to work on topics of particular importance (such as associative management, for example) and will support the exchange of knowledge between farmers, as an important tool for strengthening their capacities. This activity will make it possible to make the most of the experience and knowledge accumulated by PROCASE I beneficiary families.

#### C. Actions planned

- a) **Action: Provision of TA Services in the communities**

- 1.7 The work to strengthen family units and communities will be carried out through the provision of TA services in the communities selected to benefit from the Project. All PIR beneficiary families and the corresponding organizations will receive TA services.
- 1.8 The first responsibility of this action to provide TA in the communities will be to conduct the participatory planning process that will enable the design and implementation of the Resilient Investment Plans.
- 1.9 These Plans, which are Component 1's main instrument of action, will contain the investment actions and the introduction of practical innovations in the productive and environmental dimensions, as well as activities to develop the human and organizational capital needed to drive the desired sustainable transformation. The investments and other actions contained in these Plans will represent the materialization of the Project's support for this transformation process.
- 1.10 Once drawn up, each Plan is assessed by the Project's PMU and adjusted for subsequent approval. The approved Plans will be transformed into terms of development or collaboration, which will be the instruments that allow the transfer of Project resources to local organizations. It will then be up to the TA teams hired under this component guide, advise and monitor the execution of the activities/acquisitions contained in these Plans/Terms.
- 1.11 In this context, these teams will have to provide technical support for the families' various productive activities, especially those directly covered by the Plans. They will also work to encourage the inclusion and effective participation of women and young people in the productive and environmental activities supported by the Project.
- 1.12 The technical advice provided by these teams will play a crucial role in implementing the agroecological approach of the various production and environmental preservation and recovery initiatives to be carried out in the communities. At the same time, the TA teams will have to advise the families on access to public policies, starting with access to the CAF (National Family Farming Register)<sup>20</sup>, which is the basic instrument without which farming families cannot access any public policy intended for them, and access to or regularization of the CadÚnico, which is also the gateway to other complementary public policies. They will also have to support the registration regularization needed to access other programs such as PNAE and PAA. The communities/families will be encouraged to look for other sources of funding and service providers to complement the resources allocated by PROCASE II and to meet demands not included in the work plans and business plans it supports. The process described will also seek to create opportunities for cooperation with the private sector, the third sector and city halls.
- 1.13 TA teams will also have the task of strengthening community associations. In this respect, they will be responsible for training and accompanying the teams of these associations to make them capable of managing the terms mentioned, involving aspects such as acquisitions, recording and accounting of operations, use of financial resources and accountability, etc.<sup>21</sup> This work will be linked to the training on management issues that will

---

<sup>20</sup> The CAF replaces the previous equivalent document, the old DAP (Declaration of Aptitude to PRONAF).

<sup>21</sup> As the proper management of an agreement of this type will require the association to have some equipment (such as a computer, a filing cabinet, etc.), it will be important to include these 'association strengthening kits' in the preparation of the PIRs.

- be offered to the associations' management teams (see 'Action: Complementary training events for farmers and association managers' below). The PMU team will have to provide ongoing support to the TA teams and the associations to ensure that this process runs smoothly.
- 1.14 It should be emphasized that this TA work on the design and implementation of PIRs should pay special attention to the specific needs and aspirations of women, young people and Traditional Peoples and Communities. To this end, the working methods of these TA teams must be able to take these specificities into account.
  - 1.15 The technical advisory service must have a regular and continuous local presence with the Project's target audience throughout the duration of the service. This will require setting up permanent teams to work with the families and communities to be assisted. These teams will have to dedicate themselves exclusively to serving this public, with an approximate ratio of one technician for between 90 and 120 families. It is estimated that around 600 communities (approximately 18,000 families) will be served, for a minimum period of three and a half years, during the lifetime of the Project.
  - 1.16 The teams providing these TA services will be multidisciplinary, made up of technicians with different skills (agricultural and environmental sciences, management, etc.). Whenever possible, the incorporation of experimenting farmers and multipliers, including young people, into these teams will be very welcome. In selecting the entities that will provide the TA service, criteria will be considered to guarantee the presence of women technicians on the teams, with a view to being as adherent as possible to the specific needs of women and to propose more for the women beneficiaries of the Project's actions.
  - 1.17 This consultancy will adopt a participatory approach in all the planning and execution of the Project's actions. To this end, it will use a set of appropriate pedagogical tools, such as meetings, field visits and transects, working parties, exchange visits, etc. When necessary, the TA teams can make use of pedagogical tools that allow them to seek out new and relevant information outside the same communities. An important tool for this dimension of the work will be exchange visits.
  - 1.18 In the case of monitoring the implementation of Social Technologies, a specific TA will be contracted for this purpose, and which complies with the legal framework for contracting services for this modality. The entities contracted in this way will be responsible for acquiring materials, providing specialized services for the construction of the Social Technologies and training beneficiaries to apply good use and maintenance practices.
  - 1.19 Considering the methodological innovations taking place in TA services (see section on 'Limited access to technical advice and funding' in the Justification), PROCASE II will offer hybrid TA, combining face-to-face and remote modalities, incorporating the use of digital tools.
  - 1.20 Capacity-building and support activities on issues that require a more specific and/or technically complex approach will have to be carried out by contracting specialized technical assistance services (TA), in addition to ongoing advisory services. For this advice, the Project will hire people or institutions with the appropriate skills to assist families, community organizations, and groups of women and young people with whom the Project will work.
  - 1.21 Unlike ongoing consultancy, specialized consultancy should generally be contracted for shorter periods (a few weeks or months). In this context, partnerships can be established with entities such as EMBRAPA, SEBRAE, universities and other educational institutions,

NGOs, cooperatives and farmers' organizations, private sector companies and others. Individual professionals with the necessary skills can also be called upon to provide the specialized services required.

b) **Action: Training events training/exchange for farmers, including association leaders.**

- 1.22 The subcomponent provides for the organization of training events that are complementary to the capacity-building work carried out by the TA entities with the communities. In particular, it will be essential to hold a series of training events dedicated to management, with an emphasis on managing the terms of collaboration or development, for the management teams of community associations, with the aim of ensuring that these agreements are properly executed and that the respective accounts are properly rendered.
- 1.23 This training work will have to rely on the constant support of the Project team (regional offices and PMU), which will monitor the management processes of the agreements. In the specific case of quilombola communities that may be interested in official recognition, specific events linked to this process can be organized, such as homologation / certification workshops. Training events in environmental education will also be held, focusing on strengthening the practices, climate resilience, community management of natural resources and sustainable use of conservation areas. If other important topics emerge in which there is a significant lack of knowledge, training events could be organized for farmers and/or association leaders, dedicated to these topics. If other important topics emerge in which there is a significant lack of knowledge, training events could be organized for farmers and/or association leaders, dedicated to these topics.
- 1.24 This subcomponent will also support knowledge-sharing events between farmers from the Project's beneficiary communities, as an instrument to strengthen their capacities. This activity will make it possible to value the experience and knowledge accumulated by PROCASE I beneficiary families.

c) **Events to improve TA teams**

- 1.25 The experience of other sustainable rural development projects, including PROCASE I, shows that it will be necessary for the project to ensure that the TA services offered to the beneficiaries are adequate and effective. In particular, it is crucial that these contracted teams are fully aligned with the project's priority focuses.
- 1.26 The experience gained from previous projects in this dimension indicates that there are important shortcomings in the teams of existing TA providers that will need to be addressed<sup>22</sup>. Thus, all the technical teams hired under PROCASE II will have to undergo training throughout the implementation of the Project to ensure that they have the necessary knowledge to achieve the desired objectives. The goal is to train 300 technicians.

---

<sup>22</sup> We will highlight the shortcomings identified in the following areas: i) in the methodological dimension, it will be necessary to improve the participatory approach in the planning and implementation of investment plans and in the processes of acquiring new knowledge on the part of the families served; ii) in the technical dimension, improving the knowledge of TA entities and teams about innovations designed under the agroecological approach to improve production performance, environmental sustainability and adaptability to climate change of the production systems of families in the different regions of the state; iii) in the economic sphere, expanding knowledge about markets and the processes for accessing them; iv) in operational terms, in general the teams need to develop greater mastery of and use of digital tools in the practice of ATER, with an emphasis on carrying out the tasks of monitoring and evaluating the work carried out.

- 1.27 This process should also include a PMU in setting up a training program for the TA teams that includes the themes of participatory planning (which materialize in the PIR and PN plans), agroecology, persons with disabilities and PCT, as provided for in component 2.3), nutrition and food security, and access to markets (short circuits, certification). Targeted training will also be provided for more specific actions of the project and sanitation and animal health. The training may take place in a mixed format, with face-to-face and virtual activities, using knowledge management materials already produced, and on an ongoing basis throughout the Project.
- 1.28 The PMU will monitor the companies and trained technicians, ensuring that the quality of the work is adequate. services provided to the public.
- d) **Training family farmers in public policies**
- 1.29 The Justification section of this Component mentions that public policies to support Family Farming are poorly accessed. In other cases, there are policies and regulations in force that are not fully adopted/applied, such as various environmental regulations on pesticides, deforestation and burning, etc. The public to be served by PROCASE II should be able to know more about these policies and, where appropriate these policies.
- 1.30 That is why the Project will seek to facilitate this access, reinforcing an approach of dialog and advocacy on public policies. To this end, it will carry out a broad awareness-raising and training campaign on existing public policies and the mechanisms for accessing them. It will also be necessary to train families so that they can, where appropriate, account for and monitor the development of activities.
- 1.31 This axis of the Project's work will potentially reach a very wide range of the rural population (approximately 32,000 families) in the priority territories that will be served by the Project, with an emphasis on women, young people, PCTs, indigenous people, LGBTQIAP+ and persons with disabilities. Preference to this activity will be given to families who have not benefited from other Project activities.
- 1.32 The main instrument of this axis of work will be 400 training events in the different territories of the state. These events will be the main existing public policies for Family Farming, including PRONAF, Low Carbon Agriculture and Crop Insurance, rural worker documentation and civil birth registration programs, public procurement programs such as PNAE, PAA, PAA Milk, land access programs for young people (PNCF), access to water (P1MC and P1+2), the Rural Development program and state programs, such as the State Seed Distribution Program. These events will provide more detailed information on the characteristics of each of these policies, including aspects such as eligibility rules and access mechanisms and, where relevant, the accountability process.
- 1.33 Training / environmental education events will also be held, which will deal with environmental regulations that apply to rural areas and farming activities (such as the use of pesticides, burning, etc.) and also 'good practices' that restore/preserve environmental resources.

---

<sup>23</sup> For example, Castro and Pereira point out that the introduction of the "principles of promoting sustainable rural development based on the principles of agroecology, managed democratically and with social control, constitutes a radical change in relation to the previous paradigm of Brazilian Ater" (p.23). Cf. CASTRO, C. N. d.; PEREIRA, C. N. Family Farming, Technical Assistance and Rural Extension and the National TA Policy. Brasília / Rio de Janeiro: IPEA, 2017. 41 p. Available at: [https://portalantigo.ipea.gov.br/agencia/images/stories/PDFs/TDs/td\\_2343.pdf](https://portalantigo.ipea.gov.br/agencia/images/stories/PDFs/TDs/td_2343.pdf).

- 1.34 Specific events will also be held to facilitate access to public policies, such as documentation drives, updating the CadÚnico register, etc. In addition, local teams from town halls, NGOs, public rural extension agencies, rural workers' unions and other social movements, etc. will also be trained.
- 1.35 To implement this line of work, it will be necessary to hire advisory bodies with experience in the subject. with capacity and experience in organizing content in a didactic, dynamic and accessible language, as well as community mobilization. The first activity to be carried out will be implementing a process of identification and mobilization of the groups / organizations / communities to be trained. The second activity will be preparing the courses, defining the contents, methodologies and preparing the necessary supporting teaching materials, according to the demands and profile of the beneficiaries identified. The third activity will be to hold the 400 training events themselves, with broad mobilization of the communities and project partners.
- 1.36 In addition to producing content, organizing and mobilizing training, the(s) organization(s) contracted(s) shall(will)in partnership with the PMU, seek to involve other project partners involved in the aforementioned public policies at a regional/local level so that they can offer services for issuing/updating documents and registrations for access to programs (e.g. birth certificate or ID, CAF, Cadúnico and other state registrations) and act as a kind of focal point for future referrals and guidance, thus helping to ensure that such training already has concrete results in terms of impact and increased access to policies for rural populations.
- 1.37 Although there are converging themes, it should be pointed out that while the TA services for families and communities are focused on drawing up and monitoring the PIRs (therefore more focused and specific), this activity has a broader focus, accessing families and communities not covered by the component 1 plans or those already covered by phase I.
- D. Execution arrangements**
- 1.38 *TA activities.* All TA activities will be carried out by technical advisory bodies to be contracted by the Project. Taking the previous experience of PROCASE and other projects as a reference, in its first year of implementation the Project will select TA entities to carry out this work.
- 1.39 The Project will select and contract public or private entities (including third sector organizations, cooperatives, etc.) that have proven experience in providing TA services in the biomes present in Paraíba (Caatinga and Atlantic Forest), to provide these services to the beneficiaries. The selection criteria for these entities to be contracted will include: i) having at least 5 years' experience of working with sustainable, agroecological agricultural production systems, geared towards adapting to climate change and coexistence with the semi-arid region. and coexistence with the semi-arid region; ii) depending on the region to be served, have experience of working with TA in the semi-arid region or in the Atlantic Forest region; iii) technical team with experience of working with women, young people, traditional and/or indigenous communities; iv) the ability to work with the theme of protecting and regenerating environmental resources; v) the ability to use remote TA tools digital as a complementary strategy to face-to-face TA; vi) experience of working with public programs and policies. As mentioned above, the selection of the entities that will provide the TA service will consider criteria that guarantee the presence of women technicians on the teams.
- 1.40 To provide TA services with a territorial approach, the contracted entities will work by lot, which will be made up of groups of neighboring communities, close to each other, to be

defined by the Project after the communities to be covered have been chosen. To avoid excessive concentration, each entity may be selected for a maximum of two lots.

- 1.41 In cases where there is a need to implement social technologies, entities with experience in this area will be hired, in accordance with the rules of the Federal Government's Cistern Program.
- 1.42 In the case of TA, natural or legal persons should be selected who have proven experience with 'specialized' topics, such as drawing up plans for groups of shellfish gatherers, or specific topics such as sustainable irrigation systems, renewable energies, and others.
- 1.43 *Public Policy Training Activity.* At the beginning of the policy training work, it will be necessary to hire a specialized consultancy to define the content to be worked on in the communities and prepare teaching material on the subject. The actual training events will have to be carried out by the entity(ies) contracted for this purpose through an appropriate selection process and in addition to the above. The PMU will be responsible for organizing the training events and supervising the work of these contractors.
- 1.44 As for the other capacity-building activities (training and improvement events for TA teams, exchanges, etc.), it will be up to the PMU to organize the activities and contract the services and materials needed to carry them out.

**Costs of Subcomponent 2.1 - Strengthening family farmers' capacities (values in US\$).**

<b>Activities</b>	<b>Amount</b>	<b>Unit Cost</b>	<b>Estimated value (US\$)</b>
<b>Activity: Provision of agroecological TA services in communities</b>			<b>18 900 000</b>
Provision of agroecological TA for families	18 000 families	900	16 200 000
Specialized TA	18 000 families	150	2 700 000
<b>Activity: Complementary training/exchange events for farmers, including association leaders</b>			<b>52 800</b>
Association training courses	92 events	400	36 800
Exchange events between farmers			
Training courses and exchange events on environmental education, agroecological practices, climate resilience, community management of natural resources and sustainable use of conservation areas	40 events	400	16 000
<b>Activity: Events to improve TA teams capacities</b>			<b>300 000</b>
Training events for TA teams	20 events	15 000	300 000
<b>Activity: Training family farmers in public policies</b>			<b>1 000 000</b>
Course preparation, including content and teaching material	1		80 000
Organization of training events for access to public policies	280	2 300	644 000
Training events for access to public policies on current environmental regulations (pesticides, deforestation) and 'good practices' that restore and preserve environmental resources	120	2 300	276 000
<b>TOTAL for subcomponent 2.1</b>			<b>20 252 800</b>

**E. Results**

- 1.45 Approximately 18,000 families will benefit from TA services, of which 50% should be represented by women, 30% by young people and at least 20% by Traditional Peoples and Communities. Part of this same public (approximately 2,600 people) will be served with complementary training events. Approximately 150 technical TA agents will also be trained.
- 1.46 The Public Policy courses should benefit a total of 32,000 families, of which 50% should be represented by women, 30% by young people and at least 5% by Traditional Peoples and Communities.

## ANNEX 6

### Strengthening organizations' commercialization capacities

#### A. Objective

- 1.1 The focus of this subcomponent is to strengthen the capacities of the teams of the economic organizations (mainly cooperatives) served by the Project. Groups/organizations of farmers will also be worked with to create or strengthen local fairs and small commercialization centers. In the context of improving commercialization conditions, the Project could also support the creation and/or strengthening of health inspection services at municipal level or for groups of municipalities organized into territories / 'consortia of municipalities'.
- 1.2 The aim is to help family farming organizations and their products enter diversified commercialization channels, generating more income for the families who benefit from them.

#### B. Strategic orientation and methodology

- 1.3 In the previous section, it was seen that all existing local organizations - with a special focus on family farmers' cooperatives - have significant capacity gaps on a number of key issues. It will be necessary to strengthen the capacities of the cooperatives' teams to make it possible to draw up and then implement Business Plans (PNs). Once the implementation of the PNs is underway, it will be necessary to ensure that the cooperatives' capacities are strengthened on specific topics, such as financial and project management, good production practices, marketing and commercialization, environmental compliance, etc. They will need support, mainly in the form of training, if they are to play an active and effective role in implementing the various sustainable development initiatives, they are called upon to carry out.
- 1.4 To achieve these objectives, the subcomponent will use the following main instruments: (i) providing of Specialized Technical Assistance (STA), focused mainly on preparing and monitoring the execution of Business Plans; (ii) various types of training events will be organized (workshops, training courses, technical visits, exchanges, etc.) that will strengthen the capacities of the organizations served in areas such as management (including project management), good production practices, marketing and commercialization, environmental compliance and other topics. It will also be a Project to encourage access to short marketing chains (street markets, Solidarity Economy Centres) and another to strengthen organizations on the subject of creating and/or strengthening health inspection services.

#### C. Actions planned

##### a) Provision of Specialized Technical Assistance (STA)

- 1.5 As seen above, it will be necessary to strengthen the economic organizations (cooperatives and similar organizations) that will benefit from the Project. This will be done through the provision of STA services, with 60 of these organizations expected to be served.
- 1.6 STA's primary responsibility with the beneficiary economic organizations will be to conduct the participatory planning process that will enable the Business Plans to be drawn up, and then to monitor their implementation. It will be up to the STA to organize the provision of training on specific topics that are necessary for the success of the organization in the business it proposes proposed (and which will be supported by PROCASE II).
- 1.7 In the end, it is hoped that by strengthening the production and management processes provided by STA, the organizations will be able to better structure their production processes, thus adding more value to primary products and accessing new commercialization channels.
- 1.8 Individuals or companies may be contracted to provide these services. The criteria for selecting providers will include: i) experience in providing consultancy services to family farming cooperatives; ii) technical capacity related to the specific problem(s) identified by the cooperative, including issues such as improving processing processes, developing a business strategy and identifying new marketing channels, strengthening management in the accounting, financial and administrative spheres, etc.; iii) institutional capacity to mobilize the specific skills needed by the

organizations being assisted; iv) technical capacity to deal with environmental and/or climate issues related to the activities carried out by the cooperatives being assisted; iv) capacity to work remotely (using digital tools); v) experience with access to complementary public policies to support family farming (such as credit, public procurement, etc.).

- 1.9 The STA services should encourage supported organizations to look for other sources of funding and service providers to complement the resources allocated by PROCASE II and also to meet demands not included in the business plans it supports. As market access-oriented organizations will also have to look for possibilities for cooperation with the private sector, STA should support them in this search.

**b) Initiatives to strengthen fairs and marketing centers**

- 1.10 By supporting Family Farming organizations with PNs, the Project is encouraging greater access to markets for Family Farming products. Another way of improving access to markets is to strengthen short marketing chains, creating new short circuits or strengthening those that already exist, so that farmers have greater predictability for the disposal and sale of their produce.
- 1.11 To this end, support will be given to groups/associations of farmers who are interested in setting up or strengthening/expanding open-air markets and points of direct sale to consumers in the urban areas of the various municipalities. Groups of family producers can also be supported so that they can be present at local or wider fairs. The Project will also seek to strengthen, in partnership with the State Secretariat for Human Development (SEDH), the Marketing Centers and Solidarity Economy Houses, following the example of the initiative implemented with the same Secretariat by PROCASE I, which made it possible to strengthen the Solidarity Economy Centers that served family farmers in the municipalities of Soledade (in the Western Curimataú micro-region) and Sumé (in Western Cariri).
- 1.12 The Project is expected to support 50 groups/associations, including groups of market traders and Marketing Centers and Solidarity Economy Houses.

**c) Pilot implementation of the Participatory Guarantee Systems (PGS)**

- 1.13 There are already several organizations in Paraíba working on participatory certification. It is possible that another farmers' organization that is working on production with a focus on agroecology and sustainability may wish to become a participatory certification organization. In another plausible scenario, an existing participatory certification organization may wish to expand the scope of its certification processes, for example by adding certification of animal products to the certification of plant products that it already operates.
- 1.14 In this circumstance, the Project will be able to provide support to carry out the intense process of mobilization (various meetings), training and the acquisition of basic equipment (files, computer, etc.) that is necessary to be able to set up/extend the scope of a Participatory Guarantee System (SPG).
- 1.15 The very creation, expansion and operation of new PGSs in the regions served by the Project is a strong incentive for family farmers to advance in the sustainable production and commercialization of agroecologically-based products, being able to access new markets, sell their products for better prices and contribute to strengthening healthier local food systems. It is planned to set up 15 pilot experiences of this type.

**d) Structuring Municipal Health Inspection Services**

- 1.16 Brazilian legislation requires enterprises that process animal products to obtain a Health Inspection Seal to be able to sell them. In Paraíba, there are very few family establishments whose products have this seal. It is formally the responsibility of the municipalities to provide the municipal health inspection service, but they rarely do so, citing a lack of financial and human resources. Several states in the country have launched initiatives to form Municipal Consortia<sup>24</sup> with the aim of providing this

---

<sup>24</sup> In the Northeast, there are Municipal Consortia offering this service in Rio Grande do Norte and Bahia. There are also initiatives of this kind in other Brazilian states.

type of service to the population (and especially to farming families), and the Federal Government, through the Ministry of Agriculture (MAPA), has supported this initiative<sup>25</sup>. The government of Paraíba has embraced this idea and has set a target in the next PPA of 'articulating Municipal Agricultural Inspection Consortia'.

- 1.17 In line with this state guideline and the initiatives taking place in other states, PROCASE II proposes to stimulate the emergence/strengthening of initiatives of this kind by supporting the structuring of municipal Health Inspection Services. A support initiative of this kind will include at least the following phases or stages: i) identification of municipalities that have already formed or wish to form consortia and are interested in setting up a Sanitary Inspection Service of this type; ii) creation or updating of Municipal Inspection Service (SIM) laws by the City Councils and approval of corresponding decrees<sup>26</sup>; iii) Strengthening operational capacity by acquiring the necessary equipment; iv) Strengthening technical capacity by carrying out a series of training courses for the municipal team responsible for the Service, thus enabling them to start operating in practice; v) Monitoring the first six months of operation of the SIM thus created.
- 1.18 By expanding the supply of these services, family farmers and their organizations will be better able to adapt their production processes to obtain certification and increase the sales range of their animal products.
- 1.19 The Project will support, with some investment resources and training, the structuring of the Health Inspection Services of two Consortia during the period of its operation.

#### **D. Execution arrangement**

- 1.20 Specialized Technical Assistance (STA) will be hired by the Project (PMU), through a selection process that meets IDB standards, with funds provided in the subcomponent's budget.
- 1.21 Individuals or legal entities may be contracted to provide these consultancy services. Criteria for selecting providers will include: i) experience in providing consultancy services to Family Farming cooperatives; ii) technical capacity related to the specific problem(s) identified by the cooperative, such as improving processing processes, developing a strategy and identifying new commercialization channels, developing a certification system, etc.; iii) technical capacity to deal with and integrate environmental issues related to the activities carried out by the cooperatives being assisted; iv) capacity to work remotely (using digital tools); v) experience with access to public policies.
- 1.22 The implementation of the investments defined in the Support Plan for Solidarity Economy Fairs/Centers will be carried out through agreements, Terms of Collaboration or Promotion, or Cooperation Agreements signed by the Project (PMU) with the market associations or Solidarity Economy Centers. The regional teams will play an important role in coordinating the various players involved in these initiatives. If it is not possible to use the terms of collaboration and/or promotion in this way, it will be up to the PMU to organize and deliver the training and purchases included in the Plans. The participation of other secretariats, such as SEDH, will be done through ACTs without transferring resources, and the partner secretariats will be able to mobilize human and financial resources from their own programs.

---

<sup>25</sup> In 2021, MAPA published a booklet entitled "Municipal Inspection Services linked to a Public Consortium of Municipalities", which details the process of "how to implement, operationalize, promote health security, reduce costs and create opportunities to expand the market for local products". 1.23 In the case of pilot PGS (Participatory Guarantee Systems) implementation and initiatives to support the structuring of Health Inspection Services, the PMU will be responsible for diagnosing demands and contracting individuals and/or companies for consultancy services, the purchase of goods, equipment and/or small projects.

**E. Costs**

**Costs of Subcomponent 2.2 - Strengthening organizations' commercialization capacities (values in US\$).**

Activities	Number	Unit Cost	Value (in US\$)
Provision of STA for Economic Organizations with PNs	60 PNs/ orgs.	20 000	1 200 000
Strengthening Local Fairs and Marketing Centers	50 pcs.	16 000	800 000
Establishing Health Inspection Services with Consortia of Municipalities	2 pcs.	150 000	300 000
Pilot of a Participatory Guarantee System	15 systems	2 000	30 000
<b>TOTAL for Subcomponent 2.2</b>			<b>2 330 000</b>

**F. Results**

1.24 The provision of STA services will work with 60 Business Plans from economic organizations, benefiting approximately 5,000 families, of which 50% must be represented by women, 30% by young people and at least 5% by Traditional Peoples and Communities.

1.25 The initiative to strengthen local fairs and commercializationmarketing centers will work with 50 units (fairs and centers), benefiting approximately 800 families.

1.26 It is planned to structure 2 Sanitary Inspection Services of Municipal Consortia, as well as the structuring of 15 participatory guarantee systems - SPG

## ANNEX 7

### Diversity, gender, youth, nutrition and food security

#### A. Objective

- 1.1 This subcomponent will aim to promote the empowerment of women, young people, PCTs, LGBTQIABP+ and persons with disabilities, as well as to improving nutrition and food security of beneficiary families. The activities will work with the Project's cross-cutting themes, strengthening and supporting the integration of these themes into all the components.

#### B. Strategic orientation and methodology

##### a) Gender and Diversity:

- 1.2 The Project will take a holistic approach to transforming gender relations, promoting the inclusion of Afro-descendants and PCTs, the LGBTQIAPN+ community and persons with disabilities, focusing on the environmental, economic, political and cultural causes of the social vulnerability of these groups. To transform unequal power relations, shaped by patriarchal and exclusionary structures, norms and practices, as well as empower women, Afro-descendants and PCTs, the LGBTQIAPN+ community and persons with disabilities, the following transformation paths will be followed: i) promote economic empowerment and equality by valuing women's contributions to the family economy and community development, ii) address the issue of women's overload due to domestic and care work by promoting a fairer division of the workload between men and women, iii) empower target groups to have a greater voice and decision-making power in rural institutions and organizations, iv) promote advocacy in policies for women, youth and PCTs, v) prevent gender-based violence, v) value traditional knowledge, practices and ways of life in production, food and natural resource management and vi) promote the inclusion of the LGBTQIAPN+ community and persons with disabilities, seeking to strengthen them, promote their leadership and respect for their rights.

- 1.3 Therefore, this sub-component aims to support the mainstreaming of the gender and diversity strategy throughout the Project, which will have an intersectional approach, considering the overlap of multiple discriminations of gender, race/ethnicity, sexual orientation and disability. All the activities and products proposed for this component will be contained in and guided by the Gender and Diversity Strategy and Plan to be drawn up at the start of Project implementation.

##### b) Youth:

- 1.4 Among the factors that influence staying in rural areas is access to work and income opportunities, education/training suited to the characteristics of rural areas, appreciation of rural ways of life, the availability of services and conditions that can offer the possibility of success in agricultural production. To respond to these issues raised in the Youth diagnosis, the aim is to promote the permanence of young people in the countryside, as well as offering more opportunities for sustainable income and work for young people in general, the strategy of this subcomponent is based on three main axes:

- i) Promote a broad training program in agricultural and non-agricultural activities that generate greater employment and income opportunities,

- ii) Implement a program to revalue life in the countryside through communication activities,
- iii) Promote the formation of Youth Networks and debates on issues relevant to the development of rural youth.

**c) Nutrition and Food Security:**

- 1.5 To improve food security, nutritional status and increase the adoption of dietary healthy, this subcomponent of PROCASE II will implement a strategy centered mainly on food and nutrition education training. There will be three main lines of action:
- i) Sensitization on good nutrition and health practices (reproductive health, maternal health and child health), to improve in particular the nutritional and health status of women and children.
  - ii) Sensitization for food culture, a healthy diet that includes in particular Neglected and Underutilized Species (NUS) from the target territories, and
  - iii) The training of vulnerable communities in the processing of healthy local products to increase their daily consumption in a sustainable way and to promote the empowerment of vulnerable communities by valuing the local food culture.
- 1.6 The nutrition and food security activities in this subcomponent complement the actions to increase access to and availability of food by increasing production, productive diversification and income as a result of the productive investments provided for in component 1.

**C. Planned actions and products**

**a) Action: Gender and Diversity Plan**

- 1.7 The Gender and Diversity Plan will be drawn up in the first few months of Project implementation by the PMU's Gender and Diversity specialist with the support of a specific consultancy hired to detail the general strategy and implementation methodology for all activities related to gender equity and women's empowerment, as well as the inclusion of PCTs, persons with disabilities and LGBTQIAPN+. The activities set out in the Gender Plan should include:

**b) Modular training in Gender and Diversity for the Project and TA teams:**

- 1.8 All Project teams, from the PMU and the decentralized units (RPMUs), will be trained in gender and diversity issues to ensure that these themes are integrated into all dimensions of PROCASE II's management and implementation and that all Project activities are adapted to the specific demands of women, Afro-descendants, PCTs, the LGBTQIAPN+ community and persons with disabilities. Training will take place in all the local offices in the Project territories. The PMU's Gender and Diversity specialist will be responsible for training the Project team, as well as supporting colleagues in addressing issues of gender equality, women's empowerment, Afro-descendants, PCTs, LGBTQIAPN+ and persons with disabilities in their operations throughout implementation, including in knowledge management, M&E and results measurement.
- 1.9 The sensitization/capacity building of the RPMUs' teams will be key to ensuring that field activities integrate gender and diversity concerns, and focal points should be selected in the field offices to assist the PMU Gender and Diversity specialist in implementing the

Gender and Diversity Plan at territorial level. The Technical Assistance teams will have a regular and continuous presence with the target audience and, to promote a service that meets the specific demands of the Project's target groups (women, young people, PCTs, LGBTQIAPN+ and persons with disabilities), these teams must be trained in Gender and Diversity issues.

- 1.10 The technical specialist in Gender and Diversity at the PMU will play a crucial role in implementing an inclusive and transformative approach in terms of diversity and gender. Some of the themes proposed in the trainings are: women's rights, fair division of domestic labor, empowerment, agroecology, LGBTphobia, gender-based violence, public policies aimed at women and PCTs, as well as the ethnic and racial dimension.

**c) Gender and diversity training for the Project's direct beneficiaries**

- 1.11 PROCASE I has consolidated a successful Gender methodology. However, it must strengthen its ethnic-racial and generational sections, as well as being updated to include a broad diversity perspective that includes promoting the empowerment of Afro-descendants, PCTs and the LGBTQIAPN+ community.
- 1.12 The main objectives of the training are: i) To develop the capacities of the target groups so that they can play an active role and be socially recognized in the economic and productive spheres of the family and community; ii) To promote voice and influence in rural institutions and organizations, both of women and of PCTs and the LGBTQIAPN+ community; and iii) Promote debate on the sexual division of labor, with a view to fostering a fairer division of the workload between men and women; iv) Value and disseminate traditional knowledge, practices and ways of life and discuss issues related to racism, sexual orientation and gender identity.
- 1.13 During the training sessions, the issue of Violence against Women and Domestic Violence will be addressed, providing knowledge and information about the Maria da Penha Law, how to access the Network for Combating Violence against Women and how to file complaints, with the aim of preventing violence against girls and women. The training sessions will be held in the beneficiary communities. The training program will take an intersectional approach, considering how racism, patriarchy, heteronormativity and other exclusionary structures generate dynamics between multiple axes of subordination - gender, race/ethnicity, sexual orientation and social class.

**d) Implementation of the Agroecological Logbook Methodology:**

- 1.14 The Agroecological Logbooks (ALs) are an innovative and successful political-pedagogical instrument for women's economic empowerment, which has already been widely tested within the framework of IFAD projects in Brazil. The ALs are implemented to measure, value and give visibility to women's fundamental contributions to the family economy and, consequently, to community development. They also aim to promote greater self-esteem among women and demonstrate how they contribute, through production in agroecological backyards, to a healthy, diversified and safe family diet. As a result of valuing women's contributions to the family economy, the aim is to change power relations in the domestic and community spheres.
- 1.15 The Agroecological Logbook is a simple-to-use tool with four columns for organizing information about women's production. It records what is sold, donated, exchanged and consumed on a daily basis, based on everything that is grown in the spaces where women live in family and peasant farming units, from agricultural production to handicrafts and processing. During the implementation of PROCASE I, the Logbook proved to be an

efficient tool for monitoring women's production, even allowing for the valuation of production that does not involve monetary exchange and which was previously invisible, such as that for self-consumption, which plays a fundamental role in guaranteeing food and nutritional sovereignty. The role of the Technical Advisory Service is to mobilize the beneficiaries, train them in the use of the ALs and follow up and monitor their completion. Therefore, as well as promoting women's socio-economic empowerment, the ALs also play a role in qualifying TA actions as an instrument for intervening in reality, constituting new indicators for the Project's actions. The implementation of the complete AL Methodology includes the costs of training, implementation and M&E.

**e) Training cirandeira(o)s:**

- 1.16 The communities will select people from their own communities to be trained as facilitators of childcare circles, developing skills to care for and teach children during the Project's activities, allowing mothers to take part in the training and other activities proposed by the Project. The educational training of the facilitators (cirandeiro(a)) will be carried out by a qualified team of professionals from various fields, such as Pedagogy, Arts, Social Work, Anthropology and Sociology, and will last around a year.
- 1.17 The municipalities will be organized into training centers where 48-hour workshops will take place over 12 months, in two phases of 24 hours each, totaling 336 hours of activity. Training for cirandeiros and cirandei-ras should take a multidisciplinary approach to themes that are interrelated, such as "gender relations", "environmental education" and "child development", helping to prepare facilitators for carrying out their educational activities with children. Facilitators should also be trained in the use of dynamic methods and tools, such as storytelling, games and toy-making. A set of educational materials should also be prepared, consisting of videos, CDs, books, and memory games to increase awareness of a range of issues during the sessions with the children. One of the important aspects of this methodology is the process of training men and women, many of whom are young, to develop their leadership qualities through pedagogical methods that seek to strengthen intergenerational links.
- 1.18 The Project will ensure, through hiring a support foundation in the process of selecting cirandeiros, that there is a methodology and prioritization criteria that guarantees gender equity and diversity. PCTs, persons with disabilities and LGBTQIAPN+ will have priority. At least 50% of cirandeiros must be from these priority target groups.

**Childcare/education activities that allow women to participate in the Project's activities:**

- 1.19 The Project will offer childcare/education services to ensure women's participation in PROCASE II activities, such as the Gender and Diversity Trainings. The activities are conducted with children by one or two educators/facilitators in a physical space provided by the community. The costs of the activity are as follows: i) training childcare workers; ii) reserving materials and resources for activities; and ii) paying for childcare services. The action is built on a dynamic methodological approach that strengthens relationships between generations, promotes debate on gender equality in family and community networks and conveys positive messages about the semiarid region and sustainable practices that are developed by different organizations and communities within this ecosystem. In addition, this activity helps to reduce women's work overload due to childcare and encourages many communities to play a role in collectively sharing the task of caring, normally associated with the private sphere. Another positive aspect is the

promotion of gender-transformative education, which allows stereotypes, attitudes, norms, and practices to be transformed, generating critical awareness among both children and their educators about gender inequalities.

**f) Thematic meetings on diversity (aimed at persons with disabilities and LGBTQIAPN+ )<sup>27</sup>:**

- 1.20 The thematic meetings will be aimed at the beneficiaries of two specific target groups: Persons with Disabilities and the LGBTQIAPN+ community, will have a community approach and will be demand-driven. They will complement the Gender and Diversity training aimed at beneficiaries, addressing specific topics of interest to the communities and strategic for closing the inclusion gaps identified in the Gender and Diversity diagnoses related to Persons with Disabilities and LGBTQIAPN+.
- 1.21 In particular, persons with disabilities and the LGBTQIAPN+ community in the Project area are impacted by the combined effects of numerous forms of discrimination, including gender, race, disability, sexual orientation, and socio-economic conditions. As a result, they face even greater obstacles to participating in decisions that affect their well-being and to the full realization of their rights. Five meetings will be held for persons with disabilities and five for the LGBTQIAPN+ community. Through these thematic meetings, guided by the demands of the target groups themselves, political mobilization will be promoted, awareness will be raised about rights, as well as issues related to sexuality, sexual orientation, and the inclusion of persons with disabilities.
- 1.22 Whenever possible and necessary, the possibility of ensuring a cross-cutting and transdisciplinary Food and Nutrition Security (FNS) agenda in these thematic training meetings should be considered, considering the social vulnerability and food and nutritional insecurity of the groups mentioned, which are priority groups in FNS policies in Paraíba.

**D. Youth Plan**

- 1.23 A Youth Plan will be drawn up in the first few months of Project implementation by the PMU's Youth specialist to detail the general strategy and implementation methodology for all the activities in this subcomponent related to the socio-economic and political empowerment of young people. At least the following cross-cutting activities will be developed for rural youth in the Project area:

**a) Vocational training in agricultural and non-agricultural activities:**

- 1.24 In the area of intervention, there is a process of exodus of young people in search of better job and income opportunities in the cities, challenging the process of rural succession. In this context, non-agricultural productive activities have become an important income-generating alternative for part of the rural population, and could help young people stay in the countryside. In this sense, PROCASE II will promote vocational training for young people in activities such as: information technology, mechanics, rural tourism, maintenance of machinery and equipment, cutting and sewing, handicrafts, gastronomy, among others. For those who decide to take up agricultural activities, the Pproject will also offer vocational courses that will enable young people to diversify their sources of income and promote better conditions for success in agricultural production. Courses will be

---

<sup>27</sup> Give preference to trans people, when possible, because this is a group that is particularly marginalized among the LGBTQIAPN+ community, prioritizing self-recognition between the trainer and the participants in the meeting.

offered in agricultural subjects such as horticulture, beekeeping, poultry farming, rural administration, among others. To implement training in agricultural and non-agricultural activities, the Project will seek to build partnerships with institutions such as SENAI, SEBRAE, PRONATEC, SENAR, EMBRAPA, universities and teaching and research institutes.

**b) Training Young Communicators:**

- 1.25 PROCASE II will train young rural people to become Young Communicators. Training will be offered in subjects such as photography, audiovisual, interview techniques, cordel, digital marketing, project development and citizenship. With the skills developed, the Young Communicators will be able to help record and monitor project activities, produce audiovisual and printed materials and act as social mobilizers in their communities. This initiative will also allow young people to develop their vocation and even start practicing a new profession. The activity will involve: (i) the selection process for the young people; (ii) the training course; (iii) an exchange event and a final meeting. In this process, the Young Communicators will be encouraged to produce communication materials about the Project's experiences, good practices, etc. and will be guided in the search for the insertion of these "products" in communication channels such as blogs, YouTube channels, community radio stations, among others.

**c) Thematic meetings with young people and the formation of Rural Youth Networks:**

- 1.26 The Project will promote meetings on topics relevant to the full development of rural youth identified in the youth diagnosis (justification section), such as violence, the lack of public policies aimed at rural youth, limited access to specific lines of credit aimed at young people, education in the countryside, among other topics. The themes chosen will also be guided by the demands of the young people themselves. On this occasion, the formation of Rural Youth Networks will also be promoted, to strengthen the self-organization of young people and their groups and organizations, ensuring that they have greater capacity to access available public policies and advocate for new public policies aimed at rural youth.

**E. Plan to Strengthen Traditional Peoples and Communities (PCTs)**

- 1.27 A Plan to Strengthen Traditional Peoples and Communities will be drawn up in the first few months of the Project's implementation.

**a) Strengthening PCT networks:**

- 1.28 PROCASE II will invest in the formation of PCT groups and the strengthening of existing groups, promoting the strengthening of ties between PCTs from different territories in Paraíba, fostering the construction of networks. The PCT diagnosis showed that these groups still have inclusion gaps in various socio-economic and political dimensions. The formation of PCT networks and the strengthening of existing ones could help to close the gaps. As a strategy for scaling up promotion to strengthen the self-organization of the PCTs and their constituent groups and organizations, at least three broad meetings will be held to encourage the formation of PCT Networks, in which the common challenges faced will be debated and good practices and lessons learned shared. This activity, together with the PCT Policy Integration Fairs, will help articulate the partnerships needed to access public policies for existing PCTs and influence new public policies. The main agendas defined as priorities in the PCT Networking meetings can be presented at the PCT Policy Integration Fair.

**b) Policy Integration Fairs for the PCTs:**

1.29 The project will seek to influence public policies aimed at traditional peoples and communities, consolidating and expanding the human rights of this target group. Despite the existence of national, state, and local policies aimed at PCTs, there is a lack of greater integration between them and a specific approach to overcoming challenges and meeting the aspirations and demands of PCTs in the Project area. To this end, six PCT Policy Integration Fairs will be held with the participation of beneficiaries and various actors from the public sector and civil society at state and local level to debate public policy proposals that meet the wishes and demands of Paraíba's traditional peoples and communities. The cooperation promoted, through the exchange of information and experiences, must consider the diversity of agents involved, with a view to building intersectoral networks that can influence the definition of public policies for the PCTs.

**F. Nutrition and Food Security Plan**

1.30 A Nutrition and Food Security Plan will be drawn up in the first few months of the Project's implementation.

**a) Nutrition education initiative to improve nutrition and maternal and child health in the Project's most vulnerable communities:**

1.31 Initially, the communities with the greatest malnutrition problems in the Project area will be identified. This should be done with the support of partners such as the Secretariat for Human Development (SEDH), which has a central role in drawing up and coordinating the various actions included in the State Plan for Food and Nutrition Security, and the Paraíba School of Public Health or another potential partner with expertise in nutrition and food security. The Project's baseline study, which will measure the percentage of women with a minimum diversified diet, could also be used as an indicator to define the target groups and obtain information on the content of the diet. Once the communities with the greatest problems of malnutrition have been identified, nutritional education courses will be given there. The beneficiaries will mainly be community health workers, women, young people, and women from PCTs.

1.32 The training will take place in communities, with selected professionals teaching. The final part of the course will include the establishment, with the community agents, of an action plan to be developed in the community to monitor changes in practices over the long term. To ensure the commitment of the participants, it will be important to consult the beneficiaries about the time of year and the hours to be given priority so that the courses can be followed up regularly.

1.33 Likewise, the content of the course will be chosen jointly, prioritizing teaching related to children's nutrition to combat a micronutrient deficiency and provide a balanced diet that respects the needs of each age. The topic of promoting exclusive breastfeeding during the first 6 months of children's lives will also be part of the course, as it persists as a health problem, in addition to the topics of mothers' health (in particular to combat anemia, overweight and obesity) and reproductive health, given the high rates of teenage pregnancy. Ideally, the partnerships, course content and action methods will be defined in the first year of the Project by the PMU's nutrition and food security officer (and in collaboration with the service provider) for implementation in the communities from year 2 to year 5 of Project implementation. At the end of the course, it will be important to identify and document the results at community level.

**b) Training events on food culture and food processing to enhance local products with a view to improving nutrition and facilitating the empowerment of women and young people:**

- 1.34 The content of the training will be defined by the Project's nutrition manager (in conjunction with a partner with expertise in nutrition and food safety or a service provider specializing in this area), including priority topics such as the appreciation of Neglected and Underutilized Species (NUSs), influences on eating habits with a view to improving health, technical support for food processing with a view to economic autonomy and the appreciation of family farming products. The objectives will be to promote nutritional security, strengthen and value traditions related to food practices, promote the consumption of local and healthy products by teaching tasty and easily reproducible recipes.

**c) Raising awareness of nutrition, health, and food culture among students at the Integral Citizen Schools:**

- 1.35 Students will be made aware of food culture, healthy eating practices and gastronomy. Considering that eating habits are still developing among young people, it is hoped that the impact of the training will be significant for these students. The training is planned for around 10 schools in the Project area, prioritizing schools in poorer municipalities. The students will be divided into groups of up to 30 students, spread over the four years of the Project's implementation. The course will last one day, divided into a theoretical part (adapted for students) and a practical part (cooking class). In the process of selecting the schools, it will be necessary to investigate whether there is already some kind of nutritional teaching in the school, to propose new content. It would also be important to include all the school staff, in particular the cooks, to influence, for example, the menus and practices linked to food in schools.

**G. Local Development Agents**

- 1.36 The Project will hire a foundation, which will be responsible for hiring the Local Development Agents (ADL), who are young people from the communities themselves, hired by PROCASE II to carry out tasks such as mobilizing communities and organizations to actively engage in the Project. In addition to mobilization, the ADLs must play a significant role in the management of the agreements made by the community associations, supporting the holding of tenders, the updating of financial information, the monitoring of investments made, the rendering of accounts and the maintenance of the associations' fiscal regularization. One young person will be hired per Resilient Investment Plan, which in turn serves 3 communities. The young ADLs will receive a series of training courses to develop their skills. By playing the role of ADL, it is hoped that the young people selected will be able to gain experience in leadership and management, becoming references in the communities they represent and continuing to support them even after the end of the Project. The ADLs will also play an important role in supporting the implementation of cross-cutting activities, such as gender, diversity, and youth, as well as in communication between the communities, the Project, and the TA teams.

**H. Execution arrangement**

- 1.37 To draw up the plans for this subcomponent (Gender and Diversity, Youth, PCTs and FNS), it will be necessary to hire individual consultants or consultancy firms to design them in full methodological and operational detail. The activities planned and included in the plans for this subcomponent will be implemented both through actions carried out directly by the Project's technical team (the PMU and the Regional Project Management

Units) and through events that will be included in the terms of collaboration or promotion with producer organizations (associations). The terms will allow for the purchase of support materials, the hiring of instructors, as well as exchanges between farmers. Regarding ADLs and cirandeiros, a foundation will be selected which will be responsible for hiring these agents.

- 1.38 A Gender and Diversity specialist, a Youth specialist should be hired as part of the Project management team, a specialist in Traditional Peoples and Communities and Nutrition specialist, all with exclusive dedication. They will be responsible for drawing up and supervising the implementation of the respective plans provided for in this subcomponent according to their area of expertise. All four specialists must be trained in differentiated approaches to the inclusion of persons with disabilities and LGBTQIAPN+.
- 1.39 In each Regional Project Management Unit, there should be a focal point for social themes, who should work closely with the PMU specialists and the technical advisory teams at local and regional level.

#### I. Costs

#### Costs of Subcomponent 2.3 - Diversity, gender, youth, nutrition and food security (values in US\$)

Activities	Amount	Unit Cost	Value (in US\$)
<b>Gender and Diversity line of work</b>			<b>1 025 000</b>
Drawing up a Gender and Diversity Plan	1	25 000	25 000
Gender training for Project and TA staff	18	9 000	162 000

## ANNEX 8

### Land and Environmental Regularization

#### A. Objective

- 1.1 As previously mentioned, land and environmental regularization of rural properties is a significant challenge faced by family farmers, both due to the scenario of legal insecurity regarding land ownership and to the possibility of state sanctions or difficulties in accessing productive inputs due to non-compliance with legislation.
- 1.2 Considering this situation, this subcomponent will focus on strengthening the family units served, making the production base more secure by supporting land and environmental regularization.

#### B. Strategic orientation and methodology

- 1.3 It has already been seen, in the Justification of this report, that there is a great lack of land and environmental regularization in Paraíba. The subcomponents will focus on the following priority groups: quilombola communities and federal and state Agrarian Reform settlements. It will also be other PCT groups and traditional Family Farming communities. Whenever possible, environmental and land regularization, aimed at these priority groups, will seek to integrate the different lines of action of the Project and these communities may also receive other actions, such as productive investments.
- 1.4 The subcomponent's general methodology will be guided by the same participatory principles that frame the Project's overall work, aiming for greater social justice, preservation of natural resources, better access to public policies and appreciation of the culture of the groups to be benefited. The working method will be centered on ongoing consultations and dialogues that allow for the inclusion of the families and communities served, enabling them to participate effectively in the process.

#### C. Actions planned

- 1.5 To achieve this goal, actions to support land and environmental regularization will be implemented.
  - a) **Support for land and environmental regularization.**
- 1.6 Seeking to provide solutions to the above-mentioned problem of the existence of a large number of family units in Paraíba that do not have complete legal documentation or formal recognition of these properties, the project proposes to implement a land regularization and environmental registration initiative.
- 1.7 A Rural Property Land Regularization Program, already implemented by the Paraíba state government through EMPAER, is an appropriate background for this initiative<sup>28</sup>. It was on the basis of this experience that an action strategy was developed for this type of activity, which involves a series of stages.
  - b) **The choice of communities/properties to be benefited:**
- 1.8 As mentioned earlier, there are many families and rural properties in the state that are in an irregular land and environmental situation and that need support to overcome this situation.

---

<sup>28</sup> This program was implemented by EMPAER from 2017 to 2020, mainly in the Borborema Territory in Agreste Paraibano. See link: <https://empaer.pb.gov.br/noticias/programa-de-regularizacao-fundiaria-beneficia-mais-de-6-mil-agricultores-em-lagoa-seca>; and [https://auniao.pb.gov.br/noticias/caderno\\_paraiba/governo-realiza-regularizacao-fundiaria-30-mil-titulos-em-21-municipios](https://auniao.pb.gov.br/noticias/caderno_paraiba/governo-realiza-regularizacao-fundiaria-30-mil-titulos-em-21-municipios).

The initial task to be carried out by the Project in this area will be to choose the communities/properties that will be assisted by this action. As mentioned above, the first priority will be given to quilombola communities, followed by federal and state land reform settlements.

- 1.9 With regard to these priority communities, it should be noted that only communities and settlements that are not in a situation of conflict or litigation can benefit from this action. Therefore, when the Project comes into force, it will be up to the PMU, in partnership with the other relevant bodies/entities (INCRA, EMPAER<sup>29</sup> and the federal and state bodies for the promotion of racial equality in the case of quilombola communities), to identify and validate eligible quilombola settlements and communities based on this first criterion. Preliminarily, 33 quilombola communities (out of 47 in the state) were mapped in 21 municipalities, as well as 28 agrarian reform settlements in 27 municipalities. It is understood that there will also be the possibility of serving 'traditional' rural communities, albeit in limited numbers. The Project will have to define the prioritization criteria that will allow this choice to be made. The communities/settlements to be targeted should then be defined.
- 1.10 Preliminarily, it was agreed that 40% of the target would be focused on serving quilombola communities and federal agrarian reform settlers (preferably those already served with productive projects in phase I of PROCASE, and which have already been previously mapped). The other 60% of the target will be focused on 09 municipalities in the state, on properties of around 25 hectares (an average of 8 ha per property) belonging to beneficiaries of the PNCF, the ECOPRODUCTIVE project, state agrarian reform settlements, the riverside population, and other groups of family farmers.
- 1.11 The municipalities preliminarily mapped by EMPAER are Barra de São Miguel, Boqueirão, Cabaceiras, Camalaú, Caraúbas, Congo, Monteiro, São Domingos do Cariri and Sumé. These municipalities were worked on by PROCASE I through production projects, mechanized patrols and technical advice to riverside communities benefiting from the São Francisco river transposition project. In these 9 municipalities, the plan is to work with up to 150 communities, which have already been mapped.

**c) The implementation of the regularization roadmaps:**

- 1.12 EMPAER's previous experience has enabled it to define a roadmap or sequence of steps that must be carried out in order for a rural property to be regularized. It is this roadmap, which covers both the land ownership dimension and that of environmental registration, that forms the methodological backbone of the Project's regularization initiative.
- 1.13 It should be noted that the route to be taken by each property to be regularized is slightly different depending on the starting situation of each property, in which case there are two possible initial scenarios: i) Properties with a public deed - areas of ownership and ii) Properties without a public deed - areas of possession. Both routes are similar, with the one for squatter areas having a few additional steps. The roadmaps are presented in more detail below.

**d) Action strategy: the roadmaps for land regularization and environmental registration**

---

<sup>29</sup> In a recent administrative reform, the newly created EMPAER incorporated the function of the former EMATER-PB and INTERPA, which was the Paraíba Land Institute responsible for state settlements.

<p>Initial moment: Mobilization and dissemination action, in which the initiative is presented and explained to the beneficiary public, with the aim of identifying/confirming the family units or communities interested in participating and that meet the prioritization criteria (areas without litigation, quilombolas, settlers, PA with less than 25 ha, etc.).</p> <p>Once the potential participants have been identified, the following activity guides are applied.</p>	
<b>Activity roadmap (i): Domain areas</b>	<b>Activity roadmap (ii) - Ownership areas</b>
1 - Diagnosis of the rural property. This aims to identify whether the property is in the ownership area (with a deed) or the possession area (without a deed).	
2 - Georeferencing rural property.	2 - Georeferencing rural property.
<p>3 - Georeferencing inspection: done 100% by satellite image and on-site inspection of some properties. It checks that the landmarks are correctly implanted and if there are any discrepancies that need to be corrected.</p> <p>Any property that needs adjusting will be corrected by the contractor. The property that is suitable can be entered into the Land Management System (SIGEF).</p>	<p>3 - Georeferencing inspection: done 100% by satellite image and on-site inspection of some properties. It checks that the landmarks are correctly implanted and if there are any discrepancies that need to be corrected.</p> <p>Any property that needs adjusting will be corrected by the contractor. The property that is suitable can be entered into the Land Management System (SIGEF).</p>
4 - Evaluation of documentation by the Discriminatory Commission, to declare that the property is suitable for the next stages	4 - Evaluation of documentation by the Discriminatory Commission, to declare that the property is suitable for the next stages
5 - Creation or update of registration code in the National Rural Registration System (with issuance of CCIR) <sup>30</sup>	5 - Creation or update of registration code in the National Rural Registration System (with issuance of CCIR)
<p>6 - Approval by the agency (INCRA/EMPAER) of the georeferenced parcel/property in the Land Management System (SIGEF), which allows for the generation of technical parts (plans and descriptive memorials) of the property. The delivery of these technical documents certifies land regularization, which is the georeferencing (in script (i) of the ownership areas).</p>	6 - Approval by the agency (INCRA/EMPAER) of the geo-referenced parcel/property in the Land Management System (SIGEF), which allows technical parts (plans and descriptive memorials) of the property to be generated. As this is vacant land, the documentation is issued in the name of the state at this stage. The delivery of these documents concludes the first stage of land regularization, which is georeferencing.
	6.1 - Delivery of the plan and memorial to the notary's office, for the creation of the registration and collection of the vacant land.
	6.2 - Analysis by Discriminatory Committee
	6.3 - Updating the technical parts, which will then be in the name of the beneficial owner and drawing up a definitive title in their (or the community in the case of collective land).

<sup>30</sup> CCIR is the Rural Property Registration Certificate, which is issued by INCRA via the Rural Registration System.

	6.4 - Sending the updated documentation to the Registry Office for the transfer of ownership (State to beneficiary).
7 - Creation or updating of the CAR (Rural Environmental Registry), using the data registered in SIGEF. The receipt for the rural property's registration in the CAR proves that the registration has been completed.	7 - Creation or updating of the CAR (Rural Environmental Registry), using the data registered in SIGEF. The receipt for the rural property's registration in the CAR proves that the registration has been completed.
8 - Drawing up the title deed.	8 - When stage 6.4 of the notary's office is completed, the property is fit and up-to-date. With the above steps completed, the property's documentation is fully regularized and ready to be handed over to the beneficiary (individual or collective).
9 - The property is ready and up to date. With the above steps completed, the property is ready for occupation., with recognition of ownership. The technical documents can be sent to the notary's office for registration of the area. A new, updated certificate can then be issued.	

1.14 EMPAER will be responsible for coordinating this line of action under PROCASE II. Building on the previous experience mentioned, EMPAER will reaffirm its partnership with INCRA, which plays a vital role in the whole process (issuing the CCIR e coordination of SIGEF). Some of the stages of this roadmap will be implemented in the field by companies hired for this purpose.

1.15 Approximately 5.000 properties (covering around 100,000 hectares) will be able to follow this route with the Project, until the desired regularization is achieved. It should be made clear that in land reform settlements (federal or state) and in the municipalities served by EMPAER, title will be granted individually, per beneficiary family. In the case of quilombola communities, the title will be collective, covering the entire georeferenced polygon and in the name of the duly registered residents' associations.

**D. Execution arrangement**

1.16 EMPAER, through the Directorate of Agricultural Planning and Land Regularization, will be responsible for carrying out this subcomponent, conducting the entire process and following the flow of steps required until the definitive title deeds and domain recognition are issued. A specialized company will be hired, through a bidding process, to carry out some stages of the roadmap presented in the previous section (register and georeferencing), under EMPAER's supervision.

1.17 A specific Technical Cooperation Agreement will be signed with INCRA, with no transfer of funds, so that it can receive the georeferenced areas, carry out the inspection and approval of the technical pieces necessary for the regularization process of quilombola communities and federal land reform settlements.

- 1.18 The SEAFDS and EMPAER teams will also make efforts with ANOREG and the state's Corregedoria Geral de Justiça to sign a cooperation agreement to provide support for faster analysis by the registry offices.
- 1.19 The process will also include public hearings to talk to the municipalities and communities that will benefit, and priority will be given to titling on behalf of women. EMPAER will count on the support of the rural workers' unions and rural community associations in the municipalities and communities served.

**E. Costs**

Costs of Subcomponent 2.4 - Land and Environmental Regularization<sup>31</sup>

Activity	Amount	Unit Cost US\$	Estimated value (US\$)
<b>Activity: Land and environmental regularization initiative</b>			<b>2 000 000</b>
Implementation of rural property regularization initiative	5 000 families	Estimated average cost per hectare: 20 000	2 000 000
<b>TOTAL for Subcomponent 2.4</b>			<b>2 000 000</b>

**F. Results**

- 1.20 The land and environmental regularization initiative will serve approximately 5.000 rural properties and families, of which 40% will be quilombola communities in federal and state settlements.

**G. Implementation schedule**

Table XX: 6-year timetable for the implementation of Subcomponent 2.4

Stages	Year 1				Year 2				Year 3				Year 4				Year 5				Year 6			
	1	2	3	4	1	2	3	4	1	2	3	4	1	2	3	4	1	2	3	4	1	2	3	4
Land and environmental regularization																								

---

<sup>31</sup> This amount includes expenses for the aforementioned registration and georeferencing services, as well as for monitoring, inspection and titling. This amount may also cover the purchase of equipment and operating costs for carrying out the activities. EMPAER will pay its civil servants from its own budget.

## ANNEX 9

### Knowledge Management and South-South and Triangular Cooperation

#### A. Objective

- 1.1 Subcomponent 2.5 will develop and implement a knowledge management process capable of generating, recording, sharing, and using knowledge generated in the Project. It will also seek to feed the Project implementation process with relevant information and knowledge.
- 1.2 Knowledge will be made available at different geographical scales: among Project participants (at community and territorial level), at state level, in the Northeast region and in other developing countries (via SSTC), and to different target audiences: beneficiaries, implementing partners and service providers, the Project team, government entities and others. The objectives will be refined during the preparation of the Knowledge Management (KM) and South-South and Triangular Cooperation (SSTC) plan.

#### B. Strategic orientation and methodology

- 1.3 At the start of PROCASE II, the KM and SSTC specialist will draw up a guiding document, which will contain the entire methodology and arrangement for implementing the CG and CSST actions, known as the KM and SSTC plan. The KM and SSTC plan will be drawn up in the first year of Project implementation and will detail the general strategy and implementation methodology for all activities related to the KM and SSTC theme. Annex A specifies what a KM and SSTCS plan should contain and provides some important considerations for KM and STC in PROCASE.
- 1.4 The KM and SSTC Specialist plays a crucial role in development projects, ensuring that information and knowledge are systematically captured, shared, and used to improve Project results. To foster a culture of knowledge sharing within the Project team, the specialist must emphasize that knowledge management is a collective responsibility. This involves promoting the importance of documenting experiences, good practices, lessons learned and so on, encouraging open communication and providing training to incorporate these practices into day-to-day work. In doing so, the specialist helps to build a collaborative environment where continuous learning and improvement are integral parts of the team's success.
- 1.5 In addition, during the initial phase and throughout the implementation of the Project, the Expert will lead the identification of strategic partners to carry out studies, research and events. These partners will play a key role in the Project's sustainability strategy, ensuring that the knowledge generated is widely distributed and made available even after the end of the Project. In particular, they will seek to ensure that the knowledge, innovations, and good practices generated in the Project can be scaled up and contribute to improving local, national, and regional public policies on rural development. The Specialist will also manage the hiring of specialized consultants to prepare technical documents and specific activities.
- 1.6 The specialist will also be responsible for the Project's institutional communication. Institutional communication includes creating information leaflets about the Project, managing the Project's website and social media channels, issuing press releases, among other activities. The specialist will develop a comprehensive communication and visibility strategy. Activities related to institutional communication fall under general Project management and are not part of this specific subcomponent. However, the knowledge management plan also includes a dissemination strategy, detailing how specific knowledge products will reach their target audiences. Effective coordination between general

communication efforts and the dissemination of knowledge products will be key, as it enhances the communication activities of the Project as a whole.

**C. KM and SSTC plan**

- 1.7 This plan will define the detailed objective of the KM and SSTC activities, the products developed for each target group, the distribution channels, among others. PROCASE II will be able to draw on a wide range of resources, products and experiences from other initiatives and projects, including lessons learned from PROCASE I. Therefore, PROCASE II's KM and SSTC activities should avoid duplicating material that already exists, while at the same time using this material in project activities, such as capacity building and training.
- 1.8 The detailed KM and SSTC activities and products will be defined when the plan is drawn up. The main activities and products include:
  - a) **Systematization of experiences, good practices and results and studies of interest to the project on specialized topics:**
- 1.9 The Project's interventions will be subject to participatory and qualitative evaluations of their results, and those with a proven impact will be selected to be systematized, using the appropriate methodology for this process, and will be disseminated as a benchmark for good practice. Systematization can lead to different products such as written documents, videos, podcasts, and others. In addition to systematization, specialized studies will be contracted. Studies and consultancies will be carried out on topics relevant to the Project. such as studies on agroecology, agroforestry systems (SAFs) adapted to the Atlantic Forest and or Semiarid, sustainable management of natural resources, social technologies that improve access to water, or mechanization innovations - will generate inputs for improving the Project's implementation processes. They will also be key to ensuring the development of strategic, evidence-based Knowledge Management products that can serve as a reference for other rural development projects at various levels - state, regional, national, and international. These products are also important for the process of dialogue and influence on public policies. In total, 25 systematizations and studies on KM will be prepared and published during the Project.
  - b) **Communication and Dissemination in Knowledge Management**
- 1.10 The dissemination of accumulated knowledge is the central idea of KM. Communication actions are a means of ensuring ownership of the activities, results and knowledge generated in the implementation of the Project among stakeholders and can even lead to the creation of new knowledge. The dissemination of knowledge products allows innovative practices, lessons learned, etc. to be accessed by the Project and strategic dialogues to be established with a wide range of partners. The planning of these activities is an integral part of the KM and SSTC Plan and must be coordinated with the Project's institutional communication strategy. The project will organize various events, such as meetings, thematic exchanges (of beneficiaries, Project staff and others), round tables, webinars, among others.
- 1.11 The Project will also participate in and organize public policy dialogue events. Engagement and dialogue on public policy are important aspects of development projects. It is important that the knowledge generated during the Project informs policymakers, thus prioritizing the most important aspects for the Project's target groups. Involvement with policy is also key to the sustainability, replication, and expansion of projects. Annex A specifies the policy dialogues in which PROCASE has been involved and describes the possibilities for involvement in PROCASE II.

**c) South-South and Triangular Cooperation Actions:**

1.12 Ten SSTC events will be organized, which may cover topics such as technical exchanges and policy dialogues. One or more of these events could take the form of SSTC learning routes, so that partners can learn about the experiences and lessons learned from the implementation of the Project and so that beneficiaries, technicians, and Project managers can learn from good practices implemented in other countries or in other regions of Brazil. The Project will maintain a close relationship with IFAD's Center for Knowledge and South-South and Triangular Cooperation, located in Brasilia and with a regional mandate for Latin America and the Caribbean, which will be able to support knowledge exchanges with other IFAD initiatives in Brazil and Latin America through SSTC activities.

**D. Execution arrangement**

1.13 The PMU will hire a foundation to carry out the Project's KM and SSTC activities, as defined in the KM and SSTC plan. This means that the foundation will prepare systematizations, conduct studies, prepare other knowledge products and organize events, including SSTC events. The foundation selected must be a non-profit organization, preferably linked to a university, and the same foundation will be responsible for the Innovation component (1.3) and some of the contracts under sub-component 2.3. The KM and SSTC specialist will be the focal point for KM and SSTC within the PMU and will be responsible for overseeing the contract with the foundation and coordinating its implementation.

**E. Costs**

1.14 To implement the KM and SSTC Plan a **detailed work plan and budget** must be drawn up. This plan will be reviewed annually for proper budget execution. The following table shows a preliminary budget for general CG, OSH&S and Communication activities:

Costs for Subcomponent 2.5 - Knowledge Management and South-South and Triangular Cooperation

Activity	Unit	Number	C. Unit (in US\$)	Estimated value in (US\$)
Systematizations and studies in Knowledge Management prepared and published	Study	25	40 000	1 000 000
Annual phases of Communication and Dissemination in Knowledge Management implemented	Years	6	20 000	120 000
South-South and Triangular Cooperation	Exchanges	10	100 000	1 000 000
<b>TOTAL</b>				<b>2 120 000</b>

**F. Results**

1.15 Under this subcomponent, 25 systematizations and studies on Knowledge Management will be carried out, six annual communication and dissemination phases and ten South-South Cooperation exchange events.

**G. Implementation Schedule**

Timetable for the 6 years of implementation of Subcomponent 2.5

Stages	Year 1				Year 2				Year 3				Year 4				Year 5				Year 6

## ANNEX 10

### Eligible, Ineligible and Prohibited Investments

#### A. Eligible Investments for Financing

- 1.1 Project resources finance the investments needed to make PROCASE II actions, plans and projects viable. These investments can be classified into three groups.
  - a) **Group 1 - Non-Consulting Services.** This group includes investments associated with hiring technical-operational services, such as transport, application of inputs, installation of equipment, vehicle rental, technical assistance and rural extension (ATER) to producers, software customization, training, among others;
  - b) **Group 2 - Assets.** This group includes investments associated with the purchase of inputs, such as seedlings or seeds, semen for the genetic improvement of cattle, goats and sheep, vehicles and equipment for production, processing and commercialization, among others;
  - c) **Group 3 - Works.** This group includes investments associated with the provision or renovation of productive structures and/or economic infrastructures, such as road rehabilitation, well drilling, the construction of individual or collective sewage systems and processing plants.

#### B. Investments Not Eligible for Financing

- 1.2 Some types of investment will not be financed by PROCASE II, even if they are necessary to make the projects viable. Among other items, the following cannot be financed i) purchase of real estate of any kind; ii) current expenses (salaries and social charges of existing staff, water, electricity, internet, telephone); iii) operating and maintenance costs; v) construction, expansion, modernization, renovation or implementation of civil or water works on real estate that does not have ownership of the land; vi) construction or expansion of wood-burning ovens, unless their adoption brings a substantial reduction in greenhouse gas emissions; vii) purchase of cattle, goats and sheep, even for genetic improvement..

#### C. Investments Prohibited for Financing

- 1.3 Chapter VI of the ROP (Environmental and Social Management of the Program) includes a list of activities and goods prohibited for financing by PROCASE II.

## Annex 11

### Requirements set out in the IDB's PBAS for the content of the ESMP <sup>32</sup> (Environmental and Social Management Framework - ESMF)

#### 1.1 Requirements of PDAS 1 (IDB): Assessment and Management of Environmental and Social Risks and Impacts:

- Mitigation and performance improvement measures and actions aimed at addressing the environmental and social risks and impacts that have been identified should be described. Plans or programs should be defined, which may consist of a documented combination of operating procedures, practices, plans and related supporting documents (including legal agreements) managed in a systematic way.
- These Programs will be broad for the entire organizational structure of the executing agency for the execution of the Project, including the main contractors and suppliers over which the organization has control or influence, or for specific sites, facilities, or activities.
- The mitigation hierarchy will be considered to address the risks and impacts identified, prioritizing the prevention of impacts, measures to minimize them and then compensation or offsetting measures, when residual impacts persist and whenever they are of a technically and financially feasible nature.
- Mitigation and performance measures and relevant actions will be drawn up to ensure that the project operates in accordance with applicable laws and regulations and meets the requirements of financial institutions.
- Environmental and social action plans will be established (general or thematic), which will define the desired results and actions to tackle the issues raised in the process of identifying risks and impacts.
- Given the dynamic nature of the Project, the Management Program must be able to react to changes in circumstances, unforeseen events and the results of monitoring and review activities.
- Procedures will be established to monitor the Management Program and measure its effectiveness, as well as compliance with all related legal or contractual obligations and regulatory requirements.
- A stakeholder participation plan will be drawn up according to the risks and impacts of the Project, adapted to the characteristics and interests of the people affected by the Project and other relevant stakeholders.

---

<sup>32</sup> The details are in the Project's Strategic Environmental and Social Management Plan

- If applicable, a consultation process commensurate with the risks and adverse impacts of the Project and the concerns of affected people (including Indigenous peoples and Afro-descendants), as well as other stakeholders, will be included.

#### 1.2 Requirements of PDAS 2 (IDB) and Standard 5 (IFAD): Work and Working Conditions:

- Measures will be included (for example, an Occupational Health and Safety Plan) to prevent accidents, injuries and illnesses that may arise from work, be associated with it, or occur during it, reducing the causes of the risk factors to a minimum, as far as is reasonably practicable. In the event of pandemics or epidemics, occupational health and safety measures and protocols will be considered to protect the workers of the projects in the sample representative of the risk of exposure.
- Measures will include the elimination, replacement or modification of hazardous conditions or substances; worker training and record-keeping; documentation and reporting of occupational accidents, injuries, illnesses, and incidents; arrangements for emergency prevention, preparedness, and response; processes for reporting unsafe or unhealthy work situations, as well as mechanisms for evaluating performance in terms of occupational safety and health.
- They should also include recommendations for the prevention of child labor and forced labor.

#### 1.3 Requirements of PDAS 3 (IDB) and Standard 2 (IFAD): Resource Efficiency and Pollution Prevention:

- Technically and financially feasible measures (e.g. solid and liquid waste management plan, emissions, and other relevant environmental aspects) will be considered so that, within the Project's activities, the consumption of energy, water and other resources and inputs is improved, and greenhouse gas emissions are avoided or minimized.
- Measures to prevent or reduce the emission of pollutants into the air, water or soil, as well as responses to accidental situations.
- Measures to reduce, recover and reuse waste in a way that is safe for health and the environment.
- Considerations for treating, destroying or disposing of waste (hazardous and non-hazardous) in an environmentally correct manner.

#### 1.4 PDAS 4 requirements (IDB) and Standards 6 and 9 (IFAD): Community Health and Safety:

- Prevention and control measures will be established in accordance with international best practices for preventing risks and impacts on the health and safety of the community.
- Measures to prevent the community from being exposed to hazardous materials and substances that the Project may generate in the event of the implementation of works or the application of unauthorized chemical products within the scope of the Project.
- Measures to avoid or minimize the community's exposure to water-borne diseases, vectors, and contagious diseases.

- Emergency preparedness and response measures will be included that take into account affected people, local government agencies and other relevant parties, both for their protection and for their participation and collaboration.
  - Adequate resilience and adaptation measures to disasters and climate change, including risks caused by natural disasters or changes in land use to which Project activities may contribute.
- 1.5 Requirements of PDAS 5 (IDB) and Standard 7 (IFAD): Land Acquisition and Involuntary Resettlement:
- It should be noted that the project cannot lead to situations in which land acquisition and involuntary resettlement are necessary, in which case this requirement will not be triggered.
- 1.6 Requirements of PDAS 6 (IDB) and Standard 1 (IFAD): Biodiversity Conservation and Sustainable Management of Living Natural Resources:
- When impacts on biodiversity and ecosystem services cannot be avoided, measures will be defined to minimize them and restore biodiversity and ecosystem services in the long term, through the adoption of adaptive management practices that respond to changes and monitor the results.
  - For the protection and conservation of biodiversity, the mitigation hierarchy will include biodiversity equivalent offset measures, which can only be considered once adequate prevention, minimization and restoration measures have been applied. These biodiversity equivalent offset measures will be designed and implemented in such a way as to achieve measurable conservation outcomes that generate no net loss and preferably result in a net increase in biodiversity. These measures will not be acceptable for habitats defined as critical.
  - For critical habitats, mitigation strategies will be considered through a Biodiversity Action Plan with the aim of achieving net increases in biodiversity values.
  - For non-critical habitats, measures such as: (i) preventing impacts on biodiversity by identifying and protecting reserve areas; (ii) minimizing habitat fragmentation by implementing measures such as biological corridors; (iii) habitat restoration during operations and/or habitat restoration after the operation will be considered.
  - Impacts on ecosystem services will be avoided or minimized through measures aimed at maintaining the value and functionality of priority services to increase the efficiency of their use in operations.
- Requirements of PDAS 7 (IDB) and Standard 4 (IFAD): Indigenous Peoples<sup>33</sup> :
    - If it is not possible to avoid adverse impacts on Indigenous peoples that are eventually identified in the ESA, measures will be designed to minimize or provide restoration or compensation for such impacts in a culturally appropriate manner and commensurate with

---

<sup>33</sup> The prerogatives of this guideline are in line with ILO 169, to which Brazil is a signatory (Legislative Decree No. 143 of June 20, 2002).

the nature and size of such impacts and the vulnerability of the communities of indigenous peoples eventually affected by the Project.

- The proposed measures will be drawn up in conjunction with the consultation and informed participation of these communities, considering an Indigenous Peoples' Plan, if necessary.
- Interaction process measures with indigenous communities that may be affected by the Project will be established.
- Means will be established to obtain the free, prior and informed consent of indigenous communities that may be affected by the Project and relevant mitigation measures will be determined. Free, prior and informed consent will be applied to the design and execution of the Project and the expected results in relation to impacts affecting indigenous communities.

1.7 Requirements of PDAS 8 (IDB) and Standard 3 (IFAD): Cultural Heritage:

- Provisions will be designed to manage chance finds through a specific procedure.
- Measures will be considered according to the hierarchy proposed in this PDSA for the mitigation of adverse effects during the removal of reproducible (non-critical) cultural heritage, if these exist in the Project area.
- Measures will be developed to prevent the removal, alteration or damage of any critical cultural heritage or irreproducible cultural heritage.

1.8 PDAS 9 requirements (IDB): Gender equality.

- Measures will be drawn up to: (i) avoid, minimize or mitigate the negative impacts identified, or provide compensation in this regard with mechanisms that promote gender equality and (ii) ensure that people of different genders, including women and gender-diverse people, who may be affected by the Project, receive social and economic benefits equal to those received by other members of the community, thus avoiding the potentiation of gender inequalities.
- Measures to prevent risks of sexual and gender-based violence related to the Project will also be considered, including specific policies for contractors regarding sexual harassment and codes of conduct for workers, workshops and awareness campaigns for workers and contractors and for the communities where the Project is implemented, etc.
- Effective complaint mechanisms will be developed that minimize the reporting burden on victims, offer gender-responsive services and minimize the risk of retaliation. These mechanisms will contain specific procedures for sexual and gender-based violence, including confidential reporting through people trained in the subject, with secure and ethical documentation.
- Measures to prevent the risk of sexual exploitation or abuse of minors will be incorporated.

1.9 PDAS 10 (IDB) requirements: Stakeholder Involvement and Information Disclosure:

- The stakeholder engagement plan will describe the measures that will be used to remove barriers to participation and how the opinions of groups that are affected differently by the Project will be captured.
- In the case of projects that may have significant adverse impacts on the people affected by them, a process of consultation and informed participation will be designed, in accordance with PDAS 1. If any project is found to have adverse impacts on Indigenous peoples, a process of consultation and informed participation will be designed, with a view to obtaining free, prior and informed consent, in accordance with PDAS 1 and 7.
- A grievance mechanism will be proposed to receive concerns and complaints and facilitate their resolution. This mechanism could also serve as such to fulfill the requirements of PDAS 5 and 7. However, the grievance mechanism for project workers, required under PDAS 2, should be established separately from the others.
- The plan must include communication actions in the event of emergencies and socio-environmental accidents.

**Paraíba Sustainable Rural Development Project - PROCASE II Internal  
Regulations of the Executive Productive Investment Management Committee -  
CEGIP**

**CHAPTER I**

**The objective**

**Art. 1** These Regulations establish the rules for the organization and operation of the Executive Committee for the Management of Productive Investments, within the scope of the Paraíba Sustainable Rural Development Project - PROCASE II.

**CHAPTER II**

**Purposes and duties**

**Art. 2** The Committee is responsible for:

- I. analyze and approve or not resilient Business Plans and Investment Plans with a value of up to R\$ 6,435.00 per family and R\$ 9,400.00 (nine thousand four hundred) per family, respectively;
- II. decide on PROCASE II's strategic priorities, rules and procedures and other equally relevant issues;
- III. approve the terms of reference for the socio-economic and environmental feasibility studies and reports;
- IV. decide on the financing of the proposed investments;

- V. establish norms, guidelines, instructions, criteria and standards relating to productive investments;

**§ Paragraph 1 CEGIP may invite specialists in a given area of activity to provide the plenary with clarifications on information pertinent to the productive investments under analysis.**

## **CHAPTER III**

### **Composition**

**Art. 3** CEGIP's Plenary will be made up of the following members:

- I. the head of the State Secretariat for Family Farming and the Development of the Semi-Arid Region (SEAFDS) as President, with the Executive Secretary of this portfolio as Alternate;
- II. a representative of the State Secretariat for the Development of Agriculture and Fisheries (SEDAP)
- III. one representative and one alternate from the Paraibana Research, Rural Extension and Land Regularization Company - EMPAER;
- IV. one representative and one alternate from the State Secretariat for Infrastructure and Water Resources (SEIRH);
- V. one representative and one alternate from the State Secretariat for the Environment and Sustainability (SEMAS);
- VI. one representative and one alternate from the State Secretariat for Science, Technology, Innovation and Higher Education (SECTIES);
- VII. one representative and one alternate from the Superintendence of Environmental Administration (SUDEMA);
- VIII. one representative and one alternate from the Secretariat for Tourism and Economic Development (SETDE);
- IX. one representative and one alternate from the State Council for Sustainable Rural Development (CEDRS);

- X. one representative and one alternate from the Directorate of Mineral Resources and Hydrogeology (DRMH);
- XI. one representative and one alternate from Empreender PB;
- XII. one representative and one alternate from the Secretariat for Planning, Budget and Management (SEPLAG);
- XIII. one representative and one alternate from the COOPERAR Project;
- XIV. one representative and one alternate from the Ministry of Agriculture, Livestock and Supply (MAPA);
- XV. one representative and one alternate from the Ministry of Agrarian Development (MDA);
- XVI. one representative and one alternate from the Borborema Citizenship Territory;
- XVII. one representative and one alternate from the Western Cariri Citizenship Territory;
- XVIII. a representative from the Curimataú Citizenship Territory;
- XIX. one representative and one alternate from the Zona da Mata Norte Citizenship Territory;
- XX. one representative and one alternate from the Zona da Mata Sul Citizenship Territory
- XXI. a titular and alternate representative of the Rural Identity of Eastern Cariri;
- XXII. a representative from the Rural Identity of the Médio Sertão;
- XXIII. a representative from the Rural Identity of the Seridó;
- XXIV. a full and alternate representative of the Alto Sertão Rural Identity;
- XXV. a full and alternate representative of the Brejo Rural Identity;
- XXVI. a representative from the Rural Identity of the Middle Piranhas;
- XXVII. a full and alternate representative of the Serra do Teixeira Rural Identity;
- XXVIII. a titular and alternate representative of the Rural Identity of the Piancó Valley;
- XXIX. a full and alternate representative of the Rural Identity of the Paraíba Valley;
- XXX. a full and alternate representative of the Rural Identity of the Piranhas Valley;
- XXXI. a full and alternate representative of the Rural Identity of the Maringá Valley;

- XXXII. a full and alternate representative of the Rural Identity of Piemonte da Borborema;
- XXXIII. a representative from the State University of Paraíba (UEPB);
- XXXIV. a representative from the National Semi-Arid Institute (INSA);
- XXXV. a representative from the Brazilian Micro and Small Business Support Service (SEBRAE);
- XXXVI. a representative from the National Rural Apprenticeship Service in Paraíba (SENAR);
- XXXVII. a representative from the Paraíba Federation of Agriculture and Livestock (FAEPA);
- XXXVIII. a full and alternate representative of the Federation of Agricultural Workers (FETAG);
- XXXIX. one representative and one alternate from the Federation of Agricultural Workers (FETRAF);
- XL. a representative from the Articulação do Semiárido Brasileiro (ASA);
- XLI. a representative from the Landless Workers' Movement (MST);
- XLII. a representative from the Pastoral Land Commission (CPT);
- XLIII. a representative and alternate from the Paraíba State Water Management Executive Agency (AESAs);
- XLIV. one representative and one alternate from Banco do Brasil/Bradesco?
- XLV. one representative and one alternate from Banco do Nordeste do Brasil.

§ Paragraph 1 CEGIP shall be made up exclusively of representatives with experience and/or political-institutional responsibility in allocating resources for productive investments.

§ Paragraph 2 The Executive Secretary of CEGIP will be the State Coordinator of the Project Management Unit.

§ Paragraph 3: Representative members shall have a two-year term of office, appointed by the SEAFDS Secretary through nominations made by the bodies or entities represented.

§ Paragraph 4. The members of CEGIP shall take office before the Chairperson at the first (1st) meeting of the Committee to be held after their appointment.

Art. 4 The participation of CEGIP members is considered a relevant service and will not be remunerated.

Sole paragraph. Members shall be entitled to a certificate for relevant services rendered to the State of Paraíba.

## CHAPTER IV

### Organization

Art. 5 CEGIP is organized as follows:

- I. Presidency;
- II. Collegiate;
- III. Executive Secretariat.

## SECTION I

### The Presidency

Art. 6 The Chair is responsible for:

- I. calling Committee Meetings;
- II. chairing the meetings and work of the Committee;
- III. sign minutes, resolutions, recommendations and other acts and documents of the Committee;
- IV. propose to the Committee, at the last meeting of the year, the annual calendar of Ordinary Meetings for the following year;

- V. represent CEGIP in and out of court, and may appoint other members of the Committee to represent it;
- VI. to appoint civil servants to provide technical and administrative support to the Executive Secretary;
- VII. to swear in the other members of the Committee;
- VIII. invite to participate in meetings and debates, without the right to vote, federal, state and/or municipal persons and entities that can contribute to the clarification of matters within the Committee's competence;
- IX. perform such other duties as may be delegated to it by the Committee; and
- X. ensure compliance with the rules of these Regulations.

Sole paragraph. The Chair may approve *ad referendum* of the Committee when:

- 1) A meeting is called twice in succession and a quorum is not reached;
- 2) Urgent approval is needed to avoid harming Project beneficiaries.

## SECTION II

### The Board

Art. 7 The members of the Board are responsible for:

- I. attend, participate in and vote at Committee meetings;
- II. propose the convening of extraordinary meetings of the Committee, with the signature of at least one third of the members;
- III. approve the annual calendar of ordinary meetings;
- IV. proposing or requesting steps and clarifications that may be useful for the better judgment of the matters on the agenda of the meetings;
- V. judge the cases by voting in plenary;
- VI. propose the call for representatives and/or experts referred to in the eighth paragraph of article 6;

- VII. carry out visits to private institutions or public bodies to fulfill their duties, as delegated by the Board; e,
- VIII. propose amendments to these Rules of Procedure, by means of a request signed by at least five (5) members.

### SECTION III

#### CEGIP's Executive Secretariat

Art. 8 The Executive Secretariat is responsible for:

- I. secretariat the Committee's meetings, drawing up the respective minutes and providing information on the matters on the agenda;
- II. ask members for clarifications necessary for the correct drawing up of minutes;
- III. prepare the agendas for the Committee's meetings;
- IV. forwarding to the members a notice convening the meetings with the respective agenda and the matters on the agenda, as well as the minutes of the meetings, which are the subject of examination and discussion;
- V. carry out all the administrative services that are relevant to them;
- VI. disseminate the Committee's resolutions and implement them; e,
- VII. carry out other activities assigned to it by the president.

### CHAPTER V

#### Operation

Art. 9 The Executive Committee for the Management of Productive Investments, which will act as a normative and decision-making body, will meet ordinarily one (1) time per four-month period and, when necessary, at the extraordinary call of the Committee's Chairman or Alternate, or the Coordination of the PROCASE II Management Unit, or at least one third of the members.

Sole paragraph. The notice for ordinary and extraordinary meetings, together with the agenda and minutes of the previous meeting, must be sent at least 10 days in advance.

Art. 10 The meeting shall be held with a quorum of at least one third of its members.

Article 11 Any of its members may request sight of the cases on the agenda, and must submit an opinion on the day of the meeting.

Sole paragraph. Meetings will have their agenda prepared by CEGIP's Executive Secretariat and will necessarily include:

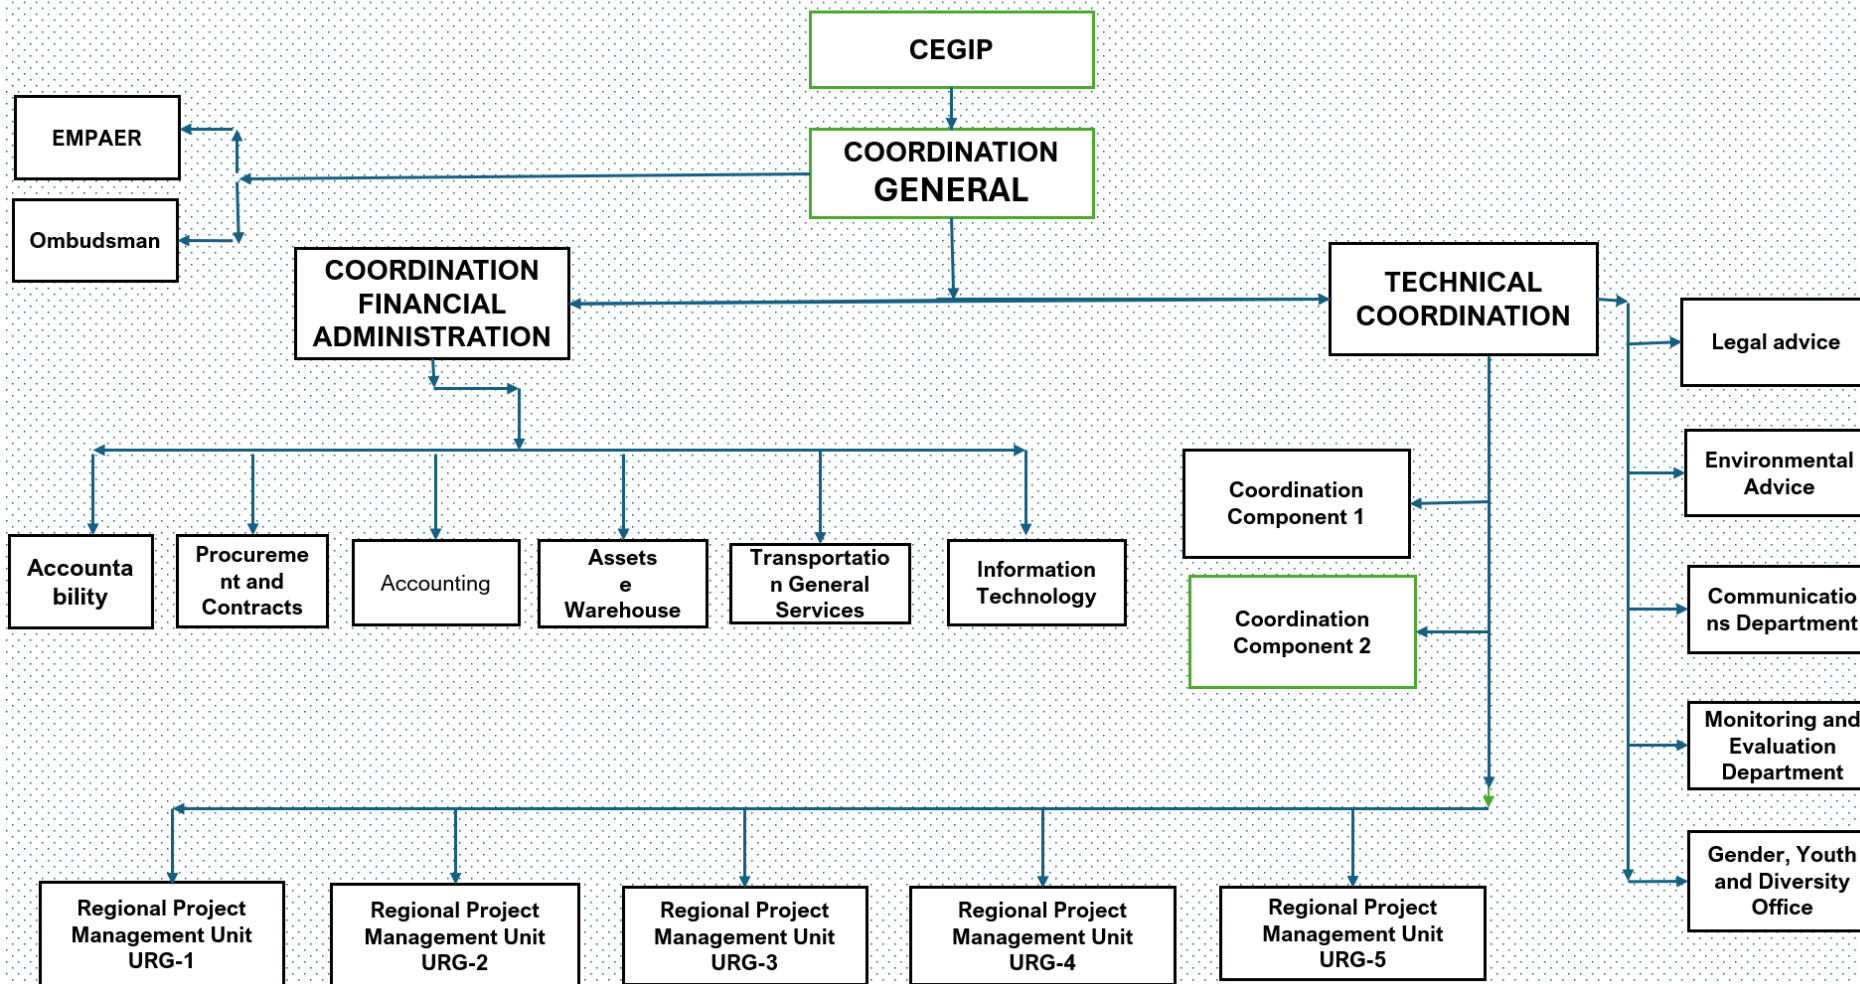

1. opening of the sitting and verification of the quorum;
2. reading, discussion and voting on the minutes of the previous meeting, if applicable;
3. reading and discussion of the agenda;
4. agenda;
5. free speech; and,
6. closing the proceedings.

ANTÔNIO RIBEIRO (FREI ANASTÁCIO) Secretary of SEAFDS President of CEGIP

## 1 INTRODUCTION

This Strategic Environmental and Social Management Plan (PGASE) is structured to evaluate the geographic region where the Project is located, in order to have a management tool that integrates the environmental and social dimensions of each of the interventions in the territory, while also aiming to identify convergences and possible gaps between the IFAD and IDB Safeguard Policies. The interventions proposed in the sanitation sub-projects and production plans may have an impact on some of the municipalities that are part of the Project.

This document is based on the Inter-American Development Bank's Environmental and Social Policy Framework (ESMP) and is an integral part of PROCASE II's Environmental and Social Management System (ESMS).

Thus, the PGASE was prepared in accordance with the IDB's MPAS and PDASs (Social and Environmental Performance Standards) 1 to 10 in order to take into account the guidelines needed to mitigate impacts or studies needed to deepen the socio-environmental assessment of projects still in the pipeline. The IDB's MPAS is a guiding framework for the systematic management of PROCASE II's environmental and social performance throughout its life cycle. The identification of gaps in relation to the requirements of the IDB MPAS made during the environmental and social assessments served as input for the definition of the socio-environmental action plan in which the necessary actions are set out in the Environmental and Social Programs of this PGASE, allowing the Project to comply with the Environmental and Social Performance Standards within an adequate period of time.

This document consists of the following main sections:

- General Description of the Project: provides the main information on the Project's justification, objectives, area of inclusion and budget, as well as a description of the Components and the types of projects and plans to be implemented by the Project.
- Main Impacts and Mitigation Measures: summarizes the list of impacts identified and the related mitigation measures.
- Environmental and Social Programs: provides a more detailed description of the actions and guidelines to be complied with as part of the mitigation measures that must be implemented to comply with the institutions' policies and safeguards.
- Annexes: this section includes documents and information that complement the understanding of the document and its mitigation guidelines.

## 2 PROJECT OVERVIEW

The State Government of Paraíba has requested the financing of a project through a specific investment loan (LON/ESP) to promote the sustainable development of the rural area of the state of Paraíba (involving the Atlantic Forest and Caatinga biomes). The project seeks to address the problems of low production and productivity and vulnerability to climate change (CC) of family farming activities, environmental degradation and deforestation, insufficient water supply services for human consumption and lack of sanitation in rural communities.

Below is the description of PROCASE II, its components and planned sub-projects.

### 2.1 Objectives of Project

The overall aim of the project is to contribute to reducing rural poverty levels, improving food and nutritional security and adapting the rural population to climate change.

The main specific objectives are:

- Increasing the adoption of agricultural technologies, including those for adapting to and mitigating climate change;
- Improving the productive and social inclusion of family farmers, prioritizing women, young people, Traditional Peoples and Communities (PCT) and people with disabilities (PcD);
- Improving the environmental conditions of rural communities and their surroundings.

## 2.2 Project Scope

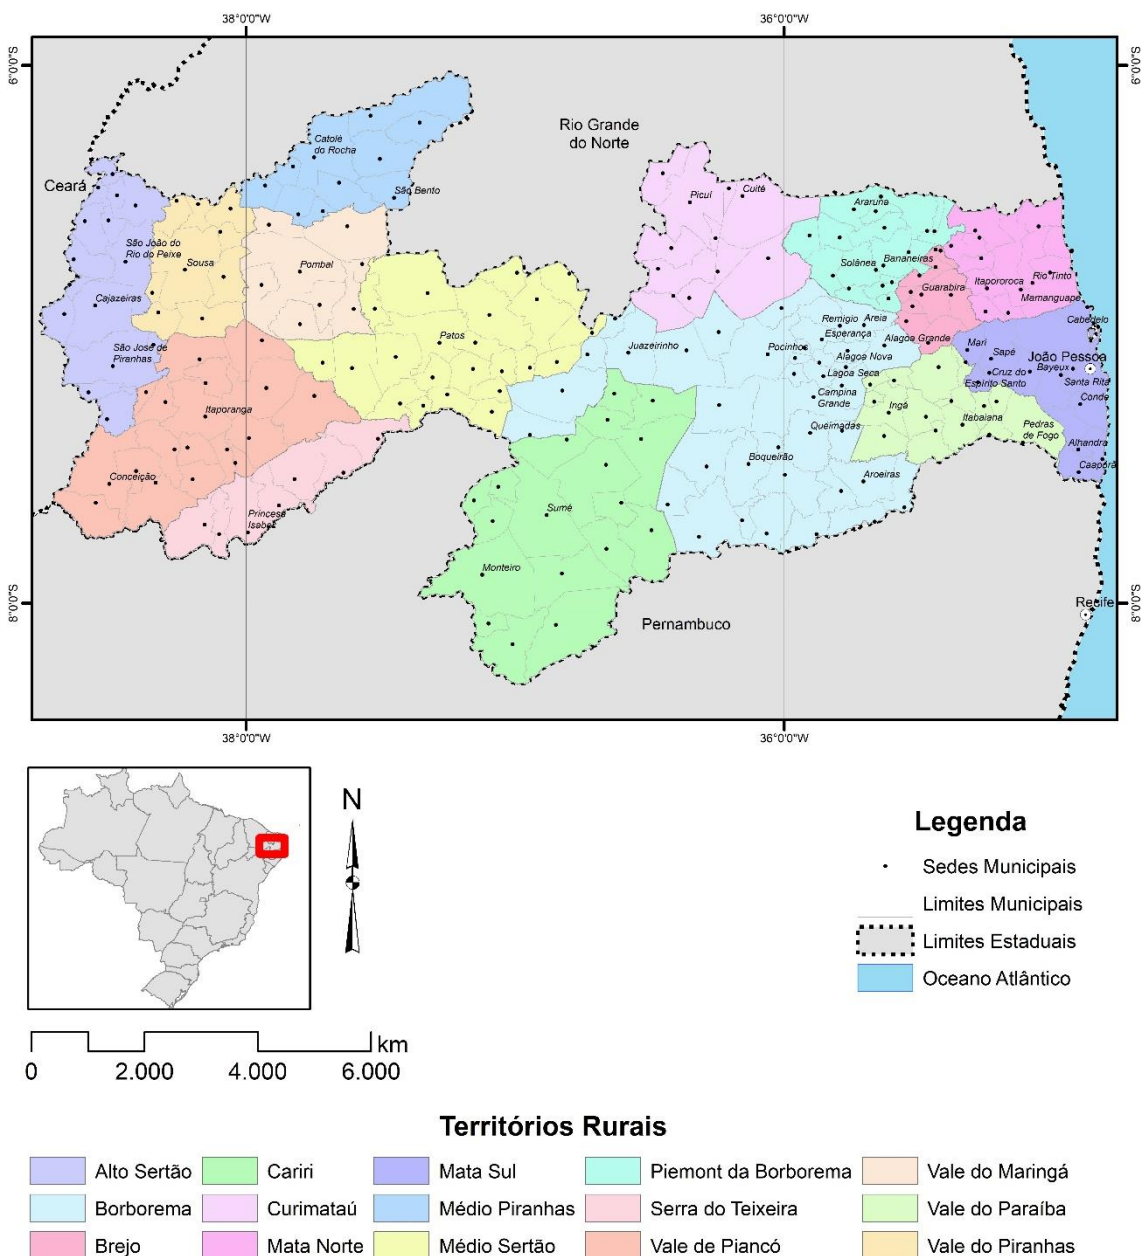

**It is important to note that the beneficiary communities for PROCASE II have not yet been defined and the consultation strategy presented in this document is aimed at communicating and interacting with the institutions representing the prominent communities in the catchment area.**

The project will cover the entire state of Paraíba, involving its 223 municipalities (see figure below), which are distributed between the Caatinga (194) and Atlantic Forest (29) biomes. The Agricultural Census (IBGE 2017) shows a total of 163,218 agricultural establishments, 76.88% of which are family farms (UAF), providing a potential universe for the project.

The project will target approximately 60,000 families as direct beneficiaries, establishing a preferential focus on the following profiles: women, young people, Persons with Disabilities, Traditional Peoples and Communities (PCT), indigenous peoples, fishing communities and gypsies. In any case, specific criteria will be defined for the prioritization and selection of communities to be benefited, involving issues such as cultural traditionality, the need for access to basic sanitation, the rate of families registered with CadÚnico, families who have not benefited from other similar projects, the level of representation of gender, youth and Persons with Disabilities, the level of environmental degradation and the lack of TA service.

The map below shows PROCASE II's area of operation.

**Figure 1 - Area covered by the Project**

Source: IBGE, 2015 - elaboration: Consultoria.

### 2.3 Project Budget

The total amount planned for PROCASE II is 105 million dollars, which will benefit an estimated 600 communities.

**Table 1 - Estimated PROJECT costs (in US\$)**

Components and sub-components	Total Value
<b>C1. Resilient production systems to reduce rural poverty</b>	<b>62.416.000</b>
<i>S1.1 - Implementing resilient biodiverse production systems</i>	56.416.000
<i>S1.2 - Strengthening and diversifying marketing</i>	6.000.000

Components and sub-components	Total Value
<b>C2 - Organizational and Farmer Capacity Building and Knowledge Management</b>	<b>32.302.800</b>
<i>S2.1 - Strengthening the Capacities of Family Farmers</i>	19.252.800
<i>S2.2 - Strengthening Organizations' Marketing Capacities</i>	2.730.000
<i>S2.3 - Diversity, Gender, Youth, Nutrition and Food Security</i>	4.600.000
<i>S2.4 - Land and Environmental Regularization, and Access to Public Programs and Policies for Family Farming</i>	2.600.000
<i>S2.5 - Innovation, Knowledge Management (KM), South-South and Trinagular Cooperation (SSTC)</i>	3.120.000
<b>Project Management, Monitoring &amp; Evaluation</b>	<b>10.281.200</b>
<i>Project Management</i>	8.981.200
<i>Monitoring &amp; Evaluation (M&amp;E)</i>	1.300.000
<b>TOTAL</b>	<b>105.000.000</b>

## 2.4 Description of the components

The PROCASE II components are presented below, highlighting the main information that describes them, including their sub-components.

### **Component 1: Resilient Production Systems to Reduce Rural Poverty**

The aim of this component is to increase the adoption of agricultural technologies, including those for adapting to and mitigating climate change, as well as improving the productive and social inclusion of family farmers, prioritizing women, young people, Traditional Peoples and Communities (PCT) and persons with disabilities.

The component's specific objectives are:

- Transform existing systems by introducing innovative, more intensive and diversified agroecological practices;
- Seeking greater resilience of production systems adapted to climate change;
- Promote improved food and nutrition security;
- Improving the integration of producers into value chains, prioritizing women, young people, people with disabilities, Traditional Peoples and Communities (PCT), indigenous peoples, fishing communities and gypsies;
- Make investments in social technologies, ensuring better access to and reuse of water, and sustainable energies;
- Supporting producer organizations (associations and cooperatives) to enable production to be processed, adding value and consequently improving marketing and market access, through investments in machinery and minor renovations;

Productive investments, both at community level and at cooperative level, will be accompanied by TA and STA respectively, financed by Component 2, in order to guarantee better business management, marketing and sustainability.

Component 1 is organized into two sub-components: 1.1: Implementing Resilient Investment Plans; and 1.2: Strengthening and diversifying marketing.

### **Subcomponent 1.1. Implementing biodiverse and resilient production systems**

The aim of this subcomponent is to strengthen and adapt production systems based on the use of agroecological practices and low greenhouse gas emissions, seeking greater resilience and allowing for improved and diversified production of healthy food for self-consumption and the market. It is hoped that these activities will improve families' food and nutritional security, while at the same time helping to improve their income.

Investments will also be made in social technologies (small water and energy infrastructures), which play a fundamental role in building and strengthening more resilient production systems and improving the basic living conditions of families.

The technical characteristics of the production proposals supported by the project will be adapted according to the specific agro-climatic characteristics of each biome.

#### **Product - Resilient Investment Plans (PIR)**

The Resilient Investment Plans (PIR) will be the main instrument for planning and implementing the resources of this subcomponent. It will have a territorial focus and will be prepared with one or more communities, with the support of TA. Each PIR will be carried out by an existing community association, representing the beneficiary community or communities, with which the project will sign an agreement establishing its obligations and rights. The project will transfer the funds and the association will procure the goods, services and works provided for in the RIP, reporting back to the project with the support of technical assistance.

The scope of the PIR will be a Local Territory, made up of up to three communities, and the beneficiaries will be the families in these communities. The PIR will support productive activities (new or strengthening existing activities) geared towards adapting to climate change, with the potential to guarantee food security and improve income through the sale of surpluses. It aims to incorporate concepts of good production practices based on the principles of agroecology, nutritional education and food security for families, as well as ensuring integration with social technologies.

The PIR will finance three areas of intervention: i) Productive and commercialization ii) Environmental and iii) Social Technologies, between which complementarity and synergy will be sought to promote sustainable change. As shown below:

**Productive and marketing axis:** The aim will be to develop productive systems at the family level, always based on the use of agroecological practices with a low impact on greenhouse gas emissions. This axis will also strengthen capacities to market production in the various channels accessible to families (local fairs, PAA, PNAE, local commerce, etc.) and relevant to the beneficiaries, such as: i) Agroforestry systems (SAFs) for diversified production, goat and sheep farming for milk and meat, dairy cattle farming, and free-range poultry farming; ii) Backyards for fruit and vegetable production, including NUS and medicinal plants; iii) Beekeeping and Meliponiculture; iv) Agroecological multi crop systems for organic production, including cotton. It is important to mention that in the case of support for cattle breeding, the project's strategy will be to support dairy production exclusively (it will not be possible to support breeding for meat production), to improve productivity from the existing herd and will not finance the purchase of animals, with the exception of the purchase to replace breeding stock. The list is not exhaustive and other activities may be considered, as long as they are in line with the demand of the beneficiaries and the objectives and criteria of the project.

Compared to the first phase of PROCASE, which focused on the semi-arid region of the Caatinga biome, the PROCASE II management team will have to pay close attention to

identifying relevant proposals for developing productive activities with the potential to adapt to climate change in the Atlantic Forest biome.

All the activities supported under this Productive and commercialization axis will be in accordance with the Environmental and Social Management Plan (ESMP) of each PIR and with the project's Strategic Environmental and Social Management Plan (SESMP).

Extractivism, both in the Caatinga biome and in the Atlantic Forest biome, could also be supported through PIRs, both to enhance non-timber products such as fruit, fibers and lianas, seeds, honey from native bees (meliponidea) and other bio-economic products. As it includes an important coastal area, the improvement of artisanal fishing activities, including shellfish gathering, which is carried out by women, could be considered when drawing up the PIR.

In addition to these activities and considering that part of the project's area of operation has strong potential, economic diversification activities based on tourism (particularly in the coastal Zona da Mata) and handicrafts could be developed through the RIPRIP. These non-agricultural activities, which generally involve women and young people, will be very relevant and in line with the project's objectives.

The Productive and Commercialization Axis will focus on actions to sustainably strengthen primary production and the commercialization of products generally in natura and on the local market. TA will encourage and support the establishment of partnerships with cooperative production processing units supported by the project through subcomponent 1.2. This should make it possible to add value to primary production in order to reach other types of market.

**Environmental Axis:** The aim is to manage and restore the environment, whether it is associated with the activities of the RIP's Productive Axis at Local Territory level or not.

They will have specific resources for collective use to encourage the implementation of territorial environmental actions, such as: i) Casas de Sementes da Paixão (Seed Houses of Passion); ii) Implementation of nurseries focused on the production of native species; iii) Reforestation, recovery of permanent preservation areas (springs and riparian vegetation) and degraded areas; iv) Soil and water protection actions; v) Recycling or composting plans, etc. These actions will be implemented in each territory by an environmental management group made up of project beneficiaries, in which the participation of Local Development Agents (ADL) will be prioritized, as key players in introducing environmental education actions and new environmental practices. To implement these actions, synergies and complementarities will be sought with the actions and competencies of SEMAS (Secretariat for the Environment and Sustainability) and AESA (Executive Agency for Water Management), the State Superintendence for the Environment (SUDEMA), the National Semi-Arid Institute (INSA), Empresa Brasileira de Pesquisa Agropecuária (EMBRAPA), Empresa Paraibana de Pesquisa, Extensão Rural e Regularização Fundiária (EMPAER), Universidade Federal de Campina Grande (UFCG), Universidade Estadual da Paraíba (UEPB), Universidade Federal da Paraíba (UFPB) and other institutions.

The activities of the Environmental Axis will mainly stem from the Environmental and Social Management Plans (PGAS/ESMP), which will be drawn up at the same time as the diagnosis of each RIP. The ESMP will provide a simplified analysis of environmental and social impacts in order to promote and encourage the adoption of environmental and agro-ecological practices. Environmental activities will be carried out with the support of TA, which will also take care of production and marketing.

**Social Technology Axis:** The aim of this axis is to implement social technologies at the family level, such as: i) second-water cisterns (agricultural production); ii) a water harvesting system; and iii) trench dams (underground dams). In addition to these

technologies, 1st water cisterns (human consumption) and other household sanitation solutions such as evapotranspiration basins, or access to more sustainable domestic energy, such as biodigesters and eco-efficient stoves, will also be implemented.

The social technologies will be implemented by entities contracted by the PMU specifically to provide TA for this axis, taking into account the specific nature of the TA and the legal framework targeted. These entities will be trained by PROCASE II, although most of them have the experience to do so. In addition to implementation, these organizations will also provide training to ensure that these technologies are properly appropriated, used and maintained by the families.

The connection and complementarity between the productive, environmental and social technology axes should be sought and highlighted when drawing up the PIRs, with the aim of maximizing the results of the investments made by the project.

In each of these areas, priority will be given to the introduction of innovative practices and technologies, particularly those that will be supported through Subcomponent 2.5, such as mechanization and the use of tools and equipment adapted to the reality of family farming, with a focus on vulnerable groups such as women, young people and the disabled.

The PIRs will also be able to support the strengthening of the functioning of community associations through the acquisition of specific equipment, for example, to improve connectivity, such as audio-visual equipment, etc.

**General aspects about the PIRs:** During the implementation of the PIRs, in addition to a close and permanent synergy with TA actions (including specialized TA in cases where it is justified) and the strengthening of community organizations, complementarities will be established with other Component 2 activities, such as: land and environmental regularization; innovations; actions related to diversity, gender, youth, PCT and families with Persons with Disabilities.

The PIR will benefit groups of families, prioritizing women, young people, traditional communities and Persons with Disabilities, and will finance inputs, tools, equipment and other investments needed to enable the adoption of technologies to improve productivity, adapt to climate change and improve food and nutritional security.

The investments will be financed with non-reimbursable resources and with an economic counterpart from the beneficiaries of at least 10%.

In all cases, the activities selected will come from the Participatory Rural Diagnosis, which will identify not only the demands, but also the problems, priorities and potential demands of the beneficiary communities and families. These activities must meet eligibility criteria that will be detailed in the Project Operational Regulations (ROP) and present: i) high adherence to the productive means characteristic of the biome, region and community, ii) allow productive intensification based on the principles of agroecology, as well as adaptation to climate change and iii) follow the full agreement of the families involved.

The same PIR can support more than one productive activity or environmental axis and include the implementation of various types of Social Technologies, thus seeking coherence with the reality of family farming to meet the demands of the communities in a diversified way and can guarantee the inclusion of various profiles of beneficiaries, particularly women and young people. In these cases, the beneficiaries will be organized into interest groups around the activities selected to make up the PIRs.

During the process of drawing up the PIRs, the integration of new members and partners into existing organizations will be encouraged, giving priority to women, young people and families with Persons with Disabilities.

**Provision of Technical Assistance and Rural Extension (TA) services:** All PIR beneficiaries and their organizations will receive TA services for a period of two years, contracted by the PMU through a competitive process that meets IDB/IFAD standards. These services will be financed by Subcomponent 2.1, in which they are presented in detail. They should enable the beneficiaries to be strengthened and advised on how to design, implement, monitor the operation of and complete the PIRs. This includes advice on production from an agroecological perspective and adaptation to climate change, management, organization, access to public policies and marketing, guaranteeing compliance with current health and environmental legislation. The support provided by the TA entities should include support for the beneficiaries to carry out the procurement and accounting processes related to the implementation of the PIRs, considering that the financial resources will be transferred to the beneficiary associations through the procedure defined in the ROP. In the selection of TA services, criteria will be applied that allow for the inclusion of women technicians in the teams, with a view to being as adherent as possible to the specific needs of women and to proposing the most appropriate solutions for the women beneficiaries of the Project's actions. For example, it will be a selection criterion for TA organizations to have a minimum percentage of 30% women on their teams.

In the case of monitoring the implementation of Social Technologies, a specific TA will be contracted for this purpose, which complies with the legal framework for contracting services for this modality. The entities contracted in this way will be responsible for acquiring materials, providing specialized services for the construction of the Social Technologies and training the beneficiaries to apply good use and maintenance practices.

**Planned Actions and Products:** The actions planned in this product involve: (i) identification of communities; (ii) community eligibility criteria; (iii) prioritization and selection of communities; (iv) Resilient Investment Plan Drafting Process; (v) drafting of PIRs; (vi) parameters for drafting PIRs; (vii) investments eligible for funding; (viii) fundable Climate Adaptation investments; (ix) fundable Climate Mitigation investments; (x) ineligible investments; (xi) PIR approval process; (xii) evaluation and prioritization criteria.

### **Subcomponent 1.2 - Strengthening and diversifying commercialization**

This subcomponent aims to improve marketing and the inclusion of families in value chains by improving the management and production structures of family farmers' cooperatives.

It aims to strengthen cooperatives by means of a Business Plan (PN), with a view to consolidating their management capacities, adding value, diversifying their commercial offer and accessing markets under better conditions. Rather than seeking to create new cooperatives, priority will be given to existing cooperatives to improve their management capacities and those with operational weaknesses.

#### ***Product - Business Plans***

The preparation of these business plans (Pn) will take into account the strengthening of production carried out in subcomponent 1.1 through the PIRs, with the aim of integrating producers into these cooperatives to access the market.

The development of the PNs will seek to diversify the markets accessed. In addition to institutional markets, such as PNAE and PAA, other players will be sought, mainly from the private sector. The project will seek to include the organizations in the Regional Information System for Family Farming in the Northeast (SIRAF), created by the

Northeast consortium and which has been offering a new channel for establishing contact between producers and buyers.

Business Plans (PNs) will be the main instrument for implementing the subcomponent and will be drawn up with producers' economic organizations, usually cooperatives. The PNs should make it possible to finance structuring investments that could benefit family farmers, including the producers benefiting from the PIRs. Specialized technical assistance services (STA) specially dedicated to the PNs and to strengthening the capacities of the beneficiary organizations will also be financed by the PNs.

The NPs should allow for the implementation of competitive mechanisms, geared towards innovative and environmentally sustainable solutions, to strengthen network marketing and cooperative centers.

Investments will be focused on existing organizations that have weaknesses in their management processes, that are unable to achieve sufficient levels of commercialization, that find it difficult to comply with environmental and health legislation, or that operate below their capacity. In these cases, the project will strengthen the capacities of the management teams, support the improvement and modernization of equipment and facilities, improving the processing and diversification of products, with a focus on adapting and/or expanding the physical infrastructure (such as processing and storage areas), with the aim of also meeting the health and environmental standards for obtaining certifications (SIF, organic certification, distinctive collective seals, valuing sustainable products from the Caatinga and Atlantic Forest biomes, etc.). Where relevant, the development of participatory guarantee systems (PGS) geared towards certification processes will also be supported. Subcomponent 2.2 will make an important contribution to these activities and complementarities will be built.

In exceptional cases, the project's support may be directed towards structuring the productive capacity of a cooperative, operating within the supported production chains. These cases will be specific and subject to prior feasibility analysis, considering in particular the existence of other similar ventures in the project area.

Strengthening the capacities of the cooperatives' teams will be a key point of the PNs, which will address the issue of best processing practices, as well as others, such as administrative and financial management. In this case, courses are planned on good management practices and the organization of production, processing, adding value, financial management, institutional strengthening, marketing strategies, etc. The management teams of these enterprises will be the main beneficiaries. These courses will mainly be carried out through specialized consultancies (such as individual consultants, EMPAER, EMBRAPA, SEBRAE, SENAR, etc.).

The preparation of the Business Plans will include a diagnosis of the organization's situation, clearly identifying the most important problems and difficulties encountered and the opportunities that can be seized. The PNs may include agricultural activities of primary production, processing and marketing of this production. Other economic initiatives can also be included, such as handicrafts and community-based tourism, among others, provided they have the potential to generate income in a sustainable way. As the object of these Plans will be 'business' related, involving production and market issues, it is necessary to include more detailed information such as a 'map' of the production chain identifying flows and actors, an analysis of the products demanded by the market and their trends (volumes, prices), an analysis of the competition, a strategy for operating in the market, a sales plan and an investment management strategy. The Business Plan will identify the material investments that will have to be made (construction/refurbishment, machinery, equipment, etc.). In addition, it should point out the training needs (which may cover production, marketing, administrative and financial

management, or other dimensions) that the implementation of the Business Plan will require.

**Provision of Specialized Technical Assistance (STA) services:** Considering the capacities found in the organizations in the region served by the Project, it will be necessary to contract STA services for the preparation and implementation of all the Plans. These services will be contracted by the PMU, through a competitive process that complies with IDB/IFAD standards, with funds provided in the budget for Subcomponent 2.2. However, in certain cases and when the beneficiary organization shows experience and capacity, it could take on the responsibility of contracting the STA directly.

Individuals or legal entities may be contracted to provide these services. The criteria for selecting providers will include: i) experience in providing consultancy services to family farming cooperatives; ii) technical capacity related to the specific problem(s) identified by the cooperative, such as improving processing processes, developing a strategy and identifying new marketing channels, developing a certification system, etc.; iii) technical capacity to deal with and integrate environmental issues related to the activities carried out by the cooperatives being assisted; iv) capacity to work remotely (using digital tools); v) experience with access to public policies.

STA services should encourage supported organizations to look for other sources of funding and service providers to complement the resources allocated by PROCASE II and to meet demands not included in the business plans it supports. Opportunities for cooperation and alliances with the private sector will also be sought whenever possible.

**Planned Actions and Products:** The actions planned in this product involve: (i) Identifying and selecting beneficiary organizations; (ii) Drawing up the PNs; (iii) Eligible investments for financing; (iv) Types of Climate Adaptation investments that can be financed; (v) Types of Climate Mitigation investments that can be financed; (vi) Non-eligible investments for financing; (vii) Criteria for evaluating and prioritizing the PNs; (viii) Implementing the PNs.

## **Component 2 - Strengthening Family Farming Capacities and Organizations and Knowledge Management**

---

The aim of this component is to strengthen the individual and collective capacities of family farmers and their organizations, necessary to increase the adoption of agricultural technologies that promote greater resilience in their systems, to improve productive and social inclusion, as well as the environmental and land conditions of rural communities and their surroundings.

The capacities strengthened through the component will be an essential tool for implementing the investments and innovative practices promoted by Component 1.

To help achieve the project's general objectives, the component will develop a set of activities with the following specific objectives:

- Strengthen the capacities of families and community organizations to implement more resilient and productive production systems, to better manage organizations and to access public policies;
- Strengthen the capacities of rural organizations so that they can develop their production and access markets;
- Strengthen the specific capacities of priority audiences in the areas of gender, youth, PCTs, Persons with Disabilities, LGBTQIAPN+ population to promote their empowerment.

- Promoting the land and environmental regularization of family farming establishments, agrarian reform settlements and quilombola communities.
- Implementing a knowledge management (KM) and South-South and Triangular Cooperation (SSTC) process to generate, record, share and use relevant knowledge.

The sub-components involved in this C2 are presented below.

### **Subcomponent 2.1. Developing the Capacities of Rural Community Organizations**

The component will focus on strengthening the capacities of beneficiary families and community organizations, considering the weaknesses identified in various areas, with adequate knowledge to implement production systems that are more resilient to climate change and more productive, as well as to improve the management of community organizations.

It will finance the contracting of Agroecological Technical Assistance Services (TA) to carry out activities aimed at increasing the beneficiary families' access to adequate and quality information. The main themes to be addressed by TA will be the development of more profitable, diversified, and resilient agricultural production, the protection and recovery of environmental resources and the improvement of organizational management. It will also seek to integrate them more closely into different value chains in the region, with initiatives to support processing and marketing. And finally, the subcomponent will seek to strengthen the TA teams contracted to ensure the good quality of this service.

#### ***Actions planned***

- Provision of agroecological TA services in communities
- Complementary training/exchange events for farmers, including association leaders.
- Events to improve TA teams
- Training family farmers in public policies

Approximately 18,000 families will benefit from TA services, of which 50% should be represented by women, 30% by young people and at least 20% by Traditional Peoples and Communities. Part of this same public (approximately 2,600 people) will benefit of complementary training events. Approximately 150 technical TA agents will also be trained.

The Public Policy courses should benefit a total of 32,000 families, of which 50% should be represented by women, 30% by young people and at least 5% by Traditional Peoples and Communities.

### **Subcomponent 2.2. Strengthening Family Farming Organizations for Market Access**

The aim of this subcomponent is to strengthen the capacities of the teams of the economic organizations (mainly cooperatives) benefiting from the project. Groups/organizations of farmers will also be targeted to create or strengthen local fairs and small marketing centers. In the context of improving marketing conditions, the project could also support the creation and/or strengthening of health inspection services at municipal level or for groups of municipalities organized into territories / 'consortia of municipalities'.

The aim is to help family farming organizations and their products enter diversified marketing channels, generating more income for the families benefiting.

### ***Actions planned***

- Provision of Specialized Technical Consultancy (CTE)
- Initiatives to strengthen fairs and marketing centers
- Pilot implementation of the Participatory Organic Certification System (POCS)
- Structuring Municipal Health Inspection Services

The provision of STA services will work with 60 Business Plans from economic organizations, benefiting approximately 5,000 families, of which 50% must be represented by women, 30% by young people and at least 5% by Traditional Peoples and Communities.

The initiative to strengthen local fairs and marketing centers will work with 50 units (fairs and centers), benefiting approximately 800 families.

It is planned to set up 2 Health Inspection Services for Municipal Consortia, as well as 15 participatory guarantee systems - PGS.

### **Subcomponent 2.3. Diversity, Gender, Youth, Nutrition and Food Security**

This sub-component will aim to promote the empowerment of women, young people, PCTs, LGBTQIABP+ and Persons with Disabilities, as well as improving the nutrition and food security of beneficiary families. The activities will work with the project's cross-cutting themes, strengthening and supporting the integration of these themes into all the components.

#### **Focus on gender and diversity**

The project will take a comprehensive approach to transforming gender relations, promoting the inclusion of Afro-descendants and PCTs, the LGBTQIAPN+ community and people with disabilities, focusing on the environmental, economic, political, and cultural causes of the social vulnerability of these groups. In order to transform unequal power relations, shaped by patriarchal and exclusionary structures, norms and practices, as well as empower women, Afro-descendants and PCTs, the LGBTQIAPN+ community and people with disabilities, the following transformation paths will be followed:

- i) promote economic empowerment and equality by valuing women's contributions to the family economy and community development,
- ii) dealing with the issue of women's overload due to domestic and care work, promoting a fairer division of the workload between men and women,
- iii) empower target groups to have a greater voice and decision-making power in rural institutions and organizations,
- iv) promoting advocacy in policies for women, young people and PCTs,
- v) prevent gender-based violence, v) value traditional knowledge, practices, and ways of life for production, food, and management of natural resources and
- vi) promote the inclusion of the LGBTQIAPN+ community and people with disabilities, seeking to empower them, promote their leadership and respect their rights.

Therefore, this sub-component aims to support the mainstreaming of the gender and diversity strategy throughout the Project, which will have an intersectional approach, considering the overlap of multiple discriminations of gender, race/ethnicity, sexual orientation, and disability. All the activities and products proposed for this component will be contained in and guided by the Gender and Diversity Strategy and Plan to be drawn up at the start of project implementation.

### Focus on youth

Among the factors that influence staying in rural areas is access to work and income opportunities, education/training that is suited to the characteristics of rural areas, appreciation of rural lifestyles, and the availability of services and conditions that can offer the possibility of success in agricultural production. In order to respond to these issues raised in the Youth diagnosis and to promote the permanence of young people in the countryside, as well as offering more opportunities for sustainable income and work for young people in general, the strategy of this subcomponent is based on three main axes:

- i) Promote a broad training program in agricultural and non-agricultural activities that generate greater employment and income opportunities,
- ii) Implement a program to revalue life in the countryside through communication activities,
- iii) Promote the formation of Youth Networks and debates on issues relevant to the development of rural youth.

### Focus on Nutrition

In order to improve food security, nutritional status and increase the adoption of healthy eating practices by the Project, this PROCASE II subcomponent will implement a strategy centered on food and nutrition education training. There will be 3 lines of action:

- Raising awareness of good nutrition and health practices (reproductive health, maternal health and child health), in particular to improve the nutritional and health status of women and children;
- Raising awareness of the food culture, healthy eating, which in particular includes the Neglected and Underutilized Species (NUS) of the target territories; and
- Training vulnerable communities in the processing of healthy local products in order to increase their daily consumption in a sustainable way and foster the empowerment of vulnerable communities, valuing local food culture.

### ***Planned actions and products***

- Gender and Diversity Plan: The Gender and Diversity Plan will be drawn up in the first few months of project implementation by the PMU's Gender and Diversity specialist with the support of a specific consultancy hired to detail the general strategy and implementation methodology for all activities related to gender equity and women's empowerment, as well as the inclusion of PCTs, people with disabilities and LGBTQIAPN+. The activities set out in the Gender Plan should include:
  1. Modular training in Gender and Diversity for project and TA teams
  2. Gender and diversity training for the project's direct beneficiaries
  3. Implementation of the Agroecological Logbook Methodology
  4. Training cirandeira(o)s

5. Childcare/education activities that allow women to participate in the project's activities
6. Thematic diversity meetings (aimed at people with disabilities and LGBTQIAPN+)
  - Youth Plan: A Youth Plan will be drawn up in the first few months of project implementation by the PMU's Youth specialist to detail the general strategy and implementation methodology for all the activities in this subcomponent related to the socio-economic and political empowerment of young people. At least the following cross-cutting activities will be developed for rural youth in the Project area:
7. Vocational training in agricultural and non-agricultural activities
8. Training Young Communicators
9. Thematic meetings with young people and the formation of Rural Youth Networks
  - Plan to Strengthen Traditional Peoples and Communities (PCTs): A Plan to Strengthen Traditional Peoples and Communities will be drawn up in the first few months of project implementation.
10. Strengthening PCT Networks
11. PCT Policy Integration Fairs
  - Nutrition and Food Safety Plan: A Nutrition and Food Safety Plan will be drawn up in the first few months of project implementation.
12. Nutrition education initiative to improve nutrition and maternal and child health in the project's most vulnerable communities
13. Training events on food culture and food processing to enhance local products with a view to improving nutrition and facilitating the empowerment of women and young people
14. Raising awareness of nutrition, health and food culture among students at the Integral Citizen Schools
  - Local Development Agents (ADL): The project will hire a foundation, which will be responsible for hiring Local Development Agents (ADLs), who are young people from the communities themselves, hired by PROCASE II to carry out tasks such as mobilizing communities and organizations to actively engage in the project. In addition to mobilization, the ADLs will have to play an important role in managing the agreements made by the community associations, supporting the holding of tenders, updating financial information, monitoring the investments made, rendering accounts and keeping the associations fiscally regular. One young person will be hired per Resilient Investment Plan, which in turn serves 3 communities. The young ADLs will receive a series of training courses to develop their skills. By playing the role of ADL, it is hoped that the young people selected will be able to gain experience in leadership and management, becoming references in the communities they represent and continuing to support them even after the end of the Project. The ADLs will also play a key role in supporting the implementation of cross-cutting activities, such as gender, diversity and youth, as well as in communication between the communities, the Project, and the TA teams.

#### **Subcomponent 2.4. Land and Environmental Regularization**

The aim of this subcomponent is to strengthen the family units served, making the production base more secure by supporting land and environmental regularization.

## Actions planned

To achieve this goal, actions will be implemented to support land and environmental regularization.

- Support for land and environmental regularization: Seeking to provide solutions to the problem of a large number of family units in Paraíba that do not have complete legal documentation or formal recognition of these properties, the project aims to implement a land regularization and environmental registration initiative.

### 15. Choice of communities/properties to be benefited

- Implementing the regularization roadmaps: EMPAER's previous experience has allowed it to define a roadmap or sequence of steps that must be taken for a rural property to be regularized. It is this roadmap, which covers both the land ownership and environmental registration dimensions, that forms the methodological backbone of the Project's regularization initiative.

It should be noted that the route to be taken by each property to be regularized is slightly different depending on the starting situation of each property, in which case there are two possible initial scenarios: i) Properties with public deeds - areas of ownership and ii) Properties without public deeds - areas of possession. Both routes are similar, with the one for possession areas having a few additional steps. The roadmaps are presented in more detail in the table below.

**Table 2 - Roadmaps for land regularization and environmental registration**

Initial phase: Mobilization and dissemination action, in which the initiative is presented and explained to the beneficiary public, with the aim of identifying/confirming the family units or communities interested in participating and that meet the prioritization criteria (areas without litigation, quilombolas, settlers, PA with less than 25 ha, etc). Once the potential participants have been identified, the following activity guides are applied.	
<b>Activities roadmap (i): Domain areas</b>	<b>Activities roadmap (ii) - Ownership areas</b>
1 - Diagnosis of the rural property. This aims to identify whether the property is in the ownership area (with a deed) or the possession area (without a deed).	2 - Georeferencing rural property.
2 - Georeferencing rural property.	2 - Georeferencing rural property.
3 - Georeferencing inspection: 100% done by satellite image and on-site inspection of some properties. It checks that the landmarks are correctly implanted and if there are any discrepancies that need to be corrected. Any property that needs adjusting will be corrected by the contractor. The property that is suitable can be entered into the Land Management System (SIGEF).	3 - Georeferencing inspection: 100% done by satellite image and on-site inspection of some properties. It checks that the landmarks are correctly implanted and if there are any discrepancies that need to be corrected. Any property that needs adjusting will be corrected by the contractor. The property that is suitable can be entered into the Land Management System (SIGEF).
4 - Evaluation of documentation by the Discriminatory Commission, to declare that the property is suitable for the next stages	4 - Evaluation of documentation by the Discriminatory Commission, to declare that the property is suitable for the next stages
5 - Creation or updating of the registration code in the National Rural Registration System (with issuance of the CCIR ) <sup>1</sup>	5 - Creation or updating of a registration code in the National Rural Registration System (with issuance of the CCIR)
6 - Approval by the agency (INCRA/EMPAER) of the geo-referenced parcel/property in the Land Management System (SIGEF), which allows technical	6 - Approval by the agency (INCRA/EMPAER) of the georeferenced parcel/property in the Land Management System (SIGEF), which allows technical

<sup>1</sup> CCIR is the Rural Property Registration Certificate, which is issued by INCRA via the Rural Registration System.

<p>parts (plans and descriptive memorials) of the property to be generated. The delivery of these technical documents certifies the regularization of land ownership, which is georeferencing (in script (i) for ownership areas).</p>	<p>documents (plans and descriptive memorials) to be generated for the property. As this is land is under public ownership, the documentation is issued in the name of the state at this stage. The delivery of these documents concludes the first stage of land regularization, which is georeferencing.</p>
	<p>6.1 - Delivery of the plan and description memorial to the notary's office, for the creation of the registration and collection of the wasteland.</p>
	<p>6.2 - Discriminatory committee review</p>
	<p>6.3 - Updating the technical documents, which will then be in the name of the beneficiary squatter, and drawing up a definitive property title in their name (or that of the community in the case of collective land).</p>
	<p>6.4 - Sending the updated documentation to the Registry Office for the transfer of ownership (State to beneficiary).</p>
<p>7 - Creating or updating the CAR (Rural Environmental Registry) register, using the data registered in SIGEF. The receipt for the rural property's registration in the CAR proves that the registration has been completed.</p>	<p>7 - Creating or updating the CAR (Rural Environmental Registry) register, using the data registered in SIGEF. The receipt for the rural property's registration in the CAR proves that the registration has been completed.</p>
<p>8 - Drawing up the domain recognition title</p>	<p>8 - When stage 6.4 of the notary's office is completed, the property is fit and up-to-date. With the above steps completed, the property's documentation is fully regularized and ready to be handed over to the beneficiary (individual or collective).</p>
<p>9 - The property is ready and up to date. Once the above steps have been completed, the property is ready, with recognition of ownership. The technical documents can be sent to the notary's office for registration of the area. A new, updated certificate can then be issued.</p>	

It is hoped that approximately 5,000 properties (covering around 100,000 hectares) will be able to follow this route with the project, until the desired regularization is achieved. It should be made clear that in agrarian reform settlements (federal or state) and in the municipalities served by EMPAER, title will be granted individually, per beneficiary family. In the case of quilombola communities, the title will be collective, as per current legal requirements, covering the entire georeferenced polygon and in the name of the duly registered residents' associations.

The land and environmental regularization initiative will assist approximately 5,000 rural properties and families, 40% of which will be quilombola communities and federal and state settlements.

### **Subcomponent 2.5. Knowledge Management and South-South and Triangular Cooperation**

Subcomponent 2.5 will develop and implement a knowledge management process capable of generating, recording, sharing and using knowledge generated in the Project. It will also seek to feed the project implementation process with relevant information and knowledge. Knowledge will be made available at different geographical scales: among project participants (at community and territorial level), at state level, in the Northeast region and in other developing countries (via CSST), and to different target audiences: beneficiaries, Implementing Partners and service providers, the project team, government entities and others. The objectives will be refined during the preparation of the Knowledge Management (KM) and South-South and Triangular Cooperation (SSTC) plan.

#### ***Planned activities***

- **CG and TSSC plan:** This plan will define the detailed objective of the KM and TSSC activities, the products developed for each target group, the distribution channels, among others. PROCASE II will be able to draw on a wide range of resources, products and experiences from other initiatives and projects, including lessons learned from PROCASE I. Therefore, PROCASE II's KM and SSTC activities should avoid duplicating existing material while at the same time utilizing this material in project activities, such as capacity building and training. The main activities and products include:
  - Systematization of experiences, good practices and results and Studies of interest to the Project on specialized topics
  - Communication and Dissemination in Knowledge Management
  - South-South and Triangular Cooperation Actions

Under this subcomponent, 25 systematizations and studies on Knowledge Management will be carried out, 6 annual communication and dissemination phases and 10 South-South Cooperation exchange events.

### **Project Management, Monitoring and Evaluation**

The aim of this component is to create an efficient mechanism for managing and controlling the activities implemented by the Project, allowing them to be fully implemented in line with the Project's objectives, as well as guaranteeing the implementation of the Annual Operational Plans (POA).

It also aims to introduce technological innovations to ensure the monitoring and evaluation of activities, the recording and systematization of Knowledge Management, as well as enabling transparent communication between stakeholders, including knowledge exchange actions.

To meet these objectives, the component will implement 2 sub-components, as follows.

## **Project Management**

It will make it possible to support the Project Management Unit (PMU)<sup>2</sup>, by implementing instruments to strengthen: i) Management; ii) Administration; iii) Technical operational capacity; iv) Procurement processes (tenders and contracts); v) Financial management and, vi) safeguards. This support should facilitate compliance with the contractual clauses of the Loan Agreement.

As a Management Sub-component, its activities converge to comply with IDB and IFAD Guidelines and Policies for financing, such as the specific procedures for: i) tenders and contracts; ii) requests for disbursements and rendering of accounts for the resources contributed, executed and/or committed; and iii) supervision of the implementation of community initiatives, ensuring compliance with environmental and social safeguards, procurement and financial management requirements, including rendering of accounts by beneficiaries.

### ***Product - Project management support***

**Main products:** Project Management Unit operational for 6 years

## **Monitoring and Evaluation (M&E)**

The project will set up a Planning, Monitoring, Evaluation and Systematization (PMAS) system for its activities and results, which will be an essential management tool, enabling planning and monitoring of the project's execution, as well as actions to ensure digital inclusion.

### ***Product - Monitoring system***

The project will implement an information management system, where data collected in the field will flow to the PMU. For better organization, a computer system will be developed based on those used in Procace - phase 1, to monitor all the activities to be carried out.

**Main products:** M&E systems developed

### ***Product - Impact assessment studies***

The impact assessment will provide information on whether the project was able to achieve the results set out in the objective, as well as recording the impacts on improving the lives of the target population, such as nutrition, income, production methods, among others.

The research will use the difference-in-differences method, and will therefore be carried out on 2 groups, the treatment (a sample of Project beneficiaries) and the control (non-beneficiaries, but who have a similar profile to the treatment group), with field research being carried out at 3 different points in time: i) Baseline, which will provide information on family composition, production, income, etc. of project beneficiaries for later comparison with subsequent studies; ii) Mid-term, which will be carried out between years 3 and 4 of the Project, i.e. halfway through its implementation; and iii) Final Impact

---

<sup>2</sup> The PMU was formally created by Decree No. 44.934 of April 15, 2024, which provides for the Unit and defines the Basic Structure for managing the Paraíba Sustainable Rural Development Project - PROCASE II.

Assessment, which will be carried out during the last year of the Project's implementation, on the same group surveyed in the previous stages.

**Main products:** Baseline, mid-term and impact research carried out

***Product - Systematization of experiences***

The project will also systematize the innovations, both in terms of processes and activities, highlighting their importance and results. These products will be used by the project team and state officials, as well as in other regions of the northeastern semi-arid region and similar areas, and could support the adoption of other public policies in the Northeast.

**Main products:** 50 systematizations carried out

### **3 MAIN IMPACTS AND MITIGATION MEASURES**

The PGASE Matrix listing the impacts and associated mitigation measures, as well as other relevant information, is presented below.

