In the last decade, between 2010 and 2022, growth was less significant than in the previous decade (0.97% p.a.). In 2022, the territory had 1,335,829 inhabitants, representing 33.6% of the state's population in the same year, with João Pessoa having the largest population (833,932 inhabitants). Santa Rita, Bayeux, Cabedelo and Sapé also stood out, with more than 50,000 residents each, while the rest of the municipalities had populations of less than 30,000 inhabitants, the smallest of which was in Riachão do Poço: 4,738 inhabitants.

In terms of population growth between 2000-2010, all the municipalities in the region showed positive rates, the highest being Cabedelo (3.07%), Conde (2.69%) and Pitimbu (2.03%), and the lowest Mari (0.25%) and Santa Rita (0.38%).

Between 2010-2022, the municipalities of the Mata Sul RT grew at a slower rate than in the previous decade, with two municipalities, Pitimbu and Bayeux, reaching negative rates, the latter being the most significant (-1.54%). In turn, the municipalities of Conde (2.14%), Santa Rita (1.85%) and Alhandra (1.58%) experienced the highest growth rates over the same period.

When we look at the household situation of the population living in the Mata Sul RT, we can see that practically all of them were located in urban areas (93.36%) in 2010, higher than the state average, which in the same year had an urbanization rate of 75.37%. This shows the highly urbanized profile of the municipalities in the region.

Therefore, in 2010, practically all the municipalities in the Mata Sul RT had high urbanization rates, especially Cabedelo (99.99%), João Pessoa (99.62%) and Bayeux (99.07%), with almost all of their populations living in urban areas. On the other hand, only in three municipalities in the CA did most of their population live in rural areas: Cruz do Espírito Santo, Riachão do Poço and Sobrado, the latter with an urbanization rate of only 11.98%.

The following table shows the degree of urbanization and the evolution of the rural and urban population in the years 2000, 2010 and 2022 in the Mata Sul RT. Next, the figure shows the urbanization rate of the municipalities in the RT in 2010.

**Table 44 - Population by Household Status - TR Mata Sul - 2000, 2010 and 2022**

## 62 - Urbanization Rate - Paraíba, TR Mata Sul and TR Municipalities - 2010

Source: IBGE - 2010 Demographic Census.

### **RT Middle Piranhas**

In the period from 2000 to 2010, the TR Médio Piranhas showed a positive variation in the number of inhabitants, with a geometric growth rate of 0.84% p.a., indicating a similar behavior to that seen in Paraíba for the same period, in which a population increase of 0.90% p.a. was observed.

In the last decade, between 2010 and 2022, growth was less significant than in the previous decade (0.15% p.a.). In 2022, the territory had 113,431 inhabitants, which represents 2.9% of the state's population in the same year, with São Bento being the municipality with the largest population (32,235 inhabitants). Catolé do Rocha also stood out, with more than 30,661 residents, while the rest of the municipalities registered populations of less than 15,000, the smallest of which was in São José do Brejo do Cruz: 1,699 inhabitants.

In terms of population growth between 2000-2010, Bom Sucesso was the only municipality in the region with a negative rate (-0.48%). The rest of the municipalities showed a positive rate, especially São Bento, Mato Grosso and Brejo do Cruz, with geometric growth rates of 1.65%, 1.08% and 1.01%, respectively.

Between 2010-2022, the municipalities of the TR Médio Piranhas grew at a slower rate than in the previous decade, with five municipalities reaching negative rates, the most significant being Belém do Brejo do Cruz (-1.08%). In turn, the municipalities of Catolé

do Rocha (0.54%), São Bento (0.36%) and Brejo do Cruz (0.31%) experienced the highest growth rates over the same period.

When we analyze the household situation of the population living in the TR Médio Piranhas, we can see that a large part was located in the urban area (71.02%) in 2010, below the state average, which in the same year had an urbanization rate of 75.37%.

Among the municipalities of the TR Médio Piranhas, it can be seen that São Bento, Brejo do Cruz, Brejo dos Santos, Catolé do Rocha, Belém do Brejo do Cruz and Jericó are basically urban municipalities, i.e. most of their populations live in urban areas, while in Bom Sucesso, Mato Grosso and Riacho dos Cavalos most of their populations live in rural areas, and in São José do Brejo do Cruz, with an urbanization rate of 56.89%, the population was more divided between urban and rural areas.

The following table shows the degree of urbanization and the evolution of the rural and urban population in the years 2000, 2010 and 2022 in the Middle Piranhas RT. Next, the figure shows the urbanization rate of the municipalities in the RT in 2010.

### 63 - Urbanization Rate - Paraíba, TR Médio Piranhas and TR Municipalities - 2010

Source: IBGE - 2010 Demographic Census.

#### **RT Middle Hinterland**

In the period from 2000 to 2010, the Médio Sertão RT showed a positive variation in the number of inhabitants, with a geometric growth rate of 0.76% p.a., indicating a lower behavior than that seen in Paraíba for the same period, in which a population increase of 0.90% p.a. was observed.

In the last decade, between 2010 and 2022, growth was less significant than in the previous decade (0.11% p.a.). In 2022, the territory had 217,262 inhabitants, which represents 5.5% of the state's population in the same year, with Patos being the municipality with the largest population (103,165 inhabitants). Santa Luzia and Teixeira also stood out, with around 15,000 inhabitants each. The rest of the municipalities had fewer than 10,000 inhabitants, especially Quixaba and Areia de Baraúnas, which had the smallest populations in the state (1,743 and 2,005 residents, respectively).

In terms of population growth between 2000-2010, seven municipalities showed negative rates, the highest being Areia de Baraúnas (-0.87% p.a.) and the lowest Cacimba de Areia (-0.06% p.a.). The rest of the municipalities had positive rates, especially Quixaba, Salgadinho and Várzea, with geometric growth rates of 2.65%, 2.20% and 2.02%, respectively.

Between 2010-2022, the municipalities of the TR Médio Sertão grew at a slower rate than in the previous decade, with eight municipalities reaching negative rates, the most significant being São José de Espinharas (-1.27%). In turn, the municipalities of

Passagem (0.82%), Maturéia (0.67%) and Malta (0.62%) experienced the highest growth rates over the same period.

When analyzing the household situation of the population living in the TR Médio Sertão, of the 22 municipalities in the territory, nine had a predominantly rural population in 2010, with Cacimbas standing out, with only 24.08% of its population living in urban areas. The highest urban proportions were found in Patos and Santa Luzia, with 96.63% and 91.58%, respectively, of the population living in this stratum.

The following table shows the degree of urbanization and the evolution of the rural and urban population in the years 2000, 2010 and 2022 in the Médio Sertão RT. Next, the figure shows the urbanization rate of the municipalities in the RT in 2010.

**Table 46 - Population by Household Status - TR Médio Sertão - 2000, 2010 and 2022**

### **RT Piemont da Borborema**

In the period 2000-2010, the population of the Piemont da Borborema RT had a geometric growth rate of 0.14% p.a., rising from 173,775 inhabitants in 2000 to 176,143 in 2010, according to data from the IBGE Demographic Censuses (2000 and 2010). During the same period, the state's population grew at a rate of 0.90% p.a., which meant a decrease in the proportion of the RT population in the composition of Paraíba's population.

In the last decade, between 2010 and 2022, the population of the TR Piemont da Borborema decreased significantly, reaching a negative geometric growth rate of -0.33% per year. In 2022 the territory had 169,348 inhabitants, which represents 4.3% of the state's population in the same year, with Solânea being the municipality with the largest population (26,774 inhabitants). Bananeiras, Araruna, Belém and Cacimba de Dentro also stood out, with populations of between 15,000 and 25,000 inhabitants. The rest of the municipalities had fewer than 15,000 inhabitants, especially Borborema and Logradouro, which had the smallest populations in the region (4,214 and 4,797 inhabitants, respectively).

In terms of population growth between 2000-2010, five municipalities showed negative rates, the highest being Solânea (-1.38% p.a.) and the lowest Cacimba de Dentro (-0.04% p.a.). The rest of the municipalities showed a positive rate, especially Damião, Logradouro and Araruna, with geometric growth rates of 3.00%, 1.52% and 1.29%, respectively.

Between 2010-2022, the municipalities of the TR Piemont da Borborema grew at a slower rate than in the previous decade, with negative rates in eleven municipalities, the most significant being Tacima (-2.04%) and Serraria (-2.02%). On the other hand, the municipalities of Logradouro (1.65%), Bananeiras (0.48%) and Damião (0.14%) experienced the highest growth rates in the same period.

When analyzing the household situation of the population living in the TR Piemont da Borborema, of the 15 municipalities in the territory, eight had a predominantly rural population in 2010, with Bananeiras standing out with only 39.67% of its population living in urban areas. The highest urban proportions were found in Belém and Borborema, with 82.56% and 73.02% of the population living in this stratum respectively.

The following table shows the degree of urbanization and the evolution of the rural and urban population in the years 2000, 2010 and 2022 in the Piemont da Borborema RT. Next, the figure shows the urbanization rate of the municipalities in the RT in 2010.

**Table 47 - Population by Household Status - TR Piemont da Borborema - 2000, 2010 and 2022**

### RT Serra do Teixeira

In the period 2000-2010, the population of the Serra do Teixeira RT had a geometric growth rate of 0.47% p.a., rising from 77,257 inhabitants in 2000 to 80,991 in 2010, according to data from the IBGE Demographic Censuses (2000 and 2010). During the same period, the state's population grew at a rate of 0.90% p.a., which meant a decrease in the proportion of the RT population in the composition of Paraíba's population.

In the last decade, between 2010 and 2022, the population of the Serra do Teixeira RT decreased slightly, reaching a negative geometric growth rate of -0.31% per year. In 2022, the territory had 78,026 inhabitants, which represents 2.0% of the state's population in the same year, with Princesa Isabel being the municipality with the largest population (21,114 inhabitants). Tavares, Manaíra and Imaculada also stood out, with populations of over 10,000 inhabitants. The rest of the municipalities had fewer than 10,000 inhabitants, especially São José de Princesa, which had the smallest population in the state (3,416 residents).

In terms of population growth between 2000-2010, three municipalities showed negative rates: São José de Princesa (-1.62% p.a.), Juru (-0.22%) and Imaculada (-0.20%). The rest of the municipalities showed a positive rate, especially Princesa Isabel and Água Branca, with geometric growth rates of 1.56% and 1.21%, respectively.

Between 2010-2022, the municipalities of the Serra do Teixeira RT grew at a slower rate than in the previous decade, with all the municipalities reaching negative rates, except for Tavares, which experienced a small increase in its population, reaching a geometric growth rate of practically zero (0.00% p.a.). São José de Princesa and Imaculada saw the biggest reductions in inhabitants, with negative growth rates of -1.74% and -0.53%, respectively.

When we analyze the household situation of the population living in the Serra do Teixeira RT, we can see that the population was divided between urban and rural areas in 2010, with an urbanization rate of only 51.05%. This shows that the municipalities in the RT are not very urbanized.

Therefore, in 2010, practically all the municipalities in the Serra do Teixeira RT had low urbanization rates, with São José de Princesa standing out (16.45%), with almost all of its population living in rural areas. In turn, Princesa Isabel was the only municipality in the RT where most of its population lived in urban areas, reaching an urbanization rate of 68.26% in 2010. In the municipality of Manairá, with an urbanization rate of 56.02%, the population was more divided between urban and rural areas.

The following table shows the degree of urbanization and the evolution of the rural and urban population in the years 2000, 2010 and 2022 in the Serra do Teixeira RT. Next, the figure shows the urbanization rate of the municipalities in the RT in 2010.

**Table 48 - Population by Household Status - Serra do Teixeira RT - 2000, 2010 and 2022**

### **RT Vale de Piancó**

In the period from 2000 to 2010, the population of the TR Vale de Piancó showed a negative variation in the number of inhabitants, with a geometric growth rate of -0.04% p.a., indicating a different behavior from that seen in Paraíba for the same period, in which a population increase of 0.90% p.a. was observed.

According to the 2000 IBGE Demographic Census, the Vale de Piancó RT had 147,225 inhabitants, which fell to 772,683 in 2010. The phenomenon of a decrease in the number of inhabitants between 2000 and 2010 extended to almost all of the 18 municipalities in the RT. The biggest drop occurred in Boa Ventura (-1.35% p.a.), followed by Olho d'Água (-1.21% p.a.) and Santana dos Garrotes (-0.81 p.a.%). Among the 18 municipalities that make up the CA, only seven showed a positive variation in the number of inhabitants in the period in question, with Itaporanga standing out, which achieved a growth rate of 0.94%.

In total, 624 people emigrated from the Vale de Piancó RT between 2000 and 2010, an atypical behavior compared to the state of Paraíba and the other rural territories.

In the last decade, between 2010 and 2022, the population of TR Vale de Piancó decreased a little more, at a faster rate than in the previous period, reaching a negative geometric growth rate of -0.28% per year. In 2022, the territory had 141,772 inhabitants, which represents 3.6% of the state's population in the same year, with Itaporanga and Conceição being the municipalities with the largest populations, 23,940 and 18,260 inhabitants respectively. The other municipalities had populations of between 16,441 and 2,292 inhabitants (Piancó and Curral Velho, respectively).

When analyzing the household situation of the population living in the Vale de Piancó RT, of the 18 municipalities in the territory, fourteen showed a predominance of the

population living in the urban stratum in 2010, with Itaporanga and Coremas standing out, with 76.01% and 75.38% of their populations living in urban areas. Only the populations of four municipalities, Santa Inês (40.41%), Santana de Mangueira (41.85%), São José de Caiana (45.41%) and Aguiar (48.84%), lived mostly in rural areas.

The following table shows the degree of urbanization and the evolution of the rural and urban population in the years 2000, 2010 and 2022 in the Vale de Piancó RT. Next, the figure shows the urbanization rate of the municipalities in the RT in 2010.

**Table 49 - Population by Household Status - TR Vale de Piancó - 2000, 2010 and 2022**

### **RT Maringá Valley**

In the period 2000-2010, the population of the Maringá Valley RT had a geometric growth rate of 0.31% p.a., rising from 66,615 inhabitants in 2000 to 68,701 in 2010, according to data from the IBGE Demographic Censuses (2000 and 2010). During the same period, the state's population grew at a rate of 0.90% p.a., which meant a decrease in the proportion of the RT population in the composition of Paraíba's population.

In the last decade, between 2010 and 2022, the population of the Maringá Valley RT decreased slightly, reaching a negative geometric growth rate of -0.03% per year. In 2022, the territory had 68,476 inhabitants, representing 1.7% of the state's population in the same year, with Pombal having the largest population (32,473 inhabitants). Paulista also stood out, with a population of over 10,000. The rest of the municipalities had fewer than 10,000 inhabitants, with São Domingos standing out as having the smallest population in the CA (2,595 residents).

With regard to population growth between 2000-2010, only one municipality showed a negative rate, Lagoa (-0.34%). The rest of the municipalities showed a positive rate, especially São Bentinho and São Domingos, with geometric growth rates of 1.43% and 1.34%, respectively.

Between 2010-2022, the municipalities of the Maringá Valley RT grew at a slower rate than in the previous decade, with four municipalities reaching negative rates, the most significant being Cajazeirinhas (-0.84%). In turn, the municipalities of São Bentinho (0.37%), Vista Serrana (0.30%) and Pombal (0.09%) experienced the highest growth rates over the same period.

When we look at the household situation of the population living in the Maringá Valley RT, we can see that most of them were located in urban areas (65.16%) in 2010, below the state average, which in the same year had an urbanization rate of 75.37%.

However, among the municipalities in the Maringá Valley RT, it can be seen that only three of the eight municipalities had more urban than rural population in 2010: Pombal, Condado and São Bentinho, with urbanization rates of 80.20%, 65.29% and 68.75%, respectively. On the other hand, Cajazeirinhas (32.97%), São Domingos (34.82%), Vista Serrana (45.16%), Paulista (48.52%) and Lagoa (49.22%) had more people living in rural areas in the same year.

The following table shows the degree of urbanization and the evolution of the rural and urban population in the years 2000, 2010 and 2022 in the Maringá Valley RT. Next, the figure shows the urbanization rate of the municipalities in the RT in 2010.

### RT Paraíba Valley

In the period from 2000 to 2010, the Paraíba Valley RT showed a positive variation in the number of inhabitants, with a geometric growth rate of 0.32% p.a., indicating a lower behavior than that seen in Paraíba for the same period, where a population increase of 0.90% p.a. was observed.

In the last decade, between 2010 and 2022, growth was less significant than in the previous decade (0.20% p.a.). In 2022, the territory had 180,552 inhabitants, which represents 4.5% of the state's population in the same year, with Pedras de Fogo being the municipality with the largest population (29,662 inhabitants). Itabaiana and Ingá also stood out, with 23,182 and 17,692 respectively. The rest of the municipalities had fewer than 15,000 inhabitants, especially Riachão do Bacamarte and Caldas Brandão, which had the smallest populations in the state (4,690 and 5,753 residents, respectively).

In terms of population growth between 2000-2010, four municipalities showed negative rates, the highest being Mogeiro (-0.57% p.a.) and the lowest Salgado de São Félix (-0.06% p.a.). The rest of the municipalities showed a positive rate, especially São José dos Ramos, São Miguel de Taipu and Caldas Brandão, with geometric growth rates of 1.18%, 0.96% and 0.90%, respectively.

Between 2010-2022, the municipalities of the Paraíba Valley RT grew at a slower rate than in the previous decade, with six municipalities experiencing negative rates, the most significant being Itabaiana (-0.45%). In turn, the municipalities of Mogeiro (0.89%), Pilar

(0.80%) and Riachão do Bacamarte (0.80%) experienced the highest growth rates over the same period.

When analyzing the household situation of the population living in the Vale do Paraíba RT, of the 15 municipalities in the territory, only five had a predominance of the population living in the rural stratum in 2010: Gurinhém (with 41.77% of the population living in urban areas), São José dos Ramos (43.08%), Salgado de São Félix (43.84%), São Miguel de Taipu (44.46%) and Mogeiro (44.70%). The highest urban proportions were found in Juripiranga, Itabaiana and Juárez Távora, with, respectively, 93.64%, 80.60% and 78.46% of the population living in this stratum. The other municipalities had an urbanization rate of between 50.00% and 70.00%.

The following table shows the degree of urbanization and the evolution of the rural and urban population in the years 2000, 2010 and 2022 in the Vale do Paraíba RT. Next, the figure shows the urbanization rate of the municipalities in the RT in 2010.

## 69 - Urbanization Rate - Paraíba, Vale do Paraíba RT and RT Municipalities - 2010

Source: IBGE - 2010 Demographic Census.

### **RT Piranhas Valley**

In the period from 2000 to 2010, the TR Vale do Piranhas showed a positive variation in the number of inhabitants, with a geometric growth rate of 0.54% p.a., indicating a behavior greater than that seen in Paraíba for the same period, in which a population increase of 0.90% p.a. was observed.

In the last decade, between 2010 and 2022, growth was less significant than in the previous decade (0.08% p.a.). In 2022, the territory had 113,363 inhabitants, representing 2.9% of the state's population in the same year, with Sousa having the largest population (67,259 inhabitants). The rest of the municipalities had populations of less than 10,000 inhabitants, the smallest of which was in São Francisco: 3,137 inhabitants.

In terms of population growth between 2000-2010, two municipalities showed negative rates, Lastro (-0.93%) and São Francisco (-0.49%). The rest of the municipalities showed a positive rate, especially Aparecida, Marizópolis and Vieirópolis, with geometric growth rates of 2.68%, 0.95% and 0.77%, respectively. It should be noted that the municipality of Santa Cruz maintained the same population over this period.

Between 2010-2022, the municipalities in the Paraíba Valley region grew at a slower rate than in the previous decade, with five municipalities experiencing negative rates, the most significant being Santa Cruz (-0.70%). In turn, the municipalities of Lastro (0.90%), Marizópolis (0.69%) and Aparecida (0.30%) experienced the highest growth rates over the same period.

When analyzing the domicile situation of the population living in the Vale do Paraíba RT, of the 9 municipalities in the territory, seven had a predominantly rural population in 2010, with Vieirópolis standing out with only 19.74% of its population living in urban areas. The

highest urban proportions were found in Marizópolis and Sousa, with 86.78% and 78.84%, respectively, of the population living in this stratum.

The following table shows the degree of urbanization and the evolution of the rural and urban population in the years 2000, 2010 and 2022 in the Piranhas Valley RT. Next, the figure shows the urbanization rate of the municipalities in the RT in 2010.

**Table 52 - Population by Household Status - TR Vale do Piranhas - 2000, 2010 and 2022**

TR Piranhas Valley	2000	2010	2022	TGCA 2000-2010	TGCA 2010-2022

## Composition by Sex

Another indicator used to profile the population is the sex ratio, which indicates the number of men for every 100 women. When the indicator is above 100, there is a predominance of men, and below this number, there is a predominance of women.

The following sub-items show the composition by sex and the sex ratio in the project area during a given period, for the state as a whole and by Rural Territory.

According to data obtained from the IBGE Demographic Census, in 2000 the state of Paraíba had a larger female than male population. The difference has increased slightly over the years, with the latest Demographic Census (2022) revealing that 48.28% of the population was male and 51.72% female in the year of the survey, as can be seen in the figure below.

**71 - Relative Distribution of the Population by Sex at State of Paraíba**

### Age composition

With regard to the population's age profile, at the beginning of this century the citizens of the state of Paraíba were largely made up of young people. Of the population, 1,083,610 inhabitants were under the age of 15 and 2,112,026 between the ages of 15 and 64. The population over 65 comprised a total of 248,189 inhabitants in 2000. The dependency ratio<sup>37</sup> was 63.08%, revealing that the availability of labor was proportionally small for the economic and financial sustainability of the population. The mismatch in the

<sup>37</sup> The dependency ratio indicates the ratio between the age segment of the population defined as economically dependent (those under 15 years of age and those aged 65 and over) and the potentially productive age segment (between 15 and 64 years of age). High values indicate that the working-age population must support a large proportion of dependents.

dependency ratio slowed down over two decades, reaching 51.14% in 2010, and falling to 46.71% in 2022 (IBGE, 2022).

The aging rate, another indicator of the population's age composition, represents the ratio of the population aged 65 and over to the total population. High values of this index indicate that the demographic transition<sup>38</sup> is at an advanced stage.

In Paraíba, the aging rate points to the growing participation of the elderly in relation to young people, rising from 7.21% in 2000 to 11.04% in 2022, a phenomenon that reflects the reduction in fertility levels and the increase in the population's life expectancy.

The details of the ageing index and dependency ratio for the state of Paraíba in the years 2000, 2010 and 2022 are shown in the table below.

**Table 69 - Age Structure, Dependency Ratio and Aging Rate in the State of Paraíba (2000, 2010 and 2022)**

State of Paraíba	2000	2010	2022
Less than 15 years old	1.083.610	952.881	826.921
15 to 64 years	2.112.026	2.492.029	2.709.129
65 years or older	248.189	321.618	438.637
Dependency ratio	63,08%	51,14%	46,71%
Ageing rate	7,21%	8,54%	11,04%

Source: IBGE - Demographic Censuses, 2000, 2010 and 2022.

In 2022, TR Mata Norte (51.07%), TR Piemont da Borborema (50.99%) and TR Cariri (50.24%) had the highest dependency ratios among Paraíba's rural territories, while TR Mata Sul (43.49%) and TR Médio Piranhas (44.62%) had the lowest.

In turn, the Cariri RT (13.59%) and the Vale do Maringá RT (13.29%) had the highest ageing rates of Paraíba's rural territories, while the lowest rates were found in the Mata Sul RT (9.69%) and the Mata Norte RT (10.32%).

The details of the ageing rates and dependency ratios of Paraíba's rural territories can be seen in the table below.

**Table 70 - Age Structure, Dependency Ratio and Aging Rate in the Rural Territories of the State of Paraíba (2000, 2010 and 2022)**

Dependency ratio	64,71%	52,48%	47,58%

<sup>38</sup> Demographic transition: A term used by experts to describe the dynamics of population growth, resulting from advances in medicine, urbanization, the development of new technologies, birth rates and other factors. In general terms, the world is experiencing a transition from a regime of high fertility associated with high mortality, to a model of low fertility with decreasing mortality.

Source: IBGE - Demographic Censuses, 2000, 2010 and 2022.

Evaluating the age composition of the population using the age pyramid is used not only to monitor the sex and age structure, but also as a complement to quality of life studies, since it is possible to visualize the average life span, the mortality rate and the regularity or otherwise of the population over time. The higher the pyramid, the higher the life expectancy and, consequently, the better the living conditions of that population. You can see that the more economically and socially developed a municipality is, the closer its pyramid is to a rectangle.

In this sense, it can be seen that the age pyramid of the state of Paraíba in 2022 is very close to a rectangular shape, showing a balance in the age groups and in the proportion between the two sexes, indicating good economic and social development.

The following figures show the age pyramids by sex for the year 2022 for the state of Paraíba and the Rural Territories.

**4.3.3 Social Vulnerability**

Social vulnerability refers to susceptibility to poverty, and is expressed by variables related to the income, education, work and housing of people and families in vulnerable situations. For these four dimensions of indicators mentioned, the results for the state of Paraíba are shown in the table below, using information from the Demographic Census.

**Table 71 - Vulnerability in the State of Paraíba - 2000 and 2010**

Indicators	2000	2010
<b>Children and young people</b>		
% of 4 to 5 year olds in school	38,83	14,46
% of 15-24 year olds not studying or working in households vulnerable to poverty	22,57	18,98
% of children under 14 extremely poor	36,71	21,09
<b>Adults</b>		
% of people aged 18 and over without complete primary education and in informal employment	64,99	50,86
% of mothers who are heads of household, have not completed primary school and have at least one child under the age of 15	15,85	20,79
% of people in households vulnerable to poverty and dependent on the elderly	7,42	4,73
<b>Income and Work</b>		
% of 15-24 year olds not studying or working in households vulnerable to poverty	22,57	18,98
% of people in households vulnerable to poverty who spend more than an hour commuting to work	-	1,47
% of people aged 18 and over without complete primary education and in informal employment	64,99	50,86
<b>Housing Condition</b>		
% of the population living in households with a toilet and running water	60,28	78,91

Source: UNDP - Atlas of Human Development in Brazil, 2022.

In the state of Paraíba, between 2000 and 2010, the percentage of extremely poor children fell from 36.71% to 21.09%. Another indicator that stands out is the percentage of mothers who are heads of household without completed primary school and with children under the age of 15, which increased over the same period, from 11.51% in 2000 to 20.79% in 2010.

In this same period, it is possible to see that there was a reduction in the percentage of people aged 15 to 24 who neither study nor work and are vulnerable to poverty, from 22.57% in 2000 to 18.98% in 2010.

Finally, also in the period observed, there was an increase in the percentage of the population in households with a bathroom and running water in the state of Paraíba, from 60.28% in 2000 to 78.91% in 2010.

Among the state's municipalities, João Pessoa (6.31%), Cabedelo (8.48%), Campina Grande (8.95%) and Patos (9.05%) had the lowest percentage of extremely poor children in 2010, while Casserengue (58.36%), Dona Inês (51.81%), Santana de Mangueira (51.57%) and Natuba (51.31%) had the highest rates in the same year.

In 2010, the municipalities in Paraíba with the lowest percentages of mothers who did not complete primary school and had children under the age of 15 were Várzea (4.66%), Vieirópolis (6.93%), Bom Sucesso (7.54%) and Santana dos Garrotes (7.64%). In turn, the highest rates were found that same year in Cacimbas (77.59%), Santa Cecília (70.77%), Algodão de Jandaíra (62.22%) and São José dos Ramos (56.74%).

The highest percentages of people aged 15 to 24 who neither studied nor worked and were vulnerable to poverty in 2010 were found in Riachão (40.98%), Tacima (39.59%), Santana de Mangueira (39.28%) and Pedra Branca (37.64%). However, João Pessoa (10.66%), Parari (12.41%), Várzea (12.54%) and Princesa Isabel (13.58%) were the municipalities with the lowest percentage of young people neither studying nor working in 2010.

Finally, also in 2010, the municipalities of João Pessoa (1.22%), Guarabira (1.24%), Cabedelo (1.34%) and Bayeux (1.47%) had the lowest percentages of people living in households with precarious water supply and sanitation, while the highest rates were found in Santa Cecília (66.50%), Santo André (66.34%), Tenório (61.56%) and Damião (60.67%).

### **Human Development Index (HDI) and Municipal Human Development Index (MHDI)**

The following description of the HDI-MHDI indicators is based on the Atlas of Human Development in Brazil - UNDP, 2022.

For many years, the authorities have established the practice of assessing the well-being of a population, and consequently classifying countries or regions, by the size of their GDP per capita. However, human progress and the evolution of people's living conditions cannot be measured solely by their economic dimension.

For this reason, the constant search for more comprehensive socio-economic measures, which also include other fundamental dimensions of life and the human condition, is very present in the development of synthesis indicators by these institutions.

The HDI, created in the early 1990s for the UNDP (United Nations Development Program) by special advisor Mahbub ul Haq, is a contribution to this quest, and combines three basic components of human development:

- longevity, which also reflects, among other things, the health conditions of the population; measured by life expectancy at birth;
- education; measured by a combination of the adult literacy rate and the combined enrollment rate at primary, secondary and higher education levels;
- income; measured by the purchasing power of the population, based on GDP per capita adjusted to the local cost of living to make it comparable between countries and regions, through the methodology known as purchasing power parity (PPP).

The methodology for calculating the HDI involves transforming these three dimensions into indices for longevity, education and income, which vary between 0 (worst) and 1 (best), and combining these indices into a summary indicator. The closer the value of this indicator is to 1, the higher the level of human development of the country or region.

So that the indicators can be combined into a single index, they are transformed into partial indices, whose values vary between 0 and 1. The general formula for constructing these indices is:

$$\text{Índice} = \frac{\text{valor máximo} - \text{valor mínimo}}{\text{valor observado} - \text{valor mínimo}}$$

Note that the limit values (worst and best) do not coincide with the worst and best values observed; they are relatively stable parameters defined by the UNDP.

Based on these values and the values observed for the country or region in question, the Longevity, Education and Income indices are calculated.

### **Longevity Index**

The Longevity Index (ILi) of country i, whose life expectancy at birth is Vi, is obtained by directly applying the general formula described above, i.e. for the application of the basic formula, the worst and best values for life expectancy are 25 and 85 years, respectively.

### **Education Index**

To obtain the Education Index (IEi) of country i, whose adult literacy rate is Ai and whose combined enrollment rate is Mi, we first transform the two variables into indices using the general formula above, using 0% and 100% as the limit values: and we combine the two indices, with the weights mentioned above.

### **Income Index**

The construction of the Income Index (IRi) for country i, whose GDP per capita is Yi, is a little more complex, and starts from the hypothesis that the contribution of income to human development has diminishing returns.

This hypothesis is incorporated into the calculation of the HDI by means of the logarithmic function. Therefore, the Income Index (IRi) of country i, whose GDP per capita is Yi, is given by:

The highest value is \$40,000 PPP, and the worst is \$100 PPP. All values are in Purchasing Power Parity dollars, to ensure comparability between countries, and the PPP dollar rate is given by the World Bank.

### **Municipal Human Development Index**

The MHDI is a methodological adaptation of the HDI at the municipal level. Both indices aggregate the health, education and income dimensions, but some of the indicators used to portray these dimensions differ.

As with the global HDI, the Education MHDI is a composite of two indicators: one indicator provides information on the educational situation of the adult population and one on the school-age population (young people). However, the variables are different. In the case of the adult population, the average years of study of people aged 25 and over, as measured in the Global HDI, cannot be obtained from the 2010 Census information and has been replaced by the proportion of the adult population aged 18 and over who have completed elementary school. This indicator provides a good assessment of the level of deprivation of the adult population in relation to what is considered basic schooling (primary level). In the case of the young population, the methodology applied by the Global HDI since 2010 - school life expectancy - is a measure of people's retention in school, regardless of repetition, and includes higher education. The MHDI was adapted for the national and municipal contexts using a combination of 4 indicators that make it possible to verify the extent to which children and young people are attending and completing certain school cycles. The resulting sub-index, the school flow of the

young population, is the arithmetic mean of the percentage of children aged 5 to 6 attending school, the percentage of young people aged 11 to 13 attending the final years of elementary school (6th to 9th grade), the percentage of young people aged 15 to 17 with completed elementary school and the percentage of young people aged 18 to 20 with completed secondary school.

While the Global HDI calculates the income component by Gross National Income per capita, in purchasing power parity (ppp, World Bank 2005), the MHDI Income considers municipal income per capita, i.e. the average monthly income of individuals living in a given municipality, expressed in Reais through municipal income per capita.

Like the Global HDI, the Longevity MHDI is calculated by life expectancy at birth, i.e. the average number of years people would live from birth, given the same mortality patterns observed in the reference year.

When comparing both indices, an important factor to highlight is the data source. To calculate the MHDI, all the data was taken from the IBGE Demographic Censuses, while the Global HDI includes data from the UN Department of Economic and Social Affairs, UNESCO Institute for Statistics, the World Bank and the International Monetary Fund. The option of restricting municipal information to a single source ensures greater comparability between locations in the country.

The Municipal Human Development bands do not follow the Global HDI bands. They have been adapted to better contextualize the Brazilian reality. The Global HDI bands are divided into Low, Medium, High and Very High Human Development, and their values vary each year, as they are calculated from the lowest and highest values observed in the countries. For the MHDI, they have been subdivided into five bands. The "Very Low" range of the MHDI generally coincides with the "Low" range of the Global HDI. And the "High" and "Very High" bands coincide with the same bands of the Global HDI. The "Low" and "Medium" bands differentiate Brazilian localities classified between 0.500 and 0.699, in order to highlight the differences and recognize the efforts of municipalities, UFs, metropolitan regions and UDHs that are closer to "High" Human Development.

- 0 < 0.499 MHDI: Very Low Human Development
- 0.500 < 0.599 MHDI: Low Human Development
- 0.600 < 0.699 MHDI: Medium Human Development
- 0.700 < 0.799 MHDI: High Human Development
- 0.800 < 1 MHDI: Very High Human Development

The figure below shows the stratification of development classes according to the MHDI.

### 103 - HDI scale M

Source: UNDP - Atlas of Human Development in Brazil, 2022.

Between 1991 and 2000, Paraíba's MHDl rose from 0.382 to 0.506, a growth rate of 32.46%. The dimension that evolved the most in the period was Education (with an increase of 0.140), followed by Longevity and Income.

Between 2000 and 2010, the MHDl also increased, from 0.506 to 0.658, according to data from the Demographic Censuses for those years. During this period, the index increased by 30.04%. When considering the dimensions that make up the MHDl, also between 2000 and 2010, it can be seen that the Longevity MHDl showed a change of 16.52%, the Education MHDl showed a change of 67.67% and the Income MHDl showed a change of 12.71%.

In 2020, according to information from the Continuous PNAD, Paraíba's MHDl was 0.714 and in 2021, 0.698, an increase in the index over this period of -2.24%, which currently places the state in the Medium Human Development range. For the dimensions that make up the MHDl, also between 2020 and 2021, we can see that the Longevity MHDl showed a change of -4.53%, the Education MHDl showed a change of -0.59% and the Income MHDl showed a change of -1.66%.

It should be noted that in 2019 and 2020, the MHDl of the state of Paraíba was 0.713 and 0.714, respectively, so in those years it was in the High Human Development range.

The following table shows the evolution of human development indices in the state of Paraíba.

**Table 72 - MHDl State of Paraíba - 1991, 2000, 2010, 2019, 2020 and 2021**

Indicators	1991	2000	2010	2019	2020	2021
<b>MHDl</b>	0,382	0,506	0,658	0,713	0,714	0,698
<b>Education MHDl</b>	0,191	0,331	0,555	0,660	0,673	0,669
<b>HDI Longevity</b>	0,565	0,672	0,783	0,816	0,816	0,779
<b>MHDl Income</b>	0,515	0,582	0,656	0,672	0,664	0,653

Source: UNDP - Atlas of Human Development in Brazil, 2022.

The figure below shows the percentage of municipalities in the state of Paraíba distributed in each of the five human development bands in 2000 and 2010. The Very Low Human Development band did not concentrate any of the state's municipalities in 2010, whereas in 2000 almost all municipalities were in this band (95.5%). In 2010, the Low Human Development band concentrated the largest number of municipalities (68.2%), while in 2000 the percentage was 3.6%. In the Medium Human Development band there were only 2 municipalities (0.9%) in 2000, rising to 66 (29.6%) in 2010. In 2010, 5 municipalities (2.2%) were in the High Human Development bracket and none in the Very High Human Development bracket. It should be noted that in 2000, no municipality was in the two highest human development bands.

*In 2021, Paraíba ranked 5th out of the 9 states in the Northeast region of the country, with Ceará in first place (0.734) and Maranhão in last place (0.676). In the national ranking, it is number 21 among the 27 Brazilian states, with the Federal District (0.814) in first place and Maranhão (0.676) in last place. It should be noted that, in 2010, it ranked 6th in the Northeast and 23rd among the country's states.*

**Figure104 - Distribution of Municipalities by MHD Band in the State of Paraíba - 2000 and 2010**

Source: UNDP - Atlas of Human Development in Brazil, 2022.

Among the state's municipalities, according to UNDP data, João Pessoa (0.763), Cabedelo (0.748), Campina Grande (0.720), Várzea (0.707) and Patos (0.701) had the highest MHD in 2010, all of them in the High Human Development bracket. On the other hand, Gado Bravo (0.513), Casserengue (0.514), Damião (0.521) and Cacimbas (0.523) had the lowest values in the same year.

In the Income dimension, the highest indices were found in Cabedelo (0.782), João Pessoa (0.770), Campina Grande (0.702) and Cajazeiras (0.668), and the lowest in Santana de Mangueira (0.488), Gado Bravo (0.491), Casserengue (0.492) and Cacimbas (0.501).

In the Education dimension, Várzea (0.714), João Pessoa (0.693), Campina Grande (0.654) and Cabedelo (0.651) had the highest values in 2010, while the worst MHDs were found in Gado Bravo (0.373), Casserengue (0.379), Lastro (0.380) and São José da Lagoa Tapada (0.389).

Finally, in the Longevity dimension, the highest MHDIs were found in João Pessoa (0.832), Cabedelo (0.822), Patos (0.821) and Santa Teresinha (0.820). Cacimbas (0.672), Mataraca (0.675), Juripiranga (0.677) and Areia de Baraúnas (0.680) had the lowest indices.

The following tables show the total MHDI by dimension and the positions they occupy in the national and state rankings of the municipalities in the state of Paraíba by Rural Territory.

Source: UNDP - Atlas of Human Development in Brazil, 2022.

The Atlas of Human Development in Brazil presents a range of disaggregated information for these social groups, with the aim of giving visibility to statistical information that highlights inequalities and, with this, supporting the development of public policies aimed at promoting racial and gender equality and the social conditions of people living in urban and rural areas. The disaggregated MHDl is the MHDl calculated for portions of the population according to color (black and white), gender (women and men) and household situation (rural and urban).

The figure below shows the MHDl data for the state of Paraíba broken down by sex and color for the years 2010, calculated with information from the Census, and 2021, for which information from the Continuous PNAD was used. In 2010, the MHDl for women was 0.690 and for men 0.618, which placed both portions of the population in the Medium Human Development range. In 2021, the MHDl for the female population was 0.726, placing it in the High Human Development bracket. The MHDl of the male population in the same year was 0.670, placing this group in the Medium Human Development range.

If we analyze by color, according to the Demographic Census, in 2010 the MHDl of the black population in the state of Paraíba was 0.629, which placed it in the Medium Human Development range. The white population's MHDl in the same year was 0.701, corresponding to the High Human Development range. In absolute numbers, the difference between the two was 0.072. In 2021, the MHDl of the black population was 0.671 and that of the white population was 0.738, placing them in the Medium and High Human Development brackets, respectively.

With regard to household situation, according to the 2010 Demographic Census, the MHDl of the population living in the urban area of the state of Paraíba was 0.690 in 2010, which placed it in the Medium Human Development range. The MHDl of the population living in rural areas in the same year was 0.541, corresponding to the Low Human Development range. In absolute numbers, the difference between the two was 0.149.

**105 - MHDl values disaggregated by color, sex and household situation in the state of Paraíba - 2010 and 2021**

Source: UNDP - Atlas of Human Development in Brazil, 2022.

In its studies on human development, the UNDP looks at two other indicators of health and well-being: life expectancy at birth and infant mortality.

Life expectancy at birth is the indicator that makes up the Longevity dimension of the MHDH and refers to Sustainable Development Goal 3 - Health and Well-being. Life expectancy at birth for the population of the state of Paraíba, according to data from the Demographic Census, changed by 6.66 years between 2000 and 2010, from 65.34 years in 2000 to 72.00 years in 2010. Analyzing the information by household situation, life expectancy at birth for the population living in the urban area of the state of Paraíba was 72.78 years, while in the rural area it was 69.95 years, both for 2010. In 2021, according to the PNAD Continuous data, life expectancy at birth decreased compared to 2010, to 71.72 years.

In turn, infant mortality is expressed in the Infant Mortality Coefficient, represented by the number of infant deaths (children up to 1 year of age) per thousand live births. With this indicator it is possible, among other things, to obtain clues about the quality of life, sanitation and health of the inhabitants of a certain region. The WHO establishes that acceptable levels of this index should be between 6 and 7. In the state of Paraíba, infant mortality fell from 43.30 per thousand live births in 2000 to 21.67 per thousand live births in 2010, according to data from the Demographic Census. Analyzing by household situation, in 2010, infant mortality in urban areas was 19.82 and in rural areas 26.97. In 2021, according to data from the Continuous PNAD, infant mortality in the state of Paraíba fell even further, reaching 17.68 per thousand live births. In 2017, this figure was 15.46 per thousand live births. With the rate observed in 2021, the state of Paraíba still does not meet target 3.2 of the United Nations Sustainable Development Goals - SDGs, according to which infant mortality in the country should be below 12 deaths per thousand live births by 2030.

The following table shows life expectancy and total infant mortality rates in the state of Paraíba for the years 2000, 2010 and 2021, disaggregated by sex and color for the year 2021 and by household situation for the year 2010.

**Table 88 - Longevity and Mortality by Sex, Color and Household Status in the State of Paraíba - 2000, 2010 and 2021**

### Income, Poverty and Inequality

Between 2000 and 2010, monthly per capita income rose significantly in the state of Paraíba, from R\$ 299.09 to R\$ 474.94. During this period, this figure grew at an average annual rate of 58.80%.

Between 2020 and 2021, according to data from the Continuous PNAD, monthly per capita income fell in the state of Paraíba, from R\$497.15 to R\$465.74 (at August 2010 prices), which is equivalent to a variation of -6.32% in the period, in real terms.

In 2010, among the state's municipalities, the ones with the highest per capita income were Cabedelo (R\$ 1.036.21), João Pessoa (R\$ 964.82), Campina Grande (R\$ 630.03) and Cajazeiras (R\$ 511.56), while the lowest per capita incomes were in Santana de Mangueira (R\$ 166.28), Gado Bravo (R\$ 170.29), Casserengue (R\$ 171.37) and Cacimbas (R\$ 181.17).

The proportion of extremely poor people, i.e. with a per capita income of less than R\$70.00 (at current August 2010 prices), fell considerably in the state of Paraíba between 2010 and 2020, from 13.39% to 6.66%, but in 2021 experienced a significant increase, possibly caused by the effects of COVID-19, reaching a rate of 12.95%. The proportion of poor people (with a per capita household income of less than R\$140.00, at August 2010 prices) was 28.93% in 2010 and 15.92% in 2020, rising to 24.91% in 2021. Finally, the proportion of people vulnerable to poverty (with a per capita income of less than R\$255.00, at August 2010 prices) followed the same trend, decreasing between 2010 and 2020 and increasing between the latter year and 2021, with respective rates of 53.65%, 40.60% and 46.62%.

In 2021, the proportions of extremely poor, poor and vulnerable to poverty in the female population of the state of Paraíba were 13.72%, 25.47% and 47.09%, respectively. In the male population, the same proportions were 12.16%, 24.31% and 46.12%.

Considering the breakdown of the population of the state of Paraíba by color, in that same year, 13.45% of blacks were extremely poor, 26.48% were poor and 49.26% were vulnerable to poverty. In the white population, these proportions were 11.93%, 21.82% and 41.50%, respectively.

In 2010, the highest proportions of extremely poor people were found in the municipalities of Casserengue (43.17%), Santana de Mangueira (38.59%), Gado Bravo (37.60%) and Cacimbas (36.97%), while João Pessoa (3.48%), Campina Grande (5.02%), Cabedelo (5.27%) and Patos (5.38%) had the lowest rates in the same year.

With regard to poor people, the municipalities with the highest rates (2010) were Casserengue (60.98%), Gado Bravo (58.49%), Santana de Mangueira (58.22%) and Damião (55.88%). In turn, João Pessoa, Cabedelo, Campina Grande and Patos were the municipalities in the sample with the lowest proportions, 11.59%, 15.61%, 16.34% and 18.86%, respectively.

As for the proportion of people vulnerable to poverty, in the same year 2010, Santana de Mangueira (80.61%), Gado Bravo (79.49%), Casserengue (78.02%) and Capim (77.37%) had the highest rates, while the lowest rates were found in João Pessoa (30.30%), Cabedelo (39.32%), Campina Grande (40.74%) and Várzea (42.47%).

Between 2000 and 2010, social inequality decreased in the state of Paraíba, i.e. the increase in the population's average income in this period was accompanied by a more equal distribution of gross income, which can be verified through the Gini index - a classic indicator measured by the UNDP which looks at the levels of income distribution in the region. During this period, the indicator went from 0.63 in 2000 to 0.61 in 2010. According to the methodology used to measure the Gini index, the closer it is to zero, the more even the distribution of income in the region, while the closer it is to 1, the greater the

concentration of earnings among a smaller number of people. More recently, according to data from the Continuous PNAD, it stood at 0.51 in 2020 and 0.56 in 2021.

In 2010, the municipalities in the state of Paraíba with the greatest social inequality, expressed through the Gini Index, were Cabedelo, Aguiar, João Pessoa and Bananeiras, with indices of 0.70, 0.65, 0.62 and 0.59, respectively, while Várzea (0.40), Logradouro (0.42) and Boa Vista (0.42) showed greater balance in income distribution among the state's municipalities.

The following table shows the information on income, poverty and inequality by sex, color and household situation in the state of Paraíba for the years 2000, 2010 and 2021. The figure below shows the evolution of the proportions of people who are extremely poor, poor and vulnerable to poverty in the state of Paraíba in the period 2016-2021.

**Table 89 - Income, poverty and inequality by sex, color and household situation in the State of Paraíba - 2000, 2010 and 2021**

Indicators	2000	2010			2021				
	Total	Total	Rural	Urban	Total	Women	Men	Blacks	White

#### 4.3.4 Economic aspects

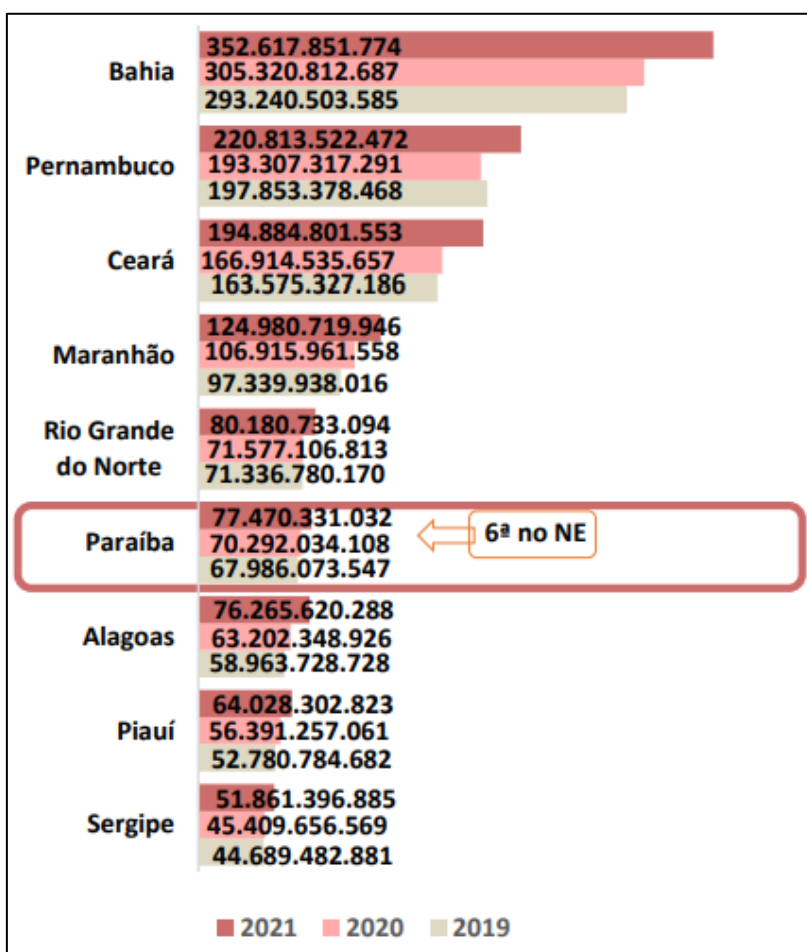

The studies on the economy presented below show the size and dynamics of the production of the municipalities in the state of Paraíba, looking at the data over a period of time. The production data comes from the State Secretariat for Planning, Budget and Management which, in partnership with IBGE, is responsible for producing and publishing the annual GDP for the state of Paraíba and its municipalities.

The productivity and production power of the municipalities in terms of available labor and economic potential are also discussed.

#### Size, Dynamics and Economic Sectors

In 2021, the state of Paraíba recorded a 10.2% growth in its Gross Domestic Product (GDP), reaching R\$77.470 billion. With this, the state remained the sixth largest economy in the Northeast region, after a nominal increase of R\$7.178 billion compared to the previous year, as can be seen in the figure below (PARAÍBA, 2023a).

### 108 - Gross Domestic Product (GDP) of the Northeastern States (in R\$ 1.00)

Source: IBGE/SEPLAG-PB.

The real growth rate, without the effect of inflation, was positive, showing an economic recovery in 2021. Thus, Paraíba's GDP registered a rate of 5.9% in that year, representing an increase of 9.9 percentage points compared to 2020. It is worth noting that this rate was higher than that of the Northeast region (4.3%) and Brazil (4.8%) (PARAÍBA, 2023a).

### 109 - National Overview - Real GDP Growth (%)

Source: IBGE/SEPLAG-PB.

In terms of the GDP growth rate, Paraíba stood out as the fourth best performing state in the Northeast in 2020 and 2021. On the national stage, its position rose from 18th place in 2020 to 10th in 2021, compared to the other Brazilian states (PARAÍBA, 2023a).

### 110 - Real GDP Growth in the Northeastern States (%)

Source: IBGE/SEPLAG-PB.

During the period from 2010 to 2021, Paraíba recorded an accumulated real growth of 16.7%, representing an increase of 6.5 percentage points compared to the previous period from 2010 to 2020. It is important to note that this rate exceeded the average for the Northeast region (9.7%) and Brazil (8.3%) (PARAÍBA, 2023a).

### 111 - National Overview - Accumulated GDP Growth (%)

Source: IBGE/SEPLAG-PB.

Considering the *ranking of the* accumulated GDP growth rate among the Northeastern states, Paraíba ranked 4th in the 2010-2021 period. In the national *ranking*, its position rose from 14th in 2020 to 12th in 2021, compared to the other states in Brazil (PARAÍBA, 2023a).

### 112 - Accumulated Real GDP Growth of the Northeastern States (%)

Source: IBGE/SEPLAG-PB.

In 2021, Paraíba's GDP *per capita* reached R\$ 19,082 per inhabitant, registering a nominal increase of 9.7%, compared to 2.9% in 2020, representing an increase of 6.8 percentage points in the period (PARAÍBA, 2023a).

Considering the GDP *per capita* ranking among the Northeastern states, Paraíba was in 7th place in 2020, dropping to 8th in 2021. On the national scene, it was also in the penultimate position (26th) in 2021, compared to the other states in Brazil.

### 113 - GDP per Capita of the Northeastern States (in R\$ 1.00)

Source: IBGE/SEPLAG-PB.

Paraíba's Gross Domestic Product (GDP), from the point of view of production, is made up of Gross Value Added (GVA), the value coming from the production process and taxes net of subsidies on the production of goods and services, when they are produced or imported, sold or distributed by the state (PARAÍBA, 2023a).

In 2021, GVA reached R\$67,766,358,252, equivalent to 87.5% of GDP. On the other hand, Taxes totaled R\$9,703,972,780, representing 12.5% of the total and registering an increase of 1.4 percentage points in its share of GDP (PARAÍBA, 2023a).

#### 114 - Composition of Paraíba State GDP from the Production Perspective

Ótica produção	2020		2021	
	R\$ 1,00	%	R\$ 1,00	%
<b>PIB Total</b>	<b>70.292.034.108</b>	<b>100</b>	<b>77.470.331.032</b>	<b>100</b>
<b>Valor Adicionado Bruto</b>	<b>62.468.031.910</b>	<b>88,9</b>	<b>67.766.358.252</b>	<b>87,5</b>
Agropecuária	2.823.160.240	4,5	3.190.465.869	4,7
Indústria	10.000.792.871	16,0	10.071.557.156	14,9
Serviços	49.644.078.799	79,5	54.504.335.227	80,4
<b>Impostos</b>	<b>7.824.002.199</b>	<b>11,1</b>	<b>9.703.972.780</b>	<b>12,5</b>

Source: IBGE/SEPLAG-PB.

Gross Value Added (GVA) and Taxes had real growth of 6.0% and 5.1%, respectively, compared to the previous year (2020), when these rates were negative, favoring a real increase in GDP in 2021. With these results, the accumulated GVA and Taxes registered 15.3% and 27.2%, respectively, in the 2010-2021 period (PARAÍBA, 2023a).

#### 115 - Real and Accumulated Growth (base 2010=100) of GVA and Taxes (%)

Source: IBGE/SEPLAG-PB.

With regard to the composition of the economic sectors in the state's GVA in 2021, Services accounted for 80.4%, traditionally remaining the sector with the greatest weight in the Paraíba economy. Industry took second place, with a 14.9% share, followed by Agriculture, which contributed 4.7% to the state's economy (PARAÍBA, 2023a).

### 116 116 - Composition of GVA by Economic Sector (%)

Source: IBGE/SEPLAG-PB.

It is important to note that, in 2021, the Services and Agriculture sectors saw an increase of 0.9 and 0.2 percentage points, respectively, in their share of the state's GVA, while the Industry sector experienced a reduction of 1.1 p.p. in its share of contribution, compared to the previous year (PARAÍBA, 2023).

In terms of real growth, the Industry sector grew the most (9.6%), followed by the Services sector (5.6%) in 2021. Agriculture was the only sector that didn't grow in volume in Paraíba, with a real change of -0.5% (PARAÍBA, 2023a).

### 117 - Real Sector Growth (%)

Source: IBGE/SEPLAG-PB.

In the 2010-2021 period, Agriculture continued to have the highest accumulated variation (19.4%) among the three sectors, despite the drop in the rate compared to the previous period. Next, Industry and Services accumulated 17.2% and 13.9% growth, with an expansion of 10.3 p.p. and 6.1 p.p., respectively, compared to the previous period (2010-2020) (PARAÍBA, 2023a).

### 118 - Accumulated Real Growth of Sectors (%) (Base 2010=100)

Source: IBGE/SEPLAG-PB.

If we analyse by Rural Territory, we can see that, in 2021, the highest GDPs were recorded in the Mata Sul RT and the Borborema RT, with R\$36.4 billion and R\$16.0 billion, respectively, while the Serra do Teixeira RT (R\$819 million) and the Vale do Maringá RT (R\$936 million) had the lowest values in the same year.

It is worth noting that 61% of the Gross Domestic Product of the Mata Sul RT is represented by João Pessoa, which with R\$22.2 billion is also the municipality with the highest GDP in the state, followed by Campina Grande, Alhandra and Cabedelo, with R\$10.3, R\$3.3 and R\$3.1 billion, respectively. In 2021, the municipalities of Parari, Coxixola and Areia de Baraúnas had the lowest GDPs in Paraíba, with R\$21.4, R\$24.0 and R\$26.0 million, respectively.

However, the Mata Sul RT and the Brejo RT recorded the highest GDP *per capita* among the state's rural territories in 2021, with R\$27,297.95 and R\$19,622.89, respectively, while the Serra do Teixeira RT (R\$10,500.60) and the Curimataú RT (R\$10,918.18) had the lowest figures in the same year.

It's important to note that many the state's municipalities are heavily dependent on public administration in the local economy, reflected in the high share of public administration in their respective GDPs, reaching more than half in 2021 in the Curimataú RT (54.72%) and Serra do Teixeira RT (54.33%). The lowest percentages were recorded in that same year in the Mata Sul RT and the Brejo RT, with 19.44% and 28.38%, respectively.

The following tables show the Total GDP, the sectoral GDP and the percentage share of each of the rural territories in the state of Paraíba in 2021.

### Job market

Jobs in the state of Paraíba are basically concentrated in the tertiary sector (services), which generates 581,751 jobs in the municipalities (2022), equivalent to 80.01% of jobs. It's important to note that 43.24% of jobs in this sector are concentrated in public administration, with 35.98% of the workforce in services and 20.78% in commerce.

The secondary and primary sectors only employ a small proportion of Paraíba's residents, accounting for 17.67% and 2.32%, respectively, of the total opportunities generated.

In total, there are 727,103 formal jobs in 55,532 establishments.

The following tables present data from the Ministry of Labor and Employment, with information on formal employment and the number of establishments in the state of Paraíba for the year 2022, highlighting this situation.

**Table 105 - Jobs by Sector in the State of Paraíba (2022)**

Mineral extraction	Manufacturing industry	Public utility industrial services	Construction	Trade	Services	Public Administration	Agriculture, plant extraction, hunting and fishing	Total
1.434	80.248	7.433	40.781	120.876	209.301	251.574	15.456	727.103

As for the stock of formal jobs in 2023, Paraíba closed the year with a stock of 487,305 formal jobs (positions with a formal contract) and a balance of 19,139, according to data from the Ministry of Economy's Special Secretariat for Social Security and Labor, based on the New General Register of Employed and Unemployed (New Caged). In the twelve months of last year, the state created 199,338 jobs against 180,199 redundancies, an increase of 8.21% in the stock of formal jobs compared to the previous year, which totaled 450,314 (Stock of 2022).

It is worth noting that Paraíba's stock of formal jobs represents 6.40% of the northeast region's stock, which is 7,616,434, with growth in 2023 compared to 2022 of 8.67%.

The following figures show the above data.

Source: <http://pdet.mte.gov.br/novo-caged>.

The unemployment rate in Paraíba in the last quarter of 2023 was 9.6%, higher than the national average (7.4%), but slightly lower than the average for the Northeast Region (10.4%), which is the highest among the country's regions, according to the National Continuous Household Sample Survey (PNADC) Quarterly.

Also noteworthy is the informality rate for Paraíba, which stood at 50.8% of the employed population in 2023, practically the same proportion as the previous year (50.9%). Nationally and in the Northeast, the informality rate increased in the 2021-2022 period, from 38.8% and 51.4% to 39.1% and 51.7%, respectively.

### **RT Alto Sertão**

Jobs in TR Alto Sertão are basically concentrated in the tertiary sector, which generates 15,074 jobs in the municipalities (2022), equivalent to 84.16% of jobs. It is important to note that of this sector, 50.67% of jobs are concentrated in public administration, while 27.55% of the workforce is allocated to commerce and 21.78% to services.

The secondary and primary sectors only employ a small proportion of TR residents, accounting for 15.35% and 0.49% respectively of the total opportunities generated.

In total, there are 17,911 formal jobs in 1,892 establishments.

The following tables present data from the Ministry of Labor and Employment, with information on formal employment and the number of establishments in the Alto Sertão RT for the year 2022, highlighting this situation.

**Table 107 - Jobs by Sector in TR Alto Sertão (2022)**

In 2010, according to data from the IBGE Demographic Census, the highest unemployment rates among the TR Alto Sertão municipalities were in Santa Helena and Bom Jesus, with 13.68% and 12.85% respectively, while Carrapateira (1.91%) and Joca Claudino (2.27%) had the lowest percentages in the same year.

### **RT Borborema**

Jobs in RT Borborema are basically concentrated in the tertiary sector, which generates 125,538 jobs in the municipalities (2022), equivalent to 79.88% of jobs. It's important to note that 46.44% of jobs in this sector are concentrated in services, with 31.06% of the workforce in public administration and 22.50% in commerce.

The secondary sector, the second largest contributor to hiring labor, has a share of 18.91%, while the primary sector only accounts for 1.20% of jobs in the TR.

In total, there are 157,157 formal jobs in 12,195 establishments.

The following tables present data from the Ministry of Labor and Employment, with information on formal employment and the number of establishments in TR Borborema for the year 2022, highlighting this situation.

**Table 109 - Jobs by Sector in TR Borborema (2022)**

In 2010, according to data from the IBGE Demographic Census, the highest unemployment rates among the municipalities of the TR Vale do Piranhas were in Lastro and Sousa, with 20.74% and 9.65%, respectively, while Santa Cruz (3.95%) and São Francisco (4.75%) had the lowest percentages in the same year.

### Agricultural Activities

According to 2017 data from the IBGE's Agricultural Census, in the year of the survey there were 163,218 agricultural establishments in the state of Paraíba, of which 125,489 were family farms, representing 77% of the total.

Data from the 2017 Agricultural Census shows that family farming in Brazil covers an area of 80.9 million hectares, equivalent to 23% of all agricultural establishments in the country. The survey of more than 5 million rural properties showed that 77% of agricultural establishments are classified as family farms. In addition, family farming employed more than 10 million people in September 2017, accounting for 67% of all jobs in agriculture and accounting for 40% of the income of the economically active population (EMBRAPA, 2024).

The sector stands out as a food producer, especially for its production of corn, cassava, dairy cattle, beef cattle, sheep, goats, vegetables, beans, sugar cane, rice, pigs, poultry, coffee, wheat, castor beans, fruit and vegetable crops. In permanent crops, the segment accounts for 48% of the value of coffee and banana production; in temporary crops, 80% of the value of cassava production, 69% of pineapple and 42% of bean production, among others. The Agricultural Census highlights that family farming is the economic base of 90% of Brazilian municipalities with up to 20,000 inhabitants (EMBRAPA, 2024).

The National Policy on Family Farming and Rural Family Enterprises (Law No. 11.326, of July 24, 2006), known as the Family Farming Law, defines family farmers and rural family entrepreneurs as those who carry out activities in rural areas while meeting the following requirements: i) they do not own, in any capacity, an area larger than 4 fiscal modules; ii) they predominantly use their own family's labor force in the economic activities of their establishment or enterprise; iii) their family income predominantly comes from economic activities linked to their own establishment or enterprise; iv) they run their establishment or enterprise with their family. Small rural producers, traditional peoples and communities, agrarian reform settlers, foresters, aquaculturists, extractivists and fishermen are considered family farmers (EMBRAPA, 2024).

Most of the agricultural establishments in Paraíba's Rural Territories are family farms, according to data from the 2017 Agricultural Census, with the Serra do Teixeira and Piemont da Borborema RTs standing out with 85% and 83% family farmers respectively, and the Alto Sertão and Vale do Piranhas RTs with 82% each. The Borborema RT (72%) has the lowest percentage of agricultural establishments dedicated to family farming, as can be seen in the table below.

**Table 137 - Agricultural Establishments in Paraíba by Rural Territory**

Source: Agricultural Census/IBGE, 2017. Prepared by: DIEESE.

Of the 125,489 family farming establishments in Paraíba, 90,000 were dedicated to animal production in 2017, which represents 72%, and 104,849 (84%) to plant production, according to data from the Agricultural Census.

Among Paraíba's Rural Territories, the Médio Piranhas and Vale do Maringá RTs had the highest percentage of establishments dedicated to animal production in 2017, 93%

and 91%, respectively, while the lowest percentages were found in the Mata Sul and Mata Norte RTs, with 39% and 42%, respectively.

With regard to establishments dedicated to plant production, the Mata Sul and Vale do Paraíba RTs had the highest percentage in 2017, 94% each. On the other hand, the Cariri and Vale do Maringá TRs had the lowest percentages, with 46% and 58% respectively, as can be seen in the table below.

**Table 138 - Establishments dedicated to Family Farming by type of production in Paraíba by Rural Territory**

Territories	Establishments dedicated to the production of animal origin	Establishments dedicated to the production of plant origin	Total establishments dedicated to family farming	% animal production	% crop production

As for the value of agricultural production, according to data from the Agricultural Census, the state of Paraíba reached a total of R\$ 2,250,673.00 thousand in 2017, of which less than half R\$ 1,075,959.00 thousand (48%) came from family farming.

In Paraíba's Rural Territories, the ones with the highest percentage of the value of family farming production are the Alto Sertão and Vale de Piancó RTs, with 76% and 74%, respectively, while the Mata Norte and Mata Sul RTs reach only 23% each.

The following table shows the value of agricultural production in Paraíba by Rural Territory and the percentage of this produced by family farming.

**Table 139 - Value of Agricultural Production in Paraíba by Rural Territory**

Territories	Value of family farming production (in thousand reais)	Value of non-family farming production (in thousand reais)	Total value of agricultural production (in thousand reais)	% of family farming
Alto Sertão	69.696,00	22.318,00	92.014,00	76%
Borborema	288.470,00	188.037,00	476.507,00	61%
Brejo	55.223,00	56.917,00	112.140,00	49%
Cariri	60.200,00	32.788,00	92.988,00	65%
Curimataú	41.689,00	20.568,00	62.257,00	67%
North Mata	66.842,00	222.717,00	289.559,00	23%
Mata Sul	95.635,00	327.532,00	423.167,00	23%
Middle Piranhas	38.214,00	27.392,00	65.606,00	58%
Middle Hinterland	58.519,00	30.473,00	88.992,00	66%
Piemont da Borborema	67.044,00	29.761,00	96.805,00	69%
Serra do Teixeira	30.914,00	29.155,00	60.069,00	51%
Piancó Valley	75.180,00	26.764,00	101.944,00	74%

<b>State of Paraíba</b>	<b>1.075.959,00</b>	<b>1.174.714,00</b>	<b>2.250.673,00</b>	<b>48%</b>

Source: Agricultural Census/IBGE, 2017. Prepared by: DIEESE.

In Paraíba, according to data from the 2017 Agricultural Census, we find a significant concentration of family farming establishments with an area of between 5 and 10 hectares, representing 16.6% of the total. In addition, 16.2% have between 1 and 2 hectares. There is also a significant percentage (13.1%) of establishments with an area of between 10 and 20 hectares.

Another fact that stands out is the presence of a percentage of family farming establishments, albeit small, in larger area groups. A possible explanation for this, according to researcher Antônio Carlos Simões Florido, is related to the presence of establishments whose main economic activity is plant extraction, the extraction process of which is not mechanized. It is therefore plausible that there are family farmers in groups with larger areas, since there is no size limit for these types of establishments (AKSAAM, 2021).

### 121 121 - Percentage of family farming establishments in Paraíba by area group

Source: AKSAAM, 2021.

According to the 2017 Agricultural Census, the majority of managers of establishments classified as family farms are male. In all of Paraíba's mesoregions, this disparity remains (AKSAAM, 2021).

### 122 - Gender of the Responsible Manager

Source: AKSAAM, 2021.

Establishments run by women are concentrated in the Agreste Paraibano and Sertão Paraibano mesoregions, accounting for 68.63%. If we compare the 2006 and 2017 agricultural censuses, we can see that women are increasingly present in the management of establishments, with a decrease in the last census of 8.5% of establishments run by men and an increase of 20.3% of establishments run by women (AKSAAM, 2021).

**123 - Percentage of family farming establishments run by women in each mesoregion in relation to the total number of establishments run by women in Paraíba**

Source: AKSAAM, 2021.

According to the 2017 census, slightly more than half of the agricultural establishments owned by family farmers in the state of Paraíba were run by brown farmers, 56.4%, followed by white farmers (34.7%), black farmers (7.7%), indigenous farmers (0.7%) and yellow farmers (0.5%).

**124 124 - Percentage of agricultural establishments owned by family farmers in the state of Paraíba run by the responsible producer according to their color or race**

Source: AKSAAM, 2021.

Data from the 2017 Agricultural Census shows that 59.9% of family farming establishments in Paraíba are run by people aged between 35 and 65, 30.3% by people over 65 and only 9.8% by people under 35 (AKSAAM, 2021).

### 125 125 - Age classes of responsible producers in family farming establishments

Source: AKSAAM, 2021.

A comparative analysis between the 2017 and 2006 censuses shows a significant increase in the number of family farming establishments run by people over 45, while there has been a considerable reduction in those run by people under 35. This trend contrasts with the reality observed in other regions of Brazil, where the presence of young people in the countryside has been decreasing, contributing to the ageing of the rural population (AKSAAM, 2021).

It is therefore clear that family farming faces major challenges in terms of its sustainability and strengthening. It is essential to expand the policies already in place to encourage family succession planning and young people to stay in the countryside. In addition, it is essential to support older farmers, guaranteeing them the right conditions to maintain farming activities on the farm and have a good quality of life (AKSAAM, 2021).

### 126 126 - Variation in the proportion of family farming establishments in each age group between the 2006 and 2017 censuses

Menos de 25 anos	↓ 49,7%	De 45 a 54 anos	↑ 6,5%
De 25 a 34 anos	↓ 38,2%	De 55 a 64 anos	↑ 8,2%
De 35 a 44 anos	↓ 19,4%	Mais de 65 anos	↑ 32,7%

Source: AKSAAM, 2021.

In Paraíba, according to data from the Agricultural Census (IBGE, 2017), 38.7% of family farming establishments have not adopted any type of soil conservation practice (AKSAAM, 2021).

### 127 127 - Adoption of soil conservation agricultural practices by family farmers in Paraíba (2017)

Source: AKSAAM, 2021.

Note: Burning is only considered an agricultural practice and does not qualify as conservation.

Only 33.2% of family farming establishments in the state of Paraíba had applied pesticides. Approximately 89.5% of these establishments were in groups of farming areas of up to 20 hectares. Another fact is that, considering the family farming establishments in Paraíba where pesticides have been applied, in 47.4% of them, the managers responsible for the farming activities cannot read or write. Of the 41,609 family farming establishments in Paraíba where pesticides were applied, 19.6% received technical guidance and 80.4% did not (AKSAAM, 2021).

### Agricultural production

According to 2022 data from the IBGE's Municipal Agricultural Production (PAM), the main temporary crops in the state of Paraíba are sugar cane, with a production that year of 5,762,668 tons, accounting for a total of R\$976,479 thousand. This is followed by pineapple and manioc, with production of 275,095 and 139,239 tons and a production value of R\$ 361,084 thousand and R\$ 113,595 thousand, respectively. It should be noted

that beans (in grain), with a production of 26,749 tons, had a higher value in 2022 than cassava, reaching R\$115,204 thousand.

In terms of permanent crops, the most produced products in 2022 in Paraíba were bananas (142,325 t), coconuts (53,613 t) and papaya (26,429 t), accounting for a production value of R\$ 228,514 thousand, R\$ 50,500 thousand and R\$ 47,080 thousand, respectively.

The following tables show the main products of temporary and permanent crops, in terms of quantity produced and production value in the state of Paraíba in 2022.

**Table 140 - Quantity Produced and Production Value of the First Temporary Crop Products in the State of Paraíba (2022)**

Temporary crops	Quantity produced (Tons)	Production Value (Thousand Reais)
Pineapple	275.095	361.084
Sweet potatoes	42.001	71.843
Sugarcane	5.762.668	976.479
Beans	26.749	115.204
Cassava	139.239	113.595
Corn (grain)	69.495	96.695
Tomato	18.897	39.193

Source: IBGE - Municipal Agricultural Production (PAM), 2022.

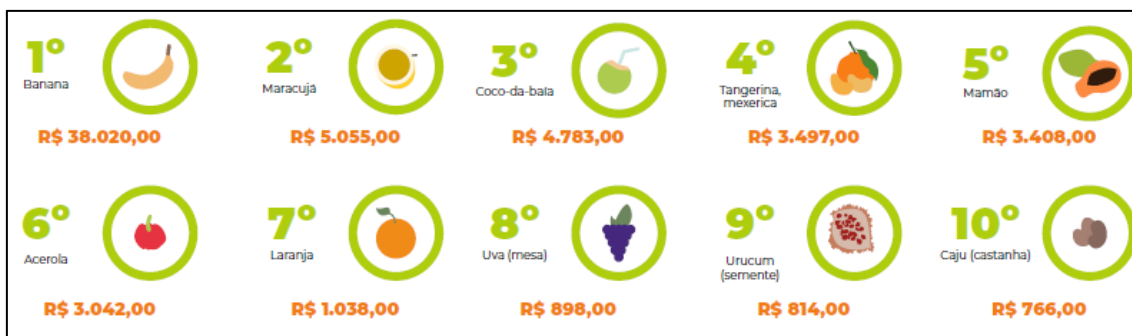

**Table 141 - Quantity Produced and Production Value of the First Permanent Crop Products in the State of Paraíba (2022)**

Product of Permanent Crops	Quantity produced (Tons)	Production Value (Thousand Reais)
Banana (bunch)	142.325	228.514
Bay coconut	53.613	50.500
Orange	5.355	5.365
Papaya	26.429	47.080
Mango	7.485	11.018
Passion fruit	10.357	32.391
Tangerine	14.554	16.871

Source: IBGE - Municipal Agricultural Production (PAM), 2022.

As far as family farming is concerned, according to data from the IBGE Agricultural Census (2017), the products that stand out from permanent crops in terms of their production value are bananas (R\$38,020,000), passion fruit (R\$5,055,000) and coconut (R\$4,783,000), as can be seen in the figure below.

**128 128 - Top 10 production values of permanent crops produced by family farming establishments in the state of Paraíba (thousand reais)**

Source: AKSAAM, 2021.

As for temporary crop products in family farming (according to the 2017 Census), pineapple (R\$53,483,000), cassava (R\$52,888,000) and grain corn (R\$30,696,000) stand out for their production value.

**129 129 - Top 10 in the production value of temporary crops produced by family farming establishments in the state of Paraíba (thousand reais)**

Source: AKSAAM, 2021.

**RT Alto Sertão**

According to 2022 data from IBGE's Municipal Agricultural Production (PAM), in TR Alto Sertão, the most produced agricultural products are corn, coconut and beans, with 8,326, 1,980 and 1,622 tons, respectively. In terms of production value, corn (R\$12,144,000), beans (R\$7,581,000) and bananas (R\$2,532,000) stand out.

Among the municipalities in TR, the biggest banana producer is Santa Helena, with 462 tons produced in 2022; São João do Rio do Peixe, sweet potatoes (400 tons), coconut (1,080 tons) and corn (3,600 tons); and Bonito de Santa Fé, sugar cane (1,350 tons) and beans (216 tons).

The following table shows the top agricultural products, in terms of quantity produced and value of production in the Alto Sertão RT in 2022.

**Table 142 - Quantity Produced and Production Value of the First Products of Agricultural Production in the TR Alto Sertão (2022)**

Proceeds from temporary and permanent crops	Quantity produced (Tons)	Production Value (Thousand Reais)
Banana (bunch)	1.445	2.532
Sweet potatoes	730	1.460
Sugarcane	2.275	390
Bay coconut	1.980	1.877
Beans	1.622	7.581
Corn (grain)	8.326	12.144

Source: IBGE - Municipal Agricultural Production (PAM), 2022.

### **RT Borborema**

According to 2022 data from IBGE's Municipal Agricultural Production (PAM), in TR Borborema, the most produced agricultural products are sugar cane, bananas and tangerines, with 169,250, 59,250 and 14,491 tons, respectively. In terms of production value, bananas (R\$85,521 thousand), beans (R\$32,462 thousand) and sugar cane (R\$29,255 thousand) stand out.

Among the municipalities in TR, the largest producers of bananas and tangerines are Alagoa Nova, with 24,000 and 6,350 tons produced in 2022, respectively; Lagoa Seca, sweet potatoes (2,100 tons); Alagoa Grande, sugar cane (96,000 tons) and fava beans (500 tons); Esperança, beans (855 tons); Campina Grande, corn (2,000 tons); and Barra de São Miguel, tomatoes (2,100 tons).

The following table shows the top agricultural products in terms of quantity produced and value of production in TR Borborema in 2022.

**Table 143 - Quantity Produced and Production Value of the First Products of Agricultural Production in TR Borborema (2022)**

Proceeds from temporary and permanent crops	Quantity produced (Tons)	Production Value (Thousand Reais)
Banana (bunch)	59.250	85.521
Sweet potatoes	10.605	17.957
Sugarcane	169.250	29.255
Broad beans	1.941	15.362
Beans	7.392	32.462
Corn (grain)	12.376	17.728
Tangerine	14.491	16.800
Tomato	9.025	18.120

Source: IBGE - Municipal Agricultural Production (PAM), 2022.

Between the municipalities of Lagoa Seca and São Sebastião de Lagoa de Roça, on the Quicé site, are the facilities of the Banco Mãe de Sementes, a project of the Borborema Hub, a structure built with federal and municipal resources.

The Borborema Hub is a collective made up of 13 Rural Workers' Unions in the Borborema territory, plus around 150 community associations, EcoBorborema and CoopBorborema. The latter provides funds to maintain the Mãe de Sementes Bank building.

Wagner Santos, a technician at AS-PTA, a partner organization of the Borborema Pole, which is EcoBorborema's umbrella institution, comments that "In addition to being an association, EcoBorborema is a Social Control Organization (OSC) accredited by the Ministry of Agriculture, Livestock and Supply (MAPA) that guarantees, through participatory certification processes for farming families, that the food sold at the fairs is, in fact, organic".

The Borborema Hub is made up of 13 municipalities. The properties of family farmers are up to 10 hectares in size, and they grow a variety of crops (corn, fava beans, beans, fruit) on small plots of land. Bananas, oranges and jackfruit are grown in the marshlands. All the produce is free from poison and pesticides, and is not transgenic; the products are totally agroecological. The diversification of the fields is a guarantee of success.

There are 13 agro-ecological fairs in the Hub, 3 of them in Campina Grande. In the Lagoa Seca area, there is a lot of renewable energy production, large investments in energy production that conflict with agricultural production and rampant deforestation. This also makes small producers insecure about their pensions.

In the municipality of Areia, the Chã de Jardim community is next to the Pau Ferro State Park Conservation Unit (the residents were relocated from inside the Conservation Unit to the surrounding area). The community's activities and the presence of the PES are responsible for the increased flow of people and tourism in the town. The community, in the form of Mrs. Neta Lucineide, develops numerous activities and projects such as the sale of organic and pesticide-free fruit pulp (produced by the factory in the community itself), Arte na Mão (a handicraft project made from dried banana straw and produced by women from the community); Restaurante Vó Maria (an enterprise which, using products produced by the community, serves homemade food with typical regional cuisine); Piquenique na Mata (a snack served with typical food is offered to tourists who choose to take the guided walk on the trail in the Mata Pau Ferro Park), Camping and hiking in the Mata do Pau-ferro Park, among many other activities developed by the community.

The community developed after the resettlement with the acerola, cajá and other fruit pulp factory, and with the support, at the start of production, of a professor from Carlos Barreto University. The association is now 18 years old, but the infrastructure was abandoned for 10 years before production took off.

MAPA (Ministry of Agriculture and Livestock) personnel arrived in the region and made demands for the project to be qualified. The community members took qualification courses to improve pulp production and meet MAPA's requirements. They also undertook a Cooperar project which enabled them to buy a cold room, a car, boxes and packaging, which led to a leap in fruit production. In addition, they brought in producers to be partners, removing the middleman from the process.

The community association currently has 35 people, around 20 of whom are women. They sell their products in João Pessoa, Campina Grande and to the PNAE.

According to local information, the rural complex brings together around 300 families who benefit directly and indirectly from fruit production, restaurants and tourism. It has 3 trained guides for the trails.

The municipality of Remígio is home to the Queimadas settlement, where there is a Procasa project to produce agroecological cotton. There are two associations in the settlement that are part of the Borborema Agroecology Network (RBA), which has been in existence for 10 years. It is the first producer of colored cotton in the region and sells to the French footwear company Vert, and to Flávia Aranha (stylist), a fashion company. There are 6 municipalities in the Network and 90 members, while in the settlement there are between 100 and 150 families. The members produce an average of 12 tons of cotton lint. They are thinking of setting up SAFs to intercrop with cotton, improving resilience. 20% of cotton production goes to the seed bank to guarantee future harvests, as they suffer from pest and drought issues. In 2012 there was a drought and they had to rescue seed from the bank.

**Photo 45 - Agro-ecological cotton production in the Queimadas settlement in the municipality of Remígio**

### **RT Brejo**

According to 2022 data from IBGE's Municipal Agricultural Production (PAM), in TR Brejo, the most produced agricultural products are pineapple, sugar cane and cassava, with 88,723, 58,325 and 14,673 tons, respectively. In terms of production value, pineapple (R\$71,065,000), bananas (R\$14,738,000) and cassava (R\$10,747,000) stand out.

Araçagi is the largest producer of pineapple (51,000 tons), sweet potatoes (800 tons), sugar cane (17,500 tons), fava beans (112 tons) and manioc (4,800 tons); Pilõezinhos, bananas (3,700 tons); Riachão, beans (250 tons); and Mulungu, corn (770 tons).

The following table shows the top agricultural products in terms of quantity produced and value of production in the Brejo RT in 2022.

**Table 144 - Quantity Produced and Production Value of the First Products of Agricultural Production in RT Brejo (2022)**

Proceeds from temporary and permanent crops	Quantity produced (Tons)	Production Value (Thousand Reais)
Pineapple	88.723	71.065
Banana (bunch)	8.284	14.738
Sweet potatoes	2.273	3.858
Sugarcane	58.325	10.410
Broad beans	295	2.451
Beans	958	4.474
Cassava	14.673	10.747
Corn (grain)	2.190	3.237

Source: IBGE - Municipal Agricultural Production (PAM), 2022.

### **RT Cariri**

According to 2022 data from IBGE's Municipal Agricultural Production (PAM), in TR Cariri, the most produced agricultural products are tomatoes, onions and corn, with 7,142, 970 and 882 tons, respectively. In terms of production value, tomatoes (R\$15,633,000), beans (R\$2,505,000) and onions (R\$2,181,000) stand out.

Among the municipalities in TR, the biggest producers of sweet potatoes, passion fruit and tomatoes are Congo, with 180, 96 and 2,800 tons produced in 2022, respectively; Sumé, onions (300 tons); Prata, coconuts (160 tons); and Monteiro, beans (213 tons), papaya (220 tons) and corn (400 tons).

The following table shows the top agricultural products in terms of quantity produced and value of production in TR Cariri in 2022.

**Table 145 - Quantity Produced and Production Value of the First Products of Agricultural Production in TR Cariri (2022)**

Proceeds from temporary and permanent crops	Quantity produced (Tons)	Production Value (Thousand Reais)
Sweet potatoes	580	1.134
Onions	970	2.181
Bay coconut	728	764
Beans	538	2.505
Papaya	482	877
Passion fruit	321	952
Corn (grain)	882	1.323
Tomato	7.142	15.633

Source: IBGE - Municipal Agricultural Production (PAM), 2022.

## RT Curimataú

According to 2022 data from IBGE's Municipal Agricultural Production (PAM), in TR Curimataú, the most produced agricultural products are corn, beans and sisal or agave, with 4,302, 1,752 and 1,534 tons, respectively. In terms of production value, beans (R\$7,402,000), corn (R\$5,953,000) and sisal or agave (R\$3,853,000) also stand out.

Among the municipalities in TR, the largest producers of sweet potatoes are Picuí and São Vicente do Seridó, with 70 tons produced in 2022; Cuité, cashew nuts (41 tons); Barra de Santa Rosa, fava beans (85 tons), corn (900 tons) and sisal or agave (1,300 tons); Picuí, beans (550 tons) and passion fruit (600 tons); and Nova Floresta, cassava (190 tons);

The following table shows the top agricultural products in terms of quantity produced and value of production in TR Curimataú in 2022.

**Table 146 - Quantity Produced and Production Value of the First Products of Agricultural Production in RT Curimataú (2022)**

Proceeds from temporary and permanent crops	Quantity produced (Tons)	Production Value (Thousand Reais)
Sweet potatoes	176	312
Cashew nuts	82	300
Broad beans	211	1.505
Beans	1.752	7.402
Cassava	445	456
Passion fruit	1.210	2.952
Corn (grain)	4.302	5.953
Sisal or agave (fiber)	1.534	3.853

In the São Domingos Settlement, in the municipality of Cubati, there is experience with forage SAF, using moringa, leucena, salt grass (which filters salt from the soil) and thornless mandacaru. On the other hand, the most developed productions include fruit SAF, including products such as cashew, pine cone and seriguela. Organic production is identified, using Creole seeds and soil management (resting the land for 6 months and mowing every 2 years). Normally, there is also animal husbandry (pigs, for example).

Practices to protect cultivation areas using Nature-Based Solutions (NBS) were noted, such as the use of hedges to block poison from neighboring crops. The use of Lannate poison by neighboring producers who do not produce organically was mentioned.

### **RT Mata Norte**

According to 2022 data from IBGE's Municipal Agricultural Production (PAM), in TR Mata Norte, the most produced agricultural products are sugarcane, pineapple and manioc, with 1,999,750, 98,160 and 13,926 tons, respectively. In terms of production value, sugar cane (R\$345,016 thousand), pineapple (R\$131,766 thousand) and papaya (R\$19,080 thousand) also stand out.

Among the municipalities in TR, the largest producers of pineapple and manioc are Itapororoca, with 60,000 and 2,500 tons produced in 2022, respectively; Mamanguape, bananas (880 tons), sweet potatoes (1,250 tons), sugar cane (495,000 tons), coconut (3,500 tons), and papaya (7,600 tons); and Marcação, passion fruit (195 tons).

The following table shows the top agricultural products, in terms of quantity produced and value of production in TR Mata Norte in 2022.

**Table 147 - Quantity Produced and Production Value of the First Products of Agricultural Production in RT Mata Norte (2022)**

Proceeds from temporary and permanent crops	Quantity produced (Tons)	Production Value (Thousand Reais)
Pineapple	98.160	131.766
Banana (bunch)	3.514	5.454
Sweet potatoes	4.425	8.399
Sugarcane	1.999.750	345.016
Bay coconut	7.500	7.055
Papaya	11.140	19.080
Cassava	13.926	11.007
Passion fruit	829	2.694

### **RT Mata Sul**

According to 2022 data from IBGE's Municipal Agricultural Production (PAM), in TR Mata Sul, the most produced agricultural products are sugarcane, manioc and pineapple, with 2,232,550, 46,630 and 34,320 tons, respectively. In terms of production value, sugar cane (R\$380,521 thousand), pineapple (R\$48,315 thousand) and cassava (R\$38,887 thousand) also stand out.

Among the municipalities in TR, the largest producer of sweet potatoes is Sapé, with 1,440 tons produced in 2022; Santa Rita, pineapple (23,400 tons) and sugar cane (786,500 tons); Pitimbu, banana (1,260 tons), coconut (11,700 tons) and papaya (3,200 tons); Alhandra, passion fruit (700 tons); and Mari, cassava (16,300 tons).

The following table shows the top agricultural products, in terms of quantity produced and value of production in TR Mata Sul in 2022.

**Table 148 - Quantity Produced and Production Value of the First Products of Agricultural Production in RT Mata Sul (2022)**

Proceeds from Temporary and Permanent Crops	Quantity produced (Tons)	Production Value (Thousand Reais)
Pineapple	34.320	48.315
Banana (bunch)	4.001	6.362
Sweet potatoes	6.676	11.170
Sugarcane	2.232.550	380.521
Bay coconut	30.953	29.233
Papaya	10.916	21.262
Cassava	46.630	38.887
Passion fruit	1.862	6.101

### **RT Middle Piranhas**

According to 2022 data from IBGE's Municipal Agricultural Production (PAM), in TR Médio Piranhas, the most produced agricultural products are corn, beans and sweet potatoes, with 1,915, 658 and 176 tons, respectively. In terms of production value, beans (R\$3,130,000), corn (R\$2,842,000) and sweet potatoes (R\$253,000) stand out.

Among the municipalities in TR, the largest producer of sweet potatoes is São Bento, with 64 tons produced in 2022; Riacho dos Cavalos, of coconut (36 tons) and corn (480 tons); Catolé do Rocha, of herbaceous cotton (14 tons), bananas (36 tons), beans (120 tons) and mangoes (30 tons); and Bom Sucesso, the only producer of guava (7 tons).

The following table shows the top agricultural products, in terms of quantity produced and value of production in the TR Médio Piranhas in 2022.

**Table 149 - Quantity Produced and Production Value of the First Products of Agricultural Production in the TR Médio Piranhas (2022)**

Proceeds from temporary and permanent crops	Quantity produced (Tons)	Production Value (Thousand Reais)
Herbaceous cotton (seed)	41	188
Banana (bunch)	36	54
Sweet potatoes	176	253
Bay coconut	76	84
Beans	658	3.130
Guava	7	14
Mango	54	70
Corn (grain)	1.915	2.842

### **TR Paraíba Valley**

According to 2022 data from IBGE's Municipal Agricultural Production (PAM), in the TR Vale do Paraíba, the most produced agricultural products are sugarcane, pineapple and manioc, with 1,260,900, 71,250 and 24,775 tons, respectively. In terms of production value, sugar cane (R\$ 204,180 thousand), pineapple (R\$ 91,680 thousand) and manioc (R\$ 20,328 thousand) also stand out.

Among the municipalities in TR, the biggest corn producer is Itatuba, with 3,000 tons produced in 2022; Mogeiro, beans (507 t); and Pedras de Fogo, pineapple (60,000 t), sweet potato (4,200 t), sugar cane (1,017,500 t), coconut (525 t), papaya (1,200 t) and cassava (12,150 t).

The following table shows the top agricultural products in terms of quantity produced and production value in the Vale do Paraíba RT in 2022.

**Table 155 - Quantity Produced and Production Value of the First Products of Agricultural Production in the TR Vale do Paraíba (2022)**

Proceeds from Temporary and Permanent Crops	Quantity produced (Tons)	Production Value (Thousand Reais)
Pineapple	71.250	91.680
Sweet potatoes	6.589	12.051
Sugarcane	1.260.900	204.180
Bay coconut	1.207	1.086
Beans	1.542	6.892
Papaya	1.200	1.680

### **RT Piranhas Valley**

According to 2022 data from the IBGE's Municipal Agricultural Production (PAM), in the RT Vale do Piranhas, the most produced agricultural products are coconut, bananas and sugar cane, with 7,748, 6,773 and 3,430 tons, respectively. In terms of production value, bananas (R\$11,236,000), coconuts (R\$6,841,000) and corn (R\$3,973,000) stand out.

Among the municipalities in TR, the largest producer of sweet potatoes is Nazarezinho, with 480 tons produced in 2022; Santa Cruz, sugar cane (1,350 tons); and, Sousa, herbaceous cotton (600 tons), bananas (4,625 tons), coconut (5,600 tons), beans (184 tons), guava (261 tons) and corn (1,425 tons).

The following table shows the top agricultural products in terms of quantity produced and value of production in the Piranhas Valley RT in 2022.

**Table 156 - Quantity Produced and Production Value of the First Products of Agricultural Production in the TR Vale do Piranhas (2022)**

Proceeds from Temporary and Permanent Crops	Quantity produced (Tons)	Production Value (Thousand Reais)
Herbaceous cotton (seed)	606	1.699
Banana (bunch)	6.773	11.236
Sweet potatoes	567	942
Sugarcane	3.430	608

## Livestock

According to 2022 data from the IBGE's Municipal Livestock Survey (PPM), the cattle herd in Paraíba reached 1,371,566 heads, while the buffalo herd had 698 heads; horses, 69,555; pigs, 288,360; goats, 796,472; and sheep, 777,790.

Following the same proportion, the total number of chickens was 12,669,505, while the number of quails was 189,204.

In general, livestock farming is considered to be of little importance to Paraíba's rural economy, and therefore its share of the country's production is also minimal. The most significant shares involve goats (8.26%) and sheep (3.62%).

With regard to family farming establishments in Paraíba that are engaged in livestock farming, according to data from the IBGE Agricultural Census (2017), the largest numbers were hens, roosters, pullets, chickens and chicks, with a percentage of 72.6%, followed by cattle with 10.2% and goats and sheep with 5.7% and 5.2%, respectively, as can be seen in the figure below.

### 130 130 - Top 10 of the Number of Livestock in Family Farming Establishments in Paraíba

Source: AKSAAM, 2021.

Among the products of animal origin, the one that stands out most in Paraíba is hen's eggs, whose production in 2022 was 59,601 thousand dozen, which represented 1.22% of national production.

According to data from the IBGE Agricultural Census (2017), 772 family farming establishments in Paraíba carry out beekeeping. This corresponds to 0.6% of all family farming establishments in the state. In 55.4% of the family farming establishments in Paraíba that keep bees, they sell honey, in 1.9% they sell royal jelly, propolis and pollen, and in 4.0% they sell beeswax. The mesoregion where beekeeping is most practiced is Agreste Paraibano (64.25%), followed by Sertão Paraibano (20.34%), Mata Paraibana (10.106) and Borborema (5.31%) (AKSAAM, 2021).

### **RT Alto Sertão**

According to 2022 data from the IBGE's Municipal Livestock Survey (*PPM*), the cattle herd in RT Alto Sertão totaled 102,722 head, while the buffalo herd totaled 93 head; horses, 4,100; pigs, 18,635; goats, 17,064; and sheep, 33,660. Following the same proportion, the total number of chickens was 171,132.

The most prominent share in state production involves the buffalo herd, with 13.32%, followed by cattle (7.49%) and pigs (6.46%).

Among the municipalities in TR, the largest number of cattle, buffalo and horses is concentrated in São João do Rio do Peixe, with 17,222, 81 and 590 head in 2022, respectively. Cachoeira dos Índios stands out for having the largest number of pigs (2,812); Bonito de Santa Fé, goats (2,500); Cajazeirinhas, sheep (5,317); and Uiraúna, chickens (40,155).

Among animal products, the ones that stand out most in RT Alto Sertão are bee honey and milk, whose production in 2022 was 72,617 kilograms and 34,614 thousand liters, which represented 20.31% and 11.88%, respectively, of the state's production.

Cajazeiras stands out as the largest producer of milk and chicken eggs among the municipalities of the CA, with a production in 2022 of 7,333 thousand liters and 62 thousand dozen, respectively; and Triunfo, of bee honey, with 27,000 kilograms.

According to 2017 data from the IBGE Agricultural Census, in the year of the survey a total of 3,638 agricultural establishments in the Alto Sertão RT produced cow's milk, of which 3,144 (86%) were family farms. The amount produced that year in the RT was 20,325 thousand liters, reaching 26,458 thousand reais in production value. Of this total, family farming contributed 14,856,000 liters (73%), which represented 19,339,000 reais in production value.

Of the 22 agricultural establishments that produced goat's milk in the Alto Sertão RT, 18, almost all (82%), were family farms in 2017. This year, the amount of goat's milk produced in the region was 11,000 liters, 7,000 of them by family farmers, equivalent to 64% of the total. The value of production that year was R\$18,000, of which R\$14,000 (78%) came from family farming.

### **RT Borborema**

According to 2022 data from the IBGE's Municipal Livestock Survey (*PPM*), the cattle herd in TR Borborema totaled 210,239 heads, while the buffalo herd totaled 258 heads; horses, 15,365; pigs, 93,861; goats, 196,748; and sheep, 189,508. Following the same

proportion, the total number of chickens was 4,234,765, while the number of quails was 12,970.

A large part of the state's livestock production is found in the municipalities of this TR, especially in the buffalo, pig and chicken sectors, accounting for 36.96%, 33.42% and 32.55% of the state's share.

Among the municipalities in TR, the largest numbers of buffalo and horses are concentrated in Campina Grande, with 145 and 2,000 head in 2022, respectively. Alagoa Grande stands out for having the largest cattle herd (19,000); Queimadas for pigs (8,225); Soledade for goats (25,000) and sheep (22,000); Pocinhos for chickens (987,650); and Puxinanã for quails (4,500).

Among animal products, the ones that stand out most in TR Borborema are milk and hen's eggs, whose production in 2022 was 71,169 thousand liters and 10,318 thousand dozen, representing 24.43% and 17.31%, respectively, of the state's production.

Queimadas stands out as the largest producer of milk among the municipalities of RT, with a production in 2022 of 8,200 thousand liters; Esperança, of chicken eggs, with 3,621 thousand dozen; Puxinanã, of quail eggs, with 32 thousand dozen; and Alagoa Grande, of bee honey, with 4,500 kilograms.

According to 2017 data from the IBGE Agricultural Census, in the year of the survey a total of 9,395 agricultural establishments in TR Borborema produced cow's milk, of which 7,588 (81%) were family farms. The amount produced that year in the RT was 66,223 thousand liters, reaching 89,218 thousand reais in production value. Of this total, family farming contributed 45,499 thousand liters (69%) produced, which represented 61,236 thousand reais in production value.

Of the 950 agricultural establishments producing goat's milk in the Borborema RT, 724 (76%) were family farms in 2017. This year, goat's milk produced in the region amounted to 1,652,000 liters, 986,000 of them by family farmers, equivalent to 60% of the total. The value of production that year was R\$3,255,000, of which R\$1,789,000 (55%) came from family farming.

In the municipality of Cabaceiras, one of the most practiced activities is goat and sheep farming, due to the ability of these animals to adapt to the dry climate of the semi-arid region. In 1996, the region's goat farmers, seeking to find a new way of generating income for rural workers, entered into a partnership with Cabaceiras City Hall and the Technical Assistance Company of Paraíba, formerly EMATER and now EMPAER, and founded the Association of Goat and Sheep Breeders of the Municipality of Cabaceiras (ASCOMCAB) (PARAÍBA, 2022).

In 2001, the Cabaceiras Goat Milk Processing Plant was officially inaugurated, working mainly to produce milk for the poorest families in the region. In 2006, ASCOMCAB managed to make the plant official as a cooperative, renaming it the Cooperativa dos Capribovinocultores de Cabaceiras e Região - Capribov (PARAÍBA, 2022).

In the Serra do Monte settlement in Cabaceiras, family farmers raise poultry, cows, dairy goats and sheep and sell their produce to the state government's PAA Milk Program. Even on a small scale, they raise beef cattle and sheep, which supply the region's butchers (PARAÍBA, 2022).

The cooperative has a series of requirements so that small producers can receive benefits. One of the complaints from producers in the Serra do Monte settlement is that

it takes a long time to get paid. They are paid almost 4 reais a liter for goat's milk, while many of them also work with cow's milk, receiving 1.8 reais a liter for this product. The average daily production is 2 liters of milk per producer and they usually use a semi-intensive system and feed their goats with palm. Other crops are corn and beans.

According to information from Capribov and a producer in the region, there is a need to improve the infrastructure for milk production on the properties, for example, with suitable places for milking and storing the herd. Another issue is the competition with the leather crafts hub, where young people from the community end up going to work in leather crafts in a nearby town.

### **RT Brejo**

According to 2022 data from the IBGE's Municipal Livestock Survey (*PPM*), the cattle herd in RT Brejo totaled 71,580 head, while the buffalo herd totaled 31 head; horses, 3,979; pigs, 14,493; goats, 5,593; sheep, 9,779. Following the same proportion, the total number of chickens was 1,196,001, while the number of quails was 22,150.

The most prominent share in state production involves quails, with 11.71%, followed by chickens (9.44%) and cattle (5.22%).

Among the municipalities in TR, the largest number of cattle, goats and sheep is concentrated in Mulungu, with 16,700, 1,255 and 3,894 head in 2022, respectively. Guarabira stands out for having the largest number of head of buffalo (22), horses (790), pigs (5,300) and chickens (780,700); and Araçagi for quails (10,500).

Among animal products, the TR Brejo stands out most for quail eggs, whose production in 2022 was 393,000 dozen, representing 16.93% of the state's production.

Araçagi stands out as the largest producer of milk, quail eggs and bee honey among the municipalities of the CA, with a production in 2022 of 1,853,000 liters, 213,000 dozen and 2,520 kilograms, respectively; and Pilõesinhos, of chicken eggs, with 671,000 dozen.

According to 2017 data from the IBGE Agricultural Census, in the year of the survey a total of 952 agricultural establishments in the Brejo RT produced cow's milk, of which

700 (74%) were family farms. The amount produced that year in the RT was 5,365 thousand liters, reaching 8,436 thousand reais in production value. Of this total, family farming contributed with 2,379,000 liters (44%) produced, which represented 4,191,000 reais in production value.

Of the 73 agricultural establishments producing goat's milk in the Brejo RT, 57 (78%) were family farms in 2017. This year, 23,000 liters of goat's milk were produced in the RT, 15,000 of them by family farmers, equivalent to 65% of the total. The value of production that year was R\$59,000, of which R\$33,000 (56%) came from family farming.

### **RT Cariri**

According to 2022 data from the IBGE's Municipal Livestock Survey (PPM), the cattle herd in RT Cariri amounted to 78,178 head, while the equine herd numbered 4,957 head; pigs, 15,420; goats, 301,519; and sheep, 178,154. Following the same proportion, the total number of chickens was 494,893 head.

Goats account for 37.86% of the state's production, followed by sheep (22.91%) and horses (7.13%).

Among the municipalities in RT, the largest number of cattle, horses and goats is concentrated in Monteiro, with 21,300, 681 and 36,915 head in 2022, respectively. Sumé stands out for having the largest number of pigs (3,080), sheep (28,782) and chickens (97,730).

Among animal products, the one that stands out most in RT Cariri is milk, whose production in 2022 was 16,345 thousand liters, representing 5.61% of state production.

Monteiro stands out as the largest producer of milk among the municipalities of RT, with a production in 2022 of 5,007 thousand liters; Sumé, of chicken eggs, with 500 thousand dozen; and Prata, of bee honey, with 2,884 kilograms.

According to 2017 data from the IBGE Agricultural Census, in the year of the survey a total of 2,807 agricultural establishments in the Cariri RT produced cow's milk, of which 2,282 (81%) were family farms. The amount produced that year in the RT was 9,631 thousand liters, reaching 14,270 thousand reais in production value. Of this total, family farming contributed with 7,211 thousand liters (75%) produced, which represented 10,732 thousand reais in production value.

Of the 1,004 agricultural establishments producing goat's milk in the Cariri RT, 805 (80%) were family farms in 2017. This year, goat's milk produced in the region amounted to 3,317,000 liters, 2,721,000 of them by family farmers, equivalent to 82% of the total. The value of production that year was 6,308 thousand reais, of which 5,162 thousand reais (82%) came from family farming.

### **RT Curimataú**

According to 2022 data from the IBGE's Municipal Livestock Survey (PPM), the cattle herd in RT Curimataú stood at 45,830 head, while the equine herd stood at 2,166 head; pigs, 11,746; goats, 33,610; and sheep, 58,065. Following the same proportion, the total number of chickens was 419,242 head.

The most prominent share in state production involves sheep, with 7.47%, followed by pigs (4.07%) and cattle (3.34%).

Among the municipalities in RT, the largest cattle and chicken herds are concentrated in Cuité, with 10,450 and 210,500 head in 2022, respectively. Barra de Santa Rosa stands out for having the largest equine (430), goat (12,700) and sheep (22,800) herds; and Cubati for pigs (2,580).

Among animal products, TR Curimataú stands out for chicken eggs, whose production in 2022 amounted to 4,572,000 dozen, representing 7.67% of the state's production.

Cuité stands out as the largest producer of milk and chicken eggs among the municipalities in the RT, with production in 2022 of 1,998,000 liters and 4,110,000 dozen, respectively; and São Vicente do Seridó is the only producer of bee honey in the RT, with 2,435 kilograms.

According to 2017 data from the IBGE Agricultural Census, in the year of the survey a total of 2,184 agricultural establishments in the Curimataú region produced cow's milk, of which 1,766 (81%) were family farms. The amount produced that year in the RT was 4,913,000 liters, reaching 8,127,000 reais in production value. Of this total, family farming contributed 3,544,000 liters (72%), which represented 5,998,000 reais in production value.

Of the 96 agricultural establishments producing goat's milk in the Curimataú RT, 73 (76%) were family farms in 2017. This year, 124,000 liters of goat's milk were produced in the region, 66,000 of them by family farmers, equivalent to 53% of the total. The value of production that year was R\$243,000, of which R\$129,000 (53%) came from family farming.

### ***RT Mata Norte***

According to 2022 data from the IBGE's Municipal Livestock Survey (PPM), the cattle herd in TR Mata Norte totaled 44,450 head, while the equine herd totaled 2,898 head; pigs, 4,865; goats, 3,671; and sheep, 3,580. Following the same proportion, the total number of chickens was 1,045,568.

The most prominent share of the state's production is accounted for by chickens, with 8.25%, followed by horses (4.17%) and cattle (3.24%).

Among the municipalities in TR, the largest cattle herds are concentrated in Itapororoca and Lagoa de Dentro, with 7,500 head in 2022 in each of them. Lagoa de Dentro also stands out for having the largest number of sheep (578); Jacaraú, horses (380) and goats (660); and Mamanguape, pigs (805) and chickens (815,000).

Among animal products, the one that stands out the most in RT Mata Norte is hen's eggs, whose production in 2022 was 10,379 thousand dozen, representing 17.41% of state production.

Lagoa de Dentro stands out as the largest producer of milk among the municipalities of TR, with a production in 2022 of 526,000 liters; Mamanguape, of chicken eggs, with 10,214 dozen; and Jacaraú, of bee honey, with 4,000 kilograms.

According to 2017 data from the IBGE Agricultural Census, in the year of the survey a total of 265 agricultural establishments in the Mata Norte RT produced cow's milk, of which 202 (76%) were family farms. The amount produced that year in the RT was 1,083,000 liters, with a production value of 1,603,000 reais. Of this total, family farming contributed with 488,000 liters (45%) produced, which represented 777,000 reais in production value.

Of the 28 agricultural establishments producing goat's milk in the Mata Norte RT, 22 (79%) were family farms in 2017. This year, goat's milk produced in the region amounted to 15,000 liters, 11,000 of them by family farmers, equivalent to 73% of the total. The value of production that year was 45,000 reais, of which 37,000 reais (82%) came from family farming.

### **RT Mata Sul**

According to 2022 data from the IBGE's Municipal Livestock Survey (*PPM*), the cattle herd in TR Mata Sul totaled 42,386 heads, while the buffalo herd totaled 215 heads; horses, 3,828; pigs, 12,776; goats, 5,231; and sheep, 7,907. Following the same proportion, the total number of chickens was 1,718,430, while the number of quails was 150,400.

The most prominent share in the state's production involves quails, which account for a large part of total production (79.49%), followed by buffaloes (30.80%) and chickens (13.56%).

Among the municipalities in RT, the largest cattle and sheep herds are concentrated in Mari, with 11,800 and 2,000 head in 2022, respectively. Sapé stands out for having the highest number of buffalo (205) and goat (936) heads; João Pessoa for horses (705) and pigs (2,996); Caaporã for chickens (700,000); and Santa Rita for quails (52,000).

Among animal products, the one that stands out most in TR Mata Sul is quail eggs, whose production in 2022 was 1,769,000 dozen, representing 76.18% of the state's production.

Sapé stands out as the largest producer of milk among the municipalities of TR, with a production in 2022 of 385,000 liters; João Pessoa, of chicken eggs, with 48,000 dozen; Conde, of quail eggs, with 855,000 dozen; and Mari, of bee honey, with 1,600 kilograms.

According to 2017 data from the IBGE Agricultural Census, in the year of the survey a total of 308 agricultural establishments in the Mata Sul RT produced cow's milk, of which 231 (75%) were family farms. The amount produced that year in the RT was 2,733,000 liters, with a production value of 4,067,000 reais. Of this total, family farming contributed 951,000 liters (35%) produced, which represented 1,601,000 reais in production value.

Of the 19 agricultural establishments that produced goat's milk in the Mata Sul RT, 17, almost all (90%), were family farms in 2017. This year, 7,000 liters of goat's milk were produced in the RT, all by family farmers, equivalent to 100% of the total. The value of production that year was 16,000 reais, all of which came from family farming.

### **RT Middle Piranhas**

According to 2022 data from the IBGE's Municipal Livestock Survey (*PPM*), the cattle herd in the TR Médio Piranhas amounted to 85,279 head, while the equine herd numbered 3,157 head; pigs, 6,287; goats, 13,156; and sheep, 33,707. Following the same proportion, the total number of chickens was 144,202 head.

The most prominent share in the state's production involves cattle, with 6.22%, followed by horses (4.54%) and sheep (4.33%).

Among the municipalities in RT, the largest number of sheep is concentrated in Belém do Brejo do Cruz, with 9,105 head in 2022. Catolé do Rocha stands out for having the

most cattle (15,000), horses (650), pigs (1,509) and goats (3,025); and Bom Sucesso for chickens (36,797).

Among animal products, the one that stands out the most in the RT Médio Piranhas is bee honey, whose production in 2022 was 85,810 kilograms, representing 24.00% of state production.

Catolé do Rocha stands out as the largest producer of milk, chicken eggs and bee honey among the municipalities of the RT, with a production in 2022 of 385,000 liters, 103,000 dozens and 66,000 kilograms, respectively.

According to 2017 data from the IBGE Agricultural Census, in the year of the survey a total of 2,161 agricultural establishments in the Middle Piranhas RT produced cow's milk, of which 1,742 (81%) were family farms. The amount produced that year in the RT was 16,567 thousand liters, reaching 19,895 thousand reais in production value. Of this total, family farming contributed with 9,485 thousand liters (57%) produced, which represented 11,718 thousand reais in production value.

Of the 8 agricultural establishments that produced goat's milk in the Middle Piranhas RT, all were family farms in 2017. This year, the amount of goat's milk produced in the RT was 5,000 liters, reaching a production value of 14,000 reais.

### ***RT Middle Hinterland***

According to 2022 data from the IBGE's Municipal Livestock Survey (PPM), the cattle herd in the RT Médio Sertão amounted to 111,111 head, while the equine herd numbered 4,269 head; pigs, 17,497; goats, 80,802; and sheep, 54,301. Following the same proportion, the total number of chickens was 259,787 head.

The most prominent share in state production involves goats, with 10.14%, followed by cattle (8.10%) and sheep (6.98%).

Among the municipalities in RT, the largest number of cattle is concentrated in São José de Espinharas, with 17,300 head in 2022. São Mamede stands out for having the largest equine herd (624); Patos for pigs (1,963); Catingueira for goats (8,772) and sheep (8,500); and Teixeira for chickens (32,053).

Among animal products, the one that stands out most in the RT Médio Sertão is milk, whose production in 2022 was 28,433 thousand liters, representing 9.76% of the state's production.

São Mamede stands out as the largest producer of milk among the municipalities of RT, with a production in 2022 of 3,600 thousand liters; Teixeira, of chicken eggs, with 58 thousand dozen; and Santa Teresinha, of bee honey, with 5,270 kilograms.

According to 2017 data from the IBGE Agricultural Census, in the year of the survey a total of 2,932 agricultural establishments in the Médio Sertão RT produced cow's milk, of which 2,257 (77%) were family farms. The amount produced that year in the RT was 20,825 thousand liters, reaching 27,923 thousand reais in production value. Of this total, family farming contributed with 12,335 thousand liters (59%) produced, which represented 17,209 thousand reais in production value.

Of the 179 agricultural establishments producing goat's milk in the Médio Sertão RT, 148 (83%) were family farms in 2017. This year, goat's milk produced in the region amounted to 189,000 liters, 109,000 of them by family farmers, equivalent to 58% of the total. The

value of production that year was R\$381,000, of which R\$225,000 (59%) came from family farming.

### ***RT Piemont da Borborema***

According to 2022 data from the IBGE's Municipal Livestock Survey (PPM), the cattle herd in TR Piemont da Borborema amounted to 101,960 head, while the buffalo herd numbered 16 head; horses, 5. Following the same proportion, the total number of chickens was 219,602, while the number of quails was 1,024.

The most prominent share in the state's production involves horses, with 7.89%, followed by cattle (7.43%) and pigs (5.20%).

Among the municipalities in RT, the largest number of goats is concentrated in Araruna, with 1,500 head in 2022. Bananeiras stands out for having the largest number of cattle (14,700), horses (810), pigs (2,300) and quails (900); Solânea, for concentrating all the buffalo (16); Damião, sheep (3,952); and Dona Inês, chickens (23,400).

Among the products of animal origin in the RT Piemont da Borborema the one that stands out the most is milk, whose production in 2022 was 9,529,000 liters, representing 3.27% of state production.

Bananeiras stands out as the largest producer of milk, hen's eggs and quail's eggs among the municipalities of RT, with a production in 2022 of 1,800 thousand liters, 46 thousand dozens and 26 thousand dozens, respectively; and Arara, of bee honey, with 1,500 kilograms.

According to 2017 data from the IBGE Agricultural Census, in the year of the survey a total of 1,850 agricultural establishments in the Piemont da Borborema RT produced cow's milk, of which 1,582 (86%) were family farms. The amount produced that year in the RT was 5,939,000 liters, reaching 9,356,000 reais in production value. Of this total, family farming contributed 3,522,000 liters (59%), which represented 6,144,000 reais in production value.

Of the 91 agricultural establishments producing goat's milk in the Piemont da Borborema RT, 75 (82%) were family farms in 2017. This year, goat's milk produced in the RT amounted to 51,000 liters, 29,000 of them by family farmers, equivalent to 57% of the total. The value of production that year was R\$113,000, of which R\$60,000 (53%) came from family farming.

### ***RT Serra do Teixeira***

According to 2022 data from the IBGE's Municipal Livestock Survey (PPM), the cattle herd in TR Serra do Teixeira amounted to 72,406 head, while the equine herd numbered 2,088 head; pigs, 16,784; goats, 31,543; and sheep, 20,536. Following the same proportion, the total number of chickens was 598,748.

The most prominent share in state production involves pigs, with 5.82%, followed by cattle (5.28%) and chickens (4.73%).

Among the municipalities in RT, the largest number of cattle is in Tavares, with 14,580 head in 2022. Princesa Isabel stands out for having the largest number of head of horses (603), pigs (5,910), sheep (5,524) and chickens (519,698); and Manaíra, goats (8,047).

Among the products of animal origin, the RT Serra do Teixeira stands out most for its chicken eggs, whose production in 2022 was 9,691,000 dozen, representing 16.26% of the state's production.

Princesa Isabel stands out as the largest producer of milk and chicken eggs among the municipalities of the RT, with a production in 2022 of 2,781 thousand liters and 9,544 thousand dozen, respectively; and Água Branca, of bee honey, with 4,100 kilograms.

According to 2017 data from the IBGE Agricultural Census, in the year of the survey a total of 1,712 agricultural establishments in the Serra do Teixeira RT produced cow's milk, of which 1,483 (87%) were family farms. The amount produced that year in the RT was 4,040 thousand liters, reaching 7,097 thousand reais in production value. Of this total, family farming contributed 3,393,000 liters (84%) produced, which represented 6,074,000 reais in production value.

Of the 66 agricultural establishments producing goat's milk in the Serra do Teixeira RT, 56 (85%) were family farms in 2017. This year, goat's milk produced in the RT amounted to 24,000 liters, 22,000 of them by family farmers, equivalent to 92% of the total. The value of production that year was R\$55,000, of which R\$51,000 (93%) came from family farming.

### ***RT Vale de Piancó***

According to 2022 data from the IBGE's Municipal Livestock Survey (PPM), the cattle herd in the RT Vale de Piancó amounted to 143,656 head, while the buffalo herd numbered 22 head; horses, 4,522; pigs, 22,209; goats, 38,084; and sheep, 48,456. Following the same proportion, the total number of chickens was 234,289 head.

Cattle account for the largest share of the state's production, with 10.47%, followed by pigs (7.70%) and horses (6.50%).

Among the municipalities in RT, the largest number of cattle is concentrated in Piancó, with 21,560 head in 2022. Itaporanga stands out for having the largest equine herd (606); Coremas has all the buffalo (22); and Conceição has pigs (3,547), goats (6,253), sheep (6,205) and chickens (33,955).

Among the products of animal origin, the RT Vale de Piancó stands out most for its milk, whose production in 2022 was 31,163 thousand liters, representing 10.70% of the state's production.

Piancó stands out as the largest producer of milk among the municipalities of RT, with a production in 2022 of 4,599 thousand liters; and Conceição, of chicken eggs and bee honey, with 92 thousand dozen and 1,578 kilograms, respectively.

According to 2017 data from the IBGE Agricultural Census, in the year of the survey a total of 4,972 agricultural establishments in the Vale de Piancó RT produced cow's milk, of which 4,154 (84%) were family farms. The amount produced that year in the RT was 21,999 thousand liters, with a production value of 29,872 thousand reais. Of this total, family farming contributed 16,906,000 liters (77%), which represented 23,052,000 reais in production value.

Of the 27 agricultural establishments producing goat's milk in the Vale de Piancó RT, 20 (74%) were family farms in 2017. This year, goat's milk produced in the RT amounted to 20,000 liters, 16,000 of them by family farmers, equivalent to 80% of the total. The value

of production that year was 41,000 reais, of which 31,000 reais (76%) came from family farming.

### ***RT Maringá Valley***

According to 2022 data from the IBGE's Municipal Livestock Survey (PPM), the cattle herd in RT Vale do Maringá totaled 90,512 head, while the buffalo herd numbered 63 head; horses, 2,214; pigs, 8,117; goats, 17,815; and sheep, 54,096. Following the same proportion, the total number of chickens was 78,189 head.

The most prominent share in the state's production involves the buffalo herd, with 9.03%, followed by sheep (6.96%) and cattle (6.60%).

Among the municipalities in RT, the largest numbers of horses and pigs are concentrated in Paulista, with 631 and 3,521 head in 2022, respectively. Pombal stands out for having the largest number of cattle (29,800), buffalo (34), goats (6,100), sheep (23,304) and chickens (30,984).

Among animal products, the RT Vale do Maringá stands out most for its milk, which in 2022 produced 21,486 thousand liters, representing 7.38% of state production.

Pombal stands out as the largest producer of milk and chicken eggs among the municipalities of the RT, with a production in 2022 of 6,649 thousand liters and 99 thousand dozen, respectively; and São Bento, of bee honey, with 3,000 kilograms.

According to 2017 data from the IBGE Agricultural Census, in the year of the survey a total of 2,326 agricultural establishments in the Vale do Maringá RT produced cow's milk, of which 1,819 (78%) were family farms. The amount produced that year in the RT was 21,633 thousand liters, with a production value of 25,432 thousand reais. Of this total, family farming contributed with 12,708 thousand liters (59%) produced, which represented 15,021 thousand reais in production value.

Of the 7 agricultural establishments producing goat's milk in the Maringá Valley RT, 5 (71%) were family farms in 2017. This year, goat's milk produced in the RT amounted to 14,000 liters, 13,000 of them by family farmers, equivalent to 93% of the total. The value of production that year was 21,000 reais, of which 19,000 reais (91%) came from family farming.

### ***RT Paraíba Valley***

According to 2022 data from the IBGE's Municipal Livestock Survey (PPM), the cattle herd in TR Vale do Paraíba totaled 92,145 head, while the buffalo herd totaled 12 head; horses, 7,624; pigs, 15,539; goats, 24,050; sheep, 28,505. Following the same proportion, the total number of chickens was 1,683,057, while the number of quails was 2,660.

The most prominent share of the state's production is accounted for by chickens, with 13.28%, followed by horses (10.96%) and cattle (6.72%).

Among the municipalities in RT, the largest number of cattle and sheep is concentrated in Gurinhém, with 17,000 and 5,000 head in 2022, respectively. Mogeiro stands out for having the largest number of buffalo (12), horses (1,050) and quails (1,500); Itabaiana, pigs (2,500) and goats (4,180); and Pedras de Fogo, chickens (1,084,087).

Among animal products, the ones that stand out most in the RT Vale do Paraíba are hen's eggs and bee honey, whose production in 2022 was 18,845 thousand dozen and 66,620 kilograms, representing 31.62% and 18.63%, respectively, of the state's production.

Gurinhém stands out as the largest producer of milk among the municipalities of RT, with a production in 2022 of 1,600 thousand liters; Pedras de Fogo, of chicken eggs, with 18,043 thousand dozen; Mogeiro, of quail eggs, with 17 thousand dozen: and Salgado de São Félix, of bee honey, with 25,000 kilograms.

According to 2017 data from the IBGE Agricultural Census, in the year of the survey a total of 908 agricultural establishments in the Vale do Paraíba RT produced cow's milk, of which 708 (78%) were family farms. The amount produced that year in the RT was 3,926,000 liters, with a production value of 6,148,000 reais. Of this total, family farming contributed 1,995,000 liters (51%) produced, which represented 3,443,000 reais in production value.

Of the 102 agricultural establishments producing goat's milk in the Vale do Paraíba RT, 79 (78%) were family farms in 2017. This year, 47,000 liters of goat's milk were produced in the RT, 37,000 of them by family farmers, equivalent to 79% of the total. The value of production that year was 126,000 reais, of which 99,000 reais (79%) came from family farming.

### ***RT Piranhas Valley***

According to 2022 data from the IBGE's Municipal Livestock Survey (PPM), the cattle herd in RT Vale do Piranhas totaled 70,648 head, while the equine herd numbered 2,191 head; pigs, 9,540; goats, 17,191; and sheep, 37,105. Following the same proportion, the total number of chickens was 139,510.

The most prominent share of the state's production involves cattle, with 5.15%, followed by sheep (4.77%) and pigs (3.31%).

Among the municipalities in RT, the largest number of goats is concentrated in São José da Lagoa Tapada, with 4,700 head in 2022. Sousa stands out for having the largest number of cattle (27,055), horses (610), pigs (3,200), sheep (22,000) and chickens (88,200).

Among the products of animal origin, the one that stands out most in the RT Vale do Piranhas is bee honey, whose production in 2022 was 30,250 kilograms, representing 8.46% of the state's production.

Sousa stands out as the largest producer of milk and chicken eggs among the municipalities of the CA, with a production in 2022 of 9,935,000 liters and 207,000 dozen, respectively; and São José da Lagoa Tapada, of bee honey, with 16,000 kilograms.

The following tables show herd numbers, animal production by type of product and the number of establishments, quantity produced and value of cow's and goat's milk production in Paraíba's Rural Territories.

According to 2017 data from the IBGE Agricultural Census, in the year of the survey a total of 2,326 agricultural establishments in the Piranhas Valley RT produced cow's milk, of which 1,999 (86%) were family farms. The amount produced that year in the RT was 13,097 thousand liters, with a production value of 16,112 thousand reais. Of this total,

family farming contributed with 8,615 thousand liters (66%) produced, which represented 10,697 thousand reais in production value.

Of the 5 agricultural establishments that produced goat's milk in the Piranhas Valley RT, 2 (40%) were family farms in 2017. This year, 5,000 liters of goat's milk were produced in the RT, 1,000 of them by family farmers, equivalent to 20% of the total. The value of production that year was 7,000 reais, of which 1,000 reais (14%) came from family farming.

### **Plant Extraction**

According to the Plant Extraction and Forestry Production Survey (PEVS), in 2022 the value of plant extraction production in Brazil totaled R\$6.2 billion.

The type of extractive product that contributed the most value to plant extraction production was roundwood, totaling R\$2.7 billion, or 44.19% of the total value.

As for the state of Paraíba, plant extraction reached R\$23.8 million in 2022, with firewood extraction contributing the most, with R\$16.9 million, 71.00% of the total value.

As far as family farming is concerned, according to data from the 2017 IBGE Agricultural Census, 18,864 establishments were engaged in plant extraction of some kind that year. This corresponded to 15.05% of all family farming establishments in the state. The value of plant extraction production achieved by family farmers' establishments in Paraíba was R\$35,512 thousand in 2017.

In the Agricultural and Livestock Census, extractivism refers to plant extraction in the reference period, from non-planted (native) plant species. It can be seen in the figure below that among the products of plant extraction, firewood is the most important in the state. Agreste Paraibano is the mesoregion that extracted the most of this product in 2017.

#### **4.3.5 Education**

The information expressed in this item includes data on the educational level of the population of the state of Paraíba, as well as its literacy and school attendance rates, among others.

According to data from INEP (2022), there are 4,723 basic education institutions in Paraíba, 3,287 of which are early childhood education institutions, as well as 3,741 primary education institutions and 658 secondary education institutions. Of this number, most (2,917) are in the urban area of the municipality, equivalent to 61.76% of the total, leaving 1,806 units (38.24%) in rural areas.

In Paraíba, there are 1,966 crèches, 1,148 in urban areas and 818 in rural areas. Of these, most are private (622) in the urban area, and in the rural area, municipal (810).

The state government is responsible for 1,025 elementary school and 9 nursery schools. Secondary education has 462 state-run institutions.

The following table shows the distribution of the number of school units by school level and administrative level in Paraíba.

**Table 161 - Number of School Units by School Level in the State of Paraíba (2022)**

School Level	Grand Total	Urban					Rural

In Paraíba, there are 47,792 elementary school teachers who teach a total of 967,833 students, resulting in an enrollment rate of 20 per staff member. There are an average of 16 pupils per teacher in early childhood education (15 in nursery schools and 16 in pre-schools), 18 in primary education and 13 in secondary education.

The following table shows the number of teachers in Paraíba and then the number of enrolments by school level and administrative level.

**Table 162 - Number of Teachers by School Level in the State of Paraíba (2022)**

According to data from the IBGE's Continuous PNAD (2018), in Paraíba, the proportion of children aged 0 to 3 in school was 28.80% in 2018. In the same year, the schooling rate for children aged 4 to 5 was 92.10%; for children aged 6 to 14, 99.10%; for young people aged 15 to 17, 87.20%; for young people aged 18 to 24, 33.30%; and for people aged 25 or over, only 5.10%.

By 2023, using data from the Continuous PNAD for that year, the proportion of children aged 0 to 3 in school was 34.50%. In the same year, the schooling rate for children aged 4 to 5 was 91.70%; for children aged 6 to 14, 99.30%; for young people aged 15 to 17,

88.30%; for young people aged 18 to 24, 33.60%; and for people aged 25 and over, 4.60%.

The above data can be seen in the figure below, which shows the schooling rate by age group in Paraíba in 2018, 2019, 2022 and 2023.

**Figure132 - Schooling Rate by Age Group in Paraíba - 2018, 2019, 2022 and 2023**

Source: IBGE - Continuous PNAD 2018, 2019, 2022 and 2023.

In 2010, approximately 28 out of every 100 children in Paraíba were 2 years or more behind in their first years of elementary school. By 2023, this percentage had fallen to 10.5%. The rate of age-grade distortion<sup>39</sup> in the final years of elementary school was 42.3% in 2010, and fell to 23.8% in 2023, a decrease of 18.5 percentage points. In turn, the age-grade distortion rate in secondary education fell significantly (16.6%) between 2010-2023, reaching a rate of 25.1% in the latter year.

In 2022, the highest rates of age-grade distortion in the first years of elementary school, among Paraíba's municipalities, were in Alagoa Grande (31.8%), São Miguel de Taipu (24.7%) and Santa Rita (24.3%), while Frei Martinho (0.6%), São José do Sabugi (0.8%) and Baraúna (0.8%) had the lowest rates.

In the final years of elementary school, in the same year, the municipalities with the highest age-grade distortion rates were Pedro Régis (49.4%), Poço Dantas (48.1%) and Marcação (45.8%), while the lowest rates were in Dona Inês (4.0%), Zabelê (7.1%) and Monteiro (10.0%).

However, in 2022, Cachoeira dos Índios (59.2%), Marcação (55.1%) and São José dos Ramos (50.7%) had the highest rates of age-grade distortion in secondary education, while Ouro Velho (11.8%), São Bentinho (13.5%) and dona Inês (13.9%) had the lowest rates.

<sup>39</sup> Age-grade distortion rate: Age-grade distortion is the proportion of students who are more than two years behind in school. In Brazil, children must enter the first year of elementary school at the age of 6, remaining in elementary school until the 9th year, with the expectation that they will complete their studies in this mode by the age of 14. The calculation of age-grade distortion is based on data collected in the School Census.

The figure below shows the evolution of the age-grade distortion rate over the period 2010-2023 in primary and secondary education in Paraíba.

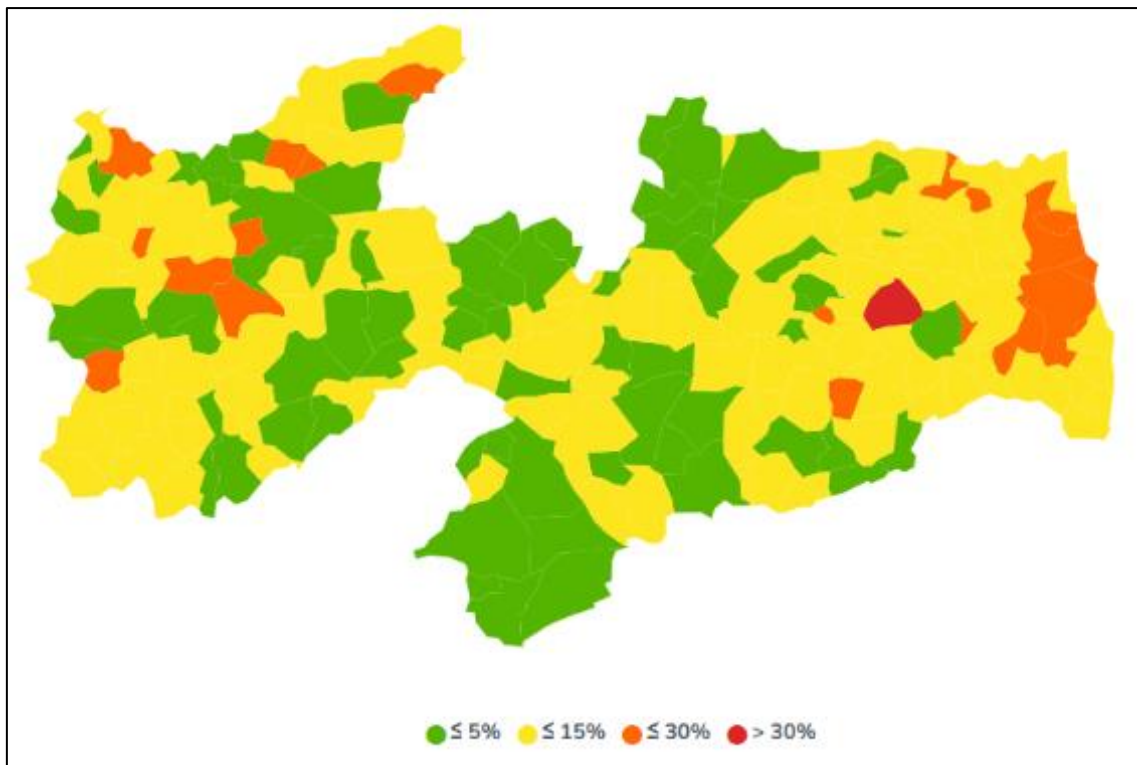

The figures below show the age-grade distortion maps for Paraíba's municipalities, for the initial and final years of elementary school and for secondary school, in 2022.

**Figure133 - Age-Grade Gap Rate in Primary and Secondary Education in Paraíba (2010-2023)**

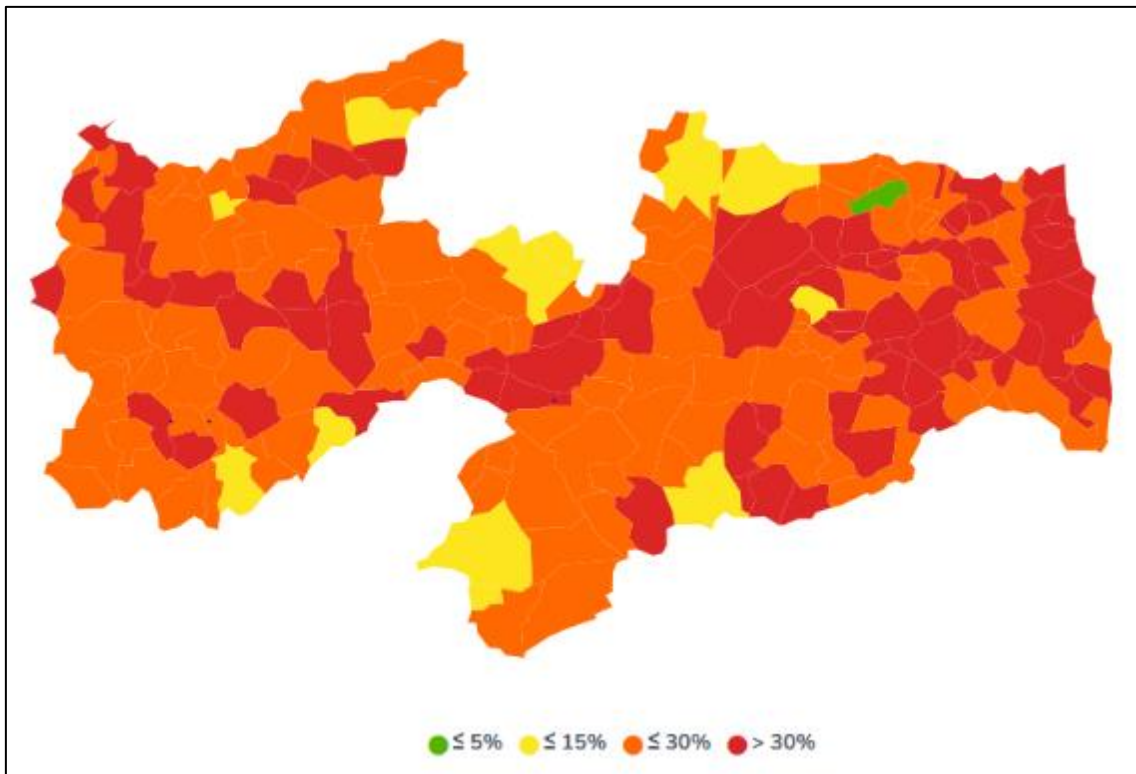

Source: INEP, 2010-2022.

**Figure134 - Map of age-grade distortion (Early Years - Elementary School) of the Municipalities of Paraíba (2022)**

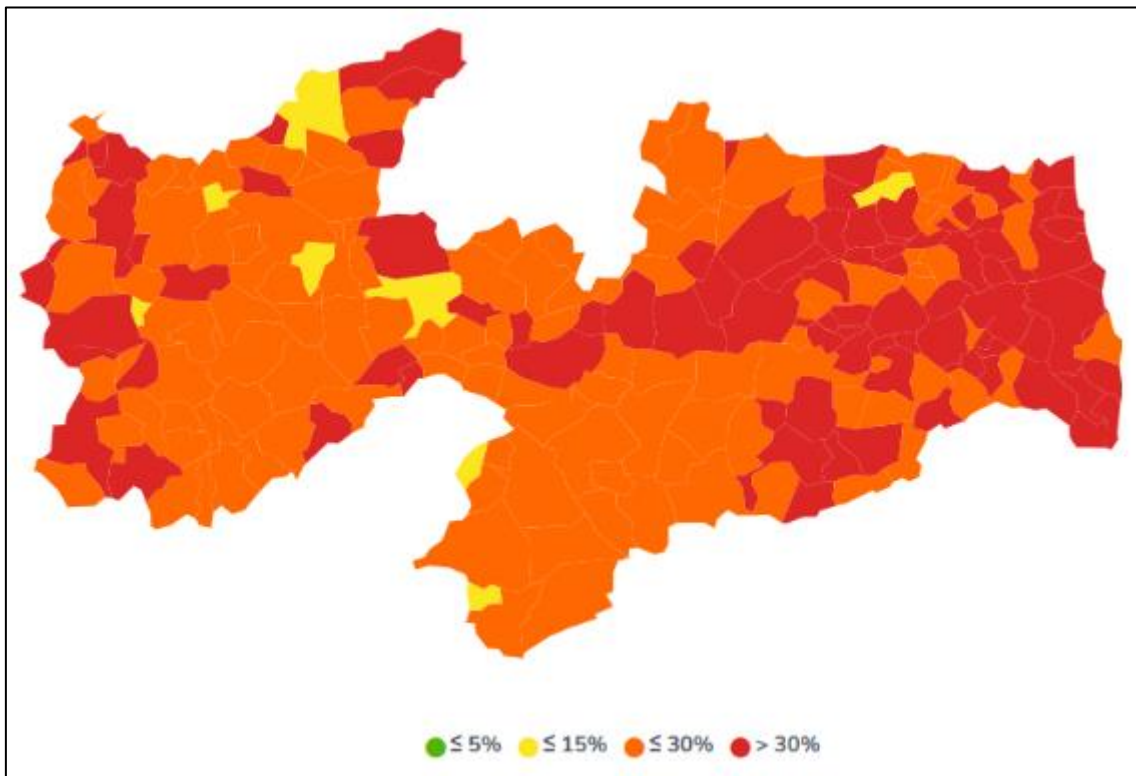

Source: Qedu Platform, 2022.

**Figure135 - Map of age-grade distortion (Final Years - Elementary School) of the Municipalities of Paraíba (2022)**

Source: Qedu Platform, 2022.

**Figure136 - Map of age-grade distortion (High School) in the municipalities of Paraíba (2022)**

Source: Qedu Platform, 2022.

However, in 2010, 16,284 students dropped out of elementary school in Paraíba, which represents a dropout rate<sup>40</sup> of 4.6%. By 2022, this percentage had dropped considerably to 0.9%. The dropout rates in the final years of elementary school and in secondary school also fell significantly in the 2010-2022 period, by 6.4 and 8.1 percentage points respectively.

It should be noted that between 2021 and 2022 there was a considerable increase in the high school rate, from 3.3% to 9.4% over this period of time, as can be seen in the figure below.

**Figure137 - Dropout Rate in Primary and Secondary Education in Paraíba (2010-2022)**

Source: INEP, 2010-2022.

Among Paraíba's municipalities, the highest dropout rates in the first years of elementary school in 2022 were in Mato Grosso (6.6%), São Miguel de Taipu (5.7%) and Lagoa (4.5%); in the final years of elementary school, in Solânea (15.2%), Araçagi (13.2%) and Lagoa de Dentro (12.9%); and in secondary school, in Areia de Baraúnas (29.7%), Monte Horebe (25.4%) and Lucena (24.9%).

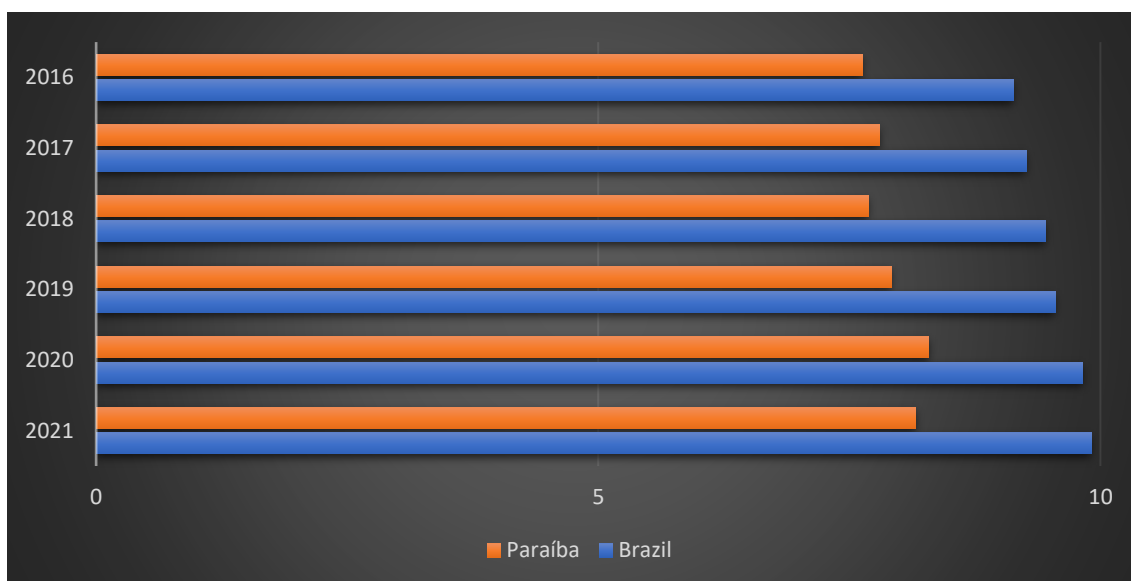

Another educational indicator is the expected years of study, which also summarizes the school attendance of the school-age population. More precisely, it indicates the average number of years of study that a child starting school in the reference year should complete by the time they reach the age of 18.

In 2016, according to information from the Continuous PNAD, this average was 7.63 years in Paraíba and in 2021, it was 8.16 years, which represents an increase over this period of 0.53 years. In the country, in the same period, it increased by 0.78 years, from 9.13 years in 2016 to 9.91 years in 2021.

In the figure below we can see the evolution of the expectation of years of study in Paraíba in the period 2016-2021.

<sup>40</sup> Dropout rate: Indicates the percentage of students enrolled in the stage of education who stop attending school during the school term. It represents the condition of the student who stops attending school during the course of the school year, but re-enrolls the following year, as opposed to "school dropout", when the student does not return the following school term.

**Figure138 - Expected years of schooling in Paraíba - 2016 to 2021**

Source: UNDP - Atlas of Human Development in Brazil, 2022.

In terms of illiteracy, in 1991 in Paraíba, 37.95% of children aged 11 to 14 were illiterate, 30.93% of young people aged 15 to 17 and 29.99% of adults aged 18 to 24 were also illiterate. In 2000, these rates fell considerably, a phenomenon resulting from investments in education: 12.82% in the 11-14 age group, 11.06% in the 15-17 age group and 16.55% among adults aged 18-24. By 2010, a large part of Paraíba's population in these age groups was literate (84.72%).

For people over 25, the illiteracy rate is falling, but at a slower rate than the other age groups. In 1991, almost half of Paraíba's inhabitants over the age of 25 were illiterate (47.14%), in 2000 this figure fell to 36.18%, and in 2010 to 27.42%, which although still a considerable amount shows the municipality's progress in education.

In 2010, among Paraíba's municipalities, the ones with the highest illiteracy rates were Casserengue (42.20%), São José da Lagoa Tapada (42.10%) and Pedro Régis (41.50%), while the lowest rates were found in João Pessoa (7.70%), Campina Grande (11.10%) and Cabedelo (11.50%).

In 2023, a large part of the population aged 15 and over in Paraíba was literate, 86.8% in fact, according to data from the Continuous PNAD (2023). The data shows a gradual reduction in the state's illiteracy rate over the years. In 2016, the rate was 15.4% and, since 2022 (13.6%), it has been below 15%, reaching its lowest point in 2023 (13.2%).

Despite this evolution, the percentage of illiteracy in Paraíba is still the third highest in the country, only surpassed by the rates in Alagoas (14.2%) and Piauí (13.3%), and above the averages for Brazil (5.4%) and the Northeast (11.2%).

According to the IBGE, in 2023 there were around 417,000 illiterate people in Paraíba, with a much higher rate among men (16.1%) than among women (10.5%). The proportion was also higher among black or brown people (14.4%) than among white people (10.6%).

In terms of age groups, the survey shows that in the 60 and over age group, the illiteracy rate (33.1%) was more than double the state average. Despite this, the indicator for this

age group was, in 2023, the lowest recorded in the historical series, well below that seen in 2016 (42.2%), the start of the series.

Another important indicator to analyze is functional illiteracy, defined as follows by UNESCO (United Nations Educational, Scientific and Cultural Organization): "A person is considered to be functionally illiterate if, even if he or she can read and write a simple statement, such as a note, for example, he or she still does not have the reading, writing and calculation skills necessary to participate in social life in its various dimensions: in the community, in the world of work and in politics, for example." In Brazil, there are approximately 14 million absolute illiterates and just over 35 million functional illiterates, according to official statistics. The 2010 IBGE census showed that one in four people are functionally illiterate (the percentage is 20.3%). The biggest problem is in the Northeast, where the rate reaches 30.8%.

In 2012, the Paulo Montenegro Institute and the NGO Ação Educativa published the Functional Illiteracy Indicator (INAF) among university students in Brazil, which stands at 38.0%, reflecting the significant growth in low-quality universities over the last decade. In some developed countries, this rate is less than 10%, as in Sweden, for example.

According to data from the Continuous PNAD (2021), Paraíba registered a rate of 22.9% of functional illiterates that year, the highest rate in the country and more than double the national average for that year (11.4%).

**Table 164 - Illiteracy Rate in Paraíba (1991, 2000 and 2010 )**

Age group (years)	Illiteracy rate (%)		
	1991	2000	2010
11 a 14	37,95	12,82	5,39
15 a 17	30,93	11,06	4,12
18 a 24	29,99	16,55	5,77
25 years or older	47,14	36,18	27,42

Source: UNDP - Atlas of Human Development in Brazil, 2022.

The IDEB is an important index, widely used today, which measures the quality of education in public and private education networks at national level, in states and municipalities, through the approval and average performance of students assessed in the Saeb and Prova Brasil tests, also consolidating the projection of annual development goals.

In the first years of elementary school, the state of Paraíba has been meeting the targets set for public education since 2007.

Moving on to the second cycle of elementary school, the public school system in Paraíba saw an increase in the indices between 2007 and 2011, but from 2013 to 2019 they did not improve, meaning that the municipality did not reach the projected targets for these years. In the final year, 2021, it managed to meet the targets again, equaling the projected target for that year.

The data from the IDEB indices in the public school system in the state of Paraíba are shown in the table below. The figures below show the evolution of the IDEB in the public school system in Paraíba between 2007 and 2021.

**Table 165 - IDEB in the Public Network in the Municipality of Porto Alegre**

Observed IDEB									
Cycle	State	2007	2009	2011	2013	2015	2017	2019	2021
4th grade/5th year	Paraíba	3,3	3,6	4,0	4,2	4,5	4,7	5,0	5,0
8th grade / 9th year		2,8	2,9	3,1	3,2	3,5	3,6	3,9	4,5
Projected targets									
Cycle	State	2007	2009	2011	2013	2015	2017	2019	2021
4th grade/5th year	Paraíba	2,8	3,1	3,5	3,8	4,1	4,4	4,7	5,0
8th grade / 9th year		2,5	2,7	2,9	3,3	3,7	4,0	4,2	4,5

#### 4.3.6 Health

Health indicators are summary measures which include information related to certain attributes and dimensions of health status, as well as the performance of the system in the area in question. The combined analysis of these indicators should reflect the health status of a given population and is important for monitoring health conditions.

The production and use of health information in Brazil involves government structures at the three levels of management (federal, state and municipal) of the Unified Health System (SUS), as well as the IBGE and other sectors of the public administration that produce data and information of commitment to health; teaching and research institutions; technical-scientific associations and those that bring together professional or functional categories; and non-governmental organizations.

The local health system must have health units distributed according to the different levels of complexity of services and according to local and regional realities.

The following description of the data is based on the Strategic Information of the Unified Health System. According to the Ministry of Health, the strategy adopted in the country recognizes the municipality as being primarily responsible for the health of its population. Under the 2006 Pact for Health, the municipal manager signs a term of commitment to fully assume the actions and services in their territory.

Municipalities have specific departments for health management. Municipal managers must use their own resources and those passed on by the federal government and the state.

The municipality formulates its own health policies and is one of the partners in implementing national and state health policies. It coordinates and plans the SUS at municipal level, respecting federal regulations and state planning. It can establish partnerships with other municipalities to guarantee full service for its population, for complex procedures that are above those it can offer.

According to the Ministry of Health, basic health care is a key factor in ensuring an adequate standard of living. That's why it's worth looking at some of the definitions formulated by the same body<sup>41</sup> :

##### Health center

"It is a health unit that provides care to a specific population, estimated at up to 2,000 inhabitants, using appropriate techniques and standardized care schemes. This unit does not have senior professionals on its permanent staff, and care is provided by mid-level or elementary professionals, with the support and supervision of the health centers it is linked to."

---

<sup>41</sup> Definitions adopted by the Health Care Secretariat, 1990.

## Health center

"It is the unit designed to provide health care to a specific population, with a permanent interdisciplinary health team of general practitioners and/or specialists. Its complexity and physical dimensions vary according to the characteristics of the population to be served, the health problems to be solved and according to its size and resolution capacity."

## Local hospital

"It is the health establishment designed to provide inpatient and emergency medical care, in basic medical specialties, for a population in a specific geographical area. For municipalities with clusters of more than 20,000 inhabitants, the local hospital is the first point of reference for hospitalization. The inpatient units of this establishment are sized to provide care in the basic specialties (medical clinic, obstetrics gynecology, pediatrics and surgical clinic) for patients referred from the health centers in its delimited area, as well as providing coverage for emergency care in the same area. Other medical specialties may be developed at the local hospital according to the peculiarities of the local epidemiological situation, but the limitations of the level of complexity of the services offered by this type of health unit must be taken into account."

"The hospital should also have the minimum infrastructure necessary for its operation. As diagnostic support, it should have a clinical pathology and radiodiagnostic laboratory."

## Regional hospital

"It is the health establishment designed to provide inpatient and emergency medical care in basic medical specialties, associated with those considered strategic and necessary for its area of coverage."

The sizing of hospital beds must be taken into account:

- Mixed unit or local hospital - Two beds/1,000 inhabitants in the delimited area, plus one bed/1,000 inhabitants to meet demand from other areas.
- Regional hospital - Two beds/1,000 inhabitants of the defined area, plus one bed/1,000 rural inhabitants of the municipality, plus one bed/1,000 inhabitants of clusters outside the municipality, plus 0.5 bed/1,000 dispersed inhabitants of the programmatic area, outside the municipality. The minimum population of the urban area where a regional hospital is located must not be less than 20,000 inhabitants.

The following table shows the number of establishments according to the type of care provided and by type of agreement in Paraíba, according to DATASUS (2023).

It should be noted that a large part of the services provided were provided by SUS and private health insurance.

**Table 166 - Number of Establishments by Type of Agreement according to Type of Service Provided in Paraíba**

Service provided	SUS	Private	Health insurance	
			Public	Private
Hospitalization	178	59	1	40
Outpatient	3.211	3.673	41	2.157
Urgency	333	60	-	29
Diagnosis and therapy	552	655	12	248
Epidemiological and health surveillance	525	-	-	-
Pharmacy or cooperative	305	120	-	9

Source: MS/DATASUS/CNES. Status of the national database in March 2024. Accessed April 2024.

However, according to standards set by the WHO (World Health Organization), the classic indicator of health care and infrastructure is the number of beds per thousand inhabitants. To meet the necessary demand, the WHO recommends a minimum of 5 beds per thousand inhabitants, while the Ministry of Health estimates the need for beds per thousand inhabitants at 2.5 to 3. It's important to note that health management today is also done on a territorial basis, in which more complex care is allocated regionally to better serve the population.

In 2022, Paraíba had 2.3 beds per thousand inhabitants, taking into account SUS beds (1.8) and beds in private establishments (0.5). Therefore, the state does not meet municipal public health policies or international standards, according to data analyzed from DATASUS (MS, CNES, 2022).

With regard to the number of doctors and nurses per inhabitant, the WHO recommends a ratio of 1 doctor per 1,000 inhabitants as the ideal parameter for health care for the population. For centers with a well-structured service network, experts advocate increasing this parameter. According to information from the study Medical Demography (2023), carried out in partnership between the Brazilian Medical Association (AMB) and the USP School of Medicine (FMUSP), in 2022 the state of Paraíba had 11,396 doctors in various specialties, with a ratio of 2.81 doctors per 1,000 inhabitants, which is above the established recommendations.

But even though Paraíba has enough doctors and meets the WHO recommendations, the problem is the distribution of professionals. In 2023, only the state capital, João Pessoa, concentrated 60.1% of Paraíba's doctors (6,853). As a result, the capital had 8.30 doctors per 1,000 inhabitants that year, more than three times the state average.

### Health problems

The studies carried out on mortality are based on the International Classification of Diseases (ICD), drawn up by the WHO. This is made up of a very large number of diseases, including their variants and complications. As such, health diagnoses are

limited to analysing the situation and trends of a few large groups of causes of morbidity and mortality.

The diagnosis made in this study deals with the analysis of mortality and, to this end, one of the most commonly used indicators is the proportion of deaths by cause group, in relation to the total number of deaths that occurred in a given period, which is known as proportional mortality by defined cause.

On the same theoretical basis, the percentage distribution of hospitalizations by group of causes is also analysed, thus providing a more detailed and plausible diagnosis.

In terms of morbidity rates, the main cause of hospitalizations in Paraíba in 2023 is naturally complications during pregnancy, childbirth and the puerperium, with a percentage of 19.79%. The number of hospitalizations for diseases of the digestive system, at 11.77%, and for diseases of the respiratory system, at 11.28%, are also quite evident. Also noteworthy is the significant incidence of injuries, poisoning and some other consequences of external causes, which account for 9.33% of hospitalizations. Diseases of the circulatory system are the fifth biggest cause with 8.10%.

In 2022, the most frequent deaths in Paraíba were linked to diseases of the circulatory system, accounting for 26.61% of all deaths in the state, followed by neoplasms (tumors) with 13.85% of all deaths. There was also a worrying number of deaths from infectious and parasitic diseases, accounting for 8.29% of all deaths in the state.

It is also worth noting that infectious and parasitic diseases can often be related to deficiencies in the provision of basic sanitation services, allowing the proliferation of vectors and waterborne diseases.

Waterborne diseases are characterized by the presence of pathogenic microorganisms in water used for different purposes. The pathogens can be bacteria, such as Salmonella, or viruses, such as rotavirus, and parasites such as Giardia lamblia. Eventually, these diseases can affect a larger number of people, causing outbreaks and, to an even greater extent, epidemics.

The following figures show the evolution of total hospitalizations and deaths from waterborne diseases in Paraíba between 2010 and 2022. Next, the tables show the percentage distribution of hospitalizations and deaths by group of causes (ICD-10 category) in the Rural Territories and in the state of Paraíba as a whole.

**Figure141 - Evolution of Total Hospitalizations due to Waterborne Diseases in Paraíba**

One of the summary indicators of the population's health and well-being is expressed in the Infant Mortality Rate, represented by the number of infant deaths (children up to 1 year of age) per thousand live births. With this indicator it is possible, among other conclusions, to obtain information on the quality of life, sanitation and health of the inhabitants of a certain region. The WHO establishes that the maximum acceptable levels for this indicator are between 6 and 7.

Between 2000 and 2010, the infant mortality rate fell significantly in the state of Paraíba, from 43.30 per thousand live births in 2000 to 21.67 per thousand live births in 2010. In 2022 this rate was reduced to 14.72, showing that there has been a significant improvement in this indicator, consequently motivated by improvements in health and education infrastructure in the state's municipalities. By comparison, in Brazil, the infant mortality rate was 12.59 in 2022, according to the most recent data released by DATASUS (2022). Despite the significant drop in the indicator, Paraíba is still well above the parameters set by the WHO, as well as having a slightly higher rate than the national average.

With the rate observed in 2022, Paraíba also fails to meet target 3.2 of the United Nations Sustainable Development Goals (SDGs), according to which infant mortality in the country should be below 12 deaths per 1,000 live births by 2030.

In the figure below, which shows the evolution of the Infant Mortality Rate in Paraíba, we can see that, despite the reduction experienced in recent years, the rate recorded in 2022 is the highest since 2011, the lowest being in 2015 (11.64).

**Figure 143 - Evolution of the Infant Mortality Rate in Paraíba**

Source: Ministry of Health, Department of Informatics of the Unified Health System - DATASUS 2022.

In 2022, the highest infant mortality rates among Paraíba's municipalities were found in Lagoa de Dentro (54.95), Barra de Santa Rosa (53.10) and Duas Estradas (50.00), while Bananeiras (3.37), Cuité (4.59) and Teixeira (4.98) had the lowest rates.

## Health quality indicators

In its studies on human development, the UNDP (United Nations Development Program) looks at two other indicators of health and well-being: life expectancy at birth and the total fertility rate. The former is based on an individual's life expectancy from birth and the latter on the average number of children per woman.

In Paraíba, life expectancy at birth increased by 8.59 years between 2000 and 2020, rising from 65.34 years in 2000 to 72.00 years in 2010, and to 73.93 years in 2020. However, between 2020 and 2021 the indicator experienced a significant drop, reaching a rate (71.72 years) in the latter year, even below that shown in 2010. By comparison, in 2021, the average life expectancy at birth for the country was 74.16 years.

**Figure144 - Evolution of Life Expectancy at Birth in Paraíba**

Source: UNDP - Atlas of Human Development in Brazil, 2022.

The total fertility rate, meanwhile, has dropped considerably in recent years in Paraíba, falling from 2.50 in 2000 to 1.70 in 2020, as can be seen in the figure below.

Figure145 - Evolution of the General Fertility Rate in Paraíba

Source: Ministry of Health, Department of Informatics of the Unified Health System - DATASUS 2022.

#### 4.3.7 Basic Sanitation

Article 3 of Law No. 14.026/2020 considers Basic Sanitation to be a set of public services, infrastructures and operational facilities:

- **drinking water supply:** consisting of the activities and the provision and maintenance of infrastructures and operational facilities necessary for the public supply of drinking water, from collection to building connections and their measuring instruments;
- **sanitary sewage:** consisting of the activities and the provision and maintenance of infrastructures and operational facilities necessary for the proper collection, transportation, treatment and final disposal of sanitary sewage, from building connections to its final destination for the production of reuse water or its proper disposal into the environment;
- **urban cleaning and solid waste management:** consisting of activities and the provision and maintenance of infrastructures and operational facilities for the collection, manual and mechanized sweeping, urban cleaning and conservation, transportation, transshipment, treatment and environmentally appropriate final disposal of household solid waste and urban cleaning waste; and
- **Drainage and management of urban rainwater:** consisting of the activities, infrastructure and operational facilities for rainwater drainage, transport, detention or retention to dampen flood flows, treatment and final disposal of drained rainwater, including cleaning and preventive monitoring of networks.

Point XVII of the main section of this article defines an individual alternative sanitation system as a basic sanitation action or the removal and final disposal of sewage, when the location is not directly served by the public network.

According to the SNIS - National Sanitation Information System (2022), 32,037,802 million people have no access to water supply and 90,276,796 million have no total

sewage service/collection in the country, which represents 15.8% and 44.5% of the total population, respectively.

A large part of this population is in the Northeast, specifically 13,319,098 million people without access to water supply, equivalent to 24.4% of the total population of this region, and 37,793,421 million without sewage collection, which represents a significant 69.1%, more than half of the population.

In Paraíba, the percentages are also very high, with 25.2% of the population in 2022 without access to water (1,002,814 people) and 61.1% without sewage collection (2,429,749).

The figure below shows the population of Paraíba without water and sewage, according to the indicators of the Brazil Sanitation Panel available on the Trata Institute website.

**Figure146 - Population of Paraíba without Water and Sewerage**

Source: Brazil Sanitation Panel. Instituto Trata Brasil.

In order to comply with Brazil's New Basic Sanitation Framework (Law No. 14.026/2020) and to seek universalization of the service, Paraíba regionalized its 223 municipalities into 4 Water and Sewage Micro-regions by means of Complementary Law No. 168/2021:

- 1-MSB - Alto Piranhas micro-region:** Aparecida; Belém do Brejo do Cruz; Bernardino Batista; Bom Jesus; Bom Sucesso; Bonito de Santa Fé; Brejo do Cruz; Brejo dos Santos; Cachoeira dos Índios; Cajazeiras; Carrapateira; Catolé do Rocha; Jericó; Joca Claudino; Lagoa; Lastro; Marizópolis; Mato Grosso; Monte Horebe; Nazarezinho; Paulista; Poço Dantas; Poço de José de Moura; Riacho dos Cavalos; Santa Cruz; Santa Helena; São Bento; São Domingos; São Francisco; São João do Rio do Peixe; São José da Lagoa Tapada; São José de Piranhas; São José do Brejo do Cruz; Sousa; Triunfo; Uiraúna; Vieirópolis and Vista Serrana.
- 2-MSB - Espinharas micro-region:** Água Branca; Aguiar; Areia de Baraúnas; Boa Ventura; Cacimba de Areia; Cajazeirinhas; Catingueira; Conceição; Condado; Coremas; Curral Velho; Diamante; Emas; Ibiara; Igaracy; Imaculada; Itaporanga; Juru; Mãe D'Água; Malta; Manaíra; Nova Olinda; Olho d'Água; Passagem; Patos; Pedra Branca; Piancó; Pombal; Princesa Isabel; Quixaba; Salgadinho; Santa Inês; Santa Luzia; Santana de Mangueira; Santana dos Garrotes; Santa Teresinha; São Bentinho; São José de Caiana; São José de Espinharas; São José de Princesa; São José do Bonfim; São José do Sabugi; São Mamede; Serra Grande; Tavares and Várzea.
- 3-MSB - Borborema micro-region:** Alagoa Grande; Alagoa Nova; Alcantil; Algodão de Jandaíra; Amparo; Arara; Araruna; Areial; Aroeiras; Assunção; Bananeiras; Baraúna; Barra de Santana; Barra de Santa Rosa; Barra de São

Miguel; Boa Vista; Boqueirão; Cabaceiras; Cacimba de Dentro; Cacimbas; Camalaú; Campina Grande; Caraúbas; Casserengue; Caturité; Congo; Coxixola; Cubati; Cuité; Damião; Desterro; Dona Inês; Esperança; Fagundes; Frei Martinho; Gado Bravo; Gurjão; Juazeirinho; Junco do Seridó; Lagoa Seca; Livramento; Massaranduba; Matinhas; Maturéia; Montadas; Monteiro; Natuba; Nova Floresta; Nova Palmeira; Olivedos; Ouro Velho; Parari; Pedra Lavrada; Picuí; Pocinhos; Prata; Puxinanã; Queimadas; Remígio; Riachão; Riachão do Bacamarte; Riacho de Santo Antônio; Santa Cecília; Santo André; São Domingos do Cariri; São João do Cariri; São João do Tigre; São José dos Cordeiros; São Sebastião de Lagoa de Roça; São Sebastião do Umbuzeiro; São Vicente do Seridó; Serra Branca; Serra Redonda; Serraria; Solânea; Soledade; Sossêgo; Sumé; Tacima; Taperoá; Teixeira; Tenório; Umbuzeiro and Zabelê.

- **4-MSB - Coastal Microregion:** Alagoinha; Alhandra; Araçagi; Areia; Baía da Traição; Bayeux; Belém; Borborema; Caaporã; Cabedelo; Caiçara; Caldas Brandão; Capim; Conde; Cruz do Espírito Santo; Cuité de Mamanguape; Cuitegi; Curral de Cima; Duas Estradas; Guarabira; Gurinhém; Ingá; Itabaiana; Itapororoca; Itatuba; Jacaraú; João Pessoa; Juarez Távora; Juripiranga; Lagoa de Dentro; Logradouro; Lucena; Mamanguape; Marcação; Mari; Mataraca; Mogeiro; Mulungu; Pedras de Fogo; Pedro Régis; Pilar; Pilões; Pilõezinhos; Pirpirituba; Pitimbu; Riachão do Poço; Rio Tinto; Salgado de São Félix; Santa Rita; São José dos Ramos; São Miguel de Taipu; Sapé; Serra da Raiz; Sertãozinho and Sobrado.

Figure147 - Map of Paraíba's Basic Sanitation Microregions

Source: Water and Sewerage Microregions of the State of Paraíba. Fundace, 2021.

According to the Instituto Água e Saneamento (Water and Sanitation Institute)<sup>42</sup>, of the 223 municipalities, 30 have drawn up Basic Sanitation Plans, 42 are in the process of doing so and 151 have no plan.

With regard to basic sanitation services, of the 223 municipalities in Paraíba, 200 are served by the Paraíba Water and Sewage Company - CAGEPA, whose service, according to the company's official website, benefits 2,789,463 people with water service and 1,177,816 with sewage throughout the state, which is equivalent to a coverage rate of 92.39% and 41.65%, respectively.

## Water Supply

CONAMA Resolution 357/2005 establishes the classification of water depending on its use. As a result, the Type of Water Treatment goes from a strict level of requirements to a less demanding level, as can be seen in the table below.

**Table 183 - Water Class and Type of Treatment**

CLASS	TYPE OF TREATMENT
Special	FILTRATION AND DISINFECTION
Class 1	Simplified treatment
Class 2	Conventional treatment
Class 3	Conventional or advanced treatment
Class 4	For less demanding uses such as browsing

Source: Product 2-Preliminary Diagnostic Report. Support in the Studies and Proposals for the Implementation of the Paraíba Sustainable Rural Development Project - Procasa II (Br-L 1623), specifically, in the Actions of Component 2- Resilient Productive Systems for the Treatment of Poverty, 27/03/2024.

The types of water treatment will depend on the water's potability standards in terms of its use, for human consumption Ordinance GM/MS No. 2,472/2021, in its article 2, states that for human consumption the water must come from: Water Supply Systems (SAA), Alternative Collective Water Supply Solution (SAC), Alternative Individual Water Supply Solution (SAI) and water tanker<sup>43</sup>, and all water distributed collectively by SAA, SAC or water tanker must be subject to water control<sup>44</sup> and surveillance<sup>45</sup>, while those from SAI must be subject to surveillance, as shown in the table below (DE LIMA, 2024).

<sup>42</sup> Instituto Água e Saneamento is a platform to facilitate access to information on sanitation in Brazil's 5,570 municipalities. <https://www.aguaesaneamento.org.br/es/>.

<sup>43</sup> Water tanker: a vehicle equipped with a tank used exclusively for distributing and transporting water for consumption.

<sup>44</sup> Control of the quality of water for human consumption: set of activities carried out regularly by the person responsible for the system or alternative collective water supply solution, aimed at verifying that the water supplied to the population is potable, in order to ensure that this condition is maintained.

<sup>45</sup> Surveillance of the quality of water for human consumption: a set of actions adopted regularly by the public health authority to verify compliance and assess whether the water consumed by the population presents a health risk.

**Table 184 - Characteristics of Water Supply Modalities**

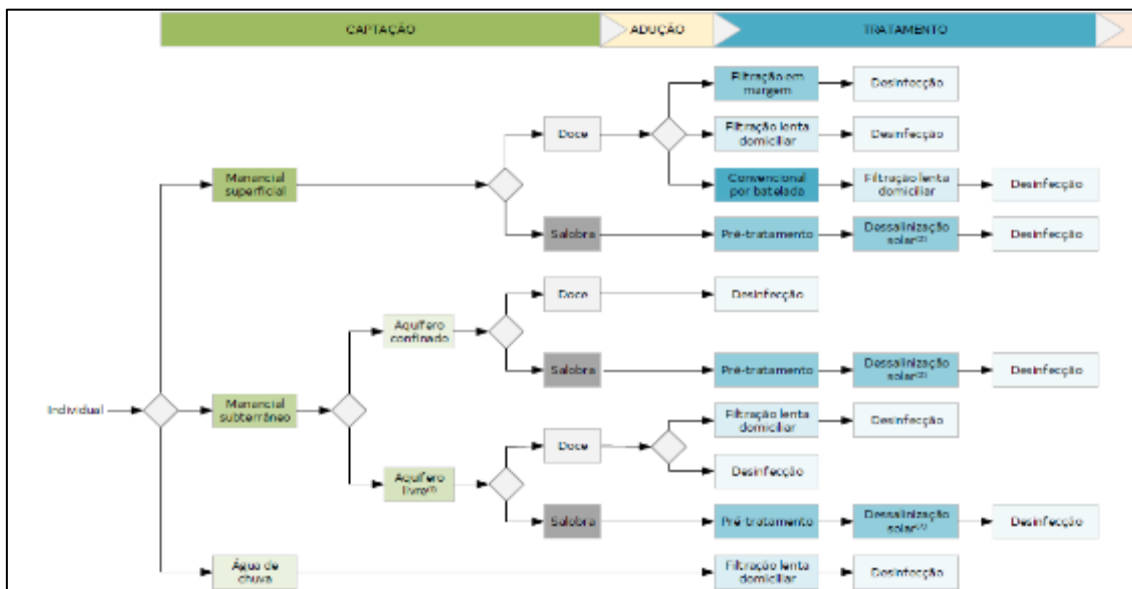

Mode of Supply	Scope	Distribution	Example
<b>1-Individual Alternative Solution - IAS</b>	Single-family	Simple piping	Direct abstraction from springs and wells
<b>2-Collective Alternative Solution- SAC</b>	Press conference	Single pipe and reservoir	Collection, supply and reservoir (fountain)
<b>4-Water Supply System - WSS</b>	Press conference	Distribution Network	Collection, adduction, reservoir and distribution network and building connections

Source: Product 2-Preliminary Diagnostic Report. Support in the Studies and Proposals for the Implementation of the Paraíba Sustainable Rural Development Project - Procasa II (Br-L 1623), specifically, in the Actions of Component 2- Resilient Productive Systems for the Treatment of Poverty, 27/03/2024.

The Water Supply Solution or System is implemented in areas where water is supplied from surface or underground sources. The SACs and SAAs must have a qualified technician responsible for the operation, with the respective ART issued by the Class Council (DE LIMA, 2024).

Individual water supplies can be provided in two ways: by Alternative Individual Water Solutions (SAI) or by rainwater, both of which must be treated by disinfection and filtration, as can be seen in the figure below (DE LIMA, 2024).

**Figure148 - Types of Treatment for Individual Water Supply System or Solution**

Source: Product 2-Preliminary Diagnostic Report. Support in the Studies and Proposals for the Implementation of the Paraíba Sustainable Rural Development Project - Procasa II (Br-L 1623), specifically, in the Actions of Component 2- Resilient Productive Systems for the Treatment of Poverty, 27/03/2024.

According to IBGE data, 74.49% of households in Paraíba were connected to the general water distribution network in 2022 (IBGE Demographic Census). In 2010, this percentage was 76.71%, almost all of which were located in urban areas (94.07%), and only 19.32% in rural areas, where the most commonly used water supply system was a cart or

rainwater (26.80%). For 2022, the IBGE has not yet provided data by household situation.

In Paraíba's Rural Territories, according to data from the 2022 Census (IBGE), only three of them had a percentage of households connected to the general water distribution network above the state average: Mata Sul (89.07%), Brejo (80.29%) and Médio Sertão (76.41%). In turn, the lowest rates were found in the Curimataú RT and the Piemont da Borborema RT, both of which had less than half of their households served by a general network, 31.55% and 43.48% respectively.

It should be noted that, in the same year, the most used form of water supply in the Curimataú RT was the water tanker or rainwater (35.83%), while in the Piemont da Borborema RT a significant proportion of households used stored rainwater (21.96%).

The following table shows the percentage of households covered by water supply in 2022 in Paraíba and the Rural Territories.

**Table 185 - Water Supply in Paraíba (Households - Coverage Percentage) - 20 22**

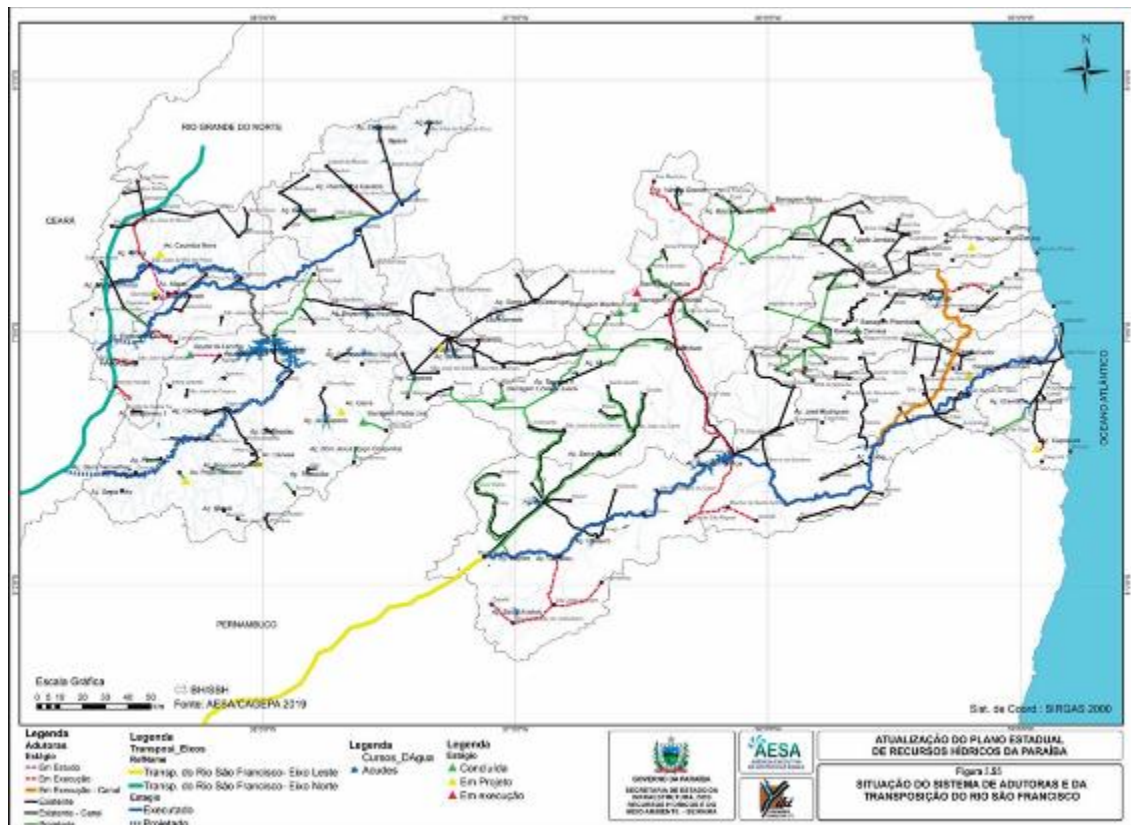

Rural Territories and UF	Water Supply							
	General distribution network	Deep or artesian well	Shallow well, phreatic well or cistern	Fountain, spring or mine	Water tanker	Stored rainwater	Rivers, reservoirs, streams, lakes and streams	Other

Source: IBGE - Demographic Census, 2022.

In Paraíba, an extensive system of water mains spreads across the entire territory, with the largest concentration in the central region of the state (Cariri, Brejo and Seridó regions), as can be seen in the figure below.

**Figure149 - Status of the Pipeline System in Paraíba**

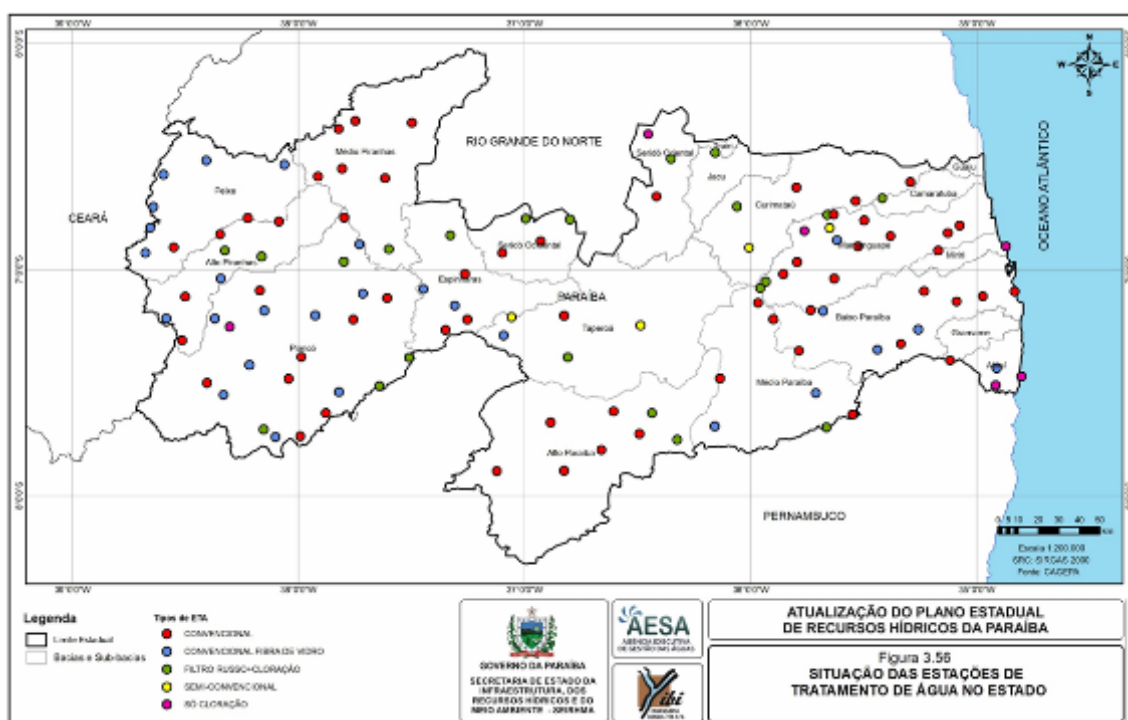

Source: Paraíba State Water Resources Plan, 2022.

In the state of Paraíba, there are currently 133 water treatment plants in operation, as shown in the figure below. These WTPs can be classified according to the type of treatment used, with the majority of the state's WTPs (45.9%) being conventional, totaling 61, followed by conventional with fiberglass (21.1%), Russian filters + staining (18%) and chlorination only (8.3%). (Paraíba, 2022).

**Figure150 - Status of Water Treatment Plants in Paraíba**

## Drainage

The analysis of Paraíba's sewage system is extremely important for socio-environmental analysis, given that access to sewage collection and treatment services reduces the chances of domestic effluent contaminating watercourses, while avoiding unhealthy environments that are prone to the proliferation of disease vectors.

According to data from the latest IBGE Demographic Census, less than half of the households (49.08%) in Paraíba had access to the general network, rainwater network or cesspit connected to the sewage network in 2022 (46.80% general or rainwater network and 2.29% septic tank or filter tank connected to the network).

In 2022, a large proportion of homes were still served by more precarious types of sewage, such as septic tanks or filter tanks not connected to the network and rudimentary cesspools, representing 16.05% and 28.13%, respectively, of the total number of homes in the state.

Septic tanks are simple sanitation infrastructures that enable primary treatment of the effluent through physical-chemical separation of the matter contained in the sewage. Widely used in rural homes, septic tanks can remove around 40% of the Biological Oxygen Demand (BOD) contained in sewage. Black or rustic cesspits, also very common in rural areas, are very precarious alternatives to this type of sewage disposal. They are often mistaken for septic tanks.

It should be noted that, in 2022, a small number of households in Paraíba disposed of their waste directly into the river, lake, stream or sea (1.41%) or into open ditches (2.95%), as can be seen in the table below.

**Table 186 - Sanitary Sewerage in Paraíba (Households - Coverage Percentage) - 2022**

Rural Territories and UF	Type of Sanitary Drainage								
	General network, rainwater network or cesspit connected to the network	General or rainwater network	Septic tank or filter tank connected to the network	Septic tank or filter tank not connected to the network	Rudimentary pit or hole	Ditch	River, lake, stream or sea	Another way	They had no bathroom or toilet
TR Alto Sertão	47,47%	44,28%	3,19%	19,96%	26,45%	2,34%	0,59%	2,00%	1,19%

Source: IBGE - Demographic Census, 2022.

In Paraíba's Rural Territories, according to data from the 2022 Census (IBGE), shown in the previous table, only in 5 of them were the percentages of households connected to the general network, rainwater network or cesspit connected to the network above half: TR Médio Sertão (68.98%), TR Borborema (62.70%), TR Médio Piranhas (58.72%), TR Vale do Piranhas (54.46%) and TR Vale do Maringá (53.41%). In turn, the lowest rates were found in the Mata Norte TR, Vale do Paraíba TR and Piemont da Borborema TR, 11.64%, 14.22% and 29.22%, respectively.

With regard to the population served per municipality, according to data from SNIS (2022), João Pessoa and Campina Grande are the cities with the largest population served by sanitary sewage, totaling 1,137,388 inhabitants, or almost 29% of the population of the state of Paraíba.

As for the volume of sewage collected, the largest volumes are collected in João Pessoa and Campina Grande, followed by Pombal, Guarabira, Boqueirão, Cabedelo and Santa Luzia (Paraíba, 2022).

### **Garbage collection**

Addressing data on solid waste collection is of the utmost importance, given that the incorrect disposal of this material can become a vector for diseases through rodents and insects present in unsanitary areas. It also has the potential to pollute watercourses and extremely delicate biomes.

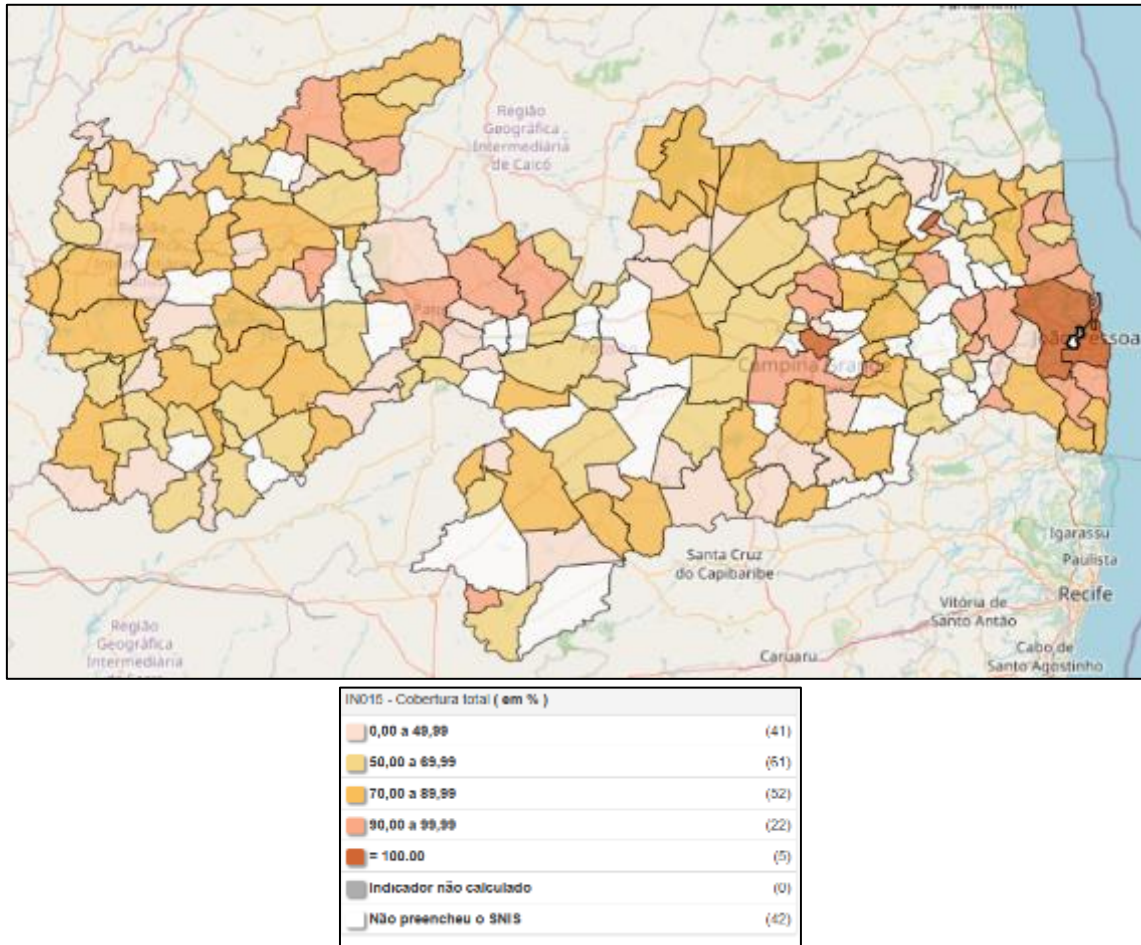

According to the IBGE (2022), garbage collection in Paraíba comprised a large proportion of households, representing 84.61% of all dwellings (79.55% collected at home by a cleaning service and 5.06% deposited in a cleaning service skip).

It should be noted that, in the same year, some of the waste was burned or buried on the property, specifically 14.13%, and 1.01% was dumped on vacant lots, hillsides or public areas, as can be seen in the table below.

Among Paraíba's Rural Territories, the ones with the highest percentages of households with garbage collection in 2022 were the Mata Sul RT, with almost all households (95.95%), and the Borborema RT, with 83.24%. The Cariri RT and the Curimataú RT, with 68.00% and 70.60% respectively, had the lowest coverage rates in the same year.

With regard to solid waste collection coverage by municipality, according to SNIS data (2022), only five cities (João Pessoa, Cabedelo and Santa Rita, in the Mata Sul RT; Lagoa Seca, in the Borborema RT; and Serra da Raiz, in the Brejo RT) had 100% coverage.

**Figure152 - Solid Waste Collection Coverage in Paraíba**

Source: SNIS, 2022.

In relation to solid waste disposal, the Paraíba Public Prosecutor's Office's Environmental Operational Support Center found in 2023 that the majority of Paraíba's municipalities (207 out of 223) use sanitary landfills as a way of disposing of solid waste. They also identified 7 cities with signs of dumps and another 9 that dispose of solid waste in active dumps. These figures represent an improvement on the data from 2022, when 29 municipalities still resorted to dumps to dispose of their waste, 22 of which deposited all their waste there and 7 sent part of it to landfills (PARAÍBA, 2023b).

According to a survey carried out by the Paraíba Public Prosecutor's Office, the number of cities with correct waste disposal has risen from 29 in 2017 to 194 in 2022, as can be seen in the "Map of dumps" below, carried out by the ministerial body (PARAÍBA, 2023b).

**Figure153 - "Map of garbage dumps" in Paraíba, 2022**

#### 4.3.8 Public Security

According to data obtained from the Brazilian Public Security Yearbook (2023), there were 47,398 victims of intentional violent deaths in the country in 2022, which represents a rate of MVI<sup>46</sup> of 23.3 per 100,000 inhabitants and a reduction of 2.4% compared to the previous year.

<sup>46</sup> The Intentional Violent Deaths (IVD) category corresponds to the sum of victims of intentional homicide, robbery, bodily injury followed by death and deaths resulting from on-duty and off-duty police interventions (in some cases, counted under intentional homicides). Thus, the MVI category represents the total number of victims of violent deaths with defined intent in a given territory. The number of police officers killed is already included in the total of intentional homicides and is presented here only to measure the phenomenon.

In 2022, among the highest rates of MVI in the country was a state in the Northeast region, the state of Bahia, with 47.1 per 100,000 inhabitants, only surpassed by the state of Amapá, which had a rate of 50.6 that same year. The lowest rates were found in the states of São Paulo (8.4), Santa Catarina (9.1) and the Federal District (11.3).

**Figure154 - Highest and lowest MVI rates in Brazil by state (2022)**

Source: Brazilian Public Security Yearbook (2023). Brazilian Public Security Forum. 17th Brazilian Public Security Yearbook.

The state of Paraíba followed the national trend in terms of victims of intentional violent deaths. In absolute terms, according to data from the 2023 Yearbook of Security and Social Defense in Paraíba, in 2022 there were 1,090 victims of intentional violent deaths, which represents an MVI rate of 27.4 per 100,000 inhabitants, while in 2023 there were 1,069 victims, an MVI rate of 26.9 per 100,000 inhabitants, so there was a 2% reduction compared to the previous year.

**Figure155 - Annual Historical Series of Absolute MVI and Rates per 100,000 inhab. in Paraíba**

Source: Anuário 2023 da Segurança e da Defesa Social na Paraíba.

Before the MVI, the statistical indicator used as of June 2023, the indicator in use was called CVLI - Lethal and Intentional Violent Crimes, which aggregated intentional homicides and other intentional crimes resulting in death, except for the number of deaths in confrontations with state agents, as the MVI does now.

In Paraíba, in absolute terms, in 2022, there were 1,036 victims of Lethal and Intentional Violent Crimes - CVLI, which represents a CVLI rate of 26.1 per 100,000 inhabitants, while in 2023, there were 995 victims, a CVLI rate of 25.0 per 100,000 inhabitants, so there was a 4% reduction compared to the previous year.

With the program, Paraíba Unida pela Paz, implemented by the state government in 2011, Paraíba achieved consecutive annual reductions in Lethal and Intentional Violent Crimes - CVLI from 2012 onwards, which were only discontinued in 2020 with the COVID-19 Pandemic.

**Figure156 - Annual Historical Series of Absolute CVLI and Rates per 100,000 inhab. in Paraíba**

Source: Anuário 2023 da Segurança e da Defesa Social na Paraíba.

With a CVLI rate of 25.0 per 100,000 inhabitants in 2023, Paraíba is well below the regional average, which reached a CVLI rate of 31.8 per 100,000 inhabitants in the same year, but above the national average (20.0). However, in general, since 2018, Paraíba has followed the downward trend in lethal violence in Brazil and in the northeast region with its percentage variations.

Last year, despite the reductions in Brazil, the Northeast is still the region with the highest CVLI rate in the country, with the highest volume in absolute numbers of deaths, and has four of the six federal units with the highest violent lethality rates in 2023. In addition, of the six states that have not reduced homicides in 2023, four are in the Northeast.

**Figure157 - Annual Historical Series of Absolute CVLI and Rates per 100,000 inhab. in Paraíba, the Northeast and Brazil**

Source: Anuário 2023 da Segurança e da Defesa Social na Paraíba.

In the regional comparison, among the 9 Northeastern states, Paraíba was in 7th place in the ranking of the most violent states in 2023, with Pernambuco in first place, with a CVLI rate of 38.7 per 100,000 inhabitants, and Sergipe in last place (20.7).

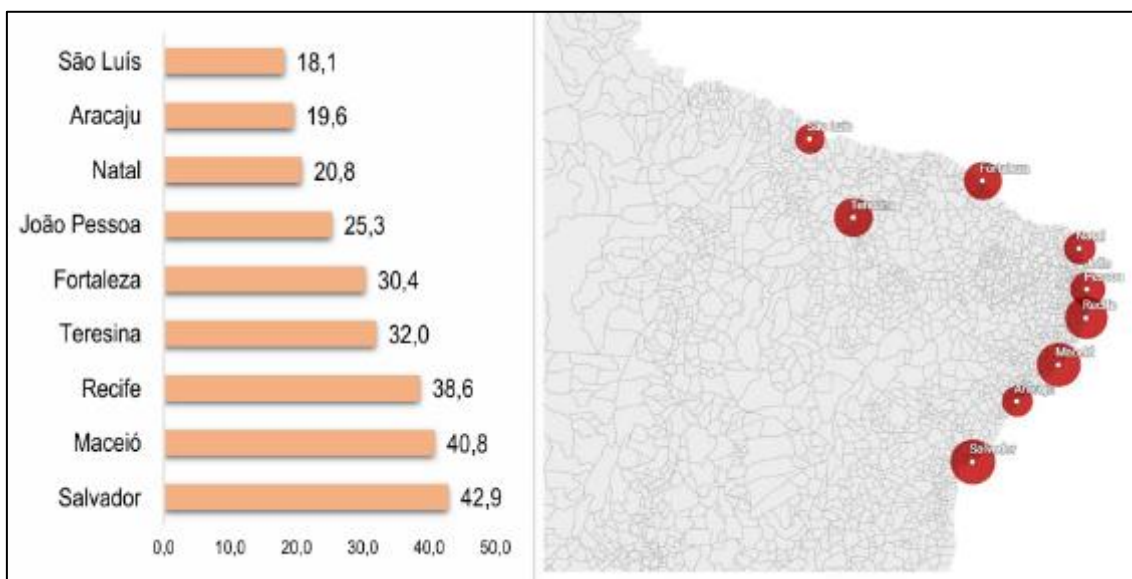

**Figure158 - Comparison of CVLI Rates in the Northeastern States in 2023**

Source: Anuário 2023 da Segurança e da Defesa Social na Paraíba.

When comparing the capitals of the Northeastern states, João Pessoa was in 6th place in the violence ranking in 2023, with a CVLI rate of 25.3 per 100,000 inhabitants, while Salvador (42.9) was in first place and São Luís in last.

**Figure159 - CVLI Rates in the Capitals of the Northeastern States in 2023**

Source: Anuário 2023 da Segurança e da Defesa Social na Paraíba.

It is worth noting that, in 2023, the CVLI rates of some Paraíba municipalities with a population of over 20,000 inhabitants, such as João Pessoa (25.0), Bayeux (53.2), Cabedelo (66.1), Patos (30.0), Sapé (25.3) and Mamanguape (31.4) were higher than the state average (25.0). The CVLI rate in Santa Rita, the most violent municipality in the state in recent years, reaching a maximum CVLI rate in 2012 of 118.0 per 100,000 inhabitants, is also well above the state average (42.0).