**Table 3 - Matrix of Impacts and Measures**

ID	Environmental and social impacts	Impacting Cause / Action	Main Mitigation Actions	Consultation and Engagement Activity	Main Plans or Programs of the Associated ESMP	Responsible for implementation in the institution	Means of Verification for Monitoring	Verification frequency	Estimated Cost
1	<b>Generating expectations in the population about the project</b>	Circulation of unofficial or incomplete information about the project	-It is considered that this impact cannot be avoided, to some degree people will always expect it. - Critical evaluation of social communication actions and the Engagement Plan, with emphasis on the application of measures already taken or the implementation of new communication actions	-Social Communication actions provided for in the Communication, Consultation and Stakeholder Engagement Plan, described in the ESMP, which must be adopted even before the start of the works to inform the public and the population about the project, as well as relevant issues arising from its implementation and operation. These actions must be sustained throughout the project's life cycle	Stakeholder Communication, Consultation and Engagement Program	PMU	TBDTBD	TBDTBD	TBDTBD
2	<b>Changes in water quality affecting aquatic habitats and water resources due to soil and other materials being carried into nearby rivers (from construction activities)</b>	Movement and handling of soils in agricultural activities and earthworks, cut and fill.  Exposed soils	- Contaminating materials handled at project sites must be stored in appropriate locations. -Productive systems must be set up respecting the local topography and geology, including strengthening the soil and following contour lines in agriculture. -The use of chemical inputs such as pesticides should be well managed according to best practices and existing technical standards to minimize pollution. . -If contaminating material leaks, rapid action measures must be taken using sawdust or other material to contain and prevent the leak from spreading, and the material used (considered contaminated) must then be disposed of properly (as per existing technical standards and regulations). -In the event of erosion, the soil should be rectified, and the siltation of downstream water bodies monitored. -If areas of degradation are identified (for example, a water channel with silting or chemical products), actions should be taken to rehabilitate the areas, such as: cleaning channels, desilting, removing contaminated soil, scraping concrete cream, among others options e.g. bioremediation). -There are no problems, however - any problems that may breach environmental licenses must be reported to the environmental agency, also showing what measures have been taken to correct the problem identified, as well as the improvements to the environmental and social management system that have been implemented to prevent such situations from recurring. In this case, the environmental agency may impose fines and additional compensation - which must be duly complied with.	-	Water quality control program	PMU	TBD	TBD	TBD

ID	Environmental and social impacts	Impacting Cause / Action	Main Mitigation Actions	Consultation and Engagement Activity	Main Plans or Programs of the Associated ESMP	Responsible for implementation in the institution	Means of Verification for Monitoring	Verification frequency	Estimated Cost
3	Contamination of soil and water resources - from civil works.	Production of unserviceable soil from excavation, unused inputs and materials and leftover materials from civil works with inadequate waste disposal	<ul style="list-style-type: none"> <li>-This impact cannot be avoided, as waste will always be generated.</li> <li>-Waste must be sorted, as set out in the PGASE, in order to provide for the sorting of waste between the different classes, and also which waste requires exclusive separation;</li> <li>-After sorting, packaging must be carried out to ensure that the waste is separated, as planned in the segregation stage, and to facilitate transportation from the construction site to treatment and disposal;</li> <li>-For transport, logistics must be drawn up, providing adequate access, timetables and control of entry and exit of the vehicles that will remove the properly packaged waste, in order to combat the excessive accumulation of waste, improving local organization;</li> <li>-Finally, waste treatment should involve actions aimed at reducing the quantity or polluting potential of solid waste, either by preventing the disposal of waste in an inappropriate place or by transforming it into inert material.</li> <li>-In the event of inappropriate waste disposal, debris and waste must be removed immediately and properly disposed of in licensed landfills and treatment centers.</li> </ul>	-	Waste management program for the installation of structures	PMU	TBD	TBD	TBD
4	People being hit by cars	Circulation of project vehicles on the roads used by the population between their origin and destination.	<ul style="list-style-type: none"> <li>-Overt daytime and nighttime signage;</li> <li>-Speed control;</li> <li>-Defensive driving and good driving practices courses for drivers and machine operators (project implementation teams - TA, contractors, UGP/Procasa); All drivers must receive defensive driving training</li> <li>-Fencing and restricting access to areas where work is being carried out, where appropriate.</li> <li>-All drivers must have knowledge of first aid and how to call emergency services in the event of accidents (project implementation teams - TA, contractors, UGP/Procasa).</li> <li>-.</li> </ul>	-	Traffic Program  Stakeholder Communication, Consultation and Engagement Plan	PMU	TBD	TBD	TBD
5	Proliferation of vector-borne diseases	Accumulation of water in poorly drained areas  presence of organic matter, such as workers' food waste, which favors the development of micro and macro vectors	<ul style="list-style-type: none"> <li>-Drainage of water accumulated on the surface;</li> <li>-Cleaning the workplace;</li> <li>-Disease and vector monitoring and control.</li> <li>-Lectures should be given to workers/producers.</li> <li>-In the event of the formation of areas with environments conducive to the proliferation of vectors, the area must be rehabilitated by removing the environment and/or implementing suitable systems to prevent the proliferation of vectors.</li> <li>-In the event of endemic situations being identified, a process should be initiated to assess the health of producers/workers in order to identify and refer the sick to appropriate treatment.</li> </ul>	-	Disease Vector Control Program	PMU	TBD	TBD	TBD
6	Accidents at work	Agricultural activities with hazardous levels and associated risks (use of cutting tools, handling of species and animals, risk of being run over on roads, etc.)	<ul style="list-style-type: none"> <li>-Workers/producers should receive adequate information and training on health and safety at work;</li> <li>-Prophylactic and reinforcement actions, such as safety dialogues, must be observed;</li> <li>-All workers/producers must be provided with personal protection equipment (PPE), trained in its proper use and charged for its use;</li> <li>-The appropriate New Regulations for the jobs to be performed by the workers must be observed.</li> <li>-Any accident, depending on the degree of seriousness, must stop the activity so that attention can be paid to the occurrence;</li> <li>-It is important that each community has a plan of action (what to do, what not to do, who to warn, where to take the injured) to reduce reaction times.</li> </ul>	-	Labor Management Plan	PMU	TBD	TBD	TBD
7	Increase in gender-based violence	Presence and movement of people (workers) not belonging to the community	<ul style="list-style-type: none"> <li>-Project workers must be made aware by the PMU and contractors of this impact, and must also receive guidance on the set of rules that must be followed when dealing with the community in general (code of conduct) and specifically on the issue of sexual harassment and abuse, as well as violence.</li> <li>-It must be made clear to everyone that no attitude will be tolerated and that inaction by managers will be punished, including the possible dismissal of the worker(s) involved.</li> <li>-Measures to care for and protect victims.</li> <li>-Actions to restore the emotional state and health of the victims;</li> <li>-Assessment of cases of harassment or violence with corrective or punitive measures when necessary.</li> </ul>	-	Gender Violence Prevention and Care Program	PMU	TBD	TBD	TBD

ID	Environmental and social impacts	Impacting Cause / Action	Main Mitigation Actions	Consultation and Engagement Activity	Main Plans or Programs of the Associated ESMP	Responsible for implementation in the institution	Means of Verification for Monitoring	Verification frequency	Estimated Cost
8	<b>Proliferation of new pests due to climate change.</b>	Implementation of production projects associated with altering the cycles of temperature, humidity, rainfall and other climate factors, providing better environments for the uncontrolled reproduction of pests.	<ul style="list-style-type: none"> <li>-The controls indicated in the PIR Investment Plans must be applied.</li> <li>-Periodic monitoring of the appearance of herbivorous insects or plant diseases should be carried out in the project implementation areas (PIR).</li> <li>-If pests are found, measures should be taken using technical guidelines. Agroecological practices based on the manufacture and use of bio-slurries, antagonistic or companion plants or biocontrol agents will be disseminated.</li> <li>-diseased or pest-infested materials should be discarded so as not to spread the pest to other natural areas and/or crops.</li> <li>-In the event of pest proliferation, measures must be taken to control dispersal and isolate contaminated crops;</li> <li>In addition, sanitary measures must be taken to combat pests and normalize the agro-ecological balance.</li> </ul>	-	Disaster and Climate Change Risk Management Plan	PMU	TBD	TBD	TBD
9	<b>Non-adherence to project design and objectives.</b>	Distorted information or misunderstanding on the part of the community about possible administrative procedures (red-tape), requirements and practices required for participation in the Project	<ul style="list-style-type: none"> <li>-It is considered that this impact cannot be avoided, and that to some degree it may occur.</li> <li>-Apply actions and measures to clarify and raise awareness among the community</li> <li>-Critical evaluation of social communication actions and the Engagement Plan, with emphasis on the application of measures already carried out or the implementation of new communication actions</li> </ul>	-Social Communication Actions of the Stakeholder Engagement Plan that should be adopted even before the start of the projects to inform the public and the benefited population about the project, as well as relevant issues arising from its implementation and operation	Stakeholder Communication, Consultation and Engagement Program	PMU	TBD	TBD	TBD
10	<b>Engaging the communities covered by the project in better agro-ecological practices</b>	Understanding and convergence of communities to the Project's practices	This impact is positive	-Public consultations and participatory planning meetings	Stakeholder Communication, Consultation and Engagement Program	PMU	TBD	TBD	TBD
11	<b>Loss of production, production systems and/or equipment due to climatic events, mainly related to excess or lack of rainfall.</b>	Unexpected extreme weather events	<ul style="list-style-type: none"> <li>-When planning areas for cultivation or the installation of structures, suitable location options and construction and installation methods should be studied, avoiding areas that are more prone to flooding or have unstable terrain.</li> <li>-The need for access to water and its adequate storage for periods of drought must be observed.</li> <li>-ATER should be involved to help with the processes of choosing areas and managing resources and the land, which could bring new perspectives and technical training.</li> <li>-It is recommended that an Action Plan be drawn up in the event of situations that threaten production and/or structures, so that in the event of climatic events, communities are aware of what can be done to minimize this impact.</li> </ul>	-	Disaster and Climate Change Risk Management Plan	PMU	TBD	TBD	TBD
12	<b>Soil improvement</b>	Community adherence to best practices and solutions on agricultural organic waste with use of plant waste from mowing, pruning, trimming or thinning as mulch to protect plants and conserve soil moisture, increasing the organic matter content in the soil	This impact is positive	-	Production Waste Management Plan	PMU	TBD	TBD	TBD
13	<b>Soil and water pollution (surface and/or groundwater) - from the operation of production systems</b>	Inadequate disposal of packaging, including pesticide packaging	<ul style="list-style-type: none"> <li>-One of the main actions is related to proper communication, indicating the need to dispose of waste and packaging properly.</li> <li>In the case of pesticide packaging, TA should be involved to discuss best practices, including taking the opportunity to discuss the harm that pesticides can cause, how to store them properly, the need to triple-wash the packaging, its destruction and delivery to appropriate collection points.</li> <li>-One of the project's actions involves reducing the use of chemical pesticides and switching to natural pesticides, which will help to reduce part of this impact.</li> <li>-It is suggested that monitoring be carried out in communities to check whether or not packaging is being disposed of inappropriately.</li> </ul>	-It is recommended that appropriate communication and environmental and health education present a range of information about common contaminants in plantations and production, as well as their effect on biota and people's health, to raise awareness and	Production Waste Management Plan Contaminating Products Management and Control Plan	PMU	TBD	TBD	TBD

ID	Environmental and social impacts	Impacting Cause / Action	Main Mitigation Actions	Consultation and Engagement Activity	Main Plans or Programs of the Associated ESMP	Responsible for implementation in the institution	Means of Verification for Monitoring	Verification frequency	Estimated Cost
		<p>Inadequate disposal of bagasse and other solids from production and processing</p> <p>Use of restricted, prohibited and banned products - Stockholm Convention</p> <p>Accidental spillage of chemical inputs or discharge of untreated effluent</p>	<p>-It is important that contaminating effluents are not directed to the sewage treatment system, as these structures are not prepared for this.</p> <p>Oily effluents should not be mixed with non-oily effluents and should be disposed of appropriately, possibly being used for the production of handmade soap that can be used by the community.</p> <p>-Enforcement actions should also be carried out in conjunction with other official bodies and the monitoring of production. In general, it is recommended that the actions are always educational in nature, so as not to create an atmosphere of mistrust between the community and the TA technicians, which has the potential to affect the project.</p> <p>-All chemicals/hazardous products must be stored properly, in environments that can contain leaks.</p> <p>-The filling of machinery and equipment with diesel or other fuel must be carried out properly, in waterproofed places or using safety trays, avoiding contact with the ground.</p> <p>-Any spillage should be cleaned up, simple actions such as using sawdust or sand, which should be properly packed afterwards, can help in the cleaning process.</p> <p>-Under no circumstances should contaminating effluents be discharged directly onto the ground or into watercourses.</p> <p>-ATER's work is important to show communities the viable alternatives for disposing of waste properly, according to its nature.</p> <p>-If packaging is still being improperly disposed it is important that the community is mobilized, as far as possible, to take action such as collecting packaging that has been thrown into the environment. Such action can help spread best practices, reducing this impact.</p> <p>It is important to segregate waste in kitchens and processing areas, avoiding, for example, putting organic waste together with material that can be recycled (plastics, long-life packaging, etc.).</p> <p>-Alternatives for production waste should be considered, including the use, where possible, of leftover stalks and peels for preparing dishes and food.</p> <p>-For organic material that cannot be reused in the units, sustainable options should be considered, such as animal feed, fertilizer, natural pesticides, among others.</p>	educate communities on how to deal with each contaminant appropriately.	<p>Stakeholder Communication, Consultation and Engagement Program</p> <p>Environmental and Health Education Program</p>				
14	Increased GHG emissions from the use of combustion engines and/or the burning of wood or garbage	Usual practices of burning crop residues (branches, garbage, etc.)	<p>-Monitoring actions are recommended in the communities to check the engines, which must be properly regulated, using the Ringelmann Scale for control (less than or equal to standard no. 2 - 40%), in the operating phase it applies to diesel generators.</p> <p>- If the equipment is not up to standard, it must be adjusted and maintained.</p>	<p>-One of the main actions is related to appropriate communication, aimed at reducing gas emissions and abandoning flaring actions.</p>	<p>Energy Efficiency Plan for Projects and Facilities</p> <p>Stakeholder Communication, Consultation and Engagement Program</p>	PMU	TBD	TBD	TBD
15	Pressure on natural areas and habitats	<p>Increased suppression of vegetation</p> <p>expansion of planting areas not foreseen in the project and in non-sustainable systems</p> <p>greater demand for water using local sources for production or irrigation</p>	<p>-The project should monitor these situations to identify the main problems and define the best actions to take, including taking into account the possible need for extensions.</p> <p>-ATER teams should be involved in helping communities to find the best solutions to the needs and demands that may arise.</p> <p>-It is also important to raise awareness that indiscriminate actions in natural environments can be classified as environmental crimes.</p> <p>-In the event of situations that damage natural environments or cause imbalances, solutions should be applied together with the communities. Such situations should be used to show the problems that can be triggered.</p> <p>-Recovery of natural environments affected indiscriminately and not foreseen by developments related to project implementation actions</p>	<p>-There must be good communication with the communities, with actions to promote the preservation of natural environments, care for water, interaction of agroforestry systems with the natural surroundings, among others.</p>	<p>Management plan, protection and restoration of natural habitats</p> <p>Stakeholder Communication, Consultation and Engagement Program</p>	PMU	TBD	TBD	TBD
16	Changes in gene flow altering the pattern of production and ecosystems in such a	Movement of people between areas where unwanted species are present	<p>-Seedlings and seeds purchased for planting in the SAF should be obtained from nurseries with a RENASEM certificate, accredited farmhouses or research centers. TA technicians should guide this process.</p>	<p>-One of the main actions is related to appropriate communication, indicating</p>	Management plan, protection and restoration	PMU	TBD	TBD	TBD

ID	Environmental and social impacts	Impacting Cause / Action	Main Mitigation Actions	Consultation and Engagement Activity	Main Plans or Programs of the Associated ESMP	Responsible for implementation in the institution	Means of Verification for Monitoring	Verification frequency	Estimated Cost
	way as to promote loss and resilience of ecosystems and production systems .	Insertion of invasive exotic species when planting reforestation seedlings and for production Compromised sanitary status of seeds, seedlings and animal germplasm.	-The management of fauna species, such as bees, also requires care to avoid unwanted proliferation in the event of the species escaping.	the need to be careful with the insertion of invasive exotic species or pests, which can jeopardize the entire production or the SAF, generating great losses for the communities and the environment.	of natural habitats Stakeholder Communication, Consultation and Engagement Program				
17	Increased gender-based violence due to women's greater engagement	Women's economic and social empowerment giving greater prominence to gender in the community	-It is recommended that the complaints management program provide a channel aimed at supporting and gathering information on situations of violence, and that PROCASE II should not be limited to informing other official channels. -On the other hand, official channels should be disclosed whenever possible as part of the project's communications. -It is important that a survey is carried out so that regions and/or communities where there is a greater possibility of violence can be mapped. -There should be monitoring and channels that women can use to report situations of violence. All complaints must be taken seriously and investigated.	-The project should promote actions to promote gender equality, highlighting rights and inclusiveness linked to communication actions.	Prevention and care of gender-based violence	PMU	TBD	TBD	TBD
18	Improving environmental quality and ecosystem flows by restoring modified habitats and forming ecological corridors	Implementing reforestation projects and agro-ecological systems	This impact is positive	-	Management plan, protection and restoration of natural habitats	PMU	TBD	TBD	TBD
19	Interruption of services due to lack of energy , water, telephony, internet	Unplanned power outage and/or interruption of other essential services	-Systems that use more efficient and safer energy sources; -Maintenance of local supply systems, including pruning trees when necessary, especially before rainy periods or strong gusts of wind. -Restoring the supply of essential services by liaising with the concessionaire or public body, and supporting the re-establishment of these services	-	Plan for energy efficiency and sustainable sources for energy generation in projects and facilities Program to Control and Mitigate Temporary Social and Economic Impacts	PMU	TBD	TBD	TBD
20	Security and reduction of costs with the implementation of energy generation and supply infrastructure independent of the public system and based on renewable and available sources	The use of photovoltaics to supply electricity.	-Seeking out national suppliers and making it possible to monitor the supply chain whenever possible; -Monitoring and investigating the supply chain to find evidence to ensure greater certainty about the integrity and behavior of suppliers; -Apply a code of conduct and declaration of commitment to suppliers in the supply chain, including clauses on human rights and the fight against child labor or labor analogous to slavery (modern slavery). If impact-related situations are identified, human rights protection measures for workers and punitive/corrective measures for employers must be applied.	-	Plan for energy efficiency and sustainable sources for energy generation in projects and facilities	PMU	TBD	TBD	TBD
21	Access to adequate sanitation in communities	Implementation and operation of adequate sanitation systems	This impact is positive	-	Water and effluent quality monitoring program	PMU	TBD	TBD	TBD
22	Increased security and stability in people's lives by increasing resilience to the risks of disasters and climate change, improving quality of life and increasing income, adding value to the production chain, access to the market and the efficiency of production processes.	Achievement of the results defined in the Project with the implementation and operation of the systems and Plans	This impact is positive	-Publicizing the positive results of the project	Stakeholder Communication, Consultation and Engagement Program	PMU	TBD	TBD	TBD

ID	Environmental and social impacts	Impacting Cause / Action	Main Mitigation Actions	Consultation and Engagement Activity	Main Plans or Programs of the Associated ESMP	Responsible for implementation in the institution	Means of Verification for Monitoring	Verification frequency	Estimated Cost
23	Increased spending by families due to the need to pay fees to access the Association's resources from the Project (such as maintenance fees for the sanitation system or industrial kitchens), which can have a significant effect on low-income family budgets, affecting their budgetary capacity and even causing the Project to run out of steam.	The need for financial resources to fund the operation and maintenance of systems and associations.	-	-Consultation and participatory planning meetings	Stakeholder Communication, Consultation and Engagement Program	PMU	TBD	TBD	TBD
24	Alteration or destruction of paleontological sites	Implementation of social technology associated with stone tanks or excavation in areas with high potential for the presence of cultural sites	-Assessment by a qualified professional of the presence of cultural sites in areas with significant potential -Rescue of remains or scientific information from the sites (as per existing national laws). -Evaluation of alternative sites that do not affect the cultural site	- Cultural Heritage and Fortuitous Finds Protection Program	-	PMU	TBD	TBD	TBD

#### 4 ENVIRONMENTAL AND SOCIAL PLANS AND PROGRAMS

The guidelines, procedures, objectives and scopes of the PGASE Socio-Environmental Programs are presented and detailed below, with the aim of complying with the IDB and IFAD Safeguard Policies, local legislation and best practices in impact mitigation, prevention and monitoring.

It is important to clarify that the defined impact mitigation measures are translated into actions established in the Environmental and Social Plans and Programs of this ESMP. In turn, it is worth establishing the definition between plan and program as follows:

- **Plan:** more comprehensive and general; includes strategies and guidelines; establishes a reference framework for sectoral and/or regional studies to support the development of specific programs and projects; offers a higher level of aggregation of decisions.
- **Program:** can be the unfolding of a plan; allows for more detailed projections; must contain the strategy and work dynamics to be adopted to carry out the program; includes the activities and projects that will make up the program.

The following table summarizes all the measures defined, specifying where they apply:

**Table 4 - Measures Adopted for Mitigation in Productive Plans**

	Plan / Program	Sub-projects	Target audience and those responsible
1.	Screening, classification and project scope	All Subprojects	Responsible: PMU and TA
2.	Monitoring and evaluation	All Subprojects	Responsible: PMU and TA, some indicators could be catalogued by construction companies.
3.	Disaster and Climate Change Risk Management Plan/Targeted Adaptation Assessment	All Subprojects (can be drawn up by set of actions for PROCASE II)	Responsible: PMU, TA and related government bodies/institutions. Target audience: all actors and stakeholders
4.	Waste Management Program for the implementation of structures and production processes	Sub-projects involving: - Food processing/production that generates packaging and waste - Civil works	Responsible: (i) PMU, TA, construction companies; (ii) rural producer for end activity waste.
5.	Water and Effluent Quality Monitoring and Control Program	Sub-projects involving: - Sanitary sewage and water reuse structures - Civil works	Responsible: PMU, TA and construction companies
6.	Biodiversity management, protection and restoration plan	Sub-projects that are within or in the immediate vicinity (up to 2km) of a Fully Protected Conservation Unit, permanent preservation areas (APP) or Critical Habitat	Responsible: (i) PMU, TA; (ii) rural producers to prevent the spread of unwanted species and support monitoring
7.	Stakeholder Communication, Consultation and Engagement Program and MQR	All Subprojects	Responsible: PMU and TA Target audience: all actors and stakeholders
8.	Environmental and Health Education Program	All Subprojects	Responsible: PMU and TA Target audience: rural producers
9.	Plan for energy efficiency and sustainable sources for energy generation in projects and facilities	Sub-projects involving building structures or machinery/equipment for production	Responsible: PMU and TA Target audience: farmers and construction companies

	Plan / Program	Sub-projects	Target audience and those responsible
10.	Contaminating Products Management and Control Plan	Sub-projects involving: - Sanitation structures that require the handling of chemical products in treatment; - Production processes that could generate contaminating waste or encourage the use of non-permitted products	Responsible: PMU and ATER Target audience: rural producers
11.	Traffic control Program	All sub-projects with actions specifically aimed at the implementation team (PMU, TA, construction company)	Responsible: PMU, TA and construction company Target audience: workers from the PMU, TA and the construction company
12.	Labor Management Plan	All sub-projects with differentiated actions for the implementation team (PMU, TA, construction company) and rural producers	Responsible: (i) PMU, TA and construction company; (ii) rural producer, with specific measures Target audience: all workers involved in the project
13.	Program to Control and Mitigate Temporary Social and Economic Impacts	Sub-projects involving civil works	Responsible: PMU, TA and construction company Target audience: benefited and/or affected communities
14.	Gender Violence Prevention and Care Program	All Subprojects	Responsible: PMU, TA and construction company Target audience: all actors and stakeholders
15.	Program to Mitigate Impacts on Traditional Communities	Sub-projects implemented in traditional communities	Responsible: PMU and TA Target audience: Protection agencies, benefited and/or affected traditional communities
16.	Vector, Disease and Pest Control Program	All sub-projects involving: - Civil works; - Sanitary sewage structures - Agriculture and livestock systems that may suffer or influence the dispersal of vectors	Responsible: PMU, TA and construction company Target audience: benefited and/or affected communities
17.	Cultural Heritage and Fortuitous Finds Protection Program	Sub-projects involving social technologies associated with stone tanks or activities requiring excavation in the region of high paleontological potential For all sub-projects, fortuitous finding actions must be applied	Responsible: PMU and TA Target audience: Heritage protection bodies, the community and project workers.

Source: Consulting, 2024

As can be seen in the table above, there are particularities that apply to certain actions or sub-projects that will involve different actors in their implementation. It should be noted, therefore, that the Plans and Programs that make up the impact mitigation and control measures have been consolidated into two blocks according to the profile/public that will be responsible or that the requirement falls on. This strategy was adopted since PROCASE II has a beneficiary profile that will also be active in implementing the actions set out in the project, which is the rural producer. The other block of profile/public that will have to apply or follow the guidelines is made up of: employees and people in charge of the PMU/borrower or executing agency, employees and people in charge of the TA contracted to implement the actions envisaged in the Project, and other companies and consultancies contracted to implement structures/works such as social technologies.

Thus, the Plans and Programs cover Management Measures, Measures for the Physical Environment, Measures for the Biotic Environment and Measures for the Socioeconomic and Cultural Environment, and are presented below in two main blocks:

- Measures applied to rural producers because of the implementation of actions provided for in the PIRs;
- Measures applied to workers and those responsible for the executing agency and companies contracted to implement the subprojects (UGP, TA and construction companies).

## 5 DESCRIPTION OF THE MEASURES APPLIED TO THE EXECUTING AGENCY AND CONTRACTORS

### 5.1 Screening, Classification and Scoping Measures for Subprojects

The environmental and social management of projects and works requires that instruments and processes be determined so that the actions defined to meet environmental and social requirements are guaranteed and are supervised and corrected when necessary.

For the environmental and social management of projects, we first considered the classification of projects and works according to their respective characteristics. Distinct characteristics are therefore highlighted, which will be taken into account when defining management instruments according to their size and the way they influence the environment and society. The criteria established are presented below.

**Responsible:** TA will be responsible for applying the screening tool to define the scope, and the PMU will be responsible for implementing this process with TA and managing and consolidating the results.

A preliminary analysis is carried out at the preliminary design stage, i.e. it should be started based on a conceptual study or, at the latest, at the stage of drawing up a preliminary sub-project. This assessment should point out sensitive environmental and social issues, eliminating situations that make the project ineligible and a ranking using established criteria. According to the IDB's MPAS, all financed operations must be pre-assessed and classified according to their potential socio-environmental impacts, using 3 categories to classify operations according to their environmental and social risk:

- **Category A:** Operations that may cause significant negative environmental or social impacts or have profound implications affecting natural resources.
- **Category B:** Operations that have the potential to cause mainly local and short-term negative environmental or social impacts and whose effective mitigation measures are known and readily available.
- **Category C:** Operations likely to cause minimal or no environmental or social impacts.

The PROCASE II classification is **Category B**, so no work within the scope of the Project can be classified higher than **Category B** without the IDB and IFAD boards being consulted for further instructions and the possibility of eligibility. The classification of the works will be assessed through a Preliminary Environmental and Social Analysis to be carried out by the PMU and TA team contracted for each Subproject, followed by an impact assessment process and the establishment of a management and mitigation plan, which will then be submitted to the IDB and IFAD for a no-objection analysis.

The category of sub-projects will be indicated according to their level of risk, involving an assessment of environmental, social, land, etc. risks, obviously considering the environment, its aspects and conditioning factors in which the project is inserted.

### 5.1.1 Environmental and Social Analysis

The environmental and social analysis system includes a preliminary assessment phase for subprojects involving a practical tool to be carried out by the TA team with guidance from the PMU during the subproject design phase (preliminary project). It is important to emphasize that no Subproject, or set of Subprojects, should be implemented without first undergoing the Environmental and Social Analysis recommended in this item.

Identifying the environmental and social risks and negative impacts of each Subproject (or set of Subprojects) covers the most important aspects for defining both the Impact Assessment and the Environmental and Social Management Plan. A Screening Worksheet should be completed by the technical team responsible for developing the Subproject as a preliminary stage of the assessment. This approach ensures that environmental and social safeguards are an integral part of each Subproject and are fully understood by the technical teams developing and supporting its implementation. By working on the development of the Subproject and the safeguards simultaneously, a "dialog" between the two processes is facilitated: the impacts and risks identified can be addressed with prior measures and design alternatives avoiding impacts or anticipating their mitigation.

**Conceptualization of Subprojects and Sets of Subprojects:** The tool can be applied either to a single Subproject, which may be configured in a single RIP, for example, or a single implementation action to be carried out in a community, or to a Set of Subprojects. The set of sub-projects must be defined by the PROCASE II team, considering the fact that they share the same geographical area and have the same socio-environmental aspects, or when the same community benefits from more than one sub-project. This joint organization aims to assess the same environment, converge impacts and propose synergistic mitigation solutions for the Subprojects, optimizing the preparation of Impact Assessments and Management Plans.

The suggested tool will work as follows:

- **Stage 1 - Screening:** The technicians fill in the screening form. The form is structured to cover the different sensitive issues that trigger environmental and social safeguards. For each safeguard, a set of questions identifies the possible risks and negative impacts. The questions are formulated so that a "yes" answer indicates a risk or negative impact.
- **Stage 2- Categorization of the Subproject or Set of Subprojects:** In this step, the level of each risk identified in STEP 1 is assessed and categorized as minimal, moderate, substantial or high. This joint categorization of the issues assessed will confirm the Category of the Subproject or Set of Subprojects, in accordance with the provisions of PDAS 1 of the IDB's MPAS (Assessment and Management of Environmental and Social Risks and Impacts)<sup>3</sup>.
- **Stage 3- Environmental and Social Impact Assessments - ESIA and ESIA:** In order to confirm the impacts and risks identified in STAGE 1 and verify the existence of other unforeseen impacts and risks, the borrower must carry out an impact assessment proportional to the outcome of the Screening and Classification phase and the size/engagement of the Subproject(s). The impact assessment study may be a Simplified Environmental and Social Assessment (SEA) or an Environmental and Social Impact Assessment (ESIA), considering only the issues/conditions relevant to the Subproject to be assessed.

---

<sup>3</sup> Environmental and Social Screening and Categorization: 3.16 Impact Classification.

- **Stage 4 - Proposing Environmental and Social Management Measures and Plans for the Subproject or Set of Subprojects - ESMP:** For each risk or negative impact identified, a mitigation measure must be listed, and for this a specific Environmental and Social Management Plan - ESMP for the Subproject or Set of Subprojects must be drawn up. The ESMP may be supported by the guidelines set out in the PROCASE II ESMP.

Below are the details of the proposed Environmental and Social Analysis mechanism. It is important to note that this tool may still undergo a process of adaptation according to the experiences and best practices observed during PROCASE II.

### **Stage 1 - Screening**

---

In the proposal for PROCASE II, the analysis of the preliminary project must focus on compliance with the IDB and IFAD Environmental and Social Policies. Therefore, the framework *checklist* to be used for the Preliminary Environmental and Social Analysis must contain the items shown in the following table. The table shows the issue analysed which may generate or suffer an impact, establishing the level of impact that may occur and directing the possible ESMP measure to be established.

**Table 5 - Requirements to be taken into account in the Preliminary Environmental and Social Analysis in the design and preliminary project approval phase**

Question analyzed	Possible impacts/risks and associated causes(6)	Impact or risk level(7)	Associated PGAS measure(8)	Category of Subproject(s) (According to Step 2)
<b>Project in area of direct influence of listed or archaeological/paleontological property</b>	Alteration or destruction of paleontological sites by the implementation of social technology associated with stone tanks or excavation activities in areas with high potential for the presence of cultural sites	<input type="checkbox"/> yes: substantial  <input type="checkbox"/> no: minimum	Cultural Heritage Protection and Fortuitous Finds	<input type="checkbox"/> A <input type="checkbox"/> B <input type="checkbox"/> C
<b>It is in or near(5) a Conservation Unit, Critical or Modified Habitat (2)(3)(4)</b>	Pressure on natural areas and habitats with the advance of plant suppression, expansion of planting areas not foreseen in the project, expansion of non-sustainable systems and greater demand for water with the use of local sources for production and irrigation.	<input type="checkbox"/> yes, close to critical natural habitats and UC-PI: high  <input type="checkbox"/> yes, interference with natural, modified or UC-US habitats: moderate  <input type="checkbox"/> no: minimum	Biodiversity Management, Protection and Restoration	<input type="checkbox"/> A <input type="checkbox"/> B <input type="checkbox"/> C
<b>It is in a permanent preservation area (APP)</b>	Pressure on natural areas and habitats with the advance of plant suppression, expansion of planting areas not foreseen in the project, expansion of non-sustainable systems and greater demand for water with the use of local sources for production and irrigation.	<input type="checkbox"/> yes: moderate  <input type="checkbox"/> no: low	Biodiversity Management, Protection and Restoration	<input type="checkbox"/> A <input type="checkbox"/> B <input type="checkbox"/> C
<b>Suppression of endangered or legally protected trees</b>	Loss of a native species with regimentation and importance to preservation.	<input type="checkbox"/> yes: substantial  <input type="checkbox"/> no: minimum	Biodiversity Management, Protection and Restoration	<input type="checkbox"/> A <input type="checkbox"/> B <input type="checkbox"/> C
<b>Provides for the use or collection of woody material</b>	Pressure on natural areas and habitats with the advance of plant suppression, expansion of planting areas not foreseen in the project, expansion of non-sustainable systems and greater demand for water with the use of local sources for production and irrigation.	<input type="checkbox"/> yes: moderate  <input type="checkbox"/> no: minimum	Biodiversity Management, Protection and Restoration	<input type="checkbox"/> A <input type="checkbox"/> B <input type="checkbox"/> C

Question analyzed	Possible impacts/risks and associated causes(6)	Impact or risk level(7)	Associated PGAS measure(8)	Category of Subproject(s) (According to Step 2)
<b>Provides for the use of exotic species</b>	Changes in gene flow, altering the pattern of production and ecosystems in such a way as to promote a loss of resilience in ecosystems and production systems, with the dispersal of unwanted species (naturally or mechanically).	<input type="checkbox"/> yes: substantial  <input type="checkbox"/> no: low	Biodiversity Management, Protection and Restoration	<input type="checkbox"/> A <input type="checkbox"/> B <input type="checkbox"/> C
<b>Provides for natural revegetation or agroforestry actions (SAF, for example)</b>	Changes in gene flow, altering the pattern of production and ecosystems in such a way as to promote a loss of resilience in ecosystems and production systems, with the dispersal of unwanted species (naturally or mechanically).  Pressure on natural areas and habitats with the advance of plant suppression, expansion of planting areas not foreseen in the project, expansion of non-sustainable systems and greater demand for water with the use of local sources for production and irrigation.	<input type="checkbox"/> yes: moderate  <input type="checkbox"/> no: minimum	Biodiversity Management, Protection and Restoration  Management and Control of Contaminating Products  Disease and Pest Vector Control	<input type="checkbox"/> A <input type="checkbox"/> B <input type="checkbox"/> C
<b>Installation of structures for food processing activities or agricultural machinery</b>	Soil and water pollution (surface and/or groundwater) - arising from the operation of production systems, with the improper disposal of packaging, including pesticides, improper disposal of bagasse and other solids from production and processing, use of restricted, prohibited and banned products - Stockholm Convention and accidental spillage of chemical inputs or discharge of untreated effluent.	<input type="checkbox"/> yes: moderate  <input type="checkbox"/> no: minimum	Energy Efficiency in Projects and Installations  Management and Control of Contaminating Products	<input type="checkbox"/> A <input type="checkbox"/> B <input type="checkbox"/> C

Question analyzed	Possible impacts/risks and associated causes(6)	Impact or risk level(7)	Associated PGAS measure(8)	Category of Subproject(s) (According to Step 2)
<p><b>Implementation of sanitation structures and sub-projects with civil works</b></p>	<p>Interruption of services due to lack of power, water, telephony, internet by Power failure and/or interruption of other unforeseen essential services</p> <p>Soil and water pollution (surface and/or groundwater) - arising from the operation of production systems, with inadequate disposal of packaging, including pesticides, inadequate disposal of bagasse and other solids from production and processing, use of restricted, prohibited and banned products - Stockholm Convention and accidental spillage of chemical inputs or discharge of untreated effluents.</p> <p>The proliferation of vector-borne diseases due to the accumulation of water in poorly drained areas, the presence of organic matter, such as workers' food waste, which favors the development of micro and macro vectors.</p> <p>Contamination of soil and water resources - from civil works by the production of unserviceable soil from excavation, unused inputs and materials and leftover materials from civil works with inadequate waste disposal</p> <p>Alteration in water quality affecting aquatic habitats and water resources by the movement of soil and other materials into nearby rivers (from construction activities) by the Movement and handling of soil in agricultural and earthmoving activities, cut and fill and exposed soils</p>	<p>( ) yes: moderate</p> <p>( ) no: minimum</p>	<p>Waste Management</p> <p>Control and Mitigation of Temporary Social and Economic Impacts</p> <p>Water and Effluent Monitoring</p> <p>Disease and Pest Vector Control</p>	<p>( ) A</p> <p>( ) B</p> <p>( ) C</p>

Question analyzed	Possible impacts/risks and associated causes(6)	Impact or risk level(7)	Associated PGAS measure(8)	Category of Subproject(s) (According to Step 2)
<p><b>Implemented in a Traditional Community</b></p>	<p>Risk of introducing diseases through the movement of people with unidentified illnesses.</p> <p>Risk of accidents in communities and access roads due to construction activities.</p> <p>Risk of internal governance conflicts between communities</p> <p>Risk of harassment of women and children and of GBV</p> <p>Risk of harassment of young people through the introduction of alcohol and drugs and harassment for the sale of natural capital assets</p> <p>Risk of shortages or interruption of essential services (energy and water supply)</p> <p>Risk of nuisance related to noise emissions, dust and traffic of strangers in the communities</p> <p>Risk of using natural capital for structures (wood, sand, gravel)</p>	<p>( ) yes: moderate</p> <p>( ) no: minimum</p>	<p>Mitigating Impacts on Traditional Communities</p>	<p>( ) A</p> <p>( ) B</p> <p>( ) C</p>
<p><b>Triggers item from IDB exclusion list or established eligibility criteria (to be established)</b></p>		<p>( ) yes: high</p> <p>( ) no: minimum</p>	<p>Can be excluded due to ineligibility (see item 5.1.2)</p>	<p>( ) A</p> <p>( ) B</p> <p>( ) C</p>

UC-PI: Integral Protection Conservation Unit / UC-US: Sustainable Use Conservation Unit

(1) Areas provided for in the legislation of the country, state, municipality or internationally recognized sites.

(2) It requires a differentiated risk management strategy for habitats, based on their values and susceptibility, in accordance with the IDB's PDAS 6.

(3) It also considers the existence of ecosystem services.

(4) The existence and degree of risk of impact on natural habitats and critical habitats can guide precautionary measures, detailed studies and plans for biodiversity or even the exclusion of areas or the definition of eligibility criteria for the location of future works that do not yet have a locational definition.

(5) Proximity will be established in accordance with the Buffer Zone defined in the Management Plan or, when this does not exist, a distance of 2,000 meters will be established in accordance with CONAMA Resolution 428/2010.

(6) It is very important to carry out an environmental and social assessment of the sub-projects and their areas of insertion, structured around a Baseline or Socio-Environmental Diagnosis, in order to ascertain the intensity of the anticipated impacts and to verify possible impacts that were not identified in the preliminary phase.

(7) Moderate to high impacts trigger ESMP measures

*(8) Mitigation Plans and Programs not mentioned in this table must be carried out in all Subprojects or Sets of Subprojects regardless of the outcome of the impact assessment (Disaster Risk Management and Climate Change, Communication/Consultation, Complaints and Reparations Mechanism, Environmental and Health Education, Traffic, Labor Management, Prevention/Attention to Gender Violence).*

To determine the level of impact, the following table is provided as a suggested reference.

**Table 6 - Determining the level of the preliminarily predicted impact**

Gravity (Level)	Probability				
	A	B	C	D	E
1	high	high	substantial	moderate	moderate
2	high	substantial	moderate	moderate	moderate
3	substantial	moderate	moderate	moderate	moderate
4	moderate	moderate	moderate	minimum	minimum
5	moderate	moderate	moderate	minimum	minimum

Based on Interpretation Note on Environmental and Social Categorization (IFC, 2012)

<b>Severity of the threat</b> 1. high impact (irreversible and unprecedented) 2. substantial impact (irreversible) 3. moderate (but permanent) impact 4. minimal impact, (temporary) 5. no impact	<b>Probability</b> A. certain occurrence B. expected occurrence C. likely to occur D. the occurrence is not expected E. extremely unlikely to occur
--	--

Elaboration: Consultancy, 2024

## Stage 2 - Categorization of the Subproject or Set of Subprojects

Thus, the Subproject will be categorized according to the result of the Preliminary Analysis presented and according to the following criteria:

- **Ineligible Category:** If the exclusion list is triggered or any eligibility criteria are violated (see item 0 Exclusion and Eligibility List).
- **Category A:** Project with at least one item of the requirements considered in the Preliminary Analysis with a certain and expected, significant, irreversible and unprecedented adverse environmental or social risk (combinations of Severity 1 and 2 with Probability "a"; and Severity 1 with Probability "a" or "b").
- **Category B+ (Substantial)<sup>4</sup> :** Project with at least one item of the requirements to be considered in the Preliminary Analysis with a certain and moderate adverse environmental or social impact, of certain or expected occurrence (combinations of Severity 3 with Probability "a"; Severity 2 with Probability "b"; and Severity 1 with Probability "c").
- **Category B (Moderate):** Project with at least one item of the requirements to be considered in the Preliminary Analysis with a certain and minor adverse environmental or social impact, or probable and significant. (combinations of Severity 4 and 5 with Probability "a", "b" or "c"; Severity 3 with Probability "b", "c", "d" or "e"; and combinations of Severity 4 with Probability "a", "b", "c" or "d"; Severity 2 with Probability "c", "d" or "e"; and Severity 1 with Probability "e").
- **Category C:** Project with minor, temporary or zero adverse impacts (combinations of Severity 4 and 5 with Probability "d" or "e").

<sup>4</sup> This intermediate category was added to differentiate B projects with greater impact, as a socio-environmental project planning strategy for the executing agency.

### **Stage 3 - Environmental and Social Impact Assessments - ESIA and SIA**

---

All PROCASE II sub-projects must be subjected to Environmental and Social Assessments, considering adaptations (inclusions and exclusions of themes) in accordance with the interference in environments that is planned and in accordance with the result of STAGE 1 defined in this process.

Two types of impact assessment are suggested at this stage:

- Environmental and Social Impact Assessment - ESIA: contemplating a more complete and robust process with an assessment based on a diagnostic baseline of the situation that expresses the existence or not of an impact;
- Simplified Environmental and Social Assessment - SESA: a more simplified process for identifying and assessing impacts, aimed at less complex sub-projects with minimal associated socio-environmental impacts.

It is important to note that the ESIA must present arguments based on a socio-environmental baseline that clearly proves the occurrence or non-occurrence of an impact in a given environment.

The scope of the Environmental and Social Assessment, both the ESIA and the SAA, are presented below:

#### **Terms of Reference for the ESIA - Environmental and Social Impact Assessment**

The ESIA may be carried out by the TA contractor, under the guidance and supervision of the PMU. To this end, the contract's terms of reference must include the appropriate guidelines for drawing up the ESIA.

The contracting **terms of reference** must consider environmental and social requirements, environmental and social assessments and environmental and social management plans, with some of these instruments being relativized according to the type and size of the Subproject or work.<sup>5</sup>

Environmental and Social Impact Assessments (ESIAs) must be drawn up for sub-projects that contain structures that : (i) involve civil works; or, (ii) involve implementation in or near<sup>6</sup> an integral protection UC, or in a permanent preservation area, or in Critical Habitat; or, (iii) are carried out in Traditional Communities; or, (iv) interfere with a cultural or paleontological site .

The structure of the ESIA in this case should include:

- Detailed description of the Subproject or Set of Subprojects, including maps, sketches, models, characteristics of support structures, forecast of waste to be generated (type, volume), materials and techniques used in implementation, forecast of professionals/workers, implementation schedule;

---

<sup>5</sup> Environmental and social characteristics and constraints in the area where the project/work is located are relevant, but they must be dealt with from the repertoire of issues defined in an extensive list of requirements assessed from the instruments used in the management process, depending on an environmental and social assessment of the level of the project/work.

<sup>6</sup> Proximity will be established in accordance with the Buffer Zone defined in the Management Plan or, when this does not exist, at a distance of 2,000 meters from the boundaries of the area in question, this requirement being based on the criteria established in CONAMA Resolution 428/2010.

- Evaluation of alternative considering multi-criteria analysis integrating environmental and social parameters to be carried out as a tool for reducing impacts;
- Identification of the relevant legislation and standards, including federal, state and municipal laws, the standards set out in the IDB's MPAS and IFAD's SECAP for the respective Subproject, international treaties related to the environmental and social aspects affected by the Subproject;
- Baseline and assessment of the physical and biotic environments:
  - Soil quality and stability, geology and geomorphological aspects;
  - Local aspects that interfere with air quality (noise, dust, etc.) and water;
  - Predominant species of native and exotic fauna and flora, identifying those threatened with extinction, vulnerable and protected by law;
  - Water quality and aquatic ecosystems in the Subproject area and its immediate surroundings;
  - Assessment of possible interference in natural, critical and modified habitats, and their influence on ecosystem services - according to the existence of risk<sup>7</sup> (if there is habitat identified);
  - Assessment of possible interference in priority areas for biodiversity conservation (Probio / MMA) and internationally recognized sites (KBA, Ramsar, IBA etc.);
- Baseline and evaluation of the socio-economic, cultural, gender and diversity profile of the community benefiting from the Subproject, with results in relation to issues and restrictions of vulnerable populations;
- Socio-cultural analysis, as established in the PGASE Program for Mitigation of Impacts on Traditional Communities (if there is a traditional community);
- Historical and cultural heritage, whether on the surface or subsurface, when the Subproject is in the area of influence of the heritage (if there is a cultural site);
- Assessment of the risk of disasters that may affect the Subproject, the benefited community or that the Subproject may contribute to exacerbating, using data from IPT/CPRM, Adapta Brasil, or mapping from the municipality itself, interviews with civil defense or local assessments;
- Impact and risk assessment, including:
  - Impacts on the physical, biotic and socio-economic environment;
  - Risks and impacts associated with primary suppliers<sup>8</sup> . Address these risks and impacts in proportion to their control and influence over primary suppliers, as established in PDAS2 and PDAS6 (construction contractors, for example);
  - Risks and impacts including disaster risks and assessment of cumulative and residual impacts;

---

<sup>7</sup> Part of this requirement is already assessed, considering conservation units and permanent preservation areas, but only from the perspective of the national, state and municipal laws in force. In this case, the recommendations of the IDB's PDAS6 need to be observed.

<sup>8</sup> Primary suppliers are those who supply, on an ongoing basis, goods or materials that are essential to the core functions of the project. The core functions of a project are the production processes and/or services essential to a specific project activity, without which the project could not continue

- The impact and risk matrix should include:
  - Identifying the impact;
  - Impacting Cause / Action;
  - Main Plans or Programs of the Associated ESMP;
  - Qualitative / descriptive aspects and justification of the impact;
  - Actions planned to avoid the impact (where applicable);
  - Actions planned to minimize the impact (where applicable);
  - Actions planned for rehabilitation (where applicable);
  - Planned compensation actions (where applicable);
  - Means of Verification for Monitoring;
  - Verification frequency
- Other relevant themes can be identified according to the triggers given by the Preliminary Environmental and Social Analysis (Screening) of each Subproject.
- A public consultation process with interested parties should also be organized and carried out, in accordance with the IDB's requirements<sup>9</sup> (see associated program in the PGASE) and considering a FPIC in the case of traditional communities. This process should seek information and primary data obtained through dialog strategies, such as interviews, participatory workshops, consultation meetings or channels for expressing the community's perception of the Subproject and its effects;

The ESIA should consider the guidelines and guidance provided in the IDB's MPAS regarding the significance of residual and cumulative impacts, their long-term effect on the environment and individuals affected by the Subproject, and the extent to which such impacts are considered reasonable in the context of the Subproject. When it is determined that it is not technically or financially feasible to offset or neutralize residual impacts, the justification for this determination (including the options that were considered) will be included in the ESIA.

The assessment will consider all the relevant socio-environmental risks and impacts, depending on the influence of the Subproject on its environment:

- (a) environmental risks and impacts, including: (i) those identified by the PDAS; (ii) those related to community safety; (iii) those related to climate change and other global or transboundary impacts; (iv) any significant threat to the protection, conservation, maintenance and recovery of natural habitats and biodiversity; and (v) those related to ecosystem services and the use of living natural resources, such as fisheries and forest resources.
- (b) social risks and impacts, including: (i) threats to human security due to intensification of personal, community or interstate conflict, crime or violence; (ii) risks that project impacts may disproportionately affect disadvantaged or vulnerable individuals and groups; (iii) any bias or discrimination against individuals or groups in accessing development resources and project benefits, especially in the case of those who may be disadvantaged or vulnerable; (iv) negative economic and social impacts related to land use restriction; (v) risks or impacts associated with the ownership and use of land and natural resources, including (where applicable)

---

<sup>9</sup> It does not refer to public hearings, although this request could be adapted to meet the requirements.

potential impacts of the project on local land use patterns, land tenure, access to and availability of land, food security and land value, and any corresponding risks related to conflicts or contestation of land and natural resources; (vi) impacts on the health, safety and well-being of workers and communities affected by the project; and (vii) risks to cultural heritage; (viii) risks associated with occupational health and safety, employment, equity, harassment and violence of the team hired to implement the projects.

### **Terms of Reference - Simplified Environmental and Social Assessment (SESA)**

The SESA may be carried out by the TA contractor, under the guidance and supervision of the PMU. To this end, the contract terms of reference must include the appropriate guidelines for drawing up the AAS.

The contracting **terms of reference** must consider environmental and social requirements, environmental and social assessments and environmental and social management plans, with some of these instruments being relativized according to the type and size of the Subproject or work.<sup>10</sup>

The Simplified Environmental and Social Assessments (SEA) should be prepared for sub-projects or sets of sub-projects that do not involve the implementation of structures that require civil works, are not within or close to Conservation Units or Critical Habitats, are not within Traditional Communities and do not interfere with paleontological sites.

The SESA structure for this case should include:

- Detailed description of the Subproject or Set of Subprojects, including maps, sketches, models, characteristics of support structures, forecast of waste to be generated (type, volume), materials and techniques used in implementation, forecast of professionals/workers, implementation schedule;
- Identification of the relevant legislation and standards, including federal, state and municipal laws, the standards set out in the IDB's MPAS and IFAD's SECAP for the respective Subproject, international treaties related to the environmental and social aspects affected by the Subproject;
- Assessment of the risk of disasters that may affect the Subproject, the benefited community or that the Subproject may contribute to exacerbating, using data from the IPT/CPRM, Adapta Brasil, or mapping from the municipality itself, interviews with civil defense or local assessments;
- Consolidated impact and risk matrix, including information on:
  - Identifying the impact;
  - Impacting Cause / Action;
  - Main Plans or Programs of the Associated ESMP;
  - Qualitative / descriptive aspects and justification of the impact;
  - Actions planned to avoid the impact (where applicable);

---

<sup>10</sup> Environmental and social characteristics and constraints in the area where the project/work is located are relevant, but they must be dealt with from the repertoire of issues defined in an extensive list of requirements assessed from the instruments used in the management process, depending on an environmental and social assessment of the level of the project/work.

- Actions planned to minimize the impact (where applicable);
  - Actions planned for rehabilitation (where applicable);
  - Planned compensation actions (where applicable);
  - Means of Verification for Monitoring;
  - Verification frequency.
- Other relevant themes can be identified according to the triggers given by the Preliminary Environmental and Social Analysis (Screening) of each Subproject.
  - A public consultation process with interested parties must also be organized and carried out, in accordance with the IDB's requirements<sup>11</sup> (see associated program in the PGASE). This process should seek information and primary data obtained through dialog strategies, such as interviews, participatory workshops, consultation meetings or channels for expressing the community's perception of the Subproject and its effects;

The assessment will consider all the relevant socio-environmental risks and impacts, depending on the influence of the sub-project on its environment.

#### **Stage 4 - Proposal of Measures and Environmental and Social Management Plan for Subproject or Set of Subprojects – PGAS/ESMP**

---

The specific Environmental and Social Management Plan for the Subproject or Set of Subprojects, containing mitigation, compensation and control programs for the environmental and social impacts identified, may be based on the structure, guidelines and directives defined in the PROCASE II ESMP.

The ESMP can be drawn up and implemented by the ATER<sup>12</sup> contractor, under the guidance and supervision of the PMU and, to this end, the contract terms of reference must include the appropriate guidelines for drawing up the ESMP.

The ESMP should apply a mitigation hierarchy, which will:

- (a) foresee and avoid risks and impacts;
- (b) when it is not possible to avoid, minimize or reduce the risks and impacts to acceptable levels;
- (c) when risks and impacts have been minimized or reduced, mitigate them;
- (d) where significant residual impacts and risks remain, offset or neutralize them where technically and financially feasible.

The requirement to mitigate impacts may include measures to help affected parties improve or at least restore their livelihoods as relevant in a given Subproject configuration.

The requirements for preparing the ESMP can be incorporated into the Terms of Reference for preparing the Environmental and Social Assessment. These Terms of Reference must be applied to all Subprojects in accordance with the trigger identified in the Preliminary Environmental and Social Assessments, regardless of whether or not a

---

<sup>11</sup> It does not refer to public hearings, although this request could be adapted to meet the requirements.

<sup>12</sup> The implementation of the specific ESMP will have the collaboration/participation of contracted construction companies and rural producers on specific issues.

specific study is required for licensing, respecting the levels of environmental and social assessment proportional to the respective project.

### **Terms of Reference for the Environmental and Social Management Plan – PGAS/ESMP**

The Environmental and Social Management Plan (ESMP) must contain the specific environmental and social management measures required according to the ESIA or SESA carried out to help maximize positive impacts and avoid, reduce, mitigate and/or compensate for negative impacts, based on the mitigation hierarchy.

A relationship will be established between the Subprojects' works; potential impact; and proposed mitigation measures.

The ESMP will also contain all the necessary guidelines to address the environmental and social management and occupational health and safety of the Subproject, including, but not limited to:

- (i) the different environmental and social plans or programs that will meet the environmental, social and health and safety requirements necessary to carry out the project activities, complying with the Safeguard Policies and their specific requirements, as well as government regulations;
- (ii) the institutional obligations and responsibilities for developing and implementing the necessary measures;
- (iii) the mitigation measures for the negative environmental impacts identified in the ESIA or SESA, during the construction/implementation, operation, closure and post-closure phases, as well as the different environmental and social plans or programs that will comply with the requirements necessary to carry out the activities of the Subproject;
- (iv) a description of the environmental and social monitoring plan for implementation, operation, closure and post-closure, identifying the expected results, the parameters to be measured, the measurement sites, the methods and tools used and the periods/frequency at which the measurements will be made, the costs and the institutions responsible;
- (v) the implementation schedule for each of the proposed measures, defining roles and responsibilities and a reference budget.

In accordance with the provisions of the IDB's Safeguard Policies, the ESMP must consider requirements that encompass the parameters described in Annex 7.1 of this document. On top of this, the size of the Subproject, its insertion environment and, consequently, the respective Performance Standards that are specifically triggered for the situation must be taken into account.

### ***ESMP for Projects Subject to Environmental and Social Impact Assessment - ESIA***

Initially, the Environmental and Social Management Plan<sup>13</sup> of Subprojects submitted to the ESIA will present the following mitigation programs, according to the impacts specifically identified:

- 1) Disaster and Climate Change Risk Management Plan;

---

<sup>13</sup> The programs set out here are a reference to the ESMP and can be complemented with other programs, based on the results of the Environmental and Social Assessment.

- 2) Waste Management Program, including construction waste (if any), operating waste and production waste;
- 3) Water and Effluent Quality Monitoring Plan;
- 4) Biodiversity Management, Protection and Restoration Plan;
- 5) Stakeholder Communication, Consultation and Engagement Program, considering participation and relations with the community during project execution, including the implementation of a community monitoring mechanism and a complaints attention and management mechanism to be monitored by the borrower;
- 6) Environmental and Health Education Program;
- 7) Contaminating Products Management and Control Plan;
- 8) Energy Efficiency Plan for Projects and Facilities (for Subprojects involving the implementation of building structures, machinery and equipment for production);
- 9) Traffic Plan;
- 10) Labor Management Plan including OHS issues, hiring a workforce that encourages gender diversity, workforce training and awareness, code of conduct and grievance mechanism for workers; attention to and prevention of gender violence;
- 11) Program for the Control and Mitigation of Temporary Social and Economic Impacts;
- 12) Gender Violence Prevention and Care Program;
- 13) Program to Mitigate Impacts on Traditional Communities (Projects located in traditional communities - Indigenous, Quilombola, Gypsy and Fishing/Marisque communities);
- 14) Disease Vector Control Program
- 15) Cultural Heritage and Fortuitous Finds Protection Program (if there are risks to cultural heritage identified in the ESIA);
- 16) Monitoring and Evaluation Plan - each program in the ESMP will have its own management indicators in order to determine compliance with the measures and indicate success or the need for corrections.

### ***ESMP for Projects Subject to Simplified Environmental and Social Assessment - SESA***

Initially, the Environmental and Social Management Plan<sup>14</sup> of Subprojects submitted to the ESIA will present the following mitigation programs, according to the impacts specifically identified:

- 1) Disaster and Climate Change Risk Management Plan;
- 2) Stakeholder Communication, Consultation and Engagement Program, considering participation and relations with the community during project execution,

---

<sup>14</sup> The programs set out here are a reference to the ESMP and can be complemented with other programs, based on the results of the Environmental and Social Assessment.

including the implementation of a community monitoring mechanism and a complaints attention and management mechanism to be monitored by the borrower;

- 3) Environmental and Health Education Program;
- 4) Traffic Plan;
- 5) Labor Management Plan including OHS issues, hiring a workforce that encourages gender diversity, workforce training and awareness, code of conduct and grievance mechanism for workers; attention to and prevention of gender violence;
- 6) Gender Violence Prevention and Care Program;
- 7) Monitoring and Evaluation Plan - each program in the ESMP will have its own management indicators in order to determine compliance with the measures and indicate success or the need for corrections.

### **Terms of Reference for Contracting Works**

---

It is advisable to establish as a contractual binding clause in the Terms of Reference for hiring the contractor, compliance with the measures established in the project's ESMP that are directly related to civil works actions.

The PMU will be responsible for including environmental and social requirements in the terms of reference for contracting the work, as well as supervising the implementation of the measures and compliance with the works, with the support of the socio-environmental supervision team of the contracted TA.

#### **5.1.2 Eligibility Criteria**

Below are the eligibility and exclusion criteria to be applied to PROCASE II sub-projects.

#### **Legally Protected Areas, Natural Habitats and Cultural Sites**

---

PROCASE II projects may not interfere in legally protected areas, except: (i) in the case of those characterized as sustainable use, where controlled and restricted interference is permitted, and also in areas of permanent preservation of rivers (APP), with the exception of situations involving high slopes, hilltops and springs; and (ii) in the case of sanitation works, especially due to the possible need to draw water from natural water resources where there is a requirement to issue a use grant. In these cases, good practices should be taken into account to ensure the least possible impact, the sustainability of the areas and the requirements established by law, respecting the permissions for uses and activities on site.

- Studies should be carried out to measure and avoid impacts on critical habitats<sup>15</sup>, including any need to revise projects and the use of support areas during the works.

---

<sup>15</sup> Critical Habitats are areas of high importance or value for biodiversity, including: (i) habitat of significant importance for critically endangered, endangered, vulnerable or near threatened species (According to the International Union for Conservation of Nature - IUCN); (ii) habitat of significant importance for endemic and/or restricted range species; (iii) habitat that supports globally significant concentrations of migratory

- Cultural sites and areas defined as being for the exclusive use of traditional communities must also be respected. It is understood that the areas established as being for the use of traditional communities are territories and groupings with Quilombola, indigenous and fishing community practices, etc.
- Cultural sites include built heritage or natural monuments, whether or not protected by law, to which the community attaches historical, cultural or landscape value. In addition to these, cultural sites preserved in the subsurface, such as buried archaeological and historical sites, are also part of this protection framework. Some cultural sites may have specific permission for intervention or restoration, and these situations are allowed when the criteria and authorizations established by local regulations are followed and good practices for such interventions are followed.
- Critical natural habitats must also be respected, including remaining areas of Atlantic forest and mangroves, and areas used as a source of ecosystem services.
- The interaction of a technically prepared team with environmental and social specialists should be considered, incorporating the ecological concerns set out in the Biodiversity Plan (PAB).

### **Risks of Expropriation and Involuntary Resettlement**

---

**the project does not incorporate actions involving involuntary resettlement, nor will it promote implementations that result in the need for this type of solution, therefore sub-projects that encompass such a situation are not eligible.**

### **Licenses and Authorizations**

---

Construction work will not be allowed to begin without the appropriate authorizations and licenses provided for by law, and which must be up to date with compliance with the requirements, at a minimum:

- All structures and works subject to the Project's licensing process must have their projects licensed by the competent environmental agencies, based on the following configuration:
  - Resilient Investment Plans and Business Plans: Because they are small investments and use agroecological production practices, they are characterized as having a low environmental impact, and there is no need for environmental licenses, just a simple permit. For food processing support, as these are small, low-complexity investments, the environmental license may need to be issued by the municipality itself. The process will be monitored by the TA team with the support of the PMU and will depend on the specific licensing process of each municipality.
  - Water supply systems, water reuse and sewage systems: According to the state's environmental legislation, these systems are subject to environmental licensing because they use water resources, because they are sanitation works that can generate environmental changes and because they directly intervene in surface or underground water bodies, with the exception of those involving SBN (Nature-Based Solutions), such as rainwater harvesting cisterns or natural

---

species and/or congregational species; (iv) highly threatened and/or unique ecosystems; (v) areas associated with major evolutionary processes; and/or (vi) legally protected areas or areas internationally recognized as having high biodiversity value."

---

effluent purification systems. Therefore, environmental licenses and water abstraction/intervention permits may be required for certain situations.

- All licenses and permits must be up to date and with the conditions proposed by the authorities met or being met, depending on the schedule;
- No works will be allowed inside Conservation Units that are not compatible with the UC's Management Plan and its objectives. New works or support structures other than those assessed and approved by the IDB and IFAD ESG team and authorized by the management body of the Conservation Units will not be accepted.

## Photovoltaic panels

---

The purchase of photovoltaic panels that do not originate from production based on sustainable systems and that comply with the United Nations General Assembly's Universal Declaration of Human Rights will not be permitted.

In the case of contracting/purchasing solar panels, the declarations of conduct and contract clauses expressed in the Labor Management Program (LMP) of this ESMP must be adopted by the construction contractors and their suppliers in the primary supply chain<sup>16</sup>. In addition, financing operations for the generation or consumption of solar energy that have detected the risk of forced labor in their respective polysilicon production chain must carry out a specific *due diligence* process on labor risks, involving the evaluation of primary suppliers up to an assessment of occupational risks, including, in some cases, an independent assessment of forced labor in primary suppliers.

In tendering processes for the purchase of photovoltaic equipment, the following measures should also be taken:

- Require the supplier to have an environmental and social management plan that includes an analysis of occupational risks and the corresponding mitigation measures;
- They will have to take into account enhanced environmental and social sustainability considerations in the qualification of the offer;
- Include contractual clauses in the event of non-compliance with the requirements, including incidents of forced labor in the primary supplier's workforce, as grounds for establishing corrective measures or contractual termination;
- It is necessary to align with the IDB's requirements, confirming that the measures to manage the risks of forced labor are aligned with the document "Medidas del Grupo BID para abordar *el riesgo de trabajo forzoso en la cadena de suministro o módulos solares a base de silicio*", which among the requirements presented in the document includes:
  - Applicable to the supply of medium and large-scale solar installations (over 20MW) using polycrystalline solar modules;
  - The vast majority of medium and large-scale projects with solar energy components include international contracts (international public bidding - LPI), which requires the borrower to use standard bidding documents, including clauses to avoid forced labor and to adopt the modality of *ex ante* supervision. The procurement requirements in the bidding processes must also include

---

<sup>16</sup> Suppliers in the primary supply chain are those who, on an ongoing basis, supply goods or materials that are essential to the core functions of the project.

selection criteria, evaluation criteria and compliance and termination measures, according to the aforementioned IDB Group Measures document;

- Adhere to the IDB Group's training and orientation programs to strengthen the capacity to implement environmental and social policies, which includes identifying risks related to labor and human rights aspects, assessing labor risks in the supply chain, and designing, executing and supervising the corresponding mitigation measures;
- Adopt a traceability protocol, including controls such as: independent external audits; a code of conduct on social responsibility; security measures to safeguard information and prevent the illicit handling of goods; due diligence and control of suppliers; employee training; application of the policy, procedures and plans for implementing corrective measures.

## **Exclusion List**

---

According to the IDB's MPAS and IFAD's SECAP, the institutions will not finance, directly or indirectly, or through financial institutions, projects involved in the production, trade or use of the products, substances or activities listed below.

### **Prohibited Activities**

- Production or activities that involve forms of forced labor or exploitation<sup>17</sup> or practices that prevent employees from exercising their rights of association and collective bargaining;
- Production or activities that involve harmful forms of child labor or constitute exploitation<sup>18</sup> ;
- Production or activities that violate lands owned or claimed by indigenous peoples, without the full documented consent of these peoples;
- Activities prohibited by the country's local legislation, or international covenants and conventions in relation to the protection of biodiversity resources, cultural heritage or other legally protected areas<sup>19</sup> ;

---

<sup>17</sup> Forced labor is any work required under threat of any penalty and for which the person does not volunteer. It can include practices such as threats of dismissal or physical violence, withholding identity documents or wages, threats to report the worker to immigration authorities, or involving the worker in fraudulent debts.

<sup>18</sup> Child labor includes: (i) work below the minimum age for admission to employment; and, (ii) any work that may be dangerous, interferes with the education of children or is harmful to their health or physical, mental, spiritual, moral or social development. If local legislation or regulations allow the employment of young people who are at least 16 years old (in accordance with the ILO Minimum Age Convention of 1973), on condition that their health, safety and morality are fully protected, and they have received specific instructions or adequate vocational training in the relevant activity, then child labor will be understood as the employment of children for work that does not comply with this legislation and regulations.

<sup>19</sup> The relevant international conventions and agreements include: the Convention on the Conservation of Migratory Species of Wild Animals (Bonn Convention); the Convention Concerning Wetlands of International Importance, especially as Waterfowl Habitat (Ramsar Convention); the Convention on the Conservation of Wild Fauna and Flora and Natural Habitats in Europe (Bern Convention); the World Heritage Convention and the Convention on Biological Diversity.

- activities that are illegal according to local laws, regulations or ratified international conventions and agreements, or subject to international interruptions or prohibitions, such as:
  - polychlorinated biphenyls (PCBs);
  - pharmaceutical products, pesticides/herbicides and other dangerous substances subject to international interruptions or bans<sup>20</sup> ;
  - Persistent Organic Pollutants (POPs);
  - ozone-depleting substances subject to international elimination, especially those governed by the Montreal Protocol<sup>21</sup> ;
  - wildlife or wildlife products regulated by the Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITIES)<sup>22</sup> ;
  - transboundary trade in waste or waste products, except for non-hazardous waste destined for recycling, as defined in the Basel Convention<sup>23</sup> ;
  - lead-based paint or coatings in the construction of structures and roads.
- Commercial exploitation of forests or purchase of equipment for such operations in primary or advanced stage humid tropical forests;
- The production or trade of wood or other forest products that do not come from sustainably managed forests;
- Marine and coastal fishing practices that use explosives in their activity, large-scale pelagic fishing with driftnets and with nets longer than 2.5 km or with small meshes, harmful to vulnerable and protected species in large volumes and harmful to biodiversity and marine habitats;
- Trade in goods without presenting the necessary export or import licenses or other evidence of transit authorization from the countries of export, import and, where applicable, transit;
- Activities that are illegal under laws, regulations or ratified international conventions and agreements relating to the protection of biodiversity resources or cultural heritage.
- Activities that, although consistent with a country's legal and/or regulatory framework, can generate particularly significant adverse impacts on people and/or the environment;

---

<sup>20</sup> The relevant international conventions and agreements include the United Nations Consolidated List of Products Whose Consumption or Sale Has Been Banned or Subjected to Strict Restrictions, or Which Have Been Withdrawn from the Market, or Have Not Been Approved by Governments; the Rotterdam Convention on the Prior Informed Consent Procedure Applicable to Certain Pesticides and Hazardous Chemicals in International Trade; the Stockholm Convention on Persistent Organic Contaminants, and the WHO Recommended Classification of Pesticides by Hazardousness. The list of pesticides, herbicides and other hazardous substances subject to bans or withdrawal measures is available at: <http://www.pic.int/Portals/5/download.aspx?d=UNEP-FAO-RC-CONVTEXT-2019.Spanish.pdf> .

<sup>21</sup> On the UNEP website you can access a list of the chemical compounds regulated by the Montreal Protocol, along with information on the signatory countries and the deadlines for their withdrawal.

<sup>22</sup> You can access the list of these species on the CITIES Secretariat website.

<sup>23</sup> Available at: <https://www.basel.int/Portals/4/Basel%20Convention/docs/text/BaselConventionText-s.pdf>

- Manufacture or trade in arms, ammunition and other military goods/technology;
- Production or trade of alcoholic beverages (except beer and wine), tobacco or drugs;
- Gambling companies, casinos and equivalent enterprises, and the trade related to pornography and prostitution;
- Contribution to money laundering, terrorist financing, tax evasion and fraud;
- Production and distribution of, or investment in, media that are racist, anti-democratic or that promote discrimination against a person, a group or a section of the population;
- Activities prohibited by the country's legislation or other legally binding agreements regarding genetically modified organisms;
- Production and trade of palm oil, unless it comes from producers and companies that have<sup>24</sup> an internationally recognized certification<sup>25</sup> ;
- Soy production in the Amazon region or trade in soy produced in that region, unless it comes from producers with internationally recognized certification<sup>26</sup> ;
- Production or trade of radioactive materials<sup>27</sup> ;
- Production or trade of unalloyed asbestos fibers or products containing asbestos;
- All mining, processing and mineral extraction activities;
- Thermal coal mining and coal-fired power plants and associated facilities;
- Upstream oil exploration and development projects;
- Upstream gas exploration and development projects. In exceptional circumstances and on a case-by-case basis, financing of upstream gas structures will be considered where there is a clear benefit in terms of access to energy for the poor and reduction of greenhouse gas (GHG) emissions, projects consistent with national climate change objectives, and where the risks of retained assets are adequately analyzed.

## 5.2 PGASE/ESMF Monitoring and Evaluation Measures

The Environmental and Social Monitoring and Follow-up Plan should be detailed in the Operation phase of the Financing and will consider the details of the construction/implementation, operation, closure and post-closure phases of the Project, identifying the expected results, parameters to be measured, the measurement sites, the methods used and the periods/frequency at which the measurements will be made, the costs and the institutions responsible.

---

<sup>24</sup> This includes producers and companies that have started the certification process.

<sup>25</sup> For example, the Round Table on sustainable palm oil.

<sup>26</sup> For example, the International Association for Responsible Soy.

<sup>27</sup> It does not apply to the purchase of medical or veterinary equipment, quality control (measurement) equipment and similar equipment where the radioactive source is minimal or adequately shielded.

**Responsible:** TA will be responsible for monitoring, and the PMU will be responsible for consolidating the results and making a critical assessment. If necessary, the construction company could be an agent for cataloging the indicators listed in the subprojects.

The following is an overview of the guidelines defined for monitoring and evaluating PGASE/ESMF programs.

The PMU should monitor the environmental and social performance of projects. The degree and manner of monitoring will be proportionate to the nature of the project, its social and environmental risks and impacts, and compliance requirements.

The PMU, with the support of TA, must draw up comprehensive monitoring reports on all the themes and programs planned in a managerial manner, and they must present:

- General progress report on the operation;
- Compliance with environmental and social aspects;
- Summary of incidents, accidents and non-conformities identified;
- Description of any remedial or corrective action that has been taken since the last monitoring report;
- It also provides an overview of complaints and claims channeled through the MQR<sup>28</sup> established for PROCASE II.

Where appropriate, the PMU may promote the involvement of stakeholders and third parties, such as independent experts, local communities or NGOs, to complement or verify its own monitoring activities.

In general, monitoring will include recording information to track performance and establishing relevant operational controls to verify compliance and progress in meeting the requirements set out in this ESMP for the project.

Based on the results of the monitoring, the PMU will identify any necessary corrective and preventive actions, which should be incorporated into the ESMP. The PMU will implement the agreed corrective and preventive actions, in accordance with the modified ESMP or the relevant management instrument, and will monitor and disclose these actions.

The PMU will facilitate access and visits to the project site for IDB and IFAD staff or consultants representing them. The PMU will notify the IDB and IFAD immediately of any incident or accident related to the project that has, or may have, a significant adverse effect on the environment, affected communities, the public or workers. The notification shall provide sufficient details of the incident or accident, including deaths and serious injuries. The PMU must immediately adopt measures to resolve the incident or accident and prevent any recurrence, in accordance with national legislation and IDB and IFAD requirements.

Monitoring will be aimed at the timely follow-up of PGASE/ESMF measures, since it is essential that their progress and bottlenecks are clearly identified and controlled in order for them to run smoothly. To this end, quantitative indicators will be established, covering the process of implementing the actions, verifying the effectiveness, efficiency and efficacy of the actions, as well as qualitative ones that include, for example, satisfaction with the processes and assistance received, clarity of the information provided, among others.

---

<sup>28</sup> Complaints and Claims Mechanism, which is the system implemented by the executive agency to deal with complaints from society.

The PMU will be responsible for the monitoring process with the support of TA companies and contracted supervisors. This process includes:

- Preparation of data collection instruments;
- Data collection with the Environmental and Social Supervision;
- Data systematization and analysis;
- Definition of corrective actions.

Monitoring will be carried out in the office for the project documentation to be assessed, whether related to environmental licensing or to legal occupational health and safety issues. *On-site* monitoring will also be carried out at the projects, construction sites, production project areas and their areas of direct influence to check for possible impacts or non-compliance, or even situations where there is a risk of occurrence.

### 5.2.1 Monitoring and Evaluation Indicators

This section presents the initial proposal of indicators that will be observed through the monitoring and evaluation of the ESMP mitigation programs. These indicators may be revised and/or supplemented as the necessary.

Below are the main indicators that will be addressed in monitoring. Basically, quantitative indicators are proposed that should be monitored on a monthly basis by the PMU, by recording and controlling activities and their results. Specific instruments will be developed and implemented to carry out the monitoring, as well as creating a database (a simple, easy-to-use system) to consolidate and extract the data.

It should be noted that only indicators related to the measures set out in the Subproject's specific ESMP should be monitored. The monitoring program should also be aligned with the Logical Framework and the PROCASE II M&E team.

**Table 7 - Monitoring and Evaluation Indicators**

Environmental and Social Program	Indicators	Target	Source of information
Stakeholder engagement	- Number of participants in community consultations and meetings - Number of institutions that provided input to consultations	- Increase the percentage of participants in the Stakeholder Matrix - Increase the percentage of female participants	To be determined
Complaints management mechanism	- Number of complaints by type - Service deadline Number of complaints with pending resolution	- reduce the number of unresolved complaints - Reduction in the average monthly number of complaints over time	To be determined
Environmental and health education	- Number of participants in environmental and health education actions; - Number of community actions	- 4 project-oriented actions per year	To be determined
Waste management	- Volume of waste generated - Volume of waste going to landfill	- Reduction in the percentage of waste going to landfill.	To be determined
Mitigation of temporary social and economic impacts	- Number of parties affected by temporary impacts of the work or project	- Reduction in the number of parts affected by temporary impacts	To be determined

Environmental and Social Program	Indicators	Target	Source of information
Preservation of cultural heritage (where applicable in accordance with the project's ESIA and ESMP)	<ul style="list-style-type: none"> <li>- Number of cultural sites affected/rescued</li> <li>- Number of cultural sites destroyed by activities</li> </ul>	<ul style="list-style-type: none"> <li>- 100% of identified sites rescued</li> </ul>	To be determined
Contingency and risk reduction	<ul style="list-style-type: none"> <li>- Number of emergencies</li> <li>- Response time</li> </ul>	<ul style="list-style-type: none"> <li>- reducing the number of emergency situations</li> <li>- reduction in the average response time</li> </ul>	To be determined
Environmental and Social Control of Works (when civil works are involved in the project)	<ul style="list-style-type: none"> <li>- Number of Non-Conformities (by type)</li> </ul>	<ul style="list-style-type: none"> <li>- Reduction in the number of non-conformities</li> </ul>	To be determined
Hiring labor	<ul style="list-style-type: none"> <li>- Number of local workers hired</li> <li>- Number of women hired</li> </ul>	<ul style="list-style-type: none"> <li>- increase in the number of local workers hired</li> <li>- increase in the number of women hired</li> </ul>	To be determined
training and awareness	<ul style="list-style-type: none"> <li>- Number of workers trained</li> </ul>	<ul style="list-style-type: none"> <li>- 100% of workers trained</li> </ul>	To be determined
Code of conduct	<ul style="list-style-type: none"> <li>- Number of complaints of embarrassment, harassment or racial / cultural or gender-based slurs with workers who were successful</li> <li>- Number of DDSs addressing the topic of conduct with employees</li> </ul>	<ul style="list-style-type: none"> <li>- reduction in the number of successful complaints of embarrassment, harassment or racial/cultural or gender-based insults against workers</li> <li>- 1 DDS per month on the subject of the code of conduct</li> </ul>	To be determined
Occupational health and safety	<ul style="list-style-type: none"> <li>- Number of days without an accident at work</li> <li>- Number of accidents with fatalities</li> <li>- Average number of days off work due to health and occupational problems</li> </ul>	<ul style="list-style-type: none"> <li>- Increase in the number of days without an accident at work</li> <li>- Zero fatal accidents</li> <li>- Reduction in the average number of days off work</li> </ul>	To be determined
Control and inspection of suppliers	<ul style="list-style-type: none"> <li>- Primary chain supplier evaluation form</li> </ul>	<ul style="list-style-type: none"> <li>- increase the performance evaluation score of the suppliers in the primary chain</li> </ul>	To be determined
Implementation, operation and closure of construction sites and support areas (when civil works are involved in the project)	<ul style="list-style-type: none"> <li>- According to the Environmental and Social Control of Works indicators</li> </ul>	<ul style="list-style-type: none"> <li>- According to the Environmental and Social Control targets for the works</li> </ul>	To be determined
Erosion control	<ul style="list-style-type: none"> <li>- According to the Environmental and Social Control of Works indicators</li> </ul>	<ul style="list-style-type: none"> <li>- According to the Environmental and Social Control targets for the works</li> </ul>	To be determined
Protection of legally protected areas	<ul style="list-style-type: none"> <li>- Legally protected areas affected by the works</li> <li>- Compensation area</li> <li>- Recovered area</li> </ul>	<ul style="list-style-type: none"> <li>- Biodiversity net profit (compensated or recovered area/affected area&gt;1)</li> </ul>	To be determined

Environmental and Social Program	Indicators	Target	Source of information
Reducing and mitigating community discontent	<ul style="list-style-type: none"> <li>- According to the Environmental and Social Control of Works indicators</li> <li>- According to the indicators of the Complaints Management Mechanism</li> </ul>	<ul style="list-style-type: none"> <li>- According to the Environmental and Social Control targets for the works</li> <li>- According to the goals of the Complaints Management Mechanism</li> </ul>	To be determined

## 5.2.2 Auditing

The objective of the audit is to identify significant environmental and social issues of the project or existing activities, and to assess their current status, specifically with regard to compliance with the requirements of the IDB MPAS and IFAD Standards.

The indicative description of the audit involves:

- (a) Executive Summary: Concisely address important conclusions and set out recommended measures, actions and deadlines.
- (b) Legal and Institutional Framework: Analyze the legal and institutional framework for the existing project or activities, including the issues listed in PDAS1;
- (c) Project description:
  - Concisely describe the existing project or activities, as well as its environmental, social, geographical and temporal context, and any associated facilities.
  - Identify the existence of any plans already developed to address specific environmental and social impacts and risks (e.g. land acquisition or resettlement plan, cultural heritage plan, biodiversity plan).
  - Include a detailed map showing the site of the existing project or activities and the proposed site of the project in question.
- (d) Environmental and Social Issues associated with the project: The analysis will consider the main risks and impacts of the project as determined in the ESIA. In addition, the audit will analyze issues not covered by the Safeguard Policies, insofar as they represent important risks and impacts in the context of the project.
- (e) Environmental and Social Analysis: The audit will also assess:
  - (i) the possible impacts of the proposed project (considering the audit findings concerning the project or existing activities); and
  - (ii) the ability of the proposed project to comply with the requirements of the Safeguard Policies.
- (f) Proposed Environmental and Social Measures: Based on the audit findings, this section will define proposed measures for aligning conduct. These measures will be included in the ESMP for the proposed project.

The measures usually covered in the audit include:

- specific actions necessary to comply with the requirements of the Safeguard Policies;
- measures and corrective actions to mitigate the potentially significant environmental and/or social risks and impacts of the project or existing activities;

- measures to avoid or mitigate the possible risks and negative socio-environmental impacts of the proposed project.

The minimum periodicity of the audit will be annual, with the possibility of it being carried out by an internal or external team (contracted).

### 5.3 Disaster and Climate Change Risk Management Plan

A Disaster and Climate Change Risk Management Plan (PGRD) should be drawn up, a system that guides actions for risk management and in the event of an emergency. This system should effectively identify the types of disasters to which the area of influence of the Projects that make up the Project is subject.

The PGRD could be supported by contributions from the guidelines and measures set out in the Targeted Adaptive Assessment document<sup>29</sup> (TAA), which was developed as part of the preparation of PROCASE II.

*A single PGRD can be drawn up for the whole of PROCASE II, differentiating between the types of subprojects and environments in which they are inserted, in order to cover all the disaster risk situations considered moderate and high. This is a macro document for the project, which should receive contributions and additions as the subprojects evolve and are drawn up. For the specific ESMP for each Subproject or Set of Subprojects, the specific risk monitoring and management measures presented in the general PROCASE II ESMP should be selected.*

**Responsible:** The PMU should draw up a specific PGRD for PROCASE II sub-projects, with the support of TA, based on this Plan and with local information on the specific risks linked to the environment and the type of investment. Institutions and government agencies should be called upon to act jointly to deal with the crisis (Civil Defense, environmental agencies, etc.).

**Target audience:** In the event of measures being triggered, the target audience for mitigation will be all the actors and stakeholders related to the Subproject.

The guidelines for emergency response preparation, including the Contingency and Risk Reduction Plan, the Disaster and Climate Change Risk Management and Assessment Plan, Monitoring, Preventive and Corrective Actions and the Action Plan, are described below.

It is important to note that the Disaster Risk Management Plan also takes into account the risks to which the community may be exposed.

Risk awareness is one of the four foundations of the Sendai Framework. The Sendai Framework for Action was defined at the Assembly of the UN Office for Disaster Risk Reduction, held in Sendai, Japan, in 2015. The Framework continues the actions defined by the Hyogo Framework for Action, establishing guidelines for local governments to invest in developing the resilience of cities.

The four priorities of the Sendai Framework are: (i) understanding disaster risk, (ii) strengthening disaster risk governance in order to manage it, (iii) investing in disaster risk reduction for resilience, (iv) increasing disaster preparedness in order to respond effectively and be efficient in recovery, rehabilitation and reconstruction.

---

<sup>29</sup> This is a document required under IFAD's SECAP for project preparation.

Disaster and climate change risk management must involve instruments that help predict emergency situations, prevent emergency situations, mitigate and respond to emergency situations and continuously monitor them.

The risks identified in the AASE for the Project refer to the following, according to the situation of the project and the area of insertion:

- Flooding;
- Mass slippage;
- Droughts;
- Rain;
- Forest fires.

These risks are linked to certain environments, climatic seasons and regions in the state of Paraíba, as in the case of droughts (more significant in the semi-arid region) or landslides (characteristic of mountainous areas with high slopes).

To this end, risk management must include a Risk Analysis and Prioritization (RAP) covering disaster risk management actions, emergency response and contingency actions, monitoring of subproject areas, preventive actions and corrective actions.

The following are guidelines for preparing these instruments.

### **Risk Analysis and Prioritization**

---

Considering the knowledge base presented by the IDB (2019), the Disaster and Climate Change Risk Analysis (DRA) addresses the disaster and climate change risk assessment for the Project based on the analysis of 3 (three) components or basic risk factors:

- **Threat:** Refers to phenomena of natural origin that pose a threat to the population or property and can therefore cause damage, economic loss, injury and loss of life. In other words, it is the danger itself, i.e. the type of event that can cause damage and destruction;
- **Exposure:** This refers to the spatial and temporal coincidence of people or goods (physical and environmental) and natural hazards. The exposure component therefore considers communities, assets, services or populations located in the area of influence of natural hazards exposed to threats and with the potential for damage;
- **Vulnerability:** Refers to how susceptible an entity is to being harmed or damaged. In the case of assets, systems and people, it is their intrinsic, internal, individual and combined characteristics that make them susceptible (or, conversely, resistant) by nature to suffering recurring damage from a threat.

Vulnerability is defined in terms of the potential to be affected by natural hazards alone.

Therefore, in the context of ARD development, disaster risk and climate change comprise the result of the coexistence of a threat (influenced by slowly and rapidly evolving threats of climate change, if applicable) and an asset (infrastructure, equipment, etc.) or a population (homes, businesses, etc.) that are not only exposed to this risk, but are also vulnerable to being harmed by it.

The ARD considers the preliminary assessment of geological risks such as mass movements (landslides) and hydro-meteorological risks such as floods and droughts.

As far as possible, the ARD should collect all information from studies, projects and official documents in the Project's area of influence relating to disaster risk and climate change.

A wide variety of studies and technical documents should be used as a database for the Project's Disaster and Climate Change Analysis (DCA). All these materials, together with stakeholder interviews, subsidize the construction of the Project's risk baseline from which the potential risks and expected impacts for each of the projects to be carried out are assessed.

This collection of information also reflects, if recorded, how and to what extent risk reduction and management measures have already been incorporated into PROCASE II sub-projects. This information contributes to composing the scenario for evaluating and identifying possible deficiencies and proposing structural and/or non-structural measures, especially in the field of developing this Disaster Risk Management Plan (PGRD).

Based on baseline data compiled from the region where the projects are located, field studies and interviews with local actors, the main threats that could cause disasters and damage to the projects and their environments:

- Rising temperatures and heat waves;
- Tropical storms, including situations of heavy rain or strong winds;
- Flooding
- Droughts;
- Landslides;
- Fires;

In the risk assessment developed at ARD, a methodological approach is considered which incorporates, for each threat, the analysis of 8 assessment attributes, which are listed below:

- Magnitude or geographical extent of the damage;
- Frequency of occurrence;
- Effects of climate change;
- Impacts on infrastructure operations and projects;
- Impacts on workers;
- Impacts on surrounding communities (or business impact);
- Impacts on the environment;
- Effects of project implementation.

From the application of the methodology described, the prioritization of the Project's threats should be achieved according to the final result of the qualitative risk analysis.

The implementation of the project's risk management and control measures must take into account the important criteria obtained through the qualitative risk analysis, with the aim of prioritizing threats that pose a high and moderate risk to projects.

## Procedures and guidelines for the Disaster and Climate Change Risk Management Plan

---

This section presents procedures and guidelines for the construction of the Disaster and Climate Change Risk Management Plan, with the aim of guiding decision-making on the subject of risk management in the different phases of project implementation.

The PGRD should be considered a fundamental instrument for implementation by the borrower. This plan is a practical tool that provides organization and guidance for the evaluation of strategies and measures (structural and non-structural) aimed at the prevention and contingency of risks associated with disasters and climate change in a broader spatial and social context that includes not only communities potentially affected by the projects, but also the public bodies and authorities involved in risk management.

As with the risk assessment matrix, presented in the context of the risk analysis (ARD), the preparation of the Risk Management Plan (RMP) also considers the preparation of a single instrument covering the Project as a whole.

The Risk Management Plan must be organized according to the following structure:

- **Threat-Objective:** Indicates the threat to which the strategy of the proposed approach and action measures refers. There may be strategies and measures that have a broader scope of action, with the aim of controlling/containing more than one threat at the same time.
- **Risk Summary for the Project:** This field contains a summary of the risk assessment carried out under the ARD, highlighting the main points that led to the risk rating assigned to each of the threats.
- **General Measures and/or Resilience Actions:** Describes the general strategy/approach proposed to manage and control the risks associated with a given threat or set of threats and details the concrete measures and actions that should support the implementation of the proposed strategy/approach.
- **Typology:** Defines the type of strategies and control measures that are proposed for a given threat or set of threats. Basically, the strategies are expected to be:
  - **Structural:** including engineering measures that involve the actual execution of works and the application of physical control devices, such as the implementation of drainage structures, the containment of slopes, the structural reinforcement of buildings, etc.
  - **Non-structural:** include measures related to the implementation of systems, programs and lines of action and contingency for the management of identified risks. This group also includes actions that highlight the participation of stakeholders, the community in the project area, institutional coordination, training of workers and decision-makers.
- **Implementation Period:** Refers to the estimated time for the implementation of a given measure, which can be:
  - Short term: up to 6 months;
  - Medium term: 6 months to 2 years;
  - Long term: from 2 years.
- **Implementation Stage:** This refers to the stage at which the strategies and measures envisaged in the project horizon are expected to be implemented: planning, execution (or construction) and operation.

- Accountability and stakeholder participation: Identifies the roles and responsibilities for implementing the proposed strategies and measures, as well as preliminarily pointing out the need to contract external support, the participation of relevant stakeholders and/or institutional coordination with entities that can contribute to the desired objective.
- Follow-up and Monitoring: Describes the approach to be planned for the follow-up, supervision and monitoring of the proposed control strategies and measures.

### **Disaster Risk Monitoring System**

---

A Risk Management and Monitoring System must be developed and implemented with the aim of assisting the Risk Management teams in the areas where the PROCASE II Subprojects or set of Subprojects are being implemented.

This tool must make it possible to map, monitor, inform, alert, control, prepare and finally propose solutions to the identified risk.

#### **Early warning system**

The early warning system should work in conjunction with the actions and tools made available by institutions and bodies working on the issue of combating disasters, such as the Civil Defense of the State of Paraíba and the Secretariat for Infrastructure and Water Resources (SEIRHMA), sharing the monitoring of risks and the systematization of data and information essential for Risk and Disaster Management.

SEIRHMA already has an alert system with the following services available that could be part of the PROCASE II monitoring system:

- Website with the system accessible to all citizens;
- Information system with weather forecast mapping, rainfall, reservoir volume and meteorological data;
- System for sending civil defense alerts via SMS;
- Disaster action plan;
- Safe meeting points and escape routes;
- Emergency call-outs in case of need (fire department, police, SAMU, environmental crimes, missing persons registration);
- Emergency kits.

### **Risk Management and Emergency and Disaster Response Preparedness**

---

Bearing in mind that the execution of the Subprojects may be paralyzed during periods of extreme weather events, the risk "*delay in the execution of projects due to climatic factors*" is identified, which could hypothetically be classified with a low probability and medium impact, resulting in a low level of risk and thus not requiring a contingency or mitigation plan according to the risk management procedure, in which case only management and monitoring actions are required.

The applicable controls involve observing a rainfall period according to the historical record in the Subproject execution schedule in order to identify unproductive periods above the historical record for the same period.

A geological risk analysis must be carried out on the sites prospected for the implementation of projects that present environments with associated risks. If the result

of the risk analysis and the defined subproject alternative indicate the need, a specific procedure should be drawn up for monitoring the stability of slopes and structures during the installation and operation phases.

The objectives of risk management and emergency response preparation may involve:

- Prevent or control operational emergencies, disasters or possible accidents that may occur during the implementation and operation of the Subprojects;
- establish measures to respond in a timely, efficient manner and with the necessary resources to fires, accidents, disasters, attacks and any other emergency that may arise;
- prevent the consequences of a major event (fire, spillage of dangerous products) from resulting in damage to life and human resources; and
- control and monitor the Subproject's equipment and facilities during the implementation phase through periodic inspections.

For the operation of emergency responses, it is suggested that a Contingency Plan be prepared, proposing to typify three levels of emergency and whose quality of response is appropriate to the seriousness of the situation:

- Grade 1 emergencies: these are emergencies that affect only one area of operation and can be controlled with the resources of that area;
- Grade 2 emergencies: these are emergencies which, by their nature, always require other resources from other areas, which will be activated automatically;
- Grade 3 emergencies: these are emergencies that, due to their characteristics, magnitude and implications, require immediate, massive and total intervention by internal and external resources.

The Contingency Plan proposes the development of activities and actions that coincide with the Labor Management Plan (PGL) established in this PGASE/ESMF.

The contingency plan must include the following specific information:

- Emergency procedures;
- Communication procedures;
- Organization of the emergency committee;
- Actions to respond to accidents at work, fire and explosions; and
- Actions to respond to disasters (floods, landslides, etc.)
- Risk management measures in the event of flooding
- Risk management measures in the event of a landslide
- Management measures in case of risk of droughts and fires
- Meeting point and warning devices in case of emergency;
- Identification of external stakeholders (civil defense, environmental agencies, hospitals, health workers, community leaders);
- Definition of emergency kits;
- Systematic training and simulations

In the event of a crisis in emergency and disaster situations, a management report should be generated for the purposes of monitoring and continuous improvement of processes, containing:

- Description of the occurrence and its relation to the works;
- Description of problems and concerns;
- Delimitation of the affected area and the area at risk of being affected;
- Time of occurrence before assistance;
- Time taken to attend the incident;
- Damages reported;
- Response Actions;
- Replacement/Reconstruction/Reactivation actions for the affected processes.
- Calling in internal and external teams and authorities;
- Monitoring results;
- Critical Analysis and Continuous Improvement.

In Annex 7.2a re some examples of procedures for common types of incidents and accidents in similar sub-projects. These procedures can be converted into action sheets - including examples and illustrative drawings - so that the teams have easy access to the information, considering the appropriate adaptations to be made as a contribution to the PROCASE II PGRD to be developed.

## 5.4 Waste Management Program

The Waste Management Program is divided into Construction Waste (to be applied mainly during the construction phases) and Agricultural Production and Processing Waste, to deal with specific waste.

**Responsible:** TA will be responsible for implementing and monitoring the waste management actions to be carried out by the construction companies, under the supervision of the PMU. TA will also be responsible for monitoring whether there has been a reduction in the use of pesticides in the areas where the Subprojects are being implemented.

### 5.4.1 Construction Waste

Construction waste(RCC) will be generated mainly during the construction of the Project, from the construction of the new infrastructures and from soil handling in the excavation and earthmoving activities.

Due to the specific nature of waste, construction is a potentially environmentally degrading activity. Construction waste management is essential to ensure that this waste is properly disposed of, with a view to using the resources used in construction and adopting more sustainable practices.

Excavation and earthmoving work will generate solid waste of various kinds. Construction also produces construction waste, which must be disposed of in a planned manner.

It is therefore necessary to implement a program that can properly manage this waste, avoiding environmental impacts due to the improper disposal of these materials.

## Objective

---

The aim of this program is to define criteria and establish minimum guidelines for the management of construction waste, which forms a volume of surplus and disposable material.

The specific objective is to define criteria for optimizing, reducing, reusing, storing, handling, transporting, treating and disposing of waste, with a view to better management and less impact on this material.

With the aim of reducing the generation of construction waste, CONAMA Resolution No. 307 of 2002 states that generators should aim first and foremost at not generating construction waste (RCC) and, in order of priority, at reducing, reusing, recycling, treating waste and the environmentally appropriate final disposal of rejects. As such, construction waste may not be disposed of in urban solid waste landfills, in dumping grounds, on slopes, bodies of water, vacant lots<sup>30</sup> or in areas protected by law.

## Procedures and Guidelines

---

Follow the recommendations of the ABNT NBRs:

- 10.004 - Classification of Solid Waste
- 10.005 - Waste leaching procedures
- 10.006 - Waste solubilization procedures
- 10.007 - Waste sampling procedures

Waste treatment measures must take into account:

- Establish waste management priorities from the outset of activities based on an understanding of the potential environmental, health and safety risks and impacts, and taking into account the generation of waste and its consequences;
- Establish a waste management hierarchy that includes: prevention, reduction, reuse, recovery, recycling, removal and finally waste disposal;
- Avoiding or minimizing the generation of waste, as far as possible, where the generation of waste cannot be avoided, but recovering and reusing waste;
- When the waste cannot be recovered or reused, treat, destroy and dispose of it in an environmentally sustainable way.

## Scope/Activities

A Construction Waste Management Plan (PGRCC) must be developed for each project or set of projects. This PGRCC must be drawn up by the construction company with the support of TA, following the roadmap in which it must describe the actions relating to the characterization, handling, segregation, packaging, identification, storage, collection, internal and external transport, treatment and final disposal of all waste generated during the execution of the work, as well as the training of those involved in the execution of the plan. The PGRCC must follow at least CONAMA Resolutions 307/02, 348/04, 431/11, 448/12, 469/15, with the respective ART. The construction contractor must present a technical manager who will implement the PGRCC.

---

<sup>30</sup> Except in cases where there is an earthworks permit and authorization from the owner.

The PGRCC must also include:

- The possibility of replacing raw materials or inputs with less hazardous products or toxic materials, or with those where processing generates lower volumes of waste;
- The application of manufacturing processes that convert materials efficiently, providing higher product output yields, including the modification of production process design, operating conditions and process controls;
- Establishment of good cleaning and operating practices, including stock control to reduce the amount of waste resulting from outdated, off-specification, contaminated, damaged or excess materials needed by the plant;
- Institution of procurement measures that recognize opportunities to return usable materials, such as containers, and that prevent excessive ordering of materials;
- Minimizing the generation of hazardous waste by implementing strict waste segregation to avoid mixing non-hazardous and hazardous waste to be managed;
- Recycling and Reuse:
  - Evaluation of waste production processes and identification of potentially recyclable materials;
  - Reuse of quality soils removed from construction sites, carrying out management that reduces the generation of residual soils from excavation and earthmoving processes;
  - Identification and recycling of products that can be reintroduced into the manufacturing process or industry and activity on site;
  - Investigation of external markets for recycling by third parties and industrial processing operations located in the neighborhood or region of the installation (e.g. waste exchange);
  - Establish recycling targets and formal tracking of waste generation and recycling rates;
  - Training and incentives for employees to meet objectives.
- Treatment and disposal:
  - If waste is still generated after the implementation of feasible waste prevention, reduction, reuse, recovery and recycling measures, the waste must be treated and disposed of and all measures must be taken to avoid potential impacts on human health and the environment. The management approaches selected must be consistent with the characteristics of the waste and local regulations, and may include one or more of the following strategies:
    - On-site or off-site biological, chemical or physical;
    - Treatment of waste material to make it non-hazardous before final disposal;
    - Treatment or disposal in permitted facilities specially designed to receive the waste. Examples include: composting operations for non-hazardous organic products, appropriately designed landfills or incinerators designed for the respective type of waste; or other methods known to be effective in the safe and final disposal of waste materials, such as bioremediation.
- Hazardous Waste Management:
  - Make a complete inventory of all harmful materials used in the project that includes an assessment of the types of materials and their potential risks to human health or the environment;

- Always separate from non-hazardous items;
- If the generation of hazardous waste cannot be avoided, its management must focus on preventing damage to health, safety and the environment, in accordance with the following principles: Understand the potential impacts and risks associated with managing any risks generated throughout its life cycle; Ensure that contractors handling, treating and disposing of hazardous waste are legitimate reputable companies, licensed by agencies and following good industry practice for the waste being handled; Ensure compliance with local standards and international regulations;
- Waste storage: Hazardous waste must be stored in such a way as to prevent or control accidental releases to air, soil and water resources in an area where:
- Waste is stored in such a way as to avoid mixing or contact between incompatible wastes, and allows inspection between containers to monitor leaks or spills. Examples include sufficient space between incompatibles or physical separation with containment walls or curbs
- Store in closed containers away from direct sunlight, wind and rain;
- Secondary containment systems must be built with appropriate materials so that the waste being contained is not lost to the environment;
- Secondary containment must be implemented where liquid waste is stored in volumes greater than 220 liters. The available volume of secondary containment must be at least 110 percent greater than the waste stored, or 25 percent of the total storage capacity (whichever is greater), at that specific site;
- Provide adequate ventilation where volatile waste is stored;
- Special management actions, conducted by employees who have received specific training in handling and storing hazardous waste, including: Providing readily available information on chemical products, including labeling each container to identify its contents;
- Limit access to hazardous waste storage areas to employees who have received appropriate training;
- Providing workers with Personal Protective Equipment (PPE) to limit exposure to toxic materials;
- Clearly identify (label) and demarcate the area, including documenting its location on a facility map or site plan;
- Carrying out periodic inspections of waste storage areas and documenting the findings;
- Prepare and implement spill response and emergency plans to deal with accidental spills, and include the preparation of incident and accident reports;
- Avoid underground storage tanks and hazardous waste pipelines;
- Comply with the protocols for transportation and disposal/treatment for the proper handling of the respective materials by all those involved in the Project who handle such materials.

The implementation and execution of the approved PGRCC will be the responsibility of the contractor, with due supervision by the PMU team, and must be evidenced by reports on the execution of the PGRCC and the Construction Waste Inventory, environmental licenses for transportation and disposal, including the ART of the person responsible for the execution of the PGRCC.

The activities provided for in this Program and which must be included in the PGRCC are:

- Waste identification, segregation and characterization;
- Waste Quantification/Inventory;
- Sampling;
- Classification;
- Determining the alternative destination, treatment, reuse, reprocessing, recycling and disposal;
- Waste valuation;
- Supplier evaluation;
- Handling and Transportation.

The waste generated must be classified into one of the categories described below:

**Class A:**

Waste that can be reused or recycled as aggregates, such as:

- Construction, demolition, renovation and repair of paving and other infrastructure works, including earthworks;
- Construction, demolition, renovation and repair of buildings: ceramic components (bricks, blocks, tiles, cladding panels, etc.), mortar and concrete;
- The process of manufacturing and/or demolishing precast concrete parts (blocks, pipes, curbs, etc.) produced on construction sites.

**Class B:**

This is waste that can be recycled for other uses, such as plastics, paper, cardboard, metals, glass, wood and plaster.

**Class C:**

This is waste for which no economically viable technologies or applications have been developed that would allow it to be recycled or recovered.

**Class D:**

Hazardous waste comes from the construction process, such as paints, solvents, oils and others, or those contaminated or harmful to health from demolitions, renovations and repairs to radiology clinics, industrial facilities and others, as well as roof tiles and other objects and materials containing asbestos or other products harmful to health.

**Segregation/Sorting**

Among these activities, waste must be sorted into different classes, and which waste requires exclusive separation. Segregation is essential because it facilitates the subsequent stages, considering that this work is carried out directly at the source of generation, removing the need for subsequent, possibly more costly segregation. It also saves time when sending waste for treatment and final disposal.

Class A waste should be segregated from the rest. As for Class B waste, it is suggested that it be separated by type of waste, given the possible need for different companies to

be responsible for treatment and final disposal, especially gypsum, which was initially categorized as Class C waste, but given the publication of CONAMA Resolution No. 431 of 2011, is now part of Class B.

Unfortunately, CONAMA Resolution 307 of 2002 does not give examples of Class C waste, but it is assumed that brushes, unused sandpaper and glass wool waste fall under this description. It is therefore suggested that such waste be segregated from the rest.

Class D hazardous waste, due to its characteristics of flammability, corrosivity, reactivity, toxicity, pathogenicity, carcinogenicity, teratogenicity and mutagenicity, presents a significant risk to public health or environmental quality, according to Law No. 12.305 of August 2, 2010 and ABNT NBR 10004:2004 (ABNT, 2004). Due to these characteristics, this waste must be separated from non-hazardous waste in order to avoid contamination, as well as so that processes such as recycling and eventual reuse are not compromised.

### ***Packaging***

Packaging must ensure that waste is separated as planned in the segregation stage, as well as facilitating transportation from the construction site to treatment and final disposal. The devices defined for packaging must be compatible with the type and quantity of waste, with the aim of preventing accidents, the proliferation of vectors, minimizing odors, loading.

Plastic bags of varying sizes should be used in different garbage cans for each type of waste. These devices should be used to store Class B waste (paper, plastic and light materials such as uniforms, gloves and boots). The storage area must be covered.

Mobile or fixed bays with partitions for temporary storage should be used for Class B, C and D waste.

Stationary skips with a capacity of around 5 m<sup>3</sup> are suitable for packaging waste such as Class A waste, as well as wood, which is classified as Class B waste. They must be removed from the site by dump trucks.

In areas where domestic waste is generated (Class B), the use of common waste garbage cans is recommended.

### ***Transportation***

The transport stage involves removing waste from its place of origin to transfer stations, treatment centers or directly to its destination. It is important to implement transport logistics for fixed construction sites, providing adequate access, timetables and control of the entry and exit of the vehicles that will remove the properly packaged waste, in order to combat the excessive accumulation of waste and improve local organization.

Transport companies must have an environmental license for this specific activity and all transportation of materials must be documented, with tracking of the origin, destination, type and quantity of materials.

### ***Treatment and disposal***

The waste treatment stage involves actions designed to reduce the quantity or polluting potential of solid waste, either by preventing the disposal of waste in an inappropriate place or by transforming it into inert or biologically stable material.

Given the priorities, when the treatment alternatives for reuse and recycling have been verified and finally result in tailings, they must be disposed of.

An essential premise is that any company providing services that is involved in this process of treatment and final disposal of waste from the Project must present all the appropriate and valid documentation for the activity, such as environmental licensing and the appropriate authorizations to operate the proposed solution.

Waste must be treated according to its classification:

- Class A

Cement, mortar and ceramic component waste must be sent to transshipment and sorting areas for construction waste and bulky waste if it is to be reused. This is where the segregated materials are sorted, temporarily stored, transformed or removed for proper disposal. They can also be sent to Class A waste landfills to reserve material for future use.

In the case of soil removal, preference should be given to using it on the site itself. If this is not possible, the soil can be reused in the recovery of contaminated soils, landfills and earthworks of abandoned quarries, used in works that require landfill material, or even sent to Class A waste landfills.

- Class B

Waste such as metal, plastic, paper, cardboard and glass should be sent to recycling plants. As for wood, you should check whether it is possible to reuse the pieces, even if they have been damaged, by cutting them up properly so that they can be used elsewhere. If it is not possible to use them on site, the wood, free of contaminants such as paints and varnishes, can be used to generate energy or as a raw material for other civil works.

- Class C

Class C waste cannot be recycled or recovered. It must therefore be sent to industrial landfills for non-hazardous and non-inert waste.

- Class D

Hazardous waste must be sent to industrial landfills, which have the technology to minimize the environmental damage caused by liabilities.

### **Sampling**

Sampling solid waste is an operation of fundamental importance, because the result of an analysis carried out on the sample is only of value if that portion of the waste taken for analysis represents as accurately as possible the composition and properties of the whole it represents.

Sampling is important in order to have a precise and adequate classification of the waste, especially to be sure of those defined as class I by NBR 10.004 (Hazardous Waste).

Sampling should be carried out as soon as the waste is generated, and for waste stored in the open air it should be collected at a depth of more than 15cm.

#### **5.4.2 Agricultural Production and Processing Waste**

Agricultural production and processing has a particular set of waste products that need specific management - there are products that are considered hazardous (pesticides or *manipueira*, which comes from the pressing of cassava dough in flour mills). There is also waste that can be recycled and should therefore be disposed of (for example, plastics, packaging for non-hazardous products, among others), and finally organic waste (peelings, pomace, pruning waste, among others).

## **Objective**

---

The aim of this program is to define criteria and establish minimum guidelines for waste management activities in Agricultural Production and Processing.

The specific objective is to define criteria for optimizing, reducing, reusing, storing, handling, transporting, treating and disposing of waste, with a view to better management and less impact on this material.

## **Procedures and Guidelines**

---

- It is important to segregate waste in kitchens and processing areas, for example by not combining organic waste with material that can be recycled (plastics, long-life packaging, etc.).
- Alternatives for production waste should be considered, including the use, where possible, of leftover stalks and peels for preparing dishes and food.
- For organic material that cannot be reused in the units, sustainable options should be considered, such as animal feed, fertilizers, natural pesticides, among others.
- It is important for TA to show communities the viable alternatives for disposing of waste properly, depending on its nature.

## **Hazardous Waste**

The main dangerous products are related to the pesticides that may be used. The sub-project will aim to reduce the use of these products by introducing agro-ecological practices, with a view to transition and replacement with natural inputs, although this process will be gradual.

Therefore, monitoring should be carried out to verify the effectiveness of reducing the use of this type of input in production. Monitoring should include indicators, interviews and photographic records that show the effectiveness of actions to combat the use of pesticides and chemical pesticides in the investment areas.

- In the case of Subprojects involving processes that generate *manipueira*, the following issues must be observed:
  - Manipueira should not be directed to collective or individual sewage treatment systems;
  - Disposal should not be directly into rivers, lakes or bare earth;
  - A Manipueira biodigestion process should be used, which could also provide natural gas;
  - Techniques involving the appropriate use of manipueira as an agricultural pesticide can also be used.

## **Production waste**

ATER should train rural producers and monitor the actions taken to manage production waste. To this end, the following guidelines should be adopted when training beneficiaries and monitored:

- It is important to segregate waste in kitchens and processing areas, for example by not combining organic waste with material that can be recycled (plastics, long-life packaging, etc.).

- Alternatives for production waste should be considered, including the use, where possible, of leftover stalks and peels for preparing dishes and food.
- For organic material that cannot be reused in the units, sustainable options should be considered, such as animal feed, fertilizer (compost), natural pesticides, among others.
- It is important for TA to show communities the viable alternatives for disposing of waste properly, depending on its nature.

It should be noted that all monitoring must gather evidence to support the respective report to be sent to the PMU, including indicators, photographic records, inspection forms, among others.

## 5.5 Water and Effluent Quality Monitoring Program

This program focuses on the collection and evaluation of water and effluent samples from water collection systems and the quality of effluents treated by the systems in place. It also includes monitoring the quality of water resources in the area of influence of civil works to ensure that there is no impact from construction activities locally.

**Responsible: TA**, together with the construction companies, will be responsible for monitoring water and effluent quality under the supervision of the PMU.

### Objective

---

The aim of this program is to guarantee the natural and healthy conditions of the aquatic environment of water resources, in order to observe possible influences caused or pre-existing in springs and aquifers, foreseeing possible needs for actions that guarantee the quality of the environment, the water supply and the treated sanitary effluent.

The quality of the water in the catchment, the quality of the treated water, the quality of the effluent discharged and the situation of the spring or surrounding environment where the effluent is discharged or drained should be monitored.

### Procedures and guidelines

---

#### ***Monitoring the Quality of Water for Public Supply***

The reference for the quality standard will be the maximum levels defined by CONAMA Resolution 357/2005 and CONAMA 430/2011 for class 2 fresh waters, i.e. those that can be used in this way:

- Class 2:
  - Supply for human consumption, after conventional treatment;
  - The protection of aquatic communities;
  - Primary contact recreation, such as swimming, water skiing and diving, according to CONAMA Resolution 274 of 2000;
  - The irrigation of vegetables, fruit plants and parks, gardens, sports and leisure fields, with which the public may come into direct contact; and
  - Aquaculture and fishing.

In addition to the local parameter, verification analysis should also be carried out on the IFC parameters, as presented above.

We also suggest considering the use of a system (automated or not) to monitor the collection points. The system should be able to display well data ranging from basic information such as its location (georeferenced map), name, as well as more complex information such as flow rate, results of physical and chemical analysis, geological and construction profile, digitized construction report, scaling, pumping test and aquifer test (in the case of wells).

The suggested system should be used to monitor the water supply, including pyrometry and macro-measurement. This system should provide information on the measurement of flow, pressure, time of measurement, etc.

These systems should provide subsidies for monitoring surface water quality.

### ***Monitoring the Quality of Basins in the Sewage Release Area***

In order to comply with good practices and international standards, the water quality conditions defined for the classes in Section II of Conama 357/2005 (and its amendment No. 397/2008) and CONAMA 430/2011 will be taken as a basis, considering the coliform parameters in accordance with CONAMA 274/2000.

The measurement of the physical-chemical-bacteriological parameters of the water must be carried out by a specialized analytical laboratory that has all the equipment necessary to carry out the tests, duly certified by INMETRO (National Institute of Metrology, Standardization and Industrial Quality - parameters in table 2), or recognized by the competent environmental agency.

Samples must be collected, preserved and analyzed in accordance with the technical standards established by ABNT NBR 9898/1987 and the *Standard Methods For The Examination Of Water and Wastewater* (APHA, 1995). The reports issued by the laboratory must contain a technical analysis of the results, showing the behavior of the parameters measured and their implications for the quality of the environment, always comparing them to the baseline results (first analyses), which will be determined before the interventions begin and at least during the recommended periods.

It will be the responsibility of the relevant sector to publish the results and draw up and publicize an annual Water Quality Report for the Project, which clearly indicates the evolution of the indicators measured throughout the execution of the Subproject, correlating their positive and negative variations to verified or probable causes, whether or not associated with the works and systems implemented. The report should contain recommendations/conclusions that allow those involved in the socio-environmental management of the Subproject to plan actions aimed at minimizing adverse impacts and boosting positive impacts.

Monitoring should be carried out periodically (monthly, quarterly, biannually, to be defined) through strategically placed points in the communities. The person responsible for providing the results of this monitoring will be TA and the measurement parameters will be as follows: Hydrogen Potential - pH, Water Temperature (°C), Electrical Conductivity, Turbidity, Hardness, Total Nitrogen, Thermotolerant Coliforms, Biochemical Oxygen Demand - BOD, Chemical Oxygen Demand - COD, Total Phosphorus.

A baseline should be built for this monitoring, checking the *ex-ante* and *ex-post* situation in order to verify the evolution of improvements in the quality of the water body and the basin and to identify possible emergencies due to sewage contamination in the surrounding environments.

## 5.6 Biodiversity Management, Protection and Restoration Plan

A Natural Habitats Management and Restoration Programme is required when there is a risk of impact on "modified habitats", "natural habitats" and "critical habitats", together with "legally protected areas and internationally and regionally recognized areas of biodiversity value", which may include habitats in any of these categories. This situation requires a differentiated risk management strategy for habitats, based on their values and susceptibility. It also takes into account the existence of ecosystem services.

**Responsible:** TA will be responsible for implementing management, protection and restoration actions, as appropriate, under the supervision of the PMU.

According to the results of the Strategic Social and Environmental Assessment (AASE), there is a risk of affecting habitats of various kinds, although the exact definition and location of the PROCASE II subprojects is not known, which may or may not trigger this Plan depending on the design of each subproject and the constraints of its area of insertion.

This program provides for the necessary actions to deepen the biodiversity assessment studies in the field and specific actions to mitigate and compensate for natural habitats expected to be affected by the eventual suppression of vegetation for the implementation of infrastructure and, above all, in the recovery of areas provided for in the project's productive development plans.

### Objective

---

The aim of this Plan is to ensure that PROCASE II does not affect biodiversity by resulting in a net loss in areas of natural habitat and that it achieves net gains in those biodiversity values for which a critical habitat has been designated.

PROCASE II sub-projects are not expected to be implemented within known critical habitats, but they may be planned in surrounding areas, close to these habitats, making it important to implement measures to avoid indirect consequences for the sub-project in these areas, such as the cutting down of species, the advance of deforestation, etc. In some infrastructure deployment situations, there may be a need to cut down isolated native and protected species, requiring measures to avoid or, where this is not possible, compensate for these situations. This Plan is in line with the proposal of these guidelines, in order to achieve the project's objectives and in compliance with the IDB's PDAS6 of the MPAS.

### Procedures and Guidelines

---

With the aim of protecting and conserving habitats and the biodiversity they support, the mitigation hierarchy includes biodiversity offsets. Offsets will only be considered as a last resort, after technically and financially feasible prevention, minimization and restoration measures have been applied and residual adverse impacts remain.

All studies that result in the identification of risks and impacts should consider adopting a mitigation hierarchy, involving solutions that consider the hierarchy in the following order of priority: (i) prevention measures; (ii) minimization measures; (iii) rehabilitation measures; and (iv) compensation measures. It will be very important to monitor and follow up on the regeneration of SAF areas, and it is also important to note the risk of affecting isolated tree species for all structures involving civil works.

A biodiversity offset will be designed and implemented to achieve measurable, additional long-term conservation outcomes that are reasonably expected to result in no net loss and preferably a net gain for biodiversity. In the case of an offset used as mitigation for

residual adverse impacts on any area of critical habitat, a net gain is required. The design of a biodiversity offset should adhere to the "comparable or better" principle and will be carried out in accordance with International Good Industry Practice<sup>31</sup>.

**Criteria for Identifying Natural or Critical Habitats**

The identification of the existence of natural or critical habitats must take into account:

- habitat of significant importance for critically endangered, endangered, vulnerable or near threatened species;<sup>32</sup>
- habitat of significant importance for endemic and/or restricted-range species;
- habitat that supports globally significant concentrations of migratory species and/or congregational species;
- highly threatened and/or unique ecosystems;
- areas associated with the main evolutionary processes;<sup>33</sup>
- areas that are legally protected or internationally recognized as having high biodiversity value.

The following table provides a consolidation matrix of the criteria for determining critical habitats.

**Table 8 - Consolidation of critical habitat identification arguments<sup>34</sup>**

Criteria	Identification feature
<p><b>habitat of significant importance for critically endangered, endangered, vulnerable or near threatened species;</b></p>	<p><i>Trichechus manatus, Touit surdus, Myrmeciza ruficauda, Picumnus fulvescens, M. ruficauda</i> and <i>Xipholena atropurpurea, Iodopleura pipra, Alouatta guiba clansans</i> (White-winged Macaque), <i>Alouatta guiba clans</i> (White-winged Macaque), <i>Xipholena atropurpurea</i> (White-winged Macaque), <i>Iodopleura pipra</i> (White-winged Macaque) <i>ruficauda and Xipholena atropurpurea</i> (white-winged anambee), <i>Iodopleura pipra</i> (little anambee), <i>Alouatta</i></p>

<sup>31</sup> Good International Industry Practice (GIP) is defined as the exercise of professionalism, diligence, care and foresight that can reasonably be expected of qualified and experienced professionals carrying out the same type of activity, under identical or similar circumstances, at a global or regional level. The outcome of this exercise should result in the project using the technologies best suited to the specific circumstances of the project (Assessment and Management of Social and Environmental Risks and Impacts: World Bank Environmental and Social Framework, 2017).

<sup>32</sup> As listed in the International Union for Conservation of Nature (IUCN) Red List of Threatened Species. The determination of critical habitat based on other listings is as follows: (i) if the species is listed nationally/regionally as threatened or critically endangered, in countries that have adhered to the IUCN guidelines, the determination of critical habitat will be made on a project by project basis in consultation with competent professionals; and (ii) in cases where the categorizations of nationally or regionally listed species do not correspond well to those of the IUCN (for example, some countries list species as generally "protected" or "restricted"), an assessment will be carried out to determine the justification and purpose of the listing. In this case, the critical habitat determination will be based on this assessment.

<sup>33</sup> This can include reserves that meet the criteria of IUCN Protected Area Management Category I to VI; World Heritage Sites designated by natural or mixed criteria, areas protected by the RAMSAR Convention on wetlands; World Biosphere Reserve core areas; areas on the UN Lists of National Parks and Protected Areas; sites listed in the World Database of Key Biodiversity Areas; and other sites that meet the requirements of the IUCN Global Standards for the Identification of Key Biodiversity Areas 2016.

<sup>34</sup> These characteristics constitute an example of completion in the identification of critical habitat and are sourced from the results of the Project's AASE.

	<i>guariba clamitans</i> (Guariba monkey); <i>Euphractus sexcinctus</i> (armadillo).
<b>habitat of significant importance for endemic and/or restricted-range species;</b>	-
<b>habitat that supports globally significant concentrations of migratory species and/or congregational species;</b>	<i>Picumnus fulvescens</i> (Tawny Piculet), <i>Crypturellus noctivagus</i> (Yellow-legged Tinamou), <i>Touit surdus</i> (Golden-tailed Parrot), <i>Carduelis yarrellii</i> (Yellow-faced Siskin), <i>Xipholena atropurpurea</i> (White-winged Cotinga), <i>Myrmeciza ruficauda</i>   (Scallop Anthill)
<b>highly threatened and/or unique ecosystems;</b>	-
<b>areas associated with the main evolutionary processes;</b>	-
<b>areas that are legally protected or internationally recognized as having high biodiversity value.</b>	Biological Reserve, Area of Ecological Interest, KBA, native formations of the Atlantic Forest and mangroves.

Note: Critical Habitat should only be considered if there is a direct impact or risk of impacts arising from the actions of the Subproject or its consequences.

Source: AASE PROCASE II, 2024

If a Natural or Critical Habitat is identified, the susceptibility to impacts from the implementation/operation of the Subproject must be assessed, according to the results to be demonstrated in the Subproject's ESIA. Should this situation arise, a Biodiversity Action and Management Plan should be drawn up, in accordance with the following guidelines.

### **Biodiversity Action and Management Plan**

The analyses carried out in the AASE resulted in the identification of risks of disturbance in areas of modified or natural habitats. Such habitats can represent the presence of natural environments, which is rarer in areas that are already anthropized, and so-called modified habitats, which are areas that may contain a large proportion of plants and/or animal species of non-native origin, and/or where human activity has substantially modified the territory's primary ecological functions and species composition.

Modified habitats can include, for example, areas managed for agriculture, forest plantations, coastal zones and reclaimed wetlands. Apps of rivers that have suffered human intervention and are de-characterized can be characterized as modified habitats, which is closely related to the mitigation and compensation concerns and requirements of protection agencies.

On the other hand, natural habitats can be characterized as critical habitats, making it necessary to draw up BAPs. Given these definitions, it is important that PROCASE II focuses the selection of areas for project implementation on places where the environment has already been modified by human action, thus avoiding the need to implement related measures.

In the event of a risk of affecting Natural or Critical Habitats, the borrower must take the following measures to mitigate and/or compensate for activities related to the Subproject that impact or may impact such habitats, measures to be carried out in the phase preceding the implementation of the Subprojects:

- a) carrying out a study to evaluate viable alternatives from a technical and financial point of view for the design of the project in the affected areas, which will lead to a reduction or, whenever possible, no suppression of vegetation or risks of occurrence, prioritizing the preservation of endemic species or species of symbolic or cultural value;

- b) evaluation of ecosystem services, according to the methodological details presented below.
- c) in situations where suppression is unavoidable, drawing up a floristic inventory and, if necessary, a fauna study.
- d) verification and analysis of the presence of priority sites for conservation, according to international organizations (KBA, AZE, IBA, IPA, Ramsar, World Heritage sites, Biosphere Reserve)<sup>35</sup>
- e) Assessment of connectivity between habitats and ecological corridors, mainly to check for new corridors that can be promoted by restoring areas.
- f) Assessment of habitat vulnerability (desertification, continuous loss of vegetation cover, etc.)
- g) identification of areas of importance for animal reproduction and spawning;
- h) checking for the presence of endangered species and species on the International Union for Conservation of Nature (IUCN) red list.
- i) implementation of appropriate mitigation and compensation measures, based on a Biodiversity Compensation Management Plan.

### ***Evaluation of ecosystem services***

It is important to conceptualize that the environment is not only a source of natural resources for economic development, but also a provider of "free" services that feed the development process itself (CONSTANZA et al, 1997). The notion that ecosystems provide benefits to society is then conceptualized as ecosystem services (HASSAN et al, 2005).

The evaluation of ecosystem services must therefore work from the perspective that these are aspects of ecosystems used (actively or passively) to produce quality of life for a certain community (FISHER et al, 2009)<sup>36</sup>.

It is assumed that there are no services without beneficiaries, so there is only a service if there is a relationship with society, even indirectly. In other words, if there is no such relationship, there are only ecological processes in the area studied.

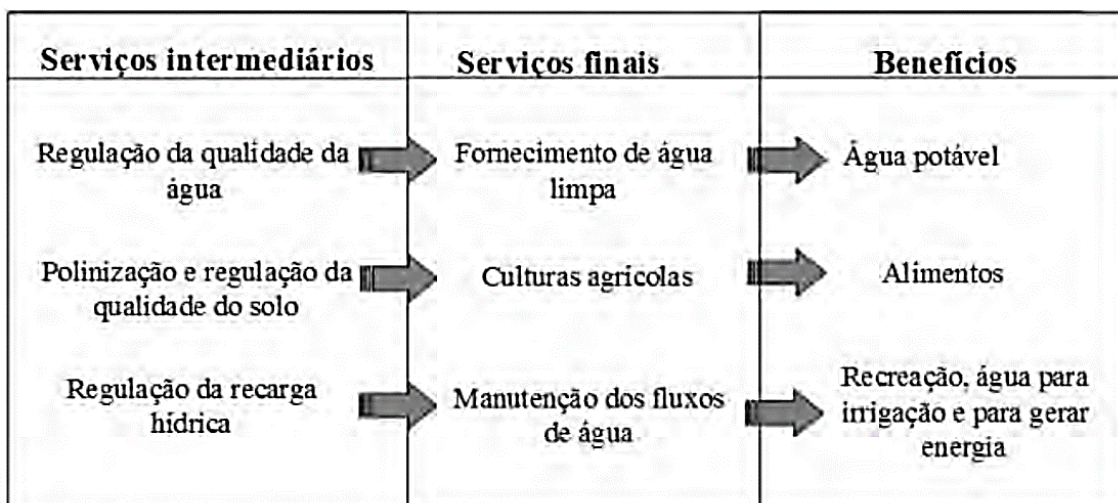

Evaluation must therefore take this concept into account. In summary, the following figure shows the chain of availability of natural resources for the benefit of the community with practical examples.

---

<sup>35</sup> KBA = Key Biodiversity Area; AZE = Alliance for Zero Extinction; IBA = Important Bird Areas; IPA = Important Plan Areas;

<sup>36</sup> BRENDAN FISHER, R. KERRY TURNER, PAUL MORLING. Defining and classifying ecosystem services for decision making. *Ecological Economics* 68, 2009. 643-653p.

**Figure 2 - Difference between intermediate and final ecosystem services**

Source: Adapted from Fisher et al (2009).

Thus, the first stage of the evaluation should involve a diagnosis that considers the identification and characterization of:

- Natural resources available in the area;
- Surrounding communities that can use the spaces economically or culturally, in an artisanal or traditional way.
- Correlation between the available resources and the economic and cultural practices of the communities should result in the identification of ecosystem services<sup>37</sup>.

The following stages of the study must then be carried out:

- Prioritization of relevant ecosystem services, with the following logic:
  - Approach according to project impacts and beneficiaries of ecosystem services<sup>38</sup>.

<sup>37</sup> In the case of SAF, it is understood that these correlations will be promoted.

<sup>38</sup> FLORENCE LANDSBERG, MERCEDES STICKLER, NORBERT HENNINGER AND JO TREWEEK. Weaving Ecosystem Services into Impact Assessment. Available at: <<https://www.wri.org/research/weaving-ecosystem-services-impact-assessment>>. Accessed on: October 10, 2021.

- Approach according to the project's operational risks

- The prioritization must present an assessment of the significance of the point of view:

- Technical experts who are developing the study;
- Communities' perspective, requiring consultation with this focal group of interested/affected parties.
- Definition of the scope and information needed to evaluate ecosystem services:
  - Ecosystem affected (including in the case of positive impacts);
  - Potentially impacted ecosystem service;
  - Potentially affected benefit;
  - Potentially affected beneficiary.
- Establishing benchmarks for prioritizing ecosystem services:
  - Ecosystem service;
  - Does the project have the potential to affect this S.E. (Systemic Service)?
  - This S.E. is important for the beneficiary's health, safety or way of life;
  - Is it possible to visualize spatial alternatives for accessing the S.E.?
  - Is S.E. a priority?
- Assessment of project impacts and dependencies on the priority of ecosystem services:
  - Priority ecosystem service;
  - Beneficiaries affected;
  - Project activity;
  - Impact on the ecosystem;
  - Impacts on beneficiaries.
- Mitigation of impacts and management of project dependencies in relation to prioritized ecosystem services:
  - What mitigations or compensations are proposed;
  - What is the community's choice among the mitigation and compensation options offered?
  - Definition of a monitoring program for both negative and positive risk situations (promotion of new ecosystem services).

### ***Compensatory Measure***

If vegetation is suppressed, this will be necessary:

- Define the need and proposal for compensation for the use of areas in natural or critical habitats, considering vegetation recovery in natural or modified habitats to be defined within the scope of the surveys and presented in the Biodiversity Compensation Management Plan;
- Compensation for ecosystem resources (to be defined in the Biodiversity Action and Management Plan).

### ***Minimum content of the Biodiversity Action and Management Plan - BAP***

The PAB must include the following elements:

- Scope and objectives.
- Legal framework.
- The relationship between the PAB and the environmental and social management system (SGAS) and the approach to other planned environmental and social action plans.
- Summary of project description and impacts.
- Summary of the biodiversity baseline and identification of the BAP targets.
- Actions to be taken to achieve the objectives, which may include in the case of negative affectation:
  - Preservation measures
  - Minimization measures
  - Restoration measures
  - Compensation measures
- Management and administration of the PAB.
- Monitoring, indicators and evaluation included in projects with a positive impact on the environment.
- Schedule and costs.

### **Measures to prevent invasive alien species**

The intentional or accidental introduction of exotic or non-native species of flora and fauna into areas where they are not normally found can pose a significant threat to biodiversity, as some exotic species can become invasive, spreading rapidly and destroying or negatively competing with native species.

PROCASE II has project proposals that involve the use of species that, although exotic to the biome, are species that have been adapted to the environment for many years, including being part of the dynamics and ecological function and local ecosystem services. This is the case with some forage species, such as the palm, for example, which, despite not being native to the Atlantic Forest or Caatinga biome, is fundamental to the entire ecological and agroforestry system found in the region where the project operates.

In this case, exotic species possibly considered for use must meet the following criteria:

- (i) have potential for the social, economic and cultural development of vulnerable or traditional rural communities;
- (ii) be a species fully adapted to the Atlantic Forest or Caatinga biome (species that are already widely used and that have accumulated knowledge about their interaction with native vegetation, this knowledge can be the practical knowledge of the families that produce and/or form the local agroforestry);
- (iii) not being an invasive or predatory species (species that can cause native species to take over territory, such as leucaena, which spreads very widely and quickly, suffocating the surrounding forest and reducing the capacity for local recovery and gene exchange);
- (iv) preferably those that play an ecological role in the recovery of the forest or soil (species that enable interaction with the surrounding vegetation, for example by acting as pioneers and providing protection for secondary

species of the Atlantic forest or that can serve as food for local fauna, without causing risks);

- (v) are not toxic to local insects, especially those that work in local pollination - with a focus on native bees.

The intentional introduction of new alien species (not currently established in the country or project region) will not be permitted, unless done in accordance with the existing regulatory framework for such introduction. Notwithstanding the above, deliberate introduction of exotic species that present a high risk of being invasive should not be allowed, regardless of whether such introductions are permitted in accordance with the regulatory framework. Any introduction of exotic species will be subject to a risk assessment (part of the Environmental and Social Assessment) to determine the invasive potential.

Measures should be implemented to prevent possible accidental or unintentional introductions, including the transportation of substrates and vectors (such as soil, ballast and plant materials) that could harbour invasive alien species.

When invasive alien species are already established in the region of the proposed project, the necessary procedures must be taken to prevent them from spreading to areas where they have not yet become established. Whenever possible, measures should be taken to eradicate such species from natural habitats where they have management control.

The best practices in the management and control of exotic species in the Subproject areas should be incorporated into the training courses for Rural Producers.

### **Monitoring the Actions Taken**

- A monitoring plan should be drawn up for reclaimed areas (e.g. app that have had intervention), in order to assess the impacts of possible changes in natural water dynamics.
- Annual reports on the monitoring of interventions in natural and modified habitats, with photographic records, must be submitted.
- An annual report on the monitoring of environmental compensation and recovery areas must be submitted. Increases in new compensation areas as a result of intervention sections not foreseen in the project should be duly evidenced and discussed in this document.

The monitoring report should present the results of the monitoring and maintenance of the area, with a view to achieving due compensation and net environmental gain:

- Mowing activities;
- Crowning and replacement of saplings;
- Pest control;
- Seedling size;
- Monitoring the colonization and diversification of fauna and flora;
- Maintenance of staking/tutoring;
- Fertilization;
- Drainage channel maintenance,
- Fence maintenance.

### **Team composition**

The borrower must ensure that the teams for biodiversity baseline studies (AIAS or PAB) include specialists in the field of biology or ecology, and for situations related to ecosystem services, they must include professionals with knowledge of socio-biodiversity issues.

### **Permanent Preservation Areas**

Subproject support areas and civil works must respect the limits and avoid interfering with Permanent Preservation Areas. Project implementation areas (PIRs) should focus on improving environmental quality, both in physical and biotic aspects, in permanent preservation areas. The implementation of SAFs may eventually be associated with APP areas<sup>39</sup>, one of the objectives of which is to restore them. It is therefore important that service roads are installed in such a way as to reduce interference in APP as much as possible and that the projects contribute to a net gain in vegetation cover.

As a guideline for the Subprojects in APP, below are guidelines based on the legal guidelines given by the Brazilian Forest Code and the Rural Environmental Registry (CAR). These are guidelines for agroforestry systems in APP:

- Agroforestry activities carried out by rural family producers in APPs are considered to be of social interest, and are described as sustainable agroforestry practiced on small properties or rural family possessions or by traditional peoples and communities, provided that they do not de-characterize the existing vegetation cover and do not harm the environmental function of the area;
- These are considered by law to be low environmental impact activities that can be implemented in APPs, as long as they involve agroforestry and sustainable, community and family forest management, including the extraction of non-timber forest products, as long as they do not de-characterize the existing native vegetation cover or harm the environmental function of the area.
- Areas can be restored by planting native and exotic species in an agroforestry system, subject to the following parameters:
  - The planting of exotic species should be combined with regionally native species;
  - The area recomposed with exotic species may not exceed 50% (fifty percent) of the total area to be recovered;
- interspersed planting of woody, perennial or long-cycle exotic species with regionally occurring natives may be carried out on up to fifty percent of the total area to be restored on small properties or rural family holdings;
- It is permitted to build in APP housing for family farmers, remnants of quilombola communities and other extractive and traditional populations in rural areas, where the water supply is provided by the residents' own efforts;
- The planting of native species that produce fruit, seeds, nuts and other plant products is permitted, as long as it does not involve the suppression of existing vegetation or harm the environmental function of the area;

---

<sup>39</sup> These APPs are related to riverbanks and other types of APPs, such as springs, steep slopes and hilltops, are not considered in Procasse II.

- Provide for the CAR of the area in order to formalize the use and zoning of the property with the use of APP for the respective purposes.

### **Prevention and Mitigation of Impacts to Flora and Fauna**

These actions bring together measures to prevent and mitigate impacts on flora and fauna that could be affected by the Subproject. They involve simple procedures, mostly relating to the construction company, teams of workers from the construction companies, and also TA, which should be an agent overseeing the activities.

- Impacts relating to the removal of vegetation for the establishment of support areas must be prevented or minimized;
- Attention should be paid to increased noise levels that could influence the behavior of wildlife;
- Whenever possible, the opportunity should be taken to retrieve biological information;
- A reduction in wild animal hunting practices should be promoted;
- Measures must also be applied to protect ecosystem services and sensitive habitats, establishing criteria for the management of flora and fauna, and establishing measures to control exotic and invasive species.

### **Vegetation Suppression and Cleaning Control**

This control aims to prevent the suppression of vegetation in areas not planned for direct intervention by the Subprojects and in areas where suppression is necessary, and to ensure that all woody material resulting from this action is removed. These guidelines relate specifically to actions that include works that may require the suppression of vegetation and land clearing for the implementation of infrastructure (social technologies). These precautions must be taken by the construction companies contracted under TA supervision.

- The removal of vegetation should only be carried out under environmental authorization and accompanied by a qualified technical professional, with ART, equipment registered with IBAMA and full compliance with the conditions of validity of the authorization.
- It must be ensured that only the areas that are essential for the implementation of the project are the target of intervention and vegetation suppression, and it is necessary to check the Subproject, respect the topographical limits defined in the field and supervise the activities by the TA team;
- There are no restrictions on the suppression of exotic species, especially those with invasive characteristics;
- The search for woody material for activities such as building structures for the life and work of producer families should focus on trees that have fallen naturally, exotic species, especially invasive species, or species with compromised phytosanitary status.

### **Erosion Control and River Siltation**

The aim of these actions is to identify and analyze the causes and situations in which erosion processes and land destabilization occur, in order to prevent situations that could compromise the natural habitat and water bodies.

The environmental control procedures for soil movement and drainage services will include the adoption of preventive, mitigating and corrective measures to control erosion and siltation and contamination of watercourses that may be affected by the Subprojects involving civil works. The following guidelines are therefore envisaged:

- Reduce areas with exposed soil to the minimum possible and, when unavoidable, these areas should be protected by temporary measures such as covering with a blanket, plant material, grasses and, depending on the situation, the installation of sediment retention measures;
- Install temporary drainage devices to allow water to drain away without causing erosion and carrying material to the lower levels;
- Correct or stabilize, in the shortest possible time, all the erosive features that have appeared in the project area;
- Projects to implement production systems, especially in APP areas, should respect the contour lines and slopes of the land, harmoniously seeking to contribute to increasing soil stability.

## 5.7 Stakeholder Communication, Consultation and Engagement Program

In the process of preparing each project, a meeting must be held with the communities on the scope of the project before work begins, in accordance with the recommendations of the IDB and IFAD Safeguards Policies.

It is important to note that the procedures presented below, as well as the entire Stakeholder Engagement process to be carried out under PROCASE II, must follow the guidelines and recommendations contained in the item **Significant Consultations** of the IDB's PDAS10. The engagement and consultation process should also ensure the involvement of vulnerable communities and LGBTQIAPN. These should be identified and listed in the Stakeholder Matrix whenever they are present in the project areas.

**Responsible:** TA will be responsible for implementing the communication, consultation and engagement actions, with the support of the PMU, including the structure and monitoring of the Complaints and Reparations Mechanism (MQR).

### Target audience

---

It covers all segments of the population directly and indirectly affected, as well as those interested in the planned interventions. This contingent will have to be identified and detailed before the works begin, and updated during the process of implementing the projects. Associated with this parameter, another of a physical or geographical nature will also be considered, which will also define the area of coverage:

- **Direct Audience:** considering two subtypes of audiences in this case:
  - The direct beneficiaries of the Subproject are the institution (association, cooperative, etc.) and its members and community members who are willing to participate in the Project.
  - Directly affected by the works, encompassing the population and economic activities located in the area required for the implementation of infrastructure, which may suffer the impacts of the construction period. This refers to the population and activities that will be directly affected by the works (roadblocks, traffic detour, interruption of essential services, dust and noise, movement of workers, among others).

- **Indirect Public:** the population of the surrounding area indirectly affected by the implementation of the Subprojects and those interested in the Project, as well as active governmental and non-governmental institutions and media outlets, normally established in the municipality where the Subproject is located.

In general, the target audience includes all the actors and stakeholders in the Subproject:

- Workers involved in implementing the Subprojects;
- Company(ies) responsible for carrying out the sub-projects;
- Company(ies) responsible for the Management, Supervision and Inspection of the Works and Subprojects;
- Associations, cooperatives and other institutions benefiting from the Subproject;
- ATER institutions that could offer services within the scope of the Subproject;
- Affected Population;
- Neighboring population;
- Beneficiaries;
- Circulating Population;
- Community representatives;
- Civil Society Organizations;
- Secretariats and departments of the municipality;
- Communication vehicles.

### **Procedures and Guidelines for Social Communication in the Stakeholder Consultation and Engagement Process and in the Monitoring of the MQR**

- (i) **Stakeholder engagement:** Stakeholder engagement is the basis for forming solid, constructive and receptive relationships, which are essential for the successful management of a project's socio-environmental impacts. Stakeholder engagement is an ongoing process that may involve, to varying degrees, the following elements: stakeholder analysis and planning, information disclosure and dissemination, consultation and participation, grievance mechanism and ongoing reporting to affected communities. The nature, frequency and level of effort of stakeholder engagement may vary considerably and will be proportional to the risks and adverse impacts of the project and the phase of project development.
- (ii) **Stakeholder Analysis and Engagement Plan:** The PMU should identify potential stakeholders in its actions and consider how external communications can facilitate dialogue with all stakeholders. When projects involve physical elements, aspects and/or facilities specifically identified as having the likelihood of causing adverse general socio-environmental impacts to Affected Communities, the developer will identify these Affected Communities. The PMU will develop and implement a Stakeholder Engagement Plan scaled according to the risks and impacts and the phase of project development, and will be adapted to the characteristics and interests of the Affected Communities/Beneficiaries. Where applicable, the Stakeholder Engagement Plan will include differentiated measures to enable the effective participation of people identified as disadvantaged or vulnerable. Where the stakeholder engagement process relies substantially on community representatives, the PMU will make all reasonable efforts to ensure that such persons do in fact represent the views of the Communities and can be relied upon

to faithfully communicate to their constituents the results of the consultations. In cases where the exact location of the project is not known, but its implementation is expected to have significant impacts on local communities, the PMU will prepare a Stakeholder Engagement Framework as part of its management program, describing general principles and a strategy for identifying Communities and other relevant stakeholders, as well as a plan for an engagement process, which will be implemented as soon as the location of the project is known.

- (iii) Disclosure of information: Disclosure of relevant project information helps Communities and other stakeholders understand project risks, impacts and opportunities. The developer will provide Communities with access to relevant information on: the purpose, nature and scale of the project; the duration of the proposed project activities; any risks and potential impacts to such communities and the planning of relevant mitigation measures; the planned stakeholder engagement process; and the grievance mechanism.
- (v) Consultation: Where Communities are subject to identified risks and adverse impacts caused by a project, the PMU will undertake a consultation process in order to provide Communities with the opportunity to express their views on the project's risks, impacts and mitigation measures and to enable the client to analyze and respond to them. The extent and degree of engagement required by the consultation process should be proportionate to the risks and adverse impacts of the project and the concerns expressed by the Communities. Effective consultation is a two-way process that should begin at the earliest stages of the socio-environmental risk and impact identification process and continue uninterrupted as risks and impacts emerge; be based on the prior disclosure and dissemination of relevant, transparent, objective, meaningful and easily accessible information in the local language(s) and in a format that is culturally appropriate and understandable to the Communities; focus on the inclusive engagement of those directly affected as opposed to those not directly affected; be free from external manipulation, interference, coercion or intimidation; allow for meaningful participation, where relevant; and be documented. The PMU will adapt its consultation process to the language preferences of the communities, their decision-making process and the needs of disadvantaged or vulnerable groups.<sup>40</sup> If the actors involved are already engaged in this process, they must provide adequate and documented proof of such engagement.
- (vi) Informed Consultation and Participation: In the case of projects with potentially significant adverse impacts on affected communities, the PMU will carry out an Informed Consultation and Participation (ICP) process that will use the steps described above under Consultation and result in the informed participation of affected communities. ICP requires a more in-depth exchange of views and information, as well as organized and interactive consultation, leading to the client's incorporation into its decision-making process of the views of the communities regarding issues that may directly affect them, such as proposed mitigation measures, benefit sharing and development opportunities, and implementation issues. The consultation process should: capture the views of men and women, if necessary through separate forums or engagements; and reflect the different concerns and priorities of men and women regarding impacts, mitigation mechanisms and benefits, if appropriate. The PMU will document the process, particularly the measures taken to avoid or minimize risks and adverse impacts for

---

<sup>40</sup> In this case, a CLPI (Free, Prior and Informed Consent) process must be carried out, documented through reports that include attendance lists, individually signed agreements and, when involving traditional and indigenous communities, follow the parameters established in ILO 169.

the communities, and inform affected people how their concerns are being considered.

The PMU must inform project-affected communities about the mechanism as part of their engagement process and ensure that the mechanism addresses concerns in an immediate, transparent and culturally appropriate manner and is easily accessible to all segments of the impacted communities. The synergy between legal requirements, PDAS10 and the ISO 14063 guidelines therefore make up the tripod of sustainability in the communication process.

The project must be presented in appropriate language, providing objective information on the main characteristics of the project, its stages and basic timetable, detailing the impacts that will be caused by the implementation and start-up of the project, as well as the measures to be implemented to mitigate and compensate for these impacts.

In order to achieve the objectives effectively, the work should address the following topics:

- Information - This involves a set of communication actions and instruments aimed at informing the different audiences about the characteristics of the project and its technical and construction specifications, benefits, associated impacts, the adoption of mitigating measures and the development of socio-environmental actions. It should be part of the dissemination of PROCASE II, through its institutional channels.
- Articulation - This covers interaction and communication actions developed with the aim of establishing a constructive relationship with regional and local public opinion, government institutions and, above all, with the local population, its representative bodies and leaders.
- Monitoring and Evaluation - This involves the process of monitoring, organizing, archiving and evaluating social communication actions in their activities of providing information and capturing and responding to society's concerns.

In order to incorporate the defined criteria, these are important items to consider when building the Social Communication strategy:

- Language - Each audience demands a different language, which is why cultural diversity must be taken into account;
- Standardization - At the same time, some concepts must be common to all profiles. The use of logos, letterheads and other graphic elements should also reflect the unity of certain concepts. Standardization helps to identify and strengthen the institutional image;
- Coherence - All texts and publications developed must maintain institutional coherence, always seeking to be guided by the communication team responsible.
- Democracy and Freedom of Expression - The plurality of interpretations and positions must be guaranteed, as must freedom of choice and expression. In certain political and social contexts, situations of reprisal must be combated, including guaranteeing the right to anonymity.
- Periodicity - Communicating actions requires, by definition, periodicity, otherwise the credibility and continuity of the information management mechanism will be damaged. Communication actions must be planned in such a way as to make the process perennial in the long term.

Finally, it is important to note that communication can take place in three ways:

- Active Form: the entrepreneur is the sender of the message, using one-way information tools (e.g. newsletters, pamphlets, advertisements).
- Passive: the public is the sender of the message, received through established communication channels (ombudsman, non-interactive channels, employees and workers, website).
- Dialogic Form: promoted through channels that foster an interactive *on-time* dialog between the parties (public consultations, interviews, planning workshops).

Most of the activities are structured in an active way and can include a dialogic way whenever they involve events that involve interaction with the public. The passive form is well-established in the mechanisms for managing public demonstrations.

Once it has the information to be disseminated, the PMU will systematize the content and apply it through communication actions, taking into account, as a minimum:

- Definition of the key messages that respond to the interests, desires and expectations of the interested and affected parties;
- Selection and training of interlocutors who will support the dialog with each interest group;
- Definition of a routine for sharing and discussing information;
- Internal alignment meetings between the entrepreneur's various interface areas;
- Development and implementation of a system for recording information and comments on each issue;
- Definition and monitoring of indicators on the effectiveness of the established dialog strategies.

Social communication activities must begin before the actual start of implementation and be intensified during the project's construction works. It is therefore a long-term project that includes both planning and structural activities.

Below are the activities defined for Stakeholder Engagement, comprising the basic essential actions.

### **Activity 1 - Defining the project's communication strategy**

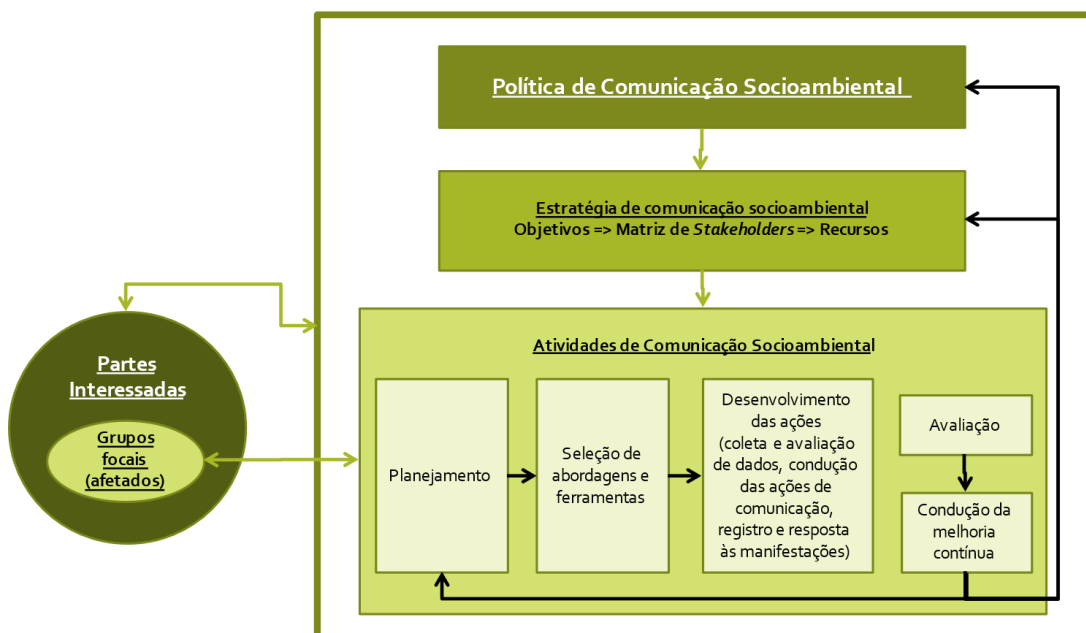

The communication strategy will be based on an organization based on ISO Standard 14063. The standard defines environmental communication as the process of sharing information on environmental issues between organizations and their stakeholders. In this program, the aim is to broaden the concept established in communication to include social issues as well as environmental ones, giving it the socio-environmental concept that encompasses human beings as part of the environment.

Socio-environmental Communication will seek to build trust, credibility and partnerships to raise awareness among stakeholders and those affected by the project, as well as using the information in the decision-making process for continuous improvement of the project design. From the perspective of ISO 14063, alignment is proposed between the principles, policy, strategy and environmental communication activities, in a flow of interaction as shown in the following figure<sup>41</sup>.

---

<sup>41</sup> CAMPOS, M. K. S. Fiesp - International Seminar "ISO trends in international environmental standardization and Brazil's actions", Environmental Communication in Brazil and the potential application of the ISO 14063 standard. FIESP. São Paulo, 2007.

**Figure 3 - Organization of the Communication Strategy**

Source: Adapted from ISO 14063.

The social and environmental communication policy will be integrated into the SGAS policy itself.

The social and environmental communication strategy should set out the objectives, identify the stakeholders, clarify the agenda and deadlines for the planned communication decisions and finally contain a commitment to allocate the appropriate resources for its implementation<sup>42</sup>.

### **Characterization of the target audience and local media**

In the stage prior to the start of the works, a general characterization of the target audience will be made, identifying the main social organizations and their leaders, as well as the main means of communication in the area.

All interested parties must be identified, establishing the target audiences for disseminating information about the works. The main groups are listed below:

- Group A - Project beneficiaries;
- Group B - populations and activities located less than 100 meters from infrastructure deployment areas;
- Group C - civil society organizations and institutions representing specific groups with profiles identified in groups A and B;
- Group D - society in general.

<sup>42</sup> PEREZ, E.S. Environmental Communication in the ISO 14063 Standard. Noviental. WordPress, January 2011. Available at: <https://noviental.wordpress.com/2011/01/05/a-comunicacao-ambiental-na-norma-iso-14063/>. Accessed on: November 2021.

## **Structuring communication tools**

Define the content to be used in the materials to be used in contacts with the different target audiences, i.e. leaflets, videos, press *releases*, among others that can be produced in accordance with the dissemination pieces defined. The definition of materials and content should include suggestions from the expropriation teams, so that they also respond to the concerns of the population and activities that may be affected.

## **Visual and communication identity of the enterprise**

All pieces of information must be standardized with a specific visual identity.

## **Activity 2 - Stakeholder matrix and planning**

This action promotes the analysis of the current situation, defines goals, selects the target audience, establishes the geographical scope and identifies the environmental information pertinent to its communication.

The most relevant socio-environmental issues of interest to stakeholders (priority issues) related to the project should be identified and understood.

The next step is to set social and environmental goals, i.e. to decide what you want to achieve with your social and environmental communication actions. The goals must be monitored in order to assess whether the objectives have been met. In general, the social communication area already has a structure and established goals that should be taken into account when detailing communication actions.

The interested and affected parties must be selected so that communication is targeted, taking into account the possibility of conflicting or diffuse interests. It is therefore essential to draw up a *Stakeholder Matrix* during the planning phase.

The Stakeholder Matrix should allow for the identification of segmented focus groups. Different places, languages, cultures and habits may require segmented communication by profile or geographical space, considering that the aspects and impacts on the environment and society addressed by a strategy to prevent and mitigate these impacts should be communicated using qualitative and quantitative data.

Once the *stakeholders* have been identified, communication strategies will have to be established that can positively influence the relationship with the interested parties. To do this, it will be necessary to define the relevant topics for each group, the company's interlocutors who are able to establish and maintain dialogue, the opportunities for recording and evaluation that will make it possible to improve practices from party to party, as well as the monitoring tools.

## **Stakeholder mapping**

The SA 8000 Standard, which deals with Social Responsibility, defines "stakeholders" as "Individuals or groups interested in or affected by the social performance of the organization and/or its activities". In this context, for social communication it is assumed that *stakeholder* and interested party have the same meaning<sup>43</sup>.

Stakeholders are therefore people, groups and/or organizations that may be mobilized, actively involved in the project, or those whose interests or expectations may be affected,

---

<sup>43</sup> SAI - SOCIAL ACCOUNTABILITY INTERNATIONAL. International Standard: Social Accountability 8000. New York, 2014. 17p

positively or negatively, by the outcome of the execution or completion of the actions developed in the project.

An in-depth knowledge of all the publics in the area of influence sometimes eliminates and/or avoids the social liabilities that may be generated, guaranteeing that the project is inserted in a safe, respectful and assertive manner.

Therefore, when taking on a particular action for a group or even a specific actor, it will be necessary to monitor the effects and changes that the action will bring about for other groups or actors. As the PMU establishes contact and begins the process of involvement and engagement, it must also systematically observe the effects of the action and the reconfiguration of these relationships. This requires the definition of communication strategies aligned with the needs of each *stakeholder* group.

In this way, interested parties or *stakeholders* will be mapped, consolidating a Matrix containing minimum contact details, type of representation, location, etc. The Matrix should be constantly updated and should serve as a contact management tool, including as a source for the calls, invitations and various newsletters that should be made throughout the communication process.

This matrix should serve as the basis for communication and engagement actions, and should also be available to those responsible for implementing the project, including the contractor and works supervision;

As a model stakeholder matrix, the following structures illustrate the basis to be established for the minimum collection of related information:

**Table 9 - Suggested General and Local Stakeholder Registration Form**

Location / Project						Date	
Complex	Nº according to Table Type of Organization	Name or company name	Complete Address	City	Contact representative	Telephone	e-mail

Stakeholder Classification Number	Type of Organization (this list does not necessarily represent the universe of types of organization and they do not necessarily have to be included in the register if they are not relevant)
1	Public or private organizations defending the interests of stakeholders, including public entities (PROCON, Public Prosecutor's Office, others), and associations or private entities with recognized representativeness;
2	State authorities with direct jurisdiction over the activities;
3	Federal authorities with direct jurisdiction over the activities;
4	Regional politicians working in areas of interest to the Organization,
5	Local (municipal) authorities, limited to those who have a direct influence on the Unit's activities (Mayors, Secretaries of Urban Planning and/or Public Works, Secretaries of the Environment, others);
6	Entities responsible for the protection of indigenous peoples and/or traditional populations in the concession area;
7	Entities and/or NGOs working to protect historical and architectural heritage (archaeological remains, historic centers, listed areas, etc.);
8	Basin Committees, Environmental Protection Area Management Committees and other environmental resource management entities operating in the Unit's concession area;
9	Fire department, civil defense, hospitals and others to be potentially activated in the event of emergency situations;
10	Neighborhood associations and/or local leaders representing the population;
11	Regional business leaders;
12	Entities representing the rural business sector;
13	Entities representing the urban business sector (trade associations, rotaries, etc.);
14	Environmental non-governmental organizations operating in the concession area;
15	Social non-governmental organizations operating in the concession area,
16	Trade union organizations in the electricity sector;
17	Representatives of the local and regional press;
18	Suppliers / service providers;

Stakeholder Classification Number	Type of Organization (this list does not necessarily represent the universe of types of organization and they do not necessarily have to be included in the register if they are not relevant)
19	Employees (including trade union leaders, members of CIPAs and others with functions in the collective interest of the Unit's internal staff).
20	National trade associations of interest to the organization
21	Environmental and/or social non-governmental organizations with national/international operations;
22	Academic institutions and/or research centers working in areas related to the organization's activities.

### **Activity 3 - Selection of socio-environmental communication tools and approaches**

In this activity, responsibilities and internal and external participation in the communication process are defined in an Action Plan designed to detail the communication actions, the media and tools used, as well as the content and approaches of the activities.

At this stage, the Social and Environmental Communication Action Plan should be produced in line with Environmental and Social Management.

In general, the PMU should adopt a proactive communication policy, favoring face-to-face communication and participatory community relations actions, which provide prompt clarification for both parties and the interaction necessary for the relationship between the parties to mature.

The selection of communication tools and approaches should take into account the most effective ways of engaging the target audience, allowing for differentiated and complementary actions such as public and community meetings, individual visits, institutional contacts, assistance from the local media office and the production and distribution of various information materials.

The tools and approaches established in this Programme are organized into categories, which are described below.

#### ***Dissemination***

Diffuse or mass dissemination, which includes social media/internet, should be understood as support channels for dissemination and not as the main tools for dissemination, communication and education. Although these media play an important role in launching ideas, concepts and data, they are fast-absorbing communication vehicles.

This action will involve managing the PMU's institutional profiles and disseminating information via telecommunications.

It is recommended that groups and *mailing lists* be set up from the social network contact catalogs, which should be incorporated into the Stakeholder Matrix (specific group of social network contacts). The *mailing list* will be used to send information and newsletters via social networks.

Examples of electronic media / social networks to be used include:

- Instagram
- Facebook
- YouTube
- Corporate website

It is suggested that the content to be covered in these electronic media and social networks include topics on:

- the environment and respect for nature;
- region of insertion and infrastructure / project design;
- legal requirements;
- events on the Environmental and Social Programs agenda;

- good practices in local activities and compliance with socio-environmental constraints;
- responses to protests and emergency response when necessary.

Electronic Media: for electronic media (social networks, electronic newsletters, among others), it is recommended to publish newsletters at least every two weeks.

### **Press Office**

It is important that the main actions planned for the project are publicized in a positive and informative way through journalistic channels, so that the information has a wide reach. The press can be a great ally in disseminating information, given its informative nature, and the initiatives can be low-cost if the stories are broadcast in a journalistic manner in the media.

In the meantime, it is important to make an effort to liaise with a press office, providing press *releases* and giving reports and interviews to clarify and disseminate information to the community through press channels.

The press *release* is one of the most important tools used by the press office. It is a short, objective text used to inform the media about a fact or event.

Press office: it is recommended that *press releases* be issued every 6 months with information on projects. It is also recommended that interviews be conducted with media outlets on an annual basis.

### **Information booklets**

Within the scope of the project, it is also recommended that information booklets and other materials be produced to support the TA team, in order to disseminate the contents of good practices in the implementation of Productive Plans and the management and use of sanitation systems.

This content may also be available electronically in a repository on the institution's social networks and websites.

Information booklets: it is recommended that at least one booklet be produced for each beneficiary family, with an additional 10% for random distribution in the communities, in order to promote the actions and practices more widely in the project's locations.

### **Complaints and Manifestations Management System**

In line with the requirements for compliance with the Safeguard Policies, in the context of PROCASE II, mechanisms will be made available to deal with the population's doubts and complaints, making it possible to establish a flow of information between the executing agent and the affected/benefited local population and enabling specific concerns about impacts and socio-environmental measures, production plans, implementation and operation of sanitation systems to be addressed and resolved in a timely manner. These resources will be structured and deployed in such a way as to target communication precisely, monitor the transmission of key messages and assess the reaction of stakeholders, anticipating obstacles or problems.

It is important to highlight the need for the following process of critical evaluation and continuous improvement in the complaints management process with the following actions:

- Evaluate the reporting structure and decision-making procedure considering the roles and responsibilities of contractors and the PMU in managing stakeholder complaints.
- Review and ensure that the registration and follow-up systems of the Complaints Mechanism accurately document complaints as they are received.
- Ensure that complaints are treated confidentially when necessary or when required by the complainant.
- Ensure the identification of repeated or similar concerns that indicate deficiencies in socio-environmental management and possible non-compliance with IDB and IFAD Policies.

In terms of complaints and information disclosure mechanisms, the PMU already has relationship channels, communication channels and service channels that will be incorporated into the PROJECT's Complaints and Claims Management Mechanism.

The **relationship and service channels** are part of the set of instruments for communicating with the population that are available both within the structure of the PMU and through the State Secretariat for Family Farming and Semi-Arid Development - SEAFDS, to which the PMU belongs:

- 8 Regional Offices and their WhatsApp;
- PROCASE II telephone number: (83) 32149248
- SEAFDS service channel:
  - Phone: (83) 3214-9247
  - E-mail: [agriculturafamiliar@seafds.pb.gov.br](mailto:agriculturafamiliar@seafds.pb.gov.br);
- General Ombudsman of the Paraíba State Government:
  - Telephone: 0800-021-2310
  - E-mail: [ouvidoriageral@casacivil.pb.gov.br](mailto:ouvidoriageral@casacivil.pb.gov.br)/
  - Website: <https://ouvidoriapb.pb.gov.br/register>

The **communication channels** include:

- Internet and social media, such as Facebook - [www.procasse.pb.gov.br](http://www.procasse.pb.gov.br) , and Instagram <https://www.instagram.com/procassepb/>
- Communication Secretariat - SECOM, involving: Mass Media and Press Office (radio, press); Advertising; Digital Communication and Citizen Information System.

These channels will filter and channel complaints to the PMU's technical team, which will be responsible for managing the PROJECT's complaints.

### **Regional Offices**

Each of PROCASE II's 8 Regional Offices are strategically located in municipalities that have regional centralities in the Rural Territories, providing not only face-to-face assistance, but also a telephone number, WhatsApp and e-mail. All these channels will be incorporated as part of PROCASE II's Complaints Management Mechanism.

The following table shows the addresses of the regional offices:

**Table 12 - Possible addresses for Regional Offices**

MUNICIPALITY	Address
João Pessoa	Avenida Rio Grande do Sul, nº 1.345, Bairro dos Estados, Edifício Evolution Business Center, 16º andar, CEP: 58.030-021
Campina Grande	Av. Jorn. Assis Chateaubriand, 2630, Estacao Velha, Edifício do CDRM, CEP: 58.105-421
Cuité	Av. Petrônio Figueiredo, 811-859, Jardim Planalto, Edifício da Casa da Cidadania, CEP: 58.175-000
Sumé	Rodovia BR-412, 425, Centro, Edifício do NEXT/UFCG, CEP: 58.540-000
Patos	Rua João da Mata, 90, Centro, CEP: 58.700-080
Sousa	Rua Emídio RIPes, 84, Centro, CEP: 58.802-270
Catolé do Rocha	Av. Deputado Américo Maia, 37, Centro, CEP: 58.884-000
Itaporanga	Rua Elvidio de Figueiredo, S/N, Margens PB 386, Bairro Loteamento João Silvino, CEP: 58.780-000

Source: PROCASE, 2024.

For face-to-face assistance at the Regional Offices, the response times are:

- Immediate: in the prompt clarification of doubts;
- Emergency: 48 hours, when the situation requires a rapid response and could cause a risk to the life or physical integrity of people or the infrastructure/project, or severe (irreversible) environmental damage;
- Up to 10 days for cases that cannot be answered promptly. In these situations, the questions will be forwarded to the PMU, which will contact the department responsible for responding and getting back to the complainant. If the responsible department still has no response, the PMU will assume responsibility and seek the necessary response or solution, clarifying the situation to the complainant and specifying how much more time will be needed to return with the definitive response.

### **PROCASE II website**

The PROCASE website (<https://www.procasse.pb.gov.br/>) contains various channels for contacting people, providing information, raising concerns and lodging complaints.

It also provides access to the Transparency Portal with detailed information on the company, its investments, contracts, income and expenses, management reports, account statements and financial operations.

The "Contact Us" section provides specific channels for citizens in general, as well as an electronic form for registering complaints.

### Social Media - Facebook and Instagram

Social media is mostly used as a channel for disseminating information about developments, launches and events. As it allows interaction with the target audience, information on access to services is also provided.

Within the framework of the Project, the operation of these platforms or any new profiles created specifically for PROCASE II or at local level by the municipalities should follow the same logic. When complaints or doubts about the project are identified, the managers of these networks must activate the flow of the complaints system through the official channels. In other words, no complaints or grievances can be dealt with or resolved on social media. These channels can receive and advise complainants on the correct channels for submitting their complaints.

**Figure 6 - Social Media**

Source: <https://www.instagram.com/procasepb>

**Other communication and complaint channels:**

Complaints channels - IDB

The IDB's own channels are also part of the Complaints Mechanism:

- IDB Complaints Protocol: [quejas@iadb.org](mailto:quejas@iadb.org)
- Website: <https://www.iadb.org/pt-br/quem-somos/enviar-uma-alegacao/reclamacoes-ambientais-e-sociais>

Independent Consultation and Investigation Mechanism (ICIM):

The Independent Consultation and Investigation Mechanism (MICI) is a structure of the IDB Group, independent of the Bank's management and project teams, which deals with environmental and social complaints from communities potentially affected by the Group's operations. This independence allows it to act impartially and seek solutions with all the parties involved (the communities claiming affections; the IDB Group, as the financier of the operation; and the borrower (company or government) in charge of executing the project).

For more details, see: <https://www.iadb.org/pt/mici/o-que-e-o-mici>

Requests can be sent to the MICI Office in Washington, D.C. or to any IDB Representative Office (marked "For the attention of: MICI Office"), from where the request will be forwarded to the MICI Office.

MICI's address is:

- Independent Consultation and Investigation Mechanism, Inter-American Development Bank, 1300 New York Avenue, NW, Washington, D.C. 20577, United States.
- E-mail: mecanismo@iadb.org
- Phone: 202-623-3952; Fax: 202-312-4057

### **Stakeholder Meetings and Consultations**

During project implementation and pre-implementation, community meetings and consultations may take place as part of the stakeholder engagement process. These meetings may be triggered by the community for collective demands, by the construction contractor (to provide specific information, such as the start of a new work front or temporary interruptions to the road system, for example) or by the PMU.

It is important to emphasize that even at these meetings, there will be an opportunity to make a statement, which should be recorded and dealt with through the system for responding to complaints and claims, including queries on any matter related to the Project, and a *Aide Memoire* (meeting minutes) should always be drawn up, including the contact details of the person making the statement, the date, time, place, descriptions and referrals. A technician or communicator, or a duly trained representative, should always be the person who captures these complaints. All those involved should be aware of their role in order to advise the public or the applicant to register with this professional.

In the case of all employees and service providers involved in the works and implementation of the projects, they should always be informed of the professional or channel responsible for dealing with complaints, including at internal meetings, training sessions and any other situations that may arise. This professional or channel responsible for communication must always be identified in the various situations.

All manifestations made through meetings, workshops or customer service channels must be recorded, and the information consolidated in a report with the following items:

- Location;
- Date and time;
- Subject Related to the Demonstration;
- Identifying and Contacting the Manifestor;
- Manifestation in full;
- Expected solution;
- Indication of the person responsible for the solution;
- Estimated turnaround time.

The primary objective of the meetings and consultations is to establish a channel of communication with the communities affected/benefited directly by the works, building a process of exchanging information that (i) enables the executor and other teams involved in the Project to get to know the particularities of the communities involved, as well as their needs, making it possible to improve the work and its relationship with society; and, (ii) present the Project and its impacts to each affected community, with the aim of bringing information to the public about what these projects actually mean in their daily lives.

Prior to holding Significant Consultations, the developer should identify the priority issues that society demands in order to anticipate information and responses and conduct a

more productive process for all parties involved. Some of these priority issues that may arise at this consultation planning stage include:

- Increased movement of people and cars;
- Risk of accidents;
- Discomfort to communities;
- Land situations;
- Features of the development;
- Use of agroecological systems versus non-sustainable systems;
- Noise, dust and odors;
- Charging for tariffs and services.

Another key instrument for holding meetings and consultations is the effective use of the Stakeholder Matrix to call for and mobilize meetings with the community. Consultation can cover different audiences or be carried out by focus group, and should involve everything from government institutions to the directly affected/benefited public.

The parties directly affected by the works should be called upon in four different ways:

- Active contact (via telephone/WhatsApp);
- Face-to-face "door-to-door" approach, with distribution of an information folder or booklet.

These instruments should briefly cover: (i) the scope of the project; (ii) the expected impacts of the project phases; (iii) the date and information of the public consultation event; (iv) the best practices envisaged in the projects. A Consultation Plan will be drawn up to organize the meetings and consultations:

- Number of meetings and consultations to be held;
- Definition of the objectives and scope of each request;
- Defining the audience for each election;
- Date, time and place of the election;
- Calling and mobilization mechanisms;
- Provision of infrastructure (transport, food, premises, equipment, etc.);
- Forms of distance transmission (social networks, Youtube, Microsoft Teams, among others);
- Presentation script;
- Accessibility;
- Attention to gender, diversity and vulnerability.
- Strategies for dealing with pandemic situations, such as Covid-19.

After each meeting, a report should be drawn up containing at least the minutes of the meeting, the public involved, the attendance list, the photographic record, the report, the comments and responses.

It is recommended that a community consultation be held in an easily accessible location, preferably in the community itself. It is also recommended that, before the project begins to be implemented, a consultation be held with institutional *stakeholders*, consisting of

civil society organizations, NGOs, institutes, foundations, universities, the City Council and its Secretariats.

### **Activity 5 - Employee training**

Training for employees responsible for social and environmental communication activities must be planned and carried out.

In addition to the employees directly involved in communication activities, the topic of communication should be included with all the workers involved in the project, including subjects such as official citizen service channels, non-violent communication, and proper posture in community communication. This activity can be included in the DDS and worker training processes.

Training is recommended at the start of project implementation and continuous retraining once a year.

### **Activity 6 - Communication in the Response to Socio-environmental Emergencies and Accidents**

This activity involves planning emergency and accident communication actions to be used in the situations that may arise.

This activity should be part of the ESMP for each sub-project, with an accident protocol as part of the action plan.

Extreme and critical situations require extraordinary and immediate communications, which often involves providing reliable and timely information to the community.

The process of immediate and efficient communication can promote the timely activation of authorities and agents who may be involved in resolving the emergency, as well as alerting and contingency situations with the community, providing security for people's integrity.

The communication system for emergency response must contain specifications and guidelines for:

- Procedures and contact with health care systems for the care of victims;
- Procedures and contact with Civil Defense to deal with extreme situations;
- Procedures and contact with the municipal environmental department and the state government;
- System for warning/activating community representatives;
- Training community leaders in emergency actions and communication channels for emergencies;
- Contact list of all residents to call in the event of an emergency;
- Publication of relevant information on social networks and broadcast media to disseminate emergency measures to society;
- Public relations services to publicize the project's image and social responsibility.

### **Activity 7 - Structuring and Operating the Database, Monitoring and Evaluation**

The PMU will have to structure and maintain an information mechanism with an organized record of all communication actions, the demands that have arisen during the planning period, the works and the start-up of the interventions. This includes requests

from different sources, such as the press, PMU departments, contractors and call centers. This system should provide the PMU with the tools to identify, systematize and continuously organize information on:

- The types of demands and claims, their intensity and location;
- The solutions and referrals made;
- The image of the entrepreneur in his efforts to meet demands and achieve results.

The database must be properly modeled so that it can provide information on demands, services provided and deadlines, as well as providing information for preparing a management report on complaints and protests. It should also provide relevant information for the preparation of summary reports using indicators to be defined.

### **Procedures and Guidelines for Stakeholder Consultations**

---

For each consultation held, a report must be submitted with a record of the discussions, a list of participants, the methodology used, photographic and/or audiovisual records and, in the case of compensation negotiations, the duly signed agreement document.

Scheduling and calling the community should always be carried out by the PMU, calling on social actors, active organizations and the population interested in and/or affected by the process, according to prior identification and analysis of the actors and interested parties. The venues must always contain all the sound and image/projection infrastructure needed for the presentation, and must be located in the areas closest to or accessible to the stakeholders (affected public), being easily accessible to the population.

The different stakeholders should be identified, including people affected by the project and other interested parties. Special attention should be paid to project-affected people who, due to their circumstances, may be at a disadvantage or vulnerable (people who may be more likely to be affected by project impacts and/or less able to take advantage of project benefits).

Broad community participation must be guaranteed and proven. This means that the event must be widely publicized, calling on the population to take part, as well as being held in a place that is easily accessible to the population, on a date and at a time that is convenient for people to attend. It should be noted that the Significant Consultations must take place regardless of whether or not local government organizations demand a Public Hearing.

The network of contacts should consolidate a *mailing list* of social actors and the parties affected by the project. The participation of local leaders, bodies and businesses, as well as the resident population, should be envisaged. Dissemination should be reinforced through radio, newspapers, advertisements, sound bites, social media groups etc.

Residents of the region affected/benefited by the project should be called upon and mobilized through the distribution of leaflets or other efficient means of communication in the area surrounding the interventions, and/or door-to-door calls to people directly benefited/affected.

A basic presentation of the project and an invitation to take part in the consultations should be publicized.

Government entities and social organizations, as well as representatives of civil society, can be invited by e-mail, telephone or other means, always making sure that the invitation is formally registered.

Consultations should follow the following minimum script:

- **Part 1:** Reception of participants, welcome and signing of the attendance list.
- **Part 2:** The Consultation will begin with a brief opening, with information about the event's program. At this point, the organizations promoting the Consultation will also be introduced.
- **Part 3:** The project will then be presented briefly and objectively, in plain language that is accessible to the general public and with the aid of audiovisual resources that make it easier for those present to understand. A qualified representative will make the institutional and project presentation. Members of the planning, engineering, environmental and social teams will complete the group of experts to explain the project. The project's objectives and justifications, its description and its technological and locational alternatives will be discussed.
- **Part 4:** Social and environmental experts will provide a summary of the results of the diagnosis of the area of influence of the project; a description of the possible impacts of the implementation and operation of activities; a description of the expected effect of the planned compensation measures in relation to the impacts, mentioning those that cannot be avoided; and the program for following up and monitoring the impacts, indicating those responsible for carrying them out.
- **Part 5:** After the presentation, a space will be opened for the public to speak. This is the moment for people to express their perception of the project, their doubts and expectations. It is an opportunity to clarify any questions that arise, while at the same time trying to capture the local reality from the participants' point of view. At this point, the questions that can be answered by the participants will be answered, and those that can't be answered will be given a forecast of how they will be answered.
- **Part 6:** The stipulated process for incorporating the notes made by the participants will be presented and the results will be published.
- **Part 7:** Finally, the communication channels for dialog and resolving issues will be presented, and the event will be thanked and closed.

**Note 1: The consultation will be recorded with minutes, recordings, photographs for documentation and later revision of the material. Technological resources for remote communication shall be made available.**

All communication involving activities such as calling the community, broadcasting the Public Consultation, disseminating data, collecting information, gathering stakeholder feedback and answering questions must include technological tools for remote communication.

Suggestions for remote communication technologies and actions include:

- **Social networks** (Facebook, Instagram, for example);
- **Tools developed for videoconferencing.** The webinar is a good option, offering a tool for sharing information and knowledge online in a modern and relevant way. This type of tool works through a live broadcast, in which an expert presents their knowledge on a given topic and interacts with the users watching. Examples of tools available for videoconferencing include Microsoft Teams, Skype and Google Meeting.
- **File repository.** The executor's own website can function as a file repository, where the interested party can view or download relevant files, whether through download *links*, file and map reading systems or *streaming* audiovisuals.

- **Registration of interested parties via website forms** and online survey systems, including *smartphone/iphone* and internet *browser* applications.
- **Quick communication apps (chat)**, such as WhatsApp, Messenger, Telegram, among others.

**Remote communication as the only alternative in the event of a crisis or contingency situation**

In the event that interested parties are unable to attend, the possibility of holding the Public Consultation remotely should be assessed, using internet transmission, presentation and participation systems. The use of this resource should encourage community participation in a democratic and meaningful way.

**Stakeholder Engagement and Participation Initiatives in Vulnerable Communities**

Communication actions should also focus on raising awareness among the families involved in the project so that they become allies in the good practices set out in the Production Plans and in adhering to the proposed sanitation system in order to prevent the project from being drained:

- Include in the communication themes guidance to the beneficiary groups on the limits of the project's service and its viability based on investment estimates and planning and the availability of physical and financial resources;
- Include in meetings and communication processes topics to raise awareness among families and communities about good practices and the risk to human health and the environment from unsustainable practices and lack of sanitation;
- Ensure the functioning of the complaints mechanism so that complaints or related information are effectively answered and acted upon for the proper functioning and implementation of PROCASE II sub-projects;
- Encourage the use of the complaints mechanism to report divergent situations;
- Keeping an eye on the areas where projects are being implemented in order to identify unsustainable practices and help disseminate good practices;
- In line with the communication actions, the PMU, the City Council and the companies contracted to carry out the projects must maintain a schedule in line with the project implementation actions;
- Communication and engagement with the surrounding community so that they can act as watchdogs to protect the areas. Topics such as the importance of not reoffending and improving the environmental and social quality of neighborhoods should be involved;
- Free, Prior and Informed Consent (FPIC) must be applied as a formal instrument that favors respect for culture and tradition, and must be applied under the terms of ILO-169 for traditional communities;
- Specifically in the case of indigenous communities, FUNAI must be consulted and authorized, in addition to Free, Prior and Informed Consent (FPIC).

## 5.8 Environmental and Health Education Program

The Environmental and Health Education Program (PEAS) is an integrated set of proposals, actions and methodologies for local environmental education. It will be aimed at the population directly benefiting from the Project, with special attention to the most vulnerable communities, young people, women, people with disabilities, LGBTQIA+, PCT (quilombolas, indigenous people, artisanal fishermen and gypsies), with the main objective of transforming environmental concerns into practice, based on the issues experienced by the local population in their daily lives.

**Responsible:** TA will be responsible for implementing environmental and health education actions in conjunction with the PMU.

**Target audience:** Rural producers and the benefiting community.

This PEAS covers the environmental and health education that encompasses the Project's actions. These actions are already provided for in the PIRs as activities linked to the investment plans.

It should be noted that the lack of basic knowledge of environmental and health education is often at the cause of serious problems of contamination of water resources and public health, as well as unnecessary pressure on ecosystems. The program is justified by the guidance to be given to the directly affected and benefited community regarding the most correct measures and attitudes to be adopted in order to prevent accidents, preserve public health and maintain a healthy and aesthetically pleasing environment.

It is also worth noting that one of the positive effects of the project is the prospect of a considerable improvement in the living conditions of the population that will benefit from the implementation of the projects.

### Objective

---

To make it possible for the population to be aware of the importance of the actions of the Project in question, involving and raising awareness in the community through socio-environmental actions that contribute to the sustainability of the project, making the community a partner in the conscious use of sanitation infrastructure and the best practices adopted, through the involvement of the community in the actions.

The PEAS will have to include specific actions to sensitize and raise environmental awareness among the population. A wide-ranging environmental education program that provides new patterns of behavior, based on the proposed interventions, becomes imperative if one of the project's objectives is to be achieved, which is to improve the population's quality of life.

The PEAS should act transversally, in some cases absorbing the suggested measures, such as those in the biotic environment, relating to preventing and combating hunting, animal escapes, accidents with venomous animals, etc. The issue of sewage and garbage and the importance of their proper disposal should also be included.

### Procedures and Guidelines

---

The focus should be on content related to: (i) water quality, sanitation and domestic solid waste; (ii) care and maintenance of septic tanks; (iii) care of the soil; (iv) risk of waterborne diseases and vectors; (v) prevention of accidents at work, occupational diseases and sexually transmitted diseases; (vi) Permanent Preservation Areas - APP; (vii) risks related to the use of pesticides, herbicides and agrottoxins; (viii) environmental

benefits of using agroecological systems; (ix) respect for river channels so that they are not embanked or strangled.

It is proposed to apply environmental education and educommunication as an investment and as strategic tools to promote training processes aimed at understanding the local socio-environmental reality and problems, and to disseminate information and raise awareness among the population about the issues addressed by the project. It should be used as a tool for participatory and democratic training, providing for constant dialog in the communities involved.

Specifically, the environmental awareness projects are aimed at training residents as environmental community agents and promoting ongoing environmental awareness actions in the area (workshops and partnerships between NGOs, schools and the community in general, planting, joint efforts to maintain public spaces, etc.), taking into account the close link between the environmental issue, the transformations resulting from urban programs and the challenges of collective-collaborative management of the area.

Promoting socio-environmental actions in the community should also be part of the ESMP. Projects aimed at the most vulnerable people and heads of household that contribute to the sustainability of the project, making the community a partner in the conscious use of the sanitation infrastructure and the best practices adopted.

It is recommended that the TA contracted to implement the subproject promote environmental education actions in partnership with municipal governments to avoid overlapping activities, optimize investments in environmental education for sustainability and expand its results.

In addition, communication for environmental education must follow the criteria of approaches that take into account the appropriate language for each audience, taking into account cultural diversity; standardization that, at the same time, some concepts must be common to all profiles; coherence in the texts and publications developed, always seeking to be guided by the best communication practices; the preservation of democracy and freedom of expression, so that the plurality of interpretations and positions are guaranteed, even combating situations of institutional or community reprisal, also guaranteeing the right to anonymity.

### **Activities**

The activities linked to the PEAS are also provided for in the PIRs to be implemented. In any case, environmental and health education actions must permeate all the communities benefiting from PROCASE II.

Actions linked to aspects of health and environmental education related to the Subprojects should include proposals for:

- Promoting new habits regarding the conservation of water supply systems and sewage collection and treatment, as well as agroforestry systems and the use of ecological practices for rural production.
- Include issues related to waste disposal, conservation of protected areas, and the integration of the area into the landscape.
- Prepare material, together with the social communication team, that demonstrates the importance of this recovery for the population's quality of life, pointing out conservation and maintenance actions.
- Draw up a calendar of events and their respective agendas for the specific population in the municipalities, working on themes relating to environmental issues.

- Develop actions and practices that promote the maintenance and upkeep of the housing units and infrastructure installed;
- Disseminate and promote practices to avoid irregularities in the installed infrastructure, such as the connection of the rainwater network to the sanitary sewage network, or modifications to sanitary facilities;
- Disseminate good practices for the rational and sustainable use of water, energy and sewage systems.
- Prepare material on good practices for dealing with cesspools, so that they operate in good working order. It should be noted that the main problem that can occur is the cesspool clogging up due to the accumulation of material, and the necessary cesspool cleaning service should be carried out.
- Material should also be prepared to deal with the grease trap installed in kitchen areas to prevent contamination of the pit, including cleaning instructions and information on proper use (e.g. don't pour oil down the sink or toilet!).
- Publicize good practices and the health and environmental benefits of using sustainable practices in agriculture and restrict the use of pesticides and herbicides;
- Holding mini-courses with the different local training groups to implement innovative practices in dealing with the environment;
- Preparation of educational material such as posters, leaflets, booklets and other materials containing guidance on the proper use of infrastructure equipment.

## 5.9 Energy Efficiency Plan for Projects and Facilities

The energy efficiency plan for new buildings and facilities is important for reducing consumption and increasing the efficiency of facilities. According to the Ministry of the Environment, buildings are responsible for 50% of electricity consumption in Brazil.

**Responsible:** TA will be responsible for carrying out the guidelines set out in this Plan together with and under the supervision of the PMU.

**Target audience:** Construction companies will be the target audience for receiving the appropriate guidelines to be considered in the construction process. Rural producers will be the target audience for guidance on the proper operation and maintenance of the systems.

### Procedures and guidelines

---

In order to implement the energy efficiency plan for buildings that are still in the pipeline, the following measures should be adopted as a minimum:

- Use of efficient light bulbs, such as LED technology, whenever there is availability and a market for replacement parts and viable system maintenance.
- Better use of natural light.
- Use of materials that provide better thermal comfort, reducing the use of heaters and air conditioning, for example, floors or ceilings that are compatible with the local climate, sizing of windows and positioning of areas that provide ventilation.
- Water reuse system.

The measures established in a building's energy efficiency project can vary according to the use of the space.

In the project implementation phase, energy efficiency is closely linked to the use of equipment with electric or fuel motors, which requires specific consumption measurements and assessments.

Therefore, energy efficiency in construction will include some more specialized actions, such as:

- Correctly dimension the electrical engineering project, both in the construction phase and in the housing and facilities projects.
- Check and correct leakage points and water loss in the site's supply system.
- Implement a water reuse system and use rainwater in the Subproject (e.g. water for irrigation, washing facilities and heavy machinery, among others).
- Control electrical disturbances that increase energy consumption.
- Avoid running electrical or combustion machinery and equipment unnecessarily.
- Look for the most energy-efficient equipment on the market.
- Switch off light bulbs in rooms that are rarely used or unoccupied.
- Adjust the luminance index and control the excess or lack of lighting in the various rooms.
- Carrying out maintenance on the machines to avoid malfunctions, which increase consumption, periodically checking that the ignition devices are adequate, as well as the alignment of the engines, noise and vibrations and proper lubrication.
- It is preferable to use machines and equipment at 75% to 90% of their rated power, using motors that are properly sized to the needs of the operation, including calibrating the appropriate speed for use.
- Seek to maintain the constancy and quality of the power supply so that there is no voltage variation, maintaining balance in the three phases.
- Implementation of filters that can correct disturbances in the quality of the power supply, fluctuations, electromagnetic interference, etc.
- The photovoltaic panels used must be properly maintained and cleaned so that they maintain their full production capacity.
- It is also suggested, if possible, to evaluate and certify green projects using systems such as LEED Certifications<sup>44</sup> or EDGE<sup>45</sup>.

## **Greenhouse Gases - GHG**

---

It is difficult to obtain accurate data on greenhouse gas (GHG) emissions for the Project, especially prior to project implementation, since most emissions from this type of project are related to construction and operation activities that are relatively small in scope (community kitchens, small-scale production, collective and individual water and sewage treatment systems, among others).

---

<sup>44</sup> <https://www.gbcbrazil.org.br/certificacao/certificacao-leed/>

<sup>45</sup> <https://edgebuildings.com/>

The main operational emission of this type of project is assumed to be the use of electricity associated with infrastructure improvements. There should also be indirect emissions associated with the increase in solid waste and wastewater that feeds collective and individual treatment systems in the communities covered by the Project.

Thus, it is worth highlighting the measures suggested to reinforce the commitment to be made to the actions outlined, such as:

- Where possible, the use of LED lighting equipment, achieving 50% energy savings, longer equipment life and a significant reduction in maintenance costs. It is important to analyze the availability of suppliers, parts and maintenance services close to the implementation sites to ensure that this measure is feasible;
- Reforestation and green areas: provided for in the project to recover environmental and risk areas, preventing erosion and increasing the capture of carbon emissions.

The nature of the developments must be taken into account, with the expansion of agroforestry and crops that can help sequester CO<sub>2</sub> and also the fact that part of the electrified systems will be powered by photovoltaic panels, reducing pressure on the public system.

## 5.10 Contaminating Products Management and Control Plan

The aim of this Plan is to define criteria and establish minimum guidelines for the management and control of contaminating products. It is important to consider that **contaminating products** have the potential to pollute the environment, but only if they are used or stored incorrectly.

**Responsible:** TA will be responsible for implementing, guiding and monitoring rural producers on measures to control and manage contaminating products used in sanitation systems or that come from production processing processes. The measures must also be supervised by the PMU.

### Procedures and Guidelines

---

#### **Contaminants related to the operation of sanitation systems**

The most widely used form of disinfection in water supply systems around the world is that which uses chlorine or chlorine-based products as disinfectant agents. It was massively introduced in the last century in water treatment as a complement to the filtration process that was already known and used, thus constituting a technological revolution in water treatment. (Funasa, 2014)

The basic process of chlorination consists of using chlorine-based chemicals to inactivate pathogenic micro-organisms in water. In addition to its basic function, chlorine is a powerful oxidizer and thus reacts with a large number of organic and inorganic substances present in water, such as removing hydrogen sulphide gas, iron and manganese (Funasa, 2014).

Chlorine can cause serious burns and in its gaseous form can have major health impacts.

How chlorine is stored will depend on which product in the chlorine family is used:

- Sodium hypochlorite;
- Bleach.

Care in storage and handling should involve:

- Containers must be properly closed when stored and kept in a dry place accessible only to adults responsible for their use;
- It should be used in accordance with the recommendations and should not exceed the recommended measures. In the event of an accident involving excess product in the water, the contents of the tank should be discarded.

### **Contaminants related to processing**

Possible contaminants from processing are mainly related to the cleaning products and the edible oil ("cooking oil") to be used.

- Cleaning products should be stored in a suitable place, not near food (especially fresh food);
- Its use must follow the manufacturer's specifications and the use of the indicated PPE, especially gloves, must be observed;
- The oil should be stored in a dry place, the packaging should be inspected to avoid leakage, expired oils should not be disposed of directly into the sewage system and should be considered kitchen waste.

## **5.11 Traffic Program**

The nuisance caused by the intensification of vehicles, including the transportation of materials or waste generated in the projects, must be mitigated with effective actions.

Situations involving the interruption of traffic for long periods can occur due to the characteristics of road systems and the risk of accidents. Accidents can have an increased impact on traffic because they involve the transportation of dangerous products and contaminants, which justifies the need for precautionary measures and emergency response specific to these cases.

In addition, care should be taken in areas where vehicle access could be compromised in the event of flooding at crossings in rural areas.

**Responsible:** The TA, PMU and construction companies are responsible for implementing traffic safety and management measures for workers who drive or use motor vehicles and who are respectively involved in their activities.

**Target audience:** Workers from the institutions involved in implementing the Subproject.

### ***Objectives***

- Avoid road closures;
- Reduce the risk of accidents;
- Acting effectively and quickly in the event of accidents.

### ***Procedures and guidelines***

In order to achieve the objectives set, the measures set out below are necessary:

#### **Signposting of construction sites and movement of machinery and equipment**

The signage consists of a set of signs and devices with their own visual characteristics, with the function of ensuring the safety of users, passers-by and workers and the fluidity

of traffic in the areas planned for the transportation of surplus material and waste. The purpose of these signs is to:

- Correctly warn all users about transport interventions, routes and timetables;
- Provide precise, clear and standardized information;
- Regulate traffic and other cars to reduce the risk of accidents and congestion;
- Ensure the continuity of paths and access to adjacent buildings;
- Provide guidance on new paths;
- Protect the project, workers and road users in general;
- Reduce the risk of accidents; and
- Reduce the discomfort caused to residents and the general population in the area affected by the intervention and transportation routes.

In order to be effective, signage must meet the following parameters:

- Be placed in a legible position and condition during the day and at night, at a distance compatible with traffic safety;
- Any obstacle to the free safety of vehicles and pedestrians, both on the road and on the shoulder and sidewalk, must be duly and immediately signposted;
- In the event of an accident, signs and specific measures must be adopted to prevent passers-by from coming into contact with the accident site;
- Any work or event that may disturb or interrupt the free movement of vehicles and pedestrians, or put their safety at risk, may only be started with prior authorization from the traffic body or entity with jurisdiction over the road or transport route, and the person responsible for carrying out or maintaining the work is obliged to provide signs.
- Clean and in good condition;
- Keep the shapes and colors unchanged, both during the day and at night;
- Standardized dimensions and graphic elements;
- It should always be placed so that it is easy to see;
- Be implemented according to uniform criteria and in such a way as to induce correct user behavior;
- To be implemented before the road works begin;
- It will be completely withdrawn when the activities come to an end.

### Deviations

Traffic detour is the transfer of part or all of the flow from one road to another, establishing a new route. The detour should only be adopted once its necessity and convenience have been proven, and a thorough study is required to choose the new routes. It can be mandatory, when it is a detour that all vehicles must follow, or alternative, when the new route is a recommendation for certain destinations.

Before traffic is diverted, the best routes for transporting hazardous and waste products must be planned. These routes should take into account the appropriate conditions of the road system for the passage of heavy vehicles, avoid more crowded areas, give preference to expressways and determine alternative routes.

Traffic detour projects must comply with the following basic guidelines:

- Use of lanes with the same characteristics as the blocked lanes;
- Use, for alternative routes, of short routes that are close to the original route;
- Preservation, whenever possible, of residential areas and roads where there are schools, hospitals and other pedestrian attractions;
- Guaranteed access to homes and businesses;
- Minimal alteration to the circulation scheme of the roads involved and their crossroads;
- Assessment of interference with bus routes;
- Preserving, wherever possible, the original bus route and its pick-up and drop-off points, or at least not moving them too far apart.

### Accidents and Occurrences

In the event of an accident, especially with material at risk to humans, the following basic measures should be adopted, but not limited to:

- Drivers must receive specific training with guidance and guidelines in the event of accidents and spills of dangerous products and victims;
- Transport equipment and trucks must always be properly signposted and follow the prerogatives and regulations of the local Traffic Department;
- Equipment and trucks must be equipped with a coating suitable for the type of product being transported, in order to avoid leaks;
- If the road is obstructed in the event of an accident, arrange for the vehicle to be removed to avoid aggravation and collisions. In the case of accidents without victims, it is not necessary for the traffic authorities to be present to arrange removal;
- Collect information from the drivers and vehicles involved, as well as information about the place and time of the accident.
- Signpost the area so that other drivers understand what has happened;
- In the event of an accident involving victims or leaks, keep the vehicle at the scene without attempting to remove it;
- Keep the victims at the scene of the accident until the rescue services arrive;
- In the event of a spill or leak, isolate the area and remove people from the site by blocking access for vehicles and pedestrians.
- Eliminate or keep away possible sources of fire.
- Protect watercourses and water supply, sewage and drainage systems by never directing spilled material into these places.
- Restrict the affected area with absorbent barriers, rags, cloth, sand or sawdust.
- If soil, water courses and bodies, sewage systems or drainage systems are affected, notify the local environmental agency and authorities immediately.
- To remove the spilled material, recover as much of it as possible by pumping it into a suitable container, duly identified and prepared for packaging and transportation.
- Avoid using water or solvents for cleaning.

- Collect all materials that come into contact with the spilled material, store them in suitable containers and identify them. Finally, send them for proper recovery or disposal for treatment and proper disposal according to the class of waste.

### Training workers

All workers from the companies responsible for implementing the Subproject, i.e. employees of the PMU, TA and construction companies, who will be involved in driving motor vehicles should receive training in defensive driving and first aid. The training sessions should cover the reality of the work environment, such as rural roads, highways, weather conditions and risky driving situations.

## 5.12 Labor Management Plan

Safety, hygiene and occupational health care for people working on the PROCASE II construction site will be restricted to employees of the contracted company and workers from other companies that may provide services for this contractor.

The following provisions set out the minimum conditions and requirements that must be followed by the contractor and any subcontractors and must be the subject of procedures that guarantee excellence in Occupational Safety, Hygiene, Medicine, Living and Environmental Management, and must cover, without distinction, the entire workforce and facilities of the contractor and any subcontractors placed at the disposal of the projects.

As a priority, these procedures must comply with current federal, state and municipal legislation and the applicable standards, procedures and instructions issued by public bodies with powers to regulate these issues. They should also include the categories of workers in situations of vulnerability, such as women, people with different gender identities or sexual orientations, people with disabilities, children (of working age, in accordance with IDB PDAS 2 and IFAD Standard 5) and migrant workers, workers hired by third parties and primary supply workers.

This implies the obligation to comply with any Collective Bargaining Agreements signed with trade unions, associations or trade associations.

**Responsible:** TA, PMU and construction companies are responsible for implementing labor management measures with the workers involved in their activities.

**Target audience:** Workers from the institutions involved in implementing the Subproject.

This document sets out the requirements for the living conditions (including accommodation, meals and transportation) of the Contractor's employees, stressing that, for those migrating from other regions, the conditions to be offered must be decent and compatible with the employee's hierarchical level.

Job creation and income generation through financing programs based on international environmental and social policies and agreements must go hand in hand with the protection of workers' fundamental rights. Having conditions that foster a solid relationship between the worker and the employer is key to the sustainability of any initiative and fundamental to improving quality of life.

In recent decades, labor risks and impacts, such as workplace bullying, precarious working conditions for migrants, child and forced labor, and occupational health and safety, have been at the forefront of development cooperation. The COVID-19 pandemic has further exposed these risk factors in global supply chains. The IDB's MPAS and

IFAD's Standards directly address the conditions of the labor force involved in the projects of its Credit Operations, including full-time, part-time or temporary, seasonal or migrant workers.

These Safeguard Policies emphasize the need for fair treatment, non-discrimination and equal opportunity for all, and support commitments to eradicate child and forced labor, promote safe and healthy work, and protect workers' health. It also supports the principles of freedom of association and collective bargaining and guides how to establish, maintain and improve relations between workers and employees in funded projects.

In order to manage occupational risks and impacts, the following guidelines must be followed:

- Respect national legislation and defend international labor rights, based on ILO and UN conventions;
- Combating child labor and forced labor, taking into account the minimum age of 16 and combating modern slavery such as work in conditions of servitude, practices of withholding documents, hiring fees or imposing debts;
- Implement labor management procedures to mitigate risks through a Labor Management Program (LMP).

### **General**

#### **Auxiliary or Complementary Rules**

Compliance with the requirements of this Program does not exempt you from full compliance with Brazilian legislation on Occupational Health and Safety, in particular compliance with Ordinance 3.214/78 of the Ministry of Labor and its Regulatory Standards, state and municipal legislation and their technical instructions in force, as well as those that deal with the subject and come into force after the service is contracted.

#### **Definitions**

- ASO - Occupational Health Certificate.
- CA - Certificate of Approval.
- CIPA - Internal Accident Prevention Committee.
- CONTRACTOR - company hired to carry out Projects.
- PPE - Personal Protective Equipment.
- PCMSO - Occupational Health Control Program.
- PPRA - Environmental Risk Prevention Program.
- PGR - Risk Management Program<sup>46</sup>
- PT - Work Permit.
- SESMT - Specialized Service in Safety Engineering and Occupational Medicine.

---

<sup>46</sup> As of February 2021, the PCMAT - Work Conditions and Environment Program for the construction industry has been replaced by the PGR - Risk Management Program, according to the revision of NR-18 published on 10/02/2020. For more details see: <https://www.gov.br/trabalho-e-previdencia/pt-br/composicao/orgaos-especificos/secretaria-de-trabalho/inspecao/seguranca-e-saude-no-trabalho/ctpp-nrs/normas-regulamentadoras-nrs>

## **Procedures and guidelines**

---

### **Occupational Health and Safety**

#### **Responsible for Safety, Health and Environmental Affairs**

Companies contracted to implement projects must formally appoint an employee to be responsible for occupational safety, hygiene and health matters.

#### **Legal conditions**

Contractors must submit the following documents to the Service Provider Administrator responsible for the contract:

- Occupational Health Medical Control Program;
- A copy of the Occupational Health Certificates for each employee who will be working on the project;
- Environmental Risk Prevention Program;
- Working Conditions and Environment Program;
- Registration form for the Contractor's employees accompanied by a copy of the employee registration form;
- Occupational Health Procedure Work Permit.

#### **Excessive noise**

Everyone working in an environment exposed to excessive noise must have a health assessment including audiometry (valid for twelve months) and the appropriate PPE.

#### **Respiratory protection**

All people working on the site who need to wear respiratory protection equipment appropriate to the level of protection required (including any type of mask) must have a health assessment that includes spirometry (valid for twelve months).

#### **Working at Height / Confined Space**

All people who will be working on site, performing activities at height and/or in confined spaces must follow the PCMSO and comply with NR 33 and 35 issued by the MTE.

#### **Mobile Machine Operation**

All people who will be working on site, carrying out activities using mobile machinery (forklifts, tractors, trucks, trailers, cranes, winches and the like) and/or drivers must comply with the PCMSO.

NOTE: For all Occupational Health Procedures, a copy of the employees' Occupational Health Certificate (ASO) must be presented, specifying the tests carried out.

#### **Vehicles**

Equipment, tools and/or materials used in the execution of the work/services may be transported in vehicle bodies. People may not be transported in their bodies.

Vehicles must be driven by a legally qualified person and be in good condition, in accordance with the applicable legislation.

#### **Personal Protective Equipment**

It is the contractor's responsibility to provide its employees free of charge with PPE for permanent and basic use (safety helmets, safety shoes and safety glasses) as well as other PPE that may be necessary according to the nature of the services. The PPE to

be used in the contractor's tasks must be based on NR 6 of Ordinance 3214/78 of the Ministry of Labor and Social Security.

The delivery control of individual PPE must be duly updated and kept in the possession of the contractor, making it available for inspection by the Service Provider and any inspections by the competent bodies.

It is the contractor's responsibility to monitor the use of appropriate PPE by its employees, as well as training them in its use, safekeeping and conservation.

All PPE distributed must have a Certificate of Approval (CA) and copies of these documents must be kept at the Contractor's site and made available for inspection by the Construction Company's Environmental Team and any checks by the competent bodies.

The Inspection Department may carry out random checks on the quality and condition of the PPE, withdrawing from use any that fail, with the contractor being obliged to replace them at no cost to the employees.

Any PPE withdrawn from use by the Service Provider shall be rendered unusable and handed over to the contractor for proper disposal.

Helmets must bear the explicit identification of the Contractor.

All safety footwear must have metal components against falling materials, except when working with electricity, where the footwear must meet specific technical standards.

The earplug used must be of the shell type and, except in combined protection applications, disposable earplugs may be permitted.

Any and all PPE defined as disposable will be limited to a maximum of one day's use or, in the event of deterioration and/or immediate contamination, to a maximum of a single use, after which it must be discarded. Contractors' employees are not permitted to use PPE that is not supplied by them and/or to use PPE of any kind discarded by the Service Provider.

### Uniforms

The contractor must wear uniforms, preferably standardized and with the contractor's identification.

### Construction site

If a construction site is required, the contractor must submit a plan of all the necessary support buildings, as well as a project or description of how these buildings will be built, with specifications for the materials (civil, mechanical, electrical).

### Materials Depot

The contractor must indicate on the site plan the areas set aside for the storage of materials to be used in the projects, whether built or not.

The materials to be used in the construction of civil works or installations must be arranged in such a way as not to hinder the transit of people, the circulation of materials, access to fire-fighting equipment, obstruct emergency doors and/or exits and not cause overloads in walls or slabs beyond those provided for in their sizing.

On raised floors, materials should not be stacked closer to their edges than the height of the stack, unless there are walls or protective elements. Pipes, rebar, profiles, bars, planks and other materials of great length or size must be arranged in layers, with spacers and retaining pieces, separated according to the type of material and the gauge of the pieces. Wood removed from scaffolding, siding, forms and shoring must be stacked after the nails, wires and lashing stPIRs have been removed or rebated.

Welding gas containers must be transported and stored properly, in compliance with the regulations on the transportation and storage of flammable products.

Toxic, flammable or explosive materials must be stored in isolated, appropriate and marked/identified locations, in accordance with current legislation. Inventories must be kept available for inspection by the service provider.

### Signage/Area Isolation

The contractor's premises must be signposted to:

- Identify the support sites that make up the construction site;
- Indicate exits with signs and/or arrows;
- Maintain communication through notices, posters or similar;
- Warn against the danger of accidental contact with moving parts of machinery and equipment;
- Warn about the risk of falling;
- Warn about the mandatory use of PPE, specific to the activity carried out, with the appropriate signs and warnings near the workstation;
- Identifying access, vehicle and equipment movements on site;
- Warn against the risk of workers passing through where the ceiling height is less than 1.80m (one meter and eighty centimeters);
- Identify places with toxic, corrosive, flammable, explosive and radioactive substances.

For any and all activities carried out outside the contractors' sites, adequate isolation is required to prevent uninvolved people from accessing the work area, as well as signaling to drivers of various vehicles. These must be provided by means of area isolation pedestals, made of material that facilitates transportation, to be used in conjunction with zebra stPIRs or demarcation screens.

### Fire Protection

The contractor is obliged to equip its facilities or facilities located in the project areas with the necessary fire-fighting equipment, in accordance with current state and federal legislation.

All employees working on the project must be trained in the correct use of portable fire-fighting equipment, as well as respecting the areas exclusively designated for this equipment, and not obstructing passageways or access to it.

### Order and cleanliness

The contractor's premises must be organized, clean and unobstructed, especially in circulation routes, passageways and staircases.

Rubble and any leftover materials must be regularly collected and removed. When removing them, special care must be taken to avoid excessive dust and possible hazards.

It is forbidden to keep garbage or debris piled up or exposed in inappropriate places on the construction site, and it is also forbidden to burn garbage or any other material inside the construction site.

### Supervision

The Environmental Inspection of Projects to be carried out by the PMU will make inspections at any time at the sites where the Contractor carries out services.

Any irregularities found by the inspector and/or agent must be dealt with by the contractor, who must implement the corrections in accordance with the instruments set out in this document.

The Environmental Inspectorate will suspend any work that poses an imminent risk to the safety of personnel, equipment or the environment. Suspensions of work due to unsafe conditions do not exempt the contractor from the obligations and penalties of the contract clauses relating to deadlines and fines.

### Safety meetings

The contractor's employee responsible for the SESMT must attend periodic meetings on Safety and the Environment, to be scheduled by the Environmental Inspectorate.

On a monthly basis, the Contractors must send the following information for statistical purposes:

- Number of man-hours worked (including overtime);
- Number of days lost;
- Number of days debited;
- Number of typical lost-time accidents;
- Number of typical accidents without lost time;
- Training.

All employees must receive induction and periodic training to ensure that they can carry out their activities safely.

### Working in rural areas

Work carried out in the rural environment must follow the guidelines set out in NR-31, which aims to establish the precepts to be observed in the organization and environment of rural work, in order to make the planning and development of the sector's activities compatible with the prevention of accidents and illnesses related to rural work.

The guidelines set out in the aforementioned Standard are highlighted, which, among others presented in the full NR-31, must be complied with by the companies involved in implementing the Subprojects when in rural areas:

- Drawing up a Rural Work Risk Management Program (PGRT), which may use risk assessment tool(s) to be made available by the Special Secretariat for Social Security and Labor (SEPRT), to structure the PGRTR and draw up an action plan, taking into account the report produced by these tool(s), in accordance with the parameters established in the Standard;
- Creation of CIPATR and SESTR, equivalent to CIPA<sup>47</sup> and Specialized OHS Service for rural activities;
- Include in the list of PPE the use of sunscreen, repellents, hats with brims and, when necessary, gloves and leggings;

---

<sup>47</sup> Internal Accident Prevention Committee

- Forage machines and other trailed equipment must have a reversing system among other safety devices supplied by the manufacturer, and the instructions for use and safety described in the operating manual, as established in NR-31;
- Training in the use of equipment and machinery must be given to users/operators;
- Lifting, transporting, loading, unloading, handling and storing products and materials must be carried out in such a way that the physical effort made by the worker is compatible with their safety, health and strength;
- Whenever technically possible and when it does not make the activity unfeasible, cargo handling should be carried out mechanically, using appropriate machinery and equipment;
- Buildings must be constructed taking into account accessibility systems and ease of access for workers moving materials, products and equipment, and must provide safety, thermal comfort, adequate ventilation, lighting and sunlight, anti-slip flooring where necessary, protection against damp and protection from the elements;
- Buildings must be constantly cleaned and disinfected;
- If dormitory accommodation is required for construction work, it must be provided:
  - a) the ratio of at least 3.00 m<sup>2</sup> (three square meters) per single bed or 4.50 m<sup>2</sup> (four square meters and fifty square centimeters) per bunk bed, in both cases including the circulation area and the closet, or alternatively beds separated by at least 1 m (one meter);
  - b) a number of beds corresponding to the number of workers housed in the room, with the prohibition of using three (3) or more beds in the same vertical position, with vertical and horizontal spacing to allow workers to move around safely;
  - c) beds with a mattress certified by INMETRO;
  - d) upper bunk beds with side protection and a ladder attached to the frame;
  - e) lockers with individual compartments for personal belongings;
  - f) doors and windows capable of providing sealing and security;
  - g) adequate lighting and ventilation;
  - h) waste collection containers; and
  - i) separation by sex.

### **Preparation and Presentation of the OHS Plan**

When drawing up the Occupational Safety, Hygiene, Medicine, Living and Environment Management Plan, the construction contractor must define, in conjunction with the Environmental Inspectorate (TA), the forms and *checklists* that will be used to assess the conditions established in the Plan for the environmental and safety conditions of workplaces and equipment.

The Environmental Supervision Unit (UGP) must set a deadline after publication of the contract signature for the submission of the Occupational Safety, Hygiene, Medicine, Living and Environment Management Plan to be supplied by the contractor, which will be implemented at the start of the project after approval by the Environmental Supervision Unit. If the Plan has not been submitted and approved, the issuance of the Work Order may be jeopardized. It is suggested that the Plan be submitted within 30 days.

### **Hiring Labor**

The Subprojects will provide a temporary boost to the labor market as a result of the demand for labor during the implementation stage of the projects.

Attention should be paid to the supply of jobs at this stage, prioritizing, where possible, the hiring of people close to the developments or local residents.

It is important to highlight the focus on gender equality in hiring employees, thus encouraging women to enter the job market.

The following strategies are envisaged for mobilizing and demobilizing the workforce during implementation:

- Publicizing training opportunities and vacancies, using regional media;
- Training, with the aim of providing the selected workforce with training that can be immediately absorbed and then facilitating the insertion of this workforce into the market once the projects have been implemented;
- Drawing up protection instruments for workers in vulnerable situations.

### **Workforce Training and Environmental Awareness**

All workers involved in the implementation of the project must receive training and environmental awareness and health education regarding the measures, precautions and environmental control procedures to be observed during the execution of the works, as well as their conduct in dealing with the surrounding community, in order to avoid possible conflicts.

The training should provide all employees with useful information on the following subjects:

- Notions of environmental legislation;
- Fire prevention;
- Emergency procedures (accidents, fire, etc.);
- Care for vegetation and fauna;
- Care for historical and archaeological heritage;
- Collection, packaging, storage and final disposal of waste;
- Use of safety equipment;
- Erosion prevention and control;
- Preventing pollution and contamination of water resources;
- Recognition of venomous animals and procedures in the event of accidents;
- Respect for the community, including tackling gender-based violence and sexual harassment;
- Reducing the risk of accidents and improving occupational and individual health conditions for site workers;
- Control of vector-borne diseases (waterborne, sexually transmitted, etc.);
- The necessary precautions and attitudes are taken to ensure that construction sites and work fronts do not harm the quality of the water or the flora and fauna, and that a respectful relationship is maintained with local communities.

## **Activities**

- Holding training courses in environmental and health education on a cyclical basis (at least once a year);
- Holding mini-courses with employees to implement innovative practices in dealing with the environment;
- Preparation of educational material such as posters, leaflets, booklets and others, containing guidance on the proper use of equipment and machinery, good relations with local residents and health and safety;
- Holding events on commemorative dates (environmental day, for example);
- Conducting the Daily Work Safety Dialogue - DDS;
- ATER, together with the PMU, must evaluate and approve the training programs and materials presented by the contractor.
- In addition to the integration course, apply training involving environmental and social issues, with annual refresher courses that are directly related to accident and near-accident metrics, not only in the PMU and TA (operational), but also on the Subproject implementation fronts. Incorporate topics such as: respect for the community, including gender, diversity, vulnerable populations and cultural aspects; labor rights and duties, community and worker protest management systems.

## **Code of Conduct for Employees**

Ethics is the ideal of human conduct that guides each human being in their decision about what is good and right for themselves and their lives in relation to their fellow human beings, with a view to the common good. Personal ethics and business ethics are inseparable in order to guarantee good practice and conduct when implementing projects.

The adoption of ethical principles and conduct based on a Code of Conduct is fundamental to ensuring that the contracted company, its managers and employees act in an integrated and coherent manner when conducting their relations and business with different audiences: clients, shareholders, investors, suppliers, partners, third parties, the government, the community and society in general.

As a goal, the code of conduct should be a standard of personal and professional conduct for all employees, collaborators and managers, regardless of the position they hold or how they are hired.

The code of conduct must include the following guidelines to be adopted by all employees, managers and contractors hired during the implementation phase of the Subprojects:

- Respect for society;
- Offering quality products and services;
- Promote sustainable development, education and environmental awareness, ensure the protection, preservation and restoration of water resources and the environment for present and future generations;
- Promoting equal opportunities, respect for diversity and professional development. Establishing relationships of trust and encouraging participation through communication and integration;

- To act fairly, legally, coherently, transparently, ethically and honestly in all practices and decisions;
- Act with professionalism, agility and efficiency, guaranteeing the quality of processes, services and products. Valuing shared knowledge, proactivity, creativity, innovation, simplicity and flexibility in the search for solutions;
- Acting with citizen awareness and responsibility in promoting the public good;
- To carry out its activities based on the principles of environmental prevention and precaution, in the pursuit of continuous improvement, not promoting practices that put the environment at risk;
- Promoting environmental education among the various stakeholders and society in general;
- To respond to the requests and complaints of the local population with the appropriate quality;
- Be patient and calm when dealing with people, especially complainants. It's important to remember that the work is disrupting local communities and this can cause stress.
- Respecting the diversity of its different audiences, assuming the commitment to carry out its activities in an impartial and unbiased manner, without favoritism of any kind, free from prejudice and any type of fraud, corruption and acts harmful to the public administration;
- Disclose transparent and objective information;
- Maintain open channels with the press, social networks and the various segments of society;
- Carrying out their role by ensuring an environment free from moral or sexual embarrassment of any kind; acting actively and preventively against gender-based violence, providing unconditional and unquestionable support and assistance to any victims.
- They must not follow practices or spread inaccurate information that increase the possibility of contagion of infectious diseases, including COVID-19, among workers or the surrounding population.
- Complying with the organization's normative instructions and legal precepts, assuming the commitment to communicate and ensure the dissemination of this knowledge and work orientation;
- To be responsible for everyone's health and safety, by complying with laws and internal regulations relating to Occupational Health and Safety, in order to preserve a healthy environment and quality of life for workers;
- Disclose information that contributes to the quality of work or of an institutional nature that is of interest to their subordinates;
- Do not use goods, services or employees for private purposes;
- To carry out their duties and activities in an ethical and transparent manner, ensuring an environment free of any favoritism for themselves or others, combating any form of bribery, corruption, kickbacks and acts harmful to national and foreign public administration.
- All workers must be instructed and released from work to take part in public vaccination campaigns;

- All workers should be instructed to behave appropriately on the way from home to work, in order to guarantee the peace and quiet of the local community;
- Only drinking water should be used for personal consumption;
- Toilets must be used properly;
- Under no circumstances will it be permitted to remove vegetation from the construction site or its surroundings without proper authorization;
- Drivers of machinery and equipment must strictly adhere to the planned routes and safe driving; and
- Graffiti is forbidden on the premises of the construction site, which must always be kept clean and tidy, as everyone's obligation.
- All workers must behave and conduct themselves appropriately with respect for other workers and the public, preventing and combating situations of harassment.

Other values may be added to the Code of Conduct, provided that they are necessitated by new realities or omissions, and must always be discussed with and approved by the PMU.

An explanatory course on what the Code of Conduct means and how it applies should be given to employees - including examples of good and bad practices involving their conduct.

Employees must be aware of the Code of Conduct and sign an acknowledgement, thereby increasing their sense of responsibility in their daily actions.

### **Code of Conduct for Contractors**

All contractors must submit a Forced Labor Performance Statement and a Forced Labor Declaration.

Companies will have to include the Forced Labor Declaration in the list of documents included in the bid or contract offer.

The Declaration of Past Performance on Forced Labor will require the contractor (including each consortium or Join Venture member), subcontractors, suppliers and/or manufacturers proposed by the construction company, to declare any contract in which it has been suspended or terminated, or other remedies or contractual sanctions applied, including performance guarantees, for reasons of non-compliance with forced labor obligations in the last 5 years.

The declaration should be adopted for companies contracted for works, subcontractors, suppliers and manufacturers in the main supply chain, being obliged to comply with contractual commitments, including terms:

- we agree that there will be no Forced Labor among employees, workers and any other person employed or contracted by us;
- we accept that the officials, employees, workers and any other person employed or contracted, are hired under working conditions that comply with the contractual obligations established in the Contract;
- we will include in our contracts with subcontractors/suppliers/manufacturers of [solar panels] [solar panel components] obligations to prevent Forced Labor among employees, officers, workers and any other person employed or engaged by the subcontractor/supplier/manufacturere;

- we will include in our contracts with Subcontractors/suppliers/manufacturers of [solar panels] [solar panel components], that Subcontractors/suppliers/manufacturers have the obligation to prevent Forced Labor in all contracts they enter into with their suppliers/manufacturers of [solar panels] [solar panel components];
- we will supervise our Subcontractors/suppliers/manufacturers of [solar panel] [solar panel components] in the implementation of the obligations to prevent Forced Labor among employees, officials, workers and any other person employed or contracted by them;
- we will require our Subcontractors/suppliers/manufacturers to notify us immediately of any incidents of Forced Labor;
- we will immediately notify the Employer of any incident of Forced Labor at the site or on the premises of the Subcontractors/suppliers/manufacturers [solar panel] [solar panel components];
- include in the periodic progress reports submitted in accordance with the contract, sufficient details of our compliance with forced labor obligations, including our subcontractors/suppliers/manufacturers; and we
- we confirm that the subcontractors/suppliers/manufacturers of [solar panels] [solar panel components] for this contract are (or are likely to be):

As a strengthening of the contractual clause, the following text should be attached to the contract:

The company contracted to implement projects, including its Subcontractors/suppliers/manufacturers, must not use or request forced labor. Forced labor is any work or service, not performed voluntarily, that is exacted from an individual under threat of force or penalty, and includes any type of involuntary or compulsory labor, such as slave labor, bonded labor or similar labor contracting arrangements.

No person who has been trafficked shall be employed or contracted. Trafficking in persons is defined as the recruitment, transportation, transfer, harboring or receipt of persons by means of the threat or use of force or other forms of coercion, of abduction, of fraud, of deception, of the abuse of power or of a position of vulnerability or of the giving or receiving of payments or benefits to achieve the consent of a person having control over another person, for the purpose of exploitation.

In this regard, the contractor must:

- (a) include in contracts with Subcontractors/suppliers/manufacturers of [XXXXXXXX], obligations to prevent Forced Labor among employees, officials, workers and any other person employed or contracted by the Subcontractor/supplier/manufacturer;
- (b) include in contracts with Subcontractors/suppliers/manufacturers of [XXXXXXXXXX], that Subcontractors/suppliers/manufacturers include the obligation to prevent forced labor in all contracts they sign with their suppliers/manufacturers of [XXXXXXXXXX];
- (c) supervise Subcontractors/suppliers/manufacturers of [XXXXXXXXXX] in the implementation of the obligations to prevent Forced Labor among employees, officials, workers and any other person employed or contracted by them;
- (d) require its Subcontractors/suppliers/manufacturers to immediately notify Contractor of any incident of Forced Labor;
- (e) immediately notify the Employer of any incident of forced labor at the site or facilities of [XXXXXXXXXX] subcontractors/suppliers/manufacturers; and

- (f) include in the periodic progress reports submitted in accordance with the contract, sufficient details on compliance with forced labor obligations, including its subcontractors/suppliers/manufacturers.

### **Complaints Management Mechanism for Workers**

The grievance management mechanism for workers must ensure the operation of channels that can deal specifically with complaints from workers in the project's service chain. The channels must be prepared to deal with and/or direct complaints involving forced labor, harassment (moral/sexual), child labor, discrimination, or complaints about risks related to projects, society and workers.

In addition to the employees directly involved in communication activities, the topic of communication should be included with all the workers involved in the project, including subjects such as official citizen service channels, non-violent communication, and proper posture in community communication. This activity can be included in the DDS and worker training processes.

The following tools are proposed for the operation of a grievance management mechanism exclusively for workers:

- Allow workers to organize collectively through unions and associations, opening up space for necessary negotiations with representatives;
- Establish an exclusive channel (whatsapp, for example) for receiving complaints from construction workers;
- Train the service teams of the non-exclusive channels to deal with or direct workers' complaints to those responsible for the matter;
- Make it possible for contractors' workers to speak to the PMU's project/work supervisor;
- Handle and respond to complaints within 5 (five) days for non-emergency situations and 24 hours for emergency situations (cases of harassment, for example);
- Establish a due diligence process in the situations listed to mitigate situations generated by postures or processes established with contractors;
- Publicize the exclusive channels and processes available for workers to express their opinions on the training sessions held.

This mechanism must be established and detailed in an internal PMU procedure and disseminated/implemented with the contractor.

### **Control and supervision of suppliers in the primary supply chain**

Procedures for the control and inspection of suppliers in the primary supply chain must be applied. The procedures to be applied involve:

- Disseminating and making suppliers aware of the ESMP instructions and the importance of following its guidelines;
- Check all supplier documentation, including licenses, permits and OHS documentation;
- Carry out random, unscheduled supervision/inspection of suppliers' facilities and activities, observing compliance with the requirements set out in the ESMP, depending on the relevance of the activity.

### 5.13 Program to Control and Mitigate Temporary Social and Economic Impacts

The aim of this program is to establish socio-environmental management procedures for the Subproject aimed at preserving the habits, activities and rights of the community present in the areas of direct influence of the projects and, consequently, to avoid or reduce discontent among local residents.

**Responsible:** TA will be responsible for implementing the measures with the construction contractors who will have to carry them out. The PMU will supervise the implementation and results of the procedures carried out.

**Target audience:** Communities benefited/affected by the Subproject.

Sub-projects can generate discontent among the community, especially in areas where there is infrastructure that includes civil works, because they interfere with people's daily habits, comfort and privacy. As such, establishing management and control procedures can prevent or significantly reduce such disturbances, as will be shown below.

#### Procedures and guidelines

The procedures designed to avoid or reduce community dissatisfaction with the Project are shown in the table below.

**Table 13 - Procedures to avoid or reduce community dissatisfaction**

OCCURRENCE	DISCONTENT TO BE AVOIDED OR REDUCED	PROCEDURES
Delays in the execution of projects due to the lack of authorization from municipal bodies and specific licenses.	<ul style="list-style-type: none"> <li>□ Increased expectations from residents;</li> </ul>	<ul style="list-style-type: none"> <li>□ Ensure compliance with all formal requirements (Installation License; authorization to suppress vegetation; authorization from the body responsible for traffic; ownership of the intervention area; license for borrowing and dumping areas; etc.) that could lead to project embargoes or legal action;</li> </ul>
	<ul style="list-style-type: none"> <li>□ change in residents' plans and contingencies.</li> </ul>	<ul style="list-style-type: none"> <li>□ prior communication to residents about the start date and duration of projects, as well as any changes to the schedule and their causes.</li> </ul>
Location and construction sites, support areas and support equipment, transportation of materials, maintenance of machinery and equipment and traffic of trucks and heavy machinery.	<ul style="list-style-type: none"> <li>□ Incidents to third parties, contamination of the surroundings, excessive noise, dust, dumping of waste on roads.</li> </ul>	<ul style="list-style-type: none"> <li>□ The construction site should be located in areas that are more isolated from homes and commercial areas;</li> </ul>
		<ul style="list-style-type: none"> <li>□ on the project fronts, the movement of trucks and heavy machinery must be planned in such a way as to shorten the route, avoid damage to the service infrastructure (power distribution, drainage, water supply, etc.);</li> <li>□ soil transport buckets should be covered with a</li> </ul>

OCCURRENCE	DISCONTENT TO BE AVOIDED OR REDUCED	PROCEDURES
		<p>tarpaulin to prevent the spread of dust.</p> <hr/> <ul style="list-style-type: none"> <li><input type="checkbox"/> in rainy periods, to avoid "wheel tracks" of mud on the asphalt and the subsequent formation of dust, truck wheels should be washed;</li> <li><input type="checkbox"/> maintenance of machinery and equipment must be carried out in workshops or at licensed facilities;</li> <li><input type="checkbox"/> the parking and storage of any material in front of projects (e.g. machinery, pipes, metal structures, rebar, etc.) must be properly isolated and signposted; and</li> <li><input type="checkbox"/> handling of residents' complaints, in accordance with the Complaints Management Program.</li> </ul>
Support services.	<ul style="list-style-type: none"> <li>• Release of waste into the environment; and</li> <li>• Constraints for residents and employees.</li> </ul>	<ul style="list-style-type: none"> <li><input type="checkbox"/> Workers' meals should only be served in an appropriate place, isolated from the Project area and in the living areas at the work fronts;</li> <li><input type="checkbox"/> use of chemical toilets at project fronts when convenient;</li> <li><input type="checkbox"/> daily collection of all domestic and industrial waste from the project fronts, as well as transportation and correct disposal of this waste;</li> <li><input type="checkbox"/> response to community complaints;</li> <li><input type="checkbox"/> implementation of projects at the times established by municipal regulations.</li> </ul>
Execution of projects on public roads.	<ul style="list-style-type: none"> <li>• Incidents with the neighborhood.</li> </ul>	<ul style="list-style-type: none"> <li>• Prior communication to residents about the start of the project and its duration;</li> <li>• isolation of construction sites (if any) with siding or "cerkit" to avoid accidents with residents;</li> <li>• adequate signposting of the work or project;</li> <li>• installation of footbridges over the ditch to allow residents access to their homes;</li> <li>• installation of planks in the ditch to allow vehicle access to residential garages;</li> </ul>

OCCURRENCE	DISCONTENT TO BE AVOIDED OR REDUCED	PROCEDURES
		<ul style="list-style-type: none"> <li>• construction companies must respect the lifestyle of the community in the areas of influence of the projects. To this end, it is recommended that a code of conduct be drawn up for project employees;</li> </ul> <hr/> <ul style="list-style-type: none"> <li>• interruption of projects during periods of heavy rainfall to avoid flooding, erosion and siltation;</li> <li>• Covering an open ditch at the end of the day;</li> </ul> <hr/> <ul style="list-style-type: none"> <li>• response to residents' complaints.</li> </ul> <hr/>
	<ul style="list-style-type: none"> <li>• Incidents and damage to commercial activities, schools, churches, associations, clubs, etc.</li> </ul>	<ul style="list-style-type: none"> <li>• to reduce project execution times as much as possible;</li> <li>• isolation of civil works (if any) with siding or fencing, to avoid accidents with passers-by;</li> <li>• adequate project signage;</li> <li>• will consider, together with the local authorities and those responsible for the institutions, the possibility of suspending activities during the project period, when necessary;</li> <li>• installation of planks over ditches to allow vehicles to access the parking lots of stores, churches, associations, clubs, etc;</li> <li>• construction companies must respect the lifestyle of the community in the areas of influence of the projects. To this end, we recommend paying attention to the code of conduct for project employees;</li> <li>• establishing, together with local authorities, special loading and unloading times at commercial establishments; and</li> </ul>

OCCURRENCE	DISCONTENT TO BE AVOIDED OR REDUCED	PROCEDURES
		<ul style="list-style-type: none"> <li>• response to community complaints.</li> </ul>
Conflicts with service providers.	<ul style="list-style-type: none"> <li>• Incidents and damage to residents with interruption of power, telephone, internet services, etc.; and</li> </ul>	<ul style="list-style-type: none"> <li>• Identify the location of power, telephone and internet networks, etc., at service provider companies before the start of projects;• inform all project employees of the location of power, telephone, internet, water and sewage networks, etc.; and</li> </ul>
	<ul style="list-style-type: none"> <li>• Conflict with service providers.</li> </ul>	<ul style="list-style-type: none"> <li>• repair damaged sidewalks and sidewalks to a condition equal to or better than the previous project.</li> </ul>
Moving and operating heavy equipment.	<ul style="list-style-type: none"> <li>• Incidents with residents and structural damage to neighboring buildings.</li> </ul>	<ul style="list-style-type: none"> <li>• noise generation should be reduced as much as possible by using efficient equipment, planning services that involve moving heavy equipment and isolating work areas;</li> </ul>
		<ul style="list-style-type: none"> <li>• prior inspection of poorly constructed residential and commercial buildings, to assess the risk of damage and structural rupture due to vibrations resulting from the movement and operation of heavy equipment;</li> <li>• reducing and fixing the speed of trucks and vehicles on project sites.</li> </ul>
	<ul style="list-style-type: none"> <li>• Nuisance to residents and surrounding businesses</li> </ul>	<ul style="list-style-type: none"> <li>• The construction company must comply with noise emission regulations.</li> </ul>
Excavation, soil movement and embankments	<ul style="list-style-type: none"> <li>• Neighborhood incidents; and</li> </ul>	<ul style="list-style-type: none"> <li>• prevent excavations and the movement of trucks and machinery from damaging adjacent properties; and</li> </ul>

OCCURRENCE	DISCONTENT TO BE AVOIDED OR REDUCED	PROCEDURES
	<ul style="list-style-type: none"> <li>• risk of damage to adjacent properties.</li> </ul>	<ul style="list-style-type: none"> <li>• the waste tips should be deposited and protected to prevent erosion and siltation of drainage systems and private properties.</li> <li>• Assessment of the site and intervention methods, before trenching and moving the soil removed from the trenches and backfill;</li> </ul>
Traffic detour and pedestrian traffic.	<ul style="list-style-type: none"> <li>• Impediment of movement; and</li> </ul>	<ul style="list-style-type: none"> <li>• Signposting of detour, entrances and exits;</li> </ul>
	<ul style="list-style-type: none"> <li>• restrictions on access to homes and businesses.</li> </ul>	<ul style="list-style-type: none"> <li>• If sidewalks are interrupted, establish temporary fenced and signposted paths;</li> </ul>
		<ul style="list-style-type: none"> <li>• Provide temporary parking in the event that access to shops is interrupted;</li> </ul>
		<ul style="list-style-type: none"> <li>• advising truck drivers and other project vehicles on speed control and care when maneuvering on roads open to traffic;</li> </ul>
<ul style="list-style-type: none"> <li>• prior communication to residents and traders about detour and alternative routes; and</li> </ul>		
<ul style="list-style-type: none"> <li>• response to community complaints.</li> </ul>		

### **Control of Atmospheric Emissions and Noise**

The aim of this activity is to minimize atmospheric emissions from the operation of equipment and machinery during project execution, especially when civil works are involved, as well as to reduce the associated noise levels. It includes the regulation and ongoing maintenance of equipment such as the concrete plant, machinery and vehicles in general.

Practices should be adopted such as spraying water on aggregate piles, lanes and loads that could release particulate matter. As well as covering trucks with tarpaulin when they are loaded.

With regard to noise, preventive maintenance of equipment and machinery will be adopted. Physical barriers such as siding should be put in place whenever possible to reduce noise in the vicinity, in specific cases where the maximum permitted levels exceed the expected occurrence time and decibels.

### **Control of Atmospheric Emissions**

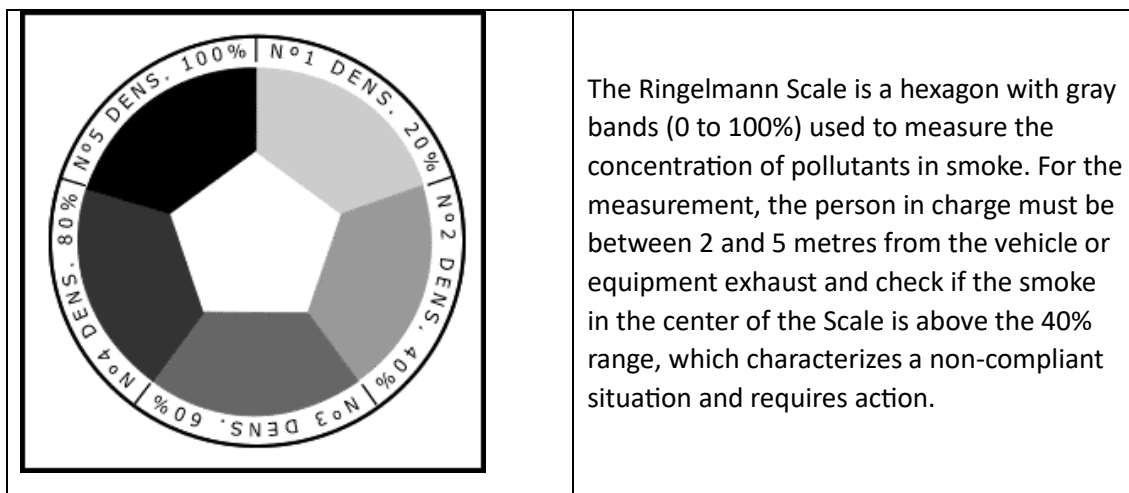

This concerns the control of emissions of particulate matter and gases into the atmosphere, which have the potential to cause damage to the environment, the health and safety of workers and the population in the areas of influence of the projects.

The procedures established for controlling atmospheric emissions are aimed at daily visual monitoring to control dust and smoke from diesel-powered vehicles and equipment used on the construction sites.

To reduce dust, water trucks should be used to spray water on the roads. The work fronts and construction sites should have simple equipment to reduce the amount of mud stuck to the wheels of the trucks, in order to avoid muddying local roads.

To monitor and control smoke emissions, the Ringelmann Scale can be used (figure below). This method is standardized in Brazilian environmental legislation by NBR 6.016/1986 (Diesel engine exhaust gas - Evaluation of soot content with the Ringelmann scale) and by IBAMA Ordinance No. 85 of July 14, 1996. When the concentration is above 40%, improvement measures and adjustments to vehicles and equipment should be required.

**Figure 7 - Ringelmann scale**

Black smoke monitoring for vehicles used in accordance with ABNT NBR 10736. In the event that high levels of pollutant emissions are found in combustion engines using the defined measurement methods (Ringelmann Scale), it is important to adopt emission assessment measures for diesel combustion engines, including assessment of NOx, SO2 and particulate matter, and to adopt measures to bring machinery and equipment into line with the parameters or to replace them.

According to the WHO<sup>48</sup>, when there is no legislation providing parameters for air emission limits, it is recommended to follow the air quality guidelines set out in their guidelines. The following table shows the emission guideline limits for small combustion plants (3MW to 50MW).

**Table 14 - Pollutant emission limits for combustion engines, according to WHO**

Substance	Liquid fuel	Gaseous fuel
Sulphur dioxide (SO2)	1.5 percent Sulfur or up to 3.0 percent Sulfur if justified by specific project considerations	N/A

<sup>48</sup> World Health Organization (WHO). Air Quality Guidelines Global Update, 2005.

PM 24-hour value is the 99th percentile

Substance	Liquid fuel	Gaseous fuel
<b>Nitrogen dioxide (NO<sub>x</sub>)</b>	1460 if diameter < 400mm (or up to 1,600 if justified to maintain energy efficiency). 1.850 diameter > = 400mm	200 (spark ignition) 400 (Dual Fuel) 1,600 (Compression ignition)
<b>Particulate Matter (PM<sub>10</sub>)</b>	50 or up to 100 if justified by specific project considerations	N/A

Source: WHO, 2005.

To prevent the generation of dust that could cause a nuisance to nearby residents, contractors must provide solutions such as water sprinkling systems in the work area during dry periods, whenever this proves necessary, using water trucks to wet down the areas handled by the project and which cause the suspension of particulate matter.

The following table shows some prevention and control actions that can be used in cutting and drilling services.

**Table 15 - Control and prevention measures in cutting and drilling services**

Generating Activity	Control measures
Bench cutting and drilling	<ul style="list-style-type: none"> <li>• Preferably carry out the work in a location isolated from the action of winds;</li> <li>• Use a sawdust collection device attached to the equipment;</li> <li>• In the case of large quantities of emissions, the activity can be carried out in a closed environment with an exhaust hood and filter.</li> <li>• Cutting/drilling with water (when equipment and material allow).</li> </ul>
Saw cut	<ul style="list-style-type: none"> <li>• As this is an activity with low emission potential, minimal controls such as cutting in a place protected from the wind and in a collection box that remains closed after use should be enough.</li> </ul>
Hand saws and drills	<ul style="list-style-type: none"> <li>• Use dust collectors attached to the equipment or vacuum/vacuum immediately after the activity or carry out the service inside collection bins or carry out the service with water, collecting the waste generated. Carry out the activity in a place protected from the wind.</li> </ul>
General	<ul style="list-style-type: none"> <li>• Use industrialized construction technologies whenever possible, avoiding cutting and drilling on site.</li> <li>• In the event of a large volume of cutting and drilling, draw up a cutting and drilling plan, rationalizing the activity. Example: production project for concrete formwork.</li> </ul>

Source: Resende, F. *Poluição Atmosférica por Emissão de Material Particulado: Avaliação e Controle nos Centes de Obras de Edifícios*, Master's Dissertation, Polytechnic School, USP, 2007.

### Noise Emission Control

Various activities envisaged in the context of the projects could generate changes in noise levels, including: in the construction area, earthmoving work and/or handling of construction waste, vehicle traffic, concreting, and in production activities, the use of motorized equipment.

Noise and vibrations from these activities should be minimized. It is important to control noise emitted by poorly regulated or poorly maintained motors. Equipment silencers should be routinely serviced to ensure that they continue to function properly. Work at night should be avoided.

If a Noise Report is required, it should be drawn up in accordance with the procedures described in NBR 10.151 - Noise assessment in inhabited areas for community comfort.

The vehicles and equipment to be used must be regulated and maintained in order to keep noise emissions under control.

In the event of noise complaints from the public, reduction measures and new measurements must be taken and the results communicated to the complainant.

A campaign should be carried out, before the start of the implementation of projects involving activities such as civil works, to measure noise at the intervention sites, together with the receptors considered sensitive when they exist. The use characteristics of the intervention sites, the main equipment planned and its noise emission characteristics should be taken into account, with the aim of ensuring the necessary compliance with current legislation: CONAMA 1/90, ABNT Standard NBR 10151 and corresponding municipal legislation.

Depending on the results of the preliminary assessment, measures should be planned to minimize and control the expected noise levels, such as restricting operating hours, siding, etc. Noise measurements in areas close to the project execution areas should be carried out again if there is a high incidence of complaints, at the discretion of the team responsible for socio-environmental inspection/supervision. The noise limits must comply with ABNT standard NBR 10.151, as shown in the table below.

**Table 16 - Acceptable noise levels, according to ABNT 10.151**

Noise limits according to ABNT NBR 10.151		
Predominant Land Use	Daytime	Evening
	dB(A)	dB(A)
Farm and ranch areas	40	35
Strictly urban residential area or hospitals or schools	50	45
Mixed area, predominantly residential	55	50
Mixed commercial and administrative area	60	55
Mixed recreational area	65	55
Predominantly industrial area	70	60

Source: ABNT 10.151

Note: If the pre-existing noise level at the site is higher than those listed in this table, then this will be the limit.

Noise control will be the responsibility of the companies contracted for the work and TA, the results of which must be presented to the PMU

In addition to the neighborhood impact that affects people's daily lives, the existing plant formations are a shelter for local fauna and could be indirectly affected by noisy activities.

#### 5.14 Gender Violence Prevention and Care Program

This program aims to act directly to combat gender-based violence in the project's areas of operation, with prophylactic and protective actions.

Sexual exploitation and gender-based violence have become a scourge throughout the country and bring insecurity to women, reducing their ability to enter the job market and often to access education. It's a storyline that traps some women in a vicious circle and often ends in violence and death.

**Responsible:** TA, construction companies and PMUs, as well as their workers, are responsible for preventing and dealing with gender-based violence. The TA must provide guidance and disseminate good practices, mechanisms and tools on worker conduct and how to act in the event of incidents to its workers and to the construction companies,

which must apply these measures. The PMU must also implement the measures with its employees and supervise the process throughout the chain of actors involved in implementing the Subproject.

**Target audience:** Workers from the institutions involved in implementing the Subproject.

## Objective

---

From this perspective, the aim of this program is to protect and promote the social and economic development of women in the Project's areas of operation.

To achieve this, it is necessary to achieve:

- Building a common understanding of the meaning of Sexual Harassment (SH) and Sexual Exploitation and Abuse (SEA);
- The shared commitment to guidelines and behaviors of all those involved in the Project to prevent, report and respond with appropriate measures in the event of the occurrence of SA and/or SAEs;
- The understanding that violating an established code of conduct will result in disciplinary action and the activation of competent authorities.

## Definitions

---

This program considers the following definitions, which should always be updated and widely discussed with employees, teams involved in the project and the community in general:

- **Sexual Harassment**<sup>49</sup> : Unwelcome sexual advances, requests for sexual favors and other verbal or physical conduct of a sexual nature.
- **Sexual Exploitation and Abuse**<sup>50</sup> : It is defined as any actual or attempted abuse in a situation of vulnerability, power (of the abuser) or trust, for the purpose of sexual satisfaction of the abuser, including, but not limited to, satisfaction, monetary, social or political profit, with the sexual exploitation of another<sup>51</sup> . **Sexual abuse**: "The actual or threatened physical intrusion of a sexual nature, whether by force or under unequal conditions or coercion".
- Distinction between **Sexual Harassment** and **Sexual Exploitation and Abuse**: while sexual **harassment** usually occurs between staff/employees of an organization or company and involves any unwanted sexual advance or unwanted verbal or physical conduct of a sexual nature, **Sexual Exploitation and Abuse** in turn prevails against a beneficiary or community member. The distinction between the two is important so that agency policies and staff trainings can include specific instructions on the procedures for reporting each.

---

<sup>49</sup> Inter-Agency Standing Committee Protection against Sexual Exploitation and Abuse (PSEA): Inter-agency cooperation in community based complaint mechanism. Global standard Operating Procedures. May 2016

<sup>50</sup> As defined in the UN Secretary's bulletin - Special Measures for protection from sexual exploitation and abuse October, 9, 2003 ST/SGB/2003/13

<sup>51</sup> In the context of World Bank-financed operations exploitation occurs when access to or benefit from a World Bank-financed good or service is used to extract sexual gain

- **Consent:** is the choice behind a person's voluntary decision to do something. Consent to any sexual activity must be freely given, made with as much knowledge as possible, and specific to the situation. If the agreement is obtained through threats, lies, coercion or exploitation of the power imbalance, it is not consent. Consent as understood here cannot be given by anyone under the age of 18<sup>52</sup>, regardless of the age of majority or the age of consent considered in local legislation. Finally, it should be understood that the alleged mistaken belief regarding the child's age is not a defense.

Thus, there is no consent when the agreement is obtained through:

- Use of threats, force or other forms of coercion, kidnapping, fraud, manipulation, deception or misrepresentation;
- Using threats to withhold a benefit to which the person is already entitled;
- A promise made to a person in order to receive a benefit.

### **Procedures and guidelines**

---

Prophylactic actions with the teams involved in implementing the project are presented below.

#### **Code of Conduct Against Gender Violence**

While all forms of violence against a resident of the local community or a co-worker are prohibited, this Code of Conduct is particularly focused on the prevention and reporting of **Sexual Exploitation and Abuse** and **Sexual Harassment** which constitute misconduct and are grounds for termination and/or other consequences with the local authorities. It is part of this code:

- Treat all people, including children (under 18), with respect regardless of sex, race, color, language, religion, political or other opinion, national, ethnic or social origin, gender identity, sexual orientation, property, disability, birth or other status.
- Commit to creating an environment that prevents **Sexual Exploitation and Abuse** and **Sexual Harassment** and promotes this code of conduct. In particular, seeking to support the systems that maintain this environment.
- Not participate in **Sexual Exploitation and Abuse** and **Sexual Harassment**, as defined by this Code of Conduct and as defined in Brazilian law.
- Do not use language or behavior towards women, children or men that is inappropriate, harassing, abusive, sexually provocative, humiliating or culturally inappropriate.
- Do not engage in sexual contact or activity with anyone under the age of 18, considering that a mistaken belief about a child's age, or the child's own consent, is not a defense.
- Do not take actions aimed at building a relationship with a minor that leads to sexual activity.
- Do not solicit or engage in sexual favors in exchange for anything.

---

<sup>52</sup> According to the United Nations Convention on the Rights of the Child.

- No sexual interactions with members of the surrounding communities, unless there is full consent from all parties involved, recognizing that a child is incapable of giving consent and a child is someone under the age of 18. Relationships involving the retention or promise of actual provision of benefits (monetary or non-monetary) to members of the community in exchange for sex is considered "non-consensual" under this Code.

### **Individual commitment signed**

It is part of the prophylactic actions that each employee signs a specific individual commitment. This commitment will be formalized in an individual Term of Commitment to be signed containing the content of the model shown below:

*I, (name) As an (employee/contractor) of (PMU, Contractor, etc.) under PROCASE II, acknowledge that **Sexual Exploitation and Abuse** and **Sexual Harassment** activities in the workplace, around the workplace, on construction sites or in the surrounding community constitute a violation of this Code of Conduct Against Gender-Based Violence. I understand that **Sexual Exploitation and Abuse** and **Sexual Harassment** activities are grounds for sanctions, penalties and termination of employment. Finally, I understand that Project Management must bring this to the attention of the competent authorities.*

*I agree that as a worker on the project I will commit to:*

- *The provisions of this code of conduct on and off the Project site.*
- *Actively participate in training courses related to the prevention of **Sexual Exploitation and Abuse** and **Sexual Harassment** whenever requested by my employer.*
- *In case of awareness or suspicion of **Sexual Exploitation and Abuse** and **Sexual Harassment**, at the project site or in the surrounding community, I understand that I am encouraged to report it to the Complaints Reporting Mechanism and/or to my manager. I must always take into account the safety and right to privacy of the person who has suffered the abuse.*

*I understand that if I violate this Individual Commitment, I may receive disciplinary action, which may include:*

- Informal notice or formal notice;*
- Suspension of employment (with or without pay);*
- Termination of employment;*
- Be indicted to the local authorities.*

*I understand that it is my responsibility to adhere to this code of conduct. I acknowledge that I have read and understood the Code of Conduct Against Gender-Based Violence, agree to comply with the standards contained in this document and understand my role and responsibility to prevent and potentially report issues of **Sexual Exploitation and Abuse** and **Sexual Harassment**. I understand that any action inconsistent with this Individual Code of Conduct or failure to act as directed by this Individual Code of Conduct may result in disciplinary action and may affect my ongoing employment.*

*Signature: \_\_\_\_\_*

*Printed name: \_\_\_\_\_*

Date: \_\_\_\_\_

### **Situations of Gender Violence Caused by a Project Collaborator**

In the event of violence caused by a Project employee, the following actions must be taken:

- Emergency action should be taken whenever the integrity and health of the abused person is still under threat;
- The victim must be located, attended to and welcomed, and the situation must be assessed by the project team to determine the best approach and sequence of care;
- The employee will be subject to the applicable legal and criminal actions, in addition to the sanctions established in the contract, including dismissal.

### **Situations of Gender-Based Violence in the Community**

If the PMU or any employee receives information about violence in the Project's area of operation, the following actions must be taken:

The PMU should check whether it is necessary to call in the authorities so as not to increase the risk to the victim and/or the team itself;

If possible, the victim should be located, cared for and taken in. The situation should be assessed by the project team to determine the best way to approach and follow up on the case.

### **Educational Campaigns and Channel Promotion**

Educational campaigns should be drawn up in connection with the Project's Communication Program on the subject of gender inclusion. Women's rights and the fight against gender-based violence must be addressed. The communication channels<sup>53</sup> for reporting cases of violence and requesting support should always be presented:

- **Women's Defense Center of the Public Defender's Office (Nudem):** The Women's Defense Center (Nudem) is a service that is part of the specialized Human Rights area of the Bahia Public Defender's Office. Nudem offers assistance in medium and long-term emergency situations, to provide women with recognition of their rights to a life without violence. Victims can go to the Public Defender's office, located at Rua Monsenhor Walfredo Leal, 503, Tambiá. The office is open from 8am to 5pm and the contact number is (83) 98826-7924 (WhatsApp), and there is also an e-mail address: [defesadamulher@defensoria.pb.def.br](mailto:defesadamulher@defensoria.pb.def.br).
- **Women Protection Program** The device is a pioneering action in the country, as it enables direct contact with the Military Police, to whom the victim informs, with a single click, the detailed situation in which she finds herself, triggering the appropriate police action. The specially programmed cell phone has three alert devices with red, yellow and green indications. A green button means that there is no need for police action. The yellow button is a warning signal that the aggressor is hanging around where the victim is; and the red band means that the police need to be present because the aggressor is embarrassing or threatening the victim. Through the monitoring system, the police are able to identify the exact location of the victim, giving them complete freedom to move around safely. In parallel with

---

<sup>53</sup> Channels need to be kept up to date and checked before each advertising event.

these actions directly related to the victims who come to the police stations, the Protected Women Program also works on prevention, holding educational and awareness-raising talks on the subject of domestic violence in schools, unions, associations, industries, construction sites, as well as leafleting in streets, squares and events.

- **Specialized Prosecutor's Office for the Defence of Women in Situations of Domestic and Family Violence:** Rua 13 de Maio, nº 691, Centro - CEP: 58013-075. Telephone: (83) 2107-6016.
- **Specialized Women's Ombudsman's Office / Center for Women Victims of Violence of the Public Defender's Office of Paraíba:** Parque Solon de Lucena, nº 300 - Centro - CEP: 58013-130. Telephone: (83) 3221-6320
- **Special Court for Domestic and Family Violence Against Women:** Rua Visconde de Pelotas, s/n, Centro - CEP: 58013-000. Telephone: (83) 3222-7682/7268
- **SOS Women Project:** a project aimed at women who are victims of serious threats and are under a protective order. The aim of the project is to help women who find themselves in a dangerous situation through alerts sent from a cell phone that is linked to the Military Police Operations Center, triggering immediate action. Victims of domestic and family violence as described in the Maria da Penha Law (Law 11.340/06), which says "Any action or omission based on gender that causes death, injury, physical, sexual or psychological suffering and moral or property damage", should seek help at a police station or by calling the women's hotline at 180. After registering the incident, the case will be analyzed and, in addition to protective measures, the victim may be given an SOS Mulher device.

The activities and themes should be detailed, for example: training, lectures, workshops, etc. As themes and actions, it is suggested that they be included in the project:

- Cervical Cancer Prevention.
- Breast Cancer Prevention.
- Prevention of Sexually Transmitted Infections.
- Teenage Pregnancy.
- Drug Prevention.
- Personal hygiene and quality of life with distribution of hygiene kits.
- The importance of women.
- The best way to act in risky situations.
- First aid.
- How to guarantee equality for women in the labor market;
- Maria da Penha Law and Femicide;
- Orange Month - Against Violence and Sexual Abuse against Children;
- Lilac August - Violence Against Women;
- International Women's Day;
- Female empowerment;
- Bullying and its consequences;
- Lecture on Rights and Duties - ECA (Statute of the Child and Adolescent);

### **Security-focused actions in Subprojects**

In the sub-project areas, it will be important to assess and adapt locations that may pose a greater risk of violence and harassment:

- Increase the fluidity of circulation and connection of spaces/places that are more confined;
- Reduce dark areas and blind spots by reassessing lighting and installations, as well as positioning security cameras where necessary;
- Workers, especially those with a degree of vulnerability and gender, must be accompanied by at least one co-worker;
- The Subprogram's actions in which the situation of GBV is identified should bring together state and municipal institutions to expand the support network.

### **5.15 Program to Mitigate Impacts on Traditional Communities**

In 2020, the Inter-American Development Bank (IDB) approved the new Environmental and Social Policy Framework (ESPM), raising the importance of respect for human rights, establishing stricter protections for people and groups in situations of vulnerability to the potential risks and impacts of supported projects. It specifies where it is necessary to obtain the free, prior and informed consent of indigenous peoples, determines the protection of people of African descent and people with disabilities and requires the consideration of factors such as race and ethnicity, age and social status, being aligned with the most recent versions of the central international conventions and instruments of the United Nations (UN) and the International Labor Organization (ILO). Similarly, IFAD Standard 4 addresses the issues required in the prevention and mitigation of impacts on traditional communities.

IDB and IFAD Policies recognize that Indigenous Peoples and traditional peoples recognized in national laws as distinct social and cultural peoples are often among the most marginalized and vulnerable segments of the population. In many cases, their economic, social and legal status limits their ability to defend their rights and interests in lands and natural and cultural resources and can restrict their ability to participate in and benefit from development that is in line with their worldview. These communities are particularly vulnerable if their territories and resources are impacted, invaded or degraded. This vulnerability can include impacts on their social organization, cultural aspects and natural resource-based livelihoods, as well as exposure to impoverishment and disease.

In PROCASE II, given the level of detail used in the studies, risks of affecting **traditional indigenous communities, quilombolas, gypsies and fishermen/ shellfish gatherers** were identified. Although no interventions directly affecting fishing communities have been identified, their presence in the project area must be acknowledged. Impacts related to these communities are expected, especially with regard to possible customs and cultural traditions, use of natural resources (wood and plants, for example), among others. It is important to comply with the guidelines presented below as the next steps to be taken.

**Responsible:** TA is responsible for implementing the measures set out in this Program, with the respective supervision and coordination of the PMU.

**Target audience:** Protection agencies (e.g. FUNAI) and traditional communities benefiting/affected by the Subproject.

## Procedures and guidelines

---

As established in the Safeguard Policies, the borrower must:

- Ensure that the development process promotes full respect for the human rights, collective rights, dignity, aspirations, culture and natural resource-based livelihoods of Indigenous Peoples and traditional communities;
- Anticipate and avoid adverse impacts of projects on Indigenous Peoples and traditional communities, or when it is not possible to avoid, minimize and/or compensate for such impacts;
- Promote sustainable development benefits and opportunities in a culturally appropriate way;
- Establish and maintain an ongoing relationship based on Consultation and Informed Participation (CPI) in a culturally appropriate manner with Indigenous Peoples and traditional communities affected by a project throughout its life cycle;
- Ensure the Free, Prior and Informed Consent (FPIC) of Indigenous Peoples and traditional communities affected by the project in the circumstances described in the Environmental and Social Policy Frameworks;
- Respect and preserve the culture, knowledge and practices of traditional populations;
- In addition to what is recommended in the previous items, all the bodies responsible for protecting traditional peoples, such as FUNAI for indigenous peoples in Brazil, must be consulted. When the body issues a statement, where appropriate, the necessary requirements must be met.

The guidelines required of borrowers must comply with the Safeguard Policies, and with the national regulatory frameworks relevant to the Project, including principles set out in treaties that form part of national law and are applicable by virtue of their ratification.

In addition to Informed Consultation and Participation and Free, Prior and Informed Consent, the following will be required:

- Carry out a Sociocultural Analysis (ASC), specific to the Subproject to be implemented, which should include:
  - Methodology with participatory planning tools and approach to sustainable livelihoods;
  - Legal framework and legal provisions, considering the National Policy for the Sustainable Development of Traditional Peoples and Communities (PNPCT), international declarations and conventions such as ILO 169;
  - Socio-cultural baseline, including information on human capital, territoriality, religious systems, worldview (cosmology), health, education, social capital, social organization, local governance, partner organizations, physical capital, access/displacement, spatiality/housing, water supply, sanitation, waste management, energy, communication, natural capital, extractivism, gardens/plantations, fishing, hunting, financial capital.
  - Vulnerability analysis and population expectations;
  - Assessment of risks and impacts, including, among others:
    - interference in traditional rituals and festivals, cultural customs,
    - introduction of diseases;

- accidents on construction sites and access roads;
  - conflicts in internal and external governance;
  - harassment of women and children;
  - introduction of drugs and alcohol;
  - harassment of illegal businesses and undue scams;
  - shortages (water, energy and natural resources);
  - annoyance from noise and air pollution;
  - other interferences with ecosystem services.
- Socio-cultural Action Plan, including mitigation, compensation and monitoring measures:
    - Situations that result in a loss of way of life, impediment to cultural activities or material loss (e.g. affecting recreational areas, cultural sites, religious sites) should be compensated with proposals that establish the replacement of the loss or the restoration to an identical or better situation.
  - Engagement Plan with guidelines for consultations with traditional communities, the structuring of a stakeholder matrix, and the implementation of a grievance mechanism prepared to deal with traditional communities.

All these tools and processes should provide results and indicate measures to eliminate, reduce, mitigate or compensate for the impacts generated in the community.

The following tables show examples of a matrix of risks and potential measures in a traditional community ASC:

**Table 17 - Example of a matrix of risk mitigation measures for indigenous populations**

Risk identified	Suggested measure
Risk of interference with rituals and festivals	- Adapt the construction schedule to stop work during the longest Temb� rituals, in May and December; - Draw up a Temb� Code of Conduct and train, with the help of the borrower, contractor and workers on their cultural specificities, warning of penalties for non-compliance with safeguards.
Enhance the degree of participation (CPI) and guarantee the process of free, prior and informed consultation (CLPI)	- Carry out a continuous consultation process, which is initiated with adequate time, prior to each stage of the work, recording the aligned decisions on the measures to be monitored.
Risk of non-compliance with safeguards related to the cultural suitability of the architectural project	- Implement a continuous Consultation Plan, which is initiated with adequate time, prior to the construction planning stage, stimulating reflection and negotiation on cultural adjustments to the Project.
Risk of introducing diseases	- possibility of hiring Temb� labor; - Requirement of a Health Protocol for external workers - (up-to-date proof of vaccination, with a complete vaccination schedule for Covid-19, accompanied by a doctor's certificate that the worker does not have a contagious disease);
Risk of accidents on the construction site and access roads	- Culturally appropriate measures discussed with the Temb� in the Consultation Plan to prevent the movement of indigenous people around the construction site: visual and audible warnings prior to the movement of machinery on access roads within the village; - Compliance with the safety standards imposed by regulations and legislation for managing vehicle traffic in places where people are present.

Risk identified	Suggested measure
Risk of internal governance conflicts between villages	- Stakeholder engagement with the displacement of representatives from the other villages for which the borrower is responsible during the consultation stages.
Risk of conflicts in external governance with partner institutions	- Stakeholder engagement carried out in advance and formally between the federal entities and FUNAI.
Risk of harassment of women and children	- Avoid housing workers in the Indigenous Territory, making it possible for them to stay in the surrounding villages with daily transportation during work shifts; - Draw up a Temb� Code of Conduct and train, with the help of the borrower, the contractor and the workers on its socio-cultural specificities, warning of penalties for non-compliance.
Risk of harassment of young people through the introduction of alcohol and drugs	- Avoid housing workers in the Indigenous Territory, making it possible for them to stay in the surrounding villages with daily transportation during work shifts; - Draw up a Temb� Code of Conduct and train, with the help of the borrower, the contractor and the workers on its socio-cultural specificities, warning of penalties for non-compliance.
Risk of harassment for selling game and fish	- Train external workers, especially with regard to current legislation and international safeguards; - Draw up a Temb� Code of Conduct and train, with the help of the borrower, the contractor and the workers on its socio-cultural specificities, warning of penalties for non-compliance.
Risk of harassment for timber sales	- Train external workers, especially with regard to current legislation and international safeguards; - Draw up a Temb� Code of Conduct and train, with the help of the borrower, the contractor and the workers on its socio-cultural specificities, warning of penalties for non-compliance.
Risk of water shortage in the village	- To build its own water supply system for the construction site, with a view to supplying the school's operations after the construction site has been handed over.
Risk of noise nuisance	- Dialogue on the work schedule, avoiding activity at weekends and at night; - Training workers about the surroundings, and better control of the flow of trucks and heavy machinery.
Risk of power cuts in the village	- Improving the village's electricity distribution network in dialogue with the energy supply company.
Risk of using natural capital on site (wood, sand, gravel)	- A ban on the use of any of the Indigenous Land's natural resources. This ban extends to surface water, soil, sand, gravel and wood.

Source: Adapted from Socio-cultural Study - Cajueiro Village / Alto Rio Guam  Indigenous Land (2023).

**Table 18 - Example of a matrix of risk mitigation measures for quilombola communities**

Identified risk	Suggested measure
Increasing the level of community participation and consultation	1. Carry out a process of ongoing consultation, starting at an appropriate time, prior to each stage of the work, recording the decisions aligned with the measures and carrying out monitoring at the time the community deems most appropriate.
Risk of non-compliance with safeguards related to the cultural suitability of the architectural project	1. implement a continuous Consultation Plan, which is initiated with adequate time, prior to the planning stage of the project, stimulating reflections and negotiations on cultural adaptations to the Project.
Risk of introducing diseases	1. Possibility of hiring labor from the community; 2. Requirement of a Health Protocol for external workers (up-to-date proof of vaccination, with a complete vaccination schedule for Covid-19, accompanied by a medical certificate that the worker does not have a contagious disease).

Identified risk	Suggested measure
Risk of accidents on the construction site and access roads	1) Appropriate social measures discussed with the community in the Consultation Plan to isolate the area and prevent the movement of people around the construction site; 2) Visual and audible warnings prior to the movement of machinery on access roads within the community in the vicinity of the school; 3) Compliance with the safety standards imposed by regulations and legislation on the management of vehicular traffic in places where people are present.
Risk of harassment of women and children *Affects women and children unequally	1. avoid housing the workers inside the community, making it possible for them to stay in the surrounding agro-villages with daily transportation during work shifts; 2. draw up a code of conduct and train the borrower, contractor and workers on their socio-cultural specificities, warning of penalties for non-compliance.
Risk of harassment of young people through the introduction of alcohol and drugs *Affects women and children unequally	1. avoid housing the workers inside the community, making it possible for them to stay in the surrounding agro-villages with daily transportation during work shifts; 2. draw up a code of conduct and train the borrower, contractor and workers on their socio-cultural specificities, warning of penalties for non-compliance.
Risk of harassment for the sale of natural capital assets	1. avoid housing the workers inside the community, making it possible for them to stay in the surrounding agro-villages with daily transportation during work shifts; 2. draw up a code of conduct and train the borrower, contractor and workers on their socio-cultural specificities, warning of penalties for non-compliance; 3. Train external workers, especially with regard to current legislation and international safeguards.
Risk of water shortages in community and public buildings near the planned construction site	Improving the water distribution network in the central area of the community, foreseeing possible shortages in the municipal school and surrounding houses or guaranteeing an individual supply structure for the operation of the building.
Risk of noise nuisance in community and public buildings near the planned construction site	1. Dialogue about the work schedule, avoiding activity at weekends and at night; 2. Training workers about the surroundings, and better control of the flow of trucks and heavy machinery.
Risk of power failure in community and public buildings near the planned construction site	Improving the community's electricity distribution network, especially in the central area where the school will be located, in dialogue with the energy supply company.
Risk of using natural capital on site	Prohibition on the use of any natural resource in Quilombola territory. This prohibition extends to soil, sand, gravel and wood.

Source: Adapted from Sociocultural Study - Campo Verde Community - AQUINEC Quilombola Territory (2023).

## 5.16 Disease Vector Control Program and Pests

It is common in construction sites or occupation projects and anthropic activities to find habitats that are conducive to the proliferation of synanthropic fauna and arboviruses that are harmful to humans and can affect a community with diseases and epidemics.

Water-borne diseases and diseases caused by vectors that use water as a breeding habitat promote the proliferation of arboviruses such as Dengue, Zika and Chikungunya.

PROCASE II encompasses actions that must be accompanied by vector control, both by eliminating habitats with the consequent scaring away of fauna, and by new situations

and environments that could enhance the presence of these harmful insects and animals.

**Responsible: TA** is responsible for guiding and supervising the construction company that will incorporate the measures into its construction activities. The TA should also monitor the areas where related agricultural sub-projects are being implemented (SAF, livestock, etc.) in order to assess the appearance of pests together with rural producers and jointly propose/implement control and mitigation actions. Public health agencies may also be involved or called upon by TA to carry out actions and provide data on the health of the population of the benefited community. The PMU should supervise the actions implemented.

**Target audience:** communities benefiting from the Subproject.

## Objectives

---

Preventing and controlling pests and disease vectors, mainly through prophylactic measures.

## Procedures and Guidelines

---

The following procedures should be established:

- Communication and environmental education regulations must be followed in order to make the population aware of disease vectors and pests, in line with the Environmental and Health Education Program;
- Regulations must be followed to avoid the accumulation of waste on the land and, in particular, in the APPs;
- When necessary, specific programs should be implemented to combat pests with sustainable practices (biological control, for example);
- Restrictions provided for in International Policies on the acquisition of certain hazardous chemicals harmful to human health and the environment should also be established and complied with, including the recommendations of the GIIPs and the IFC Technical Notes, such as pesticides, biphenyl polychlorides (PCBs); dioxins and furans. Application of environmentally sustainable measures such as biological and mechanical control, biological herbicides and traps for monitoring and control are more recommended.

Two actions must be carried out within the Subproject:

- Action 1 to control pests and diseases in the intervention and construction areas: avoiding the accumulation of water, waste and monitoring the health of workers.
- Action 2 monitoring and control of pests and diseases: which should include (i) activities to monitor the evolution and spread of vector-related diseases through health indicators in the community's families and in agriculture and livestock; (ii) actions to combat the proliferation of vectors by sanitizing/disinfecting and eliminating potential habitats in the areas where the Subprojects are being implemented/operated.

## 5.17 Cultural Heritage and Chance Finds Protection Program

This program incorporates guidelines for the preservation of local cultural heritage and the rescue of any heritage found at the sites where social technologies associated with

stone tanks and other activities involving excavation are implemented. It also provides guidelines for unforeseen fortuitous finds during project implementation work, especially those that may involve excavation and soil movement.

During implementation, areas with paleontological potential could be impacted. It is therefore important to certify the existence of sites and ensure that they are safeguarded by the National Mining Agency (ANM).

**Responsible:** TA will be responsible for the measures provided for in this Program, involving: (i) training on cultural heritage for the workers involved in the Subproject, with the possibility of hiring a professional specialist in the subject to give lectures and workshops; (ii) in addition to promoting community access to the benefits and knowledge linked to the potential protected assets identified; (iii) analysis of the Subproject alternative in order to avoid interference with the identified sites. The PMU will support and supervise the implementation of these actions.

**Target audience:** Heritage protection bodies, beneficiary communities and all the workers involved in the sub-project.

## Objectives

---

Observe the procedures established by IPHAN (archaeological sites) and ANM (paleontological sites), in order to identify possible interference by the project in cultural assets protected at federal level; and if the area is classified as a cultural site, implement the necessary actions to protect or rescue the protected assets, mitigate or compensate for the impacts on these assets when carrying out the works and other actions to be established by the protection bodies.

## Procedures and Guidelines

---

For situations in which risks of impacts on cultural sites in the project area are identified, the guidelines set out in the IDB's PDAS8 and IFAD's Standard 3 should be adopted. Thus, procedures for the chance discovery of cultural sites should be defined.

It is also recommended that stakeholder consultations be adopted at the stage of research and assessment of impacts on cultural heritage.

State and municipal cultural heritage protection bodies should also always be consulted, and the full spectrum of heritage types (material, intangible, cultural, landscape, architectural, paleontological, etc.) should always be covered in the assessments, as required by the IDB and IFAD guidelines and IPHAN's IN 001/2015.

In the case of paleontological sites, these are considered National Heritage and are protected by Brazilian law. Thus, the destruction of sites and the sale and purchase of fossils are considered crimes. Article 1 of DECREE-Law No. 4.146, OF MARCH 4, 1942, states that "Fossiliferous deposits are the property of the Nation, and, as such, the extraction of fossil specimens depends on prior authorization and supervision by the National Department of Mineral Production<sup>54</sup>, of the Ministry of Agriculture".

It should be noted that, basically, PROCASE II sub-projects do not require IPHAN to provide a statement.

---

<sup>54</sup> Current National Mining Agency - ANM

### **Workshop / Training**

Workers on the construction site and excavation activities, as well as those responsible for these activities and the project supervision team, must undergo training in the recognition of archaeological and paleontological remains. This training must be given by a specialist in the field.

### **Recognition of archaeological and paleontological remains in the event of chance finds**

During project implementation activities, especially those related to excavation and earthmoving actions (implementation of social technologies, for example), materials of archaeological interest may appear, such as pieces of pottery, stone utensils, layers of black soil and others to be better specified during archaeological prospecting. Such identification can be done through observation by the workers or those responsible for the site who are trained in identification.

In these situations, any type of activity, especially earthmoving and the movement of vehicles, should be stopped when traces are found and the area of the occurrence should be demarcated and the workers informed of the stoppage of the section.

The project supervisor should be informed immediately of this type of occurrence on site, so that an archaeologist or paleontologist can assess the location, depending on the specific nature of the find.

If evidence of the presence of sites is found, the following activities should be implemented<sup>55</sup> :

- Stoppage of work on the identified site;
- Recording and characterization of the evidence by an archaeologist;
- Submission of the evidence to IPHAN and request for authorization for research, site delimitation and salvage.

The sites found must be delimited and registered with IPHAN's National Register of Archaeological Sites (archaeological sites) or ANM (paleontological sites), and the material must be curated, analyzed and deposited in an authorized museum when appropriate, or measures must be taken to preserve it *in situ*.<sup>56</sup>

As provided for in the Normative Instruction mentioned above, depending on the framework and the identification of possible cultural sites in the project area, IPHAN or ANM may request an Impact Assessment:

- The characterization of historical and artistic heritage, both tangible and intangible;
- Consultation with the affected population who use, or have previously used, the identified cultural heritage;

---

<sup>55</sup> It is equivalent to the Fortuitous Finds Procedure specified in PDAS 8. The Fortuitous Finds Procedure will establish the protocol to be followed for the stoppage of works and rescue procedures in the cases in question

<sup>56</sup> Any actions related to the identification and classification of archaeological material, as well as the rescue of sites, must follow the requirements established in IPHAN Normative Instruction 001/2015, in addition to the issuance of an Authorization Ordinance to the archaeologist responsible.

- Requirements for community accessibility to identified heritage (normally protected and with access available in museums authorized by IPHAN to receive and store identified and rescued materials);
- Identification of whether or not the cultural heritage identified is replicable, defining mechanisms for managing risks and impacts on non-replicable cultural heritage.

### **Access to the benefits derived from the use of cultural heritage**

Access should be given to the benefits derived from the use of cultural heritage. Thus, it is recommended, as provided for in IN 001/2015, that all archaeological material, as well as the results of archaeological research and rescues, should be safeguarded in a museum institution that can manage the material and guarantee access and integrity of the materials to the community.

### **Application for Paleontological Sites**

Authorization for intervention, extraction, safekeeping or protection of paleontological sites must be made through the ANM's COPAL - Controle de Pesquisa Paleontológica (Paleontological Research Control) system. COPAL (Control of Paleontological Research) is the ANM's fossil extraction control system and aims to streamline the process of obtaining authorizations and prior communication for the extraction (collection) of fossil specimens in Brazilian territory, in accordance with the provisions of Decree-Law No. 4,146 of 04/03/1942.

The types of applications are set out in DNPM Ordinance No. 155 of May 12, 2016 (Title IV - Authorization and Prior Communication for Fossil Extraction, articles 296 to 320).

Brazilian fossils are the property of the Union and it is forbidden to grant authorization for the extraction of fossils in the national territory for the specific purpose of commercialization.

Applications must be made via the COPAL system available at <https://app.anm.gov.br/Copal/Login?ReturnUrl=%2fcopal>.

Authorization can be requested by:

- professional or student linked to a museum or scientific institution in the municipal sphere;
- professional or student linked to a private museum or scientific institution;
- professional responsible for carrying out the paleontological rescue program within the scope of environmental licensing; and
- a self-employed professional who presents a declaration of endorsement from the scientific institution that holds the fossil material collected.

## **6 DESCRIPTION OF THE MEASURES APPLIED TO RURAL PRODUCERS UNDER THE PIRS**

### **6.1 Waste Management Program**

The Waste Management Program for the activities carried out by the Rural Producers benefiting from the Subproject is presented below.

**Responsible:** Practices of waste separation, reuse, recycling and composting will be encouraged in all PIRs by the Agroecological TA teams, and responsibility for carrying out the practices will lie with the Rural Producer.

### 6.1.1 Agricultural Production and Processing Waste

Agricultural production and processing has a particular set of waste products that need specific management - there are products that are considered hazardous (pesticides or manipueira, which comes from the pressing of cassava dough in flour mills). There is also waste that can be recycled and should therefore be disposed of (for example, plastics, packaging for non-hazardous products, among others), and finally organic waste (peelings, pomace, pruning waste, among others).

#### Objective

---

The aim of this program is to define criteria and establish minimum guidelines for waste management activities in Agricultural Production and Processing.

The specific objective is to define criteria for optimizing, reducing, reusing, storing, handling, transporting, treating and disposing of waste, with a view to better management and less impact on this material.

#### Procedures and Guidelines

---

Agricultural production and processing has a particular set of waste products that need specific management - there are products that are considered hazardous (pesticides or manipueira, which comes from the pressing of cassava dough in flour mills). There is also waste that can be recycled and should therefore be disposed of (e.g. plastics, packaging for non-hazardous products, among others), and finally organic waste (peelings, pomace, pruning waste, among others).

#### Objective

---

The aim of this program is to define criteria and establish minimum guidelines for waste management activities in agricultural production and processing.

The specific objective is to define criteria for optimizing, reducing, reusing, storing, handling, transporting, treating and disposing of waste, with a view to better management and less impact on this material.

#### Procedures and Guidelines

---

- It is important to segregate waste in kitchens and processing areas, for example by not putting organic waste together with material that can be recycled (plastics, long-life packaging, etc.).
- Alternatives for production waste should be considered, including the use, where possible, of leftover stalks and peels for preparing dishes and food.
- For organic material that cannot be reused in the units, sustainable options should be considered, such as animal feed, fertilizer, natural pesticides, among others.
- It is important for TA to show communities the viable alternatives for disposing of waste properly, depending on its nature.

### **Hazardous Waste**

The main hazardous products are related to the pesticides that may be used. It is important to note that the farmer must undertake not to use chemical pesticides and agrochemicals in the areas covered by the Subproject, adopting this good practice in other areas of his activity in order to reduce the use of these inputs.

In the case of Subprojects involving processes that generate Manipueira, the following issues must be observed:

- Manipueira should not be directed to collective or individual sewage treatment systems;
- Disposal should not be directly into rivers, lakes or bare earth;
- A Manipueira biodigestion process should be used, which could also provide natural gas;
- Techniques involving the appropriate use of Manipueira as an agricultural pesticide can also be used.

### **Production waste**

Rural producers will receive training on the actions taken to manage production waste. To this end, the beneficiaries will have to make a commitment to take part in the training offered. The aim of the training is to expand and guide the following practices, among others that may be added:

- It is important to segregate waste in kitchens and processing areas, for example by not combining organic waste with material that can be recycled (plastics, long-life packaging etc.).
- Alternatives for production waste should be considered, including the use, where possible, of leftover stalks and peels for preparing dishes and food.
- For organic material that cannot be reused in the units, sustainable options should be considered, such as animal feed, fertilizer (compost), natural pesticides, among others.

## **6.2 Biodiversity Management, Protection and Restoration Plan**

A Natural Habitats Management and Restoration Programme is required when there is a risk of impact on "modified habitats", "natural habitats" and "critical habitats", together with "legally protected areas and internationally and regionally recognized areas of biodiversity value", which may include habitats in any of these categories. This situation requires a differentiated risk management strategy for habitats, based on their values and susceptibility. It also takes into account the existence of ecosystem services.

**Responsible:** The Rural Producer will be responsible for carrying out actions to prevent the dispersal of unwanted species and supporting monitoring, as well as committing to making appropriate, legally permitted and sustainable use of the woody material used. These actions will be guided by the TA team.