**Figure160 - CVLI rates for some municipalities in Paraíba with a population over 20,000 inhabitants and for Paraíba.**

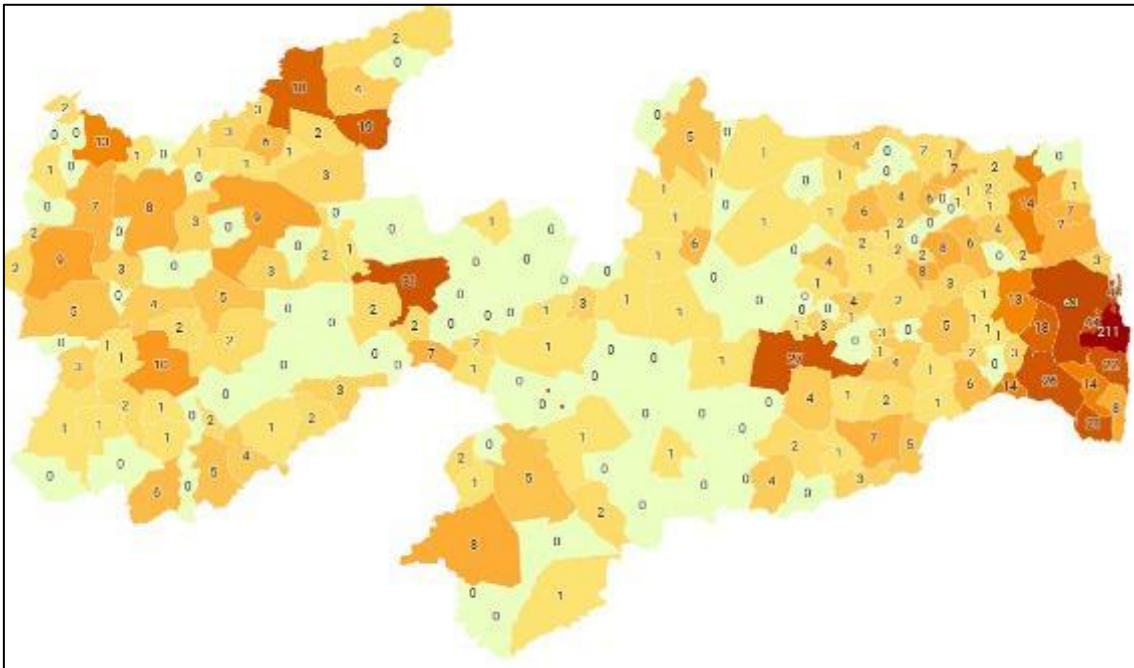

Source: Anuário 2023 da Segurança e da Defesa Social na Paraíba.

A total of 73 cities in Paraíba did not register any CVLI in 2023, as can be seen in the figure below, the highest number of municipalities without CVLI in the year since 2014.

Of this total, seven municipalities - Carrapateira, Gurjão, Joca Claudino, Lastro, Santa Helena, São Domingos and Serra da Raiz - have gone five years without a CVLI.

**Figure161 - CVLI in Paraíba by Municipalities (2023)**

Source: Anuário 2023 da Segurança e da Defesa Social na Paraíba.

It is worth noting that, in 2022, of the 50 most violent cities in the country, according to the Intentional Violent Deaths (IVD) rate, with a population of over 100,000 inhabitants, one state in the Northeast, Bahia, had the largest number of them, with four (Jequié, Santo Antônio de Jesus, Simões Filho and Camaçari) in the top positions. The state of Paraíba, meanwhile, placed two cities in this ranking, Santa Rita and Patos, in 20th and 33rd place respectively, as can be seen in the table below.

**Table 188 - 50 most violent cities in the country, according to the rate of Intentional Violent Deaths (IVD), with population over 100 thousand inhabitants (Brazil - 2022)**

When comparing the types of violence between 2022 and 2023, according to data from the 2023 Yearbook of Security and Social Defense in Paraíba, there was a 26% reduction in robberies in the state during this period, but cases of femicide and deaths resulting from police confrontations increased significantly, by 31% and 37% respectively. Bodily injuries followed by death remained unchanged between these years.

**Figure162 - Comparison of Indicator Subcategories in 2022 and 2023 in Paraíba**

Source: Anuário 2023 da Segurança e da Defesa Social na Paraíba.

In relation to robberies, which is a type of violence in which there is an attempted robbery followed by violent crimes that result in the death of the victim, in Paraíba there was a 26% reduction in the 2022-2023 period, going from 34 cases (robbery rate of 0.86 per 100,000 inhab.) to 25 between those years (0.63).

**Figure163 - Annual historical series of murders and rate of murders per 100,000 inhabitants in Paraíba**

Source: Anuário 2023 da Segurança e da Defesa Social na Paraíba.

Another issue worth highlighting is that 88.8% of homicides in Paraíba are committed by black and brown people, an important indication of "structural racism" in the state that needs to be combated with public policies, in all their various spheres and cross-cutting aspects.

**Figure164 - Historical Series of Homicide Distribution by Color\* in Paraíba**

\*Considering deaths by aggression according to ICD-10.  
 Source: Anuário 2023 da Segurança e da Defesa Social na Paraíba.

Looking at the historical series of black homicides, we can see that between 2022 and 2023 there was a 3% reduction, from 927 cases in 2022 to 899 in 2023. The figure below also shows an accumulated reduction of 38% in the CVLI of black people since 2011.

**Figure165 -Historical Series of Homicides\* of the Black Population (Black + Brown) in Paraíba**

\*Considering deaths by aggression according to ICD-10.  
 Source: Anuário 2023 da Segurança e da Defesa Social na Paraíba.

Regarding violence against women, Paraíba has seen a reduction in CVLI against female victims, from a high of 146 cases in 2011 to a low of 73 in 2019. In 2023 there was the second lowest annual total in the historical series, with 75 victims, which represents an accumulated drop of 49% since 2011. Last year, of every 100 people murdered in the state, around 93 were men and 7 were women, which means that, proportionally, the CVLI rate per group of 100,000 women was 3.6, while the CVLI rate per group of 100,000 men was 47.9.

Even so, it cannot be considered that men are exposed to a greater risk of lethality than women, since the reasons behind homicides against men are rarely related to the male gender. In the case of women, the opposite is true, so much so that Brazilian legislation has established its own criminal type to highlight and give unique criminal treatment to a specific situation. In 2015, the crime of femicide was created (PARAÍBA, 2024).

The first difficulty encountered is that to define a femicide, it is necessary to solve the murder. In relation to the CVLIs of women that occurred in Paraíba from January to October 2023, the civil and military police solved 79% of these, with 53% solved with the arrest of the possible perpetrator. However, despite the 13% decrease in CVLI cases against women compared to the previous year, femicides increased in 2023. With 34 cases, the number returned to the average level seen between 2018 and 2021, with 2022 being the only year with a lower result. This growth, although numerically it has little impact on the total amount of CVLI victims, attracts the concern of Public Security management, as it places Paraíba with a Femicide rate higher than the regional and national average (PARAÍBA, 2024).

**Figure166 - Historical Series of Women's CVLI and Rates per 100,000 in Paraíba**

Source: Anuário 2023 da Segurança e da Defesa Social na Paraíba.

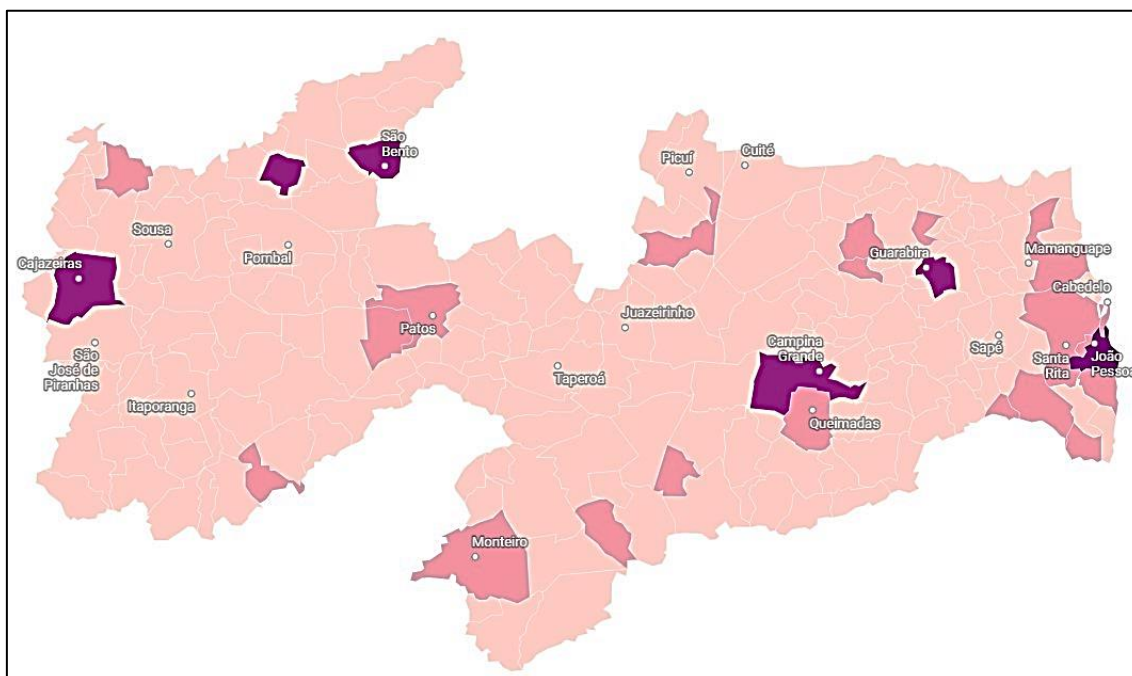

**Figure167 - Historical Series of Femicides and CVLI against Women in Paraíba**

Source: Anuário 2023 da Segurança e da Defesa Social na Paraíba.

The figure below, which shows the map of femicides by municipality in Paraíba in 2023, reveals that in that year the cities with the highest number of cases were João Pessoa (3), Guarabira (2), Campina Grande (2), São Bento (2), Jericó (2) and Cajazeiras (2).

**Figure168 - Map of femicides by municipality in Paraíba in 2023**

Source: Anuário 2023 da Segurança e da Defesa Social na Paraíba.

However, in 2022, according to data from the Brazilian Public Security Yearbook (2023), there were the highest number of rapes in the country's history, with 74,930 victims (18,110 rapes and 56,820 rapes of the vulnerable), which represents an increase of 8.2% compared to 2021. Most of the rapes took place in the victim's home (68.3%) and 9.4%

on public roads, of which 88.7% were female and 11.3% male. The main victims are children, 61.4% are between 0 and 13 years old and 10.4% are under 4 years old.

Among victims aged 0 to 13, 86.1% were known aggressors and 64.4% were family members, and among victims aged 14 and over, 77.2% were known aggressors and 24.3% were perpetrated by intimate partners or ex-partners.

With regard to the color or race of the victims, 56.8% were black, 42.3% white, 0.5% indigenous and 0.4% yellow.

**Figure169 - Indicators of rape cases in Brazil (2022)**

Source: Brazilian Public Security Yearbook (2023). Brazilian Public Security Forum. 17th Brazilian Public Security Yearbook.

In Paraíba, the number of rapes also grew between 2021-2022, from 148 cases in 2021 to 167 in 2022, an increase of 12.3%. However, in the same period, the number of rapes of vulnerable people fell by 5.9%, from 401 in 2021 to 379 in 2022, as can be seen in the table below.

**Table 189 - Rape and Rape of a Vulnerable Person in Brazil by State (2021-2022)**

The number of rapes against female victims also increased in Paraíba from 2021 (141 cases) to 2022 (155 cases), an increase of 9.4%. On the other hand, in the same period, the number of rapes of vulnerable people fell by 7.4%, from 346 in 2021 to 322 in 2022, as can be seen in the table below.

Source: Brazilian Public Security Yearbook (2023). Brazilian Public Security Forum. 17th Brazilian Public Security Yearbook.

With regard to road safety, we can see that, according to data from the 2023 Yearbook of Security and Social Defense in Paraíba shown in the figures below, in 2018 there were a total of 751 deaths from traffic accidents, which represents an average of more than two people killed every day in Paraíba as a result of this type of violence, with an average of 18.8 people killed per year per 100,000 inhabitants. In the following years (2019, 2020 and 2021), there was a slight drop in the figures. However, in 2022, the number of deaths from traffic accidents reached 802 cases, resulting in an average of around 20.2 cases per 100,000 inhabitants (PARAÍBA, 2024).

Most of these deaths occur in accidents involving motorcycle occupants. In 2023, 70% of all cases of fatal accidents involved motorcycle occupants, either as the driver or as the rider (PARAÍBA, 2024).

**Figure170 - Annual Historical Series of victims of Lethal Traffic Accidents - LTA in Paraíba**

Source: Anuário 2023 da Segurança e da Defesa Social na Paraíba.

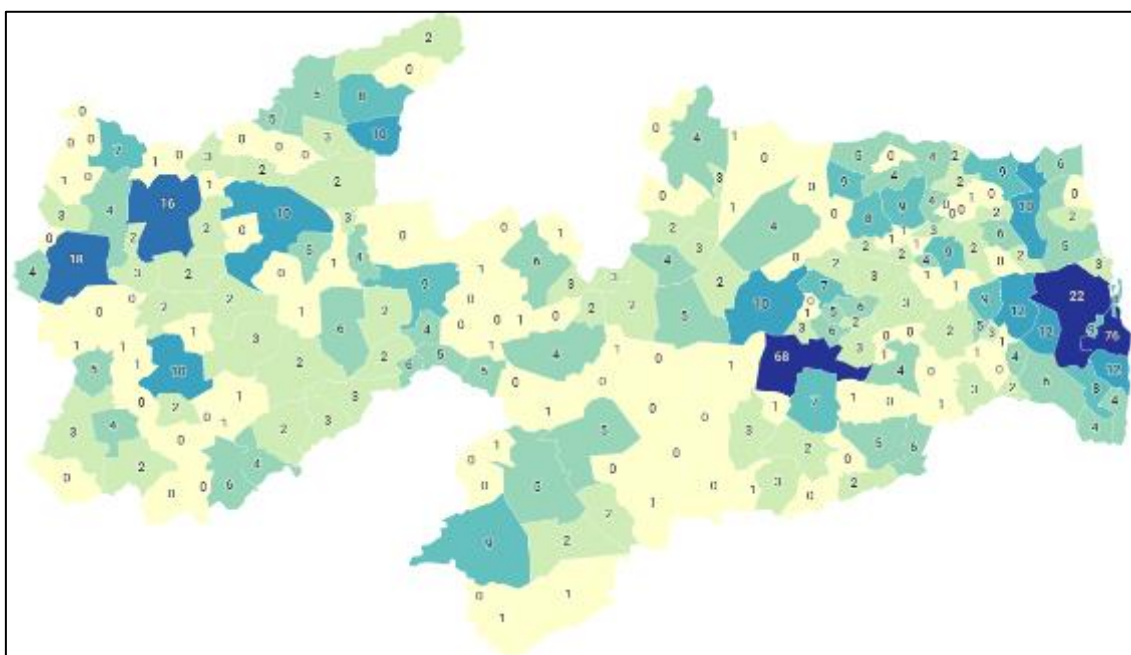

**Figure171 - Annual historical series of ALT victims in Paraíba by transportation category**

Source: Anuário 2023 da Segurança e da Defesa Social na Paraíba.

In general, the most populous cities have the highest number of traffic fatalities and in the period from 2018 to 2023, as expected, João Pessoa and Campina Grande stood out by having a significantly higher number of ALTs compared to other cities in Paraíba (PARAÍBA, 2024).

**Figure172 - Map of ALT by Paraíba Municipalities in 2023**

**Figure173 - 10 cities in Paraíba with the highest incidence of LTA by Motorcycle, Automobile and Hit-and-Run from 2018 to 2023**

Source: Anuário 2023 da Segurança e da Defesa Social na Paraíba.

Another type of crime that is a constant concern for the authorities, institutions and the population of Paraíba in general is Violent Crimes against Property (CVP). In Paraíba, if we analyze the annual historical series of CVP, since 2018, which presented the highest number of cases ever recorded (10,723), a downward trend is evident from that year onwards, with the year 2023 registering a historical low with 4,367 cases, equivalent to an absolute reduction of 6,356 robberies and a percentage variation of -59% in that period (PARAÍBA, 2024).

The crime of robbery can occur in a variety of places, such as public spaces, homes, commercial establishments and public transport, and is thus classified into different categories. When analysing the records in Paraíba in 2023, we found that robbery of a

person (or passer-by) was the most frequent, accounting for 78% of all cases. In addition, it can be seen that in 2023 there were the lowest rates of CVP in each category of the entire historical series: 3,419 cases to a person on public roads, which represents a reduction of 11% compared to the previous year (2022); 637 cases in establishments, a percentage change over the same period of -46%; 241 cases in residences (-34%); and, 70 cases in public transport (-36%). (PARAÍBA, 2024).

**Figure174 - Annual Historical Series of Violent Property Crimes - CVP by Category in Paraíba**

Source: Anuário 2023 da Segurança e da Defesa Social na Paraíba.

In relation to Property Crimes against Banking Institutions (CIBAN), there has been a 77% drop in occurrences in Paraíba in the last two years, from 22 cases in 2022 to 5 cases in 2023. The accumulated reduction since the all-time high in 2016 (120 cases) is 96%. The cumulative figures for 2019 to 2023 (84 cases) are lower than the total for 2018 alone (86 cases).

**Figure175 - Annual Historical Series of Property Crimes against Banking Institutions - CIBAN in Paraíba**

Source: Anuário 2023 da Segurança e da Defesa Social na Paraíba.

Another concern for Public Security in Paraíba is the crimes of vehicle theft and robbery, which are analysed using a specific indicator called Illegal Subtraction of Motor Vehicles (SIVA) due to their relevance. Between 2016-2023, the lowest number of SIVA records was in 2019, with 4,258 cases, as opposed to 2022, which saw 5,765 cases, an all-time high for this period of time. In 2023, the second highest number of SIVA cases in the historical series was recorded, totalling 5,440 cases, which represents a reduction of 5.7% compared to 2022 (PARAÍBA, 2024).

**Figure176 - Annual Historical Series of Vehicle Thefts and Robberies in Paraíba**

Source: Anuário 2023 da Segurança e da Defesa Social na Paraíba.

According to data from the 2023 Yearbook of Security and Social Defense in Paraíba, this past year vehicle thefts experienced a reduction in all categories, while vehicle thefts grew considerably in all of them.

Motorcycles are the most stolen vehicles in Paraíba. In 2023 there were 2,202 records, equivalent to 61% of all stolen vehicles. Even so, motorcycle thefts fell by 18% last year, as did car thefts, which went from 1,549 cases in 2022 to 1,428 cases in 2023, a percentage change of -8%.

However, with regard to thefts from vehicles, the opposite is true: in 2023 there was an increase in cases in all categories, with an 8% increase in thefts from motorcycles and a significant 60% increase in thefts from cars, as can be seen in the figure below.

**Figure 177 - Annual Comparison by category of Illegal Subtraction of Motor Vehicles - SIVA in Paraíba**

#### 4.3.9 Indigenous and Traditional Communities

This sub-item focuses on the diagnosis of traditional populations in the state of Paraíba, considering traditional communities to be those which, in accordance with Federal Decree No. 6.040 of February 2007, use a part of the territory and its natural resources as a prerequisite for their cultural, social, religious, ancestral and economic reproduction, through the use of knowledge and practices generated by their groups of origin.

Therefore, information on possible indigenous communities, quilombo remnants and traditional populations in Paraíba was sought from the main bodies responsible.

The bodies surveyed are the Palmares Cultural Foundation (FCP) - a public entity linked to the Ministry of Culture, which provides information on its demarcations and processes through the Afro-Brazilian Communities Information System - SICAB; the National Indian Foundation - FUNAI - the federal government body responsible for Brazilian indigenous policy; and the State Coordination of Black and Quilombola Communities of Paraíba - CECNEQ/PB.

According to Decree No. 6.040, of February 7, 2007, traditional peoples and communities are defined as:

*"Culturally differentiated groups who recognize themselves as such, who have their own forms of social organization, who occupy and use territories and natural resources as a condition for their cultural, social, religious, ancestral and economic reproduction, using knowledge, innovations and practices generated and transmitted by tradition." (Art. 3, I, 2007).*

In 2016, Decree No. 8.750/2016 on Traditional Peoples and Communities (PCTs) listed 28 traditional peoples and communities in Brazil: Andirobeiras; Evergreen gatherers; Caatingueiros; Mangaba pickers; Quilombolas, Indians, Extractivists, River dwellers, Caçaras, Gypsies, People of Terreiros and African Matrix, Cipozeiros, Castanheiras; Faxinalenses; Fundo e Fecho de Pasto; Geraizeiros; Ilhéus; Isqueiros; Morroquianos; Pantaneiros; Pescadores Artesanais; Piaçaveiros; Pomeranos; Quebradeiras de Coco Babaçu; Retireiros; Seringueiros; Vazanteiros; and Veredeiros. These traditional peoples and communities have a decree that protects them in view of their vulnerabilities, specificities and culturality.

## Quilombolas

In Paraíba, according to the State Coordination of Black and Quilombola Communities of Paraíba - CECNEQ/PB, there are currently 49 self-recognized quilombola communities, of which only 3 are not certified by the Palmares Cultural Foundation. The quilombola communities are spread over 28 municipalities in the state: João Pessoa, Conde, Areia, Alagoa Grande, Ingá, Riachão do Bacamarte, Serra Redonda, Mogeiro/Gurinhém, Dona Inês, Nova Palmeira / Picuí, Boa Vista, São João do Tigre, Serra Branca, Camalaú, Santa Luzia, Várzea, São José de Princesa, Tavares, Livramento, Manaíra, Cacimbas, Catolé do Rocha, Bento, Cajazeirinhas, Coremas, Pombal, Diamante, Triunfo (CECNEQ/PB, 2023).

The survey carried out by the IBGE in the latest Demographic Census (2022) reveals that there are 16,765 quilombola residents in Paraíba. According to the survey, the municipalities in Paraíba with the highest number of quilombola residents are Conde (3,008), João Pessoa (2,260), Cacimbas (1,698), Santa Luzia (1,325) and Alagoa Grande (946). In total, 51 municipalities in the state have a quilombola population.

If we analyze the ratio between the number of quilombolas and the population of each municipality, we can see that the highest rates are found in the municipalities of Cacimbas (23.5%), Conde (10.9%), Diamante (9.4%), Santa Luzia (8.9%), Riachão do Bacamarte (8.8%) and Dona Inês (7.8%). In the state capital, João Pessoa, this proportion is only 0.3%.

In Paraíba, the process of titling quilombola land takes a long time. Currently, only five quilombola communities have a concession contract for the real right of collective use of the territory, which guarantees collective possession, but not definitive titling as provided for by law. Some communities, such as Matão in Gurinhém and Pedra D'Água in Ingá, only have partial possession of the territory. Others, such as Engenho do Bonfim in Areia, Grilo in Riachão do Bacamarte and Caiana dos Crioulos in Alagoa Grande, have a concession contract for the real right of collective use of the territory. It is estimated that there are around 4,000 quilombola families in Paraíba, according to data from CECNEQ-PB (CECNEQ/PB, 2023).

Quilombola communities in Paraíba are predominantly located in rural areas, although they also exist in urban areas. Geographically, quilombos are mainly concentrated in the Sertão mesoregion of Paraíba, which is divided into two microregions, Alto and Médio Sertão, where 27 quilombola communities can be found. This is followed by Western and Eastern Cariri, with 9 communities, followed by Agreste, Brejo and Curimataú, with another 9 quilombola communities. Finally, the micro-region with the fewest communities is the coast, with only 4 quilombos, totaling 49 quilombola communities in the entire state (CECNEQ/PB, 2023).

The following table gives a brief description of the quilombola communities located in Paraíba, by Rural Territory.

**Table 191 - Quilombola Communities in Paraíba by Rural Territory**

TR Alto Sertão					
Municipality	Community	No. of families	Territorial situation	Current Stage FCP Process	Main economic activities
Triunfo	The forty	65 families	Urban Quilombo. No Process	Certified	Small businesses
Cachoeira dos Índios	Cipó Farm	40 families	Awaiting certification from Palmares	-	Family-based agriculture, raising small and medium-sized animals. Production with productive backyards. Small businesses
TR Borborema					
Municipality	Community	No. of families	Territorial situation	Current Stage FCP Process	Main economic activities
Alagoa Grande	Caiana dos Crioulos	150 families	Demarcated	Certified	Family farming, fruit growing, small and large animal husbandry, small businesses
Areia	New World	40 families	In the final process of demarcation	Certified	Family farming, small and large animal husbandry
	Bonfim Mill	28 families	Demarcated	Certified	Family-based agriculture, horticulture with agroecological and organic production, small animal husbandry
Boa Vista	Santa Rosa	95 families	In the process of being demarcated	Certified	Family farming, raising small and large animals. Production of crockery and medicinal plants
Livramento	Sussuarana	101 Families	Not checked in yet	Certified	Family farming, small and large animal husbandry
	Vila Teimosa				
	Summer sand				
TR Cariri					
Municipality	Community	No. of families	Territorial situation	Current Stage FCP Process	Main economic activities
Camalaú	Roça Velha/Rua Preta	-	-	Certified	-
São João do Tigre	Cacimba Nova	85 families	In the process of being demarcated	Certified	Family-based agriculture, raising small, medium and large animals. Income production

Serra Branca	Lightweight	60 families	Not checked in yet	Certified	Family farming, raising small and medium-sized animals. Crockery production
	Corner	45 families	Not checked in yet	Certified	Family farming, raising small and medium-sized animals. Production of jam, sweets, spices, clay or earthenware dishes, rag dolls

Figure178 - Quilombola communities in Paraíba

Source: Consulting, 2024.

In the RT Vale do Maringá, in the municipality of Pombal, there is the "Os Rufino" quilombola community, which, among other economic activities, stands out for its production of handcraft ceramics. Speaking to representatives of the community, they say that they take paint from angico and aroeira trees to paint ceramics, and that traditional handicrafts are a very old activity. In 2013, they began to leverage and improve their handicrafts, with men and women working proportionally. They sell their handicrafts in João Pessoa, at the Tambaú public center, in Soledade, in Pombal, at the solidarity economy house, and in Catolé do Rocha. They also produce beans, corn, rice, coriander and spring onions and keep chickens, pigs, dairy cattle and sheep.

There is a Pedal event in June, held in the community itself, which is very popular, with the 3rd edition being held this year in 2024. This event helps generate income for the community.

Among the community's concerns, they say that when it floods, they have problems with access, being stranded and, for example, restricting children from going to school.

They use firewood from jurema and marmeleiro trees, but only use wood from dead or fallen trees. Soapstone, sand, oil, sandpaper, a fine sieve and clay are all inputs in the

production of their handicrafts. They reuse all the waste generated in the production of their handicrafts, redoing the sandpaper and reusing broken pieces in the process. They wear PPE, such as goggles to protect against possible accidents with the grinding machine, and a mask to protect against dust inhalation.

In the rainy season, the clay takes a long time to dry and they lack the structure to dry it properly. The source of the clay is on the mesa, in the highlands near the community, and you have to walk between 600 meters and 1 km to reach it.

With regard to their health, they mentioned rheumatism, arthrosis and wear and tear on their joints. They were told by a health worker that this could be due to genetic factors. Anemia, diabetes and high blood pressure are other ailments mentioned.

### **Indigenous communities**

According to information from FUNAI, Brazil's indigenous reserves occupy 13.8% of the country's territory, covering 1,170,579.17 square kilometers distributed over 566 recognized indigenous lands. The only states without demarcated indigenous areas are Rio Grande do Norte and Piauí.

According to the latest IBGE Demographic Census (2022), there are currently 30,140 indigenous people living in Paraíba, of whom 19,044 live on indigenous lands and 11,096 outside them.

As for the indigenous population, Paraíba is home to two peoples: the Potiguar and the Tabajara.

The Tabajara people are located on the south coast of Paraíba, in the municipalities of Conde, Pitimbu, Alhandra and the outlying districts of João Pessoa. Currently, it is estimated that there are around 1,500 Tabajara indigenous people in Paraíba. Their original language is Tupi, which is in the process of being re-appropriated, but like most indigenous groups in the Northeast, they speak Portuguese. The Tabajara have four villages in the municipalities of Conde and João Pessoa: Barra de Gramame Village, Nova Conquista Taquara Village, Severo Bernardo Village and Vitória Village. Their lands have not yet been identified and delimited, however, between 2009 and 2010, an anthropologically based study was carried out, which brought together elements of a historical, sociological, land, ethnographic and environmental nature on the claimed area, for the ethnic characterization of the Tabajaras of the South Coast of Paraíba (PARAÍBA, 2020).

The Tabajara emerged in the 21st century as part of a process of reclaiming their identity and traditional territory, in the Sítio dos Caboclos, in the former Sesmaria da Jacoca, in the municipality of Conde. The name Tabajara is translated in ancient Tupi as: *taba* = village + *jara* - from *yára* = lord, owner, the one who dominates, so the Tabajara call themselves "Lords of the Village." (TABAJARAPB, 2024).

The Potiguara people, for their part, are located on the northern coast of Paraíba, in 32 villages situated in three municipalities in the coastal region: Baía da Traição, Marcação and Rio Tinto. With a population of approximately 19,000 indigenous people, including inhabitants of the villages and the towns of Baía da Traição, Marcação and Rio Tinto, the Potiguara are concentrated in an area of the northern coast of Paraíba situated between the Camaratuba and Mamanguape rivers. An unaccounted number of people also live in other cities such as Mamanguape, João Pessoa and even in Rio de Janeiro or Rio Grande do Norte. The villages together make up three contiguous Indigenous Lands (TIs), totaling 33,757 hectares. The Potiguara TI has a population of 8,109 people, the Jacaré de São Domingos TI has 449 people and the Potiguara de Monte Mór TI has 4,447 people (FUNAI, 2012).

The territory is located over the area of the municipalities of Baía da Traição, Rio Tinto and Marcação. The PB-41 highway crosses the Monte-Mor and Potiguara Indigenous Lands, connecting Rio Tinto and Baía da Traição. Other dirt roads cut through the indigenous territory, connecting the villages to each other and to urban centers. Most of the villages have a school, health center and flour houses, as well as churches, including the iconic church of São Miguel, in the village of the same name, and Nossa Senhora dos Prazeres, in Monte-Mor (FUNAI, 2012).

The Potiguara belong to the Tupi linguistic family, currently speaking Portuguese and seeking to revive Tupi through indigenous school education. Like other peoples of the Northeast, they have an extensive history of interaction with non-indigenous society (FUNAI, 2012).

The Potiguara are possibly the only indigenous people in Brazil who still live in the same place since the arrival of the colonizers 500 years ago. Historical records and documents from the state of Paraíba highlight the continued presence of the Potiguara on the coast of Paraíba, especially in Baía da Traição, since the first years after colonization. The Potiguara resisted attempts to conquer their territory by fighting bravely and through various forms of resistance and indigenization of elements of western, white culture (FUNAI, 2012).

The basis of the Potiguara economy is agriculture and fishing. Historical records show that their ancestors had advanced agriculture and an abundance of food. In recent times, however, the situation has changed drastically. The advance of the invasion of indigenous lands, the degradation of the environment, the economic and social devaluation of agricultural activity and the consequent degradation of the soil have made farming a difficult task. The main tension in this field is between traditional agriculture (the *roça*) and sugar cane cultivation, which compete for the same area, but follow different and often conflicting logics (FUNAI, 2012).

Between the house and the farm, the Potiguara grow medicinal plants, vegetables, fruit trees and coconut palms, as well as ornamental plants and other plants of spiritual value (for example, to protect the house from the evil eye). The backyards are also home to native plant species that were kept in the area when the site was opened up. The

production of fruit and coconut trees can be destined for family consumption or for sale, as is the case with most coconut sites (FUNAI, 2012).

The cultivation system practiced by the Potiguara is commonly known as "roça de coivara". The fields are "opened" in the arisco and paũ. Some villages have little or no arable land available for planting, either because they are located close to the sea or because sugarcane monoculture competes for the land (or both). Other villages, further inland, grow plenty of swiddens (even though sugar cane is present). The villages where the most swiddens are planted are Tracoeira, Santa Rita and Laranjeiras along the Sinimbu River; Estiva Velha on the banks of the Estiva River; and the retaken area of Três Rios. Camurupim, on the other hand, located near the Sinimbu river, has no area for planting and the families live mainly from fishing, shellfish gathering and carcinoculture (FUNAI, 2012).

The Potiguara fish in the mangroves, rivers, estuaries, sea and tide all year round, using a variety of fishing techniques. With a deep knowledge of ecosystems and the life of aquatic organisms, these fishermen are able to locate them and choose the most suitable techniques for catching them. The organisms caught include fish, shrimp, crabs, lobsters, shellfish and octopus. Most of the fish is for the family's own consumption and, depending on the commercial value of the species caught, it is sold, exchanged and donated to relatives and friends (FUNAI, 2012).

Raising small and large animals is also an important source of food and financial resources for many families. Among the animals raised (chickens, goats, cattle, horses and bees), chickens, bees and cattle stand out for their social and economic importance (FUNAI, 2012).

### Fishing communities

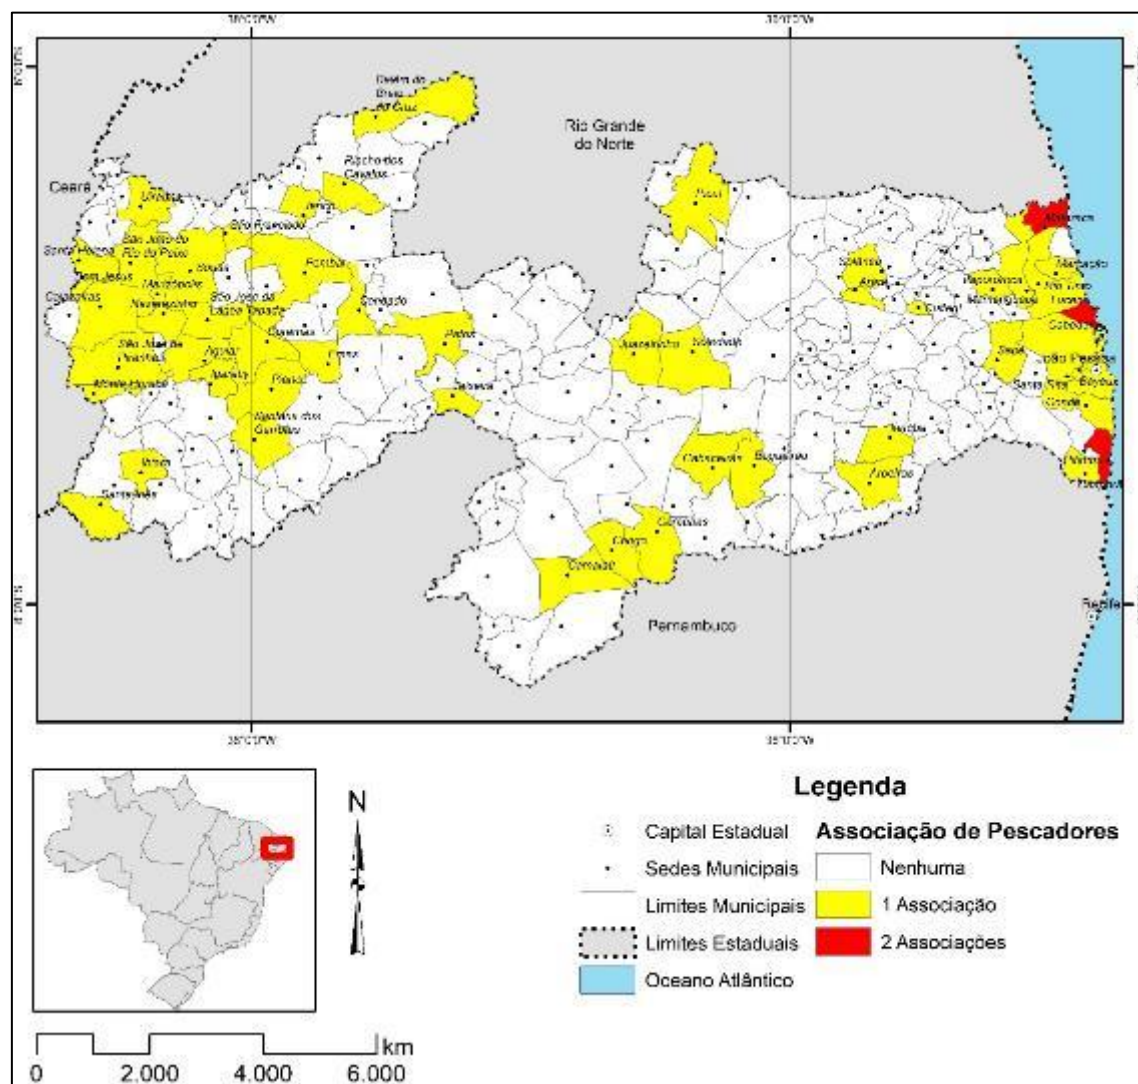

Traditional fishing is carried out individually or as part of a family system, for commercial or consumption purposes, where the fishermen themselves create and use the artifacts and their craft, and may or may not be assisted by small boats. It is an activity with a major social and economic impact in Brazil due to the volume of people involved and the extent of the territory they occupy, between river basins and the coast. The Ministry of Fisheries and Aquaculture (MPA) licenses the profession of fisherman, as well as promoting actions linked to the infrastructure and marketing of fish. Fishermen and fisherwomen registered with the colonies are entitled to receive unemployment insurance in the months when fishing for certain species is prohibited, as well as easy credit to buy diesel fuel for their boats. The MPA also promotes, in partnership with other institutions, training programs for fishermen and incentive actions (DE LIMA, 2016).

In 2009, the MPA registered just over 800,000 fishermen involved in the activity. However, considering the case of Pernambuco, where only half of the fishermen are registered, it is assumed that the real number is much higher. According to Vasconcellos et al (2014), approximately 2 million people are involved in fishing, and half of the fish

produced in Brazil comes from artisanal fishing. However, there are discrepancies in the data, since according to IBAMA (2008), the production of artisanal fishing corresponds to 65% of the national total and, according to calculations by the Movement of Fishermen and Fisherwomen of Brazil, it reaches 70% (DE LIMA, 2016).

In Paraíba, according to data collected by Procasse, there are a total of 57 fishing communities/associations/colonies, spread over 54 municipalities in the state, as can be seen in the figure below.

**Figure181 -Fishermen's associations in Paraíba**

Source: PROCASE, 2024.

Located on the south coast of Paraíba, in the metropolitan region of João Pessoa, the community of Acaú is an extractive reserve called RESEX Acaú-Goiana, situated in the municipality of Pitimbu. According to the local inhabitants, Pitimbu has indigenous origins and means "eye of water of smoke", since it was the territory of the Tabajara and Potiguar peoples (GOMES, 2016).

The Acaú community makes its living mainly from extractive activities, with fishing resources guaranteeing their self-sufficiency. Created on September 26, 2007, the Resex Acaú-Goiana is one of the 320 federal Conservation Units managed by the Chico

Mendes Institute (ICMBio). Its aim is to protect the livelihoods, guarantee the use and conserve the renewable natural resources traditionally used by the extractivist population of the communities of Acaú, Tejucupapo, Povoação de São Lourenço, Carne de Vaca and Baldo do Rio, located in the municipalities of Caaporã (PB), Pitimbú (PB) and Goiana (PE) (GOMES, 2016).

In Acaú, as in the other traditional communities of the Acaú-Goiana RESEX, the main extractive activities are related to artisanal fishing. Fish, shellfish and other molluscs, and crustaceans such as crab, crab, lobster and shrimp, are the most common catches. Production has several destinations, but most of the shellfish harvesting is still for personal consumption, and the activity is mostly carried out by women, who have been organizing themselves through the Acaú Shellfish Growers Association (AMA) (GOMES, 2016).

The Association of Shellfish gatherers (AMA) was founded in 1997 and currently has 200 members, but has already reached 600 participants. They are women of Afro-indigenous descent, most of whom are shellfish gatherers and shellfish artisans. Local artisans use solid shellfish waste to make their handicrafts.

According to information from the AMA, it was the shellfish gatherers who asked for the RESEX to be created and the leaders took part in its Management Plan, with community councillors taking part in its management. The shellfish gatherers pay 15 reais a month to be part of the association and only benefit from health insurance. The shellfish gatherers' children have no interest in the trade because they see no opportunity for growth.

The shellfish gatherers leave home at 5am, and they still have their home activities to attend to before leaving for work. The AMA has no infrastructure for logistics and seafood storage (refrigerator or collective freezer). The shellfish gatherers also point to the lack of the simplest equipment and utensils to carry out their work, such as long blouses, sunscreen or a wheelbarrow to carry equipment, material and products.

On average, shellfish gatherers harvest around 5 kg of shellfish a day per person. Some of them use a long-handled cudgel, which is forbidden by law at first, but makes it easier to catch the shellfish without having to crouch down to avoid health problems. Each shellfish gatherer produces around 3.5 kg a day.

Shellfish shells are used for handicrafts, but there is still a lot left over, generating a significant amount of waste. The shellfish gatherers are thinking of a project to use the shell to encase building bricks, and some have already used it in their own homes to make flooring instead of gravel.

To make their crafts, they use materials such as cotton string, scraps of shell from the beach, glue, wire, fish scales, among others. They make bottles out of shells, crafts out of coconuts, figures out of shellfish shells...

These shellfish gatherers don't sell their products to the public sector because they can't meet the required criteria, such as vacuum packaging.

**Photo 56 - Site of the AMA (Association of Shellfish gatherers of Acaú), in the municipality of Pitimbú**

*Source: Consulting, 2024.*

**Photo 57 - Handicrafts produced at AMA**

Source: Consulting, 2024.

The municipality of Soledade also visited the Z-27 Fishermen's Colony, which currently has almost 300 fishermen. The Colony offers technical assistance, closed season insurance, processing, sickness and maternity benefits, support for programs to buy houses, land and registration with the PAA. It has a processing shed and a processing area under construction, but it doesn't yet have the machinery. It will soon have a cold room for storage.

Information from the association reveals that it has no concerns about industrial fishing in the region, since fishermen don't face competition from this type of production. Their main complaints are the lack of permanent technical support; the lack of transportation for fishing and transportation for the products; and the lack of new technologies to bring younger people closer to the trade.

The fish they catch include tilapia, curimatã, tucunaré, piau, branquinha and traíra. During the dry season, the women catch piaba with a clay pot. Normally, the fisherman cuts off the fish's head and cleans it, leaving the waste in the weir itself. He then removes the hide and prepares the fillet. Some of the products sold by the association are fillets, boneless fish, breaded fish, hamburgers, sausages and flour.

The closed season for piau, curimatã and branquinha lasts about three months, from December to February. Fishing with trawling equipment and tarrafa is forbidden and associated fishermen use nets with 9 cm mesh for larger fish, 1 cm for shrimp, and 1.5 cm for piabeira. Some people hunt fish with harpoons and "shotguns" as a sport, which is also prohibited by law, using the big dam to catch larger fish.

A representative of the association pointed out that sometimes fishermen stay in the lagoon for an extra day because they haven't caught enough fish and extend their stay

to try to increase production, running the risk of losing part of what they've already caught due to a lack of suitable storage equipment.

In situations where the reservoir dries up, the fishermen go to another nearby state, for example Rio Grande do Norte, in search of other sources. The association sells to the PAA and the fishermen also sell at the open market on their own.

The Colony's fishermen point out incidences of skin and lung cancer, diabetes and motorcycle accidents on the way to work. Drowning also occurs, but not as often. Finally, fishermen may have an accident when they step on something in the weir.

## Gypsies

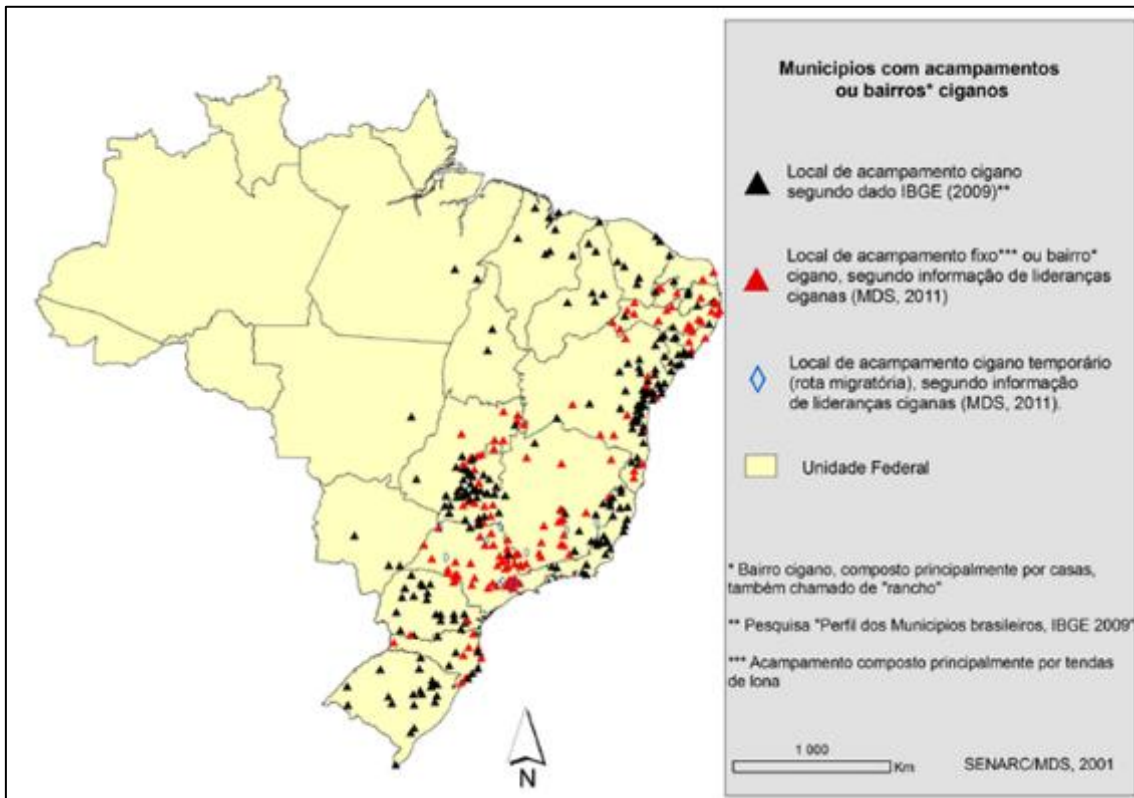

To this day, the origins of the Gypsy Peoples continue to be the subject of research. The predominant theory today states that they have their roots in India and that, around a thousand years ago, they began their dispersal around the world (BRASIL, 2013).

In Brazil, the first official record of the arrival of gypsies dates back to 1574: a decree by the Portuguese government deported the gypsy João Torres and his wife Angelina to Brazilian lands for five years. The country is home to at least three distinct Roma ethnic groups: Calon, Rom and Sinti, each with their own languages, cultures and traditions (BRASIL, 2013).

The Brazilian Rom belong mainly to the Kalderash, Machwaia and Rudari sub-groups, which have their origins in Romania; the Horahané, from Turkey and Greece, and the Lovara. In addition to these, there are the Calons, who have a strong presence in Brazil and throughout the country, and have their roots in Spain and Portugal. The Sinti mainly arrived in Brazil after World War I and II, coming from Germany and France (BRASIL, 2013).

There is still little official information available on the Roma population. According to the IBGE's Municipal Basic Information Survey (MUNIC), in 2011 there were 291 Roma encampments in 21 Brazilian states. The highest concentration of camps was in the states of Bahia (53), Minas Gerais (58) and Goiás (38). Municipalities with between 20 and 50 thousand inhabitants have the highest concentration of camps. In terms of the total Roma population, it is estimated that there are more than half a million in Brazil (BRASIL, 2013).

Figure182 - Map of Roma Communities, by municipality - Brazil, 2011

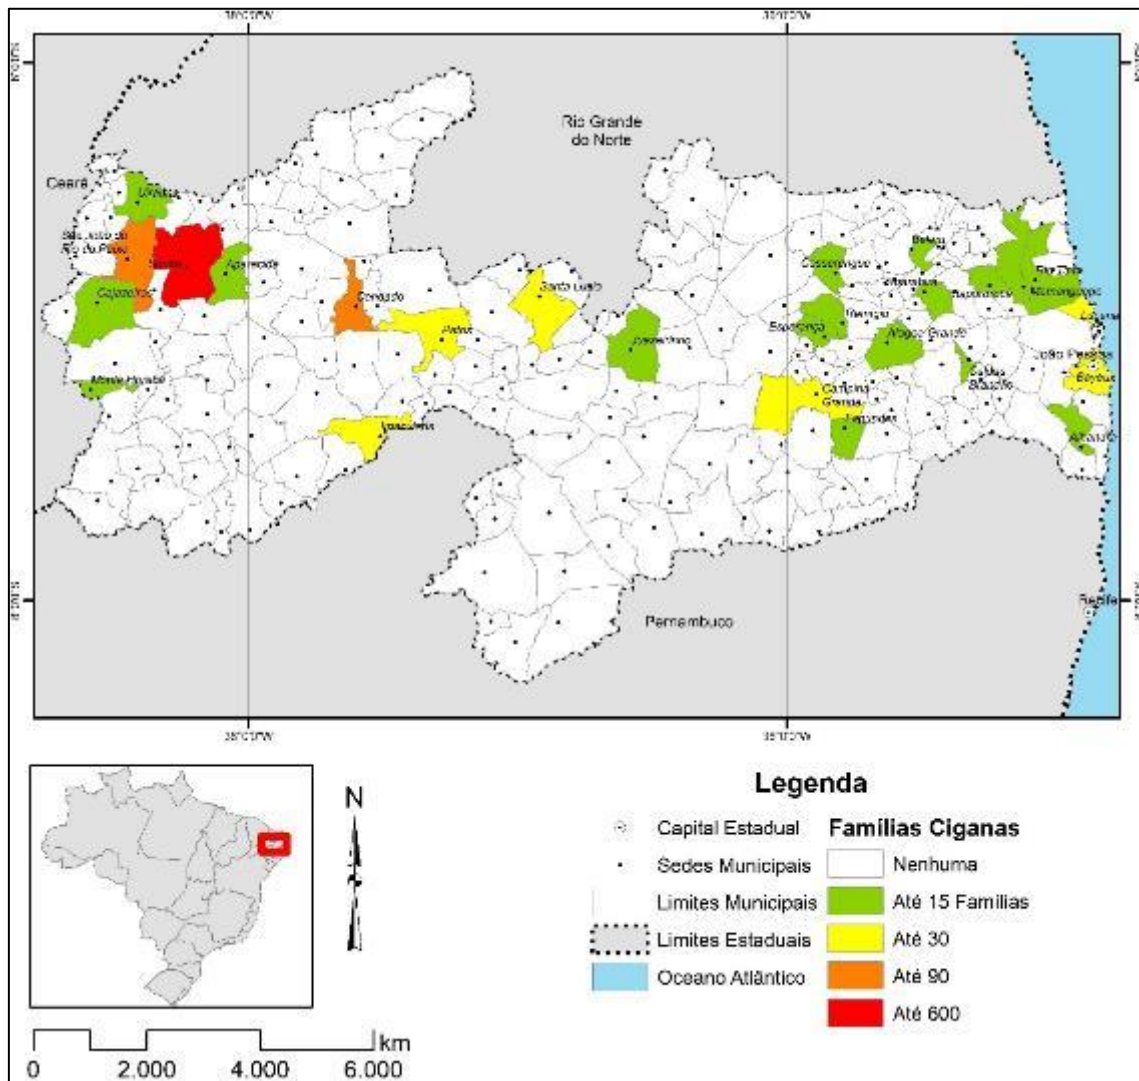

Source: Secretariat for Policies to Promote Racial Equality - SEPIR. Guide to Public Policies for Gypsy Peoples, 2013.

Approximately 1,500 gypsies live in Paraíba, more than 95% of whom are concentrated in the state's Sertão region, mainly in Sousa, which is home to the largest gypsy community in Brazil. Grouped together in communities on the outskirts of the cities, the Roma of the Calon ethnic group face a lack of infrastructure, basic sanitation and sewage disposal. In addition, they deal with high levels of unemployment, which are exacerbated by the prejudice they face (PARAÍBA, 2020).

The figure below shows the number of gypsy families and their location in different municipalities in Paraíba.

Figure183 - Gypsy Families in Paraíba

Source: PROCASE, 2024.

The gypsies of Sousa/PB have settled on land flanked by the BR 230 highway, 3 kilometers from the city center. They claim an area of 7.008 km<sup>2</sup>, with a perimeter of 12.786 km, in the areas that border the urban core, as can be seen in the figure below (MANGUEIRA; CAMPOS, 2023).

**Figure184 - Territory claimed by the gypsies in contrast to the urban center of Sousa/PB**

Source: Paraíba Calon, gypsy "sim sinhô": Analysis of the production of urban space in a traditional community in the municipality of Sousa (PB) during forty years of sedentarization, 2023.

The group led by Pedro Maia was the first to settle in the territory, choosing a higher area than those around it. Years later, Vicente and Eládio's groups settled in a lower area, giving rise to the communities known as Rancho de Baixo and Rancho de Cima. These ranches are separated from each other by about 1 kilometer, with a mediation zone known as "Várzea das Almas", a mixed area made up of gypsies and non gypsies. Despite these two nomenclatures, the community is divided into four, named after the leaders who once headed each community. They are: Manoel Valério Correia, Otavio Maia, Vicente Vidal de Negreiros and Pedro Benício Maia. According to data collected by the State People's Housing Company (CEHAP) in 2020, 1,845 people live in this gypsy community, spread over 522 families (MANGUEIRA; CAMPOS, 2023).

There is no sewage system in the community, and sewage is left out in the open without any treatment, contributing to the appearance of water-borne diseases. There is a Cartesian well in the Pedro Maia community, but it is not enough to supply all the local gypsies. Therefore, the gypsies don't have easy access to drinking water either (MANGUEIRA; CAMPOS, 2023).

Several families in the community are characterized as being below the poverty line, highlighting the difficulties faced by the Roma population of Sousa due to their social, political and environmental vulnerability. Despite all the problems they suffer, especially in relation to precarious housing, the Roma of Sousa aim to remain and legally occupy the territory, as well as finding formal and specialized jobs in the city (MANGUEIRA; CAMPOS, 2023).

#### 4.3.10 Heritage Cultural

This sub-item aims to identify and characterize the historical and archaeological heritage present in the state of Paraíba.

In this way, research and diagnostic analysis were carried out along two lines, one of which was a survey of secondary data in pre-existing conceptualized bibliography, and the other a survey of primary data in the field.

Secondary data was collected through bibliographical research and data collection (electronically - internet or in the field) at the official heritage preservation bodies: IPHAN (National Historical and Artistic Heritage Institute), and IPHAEP (Paraíba State Historical and Artistic Heritage Institute) in the state of Paraíba.

### **Archaeological sites**

Among the first steps in the research, a survey was carried out to ascertain the existence of known archaeological sites in the municipalities studied.

The National Register of Archaeological Sites (CNSA) of the National Institute of Historical and Artistic Heritage (IPHAN) was therefore consulted to determine the existence of such sites in the state of Paraíba.

According to the survey, in Paraíba, 192 archaeological sites have been catalogued in the CNSA, summarized by Rural Territory and by municipality in the Annex 8.7.

As shown in the map of archaeological sites in Paraíba below, the concentration of archaeological sites is in the central part of the state, in the regions of the Rural Territories of Borborema, Cariri, Curimataú and east of the Médio Sertão.

It should be noted that most of the archaeological sites registered include pre-colonial remains, and that there are more historical sites in the Rural Territories that cover coastal areas, such as the RT Mata Norte, where the municipality of Baía da Traição is located, the scene of important events that marked the colonization of the Indians by European peoples.

**Map 14 - Map of registered archaeological sites in the state of Paraíba**

## Paleontological sites

According to Leonardi & Carvalho (2000), Sousa and Uiraúna-Brejo das Freiras are two Cretaceous basins in the Rio do Peixe region that have a large number of dinosaur footprints. These basins are located in the west of the state of Paraíba, and their origins are related to the movements of transcurrent faults along pre-existing lineaments of the basement, during the opening of the Atlantic Ocean.

The main tetrapod ichnofauna consists of isolated footprints and tracks of large and small theropods, as well as ornithopods. There are also invertebrate ichnofossils such as tracks and excavations produced by arthropods and annelids. The fossils are palynomorphs, plant fragments, ostracods, conchostracans, fish scales and crocodylomorph bones. These fossils are preserved in deposits of alluvial fans, anastomosed rivers, meandering rivers and shallow lakes of Neocomian age - Berriasian to lower Barremian.

The paleontological-geological relevance of the Sousa and Uiraúna basins is the abundance of dinosaurian ichnofauna. 22 ichnofossiliferous sites have already been identified and mapped, and 296 tracks of large theropods have been recognized; 29 of small theropods; 42 of sauropods; 2 of quadruped ornithischians; 28 of graviportal ornithopods; a set of batrachopod footprints; a lacertid impression; a large number of unclassifiable footprints and many semi-swimming tracks attributed to chelonians. In total, more than 395 dinosaurian individuals have already been classified (LEONARDI & CARVALHO, 2000).

The most important area for the distribution of fossil footprints, located in Passagem das Pedras (Fazenda Ilha) in the municipality of Sousa, is now a natural park - the Vale dos Dinossauros Natural Monument. The 40-hectare park is one of the best preserved paleontological sites in Brazil. It has tourist infrastructure and trained guides for ecological tourism and the protection of the ichnofossiliferous site.

The Vale dos Dinossauros Monument covers an area of more than 1,730 km<sup>2</sup>, encompassing approximately 30 localities in the high hinterland of Paraíba, including the municipalities of São João do Rio do Peixe, Sousa, Aparecida, Marizópolis, Vieirópolis, São Francisco, São José da Lagoa Tapada, Santa Cruz, Santa Helena, Nazarezinho, Triunfo, Uiraúna and Cajazeiras. These locations are concentrated in the Rural Territories of Vale do Piranhas and Alto Sertão.

O Map 11 - Conservation Units presented in chapter 4.2.3 - Critical Habitats Below is a figure taken from the SGB (Brazilian Geological Service) system which illustrates the location of the paleontological sites in Paraíba.

### Historical Heritage

In this case, research was carried out on other IPHAN databases and state cultural heritage protection bodies.

Therefore, data from IPHAN's Database of Registered Cultural Property and the Noronha Santos Archive were investigated. From this research it is possible to identify the cultural assets listed by the agency in the region, whether they are integrated movable assets (objects, sculptures, works of art, among others) or immovable assets (churches, military architecture buildings, civilian houses, monuments, among others). Thirty-six records of listed cultural assets were found in the IPHAN archives in Paraíba:

**Table 192 - List of Iphan Listed Properties in Paraíba**

Municipality	Classification (related to the form of protection)	Assigned name	Year opened	Stage of Instruction (Ordinance 11/86)
Cabedelo	Ruin	Church of Nossa Senhora dos Navegantes: ruins	1938	RERRATIFIC.
João Pessoa	Building and Collection	Church of the Third Order of St. Francis	1938	TOMBADO
João Pessoa	Building and Collection	Church of the Third Order of Carmel or Saint Teresa of Jesus	1938	TOMBADO
João Pessoa	Building and Collection	Chapel of Engenho da Graça	1938	TOMBADO

Municipality	Classification (related to the form of protection)	Assigned name	Year opened	Stage of Instruction (Ordinance 11/86)
Cabedelo	Ruin	Tambaú Church - ruins	1938	TOMB. CANCEL.
Stones of Fire	Architectural complex	Aurora Mill	1938	UNFAIR
Cabedelo	Ruin	Old Fort: ruins	1938	TOMBADO
João Pessoa	Building	Sobrado at Rua Peregrino de Carvalho, 117	1938	TOMBADO
João Pessoa	Architectural complex	Convent and Church of St. Anthony and House of Prayer and cloister of the Third Order of St. Francis	1938	TOMBADO
João Pessoa	Building and Collection	Church of São Bento	1938	TOMBADO
João Pessoa	Building and Collection	Carmo Convent and Church	1938	INSTRUCTION
João Pessoa	Building and Collection	Misericórdia Church	1938	TOMBADO

Research was also carried out at the state heritage agency, the Paraíba State Historical and Artistic Heritage Institute (IPHAEP). IPHAEP has numerous listed properties in various municipalities in the state, and also identified the following municipalities with listed historic centers:

- Alagoa Grande (Decree 23.551, of November 7, 2002);
- Areia (Decree 8.312, of November 6, 1979);
- Bananeiras (Decree 31.842, of December 4, 2010);
- Cajazeiras (Decree 25.140, of June 29, 2004);
- Campina Grande (Decree 25.139, of June 29, 2004);
- Itabaiana (Registered and in the process of being listed);

- João Pessoa (Decree 9.484, of May 14, 1982);
- Mamanguape (Decree 25.031, of May 14, 2004);
- Pilar (Decree 8.625 of August 26, 1980);
- Pombal (Decree 22.913, of April 4, 2002);
- Princesa Isabel (Decree 26.099, of August 5, 2005);
- Remígio (Decree 23.809, of December 27, 2002);
- Rio Tinto (Registered and in the process of being listed);
- São João do Cariri (Decree 25.141, of June 29, 2004);
- São João do Rio do Peixe (Decree 22.917, of April 4, 2002);
- Sousa (Decree 258.030 of May 14, 2004).

#### **4.4 Profile of the Communities Listed in the PIR and PN Model Plans**

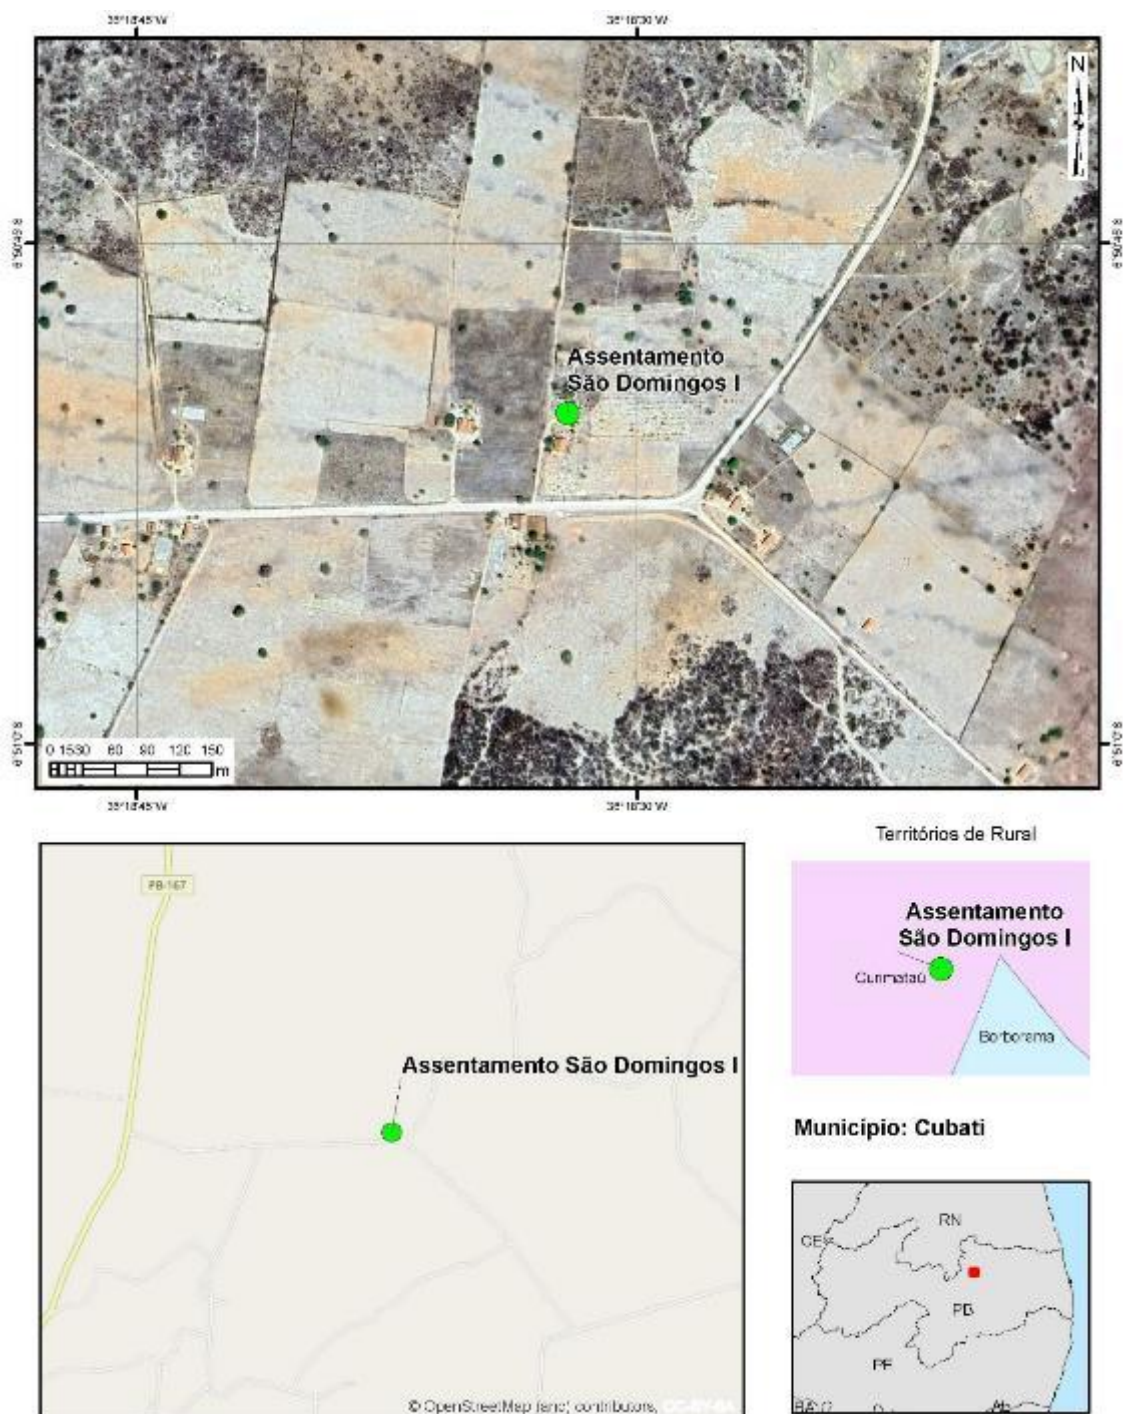

To draw up the Investment Plan (PIR) and Business Plan (PN) models, 6 communities were selected, characterized and evaluated for the production of these models.

Below is information on each of these communities.

##### **4.4.1 São Domingos I Settlement and ACAPRANE**

Below is information and an illustration of the municipality and territory where the São Domingos I settlement is located.

**Figure186 - Location of the São Domingos I Settlement**

Source: Image Google Earth Pro / Open Street Map, 2023. Prepared by Consultoria, 2024

- Information about the municipality and territory

Name	Cubati
IBGE code	2505006
Population (CENSO/year)	7,580 inhabitants - Population census (year 2022)
GDP per capita (value and year)	R\$ 9.765,34 (2021)
MHDI	0,566 (2010)

Biome	Caatinga
Territory of Identity	Paraíba's Eastern Seridó
Annual rainfall (mm)	500 to 700 mm
Distance from the state capital and other economically important municipalities	210 km from João Pessoa and 95 km from Campina Grande

- Community information

Name	São Domingos Settlement I
Type of community	Family farming/land reform settlement
Location and access	Rural area 08 km from the town center on a paved road
Number of families and people	30 families - 90 people
Main production activities carried out	Raising poultry, sheep, cattle, pigs and agriculture
Average property area and % of productive area	31.8 ha in total, of which 22.0 ha are for production
Land situation	Settlers
Environmental Registration (CAR)	They have the collective CAR
Electricity supply: type, number of families served	Families use single-phase power
Main water sources for human consumption and production	Cisterns, dams and artesian wells
Other relevant information	The settlement has a school for the children

- Information about the organization

Name	Agricultural Cooperation Association of Rural Producers of the Nova Esperança São Domingos I Settlement
Acronym	ACAPRANE
CNPJ	05.077.627/0001-64
Status (active or irregular)	Active
Date of foundation	18/02/2002
President	Sara Maria Constâncio
Address	Settlement São Domingos I, s/n - Rural area of Cubati
Location (owned, rented, leased)	It has its own headquarters
Membership numbers (men, women and young people)	58, 30 men, 28 women and 8 young people
Have you ever been involved in projects with non-reimbursable resources?	Yes. Fresh Water Project (desilter), P1MC Project and P1+2.

### **Main problems, challenges and positive points identified**

#### **Productive Area:**

- Extensive animal husbandry, resulting in poultry with low carcass standards;

- The mortality rate is high, both because of the low level of sanitary management and the lack of suitable chicken houses to protect the birds from predators;
- Lack of specialized technical assistance;
- Unavailability of equipment to grind corn and produce homemade feed;
- Lack of knowledge and guidance on how to produce poultry feed on the farm.
- Positive points:
  - Knowledge of rustic health management using homemade medicine techniques.

#### Access to TA:

- At the moment, the settlement has no specialized technical advice on poultry farming, limiting the development of the activity;
- EMPAER's technical advice is insufficient and generic in scope, and does not cover important areas such as marketing, management, the environment, among others.

#### Marketing:

- Very small production (family consumption);
- Poultry with a lower carcass standard than that required by the market;
- Lack of knowledge about the institutional market (PAA and PNAE);
- Few farmers participate in the open-air fairs in the municipalities near the settlement.
- Positive points:
  - Some families manage, even sporadically, to earn a small income by selling eggs at open-air fairs, the Solidarity Economy House in Soledade and through orders.
  - Existence of local and regional demand for quality poultry and free-range eggs

#### Environmental issues:

- Inadequate disposal of solid household waste in the community resulting in the burning of garbage;
- Positive points:
  - They preserve the settlement's legal reserve;
  - They carry out agroecological practices, such as using Creole seeds;
  - They practice reforestation by distributing seedlings at the settlement's school;
  - The association organizes environmental awareness activities for the settlement's young people and children

#### Access to water for household consumption:

- There are few artesian wells with drinking water, making the community dependent on the municipal water tanker program during the dry season.
- Positive points:
  - There are individual cisterns in each house in the community, which allows for assistance from the municipal water tanker program;

- There is a desalination plant in the settlement by the Água Doce project, which allows desalination for human consumption.

Access to water for irrigation and animal watering:

- Dependence on dam flooding to guarantee animal watering;
- Most of the families plant their crops in a rainfed system.
- Positive points:
  - The presence of wells is relatively sufficient for animal watering;
  - Two families have a water reuse system to irrigate their productive backyards

Social issue (young people, women, people with disabilities, LGBTQIA+, etc.):

- Low participation by young people in the social activities promoted by the association.
- Positive points:
  - Encouraging the involvement of young people in social projects through revolving funds;
  - Projects aimed at women (ATER mulher, Project Empreender Mulher);
  - The association's board is made up of women from the settlement.

Access to public policies: PRONAF, CROP INSURANCE, PAA, PNAE, OTHERS

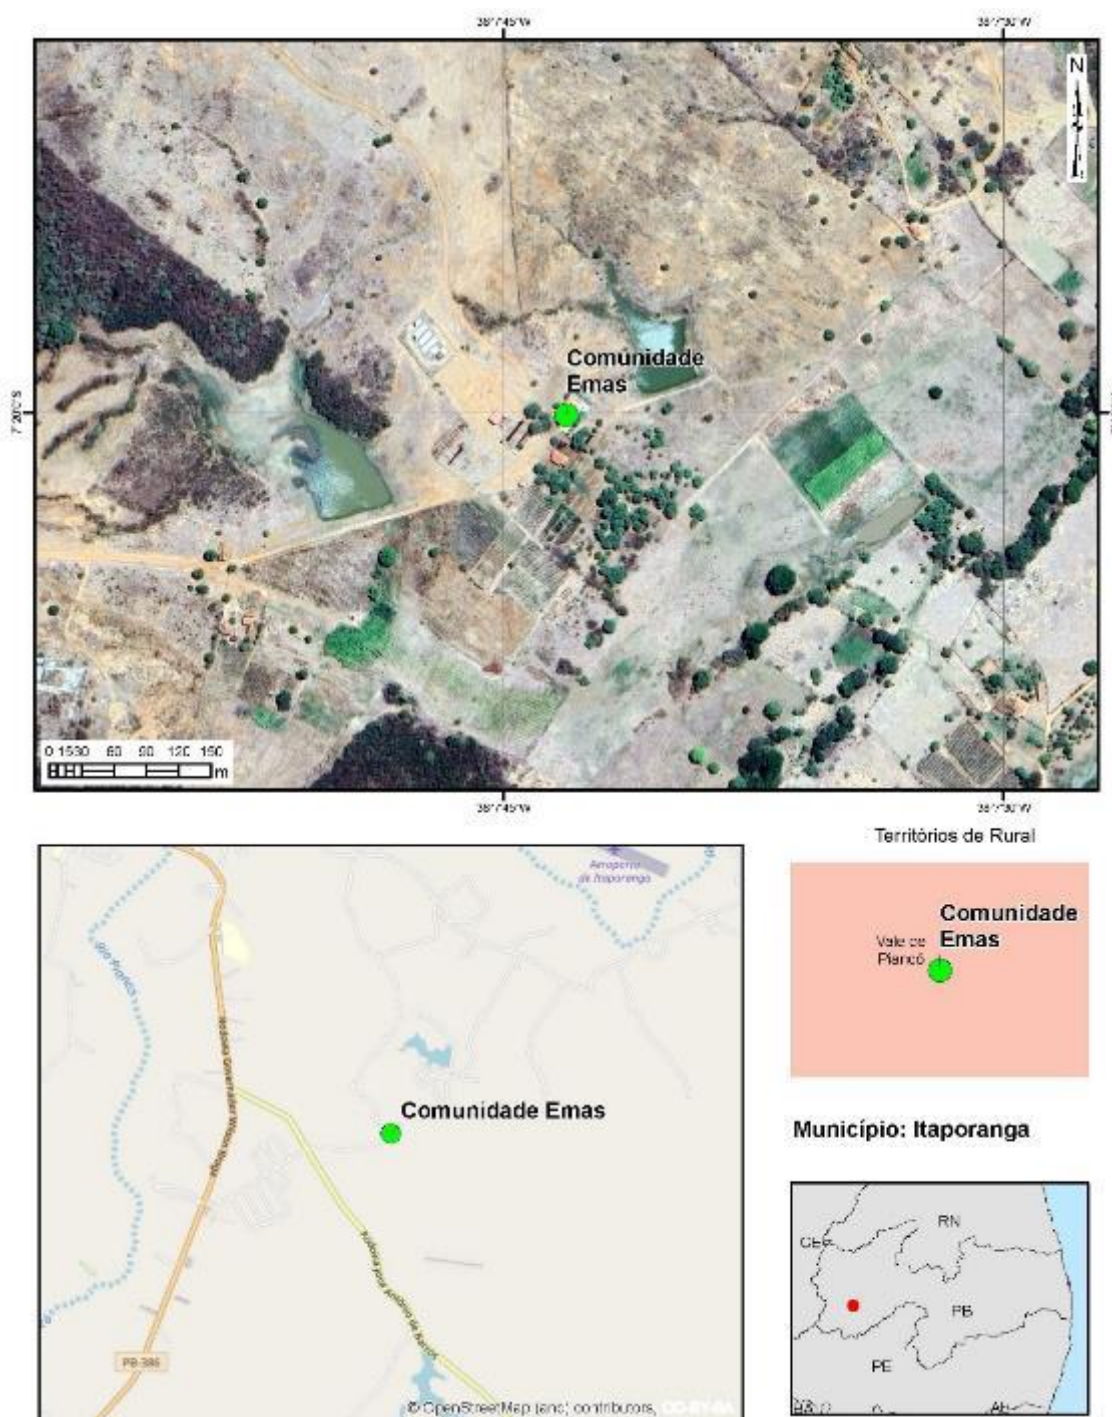

- Limited involvement of the association with potential partners, such as banks (Banco de Nordeste and Banco do Brasil) and the Rural Workers' Union;
- Limited knowledge of how to access the PAA and PNAE.
- Positive points:
  - The association has access to public policies such as crop insurance and Pronaf (Pronaf A, Semiarid);
  - They accessed Fomento Mulher, Fomento for house renovations and construction;
  - They accessed Empreender Mulher;
  - One family accesses the PAA and PNAE institutional markets.

#### **4.4.2 Emas Community and APLMITA**

Below is information and an illustration of the municipality and territory where the Emas community is located.

**Figure187 - Location of the Emas Community**

Source: Google Earth Pro / Open Street Map, 2023. Prepared by Consultoria, 2024

- Information about the municipality and territory

Name	Itaporanga
IBGE code	2507002
Population (CENSO/year)	23,940 people (CENSO 2022)
GDP per capita (value and year)	R\$ 13.671,27 (2021)
MHDI	0,615 (2010)

Biome	Caatinga
Territory of Identity	Piancó Valley
Annual rainfall (mm)	2022 - 1,063.1 mm 2023 - 1,052.5 mm
Distance from the state capital and other economically important municipalities	416 km to João Pessoa and 112 km to Patos

- Community information

Name	Emas community and surrounding areas.
Type of community	Family dairy farmers.
Location and access	10 km from the seat of the municipality of Itaporanga.
Number of families and people	60 families, an average of 240 people.
Main production activities carried out	Dairy farming and family agriculture.
Average property area and % of productive area	40 hectares - 50% (20 hectares of productive area)
Land situation	80% own their own land (with public and private deeds)
Environmental Registration (CAR)	80% of families have a CAR
Electricity supply: type, number of families served	All the families have access to single-phase power, with some having three-phase power.
Main water sources for human consumption and production	Human and production: well and weir.
Other relevant information	The partners work in family farming in general.

- Information about the organization

Name	Association of Milk Producers of the Municipality of Itaporanga
Acronym	APLMITA
CNPJ	06.201.635.0001-33
Status (active or irregular)	Active
Date of foundation	14/04/2004
President	Francisco de Sales Soares Júnior
Address	Rua Pedro Gondim, SN, centro - Itaporanga, CEP: 58.780-000
Location (owned, rented, leased)	Own headquarters
Membership numbers (men, women and young people)	60 members: 50 men, 10 women, 6 young men
Have you ever been involved in projects with non-reimbursable resources?	They have not accessed any projects through the association.

## **Main problems, challenges and positive points identified**

### **Productive Area:**

- Lack of specialized technical assistance;
- Few farmers carry out nutritional management, such as silage and haymaking, due to a lack of machinery and adequate technical guidance;
- Difficulty in feed management related to the volume source due to compromised natural pasture areas;
- High dependence on commercial feed, especially in the dry season, increasing the cost of milk production;
- Low milk productivity
- Positive points:
  - Access to water;
  - Fertile and productive soil.

### **Access to TA:**

- Occasionally, some farmers receive technical advice from SENAR and EMPAER, but the service offered is not specialized in dairy farming and does not cover other important topics such as marketing, the environment and others.

### **Marketing:**

- Market concentrated in a few private industries in the region;
- There is little competition, so farmers have little bargaining power;
- Low organizational level of the association to negotiate jointly;
- They don't have their own milk cooling tank, reducing their trading capacity;
- Lack of regulation of the Municipal Inspection Seal (SIM), limiting the installation of other small local industries.
- They don't have access to the PAA and PNAE markets due to the lack of milk processing/pasteurization.
- Positive points:
  - Guaranteed sale of milk to a private dairy in the municipality of Sousa

### **Environmental issues:**

- Use of pesticides;
- Lack of solid waste disposal;
- Burning garbage;
- Fires caused by deforestation.
- Positive points:
  - They have preservation areas, especially on riverbeds and dams

Access to water for household consumption:

- Well and reservoir water are not treated.
- Positive points:
  - All the families have access to water from wells and dams.

Access to water for irrigation and animal watering:

- All the beneficiary families have water from wells and reservoirs for irrigation and animal consumption.

Social issue (young people, women, people with disabilities, LGBTQIA+, etc.):

- Difficulty in involving women and young people in milk production;
- Lack of collectivity.
- Positive points:
  - Within the productive activity, some women in the communities produce cheese and sweets with the milk.
  - There are 6 young people in the association who are active in milk production, the others support their parents in production.

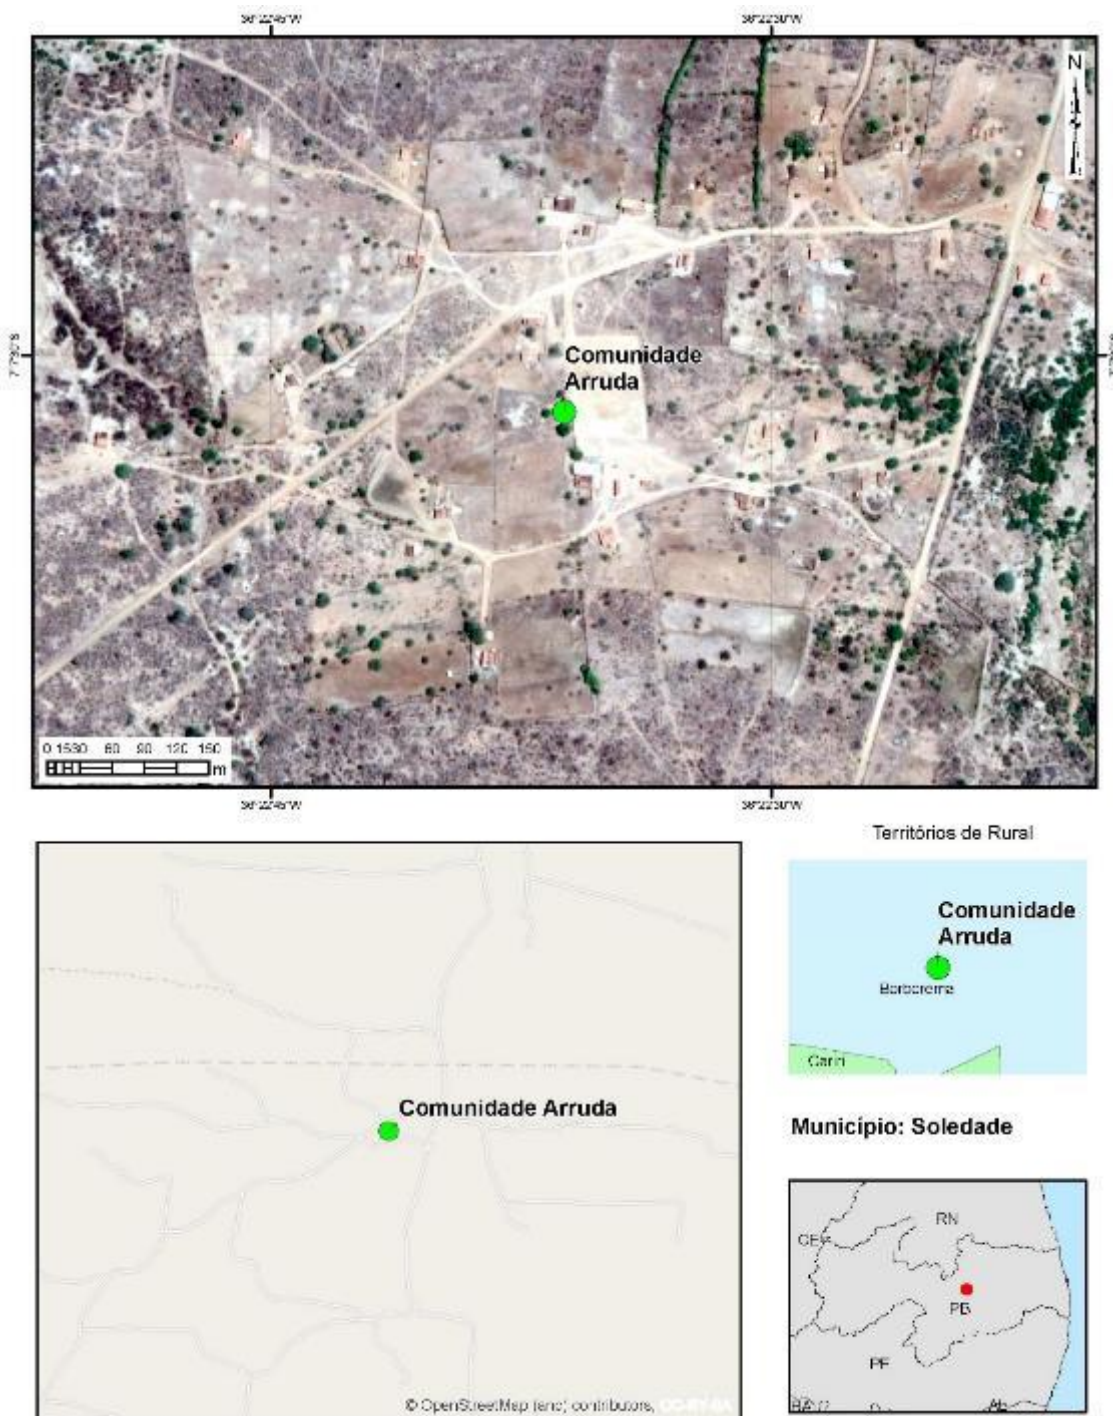

Access to public policies: PRONAF, CROP INSURANCE, PAA, PNAE, OTHERS

- CONAB closes in Itaporanga;
- They don't have access to the institutional market (PAA and PNAE) due to the lack of a processing structure;
- Lack of government action for dairy farming.
- Positive points:
  - Some of the farmers have access to PRONAF and Seguro Safra.

#### **4.4.3 Community of Arruda and ASCCO**

Below is information and illustration about the municipality and the territory where the Arruda community is located.

**Figure188 - Location of Arruda Community**

Source: Image Google Earth Pro / Open Street Map, 2023. Prepared by Consultoria, 2024

- Information about the municipality and territory

Name	Soledade
IBGE code	2516102
Population (CENSO/year)	13,968 inhabitants - Population census (year 2022)
GDP per capita (value and year)	R\$ 13.377,14 (2021)
MHDI	0,616 (2010)

Biome	Caatinga
Territory of Identity	Borborema
Annual rainfall (mm)	400.9 mm
Distance from the state capital and other economically important municipalities	186 km from João Pessoa and 58 km from Campina Grande

- Community information

Name	Municipal coverage - Arruda, Livramento, Melancias, Santa Teresa, Faustino and Belo Monte.
Type of community	Family farming
Location and access	Rural area 08 km from the town center on a dirt road
Number of families and people	35 families - 105 people
Main production activities carried out	Goats and sheep are the main activities, in addition to some secondary activities such as cattle, poultry and crops (corn and beans).
Average property area and % of productive area	An average of no more than 10 hectares, 80% of which is productive land
Land situation	Most rural lenders
Environmental Registration (CAR)	They all have
Electricity supply: type, number of families served	The families have single-phase electricity, with the exception of one family that still doesn't have electricity, as they recently moved away
Main water sources for human consumption and production	Cisterns, dams and artesian wells
Other relevant information	The Arruda community has a school for the children of this and neighboring communities.

- Information about the organization

Name	Soledad Association of Goat and Sheep Breeders
Acronym	ASCCO
CNPJ	35.614.622/0001-94
Status (active or irregular)	Active
Date of foundation	18/10/2019
President	Pablo Albuquerque Araújo
Address	Livramento Community, s/n - Rural Area of Soledade
Location (owned, rented, leased)	No headquarters The meetings take place at a member's house on the first Friday of every month
Membership numbers (men, women and young people)	35, 19 men, 16 women and 12 young people
Have you ever been involved in projects with non-reimbursable resources?	Social technologies project by PB Rural Sustentável/Cooperar

## **Main problems, challenges and positive points identified**

### **Productive Area:**

- Lack of reproductive control of the herd;
- Lack of specialized technical assistance;
- Few farmers carry out nutritional management (silage, haymaking), but they don't have the technical guidance and the right equipment to guarantee the quality and conservation of the products;
- Difficulty in food management related to the source of volume: both in the rainy and dry seasons, grazing in the caatinga area;
- High dependence on external inputs (feed) increasing the cost of milk production;
- Farmers have basic knowledge of health management (vaccination, deworming).

### **Access to TA:**

- Lack of qualified TA available to provide frequent and regular monitoring, focused on dairy goat farming;
- When available, TA does not provide guidance on environmental and marketing issues.

### **Marketing:**

- They sell their milk to a cooperative in the region, where it is collected twice a week (Monday and Thursday) from a 1,000-liter cooling tank located in the town of Soledade;
- Other associations in the neighboring towns of São Vicente do Seridó, Pocinhos and Olivedos also put milk in this tank, which makes it difficult to increase production because there is no longer a storage place or tank available;
- The municipal government supports the project by providing the place where the cooling tank is located and with the cost of electricity;
- There is a technician responsible for receiving the milk from each farmer at the collection point from 07:00 to 08:00 every day. He tests the quality of the milk delivered and keeps track of incoming and outgoing milk. At the end of the month, the associations pay this technician R\$0.19 per liter of milk for his services;
- They don't process the milk due to the difficulty of accessing the market without formalizing the activity;
- They can't access the PAA and PNAE markets due to the lack of milk processing/pasteurization

### **Environmental issues:**

- They reforest their property and preserve the legal reserve and APPs;
- They perform the zero base bus;
- They carry out agroecological practices, such as using Creole seeds

Access to water for household consumption:

- Consumption is through the storage of rainwater in a 16,000 L household cistern, which is sufficient throughout the year. In more critical periods, the cisterns are supplied by a water tanker paid for by the municipality;
- For the daily cleaning of the house, they use mud water

Access to water for irrigation and animal watering:

- For the animals, they use water from dams and some wells in the communities;
- Farmers do not use irrigation practices.

Social issue (young people, women, people with disabilities, LGBTQIA+, etc.):

- They don't have a specific project to benefit or encourage the involvement of women and young people in the association's activities, but they do take part in meetings and events organized by the organization.

Access to public policies: PRONAF, CROP INSURANCE, PAA, PNAE, OTHERS

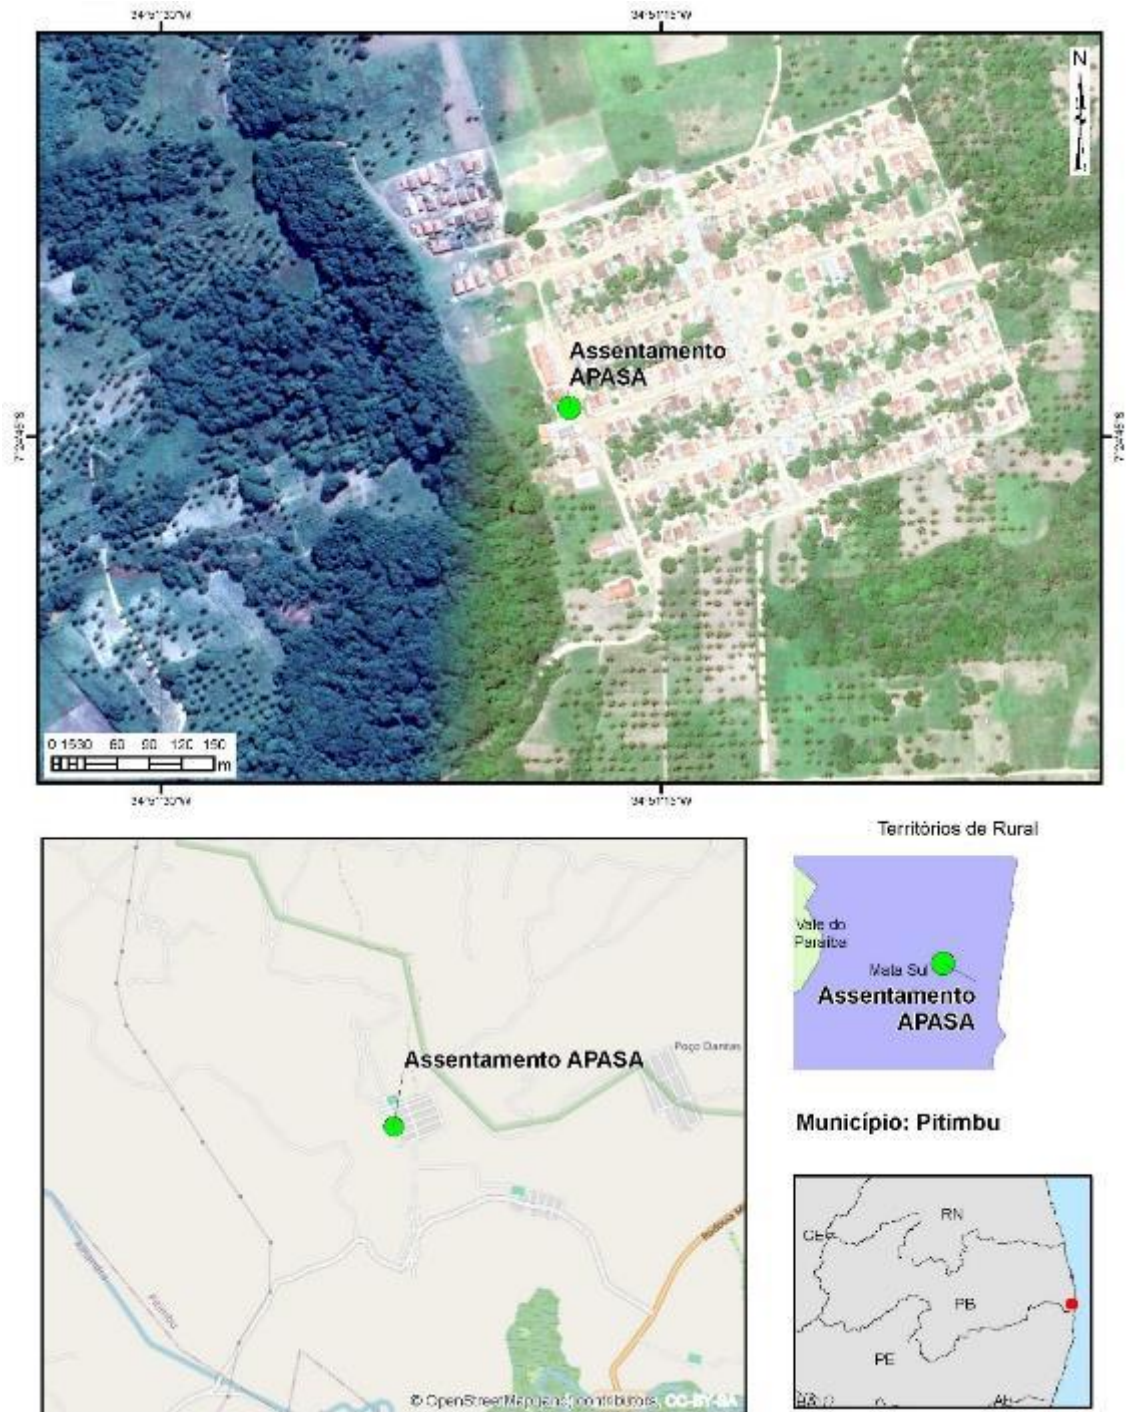

- Through the association, some of the farmers have access to public policies such as Seguro Safra and Pronaf;
- They don't have access to the institutional market (PAA and PNAE) due to a lack of processing facilities, health inspection seals, technical guidance and incentives;
- There is a lack of support and encouragement for the introduction of goat's milk products in school meals.

#### **4.4.4 APASA Settlement and Association of Agroecological Farmers of the South Coast of Paraíba**

Below is information and an illustration of the municipality and territory where the APASA settlement is located.

**Figure189 - Location of the Apasa Settlement**

Source: Image Google Earth Pro / Open Street Map, 2023. Prepared by Consultoria, 2024

- Information about the municipality and territory

Name	Pitimbu
IBGE code	2511905
Population (CENSO/year)	16,751 inhabitants - Source: IBGE, 2022
GDP per capita (value and year)	R\$ 22,092.43 - Source: IBGE, 2021
MHDI	0.570 - Source: IBGE, 2010

Biome	Atlantic Forest
Territory of Identity	Mata Sul
Annual rainfall (mm)	2022: 2,123.9 mm 2023: 2,089.6 mm Source: AESA PB
Distance from the state capital and other economically important municipalities	47 km to João Pessoa and 33 km to Conde

- Community information

Name	APASA Settlement
Type of community	Family farmers
Location and access	Rural area 12 km from the municipality's headquarters on a paved and dirt road.
Number of families and people	150 families and approximately 800 people.
Main production activities carried out	Growing vegetables, cassava, yams, sweet potatoes, beans and corn. Fruit for family consumption: papaya, cashew, cajá, green and dried coconut.
Average area of properties and % of productive area	5.6 ha and 80% productive area.
Land situation	All the partners have title to the land.
Environmental Registration (CAR)	100%
Electricity supply: type, number of families served	In the Agrovila, all 150 families are served by single-phase electricity.
Main water sources for human consumption and production	An artesian well supplies the APASA Settlement Agrovillage and another has been drilled, but without a pump and accessories.
Other relevant information	The settlement has a primary school, a basic health unit and the headquarters of the Pitimbu Department of Agriculture. There is a fenced collective area of 5.0 hectares.

- Information about the organization

Name	Association of Agroecological Farmers of the South Coast of Paraíba.
Acronym	Eco South Association
CNPJ	07.628.011/0001-60
Status (active or irregular)	Active
Date of foundation	30/09/2005
President	Criselde Maria dos Santos
Address	Eco Sul shed, next to the Assembly of God. Rua não projetada, s/n - rural area. Pitimbu, PB. CEP: 58.324-000
Location (owned, rented, leased)	Own
Membership numbers (men, women and young people)	68 members: 28 women, 40 men, including 23 young people

Have you ever been involved in projects with non-reimbursable resources?	No
--	----

### **Main problems, challenges and positive points identified**

#### Productive Area:

- Lack of technical assistance.
- Dependence on seedlings from EMPAER and UFPB.
- Lack of knowledge about soil management.
- Problems with erosion.
- Drainage problems in the soil.
- Inadequate and insufficient irrigation.
- Positive points:
  - Basic experience in vegetable production;
  - Availability of a fenced collective area with an artesian well (without pump and accessories).

#### Access to TA:

- The technical assistance offered by Pitimbu's Department of Agriculture is provided on demand, which means that it is not continuous and does not fully meet farmers' needs.
- Positive points:
  - Provision of free tractor hours by the municipality's Department of Agriculture

#### Marketing:

- The products are sold at a fixed price in João Pessoa at the Bessa, Jardim Oceania and Ponto de Cem Réis markets (weekly);
- High transportation costs for farmers to travel to fairs to sell small quantities;
- The practice of selling to middlemen is still very common. They usually set the value of the products, especially yams and manioc.
- Positive points:
  - There are a few collapsible market stalls.
  - Pitimbu City Hall provides a truck to transport the products to the fairs, but the driver's daily rate, diesel and maintenance of this vehicle are the responsibility of the Eco Sul Association.
  - Potential for expanding marketing at fairs in other districts of João Pessoa and nearby municipalities

#### Environmental issues:

- Lack of preservation of riparian forest and springs.

- The practice of burning by some farmers to clear the area.
- Burning residential waste

Access to water for household consumption:

- Reduced flow from the well during the driest periods of the year, compromising the supply to families.
- Positive points:
  - In the Agrovila, there is an artesian well that supplies the water tank responsible for distributing water to the settlers. Every month, Pitimbu Town Hall analyzes the water to ensure that it is safe to drink;
  - Individualized cisterns in each house in the community

Access to water for irrigation and animal watering:

- Unavailability of electricity in the production areas, making the use of irrigation unfeasible;
- The well drilled in the collective production area is not equipped with a pumping system.
- Positive points:
  - Presence of a borehole in the collective area

Social issue (young people, women, people with disabilities, LGBTQIA+, etc.):

- Lack of social and cultural activities for young people in the community;
- Few activities developed collectively.
- Positive points:
  - 30% of the positions on the association's board are held by women from the settlement;
  - Participation of young people in productive and commercial activities.

Access to public policies: PRONAF, CROP INSURANCE, PAA, PNAE, OTHERS

- Families have little knowledge and do not receive adequate guidance on how to access public policies (PRONAF, Seguro Safra, PNAE, etc.);
- Positive points:
  - Some families access the PAA quite frequently

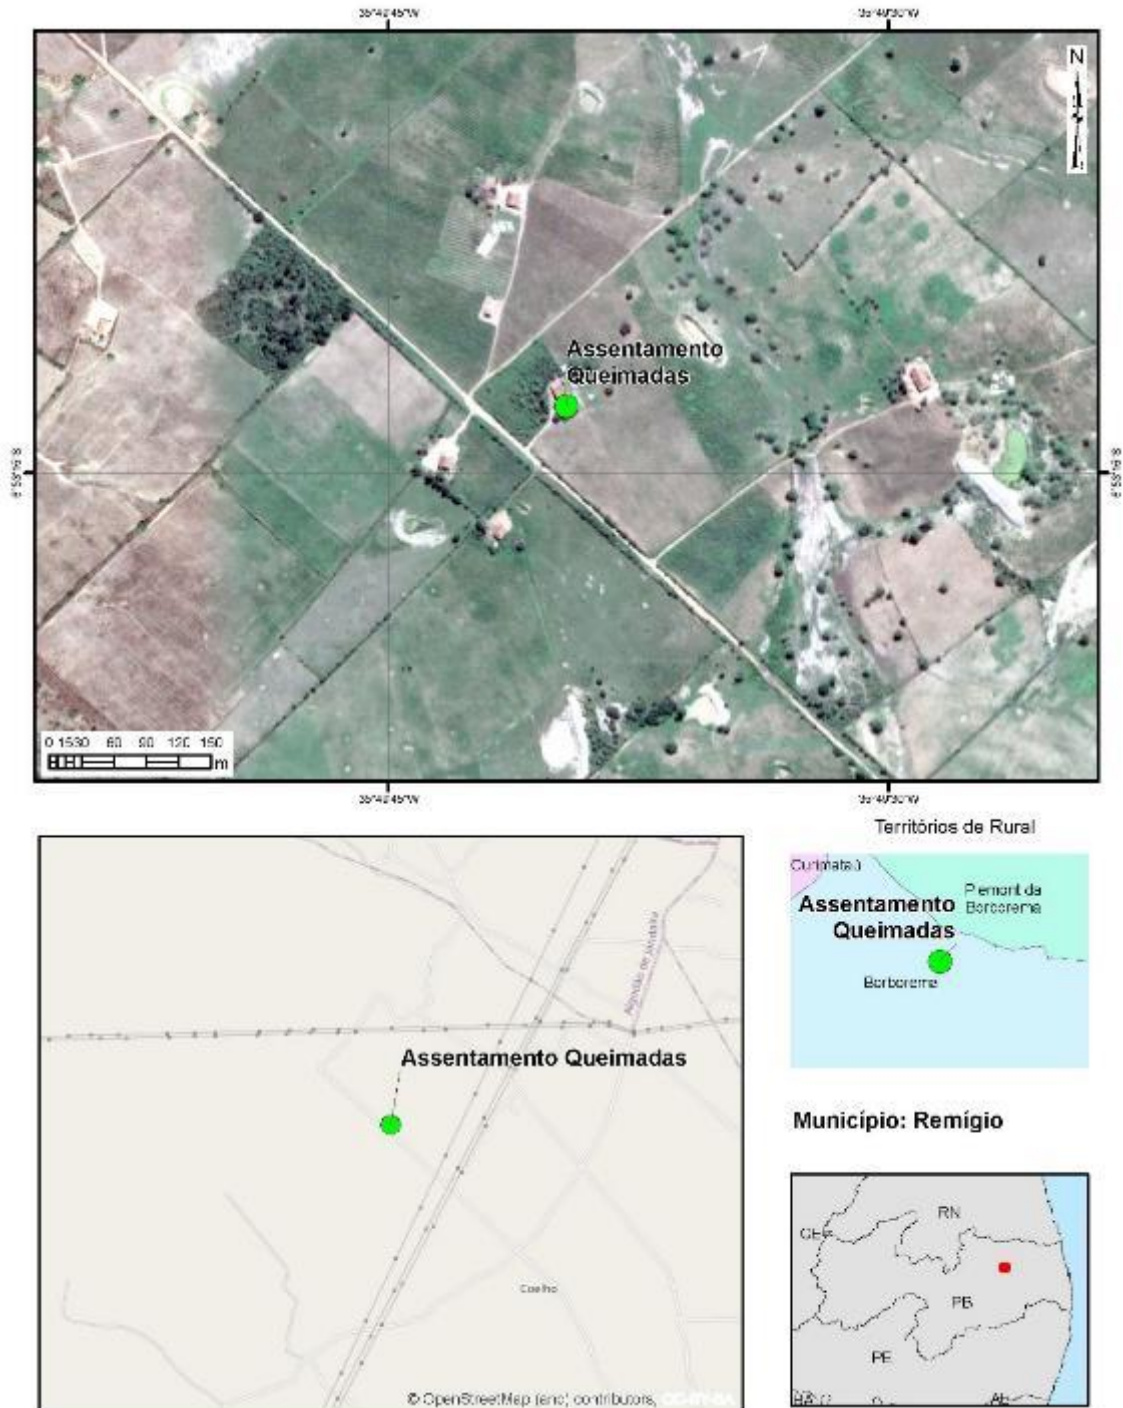

Others not mentioned above

- The municipality has no forest nursery or seed bank to supply farmers.
- The company responsible for garbage collection passes through the APASA settlement twice a week, but some settlers still burn their garbage.
- The black water goes into the pits and the gray water is left out in the open

#### 4.4.5 Queimadas Settlement and Borborema Agroecology Network

Below is information and an illustration of the municipality and territory where the Queimadas settlement is located.

Figure190 - Location of the Queimadas Settlement

Source: Image Google Earth Pro / Open Street Map, 2023. Prepared by Consultoria, 2024

- Information about the municipality and territory

Name	Remígio
------	---------

IBGE code	2512705
Population (CENSO/year)	17,885 (2022 census)
GDP per capita (value and year)	R\$ 9.080,26 (IBGE 2021]
MHDI	0.607 (IBGE 2010)
Biome	Caatinga
Territory of Identity	Borborema
Annual rainfall (mm)	708.0 mm (2020) Source: AESA website.
Distance from the state capital and other economically important municipalities	150 km from João Pessoa and 45 from Campina Grande.

- Community information

Name	Queimadas Settlement
Type of community	Settlement area
Location and access	Rural area 12 km from the town center (dirt roads and asphalt).
Number of families and people	Approximately 150 families and 600 people.
Main production activities carried out	Maize, beans, cotton, sweet potatoes and livestock farming
Average property area and % of productive area	Individual plot of 10 hectares, with an average of 40% productive area.
Land situation	Title has not yet been granted by Incra
Environmental Registration (CAR)	The settlement has a Rural Environmental Registry issued by INCRA.
Electricity supply: type, number of families served	All the families have single-phase electricity.
Main water sources for human consumption and production	Cisterns (supplied by the municipality and the army), dams and reservoirs.
Other relevant information	<p>- Young people and women are part of the Borborema Agroecology Network groups, as representatives of commissions and councils within certification activities;</p> <p>- Development of social inclusion activities for children and people with disabilities in the settlement.</p>

- Information about the organization

Name	Borborema Agroecology Network
Acronym	RBA
CNPJ	19.939.948/0001-35
Status (active or irregular)	Active
Date of foundation	23/07/2013
President	José Sinésio da Silva
Address	Queimadas Settlement, SN, Remígio-PB, Cep: 58.398-000.
Location (owned, rented, leased)	Provided (the shed belongs to the queimadas settlement association).

Membership numbers (men, women and young people)	90 members, 44 men, 46 women, 14 of them young people
Have you ever been involved in projects with non-reimbursable resources?	No

### **Main problems, challenges and positive points identified**

#### **Access to raw materials:**

Agroecological cotton production in the Borborema region is carried out by small family farmers in rainfed areas. To make organic production viable, the farmers founded the Borborema Agroecology Network (RBA) and began to develop participatory organic certification activities. Production is linked to climatic conditions, which is why not everyone is able to produce. Normally, cotton is planted in a consortium with other crops (beans, sweet potatoes, sesame, corn) and under normal conditions the yield is 500 kg/ha of cotton. The table below illustrates the average production data for a family.

Information provided by RBA/PROCASE:

Descrição	Parâmetros
Área média de produção por agricultor (ha)	2,5
Produtividade média algodão em rama (kg/ha)	500
Rendimento pluma (%)	38%
Rendimento caroço (%)	60%
Impureza (%)	2%
Produção anual de algodão em pluma (kg/agricultor)	475

- Main problems:
  - Incidence of pests;
  - Extreme weather events (prolonged drought or concentrated rainfall - flooding);
  - Difficulty on the part of some farmers in maintaining participatory organic certification;
  - Lack of water sources in quantity and quality for use in irrigation systems;
  - Lack of mechanization adapted for family farming.
- Positive points:
  - Organic production (preservation of the farmer's health, maintenance of soil fertility, differentiated price).

#### **Infrastructure for processing:**

The RBA does not have its own processing structure, and it is necessary to carry out the process in a private mill located in the municipality of Juarez Táavora - PB, approximately 50 km from the settlement.

- Main problems:
  - High transportation costs to take the cotton stalks and return with the lint and seeds;

- Payment of per diem for the driver and maintenance of the truck (support from the town hall);
- A problem of transgenic contamination, since the mill processes cotton from other municipalities outside the agroecological cotton network and not all of them produce organically;
- Lack of control against pathogens in the processing plant causing problems with contamination (contaminated branches from other producers);
- The plant's difficulty in satisfactorily serving all the farmers, limiting its capacity to expand the activity.
- Positive points:
  - There is a shed in the settlement ready to receive a mini-power plant (in the process of transforming the single-phase electricity network into three-phase);
  - Volume of cotton production in the settlement and region sufficient to justify the investment.

#### Marketing:

There is a well-defined strategy that guarantees the purchase of all agroecological cotton produced by the RBA, under differentiated price conditions, making the activity an important source of job and income generation for family farmers in the Borborema region.

- Main problems:
  - Compromised plume quality, caused by the lack of control over the processes in the mini-mill (outsourced service);
  - Lack of a person responsible for the marketing process;
  - RBA's visibility is limited (absence of a website and little use of social networks).
- Positive points:
  - Guaranteed purchase of production through a contract with two companies: Veja Fair Trade (French sneaker manufacturer) and Flávia Aranha LTDA (clothing company in São Paulo);
  - Buyers encourage an increase in production with a guarantee of purchase through the payment of premiums and bonuses (Fair Trade);
  - Differentiated payment for agroecological and organic cotton (1 kg of organic cotton lint R\$ 19.95 and 1 kg of conventional lint R\$ 8.69);
  - Buyers pay cash on invoice;
  - Growing market (other companies interested).

#### Management:

The RBA is made up of family farmers. Its board of directors is made up of the president (José Sinésio, 79), treasurer (Adivânia, 39) and executive secretary (Suzana Aguiar, 28).

#### *Theme 1: Articulation with the countryside*

- Main problems:

- Limited capacity to meet demands.
- Positive points:
  - Credibility and trust in the work carried out by the RBA;
  - Participatory organic certification by the Borborema Agroecology Network.

#### *Topic 2: Administrative, financial and commercial*

- Main problems:
  - Small management team with technical limitations;
  - Lack of IT infrastructure.
- Positive points:
  - Formation of the Financial Autonomy Incentive Fund (FIAF), from the payment of premiums by Veja Fair Trade;
  - Basic knowledge of management processes;
  - Keeps statutory commitments up to date;
  - Internet access.

#### *Theme 3: Articulation with partners (public policies, TA, social issues, etc.)*

- Main problems:
  - Public TA is not very accessible and is not specialized;
  - Limited capacity to meet all demands.
- Positive points:
  - The RBA partially makes up for the lack of TA, due to the exchange of experiences and knowledge between farmers;
  - Access to the PAA to market tubers and legumes produced in consortium with cotton;
  - It offers technical guidance to farmers on accessing public policies (PRONAF, Seguro Safra, etc.).
  - Encourages the participation of women and young people in activities.

#### *Theme 4 - Partnerships*

- The RBA has good institutional relations with the state government and with most of the municipal managers in its area of coverage. It has important partnerships with EMBRAPA Cotton, the Association for Supporting Policies to Improve Quality of Life, Coexistence with Drought, the Environment and Verticalization of Family Production - ARRIBAÇÃ, Remígio City Hall, among others.

#### *Environmental issues:*

Through the participatory organic certification process, the RBA works directly to raise farmers' awareness of environmental preservation.

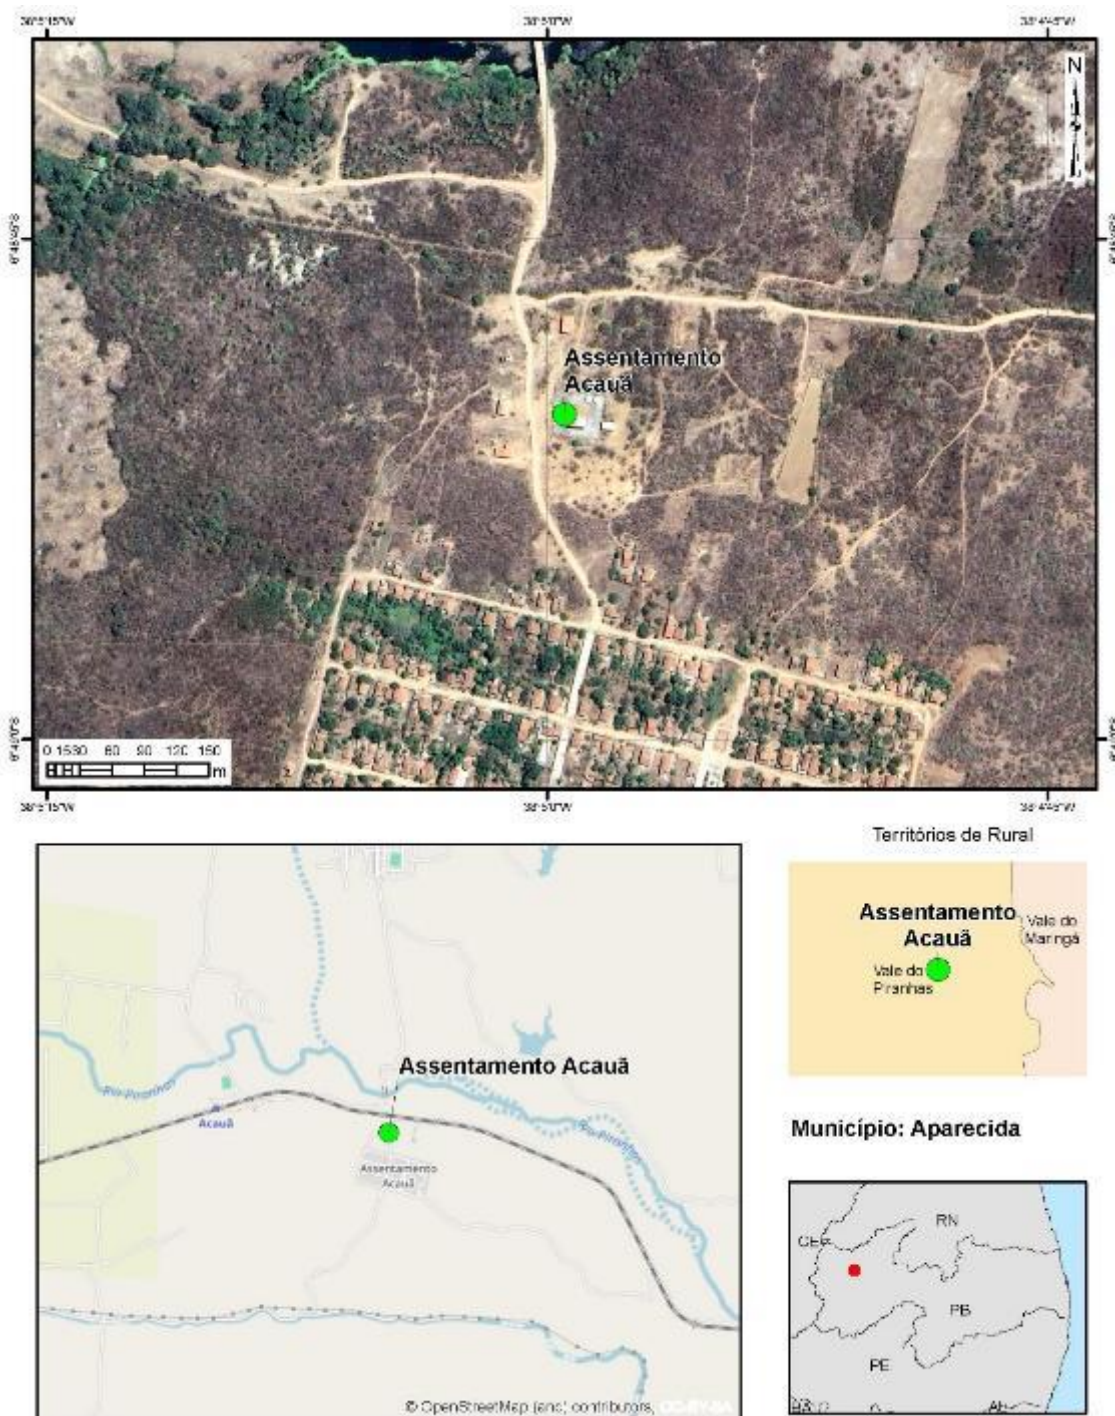

- Main problems:
  - No specific place in the settlement to dispose of household waste;

- Frequent burning of household waste by families in the settlement;
- Risk of loss of production associated with climate change.
- Positive points:
  - Organic certification;
  - The use of agroecological techniques to maintain favorable soil moisture and nutrition conditions.

#### **4.4.6 Acauã Settlement and COASPA**

Below is information and an illustration of the municipality and territory where the Acauã Settlement is located.

**Figure191 - Location of the Acauã Settlement**

Source: Image Google Earth Pro / Open Street Map, 2023. Prepared by Consultoria, 2024

- Information about the municipality and territory

Name	Aparecida
IBGE code	2500775
Population (CENSO/year)	7,960 inhabitants - 2022 Demographic Census (IBGE)
GDP per capita (value and year)	R\$ 12.405,76 (2021)
MHDI	0,578

Biome	Caatinga
Territory of Identity	Piranhas Valley
Annual rainfall (mm)	2023- 733.9 mm 2022- 1,055.5 mm
Distance from the state capital and other economically important municipalities	412 km to João Pessoa and 16.8 km to Sousa

- Community information

Name	Acauã Settlement
Type of community	Family farmers
Location and access	Rural area 4.2 km from the town center on a dirt road
Number of families and people	130 families - 394 people
Main production activities carried out	Agriculture: corn, beans and fruit trees Livestock: cattle
Average property area and % of productive area	15 hectares, with 10% productive area
Land situation	60% have provisional title to the land
Environmental Registration (CAR)	Everyone has done the CAR
Electricity supply: type, number of families served	All families served with single-phase electricity
Main water sources for human consumption and production	Well and individual cisterns. Collectively, they have two 55,000 liter cisterns
Other relevant information	All families have internet access

- Information about the organization

Name	Cooperative of Beekeepers of the Sertão Paraibano - COASPA
Acronym	COASPA
CNPJ	28.812.481/0001-59
Status (active or irregular)	Active
Date of foundation	07/03/2015
President	Francisco Mangueira Soares Peixoto
Address	Acauã Settlement, S/N, Rural Area, Aparecida - PB. ZIP CODE: 58823-000
Location (owned, rented, leased)	Own
Membership numbers (men, women and young people)	82 members - 43 men, 7 of them young, and 39 women, 5 of them young
Have you ever been involved in projects with non-reimbursable resources?	Yes. Banco do Brasil Foundation and Paraíba Rural Sustentável - formerly COOPERAR

## **Main problems, challenges and positive points identified**

### **Access to raw materials:**

Background: Honey production has been growing considerably in COASPA's area of operation, but the production chain faces numerous difficulties in operating professionally in the market.

- Information provided by COAPASA

<b>Características gerais</b>	<b>2022</b>	<b>2023</b>	<b>2024 (previsão)</b>
Nº de famílias envolvidas na produção de mel	50	80	120
Quantidade média de colméias por família	20	30	40
Quantidade média anual de colméias povoadas por família	15	23	35
Quantidade de colheitas de mel/ano	2	3	2
Produtividade média de mel por colméia (kg/ano)	22	25	25
Produção total de mel (kg/ano)	16.500	46.000	105.000

- Main problems:
  - A dispersed production base, with cooperative beekeepers in 15 municipalities;
  - Insufficient primary honey extraction units - Honey Houses - that meet the health standards required by the responsible bodies;
  - Long distances between the apiaries and the few legalized honey houses (only 1 and the warehouse), increasing transport costs;
  - Lack of organization of the productive base to act collectively;
  - There is a strong presence of middlemen who buy the honey, regardless of how it is extracted, paying prices below those practiced by the cooperative;
  - The producer sells the honey at fairs and other markets (improvised extraction);
  - Lack of encouragement from beekeepers and associations to invest in honey houses due to the difficulty and lack of knowledge in accessing the Municipal Inspection Seal (SIM);
  - Predominantly small beekeepers, with limited access to credit.
- Positive points:
  - Production of enough honey in the cooperative's area of operation to meet current and future demand

### **Infrastructure for processing:**

In beekeeping, the first processing usually takes place in honey houses, which are simpler structures and usually focus on primary extraction of the honey and storing it in 25 kg plastic buckets or 300 kg metal drums. The honey warehouse, as well as being able to carry out the primary extraction of the honey, is the place where the standardization stages are carried out, fractionation into retail packaging, etc. Both types of structures must be legalized with the competent bodies (federal, state or municipal) depending on their purpose.

- Main problems:
  - Lack of a network of certified honey houses, strategically located to serve as many beekeepers as possible, with the lowest possible transportation costs;

- There is only one certified honey house in the cooperative's area of operation;
- Lack of a small unit for the production of honeycomb wax to meet the needs of cooperative members at a more affordable cost.
- Positive points:
  - There is an equipped honey warehouse with the seal of the Federal Inspection Service (SIF), which allows products to be marketed nationwide.

#### Marketing:

Currently, the low supply of honey with a guarantee of origin is a major obstacle to the cooperative's commercial expansion, whether it's to increase sales in wholesale, retail or the institutional market with the PNAE. In addition, the small volume of honey processed prevents the development of more robust partnerships with exporting companies (cooperatives or private companies), which depend on larger volumes and constancy of supply to make their operations viable.

- Main problems:
  - Lack of a consolidated brand in the market;
  - Production scale limited to the availability of raw materials with guaranteed origin;
  - Poor distribution channels (logistics);
  - Lack of promotion of the cooperative and its products on the internet;
  - Lack of marketing strategies;
  - Low participation in fairs and events to promote products.
- Positive points:
  - Products certified by the Federal Inspection Service (SIF);
  - Growing market;
  - Final stage of negotiations with a supermarket wholesale chain;
  - Sale of honey in sachets and tubes to the PNAE

#### Cooperative management:

The cooperative's board of directors is committed to meeting the needs of its members, but its management capacity is limited to act in all cooperative dimensions.

#### *Theme 1: Articulation with the countryside*

- Main problems:
  - Lack of active technical assistance;
  - Poor control and recording of information;
  - Little coordination with community associations to support the organizational process.
- Positive points:
  - Credibility and trust between the cooperative and its members.

#### *Topic 2: Administrative, financial and commercial*

- Main problems:
  - Small management team with technical limitations;
  - Lack of IT infrastructure.
- Positive points:
  - Basic knowledge of management processes;
  - Keeps statutory commitments up to date;
  - Internet access.

*Theme 3: Articulation with cooperative members (public policies, TA, social issues, etc.)*

- Main problems:
  - Limited capacity to meet all demands;
- Positive points:
  - It offers technical guidance to cooperative members on access to public policies (PRONAF, Seguro Safra, etc.).
  - Good coordination with banks, unions and municipalities (agriculture department).
  - Encourages the participation of women and young people in activities.

*Theme 4 - Partnerships*

- COASPA has a good institutional relationship with the state government and with most of the municipal managers in its catchment area. Through the municipal agriculture departments, SENAR, SEBRAE and trade unions, it has been able to get some technical support for the development of the production chain.

Environmental issues:

The cooperative seeks to disseminate information about environmental preservation and has generally achieved satisfactory results.

- Main problems:
  - Frequent burning of household waste by some beekeepers;
  - Deforestation by some cooperative and non-cooperative members.
- Positive points:
  - This topic is widely covered in courses, training sessions, field days and TA activities.

## **5 IDENTIFICATION AND CHARACTERIZATION OF ENVIRONMENTAL RISKS AND IMPACTS**

The characterization of the environmental and social impacts is presented below, first with an assessment of the impacts through a matrix and then an analysis of the impacts, including the indication of mitigating or enhancing measures.

According to ESPS 2 to 9, the identification of environmental risks and impacts should take into account risks to nearby communities, as well as environmental risks and risks to ecosystem services and, based on these impacts, appropriate protection measures should be drawn up in the Environmental and Social Management Plan to reduce these risks.

The reference and development scenarios were evaluated to define the Impacts or Effects from the point of view of the critical factors. To this end, the indicators listed in the Socio-Environmental Diagnosis presented in this document were used.

The Impacts or Effects described below were considered to be of a general nature and, for the most part, occur during the Implementation phase of most Procasa II components.

Considering the environmental and social assessment criteria summarized, it can be said that there are large groups of interferences that will generate negative and positive impacts during the planning, implementation and operation phases of the project. It is expected that the operation of the project will have more positive impacts than negative ones.

## 5.1 Concepts

The main concepts used in this chapter are briefly described below.

**Cumulative impacts assessment:** is a tool for assessing the cumulative impacts of the project in combination with impacts from other relevant past, present and reasonably foreseeable developments, as well as unplanned but foreseeable activities that have been enabled by the project and that may occur later or in a different place.

**Cumulative impact:** the additional impact of the project when added to relevant past, present and reasonably foreseeable development impacts, as well as unplanned or foreseen activities allowed by the project that may happen later or in a different location. Cumulative impacts can arise from small individual but significantly collective activities that take place over a period of time. Cumulative impacts are limited to impacts generally recognized as important in science-based concerns and/or concerns of people affected by the project. Examples of cumulative impacts are: additional contribution in the emission of gases in the atmospheric basin; reduction of water flow in watersheds due to multiple withdrawals; increase in sediment volume in watersheds; interference in migratory routes or wildlife displacement; or more congestion and accidents due to increased vehicle traffic on common roads.

**Indirect impact:** is the impact that is not directly caused by the project activity, but contributed to by that activity, often at a distance, or resulting in a complex impact path. Other factors and third parties outside the direct control of the project are also associated factors.

**Impact:** Social and environmental impacts refer to any change, potential or actual, (i) to the physical, natural or cultural environment; and (ii) impacts on the adjacent community and workers resulting from the business activity being supported.

**Social and Environmental Risk:** is the combination of the expected severity of (i) a project that may cause or contribute to a potential adverse environmental and social impact, or (ii) problems that may negatively affect the provision of environmental and social mitigation measures and results; and the probability of one or both of these occurring.

**Environmental Aspect:** According to Sánchez (2020): An element of an organization's activities, products or services that can interact with the environment.

**Activities:** Set of actions necessary for the implementation of a given project. The environmental impacts will be identified by correlating the environmental aspects with the actions.

**Mitigation Hierarchy:** Order of preference in the application of mitigating measures, namely, prevention of adverse environmental impacts first; when they are unavoidable, application of measures to minimize them; when they cannot be totally avoided or minimized, rehabilitation of the affected areas; and finally compensation or offsetting of residual impacts, after prevention, minimization or rehabilitation. The term "mitigation hierarchy" is a tool commonly applied in Environmental Impact Assessments to help manage risks. It includes measures taken to avoid impacts from the outset of development activities and, when this is not possible, to implement measures that minimize, then restore and, as a last resort, offset possible residual adverse impacts.

**Residual Impacts:** these are those related to the project and which may remain after the mitigation hierarchy has been applied, including measures to avoid or minimize them. If compensation is required, a review of all residual impacts discovered through an assessment process must be carried out (IDB, Nov./2015).

**Ecosystem services:** these are the benefits that people, including companies, obtain from ecosystems. Ecosystem services are organized into four types: (i) provisioning services, which are the products that people obtain from ecosystems; (ii) regulating services, which are the benefits that people obtain from regulating ecosystem processes; (iii) cultural services, which are the non-material benefits that people obtain from ecosystems; and (iv) supporting services, which are the natural processes that maintain the other services. Examples are as follows: (i) provisioning services can include food, fresh water, timber, fibers and medicinal plants; (ii) regulating services can include surface water purification, carbon storage and sequestration, climate regulation and protection against natural hazards; (iii) cultural services can include natural areas that are sacred sites and important areas for recreation and aesthetic pleasure; and (iv) supporting services can include soil formation, nutrient cycling and primary production.

**Vulnerable Individuals or Groups:** are people or groups of people who may be more adversely affected by project impacts than others because of characteristics such as disability, health status, indigenous status, gender identity, sexual orientation, religion, race, color, ethnicity, age, language, personal or political opinions, national or social origin, property, birth, economic disadvantage, or social status. Other vulnerable individuals and/or groups may include people or groups in vulnerable situations, including the poor, the landless, the elderly, single-parent families, refugees, internally displaced persons, communities dependent on natural resources or other displaced persons who cannot be protected through national legislation and/or international law.

## 5.2 Impact Assessment Methodology

According to the Environmental and Social Performance Standard - ESPS 1, the Project must establish and maintain a process to identify the environmental and social risks and impacts of the project. Therefore, this analysis of environmental impacts in this document has also been prepared on the basis of the IDB's Environmental and Social Performance Standard 1:

*The process will consider all relevant direct, indirect and cumulative environmental and social risks and impacts of the project, including the issues identified in ESPS 2 to 10 and those likely to be affected by these risks and impacts. The process of identifying risks and impacts will consider, among other things: (i) risks that negative project impacts will fall disproportionately on individuals and groups who, because of their particular circumstances, are in a position of vulnerability; (ii) any prejudice or discrimination assessed against individuals or groups in the provision of access to development resources or project benefits, particularly in the case of those who are in a situation of disadvantage or vulnerability; (iii) those defined by the EHSs; (iv) those related to the health, safety and well-being of workers and communities affected by the project, including associated risk of pandemics, epidemics or the transmission of any other contagious disease caused or exacerbated by project activities; (v) GHG emissions, risks and impacts associated with natural disasters and climate change, caused or exacerbated by the project, including opportunities for adaptation and other potential transboundary effects, such as air pollution or use or pollution of international waterways; (vi) those related to community safety, including the safety of project infrastructure and threats to people's safety from risks of aggravation of individual or community conflicts or violence that could be caused or increased by the project; (vii) adverse social and economic impacts related to the appropriation or restriction of involuntary use of land; (viii) risks and impacts associated with the tenure and use of natural resources and land, including (where relevant) potential impacts of the project on local land use patterns or tenure arrangements, availability of and access to land, food and land security and values, and any other risk related to conflict or contestation of land and natural resources; (ix) any material threat to the protection, conservation, maintenance and restoration of natural habitats and biodiversity; (x) those related to ecosystem services and the use of natural resources, including risks and impacts at watershed and/or transboundary level; (xi) adverse impacts on communities of Indigenous Peoples; (xii) risks to cultural heritage; (xiii) gender-related risks, including exclusion and gender-based violence (sexual exploitation, human trafficking and the spread of sexually transmitted diseases) and potential risks of discrimination based on gender or sexual orientation, among others. (ESPS 1 - Paragraph 9).*

It is important to consider the need for the environmental and social studies to present sufficient information on the possible risks and impacts of the project and for this information to be made available to stakeholders in a timely manner and with relevant information and in easy-to-understand language so that they can take a position. It is also relevant to establish that, according to paragraph 39 of ESPS 1 "The grievance mechanism should be scaled according to the risks and adverse impacts of the project and have the people affected by the project as its main user".

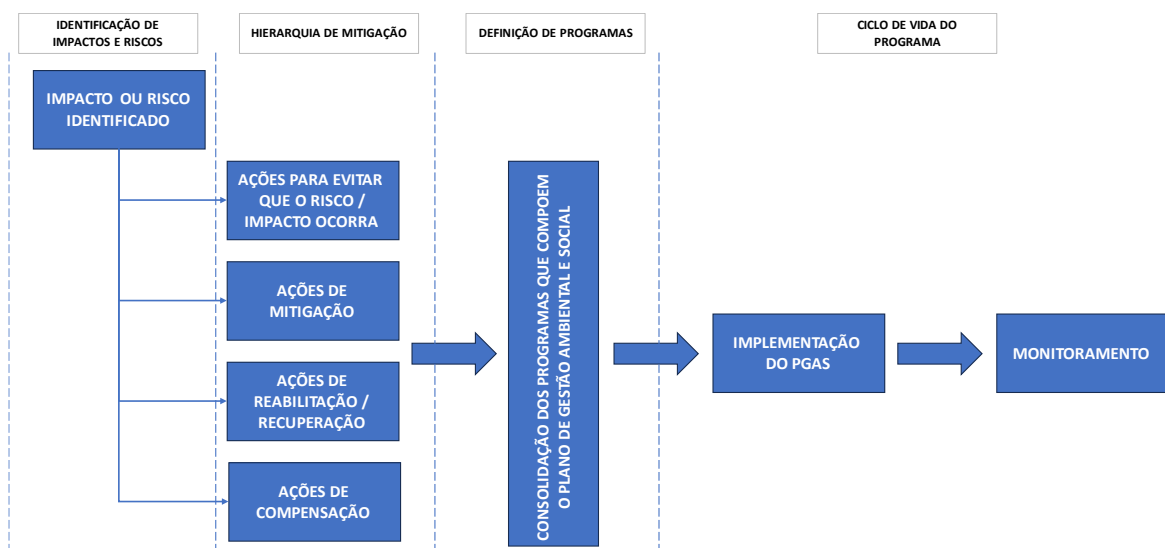

During the analysis of impacts, the mitigation hierarchy approach was also adopted:

- a) anticipate and avoid risks and impacts;
- b) when it is not possible to avoid, minimize or reduce risks and impacts to acceptable levels;
- c) once the risks and impacts have been minimized or reduced, mitigate them;
- d) where residual significant impacts remain, offset or neutralize them, where technically feasible<sup>47</sup> and financially feasible<sup>48</sup>.

Finally, it is important to consider that the social and environmental management instruments to be employed during the project life cycle should be assessed in accordance with the project's risks and impacts, as well as the definition of the measures and actions identified to manage these risks and impacts. These instruments will take into account the experience and capacity of the parties involved in the project, including control bodies, legislation, the communities affected by the project and other stakeholders, and aim to support better social and environmental performance.

Based on the process of identifying and defining the hierarchy of impact mitigation, the programs to be implemented are defined, consolidated in the Environmental and Social Management Plan (PGAS), the aim of which is to present the appropriate environmental and social management for the project, and which must be implemented throughout the life cycle of Procace II, with monitoring being necessary to adequately define the success rates of environmental and social management, or to define corrections to actions, as well as new strategies.

**Figure192 - Impact analysis and definition of the ESMP**

47 Technical feasibility is based on whether the proposed measures and actions can be implemented with commercially available expertise, equipment and materials, taking into account local factors such as climate, geography, demographics, infrastructure, security, governance, capacity and operational reliability.

48 Financial viability is based on relevant financial considerations, including the relative magnitude of the additional cost of adopting such measures and actions compared to the investment, operation and maintenance costs of the project, and whether this additional cost could make the project unviable for the Borrower.

Elaboration: consultancy, 2023.

### 5.3 Identifying impacts

The identification of impacts was based on the description of Proc case II sub-projects, as presented in Chapter 2.

The following table shows the attributes defined in the impact assessment, followed by a matrix of the most relevant impacts identified and their classification according to the selected attributes. It is also anticipated that the mitigation, control and monitoring measures or potentialization of the impacts will be presented.

**Table 193 - Description of Impact Attributes**

ATTRIBUTE	DESCRIPTION
<b>Nature</b>	Nature can be <b>Negative</b> (when it generates adverse effects) or <b>Positive</b> (when it generates beneficial effects).
<b>Spatiality</b>	Form of impact repercussions: <b>Localized</b> (spatializable) and <b>Dispersed</b> (non-spatializable).
<b>Probability</b>	<b>Certain, Probable</b> and <b>Possible</b> impact, depending on whether they can be avoided or are considered dependent on other factors.
<b>Occurrence</b>	Time for the impact to occur: <b>Short-term, Medium-term</b> or <b>Long-term</b> .
<b>Duration</b>	The impact can be <b>Temporary</b> (when it only occurs during one or more phases of the project) or <b>Permanent</b> (when the impact lasts).
<b>Reversibility</b>	If the intervention ceases, the environmental conditions return to the previous situation ( <b>Reversible</b> ) or not ( <b>Irreversible</b> ).

Source: Consultancy.

It is important to note that there are two components to be assessed in terms of environmental and social impacts: Component 1 - Resilient Production Systems and Environmental Recovery and Component 2 - Water security and rural sanitation. These components were analyzed together in the matrix.

### 5.3.1 Matrix for identifying environmental and social impacts

Impact		Impacting Cause / Action	Phase	Nature	Spatiality	Probability	Occurrence	Duration	Reversibility	Program / Measure
1	Generating expectations in the population about the project	Circulation of unofficial or incomplete information about the project	Elaboration of Study, Project and dissemination of Project	Adverse	Localized	Right	Medium Term	Temporary	Reversible	Stakeholder Communication, Consultation and Engagement Plan MQR implementation
2	Changes in water quality, affecting aquatic habitats and water resources by carrying soil and other materials into nearby rivers	Movement and handling of soils in agricultural activities and earthworks, cut and fill. exposed soils	Implementation phase	Adverse	Localized	Possible	Medium Term	Temporary	Reversible	Water quality control
3	Contamination of soil and water resources - from civil works .	Production of unserviceable soil from excavation, unused inputs and materials and leftover materials from civil works with inadequate waste disposal	Phases of implementation of social structures and technologies	Adverse	Localized	Possible	Medium Term	Temporary	Reversible	Waste management from the installation of structures
4	People hit by cars	Circulation of project vehicles on the roads used by the population between their origin and destination.	Project implementation phases	Adverse	Localized	Possible	Medium Term	Temporary	Reversible	Traffic Program and Stakeholder Communication, Consultation and Engagement Plan
5	Proliferation of vector-borne diseases	Accumulation of water in poorly drained areas presence of organic matter, such as food waste, which favors the development of micro and macro vectors	Project implementation phases	Adverse	Localized	Possible	Medium Term	Temporary	Reversible	Vector and Disease Control
6	Accidents at work	Agricultural activities with hazardous levels and associated risks (use of cutting tools, handling of species and animals, risk of being run over on roads, etc.)	Project implementation phases	Adverse	Localized	Possible	Medium Term	Temporary	Reversible	Labor Management
7	Increase in gender-based violence	Presence and movement of people (workers) not belonging to the community	Project implementation phases	Adverse	Localized	Possible	Medium Term	Temporary	Reversible	Prevention and care of gender-based violence
8	Proliferation of new pests due to climate change.	Implementation of production projects associated with altering the cycles of temperature, humidity, rainfall and other climate factors, providing better environments for the uncontrolled reproduction of pests.	The entire Program Life Cycle, in the application of RIPs	Adverse	Localized	Possible	Long term	Permanent	Reversible	Disaster and Climate Change Risk Management Plan

Impact	Impacting Cause / Action	Phase	Nature	Spatiality	Probability	Occurrence	Duration	Reversibility	Program / Measure	
9	Non-adherence to project resources	Distorted information or misunderstanding on the part of the community about possible bureaucracies, requirements and practices required for participation in the Project	The entire life cycle of the program	Adverse	Localized	Possible	Medium Term	Temporary	Reversible	Stakeholder Communication, Consultation and Engagement Plan
10	Engaging the communities covered by the project in better agro-ecological practices	Understanding and convergence of communities to the Project's practices	The entire Program Life Cycle, in the application of PIRs and NPs	Positive	Localized	Right	Medium Term	Permanent	Irreversible	Stakeholder Communication, Consultation and Engagement Plan
11	Loss of production, production systems and/or equipment due to climatic events, mainly related to excess or lack of rainfall.	Unexpected extreme weather events	The entire Program Life Cycle, in the application of RIPs	Adverse	Localized	Possible	Long term	Permanent	Reversible	Disaster and Climate Change Risk Management Plan
12	Soil improvement	Community adherence to best practices and solutions on agricultural organic waste with Use of plant waste from mowing, pruning, trimming or thinning as mulch to protect plants and conserve soil moisture, increasing the organic matter content in the soil	The entire life cycle of the program, especially during the maintenance of the agroforestry systems.	Positive	Localized	Right	Medium Term	Permanent	Irreversible	Production waste management
13	Soil and water pollution (surface and/or groundwater) - from the operation of production systems	Inadequate disposal of packaging, including pesticide packaging	The entire life cycle of the program, in the application of Community Development Plans	Adverse	Localized	Possible	Medium Term	Temporary	Reversible	Production waste management and Management and control plan for contaminating products
		Inadequate disposal of bagasse and other solids from production and processing								
		Use of restricted, prohibited and banned products - Stockholm Convention								
		Accidental spillage of chemical inputs or discharge of untreated effluent								
14	Increased GHG emissions from the use of combustion engines and/or the burning of wood or garbage	Usual practices of burning crop residues (branches, garbage, etc.)	Implementation of Community Productive Systems	Adverse	Localized	Possible	Medium Term	Temporary	Reversible	Energy Efficiency in Projects and Installations
15	Pressure on natural areas and habitats	Increase in vegetation suppression for use in wood-burning stoves	Implementation of Community Productive Systems	Adverse	Scattered	Possible	Medium Term	Permanent	Irreversible	Management and restoration of natural habitats
		expansion of planting areas not foreseen in the project and in non-sustainable systems								
		greater demand for water using local sources for production or irrigation								

Impact	Impacting Cause / Action	Phase	Nature	Spatiality	Probability	Occurrence	Duration	Reversibility	Program / Measure
16	Changes in gene flow altering the pattern of production and ecosystems in order to promote loss and resilience of ecosystems and production systems	Movement of people between areas with unwanted species	Adverse	Scattered	Possible	Medium Term	Permanent	Irreversible	Management and restoration of natural habitats
		Insertion of invasive exotic species when planting reforestation seedlings and for production							
		Compromised phytosanitary status of seeds and seedlings							
17	Increased gender-based violence due to women's greater engagement	Implementation of PIR and PN projects	Adverse	Scattered	Possible	Medium Term	Temporary	Reversible	Prevention and care of gender-based violence
18	Improving environmental quality and ecosystem flows by restoring modified habitats, increasing vegetation and forming ecological corridors	Implementing reforestation projects and agro-ecological systems	Positive	Localized	Right	Medium Term	Permanent	Irreversible	Management and restoration of natural habitats
19	Interruption of services due to lack of power, water, telephone, internet	Unplanned power outage and/or interruption of other essential services	Adverse	Localized	Possible	Medium Term	Temporary	Reversible	Energy efficiency and sustainable sources for energy generation in projects and installations Control and Mitigation of Temporary Social and Economic Impacts
20	Security and reduction of costs with the implementation of energy generation and supply infrastructure independent of the public system and based on renewable and available sources	The use of photovoltaics to supply electricity.	Positive	Localized	Right	Medium Term	Permanent	Irreversible	Energy efficiency and sustainable sources for energy generation in projects and installations
21	Access to adequate sanitation in communities	Implementation and operation of adequate sanitation systems	Positive	Scattered	Right	Medium Term	Permanent	Irreversible	Water and effluent quality monitoring
22	Increased security and stability in people's lives by increasing resilience to the risks of disasters and climate change, improving quality of life and increasing income, adding value to the production chain, access to the market and the efficiency of production processes.	Achievement of the results defined in the Project with the implementation and operation of the systems and Plans	Positive	Scattered	Right	Medium Term	Permanent	Irreversible	Stakeholder Communication, Consultation and Engagement Plan
23	Increased spending by families due to the need to pay fees to access the Association's resources from the Project (such as maintenance fees for the sanitation system or industrial kitchens), which can have a significant effect on low-income family budgets, affecting their budgetary capacity and even causing the Project to run out of steam.	The need for financial resources to fund the operation and maintenance of systems and associations.	Adverse	Scattered	Possible	Long term	Permanent	Irreversible	Stakeholder Communication, Consultation and Engagement Plan
24	Alteration or destruction of paleontological sites	Implementation of social technology associated with stone tanks	Adverse	Localized	Possible	Short Term	Permanent	Irreversible	Cultural Heritage and Fortuitous Finds Protection Program

### 5.3.2 Environmental and Social Impact Assessment Sheets

The summary sheets of the environmental and social impacts identified are presented below. These sheets contain an analysis of the impacts, their sources, the aspects and activities involved and the mitigation measures, following an appropriate mitigation hierarchy for each impact identified, in accordance with the degree of importance of each impact.

**Impact 01 - Generation of expectations in the population about the project**

Impact 01	
Generating expectations in the population about the project	
<b>Impacting Cause / Action</b>	Circulation of unofficial or incomplete information about the project
<b>Nature</b>	Adverse
<b>ESMP Associated Program</b>	Stakeholder Communication, Consultation and Engagement Plan Implementation of the Complaints and Redress Mechanism
<b>Qualitative aspects</b>	<p>Expectations of where the projects will take place are expected to increase, and it is estimated that expectations linked to the effects of both the implementation of the projects and their entry into operation will increase.</p> <p>At the same time, there may be an increase in the ability of groups (both in favour and against the project) to mobilize, as the project moves beyond the plane of intentions and promises and begins to become a fact and a goal. Also at the local level, considering the existing situation where the economy is fragile with high unemployment rates, there may also be a condensation of expectations of obtaining opportunities.</p>
<b>Actions to Avoid the Impact</b>	<ul style="list-style-type: none"> <li>It is considered that this impact cannot be avoided, to some degree people will always expect it.</li> </ul>
<b>Actions to Minimize Impact</b>	<ul style="list-style-type: none"> <li>Social Communication actions provided for in the Communication, Consultation and Stakeholder Engagement Plan, described in the ESMP, which should be adopted even before the start of the works in order to inform the general public and the population closest to the highways about the project, as well as relevant issues arising from its implementation and operation. These actions must be maintained throughout the project's life cycle</li> </ul>
<b>Actions for Rehabilitation</b>	<ul style="list-style-type: none"> <li>Not applicable</li> </ul>
<b>Compensation Actions</b>	<ul style="list-style-type: none"> <li>Critical evaluation of social communication actions and the Engagement Plan, with emphasis on the application of measures already carried out or the implementation of new communication actions</li> </ul>

**Impact 02 - Alteration in water quality affecting aquatic habitats and water resources by carrying soil and other materials into nearby rivers**

Impact 02	
Changes in water quality, affecting aquatic habitats and water resources by carrying soil and other materials into nearby rivers	
<b>Impacting Cause / Action</b>	<ul style="list-style-type: none"> <li>• Movement and handling of soils in agricultural activities and earthworks, cuttings and embankments.</li> <li>• exposed soils</li> </ul>
<b>Nature</b>	Adverse
<b>ESMP Associated Program</b>	Water quality control
<b>Qualitative aspects</b>	Agricultural activities and interventions to set up structures or manage the soil can pose a risk of carrying and contaminating water resources.
<b>Actions to Avoid the Impact</b>	<ul style="list-style-type: none"> <li>• Contaminating materials handled at project sites must be stored in appropriate locations.</li> <li>• Production systems must be set up respecting the local geomorphology and geology, including strengthening the soil and following contour lines in agriculture.</li> <li>• The use of chemical inputs such as pesticides must be curbed.</li> </ul>
<b>Actions to Minimize Impact</b>	<ul style="list-style-type: none"> <li>• If contaminating material leaks, rapid action measures must be taken using sawdust or other material to contain and prevent the leak from spreading, and the material used (considered contaminated) must then be disposed of properly.</li> <li>• In the event of erosion, the soil should be remediated and the siltation of downstream water bodies monitored.</li> </ul>
<b>Actions for Rehabilitation</b>	<ul style="list-style-type: none"> <li>• If areas of degradation are identified (e.g. a water channel with siltation or chemicals), actions must be taken to rehabilitate the areas, such as channel cleaning, desilting, removal of contaminated soil, scraping of concrete cream, among others.</li> </ul>
<b>Compensation Actions</b>	<ul style="list-style-type: none"> <li>• There are no problems, however - any problems that may infringe on environmental licenses must be reported to the environmental agency, also showing what measures have been taken to correct the problem identified, as well as the improvements to the environmental and social management system that have been implemented to prevent such situations from recurring. In this case, the environmental agency may impose fines and additional compensation - which must be duly complied with.</li> </ul>

**Impact 03 - Contamination of soil and water resources - from civil works**

<b>Impact 03</b>	
<b>Contamination of soil and water resources - from civil works</b>	
<b>Impacting Cause / Action</b>	Production of unserviceable soil from excavation, unused inputs and materials and leftover materials from civil works with inadequate waste disposal
<b>Nature</b>	Adverse
<b>ESMP Associated Program</b>	Waste management
<b>Qualitative aspects</b>	Construction work related to various structures, whether in production processes or water or sewage treatment/reuse systems, has the potential to generate construction waste, even on a small scale. This material should be disposed of according to its nature, in suitable locations, and should not remain in the areas of origin.
<b>Actions to Avoid the Impact</b>	<ul style="list-style-type: none"> <li>• This impact cannot be avoided, as waste will always be generated.</li> </ul>
<b>Actions to Minimize Impact</b>	<ul style="list-style-type: none"> <li>• The waste must be sorted, as set out in the ESMP, in order to provide for the sorting of waste between the different classes, and also which waste requires exclusive separation;</li> <li>• After sorting, packaging must be carried out to ensure that the waste is separated, as planned in the segregation stage, and to facilitate transportation from the construction site to treatment and disposal;</li> <li>• For transport, logistics must be drawn up, providing suitable access, timetables and control of entry and exit of the vehicles that will remove the properly packaged waste, in order to combat the excessive accumulation of waste, improving local organization;</li> <li>• Finally, waste treatment should involve actions aimed at reducing the quantity or polluting potential of solid waste, either by preventing the disposal of waste in an inappropriate place or by transforming it into inert material.</li> </ul>
<b>Actions for Rehabilitation</b>	<ul style="list-style-type: none"> <li>• In the event of inappropriate waste disposal, debris and waste must be removed immediately and properly disposed of in landfills and licensed treatment centers.</li> </ul>
<b>Compensation Actions</b>	<ul style="list-style-type: none"> <li>• Not applicable</li> </ul>

**Impact 04 - People hit by cars**

Impact 04	
People hit by cars due to the increase in traffic on the roads in the project area	
<b>Impacting Cause / Action</b>	Circulation of vehicles on the roads used by the population between their origin and destination
<b>Nature</b>	Adverse
<b>ESMP Associated Program</b>	Traffic Program Stakeholder Communication, Consultation and Engagement Plan
<b>Qualitative aspects</b>	During the implementation phases of the projects, an increase in the flow of light vehicles is expected, and some heavy vehicles may also circulate. It should be borne in mind that these areas are often located in places where there is a natural movement of local residents and that in many communities there are a significant number of children who are often attracted to construction sites out of curiosity. On the other hand, project workers are also subject to accidents from moving vehicles.
<b>Actions to Avoid the Impact</b>	<ul style="list-style-type: none"> <li>• Daytime and nighttime signs;</li> <li>• Speed control;</li> <li>• Courses on defensive driving and good driving practices for drivers and machine operators (TA, contractors, UGP/Procace);</li> <li>• Fencing and restricting access to deployment areas when appropriate.</li> </ul>
<b>Actions to Minimize Impact</b>	<ul style="list-style-type: none"> <li>• All drivers must have knowledge of first aid and how to call emergency services in the event of accidents (TA, contractors, UGP/Procace).</li> <li>• All drivers must receive defensive driving training (TA, contractors, UGP/Procace).</li> </ul>
<b>Actions for Rehabilitation</b>	<ul style="list-style-type: none"> <li>• Not applicable.</li> </ul>
<b>Compensation Actions</b>	<ul style="list-style-type: none"> <li>• Not applicable.</li> </ul>

### **Impact 05 - Proliferation of vector-borne diseases**

Impact 05	
Proliferation of vector-borne diseases	
<b>Impacting Cause / Action</b>	<ul style="list-style-type: none"> <li>• Accumulation of water in poorly drained areas</li> <li>• Presence of organic matter, such as food waste, which favors the development of micro and macro vectors</li> </ul>
<b>Nature</b>	Adverse
<b>ESMP Associated Program</b>	Vector and disease control
<b>Qualitative aspects</b>	<p>Different situations can create conditions for the development of disease-transmitting vectors, which can affect public health. These situations are related to the stagnation of volumes of water or the presence of organic matter, such as food waste, which favors the development of micro and macro vectors.</p> <p>The main water-borne, oral diseases are: typhoid fever (<i>Salmonella typhi</i>), paratyphoid fever (<i>Salmonella paratyphi</i>), cholera (<i>Vibrio cholerae</i>), bacillary dysentery (Shigella), amoebic dysentery (<i>Entamoeba histolytica</i>), infectious hepatitis (viruses) and others. In the case of direct contact, the most important and widespread cutaneous-mucosal disease is schistosomiasis (<i>Schistosoma mansoni</i>), which is one of the most serious public health problems in Brazil.</p> <p>In addition to waterborne diseases, water can be a habitat for the <i>Aedes aegypti</i> mosquito and other vectors that transmit arboviruses: Dengue, Zika and Chikungunya.</p>
<b>Actions to Avoid the Impact</b>	<ul style="list-style-type: none"> <li>• Drainage of water accumulated on the surface;</li> <li>• Cleaning the workplace;</li> <li>• Monitoring and control of diseases and vectors.</li> </ul>
<b>Actions to Minimize Impact</b>	<ul style="list-style-type: none"> <li>• Lectures should be given to workers/producers.</li> </ul>
<b>Actions for Rehabilitation</b>	<ul style="list-style-type: none"> <li>• In the event of the formation of areas with environments conducive to the proliferation of vectors, the area must be rehabilitated by removing the environment and/or implementing suitable systems to prevent the formation of vectors.</li> <li>• In the event of endemic situations being identified, a process of assessing the health of producers/workers should be initiated to identify and refer the sick to appropriate treatment</li> </ul>
<b>Compensation Actions</b>	<ul style="list-style-type: none"> <li>• Not applicable</li> </ul>

### **Impact 06 - Accidents at work**

Impact 12	
-----------	--

Accidents at work	
<b>Impacting Cause / Action</b>	Agricultural production activities and the construction of structures can contain levels of danger and associated risks (use of cutting tools, machinery and equipment, presses, accidents with venomous animals, etc.)
<b>Nature</b>	Adverse
<b>ESMP Associated Program</b>	Labor Management Program
<b>Qualitative aspects</b>	During the activities there is a risk of accidents to the workers/producers, and these accidents are directly related to the activities.
<b>Actions to Avoid the Impact</b>	<ul style="list-style-type: none"> <li>• Workers/producers should receive adequate information on health and safety at work;</li> <li>• Prophylactic and reinforcement actions, such as safety dialogues, must be observed;</li> <li>• All workers/producers must be provided with PPE, trained in its proper use and charged for its use;</li> <li>• The appropriate New Regulations for the jobs to be performed by the workers must be observed.</li> </ul>
<b>Actions to Minimize Impact</b>	<ul style="list-style-type: none"> <li>• Any accident, depending on the degree of seriousness, must stop the activity so that attention can be paid to the occurrence;</li> <li>• It is important that each community has a plan of action (what to do, what not to do, who to warn, where to take the injured) to reduce reaction times.</li> </ul>
<b>Actions for Rehabilitation</b>	<ul style="list-style-type: none"> <li>• Not applicable</li> </ul>
<b>Compensation Actions</b>	<ul style="list-style-type: none"> <li>• Not applicable</li> </ul>

### **Impact 07 - Increase in gender-based violence**

Impact 07	
Increase in gender-based violence	
<b>Impacting Cause / Action</b>	Presence and circulation of people (project workers) not belonging to the community
<b>Nature</b>	Adverse
<b>ESMP Associated Program</b>	Prevention and care of gender-based violence
<b>Qualitative aspects</b>	As the flow of workers increases, so can the risk of violence and harassment. These risks are stronger when it comes to women and adolescents, who are often more subject to this impact due to historical and social reasons. The objectification of women ends up making this impact often imperceptible to construction workers and even their superiors.
<b>Actions to Avoid the Impact</b>	<ul style="list-style-type: none"> <li>• Project workers must be made aware of this impact, and must also receive guidance on the set of rules that must be followed when dealing with the community in general (code of conduct) and specifically on the issue of sexual harassment and abuse, as well as violence.</li> <li>• It must be made clear to everyone that no attitude will be tolerated and that inaction by managers will be punished, including the possible dismissal of the worker(s) involved.</li> </ul>
<b>Actions to Minimize Impact</b>	<ul style="list-style-type: none"> <li>• Measures to care for and protect victims.</li> </ul>
<b>Actions for Rehabilitation</b>	<ul style="list-style-type: none"> <li>• Actions to restore the emotional state and health of the victims;</li> <li>• Assessment of cases of harassment or violence with corrective or punitive measures when necessary.</li> </ul>
<b>Compensation Actions</b>	<ul style="list-style-type: none"> <li>• Not applicable.</li> </ul>

**Impact 08 - Proliferation of new pests due to climate change**

Impact 08	
Proliferation of new pests due to climate change	
<b>Impacting Cause / Action</b>	Implementation of production projects associated with altering the cycles of temperature, humidity, rainfall and other climate factors, providing better environments for the uncontrolled reproduction of pests.
<b>Nature</b>	Adverse
<b>ESMP Associated Program</b>	Disaster and Climate Change Risk Management Plan
<b>Qualitative aspects</b>	Growing areas with a low diversity of species, coupled with climate change, could lead to a lack of control and a proliferation of pests in the plantations. This could be due to the appearance of pests that did not previously occur in these environments or pests that already existed but were in balance with the environment.
<b>Actions to Avoid the Impact</b>	<ul style="list-style-type: none"> <li>• The controls indicated in the PIR Investment Plans must be applied.</li> <li>• Periodic monitoring of the appearance of herbivorous insects or plant diseases (PIR) should be carried out.</li> </ul>
<b>Actions to Minimize Impact</b>	<ul style="list-style-type: none"> <li>• If pests are found, measures should be taken using technical guidelines. Agroecological practices based on the manufacture and use of bio-slurries, antagonistic or companion plants or biocontrol agents will be disseminated.</li> <li>• diseased or pest-infested materials should be discarded so as not to spread the pest to other natural areas and/or crops.</li> </ul>
<b>Actions for Rehabilitation</b>	<ul style="list-style-type: none"> <li>• In the event of pest proliferation, measures must be taken to control dispersal and isolate contaminated crops;</li> <li>• In addition, sanitary measures must be taken to combat pests and normalize the agro-ecological balance.</li> </ul>
<b>Compensation Actions</b>	<ul style="list-style-type: none"> <li>• Not applicable</li> </ul>

**Impact 09 - Non-adherence to project resources**

Impact 09	
Non-adherence to project resources	
<b>Impacting Cause / Action</b>	Distorted information or misunderstanding on the part of the community about possible bureaucracies, requirements and practices required for participation in the Project
<b>Nature</b>	Adverse
<b>ESMP Associated Program</b>	Stakeholder Communication, Consultation and Engagement Plan
<b>Qualitative aspects</b>	The project presents a set of innovations, practices and guidelines for developing production in a sustainable way. It also presents actions to improve water and sewage quality. In certain respects, the Project creates some necessary and beneficial bureaucracy to improve controls and build ecological use and production systems. Such innovations can generate fear on the part of the communities, reducing participation and adherence to the projects.
<b>Actions to Avoid the Impact</b>	<ul style="list-style-type: none"> <li>It is considered that this impact cannot be avoided, and that to some degree it may occur.</li> </ul>
<b>Actions to Minimize Impact</b>	<ul style="list-style-type: none"> <li>Social Communication Actions from the Stakeholder Engagement Plan that should be adopted even before the start of the projects in order to inform the general public and the beneficiary population about the project, as well as relevant issues arising from its implementation and operation.</li> </ul>
<b>Actions for Rehabilitation</b>	<ul style="list-style-type: none"> <li>Apply actions and measures to clarify and raise awareness among the community</li> </ul>
<b>Compensation Actions</b>	<ul style="list-style-type: none"> <li>Critical evaluation of social communication actions and the Engagement Plan, with emphasis on the application of measures already carried out or the implementation of new communication actions</li> </ul>

**Impact 10 - Engaging the communities covered by the project in better agro-ecological practices**

Impact 10	
Engaging the communities covered by the project in better agro-ecological practices	
<b>Impacting Cause / Action</b>	Understanding and convergence of communities to the Project's practices
<b>Nature</b>	Positive
<b>ESMP Associated Program</b>	Stakeholder Communication, Consultation and Engagement Plan
<b>Qualitative aspects</b>	Through TA, agroecological practices will be introduced, with a view to transition, aimed at reducing the use of chemical pesticides and synthetic fertilizers and replacing them with natural inputs (biocaldas, composts, bio-defenders, mechanized mowing, etc.) with expected positive effects on the soil, water and marketed production.
<b>Actions to Avoid the Impact</b>	<ul style="list-style-type: none"> <li>• Not applicable</li> </ul>
<b>Actions to Minimize Impact</b>	<ul style="list-style-type: none"> <li>• Not applicable</li> </ul>
<b>Actions for Rehabilitation</b>	<ul style="list-style-type: none"> <li>• Not applicable</li> </ul>
<b>Compensation Actions</b>	<ul style="list-style-type: none"> <li>• Not applicable</li> </ul>

**Impact 11 - Loss of production, production systems and/or equipment due to climatic events, mainly related to excess or lack of rainfall**

Impact 11	
Loss of production, production systems and/or equipment due to climatic events, mainly related to excess or lack of rainfall	
<b>Impacting Cause / Action</b>	Unexpected extreme weather events
<b>Nature</b>	Adverse
<b>ESMP Associated Program</b>	Disaster and Climate Change Risk Management Plan
<b>Qualitative aspects</b>	Situations involving more extreme climatic events can profoundly affect production (for example, the death of livestock due to water stress), while flooded areas that have been occupied could suffer from excessive rainfall, putting production at risk, as well as the equipment and structures needed for production systems.
<b>Actions to Avoid the Impact</b>	<ul style="list-style-type: none"> <li>• When planning areas for cultivation or the installation of structures, suitable location options and construction and installation methods should be studied, avoiding areas that are more prone to flooding or have unstable terrain.</li> <li>• The need for access to water and its adequate storage for periods of drought must be observed.</li> <li>• ATER should be involved to help with the processes of choosing areas and managing resources and the land, which could bring new perspectives and technical training.</li> </ul>
<b>Actions to Minimize Impact</b>	<ul style="list-style-type: none"> <li>• It is recommended that an Action Plan be drawn up in the event of situations that threaten production and/or structures, so that in the event of climatic events the communities are aware of what can be done to minimize this impact.</li> </ul>
<b>Actions for Rehabilitation</b>	<ul style="list-style-type: none"> <li>• Not applicable</li> </ul>
<b>Compensation Actions</b>	<ul style="list-style-type: none"> <li>• Not applicable</li> </ul>

## **Impact 12 - Soil improvement**

<b>Impact 12</b>	
<b>Soil improvement</b>	
<b>Impacting Cause / Action</b>	Community adherence to best practices and solutions on agricultural organic waste with Use of plant waste from mowing, pruning, trimming or thinning as mulch to protect plants and conserve soil moisture, increasing the organic matter content in the soil
<b>Nature</b>	Positive
<b>ESMP Associated Program</b>	Production waste management
<b>Qualitative aspects</b>	<p>The use of plant residues is an important agroecological practice for Agroforestry Systems, as it helps to maintain moisture in the soil, reduces leaching processes and the need for soil fertilization. It also reduces the excessive appearance of spontaneous plants.</p> <p>On the other hand, it makes use of pruning waste, reducing production costs.</p> <p>This action should be carried out under the guidance of TA technicians to avoid using material contaminated by pests and in a way that brings good results.</p>
<b>Actions to Avoid the Impact</b>	<ul style="list-style-type: none"> <li>• Not applicable</li> </ul>
<b>Actions to Minimize Impact</b>	<ul style="list-style-type: none"> <li>• Not applicable</li> </ul>
<b>Actions for Rehabilitation</b>	<ul style="list-style-type: none"> <li>• Not applicable</li> </ul>
<b>Compensation Actions</b>	<ul style="list-style-type: none"> <li>• Not applicable</li> </ul>

**Impact 13 - Soil and water pollution (surface and/or groundwater) - from production system operation activities**

<b>Impact 13</b>	
<b>Soil and water pollution (surface and/or groundwater) - from the operation of production systems</b>	
<b>Impacting Cause / Action</b>	<ul style="list-style-type: none"> <li>• Inadequate disposal of packaging, including pesticide packaging</li> <li>• Inadequate disposal of bagasse and other solids from production and processing</li> <li>• Use of restricted, prohibited and banned products - Stockholm Convention</li> <li>• Accidental spillage of chemical inputs or discharge of untreated effluent</li> </ul>
<b>Nature</b>	Adverse
<b>ESMP Associated Program</b>	<ul style="list-style-type: none"> <li>• Production waste management</li> <li>• Management and control of contaminating products</li> </ul>
<b>Qualitative aspects</b>	<p>There is a risk of improper disposal of packaging and other materials, especially plastics. This material accumulates in natural environments, remaining in action for hundreds of years. In this respect, microplastics also deserve attention, as they are often consumed by fish and other animals, remaining in their systems and causing various health problems in entire populations.</p> <p>There is also the risk of improper disposal of pesticide and chemical fertilizer packaging, which has an even greater impact due to the residues in these packages.</p> <p>Production and processing can generate production waste, bagasse and effluents, while some of this material can be treated easily (e.g. composting peels and stalks). Others may be more complex to treat (e.g. leftovers from pressing cassava dough, which can be rich in cyanide).</p> <p>The production and use of community kitchens will generate effluents, which must be disposed of properly, avoiding contamination of the environment with liquid effluents which, unlike solid production effluents, are more complex to store and easily dispersed in the environment.</p> <p>One example is Manipueira, a cyanide-containing liquid produced during the pressing of cassava dough, which has a high polluting potential and is often disposed of directly into the soil, being absorbed and apparently "disappearing".</p> <p>This impact is also related to the risk of using products that are restricted, prohibited or banned by the Stockholm Convention - to which Brazil is a signatory - in this case with a focus on Persistent Organic Pollutants - POPs. It is important to consider that the use of any substance of this nature could have major local impacts on people's health and local ecosystems, and should be a point of attention in the project.</p> <p>Finally, improper handling of chemical inputs or their uncontrolled release can lead to water and soil contamination, which can affect environments and pose risks to people and animals - both farmed and wild.</p>

<p><b>Actions to Avoid the Impact</b></p>	<ul style="list-style-type: none"> <li>• One of the main actions is related to proper communication, indicating the need to properly dispose of waste and packaging.</li> <li>• In the case of pesticide packaging, TA should be involved to discuss best practices, including taking the opportunity to talk about the harm pesticides can cause, how to store them properly, the need to triple-wash the packaging, render it unusable and hand it over to appropriate collection points.</li> <li>• One of the project's actions involves reducing the use of chemical pesticides and switching to natural pesticides, which will help to reduce part of this impact.</li> <li>• It is suggested that monitoring be carried out in the communities to check whether the packaging is being disposed of inappropriately or not.</li> <li>• It is important that contaminating effluents are not directed to the sewage treatment system, as these structures are not prepared for this.</li> <li>• Oily effluents should not be mixed with non-oily effluents and should be disposed of appropriately, possibly being used for the production of handmade soap that can be used by the community.</li> <li>• Inspection actions should also be carried out in conjunction with other official bodies and production monitoring. In general, it is recommended that the actions are always educational in nature, so as not to create an atmosphere of mistrust between the community and the TA technicians, which has the potential to affect the project.</li> <li>• All chemicals/hazardous products must be properly stored in environments that can contain leaks.</li> <li>• Machinery and equipment must be properly filled with diesel or other fuel in waterproofed areas or using safety trays, avoiding contact with the ground.</li> <li>• Any spillage should be cleaned up, simple actions such as using sawdust or sand, which should be properly packed afterwards, can help in the cleaning process.</li> <li>• Under no circumstances should contaminating effluents be discharged directly onto the ground or into watercourses.</li> <li>• It is recommended that appropriate communication and environmental and health education present a range of information on the contaminants common in plantations and production, as well as their effect on biota and people's health, in order to raise awareness and provide knowledge to communities on how to deal with each contaminant appropriately.</li> </ul>
<p><b>Actions to Minimize Impact</b></p>	<ul style="list-style-type: none"> <li>• It is important for TA to show communities the viable alternatives for disposing of waste properly, depending on its nature.</li> <li>• If packaging is still improperly disposed of, it is important that the community is mobilized, as far as possible, to take action such as collecting packaging that has been thrown</li> </ul>

	<p>into the environment. Such action can help spread best practices, reducing this impact.</p> <ul style="list-style-type: none"> <li>• It is important to segregate waste in kitchens and processing areas, avoiding, for example, putting organic waste together with material that can be recycled (plastics, long-life packaging, etc.).</li> <li>• Alternatives for production waste should be considered, including the use, where possible, of leftover stalks and peels for preparing dishes and food.</li> <li>• For organic material that cannot be reused in the units, sustainable options should be considered, such as animal feed, fertilizer, natural pesticides, among others.</li> </ul>
<b>Actions for Rehabilitation</b>	<ul style="list-style-type: none"> <li>• Not applicable</li> </ul>
<b>Compensation Actions</b>	<ul style="list-style-type: none"> <li>• Not applicable</li> </ul>

**Impact 14 - Increased GHG emissions due to the use of combustion engines and/or the burning of wood or garbage**

Impact 14	
Increased GHG emissions from the use of combustion engines and/or the burning of wood or garbage	
<b>Impacting Cause / Action</b>	<ul style="list-style-type: none"> <li>• Use of combustion machinery, equipment and vehicles during the implementation phase</li> <li>• Usual practices of burning crop residues (branches, garbage, etc.)</li> </ul>
<b>Nature</b>	Adverse
<b>ESMP Associated Program</b>	Energy Efficiency in Projects and Installations
<b>Qualitative aspects</b>	This impact is associated with the use of combustion engines, industrial ovens and the custom of burning the remains of production by rural producers (burning wood, pruning remains, crop remains and garbage in communities).
<b>Actions to Avoid Impact</b>	<ul style="list-style-type: none"> <li>• One of the main actions is related to appropriate communication, voting for the reduction of gas emissions and the abandonment of burning actions.</li> </ul>
<b>Actions to Minimize Impact</b>	<ul style="list-style-type: none"> <li>• Monitoring actions are recommended in the communities to check engines, which must be properly regulated, using the Ringelmann Scale for control (less than or equal to standard no. 2 - 40%), in the operating phase it applies to diesel generators.</li> </ul>
<b>Actions for Rehabilitation</b>	<ul style="list-style-type: none"> <li>• If the equipment is not up to standard, it must be adjusted and maintained.</li> </ul>
<b>Compensation Actions</b>	<ul style="list-style-type: none"> <li>• Not applicable</li> </ul>

**Impact 15 - Pressure on natural areas and habitats**

Impact 15	
Pressure on natural areas and habitats	
<b>Impacting Cause / Action</b>	<ul style="list-style-type: none"> <li>• Increased suppression of vegetation</li> <li>• Expansion of planting areas not foreseen in the project and in non-sustainable systems</li> <li>• Greater demand for water using local sources for production or irrigation</li> </ul>
<b>Nature</b>	Adverse
<b>ESMP Associated Program</b>	Management and restoration of natural habitats
<b>Qualitative aspects</b>	With the progress of the project, the expansion of structures and improvements in production, there could be pressure on areas that are still natural and specific habitats. This pressure would materialize through the need for new areas (expansion of planting areas), indiscriminate collection of plants, hunting, greater demand for water, among others.
<b>Actions to Avoid the Impact</b>	<ul style="list-style-type: none"> <li>• There should be good communication with the communities, with actions to promote the preservation of natural environments, care for water, interaction of agroforestry systems with the natural surroundings, among others.</li> <li>• The project must monitor these situations in order to identify the main problems and define the best actions to take, including taking into account the possible need for extensions</li> <li>• ATER teams should be involved in helping communities to find the best solutions to the needs and demands that may arise.</li> <li>• It should also be pointed out that indiscriminate actions in natural environments can be classified as environmental crimes.</li> </ul>
<b>Actions to Minimize Impact</b>	<ul style="list-style-type: none"> <li>• In the case of situations that damage natural environments or cause imbalances, solutions should be applied together with the communities. Such situations should be used to show the problems that can be triggered.</li> </ul>
<b>Actions for Rehabilitation</b>	<ul style="list-style-type: none"> <li>• Recovery of natural environments affected indiscriminately and not foreseen by developments related to project implementation actions</li> </ul>
<b>Compensation Actions</b>	<ul style="list-style-type: none"> <li>• Not applicable</li> </ul>

**Impact 16 - Changes in gene flow altering the pattern of production and ecosystems in such a way as to promote loss and resilience of ecosystems and production systems**

Impact 16	
Changes in gene flow altering the pattern of production and ecosystems in order to promote loss and resilience of ecosystems and production systems	
<b>Impacting Cause / Action</b>	<ul style="list-style-type: none"> <li>• Movement of people between areas with unwanted or invasive species.</li> <li>• Insertion of invasive exotic species when planting reforestation seedlings and for production.</li> <li>• Compromised phytosanitary status of seeds and seedlings.</li> </ul>
<b>Nature</b>	Adverse
<b>ESMP Associated Program</b>	Management and restoration of natural habitats
<b>Qualitative aspects</b>	<p>There is the possibility of an impact from the uncontrolled introduction of invasive alien species into communities. This could be due to a lack of knowledge about the subject and/or economic-productive reasons, when a risk is taken for possible monetary gain.</p> <p>On the other hand, pests can be introduced with the purchase of seedlings or seeds without an analysis of the good phytosanitary state of the species.</p> <p>It can also trigger the proliferation of species (animal and plant) through dispersal or lack of control and inadequate management.</p>
<b>Actions to Avoid the Impact</b>	<ul style="list-style-type: none"> <li>• One of the main actions is related to appropriate communication, indicating the need to be careful with the insertion of invasive exotic species or pests, which can jeopardize the entire production or the SAF, generating great losses for the communities and the environment.</li> <li>• Seedlings and seeds purchased for planting in the SAF should be obtained <b>from</b> nurseries that have a RENASEM certificate<sup>49</sup>, accredited farmhouses or research centers. TA technicians should guide this process.</li> <li>• The management of fauna species, such as bees, also requires care to avoid unwanted proliferation if the species escapes.</li> </ul>
<b>Actions to Minimize Impact</b>	<ul style="list-style-type: none"> <li>• In the case of the introduction of pests and invasive exotic species, solutions should be implemented together with the communities to control and reduce them (species suppression, use of wood, for example). These situations should be used to illustrate the problems that can be triggered.</li> </ul>
<b>Actions for Rehabilitation</b>	<ul style="list-style-type: none"> <li>• Not applicable</li> </ul>
<b>Compensation Actions</b>	<ul style="list-style-type: none"> <li>• Not applicable</li> </ul>

<sup>49</sup> National Register of Seeds and Seedlings.

***Impact 17 - Increased gender-based violence due to women's greater engagement***

Impact 17	
Increased gender-based violence due to women's greater engagement	
<b>Impacting Cause / Action</b>	Women's economic and social empowerment giving greater prominence to gender in the community
<b>Nature</b>	Adverse
<b>ESMP Associated Program</b>	Prevention and care of gender-based violence
<b>Qualitative aspects</b>	<p>As women become more involved in environments previously dominated by men or which bring greater financial independence, there may be an increase in gender-based violence, as many men may see this as a rupture in a balance which places them in a position of domination.</p> <p>On the other hand, the increase in women's self-esteem and the perception of their latent capacities could bring to the fore the need to take a stand in the family environment and demand their rights in the face of their new achievements.</p> <p>Such situations end up bringing about the need for a protection and support network, which will often also involve the protection of children.</p>
<b>Actions to Avoid the Impact</b>	<ul style="list-style-type: none"> <li>• The project should promote actions to promote gender equality, highlighting rights and inclusiveness linked to the Communication Program.</li> <li>• It is recommended that the complaints management program provide a channel aimed at supporting and gathering information on situations of violence, and that Procace II should not be limited to informing other official channels.</li> <li>• On the other hand, official channels should be disclosed whenever possible as part of the project's communications.</li> <li>• It is important that a survey is carried out to map regions and/or communities where there is a greater possibility of violence.</li> <li>• There should be monitoring and channels that women can use to report situations of violence. All complaints must be taken seriously and investigated.</li> </ul>
<b>Actions to Minimize Impact</b>	<ul style="list-style-type: none"> <li>• Not applicable</li> </ul>
<b>Actions for Rehabilitation</b>	<ul style="list-style-type: none"> <li>• Not applicable</li> </ul>
<b>Compensation Actions</b>	<ul style="list-style-type: none"> <li>• Not applicable</li> </ul>

**Impact 18 - Improving environmental quality and ecosystem flows by restoring modified habitats, increasing vegetation and forming ecological corridors**

Impact 18	
Improving environmental quality and ecosystem flows by restoring modified habitats, increasing vegetation and forming ecological corridors	
<b>Impacting Cause / Action</b>	Implementing reforestation projects and agro-ecological systems
<b>Nature</b>	Positive
<b>ESMP Associated Program</b>	Management and restoration of natural habitats
<b>Qualitative aspects</b>	<p>With the recovery of currently degraded areas and the increase in species, there will be an improvement in environmental quality and the improvement and re-establishment of ecosystem and gene flows with the restructuring of local ecological corridor systems.</p> <p>To this end, the Resilient Investment Plan (PIR) involving Agroforestry Systems provides for care actions involving the use of natural pesticides, companion plants and other methods aimed at the proper development of agroforestry, as well as pest control that does not involve the use of chemical products.</p>
<b>Actions to Avoid the Impact</b>	<ul style="list-style-type: none"> <li>• Not applicable</li> </ul>
<b>Actions to Minimize Impact</b>	<ul style="list-style-type: none"> <li>• Not applicable</li> </ul>
<b>Actions for Rehabilitation</b>	<ul style="list-style-type: none"> <li>• Not applicable</li> </ul>
<b>Compensation Actions</b>	<ul style="list-style-type: none"> <li>• Not applicable</li> </ul>

***Impact 19 - Interruption of services due to lack of power, water, telephony, internet***

Impact 19	
Interruption of services due to lack of power, water, telephony, internet	
<b>Impacting Cause / Action</b>	Unplanned power outage and/or interruption of other essential services
<b>Nature</b>	Adverse
<b>ESMP Associated Program</b>	Energy Efficiency in Projects and Installations Control and Mitigation of Temporary Social and Economic Impacts
<b>Qualitative aspects</b>	The lack of power and other essential services, such as water, telephony and internet, could interrupt production services, impacting the daily lives of communities.
<b>Actions to Avoid the Impact</b>	<ul style="list-style-type: none"> <li>• Systems that use more efficient and safer energy sources;</li> <li>• Maintenance of local supply systems, including pruning trees when necessary, especially before rainy periods or strong gusts of wind.</li> <li>• Attention and support in restoring interrupted essential services</li> </ul>
<b>Actions to Minimize Impact</b>	<ul style="list-style-type: none"> <li>• Not applicable</li> </ul>
<b>Actions for Rehabilitation</b>	<ul style="list-style-type: none"> <li>• Restore the supply of essential services by liaising with the concessionaire or public body and supporting the restoration of services.</li> </ul>
<b>Compensation Actions</b>	<ul style="list-style-type: none"> <li>• Not applicable</li> </ul>

**Impact 20 - Security and reduction of expenses with the implementation of energy generation and supply infrastructure independent of the public system and based on renewable and available sources**

Impact 20	
<b>Security and reduction of costs with the implementation of energy generation and supply infrastructure independent of the public system and based on renewable and available sources</b>	
<b>Impacting Cause / Action</b>	The use of photovoltaics to supply electricity.
<b>Nature</b>	Positive (measures should be implemented to avoid negative impacts)
<b>ESMP Associated Program</b>	Energy Efficiency in Projects and Installations
<b>Qualitative aspects</b>	The use of photovoltaics to supply electricity for production has several advantages, such as lower operating costs for the system and greater stability, since the energy is produced locally and does not depend on transmission systems. Despite this, it is important to take into account the possibility of labor liabilities and human rights violations in the supply chain for this type of material.
<b>Actions to Avoid the Impact</b>	<ul style="list-style-type: none"> <li>• Seek out national suppliers and make it possible to monitor the supply chain whenever possible;</li> <li>• Monitoring and investigating the supply chain in order to find evidence to ensure greater certainty about the integrity and behavior of suppliers;</li> <li>• Apply a code of conduct and declaration of commitment to suppliers in the supply chain, including clauses on human rights and the fight against child labor or labor analogous to slavery (modern slavery).</li> </ul>
<b>Actions to Minimize Impact</b>	<ul style="list-style-type: none"> <li>• Not applicable</li> </ul>
<b>Actions for Rehabilitation</b>	<ul style="list-style-type: none"> <li>• If impact-related situations are identified, human rights protection measures for workers and punitive/corrective measures for employers must be applied.</li> </ul>
<b>Compensation Actions</b>	<ul style="list-style-type: none"> <li>• Not applicable</li> </ul>

**Impact 21 - Access to adequate sanitation in communities**

Impact 21	
Access to adequate sanitation in communities	
<b>Impacting Cause / Action</b>	Implementation and operation of adequate sanitation systems
<b>Nature</b>	Positive
<b>ESMP Associated Program</b>	Water and effluent quality monitoring
<b>Qualitative aspects</b>	<p>The operation of sewage treatment systems and the supply of treated water will provide environments that are better protected from disease and prevent environmental degradation. In this way, it is hoped that there will be a reduction in the incidence of disease and an improvement in the quality of life of people in the communities.</p> <p>The Social Communication Program should consider actions to enhance these positive effects, in terms of environmental education and communication with the community about best practices in environmental health and sanitation.</p> <p>Conducts that promote the proper use of collective systems, such as not pouring oil down the drain and not disposing of waste, furniture and utensils without discretion on vacant lots or riverbanks, are some of the topics to be addressed with the population benefiting from the project.</p>
<b>Actions to Avoid the Impact</b>	<ul style="list-style-type: none"> <li>• Not applicable</li> </ul>
<b>Actions to Minimize Impact</b>	<ul style="list-style-type: none"> <li>• Not applicable</li> </ul>
<b>Actions for Rehabilitation</b>	<ul style="list-style-type: none"> <li>• Not applicable</li> </ul>
<b>Compensation Actions</b>	<ul style="list-style-type: none"> <li>• Not applicable</li> </ul>

**Impact 22 - Increased security and stability in people's lives**

Impact 22	
<b>Increased security and stability in people's lives by increasing resilience to the risks of disasters and climate change, by improving quality of life with access to essential sanitation services and by increasing income, adding value to the production chain, access to the market and the efficiency of production processes.</b>	
<b>Impacting Cause / Action</b>	Achievement of the results defined in the Project with the implementation and operation of the systems and Investment Plans
<b>Nature</b>	Positive
<b>ESMP Associated Program</b>	Stakeholder Communication, Consultation and Engagement Plan
<b>Qualitative aspects</b>	It is expected to increase security and stability in community life. This increase is related to various issues and objectives pursued by the project, such as increasing income, adding value to local production chains, better access to markets for the sale of products.
<b>Actions to Avoid the Impact</b>	<ul style="list-style-type: none"> <li>• Not applicable</li> </ul>
<b>Actions to Minimize Impact</b>	<ul style="list-style-type: none"> <li>• Not applicable</li> </ul>
<b>Actions for Rehabilitation</b>	<ul style="list-style-type: none"> <li>• Not applicable</li> </ul>
<b>Compensation Actions</b>	<ul style="list-style-type: none"> <li>• Not applicable</li> </ul>

**Impact 23 - Increase in family spending due to the need to pay fees to access the Association's resources from the Project**

Impact 23	
<p><b>Increased spending by families due to the need to pay fees to access the Association's resources from the Project (such as maintenance fees for the sanitation system or industrial kitchens), which can have a significant effect on low-income family budgets, affecting their budgeting capacity and even causing the Project to run out of steam.</b></p>	
<b>Impacting Cause / Action</b>	The need for financial resources to fund the operation and maintenance of the systems.
<b>Nature</b>	Adverse
<b>ESMP Associated Program</b>	Stakeholder Communication, Consultation and Engagement Plan
<b>Qualitative aspects</b>	<p>There may be an increase in household spending related to the payment of association fees, the use of collective infrastructures and connection to water and sewage systems.</p> <p>Even taking into account that the project aims to improve the quality of life of the communities and bring greater gains, this process could have a return during a timeframe that is not the same as the spending of these families, a situation that could affect household budgets, resulting in the emptying of the project in some communities and the exclusion of part of the community.</p>
<b>Actions to Avoid the Impact</b>	<ul style="list-style-type: none"> <li>• Not applicable</li> </ul>
<b>Actions to Minimize Impact</b>	<ul style="list-style-type: none"> <li>• Not applicable</li> </ul>

<b>Compensation Actions</b>	<ul style="list-style-type: none"> <li>• Not applicable</li> </ul>

### 5.3.3 Strategic Environmental and Social Management Plan - ESMP

Based on the assessment of impacts and risks, the following programs were drawn up to make up the ESMP:

- Description of Management Measures
  - Screening Measures, Classification and Scope of Subprojects
  - ESMP Monitoring and Evaluation Measures
- Description of Physical Environment Plans and Programs
  - Disaster and Climate Change Risk Management Plan
  - Waste Management Program for the implementation of structures and production processes
  - Water Quality Monitoring and Control Program
- Description of Biotic Environment Plans and Programs
  - Biodiversity Management, Protection and Restoration Plan
- Description of Socioeconomic and Cultural Plans and Programs
  - Stakeholder Communication, Consultation and Engagement Program
  - Environmental and Health Education Program
  - Contaminating Products Management and Control Plan
  - Energy Efficiency Plan for Projects and Facilities
  - Traffic Program
  - Labor Management Plan
  - Program to Control and Mitigate Temporary Social and Economic Impacts
  - Cultural Heritage Preservation Program
  - Gender Violence Prevention and Care Program
  - Program for Mitigation and Compensation of Impacts on Traditional Communities
  - Disease Vector Control Program
  - Cultural Heritage and Fortuitous Finds Protection Program

## 5.4 Cumulative Impact Assessment

Cumulative Impact Assessment is an internationally recognized practice used in environmental impact assessment processes. This assessment standard - which does not replace, but complements the classic environmental impact assessment process - is particularly important in situations where there is a spatial concentration of undertakings or events (past, current or in the design phase) which may - in combination or by accumulation over time - cause environmental impacts.

Attention should be paid to the fact that some environmental impacts can accumulate over time and act more directly on certain environmental systems, challenging the ability of these environments to recover naturally.

Therefore, certain impacts that may, in a basic matrix of environmental impacts, be considered of low relevance, can accumulate over periods of time and over a given territory.

According to the US Council on Environmental Quality:

*"A cumulative impact is the result of the incremental impact of an action, when added to other actions from the past, present and those that are reasonably foreseeable in the future, regardless of who is responsible for the other actions" (CEQ, 1978 apud DIBO, 2018).*

This item is based on the definition that a cumulative impact is a change in the environment caused by the combination of impacts from various actions, associated with similar or different actions that occurred in the past, that are practiced today, as well as those that may occur in the future, in a given geographical space. Similarly, these impacts can result from actions that are individually minor, but which can be considered significant when analyzed from an integrated and collective perspective on a time scale. Cumulative impacts are also considered to occur through additive and interactive processes (DIBO, 2018).

The main objective of this study is to identify and characterize the cumulative impacts on Procace II.

Valued Ecological Components ("VEC") are environmental and social attributes that are considered important when assessing cumulative impacts and risks. VECs can be many things: physical features, habitats, wild species and populations (e.g. biodiversity), ecosystem services (e.g. fisheries, drinking water, flood protection, etc.), natural processes (e.g. water and nutrient cycles, microclimates), social status (e.g. health, economy, food security) or cultural aspects (e.g. archaeological sites, sacred places, spiritual or traditional ceremonies).

#### **5.4.1 Cumulative Impact Assessment - CIA**

The cumulative impacts identified for the sub-projects are presented below.

##### **Selection and Characterization of Environmental Components**

The Valued Ecological Components (VEC) considered for this Cumulative Impacts Analysis are described below.

##### ***VEC Local Economy and Local Arrangements***

The implementation of Procace II is expected to improve the family economy and local arrangements, favoring local consumption and stimulating various other areas of the economy. This cumulative process can become a virtuous spiral in and around the communities, especially if other programs are taken into account, such as the Food Acquisition Program (PAA) and the National School Feeding Program (PNAE).

- **Projects Involved:** Food Acquisition Program (PAA) and National School Feeding Program (PNAE) - existing projects.

- Natural Factors or Activities: Availability of natural resources or potential for improvement in ecosystem service offering raw material for food production.
- Spatial limits: The entire Procase II area.
- Time Limits: Project Life Cycle and Beyond.
- Carrying Capacity: Improving the carrying capacity of the environment by implementing SAF.
- Positive environmental impact: Increase in vegetation cover and biological diversity of ecosystems.
- Positive economic impact: virtuous cycle in the local economy.
- Positive Social Impact: Improvement in the lives of communities, with positive repercussions on local economic arrangements.

### **VEC Forests**

Once agroforestry systems are implemented and communities are engaged in these systems, there will be a positive environment for the expansion of forested areas, with a potential change in local habits, increasing the gains from simply restoring vegetation. This VEC is in addition to forest restoration programs and PSA - Payment for Environmental Services.

- Projects Involved: PSA - Payment for Environmental Services - existing project.
- Natural Factors or Activities: Expansion of forested areas with the possibility of forming ecological corridors with other preserved areas.
- Spatial boundaries: The entire Procase II area, with a focus on the SAF areas.
- Time Limits: Project Life Cycle and Beyond.
- Support Capacity: Improving local environmental support capacities, enabling cumulative environmental gains.
- Positive environmental impact: increase in forested areas.
- Positive Economic Impact: Increased resilience of the environment, promoting healthier, more protected and naturally diverse environments, enabling quality SAFs.
- Positive Social Impact: Improving people's quality of life.

### **VEC Water Quality**

The project includes the implementation of water collection and treatment/reuse systems and simple sewage systems. This process, combined with projects such as Água Doce and the improvement in people's living conditions and greater commitment to agroforestry systems (expanding knowledge of best practices), has the potential to increase the results of improving water quality. This is not just about water treatment, but about a set of actions that stem from the project and have the potential to change people's perceptions about environmental care and the need to treat water resources seriously.

- Projects Involved: Fresh Water Program - existing projects.

- Natural Factors or Activities: Not identified.
- Spatial boundaries: The entire Procase II area, with a focus on water resources.
- Time Limits: Project Life Cycle and Beyond.
- Carrying Capacity: Improving the environmental carrying capacity of water resources, including the possibility of expanding their use.
- Positive environmental impact: Increased water quality and care by society.
- Positive economic impact: reduction in water treatment or purchase costs.
- Positive Social Impact: Improving people's quality of life.

### **VEC Slope Areas**

Areas where crops are grown on steeper slopes have been identified as part of the community's agricultural activities; if the project supports actions on sites with crops grown on steeper slopes, this could lead to landslides, with potential local impacts (loss of crops, risks to people and structures).

- Projects Involved: Not identified, but may exist sporadically, such as the Food Acquisition Program (PAA) and the National School Feeding Program (PNAE).
- Natural Factors or Activities: Current activities in areas with slopes were identified.
- Spatial boundaries: The entire Procase II area, mainly in the north.
- Time Limits: Project Life Cycle and Beyond.
- Carrying Capacity: Improving the environmental carrying capacity of water resources, including the possibility of expanding their use.
- Negative Environmental Impact: Increased Potential Risk of Mass Movements and partial destruction of ecosystems.
- Negative Economic Impact: Risk to structures and crop areas.
- Negative Social Impact: Risk to people.

## **5.5 Environmental Disaster Risk Assessment**

Initially, it is important to point out that the main dangers to which the regions where the projects are located are subject can be related mainly to landslides and mudflows (mountain areas and those closer to the coast), severe droughts, forest fires and, to a lesser extent, floods and strong winds.