According to the results of the AASE, there is a risk of affecting habitats of various kinds, although the exact definition and location of the PROCASE II subprojects is not known, which may or may not trigger this Plan depending on the design of each subproject and the constraints of its area of insertion.

## **Objective**

---

The aim of this Plan is to ensure that PROCASE II actions do not affect biodiversity resulting in a net loss of natural habitat areas and that there are net gains in those biodiversity values for which a critical habitat has been designated.

## **Procedures and Guidelines**

---

### **Measures to prevent invasive alien species**

The intentional or accidental introduction of exotic or non-native species of flora and fauna into areas where they are not normally found can pose a significant threat to biodiversity, as some exotic species can become invasive, spreading rapidly and destroying or negatively competing with native species.

PROCASE II has project proposals that involve the use of species that, although exotic to the biome, are species that have been adapted to the environment for many years, including being part of the dynamics and ecological function and local ecosystem services. This is the case with some forage species, such as the palm, for example, which, despite not being native to the Atlantic Forest or Caatinga biome, is fundamental to the entire ecological and agroforestry system found in the region where the project operates.

- The intentional introduction of new alien species (not currently established in the country or project region) will not be permitted, unless done in accordance with the existing regulatory framework for such introduction. Notwithstanding the above, deliberate introduction of exotic species that present a high risk of being invasive should not be allowed, regardless of whether such introductions are permitted in accordance with the regulatory framework. Any introduction of exotic species will be subject to a risk assessment (part of the Environmental and Social Assessment) to determine the invasive potential.
- Measures should be implemented to prevent possible accidental or unintentional introductions, including the transportation of substrates and vectors (such as soil, ballast and plant materials) that could harbor invasive alien species. These measures will be guided by the TA team.
- When invasive alien species are already established in the region of the proposed Subproject, the necessary procedures must be taken to prevent them from spreading to areas where they have not yet become established. Whenever possible, measures should be taken to eradicate these species from natural habitats where they have management control. These measures will be guided by the TA team.

### **Legally Protected Areas**

The areas where sub-projects (PIRs) are to be implemented should focus on improving environmental quality, both in physical and biotic terms, in areas of permanent preservation. The implementation of SAFs may eventually be associated with areas of APP<sup>57</sup>, one of the objectives of which is to restore them. It is therefore important that the

---

<sup>57</sup> These APPs are related to riverbanks and other types of APPs, such as springs, steep slopes and hilltops, are not considered in Proc case II.

service roads are installed in such a way as to reduce interference in APP as much as possible and that the Subprojects contribute to a net gain in vegetation cover.

Farmers must comply with and respect the guidelines given by the TA team when implementing agroforestry systems, in accordance with the guidelines set out in item 5.6 of this ESMP.

### **Erosion Control and River Siltation**

The aim of these actions is to identify and analyze the causes and situations of risk in terms of the occurrence of erosion processes and the destabilization of land, in order to prevent situations that could compromise the natural or modified habitat and water bodies.

The following guidelines are planned to combat erosion and river silting:

- Reduce areas with exposed soil to a minimum and, when unavoidable, such areas should be protected by provisional measures, as advised by the TA team;
- Correct or stabilize, in the shortest possible time, all the erosive features that have appeared in the project area with the support of ATER;
- Projects to implement production systems, especially in APP areas, must respect the contour lines and slopes of the land, harmoniously seeking to contribute to increasing soil stability.

Rural producers must comply with and respect the guidelines given by the TA team when implementing agroforestry systems, in accordance with the guidelines set out in item 5.6 of this ESMP.

### **Use of woody material**

The use of woody material in the production processes associated with PROCASE II Subprojects (use in wood-burning ovens, for example) must comply with the following guidelines on the part of the Rural Producer:

- The woody material should preferably come from fallen trees or species considered exotic;
- Purchased wood material must come from reforestation or other permitted sources that do not contain native species protected by law or threatened with extinction;
- Woody material purchased from suppliers must have the appropriate permits and licenses.

## **6.3 Contaminating Products Management and Control Plan**

The aim of this Plan is to define criteria and establish minimum guidelines for the management and control of contaminating products. It is important to consider that **contaminating products** have the potential to pollute the environment, but only if they are used or stored incorrectly.

**Responsible:** The farmer will be responsible for carrying out actions to control and manage contaminating products that involve the operation of the systems set up on their property. These actions will be guided by the TA team.

## Procedures and Guidelines

---

### **Contaminants related to processing**

Possible contaminants from processing are mainly related to the cleaning products and the edible oil ("cooking oil") to be used.

- Cleaning products should be stored in a suitable place, not near food (especially fresh food);
- Its use must follow the manufacturer's specifications and the use of the indicated PPE must be observed, especially gloves;
- The oil should be stored in a dry place, the packaging should be inspected to avoid leakage, expired oils should not be disposed of directly into the sewage system and should be considered kitchen waste.

### **Agricultural Defensives (pesticides)**

The use of pesticides will not be allowed, and rural producers will be informed of this premise from the outset of the implementation of the Subproject. If the use of pesticides is identified in a PROCASE II sub-project, this conduct must be curbed and the rural producer informed of the possibility of sanctions and loss of benefits.

### **Personal Protective Equipment - PPE**

The PPE most commonly used in the activities carried out by rural producers are: protective masks, goggles, waterproof gloves, a wide-brimmed waterproof hat, waterproof boots, overalls with long sleeves and leggings. In addition to this PPE, TA should instruct farmers on the need to use sunscreen and repellent.

PPE recommendations:

- must be used in good condition, in accordance with the manufacturer's recommendation and the product to be used;
- preferably with a Certificate of Approval (CA) from the Ministry of Labor;
- the filters in masks and respirators are specific to the type of activity and have an expiration date;
- the recommended gloves must be resistant to the products being handled;
- PPE must be kept in clean, dry, safe places and away from chemical products.
- Further recommendations can be found in 6.4 of this PGASE.

## 6.4 Labor Management Plan

**Responsible:** The farmer will be responsible for adopting the measures recommended by the TA team on health, safety and conduct in the workplace. These measures include the use of PPE, care when using machinery and equipment, respect for other workers, and combating child and forced labor.

Safety, hygiene and occupational health care for people working on the PROCASE II construction site will be restricted to employees of the contracted company and workers from other companies that may provide services for this contractor.

The following provisions set out the minimum conditions and requirements that must be followed by the contractor and any subcontractors and must be the subject of procedures that guarantee excellence in Occupational Safety, Hygiene, Medicine, Living and Environmental Management, and must cover, without distinction, the entire workforce and facilities of the contractor and any subcontractors placed at the disposal of the projects.

As a priority, these procedures must comply with current federal, state and municipal legislation and the applicable standards, procedures and instructions issued by public bodies with powers to regulate these issues. They should also include the categories of workers in situations of vulnerability, such as women, people with different gender identities or sexual orientations, people with disabilities, children (of working age, in accordance with IDB PDAS 2 and IFAD Standard 5) and migrant workers, workers hired by third parties and primary supply workers.

This implies the obligation to comply with any terms of Collective Negotiation Agreements signed with trade unions, associations or trade associations.

This document sets out the requirements for the living conditions (including accommodation, meals and transportation) of the Contractor's employees, stressing that, for those migrating from other regions, the conditions to be offered must be decent and compatible with the employee's hierarchical level.

Job creation and income generation through financing programs based on international environmental and social policies and agreements must go hand in hand with the protection of workers' fundamental rights. Having conditions that foster a solid relationship between worker and employer is key to the sustainability of any initiative and fundamental to improving quality of life.

In recent decades, labor risks and impacts, such as workplace bullying, precarious working conditions for migrants, child and forced labor, and occupational health and safety, have been at the forefront of development cooperation. The COVID-19 pandemic has further exposed these risk factors in global supply chains. The IDB's MPAS and IFAD's Standards directly address the conditions of the labor force involved in the projects of its Credit Operations, including full-time, part-time or temporary, seasonal or migrant workers.

These Safeguard Policies emphasize the need for fair treatment, non-discrimination and equal opportunity for all, and support commitments to eradicate child and forced labor, promote safe and healthy work, and protect workers' health. It also supports the principles of freedom of association and collective bargaining and guides how to establish, maintain and improve relations between workers and employees in funded projects.

In order to manage occupational risks and impacts, the following guidelines must be followed:

- Respect national legislation and defend international labor rights, based on ILO and UN conventions;
- Combating child labor and forced labor, taking into account the minimum age of 16 and combating modern slavery such as work in conditions of servitude, practices of withholding documents, hiring fees or imposing debts;
- Implement labor management procedures to mitigate risks through a Labor Management Program (LMP).

## **Procedures and guidelines**

---

### **Occupational Health and Safety**

The OHS measures must be implemented by the TA team together with the rural producer. The main aim of this action is to encourage the best practice and use of minimum protection systems that guarantee the integrity of workers in their daily production activities.

#### ***Excessive noise***

Everyone working in an environment exposed to excessive noise must have a health assessment including audiometry (valid for twelve months) and the appropriate PPE.

#### ***Respiratory protection***

All people working in production activities who need to wear respiratory protection equipment appropriate to the level of protection required (including any type of mask) must have a health assessment that includes spirometry (valid for twelve months).

#### ***Working at Height / Confined Space***

All people who will be working in productive activities, performing activities at height and/or in confined spaces must follow the provisions of NR 33 and 35 issued by the MTE.

#### ***Working in rural areas***

It is important that rural producers meet the minimum requirements set out in NR-31, which aims to establish the precepts to be observed in the organization and environment of rural work, in order to make the planning and development of the sector's activities compatible with the prevention of accidents and illnesses related to rural work.

Among the guidelines set out in the Standard, it is suggested that the following be followed, to be guided and supported by the TA team:

- Include in the list of PPE the use of sunscreen, repellents, hats with brims and, when necessary, gloves and leggings;
- Provide training in the use of forage machines and other trailed equipment;
- Lifting, transporting, loading, unloading, handling and storing products and materials must be carried out in such a way that the physical effort made by the worker is compatible with their safety, health and strength;
- Whenever technically possible and when it does not make the activity unfeasible, cargo handling should be carried out mechanically, using appropriate machinery and equipment;
- Keep buildings and production structures constantly clean and disinfected;

### **Code of Conduct for Rural Producers**

Ethics is the ideal of human conduct that guides each human being in their decision about what is good and right for themselves and their lives in relation to their fellow human beings, with a view to the common good.

The adoption of ethical principles and conduct based on a Code of Conduct is fundamental to ensuring that employees act in an integrated and coherent manner when

conducting their relationships and business with different audiences: customers, suppliers, partners, third parties, the government, the community and society in general.

As a goal, the code of conduct should be a standard of personal and professional conduct for all rural producers.

The code of conduct must include the following guidelines to be adopted by all those involved in the implementation and operation of resilient investments:

- Respect for society and the environment;
- Offering quality products and services;
- Promote sustainable development, education and environmental awareness, ensure the protection, preservation and restoration of water resources and the environment for present and future generations;
- Promoting equal opportunities, respect for diversity and professional development. Establishing relationships of trust and encouraging participation through communication and integration;
- To act fairly, legally, coherently, transparently, ethically and honestly in all practices and decisions;
- Act with professionalism, agility and efficiency, guaranteeing the quality of processes, services and products. Valuing shared knowledge, proactivity, creativity, innovation, simplicity and flexibility in the search for solutions;
- Acting with citizen awareness and responsibility in promoting the public good;
- To carry out its activities based on the principles of environmental prevention and precaution, in the pursuit of continuous improvement, not promoting practices that put the environment at risk;
- Disclose transparent and objective information;
- Carrying out their role by ensuring an environment free from moral or sexual embarrassment of any kind; acting actively and preventively against gender-based violence, providing unconditional and unquestionable support and assistance to any victims;
- Do not follow practices or spread false information;
- Comply with the guidelines established for proper social and environmental management;
- To be responsible for everyone's health and safety, by complying with laws and regulations relating to Occupational Health and Safety, in order to preserve a healthy environment and quality of life;
- Disseminate information that contributes to the quality of collective work;

Other values may be added to the Code of Conduct, provided they are necessitated by new realities or omissions, and must always be discussed and approved by TA and the PMU.

Farmers will receive a course explaining what the Code of Conduct means and how it applies - including examples of good and bad practices that involve their conduct.

Farmers should be aware of the Code of Conduct and sign an acknowledgement, thereby increasing their sense of responsibility in their daily actions.

### **Individual commitment signed**

As part of the prophylactic actions, each rural producer must sign a specific individual commitment. This commitment will be formalized in an individual Term of Commitment to be signed containing the content of the model presented below, which includes issues aimed at ensuring the fight against child and forced labour.

Clarifications on child labor and forced labor should be included in the explanatory course for the code of conduct, in order to raise awareness of the terms and associated good practices, before the commitment is presented and signed, which should be attached to the Code of Conduct.

- Model Individual Commitment Agreement on Child and Forced Labor:

*I, (name) As (employee/contractor) of (PMU, Contractor, etc.) under PROCASE II, acknowledge that **Child Labor** and **Forced Labor** activities constitute a violation of this Workers' Code of Conduct. I understand that such practices are grounds for sanctions, penalties and termination of employment. Finally, I understand that the Project Management must bring this to the attention of the competent authorities.*

*I agree that as a worker on the project I will commit to:*

- *The provisions of this code of conduct on and off the Project site.*
- *Actively participate in training courses related to the prevention of **Child Labor** and **Forced Labor** whenever requested by my employer.*
- *In case of awareness or suspicion of **Child Labor** and **Forced Labor** at the project site, I understand that I am encouraged to report it to the Complaints Reporting Mechanism and/or my manager. I must always take into account the safety and right to privacy of the person who has suffered the abuse/exploitation.*

*I understand that if I violate this Individual Commitment, I may receive disciplinary action, which may include:*

- Informal notice or formal notice;*
- Suspension of employment (with or without pay);*
- Termination of employment;*
- Be indicted to the local authorities.*

*I understand that it is my responsibility to adhere to this Code of Conduct. I acknowledge that I have read and understood the Code of Conduct, agree to comply with the standards contained herein and understand my role and responsibility to prevent and potentially report issues of **Child Labor** and **Forced Labor**. I understand that any action inconsistent with this Individual Code of Conduct or failure to act as directed by this Individual Code of Conduct may result in disciplinary action and may affect my ongoing employment.*

*Signature: \_\_\_\_\_*

*Printed name: \_\_\_\_\_*

*Date: \_\_\_\_\_*

*Forced labor is any work required under threat of any penalty and for which the person does not volunteer. It can include practices such as threats of dismissal or physical violence, withholding identity documents or wages, threats to report the worker to immigration authorities, or involving the worker in fraudulent debts.*

*Child labor includes: (i) work below the minimum age for admission to employment; and, (ii) any work that may be dangerous, interferes with the education of children or is harmful to their health or physical, mental, spiritual, moral or social development. If local legislation or regulations allow the employment of young people who are at least 16 years old (in accordance with the ILO Minimum Age Convention of 1973), on condition that their health, safety and morality are fully protected, and they have received specific instructions or adequate vocational training in the relevant activity, then child labor will be understood as the employment of children for work that does not comply with this legislation and regulations.*

## 7 ANNEXES

## 7.1 Annex - Requirements set out in the IDB's MPAS for the content of the ESMP

- Requirements of PDAS 1 (IDB): Assessment and Management of Environmental and Social Risks and Impacts:
  - Mitigation and performance improvement measures and actions aimed at addressing the environmental and social risks and impacts that have been identified should be described. Plans or programs should be defined, which may consist of a documented combination of operating procedures, practices, plans and related supporting documents (including legal agreements) managed in a systematic way.
  - These Programs will be broad for the entire organizational structure of the executing agency for the execution of the project, including the main contractors and suppliers over which the organization has control or influence, or for specific sites, facilities or activities.
  - The mitigation hierarchy will be taken into account to address the risks and impacts identified, prioritizing the prevention of impacts, measures to minimize them and then compensation or offsetting measures, when residual impacts persist and whenever they are of a technically and financially feasible nature.
  - Mitigation and performance measures and relevant actions will be drawn up to ensure that the project operates in accordance with applicable laws and regulations and meets the requirements of financial institutions.
  - Environmental and social action plans will be established (general or thematic), which will define the desired results and actions to tackle the issues raised in the process of identifying risks and impacts.
  - Given the dynamic nature of the project, the Management Program must be able to react to changes in circumstances, unforeseen events and the results of monitoring and review activities.
  - Procedures will be established to monitor the Management Program and measure its effectiveness, as well as compliance with all legal or contractual obligations and related regulatory requirements.
  - A stakeholder participation plan will be drawn up according to the risks and impacts of the project, adapted to the characteristics and interests of the people affected by the project and other relevant stakeholders.
  - If applicable, a consultation process commensurate with the risks and adverse impacts of the project and the concerns of affected people (including indigenous peoples and Afro-descendants), as well as other stakeholders, will be included.
- Requirements of PDAS 2 (IDB) and Standard 5 (IFAD): Work and Working Conditions:
  - Measures will be included (for example, an Occupational Health and Safety Plan) to prevent accidents, injuries and illnesses that may arise from work, be associated with it or occur during it, reducing the causes of the risk factors to a minimum, as far as is reasonably practicable. In the event of pandemics or epidemics, occupational health and safety measures and protocols will be considered to protect the workers of the projects in the sample representative of the risk of exposure.
  - Measures will include the elimination, replacement or modification of hazardous conditions or substances; worker training and record-keeping; documentation

and reporting of occupational accidents, injuries, illnesses and incidents; arrangements for emergency prevention, preparedness and response; processes for reporting unsafe or unhealthy work situations, as well as mechanisms for evaluating performance in terms of occupational safety and health.

- They should also include recommendations for the prevention of child labor and forced labor.
- PDAS 3 (IDB) and Standard 2 (IFAD) requirements: Resource Efficiency and Pollution Prevention:
  - Technically and financially feasible measures will be considered (e.g. solid and liquid waste management plan, emissions and other relevant environmental aspects) so that, within the project's activities, the consumption of energy, water and other resources and inputs is improved, and greenhouse gas emissions are avoided or minimized.
  - Measures to prevent or reduce the emission of pollutants into the air, water or soil, as well as responses to accidental situations.
  - Measures to reduce, recover and reuse waste in a way that is safe for health and the environment.
  - Considerations for treating, destroying or disposing of waste (hazardous and non-hazardous) in an environmentally correct manner.
- PDAS 4 requirements (IDB) and Standards 6 and 9 (IFAD): Community Health and Safety:
  - Prevention and control measures will be established in accordance with international best practices for preventing risks and impacts on the health and safety of the community.
  - Measures to prevent the community from being exposed to hazardous materials and substances that the project may generate in the event of the implementation of works or the application of unauthorized chemical products within the scope of the project.
  - Measures to avoid or minimize the community's exposure to water-borne diseases, vectors and contagious diseases.
  - Emergency preparedness and response measures will be included that take into account affected people, local government agencies and other relevant parties, both for their protection and for their participation and collaboration.
  - Adequate resilience and adaptation measures to disasters and climate change, including risks caused by natural disasters or changes in land use to which project activities may contribute.
- Requirements of PDAS 5 (IDB) and Standard 7 (IFAD): Land Acquisition and Involuntary Resettlement:
  - It should be noted that the project cannot lead to situations in which land acquisition and involuntary resettlement are necessary, in which case this requirement will not be triggered.
- Requirements of PDAS 6 (IDB) and Standard 1 (IFAD): Biodiversity Conservation and Sustainable Management of Living Natural Resources:
  - When impacts on biodiversity and ecosystem services cannot be avoided, measures will be defined to minimize them and restore biodiversity and

ecosystem services in the long term, through the adoption of adaptive management practices that respond to changes and monitor the results.

- For the protection and conservation of biodiversity, the mitigation hierarchy will include biodiversity equivalent offset measures, which can only be considered once adequate prevention, minimization and restoration measures have been applied. These biodiversity equivalent offset measures will be designed and implemented in such a way as to achieve measurable conservation outcomes that generate no net loss and preferably result in a net increase in biodiversity. These measures will not be acceptable for habitats defined as critical.
- For critical habitats, mitigation strategies will be considered through a Biodiversity Action Plan with the aim of achieving net increases in biodiversity values.
- For non-critical habitats, measures such as: (i) preventing impacts on biodiversity by identifying and protecting reserve areas; (ii) minimizing habitat fragmentation by implementing measures such as biological corridors; (iii) habitat restoration during operations and/or habitat restoration after the operation will be considered.
- Impacts on ecosystem services will be avoided or minimized through measures aimed at maintaining the value and functionality of priority services in order to increase the efficiency of their use in operations.
- Requirements of PDAS 7 (IDB) and Standard 4 (IFAD): Indigenous Peoples<sup>58</sup> :
  - If it is not possible to avoid adverse impacts on indigenous peoples that are eventually identified in the ESIA, measures will be designed to minimize or provide restoration or compensation for such impacts in a culturally appropriate manner and commensurate with the nature and size of such impacts and the vulnerability of the communities of indigenous peoples eventually affected by the Project.
  - The proposed measures will be drawn up in conjunction with the consultation and informed participation of these communities, taking into account an Indigenous Peoples' Plan, if necessary.
  - Interaction process measures with indigenous communities that may be affected by the project will be established.
  - Means will be established to obtain the free, prior and informed consent of indigenous communities that may be affected by the project and relevant mitigation measures will be determined. Free, prior and informed consent will be applied to the design and execution of the project and the expected results in relation to impacts affecting indigenous communities.
- Requirements of PDAS 8 (IDB) and Standard 3 (IFAD): Cultural Heritage:
  - Provisions will be designed to manage chance finds through a specific procedure.
  - Measures will be considered according to the hierarchy proposed in this PDSA for the mitigation of adverse effects during the removal of reproducible (non-critical) cultural heritage, if these exist in the project area.

---

<sup>58</sup> The prerogatives of this guideline are in line with ILO 169, to which Brazil is a signatory (Legislative Decree No. 143 of June 20, 2002).

- Measures will be developed to prevent the removal, alteration or damage of any critical cultural heritage or irreproducible cultural heritage.
- PDAS 9 requirements (IDB): Gender equality:
  - Measures will be drawn up to: (i) avoid, minimize or mitigate the negative impacts identified, or provide compensation in this regard with mechanisms that promote gender equality and (ii) ensure that people of different genders, including women and gender-diverse people, who may be affected by the project, receive social and economic benefits equal to those received by other members of the community, thus avoiding the potentiation of gender inequalities.
  - Measures to prevent risks of sexual and gender-based violence related to the project will also be considered, including specific policies for contractors regarding sexual harassment and codes of conduct for workers, workshops and awareness campaigns for workers and contractors and for the communities where the project is implemented, etc.
  - Effective complaint mechanisms will be developed that minimize the reporting burden on victims, offer gender-responsive services and minimize the risk of retaliation. These mechanisms will contain specific procedures for sexual and gender-based violence, including confidential reporting through people trained in the subject, with secure and ethical documentation.
  - Measures to prevent the risk of sexual exploitation or abuse of minors will be incorporated.
- PDAS 10 (IDB) requirements: Stakeholder Involvement and Information Disclosure:
  - The stakeholder engagement plan will describe the measures that will be used to remove barriers to participation and how the opinions of groups that are affected differently by the project will be captured.
  - In the case of projects that may have significant adverse impacts on the people affected by them, a process of consultation and informed participation will be designed, in accordance with PDAS 1. If any project is found to have adverse impacts on indigenous peoples, a process of consultation and informed participation will be designed, with a view to obtaining free, prior and informed consent, in accordance with PDAS 1 and 7.
  - A grievance mechanism will be proposed to receive concerns and complaints and facilitate their resolution. This mechanism could also serve as such to fulfill the requirements of PDAS 5 and 7. However, the grievance mechanism for project workers, required under PDAS 2, should be established separately from the others.
  - The plan must include communication actions in the event of emergencies and socio-environmental accidents.

## 7.2 Annex - Examples of emergency response procedures for common types of incidents and accidents on similar projects

### Oil and fuel leaks

---

The purpose of this Procedure is to define an emergency plan for any spills of diesel oil, lubricating oil and other chemical products on the ground, especially when refueling vehicles and machinery and maintaining equipment and workshop activities, as well as when parking vehicles and machinery.

#### **Responsibility**

Construction companies, under the guidance of Environmental Supervision.

#### **Procedures**

##### **Occurrences**

Occurrences must be detected by any site employee, especially train and machine operators, drivers and workshop staff. They are detected visually, at the time of the leak, or by the presence of oil stains on the ground.

##### **How to Avoid and What to Do**

Before starting to fuel and lubricate machinery and equipment, the person responsible must make sure that absorbent materials (sawdust, Absorsol or sand) and an environmental emergency kit are available in case of any spillage, as well as containment devices, such as plastic tarpaulins and/or containment devices (trays or drums) to contain small leaks.

These activities should be avoided in the vicinity of the lagoon, streams and springs, natural slopes and other elements of the area's hydraulic and hydrological formation.

- Situation 1 - Refueling and lubrication in the field on soil.

In the event of an oil spill under these conditions, the equipment operator must immediately throw absorbent material over the spilled puddle and remove the oiled material, along with the contaminated soil layer. This contaminated mixture must be stored in a specific container, first intended for the workshop, where it must remain until it is effectively disposed of, which must be a landfill duly licensed to receive this type of material.

- Situation 2 - Refueling and lubrication in the workshop

Whenever possible, refueling and lubrication operations should take place in the workshop itself, which should have an impermeable floor and an oil separator box. If oil is spilled in these conditions, the drainage system will direct the contaminated material to the oil separator box, which must be cleaned, and the contaminated material stored and sent to a landfill duly licensed to receive this type of material.

- Situation 3 - Oil leaking onto asphalt roads

When the use of any equipment causes oil to spill onto asphalt or impermeable ground, the area containing the oil must be quickly covered with absorbent material to prevent the oil from being carried into the drainage system and, consequently, into the nearest body of water. Once the oil has been absorbed, the material should be collected and sent to a landfill duly licensed to receive this type of material.

### ***Who to tell***

In the event of situations 1 and 2, the person in charge of the specific sector must be notified. If situation 3 occurs, the person responsible for the detection must immediately notify the environmental supervision support company.

### **Accidents with venomous animals**

---

The purpose of this Procedure is to define an emergency plan for accidents involving venomous animals (animals that inoculate toxic substances or poison).

#### **Responsibility**

Project implementation companies, under the guidance of the PMU.

#### **Procedures**

##### ***How to Avoid Accidents with Venomous Animals***

- Arachnids (spiders and scorpions):
  - Don't accumulate garbage and always keep the workplace clean;
  - Seal up gaps and holes in walls, ceilings and other places where arachnids can lodge;
  - Combat the proliferation of insects, especially cockroaches and termites, which are food for arachnids;
  - Shake out clothes and boots before putting them on; and
  - Do not put your hands or feet in holes, termite mounds, rock piles, firewood, etc.
- Hymenoptera (wasps, bees and hornets):
  - Avoid strong perfumes;
  - Preferably wear long pants, a long-sleeved shirt and a hat;
  - Carry a cloth to protect your face in case you bump into a beehive;
  - Do not put your hands or feet in holes, termite mounds, rock piles, firewood, etc.
- Ophidians (snakes):
  - Always work with personal protective equipment, such as leggings and gloves;
  - Don't put your hand in holes or places where organic material has accumulated, such as dry straw, leaf litter, weeds, etc;
  - When you spot a snake, don't touch it or try to touch it, keep your distance and, if possible, move your workplace away from the animal.

##### ***What to do in the event of an accident***

- Do not tie the affected limb: the tourniquet hinders blood circulation and does not prevent the poison from being absorbed;
- Do not cut the bite site. Some poisons cause bleeding and, in this case, cutting will increase blood loss;

- Do not suck on the bite site. It is not possible to remove the venom from the body after inoculation;
- Only wash the bite site with soap and water;
- Prevent the injured person from drinking kerosene, brandy or other alcoholic beverages. Not only do they not neutralize the action of the poison, but they can also cause poisoning;
- Keep the injured person at rest. Try to keep the affected part in a horizontal position, preventing the injured person from walking or running;
- Take the injured person to a health service as soon as possible;
- Catch the spider, scorpion or snake alive or dead, with caution and precautions, to help recognize the species and send it to an institute you have previously contacted;
- Do not use over-the-counter medication, coffee powder or other substances.

### ***Who to Tell in the Event of an Accident***

- The team must immediately call the PMU, or Supervision or support companies for the management and supervision of works and the construction company, for immediate rescue in the field;
- Anyone who receives an accident report should call the health service immediately.

### ***Where to take the injured person***

It is up to the health service to send the injured person to a hospital where they can receive appropriate treatment.

### ***Who to tell***

In the event of an accident, the following professionals from the companies involved should be notified immediately:

Construction Company - Name: \_\_\_\_\_; Tel: \_\_\_\_\_

PMU - Name: \_\_\_\_\_; Tel: \_\_\_\_\_

### ***First aid***

---

The purpose of this Procedure is to establish an emergency plan with first aid procedures.

### **Responsibility**

Project implementation companies, under the guidance of the PMU.

### **Procedures**

#### ***What to do in the event of an accident***

- Light and superficial wounds:
  - Always wear gloves when assisting the injured person;
  - Wash and clean the wound with soap and water;

- Be very careful when foreign bodies are present (shards of glass, sand, cement, wood or metal splinters). These should only be removed if they come out easily when washed with running water or with a light touch with anatomical tweezers. Otherwise, don't remove them, just rinse the area with saline solution, make a compress with antiseptic and dry it, then bandage it with gauze or similar;
  - Do not touch the wound with your fingers, cloths, used tissues or other dirty material;
  - Change bandages as often as necessary to keep it clean and dry;
  - If the wound becomes painful or swollen, indicating an infection, the injured person should be taken to the emergency room.
- Fainting:

Fainting can be considered a mild form of "shock", usually caused by sudden emotions, fatigue, hunger or nervousness. The victim turns pale, sweats, and their pulse and breathing are usually weak. The following steps should be taken:

- Lay the person on their back with their head flat, without pillows, loosening their clothes;
  - Apply cold cloths to the face and forehead and do not give liquids at this time;
  - If the fainting spell lasts more than 1 or 2 minutes, wrap the person up and go to the emergency room.
- Burns caused by chemical agents (concrete and muriatic acid):
    - Wash the affected area with plenty of water;
    - Always wear gloves when touching the burned area;
    - Apply plenty of water while removing the victim's clothes. Caution: do not remove clothing if it is adhered to the skin;
    - Apply 9% saline solution to the area, keeping it moist;
    - Do not apply ointments, grease, baking soda or other substances to external burns;
    - Do not remove foreign bodies or grease from the lesions;
    - Do not puncture existing bubbles.
  - Electric Shocks:
    - Do not touch the victim until they are separated from the electric current or the current is interrupted;
    - Do not remove a person attached to an electric cable, unless the person being rescued is specially trained for this type of rescue;
    - Turn off the mains socket or switch. If you don't know how, use a dry stick or branch, a dry rope or a dry cloth to pull the wire away from the casualty. Warning: All wet or damp materials, including metals, are conductors of electricity.
    - As the victim of an electric shock usually has cardiopulmonary arrest, cardiopulmonary resuscitation should be assessed and carried out.
  - Thermal burns (hot liquids, fire, steam, sun rays, etc.):
    - Lay the victim down;

- Place the victim's head and chest lower than the rest of their body, lifting their legs if possible;
- If the victim is conscious, give them plenty of water to drink;
- Place a clean, damp cloth on the burnt surface.

### **Who to tell**

In the event of an accident, the following professionals from the companies involved should be notified immediately:

Construction company - Name: \_\_\_\_\_; Tel: \_\_\_\_\_

PMU - Name: \_\_\_\_\_; Tel: \_\_\_\_\_

### **Monitoring, Preventive Actions and Corrective Actions**

---

Monitoring is essential to anticipate the arrival of extreme events. In the meantime, monitoring actions are defined:

- Definition of borderline rainfall indices and locations that require greater attention during construction work;
- Monitoring hydrological alert and overflow levels;
- Alert: Slope movement and risk of landslides;
- Alert: Municipal check comparing monitoring data with risk parameters;
- Alarm: Triggering of diffusion mechanisms after XX mm of precipitation;
- Escape: Activation of the team responsible for guiding people to the meeting points;
- Triggering the meeting points;
- Search and Rescue;
- First Aid;
- Assistance to victims;
- Installation of shelters.

### **Organizing a simulation drill**

---

Drills are important for emergency preparedness. Mock drills should be carried out periodically, involving the team responsible for guiding and managing emergency situations, such as CIPA, for example. The following is a roadmap for carrying out drills.

- Step 1: Decide to hold the drill, taking into account the definitions of periodicity (how often it is held) and responsibility (who organizes the drill) set out in the contingency plan and defining the modality.
- Step 2: choose the scenario and mode.
- Step 3: choose procedures and actions to be tested and trained.
- Step 4: distribute tasks between the training team, the observation and evaluation team, and the support team.
- Step 5: Define mobilization actions for the drill, including official communications, community meetings, wide dissemination, and the production of guidance material.

- Step 6: define the roadmap including preparation, operational and post-simulation actions.
- Step 7: Carry out the drill, which usually includes an opening meeting, a role-play and a closing with demobilization.
- Step 8: Evaluate the simulation, based on forms and the work of observers and evaluators.
- Step 9: Document the simulation in a report and update the contingency plan based on the results obtained.

## 1 INTRODUCTION

This Strategic Environmental and Social Assessment (SESA) for the **Paraíba Sustainable Rural Development Project - Procasse II (PROJECT)** is structured in such a way as to assess the geographical region in which the Project is located, in order to have a management tool that integrates the environmental and social dimensions of each of the interventions in the territory, while also aiming to identify alignments and possible gaps in compliance with IFAD and IDB Safeguard Policies. The interventions proposed in the sanitation sub-projects and production plans may have an impact on some of the municipalities that are part of the Project.

In addition, SESA involves evaluating different strategic alternatives in decision-making, so that the selected alternative is coherent and harmonious, on the one hand, with the social, economic and environmental aspects relevant to the state of Paraíba, where the sub-projects will be implemented, and on the other, with the current institutional framework and good international practices.

The Strategic Environmental and Social Assessment (SESA) is intended to be a support tool for incorporating the environmental and social dimension into the PROJECT's decision-making process. Its importance lies in defining criteria and milestones to guide the activities, work and sub-projects that will be carried out within the Project being assessed.

As part of the preparation of Procasse II, socio-environmental documents were drawn up in accordance with the IDB's Environmental and Social Policy Framework (ESPF) and IFAD's Social, Environmental and Climate Assessment Procedures (SECAP), which are equivalent, with the exception of IFAD's safeguard on climate change. The documents include the following:

- Strategic Environmental and Social Assessment (SESA): involves assessing different decision-making strategies, so that the alternatives are coherent and harmonious with the relevant socio-environmental aspects for the region where the sub-projects are located and the sector where they will be implemented, and with the institutional framework of the executing agency in force and with good international practices. The SESA includes an analysis of the alternative types of sub-projects proposed for funding, as well as the institutional structure and applicable legislation, identifying the impacts and risks that must be mitigated;
- Strategic Environmental and Social Management Plans - ESMP: determines the programs necessary for the mitigation hierarchy of the impacts foreseen in the SESA.
- Environmental and Social Management System - ESMS: presents the structure and general processes that will have to be applied in order to implement the ESMP and to monitor and guarantee the implementation of the planned mitigation actions.

In this context, the main objective of this SESA is to present a diagnosis and strategic assessment of the environmental and social risks and impacts based on the types of works in the Project, making it possible to identify the control, prevention, correction and socio-environmental monitoring measures relating to the mitigation and/or compensation of adverse or negative environmental impacts, as well as the enhancement of positive impacts (care and measures aimed at guaranteeing and amplifying the beneficial

impacts caused by the Project's sub-projects) diagnosed on the interventions planned for the Project and which will be duly dealt with in the ESMP.

The SESA is structured around four main pillars:

- (1) General Description of the Project: provides the main information regarding the justification, objectives, area of insertion and budget of the Project, as well as a description of the Components and the types of sub-projects and plans to be implemented by the Project.
- (2) Regulatory Framework: provides a compendium of the relevant local legislation the international agreements to which Brazil is a signatory and which are also taken into account in the Socio-Environmental Policies of international financial agents, and the entities responsible for environmental licensing, as well as the Environmental and Social Policy Framework of the IDB and IFAD.
- (3) Baseline: presenting a socio-economic, physical and biotic diagnosis of the project area, showing the important factors that shape the project's environment.
- (4) Identification of the Project's Potential Socio-environmental Risks and Impacts: this includes the analysis of environmental and social risks/impacts and helps define the Mitigation Programs that are presented in Procasa II's EMSF and ESMP, providing actions and guidelines to be applied in compliance with the requirements of the established Safeguard Policies.

## 2 GENERAL DESCRIPTION OF PROJECT

The State Government of Paraíba has requested the financing of a project through a specific investment loan (LON/ESP) to promote the sustainable development of the rural area of the state of Paraíba (involving the Atlantic Forest and Caatinga biomes), focusing on the problems of low production and productivity and vulnerability to climate change (CC) of family farming activities, environmental degradation and deforestation, insufficient water supply services for human consumption and lack of sanitation in rural communities.

Below is information detailing the description of Procasa II, its components and planned sub-projects.

### 2.1 Background to Project

The Cariri, Seridó and Curimataú Sustainable Development Project - PROCASE, closed in 2020, has carried out significant and impactful actions, leaving an important legacy of lessons learned. It is based on this collection and foundation that we postulate the need to significantly expand the work it has started, especially in the Borborema mesoregion, to the semi-arid region and to another Atlantic Forest biome. As noted by the IFAD Supervision Mission in 2020, the following achievements of PROCASE phase I, among others, can be highlighted:

- Significant reinforcement of water security for approximately 400 communities, with the drilling of 539 wells and the installation of 222 underground dams and 60 desalination plants;
- Implementation of 95 productive projects of various kinds (including candy making, community nurseries, handicrafts, strengthening animal husbandry, etc.);

- In these communities, fodder production has been boosted - mainly with the installation of oil palm fields, used as seed production plots (seedlings) to help recover the family oil palm fields, which were lost due to the attack of the carmine mealybug and drought;
- Implementation of 31 Agroforestry Systems (SAFs), to be considered as pilot experiences, so that water use is optimized and agroecological principles in soil use and conservation are valued, as well as providing a source of income for families;
- Experiments were also carried out with photovoltaic panels to generate energy to be used in processing units for agricultural products and handicrafts;
- Three dams were built, making it possible to build up larger water reserves, which improved the supply to the local population and the development of irrigation, benefiting 10,022 families;
- It is important to point out that the methodology and set of instruments relating to implementation developed under PROCASE I and in a semi-arid context can be used by improving and adapting them to the new area of operation of PROCASE II, such as intervention in the Zona da Mata region and work with indigenous peoples;
- PROCASE's work enabled the formation of an institutional network involving various State Secretariats and an important group of 'partner' entities. Among the latter, we should mention the Paraibana Research, Rural Extension and Land Regularization Company - EMPAER; the other entities contracted to provide technical advisory services to the families assisted by the project - SENAR, IDS, PATAC, COOPTERA; and the Fresh Water Program. With regard to the State Secretariats, it is worth highlighting the State Secretariat for Infrastructure, Water Resources and the Environment - SEIRHMA; the Executive Secretariat for Food Security and Solidarity Economy - SESAES; the Secretariat for Women and Human Diversity; it was also possible to establish partnerships with various municipal governments.

In addition, the PROCASE I impact assessment demonstrates important project impact results, among others:

- i. 51% of the families benefiting from the project had a positive change in the productive assets index, with 24% having a positive percentage change in the productive assets index of 150% or more, showing a significant improvement;
- ii. With regard to gender issues, activities related to processing by women increased by 43% in the beneficiary communities and decreased by 6% in the control communities;
- iii. With regard to the frequency of dietary diversity, the proportion of families in the beneficiary communities who declared that they always had dietary diversity was 44.8% higher than the proportion in the *control group*;
- iv. 65.1% of families reported an increase in crop production, 56.8% an increase in the production of animal by-products, 48.6% an increase in animal production, 22.8% an increase in the production of plant by-products and 9.1% in non-agricultural activities (handicrafts). In the aggregate analysis of the increase in production, 88% of families said that production had increased;
- v. 20% of the beneficiaries reported that they had access to markets through PROCASE's exclusive actions, a satisfactory percentage for the project, given that

several of the production chains supported were strengthened and restructured through the investment, and then went on to access markets.

The project's completion report states that the almost 500 wind turbines installed have reduced the cost of energy for irrigation to zero, as well as their durability compared to other means. The solar energy implemented in the cooperatives generated savings of approximately R\$ 10,000/month, reducing the production costs of these units and increasing their profits.

In the experience of previous sustainable rural development projects, including PROCASE I, the development of new capacities was key to the success and sustainability of the actions supported. It has made it possible to strengthen social and productive organizations, increase the visibility and inclusion of young people, women, PCTs and indigenous people, incorporate technological innovations, better manage environmental resources, start new activities, manage family production units more efficiently and reach markets in better conditions, and increase interaction with the state through greater access to public policies or political advocacy, using new capacities that remain after the projects end. PROCASE II takes this experience into account, which is why Component 1 focuses on capacity building.

PROCASE II was designed with a view to improving or adding new intervention axes compared to phase I. The aim is to better integrate it into the government structure, while strengthening capacities with a view to greater sustainability and expansion. In addition to these aspects, the issue of water security has been expanded and diversified. Socio-productive inclusion, the inclusion of traditional peoples and in particular indigenous peoples, is another important highlight, as well as strengthening the capacities of young people and young people with disabilities, will be other innovations that will aim to make PROCASE II more relevant for the state.

PROCASE (both phase I and phase II) is part of a set of strategic public policies aimed at strengthening family farming in the state. Its actions and projects are supported by macro planning strategies such as the Rural Territories Development Strategy, with 16 recognized rural territories in Paraíba today, with active territorial collegiate bodies supported by SEAFDS, as well as the public plenary sessions of the Democratic Budget, where communities can present their demands for PROCASE II.

The end of the project's financing with IFAD (phase I) did not immediately lead to the end of PROCASE. The state government, together with SEAFDS, kept the entire PMU team active, developing actions to support and sustain the results achieved, as well as the preparation of PROCASE II. Therefore, the PMU has already been formed, consolidated and can guarantee the immediate and efficient start-up of the new project.

## 2.2 Justification of Project

The project is justified by the need to mitigate the following problems:

### ***Rural Poverty and Extreme Poverty***

According to Cadastro Único data from March 2024 (MDS), there are 191,000 families in rural Paraíba classified as being in poverty or extreme poverty (CadÚnico bands 1 and 2). Considering that there are 251,125 households in the rural area of the state, according to IBGE 2010, it can be said that 76% of rural families are in a situation of poverty and extreme poverty.

Looking at the 2010 data, where 59% of households were in a situation of poverty or extreme poverty, it can be said that the rural population of Paraíba has become poorer. Among the possible causes are those related to more severe periods of drought, the COVID-19 pandemic and the reduction in social inclusion programs. This is consistent with Brazil's return to the Hunger Map, according to the United Nations.

In the state, only 36% of the population is food secure, while the rest are classified as mild, moderate and severe food insecure (II VIGISAN, 2021).

The HDI in 146 municipalities is considered low (70%), medium in 62 (29%) and high in 2 (1%). According to IBGE 2010, around 28% of the population has some kind of disability (visual, hearing, motor or mental).

### ***Inefficient production systems***

According to the 2017 Agricultural Census, there were 163,218 agricultural establishments in the state. Of these, 125,489 (76.9%) were family farms, while 37,729 (23.1%) were non-family or patronal. Approximately 12% of family units belong to Agrarian Reform settlers. Family farming occupies 42% of the state's agricultural area and is responsible for 47.8% of the total value of agricultural production, which is the second highest proportion in the Northeast and the sixth highest nationally. In the Mata region, 20.16% of the area is occupied by family farms, while it reaches 50.75% in the Sertão Paraibano.

Agricultural production is the main economic activity of most of the rural population, particularly family farming. The 2017 Agricultural Census highlights the following productions for their contributions to the value of production: i) poultry, cattle, goats and sheep account for 92% of the value of livestock; ii) of permanent crops, bananas, passion fruit, Bahia coconut and tangerines are the main productions in terms of value, and iii) pineapple, corn, cassava and sugar cane are the most important temporary crops. Family farming in Paraíba faces very severe and challenging conditions, especially in the semi-arid region, which include low income, low productivity in farming activities, difficulties in accessing water for human consumption and production, and high risks related to climatic events. In order to increase the production, productivity and income of family farming, it is necessary to resolve obstacles related to the lack of access to financing to make the necessary investments, technical assistance and rural extension that supports the learning of new technologies, difficulty in accessing markets and inserting producers into value chains, which in turn is related to the weakness of rural organizations. According to the 2017 Agricultural Census, only 11.7% of agricultural establishments have access to water for irrigation. In addition to the low productivity of agricultural activities that depend on the availability of water, there is the use of unsuitable production techniques. For example, 32% of Family Farming Units (FFU) use pesticides, and 39% do not adopt any conservation practices (IBGE 2017). In the case of mechanization, for every 130 farmers, 1 has the support of a tractor, seed drill, etc (IBGE 2017). Less than 1% of the PA establishments applied lime or another soil pH corrector (IBGE, 2017). 67.4% of family farming establishments have implemented soil preparation systems.

The data from the 2017 Census shows that the majority (53%) of the producers responsible for the establishments are over 55 years old. Less than 10% are under the age of 35. These figures follow a national trend of a shrinking percentage of young people in rural areas, while the rural population is getting older. This situation highlights the

challenges of providing opportunities and prospects for young people and, at the same time, conditions for the older population to maintain an agricultural activity and quality of life. This data, when added to the data on very low mechanization (see data below), can create obstacles to achieving greater productivity.

### ***Land structure***

In the state, 54% of establishments have up to 5 hectares and of these, 13% have less than one hectare, which characterizes extremely small areas for agricultural production, especially when considering the semi-arid climate. Furthermore, around 15% of family farming establishments do not have guaranteed access to land (IBGE 2017).

### ***Climate change and environmental degradation***

Climate change is causing significant losses in the productivity of some important crops for family farmers, such as cassava, beans, bananas and corn. Studies show productivity losses of up to 92% for corn and 88% for beans. Paraíba is among the states most at risk of losses, along with Ceará, Piauí and Pernambuco.

Production systems are largely not adapted to the increasing scarcity of water or to the context of climate change. The combination of expectations of high drought risks, increased desertification and more heat extremes could jeopardize agricultural activities, especially those of family farmers, and disrupt local and regional food markets.

In the Atlantic Forest region, climate risks are more related to extreme rainfall events, such as floods and landslides. Agricultural production will be affected by reduced access to markets, reduced product quality, crop losses due to increased occurrence of diseases and soil erosion. These problems are compounded by poverty and the target population's limited access to public policies aimed at reducing their vulnerability to climate change.

There is also a major problem of soil degradation, due to the use of unsustainable practices on cultivated land, such as the systematic use of burning and the removal of vegetation cover, which have resulted in greater exposure of soils to the elements (SOS-MATA-ATLÂNTICA; INPE, 2015). In turn, the intense modification of the environment mentioned here has had a significant impact on the water cycle. Thus, deforestation leads to a decrease in water infiltration and greater erosion. This has reduced the flow of water and led to the silting up of the region's watercourses (BRASIL-MDA-SDT, 2010), reducing the availability of water in the region (SILVA; BRUNO; AGUIAR; SOUSA FILHO et al., 2020). In addition, the combination of the processes mentioned here has a significant negative impact on biodiversity. In a long-term perspective, the sum of these factors (including predicted climate change) is expected to lead to more frequent "extreme" events (e.g. droughts and floods), which could trigger a significant loss of environmental quality. This, in turn, will have a direct effect on the productive potential of agricultural systems and on the population's quality of life.

### ***Inadequate and insufficient TA system***

Only 17% of family farming establishments in Paraíba have access to the TA service (IBGE 2017) and 83.4% report that they receive it from the government (federal, state or municipal). In addition to this low coverage rate, there is a lack of preparation and qualification of technicians from the point of view of knowledge of agroecological practices, which allow production systems to adapt to climate change, among other

aspects (Information gathered during the field design mission). Without the support of qualified professionals, farmers are prevented from implementing more intensive, sustainable and efficient agricultural practices, as well as adapting to climate change and the challenges of market access and access to finance. It is important to relate this data to the profile of the producers, since in 2017 (IBGE), in 47.4% of the establishments that reported applying pesticides: the person responsible could not read and write and in 80.4% of the cases, the pesticide applications were carried out without any technical guidance.

Regarding credit, 17% of family farming establishments reported having had access to it in 2017.

### ***Mechanization***

In the family farming establishments, most agricultural operations are carried out manually. Data from the 2017 Agricultural Census shows that only 0.8% of the farms in Paraíba have at least one type of machinery. The machinery and implements used are not always adequate or used appropriately. This lack of mechanization and the low availability of labour constitute a set of limiting factors for developing more efficient and relevant practices.

### ***The challenge of digital inclusion***

Access to rural telephony and, above all, the Internet is scarce in rural areas. According to studies by the Ministry of Agriculture and Livestock (MAPA), currently more than 70% of rural areas nationwide do not have Internet access.

### ***Low participation Specific difficulties for vulnerable groups (women, young people, LGBT people and residents of traditional communities)***

Data from the latest 2017 Agricultural and Livestock Census (IBGE) shows gaps in relation to vulnerable groups:

Of all the family farming establishments in Paraíba, 76.0% are run by men and only 24.0% by women. Among family farming establishments, 64.0% are run by people who say they are black or brown, 11.3% by young people under 35 and 0.9% by indigenous people.

In terms of average area (ha), establishments run by men are 80.6% larger than those run by women. While establishments run by women have an average of 7.12 hectares, those run by men have an average of 12.86 hectares. Of the family farming establishments in the project area that have access to water for irrigation, 6.7% are run by women, while 13% are run by men.

Among female family farmers, 4,486 received TA (14.9% of the total), while 16,637 male family farmers (or 17.4% of the total) received TA.

In the Single Registry, there are 6,328 indigenous families registered, 73.1% of whom live in poverty or extreme poverty, and there are 4,295 quilombola families registered, 67.9% of whom live in poverty or extreme poverty.

Considering the families of artisanal fishermen, 80.7% of them are in extreme poverty or poverty. This is a gap of 12.4% in relation to the poverty/extreme poverty situation of all registered rural families.

Finally, among riverine families, 72.6% are in poverty or extreme poverty, a gap of 6.5% compared to rural families in the project area.

### ***Limited participation in collective organizations***

Only 3.7% of rural producers in the state are members of a cooperative and 29.4% are members of an association (IBGE 2017).

Enterprises for packaging, processing and marketing the products have also encountered many difficulties. There are around 8,700 processing units in the project area (IBGE 2017). According to MDS 2018, there were 77 enterprises in the NE region registered and able to offer their products to government buyers. Of these, only 7 are from Paraíba (10%).

### ***Family Farming Cooperatives***

The cooperative-type economic organizations present in the state focus on the collection, processing and marketing of production, with milk (bovine and caprine) and fruit being the main chains involved.

These organizations have weaknesses in terms of the capacities of their management teams, on issues such as i) administrative and financial, including access to sources of working capital financing, ii) the ability to design and implement innovative and diversified marketing strategies, iii) the composition of teams with little representation of women and young people, among other weaknesses. These organizations also have important limitations from the point of view of their production infrastructures, which don't always allow them to diversify their products, comply with health and environmental legislation and don't use renewable energy sources in their processes, nor do they carry out adequate waste treatment.

This set of factors ends up limiting these organizations' ability to function and their viability. As a result, producers access the market precariously and at low prices, with difficulties in adding value to their production. In this context, middlemen predominate. Family farmers have limited marketing channels, dependent on local sales. According to FNDE data, Paraíba's PNAE received only 2% of the program's total resources in 2022. In relation to the NE, this result puts the state only ahead of Sergipe, Rio Grande do Norte FFU products.

### ***Basic Sanitation***

Article 3 of Law no. 14.026/2020 considers Basic Sanitation to be a set of public services, infrastructures and operational facilities for: i) drinking water supply, consisting of the activities and the provision and maintenance of infrastructures and operational facilities necessary for the public supply of drinking water, from collection to building connections and their measuring instruments ; ii) sanitary sewage (collection, transportation, treatment and adequate final disposal of sanitary sewage) and iii) urban cleaning and solid waste management (collection, transportation, transshipment, treatment and environmentally appropriate final disposal of household solid waste).

Regarding drinking water supply in the state, the Water and Sanitation Institute reports that in 2019, the rural service rate reached 24.16 % (in Brazil, the rate is 30.77%), through the implementation of systems with a distribution network and simplified chlorine disinfection treatment, guaranteeing the potability of the water. In other situations,

fountain-type systems are implemented, without a distribution network, with chlorine disinfection treatment. Finally, when there is no possibility of implementing one of the above solutions, the construction of cisterns for human consumption becomes the only alternative.

As for the sanitary sewage situation, the rural service rate in Paraíba is 18.82% (Instituto Água e Saneamento, 2020), significantly below the national average of 42.54%. It is worth mentioning that in the Coasta micro-region this percentage is 1.04%, showing the great precariousness of this region of the state. Most of the sewage is covered by septic tanks and/or sinks, but the treatment units have no control over the disposal of sewage effluent, either on the ground or in water bodies, making it yet another polluter of the environment and contributing to the factors that increase climate change. In addition, some of these septic tanks are of the black tank type, where the sewage is dumped directly under the ground. In these areas it is common to find sewage running out into the open and houses without toilets.

This set of vulnerabilities, coupled with climate change, puts the region's production systems in crisis and in a vicious circle, in which the processes of social and environmental degradation fuel the impoverishment of rural families and increased migration to urban areas.

### ***Family farming organizations and their weaknesses***

Often, tackling the problems posed by Paraíba's rural population's vulnerability is difficult at the individual or family level. Generally, actions of this kind require a capacity for joint or collective action. One of the issues that reinforces the processes of unsustainability mentioned above, which accentuate vulnerabilities, concerns local organizations.

Traditional rural communities are characterized by a system of social institutions that organize local social life. These mechanisms - such as kinship networks and traditional mechanisms of reciprocity - enabled various types of collective action to take place, covering issues such as the management of common resources, the holding of community festivals, the organization of religious events, etc. However, nowadays these structures don't work well in all communities, and in many cases, there is an 'erosion' of traditions. This has led to a weakening of traditional social structures. On the other hand, reality has presented new demands for community organization, mainly related to the actions of other social actors with whom families/communities establish relations. This situation has stimulated the creation of new forms of organization, generally more formalized, which may take on responsibility for old practices, but are essentially created to take on new functions. Among these new forms of organization, community associations stand out.

There are currently many community associations in rural Paraíba. However, it must be acknowledged that they have shortcomings. One of the barriers that reinforce the status quo of unsustainability involves the role of the 'community association' as an effective means of representation and, above all, of organizing collective action at local level. But, as various studies have shown, the creation of associations alone is not enough. It has been found that it is very difficult for these associations to play their potential positive role in the processes of promoting more resilient development spontaneously. Previous experience of various IFAD-supported rural development projects has shown that the role of representing all families vis-à-vis government agencies has posed major challenges for community associations, insofar as these new relationships require them

to perform tasks that are entirely new to them. In the case of associations assisted by development projects, one such task is that of managing community 'projects'.

On the other hand, in the case of rural organizations (usually in the form of cooperatives) created for the purpose of carrying out activities that seek to promote access to markets (such as packaging, processing and marketing local products), they have also encountered many difficulties in establishing themselves in this role. These organizations have significant shortcomings in terms of capacity on issues such as i) administration and finance (including access to sources of funding for working capital), ii) the ability to design and implement innovative and diversified marketing strategies, iii) the composition of teams with little representation of women and young people, among other weaknesses. They also often have significant limitations from the point of view of production infrastructure, which does not always allow for product diversification, compliance with health and environmental legislation, the use of renewable energy sources in their processes or adequate waste treatment. This set of factors limit the ability of these organizations to function and their own sustainability, including economic sustainability. As a result, producers access the market precariously and at low prices, with difficulties in adding value to their production. In this context, middlemen predominate.

The situation outlined here indicates that most of the existing local organizations - especially community associations and family farmers' cooperatives - will need support, especially in terms of training, so that they can address various types of shortcomings (for example, in organizational processes and associative/cooperative management) and come to play an active and effective role in implementing the various sustainable development initiatives they are called upon to carry out.

On the other hand, the organizations mentioned above only group together and represent a fraction of Paraíba's Family Farmers, and there is still a significant part of this population that is not yet organized. Data from the 2017 Agricultural Census indicates that only 48% of farmers are members of some kind of organization (association, union, movement, etc.) Considering only the members of cooperatives, this proportion drops to just 3.7%.

### ***Limited access to technical advice and funding***

Family farmers in Paraíba also face difficulties in minimally structuring their agricultural activities, as well as incorporating innovations that intensify their production in a sustainable way, due to limited access to technical assistance and credit.

Technical Advice and Rural Extension. After millennia in which knowledge of agricultural and livestock practices was only passed down between generations of the population dedicated to agriculture, modern rural education and extension services emerged in Europe and the United States in the 19th century to work on new agricultural technologies and practices. In Brazil, TA services began to be implemented after the Second World War, expanding nationally as a public service over several decades. Despite the crises experienced by this TA, the expectation remains that a quality Technical Assistance and Rural Extension (ATER) service can play a fundamental role in Brazilian rural development, with emphasis on strengthening family farming, access to public policies, the social organization of farmers, the management of properties and enterprises, the marketing and certification of products, production management, the transition to organic or agroecological systems, the training of farmers, among other

issues . These positive expectations related to TA were confirmed in a recent study, which proved the positive impact - mainly due to the increase in agricultural production and income - of the provision of TA services by the Dom Helder Câmara II Project in various territories of the Brazilian Northeast.

However, despite this widely accepted positive outlook, and even though there was significant investment by the federal government in TA between 2003 and 2015, the 2017 Agricultural Census records that, in Brazil, only 19.9% of family establishments had access to some kind of TA. In Paraíba, 16.8% of establishments had access to TA. Although this figure is higher than that of the Northeast region (which is 7.4%), this proportion is still small.

As of 2017, federal funding for TA services has been severely cut again, leaving millions of Brazilian family farmers without any kind of support. With this redirection of the national TA policy from 2017-18 onwards, it appears that there will be an even greater decrease in the resources made available to fund TA services between 2018 and 2022. With this situation, it is very likely that the proportion of family farms served by TA will be much lower than at the time of the 2017 Agricultural Census.

In addition to this low coverage rate, information gathered during field visits during the design mission indicates that there is a lack of preparation and qualification of technicians from the point of view of knowledge of agroecological practices, which allow production systems to adapt to climate change, among other aspects. Without qualified professionals, farmers face challenges to implement more intensive, sustainable and efficient agricultural practices and adapt to climate change and the challenges of market access and finance access. Correlating this information with the profile of producers, data from the 2017 Agricultural Census shows that in 47.4% of establishments that reported applying pesticides, the person responsible could not read and write and that in 80.4% of cases, pesticide applications were carried out without any technical guidance.

On the other hand, in recent years (especially since 2020), there have been important methodological innovations in the field of TA. Traditionally, TA actions took place face-to-face, in direct interaction between the TA agent and their audience (the farmers). With the advance and popularization of information technology and the Internet, and mainly stimulated and conditioned by the moment of mandatory social isolation imposed by the Covid-19 pandemic, remote and digital forms of interaction and communication have been gaining ground and importance in TA processes, driving a broad process of innovation and learning in the use of instruments for dialogue, interaction and exchange of knowledge at a distance or remotely.

In this process, TA actions have combined the remote tools already in use (such as TV and especially radio) with a whole range of digital tools such as instant messaging applications/platforms (Whatsapp, Telegram), social networks (Instagram, Facebook), institutional websites, YouTube channels (for broadcasting videos). There has also been an increase in the use of meeting/live/videoconferencing applications, such as Google Meet, Zoom, as well as tools such as platforms specially designed for training events, and themed chats on institutional websites.

Thus, the use and application of digital resources in the activities of the technical advisory and rural extension service, which has been called 'digital ATER' in some institutional, political and academic spheres, has enabled farmers to expand their ways of accessing information and technical guidance, constituting an excellent complementary means to the face-to-face TA service.

Access to credit. According to the 2017 Agricultural Census, in the state of Paraíba, 21,151 family establishments (16.9% of all such establishments) had access to some form of financing. According to Santos et al, "better access to financing for family farmers means contributing to greater dynamism in the agricultural sector in the state of Paraíba. The existence of a significant percentage of family farmers without an efficient financing system, both in terms of the quantity of monetary resources and the technical quality of the projects, reflects the extent to which public (financing) policies need to progress to move closer to universal access". It's interesting to note that 76.5% of the families who received funding did so for investment purposes. In addition, only 46.8% of these establishments received financing from government credit programs, PRONAF being the main one.

### ***Deficit in access to other public policies to support Family Farming***

Since the last decade of the last century, an important set of public policies to support Family Farming (FA) has been built up in Brazil. This process was led by the federal government and many states followed suit with similar state policies. Worth mentioning here are the programs: PRONAF (funding and investment credit), Seguro Safra (agricultural insurance), PAA, PAA Leite and PNAE (public food purchases), P1MC and P1+2 (support for Social Technologies for water storage), PNCF (land credit) and the Rural Development Program. In Paraíba, we should mention the State Seed Distribution Program. This set of policies expanded until 2015, when some of these programs suffered budgetary cuts. This process intensified significantly from 2017 onwards, with a significant reduction in federal funding for practically all of these policies, leading some of them to be paralyzed (such as P1MC and P1+2). However, as of the beginning of 2023, this trend has been reversed and there is a prospect that PA will once again be able to count on a wide range of incentive policies.

The existence of these policies, however, does not guarantee access for families. On the contrary, many families find themselves on the margins. Various sources show that few family establishments access them, as shown above in relation to the percentage of family farmers who regularly receive technical assistance services or manage to access credit (especially via PRONAF lines). Access to the PNAE is also limited. According to data from the FNDE, in 2022 Paraíba received only 2% of the Program's total resources, when the number of family farming establishments in Paraíba represents over 3% of the country's total.

Surveys carried out in the field and with policy managers indicate that there are several causes for this situation. The main one is a lack of more detailed and consistent information about the policies themselves, including aspects such as eligibility rules and access mechanisms. Weaknesses have also been identified in the technical teams of government agencies that are responsible for making the policies work in the field.

### ***Gender***

In the state of Paraíba, the Gender Disparity Index is 0.68%, indicating that Paraíba women are 32% less likely to have the same opportunities as men, with the biggest gaps being in the dimensions of political empowerment and economic opportunity. In rural areas, resistance to advances in women's autonomy and rights is even greater. Gender gaps are expressed in restrictions on control and access to natural, social and monetary resources.

One of the fundamental obstacles is the concentration of land ownership in the hands of men, leaving women in a situation of economic dependence. According to the 2017 Agricultural Census in Paraíba, 71.0% of female managers of family farming establishments have land titles, compared to 73.1% of male managers - an inclusion gap of 2.1 percentage points. On the other hand, when it comes to the management of establishments, only 24% of family farming establishments in the project area are run by women. However, between 2006 and 2017, there was a 20.3% increase in the proportion of establishments run by women in the state. There is no data available on joint titling.

In Paraíba, according to the same source, the total area of family farming establishments run by women is 214,500 ha (14.9%), while that of men totals 1,226,714 ha (85.1%). In terms of average area (ha), establishments run by men are 80.6% larger than those run by women. While establishments run by women have an average of 7.1 hectares, those run by men have an average of 12.9 hectares. Among the multiple legal, cultural and structural barriers that exclude women from land rights are patriarchal ideologies about the gender division of labor in the public and private spheres and the practice of ceding land rights only to one representative of the family - the man. For this reason, the Project will seek to prioritize women in the land regularization work it will promote.

One strategy for rural women to increase their autonomy has been education, with higher levels of education compared to men. According to data from the 2017 Agricultural Census, among female family farmers, illiteracy reached 35.8% of those responsible for establishments, while among men, illiteracy reached 48.1% - a gap in favor of women of 12.3 percentage points (equivalent to 34.4%). Among female family farmers, 19.5% have never been to school, while among men this proportion is 25.7%. Despite better educational indicators, women's average income is lower. In Paraíba, women earn on average 10% less than men and account for 72.5% of people earning up to one minimum wage, according to data from the Inter-Union Department of Statistics and Socio-Economic Studies (DIEESE).

Despite rural women's significant contribution to the family economy and community development, their work is often overlooked because they are not part of the formal labor market and do not generate monetary income from activities such as self-consumption. Among the establishments run by women, 80.8% produce for self-consumption, while for those run by men, the same proportion is 70.7%, a difference of 10.1 percentage points (equivalent to 14.3%). To change this reality, the project will promote the *Agroecological Logbook Methodology*, which makes it possible to measure, value and give visibility to women's fundamental contributions to the family economy and, consequently, to community development.

The main agricultural activities of women in the project area differ from those of men, requiring any public support to take a differentiated approach to meet the specific demands of women. Proportionally, women are more involved than men in temporary crops (37.1% versus 32.9%) and the production of planted/native forests (4.3% versus 2.6%), while men are proportionally more involved in permanent crops, livestock production (56.2% versus 52.4%) and horticulture/fruit growing (3.9% versus 2.8%).

Rural women in the project area also have less access to Technical Assistance (TA). Among female family farmers, 14.9% received TA, while 17.4% of male family farmers received this service, which represents a gender gap of 2.5 percentage points (equivalent to 16.8%). In this context, the project will offer continuous TA to beneficiaries, setting a specific target for women (50%), as well as other measures aimed at developing

women's capacities in areas such as leadership, management, access to public policies, agricultural and non-agricultural activities.

The examination of data on machinery shows that gender inequality is clear. Throughout the country, including in the Northeast, women have less access to tractors, planters and harvesters. In Family Farming, establishments run by men (80.3%) have 93.1% (511,727) of the tractors for this segment of producers, while women have 6.9% (37,845) of the tractors nationwide. These characteristics make women's daily lives tougher, thus impacting on various dimensions of their existence, and even on their desire to migrate from the countryside to the cities.

As far as associations are concerned, there is a higher proportion of women who are members of trade associations/trade unions and producer associations/movements. Among women family farmers, 37.2% were members of trade associations/unions and among men, 31.8% - a difference of 5.4 percentage points, equivalent to 17%, in favor of women. With regard to producer associations/movements, 15.8% of female family farmers were members in 2017, compared to just 13.6% of men. However, even with greater participation, women often do not have an equal voice because they are not equally represented in positions of power.

It is in this context that the project will promote Gender Training to develop the capacities of rural women to play an active role, have a voice and decision-making power in Rural Organizations. In addition, the strengthening of Women's Networks will be supported, thus strengthening the self-organization of rural women and their groups and organizations.

Rural women in the project area also suffer from double working hours. They have a workload that exceeds that of men, including a higher proportion of unpaid domestic responsibilities related to preparing food and collecting firewood and water. In the Northeast, women devote more hours to these activities (23.5 hours), and it is also the region with the greatest inequality in relation to men. The greater dedication to caring for people and/or household chores ends up restricting women's wider participation in the labor market. In Paraíba, women devote an average of 23.9 hours a week to domestic work, 11.5 more than men - above the average difference in the rest of the country.

The activity to be promoted by the project to provide early childhood education services (*Ciranda das Crianças*) will help to reduce women's work overload due to childcare and ensure their participation in the training activities promoted by PROCASE II. The fair division of domestic labor will also be the subject of gender training for beneficiaries. In addition, rural women are more vulnerable than men to environmental and climate challenges because of their social roles, for example as the main collectors of water, food and firewood in a context where increasing pressure on natural resources and environmental degradation are negatively affecting water and food supplies, because of the discrimination they suffer and because of their poverty rates. In this context, the project's investments in social technologies for access to water will also help to reduce the time women spend collecting water.

Violence in rural areas is increasing every year, as shown by the growing number of murders of rural workers. Domestic violence is also dramatic in rural areas and the number of femicides has increased. IPEA data for Paraíba indicates a death rate by femicide of 3.9 women per 100,000 in 2018. In 2023, 4,630 police inquiries were opened in Paraíba to investigate cases of domestic and sexual violence against women, according to the Coordination of Women's Police Stations in Paraíba (COORDEAM).

Violence indices show that black women suffer much more physical and psychological violence and are the biggest victims of female murder (femicide). The lack of facilities in the Network to Combat Violence against Women makes rural women more vulnerable to violence and restricts their access to protection. The prevention of violence against women will be a theme addressed in all the gender training offered by the project.

## **Youth**

Brazil's Youth Statute (2013) defines young people as those between the ages of 15 and 29. In the Project area, there are 893,666 young people. Among the main challenges faced by rural youth in the Project area are: i) lack of employment and income opportunities (with little diversification of agricultural and non-agricultural activities that attract young people), ii) lack of access to and control over resources, inputs, goods and technologies, iii) limited access to public policies and services and iv) low participation and decision-making power in rural and community organizations.

In Paraíba, among young people aged 15 to 29, approximately 35.1% neither studied nor worked in 2021, according to the Synthesis of Social Indicators 2022. Young women of African descent have a higher percentage out of school and out of the labor market. Household chores and caring for family members are among the main barriers young people face in continuing their studies or getting a paid job, and young women are the majority in this situation. Another important causal factor is the high rate of teenage pregnancy. Between 2020 and 2022, 12,830 pregnancies in children and adolescents aged 10 to 18 were recorded in Paraíba, according to the State Health Department.

As a consequence of the lack of sustainable study and formal work opportunities for young rural people, there is a process of migration to urban centers, mainly of young women with more schooling, which causes the rural population to age (the largest group of migrants is between 16 and 35 years old) and the proportion and number of women to decrease. The phenomenon of young women being the ones who leave the countryside the most is related not only to the lack of opportunities, but also to their refusal to take on the same roles played by their mothers and grandmothers in the family production unit. In the case of young women, the invisibility and devaluation of the labor force, in caring for children and household chores, and in family farming, are also among the factors that stimulate the desire of younger women to leave the rural environment and will therefore be addressed during the project's Gender Training sessions. Comparing the 2006 Agricultural Census and the 2017 Census, the young rural population under the age of 25 fell by 49.7%.

Among the factors that influence staying in rural areas are access to financial resources, education/training suited to the characteristics of rural areas, appreciation of rural ways of life, and the availability of services and conditions that can offer the possibility of success in agricultural production. However, in rural Paraíba, young people who decide to stay in the countryside have limited access to and control over resources, inputs, goods and technologies. The indicators for access to land and credit confirm this.

In the project area, only 9.9% of family farming establishments are run by young people under the age of 35, indicating low access to land. When they get married, few of them are able to acquire a new property, and what often happens is that the family property is divided into smaller plots for the children, which further reduces the productive potential and profitability of agricultural activities. It should be noted that there are gender tensions in inheritance patterns, which disadvantage young rural women.

Access to credit is very limited in the Project area (see paragraph on the subject, above). Although data on access to credit is not available disaggregated by generation, it can be inferred that access to credit by young people is even more limited, as this is the reality throughout the country. The PRONAF Youth program, which was created to facilitate rural youth access to credit, creating conditions to enable rural succession processes in agriculture, still has a very limited number of contracts signed in relation to the proportion of the rural youth population. In 2015-16, a total of only 2,889 contracts were signed across the country. Among the causes of this low level of access is misinformation, the lack of institutions for training young farmers, the difficult bureaucratic requirements that restrict the signing of credit agreements, and the fact that bank agents often assume that young people's inexperience in managing resources will lead them to default.

However, access to technical knowledge is higher among young people under 35 than the average among family farmers in the project area. The quantitative evidence available from the 2017 Agricultural Census indicates that, among young FA managers (under 35), 18.5% received TA compared to 16.8% of all family farmer managers. Despite the higher percentage of access, it can still be said that access to TA among young people is limited. Breaking it down by gender, access to TA was 18.1% among young women and 18.6% among young men, so there is a small access gap of 0.5 percentage points, equivalent to 2.8%, between young male and female managers.

During the field visits carried out during the PROCASE II design mission, an additional growing problem faced by rural youth was identified - vulnerability to violence associated with drug trafficking.

## ***Diversity***

### ***People of African descent and Traditional Peoples and Communities (TPCs):***

Indigenous peoples and quilombola communities are particularly vulnerable due to the historical dynamics of exclusion, high dependence on natural resources, marginalization of their ways of life, exclusion from formulating and accessing public policies and poor access to services, including health, education, sanitation, infrastructure and technical advisory services. In Paraíba, the Indigenous Lands (IL) are located in the coastal region. The Potiguara, with a population of approximately 19,000, are concentrated in three indigenous lands (CARDOSO; GUIMARÃES, 2012) located in three municipalities in the Mata Norte region. In the Mata Sul region there is a population of approximately 750 Tabajara indigenous people, but there are still no Indigenous Lands in this region. On the other hand, the 2022 Demographic Census recorded a population of 16,584 quilombola inhabitants in 6,127 households in the entire state of Paraíba. These population figures include all the inhabitants recognized as quilombolas - both those who live and those who don't live in officially delimited Quilombola Territories. In Paraíba there are 47 quilombola communities with recognized certificates of self-definition. However, according to information released by the IBGE and the Federal Public Prosecutor's Office, only 11 have officially delimited territory and none have land titles. There are also traditional gypsy populations, artisanal fishermen and shellfish gatherers in the state.

This population is impacted by the combined effects of various forms of discrimination, including gender, race and socio-economic conditions. Root causes of this exclusion are the marginalization of traditional ways of life and structural racism. Afro-descendant and PCT populations face even greater obstacles than family farmers in participating in decisions that affect their territories and in fully realizing their rights, with significant gaps in inclusion in terms of poverty, food insecurity, access to education, TA and land.

In 2023, 67.9% of quilombolas and 73.1% of indigenous people were in poverty or extreme poverty, an average higher than the average percentage of poverty in Paraíba (53.9%). In 2022, 33 million Brazilians were hungry (severe food insecurity) and food insecurity was more prevalent among people of African descent (reaching 6 out of every 10 households whose heads of household identify themselves as black or brown), with women of African descent being the most vulnerable. In terms of education, among the population of white family farmers in the project area, illiteracy reached 39.9% of those responsible for PA establishments, while among those of African descent, it reached 48.1%. With regard to access to Technical Assistance, among white family farmers, 7,694 accessed TA (17.7%), and among Afro-descendants, 12,961 or 16.1% of the total. The gap between white and Afro-descendant family farmers in access to TA is 1.6%. Furthermore, among white family farmers, 77.7% have title deeds, among indigenous farmers, only 44.6% and among Afro-descendants, 70.3%. It should be noted that none of the quilombola communities in Paraíba have land titles.

To help close the various gaps in the inclusion of Afro-descendants and TPCs identified, the project will have specific actions dealing with diversity issues and will prioritize the Afro-descendant and TPC population in the actions of all its components, such as access to TA, land and environmental regularization, access to water and sanitation infrastructure and productive investments. In addition, through Diversity training meetings, as well as cultural recovery activities in the communities benefiting from the project, the valorization and dissemination of traditional knowledge, practices and ways of life in production, food and natural resource management will be promoted, as well as issues related to racism.

People with disabilities. The Northeast is the region with the highest percentage of people with disabilities in Brazil: 10.3% of the population or around 5.8 million people. The highest percentages of people with disabilities are women and people of African descent. According to data from the Si Registry (November 2023), there are 144,655 people with disabilities in the project area, or around 5.6% of those registered.

Disability and poverty are closely linked in Paraíba, with people with disabilities facing significant stigma and discrimination. For example, this group has lower success rates at school and more limited access to economic activities, both of which are major factors contributing to family poverty. In the state, 88.7% of people with disabilities do not work and 74.4% earn less than the minimum wage.

Persons with disabilities face a number of challenges throughout their lives. Children with disabilities dropping out of school is a serious problem across the country. There is a relatively high number of single-parent families headed by women who receive the main tax-funded disability benefit in Brazil, the Continuous Social Assistance Benefit, and this may be related to the high rate of family abandonment by parents who have a child with a disability. The data highlights that people with disabilities do not achieve parity with their non-disabled peers at any level of education. This puts them at a significant disadvantage in a competitive job market. In Paraíba, 24.92% of persons with disabilities are not literate, 37.48% have only primary education and only 4.07% have higher education.

There are some additional gender dimensions that impact the challenges that people with disabilities face. For example, women and girls with some forms of disability are at high risk of abuse, and this is especially the case for those with cognitive disabilities. Furthermore, until the Brazilian Inclusion Law (2015) was enacted, it was still routine for women with cognitive disabilities to be sterilized without consent. Caring for people with

disabilities also has a significant gender dimension. In general, women face the double burden of needing to both earn money and provide care, but this burden is only exacerbated when family members are also disabled. It should also be noted that disabled women can also have a disproportionate burden of care placed on them, as they can still be expected to care for other members of their family.

LGBTQIAPN+ population . . The absence of government data on the socio-economic and political challenges faced by the LGBTQIAPN+ community is indicative of the statistical 'invisibilization' and marginalization of this group. The lack of a social assistance policy, the rural exodus of the LGBTQIAPN+ population to urban centers, the lack of family support, limited access to income and low employability in the countryside, the difficulty of staying in the school environment due to prejudice, especially from the trans population, are some of the factors that favor maintaining the invisibility of data on the LGBTQIAPN+ population in rural areas.

Throughout Brazil, the LGBTQIAPN+ population has been victimized by different forms of LGBTIphobia, placing this group in a situation of vulnerability because they do not fit into a socially referenced heteronormative pattern. Brazil is an extremely unsafe country for this population, as indicated by the upward trend in the number of violent deaths of LGBTQIAPN+ people over the last two decades. Between 2000 and 2022, 5,635 (five thousand six hundred and thirty-five) people died because of gender prejudice and intolerance. In 2022, there were a total of 273 deaths of LGBTQIAPN+ people, a national average of 1.31 deaths per million people. Most of the deaths occurred among young people aged between 20 and 29 and the Northeast region had the highest absolute number of violent deaths. It is possible to relate the number of LGBTQIAPN+ deaths in each Brazilian macro-region to the social, economic and cultural conditions of these spatial units. The Northeast, for example, has historically had lower socio-economic indicators, such as income, schooling, access to public services and life expectancy than the rest of the country, and has a significant vulnerable population. Among the Federative Units, the ones with the highest number of deaths were Ceará (34), São Paulo (28) and Pernambuco (19). According to the Observatory of LGBTI Deaths and Violence in Brazil, 8 violent deaths of LGBTQIAPN+ people were recorded in Paraíba in 2022.

Paraíba recorded 68 cases of violent deaths of the LGBTQIAPN+ population between 2017 and 2022, according to data released in a report by the Secretariat for Women and Human Diversity. In total, 24 municipalities in Paraíba recorded cases. João Pessoa has the highest number of cases, with 29 crimes, followed by Campina Grande and Bayeux, with five cases each, and Patos was in third place, recording four crimes. Gay men represent the largest number of murders in Paraíba, leading with 17 of the 29 cases between 2020 and 2022, followed by transvestites who represent six cases in the same period, and in third place are transgender women, with 4 crimes.

Partial data for 2023 from the Observatory of LGBT Deaths and Violence in Brazil, from January to April, totaled 80 deaths. To date, transvestites and trans women account for 62.50% of all deaths (50); gay men account for 32.50% of cases (26 deaths); trans men and transmasculine people, 2.50% of cases (2 deaths); lesbian women account for 2.50% of deaths (2 deaths); no cases against bisexual people and people identified as other segments have been identified.

PROCASE II includes the LGBTQIAPN+ community as one of its target audiences. The project will consider LGBTQIAPN+ diversity, support their inclusion and respect for their rights in the context of its interventions. Initially, the Project will map LGBTQIAPN+ communities and their social movements and carry out consultations to listen to their

needs and research to understand the socio-economic and political challenges they face. Based on this diagnosis and consultations, the project will seek to define a social inclusion strategy for this group. The proposed activities could include: (i) Awareness-raising campaigns on the rights of the LGBTQIAPN+ community and against LGBTphobia; (ii) Preparation, in partnership with LGBTQIAPN+ movements, of didactic dissemination materials that can support awareness-raising campaigns in schools and rural communities regarding LGBTQIAPN+ rights; (iii) Promoting consultations and collaboration with rural LGBTQIAPN+ movements, such as the LGBT Working Group of the MST; (iv) Diagnosing the socio-economic and political barriers to inclusion of this group in the state of Paraíba, especially in rural areas; (v) Supporting rural LGBTQIAPN+ movements.

### **Nutrition and Food Safety**

Food Insecurity (FI) : According to the II VIGISAN , food insecurity (FI) in 2021/2022 affected 58.7% of Brazilian households (125.2 million people); in the Northeast, it reached 68% of households, where 12.1 million people are going hungry, i.e. at a level of severe food insecurity. The family farming sector has been hit hardest by the economic crisis of recent years, with small farmers particularly hard hit. In the Northeast, 83.6% of family farming families face some degree of food insecurity in 2021/2022. The worst levels of FI were observed in the families of family farmers who were still unable to return to pre-pandemic conditions, especially those who were unable to fully re-establish their production and marketed quantities. More recent research by the PENSSAN Network (2022) points to the current worsening of food insecurity, which affects 63.9% of households in Paraíba, of which 10.6% face severe food insecurity (hunger).

Nutrition. Despite the process of nutritional transition, with increased access to food, the state of Paraíba follows the national trend and the rest of the Northeast region and faces a double burden of malnutrition, marked by both malnutrition and an increase in the prevalence of overweight. Among adults in Paraíba, 62.5% are overweight (35.5% overweight and 27.0% obese). Growth retardation affects 4.9% of children under 5, thinness and marked thinness 4.2%, overweight 8.4% and obesity 6.8%.

The situation in Paraíba is exacerbated among the most vulnerable groups, such as quilombola communities, which continue to have socio-economic disadvantages that are reflected in higher morbidity profiles, especially in relation to nutritional disorders. In addition, women of reproductive age have greater nutritional needs than men and for this reason usually have worse nutritional indicators than men of the same age, and therefore need differentiated attention. Research shows that in the Northeast, the prevalence of underweight among pregnant women is as high as 18%, compared to 6.7% in the rest of Brazil.

The main root causes of food and nutritional insecurity in the Project area are the declining quality of and difficult access to water for human consumption and food production; the limited capacity for food production and productive diversification; the low quality of the food consumed; the lack of productive infrastructure; and the low levels of food and nutritional education. It is worth highlighting the direct correlation between food and nutritional insecurity and poverty rates (69.9% of family farmers registered in the Single Registry in the Project area live in poverty or extreme poverty) and environmental restrictions (such as lack of basic sanitation, interruptions in water flows and poor quality of water sources). Access to quality water and sanitation plays a fundamental role in

combating different forms of malnutrition. According to data from the Water and Sanitation Institute from 2019, the rural water service index in Paraíba is 24.2% compared to 92.2% in the state's urban areas. In relation to sanitation, the rural sewage collection service rate is 2.7% in Paraíba compared to 50.1% in urban areas.

To tackle the causes of malnutrition and food insecurity, PROCASE II will support agro-ecological gardens, the valorization of Non-Conventional Food Plants (NCFPs) and support for access to water. Among the most common NCFPs in the state are the cactaceous plants which include species such as *Mandacaru*, *Quipá*, *Xique-xique*, *Palmatória*, *Facheiro* and *Coroa-de-frade*. These plants are characterized by the presence of thorns and slimy stems, which allow them to survive dry climates and high temperatures. This will aim to increase the availability of food for the most vulnerable families, increase the availability of water for human consumption and thus improve their food and nutritional security, while also limiting the diseases responsible for the malabsorption of micronutrients. The project will also have a cross-cutting sub-component, in which a Nutrition and Food Security Plan will be drawn up and implemented, focusing on exchanges and training. These actions will enable adults and young people to learn about good food practices, culinary practices and gastronomic culture, and will respond to the needs of families and target groups in terms of processing and promoting their products, particularly those from family farming. All these practices will be integrated into the design and implementation of the Resilient Investment Plans (RIPs), thus seeking effective implementation and results in terms of food and nutritional sovereignty.

### ***The problems of land and environmental regularization***

Land and environmental regularization of rural properties is a big challenge faced by family farmers, especially regarding properties in priority groups. Since at least the 19th century, the instrument that attested to the regularization of a rural property was the title registered at a notary's office. Many of Paraíba's peasant communities have occupied land for generations. In some cases, the properties may even have had a registered title in the past, but the inheritance/inventory processes didn't go through the notary's office. Furthermore, in countless other cases, purchase-sale transactions and other forms of access to land have never gone through the regularization process. There are also other cases, such as federal and state settlements, made up of families who are accessing land but have not completed the regularization process.

In this same context, the case of land owned by quilombola communities - which formally would be vacant land awaiting state action in order to be regularized - deserves special mention, as does the case of Agrarian Reform settlers. As mentioned in the previous section, in Paraíba there are 47 quilombola communities with recognized certificates of self-definition, with approximately 16,000 people. However, according to information released by the IBGE and the Federal Public Prosecutor's Office, only 11 have their territory officially delimited. Information provided by INCRA's Superintendence in Paraíba confirms that none of the quilombola communities in the state have land titles. In the case of the Agrarian Reform settlers, it is worth mentioning that there are 280 federal settlements in the state, according to data collected from INCRA's Superintendence in Paraíba, with 13,535 settled families. Of these, only 1,835 (13.5%) have land titles.

In addition, a recent law - the Georeferencing Law (Law 10.267/01) in force since 2001 - changed the formal requirements for land regularization, requiring the owner of rural property to inform the National Institute for Colonization and Agrarian Reform (INCRA)

of its exact position, characteristics and extension, as well as its adjoining landowners, for registration in the National Rural Registration System (SNCR) and inclusion in the Land Management System (SIGEF), which became requirements for full regularization. With this, a general and unique land registry was created in Brazil for the first time, with the intention of better organizing a dimension of the rural world that presents major difficulties.

This whole situation means that, today, many family units in Paraíba do not have full legal documentation and do not have formal recognition of their properties. In many cases, not even the owners are fully aware of the situation. The lack of land regularization weakens the situation of farming families/communities in land disputes and conflicts. It also prevents the issuance of permits and licenses of various kinds (such as licenses issued by environmental agencies or water permits necessary for the exploitation of wells or the use of springs) and can hinder access to credit and pensions. The lack of land regularization can lead to legal insecurity, social vulnerability and limitations on access to rights and benefits. This situation directly harms the quality of life of these communities, hindering their sustainable socio-economic development.

On the other hand, there are also problems in the environmental regulatory dimension. The Rural Environmental Registry (RER –CAR on its Brazilian acronym), established by the Brazilian Forest Code of 2012 (Law 12.651/2012), is an important instrument for monitoring and environmentally regularizing rural properties. In Paraíba, the CAR has been widely implemented since it was made compulsory in 2012. However, this instrument still faces important challenges, mainly related to the lack of precision in the delimitation of rural properties, compromising the reliability of the information recorded. There are just over 181,000 establishments registered with the CAR in Paraíba, which is 11% more than the total number of establishments (163,000) in the state. This results in overlapping areas between properties, generating land use conflicts, legal uncertainties and even difficulties in the analysis that must be carried out by the relevant environmental agencies and in defining responsibilities and environmental preservation actions. These problems hinder decision-making and the implementation of appropriate environmental policies in the context of the CAR.

### ***The shortcomings and potential of Knowledge Management, South-South and Triangular Cooperation actions.***

When it comes to designing policies, programs or projects aimed at tackling the challenges of poverty, environmental sustainability and resilience to climate change, there is a lack of relevant information available on experiences of promoting/supporting inclusive sustainable rural development. In recent years in Paraíba, PROCASE I began systematizing experiences in an attempt to compensate for this lack, with the production and subsequent circulation of a set of products (documents, audio pieces, etc.) which recorded and disseminated relevant knowledge about the work carried out in the Cariri, Curimataú, Seridó and Médio Sertão territories in the semi-arid region of Paraíba. In parallel, other IFAD-supported projects in the Brazilian Northeast have also begun to work in the same direction.

The idea of South-South and Triangular Cooperation is part of this set of initiatives related to the circulation of knowledge between countries in the South, including the funding bodies themselves.

In this context, a Knowledge Management initiative transversally strengthens the implementation of all project components, ensures that knowledge gaps are closed and that good practices, lessons learned and innovations are disseminated and scaled up, as well as facilitating the impact on public policies. To be effective, PROCASE II must make use of the best and most relevant knowledge available on strategic topics for the implementation and achievement of its objectives, based on evidence and practical experience from sources both internal and external to the project.

Thus, Knowledge Management (KM) should play an important role in building individual and institutional capacities so that the actors supported learn and can adapt their interventions when necessary. It is also a key tool for measuring and demonstrating the relationship between learning and better development results. CG is also justified as a means of ensuring that beneficiaries, technicians, project staff and other actors involved in implementation access, use and share the knowledge, good practices and innovations needed for greater impact in promoting sustainable and inclusive rural development.

### 2.3 Objectives of Project

The project aims to reduce rural poverty levels, improve food and nutritional security and adapt the rural population to climate change.

The main specific objectives are:

- Increasing the adoption of agricultural technologies, including those for adapting to and mitigating climate change;
- Improving the productive and social inclusion of family farmers, prioritizing women, young people, Traditional Peoples and Communities (TPC) and persons with disabilities;
- Improving the environmental conditions of rural communities and their surroundings;

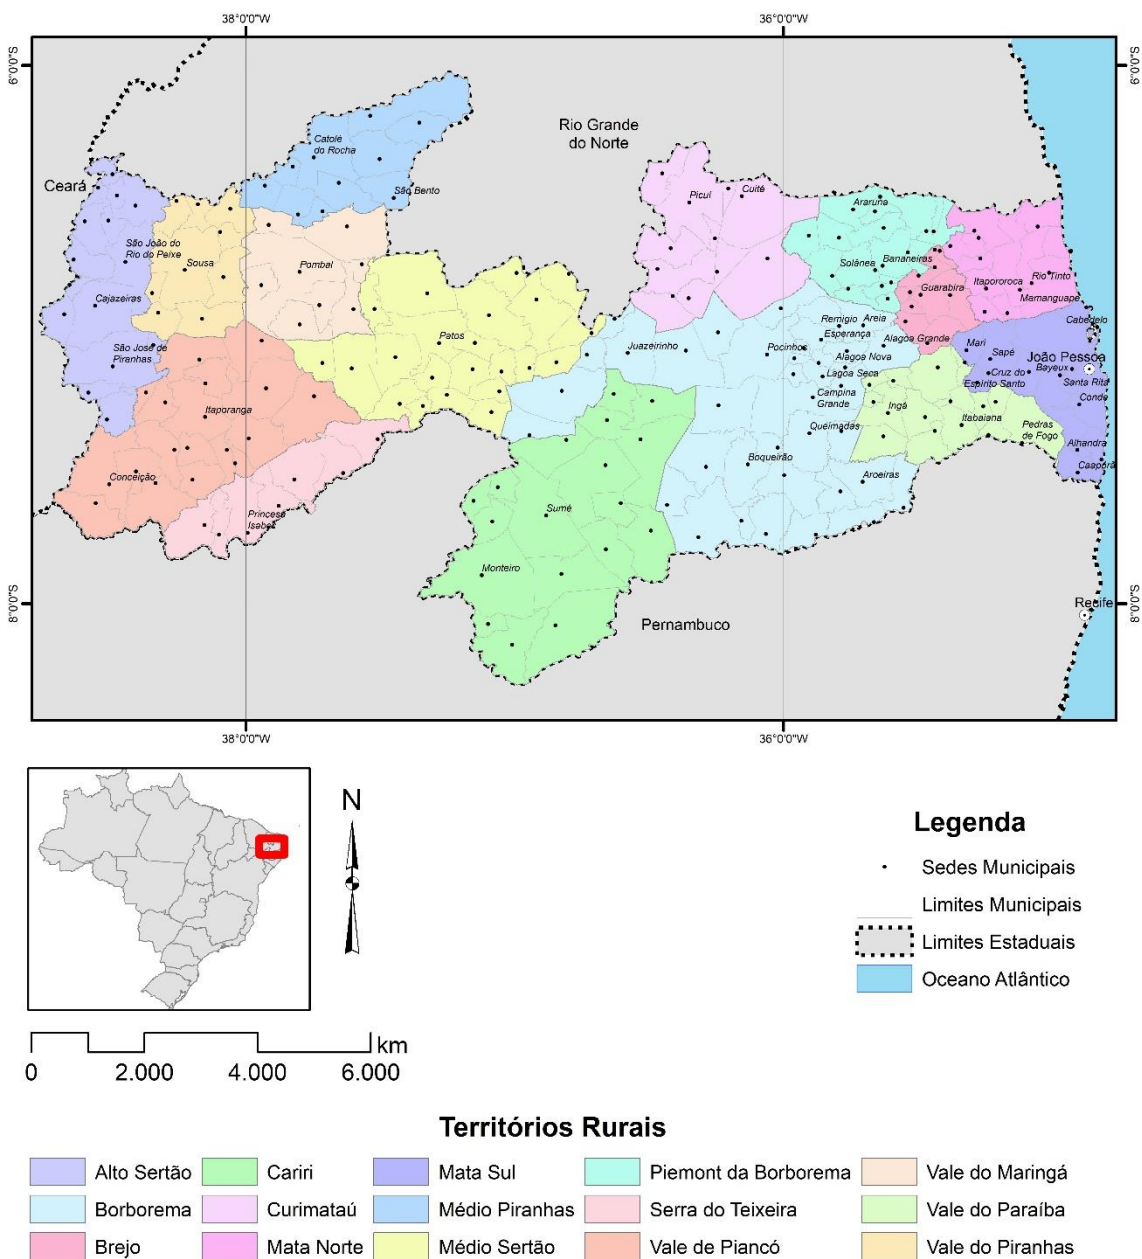

### 2.4 Project Area

The project will cover the entire state of Paraíba, involving its 223 municipalities (see figure below), which are distributed between the Caatinga (194) and Atlantic Forest (29) biomes. The Agricultural Census (IBGE 2017) shows a total of 163,218 agricultural establishments, 76.88% of which are family farms, providing a potential universe for the project.

The project will seek to serve approximately 60,000 families as direct beneficiaries, establishing a preferential focus on the following profiles: women, young people, people with disabilities, Traditional Peoples and Communities and indigenous peoples (including fishermen, gypsies and quilombolas). In any case, specific criteria will be defined for prioritizing and selecting the communities to benefit.

The following map shows Proc case II's area of operation.

**Figure 1 - Area covered by the Project**

Source: IBGE, 2015 - elaboration: Consultoria.

## 2.5 Budget from Procasse II

The total amount planned for Procasse II is 105 million dollars, which will benefit an estimated 600 communities.

**Table 1 - Estimated PROJECT costs (in US\$)**

Components and sub-components	Total Value
<b>C1. Resilient production systems to reduce rural poverty</b>	<b>62.416.000</b>
<i>S1.1 - Implementing resilient biodiverse production systems</i>	56.416.000
<i>S1.2 - Strengthening and diversifying marketing</i>	6.000.000
<b>C2 - Organizational and Farmer Capacity Building and Knowledge Management</b>	<b>32.302.800</b>

<b>Components and sub-components</b>	<b>Total Value</b>
<i>S2.1 - Strengthening the Capacities of Family Farmers</i>	19.252.800
<i>S2.2 - Strengthening Organizations' Marketing Capacities</i>	2.730.000
<i>S2.3 - Diversity, Gender, Youth, Nutrition and Food Security</i>	4.600.000
<i>S2.4 - Land and Environmental Regularization, and Access to Public Programs and Policies for Family Farming</i>	2.600.000
<i>S2.5 - Innovation, Knowledge Management (KM), South-South and Trinagular Cooperation (SSTC)</i>	3.120.000
<b>Project Management, Monitoring &amp; Evaluation</b>	<b>10.281.200</b>
<i>Project Management</i>	8.981.200
<i>Monitoring &amp; Evaluation (M&amp;E)</i>	1.300.000
<b>TOTAL</b>	<b>105.000.000</b>

## 2.6 Description of the components

The PROCASE II components are presented below, highlighting the main information that describes them, including their sub-components.

### Component 1: Resilient Production Systems to Combat Rural Poverty

The aim of this component is to increase the adoption of agricultural technologies, including those for adapting to and mitigating climate change, as well as improving the productive and social inclusion of family farmers, prioritizing women, young people, Traditional Peoples and Communities and people with disabilities .

The specific objectives are:

- Transform existing systems by introducing innovative, more intensive and diversified agroecological practices;
- Seeking greater resilience of production systems adapted to climate change;
- Promote improved food and nutrition security;
- Improving the integration of producers into value chains, prioritizing women, young people, people with disabilities, Traditional Peoples and Communities , indigenous peoples, fishing communities and gypsies;
- Make investments in social technologies, ensuring better access to and reuse of water, and sustainable energies;
- Supporting producer organizations (associations and cooperatives) to enable the processing of production, adding value and, consequently, improving marketing and market insertion, through investments in machinery and minor renovations;

Productive investments, both at community level and at cooperative level, will be accompanied by TA and STA respectively, financed by Component 2, in order to guarantee better business management, marketing and sustainability.

Component 1 is organized into two sub-components: 1.1: Implementing Resilient Investment Plans; and 1.2: Strengthening and diversifying marketing.

### **Subcomponent 1.1. Implementing biodiverse and resilient production systems**

The aim of this sub-component is to strengthen and adapt production systems based on the use of agro-ecological practices and low greenhouse gas emissions, seeking greater resilience and allowing for an improvement and diversification of healthy food production for self-consumption and the market. It is hoped that these activities will improve families' food and nutritional security, while at the same time helping to improve their income.

Investments will also be made in social technologies (small water and energy infrastructures), which play a fundamental role in building and strengthening more resilient production systems and improving the basic living conditions of families.

The technical characteristics of the production proposals supported by the project will be adapted according to the specific agro-climatic characteristics of each biome.

#### ***Product - Resilient Investment Plans (PIR)***

It will be the main instrument for planning and implementing the resources of this subcomponent. It will have a territorial focus and will be prepared with one or more communities, with the support of TA. Each PIR will be carried out by an existing community association, representing the beneficiary community or communities, with which the project will sign an agreement establishing its obligations and rights. The project will pass on the funds provided and the association will make the purchases and contracts provided for in the PIR, reporting back to the project with the support of technical assistance.

The scope of the PIR will be a Local Territory, made up of up to three communities, and the beneficiaries will be the families in these communities. The PIR will support productive activities (new or reinforcing existing activities) geared towards adapting to climate change, with the potential to guarantee food security and improve income through the sale of surpluses. It aims to incorporate concepts of good production practices based on the principles of agroecology, nutritional education and food security for families, as well as ensuring integration with social technologies.

The PIR will finance three areas of intervention: i) Productive and commercialization ii) Environmental and iii) Social Technologies, between which complementarity and synergy will be sought in order to promote sustainable change. As shown below:

**Productive and marketing axis:** The aim will be to develop productive systems at the family level, always based on the use of agro-ecological practices with a low impact on greenhouse gas emissions. This axis will also strengthen capacities to market production in the various channels accessible to families (local fairs, PAA, PNAE, local commerce, etc.) and relevant to the beneficiaries, such as: i) Agroforestry systems (SAFs) for diversified production, goat and sheep farming for milk and meat, dairy cattle farming, and free-range poultry farming; ii) Backyards for fruit and vegetable production, including PANC and medicinal plants; iii) Beekeeping and Meliponiculture; iv) Agroecological consortia for organic production, including cotton. It is important to mention that in the case of support for cattle breeding, the project's strategy will be to support dairy production exclusively (it will not be possible to support breeding for meat production), to improve productivity from the existing herd and will not finance the purchase of animals, with the exception of the purchase to replace breeding stock. The list is not exhaustive and other activities may be considered, as long as they

are in line with the demand of the beneficiaries and the objectives and criteria of the project.

Compared to the first phase of PROCASE, which focused on the semi-arid region of the Caatinga biome, the PROCASE II management team will have to pay close attention to identifying relevant proposals for developing productive activities with the potential to adapt to climate change in the Atlantic Forest biome.

All the activities supported under this Productive and commercialization axis will be in accordance with the Environmental and Social Management Plan (PGAS) of each PIR and with the project's Strategic Environmental and Social Management Plan (ESMP).

Extractivism, both in the Caatinga biome and in the Atlantic Forest biome, could also be supported through PIRs, both to enhance non-timber products such as fruit, fibers and lianas, seeds, honey from native bees and other bio-economic products. As it includes an important coastal area, the improvement of artisanal fishing activities, including shellfish gathering, which is generally carried out by women, could be considered when drawing up the RIPs.

In addition to these activities, and considering that part of the project's area of operation has strong potential, economic diversification activities based on tourism (particularly in the coastal Zona da Mata) and handicrafts could be developed through the PIR. These non-agricultural activities, which generally involve women and young people, will be very relevant and in line with the project's objectives.

The Productive and Commercialization Axis will focus on actions to sustainably strengthen primary production and the commercialization of products generally in natura and on the local market. TA will encourage and support the establishment of partnerships with cooperative production processing units supported by the project through subcomponent 1.2. This should make it possible to add value to primary production in order to reach other types of market.

**Environmental Axis:** The aim is to manage and restore the environment, whether or not it is associated with the activities of the RIP's Productive Axis at Local Territory level.

They will have specific resources for collective use to encourage the implementation of territorial environmental actions, such as: i) Casas de Sementes da Paixão (Seed Houses of Passion); ii) Implementation of nurseries with a focus on the production of native species; iii) Reforestation, recovery of permanent preservation areas (springs) and degraded areas; iv) Soil and water protection actions; v) Recycling or composting plans, etc. These actions will be implemented in each territory by an environmental management group made up of project beneficiaries, in which the participation of Local Development Agents (ADL) will be prioritized, as key players in introducing environmental education actions and new environmental practices. To implement these actions, synergies and complementarities will be sought with the actions and competencies of SEMAS (Secretariat for the Environment and Sustainability) and AESA (Executive Agency for Water Management), the State Superintendence for the Environment (SUDEMA), the National Semi-Arid Institute (INSA), Empresa Brasileira de Pesquisa Agropecuária (EMBRAPA), Empresa Paraibana de Pesquisa, Extensão Rural e Regularização Fundiária (EMPAER), Universidade Federal de Campina Grande (UFCG), Universidade Estadual da Paraíba (UEPB), Universidade Federal da Paraíba (UFPB) and other institutions.

The activities of the Environmental Axis will mainly stem from the Environmental and Social Management Plans (PGAS), which will be drawn up at the same time as the diagnosis of each PIR. The ESMP will provide a simplified analysis of environmental and social impacts in order to promote and encourage the adoption of environmental and agro-ecological practices. Environmental activities will be carried out with the support of TA, which will also take care of production and marketing.

**Social Technology Axis:** The aim of this axis is to implement social technologies at the family level, such as: i) second-water cisterns (agricultural production); ii) a water harvesting system; and iii) trench dams (underground dams). In addition to these technologies, 1st water cisterns (human consumption) and other household sanitation solutions such as evapotranspiration basins, or access to more sustainable domestic energy, such as biodigesters and eco-efficient stoves, will also be implemented.

The social technologies will be implemented by entities contracted by the PMU specifically to provide TA for this axis, taking into account the specific nature of the TS and the legal framework targeted. These entities will be trained by PROCASE II, although most of them have the experience to do so. In addition to implementation, these organizations will also provide training to ensure that these technologies are properly appropriated, used and maintained by the families.

The connection and complementarity between the productive, environmental and social technology axes should be sought and highlighted when drawing up the PIRs, with the aim of maximizing the results of the investments made by the project.

In each of these areas, priority will be given to the introduction of innovative practices and technologies, particularly those that will be supported through Subcomponent 2.5, such as mechanization and the use of tools and equipment adapted to the reality of family farming, with a focus on vulnerable groups such as women, young people and the disabled.

The PIRs will also be able to support the strengthening of the functioning of community associations through the purchase of specific equipment, for example, to improve connectivity, such as audio visual material, etc.

**General aspects about the RIPs:** During the implementation of the PIRs, in addition to a close and permanent synergy with TA actions (including specialized TA in cases where it is justified) and the strengthening of community organizations, complementarities will be established with other Component 2 activities, such as: land and environmental regularization; innovations; actions related to diversity, gender, youth, PCT and families with persons with disabilities.

The PIR will benefit groups of families, prioritizing women, young people, traditional communities and the persons with disabilities, and will finance inputs, tools, equipment and other investments needed to enable the adoption of technologies to improve productivity, adapt to climate change, and improve food and nutritional security.

The investments will be financed with non-reimbursable resources and with an economic counterpart from the beneficiaries of at least 10%.

In all cases, the activities selected will come from the Participatory Rural Diagnosis, which will identify not only the demands, but also the problems, priorities and potential demands of the beneficiary communities and families. These activities must meet eligibility criteria which will be detailed in the Project Operational Regulations (ROP) and present: i) high adherence to the productive means characteristic of the biome, region

and community, ii) allow for productive intensification based on the principles of agroecology, as well as adaptation to climate change and iii) follow the full agreement of the families involved.

The same PIR can support more than one productive activity or environmental axis and include the implementation of various types of Social Technologies, thus seeking coherence with the reality of family farming in order to meet the demands of the communities in a diversified way, and can guarantee the inclusion of various profiles of beneficiaries, particularly women and young people. In these cases, the beneficiaries will be organized into interest groups around the activities selected to make up the RIPs.

During the process of drawing up the PIRs, the integration of new members and partners into existing organizations will be encouraged, giving priority to women, young people and families with persons with disabilities.

**Provision of Technical Assistance and Rural Extension (TA) services:** All PIR beneficiaries and their organizations will receive TA services for two years, contracted by the PMU through a competitive process that meets IDB/IDA standards. These services will be financed by Subcomponent 2.1, in which they are presented in detail. They should enable the beneficiaries to be strengthened and advised on how to design, implement, monitor the operation of and complete the RIPs. This includes advice on production from an agro-ecological perspective and adaptation to climate change, management, organization, access to public policies and marketing, guaranteeing compliance with current health and environmental legislation. The support provided by the TA entities should include support for the beneficiaries to carry out the procurement and accounting processes related to the implementation of the PIRs, considering that the financial resources will be transferred to the beneficiary associations through the procedure defined in the AOP. In the selection of TA services, criteria will be applied that allow for the inclusion of women technicians in the teams, with a view to being as adherent as possible to the specific needs of women and to proposing the most appropriate solutions for the women beneficiaries of the Project's actions. For example, it will be a selection criterion for TA organizations to have a minimum percentage of 30% women on their teams.

In the case of monitoring the implementation of Social Technologies, a specific TA will be contracted for this purpose, which complies with the legal framework for contracting services for this modality. The entities contracted in this way will be responsible for acquiring materials, providing specialized services for the construction of the Social Technologies and training the beneficiaries to apply good use and maintenance practices.

**Planned Actions and Products:** The actions planned in this product involve: (i) identification of communities; (ii) community eligibility criteria; (iii) prioritization and selection of communities; (iv) Resilient Investment Plan Drafting Process; (v) drafting of RIPs; (vi) parameters for drafting RIPs; (vii) investments eligible for funding; (viii) fundable Climate Adaptation investments; (ix) fundable Climate Mitigation investments; (x) ineligible investments; (xi) PIR approval process; (xii) evaluation and prioritization criteria.

Details of the planned actions can be found in the **Annex 8.5** of this SESA.

## **Subcomponent 1.2 - Strengthening and diversifying commercialization**

This sub-component aims to improve marketing and the inclusion of families in value chains by improving the management and production structures of family farmers' cooperatives.

It aims to strengthen cooperatives by means of a Business Plan (PN), with a view to consolidating their management capacities, adding value, diversifying their commercial offer and accessing markets under better conditions. Rather than seeking to create new cooperatives, priority will be given to existing cooperatives to improve their management capacities and those with operational weaknesses.

### **Product - Business Plans**

The preparation of these PNs will take into account the strengthening of production carried out in subcomponent 1.1 through the PIR, with the aim of integrating producers into these cooperatives in order to access the market.

The development of the PN will seek to diversify the markets accessed. In addition to institutional markets, such as PNAE and PAA, other players will be sought, mainly from the private sector. The project will seek to include the organizations in the Regional Information System for Family Farming in the Northeast (SIRAF), created by the Northeast consortium and which has been offering a new channel for establishing contact between producers and buyers.

Business Plans (PNs) will be the main instrument for implementing the subcomponent and will be drawn up with producers' economic organizations, usually cooperatives. The PNs should make it possible to finance structuring investments that could benefit family farmers, including the producers benefiting from the RIPs. Specialized technical assistance services (STA) specially dedicated to the PNs and to strengthening the capacities of the beneficiary organizations will also be financed by the PNs.

The PNs should allow for the implementation of competitive mechanisms, oriented towards innovative and environmentally sustainable solutions, to strengthen network marketing and cooperative centers.

Investments will be focused on existing organizations that have weaknesses in their management processes, that are unable to achieve sufficient levels of commercialization, that find it difficult to comply with environmental and health legislation, or that operate below their capacity. In these cases, the project will strengthen the capacities of the management teams, support the improvement and modernization of equipment and facilities, improving the processing and diversification of products, with a focus on adapting and/or expanding the physical infrastructure (such as processing and storage areas), with the aim of also meeting the health and environmental standards for obtaining certifications (SIF, organic certification, distinctive collective seals, valuing sustainable products from the Caatinga and Atlantic Forest biomes, etc.). Where relevant, the development of participatory guarantee systems (PGS) geared towards certification processes will also be supported. Subcomponent 2.2 will make an important contribution to these activities and complementarities will be built.

In exceptional cases, the project's support may be directed towards structuring the productive capacity of a cooperative, operating within the supported production chains.

These cases will be specific and subject to prior feasibility analysis, taking into account in particular the existence of other similar ventures in the project area.

Strengthening the capacities of the cooperatives' teams will be a key point of the PNs, which will address the issue of best processing practices, as well as others, such as administrative and financial management. In this case, courses are planned on good management practices and the organization of production, processing, adding value, financial management, institutional strengthening, marketing strategies, etc. The management teams of these enterprises will be the main beneficiaries. These courses will mainly be carried out through specialized consultancies (such as individual consultants, EMPAER, EMBRAPA, SEBRAE, SENAR, etc.).

The preparation of the Business Plans will include a diagnosis of the organization's situation, clearly identifying the most important problems and difficulties encountered and also the opportunities that can be seized. The PNs may include agricultural activities of primary production, processing and marketing of this production. Other economic initiatives can also be included, such as handicrafts, community-based tourism and others, provided they have the potential to generate income in a sustainable way. As the object of these plans will be 'business' related, involving production and market issues, it is necessary to include more detailed information such as a 'map' of the production chain identifying flows and actors, an analysis of the products demanded by the market and their trends (volumes, prices), an analysis of the competition, a strategy for operating in the market, a sales plan and an investment management strategy. The Business Plan will identify the material investments that will have to be made (construction/refurbishment, machinery, equipment, etc.). In addition, it should point out the training needs (which may cover production, marketing, administrative and financial management, or other dimensions) that the implementation of the Business Plan will require.

**Provision of Specialized Technical Assistance (STA) services:** Considering the capacities found in the organizations in the region served by the Project, it will be necessary to contract STA services for the preparation and implementation of all the Plans. These services will be contracted by the PMU, through a competitive process that complies with IDB/IDAF standards, with funds provided in the budget for Subcomponent 2.2. However, in certain cases and when the beneficiary organization shows experience and capacity, it could take on the responsibility of contracting the STA directly.

Individuals or legal entities may be contracted to provide these services. The criteria for selecting providers will include: i) experience in providing consultancy services to family farming cooperatives; ii) technical capacity related to the specific problem(s) identified by the cooperative, such as improving processing processes, developing a strategy and identifying new marketing channels, developing a certification system, etc.; iii) technical capacity to deal with and integrate environmental issues related to the activities carried out by the cooperatives being assisted; iv) capacity to work remotely (using digital tools); v) experience with access to public policies.

STA services should encourage supported organizations to look for other sources of funding and service providers to complement the resources allocated by PROCASE II and also to meet demands not included in the business plans it supports. Opportunities for cooperation and alliances with the private sector will also be sought whenever possible.

**Planned Actions and Products:** The actions planned in this product involve: (i) Identifying and selecting beneficiary organizations; (ii) Drawing up the PNs; (iii) Eligible investments for financing; (iv) Types of Climate Adaptation investments that can be financed; (v) Types of Climate Mitigation investments that can be financed; (vi) Non-eligible investments for financing; (vii) Criteria for evaluating and prioritizing the PNs; (viii) Implementing the PNs.

Details of the planned actions can be found in the **Annex 8.5** of this SESA.

## **Component 2 - Strengthening Family Farming Capacities and Organizations and Knowledge Management**

The aim is to strengthen the individual and collective capacities of family farmers and their organizations, necessary to increase the adoption of agricultural technologies that promote greater resilience in their systems, to improve productive and social inclusion, as well as the environmental and land conditions of rural communities and their surroundings.

The capacities strengthened through the component will be an essential tool for implementing the investments and innovative practices promoted by Component 1.

To help achieve the project's general objectives, the component will develop a set of activities with the following specific objectives:

- Strengthen the capacities of families and community organizations to implement more resilient and productive production systems, to better manage organizations and to access public policies;
- Strengthening the capacities of rural organizations so that they can develop their production and access markets;
- Strengthen the specific capacities of priority audiences in the areas of gender, youth, TPCs, persons with disabilities, LGBTQIAPN+ population to promote their empowerment.
- Promoting the land and environmental regularization of family farming establishments, agrarian reform settlements and quilombola communities.
- Implementing a knowledge management (KM) and South-South and Triangular Cooperation (SSTC) process to generate, record, share and use relevant knowledge.

The sub-components involved in this C2 are presented below. The full details of each sub-component can be found in the Annex 8.6.

### **Subcomponent 2.1. Developing the Capacities of Rural Community Organizations**

The component will focus on strengthening the capacities of beneficiary families and community organizations, considering the weaknesses identified in various areas, with adequate knowledge to implement production systems that are more resilient to climate change and more productive, as well as to improve the management of community organizations.

It will finance the contracting of Agroecological Technical Advisory Services to carry out activities aimed at increasing beneficiary families' access to adequate, quality information. The main themes to be addressed by Technical Advisory Services will be

the development of more profitable, diversified and resilient agricultural production, the protection and recovery of environmental resources and the improvement of organizational management. It will also seek to integrate them more closely into different value chains in the region, with initiatives to support processing and marketing. And finally, the subcomponent will seek to strengthen the Technical Advisory Services teams contracted to ensure the good quality of this service.

### ***Actions planned***

- Provision of agro-ecological Technical Advisory Services services in communities
- Complementary training/exchange events for farmers, including association leaders.
- Events to improve Technical Advisory Services teams
- Training family farmers in public policies

Approximately 18,000 families will benefit from Technical Advisory Services , of which 50% should be represented by women, 30% by young people and at least 20% by Traditional Peoples and Communities. Part of this same public (approximately 2,600 people) will be served with complementary training events. Approximately 150 technical Technical Advisory Services agents will also be trained.

The Public Policy courses should benefit a total of 32,000 families, of which 50% should be represented by women, 30% by young people and at least 5% by Traditional Peoples and Communities.

### **Subcomponent 2.2. Strengthening Family Farming Organizations for Market Access**

The aim of this subcomponent is to strengthen the capacities of the teams of the economic organizations (mainly cooperatives) served by the project. Groups/organizations of farmers will also be worked with in order to create or strengthen local fairs and small marketing centers. In the context of improving marketing conditions, the project could also support the creation and/or strengthening of health inspection services at municipal level or for groups of municipalities organized into territories / 'consortia of municipalities'.

The aim is to help family farming organizations and their products enter diversified marketing channels, generating more income for the families who benefit from them.

### ***Actions planned***

- Provision of Specialized Technical Assistance (STA)
- Initiatives to strengthen fairs and marketing centers
- Pilot implementation of the Participatory Guarantee System (PGS)
- Structuring Municipal Health Inspection Services

The provision of STC services will work with 60 Business Plans from economic organizations, benefiting approximately 5,000 families, of which 50% must be represented by women, 20% by young people and at least 5% by Traditional Peoples and Communities and 2% by the persons with disabilities.

The initiative to strengthen local fairs and marketing centers will work with 50 units (fairs and centers), benefiting approximately 800 families.

It is planned to set up 2 Municipal Consortia Health Inspection Services, as well as 15 participatory guarantee systems (SPG).

### **Subcomponent 2.3. Gender, Youth, Diversity, Nutrition and Food Security**

This sub-component will aim to promote the empowerment of women, young people, TPCs, LGBTQIABP+ and persons with disabilities, as well as improving the nutrition and food security of beneficiary families. The activities will work with the project's cross-cutting themes, strengthening and supporting the integration of these themes into all the components.

#### **Focus on gender and diversity**

The project will take a holistic approach to transforming gender relations, promoting the inclusion of Afro-descendants and TPCs, the LGBTQIAPN+ community and people with disabilities, focusing on the environmental, economic, political and cultural causes of the social vulnerability of these groups. In order to transform unequal power relations, shaped by patriarchal and exclusionary structures, norms and practices, as well as empower women, Afro-descendants and TPCs, the LGBTQIAPN+ community and people with disabilities, the following transformation paths will be followed:

- i) promote economic empowerment and equality by valuing women's contributions to the family economy and community development,
- ii) dealing with the issue of women's overload due to domestic and care work, promoting a fairer division of the workload between men and women,
- iii) empower target groups to have a greater voice and decision-making power in rural institutions and organizations,
- iv) promoting advocacy in policies for women, young people and TPCs,
- v) preventing gender-based violence, v) valuing traditional knowledge, practices and ways of life for production, food and management of natural resources and
- vi) promote the inclusion of the LGBTQIAPN+ community and people with disabilities, seeking to empower them, promote their leadership and respect their rights.

Therefore, this sub-component aims to support the mainstreaming of the gender and diversity strategy throughout the Project, which will have an intersectional approach, considering the overlap of multiple discriminations of gender, race/ethnicity, sexual orientation and disability. All the activities and products proposed for this component will be contained in and guided by the Gender and Diversity Strategy and Plan to be drawn up at the start of project implementation.

#### **Focus on youth**

Among the factors that influence staying in rural areas is access to work and income opportunities, education/training that is suited to the characteristics of rural areas, appreciation of rural lifestyles, and the availability of services and conditions that can offer the possibility of success in agricultural production. To respond to these issues raised in the Youth diagnosis and to promote the permanence of young people in the

countryside, as well as offering more opportunities for sustainable income and work for young people in general, the strategy of this subcomponent is based on three main axes:

- i) Promote a broad training program in agricultural and non-agricultural activities that generate greater employment and income opportunities,
- ii) Implement a program to revalue life in the countryside through communication activities,
- iii) Promote the formation of Youth Networks and debates on issues relevant to the development of rural youth.

### Focus on Nutrition

To improve food security, nutritional status and increase the adoption of healthy eating practices by the Project, this PROCASE II subcomponent will implement a strategy centered mainly on food and nutrition education training. There will be 3 main lines of action:

- Raising awareness of good nutrition and health practices (reproductive health, maternal health and child health), in particular to improve the nutritional and health status of women and children;
- Raising awareness of the food culture, healthy eating, which in particular includes the Unconventional Food Plants (UFP) of the target territories; and
- Training vulnerable communities in the processing of healthy local products in order to increase their daily consumption in a sustainable way and foster the empowerment of vulnerable communities, valuing local food culture.

### ***Planned actions and products***

- Gender and Diversity Plan: The Gender and Diversity Plan will be drawn up in the first few months of project implementation by the PMU's Gender and Diversity specialist with the support of a specific consultancy hired to detail the general strategy and implementation methodology for all activities related to gender equity and women's empowerment, as well as the inclusion of PCTs, people with disabilities and LGBTQIAPN+. The activities set out in the Gender Plan should include:
  - Modular training in Gender and Diversity for project and TA teams
  - Gender and diversity training for the project's direct beneficiaries
  - Implementation of the Agroecological Logbook Methodology
  - Training *cirandeira(o)s*
  - Childcare/education activities that allow women to participate in the project's activities
  - Thematic diversity meetings (aimed at people with disabilities and LGBTQIAPN+)
- Youth Plan: A Youth Plan will be drawn up in the first few months of project implementation by the PMU's Youth specialist to detail the general strategy and implementation methodology for all the activities in this subcomponent related to the socio-economic and political empowerment of young people. At least the following cross-cutting activities will be developed for rural youth in the project area:

- Vocational training in agricultural and non-agricultural activities
- Training Young Communicators
- Thematic meetings with young people and the formation of Rural Youth Networks
- Plan to Strengthen Traditional Peoples and Communities (TPCs): A Plan to Strengthen Traditional Peoples and Communities will be drawn up in the first few months of project implementation.
  - Strengthening TPC Networks
  - TPC Policy Integration Fairs
- Nutrition and Food Safety Plan: A Nutrition and Food Safety Plan will be drawn up in the first few months of project implementation.
  - Nutrition education initiative to improve nutrition and maternal and child health in the project's most vulnerable communities
  - Training events on food culture and food processing to enhance local products with a view to improving nutrition and facilitating the empowerment of women and young people
  - Raising awareness of nutrition, health and food culture among students at the Integral Citizen Schools
- Local Development Agents: The project will hire a foundation, which will be responsible for hiring Local Development Agents (LDAs), who are young people from the communities themselves, hired by PROCASE II to carry out tasks such as mobilizing communities and organizations to actively engage in the project. In addition to mobilization, the LDAs will have to play an important role in managing the agreements made by the community associations, supporting the holding of tenders, updating financial information, monitoring the investments made, rendering accounts and keeping the associations fiscally regular. One young person will be hired per Resilient Investment Plan, which in turn serves 3 communities. The young LDAs will receive a series of training courses to develop their skills. By playing the role of LDA, it is hoped that the young people selected will be able to gain experience in leadership and management, becoming references in the communities they represent and continuing to support them even after the end of the Project. The LDAs will also play an important role in supporting the implementation of cross-cutting activities, such as gender, diversity and youth, as well as in communication between the communities, the Project and the TA teams.

#### **Subcomponent 2.4. Land and Environmental Regularization**

The aim of this sub-component is to strengthen the family units served, making the production base more secure by supporting land and environmental regularization.

#### ***Actions planned***

To achieve this goal, actions to support land and environmental regularization will be implemented.

- Support for land and environmental regularization: Seeking to provide solutions to the problem of a large number of family units in Paraíba that do not have complete

legal documentation or formal recognition of these properties, the project aims to implement a land regularization and environmental registration initiative.

- Choice of communities/properties to be benefited
- Implementing the regularization roadmaps: EMPAER's previous experience has allowed it to define a roadmap or sequence of steps that must be taken in order for a rural property to be regularized. It is this roadmap, which covers both the land ownership and environmental registration dimensions, that forms the methodological backbone of the Project's regularization initiative.

It should be noted that the route to be taken by each property to be regularized is slightly different depending on the starting situation of each property, in which case there are two possible initial scenarios: i) Properties with public deeds - areas of ownership and ii) Properties without public deeds - areas of possession. Both routes are similar, with the one for possession areas having a few additional steps. The roadmaps are presented in more detail in the table below.

**Table 2 - Roadmaps for land regularization and environmental registration**

Initial moment: Mobilization and dissemination action, in which the initiative is presented and explained to the beneficiary public, with the aim of identifying/confirming the family units or communities interested in participating and that meet the prioritization criteria (areas without litigation, quilombolas, settlers, PA with less than 25 ha, etc).	
Once the potential participants have been identified, the following activity guides are applied.	
<b>Activity roadmap (i): Domain areas</b>	<b>Activity roadmap (ii) - Ownership areas</b>
1 - Diagnosis of the rural property. This aims to identify whether the property is in the ownership area (with a deed) or the possession area (without a deed).	1 - Diagnosis of the rural property. This aims to identify whether the property is in the ownership area (with a deed) or the possession area (without a deed).
2 - Georeferencing rural property.	2 - Georeferencing rural property.
3 - Georeferencing inspection: done 100% by satellite image and on-site inspection of some properties. It checks that the landmarks are correctly implanted and if there are any discrepancies that need to be corrected. Any property that needs adjusting will be corrected by the contractor. The property that is suitable can be entered into the Land Management System (SIGEF).	3 - Georeferencing inspection: done 100% by satellite image and on-site inspection of some properties. It checks that the landmarks are correctly implanted and if there are any discrepancies that need to be corrected. Any property that needs adjusting will be corrected by the contractor. The property that is suitable can be entered into the Land Management System (SIGEF).
4 - Evaluation of documentation by the Discriminatory Commission, to declare that the property is suitable for the next stages	4 - Evaluation of documentation by the Discriminatory Commission, to declare that the property is suitable for the next stages
5 - Creation or updating of the registration code in the National Rural Registration System (with issuance of the CCIR ) <sup>1</sup>	5 - Creation or updating of a registration code in the National Rural Registration System (with issuance of the CCIR)
6 - Approval by the agency (INCRA/EMPAER) of the geo-referenced parcel/property in the Land Management System (SIGEF), which allows technical parts (plans and descriptive memorials) of the property to be generated. The delivery of these technical documents certifies the regularization of land ownership, which is georeferencing (in script (i) for ownership areas).	6 - Approval by the agency (INCRA/EMPAER) of the georeferenced parcel/property in the Land Management System (SIGEF), which allows technical parts (plans and descriptive memorials) of the property to be generated. As this is vacant land, the documentation is issued in the name of the state at this stage. The delivery of these documents concludes the first stage of land regularization, which is georeferencing.

<sup>1</sup> CCIR is the Rural Property Registration Certificate, which is issued by INCRA via the Rural Registration System.

	6.1 - Delivery of the plan and memorial to the notary's office, for the creation of the registration and collection of the wasteland.
	6.2 - Analysis by Discriminatory Committee
	6.3 - Updating the technical documents, which will then be in the name of the beneficiary squatter and drawing up a definitive property title in their name (or that of the community in the case of collective land).
	6.4 - Sending the updated documentation to the Registry Office for the transfer of ownership (State to beneficiary).
7 - Creating or updating the CAR (Rural Environmental Registry) register, using the data registered in SIGEF. The receipt for the rural property's registration in the CAR proves that the registration has been completed.	7 - Creating or updating the CAR (Rural Environmental Registry) register, using the data registered in SIGEF. The receipt for the rural property's registration in the CAR proves that the registration has been completed.
8 - Drawing up the domain recognition title	8 - When stage 6.4 of the notary's office is completed, the property is fit and up-to-date. With the above steps completed, the property's documentation is fully regularized and ready to be handed over to the beneficiary (individual or collective).
9 - The property is ready and up to date. Once the above steps have been completed, the property is ready, with recognition of ownership. The technical documents can be sent to the notary's office for registration of the area. A new, updated certificate can then be issued.	

It is hoped that approximately 5,000 properties (covering around 100,000 hectares) will be able to follow this route with the project, until the desired regularization is achieved. It should be made clear that in agrarian reform settlements (federal or state) and in the municipalities served by EMPAER, title will be granted individually, per beneficiary family. In the case of quilombola communities, the title will be collective, covering the entire georeferenced polygon and in the name of the duly registered residents' associations.

The land and environmental regularization initiative will assist approximately 5,000 rural properties and families, of which 40% will be quilombola communities and federal and state settlements.

### **Subcomponent 2.5. Knowledge Management and South-South and Triangular Cooperation**

Subcomponent 2.5 will develop and implement a knowledge management process capable of generating, recording, sharing and using knowledge generated in the Project. It will also seek to feed the project implementation process with relevant information and knowledge. Knowledge will be made available at different geographical scales: among project participants (at community and territorial level), at state level, in the Northeast region and in other developing countries (via SSTC), and to different target audiences: beneficiaries, Implementing Partners and service providers, the project team, government entities and others. The objectives will be refined during the preparation of

the Knowledge Management (KM) and South-South and Triangular Cooperation (SSTC) plan.

### ***Actions planned***

- **KM and SSTC plan:** This plan will define the detailed objective of the KM and TSSC activities, the products developed for each target group, the distribution channels, among others. PROCASE II will be able to draw on a wide range of resources, products and experiences from other initiatives and projects, including lessons learned from PROCASE I. Therefore, PROCASE II's KM and SSTC activities should avoid duplicating existing material while at the same time utilizing this material in project activities, such as capacity building and training. The main activities and products include:
  - Systematization of experiences, good practices and results and Studies of interest to the Project on specialized topics
  - Communication and Dissemination in Knowledge Management
  - South-South and Triangular Cooperation Actions

Under this subcomponent, 25 systematizations and studies on Knowledge Management will be carried out, 6 annual communication and dissemination phases and 10 South-South Cooperation exchange events.

### **Project Management, Monitoring and Evaluation**

The aim of this component is to create an efficient mechanism for managing and controlling the activities implemented by the Project, allowing them to be fully executed in line with the Project's intervention proposal, as well as guaranteeing the implementation of the Annual Operational Plans (AOP).

It also aims to introduce technological innovations to ensure the monitoring and evaluation of activities, the recording and systematization of Knowledge Management, as well as enabling transparent communication between stakeholders, including knowledge exchange actions.

To meet these objectives, the component will work on the basis of 2 sub-components, as follows.

#### **Project Management**

It will make it possible to support the Project Management Unit (PMU)<sup>2</sup>, by implementing instruments to strengthen: i) Management; ii) Administration; iii) Technical operational capacity; iv) Procurement processes (tenders and contracts); and v) Financial management. This support should facilitate compliance with the contractual clauses of the Loan Agreement.

As a Management Sub-component, its activities converge to comply with IDB and IFAD Guidelines and Policies for financing, such as the specific procedures for: i) tenders and

---

<sup>2</sup> The PMU was formally created by Decree No. 44.934 of April 15, 2024, which provides for the Unit and defines the Basic Structure for managing the Paraíba Sustainable Rural Development Project - PROCASE II.

contracts; ii) requests for disbursements and rendering of accounts for the resources contributed, executed and/or committed; and iii) supervision of the implementation of community initiatives, ensuring compliance with environmental and social safeguards, procurement and financial management requirements, including rendering of accounts by beneficiaries.

### ***Product - Project management support***

**Main products:** Project Management Unit operational for 6 years

### **Monitoring and Evaluation (M&E)**

The project will set up a Planning, Monitoring, Evaluation and Systematization (PMES) system for its activities and results, which will be an essential management tool, enabling planning and monitoring of the project's execution, as well as actions to ensure digital inclusion.

### ***Product - Monitoring system***

The project will implement an information management system, where data collected in the field will flow to the PMU. For better organization, a computer system will be developed based on those used in Procase - phase 1, to monitor all the activities to be carried out.

**Main products:** M&E systems developed

### ***Product - Impact assessment studies***

The impact assessment will provide information on whether the project was able to achieve the results set out in the objective, as well as recording the impacts on improving the lives of the target population, such as nutrition, income, production methods, among others.

The research will use the difference-in-differences method, and will therefore be carried out on 2 groups, the treatment (a sample of project beneficiaries) and the control (non-beneficiaries, but who have a similar profile to the treatment group), with field research being carried out at 3 different points in time: i) Baseline, which will be a kind of initial X-ray of the project's beneficiary families, where information on family composition, production, income, etc. will be obtained. will be obtained for later comparison with subsequent studies; ii) Mid-term, which will be carried out between years 3 and 4 of the Project, i.e. halfway through its implementation; and iii) Final Impact Assessment, which will be carried out during the last year of the Project's implementation, on the same group surveyed in the previous stages.

**Main products:** Baseline, mid-term and impact research carried out

### ***Product - Systematization of experiences***

The project will also systematize the innovations, both in terms of processes and activities, highlighting their importance and results. These products will be used by the project team and state officials, as well as in other regions of the northeastern semi-arid region and similar areas, and could support the adoption of other public policies in the Northeast.

**Main products:** 50 systematizations carried out

## 2.7 Definition of the Types of Subprojects

Procasa II is structured around investments involving productive development and small-scale infrastructure works, allocated to Components 1 and 2 as presented above.

Below is information on the types (or models) of sub-projects envisaged in the investments, including general information on the definitions that will form part of PROCASE 2.

### 2.7.1 Types of Subprojects Productive Plans

As shown, the typologies of Productive Plans are part of Component 1 - Resilient productive systems for tackling rural poverty. The models of sub-project typologies structured in the preparation phase of Procasa II are detailed below.

The main characteristic of this typology is the choice of a sustainable production model through agroforestry systems (AFS to be implemented in areas to be recovered or enhanced. In this cultivation method, the basic literature is agroecology and the diversity of the characteristics of localities and rural establishments, respecting the individualities of each area worked on. In addition, a SAF usually has at least one tree, one shrub and one herbaceous extract, starting with a predominance of annual crops (placenta) and gradually evolving to perennial crops and timber in the later stages.

According to INSA<sup>3</sup>, "*The productivity of agricultural systems in the Brazilian semi-arid region is limited mainly by the availability of water and nutrients. Thus, any management technique that leads to an increase in the water stored in the soil can have an impact on productivity. The implementation of agroforestry systems could therefore be a viable alternative for regenerating soil fertility in agroecosystems in the Brazilian semi-arid region. Some studies in the semi-arid region have shown that preserving and planting tree species in pastures and agricultural areas increases soil organic matter and nutrient levels by up to 150 %, favors the formation of "fertility islands" around isolated trees and increases biomass productivity and biodiversity.*"

In this way, it is important to note that, in general, the project itself tends to promote environmental and social improvements in the beneficiary areas.

### Resilient Investment Plan (PIR)

As already mentioned, the PIR will support productive activities (new or reinforcing existing activities) with the potential to guarantee food security and improve income by marketing surpluses. Each plan includes a portfolio of synergistic actions aimed at providing economic development and improving the quality of the natural environment in a sustainable way.

---

<sup>3</sup> Agroforestry Systems in the Brazilian Semi-Arid. Available at: <https://www.gov.br/insa/pt-br/centrais-de-conteudo/publicacoes-do-insa/desertificacao/sistemas-agroflorestais-no-semiarido-brasileiro.pdf>

The PIRs developed as a model for the preparation of Proc case II involve the poultry, dairy cattle, dairy goat, fruit and vegetable production sectors. The specific actions envisaged in these models are presented below.

### **PIR Free-range poultry farming**

The PIR model for free-range poultry farming, developed as part of the preparation of Proc case II, was designed to support the development of free-range poultry farming with a view to benefiting members of the Associação De Cooperação Agrícola Dos Produtores Rurais Do Assentamento São Domingos I - ACAPRANE, established in the municipality of Cubati - PB.

The table below summarizes the main information about this PIR and the association/community in question.

**Table 3 - Summary of the PIR model Caipira poultry farming and the association/community**

<b>PIR POULTRY FARMING</b>	
Support for the development of poultry farming	
<b>Location</b>	
<b>Municipality:</b>	Cubati
<b>Community:</b>	São Domingos Settlement I
<b>Productive activity(ies) supported:</b>	Free-range poultry farming
<b>Beneficiaries</b>	
<b>Total number of families benefiting</b>	30
<b>Proponents Men</b>	02
<b>Proponents Women</b>	28
<b>Young people (out of all applicants)</b>	08
<b>Identification of the Proponent:</b>	
<b>Name of Entity:</b>	Agricultural Cooperation Association of Rural Producers of the Nova Esperança São Domingos I Settlement - ACAPRANE
<b>Total value of the PIR (PROCASE II + Beneficiaries)</b>	<b>R\$ 462.133,90</b>
<b>Production and Marketing Section (PROCASE II)</b>	R\$ 280.613,90 (88,6%) Value/benefit: R\$ 9,353.80 (USD 1,889.66)
<b>Production and Marketing Section: CP Beneficiaries</b>	R\$ 36.000,00 (11,4%)
<b>Total Production and Marketing Section</b>	<b>R\$ 316.613,90</b>
<b>Tec. Social and Environmental Sections: PROCASE II</b>	R\$ 130.680,00 (89,8%)
<b>Tec. Social and Environmental Sections: CP Beneficiaries:</b>	R\$ 14.840,00 (10,2%)
<b>Total Tech. Social and Environmental</b>	<b>R\$ 145.520,00</b>

## **Justification**

How many people will benefit?

- 30 families benefited, including 2 men, 28 women and 6 young people.

What are the main problems to be solved by the project?

- Lack of financial capacity to invest in basic infrastructure (chicken coops, equipment, etc.) to conduct the activity properly and make it viable for generating income;
- Farmers have little technical knowledge of how to correctly carry out zootechnical reproductive, feeding and health control practices;
- Lack of knowledge about alternative ways of producing food as a partial substitute for commercial rations;
- The association is poorly prepared to support its members in developing collective actions that help improve access to public policies, marketing and logistics, among others;
- Insufficient quantity and quality of production to access the market.

What practical alternatives have been identified to solve the problems?

- Strengthen families' capacities through the provision of specialized TA services, mitigating the weaknesses identified;
- Investment in equipment for collective use (forage chopper, rattles, scales), motorcycle trailer for general logistical support;
- Investment in equipped rustic chicken coops;
- Individual investment to set up a mini Forage Agroforestry System (AFS-F 900 m<sup>2</sup>), with the aim of expanding the food reserve for grazing poultry and preparing alternative feed;
- Investment in inputs for the first production cycle (chicks, feed, vaccines);
- Implement actions to improve coexistence with the semi-arid region through a variety of social technologies, especially for the most vulnerable families;
- Implement a nursery to produce a variety of seedlings, with a view to strengthening AFSs, restoring native vegetation and diversifying production to feed families.

What opportunities have been identified that can contribute to achieving the project's results?

- Free-range poultry farming can be carried out on small areas and is therefore ideal for family farming;
- Broad market demand for eggs and meat from free-range poultry;
- The association has 08 young members;
- This activity is a source of extra income for the women and young people of the settlement;
- PIR can be installed in areas close to houses, without the need to clear new land.

## **Objectives**

Strengthening family-based poultry farming by structuring family production units individually and collectively, with the aim of raising poultry for consumption and for selling eggs and meat.

Specific Objectives:

- a) Set up suitable structures for the development of breeding, making it possible to carry out food and health management;
- b) Train beneficiaries in animal management practices;
- c) Introduce production practices, conservation of pastures and forage for feed production;
- d) Diversifying work and income opportunities in the community, particularly for women and young people;
- e) Empower beneficiaries to access better opportunities to market their products, both individually and collectively;
- f) Strengthening the collective organization and functioning of the association with a view to improving services and support for members;
- g) To diversify and improve the food and nutrition of the families involved.