In order to understand the effects of climate change in the area of influence of the Project, information from the Federal Government's Adapta Brasil<sup>50</sup> was consulted, in addition to other sources that are cited throughout the assessment, such as Cunico et al. (2023). Adapta Brasil is an important tool that presents Indices and Indicators of the risk of

---

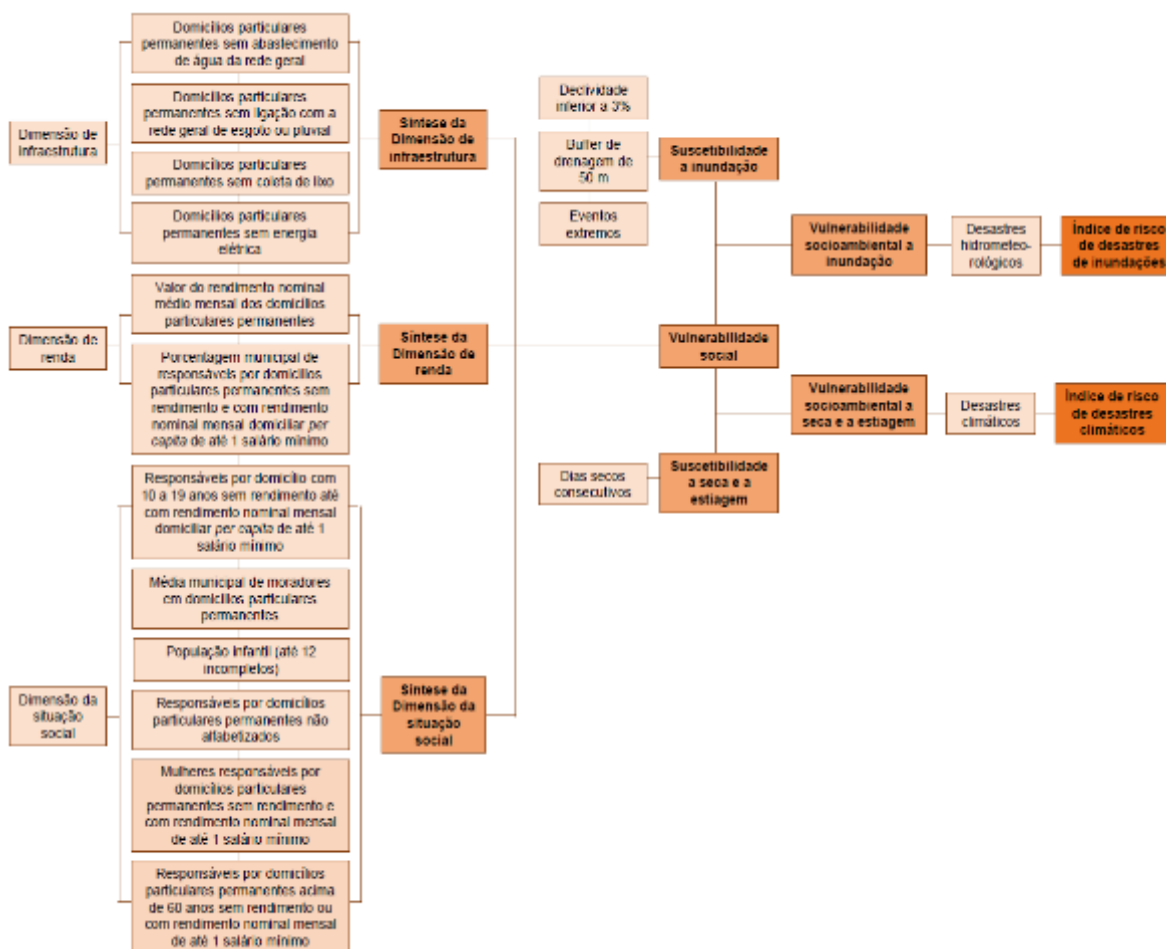

<sup>50</sup> <https://sistema.adaptabrasil.mcti.gov.br/>

climate change impacts in Brazil, integrated into a single platform, linked to the Ministry of Science, Technology and Innovation - MCTI.

### 5.5.1 Risk and Vulnerability in the State of Paraíba

This item presents information from the Atlas: Risks, Vulnerabilities and Environmental Disasters of the State of Paraíba (Cunico *et al.*, 2023) which provides an important insight into the risks and vulnerabilities of Paraíba's municipalities. This study consisted of drawing up Disaster Risk Index (DRI) maps for the state of Paraíba, considering two scenarios of environmental and climatic susceptibility: areas susceptible to flooding and areas susceptible to climatic disasters (drought/drought), the methodological pathway shown in the figure below was carried out.

**Figure193 - Methodological Path - Atlas: Risks, Vulnerabilities and Environmental Disasters in the State of Paraíba**

Source: Cunico *et al.*, 2023

It is interesting to note that the Disaster Risk Indices for both drought and floods were designed to correlate with emergencies and states of public calamity declared by municipalities between 2003 and 2016, which makes the results more robust. This data needs to be correlated with social vulnerability, which is an important indicator of communities' ability to cope with disasters that may strike their territory.

Social vulnerability is the result of a combination of infrastructure, income and social situation, which help to identify areas with greater or lesser capacity to cope with adverse situations, including environmental disasters.

The following table shows the indicators used to define social vulnerability, considering susceptibility to flood and drought disasters.

**Table 194 - indicators used to define social vulnerability - susceptibility to flood and drought disasters**

Dimension	Indicator Description
Infrastructure	Percentage of permanent private households with inadequate housing - no public lighting.
	Percentage of permanent private households with inadequate housing - no manhole.
	Percentage of permanent private households with inadequate housing - no afforestation.
	Percentage of permanent private households with inadequate housing - there is open sewage.
	Percentage of permanent private households with inadequate housing - garbage accumulated in the streets.
Income	Average nominal monthly income of people responsible for permanent private households.
	Percentage of heads of household with a nominal monthly income of up to 1 minimum wage.
	Percentage of heads of household with no nominal monthly income.
Social situation	Percentage of the child population (up to 12 years old).
	Percentage of heads of permanent private households aged 10 to 19.
	Percentage of the elderly population (over 60 years of age).
	Percentage of heads of permanent private households aged over 60.
	Percentage of heads of permanent private households who are not literate.
	Percentage of female heads of household with a nominal monthly income of up to 1 minimum wage.

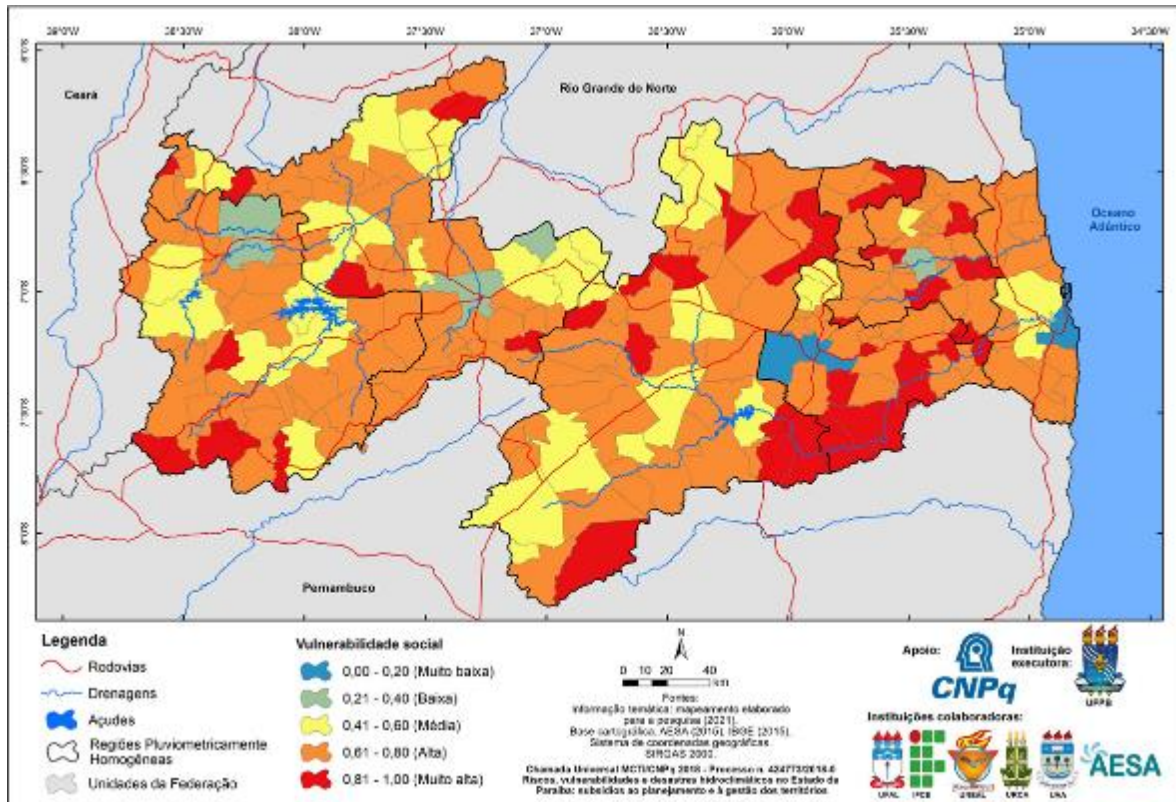

Dimension	Indicator Description
	Percentage of female heads of household with no nominal monthly income.
	Percentage of residents in permanent private households without a mains water supply.
	Percentage of residents in permanent private households without a bathroom for the exclusive use of residents or a toilet.
	Percentage of residents in permanent private households without collected waste.
	Percentage of residents in permanent private households with garbage thrown into a river, lake or sea.
	Percentage of residents in permanent private households without electricity.

Source: Cunico et al., 2023

The figure below shows the resulting map of the Social Vulnerability of Paraíba's municipalities. According to the authors, *"the predominance of the high and very high vulnerability classes is clearly perceptible, totaling 83% of the municipalities (184 municipalities in total, comprising 44% of Paraíba's population)"*. Thus, it can be seen that social vulnerability is high and occurs in a significant part of the state's territory.

**Figure194 - Social Vulnerability - Floods and Droughts**

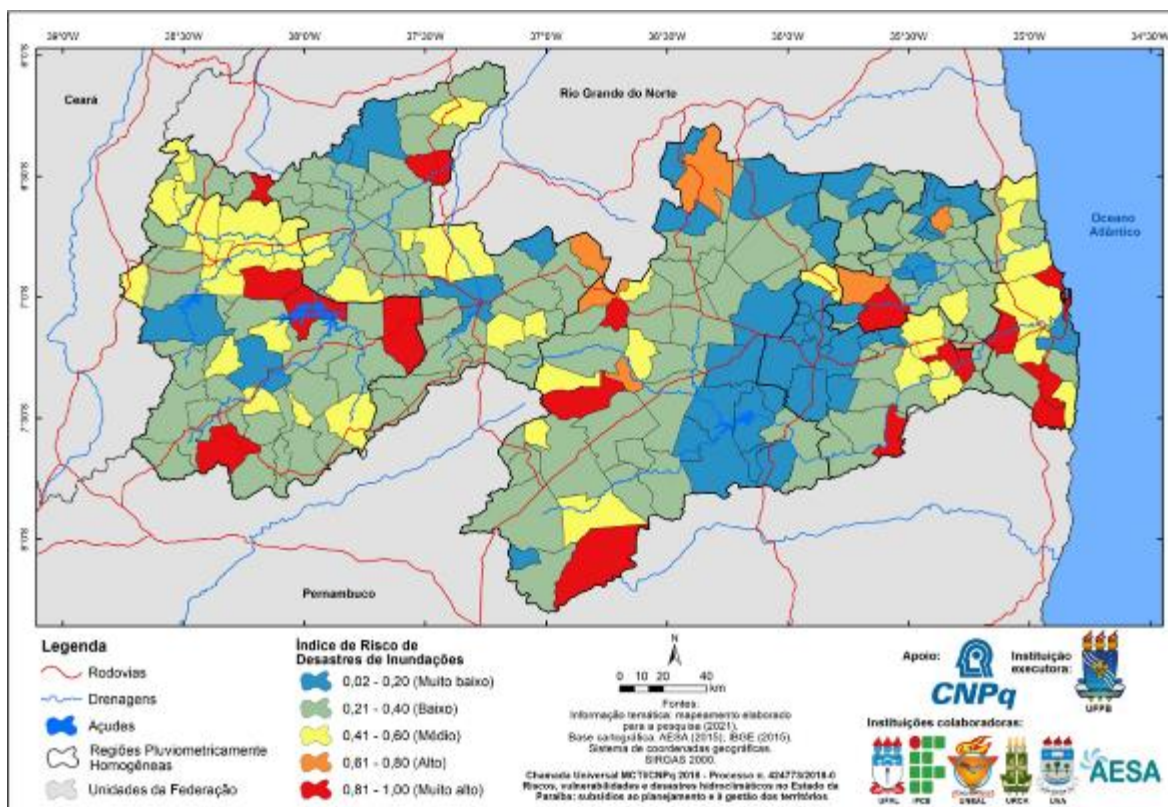

Source: Cunico et al., 2023

The Flood Disaster Risk Index (IRDI) for the state of Paraíba (figure below), is a result corresponding to socio-environmental vulnerability to flooding, integrated with the hydro-meteorological disasters recorded in the state (2003 to 2016).

This mapping reveals that 24 municipalities in the state are at Very High or High risk of flooding. According to the authors, "These two classes correspond to 11% of the entire state and include 9% of the population of Paraíba" (Source: Cunico et al., 2023).

Figure195 - Flood Disaster Risk Index

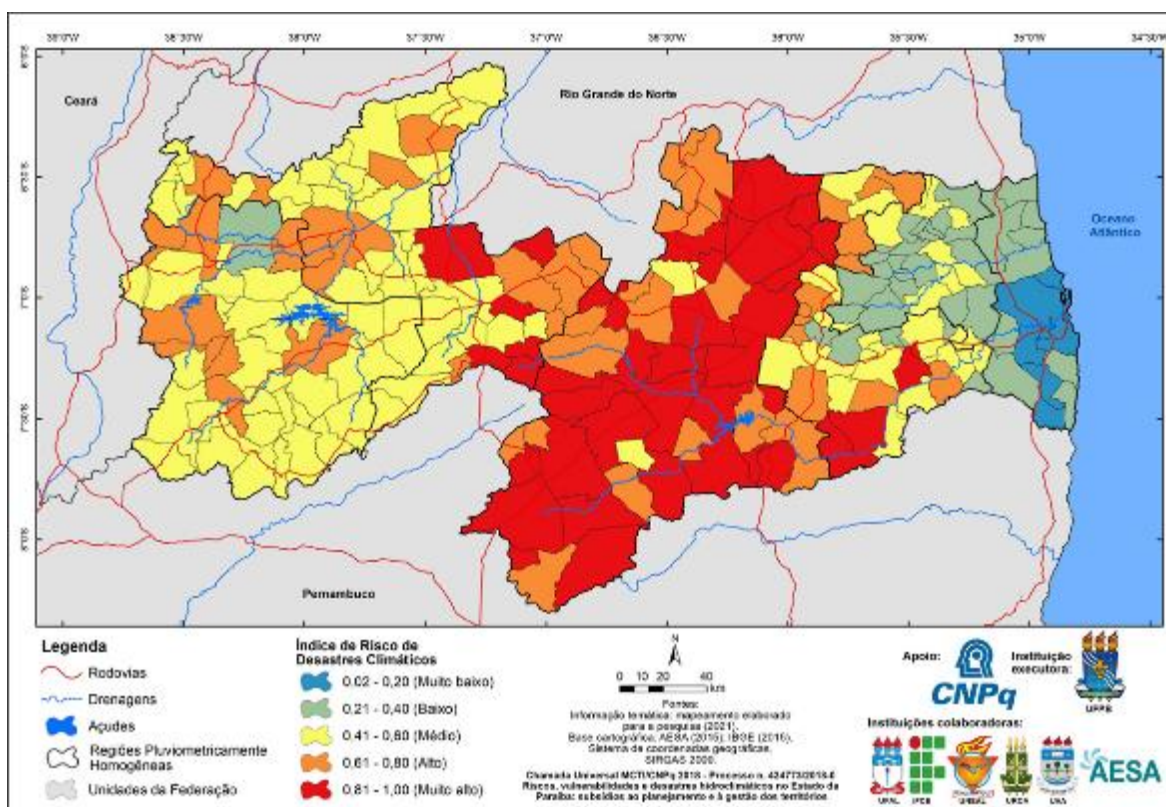

Source: Cunico et al., 2023

Finally, the Climate Disaster Risk Index (CDRI) for the state of Paraíba (figure below) is made up of socio-environmental vulnerability to drought and drought integrated with the climate disasters recorded in the state.

Being in the semi-arid regions of Brazil, the state has 42% of its territory under the condition of High or Very High IRDC, (93 municipalities), spatially concentrated in the central portion of Paraíba and affecting 23% of the population of Paraíba.

**Figure196 - Climate Disaster Risk Index**

Source: Cunico et al., 2023

### 5.5.2 Potential Effects of Climate Change

Changes in climate patterns generate consequences that directly affect natural and human systems (IPCC, 2013). These changes are part of the natural variability of the climate or can be a response to anthropogenic actions (greenhouse gas emissions and land use changes), resulting in climate change. Often, these changes are related to the precipitation regime, and can cause negative impacts depending on their intensity. With regard to the occurrence of droughts and dry spells, downward trends in precipitation have proven to be frequent and severe in various parts of the world. Climate simulations based on global atmospheric circulation models have offered predictions of more extreme climates in the future, sometimes with abundant and short-lived rainfall, sometimes with long dry spells (IPCC, 2012).

This is the risk of the impact of climate change on socio-ecological systems, resulting from the interaction between climatic events and the vulnerability and exposure components of these same systems.

For the study area, we used data from the AdaptaBrasil platform<sup>51</sup>, which presents a very extensive set of indexes and indicators involving issues such as social vulnerability,

<sup>51</sup> The Information and Analysis System on the Impacts of Climate Change (AdaptaBrasil MCTI) was established by the Ministry of Science, Technology and Innovation, through Ordinance No. 3,896, of October 16, 2020, with the aim of consolidating, integrating and disseminating information that makes it possible to advance the analysis of the impacts of climate change, observed and projected in the national territory, providing subsidies to the competent authorities for adaptation actions.

infrastructure and government actions that can bring greater efficiency in prophylactic and control actions during extreme events (such as plans and programs, better designed infrastructure, adherence to programs such as Resilient Cities, among others).

In the analysis, the scenarios were consulted: Current and 2050 (pessimistic).

### Impact of Rain

Rainfall Impact Risk Index for food security, according to Adapta Brasil:

*Heavy rainfall is considered a climate threat when its frequency and duration cause flooding and landslides, for example. The negative and harmful effects on the socio-ecological system can range from material damage and/or the death of people in areas subject to the accumulation and temporary passage of surface water, the death of animals, to crop losses due to excess water, among others.*

*Source: MARENGO, J. A. Mudanças Climáticas, Condições Meteorológicas Extremas e Eventos Climáticos no Brasil. In: FBDS (org). Climate Change and Extreme Events in Brazil. p: 04-19. FBDS & LLOYD'S. 2010.*

The AdaptaBrasil results show that in the current scenario there is already a medium risk prevailing in the coastal portions of the state of Paraíba, with the central territory of the state still having most of its area at low or very low risk. The 2050 (pessimistic) scenario predicts a significant increase in the number of municipalities at very high risk closer to the coast, with an increase in medium risk in the west of the state. The central portion is now at medium risk.

The following figures show the municipalities by class, for the current scenario and in 2050 - pessimistic.

**Figure197 - Impact of Rain - Current Scenario**

Source: Adapta Brasil - Ministry of Science, Technology and Innovation, 2024 (consultation).

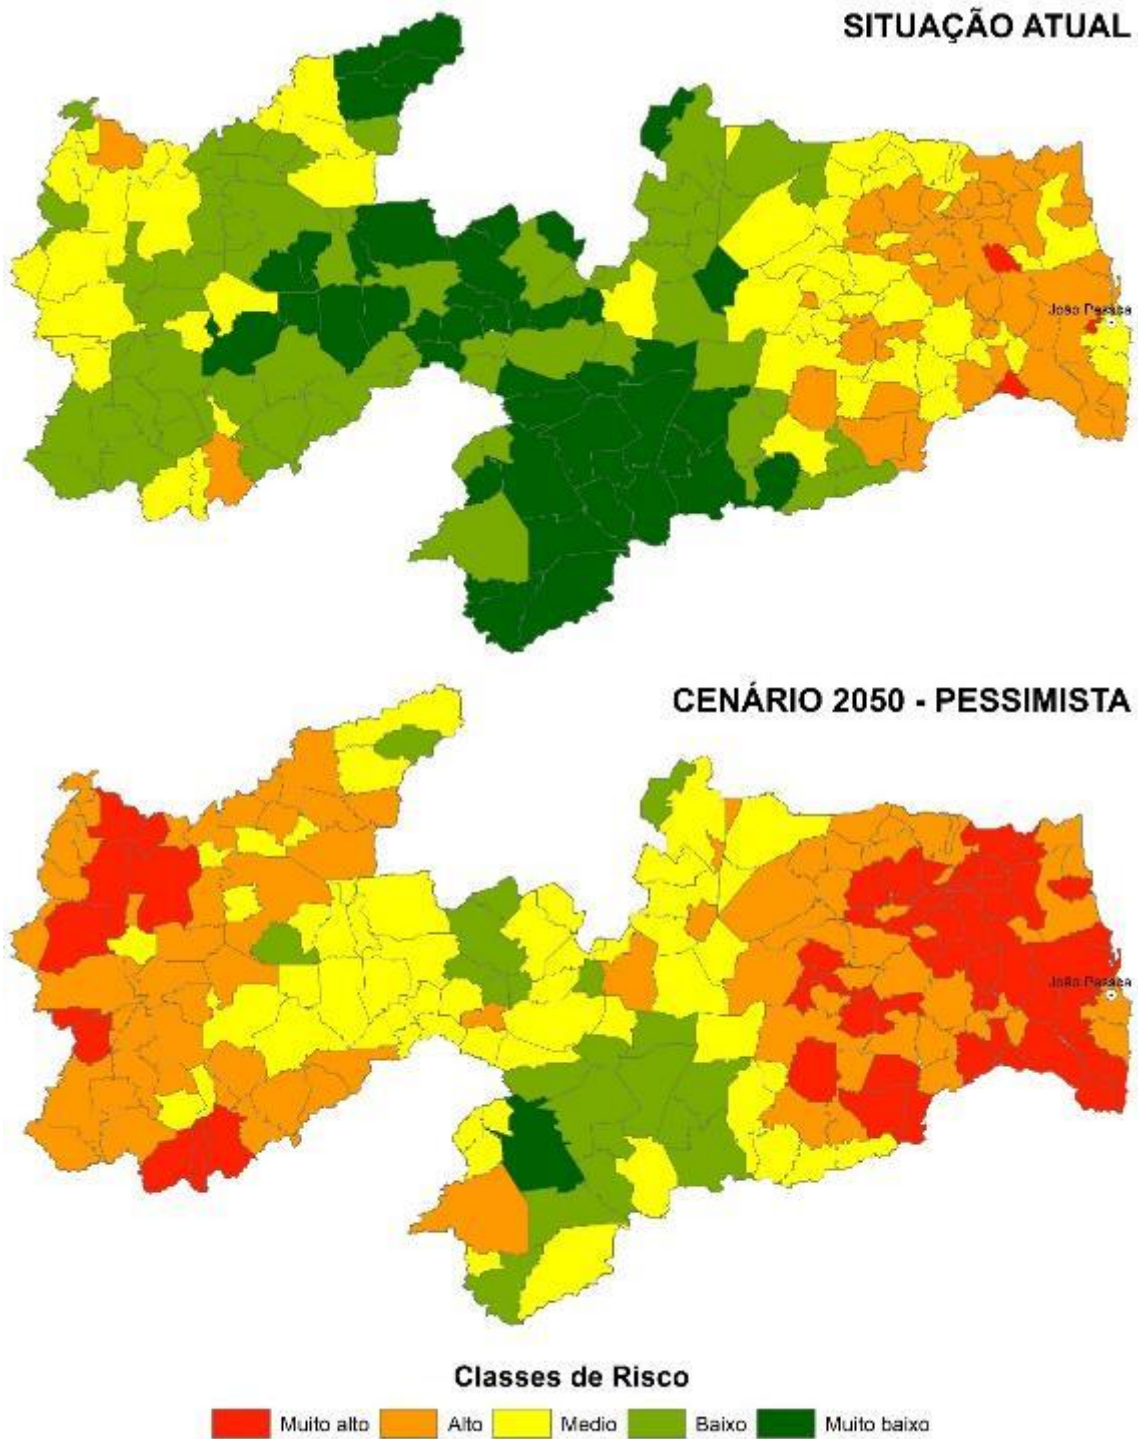

**Figure198 - Rainfall Impact - 2050 Scenario - Pessimistic**

Source: *Adapta Brasil - Ministry of Science, Technology and Innovation, 2024 (consultation).*

The figure below shows the current and future situation for the impact of rain.

Figure199 - Impact Risk Index for Rain - Food Security

**RISCO DA CHUVA - SEGURANÇA ALIMENTAR**

Source: Adapta Brasil - Ministry of Science, Technology and Innovation, 2024 (consultation).

**Impact of Drought**

Drought Impact Risk Index for food security, according to Adapta Brasil:

*Risk of impact of climate change on socio-ecological systems, resulting from the interaction between climate events related to drought, vulnerability and exposure of these systems. Drought is considered to be a prolonged period - a season, a year or several years - of deficient precipitation compared to the statistical multi-year average for a region that results in a shortage of water for some activity, group or environmental sector.*

Source: FOOD AND AGRICULTURE ORGANIZATION/NATIONAL DROUGHT MITIGATION CENTER - FAO/NDMC. *The Near East Drought Planning Manual. Food and Agriculture Organization of the United Nations (FAO): Rome: Italy, 2008.*

On the issue of drought, we can cite the INDEX OF VULNERABILITY TO NATURAL DISASTERS RELATED TO DRUCES IN THE CONTEXT OF CLIMATE CHANGE (MMA, 2017):

*Firstly, it should be noted that drought is a relative phenomenon that depends on the context in which the analysis is inserted. Therefore, any discussion in terms of precipitation deficit must refer to the particular conditions of a given region (CASTRO et al., 2003). Periods with abnormal precipitation deficits are defined as meteorological droughts and can have consequences for agricultural activities or the hydrological cycle (IPCC, 2012). In a socio-economic view of disasters, drought depends more on the vulnerabilities of the social groups affected than on the climatic conditions themselves*

According to the AdaptaBrasil platform, in the current scenario, a significant portion of the study area is at low or medium risk. Some municipalities in the western part of the state are already at high risk of the impacts of drought on food security. In the 2050 scenario, the incidence of medium to high risk begins to prevail in the state.

According to the figures below, between the current scenario and the 250 (pessimistic) scenario there will be a jump in the high class, from 20 to 70 municipalities.

**Figure 200 - Impact of Drought on Food Security - Current Scenario**

Source: Adapta Brasil - Ministry of Science, Technology and Innovation, 2024 (consultation).

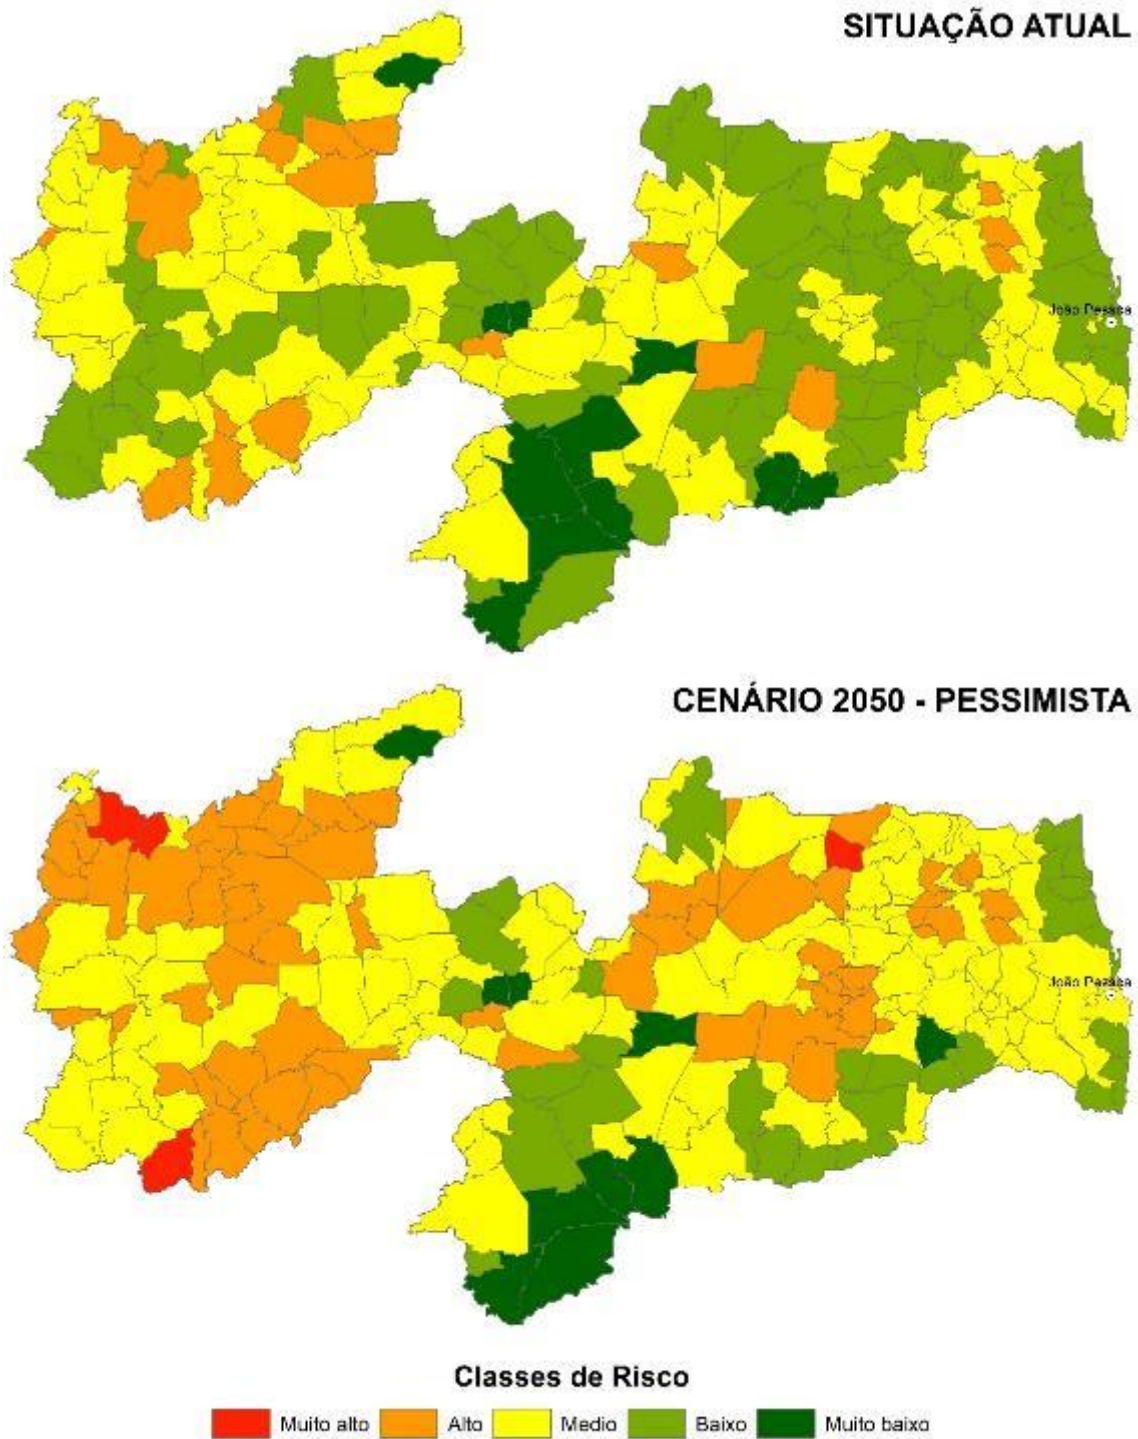

**Figure201 - Impact of Drought on Food Security - 2050 Scenario - Pessimistic**

Source: *Adapta Brasil - Ministry of Science, Technology and Innovation, 2024 (consultation).*

The figure below shows the current and future situation for the impact of rain.

Figure202 - Drought Impact Risk Index - Food Security

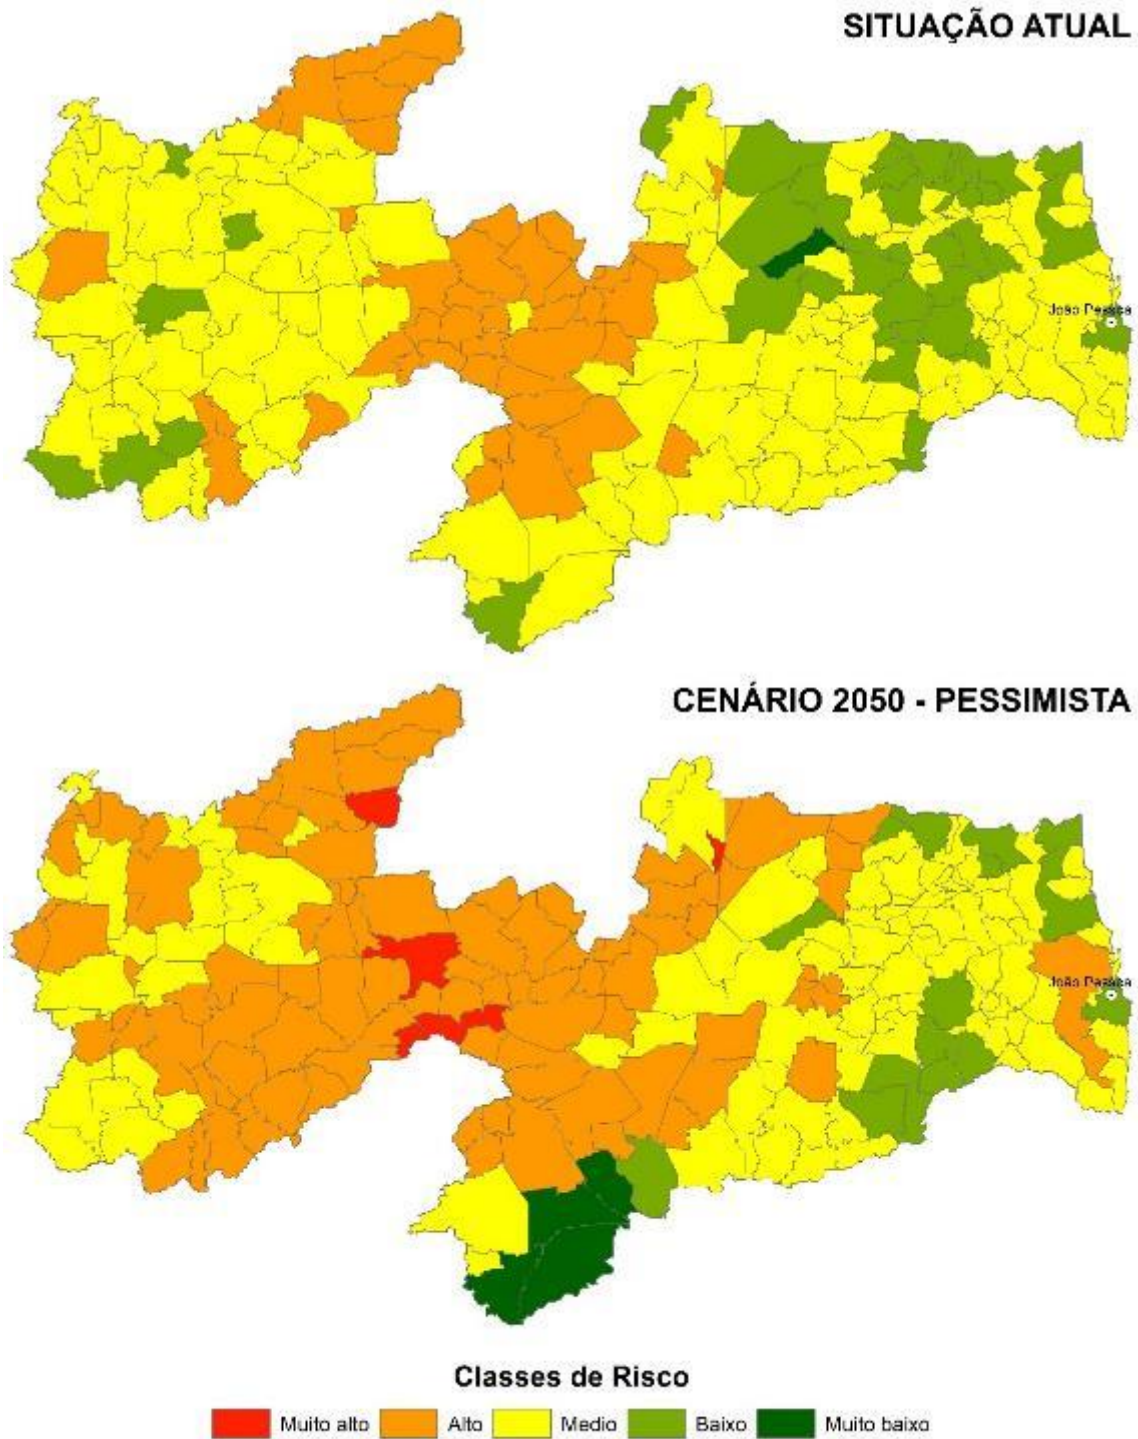

**RISCO DA SECA - SEGURANÇA ALIMENTAR**

Source: Adapta Brasil - Ministry of Science, Technology and Innovation, 2023 (consultation).

The figure below shows the impact of drought specifically on local water resources.

Figure203 - Drought Impact Risk Index - Water Resources

**RISCO DA SECA - RECURSOS HÍDRICOS**

Source: Adapta Brasil - Ministry of Science, Technology and Innovation, 2024 (consultation).

**Landslides**

Landslide Impact Risk Index, according to Adapta Brasil:

*Risk of impact of climate change on socio-ecological systems, considering the threat of geo-hydrological disaster<sup>52</sup> landslides, considering geomorphological, land use, geological characteristics and climatic indices of intense rainfall (total rainfall in 1 day and 5 days).*

*Source: Information and Analysis System on Climate Change Impacts - AdaptaBrasil MCTI.*

Analyzing the data from Adapta Brasil, we can see that several municipalities in Paraíba are at medium to high risk. It is important here to consider that landslides are usually less extensive phenomena and that, although they do not affect the entire municipal area, they have the potential to cause major damage and put important communities and structures at risk.

According to the figures below, in the current scenario, municipalities at medium risk prevail, while in the 2050 scenario (pessimistic), municipalities at high risk prevail, with a significant increase in municipalities at very high risk.

**Figure204 - Landslide Impact - Current Scenario**

Source: Adapta Brasil - Ministry of Science, Technology and Innovation, 2024 (consultation).

<sup>52</sup> Geo-hydrological disasters are the effects on lives, livelihoods, health, ecosystems, economies, societies, cultures, services and infrastructure due to climate change or climatic events that occur within specific periods of vulnerability and exposure of the society or system related to geo-hydrological disasters. A disaster is considered to be "a serious interruption in the functioning of a community or society that causes a large number of deaths, losses and material, economic and environmental impacts that exceed the capacity of the affected community or society to cope with the situation through the use of its own resources. The disaster is characterized by being immediate and localized, but often has an indirect geographic and temporal effect of greater dimensions". The geo-hydrological disasters considered are natural disasters such as landslides and floods (source: UNISDR - United Nations Office for Disaster Risk Reduction. 2009 UNISDR terminology on disaster risk reduction. Geneva: UNISDR, 2009 *apud* AdaptaBrasil, 2024)

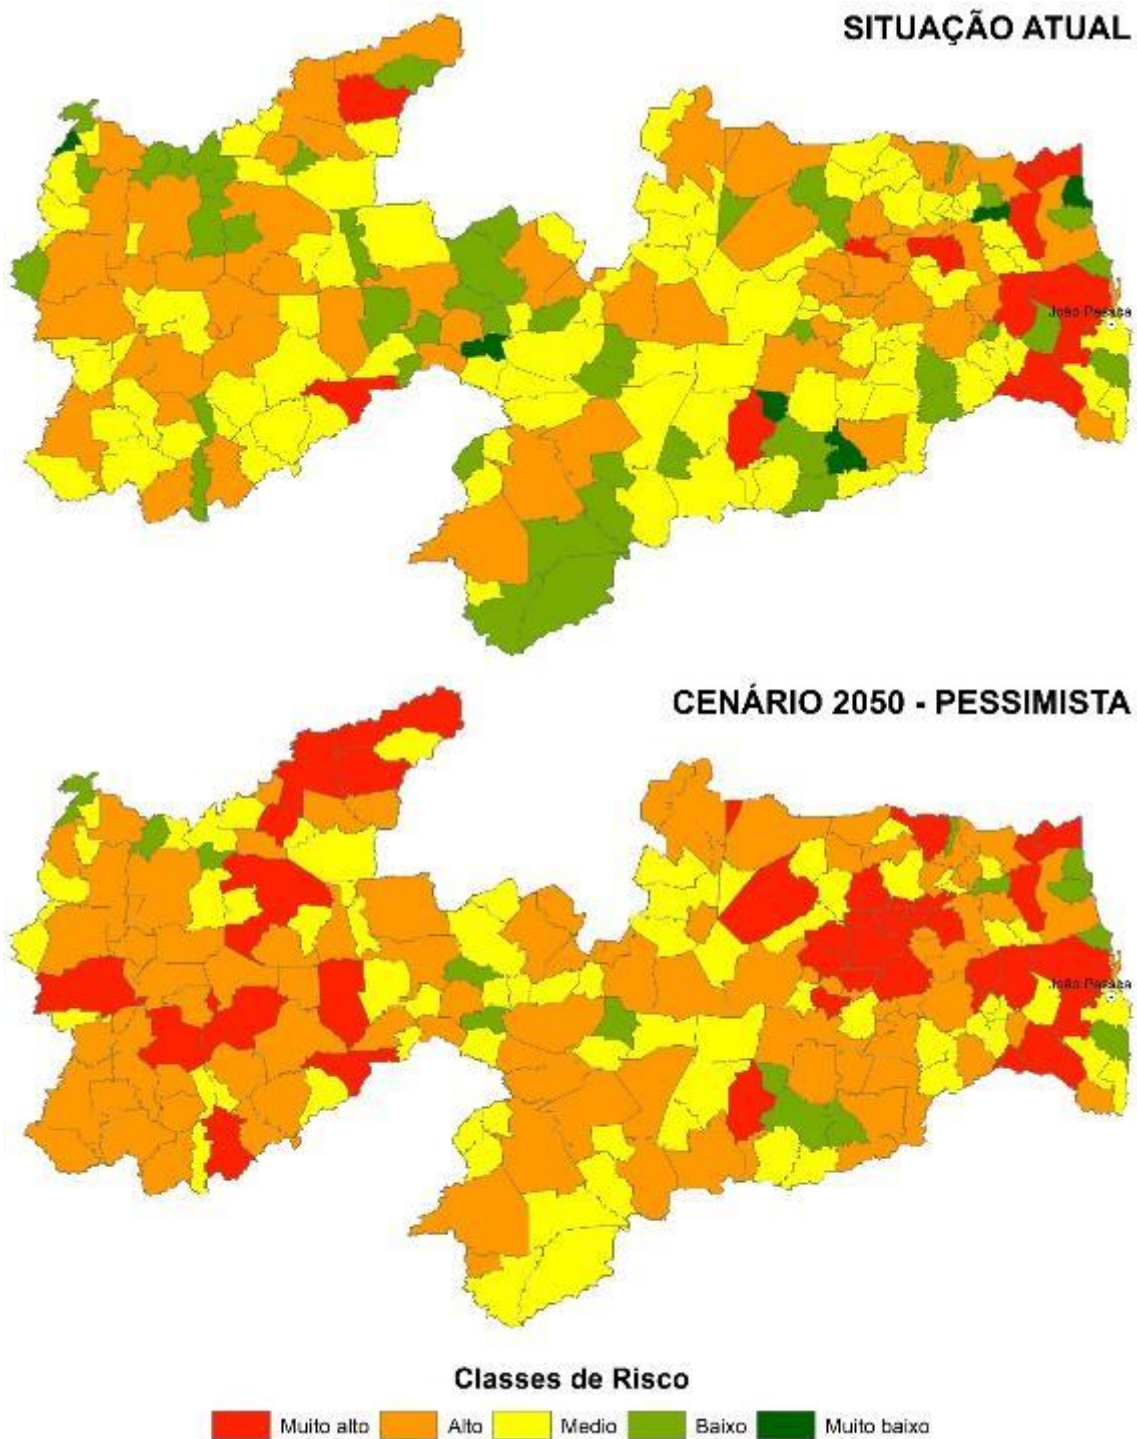

**Figure205 - Landslide Impact - 2050 Scenario - Pessimistic**

Source: *Adapta Brasil - Ministry of Science, Technology and Innovation, 2024 (consultation).*

The figure below shows the landslide risk index by municipality.

Figure206 - Landslide Risk Index

**RISCO DE DESLIZAMENTO - DESASTRES GEO-HIDROLÓGICOS**

Source: Adapta Brasil - Ministry of Science, Technology and Innovation, 2023 (consultation).

**Floods, Flash Floods and Waterlogging**

*Risk of the impact of climate change on socio-ecological systems, considering the threat of a geo-hydrological disaster of floods, flash floods and waterlogging, taking into account*

geomorphological characteristics, land use, geology and climatic indices of intense rainfall (total rainfall in 1 day and 5 days).

Source: Information and Analysis System on Climate Change Impacts - AdaptaBrasil MCTI.

According to the figures below, for floods, flash floods and waterlogging, there are no marked changes between the scenarios, with the medium and high classes prevailing, but there is an increase in the number of municipalities in the medium and high classes, with falls in the low and very high classes.

**Figure207 - Landslide Impact - Current Scenario**

DESASTRES GEO-HIDROLÓGICOS**

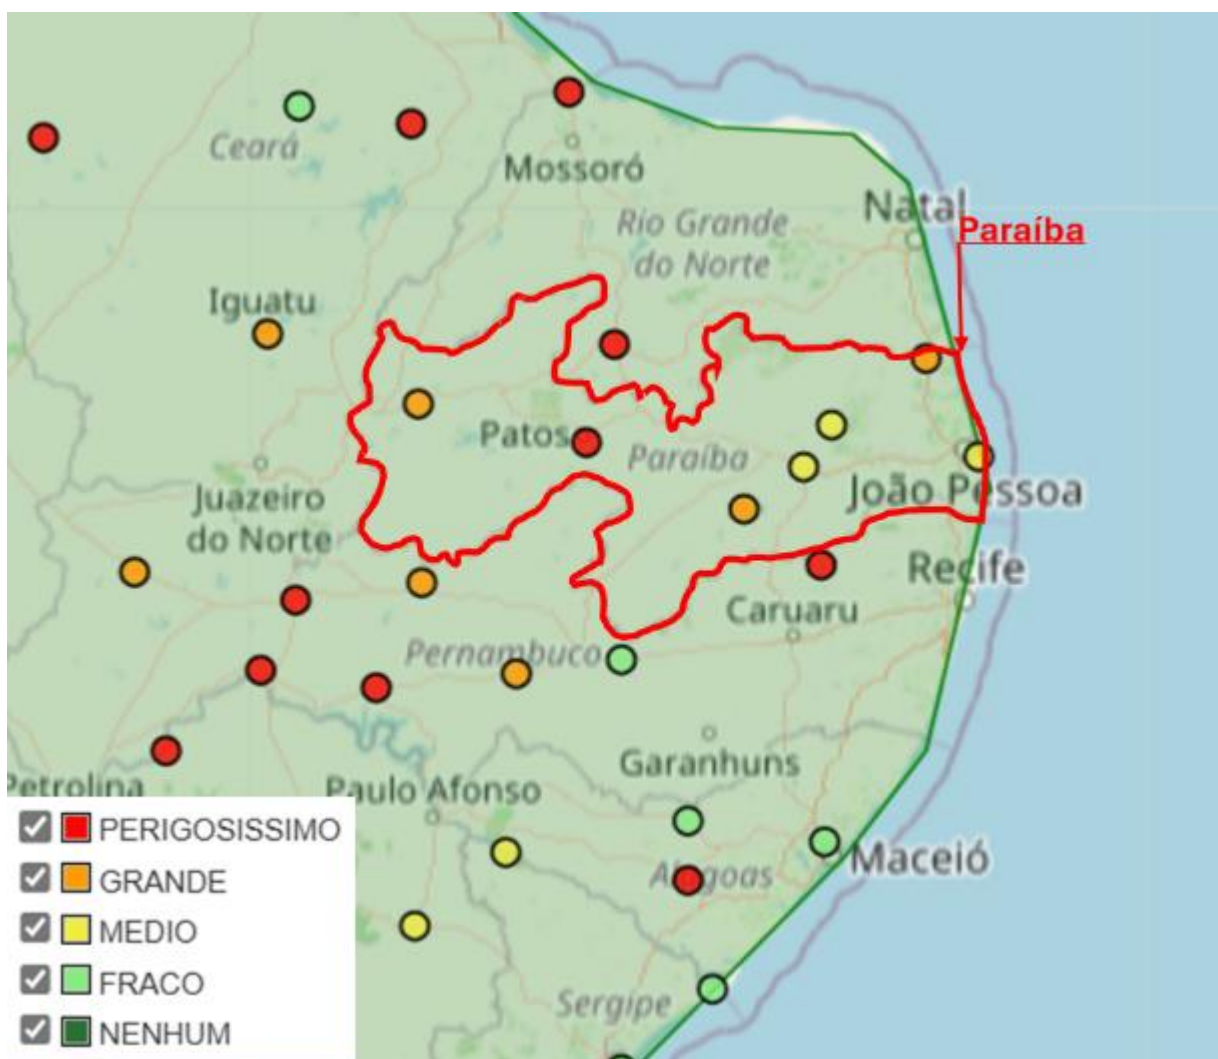

Source: Adapta Brasil - Ministry of Science, Technology and Innovation, 2023 (consultation).

**5.5.3 Flammability Index - Fires**

INMET monitors flammability indices in Brazil on a daily basis, including some stations that are located in the PROCASE II area, as can be seen in the figure below.

Figure210 - Flammability Index - INMET

Source: INMET, <https://portal.inmet.gov.br/paginas/incendio> (consultation, 2024).

## 6 CONCLUSION

The project aims to promote the sustainable development of rural areas in environments that involve the Atlantic Forest and Caatinga biomes, including different ecosystems such as swamps, semi-arid areas, mountain areas, coastal areas, among others. It focuses on the problems of low production and productivity and vulnerability to climate change (CC) of family farming activities, environmental degradation and deforestation, insufficient water supply services for human consumption and lack of sanitation in rural communities.

The Strategic Environmental and Social Assessment (SEA) is intended to be a support tool for incorporating the environmental and social dimension into the project's decision-making process. Its importance lies in defining criteria and milestones to guide the activities, work and sub-projects that will be carried out within the PROJECT being assessed.

This Strategic Environmental and Social Assessment has been structured to evaluate the geographical region where the Project is located, to have a management tool that integrates the environmental and social dimensions of each of the interventions in the

territory, while also aiming to identify alignments and possible gaps in compliance with IFAD and IDB Safeguard Policies. The interventions proposed in the sub-projects may have an impact on some of the municipalities that are part of the Project.

The area covered involves the so-called Rural Territories of the state of Paraíba, where a baseline was developed involving the physical, biotic and socio-economic environments. This baseline was analysed in the light of the project, seeking to identify socio-environmental impacts that required an appropriate mitigation hierarchy.

In the physical environment, the baseline showed the existence of diverse landscapes, with areas that require technical knowledge to manage properly, so as not to create or increase negative situations such as erosion, material being carried into rivers, among others. As for the biotic environment, the existence of natural, modified and critical habitats was observed, all with varying degrees of pressure, requiring specific attention and care. Finally, the socio-economic environment demonstrated the need for the actions envisaged in the project, seeking to improve income and quality of life in local communities, which will have several positive effects on the region.

In all, 24 socio-environmental impacts were identified with the insertion of the Project. In the case of the negative impacts (18 impacts), the majority are related to the implementation phases, and are transitory in nature. As for the positive impacts (6 impacts), their magnitude and temporality make them very important, in line with the objectives of the project proposal: improving income, food and nutritional security, access to basic services and adapting the rural population to climate change, as well as protecting the natural resource base.

There is also a connection with the specific objectives:

- Increasing the adoption of agricultural technologies, including those for adapting to and mitigating climate change;
- Improving the productive and social inclusion of family farmers, prioritizing women, young people, Traditional Peoples and Communities (PCT) and people with disabilities (PcD);
- Improving the environmental conditions of rural communities and their surroundings;

The programs proposed in the ESMP (listed in item 5.3.3 of this document) are focused on applying a mitigation hierarchy, in accordance with the descriptions in the impact sheets (item 5.3.2), avoiding, mitigating and compensating for the impacts identified.

Thus, the Paraíba Sustainable Rural Development Project (Procasa II) is considered to have very positive elements for the development of its catchment area, and the ESMP must be observed in order to control the impacts identified.

## 8 ANNEXES

## 8.1 Annex - Other relevant international agreements

### **Agreement Establishing the Inter-American Institute for Global Change Research (Minutes of Montevideo)**

The Constitutive Agreement of the Inter-American Institute for Global Change Research, also known as the Montevideo Act, the fruit of the idea that emerged at the 1990 White House Conference on Scientific and Economic Research on Global Change, aims to guarantee the exchange of scientific information on the study of global climate change.

The agreement aims to create a regional network of institutions linked to scientific research, which will be called the "Institute". The aim of the Institute is to foster cooperation between countries studying climate change, allowing for the exchange of information and thus ensuring a more comprehensive understanding of the transformations that planet Earth is undergoing.

Its nineteen members agreed on the following guidelines: (a) promotion of cooperation in scientific studies to better understand the problem and propose solutions; (b) encouragement of scientific programs and projects to find solutions; (c) implementation of technical and scientific training, as well as promotion of structural possibilities for research; (d) making the information obtained from research available to society, governments and businesspeople, with the aim of enabling plans for climate change; (e) obligation to enable the free movement of people accredited to carry out scientific studies in the territories of the States Parties.

In Brazil, climate studies are carried out by INPE - the National Institute for Space Research - the technical and scientific body responsible for studying the subject of the international document in question. It should be noted that there is no control or implementation mechanism or reports on the problem.

### **Mercosur Environment Agreement**

In 2001, Brazil, Argentina, Paraguay and Uruguay signed the Mercosur Framework Agreement on the Environment, also known as the Mercosur Common Environmental Agenda. It came into force on September 17, 2004, via decree 5208, with the aim of establishing common guidelines for environmental preservation and sustainable development.

In order to achieve the goal of environmental preservation, the signatory countries agreed as follows: (a) using natural resources in the most efficient way possible, basing policies on principles of gradualness, flexibility and balance; (b) all environmental policies should be unified in order to strengthen the measures to be implemented; (c) focusing on sustainable development through cooperation between the States Parties; (d) prioritizing the causes of environmental problems as the focus of protectionist policies; (e) collecting and exchanging information about the environment; (f) encouraging environmental management policies; (g) standardizing environmental standards, taking into account the different geographical environments; (h) finding sources of funding for a sustainable environmental policy; (i) promoting policies for the sustainable development of labor, making the necessary preservation compatible with economic progress; (j) encouraging environmentally friendly production processes, services and activities; (k) promoting clean technological progress; (l) providing information on disasters affecting the States Parties; (m) promoting environmental education; (n)

maintaining the cultural aspects of the local population whenever possible when carrying out public preservation initiatives.

Environmental issues are dealt with by two discussion forums: one technical - the Sub-Working Group No. 6 (SGT-6); and the other political - the Meeting of MERCOSUR Environment Ministers (RMMAM).

The primary objective of SGT-6 is to formulate and propose strategies and guidelines that guarantee the protection and integrity of the environment of the States Parties in a context of free trade and consolidation of the customs union, while ensuring equal conditions of competitiveness. The Ministry of the Environment participates as the national coordinator of this Subgroup.

RMMAM is the MERCOSUR body responsible for dealing with politically sensitive environmental issues, which cannot always be discussed within the framework of the Sub-Working Group. Currently, SGT-6 and RMMAM are working to strengthen the environmental perspective in the other MERCOSUR bodies, following up on various projects and identifying priority technical and political issues in order to make the agenda more effective.

### **Unesco Convention for the Safeguarding of the Intangible Cultural Heritage**

Ratified by Brazil in March 2006.

On October 17, 2003, during the 32nd General Conference of the United Nations Educational, Scientific and Cultural Organization (UNESCO), the Convention for the Safeguarding of the Intangible Cultural Heritage was approved. This Convention entered into force on April 20, 2006. The 2003 Convention has several objectives:

- (a) safeguarding intangible cultural heritage;
- (b) respect for the intangible cultural heritage of the communities, groups and individuals involved;
- (c) raising awareness at local, national and international level of the importance of intangible cultural heritage and its mutual appreciation;
- (d) international cooperation and assistance.

Claiming to be an instrument that promotes intangible cultural heritage, the main generator of cultural diversity and the guarantor of sustainable development, the 2003 Convention aims to fill a gap in the legal system for the international protection of cultural heritage, whose instruments, until now, did not consider intangible cultural heritage, but only tangible, movable and immovable cultural heritage, so that intangible cultural expressions could not be safeguarded through the international legal instruments that existed at the time.

According to the Convention, intangible cultural heritage is defined as "(...) the practices, representations, expressions, knowledge and skills - as well as the instruments, objects, artefacts and cultural spaces associated with them - which communities, groups and, where appropriate, individuals recognize as forming an integral part of their cultural heritage. This intangible cultural heritage, passed down from generation to generation, is constantly recreated by communities and groups according to their environment, their interaction with nature and their history, instilling in them a sense of identity and

continuity, thus contributing to the promotion of respect for cultural diversity and human creativity" (Article 2).

It is therefore this intangible cultural heritage that the 2003 Convention aims to safeguard, providing, among other measures, for each State Party to draw up inventories of this heritage.

### **UN Declaration on the Rights of Indigenous Peoples - UNDRIP (2007)**

Brazil's intention, as one of the signatories to the UNDRIP (2007), is to recognize indigenous peoples and traditional communities as a group distinct from the rest of its population and to create a legal framework to protect the rights of this group. The basis of this treaty focuses on interrelated areas:

- Indigenous peoples (traditional communities) are clearly a separate group from mainstream society with their own customs and beliefs. This includes collective and individual rights.
- The right to self-determination: indigenous peoples and (traditional communities) have the right to freely determine their political status and freely pursue their economic, social and cultural development.
- Free, prior and informed consent (FPIC). Allows indigenous peoples and traditional communities to give or withhold consent from a project that may affect them or their territories. Once they have given their consent, they can withdraw it at any stage. In addition, FPIC allows them to negotiate the conditions under which the project will be designed, implemented, monitored and evaluated.

### **OAS American Declaration on the Rights of Indigenous Peoples**

The American Declaration on the Rights of Indigenous Peoples (DADPI), approved by the General Assembly of the Organization of American States (OAS), is the first instrument in the history of the OAS to promote and protect the rights of indigenous peoples in the Americas. It was approved by acclamation by the Member States on June 15, 2016, in Santo Domingo, the capital of the Dominican Republic.

The member states of the Organization of American States (OAS) recall that the indigenous peoples of the Americas constitute an organized, differentiated and integral segment of their population and have the right to be part of the national identity of the countries, with a special role in strengthening state institutions and achieving national unity based on democratic principles. It also recalls that some of the democratic concepts and institutions enshrined in the constitutions of the American states have their origins in indigenous peoples' institutions and that many of their current participatory systems of decision-making and authority contribute to the improvement of democracies in the Americas, and that it is necessary to develop national legal contexts to consolidate the multiculturalism of these societies.

The declaration raises issues involving the eradication of poverty and the right to development, respect for indigenous cultural and ecological aspects, coexistence, respect and non-discrimination, the right to territory and survival, security and collective rights.

In Article II, the DADPI affirms states' recognition and respect for the multicultural and multilingual character of indigenous peoples, as an integral part of societies. The issue

is related to the provisions of the Brazilian Constitution (Art. 209 § 2, 215 § 1, 231), as well as other infra-constitutional norms.

Article IX deals with the recognition of the legal personality of indigenous peoples, as well as their forms of organization, also supported by Articles 231 and 232 of the Federal Constitution.

The right of indigenous peoples to maintain and promote their own family systems is guaranteed by Article XVII, which also states that states shall respect and protect the different indigenous forms of family, as well as their forms of matrimonial union, filiation, descent and family name. These guarantees are related to Article 6 of the Indian Statute (Law 6.003/1973). Also in Article XVII, by establishing the right of indigenous children to enjoy their own culture, religion or to speak their own language, among others, the Declaration presents precepts that are compatible with the Statute of the Child and Adolescent (Law 8.096/1990).

With regard to indigenous peoples in voluntary isolation or initial contact, Article XXVI of the American Declaration guarantees their right to remain in this condition and to live freely in accordance with their cultures. The same provision establishes the duty of states to recognize, respect and protect the lands, territories, environment and cultures of these peoples, as already provided for in Brazil's indigenous policy.

### **United Nations Convention to Combat Desertification - UNCCD**

The United Nations Convention to Combat Desertification, officially the United Nations Convention to Combat Desertification in Countries Experiencing Severe Drought and/or Desertification, Particularly in Africa (UNCCD) is a multilateral international treaty whose object is the protection of the natural environment and which, as its name suggests, has the central objective of combating desertification.

Desertification is a major contemporary problem.

It was negotiated during the United Nations Conference on Environment and Development, also known as Eco-92, held in Rio de Janeiro in 1992. It was finally adopted on June 17, 1994 in Paris, opened for signatures on October 14, 1994 and entered into force on December 26, 1996. The Conference of the Parties (COP) is its supreme body.

The work of the UNCCD is put into practice through National Action Programs (NAPs), an instrument for implementing the Convention. These programs outline long-term strategies and are formulated with the active participation of local communities. There are also Subregional Action Programmes (PASR) and Regional Action Programmes (PAR), which help to harmonize and reinforce the national programmes. This is participatory development based on a "bottom-up" method, i.e. programs to combat desertification originate at the local level and are based on this specific participation.

The UNCCD responds to the aim of facilitating a far-reaching alliance for the sustainable development of vulnerable dryland ecosystems and, to this end, of improving the channeling of official development assistance investment. The Convention builds on the lessons of the past and expresses an international consensus on an integrated framework for action.

The Global Mechanism (MM) helps the COP to promote funding for the activities planned under the Convention. It is not in charge of obtaining or administering funds, but supports

and advises donors, beneficiaries, development banks, NGOs, etc. to mobilize financial resources and allocate them where they are most needed.

Since it began its activities in 1998, the MM has been under the support of the International Fund for Agricultural Development (IFAD), one of the main international financial institutions in leveraging small farmers and in "giving poor rural people the chance to get out of poverty".

The COP was established by the Convention as the supreme decision-making body, and comprises ratifying governments and regional economic integration organizations, such as the European Union. The COP oversees the implementation of the Convention. The Conference is the supreme body of the Convention: it establishes the decisions that will subsequently be carried out and integrates the ratifications made by all governments.

Along with 192 other countries, Brazil is a signatory to the United Nations Convention to Combat Desertification and Mitigate the Effects of Droughts (UNCCD). This commitment establishes work standards and convergent international targets for coordinated actions in the search for qualitative solutions that meet socio-environmental demands in arid, semi-arid and dry sub-humid areas, particularly where the poorest populations on the planet live.

The UNCCD is recognized as a key instrument for eradicating poverty and promoting sustainable development in rural areas of drylands, which include Brazilian SSAs. The issue of desertification in the country is at the center of political formulation, both because of the legal framework, as it is the subject of a Bill currently being processed, and because of its strategic significance, as it reflects the new approach to qualifying the sustainable use of natural resources as a transforming element in the relationship between society and the environment.

The historical existence of local practices based on ethnic and traditional knowledge of the populations in the semi-arid zones of Brazil, combined with official state interventions dating back to the time of the empire, have produced the conditions and critical mass necessary for the basis of cultural and social organization in order to enable coexistence with droughts, phenomena that are more common to certain areas than others depending on various environmental factors, and almost always anthropogenic vectors.

In this context, Brazil is seen as one of the Party Countries with the greatest global leadership in the process and is active at international level, building bi- and multilateral partnerships, such as the cooperation carried out within the Community of Portuguese Speaking Countries (CPLP) and the Group of Latin American and Caribbean Countries (GRULAC).

Desertification is defined as a process of environmental degradation caused by the inadequate management of natural resources in arid, semi-arid and dry sub-humid areas, which compromises the productive systems of susceptible areas, environmental services and the conservation of biodiversity. In Brazil there are 1,480 municipalities susceptible to this process, which can be caused by man or by nature itself and aggravated by climate issues. It particularly affects the northeastern states, as well as Minas Gerais and Espírito Santo. The studies carried out by the MMA in partnership with the governments of the 11 states show that the areas susceptible to desertification represent 16% of Brazil's territory and 27% of all municipalities involving a population of 31,663,671 inhabitants, where 85% of the country's poverty is concentrated. It therefore represents a context that demands specific public policies that are important for

combating poverty and improving the living conditions of a significant part of the Brazilian population.

With the United Nations Conference on Environment and Development - Rio 92, the need for a specific convention on the subject was defined, establishing guidelines and commitments for countries. One of the main results of Rio 92 was the start of the negotiation process to draw up three conventions: the Framework Convention on Climate Change, the Convention on Biological Diversity and the United Nations Convention to Combat Desertification in Countries Affected by Severe Drought and/or Desertification, particularly in Africa (UNCCD).

In Brazil, the desertification process is a consequence of the inadequate use of forest resources, mainly in the Caatinga and Cerrado, to supply forest biomass to meet a considerable percentage of the energy matrix in the Northeast and other regions, through deforestation; agricultural practices without adequate soil management, causing erosion processes and depleting the soil; overgrazing in extensive livestock farming, compromising the texture of the soil and thus the regeneration of vegetation; and inadequate management of irrigation systems, with the consequent salinization of the land.

### **Rotterdam Convention**

The Rotterdam Convention, in force since 2004, aims to promote shared responsibility and joint efforts by the Parties in the field of international trade in certain hazardous chemicals, in order to protect human health and the environment from possible harm. The agreement establishes a prior informed consent (PIC) procedure for the import of hazardous chemicals.

In other words, the Convention establishes an "early warning system" to help countries protect themselves against certain hazardous chemicals in international trade. It also aims to complement other international instruments by addressing this fundamental element (international trade) in the area of managing chemicals throughout their life cycle.

The Convention raises issues on hazardous chemicals related to: access to information; product labeling; emissions registration; CIP for the import of hazardous chemicals; non-confidentiality.

### **Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES)**

Convention on International Trade in Endangered Species of Wild Fauna and Flora - CITES: Convention on International Trade in Endangered Species of Wild Fauna and Flora, or Convention on International Trade in Endangered Species of Wild Fauna and Flora in Brazil, also known as the Washington Convention, is a multilateral agreement signed in Washington DC - United States, on March 3, 1973, bringing together a large number of states, with the aim of ensuring that trade in wild animals and plants, and products derived from them, does not endanger the survival of species or constitute a danger to the maintenance of biodiversity.

The CITES agreement was drawn up as a result of a resolution adopted in 1963 within the World Conservation Union (IUCN). The agreement provides for various levels of protection and today covers around 30,000 species of wild fauna and flora.

This is the Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES), signed by Brazil in 1975 to effectively regulate trade in species of fauna and flora, preventing them from becoming endangered when the threat is international trade. To this end, it assigns producer and consumer countries their share of the common responsibility and establishes the necessary mechanisms to guarantee the non-damaging exploitation of populations. Based on the procedures proposed by the Convention, the Brazilian government - through the Brazilian Institute for the Environment and Renewable Natural Resources (Ibama), has incorporated into its procedures for assessing and issuing export/import licenses.

Around 5,950 animal species and 32,800 plant species from around the world are protected by the Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES) from overexploitation due to international trade. They are included in the three appendices of CITES, grouped according to their degree of threat. In some cases entire groups are included, such as primates, cetaceans (whales, dolphins and porpoises), sea turtles, parrots, corals, cacti and orchids; in others, only a subspecies or a geographically isolated population of a species (e.g. country-specific) is included.

According to Decree No. 3,607 of September 21, 2000, which implements Cites in Brazil, the species in Appendix I are considered to be endangered, the species in Appendix II are those which, although they are not necessarily currently in danger of extinction, could become so unless trade in specimens is subject to strict regulations, and the species in Appendix III were included in the list at the direct request of the country where their exploitation needs to be restricted or prevented and which requires cooperation in their international control.

### **Inter-American Convention on the Prevention, Punishment and Eradication of Violence Against Women, "Convention of Belém do Pará"**

Adopted at Belém do Pará, Brazil, on June 9, 1994, at the twenty-fourth regular session of the General Assembly

The Inter-American Convention on the Prevention, Punishment and Eradication of Violence Against Women - Convention of Belém do Pará, adopted by the General Assembly of the Organization of American States - OAS in 1994, is considered an international milestone in the attempt to curb violence against women. Brazil ratified the Belém do Pará Convention in 1995. In 2006, the Brazilian government complied with General Recommendation 19 of the Committee on the Elimination of All Forms of Discrimination against Women - CEDAW, the Belém do Pará Convention and the 1988 Federal Constitution.

### **Convention for the Protection of the Flora, Fauna and Natural Scenic Beauties of the Countries of America**

It came into force on October 12, 1940 and was ratified by Brazil via decree 58.054 of March 23, 1966. Its objective is the protection and conservation of indigenous fauna and flora, as well as migratory birds, extensive habitat sites, landscapes of great beauty and extraordinary geological formations.

The States Parties signed the Convention for the Protection of the Flora, Fauna and Natural Scenic Beauties of the Americas with the aim of protecting and conserving in

their natural environment specimens of all species and genera of indigenous flora and fauna, including migratory birds, in sufficient numbers and in locations that are extensive enough to prevent their extinction by all human means. In addition, the States Parties have aimed to protect and conserve landscapes of great beauty, extraordinary geological formations, regions and natural objects of aesthetic interest or historical or scientific value, and places characterized by primitive conditions within the cases to which this Convention refers.

### **Unesco Convention Concerning the Protection of the World Cultural and Natural Heritage**

The Convention Concerning the Protection of the World Cultural and Natural Heritage, also known as the Paris Recommendation, is an international commitment created at the seventeenth session of the General Conference of the United Nations Educational, Scientific and Cultural Organization (UNESCO), which met in Paris from October 17 to November 21, 1972.

The Convention was established in parallel with the United Nations Conference on the Human Environment, the first major international meeting dealing with the basic principles of environmental protection, where the United Nations Environment Program was also created. It is an important regulatory framework for the protection of the cultural and natural heritage of the world's nations. It defined essential concepts of world heritage, understanding it as "an irreplaceable source of life and inspiration", and provides the basis for the inscription of properties on the World Heritage List.

According to Silvia Helena Zanirato, from the State University of Maringá,

*Throughout the text, the understanding was expressed that the protection of such areas could not be carried out solely on a national scale, due to the magnitude of the means required for this procedure, which often went beyond the economic, scientific and technological resources possessed by the countries that housed the heritage elements. It was then that the concept of world heritage was developed, consisting of works of exceptional interest, sometimes unique testimonies, which should be considered as belonging not only to the states in which they were located, but to the whole of humanity, which should be involved in their defense and safeguarding, in order to ensure their transmission to future generations.*

### **Convention for the Safeguarding of the Intangible Cultural Heritage**

On October 17, 2003, the Convention for the Safeguarding of the Intangible Cultural Heritage was signed in Paris on November 3, 2003, and entered into force in Brazil on April 12, 2006, via Decree 5.753/06 and Legislative Decree No. 22/06. Its aim is to protect cultural and intangible heritage by promoting respect for the cultural and intangible heritage of the communities, groups and individuals that make up the societies of the States Parties, awareness in all spheres and without borders of the importance of the object of the international document, its recognition by all the nations involved and mutual international cooperation to safeguard it.

To facilitate the identification and limits of international legal protection, Article 2 of the document contains the following definitions:

For the purposes of this Convention:

*(1) "Intangible cultural heritage" means the practices, representations, expressions, knowledge and techniques - together with the instruments, objects, artefacts and cultural places associated with them - that communities, groups and, in some cases, individuals recognize as an integral part of their cultural heritage. This intangible cultural heritage, which is passed down from generation to generation, is constantly recreated by communities and groups as a function of their environment, their interaction with nature and their history, generating a sense of identity and continuity and thus helping to promote respect for cultural diversity and human creativity. For the purposes of this Convention, only intangible cultural heritage that is compatible with existing international human rights instruments and with the imperatives of mutual respect between communities, groups and individuals, and of sustainable development, shall be taken into account.*

*2. Intangible cultural heritage", as defined in paragraph 1 above, manifests itself in particular in the following fields:*

*a) oral traditions and expressions, including language as a vehicle for the*

*intangible cultural heritage;*

*b) artistic expressions;*

*c) social practices, rituals and festive acts;*

*d) knowledge and practices related to nature and the universe;*

*e) traditional craft techniques.*

## **Convention on Biological Diversity**

The Convention on Biological Diversity (CBD) is a United Nations treaty and one of the most important international instruments related to the environment.

The Convention was established during the notorious ECO-92 - the United Nations Conference on Environment and Development (UNCED), held in Rio de Janeiro in June 1992 - and is today the main global forum for issues related to the topic.

More than 160 countries have already signed the agreement, which came into force in December 1993. It was ratified in Brazil by Federal Decree No. 2,519 of March 16, 1998.

The Convention is structured on three main bases - the conservation of biological diversity, the sustainable use of biodiversity and the fair and equitable sharing of the benefits arising from the utilization of genetic resources - and refers to biodiversity at three levels: ecosystems, species and genetic resources.

## 8.2 Annex - Other complementary federal laws

### Vegetation cover

- Federal Law No. 7.754, of April 14, 1989, which establishes measures for the protection of forests at river sources and makes other provisions.
- IBAMA Ordinance No. 37-N, of April 3, 1992, which provides for the official list of species of Brazilian flora threatened with extinction.
- Normative Instruction No. 06 of September 23, 2008, which lists species of Brazilian flora threatened with extinction.
- Law No. 12.651, of May 25, 2012 (the New Brazilian Forest Code), as amended by Law No. 12.727, of October 17, 2012, which provides for the protection of native vegetation; amends Laws No. 6.938, of August 31, 1981, No. 9.393, of December 19, 1996, and No. 11.424, of December 22, 2006; repeals Laws No. 4.771, of September 15, 1965, and No. 7.754, of December 14, 2006.393, of December 19, 1996, and 11.428, of December 22, 2006; repeals Laws 4.771, of September 15, 1965, and 7.754, of April 14, 1989, and Provisional Measure 2.166-67, of August 24, 2001; and makes other provisions. This law establishes general rules on the protection of vegetation, Permanent Preservation Areas and Legal Reserve areas; forest exploitation, the supply of forest raw materials, control of the origin of forest products and the control and prevention of forest fires, and provides for economic and financial instruments to achieve its objectives. Article 8 establishes that intervention or suppression of native vegetation in a Permanent Preservation Area will only take place in cases of public utility, social interest or low environmental impact.

According to Article 4 of the Brazilian Forest Code, which defines the areas of permanent preservation, in section III, the areas surrounding artificial water reservoirs, resulting from the damming or impounding of natural watercourses, are considered APP, within the range defined in the project's environmental license.

### Fauna

- Federal Law No. 5.197, of January 3, 1967 (amended by Laws No. 7.584/87, No. 7.653/88, No. 97.633/89 and No. 9.111/95), which instituted the Fauna Protection Code.
- IBAMA Ordinance No. 1.522, of December 19, 1989, which provides for the official list of species of Brazilian fauna threatened with extinction.
- MMA Normative Instruction No. 03, of May 27, 2003, with the official list of species of Brazilian fauna threatened with extinction.
- IBAMA Normative Instruction No. 146, of January 10, 2007, which establishes the criteria for procedures relating to the management of wild fauna (survey, monitoring, rescue, salvage and disposal) in areas of influence of undertakings and activities considered to be effectively or potentially causing impacts on fauna subject to environmental licensing, as defined by Federal Law No. 6938/81 and CONAMA Resolutions No. 001/86 and No. 237/97.

### **Conservation Units and other Protected Areas**

- Federal Decree No. 84.017, of September 21, 1979, approving the regulations for Brazilian National Parks.
- Law No. 6.902, of April 27, 1981, which provides for the creation of Ecological Stations and Environmental Protection Areas.
- Federal Decree No. 89.336, of January 31, 1984, which provides for Ecological Reserves and Areas of Relevant Ecological Interest.
- Federal Decree No. 99.274, of June 6, 1990, which regulates Law No. 6.902, of April 27, 1981, and Law No. 6.938, of August 31, 1981, which provide, respectively, for the creation of Ecological Stations and Environmental Protection Areas and for the National Environmental Policy.
- CONAMA Resolution No. 13, of December 6, 1990, which establishes rules for the surroundings of Conservation Units with a view to protecting existing ecosystems.
- Federal Decree No. 1.298, of October 27, 1994, approving the National Forests Regulations.
- Federal Decree No. 1.922, of June 5, 1996, which provides for the recognition of Private Natural Heritage Reserves (RPPN).
- Federal Decree No. 2.119, of January 13, 1997, which provides for the Pilot Program for the Protection of Brazil's Tropical Forests and its Coordination Commission.
- Federal Law No. 9.985, of July 18, 2000, which institutes the National System of Nature Conservation Units (SNUC), establishes criteria and norms for the creation, implementation and management of conservation units, amended by Law No. 11.132/2005.
- CONAMA Resolution No. 302, of March 20, 2002, which sets out the parameters, definitions and limits of Permanent Preservation Areas of artificial reservoirs and the use regime of the surrounding area.
- CONAMA Resolution No. 303, of March 20, 2002, which sets out the parameters, definitions and limits of Permanent Preservation Areas.
- Federal Decree No. 4.340, of August 22, 2002, which regulates articles of Law No. 9.985/00, which provides for the National System of Nature Conservation Units - SNUC.
- Federal Decree No. 5.092, of May 21, 2004, which defines rules for identifying priority areas for the conservation, sustainable use and sharing of the benefits of biodiversity, within the scope of the Ministry of the Environment.
- Federal Law No. 11.132, of July 4, 2005, which adds an article to Law No. 9.985, of July 18, 2000, which regulates Article 225, § 1, items I, II, III and VII of the Federal Constitution and establishes the National System of Nature Conservation Units.
- Federal Law No. 11.284, of March 2, 2006, which provides for the management of public forests for sustainable production; establishes, within the structure of the Ministry of the Environment, the Brazilian Forestry Service - SFB; creates the National Forestry Development Fund - FNDF; amends Laws Nos. 10.683, of May 28, 2003, 5.868, of December 12, 1972, 9.605, of February 12, 1998, 4.771, of

September 15, 1965, 6.938, of February 12, 1998.683, of May 28, 2003, 5.868, of December 12, 1972, 9.605, of February 12, 1998, 4.771, of September 15, 1965, 6.938, of August 31, 1981, and 6.015, of December 31, 1973.

- CONAMA Resolution No. 369, of March 28, 2006, which sets out the exceptional cases of public utility, social interest or low environmental impact that make it possible to intervene or suppress vegetation in a Permanent Preservation Area (APP).
- Decree No. 5.746, of April 5, 2006, which regulates Article 21 of Law No. 9.985/00, which provides for the National System of Nature Conservation Units - SNUC. This article deals with the Private Natural Heritage Reserve - RPPN.
- CONAMA Resolution No. 371, of April 5, 2006, which establishes guidelines for environmental agencies for calculating, collecting, applying, approving and controlling the spending of funds from environmental compensation, in accordance with Law No. 9.985, of July 18, 2000, and makes other provisions.
- Federal Decree No. 5.758, of April 13, 2006, which establishes the National Strategic Plan for Protected Areas - PNAP, its principles, guidelines, objectives and strategies.
- Ordinance No. 09, of January 23, 2007, article 1 of which establishes that the areas referred to in paragraph 2, called Priority Areas for the Conservation, Sustainable Use and Benefit Sharing of Brazilian Biodiversity or Priority Areas for Biodiversity, are recognized as priority areas for the conservation, sustainable use and benefit sharing of Brazilian biodiversity, for the purpose of formulating and implementing public policies, programs, projects and activities under the responsibility of the Federal Government aimed at: I - in situ conservation of biodiversity; II - sustainable use of biodiversity components; III - sharing of benefits derived from access to genetic resources and associated traditional knowledge; IV - research and inventories on biodiversity; V - recovery of degraded areas and over-exploited or endangered species; and VI - economic valorization of biodiversity.
- CONAMA Resolution No. 429, of February 28, 2011, which sets out the methodology for recovering Permanent Preservation Areas (APPs).

### **Water Resources**

- Federal Decree No. 24.643, of July 10, 1934, establishing the Water Code.
- Federal Law No. 7,990 of December 28, 1989, which instituted financial compensation for states, the Federal District and municipalities for the results of the exploitation of oil or natural gas, water resources for the purpose of generating electricity, mineral resources in their respective territories, continental platforms, territorial sea or exclusive economic zone.
- Federal Law No. 8.001, of March 13, 1990, which defines the distribution percentages of the financial compensation referred to in Law No. 7.990, of December 28, 1989.
- Federal Law No. 9.433, of January 8, 1997, which instituted the National Water Resources Policy, created the National Water Resources Management System, regulates item XIX of article 21 of the Federal Constitution and amends article 1 of

Law No. 8001, of March 13, 1990, which amended Law No. 7.990, of December 28, 1989. The objectives of the National Water Resources Policy (Article 2) are: I - to ensure the necessary availability of water for current and future generations, at quality standards appropriate to their respective uses; II - the rational and integrated use of water resources, including waterway transport, with a view to sustainable development; III - prevention and defense against critical hydrological events of natural origin or resulting from the inappropriate use of natural resources.

- CNRH Resolution No. 05, of April 10, 2000, which establishes guidelines for the formation and operation of River Basin Committees, in order to implement the National Water Resources Management System, as established by Law No. 9.433/1997.
- MMA Normative Instruction No. 4, of June 21, 2000, which approves the administrative procedures for issuing grants for the right to use water resources in bodies of water in the Union's domain, as set out in the Annexes to this Normative Instruction.
- Federal Law No. 9.984, of July 17, 2000 (amended by Provisional Measure 2.216-37, of August 31, 2001), which provides for the National Water Agency - ANA, the federal entity responsible for implementing the National Water Resources Policy and coordinating the National Water Resources Management System.
- CONAMA Resolution No. 274, of November 29, 2000, which revises the criteria for bathing in Brazilian waters.
- Federal Decree No. 3.692, of December 19, 2000, which establishes the regimental structure of the National Water Agency - ANA.
- CNRH Resolution No. 15 of January 11, 2001, which establishes general guidelines for groundwater management.
- CNRH Resolution No. 16, of May 8, 2001, which provides for the granting of water resources.
- Federal Decree No. 4.613, of March 11, 2003, which regulates the National Water Resources Council.
- CNRH Resolution No. 32 of October 15, 2003, which establishes the National Hydrographic Division into Hydrographic Regions for the purpose of guiding, supporting and implementing the Water Resources Plan.
- Federal Decree No. 4.895, of November 25, 2003, which provides for the authorization of the use of physical spaces of bodies of water in the Union's domain for aquaculture purposes.
- Federal Decree No. 5.069, of May 5, 2004, which provides for the composition, structure, powers and functioning of the National Aquaculture and Fisheries Council (CONAP).
- Federal Law No. 10.881, of June 9, 2004, which provides for management contracts between the National Water Agency and entities delegating the functions of Water Agencies related to the management of water resources in the Union's domain.
- ANA Resolution No. 707, of December 21, 2004, which sets out the technical and administrative procedures to be observed when examining grant applications.

- CONAMA Resolution No. 357, of March 17, 2005, which defines the classification of bodies of water and their environmental guidelines, as well as defining the conditions and standards for discharging effluents.
- CNRH Resolution No. 48, of March 21, 2005, which establishes general criteria for charging for the use of water resources.
- CNRH Resolution No. 58, of January 30, 2006, which approves the National Water Resources Plan (PNRH).
- CNRH Resolution No. 65, of December 7, 2006, which establishes guidelines for linking the procedures for obtaining the granting of the right to use water resources with environmental licensing procedures.
- ANA Resolution No. 308, of August 6, 2007, which sets out the procedures for collecting the revenue from charging for the use of water resources in bodies of water under the Union's domain.
- Federal Law No. 11.959, of June 29, 2009, which provides for the National Policy for the Sustainable Development of Aquaculture and Fishing, regulates fishing activities, repeals Law No. 7.679, of November 23, 1988, and provisions of Decree-Law No. 221, of February 28, 1967.
- CNRH Resolution No. 129, of June 29, 2011, which establishes general guidelines for the definition of remaining minimum flows.
- CNRH Resolution No. 145, of December 12, 2012, which establishes guidelines for the preparation of River Basin Water Resources Plans.

### **Noise Emission**

- CONAMA Resolution No. 01 of March 8, 1990, which provides for the emission of noise as a result of any industrial, commercial, social or recreational activities, determining standards, criteria and guidelines. The emission of noise as a result of any industrial, commercial or recreational activities will comply, in the interests of health and public quiet, with the standards, criteria and guidelines established by NBR 10.151/2000.
- Brazilian Standard ABNT NBR 10151/2000, which deals with the assessment of noise in inhabited areas with a view to community comfort. It establishes the conditions required to assess the acceptability of noise in communities, regardless of the existence of complaints. It outlines methods for measuring noise, the application of corrections to the measured levels if the noise has special characteristics and a comparison of the corrected levels with a criterion that takes various factors into account.

### **Air Quality**

- CONAMA Resolution No. 05, of June 15, 1989, which provides for the National Air Pollution Control Program - PRONAR.
- CONAMA Resolution No. 03, of June 28, 1990, which establishes air quality standards and defines the objective to be achieved through the control strategy established by the emission standards that should guide the preparation of Regional Air Pollution Control Plans. It defines air quality standards as the concentrations of

atmospheric pollutants which, if exceeded, could affect the health, safety and well-being of the population, as well as causing damage to flora and fauna, materials and the environment in general and establishes that (i) Primary Air Quality Standards - are the concentrations of pollutants which, if exceeded, could affect the health of the population. Secondly (ii) Secondary Air Quality Standards - are the concentrations of pollutants below which the minimum adverse effect on the well-being of the population is expected, as well as the minimum damage to fauna, flora, materials and the environment in general.

- CONAMA Resolution No. 382, of December 26, 2006, which establishes the maximum emission limits for atmospheric pollutants from fixed sources.

### **Solid Waste**

- CONAMA Resolution No. 1A, of January 23, 1986, which establishes rules for the transportation of dangerous products that circulate near densely populated areas, the protection of water sources and the natural environment.
- Federal Law No. 7.802, of July 11, 1989, which provides for research, experimentation, production, packaging and labeling, transport, storage, marketing, commercial advertising, use, import, export, final destination of waste and packaging, registration, classification, control, inspection and inspection of pesticides, their components and the like.
- Federal Decree No. 98.816, of January 11, 1990, which regulated Law No. 7.802/1989.
- CONAMA Resolution No. 307, of July 5, 2002, which establishes guidelines, criteria and procedures for the management of construction waste, regulating the necessary actions in order to minimize environmental impacts. It defines the responsibilities of public authorities and private agents with regard to construction waste and makes it compulsory for municipalities to adopt integrated management plans, as well as waste management projects at construction sites, while creating legal conditions for the application of Federal Law No. 9.605/1998 (Environmental Crimes Law) with regard to construction waste.
- Brazilian standard ABNT NBR 10004/2004, which classifies solid waste according to its potential risks to the environment and public health, so that it can be managed properly.
- CONAMA Resolution No. 362, of June 23, 2005, which provides for the collection, disposal and final destination of used or contaminated lubricating oil.
- Law No. 12.305, of August 2, 2010, which defines the National Solid Waste Policy and provides for its principles, objectives and instruments, as well as guidelines for the integrated management and management of solid waste, including hazardous waste, the responsibilities of generators and public authorities and the applicable economic instruments. Classifies solid waste:
  - I - By origin: a) household waste; b) urban cleaning waste; c) urban solid waste; d) waste from commercial establishments and service providers; e) waste from public basic sanitation services; f) industrial waste; g) waste from health services; h) construction waste; i) agroforestry waste; j) waste from transport services; k) mining waste;

- II - In terms of hazardousness: a) hazardous waste; b) non-hazardous waste.
- Federal Decree No. 7.404, of December 23, 2010, which regulates Law No. 12.305/2010, which instituted the National Solid Waste Policy, creates the Interministerial Committee of the National Solid Waste Policy and the Guidance Committee for the Implementation of Reverse Logistics Systems.
- CONAMA Resolution No. 454 of November 1, 2012: establishes the general guidelines and reference procedures for the management of material to be dredged in waters under national jurisdiction.

### **Soil and Groundwater Quality**

- Federal Decree No. 303 of February 28, 1967, which creates the National Council for Environmental Pollution Control.
- Federal Decree No. 1.413, of August 14, 1975, which provides for the control of environmental pollution caused by activities.
- CONAMA Resolution No. 396, of April 3, 2008, which provides for the classification and environmental guidelines for the classification of groundwater and other provisions.
- CONAMA Resolution No. 420, of December 29, 2009, which sets out criteria and guideline values for soil quality in terms of the presence of chemical substances and establishes guidelines for the environmental management of areas contaminated by these substances as a result of anthropic activities. With a view to preventing and controlling soil quality, undertakings that carry out activities with the potential to contaminate soil and groundwater must, at the discretion of the competent environmental body: I - implement a soil and groundwater quality monitoring program in the area of the undertaking and, when necessary, in its area of direct influence and in surface waters; and II - submit a conclusive technical report on soil and groundwater quality, with each application for a license renewal and prior to the closure of activities.

### **Environmental licensing**

Environmental licensing was instituted throughout the country by Law No. 6.938/1981 and regulated by Decree No. 88.351/1983 (modified by Decree No. 99.274 of 1990), which established its main guidelines. It was structured into three mandatory licenses: Preliminary License (LP), Installation License (LI) and Operation License (LO), which correspond to the different phases of planning and implementing a project. Each license contains restrictions that condition the execution of the project and the activity's environmental control measures. The process also includes the follow-up routines for the licenses granted, i.e. the inspection and monitoring of the environmental effects of the project, essential components of the system, as well as the technical and administrative standards that regulate it.

All undertakings capable of modifying the environment are subject to licensing, i.e. those that potentially or effectively affect environmental quality, cause any form of pollution or use environmental resources, developed by individuals or legal entities, including public administration entities, that are installed in national territory. Licensing therefore applies

to the installation or expansion of private or governmental activities, including the installation of equipment or works of an industrial, commercial, extractive, agricultural, urban, transport infrastructure, energy and water generation and basic sanitation nature.

Since then, a series of resolutions by the National Environmental Council (CONAMA) have introduced other guidelines for the licensing of certain types of activity, as well as procedural and administrative elements. Of particular note are the criteria for applying environmental impact assessment to projects with significant polluting potential (Resolution 001/86). In general, the complementary rules and administrative procedures for their effective use are determined by the state environmental entities, in cases of state competence, or by the Brazilian Institute for the Environment - IBAMA, in cases of federal competence. In this context, the following CONAMA resolutions may be applied to the Project's interventions:

- CONAMA Resolution No. 01, of January 23, 1986, which establishes the definitions, responsibilities, basic criteria and general guidelines for the use and implementation of Environmental Impact Assessment as one of the instruments of the National Environmental Policy.
- CONAMA Resolution No. 05/88, which establishes rules subjecting sanitation works to environmental licensing;
- CONAMA Resolution No. 06, of September 16, 1987, which provides for the environmental licensing of works in the electricity generation sector.
- CONAMA Resolution No. 09, of December 9, 1987, which provides for public hearings.
- CONAMA Resolution No. 237, of December 19, 1997, which provides for the revision and complementation of the procedures and criteria used for environmental licensing established by CONAMA Resolution No. 001/86, in addition to requiring the presentation of Municipal Land Use and Occupation Certificates and technical examinations and manifestations by the municipalities affected by the project.
- CONAMA Resolution No. 274/2000, which establishes bathing standards for fresh, brackish and saline waters.
- CONAMA Resolution No. 302/2002, which sets out the parameters, definitions and limits of permanent preservation areas in artificial reservoirs and the regime for using the surrounding area.
- CONAMA Resolution No. 458/2013, which establishes procedures for environmental licensing in agrarian reform settlements.

### **Family farming**

**Law No. 11.326 of July 24, 2006** establishes the guidelines for formulating the National Policy for Family Farming and Rural Family Enterprises. In addition to this law, the following pieces of legislation related to the topic should also be considered:

### **Decree 11.635/23**

Amends Decree No. 7.572, of September 28, 2011, which regulates provisions of Law No. 12.512, of October 14, 2011, which deal with the Environmental Conservation Support Program - Bolsa Verde Program. The Bolsa Verde Program will be implemented

through the direct transfer of financial resources, under the responsibility of the Ministry of the Environment and Climate Change. The benefit is aimed at low-income families who practice some kind of natural resource conservation activity.

**Decree 11.636/23**

Establishes the National Commission for Employed Rural Workers to manage the National Policy for Employed Rural Workers.

**Decree 11.637/23**

It introduces the definition of an encampment as a group of families in a situation of social vulnerability, living in the same locality, who require Incra actions for their inclusion in the PNRA, enrolled in the Federal Government's Single Registry for Social Programs as encamped people and registered by Incra, in accordance with the procedures established by the municipality. It also updates the scores for the selection process

**Decree 11.638/23**

Establishes the National Commission to Combat Violence in the Countryside

**Decree 11.639/23**

Establishes an Interministerial Working Group for the National Plan for Youth and Rural Succession

**Decree 11.640/23**

It establishes the National Pact for the Prevention of Femicide, with the aim of preventing all forms of discrimination, misogyny and gender violence against women through the implementation of intersectoral government actions, from a gender perspective and its intersectionalities.

**Decree 11.641/23**

Establishes the National Citizenship and Good Living Program for Rural Women, which aims to guarantee access to basic civil documentation, joint land titling and the territory occupied by rural women, understood as women from the countryside, forests and waters, so that they can live with dignity, ensuring their civil, political and social rights

**Decree 11.642/23**

Establishes the Productive Backyard Program for Rural Women, within the scope of the Ministry of Agrarian Development and Family Agriculture and the Ministry of Development and Social Assistance, Family and Fight against Hunger, with the aim of promoting the economic autonomy of rural women through: I - structuring productive backyards; II - bringing women together in groups or collective organizations; III - helping them access public policies to support food production and marketing; IV - access to equipment, machinery, implements, utensils and supplies needed to set up or expand productive backyards; and V - social technologies for accessing water.

## National Solid Waste Policy

The National Solid Waste Policy, established by Law No. 12.305 of August 2, 2010, sets out the principles, objectives and instruments, as well as the guidelines for the integrated management and management of solid waste, including hazardous waste; the responsibilities of generators and public authorities and the applicable economic instruments.

This law established the shared responsibility of waste generators: manufacturers, importers, distributors, traders, citizens and holders of urban solid waste management services in the Reverse Logistics of post-consumer waste and packaging.

It also set important targets that will contribute to the elimination of landfills and instituted planning instruments at the national, state, micro-regional, inter-municipal and metropolitan and municipal levels; as well as requiring private entrepreneurs to draw up their Solid Waste Management Plans.

The National Solid Waste Policy puts Brazil on an equal footing with the main developed countries in terms of the legal framework and innovates with the inclusion of waste pickers of recyclable and reusable materials, both in Reverse Logistics and in Selective Collection.

## Occupational Health and Safety

The following are the legal diplomas and technical standards considered most relevant within the scope of the Program, with regard to Occupational Health and Safety.

- Decree-Law 5452 of May 1, 1943, Chapter V of Title II of the Consolidation of Labor Laws - CLT.
- Decree 62.130 of 29/07/2017 - Creates, within the direct, indirect and foundational Administration, work teams called "Brigade against Aedes aegypti" whose function is to create specific brigades to combat the mosquito and reduce the incidence of arboviruses.
- Ordinance 3.523 of 28/08/1998 of the Ministry of Health: Approves Technical Regulations containing basic measures relating to procedures for visually checking the state of cleanliness, removing dirt by physical methods and maintaining the state of integrity and efficiency of all components of air conditioning systems, in order to guarantee Indoor Air Quality and prevent risks to the health of occupants of air-conditioned environments.
- Law 6514 of December 22, 1977 - which amends Chapter V of Title II of the CLT, relating to Occupational Safety and Medicine.
- Ordinance 3214 of June 8, 1978 - Approves the NRs - Regulatory Norms of Chapter V of Title II of the CLT.

**NR 01 - General Provisions:** aims to inform about the scope of the NRs, as well as the obligations of the employer and employee with regard to the legal document.

**NR 04 - Specialized Services in Safety Engineering and Occupational Medicine:** aims to inform the sizing of Specialized Services in Safety Engineering and Occupational Medicine, linked to the risk gradation of the main activity and the total number of employees in the establishment,

**NR 05 - Comissão Interna de Prevenção de Acidentes (Internal Accident Prevention Commission):** aims to prevent accidents and illnesses arising from work, in order to make work permanently compatible with the preservation of life and the promotion of workers' health.

**NR 06 - Personal Protective Equipment - PPE:** aims to provide information on the definition, mandatory use and specifications for the use of PPE.

**NR 07 - Occupational Health Medical Control Programs:** aims to establish guidelines and requirements for the development of the Occupational Health Medical Control Program - PCMSO in organizations, with the aim of protecting and preserving the health of their employees in relation to occupational risks, according to the risk assessment of the organization's Risk Management Program - PGR.

**NR 09 - Evaluation and Control of Occupational Exposures to Physical, Chemical and Biological Agents:** establishes the requirements for evaluating occupational exposures to physical, chemical and biological agents when identified in the Risk Management Program - PGR, provided for in NR-1, and subsidizing it in terms of preventive measures for occupational risks.

**NR 10 - Safety in Electrical Installations and Services:** aims to establish the minimum requirements and conditions for the implementation of control measures and preventive systems, in order to guarantee the safety and health of workers who, directly or indirectly, interact in electrical installations and services with electricity.

**NR 12 - Safety at Work in Machinery and Equipment:** aims to define technical references, fundamental principles and protection measures to guarantee the health and physical integrity of workers and establishes minimum requirements for the prevention of accidents and occupational diseases in the design and use phases of machinery and equipment of all types, as well as their manufacture, import, sale, exhibition and assignment in any capacity, in all economic activities.

**NR 13 - Boilers, Pressure Vessels And Piping:** Establishes minimum requirements for managing the structural integrity of steam boilers, pressure vessels and their interconnecting piping in aspects related to installation, inspection, operation and maintenance, with a view to the safety and health of workers.

**NR 15 - Unhealthy Activities and Operations:** its purpose is to inform about the activities that are considered unhealthy by the MTE, due to exposure above the legal Tolerance Limits or through qualitative assessment of worker exposure.

**NR 16 - Hazardous Activities and Operations:** aims to inform about activities and operations considered hazardous due to exposure to explosives, flammables, electrical energy, ionizing radiation and exposure to physical violence.

**NR 17 - Ergonomics:** aims to establish parameters that allow working conditions to be adapted to the psycho-physiological characteristics of workers, in order to provide maximum comfort, safety and efficient performance. Working conditions include aspects related to lifting, transporting and unloading materials, furniture, equipment and the environmental conditions of the workplace and the organization of work itself.

**NR 18 - Conditions and Environment of Work in the Construction Industry:** aims to establish administrative, planning and organizational guidelines for the implementation of control measures and preventive safety systems in the processes, conditions and environment of work in the construction industry.

**NR 19 - Explosives:** The manufacture, use, import, export, traffic and trade of explosives must comply with the provisions of specific legislation, in particular the Brazilian Army's Regulations for the Inspection of Controlled Products (R-105), approved by Decree No. 3,665 of November 20, 2000.

**NR 20 - Flammable and Combustible Liquids:** Establishes minimum requirements for occupational health and safety management against accident risk factors arising from the extraction, production, storage, transfer, handling and manipulation of flammable and combustible liquids.

**NR 21 - Open-air work:** This establishes standards for work in the open, making it compulsory to have shelters, even rustic ones, capable of protecting workers from inclement weather. It also requires special measures to protect workers from excessive sunlight, heat, cold, humidity and inconvenient winds. Finally, it stipulates that workers who live at the workplace must be provided with accommodation that offers adequate sanitary conditions

**NR 24 - Sanitary and Comfort Conditions in Workplaces:** Establishes parameters for (i) Sanitary facilities, (ii) Changing rooms, (iii) Cafeterias, (iv) Kitchens, (v) Accommodation and (vi) Hygiene and comfort conditions during meals.

**NR 26 - Safety Signs:** Establishes parameters for safety signs in workplaces to warn local workers about risks and dangerous products.

**NR 31 - Rural Work:** Aims to establish the precepts to be observed in the organization and environment of rural work, in order to make the planning and development of the sector's activities compatible with the prevention of accidents and illnesses related to rural work.

**NR 33 - Safety and Health at Work in Confined Spaces:** Establishes the minimum requirements for identifying confined spaces and recognizing, evaluating, monitoring and controlling existing risks, in order to permanently guarantee the safety and health of workers who interact directly or indirectly in these spaces.

**NR 35 - Work at Height:** Work at height is considered to be any activity carried out above 2.00 m (two meters) from the lower level, where there is a risk of falling. Access by ropes is regulated in Annex 1 and for work on inclined planes, the application of this annex must be established by Risk Analysis.

With regard to legislation related to workers' health and safety, the Ministry of Labor and Social Security is the body responsible for the rights and protection of workers' health and safety in Brazil. Documents such as the PCMSO, the PPRA, or the constitution of the CIPA, linked to worker health and safety, as recommended by the Ministry's Regulatory Norms (NR), must be drawn up and reported to the Federal Government's eSocial system.

eSocial is a computerized system of the Public Administration and all the information it contains is protected by secrecy. Unauthorized access, voluntary or accidental provision of the access password or information and breach of confidentiality constitute infractions or illicit acts that subject the user to administrative, criminal and civil liability. Employers must access eSocial by logging in to the Gov.br system (the Federal Government's unified system), having previously registered and been awarded the respective seal of trust on the Gov.br Portal, requiring an official Digital Certificate for access.

The Work and Social Security Card (CTPS) is a mandatory document for workers in Brazil. The CTPS is one of the only documents that can reproduce, clarify and prove data about the worker's working life and must be used by the employer to make the appropriate functional records that will be linked to the records of the Ministry of Labor and Social Security systems.

Work cards in Brazil are issued by the Ministry of Labor and Social Security, and only those over the age of 14 can obtain a work card.

Federal Decree-Law 5,452 of May 1, 1943 approves the Consolidation of Labor Laws. The Regulatory Norms (NR), which are complementary provisions to Chapter V (On Occupational Safety and Medicine) of Title II of the Consolidation of Labor Laws (CLT), amended by Law No. 6,514 of December 22, 1977, must be taken into account. They consist of obligations, rights and duties that employers and workers must fulfill in order to guarantee a safe and healthy workplace, preventing the occurrence of illnesses and accidents at work.

The various Regulatory Norms were drawn up to provide safety for workers, and articles 8 and 11 (among other specific points in the norm) indicate the requirement to comply with workers' fundamental rights.

Regarding the protection of women's work, mentioned in Chapter III, it should be noted: Children and migrants are detailed in paragraphs 12 and 23 in terms of rights, however, the understanding of this paragraph brings special measures, therefore, anomalous situations that require attention on the part of the taker.

Chapter IV - On the Protection of Child Labor establishes working standards for minors between the ages of 14 and 18. It prohibits exploitative, degrading or offensive work and dangerous work.

Title II - General Labor Protection Standards - includes all rights related to working conditions and terms of employment, including, for example: wages and benefits; wage deductions; working hours; overtime and payment arrangements; rest days; and sick leave, maternity leave, vacations or vacations.

In relation to general provisions and occupational risk management, item 1.5.3 Responsibilities states that the organization must implement, by establishment, occupational risk management in its activities and that occupational risk management will constitute a Risk Management Program - RMP. The organization must consider working conditions, in accordance with RS-17 [Ergonomics], as well as taking the necessary measures to improve OSH [Occupational Health and Safety] results. The main NRs related to the scope of the Procasa II Program are listed below:

- NR-5 - internal accident prevention committee
- NR-7 - Occupational Health Medical Control Program
- NR-9 - environmental risk prevention program
- NR-10 - safety in electrical installations and services
- NR-11 - transportation, movement, storage and handling of materials
- NR-12 - occupational safety in machinery and equipment
- NR-15 - unhealthy activities and operations
- NR-16 - dangerous activities and operations

- NR-17 - ergonomics
- NR-18 - working conditions and environment in the construction industry
- NR-20 - occupational health and safety with flammable and combustible materials
- NR-21 - open-air work
- NR-23 - fire protection
- NR-24 - sanitary and comfort conditions in the workplace
- NR-25 - industrial waste
- NR-26 - safety signs
- NR-35 - working at heights

### **National Policy for the Sustainable Development of Traditional Peoples and Communities (PNPCT)**

Another very important issue related to cultural diversity and traditional populations is addressed in Brazil by the National Policy for the Sustainable Development of Traditional Peoples and Communities (PNPCT), established in 2007 by Decree No. 6.040/2007. The Policy establishes that the National Commission for the Sustainable Development of Traditional Peoples and Communities - CNPCT, created by Decree of July 13, 2006, is responsible for coordinating the implementation of this Policy.

The PNPCT's specific objective is to promote the aforementioned "sustainable development" with an emphasis on recognizing, strengthening and guaranteeing their territorial, social, environmental, economic and cultural rights. It also advocates respecting and valuing the identity of traditional peoples and communities, as well as their forms of organization and their different institutions. This policy is structured around four strategic axes: 1) Access to Traditional Territories and Natural Resources, 2) Infrastructure, 3) Social Inclusion and 4) Promotion and Sustainable Production.

Specifically with regard to the infrastructure axis and other related axes, Article 3 states:

- III - to set up infrastructure suited to the socio-cultural realities and demands of traditional peoples and communities;
- IV - guarantee the rights of traditional peoples and communities directly or indirectly affected by projects, works and undertakings;
- V - to guarantee and value traditional forms of education and strengthen dialogic processes as a contribution to the development of each people and community, guaranteeing participation and social control in both formal and non-formal educational training processes;
- X - guarantee access to public social policies and the participation of representatives of traditional peoples and communities in social control bodies;
- XI - ensure that social inclusion programs and actions specifically target traditional peoples and communities;
- XII - to implement and strengthen programs and actions aimed at gender relations in traditional peoples and communities, ensuring women's vision and participation

in government actions, valuing the historical importance of women and their ethical and social leadership;

- XVII - to support and guarantee productive inclusion with the promotion of sustainable technologies, respecting the social organization system of traditional peoples and communities, valuing local natural resources and traditional practices, knowledge and technologies.

The CNPCT's mission is to agree on joint action by representatives of the direct public administration and members of the non-governmental sector for the social, economic, cultural and environmental strengthening of traditional peoples and communities. Created by the Decree of December 27, 2004 and modified by the Decree of July 13, 2006, the body has a deliberative and consultative nature. It is chaired by the Ministry of Social Development and Fight against Hunger (MDS) and secretariat by the Ministry of the Environment (MMA). It is also made up of other representatives from federal bodies and entities and non-governmental organizations, who meet every four months. These include the National Indian Foundation FUNAI (for indigenous peoples), the Ministry of Fisheries and Aquaculture (for fishing communities) and the Palmares Foundation (for quilombola communities). As a direct result of the body's work, the National Policy for the Sustainable Development of Traditional Peoples and Communities was drawn up with the main objective of promoting the sustainable development of these groups with an emphasis on recognizing, strengthening and guaranteeing their territorial, social, environmental, economic and cultural rights, respecting and valuing their identities, forms of organization and institutions.

FUNAI is the official indigenist body of the Brazilian state. Created by Law No. 5.371, of December 5, 1967, linked to the Ministry of Indigenous Peoples, it is the coordinator and main executor of the Federal Government's indigenous policy. Its institutional mission is to protect and promote the rights of indigenous peoples in Brazil. Funai is responsible for carrying out identification and delimitation studies, demarcation, land regularization and registration of lands traditionally occupied by indigenous peoples, as well as monitoring and inspecting indigenous lands. FUNAI also coordinates and implements policies to protect isolated and newly-contacted peoples. It also promotes policies aimed at the sustainable development of indigenous populations. In this field, FUNAI promotes ethnodevelopment, conservation and environmental recovery actions on indigenous lands, as well as controlling and mitigating possible environmental impacts resulting from external interference on indigenous lands.

As mentioned, FUNAI, Brazil's main indigenous defense agency, is linked to the Ministry of Indigenous Peoples, a ministry of Brazil's executive branch chaired by activist Sônia Guajajara, whose duties are to guarantee indigenous people access to education and health, demarcate indigenous lands and combat the genocide of indigenous people. It was recently created in response to the historical demands of the indigenous movement (being the first ministry created dedicated to indigenous peoples).

The priorities and structure of the Ministry have been drawn up in the Thematic Group on Indigenous Peoples created during the government transition after the 2022 presidential election. The Ministry of Indigenous Peoples is responsible for indigenous policy, the recognition, guarantee and promotion of the rights of indigenous peoples, the recognition of the demarcation, defense, exclusive usufruct and management of indigenous lands and territories, the well-being of indigenous peoples, the protection of isolated and recently contacted indigenous peoples, and also the implementation on national territory of international agreements and treaties, especially Convention No. 169 of the International Labor Organization, when related to indigenous peoples.

## 1 INTRODUCTION

The State Government of Paraíba has requested the financing of a PROJECT through a specific investment loan (LON/ESP) to promote the sustainable development of rural areas in the state, **Projeto de Desenvolvimento Rural Sustentável da Paraíba - PROCASE II (PROJECT, henceforth)**, focusing on the problems of low production and productivity and vulnerability to climate change (CC) of family farming activities, environmental degradation and deforestation, insufficient water supply services for human consumption and lack of sanitation in rural communities.

The overall objective of the PROJECT is to contribute to reducing rural poverty levels, improving food and nutritional security and adapting the rural population to climate change.

The main specific objectives are:

- Increasing the adoption of agricultural technologies, including those for adapting to and mitigating climate change;
- Improving the productive and social inclusion of family farmers, prioritizing women, young people, Traditional Peoples and Communities (PCT) and persons with disabilities;
- Improving the environmental conditions of rural communities and their surroundings.

The PROJECT is structured into the following components:

- **Component 1 - Resilient production to reduce rural poverty**, involving: Subcomponent 1.1 - Implementing biodiverse and resilient production systems; and Subcomponent 1.2 - Strengthening and diversifying commercialization.
- **Component 2 - Strengthening family farming capacities and organizations and knowledge management**, involving: Subcomponent 2.1 - **Developing the capacities of family farmers and rural community organizations**; Subcomponent 2.2 - **Strengthening family farming organizations for market access**; Subcomponent 2.3 – **Diversity, gender, youth, nutrition and food security**; **Subcomponent 2.4 - Land and environmental regularization**; and Subcomponent 2.5 - **Knowledge management and South-South and Triangular Cooperation**.
- **Project Management, Monitoring and Evaluation**: This will finance equipment, consultancy and other expenses necessary for: (i) the administration and management of the project; (ii) monitoring and evaluation activities; and, (iii) project audits.

### 1.1 Objectives

This Socio-Cultural Analysis (SCA) refers specifically to Components 1 and 2 of the PROCASE II project. The purpose of this study is to prepare tools for the identification and management of potential negative socio-environmental impacts and socio-environmental risks that may arise from the PROCASE II works on the traditional communities that will benefit from them.

The communities that may be eligible to receive the Project are a fairly extensive list, which is presented in preliminary form in the Annex. 11.1 of this document.

This document is based on the IDB's Environmental and Social Policy Framework (MPAS) and IFAD's Social, Environmental and Climate Assessment Procedures (SECAP), which are equivalent, except for IFAD's safeguard on climate change.

After analyzing the demand for studies to prepare PROCASE II, which is based on a "*framework approach*", in particular, evaluating the typology of communities that could benefit from the PROJECT, but without being able to count on a specific definition of a

sample universe, and considering the territorial extension to which the PROJECT will affect, it was decided to carry out an ASCE, following the example of the AASE and PGASE<sup>1</sup>, with a cross-sectional analysis of the ethnic groups in the PROCASE II area of operation, linking comments and information sometimes specific to certain communities in order to highlight the characteristics of the existing traditional populations. In this way, it was possible to identify possible impacts and the necessary mitigation measures for situations identified in the environment in which the subproject typologies established as part of the preparation of this PROJECT were inserted.

## 2 IDB AND IFAD SAFEGUARD POLICIES

The Safeguards Policies of the institutions (IDB and IFAD) establish stricter protections for people and groups in situations of vulnerability to the potential risks and impacts of projects. It specifies where the free, prior and informed consent of traditional peoples must be obtained, determines the protection of Afro-descendants, indigenous people and people with disabilities and requires the consideration of factors such as race and ethnicity, age and social status, in line with the most recent versions of the core international conventions and instruments of the UN and the International Labor Organization (ILO).

### **IDB's Environmental and Social Policy Framework (ESPF)**

With regard to indigenous peoples and traditional communities, the IDB's new Environmental and Social Policy Framework, in particular Environmental and Social Performance Standard 7 (PDAS 7) recognizes that Indigenous Peoples and traditional peoples recognized in national laws as distinct social and cultural peoples are often among the most marginalized and vulnerable segments of the population. In many cases, their economic, social and legal status limits their ability to defend their rights and interests in lands and natural and cultural resources and can restrict their ability to participate in and benefit from development that is in line with their worldview. Indigenous Peoples are particularly vulnerable if their lands and resources are transformed, invaded or degraded. Their languages, cultures, religions, spiritual beliefs and institutions may also be threatened. As a result, indigenous and traditional peoples may be more vulnerable to the adverse impacts associated with project development than non-indigenous peoples. This vulnerability may include loss of identity, culture and natural resource-based livelihoods, as well as exposure to impoverishment and disease.

According to PDAS 7 of the IDB's MPAS, the term "Indigenous Peoples" is used in a generic sense to refer to a distinct social and cultural group possessing the following characteristics in varying degrees: (i) Self-identification as members of a distinct indigenous cultural group and recognition of that identity by others; (ii) Collective attachment to geographically distinct habitats or ancestral territories in the project area and to the natural resources of those habitats and territories; (iii) Customary cultural, economic, social or political institutions separate from those of the dominant society or culture; and (iv) A distinct language or dialect, usually different from the official language or languages of the country or region in which they reside.

The applicability of PDAS 7 must be established during the process of identifying environmental and social risks and impacts. The implementation of the actions necessary to meet the requirements of this PDAS is managed through the borrower's Environmental and Social Management System (ESMS) and must follow the guidelines and directives defined in this document.

---

<sup>1</sup> Strategic Environmental and Social Assessment and Strategic Environmental and Social Management Plan for the preparation of PROCASE II.

The main objectives of the Environmental and Social Performance Standard 7 (PDAS-7) are:

- Ensure that the development process promotes full respect for the human rights, collective rights, dignity, aspirations, culture and natural resource-based livelihoods of Indigenous and traditional Peoples;
- Anticipate and avoid adverse impacts of projects on Indigenous Peoples' communities (traditional communities), or when it is not possible to avoid, minimize and/or compensate for such impacts;
- Promote sustainable development benefits and opportunities for Indigenous Peoples (traditional communities) in a culturally appropriate way;
- Establish and maintain an ongoing relationship based on Consultation and Informed Participation (CPI) in a culturally appropriate manner with Indigenous and traditional Peoples affected by a project throughout its life cycle;
- Ensure the Free, Prior and Informed Consent (FPIC) of Indigenous Peoples and traditional communities affected by the project when the circumstances described in this PDAS are present;
- Respect and preserve the culture, knowledge and practices of indigenous and traditional populations).

The actions required of borrowers must comply with this specific PDAS 7 and others listed below, and with relevant national law, including principles/standards set out in treaties that form part of national law and are applicable by virtue of their ratification. These policies will guide this study:

- PDAS 1 Assessment and Management of Environmental and Social Risks and Impacts
- PDAS 7 Indigenous Peoples
- PDAS 9 Gender equality
- PDAS 10 Stakeholder engagement and information disclosure.

IFAD's Social, Environmental and Climate Change Assessment Procedures (SECAP)TheIFAD's SECAP in relation to indigenous peoples is based on the nine fundamental principles set out in its Policy for Action in relation to Indigenous Peoples:

- (i) recognize that cultural heritage and identity are assets;
- (ii) request free, prior and informed consent;
- (iii) contribute to community-driven development;
- (iv) promote equitable access to lands, territories and resources;
- (v) valuing the knowledge of indigenous peoples;
- (vi) strengthening the resilience of indigenous peoples' ecosystems (environmental and climate change issues);
- (vii) promote access to markets;
- (viii) promote empowerment, and
- (ix) promote gender equality.

The objectives of the IFAD Standard are:

- Support indigenous peoples in determining priorities and strategies for exercising their right to development;
- ensure that each project is designed in partnership with indigenous peoples and in full, effective and meaningful consultation with them, to obtain their free, prior and informed consent;
- ensure that indigenous peoples derive fair and equitable benefits and opportunities from project-supported activities in an inclusive and culturally appropriate manner, and
- recognize and respect the rights of indigenous peoples to their lands, territories, waters and other resources that they traditionally own, use or depend on.

### 3 STUDY OBJECTIVES

The aim of this study is to assist the borrower in preparing PROCASE II, especially with regard to Components 1 and 2, considering their implementation in traditional communities, by preparing analyses and documents that must be included in the Project's SGAS, as well as the appropriate management instruments for complying with the requirements established in the IDB's ESPF and IFAD's SECAP, for Indigenous and traditional peoples.

The content of this socio-cultural assessment, aimed at the ESMS, will include, among other things, a Strategic Environmental and Social Analysis (SEA), specifically: legal frameworks and safeguard policies that interact with the communities and the PROCASE II profile; community diagnosis, analysis of vulnerabilities and identification and assessment of impacts; guidelines for mitigation/compensation measures and a monitoring plan for the Strategic Environmental and Social Management Plan (PGASE). All the assessments were designed with a focus on analyzing the vulnerability to which the communities are subject when sanitation infrastructure is built and infrastructure or other actions related to the Productive Plans are implemented, as well as providing guidance and guidelines for dealing with such vulnerabilities in dialogue with the communities in the process of free, prior and informed consultation.

In this way, it is also part of this socio-cultural assessment to draw up relevant guidelines for the Consultation Plans, Stakeholder Engagement Matrix and Guidelines for the sub-projects for subsequent implementation by the borrower, and a guiding framework for engagement with indigenous and traditional communities.

#### 3.1 Methodology

This study used primary data collection, field visits and observations and unstructured interviews in the communities visited, and secondary data, consulted on scientific platforms and websites of governmental and non-governmental institutions, as well as PROCASE II reference documents, citing the sources when used.

In the office, the data was systematized using the sustainable livelihoods approach methodology<sup>2</sup>. This methodology makes it possible to analyze the vulnerability context of the typologies of traditional communities identified and proposes an approach to data collection and evaluation that links the analysis of vulnerability in sectors that are important for the sustainability and socio-cultural empowerment<sup>3</sup> of the communities to the insertion of the sub-projects into the environment.

---

<sup>2</sup> Scoones (1998) and Ellis (1999)

<sup>3</sup> To the extent that information is available, human, social, physical, natural and financial capital, with the aim of mapping these five community assets and understanding each one in terms of availability, access and differentiated use.

In many cases, these communities are forced to spend and/or lose their assets in order to survive a given event; in other cases, they can use them strategically to maintain and even improve their livelihoods when changes occur.

### 3.2 Results and limitations of the study

This study was carried out during the PROCASE II preparation phase, when the documents that support the signing of the contract with the borrower were being drawn up. At the time this document was drawn up, the details of PROCASE II and its sub-projects, especially the location and specifics of the works and actions that make up Components 1 and 2, including which traditional communities will benefit from the project, had not yet been defined. Thus, only with the indication of the territory covered by PROCASE II were the field surveys carried out.

One of the main limitations of this study is that it was carried out in a short period of time in the field and although it addressed various issues in the socio-cultural and socio-environmental context of the communities in the area covered, they were not exhaustively surveyed. However, the surveys conducted will help point out guidelines and relevant issues for the systematic process that will have to be conducted by the borrower, with more time and dedication, during PROCASE II's operation phase. As such, this study provides a general understanding of the context experienced by the communities that make up the area covered by the project, organizing the analysis into typologies and patterns of traditional communities (indigenous, quilombola, fishing, shellfish gatherers and gypsies).

The opportunity to receive support and investment to improve production processes and quality of life, especially through projects that are convergent with the cultural traditions of the communities, brings new perspectives for families who often suffer from the difficulties offered by the environment, the pressure from markets to receive and accept products, and situations of violence and prejudice that have plagued native and traditional peoples for many years.

In this way, addressing the issue of improving production processes and sanitation is considered a form of open and participatory dialog between the PMU and the leaders and families of all the communities involved in this process in some way. One of the limitations imposed by the short time taken to carry out the survey meant that only a few interviews were carried out, making it all the more important to consider the consultation process to be carried out by the borrower, as presented in the Consultation Plan.

Despite this limitation, it was possible to gain access to a variety of information specific to traditional communities that was gathered through primary and secondary sources by the teams designing and developing the subproject typologies presented in PROCASE II Components 1 and 2.

## 4 LEGAL FRAMEWORK

Brazil's formal legal recognition of traditional peoples and communities in the Federal Constitution of 1988 increased the mobilization of these communities, which are still struggling to strengthen measures to implement the constitutional provisions over the decades. Added to the effects of these provisions is the constant effort of instruments drawn up by multilateral agencies such as: United Nations (UN), United Nations Educational, Scientific and Cultural Organization (UNESCO) and the International Labor Organization (ILO).

International Declarations and Conventions have played an important role in the Brazilian legal system in the face of recurring threats and setbacks to the rights of these communities. While Declarations serve as "legal principles" that guide instruments and actions, Conventions, because they are ratified Treaties, generate obligations, binding

countries in the international order and imposing sanctions in the event of non-compliance with the agreed standards.

In Brazil, there are no "tribal peoples" in the strict sense that there are in other countries, but there are distinct social groups that live in society and it is this distinctiveness that brings us closer to the notion of "tribal peoples". The meaning of "tribal" here should be considered "lato sensu", involving all social groups without distinction: indigenous peoples, quilombolas, rubber tappers, Brazil nut gatherers, coconut breakers, riverine communities, faxinalenses, fundo de pasto communities and other groups. All these international legal provisions do not define a priori who these "indigenous and tribal peoples" are, but only offer instruments for the subject to define themselves, such as "awareness of their identity".

If the social groups self-designated as traditional peoples and communities define themselves as such, they should be "protected" by national legislation, especially those aimed at protecting their rights in the various dimensions they cover, and by international conventions, treaties and declarations.

#### **4.1 International Laws and Guidelines Relating to Traditional Peoples**

The main national laws and international agreements relating to traditional peoples are presented below.

##### **UN Declaration on the Rights of Indigenous Peoples - UNDRIP (2007)**

Brazil's intention, as one of the signatories to the UNDRIP (2007), is to recognize indigenous peoples and traditional communities as a group distinct from the rest of its population and to create a legal framework to protect the rights of this group. The basis of this treaty focuses on interrelated areas:

- Indigenous peoples (traditional communities) are clearly a separate group from mainstream society with their own customs and beliefs. This includes collective and individual rights.
- The right to self-determination: indigenous peoples and (traditional communities) have the right to freely determine their political status and freely pursue their economic, social and cultural development.
- Free, prior and informed consent (FPIC). Allows indigenous peoples and traditional communities to give or withhold consent from a project that may affect them or their territories. Once they have given their consent, they can withdraw it at any stage. In addition, FPIC allows them to negotiate the conditions under which the project will be designed, implemented, monitored and evaluated.

##### **OAS Declaration on the Rights of Indigenous Peoples**

The American Declaration on the Rights of Indigenous Peoples, approved by the General Assembly of the Organization of American States (OAS), is the first instrument in the history of the OAS to promote and protect the rights of indigenous peoples in the Americas. It was approved by acclamation by the Member States on June 15, 2016, in Santo Domingo, the capital of the Dominican Republic.

The member states of the OAS recall that the indigenous peoples of the Americas constitute an organized, differentiated and integral segment of their population and have the right to be part of the national identity of the countries, with a special role in strengthening state institutions and achieving national unity based on democratic principles. It also recalls that some of the democratic concepts and institutions enshrined in the constitutions of the American states have their origins in indigenous peoples'

institutions and that many of their current participatory systems of decision-making and authority contribute to the improvement of democracies in the Americas, and that it is necessary to develop national legal contexts to consolidate the multiculturalism of these societies.

The declaration raises issues involving the eradication of poverty and the right to development, respect for the cultural and ecological aspects of indigenous people, coexistence, respect and non-discrimination, the right to territory and survival, security and collective rights.

In Article II, the Declaration affirms states' recognition and respect for the multicultural and multilingual character of indigenous peoples, as an integral part of societies. The issue is related to the provisions of the Brazilian Constitution (Art. 209 § 2, 215 § 1, 231), as well as other infra-constitutional norms.

Article IX deals with the recognition of the legal personality of indigenous peoples, as well as their forms of organization, also supported by Articles 231 and 232 of the Federal Constitution.

The right of indigenous peoples to maintain and promote their own family systems is guaranteed by Article XVII, which also states that states shall respect and protect the different indigenous forms of family, as well as their forms of matrimonial union, filiation, descent and family name. These guarantees are related to Article 6 of the Indian Statute (Law 6.003/1973). Also in Article XVII, by establishing the right of indigenous children to enjoy their own culture, religion or to speak their own language, among others, the Declaration presents precepts that are compatible with the Statute of the Child and Adolescent (Law 8.096/1990).

With regard to indigenous peoples in voluntary isolation or initial contact, Article XXVI of the American Declaration guarantees their right to remain in this condition and to live freely in accordance with their cultures. The same provision establishes the duty of states to recognize, respect and protect the lands, territories, environment and cultures of these peoples, as already provided for in Brazil's indigenous policy.

### **ILO Convention concerning Indigenous and Tribal Peoples in Independent Countries No. 169**

---

ILO Convention 169 regulates different aspects of indigenous peoples' rights at the international level, from politics, employment conditions, health, education and communication to the right to territory. In June 2002, the Brazilian government ratified the Convention through Legislative Decree No. 143 and in 2019 it consolidated its ratification through Decree No. 10,088 of November 5 in the form of its annexes, which provide for the promulgation of conventions and recommendations of the International Labor Organization - ILO ratified by the Federative Republic of Brazil and in force.

This Convention recognizes indigenous and tribal peoples as subjects of rights, with the fundamental criterion for defining this subject being the elements of self-identification. The ratification of Convention 169 not only reinforces instruments for redefining agrarian policy, but also favors the application of environmental and ethnic policies in Brazil. As this is the only treaty in the multilateral system that specifically and comprehensively addresses the rights of indigenous and tribal peoples, one of its main axes is the commitment signed by the adhering countries to guarantee the right to prior, free and informed consultation of indigenous peoples and traditional communities when taking administrative and legislative decisions that directly impact their way of life. In this sense, the treaty is an important instrument that gains normative force when it is internalized by the Federal Constitution, being above legislative decrees.

The Convention states in general terms in Article 4: "1) Special measures necessary to safeguard the persons, institutions, property, cultures and environment of these peoples shall be adopted. 2) These special measures shall not contravene the freely expressed will of these peoples. 3) The enjoyment, without discrimination, of the general rights of citizenship shall in no way be prejudiced by these special measures."

The Convention guides public management on "the procedure of establishing a dialogue with representatives of indigenous communities for decisions concerning the physical structure model for indigenous schools" and regulates the necessary application, and improvement in access to formal and informal education for indigenous peoples, highlighting participation and cooperation, determining their priority in global economic development plans for the regions where they live and others in accordance with the following provisions:

### ***PART I- GENERAL POLICY / Article 7***

1. The peoples concerned shall have the right to choose their own priorities with regard to the development process, insofar as it affects their lives, beliefs, institutions and spiritual well-being, as well as the lands they occupy or otherwise use, and to control, to the extent possible, their own economic, social and cultural development. In addition, these peoples shall participate in the formulation, implementation and evaluation of national and regional development plans and programs likely to affect them directly.

2. Improving the living and working conditions and the level of health and education of the peoples concerned, with their participation and cooperation, should be a priority in the overall economic development plans of the regions where they live. Special development projects for these regions should also be designed in such a way as to promote this improvement.

3. Governments should ensure that, whenever possible, studies are carried out among the peoples concerned in order to assess the social, spiritual, cultural and environmental impact that the planned development activities may have on them. The results of these studies should be considered as fundamental criteria for the implementation of the aforementioned activities.

### ***PART VI - EDUCATION AND THE MEDIA***

#### ***Article 27***

1. Education programs and services for the peoples concerned shall be developed and implemented in cooperation with them in order to respond to their particular needs, and shall encompass their history, their knowledge and skills, their value systems and all their other social, economic and cultural aspirations.

2. The competent authority shall ensure the training of members of these peoples and their participation in the formulation and execution of education programs, with a view to progressively transferring to these peoples the responsibility for carrying out these programs, where appropriate.

3. In addition, governments should recognize the right of these peoples to establish their own institutions and means of education, provided that such institutions meet the minimum standards established by the competent authority in consultation with these peoples. Appropriate resources should be made available to them for this purpose.

#### ***Article 30***

1. Governments should adopt measures, in accordance with the traditions and cultures of the peoples concerned, to make them aware of their rights and obligations, especially with regard to work and economic possibilities, education and health issues, social services and the rights derived from this Convention.

2. To this end, written translations and the use of mass media in the languages of these peoples should be used if necessary.

### **Unesco Convention for the Safeguarding of the Intangible Cultural Heritage**

---

On October 17, 2003, during the 32nd General Conference of the United Nations Educational, Scientific and Cultural Organization (UNESCO), the Convention for the Safeguarding of the Intangible Cultural Heritage was approved. This Convention entered into force on April 20, 2006 and was ratified by Brazil in the same year. The 2003 Convention has several objectives:

- (a) safeguarding intangible cultural heritage;
- (b) respect for the intangible cultural heritage of communities, groups and individuals;
- (c) raising awareness at local, national and international level of the importance of intangible cultural heritage and its mutual appreciation;
- (d) international cooperation and assistance.

Claiming to be an instrument that promotes intangible cultural heritage, the main generator of cultural diversity and the guarantor of sustainable development, the 2003 Convention aims to fill a gap in the legal system for the international protection of cultural heritage, whose instruments, until now, did not consider intangible cultural heritage, but only tangible, movable and immovable cultural heritage, so that intangible cultural expressions could not be safeguarded through the international legal instruments that existed at the time.

According to the Convention, intangible cultural heritage is defined as "(...) the practices, representations, expressions, knowledge and skills - as well as the instruments, objects, artefacts and cultural spaces associated with them - which communities, groups and, where appropriate, individuals recognize as forming an integral part of their cultural heritage. This intangible cultural heritage, passed down from generation to generation, is constantly recreated by communities and groups according to their environment, their interaction with nature and their history, instilling in them a sense of identity and continuity, thus contributing to the promotion of respect for cultural diversity and human creativity" (Article 2).

It is therefore this intangible cultural heritage that the 2003 Convention aims to safeguard, providing, among other measures, for each State Party to draw up inventories of this heritage.

The Convention entered into force in Brazil on April 12, 2006, via Decree No. 5.753/06 and Legislative Decree No. 22/06 with the aim of protecting cultural and intangible heritage, promoting respect for the cultural and intangible heritage of the communities, groups and individuals that make up the societies of the States Parties, awareness in all spheres and without borders of the importance of the object of the international document, its recognition by all the nations involved and mutual international cooperation to safeguard it.

To facilitate the identification and limits of international legal protection, Article 2 of the document provides the following definitions:

*(1) "Intangible cultural heritage" means the practices, representations, expressions, knowledge and techniques - together with the instruments, objects, artefacts and cultural places associated with them - that communities, groups and, in some cases, individuals recognize as an integral part of their cultural heritage. This intangible cultural heritage, which is passed down from generation to generation,*

*is constantly recreated by communities and groups as a function of their environment, their interaction with nature and their history, generating a sense of identity and continuity and thus helping to promote respect for cultural diversity and human creativity. For the purposes of this Convention, only intangible cultural heritage that is compatible with existing international human rights instruments and with the imperatives of mutual respect between communities, groups and individuals, and of sustainable development, shall be taken into account.*

*2. Intangible cultural heritage", as defined in paragraph 1 above, manifests itself in particular in the following fields:*

*a) oral traditions and expressions, including language as a vehicle for the*

*intangible cultural heritage;*

*b) artistic expressions;*

*c) social practices, rituals and festive acts;*

*d) knowledge and practices related to nature and the universe;*

*e) traditional craft techniques.*

## **Escazu Agreement**

---

This is a Regional Agreement on Access to Information, Public Participation and Access to Justice in Environmental Matters in Latin America and the Caribbean, signed by the UN in Escazu (Costa Rica) in 2018.

The Escazú Agreement is a regional treaty signed by 24 Latin American and Caribbean nations on the rights of access to environmental information, public participation in environmental decision-making, environmental justice and a healthy and sustainable environment for current and future generations.

The Escazú Agreement strengthens the links between human rights and environmental protection by imposing requirements on member states in relation to the rights of environmental defenders. In addition, it aims to provide full public access to environmental information, environmental decision-making and legal protection and remedies relating to environmental issues. It also recognizes the right of present and future generations to a healthy environment and sustainable development.

## **4.2 National Laws and Guidelines**

### **Federal Constitution of 1988 (CF - 88)**

Considered a landmark in the conquest and guarantee of indigenous peoples' rights in Brazil, the 1988 Constitution established new milestones for relations between the state and indigenous peoples.

Expressed in a specific chapter of the Charter (Title VIII, "Da Ordem Social", Chapter VIII, "Dos Índios"), the constitutional rights of indigenous peoples are marked by at least two important conceptual innovations in relation to previous Constitutions and the so-called Indian Statute, Law 6.001 of 1973.

The first innovation is the abandonment of an assimilationist perspective, which saw indigenous people as a transitory social category, doomed to disappear. The second is that indigenous peoples' rights to their lands are defined as original rights. In other words, they predate the creation of the Brazilian state itself.

The text in force also raises the concept of Indigenous Lands to constitutional status, which is defined in paragraph 1 of article 231:

"The lands traditionally occupied by the Indians are those permanently inhabited by them, those used for their productive activities, those essential for the preservation of the environmental resources necessary for their well-being and those necessary for their physical and cultural reproduction, according to their uses, customs and traditions."

Constitutional precepts also guarantee indigenous peoples respect for their social organization, customs, languages, beliefs and traditions. Article 231 of the Constitution states that indigenous people in Brazil have the right to be different, i.e. to be Indians and to remain as such indefinitely.

The 1988 Constitution therefore recognized the right to cultural difference, the foundation of a multi-ethnic state, and the multicultural nature of the Brazilian nation, the basis for a fairer society and an effective democratic state based on the rule of law. In doing so, it enabled the conditions for transformations in state policies that today must ensure that inequality is overcome, including rights to health, education and food security, which can now only be traced back to this framework of cultural difference contemplated in the constitution. All of these are intrinsically linked to the demarcation and guarantee of traditionally occupied lands.

The Federal Constitution of 1988, which, in article 215, states that the "State shall guarantee the full exercise of cultural rights to all". And in article 216, I and II, it includes as distinctive signs of the identity of the various groups that make up Brazilian society, their "forms of expression" and their "ways of creating, doing and living";

With the promulgation of the Federal Constitution of 1988, the Brazilian government recognized the existence of the remaining quilombo communities and guaranteed them the right to land ownership, through article 68 of the Transitional Constitutional Provisions Act (ADCT): "The remaining quilombo communities that are occupying their land are recognized as definitive owners, and the state must issue them titles."

In addition to article 68, there are articles 3, 5, 215 and 216 that need to be taken into account when interpreting article 68. This is because they also serve as instruments in quilombola claims. Article 3 sets out as one of the objectives of the Republic the eradication of poverty and marginalization, the reduction of social and regional inequalities and the promotion of the good of all, without prejudice to origin, race, sex, color, age or any other form of discrimination. The other articles deal with the equality of all before the law, rights, access to and appreciation of the culture and cultural heritage of the groups that make up Brazilian society.

The current concept officially used by the Brazilian government to define what quilombo remnants are is the definition given by the Brazilian Anthropology Association (ABA) in 1994, which states that a quilombo is: "Any rural black community made up of descendants of enslaved people living off subsistence farming and where cultural manifestations have a strong link to the past."

Law No. 7.668, of 22/08/1988: authorizes the Executive Power to establish the Palmares Cultural Foundation, linked to the Ministry of Culture, with the purpose of promoting the preservation of cultural, social and economic values resulting from black influence in the formation of Brazilian society.

In Decree No. 4.887 of 2003, which regulates article 68 on the procedure for the identification, recognition, delimitation, demarcation and titling of lands occupied by

remnants of quilombo communities, the remnants are considered to be "ethnic-racial groups, according to criteria of self-attribution, with their own historical trajectory, endowed with specific territorial relations, with a presumption of black ancestry related to resistance to the historical oppression suffered" (BRASIL, 2003). It is up to the National Institute for Colonization and Agrarian Reform (INCRA) to title quilombola territories located on federal public land or on privately owned areas (Decree No. 4887/2003). In addition to INCRA, the Federal Patrimony Secretariat (SPU) is also responsible for issuing titles or Real Right of Use Concession Contracts (CCDRU) to quilombola communities located in areas under its management.

Federal policy for quilombos is linked to the Quilombola Brazil Program (PBQ), coordinated by the then Secretariat for Policies to Promote Racial Equality of the Presidency of the Republic (SEPPIR), created by the 1st Lula government in 2003. This program was launched in 2004 with the aim of consolidating the frameworks of state policy for quilombola areas, and as a result the Quilombola Social Agenda was instituted (Decree No. 6261/2007), which groups the actions of various ministries aimed at the communities into four main axes, namely: 1) access to land; 2) infrastructure and quality of life; 3) productive inclusion and local development; and 4) rights and citizenship. INCRA is only responsible for the first axis (access to land), while the other axes of quilombola policy are the responsibility of other bodies and ministries. It is also up to the states and municipalities to participate in this policy, in accordance with their legislation and specific attributions. SEPPIR was driven by the black movement, which has been in charge of the portfolio for the last 15 years.

Michel Temer's government has closed down the Ministry of Women, Racial Equality and Human Rights. With the status of a ministry: the Secretariat for Human Rights (SDH), SEPPIR and the Secretariat for Women's Policies (SPM) no longer exist. The secretariats became part of the structure of the Ministry of Justice. The end of SEPPIR practically ended the participation of the black community in the formulation of public policies. The extinction of SEPPIR under the Bolsonaro government was even considered, but it became part of the Ministry of Human Rights (MDH), but with much reduced resources it suffered a 69.5% budget cut. In 2023, Lula's third term recreates the Ministry of Racial Equality, under the command of Anielle Franco. The aim of the new ministry will be to work across other government portfolios, such as the Ministry of Justice, Human Rights, Health, Culture and Women. Policies aimed at the health of the black population are also high on the list of priorities, as well as the resumption of the Juventude Negra Viva plan - an initiative to reduce the vulnerability of black youth - and policies for quilombola communities in the different ministries.

### **Ministry of Indigenous Peoples and National Foundation for Indigenous Peoples (FUNAI) - Community Infrastructure Policy**

From 2019 to 2021, Jair Bolsonaro's government represented the biggest setback and violation of the rights of Indigenous Peoples since the Constitution of 88. The guidelines adopted by the government sought to challenge the original rights guaranteed by the Constitution and FUNAI, as the only indigenous body, was weakened in its capacities and competencies.

The volume of conflicts motivated by initiatives without consultation that were advancing in the Legislative Branch with the aim of withdrawing rights, as well as in the Judiciary, where the discussion of the temporal milestone thesis is ongoing, has generated legal instability and violence in the interior of Brazil. On the infra-legal front, FUNAI has issued measures that promote the delegitimization of the identity of indigenous peoples, such as the definition of new hetero-identification criteria that weaken the traditionality and culture of these peoples. In territorial management, FUNAI has been given the opportunity to certify irregular property claims on non-demarcated Indigenous Lands.

In 2023, after President Luis Inácio Lula da Silva won the elections, Decree No. 11.355, OF JANUARY 1, 2023 created the Ministry of Indigenous Peoples, promoting a state stance opposed to the previous government and a historic and political response to the demands of the national indigenous movement. Federal deputy Sônia Guajajara was appointed minister of the Ministry of Indigenous Peoples and took office on January 1, 2023. Because it is an unprecedented institution, the Ministry of Indigenous Peoples is in the process of being set up and should follow the organizational structure of other Brazilian ministries. According to Decree No. 11.355, the Ministry will have the function of recognizing, guaranteeing and promoting the rights of indigenous peoples; protecting isolated and recently contacted peoples; demarcating, defending and managing territories and Indigenous Lands; monitoring, inspecting and preventing conflicts in Indigenous Lands and promoting actions to remove invaders from these lands. The ministry will also include two important bodies that until then had been linked to the Ministry of Justice and Social Security: the National Foundation for Indigenous Peoples (FUNAI), the only official indigenous body of the Brazilian state, created by law 5.371, of December 5, 1967, and the National Council for Indigenous Policy (CNPI), created in 2015 by then President Dilma Rousseff to guarantee the participation of representatives of indigenous peoples in the formulation of public policies, which was abolished by the Jair Bolsonaro government. The Ministry created will be made up of three secretariats, as well as the Executive Secretariat and seven departments: - Secretariat for Indigenous Environmental and Territorial Rights, made up of the departments for Territorial Demarcation and Territorial Protection and for Isolated and Recently Contacted Indigenous Peoples; - Secretariat for Indigenous Environmental and Territorial Management, made up of the departments for Climate Justice and for Environmental and Territorial Management and the Promotion of Indigenous Well-Being; - Secretariat for the Articulation and Promotion of Indigenous Rights, made up of the departments for the Promotion of Indigenous Policy and for Indigenous Languages and Memories; - Department of Mediation and Conciliation of Indigenous Land Conflicts, which is not linked to any secretariat In interviews with the media, Sonia Guajajara points out that the Ministry of Indigenous Peoples will have to act in an intersectional way with other ministries and with the Brazilian Institute for the Environment and Renewable Natural Resources (Ibama) and the Chico Mendes Institute for Biodiversity Conservation (ICMBio). One of the examples of the expectation of intersectional action is the competence that the Ministry of Indigenous Peoples will have in international agreements and treaties related to indigenous peoples, with the minister working in conjunction with the Ministry of Foreign Affairs. With regard to the Program under review here, FUNAI's competencies include establishing inter-institutional coordination aimed at guaranteeing differentiated access to social and citizenship rights for indigenous peoples, by monitoring policies aimed at social security and indigenous school education, as well as promoting and supporting traditional community educational processes and social participation and control.

Community infrastructure policy refers to the set of policies, programs, projects, actions and activities that serve as a basis for the socio-economic development of Brazil's indigenous populations, while guaranteeing their constitutional rights. These infrastructure policies, programs, projects, actions and activities offered by the Federal, State and/or Municipal Executive Branch must be duly presented, discussed and clarified with indigenous peoples, safeguarding their right of access and respect for social and cultural diversity.

Ordinance No. 666/PRES, of July 17, 2017, which approved the Internal Regulations of the National Indian Foundation and sets out its regimental attributions:

VI - monitor differentiated education actions and services for indigenous peoples;

The Coordinating Unit for the infrastructure policy is the Community Infrastructure Coordination (Coordenação Infraestrutura Comunitária -COIC), a sub-unit of the General

Coordination for the Promotion of Social Rights (Coordenação Geral de Promoção dos Direitos Sociais - CGPDS), part of FUNAI's Directorate for the Promotion of Sustainable Development (Diretoria de Promoção ao Desenvolvimento Sustentável - DPDS).

According to Article 163 of the Ordinance, the Community Infrastructure Coordination Office (COIC) is responsible for:

I - to coordinate, guide and support the decentralized units and partner institutions in the processes of valuing and strengthening the traditional use of techniques, technologies and raw materials for building indigenous community infrastructures;

II - to monitor, guide, subsidize and qualify community infrastructure policies, programs and actions, in intersectoral and interinstitutional coordination, with a view to expanding differentiated access for indigenous peoples;

III - to articulate, in cooperation with competent institutions, indigenous peoples' access to appropriate environmental sanitation technologies, with regard to the collection, storage and distribution of water for human consumption and sewage disposal;

IV - to promote, coordinate and implement, in conjunction with CGEtno, policies on access to water for consumption and production, within the scope of its powers; and

V - articulate, in cooperation with competent institutions, indigenous peoples' access to alternative technologies and projects for electricity, communication, housing and mobility. In DECREE No. 11.226, OF OCTOBER 7, 2022, the revision of the Statute in relation to the specific singular bodies reinforced the attributions of the Directorate for the Promotion of Sustainable Development and in its Section III; item VI reinforces its role of monitoring the actions of indigenous school education carried out by the States, the Federal District and the Municipalities, in conjunction with the Ministry of Education.

Likewise, especially when it comes to education, the collaboration and concurrent obligation of the federative entities (states and municipalities) is regimental in order to guarantee the exercise of this right, both with regard to the promotion, maintenance and development of education, as well as the costing of education, does not affront, on the contrary, it reinforces the federative pact.

In time, the linking of FUNAI to the Ministry of Indigenous Peoples may change regulations and the structure of assistance to various public policies aimed at indigenous peoples. It will be up to the borrower, when starting the Consultation Plan, to understand whether FUNAI's Community Infrastructure Coordination (Coordenação de Infraestrutura Comunitária - COIC) will still be the interlocutor in this process of dialog on the construction of school infrastructure on Indigenous Lands. This information will be included in the attached Consultation Plan.

**Decree No. 6.040 of February 7, 2007, the National Policy for the Sustainable Development of Traditional Peoples and Communities (PNPCT).**

The PNPCT's specific objective is to promote the aforementioned "sustainable development" with an emphasis on recognizing, strengthening and guaranteeing their territorial, social, environmental, economic and cultural rights. It also advocates respecting and valuing the identity of traditional peoples and communities, as well as their forms of organization and their different institutions. This policy is structured around four strategic axes: 1) Access to Traditional Territories and Natural Resources, 2) Infrastructure, 3) Social Inclusion and 4) Promotion and Sustainable Production.

Specifically with regard to the infrastructure axis and other related areas, Art. 3 states

III - to set up infrastructure suited to the socio-cultural realities and demands of traditional peoples and communities;

IV - guarantee the rights of traditional peoples and communities directly or indirectly affected by projects, works and undertakings;

V - to guarantee and value traditional forms of education and strengthen dialogic processes as a contribution to the development of each people and community, guaranteeing participation and social control in both formal and non-formal educational training processes;

X - guarantee access to public social policies and the participation of representatives of traditional peoples and communities in social control bodies;

XI - ensure that social inclusion programs and actions specifically target traditional peoples and communities;

XII - to implement and strengthen programs and actions aimed at gender relations in traditional peoples and communities, ensuring women's vision and participation in government actions, valuing the historical importance of women and their ethical and social leadership;

XVII - to support and guarantee productive inclusion with the promotion of sustainable technologies, respecting the social organization system of traditional peoples and communities, valuing local natural resources and traditional practices, knowledge and technologies.

### **Legal Framework of the Federal Public Prosecutor's Office (MPF)**

The thematic chamber on indigenous populations and traditional communities (6th Coordination and Review Chamber) deals specifically with issues related to groups that share a traditional way of life that is distinct from the majority national society, such as indigenous peoples, quilombolas, extractive communities, riverside communities and gypsies. The main challenge for prosecutors working on these issues is to ensure the plurality of the Brazilian state from an ethnic and cultural perspective, as determined by the Brazilian Constitution. Statements by the 6th Chamber (CCR) of the MPF

- Statement of the 6th CCR No. 19, of 05/12/2014: The MPF, among other legitimate parties, is empowered to act judicially and extrajudicially in cases involving the rights of quilombolas and other traditional communities, with the federal courts having jurisdiction. This attribution is based on article 6, item VII, paragraph "c", and article 5, item III, paragraph "c", of Complementary Law no. 75/1993, on the fact that the protection of such interests corresponds to the protection and promotion of national cultural heritage (articles 215 and 216 of the Constitution);
- Statement by the 6th CCR No. 22, of 05/12/2014: In cases of territorial overlap between traditional communities and/or conservation units, it is necessary to carry out an anthropological study to contextualize the socio-cultural dynamics;
- Statement of the 6th CCR No. 25, of 05/12/2014: The territorial rights of indigenous peoples, quilombolas and other traditional communities have a constitutional basis (art. 215, art. 216 and art. 231 of CF 1988; art. 68 ADCT/CF) and a conventional one (ILO Convention No. 169). In general terms, the presence of these traditional peoples and communities has contributed to environmental protection. In cases of possible collision, the categories of Law No. 9.985 cannot override these territorial rights, and there is a need for harmonization between the rights at stake. In the process of resolving these conflicts, communities must be guaranteed free, informed and equal participation. Article 42 of Law No. 9.985 is unconstitutional insofar as it allows for the removal of traditional communities, and also contravenes international norms of supra-legal hierarchy;

- Statement of the 6th CCR No. 26, of 05/12/2014: The sustainable use of natural resources by traditional peoples and communities is guaranteed by the Federal Constitution (arts. 215 and 216) and ILO Convention No. 169 (art. 14, I), both inside and outside their territories;
- Statement of the 6th CCR No. 27, of 05/12/2014: The territorial rights of quilombola peoples and other traditional peoples and communities enjoy the same hierarchy as the rights of indigenous peoples, as both enjoy constitutional stature.

## 5 SOCIOCULTURAL BASELINE

This chapter highlights the general context of rural territories in terms of the presence and dynamics of traditional communities, with an emphasis on more detailed information about some of the communities surveyed in the PROCASE II area.

The aim of this systematization is to establish in general terms the nature of the community's mechanisms and highlight their vulnerabilities in order to reduce possible impacts on their way of life in the various phases of the sub-projects provided for in Components 1 and 2 of PROCASE II.

It is important to understand that correctly assessing a possible socio-environmental change that impacts on the territory used, or more narrowly on a community, is only possible when the specific ways in which the community imposes its logic on it are taken into account, because to do otherwise would be to reduce the scope of territorial relations to housing and production activities (GALLOIS, 2004), which would be a mistake from the perspective of understanding the resources (material and immaterial) that they use to reproduce their way of life.

The following are general themes from the baseline that contextualize the infrastructure normally available to traditional communities in the area covered by the Project.

### Overview of the PROCASE II project area

---

According to Cadastro Único data from March 2024 (MDS), there are 191,000 families in rural Paraíba classified as being in poverty or extreme poverty (CadÚnico bands 1 and 2). Considering that there are 251,125 households in the rural area of the state, according to IBGE 2010, it can be said that 76% of rural families are in a situation of poverty and extreme poverty.

Looking at the 2010 data, where 59% of households were in a situation of poverty or extreme poverty, it can be said that the rural population of Paraíba has become poorer. Among the possible causes are those related to more severe periods of drought, the COVID-19 pandemic and the reduction in social inclusion programs. This is consistent with Brazil's return to the Hunger Map, according to the United Nations.

In the state, only 36% of the population is food secure, while the rest are classified as mild, moderate and severe food insecure (II VIGISAN, 2021).

The HDI in 146 municipalities is considered low (70%), medium in 62 (29%) and high in 2 (1%). According to IBGE 2010, around 28% of the population has some kind of disability (visual, hearing, motor or mental).

According to the 2017 Agricultural Census, there were 163,218 agricultural establishments in the state. Of these, 125,489 (76.9%) were family farms, while 37,729 (23.1%) were non-family or patronal. Approximately 12% of family units belong to Agrarian Reform settlers. Family farming occupies 42% of the state's agricultural area and is responsible for 47.8% of the total value of agricultural production, which is the second highest proportion in the Northeast and the sixth highest nationally. In the Mata region, 20.16% of the area is occupied by family farms, while it reaches 50.75% in the Sertão Paraibano.

Agricultural production is the main economic activity of the vast majority of the rural population in general and, in particular, of family farming. The 2017 Agricultural Census highlights the following productions for their contributions to the value of production: i) poultry, cattle, goats and sheep account for 92% of the value of livestock; ii) of permanent crops, bananas, passion fruit, coconut and tangerines are the main productions in terms of value, and iii) pineapple, corn, cassava and sugar cane are the most important temporary crops. Family farming in Paraíba faces very severe and challenging conditions, especially in the semi-arid region, which include low income, low productivity in farming activities, difficulties in accessing water for human consumption and production, and high risk related to climatic events. In order to increase the production, productivity and income of family farming, it is necessary to resolve obstacles related to the lack of access to financing to make the necessary investments, technical assistance and rural extension that supports the learning of new technologies, difficulty in accessing markets and inserting producers into value chains, which in turn is related to the weakness of rural organizations. According to the 2017 Agricultural Census, only 11.7% of agricultural establishments have access to water for irrigation. In addition to the low productivity of agricultural activities that depend on the availability of water, there is the use of unsuitable production techniques. For example, 32% of Family Farming Units (UAF) use pesticides, and 39% do not adopt any conservation practices (IBGE 2017). In the case of mechanization, for every 130 farmers, 1 has the support of a tractor, seed drill, etc. (IBGE 2017). Less than 1% of the family farms establishments applied lime or another soil pH corrector (IBGE, 2017). 67.4% of family farms establishments have implemented soil preparation systems.

The data from the 2017 Census shows that the majority (53%) of the producers responsible for the establishments are over 55 years old. Less than 10% are under the age of 35. These figures follow a national trend of a shrinking percentage of young people in rural areas, while the rural population is getting older. This situation highlights the challenges of providing opportunities and prospects for young people and, at the same time, conditions for the older population to maintain an agricultural activity and quality of life. This data, when added to the data on very low mechanization (see data below), can create obstacles to achieving greater productivity.

***Specific difficulties for vulnerable groups (women, young people, LGBT people and residents of traditional communities)***

Data from the latest Agricultural Census of 2017 (IBGE) shows gaps in relation to vulnerable groups:

Of all the family farms in Paraíba, 76.0% are run by men and only 24.0% by women. Among family farms, 64.0% are run by people who say they are black or brown, 11.3% by young people under 35 and 0.9% by indigenous people.

In terms of average area (ha), establishments run by men are 80.6% larger than those run by women. While establishments run by women have an average of 7.12 hectares, those run by men have an average of 12.86 hectares. Of the family farms in the project area that have access to water for irrigation, 6.7% are run by women, while 13% are run by men.

Among female family farmers, 4,486 received technical assistance and extension services (ATER) (14.9% of the total), while 16,637 male family farmers (or 17.4% of the total) received ATER.

In the Unified Registry, there are 6,328 indigenous families registered, 73.1% of whom live in poverty or extreme poverty, and there are 4,295 quilombola families registered, 67.9% of whom live in poverty or extreme poverty.

Considering the families of artisanal fishermen, 80.7% of them are in poverty or extreme poverty. This is a gap of 12.4% in relation to the poverty/extreme poverty situation of all registered rural families.

Finally, among riverine families, 72.6% are in poverty or extreme poverty, a gap of 6.5% compared to rural families in the project area.

### ***Basic Sanitation***

Article 3 of Law no. 14.026/2020 considers Basic Sanitation to be a set of public services, infrastructures and operational facilities for: i) drinking water supply, consisting of the activities and the provision and maintenance of infrastructures and operational facilities necessary for the public supply of drinking water, from collection to building connections and their measuring instruments ; ii) sanitary sewage (collection, transportation, treatment and adequate final disposal of sanitary sewage) and iii) urban cleaning and solid waste management (collection, transportation, transshipment, treatment and environmentally appropriate final disposal of household solid waste).

With regard to drinking water supply in the state, the Water and Sanitation Institute reports that in 2019, the rural service rate reached 24.16 % (in Brazil, the rate is 30.77%), through the implementation of systems with a distribution network and simplified chlorine disinfection treatment, guaranteeing the potability of the water. In other situations, fountain-type systems are implemented, without a distribution network, with chlorine disinfection treatment. Finally, when there is no possibility of implementing one of the above solutions, the construction of cisterns for human consumption becomes the only alternative.

As for the sanitary sewage situation, the rural service rate in Paraíba is 18.82% (Instituto Água e Saneamento, 2020), significantly below the national average of 42.54%. It's worth mentioning that in the Litoral micro-region this percentage is 1.04%, showing the great precariousness of this region of the state. Most of the sewage is covered by septic tanks and/or drains, but the treatment units have no control over the disposal of sewage effluent, either on the ground or in water bodies, making it yet another polluter of the environment and contributing to the factors that increase climate change. In addition, some of these septic tanks are of the black tank type, where the sewage is dumped directly under the ground. In these areas it is common to find sewage running out into the open and houses without toilets.

This set of vulnerabilities, coupled with climate change, puts the region's production systems in crisis and in a vicious circle, in which the processes of social and environmental degradation fuel the impoverishment of rural families and increased migration to urban areas.

### ***Family farming organizations and their weaknesses***

Very often, tackling the problems posed by the vulnerability of Paraíba's rural population is very difficult at the individual or family level. Generally, actions of this kind require a capacity for joint or collective action. One of the issues that reinforces the processes of unsustainability mentioned above, which accentuate vulnerabilities, concerns local organizations.

Traditional rural communities are characterized by the existence of a system of social institutions that organize local social life. These mechanisms - such as kinship networks and traditional mechanisms of reciprocity - enabled various types of collective action to take place, covering issues such as the management of common resources, holding community festivals, organizing religious events, etc. However, nowadays these structures don't work well in all communities, and in many cases there is an 'erosion' of traditions. This has led to a weakening of traditional social structures. On the other hand, reality has presented new demands for community organization, mainly related to the

actions of other social actors with whom families/communities establish relations. This situation has stimulated the creation of new forms of organization, generally more formalized, which may take on responsibility for old practices, but are essentially created to take on new functions. Among these new forms of organization, community associations stand out first and foremost.

There are currently many community associations in rural Paraíba. However, it must be acknowledged that they have shortcomings. One of the barriers that reinforce the status quo of unsustainability involves the role of the 'community association' as an effective means of representation and, above all, of organizing collective action at local level. But, as various studies have shown, the creation of associations alone is not enough. It has been found that it is very difficult for these associations to play their potential positive role in the processes of promoting more resilient development spontaneously. Previous experience of various IFAD-supported rural development projects has shown that the role of representing all families vis-à-vis government agencies has posed major challenges for community associations, insofar as these new relationships require them to perform tasks that are entirely unknown to them. In the case of associations assisted by development projects, one such task is that of managing community 'projects'.

On the other hand, in the case of rural organizations (usually in the form of cooperatives) created for the purpose of carrying out activities that seek to promote access to markets (such as packaging, processing and marketing local products), they have also encountered many difficulties in establishing themselves in this role. These organizations have significant shortcomings in terms of capacity on issues such as i) administration and finance (including access to sources of financing for working capital), ii) the ability to design and implement innovative and diversified marketing strategies, iii) the composition of teams with little representation of women and young people, among other weaknesses. They also often have significant limitations from the point of view of production infrastructure, which does not always allow for product diversification, compliance with health and environmental legislation, the use of renewable energy sources in their processes or adequate waste treatment. This set of factors ends up limiting the ability of these organizations to function, as well as their own sustainability, including economic sustainability. As a result, producers access the market precariously and at low prices, with difficulties in adding value to their production. In this context, middlemen predominate.

The situation outlined here indicates that most of the existing local organizations - especially community associations and family farmers' cooperatives - will need support, especially in terms of capacity building, if they are to play an active and effective role in implementing the various sustainable development initiatives they are called upon to carry out.

On the other hand, the organizations mentioned above only group together and represent a fraction of Paraíba's Family Farmers, and there is still a significant part of this population that is not yet organized. Data from the 2017 Agricultural Census indicates that only 48% of farmers are members of some kind of organization (association, union, movement, etc.) Considering only the members of cooperatives, this proportion drops to just 3.7%.

### **Youth**

Brazil's Youth Statute (2013) defines young people as those between the ages of 15 and 29. In the Project area, there are 893,666 young people. Among the main challenges faced by rural youth in the Project area are: i) lack of employment and income opportunities (with little diversification of agricultural and non-agricultural activities that attract young people), ii) lack of access to and control over resources, inputs, goods and technologies, iii) limited access to public policies and services and iv) low participation and decision-making power in rural and community organizations.

In Paraíba, among young people aged 15 to 29, approximately 35.1% were neither studying nor working in 2021, according to the Synthesis of Social Indicators 2022. Young women of African descent have a higher percentage out of school and the job market. Household chores and caring for family members are among the main barriers young people face in continuing their studies or getting a paid job, and young women are the majority in this situation. Another important causal factor is the high rate of teenage pregnancy. Between 2020 and 2022, 12,830 pregnancies in children and adolescents aged 10 to 18 were recorded in Paraíba, according to the State Health Department.

As a consequence of the lack of continued education and formal work opportunities for young rural people, there is a process of migration to urban centers, mainly of young women with more schooling, which causes the rural population to age (the largest group of migrants is between 16 and 35 years old) and the proportion and number of women to decrease. The fact that young women are the ones who leave the countryside the most is related not only to the lack of opportunities, but also to their refusal to take on the same roles played by their mothers and grandmothers in the family production unit. In the case of young women, the invisibility and devaluation of the workforce, in caring for children and household chores, and in family farming, are also among the factors that stimulate the desire of younger women to leave the countryside and will therefore be addressed during the project's Gender Training sessions. Comparing the 2006 Agricultural Census and the 2017 Census, the young rural population under the age of 25 fell by 49.7%.

Among the factors that influence staying in rural areas are access to financial resources, education/training suited to the characteristics of rural areas, appreciation of rural ways of life, and the availability of services and conditions that can offer the possibility of success in agricultural production. However, in rural Paraíba, young people who decide to stay in the countryside have limited access to and control over resources, inputs, goods and technologies. The indicators for access to land and credit confirm this.

In the project area, only 9.9% of family farms are run by young people under the age of 35, indicating low access to land. When they get married, few of them are able to acquire a new property, and what often happens is that the family property is divided into smaller plots for the children, which further reduces the productive potential and profitability of agricultural activities. It should be noted that there are gender tensions in inheritance patterns, which disadvantage young rural women.

Access to credit is very limited in the Project area (see paragraph on the subject, above). Although data on access to credit is not available disaggregated by generation, it can be inferred that access to credit by young people is even more limited. The PRONAF Youth program, which was created to facilitate young rural people's access to credit, creating conditions to enable rural succession processes in Family Farming, still has a very small number of contracts signed in relation to the proportion of the young rural population. Among the causes of this low level of access is misinformation, the lack of institutions for training young farmers, the difficult bureaucratic requirements that restrict the signing of credit agreements, and the fact that bank agents often assume that young people's inexperience in managing resources will lead them to default.

However, access to technical knowledge is higher among young people under 35 than the average among family farmers in the project area. The quantitative evidence available from the 2017 Agricultural Census indicates that, among young family farm managers (under 35), 18.5% received technical assistance compared to 16.8% of all family farmer managers. Despite the higher percentage of access, it can still be said that access to TA among young people is limited. Breaking it down by gender, access to TA was 18.1% among young women and 18.6% among young men, so there was a small access gap of 0.1% between young male and female managers.

During the field visits carried out during the PROCASE II design mission, an additional growing problem faced by rural youth was identified - vulnerability to violence associated with drug trafficking.

### ***People of African descent and Traditional Peoples and Communities (PCTs):***

Indigenous peoples and quilombola communities are particularly vulnerable due to the historical dynamics of exclusion, high dependence on natural resources, marginalization of their ways of life, exclusion from formulating and accessing public policies and poor access to services, including health, education, sanitation, infrastructure and technical advisory services. In Paraíba, the Indigenous Lands (TI) are located in the coastal region. The Potiguara, with a population of approximately 19,000, are concentrated in three TIs (CARDOSO; GUIMARÃES, 2012) located in three municipalities in the Mata Norte region. In the Mata Sul region there is a population of approximately 750 Tabajara indigenous people, but there are still no Indigenous Lands in this region. On the other hand, the 2022 Demographic Census recorded a population of 16,584 quilombola inhabitants in 6,127 households in the entire state of Paraíba. These population figures include all the inhabitants recognized as quilombolas - both those who live and those who don't live in officially delimited Quilombola Territories. In Paraíba there are 47 quilombola communities with recognized certificates of self-definition. However, according to information released by the IBGE and the Federal Public Prosecutor's Office, only 11 have officially demarcated territory and none have land titles. There are also traditional gypsy populations, artisanal fishermen and shellfish gatherers in the state.

This population is impacted by the combined effects of various forms of discrimination, including gender, race and socio-economic conditions. Root causes of this exclusion are the marginalization of traditional ways of life and structural racism. Afro-descendant and PCT populations face even greater obstacles than family farmers in participating in decisions that affect their territories and in fully realizing their rights, with significant gaps in inclusion in terms of poverty, food insecurity, access to education, TA and land.

In 2023, 67.9% of quilombolas and 73.1% of indigenous people were in poverty or extreme poverty, an average higher than the average percentage of poverty in Paraíba (53.9%). In 2022, 33 million Brazilians were hungry (severe food insecurity) and food insecurity was more prevalent among people of African descent (reaching 6 out of every 10 households whose heads of household identify themselves as black or brown), with women of African descent being the most vulnerable. In terms of education, among the population of white family farmers in the project area, illiteracy reached 39.9% of those responsible for PA establishments, while among those of African descent, it reached 48.1%. With regard to access to Technical Assistance (TA), among white family farmers, 7,694 accessed TA (17.7%), and among Afro-descendants, 12,961 or 16.1% of the total. The gap between white and Afro-descendant family farmers in access to TA is 1.6%. Furthermore, among white family farmers, 77.7% have title deeds, among indigenous farmers, only 44.6% and among Afro-descendants, 70.3%. It should be noted that none of the quilombola communities in Paraíba have land titles.

To help close the various gaps in the inclusion of Afro-descendants and PCTs identified, the project will have specific actions dealing with diversity issues and will prioritize the Afro-descendant and PCT population in the actions of all its components, such as access to TA, land and environmental regularization, access to water and sanitation infrastructure and productive investments. In addition, through diversity training meetings, as well as cultural recovery activities in the communities benefiting from the project, the valorization and dissemination of traditional knowledge, practices and ways of life in production, food and natural resource management will be promoted, as well as issues related to racism.

## ***Nutrition and Food Safety***

**Food Insecurity:** According to the II VIGISAN, food insecurity (FI) in 2021/2022 affected 58.7% of Brazilian households (125.2 million people); in the Northeast, it reached 68% of households, where 12.1 million people are going hungry, i.e. at a level of severe food insecurity. The family farming sector has been hit hardest by the economic crisis of recent years, with small farmers particularly hard hit. In the Northeast, 83.6% of family farming families face some degree of food insecurity in 2021/2022. The worst levels of FI were observed in the families of family farmers who were still unable to return to pre-pandemic conditions, especially those who were unable to fully re-establish their production and marketed quantities. The most recent survey by the PENSSAN Network (2022) points to the current worsening of food insecurity, which affects 63.9% of households in Paraíba, of which 10.6% face severe food insecurity (hunger).

**Nutrition.** Despite the process of nutritional transition, with increased access to food, the state of Paraíba follows the national trend and the rest of the Northeast region and faces a double burden of malnutrition, marked by both malnutrition and an increase in the prevalence of overweight. Among adults in Paraíba, 62.5% are overweight (35.5% overweight and 27.0% obese). Growth retardation affects 4.9% of children under 5, thinness and marked thinness 4.2%, overweight 8.4% and obesity 6.8%.

The situation in Paraíba is exacerbated among the most vulnerable groups, such as quilombola communities, which continue to have socio-economic disadvantages that are reflected in higher morbidity profiles, especially in relation to nutritional disorders. In addition, women of reproductive age have greater nutritional needs than men and for this reason usually have worse nutritional indicators than men of the same age, and therefore need differentiated attention. Research shows that in the Northeast, the prevalence of underweight among pregnant women is as high as 18%, compared to 6.7% in the rest of Brazil.

The main root causes of food and nutritional insecurity in the Project area are the declining quality of and difficult access to water for human consumption and food production; the limited capacity for food production and productive diversification; the low quality of the food consumed; the lack of productive infrastructure; and the low levels of food and nutritional education. It is worth highlighting the direct correlation between food and nutritional insecurity and poverty rates (69.9% of family farmers registered in the Single Registry (Cadastro Unico/CadUnico) in the project area live in poverty or extreme poverty) and environmental restrictions (such as lack of basic sanitation, interruptions in water flows and poor quality of water sources). Access to quality water and sanitation plays a fundamental role in combating different forms of malnutrition. Only 39.4% of households in the project area have access to a public sewage system and 63.2% are connected to a public water supply system.

To tackle the causes of malnutrition and food insecurity, PROCASE II will support agro-ecological gardens, the valorization of Non-Conventional Food Plants (NCFPs) and support for access to water. Among the most common PANCs in the state are the cactaceae, which include species such as Mandacaru, Quipá, Xique-xique, Palmatória, Facheiro and Coroa-de-frade. These plants are characterized by the presence of thorns and slimy stems, which allow them to survive dry climates and high temperatures. This will aim to increase the availability of food for the most vulnerable families, increase the availability of water for human consumption and thus improve their food and nutritional security, while also limiting the diseases responsible for the malabsorption of micronutrients. The project will also have a cross-cutting sub-component, in which a Nutrition and Food Security Plan will be drawn up and implemented, focusing on exchanges and training. These actions will enable adults and young people to learn about good food practices, culinary practices and gastronomic culture, and will respond to the needs of families and target groups in terms of processing and promoting their

products, particularly those from family farming. All of these practices will be integrated into the design and implementation of the Resilient Investment Plans, thus seeking effective implementation and results in terms of food and nutritional sovereignty.

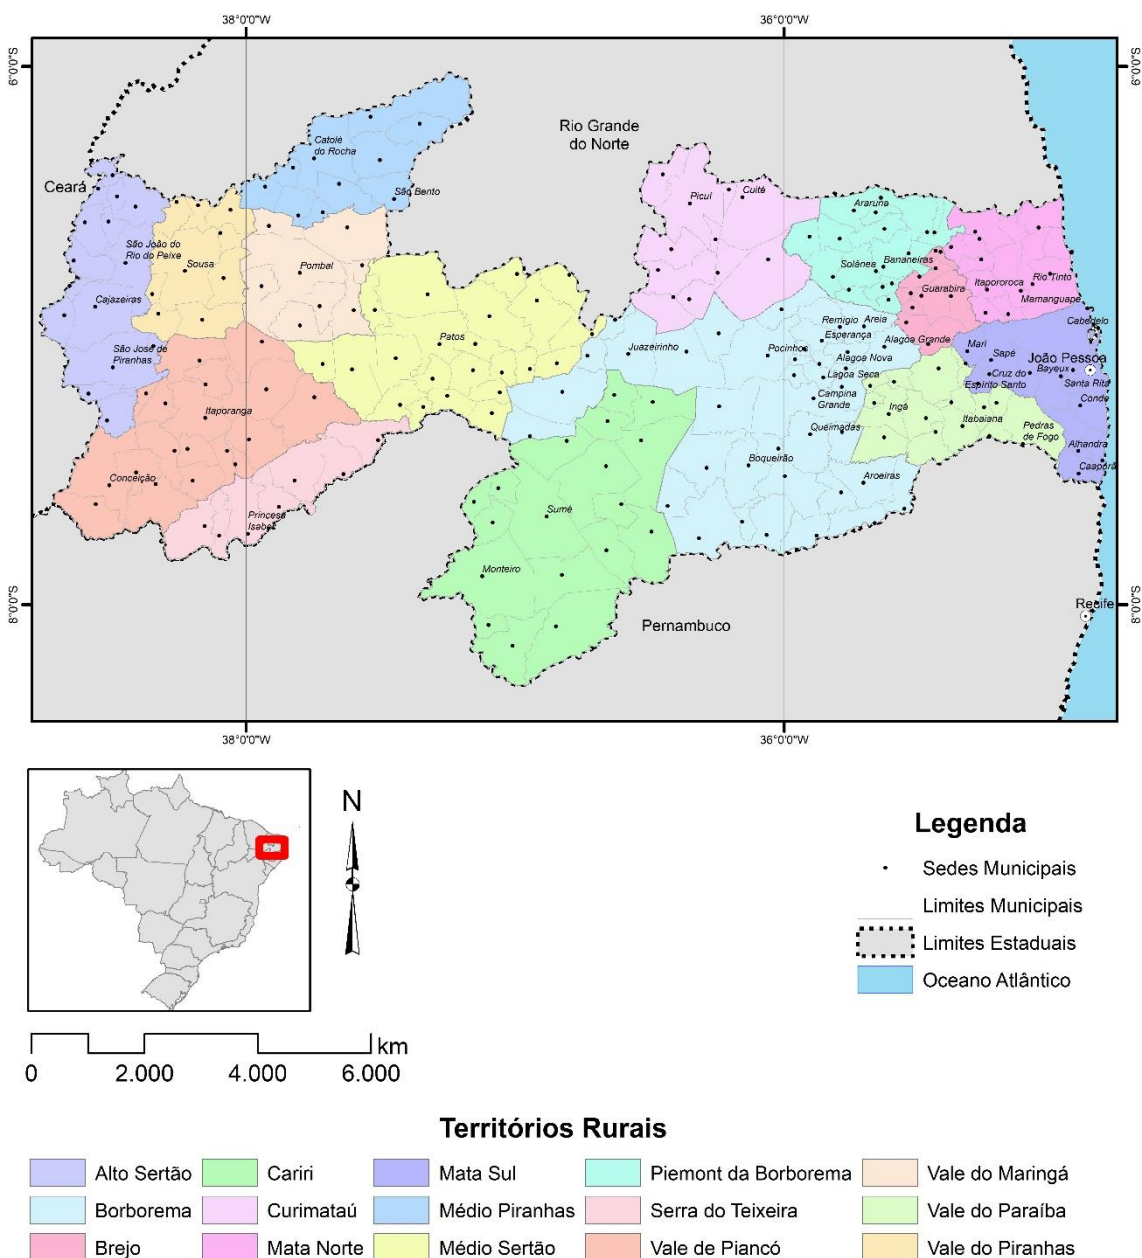

### **Area of coverage**

The project will cover the entire state of Paraíba, involving its 223 municipalities (see figure below), which are distributed between the Caatinga (194) and Atlantic Forest (29) biomes. The Agricultural Census (IBGE 2017) shows a total of 163,218 agricultural establishments, 76.88% of which are family farms (UAF), from which the project will select its beneficiaries.

The project will seek to serve approximately 60,000 families as direct beneficiaries, establishing a preferential focus on the following profiles: women, young people, persons with disabilities, Traditional Peoples and Communities (PCT), indigenous peoples, fishing communities and gypsies. In any case, specific criteria will be defined for the prioritization and selection of communities to be benefited, involving issues such as cultural traditionality, the need for access to basic sanitation, the rate of families registered with CadÚnico, families who have not benefited from other similar projects, the level of representation of gender, youth and persons with disabilities, the level of environmental degradation and the lack of ATER service.

The following map shows Procasa II's area of operation.

**Figure 1 - Area covered by the Project**

Source: IBGE, 2015 - elaboration: Consultoria.

### 5.1 Quilombola communities

In Paraíba, according to the State Coordination of Black and Quilombola Communities of Paraíba - CECNEQ/PB, there are currently 49 self-recognized quilombola communities, of which only 3 are not certified by the Palmares Cultural Foundation. The quilombola communities are spread over 28 municipalities in the state: João Pessoa, Conde, Areia, Alagoa Grande, Ingá, Riachão do Bacamarte, Serra Redonda, Mogeiro/Gurinhém, Dona Inês, Nova Palmeira / Picuí, Boa Vista, São João do Tigre, Serra Branca, Camalaú, Santa Luzia, Várzea, São José de Princesa, Tavares, Livramento, Manaíra, Cacimbas, Catolé do Rocha, Bento, Cajazeirinhas, Coremas, Pombal, Diamante, Triunfo (CECNEQ/PB, 2023).

The survey carried out by the IBGE in the latest Demographic Census (2022) reveals that there are 16,765 quilombola residents in Paraíba. According to the survey, the

municipalities in Paraíba with the highest number of quilombola residents are Conde (3,008), João Pessoa (2,260), Cacimbas (1,698), Santa Luzia (1,325) and Alagoa Grande (946). In total, 51 municipalities in the state have a quilombola population.

If we analyze the ratio between the number of quilombolas and the population of each municipality, we can see that the highest rates are found in the municipalities of Cacimbas (23.5%), Conde (10.9%), Diamante (9.4%), Santa Luzia (8.9%), Riachão do Bacamarte (8.8%) and Dona Inês (7.8%). In the state capital, João Pessoa, this proportion is only 0.3%.

In Paraíba, the process of titling quilombola land takes a long time. Currently, only five quilombola communities have a concession contract for the real right of collective use of the territory, which guarantees collective possession, but not definitive titling as provided for by law. Some communities, such as Matão in Gurinhém and Pedra D'Água in Ingá, only have partial possession of the territory. Others, such as Engenho do Bonfim in Areia, Grilo in Riachão do Bacamarte and Caiana dos Crioulos in Alagoa Grande, have a concession contract for the real right of collective use of the territory. It is estimated that there are around 4,000 quilombola families in Paraíba, according to data from CECNEQ-PB (CECNEQ/PB, 2023).

Quilombola communities in Paraíba are predominantly located in rural areas, although they also exist in urban areas. Geographically, quilombos are mainly concentrated in the Sertão mesoregion of Paraíba, which is divided into two microregions, Alto and Médio Sertão, where 27 quilombola communities can be found. This is followed by Western and Eastern Cariri, with 9 communities, followed by Agreste, Brejo and Curimataú, with another 9 quilombola communities. Finally, the micro-region with the fewest communities is the coast, with only 4 quilombos, totaling 49 quilombola communities in the entire state (CECNEQ/PB, 2023).

The following table gives a brief description of the quilombola communities located in Paraíba, by Rural Territory.

**Table 1 - Quilombola Communities in Paraíba by Rural Territory**

TR Alto Sertão					
Municipality	Community	No. of families	Territorial situation	Current Stage FCP Process	Main economic activities
Triunfo	The forty	65 families	Urban Quilombo. No Process	Certified	Small businesses
Cachoeira dos Índios	Cipó Farm	40 families	Awaiting certification from Palmares	-	Family-based agriculture, raising small and medium-sized animals. Production with productive backyards. Small businesses
TR Borborema					
Municipality	Community	No. of families	Territorial situation	Current Stage FCP Process	Main economic activities
Alagoa Grande	Caiana dos Crioulos	150 families	Demarcated	Certified	Family farming, fruit growing, small and large animal husbandry, small businesses
Sand	New World	40 families	In the final process of demarcation	Certified	Family farming, small and large animal husbandry
	Bonfim Mill	28 families	Demarcated	Certified	Family-based agriculture, horticulture with agroecological and organic production, small animal husbandry
Boa Vista	Santa Rosa	95 families	In the process of being demarcated	Certified	Family farming, raising small and large animals. Production of crockery and medicinal plants
Livramento	Sussuarana	101 Families	Not checked in yet	Certified	Family farming, small and large animal husbandry
	Vila Teimosa				
	Summer sand				
TR Cariri					
Municipality	Community	No. of families	Territorial situation	Current Stage FCP Process	Main economic activities
Camalaú	Roça Velha/Rua Preta	-	-	Certified	-
São João do Tigre	Cacimba Nova	85 families	In the process of being demarcated	Certified	Family-based agriculture, raising small, medium and large animals. Income production

Serra Branca	Lightweight	60 families	Not checked in yet	Certified	Family farming, raising small and medium-sized animals. Crockery production
	Corner	45 families	Not checked in yet	Certified	Family farming, raising small and medium-sized animals. Production of jam, sweets, spices, clay or earthenware dishes, rag dolls
	Roça Velha	126 families	In the process of being demarcated	Certified	Family farming, small and large animal husbandry
<b>TR Curimataú</b>					
Municipality	Community	No. of families	Territorial situation	Current Stage FCP Process	Main economic activities
Nova Palmeira	Serra do Abreu	27 families	In the initial demarcation process	Certified	Family farming, umbu extraction, small, medium and large animal husbandry. Production of jam, sweets, spices, crockery
<b>TR Mata Sul</b>					
Municipality	Community	No. of families	Territorial situation	Current Stage FCP Process	Main economic activities
Contagem	Gurugi	200 families	In the process of being demarcated	Certified	Family-based agriculture, mangaba extraction, fruit growing, fishing and small businesses. Handicrafts made from natural oils, clay dishes and vines. Raising small, medium and large animals
	Ipiranga	202 families	In the process of being demarcated	Certified	Family farming, fishing and small businesses. Handicrafts made from natural oils, bio-jewelry with seeds and plant fibers
	Mituaçu	350 families	Without the demarcation process	Certified	Family farming, fruit-growing, fishing and small businesses. Liana handicrafts. Raising small, medium and large animals

In the TR Vale do Maringá, in the municipality of Pombal, there is the "Os Rufino" quilombola community, which, among other economic activities, stands out for its production of handicraft pottery. Speaking to representatives of the community, they say that they take paint from angico and aroeira trees to paint ceramics, and that traditional handicrafts are a very old activity. In 2013, they began to leverage and improve their handicrafts, with men and women working proportionally. They sell their handicrafts in João Pessoa, at the Tambaú public center, in Soledade, in Pombal, at the solidarity economy house, and in Catolé do Rocha. They also produce beans, corn, rice, coriander and spring onions and keep chickens, pigs, dairy cattle and sheep.

There is a cycling event in June, held in the community itself, which is very popular, with the 3rd edition being held this year, 2024. This event helps generate income for the community.

Among the community's concerns, they say that when it floods, they have problems with access, being stranded and, for example, restricting children from going to school.

They use firewood from jurema and marmeleiro trees, but only use wood from dead or fallen trees. Soapstone, sand, oil, sandpaper, a fine sieve and clay are all inputs in the

production of their handicrafts. They reuse all the waste generated in the production of their handicrafts, redoing the sandpaper and reusing broken pieces in the process. They wear PPE, such as goggles to protect against possible accidents with the grinding machine, and a mask to protect against dust inhalation.

In the rainy season, the clay takes a long time to dry and they lack the structure to dry it properly. The source of the clay is on the mesa, in the highlands near the community, and you have to walk between 600 meters and 1 km to reach it.

With regard to their health, they mentioned rheumatism, arthrosis and wear and tear on their joints. They were told by a health worker that this could be due to genetic factors. Anemia, diabetes and high blood pressure are other ailments mentioned.

## 5.2 Indigenous communities

According to information from FUNAI, Brazil's indigenous reserves occupy 13.8% of the country's territory, covering 1,170,579.17 square kilometers distributed over 566 recognized indigenous lands. The only states without demarcated indigenous areas are Rio Grande do Norte and Piauí.

According to the latest IBGE Demographic Census (2022), there are currently 30,140 indigenous people living in Paraíba, of whom 19,044 live on indigenous lands and 11,096 outside them.

As for the indigenous population, Paraíba is home to two peoples: the Potiguar and the Tabajara.

The Tabajara people are located on the south coast of Paraíba, in the municipalities of Conde, Pitimbu, Alhandra and the outlying districts of João Pessoa. Currently, it is estimated that there are around 1,500 Tabajara indigenous people in Paraíba. Their original language is Tupi, which is in the process of being re-appropriated, but like most indigenous groups in the Northeast, they speak Portuguese. The Tabajara have four villages in the municipalities of Conde and João Pessoa: Barra de Gramame Village, Nova Conquista Taquara Village, Severo Bernardo Village and Vitória Village. Their lands have not yet been identified and delimited, however, between 2009 and 2010, an anthropologically based study was carried out, which brought together elements of a historical, sociological, land, ethnographic and environmental nature on the claimed area, for the ethnic characterization of the Tabajaras of the South Coast of Paraíba (PARAÍBA, 2020).

The Tabajara emerged in the 21st century as part of a process of reclaiming their identity and traditional territory, at the Sítio dos Caboclos, in the former Sesmaria da Jacoca, in the municipality of Conde. The name Tabajara is translated in ancient Tupi as: *taba* = village + *jara* - from *yára* = lord, owner, the one who dominates, so the Tabajara call themselves "Lords of the Village." (TABAJARAPB, 2024).

The Potiguara people, for their part, are located on the northern coast of Paraíba, in 32 villages situated in three municipalities in the coastal region: Baía da Traição, Marcação and Rio Tinto. With a population of approximately 19,000 indigenous people, including inhabitants of the villages and the towns of Baía da Traição, Marcação and Rio Tinto, the Potiguara are concentrated in an area of the northern coast of Paraíba situated between the Camaratuba and Mamanguape rivers. An unaccounted number of people also live in other cities such as Mamanguape, João Pessoa and even in Rio de Janeiro or Rio Grande do Norte. The villages together make up three contiguous Indigenous Lands (TIs), totaling 33,757 hectares. The Potiguara TI has a population of 8,109 people, the Jacaré de São Domingos TI has 449 people and the Potiguara de Monte Mór TI has 4,447 people (FUNAI, 2012).

The territory is located over the area of the municipalities of Baía da Traição, Rio Tinto and Marcação. The PB-41 highway crosses the Monte-Mor and Potiguara Indigenous Lands, connecting Rio Tinto and Baía da Traição. Other dirt roads cut through the indigenous territory, connecting the villages to each other and to urban centers. Most of the villages have a school, health center and flour houses, as well as churches, including the iconic church of São Miguel, in the village of the same name, and Nossa Senhora dos Prazeres, in Monte-Mor (FUNAI, 2012).

The Potiguara belong to the Tupi linguistic family, currently speaking Portuguese and seeking to revive Tupi through indigenous school education. Like other peoples of the Northeast, they have an extensive history of interaction with non-indigenous society (FUNAI, 2012).

The Potiguaras are possibly the only indigenous people in Brazil who still live in the same place since the arrival of the colonizers 500 years ago. Historical records and documents from the state of Paraíba highlight the continued presence of the Potiguara on the coast of Paraíba, especially in Baía da Traição, since the first years after colonization. The Potiguara resisted attempts to conquer their territory by fighting bravely and through various forms of resistance and indigenization of elements of western, white culture (FUNAI, 2012).

The basis of the Potiguara economy is agriculture and fishing. Historical records show that their ancestors had advanced agriculture and an abundance of food. In recent times, however, the situation has changed drastically. The advance of the invasion of indigenous lands, the degradation of the environment, the economic and social devaluation of agricultural activity and the consequent degradation of the soil have made farming a difficult task. The main tension in this field is between traditional agriculture (the *roça*) and sugar cane cultivation, which compete for the same area, but follow different and often conflicting logics (FUNAI, 2012).

Between the house and the farm, the Potiguaras grow medicinal plants, vegetables, fruit trees and coconut palms, as well as ornamental plants and other plants of spiritual value (for example, to protect the house from the evil). The backyards are also home to native plant species that were kept in the area when the site was opened up. The production of fruit and coconut trees can be destined for family consumption or for sale, as is the case with most coconut sites (FUNAI, 2012).

The cultivation system practiced by the Potiguara is commonly known as "roça de coivara". The fields are "opened" in the arisco and paū. Some villages have little or no arable land available for planting, either because they are located close to the sea or because sugarcane monoculture competes for the land (or both). Other villages, further inland, grow plenty of swiddens (even though sugar cane is present). The villages where the most swiddens are planted are Tracoeira, Santa Rita and Laranjeiras along the Sinimbu River; Estiva Velha on the banks of the Estiva River; and the retaken area of Três Rios. Camurupim, on the other hand, located near the Sinimbu river, has no area to plant and the families live mainly from fishing, shellfish gathering and carcinoculture (FUNAI, 2012).

The Potiguara fish in the mangroves, rivers, estuaries, sea and tide all year round, using a variety of fishing techniques. With an in-depth knowledge of ecosystems and the life of aquatic organisms, these fishermen are able to locate them and choose the most suitable techniques for catching them. The organisms caught include fish, shrimp, crabs, lobsters, shellfish and octopus. Most of the fish is for the family's own consumption and, depending on the commercial value of the species caught, it is sold, exchanged and donated to relatives and friends (FUNAI, 2012).

Raising small and large animals is also an important source of food and financial resources for many families. Among the animals raised (chickens, goats, cattle, horses and bees), chickens, bees and cattle stand out for their social and economic importance (FUNAI, 2012).

With regard to religious traditions, Catimbó-Jurema stands out as a religious manifestation that traces its origins back to ancient indigenous groups that inhabited northeastern Brazil. As a cult, it is assimilated as a tradition of knowledge that proceeds from the articulation of an experience through an "initiation". The sacred spaces are directly associated with the religious practices of the renowned Mestra Juremeira, who, even though she is no longer alive, marks a space that still concentrates the memory of the juremeiros and still holds many affective memories (GOMES, 2021).

Catimbó-Jurema is a hybrid cult, originating from the contacts between indigenous, European and African spiritualities that took place on Brazilian soil from the 16th century onwards.

Jurema (*Acacia jurema Mart.*) is one of the many species of acacia. Several species of Acacia native to northeastern Brazil have the popular name of Jurema. The Indians of northeastern Brazil considered the "Acacia jurema" (Jurema, Jerema, Calumbi) to be their sacred tree, around which the tradition known today as "sacred Jurema" developed.

Jurema has the following definitions: thorny tree, hallucinogenic or bewitching drink made from the bark, roots or fruits of Jurema and used in ritual; forest where ancestral spirits live<sup>4</sup>. Jurema, whose name characterizes the religiosity in question, represents a ritualistic drink that is attributed entheogenic properties<sup>5</sup> (GOMES, 2021).

However, according to Silva (2017, p. 22. In: GOMES, 2021) Jurema is also the name of a goddess or mystical entity revered by this cult. According to Oliveira (2011, p. 1,097) "the jurema itself still represents and materializes a goddess, since, for most indigenous

<sup>5</sup> Type of substance that alters consciousness

peoples of the Northeast, the supreme deity of existence would be a woman (Mãe Tamain)".

The drink that gives this religious universe its name is made from black jurema, whose origins go back to pajelança and Toré. According to Câmara (2005, p. 662 - 663. In: GOMES, 2021), Pajelança is an action of the Amazonian sorcerer where he seeks to "achieve traditional therapeutic formulas" by contacting "enchanted spirits" who were represented as both men and animals. Toré is presented as a variant of catimbó, a ceremony in which the caboclos or the enchanted, at the behest of the "mestre", come down to teach remedies, as in a candomblé of caboclos, important elements that sustain the indigenous structure of the sacred.

Some Catimbó-Jurema entities move between Jurema and Umbanda, such as Exu and Pombagira. Caboclos, on the other hand, are of indigenous origin and are generally associated with healing through phytolatr, due to their knowledge of herbs and healing plants, as well as benedictions. In addition to Caboclos and Mestres, there are also entities from other religious forms, such as Catholic saints; entities from Umbanda and Xangô such as Exu, Pombagira and Preto-velho; as well as generic references to "God" as a supreme deity who is almost always welcomed, but who does not manifest (GOMES, 2021).

The main rites are called Juremação and Tombo de Jurema. Juremação consists of a kind of rite of preparation in which the disciple receives more knowledge than that which is considered natural or from birth. In this rite, the science or seed of Jurema is given and inserted into the body of the juremeiro (BRANDÃO; RIOS, 2011, p. 172. In: GOMES, 2021).

### 5.3 Fishing communities

Traditional fishing is carried out individually or as part of a family system, for commercial or consumption purposes, where the fishermen themselves create and use the artifacts and their craft, and may or may not be assisted by small boats. It is an activity with a major social and economic impact in Brazil due to the volume of people involved and the extent of the territory they occupy, between river basins and the coast. The Ministry of Fisheries and Aquaculture (MPA) licenses the profession of fisherman, as well as promoting actions linked to the infrastructure and marketing of fish. Fishermen and fisherwomen registered with the colonies are entitled to receive unemployment insurance in the months when fishing for certain species is prohibited, as well as easy credit to buy diesel fuel for their boats. The MPA also promotes, in partnership with other institutions, training programs for fishermen and incentive actions (DE LIMA, 2016).