## **Structural elements of the project**

### Proposals for Technical Assistance and Rural Extension - TA

The implementation of the PIR requires more intense and frequent, multidisciplinary, agroecological-based TA to provide families with adequate support. In order to guarantee the integration of this new production model, PROCASE II will finance the hiring of an A organization, which will carry out collective and individual activities through courses, workshops, field visits, exchanges and regular visits to the properties of each beneficiary family. This entity will act according to the guidelines mentioned in the National TA Policy (PNATER).

#### Theme 1 - Improving production:

The technical team mobilized will be specialized in raising free-range poultry, where all the technical support will be provided for: i) proper animal management of the flock, according to Good Agricultural Practices; ii) implementation and management of the SAF-F and iii) production of homemade feed and forage storage.

#### Theme 2 - Commercialization:

Sales strategies will be developed at open-air fairs, markets, butchers, restaurants, bakeries, snack bars, directly to consumers and via social networks.

TA will support the association both from an organizational and production point of view, so that they can participate in public calls for tender to sell eggs and other products produced in the community to the PNAE and PAA.

Efforts will be made with EMPAER and the state government to set up or strengthen municipal open-air markets with the granting of standardized market stalls and other

support. The association will be trained to use accessible marketing techniques (social networks) to publicize its work, improving access to markets.

#### Theme 3 - Access to public policies:

Beneficiaries will receive training to increase their knowledge of the best conditions for accessing public policies, so that they can then access the most appropriate ones. These will mainly be policies on access to financing (PRONAF and ABC environmental), crop insurance, policies on access to institutional markets such as PAA and PNAE. This theme will be strengthened with the involvement of banks (Banco do Brasil and Banco do Nordeste), rural workers' unions, city hall, among other partners.

#### Theme 4 - Social inclusion of the project's target groups (young people, women, people with disabilities, LGBTQIA+, etc.)

TA will seek to involve other women and young people in training activities, in addition to those already involved as beneficiaries.

The details of the activities to be carried out by TA during its work on this PIR will be defined in a planning document to be presented and validated by the Project and beneficiaries after its approval for funding, ensuring that the scope of activities is defined at the start of implementation.

#### Proposal related to environmental issues and climate change

- Implement actions to raise awareness about the proper disposal of solid waste, eliminating the practice of burning garbage;
- The families will be trained with courses and technical guidance on composting and practices for the production and conservation of pastures and fodder for feed production;
- Adoption of agro-ecological practices in activities;
- Implementation of a collective nursery for the production of seedlings coupled with a production cistern with a capacity of 52,000 L, where seedlings will be produced for the maintenance and expansion of forage AFSs, as well as other species aimed at recovering native vegetation and fruit trees to diversify backyard production and enrich the families' diet.

#### Proposal related to access to social technologies (access to water, reuse, renewable energies, etc.)

In addition to a production cistern that will be attached to the seedling nursery, the project will finance the installation of 10 grey water reuse systems and 21 eco-efficient stoves, as well as the appropriate training for the proper use of these technologies. During the DRP, the most vulnerable families will be identified and the most suitable type of social technology will be identified.

#### Proposal related to organizational, administrative and managerial aspects

The implementation and management of the PIR will be the responsibility of the Association's Board of Directors, with the support of the beneficiaries, under the guidance and monitoring of TA, local offices and the Project itself. The main focus of the work will be:

- Strengthen the association's collective organization in order to expand and improve the services offered to members, whether in the social, environmental, productive or commercial spheres;
- Support the association in the composition of the various committees necessary for the implementation of the PIR, encouraging and prioritizing the participation of women and young people in the positions;
- Provide all the support (training and frequent monitoring) to the beneficiaries to carry out the purchases and render accounts.
- All actions will be carried out with reference to the criteria defined by the Project Operational Regulations (POR).

For maintenance purposes, the Association will set up a Reserve Fund, with amounts to be defined at the Assembly, for the maintenance and replacement of machinery and tools.

A "Regulation for the Use of Collective Assets" will be defined with the support of the TA entity and approved by the Assembly, guiding the management and use of machinery and equipment, advocating its proper functioning, user safety and conservation.

#### Proposal related to social, environmental and health aspects

The PIR will follow the rules of environmental, health and social legislation, and will also follow the requirements defined in the PROCASE II ESMP.

Environmental legislation: The PIR will respect environmental laws, especially in relation to the preservation of forests, water, soil and air. As it is a small-scale investment using agro-ecological production practices, it is characterized as a low environmental impact PIR, so there will be no need for environmental licenses to be issued by the state agency, falling under the "licensing waiver" regime, with the issuance of the DBIA (Declaration of Low Environmental Impact) carried out by SEMAS (Secretariat for the Environment and Sustainability).

Health legislation: The products will be sold fresh, i.e. unprocessed. These items will be offered in the community itself, in neighboring communities, municipal fairs, markets, restaurants, snack bars, hotels, inns, orders, among others, so it will not be necessary to obtain a health license or permit.

#### Detailed investment

Investments are items necessary for the proper functioning of the project and comprise three sections: i) production and marketing; ii) social technologies and iii) environmental.

Production and marketing section: focuses on the implementation of three main lines:

- i) installation of small poultry farms and AFSs for 30 beneficiary families;
- ii) provision of various collective items to support production (rattle, crusher/disintegrator, motorcycle trailer, etc.), and
- iii) various inputs for the first production cycle (chicks, starter feed, seedlings, fence wire, etc.).

Social technologies section: according to the needs of each family, identified during the DRP, this involves the installation of a production cistern (connected to the seedling nursery), eco-efficient stoves and gray water reuse systems.

Environmental section: involves the installation of a collective nursery to produce seedlings of various species, both to reinforce AFSs, food security (fruit) and the restoration of native vegetation. Part of the production could be marketed and guarantee the sustainability of the nursery.

**Figure 2 - Illustrated sketch of the project**

### **PIR Dairy Farming**

The PIR model for dairy farming, developed as part of the Procace II preparation, was designed to support the strengthening and support of the sector and coexistence with the semi-arid region, with a view to benefiting members of the Association of Milk Producers of the Municipality of Itaporanga - APLMITA established in the municipality of Itaporanga - PB.

The table below summarizes the main information about this PIR and the association/community in question.

**Table 4 - Summary of the Caipira Poultry PIR model and the association/community**

<b>PIR DAIRY FARMING</b>	
Strengthening and Supporting Dairy Cattle Farming and Coexistence with the Semi-arid Region	
<b>Location</b>	
<b>Municipality:</b>	Itaporanga
<b>Community:</b>	Emas Community
<b>Productive activity(ies) supported:</b>	Dairy farming
<b>Beneficiaries</b>	
<b>Total number of families benefiting</b>	<b>30</b>
<b>Proponents Men</b>	25

<b>Proponents Women</b>	5
<b>Young people (out of all applicants)</b>	3
<b>Identification of the Proponent:</b>	
<b>Name of Entity:</b>	Association of Milk Producers of the Municipality of Itaporanga (APLMITA)
<b>Total value of the PIR (PROCASE II + Beneficiaries)</b>	<b>R\$ 471.075,00</b>
<b>Production and Marketing Section (PROCASE II)</b>	R\$ 282.000,00 (87,9%) Value for money: R\$ 9.400,00 (USD 1.898,99)
<b>Production and Marketing Section: CP Beneficiaries</b>	R\$ 42.900,00 (12,1%)
<b>Total Production and Marketing Section</b>	<b>R\$ 324.900,00</b>
<b>Tec. Social and Environmental Sections: PROCASE II</b>	R\$ 131.175,00 (89,7%)
<b>Tec. Social and Environmental Sections: CP Beneficiaries:</b>	R\$ 15.000,00 (10,3%)
<b>Total Tech. Social and Environmental</b>	<b>R\$ 146.175,00</b>

### **Justification**

How many people will benefit?

- 30 families benefited, 20 men, 10 women and 6 young people.

What are the main problems to be solved by the project?

- Farmers' limited technical capacity to carry out zotechnical reproductive, food and health control practices;
- Negative impacts of the activity on the environment;
- Limited milk storage and conservation capacity (cooling tank);
- Low bargaining power with industries (price, quality, etc.);
- Lack of technical capacity and equipment for forage production and conservation;
- Low milk production and productivity;
- The association is not prepared to support its members in developing collective actions that help improve access to public policies, marketing and logistics, among others;
- Limited generation of work and income.

What practical alternatives have been identified to solve the problems?

- Strengthen families' capacities through the provision of specialized TA services, mitigating the weaknesses identified;

- Investment in equipment for collective use for the production of fodder (chainsaw, baler, brushcutter), an animal vaccination kit (health control) and a cooling tank to strengthen the marketing and quality of the milk;
- Individual investment to set up a Forage Agroforestry System (AFS-F), with the aim of expanding the herd's food reserve, reducing negative impacts on the environment and increasing milk production and productivity;
- Implement actions to improve coexistence with the semi-arid region through a variety of social technologies, especially for the most vulnerable families;
- Implement a nursery to produce a variety of seedlings, with a view to strengthening AFSs, restoring native vegetation and diversifying production to feed families.

What opportunities have been identified that can contribute to achieving the project's results?

- Favorable conditions for increasing the production of forage support and milk;
- Production and marketing chain in operation;
- Participation of some young people in the activity;
- Capacity to generate work and income;
- They have structures for installing more cooling tanks.

### **Objectives**

Strengthening the dairy cattle chain through sustainable, effective and profitable milk production, promoting alternatives for environmental conservation and recovery and the socio-economic development of the producers involved in the activities.

Specific Objectives:

- Encouraging action in dairy farming through the use of new technologies to improve and facilitate herd management activities;
- Ensure forage support for the herd by implementing an Agroforestry Forage System (AFS-F) combining species with protein and energy value, in order to increase forage production and improve the animals' diet;
- Encourage conservation practices and the recovery of degraded areas through reforestation and the construction of a nursery to produce native, forage and fruit seedlings;
- Supporting families in marketing milk and its derivatives;
- Promote the sustainable development of family dairy farmers by creating opportunities to increase their income;
- Promote training for family dairy farmers in herd management, fodder production, herd health control and genetic improvement.
- Providing advice on how to enter public and private markets;
- Implement appropriate social technologies to improve coexistence with the semi-arid region;

- Promoting income generation in the community, especially for young people and women

### ***Structural elements of the project***

#### *Proposals for Technical Assistance and Rural Extension - TA*

The beneficiary families lack adequate and sufficient TA services. In this context, the implementation of the PIR requires more intense and frequent, multidisciplinary, agroecological-based TA to provide families with distinct, adequate and frequent support. In order to guarantee the integration of this new production model, PROCASE II will finance the hiring of an TA organization, which will carry out collective and individual activities through courses, workshops, field visits, exchanges and regular visits to the properties of each beneficiary family. This entity will act according to the guidelines mentioned in the National TA Policy (PNATER).

#### Theme 1 - Improving production:

The technical team mobilized will be specialized in cattle breeding, where all the technical support will be provided for: i) proper animal management of the herd, according to Good Agricultural Practices; ii) implementation and management of the SAF-F and iii) production and storage of fodder.

#### Theme 2 - Commercialization:

TA will support the association to strengthen both its organizational and production aspects, with a view to expanding and diversifying milk marketing channels. In the case of social programs, it will support the creation of partnerships with cooperatives or private companies that have formalized dairies, to provide milk pasteurization services, so that they can sell to the PAA and PNAE.

Strategies will be developed to make farmers aware of the advantages of joint milk marketing, as a condition for increasing their bargaining power with buyers and in the search for better prices and logistical solutions. The investment in the milk cooling tank will be important for implementing this strategy. The association will be trained to use accessible marketing techniques (social networks) to publicize its work, improving access to markets.

#### Theme 3 - Access to public policies:

Beneficiaries will receive training to increase their knowledge of the best conditions for accessing public policies, so that they can then access the most appropriate ones. These will mainly be policies on access to financing (PRONAF and ABC environmental), SAFRA insurance, Livestock Costs, policies on access to institutional markets such as PAA and PNAE. This theme will be strengthened with the involvement of banks (Banco do Brasil and Banco do Nordeste), rural workers' unions, town halls and other partners.

#### Theme 4 - Social inclusion of the project's target groups (young people, women, people with disabilities, LGBTQIA+, etc.)

ATER will seek to involve other women and young people in training activities, in addition to those already involved as beneficiaries.

The details of the activities to be carried out by TA during its work on this PIR will be defined in a planning document to be presented and validated by the Project and

beneficiaries after it has been approved for funding, ensuring that at the start of implementation, the scope of activities is defined.

*Proposal related to environmental issues and climate change*

- The proposal is to set up a Forage Agroforestry System (AFS-F) in each family unit with an area of 0.5 ha, enriching the caatinga by planting forage and other species;
- The families will be trained with courses and technical guidance on agroforestry systems, seedling production, techniques such as lowering and thinning and soil management, avoiding deforestation and burning, among others;
- Encouraging organic production, reducing the use of chemical products and seeking more sustainable management of the soil and natural resources;
- Implementation of a nursery for the production of seedlings coupled with a production cistern with a capacity of 52,000 L, where seedlings will be produced for the maintenance and expansion of the forage AFSs, as well as other species aimed at recovering native vegetation and fruit trees to diversify the production of the backyards and enrich the families' diet.

*Proposal related to access to social technologies (access to water, reuse, renewable energies, etc.)*

In addition to a production cistern that will be attached to the seedling nursery, the project will finance the installation of 1 grey water reuse system and 6 biodigesters, as well as the appropriate training for the proper use of these technologies. During the DRP, the most vulnerable families will be identified and the most suitable type of social technology will be identified.

*Proposal related to organizational, administrative and managerial aspects*

The implementation and management of the PIR will be the responsibility of the Association's Board of Directors, with the support of the beneficiaries, under the guidance and monitoring of Technical Assistance, local offices and the Project itself. The focus of the work will be:

Strengthening the association's collective organization in order to expand and improve the services offered to members, whether in the social, environmental or productive spheres;

Support the association in the composition of the various committees necessary for the implementation of the PIR, encouraging and prioritizing the participation of women and young people in the positions;

Provide all the support (training and frequent monitoring) to the beneficiaries to carry out the purchases and render accounts.

All actions will be carried out with reference to the criteria defined by the Project Operational Regulations (ROP).

For maintenance purposes, the Association will set up a Reserve Fund, with amounts to be defined at the Assembly, for the maintenance and replacement of machinery and tools.

A "Regulation for the Use of Collective Assets" will be defined with the support of the TA entity and approved by the Assembly, guiding the management and use of machinery and equipment, advocating its proper functioning, user safety and conservation.

Proposal related to social, environmental and health aspects

The PIR will follow the rules of environmental, health and social legislation, and will also follow the requirements defined in the PROCASE II ESMP.

Environmental legislation: The PIR will respect environmental laws, especially in relation to the preservation of forests, water, soil and air. As it is a small-scale investment using agro-ecological production practices, it is characterized as a low environmental impact PIR. There will be no need for environmental licenses to be issued by the state agency, and the PIR falls under the "licensing exemption" regime, with the issuance of the DBIA (Declaration of Low Environmental Impact) carried out by SEMAS (Secretariat for the Environment and Sustainability).

Sanitary legislation: Families will be instructed in Good Agricultural Practices (GAP), ensuring that the milk reaches the processing industry with the appropriate quality for the manufacture of different types of products.

Detailed investment

Investments are necessary items for the proper functioning of the project and comprise three sections: i) production and marketing; ii) social technologies and iii) environmental.

Production and marketing section: focuses on the implementation of three main lines:

- i) installation of 0.5 ha of Forage AFS for 30 beneficiary families;
- ii) the supply of various collective items to support silage production (chainsaw, baler, brushcutter), milk cooling tanks (to increase milk production and quality) and vaccination kits (herd health control), and
- iii) various inputs such as seedlings (palm, gliricidia) and fence wire.

Social technologies section: according to the needs of each family, identified during the DRP, this involves the installation of a production cistern (connected to the seedling nursery), gray water reuse systems and biodigesters.

Environmental section: involves setting up a nursery to produce seedlings of various species, both to reinforce AFSs, food security (fruit) and the restoration of native vegetation. Part of the production could be marketed and guarantee the sustainability of the nursery.

**PIR Dairy goat farming**

The PIR model for dairy goat farming, developed as part of the preparation of PROCASE II, was designed to support the strengthening and support of the sector and coexistence with the semi-arid region, with a view to benefiting members of the Soledadense Association of Goat and Sheep Breeders - ASCCO established in the municipality of Soledade - PB.

The table below summarizes the main information about this PIR and the association/community in question.

**Table 5 - Summary of the Caipira Poultry PIR model and the association/community**

<b>PIR DAIRY GOAT FARMING</b>
Strengthening and supporting dairy goat farming and coexistence with the semi-arid region

<b>Location</b>	
<b>Municipality:</b>	Soledade
<b>Community:</b>	Rue
<b>Productive activity(ies) supported:</b>	Dairy Goat Farming with Forage SAF
<b>Beneficiaries</b>	
<b>Total number of families benefiting</b>	<b>30</b>
<b>Proponents Men</b>	15
<b>Proponents Women</b>	15
<b>Young people (out of all applicants)</b>	11
<b>Identification of the Proponent:</b>	
<b>Name of Entity:</b>	Soledad Association of Goat and Sheep Breeders - ASCCO
<b>Total value of the PIR (PROCASE II + Beneficiaries)</b>	<b>R\$ 467.175,00</b>
<b>Production and Marketing Section (PROCASE II)</b>	R\$ 282.000,00 (87,9%) Value for money: R\$ 9.400,00 (USD 1.898,99)
<b>Production and Marketing Section: CP Beneficiaries</b>	R\$ 39.000,00 (12,1%)
<b>Total Production and Marketing Section</b>	<b>R\$ 321.000,00</b>
<b>Tec. Social and Environmental Sections: PROCASE II</b>	R\$ 131.175,00 (89,7%)
<b>Tec. Social and Environmental Sections: CP Beneficiaries:</b>	R\$ 15.000,00 (10,3%)
<b>Total Tech. Social and Environmental</b>	<b>R\$ 146.175,00</b>

### **Justification**

How many people will benefit?

- 30 beneficiaries (15 men and 15 women, 12 of whom are young people), living in various communities in the municipality of Soledade.

What are the main problems to be solved by the project?

- Lack of technical capacity and equipment for forage production and conservation;
- Low forage productivity in the caatinga biome;
- Negative impacts of the activity on the environment;
- Depletion of native grassland;
- Limited technical capacity of beneficiaries to carry out zotechnical reproductive, food and health control practices;
- Very limited milk storage and conservation capacity (cooling tank);

- Poor conditions for increasing milk production, productivity and quality and, consequently, improving income.

What practical alternatives have been identified to solve the problems?

- Strengthen families' capacities through the provision of specialized TA services, mitigating the weaknesses identified;
- Investment in equipment for collective use to produce fodder and strengthen marketing (cooling tank);
- Individual investment to set up a Forage Agroforestry System (AFS-F), as an alternative way of producing food for livestock in adequate quantity and quality, reducing the negative impacts on the environment caused by livestock grazing in the caatinga.
- Implement actions to improve coexistence with the semi-arid region through a variety of social technologies, especially for the most vulnerable families;
- Implement a nursery to produce a variety of seedlings, with a view to strengthening SAFs, restoring native vegetation and diversifying production to feed families.

What opportunities have been identified that can contribute to achieving the project's results?

- Dairy goat farming is an activity developed in the region and has been increasing through government incentives;
- Support from Soledade City Hall for the development of the activity;
- Experience and an important level of organization among farmers in controlling the processes of receiving, storing and shipping chilled milk to the cooperative;
- Existence of a commercial relationship with the cooperative;
- Two families have an area of AFS with a focus on the protein bank;
- The association has 12 young members.

### **Objectives**

Strengthening family-based dairy goat farming, structuring family production units, promoting the adoption of practices to live with the semi-arid region and encouraging agro-ecological transition, with the aim of ensuring the herd's food security, conserving the environment and improving families' incomes.

Specific Objectives:

- Promoting food security for livestock through the production of fodder adapted to the semi-arid region;
- Support the formation of a protein bank to supplement animal feed;
- Provide guidance on reproductive management to improve the genetic quality of the existing herd; train beneficiaries in animal management practices and agroforestry system management;
- Providing advice on how to enter public and private markets;

- Implement appropriate social technologies to improve coexistence with the semi-arid region;
- Develop actions aimed at environmental conservation;
- Promote income generation in the community, especially for young people and women.

### ***Structural elements of the project***

#### *Proposals for Technical Assistance and Rural Extension - TA*

The beneficiary families lack adequate and sufficient TA services. In this context, the implementation of the PIR requires more intense and frequent, multidisciplinary, agroecological-based TA to provide families with distinct, adequate and frequent support. In order to guarantee the integration of this new production model, PROCASE II will finance the hiring of an TA organization, which will carry out collective and individual activities through courses, workshops, field visits, exchanges and regular visits to the properties of each beneficiary family. This entity will act according to the guidelines mentioned in the National Technical Assistance and Rural Extension Policy (PNATER).

#### Theme 1 - Improving production:

The technical team mobilized will be specialized in goat farming, where all the technical support will be provided for: i) proper animal management of the herd, according to Good Agricultural Practices; ii) implementation and management of the AFS-F and iii) production and storage of fodder.

#### Theme 2 - Commercialization:

The TA responsible will support the association to strengthen both its organizational and productive aspects, with a view to expanding and diversifying the milk marketing channels. In the case of social programs, it will support the creation of partnerships with cooperatives or private companies that have formalized dairies, to provide milk pasteurization services, so that they can sell to the PAA and PNAE.

Strategies will be developed to make farmers aware of the advantages of joint milk marketing, as a condition for increasing their bargaining power with buyers and in the search for better prices and logistical solutions. The association will be trained to use accessible marketing techniques (social networks) to publicize its work, improving access to markets.

#### Theme 3 - Access to public policies:

The beneficiaries will receive training to overcome their lack of knowledge about the conditions for accessing public policies, so that they can then access the most appropriate ones. These will mainly be policies on access to financing (PRONAF and ABC ambiental), SAFRA insurance, and policies on access to institutional markets such as PAA and PNAE. This theme will be strengthened with the involvement of banks (Banco do Brasil and Banco do Nordeste), rural workers' unions, town halls and other partners.

#### Theme 4 - Social inclusion of the project's target groups (young people, women, people with disabilities, LGBTQIA+, etc.)

TA will seek to involve other women and young people in training activities, in addition to those already involved as beneficiaries.

The details of the activities to be carried out by TA during its work on this PIR will be defined in a planning document to be presented and validated by the Project and beneficiaries after its approval for funding, ensuring that the scope of activities is defined at the start of implementation.

*Proposal related to environmental issues and climate change*

- The proposal is to set up a Forage Agroforestry System (AFS-F) in each family unit with an area of 0.5 ha, enriching the caatinga by planting forage species;
- The families will be trained with courses and technical guidance on agroforestry systems, agroforestry system management, seedling production, techniques such as lowering and thinning and soil management;
- These practices will follow the principle of agroecology;
- Implementation of a nursery for the production of seedlings coupled with a production cistern with a capacity of 52,000 L, where seedlings will be produced for the maintenance and expansion of the forage AFSs, as well as other species aimed at recovering native vegetation and fruit trees to diversify the production of the backyards and enrich the families' diet.

*Proposal related to access to social technologies (access to water, reuse, renewable energies, etc.)*

- All the families have rainwater harvesting cisterns for human consumption.
- In addition to a production cistern that will be attached to the seedling nursery, the project will finance the installation of 5 grey water reuse systems, 2 biodigesters and 15 eco-efficient stoves, as well as the appropriate training for the proper use of these technologies. During the DRP, the most vulnerable families will be identified and the most suitable type of social technology will be identified.

*Proposal related to organizational, administrative and managerial aspects*

The implementation and management of the PIR will be the responsibility of the Association's Board of Directors, with the support of the beneficiaries, under the guidance and monitoring of Technical Assistance, local offices and the Project itself. The main focus of the work will be:

- Strengthening the association's collective organization to expand and improve the services offered to members, whether in the social, environmental or productive spheres;
- Support the association in the composition of the various committees necessary for the implementation of the PIR, encouraging and prioritizing the participation of women and young people in the positions;
- Provide all the support (training and frequent monitoring) to the beneficiaries to carry out the purchases and render accounts.

All actions will be carried out with reference to the criteria defined by the Project Operational Regulations (POR).

For maintenance purposes, the Association will set up a Reserve Fund, with amounts to be defined at the Assembly, for the maintenance and replacement of machinery and tools.

A "Regulation for the Use of Collective Assets" will be defined with the support of the TA entity and approved by the Assembly, guiding the management and use of machinery and equipment, advocating its proper functioning, user safety and conservation.

#### Proposal related to social, environmental and health aspects

The PIR will follow the rules of environmental, health and social legislation, and will also follow the requirements defined in the PROCASE II ESMP.

Environmental legislation: The PIR will respect environmental laws, especially in relation to the preservation of forests, water, soil and air. As it is a small-scale investment and uses agro-ecological production practices, it is characterized as a low environmental impact PIR. There will be no need for environmental licenses to be issued by the state agency, and the PIR falls under the "licensing exemption" regime, with the issuance of the DBIA (Declaration of Low Environmental Impact) carried out by SEMAS (Secretariat for the Environment and Sustainability).

Sanitary legislation: Families will be instructed in Good Agricultural Practices (GAP), ensuring that the milk reaches the processing industry with the appropriate quality for the manufacture of different types of products.

#### Detailed investment

Investments are items necessary for the proper functioning of the project and comprise three sections: i) production and marketing; ii) social technologies and iii) environmental.

Production and marketing section: focuses on the implementation of three main lines:

- i) installation of 0.5 ha of Forage AFS for 30 beneficiary families;
- ii) provision of various collective items to support silage production (ensilage maker, crusher, baler, feed mixer) and milk cooling tanks (to increase milk production and quality), and
- iii) various inputs such as seedlings (palm, moringa, gliricidia and leucena) and wire for fencing.

Social technologies section: according to the needs of each family, identified during the DRP, this involves the installation of a production cistern (connected to the seedling nursery), eco-efficient stoves, grey water reuse systems and biodigesters.

Environmental section: involves setting up a nursery to produce seedlings of various species, both to reinforce AFSs, food security (fruit) and the restoration of native vegetation. Part of the production could be marketed and guarantee the sustainability of the nursery.

#### PIR Productive Backyards

The PIR model for productive backyards developed as part of the Procasa II preparation was designed to support the development of productive backyards in a collective area, with a view to benefiting members of the Association of Agroecological Farmers of the South Coast of Paraíba, established in the municipality of Pitimbu - PB.

The table below summarizes the main information about this PIR and the association/community in question.

**Table 6 - Summary of the Caipira Poultry PIR model and the association/community**

<b>PIR PRODUCTIVE BACKYARDS</b>	
Support for the development of productive backyards in collective areas	
<b>Location</b>	
<b>Municipality:</b>	Pitimbu
<b>Community:</b>	APASA Settlement
<b>Productive activity(ies) supported:</b>	Vegetable and fruit production
<b>Beneficiaries</b>	
<b>Total number of families benefiting</b>	<b>30</b>
<b>Proponents Men</b>	7
<b>Proponents Women</b>	23
<b>Young people (out of all applicants)</b>	8
<b>Identification of the Proponent:</b>	
<b>Name of Entity:</b>	Association of Agroecological Farmers of the South Coast of Paraíba
<b>Total value of the PIR (PROCASE II + Beneficiaries):</b>	<b>R\$ 458.169,00</b>
<b>Production and Marketing Section (PROCASE II)</b>	\$ 282.078,00 (89,9%) Value/benefit: R\$ 9,402.60 (USD 1,899.52)
<b>Production and Marketing Section: CP Beneficiaries</b>	R\$ 31.561,00 (10,1%)
<b>Total Production and Marketing Section</b>	<b>R\$ 313.639,00</b>
<b>Tec. Social and Environmental Sections: PROCASE II</b>	R\$ 129.690,00 (89,7%)
<b>Tec. Social and Environmental Sections: CP Beneficiaries:</b>	R\$ 14.840,00 (10,3%)
<b>Total Tech. Social and Environmental</b>	<b>R\$ 144.530,00</b>

### **Justification**

How many people will benefit?

- 30 members: 23 women and 07 men, 08 of whom are young.

What are the main problems to be solved by the project?

- Low productive capacity of families;
- High marketing costs, given the small amount of production available for sale;
- Unavailability of continuous and specialized TA;

- Lack of financial capacity to invest in basic infrastructure, such as an efficient irrigation system, appropriate tools for productive management, equipping the well to allow access to water for production;
- Association with limited knowledge to support its members in developing collective actions that help improve access to public policies, marketing, logistics and the environment, among others.

What practical alternatives have been identified to solve the problems?

- Strengthen families' capacities through the provision of specialized TA services, mitigating the weaknesses identified;
- Investment in equipment for collective use (solar energy generation, motorcycle cultivator, sprayer), transport trailer for motorcycles for general logistical support;
- Investment in market stalls to strengthen marketing;
- Investments in irrigation kits, tool kits, containers and other items for individual use, aimed at increasing the productive capacity of families;
- Investment in inputs for the first production cycle;
- Implement actions to strengthen production through a variety of social technologies, aimed at the collective development of families and the preservation of the environment;
- Set up a nursery to produce a variety of seedlings, with a view to strengthening the restoration of native vegetation and diversifying production to feed families.

What opportunities have been identified that can contribute to achieving the project's results?

- Exploitation of the association's collective area for productive purposes, without the need to clear new areas to implement the TA;
- There is good market potential, particularly because the settlement is located in a tourist area as well as important urban centers, which can guarantee the flow of the expanded production;
- Existence of a drilled well with a flow rate and water quality capable of guaranteeing the efficient use of water in small irrigation systems;
- Attendance by young people and women interested in the activity.

### **Objectives**

To implement vegetable and fruit production systems that are sustainable and adapted to climate change, promoting the generation of work and income for women and young people, increased food security and greater social integration between families in the settlement.

Specific Objectives:

- Implement efficient irrigation structures that allow the activity to develop without wasting water;

- Introducing agro-ecological production practices that conserve soil, preserve biodiversity and adapt to climate change, in particular to reduce evapotranspiration losses;
- Implementing social technologies that aim to guarantee financial savings for families as well as an improvement in well-being, and allowing for a lower impact on the environment;
- Diversifying work and income opportunities in the community, particularly for women and young people;
- Enable beneficiaries to access institutional and proven markets collectively and frequently;
- Strengthening the collective organization and functioning of the association with a view to improving services and support for members;
- To diversify and improve the food and nutrition of the families involved.

### ***Structural elements of the project***

#### ***Proposals for Technical Assistance and Rural Extension - TA***

The implementation of the PIR requires more intense and frequent, multidisciplinary, agroecological-based TA to provide families with adequate support. In order to guarantee the integration of this new production model, PROCASE II will finance the hiring of an TA organization, which will carry out collective and individual activities through courses, workshops, field visits, exchanges and regular visits to the properties of each beneficiary family. This entity will act according to the guidelines mentioned in the National Technical Assistance and Rural Extension Policy (PNATER).

#### ***Theme 1 - Improving production:***

The technical team mobilized will specialize in the production of vegetables and fruit, where all the technical support will be provided for: i) agro-ecological and, in the future, organic production; ii) management of irrigation systems, with a view to better production with the rational use of water; iii) production and use of natural fertilizers and pesticides, as well as topics related to production management (costs and income).

#### ***Theme 2 - Commercialization:***

Sales strategies will be developed at open-air markets, and direct sales to markets, restaurants, snack bars, hotels, inns and to consumers and through social networks.

ta will support the association both from an organizational and production point of view, so that they can participate in calls for tender to sell in the PNAE and PAA.

Efforts will be made with EMPAER and the state government to set up or strengthen municipal free fairs, as well as increasing the association's logistical support to take part in fairs in other municipalities in the region. The association will be trained to use accessible marketing techniques (social networks) to publicize its work, improving access to markets.

#### ***Theme 3 - Access to public policies:***

Beneficiaries will receive training to increase their knowledge of the best conditions for accessing public policies. These will mainly include policies on access to financing

(PRONAF and ABC environmental), crop insurance, and policies on access to institutional markets such as PAA and PNAE. This theme will be strengthened with the involvement of banks (Banco do Brasil and Banco do Nordeste), rural workers' unions, town halls and other partners.

Theme 4 - Social inclusion of the project's target groups (young people, women, people with disabilities, LGBTQIA+, etc.)

TA will seek to involve other women and young people in training activities, in addition to those already involved as beneficiaries.

The details of the activities to be carried out by TA during its work on this PIR will be defined in a planning document to be presented and validated by the Project and beneficiaries after its approval for funding, ensuring that the scope of activities is defined at the start of implementation.

Proposal related to environmental issues and climate change

- To raise awareness of the importance of agroforestry in mitigating climate change and conserving biodiversity;
- Implement soil and water conservation practices in productive areas, such as the use of mulch and soil water retention techniques, crop consortia and diversification, and the implementation of windbreaks;
- Implement actions to raise awareness about the proper disposal of solid waste, eliminating the practice of burning garbage;
- Training families with courses and technical guidance on composting and biofertilizer production;
- Adoption of agro-ecological practices in activities;
- Implementation of a nursery for the production of seedlings coupled with a production cistern with a capacity of 52,000 L, where seedlings of interest to the families will be produced, as well as species aimed at recovering native vegetation and fruit trees to diversify production in the backyards and enrich the families' diet.

Proposal related to access to social technologies (access to water, reuse, renewable energies, etc.)

- Financing collective actions:
  - Installation of a production cistern that will be attached to the seedling nursery;
  - Installation of a biodigester to produce biofertilizer;
  - To enable access to water, the existing artesian well will be equipped with a pump and the necessary accessories;
  - To overcome the lack of electricity and reduce production costs, investment will be made in solar panels to generate clean energy.
- Financing individual actions:
  - Installation of 18 eco-efficient stoves;
  - Installation of 04 gray water reuse systems.

The appropriate training will be provided for the proper use of social technologies.

During the DRP, the most vulnerable families will be identified and the most suitable type of social technology will be identified.

Proposal related to organizational, administrative and managerial aspects

The implementation and management of the PIR will be the responsibility of the Association's Board of Directors, with the support of the beneficiaries, under the guidance and monitoring of TA, local offices and the Project itself. The main focus of the work will be:

- Strengthen the association's collective organization in order to expand and improve the services offered to members, whether in the social, environmental, productive or commercial spheres;
- Support the association in the composition of the various committees necessary for the implementation of the PIR, encouraging and prioritizing the participation of women and young people in the positions;
- Provide all the support (training and frequent monitoring) to the beneficiaries to carry out the purchases and render accounts.

All actions will be carried out with reference to the criteria defined by the Project Operational Regulations (POR).

For maintenance purposes, the Association will set up a Reserve Fund, with amounts to be defined at the Assembly, for the maintenance and replacement of machinery and tools.

A "Regulation for the Use of Collective Assets" will be defined with the support of the TA entity and approved by the Assembly, guiding the management and use of machinery and equipment, advocating its proper functioning, user safety and conservation

Proposal related to social, environmental and health aspects

The PIR will follow the rules of environmental, health and social legislation, and will also follow the requirements defined in the PROCASE II ESMP.

Environmental legislation: The PIR will respect environmental laws, especially in relation to the preservation of forests, water, soil and air. As it is a small-scale investment using agro-ecological production practices, it is characterized as a low environmental impact PIR, so there will be no need for environmental licenses to be issued by the state agency, falling under the "licensing waiver" regime, with the issuance of the DBIA (Declaration of Low Environmental Impact) carried out by SEMAS (Secretariat for the Environment and Sustainability).

Health legislation: The products will be sold fresh, i.e. unprocessed. These items will be offered in the community itself, in neighboring communities, municipal fairs, markets, restaurants, snack bars, hotels, inns, orders, among others, so it will not be necessary to obtain a health license or permit.

Detailed investment

Investments are items necessary for the proper functioning of the project and comprise three sections: i) production and marketing; ii) social technologies and iii) environmental.

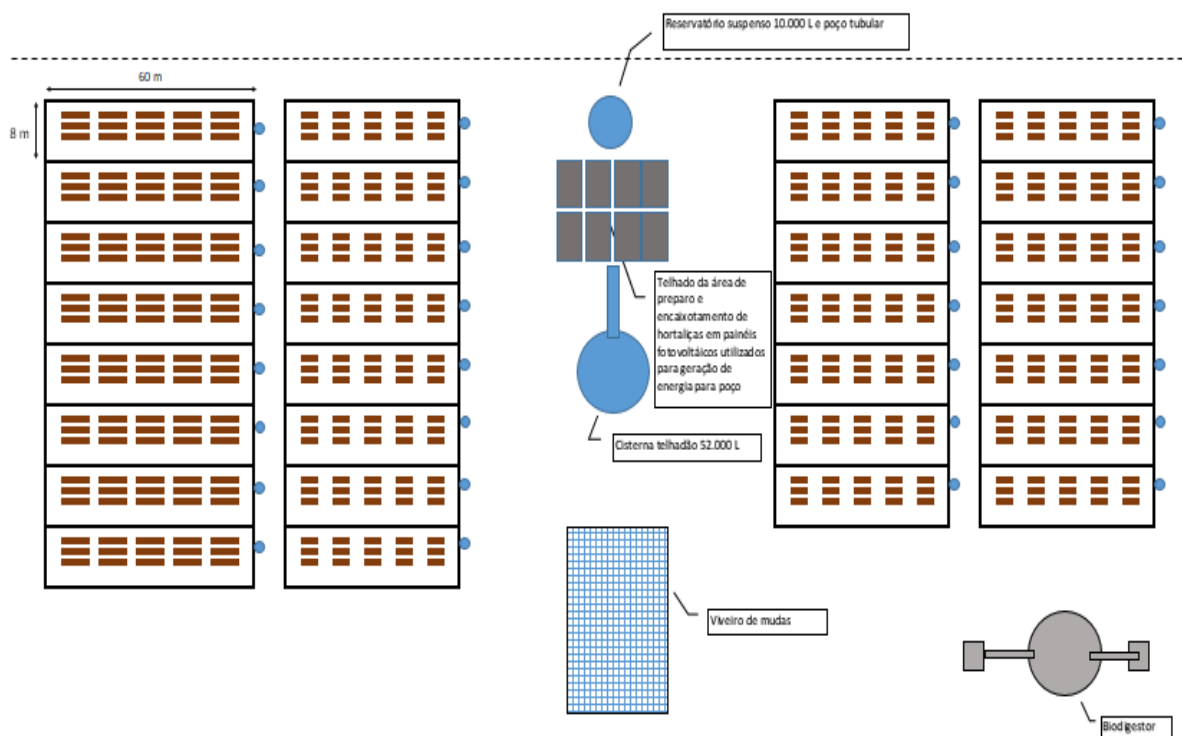

Production and marketing section: focuses on the implementation of three main lines:

- i) installation of individual production areas of 500 m<sup>2</sup> for 30 beneficiary families, including irrigation kit and water tank, etc;
- ii) provision of various collective items to support production (pump for artesian well, mini solar power plant, motorcycle cultivator, sprayers, motorcycle trailer, market stall, area for preparing and packaging food, etc.), and
- iii) various inputs for the first production cycle (seeds, seedlings, shade, etc.).

Social technologies section: collective - sidewalk cistern, mini solar power plant, artesian well equipment and biodigester. Individual - eco-efficient stoves and gray water reuse systems.

Environmental section: involves setting up a nursery to produce seedlings of various species, both to reinforce food security (fruit) and to restore native vegetation, plant windbreaks and living fences, etc. Part of the production could be marketed and guarantee the sustainability of the nursery.

**Figure 3 - Illustrative sketch of the project**

**Figure 4 - Sketch of the beds**

### Business Plans (PNs)

As already mentioned, the PN aims to support the strengthening of production through the PIRs, in order to integrate organized producers to access the market.

The development of the NPs will seek to diversify the markets accessed beyond the conventional institutional markets, such as the PNAE and PAA, looking for fronts associated mainly with the private sector.

The PNs developed as a model for the preparation of PROCASE II involve the production sectors of agroecological cotton farming and beekeeping. The specific actions envisaged in these models are presented below.

### **PN Agroecological Cotton Farming**

The PN model for agroecological cotton farming, developed as part of the preparation of Proc case II, was designed to support the development of the sector with a view to benefiting members of the Borborema Agroecology Network (RBA) in the Queimadas Settlement in the municipality of Remígio, PB.

The table below summarizes the main information about this NP and the association/community in question.

**Table 7 - Summary of the Caipira Poultry PIR model and the association/community**

<b>PN AGROECOLOGICAL COTTON FARMING</b>	
Support for the Development of Agroecological Cotton Farming in the Queimadas Settlement	
<b>Location</b>	
<b>Municipality:</b>	Remígio

<b>Community:</b>	Queimadas Settlement
<b>Productive activity(ies) supported:</b>	Cotton farming
<b>Beneficiaries</b>	
<b>Total number of families benefiting</b>	90
<b>Proponents Men</b>	44
<b>Proponents Women</b>	46
<b>Young people (out of all applicants)</b>	14
<b>Identification of the Proponent:</b>	
<b>Name of Entity:</b>	Borborema Agroecology Network
<b>Total value of the PIR (PROCASE II + Beneficiaries)</b>	<b>R\$ 355.607,00</b>
<b>Production and Marketing Section (PROCASE II)</b>	R\$ 283.607,00 (79,8%) Value/benefit: R\$ 3.151,19 (USD 636,60)
<b>Production and Marketing Section: CP Beneficiaries</b>	R\$ 72.000,00 (20,2%)

### **Justification**

How many people will benefit?

- 90 members: 44 men and 46 women, 14 of whom are young people.

What are the main problems to be solved by the project?

- Lack of financial capacity to invest in their own mini cotton processing plant;
- Vulnerability in plume quality control (outsourced service);
- Current high logistical costs for processing;
- Limited capacity to expand cotton farming due to lack of control over the processing process;
- Unavailability of access to ongoing Specialized Technical Assistance (STA) to strengthen RBA's business management capacity;
- Lack of marketing tools and strategies (website, social networks, etc.) to give visibility to the RBA and provide a more favorable environment for the development of new institutional and commercial partnerships.

What practical alternatives have been identified to solve the problems?

- Strengthen the capacities of network managers through the provision of continuous STA services, mitigating the weaknesses identified above;
- Investment in equipment to install a mini-mill for processing cotton, with a gin and press, among other accessories;
- Investment in personal protective equipment;

- Investment in IT equipment;
- Investment in website development with e-commerce and social networks.

What opportunities have been identified that can contribute to achieving the project's results?

- Organic production with high added value;
- Growing market;
- Many experienced farmers;
- Significant reduction in the distance between the field and the mini power plant, reducing the cost and problems with logistics and the impact on family income;
- RBA board compromised;
- Good institutional coordination to develop partnerships to expand activity and improve working conditions in the field;
- The presence of young people and women interested in the productive activity and management of the RBA.

### **Objectives**

Promote the strengthening of organic cotton farming in the area covered by the RBA, as well as improving the income of family farmers by adopting sustainable production and management practices.

Specific Objectives:

- Setting up a mini-processing plant for agroecological cotton;
- Implement proper management practices at the mini-mill, ensuring that as many farmers as possible have access to it;
- To absorb more cotton and increase the scale of production of the mini-mill, optimizing its operating cost, increasing its potential to serve the market and, consequently, achieving the sustainability of the RBA;
- Strengthen the management of the RBA, through Specialized Technical Consultancy, particularly by encouraging greater involvement of women and young people;
- Implement strategies to strengthen the RBA's institutional and commercial structure;
- Implementing effective sustainable measures to reduce the environmental and climatic effects that interfere with the production of cotton and other intercropped crops;
- Expand and improve the generation of work and income.

### **Structural elements of the project**

#### Proposals for access to raw materials

The implementation of the mini-mill will help to increase the volume of cotton to be processed, so it will be the main tool that will determine the potential for expanding the

activity in the region. RBA, with the support of STA, will develop a plan to organize the processes.

#### Proposal related to improving processing infrastructure and adding value

The installation of a mini-mill consisting of a ginning machine and a press will allow RBA to control the planning of the activity, both in the field and in the processing process, thus improving the services offered to members. It will also make it possible to control all the stages of the processing process, from transporting the branches to storing the lint, thereby guaranteeing the quality of the end product and better remuneration for the product.

Better control over cottonseed production will help farmers to obtain direct and indirect income from its use, either by selling it or by using it as seed or animal feed.

STA will contribute to the planning of the use and maintenance of the mini power plant, as well as identifying tools (software) to help carry out the programmed activities in a professional manner.

#### Proposal related to market access and commercialization

Marketing has not been a problem for RBA, given the commercial model developed with partner buying companies. However, given the possibility of expanding production and processing, it is necessary to invest in professionalizing the network's commercial sector. To this end, STA will train the people responsible for the sector and support the development of the website and social networks.

#### Management-related proposal

The actions to be carried out by the STA will be focused on improving the management process as a whole, while prioritizing the sectors with the greatest weaknesses. This process should be conducted in such a way as to provide the RBA with sufficient technical knowledge to ensure sustainable growth, while respecting the principles of self-management adopted by the Network and its volunteers. In this context, opportunities should be identified to increase the participation of women and young people on the board of directors.

The purchase of computers and printers will be financed to improve working conditions.

The implementation and management of the NP will be the responsibility of the RBA's board of directors, under the guidance and monitoring of the STA, local offices and the project itself.

#### Proposal related to social, environmental and health aspects

The NP will comply with environmental, health and social legislation, as well as the requirements set out in the PROCASE II ESMP.

Environmental legislation: The PN will respect environmental laws, especially in relation to the preservation of forests, water, soil and air. As it is a small investment, the mini cotton processing plant is characterized as a low environmental impact project, so there will be no need for environmental licenses to be issued by the state agency, falling under the "licensing waiver" regime, with the issuance of the DBIA (Declaration of Low Environmental Impact) carried out by SEMAS (Secretariat for the Environment and Sustainability).

Health legislation: not applicable.

### Detailed investment

In order to achieve the objectives set out in this PN, investments have been planned in different areas:

- i. Processing and adding value: implementation of a mini-plant with equipment and support materials such as scales, moisture meters, pallets and personal protective equipment.
- ii. Market and Commercialization: development of a website with e-commerce and social networks for institutional and commercial strengthening.
- iii. Management support: acquisition of IT items.

### PN Beekeeping

The PN model for beekeeping developed as part of the preparation of Procase II was based on support for strengthening the beekeeping production chain of the Cooperativa dos Apicultores do Sertão Paraibano - COASPA, established in the municipality of Aparecida - PB, in the Vale dos Piranhas territory.

The table below summarizes the main information about this NP and the cooperative/community in question.

**Table 8 - Summary of the Caipira Poultry PIR model and the association/community**

<b>PIR BEEKEEPING</b>	
Support for strengthening the beekeeping production chain in the Piranhas Valley territory	
<b>Location</b>	
<b>Municipality:</b>	Aparecida
<b>Community:</b>	Acauã Settlement
<b>Productive activity(ies) supported:</b>	Honey and wax warehouse
<b>Beneficiaries</b>	
<b>Total number of families benefiting</b>	82
<b>Proponents Men</b>	43
<b>Proponents Women</b>	39
<b>Young people (out of all applicants)</b>	12
<b>Identification of the Proponent:</b>	
<b>Name of Entity:</b>	Cooperativa Agropecuária dos Apicultores do Sertão Paraibano - COASPA
<b>Total value of the PIR (PROCASE II + Beneficiaries):</b>	<b>R\$ 323.085,00</b>
<b>Production and Marketing Section (PROCASE II)</b>	R\$ 256.085,00 (79,3%) Value/benefit: R\$ 3.122,99 (USD 630,91)
<b>Production and Marketing Section: CP Beneficiaries</b>	R\$ 67.000,00 (20,7%)

## **Justification**

How many people will benefit?

- 82 members: 43 men (7 young) and 39 women (5 young).

What are the main problems to be solved by the project?

- Idle production capacity at the warehouse due to the low volume of honey extracted under suitable conditions;
- Low marketing volume and difficulty in expanding commercially due to the unavailability of certified honey;
- Lack of financial capacity to invest in basic primary honey extraction infrastructure, such as certified honey houses;
- Unavailability of access to ongoing Specialized Technical Assistance (STA) to strengthen COASPA's business management capacity;
- Unavailability of equipment to produce honeycomb wax, causing cooperative members to pay high prices on the specialized market;
- Lack of marketing tools and strategies (website, social networks, etc.) to give the cooperative visibility and increase its potential for market access.

What practical alternatives have been identified to solve the problems?

- Strengthen the capacities of the cooperative's managers through the provision of continuous STA services, mitigating the weaknesses identified above;
- Investment in a mobile honey house (illustrative image in Annex 8.2), made from a container structure, able to be certified by the municipal health inspectorate (structure transported by truck to the place where it will be installed, and can be removed if necessary);
- Investment in suitable equipment for the full operation of the honey house;
- Investment in equipment to produce honeycomb wax;
- Investment in IT equipment;
- Investment in instruments for the quality control laboratory;
- Investment in website development with e-commerce and social networks.

What opportunities have been identified that can contribute to achieving the project's results?

- High honey production by cooperative members;
- Many trained cooperative members;
- Associação dos Apicultores Criadores de Abelhas Melíferas Europeias - ATACAMEL, located in Triunfo - PB, 86 km from COASPA, interested in receiving the mobile honey house and providing the necessary counterparts (place with electricity, floor and roof for installation, piped water or 16,000 L cistern);
- COASPA's board committed;

- Good institutional coordination to develop partnerships that enable this project to be replicated;
- The presence of young people and women interested in the productive activity and management of the cooperative.

### **Objectives**

Promote the strengthening of the beekeeping production chain in the area covered by COASPA, as well as improving the income of beekeepers by adopting sustainable production and management practices.

Specific Objectives:

- Ensuring that COASPA's operations comply with health regulations, guaranteeing the legality and quality of the honey sold;
- Introducing innovative actions in the beekeeping chain, with the installation of a mobile honey house;
- Absorbing more honey from the cooperative members and increasing the scale of the warehouse's production, optimizing its operating costs, increasing its potential to serve the market and, consequently, achieving the cooperative's sustainability;
- Training, through specialized technical consultancy, directors, managers and interested cooperative members, particularly women and young people, to carry out the management of the cooperative professionally in all its dimensions;
- Implement strategies to strengthen the cooperative institutionally and commercially;
- Implementing effective sustainable measures to reduce the environmental and climatic effects that interfere with beekeeping production;
- Expand and improve the generation of work and income.

### **Structural elements of the project**

#### Proposals for access to raw materials

As previously reported, COASPA's problem is gaining access to significant volumes of quality honey, guaranteed to be extracted in regulated honey houses. Most of the honey is produced by small beekeepers who do not have the means to travel long distances to extract the honey in suitable structures, or even to invest in such structures. The STA will draw up a diagnosis to identify the main problems related to the primary processing of honey and propose a short- and medium-term plan to reduce the problems and impacts on the production chain (quitting the activity, low prices, strong involvement of middlemen, low quality, etc.), and consequently increase the flow of larger volumes of honey through the warehouse.

#### Proposal related to improving processing infrastructure and adding value

The installation of a mobile honey house with extraction equipment that meets sanitary standards has important advantages over the traditional masonry model, including lower initial investment, less complexity and time to get up and running and not requiring land documentation (deeds, etc.) as it is not a fixed building, but equipment that can be transferred to another location. Given the experience, level of organization and

geographical location of the ATACAMEL association, the installation of the honey house at its headquarters will help to evaluate this pilot project and its potential for multiplication. All stages of this process will be monitored by STA.

Investing in equipment to produce honeycomb wax will enable beekeepers to access this important production input at a much lower price than the market.

Honey quality control will be improved by investing in instruments and reagents, modernizing the warehouse's laboratory and helping to make analysis more reliable.

#### Proposal related to market access and commercialization

Considering that the actions proposed in the project will increase the volume of honey processed at the warehouse, COASPA, supported by STA, will develop a plan to expand and professionalize the cooperative's commercial sector. The plan will propose actions to overcome the problems pointed out above and strengthen the commercial experiences that are already in place. To this end, STA will carry out training, review labels and packaging, seek out partnerships, such as SEBRAE, which supports cooperatives in participating in specialized fairs nationwide, among other demands to be identified. The development of a website with e-commerce and social networks will be funded, with the aim of increasing the cooperative's sales and visibility in the market.

#### Proposal related to cooperative management

The actions to be carried out by STA will be focused on improving the management process as a whole, while prioritizing the sectors with the greatest deficiencies. This process should be conducted to provide COASPA with sufficient technical knowledge to ensure sustainable growth. In this context, opportunities should be identified to increase the participation of women and young people on the cooperative's board of directors.

To improve working conditions, the purchase of computers and printers will be financed.

The implementation and management of the NP will be the responsibility of COASPA's board of directors, under the guidance and monitoring of the CTE, local offices and the project itself.

#### Proposal related to social, environmental and health aspects

The PN will comply with environmental, health and social legislation, as well as the requirements set out in the PROCASE II ESMP.

Environmental legislation: The NP will respect environmental laws, especially in relation to the preservation of forests, water, soil and air. Because it is a small investment, the mobile honey house is characterized as a low environmental impact project, so there will be no need for environmental licenses to be issued by the state agency, falling under the "licensing exemption" regime, with the issuance of the DBIA (Declaration of Low Environmental Impact) carried out by SEMAS (Secretariat for the Environment and Sustainability).

Health legislation: the honey warehouse will comply with current health legislation. The warehouse has the seal issued by the Federal Inspection Service (SIF) of the Ministry of Agriculture, Livestock and Supply (MAPA).

#### Detailed investment

To achieve the objectives, set out in this PN, investments have been planned in different areas:

- Adding value and diversifying production: implementing a mobile honey house and equipment for extracting honey to the standards required by the health inspectorate, and equipment for making honeycomb wax.
- Quality control: purchase of a kit of laboratory instruments for quality control of the honey received and sold.
- Market and Commercialization: development of a website with e-commerce and social networks for institutional and commercial strengthening.
- Management support: acquisition of IT items.

**Photo 1 - Illustrative photo of the honey case**

Source: Business Plan - Product description template

## 2.7.2 Types of Subprojects from Social Technologies

Social technologies are provided for in Component 1, Subcomponent 1.1 (Implementation of Resilient Biodiverse Production Systems). The Social Technology section (Access to water, reuse of waste and renewable energy) includes:

- Access to water for human consumption: Household Cisterns and Equipped Wells;
- Access to water for agricultural production and animal husbandry: Production cisterns, Construction and renovation of small dams; Underground dams, Barreiros and stone tanks;
- Reuse of waste: grey and black water reuse system, evapotranspiration basins (BETs) and pilot solid waste initiative in rural areas;
- Renewable energy production units;
- Domestic eco-technologies for energy management.

The Preliminary Diagnostic Report - Product 2, referring to the social technologies to be considered in PROCASE II, expressed the Social Technologies listed by the Federal Government, of which the Cisterns for human consumption and production, the reuse of gray water by vermifilter unit (*minhocário*), the reuse of black water by green pit unit, the underground dam, mud yard and stone tank are in accordance with the Federal Government's list for this purpose.

The Banana Tree Circle is a technology that has been cited in scientific papers and books and is used to treat gray water and/or black water. Its operation is similar to that of *wetland* sewage treatment units, which have already been endorsed by the new NBR 17076/2024, but it requires the implementation of a sewage pre-treatment unit. In this case, IN nº 1 SEISP/SEDS/MC of 2020 in its article 1 informs "... Any change in the technical specifications of the social technologies for access to water supported by the Cisterns Program contained in the operational instructions and normative instructions in force must be submitted for prior analysis by this Ministry and must be accompanied by a study or technical report issued by federal or state public universities or federal or state public agencies that proves its suitability and feasibility."

Thus, based on what has been presented, it is necessary to define the term Social Technology to be used in PROCASE-II and thus ratify the technologies adopted.

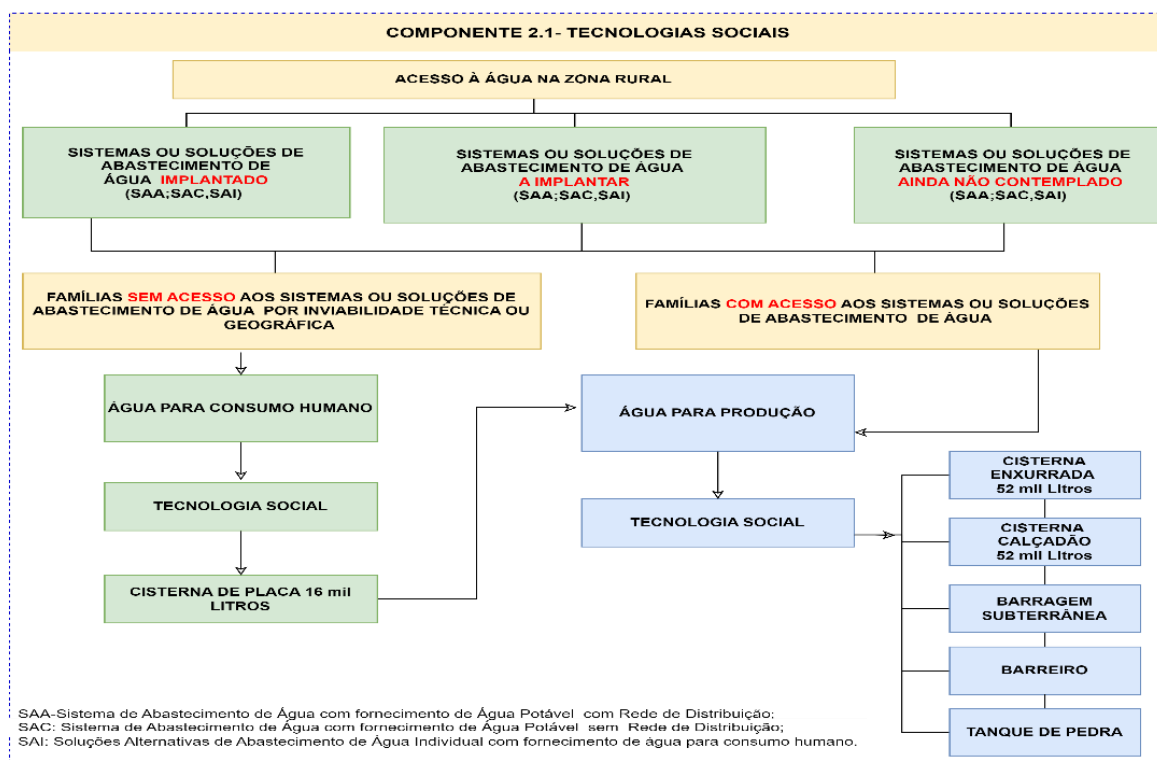

Solid waste management in rural areas and renewable energy units are units that add to the objective of Component 1 and require information from Component 2 activities in order to structure the selection criteria.

### **Water supply for human consumption and agricultural production**

Among the list of Social Technologies adopted by the Federal Government, the following water supply technologies are in line with PROCASE II: slab cisterns for human consumption and production, underground dams, mud pits and stone tanks. Water is a scarce commodity and in order to be consumed, whether for human consumption or agricultural production, it needs control and/or treatment depending on the purpose for which it is intended, which in this case may be:

- Water for human consumption: The water used for human consumption will be rainwater stored using the 16,000-liter Plate Cistern Social Technology and its collection, treatment and handling accessories. According to the regulations, this technology will be used in areas with water stress or regular water shortages, covering the whole of Paraíba. However, the families benefiting will be those in extreme poverty, who consume raw water as a priority or who consume drinking water by means other than drinking water supply systems or solutions. And even if the household is in the areas covered by drinking water supply systems or solutions, it cannot be connected due to technical or geographical impossibility;
- Water for agricultural production: The Social Technologies for storing water used for agricultural production will be a 52,000-liter rainwater cistern, a 52,000-liter cistern, an underground reservoir, a mud pit and a stone tank. They will be used in areas with water stress or regular water shortages. However, they should only be used in areas that guarantee access to water for human consumption, to prevent families from using this production water for drinking. Families that have already received a 16,000-liter cistern will therefore have priority in the application of Social Technologies for production water, where appropriate.

**Figure 5 - Guide to the implementation of water supply technologies.**

Source: Lima, A.F.F. Product 3 - PROCASE II Diagnostic Report.

### **Water Supply for Human Consumption**

Proc case II will benefit families in technically and geographically unfeasible areas (remote locations), when the alternative is the installation of Plate Cisterns for human consumption water, distributed in the 04 Water and Sewage Microregions (MSB) of the state of Paraíba and must follow the criteria preliminarily established<sup>4</sup>.

**Table 9 - Household Eligibility Criteria for Water Supply for Human Consumption.**

Criteria for choosing the families benefiting from water for human consumption-	Considerations
Social Technology	16,000-liter <b>plate cistern</b>
Paraíba Water and Sanitation Microregion: Alto Piranhas; Espinharas, Borborema and Litoral	There must be at least one beneficiary family located in one of the 04 MSBs
Municipal Basic Sanitation Plan (Guarantees municipal planning for SSS or SAC interventions)	Prioritize municipalities with a completed Municipal Basic Sanitation Plan.
Families in vulnerable situations	Families without access to water for human consumption, i.e. who use raw water for drinking.
Families in vulnerable situations	Families without access to drinking water, i.e. who buy water to drink

<sup>4</sup> These criteria are still being revised by the Proc case II preparation teams

Families in vulnerable situations	Isolated houses that limit interconnection with the SAA or SAC due to their geographical location, demand long stretches of pipe and/or alter the basic project (geographical or technical unfeasibility)
Families without access to WSS in place (located near WSS, but not connected)	Location of the house that makes it impossible to connect to the SAA for technical (hydraulic) reasons.
Families without access to the SAC (located near the SAC, but requiring some form of transportation to collect water)	Location of houses far from the fountain that makes it impossible to collect and transport the water from the support point to the residence.
Component 1	Families benefiting from component 1 activities that meet any of the above criteria.
Families with SAI access implemented	Families with plate cisterns set up by other organizations or projects, such as the P1MC, should not be chosen.

**OBS: Each choice must be justified in terms of rural water supply planning in the state, i.e. if the area is not subject to investment from other projects, whether municipal, state, NGO or other, in order to avoid overlapping resources.**

Source: Lima, A.F.F. Product 3 - PROCASE II Diagnostic Report.

The 16,000-liter slab cistern is a cylindrical, covered, semi-underground water reservoir that allows rainwater to be collected and stored from the roofs of houses using zinc or PVC gutters. It is necessary to dispose of the first rainwater and use the popular water pump social technology (Bomba Manual) (Annex to IN SESAN, March 2023).

Water from the 16,000-liter cistern should be used for drinking, personal hygiene and cooking, and should not be used for washing clothes or cleaning the house. It should also be avoided in places close to corrals, pits, garbage dumps, in order to avoid contamination, rainwater should never be mixed with other sources of raw water, the water should be filtered and chlorinated before being consumed and the first rainwater should never be used. Therefore, the eligibility criteria must be added to the technical criteria<sup>5</sup> set out in the following table.

**Table 10 - Technical criteria for choosing 16,000 liter slab cisterns**

Criteria for choosing the families benefiting from water for human consumption-	Considerations
Adequate basic design, with didactic and easy-to-interpret specifications to serve the target audience and support TA staff;	It should be developed by professionals, including engineering and social specialists. The project must contain the hydraulic parameters and execution processes in accordance with the ABNT Technical Standards, but it must present a chapter with colloquial language, where the support of the social professional is necessary. <sup>6</sup>

<sup>5</sup> These criteria are still being revised by the Proc case II preparation teams

<sup>6</sup> All social technologies, including cisterns, will be implemented through specially contracted technical assistance entities, within the existing legal framework developed by the federal government. The calls for tenders describe the minimum conditions (experience, composition of technical teams, etc.) that these entities must meet.

Installation of devices for: detour of first rainwater, overflow of surplus volume, protective screens at the inlet and outlet, among others;	Technical procedures with a clear message about why each device should be used. Preparation of a booklet.
Manual water pump: avoid contamination when removing water with other utensils that could contaminate the water during handling;	A relevant device in terms of sanitizing water collection, and the importance of sanitizing other utensils from transport to storage in the home should be added.
Identify the type of soil, whether sandy, stony and shallow or clayey.	Cracks in walls are quite common and backfilling, depending on the inappropriate material or improper construction method, can contribute to structural failure;
Implement sanitary barriers;	Avoid building near trees and bushes, keep away from corrals, latrines, garbage dumps, septic tanks and drains.
Avoid keeping the cistern empty for too long to prevent cracks;	Avoid filling the cistern with raw water.
A qualified professional with experience in rural areas.	Support for the PROCASE II team in choosing the beneficiary families and technical support for the construction process, preventive and corrective maintenance;

Source: Lima, A.F.F. Product 3 - PROCASE II Diagnostic Report.

### **Water Supply for Production**

The water supply for production will be for the use of agricultural activities and animal watering, its implementation must be associated with technical training and training for water management t, benefiting families who are covered by Plate Cisterns for human consumption or families covered by water supply systems or solutions (SAA, SAC or SAI), and must cover the 04 MSB of water and sewage of Paraíba, in areas with water scarcity and regular lack of water, the technologies adopted for this purpose are:

- **52,000-liter boardwalk cistern:** social technology that should guarantee access to rainwater from a 200 m<sup>2</sup> boardwalk for food production and/or animal watering for families benefiting from Procase II. It is a type of cylindrical water reservoir, covered and semi-underground, which allows rainwater to be collected and stored from a 200 m<sup>2</sup> sidewalk. The 3.2 m radius, 1.8 m deep reservoir has the capacity to store approximately 52 m<sup>3</sup> of rainwater. Covered and enclosed, it is protected from evaporation and contamination caused by animal waste and other impurities carried by the wind. The rainwater catchment area, called the *calçada*, has its area delimited by a curb, and is on a higher level than the reservoir, with a small slope to lead the water to a settling box and from there to the reservoir. (Annex to IN SESAN, March 2023);
- **52,000-liter rainwater cistern:** a social technology that guarantees access to rainwater from a rainwater bed for the production of food and/or animal feed for families benefiting from Procase II. It is a type of cylindrical water reservoir, covered and buried in the ground, with an internal diameter of 6.20m and a depth of 1.80m, capable of storing 52 m<sup>3</sup> of rainwater collected in the flood axis;
- **Underground Dam:** a social technology that should guarantee access to rainwater from flood beds for food production and/or animal watering for families benefiting

from Procace II. The underground dam is a barrier across the bed of torrents, streams and temporary creeks, by fixing a flexible plastic blanket in an excavated trench until it meets the crystalline or impermeable thickening, which is a rocky layer characteristic of the soils of much of the Brazilian semi-arid region. Its function is to retain rainwater that flows over and through the interstices of the soil, allowing the formation or elevation of the water table. There are two models of dam:

- a) Submerged dam: when the dam is at ground level and has no spillway. This model is indicated when the dam is built in the bed of temporary streams;
- b) Submersible dam: when the dam extends above ground level and accumulates a sheet of water on the surface of the land for a short period of time, usually two to three months after the rains have stopped. In this type of dam, a masonry spillway is built to drain the excess water and preserve the slope above ground, usually 0.6 m high. (Annex to IN SESAN, May 2023);
- Barreiro Trincheiro: a social technology that should guarantee access to rainwater from flood beds for the production of food and/or animal feed for families benefiting from Procace II. They are excavated in the ground to form a long, narrow tank with a bottom that stores rainwater. Their dimensions prevent the action of wind and sun, minimizing the effect of evaporation during periods of drought;
- Stone Tank: a social technology that should guarantee access to rainwater from flood beds for the production of food and/or animal feed for families benefiting from Procace II. It is used to store rainwater in rocky outcrops, which are sized to prevent evapotranspiration and the accumulation of rainwater in the dry season, where they are reinforced with walls to ensure the ideal height and waterproofing of cracks to prevent infiltration. It is a technology that provides access to water for production and animal husbandry, similar to the *microaçude*.

The social technology must be located in areas with water scarcity or regular water shortages. In addition, the Criteria<sup>7</sup> for choosing the beneficiary families must be observed, according to the table below.

**Table 11 - Eligibility Criteria for Choosing the Families Benefiting from Social Technology for Agricultural Production Water.**

Criteria for choosing the families benefiting from Social Technology for Agricultural Production Water	Considerations
Families with access to drinking water	Avoiding the use of production water for human consumption, Families in vulnerable situations who do not have access to drinking water.
Families benefited from a 16,000 liter plate cistern through Procace II	Balancing water management in the areas benefiting from Procace II.
Families with priority use of water for animal watering.	Ensuring access to and management of water for production
Families with agricultural activities	Ensuring access to and management of water for production

<sup>7</sup> These criteria are still being revised by the Procace II preparation teams

Support from a qualified professional.	Engineers in the civil/environmental/agricultural field to help locate the social technology, based on technical and environmental criteria.
Support from a qualified professional.	Engineers and technicians for support and guidance on execution, operation and maintenance.

Source: Lima, A.F.F. Product 3 - PROCASE II Diagnostic Report.

### Reuse of gray and black water (Green Trench)

Domestic sewage encompasses numerous peculiarities and specificities that influence the most appropriate treatment, which depends on the purpose for which it is intended: it can be dispersed in the soil, in the water body and/or used for reuse.

Among the list of Social Technologies adopted by the Federal Government, the following sewage technologies are in line with PROCASE II: gray water reuse (by physical and biological treatment - use of earthworms<sup>8</sup>) and black water reuse (Green Trench), both without the need for pre-treatment or post-treatment units for release into the soil or water body.

- Gray water reuse: treats wastewater that does not come from the toilet. The treatment of these effluents through the reuse system consists of a filtering process using biological and physical impediment mechanisms. Initially, the gray water, rich in chemical and organic waste, is directed to a filter where the organic matter is biodegraded by a population of microorganisms and earthworms (*eisenia fetida*), resulting in the removal of its main pollutants (Annex, IN SESAN/MDS No. 36, March 2024). This treatment is of the Vermifilter type<sup>9</sup>. In addition to this, the Banana Tree Circle can also be used, which is specified in academic works<sup>10</sup>, but not yet regulated in the Federal Government's Normative Instructions specifically for grey or black water, and for the treatment of black water a pre-treatment must be installed.
- Black water reuse: treats the specific water from the toilet. The evapotranspiration basin (Green Trench; Ecological Trench) will be used, which is regulated by the Federal Government's Normative Instruction and does not require pre-treatment of sewage for its use.

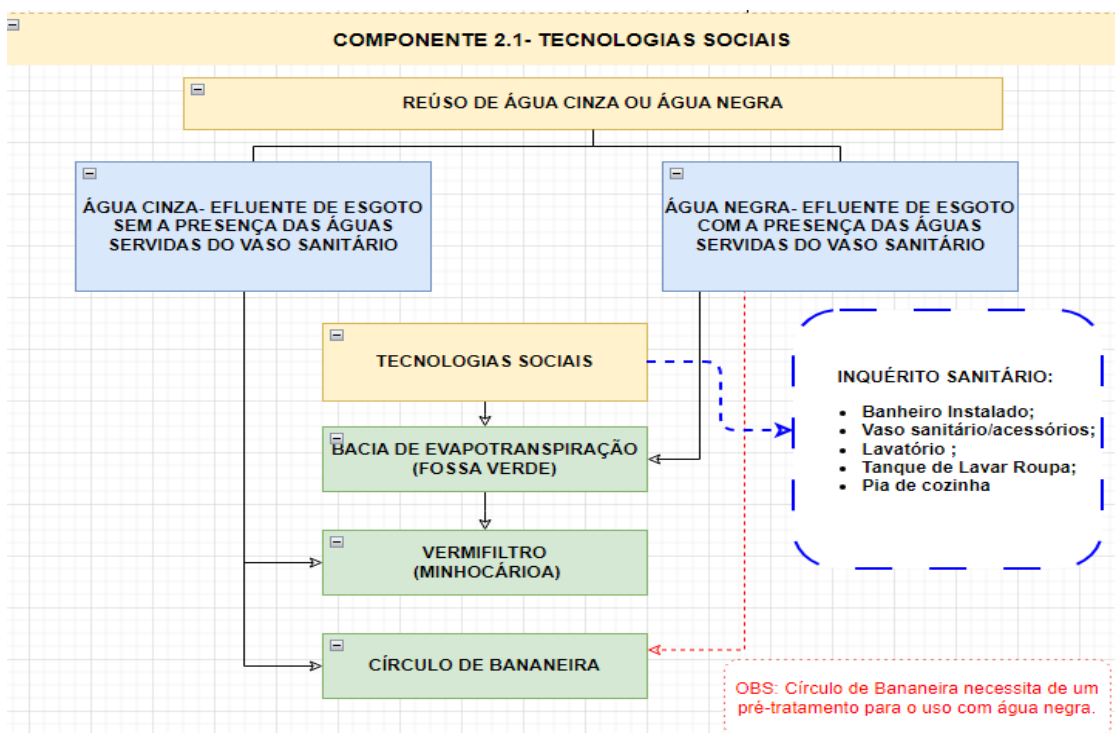

The following figure illustrates the technologies mentioned in this topic and includes the Sanitary Survey as a support for evaluating the beneficiaries of these technologies, highlighting the importance of the scenario for implementing the technologies and the accessories for their applicability, such as the grease trap and the bathroom with toilet.

<sup>8</sup> Consulting and Sustainable Oriented Technical Training - ATOS, in partnership with the Federal Rural University of the Semi-Arid, the International Fund for Agricultural Development - IFAD and the Dom Helder Câmara Project, which resulted in the Manual for the implementation and management of the family bio-water system: reuse of domestic gray water for food production in family farming in the Brazilian semi-arid region.

<sup>9</sup> Vermifilter can be used for black water, domestic sewage, but it is necessary to carry out a pre-treatment technology such as a septic tank.

<sup>10</sup> The Banana Tree Circle is not included in Brazilian standards, but it is suggested by FUNASA (FUNASA, 2015 and 2018) and its effectiveness has been proven by academic research (FIGUEIREDO, in press) and by its current use in permaculture and agroecology projects (Book Domestic Sewage Treatment UNICAMP, 2018).

**Figure 6 - Diagram Sanitary Sewage and Reuse of Treated Domestic Effluent**

Source: Lima, A.F.F. Product 3 - PROCASE II Diagnostic Report.

The reuse of grey water and black water considered in this Component will support families who are in a situation of extreme vulnerability and who have the minimum conditions for eligibility and should be a determining factor in transforming the local reality in terms of eliminating local pollution and managing the use of water, for which it is important to have the minimum conditions for implementing these technologies, which can be verified in the following Table<sup>11</sup>.

**Table 12 - Minimum Conditions for Access to Social Technologies for Treating Greywater or Blackwater.**

Criteria for choosing beneficiary families Social Technology for Reusing Grey or Black Water.	Considerations
Families with the right profile to receive social technology	Reuse needs to be well accepted by the beneficiaries and supported in terms of application, operation and maintenance.
Type of sewage and use	Specific for domestic sewage effluent and not used for vegetables.
Families benefiting from Proc case II plate cisterns for drinking water	Contribute to the control of water use, avoid local pollution. Households with open sewage drains.
Families benefiting from Proc case II plate cisterns for production water	Contribute to the control of water use, avoid local pollution. Households with open sewage drains.
The homes served must have a toilet and sink	Ensuring sanitary areas for the implementation of technologies.

<sup>11</sup> These criteria are still being revised by the Proc case II preparation teams

Kitchen sink	Ensure the implementation of the grease trap as Social Technology for gray water
Toilet bowl	In the case of Social Technology for black water.
Area available for construction of treatment units	Space for the implementation of social technologies and sanitary barriers for protection, so that treatment takes place in and around the home.
Areas for vegetable production and near the residence	Recommendation of a qualified professional regarding the choice of execution site
Location of gray water outlets in houses.	Kitchen sink, tank or washing machine, shower, hand basin.
Health survey	Draw up a questionnaire on the health situation of beneficiary families

**NOTE: Social Technologies for gray water and black water do not necessarily have to be implemented at the same time, but they can only be implemented if the other waters have been properly treated and disposed of.**

Source: Lima, A.F.F. Product 3 - PROCASE II Diagnostic Report.

In this project, specific social technologies will be implemented for the reuse of gray water and black water, as set out above. The Social Technologies for the reuse of gray water will be Vermifilter by Worm Cultivation or Banana Tree Circle, and for black water it will be the Evapotranspiration Basin (Green Trench).

### Study of Solid Waste Management in rural areas

The areas covered by Procase II should be interconnected with the Municipal Solid Waste Plan to ensure the proper disposal of waste generated in rural areas and avoid the formation of dumps. In principle, the municipality must be supported in adding value or inputs to existing municipal planning, and the municipality's capacity to receive the new waste must be proven.

The following figure illustrates the possible phases encountered during the rural solid waste management process.

**Figure 7 - Solid Waste Management in Rural Areas**

Source: Lima, A.F.F. Product 3 - PROCASE II Diagnostic Report.

The study of solid waste management in rural areas should cover at least one of the municipalities belonging to Paraíba's four MSBs and aim to provide the means, among

the five alternatives, to transform the local reality, in other words, to eliminate the pollution caused by the lack of solid waste management. In this way, the actions to be implemented must be integral and articulated with municipal solid waste management, supported by means referenced by the 05 alternatives.

Beneficiary rural areas must comply with the minimum conditions proposed<sup>12</sup> in the following table.

**Table 13 - Minimum Conditions for Implementing a Rural Solid Waste Management Study**

Criteria for choosing community associations to be covered by rural solid waste management actions.	Considerations
Municipalities belonging to the MSB of Paraíba	Municipality that has a landfill with the capacity to receive waste generated in rural areas.
Municipalities belonging to the MSB of Paraíba	Municipality that has a Controlled Sanitary Landfill and that must only receive recyclable waste from rural areas.
Community associations with component 1 activities	Sorted by level of waste generator (starting with the most polluting)
Community associations with the highest percentage of recyclable waste	Eliminate the generation of waste and/or guarantee the final disposal of waste.
Community associations with the highest percentage of organic waste	Families willing to set up a composting area with natural or accelerated organic decomposition that can benefit more than one household.
Community associations with the highest percentage of organic waste	The family is receptive to setting up a composting area with natural organic decomposition that can benefit just one household.

Source: Lima, A.F.F. Product 3 - PROCASE II Diagnostic Report.

In addition to the criteria in the table above, PROCASE II can support the implementation of actions, among others, in isolation or as a group, as follows:

- Purchase of collectors for packaging waste;
- Implementation of a voluntary drop-off point - PEV;
- Acquisition of any type of transport, large or small, to support municipal waste management;
- Implementation of recyclable sorting units;
- Support for the creation or renovation of sites for recycling activities;
- Support for waste pickers;
- Support for the implementation of natural or accelerated composting;
- Training;
- Proof that the action implemented will change the local scenario in terms of the generation, storage and final disposal of solid waste in the areas covered.

<sup>12</sup> These criteria are still being revised by the Proc case II preparation teams

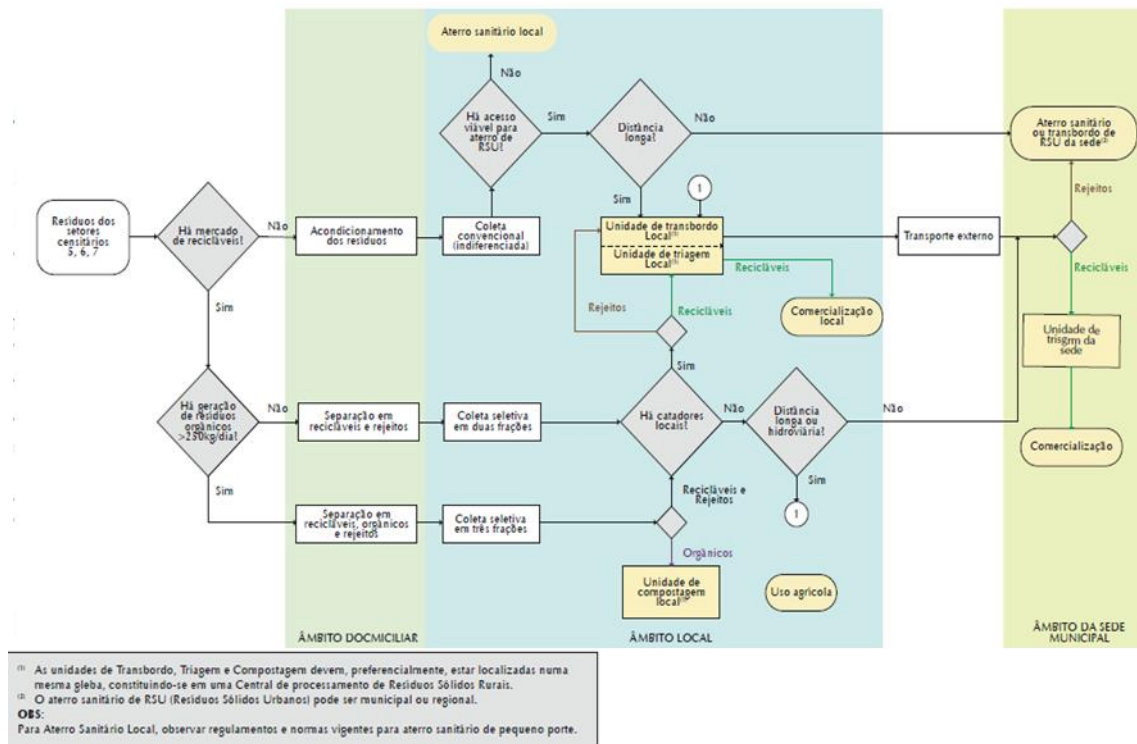

The following figures show an outline of solutions for solid waste management in rural areas, drawn up by the National Policy for Rural Sanitation (PNSR -FUNASA), which can serve as a basis for this study, the first referring to the types of census sectors shown in the other figures.

### Renewable Energy

The renewable energy to be used within the scope of the project is photovoltaic (solar energy), which can be implemented in wells for agricultural production, especially those defined in water projects for agricultural production, and can be implemented together with the social technology for production water, as support for collection and reservoirs. It is also expected to be used as an energy source for irrigation equipment and in processing plants. Biodigesters can also be used.

The Biodigester is a domestic sewage treatment unit that does not require pre-treatment, but it is necessary to install a post-treatment unit for the treated effluent so that it can be disposed of in the ground or in a water body. During the sewage treatment process, gas is generated that can be used for cooking, lighting or heating water. However, the biodigester is not only used as a domestic sewage treatment unit, it can also be used to

produce biofertilizers. The organic materials used in the biodigester can be waste from plant production (leaves, straw, crop residues) or animal production (such as manure and urine).

This product will be developed based on these three premises:

- a) water supply and reuse of gray or black water,
- b) Solid Waste Management study in rural areas and
- c) renewable energy.

Technical and socio-cultural criteria will be developed, as well as the specificities and peculiarities of the areas to be covered, ranging from the agricultural activities of component 2 to the social, economic and political aspects of the 223 municipalities in the state of Paraíba. This will lead to the presentation of eligibility guidelines for the choice of typologies that can be adopted in all of Paraíba's municipalities.

Among the actions under Component 1, three proposals were presented regarding the use of renewable energy to strengthen PROCASE II's objectives of reducing rural poverty levels and producing actions to combat and mitigate climate change: i) photovoltaic energy; ii) biodigester and iii) eco-stoves.

- i) Photovoltaic energy: solar energy can be used directly in Social Technologies for production water, with the exception of 52,000 liter plate cisterns, when installing wells to support agricultural activities. They can also directly benefit the agricultural activities of interdependent associations under Component 1;
- ii) Biodigester: a unit for the treatment of domestic sewage effluent and a unit for the production of biofertilizer supplied with waste from plant production or animal production (animal urine and manure). The use of the biodigester for domestic treatment must be accompanied by sewage post-treatment units that guarantee the disposal of the treated effluent in the soil or water body. Biogas and biofertilizer are produced. Given the lack of sanitary sewage in rural areas and the characteristics of the families benefiting from the supply of water for human consumption, the implementation of a biodigester for the treatment of domestic effluent in this project is not effective due to the numerous variables required for its use, especially with regard to the regularization of sanitary sewage in the benefited areas, such as the execution, renovation or expansion of toilets and/or sewage treatment units. Therefore, the biodigester will be implemented with vegetable or animal production waste.
- iii) Eco-stoves: the ecological stove uses sticks, corn cobs and tree bark as fuel, as opposed to the wood stove, which is fueled only by firewood.

Photovoltaics must be directly related to social technologies for supplying water for production (with the exception of 52,000-liter cisterns) and must be a priority criterion, not an exclusion factor.

Biodigesters and stoves should be prioritized rather than excluded. However, these two can also be linked to solid waste management when they require organic waste for their operation.

### 2.7.3 Analysis of Alternatives for Subproject Typologies

The alternatives for the types of sub-projects highlighted under PROCASE II are presented and evaluated below.

#### **Alternatives for Resilient Investment Plans - RIPs**

The discussions on alternatives for the PIRs involved socio-environmental concerns that touched on some important constraints.

Among these constraints, the following were addressed:

- Productive investments in permanent preservation areas (APP for springs);
- Productive investments in permanent preservation areas (river APP);

The options for each of these issues linked to the definition of PIRs are assessed and commented on below.

#### **Productive investments in permanent preservation areas (river APPs)**

River APPs are areas that must be protected and recovered from the point of view of their natural state, following the possibilities and guidelines prescribed in the Forest Code law. In addition, it is important to observe the premises of ESPS 6 of the IDB's ESPF and Standard 1 of IFAD's SECAP, which deal with issues of biodiversity conservation and sustainable management of natural resources.

Discussions about the alternatives involved joint debates between the PROCASE team, socio-environmental consultants preparing the project, local universities and representatives of environmental agencies (SUDEMA, SEMAS).

With this in mind, the following scenarios were evaluated for the project, with the following results:

#### **Implementation of SAF in APP of springs**

Springs are very sensitive areas, as they involve water production areas that need to be in their most natural state possible, in which the use of their resource should be avoided in order to boost the production of the resource, including avoiding its scarcity.

As a result of the evaluations and discussions, the implementation of SAF in these spring preservation areas could lead to a process of depletion or a significant reduction in the resource and water production due to the water demand that the SAF plants could require.

*This alternative was therefore discarded from the project.*

#### **Planting a SAF in a river APP**

On the other hand, it was noted that the possibility of implementing SAF in river APPs could bring ecosystem benefits to the natural environment. In this case, the process of recovering degraded APP areas, even with the strategy of implementing SAF, has proved to be very positive in terms of increasing the sustainability of the areas. Through observation of real cases in productive areas and discussions with institutions (scientific,

management and control/supervisory), the following results were reached for alternatives for implementing SAF in APPs:

- For the project to be successful, the **soil must first be restored with target species that are** useful for this purpose. Implementing SAF without this strategy could lead to increased erosion and loss of soil nutrients;
- **The use of exotic species can be useful for recovering the soil before inserting native tree species**, as well as some being important fodder, but preference should be given to: (i) native species; (ii) exotic species that are adapted and/or do not have invasive characteristics, and that are not new species inserted into the environment. The application of species with the aim of soil recovery and productive use must be carefully controlled;
- It was observed in the experiments carried out and in the discussions that strengthening the ecosystem with strengthened soils and good biological diversity brings greater resistance and resilience to the environment.
- The implementation of SAF in river APP **can be considered in conjunction with irrigation systems for production**, thus bringing greater sustainability to the use of available water resources.

*In this sense, this is a viable alternative with positive results for the project.*

#### **Alternative to not implementing SAF in a river APP**

According to the results of the evaluations, this would not be a good alternative, given that:

- This can exclude many rural properties from eligibility for the program, given that many rural producers with the profile to benefit have small properties (Small: up to 4 fiscal modules; Medium: between 4 and 15 fiscal modules)<sup>13</sup>. This issue, coupled with the presence of APP on the property, ends up fatally reducing the area available for production.
- The implementation of SAFs in APP areas, provided they are carried out in a careful and sustainable manner, helps to combat and recover degraded areas on river banks, benefiting both the natural environment and the rural producer.

*Experience has therefore shown that it is better not to consider this alternative of non-execution.*

<sup>13</sup> According to INCRA, the classification of property size can vary between 2ha and 100ha, depending on a series of established criteria such as the region/municipality and type of production. The classification is defined by Law 8.629, of February 25, 1993, amended by Law 13.465 of 2017, and takes into account the fiscal module, which varies according to each municipality. The fiscal module is one of the Basic Cadastral Indices used by INCRA to set parameters for characterizing and classifying rural property by municipality, according to its size and regional layout. The current indices were defined by Incra through Special Instruction No. 5 of 2022.

## Alternatives for Social Technologies

The evaluation of alternatives for Social Technologies addressed the following situations:

- Alternatives for water supply and the use/reuse of water in rural areas, considering the region's water availability and the extensive semi-arid area in the state of Paraíba;
- Alternatives for sanitation in rural areas;
- Alternatives for eco-efficient energy technologies.

The options for each of these issues linked to the definition of Social Technologies are evaluated and commented on below.

### Water Supply for Human Consumption

Firstly, the approach to defining alternatives was focused on technical aspects (rainfall irregularity, production flow) and/or the difficulty of accessing existing water sources (widely dispersed houses and/or the need to lay large stretches of raw or treated water pipeline).

Bearing in mind that some essential parameters for defining the typology can only be verified when the subproject is drawn up, specifically with regard to the community to be benefited, which has not yet been defined, the types of water treatment will depend on the standards of potability for its use.

Article 2 of Ordinance GM/MS No. 2.472/2021 states that for human consumption, water must come from:

- Water Supply Systems (WSS);
- Alternative Collective Water Supply Solution (ACWSS);
- Alternative Individual Water Supply Solution (AIWSS);
- Water truck.

The table below shows the alternative ways of supplying water.

**Table 14 - Characteristics of Water Supply Modalities**

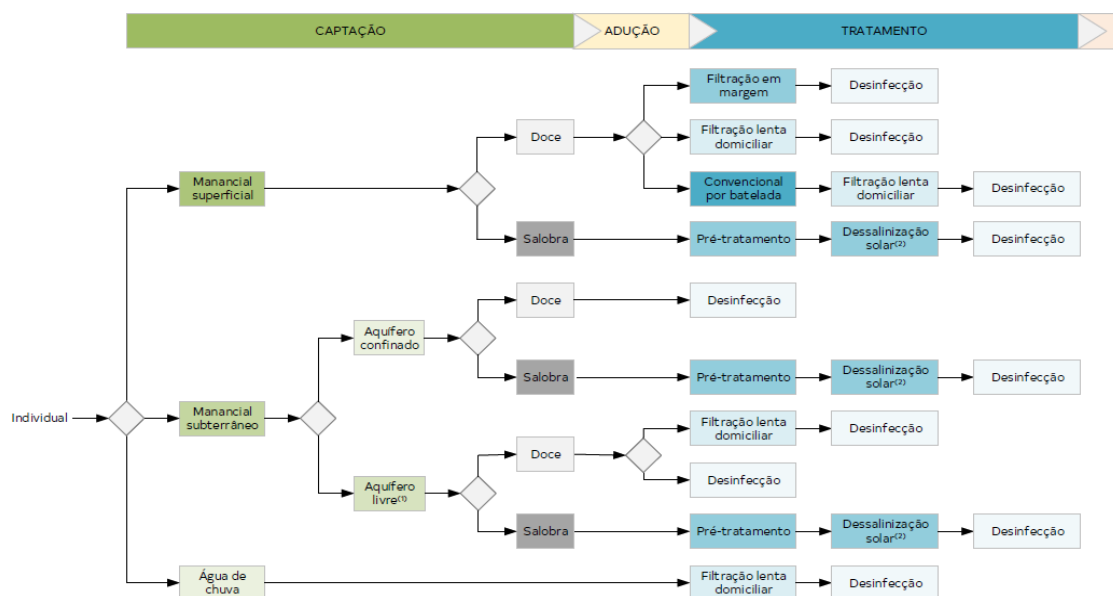

Mode of Supply	Scope	Distribution	Example
<b>1-Individual Alternative Solution - IAS</b>	Single-family	Simple piping	Direct abstraction from springs and wells
<b>2-Collective Alternative Solution- SAC</b>	Press conference	Single pipe and reservoir	Collection, supply and reservoir (fountain)
<b>4-Water Supply System - WSS</b>	Press conference	Distribution Network	Collection, adduction, reservoir and distribution network and building connections

Source: Lima, A.F.F. Product 3 - PROCASE II Diagnostic Report.

The Water Supply Solution or System is implemented in areas where water is supplied from surface or underground sources. The ACWSS and WSS must have a qualified technician responsible for the operation, with the respective ART issued by the Class Council.

The individual water supply can be provided in two ways: by Alternative Individual Water Solutions or by rainwater, both of which must be treated by disinfection and filtration, as shown in the figure below.

**Figure 12 - Types of Treatment for an Individual Water Supply System or Solution.**

Source: National Rural Sanitation Program - FUNASA-2019

The parameters that defined the choice of the best alternative for the project were:

- Best alternative for areas with low rainfall;
- The areas usually have surface or underground springs with low catchment flows;
- Many springs have water characteristics that do not meet the normative and legislative parameters for drinking water and require special technologies for water treatment and control, generating the expectation of investment;
- Often there are long distances between the water catchment and homes, requiring long stretches of raw or treated water pipelines, generating a high investment value;
- The best technology should help reduce the distance traveled to collect the water;
- The dispersion of houses in communities is likely to require a large investment to install a distribution network, depending on the technology chosen;
- The alternative should reduce the risk of water-related diseases;
- The best alternative should not compromise family income for the purchase of water for drinking and storage;
- The best alternative should provide an option for the rational use of water.

The components of a rainwater harvesting system using cistern technology are:

- Catchment surface: favorable roofs: high water run-off coefficient and less chance of contamination;
- Transport system: Prefabricated gutters that collect rainwater and can be made of galvanized steel, aluminum or PVC;
- Sanitary Protection System: avoid the first millimeters of rain, impurities and debris; hand pump and keep away from corrals, pits, garbage dumps, among others;
- Storage system: ensure technical support in terms of execution to avoid possible damage such as cracks, leaks, as well as operation and maintenance (predictive and preventive).

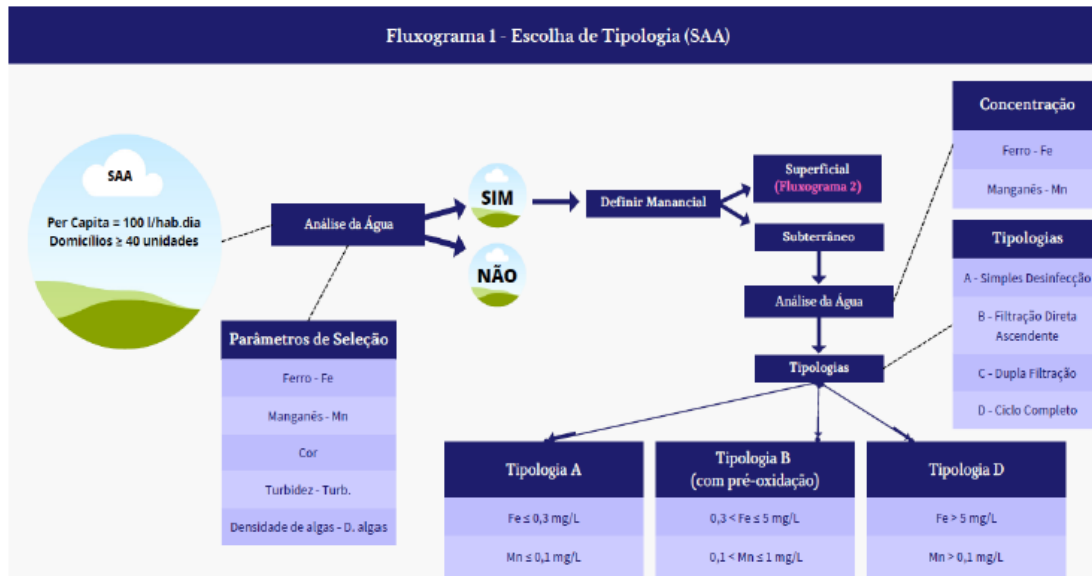

The SAls serve one family or a family nucleus (households), the catchment can be by spring, well, water tanker and cisterns, the treatment is done by simple disinfection and/or filtration. The Social Technology Cistern for human consumption is an Individual Alternative Water Supply Solution.

The WSS with a distribution network are commonly carried out in urban areas, city centers and districts with a high population density, which is reflected in the design of the project to meet hydraulic parameters, such as: adequate per capita flow, long stretches of pipeline, hydraulic design with the need for water pumping stations (WPS), hydraulic transients (TAU, Stand-PIPE, Suction Cups), among others. In addition to access difficulties for operation and maintenance, all of this can generate technical and/or financial unfeasibility and imply limiting factors, especially in rural areas, which present a scenario with low population density, dispersed houses, inhabited regions without urban planning, access difficulties, large territorial extensions, unpaved roads, large agricultural areas. In Paraíba, most of the territory is located in the semi-arid region or in a region with a regular lack of water, which is reflected in the low level of service provided to the rural population by WSS (only 24.16%).

In rural areas with a high population density and water sources that allow treatment by simple disinfection and filtration, families are generally served by WSS with a distribution network. On the other hand, those with low-flow springs and widely dispersed houses are served by fountain-type ACWSSs. Often, due to a lack of financial resources, part of the community is served by WSS (simple disinfection) and part is served by fountains (SAC), in addition to those served by cisterns for human consumption.

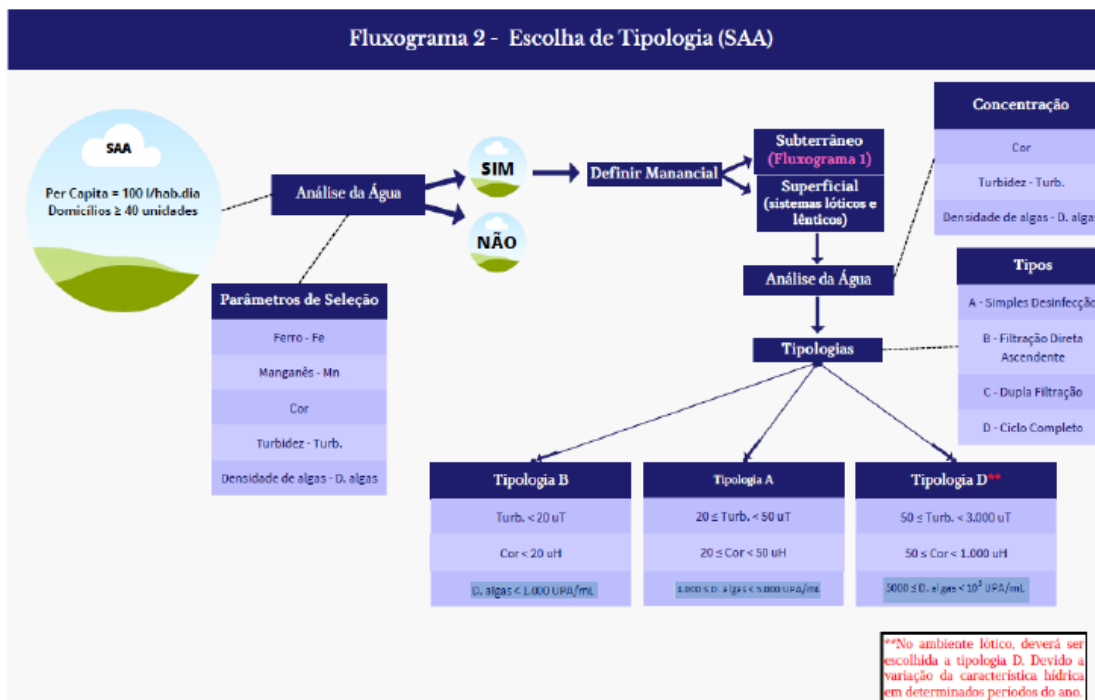

The choice of an alternative type of water supply when it involves abstraction from surface or underground water resources (except rainwater) goes through a process that takes into account the composition of the water to define the source to be used and the type of solution adopted, as defined in the flowchart below.

Figure 13 - Flowchart of the choice of WSS typology for surface water

Source: MACS / Adapted from Ponte, 2011.

Figure 14 - Flowchart of the choice of WSS typology for groundwater

Source: MACS / Adapted from Ponte, 2011.

Thus, the SAI, consisting of cisterns, was the best alternative for the Typology of Social Water Supply Technology, meeting the parameters of choice of alternative, low cost of implementation and operation, as well as low maintenance.

## **Water Supply for Agricultural Production and Animal Husbandry**

The supply of water for production helps to support agricultural activities and animal husbandry in areas affected by water scarcity. Therefore, the use of Social Technologies for this purpose complements actions to control water and mitigate climate change, since, if well controlled, they reduce the negative effects of droughts.

*The alternative technologies to be adopted by Procasa II for water supply in agricultural production and animal husbandry are Production Cisterns, Underground Dams or Trench Barriers.*

*These technologies have a low environmental impact, low implementation, operating and maintenance costs and meet the parameters similarly presented for the supply of water for human consumption.*

*In any case, these alternatives should also be evaluated from the point of view of the environment in which they are inserted, since this particularity can define the best choice.*

### **Production tank**

The production cisterns are a system made up of a plate cistern with a storage capacity of 52,000 liters accompanied by a sidewalk with an area of approximately 200m<sup>2</sup> that retains rainwater. In addition to these units, decanting boxes must be built to prevent water from accumulating on the sidewalk and to sediment sand and other debris in the water. The water is removed by hand pump.

### **Underground dam**

A social technological alternative that helps reduce the negative effects of long periods of drought is the underground dam (SILVA et al., 2007, p 1).

The technology consists of intercepting the surface and underground flow of a pre-existing or created aquifer with the construction of an impermeable wall, built with masonry, concrete, compacted clay or plastic sheeting, depending on the local conditions of the producer and the availability of materials in the region (BRITO et al., 1989).

Underground dams are built in areas of shallows, streams and creeks, in places where the most water flows when it rains. It is built by digging a trench down to the impermeable layer of soil, the rock. This trench is lined with plastic sheeting and then closed again. In this way, a barrier is created to store rainwater under the ground and keep the soil moist for a longer period.

### **Brickyard**

They are excavated in the ground to form a long, narrow tank with a bottom that stores rainwater. Their dimensions prevent the action of wind and sun, minimizing the effect of evaporation during dry periods. It should be built close to the production areas and is also used for animal watering.

These technologies do not need to be interdependent with social technologies for the supply of water for human consumption, and can be implemented in areas where there are difficulties in accessing water for production. However, the eligibility criteria for beneficiaries must be interdependent with component 1.

## **Stone Tank**

The stone tank stores rainwater in rocky outcrops, which are sized to prevent evapotranspiration and the accumulation of rainwater in the dry season, where they are reinforced with walls to ensure the ideal height and waterproofing of cracks to prevent infiltration.

The choice of the type of social technology will depend on the farming activities carried out by the family and the characteristics of the benefiting property and its environment, i.e. the minimum area needed to implement the social technology, ease of access for implementation, maintenance and operation, and the existence of environmental constraints.

## **Drainage**

The studies carried out to analyze the alternatives for the sanitation sub-projects resulted in the possibility of applying 10 different types of systems that could be implemented in the communities:

- Septic tank;
- Ascending Flow Anaerobic Reactor (AFAR);
- Anaerobic filter;
- Sand Filter and Filtration Ditch;
- Biodigester;
- Constructed Lagoon Systems;
- Vermifilter;
- Bananeiras Circle;
- Drain;
- Infiltration trench.

In the alternative analysis, the definition of the type of sewage system to be built in communities listed as beneficiaries of PROCASE II basically depends on two factors: (1) demographic density and (2) per capita water consumption, classified according to the parameters.

For the environmental criteria, it is important to look at the magnitude of the impact of implementing each Social Technology, both during implementation and operation (interference with the soil, construction waste, sludge generation, etc.).

The most suitable sewage treatment still depends on various criteria: physical, chemical and biological, also taking into account the location and effects of the disposal of the treated effluent, i.e. whether it will be discharged into the ground, into a water body or used for reuse, which depends directly on the specificities and peculiarities of the destination areas. This treatment can be of the following types: Preliminary, Primary, Secondary and Tertiary, i.e. from the simplest to the most complex.

More complex treatments, such as sewage treatment plants, require advanced technologies and qualified personnel to implement, operate and maintain them. In addition, there are the same concerns listed for water supply, such as the need to install

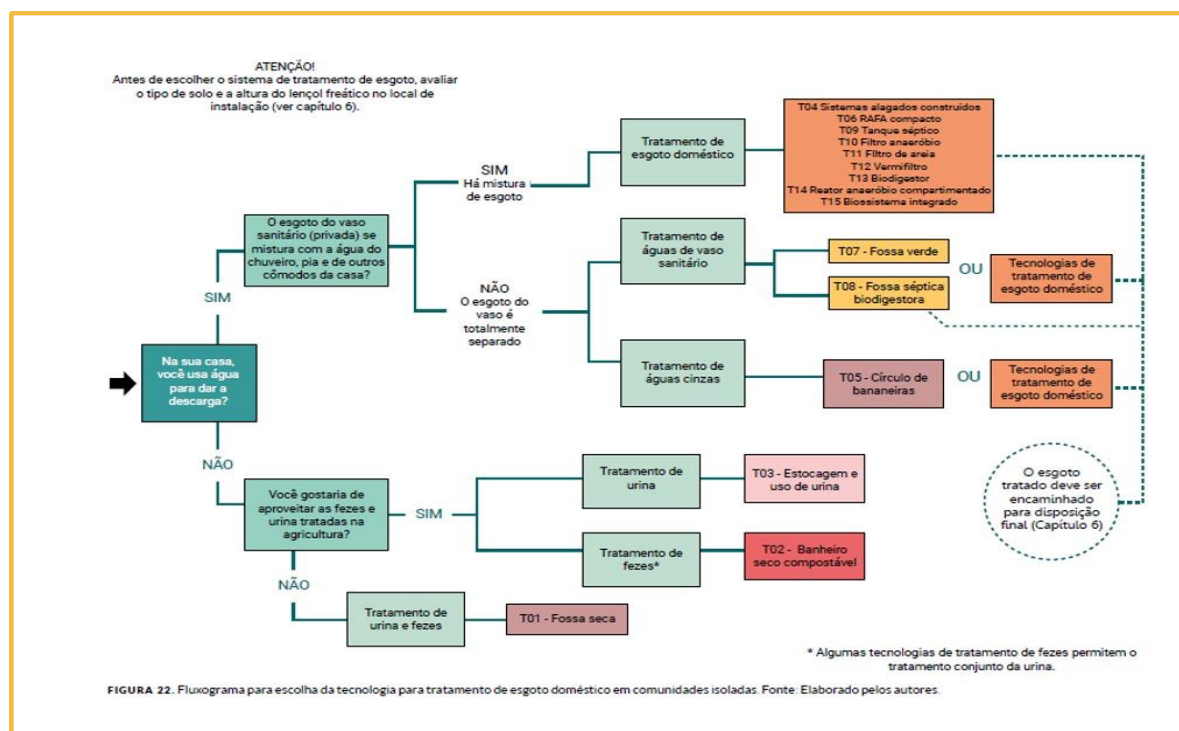

sewage networks and pumping stations, among other factors that make it more expensive and difficult to implement effective solutions for communities.

As the PROCASE II areas to be covered are in the rural areas of Paraíba where water supply systems with simple disinfection and filtration predominate, as well as alternative individual or collective water supply solutions, the best alternative indicated for sewage treatment will also be of the simple operation and maintenance type, without the need for qualified personnel to handle it, where the beneficiary, when trained, can carry out the operation and maintenance with the state's supervision.

The best alternative in sewage technology for rural areas is generally the individual type, with service per family, and which, for reasons of normative regulation, is the Septic Tank followed by the Sump, however due to the basic sanitation deficit in rural areas, the scarcity of water, the need for pollution control and the rational use of water, other types of Social Technology have already been adopted with the aim of meeting these demands, as can be seen in the figure below. These technologies may or may not be accompanied by Septic Tanks and/or Sumps.

**Figure 15 - Types of Sewage Treatment in Rural Areas**

Source Book: *Domestic Sewage Treatment in Isolated Communities*.

To choose these technologies, it is necessary to identify the type of sewage collected and the waste generated (sludge):

- Grey water: from sanitizing: kitchen sinks (grease traps), drains (bathroom sinks and showers);
- Black water: from the toilet;
- Domestic sewage: black water + gray water;
- Pre-treatment: necessary for the treatment of domestic sewage,

- Sludge removal.

This is due to the project's proposal to use technologies that are simple to operate and maintain, with a low cost of execution and the implementation of the reuse of treated effluents, which avoids the pollution of areas (open sewers) and contributes to mitigating climate change.

*Therefore, the best technological alternatives defined for the project are: Evapotranspiration Basin (Green Trench), Banana Tree Circle, Vermifilter and Biodigester.*

*In addition, such technologies are characterized by adopting nature-based solutions, avoiding or reducing the use of chemicals and processing for the technology.*

### **Evapotranspiration Basin (Green Trench):**

- Specific treatment for toilet water;
- A buried waterproof box divided into three compartments: a central chamber for receiving sewage, a filter layer and an area planted with banana trees;
- Masonry building material;
- 1st compartment: made up of materials such as old tires or hollow ceramic blocks, the solids are sedimented and the sewage is digested;
- 2nd compartment: composed of rubble, gravel and sand, anaerobic degradation of sewage;
- 3rd compartment: layer of soil where banana trees and other plants are planted;
- It can be built on sites with sandy or clay soil and on sites with a low water table.

**Figure 16 - Evapotranspiration Basin (Green Trench)**

Source: Book: Domestic Sewage Treatment in Isolated Communities.

### **Banana Tree Circle**

- Specific treatment for gray water or complementary sewage treatment;
- A circular trench filled with branches and straw is planted around banana trees or other plants specifically designed for moist, nutrient-rich soils;

- Water and nutrients from the sewage will be consumed by the banana trees and food waste and soap will be degraded by microorganisms present in the soil of the ditch;
- It should be kept away from groundwater and springs.

**Figure 17 - Banana tree circle**

Source: Book: *Domestic Sewage Treatment in Isolated Communities*.

### **Vermifilter**

- The tank can be built in concrete rings, masonry, water tanks or any other material that guarantees waterproofing;
- It consists of two layers: the top layer is made up of sawdust, humus and earthworms and the bottom layer is made up of filtering materials, gravel or rolled pebbles divided into layers of different granulometries.
- The earthworm humus must be removed and can be used as fertilizer;
- For the treatment of domestic sewage, septic tank pre-treatment must be installed

Figure 18 - Vermifilter

Source: Book: Domestic Sewage Treatment in Isolated Communities.

### Biodigester

Treatment for black water, domestic sewage, fresh manure and food waste;

- Treatment by anaerobic digestion;
- It produces biogas that can be used as cooking gas;
- Can be used in individual or collective systems;
- Care must be taken in construction and operation;
- Sludge removal required;
- It needs complementary treatment depending on its intended purpose.

Figure 19 - Biodigester

Source: Book: Domestic Sewage Treatment in Isolated Communities.

## Wastewater Reuse and Green Fossa

Among the technologies chosen, the Banana Tree Circle and the Vermifilter can be used for gray water reuse and are in line with the Procasse II guidelines. The criteria for implementation in the project area are diverse:

- Area with toilets and open sewage;
- Use of the treated effluent in some activity in the community;
- Increased water supply for other regions and activities;
- Reduction in the discharge of treated effluent into water bodies, reducing pollution and contamination;
- Vermifilter reuse already being implemented (in the semi-arid region used by the Dom Helder Câmara project).

The green cesspool (BET) is a toilet water treatment system that makes use of the water and nutrients present in sewage. The BET can be divided into three parts: a central compartment for receiving and initially digesting the sewage, a filter layer and an area planted with banana trees. Other names for the same system are: evapotranspiration tank (Tevap), ecofossa, bioseptic pit, plant bioremediation, banana pit, bioseptic bed.

**Figure 20 - Green Trench - Evapotranspiration**

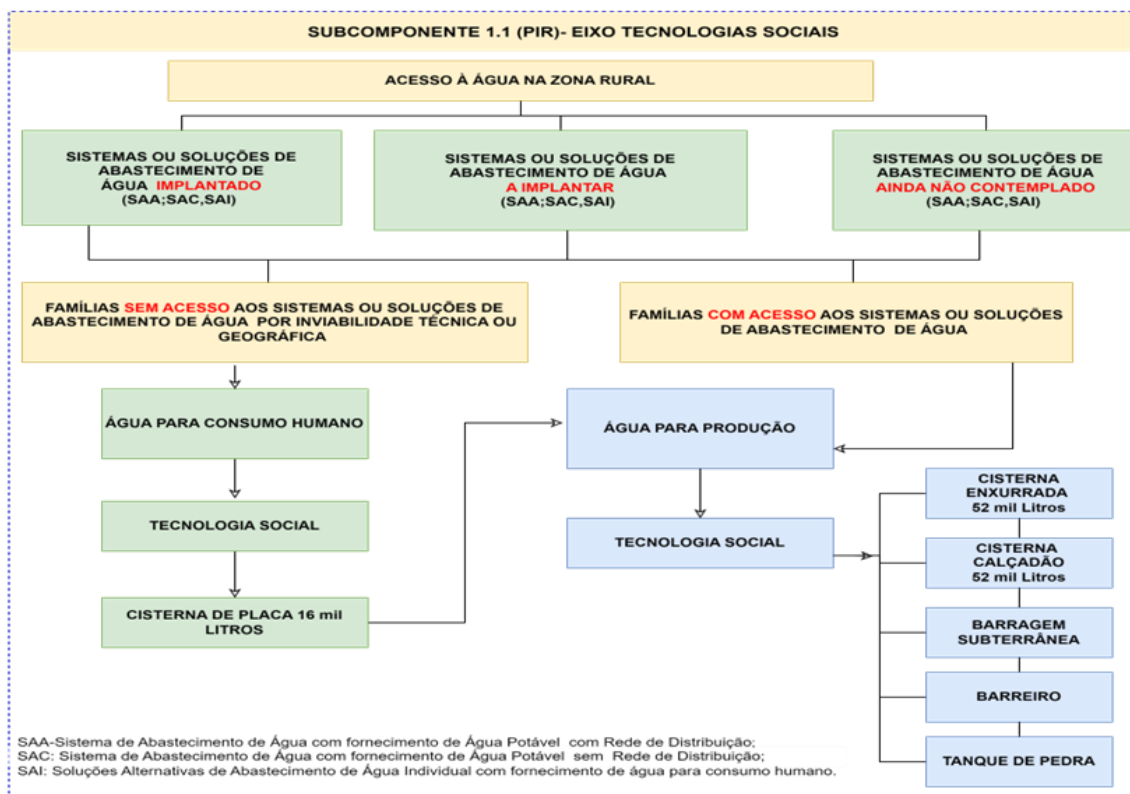

Source: Book: *Domestic Sewage Treatment in Isolated Communities*.

### **Method for choosing an alternative in the PROCASE II implementation phase**

In order to promote the health, environmental and social objectives of the project, the health conditions of the families benefiting from the supply of water for human consumption must be observed, whether by Water Supply Systems, Water Supply Solutions or Social Technologies for drinking water, depending on local conditions, the proposed Social Technologies for water reuse must be implemented.

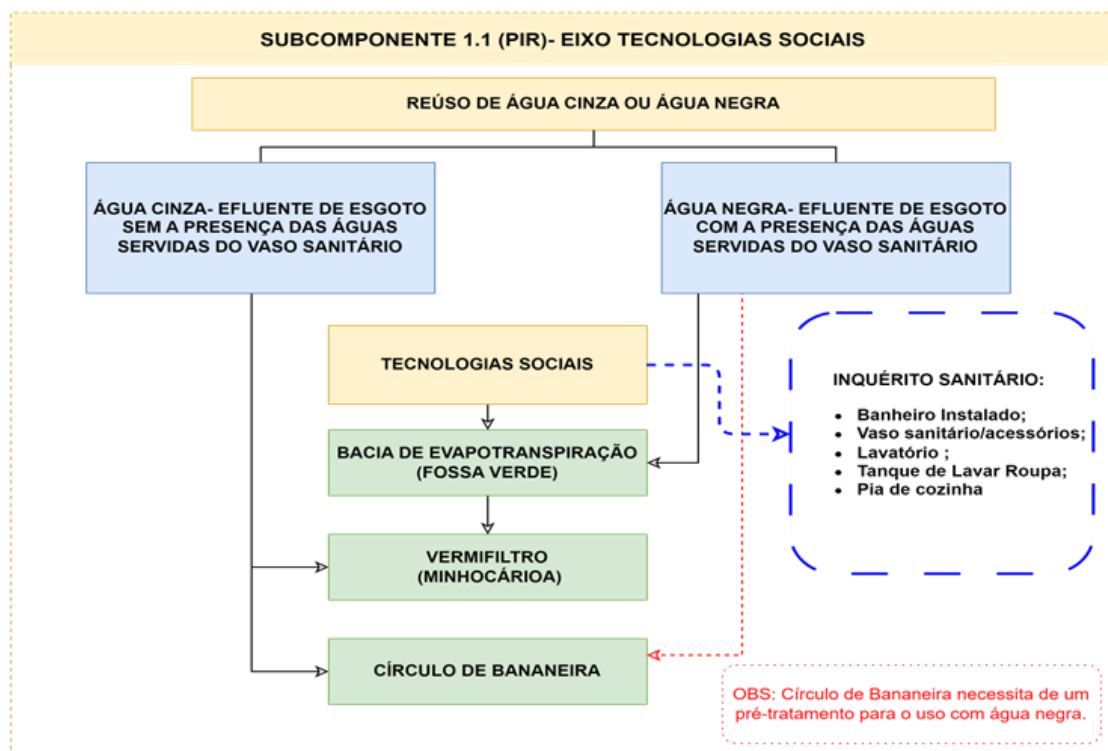

Thus, the following figures present a guiding scheme that can direct the choice of technologies.

Figure 21 - Flowchart for defining the Water Supply Social Technologies to be implemented

Source: Lima, A.F.F. Product 3 - PROCASE II Diagnostic Report.

Figure 22 - Flowchart of Sanitary Sewage Reuse of Treated Domestic Effluent

Source: Lima, A.F.F. Product 3 - PROCASE II Diagnostic Report.

### **Renewable energy: photovoltaics, biodigesters for use in agriculture and eco-stoves.**

Biodigesters for use in farming and eco-stoves are on the list of the RIP's Social Technologies axis. They are easy to operate and maintain and can be implemented at family level.

Photovoltaic energy is also an interesting option for ensuring greater energy stability in production processes and reducing emissions, as well as helping to reduce costs for producers.

- Biodigester: a domestic sewage effluent treatment unit and biofertilizer production unit supplied with plant or animal production waste (animal urine and manure). Biogas and biofertilizer are produced.

*The biodigester solution to be implemented could be of the sertanejo type, supplied by waste generated by 20 pigs and 10 cattle, and could provide energy equivalent to an average of 7.8 cooking cylinders per month.*

- Eco-stoves: ecological stoves use sticks, corn cobs and tree bark as fuel, as opposed to wood stoves, which are fueled only by wood.

*Eco-stoves are applied in rural areas and the guidelines for implementation must follow the guidelines of the environmental axis, it is a technology that is easy to handle and should reduce the consumption of firewood.*

## **2.8 Institutional arrangement**

The **State Secretariat for Family Farming and Semi-Arid Development (SEAFDS)** is the project's coordinating body, responsible for financial execution, procurement and contracting, as well as carrying out the necessary coordination, monitoring and supervising its execution.

To manage the project, SEAFDS will have a **Project Management Unit (PMU)**, which will be based in João Pessoa, and regional offices located at strategic points throughout Paraíba. The PMU and Regional Offices will be responsible for coordination, planning, institutional coordination, implementation and monitoring of the actions promoted, working in close collaboration with the SEAFDS coordinators and technical advisors.

The arrangement will also include the participation of a **sub-executing agency** formed by the **Research, Rural Extension and Land Regularization Company (EMPAER/SEDAP)**. EMPAER's directorate dedicated to technical advice and rural extension (the former EMATER) will take on the task of providing part of the Technical Assistance (TA) services, both in Component 1 and Component 2. EMPAER's directorate dealing with land issues (the former INTERPA) will be the entity in charge of carrying out the land regularization provided for in the Project. EMPAER's scientific research directorate (formerly EMEPA) will be in charge of carrying out some of the technological exchanges provided for in the Project.

EMPAER has experience in carrying out technical assistance and rural extension, land management and scientific research aimed at technological development.

There are also plans to set up an **Executive Productive Investment Management Committee (CEGIP)**, a collegiate body made up of the executing agency, sub-executing agencies, government bodies and representatives of organized civil society, which will have to approve PROCASE II's annual operational planning.

CEGIP will be set up by means of Rules of Procedure. According to Article 2 of the CEGIP Rules of Procedure, the Committee is responsible for:

I.To assess and approve the Resilient Investment Projects (PIR) submitted by the PMU/PROCASE;

II. Requesting, at any time, information from the PROCASE State Coordinator on projects and investments carried out within the scope of the territorial collegiate bodies in the state of Paraíba;

III. Monitoring the efficiency of the socio-environmental safeguard policies and actions adopted by PROCASE in the Strategic Environmental and Social Management Plan - ESMP;

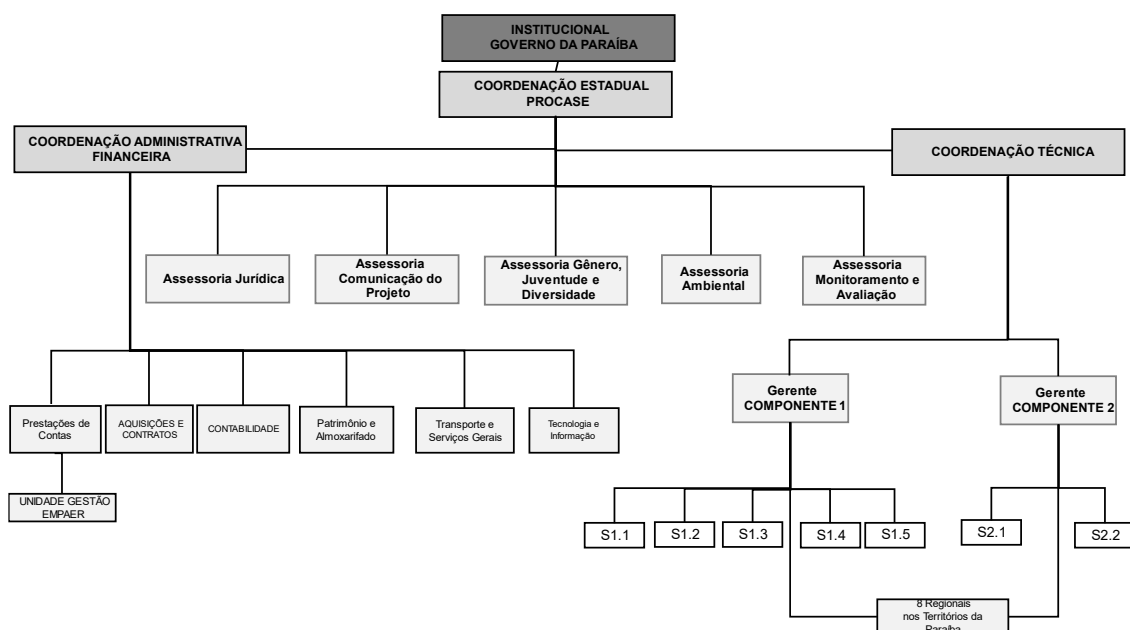

IV.To monitor, every six months, the progress measured by the results indicators and products delivered by the Sustainable Rural Development Project, in accordance with the guidelines of the Project Operational Report .

CEGIP will have the following composition:

- Head of the State Secretariat for Family Farming and Semi-Arid Development (SEAFDS) as President, with the Executive Secretary of this portfolio as Alternate;
- A representative or alternate from the Paraíba Research, Rural Extension and Land Regularization Company - EMPAER;
- A representative or alternate from the State Secretariat for the Environment and Sustainability (SEMAS);
- A representative or alternate from the Secretariat for Planning, Budget and Management (SEPLAG);
- A representative or alternate from the Ministry of Agrarian Development (MDA);
- A full representative or an alternate from the State Coordination of Territorial Collegiates;
- A representative or alternate from the Federation of Agricultural Workers (FETAG);
- Full and alternate representative of the Federation of Agricultural Workers (FETRAF);
- A representative or alternate from the Articulação do Semiárido Brasileiro (ASA);
- A representative or alternate from the Landless Workers' Movement (MST);
- A representative or alternate from the Pastoral Land Commission (CPT);
- Full representative or an alternate from PROCASE;
- State Secretariat for Human Development (SEDH);
- State Secretariat for Women and Human Diversity (SEMDH);
- Executive Secretariat for Youth, Sport and Leisure (SEJEL);

**Figure 23 - General organization chart of the Proc case II institutional arrangement**

## Regional Offices

PROCASE II will have eight Regional Project Management Units (RPMU), each made up of a team of three specialized consultants. These consultants will have backgrounds in the areas of Agricultural Sciences, Environmental Sciences and Human Sciences.

Consultants in agricultural sciences may have a background in agronomy, agroecology, agricultural engineering, zootecnics, veterinary medicine, among others.

In the area of Environmental Sciences, consultants may have a background in Biology, Ecology, Environmental Engineering, Environmental Management, among others natural sciences.

The Human Sciences consultants include professionals from the fields of Anthropology, Sociology, Psychology, Social Work, among others social sciences.

The team is multidisciplinary, reflecting the complexity and necessity of the project. This diversity of specializations allows for a holistic and integrated approach to the various demands of PROCASE II.

Within this structure, one of the consultants will be responsible for territory coordination, with the aim of supervising and coordinating the teams of consultants in their assigned territory, ensuring that project activities are aligned with project needs and local realities.

Each of the 8 PROCASE II Regional Offices are strategically located in municipalities that have regional centralities in the Rural Territories, providing, in addition to face-to-face service, a telephone number, WhatsApp and e-mail. All these channels will be incorporated as part of PROCASE II's Complaints Management Mechanism.

The following table shows the addresses and contact telephone numbers of all the regional offices:

**Table 15 - Possible addresses for Regional Offices**

MUNICIPALITY	Address
João Pessoa	Avenida Rio Grande do Sul, nº 1.345, Bairro dos Estados, Edifício Evolution Business Center, 16º andar, CEP: 58.030-021
Campina Grande	Av. Jorn. Assis Chateaubriand, 2630, Estacao Velha, Edifício do CDRM, CEP: 58.105-421
Cuité	Av. Petrônio Figueiredo, 811-859, Jardim Planalto, Edifício da Casa da Cidadania, CEP: 58.175-000
Sumé	Rodovia BR-412, 425, Centro, Edifício do NEXT/UFCG, CEP: 58.540-000
Ducks	Rua João da Mata, 90, Centro, CEP: 58.700-080
Sousa	Rua Emídio Pires, 84, Centro, CEP: 58.802-270
Catolé do Rocha	Av. Deputado Américo Maia, 37, Centro, CEP: 58.884-000
Itaporanga	Rua Elvidio de Figueiredo, S/N, Margens PB 386, Bairro Loteamento João Silvino, CEP: 58.780-000

### **Bodies/Entities and Entities that are partners in the implementation of actions**

The project will also seek to strengthen partnerships with other government bodies, whether federal, state or municipal. These include:

- The **Secretary of State for Women and Human Diversity (SEMDH)**, with the executive departments for gender equity and racial equity responsible for implementing public policies for women and traditional communities and actions to strengthen these groups.
- The **Executive Secretariat for Youth**, an important partner in carrying out activities for young people in PROCASE, such as exchanges and training.
- The **INSA (National Semi-Arid Institute)**,
- **UFCG (Federal University of Campina Grande)**,
- The **UFPB (Federal University of Paraíba)**.
- The **Federal Institutes and EMBRAPA Cotton** (which has its headquarters in Campina Grande), which will also seek to strengthen collaboration with other EMBRAPA units.

It will also be of the utmost importance to establish partnerships with town halls, as several of the project's actions will require this collaboration. Another important dialogue will be with social movements aimed at strengthening family farming and developing the semi-arid region and the forest zone. Whenever possible, the project will seek to establish partnerships with the private sector, be it business or the third sector.

### **Entities involved in environmental licensing**

In principle, Proc case II projects do not require licensing and, where applicable, these should be simple, involving simplified authorizations.

In any case, information on the state entity responsible for environmental inspections and authorizations is described below.

### **Superintendence of Environmental Administration (Sudema)**

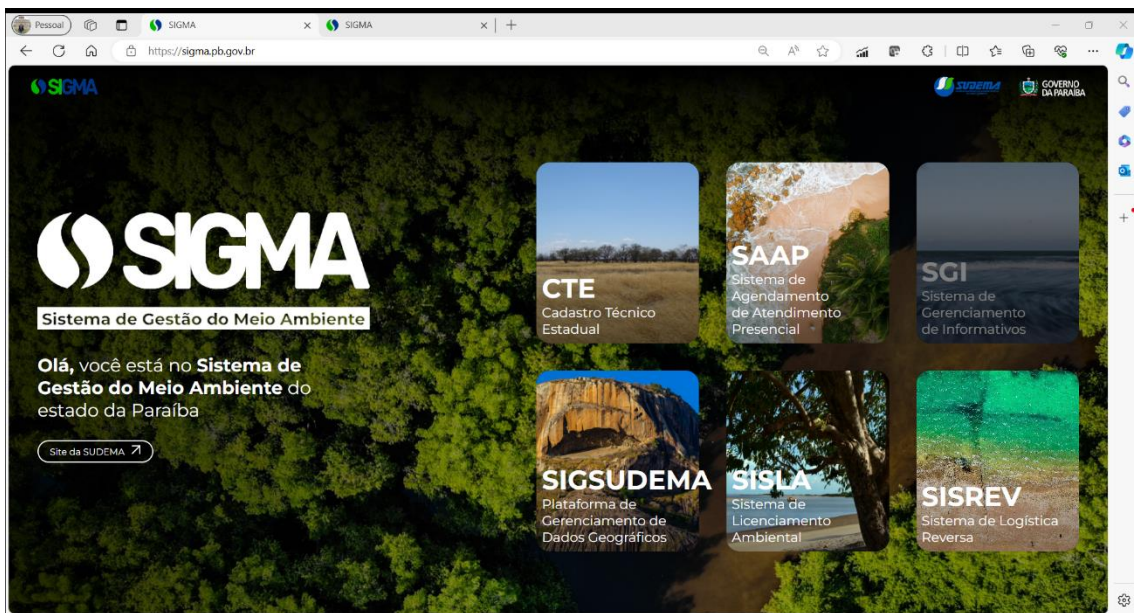

The **Superintendence of Environmental Administration (Sudema)** was created by the Paraíba State Government on December 20, 1978, by means of Law No. 4.033, with the aim of developing an environmental protection policy. As well as João Pessoa, Sudema also has offices in the cities of Patos and Campina Grande.

Sudema's mission is to develop policy actions for environmental protection, prevention and education, as well as strategies aimed at guaranteeing current and future generations a quality of life compatible with the harmony of nature and free from predatory aggression, constantly practiced by man himself. Its structure includes the following departments:

- CEDA - Environmental Education Coordination
- DIFLOR - Forestry Division
- CCA - Environmental Control Coordination
- CMA - Coordination of Environmental Measurements
- Pollution Control Division
- CEA - Coordination of Environmental Studies
- CCF - Accounting Coordination
- Financial Execution Division
- CPD - Data Processing Coordination
- CRH - Human Resources Coordination
- CSG - General Services Coordination
- Archive Division
- Customer Service Division
- DIFI - Inspection Division
- CPL - Permanent Tender Committee
- DITEL - Telecommunications Division
- SETGEO - Geoprocessing Sector
- SRS - Solid Waste Sector
- CAEIA - Commission for the Analysis of Environmental Impact Studies
- COMEG - Coastal Management Commission
- Botanical Garden Director

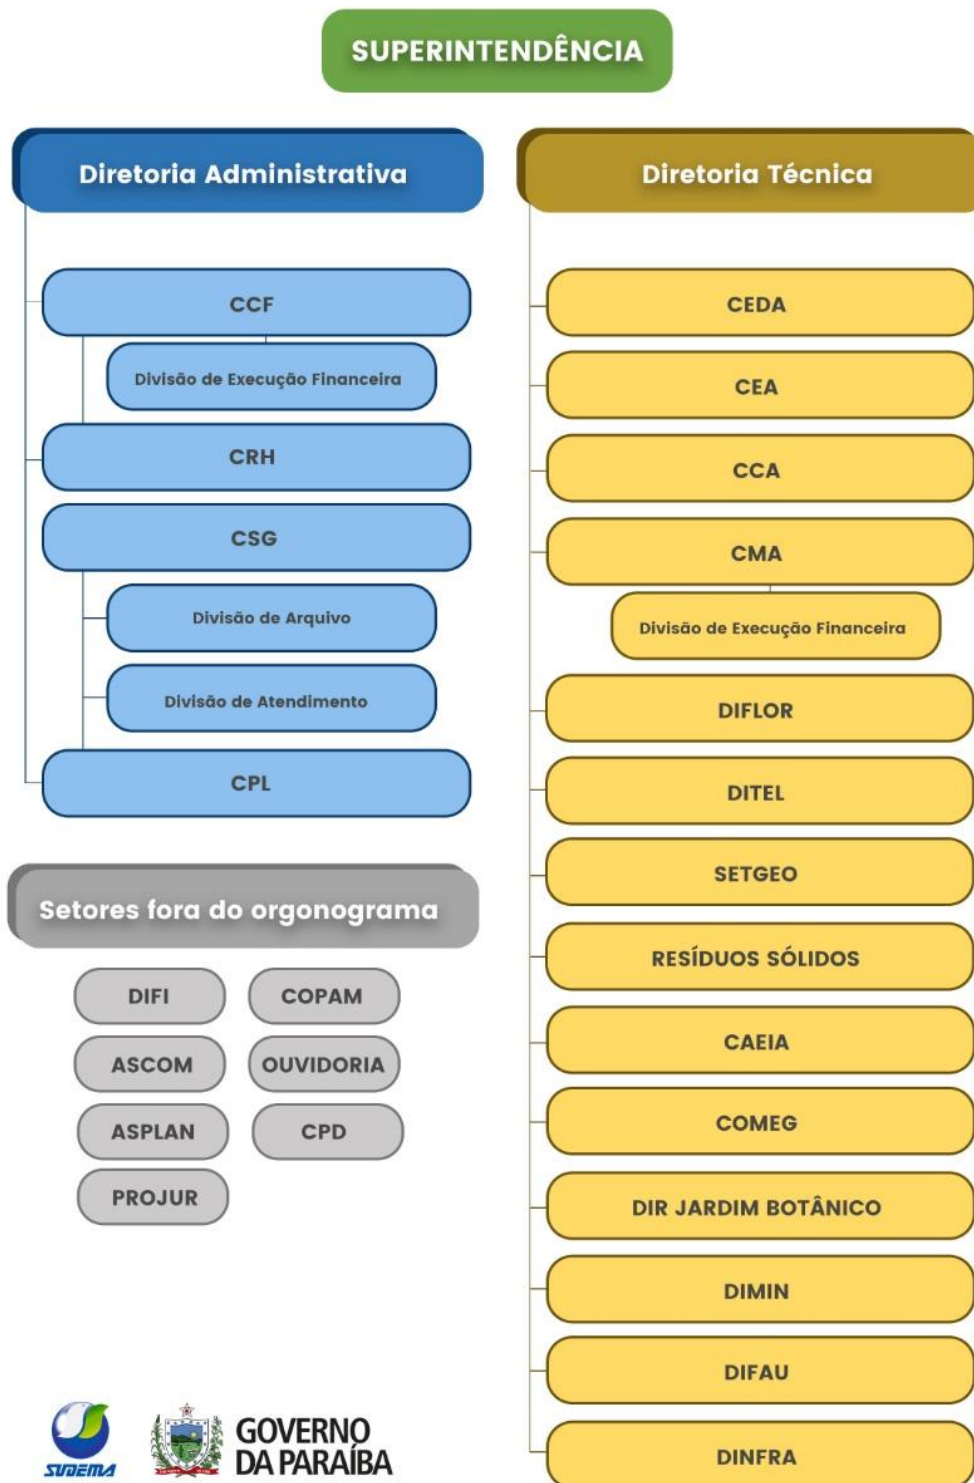

Sudema also has a computerized environmental management system (SIGMA), which includes modules for registration, scheduling, information, geographic data management, reverse logistics and environmental licensing.

Source: <https://sigma.pb.gov.br/>

Figure 25 - Sudema's organizational chart

Source: <https://sudema.pb.gov.br/institucional/organograma>

### **Environmental Protection Council - COPAM**

The Environmental Protection Council - COPAM, created under the terms of Law 4.335 of December 16, 1981, a collegiate body formerly linked to the State Secretariat for Infrastructure, Water Resources and the Environment - SEIRHMA, is part of the State Environmental System.

Currently, through Law No. 12.615, of April 25, 2023, COPAM is directly linked to the State Secretariat for the Environment and Sustainability - SEMAS, acting to prevent and control pollution and environmental degradation, aiming to protect, conserve, recover and improve environmental resources, analyzing all licenses granted by the Superintendence of Environmental Administration - SUDEMA, suggesting the maintenance, revocation or alteration of such licenses, through compliance with applicable legislation.

Its attributions include issuing guidelines, norms and instructions through deliberations regarding the protection of environmental resources, with a view to preventing pollution and the rational use of environmental resources in the state of Paraíba.

## **3 REGULATORY FRAMEWORK**

The following are the national and international regulations that may affect the PROJECT and its sub-projects.

### **3.1 International agreements**

The main environmental agreements ratified by Brazil are presented below. Other agreements that complete the list are presented in the **Annex 8.1**.

#### **United Nations Framework Convention on Climate Change - UNFCCC**

The United Nations Framework Convention on Climate Change (UNFCCC) is an international treaty resulting from the United Nations Conference on Environment and Development, held in Rio de Janeiro in 1992 (ECO-92).

This treaty aims to stabilize the concentration of greenhouse gases (GHG) in the atmosphere at levels that prevent dangerous interference with the climate system.

The treaty did not initially set mandatory limits for GHG emissions and contained no coercive provisions. Instead, the Treaty included provisions for updates (called "protocols"), which were supposed to create mandatory emission limits. The main one is the Kyoto Protocol.