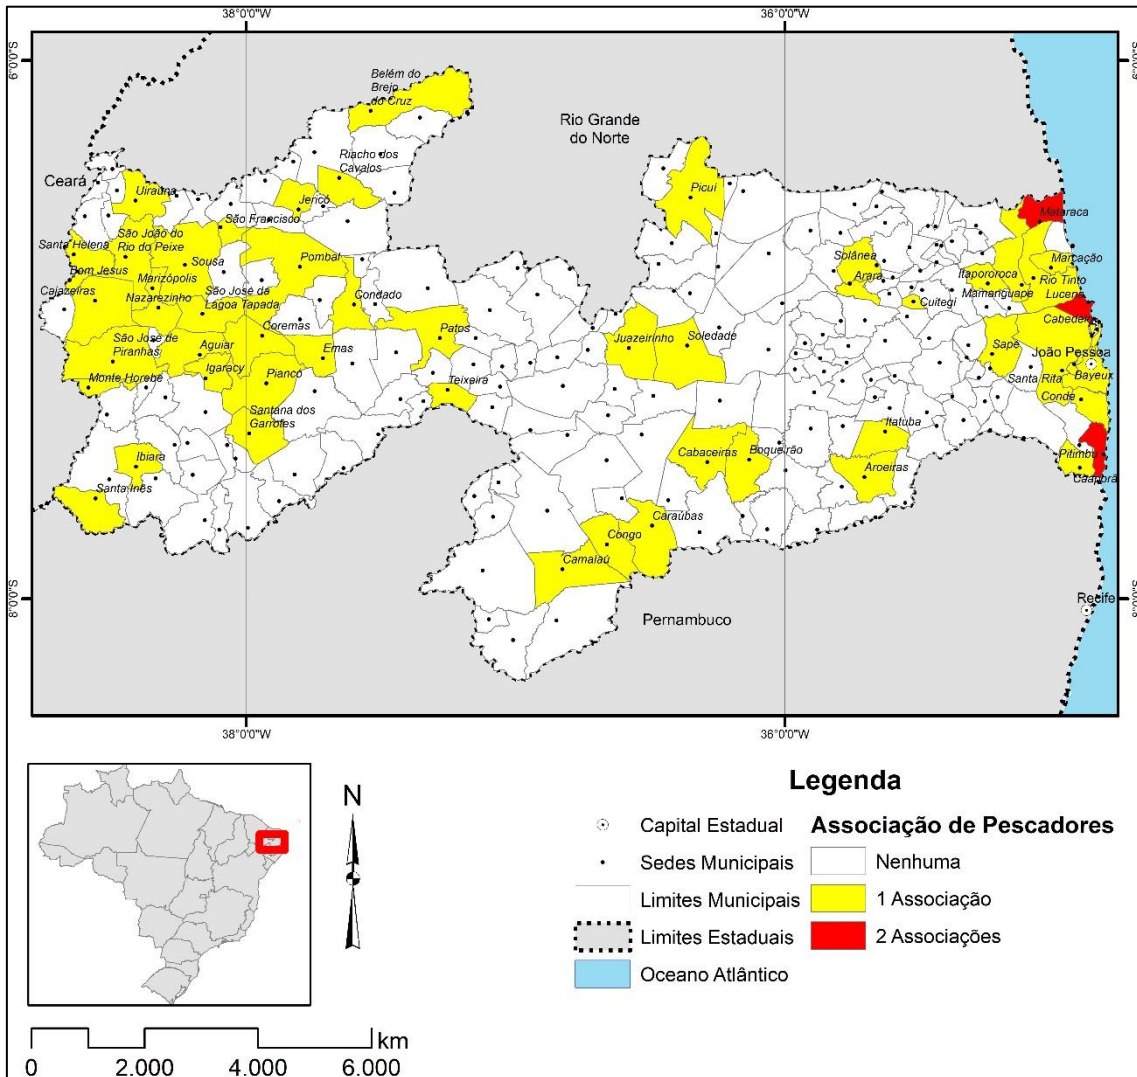

In 2009, the MPA registered just over 800,000 fishermen involved in the activity. However, considering the case of Pernambuco, where only half of the fishermen are registered, it is assumed that the real number is much higher. According to Vasconcellos et al (2014), approximately 2 million people are involved in fishing, and half of the fish

produced in Brazil comes from artisanal fishing. However, there are discrepancies in the data, since according to IBAMA (2008), the production of artisanal fishing corresponds to 65% of the national total and, according to calculations by the Movement of Fishermen and Fisherwomen of Brazil, it reaches 70% (DE LIMA, 2016).

In Paraíba, according to data collected by PROCASE, there are a total of 57 fishing communities/associations/colonies, spread over 54 municipalities in the state, as can be seen in the figure below.

**Figure 5 - Fishermen's associations in Paraíba**

Source: Technical Team, 2024.

Located on the south coast of Paraíba, in the metropolitan region of João Pessoa, the community of Acaú is an extractive reserve called RESEX Acaú-Goiana, situated in the municipality of Pitimbu. According to the local inhabitants, Pitimbu has indigenous origins and means "eye of water of smoke", since it was the territory of the Tabajara and Potiguar peoples (GOMES, 2016).

The Acaú community makes its living mainly from extractive activities, with fishing resources guaranteeing their self-sufficiency. Created on September 26, 2007, the Resex Acaú-Goiana is one of the 320 federal Conservation Units managed by the Chico

Mendes Institute (ICMBio). Its aim is to protect the livelihoods, guarantee the use and conserve the renewable natural resources traditionally used by the extractivist population of the communities of Acaú, Tejucupapo, Povoação de São Lourenço, Carne de Vaca and Baldo do Rio, located in the municipalities of Caaporã (PB), Pitimbú (PB) and Goiana (PE) (GOMES, 2016).

In Acaú, as in the other traditional communities of the Acaú-Goiana RESEX, the main extractive activities are related to artisanal fishing. Fish, shellfish and other molluscs, crustaceans such as crab, crab, lobster and shrimp, are the most commonly caught fish. Production has several destinations, but most of the shellfish harvesting is still for personal consumption, and the activity is mostly carried out by women, who have been organizing themselves through the Acaú Shellfish Growers Association (AMA) (GOMES, 2016).

The Association of Shellfish gatherers (AMA) was founded in 1997 and currently has 200 members, but has already reached 600 participants. They are women of Afro-indigenous descent, most of whom are shellfish gatherers and shellfish artisans. Local artisans use solid shellfish waste to make their handicrafts.

According to information from the AMA, it was the shellfish gatherers who asked for the RESEX to be created and the leaders took part in its Management Plan, with community councillors taking part in its management. The shellfish gatherers pay 15 reais a month to be part of the association and only benefit from health insurance. The shellfish gatherers' children have no interest in the trade because they see no opportunity for growth.

The shellfish gatherers leave home at 5am, and they still have their home activities to attend to before leaving for work. The AMA has no infrastructure for logistics and seafood storage (refrigerator or collective freezer). The shellfish gatherers also point to the lack of the simplest equipment and utensils to carry out their work, such as long blouses, sunscreen or a wheelbarrow to carry equipment, material and products.

On average, shellfish gatherers harvest around 5 kg of shellfish a day per person. Some of them use a long-handled cudgel, which is forbidden by law at first, but makes it easier to catch shellfish without having to crouch down to avoid health problems. Each shellfish gatherer produces around 3.5 kg a day.

Shellfish shells are used for handicrafts, but there is still a lot left over, generating a significant amount of waste. The shellfish gatherers are thinking of a project to use the shell to encase building bricks, and some have already used it in their own homes to make flooring instead of gravel.

To make their crafts, they use materials such as cotton string, leftover shells from the beach, glue, wire, fish scales and so on. They make bottles with shells, crafts with coconut, figures with shellfish shells, etc.

These shellfish gatherers don't sell their products to the public sector because they can't meet the required criteria, such as vacuum packaging.

**Photo 8 - Site of the AMA (Association of Shellfish gatherers of Acaú), in the municipality of Pitimbu**

*Source: Technical Team, 2024.*

**Photo 9 - Handicrafts produced at AMA**

Source: Technical Team, 2024.

The technical team also visited the municipality of Soledade the Z-27 Fishermen's Colony, which currently has almost 300 fishermen. The Colony offers technical assistance, closed season insurance, processing, sickness and maternity benefits, support for programs to buy houses, land and registration with the PAA. It has a processing shed and a processing area under construction, but it doesn't yet have the machinery. It will soon have a cold room for storage.

Information from the association reveals that it has no concerns about industrial fishing in the region, since fishermen don't face competition from this type of production. Their main complaints are the lack of permanent technical support; the lack of transportation for fishing and transportation for the products; and the lack of new technologies to bring younger people closer to the trade.

The fish they catch include tilapia, curimatã, tucunaré, piau, branquinha and traíra. During the dry season, the women catch piaba with a clay pot. Normally, the fisherman cuts off the fish's head and cleans it, leaving the waste in the weir itself. He then removes the hide and prepares the fillet. Some of the products sold by the association are fillets, boneless fish, breaded fish, hamburgers, sausages and flour.

The closed season for piau, curimatã and branquinha fish species lasts about three months, from December to February. Fishing with trawling equipment and tarrafa is forbidden and associated fishermen use nets with 9 cm mesh for larger fish, 1 cm for shrimp, and 1.5 cm for piabeira. Some people hunt fish with harpoons and "shotguns" as a sport, which is also prohibited by law, using the big dam to catch larger fish.

It was pointed out by a representative of the association that sometimes fishermen stay in the lagoon for an extra day because they haven't caught enough fish and extend their

stay to try to increase production, running the risk of losing part of what has already been caught due to a lack of suitable storage equipment.

In situations where the reservoir dries up, the fishermen go to another nearby state, for example Rio Grande do Norte, in search of other sources. The association sells to the PAA and the fishermen also sell at the open market on their own.

The Colony's fishermen point out incidences of skin and lung cancer, diabetes and motorcycle accidents on the way to work. Drowning also occurs, but not as often. Finally, fishermen may have an accident when they step on something in the weir.

#### **5.4 Gypsy communities**

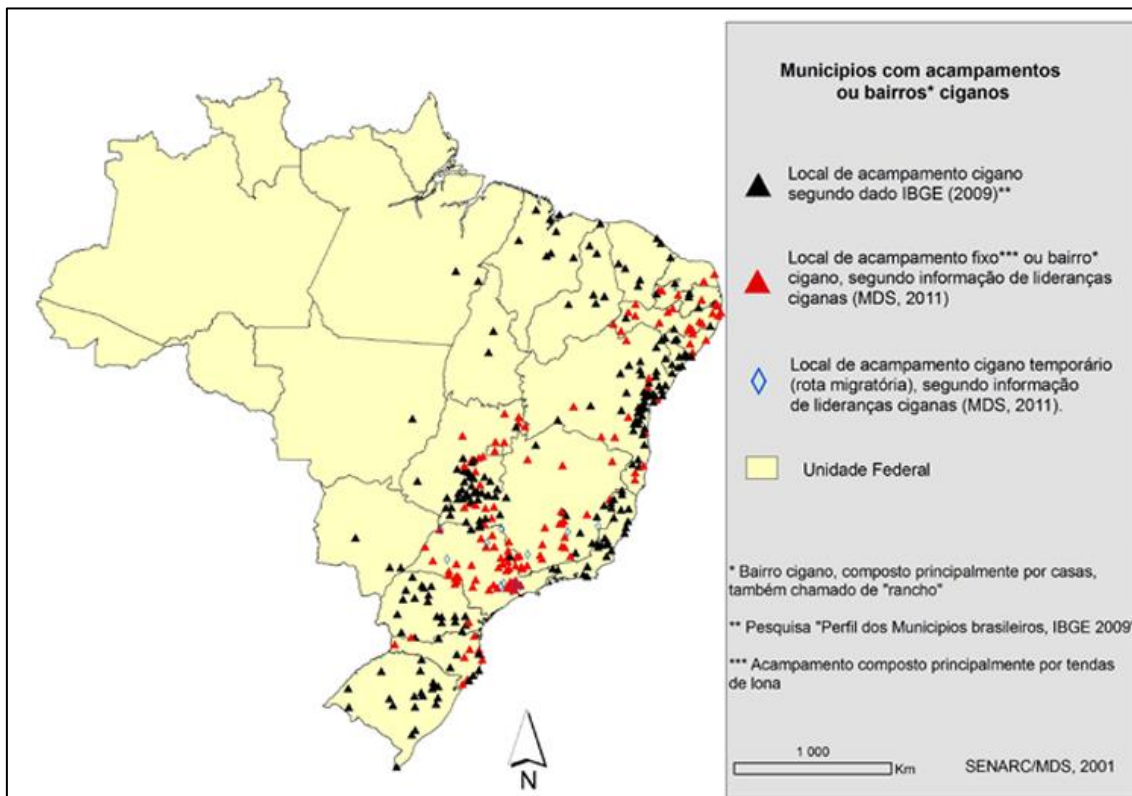

To this day, the origins of the Gypsy Peoples continue to be the subject of research. The predominant theory today states that they have their roots in India and that, around a thousand years ago, they began their dispersal around the world (BRASIL, 2013).

In Brazil, the first official record of the arrival of gypsies dates back to 1574: a decree by the Portuguese government deported the gypsy João Torres and his wife Angelina to Brazilian lands for five years. The country is home to at least three distinct Roma ethnic groups: Calon, Rom and Sinti, each with their own languages, cultures and traditions (BRASIL, 2013).

The Brazilian Rom belong mainly to the Kalderash, Machwaia and Rudari sub-groups, which have their origins in Romania; the Horahané, from Turkey and Greece, and the Lovara. In addition to these, there are the Calons, who have a strong presence in Brazil and throughout the country, and have their roots in Spain and Portugal. The Sinti mainly arrived in Brazil after World War I and II, coming from Germany and France (BRASIL, 2013).

There is still little official information available on the Roma population. According to the IBGE's Municipal Basic Information Survey (MUNIC), in 2011 there were 291 Roma encampments in 21 Brazilian states. The highest concentration of camps was in the states of Bahia (53), Minas Gerais (58) and Goiás (38). Municipalities with between 20 and 50 thousand inhabitants have the highest concentration of camps. In terms of the total Roma population, it is estimated that there are more than half a million in Brazil (BRASIL, 2013).

**Figure 6 - Map of Roma Communities, by municipality - Brazil, 2011**

Source: Secretariat for Policies to Promote Racial Equality - SEPPIR. Guide to Public Policies for Gypsy Peoples, 2013.

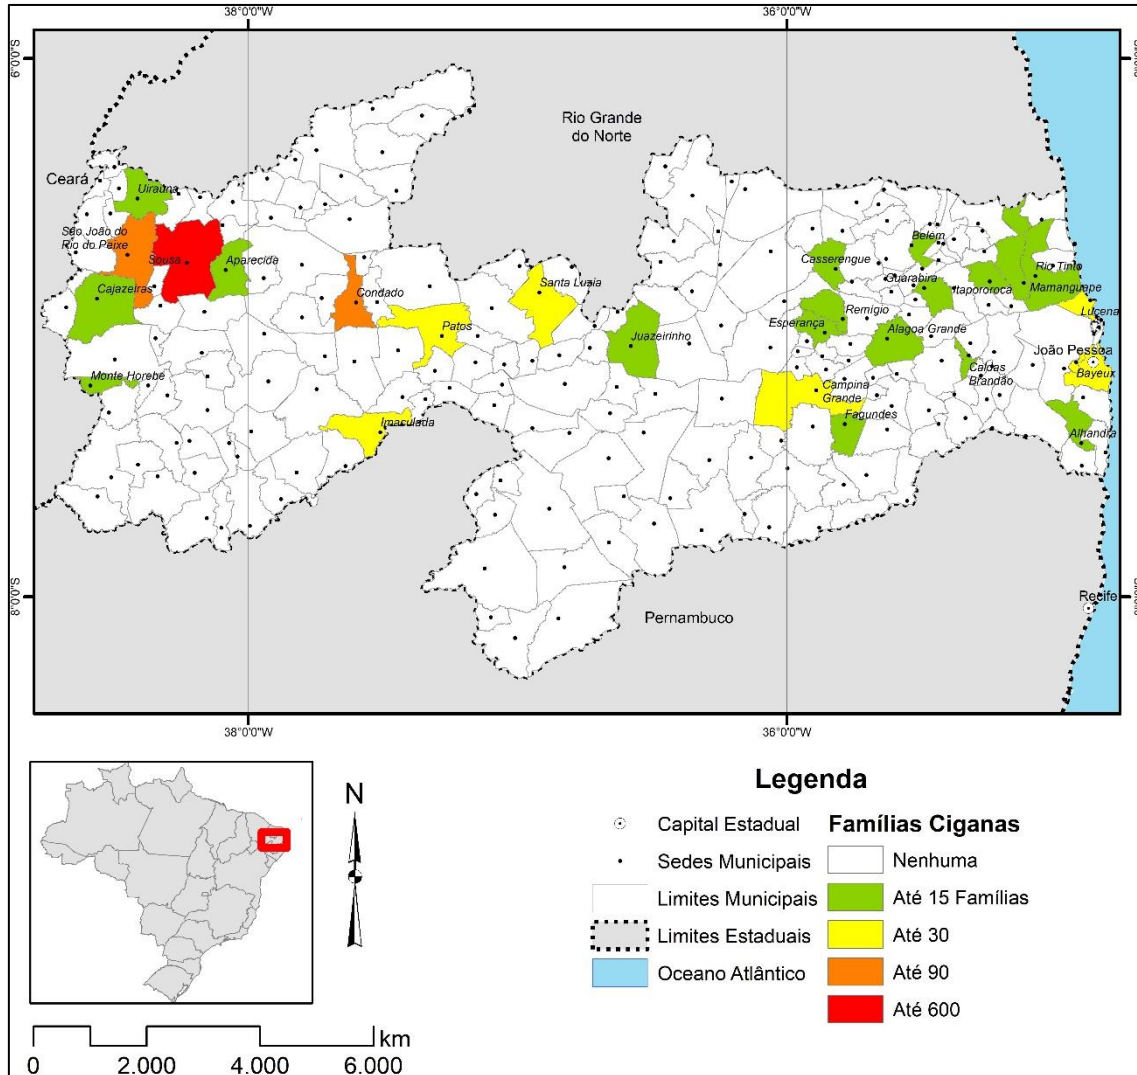

Gypsies are considered "traditional peoples and communities", as defined in Decree 6.040/2007 article 3, because they are: "Culturally differentiated groups who recognize themselves as such, who have their own forms of social organization, who occupy and use territories and natural resources as a condition for their cultural, social, religious, ancestral and economic reproduction, using knowledge, innovations and practices generated and transmitted by tradition" (GOVERNMENT OF THE STATE OF PARAÍBA, 2022).

According to researchers of Roma culture, these people have suffered discrimination in various countries for centuries, calling "attitudes, acts or policies contrary to Roma interests and rights" anti-Gypsyism. (MOONEN, 2011 p. 6. In: GOVERNO DO ESTADO DA PARAÍBA, 2022). This is the main factor that explains the nomadic lifestyle and the use of agraphic dialects as a form of protection for these people. Given this context, historical records about the Roma people are not precise, making it difficult to systematize profiles and more in-depth characteristics about them; and thus interfering with the population's access to their rights as citizens and the construction of adequate public policies.

Approximately 1,500 gypsies live in Paraíba, and more than 95% of them are concentrated in the state's Sertão region, mainly in Sousa, which is home to the largest gypsy community in Brazil. Grouped together in communities on the outskirts of the cities, the Roma of the Calon ethnic group face a lack of infrastructure, basic sanitation and sewage disposal. In addition, they deal with high levels of unemployment, which are exacerbated by the prejudice they face (PARAÍBA, 2020).

The figure below shows the number of gypsy families and their location in different municipalities in Paraíba.

**Figure 7 - Gypsy Families in Paraíba**

Source: Technical Team, 2024.

The gypsies of Sousa/PB have settled on land flanked by the BR 230 highway, 3 kilometers from the city center. They claim an area of 7.008 km<sup>2</sup>, with a perimeter of 12.786 km, in the areas bordering the urban core, as can be seen in the figure below (MANGUEIRA; CAMPOS, 2023).

**Figure 8 - Territory claimed by the gypsies in contrast to the urban center of Sousa/PB**

Source: Paraíba Calon, gypsy "sim sinhô": Analysis of the production of urban space in a traditional community in the municipality of Sousa (PB) during forty years of sedentarization, 2023.

The group led by Pedro Maia was the first to settle in the territory, choosing a higher area than those around it. Years later, Vicente and Eládio's groups settled in a lower area, giving rise to the communities known as Rancho de Baixo and Rancho de Cima. These ranches are separated from each other by about 1 kilometer, with a mediation zone known as "Várzea das Almas", a mixed area made up of gypsies and non gypsies. Despite these two nomenclatures, the community is divided into four, named after the leaders who once headed each community. They are: Manoel Valério Correia, Otavio Maia, Vicente Vidal de Negreiros and Pedro Benício Maia. According to data collected by the State People's Housing Company (CEHAP) in 2020, 1,845 people live in this gypsy community, spread over 522 families (MANGUEIRA; CAMPOS, 2023).

There is no sewage system in the community, and sewage is left out in the open without any treatment, contributing to the appearance of water-borne diseases. There is an artesian well in the Pedro Maia community, but it is not enough to supply all the local gypsies. Therefore, the gypsies don't have easy access to drinking water either (MANGUEIRA; CAMPOS, 2023).

Several families in the community are characterized by being below the poverty line, highlighting the difficulties faced by the Roma population of Sousa due to their social, political and environmental vulnerability. Despite all the problems they suffer, especially in relation to precarious housing, the Roma of Sousa aim to remain and legally occupy the territory, as well as finding formal and specialized jobs in the city (MANGUEIRA; CAMPOS, 2023).

According to data from the Socioeconomic Survey of the Gypsy Population of Sousa (GOVERNMENT OF THE STATE OF PARAÍBA, 2022), before settling in the city, these people traditionally had as their main source of income the trade of consumer goods (industrialized products) and the breeding and transport of animals. Both took place between towns in the hinterland of Paraíba, Pernambuco and Rio Grande do Norte,

supplying different communities. It was mainly the men who were responsible for earning money, while the women were responsible for the daily care of the family, and the income from palmistry and taromancy served as a supplement to the family income.

With the development of trade flows and the number of establishments in the regions where they used to sell their goods, the traditional gypsy street trade gradually became less profitable, affecting their subsistence conditions and nomadic way of life. "In view of this, sedentarization in the vicinity of a larger city became the only way out for many gypsies. In other words, in our opinion, it wasn't sedentarization that caused proletarianization, but it was proletarianization, it was impoverishment that forced the gypsies of Sousa to accept a sedentary life." Along with the change in the way of living, women's responsibility for the financial support of the family also changed, where their traditional knowledge, not only of reading hands and cards, but also of caring for the home and family, became financially important.

Sousa's gypsy population has been settled in the same area for 40 years, with more than half of the population born in the city. Since 1980, the population has been growing and today occupies an area that extends into the Jardim Sorrilândia urban neighborhood, named by the population as Rancho de Baixo and Rancho de Cima. The area has a number of public facilities: a health center, a Social Assistance Reference Center (CRAS), a kindergarten, an elementary school, a high school and an EJA school, and a federal high school and technical institute, all of which facilitate access for the population. Despite the length of time the territory has been occupied, the population still lacks adequate urban infrastructure: the streets are dirt and unlit, solid waste is not properly disposed of and is only collected once a week by the town hall, the entire territory is not connected to the sanitary sewage network and the water supply is intermittent.

It is worth noting that handicrafts appear as a source of income in only 9 family nuclei in the community in Sousa, while when asked about traditional gypsy cultural practices, the activity appears in 100 nuclei. This data shows that, although it may result in money or consumer goods for the other families who declared that the practice was present in the family nucleus, handicrafts have not gained prominence as an alternative source of work and income in the community, either because the activity has remained fundamentally a cultural manifestation or because of the lack of economic prospects, due to the absence of public incentive policies.

Still on the subject of activities and occupations reported as a source of income, it is pertinent to point out that none of the people interviewed by the Socioeconomic Survey (GOVERNMENT OF THE STATE OF PARAÍBA, 2022) reported practicing palmistry and fortune-telling, although 24% of family nuclei reported practicing them when asked about traditional aspects of gypsy culture.

Regarding the traditional cultural aspects of the Roma population, the Chibe - Calon language is the most widely practiced, followed by dance and handicrafts.

As for religion, almost all Roma families said they followed some form of religion, the most common being Catholicism, followed by Protestantism.

It's worth noting that most of the Roma families' homes are currently made of masonry, but there are still many rammed earth buildings and canvas structures.

Discrimination is a factor that has a decisive impact on the difficulties in the development and socio-economic sustainability of the Roma population in Sousa. It occurs in various sectors of daily life, most frequently in health care, followed by the workplace and access to work. Despite this, the families show resilience to the adverse conditions, taking pride in their traditional culture, staying in the territory, creating solutions for storing water, adhering to formalizations to receive social subsistence benefits, enrolling children in schools without significant cultural representation, establishing dialogue with non-Roma, mainly through their community leaders and the public sector (GOVERNMENT OF THE STATE OF PARAÍBA, 2022).

The result of the Paraíba Government's Socioeconomic Survey (2022) recommends the following aspects for strengthening inclusion and care for the Roma people:

- Valuing the culture and identity of the Roma people;
- Regularization of the territory;
- Urbanization of the neighborhood with structures that dialogue with gypsy cultural practices;
- Building new housing for the growing population;
- Replacing rammed earth houses and renovating homes that pose a risk to the population;
- Access to water and energy for the entire population of the ranches;

- Inclusion of all children in school and actions to reduce the dropout rate of young people in basic education;
- Increasing the participation of the adult population in Youth and Adult Education and other vocational courses;
- Actions to combat unemployment;
- Active search for vacancies with Roma profiles;
- Guidance for young people and adults looking for work, training and building a curriculum;
- Ethnic quotas in municipal public notices;
- Participation of Roma representatives in public management and services;
- Actions to combat racism;
- Permanent training and sensitization of the public service network on human rights and racial literacy.

## 6 VULNERABILITY ANALYSIS

This section describes the vulnerability analysis to which the communities in the project area are subject. The content on socio-cultural livelihoods described above supports the identification of the levels of vulnerability to which they are exposed.

In this assessment, vulnerability is understood to be a condition determined by physical, social, economic and environmental factors or processes that increase the community's susceptibility to the positive or negative impacts of the Project.

### 6.1 Vulnerability on Human Capital

Socio-environmental conflicts related to the contamination of the territory's natural resources and the constant advance of unsustainable land exploitation have led traditional communities to constantly reflect on the use and availability of resources for future generations. The gardens or agricultural areas for the community have a fundamental value not only in terms of subsistence, but also in terms of the reproduction of knowledge and know-how passed down for generations.

Today, agriculture occupies a significant part of the territory, which is often accompanied by sustainable agroforestry systems, thus avoiding the opening up of new areas and supporting the increase of native vegetation, allowing knowledge associated with traditional land management and the social organization of work to be reproduced to some extent. Another issue is the areas of forest, the so-called forest reserves, which they are trying to preserve even with the already restricted areas of farmland. These small areas are essential for the conservation of important ecosystem services for the communities, such as the availability of water and by-products like piassava straws for the production of handicrafts and household items, and knowledge of medicinal herbs taken from the wild.

Currently, various products related to agriculture and artifacts are marketed by the communities, but some of them stand out as the cornerstones of production, such as cotton, vegetables and cassava.

The loss and degradation of these resources in the communities highlights a vulnerability aimed at the reproduction of knowledge that is central to cultural identity and survival. In

general, it can be concluded that land is not just a natural resource, but a socio-cultural resource, comprising collectively created and historically located environmental knowledge and identities, which are used to establish and maintain their territory and identity.

Some communities have been going through a process of strengthening their cultural traditions and reaffirming their ethnic identity, especially those that have managed to position themselves in the market for the production of agro-ecological products and handicrafts. However, it is true that other communities are struggling to expand their development, either due to the lack of technical assistance and knowledge, or the lack of infrastructure to support a better quality of life and production.

In addition, the history of the communities, as well as their present day, is marked by violent conflicts, discrimination and prejudice, as well as territorial vulnerability reflected in the fragility of the lack of formalization and protection of land use rights.

Maintaining the rituals and encouraging young people and children to take part in these spaces strengthens the importance of the old leaders and their wealth of knowledge about the territory and resources, which stands up to the various challenges of exodus and cultural abandonment suffered as a result of contact with white people, the city and the technological resources and opportunities in the urban environment that reach the community and weaken the group's cohesion.

The lack of basic infrastructure resources, especially sewage treatment, resources for quality water supply and road infrastructure for transporting production and access to basic systems such as health and education, favor the potentialization of vulnerability over human capital.

## 6.2 Vulnerability on Social Capital

Territory for traditional communities is a social space marked by land and kinship, considering that their values, support network and cultural practices are built through forms of organization based on solidarity and reciprocity. When families are unable to maintain their bonds and alliances through the cultural practices that unite them, this support network is weakened and makes them exposed to risks and significant levels of social disintegration.

Racism and its effects on the distribution of resources are structural elements of social inequality in Brazil. The persistence of racial differentiation in access to public services, in the acquisition of skills and in social position reveals the consequences of the systematic operation of mechanisms for the production and reproduction of inequalities in various fields of social life (IPEA, 2011). It can be seen in the territory that people still suffer stigma and discrimination due to their ethnic and racial identity and the titling of their territories, given the land conflicts in the region.

Currently, communities have local social organizations (associations, cooperatives) as one of the only channels for defending rights and opportunities, enabling dialogue between partners and access to benefits and markets. However, due to the current fragility of social ties and alliance relationships, it is possible to foresee conflicts and lack of adherence to social organizations.

Many traditional communities in the area covered by the project experience processes of ethnic discrimination and marginalization. In particular aspects of social organization, despite the various legal prerogatives that protect them, are still constantly challenged and questioned by non-indigenous society.

### 6.3 Vulnerability on Physical Capital

The vulnerability of this asset is related to the quality and current state of conservation of the supporting infrastructure and the opportunities for access to the basic services that a community needs for its full development.

In general, the access roads to the traditional communities are in a precarious state of repair, with places that are impassable on certain days when there is heavy rainfall.

The water distribution system is very diverse and, despite the availability of water in the Atlantic Forest region, access to quality water is often scarce. There is a lack of treatment and water sources are often of poor quality for human consumption, with risks of pollutants from pesticide application. On the other hand, the semi-arid region (Caatinga) has a very limited supply of water services, especially during the dry season when drought damages production.

Electricity is supplied through public systems provided by distribution companies, with minimal structure for the communities.

In general, the main vulnerability of physical capital assets is the instability and poor quality of the services offered, especially water supply, the lack of adequate sewage systems and the precariousness of the road system.

### 6.4 Vulnerability on Natural Capital

The main vulnerability of this asset is related to environmental dynamics, especially during periods of drought, which have been influenced by the effects of climate change and natural phenomena such as El Niño. Despite the great variations suffered, the risk of forest fires and the lack of water, several projects and experiments (academic or public) have been identified that aim to achieve proper ecosystem management in order to achieve adequate resilience, such as the implementation of agroforestry systems (SAFs) that provide raw materials throughout the year, creole seed banks, etc.

In general, the territories are diverse in terms of anthropization, including areas with a greater or lesser degree of deforestation. However, it should be noted that activities outside the territories of traditional communities often put pressure on the ecosystem as a whole, influencing the quality of the resources present.

The pressure on natural resources suffered throughout the region where the communities are located causes impacts related to the reduction of tree species and gene flow, the chasing away of fauna, the loss of habitats and the contamination of the natural environment. It should be borne in mind that PROCASE II has objectives and focuses on combating these processes and increasing the positive results on the regeneration of forest areas.

### 6.5 Vulnerability Financial Capital

The vulnerability of this asset is related to the few sources of monetary resources in the face of the growing vulnerability to social breakdown faced by local communities.

Many traditional families have a subsistence economy, or make use of the resources used in production for their food, with planting and other assets offered by natural capital as part of their food source, as well as monetary resources from the sale of agricultural products and, in some cases, processed manioc, beans, mangaba and also livestock (cattle and goats). There is also the use of external sources of financial resources,

essentially from social programs (Bolsa Família, for example), pensions and salaries from public positions.

The vulnerability of this asset is related to difficulties in accessing the market to sell production and challenges related to maintaining quality production (availability of technical resources, climatic events, pest control, etc).

Thus, it must be considered that families are dependent on resources from other assets, especially Natural Capital, and any negative impact that affects existing resources in the village and territory could put the community in a situation of food insecurity that they are currently able to supply with agricultural activities. It should also be noted that financial vulnerability affects the ability to be converted into other types of capital, such as new skills and knowledge, access to digital media (internet), and/or other channels of access to health, for example, reflecting dependence on the resources and structure offered by the state.

## 7 PROJECT-RELATED RISKS

Risk is understood as the foreseen or unforeseen events that could affect the community and/or the resources and processes on which it depends, as well as the risks that the project will fail to achieve its objectives. Risks can be both negative and positive and are evidenced in terms of the consequences of the events (impact) and their significance for the recipient.

These poorly dimensioned social risks have a high chance of causing rights violations and conflicts in the future, and the consequences are significant changes in the community's way of life, as well as financial and reputational costs for the institutions involved.

This section will first describe the methodology used to assess the risks attributed to PROCASE II, followed by a matrix of the potential risks identified and their attributes, and then an objective description of each one, thus integrating the content covered in this report.

### 7.1 Evaluation Methodology

For each potential risk, the attributes described were determined based on qualitative indicators, namely: i) nature, ii) timing iii) probability and iv) magnitude, as shown in the following table. The final result of the risk assessment is given by its significance, which is the result of the probability x magnitude ratio, as shown in the following table.

**Table 2 - Attributes of the risks related to program implementation**

Attribute	Description	Category
<b>Nature</b>	how the risk affects the recipient.	Negative Positive
<b>Timing</b>	Characterization of social risk in relation to the construction phase	Planning Installation Operation
<b>Probability</b>	Characterization of the risk in relation to the possibility of occurrence, taking into account the vulnerability to which the community is exposed and the pressure that the work may put on it.	Unlikely Likely Right Small

Attribute	Description	Category
Magnitude	Amount of capital (means of subsistence) affected by the risk.	Small Moderate Review

**Table 3 - Significance Matrix of the risks related to the execution of the Project**

Probability of Occurrence	Magnitude		
	Small	Moderate	Review
Unlikely	Low	Low	Average
Likely	Low	Average	High
Right	Average	High	High

## 7.2 Assessment of Potential Risks

A total of 11 potential risks were identified, 10 of which were negative and one positive. Most of them are expected to occur during the project implementation phase.

In this context, it is worth stating that the planned works, especially those that do not require the removal of vegetation, have risks that, from a strictly environmental point of view, are considered to be of little relevance when good safety and environmental management practices are taken into account. However, from a social point of view, the event takes on greater significance, given that families have no alternative access to quality infrastructure services, and are already experiencing a certain fragility in terms of social and human capital. Even though the risks of impacts are moderate in magnitude, they could compromise the community safety net and cause conflicts over relevant socio-cultural aspects of territoriality, the basis of physical and socio-cultural sustenance, which resulted in medium and high significance for most of the risks identified. Once the safeguard prerogatives have been complied with and an adequate consultation process has been carried out in conjunction with the mitigating measures, which must be discussed in a participatory manner with the community so that they play a leading role in monitoring them, all the social risks, even if unlikely, can still occur, but with low significance.

**Table 4 - Project execution risk assessment matrix**

ID	Risk	Nature	Temporality	Probability	Magnitude	Significance
1	Enhancing the degree of community participation and consultation	Positive	Planning, Installation and Operation	Likely	Moderate	Average
2	Risk of non-compliance with safeguards related to the cultural suitability of the sub-project	Negative	Planning	Likely	Small	Average
3	Risk of introducing diseases	Negative	Installation	Unlikely	Moderate	Low
4	Risk of accidents in communities and access roads	Negative	Installation	Likely	Moderate	Average
5	Risk of internal governance conflicts between communities	Negative	Planning, Installation and Operation	Likely	Small	Low
6	Risk of harassment of women and children and of GBV *Affects women and children unequally	Negative	Installation	Likely	Moderate	Average
7	Risk of harassment of young people through the introduction of alcohol and drugs *Affects women and children unequally	Negative	Installation	Likely	Moderate	Average
8	Risk of harassment for the sale of natural capital assets	Negative	Installation	Likely	Moderate	Average
9	Risk of shortages or interruption of essential services (energy and water supply)	Negative	Installation	Likely	Moderate	Average
10	Risk of nuisance related to noise emissions, dust and traffic of strangers in the communities and near the planned construction site	Negative	Installation	Right	Moderate	High
11	Risk of using natural capital for structures (wood, sand, gravel)	Negative	Installation	Likely	Moderate	Average

## **1. Increase the level of community participation and consultation**

---

This risk was considered positive and is related to the initiatives that the PMU complies with, with the prerogatives of law, in particular consultations and participatory planning practices, considering the need to implement systems of Consultation and Informed Participation (CPI) and Free, Prior and Informed Consent (FPIC) in relation to activities that may affect the traditional community's way of life and its territory.

This risk is of a positive nature, given that the application of safeguards positively affects the lives of traditional communities, as well as acting on the borrower's learning; expected to occur at all stages of the work; of probable occurrence; of moderate magnitude as it affects three capitals (human, social and physical) and of medium significance.

In a second scenario, considering the implementation of the FPIC process, in addition to the monitoring of all aspects of the project, this risk then takes on the category of certain occurrence and raises its significance to high.

It is also essential to consult and seek authorization from FUNAI for situations involving indigenous communities.

## **2. Risk of non-compliance with safeguards related to the cultural suitability of the Project**

---

This risk is associated with a total failure to comply with the safeguards regarding open dialog about possible adjustments to PROCASE II, especially its sub-projects, to meet their cultural specificities, while safeguarding their identity expectations. The design of the sub-projects must therefore be avoided if they follow a constructive and structural pattern exclusively set by the state government, which in no way maintains identity and dialog with the traditions in which it is inserted. A project that doesn't take into account local cultural characteristics; on the contrary, it retains the identity of its developer, marking the landscape and the routine of the communities. This can result in structures that are underused, scrapped and disconnected from the community's social context, especially those that have specific identities.

This risk is negative in nature, as it includes non-compliance with safeguard policies; it is possible during the planning stage; it is certain to occur; it is small in magnitude because it affects two capitals (human and social); and it is of medium significance. However, in a second scenario considering the systematic and effective conduct of the consultation process, this risk remains negative, but takes on the category of unlikely occurrence and downgrades its significance to the low category.

## **3. Risk of introducing diseases**

---

Considering the current health situation in the country, the region and the communities in the project area, there may be a risk of disease transmission through the circulation of workers in the communities. The risk was considered to be of a negative nature, possible during the installation phase, but unlikely to occur, with moderate magnitude as it affects three capitals (Human, Social and Physical) and low significance.

Some actions could reduce this risk, such as hiring labor from the community, and drawing up a health safety protocol with a vaccination requirement for workers coming from outside the territory. In any case, it is recommended that during the consultations with the communities chosen to benefit from the Project, during the planning phase, this dialog advances and these and other measures are discussed and adopted.

In a second scenario, even if the measures are adopted effectively, the risk remains the same, because even if the chance is reduced, it cannot be guaranteed that no disease will be introduced into the community by the arrival of outsiders.

#### **4. Risk of accidents in communities and access roads**

---

This risk is associated with possible accidents on access roads due to the traffic of vehicles and machinery, as well as the use of machinery and equipment that poses an operational risk. A significant proportion of journeys are made on foot, by bicycle or motorcycle, including children. This is aggravated by the increase in dust emissions from vehicles, which can impair visibility in traffic. In addition, there is a risk of accidents in construction site areas, given their proximity to both homes and social facilities (schools, for example), which implies the possible flow and access of people from the community to the construction site, especially if it is not well isolated and signposted.

This risk was classified as negative in nature, expected to occur during the installation phase, considered probable, of moderate magnitude as it affects three capitals (Human, Social and Physical) and of medium significance.

Therefore, during the consultation and planning phase of the work, it is recommended that the safety standards and legislation of civil engineering and vehicle traffic be considered and discussed in order to minimize this risk. In a second scenario, if the measures adopted are carried out, this risk will continue to be classified as negative, but of unlikely occurrence and moderate magnitude, downgrading the significance to the low category.

#### **5. Risk of internal governance conflicts between communities**

---

This risk is associated with non-compliance with the consultation plan, especially in relation to stakeholder engagement. Issues related to social organizations representing more than one community should be discussed with all the communities involved.

In this context, the importance of social organizations in strategies for political strengthening and social cohesion is emphasized. If there is conflict between families, in disregard of the lack of listening to members and stakeholders, this cohesion can be undermined and affect the legitimacy of the institutions' governance, hurting the cohesion strategies of the communities in the territory.

This risk was considered to be of a negative nature, starting at the planning stage, of a small magnitude because it affects two capitals (human and social) and of low significance. If the guidelines of the Consultation Plan are complied with with respect to the internal governance of the territory, this risk is considered unlikely to occur.

#### **6. Risk of harassment of women and children and gender-based violence (GBV)**

---

This risk is associated with the transit of workers from outside the community, which has the potential to affect men, women and children in different ways, with women and children being more susceptible and vulnerable to these situations.

Many women in the project's area of activity have expressed insecurity due to the stigma they have suffered over many years, under the objectification and submission imposed by men in society. According to data from the Patrícia Galvão Institute, violence based on gender discrimination, such as sexual harassment in its broadest sense, is exacerbated when one considers the multiple inequalities that combine in Brazil and that affect black, peripheral, indigenous, rural women, children and people with disabilities in

different ways. The data shows that these segments are more vulnerable both to becoming targets of violence and to having their rights violated by the state, through direct action or omission. The dossier also warns that police authorities record an average of 180 rapes a day in Brazil, with the majority of victims being women (82%), black (51%) and girls under 13 (54%). Women are also the main victims of harassment and sexual harassment (rude approaches, offenses and inappropriate proposals that embarrass, humiliate and frighten).

In addition, observations and reports collected in the field suggest an increase in gender-based violence (GBV) as a result of the increase in women's income and financial independence, often fostered by associations, cooperatives, etc.

This risk was considered to be negative in nature, expected to occur during the implementation stage of the works, of probable occurrence, moderate in magnitude as it affects three capitals (human, social and physical) and of medium significance. Consideration is given to the possibility of people from the communities being hired, reducing the risk, or the possibility of external workers being housed outside the communities' territory, in nearby villages, for example. Such measures would favor a safer situation at night and on weekends. In addition, a complaints mechanism is suggested, which should be discussed so that it is culturally appropriate, so that women and adolescents can make their complaints without identifying themselves, and this can be remedied immediately. Once these measures have been applied, discussed openly with the women of the communities, together with the code of conduct for workers, the risk is considered unlikely to occur and the significance is reduced to the low category.

## **7. Risk of harassment of young people through the introduction of alcohol and drugs**

---

This risk is associated with the traffic of outside workers in the community and is due to the curiosity of young people, who end up being harassed into consuming drinks or illicit drugs brought in by workers. This impact also ends up affecting women unequally due to their overload in caring for the family, since they are responsible for domestic support in the community.

Children and adolescents will be on the move on a daily basis in the vicinity of the construction site and project implementation areas, and the vulnerability of the health system coupled with the difficulties of access mean that it is difficult to guarantee some basic rights, disguised as prejudice and racism, causing the community to be abandoned and forgotten, especially in relation to resources aimed at prevention and care measures. There is stigma and discrimination in the region because of their ethnic identity and land rights, and this has had repercussions on the lives of young people, such as the difficulty of getting a job and expectations of income and personal development.

This risk was considered to be negative in nature, expected to occur during the installation stage, likely to occur, moderate in magnitude because it affects three capitals (human, social and physical) and resulted in a medium significance. Thought was given to the possibility of workers who are not part of the community being housed outside the territory, which would create a situation of greater security in relation to the risk. Once the measures have been applied, discussed openly with the community members and associated with the code of conduct for workers, this risk is now considered unlikely to occur, lowering the significance category to low.

## **8. Risk of harassment for the sale of natural capital assets**

---

This risk is related to the history of harassment of community residents by outsiders for the illegal sale of natural capital assets, such as wildlife trade, hunting or logging.

In this context, this risk was classified as negative in nature, expected to occur during the implementation phase of the works, of probable occurrence, moderate in magnitude as it affects three capitals (human, social and natural) and of medium significance.

Therefore, during the consultation and planning phase of the project, it is recommended that measures aimed at raising awareness among residents be considered and discussed, but above all awareness among workers and companies, especially with regard to current legislation and international safeguards. In a second scenario, if the measures adopted are effective, this risk remains classified as negative, but of unlikely occurrence and moderate magnitude, downgrading the significance to the low category.

## **9. Risk of shortages or interruption of essential services (energy and water supply)**

---

This risk is associated with a lack of water for use by the community, especially homes close to the area where the infrastructure to be built is to be installed, both because of the increase in demand during the project implementation stage and because of the need for temporary cuts in the supply of essential services for the proper implementation of the infrastructure. This issue basically affects energy and water supply systems and can also interfere with roads, making access to buildings and structures difficult or impossible, for example.

As such, this risk was classified as negative in nature, expected to occur during the installation phase of the project, of probable occurrence, moderate in magnitude as it affects four capitals (human, social, natural and physical) and of medium significance.

Therefore, during the consultation and planning phase, it is recommended that measures aimed at the actual availability of basic services and warning or alert systems be considered and discussed, as well as the prevention and restoration of services in the event of an interruption.

In a second scenario, if the suggested measures are effectively adopted, this risk will continue to be classified as negative, but of unlikely occurrence and moderate magnitude, reducing the significance to low.

## **10. Risk of nuisance related to noise emissions, dust and the circulation of strangers in the communities and near the planned construction site.**

---

This risk refers to the increase in various and frequent nuisances that will occur during the installation phase of the work (Social Technologies) for all community members and, in particular, for beneficiary families who are closest to the site where the project's infrastructure will be installed.

This risk was classified as negative in nature, expected to occur during the installation phase of the Social Technology, of certain occurrence, moderate in magnitude as it affects three capitals (human, social and physical) and high in significance.

For this risk, even if it is discussed in the consultation plan during the planning phase, it is unlikely that any measure will have such a mitigating effect that there will be a reduction in the likelihood of its occurrence. In other words, during the construction phase, it is inseparable that there will be a high level of noise emissions, suspension of particulate matter or movement of different people through the community. A calendar of days and

times can be recommended, not allowing work on weekends or at times of greater sensitivity, for example. Worker training courses or greater control of the flow of trucks and heavy machinery could also be considered. Actions related to physical barriers that can reduce the impact and frequent adjustment and maintenance of machinery and equipment also help to reduce the magnitude of this situation.

It is also worth mentioning the implementation of a workers' code of conduct (a measure provided for in the project's ESMP), which applies to these cases.

However, in a second scenario, there is unlikely to be an effective measure to neutralize the attributes of this risk, which is continuously negative in nature, expected to occur during the installation phase of the work, of certain occurrence, moderate magnitude and high significance.

### **11. Risk of using natural capital on site (wood, sand, gravel)**

---

This risk refers to the possibility of raw materials from the traditional community's territory being used in the work itself, in particular wood and sand for the construction of buildings and infrastructure. It is not uncommon to observe this practice in many traditional communities in Brazil under the argument that it would either be a quid pro quo from the beneficiaries, or as a way of making the works cheaper and more viable. This risk was classified as negative in nature, expected to occur during the installation phase, likely to occur, moderate in magnitude as it affects three capitals (human, social and natural) and of medium significance.

Therefore, during the consultation and planning phase of the project, it is recommended to consider and discuss measures aimed at dialoguing with the community and the contractor about the terms of conduct regarding this practice, as well as inspection measures and mechanisms and channels for complaints. On the other hand, these issues should be addressed with the workers on site during the Daily Safety Dialogue (DDS) or similar activities.

In a second scenario, if the measures defined and adopted are effective, this risk, although still classified as negative, is unlikely to occur and has a moderate magnitude, downgrading the significance category to low.

## **8 SOCIO-CULTURAL ACTION PLAN**

The following is the socio-cultural action plan aimed at controlling, minimizing and neutralizing the anticipated risks.

### **8.1 Mitigation and Monitoring Measures**

Overall, most risks are related to impacts on activities that are essential to the community's subsistence and the reproduction of its cultural values which can affect its way of life on a daily basis, in the relationship established with the territory. These risks have a medium significance. The risks are also related to the vulnerabilities already experienced, which add to the potential for affecting existing resources. In this way, measures to mitigate the chances of risks occurring must be carried out from the planning stage to the delivery of the work, in a dialogue systematized by the Consultation Plan to identify problems, discuss solutions and monitor actions.

When the risks were assessed before the measures were implemented, they were mostly of medium significance. However, the reassessment after the implementation of the measures indicated low significance for almost all the risks, with the exception of two: boosting the degree of community participation and consultation, which is positive in

nature; and the risk of noise nuisance, which is irreversible but is only expected to occur during the construction work, as shown in the following table.

**Table 5 - Matrix of risk mitigation measures related to project execution**

Risk identified	Suggested measurement	Suggested post-measure	
		Probability	Significance
1. Increase the level of community participation and consultation	<p>1. Carry out a timely process of ongoing consultation prior to each stage of the work, recording the decisions aligned with the measures and carrying out monitoring at the time the community deems most appropriate.</p> <p>2. Consult with and seek authorization from FUNAI for situations involving Indigenous Communities.</p>	Certain	<p>High</p> <p>Due to the constant dialogues, complaints are captured early on and remain at the local level, generating positive results</p>
2. Risk of non-compliance with safeguards related to the cultural appropriateness of the architectural project	<p>1. implement the ongoing Consultation Plan, which is initiated with adequate time, prior to the construction planning stage, stimulating reflections and negotiations on cultural adaptations to the Program</p>	Unlikely	<p>Low</p> <p>Due to the constant dialogues, complaints are captured early on and remain at the local level, generating positive results.</p>

Risk identified	Suggested measurement	Suggested post-measure	
		Probability	Significance
3. Risk of introducing diseases	<p>1. Ideally of hiring labor from the community;</p> <p>2. Requirement of a Health Protocol for external workers (up-to-date proof of vaccination, with a complete vaccination schedule for Covid-19 and other transmissible diseases, accompanied by a medical certificate that they do not have a contagious disease);</p> <p>3. Discourage outside workers from using the village health center.</p>	Unlikely	<p>Low</p> <p>Due to constant dialog, suggestions are negotiated at the outset and are likely to generate positive results for the parties in respect of safeguards</p>

Risk identified	Suggested measurement	Suggested post-measure	
		Probability	Significance
4. Risk of accidents in communities and access roads	<p>1) Appropriate social measures discussed with the community in the Consultation Plan to isolate the area and prevent the movement of people around the construction site;</p> <p>2. Visual and audible signal warnings prior to the movement of machinery on access roads within the community close to the school;</p> <p>3. Compliance with safety standards imposed by regulations and legislation for managing vehicle traffic in places where people are present.</p> <p>4. Implementation of the Program for Environmental and Social Control of Construction Works provided for in the PGASE</p>	Unlikely	<p>Low</p> <p>Due to constant dialog, suggestions are negotiated at the outset and are likely to generate positive results for the parties in respect of safeguards</p>
5. Risk of internal governance conflicts between communities	<p>1. stakeholder engagement with the displacement of representatives of the other communities under the borrower's responsibility during the consultation stages.</p>	Unlikely	<p>Low</p> <p>Consultation with stakeholders offers an important source of validation for decisions, improves the quality of measures and allows people to understand their rights and responsibilities in relation to the Program.</p>

Risk identified	Suggested measurement	Suggested post-measure	
		Probability	Significance
<p>6. Risk of harassment of women and children and GBV *Affects women and children unequally</p>	<p>1) Avoid housing workers within the community, providing a place to stay in the surrounding agrovillages with daily transportation during work shifts;</p> <p>2. Draw up a code of conduct and train, with the help of the borrower, the contractor and the workers on their socio-cultural specificities, warning of penalties for non-compliance.</p> <p>3. Implement the Labor Management Program provided for in the PGASE, which includes the application of a Code of Conduct</p> <p>4. Promote training on the subject of GBV and encourage organizations representing women and the LGBTQIA+ population.</p>	<p>Unlikely</p>	<p>Low</p> <p>Due to the constant dialogues, grievances are voiced during the Program and have a chance of avoiding penalties and impacts in respect of safeguards.</p>
<p>7. Risk of harassment of young people through the introduction of alcohol and drugs *Affects women and children unequally</p>	<p>1) Avoid housing workers within the community, providing a place to stay in the surrounding agrovillages with daily transportation during work shifts;</p> <p>2. Draw up a code of conduct and train, with the help of the borrower, the contractor and the workers on their socio-cultural specificities, warning of penalties for non-compliance.</p>	<p>Unlikely</p>	<p>Low</p> <p>Due to the constant dialogues, complaints are voiced during the Program and have a chance of avoiding penalties and impacts in respect of safeguards</p>

Risk identified	Suggested measurement	Suggested post-measure	
		Probability	Significance
8. Risk of harassment for the sale of natural capital assets	<p>1. Avoid housing workers inside the community, making it possible for them to stay in the surrounding villages with daily transportation during work shifts;</p> <p>2. Draw up a code of conduct and train, with the help of the borrower, the contractor and the workers on their socio-cultural specificities, warning of penalties for non-compliance;</p> <p>3. Train external workers, especially with regard to current legislation and international safeguards.</p> <p>4. Implement the Labor Management Plan set out in the PGASE</p>	Unlikely	<p>Low</p> <p>Due to the constant dialogues, complaints are voiced during the Program and have a chance of avoiding penalties and impacts in respect of safeguards.</p>
9. Risk of shortages or interruption of essential services (energy and water supply)	<p>1. Dialogue about the work schedule, avoiding activity at weekends and at night;</p> <p>2. Training workers about the surroundings, and better control of the flow of trucks and heavy machinery.</p> <p>3. Implementation of the Environmental and Social Control Program for Construction Works, as provided for in the PGASE</p>	Certain	<p>High</p> <p>Due to prior dialogues and the identification of vulnerabilities, suggestions are negotiated at the outset and are likely to generate positive results for the parties in respect of safeguards</p>

Risk identified	Suggested measurement	Suggested post-measure	
		Probability	Significance
10. Risk of nuisance related to noise emissions, dust and the circulation of strangers in the communities and near the planned construction site.	<ol style="list-style-type: none"> <li>1. Whenever possible, the installation of physical barriers and the adjustment/maintenance of motorized equipment.</li> <li>2. Drawing up a calendar with days and times of work agreed with the community.</li> <li>3. Consultation with the community for participatory planning in order to collaborate on solutions and reduce risks and impacts.</li> <li>4. Locational study of the subproject, taking into account sensitive receptors in order to minimize nuisance situations.</li> <li>5. Noise monitoring before and during the construction phase</li> <li>6. implementation of a code of conduct for workers</li> </ol>	Certain	<p style="text-align: center;">High</p> <p>In this case, it is unlikely that there will be any effective measure to completely neutralize the attributes of this risk, but measures should be applied to reduce it as much as possible.</p>
11. Risk of using natural capital in projects and structures	<ol style="list-style-type: none"> <li>1. Prohibition on the use of any natural resource in Quilombola territory. This prohibition extends to soil, sand, gravel and wood.</li> <li>2. Address these issues with site workers during Daily Safety Dialogues (DDS) or similar activities.</li> </ol>	Unlikely	<p style="text-align: center;">Low</p> <p>Stakeholder consultation offers an important source of validation for decisions, improves the quality of measures and allows people, including the borrower, to understand their rights and responsibilities in relation to the Program.</p>

It is important to bear in mind that the measures suggested here have not been discussed systematically with the stakeholders and are only recommendations and/or guidelines based on the reflection made on the available data and field approaches. Therefore, all the risks considered here should be discussed again with the community and stakeholders in the implementation of PROCASE II, who may identify other risks, and if this is the case, new planning and mitigation measures should be implemented in the updated versions of the documents, taking into account the planning, installation and operation stages of the work.

The specific issues of each traditional community chosen to benefit from PROCASE II must be studied in depth:

- 1. Ensure that the community receives culturally appropriate social and structural benefits, including, where possible, the long-term sustainability of essential resources. This action plan is based on the socio-cultural vulnerabilities identified and must be fully in line with the IDB and IFAD Safeguards Policies, including: Implementing the measures in accordance with the dialogues and decisions established in the consultation process, which must be carried out prior to all stages of the work, including grievance assessment stages;
- 2. Implement socio-culturally appropriate and sustainable measures;
- 3. Respect traditional knowledge, cultural heritage, natural heritage, social capital and systems specific to quilombola communities in terms of social, economic and spiritual systems;
- 4. Adapt the project, keeping in mind the specifics of guaranteeing the delivery of work, services and other activities to facilitate access to benefits, including fair treatment in the possibility of contracting any service or labor and, whenever possible, appropriate procedures and criteria and training programs for this guarantee;
- 5. Draw up complementary measures and/or activities through a process of good faith negotiation with the community and prior dialog in the consultation process;
- 6. Where risks are unavoidable, the borrower will minimize these impacts in a culturally appropriate manner, commensurate with the nature and scale of such impacts and the vulnerability of the community;
- 7. Where alternatives have been explored and adverse impacts are unavoidable, the actions proposed by the borrower must be developed in a participatory manner with the affected community and require specialized and exclusive professional capacity on the part of the borrower;
- 8. The opportunities identified in the mitigation measures should aim to address the goals and preferences of the community, including improving their standard of living in a socially appropriate manner, and promoting the long-term sustainability of the natural resources on which they depend and which may have a direct bearing on the projects, in particular water supply, water reuse, sewage and energy structures;
- 9. The borrower is recommended to adopt contractual penalties for the contractor in the event of non-compliance with the requirements of the IDB and IFAD Safeguards Policies, and the guidelines established in the PROCASE II PGASE document, and the decisions defined in the consultation process, i.e. in the event of significant non-compliance;

With regard to monitoring the measures, the participatory activities for monitoring the measures defined in the consultation process and in the implementation of the Resilient

Investment Plans (RIPs) and Business Plans (BPs) must be defined together with the beneficiaries and the community. To this end, during the execution of the Consultation Plan, the possibility should be identified for community representatives and/or other people defined by the community to monitor the measures in a culturally appropriate way, using facilitating mechanisms that the beneficiaries find appropriate, as well as identifying deadlines and community indicators for evaluating the measures throughout the process.

Monitoring actions should include:

- Monitor and measure the effectiveness of the borrower management program and compliance with any legal obligations, related regulatory requirements and decisions aligned in the Consultation Plan;
- Record community information and indicators to monitor performance and establish relevant operational controls with the association;
- Plan regular and appropriate evaluations of the effectiveness of the measures, based on the collection and analysis of relevant data and the evaluation of community indicators in a participatory manner.

## 9 CONCLUSIONS AND RECOMMENDATIONS

Traditional communities belong to the most vulnerable socio-cultural populations. The rights prerogatives related to them should be included in Components 1 and 2 of the Project, starting with the implementation of the ongoing Consultation Plan, and this is an opportunity for mutual learning.

From the perspective of its dimensions and the strictly environmental risks, the project is perfectly feasible, subject to considerations related to the implementation of mitigating measures aimed at the vulnerable conditions of the community, women, children and adolescents who circulate widely in the construction area. This also includes the correct environmental and social management of the project, in line with the reflections discussed during the pre-consultation stage carried out by this technical team and described in this document.

In terms of the social dimension, the risks identified can be mitigated to reduce their impacts and effects, always taking into account the decisions that will be aligned in the Consultation Plan and guided by the assessment in question. In particular, it is important that the borrower redoubles its organizational efforts to make it possible to house workers outside the traditional community, which would be a very appropriate measure to safeguard the most relevant aspects of the assessment.

Finally, it is suggested that the measures proposed here should also be systematically discussed with the communities in the consultation process and recorded for monitoring, and should be incorporated into the corresponding Strategic Environmental and Social Management Plan (PGASE) for project preparation.

## 11 ANNEXES

## 11.1 Annex 1 - List of communities identified in the area of operation of PROCASE II

## 11.2 Annex 2 - Consultation Plan for Traditional Communities

This Consultation Plan is part of the Socio-Cultural Assessment (CSA) prepared for a loan requested by the Paraíba State Government through a specific investment loan (LON/ESP) to promote the sustainable development of rural areas in the state, the Paraíba Sustainable Rural Development Project - PROCASE II (PROJECT), focusing on the problems of low production and productivity and vulnerability to climate change (CC) of family farming activities, environmental degradation and deforestation, insufficient water supply services for human consumption and lack of sanitation in rural communities.

The aim is to meet the requirements of Components 1 and 2 of PROCASE II, to be implemented in the traditional communities in the project area, which will be defined in the future. As such, this document is part of the assessment prepared and must be implemented in line with the issues raised.

Transparent and meaningful consultation with the main stakeholders is an indispensable element of both the prior, well-founded decision-making process and good project governance. In Brazil, the consultation process related to the planning, approval and implementation of projects that may affect indigenous peoples and traditional communities is a legal requirement. In addition, the IDB and IFAD, as international financial institutions, have adopted policies and procedures to incorporate stakeholder consultation, especially when it comes to indigenous peoples and traditional communities, which must be complied with, monitored and recorded as an important part of the formal contract documents with the borrower, as indicated in the IDB's Environmental and Social Performance Standard 7 (PDAS 7) and IFAD's Standard 4.

Consultation with stakeholders is the responsibility of the borrower. Financial institutions have the responsibility of ensuring that the borrower maintains compliance with the relevant policies and requirements throughout the Project cycle, as well as complementary functions to those of the borrower, which are: explaining, advising, assisting and verifying.

The main objectives and benefits of implementing the Stakeholder Consultation Plan include:

- It records the views and perceptions of the people affected by the Project and offers a way of taking their opinions and concerns into account as contributions to improving the planning and implementation of the Project, avoiding or reducing its adverse impacts and increasing the benefits;
- Enable the parties involved to understand their rights and responsibilities in relation to the project;
- Transparency and stakeholder participation contribute to increasing trust, acceptance of the project and local ownership, which are essential for the sustainability of projects and their development results, in this case in education services.

In this context, it is worth noting that the borrower is often concerned that the consultation process may delay the planning and implementation of the project, pointing to increased costs, highlighting pre-existing tensions and/or generating expectations that are disproportionate to the project's organizational capacity. These concerns are valid, but avoiding participatory interaction with stakeholders does not eliminate these problems. On the contrary, it tends to exacerbate them and foment suspicions that lead to conflicts, legalizations and even paralysis of the project. The IDB and IFAD consider that good stakeholder consultation is not simply a requirement, but also adds real value to the

Project and contributes to a fairer society that respects different ways of life. As a general contribution to the consultation process, we suggest:

- Ensure that the preparation and consultation process with stakeholders begins as early as possible in the project cycle and is not limited to half-day decision-making meetings. Stakeholder consultation requires participation, which requires adequate time for listening and negotiation. If the process starts too late, there won't be enough time to carry out the consultations efficiently, which essentially implies the legitimate consideration of the opinions and concerns of traditional communities linked to project-related decisions, planning and implementation. The timing of consultations and the entire process need to be carefully mapped out and the timeline must coincide with disclosure requirements, approval and other project milestones. A frequent mistake is to view consultation as a separate item and unrelated to other elements of project planning, such as cultural adaptations to the architectural design, for example, and to consider it merely an informational procedure;
- Delays and costs can be reduced by being clear about requirements and good practices and ensuring that the community and borrower responsible for consultation have the necessary skills and resources to manage the process. Delays are often caused by poor planning or implementation of the consultation process, where a lack of skills or insufficient listening to environmental or socio-cultural considerations in the decision-making process can lead to costly mistakes;
- The principle of proportionality should guide the degree of effort put into the consultation process. In the case of PROCASE II, defined as category B, the risk is moderate and must include a two-way dialog with the affected stakeholders and not simply the dissemination of information. As described in the CSA, in addition to the mandatory Environmental and Social Management Programs for the works component and production plans, in view of the legal aspects, regulations and safeguard policies of the IDB and IFAD, the analysis of the typologies of traditional communities indicates guidelines for specific measures, given the socio-cultural and socio-environmental specificities and prerogatives of the communities' rights, which must be respected and discussed in the decision-making process with the communities.

Finally, this document is intended to be a guide for implementing the Consultation Plan with the traditional communities benefiting from PROCASE II, and highlights the main information that should be considered for the borrower's planning and the steps that should be followed for its implementation. It is hoped that this will include important items that cannot be missed and that are part of the mandatory requirements for an effective process.

### **11.2.1 Stakeholder identification and analysis**

Identifying stakeholders requires a basic understanding of the nature of the project and the local context. One of the main objectives of the stakeholder analysis is to clearly identify those who may be negatively affected by the risks/impacts of the Project or unfairly excluded from its benefits. People, groups, organizations, federal entities, key persons, etc., the preliminary assessment indicates who the stakeholders are that should be engaged in the Consultation Plan. The Consultation Plan is a living instrument that will have to be updated to reflect the characteristics and participation strategies of the Stakeholders affected or involved by the project in its different phases.

### 11.2.2 Stakeholder engagement

The general objective of engaging the communities of the territory in the proposed Project is to guarantee the acceptance and effective inclusion of the groups that make up the community, as well as their participation, interest and rights related to the execution of the Project and those that will be affected positively or negatively by the impacts and measures. The main objective of this plan is to present a strategy for engaging community members in the project's consultation process.

Engagement can be thought of in terms of project stages, which can generally be Planning, Installation and Operation. Each of these stages can be subdivided into different activities of information exchange, dialog, reflection and decision-making processes, following a previously discussed timetable and equipped with written and visual records.

In addition to this general objective, the engagement aims to fulfill specific objectives, which are listed below:

- a) Transparency: When stakeholders know what is expected of them at each stage of the Consultation Plan, they will have more confidence in the Project to be carried out (legitimacy). As the infrastructure project is still in the pre-design phase, it is important to provide adequate information and sufficient time at each stage, capturing contributions and complaints. In general, the planning stage may require more time when it comes to choosing and evaluating the construction site and the actions of the projects and plans.
- b) Capacity building. Stakeholder engagement must increase the capacity to ensure that families can participate, especially young people and women. To this end, at each stage it is important to highlight the didactic content of the activity, making it clear that the aim is for everyone to fully understand it.
- c) Responsibility. Involve the community in all stages of the project to improve ownership and co-responsibility, especially at decision-making moments. It should be noted that decisions can be reviewed, especially with regard to measures, and these should be re-evaluated throughout the process. But when they are related to structural processes, their definitive nature should be made clear and more time for reflection should be proposed, if appropriate.
- d) Free, prior and informed consent. This consent will be given by actively involving community representatives in the planning, design, implementation and operation of the project, and can be translated into a document that reflects the agreement reached between the interested parties.

#### **Engagement Design: Principles and Approach**

---

A well-designed stakeholder engagement plan adheres to several principles that should be aligned with all those responsible for and involved in the Project and the borrower's consultation process with indigenous peoples and traditional communities. These principles derive from relevant national and international laws and standards, the IDB's PDAS 7 and IFAD's Standard 4, and the current situation of the community's territory. The principles are discussed below.

#### **Principle 1: Respect the socio-cultural characteristics of traditional communities**

The territory of traditional communities usually has its own governance and a way of life dependent on the natural resources available in their territory, which are the socio-

cultural basis of their way of life. Due to the process at hand, consider the entire structure of the social organization (association, cooperative, etc.), and families who want to participate in the process, as stakeholders. It is also important to remember that many communities maintain alliance and kinship relationships among their members, which are fundamental for group cohesion in the territory.

This includes: (i) the people/groups chosen to take part in the process. This is an important issue to align at the start of the process, so that people or groups are always present and can make legitimate decisions. It is necessary to discuss the activities already carried out by this person and the availability of their presence; (ii) the time needed for decision-making. Decisions without adherence can be harmful and putting pressure on the group can lead to conflict, which is a risk for the project. We recommend highlighting the possibility of discussing a deadline for feedback at these more critical moments and providing more information, written and visual, on the subject for internal discussion; and (iii) the process by which decisions are made.

Free, Prior and Informed Consent (FPIC) must be applied as a formal instrument that favors respect for culture and tradition, and must be applied in accordance with ILO-169.

Specifically in the case of indigenous communities, FUNAI must be consulted and authorized, in addition to Free, Prior and Informed Consent (FPIC).

**Principle 2: Consider measures (e.g. transport logistics) to ensure stakeholders participation in consultations**

An extra effort should be made and resources and/or means put in place to guarantee the presence of grassroots groups, board members, women and young people at meetings during the consultation process. When a prior schedule of activities is drawn up with those involved, it should be guaranteed that they will be present, including the guarantee of travel and if possible a communication channel should be identified. The consultation process and the Project, given its operation, should not discriminate against communities/groups of stakeholders due to the difficulty of articulation and travel. These groups are affected by the work and also by the operation of the infrastructure and production plans, and have questions that need to be heard and incorporated into the consultation and decision-making process.

**Principle 3: Consider age and gender aspects**

The implementation of infrastructure, especially during its deployment stage, will affect men, women and young people in different ways, especially because they have different insecurities and vulnerabilities. It will also affect young and old in different ways because they have different ideas about possible measures for risks, which is valuable in the mitigation process. The Project, as described in the socio-cultural assessment, should consider the differences in participation related to: (i) the insecurities of men and women of different ages; and (ii) the role they wish to play in the management and monitoring of measures, particularly when it comes to issues related to the risk of possible sexual harassment of women and children.

**Principle 4: Recognize the rights and knowledge of traditional families**

The borrower, at all stages of the consultation and implementation process in the territory, must be aware of and guarantee the fundamental rights of the communities, in particular the right to question, ensuring that the information passed on is adequate and accessible, and to express an opinion, based on their self-determination. Because of this

right, the project and the measures must be discussed while respecting the governance of the community and its concepts of economic, social and cultural development.

**Principle 5: Create a mutual learning process**

Those directly involved in the consultation process and in the activities of Components 1 and 2 must make an effort to understand the concerns and risks to which communities are subjected by the movement of machinery and external workers during their time within the community. Often external references tend to minimize the problems listed and sometimes community members may feel insecure about pointing out problems where the borrower does not see them, which reflects the community's insecurity about the possibility that the project will not be implemented.

This issue should be given the utmost attention. Often the community, because they need the service so much, end up not participating in the process of reflecting on possible problems. The people involved should encourage such reflection and reinforce that the Consultation Plan is not intended to validate the realization of the work or production plan, but rather to allow it to be done in the best possible way while respecting the community's way of life and insecurities. Listening to and learning from each other will be fundamental in the project and mutual learning encourages a process of continuous evaluation and *feedback*. This returns to the borrower in the success of the project, and in the management of the service offered after implementation.

**Principle 7: Ensure transparency and communication of results**

The consultation process and information about the work must be clear and accessible to all interested parties. Stakeholders must be continually informed about the purpose of this process and what is expected of them. This is relevant when meetings are planned with a long time between them. At each meeting, they should be informed of the objective, review the steps taken, the results achieved, the current step and the objectives of that meeting. Encouraging agreements and reinforcing them, making food and transportation available and providing an evaluation process at the end of each meeting, where everyone can express what they thought of the meeting and what they understand about the process, are recommended practices. These evaluations will be indicative of the overall process, to understand the degree of understanding and the issues that need to be reinforced or revised. This means not just the one component that the *stakeholder* is engaged in, for example, but also all the other components of the project.

**Principle 8: Build on existing systems**

The project must build on existing social structures to engage stakeholders. The grassroots groups in each community are respected internally and articulate themselves for various activities and make up a network together with other community members. These individuals can be key to informing, facilitating discussions and stimulating stakeholder input. These groups/individuals should be identified at consultation meetings and should be strategically accessed to promote engagement in certain situations.

**Principle 9: Provide opportunities for complaints and grievances - Grievance Redress Mechanism (GRM)**

The Project must create opportunities for communities, taking into account their gender and age aspects, to make complaints and denunciations, anonymous or not, and it must be effective, culturally appropriate and have a specific space reserved for the borrower

to respond to complaints and denunciations. Many complaints require redress and/or specific and immediate measures and these must be effective in respect of the safeguards and the process of participation and trust that is being encouraged. Complaints such as harassment of women are sensitive issues, shrouded in insecurity and discrimination. Similarly, complaints related to worker misconduct and excessive noise, for example, are generally not made for fear that the project will be canceled.

To this end, the borrower will implement an accessible, sufficient and culturally appropriate Grievance Redress Mechanism, to be monitored by the borrower, in order to guarantee timely attendance and response. The use of complaint and grievance mechanisms should be encouraged and it should be emphasized that this mechanism is not intended to stop the work, but to allow it to be carried out with respect for the communities' way of life and insecurities. Project teams need to be prepared to listen to people's complaints without getting defensive, without raising doubts and giving appropriate feedback.

The Grievance Redress Mechanism (GRM) at the site level is a formal and important part of environmental and social risk prevention and management and should be designed with the community, being one of the activities of the Consultation Plan scheduled for the planning stage.

In this regard, it is essential to let community members (stakeholders) know that if something has not been answered or resolved properly, they can go to the defense institutions to file a complaint. This transparency in the dialog provides security and promotes a bond of trust in the project.

### **Approach and level of participation**

---

The starting point for the effort to engage the parties in the consultation process is the planning phase of the proposed work or production plan. This stage involves important issues related to the alignment of the purpose of the Consultation Plan, the form of stakeholder participation, a timetable that is appropriate to the reality of the community, dialogue about the project, the choice and evaluation of the construction site and measures that interfere with the planning of the work, such as worker accommodation, measures to isolate the area using adequate communication etc. This is usually the stage that lasts the longest, but community engagement will take place at all stages of the project (pre-planning, planning, construction, operation) until the school structure is fully operational.

It should be noted that if the borrower's schedule involves a project definition stage prior to planning, this should also be considered a consultation stage, especially if it includes negotiations on the project and the choice of site. Participation should be contemplated at different levels, and should take place at each and every stage, along a continuum:

- a) The first level is information sharing and allows stakeholders to get to know the project and stay informed about the planned stages, the expected timetable for the work, the number of people involved, etc. This action involves one-way information transfer: from the project to the stakeholders. This gives community members the opportunity to talk internally and in an informed way about the project, as they are asking questions of the borrower in order to process information and contribute, in the next stages, to reflections on risks and measures. The provision of information will take into account varied communication strategies and dissemination materials that are suitable for Stakeholder access, and dissemination must take place beforehand, in sufficient time for Stakeholders to be able to grasp the central themes of the Project.

- b) The second level includes consultation. Consultations are decision-making moments that will be foreseen in the various phases of each stage. In these stages, the borrower, on the basis of prior information about the project, the risks identified, measures suggested in the socio-cultural assessment, and dialogue previously established about the project, suggests measures and/or proposes some action and listens to the feedback given by the interested parties. This action involves a two-way transfer of information: the project will offer options and listen to the parties until a decision is reached. It should be noted that this stage takes more time and does not necessarily have to be decided at the same meeting, depending on the topic. Pay attention to the principles described in the previous section for this level of participation.
- c) The third level includes dialog, with stakeholders in continuous dialogue with the project. At this level of participation, the borrower should create a routine on the progress of the project and measures and encourage community members to get involved through dialogues, reflections, questions, complaints, etc. If the dialogues break down, this is evidence that some error and/or fault has been committed and the suggestion is to carry out, together with community members and social organizations, an overall evaluation and/or submit a formal complaint through the Grievance Redress Mechanism.

The suggested activities for the different levels of stakeholder engagement are detailed below.

## **Engagement activities**

---

### **Initial engagement**

To start the process, the contact procedure with the representative social organization must be respected. The need for the organization to liaise with grassroots groups and representatives of women and young people and other parties it deems relevant should be highlighted, and it should be stressed that travel will be the responsibility of the borrower. They should then ask for an answer as to the best way for this to happen.

A first meeting about the start of the process should be scheduled with the representative social organization, including institutions that can contribute to the process. The president should also be advised of this approach and await his response.

At this initial meeting, the agenda should be suggested and it should be ascertained whether the community members have any other topics to discuss at the meeting.

It is essential to specify what kind of participation is required for community members and stakeholders at the different stages of the project: before planning, during planning, construction and operation. As far as institutions are concerned, they don't have to be involved at every stage.

This first meeting will be important for aligning basic stakeholder engagement information for further meetings, especially if it is possible to validate a medium-term schedule with the planned engagement activities from the initial stage.

### **Information Sharing**

Sharing information is the starting point of the stakeholder engagement effort. The aim is to provide adequate information about the project, the planned stages, phases of engagement, related topics, anticipated risks for the community, etc. This unilateral

process is intended to introduce the project to the community and, in particular, to highlight what a consultation process that runs parallel to the work is like.

The borrower should provide the information without exalting the importance of the project for the community, or making judgments about the expected risks and whether or not the work can continue. Value judgments, as described, are not part of the principles to be adopted in consultation plans. The aim of the engagement activities is for interested parties to be able to obtain relevant and detailed information about the Project that will be implemented in the community.

The following activities are proposed to share information with stakeholders:

**a) Formalizing the start of the process with the interested parties.**

At this stage you should consider formalizing the start of the process to the interested parties so that people, groups and institutions can plan ahead and understand what is being proposed. We suggest formalizing basic information about the project, the start of the consultation process and indicating that a first information meeting will be scheduled in the community.

- A letter addressed to the social organization, its board of directors in the form of the president. This formal communication is important for registering the start of the process, giving due importance to the consultation process and consulting the association on the best date for the first meeting, which should last at least the whole day. In this letter, consider the important presence of the organization's grassroots groups, women's groups and young people. After the letter, a phone call and/or message should be sent to discuss the dates and how the representatives will travel. For this meeting, the community members can request the presence of the whole community. This prerogative should be respected and the meeting should align who will actually be the stakeholders in the process in order to plan the next trips.
- Letter to the City Council. This letter should be aimed at inviting the Municipality to participate in the first meeting of the consultation process, with the date already set by the community's social organization, and should minimally describe what the process is about and who is involved. Remember that the body must have time to request travel and these deadlines must be taken into account in the team's timetable.
- Free Prior and Informed Consent (FPIC) in accordance with ILO-169.
- In the case of activities with indigenous communities, prior contact and authorization from FUNAI is required.

**b) Information meetings**

The purpose of the first meeting is to share information, answer questions and inform the parties about the timetable, the stages of the work or production plan, the workers expected and to make it clear that a Consultation Plan will be developed with the interested parties to discuss the stages, possible risks and measures. The first part of this meeting, which should last at least a full day, is to explain what the Consultation Plan is and how it will be integrated into the work. The second part should deal with the choice of site and show the project plan, preferably leaving it with the community so that they can talk about any proposals they may have for the project, which is guaranteed at the planning stage. This action at this stage encourages participation and highlights the participatory and consultative nature of the project.

Meetings lasting a minimum of one full day and a maximum of two are the best format for sharing information with community members, given their production activities and other roles in the community.

Relevant information via an app messaging should be avoided. This communication should only be used to confirm specific dates and information. This communication centralizes information and places responsibility on one person, which can lead to conflicts with other communities.

Meetings will be scheduled throughout the process, at the different stages, and serve to provide information geared to the stage and phase of the project. Specific meetings to share information about the project, risks identified, measures considered pertinent and the timetable for monitoring and evaluating the work and measures, during the implementation stage, are considered relevant for greater time to exchange information between the borrower and community members.

Finally, it is suggested that a preplanning stage be held to choose and evaluate the project site, in line with the guidelines set out in the CSA. The purpose of this first meeting is to let the community know what will be done, when and who will be in charge, and it should be strongly avoided that any activity is carried out without the knowledge and consent of the community's social organization. The community members have their own daily activities and their own form of governance, and the person assigned will need to organize themselves to welcome someone into the community.

### ***c) Visual material to be produced***

Visual materials are an important tool for explaining processes and socializing information. Speech alone often confuses and falls by the wayside, especially when there is a lot of diverse information. Flip charts, maps and drawings can and should be used during meetings to highlight the explanation. Teachers and young people can be asked to help if necessary. After the meetings, any information that is considered relevant should be reflected on in order to prepare a consultation stage, or a timetable that needs to be available for community members to plan, and it is suggested that teachers and young people be asked to draw pictures and hand out explanatory leaflets.

### **Consultation**

During consultation meetings, i.e. meetings scheduled for decision-making purposes, to obtain consent and move on to the next stage or proposed activity, the community's social organization and other interested parties will present their considerations, points of view and doubts. Consultation meetings can take place at any stage in different phases and should follow the same format as information meetings, except that the content is different. It is recommended that everything that needs to be decided for the smooth running of the borrower's schedule and planning should be concentrated in the pre-planning stage and also in the planning stage, leaving the project implementation stage for the execution of measures, monitoring and evaluation. Consultation stages do not always reach consent in a short time, it will depend on the previous stages. Time must be built into the borrower's schedule for these breaks (which can last hours or days) to reach consent on a certain issue.

The contents that should be dealt with in this stage, in general, are: (i) the location of the sub-project (taking into account the issues highlighted in the Socio-cultural Assessment); (ii) the design of the sub-project; (iii) possible hiring of local labor and measures aimed at external workers (health protocol, accommodation outside the territory, drawing up a code of conduct); (iv) measures associated with each social risk; (v) evaluation at the end of each stage, in order to obtain consent to continue with the Project; (vi) meetings

to deal with measures to redress grievances and complaints and other definitions, all of which must be documented.

At each consultation meeting, the topic should be defined in advance and how everyone's consent will be given, as opposing opinions can remain firm until the end of the meeting. Aligning the format can be relevant for crucial moments in the construction schedule.

### **Dialogue**

During the implementation phases of the project, the borrower must maintain constant dialog with the stakeholders. At this stage, a schedule of evaluation and monitoring meetings should be defined, with a short time between them, so that problems are captured at the beginning and remain at the local level, generating positive results and not causing new impacts and/or increasing the significance of those identified in the socio-cultural evaluation.

### **Meeting Facilitation**

---

Facilitation involving traditional communities is a different process from what is usually seen in organizational meetings. Normally, each group has a governance model where decisions are taken in different formats, depending on the topic being discussed and the oppositions marked out by the group. This process must be respected as it is part of the cohesion strategies of families and alliances between communities.

The project must include the following aspects in order to be effective and comply with the consultation standards:

- a) Selection of a meeting facilitator/mediator who must have the following characteristics:
  - Understand the reality and history of the territory and communities;
  - Understand the local situation and past experiences in order to use concepts and examples that can help in times of lack of understanding. In this case, you can also ask them to bring examples of similar situations to the meeting;
  - Support horizontal discussion, valuing everyone's voice and contribution, and encourage the participation of men, women, young and old;
  - Have the patience to listen and the sensitivity to objectively capture what the interlocutor brings to the discussion;
  - Avoid words that are difficult for everyone to understand and, when necessary, explain their meaning didactically and objectively;
  - Use graphic means to support trades, such as drawings and graphic indicators with the support of flip charts;
  - Have the sensitivity to understand when the meeting is paused, when the community members need to talk among themselves and when it is necessary to decide on a course of action. Propose a course of action and let the participants decide on the best option for the moment;
  - If appropriate, a good game, dynamic or playful activity will help people get excited and participate more actively in meetings. Remember that this "I'll talk and you sit and listen" format doesn't encourage participation and makes people sleepy.

- b) Observe and encourage meetings, especially consultations, to include a representative number of men, women, young people and leaders of the representative social organization, especially grassroots groups. Encouraging dialogue about the minimum quorum for meetings is a strategy to avoid meetings becoming empty and/or being centered on just a few people, especially during consultations. Measures are effective when everyone is informed and responsible, and consents are valid when they respect safeguards and are representative of all stakeholders;
- c) Time and place of the meeting: Meetings should also be scheduled at appropriate times to allow everyone to take part. If some groups, especially grassroots groups and women, do not participate, separate consultations are necessary to ask for their opinions on the topic discussed;
- d) Announcement: The meeting must be formally announced in an appropriate manner at least one week in advance;
- e) Timeliness: As already described, collective decision-making can take a long time, depending on the topic. The project should give community members enough time to deliberate issues between all interest groups;
- f) Meeting report/record: Those responsible should draw up a report for each meeting containing at least the following information: (i) topics discussed; (ii) list of concerns raised about the topics discussed; (iii) list of decisions taken during the meeting; and (iv) list of participants, with information on community, gender and age.

### **Participatory approach**

---

The general approach to facilitation is a participatory one, which allows everyone to participate, not just a few; people allow each other the space to think and speak, even if they take their time or reproduce the same speech as someone else; opposing points of view can coexist, and should be valued; people can respect each other's point of view, even when they don't agree with them.

The facilitator will focus on moving stakeholders from low levels of commitment to the process to high levels of commitment. The facilitation method depends on what is acceptable to the community. However, the facilitator must mediate without interfering in the group's internal rules and include some procedures to ensure compliance with the international and national guidelines described in the Socio-Cultural Assessment:

- **Basic rule:** Explain the basic rules of the meeting. Explain the rights of traditional communities in relation to the right to free, prior and informed consultation, including the right to say no. Explain that some moments will be decisive and that they should be encouraged to discuss how agreement and consent will be reached. To help, we suggest inserting the points on a flip chart for everyone to see;
- **Overview:** The facilitator introduces the subject, the purpose of the dialog or decision and explains each party's contribution to the process. In this way, the interested parties will clearly understand what their contribution is and where they want to end up;
- **Sharing information:** Sharing information about the proposed project. This includes a general discussion, after which the community identifies the important points to be discussed. This phase ends with a discussion on the content and implementation of what is being proposed;

- Identify practices and rules internal to the group: Identify in a participatory manner the practices and rules that should be considered in the formulation and implementation of the Program and measures. Request and document rules, as well as associated risks and possible flexibilities to remedy or eliminate potential risks;
- Decision-making: Allow sufficient time for the community to assess risks, threats and opportunities when deciding on measures and during the execution of the work and measures. Explain the process in detail, including the phases in which community participation is required;
- Grievance redress mechanism: Clearly address the need for grievance redress mechanisms, and encourage reflection on the need and importance in relation to the work and the opportunity given to everyone to speak out, considering the shame and insecurity of speaking in plenary. Often the internal rules associated with grievance mechanisms are concentrated in the president of the association, which can be validated as a grievance channel, but creating an independent mechanism that includes the redress of complaints and denunciations of the work, an atypical event in the community's reality, should be the responsibility of the borrower and can be valuable in correcting problems as soon as they occur;
- Results report: The facilitator informs participants how the meeting report will be shared or disseminated. It should be standard practice to share and discuss the results of meetings and activities;
- Evaluation of the meeting: The facilitator gathers information from the participants to see if the goals of the meeting were achieved and evaluates them collaboratively. If they were not achieved, relevant points should be identified and reflection on how they can be improved in future meetings should be encouraged;
- Next steps: The facilitator explains to the participants what was done in that meeting, lays out the timeline and steps of the process again, updating their current momentum, and talks about the next steps that will be taken in the process, including agreeing on a time and best day for the next meeting.

## **Human and material resources**

---

Overall responsibility for the process of engaging stakeholders in the consultation process lies with the borrower. The resources needed for implementation must be foreseen before the process begins, so that initial planning can take place and commitments can be agreed in the field, avoiding cancellations and/or non-compliance with agreements, as this would jeopardize the entire process. Word of mouth has a lot of power in communities that maintain strong ties of kinship and cronyism, and if you make a commitment you must fulfill it so as not to break the bonds of trust that are being built.

Here are some important items that should not be forgotten, but they will certainly be added to by many others needed by the borrower to articulate the process. For the engagement of the parties consider:

### **Material Resources**

- Resources for participants to travel to other communities, such as money for fuel or transportation. The communities are accessed by land. Be aware of rainy months, which can make it impossible to get to the meetings;

- Consider a plan for feeding the participants. Remember that the community members will be available all day, will leave their activities and will not be in their community. Consider talking to the president of the representative social organization at the first meeting to align this point. In any case, the borrower should provide food during the meeting, for breaks during the dialog process. Coffee, sandwiches or even another product bought from the community is welcome and contributes to community income;
- Support material for meetings: Flip chart, drawings, pens, A0 paper, colored pencils, etc;
- Funds for printing important newsletters, schedules and records of meetings to hand out to participants;
- Depending on how the meeting is planned, how long it will last and how far the Stakeholders have traveled to take part in the activity, it is recommended that a minimum of water, coffee and, ideally, a small snack be provided.

### **Human resources:**

- Specialist in consultation processes to facilitate and execute the process. Preferably someone with training or experience in social communication, conflict resolution and anthropology;
- Assistant to the expert. Your role will be to support the expert, record meetings, draw up documents and letters, check the list of participants, take consent photos of the process, which should only be used to record the process on screen;
- Assess the need for support from an indigenous professional and/or a professional translator, if the majority of people in a given community express themselves in a specific language.

### **11.2.3 Grievance redress mechanism (GRM)**

The aim of the GRM is to channel a complaint or grievance into an acceptable and institutionalized mechanism to resolve conflicts arising from the implementation of the consultation process, the work and the measures. The mechanism should focus on dialogue as a neutral way for stakeholders to discuss problems and reach a solution and/or redress where necessary.

For PROCASE II, it is suggested that the mechanism be simple, with few processes, and that it be developed in dialogue with community members and representative social organizations. Considering that there is governance to solve internal problems in the territory, the idea is to collaboratively build and/or assimilate its rules, a neutral procedure that can be relevant to the project cycle, in which complaints are not subject to a possible "filter" by the social organization, for fear of the project being cancelled and/or for exposing a very particular issue in the community.

Basic principles must be taken into account when drawing up the GRM:

- The GRM should be designed to function at a local level, in all communities, throughout the life of the Project. It should be discussed that the complaints received offer opportunities to inform and improve the way the borrower conducts the process within the territory;

- The borrower must be committed to a consultative, participatory, fair and equitable working relationship with community members who express concerns;
- The borrower must also commit to ensuring that no complainant is subjected to retaliation by the borrower, the contractor or other institutions involved in the Project, as well as community members when they raise their concerns and participate in the grievance resolution process;
- The borrower should encourage individuals to have a voice in the project, especially people who, for various reasons, don't expose themselves but have a lot to contribute;
- The GRM should provide an opportunity for these communities, historically violated in their ways of expressing themselves and deciding on activities that affect them, to lodge complaints, defend their point of view and their way of life;
- The borrower must encourage communities to defend their rights, even if the project is related to a service that is so important to them, violations can be committed through carelessness, negligence or lack of information. The borrower, even on a small scale, considering the size of the project, must be able to comply with international standards and national legislation;
- The GRM must be monitored by the borrower in order to guarantee timely service, replan activities and apply a corrective plan, if necessary.

### **Building the mechanism in a participatory way**

---

The scope, size and type of grievance mechanism will be proportional to the nature and size of the possible risks and impacts of the Projeto grama, as listed in the ASC's risk matrix. The grievance mechanism should contain at least three basic steps.

#### **Step 1: receive and acknowledge a complaint**

Culturally appropriate means by which community members can raise or air their grievances, including, but not limited to: dialogue aimed at this topic, a specific meeting; a closed box in each community in the collective spaces that can receive drawings and papers with grievances, anonymously or not; reports made privately by the president of the representative social organization and community representatives, among others to be built in collaboration with the community members. It's important to discuss a routine for talking about this specific subject. One suggestion is for the mediator to dedicate an hour at each meeting to evaluation, reading the papers in the boxes without identifying the community and possible complaints about the stages underway. People should be encouraged to ask a variety of questions, taking into account the assessment of each risk described in the CSA; bear in mind that some community members may not be fluent in writing. Drawings, cards previously drawn up by the borrower and other forms to be discussed should be encouraged.

Complaints must be registered by the borrower.

#### **Step 2: evaluate, assign responsibility and investigate**

Discuss the procedures that will be followed to resolve the complaint. Often the Consultation Plan mediator does not have the power to bring about a resolution. You should establish a transparent procedure to be followed: registration of the complaint, deadline for resolution and the person responsible for responding.

The sooner complaints are resolved, the lower the chances of social impacts, conflicts and complaints to defense agencies.

### **Step 3: consult and implement the resolution**

This procedure must take into account the seriousness of the complaint, claim or grievance. The borrower must be institutionally prepared to replace workers, adapt measures, immediately resolve environmental impacts caused by the contractor and even turn to other institutions to help resolve the problem. For example, as described in the CSA, a community may have its electricity distribution network overloaded, which could affect surrounding families and the project facilities themselves. If there is a general power outage due to the work, or which impacts the work, the borrower should be ready to receive an urgent complaint via an app message, for example, and take action with the company responsible.

Even if the complaint could lead to penalties for the contractor or the borrower, it is recommended that the problem be registered, dealt with and resolved effectively and quickly, because depending on the seriousness of the complaint and the lack of resolution, the community should be encouraged to make complaints to their support network.

#### **11.2.4 Monitoring and evaluation**

The following table presents a guide with relevant questions and information, adapted from Kvam (2017), which can be used to monitor the phases of the consultation and engagement process, as well as serving as guidance for writing the summary report of the stakeholder consultation process. It is usually requested as evidence of the borrower's compliance with the safeguards during the Project stages.

This script of questions for monitoring should be drawn up at each stage of the project (Pre-planning, Planning, Implementation and Operation) and should be guided by the phases and contents described in this Consultation Plan.

The socio-cultural assessment and this Consultation Plan on canvas should be a real support for the general contextualization of the community's reality.

The public consultations held will be the subject of a report, to be submitted to the IDB for analysis and approval. The report(s) should minimally contain the minutes of the meeting, an objective summary of the issues raised by the Stakeholders and the responses offered, agreements defined in the consultation, attendance list, photographs, didactic content used, etc.

**Table 6 - Relevant questions and information in the monitoring process**

Supporting question	Objective and orientation	Relevant information to monitor
<p>1. When did the project interact with stakeholders?</p>	<p>To convey the principles that underpin engagement and decisions regarding effective interaction with stakeholders.</p>	<ul style="list-style-type: none"> <li>- At what times/how often does the borrower interact with stakeholders?</li> <li>- For example: whether at certain points in a project cycle: periodically (e.g. the phases of each stage); in response to legal or other requirements; in response to requests from interested parties;</li> <li>- Quantify these interactions in a report with photo evidence and attendance lists;</li> <li>- How has the commitment to levels of participation (sharing information, consultation and dialogue) with stakeholders during the implementation of the Program been contemplated (divide by stages)?</li> </ul>
<p>2. What objectives have been set for the stakeholder interaction processes?</p>	<p>Convey the justification and objectives of the Consultation Plan. - What resources (costs, people responsible, others) have been allocated to the consultation process?</p>	<ul style="list-style-type: none"> <li>- Reference data and indicators used in monitoring and evaluating the additional institutional capacity needed to make implementation more effective;</li> <li>- Consultation Plan: main categories and subcategories of stakeholders. Nature of their participation in the project, main characteristics, how the project interacted with each of the different groups;</li> <li>- Examples of how the Consultation Plan was based on the results of the stakeholder analysis (CSA);</li> <li>- Special measures/strategies applied to ensure the effective participation of the parties;</li> <li>- Possible updates made to the Consultation Plan;</li> <li>- Evidence of support or opposition from the institutions involved, where relevant;</li> <li>- Examples of different opinions among stakeholders (e.g. evidence of agreement or disagreement regarding consultation moments - construction site, architectural design of the school and measures to reduce risks);</li> <li>- On what basis do communities enter into consent at decision-making moments - mechanisms and interaction (e.g. acceptance, understanding, disagreement, negotiation of measures)?</li> </ul>

Supporting question	Objective and orientation	Relevant information to monitor
<p>3. Which stakeholders did the project team interact with?</p>	<p>Provide concrete examples and qualitative and quantitative data; Examples can preferably be drawn from situations where there are real challenges, as opposed to those involving a restricted and/or easy-to-solve problem.</p>	<ul style="list-style-type: none"> <li>- Specific subgroups of stakeholders with special participation: women and young people;</li> <li>- The general logic guiding interactions;</li> <li>- The specific purposes of different interactions and the extent to which these purposes have been achieved or promoted;</li> <li>- Whether the interactions were one-off (reserved) events or part of an ongoing interaction process;</li> <li>- How many stakeholders interacted or how many consultation sessions took place at decision-making moments;</li> <li>- Possible changes made to the interaction plan and reasons for the changes;</li> <li>- Full written feedback summarizing program/user initiatives related to concerns and insecurities</li> </ul>
<p>4. What interaction formats were prioritized?</p>	<p>Demonstrate that the form of consultation was adapted to the socio-cultural specificities of the community and how it was based on the Consultation Plan and CSA.</p>	<ul style="list-style-type: none"> <li>- Brief description of events and discussions (location, format, number of participants, key issues and concerns raised), how it was documented, whether consensus was reached;</li> <li>- Information provided to stakeholder groups prior to consultation meetings;</li> <li>- Times, duration and formats chosen and why;</li> <li>- Key documents disclosed to stakeholders;</li> <li>- Publication of the results of the consultation process;</li> <li>- Amount of time given to interested parties to examine and discuss the information;</li> <li>- Measures to ensure that the process respects the opinions of the different stakeholders;</li> <li>- Examples of stakeholders joining the process and developing confidence that the interaction process was fair and legitimate;</li> <li>- Dialogic methods applied to the consent process in consultation meetings;</li> <li>- The most striking differences between stakeholders (e.g. the concerns of Campo Verde and other communities).</li> </ul>

Supporting question	Objective and orientation	Relevant information to monitor
<p>5. How have the views of stakeholders influenced the planning and execution of the Program (in the different Stages)?</p>	<p>Demonstrate, by means of concrete examples, the extent to which the process of interaction with stakeholders has fulfilled the proposed objective of dialoguing about risk-related safeguards, the risks identified and the measures to be implemented.</p>	<ul style="list-style-type: none"> <li>- The opinions, wishes and specific contributions of the interested parties on the different issues concerning the work;</li> <li>- Input from stakeholders on measures to reduce identified risks;</li> <li>- Decisions or measures by the project team in relation to issues that have been based on input from stakeholders (e.g. a decision not to proceed with a measure based on community input, a change in the planning of the work based on a negotiation);</li> <li>- Reasons for the decision not to incorporate or address significant issues raised by stakeholders;</li> <li>- Whether and how stakeholders have been informed about decisions, measures or other changes resulting from their contributions.</li> </ul>
<p>6. How has the project established grievance redress mechanisms? How are they working?</p>	<p>Explain the applicable processes when affected stakeholders have questions or doubts; when mediation is required; or when the project is considered to have caused a negative impact or contributed to it occurring</p>	<ul style="list-style-type: none"> <li>- Means/mechanism by which the Program receives complaints or doubts about the impacts, complaints and denunciations of the Program/work and the effectiveness of the measures;</li> <li>- Type of Grievance Redress Mechanism created and how it aggregated internal group rules?</li> <li>- Types of complaints received and if not, to what do you attribute them?</li> <li>- Efforts to mediate or solve problems;</li> <li>- Criteria for evaluating the effectiveness of the solutions found;</li> <li>- Trends and patterns in complaints or doubts and their solutions;</li> <li>- Meaningful examples of redress for a real complaint, grievance or report.</li> </ul>

## 1. INTRODUCTION

The stakeholder engagement process is used as a link between social actors, with the intention of combining eliciting the interests of society and public authorities, promoting the sustainability of the project. During this process, proposals and criticisms can be presented, testimonies can be gathered and doubts can be clarified. It is ideal for listening to those directly affected by the project, as well as for identifying alternatives for resolving any conflicts, in accordance with national and state regulations and the IDB and IFAD Environmental and Social Safeguards Standards and Policies.

This is the context of the proposal to build a communication channel with the public directly or indirectly affected by the **Paraíba Sustainable Rural Development Project - PROCASE II (PROJECT, henceforth)**.

## 2. PROJECT OVERVIEW

The State Government of Paraíba has requested the financing of a project through a specific investment loan (LON/ESP) to promote the sustainable development of the rural area of the state of Paraíba (involving the Atlantic Forest and Caatinga biomes), focusing on the problems of low production and productivity and vulnerability to climate change (CC) of family farming activities, environmental degradation and deforestation, insufficient water supply services for human consumption and lack of sanitation in rural communities.

Below is information detailing the description of PROCASE II, its components and planned sub-projects.

### 2.1. Objectives of Project

The overall aim of the project is to contribute to reducing rural poverty levels, improving food and nutritional security and adapting the rural population to climate change.

The main specific objectives are:

- Increasing the adoption of agricultural technologies, including those for adapting to and mitigating climate change;
- Improving the productive and social inclusion of family farmers, prioritizing women, young people, Traditional Peoples and Communities (PCT) and persons with disabilities;
- Improving the environmental conditions of rural communities and their surroundings.

### 2.2. Project Scope

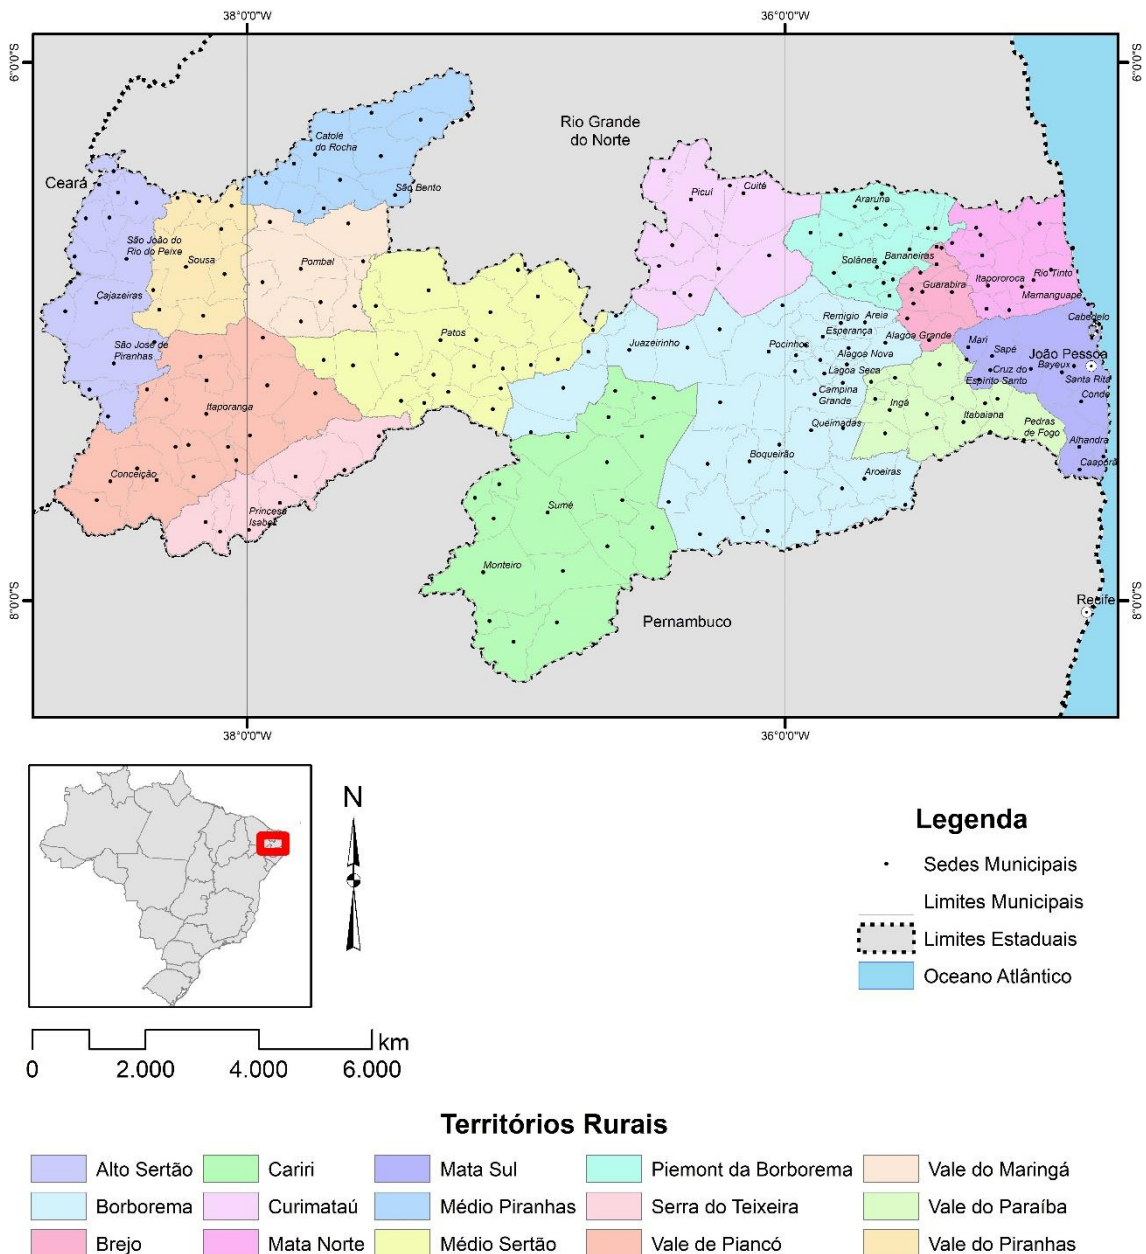

**It is important to note that the beneficiary communities for PROCASE II have not yet been defined and the consultation strategy presented in this document is aimed at communicating and interacting with the institutions representing the prominent communities in the project's area.**

The project will cover the entire state of Paraíba, involving its 223 municipalities (see figure below), which are distributed between the Caatinga (194) and Atlantic Forest (29) biomes. The Agricultural Census (IBGE 2017) shows a total of 163,218 agricultural establishments, 76.88% of which are family farms (UAF), from which the project will select its beneficiaries.

The project will seek to serve approximately 60,000 families as direct beneficiaries, establishing a preferential focus on the following profiles: women, young people, Persons with Disabilities, Traditional Peoples and Communities (PCT) and indigenous peoples (including fishermen, gypsies and quilombolas). In any case, specific criteria will be defined for prioritizing and selecting the communities to benefit.

The following map shows PROCASE II's area of operation.

**Figure 1 - Area covered by the Project**

Source: IBGE, 2015 - elaboration: Consultoria.

### 2.3. Budget from Project

The total amount planned for PROCASE II is 105 million dollars, which will benefit an estimated 600 communities.

**Table 1 - Estimated PROJECT costs (in US\$)**

<b>Components and sub-components</b>	<b>Total Value</b>
<b>C1. Resilient production systems to reduce rural poverty</b>	<b>62.416.000</b>
<i>S1.1 - Implementing resilient biodiverse production systems</i>	56.416.000
<i>S1.2 - Strengthening and diversifying marketing</i>	6.000.000
<b>C2 - Organizational and Farmer Capacity Building and Knowledge Management</b>	<b>32.302.800</b>
<i>S2.1 - Strengthening the Capacities of Family Farmers</i>	19.252.800
<i>S2.2 - Strengthening Organizations' Marketing Capacities</i>	2.730.000
<i>S2.3 - Diversity, Gender, Youth, Nutrition and Food Security</i>	4.600.000
<i>S2.4 - Land and Environmental Regularization, and Access to Public Programs and Policies for Family Farming</i>	2.600.000
<i>S2.5 - Innovation, Knowledge Management (KM), South-South and Trinagular Cooperation (SSTC)</i>	3.120.000
<b>Project Management, Monitoring &amp; Evaluation</b>	<b>10.281.200</b>
<i>Project Management</i>	8.981.200
<i>Monitoring &amp; Evaluation (M&amp;E)</i>	1.300.000
<b>TOTAL</b>	<b>105.000.000</b>

## 2.4. Description of the components

The PROCASE II components are presented below, highlighting the main information that describes them, including their sub-components.

### **Component 1: Resilient Production Systems to Combat Rural Poverty**

The aim of this component is to increase the adoption of agricultural technologies, including those for adapting to and mitigating climate change, as well as improving the productive and social inclusion of family farmers, prioritizing women, young people, Traditional Peoples and Communities (PCT) and persons with disabilities.

The specific objectives are:

- Transform existing agricultural systems by introducing innovative, more intensive and diversified agroecological practices;
- Promote greater resilience of production systems adapted to climate change;
- Promote improved food and nutrition security;
- Improve the integration of producers into value chains, prioritizing women, young people, people with disabilities, Traditional Peoples and Communities (PCT), indigenous peoples, fishing communities and gypsies;
- Make investments in social technologies, ensuring better access to and reuse of water, and sustainable energies;
- Support producer organizations (associations and cooperatives) to enable production to be processed, adding value and consequently improving marketing and market access, through investments in machinery and minor renovations;

Productive investments, both at community level and at cooperative level, will be accompanied by technical assistance and extension services (TA) and specialized

technical advisory services (STA) respectively, financed by Component 2, in order to guarantee better business management, marketing and sustainability.

Component 1 is organized into two sub-components: 1.1: Implementing Resilient Investment Plans; and 1.2: Strengthening and diversifying marketing.

### **Subcomponent 1.1. Implementing biodiverse and resilient production systems**

The aim of this sub-component is to strengthen and adapt production systems based on the use of agro-ecological practices and low greenhouse gas emissions, seeking greater resilience and allowing for an improvement and diversification of healthy food production for self-consumption and the market. It is hoped that these activities will improve families' food and nutritional security, while at the same time helping to improve their income.

Investments will also be made in social technologies (small water and energy infrastructures), which play a fundamental role in building and strengthening more resilient production systems and improving the basic living conditions of families.

The technical characteristics of the production proposals supported by the project will be adapted according to the specific agro-climatic characteristics of each biome.

#### ***Product - Resilient Investment Plans (PIR)***

It will be the main instrument for planning and implementing the resources of this subcomponent. It will have a territorial focus and will be prepared with one or more communities, with the support of TA. Each PIR will be carried out by an existing community association, representing the beneficiary community or communities, with which the project will sign an agreement establishing its obligations and rights. The project will pass on the funds provided and the association will make the purchases and contracts provided for in the PIR, reporting back to the project with the support of technical assistance.

The geographical scope of the PIR will be a Local Territory, made up of up to three communities, and its beneficiaries will be the families of these communities. The PIR will support productive activities (new or reinforcing existing activities) geared towards adapting to climate change, with the potential to guarantee food security and improve income through the sale of surpluses. It aims to incorporate concepts of good production practices based on the principles of agroecology, nutritional education and food security for families, as well as ensuring integration with social technologies.

The PIR will finance three areas of intervention: i) Productive and commercialization ii) Environmental and iii) Social Technologies, between which complementarity and synergy will be sought in order to promote sustainable change. As shown below:

**Productive and marketing axis:** The aim will be to develop productive systems at the family level, always based on the use of agroecological practices with a low impact on greenhouse gas emissions. This axis will also strengthen capacities to market production in the various channels accessible to families (local fairs, PAA, PNAE, local commerce, etc.) and relevant to the beneficiaries, such as: i) Agroforestry systems (SAFs) for diversified production, goat and sheep farming for milk and meat, dairy cattle farming, and free-range poultry farming; ii) Backyards for fruit and vegetable production, including non-conventional food plants (PANC) and medicinal plants; iii) Beekeeping and Meliponiculture; iv) Agroecological consortia for organic production, including cotton. It is important to mention that in the case of support for cattle breeding, the project's strategy will be to support dairy production exclusively (it will not support breeding for meat production), to improve productivity from the existing herd and will not finance the purchase of animals, with the exception of the purchase to replace

breeding stock. The list is not exhaustive and other activities may be considered, as long as they are in line with the demand of the beneficiaries and the objectives and criteria of the project.

Compared to the first phase of PROCASE, which focused on the semi-arid region of the Caatinga biome, the PROCASE II management team will have to pay close attention to identifying relevant proposals for developing productive activities with the potential to adapt to climate change in the Atlantic Forest biome.

All the activities supported under this Productive and commercialization axis will be in accordance with the Environmental and Social Management Plan (PGAS/ESMP) of each PIR and with the project's Strategic Environmental and Social Management Plan (PGASE).

Extractivism, both in the Caatinga biome and in the Atlantic Forest biome, could also be supported through PIRs, both to enhance non-timber products such as fruit, fibers and lianas, seeds, honey from native bees and other bio-economic products. As it includes an important coastal area, the improvement of artisanal fishing activities, including shellfish gathering, which is generally carried out by women, could be considered when drawing up the PIRs.

In addition to these activities, and considering that part of the project's area of operation has strong potential, economic diversification activities based on tourism (particularly in the coastal Zona da Mata) and handicrafts could be developed through the PIR. These non-agricultural activities, which generally involve women and young people, will be very relevant and in line with the project's objectives.

The Productive and Commercialization Axis will focus on actions to sustainably strengthen primary production and the commercialization of products generally in natura and on the local market. TA will encourage and support the establishment of partnerships with cooperative production processing units supported by the project through subcomponent 1.2. This should make it possible to add value to primary production in order to reach other types of market.

**Environmental Axis:** The aim is to manage and restore the environment, whether or not it is associated with the activities of the PIR's Productive Axis at Local Territory level.

They will have specific resources for collective use to encourage the implementation of territorial environmental actions, such as: i) Casas de Sementes da Paixão (Seed Houses of Passion); ii) Implementation of nurseries focused on the production of native species; iii) Reforestation, recovery of permanent preservation areas (springs) and degraded areas; iv) Soil and water protection actions; v) Recycling or composting plans, etc. These actions will be implemented in each territory by an environmental management group made up of project beneficiaries, in which the PROCASE II participation of Local Development Agents (ADL) will be prioritized, as key players in introducing environmental education actions and new environmental practices. To implement these actions, synergies and complementarities will be sought with the actions and competencies of SEMAS (Secretariat for the Environment and Sustainability) and AESA (Executive Agency for Water Management), the State Superintendence for the Environment (SUDEMA), the National Semi-Arid Institute (INSA), Empresa Brasileira de Pesquisa Agropecuária (EMBRAPA), Empresa Paraibana de Pesquisa, Extensão Rural e Regularização Fundiária (EMPAER), Universidade Federal de Campina Grande (UFCG), Universidade Estadual da Paraíba (UEPB), Universidade Federal da Paraíba (UFPB) and other institutions.

The activities of the Environmental Axis will mainly stem from the Environmental and Social Management Plans (PGAS/ESMP), which will be drawn up at the same time as the diagnosis of each PIR. The ESMP will provide a simplified analysis of environmental and social impacts in order to promote and encourage the adoption of environmental and agro-ecological practices. Environmental activities will be carried out with the support of TA, which will also take care of production and marketing.

**Social Technology Axis:** The aim of this axis is to implement social technologies at the family level, such as: i) second-water cisterns (agricultural production); ii) a water harvesting system; and iii) trench dams (underground dams). In addition to these technologies, 1st water cisterns (human consumption) and other household sanitation solutions such as evapotranspiration basins, or access to more sustainable domestic energy, such as biodigesters and eco-efficient stoves, will also be supported.

The social technologies will be implemented by entities contracted by the PMU specifically to provide TA for this axis, taking into account the specific nature of the TS and the legal framework targeted. These entities will be trained by PROCASE II, although most of them have the experience to do so. In addition to implementation, these organizations will also provide training to ensure that these technologies are properly appropriated, used and maintained by the families.

The connection and complementarity between the productive, environmental and social technology axes should be sought and highlighted when drawing up the PIRs, with the aim of maximizing the results of the investments made by the project.

In each of these areas, priority will be given to the introduction of innovative practices and technologies, particularly those that will be supported through Subcomponent 2.5, such as mechanization and the use of tools and equipment adapted to the reality of family farming, with a focus on vulnerable groups such as women, young people and the disabled.

The PIRs will also be able to support the strengthening of the functioning of community associations through the acquisition of specific equipment, for example, to improve connectivity, such as audio visual equipment, etc.

**General aspects about the PIRs:** During the implementation of the PIRs, in addition to a close and permanent synergy with TA actions (including specialized TA in cases where it is justified) and the strengthening of community organizations, complementarities will be established with other Component 2 activities, such as: land and environmental regularization; innovations; actions related to diversity, gender, youth, PCT and families with Persons with Disabilities.

The PIR will benefit groups of families, prioritizing women, young people, traditional communities and the Persons with Disabilities, and will finance inputs, tools, equipment and other investments needed to enable the adoption of technologies to improve productivity, adapt to climate change and improve food and nutritional security.

The investments will be financed with non-reimbursable resources and with an economic counterpart from the beneficiaries of at least 10%.

In all cases, the activities selected will come from the Participatory Rural Diagnostic, which will identify not only the demands, but also the problems, priorities and potential demands of the beneficiary communities and families. These activities must meet eligibility criteria that will be detailed in the Project Operational Regulations (ROP) and present: i) high adherence to the productive means characteristic of the biome, region and community, ii) allow productive intensification based on the principles of

agroecology, as well as adaptation to climate change and iii) follow the full agreement of the families involved.

The same PIR can support more than one productive activity or environmental axis and include the implementation of various types of Social Technologies, thus seeking coherence with the reality of family farming in order to meet the demands of the communities in a diversified way and can guarantee the inclusion of various profiles of beneficiaries, particularly women and young people. In these cases, the beneficiaries will be organized into interest groups around the activities selected to make up the PIRs.

During the process of drawing up the PIRs, the integration of new members and partners into existing organizations will be encouraged, giving priority to women, young people and families with Persons with Disabilities.

**Provision of Technical Assistance and Rural Extension (TA) services:** All PIR beneficiaries and their organizations will receive TA services for a period of two years, contracted by the PMU through a competitive process that meets IDB/IIFAD standards. These services will be financed by Subcomponent 2.1, in which they are presented in detail. They should enable the beneficiaries to be strengthened and advised on how to design, implement, monitor the operation of and complete the PIRs. This includes advice on production from an agroecological perspective and adaptation to climate change, management, organization, access to public policies and marketing, guaranteeing compliance with current health and environmental legislation. The support provided by the TA entities should include support for the beneficiaries to carry out the procurement and accounting processes related to the implementation of the PIRs, considering that the financial resources will be transferred to the beneficiary associations through the procedure defined in the ROP. In the selection of TA services, criteria will be applied that allow for the inclusion of women technicians in the teams, with a view to being as adherent as possible to the specific needs of women and to proposing more appropriate solutions for the women beneficiaries of the Project's actions. For example, it will be a selection criterion for TA organizations to have a minimum percentage of 30% women on their teams.

In the case of monitoring the implementation of Social Technologies, a specific TA will be contracted for this purpose, which complies with the legal framework for contracting services for this modality. The entities thus contracted will be responsible for acquiring materials, providing specialized services for the construction of Social Technologies and training beneficiaries to apply good use and maintenance practices.

**Planned Actions and Products:** The actions planned in this product involve: (i) identification of communities; (ii) community eligibility criteria; (iii) prioritization and selection of communities; (iv) Resilient Investment Plan Drafting Process; (v) drafting of PIRs; (vi) parameters for drafting PIRs; (vii) investments eligible for funding; (viii) fundable Climate Adaptation investments; (ix) fundable Climate Mitigation investments; (x) ineligible investments; (xi) PIR approval process; (xii) evaluation and prioritization criteria.

Details of the planned actions can be found in the **Annex** of this AASE.

### **Subcomponent 1.2 - Strengthening and diversifying commercialization**

This sub-component aims to improve marketing and the inclusion of families in value chains by improving the management and production structures of family farmers' cooperatives.

It aims to strengthen cooperatives by means of a Business Plan (PN), with a view to consolidating their management capacities, adding value, diversifying their commercial

offer and accessing markets under better conditions. Rather than seeking to create new cooperatives, priority will be given to existing cooperatives to improve their management capacities and those with operational weaknesses.

### ***Product - Business Plans***

The preparation of these PNs will take into account the strengthening of production carried out in subcomponent 1.1 through the PIRs, with the aim of integrating producers into these cooperatives in order to access the market.

The development of the PNs will seek to diversify the markets accessed. In addition to the institutional markets, such as PNAE and PAA, other players will be sought, mainly from the private sector. The project will seek to include the organizations in the Regional Information System for Family Farming in the Northeast (SIRAF), created by the Northeast consortium and which has been offering a new channel for establishing contact between producers and buyers.

Business Plans (PNs) will be the main instrument for implementing the subcomponent and will be drawn up with producers' economic organizations, usually cooperatives. The PNs should make it possible to finance structuring investments that could benefit family farmers, including the producers benefiting from the PIRs. Specialized technical assistance services (STA) specially dedicated to the NPs and to strengthening the capacities of the beneficiary organizations will also be financed by the NPs.

The PNs should allow for the implementation of competitive mechanisms, geared towards innovative and environmentally sustainable solutions, to strengthen network marketing and cooperative centers.

Investments will focus on existing organizations that have weaknesses in their management processes, that are unable to achieve sufficient levels of commercialization, that find it difficult to comply with environmental and health legislation, or that operate below their capacity. In these cases, the project will strengthen the capacities of the management teams, support the improvement and modernization of equipment and facilities, improving the processing and diversification of products, with a focus on adapting and/or expanding the physical infrastructure (such as processing and storage areas), with the aim of also meeting the health and environmental standards for obtaining certifications (SIF –federal sanitary inspection, organic certification, distinctive collective seals, valuing sustainable products from the Caatinga and Atlantic Forest biomes, etc.). Where relevant, the development of participatory guarantee systems (PGS) geared towards certification processes will also be supported. Subcomponent 2.2 will make an important contribution to these activities and complementarities will be built.

In exceptional cases, the project's support may be directed towards structuring the productive capacity of a cooperative, operating within the supported production chains. These cases will be specific and subject to prior feasibility analysis, taking into account in particular the existence of other similar ventures in the project area.

Strengthening the capacities of the cooperatives' teams will be a key point of the PNs, which will address the issue of best processing practices, as well as others, such as administrative and financial management. In this case, courses are planned on good management practices and the organization of production, processing, adding value, financial management, institutional strengthening, marketing strategies, etc. The management teams of these enterprises will be the main beneficiaries. These courses will mainly be carried out through specialized consultancies (such as individual consultants, EMPAER, EMBRAPA, SEBRAE, SENAR, etc.).

The preparation of the Business Plans will include a diagnosis of the organization's situation, clearly identifying the most important problems and difficulties encountered and also the opportunities that can be seized. The PNs may include agricultural activities of primary production, processing and marketing of this production. Other economic initiatives can also be included, such as handicrafts and community-based tourism, among others, provided they have the potential to generate income in a sustainable way. As the object of these Plans will be 'business' related, involving production and market issues, it is necessary to include more detailed information such as a 'map' of the production chain identifying flows and actors, an analysis of the products demanded by the market and their trends (volumes, prices), an analysis of the competition, a strategy for operating in the market, a sales plan and an investment management strategy. The Business Plan will identify the material investments that will have to be made (construction/refurbishment, machinery, equipment, etc.). In addition, it should point out the training needs (which may cover production, marketing, administrative and financial management, or other dimensions) that the implementation of the Business Plan will require.

**Provision of Specialized Technical Assistance (STA) services:** Considering the capacities found in the organizations in the region served by the Project, it will be necessary to contract STA services for the preparation and implementation of all the Plans. These services will be contracted by the PMU, through a competitive process that complies with IDB/IFAD standards, with funds provided in the budget for Subcomponent 2.2. However, in certain cases and when the beneficiary organization shows experience and capacity, it could take on the responsibility of hiring the STA directly.

Individuals or legal entities may be contracted to provide these services. The criteria for selecting providers will include: i) experience in providing consultancy services to family farming cooperatives; ii) technical capacity related to the specific problem(s) identified by the cooperative, such as improving processing processes, developing a strategy and identifying new marketing channels, developing a certification system, etc.; iii) technical capacity to deal with and integrate environmental issues related to the activities carried out by the cooperatives being assisted; iv) capacity to work remotely (using the internet); v) experience with access to public policies.

STA services should encourage supported organizations to look for other sources of funding and service providers to complement the resources allocated by PROCASE II and also to meet demands not included in the business plans it supports. Opportunities for cooperation and alliances with the private sector will also be sought whenever possible.

**Planned Actions and Products:** The actions planned in this product involve: (i) Identifying and selecting beneficiary organizations; (ii) Drawing up the PNs; (iii) Eligible investments for financing; (iv) Types of Climate Adaptation investments that can be financed; (v) Types of Climate Mitigation investments that can be financed; (vi) Non-eligible investments for financing; (vii) Criteria for evaluating and prioritizing the PNs; (viii) Implementing the PNs.

Details of the planned actions can be found in the of this AASE.

## **Component 2 - Strengthening Family Farming Capacities and Organizations and Knowledge Management**

---

The aim is to strengthen the individual and collective capacities of family farmers and their organizations, necessary to increase the adoption of agricultural technologies that

promote greater resilience in their systems, to improve productive and social inclusion, as well as the environmental and land conditions of rural communities and their surroundings.

The capacities strengthened through the component will be an essential tool for implementing the investments and innovative practices promoted by Component 1.

To help achieve the project's general objectives, the component will develop a set of activities with the following specific objectives:

- Strengthen the capacities of families and community organizations to implement more resilient and productive production systems, to better manage organizations and to access public policies;
- Strengthen the capacities of rural organizations so that they can develop their production and access markets;
- Strengthen the specific capacities of priority audiences in the areas of gender, youth, PCTs, Persons with Disabilities, LGBTQIAPN+ population to promote their empowerment.
- Promoting the land and environmental regularization of family farming establishments, agrarian reform settlements and quilombola communities.
- Implementing a knowledge management (KM) and south-south and triangular cooperation (SSTC) process to generate, record, share and use relevant knowledge.

The sub-components involved in this C2 are presented below. The full details of each sub-component can be found in the Annex **Error! Reference source not found.**

### **Subcomponent 2.1. Developing the Capacities of Rural Community Organizations**

The component will focus on strengthening the capacities of beneficiary families and community organizations, taking into account the weaknesses identified in various areas, with adequate knowledge to implement production systems that are more resilient to climate change and more productive, as well as to improve the management of community organizations.

It will finance the contracting of Agroecological Technical Advisory and Extension Services (TA) to carry out activities aimed at increasing the beneficiary families' access to adequate and quality information. The main themes to be addressed by TA will be the development of more profitable, diversified and resilient agricultural production, the protection and recovery of environmental resources and the improvement of organizational management. It will also seek to integrate them more closely into different value chains in the region, with initiatives to support processing and marketing. And finally, the subcomponent will seek to strengthen the TA teams contracted to ensure the good quality of this service.

#### ***Actions planned***

- Provision of agroecological TA services in communities
- Complementary training/exchange events for farmers, including association leaders.
- Events to improve TA teams
- Training family farmers in public policies

Approximately 18,000 families will benefit from TA services, of which 50% should be represented by women, 20% by young people and at least 5% by Traditional Peoples

and Communities and 2% by the PCD. Part of this same public (approximately 2,600 people) will be served with complementary training events. Approximately 150 technical TA agents will also be trained.

The Public Policy courses should benefit a total of 32,000 families, of which 50% should be represented by women, 30% by young people and at least 5% by Traditional Peoples and Communities.

### **Subcomponent 2.2. Strengthening Family Farming Organizations for Market Access**

The aim of this subcomponent is to strengthen the capacities of the teams of the economic organizations (mainly cooperatives) served by the project. Groups/organizations of farmers will also be worked with in order to create or strengthen local fairs and small marketing centers. In the context of improving marketing conditions, the project could also support the creation and/or strengthening of health inspection services at municipal level or for groups of municipalities organized into territories / 'consortia of municipalities'.

The aim is to help family farming organizations and their products enter diversified marketing channels, generating more income for the families benefiting.

#### ***Actions planned***

- Provision of Specialized Technical Assistance services (STA)
- Initiatives to strengthen fairs and marketing centers
- Pilot implementation of the Participatory Organic Certification System (POCS)
- Structuring Municipal Health Inspection Services

The provision of STA services will work with 60 Business Plans from economic organizations, benefiting approximately 5,000 families, of which 50% must be represented by women, 20% by young people and at least 5% by Traditional Peoples and Communities and 2% by the PCD.

The initiative to strengthen local fairs and marketing centers will work with 50 units (fairs and centers), benefiting approximately 800 families.

It is planned to set up 2 Municipal Consortia Health Inspection Services, as well as 15 participatory guarantee systems (SPG).

### **Subcomponent 2.3. Diversity, Gender, Youth, Nutrition and Food Security**

This sub-component will aim to promote the empowerment of women, young people, PCTs, LGBTQIAPN+ and Persons with Disabilities, as well as improving the nutrition and food security of beneficiary families. The activities will work with the project's cross-cutting themes, strengthening and supporting the integration of these themes into all the components.

#### **Focus on gender and diversity**

The project will take a holistic approach to transforming gender relations, promoting the inclusion of Afro-descendants and PCTs, the LGBTQIAPN+ community and people with disabilities, focusing on the environmental, economic, political and cultural causes of the social vulnerability of these groups. In order to transform unequal power relations, shaped by patriarchal and exclusionary structures, norms and practices, as well as empower women, Afro-descendants and PCTs, the LGBTQIAPN+ community and people with disabilities, the following transformation paths will be followed:

- i) promote economic empowerment and equality by valuing women's contributions to the family economy and community development,
- ii) dealing with the issue of women's overload due to domestic and care work, promoting a fairer division of the workload between men and women,
- iii) empower target groups to have a greater voice and decision-making power in rural institutions and organizations,
- iv) promoting advocacy in policies for women, young people and PCTs,
- v) prevent gender-based violence, v) value traditional knowledge, practices and ways of life for production, food and management of natural resources and
- vi) promote the inclusion of the LGBTQIAPN+ community and people with disabilities, seeking to empower them, promote their leadership and respect their rights.

Therefore, this sub-component aims to support the mainstreaming of the gender and diversity strategy throughout the Project, which will have an intersectional approach, considering the overlap of multiple discriminations of gender, race/ethnicity, sexual orientation and disability. All the activities and products proposed for this component will be contained in and guided by the Gender and Diversity Strategy and Plan to be drawn up at the start of project implementation.

#### Focus on youth

Among the factors that influence staying in rural areas is access to work and income opportunities, education/training that is suited to the characteristics of rural areas, appreciation of rural lifestyles, and the availability of services and conditions that can offer the possibility of success in agricultural production. In order to respond to these issues raised in the Youth diagnosis and to promote the permanence of young people in the countryside, as well as offering more opportunities for sustainable income and work for young people in general, the strategy of this subcomponent is based on three main axes:

- i) Promote a broad training program in agricultural and non-agricultural activities that generate greater employment and income opportunities,
- ii) Implement a program to revalue life in the countryside through communication activities,
- iii) Promote the formation of Youth Networks and debates on issues relevant to the development of rural youth.

#### Focus on Nutrition

In order to improve food security, nutritional status and increase the adoption of healthy eating practices by the Project, this PROCASE II subcomponent will implement a strategy centered mainly on food and nutrition education training. There will be 3 main lines of action:

- Raising awareness of good nutrition and health practices (reproductive health, maternal health and child health), in particular to improve the nutritional and health status of women and children;
- Raising awareness of the food culture, healthy eating, which in particular includes the Unconventional Food Plants (PANC/UFP) of the target territories; and

- Training vulnerable communities in the processing of healthy local products in order to increase their daily consumption in a sustainable way and foster the empowerment of vulnerable communities, valuing local food culture.

### ***Planned actions and products***

- Gender and Diversity Plan: The Gender and Diversity Plan will be drawn up in the first few months of project implementation by the PMU's Gender and Diversity specialist with the support of a specific consultancy hired to detail the general strategy and implementation methodology for all activities related to gender equity and women's empowerment, as well as the inclusion of PCTs, people with disabilities and LGBTQIAPN+. The activities set out in the Gender Plan should include:
  - a. Modular training in Gender and Diversity for project and TA teams
  - b. Gender and diversity training for the project's direct beneficiaries
  - c. Implementation of the Agroecological Logbook Methodology
  - d. Training cirandeira(o)s
  - e. Childcare/education activities that allow women to participate in the project's activities
  - f. Thematic diversity meetings (aimed at people with disabilities and LGBTQIAPN+)
- Youth Plan: A Youth Plan will be drawn up in the first few months of project implementation by the PMU's Youth specialist to detail the general strategy and implementation methodology for all the activities in this subcomponent related to the socio-economic and political empowerment of young people. At least the following cross-cutting activities will be developed for rural youth in the Project area:
  - a. Vocational training in agricultural and non-agricultural activities
  - b. Training Young Communicators
  - c. Thematic meetings with young people and the formation of Rural Youth Networks
- Plan to Strengthen Traditional Peoples and Communities (PCTs): A Plan to Strengthen Traditional Peoples and Communities will be drawn up in the first few months of project implementation.
  - a. Strengthening PCT Networks
  - b. PCT Policy Integration Fairs
- Nutrition and Food Safety Plan: A Nutrition and Food Safety Plan will be drawn up in the first few months of project implementation.
  - a. Nutrition education initiative to improve nutrition and maternal and child health in the project's most vulnerable communities
  - b. Training events on food culture and food processing to enhance local products with a view to improving nutrition and facilitating the empowerment of women and young people
  - c. Raising awareness of nutrition, health and food culture among students at the Integral Citizen Schools
- Local Development Agents: The project will hire a foundation, which will be responsible for hiring Local Development Agents (LDAs), who are young people

from the communities themselves, hired by PROCASE II to carry out tasks such as mobilizing communities and organizations to actively engage in the project. In addition to mobilization, the LDAs will have to play an important role in managing the agreements made by the community associations, supporting the holding of tenders, updating financial information, monitoring the investments made, rendering accounts and keeping the associations fiscally regular. One young person will be hired per Resilient Investment Plan, which in turn serves 3 communities. The young ADLs will receive a series of training courses to develop their skills. By playing the role of ADL, it is hoped that the young people selected will be able to gain experience in leadership and management, becoming references in the communities they represent and continuing to support them even after the end of the Project. The ADLs will also play an important role in supporting the implementation of cross-cutting activities, such as gender, diversity and youth, as well as in communication between the communities, the Project and the TA teams.

**Subcomponent 2.4. Land and Environmental Regularization**

The aim of this subcomponent is to strengthen the family units served, making the production base more secure by supporting land and environmental regularization.

**Actions planned**

To achieve this goal, actions to support land and environmental regularization will be implemented.

- Support for land and environmental regularization: Seeking to provide solutions to the problem of a large number of family units in Paraíba that do not have complete legal documentation or formal recognition of these properties, the project aims to implement a land regularization and environmental registration initiative.
  - a. Choice of communities/properties to be benefited
  - b. Implementing the regularization roadmaps: EMPAER's previous experience has allowed it to define a roadmap or sequence of steps that must be taken in order for a rural property to be regularized. It is this roadmap, which covers both the land ownership and environmental registration dimensions, that forms the methodological backbone of the Project's regularization initiative.

It should be noted that the route to be taken by each property to be regularized is slightly different depending on the starting situation of each property, in which case there are two possible initial scenarios: i) Properties with public deeds - areas of ownership and ii) Properties without public deeds - areas of possession. Both routes are similar, with the one for squatter areas having a few additional steps. The roadmaps are presented in more detail in the table below.

**Table 2 - Roadmaps for land regularization and environmental registration**

Initial moment: Mobilization and dissemination action, in which the initiative is presented and explained to the beneficiary public, with the aim of identifying/confirming the family units or communities interested in participating and that meet the prioritization criteria (areas without litigation, quilombolas, settlers, PA with less than 25 ha, etc).	
Once the potential participants have been identified, the following activity guides are applied.	
<b>Activity roadmap (i): Domain areas</b>	<b>Activity roadmap (ii) - Ownership areas</b>
1 - Diagnosis of the rural property. This aims to identify whether the property is in the ownership area (with a deed) or the possession area (without a deed).	2 - Georeferencing rural property.
2 - Georeferencing rural property.	2 - Georeferencing rural property.

<p>3 - Georeferencing inspection: done 100% by satellite image and on-site inspection of some properties. It checks that the landmarks are correctly implanted and if there are any discrepancies that need to be corrected. Any property that needs adjusting will be corrected by the contractor. The property that is suitable can be entered into the Land Management System (SIGEF).</p>	<p>3 - Georeferencing inspection: done 100% by satellite image and on-site inspection of some properties. It checks that the landmarks are correctly implanted and if there are any discrepancies that need to be corrected. Any property that needs adjusting will be corrected by the contractor. The property that is suitable can be entered into the Land Management System (SIGEF).</p>
<p>4 - Evaluation of documentation by the Discriminatory Commission, to declare that the property is suitable for the next stages</p>	<p>4 - Evaluation of documentation by the Discriminatory Commission, to declare that the property is suitable for the next stages</p>
<p>5 - Creation or updating of the registration code in the National Rural Registration System (with issuance of the CCIR )<sup>1</sup></p>	<p>5 - Creation or updating of a registration code in the National Rural Registration System (with issuance of the CCIR)</p>
<p>6 - Approval by the agency (INCRA/EMPAER) of the geo-referenced parcel/property in the Land Management System (SIGEF), which allows technical parts (plans and descriptive memorials) of the property to be generated. The delivery of these technical documents certifies the regularization of land ownership, which is georeferencing (in script (i) for ownership areas).</p>	<p>6 - Approval by the agency (INCRA/EMPAER) of the georeferenced parcel/property in the Land Management System (SIGEF), which allows for the generation of technical documents (plans and descriptive memorials) for the property. As this is vacant land, the documentation is issued in the name of the state at this stage. The delivery of these documents concludes the first stage of land regularization, which is georeferencing.</p>
	<p>6.1 - Delivery of the plan and memorial to the notary's office, for the creation of the registration and collection of the wasteland.</p>
	<p>6.2 - Analysis by the Discriminatory Commission</p>
	<p>6.3 - Updating the technical documents, which will then be in the name of the beneficiary squatter, and drawing up a definitive property title in their name (or that of the community in the case of collective land).</p>
	<p>6.4 - Sending the updated documentation to the Registry Office for the transfer of ownership (State to beneficiary).</p>
<p>7 - Creating or updating the CAR (Rural Environmental Registry) register, using the data registered in SIGEF. The receipt for the rural property's registration in the CAR proves that the registration has been completed.</p>	<p>7 - Creating or updating the CAR (Rural Environmental Registry) register, using the data registered in SIGEF. The receipt for the rural property's registration in the CAR proves that the registration has been completed.</p>
<p>8 - Drawing up the domain recognition title</p>	<p>8 - When stage 6.4 of the notary's office is completed, the property is fit and up-to-date. With the above steps completed, the property's documentation is fully regularized and ready to be handed over to the beneficiary (individual or collective).</p>
<p>9 - The property is ready and up to date. Once the above steps have been completed,</p>	

<sup>1</sup> CCIR is the Rural Property Registration Certificate, which is issued by INCRA via the Rural Registration System.

the property is ready, with recognition of ownership. The technical documents can be sent to the notary's office for registration of the area. A new, updated certificate can then be issued.	
---	--

It is hoped that approximately 5,000 properties (covering around 100,000 hectares) will be able to follow this route with the project, until the desired regularization is achieved. It should be made clear that in agrarian reform settlements (federal or state) and in the municipalities served by EMPAER, title will be granted individually, per beneficiary family. In the case of quilombola communities, the title will be collective, covering the entire georeferenced polygon and in the name of the duly registered residents' associations.

The land and environmental regularization initiative will assist approximately 5,000 rural properties and families, 40% of which will be quilombola communities and federal and state settlements.

### **Subcomponent 2.5. Knowledge Management and South-South and Triangular Cooperation**

Subcomponent 2.5 will develop and implement a knowledge management process capable of generating, recording, sharing and using knowledge generated in the Project. It will also seek to feed the project implementation process with relevant information and knowledge. Knowledge will be made available at different geographical scales: among project participants (at community and territorial level), at state level, in the Northeast region and in other developing countries (via CSST), and to different target audiences: beneficiaries, Implementing Partners and service providers, the project team, government entities and others. The objectives will be refined during the preparation of the Knowledge Management (KM) and South-South and Triangular Cooperation (SSTC) plan.

#### ***Actions planned***

- **CG and TSSC plan:** This plan will define the detailed objective of the KM and SSTC activities, the products developed for each target group, the distribution channels, among others. PROCASE II will be able to draw on a wide range of resources, products and experiences from other initiatives and projects, including lessons learned from PROCASE I. Therefore, PROCASE II's KM and SSTC activities should avoid duplicating existing material while at the same time utilizing this material in project activities, such as capacity building and training. The main activities and products include:
  - Systematization of experiences, good practices and results and Studies of interest to the Project on specialized topics
  - Communication and Dissemination in Knowledge Management
  - South-South and Triangular Cooperation Actions

Under this subcomponent, 25 systematizations and studies on Knowledge Management will be carried out, 6 annual communication and dissemination phases and 10 South-South Cooperation exchange events.

### **Project Management, Monitoring and Evaluation**

The aim of this component is to create an efficient mechanism for managing and controlling the activities implemented by the project, enabling them to be fully

implemented in line with the project's intervention proposal, as well as guaranteeing the implementation of the Annual Workplan and Budget (AWPB).

It also aims to introduce technological innovations to ensure the monitoring and evaluation of activities, the recording and systematization of Knowledge Management, as well as enabling transparent communication between stakeholders, including knowledge exchange actions.

To meet these objectives, the component will work on the basis of 2 sub-components, as follows.

### **Project Management**

It will make it possible to support the Project Management Unit (PMU)<sup>2</sup>, by implementing instruments to strengthen: i) Management; ii) Administration; iii) Technical operational capacity; iv) Procurement processes (tenders and contracts); and v) Financial management. This support should facilitate compliance with the contractual clauses of the Loan Agreement.

As a Management Sub-component, its activities converge to comply with IDB and IFAD Guidelines and Policies for financing, such as the specific procedures for: i) tenders and contracts; ii) requests for disbursements and rendering of accounts for the resources contributed, executed and/or committed; and iii) supervision of the implementation of community initiatives, ensuring compliance with environmental and social safeguards, procurement and financial management requirements, including rendering of accounts by beneficiaries.

### ***Product - Project management support***

**Main products:** Project Management Unit operational for 6 years

### **Monitoring and Evaluation (M&E)**

The project will set up a Planning, Monitoring, Evaluation and Systematization (PMAS/M&E system) system for its activities and results, which will be an essential management tool, enabling planning and monitoring of the project's execution, as well as actions to ensure digital inclusion.

### ***Product - Monitoring system***

The project will implement an information management system, where data collected in the field will flow to the PMU. For better organization, a computer system will be developed based on those used in Procase - phase 1, to monitor all the activities to be carried out.

**Main products:** M&E systems developed

### ***Product - Impact assessment studies***

The impact assessment will provide information on whether the project was able to achieve the results set out in the objective, as well as recording the impacts on improving the lives of the target population, such as nutrition, income, production methods, among others.

The research will use the difference-in-differences method, and will therefore be carried out on 2 groups, the treatment (a sample of Project beneficiaries) and the control (non-

---

<sup>2</sup> The PMU was formally created by Decree No. 44.934 of April 15, 2024, which provides for the Unit and defines the Basic Structure for managing the Paraíba Sustainable Rural Development Project - PROCASE II.

beneficiaries, but who have a similar profile to the treatment group), with field research being carried out at 3 different points in time: i) Baseline, which will be a kind of initial X-ray of the Project's beneficiary families, where information on family composition, production, income, etc. will be obtained. will be obtained for later comparison with subsequent studies; ii) Mid-term, which will be carried out between years 3 and 4 of the Project, i.e. halfway through its implementation; and iii) Final Impact Assessment, which will be carried out during the last year of the Project's implementation, on the same group surveyed in the previous stages.

**Main products:** Baseline, mid-term and impact research carried out

#### ***Product - Systematization of experiences***

The project will also systematize the innovations, both in terms of processes and activities, highlighting their importance and results. These products will be used by the project team and state officials, as well as in other regions of the northeastern semi-arid region and similar areas, and could support the adoption of other public policies in the Northeast.

**Main products:** 50 systematizations carried out

### **3. IDENTIFICATION OF PRIORITY ISSUES**

For the consultations, **the positive and adverse socio-environmental impacts of the projects should be addressed, as well as the mitigation measures provided for in the ESMP**, and topics about the project that are relevant to the discussion with the public.

In general, the following questions are anticipated:

- Description of the project, detailing the permanent items that cause the most concern or anxiety;
- Working dynamics of the major interferences to be carried out in the community during the work versus the mitigation and control actions adopted (mud, dust, traffic, noise, duration of the work);
- Risk of accidents;
- Communication and grievance channels;
- Costs and expenses that may affect the community;
- Main environmental and social risks and impacts identified;
- Main mitigation measures to address the impacts identified.

### **4. IDENTIFICATION OF ACTORS AND STAKEHOLDERS**

The PROCASE II team has a matrix of representatives from the associations and cooperatives associations and cooperatives for engagement in the Public Consultations. The stakeholder matrix is an instrument that consolidates the important actors to be invited to get involved in discussions related to PROCASE II sub-projects. This Matrix with the selection of Stakeholders related to PROCASE II sub-projects is presented in Annex 11.1.

There will therefore be a focus on publicizing and inviting to the public consultation of the PROCASE II preparation phase, in addition to institutions and representations, rural women, the active youth population, quilombolas, indigenous people, gypsy communities, artisanal fishermen and fisherwomen (shellfish gatherers), riverine dwellers and settlers.

## 5. ORGANIZATION OF PUBLIC CONSULTATIONS IN THE PREPARATION PHASE OF THE PROJECT

The aim of public consultations is to present the PROJECT and the socio-environmental documents, as well as to gather information, concerns and questions from interested parties, including answers to the questions raised. At the end of the consultation process, evidence of the process and its outcome must be catalogued.

As part of the preparation phase for the PROJECT, the following public consultations are planned<sup>3</sup> :

- **Public Disclosure of Social and Environmental Information and Reporting Channels:**

- This publicizing must begin at least 20 days before the scheduled public consultation.

By making all the social and environmental documents produced during this preparation phase (AASE, PGASE, ASCE) available on the PROCASE II website, as well as any other project information materials.

- Documents and summary reports will also be made available with information on the socio-environmental documents produced.
- This website should allow interested parties to interact via a form on the same site. This interaction will take the form of an *online* survey through which interested parties can submit their wishes and contributions.
- The deadline for publishing the answers will be between 7 and 15 days, via this same website.

- **01 Hybrid Public Consultation (with online transmission):**

Public consultation with remote participation via live transmission (from PROCASE II headquarters in João Pessoa).

Synergy with organizations will be promoted to provide suitable local structures for broadcasting the consultation, where the interested population can watch. This strategy aims to broaden the reach of the consultation to interested parties in order to make it possible for the public that has greater difficulty in accessing the internet to participate. At first, the following mapped opportunities were identified and are being articulated: 15 regional offices of EMPAER - Empresa Paraibana de Pesquisa, Assistência e Extensão Rural, City Halls and Municipal Secretariats, local unions, local associations, and FUNAI<sup>4</sup>

- Virtual platforms such as YouTube could be used, with time for participants to have the opportunity to express themselves via virtual platforms (online, chat).
- This consultation will address the main aspects, impacts and forms of mitigation of the Project in a broad manner (environmental and social), in accordance with the AASE, PGASE and ASCE documents.

---

<sup>3</sup> A public consultation is understood in this proposal to be a plenary session or request for a meeting and presentation of the PROJECT. At times, the document may use the term Public Consultation to refer to the entire process that involves the dissemination of information, calls for proposals, plenary sessions, demonstrations and responses.

<sup>4</sup> This item corroborates the characteristics of a hybrid query.

- The invitation should be made to the entire Stakeholder Matrix, but with an emphasis on the Institutional public (entities, associations, city halls, licensing bodies, etc.).

It is important to clarify that this Consultation and Participation Plan is intended to detail the Public Consultations on socio-environmental issues in accordance with the documents: AASE and PGASE.

The planning of the Consultations presented in this Plan will be led by the PROCASE II team, with the support of leaders, associations and municipal councils.

By publishing the environmental and social documents on the PROCASE II website:

- (i) The **Public Disclosure of Information** begins with the publication of the socio-environmental studies and documents produced in this preparation phase;
- (ii) The publicity period also begins with the dissemination of information and the calling of interested parties to the public consultation.
- (iii) At the end of the publicity and call period (a minimum of 10 days), the **Public Consultation** plenary session will be held.

## 6. ACTIVITIES OF THE PUBLIC CONSULTATION PROCESS OF THE DRAFT PREPARATION PHASE

The activities included in the public consultation process for environmental documents are detailed below.

### 6.1. Public Disclosure of Information and Virtual Participation

The public disclosure of information includes making available the preliminary versions of all the socio-environmental documents from the project preparation process, and other materials that may be produced, covering the main issues related to the works to be carried out, as well as complementary information material.

#### Specific objectives

---

- Establish a continuous channel of consultation and communication with the affected and beneficiary population throughout the project's life cycle.
- Provide information that can be viewed during the call and publicity period to present the PROJECT;
- Present the Projects to be carried out in the Consultation area, taking into account the priority issues identified; inform the duration of the Project activities (preparation phase + implementation phase + consultations) taking care not to create unrealistic expectations<sup>5</sup> ;
- Present the preliminary version of the socio-environmental documents, highlighting the possible risks and impacts preliminarily observed and the proposals envisaged to mitigate them;
- Inform about the process of involving the Project's interested and affected parties, highlighting the possible channels and mechanisms for complaints and grievances

---

<sup>5</sup> As of the end of the consultation process in the project preparation phase, there is no definition of which communities will benefit from the project's actions.

made available for community participation and the response time for complaints submitted and addressed;

- Open up a space, an opportunity, for demonstrations and record them, including the responses given by the PROCASE II team;
- Open up the opportunity for people to sign up to receive information about relevant consultations and channels for expressing their views;
- Formalize the participants' registration list via the Internet;
- Draw up a summary document with all the questions raised by the participants, the answers given, describing possible contributions to improving the PROJECT's design.

### Early disclosure strategy

---

PROCASE II's communication and socio-environmental team has established a strategy for publicizing the project and the public consultation process, with the aim of informing the population about the project, the socio-environmental issues that guide it, starting to capture the expectations and desires of the interested parties and publicizing the public consultation process.

Early outreach activities involved:

- 10 plenary sessions were held with interested parties between April 4 and 30, 2024;
- Liaison with town halls, trade unions and potential information dissemination agents (health workers, for example).

### Participation format

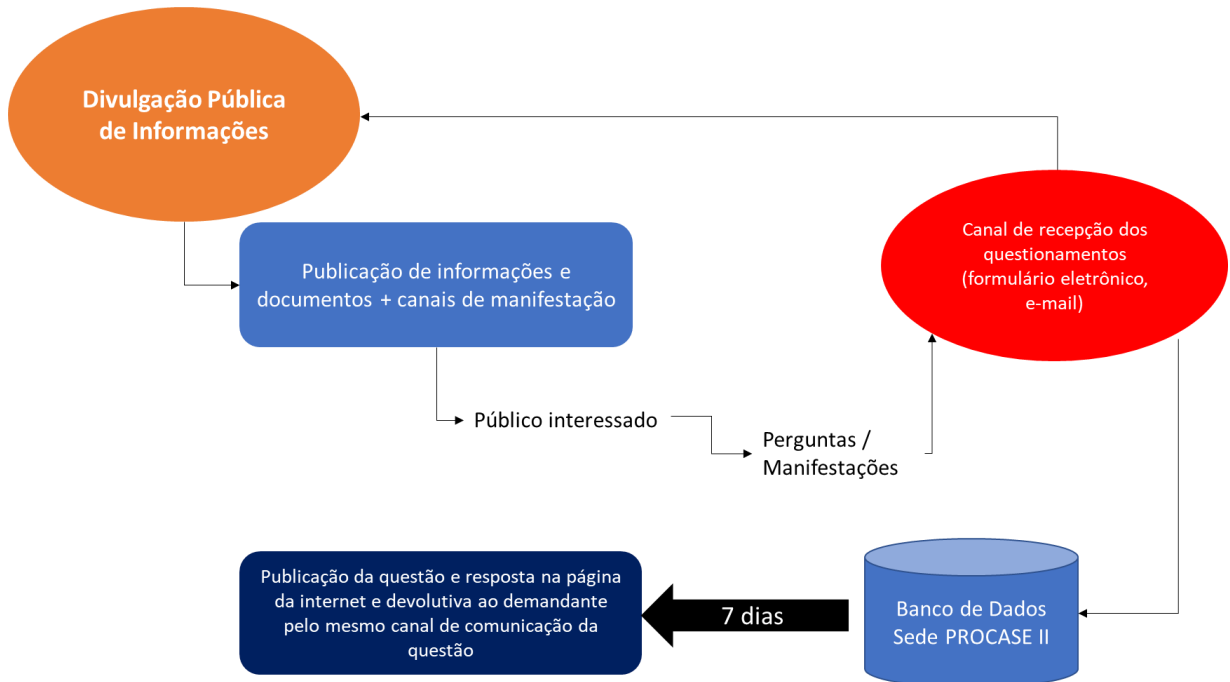

---

In the public disclosure of information, interested parties will be able to access the socio-environmental documents and other specific informative and strategic materials of the PROJECT that will be produced by PROCASE II on the website: <https://www.procasse.pb.gov.br/>

Comments can be sent via an **electronic form** that can be filled in online and sent automatically. The form will also contain questions about impressions and concerns about the project. Other exclusive channels, such as e-mail, will also be made available. The deadline for responses will be 7 days, via this same website.

These channels for dissemination and participation will be open throughout the life cycle of the PROJECT.

**Figure 36 - Flowchart of the question and answer circuit during Public Disclosure of Information**

Source: Prepared by the Consultancy, 2024

### Expected result

As a result, it is hoped to inform society about the PROJECT, its resulting benefits, as well as the expected impacts and forms of mitigation, guaranteeing the dissemination of information on social and environmental risks to interested parties, establishing openness to dialogue and manifestations from the different stakeholders.

## 6.2. Public Consultation - Distance Participation Format

### Specific objectives

- Present the PROJECT;
- Present the justifications (criteria and motivations) that give rise to the need for implementation (risk areas, quality of life, etc.);
- Inform the estimated duration of the activities in a simplified schedule (preparation phase + implementation phase + consultations);
- Present the preliminary version of the documents with the IDB/IFAD perspective, highlighting the possible risks and impacts preliminarily observed and the proposals envisaged to mitigate them;
- Present the design or preliminary design solutions;
- Inform about the process of involving the Project's stakeholders, highlighting the channels made available for community participation and the complaints and grievances mechanism (MQR/GRM) so that they can speak up
- Open up space, opportunity, for demonstrations and record these, including the answers given at the meeting;

- Inform about the deadline and response channels for questions that cannot be answered during the event (7 days on the PROCASE II website);
- Open up the opportunity for people to sign up to a list to receive information about relevant consultations and channels for speaking out;
- Draw up a summary document with all the questions raised by the participants, the answers, describing possible contributions to improving the PROJECT's design.

### Target audience

---

The consultation in virtual format includes the presentation of preliminary versions of the documents from the PROJECT's preparation process, covering the main issues related to the works and plans to be carried out. This consultation is aimed at interested and affected parties in general and the public directly affected and benefiting from the PROJECT, as well as those responsible for institutions related to the subject.

Although these are the main target audiences, the consultations are open to anyone interested.

The call for proposals and mobilization should include communication strategies aimed at the target audience of these consultations. The list of invitees to the public consultations is shown in the **Stakeholder Matrix** in **Annex 13.1**.

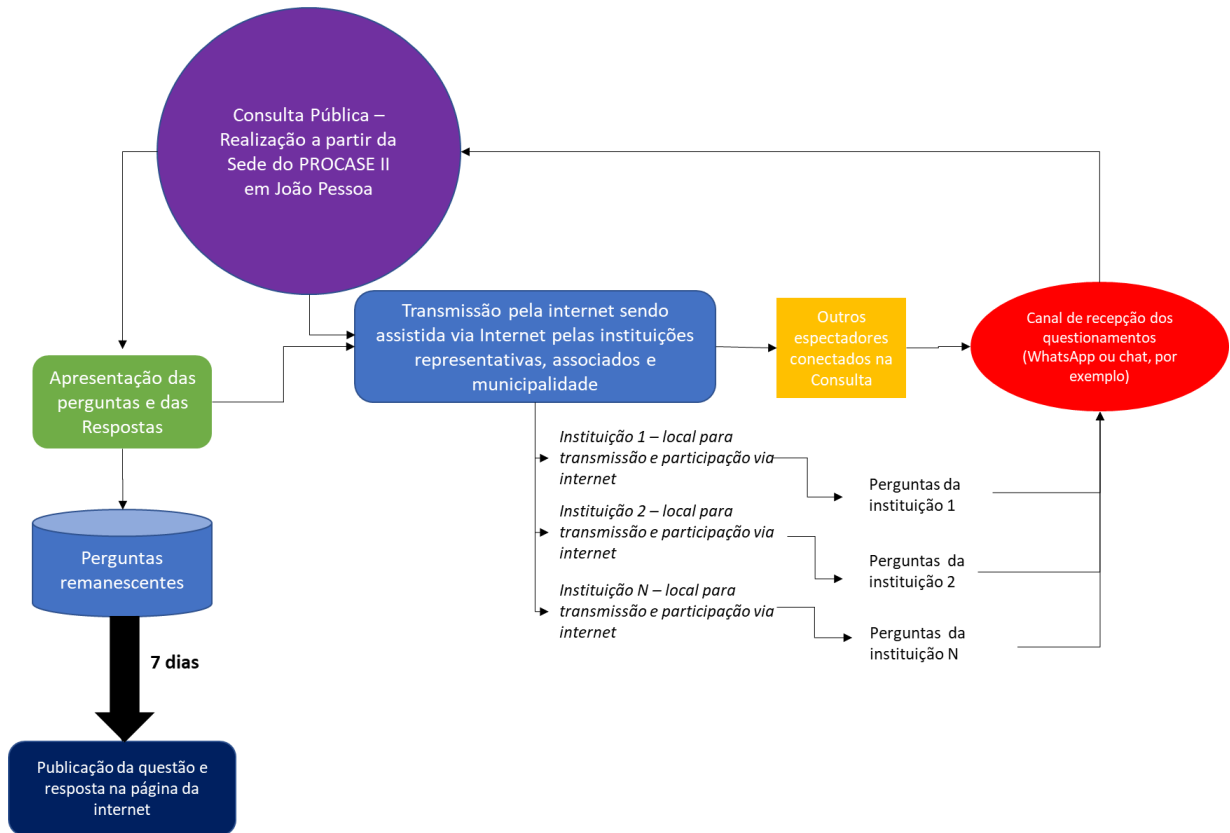

### Participation format

---

- The virtual public consultation will be broadcast via the internet.
- Associations, cooperatives, NGOs, town halls and other locally active institutions will be encouraged to organize themselves with the community concerned and to support joint publicity and feasibility in order to promote as much participation as possible during the Public Consultation.
- Work is underway with institutions, organizations and partners to set up local hubs to broadcast the public consultation and allow groups to participate collectively.
- By registering and sending questions to a specific channel during the Public Consultation, the organizing team will be able to collect questions submitted by participants and send them to this exclusive channel, which will be centered on an agent based at PROCASE II headquarters.
- The channel is still being defined, but it could be an active chat during the Consultation.
- Since it will also be broadcast online simultaneously via virtual platforms (such as Youtube), virtual participants will be able to send in their questions via chat on these platforms. It will be up to the agent based at PROCASE II's central office (João Pessoa) to select questions from the different locations and channels and pass them on to the conductors of the presentation (PROCASE II technicians who will be able to respond at the time of the presentation).

Some questions will be answered during the consultation itself and any remaining questions that cannot be answered at the time of the vote will be dealt with and answered afterwards, and published on the PROJECT website within 7 days, showing the questions, answers and indicating the communities or representations that raised the question. This strategy is suggested to better organize the responses in view of the large number of questions expected. The following is a quick flow of the question-and-answer mechanism of the Virtual Public Consultation.

**Figure 37 - Flowchart of the question and answer circuit during the Virtual Public Consultation**

Source: Prepared by the Consultancy, 2024

### Expected result

As a result, it is hoped to consult society on the PROJECT as a whole and obtain information that can improve both the AASE/PGASE/ASCE socio-environmental documents and the construction projects and production plans, by taking advantage of the knowledge of the consultation participants who work locally or regionally to enrich and improve the studies.

### 6.3. Consultation road map.

**Part 1:** The Consultation will begin with a brief opening, including information on the objectives of the event, the program and guidance on how to participate, which will be available throughout the presentation via the comments box. At this point, the organizations promoting the Consultation will also be introduced.

**Part 2:** Next, a presentation of the project will be made, in a brief and objective manner, in plain language and accessible to the general public, with the aid of audiovisual resources that facilitate the understanding of those present, when necessary. A qualified PROCASE II representative will make the institutional presentation of the PROJECT. Members of PROCASE II's planning, social, engineering and environmental teams will complete the group of experts to explain the PROJECT. The objectives and justifications of the projects, their description and their technological and locational alternatives will be discussed.

**Part 3: Socio-environmental:** The PROCASE II experts will provide a summary of the results of the social and environmental diagnosis of the area of influence of the PROJECT; a description of the possible environmental impacts of the implementation and operation of activities; a characterization of the future environmental quality of the area of influence; a description of the expected effect of the planned mitigating measures in relation to the negative impacts, mentioning those that cannot be avoided; and the actions to follow up and monitor the impacts, indicating those responsible for carrying them out.

**Part 4:** After the presentation, the floor will be opened for participants to express their perceptions of the projects, doubts and expectations.

**Part 5:** Responses will be made during the course of the Consultation and those that for technical or time reasons are not covered at the moment will be answered on the PROCASE II websites. The questions will be answered using criteria based on the order of the manifestation, similar questions or contributions, and relevance and complexity to the scope of the request.

**Part 7:** Finally, the official MQR/GRM communication channels for dialog and resolving questions, response time, thanks and closing the event will be presented. In addition, at the end of the session, the channels that will be available to receive other contributions related to the scope of the PROJECT and the socio-environmental documents will be informed.

Note: The consultation will be recorded with minutes, recordings and photographs for documentation and subsequent review of the material. The hearing will be recorded and edited in order to produce documents proving that the public consultation took place and the lessons learned by the PROJECT during the consultation phase.

#### **6.4. Consultation records**

The organization of all the records to be made during the Significant Public Consultation process will be concentrated in the PROCASE II team, which will receive the relevant information from the various channels for structuring and consolidating the Significant Public Consultation Report, whether in passive, active or dialogical form.

The forms of records of the Significant Public Consultation process will involve photos, registrations, texts provided through the channels of manifestation with subsequent consolidation in an electronic file (Word, Excel, videos, audios).

The PROJECT's Significant Public Consultations Report will present the following items in a consolidated form:

- General description of the Project;
- Principles adopted in the consultations;
- Record of the announcement and call;
- Description of the transmission and consultation locations;
- Description of forms of participation;
- Characterization of the profile and participating public;
- Contributions and Manifestations (with respective replies);
- Conclusion;
- Records (photos, attendance lists, presentation material used, etc.).

If the feasibility of broadcasting these events online is confirmed, the audiences should be recorded on each platform used and screen recordings made during the broadcast, in order to record audience interaction, as well as the responses presented.

All the registration material will be consolidated in a Report on Consultations carried out during the preparation period for the Operation.

## 7. ATTENTION TO GENDER ISSUES, VULNERABLE GROUPS AND TRADITIONAL COMMUNITIES

With regard to the issue of gender, attention to vulnerable groups and traditional communities, seeking to promote the process of public consultation with stakeholders in a democratic, equal and participatory manner, some guidelines will be assumed throughout the mobilization, call and participation actions, according to the needs and difficulties mapped throughout the process of evaluation and analysis of priority issues affecting the availability, access and participation of women, LGBTQIAPN+, the elderly, traditional communities, etc. in the Public Consultation process.

The actions that will help promote the effective participation of these groups and will be adopted throughout the PROCASE II public consultation process are as follows:

- The mobilization process must consider and observe the role of the most disadvantaged groups. The first strategy is to involve them in the preparation phase, making them the protagonists in raising awareness and involving other families in the consultation process.
- In response to the need to guarantee participation, all work teams must be oriented to incorporate issues associated with gender, attention to attention to groups and traditional communities.
- The service will be provided *on site* or in a location that is as close as possible to the communities. communities, during the Public Consultation process, with a view to providing guidance to interested community members, especially women, pregnant women, the elderly, traditional communities and LGBTQIAPN+ people. and other vulnerable groups identified. This practice aims to meet the specific needs and difficulties that the community, especially vulnerable groups, may have in accessing the virtual consultation process - in view of possible limited access to telecommunications services (internet), or even to face-to-face events, for example due to overlapping domestic, family and professional demands.
- The planned times for collecting suggestions and comments on the environmental and social studies and the project in general will be extended, considering the reduced time due to overlapping household and family tasks, allowing the least favored and vulnerable groups to participate in the consultations.
- The physical spaces and collection of information, questions and considerations will be available to the population before and during the event, to overcome any difficulties in accessing the manifestations and responses that may still occur. These spaces and channels include:
  - Local spaces or remote service channels: these will be defined according to the specifics of each project.

PROCASE II's communication channels regarding the Complaints Mechanism.

- The effective participation of local representatives on gender issues, vulnerable groups and traditional communities will be encouraged through invitations to institutions and social organizations defending each group in the PROCASE II area of influence.

## 8. PLANNED ALLOCATED RESOURCES

The resources to be allocated for preparing, calling and executing the consultations are described below.

### 8.1. Dissemination, Calling and Social Mobilization

The Public Consultations will be publicized through various forms of communication, ranging from face-to-face meetings with the public directly affected and their representatives, to mass media and digital media. At this time, information will also be disseminated about the projects involved, the expected impacts and the measures to mitigate these impacts.

The **invitation to the Consultation** will be made through content produced by the PROCASE II communications team, in line with the state government's communications department, and disseminated through conventional media such as radio, television, news portals, social networks, chat apps and printed newspapers<sup>6</sup>.

The **mobilization of interested parties** is also reinforced in person, by the PROCASE II team, local associations/cooperatives/representative institutions, leaders and town halls, promoting links with key leaders and encouraging the dissemination of information.

The **mobilization of vulnerable and traditional profiles**<sup>7</sup> (such as: the elderly, LGBTQIAPN+, PCD<sup>8</sup>, low-income people, women heads of household, among others; and also traditional populations) will be mobilized through **direct communication**, in other words, face-to-face contact, with a visit **by the PROCASE II team or community representative/leader with the support of the municipal teams involved**, explaining, in addition to the basic information related to the project, impacts and mitigations, the importance of and access for all profiles to the consultation process, projects and documents. This audience will also be told about the actions to promote accessibility and opportunities for participation. This group will also be sensitized to participate through the available channels of expression and will also be encouraged to publicize and invite possible representations or affected individuals who have an interest in the consultation process. These groups will also be asked about the need for measures to encourage participation, which is a relevant question that will be assessed and applied as appropriate.

**Content about the PROJECT**, related impacts and planned mitigations will be made available on the institutional website <https://www.procasse.pb.gov.br>, and disseminated via links on the social networks *Instagram* and *Facebook*, as well as being sent out simultaneously via tools such as *WhatsApp*, at least 7 days before the event.

---

<sup>6</sup> Public institutions (municipal, state and federal governments), as well as civil society organizations linked to the Sustainable Development of Family Farming, will be partners in the dissemination and social mobilization of the PROCASE II Virtual Plenary for Public Consultation and Participation.

<sup>7</sup> This mobilization strategy will target specific profiles, especially traditional communities.

<sup>8</sup> Strategies will be defined to reach the PCD niche, such as the adoption of sign language systems.

**An online contribution channel will be available** for interested parties during the **publicity and call period** - *WhatsApp*<sup>9</sup> which will be publicized in all the media used by the Public Consultation communication strategy, through social networks and the PROCASE II website.

For the Public Consultations, the communication strategy will be carried out through specific liaison with community leaders, as well as the publication of information materials sent to the press and disseminated on social media with the aim of raising awareness among the population and leaders in the area:

- what public consultations are, e;
- the role of the affected or interested community in this PROCASE II preparation phase.

In terms of engaging the affected communities, the role established must include their inclusion as part of the project, in order to give them the right to demonstrate and participate in the project implementation process, as well as imbuing the affected parties with a sense of belonging to the project and its benefits, and that in order to achieve the objectives set out in the project, the parties must work together. Stakeholders, on the other hand, are involved in the role of observer and promoter of the well-being of the community and the environment, as well as their role as collaborator or shaper of public opinion.

**Calling on the parties affected and interested in PROCASE II** will generally be done through a number of approaches:

- Active Contact (via phone/WhatsApp/E-mail);
- Press reports;

The forms of participation and expression in the consultation process are:

- **The parties will be able to take part in the consultation:**
  - i. in person at the locations provided for broadcasting the consultation meeting;
  - ii. remotely by accessing the consultation transmission channels via computer or cell phone;
  - iii. virtually, through the website with information and documentation on the project, impacts and measures.
- **The parties can also send their concerns:** through a statement made through the official channels established: WhatsApp/email to be informed in the call and dissemination communication pieces and vehicles, as well as in the consultation itself; through a form on the PROCASE II website.
- **Questions/issues will be answered through:**
  - i. clarifications and answers given at the time of the presentation and interaction at the Consultation meeting;
  - ii. through a consolidated publication of the questions and answers on the PROCASE II website.
  - iii. via email or WhatsApp.

---

<sup>9</sup> System being evaluated for feasibility of applying the tool

## 9. COMPLAINTS MANAGEMENT AND INFORMATION DISSEMINATION MECHANISM FOR PUBLIC CONSULTATIONS IN THE PROCASE II PREPARATION PHASE

Following the requirements set out in the IDB/IFAD Standards, in the context of PROCASE II, mechanisms will be made available to deal with the population's doubts and complaints, making it possible to establish a flow of information between the executing agent and the affected local populations and enabling specific concerns about PROCASE II projects and sub-projects and impact control and mitigation measures to be addressed and resolved in a timely manner.

These resources will be structured and deployed in such a way as to accurately target communication, monitor the transmission of key messages and assess the reaction of stakeholders, anticipating obstacles or problems.

According to the IDB's PDAS 10<sup>10</sup>, the guiding principles of this mechanism are defined:

- To promptly and effectively resolve, in a transparent, culturally appropriate and accessible manner, all the concerns of any interested party, at no cost and without retribution;
- The operation of this mechanism will not prevent access to judicial or administrative remedies, or even to the IDB's Independent Consultation and Investigation Mechanism (MICI);
- All complaint channels and their respective access and feedback procedures will be promptly and continuously informed to the population;
- Responses to all complaints received will be made publicly available;
- Grievances will be handled in a culturally appropriate and discreet manner that is objective, sensitive and responsive to the needs and concerns of the parties affected by the project;
- The mechanism should also allow anonymous or confidential complaints to be raised and dealt with;
- The Borrower will address allegations of retaliation, abuse, or discrimination and take appropriate corrective action.

The effective functioning of this mechanism will depend to a large extent on inter-institutional coordination, not only to provide answers to the resulting questions directly related to the implementation of PROCASE II, but also those concerning the functioning of services and equipment that are often the subject of doubts and complaints from the population.

In this regard, the general objectives of the complaints and grievances management mechanism under PROCASE II are:

- subsidize the decision-making processes relating to the preparation and development of PROCASE II;
- serve as an instrument for the timely resolution of issues, avoiding the generation of social conflicts;

---

<sup>10</sup> Stakeholder engagement and information disclosure

- serve as a mechanism of accountability, allowing people to seek redress when necessary.
- respond to the doubts/ dissatisfactions, suggestions and demands of complainants;
- monitor the level of satisfaction with the implementation of the Project;
- monitor the profile of complaints so that they can serve as input for strategic preventive actions to avoid and/or mitigate the reasons for dissatisfaction.

In view of these objectives, the complaints and grievances management mechanism (MQR/GRM) will be structured through the **Institutional Channels**: based on the appropriation and integration of the channels that already exist within PROCASE II.

These channels will receive complaints, doubts, concerns and claims from the various interested parties. Responses will preferably be sent through the same channels or preferred channel that the complainant indicates. The response time for each is detailed below. These channels are functional tools for monitoring the developments, impacts and expectations of the Project among the population.

### **9.1. Relationship, communication and service channels in the Public Consultation phase of the PROCASE II preparation stage**

In terms of complaints and information disclosure mechanisms, the PROCASE II structure already has relationship channels, communication channels and service channels that will be incorporated into the PROJECT's Complaints and Claims Management Mechanism.

The **relationship and service channels** are part of the set of instruments for communicating with the population that are available both within the PROCASE II structure and from the State Secretariat for Family Farming and Semi-Arid Development (SEAFDS), to which PROCASE II belongs, and comprises:

- 8 Regional Offices and their WhatsApp;
- PROCASE II telephone number: (83) 32149248
- SEAFDS service channel: Telephone: (83) 3214-9247 / E-mail: [agriculturafamiliar@seafds.pb.gov.br](mailto:agriculturafamiliar@seafds.pb.gov.br) ;
- General Ombudsman of the Paraíba State Government: Telephone: 0800-021-2310 | E-mail: [ouvidoriageral@casacivil.pb.gov.br](mailto:ouvidoriageral@casacivil.pb.gov.br) / Website: <https://ouvidoriapb.pb.gov.br/register>

The **communication channels** include:

- Internet and social media, such as *Facebook* - [www.procasse.pb.gov.br](http://www.procasse.pb.gov.br) , and *Instagram* <https://www.instagram.com/procassepb/>
- Communication Secretariat - SECOM, involving: Mass Media and Press Office (radio, press); Advertising; Digital Communication and Citizen Information System.

These channels will filter and channel complaints to the PROCASE II technical team, which will be responsible for managing the complaints.

### **Regional Offices**

Each of the 8 PROCASE II Regional Offices are strategically located in municipalities that have regional centralities in the Rural Territories, providing, in addition to face-to-

face service, a telephone number, WhatsApp and e-mail. All these channels will be incorporated as part of PROCASE II's Complaints Management Mechanism.

The following table shows the addresses and contact telephone numbers of all the regional offices:

**Table 7 - Possible locations of Regional Offices (URGP) - PROCASE II**

MUNICIPALITY	Address
João Pessoa	Avenida Rio Grande do Sul, nº 1.345, Bairro dos Estados, Edifício Evolution Business Center, 16º andar, CEP: 58.030-021
Campina Grande	Av. Jorn. Assis Chateaubriand, 2630, Estacao Velha, Edifício do CDRM, CEP: 58.105-421
Cuité	Av. Petrônio Figueiredo, 811-859, Jardim Planalto, Edifício da Casa da Cidadania, CEP: 58.175-000
Sumé	Rodovia BR-412, 425, Centro, Edifício do NEXT/UFCG, CEP: 58.540-000
Ducks	Rua João da Mata, 90, Centro, CEP: 58.700-080
Sousa	Rua Emídio Pires, 84, Centro, CEP: 58.802-270
Catolé do Rocha	Av. Deputado Américo Maia, 37, Centro, CEP: 58.884-000
Itaporanga	Rua Elvidio de Figueiredo, S/N, Margens PB 386, Bairro Loteamento João Silvino, CEP: 58.780-000

Source: PROCASE, 2024.

For face-to-face assistance at the Regional Offices, the response times are:

- Immediate: in the prompt clarification of doubts;
- Emergency: 48 hours, when the situation requires a rapid response and could cause a risk to the life or physical integrity of people or the infrastructure/project, or severe (irreversible) environmental damage;
- Up to 10 days for cases that cannot be answered promptly. In these situations, the questions will be forwarded to the PMU, which will contact the department responsible for responding and getting back to the complainant. If the responsible department still has no response, the PMU will assume responsibility and seek the necessary response or solution, clarifying the situation to the complainant and specifying how much more time will be needed to return with the definitive response.

### PROCASE website

The PROCASE II website (<https://www.procasse.pb.gov.br>) contains a number of channels for contacting people, providing information, expressions of interest and complaints.

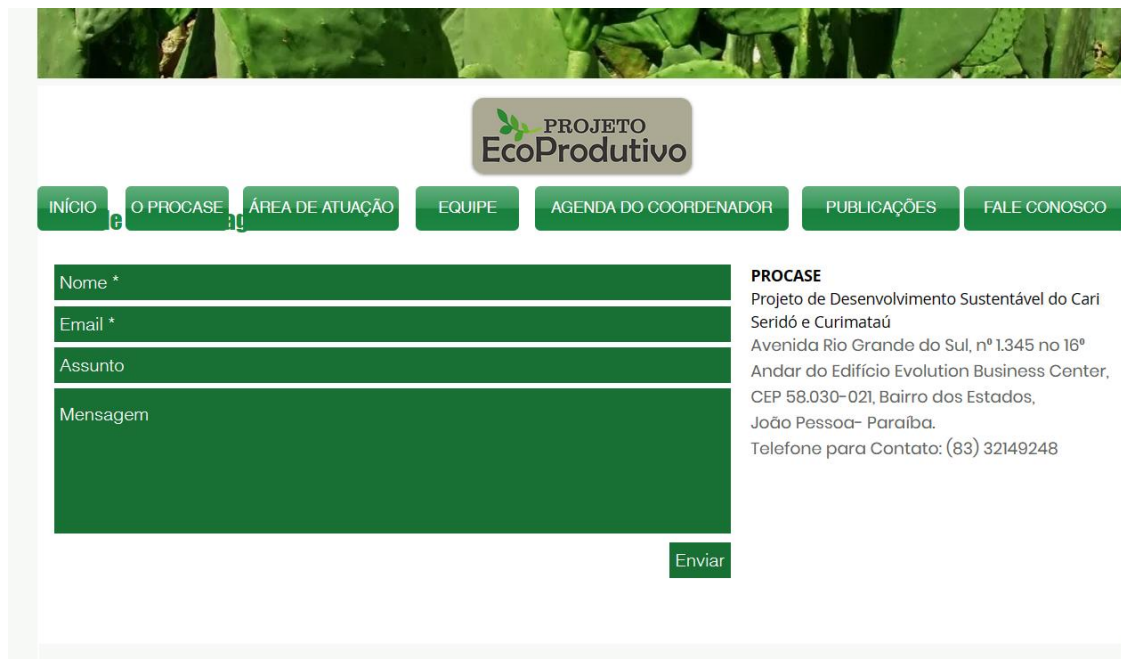

SEAFDS' "Contact Us" section provides specific channels for citizens in general, as well as a link to the State Ombudsman's Office (OGE).

## Social Media - Facebook and Instagram

Social media is mostly used as a channel for disseminating information about developments, launches and events. As it allows interaction with the target audience, information on access to services is also provided.

Within the framework of PROCASE II, the operation of these platforms or any new profiles created specifically for the project or at local level by the municipalities should follow the same logic. When complaints or doubts about PROCASE II are identified, the managers of these networks must activate the complaints system through the official channels. In other words, no complaints or grievances can be dealt with or resolved on social media. These channels can receive and advise complainants on the correct channels for submitting their complaints.

**Figure 40 - Social Media**

Source: <https://www.instagram.com/procasepb/>

**Other communication and complaint channels:**

**Complaints channels - IDB**

The IDB's own channels are also part of the Complaints Mechanism:

- IDB Complaints Protocol: [quejas@iadb.org](mailto:quejas@iadb.org)
- Website: <https://www.iadb.org/pt-br/quem-somos/enviar-uma-alegacao/reclamacoes-ambientais-e-sociais>

**Independent Consultation and Investigation Mechanism (ICIM/MICI):**

The Independent Consultation and Investigation Mechanism (MICI) is a structure of the IDB Group, independent of the Bank's management and project teams, which deals with environmental and social complaints from communities potentially affected by the Group's operations. This independence allows it to act impartially and seek solutions with all the parties involved (the communities claiming affections; the IDB Group, as the financier of the operation; and the borrower (company or government) in charge of executing the project).

For more details, see: <https://www.iadb.org/pt/mici/o-que-e-o-mici>

Requests can be sent to the MICI Office in Washington, D.C. or to any IDB Representative Office (marked "For the attention of: MICI Office"), from where the request will be forwarded to the MICI Office.

MICI's address is:

- Independent Consultation and Investigation Mechanism, Inter-American Development Bank, 1300 New York Avenue, NW, Washington, D.C. 20577, United States.
- E-mail: mecanismo@iadb.org

Phone: 202-623-3952; Fax: 202-312-4057

## **10. EXPERIENCE IN PUBLIC CONSULTATION AND PARTICIPATION**

The PROCASE II team has several practices that involve the community to support the development of the project, the application of measures, compensation, benefits and planning processes. These practices involve participatory planning carried out through joint or even individual meetings with the public.

Among these actions, the Participatory Diagnosis stands out, identifying problems, causes, actions, with targets and deadlines, support partners and responsibilities, aiming at an adequate baseline for proposing solutions, timetables and actions.

## **11. ANNEXES**

## 11.1. ANNEX 1 - Stakeholder Matrix

**Table 8 - Stakeholder Matrix - Institutional**

Id	Name / Institution (some community members also sit on the board of local institutions)	Rural Territory	Type of Stakeholder (institutional, community representative)	Preferred form of invitation	Call consultation mechanism

WSS	Water supply system
ZIKV	Zika virus

## 1. INTRODUCTION

This Targeted Adaptation Assessment for the **Paraíba Sustainable Rural Development Project – PROCASE II (Project, henceforth)** follows IFAD requirements as indicated in its Social, Environmental and Climate Change Assessment Procedures (SECAP<sup>1</sup>). For projects that are classified as "substantial risk" in the climate screening procedure, a Targeted Adaptation Assessment is required, with the identification of adaptation measures that may be necessary in the design of the project, to ensure that it is sustainable in the long term.

### Project Sheet:

<b>Project Title</b>	Paraíba Sustainable Rural Development Project – PROCASE II
<b>Territory where the Project will take place</b>	Paraíba, covering the 223 municipalities of the state's territory, which 194 are in Caatinga biome and 29 in Atlantic Forest biome
<b>Name of the Executing Entity</b>	Secretary of State for Family Agriculture and Development of the Semi-Arid Region (SEAFDS)
<b>Date of preparation of this Assessment</b>	This document was prepared between February and June 2024.

## 2. PROJECT SUMMARY

The Government of the State of Paraíba requested a loan to financing a specific investment loan Project (LON/ESP) to promote the sustainable development of the rural area in the State of Paraíba (covering Atlantic Forest and Caatinga biomes), focusing on low production, productivity problems and climate change vulnerability (CC) of family farming activities, environmental degradation and deforestation, insufficient drinking water supply services and sanitation lacks in rural communities.

### 2.1. Project Goals

The main goal of the Project is to contribute to reducing rural poverty levels, improving food and nutrition security, and the rural population adaptation for climate change.

The main specific goals are:

- Increase the adoption of agricultural technologies, including these to adaptation and mitigation for climate change;
- Improve productive and social inclusion of family farmers, prioritizing women, youth, Traditional People and Communities (PCT) and Persons with Disabilities;
- Improve the environmental conditions of rural communities and surroundings.

### 2.2. Project Intervention Area

The Project will cover the entire state of Paraíba, involving 223 municipalities, municipalities that are part distributed in Caatinga biome (194) and part in Atlantic Forest (29) biome. The Brazilian Census of Agriculture (IBGE 2017) highlights to 163,218 a total number of agricultural lands, 76.88% of which are Family Farming (FF), from which the Project will select its beneficiary population as describe in the next paragraph.

The Project will seek to benefit approximately 60,000 families directly, establishing a preferential focus on the following profiles: women, youth, Persons with Disabilities,

---

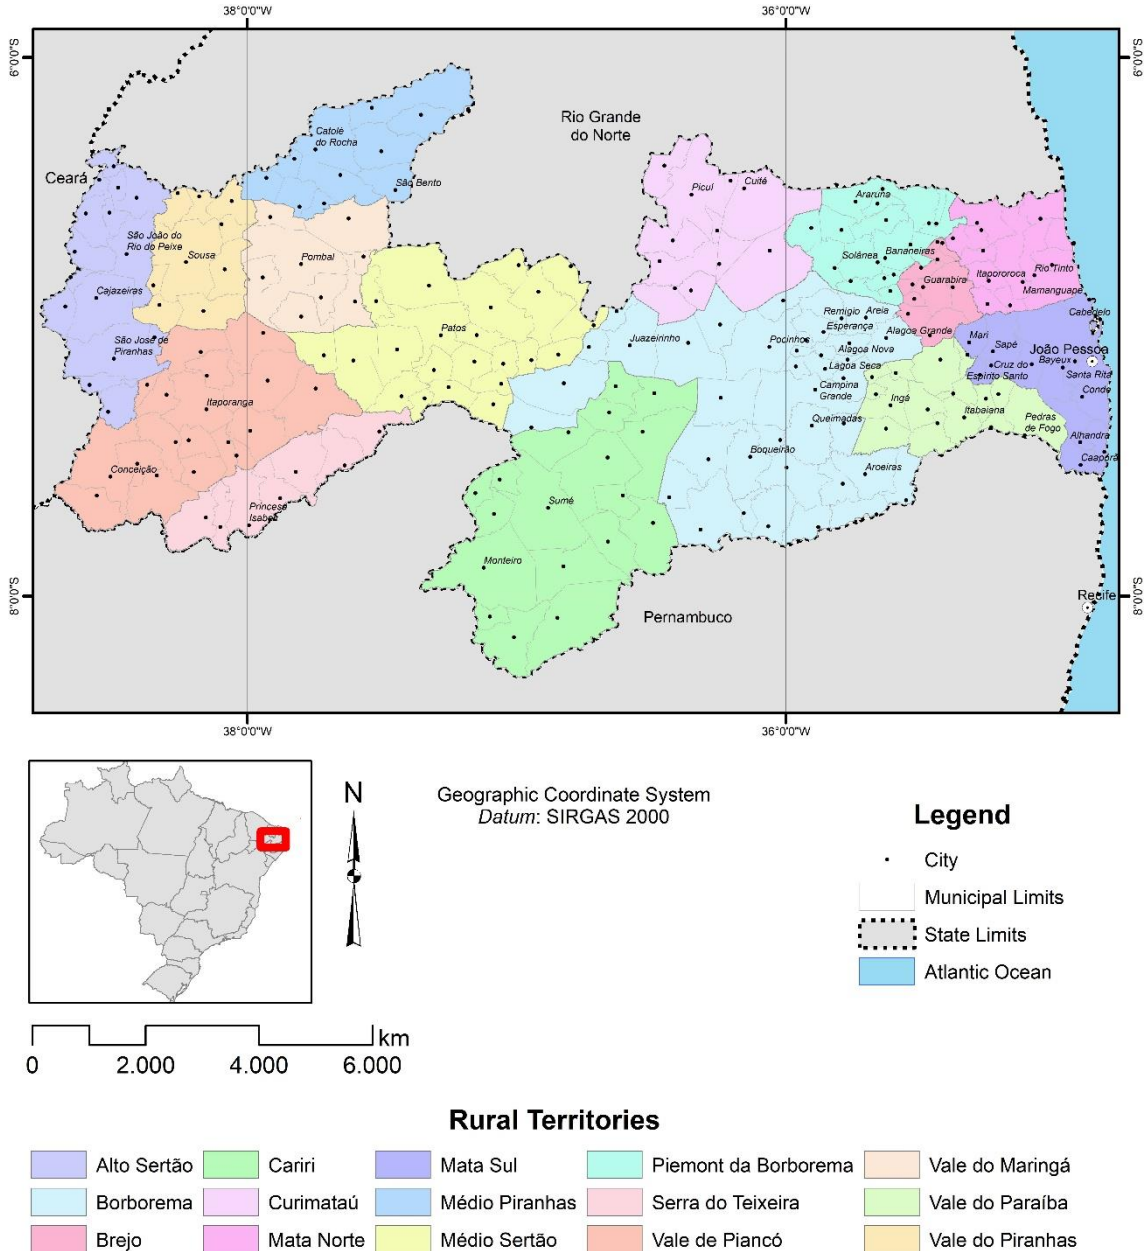

<sup>1</sup> Social Environment and Climate Assessment Procedures – IFAD (<https://www.ifad.org/en/-/social-environmental-and-climate-assessment-procedures>)

Traditional and Indigenous Peoples (including fishermen, gypsies and quilombolas). In any case, specific criteria will be defined for prioritization and selection of communities to be benefited.

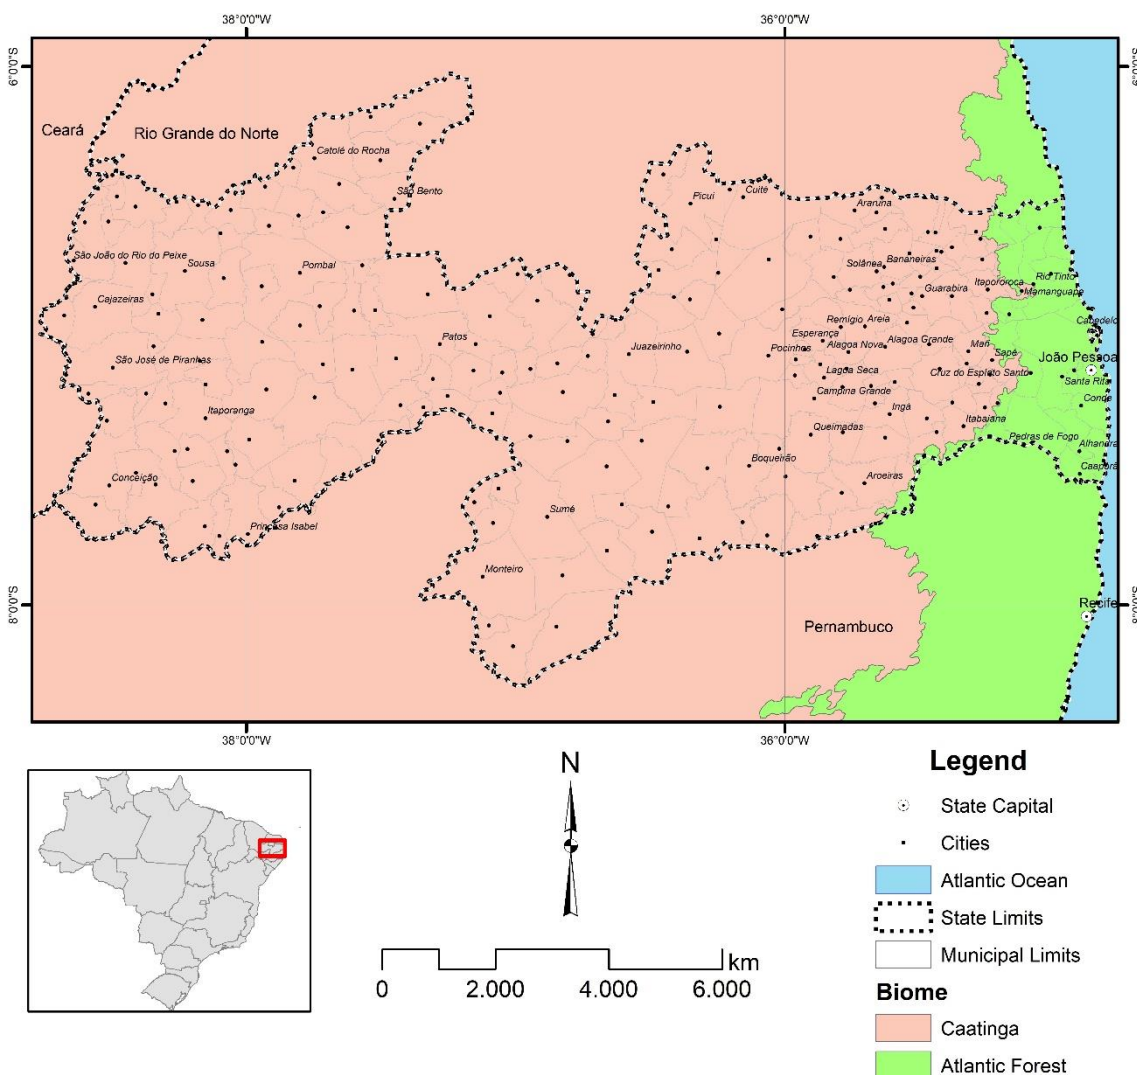

The following map shows the area of operation of PROCASE II.

**Figure 1 – Project Coverage Area**

The following map presents the area of incidence biomes on Paraíba state, highlighting the limits of Caatinga and Atlantic Florest.

**Figure 2 – Limits of biomes on Paraíba state.**

### 2.3. Project Description

The Project Components and their subcomponents are described below including key information.

#### Component 1. Resilient Production Systems to Face Rural Poverty

The objective of this component is to increase the adoption of agricultural technologies, including those for climate change adaptation and mitigation, in addition to improving the productive and social inclusion of family farmers, prioritizing women, youth, Traditional Peoples and Communities (PCT) and Persons with Disabilities.

The specific objectives of this Component 1 are:

- Transform existing systems by introducing innovative, more intensive and diversified agroecological practices;
- Seek greater resilience of production systems adapted to climate change;
- Promote the improved food and nutrition security;

- Improve the integration of producers in value chains, prioritizing women, youth, Persons with Disabilities, and Traditional Peoples and Communities (PCT);
- Invest in social technologies, ensuring more access to drinking water, reuse of water, and sustainable energy system;
- Support producer organizations (associations and cooperatives) to allow the development of production processing, providing added value and consequently the improvement of commercialization and market insertion through investments in machinery and small renovations;

Productive investments both community and cooperative level will be accompanied by Rural Technical Assistance (RTA<sup>2</sup>) and Specialized Technical Assistance (STA<sup>3</sup>) financed by Component 2, to ensure better management of business, marketing and sustainability.

Component 1 is organized into two subcomponents:

- 1.1: Implementation of Resilient Investment Plans; and;
- 1.2: Strengthening and diversification of commercialization.

## **Component 2. Strengthening of Family Farming and Organizations Capability, and Knowledge Management**

---

The objective is to strengthen the individual and collective capacities of family farmers and their organizations, needed to increase the adoption of agricultural technologies that promote greater resilience of their systems, to improve the productive and social inclusion as well as the environmental and land conditions of rural communities and surroundings.

The capacities strengthened through the component will be an essential tool for the implementation of the investments and innovative practices promoted by Component 1.

For contribution to achieve of the main goals of Project, in this component will develop a set of activities with the following specific objectives:

- Strengthen the capacities of households and community organizations to implement production systems more resilient and productive, to better manage organizations, and to access public policies;
- Strengthen the capacities of rural organizations to develop their production and markets access;
- Strengthen the specific capacities of priority beneficiary public to promote empowerment of gender, youth, PCTs, Persons with Disabilities, LGBTQIAPN+.
- Promote land and environmental regularization of family farming land, agrarian reform settlements and quilombola communities.
- Implement a process of Knowledge Management (KM) and South-South and Triangular Cooperation (SSTC) that allows for the generation, recording, sharing and use of relevant knowledge.

The following are the subcomponents involved in this C2:

- 2.1 – Capacity Development of Rural Community Organizations;
- 2.2 – Strengthening Family Farming Organizations for Market Access;

---

<sup>2</sup> Rural Technical Assistance or TA– Assistência Técnica Rural in portuguese

<sup>3</sup> Specialized Technical Assistance or STA – Consultoria Técnica Especializada in portuguese

- 2.3 – Gender, Youth, Diversity, Nutrition and Food Security;
- 2.4 - Land and Environmental Regularization;
- 2.5 - Knowledge Management and South-South and Triangular Cooperation.

### **Project Management, Monitoring and Evaluation**

---

This component aims to create an efficient mechanism for the management and control of the activities implemented by the Project, allowing full execution in line with the Project's intervention proposal, in addition to ensuring the implementation of the Annual Workplan and Budget (AWPB). It also aims to introduce technological innovations to ensure the monitoring and evaluation of activities, the registration and systematization of Knowledge Management, in addition to enabling transparent communication between stakeholders, including knowledge exchange actions.

To meet these objectives the component will act based on 2 subcomponents: (i) Project Management; and (ii) Monitoring and Evaluation (M&E).

### **3. INDICATION OF HAZARD, EXPOSURE, VULNERABILITY AND ADAPTABILITY**

The context of climate to the PROCASE II area is presented below, with the relevant climate variables to understand and evaluate the potential impacts on the Project's investments followed by the identification of the main hazards, exposure, vulnerability and adaptive capacity.

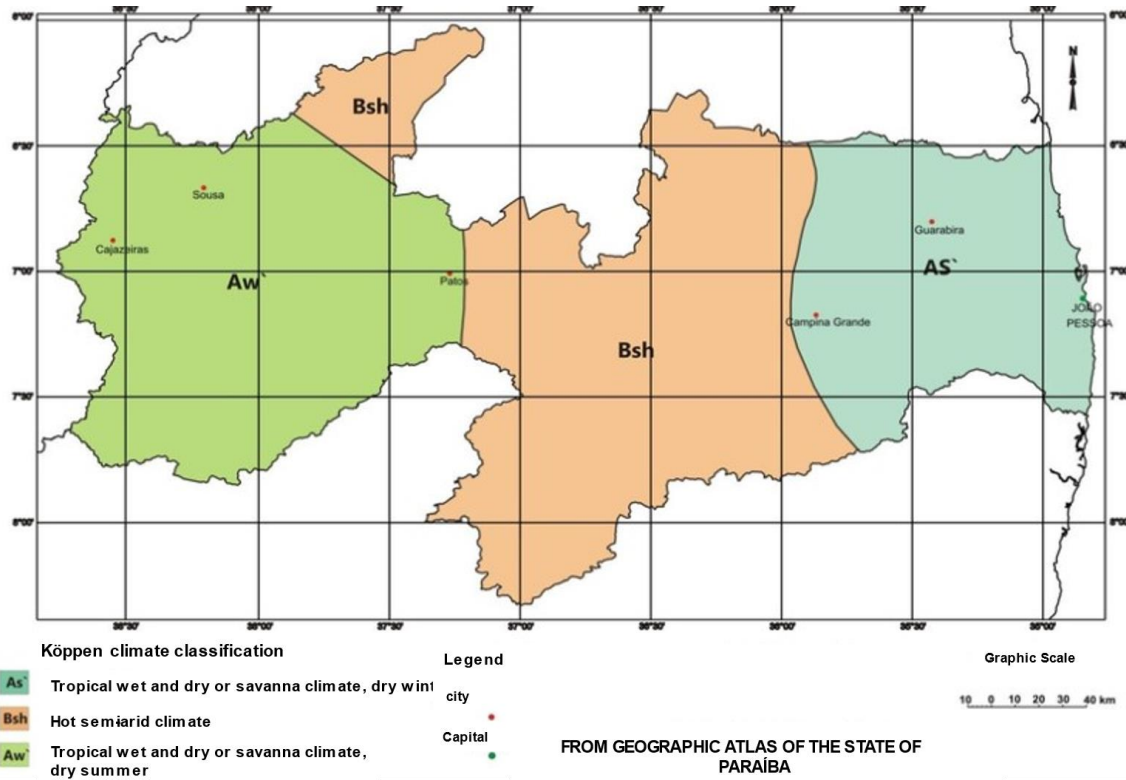

#### **3.1. Current Weather**

The climate classification expresses the average conditions of the Earth's atmosphere. These conditions, despite daily, monthly and seasonal experience variations are represented by climatic bands that remain reasonably uniform, within an average pattern of oscillation.

According to Köppen climate classification, the climate in the region of Paraíba State is shown below, encompassing the climates of type A (tropical climate) and B (dry climate). Within these two groups we can identify three subgroups in State of Paraíba:

- Hot and humid tropical climate, with a dry season in winter (As'), occurring in the eastern sector of Paraíba State. It is characterized by the absence of summer rainfall and its occurrence in the winter (regarding rainy season rather than winter period specifically), with rainfall rates around 1,600 mm per year.
- Hot semi-arid climate with summer rains (Bsh), present in the Borborema Plateau; it is characterized by scarcity of rainfall and irregularity distribution; low cloudiness; severe heat stroke; high evaporation rates; and high average temperatures (around 27°C). The relative humidity is usually low, and the low rainfall - from 250 mm to 750 mm per year - is concentrated in a short period of year, causing torrential floods. Even during the rainy season (November to April), the distribution of precipitation is irregular, may cease to occur for some years and causing droughts. The characteristic vegetation of this type of climate is xerophitic(Caatinga).
- Tropical, hot and semi-humid climate evolving summer and autumn rains (Aw'), occurring in the Sertaneja (Countryside) Depression, with dry winter. It has a rainy season in the summer, from November to April, and a dry season in the winter, from May to October (July is the driest month). The average temperature of the coldest month is over 18°C. Rainfall exceeds 750 mm per year, may reaching 1800 mm.

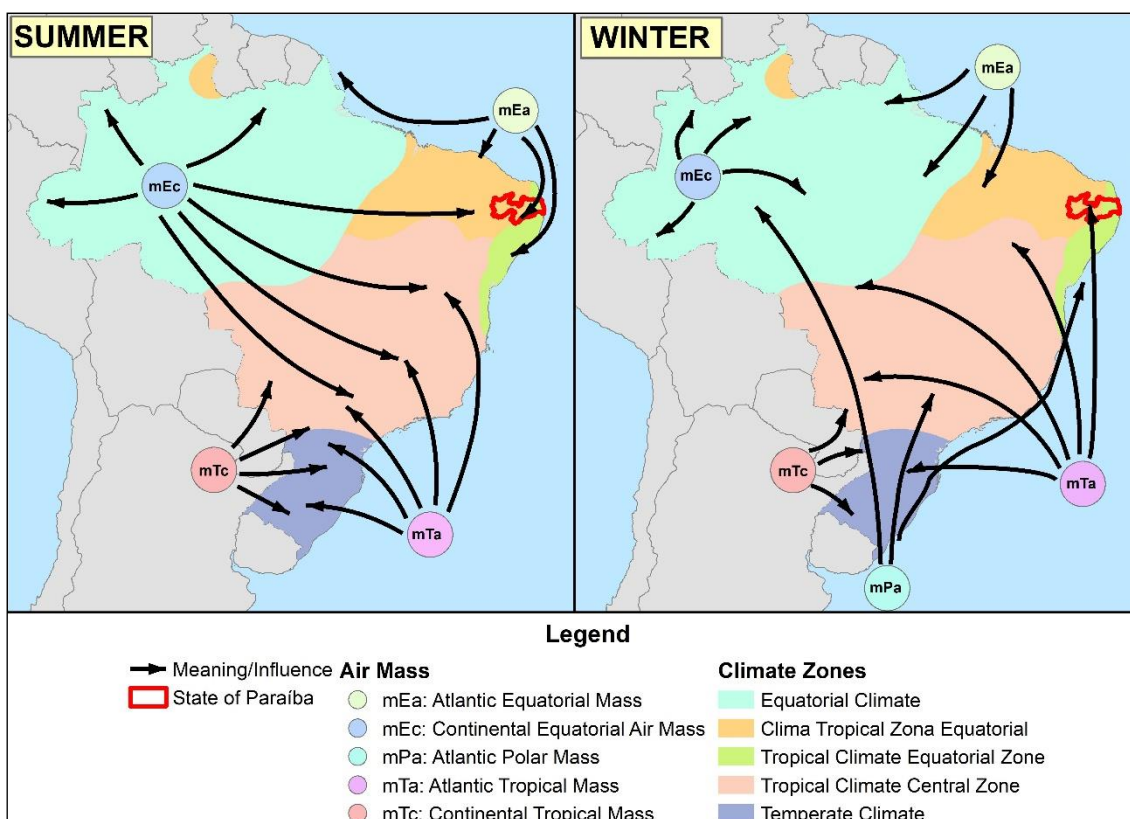

**Figure 3 – Paraíba Climate Classification – Köppen**

Source: Francisco, 2010 adapted from IBGE, 1985.

According to Nimer (1989), the main air masses that influence Brazil territory is shown in the following figure. It can see that Paraíba State is directly influenced by mEa/mEc during the summer and by the mTa/mPa during the winter.

Figure 4 – Brazil’s Main Air Masses over Climate Zones

Source: adapted from IBGE, 2017 and Nimer, 1989.

During the summer, the Continental Equatorial Air Mass (mEc) exerts influence on a large part of the Brazilian territory. In case of Paraíba, the mEc acts together with the mEa, increasing the rainfall during the summer keeping the temperature high.

However, the mEc is quite restricted during the winter and basically, it does not influence the region of Project. The mEa continues but loses moisture in the more coastal strips quickly – leaving the countryside drier. During this period, the influence of Atlantic Polar Mass (mPa) arises which brings down local temperatures in the coastal strip.

Paraíba is under the southeast trade winds, ensuring a stable weather that is interrupted by the arrival of disturbed marine currents: from the south, the cold fronts; from the North, the Intertropical Convergence Zone; from the East, disturbances from the Easterly Waves; and from the West, the lines of Intertropical and Tropical Instabilities (Nimer, 1989).

Climatologically, the main rainfall systems over the State of Paraíba are the Intertropical Convergence Zone and the Upper Air Cyclonic Vortices, which induce representative rainfall over the region and are responsible for approximately 80% of the total precipitation. In a second rainy season, there is the action of Eastern Wave Disturbances that favor the occurrence of more representative rains over the entire eastern sector of the State, especially in the coastal strip. This system contributes about 70% of the total precipitation over the region and configures a good part of the period (AESAs, 2009).

The State of Paraíba has lots of meteorological variations in measured parameters, both temporal and spatial distribution. Thus, orographic accidents may have an important participation in climate variation, and it is common to see humid mountains in the middle of the semi-arid area, with variations above 100% among situations. In relation to temporality, years are shown totally deviated from the historical pattern. These values are so anomalous that it can exceed 100% of the normal rate (EFSA, 2009).

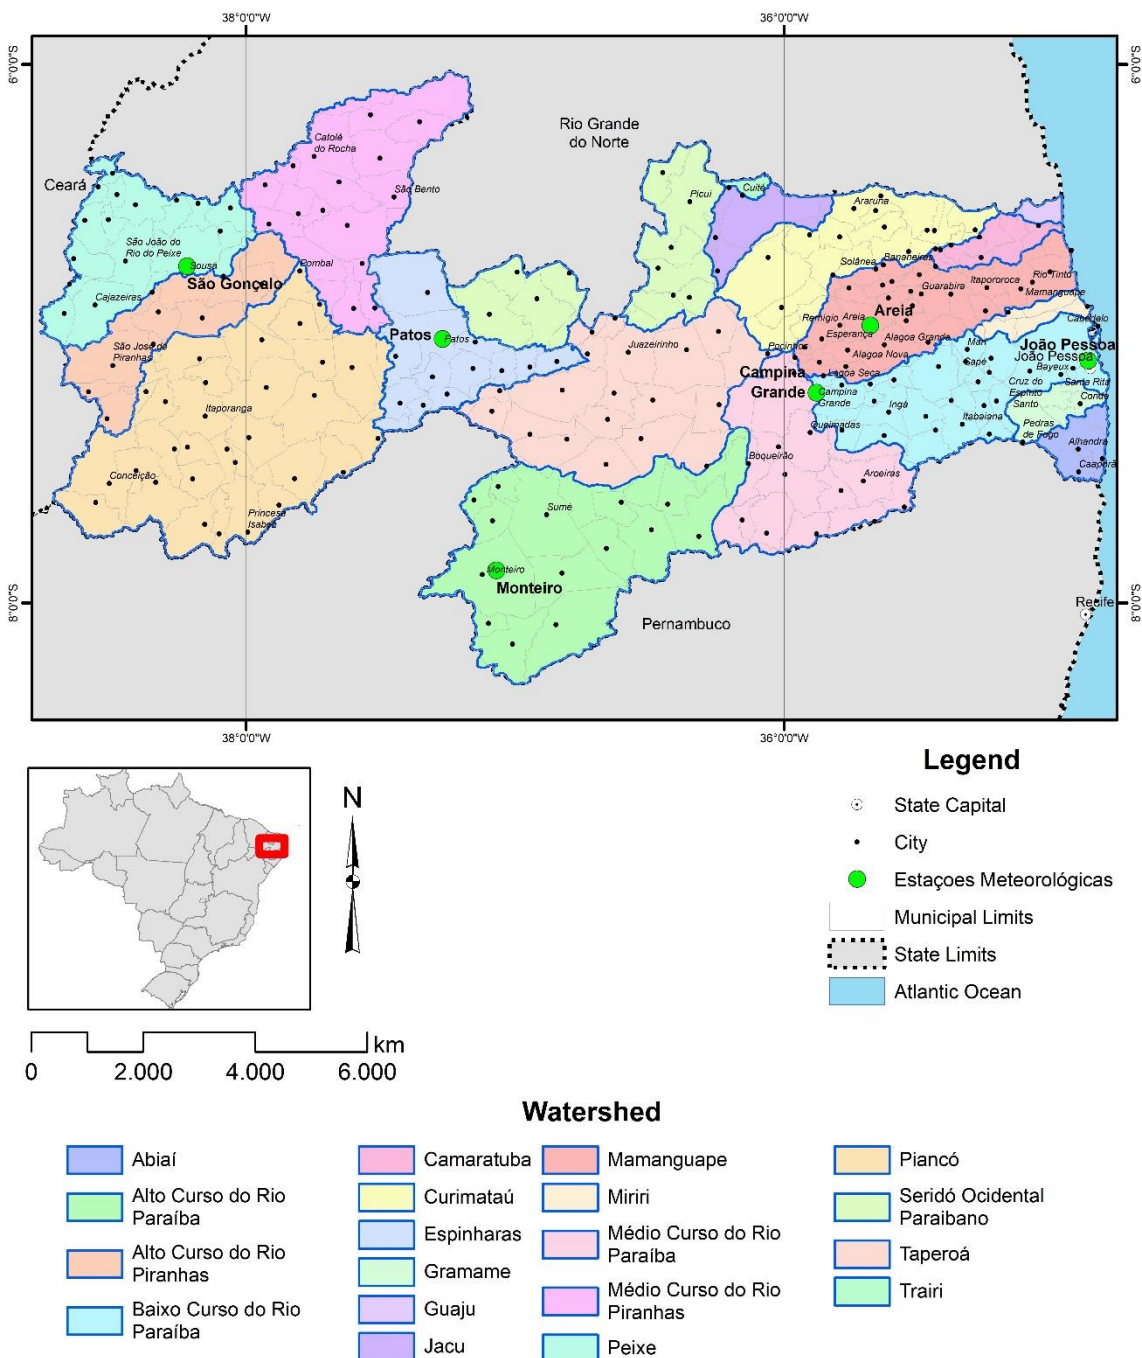

According the EFSA (2022) data to the adequate precipitation graphic for Paraíba State, based on Climatological Normal (INMET, 2018), 06 normal climatological stations were selected (see table below) distributed in the territory of the 20 hydrographic sub-basins (or 12 basins) for State of Paraíba (see figure below). The importance of these stations is their strategic distribution in main state regions (Litoral, Agreste, Brejo, Cariri and Sertão) and a series of large-period data, one of them in Mamanguape River Basin, three in the Paraíba River Basin and two in the Piranhas River Basin.

**Table 1 – Meteorological Stations considered in the State of Paraíba.**

State	Basin	Station	Code	Latitude	Longitude	Altitude (m)	Start of Operation
PB	Mamanguape	Areia	82696	-6,97	-35,68	574,62	01/01/1929
	Paraiba	Campina Grande	82795	-7,22	-35,88	547,56	01/01/1911
	Paraiba	Joao Pessoa	82798	-7,10	-34,87	7,43	01/01/1912

**Figure 5 – Location of Paraíba Meteorological Stations**

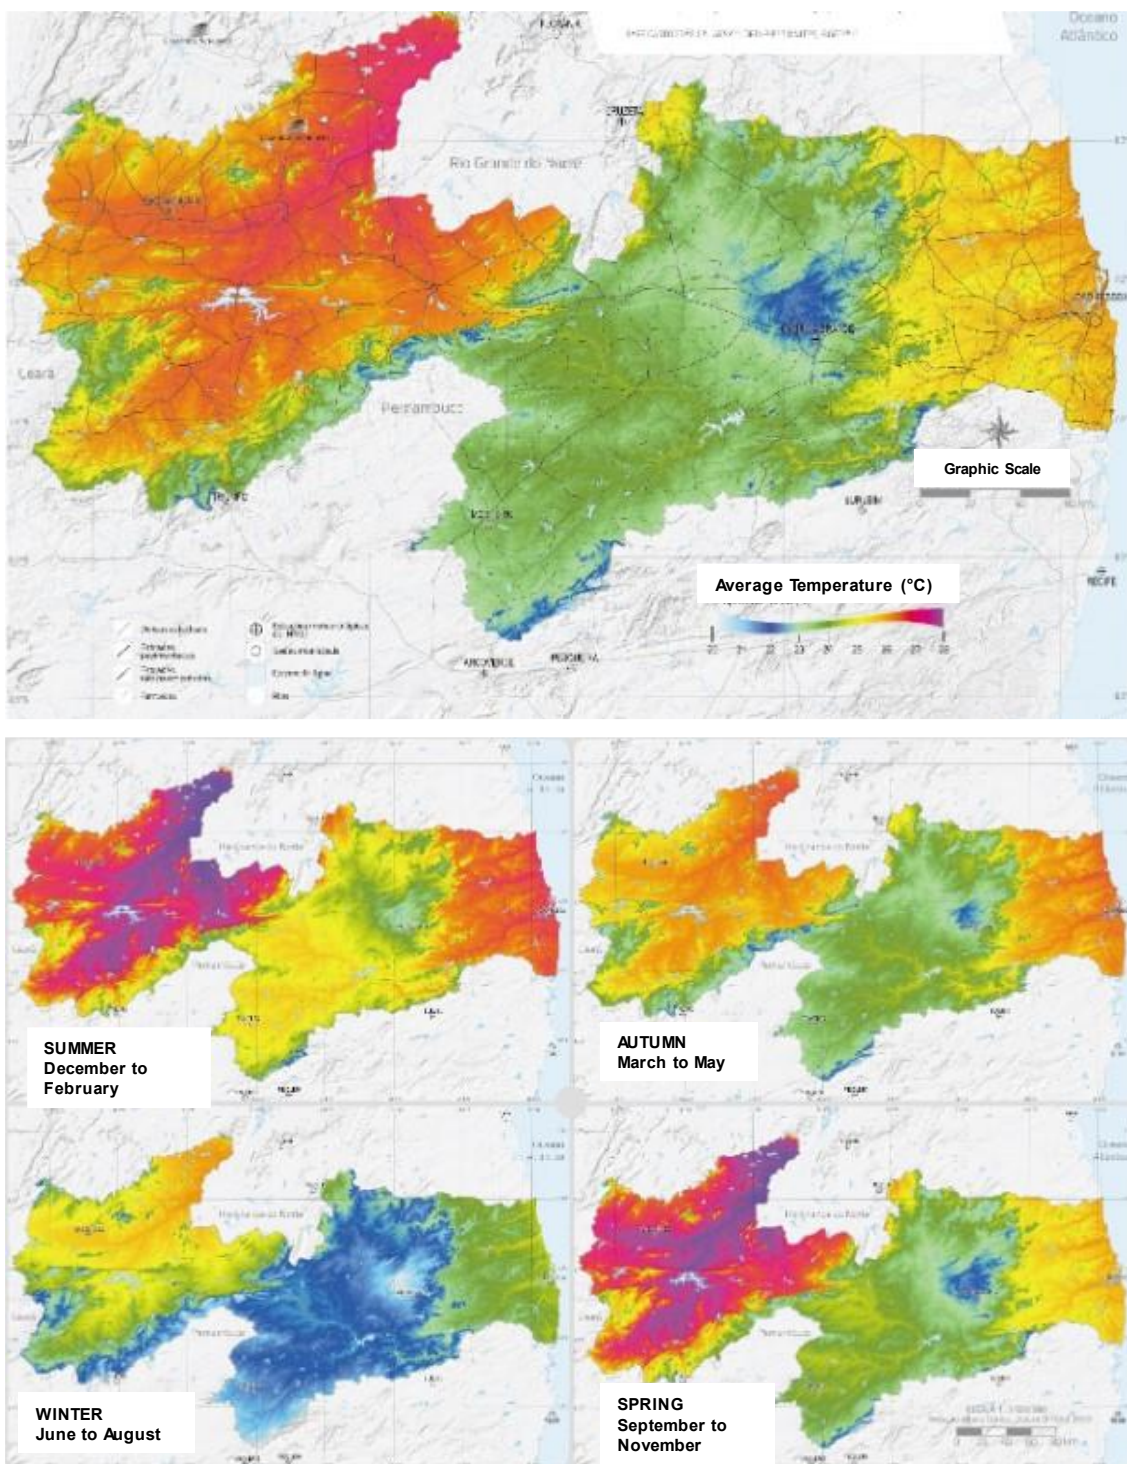

Source: INMET, 2018 apud AESA, 2022

Seasonality has low effect on the annual temperature range in the State of Paraíba, ranging from 20 °C in the central region during the winter to 27 °C in the coastal region during the summer. The region from Borborema lowlands until to the coast area has an annual average of 24°C to 26°C, with 4°C seasonal variability, while the region at the top of the plateau has 2°C variability. The west of the state has a greater amplitude, influenced by the irregularity of the masses that come from Amazon, ranging from 23°C in winter to 28°C in summer (figure below).

**Figure 6 – Annual Average and Seasonal Temperature in the State of Paraíba**

Source: *Wind Atlas of the State of Paraíba, 2017. (Climatological data from 1961 to 1990, INMET)*

Rainfall in the State of Paraíba varies between 1.3 mm in September, at Patos station, to 355.2 mm in June at João Pessoa station (see Table below). Considering the annual scale, the rainfall in the State of Paraíba is around 1,086.1 mm, whereupon Monteiro station registered the lowest annual rainfall score, and João Pessoa station registered the highest score. The tempore variation of rainfall in each climatological season can be seen in the following figure.

**Table 2 – Rainfall in the Meteorological Stations considered in State of Paraíba (mm).**

Station	Jan	Feb	Mar	Apr	Mai	Jun	Jul	Aug	Set	Out	Nov	Dez	Year
Sand	83,0	107,4	156,3	151,7	169,2	210,7	182,2	151,2	60,9	21,8	27,5	37,8	1.359,7

**Figure 7 – Rainfall recorded in the Meteorological Stations considered in State of Paraíba (Average Annual Precipitation in mm).**

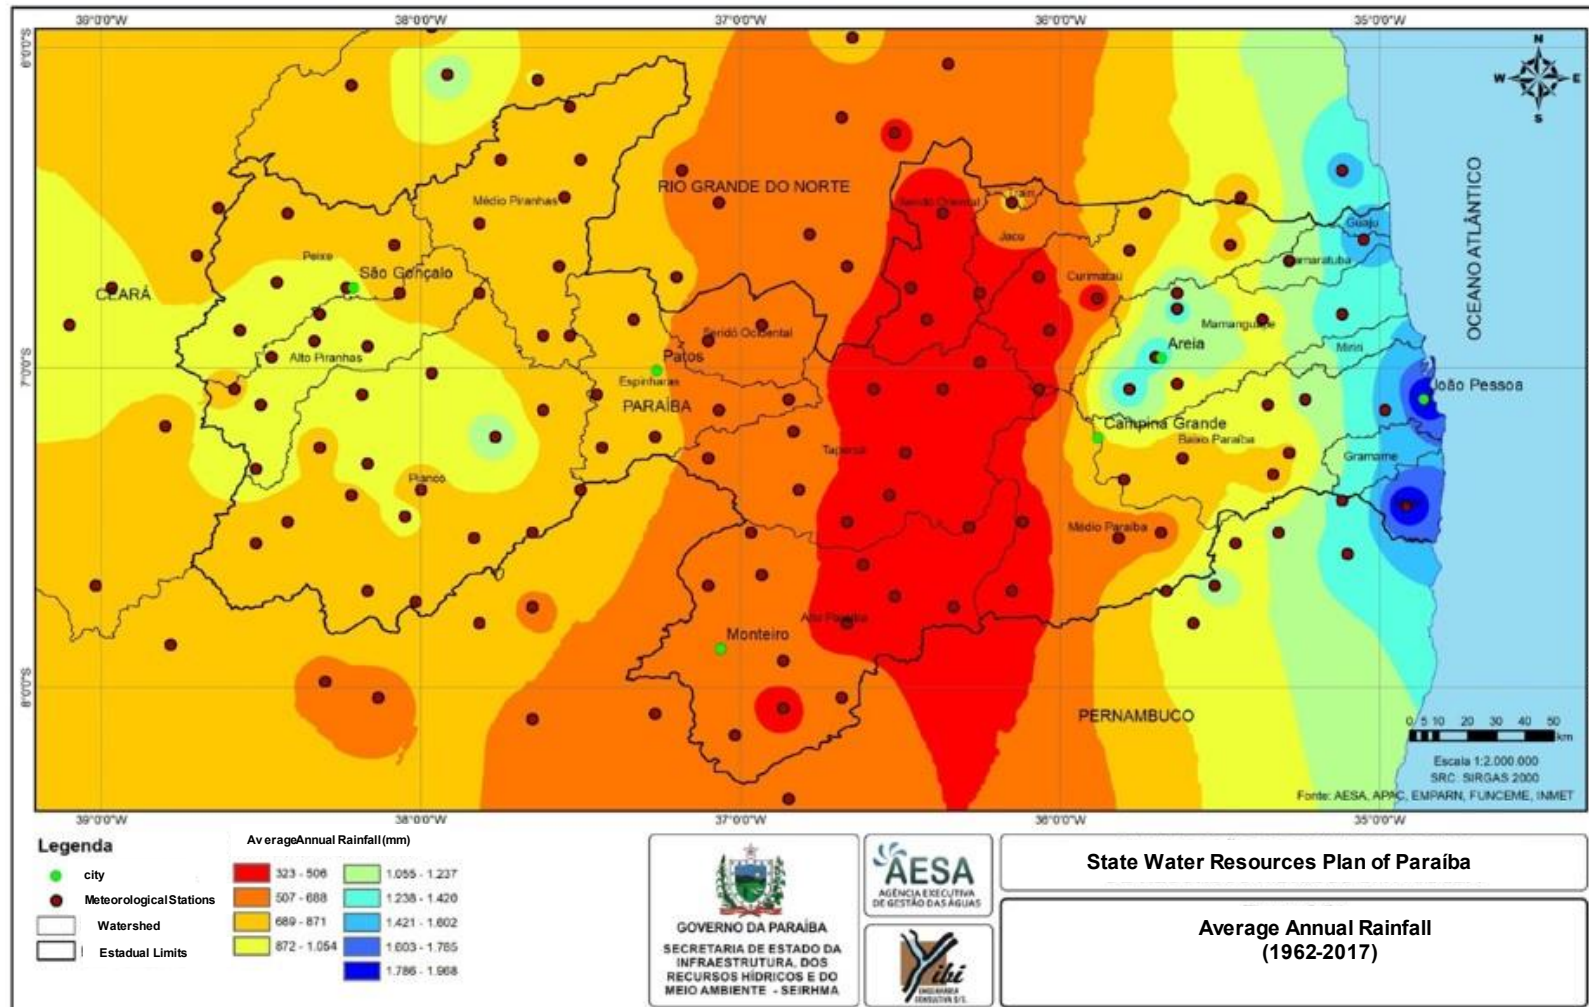

Source: INMET, 2018 apud AESA, 2022

Based on State Water Resources Plan of Paraíba - PERH-PB (AESA, 2022), and for a detailed spatial representation of precipitation in the state of Paraíba, a database with daily rainfall data monitored was organized, which a total of 137 monitoring precipitation stations.

Corrected and homogenized precipitation data from the 137 previously selected rainfall stations in a total period of 56 years (1962-2017) were used to trace the isoietes of the average annual precipitation. From each daily rainfall data accumulated by each year, the annual average rainfall was then determined, and, using the inverse distance squared method, and the annual precipitation data were interpolated as shown in the figure below.

Francisco and Santos (2017) identify two rainfall regimes that characterize the State of Paraíba: the first one occurring from February to May, on Alto Sertão, Sertão and Cariri/Curimataú regions; and the second occurring from April to July, on Agreste, Brejo and Litoral regions. The systems responsible for rainfall regimes are Intertropical Convergence Zone (ITCZ), Cold Fronts, East Disturbances or East Waves and High-Level Cyclonic Vortices (HLCV). There is an increase in rainfall in the west/east direction throughout the year. The central portion of the state has the lowest rainfall values, ranging between 300mm and 700mm per year. On the other hand, the coastal region of state is the sector that rates rainfall is highest, reaching values around 1950mm.

Figure 8 – Average Annual Rainfall (1962-2017)

Source: EFSA, 2022 (<http://www.aesa.pb.gov.br/aesa-website/wp-content/uploads/2022/10/RF-02-A-DIAGN%C3%93STICOS-vol-1.pdf>)

### 3.2. Future Climate

This item was prepared based on data from the *World Bank's* Climate Change Knowledge Portal<sup>4</sup>, and the climate projection data were modeled from the compilations of global climate models of CMIP6 (*Coupled Model Intercomparison Project Phase 6*), overseen by the World Climate Research Program. The CMIPs form the basis of IPCC Assessment Reports. There was also used information from the World Bank's Climate Risk Country Profile: Brazil report (2021), which is based on CMIP5.

According to a report by the World Bank (2021), Brazil's average annual temperatures are expected to increase between 1.7°C and 5.3°C until the end of the century. The most significant increases are expected to occur in the months of January and July. The study indicates that greater warming is expected in the western region of the country up to the eastern coast. Central regions are expected to experience the most significant temperature increases. The interior of the country is predicted to warm at a faster rate than the coastal areas, however, rising sea surface temperatures may have a negative impact on the normally cooled ocean airflow in coastal regions. The frequency and duration of heat waves in Amazon are expected to increase on 214 additional days until 2090.

Precipitation is very variable throughout Brazil, as well as the projections seasonal and geographic level. However, by the end of the century, annual rainfall is expected to increase in the northern, central-western and southern areas in Brazil. Decreases are expected for the northeastern, central and southwestern areas of the country. The dry season in Amazon is likely to get longer as precipitation values decrease, notably for the traditional dry season (August to November).

ENSO events<sup>5</sup> bring heavier and more frequent precipitation events, with greater probability to longer drier periods among them. The humid tropical region of the country is also projected to experience a significant increase in dry spells. The Figure below shows the variation in the average annual rainfall projected to Brazil. Solutions for water resources management can be very varied, depending on whether periods of precipitation occur frequently or not. On a national scale, it is expected that average annual rainfall remains similar to historical observations, but based on emissions scenarios, vary slightly over the century (World Bank, 2024 – consultation).

---

<sup>4</sup> <https://climateknowledgeportal.worldbank.org/country/brazil/climate-data-projections>

<sup>5</sup> refers to situations in which the equatorial Pacific Ocean is warmer (El Niño) or colder (La Niña) than the historical normal average.

**Figure 9 – Changes projected by the multi-model set (CMIP5) (32 GCMs) in annual temperature (top) and precipitation (bottom) during 2040–2059 (left) and during 2080–2099 (right), regarding 1986–2005 baseline at RCP8 0.527**

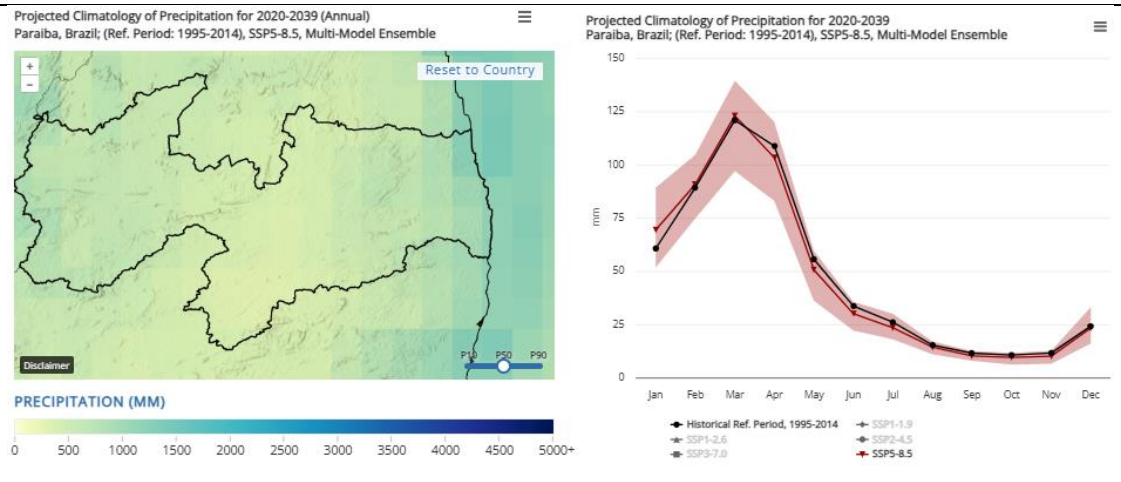

Source: World Bank's Climate Change Knowledge Portal (consultation in 2024) – Brazil

Focusing on state of Paraíba, as shown in the figure below, in the SSP5-8.5 scenario<sup>6</sup> for 2020-2039 period, large differences are not identified in the general averages of precipitation, and there is an indication that the period between January and February will have higher volumes than the historical series. However, between September and November there will be lower volumes of rainfall. This situation is marked in the period of 2060-2079 with more expressive volumes at the beginning of the year and a reduction in volumes in the last year quarter (which is usually wet).

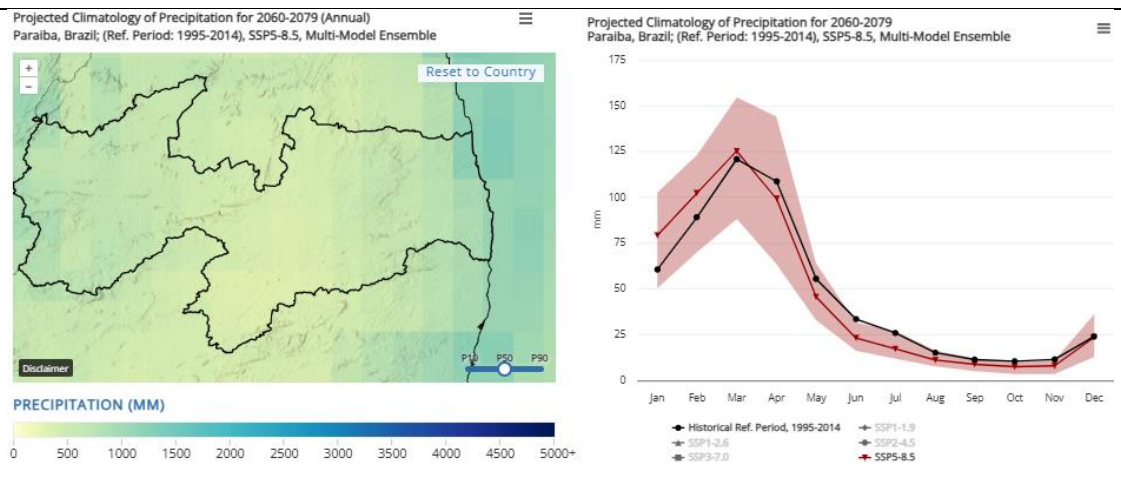

It is also important to observe the Projected Precipitation Anomaly graph where the highest volumes of rainfall in January and February (+30mm) are evident, and a reduction between October and November (-10 to -20mm).

<sup>6</sup> SSP5-8.5 is a high reference scenario with no additional climate policy. Emission levels as high as SSP5-8.5 are not obtained by Integrated Assessment Models (IAMs) under any of the SSPs other than the fossil fueled SSP5 socioeconomic development pathway.

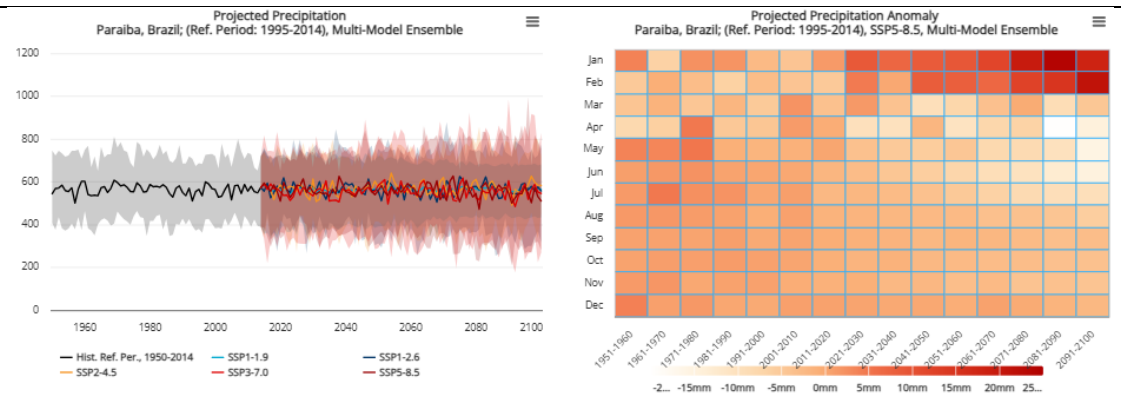

**Figure 10 – Precipitation –SSP5-8.5 – 2020-2039 Scenario**

**Figure 11 – Precipitation –SSP5-8.5 – 2060-2079 Scenario**

**Figure 12 – Precipitation – SSP5-8.5– 1960-2020-2039 Scenario and Anomalies**

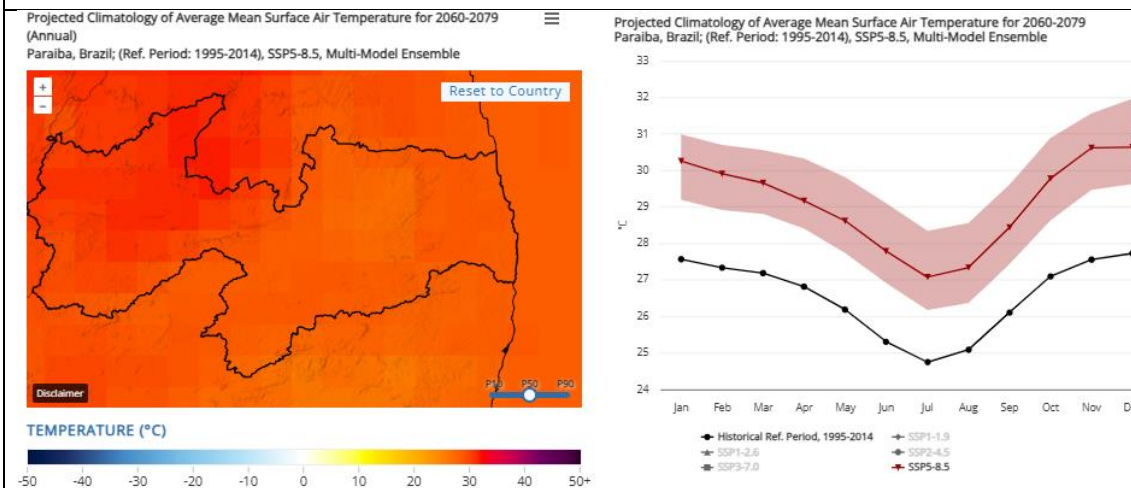

According to the figure below, there should be temperature increases in the order of 1 to 1.5 degrees in the period of 2020-2039, while in the period of 2060-2079 the increases are among 3 and 4.5 degrees, with greater anomalies precisely in October and November (note above that this period presents a reduction in rainfall volumes).

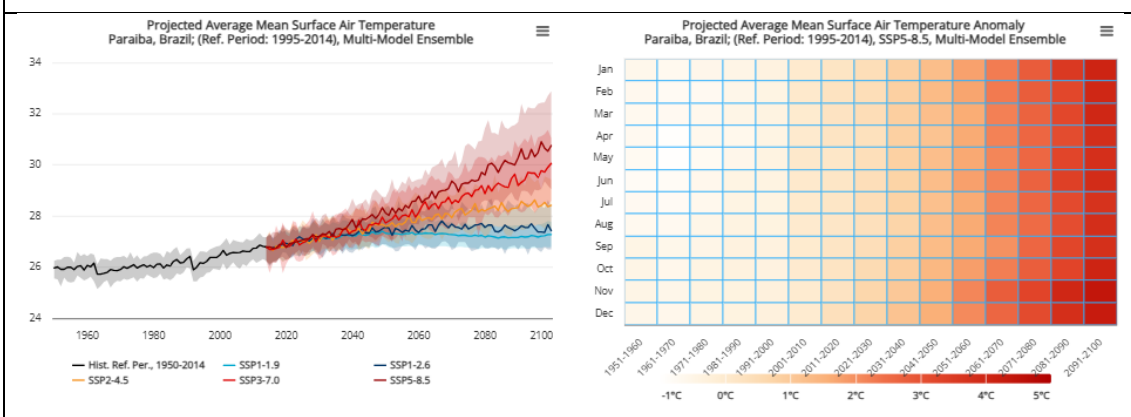

**Figure 13 – Average Surface Air Temperature – SSP5-8.5– 2020-2039 Scenario**

**Figure 14 – Mean Surface Air Temperature –SSP5-8.5– 2060-2079 Scenario**

**Figure 15 – Mean Surface Air Temperature – SSP5-8.5– 1960-2020-2039 Scenario and Anomalies**

### 3.3. Impact and Vulnerability Assessment

The Brazilian territory is quite diverse, with a variety of natural hazards that affect different parts of this territory and its population. In general, the main natural hazards are floods, droughts, extreme temperatures, landslides, tropical cyclones and infectious

diseases. Its location in the tropics, with high temperatures and high evaporation potential, facilitates large amounts of rainfall.

*Drought and excessive rainfall resulting in recurrent floods and landslides are the most frequent and disruptive risk events with important impacts on urban areas. Floods, landslides, and droughts have occurred regularly over the past century accompanied by significant mortality and social losses. Floods comprise more than 65% of natural hazards and heavy rainfall events which triggered flash floods and landslides accounted for 74% of disaster-related deaths in the period of 1991-2010 (World Bank, 2020)*

Climate change is expected to increase the risk and intensity of water scarcity and drought across the country, with the main exception of the increase in precipitation experienced in the extreme south-central area of Brazil, from the south of São Paulo. The main sectors affected are water, agriculture and livestock, forestry, and infrastructure.

According to the World Bank report (2020), by the end of the century, annual rainfall is expected to increase in the northern, central-western and southern areas in Brazil. Declines are expected for the Northeast, Center and Southwest regions of the country. Probably, the dry season in Amazon will get longer as precipitation values decrease, notably for the traditional dry season (August to November). ENSO events bring heavier and more frequent precipitation events, with a higher likelihood of longer drier periods among them.

As heavy precipitation events become more common, they will increase risks of flooding, both fluvial and sudden. Such floods have the potential to leach and/or erode soils and damage crops due to excess water, harming production and increasing food insecurity, particularly in subsistence farmers. On the other hand, such intense precipitation events are expected to occur in short periods, prevailing large periods of drought. In fact, the Northeast region of Brazil has experienced some of the worst droughts in history, affecting more than 4 million people and 1,400 municipalities<sup>7</sup>. In the case of Paraíba, there is a chance of up to 20% of droughts occurring in the next 10 years<sup>8</sup>.

Extreme temperatures, harmful to people's lives and agricultural activities, have increased the loss of soil moisture, leading to greater aridity, affecting livestock and crops, promoting economic losses, damage to agricultural land and infrastructure, as well as human communities. According to Thinkhazard (2020), almost all of Paraíba has a medium danger level for extreme heat, meaning that there is already a more than 25% chance that at least one period of prolonged exposure to extreme heat will occur in the next 5 years. It is important to consider that situations of extreme heat and water scarcity have the potential to increase situations involving forest fires, which can affect crops and water resources protection areas (riparian forests, gallery forests).

The following figure presents a sequence of danger levels for Paraíba in terms of floods, water scarcity, extreme heat and forest fires.

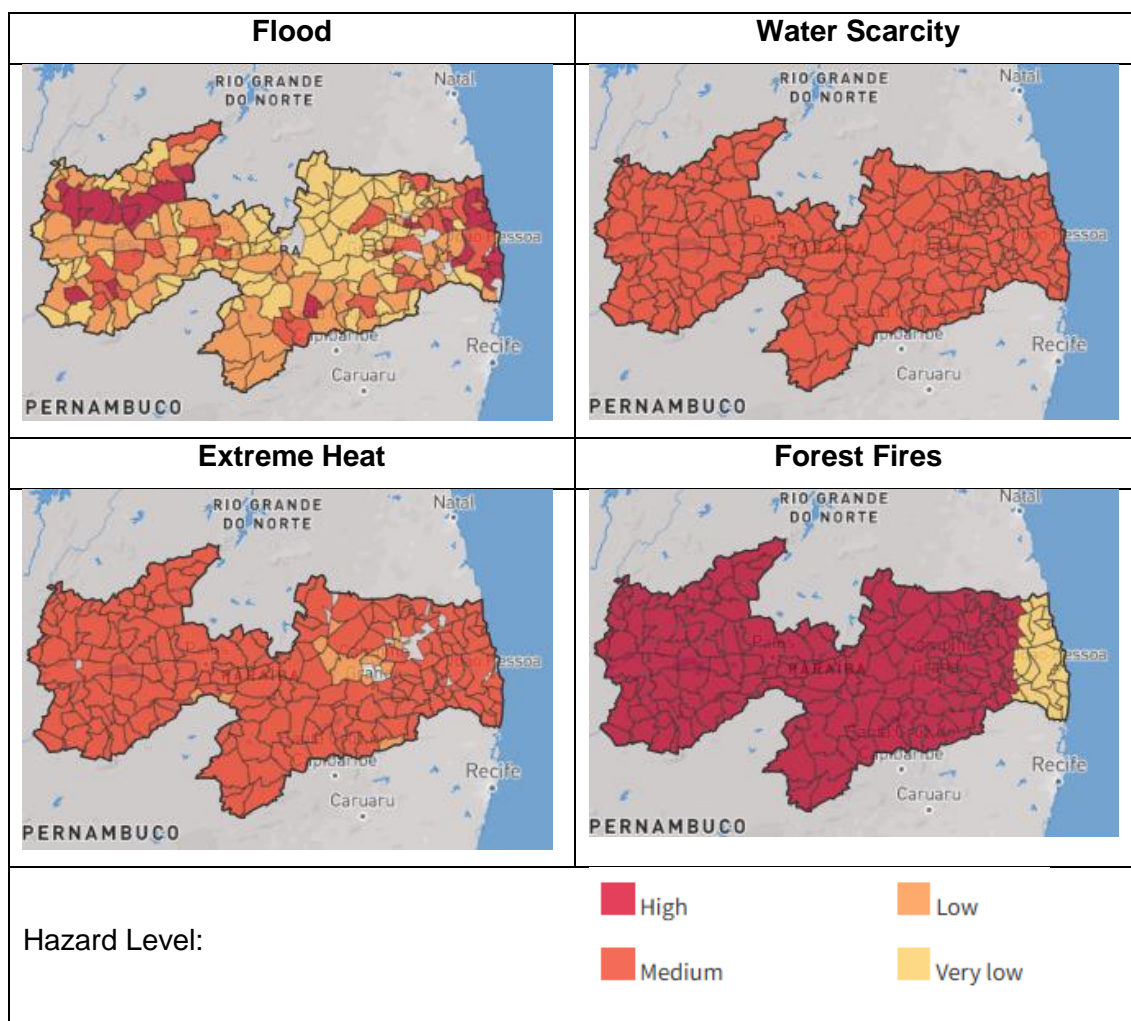

---

<sup>7</sup> Brazil (2020). Fourth National Communication of Brazil to the UNFCCC. Email: <https://unfccc.int/sites/default/files/resource/4a%20Comunicação%20Nacional.pdf>

<sup>8</sup> ThinkHazard! (2020). Brazil, State of Paraíba — Water scarcity. Address: <https://thinkhazard.org/en/report/679-brazil-paraiba/DG>

**Figure 16 – Identified hazards – Paraíba**

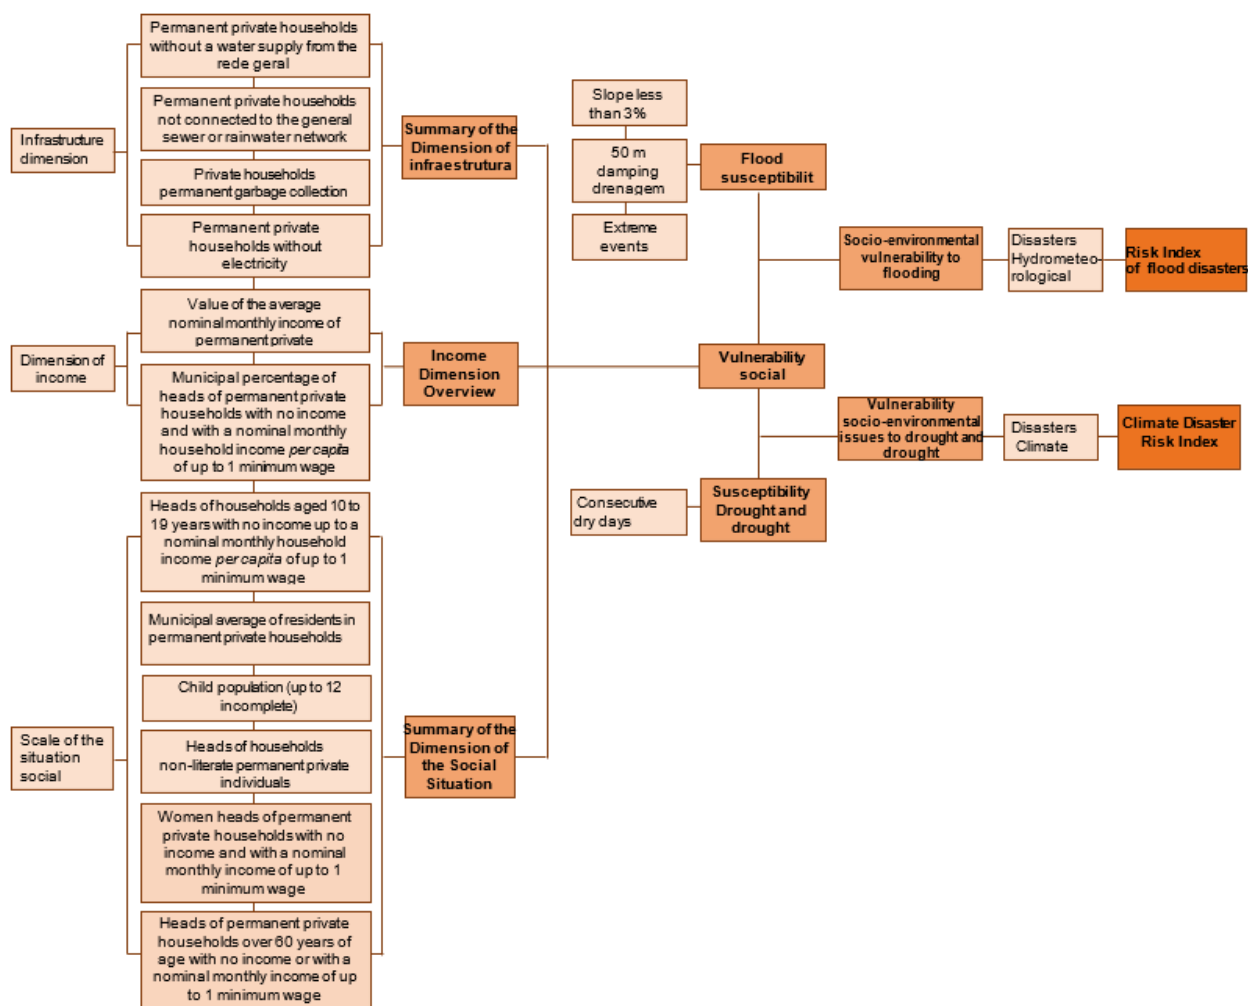

Source: ThinkHazard! (2020), consulted in 2024 in <https://thinkhazard.org>

It is important to note that smallholders are more sensitive to the impacts of disasters (floods, dry periods, forest fires) because they have limited resources to influence and increase their responses to these risks. In addition, land degradation and soil erosion exacerbated by recurrent floods and droughts affect negatively agricultural production and thus the livelihoods of the most vulnerable rural communities.

It is important to consider the **Atlas: Environmental Risks, Vulnerabilities and Disasters of State of Paraíba** (Cunico *et al.*, 2023) that provides an important insight into the risks and vulnerabilities of municipalities in Paraíba. This study consisted of elaboration of mapping of the Disaster Risk Indices (IRDs) for Paraíba state considering two scenarios of environmental and climatic susceptibility: areas susceptible to flooding and areas susceptible to climatic disasters (drought/drought). The methodological path presented in the following figure was carried out.

**Figure 17 – Methodological Path - Atlas: Environmental Risks, Vulnerabilities and Disasters of Paraíba State**

Source: Cunico et al., 2023

It is interesting to highlight that the Disaster Risk Indices for both drought and floods were designed with emergencies and public calamity states declared by municipalities between 2003 and 2016, which gives greater robustness results. These data must be correlated to social vulnerability, which presents an important indicator about communities' capacity to cope disasters that eventually can devastate the territory.

Social Vulnerability is the result of combination dimensions of infrastructures, incomes and social situations that corroborate the identification of areas with higher or lower capacities to cope with adverse situations, including environmental disasters.

The following table presents the indicators used to define social vulnerability, considering susceptibility to flood and drought disasters.

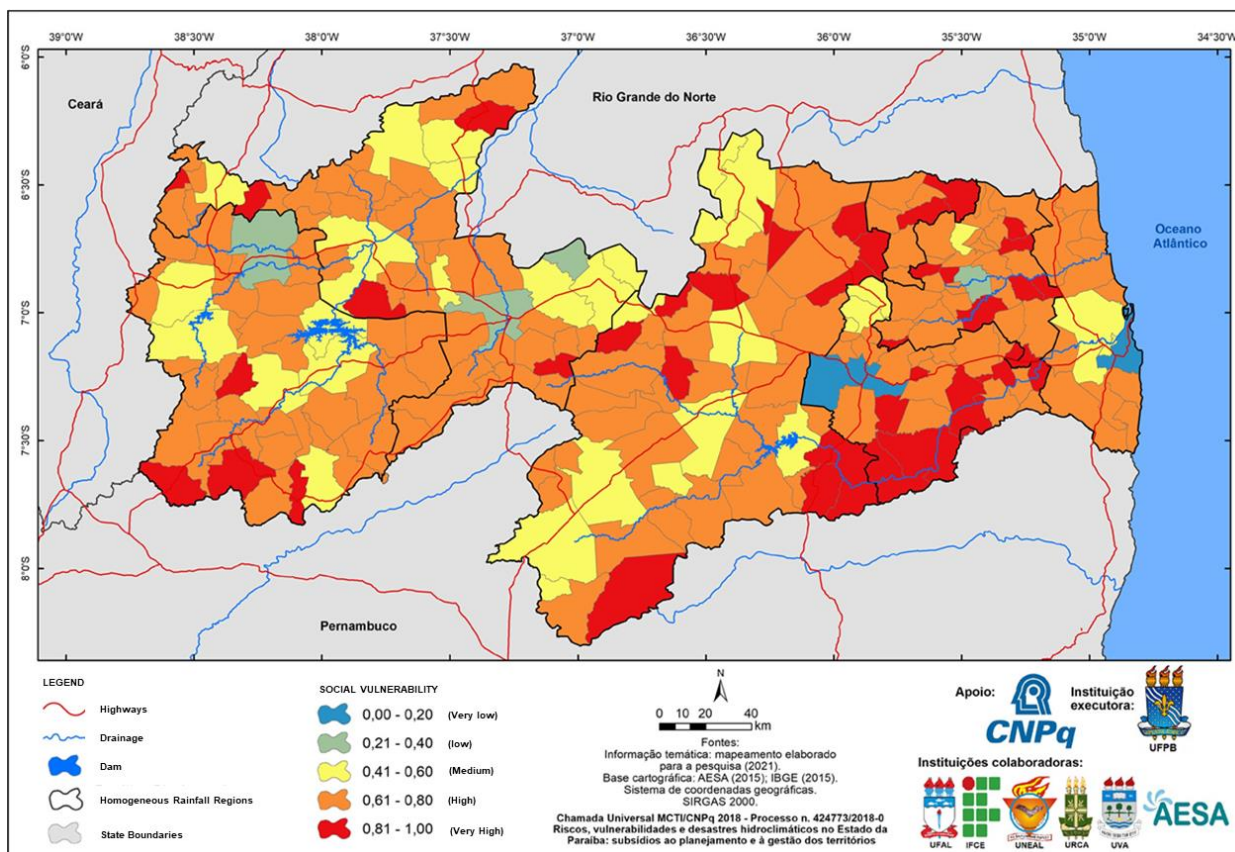

**Table 3 - Indicators used to define social vulnerability – susceptibility disasters to flood and drought**

Dimension	Indicator Description
Infrastructure	Percentage of inadequate permanent private households –no street lighting.
	Percentage of inadequate permanent private households –no manhole.
	Percentage of inadequate permanent private households –no afforestation.
	Percentage of inadequate permanent private households –open sewage.
	Percentage of inadequate permanent private households –garbage accumulated in the backyards.
Income	Value of the average monthly nominal income of persons heads of permanent private households.
	Percentage of responsible persons with a nominal monthly income of up to 1 minimum wage.
	Percentage of responsible persons with no nominal monthly income.
Social situation	Percentage of the child population (up to 12 years old).
	Percentage of heads of permanent private households aged 10 to 19 years old.
	Percentage of the elderly population (over 60 years old).
	Percentage of heads of permanent private households over 60 years old.
	Percentage of heads of permanent private households who are illiterate.
	Percentage of responsible persons with a nominal monthly income up to 1 minimum wage, female.
	Percentage of responsible persons with no nominal monthly income, female.
	Percentage of residents in permanent private households without water supply from public supply network.
	Percentage of residents in permanent private households without bathroom or toilet for exclusive use of residents.
	Percentage of residents in permanent private households with no garbage collected.
	Percentage of residents in permanent private households with garbage thrown into rivers, lakes, or seas.
Percentage of residents in permanent private households without electricity.	

Source: Cunico et al., 2023

The following figure shows the maps resulting from the Social Vulnerability of the Paraíba municipalities. According to the authors, *"the predominance of high and very high vulnerability classes is clearly noticeable, totaling 83% of cities (184 cities which includes 44% of the population of Paraíba)"*. Social vulnerability is high and occurs in a significant part of the state territory.

**Figure 18 – Social Vulnerability – Floods and Droughts**

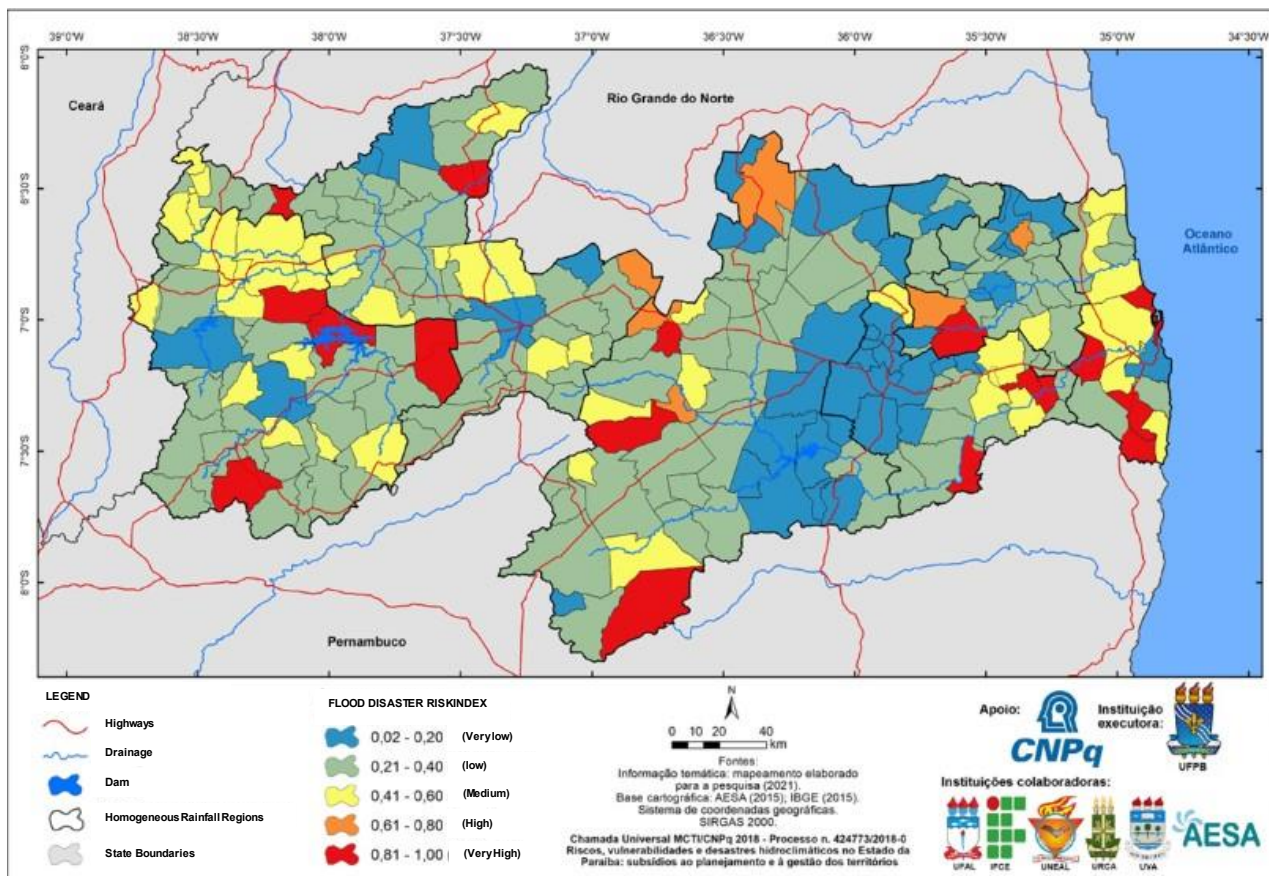

Source: Cunico et al., 2023

The Flood Disaster Risk Index (FDRI) for the state of Paraíba (figure below) is a result corresponding to the socio-environmental vulnerability to flooding, integrated with the hydrometeorological disasters recorded in the state (from 2003 to 2016).

This mapping reveals that 24 municipalities in the state have a Very High or High risks index to flooding. According to the authors, "These two classes correspond to 11% of the entire state and comprise 9% of the population of Paraíba" (Source: Cunico et al., 2023).

**Figure 19 – Flood Disaster Risk Index**

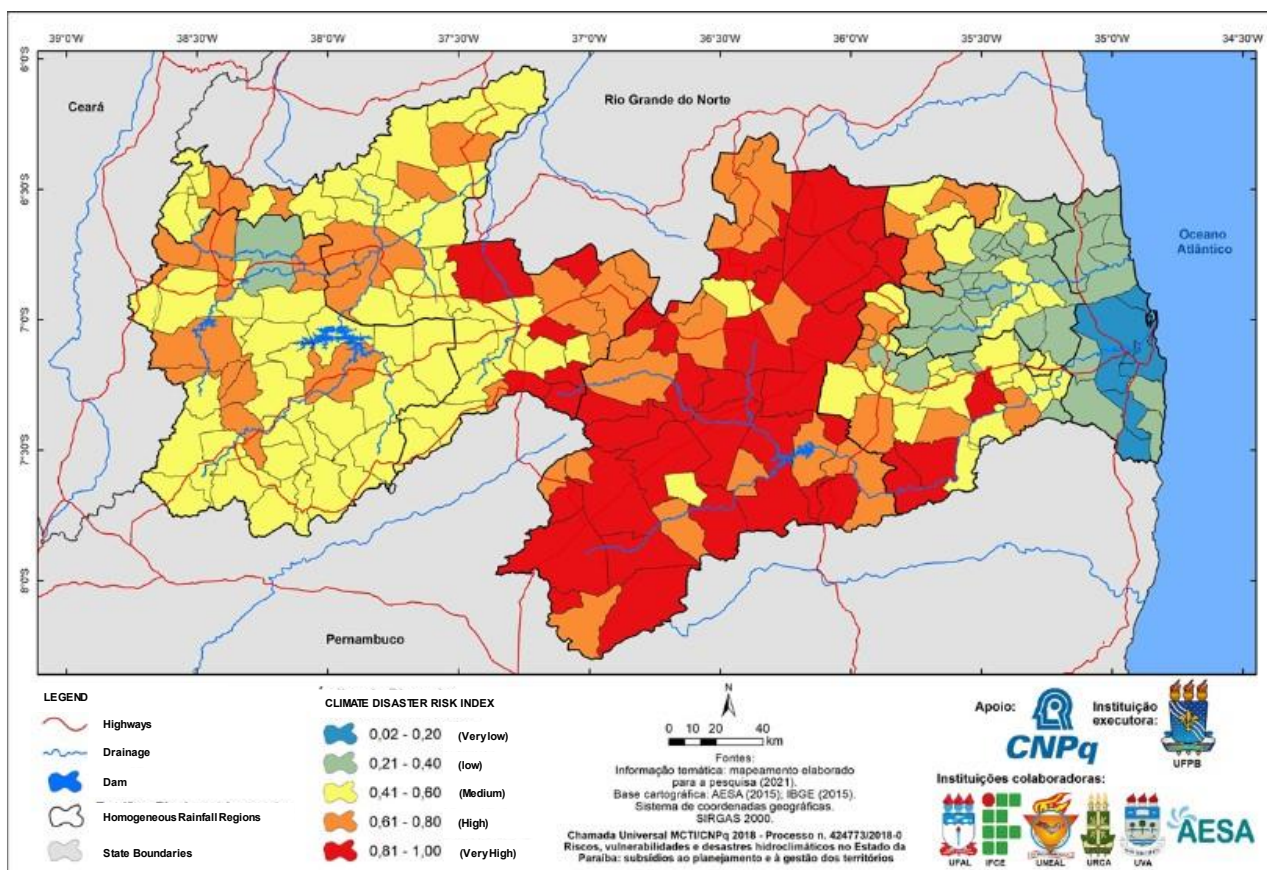

Source: Cunico et al., 2023

Finally, the Climate Disaster Risk Index (CDRI) for the state of Paraíba (figure below) is composed for socio-environmental vulnerability to dry and drought integrated to climate disasters recorded in the state.

As it is in regions of the Brazilian semi-arid region, the state presents 42% of its territory under the condition of High or Very High CDRI, (93 municipalities), spatially concentrated in the central portion of Paraíba and affecting 23% of the population of Paraíba.

**Figure 20 – Climate Disaster Risk Index**

Source: Cunico et al., 2023

### 3.3.1. Potential Effects of Climate Change

Changes in weather patterns generate consequences that directly affect natural and human systems (IPCC, 2013). These changes are part of the natural variability of the climate or may be a response to anthropogenic actions (greenhouse gas emissions and land use changes), resulting in climate change. Often, these changes are related to the precipitation regime, and can cause negative impacts depending on their intensity. Regarding the occurrence of dries and droughts, trends of decreasing precipitation have been frequent and severe in different parts of the world. Climate simulations based on global atmosphere circulation models have offered more extreme climates predictions for the future, sometimes with abundant and short-lived rainfall, sometimes with long dry periods (IPCC, 2012).

This is the risk of climate change impact on socio-ecological systems resulting interaction among climatic events and components of vulnerability and exposure of this systems.

*Gori Maia et al. (2018) concluded that temperature increases and drought episodes in the period from 1974 to 2014 reduced livestock productivity (milk and beef from cattle, sheep and goats) of family farmers in the Brazilian semi-arid region. The historical reduction in rainfall has had more negative effects on family farming, bearing in mind that the poorer the farmer is, greater is the impact. According to authors, family livestock in the region is more vulnerable, as it has fewer financial conditions to protect itself by investing, for example, in the "replacement of natural pasture with other forages (silage) as needed in more extreme climatic conditions" (MAIA et al., 2018, p. 747). – in Impacts of*

Climate Change on Family Farming in the North and Northeast Regions of Brazil (Cunha, D.A and Oliveira, L. R, 2023)

In fact, as shown in the figure below, Cunha and Oliveira (2023) demonstrate the potential effects of climate change in the RCP 4.5 and RCP 8.5 scenarios for agricultural productivity in Paraíba.

**Figure 21 - Impacts of climate change on the productivity of family and employer farming in Paraíba**

Source: Cunha, D.A and Oliveira, L. R, 2023

For the studied area, It was used data from the AdaptaBrasil platform<sup>9</sup> which presents a very extensive set of indices and indicators involving issues such as social vulnerability, infrastructure and government actions that can bring efficiency in prophylactic and control actions during extreme events (like plans and programs, better designed infrastructure, adherence to programs such Resilient Cities, and others).

In the analyses the following scenarios were consulted: Current and 2050 (pessimistic).

### Impact of Rain

Rain Impact Risk Index for food security, according to Adapta Brasil:

*Heavy rainfall is considered a climate threat when its frequency and duration cause flooding, inundation, and landslides, for example. The negative and harmful effects on the socio-ecological system can range from material damage and/or death of people in susceptible areas to accumulation and temporary flow of surface water, death of animals, crop losses due to excess water, and others.*

Source: MARENGO, J. A. *Climate Change, Extreme Weather Conditions and Climatic Events in Brazil*. In: FBDS (org). *Climate Change: Extreme Events in Brazil*. p: 04-19. FBDS & LLOYD'S. 2010.

The results of AdaptaBrasil indicate that in the current scenario there is a medium risk prevailing in the coastal portions of Paraíba, and the central territory still has most of its

<sup>9</sup> The Information and Analysis System on the Impacts of Climate Change (AdaptaBrasil MCTI) was established by the Ministry of Science, Technology and Innovations, through Ordinance No. 3,896, of October 16, 2020, with the objective of consolidating, integrating and disseminating information that enables the advancement of the analysis of the impacts of climate change, observed and projected in the national territory, providing input to the competent authorities for adaptation actions.

area with low or very low risk. For 2050 scenario (pessimistic) is expected a significant increase in very high risk closer to the coastal strip besides expansions to medium risk in the west of Paraíba State. The central portion of State has a medium risk.

The following figures present the number of municipalities in the current scenario and 2050 – pessimistic.

**Figure 22 – Impact of Rain – Current Scenario**

Source: *Adapta Brasil – Ministry of Science, Technology and Innovation, 2024 (consultation).*

**Figure 23 – Impact of Rain – 2050 Scenario – Pessimistic**

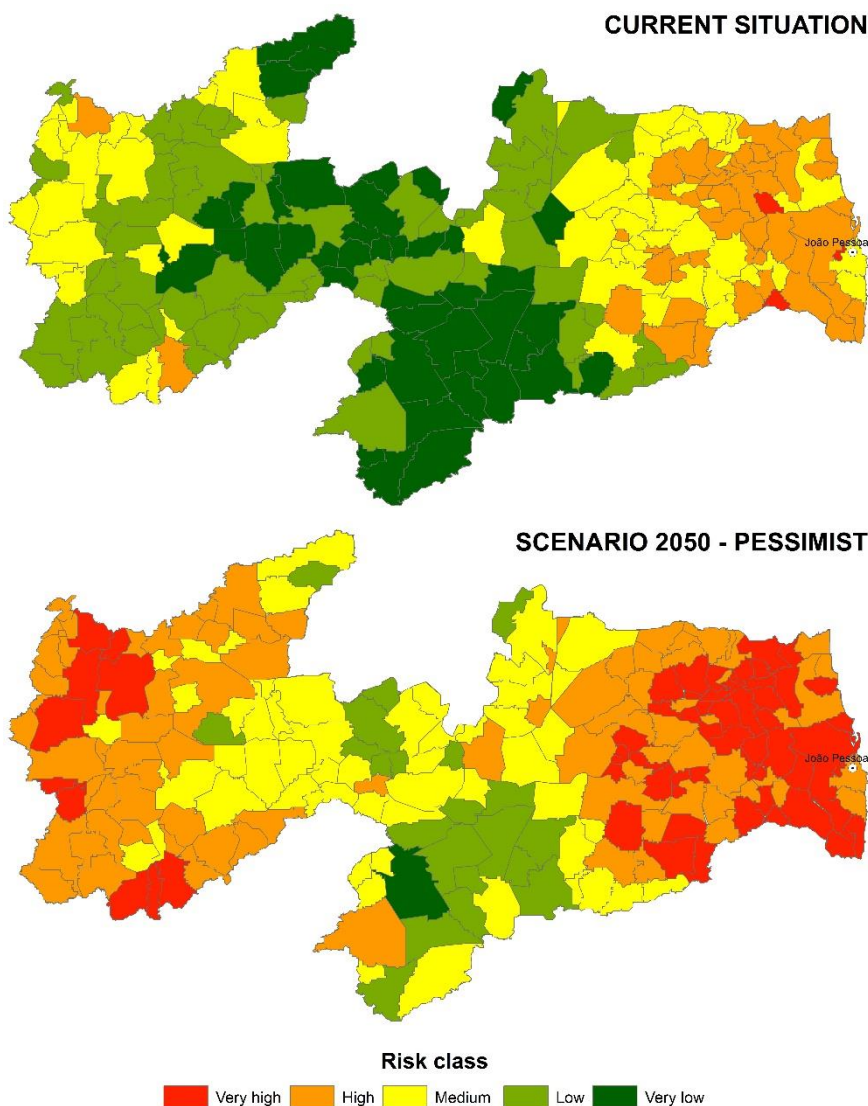

Source: *Adapta Brasil – Ministry of Science, Technology and Innovation, 2024 (consultation).*

The following figure presents the current and future situation for the impact of rainfall.

Figure 24 – Impact Risk Index for Rain – Food Security

**RISK OF RAIN - FOOD SAFETY**

Source: Adapta Brasil – Ministry of Science, Technology and Innovation, 2024 (consultation).

**Impact of Drought**

Drought Impact Risk Index for food security, according to Adapta Brasil:

*Risk of climate change impacts on socio-ecological systems resulting from the interaction among climatic events related to drought vulnerability and exposure of these systems. Drought is considered as prolonged period — a season, a year, or several years — of deficient rainfall compared to the statistical multiannual average for some region that results in water scarcity for some environmental activity, group, or sector.*

Source: FOOD AND AGRICULTURE ORGANIZATION/NATIONAL DROUGHT MITIGATION CENTER - FAO/NDMC. *The Near East Drought Planning Manual. Food and Agriculture Organization of the United Nations (FAO): Rome: Italy, 2008.*

On Drought issue, we can cite the INDEX OF VULNERABILITY TO NATURAL DISASTERS RELATED TO DROUGHTS IN THE CONTEXT OF CLIMATE CHANGE (MMA, 2017):

*First, it is necessary to emphasize that drought is a relative phenomenon that depends on the context in which analysis it is inserted. Therefore, any discussion about deficit precipitation must be referred to conditions of a given region (CASTRO et al., 2003). Periods with abnormal precipitation deficits are defined as meteorological droughts and can have consequences for agricultural activities or the hydrological cycle (IPCC, 2012). In a socioeconomic disaster's perspective, drought is more dependent on vulnerabilities that affected social groups than climatic conditions themselves.*

According to AdaptaBrasil platform, in the current scenario that involves a significant portion of the study area, low or medium risks occur. In part of the western portion of State territory, there are some municipalities in high impacts drought risks on food security. In the 2050 Scenario, the incidence of medium and high risks starts to prevail in the Paraíba territory.

According to the figures below, between the current scenario and 2050 (pessimistic) scenario, there will be a jump on the upper classes, which will be from 20 to 70 municipalities.

**Figure 25 – Impact of Drought on Food Security – Current Scenario**

Source: Adapta Brasil – Ministry of Science, Technology and Innovation, 2024 (consultation).

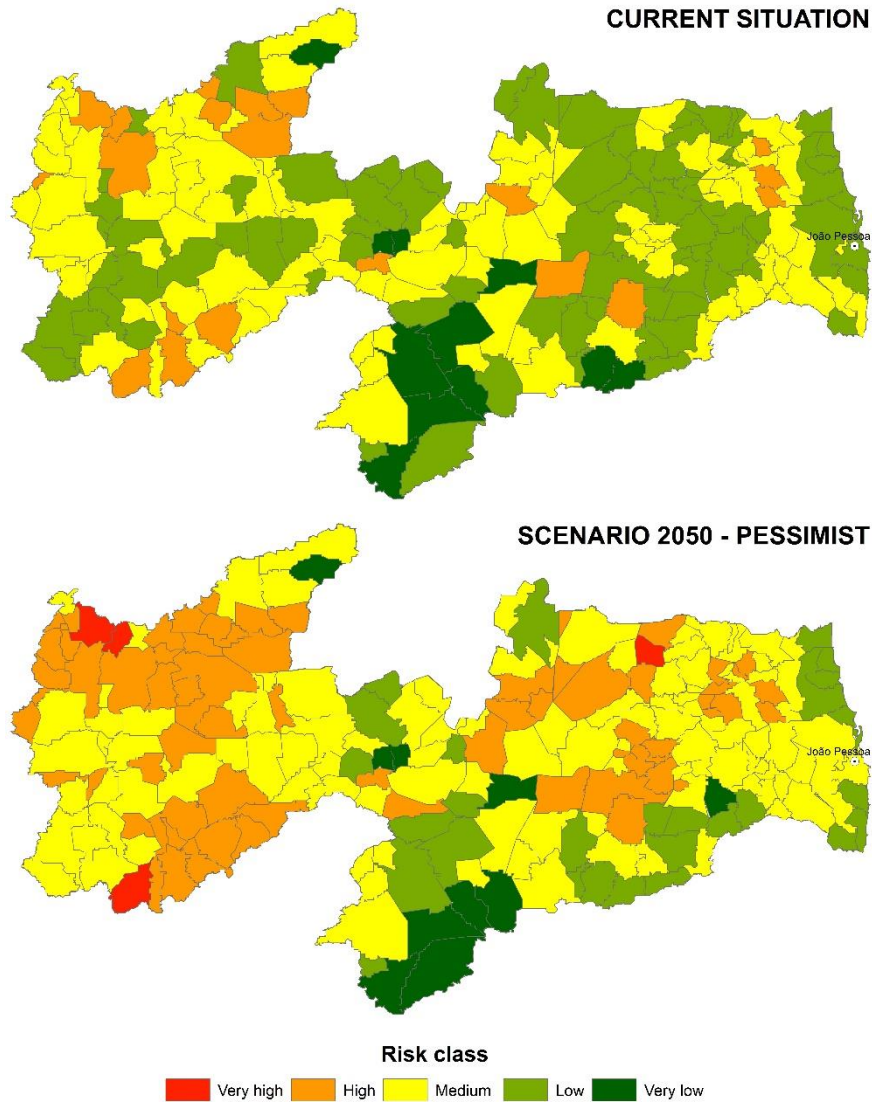

**Figure 26 – Impact of Drought on Food Security – 2050 Scenario – Pessimistic**

**3.4. SUBPROJECTS VULNERABILITY**

The following is a prognosis of vulnerability of subprojects with a short description of these subprojects and implications related to the local climate for current and future times.

**3.4.1. Resilient Investment Plans (RIPs)**

The vulnerabilities to Resilient Investment Plans are addressed below.

**Free-Range Poultry**

In the case of free-range poultry farming, for being an open breeding and does not have many birds in confined spaces (like conventional farms situations), there is a lower risk of birds dying due to excess heat or lack of water, especially if the breeding is in an area that allows shade for the birds. In this case, as presented in the Resilient Investment

Plan (PIR Free-Range Poultry) the main difficulties related to environmental aspects are the lack of technical knowledge of farmers to correctly the practices of zootechnical, reproductive, food and sanitary control, and one of the main reasons for this situation is the lack of more frequent technical assistance on the properties.

Considering climate change, there may be an increase in pests that can bring consequent increase the use of pesticides, affecting poultry farming, being the greatest vulnerability identified.

In general, part of solution is related to adequate management of free-range birds and the insertion of Agroforestry Forage Support Systems areas, which prevent the degradation of native vegetation, the restoration of degraded areas and potential water sources in addition to other environmental results. There will be recovered vegetation areas using native and adapted species. It is important to consider that the PIR provides for individual investment for the implementation of a Forage Agroforestry mini-system (AFS-F 900<sup>m2</sup>), aiming expansion of food reserves to grazing birds and to prepare an alternative feed.

Main Vulnerabilities:

- Lack of rainfall;
- Excess heat;
- The above items generate a lack of food, with impacts on milk production.

### **Dairy Cattle and Goat Farming**

---

Dairy activities present a good local opportunity on semi-arid places, however It faces technical issues that need to be worked well, so two distinct RIPS were considered for cattle and goat farming. It is important to highlight that in the cases analyzed, it was clear that the farmer´s Associations are not ready to support their members in the development of collective actions that contribute to improving access to public policies, commercialization, logistics, among others.

Issues like the power of industries to determine over milk prices, the limited storage and conservation capacity of small producers, and lack of equipment bring low financial returns to local producers and reducing their ability to improve procedures that can make them more resilient to climate change and, on the other hand, consequently making them less harmful to the local environment.

Main Vulnerabilities:

- Lack of rainfall;
- Excess heat;
- The above items generate a lack of food and water, with impacts on milk production.

### **Productive Backyards**

---

The Productive Backyards PIR aims implement vegetable and fruit sustainable production systems and adapted to climate change, besides to generate work and income for women and youth, increase food security and promoting more social integration among families.

In this case, the biggest problem is low production due to scarcity of water for crop production and the potential rise of evapotranspiration. Climate change can impact negatively the agriculture in regions where weather conditions are currently good for production. The following presents some climate change impacts for these cases.

- Plant development can be damaged by failures on pollination during flowering on very hot days (> 35°C), with excessive rainfall or other extreme events. Increased winter temperatures often take poor pollination, staggered flowering, reduced fruiting and poor fruit quality.
- Changes in the existing pest's distribution, diseases and weeds besides increased threat of new insects and diseases.
- Increased incidence of physiological disorders such as burnt tips and blossom rot.
- Increased potential for downgrading product quality, e.g. due to increased incidence of sunburn on fruits or leaves.
- Increased risk of spread and proliferation of soil-borne diseases from heavier rainfall events (along with warmer temperatures).
- Increased risk of soil erosion and off-farm effects of nutrients and pesticides from extreme precipitation events.
- Increased costs of production, especially from large use of fertilizers and pesticides due to soil leaching and the appearance of pests.

It is important to highlight that the priority of Productive Backyards PIR has the focus in collective areas in community use, therefore, deforest any additional area is not need. It is also planned to introduce innovative and better practices for beneficiaries. These include the potential to preserve the environment. The intensification of production in determined places should reduce the pressure in another areas, reducing needed to use new areas specially in which there is native forest. The native species of region will be used, avoiding introduction of new exotic species, and include simple techniques to enhance the efficiency production like implementation of fences and windbreaks to protect the cultivation area and contribute to reduction of evapotranspiration and decreasing consequently the water consumption.

Main Vulnerabilities:

- Excessive rainfall in short period.
- Lack of rainfall.
- Excess heat.
- Irregularity in the annual heat-cold system.
- Excessive winds.

### **Agroforestry Systems – AFS**

---

Agroforestry systems bring several benefits to small producers, contributing to better control of the microclimate, stabilization of temperature, relative humidity and soil moisture, in addition to providing protection against more intense rains and winds. In the case of PROCASE II, the goal is to assist free-range poultry (AFS-F 900m<sup>2</sup>), besides dairy cattle and goat farming. Despite the focus in livestock, the AFS that benefits the increase of forest was also considered appropriate to apply in river PPAs.

The implementation of this subproject will introduce innovative practices and less environmentally aggressive techniques for beneficiaries, which include potential to preserve the natural environment. The intensification of production in specific places on propriety involving sustainable practices, should reduce pressure in another areas (avoiding needed to into new areas for production and in specific areas that present native vegetation). Native species present in the region will be used in these systems, avoiding the introduction of new exotic species.

The expected effects may be enhanced by the action of ATER<sup>10</sup> that will support to producers for introduction agroecological practices in a transition perspective, aiming reduction use of chemical pesticides or synthetic fertilizers and substituting these by natural inputs (like biocaldas, composts, biopesticides, mechanized mowing, etc.), expected positive effects on the soil, water and commercialized productions.

In fact, the AFS presents an important alternative to bring greater resilience to small producers should be able to face the effects of climate change, although they are not invulnerable to be affected by climate effects like water scarcity, the entry of new pests, edge effect problems and forest fires problems in several heat and drought periods sequentially. Problems like that can affect the development and health of AFS or reduce the effectiveness of the system.

Main Vulnerabilities:

- Excessive rainfall in short periods.
- Lack of rainfall.
- Excess heat.

### 3.4.2. Business Plans (PN)

The following presents the vulnerabilities for Business Plans.

#### **Agroecological Cotton Farming - Social Technologies**

---

##### **Water Supply**

PROCASE II will benefit families who are in technical and geographical unfeasibility areas (remote areas), where the better alternative to water supply is the implementation of Plate Cisterns for human consumption. That is distributed in 04 Microregions of Water and Sewage (MWS) on the State of Paraíba, and it must follow preliminarily criteria established<sup>11</sup>.

The cisterns will be built using precast plates, including 16,000 liters of capacity, and based on social technology developed in the Northeast and for family domestic use. This social technology allows the capture and storage of rainwater from rural house roofs.

---

<sup>10</sup> Technical Assistance and Rural Extension

<sup>11</sup> These criteria are still being reviewed by technical team of PROCASE II

**Figure 29 – Example of Cistern Model**

Source: Embasa - Manual de Tecnologia Apropriada, 2022

**Figure 30 – Cistern construction**

Source: Cisterns Program<sup>12</sup> – 16 thousand Liter Plate Cisterns

The production water supply will be used for agrarian activities and animal thirst. Its implementation must be associate technical training and water management, benefiting families that was contemplated with Plate Cisterns for human consumption or families contemplated with water supply systems (WSS, CWSS or IWSS), and it should cover the 04 MWS in Paraíba that involve water scarcity and regular lack of water. The technologies adopted for this purpose are:

- 52-thousand-liter plate boardwalk cistern: social technology that should guarantee access to rainwater from a 200 m<sup>2</sup> boardwalk for food production and/or animal watering. The reservoir with a radius of 3.2 m and a depth of 1.8 m has the capacity to store approximately 52 m<sup>3</sup> of rainwater. It will be covered and closed to protect

<sup>12</sup>[https://www.mds.gov.br/webarquivos/arquivo/seguranca\\_alimentar/cisternas\\_marcolegal/tecnologias\\_sociais/IOESAN\\_n2de882017.pdf](https://www.mds.gov.br/webarquivos/arquivo/seguranca_alimentar/cisternas_marcolegal/tecnologias_sociais/IOESAN_n2de882017.pdf)

from evaporation and contamination caused by animal waste and other impurities carried by the wind. The rainwater catchment area called the boardwalk has its area delimited by a curb and it is on a higher plane than the reservoir endowed with a small slope to conduct water to a settling box and from this to the reservoir. (Annex to IN SESAN, March 2023);

- 52 thousand liters Flood Cistern: social technology that should guarantee access to rainwater from the bed of runoff for the production of food and/or animal thirst to families to be benefited by PROCASE II. capable of storing 52 m<sup>3</sup> of rainwater collected in the runoff axis;
- Underground Dam: social technology that should guarantee access to rainwater from the bed of runoffs for food production and/or animal watering. The underground dam is a transversal dam inserted into the bed of runoffs, streams and temporary rill, by fixing a flexible plastic blanket in a trench excavated until it meets the crystalline or impermeable thickening, which is a rocky layer characteristic of the soils of a large part of the Brazilian semi-arid region. Its function is to retain rainwater that drains above and in the soil interstices, providing the formation or elevation of the water table. There are two dam models:
  - a) Submerged dam: when the dam is on the same level as the ground and does not have a spillway. This model is indicated when the dam is built on the bed of temporary rills;
  - b) submersible dam: when the dam extends above ground level and accumulates a water blade on the surface for a short period of time, usually around two or three months after rain ends. In this type of dam, a masonry spillway is built to drain the excess water and preserve the slope above ground, usually 0.6 m high. (Annex to IN SESAN, May 2023);
- “Barreiro trincheiro”: a social technology that guarantees access to rainwater from the bed of runoffs for food production and/or animal thirst. Its dimensions can prevent the action of wind and sun and minimizing the effects of evaporation in periods of drought.
- Stone Tank: social technology that should guarantee access to rainwater from the bed of runoffs for food productions and/or animal thirst. It is used to store rainwater in rocky outcrops which are sized to avoid evapotranspiration and the accumulation of rainwater in the dry season that they are reinforced with walls to ensure the ideal height and crack waterproofing to prevent infiltration. It is a technology that provides access to water for food production and animal husbandry like a micro-dam.

The vulnerabilities of water supply system are mainly regard to excessive rainfall, in situations that may involve mass landslides or floods that may eventually reach the structures. Secondly, the lack of rainfall can be cited which should cause an increase on demand above the storage capacity.

Main Vulnerabilities:

- Excessive rainfall (for specific situations of structures location).
- Lack of rainfall (mainly in surface catchments and increased water consumption).
- Excess heat (increased water consumption).

### **Reuse of gray water and black water (Green Septic Tank)**

Domestic sewage encompasses countless peculiarities and specificities that influence the choice of appropriate treatment which depends on the intended purpose, that should be dispersed in the soil, in the water body and/or reused.

Observed the list of Social Technology adopted by Federal Government, the following sanitary sewage technologies are in line with PROCASE II: reuse of gray water (considering physical and biological treatment - use of earthworms<sup>13</sup>) and reuse of black water (Green Septic Tank), both don't need pre-treatment or post-treatment units for discharges into the soil or water body.

- **Greywater reuse:** treats wastewater that does not come from toilet. The treatment of these effluents through the reuse system consists in a filtration process of biological and physical impediment mechanisms. Initially, the gray water rich in chemical and organic residues, is directed to a filter where the organic matter is biodegraded by microorganisms' and earthworms (*Eisenia fetida*), resulting in main pollutants removal (Annex, IN SESAN/MDS nº 36, March 2024). This treatment consists in Vermifilter type<sup>14</sup>. In addition, the Banana Tree Circle can also be used, which is specified in academic works<sup>15</sup>, but it is not regularized in the Normative Instructions of the Federal Government specifically to gray or black water, being necessary install a pre-treatment for black water.
- **Reuse of black water:** It treats specifically toilet water, using the evapotranspiration basin (Green Septic Tank; Ecological Cesspool), which is regulated by Normative Instruction of the Federal Government and does not require sewage pre-treatment.

The vulnerabilities of water sewage systems are mainly the excessive rainfall in situations that may involve mass landslides or floods that should eventually reach the structures. Secondly, the lack of rainfall can affect the operation of the systems (lack of sewage).

Main Vulnerabilities:

- Excessive rainfall (for specific situations of structures location).
- Lack of rainfall (reducing flows and affecting systems operation).

### **Renewable energy**

For renewable energy use to strengthen the objectives of PROCASE II focusing in reduce rural poverty levels and produce actions to confront and mitigate climate change, three proposals were selected: i) photovoltaic energy; ii) biodigester and iii) eco-cookers.

- **i) Photovoltaic Energy:** or solar energy can be used directly in the Social Technologies of production water, with the exception of 52-thousand-liter plate cisterns, when installing wells pumps to support agricultural activities. This can also

---

<sup>13</sup> Sustainable Oriented Technical Consulting and Training – ATOS, in partnership with the Federal Rural University of the Semi-Arid Region, the International Fund for the Development of Agriculture – IFAD and the Dom Helder Câmara Project, which resulted in the Manual for the implementation and management of the family biowater system: reuse of domestic gray water for food production in family farming in the Brazilian semi-arid region.

<sup>14</sup> Vermifilter can be used for black water, domestic sewage, but it is necessary a pre-treatment technology using Septic Tank

<sup>15</sup> Banana Tree Circle is not contemplated in Brazilian standards, but it is suggested by Funasa (FUNASA, 2015 and 2018) and has its effectiveness proven by academic research (FIGUEIREDO, in press) and by its current use in permaculture and agroecology projects (Book Domestic Sewage Treatment UNICAMP, 2018)

directly benefit the agricultural activities of interdependent associations from Component 1;

- **(ii) Biodigester:** Domestic sewage effluent treatment unit and biofertilizer production unit supplied with residues from plant or animal production (urine and animal manure). The use of Biodigester for domestic treatment must be accompanied by sewage post-treatment units that ensure the disposal of treated effluent in the soil or in the water body. There is a production of biogas and biofertilizer. Considering the sanitary sewage deficit in rural areas and the characteristics of benefited families by water supply for human consumption, the biodigester implementation for domestic effluent treatment does not become effective due to the several variables necessary for its use, especially regarding the uniformity of sanitary sewage flow in the benefited areas, such as execution, renovation or expansion of toilets and/or sewage treatment units. Therefore, the Biodigester will be implemented with residues from plant or animal production.
- **(iii) Eco-Cookers:** The ecological stove uses sticks, corn cobs and tree barks as fuel, distinct from wood stove, that is powered only by firewood.

Main Vulnerabilities:

- Excessive rainfall (for specific situations of structures location).
- Lack of rainfall (reducing flows and affecting the functioning of biodigester systems).
- Excess Heat (Affecting photovoltaic panels)

## **Transverse Themes**

---

### **Water Resources**

The main consequences of climate change related to water resources are the increase temperature, higher evaporation rates, changes in precipitation patterns, and increase frequency of floods and droughts. Climate change will have a significant impact on agriculture by increasing water demand, limiting crop yields and reducing available water in areas where irrigation is most needed or has comparative advantages.

It is important to note that a broad part of Paraíba territory is under the semi-humid (Aw) and arid (Bsh) climatic regimes, so the water resources tend to suffer greater heat and recurrent droughts, especially from climate change, with the risk of being deeply affected by the lack of rainfall in large periods, with high rates of evapotranspiration and reduced recharge in aquifers.

Main Vulnerabilities:

- Lack of rainfall.
- Excess heat.

### **Human Health**

The main conclusions of IPCC's sixth report (2023) about climate changes showed aspects of climate change's impacts on human health highlighting that the hazards and associated risks expected in the short term include increased heat-related human mortality and morbidity (high confidence), food, waterborne and vector-borne diseases (high confidence), and mental health challenges.

It is important to highlight that climate change will cause differentiated impacts according to regional and/or local characteristics and variations in the communicable disease vectors behavior. Several diseases can be exacerbated or have their regional boundaries expanded.

As Soares (2021) highlights :

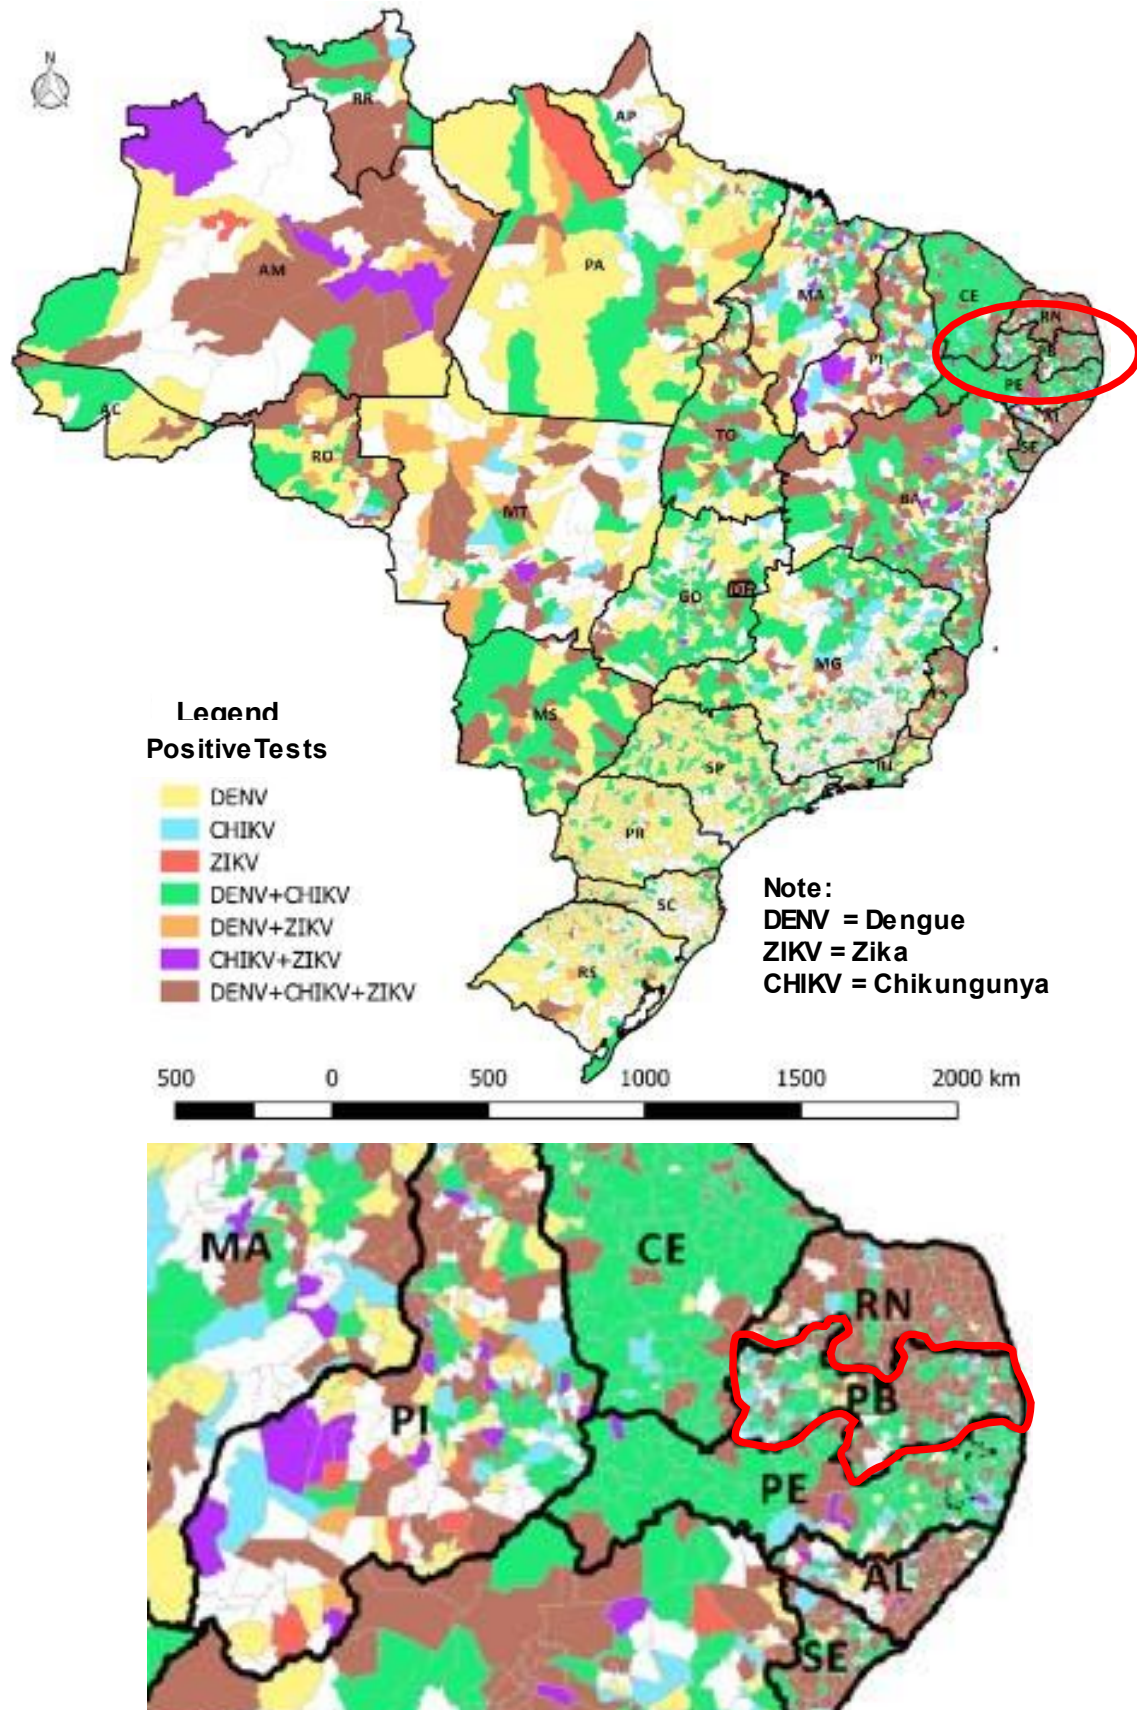

*Studies show that air temperature interferes with dengue transmission, as it affects several aspects of the mosquito's life, such as the blood meal of females, their longevity and the extrinsic incubation period of the virus (Donalísio et al., 2002; Beserra et al., 2014). It is a fact that high levels of precipitation, high air temperature, proximity to urban peripheries and low income of the population are factors that promote the spread of disease (Sobral and Sobral, 2019).*

*The epidemic diseases most affected by climatic events are malaria, dengue, cholera and other waterborne infections (WWF, 2015). In Brazil, the most relevant cases associated to climatic extremes are malaria and dengue. Although there is "evidence of climate influence on the occurrence of some diseases, not all climate-sensitive diseases are yet known" (Sousa et al., 2018, p. 2).*

It is assumed that besides Dengue and Malaria, diseases such as Yellow Fever, Zika and Chikungunya may be affected by climate change and affect more regions and more communities, since these arboviruses need mosquitoes to be transmitted.

As presented in the figure below, there are several municipalities showing positive tests for Dengue, Chikungunya and Zika.

Figure 31 – Distribution of positive tests for DENV, CHIKV and ZIKV, by municipality of residence in Brazil, until SE 44/2022

Chikungunya

## Zika

Source: Paraíba State Department of Health, *Epidemiological Bulletin of Arboviruses - No. 06, 2024*

Two key issues must be considered in the process of monitoring, controlling and combating communicable diseases: those that already exist in the region covered by PROCASE II and that may affect more communities, and those that do not currently exist in the territory and may expand due to climate change affecting new places.

Schistosomiasis is a parasitic disease, that *Schistosoma mansoni* of Schistosomatidae family can be found in Brazil. The disease has a low lethality, and the main causes of death are related to severe clinical forms. The intermediate host in Brazil are a kind of genus snails of Biomphalaria: *B. glabrata*, *B. tenagophila*, *B. straminea*, responsible for transmission

BARCELLOS (2017)<sup>16</sup> indicates that climate change may favor the disease, since the heaviest rains generate various overflows in streams and lagoons, being a vehicle for snails:

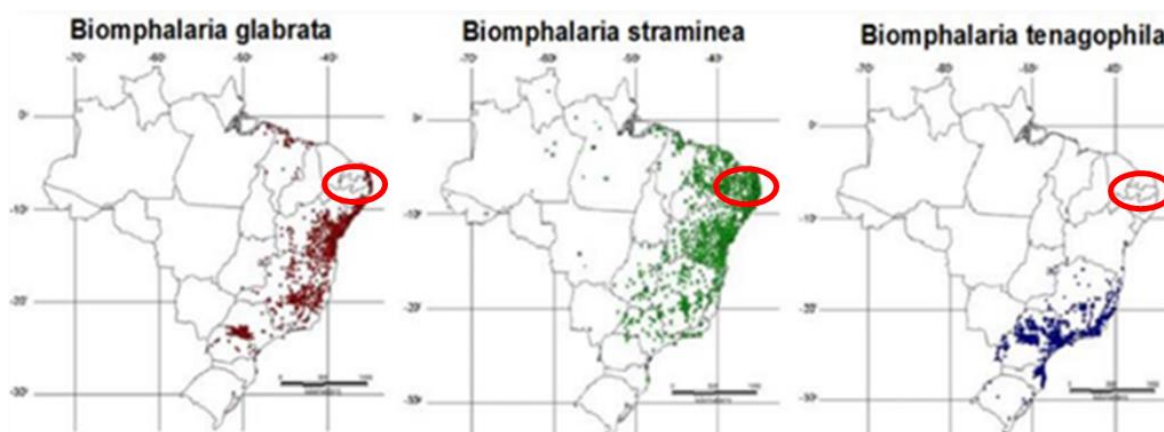

*The vector presents a determined seasonal behavior, and it is generally associated with greater rainfall periods when the breeding sites present a better situation for vector reproduction and contagion by the parasite. Rainfall patterns can directly influence the maintenance of abiotic factors (temperature, pH, salinity) related to breeding sites, providing ideal conditions.*

Schistosomiasis exist in the most of Brazilian states, especially in the Northeast and Southeast regions. The states of Alagoas, Bahia, Pernambuco, Rio Grande do Norte, Paraíba, Sergipe, Espírito Santo, Maranhão and Minas Gerais are endemic areas, with established transmission. It is estimated that millions of people live in areas at risk of disease infection (figure below).<sup>17</sup>

<sup>16</sup> BARCELLOS, C. et al. Climate and Health Situation Analysis. National Observatory of Climate & Health, October, 2017 in: [https://climaesaude.icict.fiocruz.br/sites/climaesaude.icict.fiocruz.br/files/analisedesituacaoems\\_audecursoopasfiocruzatualizado\\_0.pdf](https://climaesaude.icict.fiocruz.br/sites/climaesaude.icict.fiocruz.br/files/analisedesituacaoems_audecursoopasfiocruzatualizado_0.pdf)

<sup>17</sup> Ministry of Health, Health Surveillance Secretariat, Epidemiological Bulletin 43 (Nov.22) available at:

[https://climaesaude.icict.fiocruz.br/sites/climaesaude.icict.fiocruz.br/files/analisedesituacaoemsaudecursoopasfiocruzatualizado\\_0.pdf](https://climaesaude.icict.fiocruz.br/sites/climaesaude.icict.fiocruz.br/files/analisedesituacaoemsaudecursoopasfiocruzatualizado_0.pdf)

Another disease that can affect communities is "Chagas disease" (American trypanosomiasis). It is transmitted by the insect vector known as 'kissing bug' and that can cause serious health problems if not diagnosed and treated early. It is estimated that there are about 1 million people infected in Brazil. Currently, it is the disease that occupies the fourth cause of death among infectious and parasitic diseases in the country, accounting about 4.5 thousand deaths per year. In addition to socioeconomic and cultural factors, environmental factors perform an important role in determining Chagas disease. Climate change, deforestation and disorderly urbanization can alter the natural habitats of vectors, increasing the populations to *Trypanosoma cruzi*<sup>18</sup> exposure.

According to the figure below, Chagas disease in Paraíba does not differ from national scenario, and there is still a risk of vector transmission due to the existence of autochthonous triatomines with high potential colonization, presence of *Trypanosoma cruzi* reservoirs and the frequent approach of human populations to these environments<sup>19</sup>.

Regarding notifications confirmed on figure below, from 2015 to 2021 until SE 2021 there were 445 notifications distributed in 29 municipalities, of which 48 were confirmed cases, presenting an average of 6.85 cases per year. Over the years mentioned above, the cases occurred in 21.5% (48/223) of the municipalities. The Sanitary Districts (RE) with the highest number of cases were: 3rd RE - 15 cases, distributed in the municipalities of Alagoa Grande, Areia, Campina Grande, Livramento, Riacho de Santo Antônio, Santo André and Tenório; 5th RE - 09 cases, distributed in the municipalities of Amparo, Camalaú, Coremas and Prata; and the 11th RE - 08 cases, distributed in the municipalities of Água Branca, Juru, Princesa Isabel and Tavares.

<sup>19</sup> Paraíba State Department of Health, Epidemiological Bulletin 01, 2021.

**Figure 34 – Distribution of municipalities with positive cases of Chagas Disease by Health Region. Paraíba, 2015 to 2021**

Source: Paraíba State Department of Health, Epidemiological Bulletin 01, 2021.

Main Vulnerabilities:

- Excessive rainfall.
- Lack of rainfall.
- Excess heat.

**Excessive Increase in Pesticides Use**

Diseases that can affect cultivated plants are the result of the interaction between pathogens and hosts. Angelotti<sup>20</sup> (2024, consultation) points out that

*The environment acts in host plant, pathogen and in the host-pathogen interaction. Thus, the severity of disease, its distribution and incidence are conditioned by the direct action of environment on pathogen and indirectly of environment on host plant. In this way, environmental factors play an important role in increasing or limiting development diseases, acting in the different phases of the disease cycle such as spore germination, infection, incubation, incubation period, symptom development, dispersion and survival of the pathogen.*

The following table presents an example of the phases of plant infection and the climatic factors associated that may contribute to limit the development of infection.

<sup>20</sup> EMBRAPA Semi-Arid Region, Climate Change and Phytosanitary Problems, Lecture in <https://ainfo.cnptia.embrapa.br/digital/bitstream/CPATSA-2010/41820/1/OPB2581.pdf>

**Table 4 – Phases of Infection and Climatic Factors.**

Phase	Climatic factor
Infection	Leaf wetness (rain, dew); temperature
Incubation, latency and growth of lesions	Air and leaf temperature
Sporulation <sup>21</sup>	Leaf wetness and/or high relative humidity; Temperature, Light, Radiation
Dispersion	Wind speed, temperature, relative humidity, leaf wetness, rainfall, or sprinkler irrigation (splashing)
Survival	Temperature and relative humidity, radiation

Source: Embrapa Semi-Arid (FRIESLAND; SCHRODER -1988) – consultation in 2024

Angelotti (2023) also points out that some studies in Brazil indicate that diseases can be reduced, for example the case of black Sigatoka from the banana tree, through the elaboration of distribution maps of disease made based on future climate scenarios available by IPCC, verifying that there will be a reduction in disease favorable country area. On the other hand, geographic distribution maps were also prepared to predict the number of annual generations of nematodes<sup>22</sup>, verifying that there may be an increase infestation, due to the monthly number.

In this way, climate change will exert a strong influence on pests that affect cultivars and may result in exponential situations that cause excessively increase of pesticides use for local farmers, creating various problems for the plants, fauna, water and to the communities health.

It is also important to note that farmers with limited resources are often unwilling or unable to purchase the appropriate personal protective equipment (PPE). Therefore, it is important to be aware of the climatic risks that can increase the use of pesticides in the agricultural sector as well as the risks to human health that this increase in use can provide.

Main Vulnerabilities:

- Excessive rainfall.
- Lack of rainfall.
- Excess heat.
- Irregularity in the annual heat-cold system.
- Excessive winds.

<sup>21</sup> It consists of information of spores, specialized cells surrounded by a cell wall that ensures the protection of structure. The spore, when it finds a suitable environment for its development, germinates and originates another being

<sup>22</sup> Nematodes are microscopic worms and are generally abundant in soil, freshwater, and salt water and often they are parasites of animals, insects, and plants (Embrapa portal, 2023)

### 3.4.1. Summary of Subproject Vulnerability

Table 5 – Sectoral Risks

Climate	Sector Risks											
	Free-Range Poultry	Cattle and Dairy Goat Farming	Productive Backyards	Agroforestry Systems – SAF	Agroecological cotton farming	Apiculture	Water Supply	Reuse of greywater and black water (Fossa Verde)	Renewable energy	Water Resources	Human Health	Excessive Increase in the Use of Pesticides
Instability in Rainfall	Reduction in food supply due to irregular rainfall (excess/under).	Reduction in food supply due to irregular rainfall (excess/under).	Plant development impaired by irregular rainfall (excess/under).	Plant development impaired by irregular rainfall.	Plant development impaired by irregular rainfall (excess/under).	Plant development hindered by irregular rainfall (excess/lack), affecting pollination and pollen collection, reducing the honey production capacity in hives.	-	Excess water in sewage treatment systems.	-	Excessive reduction in river flows, affecting the biota and dependent communities.	Increase in communicable diseases such as arboviruses or waterborne diseases.	Increased frequency of pesticide use (leaf wetting).
	-	-	Increased incidence of physiological disorders such as burnt tips and blossom rot.	Excess moisture in the SAF.	Excessive rainfall when the fruits are open, affecting the fibers by fungi that attack the surface of the cotton, making them gray and weak, making it impossible to market.	Excess use of Pesticides.	-	-	-	-	-	-
	-	-	Increased risk of soil erosion and off-farm effects of nutrients and pesticides from extreme precipitation events.	Increased risk of spread and proliferation of soil-borne diseases as a result of heavier rainfall events (along with warmer temperatures).	-	-	-	-	-	-	-	-
	-	-	Increased production costs, especially for fertilizers and pesticides due to soil leaching and the appearance of pests.	-	-	-	-	-	-	-	-	-
	-	-	Increased risk of spread and proliferation of soil-borne diseases as a result of heavier rainfall events (along with warmer temperatures).	-	-	-	-	-	-	-	-	-
	-	-	Changes in the distribution of existing pests, diseases, and weeds, and increased threat of new insects and diseases.	-	-	-	-	-	-	-	-	-

Climate	Sector Risks											
	Free-Range Poultry	Cattle and Dairy Goat Farming	Productive Backyards	Agroforestry Systems – SAF	Agroecological cotton farming	Apiculture	Water Supply	Reuse of greywater and black water (Fossa Verde)	Renewable energy	Water Resources	Human Health	Excessive Increase in the Use of Pesticides
Increased intensity and frequency of extreme weather events	Health and integrity of herds.	Health and integrity of herds.	Flooding/crop damage due to flooding, with the potential to destroy entire cultivars.	SAF integrity (floods, landslides).	Flooding/crop damage due to flooding, with the potential to destroy entire cultivars.	Health and integrity of creations.	Risks to structures.	Risks to structures.	Risks to structures.	-	Risks of contamination by waterborne diseases.	-
Longer and more intense periods of drought	Health and integrity of creations.	Health and integrity of creations.	Crop failure due to lack of rainfall.	Resilience threshold of SAF reached by drought for a very long period.	Plant development hindered by lack of irrigation.	Plant development impaired by drought, affecting pollination and pollen collection, reducing the honey production capacity in hives.	Limit of the collection and reservation systems reached.	Lack of water in treatment systems.	Reduction in the production capacity of the plates, due to lack of washing.	Reduction in the amount of water in rivers and streams.	-	-
Increasing Frequency of Droughts	-	-	Changes in the distribution of existing pests, diseases, and weeds, and increased threat of new insects and diseases.	Risk of fire.	Risk of fire.	-	-	-	-	Reduction in the amount of water in rivers and streams.	-	-
Excess Heat Flashes	-	-	pollination failures during flowering on very hot days (> 35°C).	-	-	Increased heat can kill the hives.	Increased water consumption.	-	Increased heat in the solar panels reducing their performance.	Increased surface water temperature, affecting aquatic biota.	Increase in arboviruses due to changes in mosquito reproductive cycles.	Increase in pests requiring a greater quantity of pesticides.
	-	-	Changes in the distribution of existing pests, diseases, and weeds, and increased threat of new insects and diseases.	-	-	-	-	-	-	-	-	-
Excess Heat Stroke	-	-	Increased potential for product quality downgrading, e.g. due to increased incidence of sunburn on fruits or leaves.	-	Too much sunshine can burn leaves and fruits, making it easier for pests to enter	-	-	-	-	-	-	-
Instability in the annual cold heat system	-	-	Impaired flowering and fruiting.	Impaired flowering and fruiting.	-	-	-	-	-	-	-	-
Excessive and strong winds	-	-	-	-	Increased dispersal of pests (e.g. ramulosis).	Carrying pesticides from cultivation areas to bee pollination sites	-	-	-	-	-	Increased dispersal of pests (by spores).
	-	-	-	-	Drop the cotton to the ground before harvesting.	-	-	-	-	-	-	-

#### 4. ADAPTATION ASSESSMENT

"Climate change adaptation relates to the process of natural and human systems adjustment related to behavior of climate in present and future. In human systems, adaptation seeks to reduce and avoid potential harm or exploit beneficial opportunities arising from climate change. In natural systems, human intervention attempts to support the adjust of these systems to the current and future climate and its effects" (IPCC, 2014).

Thus, this chapter presents the main adaptation measures for the possible impacts identified. It is important to highlight that there is a high degree of uncertainty about when and how strong impacts could be. Therefore, all proposals of adaptation measures should have monitoring that shall indicate any additional needs for the adaptation process to continue efficaciously.

##### 4.1. Identification of Measures to Adaptation for Possible Impacts of Climate Change

Adaptation measures can vary significantly in relation to the issue of climate change. Usually there will be strategic measures (e.g., represented by national plans), and support systems (e.g., warning systems for critical events). Lastly there are local actions that will be employed by communities (modification of plantations, land care, watering, etc.). There needs to be synergy among various categories of adaptation.

Figure 35 – Adaptation Categories

Source: Consultancy, 2023

Both strategic measures and support systems need to be considered by communities in decisions (e.g., We will participate in ProAgro Mais23? Or following the Inmet's

---

23 The Agricultural Activity Guarantee Program (Programa de Garantia da Atividade Agropecuária - Proagro) guarantees the exoneration of financial obligations relating to rural credit operations, the settlement of which is hindered by the occurrence of natural phenomena, pests and diseases affecting livestock and crops, in the manner established by the National Monetary Council (Conselho Monetário Nacional - CMN). Proagro was created by Law 5.969/1973 and governed by Law 8.171/1991, both regulated by Decree 175/1991 and Federal Law 12.058/2009. Its rules are approved by the National Monetary

SISDAGRO to find out the best time to planting or harvesting?). For that, it is important to provide support from TA – Technical Assistance, within the scope of the Project for communities to understand how to use existing national and/or state programs as well as to keep up with the information available in monitoring systems and be able for make appropriate decisions.

The following are some strategic measures and support systems that should be considered in the PROCASE II. The next tables present the triggers and risks/impacts associated as well as the adaptation measures for each model Plan prepared for PROCASE II preparation stage.

- National Plan for Adaptation to Climate Change (PNA).
- Inmet – Decision Support System in Agriculture – SISDAGRO (<http://sisdagro.inmet.gov.br/sisdagro/app/index>)
- Inmet – Fire Risk (<https://portal.inmet.gov.br/paginas/incendio>).
- Embrapa (technical support) – working together with ATER.
- SISZARC – Climate Risk Agricultural System and Zoning<sup>24</sup>
- ProAgro and ProAgro Mais<sup>25</sup>.

**Table 6 – Free-Range Poultry**

Trigger	Identified Risks/Impacts	Adaptation Measures
Instability in Rainfall regime	<ul style="list-style-type: none"> <li>• Reduction in food supply due to irregular rainfall (excess/under).</li> </ul>	<ul style="list-style-type: none"> <li>• Use of AFSs, Adequate storage of forage.</li> </ul>
Increased intensity and frequency of extreme weather events, Periods of Drought and Excess Heat	<ul style="list-style-type: none"> <li>• Health and integrity of husbandry.</li> </ul>	<ul style="list-style-type: none"> <li>• Simple forms of protection for breeding should be observed (protections with straw, not very high perches and installation of physical barriers to prevent access to unwanted places).</li> <li>• Refuges need to bring protection, thermal comfort and be clean to avoid the appearance of diseases and pests.</li> <li>• Adequate and balanced food, as well as adequate clean water supply.</li> <li>• Proper cleaning of refuges to avoid attracting rats or harmful insects, as well as predators that may be hungrier, due to reduced natural food supply.</li> </ul>

Council (CMN) and codified in the Rural Credit Manual (MCR-16), which is published by the Central Bank of Brazil.

<sup>24</sup> Developed with objective of producing Ministerial Ordinances that guide the cultivar-producing community and stakeholders, regard to the periods of year and regions of country that are suitable for orderly planting and offering less climatic risk of crop losses, always based on the study of agricultural zoning carried out by consultancies hired by MAPA, as well as providing systemic resources capable of analyzing the studies produced, processing and criticizing it, producing different means of queries as well as reports that aim to add value to the work development under Coordination of Agricultural Zoning of the Ministry of Agriculture responsibility.

<sup>25</sup> Actions aimed to support financial and payment capacity of rural producers, faced to fluctuations market of product prices. The Crop Guarantee, which also includes a specific type of Agricultural Insurance for Family Farming, is a strategy for the productive sector, seeking provide guarantee to the producer in the face of crop losses caused by climatic events.

Trigger	Identified Risks/Impacts	Adaptation Measures
		<ul style="list-style-type: none"> <li>The herd needs to go through adequate sanitary actions, together with the TA team.</li> <li>Restoration of water sources, Permanent Preservation Areas (APPs) and other degraded areas, to increase water supply and thermal comfort.</li> <li>Integrated Pest Management.</li> </ul>

#### 4.2. Evaluation and selection of adaptation options

Once the potential adaptation options have been identified (which can be repeated in the various subprojects of PROCASE II) a General Framework of Adaptation Options has been elaborated. The next step is to evaluate and prioritize the options based on detailed information and criteria. These options should be assessed to determine: their suitability for the local context; their effectiveness in reducing vulnerability or building resilience; and their broader impact on sustainability.

It is important that the selection and ranking presented here is timely discussed with stakeholders and technicians of ATER. As observed in the Strategic Environmental and Social Assessment (SESA) It should be noted that the area of PROCASE II is quite broad and diverse – thus, thus, good practices that could have excellent results in each location, it won't be the best fit for another necessarily.

Making decisions about adaptation options is a complex process, involving decision-makers from various sectors and experts who must deal with high levels of uncertainty. It is critical to choose adaptation options that are effective in increasing resilience as well as socially, economically, and politically feasible. Thus, it was considered more appropriate to use a multicriteria analysis (MCA), which provides systematically a wide range of information that may be relevant to make adaptation choices. MCA allows decision-makers to have a framework for comparing a set of options defined on several criteria, so that they can evaluate adaptation options on a variety of priorities or values.

That way, MCA is a performance matrix in which each row describes an option, and each column describes the performance of each option against each criterion. Individual performance appraisals are numerical value, with higher scores representing more preferred options. The individual scores can be combined into a final score for each option based on the weights assigned to each criterion. This matrix may be the product of an MCA analysis. For the present study, the MCA of IFAD's Adaptation Options Prioritization System was used.

An adaptation database options and a system for evaluating and prioritizing adaptation options have been developed as part of IFAD's Adaptation Framework. Prioritization comprises two main elements: First, adaptation options are filtered based on the project sector and the climate risks identified during the climate screening process; Then, an MCA is carried out on the shortlist of adaptation options to help in the choice of measures to be integrated into the project, using the following criteria:

1. Technical feasibility.
2. Cost-benefit.
3. Addresses Climate Risk.
4. Accessibility for beneficiaries.
5. Flexibility.
6. Co-benefits.
7. Transformative potential.
8. Complementarity to IFAD Themes.

The ranking of options uses a simple scoring system based on the eight criteria above. The first four criteria require 2 as a minimum score; Options that score less than 2 on any of these criteria do not meet the minimum requirements and it is not considered

adequate. The fitting options that are scored higher are the most suitable for a project. The following guidelines define how users of the system should score, score adaptation options for each of the criteria of the multi-criteria assessment.

The following table shows the score for each criterion.

**Table 18 – Criteria and Scoring Used**

Criteria	Score Considered		
	1	2	3
Technical feasibility	Implementing partners have no experience implementing this type of adaptation option and there are no project partners with this experience.	Implementing partners do not have direct experience with this adaptation option, but partners are available who can provide technical expertise and experience with this type of option.	Implementing partners have previously implemented this type of adaptation option and have this technical expertise.
Cost-benefit	The benefits are less than the costs (BCR < 1) over the lifetime of the option, even with indirect benefits included	The benefit-cost ratio is in the range of 1-2. Benefits of implementing the option are higher than the estimated costs over the lifetime of the option although the benefits are not large and may be distributed unevenly among beneficiaries.	The benefit-cost ratio is greater than 2. Benefits of implementing the option are significantly higher than the estimated costs over the lifetime of the option and should be readily achieved.
Addresses climate risks	Adaptation option is not relevant or may not be effective for the risks identified for the project.	Adaptation option effectively addresses at least one of the identified risks.	Adaptation option is relevant for all of the major climate risks identified for the project.
Accessibility for project beneficiaries	Adaptation option is inaccessible for the main project beneficiaries (e.g., unaffordable, requiring regular complex maintenance), or exacerbates existing inequalities.	Adaptation option is accessible to most project's target beneficiaries.	Adaptation option is accessible to project beneficiaries and specifically benefits women or other marginalized groups.

Criteria	Score Considered		
	1	2	3
Flexibility	The adaptation option has a long lifetime (>10 years) and its design does not allow for any adjustment. For example, a flood defense designed to cope with an additional 1m of flooding, and which would need to be completely replaced if greater protection was required.	The adaptation option being considered has a short lifetime (<10 years) meaning that considerations of flexibility are not as relevant.	The adaptation option is low or no regrets or is part of an adaptive management approach. Low regrets mean the option has benefits across a wide range of conditions. Thresholds and trigger points identified in adaptation strategies support adjustments in response to new information, risks, or opportunities.
Mitigation co-benefits	No mitigation co-benefits or adaptation significantly increases greenhouse gas emissions.	Adaptation option leads to emissions reductions, either at present or in the future.	Adaptation option involves reforestation, restoration of carbon sinks, or the substitution of fossil fuels for renewable energy sources.
Transformative potential	Adaptation option is limited to small increases in the resilience of target group but does not involve changes in wider systems.	Adaptation option operates at scale or enables wider implementation of the option, for instance with a declining marginal cost.	Adaptation option enables change in the system in question which significantly increases opportunities for target beneficiaries to adapt to climate change.
Complementarity to IFAD themes	No complementarity	Complements at least one other cross-cutting theme that is directly relevant to adaptation outcomes.	Complements more than one other cross-cutting theme to support systemic resilience.

Source: IFAD, 2023 (consultation)

The following table present options classification of adaptation considered.

**Table 19 – Adaptative Options Score and Classification**

Adaptative Options		Subprojects	Technical feasibility	Cost-benefit	Addresses Climate Risk	Accessibility for beneficiaries	Flexibility	Co-benefit	Transformative potential	Complementarity to IFAD Themes	Total
1	Apply soil treatment management practices to reduce spread of diseases and take control and constant visual inspection.	Productive Backyards and Agroforestry Systems – AFS	2	3	2	3	3	3	3	2	21
2	Enlist TA consultancy.	Productive Backyards and Agroforestry Systems – AFS	3	3	2	3	3	2	3	2	21
3	PMU/ATER actions, if possible with the Health Department of Paraíba, with information on environmental and health education for the communities	Human Health	3	3	2	3	3	1	3	2	20
4	Check Inmet Fire Risk monitoring system	Agroforestry Systems – AFS	2	3	2	2	3	3	3	2	20
5	Check rain forecast systems (INMET or Regional).	Productive Backyards and Agroforestry Systems – AFS	2	3	2	2	3	3	3	2	20
6	Manual weed control	Productive Backyards	3	3	2	3	3	2	2	2	20
7	Structuring community seed banks to bring greater resilience in case of losses.	Productive Backyards	2	3	3	2	3	1	3	3	20
8	Provide adequate ventilation in AFS implantation	Agroforestry Systems – AFS	2	3	2	2	3	3	3	2	20
9	Provide community fire brigades	Agroecological Cotton Farming and Agroforestry Systems – AFS	2	3	2	2	3	3	3	2	20
10	Husbandry needs to take adequate sanity actions with TA.	Free-Range Poultry and Cattle and Dairy Goat Farming	2	3	2	3	3	2	2	2	19

12	Apply corrective measures for any erosion process immediately.	Productive Backyards	3	3	2	3	3	1	2	2	19

Adaptative Options		Subprojects	Technical feasibility	Cost-benefit	Addresses Climate Risk	Accessibility for beneficiaries	Flexibility	Co-benefit	Transformative potential	Complementarity to IFAD Themes	Total
13	Harvest at the right time, reducing the risk of losing cotton.	Agroecological cotton farming	3	3	2	3	3	1	2	2	19
14	Implement adequate drainage systems to prevent the accumulation of water in crops.	Productive Backyards and Agroforestry Systems – AFS	2	3	2	3	3	1	2	3	19
15	Have contact with neighbors to be warned of periods of pesticide use, to close the bee hives during the period of high intensity use;	Beekeeping	2	3	2	3	3	1	3	2	19
16	Do not use fire to clean areas, without proper preparation and support staff for any eventuality; do not burn in periods of strong winds.	Agroecological cotton farming	2	3	2	3	3	2	2	2	19
17	Projects must consider the entry of rainwater into the systems, finding simple solutions and guiding communities for better installation;	Reuse of greywater and black water (Fossa Verde)	2	3	2	3	3	1	3	2	19
18	Seek support from ATER;	Agroecological cotton farming	2	3	2	3	3	1	3	2	19
19	Look for crops that are more suitable, including improvements developed by Embrapa	Productive Backyards and Agroforestry Systems – AFS	2	3	2	2	3	2	3	2	19
20	Using biomixtures, compounds, bio-pesticides, mechanized mowing, etc., rather than chemical pesticides.	Free-Range Poultry, Cattle and Goat Farming, Productive Backyards, Excessive Increase in Pesticide Use	2	3	3	2	3	2	2	2	19

Adaptative Options		Subprojects	Technical feasibility	Cost-benefit	Addresses Climate Risk	Accessibility for beneficiaries	Flexibility	Co-benefit	Transformative potential	Complementarity to IFAD Themes	Total
21	Recovery of permanent preservation areas around rivers (APP) and lakes to create adequate microclimates and avoid extreme heat, mainly for excessive sunlight directly on the water.	Water Resources	2	3	2	2	2	3	3	2	19
22	Adequate water reserve for animal thirst and irrigation	Cattle and Goat Farming, Agroforestry Systems and Productive Backyards	2	3	2	3	3	1	3	2	19
23	Adequate water storage (e.g. cisterns).	Water Supply	2	3	2	3	3	1	3	2	19
24	Active actions to search for disease vectors, with appropriate application of mechanical or biological control.	Human Health	2	3	2	3	3	1	2	2	18
25	Communities need to be instructed about to connect sewage treatment solution systems, such as not connecting surface rainfall runoff to the sewage system.	Reuse of greywater and black water ( <i>Fossa Verde</i> )	2	3	2	2	3	1	3	2	18
26	Be careful with the location of crops in places that naturally flood or that are easily flooded.	Productive Backyards and Agroforestry Systems – AFS	2	3	2	2	3	1	3	2	18
27	Simple forms of protection for husbandry should be observed (protections with straw and installation of physical barriers to prevent access to unwanted places);	Cattle and goat farming	2	3	2	3	3	1	2	2	18

Adaptative Options		Subprojects	Technical feasibility	Cost-benefit	Addresses Climate Risk	Accessibility for beneficiaries	Flexibility	Co-benefit	Transformative potential	Complementarity to IFAD Themes	Total
28	Simple forms of protection for husbandry should be observed (protections with straw, not very high perches and installation of physical barriers to prevent access to unwanted places).	Free-Range Poultry	2	3	2	3	3	1	2	2	18
29	Irrigate properly.	Agroecological cotton farming	3	3	2	2	3	1	2	2	18
30	Installation of physical barriers to prevent access to unwanted places).	Free-Range Poultry and Cattle and Dairy Goat Farming	2	3	2	3	3	1	2	2	18
31	Adequate cleaning of refuges to avoid attracting rats or harmful insects, as well as predators that may be hungrier, due to reduced natural food supply.	Free-Range Poultry	2	3	2	3	3	1	2	2	18
32	Have contact with neighbors to discuss the avoidance of pesticide use in times of strong winds, if necessary, request support from ATER;	Apiculture	2	3	2	2	3	1	3	2	18
33	Implement firefighting systems and equipment (dampers, protection, water sprinklers, etc.).	Agroforestry Systems – AFS	2	3	2	1	3	3	2	2	18
34	Map producers with the use of pesticides, trying to keep the apiary as far away as possible from these areas.	Apiculture	2	3	2	3	3	1	2	2	18
35	Do not plant crops in flooded areas	Agroecological cotton farming	3	3	2	2	3	1	2	2	18
36	Do not use pesticides near to beehives or in pollination areas, especially on strong winds days.	Beekeeping	2	3	2	3	3	1	2	2	18
37	Observe most prone periods of fires;	Agroecological cotton farming	2	3	2	3	3	1	2	2	18

Adaptative Options		Subprojects	Technical feasibility	Cost-benefit	Addresses Climate Risk	Accessibility for beneficiaries	Flexibility	Co-benefit	Transformative potential	Complementarity to IFAD Themes	Total
38	Guidance to communities for the rational use of water.	Renewable Energy, Water Supply, reuse of grey water and black water (Green Cesspool), Water Resources	2	3	2	3	3	1	2	2	18
39	Refuges need to bring protection, thermal comfort and be clean to avoid the appearance of diseases and pests;	Free-Range Poultry	2	3	2	3	3	1	2	2	18
40	Avail the protections of ProAgro and ProAgro Plus.	Productive Backyards	2	3	2	2	3	2	2	2	18
41	Use the terrain with adequate drainage and covered with local material (antlers, leaves, pebbles) to reduce leaching and prevent the appearance of erosion.	Agroecological Cotton Farming and Productive Backyards	2	3	2	2	3	2	2	2	18
42	Use AFS, adequate storage of forages (e.g. forage palm).	Cattle and goat farming	3	3	2	2	3	1	2	2	18
43	Use AFS, adequate storage of forage.	Free-Range Poultry	3	3	2	2	3	1	2	2	18
44	Adequate and balanced food, as well as adequate clean water supply.	Free-Range Poultry and Cattle and Dairy Goat Farming	2	3	2	2	3	1	2	2	17
45	The areas where the systems will be installed must not be floodable or at risk of landslides/strong erosion.	Renewable Energy, Water Supply, reuse of grey water and black water (Green Cesspool)	3	3	2	2	1	1	3	2	17
46	The cultivation window for cotton should be observed, seeking to reduce the possibility of situations of excessive rainfall	Agroecological cotton farming	3	3	2	3	3	1	2		17
47	Assess the requirement of protect beehives from wind and rain, with the use of hut protections	Beekeeping	2	3	2	2	3	1	2	2	17

Adaptative Options		Subprojects	Technical feasibility	Cost-benefit	Addresses Climate Risk	Accessibility for beneficiaries	Flexibility	Co-benefit	Transformative potential	Complementarity to IFAD Themes	Total
48	Assess the requirement to protect beehives, with the use of hut protections	Beekeeping	2	3	2	2	3	1	2	2	17
49	Assess the possibility of areas to be pollinated, maintained with irrigation, when it is possible.	Beekeeping	2	3	2	2	3	1	2	2	17
50	Maintain the health of crops, looking for evidence of pests and their immediate control.	Agroecological cotton farming	2	3	2	2	3	1	2	2	17
51	Choose beehive areas near to moist regularity places	Beekeeping	2	3	2	2	3	1	2	2	17
52	Set up the apiary in a suitable place free of flooding.	Beekeeping	2	3	2	2	3	1	2	2	17
53	Pigsties and sheepfolds need to be protected, offering thermal comfort and be clean to prevent the appearance of diseases and pests.	Cattle and goat farming	2	3	2	3	3	1	1	2	17
54	For shelters intended exclusively for shading, where there is no limitation of space on the sides for the movement of animals, the best orientation is north-south. In this way, the animals move with the displacement of shelter's shade, allowing greater exposure of the floor to the sun, reducing the formation of mud and keeping it drier.	Cattle and goat farming	2	3	2	3	3	1	1	2	17
55	Try to use the most resistant and local plants.	Agroecological cotton farming	2	3	2	2	3	1	2	2	17
56	Use of beekeeping close to suitable AFS;	Beekeeping	2	3	2	2	3	1	2	2	17

Adaptative Options		Subprojects	Technical feasibility	Cost-benefit	Addresses Climate Risk	Accessibility for beneficiaries	Flexibility	Co-benefit	Transformative potential	Complementarity to IFAD Themes	Total
57	Use simple roofs and systems to reduce direct rainfall, if necessary.	Productive Backyards	2	3	2	2	3	1	2	2	17
58	Use physical protection to avoid excessive sunshine.	Productive Backyards	2	3	2	2	3	1	2	2	17
59	Use screens or other protection in case of hail.	Productive Backyards	2	3	2	2	3	1	2	2	17
60	Assess the implementation of firebreaks for the plantation protection.	Agroecological cotton farming	2	3	2	2	1	2	2	2	16
61	Keep the plates clean and surroundings free of obstacles so that there is a passage of air, providing cooling.	Renewable energy	2	3	2	3	3	1	1	1	16
62	Fix up a calendar for cleaning the plates during the rainy periods	Renewable energy	2	3	2	3	3	1	1	1	16
63	Adequate protection to prevent access by predators that may be hungrier, due to reduced natural food supply;	Cattle and goat farming	2	3	2	2	3	1	1	2	16
64	Study the implementation of appropriate heat exchange systems.	Renewable energy	1	2	1	1	2	1	1	1	10

Elaboration: consultancy, 2023

Of the 64 adaptation options presented, 42 were considered adequate or very adequate for PROCASE II.

- The adaptation options are repeated in part of the subprojects, but were considered only once for classification purposes, a column was added to identify which subprojects the adaptation action is linked to.
- All 62 options are feasible, the previous selection of options has already ruled out those that would be totally unrealistic for the target communities of the Project (e.g., the construction of a complex irrigation system, typical of monocultures).
- Two options are not considered feasible for communities: 33 and 64 – the solutions are related to more complex actions in photovoltaic systems, which may not be accessible to communities. It is important here to reinforce that the first four criteria require a minimum score of 2; Options with a score of less than 2 in any of these criteria do not meet the minimum requirements and are not considered suitable, this mainly affects adaptation solution 33 of the table above.

- It is considered very important that, in due course, this evaluation, especially the adaptation actions, be passed on with TA technicians, to consider its effectiveness for the Project/communities, including considering the fact that eventually the solutions may vary due to the location of the communities, given the size and diversity of the area covered by PROCASE II.

A comprehensive hazard mapping and vulnerability assessment should be carried out, using standardized vulnerability and risk assessment (VRA), and the Disaster and Climate Change Risk Management Plan should be considered for this purpose, as provided for in the Project's PGASE.

It is important to highlight that the project can count on effective and comprehensive adaptation measures, such measures should not be configured only in a set of crops, techniques and practices, often created individually by local producers, but involving the definition of a catalogue of proven adaptation solutions and techniques that, based on experimentation, bring resilience to climate change. The approach must move from what can be called spontaneous adaptation to what is called planned adaptation, involving TA technicians and being articulated with local research and support institutions (universities, NGOs, Embrapa, among others), involving:

- Elaboration of proposals that can increase the resilience of productions and communities, with the appropriate elaboration of community tests.
- Incorporation of successful proposals into the portfolio of actions and technical courses made available by ATER, to disseminate knowledge.
- Incorporation of proposals that have caused problems or that would result in losses (lessons learned).
- Review and adaptation of the Disaster and Climate Change Risk Management Plan whenever necessary.

### **Additional measures to reduce vulnerability in Productive Development Plan**

---

The measures presented below include additional actions that should contribute to the reduction of vulnerability levels assessed in this document. The measures seek to achieve better results in climate adaptation and in reducing identified risks.

#### ***Measures to reduce the vulnerability of production systems***

A comprehensive hazard mapping and vulnerability and risk assessment (VRA) should be carried out, considering in this proposal the Disaster and Climate Change Risk Management Plan provided in Project's MGAS.

It is important to highlight that the Project and subprojects shall consider effective and comprehensive adaptation measures. These measures should not be only a set of crops, techniques, and practices often implemented individually by local producers. It should encompass actions in agricultural technical packages that bring resilience to climate change based on experimentation. The proposal needs embody the development of planned actions to adaptation instead the spontaneous actions to adaptation, involving TA technicians, local scientific institutions, and research centers (universities, NGOs, Embrapa, and others). In general terms, the following actions are recommended:

- Effective adaptation measures, besides the introduction of a set of crops, techniques and practices, through the definition of the climate proof catalogue of adaptation solutions and techniques on the basis of experimentation, community-based trial of proposed solutions, testing and revision of disasters, risk and resilience plans.
- Measures to encourage integration of climate smart agri-practices, and nutrition in community plans.

- Alternative study to evaluate project design that affects areas to result in reduction or, whenever possible, non-suppression of vegetation, prioritizing the preservation of endemic and native species.
- In situations where vegetation suppression is unavoidable, off-set planting must be carried out aiming at net environmental gain at the micro-watershed level.
- Assess habitats and ecological corridors connectivity, mainly to verify new corridors that can be promoted with the recovery of areas and project actions, in special riparian areas.
- Assess vulnerable habitats to desertification, loss of vegetation, etc. and adopt protection measures.
- Avoid implementing agricultural and animal production in riparian areas and high slopes areas.
- Promote the substitution of monoculture by agroforestry systems.
- Promote species increasing and diversification encompassing agroecological production systems that include native species and, when involving exotic species, consider the following criteria established about fully adaptation, do not present characteristic of invasive or predatory species, perform an ecological function in the environment, do not present toxicity to local insects, especially those that act in local pollination – with a focus on native bees.

#### ***Training program - methods of pest and disease control in production systems***

Although the Project does not provide and encourage acquisition the use of chemical substances inputs in agricultural, the risk of pesticide use by the beneficiaries is identified, owing of communities producing habit and of being able to purchase and apply them with their own resources. In this sense, two actions are indicated for the recommended measure:

- In order to reduce and, as far as possible, combat the use of pesticides, it is important that the Project, in each Production Plan, implements a training program for TA and beneficiaries regarding the use of these substances. To this extent, in addition to others topics to be addressed in the training should be included: (i) information and guidance regarding the prohibition and consequences of the use of certain substances; (ii) the correct use and application of substances (quantity, frequency safe application, transport, storage, prescription, handling, PPE); (iii) and the application and benefits of ecological techniques that can efficiently replace the use of pesticides. It is suggested to be based on the recommendations of procedures established by Embrapa<sup>26</sup>.
- ATER should monitor and follow up on the methods and techniques applied by the communities in the implementation of Production Plans actions, with the objective of mapping the intensification or reduction use of pesticides during the life cycle of the Project implementation, and to apply guidance and adjustment measures to increasingly encourage the replacement of pesticides by more sustainable, health and environmentally friendly methods.

---

<sup>26</sup> The Brazilian Agricultural Research Corporation (Embrapa) is a public company, linked to the Ministry of Agriculture and Livestock (Mapa), which was created in 1973 to develop the technological basis of a genuinely tropical agriculture and livestock model.

### ***Training management and assistance teams in climate change resilience measures***

There is also an opportunity and convenience to improve the institutional capacity of partner institutions of TA to manage climate and resilience issues. It is expected that better results will be achieved in the dissemination of good practices and more effective implementation of the measures provided in the environmental and social documents. The training could incorporate topics such as:

- Knowledge of national and international environment, social and climate change safeguards policies.
- Guidance to preparing a baseline knowledge on local risks, including research and consultation in scientific and academic institutions;
- Detailing and implementation of measures provided for Project's Environmental and Social Management documents (AAS/SESA, MGAS/ESMF, PGAS/ESMP, TCA/TAA).

#### **4.3. Monitoring**

This Targeted Adaptation Assessment should be implemented by PMU and its regional offices, and the participation of TA is essential for the results to be achieved, since it is through technical assistance that many communities will be able to achieve good results. IFAD's regional team will also provide mentoring support throughout the duration of the project.

Monitoring is critical to ensure the long-term success of climate adaptation initiatives, plans and actions. It plays an important role in the following aspects of adaptation.

- Monitors the performance of the activities carried out during the development of the adaptation plan (e.g., AFS implementation activities).
- It determines whether the planned results and the results of adaptation actions have been achieved (e.g., AFS evolution indexes).
- Determines what adjustments need to be made to achieve planned goals and results.
- It helps to determine if the actions are generating unforeseen side effects.

The PMU shall be responsible for the preparation of monitoring reports, procurement plans, cost estimates, and corrective action mechanisms that shall be implemented during the activities of this Target Adaptation Assessment.

## **5. COSTS AND BUDGET CONSIDERATIONS**

The implementation of Targeted Adaptation depends on structuring actions of the project and non-structuring actions (guidance of communities for development of AFS, vegetable cultivation, free-range poultry farming, avoid pesticides).

The Key to success of the Project is ATER's performance, with, who have not only the technical mastery and trained technicians, but also the ability to communicate adequately with the communities, creating bonds of trust and promote the transmission of knowledge that has expected. On the other hand, part of the actions considered here are also present in the Strategic Environmental and Social Management Plan (ESMP) prepared for PROCASE II.

The following table presents budgetary considerations for the implementation of this Target Adaptation Assessment.

**Table 20 – Budgetary considerations**

Seq.	Description	Budget	Responsibility
1	Training for interested communities	Inserted in the Project Budget	PMU/ATER
2	Implementation of Social Technology Frameworks	Inserted in the Project Budget	PMU
3	Accompaniment of Communities	Inserted in the Project Budget	PMU/ATER
4	Monitoring & Auditing	Inserted in the Project Budget	As Provided in the PGASE/ESMF

<b>Resumen ejecutivo</b>	
<p>Según el Marco de Política Ambiental y Social (MPAS), y en base a la información disponible en este momento, la operación está clasificada como Categoría B debido a que las actividades y planes financiados por los componentes 1 y 2 pueden generar impactos ambientales y sociales negativos moderados a significativos a medio y largo plazo, gestionables y mitigables con medidas conocidas. Estos impactos están vinculados a actividades agrícolas y actividades puntuales de construcción civil que financiará el proyecto, incluyendo generación de ruido, de residuos de la construcción civil y agrícolas y de polvo, emisiones, erosión y sedimentación de cursos de agua, presión sobre las hábitats modificados y naturales. No se espera que las actividades orientadas a mejorar la productividad y los ingresos de los grupos de productores afecten negativamente ni contribuyan con la degradación de áreas protegidas o hábitats críticos. Se espera que la titulación de tierras promoverá el desarrollo económico y el mejor uso y conservación.</p> <p>La Clasificación de Riesgo Socioambiental es Sustancial, asociado a impactos ambientales y sociales negativos, temporales, gestionables y mitigables, a riesgos de intervención e impactos en hábitats modificados con un valor significativo para la biodiversidad, y riesgos de impacto indirecto para hábitats naturales y críticos. Algunas situaciones, relativas al tema de regularización (titulación) de tierras, conllevan riesgos de que generen conflictos en relación con el uso y ocupación de tierras entre potenciales beneficiarios y ocupantes que reclaman la propiedad de la tierra. El análisis PACI identificó que el Ejecutor tiene experiencia con los temas del proyecto, pero será necesario incorporar 2 especialistas – uno ambiental y otro social – para tratar de los temas socioambientales. Los riesgos de contexto están relacionados con la dispersión territorial de las intervenciones una amplia área del estado de Paraíba, lo que podrá dificultar la supervisión y control ambiental y social adecuado.</p> <p>El Riesgo de Desastres y Cambio Climático se clasificó como Moderado debido a la exacerbación de los riesgos de desastres naturales durante eventos extremos de sequías, precipitación e inundaciones e incendios en bioma sensible. La infraestructura que se va a construir es de criticidad moderada, ya que es de tamaño medio, lo que deberá confirmarse cuando se definan los proyectos y las áreas de implementación a través de una Evaluación de Riesgo de Desastres, a incluirse en el PGAS previo a la ejecución.</p>	

Estas clasificaciones se confirmaron a través de los resultados de los estudios en la Evaluación Ambiental y Social Estratégica -EASE realizados durante la debida diligencia. Los criterios de elegibilidad establecidos para la operación excluyen actividades que pudieran ser clasificados como categoría de impacto “A”, y específicamente aquellas que conlleven desplazamientos y reasentamiento involuntarios (físicos o económicos), impactos negativos en los medios de subsistencia, impactos negativos en las comunidades tradicionales y/o pueblos indígenas, así como impactos en los recursos ecosistémicos de los que dependen los pueblos indígenas y en su patrimonio cultural. Tampoco serán elegibles inversiones que generen impactos adversos en hábitats críticos.

Para tratar adecuadamente estos riesgos y con el fin de atender los requerimientos establecidos en las Normas de Desempeño Ambiental y Social (NDAS), fue desarrollada una (i) Evaluación Ambiental/Social Estratégica (EASE); (ii) un Plan de Gestión Ambiental/Social Estratégico (PGASE), (iii) un Análisis Sociocultural centrado en las poblaciones indígenas, las comunidades *quilombolas* y otras comunidades tradicionales, previo a las intervenciones que se llevarán a cabo, así como (iv) un Plan de Participación de las Partes Interesadas Específico (PPPI). Los riesgos referentes a las Comunidades Indígenas fueron evaluados durante la Debida Diligencia y se identificó la necesidad de una Consulta Libre Previa e Informada para las comunidades indígenas y tradicionales que pueden ser afectadas por el proyecto. Además, la UGP implementará un Sistema de Gestión Ambiental y Social (SGAS) consistente con la Norma de Desempeño Ambiental y Social NDAS 1.

Los estudios ambientales y sociales fueron divulgados en su versión preliminar en la página web del Banco previo a la Misión de Análisis, y se llevará a cabo un proceso de consulta pública para todo el proyecto, teniendo en cuenta los mecanismos culturalmente apropiados y el avance de los estudios y planes de gestión, previo a la fecha de Directorio de la operación.

## Descripción de la operación

El objetivo general del proyecto es reducir los niveles de pobreza rural, mejorando la seguridad alimentaria y nutricional y la adaptación de la población rural al cambio climático. Los objetivos específicos son los siguientes: (i) aumentar la adopción de tecnologías agrícolas, incluidas las de adaptación y mitigación al cambio climático; (ii) mejorar la inclusión productiva y social de los agricultores familiares, priorizando mujeres, jóvenes, PCT y PcD; y (iii) mejorar las condiciones ambientales de las comunidades rurales y su entorno. El proyecto está dividido en dos componentes, a saber:

**Componente I. Sistemas productivos resilientes para reducir la pobreza rural (BID US\$42,8 millones, FIDA US\$6,04 millones, Local US\$15,10 millones).** Financiamiento de planes para mejorar la producción y comercialización de los beneficiarios, fortalecer su capacidad de adaptación al cambio climático y recuperar áreas ambientalmente degradadas, incluyendo: Planes de Inversión Resiliente (PIR) y Planes de Negocios (PN). Los PIR beneficiarán a grupos de comunidades rurales, basados en un diagnóstico participativo, con foco en mujeres, jóvenes, PCT y PcD. Los PN beneficiarán a cooperativas y organizaciones similares, y financiarán inversiones y asistencia técnica especializada para fortalecer capacidades de gestión, promover agregación de valor, mejorar la comercialización y la adaptación al cambio climático

**Componente II. Fortalecimiento organizacional y de capacidades y gestión del conocimiento (BID US\$20,87, FIDA US\$2,98 millones, Local US\$7,45 millones).** y

**Gestión, seguimiento y evaluación del proyecto (BID US\$6,85 millones, FIDA US\$0,98 millones, Local US\$2,45 millones).** Financiará equipos, consultorías y otros gastos necesarios para (i) administración y gestión del proyecto, (ii) seguimiento, monitoreo y evaluación (M&E); (iii) capacitaciones para el personal de la UGP; y (iv) auditorías del proyecto.

El Proyecto tendrá cobertura en todo el estado de Paraíba, involucrando sus 223 municipios (Figura 1 en Anexo C), municipios que están distribuidos entre los Biomas Caatinga (194) y Mata Atlántica (29). El Censo Agropecuario (IBGE 2017) señala un total de 163.218 establecimientos agropecuarios, de los cuales el 76,88% pertenece a la Agricultura Familiar (UAF), contabilizando un universo potencial para el Proyecto. El Proyecto buscará atender aproximadamente a

560.000 familias (200.000 personas) como beneficiarias directas, estableciendo un enfoque preferencial en los siguientes perfiles: mujeres, jóvenes, personas con discapacidad (PcD), Pueblos y Comunidades Tradicionales (PCT), pueblos originarios, comunidades de pescadores y gitanos. De todos modos, se definirán criterios específicos para la priorización y selección de las comunidades beneficiadas, involucrando aspectos como la tradicionalidad cultural, la necesidad de acceso a saneamiento básico, la tasa de familias inscritas en el CadÚnico, familias que no hayan sido beneficiadas por otros proyectos similares, el nivel de representación de género, juventud y PcD, el nivel de degradación ambiental y la falta de asistencia técnica y extensión rural (ATER). El estado de Paraíba presenta una gran diversidad de ocupación en su territorio, incluyendo grupos vulnerables, como afrodescendientes, colonos de la reforma agraria, pueblos indígenas, gitanos y pescadores artesanales. Las características de uso y ocupación de suelo, la no formalización de las áreas ocupadas por las comunidades tradicionales, los riesgos de sequía y dificultad de acceso a agua potable podrían representar riesgos para la implementación de los proyectos.

<b>Fundamentos de las clasificaciones/valoraciones</b>	
<i>Clasificación de impacto ambiental y social</i>	El proyecto ha sido clasificado con <b>Categoría B</b> , debido principalmente a potenciales impactos <b>moderados</b> directos, indirectos negativos como ruido, generación de polvo, emisiones, erosión y sedimentación de cursos de agua y residuos, asociados con la construcción de pequeñas obras y planes productivos de pequeña escala en áreas de producción existentes. Asimismo, serán localizados, de corta duración y fácilmente mitigables a través de planes de gestión, buenas prácticas y aplicación de códigos de conducta. Se reconocen potenciales impactos acumulativos a hábitats naturales, afectación de ocupación y uso del suelo por propietarios, ocupantes y usuarios de terrenos a lo largo de las márgenes de los ríos y costa marina.
<i>Calificación de riesgo ambiental y social</i>	<u>Causa</u> : La operación puede tener un impacto directo moderado en hábitats naturales y modificados con un valor significativo para la biodiversidad, también podría causar impactos directos generados por ruido, polvo, erosión, emisiones, generación de residuos sólidos (peligrosos y/o no peligrosos, accidentes de trabajo y salud y seguridad. <u>Contribución</u> : La operación tiene el potencial de causar impactos indirectos y/o acumulativos menores asociados a cambios acumulativos o inducidos en la calidad de suelos o cobertura de bosque, impactos menores indirectos y/o acumulativos generados por ruido, polvo, erosión, emisiones, generación de residuos sólidos (peligrosos y/o no peligrosos, accidentes de trabajo, salud y seguridad comunitaria y posibles afectaciones a comunidades indígenas. La operación tiene el potencial, a través de la cadena de suministro, de generar riesgos de impactos indirectos para hábitats naturales y críticos, particularmente si se genera demanda percibida y otros actores deciden expandir su producción. Además, la diversidad de actores sociales incluyendo comunidades afrodescendientes, asentados de la Reforma Agraria y pueblos indígenas que en caso de no hacerse la identificación de impactos ambientales y sociales y las medidas de mitigación pueden resultar afectados en sus modos de vida de manera significativa. <u>Contexto</u> : La dispersión territorial de las intervenciones podrá dificultar la supervisión y el control ambiental y social adecuado. El proyecto se desarrollará en un contexto mayoritariamente rural, en áreas vulnerables, pudiendo abarcar comunidades tradicionales, indígenas y quilombolas, asentamientos de INCRA, entre otros con algún grado de inseguridad alimentar. Además, existe riesgo contextual por temas reputacionales en relación con la regularización y titulación de tierras que puede ocasionarse reclamos y perjuicios en las personas afectadas del Proyecto. <u>Desempeño</u> : El prestatario tiene una buena capacidad para implementar el SGAS y los planes de gestión ambientales y sociales necesarios para gestionar los riesgos e impactos. Por ende, la Calificación de Riesgo general se categoriza como <b>Substancial</b> .
<i>Clasificación de riesgo de desastre y cambio climático</i>	El Riesgo de Desastre y Cambio Climático ha sido clasificado como <b>Moderado</b> , debido que en la zona del proyecto se producen amenazas naturales como inundaciones fluviales, sequías, incremento del nivel del mar, incendios forestales y otros, incluidos los causados o exacerbados por el cambio climático, y porque éstos puedan afectar significativamente al

	proyecto y/o porque el proyecto puede exacerbar significativamente la exposición de vida humana, la propiedad, y/o el medio ambiente hacia estas amenazas.
<b>Uso del marco ambiental y social del prestatario</b>	<b>No</b>
Para el proyecto se utilizará solamente el Marco de Políticas Ambientales y Sociales del BID.	
<b>¿Se aplicará un enfoque de “framework approach”?</b>	<b>Sí</b>
Debido a que la operación financia un grupo grande de intervenciones replicables en un mismo sector o subsector dentro de una misma región geográfica, el proyecto tiene un enfoque de framework approach. Para eso, se preparó una Evaluación Ambiental y Social Estratégica (EASE) y un Plan de Gestión Ambiental y Social Estratégico (PGASE), considerando las diferentes tipologías de intervención y riesgos previstos en los Planes de Inversión Resilientes. Para cada de estas intervenciones serán realizados Análisis Ambiental y Social (AAS) y Planes de Gestión Ambiental y Social (PGAS) específicos para los Planes de Negocio y Planes de Inversión Resilientes.	
<b>¿Se cofinanciará la operación?</b>	<b>Sí</b>
Se anticipa que esta operación involucre el cofinanciamiento del Fondo Internacional para el Desarrollo Agrícola (FIDA) por un monto estimado de US\$ 10.000.000,00. El FIDA es una institución financiera internacional y organismo especializado de las Naciones Unidas dedicado a erradicar la pobreza y el hambre en las zonas rurales de los países en desarrollo. Dicho cofinanciamiento tendrá la modalidad de cofinanciamiento conjunto. Se harán esfuerzos para establecer un enfoque común. El FIDA ha indicado que se alinearía para el atendimento/seguimiento de los estándares sociales y ambientales del BID. También, se analizará el atendimento a las salvaguardas del FIDA y se verificará la mejor forma para su aplicación.	
<b>Normas de Desempeño Ambiental y Social con requerimientos para el proyecto propuesto</b>	
<b>NDAS-1. Evaluación y gestión de riesgos e impactos ambientales y sociales</b>	<b>Sí</b>
<p>El proyecto será ejecutado por el Gobierno del Estado a través de la Secretaría de Agricultura Familiar y Desarrollo del Semiárido, donde se creará una Unidad de Gestión del Proyecto (UGP), que incorporará como equipo mínimo para los temas de ambientales y sociales un especialista en PCT (Pueblos y Comunidades Tradicionales) y salvaguardas sociales; y un especialista en salvaguardas ambientales.</p> <p>El esquema de ejecución, incluyendo los mecanismos de coordinación será detallado en el POD y en el Reglamento Operativo del Proyecto (ROP) y el Sistema de Gestión Ambiental y Social (SGAS), el cual se diseñará e implementará conforme a los requisitos del MPAS y las diez NDAS del Banco.</p> <p>Para la fase de preparación de esta operación, se encuentra en elaboración un SGAS que está compuesto por los elementos identificados por el MPAS como esenciales para un sistema de gestión socioambiental: El SGAS se basará en siete pilares fundamentales:</p> <p><b>1-El Marco Ambiental y Social Especifico</b>, que define los compromisos ambientales y sociales aplicables, considerando los requisitos de las Normas de Desempeño del MPAS y la legislación nacional.</p> <p>La UGP, con el apoyo del BID y el Fondo Internacional para del Desarrollo Agrícola (FIDA), establecerá un marco legal, y un Sistema de Gestión Ambiental y Social, compatible con las Normas de Desempeño del MPAS, que apoyará la gestión de los programas de control y mitigación de impacto del PGASE, el monitoreo de los procesos de licenciamiento y el cumplimiento de la legislación ambiental y estándares de desempeño socioambiental del BID. Esta estructura define los objetivos, principios y metas que guían al Proyecto para lograr el desempeño ambiental y social deseado y describe el proceso, la estructura y el funcionamiento general de la gestión de los aspectos ambientales y sociales;</p> <p><b>2- Identificación de Riesgos e Impactos:</b> Los riesgos e impactos socioambientales del PROCASE II fueron detallados en la Evaluación Ambiental y Social Estratégica (EASE). En relación con a las comunidades tradicionales, fue elaborada una Evaluación Sociocultural (ASCE).</p> <p><b>3- Programas de Gestión.</b> Los programas de gestión socioambiental fueron detallados en el Plan de Gestión Ambiental y Social Estratégico (PGASE) y en el Plan de Acción Ambiental y Social (PAAS). El PGASE desarrollado tiene un carácter global para que sea aplicable a todos los tipos de intervención y sus varios medios receptores, y contiene los</p>	

procedimientos para que la Agencia Ejecutora realice un screening de las actividades contra criterios de elegibilidad (que excluirán proyectos categoría A). El PGASE describe las medidas de mitigación y mejora del desempeño y las acciones destinadas a abordar los riesgos e impactos ambientales y sociales significativos identificados en el EASE. Los estudios desarrollados para el Programa apuntan a que, en la fase de Operación, sean desarrollados PGAS específicos en conformidad a las tipologías de los Planes de Inversión Resilientes.

**4-Capacidad y Competencia Organizacional.** Durante la debida diligencia fue realizada un análisis de la capacidad institucional del Organismo Ejecutor (OE) por medio de la Plataforma de Análisis de la Capacidad Institucional (PACI) del Banco. Fue verificado que la OE tiene capacidad técnica para tratar los temas ambientales y sociales relativos al Proyecto, mientras el análisis indicó la necesidad del equipo de apoyo, siendo mínimamente un especialista ambiental y un especialista social, con dedicación exclusiva para apoyo a los temas socioambientales, que deberán ser entrenados en el Marco de Política Ambiental y Social del BID para asumir las responsabilidades y autoridad para coordinar la implementación del SGAS en la estructura organizacional de la UGP.

**5-Preparación y respuestas ante emergencias.** El PGASE presenta la orientación para un Plan de Respuesta a Emergencias (PRE). Este sistema deberá identificar efectivamente la tipificación de los desastres a los que está sujeta el área de influencia de los Proyectos, estableciendo un conjunto de protocolos a seguir no solo por los equipos de obras, sino también por la defensa civil y otros órganos involucrados en la seguridad de la población. Entre las acciones establecidas en los protocolos se incluyen, entre otras: (i) identificación de los lugares de seguridad, (ii) puntos de encuentro y comunicación, (iii) evacuación de la población, (iv) refugio y alimentación para los afectados, y (v) sistema de aviso "multicanal" (sirenas, vía telefónica, mensajes en celular, radio/TV). El PRE se ha preparado para cada proyecto, ya que depende de la tipificación de la obra y de su inserción en el entorno. En el SGAS deberá incluir, en programas específicos, procedimientos de preparación y respuesta a situaciones accidentales y de emergencia asociadas a las intervenciones del Proyecto, de manera adecuada para prevenir y mitigar cualquier daño a las personas y al medio ambiente;

**6- Seguimiento y revisión.** Sobre la base de los programas y recomendaciones de PGASE, el SGAS incluye procedimientos para: (i) monitorear sistemáticamente la implementación de programas de gestión socioambiental y medir su efectividad, así como monitorear el cumplimiento de las obligaciones legales y contractuales y los requisitos regulatorios relevantes; ii) registrar e informar los resultados del monitoreo y las acciones correctivas y preventivas necesarias, con la emisión de informes aprobados por la UCP y remitidos al BID; y iii) planificar y realizar evaluaciones periódicas de la eficacia del SGAS, con base en los resultados del monitoreo sistemático.

**7-Participación de las partes interesadas.** Durante la debida diligencia fue desarrollado un Plan de Participación de Partes Interesadas (PPPI) para planificar e implementar un proceso de participación continua de las partes interesadas, esencial para la gestión exitosa de los impactos sociales y ambientales del programa, que hará parte del SGAS del Proyecto, siendo actualizado conforme los avances durante la ejecución. Este proceso puede incluir los siguientes elementos: i) análisis (mapeo) de los grupos de interés y la planificación correspondiente; ii) difusión de información; iii) consulta y participaciones significativas, mecanismos de denuncia y comunicación externa; y iv) procedimiento para la comunicación periódica de información a las personas afectadas por el trabajo y otras partes interesadas. El proceso debe estar de acuerdo con los requisitos establecidos en NDAS 2 a 10. El PPPI fue publicado en 07 de junio de 2024, y se puede encontrar en la pagina del BID <https://www.iadb.org/es/proyecto/BR-L1623>.

En base a los requerimientos del SGAS, el proceso de evaluación y mitigación de riesgos e impactos del Proyecto incluirá los siguientes instrumentos: Análisis Ambiental y Social (AAS) para las comunidades tradicionales y un Plan de Gestión Ambiental y Social Estratégico para los Planes de Inversión Resilientes y la implementación del Sistema de Quejas y Reparación, en correspondencia a los riesgos e impactos que pueden afectar las poblaciones. Entre los grupos potencialmente vulnerables del área de influencia del proyecto se incluyen comunidades indígenas, quilombolas, gitanos, y otras poblaciones tradicionales mujeres, personas discapacitadas, ancianos. La EASE incluyó un Análisis Sociocultural de las comunidades tradicionales y vulnerables del área del Proyecto para identificar mecanismos culturalmente apropiados de consulta para cada grupo identificado. También se actualizará el Plan de Participación de Partes Interesadas (PPPI), y el proceso de Consultas Pública conforme está establece en las NDAS 1 e 10, y no tocante a las comunidades tradicionales, especialmente las comunidades indígenas, las Análisis Socioculturales indican la aplicación del Consentimiento Libre, Previo e Informado (CLPI) de las comunidades indígenas involucradas.

Destacase que no será elegible cualquier potencial intervención que genera reasentamiento involuntario (desplazamiento físico o económico), impactos negativos en las comunidades tradicionales y/o pueblos indígenas.

Las medidas de gestión de riesgos e impactos ambientales y sociales que conforman el SGAS deben formar parte de los contratos y demás documentos legales de la Operación, además de documentos complementarios, y por tanto son obligaciones del Prestatario.	
<b>ESGI-1.1. Número de elementos del SGAS completamente preparados</b>	3
<b>ESGI-1.3. Número de comunidades de pueblos afrodescendientes y/o tradicionales* dentro del área de influencia directa e indirecta de la operación</b> <i>*No considerado bajo NDAS7</i>	36335
<b>NDAS-2. Trabajo y condiciones laborales</b>	Sí
<p>El PROCASE II adoptará e implementará políticas y procedimientos de gestión laboral (PGL) que hace parte del PGASE lo actual se aplicará a los planes de Negocio (PN) y Planes de Planes de Inversión Resilientes (PIR) futuros y su fuerza laboral. En este contexto, los trabajadores recibirán información documentada, clara y comprensible sobre sus derechos establecidos en las leyes nacionales de trabajo y empleo y en cualquier convenio colectivo aplicable, incluidos sus derechos relacionados con las horas de trabajo, los salarios, las horas extraordinarias, la remuneración, la pensión y otros beneficios al iniciar la relación laboral. Estas políticas incluyen la atención de quejas de la comunidad, según lo establecido en el Sistema de Gestión Ambiental y Social del Proyecto.</p> <p>Los PGL preparados presentan dos Códigos de Conducta para las fuerzas laborales involucradas en el proyecto, siendo uno directamente para los trabajadores y otro para las empresas contratadas. Con respecto a las condiciones de trabajo, se respetarán los requisitos de las Normas Reglamentarias N° 18 y N° 31 del Ministério del Trabajo y Seguridad Social, que establecen lineamientos administrativos, de planificación y organización, que tienen como objetivo implementar medidas de control y sistemas de seguridad preventiva en los procesos, condiciones y ambiente de trabajo en la Industria de la Construcción. Dicha norma y los PGL cumple con los requisitos de la NDAS.</p> <p><b>Protección de la fuerza laboral.</b> En los PGL del Proyecto se establece que no será permitido el empleo de adolescentes menores a 15 años, conforme establecido en la NDAS2. Tampoco se permitirá el trabajo forzoso, que consiste en cualquier trabajo o servicio que no se realice voluntariamente o que se realice bajo amenaza de fuerza o sanción. Tales requisitos se aplican a los contratos establecidos con terceros o proveedores primarios.</p> <p><b>Cadena Principal de Suministro:</b> Las obras civiles utilizarán los insumos básicos de construcción directa (tierra, cemento, arena, ladrillos, hierro, etc.) y otros equipos que se instalarán para la fase operativa. Los riesgos laborales que conlleva la producción de estos insumos se consideran bajos y ya están reconocidos en la EASE. Los Planos Productivos del Componente 1 del proyecto, además prevén la introducción de prácticas agroecológicas, con vistas a la transición, destinadas a reducir el uso de pesticidas químicos y fertilizantes sintéticos y sustituirlos por insumos naturales (biocaldas, compost, defensas biológicas, siega mecanizada, etc.) con los efectos positivos esperados sobre el suelo, el agua y los productos comercializados.</p> <p>El proyecto prevé la adquisición y uso de paneles solares como forma de energía limpia, así tanto el Código de Conducta de las Empresas incluidos en el PGL establece reglas para la adquisición de estos equipos, considerando que deben llevar a cabo un proceso específico de debida diligencia sobre los riesgos laborales, que incluya la evaluación de los proveedores primarios hasta una evaluación de los riesgos laborales, incluida, en algunos casos, una evaluación independiente del trabajo forzoso en los proveedores primarios.</p> <p><b>Seguridad y Salud en el Trabajo.</b> En las intervenciones del Proyecto se garantizará un ambiente de trabajo seguro y saludable, teniendo en cuenta los riesgos inherentes al proyecto y las clases específicas de peligros, incluidos los riesgos físicos, químicos, biológicos y las amenazas específicas para las mujeres, las personas de diversa identidad de género u orientación sexual, las personas con discapacidad, los niños (en edad de trabajar de acuerdo con la Ley N° 8.069/1999) y los trabajadores migrantes. También se respetarán todos los artículos de las Normas Reglamentarias N° del Ministerio de Trabajo y Seguridad Social, NR-18 -Segurança e Saúde no Trabalho na Indústria da Construção y NR-31 Segurança e Saúde no Trabalho na Agricultura, Pecuária, Silvicultura, Exploração Florestal e Aquicultura. En la EASE y el</p>	

<p>PGASE se detallarán los procedimientos de Salud y Seguridad para los tipos de obras que serán implementados, y de mitigación de los riesgos asociados. Como parte de los PGL fue elaborado el Subprograma de Salud y Seguridad Ocupacional considerando elementos como cumplimiento de las condiciones legales, ruido excesivo, protección respiratoria, trabajos en altura /espacios confinados, manejo de maquinaria móvil, manejo de vehículos, uso de Equipamientos de Protección Personal, uso de uniformes, las condiciones de los campamentos como alimentación, depósitos de materiales incluyendo material peligroso, señalización / aislamiento de zonas, protección contra incendios, orden y limpieza y las reuniones de seguridad y fiscalización.</p>	
<p><b>ESGI-2.1. Número de trabajadores (contratistas, subcontratistas, autónomos y/o entidades gubernamentales) en el sitio del proyecto</b></p>	<p>N/A</p>
<p><b>NDAS-3. Uso eficiente de los recursos y prevención de la contaminación</b></p>	<p>Sí</p>
<p><b>Eficiencia de recursos.</b> No se espera un consumo de agua, energía y otros tipos de insumos significativos que representen riesgo mayor a la disponibilidad de recursos naturales. De todas maneras se prevén sistemas más eficientes de uso de recursos. En la EASE se presentan medidas o proyectos de ingeniería que prevén el manejo de recursos naturales buscando mayor eficiencia, donde las intervenciones del PROCASE II deberán traer mejoras en la eficiencia del consumo de energía, agua y otros recursos e insumos materiales naturales. En el PGASE se describen las principales medidas que integrarán los principios de producción más limpia en el desarrollo del proyecto, con conservación de insumos, materias primas, energía y agua cómo: uso de bombillas eficientes, como la tecnología LED, siempre que haya disponibilidad y mercado para las piezas de repuesto y un mantenimiento viable del sistema; mejor aprovechamiento de la iluminación natural; utilización de materiales que proporcionen un mayor confort térmico, reduciendo el uso de calefactores y aire acondicionado, por ejemplo, suelos o techos compatibles con el clima local, dimensionamiento de ventanas y colocación de zonas que proporcionen ventilación y sistemas de reutilización del agua. En la fase de obras del proyecto, la eficiencia energética está estrechamente relacionada con el uso de equipos con motores eléctricos o de combustible, lo que requiere mediciones y evaluaciones específicas del consumo. Por este motivo, la eficiencia energética en la construcción incluirá algunas acciones más especializadas, como: dimensionamiento correcto de los proyectos de ingeniería eléctrica; inspección de puntos de fuga de agua y energía; sistemas de reutilización de agua y aprovechamiento de aguas pluviales; adquisición de equipos ofrecidos en el mercado con mayor eficiencia energética; mantenimiento constante de la maquinaria; mantenimiento de la tensión de energía; implementación de filtros que puedan corregir alteraciones en la calidad del suministro de energía, fluctuaciones, interferencias electromagnéticas, entre otros.</p> <p><b>Prevención de la contaminación.</b> El PGASE presentan los planes y medidas de prevención de polución, en base a las características de las obras y de operación futura, considerando mínimamente los temas siguientes:</p> <p><u>Residuos.</u> La generación de residuos peligrosos y no peligrosos durante la implementación de los proyectos que integran la muestra del Proyecto presenta riesgo de contaminación del suelo, agua superficial y subterránea, bien como a salud humana. Las actividades del proyecto en materia de gestión de residuos sólidos se ajustan al marco jurídico brasileño (que cumple con los requisitos aplicables de NDAS3) y evitarán que los residuos resultantes de las actividades del proyecto provoquen contaminación. Siempre que sea posible, los residuos sólidos se reciclarán y se utilizarán como fuentes de nutrientes y energía, con el objetivo de desarrollar sistemas de producción de ciclo cerrado. Además, fue preparado un Programa de Gestión de Residuos, considerando principalmente dos tipos de generación, los Residuos de la Construcción (que se aplicará principalmente durante las fases de construcción) y Residuos de la Producción y Transformación Agrícolas, para tratar residuos específicos. Además, serán adoptados los requisitos de la Ley N° 10.305/2010, que establece la Política Nacional de Residuos Sólidos, adoptándose siempre los criterios más restrictivos. Según el PGASE, para cada proyecto o conjunto de proyectos debe elaborarse un Plan de Gestión de Residuos de Construcción (PGRCC), que deberá ser elaborado por la UGP (PROCASE II), que lo transmite al contratista de la obra, siguiendo la hoja de ruta en la que debe describir las actuaciones relativas a la caracterización, manipulación, segregación, envasado, identificación, almacenamiento, recogida, transporte interno y externo, tratamiento y disposición final de todos los residuos generados durante la ejecución de la obra, así como la formación de los implicados en la ejecución del plan.</p>	

Control de las emisiones y atmosféricas y ruidos. En el PGASE por medio del subprograma de Control de Emisiones Atmosféricas y Ruido, se minimizarán las emisiones atmosféricas derivadas del funcionamiento de equipos y maquinaria durante las obras de construcción, así como reducir los niveles de ruido asociados a las mismas. Esto incluye la regulación y el mantenimiento continuo de equipos como la planta de hormigón, la maquinaria y los vehículos en general. Habrá que adoptar prácticas como rociar con agua las pilas de áridos, los carriles y las cargas que puedan liberar partículas. Así como cubrir los camiones con una lona cuando estén cargados. En cuanto al ruido, se prevé la adopción del mantenimiento preventivo de equipos y maquinaria. Siempre que sea posible, se colocarán barreras físicas, como revestimientos, para reducir el ruido en el vecindario, en casos concretos en los que los niveles máximos permitidos superen el tiempo de ocurrencia y los decibelios previstos conforme la norma NBR 10.151 – Avaliação do ruído em áreas habitadas visando o conforto da comunidade.

Control de efluentes: La gestión de los efluentes seguirá las disposiciones de la legislación nacional brasileña, que cumple con los requisitos aplicables de NDAS3: el Consejo Nacional del Medio Ambiente (Conama). Las resoluciones del Conama aplicables son: 430/2011 para la descarga en un cuerpo de agua y 420/2009 para la descarga en el suelo. Las normas siguen las mejores prácticas internacionales. Además, en algunos casos se utilizará el sistema (Fossa + Sumidouro). La gestión de los lodos se realizará mediante la retirada periódica de los lodos con camión de vacío y la estabilización de la materia orgánica en lecho de secado (basado en otros proyectos de referencia del BID). La materia orgánica estabilizada podrá utilizarse como fertilizante en la agricultura local. El manejo de los efluentes generados en el Proyecto está descrito en varios programas como el Programa de control de la calidad del agua y de los efluentes, que prevé medidas de control como Control de la calidad del agua para abastecimiento público, Control de los efluentes de los sistemas colectivos de alcantarillado, Control de la calidad de las cuencas en la zona de vertido de aguas residuales.

Gases de Efecto Invernadero. Se han realizado estimaciones ex ante para los cálculos de Gases de Efecto Invernadero (GEI), se prevé que el proyecto no produzca más de 25,000 toneladas equivalentes de Co<sub>2</sub>. El cálculo para la fase de construcción se realizó una evaluación teniendo en cuenta los tipos de actividades de los proyectos productivos, utilizando la metodología sectorial apropiada del BID. El proyecto en la fase de implementación podrá potencialmente emitir 11.000 tCO<sub>2</sub>e, pero estas serán compensadas por la implementación de las actividades de los PIR y PNs que son basados en prácticas agrícolas de reducción de emisiones de gases de efecto invernadero, asimismo se realizará la instalación de PTARS de menor escala que obtendrán reducciones de emisiones ya que tratarán emisiones residenciales que no eran tratadas previamente al igual la reducción de emisiones a través del financiamiento de cocinas eficientes. Así no se espera impactos relacionados a emisiones brutas durante la fase de implementación del proyecto ya que en su totalidad se tendrán reducciones. Para las etapas de implementación y operación del proyecto FIDA contrató un estudio específico junto a la Food and Agriculture Organization (FAO) para cálculos de gases de efecto invernadero y se concluyó que habrá un balance positivo entre la regeneración de Gases Efecto Invernadero, y la captura de carbono por los sistemas productivos y obras que se van a implementar. El estudio del FAO presenta un balance total estimado de carbono de PROCASE II de -1,449,802 tCO<sub>2</sub>-eq para 20 años de contabilidad, 6 años de implementación y 14 años de capitalización, para un área total de 13,575 hectáreas y 1,072,757 cabezas de ganado. Esto equivale a un balance de carbono de -107 tCO<sub>2</sub>-eq por hectárea y -5 tCO<sub>2</sub>-eq por hectárea por año. El proyecto va a promover una forestación donde ocurrir sus actividades (ver Tabla en Anexo C). El proyecto se desarrolla en dos biomas distintos, Mata Atlántica (8% de las actividades) y Caatinga (92% de las actividades). El balance de carbono es una media ponderada de dos análisis que utilizan los mismos parámetros de datos de actividad, pero con variaciones en los descriptores clave del bioma (tabla 2) y los valores de nivel 2. El balance de carbono estimado representa un balance esperado que oscila entre -1419.739 tCO<sub>2</sub>-eq (tropical húmedo) y -1.452.416 tCO<sub>2</sub>-eq (tropical seco).

**Control de Productos Peligrosos.** En el PGASE se incluye el Plan de Gestión y Control de Productos Contaminantes, donde son incluidas las medidas de control de productos peligrosos que serán utilizados como aquellos relacionados a operación de los sistemas de saneamiento (ej. cloro); de los procesamientos como productos de limpieza y el aceite comestible ("aceite de cocina") que se va a utilizar; y defensivos agrícolas, desde su acondicionamiento y transporte. Además, el Programa de Controle Ambiental de las Obras-PCAO y sus subprogramas establecen las medidas de control para almacenamiento, manoseo y accidentes con productos peligrosos que se van a utilizar en las obras. Pesticidas: El proyecto no podrá financiar la compra de pesticidas y otros insumos sintéticos, sino únicamente insumos alineados con los principios de la agroecología.

<p><b>Erosión y sedimentación.</b> Para las actividades de la muestra que involucran el movimiento de tierras o reemplazo del suelo, el PGASE incluye una Medida de Control de Procesos Erosivos, con las medidas de control de erosión y protección del sistema de drenaje natural. Las medida incluye las siguientes directrices: 1-Reducir al mínimo posible las áreas con suelo expuesto y, cuando sean inevitables, dichas áreas deberán ser protegidas por medidas provisionales, como cobertura con manta, material vegetal, gramíneas y, dependiendo de la situación, contar con la instalación de medidas para retención de sedimentos; 2- Implementar dispositivos de drenaje provisionales de forma que permitan que las aguas escurran sin que surjan procesos erosivos y arrastre de material hacia los lugares con las cotas más bajas; 3- Corregir o estabilizar, en el menor plazo posible, todas las formaciones erosivas surgidas en el área de implementación del proyecto. 4-Los proyectos de implementación de sistemas productivos, principalmente en áreas de APP, deberán respetar las curvas de nivel y la pendiente del terreno, buscando de manera armoniosa contribuir al aumento de la estabilidad del suelo.</p>	
ESGI-3.1. Emisiones totales estimadas de Gases de Efecto Invernadero (GEI) durante la construcción	11000
ESGI-3.2. Emisiones totales estimadas de Gases de Efecto Invernadero (GEI) durante la operación	0
NDAS-4. Salud y seguridad de la comunidad	Sí
<p>Las actividades de construcción de las obras, incluyendo el transporte de material de construcción civil, presentan riesgos menores de accidentes y exposición al ruido, emisiones y sustancias peligrosas para personas de las comunidades locales. La circulación de maquinaria y equipamientos por las comunidades puede presentar un riesgo moderado de accidentes con la población local, una vez que estos podrán circular dentro de comunidades rurales. Para estos escenarios el PGASE presenta los siguientes programas y planes: Programa de Control Ambiental y Social de las Obras, Programa de Comunicación, Consulta e Participación de Partes Interesadas para tratar las interferencias e incomodidades causadas en las comunidades locales, así como un Plan de Transporte, de modo de evitar al máximo las interferencias con la población local. El Subprograma de Reducción y Mitigación del Descontento Comunitario, presenta una serie de procedimientos para reducir los riesgos de la seguridad de la comunidad. Las actividades productivas pueden utilizar pesticidas químicas y otros insumos tóxicos. La ejecución de excavaciones puede presentar riesgos de caídas y atrapamiento. Los EIAS de los Planes de Negocio y Planes de Inversión Resiliente específicos establecerán medidas de mitigación para dichos tipos de impactos potenciales y riesgos.</p> <p>Debido el alcance geográfico del Proyecto, diferentes escenarios podrán ser identificados relacionados a ocurrencia de Covid-19, malaria, dengue y chikunguña y otras enfermedades contagiosas y basadas en el agua. Así, la presencia de trabajadores foráneos en las comunidades locales puede conllevar riesgos de exposición a enfermedades y además riesgos de uso de personal de seguridad. En el PGASE se presentó el Programa de Control de Vectores de Enfermedades, lo cual engloba acciones que deben ir acompañadas de un control de vectores, tanto por la eliminación de hábitats con el consiguiente ahuyentamiento de fauna, como por nuevas situaciones y entornos que puedan aumentar la presencia de estos insectos y animales dañinos. Finalmente, el PGASE presenta el Programa de Educación Ambiental y Sanitaria (PEAS) para la población directa del proyecto donde se incluye acciones específicas de sensibilización y concientización medioambiental de la población priorizando los siguientes contenidos: (i) calidad del agua, saneamiento y residuos sólidos domésticos; (ii) cuidado y mantenimiento de fosas sépticas; (iii) cuidado del suelo; (iv) riesgo de enfermedades transmitidas por el agua y vectores; (v) prevención de accidentes de trabajo, enfermedades profesionales y enfermedades de transmisión sexual; (vi) Áreas de Preservación Permanente - APP; (vii) riesgos relacionados con el uso de pesticidas, herbicidas y agrotóxicos; (viii) beneficios ambientales del uso de sistemas agroecológicos; (ix) respeto a los cauces de los ríos para que no sean terraplenados o estrangulados.</p> <p>El Riesgo de Desastre y Cambio Climático fue clasificado como Moderado, ya que en gran parte de los municipios del PROCASE II, Las amenazas naturales presentes en el área de influencia se identifican como amenazas de sequías, y en las áreas de orillas de algunos de los municipios del proyecto se reconocen amenazas moderadas a altas, principalmente relacionadas a inundaciones fluviales y lluvias según el Screening App de ESG. Para esta operación, ambas amenazas se clasifican como Moderadas y Altas (ver Figuras y Mapas en Anexo C). La criticidad y vulnerabilidad del componente de</p>	

infraestructuras de agua y saneamiento es clasificada como Moderada, según los criterios incluidos en la tabla de criticidad para infraestructura de drenaje, suministro de agua y gestión de aguas residuales (Ver figura en Anexo C): (i) características físicas es Baja, ya que las estructuras de retención no son mayores a 5m; (ii) la pérdida de servicio esencial es Baja, pues no se esperan impactos que afecten a la municipalidad (menores que 10.000 hab.); y (iii) el impacto en la comunidad es Moderado con daños físicos moderados y muy esporádicos. Entonces, la criticidad es clasificada como Moderada. Se esperan incrementos poco significativos de las condiciones actuales de amenazas naturales o de la vulnerabilidad de las comunidades locales o del entorno por la presencia de las estructuras de abastecimiento y tratamiento de agua, sin embargo, considerando los niveles de amenaza identificados, la estimación de la criticidad y de la vulnerabilidad de las intervenciones de infraestructura y los niveles de exacerbación del riesgo, una clasificación de riesgo Moderada es adecuada.

Cómo parte del diagnóstico, la EASE presentó una evaluación de riesgo de desastres, considerando los riesgos y vulnerabilidad del Estado da Paraíba para los escenarios de inundaciones y sequías. Como fuente de información utilizaron el reciente "Atlas de Riscos, Vulnerabilidades e Desastres Ambientales del Estado da Paraíba (2023)". El Índice de Riesgo de Desastres por Inundaciones (IRDI) para el estado de Paraíba se obtuvo por medio de la evaluación de la vulnerabilidad socioambiental con la inundación, integrado a los desastres hidrometeorológicos registrados en el estado (2003 a 2016). Este mapeo revela que 24 municipios del estado presentan un índice de riesgo Muy Alto o Alto frente a las inundaciones. Según los autores, "estas dos clases corresponden al 11% de todo el estado y comprenden el 9% de la población paraibana. Para la amenaza a sequías se consideró vulnerabilidad socioambiental a la sequía y la aridez, integrada a los desastres climáticos registrados en el Estado. Por estar en regiones del semiárido brasileño, Paraíba presenta el 42% de su territorio bajo la condición de Alto o Muy Alto IRDC, (93 municipios), concentrados espacialmente en la porción central de Paraíba y afectando al 23% de la población paraibana.

Para conocer los efectos del cambio climático en el área de influencia del proyecto, se consultó la información "Adapta Brasil" del Gobierno Federal, donde se presenta Índices e Indicadores de riesgo de impactos del cambio climático en Brasil, integrados en una única plataforma, vinculada al Ministerio de Ciencia, Tecnología e Innovación - MCTI. En la EASE fueron considerados los siguientes escenarios de riesgo:

Lluvias: Los resultados de AdaptaBrasil señalan que en el escenario actual ya existe un riesgo medio prevaleciendo en las porciones costeras del estado de Paraíba, mientras que el territorio central del estado aún presenta la mayor parte de su área con riesgo bajo o muy bajo. Para el escenario de 2050 (pesimista) se prevé un aumento significativo de los municipios en riesgo muy alto más cerca de la franja costera, con ampliaciones para riesgo medio en el oeste del estado. Sequía: Según la plataforma AdaptaBrasil, en el escenario actual, en una parte significativa del área de estudio, ocurre un riesgo bajo o medio. En parte de la porción oeste del estado ya hay algunos municipios con riesgo alto para los impactos de la sequía en la seguridad alimentaria. En el escenario para 2050, la incidencia de riesgo medio a alto comienza a prevalecer en el estado. Entre el escenario actual y el escenario de 2050 (pesimista), habrá un aumento en la clase alta, que pasará de 20 a 70 municipios.

Deslizamientos: Analizando los datos de AdaptaBrasil, se puede percibir que en varios municipios de Paraíba ocurre un riesgo medio a alto. Es importante considerar que los deslizamientos normalmente se configuran como fenómenos de menor extensión y que, aunque no afectan toda el área municipal, tienen el potencial de causar grandes daños y poner en riesgo a comunidades y estructuras importantes. En el escenario actual prevalecen los municipios con riesgo medio, pero en el escenario de 2050 (pesimista) pasan a prevalecer los municipios con riesgo alto, con un aumento significativo de municipios en riesgo muy alto.

Inundaciones, Torrentes y Anegamientos: Para inundaciones, torrentes y anegamientos, no ocurren alteraciones marcantes entre los escenarios actuales, prevaleciendo las clases media y alta. Se observa un aumento de municipios en la clase media y alta, con disminuciones en las clases baja y muy alta. Los mapas se encuentran en el Anexo C. En el PGASE se presentó una estructura de un Plan de Gestión de Riesgos de Desastres y Cambio Climático (PGRD), donde además se detallan las directrices para la preparación de un Plan de Respuesta de Emergencia. El PGRD incluye, Evaluación de Riesgos de Desastres y Cambio Climático medidas de Reducción de Riesgos y de Contingencia, acciones de seguimiento, acciones preventivas y correctivas y el Plan de Acción.