Due to the fact that GHGs remain in the atmosphere for many decades after they are emitted, it is not possible to halt or reverse climate change and, for this reason, the measures to be taken are mitigating, in the sense of reducing the impact of such changes, and adapting, in the sense of creating mechanisms to adapt to the changes that will occur.

The member countries of the Convention meet periodically in meetings called the Conference of the Parties.

The first Conference of the Parties (COP 1) took place in Berlin in 1995 and saw the signing of the Berlin Mandate, in which the Annex I countries (industrialized countries) made greater commitments to stabilizing the concentration of GHGs, through policies and measures or quantitative emission reduction targets.

In 1997, the Kyoto Protocol was approved in Kyoto, which followed the guidelines of the Berlin mandate and placed greater emphasis on quantitative targets as a way of minimizing the costs of mitigation in each country. To this end, mechanisms such as the Clean Development Mechanism (CDM) were also established, which enables both the reduction of emissions in industrialized countries and the transfer of resources from industrialized countries to developing countries.

In mid-2001, discussions resumed at COP 6 in Bonn, which became known as COP 6 BIS. At this meeting, the Bonn Agreement was established, in which concessions were made in order to guarantee the permanence of countries such as Japan and the Russian Federation, which was necessary for the Protocol to enter into force. This agreement also allowed for different interpretations on issues such as LULUCF (*Land use, Land use change and Forestry*), by countries that started to review their positions when the USA left and the concessions made to other countries.

At the end of 2001, COP 7 was held in Marrakech and the Marrakech Accord was reached, which included the political aspects of the Bonn Agreement and the environmental aspects of the Kyoto Protocol. This agreement defines the operational rules for LULUCF, flexibility mechanisms, the definition of the national emissions inventory system, additional information derived from the Kyoto Protocol and the process for reviewing national communications. It was necessary for the countries of the European Union and the G77 and China to give way to the countries of the *Umbrella Group* (Japan, Australia, Canada and the Russian Federation). Even if the reductions provided for in the Kyoto Protocol are achieved, they will not be enough to significantly reduce man's interference in the climate system. COP 7 also saw the creation of the CDM Executive Committee and the drafting of a declaration emphasizing the relationship between sustainable development and climate change, defining poverty eradication and development as priorities for developing countries.

COP 17 was held in 2011 in Durban, South Africa. During this meeting, a legally binding agreement was reached, integrating all the participating countries, which will be prepared by 2015 and will enter into force in 2020.

COP 18 was held between November 26 and December 7, 2012, in Doha, Qatar. Its main objective was to reach an agreement on the emission targets of Annex I countries. At the same time, the Doha Amendment was approved, which extended the validity of the Kyoto Protocol until 2020. Canada, Japan and New Zealand chose not to sign the amendment, joining the United States as countries that have not ratified the Protocol.

COP 19 took place in 2013 in Warsaw, Poland, with the aim of defining several important aspects, but it was a tumultuous and controversial meeting, and progress was only made in the negotiations on payment for reduced emissions from deforestation and forest degradation (REDD+), reaching a commitment to raise 280 million dollars for funding. It was also established that countries should set voluntary emission targets by 2015.

COP 20 took place between December 1 and 14, 2014 in Lima, Peru, with the aim of defining the text of the agreement that would replace the Kyoto Protocol, to be sealed in Paris in 2015. A first draft, entitled the Lima Call to Action on Climate, was approved, but the resolutions were modest and most of the important decisions were postponed.

COP 21, held in Paris between November 30, 2015 and December 12, 2015, fulfilled its main objective of approving the Paris Agreement, which established that global warming should be contained below 2 °C, preferably 1.5 °C. However, although widely praised as an important step forward, the Agreement was also intensely criticized for being unambitious, leaving it up to the countries to decide what their emission targets would be, for not being very clear about the means of financing, for not redefining mitigation and adaptation mechanisms that have already proven to be inefficient, and for not penalizing non-compliance with the targets, which brings a risk in the event that the voluntary targets set are not met and warming is not contained at the desired level.

COP 22 was held in Marrakech in 2016 and managed to set some important measures, especially in terms of starting to define the rules for the practical implementation of the Paris Agreement. In addition, countries pledged to donate 80 million dollars to the Adaptation Fund; announced more than 23 million dollars for the *Climate Technology Center and Network*, aimed at supporting technology transfer to developing countries, and the Green Climate Fund announced the approval of the first proposals for formulating National Adaptation Plans. A series of other initiatives have been launched in parallel by individual countries or groups of countries to increase the efficiency and transparency of mitigation and adaptation plans, expand funding, promote sustainable development and focus on the special needs of vulnerable countries and indigenous communities.

COP 23 took place in Bonn, Germany, from November 6 to 18, 2017. The difficulties in implementing the Paris Agreement were discussed and preparations were made for the Talanoa Dialogue, which should facilitate the expansion of countries' voluntary emission targets. National and group projects offered specific improvements in various aspects of the fight against global warming.

COP 24 was held in Katowice, Poland, in December 2018. The main goal was to define the practical rules for implementing the Paris Agreement, which were approved, especially the mechanism for measuring national emissions and integrating them into an international system, but the results were hampered by the opposition of a group of countries, including Saudi Arabia, the United States, Russia and Kuwait, to the official recognition of the conclusions of the IPCC special report on warming of 1.5 °C. In the end, the rules set were limited to inviting countries to make use of the report, did not make much progress on the means of financing and did not oblige countries to increase their emission targets. On the other hand, the World Bank announced the allocation of 200 billion dollars to tackle the climate challenge.

COP 25 was due to take place in Brazil in November 2019, but the Brazilian government announced that it would not be hosting the event. The possibility of holding it in Chile was then mooted, but - due to various social demonstrations that were taking place during this period - an agreement was reached for COP 25 to be held in Madrid, Spain. One of the most important issues at the event was the regulation of the carbon credit market, which ended without an agreement.

COP 26 was supposed to take place in 2020 - however, due to the Covid 19 pandemic scenario, the event ended up taking place in November 2021 in Glasgow, Scotland. This Conference also included the 15th meeting of the parties to the Kyoto Protocol (CMP16) and the 2nd meeting of the parties to the Paris Agreement (CMA3). COP 26 ended with the signing of the Glasgow Pact, which aims to ensure that the increase in global temperatures does not exceed 1.5 °C. The Pact also recognizes that it will be necessary to reduce global carbon emissions by 45% by 2030 compared to the 2010 level and to

achieve net zero emissions (an emission equivalent to what is removed from the atmosphere, leading to a total of zero emissions) by the middle of the century, as well as significant reductions in other greenhouse gases. Countries were encouraged to act more transparently on their climate commitments and to accelerate the transition to low-carbon energies. What was considered one of the biggest victories of the negotiations to be included in the Glasgow Pact was the approval of the Paris Article 6 rules, which deal with the international carbon market.

COP 27 took place in 2022 in Egypt, when world leaders discussed the practical rules of the Climate Convention, a global agreement to combat climate change. The main outcome was the creation of a fund to help the poorest countries cope with natural disasters caused by global warming.

COP28 was held from November 30 to December 12 at Expo City in Dubai, United Arab Emirates. COP28 began with the announcement of a concrete result, with the opening session officially approving the Loss and Damage Fund, the creation of which dates back to last year's COP27 negotiations. Immediately after the announcement, the United Arab Emirates, Germany and Japan presented their first contributions to the fund, which will initially be administered by the World Bank and designed to address the challenges of countries highly vulnerable to climate effects. By the end of the COP, pledges had already amounted to US\$ 800 million. It was also decided that the venue for COP 29, to be held in 2024, will be Baku, the capital of Azerbaijan. A novelty emerging from the COP processes is the launch of a *troika*, which will be made up of the presidents of COP 28, COP 29 and COP 30. Thus, the United Arab Emirates, Azerbaijan and Brazil must lead the efforts to raise the parties' climate ambitions and safeguard the goal of limiting the global temperature increase to 1.5° C.

Another great expectation surrounding COP28 was the completion of the first global *stocktake* of the Paris Agreement, the *Global Stocktake*. This is a huge inventory that aims to determine how far we are from achieving the goals of the agreement and, based on the best available science, outline the next steps to prevent the window of opportunity for guaranteeing a safe climate future for people and the planet from closing. In this sense, the content of the global stocktaking should inform the process of updating the next round of Nationally Determined Contributions (NDCs) to be submitted by COP 30. The document pointed to the need to achieve net zero emissions globally by 2050 and to reduce global emissions by 43% by 2030 and 60% by 2035. It also highlighted the centrality of the means of implementation and of scaling up climate finance to ensure that global emissions are reduced at the pace required for a 1.5°C scenario. The document also highlights the growing importance of adaptation initiatives, which must be informed by local priorities and context.

### **Kyoto Protocol to the United Nations Framework Convention on Climate Change**

The Kyoto Protocol is a complementary treaty to the United Nations Framework Convention on Climate Change, setting emission reduction targets for developed countries and those that, at the time, had economies in transition to capitalism, considered to be historically responsible for the current climate change.

Created in 1997, the Protocol entered into force on February 16, 2005, shortly after meeting the conditions that required ratification by at least 55% of all member countries of the Convention and that were responsible for at least 55% of total emissions in 1990.

During the first commitment period, between 2008-2012, 37 industrialized countries and the European Community committed to reducing greenhouse gas (GHG) emissions by an average of 5% compared to 1990 levels. In the second commitment period, the Parties pledged to reduce GHG emissions by at least 18% below 1990 levels over the eight-year period 2013-2020. Each country negotiated its own emissions reduction target based on its view of its ability to achieve it in the period considered.

Brazil ratified the document on August 23, 2002, and it was approved by Legislative Decree No. 144 of 2002. Among the main emitters of greenhouse gases, only the United States has not ratified the Protocol. However, they continue to have responsibilities and obligations under the Convention.

### **Paris Agreement (2015)**

At the 21st Conference of the Parties (COP21) to the UNFCCC in Paris, a new agreement was adopted with the central aim of strengthening the global response to the threat of climate change and reinforcing the capacity of countries to deal with the impacts arising from these changes.

The Paris Agreement was approved by the 195 countries party to the UNFCCC to reduce greenhouse gas (GHG) emissions in the context of sustainable development. The commitment is to keep the global average temperature increase to well below 2°C above pre-industrial levels and to make efforts to limit the temperature increase to 1.5°C above pre-industrial levels.

After approval by the National Congress, Brazil completed the ratification process of the Paris Agreement on September 12, 2016. On September 21, the instrument was delivered to the United Nations. With that, Brazil's goals ceased to be intended and became official commitments. Now, therefore, the acronym has lost the letter "i" (from the English, *intended*) and is now just called NDC.

Brazil's NDC committed it to reducing greenhouse gas emissions by 37% below 2005 levels by 2025, with a subsequent indicative contribution of reducing greenhouse gas emissions by 43% below 2005 levels by 2030. To this end, the country has committed to increasing the share of sustainable bioenergy in its energy matrix to approximately 18% by 2030, restoring and reforesting 12 million hectares of forests, as well as achieving an estimated 45% share of renewable energies in the composition of the energy matrix by 2030.

### **Escazu Agreement**

This is a Regional Agreement on Access to Information, Public Participation and Access to Justice in Environmental Matters in Latin America and the Caribbean, signed by the UN in Escazu (Costa Rica) in 2018.

The Escazú Agreement is a regional treaty signed by 24 Latin American and Caribbean nations on the rights of access to environmental information, public participation in environmental decision-making, environmental justice and a healthy and sustainable environment for current and future generations.

The Escazú Agreement strengthens the links between human rights and environmental protection by imposing requirements on member states in relation to the rights of environmental defenders. In addition, it aims to provide full public access to environmental information, environmental decision-making and legal protection and remedies relating to environmental issues. It also recognizes the right of present and future generations to a healthy environment and sustainable development.

### **ILO Convention concerning Indigenous and Tribal Peoples in Independent Countries No. 169**

The Convention on Indigenous and Tribal Peoples, which recognizes, along with indigenous peoples, other groups whose social, economic and cultural conditions distinguish them from other sectors of the national community, establishing specific rights for them.

### **Stockholm Convention**

The Stockholm Convention on Persistent Organic Pollutants is an international treaty signed in 2001 in Stockholm, Sweden and was sponsored by the United Nations Environment Program. It was designed to globally eliminate the production and use of some man-made toxic substances.

The Stockholm Convention was signed by 152 countries and currently 34 countries have not ratified it. The ratification of 50 countries is required for the Convention to enter into force 90 days later and for policies to begin to be implemented to eliminate these compounds.

The list of participating signatory countries and their ratification status can be found on the Stockholm Convention's official website.

It had the express aim of becoming an international foundation for the protection of human health and the environment from the harmful effects of persistent organic pollutants (POPs). This convention was the result of long years of negotiation to obtain legally binding commitments from the various countries for the immediate elimination of all persistent organic compounds.

The Convention stipulates that action must be taken as a matter of priority on a dozen compounds, including internationally produced chemicals such as pesticides, biphenyl polychlorides (PCBs), dioxins and furans.

Persistent Organic Pollutants - POPs are chemical substances that have been used as agrochemicals, for industrial purposes or released unintentionally in anthropogenic activities, and which have characteristics of high persistence (they are not easily degraded), are capable of being transported over long distances by air, water and soil, and accumulate in fatty tissues of living organisms, making them toxicologically worrying for human health and the environment.

Aware that POPs pose major and growing threats to human health and the environment, in May 1995 the UNEP Council requested in its decision 18/32 that an international process be carried out to evaluate an initial list of 12 POPs, and that the Intergovernmental Forum on Chemical Safety (IFCS/FISQ) draw up recommendations for international action on these pollutants, for consideration by the UNEP Governing Council and the World Health Assembly by 1997.

From then on, an international negotiation process began to conclude the Stockholm Convention, which was adopted in 2001 and entered into force in 2004, after 50 countries ratified it.

Brazil approved the text of the Convention through Legislative Decree No. 204 of May 7, 2004, and promulgated the text of the Convention in 2005 through Decree No. 5,472 of June 20, 2005.

The Secretariat of Water Resources and Environmental Quality of the Ministry of the Environment acts as the Technical Focal Point of the Convention, together with the Environmental Policy and Sustainable Development Division of the Ministry of Foreign Affairs, which acts as the Official Focal Point.

### **Commitments made**

The Stockholm Convention stipulates that countries parties adopt control measures related to all stages of the life cycle - production, import, export, use and final disposal - of the POPs substances listed in its Annexes. Annex D of the Convention sets out the criteria for a substance to be classified as a POP.

The Convention aims to eliminate and/or restrict POPs, their stockpiles and residues, reduce the release of their unintentional emissions into the environment, and identify and manage areas contaminated by these substances.

In a preventive stance, the treaty requires governments to promote the best technologies and practices in their technological field and to prevent the development of new POPs. Going further, it sets as its ultimate goal the total elimination of POPs. The Convention presents innovative and objective options for action to properly manage these substances.

Initially, 12 POPs were listed in the Convention, a number that was expanded in 2009 following a decision by the 4th Conference of the Parties to include 9 more substances, and then in 2011 with the inclusion of Endosulfam. Hexabromocyclododecane was added at COP 6 in May 2013. At COP 7, in May 2015, Hexachlorobutadiene, Pentachlorophenol, its salts and esters and Polychlorinated Naphthalenes were included. In 2017, during COP 8, Decabromodiphenyl Ether and Short Chain Chlorinated Paraffins were listed as POPs.

POPs are listed in three annexes to the Convention, which differ in the specific treatment they receive:

- Annex A - SOPs to be eliminated;
- Annex B - SOPs with restricted uses (but with the prospect of being eliminated);
- Annex C - SOPs produced unintentionally.

### **List of POPs Substances:**

#### **Annex A:**

Pesticides: Aldrin, Dieldrin, Endrin, Chlordane, Chlordecone, Heptachlor, Hexachlorobenzene (HCB), Alpha hexachlorocyclohexane (alpha HCH), Beta hexachlorocyclohexane (beta HCH), Lindane, Mirex (dodecachlor), Pentachlorobenzene (PeCB), Endosulfam, Toxaphene, Pentachlorophenol and its salts and esters.

Chemicals for industrial use: Polychlorinated Biphenyls (PCBs), Hexabromobiphenyl (HBB), Hexabromodiphenyl Ether and Heptabromodiphenyl Ether (C OctaBDE), Hexachlorobenzene (HCB), Tetrabromodiphenyl Ether and Pentabromodiphenyl Ether (C PentaBDE), Hexabromocyclododecane (HBCD), Hexachlorobutadiene (HCB), Polychlorinated Naphthalenes, Decabromodiphenyl Ether (C DecaBDE) and Short Chain Chlorinated Paraffins (SCCP).

#### **Annex B:**

Pesticide: DDT.

Chemicals for industrial use: Perfluorooctane Sulphonic Acid (PFOS), its salts and Perfluorooctane Sulphonyl Fluoride (PFOSF).

#### **Annex C:**

Polychlorinated Dibenzo-p-Dioxins and Dibenzofurans (PCDD/PCDF), Hexachlorobenzene (HCB), Polychlorinated Biphenyls (PCBs), Pentachlorobenzene (PeCB), Hexachlorobutadiene (HCB) and Polychlorinated Naphthalenes.

Article 7 of the Convention stipulates that countries must draw up National Implementation Plans for the Stockholm Convention (NIP), identifying priorities, deadlines and strategies for complying with the treaty's obligations.

It is therefore a binding instrument, which includes substances that are highly toxic and harmful to humans and the environment, and is of great interest and monitoring by industry and civil society.

#### **Ramsar Convention**

The Convention on Wetlands of International Importance Especially as Waterfowl Habitat, also known as the Ramsar Convention because it was signed in the Iranian city of Ramsar on February 2, 1971, is an international treaty that came into force in 1975.

It is considered the first intergovernmental treaty to provide a structural basis for international cooperation and national action for the conservation and sustainable use of natural resources, specifically wetlands and their resources.

By ratifying the convention, the governments of the countries, Contracting Parties to the Convention, designate a site to be included in the List of Wetlands of International Importance and commit to working towards the sustainable use of their wetlands through territorial planning, policy development and publication of legislation, management actions and education of their populations. They also undertake to designate additional sites for the List of Wetlands of International Importance and to ensure their proper and effective management, and to cooperate internationally on transboundary wetlands, shared wetland systems, common species and development projects that may affect wetlands.

When a Ramsar site has lost, or is under threat of losing, its ecological characteristics, the respective Contracting Party can register it in the Montreux Record, a list of priority sites to be conserved and which can be the target of the application of a support and technical advice mechanism provided for in the convention.

Established in February 1971 in the Iranian city of Ramsar, the Convention on Wetlands of International Importance, better known as the Ramsar Convention, has been in force since December 21, 1975. It was fully incorporated into Brazil's legal framework in 1996, by the enactment of Decree No. 1.905/96.

The Convention is an intergovernmental treaty initially created to protect aquatic habitats important for the conservation of migratory birds, which is why it was called the "Convention on Wetlands of International Importance, especially as Waterfowl Habitat". However, over time, it has expanded its concern to other wetlands in order to promote their conservation and sustainable use, as well as the well-being of the human populations that depend on them.

Ramsar establishes frameworks for national actions and cooperation between countries with the aim of promoting the conservation and rational use of wetlands around the world. These actions are based on the recognition by the signatory countries of the Convention of the ecological importance and the social, economic, cultural, scientific and recreational value of such areas.

### **International Labor Organization**

The ILO's principles and rights are governed by eight fundamental conventions covering: freedom of association, effective recognition of the right to collective bargaining, elimination of all forms of forced or compulsory labor, effective elimination of child labor and elimination of discrimination in respect of employment and occupation. Among the conventions, those ratified by Brazil are listed below, seven in total.

- ILO Convention 29 (Forced Labor);
- ILO Convention 98 (Right to Organize and Collective Bargaining);
- ILO Convention 100 (Equivalent pay for male and female workers for equivalent work);
- ILO Convention 105 (Abolition of Forced Labor);
- ILO Convention 111 (Discrimination - Employment and Occupation);
- ILO Convention 138 (Minimum Age for Admission to Employment);
- ILO Convention 169 (Indigenous and Tribal Peoples);
- ILO Convention 182 (Prohibition and Immediate Action for the Elimination of the Worst Forms of Child Labor).

### **Montreal Protocol and Kigali Agreement**

The Montreal Protocol is an international treaty that aims to protect the ozone layer by eliminating the production and consumption of the substances responsible for its destruction (ODS – ozone depleting substances). The agreement is a consequence of the Vienna Convention for the Protection of the Ozone Layer; Brazil is one of the signatory countries.

The Vienna Convention and the Montreal Protocol were promulgated by Decree No. 99.280/90.

The adoption of the measures determined by the Protocol as public policy has made it possible to achieve positive results for the agenda in the country and in the world, with the combined efforts of the treaty's signatory nations.

### **Control actions**

As there is no production of ODS in Brazil, the control actions take place in the process of importing, trading and using the substance. Ibama is the federal institution responsible for this control; for ensuring that the country complies with its part of the treaty.

### **Reduction of hydrochlorofluorocarbons (HCFCs)**

Decision XIX/6 of the Montreal Protocol<sup>14</sup> established a timetable for reducing HCFC consumption in Brazil in 2007. This plan has three stages and, by the year 2021, has already succeeded in reducing HCFC consumption by 51.6% compared to the base year (2013). It is estimated that the reduction will reach 100% by 2040.

### **Control of hydrofluorocarbons (HFCs)**

Signed in 2016 during a meeting in the capital of Rwanda (hence its name), the Kigali Amendment includes hydrofluorocarbons (HFCs) in the Montreal Protocol. HFCs are powerful greenhouse gases that heat the planet up to 12,000 times more than CO<sub>2</sub>. The main aim of the Kigali Amendment is to reduce the production and consumption of HFCs, which are used in equipment such as air conditioners and refrigerators. In addition to the climate benefits, ratification of the Amendment will allow Brazilian industry to access 100 million dollars in non-refundable UN funds to upgrade production lines and increase efficiency and competitiveness.

Brazil took part in the 34th Meeting of the Parties as one of the 140 countries to ratify the Kigali Amendment. This amendment is an agreement that provides for a staggered reduction in the consumption of hydrofluorocarbons (HFCs) by 2045. By complying with this agreement, the expectation is that there will be a decrease of up to 0.4°C in global temperature.

Although HCFs do not have the potential to destroy the ozone layer, they do have a high global warming potential.

With the ratification of the Kigali Amendment, the country undertakes to freeze the baseline consumption of HFCs in 2024 and reduce consumption by 10% by 2029.

In addition to the climate benefits, the ratification of this amendment will give Brazilian industry access to international resources to update production lines and increase efficiency and national competitiveness.

Brazil's ratification of the Kigali Amendment took place on October 19, 2022, after approval by the Federal Senate and respective delivery of the documents to the United Nations.

### 3.2 Federal legislation

**he Constitution of the Federative Republic of Brazil**, promulgated in 1988, broke new ground in dealing with environmental issues by dedicating Chapter VI - The Environment (Title VIII - Social Order) to the subject, which in Art. 225 states: "Everyone has the right to an ecologically balanced environment, a good for the common use of the people and essential to a healthy quality of life, imposing on the public authorities and the community the duty to defend and preserve it for present and future generations".

The main federal laws affecting the Project are presented below. In the Annex **Error! Reference source not found.** other complementary laws are presented.

#### Environment

- Law No. 6.938, of August 31, 1981, which establishes the National Environmental Policy, its purposes and mechanisms for formulation and application, constituting the National Environmental System (SISNAMA). It states that this policy: aims to preserve, improve and restore environmental quality that is conducive to life, with a view to ensuring conditions for socio-economic development in the country, the interests of national security and the protection of the dignity of human life.
- Law No. 7.347, of July 24, 1985 (amended by Laws No. 8.078, of 09/11/1990 and No. 8.884, of 06/11/1994, No. 9.494, of 09/10/1997 and No. 10.257, of 07/10/2001 and by Provisional Measure No. 2.180-35, of 08/27/2001), which regulates public civil action for liability for damage caused to the environment, to consumers, to goods and rights of artistic, aesthetic, historical, tourist and landscape value.
- Federal Law No. 7.735, of February 22, 1989, which provides for the extinction of agencies and autarchic entities, creates the Brazilian Institute of the Environment and Renewable Natural Resources and makes other provisions.
- Federal Law No. 7.797, of July 10, 1989, which creates the National Environmental Fund and makes other provisions.
- Federal Law No. 9.605, of February 12, 1998 (amended by Law No. 9.985, of July 18, 2000 and by Provisional Measure No. 2.163-41, of August 23, 2001), which provides for criminal and administrative sanctions arising from conduct and activities harmful to the environment (Environmental Crimes Law).
- Federal Decree No. 2.519, of March 16, 1998, promulgating the Convention on Biological Diversity, signed in Rio de Janeiro on June 5, 1992.
- Federal Law No. 9.795, of April 27, 1999, which provides for environmental education and establishes the National Environmental Education Policy.
- Federal Decree No. 3.179, of September 21, 1999, which provides for the specification of sanctions applicable to conduct and activities harmful to the environment (environmental administrative infraction).
- Federal Decree No. 4.339, of August 22, 2002, which establishes principles and guidelines for the implementation of the National Biodiversity Policy.
- Federal Law No. 10.650, of April 16, 2003, which provides for public access to data and information held by the agencies and entities that make up SISNAMA.

- Federal Decree No. 855, of January 30, 2004, which amends Decrees No. 5.741 and 5.742, dated December 19, 2002, which regulate, respectively, the Technical Register of Activities that Potentially Pollute or Use Environmental Resources and the Technical Register of Environmental Defense Activities.
- Federal Decree No. 5.877, of August 17, 2006, which gives new wording to Article 4 of Decree No. 3.524, of June 26, 2000, which regulates Law No. 7.797, of July 10, 1989, which creates the National Environment Fund.
- IBAMA Normative Instruction No. 154, of March 1, 2007, which establishes the Biodiversity Authorization and Information System (SISBIO) and provides for licenses, collection and capture of species of fauna and flora and access to genetic heritage.
- Federal Law No. 11.516, of August 28, 2007, which provides for the creation of the Chico Mendes Institute for Biodiversity Conservation - Instituto Chico Mendes.
- Federal Decree No. 6.514, of July 22, 2008, which provides for environmental infractions and administrative sanctions, and establishes the federal administrative process for investigating these infractions.
- Complementary Law No. 140, of December 8, 2011, which establishes rules, under the terms of items III, VI and VII of the caput and sole paragraph of art. 23 of the Federal Constitution, for cooperation between the Union, the States, the Federal District and the Municipalities in administrative actions arising from the exercise of common competence relating to the protection of notable natural landscapes, the protection of the environment, the fight against pollution in any of its forms and the preservation of forests, fauna and flora; and amends Law No. 6.938, of August 31, 1981.
- ICMBio Normative Instruction 06, of July 25, 2019 - provides for the prevention of introductions and the control or eradication of exotic or invasive species in federal Conservation Units and their buffer zones.

### **Basic Sanitation**

- Federal Law No. 11.445, of January 5, 2007, which establishes national guidelines for basic sanitation; amends Laws No. 6.766, of December 19, 1979, No. 8.036, of May 11, 1990, No. 8.666, of June 21, 1993, No. 8.987, of February 13, 1995; and repeals Law No. 6.528, of May 11, 1978.

### **Water Quality**

- Federal Decree No. 79.367, of March 9, 1977, which lays down rules and standards for the potability of water.
- Federal Law No. 9.966, of April 28, 2000, which provides for the prevention, control and monitoring of pollution caused by the discharge of oil and other harmful or dangerous substances into waters under national jurisdiction.
- CONAMA Resolution No. 274, of November 29, 2000, which revises the criteria for bathing in Brazilian waters.
- Federal Decree No. 4.136, of February 20, 2002, which specifies the sanctions applicable to violations of the rules for the prevention, control and monitoring of

pollution caused by the discharge of oil and other harmful or dangerous substances into waters under national jurisdiction.

- Federal Decree No. 4.871, of November 6, 2003, which provides for the establishment of Area Plans to combat oil pollution in waters under national jurisdiction.
- CONAMA Resolution No. 357, of March 17, 2005, which provides for the classification of bodies of water and environmental guidelines for their classification, as well as establishing the conditions and standards for discharging effluents.
- CONAMA Resolution No. 397, of April 3, 2008, which amends item II of § 4 and Table X of § 5, both of art. 34 of National Environmental Council Resolution - CONAMA No. 357, of 2005, which provides for the classification of bodies of water and environmental guidelines for their classification, as well as establishing the conditions and standards for discharging effluents.
- CONAMA Resolution No. 430, of May 13, 2011, which supplements and amends Resolution No. 357/2005. Provides for the conditions and standards for effluent discharge, complements and amends Resolution No. 357, of March 17, 2005, of the National Environmental Council (CONAMA).
- MS Ordinance No. 2.914 of December 12, 2011, of the Ministry of Health, which provides for procedures to control and monitor the quality of water for human consumption and its standard of potability.
- CONAMA Resolution No. 454 of November 1, 2012: establishes the general guidelines and reference procedures for the management of material to be dredged in waters under national jurisdiction.

### **Historical and Cultural Heritage**

- Federal Law No. 3.924, of July 26, 1961, which provides for archaeological and prehistoric monuments of any nature existing in national territory and all the elements found therein, in accordance with the provisions of Article 175 of the Federal Constitution.
- IPHAN Ordinance No. 07, of December 1, 1988, which regulates requests for permission and authorization and prior communication when carrying out field research and archaeological excavations in the country, in order to protect objects of scientific and cultural value present at the sites of such research, as provided for in Law No. 3,924, of July 26, 1961. It lists the information that must accompany requests for permission and authorization, as well as prior communication, to be sent to the Secretary of the National Historical and Artistic Heritage Institute - IPHAN. It also lists the information that must accompany the reports to be sent to IPHAN.
- Federal Decree No. 3.551, of August 4, 2000, which establishes the Register of Intangible Cultural Goods that constitute Brazilian cultural heritage and creates the National Intangible Heritage Program.
- IPHAN Ordinance No. 230, of December 17, 2002, which makes preventive archaeological studies compatible with the environmental licensing phases of projects potentially capable of affecting archaeological heritage, as well as defining

the procedures to be adopted in each of the environmental licensing phases. In the phase of obtaining the Preliminary License (EIA/RIMA): Exhaustive survey of secondary archaeological data and archaeological field survey. The assessment of impacts will be based on the diagnosis made, the analysis of thematic environmental maps (geology, geomorphology, hydrography, slope and vegetation) and the technical particularities of the work. The Prospecting and Rescue programs will be drawn up based on the diagnosis and assessment of impacts. At the stage of obtaining the Installation License (LI): Prospecting Program: intensive prospecting in the environmental compartments with the greatest archaeological potential, in the area of direct influence of the project and in the places that will suffer indirect impacts potentially damaging to the archaeological heritage. In the phase of obtaining the Operating License (LO): Execution of the Archaeological Rescue Program proposed in the EIA and detailed in the Prospecting Program (LI). A report should be prepared detailing the activities carried out in the field and in the laboratory, as well as the results obtained from the efforts made in terms of producing knowledge about the archaeology of the study area, so that the physical loss of archaeological sites can be effectively offset by the incorporation of the knowledge produced into the National Memory.

- IPHAN Ordinance No. 28 of January 31, 2003, which stipulates that the reservoirs of hydroelectric projects of any size or dimension within the national territory must henceforth, when applying for the renewal of the environmental operating license, provide for the execution of archaeological survey, prospection, rescue and salvage projects in the depletion strip.

### **Occupational Safety and Medicine**

- Law No. 6.514, of December 21, 1977, which amends Chapter V of Title II of the Consolidation of Labor Laws, relating to occupational safety and medicine, and makes other provisions.
- MTB Ordinance No. 3.214, June 8, 1978, which approves the Regulatory Norms - NR - of Chapter V, Title II, of the Consolidation of Labor Laws, relating to Occupational Safety and Medicine.
- Federal Law No. 8.080, of September 19, 1990, which provides for the conditions for the promotion, protection and recovery of health, the organization and operation of the corresponding services and makes other provisions.

### **Rural Environmental Regularization**

The Forest Code (Federal Law No. 12.651/2012) creates the Rural Environmental Registry - CAR and its system (SICAR). The CAR is a compulsory electronic register for all rural properties, which assists in the control, monitoring and environmental planning of these properties, under the terms of Article 29 of the aforementioned Code. The CAR was regulated by Decree No. 7.830/2012, which created the Rural Environmental Registration System (SICAR), and by the Normative Instruction of the Ministry of the Environment - MMA No. 02/2014.

Registration is the responsibility of the owner or the state land authority or INCRA in the case of land regularization of public land owned by the state or the federal government, respectively. Once they have registered with the CAR, owners and/or possessors of rural

properties with environmental liabilities relating to the irregular suppression of remnants of native vegetation, which occurred up until July 22, 2008, in Permanent Preservation Areas (APP), Legal Reserves (RL) and Restricted Use Areas (AUR), may apply to join the Environmental Regularization Programs (PRA) of the states and the Federal District, in order to proceed with the environmental regularization of their rural properties.

APPs are protected areas, whether or not they are covered by native vegetation, with the environmental function of preserving water resources, the landscape, geological stability and biodiversity, facilitating the gene flow of fauna and flora, protecting the soil and ensuring the well-being of human populations.

For rural properties with an area greater than four Fiscal Modules - MF, which have an area with environmental liabilities in APP along natural watercourses, it is mandatory to restore the marginal strips: i) 20 meters, counted from the edge of the channel of the regular bed, for properties with an area between 4 and 10 MF, in watercourses up to 10 meters wide; and ii) in other cases, an extension corresponding to half the width of the watercourse, observing a minimum of 30 and a maximum of 100 meters, counted from the edge of the channel of the regular bed, regardless of the width of the river.

### **Natural Disasters and Climate Change**

Law No. 12.187 of December 29, 2009 institutes the National Policy on Climate Change - PNMC and establishes its principles, objectives, guidelines and instruments. The PNMC aims, among other things: to make economic and social development compatible with the protection of the climate system; the reduction of anthropogenic GHG emissions, the implementation of measures to promote adaptation to climate change and the conservation and recovery of environmental resources, including the expansion of protected areas and incentives for reforestation and the restoration of vegetation in degraded areas.

The law establishes guidelines in line with Brazil's commitments to the United Nations Convention on Climate Change and other agreements and documents on the subject to which the country is a signatory, and establishes as instruments the National Plan on Climate Change, the National Fund on Climate Change and the Action Plans for the prevention and control of deforestation in the biomes (regulated by Decree No. 10.142/2019).

Presidential Decree No. 7.513/2011 created CEMADEN - the National Center for Monitoring and Alerts of Natural Disasters - a research unit of the Ministry of Science, Technology and Innovation - to consolidate the National Plan for Risk Management and Response to Natural Disasters (PNGRRD) and implement a system of early warnings of the probability of occurrence of natural disasters associated with natural phenomena.

Within the scope of the National Plan for Risk Management and Disaster Response, CEMADEN monitors 959 municipalities in all Brazilian regions. The Center issues periodic reports analyzing the various risks, at least monthly for drought risks and impacts on agriculture.

### **Pesticides**

Law No. 7.802, of July 11, 1989, governs research, experimentation, production, packaging and labeling, transport, storage, marketing, commercial advertising, use, import, export, the final destination of waste and packaging, registration, classification,

control, inspection and inspection of pesticides, their components and the like, and makes other provisions.

### **New Brazilian Forest Code**

It is worth highlighting Law No. 12.651 of May 2012, referring to the new Forest Code, which provides for the protection of native vegetation; amends Laws No. 6.938, of August 31, 1981, No. 9.393, of December 19, 1996, and No. 11.424, of December 22, 2006; repeals Laws No. 4.771, of September 15, 1965, and No. 7.754, of April 14, 1989, and Provisional Measure No. 2.166.428, of December 22, 2006; repeals Laws Nos. 4.771, of September 15, 1965, and 7.754, of April 14, 1989, and Provisional Measure No. 2.166-67, of August 24, 2001; and makes other provisions.

The new Forest Code was approved on May 25, 2012 and brought changes in relation to the 1965 code on important points such as Permanent Preservation Areas (APP) and legal reserves.

### **Ecological and Economic Zoning**

Federal Decree No. 4.297, of July 10, 2002, defines the EEZ as an environmental instrument whose main objective is to guide planning and decision-making on programs, projects and activities that use natural resources and promote sustainable development (harmonizing production, preservation and conservation), including the prevention of impacts and the implementation of actions to mitigate or correct any damage to the environment.

### **3.3 State Legislation**

Legislation in the state of Paraíba offers a series of guidelines that can set restrictions, permissions or guidelines for human activities and environmental preservation. Among the laws, 4.335/1981 stands out, which provides for the preservation and control of pollution, as well as establishing disciplinary standards. In turn, State Law 6.002/1994 establishes the state's Forest Code, which was regulated by State Decree 23.835/2002.

On more specific issues of the state's legal requirements, there are instruments aimed at measures to preserve and restore biomes, with special attention to the Caatinga. These pieces of legislation - established, for example, in State Law No. 8.387/2007; State Law No. 9.569/2011; State Law No. 9.645/2011; State Law No. 9.857/2012; State Decree No. 24.419/2006 - offer requirements for restricting the cutting of certain species, licensing characteristics and even the creation of state committees, but also qualify and exempt types of activities such as SAFs or traditional practices from the requirements, or simplify them.

You must also observe the guidelines set out in State Law 11.140/2018, which deals with the rights and welfare of animals, including guidelines on comfort, food and zoonosis.

SUDEMA also establishes its Administrative Norms in order to offer more specific parameters on environmental licensing, in particular NAs 101, 115 and 118.

Below is a list of the most relevant state laws.

- State Law No. 4.335, of December 16, 1981 - Provides for the preservation and control of environmental pollution and establishes disciplinary norms;

- State Law No. 6.002, of December 29, 1994 - Establishes the Forest Code of the state of Paraíba;
- State Law No. 6.960, of February 6, 2001 - Provides for mandatory forest replacement and other measures;
- State Law No. 8.387, of November 14, 2007 - Provides for the Conservation and Management Policy of the Caatinga biome;
- State Law No. 9.569, of December 6, 2011 - Considers the Caatinga Biome to be a Heritage of the State of Paraíba;
- State Law No. 9.645, of December 29, 2011 - Creates the State Committee of the Caatinga Biosphere Reserve in the State of Paraíba - CERBCAAT-PB;
- State Law No. 9.857, of July 6, 2012 - Provides for the use and protection of vegetation in the Caatinga Biome and makes other provisions;
- State Law No. 10.146, of November 14, 2013 - Establishment of the Paraíba week to raise awareness of the Caatinga biome (week of April 28);
- State Law No. 11.140, of June 8, 2018 - Institution of the animal law and welfare code of the State of Paraíba;
- State Law No. 11.153, of July 2, 2018 - Amends the wording of the Sole Paragraph of Article 7 of Law No. 9.857/2012, which provides for the use and protection of vegetation in the Caatinga Biome, allowing the cutting of algaroba without the need for authorization;
- State Law No. 11.764, of August 26, 2020 - Provides for the establishment of Agrovilas in the State of Paraíba;
- State Decree No. 21.120, of June 20, 2000 - Regulates Law No. 4.335, of December 16, 1981, amended by Law No. 6.757, of July 8, 1999, which provides for the prevention and control of environmental pollution, establishes rules governing the species and makes other provisions;
- State Decree No. 23.835, of December 27, 2002 - Regulates the Forest Code in the State of Paraíba and makes other provisions;
- State Decree No. 24.414, of September 27, 2003 - Provides for forest exploitation in the state of Paraíba and makes other provisions;
- State Decree No. 24.415, of September 27, 2003 - Provides for the compulsory registration of individuals and legal entities that consume forest products and by-products with the Superintendence of Environmental Administration - SUDEMA and makes other provisions;
- State Decree No. 24.416, of September 27, 2003 - Provides for mandatory forest replenishment in the state of Paraíba and other measures;
- State Decree No. 24.417/2003, of September 27, 2003 - Provides for Alternative Land Use and other measures;
- State Decree No. 24.419, of August 23, 2006 - Gives new wording to articles 1 and 5 of Decree 24.419, of September 27, 2003, on the use of controlled fire in the state of Paraíba;

- SUDEMA Administrative Standard NA 101 - Procedures and Specifics for Environmental Licensing based on the Legal System and Specific Regulations analogous to the matter;
- SUDEMA Administrative Standard NA 115 - Adopts guidelines for environmental licensing of agrarian reform settlement projects;
- SUDEMA Administrative Standard NA 118 - Procedures for licensing dryland activities;

### 3.4 IDB Environmental and Social Policy Framework

The following are the Environmental and Social Performance Standards (ESPS) that make up the IDB's Environmental and Social Policy Framework.

#### **ESPS 1: Assessment and Management of Environmental and Social Risks and Impacts**

The Environmental and Social Performance Standard (ESPS) 1 highlights the importance of managing environmental and social performance throughout the life of a project. An effective Environmental and Social Management System (ESMS) is a dynamic and continuous process initiated and supported by the Borrower, and involves commitment between the Borrower, its workers, and project-affected people and, where appropriate, other stakeholders. Based on the elements of the established management process of "plan, do, check and act", the ESMS involves a methodological approach to managing environmental and social risks and impacts in a systematic and structured manner on an ongoing basis. A good ESMS appropriate to the nature and scale of the project promotes sound and sustainable environmental and social performance and can lead to better financial, social and environmental results.

Objectives:

- Identify and assess the project's environmental and social risks and impacts.
- Adopt a mitigation hierarchy and a precautionary approach to anticipate
- and avoid adverse impacts on workers, communities and the environment, or where avoidance is not possible, minimize and, where residual impacts remain, compensate for risks and impacts as appropriate.
- Promote better environmental and social performance of Borrowers through the effective use of management systems.
- Ensure that complaints from people affected by the project and external communications from other interested parties are answered and managed appropriately.
- Promote and provide means for adequate engagement with project-affected people and other stakeholders throughout the project cycle on issues that could potentially affect them and ensure that relevant environmental and social information is disclosed and disseminated.

## ESPS 2: Labor and Working Conditions

The Environmental and Social Performance Standard (ESPRS) 2 recognizes that the pursuit of economic growth through job creation and income generation must go hand in hand with the protection of workers' fundamental rights. The workforce is a valuable asset, and a good worker-employer relationship is a key ingredient in the sustainability of any enterprise. Failure to establish and foster a solid employee-management relationship can undermine employee engagement and retention and can put a project at risk. On the other hand, through a constructive worker-management relationship and by treating workers fairly and providing safe and healthy working conditions, Borrowers can create tangible benefits, such as improving the efficiency and productivity of their operations.

The requirements set out in this ESPS were partly guided by various international conventions and instruments, including those of the International Labor Organization (ILO) and the United Nations (UN)

Objectives:

- Respect and protect workers' fundamental rights and principles.
- Promoting fair treatment, non-discrimination and equal opportunities for workers.
- Establishing, maintaining and improving the employee-employer relationship.
- Ensuring compliance with national employment and labor laws.
- Protecting workers, including vulnerable categories such as women, people of different gender identity or sexual orientation, people with disabilities, children (of working age, according to this ESPS) and migrant workers, third-party contract workers and primary supply workers.
- Promoting safe and healthy working conditions and workers' health.
- Preventing the use of child labor and forced labor (as defined by the ILO).
- Support the principles of freedom of association and collective bargaining for project workers.
- Ensure that workers have accessible and effective means of raising and addressing work-related concerns.

## ESPS 3: Resource Efficiency and Pollution Prevention

This ESPS describes a project-level approach to resource management and pollution prevention and control, and GHG emission prevention and minimization. It will build on the mitigation hierarchy and the "polluter pays" principle. It recognizes the disproportionate impact of pollution on women, children, the elderly, the poor and the vulnerable. This ESPS also recognizes the emerging concept and practice of the circular economy and/or resource recovery, where usable and valuable products can be created or derived from what was previously seen as waste. The project has reported risks and impacts associated with the use of resources, and the generation and emission of waste must be assessed from the local context and environmental conditions of the project. Appropriate mitigation measures, technologies and practices should be adopted for the efficient and effective use of resources, the prevention and control of pollution, and the

prevention and minimization of GHG emissions, in accordance with internationally disseminated technologies and practices.

Objectives:

- Avoid or minimize adverse impacts on human health and the environment by avoiding or reducing pollution resulting from project activities.
- Promoting a more sustainable use of resources, including energy and water.
- Reduce or avoid GHG emissions related to the project.
- Avoid or minimize the generation of waste.
- Minimize and manage the risks and impacts associated with pesticide use.

#### **ESPS 4: Community Health and Safety**

Environmental and Social Performance Standard (ESPP) 4 recognizes that project activities, equipment and infrastructure may increase community exposure to risks and impacts including those caused by disasters and climate change. In addition, communities that are already subject to adverse impacts from natural hazards and climate change may also experience an acceleration and/or intensification of these adverse impacts due to project activities. Natural hazards and climate change impacts can affect the project itself, which can cause additional adverse impacts on the health and safety of people affected by the project. This ESPS addresses the Borrower's responsibility to avoid or minimize risks and impacts to community health, safety and security that may arise from project-related activities, with special attention to vulnerable groups. It also addresses the Borrower's responsibility to avoid or minimize the risks and impacts of the project itself that may result from disasters or climate change.

Objectives:

- Anticipate and avoid adverse impacts on the health and safety of people affected by the project during the project life cycle, in routine and non-routine circumstances.
- Ensure that the safeguarding of personnel and property is carried out in accordance with the relevant human rights principles and in such a way as to avoid or minimize the risks to those affected by the project.
- Anticipate and avoid adverse impacts on the project itself due to disasters and climate change during the project life cycle.

#### **ESPS 5: Land Acquisition and Involuntary Resettlement**

Environmental and Social Performance Standard (ESPP) 5 addresses the impacts of project-related land acquisition, including restrictions on land use and access to its assets and resources, which can cause physical displacement (relocation, loss of residential land or loss of shelter) and/or economic displacement (loss of land, assets or access to assets, including those leading to loss of income sources or other means of livelihood). The term "involuntary resettlement" refers to these two impacts and the processes of mitigating and compensating for these impacts. Resettlement is considered involuntary when project-affected people do not have the right to refuse land acquisition or land use restrictions that result in physical or economic displacement. This occurs in cases of (i) legal expropriation or temporary or permanent restrictions on land use and

(ii) negotiated agreements in which the buyer can resort to expropriation or impose legal restrictions on land use if negotiations with the seller fail.

Unless properly managed, involuntary resettlement can result in long-term hardship and impoverishment for the people affected by the project, as well as environmental damage and adverse socio-economic impacts in the areas to which they have been displaced. For these reasons, involuntary resettlement should be avoided. However, where involuntary resettlement is unavoidable, it should be minimized and appropriate measures to mitigate adverse impacts on displaced people and host communities should be carefully planned and implemented. The government plays a central role in the land acquisition and resettlement process, including the determination of compensation. Close collaboration and coordination between government agencies and project-affected people can result in more cost-effective, efficient and timely implementation of these activities, as well as the introduction of innovative approaches to improving the livelihoods of those affected by resettlement.

Objectives:

- Avoid, and when it can't be avoided, minimize displacement by exploring alternative projects.
- Avoid forced evictions.
- Anticipate and avoid, or where not possible, minimize the adverse social and economic impacts of land acquisition or use restrictions by (i) compensating for the loss of assets at replacement cost and transition difficulties, (ii) minimizing the disruption of their social networks and other intangible assets, and (iii) ensuring that resettlement activities are implemented with adequate disclosure of information, consultation and informed participation of affected people.
- Improving or restoring the livelihoods and living standards of those relocated.
- Improve the living conditions of physically displaced people by providing adequate housing with security of tenure, and security at resettlement sites.

## **ESPS 6: Biodiversity Conservation and Sustainable Management of Living Natural Resources**

Environmental and Social Performance Standard (ESPRS) 6 recognizes that protecting and conserving biodiversity, maintaining ecosystem services and sustainably managing living natural resources are fundamental to sustainable development. The requirements set out in this ESPS have been guided by the Convention on Biological Diversity, which defines biodiversity as "the variability among living organisms from all sources, including terrestrial, marine and other aquatic ecosystems and the ecological complexes of which they are a part; this includes diversity within species, between species and of ecosystems." Ecosystem services are the benefits that people, including companies, obtain from ecosystems.

Ecosystem services are organized into four types: (i) provisioning services, which are the products that people obtain from ecosystems; (ii) regulating services, which are the benefits that people obtain from regulating ecosystem processes; (iii) cultural services, which are the non-material benefits that people obtain from ecosystems; and (iv) support services, which are the natural processes that maintain the other services.

The ecosystem services valued by humans are generally sustained by biodiversity. Impacts on biodiversity can therefore adversely affect the provision of ecosystem services. This ESDP addresses how Borrowers can sustainably manage and mitigate impacts on biodiversity and ecosystem services throughout the project life cycle.

Objectives:

- Protect and conserve terrestrial, aquatic, coastal and marine biodiversity.
- Maintaining the functioning of the ecosystem to guarantee the benefits of ecosystem services.
- Promote the management and sustainable use of natural resources by adopting practices that integrate conservation needs and development priorities.

### ESPS 7: Indigenous Populations

The Environmental and Social Performance Standard (ESPRS) 7 recognizes that Indigenous Peoples<sup>15</sup>, as distinct social and cultural peoples, are often among the most marginalized and vulnerable segments of the population. In many cases, their economic, social and legal status limits their ability to defend their rights and interests in lands and natural and cultural resources and can restrict their ability to participate in and benefit from development that is in line with their worldview. Indigenous Peoples are particularly vulnerable if their lands and resources are transformed, invaded or significantly degraded. Their languages, cultures, religions, spiritual beliefs and institutions may also be threatened. As a consequence, indigenous peoples may be more vulnerable to the adverse impacts associated with project development than non-indigenous peoples. This vulnerability may include loss of identity, culture and natural resource-based livelihoods, as well as exposure to impoverishment and disease.

Projects can create opportunities for Indigenous Peoples to participate in and benefit from project-related activities that can help them fulfill their aspirations for the economic and social development of their identity. In addition, Indigenous Peoples can play a role in sustainable development by promoting, owning and managing activities and companies as partners in development. The government often plays a central role in managing Indigenous Peoples' issues. It is therefore important that there is collaboration and coordination between responsible and relevant authorities in managing the risks and impacts associated with the project.

---

15 There is no universally accepted definition of "Indigenous Peoples". Indigenous peoples may be referred to in different countries by terms such as "original peoples" (*pueblos originarios*), "autochthonous peoples" (*pueblos autóctonos*), residents of indigenous municipalities (comarcas) or reservations (resguardos) or any other formally recognized indigenous peoples in Latin America and the Caribbean. In ESPS 7, the term "Indigenous Peoples" is used in a generic sense to refer to a distinct social and cultural group possessing the following characteristics in varying degrees: (i) Self-identification as members of a distinct indigenous cultural group and recognition of this identity by others. (ii) Collective attachment to geographically distinct habitats or ancestral territories in the project area and to the natural resources of those habitats and territories. (iii) Customary cultural, economic, social or political institutions separate from those of the dominant society or culture. (iv) A distinct language or dialect, usually different from the official language or languages of the country or region in which they reside. For the purposes of this ESPS, traditional peoples, as recognized by national laws, should be treated as indigenous peoples.

The requirements presented in this ESPS have been guided in part by international conventions and instruments, including those of the International Labor Organization (ILO) and the United Nations (UN).

Objectives:

- Ensure that the development process promotes full respect for the human rights, collective rights, dignity, aspirations, culture and natural resource-based livelihoods of Indigenous Peoples.
- Anticipate and avoid adverse impacts of projects on Indigenous Peoples' communities, or when it is not possible to avoid, minimize and/or compensate for such impacts.
- Promote sustainable development benefits and opportunities for Indigenous Peoples in a culturally appropriate manner.

### **ESPS 8: Cultural Heritage**

Environmental and Social Performance Standard (ESPR) 8 recognizes the importance of cultural heritage for current and future generations. Consistent with the Convention Concerning the Protection of the World Cultural and Natural Heritage, this ESPS aims to ensure that Borrowers protect cultural heritage in the course of their project activities. In addition, the requirements of this ESPS on the use of a project's cultural heritage are based in part on the standards set by the Convention on Biological Diversity.

Objectives:

- Protect cultural heritage from the adverse impacts of project activities and support its preservation.
- Promote the equitable sharing of the benefits arising from the use of cultural heritage.

### **ESPS 9: Gender Equality**

This ESDP aims to identify possible gender-based risks and impacts and introduce effective measures to avoid, prevent or mitigate these risks and impacts, thus eliminating the possibility of reinforcing pre-existing inequalities or creating inequalities that did not exist. For the purposes of this ESPS, affirmative action specifically aimed at reducing existing gender gaps, addressing specific gender-based needs or ensuring the participation of people of all genders in consultations shall not constitute discrimination or exclusion.

This ESPS pays special attention to how gender inequalities interact with other inequalities, such as socioeconomic, ethnic, racial, disability and other factors, and how this intersectionality can exacerbate barriers to accessing project benefits, limit the ability to cope with negative project impacts and create other vulnerabilities.

This ESPS recognizes that diverse sexual orientations and gender identities can make people excluded and/or make segments of the population more vulnerable to negative impacts from the project, often preventing them from taking advantage of opportunities available to other members of the community.

This ESPS also recognizes that sexual and gender-based violence (SGBV) is a prevalent global problem. Manifestations of SGBV likely exist in all settings. Gender-related

impacts, including all forms of SGBV, including sexual exploitation and abuse, disproportionately affect women and people of diverse sexual orientations and gender identities. Projects that involve a large influx of workers in a community can exacerbate existing risks of SGBV or create risks, ranging from sexual harassment to sexual abuse and exploitation of women and children.

Likewise, this ESPS recognizes that globally and in LAC countries, the majority of unpaid care work falls to women. Unpaid care work is one of the main barriers preventing women from entering, continuing or progressing in the workforce. This presents a major barrier to gender equality and women's economic empowerment, including women's meaningful participation in opportunities available to other members of the community.

Objectives:

- Anticipate and prevent risks and adverse impacts based on gender, sexual orientation and gender identity and, where this cannot be avoided, mitigate and compensate for these impacts.
- Establish preventive actions to prevent or mitigate risks and impacts arising from gender in projects, throughout the project cycle.
- Achieving the inclusion of benefits derived from projects by people of all genders, sexual orientations and gender identities.
- Avoid exacerbating SGBV, including sexual harassment, exploitation and abuse, and when incidents of SGBV occur, respond immediately.
- Promote safe and equitable participation in stakeholder consultation and engagement processes, regardless of gender, sexual orientation and/or gender identity.
- Meet the requirements of applicable national legislation and international commitments related to gender equality, including actions to mitigate and prevent gender-related impacts.

### **ESPS 10: Stakeholder engagement and information disclosure**

This Environmental and Social Performance Standard (ESDP) recognizes the importance of open and transparent engagement between the Borrower and stakeholders, in particular project-affected people, as a key element that can improve the environmental and social sustainability of projects, enhance project acceptance and contribute significantly to the successful development of a project and its implementation. This ESPS is consistent with the objectives of implementing the right to access to information, public participation in the decision-making process and access to justice in environmental matters.

Stakeholder engagement is an inclusive process, conducted throughout the life cycle of a project. When properly designed and implemented, it supports the development of strong, constructive and responsive relationships, which are important for the successful management of a project's environmental and social risks and impacts. Stakeholder engagement is most effective when initiated at an early stage in the project development process. It is an integral part of the project's initial decisions on the assessment, management and monitoring of the project's environmental and social risks and impacts

Objectives:

- Establish a systematic approach to stakeholder engagement that will help the Borrower to identify stakeholders, especially people affected by the project, and to build and maintain a constructive relationship with them.
- Assess the level of stakeholder interest and support in the project and allow stakeholder views to be considered in the design and environmental and social performance of the project.
- Promote and provide means for effective and inclusive engagement with project-affected people throughout the project lifecycle on issues that could potentially affect or benefit them.
- Ensure that appropriate project information on environmental and social risks and impacts is disclosed to stakeholders in a timely, understandable, accessible and appropriate manner and format.
- Provide stakeholders with accessible and inclusive means to raise issues, proposals, concerns and complaints and enable Borrowers to respond and manage appropriately.

### Exclusion List

The IDB's exclusion list contains a series of activities that are not allowed in the Bank's financing, mainly because they are incompatible with its commitments to address the challenges of climate change and promote environmental and social sustainability. The list of activities not permitted under the IDB's criteria is presented below.

- Activities that are illegal according to laws, regulations or ratified international conventions and agreements, or subject to international interruptions or prohibitions, such as:
  - polychlorinated biphenyls (PCBs);
  - pharmaceutical products, pesticides/herbicides and other dangerous substances subject to international interruptions or bans;
  - Persistent Organic Pollutants (POPs);
  - ozone-depleting substances subject to international elimination;
  - wildlife or wildlife products regulated by the Convention on International Trade in Endangered Species of Wild Fauna and Flora;
  - cross-border trade in waste or waste products, except for non-hazardous waste destined for recycling;
  - lead-based paint or coatings in the construction of structures and roads.
- Activities that are illegal under laws, regulations or ratified international conventions and agreements relating to the protection of biodiversity resources or cultural heritage.
- Activities which, although consistent with the legal and/or regulatory framework of a country, may generate particularly significant adverse impacts on people and/or the environment, such as:
  - weapons, ammunition and other military goods/technology;

- tobacco;
- gambling, casinos and similar enterprises;
- radioactive materials;
- unbound asbestos fibers or products containing asbestos;
- drift nets in the marine environment, using nets more than 2.5 km long.
- Activities incompatible with the IDB's commitments to address the challenges of climate change and promote environmental and social sustainability, such as:
  - thermal coal mining and coal-fired power plants and associated facilities;
  - upstream oil exploration and development projects;
  - upstream gas exploration and development projects. In exceptional circumstances and on a case-by-case basis, financing of upstream gas structures will be considered where there is a clear benefit in terms of access to energy for the poor and reduction of greenhouse gas (GHG) emissions, projects consistent with national climate change objectives, and where the risks of retained assets are adequately analyzed.

### 3.5 IFAD's Environmental, Social and Climate Standards

IFAD has established Social, Environmental and Climate Assessment Procedures (SECAP) which require the project to take into account social, environmental and climate change issues.

The IFAD Standards establish fundamental requirements for the environmental and social sustainability of projects. Project teams (and co-financiers, if applicable) must apply them during design and implementation, but they are also aimed at borrowers/beneficiaries/associates, who are ultimately responsible for implementation.

These standards are based on the good practices of the United Nations, financial institutions, international organizations and multilateral development banks.

All projects must undergo an ex-ante environmental, social and climate assessment. The assessment determines how the risks and effects (both those affecting the project and those caused by it). The level of risk is determined on a case-by-case basis, with appropriate mitigation measures depending on the nature and scale of the project, and its level of environmental, social and climate risk. The assessment also considers the capacity and degree of commitment of the borrower/beneficiary/partner to implement the project in accordance with environmental and social standards. If environmental and social risks or effects arise during implementation, the project team, in collaboration with the national authorities, must adjust the project plan or introduce appropriate mitigation measures.

#### Standard 1: Biodiversity Conservation

According to the Convention on Biological Diversity (CBD), this standard recognizes that biological diversity includes more than plants, animals and microorganisms and their ecosystems; it also refers to people and their needs for food security, medicines, clean air and drinking water, housing and a clean and healthy environment in which to live.

Biological diversity is essential for maintaining ecosystem services (such as water and food supply) and other resources that are important both for the ecosystems themselves and for human life. The diversity of agroecological systems promotes the resilience of rural families and their production systems. The aim of conserving biological diversity is to maintain the resources and related services to meet humanity's current needs, while guaranteeing their availability for future generations, a fundamental criterion of sustainable development.

Objectives:

- maintaining and conserving biodiversity;
- ensure that the benefits of using genetic resources are distributed fairly and equitably;
- respect, preserve, maintain and strengthen the knowledge, innovations and practices of indigenous peoples and local communities relevant to the conservation and sustainable use of biodiversity and their customary use of biological resources, and
- apply the precautionary principle in the conservation and management of natural resources to ensure that there are opportunities for environmentally sustainable development.

## Standard 2: Resource Efficiency and Pollution Prevention

This standard recognizes that economic activity and development often pollute the air, water and land, and can lead to the consumption of finite resources, which in turn can pose a threat to humans, ecosystem services and society.

IFAD calls for the application of the precautionary principle to address significant environmental and social risks and effects through the mitigation hierarchy, the "polluter pays" principle (which proposes that the cost of mitigation be borne by the polluter, where applicable) and adaptive management techniques (where lessons are drawn from previous management actions and then used proactively to improve management in the future).

This standard establishes a project-level approach to mitigating, minimizing and managing potential risks and adverse effects that may be related to resource use and pollution.

Objectives:

- Avoid, minimize and manage the risks and effects associated with hazardous substances and materials, including pesticides;
- avoid or minimize short- and long-term climate-related pollutant emissions caused by the project<sup>36</sup>;
- promote a more sustainable use of resources, including energy, land and water, and identify opportunities to contribute to the efficient use of resources.

## Standard 3: Cultural Heritage

This standard recognizes that cultural heritage is a fundamental element of identity and memory, both individual and collective, and facilitates continuity between the past, the present and the future.

Likewise, it reflects and expresses people's values, beliefs, knowledge, traditions and practices, all of which are constantly evolving. In addition, it plays an essential role in the process of sustainable development, as it improves social cohesion, diversity, well-being and quality of life; strengthens cultural rights, protecting the heritage of minorities and indigenous peoples; encourages socio-economic regeneration; improves the attractiveness and creativity of cities and regions; boosts the long-term benefits of tourism and encourages sustainable practices. Cultural heritage resources are often unique and irreplaceable, and can be especially fragile due to neglect, exploitation or even destruction.

This standard aims to preserve, protect and promote cultural heritage in projects supported by IFAD in a manner consistent with the United Nations Educational, Scientific and Cultural Organization (UNESCO) conventions on the subject, as well as other applicable national and international legal instruments.

For the purposes of this standard, cultural heritage is considered to include both tangible heritage (sometimes referred to as "physical cultural resources") and intangible heritage.

Objectives:

- preserving and safeguarding cultural heritage;

- ensure that active efforts are made to prevent IFAD-supported projects from altering, damaging or eliminating any tangible or intangible cultural heritage;
- promote the equitable distribution of the benefits derived from the use of cultural heritage, and
- promote meaningful consultations on issues related to this heritage.

#### **Standard 4: Indigenous Peoples**

IFAD's comparative advantage in working with indigenous peoples lies in its core mission of empowering the rural poor, its targeting method and its people-centered approach, which takes into account the diverse contexts in which the rural poor live.

The Fund's actions in relation to indigenous peoples are based on the nine fundamental principles set out in its Policy for Action in relation to Indigenous Peoples:

- (i) recognize that cultural heritage and identity are assets;
- (ii) request free, prior and informed consent;
- (iii) contribute to community-driven development;
- (iv) promote equitable access to lands, territories and resources;
- (v) valuing the knowledge of indigenous peoples;
- (vi) strengthening the resilience of indigenous peoples' ecosystems (environmental and climate change issues);
- (vii) promote access to markets;
- (viii) promote empowerment, and
- (ix) promote gender equality.

Objectives:

- Support indigenous peoples in determining priorities and strategies for exercising their right to development;
- ensure that each project is designed in partnership with indigenous peoples and in full, effective and meaningful consultation with them, to obtain their free, prior and informed consent;
- ensure that indigenous peoples derive fair and equitable benefits and opportunities from project-supported activities in an inclusive and culturally appropriate manner, and
- recognize and respect the rights of indigenous peoples to their lands, territories, waters and other resources that they traditionally own, use or depend on.

#### **Standard 5: Work and Working Conditions**

IFAD seeks to promote inclusive, diversified and productive rural economies that generate decent work opportunities and higher incomes. By investing in rural populations to improve their productive capacities and increase the benefits they derive from their participation in the market, IFAD promotes the development of value chains, inclusive financial services and rural businesses.

The Fund's commitment to promoting inclusive and sustainable economic growth, full and productive employment and decent work for all includes protecting the rights of project workers to ensure that they receive fair treatment and work in safe, secure and healthy conditions. The following requirements reflect this commitment, which is guided by a series of international agreements, conventions and instruments, including those of the International Labor Organization (ILO) and the United Nations.

Objectives:

Promote direct actions to promote decent rural employment;

- promoting, respecting and implementing fundamental principles and rights through:
  - preventing discrimination and promoting equal opportunities for workers;
  - promoting freedom of association and the right to collective bargaining, and preventing the use of forced labor and child labor;
- protect and promote the safety and health of workers;
- ensure that projects comply with national labor and employment laws and international commitments, and
- leaving no one behind, protecting and supporting workers in disadvantaged and vulnerable situations, with special attention to women (e.g. maternity protection), young people, migrants and health workers, the informal economy and people with disabilities.

#### **Standard 6: Community Health and Safety**

Given IFAD's mandate and the sectors in which its interventions take place, the health and safety of communities are essential elements. In many countries, the agricultural sector has undergone enormous changes in the last 30 years thanks to a better understanding of the health and safety risks and effects associated with farming, as well as the use of better technologies and personal protective equipment. However, in many parts of the world (especially in low- and middle-income countries) there is still a lack of knowledge about how farmers are affected by their exposure to the numerous risks and health effects they face every day. Even in the most developed countries, improvements in workplace health and safety and the implementation of ILO policies have yet to reach the agricultural sector.

This standard emphasizes the prevention (and when this is not possible, the minimization and mitigation) of health and safety risks and impacts that may arise from IFAD-supported projects, with special attention to the marginalized and disadvantaged.

Objectives:

- Ensuring quality and safety in the design and construction of infrastructure linked to the programs, avoiding and minimizing possible safety risks and accidents;
- avoid or minimize the exposure of the community to the risk of disasters, diseases and hazardous materials associated with project activities;
- ensure that personnel and property protection measures minimize risks to communities and comply with international human rights standards and principles, and

- have effective measures in place to respond to emergency situations, whether they are due to natural hazards or caused by human beings.

### **Standard 7: Physical and economic resettlement**

Based on IFAD policies, international guidelines and best practices regarding safeguards in cases of involuntary resettlement, this standard considers resettlement not only as the physical relocation of people, but also as an economic, social and cultural factor that restricts people's access to places important to their livelihoods and culture.

Physical resettlement involves relocation due to the loss of residential land or housing, and economic displacement involves the loss or destruction of land or assets, and includes restrictions on access to goods, sources of income and livelihoods, as well as assistance to vulnerable groups.

Objectives:

- Avoid involuntary resettlement or, when this is not possible, minimize it by studying alternatives for the design and location of developments;
- avoid forced evictions;
- ensure that resettlement activities are planned and carried out in a collaborative manner, with the meaningful participation of the people affected;
- improve and restore the livelihoods of all displaced persons, and
- provide explicit guidance to borrowers/beneficiaries/partners on the conditions that must be met in relation to involuntary resettlement.

### **Standard 8: Financial Intermediaries**

This standard recognizes that investments in financial intermediaries (FIs) (indirect investments) and private sector companies (direct investments) are key to promoting the sustainability of financial markets and providing financial products and services to agricultural companies and rural micro, small and medium-sized enterprises.

Financial intermediation implies that responsibility for environmental and social assessment, risk management and monitoring, and overall portfolio management is delegated to intermediaries. The effectiveness of the financial intermediary's management of environmental and social risks should be assessed and monitored continuously throughout the project's life cycle, paying attention to its core business of generating returns for investors and ensuring sustainability.

Objectives:

- Promoting good environmental, social and climate practices, as well as good human resource management among financial intermediaries and beneficiaries of direct investments;
- ensure that the said intermediaries and beneficiaries assess and manage the environmental and social risks and effects of the subprojects, and
- promote the use of good environmental and social practices by beneficiaries of direct investments and sub-projects financed by financial intermediaries.

## Standard 9: Climate Change

The effects of climate change represent a fundamental threat to sustainable development and the fight against poverty. They can reverse human development by affecting essential development sectors such as agriculture and food production, ecosystems, water and other natural resources, disaster risk management and health. Climate change has become one of the main causes of hydro-meteorological disasters, and has the potential to produce gradual environmental changes that can intensify extreme weather events, increasing the risk of high-impact disasters, whether sudden or slow-onset. Climate variability also contributes to increasing the frequency and impact of localized small-scale disasters, which have long-term and far-reaching effects.

Investment decisions must take into account the changing nature of climate risks and impacts. In project design, this can be achieved through climate risk analysis, planning to improve the resilience of vulnerable livelihoods (adaptation) and minimizing greenhouse gas emissions and enhancing carbon sinks (mitigation). All borrowers/beneficiaries/partners of IFAD-supported projects must consider the effects that climate change may have on the projects, as well as the effects of other projects.

Objectives:

- Ensure that IFAD-supported projects are aligned with the targets set in the countries' nationally determined contributions and with the targets of the Paris Agreement and other international frameworks;
- ensure that the proposed activities are monitored and evaluated in relation to the risks and effects of climate change and disasters, including the effects on and generated by the projects;
- apply the mitigation hierarchy in project design;
- strengthening the resilience of communities to face the risks of the effects of climate change and related disasters, and
- increase the capacity of communities to adapt to the negative effects of climate change and promote climate resilience and low greenhouse gas emission projects that do not pose a threat to food production.

### 3.6 Gap analysis

The following is a *Gap Analysis* of compliance with IDB/IDA standards.

**Table 16 - Summary table of the gap analysis for compliance with the IDB/IDA Standards**

Executive Agency procedures and gaps identified	Recommendations
<b>Assessment and Management of Social and Environmental Risks and Impacts</b>	
<ul style="list-style-type: none"> <li>• Although some stages of projects and works do not require environmental licensing or have simple licensing, the PMU must have a stage that includes instruments for environmental and social assessment and planning of projects. This instrument is the screening or preliminary analysis, which involves analyzing the legal requirements and environmental constraints present, generating an Official Letter with the results of this screening and the necessary recommendations for the application of socio-environmental measures and commitments in the context of each project.</li> <li>• This screening process must incorporate environmental and social requirements aimed at complying with Brazilian legislation, project feasibility and meeting some of the requirements set out in the IDB/IDA Standards.</li> <li>• During the implementation phase of the projects, there is no formalized supervision or inspection process, but this is a process that needs to be developed.</li> <li>• The PMU should incorporate a Social and Environmental Development sector into its structure to manage the social and environmental requirements set out in the IDB/IDA Standards.</li> <li>• No system for assessing socio-environmental impacts and risks was identified for Procace II</li> </ul>	<ul style="list-style-type: none"> <li>• Implement a preliminary socio-environmental assessment process with a view to screening and scoping the necessary socio-environmental studies and planning mitigation programs, as well as determining the eligibility of projects before the IDB's ESPF and IFAD's SECAP.</li> <li>• Implement a socio-environmental management and supervision sector with a dedicated team</li> <li>• Train workers in the environmental and social requirements of the IDB/IDA Standards</li> <li>• Incorporate an impact and risk assessment stage for projects and the development of an Environmental and Social Management Plan. The process of identifying the environmental and social risks and impacts of each project must be clear.</li> <li>• Increasing the Environmental and Social Management System (ESMS) with guidelines for classifying the socio-environmental impact of potential projects.</li> <li>• Incorporate into the ESMS definitions for the environmental and social studies that will need to be carried out based on the level of impact of the projects, complying with the requirements of the IDB/IDA Standards.</li> <li>• Draw up a Social, Environmental and Health and Safety Management Procedures Manual</li> <li>• Promote the interoperability of the systems under development to include georeferenced information and interoperability with databases from official sources, with a view to increasing the capacity for environmental and social assessment, identification of impacts and risks.</li> <li>• As part of the PMU's Environmental and Social Management System (ESMS), project ESMPs must include Emergency Preparedness and Response Plans in accordance with IDB/IDA Standards.</li> </ul>
<b>Labor and Working Conditions</b>	
<ul style="list-style-type: none"> <li>• Brazilian legislation includes several topics in line with the requirements of the IDB/IDA Standards, such as compliance with occupational health and safety requirements, working conditions and labor relations management, protection of the workforce, among others.</li> <li>• In general, PROCASE's processes are largely compliant with the requirements of the Standard, but some gaps have been identified, such as the need to publicize the complaints mechanism to</li> </ul>	<ul style="list-style-type: none"> <li>• Disseminate workers' complaints and grievances mechanism extended to workers of outsourced companies.</li> <li>• Carry out environmental and social responsibility training with workers and contractors.</li> <li>• Implement a code of conduct for project workers</li> </ul>

Executive Agency procedures and gaps identified	Recommendations
<p>workers and contractors and the need for a dedicated and specialized team to monitor OHS compliance.</p> <ul style="list-style-type: none"> <li>The PROCASE II management team is considered to be in a position to carry out adequate management to ensure that the workers of the contracted companies have their rights guaranteed</li> </ul>	<ul style="list-style-type: none"> <li>Consolidate the OHS supervision and compliance, training and inspection process, preferably including a specialized and dedicated technician.</li> </ul>
Resource Efficiency and Pollution Prevention and Management	
<ul style="list-style-type: none"> <li>There is no specific requirement for the PMU to implement resource efficiency and contamination prevention principles and techniques consistent with International Good Industry Practice.</li> <li>federal law 12.187 of 2009 is quite objective in its responsibility and obligation to reduce gas emissions, but it does not include a regulation that explicitly defines the requirement to avoid or minimize GHG emissions related to projects during their design, implementation or operation. On the other hand, CONAMA resolutions set limits for pollutant emissions in line with the GIIP.</li> <li>The National Waste Policy, established by Law No. 12.305 of 2010, sets out the principles, objectives and instruments, as well as the guidelines for integrated management and solid waste management. It also set important targets that will contribute to the elimination of landfill sites and established planning instruments at the national, state, micro-regional, inter-municipal and metropolitan and municipal levels; as well as requiring private entrepreneurs to draw up their Solid Waste Management Plans.</li> <li>With regard to EHS<sup>16</sup>, the references to gas emissions, volatile organic compounds and particulate matter are not only listed in CONAMA resolutions, but the commitment to reduction and control is ratified in international agreements.</li> </ul>	<ul style="list-style-type: none"> <li>Some of the permissible emission limits laid down are generally more restrictive in the case of the GIIP guides<sup>17</sup> than what is recommended in national legislation, so it is important to adopt what is referenced in these regulations.</li> <li>some types of subproject do not require an environmental licensing process and subsequent environmental studies, so issues involving the emission of pollutants and the generation of waste should be included in the PMU's internal assessments to be incorporated into the processes (impact assessment, management plans, etc.)</li> <li>The PMU could incorporate available tools for analyzing energy efficiency and reducing emissions into the project development phase, such as the Edge Building system provided by the IFC, but even if these tools are not used, it is recommended to incorporate efficient and lower impact systems in the case of civil works.</li> <li>A construction supervision/inspection checklist should include important items to be checked on this subject, such as emission limits, noise, area recovery, preservation areas, etc.</li> </ul>
Climate Change and GHG Emissions	
<ul style="list-style-type: none"> <li>In general, the projects have a strong appeal to the issue of climate change and GHG reduction;</li> <li>However, it is necessary to look at issues related to the use of wood-burning stoves, which are the most viable option in remote rural communities that have no other better-performing alternative for producing heat in their production processes.</li> <li>It should be noted that the ovens are used in family kitchens and are not related to or industrial in size.</li> </ul>	<ul style="list-style-type: none"> <li>Apply fuel input management measures such as checking the plant species used in burning and its origin/procedure, as well as monitoring the proper execution of the acquisition and use of firewood.</li> <li>More efficient furnaces are also important to prioritize in order to reduce emissions.</li> <li>In the case of ovens in traditional kitchens, these can be aligned with the Standards as long as it is possible to estimate the increase in energy efficiency resulting from replacing the current models with closed equipment and the challenges of replacing them with systems based on other technologies, such as the additional cost for families to keep the system running.</li> </ul>

16 Environmental, Health, and Safety Guidelines.

17 The Health, Environment and Safety Guidelines adopted by the IDB are technical reference documents based on Good International Industry Standards (GIIP).

Executive Agency procedures and gaps identified	Recommendations
	<ul style="list-style-type: none"> <li>In particular, the construction of wood-based flour mills would not be permitted due to the lack of sufficient information to analyze the emissions to be avoided when new equipment is installed. However, studies could be proposed on the feasibility of adopting more efficient low-carbon energy sources or even pilot projects.</li> </ul>
Community Health and Safety	
<ul style="list-style-type: none"> <li>Brazilian legislation does not explicitly establish the management of risks and impacts on the health and safety of the community for projects, it only establishes a requirement to evaluate the impacts related to projects that have housing actions covered by financing with the Federal Government.</li> <li>There is no mechanism for identifying and managing disaster risks, which is important for establishing standards and emergency actions that must be followed in the event of an emergency or contingency. The measures adopted are those commonly provided for by law for OHS</li> <li>Despite not having a risk management mechanism in place, the project screening phase must observe requirements related to safety, especially flooded areas, drought and susceptibility to erosive processes, percolation levels and geotechnical safety.</li> </ul>	<ul style="list-style-type: none"> <li>It is recommended that a risk identification and management system be developed for projects;</li> <li>It is also recommended to develop appropriate measures to reduce vulnerability and foster adaptation to natural hazards and climate change, the scope of which should include structural and non-structural measures to be implemented in the design, construction and operation stages of the projects. These measures should be part of the Disaster and Climate Change Management Plan, forming part of Procace II's ESMP and the PGAS of the sub-projects.</li> </ul>
Land Acquisition and Involuntary Resettlement	
<ul style="list-style-type: none"> <li>This Standard is not triggered by Procace II.</li> </ul>	<ul style="list-style-type: none"> <li>There is no provision for land acquisition in the project, but if necessary, methods for calculating financial compensation (indemnities) should be applied to make them compatible with the requirements of ESPS 5 (IDB) and Standard 7 (IFAD), taking into account compensation for replacement cost, and based on NBR 14.653.</li> <li>In this same case, a post-indemnification or resettlement assessment should be carried out to identify the risk of impoverishment related to the project, when the action involves a vulnerable population.</li> <li>These requirements also apply in the case of economic activities to be expropriated.</li> </ul>
Biodiversity Conservation and Sustainable Management of Living Natural Resources	
<ul style="list-style-type: none"> <li>PROCASE II plans to implement actions related to the preservation of water sources, green areas and rural technical assistance with a view to best sustainable rural practices, in order to avoid impacts and promote sustainability in its projects.</li> <li>In Brazil, the law explicitly establishes the requirement for modified habitat areas that include significant biodiversity value.</li> <li>In addition to legislation, several international agreements to which Brazil is a signatory contain criteria to meet the requirements of the IDB/IDA Standards.</li> <li>Among the habitat categories highlighted in the Brazilian standard, only established conservation units, both sustainable use and full protection, must have their Management Plan drawn up</li> </ul>	<ul style="list-style-type: none"> <li>Include in the assessments the existence and degree of risk of impact on natural habitats and critical habitats, and guide precautionary measures, detailed studies and plans for biodiversity or even the exclusion of areas and eligibility criteria for locating projects that do not yet have a locational definition.</li> <li>Mitigation or the development of Biodiversity Action Plans, Biodiversity Compensation Management Plans and Biodiversity Monitoring and Evaluation Plans are recommended for identified habitats, according to the impact levels of each project.</li> </ul>

Executive Agency procedures and gaps identified	Recommendations
<ul style="list-style-type: none"> <li>• Brazilian laws do not require an assessment of critical habitats and generally do not require studies to identify and assess ecosystem services</li> <li>• Federal Law No. 12.651, of May 25, 2012 (the New Brazilian Forest Code), as amended, establishes general rules on the protection of vegetation, especially Permanent Preservation Areas (APP) and Legal Reserve areas, with regard to forest exploitation, the supply of forest raw materials, control of the origin of forest products and the control and prevention of forest fires, and provides for economic and financial instruments to achieve its objectives. Article 8 establishes that intervention or suppression of native vegetation in a Permanent Preservation Area will only take place in cases of public utility, social interest or low environmental impact.</li> <li>• It can be said that Brazilian legislation partially complies with the established requirement, given that only projects with high levels of negative impacts would be subject to more complex environmental studies</li> <li>• PROCASE II's proposal is to avoid actions that require the suppression of forest, and to focus on actions that increase vegetation cover through sustainable cultivation processes.</li> </ul>	<ul style="list-style-type: none"> <li>• Include issues related to the protection of biodiversity and ecosystem services in the training and capacity building of environmental and social teams.</li> <li>• It is necessary to incorporate into the requirements for the preliminary assessment of projects that they do not affect areas with steep slopes, in order to guarantee safety and combat risk situations and disasters.</li> <li>• Habitat restoration and management measures, especially in permanent preservation areas, must include requirements for the proper management of exotic species in a strategic manner and with a view to their replacement, as well as requirements to combat the use of chemical pesticides and prohibited products (Stockholm Convention).</li> </ul>
Indigenous and Traditional Populations	
<ul style="list-style-type: none"> <li>• The presence of traditional populations is common in PROCASE II projects, where the rights and integrity of these communities are respected in the processes;</li> <li>• FUNAI, the body responsible for protecting indigenous peoples in Brazil, has defined guidelines for assessing the impact on these communities, including prerogatives that follow the same guidelines required by the IDB/IDA Standards and ILO Convention 169.</li> <li>• Despite this, the PMU does not have an institutionalized and formalized process for dealing specifically with traditional communities</li> </ul>	<ul style="list-style-type: none"> <li>• It is important to map and build a baseline of the traditional beneficiary communities (TBCs) of the projects, including a process of Informed Participatory Consultation and subsequent Free Prior and Informed Consent when necessary;</li> <li>• It is recommended that the same guidelines and regulations be followed for indigenous communities for impact assessment and informed consultation with any existing traditional communities (formally recognized or not), whether quilombolas, fishermen, shellfish gatherers, gypsies, among others;</li> <li>• It is important to include respect for the cultural integrity of the populations directly or indirectly affected by the projects in worker training.</li> <li>• Need for alignment/authorization from FUNAI as a preliminary step to working with Indigenous Communities</li> </ul>
Cultural Heritage	
<ul style="list-style-type: none"> <li>• This Standard is not expected to be triggered, given that the projects/sub-projects envisaged in PROCASE II do not pose significant risks or impacts on cultural heritage or on areas that may have a high potential for the presence of sites. Despite this, the following analysis is made of compliance with the safeguard.</li> <li>• The PMU does not have procedures for evaluating possible interference in cultural heritage at the project design stage, but it does meet the premises defined in the rites for evaluating the impact on archaeological heritage set out in IPHAN's IN 001/2015.</li> <li>• Some types of sub-projects do not require a heritage impact assessment for IPHAN's approval.</li> </ul>	<ul style="list-style-type: none"> <li>• It must be confirmed that there are no potential risks in cultural heritage areas in the locations defined for the implementation of each sub-project, in accordance with the respective definition of actions and structures to be implemented. This must be confirmed through a specific environmental and social assessment.</li> <li>• Procedures for the chance discovery of cultural sites must be defined.</li> </ul>

Executive Agency procedures and gaps identified	Recommendations
<ul style="list-style-type: none"> <li>• It should be noted that under Brazilian law there are no instruments that distinguish between replicable and non-replicable cultural heritage, nor specific provisions for assessing and managing risks and impacts on non-replicable cultural heritage.</li> <li>• With regard to the promotion of equitable participation in the benefits derived from the use of cultural heritage, the legislation complies with this requirement only for tangible cultural goods and there is no mention of equitable participation for intangible cultural goods in any provision</li> <li>• For situations of chance discovery, no specific actions are provided for by law or in the PMU's procedures, despite Brazilian legislation being very clear about responsibility for any impact on cultural heritage, even when these are unknown.</li> <li>• The legislation also stipulates that the authorities must be called in, the area must be cordoned off and an authorized archaeologist must carry out the appropriate assessments and measures to protect and rescue the heritage when possible.</li> <li>• Brazilian law also stipulates the need for heritage education and the dissemination of knowledge to the community.</li> <li>• Actions related to stakeholder consultation with regard to cultural heritage are also not explicitly required by law or by PMU procedures</li> </ul>	<ul style="list-style-type: none"> <li>• It is recommended that stakeholder consultations be adopted at the stage of research and assessment of impacts on cultural heritage when these are identified.</li> <li>• State and municipal cultural heritage protection bodies should always be consulted, and the full spectrum of heritage typologies (material, intangible, cultural, landscape, architectural, etc.) should also always be covered in assessments, as required by IPHAN's IN 001/2015.</li> </ul>
Gender equality	
<ul style="list-style-type: none"> <li>• The PROCASE II team has adopted an internal philosophy and policies for hiring workers without restrictions on gender, sexual orientation and/or gender identity;</li> <li>• Brazilian legislation points to the criminalization of acts of prejudice, harassment and violence against gender diversity;</li> <li>• The PROCASE II team usually carries out baseline diagnoses considering information on the gender and vulnerability profiles of beneficiary families in the areas where its projects operate;</li> <li>• Its portfolio of social actions also includes initiatives for the development of women;</li> <li>• In community meeting processes there is always room for stakeholder participation, regardless of gender;</li> <li>• Despite this, there is a prevalence of male activity in many of the communities in the project's area of operation.</li> </ul>	<ul style="list-style-type: none"> <li>• It is recommended to include the topic of gender and diversity in training courses for workers and contractors, with information on punitive laws, good practices and conduct, and reporting channels;</li> <li>• We recommend raising awareness about the importance and role of women, as well as gender equality and combating gender-based violence in the beneficiary communities.</li> </ul>
Stakeholder Engagement and Information Disclosure	
<ul style="list-style-type: none"> <li>• The PROCASE II team carries out a series of actions related to stakeholder engagement, including participatory planning processes.</li> <li>• The PROCASE II team carries out a very intense communication process before, during and after the project to disseminate information, engage and capture contributions from the beneficiary communities.</li> </ul>	<ul style="list-style-type: none"> <li>• It is recommended to prepare a more effective and analytical organization of the question-and-answer records for the relevant consultations held by the PMU (consultation report containing an account of the request, questions / manifestations and answers made during the meeting).</li> <li>• Implement a Complaints and Redress System, to be monitored by the borrower</li> </ul>

## 4 BASE LINE

The baseline presented below shows the basic characteristics of the environment where PROCASE II is located, considering aspects of the physical and biotic environments and the socio-economic and cultural panorama of the state of Paraíba and the main municipalities where the project is located.

### 4.1 Physical Environment

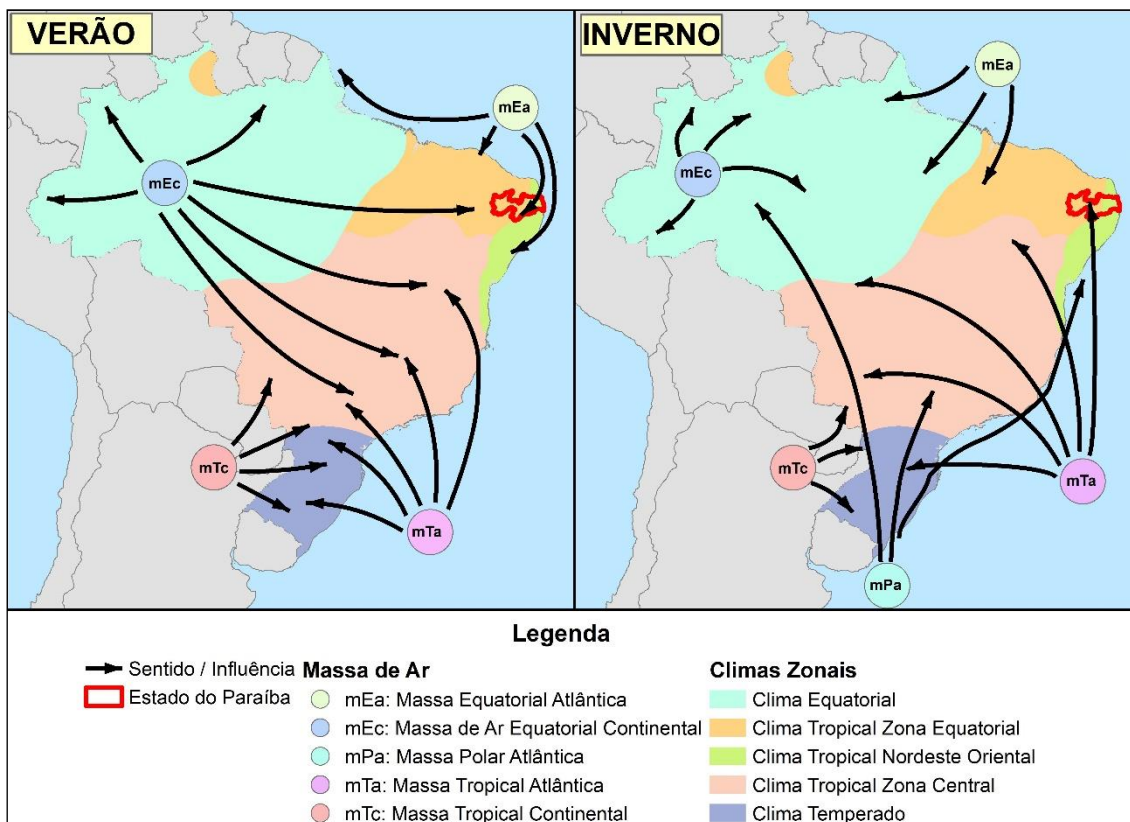

The following is diagnostic information on the physical environment of the Proc case II area in the state of Paraíba. The data catalogued comes from studies, mapping and statistical bases from available official sources.

#### 4.1.1 Weather

The climate and weather conditions in the study area are strongly conditioned by the geographical location (latitude) and relief, which, in conjunction with the major atmospheric systems (air masses), control rainfall distribution, evapotranspiration, temperature, air humidity and wind regime. In this respect, it is important to highlight the presence of the Amazon rainforest as a major factor in regulating the local and regional climate.

According to Nimer (1989), the main air masses that influence Brazil are shown in the figure below. It can be seen that the state of Paraíba is directly influenced by mEa / mEc during the summer and by mTa / mPa during the winter.

#### 26 - Main Air Masses in Brazil on Zonal Climates

Source: adapted from IBGE, 2017 and Nimer, 1989.

During the summer, the continental equatorial air mass exerts an influence over much of Brazil. In the case of Paraíba, during the summer the cEm acts together with the aEm, increasing the rainfall during this period, but keeping the temperature high.

However, during the winter, the mEc is quite restricted, basically not influencing the study region. The mTa continues to act, but quickly loses moisture in the coastal areas - leaving the interior drier. During this period, the Atlantic Polar Mass (APM) also comes into play, dropping temperatures along the coast.

Paraíba is under the southeast trade winds, which guarantee stable weather that is interrupted by the arrival of disturbed currents: from the south, the cold fronts; from the north, the Intertropical Convergence Zone; from the east, the disturbances originating from the East Waves; and from the west, the lines of Intertropical and Tropical Instabilities (Nimer, 1989).

Climatologically, the main systems causing rainfall over the state of Paraíba are the Intertropical Convergence Zone and the Upper Air Cyclonic Vortices, which induce representative rainfall over the region and are responsible for approximately 80% of the total rainfall. In a second rainy period, there is the action of Eastern Wave Disturbances that favor the occurrence of more representative rainfall over the entire eastern sector of the state, especially in the coastal strip. This system contributes around 70% of the total rainfall over the region and covers most of the period (AESA, 2009).

The state of Paraíba has large meteorological variations in the parameters measured, both in their temporal and spatial distribution. Thus, orographic features may play a greater role in differentiating the climate, and it is common to see humid mountain ranges in the middle of the semi-arid region, with variations of more than 100% between one situation and another. In terms of timing, there are years that are totally out of line with the historical pattern. These values are so anomalous that they can even exceed 100% of the normal (AESA, 2009).

### **Climate classification**

Climate classification expresses the average conditions of the Earth's atmosphere. These conditions, despite experiencing daily, monthly and seasonal variations, are represented by climatic bands that remain reasonably uniform, within an average pattern of oscillation.

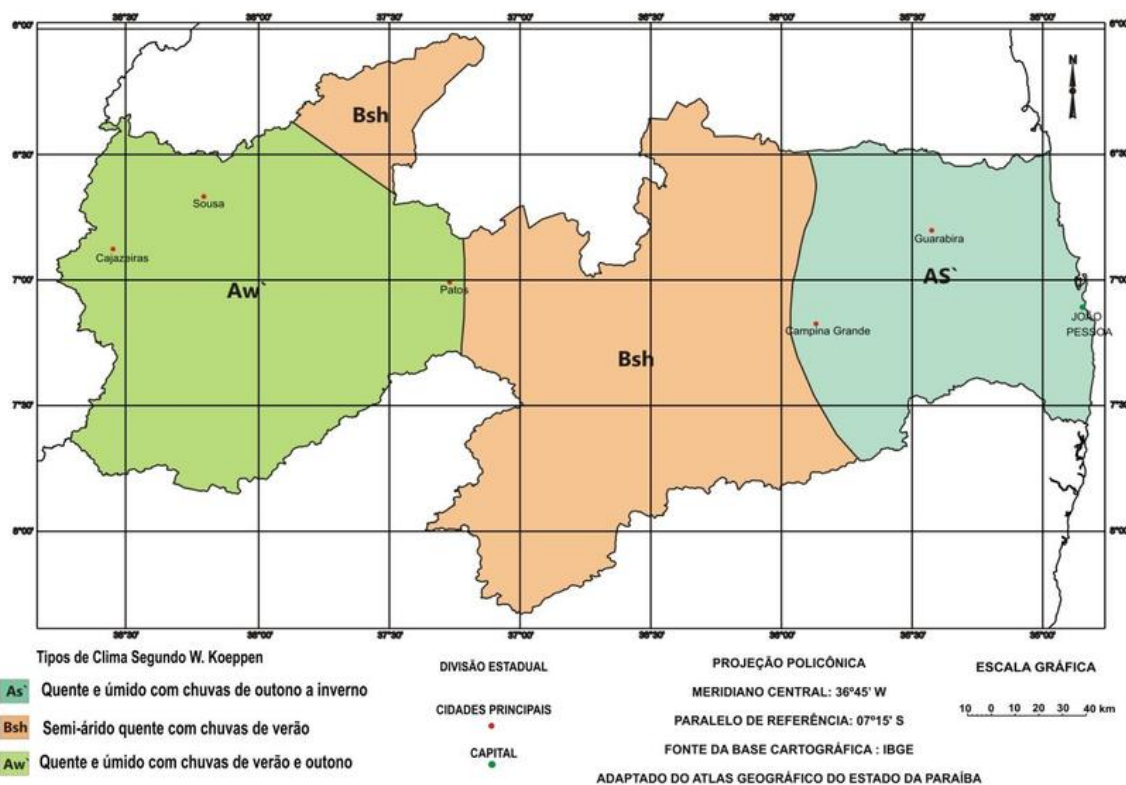

According to the Köppen climate classification, the state of Paraíba only has type A (tropical climate) and type B (dry climate) climates. Within these two groups there are subgroups, of which Paraíba has three:

- Hot and humid tropical climate, with a dry season in winter (As'), present in the eastern sector of the state of Paraíba; it is characterized by the absence of summer rains and their occurrence in the "winter" (which corresponds to the rainy season and not the winter itself), with rainfall rates of around 1,600 mm per year.
- Hot semi-arid climate with summer rains (Bsh), present on the Borborema Plateau; it is characterized by a scarcity of rainfall and great irregularity in its distribution; low cloudiness; strong sunshine; high evaporation rates, and high average temperatures (around 27°C). The relative humidity is usually low, and the little rainfall - from 250 mm to 750 mm per year - is concentrated in a short space of time, causing torrential floods. Even during the rainy season (November to April), its distribution is irregular,

ceasing to occur during some years and causing droughts. The characteristic vegetation of this type of climate is xerophytic (Caatinga).

- Tropical climate, hot and semi-humid with summer and fall rains (Aw'), found in the Sertaneja Depression, with a dry winter. It has a rainy season in summer, from November to April, and a clear dry season in winter, from May to October (July is the driest month). The average temperature of the coldest month is over 18°C. Rainfall is over 750 mm per year, reaching 1800 mm.

## 27 - Climate Classification of the State of Paraíba - Köppen

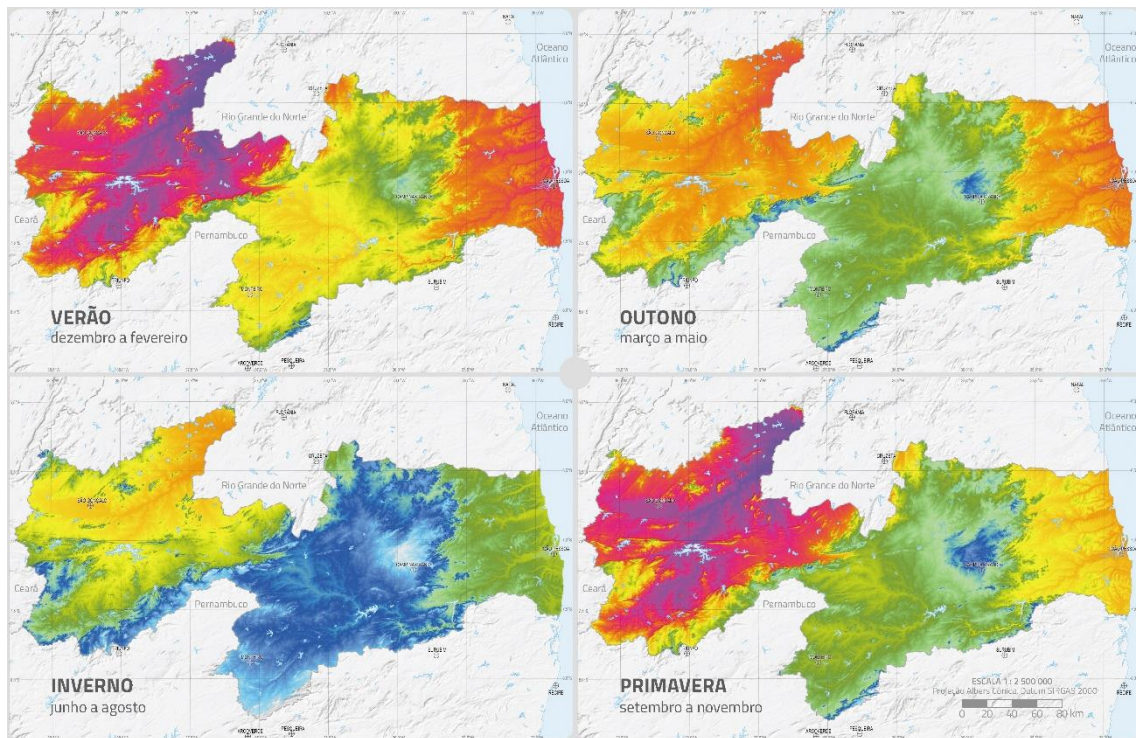

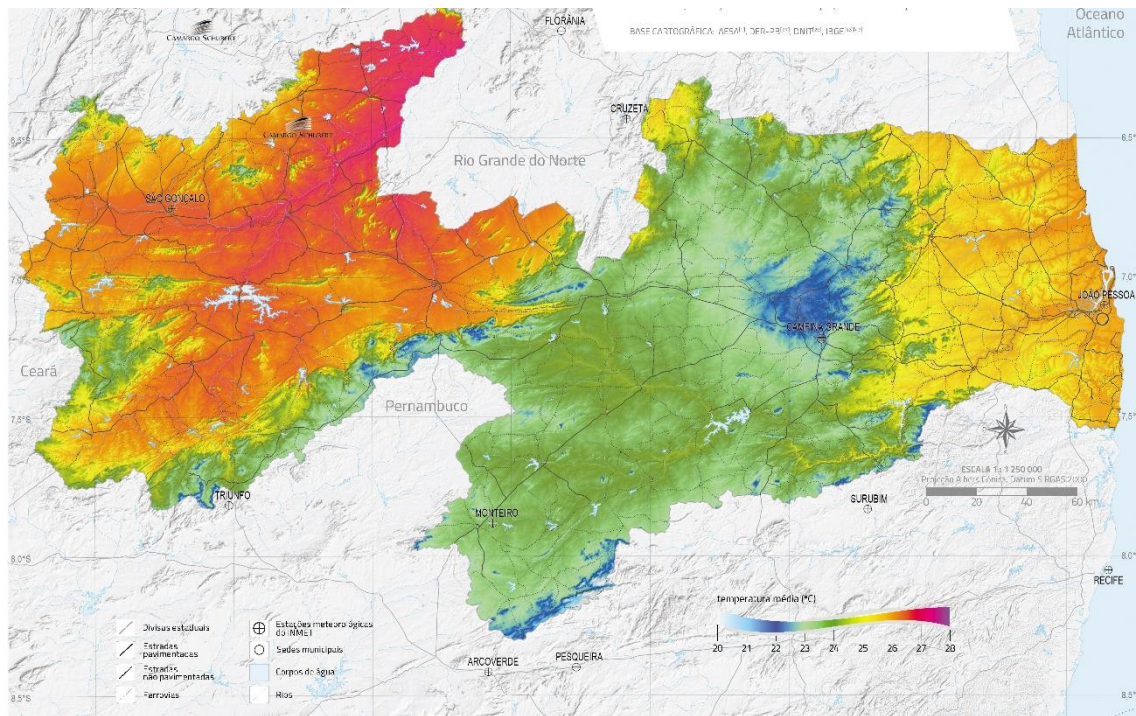

Source: Francisco, 2010 adapted from IBGE, 1985.

## Temperature

Seasonality has very little effect on the annual temperature range in the state of Paraíba, varying from 20 °C in the central region during the winter to 27 °C in the coastal region during the summer. The region from the Borborema lowlands to the coast has an annual average of 24 to 26°C, with seasonal variability of 4°C, while the region at the top of the plateau has variability of just 2°C. The west of the state has a greater amplitude, influenced by the irregularity of the masses coming from the Amazon, ranging from 23°C in winter to 28°C in summer, see figure below.

## 28 - Average Annual and Seasonal Temperature in the State of Paraíba

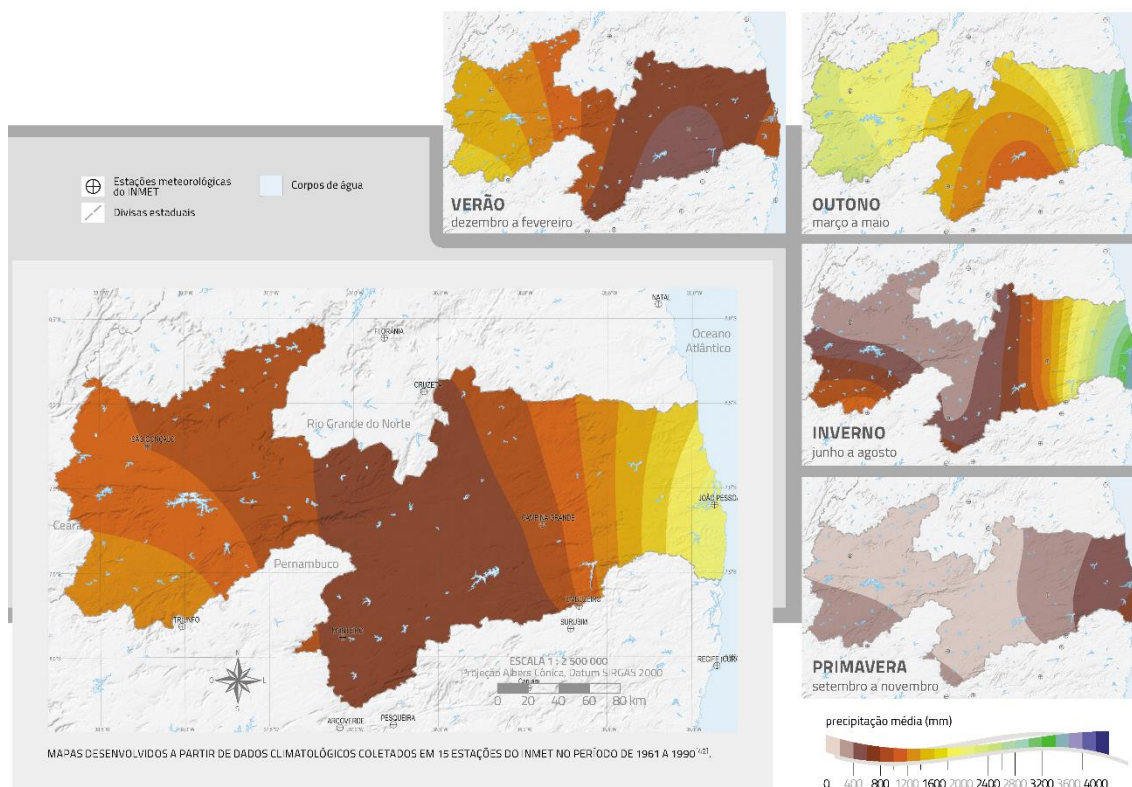

Source: Wind Atlas of the State of Paraíba, 2017. (Climatological data from 1961 to 1990, INMET)

### Precipitation

The seasonal rainfall regime shows significant spatial variability, as can be seen in the figure below, due to the geography and location of the state. On the coast, the climate is well-defined tropical, with abundant rainfall during the fall and winter and drought in the summer, resulting in an annual average of over 1800 mm. The central region of the state,

close to the Borborema plateau, has a semi-arid climate, with the lowest annual rainfall in the state, around 700 mm. In the far west, in the area that encompasses the Sertanejo Pediplano, the climate reverts to tropical due to the higher rainfall, resulting from hot and humid masses coming from the Amazon, which bring summer rains, contributing to an annual average of over 1000 mm, but with very irregular rainfall distribution.

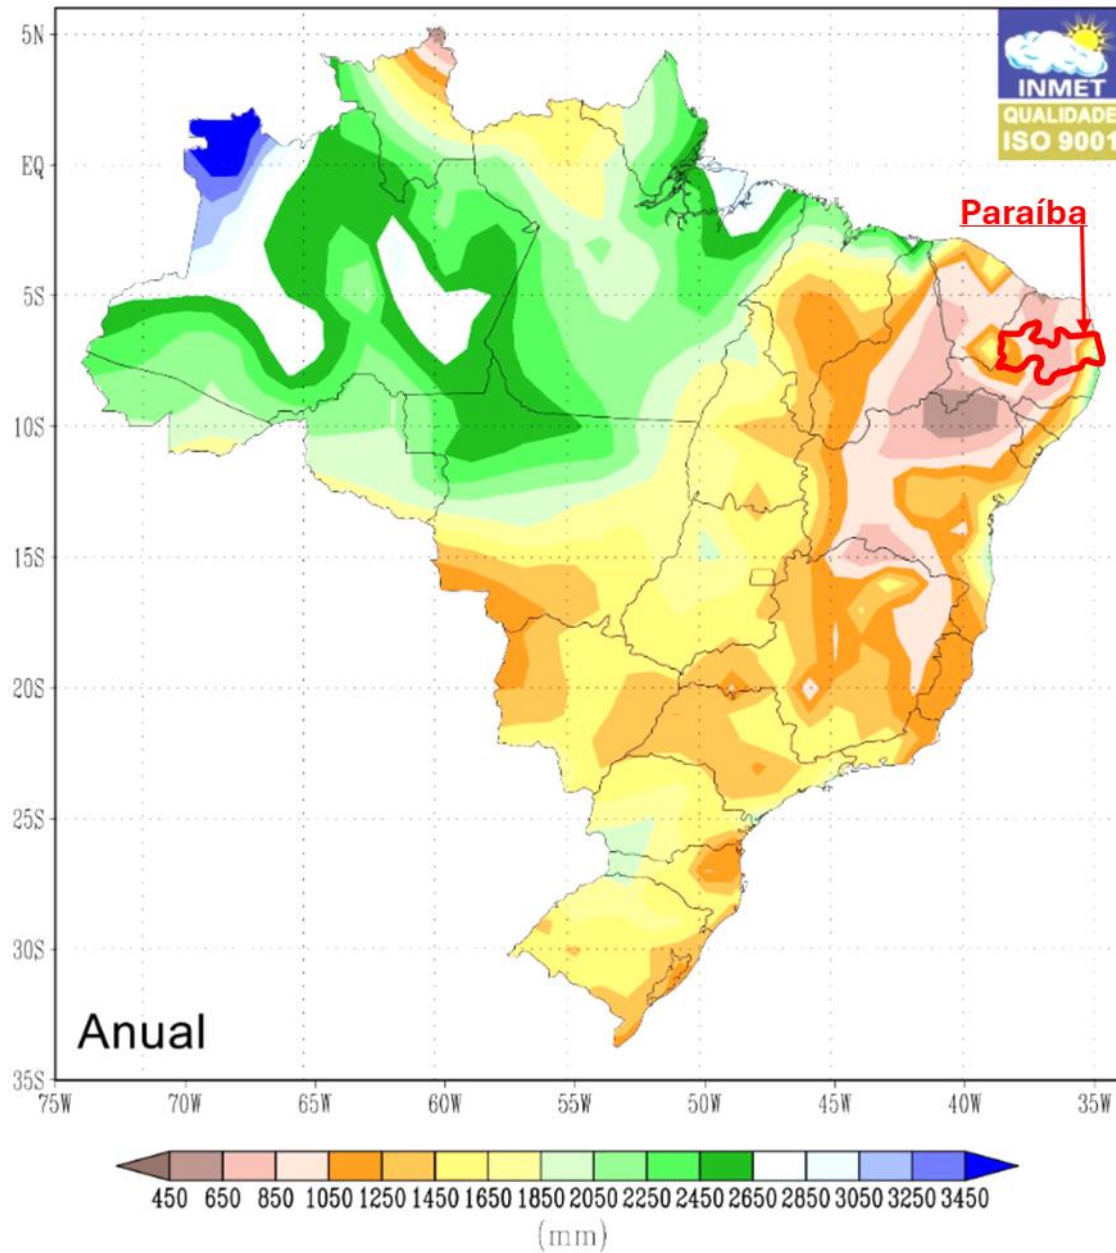

### 29 - Average Annual and Seasonal Precipitation in the State of Paraíba

Source: Wind Atlas of the State of Paraíba, 2017 . (Climatological data from 1961 to 1990, INMET)

According to the figure below, the climatological normal for Brazil (1961 to 1990) drawn up by the Meteorological Institute - INMET indicates that in the area of the state of Paraíba, the accumulated annual rainfall varied between 2050 mm (in the coastal strip - Atlantic Forest Biome) and 650 mm (in the more inland strips, already in the Caatinga Biome).

### 30 - Brazilian Climatological Normal 1961-1990 - Annual Accumulated Precipitation

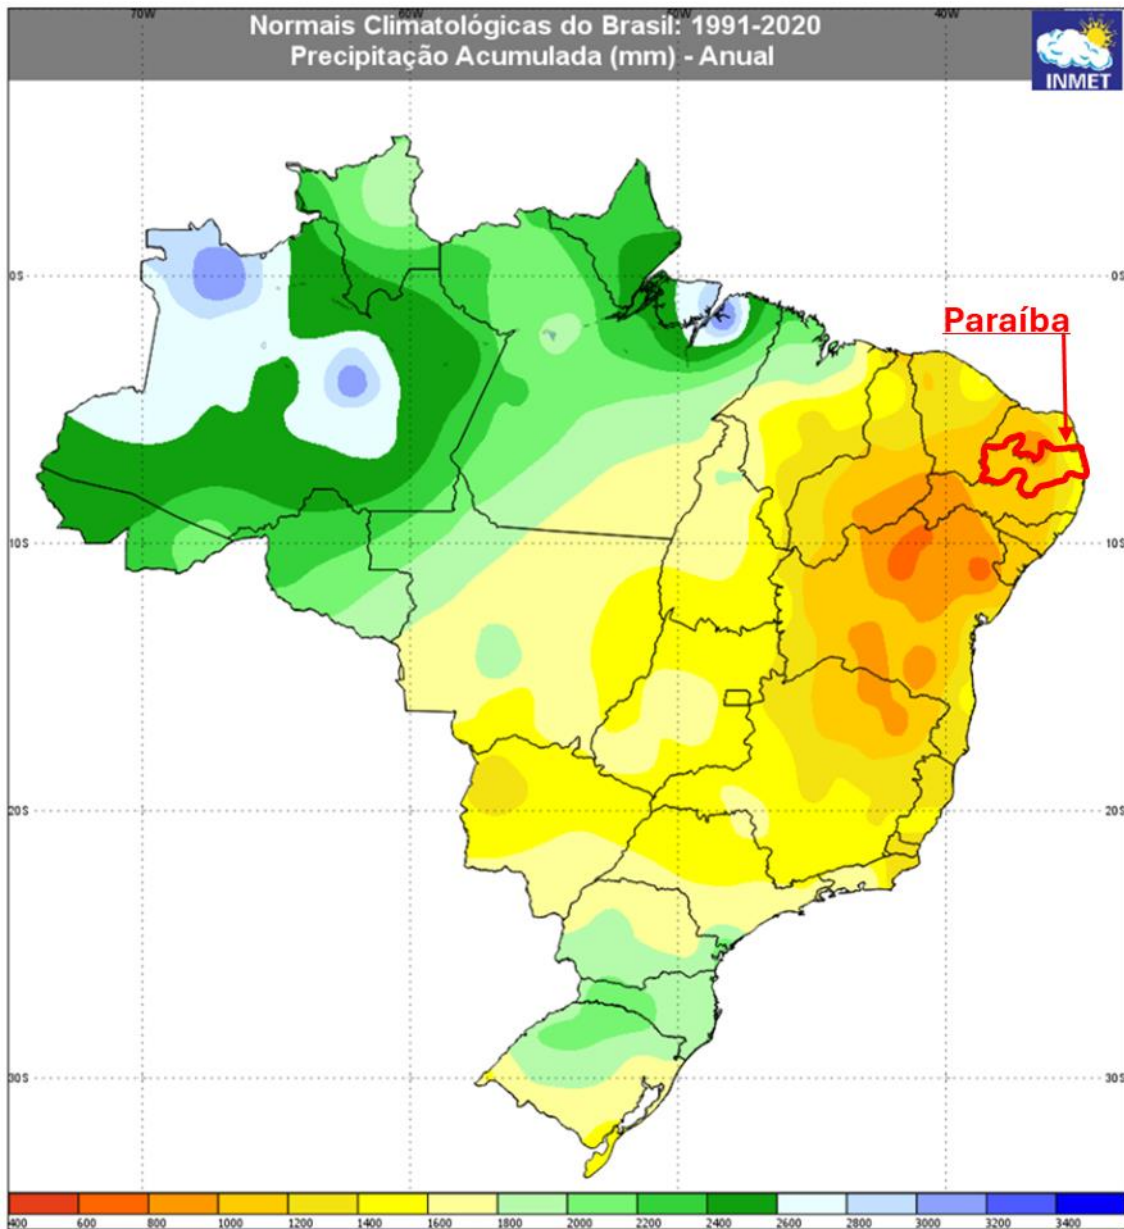

Source: INMET, 2024 (consultation)

On the other hand, the climatological normal from 1991 to 2020 for the state of Paraíba shows accumulated annual rainfall between 1,600 mm (Atlantic Forest - coastal region) and 800 mm (Caatinga Biome - central region of the state), indicating important differences between these normals.

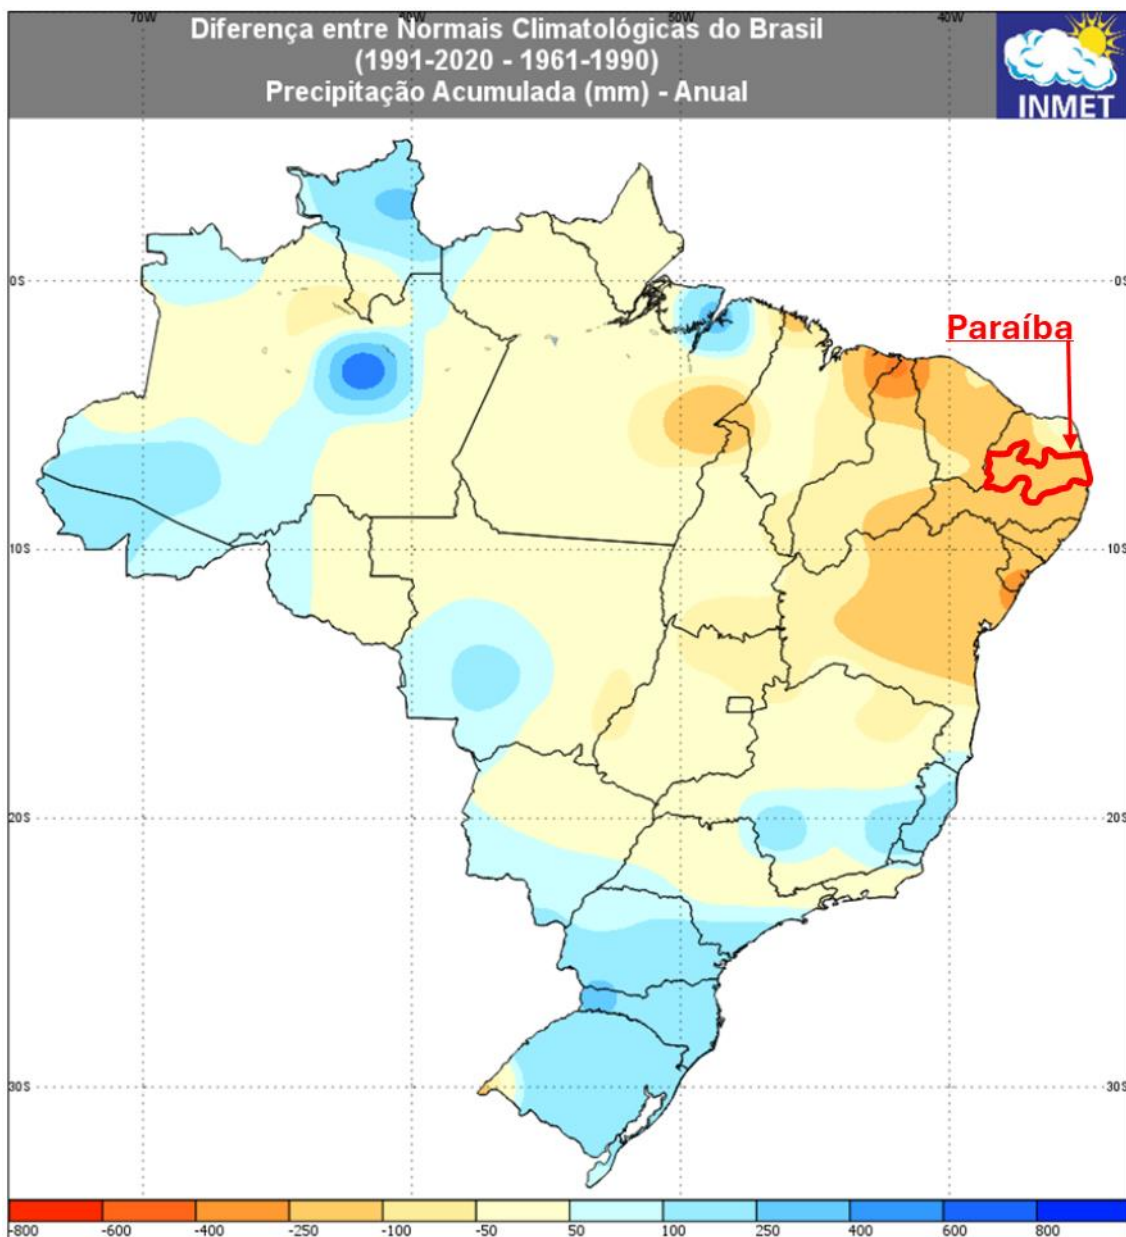

### 31 - Brazilian Climatological Normal 1991-2020 - Accumulated Annual Precipitation

Source: INMET, 2024 (consultation)

INMET has therefore mapped the difference between the climatological normals, indicating a reduction in accumulated rainfall of around 250mm in the normal periods (the climatological normal from 1991 to 2020 shows lower accumulated indices than the normal from 1961 to 1990) in the area covered by the state of Paraíba. The difference is constant throughout the state, even in the most inland part of the state (Caatinga), considering that the coastal region (Atlantic Rainforest) generally has higher rainfall figures.

**32 - Difference between Brazilian Climatological Normals (1991 to 2020 - 1961 to 1990 - Accumulated Annual Precipitation)**

Source: INMET, 2024 (consultation)

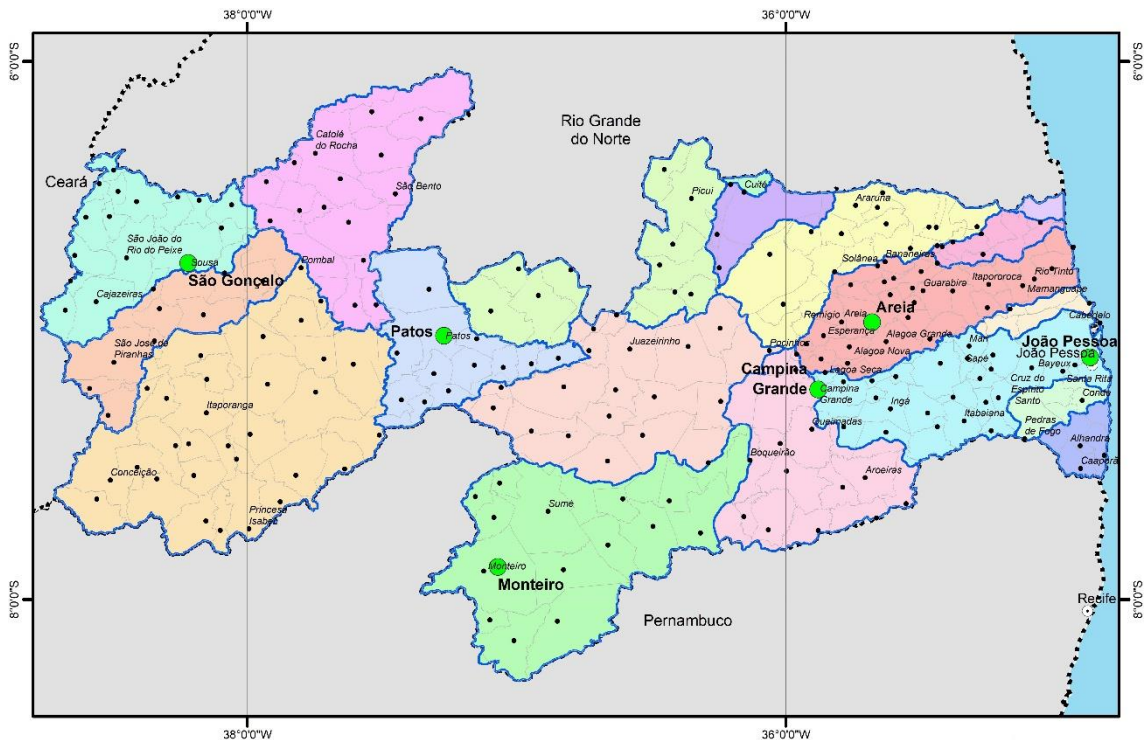

According to data from AESA (2022), for the graphical representation of precipitation suitable for the state of Paraíba, based on the Climatological Normals (INMET, 2018), 6 climatological normal stations were selected (see table below) distributed over the territory of the 20 sub-basins (or 12 basins) of the state of Paraíba (see figure below). The importance of these stations is their strategic distribution in the main regions of the state (Litoral, Agreste, Brejo, Cariri and Sertão) and a series of long-term data. They are distributed as follows: one in the Mamanguape River Basin, three in the Paraíba River Basin and two in the Piranhas River Basin.

**Table 17 - Meteorological stations considered in the state of Paraíba.**

State	Basin	Station	Code	Latitude	Longitude	Altitude (m)	Start-up
PB	Mamanguape	Sand	82696	-6,97	-35,68	574,62	01/01/1929

Rainfall in the state of Paraíba ranges from 1.3 mm in September at the Patos station to 355.2 mm in June at the João Pessoa station (see Table below). On an annual scale, rainfall in the state of Paraíba is around 1,086.1 mm, with the Monteiro station recording the lowest annual rainfall and the João Pessoa station the highest. The temporal variation in rainfall at each climatological station can be seen in the following figure.

**Table 18 - Rainfall at the Meteorological Stations considered in the State of Paraíba (mm).**

Station	Jan	Feb	Sea	Apr	May	Jun	Jul	Aug	Set	Out	Nov	Dec	Year
Sand	83,0	107,4	156,3	151,7	169,2	210,7	182,2	151,2	60,9	21,8	27,5	37,8	1.359,7

### 34 - Rainfall recorded at the Meteorological Stations considered in the State of Paraíba (mm).

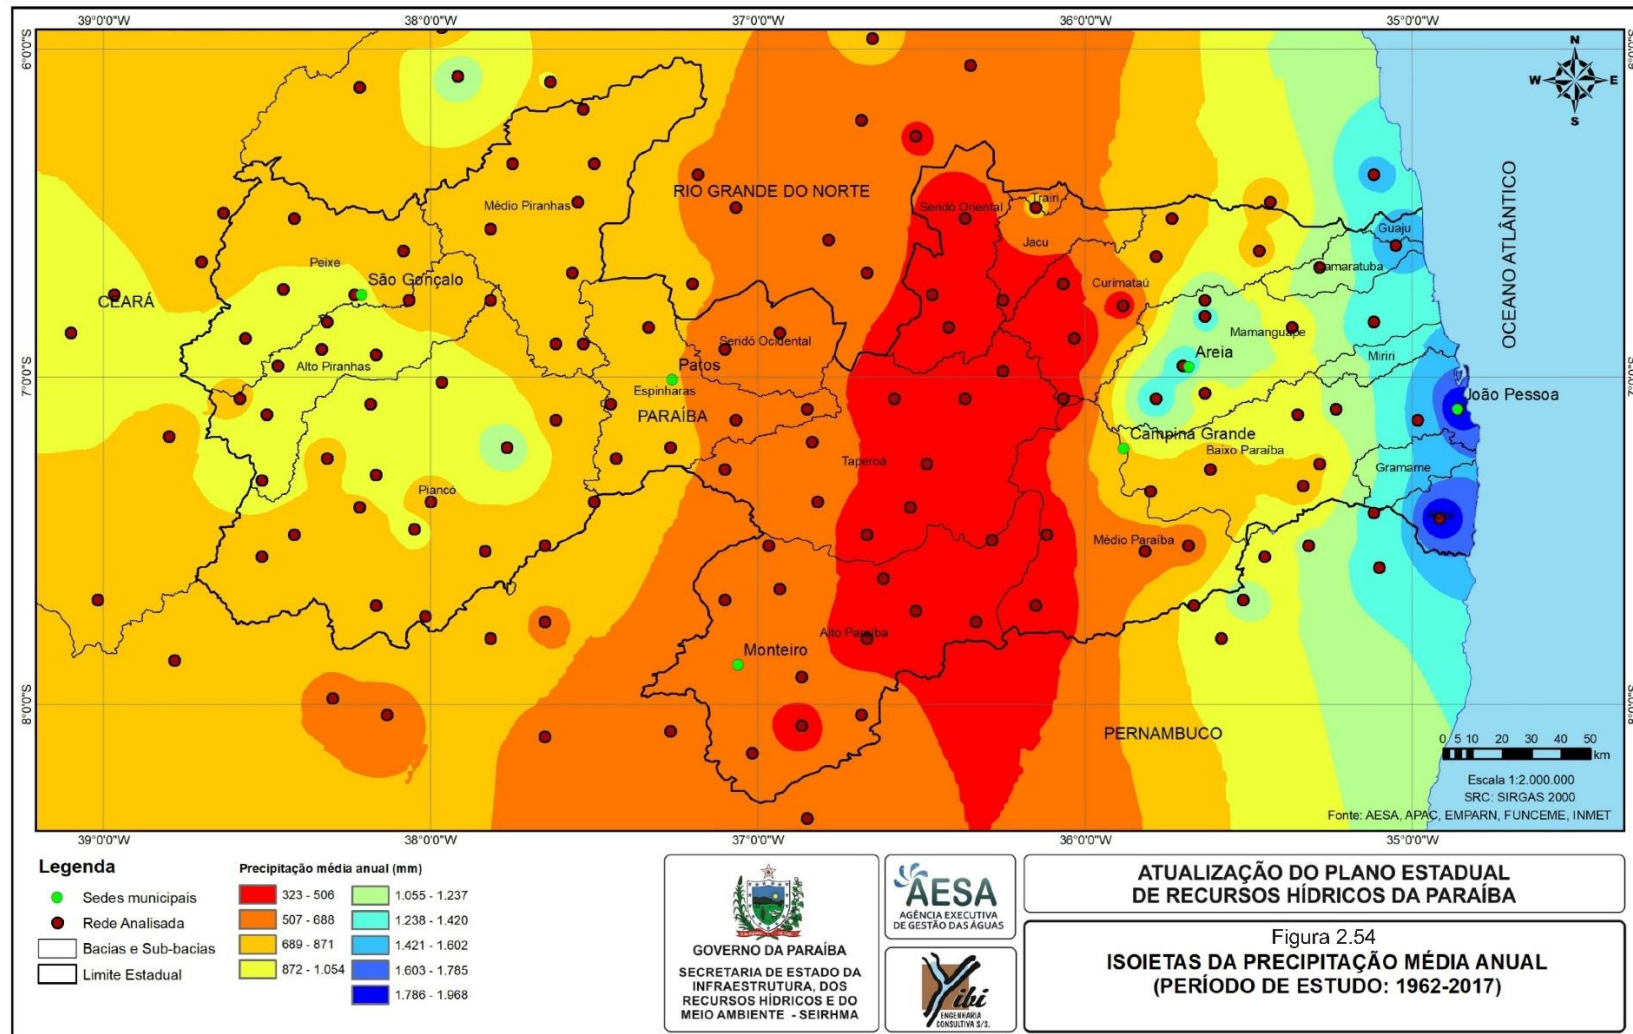

Source: INMET, 2018 apud AESA, 2022

For a detailed spatial representation of precipitation in the state of Paraíba in accordance with the Paraíba State Water Resources Plan - PERH-PB (AESA, 2022), a database was organized with daily precipitation data monitored in the four states (PB, CE, PE and RN). Although 354 rainfall monitoring stations had been inventoried, after analyzing the quality of the data and the common periods, which are important requirements for rainfall analysis and subsequent use in the rainfall-runoff model, a total of 137 rainfall monitoring stations were arrived at for use in the PERH-PB.

In order to plot the average annual rainfall isohyets, the corrected and homogenized rainfall data from the 137 previously selected rain gauge stations was used, for a total period of 56 years (1962-2017). Based on the accumulation of daily rainfall from each station for each year, the average annual rainfall was determined and, using the inverse distance squared method, the annual rainfall data was interpolated as shown in the figure below.

Francisco and Santos (2017), in terms of rainfall, identify two rainfall regimes that characterize the state of Paraíba: the first, occurring in the months of February to May, in the regions of Alto Sertão, Sertão and Cariri/Curimataú; and the second, occurring from April to July, in the regions of Agreste, Brejo and Litoral. The systems responsible for the rainfall patterns are the Intertropical Convergence Zone (ITCZ), cold fronts, easterly disturbances or easterly waves and high-level cyclonic vortices (HLCV). Rainfall increases in a west-east direction throughout the year. The central portion has the lowest rainfall, ranging from 300mm to 700mm. The coast, on the other hand, has the highest rainfall in the state, reaching 1950mm.

### 35 - Map of Average Annual Precipitation (1962-2017)

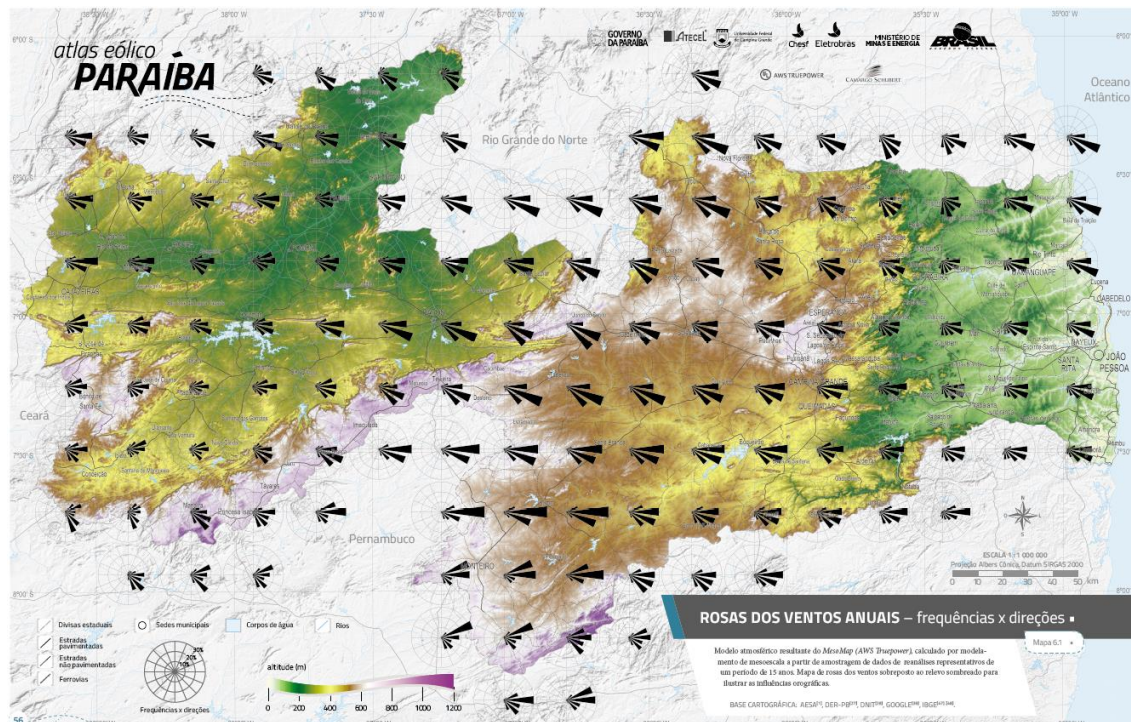

Source: EFSA, 2022 (<http://www.aesa.pb.gov.br/aesa-website/wp-content/uploads/2022/10/RF-02-A-DIAGN%C3%93STICOS-vol-1.pdf>)

## Winds

In the state of Paraíba, as shown in the figure below, the frequency of winds prevails from east to west. As for seasonality, the state of Paraíba has a well-defined seasonality, with maximum winds in spring and summer, predominantly in the central areas of the state and along the coast (Atlas Eólico do Estado da Paraíba, 2017).

### 36 - Wind Frequency and Direction

Source: Wind Atlas of the State of Paraíba, 2017.

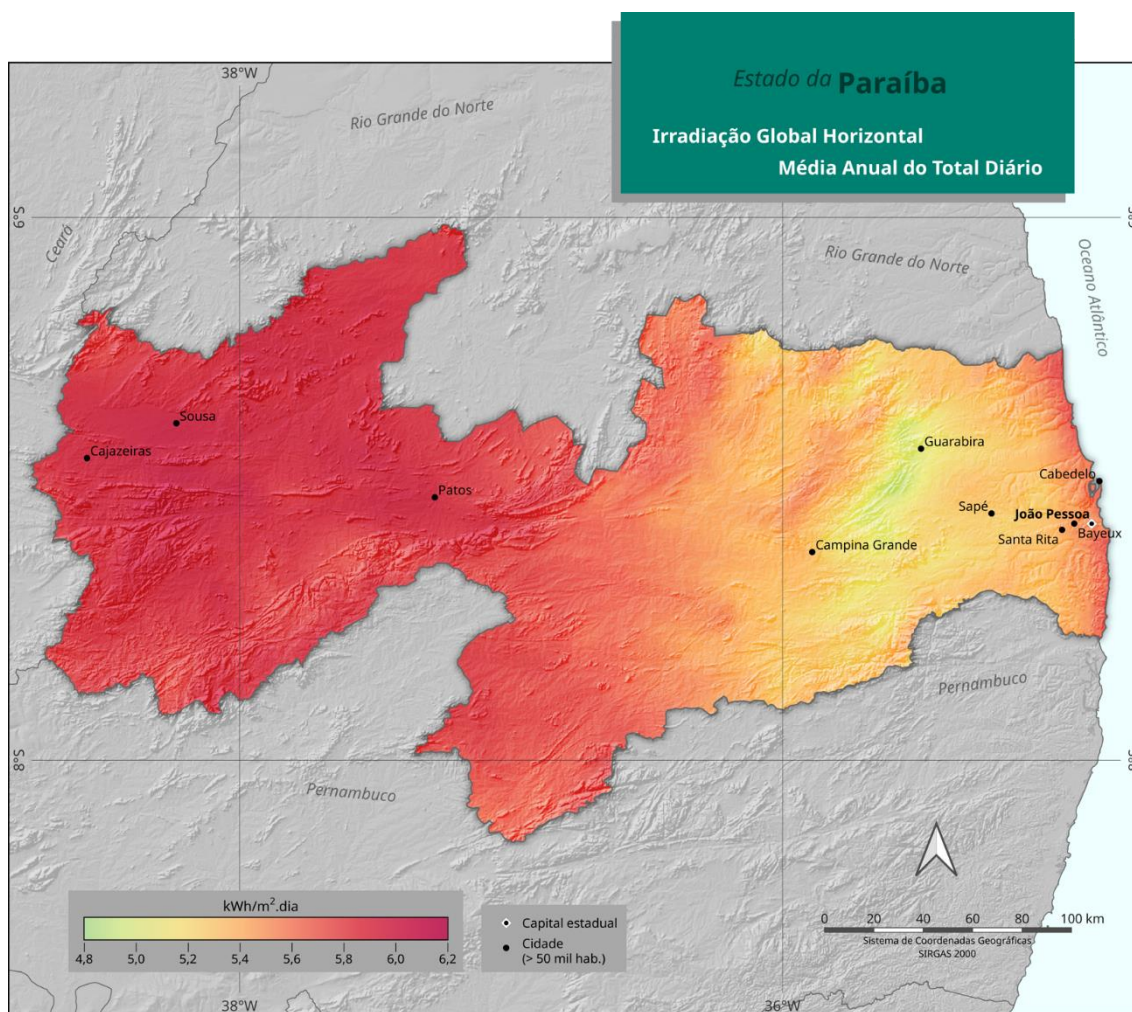

## Sunshine

The figure below shows the map of global irradiation in the horizontal plane (GHI), with the highest incidence of solar energy in the west of the state of Paraíba, with average values for GHI of up to 6.2 kWh/m<sup>2</sup> per day. Brejo Paraibano, located between the Immediate Regions of Campina Grande and Guarabira, showed the lowest incidence of solar energy on the surface (with GHI values of approximately 5 kWh/m<sup>2</sup> day), but still higher than the average determined in previous studies (Pereira *et al.*, 2017) for GHI solar irradiation in the Brazilian territory (around 4.8 kWh/m<sup>2</sup> day) (Atlas Solarimétrico da Paraíba, 2023).