<p>La narrativa concluyó que para esta operación no se requiere un análisis completo de riesgo cualitativo, Paso 4 de la Metodología de Evaluación de Riesgo de Desastres y Cambio Climático del Banco (MERDCC), dado que no hay vacíos de información significativos, las medidas de gestión de riesgos se han identificado, y se documentarán exhaustivamente en los PGRD del PGASE de la operación, y es posible con todo ello asegurar un nivel de riesgo tolerable.</p>	
<p><b>ESGI-4.1 Narrativa consistente cumpliendo al menos con el paso 3 de la metodología de Riesgo de Desastres y Cambio Climático</b></p>	<p>Sí</p>
<p><b>ESGI-4.3 Tipos de amenazas naturales presentes en el proyecto/ programa</b>  <i>Tipos de amenazas naturales: Terremoto, Deslizamientos de tierra, Erosión del suelo, Erosión costera, Erosión fluvial, Tsunami, Volcánica, Hundimiento, Sequía, Helada, Ola de frío, Granizo, Marejada ciclónica (inundaciones costeras), Inundación fluvial, Inundación pluvial, Marea, Vientos extremos, Huracán-Viento extremo, Tormenta Tropical, Ola de calor, Retroceso Glacial, Aumento del nivel del mar, Lluvias intensas, Escasez de agua, Incendio forestal</i></p>	<p>Inundación fluvial, Inundación pluvial, Escasez de agua, Incendio forestal, Erosión fluvial, Sequía</p>
<p><b>NDAS-5. Adquisición de tierras y reasentamiento involuntario</b></p>	<p>No</p>
<p>Durante la debida diligencia se evidenció que las intervenciones del Proyecto no generarán reasentamiento involuntario, adquisición de tierras o repercusiones en los medios de subsistencia. De todas maneras, el programa excluirá todas las actividades que conlleven a reasentamiento involuntario (físico y económico) de personas o grupos tradicionales por motivos de las intervenciones. Los requisitos de las exclusiones correspondientes formarán parte del ROP.</p> <p>La operación incluirá titulación de tierra con el objetivo de incrementar eficiencia en la utilización de recursos escasos. Si por un lado la titulación de tierra puede contribuir al desarrollo económico del sector agrícola, por otro puede generar conflictos relativos a los usos y ocupación de tierras entre usuarios y propietarios, a partir de la implementación de la regularización fundaría. La EASE/PGASE incluirá directrices para asegurar que el proceso de regularización de tierras no tenga repercusiones negativas en la población que se beneficiará de él, y directrices que aseguran un levantamiento catastral, mecanismo de quejas y plan de participación y comunicación con los partes afectado-específicos para temas de titulación de tierra. Los riesgos e impactos serán identificados y evaluados para cada proyecto y registrados en la EASE, y cuando pertinente, en las Análisis Sociocultural previstas para las poblaciones tradicionales vulnerables. Las condiciones de elegibilidad serán incorporadas en el SGAS, que reflejará los criterios sociales y ambientales de elegibilidad previstas en el Programa, se destacando el factor de exclusión: está prohibido realizar cualquier desplazamiento físico o económico de personas o grupos con motivo de las intervenciones, principalmente a los pueblos tradicionales, como los indígenas, quilombolas y gitanos. Además, los directrices deberán asegurar la igualdad de género en la titulación de tierra y serán conformes a leyes y decretos nacionales como el Programa Nacional de Ciudadanía y Buen Vivir para Mujeres Rurales, que tiene como objetivo garantizar el acceso a la documentación civil básica, la titulación conjunta de tierras y el territorio ocupado por las mujeres rurales.</p>	
<p><b>ESGI-5.1. Número de hogares (familias o unidades socioeconómicas) físicamente desplazados*</b>  <i>*Incluye hogares desplazados físicamente y personas desplazadas física y económicamente</i></p>	<p>0</p>
<p><b>ESGI-5.2. Número de personas desplazadas físicamente*</b>  <i>*Incluye hogares desplazados físicamente y personas desplazadas física y económicamente</i></p>	<p>0</p>
<p><b>ESGI-5.3. Número de hogares (familias o unidades socioeconómicas) económicamente desplazados</b></p>	<p>0</p>
<p><b>ESGI-5.4. Número de personas desplazadas económicamente</b></p>	<p>0</p>
<p><b>NDAS-6. Conservación de la biodiversidad y gestión sostenible de los recursos naturales vivos</b></p>	<p>Sí</p>

El Proyecto se llevará a cabo en ambientes rurales del Estado de Paraíba dentro de los biomas Caatinga y del Bosque Atlántico en paisajes con larga historia de ocupación humana, la cual ha resultado en un mosaico de hábitats naturales y modificados, algunos de los cuales son críticos. La Caatinga es un bioma semiárido de altos niveles de endemismo y degradación por usos insostenibles históricos, por otro lado, el Bosque Atlántico se reconoce internacionalmente como un ecosistema altamente amenazado y Hábitat Crítico debido al grado histórico de conversión de los bosques de alta biodiversidad para fines agropecuarios y urbanos.

Dentro del área de influencia del Proyecto, existen 23 áreas legalmente protegidas y dos áreas clave para la biodiversidad, considerados como Hábitat Crítico por el Banco (para mayor detalle, ver Figuras 1 e 2 del Anexo C), además de varias especies indicadores de Hábitats Críticos. Los criterios de elegibilidad, descritos en el SGAS y el ROP, excluirán actividades que generan intervenciones con impactos adversos a Hábitat Crítico o que requieran o resulten en la conversión significativa o degradación de Hábitats Naturales o la expansión de la frontera agropecuaria. Además, para mantener la Categoría B, el SGAS y el ROP del Proyecto excluyen actividades que resulten en impactos negativos sobre áreas legalmente protegidas, incluyendo toda unidad de conservación. Para estos fines, el Ejecutor deberá desarrollar un mecanismo para identificar la presencia de Hábitats Críticos en sus procesos de evaluación de actividades a ser financiadas durante la vida del préstamo. Las actividades para financiar por el Proyecto, incluyendo los planes de desarrollo sostenible, se deben diseñar de manera que no resulte en la pérdida neta de biodiversidad en Hábitats Naturales como definido por NDAS 6.

En el caso de actividades en Hábitats Críticos, se presentará al Banco un Plan de Acción de Biodiversidad para su no objeción como requisito del Plan de Acción Ambiental y Social. El diseño, construcción, operación y mantenimiento de los puentes mojados deberán incluir medidas de mitigación para evitar y minimizar impactos negativos a los ambientes acuáticos, incluyendo la conectividad para organismos acuáticos. El SGAS excluirá el uso o introducción de especies exóticas invasivas en las actividades financiadas por el Proyecto y además excluirá obras o actividades que provoquen impactos negativos a servicios ecosistémicos prioritarios para las comunidades locales. Como operación de desarrollo rural con enfoque en el uso de recursos naturales vivos, el Proyecto debe ser diseñado para que toda gestión de recursos naturales vivos financiado o promovido por el mismo se realice de acuerdo con normas reconocidas de sostenibilidad de acuerdo con los párrafos 25 a 28 de esta NDAS. Además, el SGAS y PGASE incluyen mecanismos para verificar que la cadena de suministros no resulte en conversión significativa de hábitats naturales o impactos a hábitats naturales en el caso de financiar subproyectos o actividades que requieren insumos de recursos naturales vivos.

<b>ESGI-6.1. Área en hectáreas (ha) de hábitats naturales afectados negativamente (por ejemplo, convertidos o degradados)</b>	0
<b>ESGI-6.2. Área en hectáreas (ha) de hábitats críticos afectados negativamente (por ejemplo, convertidos o degradados)</b>	0
<b>NDAS-7. Pueblos indígenas</b>	Sí

Durante la debida diligencia se verificó que en el área del proyecto hay comunidades quilombolas, indígenas, pescadoras y gitanos que responden a las características definidas en NDAS 7 para definir “Pueblos Indígenas,” por lo cual se preparó un Análisis Sociocultural Estratégica (ASCASCEE) para el proyecto (ver Anexo de Mapas), y como parte del SGAS del Programa que presentó sus características generales, los principales riesgos y medidas generales de mitigación, que hacen parte del PGASE. El ASCEE desarrollado indicó ser importante mapear y construir una línea de base de las comunidades tradicionales beneficiarias de los proyectos, incluyendo un proceso de Consulta Participativa Informada y posterior Consentimiento Libre, Previo e Informado; reunió informaciones relevantes para actualizar el Plan de Participación de Partes Interesadas (PPPI), que deberá obtener la aprobación del Banco anterior a la consulta significativa, que, por su vez, deberá ocurrir antes del inicio de las intervenciones. Además, recomienda que se sigan las mismas directrices y normativas para las comunidades indígenas para la evaluación de impacto y consulta informada de cualquier comunidad tradicional existente (reconocida formalmente o no), ya sean quilombolas, pescadores, mariscadores, gitanos, entre otros.

El AASCEE incluyó un enfoque de vulnerabilidad a la que están sujetas las comunidades al momento de construir infraestructura de saneamiento (Componente 2) e implementar infraestructura u otras acciones relacionadas con los Planes Productivos (Componente 2), así como brindar orientaciones y lineamientos para abordar dichas vulnerabilidades en diálogo con las comunidades. Otro riesgo se refiere a la posibilidad de discriminación, prejuicio y/o

acoso durante las intervenciones, o aún de exclusión de las comunidades indígenas de los procesos participativos del programa y/o de no obtención de su consentimiento libre, previo e informado. proceso de consulta previa, libre e informada. Por lo tanto, el ASCEE Indicó la inclusión de formación de los trabajadores el respeto a la integridad cultural de las poblaciones directa o indirectamente afectadas por los proyectos.

El programa incluye titulación de tierras y directrices en el PGASE para asegurar que en caso de necesitar titulación en comunidades indígenas se seguirá el Programa de Comunicación, y Consulta y Participación y lineamientos para el Consentimiento Libre, Previo e Informado elaborada para la operación. El SGAS también establece la necesidad de obtener todas las autorizaciones aplicables antes del inicio de las intervenciones con comunidades indígenas, lo que incluye aquellas relacionadas a la Fundación Nacional de los Pueblos Indígenas (FUNAI). El SGAS define aún los roles mínimos que deberán componer la estructura de la Unidad de Gestión del Programa (UGP) con relación a los temas socioculturales, pudiendo haber indicación de un especialista social con conocimiento en temas indígenas para apoyo.

<b>ESGI-7.1. Número de comunidades Indígenas* que se encuentran dentro del área de influencia directa e indirecta de la operación</b> <i>*Para efectos de la NDAS7, los pueblos tradicionales son tratados como pueblos indígenas, según lo reconocen las leyes nacionales</i>	34
<b>NDAS-8. Patrimonio cultural</b>	Sí

El Estado de Paraíba es conocido por su rica variedad de yacimientos arqueológicos, que atestiguan la presencia de pueblos antiguos en la región. Destacan los sitios con vestigios de la presencia indígena, como las pinturas rupestres encontradas en varias regiones del Estado.

Patrimonios Arqueológicos: Entre los primeros pasos de la investigación, se realizó un levantamiento para verificar la existencia de Sitios Arqueológicos conocidos en los municipios estudiados. De esta forma, se levantó junto al Cadastro Nacional de Sítios Arqueológicos (CNSA) del Instituto do Patrimônio Histórico e Artístico Nacional (IPHAN) la existencia de tales sitios en el estado de Paraíba. Según el levantamiento, en Paraíba, se catalogaron en el CNSA 192 sitios arqueológicos, resumidos por Territorio Rural y por municipio en el Anexo 8.8. Conforme presentado en el mapa de sitios arqueológicos de Paraíba, a continuación, la concentración de sitios arqueológicos está en la porción central del estado, regiones de los Territorios Rurales de Borborema, Cariri, Curimataú y este del Médio Sertão. Se destaca que la mayor parte de los sitios arqueológicos registrados abarcan vestigios precoloniales, cabe mencionar la mayor presencia de sitios históricos en los Territorios Rurales que abarcan áreas costeras, como el TR Mata Norte, donde se encuentra el municipio de Baía da Traição, escenario de eventos importantes que marcaron la colonización de los indígenas por los pueblos europeos.

Patrimonio Paleontológico: En el diagnóstico de la EASE, Sousa e Uiraúna-Brejo das Freiras son dos cuencas cretácicas de la región del Río do Peixe que poseen una gran cantidad de huellas de dinosaurios. Estas cuencas están ubicadas en el oeste del Estado de Paraíba, y sus orígenes se relacionan con los movimientos de fallas transcurrentes a lo largo de lineamientos preexistentes del basamento, durante la apertura del Océano Atlántico. La principal icnofauna de tetrápodos se compone de huellas aisladas y rastros de grandes y pequeños terópodos, además de ornitópodos. También hay icnofósiles de invertebrados como pistas y excavaciones producidas por artrópodos y anélidos. Los fósiles son palinomorfos, fragmentos de plantas, ostrácodos, conchostráceos, escamas de peces y huesos de crocodylomorfos. Estos fósiles están preservados en depósitos de abanicos aluviales, ríos anastomosados, meandranes y lagos someros de edad neocomiana - Berriasiano a Barremiano inferior.

Ya se han identificado y mapeado 22 sitios icnofosilíferos, y se han reconocido 296 rastros de grandes terópodos; 29 de pequeños terópodos; 42 de saurópodos; 2 de ornitíscuos cuadrúpedos; 28 de ornitópodos graviportales; un conjunto de huellas batracopódidas; una impresión lacertoide; un gran número de huellas no clasificables y muchos rastros de semi-natación atribuidos a quelonios. Según presentado en la EASE, en total, ya se han clasificado más de 395 individuos dinosaurios. El área más importante de distribución de huellas fósiles, ubicada en Passagem das Pedras (Fazenda Ilha) en el municipio de Sousa, es actualmente un parque natural - Monumento Natural Vale dos Dinossauros. El parque, con

40 hectáreas de área, es uno de los sitios paleontológicos mejor preservados en Brasil. Posee infraestructura turística y guías capacitados para el turismo ecológico y la protección del sitio icnofosilífero.

El Monumento Vale dos Dinossauros comprende un área de más de 1.730 km<sup>2</sup>, abarcando aproximadamente 30 localidades en el alto sertón de Paraíba, entre ellas los municipios de São João do Rio do Peixe, Sousa, Aparecida, Marizópolis, Vieirópolis, São Francisco, São José da Lagoa Tapada, Santa Cruz, Santa Helena, Nazarezinho, Triunfo, Uiraúna, Cajazeiras. Estas localidades se concentran en los Territorios Rurales del Vale do Piranhas y Alto Sertão.

Las actividades previstas en el proyecto tienen potencial de afectar recursos de patrimonio cultural en las zonas en las cuales se desarrollen las intervenciones. Poderá ocurrir impacto sob sítios arqueológicos no caso de implantação das tecnologias sociais associadas a tanques de pedra, já que este tipo de patrimônio se forma nos leitos rochosos.

Con la presencia de áreas de concentración de vestigios en la región de Sousa (Río do Peixe), en la porción noroeste de Paraíba, se debe prestar atención a los riesgos en la implantación de estructuras que puedan afectar los sitios o inundar áreas con su presencia. La destrucción o interrupción del acceso a estos sitios puede significar la pérdida de un bien patrimonial prehistórico y de conocimiento científico.

El proyecto tendrá alcance estatal y aún no se han definido todas las localidades del estado que serán beneficiadas, de esta manera el PGASE se presentó el **Programa de Proteção ao Patrimônio Cultural e Achados Fortuitos**. Este programa incorpora directrices para la preservación del patrimonio cultural local y el rescate de eventuales patrimonios encontrados en los lugares de implementación de tecnologías sociales asociadas a tanques de piedra y otras actividades que involucren excavación. También presenta directrices para el caso de hallazgos fortuitos no previstos durante la ejecución de los trabajos de implementación de los proyectos, en especial aquellos que puedan involucrar excavaciones y movimientos de tierra.

Durante la implementación, áreas con potencial paleontológico podrán sufrir impactos. De esta forma, es importante certificar la existencia de sitios y asegurar la salvaguarda junto a la Agencia Nacional de Mineração (ANM).

<b>ESGI-8.1. Área en hectáreas (ha) de patrimonio cultural tangible afectada negativamente</b>	0
<b>NDAS-9. Igualdad de género</b>	Sí

No se esperan impactos diferenciados o adversos basados en la identidad de género o la orientación sexual, ni que afecten desproporcionadamente a minorías, grupos vulnerables o personas con discapacidades. Durante la diligencia debida, los riesgos relacionados con el género y la diversidad (incluido el riesgo de abuso y explotación sexual infantil) se analizaron y los indicadores de seguimiento fueron definidos en el PGASE, y harán parte del SGAS.

La EASE recomienda incluir el tema de género y diversidad en los programas de formación para trabajadores y contratistas, con información sobre leyes punitivas, buenas prácticas y conductas, y canales de denuncia; además, se recomienda sensibilizar a las comunidades beneficiarias sobre la importancia y el papel de la mujer, así como sobre la igualdad de género y la lucha contra la violencia basada de género (VBG).

Adicionalmente, se prestará especial atención a comprender cómo las desigualdades de género interactúan con otras desigualdades, como factores socioeconómicos, étnicos, raciales, de discapacidad y de otro tipo, y cómo esta interseccionalidad puede exacerbar las barreras para acceder a los beneficios del Programa, limitar la capacidad de hacer frente a los impactos negativos y crear otras vulnerabilidades. Para tanto, se propondrán medidas para la inclusión de las mujeres en los procesos consultivos en los planes de participación de las partes interesadas. Un Código de Conducta será parte integrante del PGASE y del SGAS para las intervenciones de la muestra y se incluirá en los documentos de licitación. Es importante resaltar que el Código de Conducta deberá ser aplicable a todos los colaboradores involucrados con las intervenciones, especialmente aquellos involucrados con la implantación de las infraestructuras en comunidades indígenas o tradicionales. El PPPI, a su vez, establece el principio central de igualdad de género, añadiendo la inclusión de la diversidad y la consideración de factores de vulnerabilidad específicos relacionados a género en el diseño y en la implementación de las estrategias de participación, a lo largo del ciclo de vida del proyecto, para garantizar la debida representatividad.

ESGI-9.1. Porcentaje de mujeres que participan en la consulta pública	N/A
<b>NDAS-10. Participación de las partes interesadas y divulgación de información</b>	Sí
<p>El Plan de Participación de Partes Interesadas (PPPI) del Programa fue elaborado basado en los requisitos de la NDAS 10 del MPAS. Dado que, en esta fase de preparación no se conoce específicamente las comunidades a ser beneficiarias o afectadas por el proyecto, el PPPI fue estructurado a partir de un abordaje marco, con principios y lineamientos generales para el cumplimiento de los requisitos de la NDAS 10 durante la fase de ejecución, además de las directrices y procedimientos necesarios para la planificación y organización de la consulta significativa de la fase preparatoria (con carácter estratégico). El PPPI establece la responsabilidad de la Agencia Ejecutora, a través de su Unidad de Gestión del Programa, en cuanto a la consecución apropiada de los principios, lineamientos, procedimientos y acciones determinados en el plan. El documento reúne las principales actividades para apoyar el objetivo de involucramiento significativo y continuo de las partes interesadas y personas afectadas durante todo el ciclo de proyecto, previendo: análisis de las partes interesadas; profundización/adequación de las estrategias de participación y comunicación según las comunidades involucradas en las actividades del proyecto; los principios y objetivos de la disseminación de información sobre el proyecto; la necesidad de consultas continuas y socioculturalmente adecuadas a las partes interesadas (incluyendo los requisitos específicos de la NDAS 7 hacia los pueblos indígenas y otras comunidades tradicionales); el reporte apropiado a las partes interesadas; los objetivos y forma de operación del mecanismo de gestión de quejas.</p> <p>El PPPI indicó que se llevará a cabo un formato mixto de consultas, especialmente considerando las características de las comunidades involucradas, siempre que posible presencial. La consulta pública y la publicación del respectivo informe ocurrirán previo a la fecha del Directorio del Banco. La implementación del PPPI presupone un proceso de consulta significativa con los Grupos de Interés identificados, utilizando formatos comprensibles, accesibles y culturalmente apropiados para la divulgación y como parte de la evaluación ambiental y social. Cabe destacar que el PPPI es una parte integral y fundamental del Sistema de Gestión Ambiental y Social del Programa y debe ser tratado como un documento vivo. Por lo tanto, la Agencia Ejecutora tiene la responsabilidad de mantenerlo actualizado periódicamente y, a medida que avanza el proyecto, adaptarlo a las diferentes necesidades, a la aparición de nuevos Grupos de Interés y a la dinámica del proyecto, al igual que todos los demás procesos de gestión incluidos en el SGAS del PROCASE II.</p> <p>Durante la fase de ejecución del Programa, el PPPI establece que, tan pronto sean definidas las ubicaciones específicas de los terrenos para implantación de las infraestructuras, la UGP-PADEAM (con el apoyo de la consultoría de gestión de proyecto contratada) deberá identificar las personas afectadas y partes interesadas de cada intervención. Este mapeo y análisis resultará en la actualización del PPPI, lo cual deberá presentar de forma detallada las estrategias de comunicación y participación adecuadas según las personas afectadas y las partes interesadas identificadas. El PPPI deberá incluir medidas específicas dirigidas a la efectiva participación de personas y grupos sociales vulnerables y guiará la organización de las consultas significativas. La actualización del PPPI es una condición previa a la realización de las consultas y a la publicación de los documentos de licitación de obras del Programa.</p> <p>Además, la NDAS10 indica la implementación del mecanismo de quejas, por donde se recibirá sugerencias, quejas y reclamaciones a través de los canales establecidos y publicitados a los Grupos de Interés del Programa, con especial atención a los considerados Grupos de Interés Afectados por las actividades. Se establecerán los canales de atención directa al Programa, debiendo tener en cuenta aspectos etno-culturales, sociales, de accesibilidad y de género para facilitar una amplia participación. Oportunamente tanto el PPPI, cuanto los demás documentos socioambientales, fueran divulgados en la página web del BID en 07 de junio de 2024 previo a la Misión de Análisis.</p>	
ESGI-10.1. Número de documentos socioambientales divulgados por el BID y el Prestatario	4
<b>Requisitos de divulgación de información (para el BID)</b>	
<p>Los siguientes documentos socioambientales fueron divulgados en la web página del BID en 07 de junio de 2024: <i>Avaliação Ambiental e Social Estratégica-AASE (Versão Preliminar)</i>; <i>Plano de Gestão Ambiental y Social Estratégica-PGASE (Versão Preliminar)</i>; <i>Avaliação Sociocultural Estratégica-ASCASCEE (Versão Preliminar)</i> y</p>	

*Plano de Consulta e Participação de Partes Interessadas (Versão Preliminar)*. Los documentos pueden ser encontrados en el website del BID (<https://www.iadb.org/es/proyecto/BR-L1623>) y en la página del PROCASE II (<https://www.procasse.pb.gov.br/consultapublica>).

## Anexo A. Plan de Acción Ambiental y Social (PAAS)

Plan de Acción Ambiental y Social (PAAS)	
<b>Nombre de la operación</b>	Proyecto de Desarrollo Sostenible de Paraiba - PROCASE II
<b>Número de la operación</b>	BR-L1623
<b>Versión de PAAS</b>	V.1
<p>El contenido del PAAS debe ser acordado entre el BID y el Prestatario durante la debida diligencia. El PAAS identificó medidas materiales y acciones específicas para abordar las brechas ambientales y sociales identificadas durante la debida diligencia A&amp;S o las acciones clave que se llevarán a cabo posteriormente. Todos los requisitos se establecerán claramente, de modo que no haya ambigüedad en torno al cumplimiento, el tiempo y el seguimiento. El PAAS se adjunta al ESRS y será legalmente vinculante (referencia cruzada en el contrato de préstamo).</p> <p><i>Según lo acordado por el Banco y el Prestatario, este PAAS puede ser revisado de vez en cuando durante la ejecución del Proyecto para reflejar la gestión adaptativa de los cambios del Proyecto y las circunstancias imprevistas o en respuesta a la evaluación de desempeño del Proyecto realizada bajo el PAAS en sí. En tales circunstancias, el Prestatario, a través de la Agencia Ejecutora, acordará los cambios con el Banco y actualizará el PAAS para reflejar dichos cambios. Los acuerdos sobre cambios al PAAS se documentarán mediante el intercambio de cartas firmadas entre el Banco y el Prestatario, a través del Organismo Ejecutor. El Prestatario, a través de la Agencia Ejecutora, divulgará sin demora el PAAS actualizado.</i></p>

## Anexo B. Requisitos ambientales y sociales legales

**Nota general:** De acuerdo con cada operación y país, el especialista de ESG podrá proponer ajustar o incorporar cláusulas de acuerdo con la operación, país y temas relevantes

Con el propósito de cumplir con los requerimientos del Marco de Políticas Ambientales y Sociales (MPAS), el Prestatario, directamente o a través del Organismo Ejecutor, cumplirá a satisfacción del Banco con las condiciones y términos contractuales establecidos en este Anexo. Cuando se ha determinado que un Plan de Acción Ambiental y Social (PAAS) es necesario, este será contractualmente vinculante (referencia cruzada en el contrato de préstamo – ver párrafo abajo). El especialista de ESG se debe asegurar que la referencia sea incluida en dicha cláusula.

**Esta cláusula debe ser incluida en el correspondiente contrato de un proyecto que tenga un PAAS (categoría A, B o C con ESRR sustancial o alto)**

*Condiciones Especiales. “CLÁUSULA XX. Otros documentos que rigen la ejecución del (Proyecto/Programa). (a) Las Partes convienen en que la ejecución del Proyecto será llevada a cabo de acuerdo con las disposiciones establecidas en el presente Contrato y lo establecido en el ROP, el SGAS y el PAAS. Si alguna disposición del presente Contrato resultase inconsistente o estuviere en contradicción con las disposiciones del ROP y PAAS prevalecerá lo previsto en este Contrato. Asimismo, las Partes convienen que será necesario el consentimiento previo y por escrito del Banco para la introducción de cualquier cambio al ROP, SGAS, Y PAAS.”*

Los términos y condiciones, así como el PAAS, solo podrán ser modificados con el consentimiento previo y por escrito del Banco, incluyendo el visto bueno de ESG.

### Normas Generales

Las Normas Generales del modelo de contrato para préstamos para inversión, específicamente el Artículo 6.03 Disposiciones Generales para la ejecución del Proyecto/Programa, 6.06 Gestión ambiental y social, y Artículo 7.02 Planes e informes establecen la base legal para garantizar el cumplimiento de las políticas A&S durante la ejecución de la operación.

#### ***ARTÍCULO 6.06. Gestión ambiental y social.***

*(a) El Prestatario se compromete, por sí o, por intermedio del Organismo Ejecutor, a llevar a cabo la ejecución (preparación, construcción y operación) de las actividades comprendidas en el Proyecto, de conformidad con el Marco de Política Ambiental y Social (MPAS) del Banco, sus Normas de Desempeño Ambientales y Sociales, y de acuerdo con las disposiciones ambientales y sociales específicas que se incluyan en las Estipulaciones Especiales de este Contrato.*

*(b) El prestatario se compromete, por sí o, por intermedio del Organismo Ejecutor a informar inmediatamente al Banco la ocurrencia de cualquier incumplimiento de los compromisos ambientales y sociales establecidos en las Estipulaciones Especiales.*

(c) El prestatario se compromete, por sí o, por intermedio del Organismo Ejecutor, a implementar un plan de acción correctiva, acordado con el Banco para mitigar, corregir o compensar las consecuencias adversas que puedan ocurrir por el incumplimiento en la implementación de los compromisos ambientales y sociales establecidos en las Estipulaciones Especiales.

(d) El Prestatario se compromete, a permitir que el Banco por sí mismo o mediante contratación de servicios de consultoría, realice actividades de supervisión, inclusive auditorías ambientales y sociales del Proyecto, con el fin de confirmar el cumplimiento de los compromisos ambientales y sociales establecidos en las Estipulaciones especiales.”

#### **Definiciones para incluir en el Contrato**

**“Plan de Acción Ambiental y Social”** o **“PAAS”** significa el plan de acción ambiental y social del Proyecto/Programa, acordado con fecha [                    ], el cual establece las acciones necesarias, dentro de plazos determinados, para que el Proyecto/Programa cumpla con las Normas de Desempeño Ambientales y Sociales.

**“EASE”** significa Evaluación Ambiental y Social Estratégica.

**“PGASE”** significa Plan de Gestión Ambiental y Social Estratégico.

**“SGAS”** significa Sistema de Gestión Ambiental y Social.

**“PAB”** significa Plan de Acción de Biodiversidad.

**“Normas de Desempeño Ambientales y Sociales”** o **“NDASs”** se refieren a las 10 Normas de Desempeño que forman parte del Marco de Políticas Ambientales y Sociales (GN-2965-23).

**“Código de Conducta”**: Declaración formal de principios que establecen las normas de comportamiento de los trabajadores en relación con las medidas de prevención y gestión de los riesgos ambientales, laborales y sociales del Proyecto, incluyendo los riesgos de salud y seguridad ocupacional, violencia sexual y de género, discriminación, y abuso y explotación sexual infantil y de otras personas o grupos vulnerables, en cuanto ello resulte aplicable a las obras, servicios diferentes de consultoría, consultorías, y bienes.

**“Instalaciones conexas”**: obras o infraestructuras nuevas o adicionales, independientemente de la fuente de financiamiento, consideradas esenciales para que un Proyecto/Programa financiado por el Banco pueda funcionar, tales como caminos de acceso, líneas ferroviarias, líneas eléctricas o ductos, tanto nuevos como adicionales, que deban construirse para el Proyecto/Programa; campamentos de obra o alojamientos permanentes, tanto nuevos como adicionales, que se requieran para alojar a los trabajadores del Proyecto/Programa; plantas de energía nuevas o adicionales que se requieran para el Proyecto/Programa; instalaciones de tratamiento de efluentes nuevas o adicionales para el Proyecto/Programa; y almacenes y terminales marítimas, nuevos o adicionales, construidos para la gestión de los bienes del Proyecto..

## Condiciones Especiales

### A. Cláusulas para incorporar en las Estipulaciones Especiales para todas las operaciones categoría B

#### Condiciones previas al primer desembolso

a. Que el Prestatario, directamente, o por intermedio del Organismo Ejecutor, haya aprobado y haya entrado en vigencia el ROP en los términos y condiciones acordados previamente con el Banco, que deberá incluir, entre otros elementos, los requerimientos ambientales y sociales e incorporar como anexos el Sistema de Gestión Ambiental y Social, el Plan de Gestión Ambiental y Social y el PAAS.

b. Que como parte de la estructura de ejecución del Proyecto cuya conformación es una condición previa al primer desembolso de los recursos del Proyecto, se haya designado mínimamente (i) un coordinador general; (ii) un coordinador técnico; (iii) un coordinador administrativo financiero; (iv) un coordinador operacional del componente I; (v) un coordinador operacional del componente II; (vi) un especialista en género y diversidad; (vii) un especialista en PCT y salvaguardias sociales; (viii) un especialista en salvaguardias ambientales; (ix) un especialista en monitoreo y evaluación; (x) un especialista en adquisiciones; y (xi) un especialista en gestión del conocimiento, comunicación y cooperación sur-sur y triangular (CSST)

Justificación: Condición necesaria para garantizar el cumplimiento con la NDAS 1.

#### Condiciones especiales de Ejecución

Para aplicar y poner en práctica el Artículo 6.06 Gestión Ambiental y Social párrafo (a) de las Normas Generales, las siguientes disposiciones deben ser incluidas en la cláusula correspondiente a Gestión Ambiental y Social en las Estipulaciones Especiales para todas las operaciones de Categoría B.:

##### *Cláusula XX. Gestión Ambiental y Social*

2. Para efectos de lo dispuesto en los Artículos 6.06 y 7.02 de las Normas Generales, las partes convienen que la ejecución del Proyecto se regirá por las siguientes disposiciones que se han identificado como necesarias para el cumplimiento de los compromisos ambientales y sociales del Proyecto/Programa:

- (a) El Prestatario acuerda diseñar, construir, operar, mantener y monitorear el Proyecto y administrar los riesgos A&S de las Instalaciones Conexas del Proyecto, si las hay, directamente o a través del Organismo Ejecutor, o a través de cualquier otro contratista, operador o cualquier otra persona que realice actividades relacionadas con el Proyecto de acuerdo con el Sistema de Gestión Ambiental y Social, Plan de Gestión Ambiental y Social, Plan de Gestión del Riesgo de Desastres y Cambio Climático, Plan de Acción Ambiental y Social, y cualquier

*otro plan ambiental, social, de salud y seguridad laboral que haya sido preparado y/o que deba ser elaborado durante la ejecución, y los requisitos incluidos en el Plan de Acción Correctiva*

- (b) El Prestatario, directamente o a través del Organismo Ejecutor, deberá asegurar que el Proyecto sea implementado de acuerdo con el PAAS de fecha 17 de junio, en una manera aceptable para el Banco. Con este propósito, el Prestatario deberá asegurar que sus costos sean cubiertos y contar con el personal requerido para su implementación. El PAAS podrá ser modificado con el consentimiento previo y por escrito del Banco, según se indica en el mismo.*
- (c) El Prestatario, directamente o a través del Organismo Ejecutor, deberá: (i) implementar procesos de participación con las comunidades afectadas y partes interesadas de las actividades previstas en el Programa/Proyecto; (ii) divulgar toda documentación ambiental y/o social del Sistema de Gestión Ambiental y Social; (iii) establecer, publicitar, mantener y operar un mecanismo de quejas y reclamos accesible, eficaz y eficiente para facilitar la atención o resolución de las preocupaciones que pudieren surgir por la implementación de las actividades del Programa/Proyecto, en una manera aceptable para el Banco.*
- (d) El Prestatario, directamente o, a través del Organismo Ejecutor, se compromete a asegurar que en todos los documentos de licitación y contratos, a ser financiados con recursos del Préstamo se incluyan disposiciones que exijan que los solicitantes, oferentes, proponentes, contratistas, consultores, representantes, miembros del personal, subconsultores, subcontratistas, y proveedores de bienes y servicios, sus representantes, y entidades supervisoras se obliguen, entre otros aspectos, a: (a) cumplir con los instrumentos ambientales y sociales del SGAS, PAAS, PGAS, incluyendo disposiciones y procedimientos para prevenir trabajo infantil y trabajo forzoso; (b) adoptar y hacer cumplir el Código de Conducta del Proyecto, el cual deberá ser proporcionado y debidamente notificado a todos sus trabajadores [y (c) en caso de Proyectos que prevean la adquisición de paneles solares o componentes de paneles solares, el Prestatario directamente o a través del organismo ejecutor se asegurará que los respectivos procesos de adquisiciones, documentos de licitación y contratos incluyan las disposiciones específicas del Banco que previenen cualquier tipo de trabajo infantil o forzoso].*

Justificación: Condiciones necesarias para cumplir con los requisitos de las NDAS aplicables al Proyecto.

### **Supervisión y Evaluación**

Las siguientes disposiciones deben ser incluidas para todas las operaciones Categoría A y B en el Capítulo V “Supervisión y Evaluación del Programa”.

1. *El Prestatario, directamente o a través del Organismo Ejecutor, deberá:*
  - (a) Preparar y presentar a satisfacción del Banco, un Informe de Cumplimiento Ambiental y Social, en la forma y contenido acordados con el Banco sobre la implementación del SGAS y el cumplimiento del PAAS, de haberlo, como parte del informe de progreso semestral. Si el Banco lo solicita dentro de los dos (2) años siguientes al último desembolso de recursos del Préstamo, el Prestatario se compromete a proporcionar al Banco información sobre cuestiones ambientales y sociales relacionadas con el Proyecto.*

- (b) *Adoptar todas las medidas necesarias para recolectar, compilar y suministrar al Banco a través de informes regulares, con la frecuencia acordada entre el Banco y el Organismo Ejecutor, o cuando sea requerido por el Banco, que incluyan: (i) la información del estado de implementación del SGAS y de cumplimiento del PAAS, en caso corresponda; (ii) las condiciones, de haberlas, que interfieren o podrían interferir con la implementación del SGAS y/o cumplimiento del PAAS, en caso corresponda; y (iii) las medidas correctivas y preventivas que han sido tomadas o que deban ser tomadas para abordar las condiciones indicadas en el literal (a) anterior; y,*
- (c) *Con respecto al Proyecto y sus instalaciones conexas, el Organismo Ejecutor notificará al Banco por escrito dentro de los diez (10) días desde que toma conocimiento de cualquier (1) incumplimiento material de los requisitos ambientales y sociales; (2) incidente o accidente grave relacionado con las obras del Proyecto donde haya resultado en fatalidades o lesiones con invalidez permanente de trabajadores o terceros, así como casos de violencia sexual asociado a un trabajador contratado por el Proyecto y cualquier otro que a criterio del organismo ejecutor pueda generar un impacto significativo en el ambiente, la comunidad o trabajadores; (3) acción reguladora de carácter ambiental, social y/o de salud y seguridad ocupacional que de inicio a un proceso sancionador por falta grave; o (4) cualquier riesgo e impacto ambiental y social recientemente identificado, que pueda afectar los aspectos ambientales y sociales del Proyecto y de sus instalaciones conexas; en cada caso dicha notificación incluirá acciones tomadas o propuestas con respecto a tales eventos.*

Justificación: Condiciones necesarias para hacer seguimiento al desempeño socioambiental del Programa.

#### **B. Cláusulas para incorporar en las Estipulaciones Especiales caso por caso (categoría A y B)**

*El Prestatario, directamente o a través del Organismo Ejecutor, no deberá participar en ninguna de las siguientes actividades con respecto al Programa y/o subproyectos: Proyectos de categoría A y actividades que conlleven reasentamiento involuntario (físico y económico), proyectos que impacten negativamente las comunidades tradicionales y/o pueblos indígenas, proyectos que impliquen la conversión significativa o degradación de hábitats naturales, proyectos que impliquen riesgo de impacto adverso cuantificable a hábitats críticos o en áreas legalmente protegidas, proyectos que causen un impacto negativo significativo en bienes o activos culturales críticos, por ejemplo, yacimientos religiosos, arqueológicos, paleontológicos y otros.*

Justificación: Los criterios de elegibilidad excluyen los proyectos que generan impactos que no caracterizan a los proyectos de la muestra representativa, de acuerdo con PR-202.

#### **C. Disposiciones para incluir en el ROP**

La siguiente disposición normalmente debería incluirse en el ROP:

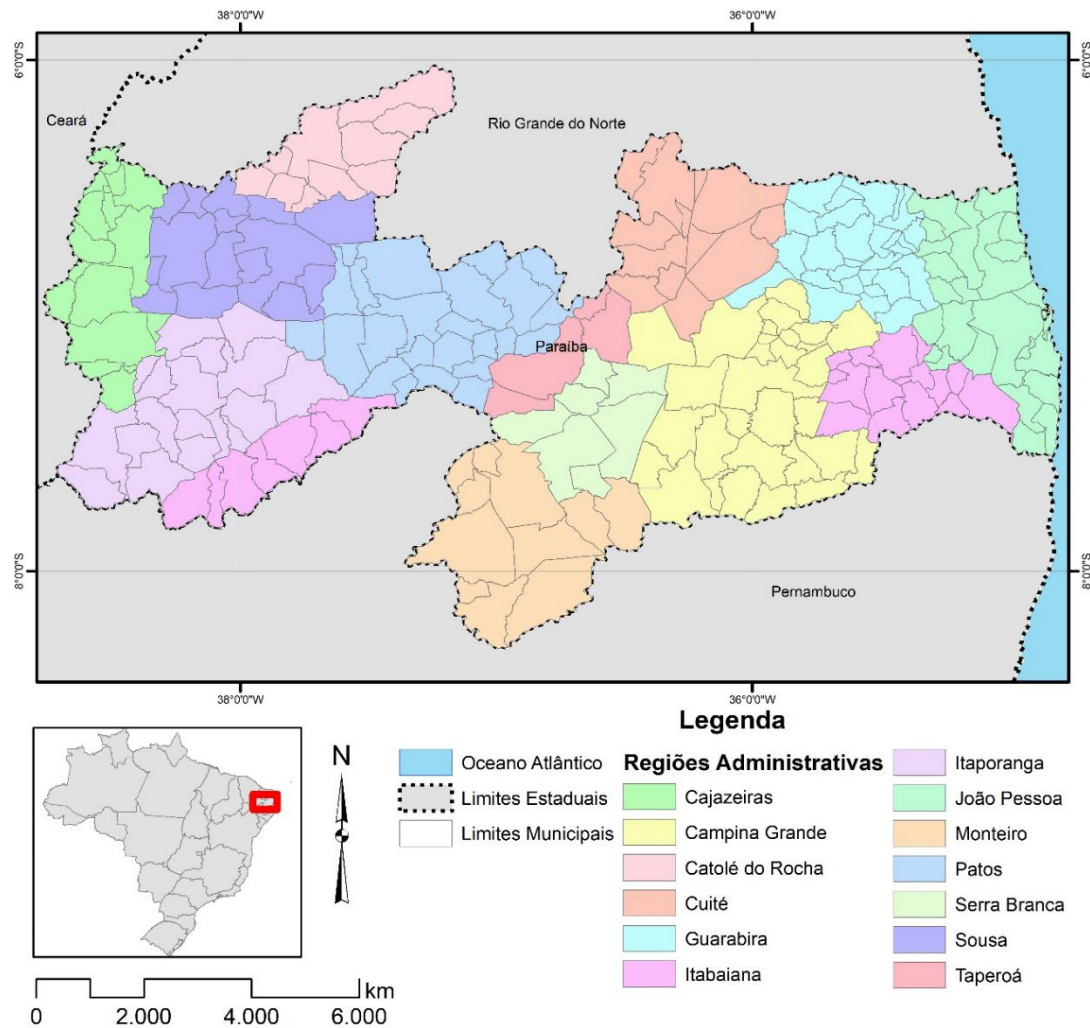

- (a) *Cualquier cambio sustancial al Sistema de Gestión Ambiental y Social o cualquier Plan A&S, debe ser por escrito y aprobado por el Banco de manera consistente con las NDASs del Banco.*

En caso de no tener un ROP, esta disposición debe ser incluida en las Estipulaciones Especiales del contrato.

### Anexo C. Mapas ambientales y sociales

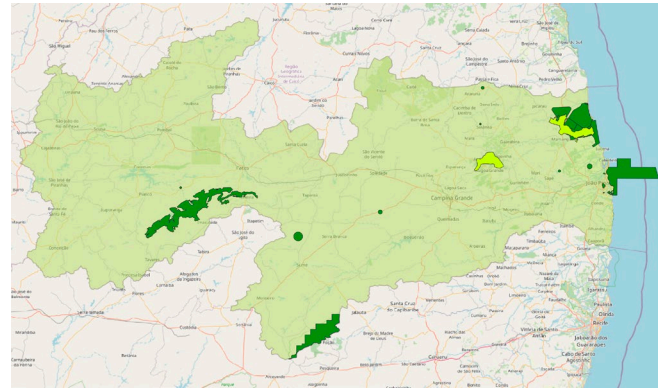

*Nombra, explica y pega toda la información gráfica necesaria (Mapas generados desde la Plataforma ESG ARC -GIS).*

## 1 PRESENTATION

This report presents the record of the public consultation carried out within the framework of the **Paraíba Rural Sustainable Development Project - PROCASE II (PROJECT)**, held in July 2024, as part of the PROJECT's preparation stage.

## 2 INTRODUCTION

The aim of the public consultation with interested parties is to establish a channel of communication with the communities directly affected by the works, building a process of information exchange that (i) enables the executor and the IDB/IDAF and other teams involved in the PROJECT to get to know the particularities of the benefited/affected communities, as well as their needs, (ii) to present the PROJECT and its impacts to the affected communities with the aim of making them aware of what this investment proposal actually means in their daily lives, against the backdrop of the fact that the PROJECT aims to contribute to reducing rural poverty levels, improving food and nutritional security and adapting the rural population to climate change.

The Public Consultation process was based on an inclusive proposal, i.e. the formats and language used to communicate with the population were suitable for transmitting the information to the public, preserving the integrity of the information, while at the same time trying to suit the target audiences.

In line with Environmental and Social Performance Standard 10 of the IDB's Environmental and Social Policy Framework, a round of public consultation took place in a semi-presential event<sup>1</sup> on July 2, 2024, with the participation of communities that could potentially benefit from the PROJECT and related institutions (associations, NGOs, cooperatives, etc.), including traditional communities such as indigenous peoples, quilombolas, gypsies, fishermen and shellfish gatherers. The consultation involved the area covered by the PROJECT, given that the socio-environmental studies carried out were *Framework Approach* in nature, but also focused on the effort to call on and include defined communities in the territory of Paraíba.

## 3 OBJECTIVES

The aim of this document is to present the results of the Public Consultation process carried out as part of the preparation of **PROCASE II**, explaining the public call process, the dynamics of the event and the main questions and concerns raised by the public, as well as the answers given to these questions.

## 4 PRINCIPLES ADOPTED IN CONSULTATIONS

The communication adopted for the implementation of the Public Consultation is based on an inclusive proposal, i.e. the formats and language used to communicate with the population must be appropriate to convey the information to the public. It is important to emphasize that adequate communication seeks to preserve the integrity of the information, while at the same time adapting it to the target audience, in this sense the following criteria have been adopted:

---

<sup>1</sup> Considered a hybrid format, with some of the stakeholders participating in person or virtually, either through their own internet access or in transmission rooms distributed throughout the territory of Paraíba, as provided for in the Stakeholder Participation Plan for the preparation of the PROJECT.

- Written language should be simple and straightforward, avoiding technical terms as much as possible and explaining them as much as possible.
- Whenever possible, didactic examples (drawings, photos, animations) should be presented in order to convey to the population the reality of what the works that make up the PROJECT mean.
- Any requests/complaints from the population must be met with patience and attention to understanding the demand. Special attention should be paid to vulnerable populations.
- The information transmitted to the public, regardless of the medium, must be simple, clear and transparent.

## 5 PUBLIC CONSULTATIONS

According to the IDB's PDAS 10, the Public Consultation was held in order to publicize and debate, in addition to the planned projects, the Strategic Environmental and Social Assessment (SEA) - including the results of the Strategic Socio-Cultural Analysis (SSA), the Strategic Environmental and Social Management Plan (ESMP).

The activities carried out to prepare the consultation included:

- **Disclosure: in accordance** with the Safeguarding Policies, the broad participation of the communities taking part in the PROJECT must be guaranteed and proven. This means that it must be widely publicized, calling on the population to take part in the event, as well as being held in a place or medium that is easily accessible to the population, on a date and at a time that is convenient for them to join. It should be noted that the Consultation took place regardless of whether or not a Public Hearing was required by the state or municipal environmental agency. Communication for the public consultation (call for proposals) began 20 days before the consultation was due to take place. It is worth noting that some of the actions to disseminate information and call for proposals in person in the Rural Territories of Paraíba began around 30 days before the date scheduled for the Consultation.
- **Organization:** the Consultation process was drawn up by the Executor, the PROCASE PMU, which provided and organized the infrastructure for the meeting, with a suitable venue, sound system and support material.
- **Registration of the Public Consultation:** The consultation was broadcast on the internet and its content was kept on the institution's channels. In addition, a channel was made available for comments on the website, which has been available since the beginning of the broadcast.
- The **AASE, PGASE, ASCE and Consultation Plan** documents, as well as an Executive Summary and other information, **were** also made available in digital format for public consultation during the event.
- The event was broadcast over the internet on PROCASE's official YouTube channel. The place of origin of the broadcast was João Pessoa: July 2, 2024, between 10:00 and 12:00 a.m., broadcast channel:
  - <https://www.youtube.com/live/gCMA9iYKSvQ>

**Figure 1 - Youtube portal of the virtual consultation broadcast**

Source: <https://www.youtube.com/live/gCMA9iYKSvQ>

### 5.1 Publicity and Public Call

Dissemination took place in four basic ways: (i) the publication of notices and calls on PROCASE's official electronic channels and social networks; (ii) direct calls to communities and institutions<sup>2</sup> ; (iii) through publication in printed and virtual media, such as newspapers, magazines and presses; (iv) through plenary sessions with communities and authorities in the Rural Territories. Samples of such publicity are presented below.

The publication in the Official Gazette was made on June 12, 2024, 20 days before the meeting was held. The figure below shows this publication.

<sup>2</sup> The focus was on direct outreach to the public through official invitations to community representatives, including traditional populations, using email or WhatsApp.

E DO DESENVOLVIMENTO DO SEMIÁRIDO - SEAFDS

**AVISO DE CONSULTA PÚBLICA Nº 001/2024**

O GOVERNO DO ESTADO DA PARAIBA, entidade de direito público interno, inscrito no CNPJ sob o nº 08.761.124/0001-00, através da SECRETARIA DE ESTADO DA AGRICULTURA FAMILIAR E DO DESENVOLVIMENTO DO SEMIÁRIDO - SEAFDS, no uso de suas atribuições, torna público a realização de Consulta Pública com o objetivo de engajar efetivamente as comunidades, organizações e instituições ligadas à agricultura familiar, oferecendo informações e abrindo espaço para que possam expressar suas opiniões e contribuir para a construção e o aprimoramento do Projeto de Desenvolvimento Rural Sustentável da Paraíba - PROCASE II, atuando com foco na redução da pobreza rural, na garantia da segurança alimentar e nutricional, e na mitigação dos efeitos das mudanças climáticas em áreas rurais do Estado da Paraíba.

Os interessados podem participar acessando o site do PROCASE (<http://www.procase.pb.gov.br/consulta-publica>) para conhecer e contribuir com o projeto, ter acesso aos documentos, expressar suas opiniões ou esclarecer dúvidas por meio dos canais de comunicação divulgados.

Os estudos e os documentos socioambientais - Normas e Políticas de Salvaguarda Ambientais do BID e do FIDA, divulgados previamente no site, serão apresentados, de maneira acessível durante o evento de consulta, pela equipe técnica do PROCASE, sobre possíveis riscos e impactos ambientais, bem como as soluções previstas pelo Projeto. As contribuições, anexas e sugestões das partes interessadas, além dos questionamentos apresentados, durante e após a consulta, auxiliarão na implementação das medidas de mitigação dos impactos ambientais.

A apresentação da Consulta Pública do PROCASE II será aberta a toda a sociedade e demais partes interessadas, e ocorrerá no dia 2 de julho, das 10h00 às 12h00, presencialmente no Auditório da PBPREV e, de forma virtual, pelo canal divulgado no site oficial. Adicionalmente, haverá transmissões nos escritórios regionais da EMPAER.

A organização do PROCASE II, amparado pelo **Decreto estadual nº 44.934/2024**, que o regulamentou, e as condições gerais de participação, pelas normas desta consulta pública, estarão disponíveis também no site eletrônico: <http://www.procase.pb.gov.br/consulta-publica>, a partir de sua publicação no Diário Oficial do Estado.

**ANTONIO RIBEIRO (Frei Anastácio)**  
Secretário de Estado - SEAFDS

**IVALDO MORENO DE MACALHÃES**  
Coordenador Estadual do PROCASE II

### 5.1.1 Internet publishing

A page was created on the PROCASE website (<https://www.procase.pb.gov.br/consultapublica>), calling for public consultation and making available materials and documents produced on the PROJECT. News stories were also broadcast on the PROCASE news channel.

In order to strengthen the publicity and prestige of the PROJECT, videos were made with the Governor of the State, the Secretary for Family Farming and the Project Coordinator, making statements and calling on the public to take part in the Consultation process.

Several articles have been published about the PROJECT, as well as the dissemination and participation in a Podcast aimed at broadening the scope of the dissemination of information.

We also had the support of various municipalities and institutions that helped to create new channels and mechanisms for publicizing the PROCASE Consultation, which showed the Executive Agency's excellent coordination with local institutions and partners.

The following figures show an image of the Public Consultation page and a news article on the PROCASE news channel; these pages remained active during the call process.

## Figure 19 - Letter

OFÍCIO CIRCULAR Nº: 037.2024/COORD/PROCASE.

Assunto: Convite para a Plenária de Consulta Pública do PROCASE II

João Pessoa/PB, 19 de junho de 2024

O Governo do Estado da Paraíba, por meio da Secretaria de Estado da Agricultura Familiar e Desenvolvimento do Semiárido (Seafds), tem a honra de **convidar Vossa Senhoria para participar da Plenária de Consulta Pública do PROCASE II**. O evento ocorrerá no dia 2 de julho (terça-feira), das 10h às 12h, no Auditório da PBPrev, localizado na Av. Rio Grande do Sul, s/n, bairro dos Estados, em João Pessoa.

O evento também será transmitido ao vivo pelo canal PROCASE PARÁIBA no YouTube.

A Consulta Pública incluirá uma apresentação institucional do PROCASE, com foco na elaboração da segunda fase do Projeto PROCASE e nos documentos socioambientais, que estão disponíveis no site: <https://www.procasse.pb.gov.br/consultapublica>.

Contamos com a sua valorosa participação.

Atenciosamente,

NIVALDO MORENO MAGALHÃES  
COORDENADOR ESTADUAL DO PROCASE

Source: UGP/PROCASE

The list in Annex 7.2 shows the list of stakeholders who received official invitations to the Public Consultation and to express their views on PROCASE II and the socio-environmental documents drawn up. A total of 467 invitations were sent out, involving government institutions and civil society organizations representing the communities.

### 5.1.3 Participation in the Plenary Councils of the Rural Territories

As mentioned, plenary sessions were held in the Councils of the Rural Territories with the participation of interested parties, in order to present PROCASE, instruct the councilors of the territories on the public consultation process and the channels/forms of manifestation, as well as collecting contributions to improve the process. It is important to mention that the Councillors were also agents for spreading the word about the PROJECT to interested parties. The plenary sessions took place in April, totaling 10 meetings, each in a Rural Territory. The following table and images provide information on the plenary sessions.

#### 5.1.4 Pre-consultation meetings in the Rural Territories

In addition to the plenary sessions with the councils of the Rural Territories, additional meetings were also held to present the PROJECT, the socio-environmental documents, guidance on participation in the public consultation and instructions on how to fill in the form to contribute to the process. In total, 30 pre-consultation meetings were held with interested parties.

These meetings were organized by the PROCASE team, in conjunction with the territorial collegiate bodies. Various representatives took part, such as territorial councils, unions, organizations, municipal secretariats and other entities. Some meetings took place during the agendas of the territorial collegiate bodies, such as in the Maringá Valley and Borborema.

The following table and images show information on the additional pre-consultation meetings held in the Rural Territories.

**Table 5 - Plenaries held in the Rural Territories**

### **5.1.5 Broadcasting room orientation meeting**

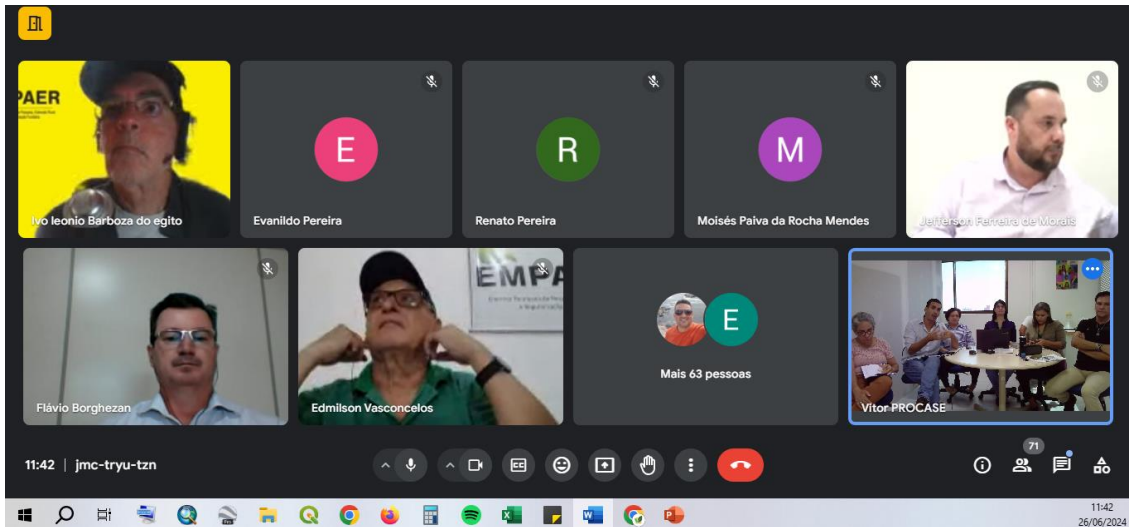

The consultation process also involved the strategy of using broadcasting rooms distributed throughout Paraíba in order to make it possible for interested parties with restricted internet access to take part. These transmission rooms were promoted through partnerships with local organizations that were able to provide structures and manage remote participation at predefined locations closer to the interested public. Examples of these partners include FUNAI and various local authorities, among others.

In order to align the procedure and management of the broadcasting rooms, a virtual meeting was held with the partner organizations involved to provide guidance and training on the process. This guidance reached more than 70 participants who made it possible to implement 110 transmission rooms distributed throughout the territory of Paraíba, which made it possible, in addition to individual virtual participation, to hear from 2,525 people on the day of the Public Consultation (02/07/2024).

The following figures show the meeting held to establish the framework and the interaction with the partners who made the transmission rooms possible, and the images below show the participation and territorial scope of the transmission rooms throughout Paraíba. The list of participation by transmission room during the Public Consultation can be seen in the Annex. 7.4.

## 5.2 Attention to Gender Issues, Vulnerable Groups and Traditional Communities

PROCASE II will operate throughout the state of Paraíba, targeting family farmers, with priority given to women, youth groups, traditional peoples and communities (quilombolas, gypsies, artisanal fishermen and riverside dwellers), indigenous people, people with disabilities (PCDs) and LGBTQIAPN+.

We therefore took the initiative to mobilize these priority audiences through contacts with their state leaders and with strategic organized movements that represent each people

and community. The aim was to achieve integration with respect for each culture, with its diversity and intersectionality.

Meetings were held with: Groups of organized women, leadership of quilombola communities, leadership of the Potiguaras people (indigenous), leadership of the Tabajaras people (indigenous), Funai - National Foundation for Indigenous Peoples, State Council for People with Disabilities, Leadership of the Calon Gypsy people, State Secretariat for Women and Human Diversity (in its Sexual Rights and LGBTQIAPNB+ managements, Operational for Confronting Violence Against Women, Executive Management for Racial Equity).

These face-to-face contacts provided access to other leaders (of women, young people, gypsies, quilombolas and indigenous peoples) throughout the state, as well as access to communication channels organized through WhatsApp groups. In the meantime, the PROCASE II project has been well publicized and known, as well as recognition of the importance of the consultative public consultation, which offers the opportunity to work together with civil society to build PROCASE II.

These mobilizations brought a significant demand for social participation, triggering another challenge for the team: how to encourage monitoring and participation in the online public consultation, which was consultative and had to be documented. So a partnership was set up with EMPAER, trade unions, SEAFDs - the State Secretariat for Family Farming and Semi-Arid Development, where they provided spaces, transmission equipment and technicians (who were trained to carry out this action), in order to provide civil society with qualitative participation.

Therefore, this strategy of articulation and mobilization, with the operation of the transmission rooms, was one of the keys to the excellent and expressive result of this public consultation. It not only complied with the IDB's safeguard, but also promoted the integration of organized society with PROCASE II, especially with the priority audiences.

During the public consultation event on July 2, specific broadcasting rooms were set up to meet the needs of certain priority audiences. This strategy aimed to ensure effective participation and direct dialog with these groups.

An emblematic example was the broadcasting room in Aldeia Forte, in Baía da Traição/PB, for Potiguaras indigenous leaders. This initiative was fundamental in ensuring the participation and representativeness of this important segment of society.

Another case in point was the transmission room set up in the town of Acaú, in Pitimbu/PB, which brought together the region's shellfish gatherers. This action aimed to provide an adequate space for this historically marginalized group to participate in the Consultation.

In addition, there was a specific room for the Curral Velho/PB Fishermen's Colony, as well as another made up of young representatives of the Agricultural Cultural Association of Young Environmentalists of Paraíba, based in Alagoa Nova/PB. These initiatives reflect PROCASE's commitment to ensuring the participation of diverse audiences, including traditionally under-represented groups.

With regard to the priority publics, the Consultation was attended by various representatives of these publics, including: The women's groups who took part online, the Potiguaras (Mata Norte) and Tabajaras (Mata Sul) Indigenous Peoples, represented by Eugênio Herculano (FUNAI Regional Coordinator), Sandro Gomes (Potiguara General Chief) and Ednaldo (Tabajara Chief), who were present at the face-to-face Public Consultation in João Pessoa (PBPrev Auditorium); the Potiguara women's group YBY-RAPÓ Kunhã, who were online; the Quilombola Communities, represented by CEQNEC/PB - State Coordination of Black and Quilombola Communities of Paraíba,

with the participation of president José Amaro in the virtual room in the municipality of Catolé do Rocha (Médio Sertão), and Raísa Rodrigues representing CEQNEC at the face-to-face consultation in João Pessoa; AACAD-PB - Associação de Apoio aos Assentamentos e Comunidades Afrodescendentes da Paraíba, represented by Francimar Fernandes; and the Gypsy Peoples/CALON, through ASCOCIC - Associação Comunitária dos Ciganos de Condado, with the participation of President Maria Jane Soares - Gypsy Calin and founder of the Association, who took part online, and the Gypsy leaders from Rancho dos Ciganos in Sousa, who took part in the virtual room in Sousa (Centro Cultural); several fishermen took part in the transmission/online rooms and the shellfish gatherers/AMA took part in the specific room in Acaú and in the municipal seat of Pitimbú. There was also representation from organizations representing people with disabilities, such as the Association of Atypical Mothers, who took part in the virtual room in Monteiro, the Group of Mothers in the Regional TEA of PB, who watched online, and the representative of the Paraibana Association for the Inclusion of People with Disabilities, who watched in a broadcast room; the representative of the LGBTQIAPNB+ Forum, Cleber Ferreira, took part in person in the PBPrev auditorium.

This diversity of representatives of the priority audiences demonstrates the effort to ensure the inclusion and protagonism of these groups in the Public Consultation.

### 5.3 Query Description

The following is a summary of the Public Consultation held on July 2, 2024, with the main points raised that contribute to the DRAFT. Annex 7.1 you can see the presentation prepared for the consultation.

The Public Consultation was broadcast via the official link on PROCASE's YouTube channel: <https://www.youtube.com/live/gCMA9iYKSvQ>. It was also possible to participate in person at the broadcasting venue, the PBPrev Auditorium - Av. Rio Grande do Sul, s/n, Estados, João Pessoa-PB.

The process began at 10:10 a.m. and ended at 12:10 p.m. It lasted two hours, with a 45-minute presentation of the PROJECT and socio-environmental documents, 30 minutes of interaction with the public with comments and responses, and the rest of the time with other presentations and discussions. It's important to note that the actions taken to capture comments prior to the Consultation, which was made possible by the communication channels and online form, as well as the local meetings and plenary sessions with the communities, resulted in the optimization of the questioning and response process and, even so, other issues were addressed during the ballot.

The video of the public consultation is still available on the official Youtube channel and had 3,900 views by the time this report closed, and the peak number of simultaneous accesses during the live broadcast reached 572, according to Youtube's official *Analytics* report.

Regarding the profile of the public who viewed the Public Consultation video during the month of July, 47.7% of the public were female, with a concentration of 32% of the public between 35 and 44 years of age, reaching 185 municipalities in the area covered by the PROJECT.

Participants included:

- Land reform settlements;
- Traditional peoples and communities;
- Municipal Secretariats;
- State Secretariats;
- NGOs;
- Representatives of social movements;
- Rural workers' unions;
- Community associations;
- Association of specific audiences;
- Associations of family farmers;
- Cooperatives;
- Universities;
- City councils;
- Municipal Councils for Sustainable Rural Development;
- Fishermen's colonies;
- Federal institutes;
- Territorial committees;

- Women's groups;
- ATER institutions and organizations

The following table shows the general data of the participants in the Public Consultation.

**Table 6 - General data of participants in the Public Consultation**

Information		In person	Broadcast rooms	Virtual

**Presentation of the consultation**

The meeting was opened by Mr. Wallene Cavalcante, inviting the representatives to the table, greeting those present and the remote participants and giving a brief reading of the objectives of the Public Consultation. The authorities present and who took part in the Opening Table of the Public Consultation were:

- Mrs. Francimar Fernandes, representing AACAD-PB - Associação de Apoio aos Assentamentos e Comunidades Afrodescendentes da Paraíba (Support Association for Afro-descendant Settlements and Communities in Paraíba)
- Mrs. Raísa Rodrigues, representing CECNEQ/PB - State Coordination of Black and Quilombola Communities of PB
- Mr. Arimatéia França, President of CONSEA-PB
- Ms. Tânia Maria, representative of the CPT - Pastoral Land Commission

- Mr. Aristeu Chaves, CEO of EMPAER
- Mr. Cleber Ferreira, representing the Paraibano LGTQIAPNB+ Forum
- Mr. Eugênio Herculano, FUNAI Regional Coordinator
- Mr. Osvaldo Bernardo, representative of the Movement of Dam-Affected People
- Mr. Sandro Gomes, General Chief of the Potiguara Indigenous People (North Coast)
- Mr. Ednaldo, Chief of the Tabajara Indigenous People (South Coast)
- Mrs. Márcia Dornelles, representative of the State Network of Territorial Collegiates and Forums of PB and the National Network of Territorial Collegiates
- Mr. Frei Anastácio Ribeiro - Secretary for Family Farming and Semi-Arid Development and President of the State Council for Sustainable Rural Development - CEDRS.
- Mr. Bivar Duda - Executive Secretary of SEAFDS
- Ms. Jadiele Berto, representative of the Secretary of State for Women and Diversity
- Mr. Pedro Matias, Executive Secretary for Youth
- Mr. Thiago César, representative of the Secretariat for the Environment and Sustainability - SEMAS
- Mrs. Pollyanna Dutra, Secretary for Human Development and President of CAISAN-PB

During the introduction and presentation, the following were heard: Secretary of SEAFDS, Mr. Antônio Ribeiro (Frei Anastácio), Executive Secretary of SEAFDS, Mr. Bivar de Souza Duda, Secretary of State for Human Development, Ms. Polyana Dutra, State Coordinator of PROCASE, Mr. Nivaldo Moreno de Magalhães, and Governor of the State of Paraíba Mr. João Azevedo.

After the Governor's speech, a technical panel was called with PROCASE experts to explain and answer questions:

- Ms. Aparecida Henriques, from the Social axis of the Project;
- Ms. Carleuza Andrade, from the Monitoring and Evaluation axis;
- Ms. Natália Cavalcanti, from the Productive axis of the Project;
- Mr. Vitor Andrade, from the Environmental axis.
- PROCASE State Coordinator, Mr. Nivaldo Magalhães;
- Executive Secretary of SEAFDS, Mr. Bivar de Souza Duda;
- Secretary for Human Development, Ms. Pollyanna Dutra.

The floor was passed to the Technical Coordinator of PROCASE II, Mr. Nicholas Lucena Queiroz, to discuss all the details of PROCASE II. In this section, the following sequence of information was given:

- Presentation of the dynamics of the Public Consultation and the issues to be addressed;
- Presentation of PROCASE II projects and components;
- Information on the preparation's socio-environmental documents;
- Expected impacts/risks and mitigation measures listed in the ESMP;

- Channels available for expressions of interest and complaints (MQR);
- Questionnaire response section.

Finally, he said that the answers to the questions would be answered and made available on the PROCASE II website. Afterwards, questions from the public were sent in, which were read out by Mr. Wallene Cavalcante in 2 blocks.

**BLOCK 1** - I was asked in the First Block about:

- 1 - Socio-environmental documents: it was stated that the documents are lengthy, making it difficult for the beneficiaries to access and understand them. The question was asked whether there would be practical guidance on how to deal with the demands;
- 2 - How the beneficiary communities and families will be selected, what criteria will be used, whether through public notices or draws;
- 3 - Priority public (access to actions and the project) How women, young people, PCTs, PCDs can access the projects; and whether LGBTQIAPNB+ communities will be included;
- 4 - Type of contract and documentation required; what types of activities and investments the project can support;
- 5 - Organizations, associations and cooperatives in default have the right to access projects and benefits;
- 6 - Types of investments that the project will support, such as water access actions (wells, underground dams, wet crossings, machinery and equipment and mechanized patrols).

The floor was passed to Mr. Vitor Andrade, who greeted everyone and explained that there is no need for farmers to read and understand all the socio-environmental safeguard documents that have been made available, since they are technical instruments, based on the logic of making a diagnosis considering the biotic, physical and socio-economic environments. And the size of this document is due to the fact that we are dealing with an entire state, with 223 municipalities, which means a large amount of information to carry out a diagnosis, as well as the fact that these documents will provide guidance, as a series of guidelines to be followed by the PROCASE technical team and the Technical Assistance that will support farmers. He added that the documents help PROCASE's actions to converge with the state's environmental policy and environmental legislation. It is important to point out that all of this collection and the actions that are planned are exhaustive because the typologies will take into account the specific characteristics of each community, which is why they have resulted in a large amount of information that needs to be discussed in order to take into account this panorama. That's why the documents are extensive. Each plan will be screened. And this screening will bring the demands into line. The questions will be answered and the documents will be available for consultation by the institutions and the entire population for the duration of the project. After answering the first question, the floor was passed to Ms. Carleuza Andrade. Carleuza Andrade was given the floor to answer the question about how the beneficiary communities and families will be selected (criteria). She began by greeting everyone, introduced herself and went on to clarify that the criteria for selecting PROCASE II communities and families will be slightly different from the PROCASE 1 criteria, pointing out that for the 200 PIR, there will be an active search, in which a survey will be carried out in all the municipalities of Paraíba, identifying the most priority communities considering the criteria: communities of families linked to family farming, both agricultural and non-agricultural; communities with a high number of

families registered with CadÚnico; adding that a degree of prioritization of these communities will be applied. Prioritization criteria: one of the priorities is for communities to be part of the group of traditional peoples and communities - PCT (including indigenous peoples, quilombolas, gypsy communities, riverine communities and fishermen); communities that have difficulty accessing water, families that have not benefited from other projects; a higher proportion of families represented by women, young people, people with disabilities - PCD, evidence of environmental degradation, lack of or low level of access to Technical Assistance; Calls for Proposals will only apply to some specific actions in the PN (Business Plans). She clarified that there would be no lottery. Ms. Aparecida Henriques was given the floor to answer the question of whether the LGBTQIAPNB+ population would be included. She began by greeting everyone, stating that we will have priority groups, and all priority groups will have access to PROCASE II, as well as training moments, moments for dialogue to help tackle the difficulties these groups face in rural areas. He explained that there will be four plans in the Subcomponent: a gender plan, a diversity plan, a youth plan and a food security plan. She closed. Ms. Natália Cavalcanti was given the task of answering the question regarding the documents and the form of contracting: she greeted everyone and clarified that the contracting for the Resilient Investment Plans (PIR) that will serve the communities will be via associations, and the Business Plans (PN) will be via cooperatives; informing that the partnership between the Public Administration and the associations and cooperatives will be through the signing of a Development Agreement, which delimits the obligations and responsibilities. He then explained that the beneficiaries must be in good standing and listed the documents that must be presented. He explained that the following cannot be financed by PROCASE II: the purchase of real estate, current expenses (salaries, social charges, water, electricity, operational maintenance costs), the expansion and modernization of certain works, the purchase of cattle, the purchase of agrochemicals, pesticides, wet crossings, mechanized patrols, are also not included in the types of financing.

**BLOCK 2** - I was asked in the Second Block about:

1 - Referring to land regularization, the floor was passed to the PROCASE State Coordinator, Mr. Nivaldo Moreno de Magalhães. Nivaldo Moreno de Magalhães, who said that US\$10 million reais would be allocated to land regularization in PROCASE II, with agrarian reform settlements as the criterion, and in a partnership with INCRA, land regularization would be carried out on properties that were not in dispute; quilombola settlements that are suitable according to INCRA will be regularized; informing that in the rest, the 9 municipalities bordering Cariri (up to 25 hectares) will receive land regularization to be carried out by EMPAER (sub-executor of PROCASE II). The goal is to reach 10,000 rural properties, with 20,000 families covered.

2 - Ms. Carleuza Andrade then asked about the strategy to avoid overlapping actions, and how the project's social control would be carried out. She replied that we have numerous policies and projects underway that converge with each other in the state of Paraíba, and that the strategy is to integrate all the actions in order to plan in the best possible way, so that as many families as possible are served. He emphasized that social control begins with the association itself. He said that in each municipality we have the Sustainable Rural Development Councils, which carry out the social control of all the public policies aimed at family farming in the municipality, as well as the territorial collegiate body, CEGIP - the Executive Committee for the Management of Productive Investments, which is made up of a composition between the government and civil society, mainly the large social movements, which has the role of checking, approving the projects, monitoring the set of indicators of products and results and impact, in which PROCASE is accountable not only for the resources, but for the results achieved by the project's actions.

Below are images from the Public Consultation.

The Annex 7.1 shows the presentation prepared by the PMU/PROCASE team and Annex 7.3 shows the registered participants.

### **Participation Tools and Results**

The PROCASE II consultation process was an enriching moment that allowed for a wide range of comments from the various actors, movements, organizations and institutions linked to family farming and sustainable rural development. Participants in the public consultation made their views known in two different ways. The first was through the online form, which sought to identify the territory/municipality, profile, organizations/institutions, as well as wishes and expectations, doubts and observations and suggestions. The form was open from June 10 to July 3 and received 1,338 submissions from all of Paraíba's rural territories.

The participation of the territories was quite significant, with Borborema, Vale do Piancó and Cariri standing out. In terms of participation by municipality, applications were received from 165 of them, which corresponds to 74% of the state's municipalities.

**Figure 45 - Number of online forms by rural territory**

Source: Procace/public consultation/2024

With regard to the profile of the organizations that took part in the online form, 52% of them were rural organizations (producer associations, community associations, cooperatives and others), 26% public institutions and/or civil society entities that work directly with family farming and sustainable rural development. This category also included universities and colleges, as well as representative bodies such as unions, councils, town councils, associations representing priority publics, etc. Around 22% of the questionnaires were filled in by individuals - farmers, indigenous people, quilombolas, fishermen, river dwellers, disabled people, atypical mothers, technicians and students. According to the graph below, the participation of the different categories of organizations and individuals was quite significant, reflecting the diversity of actors involved.

**Figure 46 - Profile by type of representation**

Source: Procace/public consultation/2024

When we look at the group of rural organizations that responded to the form, we can see the diversity of the types of rural communities that took part in the process. The highest

percentage, 78%, corresponds to family farming communities, but there was also representation from priority public communities such as Quilombolas, indigenous people, fishermen/ shellfish gatherers, gypsy communities, among others.

**Figure 47 - Profile of rural organizations/communities**

Source: Procace/public consultation/2024

With regard to gender, 48% of the participants were female, 49% male and 3% had no gender identification

**Figure 48 - Gender profile in the responses to the online form**

Source: Procace/public consultation/2024

The systematization of the online forms in the fields of desires and expectations, doubts/questions and observations and suggestions, regarding the project and the socio-environmental documents, resulted in very rich material for the project, allowing the possibility of guiding elements for its actions, as well as identifying possible future demands and partnerships.

In relation to the wishes and expectations expressed, the systematization was organized into axes and sub-axes, as shown below:

- Strengthening Family Farming (Projects and resources);
- Sustainable Development and Improved Quality of Life (Economy and environment, Infrastructure and water resources, Expectations of improvement);

- Support for Communities and Associations (Inclusion and participation and Social Development);
- Project Specifications (Initiatives to improve infrastructure and support production and marketing).

The same structure of axes was also used in the field of observations and suggestions, with some different sub-axes.

- Strengthening Family Farming (Projects and resources);
- Sustainable Development and Improving Quality of Life (Projects and resources, Economy and environment and Land regularization);
- Support for Communities and Associations (Exchange and Advice, Communication and Expectations of Improvement);
- Project Specifications (Access to Projects).

The systematized material on wishes and expectations and observations and suggestions will be attached to this report.

The set of doubts and questions was systematized together with the manifestations of the second stage of the Public Consultation, which took place through questions asked during the live broadcast. A YouTube link was created for this stage, where 172 interactions were recorded, including questions and queries from participants.

The majority of these interactions, around 75%, came from the public following the online broadcast. Another 20% of the questions came from the broadcasting rooms spread across the rural territories, and 5% from the PBPrev office, from where the consultation was broadcast.

**Figure 49 - Where to ask questions on the link during the consultation**

Source: Procasse/public consultation/2024

With regard to gender, 52% of the questions were asked by men and 46% by women, and 2% could not be identified.

**Figure 50 - Gender profile in the questions on the link during the consultation**

Source: Procasse/public consultation/2024

Most of the questions asked via the YouTube link were in line with the doubts and questions already registered on the online form. When you add up the interactions on the online form and the link during the consultation (172 comments), you reach a total of 1,510 comments throughout the Public Consultation process carried out as part of the preparation of the PROJECT.

Not all of the 1,510 interactions corresponded to doubts or questions per se, but a significant number of questions were asked, mainly in relation to direct aspects of the PROJECT. In order to make clarifications easier and more efficient, the questions that required answers were organized into blocks and quantified according to the frequency of repetition of the question or theme. In this way, it was possible to identify the most recurrent questions asked through the channels. Once the questions had been systematized, it was possible to analyse and identify which of them could be answered during the presentation of the Public Consultation and which would require additional answers, to be provided during the plenary session and on the PROJECT website.

The questions that required specific answers therefore totaled 195, which were condensed into 17 questions grouped by similarity. The following table shows the consolidation of these questions, the frequency with which they were asked, as well as their origin (profile of the protester) and the respective response structured by the PROCASE team. Some of these questions were answered in the plenary session, and all of them are being organized and made available on the PROJECT website.

**Table 7 - Summary of the main doubts/questions from the Public Consultation**

Questions	Number of times the question was asked	Origin of the questions	Answers
1- The documents are a lot of pages long, it's a lot of reading for farmers to analyze and understand, will you have guidance support in practice and to forward demands?	2	Rural organizations and family farmers	The documents are extensive due to the volume of information needed to compose the environmental diagnosis of the entire state of Paraíba, covering 223 municipalities. In addition, the various types of possible actions broaden the analysis and proposals, resulting in detailed and comprehensive documents. Farmers do not need to read the technical documents in full. These documents are designed to serve as a reference for PROCASE technicians and contracted technical assistance and rural extension (ATER). Practical guidance support will be provided to ensure that farmers understand and apply the recommendations effectively.
2- How will the beneficiary communities and families be selected? What criteria will be established? Will there be public notices or draws?	78	Rural organizations and family farmers	In PROCASE II, the identification/selection of the communities that will benefit from the PIRs will be carried out by means of an active search in which detailed work will be done to identify these communities, taking into account criteria and an appropriate methodology. The general criteria for community eligibility are: <ul style="list-style-type: none"> <li>i) Be rural communities of family farmers who develop agricultural or non-agricultural activities aligned with the productive activities of the Project;</li> <li>ii) High percentage of families registered with CadÚnico;</li> </ul> From the set of communities identified, a list will be drawn up by Rural Territory of the possible communities to be supported by the Project. The territorial collegiate will validate this list. However, for the final choice of communities, the following prioritization criteria will also be used: <ul style="list-style-type: none"> <li>i) Being a traditional and original community (quilombola, indigenous, artisanal fishermen, riverine, gypsy and others);</li> <li>ii) High rate of families registered with CadÚnico;</li> <li>iii) A higher proportion of families needing a cistern for drinking water and sanitation;</li> <li>iv) Prioritize families that have not benefited from other projects to finance activities similar to those that the PIR will finance;</li> <li>v) A higher proportion of families represented by women and young people and families with PwD;</li> <li>vi) Evidence of environmental degradation (using the appropriate platform); and</li> <li>vii) No or low level of access to ATER services.</li> </ul> With regard to the launch of calls for proposals, some of the project's actions may be carried out in this way, as is the case with the Business Plans action. Procasse will not use the lottery method in any way. It's important to note that once the communities have been defined, the diagnosis is made, the projects are drawn up (parameters for preparation) and when they are approved, there are also the evaluation criteria.

Questions	Number of times the question was asked	Origin of the questions	Answers
<p>3- How can priority audiences such as women, young people, PCTs and PCDs access the actions and projects? Will the LGBTQIAPN+ population be included?</p>	<p>6</p>	<p>Organizations representing priority audiences: women, young people, quilombolas, indigenous people, PWD (atypical mothers) and the LGBTQIAPN+ community.</p>	<p>In all the activities carried out by PROCASE, women must be a priority, as the project aims to serve 60,000 families, 50% of which are led by women, considering the importance of rural women for the family economy and community development. They are the guardians of life, caring for children, the elderly and the sick. They take care of their surroundings, making them productive, looking after animals and water.</p> <p>Women and traditional peoples and communities will have access to PROCASE in the investment plans, will have access to TA and will also take part in training and exchanges.</p> <p>As well as having access to training in both agricultural and non-agricultural activities and exchanges, young people will be able to participate as Local Development Agents as scholarship holders and also benefit from RIPs in their communities.</p> <p>Impacted by countless forms of discrimination, the LGBTQIAPNB+ community faces major obstacles in participating in decisions that affect their well-being and rights. PROCASE will promote thematic meetings, with topics demanded by the group itself, as well as raising awareness about their rights and coping with adversity and violence, and encouraging and collaborating in the search for access to public policies. This population will also be able to take part in PIRs in their communities of origin.</p> <p>Families who happen to have a PCD member will be prioritized in the activities and PIR.</p> <p>It should also be noted that PROCASE will draw up an action plan on the themes of gender, diversity, youth and food security.</p>
<p>4- How are the projects contracted and what documentation does the organization/association/cooperative need? Are organizations that are in default entitled to access the projects/benefits?</p>	<p>59</p>	<p>Rural organizations and family farmers</p>	<p>The contracting modality will be through the Termo de Fomento, which is a document that formalizes partnerships between the government and civil society organizations to carry out projects in the public interest. The document will be signed between the associations and cooperatives and the Sustainable Rural Development Project - Procasse II/Secretariat of State for Family Farming and Semi-Arid Development/SEAFDS, establishing obligations and rights and allowing the transfer of funds.</p> <p>The documentation required from the organizations to formalize the Agreement, after the Resilient Investment Plans (RIPs) and Business Plans (BPs) have been drawn up, is as follows: i) Association Bylaws; ii) Minutes of Election of the Board of Directors; iii) Proof of CNPJ; iv) Documents of the President, (ID; CPF; Proof of Residence and List of Officers with CPF); v) Federal Tax Clearance Certificate; vi) State Tax Clearance Certificate; vii) Municipal Tax Clearance Certificate; viii) Labor Debt Clearance Certificate; ix) FGTS Clearance Certificate.</p> <p>Organizations will need to be in compliance in order to be beneficiaries. However, in view of the timetable for starting to implement the plans (2nd year of Procasse II), they will have time to comply.</p>

<p>5- What types of activities and investments will PROCASE be able to support? Will it be able to have wells, underground dams, wet passes, machinery/equipment and mechanized patrols?</p>	<p>7</p>	<p>Rural organizations, family farmers, technicians, students, etc.</p>	<p>The activities and investments are divided into three areas: production and marketing, environmental and social technology.</p> <p>For the Productive axis:</p> <p>i) Agroforestry systems (SAFs) for diversified production; ii) Backyards for the production of fruit, vegetables, including unconventional food plants (PANCS) and medicinal plants; iii) Beekeeping and Meliponiculture; iv) Agroecological consortia for organic production, including cotton; v) Goat and sheep farming for milk and meat with forage SAFs; vi) Dairy cattle farming with forage SAFs; and vii) Poultry farming with forage SAFs. It is important to mention that in the case of support for cattle breeding, the project's strategy will be to support dairy production exclusively (it will not be possible to support breeding for meat production), to improve productivity from the existing herd and will not finance the purchase of animals, with the exception of the purchase to replace breeding stock. The list is not exhaustive and other activities may be considered, as long as they are in line with the demand of the beneficiaries and the objectives and criteria of the project.</p> <p>For the environmental axis, the aim will be to manage and restore the environment, whether or not associated with the activities of the PIR's Productive Axis at Local Territory level.</p> <p>The PIRs will have specific resources for collective use to encourage the implementation of territorial environmental actions, such as: i) Casas de Sementes da Paixão (Seed Houses of Passion); ii) Implementation of nurseries focused on the production of native species; iii) Reforestation, recovery of permanent preservation areas (such as springs, riparian forests, areas with a slope of more than 45º, etc.) and degraded areas; iv) Soil and water protection actions; v) Recycling or composting plans, etc.</p> <p>The social technology axis consists of implementing social technologies at the family level, such as: i) 2nd water cisterns (agricultural production); ii) gray water reuse systems; and iii) trench dams (underground dams). In addition to these technologies, 1st water cisterns (for human consumption) and other household sanitation solutions will also be implemented, such as evapotranspiration basins, or access to more sustainable domestic energy, such as biodigesters and eco-efficient stoves.</p> <p>Investments not eligible for RIP funding:</p> <p>Some types of investment will not be financed by the project. Among other things, they cannot be financed:</p> <ul style="list-style-type: none"> <li>- Purchase of real estate of any kind;</li> <li>- Spending on land and environmental regularization;</li> <li>- Current expenses (salaries and social charges for existing staff, water, electricity, internet, telephone);</li> <li>- Operating and maintenance costs, construction, expansion, modernization, renovation and construction of civil or water works on properties that do not have ownership of the land, but can present a declaration of ownership, a declaration of purchase and sale or a lending agreement;</li> <li>- Purchase of bovine matrices;</li> <li>- Purchase of agrochemicals such as herbicides, fungicides and insecticides;</li> <li>- Construction or refurbishment of processing plants that use firewood as a source of energy, in whole or in part.</li> </ul>
--	----------	---	--

Questions	Number of times the question was asked	Origin of the questions	Answers
6- Will the arrival of Procasa II also bring land regularization to the communities?	5	Rural organizations and family farmers	<p>With regard to priority communities, it should be noted that only communities and settlements that are not in a situation of conflict or litigation can benefit from this action. Therefore, when the project comes into force, it will be up to the PMU, in partnership with the other relevant bodies/entities (INCRA, EMPAER and the federal and state bodies promoting racial equality in the case of quilombola communities), to identify and validate the eligible quilombola settlements and communities based on this first criterion. Preliminarily, 33 quilombola communities (out of 47 in the state) were mapped in 21 municipalities, as well as 28 agrarian reform settlements in 27 municipalities. It is understood that there will also be the possibility of serving 'traditional' rural communities, albeit in limited numbers. The project will have to define the prioritization criteria that will allow this choice to be made. The communities/settlements to be targeted should then be defined.</p> <p>Thus, 40% of the target will be focused on serving quilombola communities and federal land reform settlers (preferably those already served with productive projects in phase I of PROCASE, and which have already been previously mapped). The other 60% of the target will be focused on 09 municipalities in the state, on properties of around 25 hectares (an average of 8 hectares per property) belonging to beneficiaries of the PNCF, the ECOPRODUCTIVE project, state agrarian reform settlements, the riverside population and other groups of family farmers.</p> <p>The municipalities preliminarily mapped by EMPAER are Barra de São Miguel, Boqueirão, Cabaceiras, Camalaú, Caraúbas, Congo, Monteiro, São Domingos do Cariri and Sumé. These municipalities were worked on by Procasa I through production projects, mechanized patrols and technical advice to riverside communities benefiting from the São Francisco River water transposition project. In these 9 municipalities, the plan is to work with up to 150 communities, which have already been mapped.</p>
7- Will informal groups without a CNPJ be able to participate or join their project with a partner that has a CNPJ? Can the project support more than one activity with a single association?	3	Rural organizations and family farmers	<p>Yes, informal groups can participate in a PIR through an association that has a CNPJ and current certificates. Each PIR can be made up of up to three communities and will benefit the families in those communities. The PIR can support more than one productive activity, geared towards adapting to climate change, with the potential to guarantee food security and improve income by selling surpluses. It aims to incorporate concepts of good production practices based on the principles of agroecology, nutritional education and food security for families, as well as ensuring integration with social technologies.</p>

Questions	Number of times the question was asked	Origin of the questions	Answers
8- It will be possible to include Soil Education (in addition to Environmental Education) in proposals to strengthen the sense of belonging and appreciation of the soil in order to minimize the advance of degradation processes that lead to desertification.	1	UFCG University Professor	The inclusion of Soil Education, in addition to Environmental Education, in PROCASE's actions is an important strategy to strengthen the sense of belonging and appreciation of the soil by the beneficiary communities. This will be possible through a number of key initiatives: <ol style="list-style-type: none"> <li>1. The project's Agroecological ATER will promote the best soil management and conservation practices among family farmers.</li> <li>2. The Environmental Axis of the Resilient Investment Plans will make it possible to implement actions for the recovery and conservation of degraded areas, protection of water resources and sustainable soil management.</li> </ol> Knowledge management initiatives will be developed, including the collection, systematization and dissemination of relevant information on sustainable agricultural practices. Exchanges, seminars and educational materials will train farmers and share successful experiences.
9- Can an organization that has recently benefited from PROCASE I or other projects make another proposal viable?	1	Rural organizations and family farmers	Priority will be given to organizations that have not benefited from other projects. If these organizations have families that fall within the priority groups (women, young people, quilombolas, indigenous people, artisanal fishermen/ shellfish gatherers, gypsies, riverside dwellers, people with disabilities (PwD) and LGBTQIAPN+), they can be assisted, as long as they are activities that have not been previously funded and that fall within the project's eligible investment.

Questions	Number of times the question was asked	Origin of the questions	Answers
10- What is the strategy to avoid overlapping actions? And how will social control of the project be carried out and at what times?	2	Territorial committees and representatives of public policy councils	<p>To avoid overlapping actions, the first step is to identify the policies and projects that are underway in the state in the area of family farming, whether they have state or federal resources (e.g. the Cooperar Project, the Sertão Vivo Project, the Dom Helder/IDAF Project), and try to integrate them. To do this, planning is essential, so as not to overlap strategies and actions or benefit some families too much to the detriment of others.</p> <p>Social control, on the other hand, can come from the community (the members themselves), and in the municipality it can be done through the CMDRS, which has the role of controlling all policies aimed at rural development. In the case of PROCASE, the communities/projects will be presented to the territorial collegiate body, which will have the role of validating/validating the communities identified, and there is also the Executive Committee for the Management of Productive Investments (CEGIP), which will be made up of government and civil society and will have the role of:</p> <ul style="list-style-type: none"> <li>I. To assess and approve the Resilient Investment Projects (RIP) submitted by the PMU/PROCASE;</li> <li>II. To request, at any time, information from the PROCASE State Coordinator on projects and investments carried out within the scope of the territorial collegiate bodies in the state of Paraíba;</li> <li>III. Monitoring the efficiency of the socio-environmental safeguard policies and actions adopted by PROCASE in the Strategic Environmental and Social Management Plan - PGASE;</li> <li>IV. To monitor, every six months, the progress measured by the results indicators and products delivered by the Sustainable Rural Development Project, in accordance with the guidelines of the Project Operational Report (ROP).</li> </ul> <p>In addition to the spaces/instruments mentioned above, the public can also use the official channels for protests and complaints.</p> <ul style="list-style-type: none"> <li>- E-mail: <a href="mailto:contato@procase.pb.gov.br">contato@procase.pb.gov.br</a></li> <li>- Phone: (83) 3214-9248</li> <li>- PROCASE's "Contact Us" channel: <a href="https://www.procase.pb.gov.br/contato">https://www.procase.pb.gov.br/contato</a></li> <li>- Paraíba Government Ombudsman: <a href="https://ouvidoria.pb.gov.br/">https://ouvidoria.pb.gov.br/</a></li> <li>- IDB Complaints Channel: <a href="https://www.iadb.org/pt-br/quem-somos/enviar-uma-alegacao/reclamacoes-ambientais-e-sociais">https://www.iadb.org/pt-br/quem-somos/enviar-uma-alegacao/reclamacoes-ambientais-e-sociais</a></li> <li>- IFAD Complaints Channel: <a href="mailto:ethicsoffice@ifad.org">ethicsoffice@ifad.org</a></li> </ul>
11- When the projects are approved by the rural organizations, will the funds go straight to the organizations or will there be local political interference?	1	Rural organizations and family farmers	<p>The funds related to both the Resilient Investment Plans (RIPs) and the Business Plans will be passed on directly to the associations and/or cooperatives, which will receive technical advice on how to carry them out. In addition, the approved projects will have to pass technical evaluation criteria, thus avoiding any political interference.</p>

Questions	Number of times the question was asked	Origin of the questions	Answers
12- Will the project include investment in construction/works?	1	Rural organizations and family farmers	Procasa II will cover renovations and small social technology projects implemented by contracted entities, such as drilling wells, building dams and installing cisterns. In Resilient Investment Plans (PIRs), carried out by associations, and Business Plans (PNs), conducted by cooperatives, the reforms may represent a maximum of 20% of the value of each plan.
13- Will the projects offer conditions to increase production and marketing?	1	Rural organizations and family farmers	Yes, PROCASE II projects will offer conditions to increase production and the marketing of agricultural products. The central objective is to promote sustainable rural development and the productive and social inclusion of family farmers. To this end, key strategies will be implemented. Among them, resilient investment plans will include an axis focused on productivity and the insertion of products into the market, prioritizing practices that increase farmers' resilience to climate change and market variations. There will also be significant investments in business plans for cooperatives of different sizes. In addition, another important initiative will be to improve the infrastructure and logistics of local fairs and marketing centers, giving farmers more opportunities to sell their products directly to consumers. Events will also be organized to facilitate farmers' access to programmes such as PAA and PNAE, providing information and support so that they can benefit from these policies and expand their market opportunities. These strategies aim to create a favorable environment for a sustainable increase in production and improved marketing conditions, contributing to the economic sustainability of rural communities.
14- Who will draw up the projects? Will there be training on how to prepare the projects?	2	Rural organizations, family farmers and ATER technicians	PROCASE II projects will be drawn up by ATER in a participatory way with the communities, with the technicians undergoing further training. Practical workshops and training will be offered, as well as teaching materials adapted to the farmers' reality and ongoing support from the ATER teams to guarantee the quality of the projects. The projects will be drawn up in a participatory manner between the Technical Assistance and Rural Extension (ATER) teams and the beneficiary rural communities. To guarantee the quality of the projects, the ATER technicians will undergo a process of improvement and training and throughout the process, the ATER teams will have the continuous support of PROCASE, ensuring that the projects are built collaboratively, reflecting the needs and potential of the communities.
15- Can we take part in all the projects/actions offered by Procasa?	5	Rural organizations and family farmers	The work of PROCASE is to assist farming families through organizations (associations and/or cooperatives), so each family will have a single registration, so that family/beneficiary can participate in a single action and/or complementary actions (for example, a family that is a beneficiary of a PIR project will also receive ATER and training activities). The same family cannot participate in two different projects.
16- Is Procasa II interested in formulating/supporting projects in Agrarian Reform settlements? My question is why the settlers didn't appear as priorities.	1	Agrarian reform settlers	Family farmers, whether supported by agrarian reform or not, can benefit from Procasa II investments and actions.

<b>Questions</b>	<b>Number of times the question was asked</b>	<b>Origin of the questions</b>	<b>Answers</b>
17- Will it be less bureaucratic than other projects? Will there be agility in the processes?	20	Rural organizations and family farmers	The administrative processes, which we call "bureaucratic", exist to give transparency to the public resources involved in the bidding process, but the technical advisory companies that will monitor the implementation of the PIRs will be trained to speed up the purchasing and procurement processes of the bidding committees that each association will have.

## **Continuous Participation Process**

---

After the end of the consultations, the video was published and available for consultation, with the option for new questions and contributions to be made by any interested party.

The process of collecting contributions remains active so that people can take the time to consult the studies, watch the consultation videos and speak out if they wish.

All the questions asked during the consultation process (whether spoken, written or sent via the website) have been consolidated and are presented together with the relevant answers in the table above.

To facilitate access to information, all PROCASE-related documents remain available for download on the project's official website. In addition, the video of the consultation session held on July 2 is also open to the public on PROCASE's YouTube channel, allowing those who were unable to attend to follow the clarifications.

In view of the large number of contributions and questions raised at this initial stage, the team responsible for PROCASE remains committed to responding to these queries as quickly as possible. In the meantime, new suggestions and questions continue to arrive by e-mail and will be answered.

## **6 CONCLUSION**

When the public consultation was held/broadcast on July 2, there was a significant turnout of more than 3,000 people (in person, online and in the broadcasting rooms) in Paraíba's 15 rural territories, with Borborema, Cariri, Vale do Piranhas, Vale do Paraíba, Médio Sertão and Serra do Teixeira being the most prominent in terms of participation.

Coverage by municipalities in the state was 82%, involving 183 municipalities. Regarding gender when the consultation was broadcast, participation was 53% male and 40% female, and 7% could not be identified. Female participation was higher online at 44%, in the transmission rooms at 40% and in the face-to-face/PBPrev part at 28%. This expresses the importance of the model chosen to carry out the consultation, which allowed women to participate more expressively, especially online and in the broadcasting rooms.

The consultation also enabled the participation of various institutions, organizations, entities and social movements directly linked to family farming and sustainable rural development.

37 representatives of institutions, organizations and movements took part in the face-to-face session at the PBPrev auditorium in João Pessoa/PB. The State Secretariats that will be SEAFDS/PROCASE's partners stood out: Secretariat for Women and Human Diversity (SEMDH), Secretariat for Human Development (SEDH), Secretariat for Youth and Secretariat for the Environment and Sustainability (SEMAS); as well as EMPAER (co-executor of Proc case II); INCRA; FUNAI; PB/Prev; Social Movements (CPT - Pastoral Land Commission and MAB - Movement Affected by Dams); Public policy councils (CEDRS, CONSEA, COSEMS/PB and Rede Nacional de Colegiados e Fóruns Territoriais/Colegiado Estadual da Mata Norte); Banco do Nordeste (BNB); ODE/PB; SESCOOP/OCB-PB; PLANES; town halls; and production organizations such as Capribom, CONAP, COOPERVALE, COOPRAFE, FRUTIACU, INOVAGRO. The leaders of the priority groups were also present in the classroom.

In the broadcasting rooms and online, participation was expressive and diverse, encompassing 540 organizations and institutions, involving the participation of: organizations/cooperatives and/or associations of small producers, and/or family

farmers, and/or specific producers (beekeepers, sheep and goat farmers, melipon farmers, fishermen, animal breeders, and other diversified crops, etc.); Central Cooperatives; community and/or residents' associations; craftswomen's associations; Agrarian Reform settlement associations; Quilombola community associations; Fishermen's Colony; Women's Groups; NGOs, OSCIPs, Institutes, Trade Union Representation (STRs, Cut, Sintraf); Cultural Groups; Public Banks; Universities (public and private); Federal Institutes; City Halls (Agriculture, Environment, Education, Social Assistance, Tourism and Development Secretariats); City Councils; Technical Assistance Institutions and/or Entities (public and private); and Public Policy Councils (CMDRS, Collegiate/Territorial Forums).

With regard to the priority public, the Consultation was attended by various representatives of these publics, including:

- groups of women who participated online;
- Potiguaras (Mata Norte) and Tabajaras (Mata Sul) Indigenous Peoples, represented by Eugênio Herculano (FUNAI Regional Coordinator), Sandro Gomes (Potiguara General Chief) and Ednaldo (Tabajara Chief);
- Potiguara Women's Group YBY-RAPÓ Kunhã;
- Quilombola communities, represented by CEQNEC/PB - State Coordination of Black and Quilombola Communities of Paraíba, with the participation of president José Amaro in the virtual room in the municipality of Catolé do Rocha (Médio Sertão), and Raísa Rodrigues representing CEQNEC in the face-to-face consultation in João Pessoa;
- AACAD-PB - Associação de Apoio aos Assentamentos e Comunidades Afrodescendentes da Paraíba, represented by Francimar Fernandes;
- Povos Ciganos/CALON, through ASCOCIC - Associação Comunitária dos Ciganos de Condado, with the participation of President Maria Jane Soares - Gypsy Calin and founder of the Association, who participated online, and the Gypsy leaders of Rancho dos Ciganos in Sousa, who participated in the virtual room in Sousa (Cultural Center);
- Artisanal fishermen who participated in the broadcast/online rooms;
- Shellfish gatherers/AMA participated in the specific room in Acaú and in the municipal seat of Pitimbú.
- Representatives of organizations representing people with disabilities, such as the Association of Atypical Mothers, who participated in the virtual room in Monteiro, the Group of Mothers in the PB Regional ASD, who watched online, and the representative of the Paraibana Association for the Inclusion of People with Disabilities, who watched in a broadcast room;
- A representative of the LGBTQIAPNB+ Forum, Cleber Ferreira, took part in person in the PBPrev auditorium.

The decision to hold the PROCASE consultation in a hybrid format further qualified the presence and diverse profile of the public present and interested parties in learning about and interacting with the project's socio-environmental commitments. The virtual transmission, organized in the most diverse spaces (town halls, universities, schools, rural unions, councils, in addition to the regional offices of EMPAER/SEDAP and SEAFDS itself, ensured a greater reach in collecting suggestions, expectations and questions for the Project in this phase of qualified and attentive listening to the participating public and stakeholders.

During the public consultation held on 02/07/2024, 172 interactions were recorded via the Question Form in the broadcast. These interactions came mainly from the public participating online (75%), but also from broadcast rooms in rural territories (20%) and from the face-to-face room in the PBPREV auditorium (5%). The gender breakdown was 46% female, 52% male and 2% with no gender identification.

When you add up the interactions registered on the online Contribution Form and the Question Form during the broadcast, you reach a total of 1,510 manifestations. This significant number of participations demonstrates a high level of interaction and engagement by the public with the public consultation.

Participation in the holding and broadcasting of the consultation was very diverse, guaranteeing an audience of more than 3,000 participants.

The public consultation held for PROCASE/SEAFDS had several success points, such as the coordination established with the territorial councils, EMPAER and the SEAFDs, which made it possible to effectively mobilize the target audience. The meetings held with this public were important for clarifying specific doubts, and the distribution of the PROCASE field team across the rural territories also made a positive contribution. Another noteworthy aspect was the use of dates for plenary sessions and meetings of councils and collegiate bodies, as well as the operation of more than 100 rooms for live transmission of the consultation, which significantly increased participation, especially for those without internet access. The hiring of a specialized company for the broadcast, with audio and video quality, also proved to be a positive point.

The 1,510 interactions that took place via the online form and questions via the link provided a vast array of expectations, desires and suggestions that will help to strategically guide the demands of family farmers from the priority audiences. We tried to focus the responses during the consultation process on doubts and questions that required an explanation, and most of the comments were linked to contributions and ideas for the design of the project. Among the elements contributing to the design of the project, the suggestion to use information from health workers to identify rural communities that are not yet organized or to include some productive sectors in the development of the PIR/PN stands out.

It can be concluded that the public consultation achieved the expected objective with great excellence, reaching a significant number of interested parties, transmitting the necessary and appropriate information, as well as answering the questions raised, since the focus of the comments was on the scope of PROCASE, and not on the socio-environmental documents. This is understandable, given that the project is based on sustainable rural development, with positive results in many aspects.

## 6.1 Recommendations

Based on the results of the Public Consultation, we recommend:

- Follow up on the specific Public Consultation process according to the official selection of the communities to benefit from the PROJECT, also considering the actions established in the Socio-Cultural Analysis aimed at traditional peoples;
- Consider in the debate on the design of the PROJECT the various contributions/suggestions related to subproject proposals (PIR/PN), arising from the Public Consultation process.

## 7 ANNEXES

## 7.1 Annex - Presentation/slides from the Public Consultation in Belém and Santarém

## 7.2 Annex - List of Stakeholders who received an official invitation

Name / Institution (some community members also sit on the board of local institutions)	Type of Stakeholder (institutional, community representative)	Form of invitation

### 7.3 Annex - List of Participants in the Public Consultation

Name	Territory of Identity	Association or Entity

## 7.4 Annex - List of participants in the Breakout Rooms

## 1. INTRODUCTION

The Government of the State of Paraíba, through the State Secretariat for Family Farming and Semiarid Development (SEAFDS), has started a credit operation with the Inter-American Development Bank (IDB) and the International Fund for Agricultural Development (IFAD), aimed at supporting the development of the "**Paraíba Rural Sustainable Development Project - PROCASE II (PROJECT)**".

The intended PROJECT with the IDB and IFAD was structured into the following components: (i) Resilient production systems to reduce rural poverty; (ii) Organizational strengthening, capacity building and knowledge management. The Project has also Project Management, Monitoring and Evaluation.

This is a multiple works program, with socio-environmental documents being drawn up in the Framework Approach format<sup>1</sup>, in accordance with the IDB's new Environmental and Social Policy Framework and IFAD's Social, Environmental and Climate Assessment Procedures - SECAP, and guided by the PROJECT's Environmental and Social Management System - ESMS, made up of seven main pillars, including the environmental and social documents:

- Strategic Environmental and Social Assessment - AASE: involves assessing different decision-making strategies, so that the alternatives are coherent and harmonious with the relevant socio-environmental aspects for the region where the sub-projects are located and the sector where they will be implemented, and with the institutional framework of the executing agency in force and with good international practices. The AASE includes an analysis of the alternative types of sub-projects proposed for funding, as well as the institutional structure and applicable legislation, identifying the impacts and risks that must be mitigated;
- Strategic Environmental and Social Management Plan - PGASE: which determines, based on the results obtained in the AASE, the levels of studies required and the social and environmental programs that are essential to mitigate the impacts of the PROJECT's subprojects, as well as presenting guidelines for the adequacy and eligibility of subprojects that are under development through a mitigation hierarchy.
- Strategic Socio-Cultural Analysis - ASCE: which aims to prepare the instruments for identifying and managing potential negative socio-environmental impacts and socio-environmental risks that may arise from the actions envisaged in PROCASE II on traditional communities.

AASE identified risks and impacts in accordance with the requirements of PDAS 1 to 10 of the IDB's MPAS and the Standards established in IFAD's SECAP, confirming the negative and positive environmental and social impacts of the PROJECT. The ESMP (Environmental, Social and Climate Management Plan) includes measures to prevent impacts from materializing.

The AASE and PGASE are used to identify the possible key social and environmental risks and impacts of the PROJECT and the effective measures to be adopted to manage them.

The purpose of this Environmental and Social Management System (ESMS) is to present the structure and instruments for environmental and social management and to propose Action Plans for the PROJECT. The proposed PROJECT must present mechanisms that guarantee adequate management in order to meet the requirements defined in the PDAS1 of the IDB's MPAS. This ESMS is directly related to the Impact Mitigation and Control Programs defined in the Strategic Environmental and Social Management Plan

---

<sup>1</sup> Or *Framework Approach* (IDB - ESPF, 2020)

(PGASE), guaranteeing their execution and compliance, as well as the monitoring and continuous improvement of processes.

In the PROJECT's Environmental and Social Management System, a framework of rules and instructions has been established involving socio-environmental management and control, worker protection, proper communication and control of complaints received. Team training and the clear definition of responsibilities are also addressed.

Subsequently, a set of practical procedures is drawn up, with simple routines and organization of documentation to comply with the framework of standards and instructions.

It is important to note that it will be up to the PMU, with the support of the contracted sub-executing agency, to control the documentation received and to pay attention to the instructions and standards that make up this ESMS, always considering the possible need for its revision and adaptation to national and international legislation and best practices.

## **2. PROJECT-SPECIFIC ENVIRONMENTAL AND SOCIAL MANAGEMENT FRAMEWORK (ESMF)**

The Environmental and Social Management Framework is structured in such a way as to meet all the environmental and social demands identified, covering the care and control, prevention and correction measures, and socio-environmental monitoring relating to the mitigation and/or compensation of adverse or negative environmental impacts, as well as the enhancement of positive impacts (care and measures aimed at guaranteeing and amplifying the beneficial impacts caused by the project) diagnosed within the scope of the socio-environmental studies on the interventions planned for **PROCASE II**.

Programs with different components or when it involves the financing of sub-projects through International Financial Institutions (IFIs), or institutions or agencies acting as intermediaries, it is necessary to position the Environmental and Social Management System (ESMS) at a sufficiently high level in the organizational structure so that the borrower can establish the depth and breadth of supervision necessary for the effective management of environmental and social risks and impacts. In addition, it may be necessary to delegate certain aspects of the ESMS, which will require appropriate management oversight from the borrower. When PROJECTS consist of several works or multiple sub-projects, the ESMS can be consolidated with an Environmental and Social Management Framework.

Thus, the ESMF was prepared in accordance with the IDB's Environmental and Social Policy Framework - MPAS and its respective Environmental and Social Performance Standards - PDAS 1 to 10, as well as IFAD's Social, Environmental and Climate Assessment Procedures - SECAP and its respective Environmental, Social and Climate Standards. for the works or sub-projects that have not yet been defined by PROCASE II. These Frameworks and Procedures established by the IDB and IFAD are a guiding framework for the systematic management of the PROJECT's environmental and social performance throughout its life cycle. The identification of gaps in relation to the requirements of the IDB's MPAS and IFAD's SECAP made throughout the environmental and social assessments served as input for the definition of the socio-environmental action plan in which the necessary actions are set out in the PGASE's Environmental and Social Programs, allowing the PROJECT to comply with the Environmental and Social Performance Standards and Norms established within an adequate period of time.

Details of the content and guidelines set out in this item are available for review in the relevant PGASE document.

### 3. APPLICABLE STANDARDS AND LEGAL FRAMEWORK

The following are the rules and regulations applicable to the study area and related to the types of work and investments envisaged in the PROJECT, including the federal and state rules and regulations that affect the actions envisaged. It also presents the international environmental and social agreements and conventions applicable to the sub-projects/works. The assessment of the legal framework covers the environmental licensing system, land and natural resource use and ownership permits, workers' rights, health and safety, cultural heritage, landscape, social protection, and security, among others.

To elucidate the work of the entities responsible for the main regulations, a description is given of these institutions, considering their involvement with PROCASE II sub-projects.

Following on from the sub-items presented, the IDB's MPAS and IFAD's SECAP are presented, highlighting the Environmental and Social Performance Standards - PDAS and Norms triggered for the sub-projects assessed in the preparation of the PROJECT, including a comparative table and gap analysis with recommendations to be followed by the PMU in order to generate adherence with the requirements envisaged.

#### 3.1. International agreements

The main environmental agreements ratified by Brazil are presented below. Other agreements that complete the list are presented in Annex 11.1.

##### **United Nations Framework Convention on Climate Change - UNFCCC**

---

The United Nations Framework Convention on Climate Change (UNFCCC) is an international treaty resulting from the United Nations Conference on Environment and Development, held in Rio de Janeiro in 1992 (ECO-92).

This treaty aims to stabilize the concentration of greenhouse gases (GHG) in the atmosphere at levels that prevent dangerous interference with the climate system.

The treaty did not initially set mandatory limits for GHG emissions and contained no coercive provisions. Instead, the Treaty included provisions for updates (called "protocols"), which were supposed to create mandatory emission limits. The main one is the Kyoto Protocol.

Due to the fact that GHGs remain in the atmosphere for many decades after they are emitted, it is not possible to halt or reverse climate change and, for this reason, the measures to be taken are mitigating, in the sense of reducing the impact of such changes, and adapting, in the sense of creating mechanisms to adapt to the changes that will occur.

The member countries of the Convention meet periodically in meetings called the Conference of the Parties.

The first Conference of the Parties (COP 1) took place in Berlin in 1995 and saw the signing of the Berlin Mandate, in which the Annex I countries (industrialized countries) made greater commitments to stabilizing the concentration of GHGs, through policies and measures or quantitative emission reduction targets.

In 1997, the Kyoto Protocol was approved in Kyoto, which followed the guidelines of the Berlin mandate and placed greater emphasis on quantitative targets as a way of minimizing the costs of mitigation in each country. To this end, mechanisms such as the

Clean Development Mechanism (CDM) were also established, which enables both the reduction of emissions in industrialized countries and the transfer of resources from industrialized countries to developing countries.

In mid-2001, discussions resumed at COP 6 in Bonn, which became known as COP 6 BIS. At this meeting, the Bonn Agreement was established, in which concessions were made to guarantee the permanence of countries such as Japan and the Russian Federation, which was necessary for the Protocol to enter into force. This agreement also allowed for different interpretations of issues such as LULUCF (*Land use, Land use change and Forestry*), by countries that started to review their positions when the USA left, and the concessions made to other countries.

At the end of 2001, COP 7 was held in Marrakech and the Marrakech Accord was reached, which included the political aspects of the Bonn Agreement and the environmental aspects of the Kyoto Protocol. This agreement defines the operational rules for LULUCF, flexibility mechanisms, definition of the national emissions inventory system, additional information derived from the Kyoto Protocol and the process for reviewing national communications. It was necessary for the countries of the European Union and the G77 and China to give way to the countries of the *Umbrella Group* (Japan, Australia, Canada, and the Russian Federation). Even if the reductions provided for in the Kyoto Protocol are achieved, they will not be enough to significantly reduce man's interference in the climate system. COP 7 also saw the creation of the CDM Executive Committee and the drafting of a declaration emphasizing the relationship between sustainable development and climate change, defining poverty eradication and development as priorities for developing countries.

COP 17 was held in 2011 in Durban, South Africa. During this meeting, a legally binding agreement was reached, integrating all the participating countries, which will be prepared by 2015 and will enter into force in 2020.

COP 18 was held between November 26 and December 7, 2012, in Doha, Qatar. Its main objective was to reach an agreement on the emission targets of Annex I countries. At the same time, the Doha Amendment was approved, which extended the validity of the Kyoto Protocol until 2020. Canada, Japan, and New Zealand chose not to sign the amendment, joining the United States as countries that have not ratified the Protocol.

COP 19 took place in 2013 in Warsaw, Poland, with the aim of defining several important aspects, but it was a tumultuous and controversial meeting, and progress was only made in the negotiations on payment for reduced emissions from deforestation and forest degradation (REDD+), reaching a commitment to raise 280 million dollars for funding. It was also established that countries should set voluntary emission targets by 2015.

COP 20 took place between December 1 and 14, 2014 in Lima, Peru, with the aim of defining the text of the agreement that would replace the Kyoto Protocol, to be sealed in Paris in 2015. A first draft, entitled the Lima Call to Action on Climate, was approved, but the resolutions were modest and most of the important decisions were postponed.

COP 21, held in Paris between November 30, 2015, and December 12, 2015, fulfilled its main objective of approving the Paris Agreement, which established that global warming should be contained below 2 °C, preferably 1.5 °C. However, although widely praised as an important step forward, the Agreement was also heavily criticized for being unambitious, leaving it up to the countries to decide what their emission targets would be, for not being very clear about the means of financing, for not redefining mitigation and adaptation mechanisms that have already proved to be inefficient, and for not penalizing non-compliance with the targets, which brings a risk in the event that the voluntary targets set are not met and warming is not contained at the desired level.

COP 22 was held in Marrakech in 2016 and managed to set some important measures, especially in terms of starting to define the rules for the practical implementation of the Paris Agreement. In addition, countries pledged to donate 80 million dollars to the Adaptation Fund; announced more than 23 million dollars for the *Climate Technology Center and Network*, aimed at supporting technology transfer to developing countries, and the Green Climate Fund announced the approval of the first proposals for formulating National Adaptation Plans. A series of other initiatives have been launched in parallel by individual countries or groups of countries to increase the efficiency and transparency of mitigation and adaptation plans, expand funding, promote sustainable development, and focus on the special needs of vulnerable countries and indigenous communities.

COP 23 took place in Bonn, Germany, from November 6 to 18, 2017. The difficulties in implementing the Paris Agreement were discussed and preparations were made for the Talanoa Dialogue, which should facilitate the expansion of countries' voluntary emission targets. National and group projects offered specific improvements in various aspects of the fight against global warming.

COP 24 was held in Katowice, Poland, in December 2018. The main goal was to define the practical rules for implementing the Paris Agreement, which were approved, especially the mechanism for measuring national emissions and integrating them into an international system, but the results were hampered by the opposition of a group of countries, including Saudi Arabia, the United States, Russia and Kuwait, to the official recognition of the conclusions of the IPCC special report on warming of 1.5 °C. In the end, the rules set were limited to inviting countries to make use of the report, did not make much progress on the means of financing and did not oblige countries to increase their emission targets. On the other hand, the World Bank announced the allocation of 200 billion dollars to tackle the climate challenge.

COP 25 was due to take place in Brazil in November 2019, but the Brazilian government announced that it would not be hosting the event. The possibility of holding it in Chile was then mooted, but - due to various social demonstrations that were taking place during this period - an agreement was reached for COP 25 to be held in Madrid, Spain. One of the most important issues of the event was related to the regulation of the carbon credit market, which ended without an agreement.

COP 26 was supposed to take place in 2020 - however, due to the Covid-19 pandemic scenario, the event ended up taking place in November 2021 in Glasgow, Scotland. This Conference also included the 15th meeting of the parties to the Kyoto Protocol (CMP16) and the 2nd meeting of the parties to the Paris Agreement (CMA3). COP 26 ended with the signing of the Glasgow Pact, which aims to ensure that the increase in global temperatures does not exceed 1.5 °C. The Pact also recognizes that it will be necessary to reduce global carbon emissions by 45% by 2030 compared to the 2010 level and to achieve net zero emissions (an emission equivalent to what is removed from the atmosphere, leading to a total of zero emissions) by the middle of the century, as well as significant reductions in other greenhouse gases. Countries were encouraged to act more transparently on their climate commitments and to accelerate the transition to low-carbon energies. What was considered one of the biggest victories of the negotiations to be included in the Glasgow Pact was the approval of the Paris Article 6 rules, which deal with the international carbon market.

COP 27 took place in 2022 in Egypt, when world leaders discussed the practical rules of the Climate Convention, a global agreement to combat climate change. The main outcome was the creation of a fund to help the poorest countries cope with natural disasters caused by global warming.

COP28 was held from November 30 to December 12 at Expo City in Dubai, United Arab Emirates. COP28 began with the announcement of a concrete result, with the opening session officially approving the Loss and Damage Fund, the creation of which dates back to last year's COP27 negotiations. Immediately after the announcement, the United Arab Emirates, Germany, and Japan presented their first contributions to the fund, which will initially be administered by the World Bank and designed to address the challenges of countries highly vulnerable to climate effects. By the end of the COP, pledges had already amounted to US\$ 800 million. It was also decided that the venue for COP 29, to be held in 2024, will be Baku, the capital of Azerbaijan. A novelty emerging from the COP processes is the launch of a *troika*, which will be made up of the presidents of COP 28, COP 29, and COP 30. Thus, the United Arab Emirates, Azerbaijan and Brazil must lead the efforts to raise the parties' climate ambitions and safeguard the goal of limiting the global temperature increase to 1.5° C.

Another great expectation surrounding COP28 was the completion of the first global *stock take* of the Paris Agreement, the *Global Stock take*. This is a huge inventory that aims to determine how far we are from achieving the goals of the agreement and based on the best available science, outline the next steps to prevent the window of opportunity for guaranteeing a safe climate future for people and the planet from closing. In this sense, the content of the global stocktaking should inform the process of updating the next round of Nationally Determined Contributions (NDCs) to be submitted by COP 30. The document pointed to the need to achieve net zero emissions globally by 2050 and to reduce global emissions by 43% by 2030 and 60% by 2035. It also highlighted the centrality of the means of implementation and of scaling up climate finance to ensure that global emissions are reduced at the pace required for a 1.5°C scenario. The document also highlights the growing importance of adaptation initiatives, which must be informed by local priorities and context.

### **Kyoto Protocol to the United Nations Framework Convention on Climate Change**

The Kyoto Protocol is a complementary treaty to the United Nations Framework Convention on Climate Change, setting emission reduction targets for developed countries and those that, at the time, had economies in transition to capitalism, considered to be historically responsible for the current climate change.

Created in 1997, the Protocol entered into force on February 16, 2005, shortly after meeting the conditions that required ratification by at least 55% of all member countries of the Convention and that were responsible for at least 55% of total emissions in 1990.

During the first commitment period, between 2008-2012, 37 industrialized countries and the European Community committed to reducing greenhouse gas (GHG) emissions by an average of 5% compared to 1990 levels. In the second commitment period, the Parties pledged to reduce GHG emissions by at least 18% below 1990 levels over the eight-year period 2013-2020. Each country negotiated its own emissions reduction target based on its view of its ability to achieve it in the period considered.

Brazil ratified the document on August 23, 2002, and it was approved by Legislative Decree No. 144 of 2002. Among the main emitters of greenhouse gases, only the United States has not ratified the Protocol. However, they continue to have responsibilities and obligations under the Convention.

### **Paris Agreement (2015)**

At the 21st Conference of the Parties (COP21) to the UNFCCC in Paris, a new agreement was adopted with the central aim of strengthening the global response to the

threat of climate change and reinforcing the capacity of countries to deal with the impacts resulting from these changes.

The Paris Agreement was approved by the 195 countries party to the UNFCCC to reduce greenhouse gas (GHG) emissions in the context of sustainable development. The commitment is to keep the global average temperature increase to well below 2°C above pre-industrial levels and to make efforts to limit the temperature increase to 1.5°C above pre-industrial levels.

Following approval by the National Congress, Brazil completed the ratification process of the Paris Agreement on September 12, 2016. On September 21, the instrument was delivered to the United Nations. With that, Brazil's goals ceased to be aspirational and became official commitments. Now, therefore, the acronym has lost the letter "i" (from the English, *intended*) and is now just called NDC.

Brazil's NDC committed it to reducing greenhouse gas emissions by 37% below 2005 levels by 2025, with a subsequent indicative contribution of reducing greenhouse gas emissions by 43% below 2005 levels by 2030. To this end, the country has committed to increasing the share of sustainable bioenergy in its energy matrix to approximately 18% by 2030, restoring and reforesting 12 million hectares of forests, as well as achieving an estimated 45% share of renewable energies in the composition of the energy matrix by 2030.

### **Escazú Agreement**

---

This is a Regional Agreement on Access to Information, Public Participation and Access to Justice in Environmental Matters in Latin America and the Caribbean, signed by the UN in Escazú (Costa Rica) in 2018.

The Escazú Agreement is a regional treaty signed by 24 Latin American and Caribbean nations on the rights of access to environmental information, public participation in environmental decision-making, environmental justice, and a healthy and sustainable environment for current and future generations.

The Escazú Agreement strengthens the links between human rights and environmental protection by imposing requirements on member states in relation to the rights of environmental defenders. In addition, it aims to provide full public access to environmental information, environmental decision-making and legal protection and remedies relating to environmental issues. It also recognizes the right of present and future generations to a healthy environment and sustainable development.

### **ILO Convention concerning Indigenous and Tribal Peoples in Independent Countries No. 169**

---

The Convention on Indigenous and Tribal Peoples, which recognizes, along with indigenous peoples, other groups whose social, economic, and cultural conditions distinguish them from other sectors of the national community, establishing specific rights for them.

### **Stockholm Convention**

---

The Stockholm Convention on Persistent Organic Pollutants is an international treaty signed in 2001 in Stockholm, Sweden and was sponsored by the United Nations Environment Program. It was designed to globally eliminate the production and use of some human-caused toxic substances.

The Stockholm Convention was signed by 152 countries and currently 34 countries have not ratified it. The ratification of 50 countries is required for the Convention to enter into force 90 days later and for policies to begin to be implemented to eliminate these compounds.

The list of participating signatory countries and their ratification status can be found on the Stockholm Convention's official website.

It had the express aim of becoming an international foundation for the protection of human health and the environment from the harmful effects of persistent organic pollutants (POPs). This convention was the result of long years of negotiation to obtain legally binding commitments from the various countries for the immediate elimination of all persistent organic compounds.

The Convention stipulates that action must be taken as a matter of priority on a dozen compounds, including internationally produced chemicals such as pesticides, biphenyl polychlorides (PCBs), dioxins and furans.

Persistent Organic Pollutants - POPs are chemical substances that have been used as agrochemicals, for industrial purposes or released unintentionally in anthropogenic activities, and which have characteristics of high persistence (they are not easily degraded), are capable of being transported over long distances by air, water and soil, and accumulate in fatty tissues of living organisms, making them toxicologically worrying for human health and the environment.

Aware that POPs represent major and growing threats to human health and the environment, in May 1995 the UNEP Council requested in its decision 18/32 that an international process be carried out to evaluate an initial list of 12 POPs, and that the Intergovernmental Forum on Chemical Safety (IFCS/FISQ) draw up recommendations for international action on these pollutants, for consideration by the UNEP Governing Council and the World Health Assembly by 1997.

From then on, an international negotiation process began to conclude the Stockholm Convention, which was adopted in 2001 and entered into force in 2004, after 50 countries ratified it.

Brazil approved the text of the Convention through Legislative Decree No. 204 of May 7, 2004, and promulgated the text of the Convention in 2005 through Decree No. 5,472 of June 20, 2005.

The Secretariat of Water Resources and Environmental Quality of the Ministry of the Environment acts as the Technical Focal Point of the Convention, together with the Environmental Policy and Sustainable Development Division of the Ministry of Foreign Affairs, which acts as the Official Focal Point.

### **Commitments made**

The Stockholm Convention stipulates that countries parties adopt control measures related to all stages of the life cycle - production, import, export, use and final disposal - of the POPs substances listed in its Annexes. Annex D of the Convention sets out the criteria for a substance to be classified as a POP.

The Convention aims to eliminate and/or restrict POPs, their stockpiles, and residues, reduce the release of their unintentional emissions into the environment, and identify and manage areas contaminated by these substances.

In a preventive stance, the treaty requires governments to promote the best technologies and practices in their technological field and to prevent the development of new POPs. Going further, it sets as its ultimate goal the total elimination of POPs. The Convention

presents innovative and objective options for action to properly manage these substances.

Initially, 12 POPs were listed in the Convention, a number that was expanded in 2009 following a decision by the 4th Conference of the Parties to include 9 more substances, and then in 2011 with the inclusion of Endosulfam. Hexabromocyclododecane was added at COP 6 in May 2013. At COP 7, in May 2015, Hexachlorobutadiene, Pentachlorophenol, its salts and esters and Polychlorinated Naphthalenes were included. In 2017, during COP 8, Decabromodiphenyl Ether and Short Chain Chlorinated Paraffins were listed as POPs.

POPs are listed in three annexes to the Convention, which differ in the specific treatment they receive:

- Annex A - SOPs to be eliminated;
- Annex B - SOPs with restricted uses (but with the prospect of being eliminated);
- Annex C - SOPs produced unintentionally.

### **List of POPs Substances:**

#### **Annex A:**

Pesticides: Aldrin, Dieldrin, Endrin, Chlordane, Chlordecone, Heptachlor, Hexachlorobenzene (HCB), Alpha hexachlorocyclohexane (alpha HCH), Beta hexachlorocyclohexane (beta HCH), Lindane, Mirex (dodecachlor), Pentachlorobenzene (PeCB), Endosulfam, Toxaphene, Pentachlorophenol and its salts and esters.

Chemicals for industrial use: Polychlorinated Biphenyls (PCBs), Hexabromobiphenyl (HBB), Hexabromodiphenyl Ether and Heptabromodiphenyl Ether (C OctaBDE), Hexachlorobenzene (HCB), Tetrabromodiphenyl Ether and Pentabromodiphenyl Ether (C PentaBDE), Hexabromocyclododecane (HBCD), Hexachlorobutadiene (HCB), Polychlorinated Naphthalenes, Decabromodiphenyl Ether (C DecaBDE) and Short Chain Chlorinated Paraffins (SCCP).

#### **Annex B:**

Pesticide: DDT.

Chemicals for industrial use: Perfluorooctane Sulphonic Acid (PFOS), its salts and Perfluorooctane Sulphonyl Fluoride (PFOSF).

#### **Annex C:**

Polychlorinated Dibenzop-Dioxins and Dibenzofurans (PCDD/PCDF), Hexachlorobenzene (HCB), Polychlorinated Biphenyls (PCBs), Pentachlorobenzene (PeCB), Hexachlorobutadiene (HCB) and Polychlorinated Naphthalenes.

Article 7 of the Convention stipulates that countries must draw up National Implementation Plans for the Stockholm Convention (NIP), identifying priorities, deadlines, and strategies for complying with the treaty's obligations.

It is therefore a binding instrument, which includes substances that are highly toxic and harmful to humans and the environment and is of great interest to and monitored by industry and civil society.

## **Ramsar Convention**

---

The Convention on Wetlands of International Importance Especially as Waterfowl Habitat, also known as the Ramsar Convention because it was signed in the Iranian city of Ramsar on February 2, 1971, is an international treaty that came into force in 1975.

It is considered the first intergovernmental treaty to provide a structural basis for international cooperation and national action for the conservation and sustainable use of natural resources, specifically wetlands and their resources.

By ratifying the convention, the governments of the countries, Contracting Parties to the Convention, designate a site to be included on the List of Wetlands of International Importance and commit to working towards the sustainable use of their wetlands through territorial planning, policy development and publication of legislation, management actions and education of their populations. They also undertake to designate additional sites for the List of Wetlands of International Importance and to ensure their proper and effective management, and to cooperate internationally on transboundary wetlands, shared wetland systems, common species and development projects that may affect wetlands.

When a Ramsar site has lost, or is under threat of losing, its ecological characteristics, the respective Contracting Party can register it in the Montreux Record, a list of priority sites to be conserved and which can be the target of the application of a support and technical advice mechanism provided for in the convention.

Established in February 1971 in the Iranian city of Ramsar, the Convention on Wetlands of International Importance, better known as the Ramsar Convention, has been in force since December 21, 1975. It was fully incorporated into Brazil's legal framework in 1996, by the enactment of Decree No. 1.905/96.

The Convention is an intergovernmental treaty initially created to protect aquatic habitats important for the conservation of migratory birds, which is why it was called the "Convention on Wetlands of International Importance, especially as Waterfowl Habitat". However, over time, it has expanded its concern to other wetlands in order to promote their conservation and sustainable use, as well as the well-being of the human populations that depend on them.

Ramsar establishes frameworks for national actions and cooperation between countries with the aim of promoting the conservation and rational use of wetlands around the world. These actions are based on the recognition by the signatory countries of the Convention of the ecological importance and the social, economic, cultural, scientific, and recreational value of such areas.

## **International Labor Organization**

---

The ILO's principles and rights are governed by eight fundamental conventions covering: freedom of association, effective recognition of the right to collective bargaining, elimination of all forms of forced or compulsory labor, effective elimination of child labor and elimination of discrimination in respect of employment and occupation. Among the conventions, those ratified by Brazil are listed below, seven in total.

- ILO Convention 29 (Forced Labor);
- ILO Convention 98 (Right to Organize and Collective Bargaining);
- ILO Convention 100 (Equivalent pay for male and female workers for equivalent work);
- ILO Convention 105 (Abolition of Forced Labor);

- ILO Convention 111 (Discrimination - Employment and Occupation);
- ILO Convention 138 (Minimum Age for Admission to Employment);
- ILO Convention 169 (Indigenous and Tribal Peoples);
- ILO Convention 182 (Prohibition and Immediate Action for the Elimination of the Worst Forms of Child Labor).

### **Montreal Protocol and Kigali Agreement**

---

The Montreal Protocol is an international treaty that aims to protect the ozone layer by eliminating the production and consumption of the substances responsible for its destruction (ODS). The agreement is a consequence of the Vienna Convention for the Protection of the Ozone Layer; Brazil is one of the signatory countries.

The Vienna Convention and the Montreal Protocol were promulgated by Decree No. 99.280/90.

The adoption of the measures determined by the Protocol as public policy has made it possible to achieve positive results for the agenda in the country and in the world, with the combined efforts of the treaty's signatory nations.

#### **Control actions**

As there is no production of SDO in Brazil, the control actions take place in the import process, in trade and in the use of the substance. IBAMA is the federal institution responsible for this control; for ensuring that the country complies with its part of the treaty.

#### **Reduction of hydrochlorofluorocarbons (HCFCs)**

Decision XIX/6 of the Montreal Protocol<sup>2</sup> established a timetable for reducing HCFC consumption in Brazil in 2007. This plan has three stages and, by the year 2021, has already succeeded in reducing HCFC consumption by 51.6% compared to the base year (2013). It is estimated that the reduction will reach 100% by 2040.

#### **Control of hydrofluorocarbons (HFCs)**

Signed in 2016 during a meeting in the capital of Rwanda (hence its name), the Kigali Amendment includes hydrofluorocarbons (HFCs) in the Montreal Protocol. HFCs are powerful greenhouse gases that heat the planet up to 12,000 times more than CO<sub>2</sub>. The main aim of the Kigali Amendment is to reduce the production and consumption of HFCs, which are used in equipment such as air conditioners and refrigerators. In addition to the climate benefits, ratification of the Amendment will allow Brazilian industry to access 100 million dollars in non-refundable UN funding to upgrade production lines and increase efficiency and competitiveness.

Brazil took part in the 34th Meeting of the Parties as one of the 140 countries to ratify the Kigali Amendment. This amendment is an agreement that provides for a staggered reduction in the consumption of hydrofluorocarbons (HFCs) by 2045. By complying with this agreement, the expectation is that there will be a decrease of up to 0.4°C in global temperature.

---

<sup>2</sup> Available at: <https://www.gov.br/ibama/pt-br/assuntos/emissoes-e-residuos/emissoes/protocolo-de-montreal#reducao-HCFCs> Published: 29/11/2022 10h31

Although HCFs do not have the potential to destroy the ozone layer, they do have a high global warming potential.

With the ratification of the Kigali Amendment, the country undertakes to freeze the baseline consumption of HFCs in 2024 and reduce consumption by 10% by 2029.

In addition to the climate benefits, the ratification of this amendment will give Brazilian industry access to international resources to update production lines and increase efficiency and national competitiveness.

Brazil's ratification of the Kigali Amendment took place on October 19, 2022, after approval by the Federal Senate and respective delivery of the documents to the United Nations.

### 3.2. Federal legislation

**The Constitution of the Federative Republic of Brazil**, promulgated in 1988, broke new ground in dealing with environmental issues by dedicating Chapter VI - The Environment (Title VIII - Social Order) to the subject, which in Art. 225 states: "Everyone has the right to an ecologically balanced environment, a good for the common use of the people and essential to a healthy quality of life, imposing on the public authorities and the community the duty to defend and preserve it for present and future generations".

The main federal laws affecting the Project are presented below. In Annex 11.2, other complementary laws are presented.

#### **Environment**

- Law No. 6.938, of August 31, 1981, which establishes the National Environmental Policy, its purposes and mechanisms for formulation and application, constituting the National Environmental System (SISNAMA). It states that this policy: aims to preserve, improve, and restore environmental quality that is conducive to life, with a view to ensuring conditions for socio-economic development in the country, the interests of national security and the protection of the dignity of human life.
- Law No. 7.347, of July 24, 1985 (amended by Laws No. 8.078, of 09/11/1990 and No. 8.884, of 06/11/1994, No. 9.494, of 09/10/1997 and No. 10.257, of 07/10/2001 and by Provisional Measure No. 2.180-35, of 08/27/2001), which regulates public civil action for liability for damage caused to the environment, to consumers, to goods and rights of artistic, aesthetic, historical, tourist and landscape value.
- Federal Law No. 7.735, of February 22, 1989, which provides for the extinction of agencies and autarchic entities, creates the Brazilian Institute of the Environment and Renewable Natural Resources, and makes other provisions.
- Federal Law No. 7.797, of July 10, 1989, which creates the National Environmental Fund and makes other provisions.
- Federal Law No. 9.605, of February 12, 1998 (amended by Law No. 9.985, of July 18, 2000, and by Provisional Measure No. 2.163-41, of August 23, 2001), which provides for criminal and administrative sanctions arising from conduct and activities harmful to the environment (Environmental Crimes Law).
- Federal Decree No. 2.519, of March 16, 1998, promulgating the Convention on Biological Diversity, signed in Rio de Janeiro on June 5, 1992.
- Federal Law No. 9.795, of April 27, 1999, which provides for environmental education and establishes the National Environmental Education Policy.

- Federal Decree No. 3.179, of September 21, 1999, which specifies the sanctions applicable to conduct and activities harmful to the environment (environmental administrative infractions).
- Federal Decree No. 4.339, of August 22, 2002, which establishes principles and guidelines for the implementation of the National Biodiversity Policy.
- Federal Law No. 10.650, of April 16, 2003, which provides for public access to data and information held by the agencies and entities that make up SISNAMA.
- Federal Decree No. 855, of January 30, 2004, which amends Decrees No. 5.741 and 5.742, dated December 19, 2002, which regulate, respectively, the Technical Register of Potentially Polluting Activities or Users of Environmental Resources and the Technical Register of Environmental Defense Activities.
- Federal Decree No. 5.877, of August 17, 2006, which gives new wording to Article 4 of Decree No. 3.524, of June 26, 2000, which regulates Law No. 7.797, of July 10, 1989, which creates the National Environment Fund.
- IBAMA Normative Instruction No. 154, of March 1, 2007, which establishes the Biodiversity Authorization and Information System (SISBIO) and provides for licenses, collection, and capture of species of fauna and flora and access to genetic heritage.
- Federal Law No. 11.516, of August 28, 2007, which provides for the creation of the Chico Mendes Institute for Biodiversity Conservation - Instituto Chico Mendes.
- Federal Decree No. 6.514, of July 22, 2008, which provides for environmental infractions and administrative sanctions, and establishes the federal administrative process for investigating these infractions.
- Complementary Law No. 140, of December 8, 2011, which establishes rules, under the terms of items III, VI and VII of the caput and sole paragraph of art. 23 of the Federal Constitution, for cooperation between the Union, the States, the Federal District and the Municipalities in administrative actions arising from the exercise of common competence related to the protection of notable natural landscapes, the protection of the environment, the fight against pollution in any of its forms and the preservation of forests, fauna and flora; and amends Law No. 6.938, of August 31, 1981.
- ICMBio Normative Instruction 06, of July 25, 2019 - provides for the prevention of introductions and the control or eradication of exotic or invasive species in federal Conservation Units and their buffer zones.

### **Basic Sanitation**

- Federal Law No. 11.445, of January 5, 2007, which establishes national guidelines for basic sanitation; amends Laws No. 6.766, of December 19, 1979, No. 8.036, of May 11, 1990, No. 8.666, of June 21, 1993, No. 8.987, of February 13, 1995; and repeals Law No. 6.528, of May 11, 1978.

### **Water Quality**

- Federal Decree No. 79.367, of March 9, 1977, which lays down rules and standards for the potability of water.
- Federal Law No. 9.966, of April 28, 2000, which provides for the prevention, control and monitoring of pollution caused by the discharge of oil and other harmful or dangerous substances into waters under national jurisdiction.

- CONAMA Resolution No. 274, of November 29, 2000, which revises the criteria for bathing in Brazilian waters.
- Federal Decree No. 4.136, of February 20, 2002, which specifies the sanctions applicable to violations of the rules for the prevention, control and monitoring of pollution caused by the discharge of oil and other harmful or dangerous substances into waters under national jurisdiction.
- Federal Decree No. 4.871, of November 6, 2003, which provides for the establishment of Area Plans to combat oil pollution in waters under national jurisdiction.
- CONAMA Resolution No. 357, of March 17, 2005, which provides for the classification of bodies of water and environmental guidelines for their classification, as well as establishing the conditions and standards for discharging effluents.
- CONAMA Resolution No. 397, of April 3, 2008, which amends item II of § 4 and Table X of § 5, both of art. 34 of National Environmental Council Resolution - CONAMA No. 357, of 2005, which provides for the classification of bodies of water and environmental guidelines for their classification, as well as establishing the conditions and standards for discharging effluents.
- CONAMA Resolution No. 430, of May 13, 2011, which supplements and amends Resolution No. 357/2005. Provides for the conditions and standards for effluent discharge, complements and amends Resolution No. 357, of March 17, 2005, of the National Environmental Council (CONAMA).
- Ordinance MS No. 2.914 of December 12, 2011, of the Ministry of Health, which provides for the control and surveillance procedures of the quality of water for human consumption and its potability standard.
- CONAMA Resolution No. 454 of November 1, 2012, establishes the general guidelines and reference procedures for the management of material to be dredged in waters under national jurisdiction.

### **Historical and Cultural Heritage**

- Federal Law No. 3.924, of July 26, 1961, which provides for archaeological and prehistoric monuments of any nature existing in national territory and all the elements found therein, in accordance with the provisions of Article 175 of the Federal Constitution.
- IPHAN Ordinance No. 07, of December 1, 1988, which regulates requests for permission and authorization and prior communication when carrying out field research and archaeological excavations in the country, in order to protect objects of scientific and cultural value present at the sites of such research, as provided for in Law No. 3,924, of July 26, 1961. It lists the information that must accompany requests for permission and authorization, as well as prior communication, to be sent to the Secretary of the National Historical and Artistic Heritage Institute - IPHAN. It also lists the information that must accompany the reports to be sent to IPHAN.
- Federal Decree No. 3.551, of August 4, 2000, which establishes the Register of Intangible Cultural Goods that constitute Brazilian cultural heritage and creates the National Intangible Heritage Program.
- IPHAN Ordinance No. 230, of December 17, 2002, which makes preventive archaeological studies compatible with the environmental licensing phases of projects potentially capable of affecting archaeological heritage, as well as defining

the procedures to be adopted in each of the environmental licensing phases. In the phase of obtaining the Preliminary License (EIA/RIMA): Exhaustive survey of secondary archaeological data and archaeological field survey. The assessment of impacts will be based on the diagnosis made, the analysis of thematic environmental maps (geology, geomorphology, hydrography, slope and vegetation) and the technical particularities of the work. The Prospecting and Rescue programs will be drawn up based on the diagnosis and assessment of impacts. At the stage of obtaining the Installation License (LI): Prospecting Program: intensive prospecting in the environmental compartments with the greatest archaeological potential, in the area of direct influence of the project and in the places that will suffer indirect impacts potentially damaging to the archaeological heritage. In the phase of obtaining the Operating License (LO): Execution of the Archaeological Rescue Program proposed in the EIA and detailed in the Prospecting Program (LI). A report should be prepared detailing the activities carried out in the field and in the laboratory, as well as the results obtained from the efforts made in terms of producing knowledge about the archaeology of the study area, so that the physical loss of archaeological sites can be effectively offset by the incorporation of the knowledge produced into the National Memory.

- IPHAN Ordinance No. 28 of January 31, 2003, which stipulates that the reservoirs of hydroelectric projects of any size or dimension within the national territory must henceforth, when applying for the renewal of the environmental operating license, provide for the execution of archaeological survey, prospection, rescue, and salvage projects in the depletion strip.

### **Occupational Safety and Medicine**

- Law No. 6.514, of December 21, 1977, which amends Chapter V of Title II of the Consolidation of Labor Laws, relating to occupational safety and medicine, and makes other provisions.
- MTB Ordinance No. 3.214, June 8, 1978, which approves the Regulatory Norms - NR - of Chapter V, Title II, of the Consolidation of Labor Laws, relating to Occupational Safety and Medicine.
- Federal Law No. 8.080, of September 19, 1990, which provides for the conditions for the promotion, protection and recovery of health, the organization and operation of the corresponding services and makes other provisions.

### **Rural Environmental Regularization**

The Forest Code (Federal Law No. 12.651/2012) creates the Rural Environmental Registry - CAR and its system (SICAR). The CAR is a compulsory electronic register for all rural properties, which assists in the control, monitoring and environmental planning of these properties, under the terms of Article 29 of the aforementioned Code. The CAR was regulated by Decree No. 7,830/2012, which created the Rural Environmental Registration System (SICAR), and by the Normative Instruction of the Ministry of the Environment - MMA No. 02/2014.

Registration is the responsibility of the owner or the state land authority or INCRA in the case of land regularization of public land owned by the state or the federal government, respectively. Once they have registered with the CAR, owners and/or possessors of rural properties with environmental liabilities related to the irregular suppression of remnants of native vegetation, which occurred up until July 22, 2008, in Permanent Preservation Areas (APP), Legal Reserves (RL) and Restricted Use Areas (AUR), may apply to join

the Environmental Regularization Programs (PRA) of the states and the Federal District, in order to proceed with the environmental regularization of their rural properties.

APPs are protected areas, whether or not they are covered by native vegetation, with the environmental function of preserving water resources, the landscape, geological stability, and biodiversity, facilitating the gene flow of fauna and flora, protecting the soil, and ensuring the well-being of human populations.

For rural properties with an area greater than four Fiscal Modules - MF, which have an area with environmental liabilities in APP along natural watercourses, it is mandatory to restore the marginal strips: i) 20 meters, counted from the edge of the channel of the regular bed, for properties with an area between 4 and 10 MF, in watercourses up to 10 meters wide; and ii) in other cases, an extension corresponding to half the width of the watercourse, observing a minimum of 30 and a maximum of 100 meters, counted from the edge of the channel of the regular bed, regardless of the width of the river.

### **Natural Disasters and Climate Change**

Law No. 12.187 of December 29, 2009, institutes the National Policy on Climate Change - PNMC and establishes its principles, objectives, guidelines, and instruments. The PNMC aims, among other things: to make economic and social development compatible with the protection of the climate system; the reduction of anthropogenic GHG emissions, the implementation of measures to promote adaptation to climate change and the conservation and recovery of environmental resources, including the expansion of protected areas and incentives for reforestation and the restoration of vegetation in degraded areas.

The law establishes guidelines in line with Brazil's commitments to the United Nations Convention on Climate Change and other agreements and documents on the subject to which the country is a signatory, and establishes as instruments the National Plan on Climate Change, the National Fund on Climate Change and the Action Plans for the prevention and control of deforestation in the biomes (regulated by Decree No. 10.142/2019).

Presidential Decree No. 7.513/2011 created CEMADEN - the National Center for Monitoring and Alerts of Natural Disasters - a research unit of the Ministry of Science, Technology, and Innovation - to consolidate the National Plan for Risk Management and Response to Natural Disasters (PNGRRD) and implement a system of early warnings of the probability of occurrence of natural disasters associated with natural phenomena.

Within the scope of the National Plan for Risk Management and Disaster Response, CEMADEN monitors 959 municipalities in all Brazilian regions. The Center issues periodic reports analyzing the various risks, at least monthly for drought risks and impacts on agriculture.

### **Pesticides**

Law No. 7.802, of July 11, 1989, governs research, experimentation, production, packaging and labeling, transport, storage, marketing, commercial advertising, use, import, export, the final destination of waste and packaging, registration, classification, control, inspection and inspection of pesticides, their components, and the like, and makes other provisions.

### **New Brazilian Forest Code**

---

It is worth highlighting Law No. 12.651 of May 2012, referring to the new Forest Code, which provides for the protection of native vegetation; amends Laws Nos. 6.938, of

August 31, 1981, 9.393, of December 19, 1996, and 11.428, of December 22, 2006; repeals Laws Nos. 4.771, of September 15, 1965, and 7.754, of April 14, 1989, and Provisional Measure No. 2.166-67, of August 24, 2001; and makes other provisions.

The new Forest Code was approved on May 25, 2012, and brought changes in relation to the 1965 code on important points such as Permanent Preservation Areas (APP) and legal reserves.

### **Ecological and Economic Zoning**

---

Federal Decree No. 4.297, of July 10, 2002, defines the EEZ as an environmental instrument whose main objective is to guide planning and decision-making on programs, projects and activities that use natural resources and promote sustainable development (harmonizing production, preservation and conservation), including the prevention of impacts and the implementation of actions to mitigate or correct any damage to the environment.

#### **3.3. State Legislation**

Legislation in the state of Paraíba offers a series of guidelines that can set restrictions, permissions or guidelines for human activities and environmental preservation. Among the laws, 4.335/1981 stands out, which provides for the preservation and control of pollution and establishes disciplinary standards. In turn, State Law 6.002/1994 establishes the state's Forest Code, which was regulated by State Decree 23.835/2002.

On more specific issues of the state's legal requirements, there are instruments aimed at measures to preserve and restore biomes, with special attention to the Caatinga. These pieces of legislation - established, for example, in State Law No. 8.387/2007; State Law No. 9.569/2011; State Law No. 9.645/2011; State Law No. 9.857/2012; State Decree No. 24.419/2006 - offer requirements for restricting the cutting of certain species, licensing characteristics and even the creation of state committees, but also qualify and exempt types of activities such as SAFs or traditional practices from the requirements, or simplify them.

You must also observe the guidelines set out in State Law 11.140/2018, which deals with the rights and welfare of animals, including guidelines on comfort, food, and zoonosis.

SUDEMA also establishes its Administrative Norms to offer more specific parameters on environmental licensing, particularly NAs 101, 115 and 118.

Below is a list of the most relevant state laws.

- State Law No. 4.335, of December 16, 1981 - Provides for the preservation and control of environmental pollution and establishes disciplinary norms;
- State Law No. 6.002, of December 29, 1994 - Establishes the Forest Code of the state of Paraíba;
- State Law No. 6.960, of February 6, 2001 - Provides for mandatory forest replacement and other measures;
- State Law No. 8.387, of November 14, 2007 - Provides for the Conservation and Management Policy of the Caatinga biome;
- State Law No. 9.569, of December 6, 2011 - Considers the Caatinga Biome to be a Heritage of the State of Paraíba;
- State Law No. 9.645, of December 29, 2011 - Creates the State Committee of the Caatinga Biosphere Reserve in the State of Paraíba - CERBCAAT-PB;

- State Law No. 9.857, of July 6, 2012 - Provides for the use and protection of vegetation in the Caatinga Biome and makes other provisions;
- State Law No. 10.146, of November 14, 2013 - Establishment of the Paraíba week to raise awareness of the Caatinga biome (week of April 28);
- State Law No. 11.140, of June 8, 2018 - Institution of the animal law and welfare code of the State of Paraíba;
- State Law No. 11.153, of July 2, 2018 - Amends the wording of the Sole Paragraph of Article 7 of Law No. 9.857/2012, which provides for the use and protection of vegetation in the Caatinga Biome, allowing the cutting of algaroba without the need for authorization;
- State Law No. 11.764, of August 26, 2020 - Provides for the establishment of Agrovilas in the State of Paraíba;
- State Decree No. 21.120, of June 20, 2000 - Regulates Law No. 4.335, of December 16, 1981, amended by Law No. 6.757, of July 8, 1999, which provides for the prevention and control of environmental pollution, establishes rules governing the species and makes other provisions;
- State Decree No. 23.835, of December 27, 2002 - Regulates the Forest Code in the State of Paraíba and makes other provisions;
- State Decree No. 24.414, of September 27, 2003 - Provides for forest exploitation in the state of Paraíba and makes other provisions;
- State Decree No. 24.415, of September 27, 2003 - Provides for the compulsory registration of individuals and legal entities that consume forest products and by-products with the Superintendence of Environmental Administration - SUDEMA and makes other provisions;
- State Decree No. 24.416, of September 27, 2003 - Provides for mandatory forest replacement in the state of Paraíba and other measures;
- State Decree No. 24.417/2003, of September 27, 2003 - Provides for Alternative Land Use and other measures;
- State Decree No. 24.419, of August 23, 2006 - Gives new wording to articles 1 and 5 of Decree 24.419, of September 27, 2003, on the use of controlled fire in the state of Paraíba;
- SUDEMA Administrative Standard NA 101 - Procedures and Specifics for Environmental Licensing based on the Legal System and Specific Regulations analogous to the matter;
- SUDEMA Administrative Standard NA 115 - Adopts guidelines for environmental licensing of agrarian reform settlement projects;
- SUDEMA Administrative Standard NA 118 - Procedures for licensing dryland activities;

### **3.4. IDB Environmental and Social Policy Framework**

The following are the Environmental and Social Performance Standards (ESPP) that make up the IDB's Environmental and Social Policy Framework.

## **PDAS 1: Assessment and Management of Environmental and Social Risks and Impacts**

---

The Environmental and Social Performance Standard (ESPS) 1 highlights the importance of managing environmental and social performance throughout the life of a project. An effective Environmental and Social Management System (ESMS) is a dynamic and continuous process initiated and supported by the Borrower, and involves commitment between the Borrower, its workers, and project-affected people and, where appropriate, other stakeholders. Based on the elements of the established management process of "plan, do, check and act", the ESMS involves a methodological approach to managing environmental and social risks and impacts in a systematic and structured manner on an ongoing basis. A good ESMS appropriate to the nature and scale of the project promotes sound and sustainable environmental and social performance and can lead to better financial, social, and environmental results.

Objectives:

- Identify and assess the project's environmental and social risks and impacts.
- Adopt a mitigation hierarchy and a precautionary approach to anticipate
- and avoid adverse impacts on workers, communities, and the environment, or where avoidance is not possible, minimize and, where residual impacts remain, compensate for risks, and impacts as appropriate.
- Promote better environmental and social performance of Borrowers through the effective use of management systems.
- Ensure that complaints from people affected by the project and external communications from other interested parties are answered and managed appropriately.
- Promote and provide means for adequate engagement with project-affected people and other stakeholders throughout the project cycle on issues that could potentially affect them and ensure that relevant environmental and social information is disclosed and disseminated.

## **PDAS 2: Labor and Working Conditions**

---

The Environmental and Social Performance Standard (ESPRS) 2 recognizes that the pursuit of economic growth through job creation and income generation must go hand in hand with the protection of workers' fundamental rights. The workforce is a valuable asset, and a good worker-employer relationship is a key ingredient in the sustainability of any enterprise. Failure to establish and foster a solid employee-management relationship can undermine employee engagement and retention and can put a project at risk. On the other hand, through a constructive worker-management relationship and by treating workers fairly and providing safe and healthy working conditions, Borrowers can create tangible benefits, such as improving the efficiency and productivity of their operations.

The requirements set out in this PDAS were partly guided by various international conventions and instruments, including those of the International Labor Organization (ILO) and the United Nations (UN)

Objectives:

- Respect and protect workers' fundamental rights and principles.
- Promoting fair treatment, non-discrimination, and equal opportunities for workers.

- Establishing, maintaining and improving the employee-employer relationship.
- Ensuring compliance with national employment and labor laws.
- Protecting workers, including vulnerable categories such as women, people of different gender identity or sexual orientation, people with disabilities, children (of working age, according to this PDAS) and migrant workers, third-party contract workers and primary supply workers.
- Promoting safe and healthy working conditions and workers' health.
- Preventing the use of child labor and forced labor (as defined by the ILO).
- Support the principles of freedom of association and collective bargaining for project workers.
- Ensure that workers have accessible and effective means of raising and addressing work-related concerns.

### **PDAS 3: Resource Efficiency and Pollution Prevention**

---

This PDAS describes a project-level approach to resource management and pollution prevention and control, and GHG emission prevention and minimization. It will build on the mitigation hierarchy and the "polluter pays" principle. It recognizes the disproportionate impact of pollution on women, children, the elderly, the poor and the vulnerable. This PDAS also recognizes the emerging concept and practice of the circular economy and/or resource recovery, where usable and valuable products can be created or derived from what was previously seen as waste. The project has reported risks and impacts associated with the use of resources, and the generation and emission of waste must be assessed from the local context and environmental conditions of the project. Appropriate mitigation measures, technologies and practices should be adopted for the efficient and effective use of resources, the prevention and control of pollution, and the prevention and minimization of GHG emissions, in accordance with internationally disseminated technologies and practices.

Objectives:

- Avoid or minimize adverse impacts on human health and the environment by avoiding or reducing pollution resulting from project activities.
- Promoting a more sustainable use of resources, including energy and water.
- Reduce or avoid GHG emissions related to the project.
- Avoid or minimize the generation of waste.
- Minimize and manage the risks and impacts associated with pesticide use.

### **PDAS 4: Community Health and Safety**

---

Environmental and Social Performance Standard 4 recognizes that project activities, equipment and infrastructure may increase community exposure to risks and impacts including those caused by disasters and climate change. In addition, communities that are already subject to adverse impacts from natural hazards and climate change may also experience an acceleration and/or intensification of these adverse impacts due to project activities. Natural hazards and climate change impacts can affect the project itself, which can cause additional adverse impacts on the health and safety of people affected by the project. This PDAS addresses the Borrower's responsibility to avoid or minimize risks and impacts to community health, safety and security that may arise from project-related activities, with special attention to vulnerable groups. It also addresses

the Borrower's responsibility to avoid or minimize the risks and impacts of the project itself that may result from disasters or climate change.

Objectives:

- Anticipate and avoid adverse impacts on the health and safety of people affected by the project during the project life cycle, in routine and non-routine circumstances.
- Ensure that the safeguarding of personnel and property is done in accordance with the relevant human rights principles and to avoid or minimize the risks to those affected by the project.
- Anticipate and avoid adverse impacts on the project itself due to disasters and climate change during the project life cycle.

### **PDAS 5: Land Acquisition and Involuntary Resettlement**

---

Environmental and Social Performance Standard 5 addresses the impacts of project-related land acquisition, including restrictions on the use of land and access to its assets and resources, which can cause physical displacement (relocation, loss of residential land or loss of shelter) and/or economic displacement (loss of land, assets or access to assets, including those leading to loss of sources of income or other means of livelihood). The term "involuntary resettlement" refers to these two impacts and the processes of mitigating and compensating for these impacts. Resettlement is considered involuntary when project-affected people do not have the right to refuse land acquisition or land use restrictions that result in physical or economic displacement. This occurs in cases of (i) legal expropriation or temporary or permanent restrictions on land use and (ii) negotiated agreements in which the buyer can resort to expropriation or impose legal restrictions on land use if negotiations with the seller fail.

Unless properly managed, involuntary resettlement can result in long-term hardship and impoverishment for the people affected by the project, as well as environmental damage and adverse socio-economic impacts in the areas to which they have been displaced. For these reasons, involuntary resettlement should be avoided. However, where involuntary resettlement is unavoidable, it should be minimized and appropriate measures to mitigate adverse impacts on displaced people and host communities should be carefully planned and implemented. The government plays a central role in the land acquisition and resettlement process, including the determination of compensation. Close collaboration and coordination between government agencies and project-affected people can result in more cost-effective, efficient, and timely implementation of these activities, as well as the introduction of innovative approaches to improving the livelihoods of those affected by resettlement.

Objectives:

- Avoid, and when it cannot be avoided, minimize displacement by exploring alternative projects.
- Avoid forced evictions.
- Anticipate and avoid, or where not possible, minimize the adverse social and economic impacts of land acquisition or land use restrictions by (i) compensating for the loss of assets at replacement cost and transition difficulties, (ii) minimizing the disruption of their social networks and other intangible assets, and (iii) ensuring that resettlement activities are implemented with adequate disclosure of information, consultation and informed participation of affected people.
- Improving or restoring the livelihoods and living standards of those relocated.

- Improve the living conditions of physically displaced people by providing adequate housing with security of tenure, and security at resettlement sites.

## **PDAS 6: Biodiversity Conservation and Sustainable Management of Living Natural Resources**

---

Environmental and Social Performance Standard 6 recognizes that protecting and conserving biodiversity, maintaining ecosystem services, and sustainably managing living natural resources are fundamental to sustainable development. The requirements set out in this PDAS have been guided by the Convention on Biological Diversity, which defines biodiversity as "the variability among living organisms from all sources, including terrestrial, marine and other aquatic ecosystems and the ecological complexes of which they are a part; this includes diversity within species, between species and of ecosystems." Ecosystem services are the benefits that people, including companies, obtain from ecosystems.

Ecosystem services are organized into four types: (i) provisioning services, which are the products that people obtain from ecosystems; (ii) regulating services, which are the benefits that people obtain from regulating ecosystem processes; (iii) cultural services, which are the non-material benefits that people obtain from ecosystems; and (iv) support services, which are the natural processes that maintain the other services.

The ecosystem services valued by humans are generally sustained by biodiversity. Impacts on biodiversity can therefore adversely affect the provision of ecosystem services. This ESDP addresses how Borrowers can sustainably manage and mitigate impacts on biodiversity and ecosystem services throughout the project life cycle.

Objectives:

- Protect and conserve terrestrial, aquatic, coastal and marine biodiversity.
- Maintaining the functioning of the ecosystem to guarantee the benefits of ecosystem services.
- Promote the management and sustainable use of natural resources by adopting practices that integrate conservation needs and development priorities.

## **PDAS 7: Indigenous Populations**

---

The Environmental and Social Performance Standard (ESPS) 7 recognizes that Indigenous Peoples<sup>3</sup>, as distinct social and cultural peoples, are often among the most marginalized and vulnerable segments of the population. In many cases, their economic, social, and legal status limits their ability to defend their rights and interests in lands and natural and cultural resources and can restrict their ability to participate in and benefit from development that is in line with their worldview. Indigenous Peoples are particularly vulnerable if their lands and resources are transformed, invaded, or significantly

---

<sup>3</sup> There is no universally accepted definition of "Indigenous Peoples". Indigenous peoples may be referred to in different countries by terms such as "original peoples" (*pueblos originarios*), "autochthonous peoples" (*pueblos autóctonos*), residents of indigenous municipalities (comarcas) or reservations (resguardos) or any other formally recognized indigenous peoples in Latin America and the Caribbean. In PDAS 7, the term "Indigenous Peoples" is used in a generic sense to refer to a distinct social and cultural group possessing the following characteristics in varying degrees: (i) Self-identification as members of a distinct indigenous cultural group and recognition of this identity by others. (ii) Collective attachment to geographically distinct habitats or ancestral territories in the project area and to the natural resources of those habitats and territories. (iii) Customary cultural, economic, social or political institutions separate from those of the dominant society or culture. (iv) A distinct language or dialect, usually different from the official language or languages of the country or region in which they reside. For the purposes of this PDAS, traditional peoples, as recognized by national laws, should be treated as indigenous peoples.

degraded. Their languages, cultures, religions, spiritual beliefs, and institutions may also be threatened. As a consequence, indigenous peoples may be more vulnerable to the adverse impacts associated with project development than non-indigenous peoples. This vulnerability may include loss of identity, culture and natural resource-based livelihoods, and exposure to impoverishment and disease.

Projects can create opportunities for Indigenous Peoples to participate in and benefit from project-related activities that can help them fulfill their aspirations for the economic and social development of their identity. In addition, Indigenous Peoples can play a role in sustainable development by promoting, owning, and managing activities and companies as partners in development. The government often plays a central role in managing Indigenous Peoples' issues. It is therefore important that there is collaboration and coordination between responsible and relevant authorities in managing the project's risks and impacts.

The requirements presented in this PDAS have been guided in part by international conventions and instruments, including those of the International Labor Organization (ILO) and the United Nations (UN).

Objectives:

- Ensure that the development process promotes full respect for the human rights, collective rights, dignity, aspirations, culture, and natural resource-based livelihoods of Indigenous Peoples.
- Anticipate and avoid adverse impacts of projects on Indigenous Peoples' communities, or when it is not possible to avoid, minimize and/or compensate for such impacts.
- Promote sustainable development benefits and opportunities for Indigenous Peoples in a culturally appropriate manner.

### **PDAS 8: Cultural Heritage**

---

Environmental and Social Performance Standard (ESPS) 8 recognizes the importance of cultural heritage for current and future generations. Consistent with the Convention Concerning the Protection of the World Cultural and Natural Heritage, this PDAS aims to ensure that Borrowers protect cultural heritage in the course of their project activities. In addition, the requirements of this PDAS on the use of a project's cultural heritage are based in part on the standards set by the Convention on Biological Diversity.

Objectives:

- Protect cultural heritage from the adverse impacts of project activities and support its preservation.
- Promote the equitable sharing of the benefits arising from the use of cultural heritage.

### **PDAS 9: Gender Equality**

---

This ESDP aims to identify possible gender-based risks and impacts and introduce effective measures to avoid, prevent or mitigate these risks and impacts, thereby eliminating the possibility of reinforcing pre-existing inequalities or creating inequalities that did not exist. For the purposes of this PDAS, affirmative action specifically aimed at reducing existing gender gaps, addressing specific gender-based needs or ensuring the participation of people of all genders in consultations shall not constitute discrimination or exclusion.

This PDAS pays special attention to how gender inequalities interact with other inequalities, such as socioeconomic, ethnic, racial, disability and other factors, and how this intersectionality can exacerbate barriers to accessing project benefits, limit the ability to cope with negative project impacts and create other vulnerabilities.

This PDAS recognizes that diverse sexual orientations and gender identities can make people excluded and/or make segments of the population more vulnerable to negative impacts from the project, often preventing them from taking advantage of the opportunities available to other members of the community.

This PDAS also recognizes that sexual and gender-based violence (SGBV) is a prevalent global problem. Manifestations of SGBV likely exist in all settings. Gender-related impacts, including all forms of SGBV, including sexual exploitation and abuse, disproportionately affect women and people of diverse sexual orientations and gender identities. Projects that involve a large influx of workers in a community can exacerbate existing risks of SGBV or create risks, ranging from sexual harassment to sexual abuse and exploitation of women and children.

Likewise, this PDAS recognizes that globally and in LAC countries, most unpaid care work falls to women. Unpaid care work is one of the main barriers preventing women from entering, continuing, or progressing in the workforce. This presents a major barrier to gender equality and women's economic empowerment, including women's meaningful participation in opportunities available to other members of the community.

Objectives:

- Anticipate and prevent risks and adverse impacts based on gender, sexual orientation, and gender identity and, where this cannot be avoided, mitigate, and compensate for these impacts.
- Establish preventive actions to prevent or mitigate risks and impacts arising from gender in projects, throughout the project cycle.
- Achieving the inclusion of benefits derived from projects by people of all genders, sexual orientations, and gender identities.
- Avoid exacerbating SGBV, including sexual harassment, exploitation, and abuse, and when incidents of SGBV occur, respond immediately.
- Promote safe and equitable participation in stakeholder consultation and engagement processes, regardless of gender, sexual orientation, and/or gender identity.
- Meet the requirements of applicable national legislation and international commitments related to gender equality, including actions to mitigate and prevent gender-related impacts.

#### **PDAS 10: Stakeholder engagement and information disclosure**

---

This Environmental and Social Performance Standard (ESPS) recognizes the importance of open and transparent engagement between the Borrower and stakeholders, in particular project-affected people, as a key element that can improve the environmental and social sustainability of projects, enhance project acceptance, and contribute significantly to the successful development of a project and its implementation. This PDAS is consistent with the objectives of implementing the right to access to information, public participation in the decision-making process and access to justice in environmental matters.

Stakeholder engagement is an inclusive process, conducted throughout the life cycle of a project. When properly designed and implemented, it supports the development of strong, constructive, and responsive relationships, which are important for the successful management of a project's environmental and social risks and impacts. Stakeholder engagement is most effective when initiated at an early stage in the project development process. It is an integral part of the project's initial decisions on assessing, managing, and monitoring the project's environmental and social risks and impacts

Objectives:

- Establish a systematic approach to stakeholder engagement that will help the Borrower to identify stakeholders, especially people affected by the project, and to build and maintain a constructive relationship with them.
- Assess the level of stakeholder interest and support in the project and allow stakeholder views to be considered in the design and environmental and social performance of the project.
- Promote and provide means for effective and inclusive engagement with project-affected people throughout the project lifecycle on issues that could potentially affect or benefit them.
- Ensure that appropriate project information on environmental and social risks and impacts is disclosed to stakeholders in a timely, understandable, accessible, and appropriate manner and format.
- Provide stakeholders with accessible and inclusive means to raise issues, proposals, concerns and complaints and enable Borrowers to respond and manage appropriately.

### **Exclusion List**

---

The IDB's exclusion list contains a series of activities that are not allowed in the Bank's financing, mainly because they are incompatible with its commitments to address the challenges of climate change and promote environmental and social sustainability. The list of activities not permitted under the IDB's criteria is presented below.

- Activities that are illegal according to laws, regulations or ratified international conventions and agreements, or subject to international interruptions or prohibitions, such as:
  - polychlorinated biphenyls (PCBs);
  - pharmaceutical products, pesticides/herbicides, and other dangerous substances subject to international interruptions or bans;
  - Persistent Organic Pollutants (POPs);
  - ozone-depleting substances subject to international elimination;
  - wildlife or wildlife products regulated by the Convention on International Trade in Endangered Species of Wild Fauna and Flora;
  - cross-border trade in waste or waste products, except for non-hazardous waste destined for recycling;
  - lead-based paint or coatings in the construction of structures and roads.
- Activities that are illegal under laws, regulations or ratified international conventions and agreements relating to the protection of biodiversity resources or cultural heritage.

- Activities which, although consistent with the legal and/or regulatory framework of a country, may generate particularly significant adverse impacts on people and/or the environment, such as:
  - weapons, ammunition, and other military goods/technology;
  - tobacco;
  - gambling, casinos, and similar enterprises;
  - radioactive materials;
  - unbound asbestos fibers or products containing asbestos;
  - fishing nets drifting in the marine environment, using nets over 2.5 km long.
- Activities incompatible with the IDB's commitments to address the challenges of climate change and promote environmental and social sustainability, such as:
  - thermal coal mining and coal-fired power plants and associated facilities;
  - upstream oil exploration and development projects;
  - upstream gas exploration and development projects. In exceptional circumstances and on a case-by-case basis, financing of upstream gas structures will be considered where there is a clear benefit in terms of access to energy for the poor and reduction of greenhouse gas (GHG) emissions, projects consistent with national climate change objectives, and where the risks of retained assets are adequately analyzed.

### 3.5. IFAD's Environmental, Social and Climate Standards

IFAD has established Social, Environmental and Climate Assessment Procedures (SECAP) in which it requires the project to consider social, environmental and climate change issues.

The IFAD Standards establish fundamental requirements for the environmental and social sustainability of projects. Project teams (and co-financiers, if applicable) must apply them during design and implementation, but they are also aimed at borrowers/beneficiaries/associates, who are ultimately responsible for implementation.

These standards are based on the good practices of the United Nations, financial institutions, international organizations, and multilateral development banks.

All projects must undergo an ex-ante environmental, social and climate assessment. The assessment determines how the risks and effects (both those affecting the project and those caused by it). The level of risk is determined on a case-by-case basis, with appropriate mitigation measures depending on the nature and scale of the project, and its level of environmental, social and climate risk. The assessment also considers the capacity and degree of commitment of the borrower/beneficiary/partner to implement the project in accordance with environmental and social standards. If environmental and social risks or effects arise during implementation, the project team, in collaboration with the national authorities, must adjust the project plan or introduce appropriate mitigation measures.

#### **Standard 1: Biodiversity Conservation**

---

According to the Convention on Biological Diversity (CBD), this standard recognizes that biological diversity includes more than plants, animals and microorganisms and their ecosystems; it also refers to people and their needs for food security, medicines, clean air and drinking water, housing, and a clean and healthy environment in which to live.

Biological diversity is essential for maintaining ecosystem services (such as water and food supply) and other resources that are important both for the ecosystems themselves and for human life. The diversity of agroecological systems promotes the resilience of rural families and their production systems. The aim of conserving biological diversity is to maintain the resources and related services to meet humanity's current needs, while guaranteeing their availability for future generations, a fundamental criterion of sustainable development.

Objectives:

- maintaining and conserving biodiversity;
- ensure that the benefits of using genetic resources are distributed fairly and equitably;
- respect, preserve, maintain and strengthen the knowledge, innovations and practices of indigenous peoples and local communities relevant to the conservation and sustainable use of biodiversity and their customary use of biological resources, and
- apply the precautionary principle in the conservation and management of natural resources to ensure that there are opportunities for environmentally sustainable development.

## **Standard 2: Resource Efficiency and Pollution Prevention**

---

This standard recognizes that economic activity and development often pollute the air, water, and land, and can lead to the consumption of finite resources, which in turn can pose a threat to humans, ecosystem services and society.

IFAD calls for the application of the precautionary principle to address significant environmental and social risks and effects through the mitigation hierarchy, the "polluter pays" principle (which proposes that the cost of mitigation be borne by the polluter, where applicable) and adaptive management techniques (where lessons are drawn from previous management actions and then used proactively to improve management in the future).

This standard establishes a project-level approach to mitigating, minimizing, and managing potential risks and adverse effects that may be related to resource use and pollution.

Objectives:

- Avoid, minimize, and manage the risks and effects associated with hazardous substances and materials, including pesticides;
- avoid or minimize short- and long-term climate-related pollutant emissions caused by the project<sup>36</sup>;
- promote a more sustainable use of resources, including energy, land, and water, and identify opportunities to contribute to the efficient use of resources.

## **Standard 3: Cultural Heritage**

---

This standard recognizes that cultural heritage is a fundamental element of identity and memory, both individual and collective, and facilitates continuity between the past, the present and the future.

Likewise, it reflects and expresses people's values, beliefs, knowledge, traditions, and practices, all of which are constantly evolving. In addition, it plays an essential role in the process of sustainable development, as it improves social cohesion, diversity, well-being, and quality of life; strengthens cultural rights, protecting the heritage of minorities and indigenous peoples; encourages socio-economic regeneration; improves the attractiveness and creativity of cities and regions; boosts the long-term benefits of tourism and encourages sustainable practices. Cultural heritage resources are often unique and irreplaceable, and can be especially fragile due to neglect, exploitation or even destruction.

This standard aims to preserve, protect, and promote cultural heritage in IFAD-supported projects in a manner consistent with the United Nations Educational, Scientific and Cultural Organization (UNESCO) conventions on the subject, as well as other applicable national and international legal instruments.

For the purposes of this standard, cultural heritage is considered to include both tangible heritage (sometimes referred to as "physical cultural resources") and intangible heritage.

Objectives:

- preserving and safeguarding cultural heritage;
- ensure that active efforts are made to prevent IFAD-supported projects from altering, damaging, or eliminating any tangible or intangible cultural heritage;

- promote the equitable distribution of the benefits derived from the use of cultural heritage, and
- promote meaningful consultations on issues related to this heritage.

#### **Standard 4: Indigenous Peoples**

---

IFAD's comparative advantage in working with indigenous peoples lies in its core mission of empowering the rural poor, its method of targeting and its people-centered approach, which considers the diverse contexts in which the rural poor live.

The Fund's actions in relation to indigenous peoples are based on the nine fundamental principles set out in its Policy for Action in relation to Indigenous Peoples:

- (i) recognize that cultural heritage and identity are assets;
- (ii) request free, prior, and informed consent;
- (iii) contribute to community-driven development;
- (iv) promote equitable access to lands, territories, and resources;
- (v) valuing the knowledge of indigenous peoples;
- (vi) strengthening the resilience of indigenous peoples' ecosystems (environmental and climate change issues);
- (vii) promote access to markets;
- (viii) promote empowerment, and
- (ix) promote gender equality.

Objectives:

- Support indigenous peoples in determining priorities and strategies for exercising their right to development;
- ensure that each project is designed in partnership with indigenous peoples and in full, effective, and meaningful consultation with them, to obtain their free, prior, and informed consent;
- ensure that indigenous peoples derive fair and equitable benefits and opportunities from project-supported activities in an inclusive and culturally appropriate manner, and
- recognize and respect the rights of indigenous peoples to their lands, territories, waters, and other resources that they traditionally own, use or depend on.

#### **Standard 5: Work and Working Conditions**

---

IFAD seeks to promote inclusive, diversified, and productive rural economies that generate decent work opportunities and higher incomes. By investing in rural populations to improve their productive capacities and increase the benefits they derive from their participation in the market, IFAD promotes the development of value chains, inclusive financial services, and rural businesses.

The Fund's commitment to promoting inclusive and sustainable economic growth, full and productive employment, and decent work for all includes protecting the rights of project workers to ensure that they receive fair treatment and work in safe, secure, and healthy conditions. The following requirements reflect this commitment, which is guided

by a series of international agreements, conventions, and instruments, including those of the International Labor Organization (ILO) and the United Nations.

Objectives:

Promote direct actions to promote decent rural employment;

- promoting, respecting, and implementing fundamental principles and rights through:
  - preventing discrimination and promoting equal opportunities for workers;
  - promoting freedom of association and the right to collective bargaining, and preventing the use of forced labor and child labor;
- protect and promote the safety and health of workers;
- ensure that projects comply with national labor and employment laws and international commitments, and
- leaving no one behind, protecting and supporting workers in disadvantaged and vulnerable situations, with special attention to women (e.g. maternity protection), young people, migrants and health workers, the informal economy, and people with disabilities.

### **Standard 6: Community Health and Safety**

---

Given IFAD's mandate and the sectors in which its interventions take place, the health and safety of communities are essential elements. In many countries, the agricultural sector has undergone enormous changes in the last 30 years thanks to a better understanding of the health and safety risks and effects associated with farming, as well as the use of better technologies and personal protective equipment. However, in many parts of the world (especially in low- and middle-income countries) there is still a lack of knowledge about how farmers are affected by their exposure to the numerous risks and health effects they face every day. Even in the most developed countries, improvements in workplace health and safety and the implementation of ILO policies have yet to reach the agricultural sector.

This standard emphasizes the prevention (and when this is not possible, the minimization and mitigation) of health and safety risks and impacts that may arise from IFAD-supported projects, with special attention to the marginalized and disadvantaged.

Objectives:

- Ensuring quality and safety in the design and construction of infrastructure linked to the programs, avoiding, and minimizing possible safety risks and accidents;
- avoid or minimize the exposure of the community to the risk of disasters, diseases and hazardous materials associated with project activities;
- ensure that personnel and property protection measures minimize risks to communities and comply with international human rights standards and principles, and
- have effective measures in place to respond to emergency situations, whether they are due to natural hazards or caused by human beings.

### **Standard 7: Physical and economic resettlement**

---

Based on IFAD policies, international guidelines, and best practices regarding safeguards in cases of involuntary resettlement, this standard considers resettlement not

only as the physical relocation of people, but also as an economic, social, and cultural factor that restricts people's access to places important to their livelihoods and culture.

Physical resettlement involves relocation due to the loss of residential land or housing, and economic displacement involves the loss or destruction of land or assets, and includes restrictions on access to goods, sources of income and livelihoods, as well as assistance to vulnerable groups.

Objectives:

- Avoid involuntary resettlement or, when this is not possible, minimize it by studying alternatives for the design and location of developments;
- avoid forced evictions;
- ensure that resettlement activities are planned and carried out in a collaborative manner, with the meaningful participation of the people affected;
- improve and restore the livelihoods of all displaced persons, and
- provide explicit guidance to borrowers/beneficiaries/partners on the conditions that must be met in relation to involuntary resettlement.

### **Standard 8: Financial Intermediaries**

---

This standard recognizes that investments in financial intermediaries (FIs) (indirect investments) and private sector companies (direct investments) are key to promoting the sustainability of financial markets and providing financial products and services to agricultural companies and rural micro, small and medium-sized enterprises.

Financial intermediation implies that responsibility for environmental and social assessment, risk management and monitoring, and overall portfolio management is delegated to intermediaries. The effectiveness of the financial intermediary's management of environmental and social risks should be assessed and monitored continuously throughout the project's life cycle, paying attention to its core business of generating returns for investors and ensuring sustainability.

Objectives:

- Promoting good environmental, social and climate practices, as well as good human resource management among financial intermediaries and beneficiaries of direct investments;
- ensure that the said intermediaries and beneficiaries assess and manage the environmental and social risks and effects of the subprojects, and
- promoting the use of good environmental and social practices by beneficiaries of direct investments and sub-projects financed by financial intermediaries.

### **Standard 9: Climate Change**

---

The effects of climate change represent a fundamental threat to sustainable development and the fight against poverty. They can reverse human development by affecting essential development sectors such as agriculture and food production, ecosystems, water and other natural resources, disaster risk management and health. Climate change has become one of the main causes of hydro-meteorological disasters and has the potential to produce gradual environmental changes that can intensify extreme weather events, increasing the risk of high-impact disasters, whether sudden or

slow-onset. Climate variability also contributes to increasing the frequency and impact of localized small-scale disasters, which have long-term and far-reaching effects.

Investment decisions must consider the changing nature of climate risks and impacts. In project design, this can be achieved through climate risk analysis, planning to improve the resilience of vulnerable livelihoods (adaptation), and minimizing greenhouse gas emissions and enhancing carbon sinks (mitigation). All borrowers/beneficiaries/partners of IFAD-supported projects must consider the effects that climate change may have on the projects, as well as the effects of other projects.

Objectives:

- Ensure that IFAD-supported projects are aligned with the targets set in the countries' nationally determined contributions and with the targets of the Paris Agreement and other international frameworks;
- ensure that the proposed activities are monitored and evaluated in relation to the risks and effects of climate change and disasters, including the effects on and generated by the projects;
- apply the mitigation hierarchy in project design;
- strengthen the resilience of communities to face the risks of the effects of climate change and related disasters, and
- increase the capacity of communities to adapt to the negative effects of climate change and promote climate resilience and low greenhouse gas emission projects that do not pose a threat to food production.

### 3.6. Entities involved in environmental licensing

In principle, PROCASE II projects do not foresee the need for licensing and, where applicable, these should be simple, involving simplified authorizations.

In any case, information on the state entity responsible for environmental inspections and authorizations is described below.

#### **Superintendence of Environmental Administration (Sudema)**

---

The **Superintendence of Environmental Administration (Sudema)** was created by the Paraíba state government on December 20, 1978, through Law No. 4.033, with the aim of developing an environmental protection policy. As well as João Pessoa, Sudema also has offices in the cities of Patos and Campina Grande.

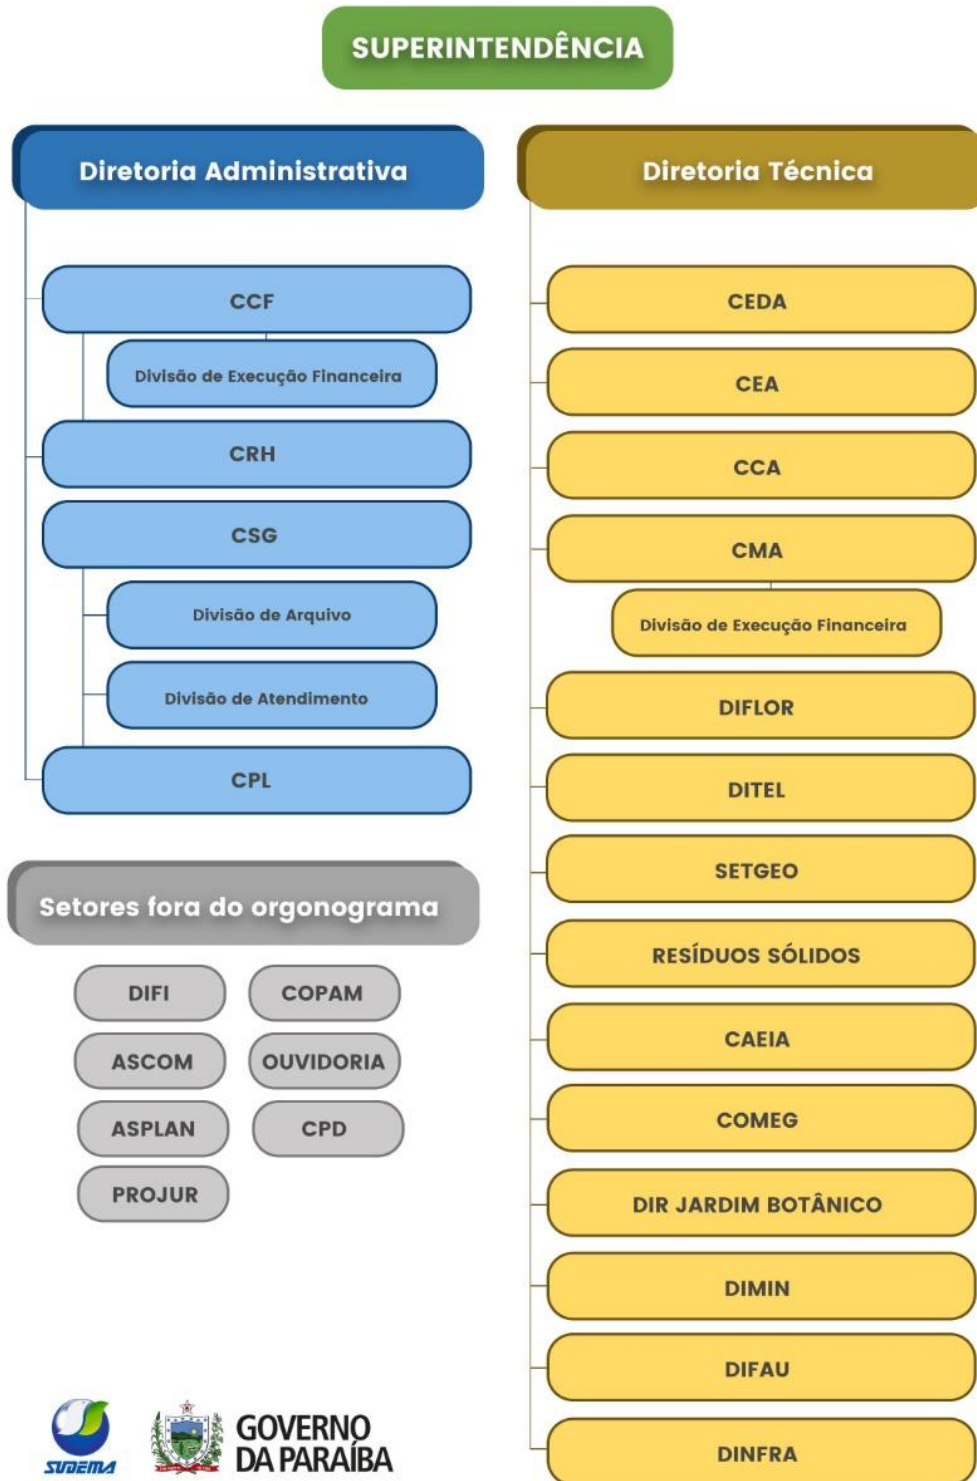

Sudema's mission is to develop policy actions for environmental protection, prevention, and education, as well as strategies aimed at guaranteeing current and future generations a quality of life compatible with the harmony of nature and free from predatory aggression, constantly practiced by man himself. Its structure includes the following departments:

- CEDA - Environmental Education Coordination
- DIFLOR - Forestry Division
- CCA - Environmental Control Coordination
- CMA - Coordination of Environmental Measurements
- Pollution Control Division
- CEA - Coordination of Environmental Studies

- CCF - Accounting Coordination
- Financial Execution Division
- CPD - Data Processing Coordination
- CRH - Human Resources Coordination
- CSG - General Services Coordination
- Archive Division
- Customer Service Division
- DIFI - Inspection Division
- CPL - Permanent Tender Committee
- DITEL - Telecommunications Division
- SETGEO - Geoprocessing Sector
- SRS - Solid Waste Sector
- CAEIA - Commission for the Analysis of Environmental Impact Studies
- COMEG - Coastal Management Commission
- Botanical Garden Director

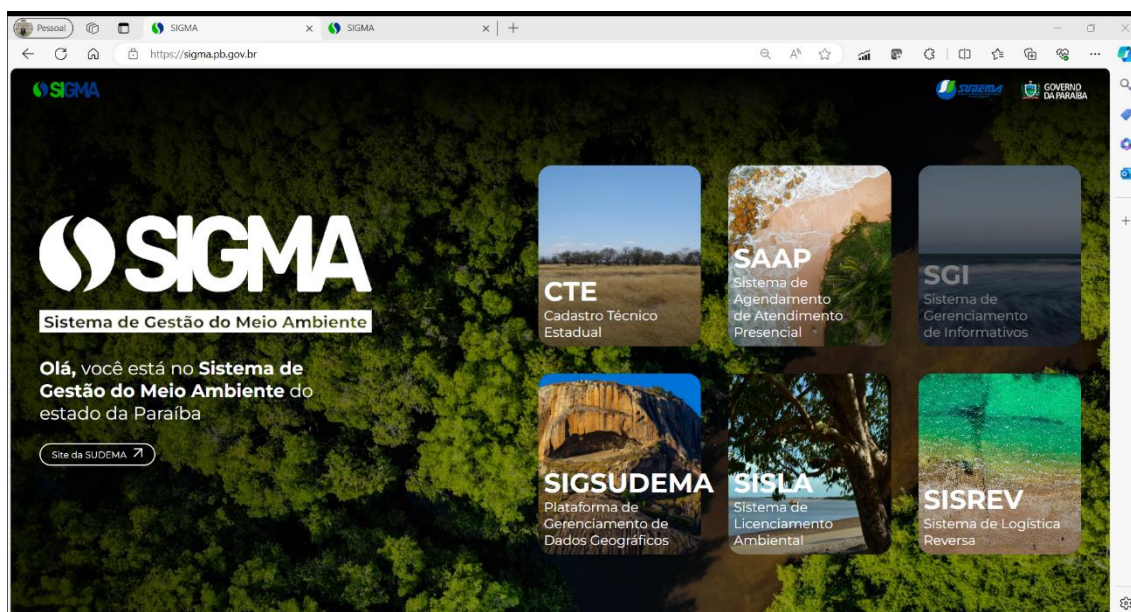

Sudema also has a computerized environmental management system (SIGMA), which includes modules for registration, scheduling, information, geographic data management, reverse logistics and environmental licensing.

Figure 1 - Sudema's organizational chart

Source: <https://sudema.pb.gov.br/institucional/orgnograma>

**Figure 2 - SIGMA website - Sudema's Environmental Management System**

Source: <https://sigma.pb.gov.br/>

## **Environmental Protection Council - COPAM**

The Environmental Protection Council - COPAM, created under the terms of Law 4.335 of December 16, 1981, a collegiate body formerly linked to the State Secretariat for Infrastructure, Water Resources and the Environment - SEIRHMA, is part of the State Environmental System.

Currently, through Law No. 12.615, of April 25, 2023, COPAM is directly linked to the State Secretariat for the Environment and Sustainability - SEMAS, acting to prevent and control pollution and environmental degradation, aiming to protect, conserve, recover and improve environmental resources, analyzing all licenses granted by the Superintendence of Environmental Administration - SUDEMA, suggesting the maintenance, revocation or alteration of such licenses, through compliance with applicable legislation.

Its attributions include issuing guidelines, norms, and instructions through deliberations regarding the protection of environmental resources, with a view to preventing pollution and the rational use of environmental resources in the state of Paraíba.

### **3.7. Gap analysis**

The following is a *Gap Analysis* of compliance with IDB/IDA standards.

**Table 1 - Summary table of the gap analysis for compliance with the IDB/IDA Standards**

Executive Agency procedures and gaps identified	Recommendations
<b>Assessment and Management of Social and Environmental Risks and Impacts</b>	
<ul style="list-style-type: none"> <li>• Although some stages of projects and works do not require environmental licensing or have simple licensing, the PMU must have a stage that includes instruments for environmental and social assessment and planning of projects. This instrument is the screening or preliminary analysis, which involves analyzing the legal requirements and environmental constraints present, generating an Official Letter with the results of this screening and the necessary recommendations for the application of socio-environmental measures and commitments in the context of each project.</li> <li>• This screening process must incorporate environmental and social requirements aimed at complying with Brazilian legislation, project feasibility and meeting some of the requirements set out in the IDB/IDA Standards.</li> <li>• During the implementation phase of the projects, there is no formalized supervision or inspection process, but this is a process that needs to be developed.</li> <li>• The PMU should incorporate a Social and Environmental Development sector into its structure to manage the social and environmental requirements set out in the IDB/IDA Standards.</li> <li>• No system for assessing socio-environmental impacts and risks was identified for PROCASE II</li> </ul>	<ul style="list-style-type: none"> <li>• Implement a preliminary socio-environmental assessment process with a view to screening and scoping the necessary socio-environmental studies and planning mitigation programs, as well as determining the eligibility of projects before the IDB's MPAS and IFAD's SECAP.</li> <li>• Implement a socio-environmental management and supervision sector with a dedicated team</li> <li>• Train workers in the environmental and social requirements of the IDB/IDA Standards</li> <li>• Incorporate an impact and risk assessment stage for projects and the development of an Environmental and Social Management Plan. The process of identifying the environmental and social risks and impacts of each project must be clear.</li> <li>• Increasing the Environmental and Social Management System (ESMS) with guidelines for classifying the socio-environmental impact of potential projects.</li> <li>• Incorporate into the ESMS definitions for the environmental and social studies that will need to be carried out based on the level of impact of the projects, complying with the requirements of the IDB/IDA Standards.</li> <li>• Draw up a Social, Environmental and Health and Safety Management Procedures Manual</li> <li>• Promote the interoperability of the systems under development to include georeferenced information and interoperability with databases from official sources, with a view to increasing the capacity for environmental and social assessment, identification of impacts and risks.</li> <li>• As part of the PMU's Environmental and Social Management System (ESMS), project ESMPs (Environmental, Social and Climate Management Plan) must include Emergency Preparedness and Response Plans in accordance with IDB/IDA Standards.</li> </ul>
<b>Labor and Working Conditions</b>	
<ul style="list-style-type: none"> <li>• Brazilian legislation includes several topics in line with the requirements of the IDB/IDA Standards, such as compliance with occupational health and safety requirements, working conditions and labor relations management, protection of the workforce, among others.</li> </ul>	<ul style="list-style-type: none"> <li>• Disseminate workers' complaints and grievances mechanism extended to workers of outsourced companies.</li> <li>• Carry out environmental and social responsibility training with workers and contractors.</li> </ul>

Executive Agency procedures and gaps identified	Recommendations
<ul style="list-style-type: none"> <li>In general, PROCASE's processes are largely compliant with the requirements of the Standard, but some gaps have been identified, such as the need to publicize the complaints mechanism to workers and contractors and the need for a dedicated and specialized team to monitor OHS compliance.</li> <li>The PROCASE II management team is considered to be in a position to carry out adequate management to ensure that the workers of the contracted companies have their rights guaranteed</li> </ul>	<ul style="list-style-type: none"> <li>Implement a code of conduct for project workers</li> <li>Consolidate the OHS supervision and compliance, training, and inspection process, preferably including a specialized and dedicated technician.</li> </ul>
Resource Efficiency and Pollution Prevention and Management	
<ul style="list-style-type: none"> <li>There is no specific requirement for the PMU to implement resource efficiency and contamination prevention principles and techniques consistent with International Good Industry Practice.</li> <li>federal law 12.187 of 2009 is quite objective in its responsibility and obligation to reduce gas emissions, but it does not include a regulation that explicitly defines the requirement to avoid or minimize GHG emissions related to projects during their design, implementation, or operation. On the other hand, CONAMA resolutions set limits for pollutant emissions in line with the GIIP.</li> <li>The National Waste Policy, established by Law No. 12.305 of 2010, sets out the principles, objectives and instruments, as well as the guidelines for integrated management and solid waste management. It also set important targets that will contribute to the elimination of landfill sites and instituted planning instruments at national, state, micro-regional, inter-municipal and metropolitan and municipal levels; as well as requiring private entrepreneurs to draw up their Solid Waste Management Plans.</li> <li>With regard to EHS<sup>4</sup>, the references to gas emissions, volatile organic compounds and particulate matter are not only listed in CONAMA resolutions, but the commitment to reduction and control is ratified in international agreements.</li> </ul>	<ul style="list-style-type: none"> <li>Some of the permissible emission limits laid down are generally more restrictive in the case of the GIIP guides<sup>5</sup> than what is recommended in national legislation, so it is important to adopt what is referenced in these regulations.</li> <li>some types of subprojects do not require an environmental licensing process and subsequent environmental studies, so issues involving the emission of pollutants and the generation of waste should be included in the PMU's internal assessments to be incorporated into the processes (impact assessment, management plans, etc.)</li> <li>The PMU could incorporate available tools for analyzing energy efficiency and reducing emissions into the project development phase, such as the Edge Building system provided by the IFC, but even if these tools are not used, it is recommended to incorporate efficient and lower impact systems in the case of civil works.</li> <li>A works supervision/inspection checklist should include important items to be checked on this subject, such as emission limits, noise, area recovery, preservation areas, etc.</li> </ul>
Climate Change and GHG Emissions	
<ul style="list-style-type: none"> <li>In general, the projects have a strong appeal to the issue of climate change and GHG reduction;</li> <li>However, it is necessary to look at issues related to the use of wood-burning stoves, which are the most viable option in remote rural communities that have no other better-performing alternative for producing heat in their production processes.</li> <li>It should be noted that the ovens are used in family kitchens and are not related to or industrial in size.</li> </ul>	<ul style="list-style-type: none"> <li>Apply fuel input management measures such as checking the plant species used in burning and its origin/procedure, as well as monitoring the proper execution of the acquisition and use of firewood.</li> <li>More efficient furnaces are also important to prioritize in order to reduce emissions.</li> <li>In the case of ovens in traditional kitchens, these can be aligned with the Standards as long as it is possible to estimate the increase in energy efficiency resulting from replacing the current models with closed equipment and the</li> </ul>

<sup>4</sup> Environmental, Health, and Safety Guidelines.

<sup>5</sup> The Health, Environment and Safety Guidelines adopted by the IDB are technical reference documents based on Good International Industry Standards (GIIP).

Executive Agency procedures and gaps identified	Recommendations
	<p>challenges of replacing them with systems based on other technologies, such as the additional cost for families to keep the system running.</p> <ul style="list-style-type: none"> <li>In particular, the construction of wood-based flour mills would not be permitted due to the lack of sufficient information to analyze the emissions to be avoided when new equipment is installed. However, studies could be proposed on the feasibility of adopting more efficient low-carbon energy sources or even pilot projects.</li> </ul>
Community Health and Safety	
<ul style="list-style-type: none"> <li>Brazilian legislation does not explicitly establish the management of risks and impacts on the health and safety of the community for projects, it only establishes a requirement to evaluate the impacts related to projects that have housing actions covered by financing with the Federal Government.</li> <li>There is no mechanism for identifying and managing disaster risks, which is important for establishing standards and emergency actions that must be followed in the event of an emergency or contingency. The measures adopted are those commonly provided for by law for OHS</li> <li>Despite not having a risk management mechanism in place, the project screening phase must observe requirements related to safety, especially flooded areas, drought and susceptibility to erosive processes, percolation levels and geotechnical safety.</li> </ul>	<ul style="list-style-type: none"> <li>It is recommended that a risk identification and management system be developed for projects;</li> <li>It is also recommended to develop appropriate measures to reduce vulnerability and foster adaptation to natural hazards and climate change, the scope of which should include structural and non-structural measures to be implemented in the design, construction, and operation stages of the projects. These measures should be part of the Disaster and Climate Change Management Plan, forming part of PROCASE II's PGASE and the PGAS of the sub-projects.</li> </ul>
Land Acquisition and Involuntary Resettlement	
<ul style="list-style-type: none"> <li>This Standard is not triggered by PROCASE II.</li> </ul>	<ul style="list-style-type: none"> <li>There is no provision for land acquisition in the project, but, if necessary, methods for calculating financial compensation (indemnities) should be applied to make them compatible with the requirements of PDAS 5 (IDB) and Standard 7 (IFAD), considering compensation for replacement cost, and based on NBR 14.653.</li> <li>In this same case, a post-indemnification or resettlement assessment should be carried out to identify the risk of impoverishment related to the project, when the action involves a vulnerable population.</li> <li>These requirements also apply in the case of economic activities to be expropriated.</li> </ul>
Biodiversity Conservation and Sustainable Management of Living Natural Resources	
<ul style="list-style-type: none"> <li>PROCASE II plans to implement actions related to the preservation of water sources, green areas, and rural technical assistance with a view to best sustainable rural practices, in order to avoid impacts and promote sustainability in its projects.</li> <li>In Brazil, the law explicitly establishes the requirement for modified habitat areas that include significant biodiversity value.</li> <li>In addition to legislation, several international agreements to which Brazil is a signatory contain criteria to meet the requirements of the IDB/IDA Standards.</li> </ul>	<ul style="list-style-type: none"> <li>Include in the assessments the existence and degree of risk of impact on natural habitats and critical habitats, and guide precautionary measures, detailed studies and plans for biodiversity or even the exclusion of areas and eligibility criteria for locating projects that do not yet have a locational definition.</li> <li>Mitigation or the development of Biodiversity Action Plans, Biodiversity Compensation Management Plans and Biodiversity Monitoring and Evaluation</li> </ul>

Executive Agency procedures and gaps identified	Recommendations
<ul style="list-style-type: none"> <li>• Among the habitat categories highlighted in the Brazilian standard, only established conservation units, both sustainable use and full protection, must have their Management Plan drawn up</li> <li>• Brazilian laws do not require an assessment of critical habitats and generally do not require studies to identify and assess ecosystem services</li> <li>• Federal Law No. 12.651, of May 25, 2012 (the New Brazilian Forest Code), as amended, establishes general rules on the protection of vegetation, especially Permanent Preservation Areas (APP) and Legal Reserve areas, with regard to forest exploitation, the supply of forest raw materials, control of the origin of forest products and the control and prevention of forest fires, and provides for economic and financial instruments to achieve its objectives. Article 8 establishes that intervention or suppression of native vegetation in a Permanent Preservation Area will only take place in cases of public utility, social interest, or low environmental impact.</li> <li>• It can be said that Brazilian legislation partially complies with the established requirement, given that only projects with high levels of negative impacts would be subject to more complex environmental studies</li> <li>• PROCASE II's proposal is to avoid actions that require the suppression of forest, and to focus on actions that increase vegetation cover through sustainable cultivation processes.</li> </ul>	<p>Plans are recommended for identified habitats, according to the impact levels of each project.</p> <ul style="list-style-type: none"> <li>• Include issues related to the protection of biodiversity and ecosystem services in the training and capacity building of environmental and social teams.</li> <li>• It is necessary to incorporate into the requirements for the preliminary assessment of projects that they do not affect areas with steep slopes, to guarantee safety and combat risk situations and disasters.</li> <li>• Habitat restoration and management measures, especially in permanent preservation areas, must include requirements for the proper management of exotic species in a strategic manner and with a view to their replacement, as well as requirements to combat the use of chemical pesticides and prohibited products (Stockholm Convention).</li> </ul>
Indigenous and Traditional Populations	
<ul style="list-style-type: none"> <li>• The presence of traditional populations is common in PROCASE II projects, where the rights and integrity of these communities are respected in the processes;</li> <li>• FUNAI, the body responsible for protecting indigenous peoples in Brazil, has defined guidelines for assessing the impact on these communities, including prerogatives that follow the same guidelines required by the IDB/IDA Standards and ILO Convention 169.</li> <li>• Despite this, the PMU does not have an institutionalized and formalized process for dealing specifically with traditional communities</li> </ul>	<ul style="list-style-type: none"> <li>• It is important to map and build a baseline of the traditional beneficiary communities (TBCs) of the projects, including a process of Informed Participatory Consultation and subsequent Free Prior and Informed Consent when necessary;</li> <li>• It is recommended that the same guidelines and regulations be followed for indigenous communities for impact assessment and informed consultation with any existing traditional communities (formally recognized or not), whether quilombolas, fishers, shellfish gatherers, Roma, among others;</li> <li>• It is important to include respect for the cultural integrity of the populations directly or indirectly affected by the projects in worker training.</li> <li>• Need for alignment/authorization from FUNAI as a preliminary step to working with Indigenous Communities</li> </ul>
Cultural Heritage	
<ul style="list-style-type: none"> <li>• This Standard is not expected to be triggered, given that the projects/sub-projects envisaged in PROCASE II do not pose significant risks or impacts on cultural heritage or on areas that may have a high potential for the presence of sites. Despite this, the following analysis is made of compliance with the safeguard.</li> </ul>	<ul style="list-style-type: none"> <li>• It must be confirmed that there are no potential risks in cultural heritage areas in the locations defined for the implementation of each sub-project, in accordance with the respective definition of actions and structures to be implemented. This must be confirmed through a specific environmental and social assessment.</li> <li>• Procedures for the chance discovery of cultural sites must be defined.</li> </ul>

Executive Agency procedures and gaps identified	Recommendations
<ul style="list-style-type: none"> <li>• The PMU does not have procedures for evaluating possible interference in cultural heritage at the project design stage, but it does meet the premises defined in the rites for evaluating the impact on archaeological heritage set out in IPHAN's IN 001/2015.</li> <li>• Some types of sub-projects do not require a heritage impact assessment for IPHAN's approval.</li> <li>• It should be noted that under Brazilian law there are no instruments that distinguish between replicable and non-replicable cultural heritage, nor specific provisions for assessing and managing risks and impacts on non-replicable cultural heritage.</li> <li>• Regarding the promotion of equitable participation in the benefits derived from the use of cultural heritage, the legislation complies with this requirement only for tangible cultural goods and there is no mention of equitable participation for intangible cultural goods in any provision</li> <li>• For situations of chance discovery, no specific actions are provided for in law or in the PMU's procedures, despite Brazilian legislation being very clear about responsibility for any impact on cultural heritage, even when these are unknown.</li> <li>• The legislation also stipulates that the authorities must be called in, the area must be cordoned off and an authorized archaeologist must carry out the appropriate assessments and measures to protect and rescue the heritage when possible.</li> <li>• Brazilian law also stipulates the need for heritage education and the dissemination of knowledge to the community.</li> <li>• Actions related to stakeholder consultation with regard to cultural heritage are also not explicitly required by law or by PMU procedures</li> </ul>	<ul style="list-style-type: none"> <li>• It is recommended that stakeholder consultations be adopted at the stage of research and assessment of impacts on cultural heritage when these are identified.</li> <li>• State and municipal cultural heritage protection bodies should always be consulted, and the full spectrum of heritage typologies (material, intangible, cultural, landscape, architectural, etc.) should also always be covered in assessments, as required by IPHAN's IN 001/2015.</li> </ul>
Gender equality	
<ul style="list-style-type: none"> <li>• The PROCASE II team has adopted an internal philosophy and policies for hiring workers without restrictions on gender, sexual orientation, and/or gender identity;</li> <li>• Brazilian legislation points to the criminalization of acts of prejudice, harassment, and violence against gender diversity;</li> <li>• The PROCASE II team usually carries out baseline diagnoses considering information on the gender and vulnerability profiles of beneficiary families in the areas where its projects operate;</li> <li>• Its portfolio of social actions also includes initiatives for the development of women;</li> <li>• In community meeting processes there is always room for stakeholder participation, regardless of gender;</li> <li>• Despite this, there is a prevalence of male activity in many of the communities in the project's area of operation.</li> </ul>	<ul style="list-style-type: none"> <li>• It is recommended to include the topic of gender and diversity in training for workers and contractors, with information on punitive laws, good practices and conduct, and reporting channels;</li> <li>• We recommend raising awareness about the importance and role of women, as well as gender equality and combating gender-based violence in the beneficiary communities.</li> </ul>
Stakeholder Engagement and Information Disclosure	
<ul style="list-style-type: none"> <li>• The PROCASE II team carries out a series of actions related to stakeholder engagement, including participatory planning processes.</li> </ul>	<ul style="list-style-type: none"> <li>• It is recommended to prepare a more effective and analytical organization of the question-and-answer (Q&amp;A) records for the relevant consultations held by the</li> </ul>

Executive Agency procedures and gaps identified	Recommendations
<ul style="list-style-type: none"> <li>The PROCASE II team carries out a very intense communication process before, during and after the project to disseminate information, engage and capture contributions from the beneficiary communities.</li> </ul>	PMU (consultation report containing an account of the request, questions / manifestations and answers made during the meeting). <ul style="list-style-type: none"> <li>Implement a Complaints and Redress System, to be monitored by the borrower</li> </ul>

#### 4. ORGANIZATIONAL COMPETENCE

This item covers the PMU's institutional capacity and organization for PROCASE II's environmental and social management actions.

##### 4.1. DECLARATION OF COMMITMENT

The borrower must establish a comprehensive policy that defines the environmental and social objectives and principles that will guide the PROJECT and its subprojects to achieve sound social and environmental performance. The policy must provide a framework for the social and environmental assessment and management process and specify that the PROJECT will comply with the applicable laws and regulations of the jurisdictions in which it is being implemented, including laws defining obligations under international law. The policy must be consistent with the principles of the IDB's PDAS and IFAD's SECAP. In certain circumstances, other internationally recognized standards, certification plans or codes of conduct may also be adhered to and included in the policy.

This requirement is an independent policy specific to the PROJECT and is not intended to affect existing SEAFDS policies (or require them to be changed).

The Environmental and Social Management Leadership and Commitment Policy provides the basis on which a structured and effective ESMS can be built. It sets the tone within the institution and provides the necessary support to ensure that commitment and engagement are maintained.

The borrower and Executing Agency do not have a Social and Environmental Policy in place. In this case, there is an opportunity to design a specific policy that meets the requirements of the IDB's MPAS and IFAD's SECAP, which in the future could serve as a model for drafting a policy that cuts across all of the institution's processes. We therefore suggest incorporating the following policy, which could be adopted specifically for PROCASE II.

##### **Objectives and Principles**

---

The main objectives of this Environmental and Social Management System are described below:

- to consider socio-environmental aspects as an inseparable part of PROCASE II sub-projects, thus being included in all stages of the cycle: conception, design, execution, operation, and maintenance;
- develop technical instructions and operating procedures to avoid socio-environmental impacts and/or reduce their magnitude;
- developing technical and managerial instruments to guarantee the recording, storage, updating and retrieval of information related to socio-environmental issues, making it available to the technical staff and publicizing it accordingly;
- to disseminate good socio-environmental practices in all its activities, demanding ever-improving levels of excellence in its socio-environmental performance from its contractors;
- develop communication tools with PROCASE II beneficiaries, neighboring communities, and society in general to ensure the flow of information about the PMU's actions, safety procedures and emergency actions;

- create a set of regulations to guarantee respect, safety and health for workers involved in the construction and operation of PROCASE II subprojects, whether they are hired directly by the PMU or by service providers and material suppliers;
- building an environment of respect for the original and/or traditional peoples of Brazil: indigenous peoples, quilombolas, fishers, Roma, and others;
- adapting the PMU's actions to the various legally protected areas and/or environments considered critical due to the need for their conservation or the ecosystem services they provide;
- promote the dissemination of information about the direct and indirect benefits and implications of PROCASE II infrastructure interventions;
- Enable the involvement of office and field teams in complying with legal socio-environmental parameters;
- involve the participation of sectors from *input* (design) to *output* (execution and control and monitoring) in meeting social and environmental requirements;
- promote proactivity in the perception and practice of sustainability principles in projects and works.

### **Targets - Starter Set**

---

- reviewing, approving, and implementing the Normative Set described in this ESMS;
- draw up a set of Technical Reference Procedures, based on the ESMS Technical Instructions;
- carry out at least one annual cycle of training and further training in Environmental and Social Management for the technical staff of the teams involved in PROCASE II;
- drawing up and implementing the socio-environmental budget for the fiscal year, in order to make this ESMS viable;
- promote an annual board meeting to discuss the objectives of the ESMS, update them and ensure that they are fully implemented.

### **Health and Safety Policy**

---

At PROCASE II, we are committed to operating in a safe manner, continually improving our policies and practices for the future. We aim to create a work culture that incorporates safety into all daily activities. We strive to maintain our corporate goal of providing an accident-free work environment and continue to strive for excellence in the areas of operational health and safety through the following commitments:

#### **Health and Safety Management**

- We will conduct our operations in such a way as to ensure the protection of the health and safety of our employees and the general public;
- We will require all employees of the organization to participate in our Occupational Health and Safety program and to be responsible, both individually and collectively, for working safely;
- We will provide our employees with the necessary on-the-job training, as well as training in industrial and operational safety issues;

- We will seek to comply with all applicable legal requirements and regulations;
- We will investigate incidents and accidents to determine their root cause;
- We will ensure that contractors working for PROCASE II are committed to conducting all operations safely and in accordance with applicable laws and regulations.

### **Continuous Improvement**

- We will carry out regular audits to ensure the success of the accident prevention plans, as well as to identify, where possible, areas for improvement;
- We will implement the necessary measures to minimize or eliminate the hazards identified within the scope of PROCASE II;
- We will publish occupational safety statistics, both for employees and contractors, to be able to monitor items that require improvement;
- We will review the Workers' Health and Safety Plan annually to ensure that it is in force and effective.

### **Communications**

- We will ensure that all workers, whether contractors or employees, know that they have the right to refuse to do any work they consider unsafe;
- We will inform employees and contractors of possible safety hazards on an ongoing basis;
- We will encourage all workers to immediately report and, if applicable, remedy any unsafe working condition or activity;
- We will openly communicate hazard and emergency response plans to affected parties through the company;
- We will hold general safety meetings for construction sites and project implementation, as well as safety meetings for specific jobs when necessary.

### **Environmental Policy**

---

At PROCASE II we are committed to protecting the environment in which we operate, and we pride ourselves on operating in a safe and responsible manner. We recognize and accept our responsibility to develop resources, considering the environmental, economic, and social needs and expectations of interest groups. Our commitment is contained in the following environmental policy statement:

### **Environmental Management**

- We will incorporate the principles of environmental integrity, social justice and economic viability into our processes and projects;
- We will provide the teams with all the resources they need to make environmentally responsible decisions;
- We will strive to comply fully with applicable environmental legislation and regulations;
- We will carefully manage natural resources and improve the energy efficiency of our activities;

- We will assess the environmental sensitivity of the territory, identify impacts, and propose mitigation measures, as appropriate;
- In carrying out our operations, we will avoid pollution, conserve resources, and responsibly manage environmental liabilities;
- We will reduce the impact on the territory to a minimum;
- We will ensure that we are prepared at corporate level with an effective emergency response program.

### **Continuous Improvement**

- We will promote innovation and the development and implementation of innovative ideas related to environmental integrity;
- We will measure our performance through comprehensive audits;
- We will set environmental goals and objectives to improve our performance.

### **Communications**

- We will respond to the concerns and expressions of interest groups in a timely and open manner;
- We will engage stakeholders to participate, if necessary, in discussions about our operations and the relationship they have with affected communities and the environment;
- We will provide clear and accurate environmental information about our operations, activities and services to users, employees, government entities and the general public, as required.

### **Community Relations Policy**

---

PROCASE II has a responsibility to conduct its activities in a way that benefits the communities where it operates and society as a whole. This can be enhanced by involving responsible citizens in the communities where they live and work as project collaborators.

Success depends on the competence of staff, protection of the natural environment and the value PROCASE II brings to communities, with a commitment to generating value for communities, and considering the appropriate balance between the economic viability of its projects and the needs and interests of the communities in which it operates. PROCASE II builds a legacy of trust by implementing sub-projects in a sustainable manner. To ensure the long-term success of both PROCASE II and the benefiting community, the PMU believes in striking the right balance between the economic viability of its projects and the needs and interests of the communities in which it operates.

PROCASE II is committed to the following principles of community relations:

- Conduct operations according to the highest standards of personal integrity and ethical behavior;
- Respect the laws and regulations of the governments with which it works, as well as the beliefs and values of the communities;
- Offer an open exchange of information that is clear and relevant between communities, leaders, affected parties and PROCASE II;

- Communicate expectations about community relations to all employees and contractors;
- Always act with respect and in line with human rights;
- Always act with respect for the rights of traditional communities and indigenous peoples;
- Fighting gender-based violence, working for gender equality and diversity;
- Regularly review the effectiveness of community relations programs.

#### **4.2. RESPONSIBILITY FOR ESMS**

Responsibility for the ESMS lies with the PROCASE II management unit (PMU), represented by the designated SEAFDS team, with the support of the sub-executing agency team made up of EMPAER/SEDAP and any ATER companies contracted for technical assistance actions.

#### **4.3. COMMUNICATION AND DISSEMINATION OF THE ENVIRONMENTAL AND SOCIAL MANAGEMENT FRAMEWORK**

PROCASE II's Environmental and Social Management Framework, including its socio-environmental management and control instruments, will be disseminated through a formal implementation meeting held by the PMU for managers, advisors, and supervisors, who will then hold alignment meetings with their support teams, according to their responsibilities.

#### **4.4. ORGANIZATION AND COMPETENCIES**

The organization of environmental and social management is initially based on a framework involving legislation, the Environmental and Social Framework of the IDB and IFAD and the Institutional Aspects of the PMU, aligned with the specific typology of sub-projects, with specific socio-environmental impacts and goals.

A set of Technical Instructions has therefore been drawn up, which must be documented and followed by management in order to concisely implement the PROCASE II management framework. These instructions include:

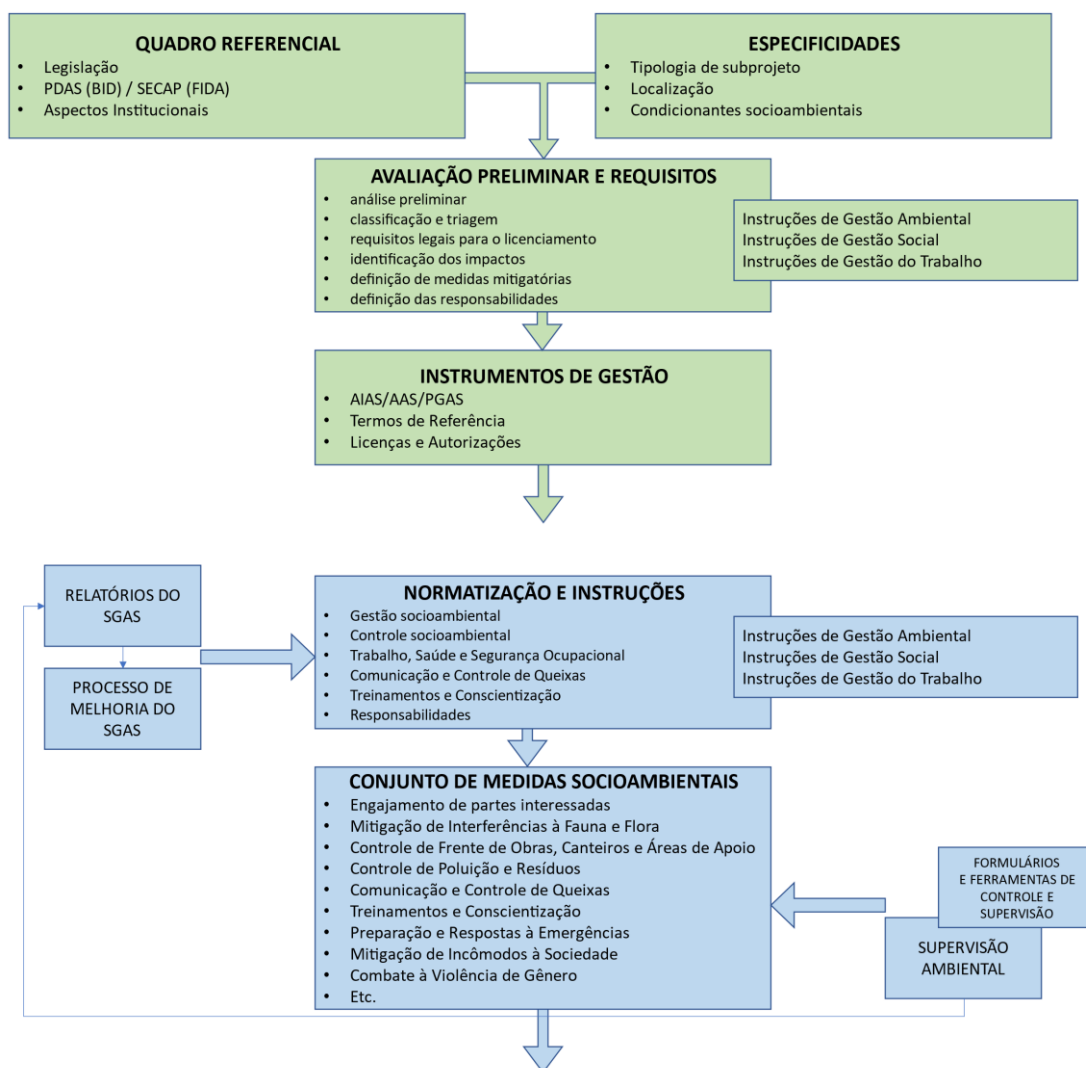

- in the design phase:
  - the preliminary environmental and social assessment of the subproject;
  - classification and sorting;
  - the legal requirements for licensing (where applicable);
  - the identification of environmental and social impacts;
  - the definition of mitigation measures;
  - the clear definition of responsibilities for mitigation and supervision activities;
  - the preparation of the Environmental and Social Management Plan specific to the sub-project;
  - preparing the terms of reference for contracting services and works for the sub-project.
- in the implementation phase:

- social and environmental management and control through the mitigation measures of the Environmental and Social Management Plan;
- the management of occupational health and safety requirements;
- the guarantee of communication and complaint control actions;
- training and awareness-raising for those involved;

The technical instructions for the implementation phase should provide for the definition of socio-environmental measures for each sub-project, with the planned procedures being effectively checked by socio-environmental supervision work in line with the mitigation measures. Socio-environmental supervision should be of a guiding and possibly punitive nature and should produce standardized documentation to compose the socio-environmental management reports and also feed its continuous improvement process.

The following figure shows the general logic of the Environmental and Social Management process.

**Figure 3 - General logic for project and works management**

Project phase

Construction phase

Source: Consulting, 2024

The execution of the socio-environmental measures set out in the ESMP must ensure that their implementation meets the established objectives and deadlines, including monitoring or preparation by the Supervision team responsible for the socio-environmental management of sub-projects. This team will be involved in the following assigned activities:

- Monitoring the timetables for implementing the Environmental and Social Mitigation Measures included in the sub-project execution contracts;
- Analysis and monitoring of Terms of Reference for contracting services for the supervision and/or execution of specific programs;
- Structuring a mechanism for producing and organizing information on the studies and assessments carried out, the progress and results of mitigation measures;
- Preparation of half-yearly management reports;
- Establishment of procedures for monitoring socio-environmental quality parameters in the intervention area, such as: noise, atmospheric emissions, effluents, waste, inconvenience to the population, impacts on the road system and traffic, erosion and silting up of rivers, destruction of habitats, disturbance to flora and fauna, etc., resulting from the implementation activities of the sub-projects, including actions to supervise activities related to good sustainable rural production practices for the production plans;
- Establishment of procedures for the relationship between the activities of socio-environmental supervision, management and inspection of actions related to the implementation of infrastructure and contracted companies, as well as in the case of the implementation of sub-projects of the Investment Plans with community beneficiaries, including the flow of documents for reporting socio-environmental occurrences, notification of non-compliance, periodic meetings to discuss the planning of works activities aimed at reducing environmental and social impacts.

#### 4.4.1. Teams Involved in Environmental and Social Management

The **State Secretariat for Family Farming and Semiarid Development (SEAFDS)** is the project's coordinating body, responsible for financial execution, procurement and contracting, as well as carrying out the necessary coordination, monitoring and supervising its execution.

To manage the project, SEAFDS will have a **Project Management Unit (PMU)**, which will be based in João Pessoa, and regional offices located at strategic points throughout Paraíba. The PMU and Regional Offices will be responsible for coordination, planning, institutional coordination, implementation, and monitoring of the actions promoted, working in close collaboration with the SEAFDS coordinators and technical advisors.

The arrangement will also include the participation of a **sub-executing agency** formed by the **Research, Rural Extension and Land Regularization Company (EMPAER/SEDAP)**. EMPAER's directorate dedicated to technical advice and rural extension (the former EMATER) will take on the task of providing part of the Technical Assistance (TA) services, both in Component 1 and Component 2. EMPAER's directorate dealing with land issues (the former INTERPA) will be the entity in charge of carrying out the land regularization provided for in the Project. EMPAER's scientific research directorate (formerly EMEPA) will be in charge of carrying out some of the technological exchanges provided for in the Project.

EMPAER has experience in carrying out technical assistance and rural extension, land management and scientific research aimed at technological development.

It is also planned to set up an **Executive Productive Investment Management Committee (CEGIP)**, a collegiate body made up of the executing agency, sub-executing agencies, government bodies and representatives of organized civil society, which will have to approve PROCASE II's annual operational planning.

CEGIP will be set up by means of Rules of Procedure. According to Article 2 of the CEGIP Rules of Procedure, the Committee is responsible for:

I. To assess and approve the Resilient Investment Projects (RIP) submitted by the PMU/PROCASE;

II. Requesting, at any time, information from the PROCASE State Coordinator on projects and investments carried out within the scope of the territorial collegiate bodies in the state of Paraíba;

III. Monitoring the efficiency of the socio-environmental safeguard policies and actions adopted by PROCASE in the Strategic Environmental and Social Management Plan - PGASE;

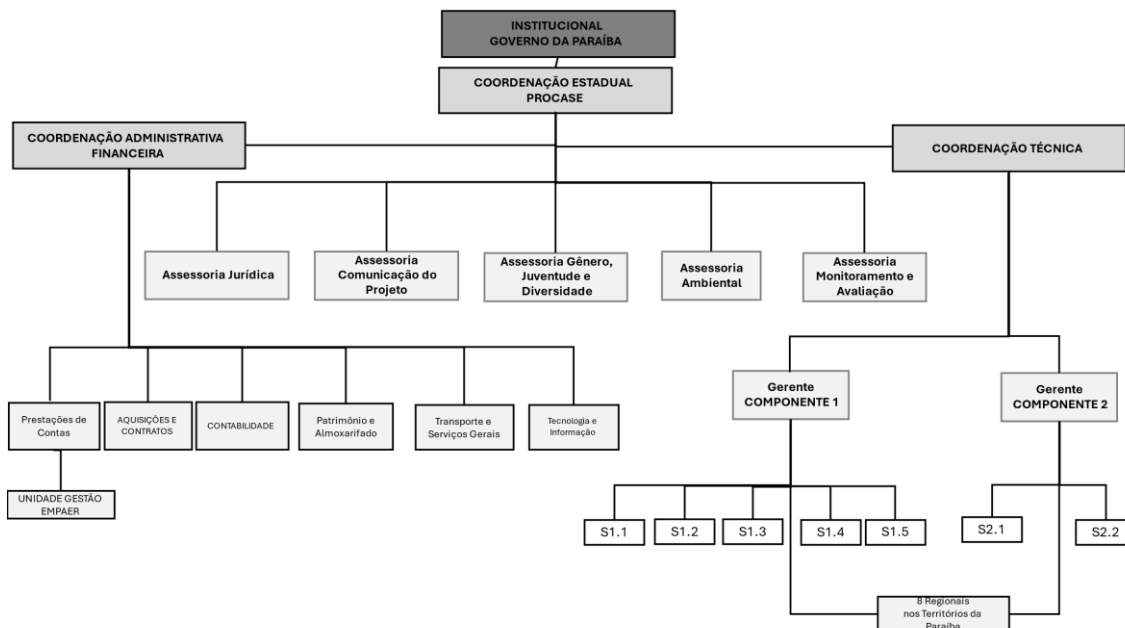

IV. To monitor, every six months, the progress measured by the results indicators and products delivered by the Sustainable Rural Development Project, in accordance with the guidelines of the Project Operational Report (ROP).

CEGIP will have the following composition:

- Head of the State Secretariat for Family Farming and Semiarid Development (SEAFDS) as President, with the Executive Secretary of this portfolio as Alternate;
- A representative or alternate from the Paraibana Research, Rural Extension and Land Regularization Company - EMPAER;
- A representative or alternate from the State Secretariat for the Environment and Sustainability (SEMAS);
- A representative or alternate from the Secretariat for Planning, Budget, and Management (SEPLAG);
- A representative or alternate from the Ministry of Agrarian Development (MDA);
- A full representative or an alternate from the State Coordination of Territorial Collegiates;
- A representative or alternate from the Federation of Agricultural Workers (FETAG);
- Full and alternate representative of the Federation of Agricultural Workers (FETRAF);
- A representative or alternate from the Articulação do Semiárido Brasileiro (ASA);
- A representative or alternate from the Landless Workers' Movement (MST);
- A representative or alternate from the Pastoral Land Commission (CPT);
- Full representative or an alternate from PROCASE;
- State Secretariat for Human Development (SEDH);
- State Secretariat for Women and Human Diversity (SEMDH);
- Executive Secretariat for Youth, Sport, and Leisure (SEJEL);

The general organization chart of the PROCASE II PMU is shown below, followed by the preliminary structure of socio-environmental management.

**Figure 4 - General organization chart of the PROCASE II institutional arrangement**

Source: PMU/PROCASE, 2024

**Figure 5 - PROCASE II Management Unit Proposal and Actors involved in the socio-environmental management of the Project**

Source: PMU/PROCASE, 2024

The sub-projects involved in PROCASE II will go through a process of analysis, evaluation, and definition of management instruments. This process is described in Chapter 5 below (Process for Identifying and Assessing the Program's Environmental and Social Risks and Impacts), and encompasses the screening / preliminary environmental analysis, and scoping / environmental and social assessment phases, containing impact assessment and definition of the environmental and social management plan.

Before the first phase, the subprojects are subjected to exclusion and eligibility criteria from the IDB and IFAD, which will ensure that the subproject is not eligible to be included in the PROCASE II portfolio. During the first phase, a Preliminary Analysis is carried out to screen and classify the subproject in order to establish which impact assessment and environmental and social management instruments should be drawn up. Once the first phase has been completed and the scope of the ESIA/SIA and ESMP has been defined, these documents should be drawn up in accordance with the level and particularities of the subproject typology. At this point, the Public Consultation and Stakeholder Engagement Process should be carried out, and these actions should be planned and foreseen in the preparation of the ESIA/SIA and ESMP. The documents resulting from this phase should be submitted to the IDB and IFAD for non-objection.

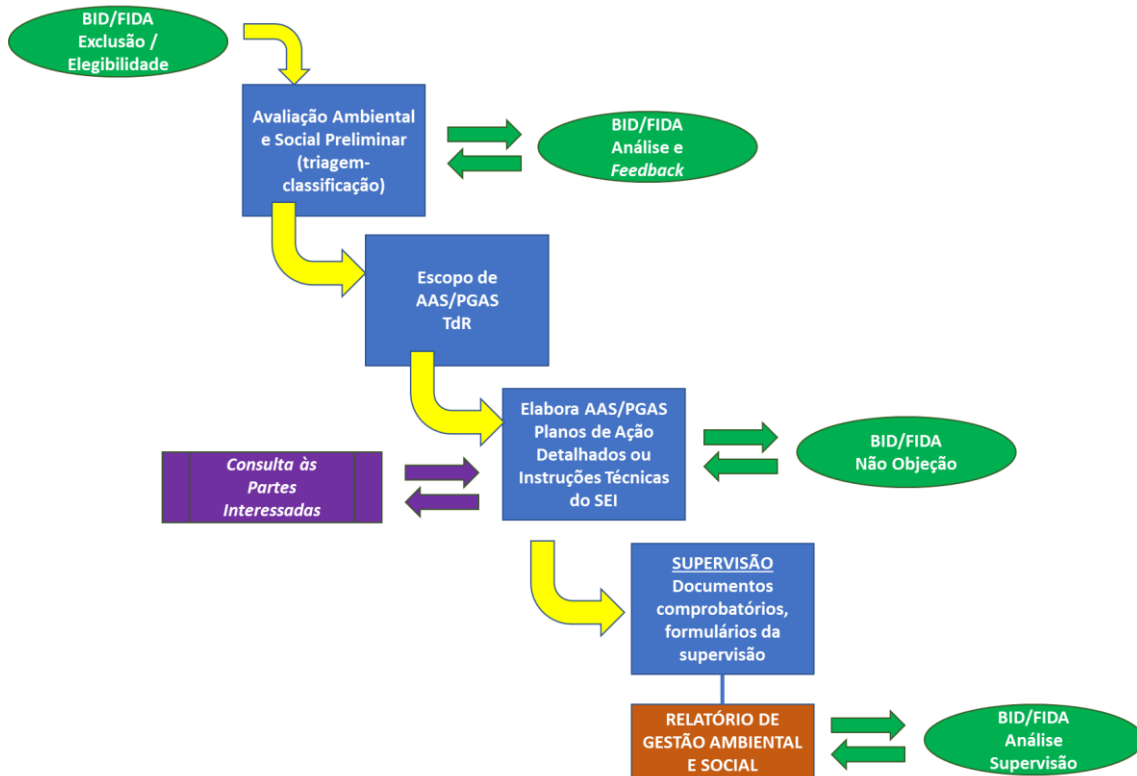

The result of this process will enable the implementation of action plans, procedures, and technical instructions internally within the PMU and contractors for the implementation of the ESMP and Environmental and Social Supervision which, in turn,

will generate supporting documents on the implementation of the planned measures which will result in the Environmental and Social Management Report. This report must also be submitted to the IDB/IFAD, through the appropriate channels to be agreed between the teams, for analysis and recommendations.

The IDB/IFAD will analyze and respond to the verdict of no objection and additional observations/requests. The IFIs may also carry out supervision of PROCASE II works and structures.

The figure below illustrates IDB/IFAD participation in the environmental and social analysis and *feedback* of documents and sub-projects.

**Figure 6 -IDB/IFAD Analysis and Feedback**

Source: Consulting, 2023

In summary, the main social and environmental management processes will be linked to those responsible as follows:

- It is intended to use EMPAER/TA to carry out some implementation and supervision roles for some socio-environmental and climate change mitigation programs, including the support of a specific community representative. In order to meet the demands of the IDB's PDAS and IFAD's SECAP, the PMU team supported by EMPAER/TA will have to include a specialist in social, environmental, gender, cultural diversity<sup>6</sup> and occupational health and safety<sup>7</sup>. The PMU will also be responsible for hiring specialists to meet specific demands in environmental and social studies.

<sup>6</sup> Cultural diversity experts can be hired through specialized consultancy services on demand.

<sup>7</sup> Occupational health and safety specialists can be hired by construction companies or by specialized consultancy services on demand.

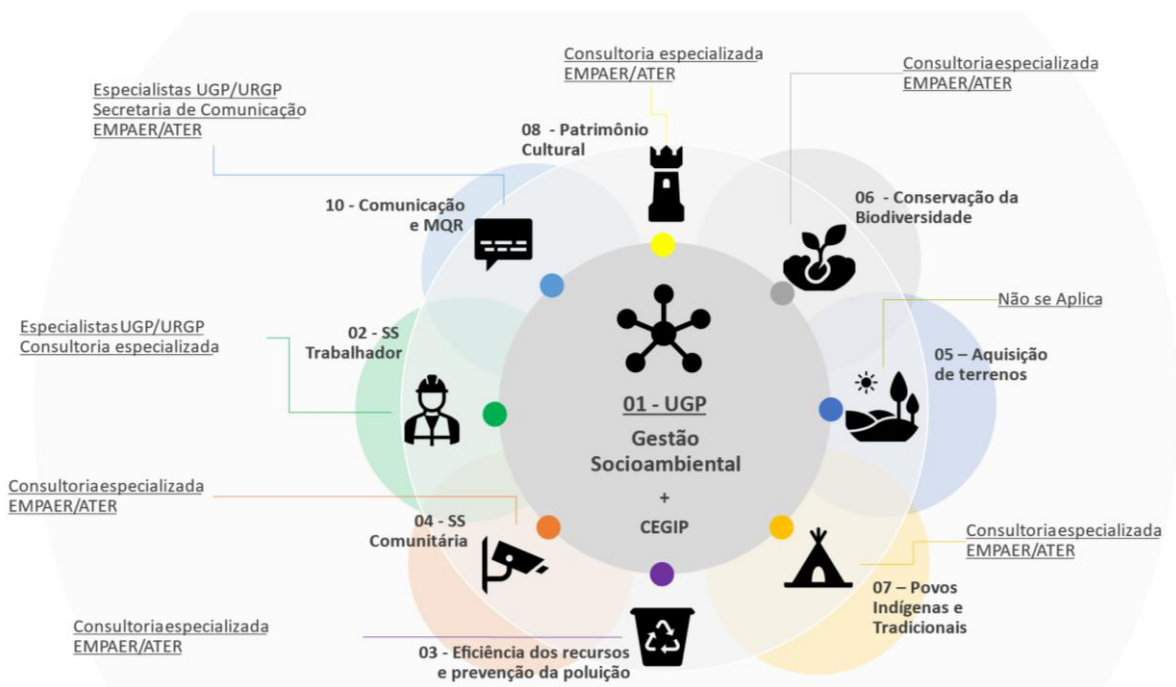

- The PMU's Socio-Environmental Management should consolidate the six-monthly report with the help of the Supervision team. The Environmental and Social Report will be reviewed by Management once it has been consolidated.
- All the sub-projects drawn up within the scope of the PROJECT will go through the Socio-Environmental Management screening and evaluation process for considerations and possible adjustments, before being submitted to the IDB/IFAD for non-objection.
- The preparation of ESIA's and ESMP's for each subproject will be carried out by a team provided by EMPAER/TA or contracted separately under the supervision of the PMU.
- Communication actions will be carried out by the PMU team, including EMPAER/TA and the 8 Regional Offices -Regional Project Management Unit (RPMU), as well as the citizen service system of the State Government Departments involved in PROCASE II. For the Environmental Education actions, the PMU's socio-environmental management team will be responsible for publicizing them, in collaboration with EMPAER/TA.

### Structure of Environmental and Social Management

In general, the institutional assessment carried out found that the proposal to coordinate Socio-Environmental Management, together with the contracted TA, will play an important role in the screening/classification process and the implementation of socio-environmental measures, with the support of the Regional Offices (RPMU) and any specialists hired for implementation and supervision.

Another interrelationship of the PMU/TA is observed in the evaluation of sub-projects with a view to improving their design and meeting relevant environmental and social requirements.

**Figure 7 - Mental model of the interrelationship process between the departments of the State Government, the PMU and TA**

Source: Consulting, 2024

The main activities related to the parties involved in PROCASE II's environmental and social management structure are described below.

### **Social and Environmental Management**

- Monitor the implementation of the programs set out in the Project's ESMP in conjunction with the other departments involved;
- To monitor actions relating to interventions involving socio-environmental issues and climate change, with the support of the Regional Offices and TA;
- Supporting consultations and public hearings, as appropriate;
- Periodically present an assessment of the efficiency of the socio-environmental projects related to the planned physical interventions, and any necessary adjustments;
- Liaising with the environmental authorities regarding the environmental licensing processes for the project components;
- Articulate permanently with the other members of the PMU and other participating entities, considering, in particular, socio-environmental planning and climate change issues;
- Ensure that the population directly affected by the temporary effects of the subprojects is informed of the project cycle, in accordance with local and IDB/IDA regulations;
- Advising the key TA and Regional teams in the field of socio-environmental interventions;
- Coordinate the monitoring of strategic impact and results indicators, both social and environmental, and climate change, as part of the project's monitoring and evaluation system;
- Coordinate actions regarding environmental and social questions raised by civil society and other stakeholders in the planned programs;
- Coordinate actions relating to the socio-environmental aspects of the project's implementation;
- Facilitating dialog and coordination between municipal departments and communities in socio-environmental actions;
- To plan and coordinate all socio-environmental activities in the services to be provided, observing the IDB/IFAD's socio-environmental and climate change policies and the guidelines established for the Project;
- Supervising and evaluating activities related to socio-environmental studies and projects, promoting compliance with the norms and standards established in the loan agreement and the Project Operational Manual, as well as technical supervision related to the implementation of recurring actions, with a view to achieving the defined goals;
- Supervising and assessing compliance with the environmental requirements set out in the environmental impact and control studies (AIAS, AAS, PGAS, ASC and others), in national, state, and municipal legislation and standards, and in the environmental licenses granted by the licensing authority;
- Carry out a preliminary assessment of the sub-projects.

### **Regional Project Management Units - RPMU**

PROCASE II will have eight Regional Project Management Units (RPMU), each made up of a team of three specialized consultants. These consultants will have backgrounds in the areas of Agricultural Sciences, Environmental Sciences and Human Sciences.

Consultants in agricultural sciences may have a background in agronomy, agroecology, agricultural engineering, zootecnics, veterinary medicine, among others.

In the area of Environmental Sciences, consultants may have a background in Biology, Ecology, Environmental Engineering, Environmental Management, among others.

The Human Sciences consultants include professionals from the fields of Anthropology, Sociology, Psychology, Social Work, among others.

The team is multidisciplinary, reflecting the complexity and necessity of the project. This diversity of specializations allows for a holistic and integrated approach to the various demands of PROCASE II.

Within this structure, one of the consultants will be responsible for territory coordination, with the aim of supervising and coordinating the teams of consultants in their assigned territory, ensuring that project activities are aligned with project needs and local realities.

Each of the 8 PROCASE II Regional Offices are strategically located in municipalities that have regional centralities in the Rural Territories, providing, in addition to face-to-face service, a telephone number, WhatsApp and e-mail. All these channels will be incorporated as part of PROCASE II's Complaints Management Mechanism.

The following table shows the addresses and contact telephone numbers of all the regional offices:

**Table 2 - Possible addresses of Regional Offices**

<b>MUNICIPALITY</b>	<b>Address</b>
João Pessoa	Avenida Rio Grande do Sul, nº 1.345, Bairro dos Estados, Edifício Evolution Business Center, 16º andar, CEP: 58.030-021
Campina Grande	Av. Jorn. Assis Chateaubriand, 2630, Estacao Velha, Edifício do CDRM, CEP: 58.105-421
Cuité	Av. Petrônio Figueiredo, 811-859, Jardim Planalto, Edifício da Casa da Cidadania, CEP: 58.175-000
Sumé	Rodovia BR-412, 425, Centro, Edifício do NEXT/UFCG, CEP: 58.540-000
Patos	Rua João da Mata, 90, Centro, CEP: 58.700-080
Sousa	Rua Emídio Pires, 84, Centro, CEP: 58.802-270
Catolé do Rocha	Av. Deputado Américo Maia, 37, Centro, CEP: 58.884-000
Itaporanga	Rua Elvidio de Figueiredo, S/N, Margens PB 386, Bairro Loteamento João Silvino, CEP: 58.780-000

Source: PROCASE, 2024.

The RPMUs, therefore, are the "field arms" of the PMU and usually carry out actions such as: (i) interaction with the Municipalities, with the benefited communities and with other institutions operating locally; (ii) interlocution in the implementation processes of the sub-projects; (iii) inspection and supervision of project works in the field in conjunction with EMPAER/TA.

The RPMU technical team, in conjunction with the TA teams, is responsible for implementing and executing socio-environmental actions. It is also responsible for direct relations with the residents, individual approaches, on-site assistance, monitoring the progress of the implementation of the sub-projects and their indicators, and constant monitoring of the families at all stages of the sub-project, with the support of TA.

These include:

- Monitor all stages of the subproject;
- Supporting the PMU in carrying out Public Consultations;
- Assembling documentary files;
- Supervising and guiding EMPAER/TA, municipalities and communities;
- Communicate situations and occurrences in the field to the PMU;
- Providing individual and collective assistance to clarify doubts and disseminate information about the sub-projects;
- Assisting in the reception of queries and complaints, providing clarification where appropriate and/or forwarding them to the official complaints channels for resolution by the competent teams;
- Record and maintain consolidated, up-to-date, and standardized information on the services provided.

### **Bodies/Entities and Entities that are partners in the implementation of actions**

The project will also seek to strengthen partnerships with other government bodies, whether federal, state, or municipal. These include:

- The **Secretary of State for Women and Human Diversity - SEMDH**, with the executive departments for gender equity and racial equity responsible for implementing public policies for women and traditional communities and actions to strengthen these groups.
- The **Executive Secretariat for Youth**, an important partner in carrying out activities for young people in PROCASE II, such as exchanges and training.
- The **INSA (National Semi-arid Institute)**,
- **UFCG (Federal University of Campina Grande)**,
- The **UFPB (Federal University of Paraíba)**.
- The **Federal Institutes and EMBRAPA Cotton** (which has its headquarters in Campina Grande), will also seek to strengthen collaboration with other EMBRAPA units.

It will also be of the utmost importance to establish partnerships with town halls, as several of the project's actions will require this collaboration. Another important dialogue will be with social movements aimed at strengthening family farming and developing the semi-arid region and the forest zone. Whenever possible, the project will seek to establish partnerships with the private sector, be it business or the third sector.

### **Structure of the Mechanism for Receiving Complaints and Manifestations**

In line with the requirements for compliance with the Safeguard Policies, PROCASE II will provide mechanisms for dealing with the population's doubts and complaints, making it possible to establish a flow of information between the executing agent and the affected/benefited local population, and enabling specific concerns about impacts and socio-environmental measures, production plans, implementation and operation of sanitation systems to be addressed and resolved in a timely manner. These resources will be structured and deployed in such a way as to target communication precisely, monitor the transmission of key messages and assess the reaction of stakeholders, anticipating obstacles or problems.

It is important to highlight the need for the following process of critical evaluation and continuous improvement in the complaints management process with the following actions:

- Evaluate the reporting structure and decision-making procedure considering the roles and responsibilities of contractors and the PMU in managing stakeholder complaints.
- Review and ensure that the registration and follow-up systems of the Complaints Mechanism accurately document complaints as they are received.
- Ensure that complaints are treated confidentially when necessary or when required by the complainant.
- Ensure the identification of repeated or similar concerns that indicate deficiencies in socio-environmental management and possible non-compliance with IDB and IFAD Policies.

In terms of complaints and information disclosure mechanisms, the PMU already has relationship channels, communication channels and service channels that will be incorporated into the Project's Complaints and Grievances Management Mechanism.

The **relationship and service channels** are part of the set of instruments for communicating with the population that are available both within the structure of the PMU and through the State Secretariat for Family Farming and Semiarid Development - SEAFDS, to which the PMU belongs:

- 8 Regional Offices and their WhatsApp;
- PROCASE II telephone number: (83) 32149248
- SEAFDS service channel:
  - Phone: (83) 3214-9247
  - E-mail: [agriculturafamiliar@seafds.pb.gov.br](mailto:agriculturafamiliar@seafds.pb.gov.br);
- General Ombudsman of the Paraíba State Government:
  - Telephone: 0800-021-2310
  - E-mail: [ouvidoriageral@casacivil.pb.gov.br](mailto:ouvidoriageral@casacivil.pb.gov.br)
  - Website: <https://ouvidoriapb.pb.gov.br/register>

The **communication channels** include:

- Internet and social media, such as Facebook - [www.PROCASE.pb.gov.br](http://www.PROCASE.pb.gov.br), and Instagram <https://www.instagram.com/PROCASEpb/>
- Communication Secretariat - SECOM, involving: Mass Media and Press Office (radio, press); Advertising; Digital Communication and Citizen Information System.

These channels will filter and channel complaints to the PMU's technical team, which will be responsible for managing the PROJECT's complaints.

### **Regional Offices**

Each of PROCASE II's 8 Regional Offices are strategically located in municipalities that have regional centralities in the Rural Territories, providing not only face-to-face assistance, but also a telephone number, WhatsApp, and e-mail. All these channels will be incorporated as part of PROCASE II's Complaints Management Mechanism.

The following table shows the addresses of the regional offices:

**Table 3 - Possible addresses of Regional Offices**

MUNICIPALITY	Address
João Pessoa	Avenida Rio Grande do Sul, nº 1.345, Bairro dos Estados, Edifício Evolution Business Center, 16º andar, CEP: 58.030-021
Campina Grande	Av. Jorn. Assis Chateaubriand, 2630, Estacao Velha, Edifício do CDRM, CEP: 58.105-421
Cuité	Av. Petrônio Figueiredo, 811-859, Jardim Planalto, Edifício da Casa da Cidadania, CEP: 58.175-000
Sumé	Rodovia BR-412, 425, Centro, Edifício do NEXT/UFCG, CEP: 58.540-000
Ducks	Rua João da Mata, 90, Centro, CEP: 58.700-080
Sousa	Rua Emídio Pires, 84, Centro, CEP: 58.802-270
Catolé do Rocha	Av. Deputado Américo Maia, 37, Centro, CEP: 58.884-000
Itaporanga	Rua Elvidio de Figueiredo, S/N, Margens PB 386, Bairro Loteamento João Silvino, CEP: 58.780-000

Source: PROCASE, 2024.

For face-to-face assistance at the Regional Offices, the response times are:

- Immediate: in the prompt clarification of doubts;
- Emergency: 48 hours, when the situation requires a rapid response and could cause a risk to the life or physical integrity of people or the infrastructure/project, or severe (irreversible) environmental damage;
- Up to 10 days for cases that cannot be answered promptly. In these situations, the questions will be forwarded to the PMU, which will contact the department responsible for responding and getting back to the complainant. If the responsible department still has no response, the PMU will assume responsibility and seek the necessary response or solution, clarifying the situation to the complainant and specifying how much more time will be needed to return with the definitive response.

### **PROCASE II website**

The PROCASE website (<https://www.PROCASE.pb.gov.br/>) contains various channels for contacting people, providing information, raising concerns and lodging complaints.

It also provides access to the Transparency Portal with detailed information on the company, its investments, contracts, income and expenses, management reports, account statements and financial operations.

The "Contact Us" section provides specific channels for citizens in general, as well as an electronic form for registering complaints.

**Social Media - Facebook and Instagram**

Social media is mostly used as a channel for disseminating information about developments, launches and events. As it allows interaction with the target audience, information on access to services is also provided.

Within the framework of the Project, the operation of these platforms or any new profiles created specifically for PROCASE II or at local level by the municipalities should follow the same logic. When complaints or doubts about the project are identified, the managers of these networks must activate the complaints system through the official channels. In other words, no complaints or grievances can be dealt with or resolved on social media. These channels can receive and advise complainants on the correct channels for submitting their complaints.

**Figure 10 - Social Media**

Source: <https://www.instagram.com/PROCASEpb>

**Other communication and complaint channels:**

Complaints channels - IDB

The IDB's own channels are also part of the Complaints Mechanism:

- IDB Complaints Protocol: [quejas@iadb.org](mailto:quejas@iadb.org)
- Website: <https://www.iadb.org/pt-br/quem-somos/enviar-uma-alegacao/reclamacoes-ambientais-e-sociais>

Independent Consultation and Investigation Mechanism (ICIM):

The Independent Consultation and Investigation Mechanism (MICI) is a structure of the IDB Group, independent of the Bank's management and project teams, which deals with environmental and social complaints from communities potentially affected by the Group's operations. This independence allows it to act impartially and seek solutions with all the parties involved (the communities claiming affections; the IDB Group, as the financier of the operation; and the borrower (company or government) in charge of executing the project).

For more details, see: <https://www.iadb.org/pt/mici/o-que-e-o-mici>

Requests can be sent to the MICI Office in Washington, D.C. or to any IDB Representative Office (marked "For the attention of: MICI Office"), from where the request will be forwarded to the MICI Office.

MICI's address is:

- Independent Consultation and Investigation Mechanism, Inter-American Development Bank, 1300 New York Avenue, NW, Washington, D.C. 20577, United States.
- E-mail: mecanismo@iadb.org
- Phone: 202-623-3952; Fax: 202-312-4057

## **Institutional Strengthening of Social and Environmental Management**

---

In order to complete this framework of professionals and functions in the environmental and social management of PROCASE II in an efficient manner, it is recommended that the PMU carry out:

- Definition of positions, responsibilities, and workflows for managing environmental, social and health and safety impacts;
- Hiring 5 professional specialists, one social specialist, one gender and social inclusion specialist, one environment and climate change specialist and two environmental and social safeguards specialists in the PMU structure.

According to the analysis of the institutional arrangement made between the IDB<sup>8</sup> and the PMU, there will also be a need for:

- Ensuring that the environmental and social impact management team is sufficient to respond to the high demand that will be generated by PROCASE II.
- Promote periodic training on the IDB's Social and Environmental Safeguards Policies;
- Develop, within the PMU, manuals for impact management, considering the best practices of the EO and IDB policies, for application in PROCASE II activities.

### **4.4.2. Management System Process**

As shown in the figure below, the Management Framework established and consolidated in the PROCASE II ESMP should be the beacon for the entire ESMS process flow, enabling the development of the system manual containing practical issues such as management tools, action plans, instructions for construction contractors, instructions for supervision, and all the documentation generated during the project phases (ESIAs, ESMPs, ToRs, etc.).

The Manual<sup>9</sup> to be generated must consider the document control system used by the PMU, as well as the Technical Instructions, Technical Notes, Plans established, and the entire framework structured for environmental and social management currently in force.

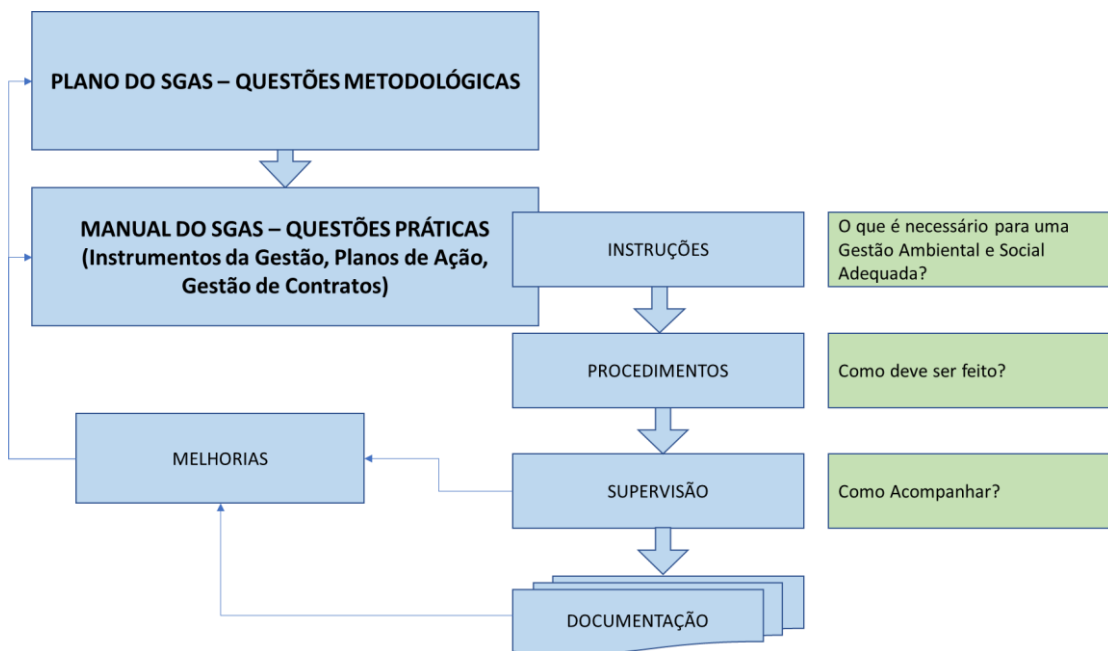

The instructions show what needs to be developed for proper environmental and social management, which in turn can be broken down into specific procedures (how the action should be carried out). The Environmental and Social Supervision team, in turn, will use these tools to monitor the implementation of sub-projects, generating the necessary documentation that will support part of the Environmental and Social Management Report.

---

<sup>8</sup> Consolidated in the PACI Report document prepared by the IDB team in collaboration with car

<sup>9</sup> The ESMS Manual corresponds to the set of instructions and procedures established, described and formalized for environmental and social management.

**Figure 11 - Overview of ESMS**

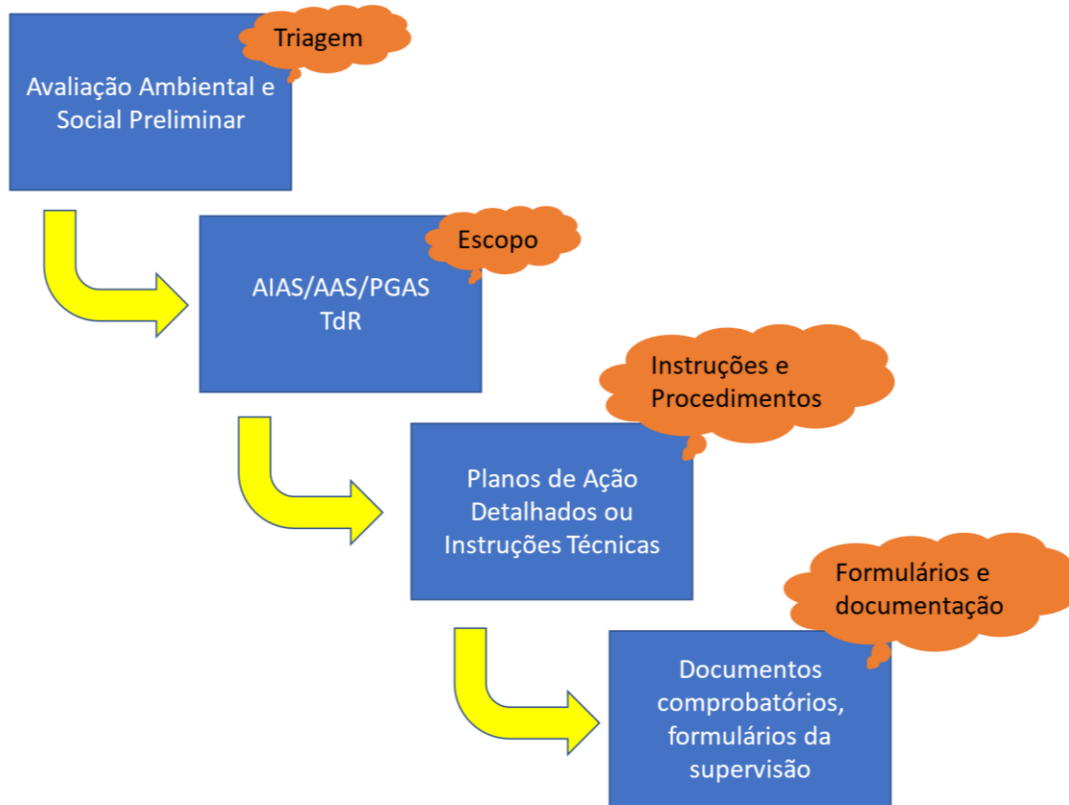

*Elaboration: Consultancy, 2021*

The preparation of action and mitigation plans should consider a mitigation hierarchy to: (i) anticipate and avoid risks and impacts; (ii) when avoidance is not possible, minimize or reduce risks and impacts to acceptable levels; (iii) when risks and impacts have been minimized or reduced, mitigate them; (iv) when significant residual impacts and risks remain, compensate or neutralize them, when technically and financially feasible.

The process of developing and defining measures for the plans and programs follows the sequence presented below, first going through a screening phase, defining the scope (terms of reference) of the environmental and social assessments and environmental and social management plans, followed by carrying out the assessments<sup>10</sup> and consequent action plans and, finally, refining the monitoring and supervision instruments and forms, based on the models presented in this ESMS.

<sup>10</sup> These assessments incorporate the necessary mitigation hierarchy.

**Figure 12 - Process flow for developing and defining measures**

Source: Consulting, 2022

#### 4.4.3. Environmental and Social Management Report

Environmental and social management must be controlled by means of specific systematized documents through which the PMU will promote environmental and social management during the planning and implementation of works and compliance with legislation and the IDB's PDAS1: Assessment and Management of Environmental and Social Risks and Impacts.

Environmental and social monitoring reports will be drawn up for PROCAS II projects - the Environmental and Social Management Report - on the implementation of sub-projects and compliance with the measures defined in the ESMP, including those that go beyond the implementation period and into the operation stage, where appropriate.

The main document of the ESMS is the **Environmental and Social Management Report**, which will be developed based on compliance with the impact mitigation programs that make up the set of PROCASE II mitigation measures and which are presented in the PGAS.

The **Environmental and Social Management Report** presents the results of the environmental and social actions carried out and establishes the general guidelines, the main socio-environmental procedures, as well as some project instructions and technical specifications necessary for carrying out the activities in accordance with the socio-environmental studies and programs resulting from the environmental licensing of the works and the subproject's ESIA/AAS and ESMP.

The aim of the report is to indicate the main events related to environmental and social issues, including a summary of all the activities planned in the ESMP, the progress of these activities, occurrences, and issues, as well as their resolution and follow-up. The

evaluation of the community's concerns should also be included in this report, as well as an assessment of the sectors most concerned and the effectiveness of the solutions provided.

Information should be presented, which will be used as indicators for identifying problems and resolutions and improving the methodology for mitigating, compensating, and enhancing impacts, as well as improving the process of executing the ESMP for each sub-project.

The report should include all documentation, forms and formalizations and should be produced **every six months** consolidated, which should be sent to the IDB and IFAD as part of compliance with the measures established in this ESMS. Reports may also be produced at shorter intervals (quarterly, for example), giving an overview of the progress made in environmental and social management and the sensitive issues identified, and reports may be produced outside of these intervals when the matter reported on requires urgency.

The person **responsible** for drawing up this report will be the PMU's Socio-Environmental Management, with the support of the PMRUs and EMPAER/TA teams, consolidating the final version based on the input provided by each party involved in accordance with their responsibilities.

## 5. PROCESS FOR IDENTIFYING AND ASSESSING THE PROGRAM'S ENVIRONMENTAL AND SOCIAL RISKS AND IMPACTS

The guidelines proposed below are established for all PROCASE II sub-projects.

### 5.1. Screening Measures, Classification and Scope for Subprojects

The environmental and social management of projects and works requires that instruments and processes be determined so that the actions defined to meet environmental and social requirements are guaranteed and are supervised and corrected when necessary.

For the environmental and social management of projects, we first considered the classification of projects and works according to their respective characteristics. Distinct characteristics are therefore highlighted, which will be considered when defining management instruments according to their size and the way they influence the environment and society. The criteria established are presented below.

**Responsible:** TA will be responsible for applying the screening tool to define the scope, and the PMU will be responsible for implementing this process with TA and managing and consolidating the results.

A preliminary analysis is carried out at the preliminary design stage, i.e. it should be started on the basis of a conceptual study or, at the latest, at the stage of drawing up a preliminary sub-project. This assessment should point out sensitive environmental and social issues, eliminating situations that make the project ineligible and a ranking using established criteria. According to the IDB's MPAS, all financed operations must be pre-assessed and classified according to their potential socio-environmental impacts, using 3 categories to classify operations according to their environmental and social risk:

- **Category A:** Operations that may cause significant negative environmental or social impacts or have profound implications affecting natural resources.
- **Category B:** Operations that have the potential to cause mainly local and short-term negative environmental or social impacts and whose effective mitigation measures are known and readily available.

- **Category C:** Operations likely to cause minimal or no environmental or social impacts.

The PROCASE II classification is **Category B**, so no work within the scope of the Project can be classified higher than **Category B** without the IDB and IFAD boards being consulted for further instructions and the possibility of eligibility. The classification of the works will be assessed through a Preliminary Environmental and Social Analysis to be carried out by the PMU and TA team contracted for each Subproject, followed by an impact assessment process and the establishment of a management and mitigation plan, which will then be submitted to the IDB and IFAD for a no-objection analysis.

The category of sub-projects will be indicated according to their level of risk, involving an assessment of environmental, social, land, etc. risks, obviously considering the environment, its aspects, and conditioning factors in which the project is inserted.

#### 5.1.1. Environmental and Social Analysis

The environmental and social analysis system includes a preliminary assessment phase for subprojects involving a practical tool to be carried out by the TA team with guidance from the PMU during the subproject design phase (preliminary project). It is important to note that no Subproject, or set of Subprojects, should be implemented without first undergoing the Environmental and Social Analysis recommended in this item.

Identifying the environmental and social risks and negative impacts of each Subproject (or set of Subprojects) covers the most important aspects for defining both the Impact Assessment and the Environmental and Social Management Plan. A Screening Worksheet should be completed by the technical team responsible for developing the Subproject as a preliminary stage of the assessment. This approach ensures that environmental and social safeguards are an integral part of each Subproject and are fully understood by the technical teams developing and supporting its implementation. By working on the development of the Subproject and the safeguards simultaneously, a "dialog" between the two processes is facilitated: the impacts and risks identified can be addressed with prior measures and design alternatives avoiding impacts or anticipating their mitigation.

**Conceptualization of Subprojects and Sets of Subprojects:** The tool can be applied either to a single Subproject, which may be configured in a single PIR, for example, or a single implementation action to be carried out in a community, or to a Set of Subprojects. The set of sub-projects must be defined by the PROCASE II team, considering the fact that they share the same geographical area and have the same socio-environmental aspects, or when the same community benefits from more than one sub-project. This joint organization aims to assess the same environment, converge impacts, and propose synergistic mitigation solutions for the Subprojects, optimizing the preparation of Impact Assessments and Management Plans.

The suggested tool will work as follows:

- **Stage 1- Screening:** The technicians fill in the screening form. The form is structured to cover the different sensitive issues that trigger environmental and social safeguards. For each safeguard, a set of questions identifies the possible risks and negative impacts. The questions are formulated so that a "yes" answer indicates a risk or negative impact.
- **Stage 2- Categorization of the Subproject or Set of Subprojects:** In this step, the level of each risk identified in STEP 1 is assessed and categorized as minimal, moderate, substantial, or high. This joint categorization of the issues assessed will confirm the Category of the Subproject or Set of Subprojects, in accordance with the

provisions of PDAS 1 of the IDB's MPAS (Assessment and Management of Environmental and Social Risks and Impacts)<sup>11</sup>.

- **Stage 3- Environmental and Social Impact Assessments - ESIA and ESIA:** In order to confirm the impacts and risks identified in STAGE 1 and verify the existence of other unforeseen impacts and risks, the borrower must carry out an impact assessment proportional to the outcome of the Screening and Classification phase and the size/engagement of the Subproject(s). The impact assessment study may be a Simplified Environmental and Social Assessment (SEA) or an Environmental and Social Impact Assessment (ESIA), considering only the issues/conditions relevant to the Subproject to be assessed.
- **Stage 4 - Proposing Environmental and Social Management Measures and Plans for the Subproject or Set of Subprojects - ESMP:** For each risk or negative impact identified, a mitigation measure must be listed, and for this a specific Environmental and Social Management Plan - ESMP for the Subproject or Set of Subprojects must be drawn up. The ESMP may be supported by the guidelines set out in the PROCASE II ESMP.

**Chapter 5.1.1 of the PGASE** provides details of the proposed Environmental and Social Analysis mechanism. It is important to note that this tool may still undergo a process of adaptation in line with the experiences and best practices observed during PROCASE II.

#### 5.1.2. Eligibility Criteria

The socio-environmental eligibility criteria defined for PROCASE II can be found in **Chapter 5.1.2 of the PGASE**.

### 5.2. Suggested Methodology for Identifying and Assessing Environmental and Social Risks and Impacts

This chapter presents the methodology for the integrated analysis of the environmental and social impacts resulting from the implementation and operation phases of PROCASE II. The analysis is carried out in three stages, beginning with the identification of the environmental and social impacts, moving on to the prediction of their magnitude, and ending with the assessment of the importance of these impacts.

In accordance with the guidelines of the IDB's Environmental and Social Policy Framework, the Environmental and Social Performance Standard PDAS1 applies to all projects for which IDB financing is requested and defines the importance of the borrower establishing and maintaining an ESMS appropriate to the nature and scale of the project and commensurate with the level of its environmental and social risks and impacts, incorporating the identification of risks and impacts.

As a guide to the methodology for identifying and assessing risks and impacts, IFC Guidance Note 6 (June 27, 2019) states:

*The process of identifying risks and impacts will vary depending on the nature, size and location of the project. As a minimum, the client should examine and assess the risks and possible impacts on biodiversity and ecosystem services in the project's area of influence, taking into account the following items: (i) the location and scale of project activities, including those of associated facilities; (ii) their supply chains (as*

<sup>11</sup> Environmental and Social Screening and Categorization: 3.16 Impact Classification.

*required in paragraph 30 of Performance Standard 6); (iii) the proximity of the project to areas of known biodiversity value or areas known to provide ecosystem services; and (iv) the types of technology to be used (e.g. underground versus open pit mining, directional drilling and dispersed multi-well drilling areas versus high well density drilling areas, air cooled versus water cooled towers, etc.) and the efficiencies of the proposed equipment; and the potential for the project to induce impacts caused by third parties (for example, through new means of access to remote areas), such as informal settlers or hunters. Performance Standard 6 will not apply when no known risks to biodiversity or ecosystem services, including risks to possible knowledge gaps, are identified through a robust assessment.*

Thus, the process of identifying risks and impacts establishes that direct and indirect impacts related to the project on biodiversity, ecosystem services and society should be considered, and significant residual impacts identified. This process will consider the relevant threats to biodiversity and ecosystem services, focusing especially on habitat loss, degradation and fragmentation, invasive alien species, overexploitation, hydrological alterations, nutrient loading, and pollution. It also establishes that consideration should be given to the different values attributed to biodiversity and ecosystem services by the affected communities and, where relevant, by other stakeholders.

In this regard, it is important to highlight IFC Guidance Note (NO) 6 (June 27, 2019), which states in its paragraph 15 that the environmental study should make clear the direct, indirect, and residual impacts related to the project on the species, ecosystems and ecosystem services identified in the baseline studies.

At the national level, it should be noted that federal legislation stipulates that Article 6(II) of CONAMA Resolution 01/86.

*Art. 6 - The environmental impact study will carry out at least the following technical activities:*

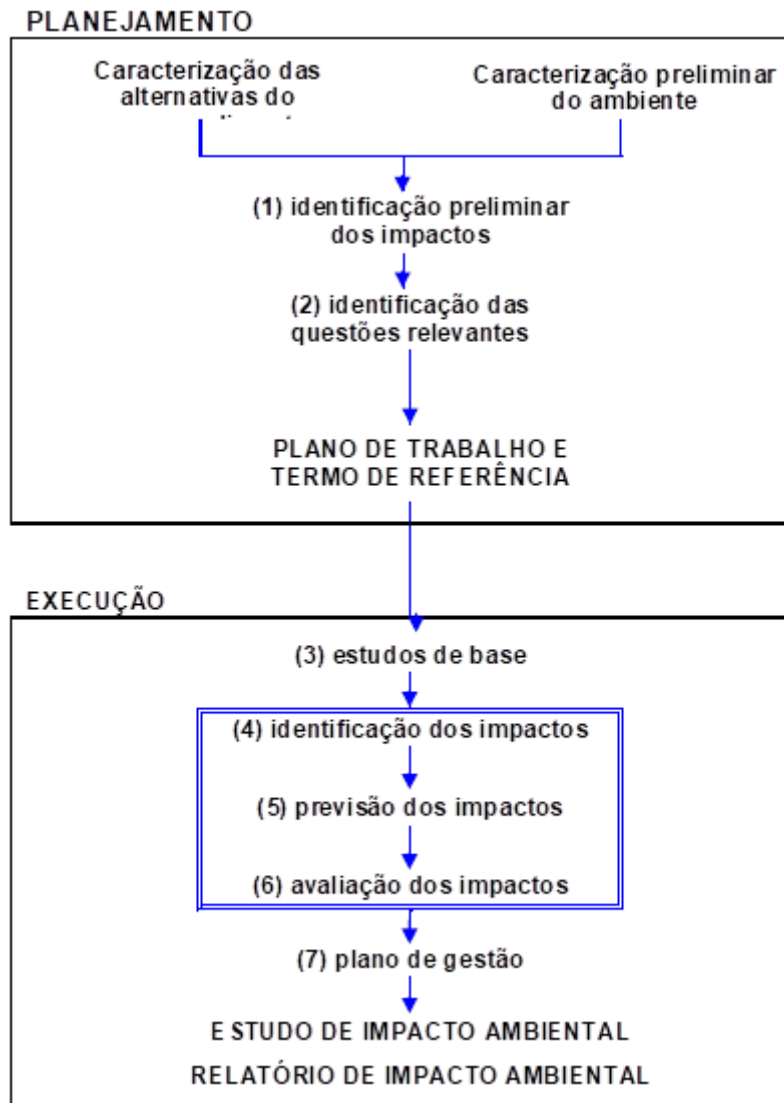

*II - Analysis of the environmental impacts of the project and its alternatives, by identifying, predicting the magnitude and interpreting the importance of the likely relevant impacts, breaking down: the positive and negative impacts (beneficial and adverse), direct and indirect, immediate and medium and long-term, temporary and permanent; their degree of reversibility; their cumulative and synergistic properties; the distribution of social burdens and benefits*

This chapter is divided into three sections:

- **Identification of Impacts:** construction of a list of impacts, correlating them to the activities of each of the phases of the project;
- **Prediction of Impacts:** presents estimates of the magnitude or intensity of the predicted impacts, using, where appropriate, quantitative, or qualitative indicators;
- **Impact assessment:** with the interpretation of the importance or significance of the expected impacts.

This process is based on Sánchez (2020), as shown in the following figure

**Figure 13 - Impact analysis process**

Source: Adapted from Sánchez (2020)

### Concepts

The main concepts used in this chapter are briefly described below.

**Cumulative impacts assessment:** is a tool for assessing the cumulative impacts of the project in combination with impacts from other relevant past, present and reasonably foreseeable developments, as well as unplanned but foreseeable activities that have been enabled by the project and that may occur later or in a different place.

**Cumulative impact:** the additional impact of the project when added to relevant past, present and reasonably foreseeable development impacts, as well as unplanned or foreseen activities allowed by the project that may happen later or in a different location. Cumulative impacts can arise from small individual but significantly collective activities that take place over a period of time. Cumulative impacts are limited to impacts generally recognized as important in science-based concerns and/or concerns of people affected by the project. Examples of cumulative impacts are: additional contribution in the emission of gases in the atmospheric basin; reduction of water flow in watersheds due

to multiple withdrawals; increase in sediment volume in watersheds; interference in migratory routes or wildlife displacement; or more congestion and accidents due to increased vehicle traffic on common roads.

**Indirect impact:** is the impact that is not directly caused by the project activity, but contributed to by that activity, often at a distance, or resulting in a complex impact trail. Other factors and third parties outside the direct control of the project are also associated factors.

**Impact:** Social and environmental impacts refer to any change, potential or actual, (i) to the physical, natural, or cultural environment; and (ii) impacts on the adjacent community and workers resulting from the business activity being supported.

**Social and Environmental Risk:** is the combination of the expected severity of (i) a project that may cause or contribute to a potential adverse environmental and social impact, or (ii) problems that may negatively affect the provision of environmental and social mitigation measures and results; and the probability of either or both of these occurring.

**Environmental Aspect:** According to Sánchez (2020): An element of an organization's activities, products or services that can interact with the environment.

**Activities:** Set of actions necessary for the implementation of a given project. The environmental impacts will be identified by correlating the environmental aspects with the actions.

**Mitigation Hierarchy:** Order of preference in the application of mitigating measures, namely, prevention of adverse environmental impacts first; when they are unavoidable, application of measures to minimize them; when they cannot be totally avoided or minimized, rehabilitation of the affected areas; and finally, compensation or offsetting of residual impacts, after prevention, minimization, or rehabilitation. The term "mitigation hierarchy" is a tool commonly applied in Environmental Impact Assessments to help manage risks. It includes measures taken to avoid impacts from the outset of development activities and, when this is not possible, to implement measures that minimize, then restore and, as a last resort, offset possible residual adverse impacts.

**Residual Impacts:** these are those related to the project, and which may remain after the mitigation hierarchy has been applied, including measures to avoid or minimize them. If compensation is required, a review of all residual impacts discovered through an assessment process must be carried out (IDB, Nov./2015).

**Ecosystem services:** these are the benefits that people, including companies, obtain from ecosystems. Ecosystem services are organized into four types: (i) provisioning services, which are the products that people obtain from ecosystems; (ii) regulating services, which are the benefits that people obtain from regulating ecosystem processes; (iii) cultural services, which are the non-material benefits that people obtain from ecosystems; and (iv) supporting services, which are the natural processes that maintain the other services. Examples are as follows: (i) provisioning services can include food, fresh water, timber, fibers and medicinal plants; (ii) regulating services can include surface water purification, carbon storage and sequestration, climate regulation and protection against natural hazards; (iii) cultural services can include natural areas that are sacred sites and important areas for recreation and aesthetic pleasure; and (iv) supporting services can include soil formation, nutrient cycling and primary production.

**Vulnerable Individuals or Groups:** are people or groups of people who may be more adversely affected by project impacts than others because of characteristics such as disability, health status, indigenous status, gender identity, sexual orientation, religion, race, color, ethnicity, age, language, personal or political opinions, national or social origin, property, birth, economic disadvantage, or social status. Other vulnerable

individuals and/or groups may include persons or groups in vulnerable situations, including the poor, the landless, the elderly, single-parent families, refugees, internally displaced persons, communities dependent on natural resources or other displaced persons who cannot be protected through national legislation and/or international law.

### 5.2.1. Suggested Impact Assessment Methodology

During the analysis of impacts, the mitigation hierarchy approach should be adopted:

- anticipate and avoid risks and impacts;
- when it is not possible to avoid, minimize or reduce risks and impacts to acceptable levels;
- once the risks and impacts have been minimized or reduced, mitigate them;
- where residual significant impacts remain, compensate, or neutralize them, where technically<sup>12</sup> and financially feasible<sup>13</sup>

It is important to consider that the social and environmental management tools to be employed during PROCASE II should be assessed in accordance with the risks and impacts of the sub-project, as well as the definition of the measures and actions identified to manage these risks and impacts. These instruments will consider the experience and capacity of the parties involved in the project, including control bodies, legislation, the communities affected by the project and other stakeholders, and aim to support better social and environmental performance.

The identification of the probable impacts resulting from PROCASE II can be used as a tool for identifying socio-environmental aspects and impacts drawn up by Sánchez and Hacking (2002). In this matrix, lists of project activities, socio-environmental aspects and impacts are entered, with a view to identifying possible interactions between the elements. The following steps are followed to fill in the matrix:

1. Drawing up a list of activities<sup>14</sup> for implementation and operation, as provided for in the project and in accordance with the types of work presented.
2. Identification of socio-environmental aspects;
3. Completion of the first part of the matrix (correlation between activities and socio-environmental aspects), with: (i) Review of the selected activities and environmental aspects, in order to exclude or include new elements; and (ii) Classification of the environmental aspects as significant or insignificant;
4. Identification of the probable environmental impacts associated with each aspect, by filling in the second part of the matrix for identifying environmental aspects and impacts;

---

<sup>12</sup> Technical feasibility is based on whether the proposed measures and actions can be implemented with commercially available expertise, equipment and materials, considering local factors such as climate, geography, demographics, infrastructure, security, governance, capacity and operational reliability

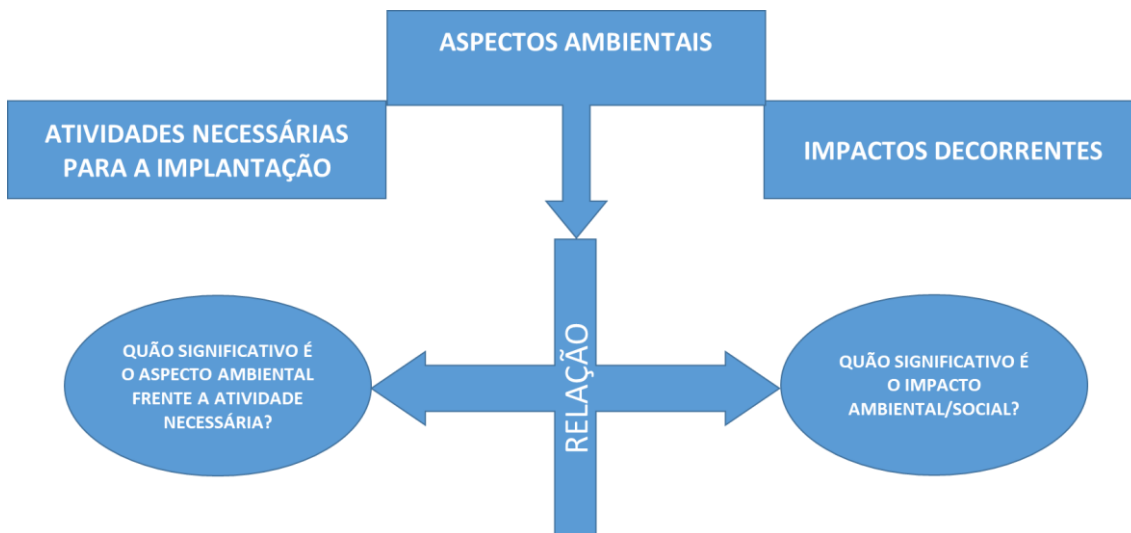

<sup>13</sup> Financial viability is based on relevant financial considerations, including the relative magnitude of the additional cost of adopting such measures and actions compared to the investment, operation and maintenance costs of the project, and whether this additional cost could make the project unviable for the Borrower

<sup>14</sup> Activities are the sets of actions required to implement a project, for example, if cutting down vegetation is required to construct a building, then this is considered an activity inherent to the project.

5. Evaluation of the importance of impacts as low, medium, or high.
6. Analysis of impacts and determination of mitigating measures, according to the mitigation hierarchy.

The following figure shows the logic used to identify the impacts, considering which activities are necessary for the implementation or operation of the systems and their relationship of relevance to the socio-environmental aspects. Based on this analysis, the socio-environmental impacts and their significance are established, as well as the best way to mitigate them.

**Figure 14 - Definition of Environmental Impacts.**

*Elaboration: AmbGis 2022, adapted from Sánchez and Hacking (2002)*

As an example of this analysis strategy, a supposed impact identified as "Deterioration of surface water quality" can occur as a result of various project actions and be related to various socio-environmental aspects depending on: the environment, the works, the project phases, among others. Thus, the matrix designed aims to identify which activities and aspects effectively contribute to the socio-environmental impact, so as to enable the definition and direction of which Environmental/Social Programs and which mitigating actions should be carried out in a hierarchical manner to avoid or reduce the effects of a given impact.<sup>15</sup>

### **Matrix for identifying environmental and social activities, aspects, and impacts**

When filling in the Matrix, the environmental and social aspects are classified according to their significance, which can be significant or insignificant. Aspects are classified as significant if they meet at least one of the following criteria:

- (a) environmental risks and impacts, including:
  - (i) those identified by the environmental, health and safety guidelines;

<sup>15</sup> The mitigation hierarchy is defined by the order of preference in the application of mitigating measures, namely: first, the prevention of adverse socio-environmental impacts; when they are unavoidable, the application of measures to minimize them; when they cannot be totally avoided or minimized, the rehabilitation of the affected areas; and finally the compensation or offsetting of residual impacts, after prevention, minimization or rehabilitation. (IADB, 2015: Guide to assessing and managing impacts and risks to biodiversity in projects supported by the Inter-American Development Bank. Graham Watkins: Washington D.C., 2015. 94p.)

- (ii) those related to community safety;
- (iii) those related to climate change;
- (iv) any significant threat to the protection, conservation, maintenance and recovery of natural habitats and biodiversity; and
- (v) those related to ecosystem services and the use of living natural resources, such as fishing and forestry resources;
- (b) social risks and impacts, including:
  - (i) threats to human security due to the intensification of personal, community or interstate conflict, crime, or violence;
  - (ii) risks that project impacts may disproportionately affect disadvantaged or vulnerable individuals and groups;
  - (iii) any prejudice or discrimination against individuals or groups in access to development resources and project benefits, especially in the case of those who may be disadvantaged or vulnerable;
  - (iv) negative economic and social impacts related to the expropriation or restriction of land use;
  - (v) risks or impacts associated with the property

After defining the significance of the aspects, the probable environmental impacts are classified according to their importance, which can be low, medium, or high, according to the item **Assessing the importance of impacts**, below.

### **Assessing the importance of impacts**

---

According to Sánchez (2020), the functions of assessing the significance of impacts are to interpret the meaning of the impacts identified, facilitate the comparison of alternatives, determine the need for mitigation measures and determine the need for project modifications. According to the author, "an impact will be more significant the more important or vulnerable the environmental or cultural resource affected and the greater the pressure on that resource".

In order to reduce the subjectivity of assessing the importance of impacts, the following criteria may be adopted:

- (I) Selection of attributes;
- (II) Classification of impacts according to attributes;
- (III) Combining the attributes, following logical rules, in order to assess the importance of the impacts;
- (IV) Applying logical rules to environmental impacts.

Attributes are characteristics of impacts that help to describe and qualify them. The following attributes were selected:

- **Expression:** beneficial or adverse impact, positive or negative character.
- **Origin:** direct or indirect impact, in terms of source. A direct impact results from the activities of the entrepreneur or contractor. An indirect impact is the consequence of a direct impact or the actions of third parties.

- **Duration:** temporary or permanent impact. Temporary impacts occur during one or more stages of the project and cease at the end of the project (at decommissioning). On the other hand, permanent impacts have a permanent or indefinite duration.
- **Time scale:** immediate, medium, or long-term impact. Immediate impacts occur simultaneously with the activities that cause them, while medium- to long-term impacts occur with a delay in relation to the source action. Medium-term impacts have a time lag of months, while long-term impacts have a time lag of years.
- **Reversibility:** reversible or irreversible impact, in terms of the ability of the affected environment/element to return to its previous state if the associated activities are terminated or corrective measures are applied.
- **Magnitude:** impact of high, medium, or low magnitude. Refers to the expected intensity of the impacts, with the effective implementation of mitigating measures.
- **Probability of occurrence:** impact with a certain, high, medium, or low probability of occurrence. Impacts of certain occurrences have no uncertainty as to their occurrence. On the other hand, high probability impacts are very likely to occur. Medium probability impacts are unlikely to occur but cannot be ruled out. Low probability impacts are very unlikely.
- **Spatial scale:** local, linear, municipal, regional, or global impact. Local impacts are limited to the project area. Linear impacts occur along transportation routes for inputs or products. Municipal impacts are limited to the boundaries of the municipality, while regional impacts have an area of influence that goes beyond the previous ones. Global impacts can affect the entire planet.
- **Existence of legal requirement:** legal requirement exists (yes) or does not exist (no). This refers to the existence of municipal, state, or federal legislation regulating the impact.

Some of these attributes should not influence the assessment of the importance of impacts, such as their expression and origin. Regardless of whether it is beneficial or adverse, direct, or indirect, an impact can be significant or insignificant. Analysis of the Impact Classification Matrix will show which attributes best represent the importance of an impact, so if - for example - there is little variability in the **time scale** attribute (all immediate impacts) this attribute is not relevant in determining the importance of the impact.

In this proposal, the importance of impacts can be determined by combining three attributes: magnitude, reversibility, and the existence of a legal requirement:

- **Magnitude** identifies "how much" the project may modify a resource. It is therefore fundamental for quantifying the extent of an impact, since the greater the magnitude of an impact, the greater the modification of the resource analyzed. However, the importance of environmental and social impacts must be analyzed in conjunction with other attributes.
- **Reversibility** represents the ability of the affected environment to return to its characteristics prior to the implementation of the project, through the termination of activities or the implementation of corrective measures. It therefore characterizes the impact as reversible or irreversible, which must consider not only technical characteristics, but also economic viability. Therefore, reversibility is fundamental in assessing importance, as irreversible impacts can compromise future generations.
- The **existence of legal requirements** highlights the regulated impacts - on the physical-biotic and anthropic environment - these are issues that are valued by

society, given that the laws incorporated have been voted on by parliamentarians or inserted into regulations arising from these laws (SÁNCHEZ, 2020).

In this way, the impacts can be considered as:

- high degree of importance:
  - when high or medium magnitude and, at the same time, the existence of legal requirements, regardless of their reversibility; or
  - high magnitude and irreversible, regardless of the existence of legal requirements.
- Small degree of importance:
  - when they are small and reversible, regardless of the existence of legal requirements.

It is important to note that impacts that do not fit the above criteria can be classified as of medium importance.

The following table summarizes the possibilities for classifying impacts, using the Magnitude, Reversibility and Existence of legal requirements attributes.

**Table 4 - Criteria for combining attributes to classify degree of importance**

Attributes			Degree of importance
Magnitude	Reversibility	Existence of legal requirements	
★★★ or ★★☆☆	independent		●
★★★		independent	
★☆☆		independent	◆
Other situations			▲

Table legend:

<b>Magnitude</b>	★★★ high	★★☆☆ average	★☆☆ low
<b>Reversibility</b>	reversible	irreversible	
<b>Existence of legal requirements</b>	yes	no	
<b>Degree of importance</b>	● high	▲ medium	◆ low

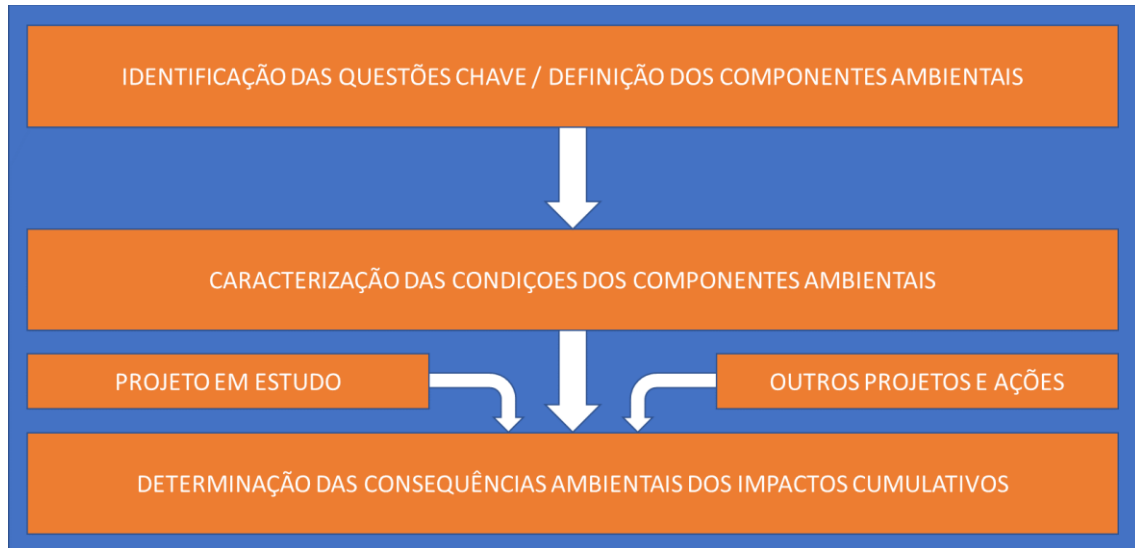

### 5.2.2. Suggested Methodology for Assessing Cumulative Impacts

To determine cumulative impacts, it is important to define a logical sequence that establishes clear limits on issues such as temporality, spatiality, significance of the impacts to be analyzed, as well as the identification of the Selected Environmental Components - CAS.

CAS are related to environmental and/or social attributes that can be individualized in a system and that are considered regionally relevant or that can be affected by combined/accumulated activities.

The simplified process is shown in the figure below:

**Figure 15 - Simplified Cumulative Impact Assessment Process**

*Elaboration: Consultancy, 2021*

### **Identification of key issues of interest and environmental components**

Initially, some questions must be answered that are key to the Selected Environmental Components, defined as follows (DIBO, 2018):

- identifying regional issues of interest associated with the project and defining the objectives of the assessment: this involves identifying the direct and indirect impacts of the proposed action, and which effects on the components are important from the perspective of cumulative impacts;
- select the environmental components: the environmental components that may be affected by the proposed action must be selected. Each component selected must be the subject of each step described below;
- establish spatial boundaries for the analysis: to define spatial boundaries for each selected environmental component (CAS), you can, for example, determine the area that will be affected by the action (project impact zone);
- establishing time limits: the aim is to determine the periods in the past and future that should be considered for the analysis. The time limit for the past starts before the proposed action and for the future it is the time in which a CAS recovers from the effects of the actions;
- identify other actions that affect the CAS: other past, present, and reasonably near future actions that can cause effects and that can interact with the effects caused by the action under analysis should be identified for each environmental component.

It is important to note that the CAS makes it possible to better understand and monitor environmental consequences, particularly considering the growing significance of risk factors, such as those related to biodiversity (IFC, 2013).

## Characterization of the conditions of the selected environmental components

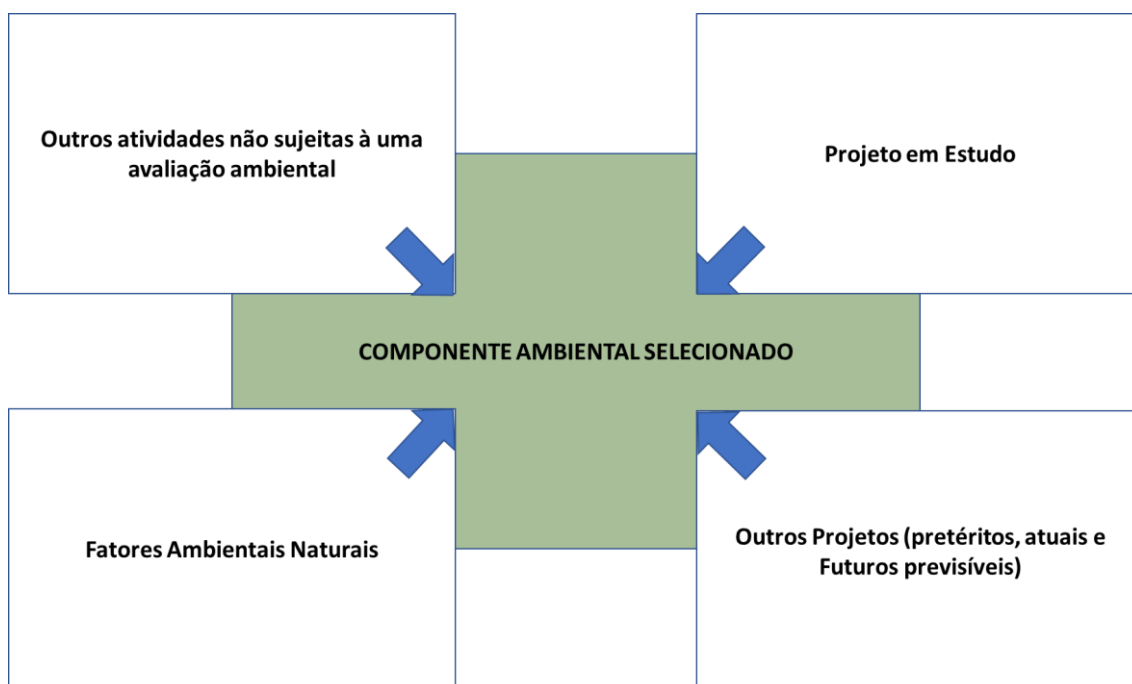

Once the Environmental Components have been defined, it is important to carry out an analysis to determine the current condition of the components. This baseline analysis shows any imbalances and tensions that are already occurring in these components, and which may be accentuated. In general, the characterization includes:

- historical issues (formation, presence of liabilities, among others);
- current diagnosis;
- tensions and pressures already existing on the components, when identified;
- future projects that could put pressure on the components, when identified.

## Determining the environmental consequences of cumulative impacts

Once the key issues have been defined and the situation of the selected environmental components has been characterized, the cause-and-effect relationships between the actions can be identified, i.e., how the CAS will react to the stimuli caused by the cumulative changes imposed by the project under analysis together with the other actions within a given timeframe.

**Figure 16 - Selected Environmental Component and its possible interactions**

*Elaboration: Consultancy, 2021*

It is important to establish a standard for determining the magnitude and significance of cumulative impacts in order to establish a ranking of consequences on the CAS, making it easier to propose forms of mitigation.

A valuable tool can be the overlay of maps on geographic information systems (GIS), which incorporate various spatial analysis tools that make it easier to understand the effects of environmental impacts on the land and their possible interrelationship with the CAS. This overlay can also be used to accumulate disturbances in zones, providing a more realistic picture for analysis.

There are various methods for assessing cumulative impacts, including participatory methods with local populations, methods in the form of checklists and matrices, as well as diagrams and decision networks.

Below are some methods that should/could be used (adapted from Dibo, 2018).

### **Analysis of carrying capacity and ecosystem**

The analysis of carrying capacity seeks to establish a threshold for environmental resources, providing mechanisms for monitoring them. It is a valuable tool in situations where projects are acting directly on biota, especially extractive projects, but it is also good for establishing monitoring tools for other activities.

In the case of ecosystem analysis, the approach explicitly targets the sustainability of biodiversity and ecosystems. The ecosystem approach uses natural boundaries (such as watersheds and ecoregions), where new ecological indicators (such as biotic integrity indices and landscape metrics analysis) are applied. Furthermore, ecosystem analysis implies a broad regional perspective and holistic thinking, which are necessary for a successful CTA in this method.

### **Economic impact analysis**

Economic impact analysis is an important component during CTAs because the economic well-being of a local community depends on several different actions that can act synergistically. The first steps in conducting an economic impact analysis are: (1) establishing the region of influence, (2) modeling the economic effects, and (3) determining the significance of the effects. Economic models play an important role in impact assessments and vary from simple to sophisticated models.

### **Social impact analysis**

Social impact analysis considers cumulative impacts related to the sustainability of human communities, focusing on (1) key social variables such as population characteristics, community and institutional structures, political and social resources, individual and family changes, and community resources, (2) projecting future effects using social analysis techniques such as linear trend projections, population multiplier methods, scenarios, expert testimony and simulation modeling.

### **Mitigation and Monitoring**

---

Once the environmental consequences of cumulative impacts have been determined, it is important to have procedures and tools to avoid, minimize or mitigate these impacts within the environmental components.

It is important to note that these procedures must always target the environmental components, since cumulative impacts of great importance in one component may be zero in another. This approach is necessary in order to avoid the development of extremely complex and expensive tools.

Finally, it is important to establish monitoring programs, where necessary and possible, for cumulative impacts, including a management vision for the Environmental Components and cumulative impacts.

### 5.2.3. Suggested Methodology and Concepts for Determining Disaster Risks

Risk and natural disaster management aims to provide the PROJECT with instruments to ensure better control and reduction of such risks. These instruments should prepare local authorities to prevent, mitigate and respond in the event of extreme events, reducing human losses and social and environmental damage.

To this end, we suggest adopting the measures set out in **Chapter 5.3 of the PGASE**.

The actions to be adopted in risk management for these areas should consider more detailed studies and monitoring that will be used as input for formulating the action plan. The procedures should follow the steps recommended in the IDB's Methodology for Assessing Environmental and Social Risks and Climate Change.

The procedure for a Disaster Risk and Climate Change Study follows these steps:

- Phase 1: Screening and classification
  - Step 1 - Exposure to threats: preliminary classification based on location and threat
    - Based on regional secondary data and georeferenced information from official research organizations.
    - It should also question the risks associated with the location of the development at a regional level, in a *top-down* assessment and respective risk classification of the associated hazard.
  - Step 2 - Criticality and vulnerability: classification based on the criticality of the hazard and the vulnerability of the environment
    - It involves the project's characteristics and vulnerability to natural hazards and the criticality of interrupting or canceling the project and its benefits, or even losses (material or human). Both in the construction phase and in the operation phase in three dimensions of analysis:
      - a) *Interruption of essential services*
      - b) *Impact on the population*
      - c) *Physical losses of the enterprise*
- Phase 2: Qualitative assessment
  - Step 3 - narrative: diagnosis and simplified qualitative risk assessment with preparation of draft risk management plan
    - This assessment must be based, at the very least, on the basic engineering project.
    - It must also consider an assessment of cumulative impacts
    - The draft risk management plan should include an outline of the communication mechanisms for emergency response
  - Step 4 - qualitative analysis: complete qualitative assessment and finalization of the risk management plan
    - In this step, a risk matrix should be developed based on surveys, discussions and forums with experts, technical visits, interpolated data maps with scenario forecasts, etc.
- Phase 3: Quantitative evaluation

- Step 5 - Quantitative risk assessment based on a scientific and technical study with primary surveys where necessary and detailing of the executive risk management plan
  - This step should be carried out with pre-implementation activities, which include activities such as topography, soil analysis, bathymetry, geotechnics, among other information that forms the basis of the quantitative risk assessment.
  - Developing the Executive Emergency Action Plan
  - Develop the maintenance program for structures associated with risk containment
  - Provide for the implementation of alternative structures to combat the disaster

Further details for the construction of the assessment study and management plan can be found in the Disaster and Climate Change Assessment Methodology for IDB Projects.

### Other concepts used

Below are some important concepts on the subject, as presented in Carvalho et al. (2007).

- **Risk:** The relationship between the possibility of a given process or phenomenon occurring and the magnitude of damage or social and/or economic consequences for a given element, group, or community. The greater the vulnerability, the greater the risk. It can also be expressed as the probability (P) of an accident occurring associated with a given danger or threat (A) that could result in consequences (C) harmful to people or property, due to the vulnerability (V) of the environment exposed to the danger and which can have its effects reduced by the degree of management (g) administered by public agents or the community, i.e.:

$$R = P (f A). C (f V). g^{-1}$$

- **Vulnerability:** Degree of loss for a given element, group, or community within a given area likely to be affected by a phenomenon or process.
- **Susceptibility:** Indicates the potential for natural and induced processes to occur in a given area, expressed according to classes of probability of occurrence.

As an example of risk classification, the CPRM methodology used in Brazil is described. The CPRM (2019) considered that "geological risk areas are inhabited areas likely to be affected by natural and/or induced processes that cause adverse effects, and the people who live there are subject to damage to physical integrity, material and property losses. Normally, these areas correspond to low-income housing estates (precarious settlements)".

The risk sectors in each area mapped by CPRM (2019) were delimited according to the classification criteria proposed by the IPT Technological Research Institute and the Ministry of Cities (IPT, 2004), which observes the evidence present in the mapped locations, with a hierarchy of risk degrees represented by four levels: low (R1), medium (R2), high (R3) and very high (R4).

**Table 5 - Classification of degrees of risk to mass movements (Modified from IPT, 2004)**

Degree of risk	Description of the evidence
----------------	-----------------------------

R1 Low	There is no evidence of destructive processes developing on slopes and drainage banks. Given the existing conditions, no destructive events are expected.
R2 Medium	There is some evidence of instability (slopes and drainage banks), but it is incipient. If the existing conditions are maintained, the possibility of destructive events occurring during episodes of intense and prolonged rainfall is reduced.
R3 High	The presence of significant evidence of instability (cracks in the soil, slumps in the slopes, etc.) can be observed. Given the existing conditions, it is perfectly possible for destructive events to occur during episodes of intense and prolonged rainfall.
R4 Very high	Evidence of instability (cracks in the soil, slumps on slopes, cracks in houses or retaining walls, leaning trees or poles, slip scars, erosive features, proximity of the house to the stream, etc.) is significant and present in large numbers and/or magnitude. Given the existing conditions, destructive events are very likely to occur during episodes of prolonged rainfall.

**Table 6 - Classification of the degrees of risk to hydrological processes (flooding) (Modified from IPT, 2004).**

Degree of risk	Description of the evidence
R1 Low	Drainage or drainage compartments subject to processes with low potential to cause damage. Low frequency of occurrence (no records of occurrences in the last five years).
R2 Medium	Drainage or drainage compartments subject to processes with medium potential to cause damage. Medium frequency of occurrence (record of one significant occurrence in the last five years).
R3 High	Drainage or drainage compartments subject to processes with a high potential to cause damage. Medium frequency of occurrence (record of a significant occurrence in the last five years) and involving highly vulnerable housing.
R4 Very high	Drainage or drainage compartments subject to processes with a high potential to cause damage. High frequency of occurrence (at least three significant events in five years) and involving dwellings with high vulnerability.

### **Suggested Methodology for Qualitative Risk Assessment**

The methodology presented below is a guide to developing qualitative risk assessments and thus being able to identify information gaps that should be investigated in greater depth.

## **Risk matrices**

A risk matrix consists of a matrix with classes of risk frequency and severity (or consequences), each on an axis. Risk matrices can be constructed using qualitative or semi-quantitative categories or thresholds.

The steps to follow this approach include (FEMA, 1997):

### **(1) Identify and characterize relevant threats, including their severity, and interrelationships with other threats.**

The first step involves defining categories for the matrix, for example: Frequency or Probability vs. Severity.

To define the frequency categories, it is first necessary to define the number of categories required (for example, four categories that define a very low, low, moderate and high frequency), and optionally define the thresholds that will define each category (for example, very low: less than once every 1,000 years, low: between once in 100 years and once in 1,000 years, moderate: between once in 10 years and once in 100 years, and high: more than once in 10 years). The following table shows an example of defining criteria for assessing the probability of a threat occurring. The case occurrence limits must be adjusted to each type of threat.

**Table 7 - Criteria for assessing the likelihood of the threat occurring**

PROBABILITY	OCCURRENCE OF CASES
Frequent	1 occurrence in up to 5 years
Moderate	1 occurrence between 5 and 20 years
Bass	1 occurrence in more than 20 years

To define the severity categories, it is necessary to consider which types of impacts are most appropriate for the project under study, such as material damage, economic interruptions, environmental impacts, fatalities, and/or injuries, and again optionally define specific limits for each category (FEMA, 1997). The following table shows an example of defining criteria for assessing severity in terms of consequences or impacts. The criteria categories can be adjusted (included or excluded) based on the specific project context.

**Table 8 - Consequence assessment scale**

CRITERIA/ CONSEQUENCE	INSIGNIFICANT OR LOW	CRITICS	CATASTROPHIC
	1	2	3
Economic	Marginal	Review	Catastrophic
Damage to people	Marginal	Review	Catastrophic
Environmental impact	Marginal	Review	Catastrophic
Image of the institution	Marginal	Review	Catastrophic

The definition of each scale defined for each criterion or consequence in the example is shown in the following table.

**Table 9 - Definition of rating scales for consequences**

APPEAL IN QUESTION	GRAVITY	DEFINITION
Economic	Insignificant or Low	Economic losses up to US\$100,000.00

	Review	Economic losses up to US\$5,000,000.00
	Catastrophic	Economic losses exceeding US\$5,000,000.00
Damage to people	Insignificant or Low	Minor injury, may occur Temporary disability > 1 day
	Review	Permanent disability
	Catastrophic	1 or more deaths
Environmental impact	Insignificant or Low	Localized effects
	Review	Great effects
	Catastrophic	Irreparable damage
Image of the institution	Insignificant or Low	Location
	Review	National
	Catastrophic	International

**(2) Estimate the risk of each identified threat based on the relative degree of risk obtained from the matrix and order these risks.**

Risk is obtained from the product of threat and vulnerability. For this purpose, the following expression should be used:

$$R=A \times V$$

When R is the risk, A is the threat in terms of frequency or probability, and V is the vulnerability measured by the severity criterion.

**Table 10 - Probability and consequence risk matrix product**

PROBABILITY (A)		CONSEQUENCE (V)		
		Insignificant	Critical	Catastrophic
		1	2	3
Frequent	3	3	6	9
Moderate	2	2	4	6
Bass	1	1	2	3

**(3) Assess the acceptability of these risk levels to determine whether they are tolerable or not.**

The results obtained from the risk matrix are then categorized to define the levels of risk acceptability, as well as the actions that should be formulated to prevent and mitigate them.

**Table 11 - Levels of risk, acceptability, and actions to be implemented**

RISK ACCORDING TO MATRIX	RISK LEVEL	RISK ACCEPTABILITY	ACTIONS TO BE IMPLEMENTED
1 a 2	LOW	Acceptable	No plan necessary
3	MODERATE	Tolerable	Designing a general response
Above 3	HIGH	Unacceptable	It always requires the preparation of a detailed response to contingencies and requires the investment of resources

**(4) Carry out simulations and tests on the risk matrix with the implementation of risk mitigation measures that can bring the risk down to tolerable levels.**

The actions formulated to prevent or mitigate risks can also be assessed using the risk matrix, in order to determine the reduction in the levels of exposure or vulnerability of the infrastructure and socio-environmental systems in the area of influence.

**(5) Monitor and review risks periodically using the matrix.**

This matrix is not a static document; both threat and vulnerability conditions can vary during the life cycle of projects. Therefore, the matrix is a useful tool for tracking and monitoring the risks identified in the preliminary phases, identifying new risks during the construction and operation phases, or reclassifying risks based on the availability of new information.

As the CHARIM (*Caribbean Handbook on Risk Information Management*) project (Haimes, 2008; van Westen, n.d.) makes clear, this method allows for more flexibility and the incorporation of expert opinion. It also offers a way of visualizing the effects and consequences of risk reduction measures. It also becomes a good communication tool because it helps the non-expert public to understand a risk assessment more easily. It is important to note that the results will largely depend on the experts involved in the process of creating the matrix. It is therefore very important to select the group that will inform the process, including the identification of threat scenarios, the classification characterized by frequency (probability) and impact classes and their corresponding limits.

## **6. EMERGENCY RESPONSE PREPAREDNESS**

Emergency response preparedness should involve instruments that help predict emergency situations, prevent emergency situations, mitigate, and respond to emergency situations and monitor them continuously.

To this end, the provisions of **Chapter 5.3 of the PGASE** drawn up as part of the preparation of PROCASE II must be applied.

## **7. STAKEHOLDER ENGAGEMENT AND COMPLAINTS MANAGEMENT**

In the process of drawing up the Engagement Plan for each Project in the Program, a meeting should be held with the communities on the scope of the Project before the works begin, in accordance with the recommendations of the PDAS10, part of the IDB's Environmental and Social Policy Framework.

It is important to note that the procedures presented, as well as the entire Stakeholder Engagement process to be carried out within the scope of PROCASE II, must follow the guidelines and recommendations contained in item Significant Consultations of the PDAS10.

The guidelines relating to the stakeholder engagement process and grievance management are detailed in **Chapter 5.7 of the PROCASE II ESMP**.

## **8. MONITORING AND EVALUATION**

Monitoring refers to the continuous and systematic collection of data and aims to provide timely information on the progress of an initiative, mainly supporting management. It is also understood as a regular activity to monitor key processes in the intervention logic and is capable of producing information that allows or enables a rapid assessment of the

program or project's situation, as well as the identification of necessary and relevant corrective actions (Nogueira, 2002<sup>16</sup>, Jannuzzi, 2016<sup>17</sup>).

Evaluation, on the other hand, also refers to systematic and methodologically rigorous processes for collecting and analyzing data, but it is aimed at making judgments about the value or merit of an intervention that aims to change a social reality. This is the fundamental difference with audits. Audits have the role of verifying compliance with norms and standards.

Therefore, although they are close and there is a possible feedback relationship, they are three different processes.

The PMU should monitor the environmental and social performance of projects. The degree and manner of monitoring will be proportionate to the nature of the project, its social and environmental risks and impacts, and compliance requirements.

Where appropriate, the PMU may promote the involvement of stakeholders and third parties, such as independent experts, local communities, or NGOs, to complement or verify its own monitoring activities.

In general, monitoring will include recording information to track performance and establishing relevant operational controls to verify compliance and progress in meeting the requirements established in this ESMS for the project.

Based on the results of the monitoring, the PMU will identify any necessary corrective and preventive actions, which should be incorporated into the ESMP. The PMU will implement the agreed corrective and preventive actions, in accordance with the modified ESMP or the relevant management instrument and will monitor and disclose these actions.

The PMU will facilitate access and visits to the project site for IDB staff or consultants representing the IDB. The PMU will notify the IDB immediately of any incident or accident related to the project that has, or may have, a significant adverse effect on the environment, affected communities, the public or workers. The notification shall provide sufficient details of the incident or accident, including deaths and serious injuries. The PMU shall immediately take measures to resolve the incident or accident and prevent any recurrence, in accordance with national legislation and the PDAS.

Monitoring will be aimed at the timely follow-up of PGAS measures, since it is essential that their progress and bottlenecks are clearly identified and controlled in order for them to run smoothly. To this end, quantitative indicators will be established, covering the process of implementing the actions, verifying the effectiveness, efficiency, and efficacy of the actions, as well as qualitative ones that include, for example, satisfaction with the processes and assistance received, clarity of the information provided, among others.

Responsibility for the monitoring process will be shared between the PMU Coordination teams, including:

- Preparation of data collection instruments;
- Data collection with the Environmental and Social Supervision;
- Data systematization and analysis;
- Periodic reporting to the Coordination and jointly defining corrective actions.

<sup>17</sup> JANNUZZI, Paulo de Martino. Monitoring and Evaluation of Social Programs: an introduction to concepts and techniques. Campinas, SP: Editora Alínea, 2016.

## Monitoring and Evaluation Indicators

In this section we present the initial proposal of indicators that will be observed through the monitoring and evaluation of the ESMP mitigation programs. These indicators may be revised and/or supplemented as the activities progress.

According to Jannuzzi (2016), each program or public policy requires its own monitoring system, specific to its design and management model. In general, the author indicates the following basic elements that should make up a monitoring information system: (i) the program narrative<sup>18</sup>, (ii) key process indicators; (iii) monitoring indicators; and (iv) data sources.

Indicators are the fundamental information for defining monitoring strategies. Adequate monitoring indicators are those that make it possible to "film" the process of implementing programs and their efficiency, the development of activities, the delivery of products or the general effects triggered by the Program. According to Jannuzzi (2016) "*ideally, monitoring indicators should not only be relevant to the program's critical processes, but should also be timely in terms of the decision needed, modest in terms of cost and operational effort, potentially sensitive to the program and specific to the actions and activities inherent to it*" (JANNUZZI, 2016, p.117).

Below are the main indicators that will be addressed in monitoring. Basically, quantitative indicators are proposed which should be monitored on a monthly basis by recording and controlling activities and their results. Specific instruments will be developed and implemented to carry out the monitoring, as well as creating a database (a simple, easy-to-use system) to consolidate and extract the data.

**Table 12 - Monitoring and Evaluation Indicators**

Environmental and Social Program	Indicators	Target	Source of information
Stakeholder engagement	- Number of participants in community consultations and meetings - Number of institutions that provided input to consultations	- Increase the percentage of participants in the Stakeholder Matrix - Increase the percentage of female participants	Social and Environmental Management of the PMU  EMPAER/TA  Regional Offices - RPMU
Complaints management mechanism	- Number of complaints by type - Service deadline Number of complaints with pending resolution	- reduce the number of unresolved complaints - Reduction in the average monthly number of complaints over time	Social and Environmental Management of the PMU  EMPAER/TA  Regional Offices - RPMU
Environmental and health education	- Number of participants in environmental and health education actions; - Number of community actions	- 4 project-oriented actions per year	Social and Environmental Management of the PMU  EMPAER/TA  Regional Offices - RPMU
Waste management	- Volume of waste generated - Volume of waste going to landfill	- Reduction in the percentage of waste going to landfill.	Social and Environmental Management of the PMU  EMPAER/TA  Regional Offices - RPMU

<sup>18</sup> The author uses the concept of a Map of Processes and Results (MaPR) defined as "a *synthetic narrative of how the program works, its operating context, how its various components-inputs, processes and products-are aligned to produce the desired results and social impact, and the conditions for this to be achieved*" (Jannuzzi, 2016, p.20).

Environmental and Social Program	Indicators	Target	Source of information
Mitigation of temporary social and economic impacts	- Number of parties affected by temporary impacts of the work or project	- Reduction in the number of parts affected by temporary impacts	Social and Environmental Management of the PMU EMPAER/TA Regional Offices - RPMU
Preservation of cultural heritage (where applicable in accordance with the project's ESIA and ESMP)	- Number of cultural sites affected/rescued - Number of cultural sites destroyed by activities	- 100% of identified sites rescued	Social and Environmental Management of the PMU EMPAER/TA Regional Offices - RPMU
Contingency and risk reduction	- Number of emergencies - Response time	- reducing the number of emergency situations - reduction in the average response time	Social and Environmental Management of the PMU EMPAER/TA Regional Offices - RPMU
Environmental and Social Control of Works (when civil works are involved in the project)	- Number of non-conformities (by type)	- Reduction in the number of non-conformities	Social and Environmental Management of the PMU EMPAER/TA Regional Offices - RPMU
Hiring labor	- Number of local workers hired - Number of women hired	- increase in the number of local workers hired - increase in the number of women hired	Social and Environmental Management of the PMU EMPAER/TA Regional Offices - RPMU
training and awareness	- Number of workers trained	- 100% of workers trained	Social and Environmental Management of the PMU EMPAER/TA Regional Offices - RPMU
Code of conduct	- Number of complaints of embarrassment, harassment or racial / cultural or gender-based slurs with workers who were successful - Number of DDSs addressing the topic of conduct with employees	- reduction in the number of successful complaints of embarrassment, harassment or racial/cultural or gender-based insults against workers - 1 DDS per month on the subject of the code of conduct	Social and Environmental Management of the PMU EMPAER/TA Regional Offices - RPMU
Occupational health and safety	- Number of days without an accident at work - Number of accidents with fatalities - Average number of days off work due to health and occupational problems	- Increase in the number of days without an accident at work - Zero fatal accidents - Reduction in the average number of days off work	Social and Environmental Management of the PMU EMPAER/TA Regional Offices - RPMU
Control and inspection of suppliers	- Primary chain supplier evaluation form	- increase the score of the performance evaluation of suppliers in the primary chain	Social and Environmental Management of the PMU EMPAER/TA Regional Offices - RPMU

Environmental and Social Program	Indicators	Target	Source of information
Implementation, operation and closure of construction sites and support areas (when civil works are involved in the project)	- According to the Environmental and Social Control of Works indicators	- According to the Environmental and Social Control targets for the works	Social and Environmental Management of the PMU EMPAER/TA Regional Offices - RPMU
Erosion control	- According to the Environmental and Social Control of Works indicators	- According to the Environmental and Social Control targets for the works	Social and Environmental Management of the PMU EMPAER/TA Regional Offices - RPMU
Protection of legally protected areas	- Legally protected areas affected by the works - Compensation area - Recovered area	- Biodiversity net profit (compensated or recovered area/affected area > 1)	Social and Environmental Management of the PMU EMPAER/TA Regional Offices - RPMU
Reducing and mitigating community discontent	- According to the Environmental and Social Control of Works indicators - According to the indicators of the Complaints Management Mechanism	- According to the Environmental and Social Control targets for the works - According to the goals of the Complaints Management Mechanism	Social and Environmental Management of the PMU EMPAER/TA Regional Offices - RPMU

### Critical Evaluation by the PMU

The instructions and procedures defined in this ESMS applied to the main characteristics of the works and operation of the projects must be monitored and followed up by means of internal reports fed by: environmental supervision reports for the works and environmental monitoring reports for the operation, which include procedures for verifying compliance with environmental legislation.

Every twelve months, the PMU will carry out a critical assessment of the Environmental and Social Management System to verify the system's suitability, its effectiveness in controlling environmental impacts and achieving the performance indicators for the activities set out in the Environmental and Social Management Plan and Framework, and its effectiveness in achieving the Objectives and Targets established herein.

It is recommended that these meetings be held before the start of the fiscal year or when new projects are planned. It is important that the Monitoring considers the results of the Supervision work.

### Auditing

The aim of the audit is to identify significant environmental and social issues of the project or existing activities, and to assess their current status, specifically with regard to compliance with the requirements of the PDAS.

The indicative description of the audit involves:

- (a) Executive Summary: Concisely address important conclusions and set out recommended measures, actions, and deadlines.
- (b) Legal and Institutional Framework: Analyze the legal and institutional framework for the existing project or activities, including the issues listed in PDAS1;

- (c) Project Description
  - Concisely describe the existing project or activities, as well as its environmental, social, geographical and temporal context, and any associated facilities.
  - Identify the existence of any plans already developed to address specific environmental and social impacts and risks (e.g. land acquisition or resettlement plan, cultural heritage plan, biodiversity plan).
  - Include a detailed map showing the site of the existing project or activities and the proposed site of the project in question.
- (d) Environmental and social issues associated with the project: The analysis will consider the main risks and impacts of the project determined in the ESIA. In addition, the audit will analyze issues not covered by the PDAS, insofar as they represent important risks and impacts in the context of the project.
- (e) Environmental and Social Analysis: The audit will also evaluate
  - (i) the possible impacts of the proposed project (considering the audit findings concerning the project or existing activities); and
  - (ii) the ability of the proposed project to meet the requirements of the PDAS.
- (f) Proposed Environmental and Social Measures: Based on the audit findings, this section will define proposed measures for aligning conduct. These measures will be included in the ESMP for the proposed project.

The measures usually covered in the audit include:

- specific actions necessary to comply with the requirements of the PDAS;
- measures and corrective actions to mitigate the potentially significant environmental and/or social risks and impacts of the project or existing activities;
- measures to avoid or mitigate the possible risks and negative socio-environmental impacts of the proposed project.

The minimum periodicity of the audit will be annual, with the possibility of it being carried out by an internal team, from an independent department of the PMU or of the Paraíba State Government that adds this function. External audits may be contracted to evaluate a sample to be determined for larger projects.

## 9. ENVIRONMENTAL AND SOCIAL PROGRAMS

The Mitigation Measures for the impacts identified as relevant or subject to Mitigation/Compensation for the sub-projects are detailed in the respective PROCASE II ESMP. This describes the measures and procedures to be adopted to avoid, minimize, and compensate for environmental damage to the physical, biotic, and socio-economic environments.

The following table summarizes all the measures defined in the PGASE.

**Table 13 -Environmental and Social Programs**

	Plan / Program	Sub-projects	Target audience and responsible parties
1.	Screening, classification, and project scope	All Subprojects	Responsible: PMU and TA
2.	Monitoring and evaluation	All Subprojects	Responsible: PMU and TA, some indicators could be catalogued by construction companies.

	Plan / Program	Sub-projects	Target audience and responsible parties
3.	Disaster and Climate Change Risk Management Plan	All Subprojects (can be drawn up by set of actions for PROCASE II)	Responsible: PMU, TA and related government bodies/institutions. Target audience: all actors and stakeholders
4.	Waste Management Program for the implementation of structures and production processes	Sub-projects involving: - Food processing/production that generates packaging and waste - Civil works	Responsible: (i) PMU, TA, construction companies; (ii) rural producer for end activity waste.
5.	WTA and Effluent Quality Monitoring and Control Program	Sub-projects involving: - Sanitary sewage and water reuse structures - Civil works	Responsible: PMU, TA and construction companies
6.	Biodiversity management, protection, and restoration plan	Sub-projects that are within or in the immediate vicinity (up to 2km) of a Fully Protected Conservation Unit, APP or Critical Habitat	Responsible: (i) PMU, TA; (ii) rural producers to prevent the spread of unwanted species and support monitoring
7.	Stakeholder Communication, Consultation and Engagement Program and MQR	All Subprojects	Responsible: PMU and TA Target audience: all actors and stakeholders
8.	Environmental and Health Education Program	All Subprojects	Responsible: PMU and TA Target audience: rural producers
9.	Plan for energy efficiency and sustainable sources for energy generation in projects and facilities	Sub-projects involving building structures or machinery/equipment for production	Responsible: PMU and TA Target audience: farmers and construction companies
10.	Contaminating Products Management and Control Plan	Sub-projects involving: - Sanitation structures that require the handling of chemical products in treatment; - Production processes that could generate contaminating waste or encourage the use of non-permitted products	Responsible: PMU and TA Target audience: rural producers
11.	Traffic Program	All sub-projects with actions specifically aimed at the implementation team (PMU, TA, construction company)	Responsible: PMU, TA and construction company Target audience: workers from the PMU, TA and the construction company
12.	Labor Management Plan	All sub-projects with differentiated actions for the implementation team (PMU, TA, construction company) and rural producers	Responsible: (i) PMU, TA and construction company; (ii) rural producer, with specific measures Target audience: all workers involved in the project
13.	Program to Control and Mitigate Temporary Social and Economic Impacts	Sub-projects involving civil works	Responsible: PMU, TA and construction company Target audience: benefited and/or affected communities
14.	Gender Violence Prevention and Care Program	All Subprojects	Responsible: PMU, TA and construction company Target audience: all actors and stakeholders
15.	Program to Mitigate Impacts on Traditional Communities	Sub-projects implemented in traditional communities	Responsible: PMU and TA Target audience: Protection agencies, benefited and/or affected traditional communities

	Plan / Program	Sub-projects	Target audience and responsible parties
16.	Vector, Disease and Pest Control Program	All sub-projects involving: - Civil works; - Sanitation structures - Agriculture and livestock systems that may suffer or influence the dispersal of vectors	Responsible: PMU, TA and construction company Target audience: benefited and/or affected communities
17.	Cultural Heritage and Fortuitous Finds Protection Program	Sub-projects involving social technologies associated with stone tanks or activities requiring excavation in the region of high paleontological potential For all sub-projects, fortuitous finding actions should be applied	Responsible: PMU and TA Target audience: Heritage protection bodies, the community and project workers.

## 10. ENVIRONMENTAL AND SOCIAL SUPERVISION OF SUB-PROJECTS

The Environmental and Social Supervision of the Subprojects<sup>19</sup> includes activities to monitor and supervise the construction work fronts, in order to check that the measures and procedures aimed at preventing, controlling, and correcting environmental and social impacts have been effectively adopted:

- Accompanying the studies and environmental licensing of the planned interventions and support facilities (construction sites, work fronts, surplus material deposits, borrow areas, etc.), where applicable;
- Systematic monitoring of the implementation of sub-projects, checking compliance with socio-environmental specifications, the occurrence of impacts and the adoption of measures to prevent/control/mitigate impacts;
- Monitoring activities that generate solid and liquid waste, especially polluting, oily, chemical, and flammable products.
- Monitoring the proper handling of waste found, including soil during excavation work;
- Drawing up monthly reports recording environmental and social incidents and evaluating the performance of the construction company or contractors in meeting social and environmental requirements;
- Monitoring the decommissioning of support facilities and the recovery of used areas;
- Preparation of the Socio-Environmental Closure Report, recording compliance with all the requirements of the environmental licenses and IDB and IFAD policies and safeguards;

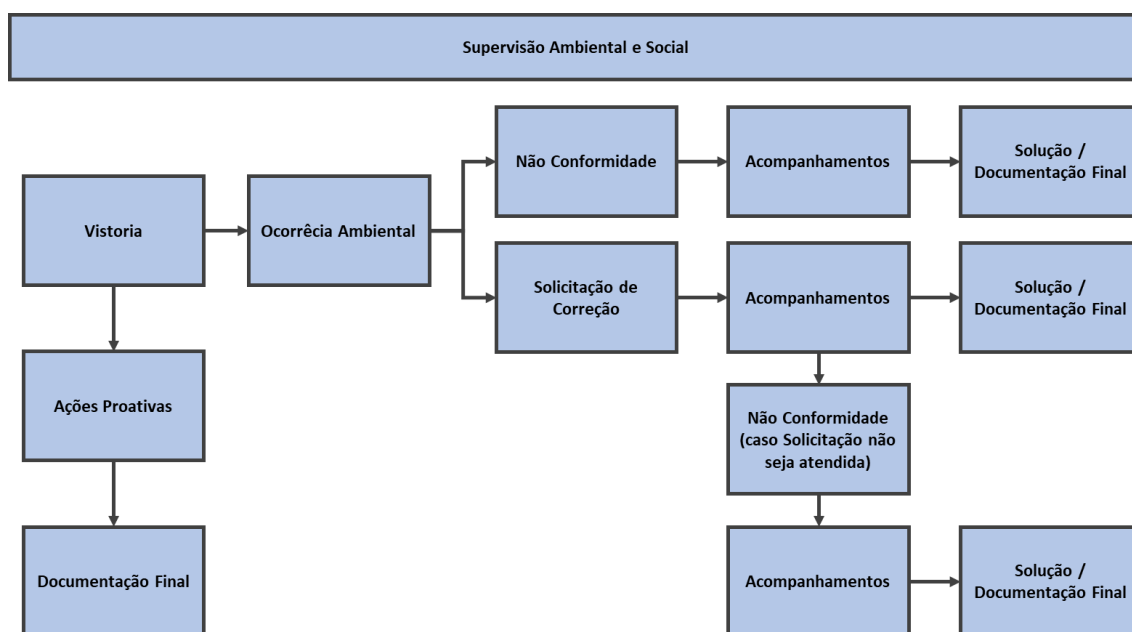

Environmental and Social Supervision will follow the guidelines and procedures set out in the ESMS, based on the management procedures presented in this chapter and the definitions of specific forms and tools, as well as the details of the actions to be carried out.

Environmental and Social Supervision will be responsible for consolidating the materials, information, records, documents, and surveys to be incorporated into the Environmental and Social Management Report<sup>20</sup>. The flowchart of the Supervision's actions is presented below:

<sup>19</sup> Each sub-project will present its respective environmental and social aspects that will be subject to environmental and social supervision, in accordance with the respective ESIA/SIA and ESMP.

<sup>20</sup> Internal monthly reports, and half-yearly and annual summaries to be provided to the IDB/IFAD.

**Figure 17 - General flowchart of Environmental and Social Supervision**

Elaboration: Consultancy, 2021

Environmental and Social Supervision must be carried out continuously and systematically on the construction sites and during the implementation of the Investment Plans, starting simultaneously with the process of setting up the construction site and being maintained throughout the implementation phase and afterwards, in order to check for residual impacts and environmental and social measures that are still being implemented.

In order to carry out this process, the minimum frequency of environmental and social inspections to be carried out must be defined, with no less than one inspection every thirty days.

It is recommended that the Environmental and Social Supervision has at least the following documents:

- Inspection report (*checklist*);
- Correction Request Document;
- Social and Environmental Non-Compliance Document;
- Environmental and Social Supervision Report that presents the inspections, the correction requests and their follow-up/solution and the non-conformities issued and their follow-up/solution.

### **Procedures for Environmental and Social Supervision of Subprojects**

The procedures for Environmental and Social Supervision should provide clear and concise documentation of how the Supervision should act, what and how it should be observed, indications of problems and documentation to be drawn up. Among the issues that should have specific procedures are the following:

- Planning and Execution of Works and Production Systems;
- Procedures for the Implementation, Operation and Demobilization of Construction Sites and Support Areas;

- Implementation of Support Structures - Service Roads, Batching, Borrowing Areas, etc.
- Inspection of construction sites, construction sites and other support areas;
- Inspection of the Productive Systems areas;
- Workers' Health and Safety Inspection
- Inspection of sanitary and comfort conditions;
- Checking Fire Fighting Systems;
- Socio-environmental Control of Works and Production Systems
- Material Control of Works and Production Systems
- Vegetation Protection and Tree Suppression;
- Fauna protection;
- Site signage;
- Archaeological monitoring and preservation of cultural heritage;
- Control of Erosive Processes and Siltation;
- Waste Management Procedures;

The Socio-environmental Supervision procedures should be based on the standardization set out in this ESMS, but it is important that they are updated by the Supervision team so that they adhere to the specific issues of the sub-projects and the environmental conditions set out in environmental licenses and other requirements that may fall upon the sub-projects.

These are suggestions for incorporation into supervisory procedures:

- The process also includes checking compliance with the aspects mentioned in the IFC's Occupational Health and Safety (OHS) Guidance,
- Procedures for the control and inspection of suppliers in the primary supply chain;
- Transmission of the established minimum guidelines to suppliers and contractors;
- Continuous review and improvement of procedures as new approaches prove necessary.

## **Inspection reports**

---

The Inspection Report - the result of the Environmental and Social Supervision team's inspection - should be based on a *checklist* that will facilitate the inspection process, optimizing actions and reducing time in the field. The *checklist* may be expanded by the Environmental and Social Supervision team to include issues not originally foreseen, and it is up to the environmental and social management of the ESMS to identify and incorporate recurring suggestions that are pertinent and justified.

The flow of the supervision procedure will be carried out under the guidance of Socio-environmental Management for Environmental and Social Supervision, using a checklist (VL) as a recording tool that will guide the checking of conformities and non-conformities. The result of the application of the VL may result in: (i) "Environmental and Social Compliance" which approves the inspection; (ii) "Exceptional Clearance" with the identification of low-risk failures; and (iii) "Environmental and Social Non-Compliance" with the identification of inadequate actions and medium and high-risk impacts.

The figure in Annex 11.3 a model for the Checklist (VL) suggested for carrying out the inspection and subsequently drawing up the report. It is important that each item identified as inadequate has a specific request, which can be a Correction Request (Low Risk<sup>21</sup>) or an Environmental Non-Compliance (Medium Risk<sup>22</sup> or High Risk<sup>23</sup>).

### **Correction Requests**

---

During Environmental and Social Supervision, the faults identified (Low and Moderate Risk) must be dealt with by issuing a Request for Correction document. The purpose of this document is to provide guidance, including not only the identification of the problem, but also an explanation - albeit brief - of the actions that must be taken by the companies and teams involved in the works. These actions will always be based on the environmental and social management documents and/or those drawn up by the Environmental and Social Supervision itself, as well as environmental licensing conditions or other socio-environmental requirements.

This is an important procedure so that companies have the opportunity to correct any deviations in procedures and resolve problems. It also generates socio-environmental awareness and helps the teams involved in implementing the sub-project to foresee and avoid other failures.

The figure in Annex 11.3 shows the correction request form.

### **Social and Environmental Non-Conformities**

---

Socio-environmental Non-Compliance must be issued if impacts are identified as a result of the problems identified as high or medium risk. Medium Risk is when an item poses a risk to human health, loss of assets or may cause a reversible impact on the environment; High Risk is when an item poses a direct or imminent risk to human health and life, loss of assets or irreparable or serious destruction of the environment.

Non-Conformities must be oriented and punitive. The latter should be associated with the measurements of the companies involved in the non-conformity. It is therefore essential that these procedures are duly described and made clear during the contracting processes and in the contracts of the companies providing the services, and that they are included in the Terms of Reference.

The figure in the Annex 11.3 shows the model Non-Conformity Notice.

### **Accompaniments**

---

Once the Requests for Corrections and/or Socio-Environmental Non-Conformities have been issued, Supervision must monitor compliance. To this end, visits must be scheduled, which may or may not take place in conjunction with the Social and Environmental Surveys (depending on the deadlines for compliance).

For each visit, a follow-up form must be filled in, according to the model in the Annex 11.3.

---

<sup>21</sup> Low Risk is characterized by those that do not pose a direct and significant threat to humans or the environment.

<sup>22</sup> Medium risk is risk to human health, loss of assets or a reversible impact on the environment.

<sup>23</sup> High Risk is when an item poses direct imminent harm or risk to human health and life, loss of assets or irreparable or serious destruction of the environment.

## 11. ANNEXES

## 11.1. Annex - Other relevant international agreements

### **Agreement Establishing the Inter-American Institute for Global Change Research (Minutes of Montevideo)**

---

The Constitutive Agreement of the Inter-American Institute for Global Change Research, also known as the Montevideo Act, the fruit of the idea that emerged at the 1990 White House Conference on Scientific and Economic Research on Global Change, aims to guarantee the exchange of scientific information on the study of global climate change.

The agreement aims to create a regional network of institutions linked to scientific research, which will be called the "Institute". The aim of the Institute is to foster cooperation between countries studying climate change, allowing for the exchange of information and thus ensuring a more comprehensive understanding of the transformations that planet Earth is undergoing.

Its nineteen members agreed on the following guidelines: (a) promotion of cooperation in scientific studies to better understand the problem and propose solutions; (b) encouragement of scientific programs and projects to find solutions; (c) implementation of technical and scientific training, as well as promotion of structural possibilities for research; (d) making the information obtained from research available to society, governments and businesspeople, with the aim of enabling plans for climate change; (e) obligation to enable the free movement of people accredited to carry out scientific studies in the territories of the States Parties.

In Brazil, climate studies are carried out by INPE - the National Institute for Space Research - the technical and scientific body responsible for studying the subject of the international document in question. It should be noted that there is no control or implementation mechanism or reports on the problem.

### **Mercosur Environment Agreement**

---

In 2001, Brazil, Argentina, Paraguay, and Uruguay signed the Mercosur Framework Agreement on the Environment, also known as the Mercosur Common Environmental Agenda. It came into force on September 17, 2004, via decree 5208, with the aim of establishing common guidelines for environmental preservation and sustainable development.

In order to achieve the goal of environmental preservation, the signatory countries agreed as follows: (a) using natural resources in the most efficient way possible, basing policies on principles of gradualness, flexibility and balance; (b) all environmental policies should be unified in order to strengthen the measures to be implemented; (c) focusing on sustainable development through cooperation between the States Parties; (d) prioritizing the causes of environmental problems as the focus of protectionist policies; (e) collecting and exchanging information about the environment; (f) encouraging environmental management policies; (g) standardizing environmental standards, taking into account the different geographical environments; (h) finding sources of funding for a sustainable environmental policy; (i) promoting policies for the sustainable development of labor, making the necessary preservation compatible with economic progress; (j) encouraging environmentally friendly production processes, services and activities; (k) promoting clean technological progress; (l) providing information on disasters affecting the States Parties; (m) promoting environmental education; (n) maintaining the cultural aspects of the local population whenever possible when carrying out public preservation initiatives.

Environmental issues are dealt with by two discussion forums: one technical - the Sub-Working Group No. 6 (SGT-6); and the other political - the Meeting of MERCOSUR Environment Ministers (RMMAM).

The main objective of SGT-6 is to formulate and propose strategies and guidelines that guarantee the protection and integrity of the environment of the States Parties in a context of free trade and consolidation of the customs union, while ensuring equal conditions of competitiveness. The Ministry of the Environment participates as the national coordinator of this Subgroup.

RMMAM is the MERCOSUR body responsible for dealing with politically sensitive environmental issues, which cannot always be discussed within the framework of the Sub-Working Group. Currently, SGT-6 and RMMAM are working to strengthen the environmental perspective in the other MERCOSUR bodies, following up on various projects and identifying priority technical and political issues in order to make the agenda more effective.

### **UNESCO Convention for the Safeguarding of the Intangible Cultural Heritage**

Ratified by Brazil in March 2006.

On October 17, 2003, during the 32nd General Conference of the United Nations Educational, Scientific and Cultural Organization (UNESCO), the Convention for the Safeguarding of the Intangible Cultural Heritage was approved. This Convention entered into force on April 20, 2006. The 2003 Convention has several objectives:

- (a) safeguarding intangible cultural heritage;
- (b) respect for the intangible cultural heritage of the communities, groups and individuals involved;
- (c) raising awareness at local, national, and international level of the importance of intangible cultural heritage and its mutual appreciation;
- (d) international cooperation and assistance.

Claiming to be an instrument that promotes intangible cultural heritage, the main generator of cultural diversity and the guarantor of sustainable development, the 2003 Convention aims to fill a gap in the legal system for the international protection of cultural heritage, whose instruments, until now, did not consider intangible cultural heritage, but only tangible, movable and immovable cultural heritage, so that intangible cultural expressions could not be safeguarded through the international legal instruments that existed at the time.

According to the Convention, intangible cultural heritage is defined as "(...) the practices, representations, expressions, knowledge and skills - as well as the instruments, objects, artefacts and cultural spaces associated with them - which communities, groups and, where appropriate, individuals recognize as forming an integral part of their cultural heritage. This intangible cultural heritage, passed down from generation to generation, is constantly recreated by communities and groups according to their environment, their interaction with nature and their history, instilling in them a sense of identity and continuity, thus contributing to the promotion of respect for cultural diversity and human creativity" (Article 2).

It is therefore this intangible cultural heritage that the 2003 Convention aims to safeguard, providing, among other measures, for each State Party to draw up inventories of this heritage.

## **UN Declaration on the Rights of Indigenous Peoples - UNDRIP (2007)**

---

Brazil's intention, as one of the signatories to the UNDRIP (2007), is to recognize indigenous peoples and traditional communities as a group distinct from the rest of its population and to create a legal framework to protect the rights of this group. The basis of this treaty focuses on interrelated areas:

- Indigenous peoples (traditional communities) are clearly a separate group from mainstream society with their own customs and beliefs. This includes collective and individual rights.
- The right to self-determination: indigenous peoples and (traditional communities) have the right to freely determine their political status and freely pursue their economic, social, and cultural development.
- Free, prior, and informed consent (FPIC). Allows indigenous peoples and traditional communities to give or withhold consent from a project that may affect them or their territories. Once they have given their consent, they can withdraw it at any stage. In addition, FPIC allows them to negotiate the conditions under which the project will be designed, implemented, monitored and evaluated.

## **OAS American Declaration on the Rights of Indigenous Peoples**

---

The American Declaration on the Rights of Indigenous Peoples (DADPI), approved by the General Assembly of the Organization of American States (OAS), is the first instrument in the history of the OAS to promote and protect the rights of indigenous peoples in the Americas. It was approved by acclamation by the Member States on June 15, 2016, in Santo Domingo, the capital of the Dominican Republic.

The member states of the Organization of American States (OAS) recall that the indigenous peoples of the Americas constitute an organized, differentiated, and integral segment of their population and have the right to be part of the national identity of the countries, with a special role in strengthening state institutions and achieving national unity based on democratic principles. It also recalls that some of the democratic concepts and institutions enshrined in the constitutions of the American states have their origins in indigenous peoples' institutions and that many of their current participatory systems of decision-making and authority contribute to the improvement of democracies in the Americas, and that it is necessary to develop national legal contexts to consolidate the multiculturalism of these societies.

The declaration raises issues involving the eradication of poverty and the right to development, respect for indigenous cultural and ecological aspects, coexistence, respect and non-discrimination, the right to territory and survival, security, and collective rights.

In Article II, the DADPI affirms states' recognition and respect for the multicultural and multilingual character of indigenous peoples, as an integral part of societies. The issue is related to the provisions of the Brazilian Constitution (Art. 209 § 2, 215 § 1, 231), as well as other infra-constitutional norms.

Article IX deals with the recognition of the legal personality of indigenous peoples, as well as their forms of organization, also supported by Articles 231 and 232 of the Federal Constitution.

The right of indigenous peoples to maintain and promote their own family systems is guaranteed by Article XVII, which also states that states shall respect and protect the different indigenous forms of family, as well as their forms of matrimonial union, filiation, descent, and family name. These guarantees are related to Article 6 of the Indian Statute (Law 6.003/1973). Also in Article XVII, by establishing the right of indigenous children to enjoy their own culture, religion or to speak their own language, among others, the Declaration presents precepts that are compatible with the Statute of the Child and Adolescent (Law 8.096/1990).

With regard to indigenous peoples in voluntary isolation or initial contact, Article XXVI of the American Declaration guarantees their right to remain in this condition and to live freely and in accordance with their cultures. The same provision establishes the duty of states to recognize, respect and protect the lands, territories, environment, and cultures of these peoples, as already provided for in Brazil's indigenous policy.

### **United Nations Convention to Combat Desertification - UNCCD**

---

The United Nations Convention to Combat Desertification, officially the United Nations Convention to Combat Desertification in Countries Experiencing Severe Drought and/or Desertification, particularly in Africa (UNCCD), is a multilateral international treaty whose object is the protection of the natural environment and which, as its name suggests, has the central objective of combating desertification.

Desertification is a major contemporary problem.

It was negotiated during the United Nations Conference on Environment and Development, also known as Eco-92, held in Rio de Janeiro in 1992. It was finally adopted on June 17, 1994, in Paris, opened for signatures on October 14, 1994, and entered into force on December 26, 1996. The Conference of the Parties (COP) is its supreme body.

The work of the UNCCD is put into practice through National Action Programs (NAPs), an instrument for implementing the Convention. These programs outline long-term strategies and are formulated with the active participation of local communities. There are also Sub regional Action Programmes (PASR) and Regional Action Programmes (PAR), which help to harmonize and reinforce the national programmes. This is participatory development based on a "bottom-up" method, i.e. programs to combat desertification originate at the local level and are based on this specific participation.

The UNCCD responds to the aim of facilitating a far-reaching alliance for the sustainable development of vulnerable dryland ecosystems and, to this end, of improving the channeling of official development assistance investment. The Convention builds on the lessons of the past and expresses an international consensus on an integrated framework for action.

The Global Mechanism (MM) helps the COP to promote funding for the activities planned under the Convention. It is not in charge of obtaining or administering funds, but supports and advises donors, beneficiaries, development banks, NGOs, etc. to mobilize financial resources and allocate them where they are most needed.

Since it began its activities in 1998, the MM has been under the support of the International Fund for Agricultural Development (IFAD), one of the main international financial institutions in leveraging small farmers and in "giving poor rural people the chance to get out of poverty".

The COP was established by the Convention as the supreme decision-making body, and comprises ratifying governments and regional economic integration organizations, such as the European Union. The COP oversees the implementation of the Convention. The

Conference is the supreme body of the Convention: it establishes the decisions that will subsequently be carried out and integrates the ratifications made by all governments.

Along with 192 other countries, Brazil is a signatory to the United Nations Convention to Combat Desertification and Mitigate the Effects of Droughts (UNCCD). This commitment establishes work standards and convergent international targets for coordinated actions in the search for qualitative solutions that meet socio-environmental demands in arid, semiarid and dry sub-humid areas, particularly where the poorest populations on the planet live.

The UNCCD is recognized as the fundamental instrument for eradicating poverty and promoting sustainable development in rural areas of drylands, which include the Brazilian SSAs. The issue of desertification in the country is at the center of political formulation, both because of the legal framework, as it is the subject of a Bill currently being processed, and because of its strategic significance, as it reflects the new approach of qualifying the sustainable use of natural resources as a transforming element in the relationship between society and the environment.

The historical existence of local practices based on ethnic and traditional knowledge of the populations in the semiarid zones of Brazil, combined with official state interventions dating back to the time of the empire, have produced the conditions and critical mass necessary for the basis of cultural and social organization in order to enable coexistence with droughts, phenomena that are more common to certain areas than others depending on various environmental factors, and almost always anthropogenic vectors.

In this context, Brazil is seen as one of the Party Countries with the greatest global leadership in the process and is active at international level, building bi- and multilateral partnerships, such as the cooperation carried out within the Community of Portuguese Speaking Countries (CPLP) and the Group of Latin American and Caribbean Countries (GRULAC).

Desertification is defined as a process of environmental degradation caused by the inadequate management of natural resources in arid, semiarid and dry sub-humid areas, which compromises the productive systems of susceptible areas, environmental services, and the conservation of biodiversity. In Brazil there are 1,480 municipalities susceptible to this process, which can be caused by man or by nature itself and aggravated by climate issues. It particularly affects the northeastern states, as well as Minas Gerais and Espírito Santo. The studies carried out by the MMA in partnership with the governments of the 11 states show that the areas susceptible to desertification represent 16% of Brazil's territory and 27% of all municipalities involving a population of 31,663,671 inhabitants, where 85% of the country's poverty is concentrated. It therefore represents a context that demands specific public policies that are important for combating poverty and improving the living conditions of a significant part of the Brazilian population.

With the United Nations Conference on Environment and Development - Rio 92, the need for a specific convention on the subject was defined, establishing guidelines and commitments for countries. One of the main results of Rio 92 was the start of the negotiation process to draw up three conventions: the Framework Convention on Climate Change, the Convention on Biological Diversity, and the United Nations Convention to Combat Desertification in Countries Affected by Severe Drought and/or Desertification, particularly in Africa (UNCCD).

In Brazil, the desertification process is a consequence of the inadequate use of forest resources, mainly in the Caatinga and Cerrado, to supply forest biomass to meet a considerable percentage of the energy matrix in the Northeast and other regions, through deforestation; agricultural practices without adequate soil management, causing erosion processes and depleting the soil; overgrazing in extensive livestock farming,

compromising the texture of the soil and thus the regeneration of vegetation; and inadequate management of irrigation systems, with the consequent salinization of the land.

### **Rotterdam Convention**

---

The Rotterdam Convention, in force since 2004, aims to promote shared responsibility and joint efforts by the Parties in the field of international trade in certain hazardous chemicals, in order to protect human health and the environment from possible harm. The agreement establishes a prior informed consent (PIC) procedure for the import of hazardous chemicals.

In other words, the Convention establishes an "early warning system" to help countries protect themselves against certain hazardous chemicals in international trade. It also aims to complement other international instruments by addressing this fundamental element (international trade) in the area of managing chemicals throughout their life cycle.

The Convention raises issues on hazardous chemicals related to: access to information; product labeling; emissions registration; CIP for the import of hazardous chemicals; non-confidentiality.

### **Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES)**

---

Convention on International Trade in Endangered Species of Wild Fauna and Flora - CITES: Convention on International Trade in Endangered Species of Wild Fauna and Flora, or Convention on International Trade in Endangered Species of Wild Fauna and Flora in Brazil, also known as the Washington Convention, is a multilateral agreement signed in Washington DC - United States, on March 3, 1973, bringing together a large number of states, with the aim of ensuring that trade in wild animals and plants, and products derived from them, does not endanger the survival of species or constitute a danger to the maintenance of biodiversity.

The CITES agreement was drawn up as a result of a resolution adopted in 1963 within the World Conservation Union (IUCN). The agreement provides for various levels of protection and today covers around 30,000 species of wild fauna and flora.

This is the Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES), signed by Brazil in 1975 to effectively regulate trade in species of fauna and flora, preventing them from becoming endangered when the threat is international trade. To this end, it assigns producer and consumer countries their share of the common responsibility and establishes the necessary mechanisms to guarantee the non-damaging exploitation of populations. Based on the procedures proposed by the Convention, the Brazilian government - through the Brazilian Institute for the Environment and Renewable Natural Resources (Ibama), has incorporated into its procedures for assessing and issuing export/import licenses.

Around 5,950 animal species and 32,800 plant species from around the world are protected by the Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES) from overexploitation due to international trade. They are included in the three appendices of CITES, grouped according to their degree of threat. In some cases, entire groups are included, such as primates, cetaceans (whales, dolphins, and porpoises), sea turtles, parrots, corals, cacti, and orchids; in others, only a subspecies or a geographically isolated population of a species (e.g. country-specific) is included.

According to Decree No. 3,607 of September 21, 2000, which implements Cites in Brazil, the species in Appendix I are considered to be endangered, the species in Appendix II are those which, although they are not necessarily currently in danger of extinction, could become so unless trade in specimens is subject to strict regulations, and the species in Appendix III were included in the list at the direct request of the country where their exploitation needs to be restricted or prevented and which requires cooperation in their international control.

### **Inter-American Convention on the Prevention, Punishment and Eradication of Violence Against Women, "Convention of Belém do Pará"**

---

Adopted at Belém do Pará, Brazil, on June 9, 1994, at the twenty-fourth regular session of the General Assembly

The Inter-American Convention on the Prevention, Punishment and Eradication of Violence Against Women - Convention of Belém do Pará, adopted by the General Assembly of the Organization of American States - OAS in 1994, is considered an international milestone in the attempt to curb violence against women. Brazil ratified the Belém do Pará Convention in 1995. In 2006, the Brazilian government complied with General Recommendation 19 of the Committee on the Elimination of All Forms of Discrimination against Women - CEDAW, the Belém do Pará Convention and the 1988 Federal Constitution.

### **Convention for the Protection of the Flora, Fauna, and Natural Scenic Beauties of the Countries of America**

---

It came into force on October 12, 1940, and was ratified by Brazil via decree 58.054 of March 23, 1966. Its objective is the protection and conservation of indigenous fauna and flora, as well as migratory birds, extensive habitat sites, landscapes of great beauty and extraordinary geological formations.

The States Parties signed the Convention for the Protection of the Flora, Fauna and Natural Scenic Beauties of the Countries of America with the aim of protecting and conserving in their natural environment specimens of all species and genera of indigenous flora and fauna, including migratory birds, in sufficient numbers and in locations that are extensive enough to prevent their extinction by all human means. In addition, the States Parties have aimed to protect and conserve landscapes of great beauty, extraordinary geological formations, regions, and natural objects of aesthetic interest or historical or scientific value, and places characterized by primitive conditions within the cases to which this Convention refers.

### **UNESCO Convention Concerning the Protection of the World Cultural and Natural Heritage**

---

The Convention Concerning the Protection of the World Cultural and Natural Heritage, also known as the Paris Recommendation, is an international commitment created at the seventeenth session of the General Conference of the United Nations Educational, Scientific and Cultural Organization (UNESCO), which met in Paris from October 17 to November 21, 1972.

The Convention was established in parallel with the United Nations Conference on the Human Environment, the first major international meeting dealing with the basic principles of environmental protection, where the United Nations Environment Program was also created. It is an important regulatory framework for the protection of the cultural and natural heritage of the world's nations. It defined essential concepts of world

heritage, understanding it as "an irreplaceable source of life and inspiration", and provides the basis for the inscription of properties on the World Heritage List.

According to Silvia Helena Zanirato, from the State University of Maringá,

*Throughout the text, the understanding was expressed that the protection of such areas could not be carried out solely on a national scale, due to the magnitude of the means required for this procedure, which often went beyond the economic, scientific, and technological resources possessed by the countries that housed the heritage elements. It was then that the concept of world heritage was developed, consisting of works of exceptional interest, sometimes unique testimonies, which should be considered as belonging not only to the states in which they were located, but to the whole of humanity, which should be involved in their defense and safeguarding, in order to ensure their transmission to future generations.*

### **Convention for the Safeguarding of the Intangible Cultural Heritage**

---

On October 17, 2003, the Convention for the Safeguarding of the Intangible Cultural Heritage was signed in Paris on November 3, 2003, and entered into force in Brazil on April 12, 2006, via Decree 5.753/06 and Legislative Decree No. 22/06. Its aim is to protect cultural and intangible heritage, promoting respect for the cultural and intangible heritage of the communities, groups and individuals that make up the societies of the States Parties, awareness in all spheres and without borders of the importance of the object of the international document, its recognition by all the nations involved and mutual international cooperation for its safeguarding.

To facilitate the identification and limits of international legal protection, Article 2 of the document contains the following definitions:

For the purposes of this Convention:

*(1) "Intangible cultural heritage" means the practices, representations, expressions, knowledge, and techniques - together with the instruments, objects, artefacts, and cultural places associated with them - that communities, groups and, in some cases, individuals recognize as an integral part of their cultural heritage. This intangible cultural heritage, which is passed down from generation to generation, is constantly recreated by communities and groups as a function of their environment, their interaction with nature and their history, generating a sense of identity and continuity and thus helping to promote respect for cultural diversity and human creativity. For the purposes of this Convention, only intangible cultural heritage that is compatible with existing international human rights instruments and with the imperatives of mutual respect between communities, groups, and individuals, and of sustainable development, shall be considered.*

*2. Intangible cultural heritage", as defined in paragraph 1 above, manifests itself in particular in the following fields:*

*a) oral traditions and expressions, including language as a vehicle for the*

*intangible cultural heritage;*

*b) artistic expressions;*

*c) social practices, rituals, and festive acts;*

*d) knowledge and practices related to nature and the universe;*

*e) traditional craft techniques.*

## **Convention on Biological Diversity**

---

The Convention on Biological Diversity (CBD) is a United Nations treaty and one of the most important international instruments related to the environment.

The Convention was established during the notorious ECO-92 - the United Nations Conference on Environment and Development (UNCED), held in Rio de Janeiro in June 1992 - and is today the main global forum for issues related to the topic.

More than 160 countries have already signed the agreement, which came into force in December 1993. It was ratified in Brazil by Federal Decree No. 2,519 of March 16, 1998.

The Convention is structured on three main bases - the conservation of biological diversity, the sustainable use of biodiversity and the fair and equitable sharing of the benefits arising from the utilization of genetic resources - and refers to biodiversity at three levels: ecosystems, species, and genetic resources.

## 11.2. Annex - Other complementary federal laws

### Vegetation cover

- Federal Law No. 7.754, of April 14, 1989, which establishes measures for the protection of forests at river sources and makes other provisions.
- IBAMA Ordinance No. 37-N, of April 3, 1992, which provides for the official list of species of Brazilian flora threatened with extinction.
- Normative Instruction No. 06 of September 23, 2008, which lists species of Brazilian flora threatened with extinction.
- Law No. 12.651, of May 25, 2012 (New Brazilian Forest Code), as amended by Law No. 12.727, of October 17, 2012, which provides for the protection of native vegetation; amends Laws No. 6.938, of August 31, 1981, No. 9.393, of December 19, 1996, and 11.428, of December 22, 2006; repeals Laws 4.771, of September 15, 1965, and 7.754, of April 14, 1989, and Provisional Measure 2.166-67, of August 24, 2001; and makes other provisions. This law establishes general rules on the protection of vegetation, Permanent Preservation Areas, and Legal Reserve areas; forest exploitation, the supply of forest raw materials, control of the origin of forest products and the control and prevention of forest fires and provides for economic and financial instruments to achieve its objectives. Article 8 establishes that intervention or suppression of native vegetation in a Permanent Preservation Area will only take place in cases of public utility, social interest, or low environmental impact.

According to Article 4 of the Brazilian Forestry Code, which defines the areas of permanent preservation, in section III, the areas around artificial water reservoirs, resulting from the damming or impounding of natural watercourses, are considered APP, within the range defined in the project's environmental license.

### Fauna

- Federal Law No. 5.197, of January 3, 1967 (amended by Laws No. 7.584/87, No. 7.653/88, No. 97.633/89, and No. 9.111/95), which instituted the Fauna Protection Code.
- IBAMA Ordinance No. 1.522, of December 19, 1989, which provides for the official list of species of Brazilian fauna threatened with extinction.
- MMA Normative Instruction No. 03, of May 27, 2003, with the official list of species of Brazilian fauna threatened with extinction.
- IBAMA Normative Instruction No. 146, of January 10, 2007, which establishes the criteria for procedures relating to the management of wild fauna (survey, monitoring, rescue, salvage and disposal) in areas of influence of undertakings and activities considered to be effectively or potentially causing impacts on fauna subject to environmental licensing, as defined by Federal Law No. 6938/81 and CONAMA Resolutions No. 001/86 and No. 237/97.

### Conservation Units and other Protected Areas

- Federal Decree No. 84.017, of September 21, 1979, approving the regulations for Brazilian National Parks.
- Law No. 6.902, of April 27, 1981, which provides for the creation of Ecological Stations and Environmental Protection Areas.

- Federal Decree No. 89.336, of January 31, 1984, which provides for Ecological Reserves and Areas of Relevant Ecological Interest.
- Federal Decree No. 99.274, of June 6, 1990, which regulates Law No. 6.902, of April 27, 1981, and Law No. 6.938, of August 31, 1981, which provide, respectively, for the creation of Ecological Stations and Environmental Protection Areas and for the National Environmental Policy.
- CONAMA Resolution No. 13, of December 6, 1990, which establishes rules for the surroundings of Conservation Units with a view to protecting existing ecosystems.
- Federal Decree No. 1.298, of October 27, 1994, approving the National Forests Regulations.
- Federal Decree No. 1.922, of June 5, 1996, which provides for the recognition of Private Natural Heritage Reserves (RPPN).
- Federal Decree No. 2.119, of January 13, 1997, which provides for the Pilot Program for the Protection of Brazil's Tropical Forests and its Coordination Commission.
- Federal Law No. 9.985, of July 18, 2000, which institutes the National System of Nature Conservation Units (SNUC), establishes criteria and norms for the creation, implementation, and management of conservation units, amended by Law No. 11.132/2005.
- CONAMA Resolution No. 302, of March 20, 2002, which sets out the parameters, definitions, and limits of Permanent Preservation Areas of artificial reservoirs and the use regime of their surroundings.
- CONAMA Resolution No. 303, of March 20, 2002, which sets out the parameters, definitions, and limits of Permanent Preservation Areas.
- Federal Decree No. 4.340, of August 22, 2002, which regulates articles of Law No. 9.985/00 on the National System of Nature Conservation Units (SNUC).
- Federal Decree No. 5.092, of May 21, 2004, which defines the rules for identifying priority areas for the conservation, sustainable use and sharing of the benefits of biodiversity, within the scope of the Ministry of the Environment.
- Federal Law No. 11.132, of July 4, 2005, which adds an article to Law No. 9.985, of July 18, 2000, which regulates Article 225, § 1, items I, II, III and VII of the Federal Constitution and establishes the National System of Nature Conservation Units.
- Federal Law No. 11.284, of March 2, 2006, which provides for the management of public forests for sustainable production; establishes, within the structure of the Ministry of the Environment, the Brazilian Forestry Service - SFB; creates the National Forestry Development Fund - FNDF; amends Laws Nos. 10.683, of May 28, 2003, 5.868, of December 12, 1972, 9.605, of February 12, 1998, 4.771, of September 15, 1965, 6.938, of February 12, 1998, 6.83, of May 28, 2003, 5.868, of December 12, 1972, 9.605, of February 12, 1998, 4.771, of September 15, 1965, 6.938, of August 31, 1981, and 6.015, of December 31, 1973.
- CONAMA Resolution No. 369, of March 28, 2006, which sets out the exceptional cases of public utility, social interest or low environmental impact that make it possible to intervene or suppress vegetation in a Permanent Preservation Area (APP).
- Decree No. 5.746, of April 5, 2006, which regulates Article 21 of Law No. 9.985/00, which provides for the National System of Nature Conservation Units - SNUC. This article deals with the Private Natural Heritage Reserve - RPPN.

- CONAMA Resolution No. 371, of April 5, 2006, which establishes guidelines for environmental agencies for calculating, collecting, applying, approving, and controlling the spending of funds from environmental compensation, in accordance with Law No. 9.985, of July 18, 2000, and makes other provisions.
- Federal Decree No. 5.758, of April 13, 2006, which establishes the National Strategic Plan for Protected Areas - PNAP, its principles, guidelines, objectives, and strategies.
- Ordinance No. 09, of January 23, 2007, article 1 of which establishes that the areas referred to in paragraph 2, called Priority Areas for the Conservation, Sustainable Use and Benefit Sharing of Brazilian Biodiversity or Priority Areas for Biodiversity, are recognized as priority areas for the conservation, sustainable use and benefit sharing of Brazilian biodiversity, for the purpose of formulating and implementing public policies, programs, projects and activities under the responsibility of the Federal Government aimed at: I - in situ conservation of biodiversity; II - sustainable use of biodiversity components; III - sharing of benefits derived from access to genetic resources and associated traditional knowledge; IV - research and inventories on biodiversity; V - recovery of degraded areas and over-exploited or endangered species; and VI - economic valorization of biodiversity.
- CONAMA Resolution No. 429, of February 28, 2011, which sets out the methodology for recovering Permanent Preservation Areas (APPs).

### **Water Resources**

- Federal Decree No. 24.643, of July 10, 1934, establishing the Water Code.
- Federal Law No. 7,990 of December 28, 1989, which instituted financial compensation for states, the Federal District, and municipalities for the results of the exploitation of oil or natural gas, water resources for the purpose of generating electricity, mineral resources in their respective territories, continental platforms, territorial sea, or exclusive economic zone.
- Federal Law No. 8.001, of March 13, 1990, which defines the distribution percentages of the financial compensation referred to in Law No. 7.990, of December 28, 1989.
- Federal Law No. 9.433, of January 8, 1997, which instituted the National Water Resources Policy, created the National Water Resources Management System, regulates item XIX of article 21 of the Federal Constitution and amends article 1 of Law No. 8001, of March 13, 1990, which amended Law No. 7.990, of December 28, 1989. The objectives of the National Water Resources Policy (Article 2) are: I - to ensure the necessary availability of water for current and future generations, at quality standards appropriate to their respective uses; II - the rational and integrated use of water resources, including waterway transport, with a view to sustainable development; III - prevention and defense against critical hydrological events of natural origin or resulting from the inappropriate use of natural resources.
- CNRH Resolution No. 05, of April 10, 2000, which establishes guidelines for the formation and operation of River Basin Committees, in order to implement the National Water Resources Management System, as established by Law No. 9.433/1997.
- MMA Normative Instruction No. 4, of June 21, 2000, which approves the administrative procedures for issuing grants for the right to use water resources in bodies of water in the Union's domain, as set out in the Annexes to this Normative Instruction.

- Federal Law No. 9.984, of July 17, 2000 (amended by Provisional Measure 2.216-37, of August 31, 2001), which provides for the National Water Agency - ANA, the federal entity responsible for implementing the National Water Resources Policy and coordinating the National Water Resources Management System.
- CONAMA Resolution No. 274, of November 29, 2000, which revises the criteria for bathing in Brazilian waters.
- Federal Decree No. 3.692, of December 19, 2000, which establishes the regimental structure of the National Water Agency - ANA.
- CNRH Resolution No. 15 of January 11, 2001, which establishes general guidelines for groundwater management.
- CNRH Resolution No. 16, of May 8, 2001, which provides for the granting of water resources.
- Federal Decree No. 4.613, of March 11, 2003, which regulates the National Water Resources Council.
- CNRH Resolution No. 32 of October 15, 2003, which establishes the National Hydrographic Division into Hydrographic Regions for the purpose of guiding, supporting and implementing the Water Resources Plan.
- Federal Decree No. 4.895, of November 25, 2003, which provides for the authorization of the use of physical spaces of bodies of water in the Union's domain for aquaculture purposes.
- Federal Decree No. 5.069, of May 5, 2004, which provides for the composition, structure, powers and functioning of the National Aquaculture and Fisheries Council (CONAP).
- Federal Law No. 10.881, of June 9, 2004, which provides for management contracts between the National Water Agency and entities delegating the functions of Water Agencies related to the management of water resources in the Union's domain.
- ANA Resolution No. 707, of December 21, 2004, which sets out the technical and administrative procedures to be observed when examining grant applications.
- CONAMA Resolution No. 357, of March 17, 2005, which defines the classification of bodies of water and their environmental guidelines, as well as defining the conditions and standards for discharging effluents.
- CNRH Resolution No. 48, of March 21, 2005, which establishes general criteria for charging for the use of water resources.
- CNRH Resolution No. 58, of January 30, 2006, which approves the National Water Resources Plan (PNRH).
- CNRH Resolution No. 65, of December 7, 2006, which establishes guidelines for linking the procedures for obtaining the granting of the right to use water resources with environmental licensing procedures.
- ANA Resolution No. 308, of August 6, 2007, which sets out the procedures for collecting the revenue from charging for the use of water resources in bodies of water under the Union's domain.
- Federal Law No. 11.959, of June 29, 2009, which provides for the National Policy for the Sustainable Development of Aquaculture and Fishing, regulates fishing activities, repeals Law No. 7.679, of November 23, 1988, and provisions of Decree-Law No. 221, of February 28, 1967.

- CNRH Resolution No. 129, of June 29, 2011, which establishes general guidelines for the definition of remaining minimum flows.
- CNRH Resolution No. 145, of December 12, 2012, which establishes guidelines for the preparation of River Basin Water Resources Plans.

### **Noise Emission**

- CONAMA Resolution No. 01, of March 8, 1990, which provides for the emission of noise as a result of any industrial, commercial, social, or recreational activities, determining standards, criteria, and guidelines. The emission of noise as a result of any industrial, commercial, or recreational activities will comply, in the interests of health and public quiet, with the standards, criteria and guidelines established by NBR 10.151/2000.
- Brazilian Standard ABNT NBR 10151/2000, which deals with the assessment of noise in inhabited areas with a view to community comfort. It establishes the conditions required to assess the acceptability of noise in communities, regardless of the existence of complaints. It outlines methods for measuring noise, the application of corrections to the measured levels if the noise has special characteristics and a comparison of the corrected levels with a criterion that considers various factors.

### **Air Quality**

- CONAMA Resolution No. 05, of June 15, 1989, which provides for the National Air Pollution Control Program - PRONAR.
- CONAMA Resolution No. 03, of June 28, 1990, which establishes air quality standards and defines the objective to be achieved through the control strategy established by the emission standards that should guide the preparation of Regional Air Pollution Control Plans. It defines air quality standards as the concentrations of atmospheric pollutants which, if exceeded, could affect the health, safety and well-being of the population, as well as causing damage to flora and fauna, materials and the environment in general and establishes that (i) Primary Air Quality Standards - are the concentrations of pollutants which, if exceeded, could affect the health of the population. Secondly (ii) Secondary Air Quality Standards - are the concentrations of pollutants below which the minimum adverse effect on the well-being of the population is expected, as well as the minimum damage to fauna, flora, materials, and the environment in general.
- CONAMA Resolution No. 382, of December 26, 2006, which establishes the maximum emission limits for atmospheric pollutants from fixed sources.

### **Solid Waste**

- CONAMA Resolution No. 1A, of January 23, 1986, which establishes rules for the transportation of dangerous products that circulate near densely populated areas, the protection of water sources and the natural environment.
- Federal Law No. 7.802, of July 11, 1989, which provides for research, experimentation, production, packaging and labeling, transport, storage, marketing, commercial advertising, use, import, export, final destination of waste and packaging, registration, classification, control, inspection and inspection of pesticides, their components, and the like.

- Federal Decree No. 98.816, of January 11, 1990, which regulated Law No. 7.802/1989.
- CONAMA Resolution No. 307, of July 5, 2002, which establishes guidelines, criteria and procedures for the management of construction waste, regulating the necessary actions in order to minimize environmental impacts. It defines the responsibilities of public authorities and private agents with regard to construction waste and makes it compulsory for municipalities to adopt integrated management plans, as well as waste management projects on construction sites, while creating legal conditions for the application of Federal Law No. 9.605/1998 (Environmental Crimes Law) with regard to construction waste.
- Brazilian standard ABNT NBR 10004/2004, which classifies solid waste according to its potential risks to the environment and public health, so that it can be managed properly.
- CONAMA Resolution No. 362, of June 23, 2005, which provides for the collection, disposal, and final destination of used or contaminated lubricating oil.
- Law No. 12.305, of August 2, 2010, which defines the National Solid Waste Policy and provides for its principles, objectives and instruments, as well as guidelines for the integrated management and management of solid waste, including hazardous waste, the responsibilities of generators and public authorities and the applicable economic instruments. Classifies solid waste:
  - I - By origin: a) household waste; b) urban cleaning waste; c) urban solid waste; d) waste from commercial establishments and service providers; e) waste from public basic sanitation services; f) industrial waste; g) waste from health services; h) construction waste; i) agroforestry waste; j) waste from transport services; k) mining waste;
  - II - In terms of hazardousness: a) hazardous waste; b) non-hazardous waste.
- Federal Decree No. 7.404, of December 23, 2010, which regulates Law No. 12.305/2010, which instituted the National Solid Waste Policy, creates the Interministerial Committee of the National Solid Waste Policy and the Guidance Committee for the Implementation of Reverse Logistics Systems.
- CONAMA Resolution No. 454 of November 1, 2012, establishes the general guidelines and reference procedures for the management of material to be dredged in waters under national jurisdiction.

### **Soil and Groundwater Quality**

- Federal Decree No. 303, of February 28, 1967, which creates the National Council for Environmental Pollution Control.
- Federal Decree No. 1.413, of August 14, 1975, which provides for the control of environmental pollution caused by activities.
- CONAMA Resolution No. 396, of April 3, 2008, which provides for the classification and environmental guidelines for the classification of groundwater and other provisions.
- CONAMA Resolution No. 420, of December 29, 2009, which sets out criteria and guideline values for soil quality in terms of the presence of chemical substances and establishes guidelines for the environmental management of areas contaminated by these substances because of anthropic activities. With a view to preventing and

controlling soil quality, undertakings that carry out activities with the potential to contaminate soil and groundwater must, at the discretion of the competent environmental body: I - implement a soil and groundwater quality monitoring program in the area of the undertaking and, when necessary, in its area of direct influence and in surface waters; and II - submit a conclusive technical report on soil and groundwater quality, with each application for a license renewal and prior to the closure of activities.

### **Environmental licensing**

Environmental licensing was instituted throughout the country by Law No. 6.938/1981 and regulated by Decree No. 88.351/1983 (modified by Decree No. 99.274 of 1990), which established its main guidelines. It was structured into three mandatory licenses: Preliminary License (LP), Installation License (LI) and Operation License (LO), which correspond to the different phases of planning and implementing a project. Each license contains restrictions that condition the execution of the project and the activity's environmental control measures. The process also includes the follow-up routines for the licenses granted, i.e. the inspection and monitoring of the environmental effects of the project, essential components of the system, as well as the technical and administrative standards that regulate it.

All undertakings capable of modifying the environment are subject to licensing, i.e. those that potentially or effectively affect environmental quality, cause any form of pollution, or use environmental resources, developed by individuals or legal entities, including public administration entities, that are installed in national territory. Licensing therefore applies to the installation or expansion of private or governmental activities, including the installation of equipment or works of an industrial, commercial, extractive, agricultural, urban, transport infrastructure, energy and water generation and basic sanitation nature.

Since then, a series of resolutions by the National Environmental Council (CONAMA) have introduced other guidelines for the licensing of certain types of activity, as well as procedural and administrative elements. Of particular note are the criteria for applying environmental impact assessment to projects with significant polluting potential (Resolution 001/86). In general, the complementary rules and administrative procedures for their effective use are determined by the state environmental entities, in cases of state competence, or by the Brazilian Institute for the Environment - IBAMA, in cases of federal competence. In this context, the following CONAMA resolutions may be applied to the Project's interventions:

- CONAMA Resolution No. 01 of January 23, 1986, which establishes the definitions, responsibilities, basic criteria and general guidelines for the use and implementation of Environmental Impact Assessment as one of the instruments of the National Environmental Policy.
- CONAMA Resolution No. 05/88, which establishes rules subjecting sanitation works to environmental licensing;
- CONAMA Resolution No. 06, of September 16, 1987, which provides for the environmental licensing of works in the electricity generation sector.
- CONAMA Resolution No. 09, of December 9, 1987, which provides for public hearings.
- CONAMA Resolution No. 237, of December 19, 1997, which provides for the revision and supplementation of the procedures and criteria used for environmental licensing established by CONAMA Resolution No. 001/86, in addition to requiring

the presentation of Municipal Land Use and Occupation Certificates and technical examinations and statements by the municipalities affected by the project.

- CONAMA Resolution No. 274/2000, which establishes bathing standards for fresh, brackish, and saline waters.
- CONAMA Resolution No. 302/2002, which sets out the parameters, definitions, and limits of permanent preservation areas in artificial reservoirs and the regime for using the surrounding area.
- CONAMA Resolution No. 458/2013, which establishes procedures for environmental licensing in agrarian reform settlements.

### **Family farming**

**Law No. 11.326 of July 24, 2006**, establishes the guidelines for formulating the National Policy for Family Farming and Rural Family Enterprises. In addition to this law, the following pieces of legislation related to the topic should also be considered:

#### ***Decree 11.635/23***

Amends Decree No. 7.572, of September 28, 2011, which regulates provisions of Law No. 12.512, of October 14, 2011, which deals with the Environmental Conservation Support Program - Bolsa Verde Program. The Bolsa Verde Program will be implemented through the direct transfer of financial resources, under the responsibility of the Ministry of the Environment and Climate Change. The benefit is aimed at low-income families who practice some kind of natural resource conservation activity.

#### ***Decree 11.636/23***

Establishes the National Commission for Employed Rural Workers to manage the National Policy for Employed Rural Workers.

#### ***Decree 11.637/23***

It introduces the definition of an encampment as a group of families in a situation of social vulnerability, living in the same locality, who require INCRA actions for their inclusion in the PNRA, enrolled in the Federal Government's Single Registry for Social Programs as encamped people and registered by INCRA, in accordance with the procedures established by the municipality. It also updates the scores for the selection process

#### ***Decree 11.638/23***

Establishes the National Commission to Combat Violence in the Countryside

#### ***Decree 11.639/23***

Establishes an Interministerial Working Group for the National Plan for Youth and Rural Succession

#### ***Decree 11.640/23***

It establishes the National Pact for the Prevention of Femicide, with the aim of preventing all forms of discrimination, misogyny, and gender-based violence against women through the implementation of intersectoral governmental actions, from the perspective of gender and its intersectionalities.

#### ***Decree 11.641/23***

Establishes the National Citizenship and Good Living Program for Rural Women, which aims to guarantee access to basic civil documentation, joint land titling and the territory occupied by rural women, understood as women from the countryside, forests and waters, so that they can live with dignity, ensuring their civil, political, and social rights

### **Decree 11.642/23**

Establishes the Productive Backyard Program for Rural Women, within the scope of the Ministry of Agrarian Development and Family Agriculture and the Ministry of Development and Social Assistance, Family and Fight against Hunger, with the aim of promoting the economic autonomy of rural women through: I - structuring productive backyards; II - bringing women together in groups or collective organizations; III - helping them access public policies to support food production and marketing; IV - access to equipment, machinery, implements, utensils and supplies needed to set up or expand productive backyards; and V - social technologies for accessing water.

### **National Solid Waste Policy**

---

The National Solid Waste Policy, established by Law No. 12.305 of August 2, 2010, sets out the principles, objectives, and instruments, as well as the guidelines for the integrated management and management of solid waste, including hazardous waste; the responsibilities of generators and public authorities and the applicable economic instruments.

This law established the shared responsibility of waste generators: manufacturers, importers, distributors, traders, citizens, and holders of urban solid waste management services in the Reverse Logistics of post-consumer waste and packaging.

It also set important targets that will contribute to the elimination of landfills and instituted planning instruments at the national, state, micro-regional, inter-municipal and metropolitan and municipal levels; as well as requiring private entrepreneurs to draw up their Solid Waste Management Plans.

The National Solid Waste Policy puts Brazil on an equal footing with the main developed countries in terms of the legal framework and innovates with the inclusion of waste pickers of recyclable and reusable materials, both in Reverse Logistics and in Selective Collection.

### **Occupational Health and Safety**

---

The following are the legal diplomas and technical standards considered most relevant within the scope of the Program, with regard to Occupational Health and Safety.

- Decree-Law 5452 of May 1, 1943, Chapter V of Title II of the Consolidation of Labor Laws - CLT.
- Decree 62.130 of 29/07/2017 - Creates, within the direct, indirect, and foundational Administration, work teams called "Brigade against Aedes aegypti" whose function is to create specific brigades to combat the mosquito and reduce the incidence of arboviruses.
- Ordinance 3.523 of 28/08/1998 of the Ministry of Health: Approves Technical Regulations containing basic measures relating to procedures for visually checking the state of cleanliness, removing dirt by physical methods and maintaining the state of integrity and efficiency of all components of air conditioning systems, in order to guarantee Indoor Air Quality and prevent risks to the health of occupants of air-conditioned environments.
- Law 6514 of December 22, 1977 - which amends Chapter V of Title II of the CLT, relating to Occupational Safety and Medicine.
- Ordinance 3214 of June 8, 1978 - Approves the NRs - Regulatory Norms of Chapter V of Title II of the CLT.

**NR 01 - General Provisions:** aims to inform about the scope of the NRs, as well as the obligations of the employer and employee with regard to the legal document.

**NR 04 - Specialized Services in Safety Engineering and Occupational Medicine:** aims to inform the sizing of Specialized Services in Safety Engineering and Occupational Medicine, linked to the risk gradation of the main activity and the total number of employees in the establishment,

**NR 05 - Comissão Interna de Prevenção de Acidentes (Internal Accident Prevention Commission):** aims to prevent accidents and illnesses arising from work, in order to make work permanently compatible with the preservation of life and the promotion of workers' health.

**NR 06 - Personal Protective Equipment - PPE:** aims to provide information on the definition, mandatory use, and specifications for the use of PPE.

**NR 07 - Occupational Health Medical Control Programs:** aims to establish guidelines and requirements for the development of the Occupational Health Medical Control Program - PCMSO in organizations, with the aim of protecting and preserving the health of their employees in relation to occupational risks, according to the risk assessment of the organization's Risk Management Program - PGR.

**NR 09 - Evaluation and Control of Occupational Exposures to Physical, Chemical and Biological Agents:** establishes the requirements for evaluating occupational exposures to physical, chemical, and biological agents when identified in the Risk Management Program - PGR, provided for in NR-1, and subsidizing it with regard to preventive measures for occupational risks.

**NR 10 - Safety in Electrical Installations and Services:** aims to establish the minimum requirements and conditions for the implementation of control measures and preventive systems, in order to guarantee the safety and health of workers who, directly or indirectly, interact in electrical installations and services with electricity.

**NR 12 - Safety at Work in Machinery and Equipment:** aims to define technical references, fundamental principles and protection measures to guarantee the health and physical integrity of workers and establishes minimum requirements for the prevention of accidents and occupational illnesses in the design and use phases of machinery and equipment of all types, as well as their manufacture, import, sale, exhibition and assignment in any capacity, in all economic activities.

**NR 13 - Boilers, Pressure Vessels, and Piping:** Establishes minimum requirements for managing the structural integrity of steam boilers, pressure vessels and their interconnecting piping in aspects related to installation, inspection, operation, and maintenance, with a view to the safety and health of workers.

**NR 15 - Unhealthy Activities and Operations:** its purpose is to inform about the activities that are considered unhealthy by the MTE, due to exposure above the legal Tolerance Limits or through qualitative assessment of worker exposure.

**NR 16 - Hazardous Activities and Operations:** aims to inform about activities and operations considered hazardous due to exposure to explosives, flammables, electrical energy, ionizing radiation, and exposure to physical violence.

**NR 17 - Ergonomics:** aims to establish parameters that allow working conditions to be adapted to the psycho-physiological characteristics of workers, in order to provide maximum comfort, safety and efficient performance. Working conditions include aspects related to lifting, transporting and unloading materials, furniture, equipment and the environmental conditions of the workplace and the organization of work itself.

**NR 18 - Conditions and Environment of Work in the Construction Industry:** aims to establish administrative, planning, and organizational guidelines for the implementation of control measures and preventive safety systems in the processes, conditions, and environment of work in the construction industry.

**NR 19 - Explosives:** The manufacture, use, import, export, traffic, and trade of explosives must comply with the provisions of specific legislation, in particular the Brazilian Army's Regulations for the Inspection of Controlled Products (R-105), approved by Decree No. 3,665 of November 20, 2000.

**NR 20 - Flammable and Combustible Liquids:** Establishes minimum requirements for occupational health and safety management against accident risk factors arising from the extraction, production, storage, transfer, handling, and manipulation of flammable and combustible liquids.

**NR 21 - Open-air work:** This establishes standards for work in the open, making it compulsory to have shelters, even rustic ones, capable of protecting workers from inclement weather. It also requires special measures to protect workers from excessive sunlight, heat, cold, humidity and inconvenient winds. Finally, it stipulates that workers who live at the workplace must be provided with accommodation that offers adequate sanitary conditions

**NR 24 - Sanitary and Comfort Conditions in the Workplace:** Establishes parameters for (i) Sanitary facilities, (ii) Changing rooms, (iii) Cafeterias, (iv) Kitchens, (v) Accommodation and (vi) Hygiene and comfort conditions during meals.

**NR 26 - Safety Signs:** Establishes parameters for safety signs in workplaces to warn local workers about risks and dangerous products.

**NR 31 - Rural Work:** Aims to establish the precepts to be observed in the organization and environment of rural work, in order to make the planning and development of the sector's activities compatible with the prevention of accidents and illnesses related to rural work.

**NR 33 - Safety and Health at Work in Confined Spaces:** Establishes the minimum requirements for identifying confined spaces and recognizing, evaluating, monitoring, and controlling existing risks, in order to permanently guarantee the safety and health of workers who interact directly or indirectly in these spaces.

**NR 35 - Work at Height:** Work at height is considered to be any activity carried out above 2.00 m (two meters) from the lower level, where there is a risk of falling. Access by ropes is regulated in Annex 1 and for work on inclined planes, the application of this annex must be established by Risk Analysis.

Regarding legislation related to workers' health and safety, the Ministry of Labor and Social Security is the body responsible for the rights and protection of workers' health and safety in Brazil. Documents such as the PCMSO, the PPRA, or the constitution of the CIPA, linked to worker health and safety, as recommended by the Ministry's Regulatory Norms (NR), must be drawn up and reported to the Federal Government's eSocial system.

eSocial is a computerized system of the Public Administration and all the information it contains is protected by secrecy. Unauthorized access, voluntary or accidental provision of the access password or information and breach of confidentiality constitute infractions or illicit acts that subject the user to administrative, criminal, and civil liability. Employers must access eSocial by logging in to the Gov.br system (the Federal Government's unified system), having previously registered and been awarded the respective seal of trust on the Gov.br Portal, requiring an official Digital Certificate for access.

The Work and Social Security Card (CTPS) is a mandatory document for workers in Brazil. The CTPS is one of the only documents that can reproduce, clarify, and prove data about the worker's working life and must be used by the employer to make the appropriate functional records that will be linked to the records of the Ministry of Labor and Social Security systems.

Work cards in Brazil are issued by the Ministry of Labor and Social Security, and only those over the age of 14 can obtain a work card.

Federal Decree-Law 5,452 of May 1, 1943, approves the Consolidation of Labor Laws. The Regulatory Norms (NR), which are complementary provisions to Chapter V (On Occupational Safety and Medicine) of Title II of the Consolidation of Labor Laws (CLT), amended by Law No. 6,514 of December 22, 1977, must be considered. They consist of obligations, rights and duties that employers and workers must fulfill in order to guarantee a safe and healthy workplace, preventing the occurrence of illnesses and accidents at work.

The various Regulatory Norms were drawn up to provide safety for workers, and articles 8 and 11 (among other specific points in the norm) indicate the requirement to comply with workers' fundamental rights.

Regarding the protection of women's work, mentioned in Chapter III, it should be noted: Children and migrants are detailed in paragraphs 12 and 23 in terms of rights, however, the understanding of this paragraph brings special measures, therefore, anomalous situations that require attention on the part of the taker.

Chapter IV - On the Protection of Child Labor establishes working standards for minors between the ages of 14 and 18. It prohibits exploitative, degrading, or offensive work and dangerous work.

Title II - General Labor Protection Standards - includes all rights related to working conditions and terms of employment, including, for example: wages and benefits; wage deductions; working hours; overtime and payment arrangements; rest days; and sick leave, maternity leave, vacations, or vacations.

In relation to general provisions and occupational risk management, item 1.5.3 Responsibilities states that the organization must implement, by establishment, occupational risk management in its activities and that occupational risk management will constitute a Risk Management Program - RMP. The organization must consider working conditions, in accordance with RS-17 [Ergonomics], as well as taking the necessary measures to improve OSH [Occupational Health and Safety] results. The main NRs related to the scope of the PROCASE II Program are listed below:

- NR-5 - internal accident prevention committee
- NR-7 - Occupational Health Medical Control Program
- NR-9 - environmental risk prevention program
- NR-10 - safety in electrical installations and services
- NR-11 - transportation, movement, storage, and handling of materials
- NR-12 - occupational safety in machinery and equipment
- NR-15 - unhealthy activities and operations
- NR-16 - dangerous activities and operations
- NR-17 - ergonomics
- NR-18 - working conditions and environment in the construction industry

- NR-20 - occupational health and safety with flammable and combustible materials
- NR-21 - working in the open
- NR-23 - fire protection
- NR-24 - sanitary and comfort conditions in the workplace
- NR-25 - industrial waste
- NR-26 - safety signs
- NR-35 - working at heights

### **National Policy for the Sustainable Development of Traditional Peoples and Communities (PNPCT)**

---

Another very important issue related to cultural diversity and traditional populations is addressed in Brazil by the National Policy for the Sustainable Development of Traditional Peoples and Communities (PNPCT), established in 2007 by Decree No. 6.040/2007. The Policy establishes that the National Commission for the Sustainable Development of Traditional Peoples and Communities - CNPCT, created by Decree of July 13, 2006, is responsible for coordinating the implementation of this Policy.

The PNPCT's specific objective is to promote the aforementioned "sustainable development" with an emphasis on recognizing, strengthening, and guaranteeing their territorial, social, environmental, economic, and cultural rights. It also advocates respecting and valuing the identity of traditional peoples and communities, as well as their forms of organization and their different institutions. This policy is structured around four strategic axes: 1) Access to Traditional Territories and Natural Resources, 2) Infrastructure, 3) Social Inclusion and 4) Promotion and Sustainable Production.