The seasonal variability of the incidence of solar energy in Paraíba increases from July onwards, reaching maximum values in November, when the GHI component on the surface reaches values of up to 7 kWh/m<sup>2</sup> day. The minimum incidence of solar energy in Paraíba is in June, when the highest GHI values observed in the west of the state are around 5.5 kWh/m<sup>2</sup>. This behavior follows the state's seasonal precipitation cycle - where the rainy season occurs mainly between the months of February and June, depending on the region of the state (Atlas Solarimétrico da Paraíba, 2023).

### Greenhouse Gases - GHG in Paraíba

The surveys for the production of the Inventory of Emissions and Removals of Effect Gases (GHG) based on the IPCC for the state of Paraíba have not yet been carried out, however, universities, companies, organizations and the João Pessoa city government have been seeking to meet the demands of the climate agenda both in terms of quantifying and reducing GHG in the state.

According to Santos *et al.* (2023), the distribution by sector reveals that agriculture and livestock, between 2010 and 2011 in the figure below, was the sector responsible for the highest level of greenhouse gas emissions in the state of Paraíba, followed by the energy and land use change and forestry sectors. However, from 2012 to 2018, the last year of the data series, the energy sector was the one that emitted the most polluting gases, with significant growth over the years, while agriculture and livestock occupied second place in the volume of emissions, with a practically constant evolution over this period.

### 38 - GHG emissions by sector in CO<sub>2</sub> and (t) in the state of Paraíba, 2010 - 2018.

Source: Prepared by Santos et al., (2023) SEEG data (2021)

According to data from the Paraíba Alcohol Manufacturing Industry Union (Sindalcool-PB), which represents sugar, ethanol and bioelectricity plants in the state, ethanol consumption in Paraíba (anhydrous and hydrated) avoided around 387,000 tons of greenhouse gases in 2021. Hydrous ethanol, which is sold at gas stations, was responsible for avoiding 159,509 thousand tons of carbon dioxide (CO<sub>2</sub>) in the atmosphere, which is equivalent to the consumption of 136,332,901 million liters. On the other hand, anhydrous, which is added to regular gasoline at a percentage of 27%, avoided a total of 227,421 thousand tons of CO<sub>2</sub> in the atmosphere, which corresponds to the consumption of 177,673,000 million liters (Sindalcool-PB, 2022).

On the other hand, gasoline and diesel, fuels derived from petroleum, have worsened pollutant emissions in the state. The survey carried out by Sindalcool-PB found that, in 2021, ordinary gasoline, with 660,191,214 million liters consumed, emitted around 1,337,382 tons of CO<sub>2</sub> into the atmosphere. Diesel, on the other hand, emitted around 1,131,320 tons of CO<sub>2</sub>, with a consumption of 435,123,116 million liters in Paraíba (using the emission standard of 2.6kg/l of diesel consumed) (Sindalcool-PB, 2022).

The methodology proposed by the GPC (*Global Protocol for Community-Scale Greenhouse Gas Emission Inventories*) was used to draw up the *GHG Emissions Inventory for the municipality of João Pessoa*, based on the National Inventory Guide published in 2006 by the IPCC. João Pessoa's total greenhouse gas emissions were calculated for the years 2011 to 2020 using the *CLIMAS software*. The results are shown in the figure below, separated by the Stationary Energy, Transport and Waste sectors (João Pessoa Climate Action Plan, 2023).

### 39 - Total emissions in João Pessoa, by year and by sector

Source: WayCarbon based on data from Climas software

Emissions fell by around 4% in 2020 compared to 2011. There have been fluctuations in emissions throughout the historical series, with an increase until 2014, followed by a reduction in all subsequent years. Part of the increase up to 2014 was influenced by the growth in emissions from electricity generation nationally, which peaked this year due to the country's water shortage. When comparing 2020 emissions to 2019, there is a reduction of around 10%, which can be explained by the restrictions caused by the COVID-19 pandemic (João Pessoa Climate Action Plan, 2023).

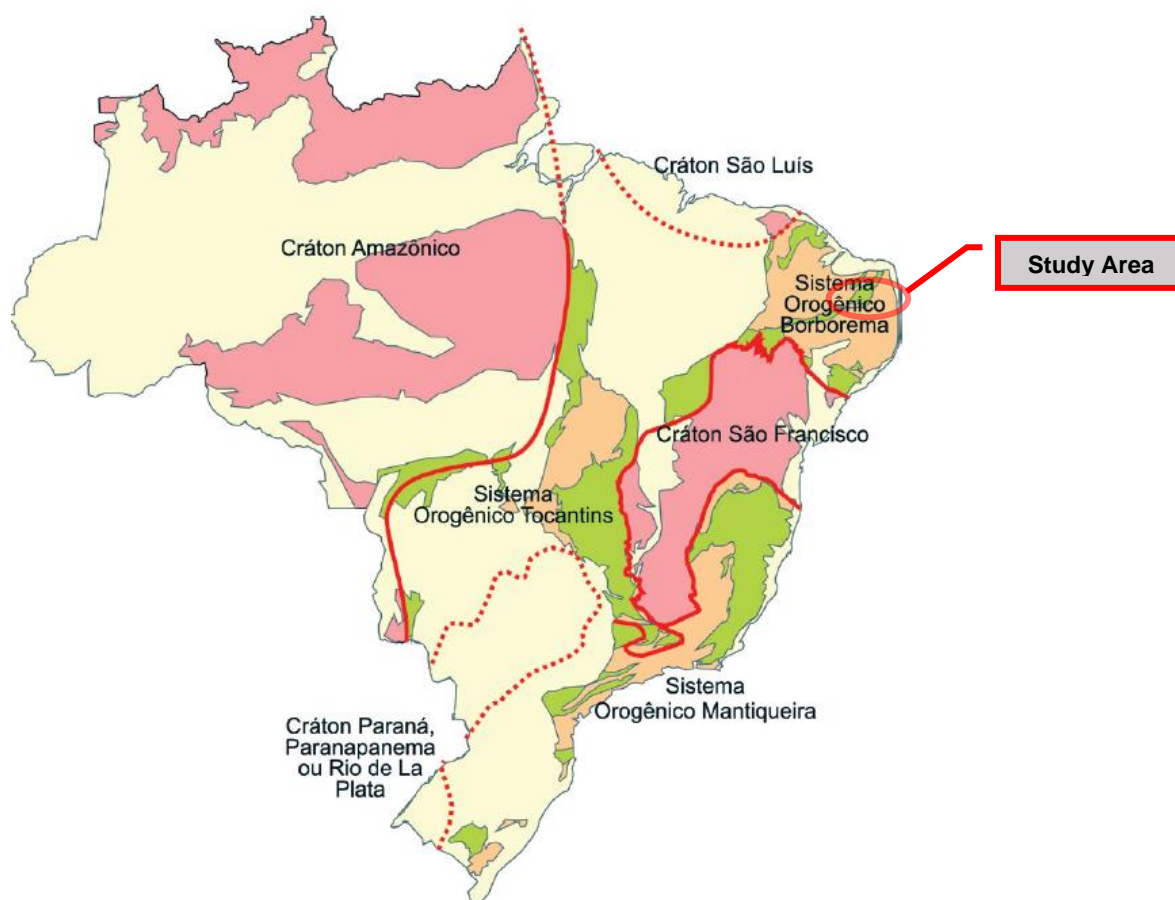

Looking at 2020 alone, the result was 1.1 million tons of CO<sub>2</sub> e (*By default, emissions are reported in terms of CO equivalence<sub>2</sub> = CO<sub>2</sub> e*), with the Transport sector responsible for 40.6% of emissions, followed by the Waste sector (35.7%) and Stationary Energy (23.7%). The main sources of emissions in the Transport sector are related to the consumption of diesel (31%) and gasoline (65%), mostly in land transportation. In the Waste sector, 66% of emissions come from solid waste, most of which is disposed of in landfills, while 33% of emissions in this sector come from wastewater treatment. Finally, most of the emissions from the Stationary Energy sector come from Liquefied Petroleum Gas (LPG), or cooking gas, with 43%, and from the use of electricity, with 32% (João Pessoa Climate Action Plan, 2023).

The Paraíba Water and Sewage Company (Cagepa) is converting a third of all its energy use to renewable sources by the end of 2023. In addition to the initial savings of R\$10 million per year, the company will be taking an important step towards strengthening its environmental policy, i.e. in the first move to the free energy market, Cagepa will be able to remove approximately 25,000 tons of carbon dioxide from the environment per year. With the process completed, by the end of 2024, 37,000 tons of greenhouse gases will have been removed from the atmosphere (Governo da Paraíba, 2023).

### 4.1.2 Geology

According to Hasui (2012), the state of Paraíba is located in the northeasternmost part of the Borborema Orogenic System. This system lies between the Amazon craton to the west and the São Francisco craton to the south and is cut by a narrow strip of the Tocantins Province that extends into areas of Central Brazil. It is presented as a set of three orogenic belts, arranged in the form of a scissors centered on Goiás, with one end in the north advancing to Tocantins and eastern Pará; another to the southwest, extending to Mato Grosso and Mato Grosso do Sul, and the third to the southeast, reaching the south of Minas Gerais.

#### 40 - Existing provinces in the Amazon Craton

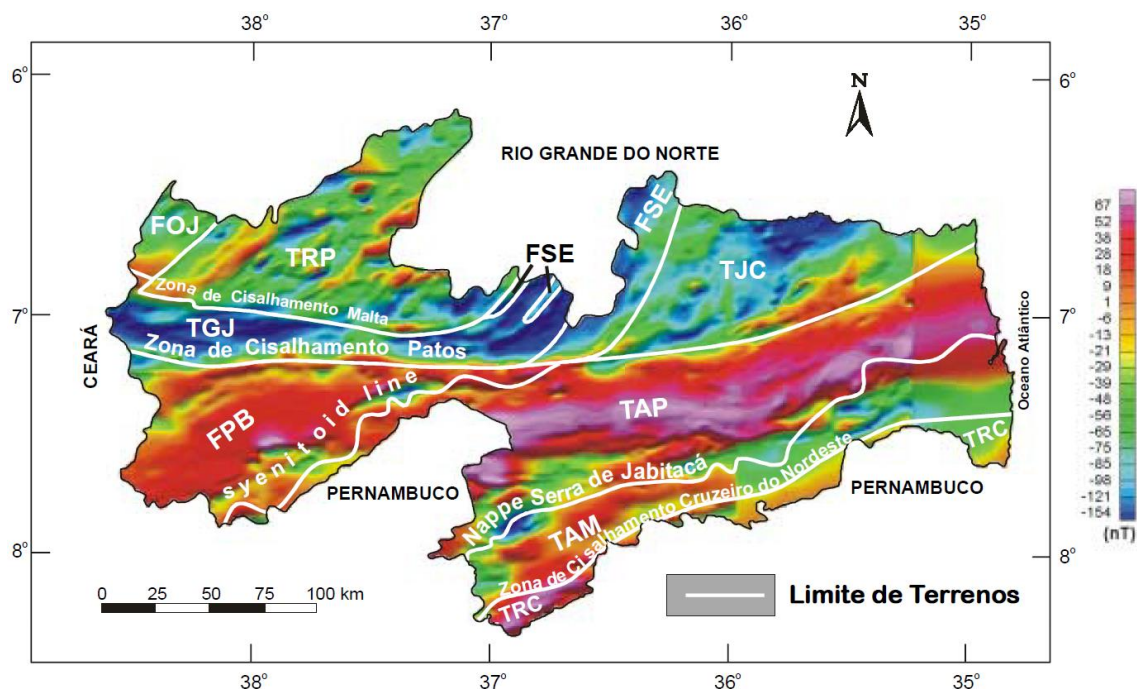

Source: Hasui, 2012.

As shown in the figure below, the state of Paraíba has several segments of the Cearense, Rio Grande do Norte and Transversal domains (subprovinces, superterrains). Paraíba's aeromagnetic patterns support this crustal compartmentalization and highlight the importance of the Patos Lineament, which practically divides the state into two superterrains: one to the north, involving a small portion of the Cearense domain and the Rio Grande do Norte domain, and another to the south, involving the lands of the Transversal domain (CPRM, 2002).

Various geophysical studies show that the crust of the northern superterrane is dense and magnetic, suggesting the existence of a broad lower crustal floor/embayment. On the other hand, to the south, a light, less dense and magnetic crust predominates,

suggesting a predominance of supracrustal rocks and granites, with restricted exposures of the basement (CPRM, 2002).

#### 41 - Aeromagnetic patterns of the Paraíba subsoil and tectono-stratigraphic compartmentalization of Paraíba

Source: CPRM, 2002

The preserved portion of the Ceará domain corresponds to the Orós-Jaguaribe Belt (FOJ), which preserves features generated during rifting, passing into a passive margin, generated at the end of the Paleoproterozoic. The boundary of this belt with the Rio Grande do Norte Domain is the Portalegre Shear Zone (CPRM, 2016).

The Rio Grande do Norte Terrain comprises a Neoproterozoic turbidite platform belt, known as the Seridó Belt (FSE), as well as the basement represented by the Rio Piranhas (TRP), Granjeiro (TGJ) and São José do Campestre (TJC) terrains, dating from the Archean/Paleoproterozoic. The boundary of the Rio Grande do Norte Domain with the Transversal Domain is the Patos Lineament, formed by a bundle of ductile shear zones, where the rocks are plastically deformed, extending for more than 900 km, which continues into the African continent (Castaing *et al.*, 1994).

The Transversal Domain runs from west to east:

- (1) the Piancó-Alto Brígida Belt (FPB) (Cachoeirinha-Salgueiro);
- (2) Alto Pajeú land (TAP);
- (3) Alto Moxotó land (TAM);
- (4) Capibaribe River Land (TRC).

These items are organized into a large structure with portions arranged similarly to dominoes in a row (giving it the name "Domino Megastructure"), whose boundaries represent shear zones that began in the Brasiliano (see table below) or formed through the reworking of shear zones generated in the Cariris Velhos Event (currently the trend

is to position the Cariris Velhos Event as belonging to the Tonian/Neoproterozoic I) (CPRM, 2016).

**Table 19 - Description of geotectonic events in the Borborema Province.**

EVENT	AGE	DESCRIPTION
Brasilian Cycle	Neoproterozoic to Eopaleozoic (640 - 450 Ma)	Event that generated plutonic bodies in the Borborema Province and affected much of the pre-existing lithology.
Old Cariris	Mesoproterozoic (1100 - 950 Ma)*	Some authors consider it to be just a rifting event, while others consider it to be an orogenesis (generator of magmatic bodies).
Trans-Amazon	Paleoproterozoic (~ 2.1-2.0 Ga)	The main event that created the continental crust of the Borborema Province, generating a large part of the basement.

Ma - 10<sup>6</sup> years Ga - 10<sup>9</sup> years

\*Currently, the Cariris Velhos Event tends to belong to the Tonian (Neoproterozoic I) (Santos et al, 2010).

Source: CPRM, 2016

Tectonic compartmentalization models have been developed by various authors (Brito Neves, 1975; 1983; Santos & Brito Neves, 1984; Jardim de Sá, 1994), recognizing a stratigraphic and geochronological complexity, which has led most to conceive of a long Precambrian history.

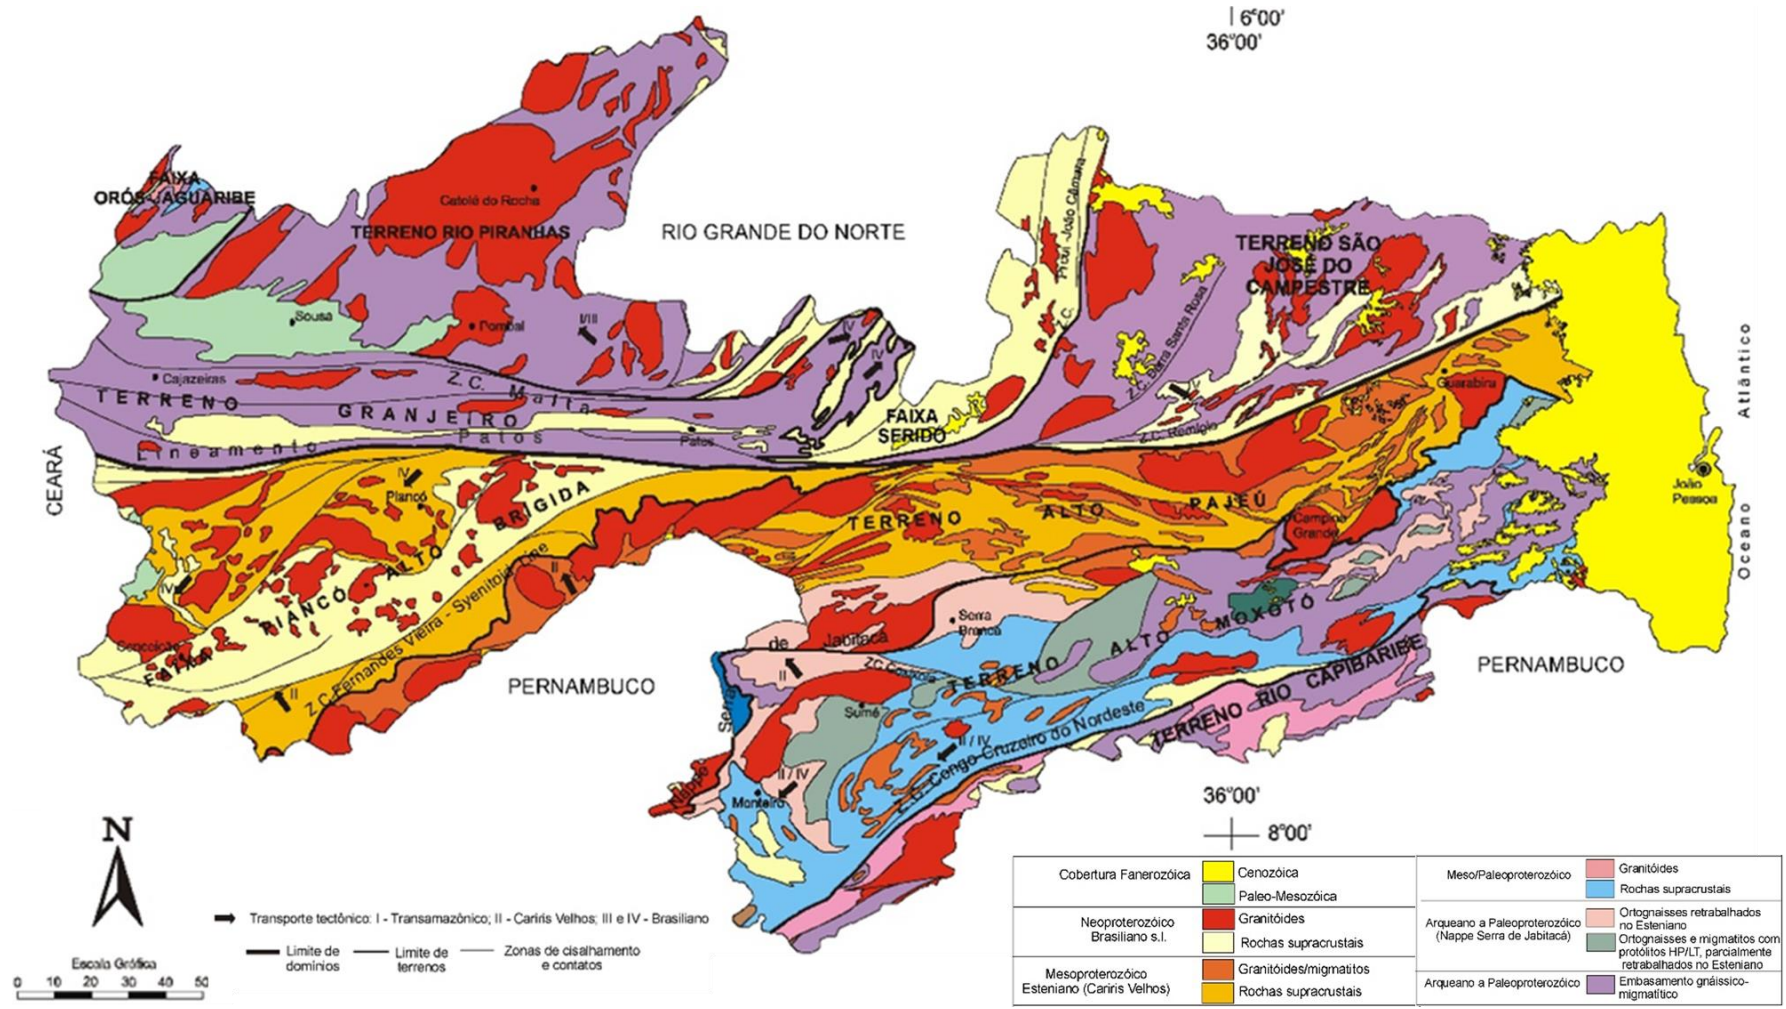

According to CPRM (2002), the geological substratum of Paraíba is dominantly made up of Precambrian rocks, which occupy more than 80% of its territory, complemented by sedimentary basins, Cretaceous volcanic rocks, Paleogene/Neogene platform covers and Quaternary surface formations. The Precambrian area encompasses tracts of the Borborema Province (Almeida *et al.*, 1977), a Meso/Neoproterozoic orogenic belt that stretches across a large part of the Northeast, from Sergipe to the eastern part of Piauí.

The geological map of the state of Paraíba drawn up by CPRM (2002) for the work Geology and Mineral Resources of the State of Paraíba, shows the superficial distribution of the rocks, which are distinguished in the legend according to their geological age, as shown in the figure and table below.

The oldest rocks are from the Precambrian Eon, comprising Archean and Proterozoic rocks; their age varies between 4.5-2.5 billion years, these rocks predominate in the regions north of the Patos Lineament; the rocks of the Paleoproterozoic (2.5 to 1.6 billion years old), Mesoproterozoic (1.6 to 1.0 billion years old), Neoproterozoic (1.0 billion years old to 542 million years old) respectively predominate in regions to the south of the Patos Lineament.

The rocks of the Phanerozoic Eon range in age from 542 million years ago to the present day. In Paraíba, they are distributed in a strip in the far west of the state (around the city of João Pessoa).

The state of Paraíba primarily involves four territories called the Cearense, Rio Grande do Norte and Transversal domains and Paleogene/Neogene coverings and Quaternary surface formations in the eastern part of the state. Geophysical studies support this compartmentalization and highlight the importance of the Patos Lineament, which

divides the state into two super-terrains to the north, a portion of the Cearense domain and the Rio Grande do Norte domain, and to the south, the Transversal domain.

For this work, information from different sources was consulted and compiled, and this main information is compiled, due to the scale of the project, in the information contained in the geological map of the state of Paraíba (**Error! Reference source not found.**) and in the expanded legend (Table 20), which were sourced from the Geological Map of Paraíba (CPRM, 2002) and the book Geodiversity of the State of Paraíba (CPRM, 2016).

It should therefore be noted that in the study region, considering the geological macro-conditions of the terrain, it is possible to simplify the study region into three main areas: the more coastal regions, where there are areas of more recent geology, where the Detrital Coverings predominate (which may be Tertiary or Quaternary) and the regions of geology with the presence of much older rocks, identified as the areas where rocks from the Proterozoic predominate to the south of the Patos Lineaments and from the Archean period to the north (in this case they are identified and dated, using specific methods with rocks from around 3.85 billion years ago).

According to Nascimento (1998), the Patos Lineament is one of the main examples of the Brazilian trans-currents that segment the Borborema Province in an E-W direction (41). It comprises a band of high-temperature millonites, with an approximately E-W foliation and sub-vertical dips either to the south or to the north, containing a sub-horizontal mineral lineation (amphibole, sillimanite and cordierite). The kinematic criteria (e.g. S-C foliation, asymmetry of the feldspar phenocrysts, elongated shape of the granite bodies and xenoliths contained therein) indicate dextral movement (Corsini *et al.*, 1991).

For the younger terrains, in flatter areas, mainly in the coastal region, there are, in sequence from the youngest sedimentary deposit to the oldest, marsh and mangrove deposits, which contain materials such as clay and silt rich in organic matter and peat may also occur; recent undifferentiated coastal deposits, where areas of sand with marine shells are predominant; clays and silt always rich in organic matter; fluvial and aeolian deposits, where clayey sand and silt rich in organic matter occur; dunes of well-sorted quartz sand (from aeolian actions) and, finally, ancient undifferentiated coastal deposits: well-sorted sand with fossil tubes.

It is worth remembering that in the region furthest from the coast there is the Barreiras Formation covering the Precambrian crystalline bedrock and the sedimentary rocks of the Paraíba Group of the Pernambuco-Paraíba Sedimentary Basin, with poorly consolidated sandy-clay sediments that basically come from the products resulting from the action of weathering on the crystalline bedrock, located further inland from the continent. In the state of Paraíba, this bedrock is made up of the crystalline rocks of the Borborema Plateau. Sedimentological analyses carried out on the Barreiras Formation, in the state of Paraíba, found that the sources of the sediments were granites, gneisses and schists, which are predominant lithologies on the Borborema Plateau (Furrier *et al.*, 2006).

According to Alheiros *et al.* (1988) *apud* Furrier *et al.*, (2006), the sediments of the Barreiras Formation were deposited through interlaced fluvial systems developed over alluvial fans. The interlaced fluvial systems facies presents deposits of varied granulometry with gravels and coarse to fine sands, yellowish cream in color, with intercalations of microclasts of silty clay, indicative of calm sedimentation environments such as alluvial plains. The fan facies is made up of reddish-cream polymitic

conglomerates, with subangular quartz pebbles and granules and blocks of reworked clay, in tabular and lenticular bodies up to one meter thick, interspersed with a less thick silty-clay layer.

Technically, the areas where these deposits occur have more or less resistant soils and are highly susceptible to phenomena resulting from precipitation processes, such as accentuated erosion and/or flooding, since sometimes their location and morphology do not allow for adequate drainage. It also has variable agricultural aptitudes, but the predominance is of low aptitude.

The rocks to the north of the Patos Lineament in the state of Paraíba are predominantly from the Archean (Ay), made up of originally granitic rocks that underwent metamorphism (orthogneisses), gray in color, of the TTG type (tonalitic trondhjemitic-granodioritic). They often have dark bands (called mafic) rich in hornblende and/or biotite. In some places, these orthogneisses encompass portions of other mafic and ultramafic rocks (these portions are called xenoliths), all metamorphosed and belonging to the Granjeiro Complex (CPRM, 2016).

The two superterrains to the north of the Patos Lineament, a portion of the Cearense Domain and the Rio Grande do Norte Domain, and to the south, the Transversal Domain, occupy areas belonging to the Borborema Province, which is made up of terrains or fold belts associated with Meso and Neoproterozoic orogenesis and related granitogenesis, including ancient fragments of the Archean/Paleoproterozoic, Mesozoic tectonic sedimentary basins and finally recent surface coverings.

Located in NE Brazil, the Borborema Province is bounded by the Phanerozoic sediments of the Paraíba Basin to the W, the coastal basins to the N-NE, and the São Francisco and São Luiz Brazilian cratons to the south and extreme NW, respectively. It has a stratigraphic and geochronological complexity that defines a series of tectonic compartments that are defined by different geological and geophysical aspects. Tectonic compartmentalization models have been proposed by various authors (Nascimento, 1998; Rodrigues, 2008).

The Borborema Province comprises supracrustal belts (metasediments and metavolcanics) of Proterozoic age, which can present a simple geological evolution, linked to a single orogenic event (monocyclic belts) or, alternatively, a complex sequence of metamorphic events and granitoid intrusion, due to the action of more than one orogenic event (polycyclic belts). Its bedrock is represented by Paleoproterozoic to Archean gneissic-migmatitic rocks, found adjacent to or within the supracrustal belts. Extensive transcurrent Brazilian shear zones section the Borborema Province in the E-W and NE directions, and these zones generally controlled the accommodation of various granitoid bodies. In a paleogeographic context, the Borborema Province shows continuity with the orogenic belts to the east of the West African craton (Nascimento, 1998).

In Paraíba, granitoid suites represent a significant part of the region's geology. These suites consist of different types of granites and associated rocks that were formed through different magmatic processes. The granites found in Paraíba include: Porphyritic Granites (feldspar crystals surrounded by a fine matrix of minerals such as quartz and mica), Alkaline Granites (high chemical composition of potassium and sodium), Biotite and Hornblende Granites (contain significant amounts of biotite and/or hornblende minerals), S-Type Granites (are of sedimentary origin, composition rich in aluminum).

The first tectonic compartmentalization of the Borborema Province is due to Brito Neves (1975), followed by other authors who generally included bands, fold systems or metamorphic belts, separated by median massifs and geoanticlinal zones of a gneissic-migmatitic-granitic nature, which contain supracrustal bands in their interiors (CPRM, 2001). The supracrustal rocks in Paraíba are mainly made up of formations of metamorphic and sedimentary rocks that formed above the earth's crust. They are an integral part of the region's geology and play an important role in understanding the geological history and evolution of the state.

The Campina Grande region is a key area for understanding the Borborema Province. The region is home to four of the most important terrains that make up the framework of the Borborema Province: from north to south, the Rio Grande do Norte Terrain (RGN), made up mainly of Paleoproterozoic rocks that have preserved the Archean cores: the Alto Pajeú Terrain (TAP), made up of orthogneisses (Cariris Velhos) and supracrustals (Complexo S. Caetó) of Eo-Neoproterozoic age. Caetano Complex) of Eo-neoproterozoic age; Alto Moxotó Terrain (TAM), structured by very varied orthognaths, migmatites, mafic-ultramafic rocks: Rio Capibaribe Terrain (TRC) composed mainly of schistose supracrustals, quartzites with calcium-silicate and carbonate intercalations. The first of these terrains is representative of the northern Borborema domain and the last three are part of the Transverse Zone Domain. All of these terrains contain granitic intrusions associated with the Brasiliano Event (granite complexes of Esperança, Campina Grande, Queimadas, Timbaúba, etc.) (Rodrigues, 2008).

In the western part of the state of Paraíba, the structural geological framework of this region shows a relief well shaped by the Malta fault to the south, which runs east-west, and several other smaller elements, which run preferentially NE-SW. It is worth mentioning that the Malta fault is the northern controller of the E-W lineaments in the state of Paraíba, which are mainly controlled further south by the Patos fault, both of which have regional dimensions.

Still areas of the Borborema Province in the Rio Grande do Norte Domain, the Rio Piranhas subdomain separates the Orós-Jaguaribe belt from the Seridó belt; it is made up of Paleoproterozoic rocks belonging to the Caicó Complex, formed by intrusive orthogneisses of the Poço da Cruz Suite and rare metasedimentary supracrustals. Metamorphism in this region varies from the green schist facies to high amphibolite, and may have reached the granulite facies. The Poço da Cruz Suite has recently been dated with ages of between 2.0 and 1.7 Ga. This area is part of the Rio do Peixe basins (Hackspacher *et al.*, 1990; Ribeiro, 2020).

In the southwestern part of the state of Paraíba, in the areas of the Transversal Domain, there is the Piancó-Alto Brígida Belt formed by meta-volcano-sedimentary and metasedimentary sequences and Neoproterozoic plutonic rocks. Unlike the previously described terrains, there are no exposures of Archean or Paleoproterozoic rocks. The boundary with the Alto Pajeú Terrain is made up of the Fernandes Vieira Shear Zone and the *syenitoid line*, the latter being represented by the alignment of shoshonitic and ultrapotassic syenitic and granitic batholiths. The northern boundary with the Granjeiro Terrain is marked by the Patos Shear Zone. Bittar (1998) separated this belt into tectono-stratigraphic terrains, developed under different metamorphic and deformational regimes and juxtaposed during the Brasiliana orogeny (CPRM, 2002).

### 4.1.3 Hydrogeology

According to the Hydrogeological Map of the State of Paraíba at a scale of 1:500,000 drawn up by the Geological Survey of Brazil - CPRM (2019), there are three main hydrogeological domains in the state: Granular, Karstic and Fractured, where only the form of accumulation and conduction of groundwater is considered; *Aquifer Systems* (union of two or more aquifers to create a new set of aquifer units); *Aquifers* (corresponding to geological units capable of storing water and allowing it to circulate).

The mapping also considered geological units that do not store water or store but do not transmit water - Non-Aquifers - these units are shown in brown on the Hydrogeological Map.

The map presented below has been organized on the basis of Hydrostratigraphic Units, which aggregate geological formations or parts of them that store and transmit groundwater in a similar way and with yields of the same order of magnitude. These Hydrostratigraphic Units constitute the basic indivisible elements of the mapping and have been described according to the explanatory text on the map itself.

The legend also accompanies a water productivity table organized as Very High (1), High (2), Moderate (3), Generally Low (4), Generally Very Low (5), Not Very Productive or Not Aquiferous (6).

After the map, the hydrogeological units are described.

## Map 2 - Hydrogeological map

## Granular Aquifer Domains

### **Alluvial deposit - Qa**

*Location* - It occurs in a discontinuous manner, on flat terrain, throughout the state of Paraíba in an area of 3,147 km<sup>2</sup>, but it stands out in the coastal region where it has a more marked hydrogeological expression. Highlights include the Tracunhaém/Goiana, Abiaí, Garaú, Guriji and Gramame river basins, to the south of the João Pessoa Metropolitan Region, and the Paraíba, Miriri, Mamanguape, Sinimbu, Camaratuba and Guajú river basins, located in the northern part of the coastal zone.

*Lithological characteristics* - These are sandy, unconsolidated sediments, fine to medium in grain size, but also coarse, with a contribution of silt and clay in the ebb areas. Gravel beds, rich in quartz pebbles and clasts, are common both at the base and interspersed in the alluvial package. Its thickness varies, with an average of 5 meters.

*Hydrogeological characteristics* - This is a free-flowing, discontinuous aquifer with a small extent and thickness. They generally produce flows of between 1 and 5 m<sup>3</sup>/h, although in the deposits that occur in the rivers that drain the coastal zone they can produce flows of up to 10 m<sup>3</sup>/h depending on their thickness. They are generally used through shallow wells (tubular and cacimbões) to meet small demands.

*Productivity* - In most of Paraíba, an area of 2,337 km<sup>2</sup>, productivity is *generally Very Low, but locally Low (Class 5)*, with the exception of the coastal areas, 810 km<sup>2</sup>, where productivity is *generally Low, but locally Moderate (Class 4)*.

*Hydrostratigraphic Unit acronym* - (4) Qa and (5) Qa

*Quality* - Its waters have variable physical and chemical characteristics with extreme values of Electrical Conductivity (EC). As an example, we can cite the alluvial fans that occur near the coast, in the data collected, the Electrical Conductivity (EC) can reach a minimum value of 104 µS/cm to a maximum value of 4,400 µS/cm, with an average of 860 µS/cm and Total Dissolved Solids (STD), an average of 573 mg/L. They are highly vulnerable to contamination.

### **Coastal deposit -Depósito Litorâneo - Ql**

*Location* - They occur all along the coast, on flat terrain, from the municipalities of Caaporé and Pitimbu, on the border with the state of Pernambuco, to the municipality of Mataraca, on the border with the state of Rio Grande do Norte, covering a total of 165 km<sup>2</sup>.

*Lithological characteristics* - These correspond to recent, polygenic, unconsolidated sediments, made up of colluvium, river terraces, marine terraces, beach sands and old dunes, with intensely varied granulometry, from the clay fraction to the coarse sand fraction with gravel levels, especially on the river terraces.

*Hydrogeological characteristics* - This is a free-flowing aquifer, with an average thickness of 15 meters, a static level between 1 and 5 m deep, and flows varying between 1 and 10 m<sup>3</sup>/h.<sup>3</sup>

*Productivity* - In general, this hydrostratigraphic unit has *very low* productivity, *but it is locally low (Class 5)*.

*Hydrostratigraphic Unit acronym* - (5) Ql

*Quality* - There is not much information on the physical chemistry of the water in this hydrogeological unit. The results obtained show an average Electrical Conductivity (EC) of 556  $\mu\text{S}/\text{cm}$  and an average Total Dissolved Solids (TDS) of 371 mg/L. Locally, there are maximum values for these parameters above the drinking water limits. In general, the waters of this aquifer are used by the population for secondary purposes, since they are highly vulnerable to contamination.

### **Campos Novos - Ec**

*Location* - Occurs in isolation, on gently undulating terrain, in an area of 105 km<sup>2</sup>, encompassing part of the municipalities of Sossego, Barra de Santa Rosa, Olivedos, Boa Vista, Caturité and Boqueirão, in the central and north-central regions of the state.

*Lithological characteristics* - made up predominantly of poorly consolidated sediments with very low permeability, such as bentonite and montmorillonite clays, with levels of fossiliferous "chert".

*Hydrogeological characteristics* - Unit of small regional expression, discontinuous, zero to very low hydraulic conductivity, behaving as a non-aquifer.

*Productivity* - Low Productivity or Non-Aquiferous (Class 6).

*Hydrostratigraphic Unit acronym* - (6) Ec

### **Barreiras - ENb**

*Location* - It takes the form of extensive tablelands along the coastline, with an average width of around 30 km and an outcrop area of 3,078 km<sup>2</sup>.

*Lithological characteristics* - It is made up of unconsolidated to semi-consolidated sediments, from sandy-clay to silty-clay, locally with conglomeratic fractions of varying colors. Of continental origin, it has an average thickness of around 60 meters.

*Hydrogeological characteristics* - This is a free-flowing aquifer, a regional extension, generally continuous, with local conditions of semi-confinement and facies variations that lead to significant changes in storage and permeability conditions. Its flow rates vary from 1.0 to 50 m<sup>3</sup>/h and specific flow rates from 0.04 to 2.0 m<sup>3</sup>/h/m for 25 meters of lowering and 12 hours of pumping.

*Productivity* - In general, there is an increase in productivity from west to east and from south to north of the area of occurrence, with the highest productivity occurring in the Paraíba Basin domains. In the domains of the Paraíba Basin, in the northern portion, this hydrogeological unit has *Moderate* productivity (Class 3) which, towards the south, varies to *Generally low, but locally moderate* (Class 4), with the exception of an area to the southwest and south where productivity changes to *Generally very low, but locally low* (Class 5). Preponderately, the lowest yields are observed to the west in areas where the Barreiras Formation is overlying the rocks of the crystalline basement, where they are small and thick. Therefore, productivity is *generally very low, but locally low* (Class 5). In these areas, the closer to the edge, the more unproductive the Barreiras is. In this situation, wells are drilled through the small thickness of the Barreiras to fetch water from the crystalline bedrock.

*Hydrostratigraphic Unit acronym* - (3) ENb, (4) ENb and (5) ENb

Quality - The water is of good quality, suitable for human consumption, with an average Electrical Conductivity (EC) of 375  $\mu\text{S}/\text{cm}$  and Total Dissolved Solids (TDS) averaging 243 mg/L. In the areas overlying the basement rocks, the Electrical Conductivity (EC) is higher, with an average of 639  $\mu\text{S}/\text{cm}$  and Total Dissolved Solids (STD), with an average of 415 mg/L. It shows low to medium vulnerability to contamination.

### **Serra do Martins - ENsm**

*Location* - The deposits of the Serra do Martins Formation occur discontinuously on gently undulating to mountainous terrain in the north-east of the state, covering a total area of 294 km<sup>2</sup>. They are a residual sedimentary layer, resting discordantly on rocks of the Precambrian crystalline basement.

*Lithological characteristics* - It essentially comprises a sequence of fine to very coarse clayey sandstones, sometimes conglomeratic, of variegated colors, with clay intercalations and a laterite crust with quartz pebbles.

*Hydrogeological characteristics* - Free, discontinuous aquifer, small in extent and between 30 and 50 meters thick. It has an average flow rate of 2 m<sup>3</sup>/h and a specific flow rate of 0.33 m<sup>3</sup>/h/m.<sup>3</sup>

*Productivity* - According to the classification adopted, productivity is *Generally Very Low, but Locally Low (Class 5)*.

*Hydrostratigraphic Unit acronym* - (5) ENsm

*Quality* - There is not much information on the physical and chemical quality of the water in this aquifer, however, analyzing existing wells in SIAGAS shows a Hydraulic Conductivity (EC) ranging from 550 to 4800  $\mu\text{S}/\text{cm}$ , with an average of 1989  $\mu\text{S}/\text{cm}$ . It shows low vulnerability to contamination.

### **Piranhas River - Klrp**

*Location* - It occurs in the northwest of the state, on gently undulating terrain, precisely in the Rio do Peixe Sedimentary Basin, with an area of 51 km<sup>2</sup>.

*Lithological features* - The unit is made up of polymictic conglomerates and coarse sandstones, with interspersed fine and micaceous sandstones, siltstones and claystones.

*Hydrogeological characteristics* - Free, discontinuous aquifer, small lateral extension, mostly limited to the municipality of Sousa, average flow of 4.0 m<sup>3</sup>/h, Specific Flow of 0.2 m<sup>3</sup>/h/m for 12 hours of pumping and thickness that can reach 300 meters. The lithotypes are generally cemented and show a low degree of fracturing and very low permeability. Productivity - *Generally very low productivity, but locally low (Class 5)*.

*Hydrostratigraphic Unit acronym* - (5) Klrp

*Quality* - It has an average Electrical Conductivity (EC) of 1360  $\mu\text{S}/\text{cm}$  and Total Dissolved Solids (STD) of 884 mg/L. Vulnerability to contamination is predominantly high.

### **Souza - Klsz**

*Location* - It occurs in the northwestern region of the state, on gently undulating terrain, precisely in the Rio do Peixe Sedimentary Basin, with an area of 448 km<sup>2</sup>.

*Lithological features* - In the upper section, a sandy sequence with subordinate pelites predominates, while in the lower section there is a predominance of siltstones and shales.

*Hydrogeological characteristics* - Regional in extent, thickness of up to 800 meters, lateral extension limited to the Rio do Peixe Basin. The lower section predominates in most of this basin, where flow rates are generally less than 1 m<sup>3</sup>/h. The upper section is free, either outcropping or covered by the Rio Piranhas formation with an average flow of 2.64 m<sup>3</sup>/h and an average specific flow of 0.35 m<sup>3</sup>/h/m for 12 hours of pumping and very low hydrogeological potential.

*Productivity* - According to the methodology used, it is Low Productivity or Non-Aquiferous (Class 6), although it can occur with Generally Very Low productivity, but Locally Low in (Class 5) when underlying the Rio Piranhas Formation or in areas associated with the upper portion of this unit (not individualized in this scale of work).

*Hydrostratigraphic Unit acronym* - (6) Kl sz

*Quality* - It has an average Electrical Conductivity (EC) of 1250 µS/cm and Total Dissolved Solids (STD) of 812 mg/L. Vulnerability to contamination is medium.

### **Antenor Navarro - Klan**

*Location* - It occurs in the northwestern region of the state, on gently undulating terrain, precisely in the Rio do Peixe Sedimentary Basin, with an area of 549 km<sup>2</sup>.

*Lithological characteristics* - The base is made up of conglomerates and coarse sandstones, which gradually change to fine sandstones and micaceous sandstones interspersed with claystones towards the top of the sequence.

*Hydrogeological characteristics* - It occurs as a free aquifer in the northwest of the Triunfo Sub-Basin, the entire northwest, north and northeast edges of the Sousa Sub-Basin and the entire Pombal Sub-Basin. In the rest of the Rio do Peixe Sedimentary Basin, it is confined by the lower section of the Sousa Formation. It is a continuous aquifer, with a regional extension, an average thickness of 100 meters, primary porosity, permeability and very low hydrogeological potential. Flow varies between 1 and 10 m<sup>3</sup>/h and specific flow between 0.04 and 0.4 m<sup>3</sup>/h/m, for 12-hour pumping. Productivity - According to the classification adopted, it has Generally Very Low productivity, but Locally Low (Class 5).

*Hydrostratigraphic Unit acronym* - (5) Klan

*Quality* - Electrical Conductivity (EC) averages 962 µS/cm and Total Dissolved Solids (TDS) 625 mg/L. Vulnerability to contamination is predominantly high, although it can vary to medium in some places.

### **Beberibe - K2be**

*Location* - It occurs along the state's coastal strip, in the Paraíba sedimentary basin, generally underlain by Cenozoic sediments of the Barreiras Formation and karst units.

The outcropping area is located to the south-southwest, on flat to gently undulating terrain and is restricted to 118 km<sup>2</sup>.

*Lithological features* - It essentially comprises a sequence of continental quartz sandstones in the lower section, graduating to calcareous sandstones, marls and detrital limestones in the upper section.

*Hydrogeological characteristics* - Continuous, porous aquifer, regional in extent, with confined and free conditions. When free, it has a thickness of up to 100 meters, flows between 10 and 25 m<sup>3</sup> /h and specific flows between 0.4 and 1 m<sup>3</sup> /h/m for 12 hours of pumping. When in confinement, its thickness can reach 300 meters, flow rates greater than 100 m<sup>3</sup> /h and specific flow rates greater than 4 m<sup>3</sup> /h/m. This greater productivity occurs in the coastal zone, when confined by the carbonates of the Gramame Formation, from the border with Pernambuco to the border with Rio Grande do Norte, in a subsurface area of approximately 1,420 km<sup>2</sup>. It is important to note that this unit, when confined, can vary locally from very high to high depending on the thickness and facies variations.

*Productivity* - It has *very high productivity (Class 1)* in the coastal strip, where it is confined by karst hydrostratigraphic units, and when outcropping it has *generally low productivity, but locally moderate (Class 4)*.

*Hydrostratigraphic Unit acronym* - (1) K2be and (4) K2be

*Quality* - In the lower section the water is good for human consumption, with an average Electrical Conductivity (EC) of 300 µS/cm and Total Dissolved Solids (TDS) averaging 195 mg/L. The upper section has water with a higher conductivity, an average of 818 µS/cm and total dissolved solids of 532 mg/L. It shows low to medium vulnerability to contamination.

### **Mauriti - Sm**

*Location* - It occurs in the west of the state in an area of 11.9 km<sup>2</sup> in the municipalities of Monte Horebe and Bonito de Santa Fé, on undulating and mountainous terrain, respectively. Although its area is restricted to Paraíba, this unit continues into Ceará and is an integral part of the stratigraphic sequence of the Araripe Sedimentary Basin.

*Lithological characteristics* - It consists lithologically of fine to coarse sandstones, sometimes conglomeratic, consolidated, generally with a high degree of cementation, compaction and fracturing.

*Hydrogeological characteristics* - Due to its restricted presence in the state of Paraíba and the lack of studies and well data, the description will be similar to its continuity in Ceará. Aquifer of limited extent, continuous, free, with an average thickness of 70 meters, an average flow of 17 m<sup>3</sup> /h and an average specific flow of 0.67 m<sup>3</sup> /h/m. Groundwater storage is partly conditioned by the degree of fracturing. In Ceará, it is also confined by the Brejo Santo Formation, in which case its productivity is moderate.

*Productivity* - According to the classification adopted, productivity is *Generally Low, but locally Moderate (Class 4)*.

*Hydrostratigraphic Unit acronym* - (4) Sm

*Quality* - The water is normally of good chemical quality, in the order of 308 µS/cm and 200 mg/L for Electrical Conductivity (EC) and Total Dissolved Solids (STD), respectively. Low vulnerability to contamination.

## Karst Domain

### **Gramame - K2g**

*Location* - It occurs on gently undulating terrain over an area of 25 km<sup>2</sup> in the municipalities of Pitimbu and Alhandra, although it is present in the subsurface throughout the Paraíba Basin.

*Lithological characteristics* - With an average thickness of 40 meters, this unit is composed, in the lower section, of calcareous sandstones that gradually pass into sandy limestones, culminating in the upper section in very fossiliferous dolomitic and marly limestones.

*Hydrogeological Characteristics* - Continuous, with limited regional extension, low karstification and very low or zero productivity. It gains importance due to the underlying presence of the Beberibe hydrostratigraphic unit (K2be), with *very high* productivity (Class 1). When subsurface, this unit generally underlies the non-aquiferous karst unit Maria Farinha (Elmf), which is not outcropping and is not represented on this map.

*Productivity* - Low Productivity or Non-Aquiferous (Class 6).

*Hydrostratigraphic Unit acronym* - (6) K2g

### **Jucurutu - NP3sjuc**

*Location* - It rises on gently undulating terrain over an area of 6 km<sup>2</sup> in the municipality of Várzea, in the north-central part of the state.

*Lithological characteristics* - This unit is mainly composed of marble, although gneiss, quartzite and calcissilicate rocks do occur.

*Hydrogeological characteristics* - A discontinuous hydrostratigraphic unit with limited regional extension and a low degree of karstification. Its productive characteristics are associated with fractures and dissolution cavities, where productivity is very low or nil.

*Productivity* - Low Productivity or Non-Aquiferous (Class 6).

*Hydrostratigraphic Unit acronym* - (6) NP3sjuc

## Fractured Domain

### **Undifferentiated Fractured Basement - Fr**

*Location* - With an area of 48,498 km<sup>2</sup>, it is the most predominant hydrostratigraphic unit. It occurs in all regions of the state, with the exception of the sedimentary basins (Paraíba, Rio do Peixe and a small part of the Araripe), as well as the alluvial cover.

*Lithological characteristics* - The Undifferentiated Fractured Basement defined here encompasses a series of lithological types, sometimes comprising metasediments and sometimes rocks from the crystalline basement, such as granites, volcanic rocks, metavolcanics, gneisses, migmatites, granulites, schists and quartzites.

*Hydrogeological characteristics* - This is a discontinuous environment, characterized by the occurrence of random reservoirs that together form a hydrogeological unit. It has low flow rates, generally less than 2 m<sup>3</sup> /h, although locally higher values can occur, depending on structural conditions. All areas with steep terrain and inselbergs are unproductive, with a remote possibility of obtaining water.

*Productivity* - Productivity generally falls into the class *Generally Very Low, but Locally Low (Class 5)*, although where the relief is steep and inselbergs, productivity is characterized as *Low Productive or Non-Aquiferous (Class 6)*.

*Hydrostratigraphic Unit acronym* - (5) Fr and (6) Fr

*Quality* - Its waters are generally salinized. The most likely causes of this salinization are the practically non-existent surface weathering mantle, the low rainfall rate and the high evaporation rates. In the areas where aquifers occur (Non-aquifer, class 6), the vulnerability is insignificant. In the other areas of the fractured basement, the natural vulnerability to contamination is low to medium.

#### **4.1.4 Mining Potential**

With regard to mining, a total of 4,240 polygonal areas were identified (database as of May 2, 2024), of which only 216 polygonal areas are mining concessions - the final stage of the federal government's authorization process so that mining can effectively operate, provided it has the appropriate environmental licensing.

It is important to consider that in Brazil, as provided for in the Mining Code, mineral assets belong to the Federal State, regardless of who owns the land, so - except for specific restrictions: Integral Protection Areas, Security Areas, Indigenous Lands, Urban Areas, among others - access is a right of mining, which must occur in agreement with the owners, but may come by court order, in the event of failure to agree, according to Article 27 of the Mining Code (Decree Law 227/1967) to enable mineral research:

*Art. 27 - The holder of the research authorization may carry out the respective work, as well as the necessary auxiliary works and services, on land in the public or private domain, covered by the areas to be researched, provided that it pays the respective owners or squatters a rent for occupying the land and compensation for damages that may be caused by the research work, subject to the following rules:*

*I - The rent may not exceed the amount of the maximum net income of the property to the extent of the area to be actually occupied;*

*II - Compensation for damage caused may not exceed the property's market value to the extent of the area actually occupied by the research work, except in the case provided for in the following item;*

*III - When the damage is such as to render the entire property on which the area required for the research work is located unusable for agricultural or pastoral purposes, the compensation for such damage may reach the maximum market value of the entire property;*

*IV - The sales values referred to in items II and III will be obtained by comparing the sales values of properties of the same type in the same region;*

*V - In the case of public land, the payment of rent is waived and the holder of the survey is only liable to pay for damages;*

*VI - If the holder of the Exploration Permit, by the date of the transcription of the authorization title, does not attach to the respective process proof of agreement with the owners or squatters of the land regarding the rent and compensation referred to in this article, the Director General of the D. N. P. M.<sup>18</sup>, within 3 (three) days of that date, shall send a copy of the title deed to the Judge of the District where the deposit is located;*

*VII - Within 15 (fifteen) days from the date of receipt of this communication, the judge shall order an appraisal of the income and of the damages referred to in this article, in the manner prescribed in the Code of Civil Procedure;*

*VIII - The District Prosecutor will be summoned for the terms of the action, as representative of the Union;*

*IX - The evaluation will be judged by the judge within a maximum of 30 (thirty) days from the date of the order referred to in item VII, and any appeals lodged will not have suspensive effect;*

*X - The legal costs of the evaluation process will be paid by the holder of the research authorization;*

*XI - Once the appraisal has been judged, the judge shall, within eight (8) days, summon the owner to deposit an amount corresponding to the rent for two (2) years and the security for payment of the indemnity;*

*XII - Once these deposits have been made, the Judge shall, within eight (8) days, summon the owners or squatters of the land to allow the survey work to be carried out, and shall communicate his order to the Director General of the D. N. P. M. and, upon request by the holder of the survey, to the local police authorities to guarantee the execution of the work. M. and, at the request of the owner of the survey, to the local police authorities, to guarantee the execution of the work;*

Once the Exploration phase has been completed and there are conditions to proceed with mining, the area of the deposit is delimited for the imposition of possession<sup>19</sup>, it is also important to note article 59 of the Mining Code, which states:

---

<sup>18</sup> The DNPM - National Department of Mineral Production was abolished and its duties were transferred to the ANM - National Mining Agency.

<sup>19</sup> The imposition of possession is an administrative formality that consists of georeferencing, demarcation and setting of demarcation marks for the area granted by means of a Mining Ordinance for mineral exploitation, precisely defining the location and space of the deposit/mine. Obligation of the holder under Arts. 44 and 45 of Decree-Law 227/1967 - Mining Code.

*Art. 59 Not only the property where the deposit is located, but also the neighboring properties, are subject to soil and subsoil easements for the purposes of research or mining.*

Easements are all the actions and structures necessary for the proper functioning of mining (workshops, installations, accessory works, housing, transportation routes, electricity and communication networks, water collection and supply, deposits of waste material from mining activities, among others).

Finally, it is important to mention Article 60 on the creation of easements:

*Art. 60 Servitudes shall be established by prior indemnification of the value of the land occupied and the damage resulting from such occupation.*

*§ Paragraph 1 If there is no agreement between the parties, payment shall be made by means of a judicial deposit of the amount set for indemnification, by means of a survey or expert opinion with arbitration, including the rent for occupation, followed by the competent warrant for possession of the area, if necessary.*

*§ Paragraph 2 The calculation of the compensation and damages to be paid by the holder of the research authorization or mining concession to the owner of the land or the owner of the improvements will comply with the requirements of Article 27 of this Code, and will follow the procedure established in a Federal Government Decree.*

It is therefore important to note that such situations may occur in some of the areas that will be targeted by the project, especially given the large number of mineral research areas identified in the PROCASE II area, as shown in the table below.

**Table 21 - Phases of the ANM Polygons in the area covered by Proc case II**

Phase	Polygonal	%
Research Authorization	2.248	53%
Mining Concession	216	5%
Area availability	325	8%
Mining (Application/Concession)	129	3%
Others	742	18%
Requirements	580	14%
Total	4.240	100%

Source: ANM, 2024 (consultation).

As shown, only 5% of the polygonal areas are in the Mining Concession phase (with the exception of garimpeiro mining); the figure below shows the graph of the main mineral substances, followed by the table showing the substances mined in the 216 polygonal areas currently in the mining concession situation (operational phase).

**42 - Main Substances under Mining Concession at ANM - Paraíba.**

Source: ANM, 2024 (consultation).

**Table 22 - Mined Substances - Mining Concessions in the Proc case II coverage area**

Substance	Polygonal	%
Mineral water	9	4,2%
Sand	35	16,2%
Foundry Sand	1	0,5%
Sandstone	1	0,5%
Clay	11	5,1%
Bentonite clay	4	1,9%
Ferruginous clay	1	0,5%
Refractory Clay	1	0,5%
Basalt	2	0,9%
Bentonite	23	10,6%
Beryl	1	0,5%
Limestone	31	14,4%
Calcitic limestone	2	0,9%
Chalcedony	1	0,5%

Substance	Polygonal	%
Calcite	1	0,5%
Cassiterite	2	0,9%
Kaolin	5	2,3%
Diorito	3	1,4%
Feldspar	13	6,0%
Phosphorite (O)	1	0,5%
Gneiss	2	0,9%
Granite	50	23,1%
Ornamental granite	1	0,5%
Ilmenite	1	0,5%
Migmatite	2	0,9%
Iron ore	1	0,5%
Gold	2	0,9%
Pegmatite	1	0,5%
Industrial Quartzite	1	0,5%
Sienite	1	0,5%
Tungsten	1	0,5%
Tourmaline	1	0,5%
Vermiculite	4	1,9%
Grand Total	216	100,0%

Source: ANM, 2024 (consultation).

As can be seen in the figure below, Mineral Surveys include a large number of substances, but the following prevail: Sand (16%), Granite (10%), Gold Ore (9%), Iron Ore (9%), Lithium Ore (8%), Copper Ore (6%) and Limestone (5%), representing 63% of the polygonal areas being surveyed.

**43 - Main Substances under Mining Research at the ANM - Paraíba**

Source: ANM, 2024 (consultation).

The following map shows the polygonal areas of the National Mining Agency - ANM, in Paraíba, according to the stage of the processes.

**Map 3 - ANM polygons in the Proc case II area.**

**Map 4 - ANM polygons by substance in the area covered by Proc case II.**

#### 4.1.5 Geomorphology

The geomorphological map presented below is based on the work carried out by the Paraíba State Water Resources Plan (AESAs, 2022), which was drawn up based on data published by the IBGE in 2017. It is a set of vector and alphanumeric information, georeferenced and stored in the Environmental Information Database (BDIA), surveyed and published on a scale of 1:250,000. With a description of the geomorphological units and morphostructural domains.

The geomorphological map was also updated to a scale of 1/250,000, taking into account, among other things, the updated relief map, EMBRAPA's Landsat image mosaics and the geodiversity map of the state of Paraíba published by CPRM in 2013 (AESAs, 2022).

#### 4.1.6 Geomorphology

The geomorphological map presented below is based on the work carried out by the Paraíba State Water Resources Plan (AESAs, 2022), which was drawn up on the basis of data published by the IBGE in 2017. It is a set of vector and alphanumeric information, georeferenced and stored in the Environmental Information Database (BDIA), surveyed and published on a scale of 1:250,000. With a description of the geomorphological units and morphostructural domains.

The geomorphological map was also updated to a scale of 1/250,000, considering, among other things, the updated relief map, EMBRAPA's Landsat image mosaics and the geodiversity map of the state of Paraíba published by CPRM in 2013 (AESAs, 2022).

## Map 5 - Geomorphology of the State of Paraíba

## Quaternary Sedimentary Deposits.

This domain is made up of areas of accumulation represented by low slope plains and terraces and, eventually, depressions modeled on deposits of horizontal to sub-horizontal sediments from fluvial, marine, fluvial-marine, lagoonal and/or aeolian environments, arranged in the coastal zone or inland from the continent.

### Northeastern East Coast

According to Feio (1954), the coastal area was formed by a flexure that led to the lowering of the entire area in recent times. Phenomena resulting from eustatic processes (changes in sea level) have contributed to the current shape of the coastline and sea level. The eustatic movements either generated larger river and sea plains when the sea level receded or eliminated the coastal strip when the sea level directly hit the Barreiras Group cliffs.

The width of the coastal strip is variable, reaching approximately 4 kilometers to the east, with occasional interruptions in continuity due to the presence of cliffs formed in Cenozoic sediments of the Barreiras Group.

The fluvial-marine plains are found at the mouths of the main rivers. They are generally filled with clayey material, where there is a widespread proliferation of mangroves, especially at the mouths of rivers that have sediments from the Barreiras Group. Despite their perennial nature, the rivers carry little continental sediment and are hydrological barriers from which sandbanks can form.

On the coast, quartz sands predominate, with occasional podzolic soils (characteristic of the tabuleiros), as well as Solodized Solonetz on the river and sea plains. The sandy reefs have a fine texture, vary in hardness and contain rounded quartz pebbles and shell remains.

### **Photo 2 - Municipality of Baía da Traição, view of the Northeastern East Coast.**

Source: Consulting, 2024.

### **Plains and River Terraces**

The construction of plains and terraces shows evidence of adjustments to neotectonics and is accelerated by meander evolution processes. Clogging takes place through suspended sediments, dragging and bouncing of coarse material; suspended transport of colloids and deposition of sediments along stretches of the banks. Sometimes the material is pedogenized.

They include floodplains and alluvial terraces built on Holocene sedimentary deposits. They occur mainly along the main rivers, where they appear as discontinuous stretches of river plain. There are sectors where the terraces coalesce with the plains.

In some regions, riverbeds are marked by sandy ridges and, during the dry season, form steep ravines. Stretches of plains can look like veredas with sandy edges and peaty substrate, marked by shrubs including palm trees.

Levels of very fine to coarse, stratified clays, silts and sands are locally interspersed with ferruginous concretions and organic concentrations, resulting in Fluvial Neosols and Gleissols.

**Photo 3 - Municipality of Baía da Traição, landscape of the Plains and River Terraces unit.**

Source: Consulting, 2024.

### **Phanerozoic Basins and Sedimentary Covers Domain**

Plateaus and plateaus developed on horizontal to sub-horizontal sedimentary rocks, possibly folded and/or faulted, in different sedimentation environments, arranged on the continental margins and/or in the interior of the continent.

### **Cariri Depression**

The Cariri Depression is located to the east of the Araripe Plateau. It lies at an altitude of 450m and covers an area of 2,442 km<sup>2</sup>. It is characterized by extensive planes modeled on sedimentary rocks such as conglomerates, sandstones, calciferous and fossiliferous phyllites, bituminous shale and localized occurrences of granodiorites and alluvial sediments.

The origin of this unit follows ancient depositions that occurred in abaciated areas present on the crystalline, from a system of folds and faults in the geological complex known as the Borborema Province. The Araripe sedimentary basin (which also includes the Chapada do Araripe), formed in the Phanerozoic, is associated with events prior to, concomitant with and after the continental rift responsible for the opening of the Atlantic.

The occurrence of numerous springs in this system has given rise to one of the most typical foothill wetlands in northeastern Brazil. The Cariri region has very favorable environmental conditions from a water and soil point of view, which favors intense agricultural development and a large population concentration.

### **Retouched Pediplano from Iguatu**

During the Cretaceous, extensive sedimentation over the continent took place in two stages. In the first phase, the deposition of clastic sediments present in almost all the basins of this period persists. The presence of these coarse sediments, hundreds of meters thick in some cases, indicates the existence of a semi-arid climate and that they were transported over short distances.

In a second phase, sedimentation becomes marine, transgressive, indicating a lowering of the continental level as a continuation of tectonic reactivations and possibly a rise in sea level.

It comprises two depressed regions within the Sertaneja Depression: around Iguatu (CE) and along the stretch where the Jaguaribe river runs parallel to the São Vicente mountain range. It presents itself as a depression in relation to the Patamar Sertanejo, confusing itself altimetrically with the Depressão Sertaneja, and in some places at a lower level than it. Its altitudes vary between 180 and 280 meters.

The terrain is flat for almost the entire area, with staggered pedimented ramps at the contacts with other units. Some sectors are slightly dissected, with elongated shapes and higher levels than the surrounding area, with shallow incipient drainage.

### **Mountains of Martins-Portalegre and João do Vale**

This unit lies entirely within the Northern Sertaneja Depression. With altitudes ranging from 700 to 730 meters. These mountains occupy a small area in the state of Paraíba (0.05%).

According to the first detailed study of mountain ranges capped by consolidated sediments, carried out by Moraes (1924), these relief compartments formed an extensive plateau that encompassed the entire Borborema Plateau.

This unit is made up of cliff tops like those found in the Serra de Santana and Cuité units, but which are already separated from the Borborema Plateau as a result of widespread erosion. The Serra do Martins-Portalegre is a mountain range to the east of Pau dos

Ferros-RN, arranged in a SE-NO direction, with a granite framework capped in parts by sedimentary rocks. It has a flat top maintained by the sedimentary capping, while in the sectors where the granite outcrops, there is a beginning of dissection. The slopes are dissected into ridges with deep V-shaped valleys.

The João do Vale mountain range, located to the northwest of the western mountains of the Borborema Plateau and to the west of the Piranhas/Açu river, stands out from its flat surroundings with a sediment-covered top, just like the Santana mountain range, although it is already separated from the Borborema region as a whole.

The hills that make up this unit are formed by dystrophic yellow latosols.

### **Santana and Cuité mountains**

According to the first detailed study of mountain ranges capped by consolidated sediments, carried out by Moraes (1924), these relief compartments formed an extensive plateau that covered the entire Borborema Plateau, stretching as far as the Serra dos Bastiões and encompassing the Chapada do Araripe.

This unit is made up of several sedimentary plateaus arranged over the Borborema Plateau. The most significant of these, the Serra de Santana, is elongated in an east-west direction, approximately 40km long and 700m high. It stands out lithologically for being capped by sedimentary rocks within the crystalline complex that makes up the Borborema Plateau. It has a perfectly flat top contoured by abrupt dissected escarpments. In the areas where the sedimentary capping has been removed, there are small collinear planes that are uneven in relation to the summit. The top forms a small cornice approximately 2m thick.

Another significant sedimentary layer can be found in the Serra do Cuité, located in the interior of Borborema near the town of the same name, between the states of Paraíba and Rio Grande do Norte. The altitude difference in relation to the surrounding area is not significant, reaching 40 to 60 meters both north and south of the mountain. Further south, between the municipalities of Cuité and Barra de Santa Rosa-PB, is the Serra do Bom Bocadinho, with similar characteristics to the Serra do Cuité.

### **Eastern Tablelands of the Northeast**

First recognized by Birot (1958) as the Barreiras Accumulation Surface, formed by flexure. The surface of the Barreiras Group deposits was leveled by Cenozoic pediplanation, under aggressive climatic conditions, in two contrasting seasons.

Consisting of tabular shapes, this unit occupies the area marked by the presence of sediments from the Barreiras Group, bordered to the east by the eastern coast of the Northeast and to the west by the eastern piedmont of Borborema, which has erosive escarpments whose altimetric gradient increases from north to south. The altitude varies from 30 to 130 meters.

The unit's parallel drainage is markedly influenced by regional tectonics, which can be seen in the lower reaches of the longest rivers, such as the Paraíba. These rivers interrupt the continuity of the tablelands, which are higher flat areas interspersed with valleys where Quaternary sediments accumulate, with valleys deepening to around 90m.

**Photo 4 - Marcação municipality, landscape of the Tabuleiros Orientais do Nordeste unit.**

Source: Consulting, 2024.

**Photo 5 - Pitimbu municipality, landscape of the Tabuleiros Orientais do Nordeste unit.**

Source: Consulting, 2024.

## **Domain of the Neoproterozoic Mobile Belts.**

They comprise extensive areas represented by plateaus, mountain alignments and interplanaltic depressions made up of folded and faulted terrain, including mainly metamorphites and associated granitoids.

### **Southern Sertaneja Depression**

The unit is almost entirely contained in sheet SC.24, with a small stretch in the far north penetrating sheet SB.24, both of which cover areas of the state of Paraíba. The leveled surface, truncating different rock types, denotes the action of polycyclic pediplanation processes during the Plio-Pleistocene, under aggressive climatic conditions. The subsequent organization of the drainage network led to erosive reworking of the pediplain, with the creation of humps. Sectors of convex shapes along the streams are evidence of sub-date phases of erosion.

In the Southern Sertaneja Depression, preserved (Pgi) and retouched (Pri) plateaus predominate, with formations that indicate successive relocation of the material. These forms are ramped and weakly dissected with hump features with a slope of less than 5°. In other sectors, considered to be denuded retouched flatland (Pru), the erosion processes at work make the little altered rock appear on the surface, locally under the slabs.

Scattered throughout the unit are residual reliefs in the form of ridges and bars with a preferential N-S and NE-SO orientation, in line with the structural alignments. Around some streams there are areas of homogeneous dissection with different drainage densities and shallow depths, indicating a resumption of sub-date erosion. This resumption of erosion is also evidenced by the occurrence of narrow terraces with gradients of 2 to 3 m. In general, the valleys have flat bottoms and sandy, locally stony beds, limited by altered and gullied shoulders.

The branched planes to the northwest and northeast of the unit show alterations 1.50 to 2.00 m thick, with a variation in color from orange to red and textures related to the nature of the rocks. In the foothills of the Peripheral Patamares to Ibiapaba - Araripe, the Northern Massifs of the Borborema Plateau and the Chapadas do Tonã and Serra Talhada, these alterations, coming from different paleoclimatic conditions to those of today, give rise to Latosols, Argissols and Luvisols.

### **Eastern slopes of the Borborema Plateau**

The pumping of the Borborema massif towards the Atlantic Ocean led to erosive processes dissecting the eastern slopes to the east. The lithostructural aspects controlled these erosive processes, resulting in models strongly controlled by the structure.

The unit occupies 14.34% of the territory of Paraíba and comprises the eastern facade of the Borborema Plateau. It is an intensely dissected area with tops decreasing in altitude towards the coast. Morphologically, it is characterized by the predominance of convex and sharp forms of structural dissection, evidenced by the deepening orientation of the valleys, usually in a "V" shape. This pattern shows drainage depths varying from low to high and slopes with gradients varying from 5° to 25°.

In the middle of these reliefs, homogeneous dissection patterns were also mapped, with drainage densities varying from fine to medium and low to medium depths, found in the central and southern parts of the unit, where the processes of relief sculpture partially mask the structural features, producing more dissected compartments and consequently less spaced interfluves.

The interfluves, represented by ridge lines and symmetrical and asymmetrical *hogback ridges*, reflect the structural constraints and are aligned according to the directions of the faults. The relationship between these factors and drainage also explains cases of overlapping rivers opening gorges on the ridges. The preferential orientation of the valleys, combined with high rainfall, has favored the installation of an intricate and complex drainage network ranging from dendritic to parallel and lattice.

To the south of Campina Grande, extending as far as the Capibaribe valley in the state of Pernambuco, the altitudes are around 400m, reaching heights close to 800m, with the surface sloping gently to the east. The area is very dissected in the form of hills interspersed with valleys. In some places, particularly in stretches bordering the Capibaribe River, the hills are bare with steep slopes and rock outcrops.

Immediately south of Campina Grande-PB is the Serra das Queimadas-Bodopitá. This is a higher portion of the mountain, which would have formed the Borborema dome when it rose, corresponding to a granite stock stripped bare by differential erosion.

### **Serra do Pereiro**

The Sertanejo Residual Massifs are made up of ancient lithologies, formed before the Brasiliano Cycle, which were uplifted as a result of geanticlinal processes and have resisted successive pediplanations and wear and tear due to mechanical erosion (in arid and semi-arid climates) and chemical erosion (during humid climates). They stand out in the Sertanejo landscape for being elevated clusters in the midst of the current level of pediplanation represented by the Sertaneja Depression.

The unit is located in the central region of Paraíba near the municipality of Boa Vista and covers 0.48% of the state. It is a group of mountain ranges, carved out of parametamorphic rocks with quartzites, schists, phyllites and gneisses, intercalated with metamorphic limestones, fine to coarse granites, anatexites and diorites, whose variation is clearly reflected in the morphological features. It can be seen that in the central part, the granitic rocks are more resistant to erosion, preserving a relief that's less rocky. In the gneissic zones, there is dissection in the form of ridges and hills. Altitudes vary between 420 and 750 meters, with a lattice drainage pattern.

Escarpmets limit the entire mountain range, and the northern limit, where the Bastiões and Aimoré mountain ranges meet, has large alignments of asymmetrical *hogback* ridges. Between these two mountain ranges there are depressions carved into anticlinal zones. In the extreme south, the relief is also highlighted by extensive alignments of ridges arranged in semicircular shapes, flanking closed depressions. The steppe savannah vegetation (Caatinga) practically colonizes the entire slope where the soils are thin and sandy in texture, with the presence of boulders.

There are no significant differences between the morphogenesis of the eastern escarpment and that of the western escarpment, both of which have a semi-aridity similar

to that of the Sertaneja Depression. As you reach the top, the climate softens, giving rise to the appearance of forest, which has now been practically replaced by agriculture.

### **Ridge alignment of the Sertanejo plateau**

Ab'Saber (1969) characterized the Superfície Sertaneja as being formed by modern pediplanes, locating it around Borborema, the residual massifs and Araripe up to the foothills of Ibiapaba. He focused on the notching and remodeling undergone by the pediplains during the Quaternary. He stated that the Quaternary deposits of the semi-arid lowlands of the Northeast are testimony to the occurrence of renewed pedimentation during the Quaternary, which resulted in the lowering of the Sertaneja Surface.

The unit covers 7.71% of the state of Paraíba. It has a rectangular and dendritic drainage pattern. Altitudes vary between 250 and 680 meters. It is characterized by intense dissection of the relief, resulting in ridges and hills generally arranged in a preferential SO-NE and E-W direction. It is an area with a structural framework of lineaments that represent fault zones, where major faults are reflected in the relief through extensive alignments of ridges, generally parallel to each other, some semicircular, others rectilinear, interspersed with depressed collinear areas.

These reliefs are carved into zones of intense migmatization, predominantly gneiss-granite-migmatite rocks, and subordinately metasedimentary rocks and acid and intermediate dykes, with intercalations of metabasites, quartzites and metamorphic limestones. These ridges would fall into the category of "Dry Mountains", subject to the water deficiencies typical of a semi-arid climate, which condition the surface to be covered with Caatinga vegetation. In the vicinity of Carrapateira and Aguiar-PB, the alignments make up a remarkable mountain range called the Serra da Santa Catarina. The Piranhas/Açu river, whose headwaters are in the vicinity of the Serra do Braga, to the south, opens up a vast reservoir as it cuts through the Serra de Santa Catarina, then takes a northeasterly direction until it enters the Retouched Pediplano of the Rio do Peixe Valley.

### **Northern Sertaneja Depression**

Identified as a plain by the initial survey carried out by Crandall (1910), for Ab'Saber (1953) it would be the result of the process of marginal denudation in the interior of the Eastern Northeast, with a pronounced rebuilding of the Pre-Araripe Series crystalline floor, accompanied by a rejuvenation and partial lowering of the old levels.

Andrade (1958) considered this entire flattened area with altimetry between 50 and 280m to be a residual formed in the Pliocene, through the erosion of the edges of Borborema and the retreat of the escarpments.

Ab'Saber (1969) proposed calling this unit the Superfície Sertaneja, a proposition followed by Moreira and Gatto (1981). The coalescence between the Northern Sertaneja Depression and the Eastern Piedmont of Borborema, in Rio Grande do Norte, according to Feio (1954) was the result of the erosive phase after the last uplift of portions of the Borborema Plateau, generating deposits in the upper basins of the Piranhas or Açu, Apodi and Jaguaribe rivers.

The unit covers 12.96% of the state of Paraíba. Positioned between the highest compartments of the relief or extending from the steep bases of the plateaus, this large unit is characterized by having a dominantly flat topography (tabular interfluves) with

small sectors showing incipient dissection translated into hills and ridges. There are also remnants of preserved plateaus around the Baturité mountain range and in the upper reaches of the Piranhas/Açu river, near the Serra do Pereiro. This unit is made up of crystalline basement rocks such as migmatites, metasediments, granitoid cores, etc., by the prominent action of physical weathering processes and the removal of debris by diffuse and concentrated flow. The dendritic and parallel drainage pattern predominates.

There is a generalized covering of caatinga, with occasional changes in physiognomy and flora as a result of local changes in climate and soils. The effect of selective erosion can be seen in the residual reliefs (*inselbergs*) distributed in isolation or forming groups, such as the Sertanejos Residual Massifs. The *inselbergs* are defining elements of the landscape. The ridges, made up mainly of quartzite, are sometimes cut off by rivers, which leads to the formation of boqueirões, which are preferred spots for dams.

In this unit, semi-arid conditions tend to be more pronounced, as evidenced by the minimal thickness of the alterations and the widespread covering of the surface by stony material. The soils are generally not very thick, developed from the alteration of rocks from the crystalline basement. Litholic soils, Luvissoles, Planossolos and Argissolos Vermelho-Amarelos predominate, and there are also outcrops scattered throughout the area.

### **Serra do Braga**

The Sertanejo Residual Massifs are made up of ancient lithologies, formed before the Brasiliano Cycle, which were uplifted as a result of geoanticlinal processes and have resisted successive pediplanations and wear and tear due to mechanical erosion (in arid and semi-arid climates) and chemical erosion (during humid climates). They stand out in the Sertanejo landscape for being elevated clusters in the middle of the current level of pediplanation represented by the Sertanejo Plateau.

The Serra do Braga is a high mountain range in the middle of the Patamar Sertanejo, with contact with the Cariri Depression to the west. The altitude varies from 380 to 740 meters, with a dendritic drainage pattern.

The unit covers an area of 2.98% of the state of Paraíba. It is made up of the mountain range found in the Paraíba municipalities of Monte Horebe, Bonito de Santa Fé, Serra Grande, São José de Caiana and part of the neighboring municipalities. It has dissected reliefs with sharp tops in the western portion and tabular dissections in the center of the mountain range.

In the residual massifs, litholic soils with a sandy texture generally occur. In areas where there are better soil conditions (due to humidity), eutrophic Red-Yellow Podzolic soils develop, with low clay activity and a medium/clayey texture.

### **Central Pediplano of the Borborema Plateau**

Ancient (pre-Neogene) pediplanation can be detected on the tops of residual reliefs (Pgi). Subsequent stages of Cenozoic pediplanation developed the broader surface of the unit, truncating rocks and structures. This pediplano corresponds to an intermediate level of Borborema, related to the Cariris Velhos Surface or Soledade Surface (Andrade, 1958 and 1968).

Subcurrent processes of relief sculpture, led by fluvial dynamics, mask the structural features that are occasionally reflected in straightened stretches of drainage. The Borborema Plateau is a slightly dome-shaped edifice, the result of a pre-Cretaceous flexure, surrounded by peripheral depressions (Ab'Saber, 1953).

The unit occupies a significant area of 26.30% of Paraíba's territory. It is characterized by a set of high reliefs, slightly inclined to the east, with average altitudes of 500 to 600 m, with stretches reaching over 800 m represented by residual mountain blocks. Although flattened forms (Pri, Pru) predominate in the area, there are also structural and homogeneous dissection patterns with low to medium drainage density and shallow to medium depths. The structural dissection patterns indicate strong structural control and have been identified in the residual reliefs and on the western boundary of the unit, marked by a fault scarp festooned with deep valley notches adapted to transverse faulting. The homogeneous dissection patterns are characterized by convex top forms with medium drainage density and weak notches.

Although the Central Pediplano is not the highest sector of Borborema, it is an important hydrographic disperser, with drainage patterns that vary from radial to dendritic, with structural control. Among the most important rivers is the Ipojuca, which runs along the so-called Pernambuco Lineament in the northern part of the unit.

The region drained by the Pajeú river is significant, from the southwest of São José do Egito to Triunfo-PB. It is an interplanal depression marked by major faults, embedded in the high reliefs of the western edge and in the elevations that mark the Paraíba and Pajeú interfluve, with converging pediments in the form of ramps. It has an altitude of around 540m, which gradually decreases towards the southwest. It is dominated by flat terrain made up of tabular interfluves.

Mechanical weathering processes are responsible for breaking down the rocks, resulting in a predominance of lithic neosols, which vary to planosols in flat areas and around drainage channels. Rock outcrops are a frequent presence. In the higher areas, subject to wetter climatic conditions, the dominant chemical weathering results in thicker surface formations and deeper soils.

**Western Sierras of the Borborema Plateau**

Continuous steep slope to the west of the Borborema Plateau. According to Czajka (1958), the high-altitude stretch of the Serra do Teixeira corresponds to an arching zone

related to one of the periods of uplift of the Borborema dome. Demangeot (1959) considered the Serra do Teixeira to be one of the flattening surfaces of eastern Brazil, and therefore of the upper Cretaceous to Paleogene period (prior to the uplift of Borborema).

Its irregular and tortuous layout has close connections with tectonic events and, above all, with morphogenetic evolution associated with the processes of pedimentation that justify the expansion of the sertanejo depressions in the Cenozoic.

This unit occupies an area corresponding to 8.05% of the state of Paraíba, with altitudes ranging from 350 to 1030 meters, with a parallel and dendritic drainage pattern. It is made up of a steep slope to the west of the Borborema Plateau with a concave-convex semicircular configuration, extending from the Serra de Santana in a south-westerly direction to the city of Triunfo-PE. It is characterized by forms carved out of granitic rocks and ridges carved out of phyllites, biotite schist and quartzites. Mechanical morphogenesis dominates. The steppe savannah (Caatinga) occupies even the highest parts. This slope is the source of most of the right bank tributaries of the Piranhas/Açu river, which flow towards the Northern Sertaneja Depression in a dendritic pattern.

The northern boundary of the unit is made up of the mountains to the west of the Serra de Santana, which are isolated from the Borborema Plateau as a whole. The Serra da Garganta stands out, next to the Serra de Santana, whose depressed central part forms an intensely dissected hill plateau, like bad lands, flanked by bare ridges.

The alignment of ridges that began in Parelhas-RN, with a general north-south direction, ends in the town of Quixabá-PB to the east of Patos-PB, where it already has a general east-west direction following the fault zone related to the Patos Lineament. These ridges are sometimes sectioned off by rivers that open boqueirões. These ridges have concordant tops and ravine slopes. This whole complex is separated from the Serra da Borborema by the widened valley of the Farinha river, which is a fault valley in the form of a pedimented ramp that narrows towards the plateau.

### **Eastern Piedmont of the Borborema Plateau**

Remnants of flat tops appear as residuals, indicating that pediplanation processes were at work in the Cenozoic. The erosion surface was almost entirely de-characterized by erosion processes triggered by subsequent climatic humidification, giving rise to highly dissected reliefs covered with thick alterites. The morphogenetic conditions characterized by chemical actions and the intensity of fluvial dissection have masked the geological structures, which are revealed sporadically in straight stretches and abrupt inflections of the drainage.

The unit extends over the eastern part of the state of Paraíba, occupying an area of 7.80% of the state, with altitudes varying between 70 and 250 meters, and a parallel drainage pattern. In the southeast, it is characterized by intense dissection, with a predominance of convex top features, with slopes between 5° and 15°, and occasional sharp top features, with slopes of between 15° and 25°. This pattern mainly includes forms of homogeneous dissection with drainage densities varying from fine to coarse and notches in the 20 to 25 m range. At the contact with the Eastern Slopes of the Borborema Plateau, the modeling shows flat tops limited by valleys with depths of around 30 m, with slopes with steeper gradients cultivated with sugar cane.

Spread out behind the Tabuleiros Costeiros to the foot of the eastern slope of the Borborema Plateau, this unit is made up of a dissected area with small tabular interfluves. Its pre-littoral position, together with the large orographic barrier represented by the eastern escarpment of the Borborema Plateau, means that it receives regular and intense rainfall. Chemical morphogenesis prevails over mechanical processes, a fact that sets this sector apart from the others that make up the Depression.

The portion of this unit in Pernambuco and Paraíba is dissected into convex and tabular forms known locally as *chãs*. Generalized processes of reptation and colluviation predominate on the slopes of these areas. The valleys are flat-bottomed and clogged with sandy material.

Positioned along the ocean coast, the unit is subject to the influence of the southeast trade winds and therefore has a very humid climate. The climatic conditions interfere with the nature of the surface formations, constituting thick mantles of weathering, which has enabled the development of deep soils such as Argissolos and Latossolos.

The unit has a prominent position in the regional economy as it concentrates development poles based on the sugarcane agro-industry.

### **Patos Depression**

The Patos Depression is a lower unit in relation to its surroundings, but higher than the Northern Sertaneja Depression. The unit covers 7.13% of the state of Paraíba, with altitudes varying between 270 and 360 meters and a dendritic drainage pattern. The area of Patos (PB) is a semi-arid depression bordering one of the highest sectors of the Borborema Plateau. In this depression, residual reliefs stand out with the most distinct geomorphological features; sometimes they are elongated in the form of quartzite ridges arranged in a SO-NE direction, others have convex tops carved out of granites and gneisses. These elevations have steep, bare slopes and at the base there is a constant presence of blocky chaos.

Patos (PB) has a remarkable field of *inselbergs*. According to Fenelon (1958), the shape of the *inselbergs* correlates with their lithology. According to this author, "granulites are pyramids; gneisses are half spheres, sugar loaves or the backs of pachyderms; quartzites are monoclinical hills with serrated crests".

**Photo 14 - Passagem municipality, landscape of the Patos Depression unit - in the background with *inselbergs*.**

*Source: Consulting, 2024.*

Recognized by various authors as a low pediplain area (around 250m above sea level), it is called a closed basin, to the south of the Serra do Teixeira escarpment, where there are two types of relief: the pediplain at the beginning of dissection (created at the end of the Pliocene) and residuals of different lithology, which were carved during the Pleistocene.

**Photo 15 - Quixabá municipality, landscape of the Patos Depression unit.**

*Source: Consulting, 2024.*

### **Araripe-Borborema Hinterland Plateau**

Ab'Saber (1969) characterized this unit as part of the Sertaneja Surface, as being formed by modern pediplains, focusing on the notching and remodelling that the pediplains underwent during the Quaternary. He stated that the Quaternary deposits of the semi-arid lowlands of the Northeast are testimony to the occurrence of renewed pedimentation during the Quaternary, which resulted in the lowering of the Sertaneja Surface.

The unit has a dendritic drainage pattern, with altitudes varying between 400 and 700 meters, occupying an area of 1.97% of the state of Paraíba. It is located from the south of the Chapada do Araripe to the foothills of Borborema, near Serra Talhada (PE), from an approximate level of 500m which gradually decreases to the south. The morphology is largely subject to a principle of dissection as the drainage density increases. The current morphogenesis of this stretch is also driven by semi-arid conditions, except at the foot of the Chapada do Araripe, where the processes of chemical morphogenesis are of some significance.

It has Eutrophic Litholic and Red-Yellow Podzolic soils. The colluvial cover is made up of dystrophic Red-Yellow Latosols with a medium/clayey texture.

#### **4.1.7 Pedology**

The pedological map presented below is based on the mapping prepared from the databases published by the IBGE in 2017. It is a set of vector and alphanumeric information, georeferenced and stored in the Environmental Information Database (BDIA), surveyed and published on a scale of 1:250,000. The descriptions of the soil units below are mainly from Embrapa - Brazilian Soil Classification System SiBCS<sup>20</sup>, (consultation in 2024) and are presented below.

---

<sup>20</sup> <https://www.embrapa.br/agencia-de-informacao-tecnologica/tematicas/solos-tropicais> (Silva, MSL; Neto, MBO; Santos, HG)

## Map 6 - Pedology of the State of Paraíba

## Argisols

These are mineral soils mainly related to Barreiras Group sediments, non-hydromorphic, with an A or E horizon (horizon with loss of clay, iron or organic matter, light in color) followed by a textural B horizon, with a clear difference between the horizons. They have a reddish to yellowish B horizon and iron oxide contents of less than 15%. They can be eutrophic, dystrophic or alkalic. They have varying depths and a wide range of textural classes.

Argisols with higher natural fertility (eutrophic), good physical conditions and more gentle terrain have greater potential for agricultural use. Their limitations are more related to their low fertility, acidity, high aluminum content and susceptibility to erosion processes, especially when they occur on busier terrain. Argissolos tend to be more susceptible to erosion due to the textural relationship present in these soils, which implies differences in the infiltration of surface and subsurface horizons. However, those with lighter textures or medium texture and a lower textural ratio are more porous, have good permeability and are therefore less susceptible to erosion.

Given the limitations of Argissolos, their use requires proper management with the adoption of correction, fertilization and conservation practices to control erosion.

In the area of this study, the Argissolos represent 16.55% of the surface area of the state of Paraíba.

Source: Consulting, 2024.

**Photo 18 - Municipality of Remígio, Red Argissolo landscape.**

Source: Consulting, 2024.

### **Cambisols**

These are non-hydromorphic mineral soils with a small degree of development, with an incipient B horizon (Bi) underlying any type of surface horizon (Embrapa, 2007). Depending on their stage of evolution, they have different characteristics in terms of

color, depth, texture, base saturation, etc., and it is very common to identify some characteristics inherited directly from the source material.

Cambisols are found in a wide range of environments and are usually associated with areas of very steep terrain (undulating to mountainous), although they can also occur in flat areas (lowlands) outside the influence of the water table.

The Cambissolos class includes shallow to deep soils. They are burnished or yellowish-bronze in color, even dark red. They can be strongly to imperfectly drained. They can have high to low base saturation and chemical activity of the clay fraction.

In flatter areas, Cambisols, especially those with higher natural fertility, low clay activity and greater depth, have potential for agricultural use. On the other hand, in environments with steeper slopes, the shallower Cambisols have strong limitations for agricultural use related to mechanization and high susceptibility to erosion processes.

Proper management of Cambisols involves correcting acidity and aluminum levels that are harmful to most plants, as well as fertilizing according to the crop's needs. Cambisols on hillsides, on the other hand, require conservation practices due to their greater susceptibility to erosion.

The Cambissolos found in the study area represent only 0.34% of the surface area of the state of Paraíba.

## **Spodosol**

This soil class is defined by the presence of a spodic B diagnostic horizon in sequence with an E horizon (albic or not) or an A horizon, according to criteria established by the SiBCS (Embrapa, 2006).

In the field, it can be identified by the color of the spodic horizon, which varies from grey, dark or black, to reddish or yellowish, and by the clear differentiation of horizons. They may have a cemented horizon such as fragipã, duripã or "ortstein" underlying the spodic horizon.

Chemically, they are poor soils, with low fertility due to low nutrient reserves, a pH reaction ranging from moderately to strongly acidic, low base saturation and high levels of extractable aluminum. The process of loss of aluminum compounds with or without iron occurs in the presence of acid humus and the consequent accumulation of these constituents at depth.

These soils are generally moderately to strongly acidic, usually with low base saturation (dystrophic), and there may be high levels of extractable aluminum. The texture is predominantly sandy, less commonly medium-textured and rarely clayey (tending towards medium or silty) in the spodic B horizon. They range from shallow to very deep. Drainage is very variable, with a close relationship between depth, degree of development, hardening or cementation of the diagnostic horizon (spodic B) and soil drainage.

They originate mainly from sandstone materials, under tropical and subtropical climate conditions, on flat, gently undulating or wavy terrain. They occur in places of high humidity, in areas of emergence, subsidence and depressions, under the most diverse types of vegetation.

The main limitations of this soil class are related to its sandy texture, the presence of an impediment horizon and low fertility. The presence of a fragipã, duripã or "ortstein" horizon can hinder root penetration and water infiltration.

They are not normally suitable for agriculture and are recommended for environmental conservation areas. However, in some areas the Spodosols can be used for grazing. There are also areas of Spodosols used for coconut cultivation.

The spodosols found in the study area make up only 0.33% of the surface area of the state of Paraíba.

### **Gleissols**

These are mineral, poorly evolved, hydromorphic soils that have a glei horizon in the first 50 cm from the surface, or at depths of 50 to 125 cm, as long as they are immediately below the A horizon. Soils in this class are saturated by water permanently or periodically, unless artificially drained. The saturated water remains stagnant internally or saturation occurs through lateral flow in the soil. In either case, the water in the soil can rise by capillary ascension, reaching the soil surface.

They are thus characterized by strong gleaning, due to the reducing humidity regime, virtually free of dissolved oxygen, due to water saturation throughout the year, or at least for a long period, associated with oxygen demand from biological activity.

They are defined by the SiBCS (Embrapa, 2006) as hydromorphic soils, made up of mineral material, which have a glei horizon, which can be a subsurface horizon (C, B or E) or a superficial A horizon. The surface horizon ranges in color from grey to black, is usually between 10 and 50 cm thick and contains medium to high levels of organic carbon.

The gleaning process implies the manifestation of greyish, bluish or greenish colors, due to the reduction and solubilization of iron, allowing the expression of the neutral colors of clay minerals, or even the precipitation of ferrous compounds.

They may have a sulphuric or calcium horizon, solodic or sodic properties, a salic character or plinthite in a quantity or position that is not diagnostic for classification in the plinthosol class.

These are soils formed by stratified or unstratified original materials, subject to constant or periodic excess water. They commonly develop in recent sediments near watercourses and in colluvial-alluvial materials subject to hydromorphic conditions (water-influenced environments). They can also form in areas of flat relief on river, lake or marine terraces, as well as in residual materials in depressed areas. They can also form in sloping areas under the influence of groundwater outcrops (emergents).

These are soils that occur under hydrophilous or hygrophilous herbaceous, shrub or tree vegetation. They have low natural fertility (dystrophic) and may also have problems with acidity (very low pH) and high levels of aluminum, sodium (saline) and sulfur (thiomorphic).

In terms of physical characteristics, they are poorly or very poorly drained soils under natural conditions.

Its proximity to rivers limits the agricultural use of this soil class, and it is also an area suitable for preserving riparian forests. However, areas outside environmental protection

have potential for agricultural use, provided they do not have high levels of aluminum, sodium and sulfur.

Proper management of Gleissolos requires taking care with drainage because of the risk of sulphur precipitation (formation of jarosite), correcting acidity and aluminum levels that are harmful to most plants, and fertilizing according to the crop's needs.

Restrictions on agricultural use are related to toxicity to most plants caused by high levels of aluminum, sodium and sulfur.

The Gleissolos found in the study area represent only 0.59% of the surface area of the state of Paraíba.

## **Latosols**

Intense weathering soils are popularly called old soils and are defined by the SiBCS (Embrapa, 2006) by the presence of a latosolic diagnostic horizon and general characteristics such as: clays with a predominance of iron, aluminium, silicon and titanium oxides, low activity clays (low CTC), strongly acidic and low base saturation.

They usually have low fertility, except when they originate from rocks that are richer in minerals essential to plants, and high acidity and aluminum content. They have good physical conditions for agricultural use, associated with good permeability as they are well-structured and very porous soils. However, due to the same physical aspects, they have low moisture retention, especially those with a coarser texture in drier climates.

Considering other morphological characteristics, these are very deep soils, with surface and subsurface horizons over 100 cm thick, with a natural sequence of horizons: A, B and C. There is little differentiation between subhorizons and the transitions between them are usually diffuse or gradual. In contrast to the darker colors of the A horizon, the colors of the B horizon are brighter, ranging from yellow or even grayish-bronze to dark grayish-red, in shades from 2.5 YR to 10 YR, depending on the nature, form and quantity of the mineral constituents - especially iron oxides and hydroxides - subjected to the type of water regime and drainage and even whether or not the hematite is inherited. The C horizon is usually less colorful, and its heterogeneous chromatic expression is quite variable, depending on its saprolitic or sedimentary nature (AESA, 2022).

They are the most common soils in Brazil, being more frequent in equatorial and tropical regions, although they can also occur in subtropical zones. They are distributed over broad and ancient erosion surfaces: tablelands, plateaus, plateaus, river terraces, and are usually associated with flat and gently undulating reliefs and, more rarely, with more rugged areas.

Due to their good physical conditions and gentle terrain, they have high potential for agricultural use. They are widely used for grain production: soybeans, corn and rice, among others. Their limitations are more related to the low fertility found in most latosols and low moisture retention when the textures are coarser and in drier climates.

The management of Latosols generally requires the adoption of acidity correction, fertilization and, in drier climates, irrigation according to the crop's requirements. Despite being considered more erosion-resistant soils, latosols require careful management. The strong, very small and granular structure means that clayey latosols behave similarly to sandy soils when bare. In addition, when intensively mechanized, the structure of clayey to very clayey latosols is destroyed, leading to a reduction in soil porosity and the

consequent formation of a compacted layer (20 to 30 cm), making it difficult for plants to take root and for rainwater to infiltrate.

It comprises mineral soils with a high degree of pedogenetic development, with solum thicknesses of more than 2 meters in the vast majority of cases, absence of easily weatherable primary or secondary minerals, cation exchange capacity of less than 17 cmolc/kg of clay without correction for carbon, with kaolinitic or oxidic clay mineralogy (Embrapa, 2007).

The latosols found in the study area represent only 0.65% of the surface area of the state of Paraíba.

### **Luvissolos**

These are shallow to shallow soils, with a textural B horizon (horizon resulting from the accumulation or absolute or relative concentration of clay due to illuviation and/or in situ formation processes) of bright colors and high clay activity, with a weak A horizon, light in color, not very thick, massive or with a weakly developed structure. They are moderately acidic to neutral, with high base saturation. They often have a stony coating on the surface (desert sidewalk) or in the soil mass and usually have a surface crust 5 to 10 mm thick, as well as high silt contents. They are highly susceptible to erosion due to the large textural difference between the A and B horizons (Jarbas *et al.*, 2021).

Drainage ranges from well to imperfectly drained. In the superficial part, stoniness may occur. On the subsurface, solodic or sodic character may or may not appear. The color of the Bt horizon can be reddish, yellowish and less often burnished or greyish. The structure is usually blocky, moderately or strongly developed, or prismatic, made up of angular and sub-angular blocks.

These soils occupy crystalline areas of the northeastern sertão, where desert sidewalk is often present on the soil surface or within the A horizon, and are mainly related to biotite-gneiss and biotite-shale containing a good amount of easily weathered primary minerals (nutritional reserves), which are a source of nutrient release from the soil, and are rich in exchangeable bases, especially potassium. Most of them occur in flat and gently undulating areas (Embrapa, 2006).

Despite the good terrain and natural fertility conditions, the limitations of these soils for agricultural use are primarily due to the lack of water in the regions where they occur and the frequent presence of pebbles and even clods that are scattered on the surface of the soil and in the surface layer, and the consistency ranging from very to extremely hard, which hinders the development of the root system of crops, and also due to the lack of water in the regions where they occur (Oliveira *et al.*, 1992).

The main use of these soils in the semi-arid region is associated with rainfed agriculture (maize and beans), fodder palm and extensive livestock farming, which means that animals are raised in large areas, without much care and are almost always fed on native, uncultivated pastures; as a result, productivity is low (Oliveira *et al.*, 1992).

Luvissolos are found in abundance in the state of Paraíba, representing 35.57% of the state's surface according to mapping data from IBGE/BDIA.

## Neosols

Soils made up of mineral material or thin organic material, with insufficient manifestation of the diagnostic attributes that characterize the various soil formation processes, either due to the greater resistance of the parent material or other formation factors (climate, relief or time) that can prevent or limit soil evolution. They show a predominance of characteristics inherited from the original material and are defined by the SiBCS (Embrapa, 2006) as poorly evolved soils with no diagnostic horizon.

Neosols can have high (eutrophic) or low (dystrophic) base saturation, acidity and high levels of aluminum and sodium. They range from shallow to deep soils with low to high permeability.

They cover a wide range of climatic environments, ranging from areas with very steep terrain (undulating to mountainous) to flat areas under the influence of the water table. As for the source material, it ranges from alluvial sediments to materials from the decomposition of crystalline rocks (Precambrian).

In flatter areas, neosols, especially those with higher natural fertility (eutrophic) and greater depth, have potential for agricultural use. Soils with low natural fertility (dystrophic) and more acidic are more dependent on the use of fertilizers and liming to correct acidity. Neosols with a sandy texture are restricted by low moisture retention.

The use of these soils should be restricted when they are close to watercourses, as they are areas for preserving riparian forests. On the other hand, in environments with steeper slopes, the shallower neosols have strong limitations for agricultural use related to restrictions on mechanization and strong susceptibility to erosion processes.

Proper management of neosols in flatter areas generally requires correction of acidity and harmful aluminum levels for most plants, and fertilization according to the crop's

needs. For hillside neosols, in addition to these, there is a need to use conservation practices due to their strong susceptibility to erosion processes.

Neosols occupy a significant area of the state of Paraíba with around 33.25%, of which the largest percentage is attributed to lithic neosols with 28.53% according to mapping data from IBGE/BDIA. These occur throughout the semi-arid region of the state, mainly in areas where rocky outcrops are found. They are poorly developed, shallow to very shallow, stony and rocky with a medium or sandy texture and an A horizon resting on rock or thick gravel, or on thin C horizons. They occur on both gently undulating and mountainous terrain. It is common to find coarse material both in the soil mass and on the surface, represented by pebbles and gravel (Cunha *et al.*, 2021).

## Nitossols

These are mineral soils with a B horizon. The texture is clayey or very clayey (clay contents are equal to or even greater than 350g kg<sup>-1</sup> of TFSA) from the surface. They have a moderate or strong structure in the form of subangular or angular blocks or prismatic blocks. They also show cerosity and/or compressive surfaces on the faces of the aggregates and/or a retractable character. The textural gradient is equal to or less than 1.5. The class does not show a significant increase in clay content with depth, as is the case with the textural B horizon; however, the differentiation of horizons is much less marked than in the Argissolos. The transition from A to B is clear or gradual and in the sub-horizons of B gradual or diffuse. The soils are deep, well-drained and vary in color from red to burnished (Santos and Zaroni, 2021).

As far as chemistry is concerned, these are soils with a pH of moderately acidic to acidic, with low-activity clay or with an aliphatic character combined with high-activity clay and with a kaolinic-oxidic composition.

They can be found in a variety of climatic environments and are usually associated with areas of gently undulating to steeply undulating terrain.

Nitossolos can have high (eutrophic) or low (dystrophic) natural fertility, slightly high acidity and variable aluminum content. In flatter areas, Nitossolos, especially those with higher natural fertility and greater depth, have high potential for agricultural use. On the other hand, in more sloping environments, they have some limitations for agricultural use related to restrictions on mechanization and susceptibility to erosion.

Proper management of Nitossolos involves correcting the acidity of those with low pH and higher aluminum levels and fertilizing according to the crop's needs. As for Nitossolos in steeper areas, in addition to these, there is a need for conservation

practices due to their greater susceptibility to erosion processes (Santos and Zaroni, 2021).

According to the IBGE/BDIA survey, Nitossolos in the state of Paraíba account for 0.67% of the state's area.

### **Planosol**

Mineral soils that show vigorous desargilization (loss of clay) of the superficial part and intense accumulation or concentration of clay in the subsurface horizon, giving them the distinctive characteristics of a normally abrupt textural change or abrupt transition combined with a marked difference in texture from the A to the B horizon. This desiccation is responsible for the sandy texture of the surface horizons (A or E).

They are defined by the SiBCS (Embrapa, 2006) by the presence of a plannic B horizon, underlying any type of A horizon, and may or may not have an E horizon (albic or not). They may have a calcium horizon, carbonate character, duripppa, sodic or solodic properties, saline or salic character.

Normally thickened due to the accumulation of clay in the subsurface, they sometimes have a bread horizon (a horizon that hardens or cements when dry). They occur preferentially in areas of flat or gently undulating terrain, where the environmental conditions and the soil itself favor periodic annual excess water, even if it is short-lived, especially in regions subject to prolonged drought, and even under semi-arid climate conditions.

In the lowlands, floodplains and depressions under humid climate conditions, these soils are truly hydromorphic soils. However, in semi-arid zones, even in areas where the soil is subject to an excess of water for a short period, mainly under conditions of gentle undulating relief, they are not really hydromorphic soils.

The potential for agricultural use of these soils is related to the environment in which they occur, especially the flat and gently undulating terrain. The hydromorphic soils are used for irrigated rice.

The limitations or restrictions are related to slow or very slow permeability, usually densified due to the accumulation of clay on its surface. The presence of a hardened or cemented horizon is responsible for the formation of an overlying (suspended) water table, which is present periodically and varies throughout the year. This condition is responsible for restricting the percolation of water, regardless of the position of the water table, causing temporary water retention.

Also limiting their use are their sandy surface texture, which has implications for moisture retention and nutritional deficiency, and the presence of high sodium levels, which can affect the development of most crops. According to the limitations listed above, proper management of Planosols requires care with drainage, especially hydromorphic ones, correction of acidity and harmful aluminum levels for most plants.

The Planosols found in the study area represent 8.30% of the surface area of the state of Paraíba.

### **Vertisols**

Vertisols are soils with restricted development due to expansion and contraction, generally associated with the high activity of the clays, which gives the soil's constituent

material great capacity for movement. They are soils with a high cation exchange capacity (CEC), high base saturation (eutrophic) with high calcium and magnesium contents, with a neutral to alkaline reaction (pH) and, less frequently, in the moderately acidic range (Santos and Zaroni, 2021).

The expression of the phenomenon of expansion and contraction of the inorganic clay material that makes up the soil can be seen in the resulting features, such as pronounced changes in volume with increasing soil moisture content, deep cracks in the dry season and evidence of movement of the soil mass in the form of slickensides. They may show gilgai-type micro-reliefs, consisting of elevations and depressions in the terrain, and cuneiform-type structures that are inclined and form an angle with the horizontal. They are usually shallow to deep, although shallow soils also occur. They range from imperfectly to poorly drained.

These soils are normally developed in sedimentary basin environments or from sediments with a predominance of fine-textured materials with high calcium and magnesium contents, or directly from basic rocks rich in calcium and magnesium. They occur in a wide range of climates, from the wettest (with a defined dry season) to the driest, and are most prevalent in the sedimentary basins located in the semi-arid region of northeastern Brazil. As far as relief is concerned, these soils are distributed in flattened areas with little movement.

Its agricultural potential is due to its high fertility. Its main limitations are related to the use of machinery in the rainy season. At this time, these very clayey soils, when very wet, become "heavy", restricting the use of machinery. Low water infiltration and slow drainage encourage these soils to become waterlogged.

The management of these soils requires, in addition to fertilization according to the crop's needs, drainage in the case of use with plants susceptible to excess water and use with crops that are not very mechanized. In areas with a semi-arid climate, care must be taken with the quality of irrigation water, specifically the salt content, so as not to salinize the soil (Santos and Zaroni, 2021).

The Vertisols found in the study area represent 1.89% of the surface area of the state of Paraíba.

## Dunes

These are accumulations of homogeneous fine quartz sands at the back of the seafront resulting exclusively from the action of winds in removing beach sands, transporting them and depositing them.

These are very deep soils, with low natural fertility, excessively drained and which can present serious problems of wind erosion in the areas most exposed to the action of the winds. Their base saturation can vary from low to high.

They are considered a separate class, as they only have dystrophic profiles. This class includes not only fixed dunes, which have a very poorly developed A horizon, but also mobile dunes with no horizon development, which are considered to be a type of terrain (Jacomine *et al.*, 1972).

The vegetation cover, when it exists, is made up of typical dune formations, herbaceous or sub-shrubby, forming dense thickets (fixed dunes). Large areas, however, are completely devoid of vegetation (mobile dunes). It is also highly susceptible to wind

erosion; the A horizon has not yet been formed or is very poorly developed; and it has no agricultural use.

They occur in the Baixada Litorânea or, in some cases, capping the Low Coastal Plateaus closer to the coast. The relief is made up of a series of hills of varying size, arranged in chains according to the direction of the prevailing winds. In the parts devoid of vegetation (mobile dunes), there can be major shifts, with changes in physiognomy over a short period of time. The altitudes vary between 0 and 20 meters, with higher altitudes occurring in cases where they are capped by sediments from the Barreiras Group, intersecting at many points with the appearance of cliffs (Jacomine *et al.*, 1972).

These areas date back to the Holocene and the original material consists of unconsolidated sandy-quartz sediments, white or light grey in color, of marine origin.

In terms of morphological characteristics, these soils have a sequence of A and C horizons. The A horizon may be absent in some areas without vegetation, which are located closer to the sea or are subject to constant wind action.

This horizon is weakly developed and can reach a depth of 30 or 40 cm. It is made up of loose (quartz) sand, dark or very dark grey in color, due to the presence of organic matter. It has many white dots of washed sand and the color of the dry soil is usually grey. The texture is sand; simple grain structure; with many small and medium pores and, in terms of consistency, it is loose when dry and moist, non-plastic and non-sticky when wet; its transition to the C horizon is normally gradual and undulating (Jacomine *et al.*, 1972).

These soils have no agricultural use. They have strong or very strong limitations in almost every respect. The natural vegetation should be conserved, and attempts should be made to plant vegetation in the unprotected areas, in order to promote sediment fixation.

#### 4.1.8 Hydrography

The state of Paraíba (an area of 56,439.84 km<sup>2</sup>) is located in the Atlantic Hydrographic Region of Northeast Brazil, with approximately 90% of its territory in the Brazilian semi-arid region, which is prone to periodic droughts. As such, it is characterized by: (i) low rainfall rates (annual average of less than 500 mm); (ii) high spatial variability (for example, 300 mm in Cabaceiras, in the Cariri region of Paraíba, and more than 1,700 mm on the state's coast), inter-seasonal (concentration in four months of the year) and inter-annual rainfall; (iii) high evaporation rates (2,000 mm/year); (iv) intermittent rivers, which require the accumulation of water in reservoirs with regularization capacity.

Paraíba's Executive Water Management Agency (AESAs) is responsible for making the actions proposed by the state's CBHs feasible and operational as the executive secretariat. In addition, these bodies are linked to the State Secretariat for Infrastructure, Water Resources and the Environment (SEIRHMA) and the Paraíba State Water Resources Council (CERH-PB), in accordance with the Integrated Water Resources Planning and Management System, established by Law No. 6.308/1996.

In Paraíba there are three Basin Committees under state control: the Paraíba River Basin Committee (CBH-PB), the North Coast Basin Committee (CBH-LN) and the South Coast Basin Committee (CBH-LS); as well as one under federal control: the Piancó-Piranhas-Açu River Basin Committee (CBH-PPA).

The state is divided into eleven hydrographic basins - six state-owned (Paraíba, Abiaí, Gramame, Miriri, Mamanguape and Camaratuba rivers) and five federally-owned (Guaju, Piranhas, Curimataú, Jacu and Trairi rivers) - in this study, the subdivisions of some hydrographic basins were also considered: Piranhas River basins: sub-basins of the Peixe River, Piancó River, Espinharas River, Seridó River, Alto Piranhas River, Médio Piranhas River; and Paraíba River basins: Taperoá River sub-basin, Alto Paraíba River sub-basin, Médio Paraíba River sub-basin and Baixo Paraíba River sub-basin, as indicated on the following map.

The following information on the characteristics of the basins is based on the Paraíba State Water Resources Plan (AESAs, 2022), other information was consulted on the AESA website and the Basin Committees, which are duly cited in this report.

## Map 7 - Paraíba State Hydrographic Basins

### **Abiaí River Basin**

The Abiaí River basin is located in the extreme southeast of Paraíba, between 7°15'16" and 7°32'59" South Latitude and 34°47'37" and 35°03'60" West Longitude. The drainage area of the basin is 584.83 km<sup>2</sup>. The basin is bordered to the south and west by the state of Pernambuco, to the north by the Gramame River basin and to the east by the Atlantic Ocean. Five municipalities belong to this basin: Alhandra, Caaporã, Conde, Pedras de Fogo and Pitimbu.

Argisols dominate the surface of this watershed, making up at least  $\frac{3}{4}$  of the total. The rest of the area is occupied by Spodosols, Gleissols and Indiscriminate Mangrove Soils. There are occurrences of Quartzarenic Neosols by the sea.

The relief of the basin is completely flat. Subperennial rainforest dominates the area. In the background, the Cerrado and, later, the Campo de Várzeas.

The basin has a total of 15 watercourses, 4 of which are federally owned. The most important tributaries of the Abiaí basin are the Popocas, Camocim and Aterro rivers.

### **Camaratuba River Basin**

The Camaratuba River basin is located in the eastern region of the state of Paraíba, between latitudes 6°33'13" and 6°46'05" South and longitudes 34°57'48" and 35°27'54" West of Greenwich. It is bordered to the north by the Guaju and Curimataú basins, to the south by the Mamanguape basin, to the west by the Curimataú basin and to the east by the Atlantic Ocean. The basin drains an area measuring around 640.19 km<sup>2</sup>.

The area of this basin covers the municipalities of Araçagi, Baía da Traição, Curral de Cima, Duas Estradas, Jacaraú, Lagoa de Dentro, Mamanguape, Mataraca, Pedro Régis, Rio Tinto, Serra da Raiz and Sertãozinho.

The dominant soil in this basin is the Quartzarenic Neosol, with the Argisols coming in second, much less expressive.

The most representative relief is flat and only a small area has undulating relief.

Cerrado-type vegetation is completely dominant. There are, however, areas with deciduous and sub-deciduous forests.

In the Camaratuba River basin region, there are the Duas Estradas and Suspiro weirs, located in the municipalities of Duas Estradas and Serra da Raiz, respectively, both with a capacity of less than 1 hm<sup>3</sup>.

### **Curimataú River Basin**

The main river in the Curimataú basin is the Curimataú, which takes its name from the confluence of the Guandu and Urubu rivers. The basin is directed to the north and penetrates the state of Rio Grande do Norte. It is a federally controlled basin and is located almost entirely in the Curimataú Homogeneous Microregion, between coordinates 6°25'01" and 7°04'08" south latitude and 35°11'51" and 36°15'34" west longitude. Its area is approximately 3,350.85 km<sup>2</sup>.

There are 4 dams with a capacity of more than 1 hm<sup>3</sup> in this basin: Algodão, Curimataú, Jandaia and Poleiros dams. In addition, the following municipalities are located in its territory: Algodão de Jandaíra, Araruna, Areial, Bananeiras, Barra de Santa Rosa,

Belém, Cacimba de Dentro, Caiçara, Campo de Santana (Tacima), Casserengue, Cuité, Damião, Dona Inês, Esperança, Jacaraú, Lagoa de Dentro, Logradouro, Mamanguape, Olivedos, Pedro Régis, Pocinhos, Remígio, Riachão, Serra da Raiz, Solânea and Sossêgo.

It is a favorable basin for damming if the topographic conditions of the valleys are satisfactory.

Neosols dominate almost the entire basin area, with lithic soils being the most expressive, although regolithic soils also appear. Planosols are a close second. There are even less significant areas of Luvissoles and Argissolos. Latosols, Nitosols and Quartzarenic Neosols appear almost as occurrences. The wavy/smoothly undulating relief is dominant.

The hyperxerophytic caatinga is practically the entire type of vegetation in this watershed.

The watershed of this river has a compactness coefficient of 1.71 and a shape factor of 0.12. The drainage density is 1.15 km/km<sup>2</sup>. These factors indicate that the basin is not prone to flooding and that its drainage is in the reasonable to average range.

### **Gramame River Basin**

The main watercourse in the basin, the Gramame River, is 54.3 km long. It is located in the east/southeast region of the state. The Gramame River basin is located between latitudes 7°10'27" and 7°24'23" south and longitudes 34°48'12" and 35° 10'46" west, on the south coast of the state of Paraíba. It has an area of approximately 592.53 km<sup>2</sup>.

The basin is made up of the municipalities of Alhandra, Conde, Cruz do Espírito Santo, João Pessoa, Pedras de Fogo and Santa Rita, as well as a small section of the municipality of São Miguel do Taipu.

The basin is predominantly occupied by Argisols, more or less  $\frac{3}{4}$  of the area. Spodosols are in the background, followed by a small area of Gleissols. At the point where the water flows into the sea, there is an insignificant area of Indiscriminate Mangrove Soils. The relief of this basin is practically flat.

As far as vegetation is concerned, there is a certain balance between the cerrado type and the forest type. The latter can be subperenifolia and subcaducifolia.

In this basin, the values of the shape factor, equal to 0.2, and the compactness coefficient, equal to 1.43, indicate that the basin is slightly rounded, relatively compact and regular. Therefore, without considering the influence of other factors, we can conclude that the basin is not very prone to flooding.

Crossing the Gramame and Mamuaba Rivers is the Gramame-Mamuaba dam, with a capacity of almost 57 hm<sup>3</sup>.

### **Guaju River Basin**

The Guaju River basin, a federally-owned basin, lies at latitudes 6°29'04" and 6°35'30" south and longitudes 34°57'578" and 35°10'12" west of Greenwich.

The area of the basin in the state of Paraíba is approximately 152.62 km<sup>2</sup> and is located in the extreme northeast of Paraíba, covering part of the municipalities of Mamanguape

and Mataraca. The watercourses that cross the basin's territory are the Uriúna Creek, Catu River, Volta River, Coelho River and Guaju River.

It is basically occupied by Quartzarenic Neosols, with some Argisols and Spodosols. The relief is flat.

Cerrado-type vegetation occupies at least 65% of the basin's area, the rest being suberenifolia forest.

### **Jacu River Basin**

The Jacu river basin occupies the northern part of the state of Paraíba, although it continues into Rio Grande do Norte. A federal watershed, it is located almost entirely in the Curimataú Homogeneous Microregion, between the coordinates 6°26'10" and 6°50'33" south latitude and 35°49'15" and 36°17'53" west longitude. In the state of Paraíba, the Jacu River basin covers an area of approximately 967.43 km<sup>2</sup>, in which the municipalities of Araruna, Baraúna, Barra de Santa Rosa, Cacimba de Dentro, Cuité, Damião, Nova Floresta, Nova Palmeira, Pedra Lavrada, Picuí and Sossego are located.

The Rio Jacu changes its name when it crosses the border into the state of Paraíba, taking on the name Rio Japi. Its source is located at an altitude of 700 m, called Alto do Chapéu. Its main tributary in Paraíba, on the left bank, is the Rio Campo, with no tributary on the right bank. It also has a reservoir located in the municipality of Cuité, the Boqueirão do Cais reservoir, with a capacity of 12,367,300 m<sup>3</sup>, and the Santa Rita do Cais reservoir, in the municipality of Sossego, which can store 5,456,120m<sup>3</sup>.

The watershed of this river has a compactness coefficient of 1.62, a shape factor of 0.20 and a drainage density of 0.76 km/km<sup>2</sup>. These indices indicate that the basin is not prone to flooding and has reasonable to average drainage.

Hydrological studies show that the possibilities of dams with a certain volume of water storage are relatively weak.

The soils that occupy this basin are mainly the very expressive Luvisolos and Litholic Neosols and Regolithic Neosols, with less significant areas. Latosols do occur.

The predominant type of relief is undulating, followed at a distance by strongly undulating and, to a lesser extent, gently undulating. There are insignificant occurrences of flat terrain.

In terms of vegetation, hyperxerophilous caatinga dominates almost the entire area of the basin. In areas of no geographical significance, there is sub-caducifolia forest type vegetation.

### **Mamanguape River Basin**

The Mamanguape River basin, located in the extreme east of the state of Paraíba, lies between latitudes 6°36'49" and 7°11'08" South and longitudes 34°54'42" and 35°57'51" West of Greenwich. The municipalities in this basin are as follows: Alagoa, Grande, Alagoa Nova, Alagoinha, Algodão de Jandaíra, Araçagi, Arara, Areia, Areial, Baía da Traição, Bananeiras, Belém, Borborema, Capim, Casserengue, Cuité de Mamanguape, Cuitegi, Curral de Cima, Duas Estradas, Esperança, Guarabira, Gurinhém, Itapororoca, Juarez Távora, Lagoa Seca, Mamanguape, Marcação, Mari, Massaranduba, Matinhas, Montadas, Mulungu, Pilões, Pilõezinhos, Pirpirituba, Pocinhos, Puxinanã, Remígio, Rio

Tinto, São Sebastião da Lagoa de Roça, Serra da Raiz, Serra Redonda, Serraria, Sertãozinho and Solânea.

Its main river is the Mamanguape, an intermittent river that rises in the Agreste da Borborema micro-region and flows into the Atlantic Ocean in the municipality of Rio Tinto, draining an area of around 3,520.36 km<sup>2</sup>. It receives contributions from watercourses such as the Guandu, Araçagi and Saquaiba rivers.

The dominant soils in the basin area are Argissolos, followed by Neossolos, expressed according to their territorial dominance by Neossolos: Quartzarenic, Regolithic and Litholic. There is a representative area of Luvisolos and, to a lesser extent, areas of Nitossolos.

As far as relief is concerned, the wavy/strong wavy and gentle wavy forms dominate in the westernmost part of the basin. In the central part of the basin, wavy relief prevails. In the easternmost region, flat terrain is dominant. In short, the most expressive landforms in the basin are: undulating and strongly undulating. In second place is gently undulating.

As far as vegetation is concerned, the forest type dominates, sometimes sub-perennial, sometimes sub-caducifolous, and rarely deciduous. The hypoxerophilous caatinga appears in the background, as does the cerrado.

The Mamanguape River basin has 21 reservoirs in its territory, 14 of which have a capacity of over 1 hm<sup>3</sup>: Araçagi, Camará, Canafístula II, Lagoa do Matias, Pirpirituba, Pitombeira, Saulo Maia, Sindô Ribeiro, Tauá and Vaca Brava, etc. The Araçagi reservoir is the largest, with a maximum volume of around 63.3 hm<sup>3</sup>.

### **Miriri River Basin**

The Miriri river basin is located in eastern Paraíba and lies between latitudes 6°49'45" and 7°1'59" south and longitudes 34°51'13" and 35°18'54", west of Greenwich. It has a drainage area of 432.42 km<sup>2</sup>, which flows into the Atlantic Ocean in the municipality of Rio Tinto.

The basin covers all or part of the municipalities of Araçagi, Capim, Cuité de Mamanguape, Lucena, Mari, Rio Tinto, Santa Rita and Sapé.

This is a basin that is not conducive to significant water impoundments.

The basin is mainly occupied by Argissolos. The relief is flat and rarely gently undulating.

It has cerrado-type vegetation and subperenifolia forest, as well as a small area of subcaducifolia forest.

### **Paraíba River Basin**

The Paraíba River basin has an area of 20,116.42 km<sup>2</sup>, lying between latitudes 6°51'31" and 8°26'21" South and longitudes 34°48'35"; and 37°2'15"; West of Greenwich, and is the second largest in the state of Paraíba, as it covers 38% of its territory and is home to 1,828,178 inhabitants, corresponding to 52% of its total population. In addition to its high population density, the basin includes the cities of João Pessoa, the state capital, and Campina Grande, its second largest urban center (AESAs, c2024).

The Paraíba River Basin occupies areas in the mesoregions of Borborema, Agreste Paraibano and Litoral Paraibano, with a wide variety of climates and distinct physical (geomorphological) characteristics that divide the basin into four sub-basins. The sub-basin is made up of the Taperoá River and the Upper Paraíba River, Middle Paraíba

River and Lower Paraíba River regions, making it possible to carry out a more complete and detailed study of these areas.

Through the federal and state governments, several public reservoirs have been built in the Basin area, which are used to supply the population and livestock, irrigation, fishing and some regional leisure and tourism initiatives. These reservoirs are the main sources of water in the region and during droughts many of them collapse, causing conflicts over the use of water resources and serious social and economic problems, as is the case with the Epitácio Pessoa Dam in Boqueirão (AESAs, c2024).

### **Upper Paraíba sub-basin**

Located in the southwestern part of the Borborema Plateau, the Alto Paraíba sub-basin lies between latitudes 7°20'48" and 8°18'12" south and between longitudes 36°7'44" and 37°21'22", west of Greenwich. It has a catchment area of 6,712.36 km<sup>2</sup>, of which 10.30 km<sup>2</sup> are outside the state of Paraíba. The sub-basin covers all or part of the municipalities of Amparo, Barra de São Miguel, Boqueirão, Cabaceiras, Camalaú, Caraúbas, Congo, Coxixola, Monteiro, Ouro Velho, Prata, São Domingos do Cariri, São João do Cariri, São João do Tigre, São José dos Cordeiros, São Sebastião do Umbuzeiro, Serra Branca, Sumé and Zabelê.

The main watercourse in the basin is the Paraíba River, which receives contributions from the Monteiro, Sucurú and Taperoá Rivers. In addition, there are 17 dams in the region: Bichinho, Camalaú, Campos, Cordeiro, Epitácio Pessoa, Ouro Velho, Poções, Prata II, Santo Antônio, São Domingos, São José II, São Paulo, Serrote, Sumé etc, with the Epitácio Pessoa dam standing out, which can store up to 466 hm<sup>3</sup>.

The rainfall in the Upper Paraíba River region averages between 350 and 600 mm per year. The annual totals are concentrated in a four-month period, which generally corresponds to the months of February, March, April and May (CBH PB, 2004).

The predominant vegetation is hyperxerophilous Caatinga, deciduous and sub-deciduous forest. The areas that have been deforested and used for agriculture are generally planted with fodder palm, agave, cotton and corn and beans.

The relief of the region, which is part of the southwestern escarpment of the Borborema Plateau, is higher than 600 meters, with undulating and strongly undulating terrain, and some areas are also mountainous.

The predominant soils are of the Non-Calcareous Bruno type, which cover all the crystalline rock in the area covered by the Upper Paraíba River course.

The geology is made up of geological compartments classified as Proterozoic and Archezoic formations, including quartzites, gneisses and migmatites, as well as mica schists and lithology associated with the gneissic complex. There are also volcanic and plutonic rocks of various ages (CBH PB, 2004).

### **Middle Paraíba sub-basin**

The Médio Paraíba sub-basin is located to the south of the Borborema Plateau, in the state of Paraíba, between latitudes 7°3'50" and 7°49'13" South, and longitudes 35°30'15" and 36°16'38", west of Greenwich. It is bordered to the south by the state of Pernambuco, to the west by the Taperoá basin and the Alto Paraíba sub-basin, and to the east by the Baixo Paraíba sub-basin.

The Médio Paraíba basin covers an area of approximately 3,756.35 km<sup>2</sup>, of which 36.93 km<sup>2</sup> is outside the state. It has 19 municipalities in its territory that are totally or partially part of it: Alcantil, Aroeiras, Barra de Santana, Barra de São Miguel, Boa Vista, Boqueirão, Campina Grande, Caturité, Fagundes, Gado Bravo, Itatuba, Montadas, Natuba, Pocinhos, Puxinanã, Queimadas, Riacho de Santo Antônio, Santa Cecília and Umbuzeiro.

It receives contributions from watercourses such as the Ingá, São Pedro and Catolé rivers, as well as the Bodocongó stream. There are also 9 dams in the region, the most notable being the Acauã dam (Argemiro de Figueiredo), with 253 hm<sup>3</sup>.

Rainfall data shows that the region has an average annual rainfall of between 600 and 1,100 mm, with decreasing values from east to west.

The dominant natural vegetation is hyperxerophilous, hypoxerophilous Caatinga, deciduous and sub-deciduous forest. The deforested areas used for agriculture are generally occupied by fodder palm, agave, cotton and corn and beans (CBH PB, 2004).

The relief of the area, which is situated on part of the Borborema Plateau, has three transitional bands between the Sublittoral Depression and the Serra da Borborema region, in the municipality of Campina Grande with undulating, strongly undulating and mountainous sectors.

The region is home to soils of the following types: Bruno Não Cálcico with little thickness, Litólicos, Solonetz Solodizado, Regossolos and Cambissolos.

From a geological point of view, the lithology of the middle reaches of the Paraíba River is dominated by the crystalline complex and sedimentary soils, as well as occurrences of volcanic and plutonic rocks of various ages - granitic and volcanic (CBH PB, 2004).

### **Lower Paraíba sub-basin**

The Baixo Paraíba sub-basin is located in the coastal part of the state of Paraíba, between latitudes 6°55'13" and 7°30'20" south and longitudes 34°47'37" and 35°55'23", west of Greenwich. The municipalities included in this sub-basin are Alagoa Grande, Bayeux, Cabedelo, Caldas Brandão, Campina Grande, Cruz do Espírito Santo, Fagundes, Gurinhém, Ingá, Itabaiana, Itatuba, João Pessoa, Juarez Távora, Juripiranga, Lagoa Seca, Lucena, Mari, Massaranduba, Mogeiro, Mulungu, Natuba, Pedras de Fogo, Pilar, Puxinanã, Queimadas, Riachão do Bacamarte, Riachão do Poço, Salgado de São Félix, Santa Rita, São José dos Ramos, São Miguel de Taipu, Sapé, Serra Redonda and Sobrado.

The Lower Paraíba sub-basin covers an area of 3,970.64 km<sup>2</sup>, of which 15.04 km<sup>2</sup> is located outside the state. Its main river is the lower course of the Paraíba River, and its main tributary is the Paraibinha River. This region also has 8 reservoirs, all with a capacity of more than 1 hm<sup>3</sup>, with the São Salvador reservoir being the most notable, storing more than 12 hm<sup>3</sup>.

In the general context of the coastal region, rainfall data indicates that the average annual rainfall varies between 1,200 and 1,600 mm, with decreasing values inland. It can be seen that the greatest concentration of rainfall occurs in the areas closest to the ocean, in the coastal areas (CBH PB, 2004).

The natural vegetation that dominated the area consisted of the Atlantic Forest and associated ecosystems, i.e. mangroves, floodplain fields and mixed formations of

tabuleiros, cerrados and restingas. However, throughout the process of colonization and occupation of the land, almost all of the natural vegetation was indiscriminately removed and replaced by sugar cane, pineapple and manioc crops, among others of an intensive and extensive nature. Today, only a few small patches of Atlantic forest and its ecosystems remain.

The relief of the region is flat, with a predominance of tableland areas with shallow U-shaped valleys.

As far as soil characterization is concerned, the predominant types are: thin non-calcareous Bruno, Litholic, Solodized Solonetz, Regosols and Cambisols. Also noteworthy is the occurrence of Eutrophic Alluvial soils with a sandy texture, well-drained and with no stoniness.

From a geological point of view, the lithology shows a predominance of sedimentary soils, sands belonging to the barrier group, variegated sandstones and limestone, as well as mangroves and soils influenced by the tides (CBH PB, 2004).

### **Taperoá River sub-basin**

The Taperoá River sub-basin, a sub-basin of the Paraíba River basin, is located in the central part of the state of Paraíba, between latitudes 6°51'47" and 7°34'33" south, and between longitudes 36°0'10" and 37°14'0", west of Greenwich. The sub-basin includes, in whole or in part, 26 municipalities: Areia de Baraúnas, Assunção, Barra de Santa Rosa, Boa Vista, Cabaceiras, Cacimbas, Cubati, Desterro, Gurjão, Juazeirinho, Junco do Seridó, Livramento, Olivedos, Parari, Pocinhos, Salgadinho, Santo André, São João do Cariri, São José dos Cordeiros, São Vicente do Seridó, Serra Branca, Soledade, Sumé, Taperoá, Teixeira and Tenório.

Its main river is the intermittent Taperoá, which rises in the Serra de Teixeira and flows into the Paraíba River at the Boqueirão Dam (Açude Presidente Epitácio Pessoa).

Its watershed has an area of approximately 5,677.07 km<sup>2</sup> and receives contributions from watercourses such as the Soledade and Boa Vista rivers and the Carneiro stream.

The Taperoá River sub-basin has 16 dams built: Gurjão, Jeremias, Lagoa do Meio, Livramento (Russos), Mucutu, Namorado, Olivedos, Serra Branca I, Serra Branca II, Soledade, Taperoá II (Manoel Marcionilo) and others.

Rainfall data shows that the region has an average annual rainfall of between 350 and 600 mm. It can be seen that the greatest concentration of rainfall occurs in a period of approximately two to four months, corresponding to 65% of the total annual rainfall (CBH PB, 2004).

The dominant natural vegetation in the Taperoá River Sub-Basin area is hyperxerophilous and hypoxerophilous Caatinga, deciduous and sub-deciduous forest. The areas that have been deforested and used for agriculture are generally planted with fodder palm, agave, cotton and corn and beans.

The relief of the sub-basin is undulating, strongly undulating and mountainous. The topography's hypsometric variations take on altitudes that are considered relevant, with the highest points reaching 600 m on the eastern escarpments of the Borborema Plateau.

In the Sub-Basin region, there are soils of the following types: Bruno Não Cálculo, which is thin and covers all the crystalline rock in the basin area, Litholic, Solodized Solonetz, Regossolos and Cambissolos.

In geological terms, the area of the Taperoá River Sub-Basin is predominantly made up of formations from the Proterozoic and Archezoic, including quartzites, gneisses and migmatites, as well as mica schists and lithology associated with the gneissic complex. There are also granites originating from volcanic and plutonic rocks (CBH PB, 2004).

### **Piranhas River Basin**

The hydrographic basin of the Piranhas River is a federal domain, considering that it rises in the mesoregion of the Paraíba hinterland and also drains a large area of the state of Rio Grande do Norte, with a total area of 22,605.60 km<sup>2</sup>, 210 km<sup>2</sup> of which is located outside the state of Paraíba.

It is an intermittent river under natural conditions. Its perennial flow is ensured by two regularization reservoirs built by DNOCS: Coremas - Mãe d'Água, in Paraíba, with a capacity of 1.360 billion m<sup>3</sup> and a regularized flow of 9.5 m<sup>3</sup>/s, and the Armando Ribeiro Gonçalves dam, in Rio Grande do Norte, with 2.400 billion m<sup>3</sup> and a regularized flow of 17.8 m<sup>3</sup>/s, considered strategic for the socio-economic development of these states (CBH PPA, c2024).

The basin is entirely located in semi-arid territory, with average rainfall varying between 400 and 800 mm per year, concentrated between the months of February and May. The concentration of rainfall in a few months of the year, combined with the geomorphology of the region, characterized by shallow soils formed on a crystalline substrate, with low storage capacity, is responsible for the intermittent nature of the region's rivers. In addition, the rainfall pattern tends to show strong inter-annual variability, causing years of regular rainfall to alternate with years of severe water scarcity, leading to water droughts. On the other hand, evapotranspiration rates are quite high, reaching over 2000 mm/year, which causes a significant water deficit and is a key factor to be considered in the operation of the region's reservoirs (CBH PPA, c2024).

Its main river, the Piranhas River, is 405 km long and forms a hydrographic system made up of its upper and middle reaches, the basins of the Peixe and Piancó Rivers and part of the basins of the Espinharas and Seridó Rivers, these four being its main tributaries.

Due to its specific characteristics, the Piranhas River Basin was divided into six sub-basins: Upper and Middle reaches of the Piranhas River and sub-basins of the Peixe, Piancó, Espinharas and Seridó Rivers.

This basin is one of the most important in the semi-arid Northeast and, together with the Paraíba River basin, makes up 82% of the total surface area of the state of Paraíba.

### **Fish River sub-basin**

The Rio do Peixe sub-basin, which has a drainage area of 3,432.82 km<sup>2</sup>, is located in the extreme northwest of the state of Paraíba, between 6°20' and 7°03' south latitude and 37°57' and 38°46' west longitude. Its territory includes 21 municipalities, either totally or partially: Aparecida, Bernardino Batista, Bom Jesus, Cachoeira dos Índios, Cajazeiras, Joca Claudino, Lagoa, Lastro, Marizópolis, Poço Dantas, Poço de José de Moura, Pombal, Santa Cruz, Santa Helena, São Francisco, São João do Rio do Peixe, São José de Piranhas, Sousa, Triunfo, Uiraúna and Vieirópolis.

According to studies by the Paraíba State Master Plan (SCIENTEC, 1996), the Rio do Peixe basin has shape factor and compactness coefficient values that indicate that it is a slightly elongated, relatively compact and regular basin. Thus, it is interpreted that, without considering the influences of other factors, it would be subject to intense floods, but of short duration. In addition, it reports that the Rio do Peixe basin has a drainage density of 1.1 km/km<sup>2</sup>, which means drainage in the reasonable to medium range.

The Peixe River basin has 11 dams in its territory, 6 of which have a capacity of over 6 hm<sup>3</sup>. The most notable are the Lagoa do Arroz dam, which can store up to 80 hm<sup>3</sup>, and the Capivara dam with a storage capacity of 37.5 hm<sup>3</sup>

Its main watercourse is the Rio do Peixe, which is 106.1 km long and has its source in Serra do Padre, in the municipality of Uiraúna, until it flows into the left bank of the Piranhas River in the district of Aparecida, in the municipality of Sousa.

There are significant areas with surface water runoff that is favorable to damming, provided there are satisfactory culverts.

As for the soils that occupy it, there is an almost equal distribution among the most significant. They are: Argissolos, Vertissolos, Neossolos Litólicos and Luvisolos, the latter with a slightly larger area than the others. The predominant type of relief is gently undulating.

The vegetation is hyperxerophilous caatinga.

### **Espinharas River sub-basin**

The Espinharas River sub-basin, with an area of 2,883.37 km<sup>2</sup>, is located between parallels 6°41'18" and 7°21'51" south, and meridians 36°43'41" and 37°33'50", west of Greenwich. The towns within its territory are Areia de Baraúnas, Assunção, Cacimba de Areia, Cacimbas, Catingueira, Imaculada, Junco do Seridó, Mãe d'Água, Malta, Maturéia, Passagem, Patos, Paulista, Quixaba, Salgadinho, Santa Luzia, Santa Teresinha, São José de Espinharas, São José do Bonfim, São Mamede, Taperoá, Teixeira, Vista Serrana.

Its main river, the Rio Espinharas, is formed by the meeting of the Rios da Cruz and da Farinha, in the city of Patos. This river runs for 45 km until it meets the Piranhas River.

The Espinharas sub-basin has a compactness coefficient (KC) of 1.93 and a drainage density (Dd) of 1.16 km/km<sup>2</sup>.

This basin also has 14 dams, all of which have a maximum volume of more than 1 hm<sup>3</sup>. The most notable are the Capoeira dam, which can store up to 53.4 hm<sup>3</sup>, and the Farinha dam with 25.7 hm<sup>3</sup> of storage capacity.

Hydrological studies show that it is still possible to build dams if there are reservoirs.

This sub-basin is mainly occupied by Luvisolos (more than 60%) and, in second place, by Litholic Neosols, with insignificant occurrences of Regolithic Neosols and Cambissolos.

The dominant relief is of the gentle undulating type, with occurrences of the undulating form.

The hyperxerophilous caatinga vegetation predominates in practically the entire sub-basin area.

### **Piancó River sub-basin**

The Piancó River sub-basin is located in the southwest of the state of Paraíba, bordered to the north by the Middle and Upper reaches of the Piranhas River, to the south by the state of Pernambuco, to the east by the Espinharas River sub-basin and the state of Pernambuco, and to the west, with the state of Ceará and the region of the upper course of the Piranhas River, between parallels 6°43'52" and 7°50'28" south and meridians 37°26'56" and 38°42'56", west of Greenwich. The sub-basin covers an area of approximately 9,237.78 km<sup>2</sup>.

This sub-basin contains 37 municipalities, all or part of which fall within its territory: Água, Branca, Aguiar, Boa Ventura, Bonito de Santa Fé, Cajazeirinhas, Carrapateira, Catingueira, Conceição, Condado, Coremas, Curral Velho, Diamante, Emas, Ibiara, Igaracy, Imaculada, Itaporanga, Juru, Mãe d'Água, Manaíra, Nova Olinda, Olho d'Água, Pedra Branca, Piancó, Pombal, Princesa Isabel, Santa Inês, Santa Teresinha, Santana de Mangueira, Santana dos Garrotes, São Bentinho, São José da Lagoa Tapada, São José de Caiana, São José de Piranhas, São José de Princesa, Serra Grande and Tavares.

The main river in this sub-basin is the Piancó River, whose main tributaries are the Santana, Minador, Canoas, Maria and Verde streams.

Paraíba's largest reservoirs are located in the Piancó basin, the most important of which, due to their storage capacities, are the following: the Curema reservoir (744 hm<sup>3</sup>), the Mãe D'água reservoir (545 hm<sup>3</sup>) and the Saco reservoir (97 hm<sup>3</sup>).

The Piancó River basin has a shape factor of 0.21 and a compactness coefficient of 1.59, indicating that the basin is slightly rounded, relatively compact and regular, suggesting that it is not very prone to flooding. In addition to these parameters, the drainage density increases with the length of the drainage network and shows a value for the entire sub-basin of 1.52 km/km<sup>2</sup>, which suggests a drainage classification in the reasonable to medium range.

Soil runoff is favorable for the construction of water reservoirs.

The predominant soils in this sub-basin are stony, rocky Litholic Neosols (shallow soils), associated with representative areas of rock outcrops. Luvissoles and Argissolos are also present in less significant areas.

The dominant relief of the sub-basin is undulating to strongly undulating, with insignificant areas of gentle undulation.

The predominant vegetation is hyperxerophilous caatinga.

### **Upper Piranhas sub-basin**

The Alto Piranhas sub-basin, which covers an area of 2,566.57 km<sup>2</sup>, is located in the far west of the state of Paraíba, between 6°37'18" and 7°22'56" south latitude, and 37°48'11" and 38°41'14" longitude, west of Greenwich. It has 16 municipalities in its territory: Aparecida, Bonito de Santa Fé, Cajazeiras, Carrapateira, Coremas, Lagoa, Marizópolis, Monte Horebe, Nazarezinho, Pombal, São Domingos, São João do Rio do Peixe, São José da Lagoa Tapada, São José de Piranhas, Serra Grande and Sousa.

The main river in the Alto Piranhas sub-basin is the Piranhas River itself, which is 30 km long and has a gradient of 10.67 m/km. The river flows in a northeasterly direction

towards the state of Rio Grande do Norte, after encountering the stretch corresponding to the Middle Course of the Piranhas River. It receives contributions from watercourses that are not very dense and have intermittent regimes. On its right bank, the Cachoeira and Trapiá streams stand out. On the left bank, the Tamanduá stream flows. With regard to reservoirs, the Engenheiro Avidos reservoir stands out, storing up to 293.6 hm<sup>3</sup>.

Hydrological studies show that this sub-basin is also favorable for the construction of dams, as long as there are points available for damming.

The sub-basin is mainly occupied by Luvisolos and secondly by Argissolos. There are small occurrences of Vertisols and Litholic Neosols.

The predominant landform is gently undulating.

The type of vegetation that prevails in the area is caatinga, mainly hyperxerophilous.

### **Middle Piranhas sub-basin**

The Médio Piranhas sub-basin, which covers an area of 4,485.07 km<sup>2</sup>, is located in the northwest of the state of Paraíba, between the coordinates 6°1'38" and 7°0'90" south latitude and 37°09'25" and 38°01'44" longitude, west of Greenwich. The sub-basin has 22 municipalities in its territory, including Belém do Brejo do Cruz, Bom Sucesso, Brejo do Cruz, Brejo dos Santos, Cajazeirinhas, Catingueira, Catolé do Rocha, Condado, Jericó, Lagoa, Malta, Mato Grosso, Patos, Paulista, Pombal, Riacho dos Cavalos, Santa Cruz, São Bentinho, São Bento, São José de Espinharas, São José do Brejo do Cruz and Vista Serrana.

The Piranhas River, in its middle course, runs for 123 km and has a slope of 1.4 m/km, perennialized by the Curema-Mãe d'Água reservoir, and is the main tributary of the Piancó River. It receives contributions from other watercourses, which are not very dense and have intermittent regimes. Its main tributaries are the Caiçara, Baião, Escuro, Sabiá and Mato Grosso streams.

The basin has 9 built dams, the largest of which have a maximum volume: Baião, Engenheiro Arcoverde, Carneiro, Escondido, Riacho dos Cavalos, Santa Rosa and Tapera.

With regard to the drainage system, the Middle Piranhas sub-basin has a drainage density of 1.26 km/km<sup>2</sup>, indicating that it has drainage in the reasonable to medium range.

Hydrological studies indicate that this sub-basin is favorable for the construction of reservoirs.

The dominant soils are Luvisolos, followed by Argissolos. There are insignificant occurrences of Litholic Neosols. The dominant relief is gently undulating.

The predominant vegetation is hyperxerophilous caatinga.

### **Seridó River sub-basin**

The eastern sector of the Seridó sub-basin has a total area of 3,448.49 km<sup>2</sup>, with 1,474.56 km<sup>2</sup> belonging to the Western Seridó region and 1,973.93 km<sup>2</sup> to the Eastern Seridó. The sub-basin is located between the coordinates 6°16'57" and 6°59'33" south latitude, and 36°13'12" and 36°36'21" longitude, west of Greenwich. The western sector

of the sub-basin is located between latitude 6°42'63" and 7°03'56" south and longitude 36°43'48" and 37°15'16" west of Greenwich.

The Western Seridó sub-basin has 8 municipalities totally or partially within its territory, namely Areia de Baraúnas, Junco do Seridó, Quixaba, Santa Luzia, São José de Espinharas, São José do Sabugi, São Mamede and Várzea. The Eastern Seridó sub-basin has 11 municipalities: Baraúna, Cubati, Frei Martinho, Juazeirinho, Nova Palmeira, Olivedos, Pedra Lavrada, Picuí, São Vicente Do Seridó, Sossego and Tenório.

The main river in this sub-basin is the Seridó River, which rises to the west of the Borborema Plateau, in the vicinity of the Serra do Caldeiro, in Paraíba territory. Its main tributaries are the Picuí River and the Quinturaré and Vazantes streams in the Eastern Seridó region, the Sabuji River, as well as the Papagaio, Chafariz and Santa Maria streams in the Western Seridó region. A highlight is the Várzea Grande reservoir with a capacity of 21.5 hm<sup>3</sup>.

In terms of morphometric parameters, the hydrographic basins of these rivers have compactness coefficients equal to 1.62 (East) and 1.71 (West). With regard to the drainage system, the Seridó River sub-basin has drainage densities equal to 0.76 km/km<sup>2</sup> and 1.15 km/km<sup>2</sup>, for the east and west, respectively, meaning that both basins have drainage in the reasonable to average range.

Surface water runoff in soils is favorable to the construction of water reservoirs if there are satisfactory topographical conditions.

The dominant soils are lithic neosols, followed by luvisols. These soils occupy approximately 70 to 80% of the sub-basin.

The dominant reliefs are gently undulating and steeply undulating.

The vegetation in the area is hyperxerophilous caatinga.

### **Trairi River Basin**

The Trairi River basin is a federal watershed, with part of its area located in the state of Rio Grande do Norte. It lies between latitude 6°24'19" and 6°30'09" south and longitude 36°02'47" and 36°14'29" west, covering an area of 109.79 km<sup>2</sup>.

The Trairi River basin is almost entirely located in the state of Rio Grande do Norte. It lies in the mesoregion of Agreste Paraíba and the microregion of Curimataú Ocidental. The municipalities of Cuité, Nova Floresta and Picuí are part of the basin.

In the state of Paraíba, it is occupied by Latossolos, Luvisolos and Neossolos Litólicos.

It has flat, undulating and steeply undulating landforms, the most significant of which is flat.

As far as vegetation is concerned, there is a level playing field between the subcaducifolia forest and the sum of the areas of hypo- and hyperxerophilous caatinga.

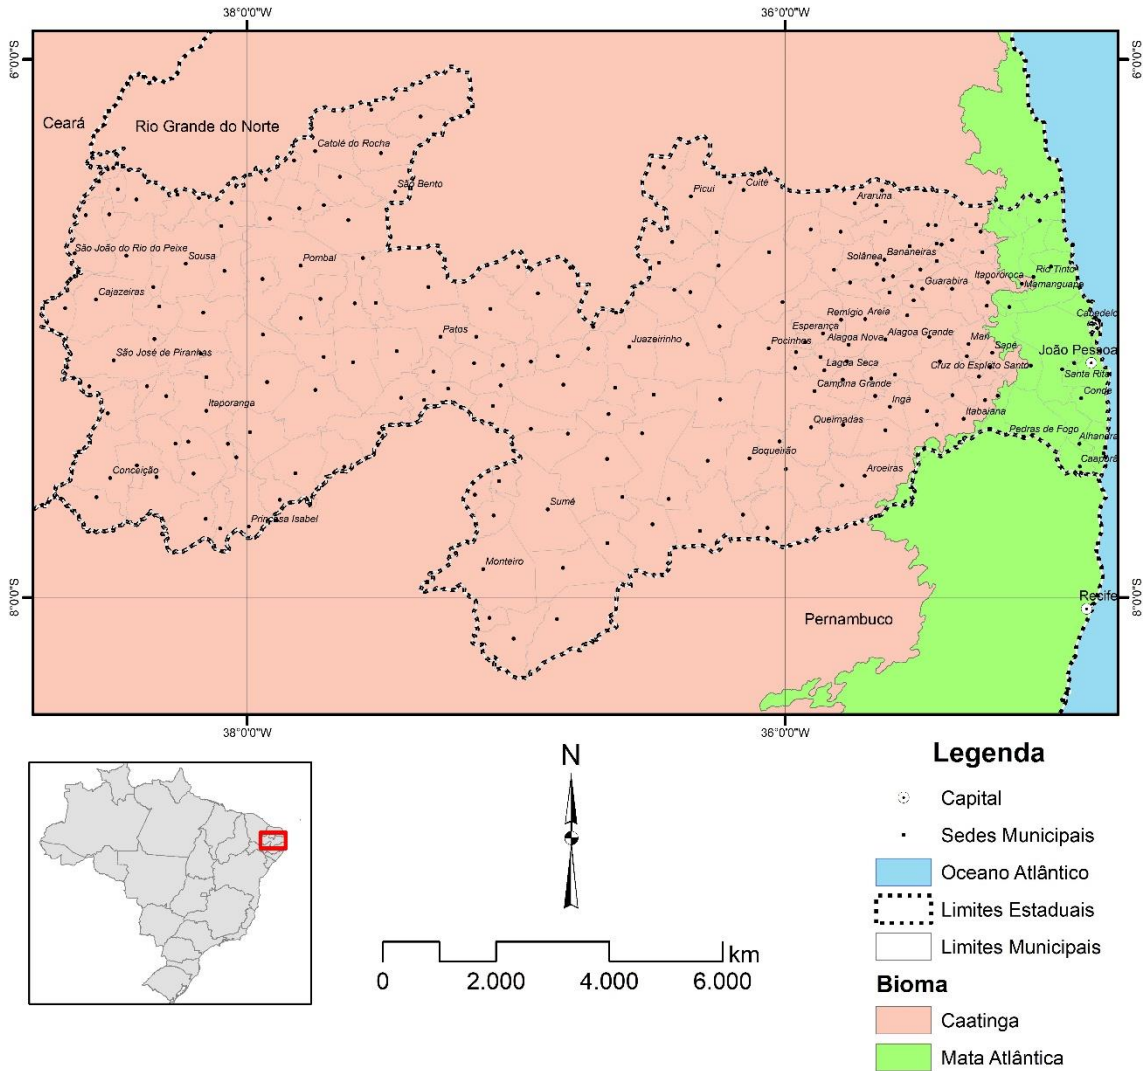

## **4.2 Biotic Environment**

Diagnostic information on the biotic environment of the Procace II area is presented below. The data catalogued comes from studies, mapping and statistical bases from available official sources.

### 4.2.1 Natural Habitats

As can be seen in the figure below, Paraíba has two biomes: the Atlantic Forest and the Caatinga, with the Caatinga biome predominating in the state, with the Atlantic Forest predominating only in the areas most influenced by the coastal strip.

#### 44 - Biomes - Proc case II

Source: MMA, 2024, Consultation

### Atlantic Forest

The Atlantic Rainforest formed a continuum of rainforests that stretched along the Atlantic coast in a band 120 to 160 km wide, from Rio Grande do Norte to Rio Grande do Sul (Giulietti & Forero 1990 *apud* Catharino 2006), with floristic and structural differences in different regions; these differences were linked to the climatic gradient, with populations of species adapted to the different climates.

The northeastern Atlantic Forest region covers the gently undulating areas between the Serra da Borborema and the Atlantic Ocean, occupying a large part of the Coastal Tablelands located in northeastern Brazil, from the state of Rio Grande do Norte to southern Bahia.

The few remnants of true Atlantic Forest, megathermic and hydrophilous, with a few tall trees carrying epiphytic species or lianas, these areas are called capões in the Northeast. On the ground there are arborescent ferns, isolated palms, mosses, bamboos, marantáceas, musáceas, cactáceas, bromeliáceas and other xerophytes. The remains of the primary forest are located in the central part of Bahia and on the slopes of the Serra do Araripe, Aba, Teixeira and Santa Luzia, in Paraíba (Luetzelburg, 1922).

In studies carried out in the Northeast, it was observed that the states of Rio Grande do Norte, Paraíba, Pernambuco and Alagoas had the highest levels of pressure on vegetation cover. They tended to be higher in the coastal regions, in the so-called Zona da Mata, where the Atlantic Forest predominated.

The Atlantic Forest Biome is subdivided into phytogeographic units, as follows:

### **Dense Ombrophilous Forest**

It is an evergreen forest, with a canopy made up of trees between 20 and 30 m tall. It is located in regions where there is no biologically dry period during the year (IBGE, 1992), in areas close to the ocean under the influence of the humid air masses that enter the continent from the sea and in mountainous elevations with physiognomic variations that allow it to be extremely rich and diverse (IBGE, 1992; Mata Atlântica, 2001).

### **Mixed Ombrophilous Forest**

Also known as the Araucaria Forest, it is characterized by a combination of Atlantic Forest in the middle and lower stratum of the forest, with the Paraná pine (*Araucaria angustifolia*) in the upper stratum, as well as trees 25 to 30 meters high and a large number of epiphytes. The regions where this phytophysiology occurs have an ombrophilous climate with a few months of low temperatures, and are mainly in the plateaus of the southern states of the country (Rio Grande do Sul, Santa Catarina and Paraná) and in the discontinuous massifs of São Paulo and Rio de Janeiro (Paranapiacaba, Mantiqueira and Bocaina mountains) (IBGE, 1992; Mata Atlântica, 2001).

### **Open Ombrophilous Forest**

It is characterized by transitional vegetation between the Amazon rainforest and extra-Amazon areas. This forest has four floristic facies that alter the ecological physiognomy of the Dense Ombrophilous Forest. In this physiognomy, the treetops are generally not so close together, which allows for more sunlight. There are palm trees, lianas, the sororoca or wild banana tree and bamboos. It is characterized by a short dry period, which lasts from two to three months, and an average temperature of over 22° (IBGE, 1992).

### **Semideciduous Seasonal Forest**

Also called Semideciduous Mesophytic Seasonal Forest by Rizzini (1963), it is a phytophysiology intrinsic to the Atlantic Forest biome, constituting a transitional formation between coastal hillside forests and inland non-forest formations (Mata Atlântica, 2001). It is a forest formation characterized by the presence of trees that lose their leaves (deciduous) during the winter, or dry season (Mata Atlântica, 2001). The percentage of deciduous individuals varies from 20 to 50% of the forest as a whole

(IBGE, 1992). This phenomenon of leaf fall has been attributed to factors such as water availability, low temperature and nutrient availability (Oliveira, 1997).

### **Seasonal deciduous forest**

It has large discontinuous areas located from north to south, between the Open Ombrophilous Forest and the Savannah (Cerrado); from east to west, between the Steppic Savannah (caatinga of the arid hinterland) and the Semideciduous Seasonal Forest (Subcaducifolia Tropical Forest); and finally, in the south, already in the subtropical area, in the valley of the River Uruguay, between the Mixed Ombrophilous Forest of the Southern Plateau and the steppe (IBGE, 1992). This vegetation is characterized by two well-demarcated climatic seasons, a rainy season followed by a long biologically dry period. It occurs in the form of forest disjunctions, are dominated by genera such as *Peltophorum*, *Anadenanthera* and *Apuleia*, and have the dominant macro or mesophanerophytic stratum predominantly deciduous, with more than 50% of the individuals stripped of foliage in the unfavorable period (IBGE, 1992).

### **Coastal vegetation**

Subdivided as follows:

#### ***Mangrove***

It is a wetland, defined as a "coastal ecosystem, a transition between the terrestrial and marine environments, characteristic of tropical and subtropical regions, subject to the tidal regime". It is necessary to distinguish between the mangrove, which is the ecosystem, with vegetation, animals and microorganisms interacting with the physical environment, and the mangrove, which are the plants that occupy this space. These plants, from different taxonomic groups, have in common the ability to survive in soils with brackish or salty water, low oxygen availability and an unconsolidated substrate.

In Brazil, mangroves are found on almost the entire Brazilian coast, from Oiapoque/AP to Laguna/SC, generally associated with low-energy coastlines or estuarine areas, lagoons, bays and inlets. In 2012, they occupied an area of 1,225,444 hectares on the Brazilian coast.

The conservation of mangroves throughout their entire length, including the apicuns, is also of social importance as they are considered nurseries for fishing resources and directly or indirectly support more than 1 million people. They also provide coastal protection against erosion and extreme weather events, regulate the climate and retain carbon dioxide, storing more carbon than tropical forests.<sup>21</sup>

Apicuns are sandy areas that feature exposed soil, usually because they are devoid of vegetation due to their high salinity. Apicuns, which occur in areas on the inner edge of mangroves, are transitional environments between hillside sediments and mangrove sediments (Araújo, et al, 2019).

It is worth noting that the apicum feature supports the mangrove fauna in the different phases of its biological cycles, in addition to various other functions that are essential for

---

<sup>21</sup><https://www.gov.br/mma/pt-br/assuntos/biodiversidade-e-ecossistemas/ecossistemas/ecossistemas-costeiros-e-marinhos/manguezais>

maintaining the coastal zone, so any intervention in these environments will interrupt the flow of nutrients between features of the ecosystem itself (Ibama, 2005).

### **Restinga**

It is the set of plant communities, distributed in a mosaic, associated with recent coastal sandy deposits (Quaternary and Tertiary) and coastal rocky environments - also considered edaphic communities - as they depend more on the nature of the soil than on the climate, found in beach environments, sandy strands, dunes, depressions and transitions to adjacent environments, and may present, according to the predominant phytophysiology, a herbaceous, shrub and tree layer.

Corroborating this, according to CONAMA Resolution 07 of July 23, 1996, "restinga vegetation is understood to be the set of physiognomically distinct plant communities under marine and fluvial-marine influence. These communities, distributed in a mosaic, occur in areas of great ecological diversity and are considered edaphic communities because they depend more on the nature of the soil than on the climate."

Normally, restinga vegetation differs from the crystalline forest formations and the Coastal Tableland formations in its smaller size, less vigorous nature, as well as its physiognomy and floristic composition. It is a relatively sparse vegetation with trees around 10 to 12 meters high, thin trunks, generally low branching, sometimes crooked stems and irregular canopies, sometimes comprising open areas where vegetation known as restinga fields develops with a marked presence of grasses. It is related to the soil classes Quartzarenic Neosols and Spodosols.

The trees include *Schinus terebinthifolius Raddi* (aroeira-da-praia), *Anacardium occidentale L.* (cajueiro), *Tabebuia roseo-alba* (Riddley) Sandw. (*Ocotea sp.* (laurel), *Andira nitida Mart.* (angelim), *Manilkara salzmannii* (A.DC.) H. J. Lam. (maçaranduba) and *Hancornia speciosa Gomes* (mangabeira). The long-standing coconut groves with *Cocos nucifera L.* (coconut palm), planted or not, along with this plant formation have been devastated mainly for real estate purposes.

According to Zickel, et al (2021), these restinga areas, also known as sandy Tabuleiro, have an important biodiversity and variability. In their study, four areas were studied (Mamanguape, João Pessoa, Conde and Pedras de Fogo) and 82 species distributed in 29 families were recorded. Variations were found in total density, diversity, average height and diameter, total basal area and proportion of individuals with tillers, as well as differences in the distribution of height frequencies. It can be seen that the coastal tablelands varied in the diversity and spatial structure of the vegetation, despite sharing similar environmental conditions. The influence of surrounding areas, edaphic factors and different degrees of disturbance on the floristic composition may explain the heterogeneity found in the tabuleiros.

## Caatinga

The Caatinga is an ecosystem that covers 11% of Brazil's territory and 70% of the Northeast region. This area includes the states of Ceará, Rio Grande do Norte, most of Paraíba and Pernambuco, southeastern Piauí, western Alagoas and Sergipe, central Bahia and part of northern Minas Gerais. With an area of 826,411km<sup>2</sup>, this biome is considered to be of biological importance, as it is the only one whose geographical occurrence is restricted to Brazil (Embrapa, 2021).

Caatinga is the type of vegetation that covers most of the area with a semi-arid climate in the northeast of Brazil. The xerophytic vegetation of the caatinga is essentially heterogeneous in terms of phytophysiognomy and structure, making it difficult to draw up classification schemes capable of satisfactorily covering the numerous types that occur there. According to (FERNANDES, 2000) it is more practical and accurate to consider basically two phytophysiognomies in the Biome: arboreal caatinga and shrubby caatinga. According to this author, detailed and careful descriptions should be left to each researcher, when the peculiarities of the sites studied so require.

The IBGE, on the other hand, exclusively uses the name Savannah-Sepic for Caatinga environments and considers the following vegetation subtypes: Forested Savannah-Sepic, Wooded Savannah-Sepic, Park Savannah-Sepic and Grassy Savannah-Sepic.

It should be noted that the predominant vegetation in the state of Paraíba is the steppe savannah, which covers approximately 90% of the territory.

It should be noted that the **caatinga**, an indigenous term used in literature and popular circles to describe the xerophytic vegetation that normally occurs in the semi-arid region, has various physiognomies. Tall trees, reaching 20 (twenty) meters, straight stems and an understory made up of smaller trees, shrubs and ephemeral subshrubs. The treetops touch, resulting in a forest-like appearance during the rainy season. The continuous canopy, the size and the closed understorey led to this community being called Caatinga Arbórea Densa, made up primarily of Braúna (*Schinopsis brasiliensis*) and Aroeira (*Astronium urundeuva*).

Another type of arboreal caatinga is made up of tall, isolated, broad-crowned individuals of the same height as the trees in the previous community; however, they form an open vegetation in which large spaces of bare soil or only herbaceous plants are found. The main species are: Angico-vermelho (*Anadenanthera macrocarpa*) and Aroeira (*Astronium urundeuva*). The physiognomy of this community is differentiated from the previous one by its low plant density, giving it the name of Open Arboreal Caatinga.

The degradation of the Arboreal Caatinga leads to the emergence of the Arbustive Caatinga. The most common species in shrubby Caatingas are: jurema (*Mimosa hostile*), catingueira (*Caesalpinia bracteosa*), sabiá (*Mimosa caesalpinifolia*), marmeleiro-preto (*Cróton sonderianus*), mandacaru (*Cereus jamacaru*) and others.

Because it has different ecosystems and associated plant types, ranging from shrubby vegetation to a Seasonal Forested Savannah (arboreal caatinga), there is great technical difficulty in classifying the different types of vegetation in the Caatinga, as well as the natural caatingas and the caatingas heavily altered by anthropogenic action (CASTELLETTI et al., 2003).

According to (IBGE, 2012), these subgroups have the following characteristics:

### **Forested Seasonal Savannah**

This subgroup is fundamentally structured in two strata: an upper stratum with a predominance of periodically deciduous nanophanerophytes, more or less thickened by thick trunks that are generally profusely gnarled and thorny or aculeate, and a lower grassy-woody stratum that is generally discontinuous and has little physiognomic expression;

### **Wooded Seasonal Savannah**

This subgroup is structured in two clear strata: an upper, sparse shrub layer, generally identical in characteristics to that of the Seasonal Forested Savannah, described above, and a lower, grassy-ligneous layer, also of significant phytophysiognomic importance;

### **Savannah-Sepic Park**

A sub-group with very typical physiognomic characteristics, with shrubs and small trees, generally of the same species, distributed fairly widely apart, as if they were planted. This formation subgroup generally covers small depressions topped by vertisols, which are flooded during the rainy season because they don't have good drainage. This subgroup is found in a small strip in the north of the state of Rio Grande do Norte, far from the areas in question in this study.

### **Seasonal Grassy Savannah**

This subgroup of formation, also known as the thorny field, has very typical floristic and physiognomic characteristics, with an extensive grassy carpet dotted with thorny dwarf woody plants.

#### **Vegetation distribution**

The state of Paraíba, located in the northeastern region of Brazil, has an area of 56,467.24 km<sup>2</sup> (IBGE, 2021). The current use and vegetation cover is characterized by defined forest formations, such as Caatinga Arbustiva Arbórea Aberta, Caatinga Arbustiva Arbórea Fechada, Caatinga Arbórea Fechada, Tabuleiro Costeiro, Mangues, Mata-úmida, Mata semidecidual, Mata Atlântica and Restinga (PARAÍBA, 2006).

#### **Vegetation**

Paraíba's vegetation is very diverse, a reflection of its ecological richness, as it encompasses the Caatinga biome, predominantly, and the Atlantic Rainforest in its territory, and thus has a variety of species adapted to different climatic and environmental conditions.

The state of Paraíba has at least 11 types of vegetation as forests, according to information from the Brazilian Forestry Service (2019), with the Seasonal Savannah (Caatinga) being the predominant type, covering approximately 94% of the state's natural vegetation areas: Wooded and Forested Seasonal Savannah (Caatinga), Semideciduous Seasonal Forest, Open Ombrophilous Forest, Wooded and Forested Savannah, Mangrove Swamp, Palm Grove, Restingas, Planted Forests and Contacts, where more than one typology occurs. (SFB, 2019).

Paraíba's vegetation is shown in the following Figure and Table.

**Figure45 - Proportion of the area occupied by different types of natural vegetation in Paraíba.**

Note: **Contacts\*** refer to areas of ecological tension, in which undifferentiated communities are found, where the floras interpenetrate, constituting floristic transitions between two or more types of vegetation. In Paraíba, there are areas of contact between Savannah and Seasonal Forest and Seasonal Savannah and Seasonal Forest.

Source: Brazilian Forest Service - SFB, 2019

According to the Paraíba Forest Inventory (SFB, 2019), the largest proportions of its territory covered by natural vegetation are found in the Borborema and Sertão Paraibano mesoregions (over 50%). The largest absolute area of natural vegetation in the state is in the Sertão Paraibano region, with around 1.2 million hectares of vegetation, predominantly caatinga. On the state's coast, the Mata Paraibana is the region with the smallest area covered by natural vegetation when compared to the other regions, where only 19% of the territory is covered by vegetation, as can be seen in the table below. This region is home to the state's Atlantic Forest, with ombrophilous and seasonal forests, mangroves and sandbanks.

**Table 23 - Area (ha) and proportion of natural vegetation cover by mesoregion in the state of Paraíba.**

Mesoregion	Total area	Natural Vegetation Area	Proportion of Natural Vegetation Cover
Borborema	1.556.760,43	876.502,29	56%
Sertão Paraibano	2.274.036,42	1.205.029,41	53%
Agreste Paraibano	1.292.584,56	352.167,71	27%
Mata Paraibana	524.084,19	100.498,84	19%
<b>Paraíba</b>	<b>5.647.465,60</b>	<b>2.534.198,25</b>	<b>45%</b>

## Map 8 - Vegetation

#### 4.2.2 Modified Habitats

Based on the work carried out by MapBiomias<sup>22</sup>, the variation in natural vegetation cover in the project area was surveyed. The data used from the MapBiomias collections project is from 1985 to 2022. The total change in natural vegetation, considering forest and non-forest natural formation, was 3,307,523 ha in 1985 to 3,043,821 ha in 2022 - representing a reduction of 4.66 % in natural vegetation over the period.

Taking the variation in the main comparison classes (Natural vegetation vs. Agriculture), the change in use becomes more evident. In 1985, vegetation represented 57.99% of the area of the state of Paraíba, compared to 39.48% of agricultural activities. By 2022, natural vegetation coverage had reached 52.89%, compared to 43.72% for farming activities.

<sup>22</sup> <https://brasil.mapbiomas.org/colecoes-mapbiomas/> see about at: <https://brasil.mapbiomas.org/o-projeto/>

46 - Coverage in 1985

Source: Calculated from MapBiomas data (consultation in 2024).

47 - Coverage in 2022

Source: Calculated from MapBiomass data (consultation in 2024).

It is important to note that, according to the figure below, there was a greater change in coverage (with vegetation being converted to anthropic uses) during the period from 1985 to 1995, after which the graph indicates stability in the region covered by the Project.

#### 48 - Variation in Coverage between 1985 and 2022

Source: Calculated from MapBiomas data (consultation in 2024).

When analyzing the coverage in the areas of the municipalities, it can be seen that the stability shown in the total area of Procace II is linked to the reduction of vegetation in some municipalities, but also to the expansion of the vegetation area in other municipalities, as can be seen in the following tables. Thus, while the municipality of Logradouro lost 62.81% of its vegetation between 2000 and 2022, the municipality of Algodão de Jandaíra saw its vegetation increase by 82%, which indicates that the vegetation in these places has been recomposed.

**Table 24 - Municipalities with vegetation loss greater than 20% in the Project area between 2000-2022**

Municipality	Natural formations		Amendment	%

The following maps show the state's vegetation cover in the years 2000 and 2022

**Map 9 - Coverage 2000 - Area covered by Proc case II**

**Map 10 - Coverage 2022 - Area covered by Procasse II**

## Land Use

The classification by land cover and land use classes was based on the information presented in the **Characterization Notebook of the State of Paraíba** (2022), which follows the one adopted by the IBGE (2020), where it can be seen that most of the use is made up of grassland vegetation (33,020.88 Km<sup>2</sup> / 57.32%) and the smallest area is made up of wetlands (1.01 Km<sup>2</sup> / < 0.01%), as can be seen in the **Error! Reference source not found**.table below.

**Table 26 - Land cover and land use classes, Paraíba state.**

Class	Total (km ) <sup>2</sup>	% of territory
Artificial Area	518,01	0,9
Agricultural Area	1.716,31	2,98
Managed Pasture	1.126,27	1,96
Mosaic of Occupations in Forest Areas	2.714,81	4,71
Forestry	36,05	0,06
Forest vegetation	4.373,21	7,59
Country vegetation	33.020,88	57,32
Mosaic of Occupations in the Countryside	13.844,33	24,03
Continental water body	254,2	0,44
Wet Area	1,01	< 0,01

Source: Prepared with data from IBGE, 2020b apud Caderno de Caracterização da Paraíba 2022.

Below is a description of the use classes considered.

### **Artificial area**

Areas where non-agricultural anthropogenic surfaces predominate. These are areas structured by buildings and the road system, including metropolises, cities, towns, indigenous villages and quilombola communities, areas occupied by industrial and commercial complexes and buildings that may, in some cases, be located in peri-urban areas. Also included in this class are areas where the exploration or extraction of mineral substances takes place, through mining or quarrying.

### **Agricultural Area**

Area characterized by temporary, semi-perennial and permanent crops, irrigated or not, with the land used to produce food, fibres, fuel and other raw materials. It follows the parameters adopted in the IBGE's agricultural surveys and includes all cultivated areas, including those that are fallow or located on flooded land. It can be represented by heterogeneous agricultural zones or extensive areas of plantations. Includes aquaculture ponds.

### **Managed Pasture**

Areas used for grazing cattle and other animals, with cultivated herbaceous vegetation (brachiaria, ryegrass, etc.) or (natural) grassland vegetation, both of which are subject to

high-intensity anthropogenic interference. These interferences can include planting; clearing the land (clearing and plowing); eliminating weeds mechanically or chemically (applying herbicides); harrowing; liming; fertilizing; among others that de-characterize the natural cover.

### **Mosaic of Occupations in Forest Areas**

Area characterized by mixed occupation of agricultural land, pasture and/or forestry associated or not with forest remnants, in which it is not possible to individualize its components. It also includes areas with natural and man-made disturbances, mechanical or non-mechanical, which make it difficult to characterize the area.

### **Forestry**

Area characterized by forest plantations of exotic or native species as monocultures. It follows the parameters adopted in IBGE's plant extraction and forestry surveys.

### **Forest vegetation**

Area occupied by forests. Forests are considered to be tree formations over 5 meters in height, including areas of Dense Ombrophilous Forest, Open Ombrophilous Forest, Seasonal Forest and Mixed Ombrophilous Forest. It includes other features due to their size exceeding 5 m in height, such as the Forested Savannah, Forested Campinarana, Forested Seasonal Savannah, Mangroves and Buritizais, according to the Land Use Technical Manual (IBGE, 2013).

### **Wet Area**

Area characterized by natural herbaceous or shrub vegetation (10% or more cover), permanently or periodically flooded by fresh or brackish water. It includes marshes, swamps, wetlands, estuaries, among others. The flooding period must be at least 2 months per year. Shrub or tree vegetation may occur, as long as they occupy less than 10% of the total area.

### **Country vegetation**

Area characterized by grassland formations. Grasslands are understood to be the different categories of vegetation that are physiognomically quite different from forests, i.e. those characterized by a predominantly shrubby layer, sparsely distributed over a grassy-ligneous layer. This category includes savannas, steppes, steppe savannas, pioneer formations and ecological refuges. They are spread across different phytogeographic regions, comprising different primary typologies: plateau steppes, coastal rupestrian fields and coastal hydro-sandy fields (restinga), according to the Land Use Technical Manual (IBGE, 2013).

### **Mosaic of Occupations in the Countryside**

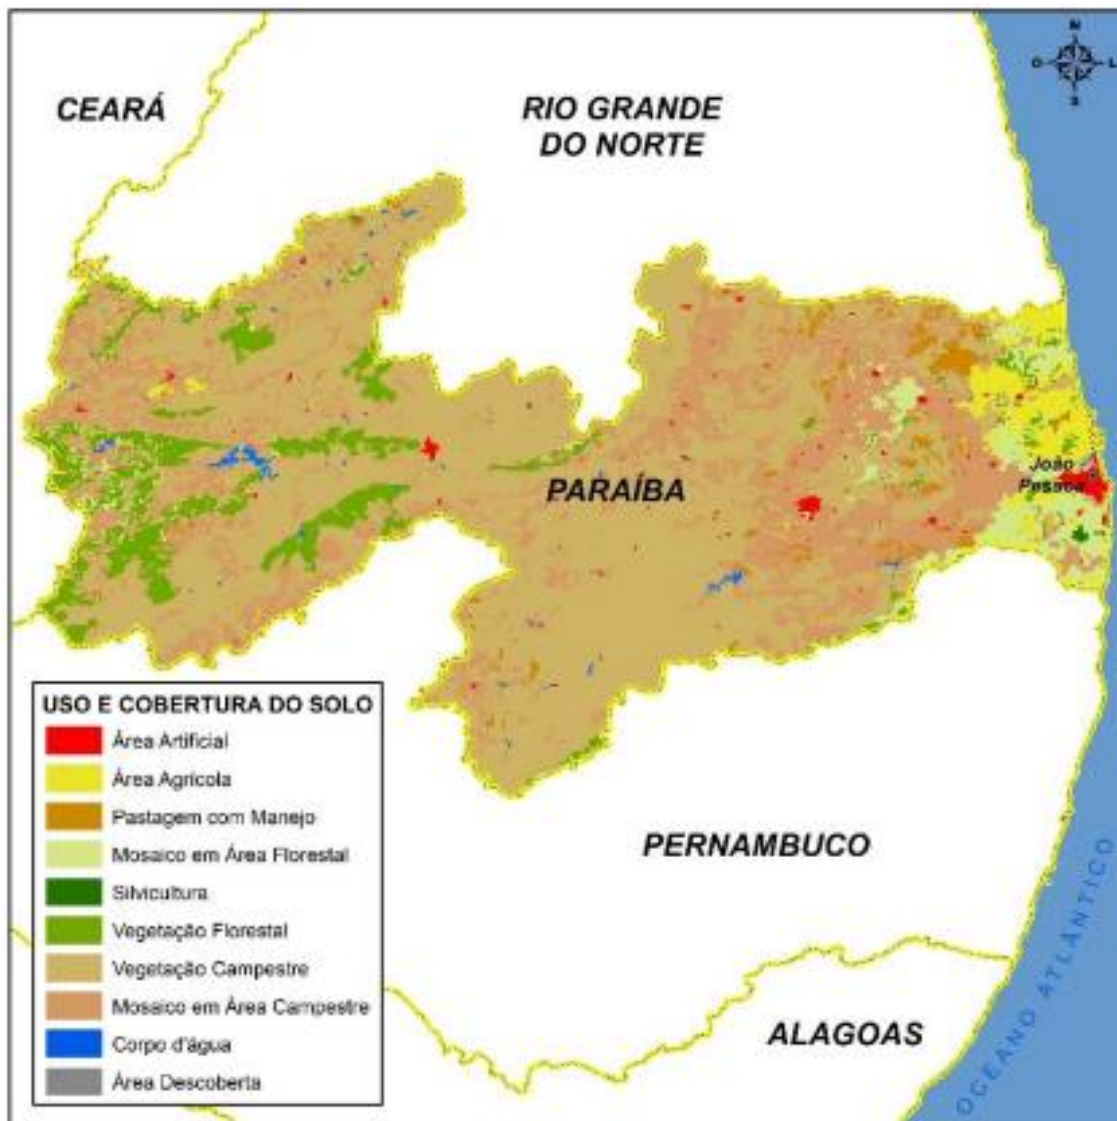

An area characterized by the mixed occupation of agriculture, pasture and/or forestry, whether or not associated with remnants of grassland, in which it is not possible to individualize its components. It also includes areas with natural and man-made

disturbances, mechanical or non-mechanical, which make it difficult to characterize the area.

**Continental water body**

It includes all inland waters, such as rivers, streams, canals and other linear bodies of water. It also includes naturally enclosed bodies of water (natural lakes) and artificial reservoirs (artificial water impoundments built for irrigation, flood control, water supply and power generation). It does not include aquaculture ponds.

**49 - Land use and cover in the state of Paraíba.**

Source: Prepared with data from IBGE, 2020b apud Caderno de Caracterização da Paraíba 2022.

## Ecosystem services highlighted in the Rural Territories

Paraíba is divided into 15 rural territories, which choose their priority demands, working on common policies between the municipalities in each territory, and forward them to the state government. The aim is for public policies for family farming to reach the rural population more effectively.

Some locations in the rural territories were visited in March 2024, such as the Borborema, Cariri, Brejo and Zona da Mata regions, and the information gathered will be presented below.

### **Ecoborborema Pole**

In the Borborema region, in the municipality of Remígio, approximately 150 km from the state capital, known as the Ecoborborema Pole, the importance of growing cotton and the advantages of growing it in consortium with other crops have been noted, with the idea of implementing SAFs to improve their resilience.

There is also the work of the seed guardians, who develop the protection of creole seeds, which are all-natural seeds used in times of water scarcity, with 20% of cotton production going to the seed bank to guarantee future crops that may suffer from pest or drought issues.

In the Queimadas Settlement, the Borborema Agroecology Network (RBA) has been producing agroecological cotton for 10 years. It is the region's first producer of colored cotton and sells to Veja/Vert, a French company that produces sustainable sneakers using cotton from agroecological family farming. Some producers have complained about the demand for cotton and its results, signaling that they want to stop producing it.

The Borborema Agroecology Network (RBA) is a Participatory Conformity Assessment Body (OPAC), an association of family farmers who work with organic/agroecological production, organized as a non-profit legal entity, founded mainly to organize and certify organic production areas (SILVA, 2015).

In this region of Paraíba, cotton was a very strong crop, decimated in the 1980s by the boll weevil. Many families even lost their seeds. In 2019, the network of farmer-experimenters and seed guardians decided to return to growing cotton in an agroecological way, without the use of poisons and promoting care for natural resources, such as the soil.

Biological ant control is done with manipueira according to the information gathered in the field. Manipueira is not only an excellent food supplement for livestock, but it can also be used to combat pests and diseases, control ants and insects and even make vinegar and soap. Mixed with castor oil, it can also be used to control ticks.

As an organic fertilizer, the dilution of manipueira depends on the crop and how it is applied, which can be either to the soil or to the foliage. For combating leaf-cutting ants, he recommends concentrated manipueira.

Photo 28 - Cotton plantations in the Borborema region

Source: Consulting, 2024

**Photo 29 - Cotton harvest in the Borborema region**

Source: Consulting, 2024

In the Borborema region, in the same municipality as Remígio, there is also fruit production. In the AFS of the Camará quilombola community, which was set up in 2002, avocado, acerola, jaboticaba, jackfruit, orange, mango, passion fruit, seriguela and tangerine are being planted, and they are starting to plant bananas again because orange production has fallen a lot. They are also planting medicinal plants such as Chilean boldo, capim santo and pitanga. As for the Camará plant, they make empanada for food, which gave the community its name.

In the Chã de Jardim community in the municipality of Areia, fruit is also produced, but only during the harvest because they can't stock up. They grow caja, umbu, acerola, mango espada and passion fruit.

Agrovila Águas de Acauã, in the municipality of Itatuba, is experimenting with Agroecological Cotton consortiums for the families resettled after the Acauã dam burst, and is working with Creole seeds to avoid transgenics and contamination.

They also plant corn, beans, sweet potatoes, manioc, sugar cane, bananas, coconuts, pine cones, guavas, apple bananas, onions, lemons, passion fruit, all agroecological, most of which is for subsistence. The cotton is sold to Santa Luzia Decorações, which produces hammocks.

The problem with cotton is the weevil, but intercropping with other crops avoids this pest. The cotton bollworm is the insect with the highest incidence and the greatest potential for damage in this crop and biological control is being used more and more because it is more efficient and safer than chemical control.

## **Semiarid Region - Cariri**

In the semi-arid region, areas of Agroforestry Systems were visited, as well as seedling nurseries and places where various species occur.

### **Agroforestry system**

Factors such as pasture and soil degradation, inadequate animal management, low nutrient replenishment in the soil, the physical impediments of the soil and low technological investments, among other causes, can lead to a drop in productivity in conventional systems.

Agroforestry systems are an alternative for better coexistence with these adversities typical of the semi-arid region, and can make a significant contribution to reversing this scenario, with the strategy of using integrated production systems and, consequently, increasing the sustainability of these areas, especially with regard to soil degradation and the need for energy biomass with a view to conserving areas of native vegetation.

Planting fast-growing, multi-purpose tree species could be an alternative to reducing the pressure on the caatinga<sup>23</sup>.

Research carried out by Embrapa in partnership with the Confederation of Agriculture and Livestock of Brazil (CNA) with 26 species of forage in the nine states of the Northeast and in Minas Gerais prove the importance of diversifying the forage menu in the Brazilian semi-arid region.<sup>24</sup>

Research proves that this strategy guarantees resilience and productive capacity even during periods of drought, increasing productivity

Regardless of the size of the property, species adapted to the heterogeneous conditions of local realities improve the quality of animal feed, strengthening livestock farming in the semi-arid region.

During the fieldwork carried out in March 2024, two SAF areas were visited, one in the Semi-Arid Region, in the municipality of Camalau - PB, called SAF Forage in APP at Sítio Vegas, this being an experiment by Prof. Ezequiel Sóstenes Bezerra Farias Sóstenes Bezerra Farias from the University of Campina Grande, which began in 2017/2018. At this site, an experimental SAF area, the production of Palma (*Agave sisalana*) was used to recover the soil, a species that is widely used in the semi-arid region, resistant to drought and also used as food for livestock.

Planting takes place on contour lines in degraded soils in abandoned areas near the river. The thorn palm (*Opuntia dillenii*) has also been used to contain the erosion process.

According to research carried out at the National Semi-Arid Institute (Insa), thorn palm plantations can be transformed into green dams since the plants store a high level of water. However, the most important result of the research is the ability of the soil to

---

<sup>23</sup> [Agroforestry systems for the Brazilian semi-arid region. - Embrapa Portal](#)

<sup>24</sup> [Diversification of forage crops in the semi-arid region increases productivity and resilience to drought - Embrapa Portal](#)

recover from degraded areas, even those subjected to severe stages of desertification<sup>25</sup>

Soil recovery is therefore carried out by planting exotic species, but as the SAF evolves, these species are replaced by other native species.

The Algaroba *Prosopis juliflora*, considered an invasive species, was already present in the area before the project began, and this species was not removed from the area in order to observe its behavior and invasive potential over time. Agave (*Agave sisalana*) was also managed to recover the soil in order to control and use it. Despite the use of exotic species in the SAF, the results show that the greater the diversity of species, the more difficult it is to observe the presence of invasive species, as well as the rapid recovery of the soil in the management of species used specifically for this purpose.

**Photo 32 - Species such as agave and palm used in soil recovery for AFS implementation**

Source: Consulting, 2024

The experiment carried out in the same semi-arid region, in the municipality of Sumé - PB, where the seedling nursery set up in mid-2009 by Prof. Aleksandra Vieira of the Federal University of Campina Grande is located, was an experiment with active management and natural recovery with native caatinga species with the aim of ecological restoration of the area. The experiment shows that there is a lower incidence of invasive species when there is greater diversity in the natural ecosystem.

It should be noted that the aim of the project is research, with a focus on ecosystem conservation and the recovery of degraded areas.

<sup>25</sup> <https://crbio08.gov.br/noticias/biologia-em-pauta/pesquisa-do-insa-revela-potencial-da-palma-de-espinhos-na-recuperacao-de-areas-degradadas/>

**Photo 33 - Plaque of the Experimental Area for Studies in the Ecology and Dynamics of the Caatinga**

Source: Consulting, 2024

**Photo 34 - Panoramic view of the nursery area**

Source: Consulting, 2024

In the same municipality, a *nursery of native caatinga species* was visited, with the aim of improving technology to lower costs and increase efficiency for a future seed bank.

More than 100 species of trees are planted in this nursery, such as the ingá, which is used to recover the riparian forest, the craibeira, which is important for recovering the APP, the mulungu and the baraúna. The umbu leaf, which is edible, and the highly medicinal cumarú are also used.

### Invasive alien species

Invasive alien species represent one of the greatest threats to the environment, with huge impacts and damage to biodiversity and natural ecosystems, affecting the provision of environmental services, health, the economy, as well as the conservation of genetic and natural heritage.

Invasive species, due to their ability to take the place of and exclude native species, either directly or through competition for resources, can transform the structure and composition of ecosystems, homogenizing environments and destroying peculiar characteristics of local and regional biodiversity<sup>26</sup>.

The algaroba (*Prosopis juliflora*) is a tree species native to the arid and semi-arid regions of North and Central America and northern South America. It has a high susceptibility to occurrence in the Caatinga and a medium probability in adjacent formations, especially in Seasonal Forests (Fabricante, 2013).

It is a species that is highly resistant to dry environments and has a high reproductive capacity. It is commonly found near bodies of water, where it is able to establish dense populations and compete with and locally extinguish native species in the Caatinga. In addition, this species has a high capacity for capturing water from the soil, reducing the soil's water resources for other native Caatinga species. Despite this, Algaroba is a plant much appreciated by the population due to its use for wood, animal fodder, living fences, among others, which could further facilitate its invasion process in the Caatinga.

In some of the areas visited, the presence of exotic species such as Algaroba can be seen in the Semiarid region of Paraíba, in the municipality of Camalau.

In the places visited where it occurs, according to the interviewees, despite being exotic, the algaroba feeds the animals and helps to preserve native species and when there is balance in the ecosystem it doesn't invade the spaces.

The animals feed on algaroba and fertilize the land with their droppings. They fence it off with algaroba to prevent animals from entering the APP.

### Mandacaru

The semi-arid region of northeastern Brazil is home to a number of cacti that are of great importance to the region's fauna and flora. Among these, the mandacaru facheiro (*Pilosocereus pachycladus*) stands out.

The facheiro, facheiro-azul or mandacaru-de-facho (*Pilosocereus pachycladus*) is a plant of the genus *Pilosocereus* and of the cactaceae family. It is endemic to the northeast of Brazil. It grows up to ten meters high with dark green branches and plenty

---

<sup>26</sup> [Invasive Alien Species - Ministry of the Environment and Climate Change \(www.gov.br\)](http://www.gov.br)

of thorns. It occurs in the caatingas of the states of Piauí, Ceará, Rio Grande do Norte, Paraíba, Pernambuco, Alagoas, Sergipe and Bahia (Lima, 1996).

It is a xerophyte used for ornamental purposes, whose lateral shoots, shaped like "arms", create ornamental effects. It predominates in the shrubby caatinga and in the higher regions (mountain ranges). It is used by small farmers as a food supply for their animals.

This species was observed in the semi-arid region of Paraíba in the municipality of Camalau.

## **Bees**

In the caatinga mountains, there is a production center for native stingless bees, especially the jandaíra (*Melipona interrupta*), or manduri). The jandaíra is a species of the genus *Melipona* and family Apidae and is a social bee from northern Brazil. The species is black with yellow stripes on the abdomen and produces clear, aromatic honey. There are 243 species of stingless bees kept in Brazil, of which the Jandaíra ranks 3rd (Hiara Menezes, in: Rádio Brasil de Fato, 2022. Podcast: Mel do Bem<sup>27</sup> ).

The urucu bee, a common name for several larger species of social bees from the meliponidae subfamily, which generally measure more than 10 mm in length, is more present on the coast and has economic potential for the production of propolis.

There are other native species in Paraíba, such as the cupira (*Partamona cupira*), but they still need more study. These bees are more sensitive to environmental changes and may suffer from competition from species such as the *Apis mellifera* bee, as they are more aggressive and have the potential to disperse their colonies more widely.

According to information from producers and researchers, honey from native bees offers high quality, medicinal properties and high potential for commercial exploitation, although it is more difficult to work economically with these species when compared to *Apis mellifera*.

## **Zona da Mata and the coast of Paraíba**

In the Zona da Mata region of Paraíba, which encompasses the Matas Sul and Mata Norte, fruit production is particularly noteworthy, especially mangaba.

Paraíba's production of mangaba was the highest in Brazil in 2020, according to the survey Production of Vegetable Extraction and Forestry (PEVS) by the Brazilian Institute of Geography and Statistics (IBGE). The survey provides information on the exploitation of natural plant resources, as well as forests planted for commercial purposes.

The mangabeira (*Hancornia speciosa* Gomes) is a fruit species with a wide distribution, occurring in the Tabuleiros Costeiros, Baixada Litorânea and Cerrados of Brazil. In the Northeast, it plays an important economic, social and cultural role for the region's coastal populations. The production of mangaba comes almost entirely from extractivism, practiced by traditional populations made up mostly of women, who call themselves mangaba pickers.

A visit to Aldeia Forte in Baía da Traição revealed mangaba agro-extractivist forests, a prominent activity in the state, which is Brazil's largest producer, but which still needs to be boosted. There are a lot of middlemen, but if they manage to benefit there is a lot of

---

<sup>27</sup> Available at: <https://www.brasildefato.com.br/2022/11/11/conheca-a-jandaira-a-pequena-abelha-nordestina-com-mel-diferenciado-e-amiga-do-semiarido>

potential. There is no cultivation by extraction in the forest and with deforestation the resource disappears.

On a visit to the community of Aldeia Estiva Velha, in the municipality of Rio Tinto, the Potiguara also collect mangaba, which is distributed through the Piabuçu Agroindustrial Cooperative - Frutiaçu, where they work with family farming.

In the municipality of Pitimbu, on the state's southern coast, there are 13 settlements and 883 family farming properties, with more than 1,500 families and more than 2,000 registered rural dwellers. With production of 500 tons of products for the government with more than 14 diversified products, including pumpkin, avocado, pineapple, acerola, banana, sweet potato, cashew, green bean, yam, cashew, soursop, cassava, papaya, mango, mangaba and passion fruit.

**Photo 35 - Mangaba production in Baía da Traição**

Source: Consulting, 2024

In the same municipality of Pitimbu, on the south coast of the state, there is the Association of Shellfish gatherers of the Acaú Community in the Acaú - Goiana Extractive Reserve.

The shellfish gatherers practice the artisanal collection of shellfish (*Anomalocardia brasiliensis*). All the local shellfish gatherers are currently beneficiaries of the Association of Shellfish Gatherers of Acaú (AMA), and are part of a current socio-economic context in which they influence the development and generation of income in the territory in which they live.

It was the shellfish gatherers who asked for the creation of the Resex, which is federal and covers four communities in Pernambuco and two in Paraíba. The leaders took part in the Conservation Unit's Management Plan and have councillors who take part in its management.

Photo 36 - Basket with shellfish at RESEX Açau

Invasive alien species

Of particular concern in coastal areas is the incidence of invasive exotic fauna: African snails (*Achatina fulica*) and lionfish (*Pterois volitans*), which are usually brought in by boats traveling along the coast.

The lionfish, a species considered dangerous and without predators, has been spreading throughout the Brazilian sea. It is an aggressive predator of other fish and marine invertebrates and can eat 20 fish in up to half an hour, as well as being a venomous animal with poisonous spines.

### 4.2.3 Critical Habitats

According to paragraph 16 of ESPS 6, part of the IDB's Environmental and Social Framework, Critical habitats are areas of high importance or value for biodiversity, including:

- habitat of significant importance for critically endangered, endangered, vulnerable or near threatened species;<sup>28</sup>
- habitat of significant importance for endemic and/or restricted-range species;
- habitat that supports globally significant concentrations of migratory species and/or congregational species;
- highly threatened and/or unique ecosystems;
- areas associated with the main evolutionary processes;<sup>29</sup>
- areas that are legally protected or internationally recognized as having high biodiversity value.

In line with the guidelines of the IDB's Environmental and Social Policy Framework, paragraph 16 of ESPS 6 states that critical habitats are areas with high biodiversity values. It is important to note that the term "area" refers to a demarcated and mapped two-dimensional unit, similar to the concept of Key Biodiversity Areas (KBA) or legally defined protected areas in this sense, as these are broadly inclusive cartographic entities and management areas, not specific patches of habitat. Although the definitions of modified and natural habitats refer to "areas", for the purposes of ESPS 6, these areas are generally smaller units of land or water that can be mapped at the scale of a project's site plan. Critical habitat is identified and delineated at scales that are ecologically relevant to the biodiversity values and processes that designate it, typically, but not always, at terrestrial landscape, seascape or ecosystem scales that are specific to a site. Furthermore, species and ecological processes are generally not restricted to a narrowly defined type of habitat. Therefore, most critical habitats will contain several different habitat types and units, usually with areas of modified and natural habitat.

However, most potential critical habitat has not been identified or mapped. The use of online screening tools is not a substitute for a more complete assessment of the presence of critical habitat in a project's area of influence. GIS-based online approaches to identifying biodiversity values that may designate critical habitat do not provide complete information on all categories of these values. For example, there are few highly

---

28 As listed in the International Union for Conservation of Nature (IUCN) Red List of Threatened Species. The determination of critical habitat based on other listings is as follows: (i) if the species is listed nationally/regionally as threatened or critically endangered, in countries that have adhered to the IUCN guidelines, the determination of critical habitat will be made on a project by project basis in consultation with competent professionals; and (ii) in cases where the categorizations of nationally or regionally listed species do not correspond well to those of the IUCN (for example, some countries list species as generally "protected" or "restricted"), an assessment will be carried out to determine the justification and purpose of the listing. In this case, the critical habitat determination will be based on this assessment.

29 This can include reserves that meet the criteria of IUCN Protected Area Management Category I to VI; World Heritage Sites designated by natural or mixed criteria, areas protected by the RAMSAR Convention on wetlands; World Biosphere Reserve core areas; areas on the UN Lists of National Parks and Protected Areas; sites listed in the World Database of Key Biodiversity Areas; and other sites that meet the requirements of the IUCN Global Standards for the Identification of Key Biodiversity Areas 2016.

threatened or unique ecosystems that are mapped, and many Ramsar sites are not mapped in a comprehensive geographical database.

Thus, the analysis can identify critical habitats, even if they are not listed in official databases or are well known, and there is often a need for appropriate *on-site* screening.

You should therefore evaluate the planned area of allocation from the point of view of meeting some of the requirements listed in this item.

Analysis of Possible Critical Habitats According to the descriptions below, various qualities of areas with important value for biodiversity in Paraíba have been identified, however, we can point to two areas with critical habitat characteristics in the state, which will not necessarily receive investments from the Project and which, if producer families in the surrounding area benefit from the investments, possible adverse influences should be assessed in order to apply measures to avoid impacts on these sites.

These areas are consolidated in the conservation units Rebio Guaribas (Full Protection) and Arie Manguezais Da Foz Do Rio Mamanguape (Sustainable Use). These two areas, as well as being legally protected conservation units, also overlap the Mamanguape KBA and include several species of endangered Brazilian fauna. As such, these two areas consolidate Critical Habitats, as can be seen in the table below<sup>30</sup>.

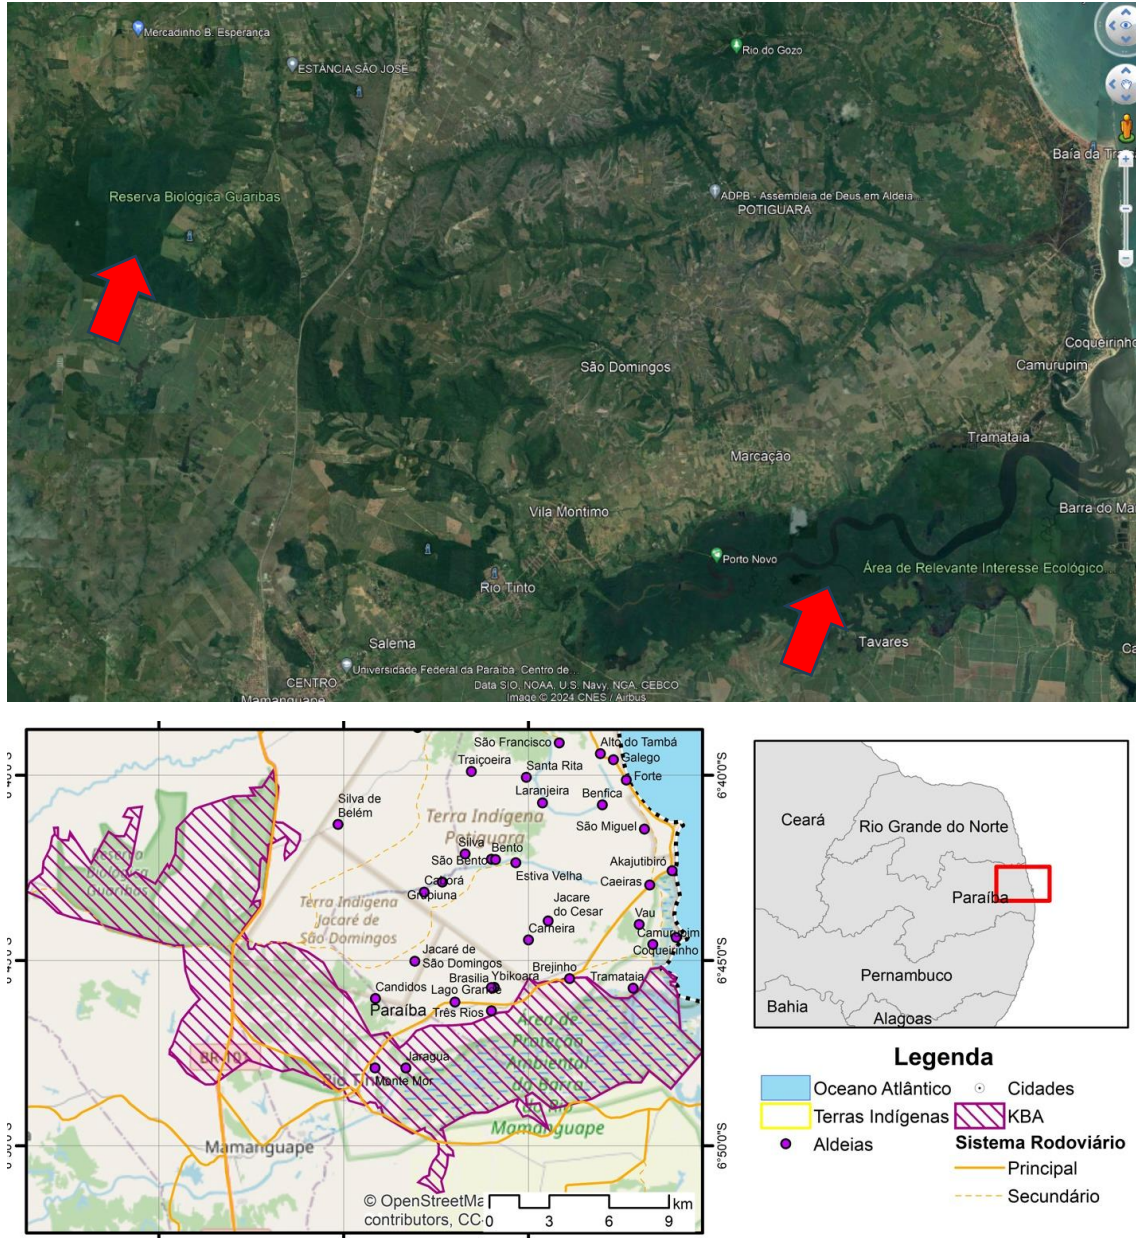

**Table 27 - Consolidation of critical habitat identification arguments**

Criteria	Identification feature
habitat of significant importance for critically endangered, endangered, vulnerable or near threatened species;	<i>Trichechus manatus</i> , <i>Touit surdus</i> , <i>Myrmeciza ruficauda</i> , <i>Picumnus fulvescens</i> , <i>M. ruficauda</i> and <i>Xipholena atropurpurea</i> , <i>Iodopleura pipra</i> , <i>Alouatta guiba clansans</i> (White-winged Macaque), <i>Alouatta guiba clans</i> (White-winged Macaque), <i>Xipholena atropurpurea</i> (White-winged Macaque), <i>Iodopleura pipra</i> (White-winged Macaque) <i>ruficauda</i> and <i>Xipholena atropurpurea</i> (white-winged anambee), <i>Iodopleura pipra</i> (little anambee), <i>Alouatta guariba clamitans</i> (Guariba monkey); <i>Euphractus sexcinctus</i> (armadillo).
habitat of significant importance for endemic and/or restricted-range species;	-
habitat that supports globally significant concentrations of migratory species and/or congregational species;	<i>Picumnus fulvescens</i> (Tawny Piculet), <i>Crypturellus noctivagus</i> (Yellow-legged Tinamou), <i>Touit surdus</i> (Golden-tailed Parrot), <i>Carduelis yarrellii</i> (Yellow-faced Siskin), <i>Xipholena atropurpurea</i> (White-winged Cotinga), <i>Myrmeciza ruficauda</i> / (Scallop Anthill)
highly threatened and/or unique ecosystems;	-
areas associated with the main evolutionary processes;	-
areas that are legally protected or internationally recognized as having high biodiversity value.	Biological Reserve, Area of Ecological Interest, KBA, native formations of the Atlantic Forest and mangroves.

<sup>30</sup> It should be reiterated that the recognition of these critical habitats presented in this section does not necessarily mean that Procasa II will act or influence these habitats.

The following figure shows the location of these areas potentially considered to be Critical Habitat.

**Figure 50 - Location of the critical habitats mentioned in the satellite image.**

### Endangered species

The surveys of threatened species in the state of Paraíba are presented below.

## Flora

The state of Paraíba does not have an official list of endangered species, so a search was made in studies of the region to come up with an estimated number of endangered species in the state.

According to CNCFlora, 34 species have been recorded in categories of extinction risk assessment in Paraíba. Of these species, three are also on the Official National List of Endangered Species defined by the MMA. They are: *Erythroxylum pauferrense* (oak guard) defined as an endangered species, and *Apuleia leiocarpa* (jitaí) and *Cedrela fissilis* (cedar), both defined as vulnerable species.

The cumaru-de-cheiro (*Amburana cearensis*), on the other hand, is classified as "Near Threatened" on the international list; and as "Near Threatened" on the national list and "Threatened" on the international list.

The cumaru-de-cheiro (*Amburana cearensis*), from the Fabaceae family, is a tree with a potential height of around 20m. It is distributed throughout various South American biomes: Atlantic Forest, Cerrado, Caatinga, Chaco and the Lower Andes. It occurs in seasonal phytogeographies: semi-deciduous forest, deciduous forest, dwarf cloud forest and semi-arid forest areas. Its wood has international trade value. Despite its wide distribution, it has been considered almost threatened on a national scale due to its use and studies indicating the suppression of subpopulations. Therefore, the species could be categorized as "Vulnerable" if there is no reduction in the population reduction caused by logging (CNCFLORA, 2024).

Paraíba is home to the following species recorded in the National Forest Inventory: *Astronium fraxinifolium* (sete-cascas), *Myracrodruon urundeuva* (aroeira), *Schinopsis brasiliensis* (braúna), *Hymenaea courbaril* L. (jatobá), *Handroanthus impetiginosus* (pau d'arco-roxo), *Amburana cearenses* (cumaru) and *Bowdichia virgilioides* (sucupira), all of which are of high economic importance due to the commercial use of their wood.

\*Espécies ameaçadas de extinção conforme Lista Nacional Oficial de Espécies da Flora Ameaçadas de Extinção. Portaria MMA nº 443, de 17 de dezembro de 2014.

Apart from endangered species, in the state of Paraíba there is specific legislation for native species with restrictions on cutting, State Law No. 9.857 - OF JULY 6, 2012, which provides for the use and protection of vegetation in the Caatinga Biome and makes other provisions. Article 7 of this law stands out:

Art. 7" The following native species located in the Caatinga Biome in the state of Paraíba and those defined in the Normative

Decision of the Environmental Protection Council of the State of Paraíba (COPAM) are hereby declared to be subject to felling and exploitation restrictions, based on a floristic and phytosociological inventory that considers, as a minimum and jointly, the parameters of frequency and density and their respective values:

- I - *Anadenanthera colubrina* (Vel1.) Brenan - Angico;
- II - *Sideroxylon obtusifolium* (Roem & Schult) T.D.Penll. - Quixabeira;
- III - *Ceiba glaziovii* (Kuntze) K. Schum. - Barriguda;
- IV - *Comruiphora leptophloeos* (Marl.) B. Gillett - Imburana de cambão;
- V - *Handrourthus impetiginosus* (Marl. ex De.) Mattos - Pau O'arco roxo; Pau ferro; Craibeira
- VI - *Myracrodruon urundeuva* (German) -Aroeira;
- VII - *Libidibia ferrea* (Marl. ex Tul.) L.R Queiroz;
- VIII - *Tabebuia aurea* (Silva Manso) S. Moore;
- IX - *Schinopsis brasiliensis* (Engl.) - Barauna;
- X - *Amburana cearensis* (Ducke) - Cumaru.

## **Fauna**

Brazil officially has 1,173 endangered species, 34 of which occur in the state of Paraíba. The number seems small, but according to experts, the lack of a specific list of the state's fauna makes it difficult to know all the threatened or endangered species in Paraíba.<sup>31</sup>

The state of Paraíba does not have a State List of Endangered Fauna Species, so a search was made in studies of the region to come up with an estimated number of endangered species in the state.

The fauna of the Caatinga is represented by diverse groups rich in endemism. Like the plants, the animals have adapted to the conditions of the region by developing nocturnal habits, migratory behavior and physiological processes such as estivation, a type of "hibernation" in hot environments. Few studies have been carried out on the region's wildlife. Those that have been carried out are aimed at identifying and quantifying specific groups or those related to ecological processes, such as pollination and dispersal (Portal Embrapa, 2021).

Despite being identified as an important area of bird endemism in South America, the Caatinga has always been a neglected environment in terms of studies (PACHECO, 2004). Sampling of the biome's ornithofauna only began in the 19th century on the initiative of foreigners (PACHECO, 2003). Over the years, the number and quality of research has increased, but not enough when compared to the others. Currently, research, both ornithological and on the Biome as a whole, tends to be concentrated near large urban centers, research centers and easily accessible locations (PACHECO, 2003; TABARELLI; VICENTE, 2003).

The most recent compilations on the richness of birds in the Caatinga indicate a number of species varying between 348 and 510, depending on the different inclusion criteria used (SILVA *et al.*, 2003; MAJOR *et al.*, 2004; PACHECO, 2004). All of these were

<sup>31</sup> [State of Paraíba has 34 endangered species \(naturezaeconservacao.eco.br\)](http://naturezaeconservacao.eco.br)

important efforts to gain knowledge of the birds that occur in this biome, which complement other initiatives for the conservation of birds in this region, such as the establishment of priority areas for conservation (PACHECO *et al.*, 2004; FARIAS *et al.*, 2005). Despite these efforts, there are still many gaps in knowledge about the distribution of birds in this ecosystem and only a small number of sites are protected by the system of protected areas (TABARELLI; SILVA, 2004).

Birds are the most representative, with around 510 species of birds, 20 of which are already on the endangered list, including the hyacinth macaw (*Cyanopsitta spixii*) and the Leary macaw (*Anodorhynchus leari*), as a result of wildlife traffic. Mammals are represented by around 150 species. However, it is believed that this number will be much higher when studies of rodents and bats are intensified. Some of their representatives are already on the list of endangered species. Felines are among the top of this list due to hunting, which has been reducing their population and that of the animals that are part of their diet. The herpetofauna is represented by 47 species of amphibians and 47 of snakes. The lizards, with 44 species, stand out due to the large number of endemic species found, especially in the São Francisco River Dunes - BA. Some exhibit interesting behavior, such as frogs, which can remain buried and without eating during the dry season (aestivation). Studies carried out in the Ouricuri-PE region have shown cases of distinct stands related to the dry and wet seasons, which has made it possible to establish a typology for each season.

Paraíba is one of the Brazilian states in which most of the Conservation Units do not have any endangered species. According to the Federal Atlas of Endangered Brazilian Fauna in Federal Protected Areas (2011), 15 endangered species were found in the state's protected areas, as shown in the table below.

**Table 29 - Endangered species in PAs in Paraíba.**

Federal PAs	Species	Common Name	Source

## Legally Protected Areas

---

The following table shows the data on the conservation units identified: 16 federal units, 17 state units and 6 municipal units. With regard to the group, 11 areas are in the Full Protection group and 23 are in the Sustainable Use group. It is important to note that in the case of RPPNs, all are considered to be sustainable use.

**Table 31 - Legally Protected Areas**

Seq.	Name	Creation	Sphere	Group	Category	Area (ha)	IUCN

Ministry of the Environment (2024, consultation: <https://dados.gov.br/dados/conjuntos-dados/unidadesdeconservacao>)

## Map 11 - Conservation Units

In Paraíba, there are currently Conservation Units protecting natural landscapes in the territory's two biomes - the Atlantic Forest and the Caatinga - as well as others in the marine ecosystem.

Various activities can be carried out in these protected territories, such as environmental education, scientific research, ecotourism and sustainable extraction of renewable natural resources.

Important natural heritage is preserved in the Conservation Units, such as endangered biodiversity, like the pau-brasil (*Paubrasilia echinata*), with an important population preserved in the Ecological Station of the same name, which has one of the most important germplasm banks of this species in the country. In addition, there are endemic birds (Mata do Pau-Ferro State Park), cave paintings (APA das Onças) and ichnofossils from the Cretaceous period (Vale dos Dinossauros Natural Monument), which are also protected in UCs.

An important role of Conservation Units is to preserve and encourage the maintenance of the traditional knowledge of human populations within the socio-environmental context that surrounds them. In the buffer zone of the Areia Vermelha Marine State Park (PEMAV), the project known as the Community Integration Project, supported by GEF-Mar and signed by a Cooperation Agreement between the state of Paraíba and the Ministry of the Environment, supports the women of the fishermen's colony in the municipality of Cabedelo, with activities such as handicrafts produced by the shellfish gatherers of the Renascer community.

*"Knowing in order to conserve"* is an affirmative maxim that guides the management of Conservation Units. Through popular participation, scientific dissemination and the experience of these spaces, we can believe in a future in which ecosystems will be perpetuated for future generations.

It is important to note that full protection units have a buffer zone around them, the radius of this zone and any impacts that cannot occur in this area are defined in each unit's Management Plan. Therefore, in the case of areas of destination and origin that are close to full protection conservation units, this documentation should be consulted and, if necessary, the unit's administration.

In the case of sustainable use units, interaction can occur. Some units are quite extensive and encompass public and private properties, including urban areas and entire municipalities. These units can be used, and there may be rules governing occupation, based on impacts that are not permitted.

## KBA sites

---

Two KBA<sup>32</sup> sites were identified in the Procasse II area, as shown in the table below:

---

32 Key Biodiversity Areas Partnership (2024) Key Biodiversity Areas factsheet: Jaguaquara. Extracted from the World Database of Key Biodiversity Areas. Developed by the Key Biodiversity Areas Partnership: BirdLife International, IUCN, American Bird Conservancy, Amphibian Survival Alliance, Conservation International, Critical Ecosystem Partnership Fund, Global Environment Facility, Re:wild, NatureServe, Rainforest Trust, Royal Society for the Protection of Birds, World Wildlife Fund and Wildlife Conservation Society. Downloaded from <http://www.keybiodiversityareas.org/> on 08/04/2024.

**Table 32 - KBAs identified in the study area**

Seq	Name	Year	KBA area (ha)	% of Area Protected	KBA criteria
1	<b>Pau-Ferro Forest</b>	2006	13783		TBD Global/Regional'
2	<b>Mamanguape</b>	2006	16656	74,9	TBD Global/Regional'

Source: <https://www.keybiodiversityareas.org/>, 2024 (consultation).

Below are details of the areas, with a summary of threats, reasons for qualifying as KBA and biodiversity elements, followed by a map showing the location of the KBA Sites.

### **Pau Ferro Forest**

The Mata do Pau-Ferro State Park is an ecological heritage site in Paraíba, located in the municipality of Areia, occupying around 600 hectares of the Vaca Brava site. Its climate is typical of the Paraíba wetlands, with an average temperature of 22°C and relative humidity of around 85%. It has great plant and animal biodiversity, as it is a remnant of the Atlantic Forest in the Northeast. Its hydrography is mainly represented by the Vaca Brava dam, a reservoir that supplies some municipalities in the Brejo Paraibano micro-region<sup>33</sup>

It is of economic importance to the Chã de Jardim community, which earns money by developing rural tourism activities in the park for visitors. It is also used as a source of research for scientific papers and educational activities.

### **Summary of threats to biodiversity**

The Pau-Ferro forest used to belong to the Atlantic forest, but due to the growing influence of man, the area was constantly cleared and occupied for agricultural activities to produce sugar cane. Only in 1937 was the area acquired by the state of Paraíba, expropriating it from the sugar mills. In 1992, by decree 14.842, the area became an ecological reserve and was administered by the Superintendence of Environmental Administration (SUDEMA).

Through Decree No. 26.098 of August 4, 2005, the Paraíba government classified the ecological reserve as a state park. The Pau-Ferro forest represents 1% of the highland swamp forest and has great biodiversity, being recognized by national and international institutions as a conservation area for endangered species, as it has endemic species, such as BirdLife International and SAVE Brasil, institutions focused on bird conservation. It is also a conservation area for tributaries of the Mamanguape River basin, the Vaca Brava dam.

### **Justification for qualifying as KBA**

This site qualifies as a Key Biodiversity Area of international importance because it meets one or more criteria and thresholds previously established for the identification of sites of importance for biodiversity (including Important Bird and Biodiversity Areas, Zero Extinction Alliance Sites and Key Biodiversity Areas).

<sup>33</sup> Pau-ferro Forest - Federal University of Paraíba Francisco Tancredo Torres Sector Library (ufpb.br)

**Table 33 - Biodiversity elements that trigger the KBA qualification criteria**

Taxonomic Group	Scientific Name	Common Name	IUCN Category	KBA criteria
Birds	<i>Hemitriccus mirandae</i>	Puffed-breasted tyrant	VU	A1, B1a (2023)
Birds	<i>Tangara fastuosa</i>	Seven-color tanager	VU	A1, B1a (2023)

Source: <https://www.keybiodiversityareas.org/site/factsheet/20118>, 2024 (consultation).

### **Mamanguape**

Formed by remnants of lowland forest, mangroves, cerrados ("tabuleiros") and restingas along the Quandu and Mamanguape rivers, this area is located on the northern coast of Paraíba, a few kilometers north of the Jacuípe Forest (PB02) and about 35 km south of the Estrela Forest (RN02). The climate is hot and humid, with abundant rainfall due to the influence of the trade winds that blow constantly from the southeast. The forests in the region are of the seasonal semi-deciduous type and, for the most part, have already been selectively cut or are secondary. The largest remnants are in the Guaribas Biological Reserve, which is made up of three disjointed areas corresponding to forest fragments measuring 3,016, 673 and 338 ha. The adjacent mangroves are home to the manatee (*Trichechus manatus*), an aquatic mammal threatened with extinction.

### **Summary of threats to biodiversity**

Little information has been released on the current avifauna of Mamanguape. A survey carried out between 1989 and 1994 indicated the occurrence of 175 species in R.B. Guaribas, while a rapid ecological assessment of this conservation unit, conducted in 2002, resulted in the recording of 140 species, including the endangered *Touit surdus* (yellow-tailed apuim), *Myrmeciza ruficauda* (red-tailed antbird) and *Picumnus fulvescens* (dwarf cinnamon woodpecker). Mamanguape seems to be the northern limit of distribution for a number of birds endemic to the Atlantic Rainforest, including the endangered *M. ruficauda* and *Xipholena atropurpurea* (white-winged anambee) and the almost endangered *Iodopleura pipra* (little anambee).

In addition to the bird species mentioned, it is also important to point out other species that justify the presence of the conservation units contained in the territory defined for this KBA. These species are: Guariba monkey (*Alouatta guariba clamitans*), the species that represents the Rebio Guaribas CU; Tatupeba (*Euphractus sexcinctus*); Manatee (*Trichechus manatus*);

**Map 12 - KBA sites**

## Ramsar sites

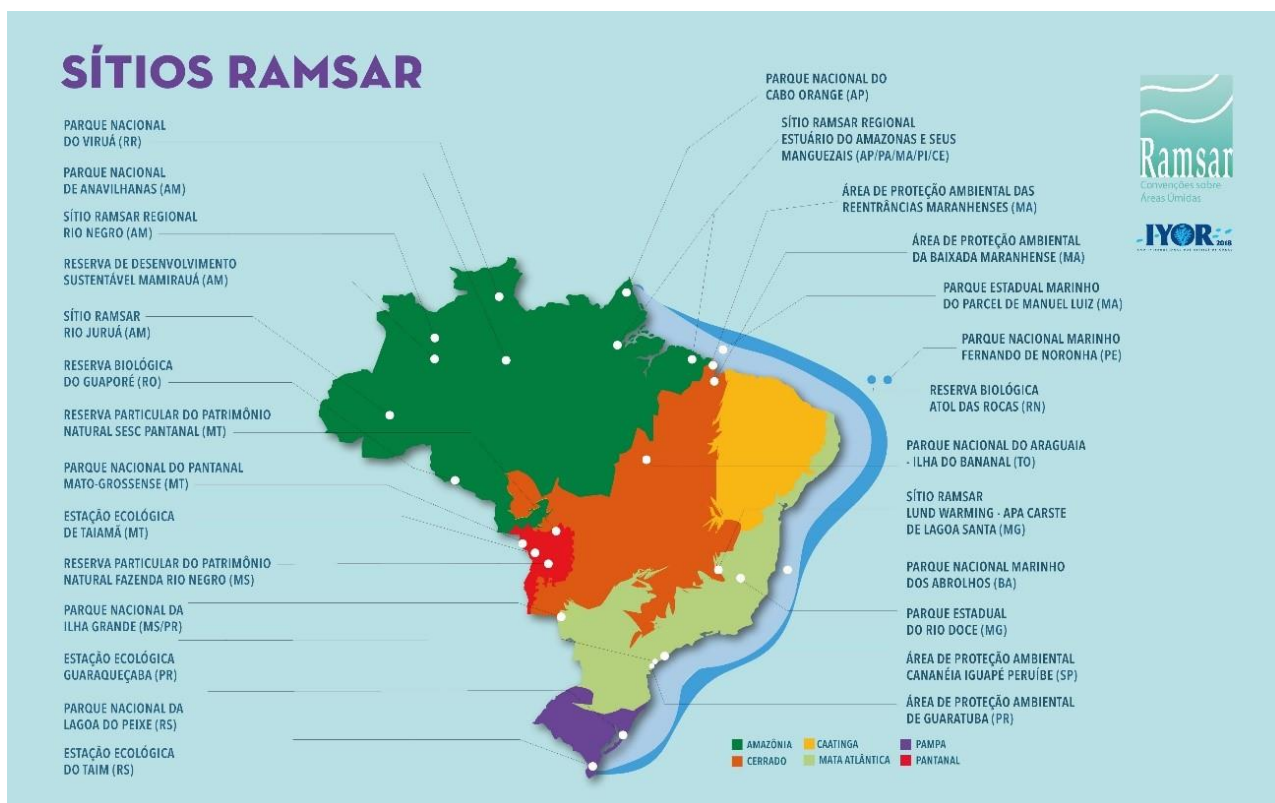

According to the Ministry of the Environment, until 2017 Brazil adopted the guideline for nominating wetlands to be included on the Ramsar List that these areas should correspond to protected areas, which favors the adoption of the necessary measures to implement the country's commitments to the Convention. As of 2018, a new concept has been developed with the aim of creating Ramsar Sites at a regional level, including protected areas and other wetlands of international importance.

Since joining the Ramsar Convention, Brazil has promoted the inclusion of twenty-four conservation units and three Regional Ramsar Sites, bringing the total to 27 Sites on the Ramsar List. The inclusion of these areas on the Ramsar List allows Brazil to obtain support for research, access international funds to finance projects and create a favorable scenario for international cooperation.

In return, Brazil has made a commitment to maintain its ecological characteristics - the elements of biodiversity, as well as the processes that maintain them - and must give priority to their consolidation over other protected areas, as even provided for in the National Strategic Plan for Protected Areas (PNAP), approved by Decree No. 5.758/06.

As shown in the figure below, there are still no Ramsar sites in the Project area.

**Figure51 - Ramsar sites in Brazil**

## IUCN Sites

Thirty-four mapped units were identified from the IUCN System of Protected Area Management Categories:

Category **Ia**: 2 areas;

Category **II**: 8 areas;

Category **III**: 3 areas;

Category **IV**: 12 areas;

Category **V**: 7 areas;

Category **VI**: 2 areas;

Below is a brief description of each Category:

- **Category Ia** - Strict nature reserve: these are strictly protected areas designed to protect biodiversity and possibly geological/geomorphological features, where human visitation, use and impacts are strictly controlled and limited to ensure the protection of conservation values. These protected areas can serve as indispensable reference areas for scientific research and monitoring.
- **Category II** - National Park: protected areas are large natural or near-natural areas set aside to protect large-scale ecological processes, together with the complement of species and ecosystems characteristic of the area, which also provide a base for environmentally and culturally compatible spiritual, scientific, educational, recreational and cultural activities. visitor opportunities.
- **Category III** - Monument or Natural Feature: these are set aside to protect a specific natural monument, which can be a landform, a seamount, an underwater cave, a geological feature such as a cave or even a living feature such as an ancient woodland. They are usually quite small protected areas and often have a high value for visitors.
- **Category IV** - Habitat/Species Management Area: aims to protect specific species or habitats and management reflects this priority. Many category IV protected areas will require regular and active interventions to respond to the needs of specific species or to maintain habitats, but this is not a requirement of the category.
- **Category V** - Protected Landscape/Marine: Protected area where the interaction of people and nature over time has produced an area of distinct character with significant ecological, biological, cultural and landscape value: and where safeguarding the integrity of this interaction is vital to protecting and sustaining the area and its associated nature conservation and other values.
- **Category VI** - Protected Area with Sustainable Use of Natural Resources: Protected areas that conserve ecosystems and habitats, together with associated cultural values and traditional natural resource management systems. They are generally large, with most of the area in natural conditions, where a portion is under sustainable natural resource management and low-level, non-industrial use of natural resources compatible with nature conservation is seen as one of the area's main objectives.

The following figure shows the areas described.

## Map 13 - IUCN Categorization

### 4.3 Socio-economic environment

The following is diagnostic information on the socio-economic environment of the Procasa II area. The data catalogued comes from studies, mapping and statistical bases from available official sources.

#### 4.3.1 Urban Network and Hierarchy between Cities

This section discusses the formation of the urban network of the state of Paraíba and the municipalities in the project area. This study identifies the network of cities as playing a fundamental role in structuring and organizing the geographical space of the region under analysis. The urban centers of a given region have a set of interdependent relationships between them and, depending on their hierarchical status, can also establish relationships with urban centers in other regions.

In general terms, this chapter was based on the analysis presented in the study **Regions of Influence of Cities - 2018**, published by the IBGE (2018).

This study was carried out by the Brazilian Institute of Geography and Statistics - IBGE (2018), addressing the Region of Influence of Cities, made for planning, creates socioeconomic indicators and interdependence between cities in terms of products, services, commerce, health and education facilities, transportation, etc. Issues such as community vulnerabilities are not assessed.

The study of the interrelationships between urban centers is justified by the need to understand the dynamics of interactions, the flow of population in search of products, services and employment, and their distribution in geographical space.

The methodology used to study the city system provides for a hierarchical organization of urban centers. In this way, each city has different areas of influence, depending on the scope of the goods and services offered there, as opposed to other centers. In this sense, some goods and services produced and offered by urban centers can have a national, regional or local reach. The wider and more varied the range of goods and services offered to the population, the higher the hierarchical level reached by the urban center and the greater its area of influence.

Overall, there is a tendency for the population to be concentrated in large cities with more central functions, which are largely state capitals. On the other hand, urban centers that only produce the goods and services sought by the local population to satisfy their daily needs have a smaller area of influence and are positioned at lower hierarchical levels.

The analysis is based on two types of classification that are interrelated: the functional hierarchy between cities and the polarization between urban centers and between land management centers.

#### Functional Hierarchy

In the study of the functional hierarchy, or hierarchy of urban centers (following the categories adopted in the previous version of Regic, *Regions of Influence of Cities - 2007*), the cities were classified into five major levels, in turn subdivided into sub-levels, namely:

### **Metropolis:**

These are the 15 main urban centers in the country, characterized by their large size and strong relationships with each other, as well as generally having an extensive area of direct influence. All of the country's existing cities are directly influenced by one or more metropolises at the same time.

The region of influence of these centralities is wide and covers the entire territorial extension of the country, with areas of overlap in certain contacts. Metropolises are subdivided into three levels:

- **Large National Metropolis** - the Population Arrangement<sup>34</sup> of São Paulo/SP alone occupies the position of the largest urban hierarchy in the country;
- **National Metropolis** - the Population Arrangements of Brasília/DF and Rio de Janeiro/RJ occupy the second hierarchical position, also with a strong national presence;
- **Metropolis** - the Population Arrangements of Belém/PA, Belo Horizonte/MG, Campinas/SP, Curitiba/PR, Florianópolis/SC, Fortaleza/CE, Goiânia/GO, Porto Alegre/RS, Recife/PE, Salvador/BA, Vitória/ES and the Municipality of Manaus (AM) are the 12 Cities identified as Metropolises. They are made up of nine capitals that have been classified as 1 in terms of centrality of territorial management, plus Belém (PA), Campinas (SP) and Manaus (AM), which, although they are in class 2, have a significant population of more than 2 million inhabitants. Campinas (SP) is the only city that is not a state capital to be classified as a metropolis.

In Regic's 2007 study, there were 12 main urban centers in this category, including the Population Arrangements of Campinas/SP, Florianópolis/SC and Vitória/ES.

### **Regional Capitals:**

These are the urban centers with a high concentration of management activities, but with a smaller reach in terms of region of influence compared to the Metropolises. In all, 97 cities were classified as Regional Capitals throughout the country, with three subdivisions:

- **Regional Capital A** - made up of 9 Cities, generally State Capitals of the Northeast and Center-West Regions, with the exception of the Population Arrangement of Ribeirão Preto/SP. Their populations are close to each other, ranging from 800,000 to 1.4 million inhabitants in 2018. They are all directly related to metropolises;
- **Regional Capital B** - brings together 24 cities, generally reference centers in the interior of the states, except for the state capitals Palmas/TO and Porto Velho (RO). They are characterized by having an average of 530,000 inhabitants, with only the São José dos Campos/SP Population Arrangement having a higher population level (1.6 million inhabitants in 2018). They are numerous in the Southern Region, where 10 of the 24 Regional Capitals in this category are located;
- **Regional Capital C** - has 64 Cities, including three State Capitals: the Municipalities of Boa Vista (RR), Rio Branco (AC) and the Population Arrangement of Macapá/AP,

---

<sup>34</sup> Population Arrangements are territorial cutouts established by a study published by the IBGE in 2016, which consist of groupings of two or more municipalities.

all belonging to the Northern Region. The other cities are mainly in the Southeast, where 30 of the 64 Regional Capitals C are located. The national average population of the cities in this category was 300,000 inhabitants in 2018, the highest being in the Southeast (360,000) and the lowest in the South (200,000).

In the previous 2007 version of Regic, 70 urban centers were included at this level, 11 cities classified as Regional Capital A, 20 as Regional Capital B, and 39 as Regional Capital C.

### **Sub-Regional Centers:**

At this third hierarchical level, the 352 cities have less complex management activities (all are level 3 in the territorial management classification), with smaller areas of influence than the Regional Capitals. They are also smaller cities, with a national average of 85,000 inhabitants, larger in the Southeast (100,000) and smaller in the South and Midwest (75,000). This level is divided into two groups:

- **Sub-Regional Center A** - made up of 96 cities in the Southeast, South and Northeast regions, with an average population of 120,000 inhabitants;
- **Sub-Regional Center B** - made up of 256 cities with a large share from the Southeast and Northeast regions, with a national average of 70,000 inhabitants, higher in the Southeast (85,000) and lower in the South (55,000).

Compared to the previous 2007 version of Regic, this level comprised 169 urban centers, 85 cities classified as Sub-Regional Center A and 79 as Sub-Regional Center B.

### **Zone centers:**

The cities classified at the fourth level of the urban hierarchy are characterized by lower levels of management activities, polarizing a smaller number of neighbouring cities due to the direct attraction of the population by commerce and services based on proximity relationships. There are 398 cities with an average population of 30,000 inhabitants, subdivided into two groups:

- **Zone A Center** - made up of 147 cities with around 40,000 people, more populous in the North Region (average of 60,000 inhabitants) and less populous in the South and Central-West Regions (both with an average of just over 30,000 people). In terms of land management, most of them were classified at levels 3 and 4;
- **Zone B Centers** - this sub-level has 251 cities, all of which are classified at territorial management levels 4 and 5. They are smaller in population than the Zone A Centers (average of less than 25,000 inhabitants), also more populous in the North Region (35,000 on average) and less populous in the South Region (where they have 15,000 inhabitants). Zone B centers are more numerous in the Northeast, where 100 of the 251 cities in this classification are located.

In Regic's 2007 study, 556 cities fell into this category, 192 as Zone A centers and 364 as Zone B centers.

### **Local Centers:**

The last hierarchical level is defined by cities that exert influence restricted to their own territorial limits, and may attract some residents from other cities for specific issues, but

are not the main destination for any other city. At the same time, Local Centers have a low degree of centrality in their business and public management activities, generally having other higher-ranking urban centers as a reference point for their population's daily shopping and service activities, as well as access to government activities and business dynamics. They make up the majority of the country's cities, totaling 4,037 urban centers, as opposed to the 4,473 cities that were part of this level in the 2007 Regic study.

### **Regions of influence - (State of Paraíba)**

The Population Arrangement of João Pessoa, made up of the municipalities that make up the Metropolitan Region (João Pessoa, Bayeux, Cabedelo, Conde, Lucena and Santa Rita), occupies 1st place in Paraíba's hierarchy of influence, being classified by the IBGE's Regic study as Regional Capital A. Almost all of the state's municipalities are part of this urban network, made up of different regions of influence which, in some way, command business and public management activities or are responsible for supplying goods and services (PORTAL CORREIO, 2020).

João Pessoa's relationship of influence with other cities extends beyond the state borders, reaching some municipalities in the neighboring states of Ceará, Rio Grande do Norte and Pernambuco. With the capital of Pernambuco, Recife (classified by Regic as a metropolis), the connection is mainly due to territorial management relations, which include the link established by branches and headquarters of companies, as well as between decentralized public institutions (PORTAL CORREIO, 2020).

However, according to Regic 2018, some cities in Paraíba are not linked to the João Pessoa PA, such as Conceição, located in the west of Paraíba. This city, which polarizes the local centers of Ibiara and Santa Inês, is linked, along with these two municipalities, to the Juazeiro do Norte Population Arrangement in Ceará. Another example is the urban center of Princesa Isabel, which is polarized exclusively by Serra Talhada, in Pernambuco (PORTAL CORREIO, 2020).

In turn, over 11 years, the Patos Population Arrangement has grown in influence in the state, compared to the 2007 survey. According to Regic, in that year Campina Grande polarized practically the entire region to the west of the city. However, in 2018, there was a significant change, with the Patos AP emerging and taking over from the Campina Grande Population Arrangement in much of the western region of the state (PORTAL CORREIO, 2020).

In addition to Campina Grande, which was downgraded from Regional Capital B to Regional Capital C, 10 other cities also lost their influence and hierarchical position in the state, such as Itabaiana, Sousa and the Guarabira Population Arrangement (PORTAL CORREIO, 2020).

On the other hand, the IBGE study points out that eight cities have not only become more influential, but have also increased their centrality in the state: São Bento, São José de Piranhas, Conceição, Picuí, Brejo do Cruz and Serra Branca, along with the Solânea-Bananeiras and Cuité-Nova Floresta Population Arrangements (PORTAL CORREIO, 2020).

According to the study carried out, the urban network tends to be relatively stable over time, undergoing subtle or slow changes that can be attributed to various factors, such as the dynamics or major economic projects, historical trends, changes in transportation and mobility infrastructure and migration issues. In the state of Paraíba, around 90% of

the cities had no change in hierarchy during the period analyzed, which indicates stability in the state's urban network (PORTAL CORREIO, 2020).

According to Regic 2018, Paraíba had the 6th shortest average distance in Brazil, in a straight line, for the population to access goods and services. According to the survey, the average distance traveled by the population is 82 km, matching the result obtained in Ceará, both of which occupy 6th place in the national ranking (PORTAL CORREIO, 2020).

The average number of trips to buy clothes and shoes, furniture and electronics, as well as for low-complexity health care and cultural activities were low in the state. According to the survey, this indicates that some points spread across the interior of the state are able to meet the demands of the cities (PORTAL CORREIO, 2020).

When it comes to traveling to sporting events or practicing these activities, Paraíba stands out for having the shortest distance in the country, at just 32 km, well below the average for the Northeast (61 km) and Brazil (73 km) (PORTAL CORREIO, 2020).

However, when it comes to highly complex health services and access to airports, the average increases significantly, both with an average distance of 158 km, which points to a greater concentration of these services in the capital of Paraíba (PORTAL CORREIO, 2020).

In addition, some cities in Paraíba stood out in the IBGE survey for being much more attractive in some areas than they were in general, such as the population areas of Patos and Cajazeiras, which had high Attraction Indices in terms of higher education (PORTAL CORREIO, 2020).

The following table shows the main characteristics of the João Pessoa PA urban network, which comprises 209 cities, with the following standing out in the functional hierarchy:

- **Regional Capital C:** AP Campina Grande;
- **Sub-Regional Centers A:** AP Patos and Cajazeiras;
- **Sub-Regional Centers B:** AP Guarabira and Sousa;
- **Zone A centers:** AP Mamanguape - Rio Tinto, Itaporanga, Pombal and São Bento;
- **Zone B centers:** AP Cuité - Nova Floresta, AP Solânea - Bananeiras, Brejo do Cruz, Catolé do Rocha, Monteiro, Piancó, Picuí, Santa Luzia, São José de Piranhas, Serra Branca, Sumé and Uiraúna.

**Table 35 - Size of the second-level network (João Pessoa PA - Regional Capital A) in the state of Paraíba - 2018**

Features	João Pessoa PA's region of influence	Participation of the João Pessoa PA region of influence in Brazil	Headquarters (AP João Pessoa)	AP João Pessoa's participation in its region of influence
Population (2018)	4.049.563	1,9	1.136.627	28,1
Area (km ) <sup>2</sup>	56.645	0,7	1.259	2,2
Population density (inhabitants/km <sup>2</sup> )	71,5	291,8	902,8	1.263,2
Cities	209	4,3	1	0,5
GDP 2016 (1,000 R\$)	59.737.614	1,0	25.392.824	42,5
Value added services (except public administration)	25.111.577	0,8	12.541.280	49,9
Value added industry	8.328.797	0,7	4.395.704	52,8
Agricultural value added	2.244.160	0,7	162.488	7,2
Added value public administration	17.732.316	1,9	4.967.731	28,0
Taxes	6.320.768	0,7	3.325.620	52,6
GDP per capita (R\$)	14.752	49,1	22.341	151,4

The following figures show the region of influence of the João Pessoa Population Arrangement and its external connections with the other metropolises.

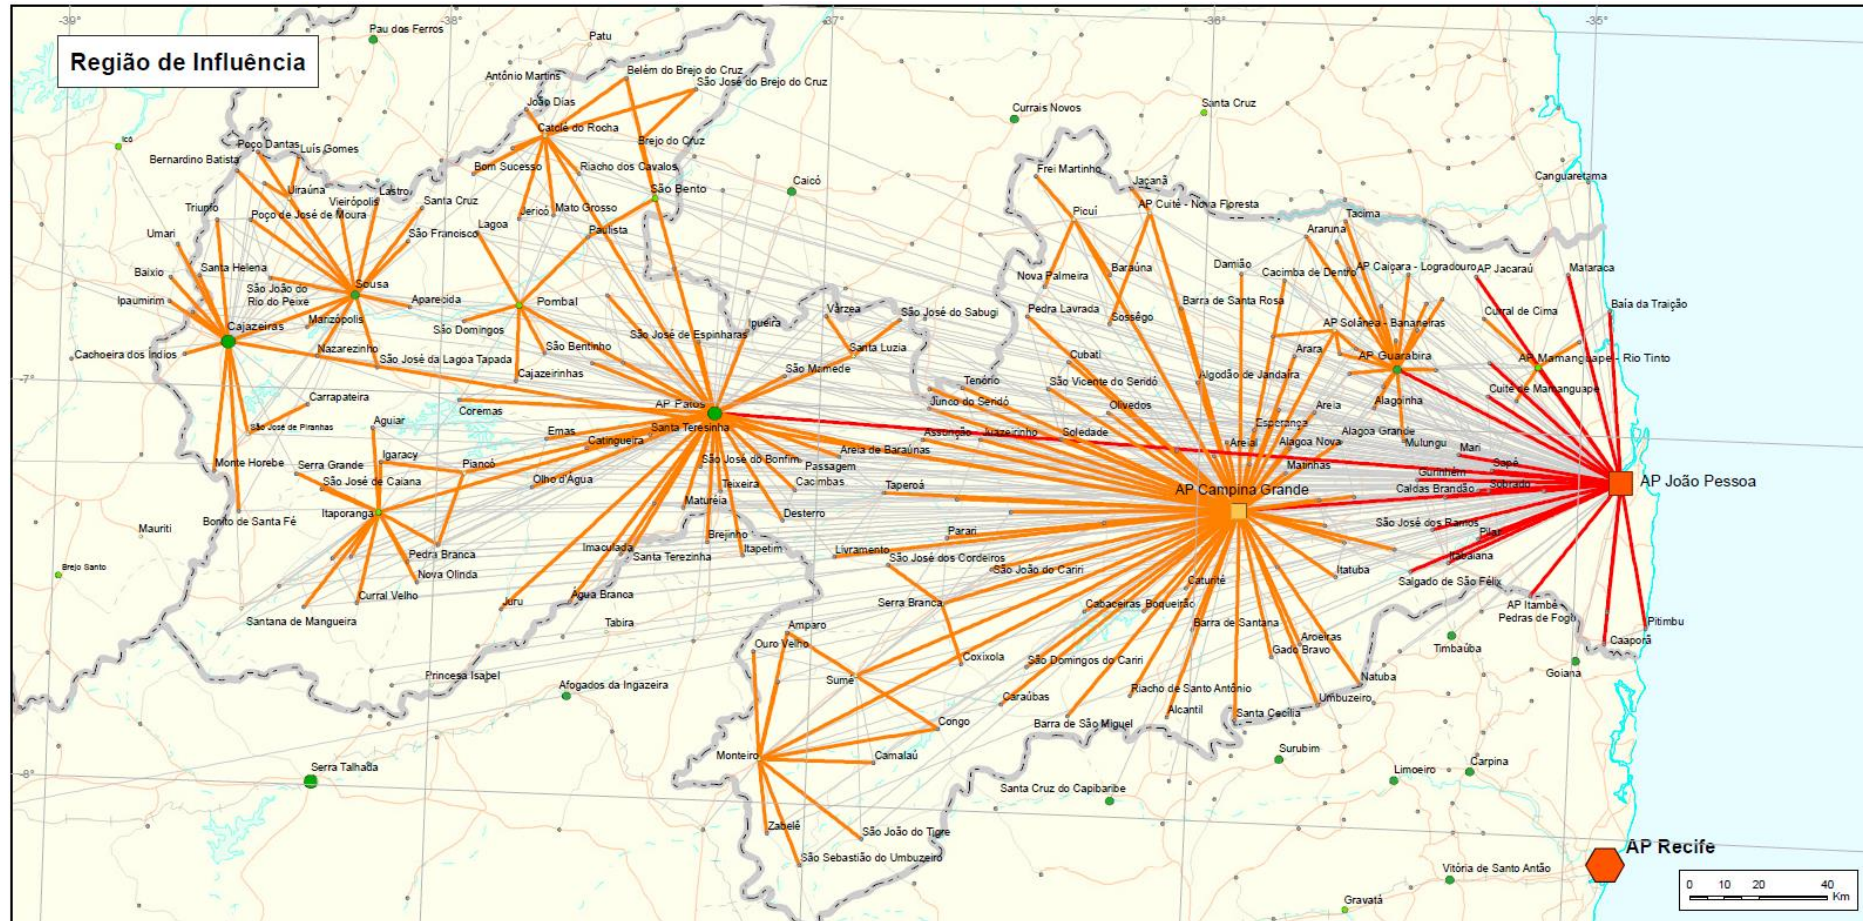

The figure representing the Region of Influence shows the structure of the network, indicating direct connections to the main center (red) and connections mediated by a secondary center (orange). The same figure shows the hierarchies of the centers belonging to the network and those adjacent to it. Also shown, in gray, are the connections related to the search for goods and services by the centers that occupy a lower level in the hierarchy.

Among the cities in the state of Paraíba with a centrality defined by displacements by specific theme, the following stand out:

- AP Patos, for trips to buy furniture and electronics, occupying 27th place in the national ranking;
- AP Campina Grande, Cajazeiras and AP Patos, for commuting to higher education, ranked 9th, 13th and 18th, respectively, in the national ranking;
- AP João Pessoa (15th), for trips to highly complex health services.

### 4.3.2 Demographic Profile

The project area covers 223 municipalities in the state of Paraíba, with an area of 56.467.242 km<sup>2</sup>, located in the Northeast of the country, which are part of fifteen Rural Territories (Alto Sertão, Borborema, Brejo, Cariri, Curimataú, Mata Norte, Mata Sul, Médio Piranhas, Médio Sertão, Piemont da Borborema, Serra do Teixeira, Vale de Piancó, Vale do Maringá, Vale do Paraíba and Vale do Piranhas) and fifteen Geoadministrative Regions (Cajazeiras, Campina Grande, Catolé do Rocha, Cuité, Guarabira, Itabaiana, Itaporanga, João Pessoa, Mamanguape, Monteiro, Patos, Pombal, Princesa Isabel, Solânea and Sousa).

Below is a brief demographic profile of each of the Rural Territories in the state of Paraíba.

**Table 36 - Demographic Profile of the Rural Territories of the State of Paraíba**

Rural Territory	Area (Census 2022, IBGE)	Population (Census 2022, IBGE)	Population density (Census 2022, IBGE)	Demographic distribution (2010 Census, IBGE)	
				Urban	Rural
<b>Alto Sertão</b>	3,419.48 km <sup>2</sup>	173,175 inhabitants	50.64 inhabitants/km <sup>2</sup>	61,1%	38,9%
<b>Borborema</b>	10,333.59 km <sup>2</sup>	875,917 inhabitants	84.76 inhabitants/km <sup>2</sup>	72,3%	27,7%
<b>Brejo</b>	1,033.29 km <sup>2</sup>	132,447 inhabitants	128.18 inhabitants/km <sup>2</sup>	72,3%	27,7%
<b>Cariri</b>	7,626.61 km <sup>2</sup>	113,901 inhabitants	14.93 inhabitants/km <sup>2</sup>	61,3%	38,7%
<b>Curimataú</b>	3,742.93 km <sup>2</sup>	100,622 inhabitants	26.88 inhabitants/km <sup>2</sup>	61,7%	38,3%
<b>North Mata</b>	2,044.89 km <sup>2</sup>	160,566 inhabitants	78.52 inhabitants/km <sup>2</sup>	61,2%	38,8%
<b>Mata Sul</b>	2,485.93 km <sup>2</sup>	1,335,829 inhabitants	537.36 inhabitants/km <sup>2</sup>	93,4%	6,6%
<b>Middle Piranhas</b>	2,859.34 km <sup>2</sup>	113,431 inhabitants	39.67 inhabitants/km <sup>2</sup>	71,0%	29,0%
<b>Middle Hinterland</b>	5,769.80 km <sup>2</sup>	217,262 inhabitants	37.66 inhabitants/km <sup>2</sup>	78,2%	21,8%
<b>Piemont da Borborema</b>	2,222.53 km <sup>2</sup>	169,348 inhabitants	76.20 inhabitants/km <sup>2</sup>	57,8%	42,2%

### **TR Alto Sertão**

The Alto Sertão Rural Territory is located in the Cajazeiras Geo-administrative Region, occupying an area of 3,419.48 km<sup>2</sup> (IBGE, 2022), which corresponds to 6.06% of the state's territory. According to the IBGE Demographic Census of 2022, the Alto Sertão RT had 173,175 inhabitants that year, which represents a population density of 50.64 inhabitants/km<sup>2</sup>. In 2010, of the total number of inhabitants, 61.1% were located in urban areas and 38.9% in rural areas (IBGE, 2010).

The TR Alto Sertão is administratively made up of 15 municipalities: Bernardino Batista, Bom Jesus, Bonito de Santa Fé, Cachoeira dos Índios, Cajazeiras, Carrapateira, Joca Claudino, Monte Horebe, Poço Dantas, Poço de José de Moura, Santa Helena, São João do Rio do Peixe, São José de Piranhas, Triunfo and Uiraúna.

### **RT Borborema**

The Borborema Rural Territory is located in the Geoadministrative Region of Campina Grande, occupying an area of 10,333.59 km<sup>2</sup> (IBGE, 2022), which corresponds to 18.30% of the state's territory. According to the IBGE Demographic Census of 2022, TR Borborema had 875,917 inhabitants that year, which represents a population density of 84.76 inhabitants/km<sup>2</sup>. In 2010, of the total number of inhabitants, 72.3% were located in urban areas and 27.7% in rural areas (IBGE, 2010).

TR Borborema is administratively made up of 38 municipalities: Alagoa Grande, Alagoa Nova, Alcantil, Algodão de Jandaíra, Areia, Areial, Aroeiras, Assunção, Barra de Santana, Barra de São Miguel, Boa Vista, Boqueirão, Cabaceiras, Campina Grande, Caturité, Esperança, Fagundes, Gado Bravo, Juazeirinho, Lagoa Seca, Livramento, Massaranduba, Matinhas, Montadas, Natuba, Olivedos, Pocinhos, Puxinanã, Queimadas, Remígio, Riacho de Santo Antônio, Santa Cecília, São Domingos do Cariri, São Sebastião de Lagoa de Roça, Soledade, Taperoá, Tenório and Umbuzeiro.

### **RT Brejo**

The Brejo Rural Territory is located in the Geoadministrative Region of Guarabira, occupying an area of 1,033.29 km<sup>2</sup> (IBGE, 2022), which corresponds to 1.83% of the state's territory. According to the IBGE Demographic Census of 2022, TR Brejo had 132,447 inhabitants that year, which represents a population density of 128.18 inhabitants/km<sup>2</sup>. In 2010, of the total number of inhabitants, 72.3% were located in urban areas and 27.7% in rural areas (IBGE, 2010).

The Brejo RT is administratively made up of 11 municipalities: Alagoinha, Araçagi, Cuitegi, Duas Estradas, Guarabira, Mulungu, Pilõezinhos, Pirpirituba, Riachão, Serra da Raiz and Sertãozinho.

### **RT Cariri**

The Cariri Rural Territory is located in the Geoadministrative Region of Monteiro, occupying an area of 7,626.61 km<sup>2</sup> (IBGE, 2022), which corresponds to 13.51% of the state's territory. According to the IBGE Demographic Census of 2022, TR Cariri had 113,901 inhabitants that year, which represents a population density of 14.93 inhabitants/km<sup>2</sup>. In 2010, of the total number of inhabitants, 61.3% were located in urban areas and 38.7% in rural areas (IBGE, 2010).

TR Cariri is administratively made up of 18 municipalities: Amparo, Camalaú, Caraúbas, Congo, Coxixola, Gurjão, Monteiro, Ouro Velho, Parari, Prata, Santo André, São João do Cariri, São João do Tigre, São José dos Cordeiros, São Sebastião do Umbuzeiro, Serra Branca, Sumé and Zabelê.

### **RT Curimataú**

The Curimataú Rural Territory is located in the Geo-administrative Region of Cuité, occupying an area of 3,742.93 km<sup>2</sup> (IBGE, 2022), which corresponds to 6.63% of the state's territory. According to the IBGE Demographic Census of 2022, TR Curimataú had 100,622 inhabitants that year, which represents a population density of 26.88 inhabitants/km<sup>2</sup>. In 2010, of the total number of inhabitants, 61.7% were located in urban areas and 38.3% in rural areas (IBGE, 2010).

TR Curimataú is administratively made up of 11 municipalities: Baraúna, Barra de Santa Rosa, Cubati, Cuité, Frei Martinho, Nova Floresta, Nova Palmeira, Pedra Lavrada, Picuí, São Vicente do Seridó and Sossêgo.

### **RT Mata Norte**

The Mata Norte Rural Territory is located in the Mamanguape Geo-administrative Region, occupying an area of 2,044.89 km<sup>2</sup> (IBGE, 2022), which corresponds to 3.62% of the state's territory. According to the IBGE Demographic Census of 2022, the Mata Norte RT had 160,566 inhabitants that year, which represents a population density of 78.52 inhabitants/km<sup>2</sup>. In 2010, of the total number of inhabitants, 61.2% were located in urban areas and 38.8% in rural areas (IBGE, 2010).

The Mata Norte RT is administratively made up of 12 municipalities: Baía da Traição, Capim, Cuité de Mamanguape, Curral de Cima, Itapororoca, Jacaraú, Lagoa de Dentro, Mamanguape, Marcação, Mataraca, Pedro Régis and Rio Tinto.

### **RT Mata Sul**

The Mata Sul Rural Territory is located in the João Pessoa Geo-administrative Region, occupying an area of 2,485.93 km<sup>2</sup> (IBGE, 2022), which corresponds to 4.40% of the state's territory. According to the IBGE Demographic Census of 2022, the Mata Sul RT had 1,335,829 inhabitants that year, which represents a population density of 537.36 inhabitants/km<sup>2</sup>. In 2010, of the total number of inhabitants, 93.4% were located in urban areas and only 6.6% in rural areas (IBGE, 2010).

The Mata Sul RT is administratively made up of 14 municipalities: Alhandra, Bayeux, Caaporã, Cabedelo, Conde, Cruz do Espírito Santo, João Pessoa, Lucena, Mari, Pitimbu, Riachão do Poço, Santa Rita, Sapé and Sobrado.

### **RT Middle Piranhas**

The Médio Piranhas Rural Territory is located in the Catolé do Rocha Geoadministrative Region, occupying an area of 2,859.34 km<sup>2</sup> (IBGE, 2022), which corresponds to 5.06% of the state's territory. According to the IBGE Demographic Census of 2022, the TR Médio Piranhas had 113,431 inhabitants that year, which represents a population density of 39.67 inhabitants/km<sup>2</sup>. In 2010, of the total number of inhabitants, 71.0% were located in urban areas and only 29.9% in rural areas (IBGE, 2010).

The TR Médio Piranhas is administratively made up of 10 municipalities: Belém do Brejo do Cruz, Bom Sucesso, Brejo do Cruz, Brejo dos Santos, Catolé do Rocha, Jericó, Mato Grosso, Riacho dos Cavalos, São Bento and São José do Brejo do Cruz.

### **RT Middle Hinterland**

The Médio Sertão Rural Territory is located in the Patos Geo-administrative Region, occupying an area of 5,769.80 km<sup>2</sup> (IBGE, 2022), which corresponds to 10.22% of the state's territory. According to the IBGE Demographic Census of 2022, the TR Médio Sertão had 217,262 inhabitants that year, which represents a population density of 37.66 inhabitants/km<sup>2</sup>. In 2010, of the total number of inhabitants, 78.2% were located in urban areas and only 21.8% in rural areas (IBGE, 2010).

The TR Médio Sertão is administratively made up of 22 municipalities: Areia de Baraúnas, Cacimba de Areia, Cacimbas, Catingueira, Desterro, Emas, Junco do Seridó, Mãe d'Água, Malta, Maturéia, Passagem, Patos, Quixaba, Salgadinho, Santa Luzia, Santa Teresinha, São José de Espinharas, São José do Bonfim, São José do Sabugi, São Mamede, Teixeira and Várzea.

### **RT Piemont da Borborema**

The Piemont da Borborema Rural Territory is located in the Solânea Geoadministrative Region, occupying an area of 2,222.53 km<sup>2</sup> (IBGE, 2022), which corresponds to 3.94% of the state's territory. According to the IBGE Demographic Census of 2022, the TR Piemont da Borborema had 169,348 inhabitants that year, which represents a demographic density of 76.20 inhabitants/km<sup>2</sup>. In 2010, of the total number of inhabitants, 57.8% were located in urban areas and 42.2% in rural areas (IBGE, 2010).

The TR Piemont da Borborema is administratively made up of 15 municipalities: Arara, Araruna, Bananeiras, Belém, Borborema, Cacimba de Dentro, Caiçara, Casserengue, Damião, Dona Inês, Logradouro, Pilões, Serraria, Solânea and Tacima.

### **TRT Serra do Teixeira**

The Serra do Teixeira Rural Territory is located in the Geoadministrative Region of Princesa Isabel, occupying an area of 2,072.69 km<sup>2</sup> (IBGE, 2022), which corresponds to 3.67% of the state's territory. According to the IBGE Demographic Census of 2022, the Serra do Teixeira RT had 78,026 inhabitants that year, which represents a population density of 37.64 inhabitants/km<sup>2</sup>. In 2010, of the total number of inhabitants, 51.1% were located in urban areas and 48.9% in rural areas (IBGE, 2010).

The Serra do Teixeira RT is administratively made up of 7 municipalities: Água Branca, Imaculada, Juru, Manaíra, Princesa Isabel, São José de Princesa and Tavares.

### **RT Vale de Piancó**

The Vale de Piancó Rural Territory is located in the Geoadministrative Region of Itaporanga, occupying an area of 5,557.73 km<sup>2</sup> (IBGE, 2022), which corresponds to 9.84% of the state's territory. According to the IBGE Demographic Census of 2022, the TR Vale de Piancó had 141,772 inhabitants that year, which represents a population density of 25.51 inhabitants/km<sup>2</sup>. In 2010, of the total number of inhabitants, 63.0% were located in urban areas and 37.0% in rural areas (IBGE, 2010).

The TR Vale de Piancó is administratively made up of 18 municipalities: Aguiar, Boa Ventura, Conceição, Coremas, Curral Velho, Diamante, Ibiara, Igaracy, Itaporanga, Nova Olinda, Olho d'Água, Pedra Branca, Piancó, Santa Inês, Santana de Mangueira, Santana dos Garrotes, São José de Caiana and Serra Grande.

### **RT Maringá Valley**

The Vale do Maringá Rural Territory is located in the Pombal Geo-administrative Region, occupying an area of 2,626.68 km<sup>2</sup> (IBGE, 2022), which corresponds to 4.65% of the state's territory. According to the IBGE Demographic Census of 2022, the TR Vale do Maringá had 68,476 inhabitants that year, which represents a population density of 26.07 inhabitants/km<sup>2</sup>. In 2010, of the total number of inhabitants, 65.2% were located in urban areas and 34.8% in rural areas (IBGE, 2010).

The TR Vale do Maringá is administratively made up of 8 municipalities: Cajazeirinhas, Condado, Lagoa, Paulista, Pombal, São Bentinho, São Domingos and Vista Serrana.

### **RT Paraíba Valley**

The Vale do Paraíba Rural Territory is located in the Itabaiana Geo-administrative Region, occupying an area of 2,492.00 km<sup>2</sup> (IBGE, 2022), which corresponds to 4.41% of the state's territory. According to the IBGE Demographic Census of 2022, the TR Vale do Paraíba had 180,552 inhabitants that year, which represents a population density of 72.45 inhabitants/km<sup>2</sup>. In 2010, of the total number of inhabitants, 61.4% were located in urban areas and 38.8% in rural areas (IBGE, 2010).

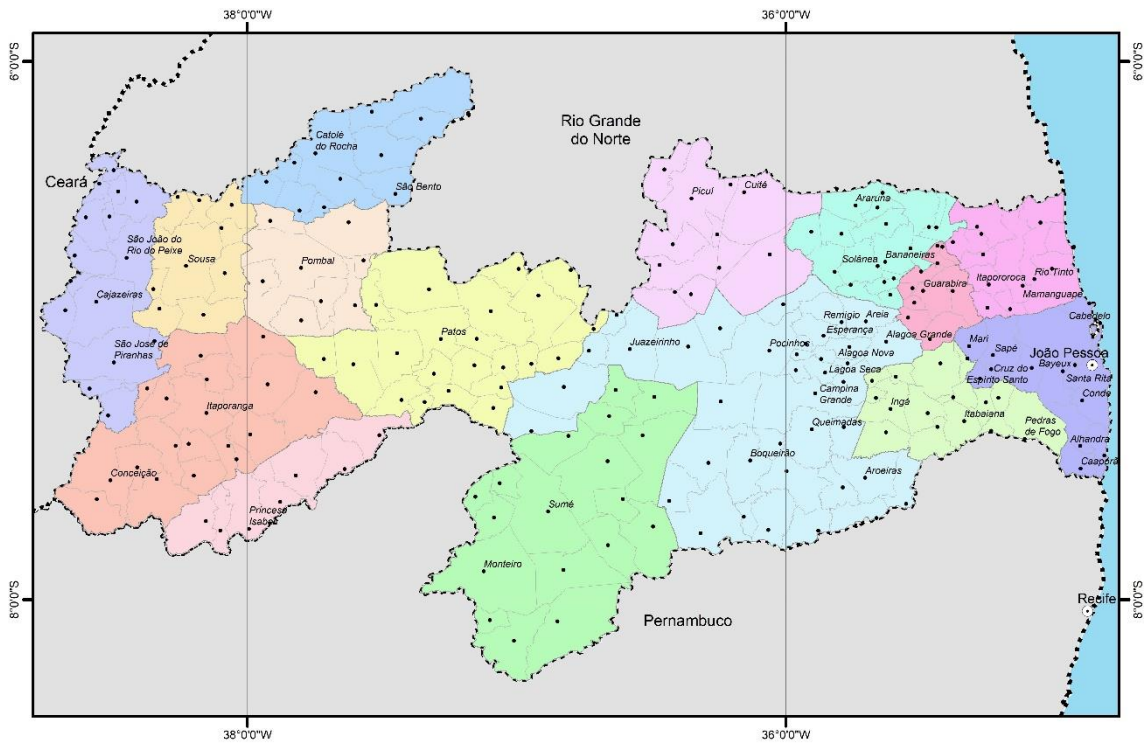

The TR Vale do Paraíba is administratively made up of 15 municipalities: Caldas Brandão, Gurinhém, Ingá, Itabaiana, Itatuba, Juarez Távora, Juripiranga, Mogeiro, Pedras de Fogo, Pilar, Riachão do Bacamarte, Salgado de São Félix, São José dos Ramos, São Miguel de Taipu and Serra Redonda.

### **RT Piranhas Valley**

The Vale do Piranhas Rural Territory is located in the Geoadministrative Region of Sousa, occupying an area of 2,492.00 km<sup>2</sup> (IBGE, 2022), which corresponds to 3.86% of the state's territory. According to the IBGE Demographic Census of 2022, the TR Vale do Piranhas had 113,363 inhabitants that year, which represents a population density of 52.00 inhabitants/km<sup>2</sup>. In 2010, of the total number of inhabitants, 66% were located in urban areas and 34% in rural areas (IBGE, 2010).

The TR Vale do Piranhas is administratively made up of 9 municipalities: Aparecida, Lastro, Marizópolis, Nazarezinho, Santa Cruz, São Francisco, São José da Lagoa Tapada, Sousa and Vieirópolis.

## Population Distribution and Growth

Analysis of the degree of urbanization not only measures the process of urbanization in a given area, but also makes it possible to support planning processes and an understanding of the network of social services and urban infrastructure.

In the following sub-items we can see the distribution and growth of the population in the project area over a given period for the state as a whole and by Rural Territory.

### State of Paraíba

In the period 2000-2010, the population of the state of Paraíba had a geometric growth rate<sup>35</sup> of 0.90% p.a., rising from 3,443,825 inhabitants in 2000 to 3,766,528 in 2010. The urbanization rate<sup>36</sup> grew significantly over the same period, from 71.06% in 2000 to 75.37% in 2010.

In the last decade, between 2010 and 2022, Paraíba showed a growth rate of 0.55% p.a., reaching 3,974,687 inhabitants, according to data from the latest IBGE Demographic Census.

Paraíba is therefore basically an urban state, meaning that a large part of its population lives in urban areas.

The following table shows the degree of urbanization and the evolution of the rural and urban population in the years 2000, 2010 and 2022 in the state of Paraíba.

**Table 37 -Population by Household Status - Paraíba - 2000, 2010 and 2022**

State of Paraíba	2000	2010	2022	TGCA 2000-2010	TGCA 2010-2022
<b>Total Population:</b>	3.443.825	3.766.528	3.974.687	0,90%	0,45%

<b>Rural:</b>	996.613	927.850	N/A	-0,71%	-
<b>Urbanization rate:</b>	71,06%	75,37%	-	-	-

Source: IBGE - Demographic Censuses, 2000, 2010 and 2022.

GGRR: Geometric annual growth rate.

N/A: Not available.

<sup>35</sup> Geometric average annual population growth rate: Percentage of the average annual increase in the resident population in a given geographical area during the period in question. Population growth estimates are made using the geometric method. In technical terms, to obtain the growth rate (r), 1 is subtracted from the nth root of the quotient between the final population (Pt) and the population at the start of the period considered (P0), and the result is multiplied by 100, with "n" being equal to the number of years in the period.

$$r = \left[ \left( \sqrt[n]{\frac{P_t}{P_0}} \right) - 1 \right] \times 100$$

<sup>36</sup> Urbanization rate: Percentage of the population in urban areas in relation to the total population.

## **RT Alto Sertão**

In the period 2000-2010, the population of the Alto Sertão RT had a geometric growth rate of 0.67% p.a., rising from 157,169 inhabitants in 2000 to 167,971 in 2010, according to data from the IBGE Demographic Censuses (2000 and 2010). During the same period, the state's population grew at a rate of 0.90% p.a., which meant a decrease in the proportion of the RT population in the composition of Paraíba's population.

In the last decade, between 2010 and 2022, growth was less significant than in the previous decade (0.25% p.a.). In 2022, the territory had 173,175 inhabitants, which represents 4.4% of the state's population in the same year, with Cajazeiras being the municipality with the largest population (63,239 inhabitants). São José de Piranhas, São João do Rio do Peixe, Uiraúna and Bonito de Santa Fé had populations of between 10,000 and 20,000 inhabitants, while ten other municipalities had populations of less than 10,000 inhabitants, the smallest of which was in Bom Jesus: 2,286 inhabitants.

In terms of population growth between 2000-2010, two municipalities had negative rates, the lowest of which was in Santa Helena (-1.38% p.a.). On the other hand, 13 municipalities had positive growth rates, especially Cachoeira dos Índios (2.00% p.a.), Bernardino Batista (1.85% p.a.) and Bonito de Santa Fé (1.59% p.a.).

Between 2010-2022, the municipalities of the Alto Sertão RT grew at a slower rate than in the previous decade, with seven municipalities experiencing negative rates, the most significant being Bernardino Batista (-1.08%). In turn, the municipalities of Bonito de Santa Fé (0.44%), Bom Jesus (0.41%) and Cachoeira dos Índios (0.35%) experienced the highest growth rates over the same period.

When analyzing the household situation of the population living in the Alto Sertão RT, 61.11% lived in urban areas and 38.89% in rural areas in 2010. In comparison, in the state as a whole, a large part of the population lived in urban areas in the same year (75.37%) and only 24.63% in rural areas. It should be noted that, in 2000, just under half of the population of the Alto Sertão RT lived in rural areas (45.14%), with a low urbanization rate (54.86%).

Among the municipalities of the TR Alto Sertão, it can be seen that Cajazeiras, Carrapateira, Uiraúna, Bonito de Santa Fé, São José de Piranhas and Monte Horebe are basically urban municipalities, i.e. most of their populations live in urban areas, while in the other municipalities most of their populations live in rural areas and in Santa Helena its population is divided between the two areas.

The following table shows the degree of urbanization and the evolution of the rural and urban population in the years 2000, 2010 and 2022 in the Alto Sertão RT. Next, the figure shows the urbanization rate of the municipalities in the RT in 2010.

**Table 38 - Population by Household Status - TR Alto Sertão - 2000, 2010 and 2022**

TR Alto Sertão	2000	2010	2022	TGCA 2000-2010	TGCA 2010-2022

Source: IBGE - 2010 Demographic Census.

**RT Borborema**

The Borborema RT has the largest number of municipalities in the state of Paraíba: 38. In the period from 2000 to 2010, it showed a positive variation in the number of inhabitants, with a geometric growth rate of 0.72% p.a., indicating a lower behavior than that seen in Paraíba for the same period, in which a population increase of 0.90% p.a. was observed.

In the last decade, between 2010 and 2022, growth was less significant than in the previous decade (0.46% p.a.). In 2022, the territory had 875,917 inhabitants, representing 22.0% of the state's population in the same year, with Campina Grande having the largest population (419,379 inhabitants). Queimadas and Esperança had populations of between 30,000 and 50,000 inhabitants, while 15 municipalities had populations of between 10,000 and 30,000 inhabitants and the rest had fewer than 10,000 inhabitants, the smallest of which was in Riacho de Santo Antônio: 1,955 inhabitants.

In terms of population growth between 2000-2010, six municipalities had negative rates, the lowest of which was in Areia (-0.92% p.a.). On the other hand, the rest of the municipalities had positive growth rates, especially Riacho de Santo Antônio (2.59% p.a.), Montadas (2.32% p.a.) and Boa Vista (2.25% p.a.).

Between 2010 and 2022, the municipalities of TR Borborema grew at a slower rate than in the previous decade, with eleven municipalities experiencing negative rates, the most significant being Natuba (-1.38%). In turn, the municipalities of Algodão de Jandaíra (1.86%), Assunção (1.38%) and Montadas (1.28%) experienced the highest growth rates over the same period.

When we analyze the household situation of the population living in TR Borborema, we can see that most of them were located in urban areas (72.26%) in 2010, below the state average, which in the same year had an urbanization rate of 75.37%.

Among the municipalities in TR Borborema, it can be seen that just over half of the population lived in urban areas, with Campina Grande and Assunção standing out, with urbanization rates of 95.33% and 80.81%, respectively. On the other hand, Barra de Santana (8.91%), Gado Bravo (10.84) and Matinhas (15.78%) had the lowest rates in the same year, with most of their inhabitants living in rural areas.

The following table shows the degree of urbanization and the evolution of the rural and urban population in the years 2000, 2010 and 2022 in the Borborema RT. Next, the figure shows the urbanization rate of the municipalities in the RT in 2010.

**Table 39 - Population by Household Status - TR Borborema - 2000, 2010 and 2022**

TR Borborema	2000	2010	2022	TGCA 2000-2010	TGCA 2010-2022

### RT Brejo

In the period 2000-2010, the population of the Brejo RT had a geometric growth rate of 0.42% p.a., rising from 126,972 inhabitants in 2000 to 132,468 in 2010, according to data from the IBGE Demographic Censuses (2000 and 2010). During the same period, the state's population grew at a rate of 0.90% p.a., which meant a decrease in the proportion of the RT population in the composition of Paraíba's population.

In the last decade, between 2010 and 2022, the Brejo RT kept its resident population practically stable, with a geometric growth rate of practically zero (0.00% p.a.). In 2022, the territory had 132,447 inhabitants, representing 3.3% of the state's population in the same year, with Guarabira having the largest population (57,484 inhabitants). The rest of the municipalities had populations of less than 20,000 inhabitants, the smallest of which was in Riachão: 2,927 inhabitants.

In terms of population growth between 2000-2010, five municipalities had negative rates, the lowest of which was in Serra da Raiz (-0.70% p.a.). On the other hand, the rest of the municipalities had positive growth rates, especially Sertãozinho (2.47% p.a.), Riachão (1.58% p.a.) and Alagoinha (1.38% p.a.).

Between 2010-2022, the municipalities of the Brejo RT grew at a slower rate than in the previous decade, with seven municipalities experiencing negative rates, the most significant being Riachão (-0.91%). On the other hand, the municipalities of Sertãozinho (1.17%), Guarabira (0.32%) and Pilõesinhos (0.28%) experienced the highest growth rates over the same period.

When we analyze the household situation of the population living in the Brejo RT, we can see that most of them were located in urban areas (72.32%) in 2010, below the state average, which in the same year had an urbanization rate of 75.37%.

Among the municipalities in the Brejo RT, it can be seen that practically all of them lived in urban areas, with Guarabira and Cuitegi standing out, with urbanization rates of 88.49% and 81.41%, respectively. Only the population of two municipalities, Araçagi (39.50) and Mulungu (47.90), lived mostly in rural areas in the same year.

The following table shows the degree of urbanization and the evolution of the rural and urban population in the years 2000, 2010 and 2022 in the Brejo RT. Next, the figure shows the urbanization rate of the municipalities in the RT in 2010.

## **RT Cariri**

In the period 2000-2010, the population of the Cariri RT had a geometric growth rate of 0.64% p.a., rising from 103,165 inhabitants in 2000 to 109,949 in 2010, according to data from the IBGE Demographic Censuses (2000 and 2010). During the same period, the state's population grew at a rate of 0.90% p.a., which meant a decrease in the proportion of the RT population in the composition of Paraíba's population.

In the last decade, between 2010 and 2022, growth was less significant than in the previous decade (0.29% p.a.). In 2022, the territory had 113,901 inhabitants, representing 2.9% of the state's population in the same year, with Monteiro having the largest population (32,277 inhabitants). Sumé and Serra Branca also stood out, with more than 10,000 residents each, while the rest of the municipalities had populations of less than 10,000, the smallest being Parari: 1,720 inhabitants.

In terms of population growth between 2000-2010, five municipalities showed negative rates, the highest being Parari (-1.34% p.a.) and the lowest São João do Tigre (-0.19% p.a.). The rest of the municipalities showed a positive rate, with Coxixola, Caraúbas and Gurjão standing out, with geometric growth rates of 2.22%, 1.38% and 1.25%, respectively.

Between 2010 and 2022, the municipalities of TR Cariri grew at a slower rate than in the previous decade, with five municipalities reaching negative rates, the most significant being São José dos Cordeiros (-1.29%). On the other hand, the municipalities of Parari (2.65%), Zabelê (0.59%) and Amparo (0.56%) experienced the highest growth rates over the same period.

When analyzing the household situation of the population living in TR Cariri, of the 18 municipalities in the territory, only five had a predominance of the population living in the rural stratum in 2010: Santo André (with only 32.79% of the population living in urban areas), São João do Tigre (34.78%), Caraúbas (38.91%), São José dos Cordeiros (41.23%) and Coxixola (44.16%). The highest urban proportions were found in Sumé and Zabelê, with 76.19% and 70.94%, respectively, of the population living in this stratum. The other municipalities had an urbanization rate of between 50.00% and 70.00%.

The following table shows the degree of urbanization and the evolution of the rural and urban population in the years 2000, 2010 and 2022 in the Cariri RT. Next, the figure shows the urbanization rate of the municipalities in the RT in 2010.

**Table 41 - Population by Household Status - TR Cariri - 2000, 2010 and 2022**

### RT Curimataú

Between 2000 and 2010, TR Curimataú showed a positive variation in the number of inhabitants, with a geometric growth rate of 0.75% p.a., indicating a lower behavior than that seen in Paraíba for the same period, where a population increase of 0.90% p.a. was observed.

In the last decade, between 2010 and 2022, the population of TR Curimataú decreased slightly, reaching a negative geometric growth rate of -0.13% per year. In 2022, the territory had 100,622 inhabitants, which represents 2.5% of the state's population in the same year, with Cuité having the largest population (19,719). Picuí, Barra de Santa Rosa and São Vicente do Seridó also stood out, with more than 10,000 residents. The rest of the municipalities had fewer than 10,000 inhabitants, with Frei Martinho and Sossêgo standing out as having the smallest populations in the state (2,846 and 3,345 residents, respectively).

In terms of population growth between 2000-2010, all the municipalities in the CA showed positive rates, the highest being Baraúna (2.91%), Nova Palmeira (2.01%) and Sossêgo (2.01%), and the lowest Cuité (0.02%) and Frei Martinho (0.03%).

Between 2010-2022, the municipalities of the Curimataú RT grew at a slower rate than in the previous decade, with six municipalities experiencing negative rates, the most

significant being Barra de Santa Rosa (-0.77%). On the other hand, the municipalities of Baraúna (1.01%), Cubati (0.83%) and Sossêgo (0.45%) experienced the highest growth rates over the same period.

When analyzing the household situation of the population living in TR Curimataú, of the 11 municipalities in the territory, only three had a predominance of the population living in the rural stratum in 2010: Pedra Lavrada (with only 41.14% of the population living in urban areas), São Vicente do Seridó (44.94%) and Sossêgo (49.92%). The highest urban proportions were found in Baraúna and Nova Floresta, with 75.52% and 74.93%, respectively, of the population living in this stratum. The other municipalities had an urbanization rate of between 50.00% and 70.00%.

The following table shows the degree of urbanization and the evolution of the rural and urban population in the years 2000, 2010 and 2022 in the Curimataú RT. Next, the figure shows the urbanization rate of the municipalities in the RT in 2010.

### **RT Mata Norte**

In the period from 2000 to 2010, the Mata Norte RT showed a positive variation in the number of inhabitants, with a geometric growth rate of 0.97% p.a., indicating a behavior greater than that seen in Paraíba for the same period, in which a population increase of 0.90% p.a. was observed.

In the last decade, between 2010 and 2022, growth was less significant than in the previous decade (0.60% p.a.). In 2022, the territory had 160,566 inhabitants, representing 4.0% of the state's population in the same year, with Mamanguape having the largest population (44,599 inhabitants). Rio Tinto, Itapororoca and Jacaraú also stood out, with more than 10,000 residents each, while the rest of the municipalities had populations of less than 10,000 inhabitants, the smallest of which was in Curral de Cima: 5,254 inhabitants.

With regard to population growth, between 2000-2010, two municipalities showed negative rates, the highest being Curral de Cima (-0.22% p.a.) and the lowest Jacaraú (-0.12% p.a.). The rest of the municipalities showed a positive rate, especially Mataraca, Capim and Baía da Traição, with geometric growth rates of 3.02%, 2.97% and 2.14%, respectively.

Between 2010-2022, the municipalities of the Mata Norte RT grew at a slower rate than in the previous decade, but only Pedro Régis saw a small reduction in its population, reaching a geometric growth rate of practically zero (0.00% p.a.). On the other hand, the municipalities of Capim (1.84%), Marcação (1.41%) and Baía da Traição (1.18%) experienced the highest growth rates in the same period.

When we look at the household situation of the population living in the Mata Norte RT, we can see that most of them were located in urban areas (61.21%) in 2010, below the state average, which in the same year had an urbanization rate of 75.37%.

Among the municipalities in the Mata Norte RT, it can be seen that Mataraca, Mamanguape, Capim, Itapororoca, Jacaraú and Rio Tinto are basically urban municipalities, i.e. most of their populations live in urban areas, while in the other municipalities most of their populations live in rural areas (with Curral de Cima standing out with an urbanization rate of just 9.08%) and in Lagoa de Dentro its population is divided between the two areas.

The following table shows the degree of urbanization and the evolution of the rural and urban population in the years 2000, 2010 and 2022 in the Mata Norte RT. Next, the figure shows the urbanization rate of the municipalities in the RT in 2010.