Specifically with regard to the infrastructure axis and other related axes, Article 3 states:

- III - to set up infrastructure suited to the socio-cultural realities and demands of traditional peoples and communities;
- IV - guarantee the rights of traditional peoples and communities directly or indirectly affected by projects, works and undertakings;
- V - to guarantee and value traditional forms of education and strengthen dialogic processes as a contribution to the development of each people and community, guaranteeing participation and social control in both formal and non-formal educational training processes;
- X - guarantee access to public social policies and the participation of representatives of traditional peoples and communities in social control bodies;
- XI - ensure that social inclusion programs and actions specifically target traditional peoples and communities;
- XII - to implement and strengthen programs and actions aimed at gender relations in traditional peoples and communities, ensuring women's vision and participation in government actions, valuing the historical importance of women and their ethical and social leadership;
- XVII - to support and guarantee productive inclusion with the promotion of sustainable technologies, respecting the social organization system of traditional peoples and communities, valuing local natural resources and traditional practices, knowledge, and technologies.

The CNPCT's mission is to agree on joint action by representatives of the direct public administration and members of the non-governmental sector for the social, economic, cultural, and environmental strengthening of traditional peoples and communities. Created by the Decree of December 27, 2004, and modified by the Decree of July 13, 2006, the body has a deliberative and consultative nature. It is chaired by the Ministry of Social Development and Fight against Hunger (MDS) and secretariat by the Ministry of the Environment (MMA). It is also made up of other representatives from federal bodies and entities and non-governmental organizations, who meet every four months. These include the National Indian Foundation FUNAI (for indigenous peoples), the Ministry of Fisheries and Aquaculture (for fishing communities) and the Palmares Foundation (for quilombola communities). As a direct result of the body's work, the National Policy for the Sustainable Development of Traditional Peoples and Communities was drawn up with the main objective of promoting the sustainable development of these groups with an emphasis on recognizing, strengthening and guaranteeing their territorial, social, environmental, economic and cultural rights, respecting and valuing their identities, forms of organization and institutions.

FUNAI is the official indigenist body of the Brazilian state. Created by Law No. 5.371, of December 5, 1967, linked to the Ministry of Indigenous Peoples, it is the coordinator and main executor of the Federal Government's indigenous policy. Its institutional mission is to protect and promote the rights of indigenous peoples in Brazil. FUNAI is responsible for carrying out identification and delimitation studies, demarcation, land regularization and registration of lands traditionally occupied by indigenous peoples, as well as monitoring and inspecting indigenous lands. FUNAI also coordinates and implements policies to protect isolated and newly contacted peoples. It also promotes policies aimed at the sustainable development of indigenous populations. In this field, FUNAI promotes ethnodevelopment, conservation and environmental recovery actions on indigenous lands, as well as controlling and mitigating possible environmental impacts resulting from external interference on indigenous lands.

As mentioned, FUNAI, Brazil's main indigenous defense agency, is linked to the Ministry of Indigenous Peoples, a ministry of Brazil's executive branch chaired by activist Sônia Guajajara, whose duties are to guarantee indigenous people access to education and health, demarcate indigenous lands, and combat the genocide of indigenous people. It was recently created in response to the historical demands of the indigenous movement (being the first ministry created dedicated to indigenous peoples).

The priorities and structure of the Ministry have been drawn up in the Thematic Group on Indigenous Peoples created during the government transition after the 2022 presidential election. The Ministry of Indigenous Peoples is responsible for indigenous policy, the recognition, guarantee and promotion of the rights of indigenous peoples, the recognition of the demarcation, defense, exclusive usufruct and management of indigenous lands and territories, the well-being of indigenous peoples, the protection of isolated and recently contacted indigenous peoples, and also the implementation on national territory of international agreements and treaties, especially Convention No. 169 of the International Labor Organization, when related to indigenous peoples.

**(BR-L1623)**

### **Component 1 Narrative**

**Development of resilient production systems to reduce rural poverty**

## Summary

1	JUSTIFICATION	3
2	OBJECTIVES	6
3	SUBCOMPONENTS	7
3.1	<b>Subcomponent 1.1: Implementation of resilient and biodiverse production systems</b>	<b>7</b>
3.1.1	Objective	7
3.1.2	Strategic orientation and methodology	7
3.1.3	Planned activities and results	10
3.1.4	Running arrangement	18
3.1.5	Costs and reach	18
3.1.6	Achievement of targets	19
3.1.7	Timetable for the 6 years of implementation	19
3.2	<b>Subcomponent 1.2: Strengthening and diversifying commercialization</b>	<b>19</b>
3.2.1	Objective	19
3.2.2	Strategic orientation and methodology	19
3.2.3	Planned activities and results	21
3.2.4	Running arrangement	27
3.2.5	Costs and reach	27
3.2.6	Timetable for the 6 years of implementation	27
3.3	<b>Subcomponent 1.3: Incentives for innovation</b>	<b>28</b>
3.3.1	Objective	28
3.3.2	Strategic orientation and methodology	28
3.3.3	Planned activities and results	28
ii.	Execution Arrangement	29
3.3.4	Costs	30
3.3.5	Implementation schedule	30

## 1 Justification

Rural Paraíba, the Project's intervention area, faces a series of limiting factors that were considered when elaborating this component's intervention proposal.

### Rural Poverty and Extreme Poverty

According to data from the Single Registry (Cadastro Único) from March 2024 (MDS), there are 191,000 families in rural Paraíba classified as being in poverty or extreme poverty (Single Registry - Cadastro Único - bands 1 and 2). Given that the total number of rural households in the state is 251,125<sup>1</sup>, based on IBGE 2010 data, 76% of rural families in Paraíba are in poverty and extreme poverty. Comparing this to 2010 data, where 59% of households were in poverty or extreme poverty, it is evident that the rural population of Paraíba has become poorer. Contributing factors likely include more severe droughts, the COVID-19 pandemic, and the reduction in social inclusion programs. This trend aligns with Brazil's return to the Hunger Map, as reported by the United Nations.

In Paraíba, only 36% of the population is food secure, while the rest are classified as mild, moderate, and severe food insecure (II VIGISAN, 2021).

The HDI in 146 municipalities is considered low (70%), medium in 62 (29%), and high in 2 (1%). According to IBGE 2010, around 28% of the population has some kind of disability (visual, hearing, motor, or mental).

### Paraíba's biomes

Paraíba is characterized by the presence of two regions and biomes: (i) the semiarid region, the largest part of the state, characterized by the Caatinga biome, which includes 193 of the state's 223 municipalities, covering 92% of the area and 62% of the state's population, and (ii) the Mata Paraibana region, characterized by the Atlantic Forest biome, located in the far east, which includes 30 municipalities, representing 8% of the state's surface area and home to 38% of the population.

The semiarid region is a rural region, home to 85% of the state's rural population and with the worst social indicators. The average annual rainfall in the semiarid region ranges from 330 to 900 mm, with rainfall concentrated in a short period that rarely exceeds four months. The Caatinga was deforested at a rate of 0.28% per year (2,352 km<sup>2</sup> /year) between 2002 and 2008. Another problem that increases the vulnerability of family farming in the semiarid region is desertification. This is a complex phenomenon whose causes involve interactions between biophysical, socioeconomic, and demographic variables and which could be accelerated by climate change. Depending on the considered climate scenario, areas with high susceptibility to desertification could increase by between 12.3% and 19.6% by 2045.

Rainfall totals are higher in the Atlantic Forest, ranging from 1,300 to 1,800 mm per year. There is also a seasonality to the rainfall in the Atlantic Forest, with the wettest or 'winter' season generally extending from February to August. It is estimated that Paraíba's Atlantic Forest currently occupies only 13.8% of its original area in the region. The technical report "Atlas of Atlantic Forest Remnants - Period 2021-2022", published by the organization SOS Mata Atlântica, shows that deforestation is continuing in this biome (SOS-MATA-ATLÂNTICA, 2023). During this period, 20,075 ha of Atlantic Forest were lost, equivalent to 0.1% of its current area<sup>2</sup>. At the level of the Brazilian Atlantic Forest, current deforestation varies between 11,000 and 25,000 hectares per year, which is equivalent to an annual deforestation rate of between 0.05 and 0.125%. While this rate is significantly lower than during the period from 1985 to 2000, it remains a serious cause for concern.

### Inefficient production systems

According to the 2017 Agricultural Census, there were 163,218 agricultural establishments in the state of Paraíba. Of these, 125,489 (76.9%) were family farms, while 37,729 (23.1%) were non-family or patronal. Approximately 12% of family farms belong to Agrarian Reform settlers. Family farming occupies 42% of the state's agricultural area and is responsible for 47.8% of

---

<sup>1</sup> So far, the Demographic Census (IBGE 2022) has not provided the number of resident families segregated by urban and rural area. However, the IBGE has provided the geometric growth rate for the federation units, which in the case of Paraíba, was calculated as an increase of 0.45% in the intra-census period. In this case, this rate was added to the previous census figure of 250,000 households.

<sup>2</sup> Currently, there are approximately 20 million hectares of Atlantic Forest in Brazil, according to the SOS Atlantic Forest Atlas 2017. (SOS-MATA-ATLÂNTICA, 2017).

the total value of agricultural production, which is the second-highest proportion in the Northeast and the sixth-highest nationally. In the region of the Atlantic Forest, 20.16% of the area is occupied by family farms, while it reaches 50.75% in the Semiarid region of Paraíba.

Agricultural production is the main economic activity of most of the rural population in general and, in particular, family farming. The 2017 Agricultural Census highlights the following productions for their contributions to the total value of production: i) poultry, cattle, goats, and sheep account for 92% of the value of livestock; ii) permanent crops, bananas, passion fruit, Bahia coconut, and tangerines are the main productions in terms of value, and iii) pineapple, corn, cassava and sugar cane are the most important temporary crops. Family farming in Paraíba faces very severe and challenging conditions, especially in the semiarid region, which include low income, low productivity in farming activities, difficulties in accessing water for human consumption and production, and high risk related to climatic events. To increase the production, productivity and income of family farming, several obstacles must be resolved. These include limited access to finance for essential investments, limited access to technical assistance and rural extension that supports the learning of new technologies and techniques, challenges in accessing markets and integrating producers into value chains. These issues are further compounded by the weakness of rural organizations. According to the 2017 Agricultural Census, only 11.7% of agricultural establishments have access to water for irrigation. In addition to the low productivity of agricultural activities that depend on the availability of water, unsuitable production techniques are also used. For example, 32% of family farming establishments use pesticides, and 39% do not adopt any conservation practices (IBGE 2017). In the case of mechanization, out of 130 farmers, only 1 has access to a tractor, seed drill, or similar (IBGE 2017). Less than 1% of the family farming establishments applied lime or another soil pH corrector (IBGE, 2017). 67.4% of family farming establishments have implemented soil preparation systems.

The data from the 2017 Census shows that the majority (53%) of the producers responsible for the establishments are over 55 years old. Less than 10% are under the age of 35. These figures follow a national trend of a shrinking percentage of young people in rural areas while the rural population is getting older. This situation highlights the challenges of providing opportunities and prospects for young people and, at the same time, conditions for the older population to maintain agricultural activity and quality of life. This data, when added to the data on very low mechanization (see data below), can create obstacles to achieving greater productivity.

### **Land structure**

In the state, 54% of establishments have up to 5 hectares and, of these, 13% have less than one hectare, which characterizes extremely small areas for agricultural production, especially when considering the semiarid climate. Furthermore, around 15% of family farming establishments do not have guaranteed access to land (IBGE 2017).

### **Climate change and environmental degradation**

Climate change is causing significant losses in the productivity of some important crops for family farmers, such as cassava, beans, bananas, and corn.. Paraíba is among the states most at risk of losses, along with Ceará, Piauí, and Pernambuco. Production systems are largely not adapted to the increasing water scarcity or to the context of climate change in general. The combination of more intense droughts, increased desertification, and more heat extremes could jeopardize agricultural activities, especially those of family farmers, and disrupt local and regional food markets.

In the Atlantic Forest region, climate risks are more related to extreme rainfall events that cause floods and landslides. Agricultural production will be affected by reduced produce quality and crop losses due to the increased occurrence of diseases and soil erosion. These problems are compounded by poverty and the population's limited access to public policies aimed at reducing their vulnerability to climate change.

There is also a major problem of soil degradation due to the use of unsustainable practices on cultivated land, such as the systematic use of slash-and-burn, which has resulted in greater exposure of soils to the elements (SOS-MATA-ATLÂNTICA; INPE, 2015). The degradation of the environment has had a significant impact on the water cycle, as deforestation leads to a decrease in water infiltration and greater erosion. This has reduced the flow of water and led to the silting up of the region's watercourses (BRASIL-MDA-SDT, 2010), reducing the availability of water in the region (SILVA; BRUNO; AGUIAR; SOUSA FILHO *et al.*, 2020). In addition, the combination of the processes mentioned here has a significant negative impact on biodiversity. From a long-term

perspective, the sum of these factors (including predicted climate change) is expected to lead to more frequent extreme events (e.g., droughts and floods), which could trigger a significant loss of environmental quality. This, in turn, will have a direct effect on the productive potential of agricultural systems and on the population's quality of life.

### **Inadequate and insufficient Technical Assistance (TA) system**

Only 17% of family farming establishments in Paraíba have access to the TA service<sup>3</sup> (IBGE 2017), and 83.4% report that they receive it from the government (federal, state, or municipal). In addition to this low coverage rate, there is a lack of preparation and qualification of technicians from the point of view of knowledge of agroecological practices, which allow production systems to adapt to climate change, among other aspects (Information gathered during the field design mission). Without the support of qualified professionals, farmers are prevented from implementing more intensive, sustainable, and efficient agricultural practices, as well as adapting to climate change and the challenges of market access and access to finance. It is important to relate this data to the profile of the producers. In 2017 (IBGE), in 47.4% of the establishments that reported applying pesticides, the responsible person could not read nor write, and in 80.4% of the cases, the pesticide was applied without any technical guidance. Regarding credit, 17% of family farming establishments reported having had access to it in 2017.

### **Mechanization**

In the family farming establishments, most agricultural operations are carried out manually. Data from the 2017 Agricultural Census shows that only 0.8% of the farms in Paraíba have at least one type of machinery. The machinery and implements used are not always adequate or used appropriately. This lack of mechanization and the low availability of labor constitute a set of limiting factors for developing more efficient and relevant practices.

### **The challenge of digital inclusion**

Access to rural telephony and, above all, the internet is scarce in rural areas. According to studies by the Ministry of Agriculture and Livestock (MAPA), currently, more than 70% of rural areas nationwide do not have access to the internet<sup>4</sup>.

### **Low participation Specific difficulties for vulnerable groups (women, young people, LGBTQIAPN+ people, and residents of traditional communities)**

Data from the latest Agricultural Census of 2017 (IBGE) shows gaps in relation to vulnerable groups: Of all the family farming establishments in Paraíba, 76 % are run by men and only 24 % by women. Among family farming establishments, 64 % are run by people who say they are black or brown, 11.3% by young people under 35, and 0.9% by indigenous people. In terms of average area (ha), establishments run by men are 80.6% larger than those run by women. While establishments run by women have an average of 7.12 hectares, those run by men have an average of 12.86 hectares. Of the family farms in the Project area that have access to water for irrigation, 6.7% are run by women, while 13% are run by men. Among female family farmers, 4,486 received TA (14.9% of the total), while 16,637 male family farmers (or 17.4% of the total) received TA. In the Single Registry (Cadastro Único), there are 6,328 indigenous families registered, 73.1% of whom live in poverty or extreme poverty, and 4,295 quilombola families registered, 67.9% of whom live in poverty or extreme poverty. Considering the families of artisanal fishers, 80.7% of them are in extreme poverty or poverty. This is a gap of 12.4% in relation to the poverty and extreme poverty situation of all registered rural families. Finally, among riverine families, 72.6% are in poverty or extreme poverty, a gap of 6.5% compared to rural families in the Project area.

### **Limited participation in collective organizations**

Only 3.7% of rural producers in the state are members of cooperatives, and 29.4% are members of associations (IBGE 2017). Enterprises that package, process, and market products have also encountered many difficulties. There are around 8,700 processing units in the Project area (IBGE 2017). According to MDS 2018, there were 77 enterprises in the northeastern region registered and able to offer their products to government buyers. Of these, only 7 are from Paraíba (10%).

### **Family Farming Cooperatives**

---

<sup>3</sup> The average in the Northeast region was 7% in the 2017 Census.

<sup>4</sup> Source: Link - <https://www.gov.br/agricultura/pt-br/assuntos/inovacao/agrohub-brasil/produtores-rurais/internet-no-campo-1/internet-no-campo>.

The cooperative-type economic organizations present in the state focus on the collection, processing, and marketing of production, with the main chains being milk (bovine and caprine) and fruit. These organizations have weaknesses in terms of the capacities of their management teams on issues such as i) administrative and financial, including access to sources of working capital financing, ii) the ability to design and implement innovative and diversified marketing strategies, iii) the composition of teams with little representation of women and young people. These organizations also have important limitations in their production infrastructure, which does not always allow them to diversify their products or comply with health and environmental legislation. Most organizations do not use renewable energy sources in their processes, nor do they adequately treat their waste.

This set of factors limits these organizations' ability to function and their viability. As a result, producers access the market precariously and at low prices, with difficulties in adding value to their production. In this context, intermediaries predominate. Family farmers have limited marketing channels, dependent on local sales. According to FNDE data, Paraíba's PNAE received only 2% of the program's total resources in 2022. In relation to the northeast, this result puts the state only ahead of Sergipe, Rio Grande do Norte and Alagoas. It is worth noting that the PNAE is an important means of marketing family farming products.

### **Basic Sanitation**

Article 3 of Law no. 14.026/2020 considers Basic Sanitation to be a set of public services, infrastructures, and operational facilities for: i) drinking water supply, consisting of the activities and the provision and maintenance of infrastructures and operational facilities necessary for the public supply of drinking water, from collection to building connections and their measuring instruments; ii) sanitary sewage (collection, transportation, treatment and adequate final disposal of sanitary sewage) and iii) urban cleaning and solid waste management (collection, transportation, transshipment, treatment and environmentally appropriate final disposal of household solid waste).

Regarding drinking water supply in the state, the Water and Sanitation Institute reports that in 2019, the rural service rate reached 24.16 % (in Brazil, the rate is 30.77%) through the implementation of systems with a distribution network and simplified chlorine disinfection treatment, guaranteeing the potability of the water. In other situations, fountain-type systems are implemented without a distribution network and with chlorine disinfection treatment. Finally, when there is no possibility of implementing one of the above solutions, the construction of cisterns for human consumption becomes the only alternative.

As for the sanitary sewage situation, the rural service rate in Paraíba is 18.82% (Instituto Água e Saneamento, 2020), significantly below the national average of 42.54%. It is worth mentioning that in the costal micro-region, this percentage is 1.04%, showing the great precariousness of this region of the state. Most of the sewage is covered by septic tanks and/or sinks, but the treatment units have no control over the disposal of sewage effluent, either on the ground or in water bodies, making it yet another polluter of the environment. In addition, some of these septic tanks are of the black tank type, where the sewage is dumped directly in the ground. In these areas it is common to find sewage running out into the open and even houses without toilets.

The set of vulnerabilities outlined in this chapter, coupled with climate change, puts the region's production systems in crisis and in a vicious circle in which the processes of social and environmental degradation fuel the impoverishment of rural families and increase migration to urban areas.

## **2 Objectives**

The aim of this component is to increase the adoption of agricultural technologies, including those for adapting to and mitigating climate change, as well as improving the productive and social inclusion of family farmers, prioritizing women, young people, Traditional Peoples and Communities (PCT) and Persons with Disabilities.

The specific objectives are:

- Transform existing systems by introducing innovative, more intensive, and diversified agroecological practices;
- Seek greater resilience of production systems adapted to climate change;
- Promote improved food security and nutrition;

- Improve the integration of producers into value chains, prioritizing women, young people, people with disabilities, Traditional Peoples and Communities (PCT), indigenous peoples, fishing communities and gypsies;
- Make investments in social technologies, ensuring better access to and reuse of water, and sustainable energies;
- Support producer organizations (associations and cooperatives) to enable production to be processed, adding value and consequently improving marketing and market access through investments in machinery and minor renovations;

Productive investments, both in the communities and in the cooperatives, will be accompanied by technical assistance (TA) and specialized technical assistance (STA), respectively, financed by Component 2, so that better business management, marketing, and sustainability can be guaranteed.

### 3 Subcomponents

Component 1 is organized into three sub-components: 1.1: Implementation of resilient and biodiverse production systems ; 1.2: Strengthening and diversifying commercialization; and Sub-component 1.3: Incentives for Innovation.

#### 3.1 Subcomponent 1.1: Implementation of resilient and biodiverse production systems

##### 3.1.1 Objective

The aim of this sub-component is to strengthen and adapt production systems based on the implementation of agroecological practices and low greenhouse gas emissions, seeking greater resilience and allowing for an improvement and diversification in the production of healthy food for self-consumption and the market. It is expected that these activities will improve families' food security and nutrition while at the same time helping to improve their income.

Investments will also be made in social technologies (small water and energy infrastructures), which play a fundamental role in building and strengthening more resilient production systems and improving the basic living conditions of families.'

The technical characteristics of the production proposals supported by the Project will be adapted according to the specific agro-climatic characteristics of each biome.

##### 3.1.2 Strategic orientation and methodology

Resilient Investment Plan (PIR, according to the Portuguese acronym): This will be the main instrument for planning and implementing the resources of this subcomponent. Each PIR will have a territorial focus and will be prepared with one or more communities, with the support of agroecological TA. Each PIR will be carried out by an existing community association, representing the beneficiary community or communities, with which the Project will sign an agreement establishing its obligations and rights. The Project will transfer the defined funds to the association, which will make the procurements and contracts established in the PIR, reporting back to the Project with the support of technical assistance.

The scope of the PIR will be a Local Territory<sup>5</sup>, consisting of up to three communities, and its beneficiaries will be the families of these communities. The PIR will support productive activities (new or reinforcing existing activities) aimed at adapting to climate change, with the potential to guarantee food security and improve income by marketing surpluses. The PIR aims to incorporate concepts of good production practices based on the principles of agroecology, nutritional education, and food security for families, as well as ensure integration with social technologies.

The PIR will finance three axes of intervention: i) Production and commercialization, ii) Environmental, and iii) Social Technologies, between which complementarity and synergy will be sought to promote sustainable change, as shown below:

**Production and commercialization axis:** The aim will be to develop productive systems at the family level, always based on the use of agroecological practices and with a low impact on greenhouse gas emissions, such as: (i) agroforestry systems (AFSs) for diversified production; (ii) agroecological backyard gardens for the production of fruit, vegetables including PANC<sup>6</sup> and medicinal plants; (iii) beekeeping and meliponiculture; (iv) agroecological consortia for organic production including cotton; (v) goat

<sup>5</sup> This spatial unit is specific to PROCASE II and was defined when the Project was being drawn up, for the purposes of planning and implementing actions.

<sup>6</sup> Unconventional Food Plants

farming for milk and meat with fodder AFSs; (vi) dairy cattle farming with fodder AFSs; and (vii) free-range poultry farming with fodder AFSs. The list is not exhaustive and other activities may be considered if they are in line with the demands of the beneficiaries and the objectives and criteria of the Project. It is important to mention that in the case of support for cattle breeding, the Project's strategy will be to support dairy production exclusively (it will not be possible to support breeding for meat production), to improve productivity from the existing herd and will not finance the purchase of animals, except for the purchase to replace breeding stock. This axis will also strengthen the capacity to market production in the various channels accessible to families (local fairs, PAA, PNAE, local commerce, etc.) and relevant to the beneficiaries.

Compared to the first phase of PROCASE, which focused exclusively on the semiarid region of the Caatinga biome, the PROCASE II management team will have to pay close attention to identifying relevant proposals for developing productive activities with the potential to adapt to climate change in the Atlantic Forest biome.

All the activities supported under this Productive and commercialization axis will be in accordance with the Environmental and Social Management Plans (ESMP) of each PIR and with the project's Strategic Environmental and Social Management Plan (SESMP).

Extractivism, both in the Caatinga biome and in the Atlantic Forest biome, could also be supported through PIRs, both to enhance non-timber products such as fruit, fibers and lianas, seeds, honey from native bees, and other bio-economic products. As the Project area includes an important coastal area, the improvement of artisanal fishing activities, including shellfish gathering, which is generally carried out by women, could be considered when drawing up the PIRs.

In addition to the activities mentioned above and considering that part of the Project's area of operation has strong potential, economic diversification activities based on tourism (particularly in the coastal Atlantic Forest) and handicrafts could be developed through the PIR. These non-agricultural activities, which generally involve women and young people, will be very relevant and in line with the project's objectives.

The Productive and Commercialization Axis will focus on activities to sustainably strengthen primary production and the commercialization of products generally *in natura* and on the local market. It will be encouraged and supported through agroecological TA and the establishment of partnerships with cooperative production processing units, supported by the Project through subcomponent 1.2. This should make it possible to add value to primary production to reach other types of market.

**Environmental Axis:** The aim is to manage and restore the environment at the Local Territory level, whether it is associated with the activities of the PIR's Productive Axis.

The PIRs will have specific and collective resources to encourage the implementation of territorial environmental activities, such as: i) Casas de Sementes da Paixão<sup>7</sup>; ii) Implementation of nurseries focused on the production of native species; iii) Reforestation, recovery of permanent preservation areas (such as springs, riparian forests, areas with a slope of more than 45°, etc.) and degraded areas; iv) Soil and water protection activities; v) Recycling or composting plans, amongst others. It was agreed during the design of the Project that in the PIRs that will support the production of bovine milk, the resources of the environmental axis will be primarily allocated to the recovery of degraded areas. These activities will be implemented in each territory by an environmental management group made up of project beneficiaries, in which the participation of Local Development Agents (ADL, according to the Portuguese acronym)<sup>8</sup> will be prioritized, as key players in introducing environmental education activities and new environmental practices. To implement these activities, synergies and complementarities will be sought with the activities, and competencies of SEMAS (Secretariat for the Environment and Sustainability), AESA (Executive Agency for Water Management), the State Environment Superintendence (SUDEMA), and the National Semiarid Institute (INSA), Brazilian Agricultural Research Company (EMBRAPA), Paraíba Research, Rural Extension and

---

<sup>7</sup> In Paraíba, several civil society organizations have organized themselves in recent years to support community initiatives around the preservation and dissemination of transgenic-free Creole seeds, known as Sementes da Paixão (Seeds of Passion).

<sup>8</sup> One ADL per PIR, financed by Component 2. The ADLs are young people selected from the community who are paid for two years to help TA and the Project in mobilizing the community and in communication between the community and the Project.

Land Regularization Company (EMPAER), Federal University of Campina Grande (UFCG), State University of Paraíba (UEPB), and Federal University of Paraíba (UFPB), among other institutions.

The activities of the Environmental Axis may result from the Environmental and Social Management Plans (ESMP), which will be drawn up at the same time as the diagnosis of each PIR. The ESMPs will provide a simplified analysis of environmental and social impacts to promote and encourage the adoption of environmental and agroecological practices. Environmental activities will be carried out with the support of TA, which will also support production and commercialization.

**Social Technology Axis:** The aim of this axis is to implement social technologies at the family level, such as: i) 2<sup>nd</sup> water cisterns (agricultural production); ii) grey water reuse systems; and iii) trench dams (underground dams). In addition to these technologies, 1<sup>st</sup> water cisterns (for human consumption) and other household sanitation solutions will also be implemented, such as evapotranspiration basins or access to more sustainable domestic energy, such as biodigesters and eco-efficient stoves. The social technologies will be implemented by entities contracted by the Project Management Unit (PMU) specifically to provide TA for this axis, considering the specific nature of social technologies and the legal framework. These entities will be trained by PROCASE II, although most of them have the experience to do so. In addition to implementation, these organizations will also provide training to ensure that these technologies are properly appropriated, used and maintained by the families.

The connection and complementarity between the productive, environmental, and social technology axes should be sought and highlighted when drawing up the PIRs, with the aim of maximizing the results of the investments made by the Project.

In each of these areas, the introduction of innovative practices and technologies will be prioritized, in particular those that will be supported through Subcomponent 1.3, such as mechanization and the use of tools and equipment adapted to the reality of family farming, with a focus on vulnerable groups such as women, young people and persons with disabilities.

The PIRs could also support the strengthening of the functioning of community associations by purchasing specific equipment, for example, to improve connectivity (access to the internet), access to audio-visual material, etc.

### **General aspects of PIRs**

During the implementation of the PIRs, in addition to close and permanent synergy with TA activities (including STA where justified), strengthening community organizations, and supporting innovation, complementarities will be established with other Component 2 activities, such as: land and environmental regularization; activities related to diversity, gender, youth, PCT and families with persons with disabilities.

The PIR will benefit groups of families, prioritizing women, young people, traditional communities, and persons with disabilities, and will finance inputs, tools, equipment, and other investments needed to enable the adoption of technologies to improve productivity, adapt to climate change and improve food security and nutrition.

The investments will be financed with non-reimbursable resources and with a financial or economic counterpart from the beneficiaries of at least 10%.

In all cases, the selected activities will come from the Participatory Rural Diagnosis, which will identify not only the demands, but also the problems, priorities and potential demands of the beneficiary communities and families. These activities must meet eligibility criteria that will be detailed in the Project Operational Regulations (ROP) and present: i) high adherence to the productive means characteristic of the biome, region, and community, ii) allow productive intensification based on the principles of agroecology, as well as adaptation to climate change and iii) follow the full agreement of the involved families.

The same PIR can support more than one productive activity or environmental axis and include the implementation of various types of Social Technologies, thus seeking coherence with the reality of family farming to meet the demands of the communities in a diversified way and guarantee the inclusion of various profiles of beneficiaries, particularly women and young people. In these cases, the beneficiaries will be organized into interest groups around the selected activities to make up the PIRs.

During the process of drawing up the PIRs, the integration of new members and partners into existing organizations will be encouraged, giving priority to women, young people, and families with persons with disabilities.

### **Provision of Agroecological Technical Assistance (TA) services**

All PIR beneficiaries and their organizations will receive agroecological TA for a period of three and a half years (Annex "Promoting Agroecological Transitions in Brazilian IFAD Projects"<sup>9</sup>), contracted by the PMU through a competitive process that meets IDB/IFAD standards. These services will be financed by Subcomponent 2.1, which presents them in detail. They should enable the beneficiaries to be strengthened and advised on how to design, implement, monitor the operation of, and complete the PIRs. This includes advice on agroecological production and adaptation to climate change, management, organization, access to public policies and marketing, guaranteeing compliance with current health and environmental legislation. The support provided by the TA entities should include support for the beneficiaries in carrying out the procurement and accountability processes related to the implementation of the PIRs, considering that the financial resources will be transferred to the beneficiary associations through a procedure defined in the ROP. In the selection of TA services, criteria will be applied that allow for the inclusion of women technicians in the teams, being as adherent as possible to the specific needs of women and to proposing more appropriate solutions for the women beneficiaries of the Project's activities. For example, it will be a selection criterion for TA organizations to have a minimum percentage of 30% women on their teams.

In the case of monitoring the implementation of Social Technologies, a specific TA will be contracted for this purpose, which complies with the legal framework for contracting services for this modality. The entities contracted in this way will be responsible for acquiring materials, providing specialized services for the construction of Social Technologies and training beneficiaries to apply good usage and maintenance practices.

### **3.1.3 Planned activities and results**

#### **Identifying communities**

To select the communities, a field survey will be carried out by a state agency, coordinated, and supervised by the PMU and with the support of the Regional Project Management Units (RPMU), to survey the characteristics of the communities based on a list of criteria and the methodology defined in the ROP.

#### **Community eligibility criteria:**

To be eligible, communities must meet the following criteria:

- i) Be rural communities of family farmers who are engaged in agricultural or non-agricultural activities aligned with the productive activities of the Project;
- i) High percentage of families registered in the Single Registry (Cadastro Único);

Based on this survey, a list of communities with the profile and characteristics to receive investment and support from the two components will be drawn up in each Rural Territory.<sup>10</sup>

#### **Prioritization and selection of communities:**

From this list of identified communities, the Project team will visit the communities (between 5 and 10 per municipality) to validate the data provided during the identification.

#### **Criteria for prioritizing communities:**

- i) Being a traditional and indigenous community (quilombola, indigenous, artisanal fishers, others);
- ii) High rate of families registered in the Single Registry (Cadastro Único);
- iii) High proportion of families needing a cistern for drinking water and sanitation;
- iv) Prioritize families that have not benefited from other projects that finance similar activities to those that the PIR will finance;

---

<sup>9</sup> The annex describes how the concept of agroecology is applied in IFAD projects in Brazil, and specifically in the PROCASE II Project.

<sup>10</sup> Rural Territory: Paraíba is divided into rural territories that identify and prioritize their specific needs. These territories collaborate on common policies across municipalities and present their demands to the state government. This approach aims to ensure that public policies for family farming effectively reach the rural population.

- v) A high proportion of families represented by women and young people and families with persons with disabilities;
- vi) Evidence of environmental degradation (using appropriate monitoring platforms for environmental degradation);  
and
- vii) No or low level of access to TA services.

Once the field assessment has been completed, the PMU team will draw up a prioritization list of communities by Rural Territory, which will be presented and validated at a plenary meeting in each Territorial Council, ensuring the selection process is legitimate and recognized by other local stakeholders.

The entire process of identifying, prioritizing, and selecting communities will be carried out under the supervision of the PMU during the first few months of Project implementation. Ideally, this process should be prepared and initiated before the Project's official start (leveraging the possibility of retroactive financing) to prevent potential delays in the initial phase of the Project.

At the end of this stage, all the communities in which the Project will carry out some kind of activity will be selected. It has been estimated that the Project will be able to work in approximately 600 communities.

For reasons related to implementation, the work of ATER, the ADLs and the creation of local dynamics and synergies, these 600 communities will be organized into small groups of up to 3 surrounding communities (or the equivalent of approximately 100 families), thus constituting a Local Territory. As part of the Project design process, 3 communities per Local Territory were considered, thus reaching around 200 Local Territories and, consequently, 200 PIRs. This organizational model in Local Territories has been used in other projects (especially in Bahia with the Gente de Valor and Pró-semiárido projects), with beneficial outcomes for both Project execution and enhancing the beneficiaries' organizational processes.

Each PIR will be prepared and implemented with an existing community association that is able to make this commitment to the Project. This formalized association will represent all the communities that make up the Local Territory and will be selected based on its organizational capacity and experience.

#### **Participatory Rural Diagnosis for PIR**

In each selected community, the TA entity will draw up the PIR together with the communities, starting with a Participatory Rural Diagnosis, to characterizing the problems and challenges (productive, environmental and social) affecting the communities and rural families, identifying the needed investments to solve them, and collecting all the data and information needed to draw up the activities that the Project will implement through the PIRs.

The aim of the diagnosis is to

- i. Evaluate the community's characteristics regarding the productive activities to be supported (availability of natural resources, potential adaptation to climate change, viability, etc.);
- ii. Collect technical data on production capacity and market access, identifying potential and related risks;
- iii. Analyze the state of conservation of vegetation cover, biodiversity, soil and water resources and the ways in which these natural resources are used for productive purposes;
- iv. Survey the social characteristics of the beneficiaries, their previous experiences and forms of organization, collective management capacity and level of social organization;
- v. Collect data on obtaining the Declaration of Aptitude for PRONAF (DAP) and registering families in the Rural Environmental Registry (CAR);
- vi. Identify the needs of the families and the association about TA to strengthen capacities relating to productive issues, adaptation to climate change, organizational capacities, management, and governance;
- vii. Identify the characteristics and socio-productive needs of each group, and in particular the priority groups - PCT, women, young people, and families with persons with disabilities;
- viii. Identify the needs, relevance, and modalities for carrying out environmental recovery activities;
- ix. Identify the demand for access to water for production (52,000-liter cisterns and reuse of grey water);
- x. Identify the need for and the situation regarding access to other social technologies for collecting, storing, and reusing water, sanitation, improving energy consumption, such as biodigesters, access to renewable energies, and waste management;
- xi. Identify the connectivity situation in terms of internet access;

- xii. Identify the land ownership situation of the association's members;
- xiii. Identify access to public policies;
- xiv. Identify the environmental and social risks of the supported production activities in accordance with social and environmental safeguards;
- xv. In the case of PCT, survey the specific forms of organization (collective work and production, for example) and management of natural resources, characteristics of socio-cultural habits; and
- xvi. Assess the potential for coordination with other local stakeholders.

Drawing up the diagnosis will be a participatory process, with consultations carried out through successive collective meetings with all the members of the association and specific meetings with women and young people, thus enabling the identification of demands. These consultations will be complemented by visits to the farms and production areas. It is estimated that it will take a maximum of two months to prepare the diagnosis.

The diagnosis should point to the activities that could be carried out in the community and will therefore be the basis for drawing up the PIR, as well as gender, diversity and youth activities and land and environmental regularization.

Once the diagnosis has been drawn up (within a maximum of 2 months), it will be validated by all the beneficiaries in a collective meeting.

### **Drawing up PIRs**

Once the diagnosis has been completed, the PIRs will be drawn up. This process will be participatory and conducted by TA entities previously contracted and trained by the PMU to draw up and implement the PIRs (see details on capacity building in subcomponent 2.1). Throughout the elaboration process, the RPUMs will play an important support and quality control role. Each PIR will be drawn up and implemented with technical support from the same TA organization, thus ensuring greater commitment, quality, and continuity throughout the process.

The scope of the PIR will be the territory of the selected communities and all the families in these communities. During the preparation process, new families will be encouraged to join the associations, particularly those represented by young women and families with persons with disabilities, to expand the scale of work and encourage the integration of this public.

For the design of the Project, it was estimated that each PIR will cover an average of 90 families from the Project's target groups, selected according to the criteria presented above and detailed in the ROP. The PIR will support productive activities in the community (new or consolidating existing activities) with potential for commercialization, incorporating concepts of sustainability and agroecology, good production practices and environmental resilience, nutritional education, and food security and nutrition for families, encouraging nutritious and diversified diets, expanding agri-food diversity, as well as ensuring integration of social technologies.

Agricultural activities with the region's main production systems and non-agricultural activities (such as handicrafts, community-based rural tourism, etc.) can be supported. The same PIR may support more than one productive activity, provided it is justified and has the potential to be viable. In these cases, the beneficiaries will be organized into interest groups around each activity, and the same beneficiary may not participate in more than one group. The Project's methodology will be based on strengthening and establishing synergies and complementarities with existing dynamics developed with other actors and projects present in the Rural Territories (COOPERAR Project, Project Dom Hélder Câmara III, and Sertão Vivo Project (PCRP)).

The PIR will be drawn up based on the data collected during the diagnosis (see Annex PIR structure, at the end of this document). The same TA team that carried out the diagnosis will conduct this work, following the methodology defined in the ROP, (with reference to the methodology of the System for Financial Analysis of Productive Projects<sup>11</sup> (SAF-PP) developed by IFAD/ Project Semear and applied in various projects). The SAF-PP that is used in other projects funded by IDB/IFAD, for example, in Piauí, and is now under the guidance of the Federal University of Viçosa (UFV), and must be acquired by PROCASE II and adjusted to fit its features.

---

<sup>11</sup> The system allows you to enter all the information relating to the investments made and the projections of costs and results to calculate the main economic and financial evaluation indicators.

The PIR should describe the initial situation of the families, the investments to be made and the expected results for the three axes (productive, environmental, and social technologies). Investments should always consider the integration of innovative practices for the sustainable use and management of natural resources appropriate to the local context, conservation practices for each biome and other low greenhouse gas emission agricultural techniques that maximize the provision of ecosystem services.

The PIR's strategy and methodology will be based on agroecological practices, combining sustainable production intensification with the conservation of natural resources, and promoting a paradigm shift to transform current practices into adaptive and resilient models, increasing diversity (biological and productive) and resulting in an improvement in the quality of life of beneficiary families. The Project will not be able to finance the purchase of pesticides and other synthetic inputs, but only inputs aligned with the principles of agroecology.

Due to the importance of supporting commercialization, the PIRs will define and support market access strategies and may also allow for the acquisition of the necessary material (stalls for fairs, scales, boxes for transporting products, visual identity material, etc.). In these commercialization strategies, access to the PNAE and PAA will be considered. Given the importance of valuing access to markets for agroecological products and those produced in traditional communities, courses and workshops will be held by TA entities for the beneficiaries, to present the conditions for obtaining the Quilombos and Family Farming labels, among other possibilities. With the participation of representatives of the beneficiaries and the TA teams, these courses should help to structure the productive activities of the PIRs, contributing to their economic viability. The PIRs' market access activities should be linked to the activities envisaged under subcomponent 2.2 - Strengthening organizations' commercialization capacities.

When drawing up the PIRs, prioritization criteria will be applied so that women, young people and persons with disabilities can be involved and be direct beneficiaries of the Project's activities, particularly in the processes of processing, access to markets and the use of new technologies, including virtual commerce and other digital solutions.

A feasibility and financial profitability study will be carried out using the SAF-PP system by TA (who will have received training for this) on a realistic projection basis, assessing the expected increase in income per family, considering self-consumption of production. The selected PIRs must demonstrate technical, economic, financial, and environmental viability and sustainability.

### **Criteria for drawing up PIRs**

The PIRs will be drawn up considering the following criteria (see details in the ROP):

- I. Number of families: a PIR can serve no fewer than 30 families and no more than 120;
- II. The name and CPF<sup>12</sup> of each representative member of the beneficiary family will be attached to the PIR;
- III. The amount of funding from the Project cannot exceed: USD 1,900 per family for the productive axis, USD 100 per family for the environmental axis and USD 786 per family for the Social Technologies axis, totaling USD 2,786 per family as the maximum investment;
- IV. The minimum amount of Project resources per PIR is USD 83,580 and the maximum is USD 334,320;
- V. The funds from the Project will be non-reimbursable. The beneficiaries must provide a counterpart of at least 10% of the amount financed by the PIR, which can be either financial or economic, such as labor, goods and services directly related to the implementation of the PIR;
- VI. Priority will be given to PIRs for associations and/or interest groups in which more than 50% of the beneficiaries are women, or which are led by women;
- VII. Priority will be given to PIRs for associations and/or interest groups with at least 20% young beneficiaries of the activities funded;
- VIII. Priority will be given to PIRs for associations and/or interest groups with at least 5% of PCT beneficiaries;
- IX. The funds allocated to the PIR can finance goods for collective use (e.g., a milk cooling tank or a forage harvester) or for family use (setting up a fodder production field or pruning tools, etc.);

---

<sup>12</sup> "Cadastro de Pessoas Físicas" (Natural Persons Register)

- X. The PIR should define the rules for the use, maintenance, and management of collective assets;
- XI. The PIR should define the forms and modalities of access to the market for production from the PIR and the connection with processing units, particularly those financed by the Project;
- XII. Describe the needs and points of attention in terms of TA and strengthening the capacities of the association and its members;
- XIII. To highlight the investments and activities carried out to adapt production systems and organizations to climate change, as climate investments;
- XIV. Beneficiaries who have not registered in the CAR at the drafting stage must do so in the initial phase of implementing the PIR with the support of TA and the PMU team.
- XV. The community must be represented by an entity that has been legally constituted for at least two years;
- XVI. Entities must be in good standing with the Federal, State and Municipal Revenue Service.

For the design of the PROCASE II Project, four PIRs were drawn up to form a sample for the Economic and Financial Assessment. Based on field visits and analysis of secondary data, the following production activities were selected: i) Improving bovine milk production by implementing AFS, ii) Improving goat milk production by implementing SAF, iii) Implementing irrigated backyard gardens for fruit and vegetable production and iv) raising poultry for egg and meat production. These activities were selected because they have strong potential, present good integration in the socioeconomic and agro-environmental context and can be in individual or collective areas.

It is important to note that the four PIRs that were drawn up as a sample during the design of the Project will have to be updated (mainly in the financial part, to take account of changes in procurement costs, and to update the list of intended beneficiaries, which may change between the design and the start of implementation).

During the design phase of PROCASE II, it was not possible to draw up sample PIRs for a group of communities organized in a Local Territory. The four sample PIRs therefore include only one community.

The ROP will detail the items that can and cannot be financed with the PIRs. The main ones are as follows:

**Investments eligible for PIR funding:**

The Project will finance the investments needed to make the PIRs viable. These investments can be classified into three groups. The extended list of eligible investments is available in the ROP:

- i) Group 1 - Non-Consulting Services. This group includes investments associated with hiring technical-operational services, such as transportation, application of inputs, installation of equipment, vehicle rental, TA for producers, among others;
- iii) Group 2 - Assets. This group includes investments associated with the purchase of inputs, such as seedlings or seeds, and equipment for the production, processing, marketing, and distribution of the PIR products to be promoted;
- iv) Group 3 - Works. This group includes investments associated with the provision or renovation of productive structures and/or economic infrastructure, such as drilling wells and processing units, with a maximum of 20% of the value of each PIR. If this percentage is exceeded, a no-objection request must be made to IDB and IFAD, which will analyze each specific case.

**Types of Climate Adaptation investments that can be financed by investments in the PIRs:**

- Implementation of good ecological fertilization practices (such green manures) in areas vulnerable to climate change;
- Implementation of erosion and soil erosion management technologies in areas vulnerable to climate change,
- Implementation of crop protection technologies in critical areas, with Nature-based Solutions concepts ;
- Implementation of technologies to recover soil degraded by salinization in areas vulnerable to climate change. The use of correctors such as organic matter and the insertion of microorganisms to accelerate processes will be supported;

- Productive diversification in crops and livestock in areas most vulnerable to climate change. Avoid monoculture and invasive exotic species (particularly in AFSs). Encourage crop rotation, permanent vegetation cordons, among other techniques;
- Integrated pest and disease management in areas most vulnerable to climate change, considering restrictions on the use of pesticides and genetic manipulation (transgenics);
- Management of natural pastures to guarantee animal feed and reduce vulnerability to climate change. The ESMP (Environmental, Social and Climate Management Plan) will consider monitoring to prevent undue deforestation to establish pastures;
- Improvement and transfer of genetic resources in plantations and genetic improvement to increase their resilience to climate change;
- In situ and ex situ conservation of biodiversity to increase resilience to climate change;
- Added value of agricultural products in value chains vulnerable to climate change;
- Irrigation or use of water in the agricultural sector, considering the source of the resource (wells, for example) and the restrictions or conditions to be respected;
- Improving existing water reservoirs for agricultural use;
- Implementation of "seeding" and water harvesting interventions;
- Implementation of intra-property infrastructure for the conduction, distribution, and application of irrigation water;
- Implementation of irrigation systems with water-efficient technologies;
- Technical assistance for the sustainable use of water;
- Conservation and recovery of natural infrastructure in basins vulnerable to climate change;
- Implementation of early warning systems for floods, droughts, and alluvial floods in basins vulnerable to climate change;
- Implementation of water quality monitoring systems in basins vulnerable to climate change.

#### **Types of Climate Mitigation Investments that can be financed by investments in PIRs**

##### **a) Agricultural production**

- Improving the industrial energy efficiency of projects in operation (e.g., photovoltaic systems);
- Reduced energy consumption in operations;
- Agricultural projects that contribute to increasing soil carbon or preventing soil carbon loss through erosion control measures;
- Reduction of GHG emissions from low-carbon agricultural practices or technologies;
- Projects that reduce methane or other GHG emissions;
- Projects that improve carbon sequestration through land management;
- Forestry or agroforestry projects that sequester carbon through sustainable forest management, avoid deforestation or prevent land degradation;
- Projects that reduce food loss or waste or promote low-carbon diets;
- Projects that contribute to the reduction of GHG emissions through the production of biomaterials / bioenergy from biomass; and
- Improving the energy efficiency of existing irrigation system projects, implementing technologies or equipment with low energy consumption, promoting good control practices, or reducing water losses (drip irrigation).

##### **b) Solid Waste and Effluent Management in Processing and Marketing Units**

- Anaerobic digestion of bio-waste collected separately;
- Composting bio-waste collected separately;
- Other types of bio-waste recovery;
- Mechanical or biological treatment of mixed waste;
- Care and handling in operation, use of personal protective equipment and accident response systems; and
- Effluent treatment systems.

##### **c) Buildings in the agricultural sector**

- Measures that reduce energy consumption, resource consumption or CO<sub>2</sub> emissions and or increase carbon sinks by using vegetation in new and existing buildings and associated land;
- Measures that reduce energy consumption, resource consumption or CO<sub>2</sub> emissions and, or measures that increase carbon sinks by using vegetation in new or refurbished buildings and associated land, thus meeting certification standards;

- Measures that reduce energy consumption, resource consumption or CO<sub>2</sub> emissions and or increase carbon sinks through the use of vegetation in public areas or facilities; and
- New or low-consumption appliances or equipment;
- Pilot experiments to introduce renewable energy sources, such as biogas or solar energy.

**Investments not eligible for PIR funding:**

Some types of investment will not be financed by the Project. Among other things, they cannot be financed:

- Purchase of real estate of any kind;
- Spending on land and environmental regularization;
- Current expenses (salaries and social charges for existing staff, water, electricity, internet, telephone);
- Operating and maintenance costs, construction, expansion, modernization, renovation, and construction of civil or water works on real estate that does not have title to the land, but can present a declaration of ownership, a declaration of purchase and sale or a loan agreement;
- Purchase of bovine matrices;
- Purchase of agrochemicals such as herbicides, fungicides, insecticides and synthetic fertilizer;
- Construction or refurbishment of processing plants that use firewood as a source of energy, in whole or in part.

The ROP contains the list of non-financeable investments. The PIRs and the definition of productive activities will be drawn up in accordance with the guidelines of the Strategic Environmental and Social Analysis (AASE). In the case of PIRs drawn up with traditional communities, it will be necessary to meet the requirements of the Free, Prior, Informed Consultation (FPIC) process.

**PIR approval process:**

Throughout its preparation, the PIR will be entered into the Project's management system, to make the information accessible and available for wide consultation.

During the drafting process, the teams from the RPUMs will make an important contribution to validating and verifying the information in the PIR. Once finalized, the PIR will be submitted to an evaluation by CEGIP (Executive Committee for the Management of Productive Investments), made up of the PMU and representatives of Paraíba state agencies (detailed composition is in the ROP). CEGIP will draw up an opinion covering the technical, economic, social, and environmental areas. The assessment will follow the criteria defined in the ROP, including:

**Criteria for evaluating and prioritizing PIRs:**

- I. Proof of economic and financial viability;
- II. Integration of technological innovations with environmental benefits (on water, biodiversity, soils, native vegetation, riparian forests, recovery of springs, etc.);
- III. Prove of the ability to integrate and adopt techniques for the recovery and protection of environmental resources;
- IV. Proof of the adoption of technological proposals based on the principles of agroecology;
- V. Proof of feasibility and technical sustainability;
- VI. Potential for strengthening family capacities and community organization;
- VII. Prove the integration and relevance of the use of social technologies;
- VIII. Achieving the required 10% match, whether monetary or non-monetary;
- IX. Representation of groups of women, young people, and families with persons with disabilities;
- X. Belong to traditional communities and socially vulnerable family farming communities.

The criteria mentioned in the table below have been drawn up for transparency and will be used as a reference during the evaluation process conducted by CEGIP.

Table 01: Criteria for evaluating PIRs

	VARIABLE (K)	MEASUREMENT (1-10)	WEIGHTING (1-5)	SCORE
	Analysis of the contextualization (Reference Framework) of the Project (Points from 1 to 5)	1 to 5	5	25
	Analysis of the Results Matrix (feasibility, level of risks) Notes from 1 to 5	1 to 5	3	15
P R O P O S A L	Profitability (%) of PIR: classes ( $X \leq 5 = 3$ points; $5.1 \leq X \leq 10 = 5$ ; $10.1 \leq X \leq 20 = 7$ ; $X \geq 21 = 10$ )	10	2	20
	Economic internal rate of return (eIRR) (%) of the PIR (classes ( $12 \leq X \leq 17 = 3$ points; $17.1 \leq X \leq 25 = 5$ ; $X \geq 25.1 = 10$ ).	10	5	50
	Lowest cost per beneficiary, (USD1.00/producer) (classes ( $X \leq 2,000 = 10$ points; $2,001 \leq X \leq 2,500 = 7$ ; $2,501 \leq X \leq 3,000 = 5$ ; $3,001 \leq X \leq 4,000 = 3$ ; $X > 4,000 = 0$ ).	10	5	50
	Percentage of women direct beneficiaries, (women direct beneficiaries/total beneficiaries) (classes ( $X \leq 10\% = 0$ points; $10\% \leq X \leq 50\% = 3$ ; $50\% \leq X \leq 75\% = 7$ ; $X \geq 75\% = 10$ ).	10	5	50
	Percentage of PCT direct beneficiaries, (PCT direct beneficiaries/total beneficiaries) (classes ( $X = 0\% = 0$ points; $1\% \leq X \leq 25\% = 3$ ; $25\% \leq X \leq 65\% = 5$ ; $X \geq 65\% = 10$ ).	10	5	50
	Expectation of annual growth in production activity (< 10%=1 point, 10.1% to 20%= 2 points, > 20.1%= 3 points)	3	3	9
	Percentage of young people (up to 35 years old) who are direct beneficiaries, (young direct beneficiaries/total beneficiaries) (classes ( $X \leq 10\% = 0$ points; $10\% \leq X \leq 50\% = 3$ ; $50\% \leq X \leq 75\% = 7$ ; $X \geq 75\% = 10$ ).	10	5	50
	Expected increase in income for beneficiary producers (up to 20% = 1 point, > 20% = 2 points)	2	5	10
	Market risks <sup>(3)</sup> (None or NA=10; Small= 8; Medium= 5; Large- 2; Uncertain= 1)	10	3	30
	Counterpart mobilized (from 10.1 to 20 %=1, > 20.1 % =2 points)	2	3	6
	Proportion of resources allocated to environmental adaptation including social technologies (< 20% = 2 points; from 20.1% to 50% = 5 points; from 50.1% to 80% = 7 points; > 80% = 10 points)	10	5	50
	Technical Capacity to Generate Water Security Compatible with the Project	10	5	10
	Ability to guarantee food security for beneficiary families.	10	5	10

Once the Committee's no-objection has been received, an agreement based on the PIR will be signed by the president and one other representative of the proposing association and SEAFDS, thus allowing the transfer of funds and the start of the PIR's implementation.

The Project includes a compulsory social inclusion measure and must guarantee that 50% of the resources in the PIR as a whole benefit women, 20% benefit young people, 5% benefit PCTs and 2% benefit families with persons with disabilities. The PMU must monitor and enable the achievement of this target throughout the process of evaluating and validating PIR proposals.

#### **3.1.4 Running arrangement**

SEAFDS, through the PMU, will be the executor of this subcomponent and will contract civil society organizations and service cooperatives to provide TA in the selected communities. The selection will be made through a competitive process, in accordance with the IDB's procurement policies. The teams from the RPMUs will be mobilized to supervise the implementation of the PIRs and to establish synergies and complementarities between the Project and other interventions.

The implementation of the investments defined in the PIRs will be carried out through the agreement signed with SEAFDS and an association representing the Local Territory that drew up and submitted the PIR for approval.

As Local Territories are generally made up of several communities (up to 3 communities) and there may be more than one association in the Territory that is able to sign an agreement with PROCASE II/SEAFDS. In these circumstances, it will be necessary to choose the one that will sign the agreement, which will be defined at a general assembly of the communities that make up the Local Territory. At this assembly, the various criteria that are relevant to making this choice are discussed (such as the existence of a legally constituted association in good fiscal standing, openness to incorporating new members, previous experience of managing resources, and others).

The beneficiary organizations that have signed the agreement will be responsible for purchasing goods and services with the funds received through the agreement and for accounting for these funds. To support the organizations in these activities, they will receive training and support from TA (see Subcomponent 2.1).

The state of Paraíba requested this methodology of making beneficiary organizations accountable through the transfer of funds to associations, based on the good results obtained during the implementation of PROCASE I, among other projects monitored by the IDB and IFAD in other states. Other projects supported by IDB, such as PDSA II in the state of Acre, have also achieved good results, both in terms of implementing activities and strengthening beneficiaries' capacities to collectively manage resources to implement activities. This strengthening contributes to sustainability and the ability to replicate the activities once the projects have been completed.

The funds will be transferred according to the criteria defined by the fiduciary area and mentioned in the ROP.

The aspects and modalities that will have to be applied for financial implementation, the procurement processes and the accounting of the beneficiaries' counterparts will be detailed in the ROP.

Based on these aspects, there will be a training process led by the PMU to create the necessary capacities to manage the implementation of the PIR. The TA entity responsible for drafting and monitoring its implementation will train the heads of the associations involved and provide the necessary support to the beneficiaries to comply with the defined rules.

For the implementation of the PIR and with the support of TA, the partner associations will organize thematic committees (such as procurement, accountability, and transparency) to support management, in which the participation of women and young people will be a composition criterion. The participation of young people will be encouraged, in particular to develop the use of digital technology, for the implementation and monitoring of the PIRs.

#### **3.1.5 Costs and reach**

Subcomponent 1.1 has a total budget of USD 56 million, which represents 54% of the Project's total budget.

The Project will work in up to 600 communities, through 200 PIR, considering that each PIR will be drawn up for around 3 communities, thus constituting a Local Territory. The PIR of a Local Territory will be equivalent to the accumulation of 3 community PIRs, such as the models drawn up in the design (sample for the Economic and Financial Assessment).

Table 02: Costs and scope of Subcomponent 1.1

Discrimination	Unit	Number	Costs (US\$)		Reach
			Unit	Total	
Resilient Investment Plan (PIR)	PIR	200	281 080	56 216 000	18 000 Families

### 3.1.6 Achievement of targets

The PIRs will benefit approximately 18,000 families, of which 50% should be represented by women, 20% by young people and 5% by Traditional Peoples and Communities and 2% for families with persons with disabilities.

### 3.1.7 Timetable for the 6 years of implementation

Table 03: 6-year timetable for the implementation of Subcomponent 1.1

Stages	Year 1				Year 2				Year 3				Year 4				Year 5				Year 6			
	1	2	3	4	1	2	3	4	1	2	3	4	1	2	3	4	1	2	3	4	1	2	3	4
Action 1: Resilient Investment Plans drawn up																								
Action 2: Resilient Investment Plans executed (>75%)																								

## 3.2 Subcomponent 1.2: Strengthening and diversifying commercialization

### 3.2.1 Objective

This subcomponent aims to improve commercialization and the inclusion of families in value chains by improving the management and production structures of family farmers' cooperatives.

### 3.2.2 Strategic orientation and methodology

The subcomponent aims to strengthen cooperatives by means of a Business Plan (PN), thereby consolidating their management capacities, adding value, diversifying their commercial offer, and accessing markets under better conditions. Rather than seeking to create new cooperatives, priority will be given to existing cooperatives and to improving their management capacities and those with operational weaknesses.

The elaboration of these PNs will consider the strengthening of production carried out in subcomponent 1.1 through the PIRs, with the aim of integrating producers into these cooperatives to access the market.

The development of the PN will seek to diversify the accessed markets. In addition to institutional markets, such as PNAE and PAA, other players will be sought, mainly from the private sector. The Project will seek to include the organizations in the Regional Information System for Family Farming in the Northeast (SIRAF), created by the Northeast consortium and which has been offering a new channel for establishing contact between producers and buyers.

Business Plans (PNs) will be the main instrument for implementing the subcomponent and will be drawn up with producers' economic organizations, usually cooperatives. The PNs should make it possible to finance structuring investments that could

benefit family farmers, including the producers benefiting from the PIRs. Specialized Technical Assistance (STA) specially dedicated to the PNs and to strengthening the capacities of the beneficiary organizations will also be financed by the PNs.

The PNs should allow for the implementation of competitive mechanisms, tailored towards innovative and environmentally sustainable solutions, to strengthen network marketing and cooperative centers. Investments will be focused on existing organizations that have weaknesses in their management processes, that are unable to achieve sufficient levels of commercialization, that find it difficult to comply with environmental and health legislation, or that operate below their capacity. In these cases, the Project will strengthen the capacities of the management teams, support the improvement and modernization of equipment and facilities, improving the processing and diversification of products, with a focus on adapting and/or expanding the physical infrastructure (such as processing and storage areas), with the aim of also meeting the health and environmental standards for obtaining certifications (SIF, organic certification, distinctive collective labels, valuing sustainable products from the Caatinga and Atlantic Forest biomes, etc.). Where relevant, the development of participatory guarantee systems (PGS) for certification processes will also be supported. Subcomponent 2.2 will make an important contribution to these activities and complementarities will be built.

In exceptional cases, the Project's support may be aimed at developing the productive capacity of a cooperative, operating within the supported production chains. These cases will be specific and subject to prior feasibility analysis, considering in particular the existence of other similar organizations in the Project area.

Strengthening the capacities of the cooperatives' teams will be a key point of the PNs, which will address the issue of best processing practices, as well as others, such as administrative and financial management. In this case, courses are planned on good management practices and the organization of production, processing, adding value, financial management, institutional strengthening, marketing strategies, amongst others. The management teams of these enterprises will be the main beneficiaries. These courses will mainly be carried out through STA (such as individual consultants, EMPAER, EMBRAPA, SEBRAE, SENAR, etc.).

The preparation of the PNs will include a diagnosis of the organization's situation, clearly identifying the most important problems, challenges and the opportunities that can be seized. The PNs may include agricultural activities of primary production, processing, and marketing of this production. Other economic initiatives can also be included, such as handicrafts, community-based tourism, and others, provided they have the potential to generate income in a sustainable way. As the object of these plans will be 'business' related, involving production and market issues, it is necessary to include more detailed information such as a 'map' of the value chain identifying flows and actors, an analysis of the products demanded by the market and their trends (volumes, prices), an analysis of the competition, a strategy for operating in the market, a sales plan and an investment management strategy. The PNs will identify the material investments that will have to be made (construction/refurbishment, machinery, equipment, etc.). In addition, it should point out necessary training (which may cover production, marketing, administrative and financial management, or other dimensions) that the implementation of the PN will require.

### **Provision of Specialized Technical Assistance (STA)**

Considering the capacities found in the organizations in the region served by the Project, it will be necessary to contract STA (Specialized Technical Assistance) services for the preparation and implementation of all the PNs. These services will be contracted by the PMU, through a competitive process that meets IDB/IFAD standards, with funds provided in the budget for Subcomponent 2.2. However, in certain cases and when the beneficiary organization shows experience and capacity, it could take on the responsibility of contracting the STA directly.

Individuals or legal entities may be contracted to provide these services. The selection criteria for providers will include: i) experience in providing technical assistance to family farming cooperatives; ii) technical capacity related to the specific problem(s) identified by the cooperative, such as improving processing processes, developing a strategy and identifying new marketing channels, developing a certification system, etc.; iii) technical capacity to deal with and integrate environmental issues related to the activities carried out by the cooperatives being assisted; iv) capacity to work remotely (using digital tools); v) experience with access to public policies.

STA services should encourage supported organizations to look for other sources of funding and service providers to complement the resources allocated by PROCASE II and to meet demands not included in the PNs it supports. Opportunities for cooperation and alliances with the private sector will also be sought whenever possible.

### **3.2.3 Planned activities and results**

#### **Identification and selection of beneficiary organizations**

Considering the heterogeneity between the cooperatives in the Project area in terms of structure, capacities and experience, the process of selecting and drawing up the PNs will be different depending on the size of the organizations.

**For small organizations**, with an annual turnover of up to USD 100,000 (average of the last 3 years), which are generally inexperienced organizations with more limited capacities for drawing up a PNs, the PMU will carry out a direct survey of these organizations in the area of operation and will conduct a selection process. Once the organization has been selected, the PMU will contract the services of STA, either an individual or a legal entity, to begin drafting the PN and its subsequent implementation.

For larger organizations with annual turnover of over USD 100,000 (average of the last 3 years), which generally have greater capacity, the identification and selection process will be done through publishing calls for proposals. In the first years of implementation, a broad dissemination and information process will be carried out by the PMU to ensure that interested organizations are aware of this selection procedure. Proposals (Expressions of Interest, presenting a project proposal) will be drawn up directly by the proposing organizations and sent to the PMU, which will be evaluated by the Evaluation Committee.

In both cases (small organizations and larger organizations) the selection of proposals will be based on the following criteria: i) Productive activity with potential technical, economic, financial and environmental viability; ii) Not having received benefits from other grant projects for similar items; iii) Inclusion of new members in the cooperative through the investment, with priority given to women, young people and persons with disabilities; iv) Ability to provide a counterpart (monetary and non-monetary) of more than 20% of the value of the PN; v) Making innovative environmental investments and climate adaptation and mitigation.

To provide STA, the Project could seek partnerships with experienced organizations, such as SEBRAE, so that an integrated technical assistance plan can be drawn up.

#### **Preparation of the PNs**

Once the PN proposals have been selected (criteria defined in the ROP), the drafting process will begin, which will be identical in format for both modalities (small and large organizations), being adapted to the level of complexity of each organization.

The first stage of the preparation will be to carry out a diagnosis (within a maximum of 3 months), with the aim of:

- i. Validate the organization's demand in terms of the processing process and market access to be supported;
- ii. Evaluate the organization's capacity to manage the requested PN and assess its experience in similar areas to carry out procurement, production, commercial and accounting management, etc.;
- iii. Carrying out specific and pragmatic studies to provide information on the characteristics, bottlenecks and potential of each product and identifying innovative and differentiated markets that can add value to the sustainable production initiatives supported by the Project;
- iv. Carry out local demand studies (inputs and production for sale) detailing key factors such as volumes sold, prices, quality, ease of access, competition, weaknesses, and deficiencies;
- v. Survey the availability of raw materials, taking into account, among other factors, the planned production of the PIRs supported by the Project, in order to guarantee the viability of these units and the distribution of the production of the families benefiting from the PIRs;
- vi. Gather technical data on the evolution of production and marketing capacity, identifying potential and risks;
- vii. Identify the main competition and other similar units in the region;
- viii. Gather information and lessons learned about previous support received to strengthen the organization;
- ix. Survey the social characteristics of the members, the capacity for collective management and the level of social organization, which will include the participation of women and young people in decision-making processes;

- x. Compliance with aspects related to environmental and health management and in accordance with the relevant legislation;
- xi. Identify the needs in terms of STA to strengthen capacities in production process, marketing, management, and governance;
- xii. Identify the need for adaptations for persons with disabilities;
- xiii. Identify technical proposals to introduce technologies such as biodigesters, solar energy and internet access;
- xiv. Identification of points of attention related to social and environmental safeguards;
- xv. Identifying the ability to access public policies;
- xvi. Articulation with other local actors and in particular with COOPERAR, which has developed similar actions;
- xvii. Compliance with aspects related to Health and Safety at Work in accordance with the relevant legislation.

Based on the diagnosis, the PN will define the needed resources to invest in infrastructure, equipment, and goods, as well as to finance STA services to implement and strengthen management capacities (considering that the resources to finance STA are allocated to Component 2).

The main items that can be financed by the PN are:

- i. Adapting and/or expanding existing processing units and adjusting comply with health and environmental legislation, as well as ensuring accessibility for the persons with disabilities;
- ii. The investments should enable cooperatives to adapt to climate change, for example through the use of solar energy, water collection and reuse systems, etc. These investments could include social technologies such as production cisterns or grey water reuse systems;
- iii. Support from STA for the development of marketing strategies, including the definition of strategies for reaching the municipal and state institutional market, as well as access to the private market. This could include the development of printed material or electronic media (website, Instagram, etc.) for the dissemination of information and e-commerce;
- iv. Support for obtaining organic and agroecological certifications and labels of origin;
- v. Construction, adaptation, or renovation of processing units with producer organizations in compliance with environmental and health legislation;
- vi. Improvement of management processes (through technical support, acquisition of a program/system to improve process management, etc.) with a focus on efficiency and transparency;
- vii. Investment in the installation of renewable energy and rural connectivity, investment in product development and packaging;
- viii. Investments that enable greater participation by young people, women and persons with disabilities.

All the activities financed in the PNs will be in accordance with the Environmental and Social Management Plan (ESMP) for each one and with the Project's Strategic Environmental and Social Management Plan (SESMP).

During the process of drawing up the PN, the following criteria will have to be considered (detailed in the ROP):

- i. PN for small cooperatives: The minimum amount per PN (without counterpart from the beneficiary organization) is USD 40,000 and the maximum amount is USD 80,000. Cooperatives with fewer than 30 members cannot be financed. The amount of funding from PROCASE II cannot exceed USD 700 per cooperative member;
- ii. PN for medium and large cooperatives: The minimum amount per PN (without counterpart from the beneficiary organization) is USD 120,000 and the maximum amount is USD 250,000. Cooperatives with fewer than 80 members cannot be financed. The amount of funding from PROCASE II cannot exceed USD 800 per cooperative member;
- iii. The funds from the Project will be non-reimbursable. A counterpart contribution must be made by the beneficiary organization, equivalent to at least 20% of the amount financed by the Project, and may be monetary or proven in goods and services related to the implementation of the PN;
- iv. There must be a commitment for organizations to increase the number of new members, especially women and young people;

- v. The resources allocated to the PN should make it possible to finance goods for collective use (such as processing equipment);
- vi. Planning proposed within the framework of marketing to include additional production from the PN (and related PIRs);
- vii. Definition of the STA services that will be carried out for the main themes such as management, governance, good practices in production and marketing processes, environmental and social management;
- viii. Evidence of investments in activities carried out to adapt processes and adhere to climate change (which can be described as climate investments);
- ix. Facilitate dialogues with financial institutions to access PRONAF and other sources of credit;
- x. The list of fundable and non-fundable items is shown below and is detailed in the ROP.

### **Investments eligible for funding**

PROCASE II will finance the investments needed to make the PNs viable. These investments can be classified into three groups:

- i) **Group 1 - Non-Consulting Services.** This group includes investments associated with hiring technical-operational services, such as transportation, application of inputs, financing of working capital for the first year of operation, installation of equipment, rental of vehicles, among others;
- ii) **Group 2 - Assets.** This group includes investments associated with the purchase of inputs for the cooperative, such as seedlings or seeds, and equipment for the production, processing, marketing, and distribution of the products of the PN to be promoted;
- iii) **Group 3 - Works.** This group includes investments associated with the provision or renovation of production structures and/or economic infrastructure, such as road rehabilitation, well drilling and processing units, with a maximum of 20% of the value of each business plan.

### **Types of Climate Adaptation investments that can be financed by investments in the PNs:**

- Implementing good agroecological fertilization practices in areas vulnerable to climate change;
- Implementation of erosion and soil loss management technologies in areas vulnerable to climate change;
- Implementation of crop protection techniques in critical areas;
- Implementation of technologies to recover soils degraded by salinization in areas vulnerable to climate change;
- Productive diversification in crops and livestock in areas most vulnerable to climate change;
- Integrated pest and disease management in areas most vulnerable to climate change;
- Management of natural pastures to guarantee food for young animals and reduce vulnerability to climate change;
- Improvement and transfer of genetic resources in plantations and genetic improvement to increase their resilience to climate change;
- In situ and ex situ conservation of biodiversity to increase resilience to climate change;
- Strengthening risk transfer systems in the event of adverse climatic events;
- Implementation of strategic agro-climatic information services to adapt to the effects of climate change;
- Implementation of adaptive technological innovation services in the face of climate change in agricultural value chains;
- Added value of agricultural products in value chains vulnerable to climate change;
- Irrigation or water use in the agricultural sector;
- Improving existing water reservoirs for agricultural use;
- Implementation of "seeding" and water harvesting interventions;
- Implementation of intra-property infrastructure for the conduction, distribution, and application of irrigation water;
- Implementation of irrigation systems with water-efficient technologies;
- Technical assistance for the sustainable use of water;
- Conservation and recovery of natural infrastructure in basins vulnerable to climate change;
- Implementation of early warning systems for floods, droughts, and alluvial floods in basins vulnerable to climate change;
- Implementation of water quality monitoring systems in basins vulnerable to climate change; and
- Implementation of information systems to improve the planning and management of water resources in basins vulnerable to climate change.

## **Types of Climate Mitigation Investments that can be financed by investments in the PNs**

- a) Agricultural production**
  - Improving the industrial energy efficiency of projects in operation;
  - Reduced energy consumption in operations;
  - Agricultural projects that contribute to increasing soil carbon or preventing soil carbon loss through erosion control measures;
  - Reduction of GHG emissions and low-carbon agricultural practices or technologies;
  - Projects that reduce methane or other GHG emissions;
  - Projects that improve carbon sequestration through land management;
  - Forestry or agroforestry projects that sequester carbon through sustainable forest management, avoid deforestation or prevent land degradation;
  - Projects that reduce food loss or waste or promote low-carbon diets;
  - Projects that contribute to the reduction of GHG emissions through the production of biomaterials / bioenergy from biomass; and
  - Improving the energy efficiency of existing irrigation system projects, implementing technologies or equipment with low energy consumption, promoting good control practices, or reducing water losses (drip irrigation).
  
- b) Solid waste and effluent management in processing and marketing units**
  - Anaerobic digestion of bio-waste collected separately;
  - Composting bio-waste collected separately;
  - Other types of recovery and recovery of bio-waste; and
  - Mechanical or biological treatment of mixed waste.
  
- c) Buildings in the agricultural sector**
  - Measures that reduce energy consumption, resource consumption or CO<sub>2</sub> emissions, or increase carbon sinks by using vegetation in new and existing buildings and associated land;
  - Measures that reduce energy consumption, resource consumption or CO<sub>2</sub> emissions, or measures that increase carbon sinks by using vegetation in new or refurbished buildings and associated land, thus meeting certification standards;
  - Measures that reduce energy consumption, resource consumption or CO<sub>2</sub> emissions and or increase carbon sinks through the use of vegetation in public areas or facilities; and
  - New or low-consumption appliances or equipment;
  - Pilot trials of processing plants using renewable energy sources, such as biogas or solar energy.

## **Investments Not Eligible for Financing**

Some types of investment will not be financed by the Project, even if they are necessary to make the PNs viable. Among other things, they cannot be financed:

- i) Purchase of real estate of any kind, spending on land regularization;
- ii) Current expenses (salaries and social charges for existing staff, water, electricity, internet, telephone);
- iii) Operating and maintenance costs, construction, expansion, modernization, refurbishment, and construction of civil or water works on properties with a lending agreement;
- iv) Activities related to raising cattle for meat production;
- v) Purchase of agrochemicals such as herbicides, fungicides, insecticides and synthetic fertilizer;
- vi) Construction or renovation of flour mills and other processing units that use firewood as a source of energy, in whole or in part.

Some of these investments may be considered as the beneficiary's counterpart to the Project.

During the process of drawing up the PNs, the Project and STA teams will be responsible for checking that the type of investment complies with these conditions.

### Criteria for evaluating and prioritizing PNs

Once the ROP has been drawn up, it will be presented to the Council of Territories for consultation and then submitted for evaluation by CEGIP (Executive Committee for Productive Investment Management), made up of the PMU and representatives of Paraíba state bodies. The evaluation will follow the criteria defined in the ROP. These include:

- i. Potential for adding value;
- ii. Technical, economic, financial, and environmental feasibility;
- iii. Achieving the required counterpart level;
- iv. Percentage of the PN earmarked for financing environmental investments;
- v. Proof of the adoption of technological proposals based on the principles of agroecology;
- vi. Integration of new members into cooperatives, particularly women, young people, and families with persons with disabilities;
- vii. Participation of women and young people as members and in positions of responsibility on the board of the beneficiary organization;
- viii. Creation of new jobs;
- ix. Absorption capacity of production from PIRs financed by Subcomponent 1.1;
- x. Ability to contribute to accessing new markets;
- xi. Ability to help integrate new producers as raw material suppliers.

The Project includes a mandatory social inclusion measure and must guarantee that 50% of the resources from all the PNs benefit women, 20% benefit young people, 5% benefit PCTs and 2% benefit families with persons with disabilities. The Project Committee must monitor and enable the achievement of this target throughout the process of evaluating and validating the proposals for the PNs.

The criteria mentioned in the table below have been drawn up with a view to transparency and will be used as a reference during the evaluation process conducted by CEGIP.

Table 04: PN evaluation criteria

	VARIABLE (K)	MEASUREMENT (1-10)	WEIGHTING (1-10)	SCORE
	Analysis of the contextualization (Reference Framework) of the Project (Points from 1 to 10)	1 a 10	5	50
	Analysis of the Results Matrix (feasibility, level of risks) Notes from 1 to 10	1 a 10	5	50
P R O P O S A L	Profitability (%) of agribusiness estimated in PN (classes ( $X \leq 5$ ) =3 points; ( $5.1 \leq X \leq 10$ ) =5; ( $10.1 \leq X \leq 20$ ) =7; ( $X \geq 21$ ) =10)	10	2	20
	Economic internal rate of return (EIRR) <sup>13</sup> (%) of the Business Plan (classes ( $12 \leq X \leq 17$ ) =3 points; ( $17.1 \leq X \leq 25$ ) =5; ( $X \geq 25.1$ ) = 10).	10	5	50
	Lowest cost per beneficiary, (USD1.00/producer) (classes ( $X \leq 2,000$ ) =10 points; ( $2,001 \leq X \leq 2,500$ ) =7; ( $2,501 \leq X \leq 3,000$ ) =5; ( $3,001 \leq X \leq 4,000$ ) =3; ( $X > 4,000$ ) = 0).	10	5	50

<sup>13</sup> Business plans with a TIRE of less than 12% will not be eligible to receive funds from the Project.

	VARIABLE (K)	MEASUREMENT (1-10)	WEIGHTING (1-10)	SCORE
	Percentage of women direct beneficiaries, (women direct beneficiaries/total beneficiaries) (classes ( $X \leq 10\%$ = 0 points; ( $10\% \leq X \leq 50\%$ ) =3; ( $50\% \leq X \leq 75\%$ ) =7; ( $X \geq 75\%$ ) = 10).	10	10	100
	Percentage of PCT direct beneficiaries, (PCT direct beneficiaries/total beneficiaries) (classes ( $X=0\%$ = 0 points; ( $1\% \leq X \leq 25\%$ ) =3; ( $25\% \leq X \leq 65\%$ ) =5; ( $X \geq 65\%$ ) = 10).	10	10	100
	Percentage of young direct beneficiaries, (young direct beneficiaries/total beneficiaries) (classes ( $X=0\%$ = 0 points; ( $1\% \leq X \leq 25\%$ ) =3; ( $25\% \leq X \leq 65\%$ ) =5; ( $X \geq 65\%$ ) = 10).	10	7	70
	No. of producers benefiting from the PN (classes: up to 100 =3; 100 up to 150 =7; > 150=10 points)	10	2	20
	Expected increase in income for beneficiary producers (up to 20% = 1 point, > 20% = 2 points)	5	2	10
	Market risks (None or NA=10; Small= 8; Medium= 5; Large- 2; Uncertain= 1)	10	3	30
	Proponent's maturity (( $2 \leq X \leq 3$ years) = 2 points; ( $3 \leq X \leq 5$ years) =5 points; ( $6 \leq X \leq 10$ years) =7 ( $X \geq 10$ years) = 10 points)	10	5	50
	Technical capacity to generate water security compatible with the Project	10	5	10
	Ability to guarantee food security for beneficiary families	10	5	10
	<b>TOTAL TENDER</b>			

Once the ROP has been approved, an Agreement will be signed between the beneficiary organization and SEAFDS. The funds will be transferred according to the criteria defined by the fiduciary sector and mentioned in the ROP.

To prepare the Project, two PNs were drawn up to form a sample for the Economic and Financial Assessment. Based on field visits and analysis of secondary data, the following economic organizations and productive activities were selected: i) Primary production and processing of honey, and ii) Strengthening of production capacities and primary processing of organic cotton. These activities were selected because they have strong potential and are well integrated into the socioeconomic and agro-environmental context. It is important to mention that during implementation, based on the demands and identified economic organizations, other agricultural and non-agricultural chains may be supported through PNs, provided they meet the criteria and objectives of the Project.

### Implementation of the PNs

Implementation of the PN will begin once the agreement has been signed and the funds have been made available to the organization. The use of the PN amount will follow the rules defined in the ROP, through installments, proof, and validation of spending, provided that at least 60% of the amount already disbursed is accounted for.

The implementation phase will follow the timetable drawn up during the preparation of the PN. In general, in the first year of implementation, priority will be given to investments in infrastructure and equipment. Capacity building in the areas of management, marketing and market access will be carried out over two years with the support of STA. During this phase, STA will be looking to establish agreements and partnerships between the cooperatives and associations benefiting from the PIR, to source, process and market production.

#### 3.2.4 Running arrangement

SEAFDS, through the PMU, will be responsible for implementing this sub-component. In each Rural Territory of the state, the teams from the RPMU will be mobilized and will contribute to establishing synergies and complementarities between the implemented PN and other interventions (COOPERAR in particular).

The implementation of the PNs will be carried out through the agreement signed by SEAFDS with each beneficiary organization.

#### 3.2.5 Costs and reach

Table 05: Costs and scope of subcomponent 1.2

Discrimination	Unit	Quantity.	Costs (US\$)		Reach (families)
			Unit	Total	
Business plans for large and medium-sized cooperatives	PN	20	198 000	3 960 000	3 000
Business plans for small cooperatives	PN	40	48 000	1 920 000	2 000
<b>Total</b>	<b>PN</b>	<b>60</b>	-	<b>6 000 000</b>	<b>5 000</b>

#### 3.2.6 Timetable for the 6 years of implementation

Table 6- 6-year timetable for the implementation of Subcomponent 1.2

	1	2	3	4	1	2	3	4	1	2	3	4	1	2	3	4	1	2	3	4	1	2	3	4
Economic organizations with agreed Business Plans																								
Economic organizations with executed business plans (>75%)																								

### 3.3 Subcomponent 1.3: Incentives for innovation

#### 3.3.1 Objective

Innovations are an important part of this component, focusing mainly on the topic of mechanization (see also Annex "Knowledge Management (KM), South-South and Triangular Cooperation (SSTC) and Innovations in PROCASE II").

PROCASE II will promote innovation initiatives by providing funding and technical assistance to identified innovators, supporting them in scaling up their initiatives to reach other farmers.

#### 3.3.2 Strategic orientation and methodology

PROCASE II will promote innovations developed specifically for family farming systems, such as tools for agroecological practices, machinery for small-scale agro-industries, biotechnologies aligned with the concept of resilient production systems, among others. Some examples include small tractors, pruning tools, fodder cutting machines and oilseed processing engines. Many of these innovative initiatives already exist in the Project area. They will need to be identified, assessed in terms of their suitability for strengthening resilient family systems, improved (where appropriate), and/or disseminated. In several cases, it will be a question of promoting tests of the use of new equipment in the real conditions of family units in Paraíba. Promising innovative initiatives that need resources to consolidate themselves as a benchmark for innovation to be disseminated may be financed by an investment fund that will provide between US\$ 10,000 and 60,000 (R\$ 50,000 and 300,000) for each one, depending on their financing needs. The selected projects will be accompanied by a team of experts in the expansion process (the costs of the support activities are included in the amount of funding received by each initiative).

#### 3.3.3 Planned activities and results

The Project will fund the development of initiatives (which could be small 'backyard' companies, research groups, experimenting farmers, among others) aimed at creating products and technologies tailored to the local context, such as machinery adapted to small producers and equipment for processing and adding value (priority themes). The Project will also fund innovations in secondary themes, such as products derived from native/traditional species, bio-inputs (soil nutrition, bio-insecticides), efficient water management technologies, solid waste treatment, etc. The investment dedicated to this subcomponent will allow up to 25 of these initiatives to be financed (with amounts of up to US\$ 60,000 each).

##### *Expected benefits for each initiative*

The companies or teams selected will receive the following benefits:

- i) Funding from US\$ 10,000 and 60,000 (including support activities mentioned below);
- ii) Technical assistance;
- iii) Mentoring focused on the business and the market;
- iv) Development of business plans;
- v) Support with design and visual communication;
- vi) Networking and partnership opportunities

##### *Priority Innovative Themes*

- 1) **Mechanization for small producers/organizations:** Adapted mechanization for agroecological and agroforestry family farming, such as motor cultivators, fodder palm choppers and feeders, long-arm pruning shears, woodchippers and other small implements. Companies that share or rent<sup>14</sup> machines and implements will also be supported.
- 2) **Technologies for Cooperatives and Associations:** machines and implements for cooperatives and associations, such as pulpers, dehydrators, dryers, mills, packaging machines and processing machines in general, as well as recycling machines such as waste separators and processors.

##### *Secondary Innovative Themes*

- 3) **Agroecological Markets and Local Biodiversity:** Promoting nutrition based on local biodiversity, through the development of products derived from native/traditional species, the extraction of oils and essences, the creation of agroecological fairs, greengrocers, restaurants, and snack bars, etc.
- 4) **Adapting to Climate Change:** water harvesting and efficiency technologies, climate comfort, etc.

<sup>14</sup> Cf.: <https://www.sciencedirect.com/science/article/pii/S0308521X18314914> and <https://repository.cimmyt.org/xmlui/bitstream/handle/10883/22429/65927.pdf?sequence=1&isAllowed=y>

- 5) **Access to renewable energies:** Financing and installation of photovoltaic panels for small producers, heat pumps, energy efficiency works, reduction in the use of firewood, biodigesters, etc.
- 6) **Soil nutrition and integrated pest/weed management:** manufacture of organic fertilizers and products used in the biological control of pests and weeds, such as the production of green manure seedlings and seeds, inoculation of natural enemies, production of compost, bio-slurries, and other bio-inputs.
- 7) **Studies and research projects:** small research projects that can be classified as innovative projects, for example new variants of agroforestry systems.
- 8) **Digital tools for small producers:** Access to digital technical assistance (including plant and insect identification, recommendations for fertilization or weed or pest control), Information services (prices, logistics, soil conditions, weather information and early warning systems), Financial services (financial management tools and access to credit and insurance), Digitization of the supply chain (recording information, planning tools, sharing implements, shared transport of products and inputs, etc.) and Access to markets and inputs (Sale of family farming products, purchase of inputs, etc.) and Access to markets and e-commerce (Sale of family farming products, purchase of inputs, etc.).
- 9) **Digital tools for cooperatives and associations:** Resource sharing (machinery, tools, processing equipment/facilities, etc.), Market access and e-commerce, Planning and management tools (recording information, organizing inventories, etc.) and Certification and legal compliance tools, (checklists for obtaining licenses or preparing for health inspections, etc.).

### Execution Arrangement

The PMU will appoint a foundation responsible for innovation that will examine existing prototypes in the Project area and select innovators according to predefined criteria. The Project will finance the expansion of these initiatives, providing guidance, refining the prototypes, and facilitating access to the market. The selection can be made through a competitive process (calls for tenders) or through a direct search in the Project area, with the help of the Project team and TA technicians. The direct search for existing innovations will involve the RPMUs and will focus on Federal Institutes (IFs), Agricultural Family Schools (EFAs), Universities, Rural Schools, and local artisans. The work carried out by local institutions such as SERTA (<https://serta.org.br/>) serves as an example of how the innovations identified by the Project could be supported.

The selected foundation must be a non-profit organization and preferably linked to a university, with the same foundation being responsible for the Knowledge Management and South-South Cooperation component (2.5). The incubation and monitoring of innovations can be done directly by the Foundation (if it has experience in this area) or in partnership with a social entrepreneurship incubator, such as IACOC (incubator of the Paraíba Technology Park).

### Possible criteria for funding and support

Below are some criteria that could be considered when choosing the innovative initiatives to be supported by the Project. These criteria will be further detailed in the ROP.

- 1) **Social Criterion:** The innovation must seek to have a positive social and environmental impact, for example by aiming for low prices for farmers and fair pay for workers.
- 2) **Right to repair:** Machinery, implements and equipment must be designed in such a way that they are easily repairable using accessible technologies and with easy parts replacement, thus avoiding the user being forced to buy a new copy.
- 3) **Economic sustainability:** The entity must prove that there is a demand for its service/product in the long term.
- 4) **Environmental sustainability:** The entity must show that its product/service does not generate significant environmental impacts (GHG emissions, waste, etc.).
- 5) **Local Impact:** Team members come from the Project regions.
- 6) **Traditional/ancestral knowledge:** Valuing and integrating indigenous and traditional/ancestral knowledge and technologies.
- 7) **Focus on young people and women:** We suggest quotas of 50% for women and 50% for young people, with 50% of young people's places reserved for women.

### 3.3.4 Costs

Actions	Unit	Number	C. Unit (in US\$)	Estimated value in (US\$)
Support for Innovative Initiatives	Unit	25	40 000	1 000 000
<b>TOTAL</b>				<b>1 000 000</b>

## PROJECT PRESENTATION.

The Cariri, Seridó, and Curimataú Sustainable Development Project (PROCASE), funded by IFAD and the Paraíba State Government, was implemented between 2012 and 2022 and benefited 56 (fifty-six) municipalities in the semi-arid region of the state of Paraíba, specifically those located in the Agreste Paraibano, Borborema and Sertão Paraibano mesoregions. It aimed to contribute to sustainable rural development in the semi-arid region of Paraíba, reducing levels of rural poverty and strengthening actions to prevent and mitigate desertification in its intervention area.

The Paraíba Sustainable Rural Development Project (PROCASE II), which is currently being designed, will be implemented in 223 (two hundred and twenty-three) municipalities, distributed among the 23 micro-regions of the state of Paraíba, and aims to reduce rural poverty levels by improving food and nutritional security and adapting the rural population to climate change. Implementation will be the responsibility of the State Secretariat for Family Farming and Semi-arid Development (SEAFDS) and will be supported by the PROCASE team and structure. The total amount is US\$ 105,000,000.00, of which US\$ 70,000,000.00 will come from the IDB, US\$ 10,000,000.00 from an IFAD loan, and US\$ 25,000,000.00 from the Paraíba State Government.

The PROCASE II proposal is for two (2) components: Component 1 - Resilient production systems to reduce rural poverty and Component 2- Organizational strengthening, capacity building and knowledge management. Both are accompanied by Project Management, Monitoring, and Evaluation.

The aim of Component 1 is to increase the implementation of agricultural technologies, including climate change adaptation and mitigation, as well as improving the productive and social inclusion of family farmers, prioritizing women, young people, Traditional Peoples and Communities (PCT) and persons with disabilities. Component 1 is subdivided into three subcomponents: 1.1- Implementation of resilient and biodiverse production systems, 1.2- Strengthening and diversifying commercialization and 1.3 Incentives for innovation. Project investments in rural communities financed under Component I will be carried out through Resilient Investment Plans (RIPs). The PIR will finance three areas of intervention: i) Productive and Commercialization; ii) Environmental and iii) Social Technologies and will have a territorial focus composed of one or more communities.

---

### **1 Preliminary Report to support the preparation of the PIR in Social Technology.**

The PIR will be made up of three axes: i) Productive; ii) Environmental, and iii) Social Technology (ST) which will benefit family units. Each PIR will serve a Local Territory<sup>1</sup> (up to three neighboring communities with approximately 100 families) in which more than one productive and/or environmental activity can be covered, and various types of ST can be implemented.

The implementation of the ST will be carried out by entities contracted by the PMU to provide TA, and they must follow the references of the Normative Instructions of the MDS Cistern Program and the ABNT Technical Standards with attention to local and regional peculiarities and specificities.

In addition to the ST, this report presents a chapter on Solid Waste Management in rural areas to support the preparation of the PIR regarding the environmentally appropriate final disposal of household solid waste and processing and marketing units. These activities can be developed as a type of Climate Mitigation investment that the PIR can finance.

---

<sup>1</sup> The Project will serve up to 600 communities, which will represent 200 Local Territories.

The guidelines for the use of the ST will follow the references of Article 1 of Ordinance No. 2,462/2018 of the Ministry of Social Development<sup>2</sup> (MDS), which are:

- i. promoting decentralized, autonomous, and sustainable access to water;
- ii. **access to water that complements and does not exclude access to other forms of supply;**
- iii. gradual expansion of water collection and storage capacity to ensure water security for families;
- iv. assisting families without requiring fees or financial compensation;
- v. **promoting access to water for human consumption, with priority given to drinking and cooking; and**
- vi. **promoting access to water for food production**, considering the family's productive system and in conjunction with policies for the development of family farming and traditional peoples and communities.

This Product 5 will present the main characteristics of the ST and solid waste management activities and will provide support material for choosing the communities that can be part of the PIR and the other stages of the Project that involve carrying out these activities. The priority and eligibility criteria were developed with the aim of changing the local reality and not just meeting demands.

---

## 2 Basic Sanitation in Paraíba

According to the data provided by SNIS 2022, the total population of Paraíba served by water supply systems is 77.0%, and sewage systems serve 40%. The Water and Sanitation Institute (IAS), based on data from SNIS 2019, shows the following percentages for Paraíba's rural population: 24.16% of the population is served by a water supply network and 18.82% by a sewage system. These percentages exclude those not served by a water or sewage network and those using alternative water supply and sewage solutions.

Paraíba has actions, programmed or implemented by the state, to promote water, sewage, and solid waste in municipalities with up to 50,000 inhabitants, developed by the following bodies (Paraíba State Water Resources Plan, Diagnostic Report-vol-2, March 2022):

### i) Ministry of the Environment:

- Food and Nutrition Security: Water Desalination;
- Support for the Implementation of Structural Instruments of the National Solid Waste Policy;
- Recovery and Preservation of Watersheds

### ii) Ministry of Health/National Health Foundation Basic Sanitation:

- Support for the Quality Control of Water for Human Consumption for the Prevention and Control of Diseases;
- Support for the Management of Basic Sanitation Systems in Municipalities with up to 50,000 inhabitants;
- Implementation, Expansion, and Improvement of Public Water Supply Systems in Municipalities with a population of up to 50,000 inhabitants, except in Metropolitan Regions (RM) or Integrated Economic Development Regions (RIDE);
- Implementation, Expansion, and Improvement of Public Sanitation Systems in Municipalities with a population of up to 50,000 inhabitants, except in Metropolitan Regions (RM) or Integrated Economic Development Regions (RIDE);

---

<sup>2</sup> Ministry of Social Development (MDS), now known as the Ministry of Development and Social Assistance, Family and Fight against Hunger.

- Implementation and Improvement of Public Solid Waste Management Systems in Municipalities with up to 50,000 inhabitants, excluding Metropolitan Regions (RM) or Integrated Economic Development Regions (RIDE);
- Implementation of Household Sanitation Improvements for the Prevention and Control of Diseases in urban areas of municipalities with a population of up to 50,000 inhabitants;
- Implementation, Expansion or Improvement of Sustainable Basic Sanitation Actions and Services in Small Rural Communities or Traditional Communities.

iii) Executive Water Management Agency of the State of Paraíba:

- Action: Implementation and Improvement of Water Resources Management Instruments;
- Action: São Francisco River Integration Project;
- Action: Implementation of the Dam Safety Policy;

In addition to these actions, Paraíba has the Cooperar project for rural sanitation through the implementation of Complete Water Supply systems, known as WSS, and Single Water Supply systems, known as collective WSS, CWSS. The following units are currently being implemented:

- 26 WSS units are being tendered, serving a total of 1,288 families in 17 municipalities;
- 18 CWSS units, currently out to tender, serving a total of 344 families in 13 municipalities;
- 15 units of CWSS (Desalinator with photovoltaic power supply), currently out to tender, serving a total of 429 families in 13 municipalities;
- 6 CWSS units completed, serving a total of 95 families in 5 municipalities;
- 26 units of CWSS (Desalination Plant with photovoltaic power supply), completed, serving a total of 608 families in 18 municipalities;

Of the 223 municipalities in Paraíba, 20 have their Municipal Basic Sanitation Plans (PMSB) drawn up, 42 are in the process of doing so and 151 have no plan (Instituto Água e Saneamento<sup>3</sup>, 2020).

Complementary Law No. 168/2021 regionalized the 223 municipalities into 4 Water and Sewage Microregions with the following division:

- 1-MSB - Alto Piranhas micro-region made up of 38 municipalities;
- 2- MSB - Espinharas micro-region made up of 46 municipalities;
- 3- MSB - Borborema micro-region made up of 84 municipalities;
- 4- MSB - Microregion of the Coast made up of 55 municipalities;

---

### 3 - Social Technologies

For this study, the STs were divided into four phases according to their implementation methods

The ST defined in each phase to initially make up PROCASE II are as follows:

---

<sup>3</sup> Instituto Água e Saneamento is a platform that facilitates access to information on sanitation in Brazil's 5,570 municipalities. <aguaesaneamento.org.br>

- **Phase I:** 16,000-liter slab cistern;
- **Phase II:** 52,000-liter rainwater cistern; 52,000-liter sidewalk cistern; underground dam; trench yard and stone tank;
- **Phase III:** gray water reuse (Vermifilter or Banana Tree Circle) or black water reuse (Evapotranspiration Basin - Green Trench);
- **Phase IV:** Biodigester for agricultural waste;

The ST and solid waste management activity will support PROCASE II's sustainability and contribute to the Project's objectives in eliminating waterborne diseases, controlling water use, preserving the environment, and mitigating climate change. They are intrinsic to basic sanitation and must follow its premises. Specifically, the ST of PHASE I will serve an extremely vulnerable target group and should benefit households that cannot be served by local water supply systems or solutions for hydraulic or geographical reasons<sup>4</sup>. Thus, they can be implemented in isolation or consortium according to the following premises:

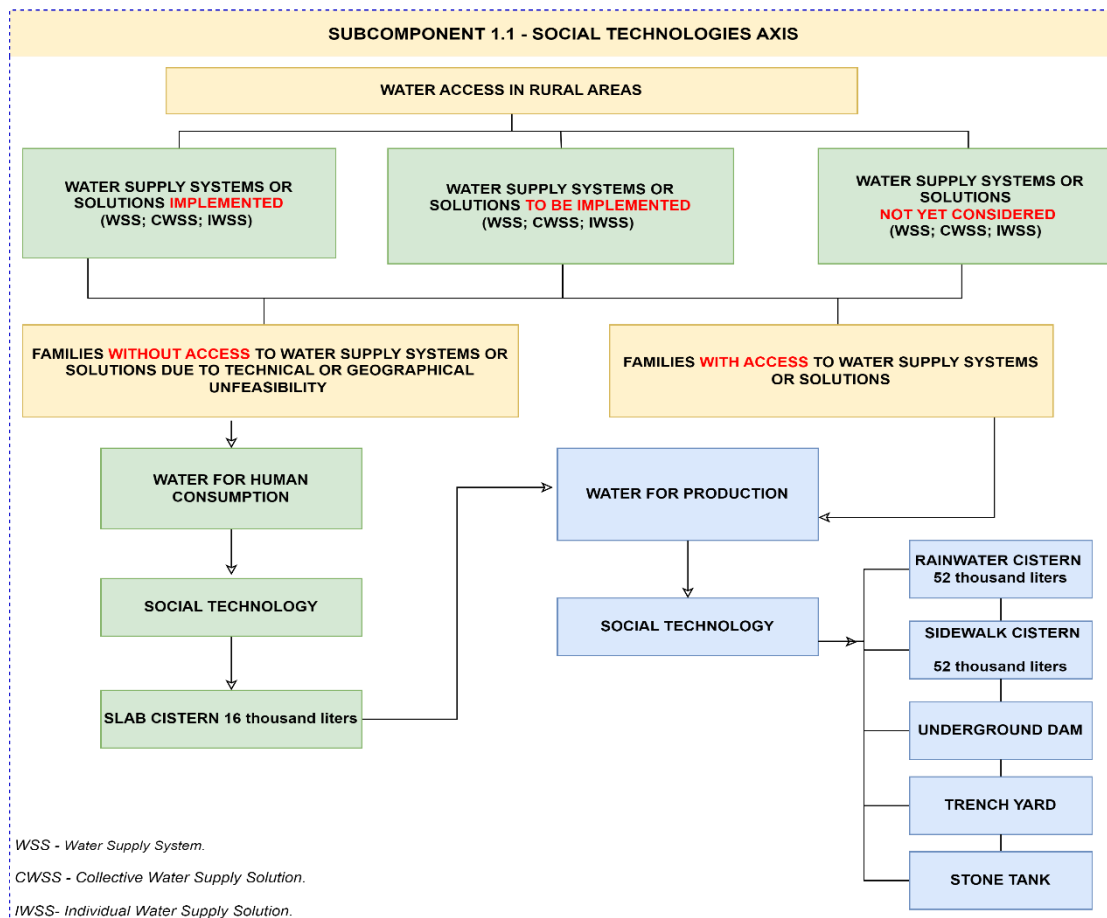

- STs implemented in consortium: these are the STs from phases I and III, which must provide treated water and properly dispose of domestic sewage effluents to guarantee the effectiveness of their actions within the basic sanitation proposal;
- STs implemented in isolation: these are the STs from phases II to IV, which should only be implemented if water is guaranteed for human consumption. They will contribute to controlling the use of water for human consumption and other purposes. Guaranteeing access to water for human consumption means assuming that the areas to be served by the Project are assisted by public sanitation policies.

The PIR to be covered by ST must guarantee access to water for human consumption and, to this end, the choice of beneficiary families must be based on the existing types of drinking water supply, with the ST in phase I taking priority over the others, as shown in the Flowchart in Figure 1:

---

<sup>4</sup> Geographical reasons: dispersed households, located in very remote areas or with difficult access that makes it impossible to interconnect with the local water supply system or solution.

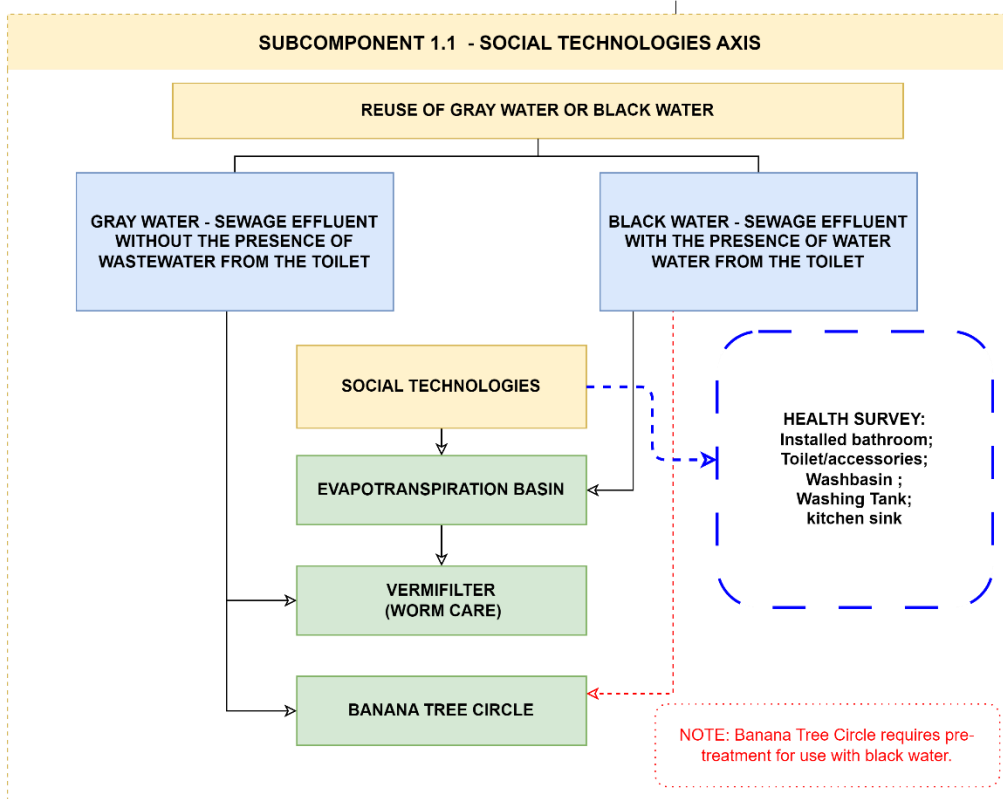

**FIGURE 1-FLOWCHART SOCIAL TECHNOLOGY FOR WATER SUPPLY - PHASE I AND III**

Source: Own (2024).

The ST of PHASE III should prioritize the ST of PHASE I and promote the sustainability of basic sanitation in water and sewage. However, the application of this ST in the other phases should only be implemented if it transforms the local reality. Its units are set out in the Flowchart in Figure II, which highlights the Wastewater Health Survey as a relevant factor because the elements that make up the health survey can make the implementation of reuse units unfeasible due to technical and financial factors.

FIGURE 2-FLOWCHART OF DOMESTIC EFFLUENT REUSE

### 3.1 Characteristics of Social Technologies (ST)

The ST will follow the references of the Normative Instruction (IN) of the MSD. For each ST, the corresponding IN number will be presented. Each IN has an annex with execution and assembly procedures; activities for mobilizing, selecting, and registering families in the Cisterns SIG (Integrated Management System) computerized<sup>5</sup>; training of families to manage the technologies; training of people to build the technologies; training of the construction process; and estimated unit values for implementing the technology within the scope of the Cisterns Program.

#### i) PHASE I: Water supply for human consumption:

- **16,000-liter slab cistern:** the operational requirements for implementation are set out in **SESAN/MDS Normative Instruction No. 9 of 03/03/2023** and its annexes. This social technology should provide access to quality water in sufficient quantity for human consumption for low-income families living in rural areas by capturing and storing rainwater, combined with training and education in water management. This technology should improve living conditions by facilitating access to quality water for human consumption, directly impacting health, food security, and nutrition.

The methodology for implementing this technology follows the following stages: i) mobilization, selection, and registration of families; ii) training of beneficiaries on the proper use of the cistern and on the management of stored water and those responsible for construction; iii) construction of the cisterns.

<sup>5</sup> SIG Cisterns: is the guarantee of the management, control and transparency of the Cisterns Program, all Social Technologies are registered in this system.

ii) **PHASE II: Water supply for agricultural use:**

- **A 52,000-liter rainwater cistern**, with catchment from a rainwater bed, set out in **SESAN-Support/MDS Normative Instruction No. 31 of 23/05/2023** and its annexes, aims to provide low-income families living in rural areas with access to water for food production and/or animal watering. This technology should improve living conditions, facilitate access to water, contribute to ensuring food security and nutrition, and generate income from the sale of surpluses, if applicable.

The methodology for implementing this technology follows the following stages: i) mobilization, selection, and registration of families; ii) training of beneficiaries on water management in agri-food production, including exchanges of experiences, and of those responsible for construction; iii) implementation of the cisterns; and iv) implementation of a productive nature;

- **52,000-liter sidewalk cistern**, with a rainwater catchment area based on a 200-meter sidewalk<sup>2</sup>, set out in **SESAN-Support/MDS Normative Instruction No. 10 of 03/03/2023** and its annexes, aims to provide access to water for food production and/or animal watering for low-income families living in rural areas, combined with technical training and training for water management and handling. This technology should improve the living conditions of beneficiary families, facilitating access to water and helping to guarantee food security and nutrition and generating income from the sale of surpluses, if applicable.

The methodology for implementing this technology follows the following stages: i) mobilization, selection, and registration of families; ii) training of beneficiaries on water management from the perspective of agri-food production, including exchanges of experiences, and of those responsible for construction; iii) implementation of the cisterns; and iv) implementation of a productive nature;

- The purpose of the **Underground Dam**, set out in **Normative Instruction SESAN-Apoio/MDS No. 32 of 24/05/2023** and its annexes, is to provide low-income families living in rural areas affected by drought or regular water shortages with access to water for food production, combined with technical training and training in water management. This technology should improve beneficiary families' living conditions, helping guarantee food security and nutrition and generating income from the sale of surpluses, if applicable.

The methodology for implementing this technology follows the following stages: i) mobilization, selection, and registration of families; ii) training of beneficiaries on water management for agri-food production, including exchanges of experiences; iii) implementation of the dams; and iv) implementation of a productive nature;

- **Dugout trench (Barreiro trincheiro)**, set out in **Normative Instruction SESAN-Apoio/MDS No. 33 of 07/07/2023** and its annexes, aims to provide low-income families living in rural areas with access to water for food production and animal watering, combined with technical training and training in water management and handling. This technology should improve beneficiary families' living conditions, helping guarantee food security and nutrition and generating income from the sale of surpluses, if applicable..

The methodology for implementing this technology follows the following stages: i) mobilization, selection, and registration of families; ii) training of beneficiaries in water management, including exchanges of experiences; iii) implementation of trench sluices; and iv) implementation of a productive nature;

- **Stone Tanks** or Cauldrons, an easy-to-implement technology for food production and/or animal feed, are built in areas with cliffs or rock formations, natural places that can

accumulate water. It is not included in the Cistern program's list of social technologies, but it is used in semiarid regions in other actions such as the Articulation in the Brazilian Semiarid (ASA).

iii) **PHASE III-Reuse of gray water and black water:**

Among the list of Social Technologies adopted by the MDS Cistern Program, the following technologies are in line with PROCASE II in terms of sanitary sewage: reuse of gray water (through physical and biological treatment - use of earthworms) and reuse of black water (Green Trench), both without the need for pre-treatment or post-treatment units for release into the soil or water body.

- **Gray water reuse:** treats wastewater that does not come from the toilet, as set out in **IN SESAN/MDS No. 36 of 08/03/2024** and annexes. The treatment of these effluents through the reuse system consists of a filtering process using biological and physical impediment mechanisms. Initially, the gray water, rich in chemical and organic waste, is directed to a filter where the organic matter is biodegraded by a population of microorganisms and earthworms (*eisenia fetida*), removing its main pollutants (Annex). This treatment is of the Vermifilter type<sup>6</sup>.

It should be noted that most of the guidelines in this document were obtained from the systematization completed in 2015 by Assessoria, Consultoria e Capacitação Técnica Orientada Sustentável - ATOS, in partnership with the Federal Rural University of the Semiarid, IFAD and the Dom Helder Câmara Project, which resulted in the *Manual for the implementation and management of the family bio-water system: water reuse* (Annex to IN SESAN/MDS No. 36).

In addition to this, the Banana Tree Circle can also be used, which is specified in academic works<sup>7</sup>, but not yet regulated in the Federal Government's Normative Instructions specifically for gray or black water, and for the treatment of black water, pre-treatment must be installed.

- **Black water reuse:** treats the specific water from the toilet, the evapotranspiration basin (Green Pit; Ecological Pit) will be used, as set out in the Annex to **IN SESAN/MDS No. 36 of 08/03/2024**. The ecological or green pit is a technology designed to collect and treat fecal water (toilet effluent) from an evapotranspiration tank. It is a planted system where the anaerobic decomposition of organic matter takes place, mineralization, absorption of nutrients and water by the plant roots and, finally, the water is returned to the hydrological cycle through the evapotranspiration of the plant species planted in the ecological pit.

iv) **PHASE IV - Biodigester for farming.**

Biodigesters<sup>8</sup> are easy to operate and maintain and can be implemented at the family level. PROCASE I implemented a biodigester in partnership with UFCG at the Ecoprodutiva unit in the municipality of Congo-PB.

---

<sup>6</sup> Vermifilter can be used for black water, domestic sewage, but it is necessary to carry out a pre-treatment technology such as a septic tank.

<sup>7</sup> The Banana Tree Circle is not included in Brazilian standards, but it is suggested by FUNASA (FUNASA, 2015 and 2018) and its effectiveness has been proven by academic research (FIGUEIREDO, in press) and by its current use in permaculture and agroecology projects (Book Domestic Sewage Treatment UNICAMP, 2018).

<sup>8</sup> The biodigester for treating domestic effluent does not require pre-treatment, but it is necessary to install post-treatment of the treated effluent for disposal in the soil or water body, requiring more specific monitoring, which differs from the project proposal.

They are not included in the list of MDS INs, but they are easy-to-implement and operate units with published academic studies. Of particular note here is Article 1 of **NORMATIVE INSTRUCTION No. 1 SEISP/SEDS/MC, OF DECEMBER 1, 2020**, published in the DOU on December 2, 2020, which states "...

*Any alteration to the technical specifications of the social technologies for access to water supported by the Cisterns Program contained in the operational instructions and normative instructions in force must be submitted for prior analysis by this Ministry and must be accompanied by a study or technical report issued by federal or state public universities or by federal or state public agencies that prove its suitability and viability."*

- **Biodigester:** a domestic sewage effluent treatment unit and biofertilizer production unit supplied with plant or animal production waste (animal urine and manure). Biogas and biofertilizers are produced.

The rural biodigester implemented by PROCASE I was supported by the Human Resources Training Program for the Construction of Rural Biodigesters, aiming to train human resources and build rural biodigesters. The biodigester implemented was of the sertanejo type, supplied by waste generated by 20 pigs and ten cattle, and was able to provide energy equivalent to an average of 7.8 cooking cylinders per month.

### 3.2 - Eligibility criteria for the choice of ST.

Table 1 shows the eligibility criteria for the target public defined in the Normative Instructions of the Cistern Program.

**TABLE 1 ELIGIBILITY CRITERIA ACCORDING TO THE CISTERN PROGRAM**

Eligibility criteria: MDS Normative Instructions	Social Technologies	Target audience (all ST) and prioritization criteria for water supply and wastewater reuse
<b>Mobilization, which involves holding local and territorial meetings to plan the actions to be carried out and working to mobilize the community for the participatory identification and implementation of the Project.</b>	All: Cisterns, Earthen dams, Trench dams, Vermifilters and Green trenches	The potential target audience is families with an income of up to half the minimum wage <i>per capita</i> living in rural areas without access to drinking water.
<b>Selection and registration of families, based on the training and involvement of social leaders and local public authorities who organize community meetings, guide home visits, validate the selection process, and monitor the entire implementation process.</b>	All: Cisterns, Earthen dams, Trench dams, Vermifilters and Green trenches	<b>Prioritization criteria, in that order, for water supply TS:</b> <ol style="list-style-type: none"> <li>i. Families in extreme poverty;</li> <li>ii. Families with a Single Registry profile;</li> <li>iii. Female-headed households;</li> <li>iv. Families with more children aged 0 to 6;</li> <li>v. Families with more school-age children;</li> <li>vi. Families with persons with disabilities;</li> <li>vii. Families headed by the elderly (in this case, a gross family income of up to three minimum wages is allowed)</li> </ol>
<b>Selection, which involves identifying sites with suitable soil conditions for building the cistern and identifying the families to be assisted, according to the prioritization criteria.</b>	All: Cisterns, Earthen dams, Trenches, Vermifilters and Green trenches	
<b>Registration of beneficiaries in the SIG Cisterns computerized system</b>	Cisterns, earth dams, trenches, vermifilters and green trenches	
<b>Training families in water management for human consumption</b>	16,000-liter cisterns for human consumption.	<b>The prerequisite for water reuse STs is that the family/household has:</b>

<b>Training families in water management for food production.</b>	Sidewalk cistern; Overflow cistern; Earth dam; Trench cistern; Vermifilter and Green pit	<ul style="list-style-type: none"> <li>i. water for domestic use, not brackish;</li> <li>ii. bathroom and sink;</li> <li>iii. toilet, if the ecological pit is installed;</li> <li>iv. area for vegetable production close to home</li> </ul>
<b>Training families in simplified water management systems for food production.</b>	Sidewalk cistern; Earth dam; Trench yard; Vermifilter and Green trench	<b>Prioritization criteria, in addition to the minimum requirements indicated above for water reuse TS:</b> <ul style="list-style-type: none"> <li>i. families belonging to traditional peoples and communities;</li> <li>ii. women-headed households;</li> <li>iii. families with more children aged 0 to 6;</li> <li>iv. families with more school-age children;</li> <li>v. families with persons with disabilities;</li> </ul>
<b>Exchange of experiences: a dynamic that involves interaction between Project beneficiaries and other farmers, based on the horizontal exchange of knowledge and experiences, making it possible to value local practices and knowledge.</b>	Sidewalk cistern; Overflow cistern; Earth dam; Trench cistern; Vermifilter and Green pit	
<b>Implementation of the cisterns: corresponds to the building/construction processes</b>	16,000-liter cistern; sidewalk cistern; earth dam; dugout trench; vermifilter and green trench; vermifilter and green trench	
<b>Productive implementation: corresponds to the delivery of inputs and infrastructure material.</b>	16,000-liter cistern; Sidewalk cistern; Trench yard	
<b>Implementation: corresponds to the delivery of inputs and infrastructure material and the installation of the system associated with the productive character of the technology.</b>	Trench cistern; Flood cistern; Earth dam; Trench yard	

Table 2 complements the criteria in Table I to align them with the PROCASE II design.

**TABLE 2 - ELIGIBILITY CRITERIA FOR ST ACCORDING TO IMPLEMENTATION PHASES.**

IMPLEMENTATION PHASES OF -TS	TYPE OF TS	ELIGIBILITY CRITERIA
<b>PHASE I</b>	16,000-liter plate cistern	benefit households that cannot be served by any other type of drinking water supply, either for technical reasons of civil or hydraulic engineering or for geographical location (located in very dispersed areas that make it unfeasible to invest in interconnection with other WSS or Supply Solutions) - see Figure 1;
		must have priority over the other PHASES
<b>PHASE II</b>	Sidewalk and rainwater cistern with 52,000-liter; underground dam, trench, and stone tank	must be implemented in households that have water for human consumption;
		prioritize assistance, where appropriate, to families benefiting from the ST of phase I.
<b>PHASE III</b>		priority in households benefiting from PHASE I

	Vermifilter, Banana Tree Circle and Green Trench	families benefiting from a water supply other than a cistern must provide proof of the existence of a grease trap, toilet, and sink; toilet, for plant production and close to the home
<b>PHASE IV</b>	Biodigester for agricultural use	must be implemented in households that have access to water for human consumption.

The proposed criteria in Tables 1 and 2 should be aligned with the following propositions:

- The published Municipal Basic Sanitation Plan must be a tie-breaking criterion when choosing the technologies for Phases I and III;
- The area covered by the implementation of the social technologies should be the four basic sanitation micro-regions of Paraiba;
- The TA teams must have qualified and trained professionals with experience in rural sanitation on their staff so that they can support both the eligibility process for the technologies and the process of guiding the implementation, operation, maintenance, management, and monitoring of each of the social technologies;
- Training should prioritize the teaching of the rational use of water in terms of the purpose for which it is used and the control of waste;
- The sanitary survey is indispensable and must be implemented in all the areas covered by social technologies. It must include questions about the conditions of access to water for any purpose, the conditions of sanitary sewage (toilets, grease traps, open sewage, ways of sanitizing, etc.);

Of note in these guidelines is the guarantee of drinking water consumption for all the covered STs. This is pertinent to the Project, which specifies the target audience to be served in the context of the productive and social inclusion of family farmers, as well as the adaptation and mitigation of climate change, contributing to the sustainability of PROCASE II.

The Municipal Basic Sanitation Plan should be used as a tiebreaker for the choice of ST, where relevant since the Plans do not reflect the reality of basic sanitation in the municipalities. There may be municipalities with a published PMSB but without implemented water and sewage systems. However, the published PMSB presents the basic sanitation guidelines and can support the choice of beneficiary areas, serving as a valid justification for the choice of ST.

### 3.3- Technical criteria for implementing ST

The ST of all the phases mentioned are structures that are easy to execute, operate and maintain. However, their efficiency comes from technical characteristics that must be appropriately presented during training, as highlighted in Table 3.

**TABLE 3- TECHNICAL CRITERIA FOR ST EXECUTION**

TECHNICAL CRITERIA	FEATURES	NOTE
<b>Location</b>	<ul style="list-style-type: none"> <li>▪ terrain and relief conditions for building the structures;</li> <li>▪ difficult to access for operation and/or maintenance;</li> <li>▪ building cisterns near trees and bushes;</li> <li>▪ building cisterns for human consumption near unhealthy environments (corrals, septic tanks, garbage dumps);</li> </ul>	The location of the ST units is a major factor in the service life of the ST because it covers both structural and operational aspects.

<b>Type of soil</b>	<ul style="list-style-type: none"> <li>need for evaluation for the foundation;</li> <li>will define the type of backfill and forms of soil compaction, among others;</li> <li>earthmoving: will define the use of the appropriate equipment for excavation, Phase III ST, in terms of rent and hours worked;</li> </ul>	Even though these points are the responsibility of the designer and the construction companies, it is pertinent that the beneficiaries have basic knowledge of the characteristics of execution as they play an important role in supervising the works.
<b>Sizing</b>	<ul style="list-style-type: none"> <li>Present the volume with reference to the intended use of each ST to control water use and avoid waste;</li> <li>for PHASE IV - biodigester - provides information on biogas consumption and biofertilizer production;</li> </ul>	Knowing the production capacity of each technology prevents waste and contributes to proper use.
<b>Material</b>	<ul style="list-style-type: none"> <li>identification of materials;</li> <li>storage;</li> </ul>	It is relevant that beneficiaries know the materials to check the type and quantity provided for in the Project and storage conditions during the work and post-work.
<b>Equipment:</b>	<ul style="list-style-type: none"> <li>operating manual, hand pump, electric pump, photovoltaics, eco-stoves, biodigesters, among others;</li> </ul>	Emphasize the importance of the equipment's operating manual in training sessions and present the relevant points didactically in plain language.
<b>Labor</b>	<ul style="list-style-type: none"> <li>having a qualified bricklayer during the construction work;</li> <li>presence of a qualified technician;</li> </ul>	Professionals are essential for the execution of works, even if the labor is provided by the beneficiaries. The competence of the professional raises the quality of the work and eliminates many faults.
<b>Site measurements</b>	<ul style="list-style-type: none"> <li>control of the construction budget spreadsheet;</li> <li>knowledge of the work's physical and financial schedule;</li> </ul>	Foster beneficiary's interest in controlling the services and materials contracted and executed.
<b>Construction Diary</b>	<ul style="list-style-type: none"> <li>Include the beneficiary in the work's technical notes.</li> </ul>	The association should be responsible, but the presence of the beneficiary is important, as they will be the operator of the technology, where appropriate.

Figure 3 shows intervening factors during the use and operation of cisterns presented in a study on cisterns, which is fully aligned with the premises of the ST axis and will be used with pertinent adaptations for the other phases established in this process.

Tables 4, 5, and 6 will adapt the information according to the other Phases III and IV. Phase II is similar to the cistern criteria, differing only in the water quality parameter criterion, which specifically focuses on human use.

**FIGURE 3 FACTORS AFFECTING THE USE AND OPERATION OF CISTERNS**

Group	Dimension	Variable	Effect
Operation	Technique	Cistern design	Functional use of the cistern
		Roof area of the residence	Increase/decrease in water availability
		Water Pump Type	Appropriation and use by the population
		Construction process	Strength and durability
		Quality of the work	Efficiency in the implementation of systems
		Physical conditions of the structure and hydraulic installations	Preservation of water quality and quantity
		Existence of sanitary barriers	Improved water quality
		User maintenance of the system	Preservation of the physical integrity and functioning of the cistern
	Institutional	Program Design and Investments Made	Effectiveness of human supply of cisterns
		Post-construction municipal assistance	Technical assistance, maintenance and repairs
		Control of drinking water	Maintenance of water quality
		Standardization of the use of rainwater by means of cisterns	Establishment of guidelines and quality standards for the construction, operation and maintenance of systems
Use	Sociocultural	Social Participation	Appropriation of technology
		Health and Environmental Education	Adoption of personal hygiene, food and water security habits
		Hygiene in domestic water handling	Compromise of water security
		Social conditions of the family	Freeing women and children from the task of collecting water, in return for work and education
		Alteration in gender relations	Women's empowerment in water management
	Sanitary and Environmental	Water quality	Impact on the health of the supplied family
		Water Quantity	Commitment of well-being and personal and food hygiene
		Pluviometry	Feasibility of using cisterns
Climate Change		Vulnerability of systems to climate change impacts	

Source: Dissertation: Cistern for Human Supply - Silva, Anne (2017)

**TABLE 4 INTERVENING FACTORS IN THE USE AND FUNCTIONING OF PHASE III STS**

DIMENSION	VARIABLE	EFFECT
Technique	<b>Gray or black water reuse project</b>	<b>Applicability</b>
	Construction process	Strength and durability.
	Quality of work	Efficient system implementation.

	The physical condition of the structure and hydraulic installations (grease trap, hand-washing sink, toilet, etc.).	Ensuring the use of treated effluent in plant production and producing humus from earthworms.
	Existence of sanitary barriers	Protecting areas that could be contaminated by the rupture of the structure.
	User maintenance and operation of the system	Appropriate destination for domestic effluent.
<b>Institutional</b>	Post-construction assistance	Technical assistance, maintenance, and repair.
	Monitoring of treated effluent and fertilizer	Maintaining the quality of domestic effluent.
	Standardization of effluent use	Following the recommendations of the relevant technical standards and the IN of the Cistern Program.
<b>Sociocultural</b>	Social Participation	Appropriation of technology.
	Health and environmental education	Knowledge of the operation of treatment units and their use in plant production.
	External hygiene of the home	Avoiding diseases linked to open sewage.
<b>Sanitary and environmental</b>	Quality of treated effluent	Impacting on environmental protection of soil and/or water bodies.
	Climate change	Contributing to climate change mitigation.

**TABLE 5- FACTORS THAT INTERVENE IN THE USE AND FUNCTIONING OF THE ST - PHASE IV**

<b>DIMENSION</b>	<b>VARIABLE</b>	<b>EFFECT</b>
	<b>Biodigester project - farming</b>	<b>Applicability</b>
<b>Technique</b>	Construction process	Strength and durability.
	Quality of work	Efficiency in setting up the unit.
	Physical condition of the structure	Ensuring the use of biogas and biofertilizer.
	Existence of sanitary barriers	Protecting units that could be contaminated by the misuse of biodigester waste.
	User maintenance and operation of the system	Encouraging proper management of livestock waste.
<b>Institutional</b>	Post-construction assistance	Technical assistance, maintenance, and repair.
	Monitoring biogas and biofertilizer production	Availability of waste to produce gas and biofertilizer.
	Standardization of effluent use	Following the recommendations of the relevant technical standards.
<b>Sociocultural</b>	Social Participation	Appropriation of technology, income generation, biogas for cooking, lighting, among others.
	Health and environmental education	Converting electrical and thermal energy.
	External hygiene of the home	Avoiding illness when handling waste.
	Quality of the waste generated	Reducing greenhouse gases. Avoiding soil and aquifer contamination. Clean technology.

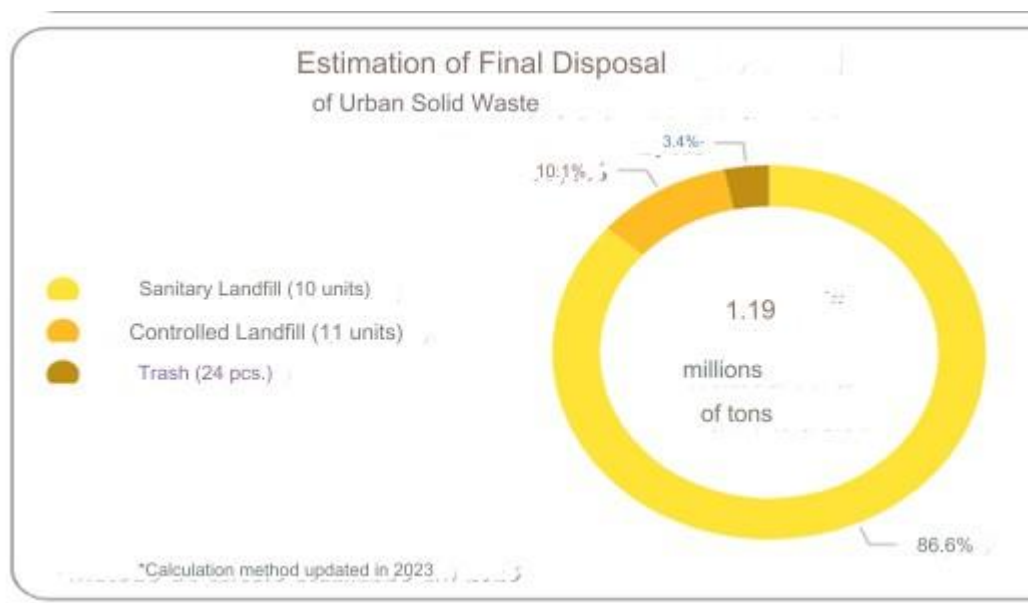

Sanitary and environmental I	Climate change	Contributing to climate change mitigation.
------------------------------	----------------	--

#### 4- Solid Waste Management

Solid waste management is not part of the Social Technologies axis of sub-component 1.1 and will, therefore, be mentioned in this chapter as complementary information. In Component 1, it is listed under the Types of Climate Mitigation Investments that can be financed by PIR and PN investments. However, solid waste management is part of the basic sanitation axes and requires attention regarding waste generated in rural areas.

Solid waste management depends on several variables, mainly those relating to landfills and municipal solid waste plans. The few existing landfills, see Figure 4, are planned to directly serve urban areas, municipal seats, or districts with high population density, and some municipalities have not completed their Municipal Plans.

FIGURE 4-ESTIMATED FINAL DISPOSAL OF MUNICIPAL SOLID WASTE MANAGEMENT

Rural areas have situations of isolation and/or difficulties in accessing households. The potential sources of solid waste generation are diverse, ranging from agricultural production waste to household waste, in addition to the lack of sanitation in these areas. In other words, all these factors, together with the lack of access to solid waste collection, mean that the population has the option of burying, burning or irregularly disposing of the waste produced in their homes and in their agricultural activities. Another point of impact is the change in consumption patterns in rural communities, where the composition of rural household waste is increasingly like urban solid waste, with an increase in the disposal of plastics, metal cans, batteries, tires, light bulbs, household appliances, among others (CAPANEMA, 2014).

Faced with the scenario of rural areas with isolated households difficult to access and a basic sanitation deficit, it becomes pertinent to implement actions that can contribute to the elimination of dumps, i.e. to minimize the polluting effects of agglomeration of waste.

Among the implemented actions, these can be carried out in isolation or groups, as long as they minimize the effects generated by the lack of solid waste management. Examples of activities include:

- Purchase of collectors for packaging waste;
- Implementation of a voluntary drop-off point - PEV;
- Acquisition of any type of transport, large or small, to support municipal waste management;
- Implementation of recyclable sorting units;
- Support for the creation or renovation of sites for recycling activities;
- Support for waste pickers;
- Support for the implementation of natural or accelerated composting;
- Training;
- Proof that the implemented activity will change the local scenario in terms of the generation, storage, and final disposal of solid waste in the covered areas.

These activities contribute to reducing pollutants and mitigating climate change and are easy to implement as part of the Project design. However, their effectiveness depends on municipal management, which is responsible for the final destination of solid waste. Given the shortfall in solid waste management in Paraíba, the associations selected for this purpose should have as an eligibility criterion the greatest positive impact generated by their implementation and use the Municipal Solid Waste Plan as a tie-breaking factor.

---

## 5- Final considerations.

This Social Technology (ST) Report presents the social technologies to be developed in the PIRs and the proposal for implementing solid waste management.

Eligibility criteria and priorities for the implementation of ST were presented, which will serve as a reference for the identification and selection of families that can benefit from these STs and be assisted through TA.

These criteria will guarantee the use of simple-to-apply and sustainable technologies where execution, operation, maintenance, monitoring, and management can be carried out by the beneficiary families and supported by the relevant state bodies so that together they can guarantee technical, socio-cultural, environmental, and budgetary control of each phase of the project.

## 1 Justification

The Project region faces a number of limiting factors which were considered when elaborating the proposal for this component.

### Family farming organizations and their weaknesses

Often, tackling the problems posed by Paraíba's rural population's vulnerability is difficult at the individual or family levels. Generally, activities of this kind require a capacity for joint or collective action. One of the issues that reinforces the processes of unsustainability, which accentuate vulnerabilities, concerns local organizations<sup>1</sup>.

Traditional rural communities are characterized by the existence of a system of social institutions that organize local social life. These mechanisms - such as kinship networks and traditional mechanisms of reciprocity - enabled various types of collective action to take place, covering issues such as the management of common resources, holding community festivals, organizing religious events, etc.<sup>2</sup> However, nowadays these structures do not work well in all communities, and in many cases, there is an 'erosion' of traditions<sup>3</sup>. This has led to a weakening of traditional social structures. On the other hand, reality has presented new demands for community organization, mainly related to the actions of other social actors with whom families/communities establish relations. This situation has stimulated the creation of new forms of organization, generally more formalized, which may take on responsibility for old practices, but are essentially created to take on new functions. Among these new forms of organization, community associations stand out first and foremost.

There are currently many community associations in rural Paraíba. However, it must be acknowledged that they have shortcomings. One of the barriers that reinforce the *status quo* of unsustainability involves the role of the 'community association' as an effective means of representation and, above all, of organizing collective action at local level. But, as various studies have shown, the creation of associations alone is not enough. It has been found that it is very difficult for these associations to play their potential positive role in the processes of promoting more resilient development spontaneously<sup>4</sup>.

Previous experience of various rural development projects supported by different donors, including IFAD, has shown that the role of representing the group of families vis-à-vis government agencies has posed major challenges for community associations, as far as these new relationships require them to carry out tasks that are entirely unknown to them. In the case of associations assisted by development projects, one such task is that of managing community 'projects'.

On the other hand, rural organizations (usually in the form of cooperatives) created for the purpose of carrying out activities that seek to promote access to markets (such as packaging, processing, and marketing local products), encountered many difficulties in establishing themselves in this role. These organizations have significant shortcomings in terms of capacity on issues such as i) administration and finance (including access to sources of financing for working capital), ii) the ability to design and implement innovative and diversified marketing strategies, iii) the composition of teams with little representation of women and young people, among other weaknesses.

2 SABOURIN, E. Camponeses do Brasil: entre a troca mercantil e a reciprocidade. Rio de Janeiro: Garamond, 2009. 336 p.

3 For example, it is not uncommon to hear from farmers in various regions of the northeast that collective action instruments, such as *mutirões*, worked much better before than they do today. Sabourin mentions other symptoms of this "erosion": some farmers go as far as to pay a day laborer "instead of guaranteeing the service directly. They thus assume their material duty, but, according to the community, they do not respect their social duty". (SABOURIN, E. Mudanças sociais, organização dos produtores e intervenção externa. In: CARON, P. and SABOURIN, E. (Ed.). Peasants of the Sertão. Changes in family farming in the Northeast of Brazil. Brasília: EMBRAPA Informação Tecnológica, 2003. p. 145 - 178).

4 UPHOFF, N. Grassroots organizations and NGOs in rural development: opportunities with diminishing states and expanding markets. World Development, v. 21, n. 4, p. 607-622, 1993; UPHOFF, N. T.; ESMAN, M. J.; KRISHNA, A. Reasons for success: learning from instructive experiences in rural development. West Hartford, Conn: Kumarian Press, 1998. 232 p.

Often, they also have significant limitations in their production infrastructures, which do not always allow them to diversify their products, comply with health and environmental legislation, use renewable energy sources in their processes or treat their waste properly. This set of factors limit the ability of these organizations to function and their own sustainability, including economic sustainability. As a result, producers access the market precariously and at low prices, with difficulties in adding value to their production. In this context, intermediaries predominate.

In Paraíba, enterprises for packaging, processing, and marketing products have encountered many difficulties. There are around 8,700 processing units in the Project area<sup>5</sup>. According to the MDS, there were 77 enterprises in the northeast region registered and able to offer their products to government buyers. Of these, only 7 are from Paraíba (9%)<sup>6</sup>.

The situation outlined here indicates that most of the existing local organizations - especially community associations and family farmers' cooperatives - will need support, especially in terms of training, so that they can address various types of shortcomings (for example, in organizational processes and associative/cooperative management) and come to play an active and effective role in implementing the various sustainable development initiatives they are called upon to carry out.

On the other hand, the organizations mentioned above only group together and represent a fraction of Paraíba's Family Farmers, and there is still a significant part of this population that is not yet organized. Data from the 2017 Agricultural Census indicates that only 48% of farmers are members of some kind of organization (association, union, movement, etc.) Considering only the members of cooperatives, this proportion drops to just 3.7%<sup>7</sup>.

#### **Limited access to technical assistance (TA) and credit**

Family farmers in Paraíba also face difficulties in minimally structuring their agricultural activities, as well as incorporating innovations that intensify their production in a sustainable way, due to limited access to technical assistance and credit.

#### **Technical Assistance**

After millennia in which knowledge of agricultural and livestock practices was only passed down between generations of the population dedicated to farming, modern rural education and extension services emerged in Europe and the United States in the 19th century to work on new agricultural technologies and practices<sup>8</sup>. In Brazil, TA services began to be implemented after the Second World War, expanding nationally as a public service over several decades. Despite the crises experienced by this TA, the expectation remains that a quality TA service can play a fundamental role in Brazilian rural development, with emphasis on strengthening family farming, access to public policies, the social organization of farmers, the management of properties and enterprises, the marketing and certification of products, production management, the transition to organic or agroecological systems, the training of farmers, among other issues<sup>9</sup>.

8 CASTRO, C. N. d. Challenges of family farming: the case of technical assistance and rural extension. *Urban and Environmental*, v. 12, p. 49 - 59, 2015.

9 DELGROSSI, M. E.; VIEIRA, L. C. G.; AVILA, M. L. d.; PERAFÁN, M. V. et al. The impact of technical assistance and rural extension for poor family farmers: the case of the Dom Hélder Câmara II Program. *Revista de Economia e Sociologia Rural - RESR*, v. 62, n. 2 e271282, 2024.

These positive expectations related to TA<sup>10</sup> were confirmed in a recent study, which proved the positive impact - mainly due to the increase in agricultural production and income - of the provision of TA services by the Dom Helder Câmara II Project in various territories of the Brazilian Northeast<sup>11</sup>.

However, despite this widely accepted positive outlook, and even though there was significant investment by the federal government in TA between 2003 and 2015, the 2017 Agricultural Census shows that in Brazil, only 19.9% of family establishments had access to some kind of TA<sup>12</sup>. In Paraíba, 16.8% of establishments had access to TA. Although this figure is higher than that of the Northeast region (which is 7.4%), this proportion is still small<sup>13</sup>.

As of 2017, federal funding for TA services has been severely cut again, leaving millions of Brazilian family farmers without any kind of assistance<sup>14</sup>. With this redirection of the national TA policy as of 2017-18, there was an even greater decrease in the resources made available to finance TA services between 2018 and 2022<sup>15</sup>. Given this situation, it is very likely that the proportion of family farms receiving TA services is now much lower than it was at the time of the 2017 Agricultural Census.

In addition to this low coverage rate, information gathered during field visits during the design mission indicates that there is a lack of preparation and qualification of technicians in agroecological practices allow production systems to adapt to climate change, among other aspects. Without qualified professionals, farmers cannot implement more intensive, sustainable, and efficient agricultural practices and adapt to climate change and the challenges of access to market and finance. Correlating this information with the profile of the producers, data from the 2017 Agricultural Census<sup>16</sup> shows that in 47.4% of the establishments that reported applying pesticides, the person responsible could not read and write and that in 80.4% of the cases, the pesticide applications were carried out without any technical guidance.

On the other hand, in recent years (especially since 2020), there have been important methodological innovations in the field of TA. Traditionally, TA activities took place face-to-face, in direct interaction between the TA agent and their audience (the farmers). With the advance and popularization of information technology and the Internet, and mainly stimulated and conditioned by the moment of mandatory social isolation imposed by the Covid-19 pandemic, forms of remote and digital interaction and communication have been gaining ground and importance in TA processes, driving a broad process of innovation and learning in the use of instruments for dialogue, interaction and exchange of knowledge at a distance or remotely<sup>17</sup>.

In this process, TA activities have combined the remote tools already in use (such as TV and especially radio) with a full range of digital tools such as instant messaging applications/platforms (WhatsApp, Telegram), social networks (Instagram, Facebook), institutional websites, YouTube channels (for broadcasting videos). There has also been an

---

10 Internationally, there are also studies that attest to the added value of providing TA services. Here we cite a study carried out by the IDB's Office of Evaluation and Oversight: MARCANO, L.; RUPRAH, I. J. Does Technical Assistance Matter? An Impact Evaluation Approach to Estimate its Value Added. Washington, D.C.: Inter-American Development Bank. Office of Evaluation and Oversight (OVE). 13 p. + Appendixes, 2009.

Disponível em: <https://lac-conocimientos-sstc.ifad.org/documents/262275/0102b72b-56e8-22c2-5916-03ed4bc439f7>.

increase in the use of meeting/live/videoconferencing applications such as Google Meet, Zoom, as well as tools such as platforms specially designed for training events, and themed 'chats' on institutional websites<sup>18</sup>.

Thus, the use and application of digital resources in the activities of the technical assistance and rural extension service, which has been called 'digital TA' in some institutional, political, and academic spheres, has enabled farmers to expand their ways of accessing information and technical guidance, making it an excellent complement to the face-to-face TA service<sup>19</sup>.

### **Access to credit**

According to the 2017 Agricultural Census, in the state of Paraíba, 21,151 family farming establishments (16.9% of all these establishments) had access to some form of financing<sup>20</sup>. According to Santos et al, "*better access to financing for family farmers means contributing to greater dynamism in the agricultural sector in the state of Paraíba. The existence of a significant percentage of family farmers without an efficient financing system, both in terms of the quantity of monetary resources and the technical quality of the projects, reflects how much (financing) public policies need to progress to get closer to universal access*"<sup>21</sup>.

It is worth noting that 76.5% of the families that received financing did so for investment purposes. In addition, only 46.8% of these establishments received funding from government credit programs, PRONAF being the main one<sup>22</sup>.

### **Deficit in access to other public policies to support Family Farming**

Brazil has developed a significant group of public policies to help Family Farming since the 1990s. This process was led by the federal government and many states followed suit with similar state policies. Worth mentioning here are the programs: PRONAF (funding and investment credit), Seguro Safra (agricultural insurance), PAA, PAA Leite and PNAE (public food purchases), P1MC and P1+2 (support for Social Technologies for water storage), PNCF (land credit) and the Rural Development Program. In Paraíba, we should mention the State Seed Distribution Program.

This set of policies expanded until 2015, when some of these programs saw a resource reduction. This process intensified significantly from 2017 onwards, with a significant reduction in federal funding for practically all these policies, leading some of them to be paralyzed (such as P1MC and P1+2). However, as of the beginning of 2023, this trend has been reversed and there is a prospect that family farming will once again be able to count on a wide range of incentive policies.

The existence of these policies, however, does not guarantee access for families. On the contrary, many families find themselves on the margins. Various sources show that few family establishments access them, as shown above in relation to the percentage of family farmers who regularly receive TA services or manage to access credit (especially via PRONAF lines). Access to the PNAE is also limited. According to data from the FNDE, in 2022 Paraíba received only 2% of the Program's total resources, while the number of family farming establishments in Paraíba represents just over 3% of the country's total.

Surveys carried out in the field and with policy managers indicate that there are several causes for this situation. The main one is a lack of more detailed and consistent information about the policies themselves, including aspects such as

eligibility criteria and access mechanisms. Weaknesses have also been identified in the technical teams of government agencies that are responsible for making the policies work in the field.

## Gender

In the state of Paraíba, the Gender Disparity Index is 0.68%, indicating that Paraíba women are 32% less likely to have the same opportunities as men, with the biggest gaps being in the dimensions of political empowerment and economic opportunity<sup>23</sup>. In rural areas, resistance to advances in women's autonomy and rights is even greater. Gender gaps are expressed in restrictions on control and access to natural, social, and monetary resources.

One of the fundamental obstacles is the concentration of land ownership in the hands of men, leaving women in a situation of economic dependence. According to the 2017 Agricultural Census in Paraíba, 71.0% of female heads of family farming establishments have land titles, compared to 73.1% of male heads - an inclusion gap of 2.1 percentage points. On the other hand, when it comes to the management of establishments, only 24% of family farming establishments in the Project area are run by women<sup>24</sup>. However, between 2006 and 2017, there was a 20.3% increase in the proportion of establishments run by women in the state<sup>25</sup>. There is no data available on joint titling.

In Paraíba, according to the same source, the total area of family farming establishments run by women is 214,500 ha (14.9%), while that of men totals 1,226,714 ha (85.1%). In terms of average area (ha), establishments run by men are 80.6% larger than those run by women. While establishments run by women have an average of 7.1 hectares, those run by men have an average of 12.9 hectares. Among the multiple legal, cultural, and structural barriers that exclude women from land rights are patriarchal ideologies about the gender division of labor in the public and private spheres and the practice of transferring land rights only to one representative of the family - the man. For this reason, the Project will seek to prioritize women in the land regularization work it will promote.

One strategy for rural women to increase their autonomy has been education, with higher levels of education compared to men. According to data from the 2017 Agricultural Census, among female family farmers, illiteracy reached 35.8% of those responsible for establishments, while among men, illiteracy reached 48.1% - a gap in favor of women of 12.3 percentage points (equivalent to 34.4%)<sup>26</sup>. Among female family farmers, 19.5% have never been to school, while among men this proportion is 25.7%<sup>27</sup>. Despite better educational indicators, women's average income is lower. In Paraíba, women earn, on average, 10% less than men and account for 72.5% of people earning up to one minimum wage, according to data from the Inter-Union Department of Statistics and Socioeconomic Studies (DIEESE).<sup>28</sup>

Despite rural women's significant contribution to the family economy and community development, their work is often overlooked because they are not part of the formal labor market and do not generate monetary income from activities such as self-consumption. Among the establishments run by women, 80.8% produce for self-consumption, while for those run by men, the same proportion is 70.7%, a difference of 10.1 percentage points (equivalent to 14.3%).

To change this reality, the Project will promote the Agroecological Logbook Methodology, which makes it possible to measure, value and give visibility to women's fundamental contributions to the family economy and, consequently, to community development.

The main agricultural activities of women in the Project area differ from those of men, requiring any public support to take a differentiated approach to meet the specific demands of women. Proportionally, women are more involved than men in temporary crops (37.1% versus 32.9%) and the production of planted/native forests (4.3% versus 2.6%), while

<sup>26</sup> IBGE (2017). Agricultural Census.

<sup>27</sup> Idem.

<sup>28</sup>Source :<https://g1.globo.com/pb/paraiba/noticia/2023/03/06/mulheres-recebem-cerca-de-10percent-a-menos-que-homens-na-paraiba-segundo-dieese.ghtml>

men are proportionally more involved in permanent crops, livestock production (56.2% versus 52.4%) and horticulture/fruit growing (3.9% versus 2.8%).

Rural women in the Project area also have less access to TA. Among female family farmers, 14.9% received TA, while 17.4% of male family farmers received this service, which represents a gender gap of 2.5 percentage points (equivalent to 16.8%)<sup>29</sup>. In this context, the Project will offer continuous TA to beneficiaries, setting a specific target for women (50%), as well as other measures aimed at developing women's capacities in areas such as leadership, management, access to public policies, agricultural and non-agricultural activities.

Looking at the data on machinery, gender inequality is clearly evident. Throughout the country, including in the Northeast, women have less access to tractors, planters, and harvesters. In Family Farming, establishments run by men (80.3%) have 93.1% (511,727) of the tractors for this producer segment, while women have 6.9% (37,845) of the tractors nationwide<sup>30</sup>. These characteristics make women's daily lives tougher, thus impacting on various dimensions of their existence, and even on their willingness to migrate from rural areas to the cities.<sup>31</sup>

As far as associations are concerned, there is a higher proportion of women who are members of trade associations/trade unions and producer associations/movements. Among women family farmers, 37.2% were members of trade associations/unions and among men, 31.8% - a difference of 5.4 percentage points, equivalent to 17%, in favor of women. Regarding producer associations/movements, 15.8% of female family farmers were members in 2017, compared to just 13.6% of men. However, even with greater participation, women often do not have an equal voice because they are not equally represented in positions of power.

It is in this context that the Project will promote Gender Training to develop the capacities of rural women to play an active role, have a voice and decision-making power in Rural Organizations. In addition, the strengthening of Women's Networks will be supported, thus strengthening the self-organization of rural women and their groups and organizations.

Rural women in the Project area also suffer from double working hours. They have a workload that exceeds that of men, including a higher proportion of unpaid domestic responsibilities related to preparing food, caring for family members, and collecting firewood and water<sup>32</sup>. In the Northeast, women devote more hours to these activities (23.5 hours), and it is also the region with the greatest inequality in relation to men. The greater dedication to caring for people and/or household chores ends up restricting women's wider participation in the labor market. In Paraíba, women devote an average of 23.9 hours a week to domestic work; 11.5 more than men - above the average difference in the rest of the country<sup>33</sup>.

The activity to be promoted by the Project to provide early childhood education services (*Ciranda das Crianças*) will help to reduce women's work overload due to childcare and ensure their participation in the training activities promoted by PROCASE II. The fair division of domestic labor will also be the subject of gender training for beneficiaries. In addition, rural women are more vulnerable than men to environmental and climate challenges because of their social roles, for example, as the foremost collectors of water, food, and firewood in a context where increasing pressure on natural resources and environmental degradation are negatively affecting water and food supplies.<sup>34</sup>. In this context, the

Project's investments in social technologies for access to water will help to reduce the time women spend collecting water.

Violence in rural areas is increasing every year, as shown by the growing number of murders of rural workers<sup>35</sup>. Domestic violence is also dramatic in rural areas and the number of femicides has increased. IPEA data for Paraíba indicates a death rate by femicide of 3.9 women per 100,000 in 2018<sup>36</sup>. In 2023, 4,630 police inquiries were opened in Paraíba to investigate cases of domestic and sexual violence against women, according to the Coordination of Women's Police Stations in Paraíba (Coordeam)<sup>37</sup>. Violence indices show that black women suffer much more physical and psychological violence and have the highest risk of being victims of female murder (femicide)<sup>38</sup>. The lack of facilities of the Network to Combat Violence against Women makes rural women more vulnerable to violence and restricts their access to protection. The prevention of violence against women will be addressed in all the gender training offered by the Project.

## Youth

Brazil's Youth Statute (2013)<sup>39</sup> defines young people as those between 15 and 29 years of age. In the Project area, there are 893,666 young people<sup>40</sup>. Among the main challenges faced by rural youth in the Project area are: i) lack of employment and income opportunities (with little diversification of agricultural and non-agricultural activities that attract young people), ii) lack of access to and control over resources, inputs, goods and technologies, iii) limited access to public policies and services and iv) low participation and decision-making power in rural and community organizations.

In Paraíba, among young people aged 15 to 29, approximately 35.1% were neither studying nor working in 2021, according to the Synthesis of Social Indicators 2022. Young women of African descent have a higher percentage out of school and out of the labor market<sup>41</sup>. Household chores and caring for family members are among the main barriers young people face in continuing their studies or getting a paid job, and young women are the majority in this situation. Another important causal factor is the high rate of teenage pregnancy. Between 2020 and 2022, 12,830 pregnancies in children and adolescents aged 10 to 18 were recorded in Paraíba, according to the State Health Department<sup>42</sup>.

As a consequence of the lack of sustainable opportunities for study and formal work for young rural people, there is a process of migration to urban centers, mainly of young women with more schooling, which causes the aging of the rural population (the largest group of migrants is between 16 and 35 years old) and a decrease in the proportion and number of women<sup>43</sup>. The phenomenon of young women being the ones who leave rural areas the most is related not only to the lack of opportunities, but also to their refusal to take on the same roles played by their mothers and grandmothers in the family production unit<sup>44</sup>. In the case of young women, the invisibility and devaluation of the workforce, in caring for children and household chores, and in family farming, are also among the factors that encourage the desire of younger women to leave rural areas and will therefore be addressed during the Project's Gender Training sessions.

---

35 The Report "Conflicts in the Countryside Brazil 2022" by the Pastoral Land Commission (CPT) shows that the number of conflicts in the countryside has increased from 804 cases in 2013 to 1500 in 2022; in 2022 alone 47 murders were recorded compared to 35 in 2013. 44 SILVA, Luciana Porto da. "Female youth in the rural Northeast: an analysis of the process of permanence based on the Census (1980-2010) and Pnad (1992-2015)." (2018). Available at: [https://repositorio.unb.br/bitstream/10482/32747/1/2018\\_LucianaPortodaSilva.pdf](https://repositorio.unb.br/bitstream/10482/32747/1/2018_LucianaPortodaSilva.pdf).

Comparing the 2006 Agricultural Census and the 2017 Census, the young rural population under the age of 25 fell by 49.7%<sup>45</sup>.

Among the factors that influence staying in rural areas are access to financial resources, education/training suited to the characteristics of rural areas, appreciation of rural lifestyles, and the availability of services and conditions that can offer the possibility of success in agricultural production<sup>46</sup>. However, in rural Paraíba, young people who decide to stay in rural areas have limited access to and control over resources, inputs, goods, and technologies. The indicators for access to land and credit confirm this.

In the Project area, only 9.9% of family farms are run by young people under the age of 35<sup>47</sup>, indicating low access to land. When they marry, few acquire a new property and it often happens that the family property is divided into smaller plots for the children, which further reduces the productive potential and profitability of agricultural activities. It should be noted that there are gender tensions in inheritance patterns, which disadvantage young rural women.

Access to credit is very limited in the Project area (see paragraph on the subject above). Although data on access to credit is not available disaggregated by generation, it can be inferred that access to credit by young people is even more limited, as this is the reality throughout the country. The PRONAF Youth program, which was created to facilitate rural youth access to credit, creating conditions to enable rural succession processes in agriculture, still has a very limited number of contracts signed in relation to the proportion of the rural youth population. In 2015-16, a total of only 2,889 contracts were signed across the country<sup>48</sup>. Among the reasons for this lack of access is misinformation, the lack of institutions for training young farmers, the difficult bureaucratic requirements that restrict the signing of credit agreements, and the fact that bank agents often assume that young people's inexperience in managing resources will lead them to default<sup>49</sup>.

However, access to technical knowledge is higher among young people under 35 than the average among family farmers in the Project area. The quantitative evidence available from the 2017 Agricultural Census indicates that, among young heads of family farmers (under 35), 18.5% received TA compared to 16.8% of all adult heads of family farmers. Despite the higher percentage of access, it can still be said that access to TA among young people is limited. Disaggregating by gender, access to TA was 18.1% among young women and 18.6% among young men, so there is a small gap of 0.5 percentage points, equivalent to 2.8%, between young male and female managers.

During the field visits carried out during the PROCASE II design mission, an additional growing problem faced by rural youth was identified - vulnerability to violence associated with drug trafficking.

## **Diversity**

### **Afro-descendants and Traditional Peoples and Communities (PCTs):**

Indigenous peoples and quilombola communities<sup>50</sup> are particularly vulnerable due to the historical dynamics of exclusion, high dependence on natural resources, marginalization of their ways of life, exclusion from formulating and accessing public policies and poor access to services, including health, education, sanitation, infrastructure, and technical assistance services. In Paraíba, the Indigenous Lands are in the coastal region. The Potiguara, with a population

50 Quilombolas are descendants of slaves who resisted the slave regime and have their own cultural identity and values, religious beliefs and means of subsistence.

of approximately 19,000, are concentrated in three Indigenous Lands<sup>51</sup> (CARDOSO; GUIMARÃES, 2012) located in 3 municipalities in the Northern Atlantic Forest region<sup>52</sup>. In the Southern Atlantic Forest region, there is a population of approximately 750 Tabajara indigenous people, but there are still no Indigenous Lands in this region. On the other hand, the 2022 Demographic Census recorded a population of 16,584 quilombola inhabitants in 6,127 households in the entire state of Paraíba. These population figures include all the inhabitants recognized as quilombolas - both those who live and those who do not live in officially delimited Quilombola Territories<sup>53</sup>.

According to data provided by INCRA's state superintendence, there are 47 quilombola communities in Paraíba with recognized certificates of self-definition. However, according to information released by the IBGE and the Federal Public Prosecutor's Office, only 11 have officially delimited territory and none have land titles<sup>54</sup>. There are also traditional gypsy populations, artisanal fishers and shellfish gatherers in the state.

The population afro-descendants and PCTs is impacted by the combined effects of various forms of discrimination, including gender, race, and socioeconomic conditions. Root causes of this exclusion are the marginalization of traditional ways of life and structural racism. Afro-descendant and PCT populations face even greater obstacles than family farmers in participating in decisions that affect their territories and in fully realizing their rights, with significant gaps in inclusion in terms of poverty, food insecurity, access to education, TA, and land<sup>55</sup>.

In 2023, 67.9% of quilombolas and 73.1% of indigenous people were in poverty or extreme poverty<sup>56</sup>, an average higher than the average percentage of poverty in Paraíba (53.9%). In 2022, 33 million Brazilians were hungry (severe food insecurity) and food insecurity was more prevalent among afro-descendant (reaching 6 out of every 10 households whose heads of household identify themselves as black or brown), with women of African descent being the most vulnerable<sup>57</sup>.

In terms of education, among the population of white family farmers in the Project area, illiteracy reached 39.9% of those responsible for family farm establishments, while among those of African descent, it reached 48.1%<sup>58</sup>. Regarding access to TA, among white family farmers, 7,694 accessed TA (17.7%), and among Afro-descendants, 12,961 or 16.1% of the total. The gap between white and Afro-descendant family farmers in access to TA is 1.6 percentage points, equivalent to 9.9%. Furthermore, among white family farmers, 77.7% have land titles, among indigenous farmers, only 44.6% and among Afro-descendants, 70.3%<sup>59</sup>.

To help close the various gaps in the inclusion of Afro-descendants and PCTs identified, the project will have specific activities dealing with diversity issues and will prioritize the Afro-descendant and PCT population in the activities of all its components, such as access to TA, land regularization<sup>60</sup> and the environment, access to water and sanitation infrastructure and productive investments. In addition, through Diversity training meetings, as well as cultural recovery activities in the communities benefiting from the Project, the valorization and dissemination of traditional knowledge,

60 To close the gap in access to land, the Project will promote land regularization, prioritizing quilombola communities.

practices, and ways of life in production, food and natural resource management will be promoted, as well as issues related to racism.

### **Persons with disabilities**

The Northeast is the region with the highest percentage of persons with disabilities Brazil: 10.3% of the population or around 5.8 million people<sup>61</sup>. The highest percentages of persons with disabilities are women and afro-descendant. According to data from the Single Registry (Cadastro Único, November 2023), there are 144,655 persons with disabilities in the Project area, or around 5.6% of those registered.

Disability and poverty are intricately linked in Paraíba, with persons with disabilities facing significant stigma and discrimination. For example, this group has lower success rates at school and more limited access to economic activities, both of which are major factors contributing to family poverty. In the state, 88.7% of persons with disabilities do not work and 74.4% earn less than the minimum wage<sup>62</sup>.

Persons with disabilities face a number of challenges throughout their lives. Children with disabilities dropping out of school is a serious problem across the country. There is a relatively high number of single-parent families headed by women who receive the main tax-funded disability benefit in Brazil, the Continuous Social Assistance Benefit, and this may be related to the high rate of family abandonment by parents who have a child with a disability. The data highlights that persons with disabilities do not achieve parity with their non-disabled peers at any level of education. This puts them at a significant disadvantage in a competitive job market. In Paraíba, 24.92% of persons with disabilities are not literate, 37.48% have only primary education and only 4.07% have higher education<sup>63</sup>.

There are some additional gender dimensions that have an impact on the challenges that persons with disabilities face. For example, women and girls with some form of disability are at high risk of abuse, and this is especially the case for those with cognitive disabilities. Furthermore, until the Brazilian Inclusion Law (2015) was enacted, it was still routine for women with cognitive disabilities to be sterilized without consent.

Caring for persons with disabilities also has a significant gender dimension. In general, women face the double burden of needing to both earn money and provide care, but this burden is only exacerbated when family members are also disabled. It should also be noted that disabled women can have a disproportionate burden of care placed on them, as they can still be expected to care for other members of their family.

### **LGBTQIAPN+ population<sup>64</sup>:**

The lack of government data on the socioeconomic and political challenges faced by the LGBTQIAPN+ community is indicative of the statistical 'invisibilization' and marginalization of this group. The lack of a social assistance policy, the rural exodus of the LGBTQIAPN+ population to urban centers, the lack of family support, limited access to income and low employability in the countryside, the difficulty of staying in the school environment due to prejudice, especially from the trans population, are some of the factors that favor maintaining the invisibility of data on the LGBTQIAPN+ population in rural areas.

Throughout Brazil, the LGBTQIAPN+ population has been victimized by different forms of LGBTIphobia, placing this group in a situation of vulnerability because they do not fit into a socially referenced heteronormative pattern. Brazil is an extremely unsafe country for this population, as indicated by the upward trend in the number of violent deaths of LGBTQIAPN+ people over the last two decades. Between 2000 and 2022, 5,635 people died because of gender prejudice

---

62 PwD CENSUS (2023). Available at: <https://wemp.com.br/censo/#>.

63 Idem.

64 Meaning of LGBTQIAPN+: Lesbian; Gay; Bisexual; Transgender; Queer; Intersex; Asexual; Pansexual; non-Binary, + other identities/orientations.

and intolerance. In 2022, there were a total of 273 deaths of LGBTQIAPN+ people, a national average of 1,31 deaths per million people<sup>65</sup>.

Most deaths occurred among young people aged between 20 and 29 and the Northeast region had the highest absolute number of violent deaths. It is possible to relate the number of LGBTQIAPN+ deaths in each Brazilian macro-region to the social, economic, and cultural conditions of these spatial units. The Northeast, for example, has historically had lower socioeconomic indicators, such as income, schooling, access to public services and life expectancy, than the rest of the country, and has a significantly vulnerable population. Among the states, those with the highest number of deaths were Ceará (34), São Paulo (28) and Pernambuco (19). According to the Observatory of LGBTI Deaths and Violence in Brazil, 8 violent deaths of LGBTQIAPN+ people were recorded in Paraíba in 2022.

Paraíba recorded a total of 68 cases of violent deaths of the LGBTQIAPN+ population between 2017 and 2022, according to data released in a report by the Secretariat for Women and Human Diversity. In total, 24 municipalities in Paraíba recorded cases. João Pessoa has the highest number of cases, with 29 crimes, followed by Campina Grande and Bayeux, with five cases each, and Patos was in third place, recording four crimes. Gay men represent the largest number of murders in Paraíba, leading with 17 of the 29 cases between 2020 and 2022, followed by transvestites who represent six cases in the same period, and in third place are transgender women, with 4 crimes.

Partial data for 2023 from the Observatory of LGBT Deaths and Violence in Brazil, from January to April, totaled 80 deaths. To date, transvestites and trans women account for 62.50% of the total deaths (50); gay men account for 32.50% of the cases (26 deaths); trans men and transmasculine people, 2.50% of the cases (2 deaths); lesbian women account for 2.50% of the deaths (2 deaths); no cases against bisexual people and people identified as other segments have been identified<sup>66</sup>.

PROCASE II includes the LGBTQIAPN+ community as one of its target audiences. The Project will consider LGBTQIAPN+ diversity, support their inclusion and respect for their rights in the context of its interventions. Initially, the Project will map LGBTQIAPN+ communities and their social movements and carry out consultations to listen to their needs and research to understand the socioeconomic and political challenges they face.

Based on this diagnosis and consultations, the Project will seek to define a social inclusion strategy for this group. The proposed activities could include: (i) Awareness campaigns on the rights of the LGBTQIAPN+ community and against LGBTphobia; (ii) Preparation, in partnership with the LGBTQIAPN+ movements, of didactic dissemination materials that can support awareness campaigns in schools and rural communities regarding LGBTQIAPN+ rights; (iii) Promoting consultations and collaboration with rural LGBTQIAPN+ movements, such as the LGBT Working Group of the MST; (iv) Diagnosing the socioeconomic and political barriers to inclusion of this group in the state of Paraíba, especially in rural areas; (v) Supporting rural LGBTQIAPN+ movements.

### **Food Security and Nutrition**

*Food Security:* According to the II VIGISAN<sup>67</sup>, in 2021/2022 food insecurity affected 58.7% of Brazilian households (125.2 million people); in the Northeast, it affects 68% of households, where 12.1 million people are going hungry, i.e., at a level of severe food insecurity. The family farming sector has been hit hardest by the economic crisis of recent years, with small farmers particularly hard hit. In the Northeast, 83.6% of family farming families face some degree of food insecurity in 2021/2022. The worst levels of food insecurity were observed in the families of family farmers who were still unable to return to pre-pandemic conditions, especially those who were unable to fully re-establish their production and marketed quantities. The most recent survey by the PENSSAN Network (2022) points to the current worsening of food insecurity, which affects 63.9% of households in Paraíba, of which 10.6% face severe food insecurity (hunger).

67 II National Survey on Food Insecurity in the Context of the COVID-19 Pandemic in Brazil [II VIGISAN: final report]. Brazilian Research Network on Food Sovereignty and Security - PENSSAN. São Paulo, SP : Friedrich Ebert Foundation. PENSSAN Network, 2022.

*Nutrition.* Despite the process of nutritional transition, with increased access to food, the state of Paraíba follows the national trend and the rest of the Northeast region and faces a double burden of malnutrition, marked by both malnutrition and an increase in the prevalence of overweight. Among adults in Paraíba, 62.5% are overweight (35.5% overweight and 27.0% obese)<sup>68</sup>. Growth retardation affects 4.9% of children under 5 in the state, thinness and marked thinness 4.2%, overweight 8.4% and obesity 6.8%.

The situation in Paraíba is exacerbated among the most vulnerable groups, such as quilombola communities, which continue to have socioeconomic disadvantages that are reflected in higher morbidity profiles, especially in relation to nutritional disorders. In addition, women of reproductive age have greater nutritional needs than men and for this reason usually have worse nutritional indicators than men of the same age, and therefore need differentiated attention. Research shows that in the Northeast, the prevalence of underweight among pregnant women is as high as 18%, compared to 6.7% for the rest of Brazil<sup>69</sup>.

The main root causes of food insecurity and malnutrition in the Project area are the declining quality of and difficult access to water for human consumption and food production; the limited capacity for food production and productive diversification; the low quality of the food consumed; the lack of productive infrastructure; and the low levels of food and nutritional education. It is worth highlighting the direct correlation between food insecurity and malnutrition and poverty rates (69.9% of family farmers registered in the Single Registry (Cadastro Único) in the Project area live in poverty or extreme poverty)<sup>70</sup> and environmental restrictions (such as lack of basic sanitation, interruptions in water flows and poor quality of water sources).

Access to quality water and sanitation play a fundamental role in combating different forms of malnutrition. According to data from the Water and Sanitation Institute in 2019, the rural water service rate in Paraíba is 24.2% compared to 92.2% in the state's urban areas. In relation to sanitation, the rural sewage collection service rate is 2.7% in Paraíba compared to 50.1% in urban areas<sup>71</sup>.

To tackle the causes of malnutrition and food insecurity, PROCASE II will support agroecological backyard gardens, the valorization of underutilized and neglected species (NUS) and support access to water. Among the most common NUS in the state are the cactaceae, which include species such as Mandacaru, Quipá, Xique-xique, Palmatória, Facheiro and Coroa-de-frade. These plants are characterized by the presence of thorns and succulent stems, which allow them to survive dry climates and high temperatures. These activities aim to increase the availability of food for the most vulnerable families, increase the availability of water for human consumption and thus improve their food security and nutrition, while limiting the diseases responsible for the malabsorption of micronutrients.

In addition, the Project will have a cross-cutting sub-component, in which a Nutrition and Food Security Plan will be drawn up and implemented, focusing on exchanges and training. These activities will enable adults and young people to learn about healthy food practices, culinary practices, and gastronomic culture, and will respond to the needs of families and target groups in terms of processing and promoting their products, particularly those from family farming. All these practices will be integrated into the design and implementation of the Resilient Investment Plans (PIR), thus seeking effective implementation and results in terms of food security and nutrition.

### **The problems of land and environmental regularization**

Land and environmental regularization of rural properties is a significant challenge faced by family farmers, especially regarding properties of the Project's target groups. Since the 19<sup>th</sup> century, the instrument that attested to the regularization of a rural property is the title registered at a notary's office. Many of Paraíba's peasant communities have occupied land for generations, however, only few families own an official land title. In some cases, the properties may

71 Water and Sanitation Institute. Sanitation Legal Framework Panel. Available at: <https://aguasaneamento.shinyapps.io/painel-marco-legal/#section-cobertura>. 2019.

have had a registered title in the past, but the inheritance or inventory processes did not go through the notary's office. In countless other cases, purchase-sale transactions and other forms of access to land, have never gone through the regularization process. There are also other cases, such as federal and state settlements of families who are in the process of accessing the land, but who have not completed the regularization process.

In this same context, the case of land owned by quilombola communities - which formally would be vacant land awaiting state action to be regularized - deserves special mention, as does the case of Agrarian Reform settlers. As mentioned in the previous section, in Paraíba there are 47 quilombola communities with recognized certificates of self-definition, with approximately 16,000 people. However, according to information released by the IBGE and the Federal Public Prosecutor's Office, only 11 have their territory officially delimited. Information provided by INCRA's Superintendence in Paraíba confirms that none of the quilombola communities in the state have land titles<sup>72</sup>. In the case of the Agrarian Reform settlers, there are 280 federal settlements in the state, according to data collected from the INCRA Superintendence in Paraíba, with 13,535 settled families. Of these, only 1,835 (13.5%) have land titles.

In addition, a recent law - the Georeferencing Law (Law 10.267/01) in force since 2001 - changed the formal requirements for land regularization, requiring the owner of rural property to inform the National Institute for Colonization and Agrarian Reform (INCRA) of its exact position, characteristics, and extension, as well as its adjoining landowners. Only with this information can the property be registered in the National Rural Registration System (SNCR) and included in the Land Management System (SIGEF), which is a requirement for full land regularization. This created, for the first time in Brazil, a comprehensive and unified land ownership registry, aiming to better organize a complex aspect of the rural sector that faces significant challenges.

Today, many family units in Paraíba do not have full legal documentation and do not have formal recognition of their properties. In many cases, not even the owners themselves are fully aware of this situation. The lack of land regularization weakens the situation of farming families and communities in the event of land disputes and conflicts. It also prevents the issuance of permits and licenses of various kinds (such as licenses issued by environmental agencies or water permits necessary for the exploitation of wells or the use of springs) and can hinder access to credit and pensions. The lack of land regularization can lead to legal insecurity, social vulnerability, and limitations on access to rights and benefits. This situation directly harms the quality of life of these communities, hindering their sustainable socioeconomic development.

On the other hand, there are also problems in the environmental regulatory dimension. The Rural Environmental Registry (CAR), established by the Brazilian Forest Code of 2012 (Law 12.651/2012), is an important instrument for monitoring and environmentally regularizing rural properties. In Paraíba, the CAR has been widely implemented since it was made compulsory in 2012. However, this instrument still faces important challenges, mainly related to the lack of precision in the delimitation of rural properties, compromising the reliability of the recorded information.

Thus, in Paraíba there are just over 181,000 establishments registered with the CAR<sup>73</sup>, which is 11% more than the total number of establishments (163,000) in the state. This results in overlapping areas between properties, generating land use conflicts, legal uncertainties and even difficulties in the analysis that must be carried out by the relevant environmental agencies and in defining responsibilities and environmental preservation actions. These problems hinder decision-making and the implementation of appropriate environmental policies in the context of the CAR.

### **The shortcomings and potential of Knowledge Management, South-South and Triangular Cooperation activities**

When it comes to designing policies, programs or projects aimed at tackling the challenges of poverty, environmental sustainability and resilience to climate change, there is a lack of relevant information available on experiences of

Available at: [https://www.gov.br/mma/pt-br/composicao/servico-florestal-brasileiro/regularizacao-ambiental/boletins-informativos-car/BoletimCAR\\_OUT03\\_2023.pdf](https://www.gov.br/mma/pt-br/composicao/servico-florestal-brasileiro/regularizacao-ambiental/boletins-informativos-car/BoletimCAR_OUT03_2023.pdf)

promoting and supporting inclusive sustainable rural development. In recent years in Paraíba, PROCASE I began systematizing experiences to make up for this lack, with the production and subsequent circulation of a set of products (documents, audio pieces, etc.) which recorded and disseminated relevant knowledge about the work carried out in the Cariri, Curimataú, Seridó and Médio Sertão territories in the semiarid region of Paraíba. In parallel, other IFAD-supported projects in the Brazilian Northeast have also begun to work in the same direction.

South-South cooperation<sup>74</sup> and triangular cooperation<sup>75</sup> is part of this set of initiatives related to the circulation of knowledge between countries in the South, including the funding bodies themselves.

In this context, a Knowledge Management initiative transversally strengthens the implementation of all project components, ensures that knowledge gaps are closed and that good practices, lessons learned, and innovations are disseminated and scaled up, as well as facilitating the impact on public policies. To be effective, PROCASE II must make use of the best and most relevant knowledge available on strategic topics for the implementation and achievement of its objectives, based on evidence and practical experience from sources both internal and external to the project.

Thus, Knowledge Management (KM) should play an important role in building individual and institutional capacities so that the actors learn and can adapt their interventions when necessary. It is also a key tool for measuring and demonstrating the relationship between learning and better development results. KM is also justified as a means of ensuring that beneficiaries, technicians, project staff and other actors involved in implementation access, use, and share the knowledge, good practices and innovations needed for greater impact in promoting sustainable and inclusive rural development.

### **Lessons learned from previous projects**

In the experience of previous sustainable rural development projects, including PROCASE I, the development of new capacities was key to the success and sustainability of the activities. It has made it possible to strengthen social and productive organizations, increase the visibility and inclusion of young people, women, PCTs and indigenous people, incorporate technological innovations, better manage environmental resources, start new activities, manage family production units more efficiently and reach markets in better conditions, and increase interaction with the state through greater access to public policies or political advocacy, using new capacities that remain after the projects end.

We will cite here the example of the Dom Hélder Câmara II Project (PDHC), implemented by the Federal Government, with the financial participation of IFAD, from 2014 to 2022. This project served people living in extreme poverty in several states in the Northeast region. The PDHC succeeded in bringing technical assistance to these farmers, generating a positive and significant impact on their production, both in terms of self-sufficiency and marketed surplus.

PROCASE II takes this accumulated experience into account, which is why Component 2 focuses on capacity building.

## **2 Objectives**

Given the context of vulnerabilities and challenges described above, the aim of this Component is to strengthen the individual and collective capacities of family farmers and their organizations, necessary to increase the adoption of agricultural technologies that promote greater resilience in their systems, to improve productive and social inclusion, as well as the environmental and land conditions of rural communities and their surroundings.

The capacities strengthened through the component will be an essential tool for implementing the investments and innovative practices promoted by Component 1.

---

<sup>74</sup> The United Nations defines South-South Cooperation (SSC) as "a process by which two or more developing countries pursue their individual and/or shared capacity development objectives through the exchange of knowledge, skills, resources and technical expertise, and through collective regional and inter-regional actions, including partnerships involving governments, regional organizations, civil society, academia and the private sector, for their individual and/or mutual benefit within and between regions". Cf. Link: <https://www.ilo.org/brasil/temas/south-south/lang--pt/index.htm>.

<sup>75</sup> Triangular South-South Cooperation (TSSC) is defined in the same document by the United Nations as South-South cooperation supported by a developed country or a multilateral organization. Today, TSSC is an important form of development cooperation. See same link above.

To help achieve the project's general objectives, the component will develop a set of activities with the following **specific objectives**:

- Strengthen the capacities of families and community organizations to implement more resilient and productive production systems, to better manage organizations and to access public policies;
- Strengthening the capacities of rural organizations so that they can develop their production and access markets;
- Strengthen the specific capacities of target groups in the topics gender, youth, PCTs, persons with disabilities, and LGBTQIAPN+ population, to promote their empowerment;
- Promote land and environmental regularization of family farming establishments, agrarian reform settlements and quilombola communities;
- Implementing a knowledge management (KM) and South-South and Triangular Cooperation (SSTC) process to generate, record, share and use relevant knowledge.

### **3 Subcomponents**

Component 2 is organized into five sub-components: Subcomponent 2.1: Strengthening family farmers' capacities; Subcomponent 2.2: Strengthening organizations' commercialization capacities 2.3: Diversity, gender, youth, nutrition and food security; Subcomponent 2.4: Land and environmental regularization; and Subcomponent 2.5: Knowledge management and south-south and triangular cooperation.

#### **3.1 Subcomponent 2.1 - Strengthening family farmers' capacities**

##### **3.1.1 Objective**

The subcomponent will focus on strengthening the capacities of beneficiary families and community organizations with adequate knowledge to implement production systems that are more resilient to climate change and more productive, as well as to improve the management of community organizations, considering the weaknesses and challenges identified in various areas.

It will finance the contracting of Agroecological Technical Assistance (TA) to carry out activities aimed at increasing the beneficiary families' access to adequate and quality information. The main themes to be addressed by TA will be the development of more profitable, diversified, and resilient agricultural production, the protection and recovery of environmental resources and the improvement of organizational management. It will also seek to integrate them more closely into different value chains in the region, with initiatives to support processing and marketing. And finally, the subcomponent will seek to strengthen the contracted TA teams to ensure the good quality of this service.

##### **3.1.2 Strategic orientation and methodology**

There are several barriers in the project area that reinforce the unsustainable *status quo*. Of relevance is the lack of knowledge about resilient and better performing production systems, for various reasons, including the lack of access to agroecological TA services. Also noteworthy is the limited capacity for collective action found in the communities, mainly due to the fragility of the local population's organizations. This situation needs to be overcome to pave the way for transformations that will help overcome the vulnerabilities that characterize this unsustainability.

To carry out this task satisfactorily, the contracted TA entities will follow a training program on topics related to building resilient production systems and associative management. The first task of the contracted TA teams will be to assist on the participatory design process of the Resilient Investment Plans (PIR) and then on their implementation.

There are also significant shortcomings in terms of access to public policies to support Family Farming, whether due to a lack of information about the rules governing access to and operation of government programs, or the lack of or outdated documentation, which diminishes the potential and benefits of the investments made directly by the Project. For this reason, the subcomponent will also aim to develop the skills of the Family Farming public about these public policies.

This subcomponent will also use other instruments to develop the capacities of the target groups. It will be able to hire specialized consultants, hold training events designed to work on topics of particular importance (such as associative

management, for example) and will support the exchange of knowledge between farmers, as an important tool for strengthening their capacities. This activity will make it possible to make the most of the experience and knowledge accumulated by PROCASE I beneficiary families.

### **3.1.3 Planned Activities**

#### ***Activity: Provision of agroecological TA services in communities***

The work to strengthen family units and communities will be carried out through the provision of agroecological TA services in the communities selected to benefit from the Project. All PIR beneficiary families and the corresponding organizations will receive TA services.

This activity to provide TA in the communities will be primarily responsible for conducting the participatory planning process that will enable the PIR to be drawn up and implemented.

These PIR, which are main instrument of activity of Component 1, will contain the investment activities and the introduction of practical innovations in the productive and environmental dimensions, as well as activities to develop the human and organizational capital needed to drive the desired sustainable transformation. The Project's support for this transformation process materializes through the investments, actions, and activities contained in these PIRs.

Once drawn up, each PIR is assessed by the Project's Project Management Unit (PMU) and adjusted for subsequent approval. The approved PIR will be transformed into an agreement, which will be the instrument that allows the transfer of Project resources to local organizations. It will then be up to the hired TA teams under this subcomponent to guide, assist, and monitor the execution of the activities and acquisitions contained in these PIR and the agreement.

In this context, the TA teams will have to provide technical support for the families' various productive activities, especially those directly covered by the PIR. They will also work to encourage the inclusion and effective participation of women and young people in the productive and environmental activities supported by the Project.

The TA provided by these teams will play a crucial role in implementing the agroecological approach of the various production initiatives and environmental preservation and recovery initiatives to be carried out in the communities.

At the same time, the TA teams will have to assist families on access to public policies, starting with access to the CAF (National Family Farming Register)<sup>76</sup>, which is the basic instrument without which farming families cannot access any public policy aimed at them, and access to or regularization of the Single Registry (Cadastro Único), which is also the gateway to other complementary public policies. They should also support the registration needed to access other programs such as PNAE and PAA. The communities and families will be encouraged to look for other sources of funding and service providers to complement the resources allocated by PROCASE II and to meet demands not included in the work plans and business plans it supports. The described process will also seek to create opportunities for cooperation with the private sector, the S System<sup>77</sup>, the third sector and municipalities.

The TA teams will also have the task of strengthening community associations. In this respect, they will be responsible for training and accompanying the teams of these associations to make them capable of managing the defined terms, involving aspects such as acquisitions, recording and accounting of operations, use of financial resources and accountability<sup>78</sup>. This work will be linked to the training on management issues that will be offered to the associations' management teams (see 'Action: Complementary training events for farmers and association managers' below). The PMU team will have to provide ongoing support to the TA teams and the associations to ensure that this process runs smoothly.

---

<sup>76</sup> The CAF replaces the previous equivalent document, the old DAP (Declaration of Aptitude to PRONAF).

<sup>77</sup> The S System is a group of 9 Brazilian private companies (all of which start with S) that provide services in the public interest related to the main sectors of the economy.

<sup>78</sup> As the proper management of an agreement of this type will require the association to have some equipment (such as a computer, a filing cabinet, etc.), it will be important to include these 'association strengthening kits' in the preparation of the PIRs.

It should be emphasized that this TA work on the design and implementation of PIRs should pay special attention to the specific needs and aspirations of women, young people and Traditional Peoples and Communities. To this end, the working methods of these TA teams must be able to take these specificities into account.

The TA must have a regular and continuous local presence with the Project's target group throughout the duration of the service. This will require setting up permanent teams to work with the families and communities to be assisted. These teams will have to dedicate themselves exclusively to serving this public, with an approximate ratio of one technician for between 90 and 120 families. It is estimated that around 600 communities (approximately 18,000 families) will be assisted, for a minimum period of three and a half years, during the lifetime of the Project.

The teams providing these TA services will be multidisciplinary, consisting of technicians with different skills (agricultural and environmental sciences, management, etc.). Whenever possible, the incorporation of experimenting farmers and multipliers, including young people, into these teams will be sought. When selecting the entities that will provide the TA service, criteria will be considered to guarantee the presence of women technicians on the teams, to be as adherent as possible to the specific needs of women and to propose more appropriate solutions for the women beneficiaries of the Project's activities.

The TA will adopt a participatory approach in all the planning and execution of the Project's activity. To this end, it will use a set of appropriate pedagogical tools, such as meetings, field visits and transects, working groups, exchange visits. When necessary, the TA teams will be able to make use of pedagogical tools that allow them to seek out new and relevant information outside the same communities, for example through exchange visits.

In the case of monitoring the implementation of Social Technologies, a specific TA will be contracted which complies with the legal framework for contracting services for this modality. The entities contracted in this way will be responsible for acquiring materials, providing specialized services for the construction of the Social Technologies and training beneficiaries to apply good usage and maintenance practices.

Considering the methodological innovations taking place in TA services (see section on 'Limited access to technical assistance and credit' in chapter 1 Justification), PROCASE II will offer hybrid TA, combining face-to-face and remote modalities, incorporating the use of digital tools.

Capacity-building and support activities on issues that require a more specific and/or technically complex approach will have to be carried out by contracting specialized technical assistance (STA), in addition to ongoing TA. The Project will hire people or institutions with the appropriate skills to assist families, community organizations, and groups of women and young people with whom the Project will work.

Unlike ongoing assistance, STA should generally be contracted for shorter periods (a few weeks or months). In this context, partnerships can be established with entities such as EMBRAPA, SEBRAE, universities and other educational institutions, NGOs, cooperatives and farmers' organizations, private sector companies and others. Individual professionals with the necessary skills can also be contracted to provide STA.

***Activity: Complementary training/exchange events for farmers, including association leaders***

The sub-component provides for the organization of training events that are complementary to the capacity-building work carried out by the TA entities with the communities. It will be essential to hold a series of training events dedicated to management, with an emphasis on managing the agreements connected to the PIR, for the management teams of community associations. Such trainings are important to ensure that these agreements are properly executed and that the respective accounts are properly rendered.

This training work will have to rely on the constant support of the Regional Project Management Unites (RPMU), which will monitor the management processes of the agreements. In the specific case of quilombola communities that may be interested in official recognition, specific events linked to this process can be organized, such as homologation / certification workshops. Training events in environmental education will also be held, focusing on strengthening agroecological practices, climate resilience, community management of natural resources and sustainable use of conservation areas. If other important topics emerge in which there is a significant lack of knowledge, training events dedicated to these topics could be organized for farmers and/or association leaders.

This subcomponent will also support knowledge-sharing events between farmers from the Project's beneficiary communities, as an instrument to strengthen their capacities. This activity will make it possible to value the experience and knowledge accumulated by PROCASE I beneficiary families.

**Activity: Events to improve TA teams' capacities**

The experience of other sustainable rural development projects, including PROCASE I, shows that it will be necessary for the Project to ensure that the TA services offered to the beneficiaries are adequate and effective. It is crucial that the TA teams are fully aligned with the Project's priority focuses.

The experience gained from previous projects in this dimension indicates that there are important shortcomings in the teams of existing TA providers that will need to be addressed<sup>79</sup>. Thus, all the T teams hired under PROCASE II will have to undergo training throughout the implementation of the Project to ensure that they have the necessary knowledge to achieve the desired objectives. The goal is to train 300 technicians.

The PMU is responsible for putting together a training program for the TA teams that includes the themes of participatory planning (which will be materialized in the PIR and PN), agroecology, climate resilience, gender and diversity (including PwD and PCT, as provided for in subcomponent 2.3), nutrition and food security, and access to markets (short value chains, certification).<sup>80</sup> Targeted training will also be provided for more specific activities of the Project, such as restoration of degraded areas, water and sanitation and animal health. The training may take place in a mixed format, with face-to-face and virtual activities, using already produced knowledge management materials, and on an ongoing basis throughout the Project.

The PMU will monitor the TA teams and trained technicians, ensuring that the quality of the services provided to the public is adequate.

**Activity: Training family farmers in public policies**

Chapter 1, Justification, mentions that public policies to support Family Farming are poorly accessed. In other cases, there are policies and regulations in force that are not fully adopted or applied, such as various environmental regulations relating to pesticides and deforestation. The beneficiaries of PROCASE II should be able to get to know these policies better and, when necessary, make use of them.

That is why the Project will seek to facilitate this access, reinforcing an approach of dialog and advocacy on public policies. To this end, it will carry out a broad awareness-raising and training campaign on existing public policies and the mechanisms for accessing them. It will also be necessary to train families so that they can, where appropriate, account for and monitor the development of activities.

This activity of the Project's work will potentially reach a very wide range of the rural population (approximately 32,000 families) in the priority territories of the Project, with an emphasis on women, young people, PCTs, indigenous people, LGBTQIAP+ and persons with disabilities. In this activity, preference will be given to families who have not benefited from other Project activities.

The main instrument of this line of work will be 400 training events in the state's different territories. These events will deal with the main existing public policies for family farming, including PRONAF, Low Carbon Agriculture and Crop Insurance, rural worker documentation and civil birth registration programs, public procurement programs such as

---

<sup>79</sup> We will highlight the shortcomings identified in the following areas: i) in the methodological dimension, it will be necessary to improve the participatory approach in the planning and implementation of investment plans and in the processes of acquiring new knowledge on the part of the families served; ii) in the technical dimension, improving the knowledge of TA entities and teams about innovations designed under the agroecological approach to improve production performance, environmental sustainability and adaptability to climate change of the production systems of families in the different regions of the state; iii) in the economic sphere, expanding knowledge about markets and the processes for accessing them; iv) in operational terms, in general the teams need to develop greater mastery of and use of digital tools in the practice of TA, with an emphasis on carrying out the tasks of monitoring and evaluating the work carried out.

<sup>80</sup> For example, Castro and Pereira point out that the introduction of the "principles of promoting sustainable rural development based on the principles of agroecology, managed democratically and with social control, constitutes a radical change in relation to the previous paradigm of Brazilian TA" (p.23). CASTRO, C. N. d.; PEREIRA, C. N. Agricultura Familiar, Assistência Técnica e Extensão Rural e a Política Nacional de ATER. Brasília / Rio de Janeiro: IPEA, 2017. 41 p. Available at: [https://portalantigo.ipea.gov.br/agencia/images/stories/PDFs/TDs/td\\_2343.pdf](https://portalantigo.ipea.gov.br/agencia/images/stories/PDFs/TDs/td_2343.pdf).

PNAE, PAA, PAA Milk, land access programs for young people (PNCF), access to water (P1MC and P1+2), the Rural Development program and state programs, such as the State Seed Distribution Program. These events will provide more detailed information on the characteristics of each of these policies, including aspects such as eligibility criteria and access mechanisms and, where relevant, the accountability process.

Environmental training and education events will also be held, dealing with the environmental regulations that concern the rural environment and agricultural activities (such as the use of pesticides and deforestation) and also 'good practices' that restore and preserve environmental resources.

Specific events will also be held to facilitate access to public policies, such as initiatives to provide access to basic documentation (e.g., birth certificates and ID cards), updating the Single Registry (Cadastro Único), etc. In addition, local teams from town halls, NGOs, public rural extension agencies, rural workers' unions, and other social movements will be trained.

To implement this activity, it will be necessary to hire advisory bodies with experience in the subject, with capacity and experience in organizing content in a didactic, dynamic way and in accessible language, as well as community mobilization. The first activity to be carried out will be the implementation of a process to identify and mobilize the groups, organizations and communities to be trained. The second activity will be to prepare the courses, defining the content, methodologies and preparing the necessary support materials, according to the demands and profile of the identified beneficiaries. The third activity will be to hold the 400 training events, with broad mobilization of the communities and Project partners.

The contracted entity(ies) should not only produce content and organize and mobilize training sessions but also collaborate with the PMU to involve other project partners engaged in relevant public policies at regional or local levels. This collaboration aims to provide services for issuing and updating documents and registrations necessary for accessing programs (e.g., birth certificates, ID cards, CAF, Single Registry, and other state registrations). By doing so, the contracted entity(ies) can become a focal point for future referrals and guidance, ensuring that the training sessions have tangible impacts and increase access to policies for rural populations.

Although there are converging themes, it should be noted that while the TA and STA services for families and communities are focused on drawing up and monitoring the PIRs (therefore more focused and specific), this activity has a broader focus, accessing families and communities not served by the component 1 plans or those already served by phase I.

#### **3.1.4 Execution arrangements**

*TA and STA activities.* All TA activities will be carried out by TA bodies to be contracted by the Project. Taking the previous experience of PROCASE and other projects as a reference, in its first year of implementation the Project will select TA entities to carry out this work.

The Project will select and contract public or private entities (including third sector organizations, technical cooperatives, etc.) that have proven experience in providing TA services in the biomes present in Paraíba (Caatinga and Atlantic Forest), to provide these services to the beneficiaries. The selection criteria for these entities to be contracted will include: i) having at least 5 years' experience working with sustainable, agroecological agricultural production systems, geared towards adapting to climate change and living in the semiarid region; ii) depending on the region to be served, having experience working with TA in the semiarid region or in the Atlantic Forest region; iii) a technical team with experience working with women, young people, traditional and/or indigenous communities; iv) the ability to work with the theme of protecting and regenerating environmental resources; v) the ability to use digital remote TA tools as a complementary strategy to face-to-face TA; vi) experience working with public programs and policies. As mentioned above, the selection of the entities that will provide the TA service will consider criteria that guarantee the presence of women technicians on the teams.

To provide TA services with a territorial approach, the contracted entities will work by lot, which will be made up of groups of neighboring communities, close to each other, to be defined by the Project after the communities to be covered have been chosen. To avoid excessive concentration, each entity may be selected for a maximum of two lots.

In cases where there is a need to implement social technologies, entities with experience in this area will be contracted, in accordance with the rules of the Federal Government's Cistern Program.

In the case of STA, natural or legal persons should be selected who have proven experience with 'specialized' topics, such as drawing up plans for groups of shellfish gatherers, or specific topics such as sustainable irrigation systems, renewable energies.

*Public Policy Training Activity.* At the beginning of the policy training work, it will be necessary to hire a STA to define the content to be worked on in the communities and to prepare teaching material on the subject. The actual training events will have to be carried out by entity(ies) contracted for this purpose, through an appropriate selection process in addition to the previous ones. The PMU will be responsible for organizing the training events and supervising the work of these contractors.

For other capacity-building activities (training events for TA teams, exchanges, etc.), the PMU will be responsible for organizing the activities and contracting the services and materials needed to carry them out.

### 3.1.5 Costs

Table 1 - Costs of Subcomponent 2.1 - Strengthening family farmers' capacities (values in US\$).

Activities	Amount	Unit Cost	Estimated value (US\$)
<b>Activity: Provision of agroecological TA services in communities</b>			<b>18 900 000</b>
Provision of agroecological TA for families	18 000 families	900	16 200 000
Specialized TA	18 000 families	150	2 700 000
<b>Activity: Complementary training/exchange events for farmers, including association leaders</b>			<b>52 800</b>
Association training courses	92 events	400	36 800
Exchange events between farmers			
Training courses and exchange events on environmental education, agroecological practices, climate resilience, community management of natural resources and sustainable use of conservation areas	40 events	400	16 000
<b>Activity: Events to improve TA teams capacities</b>			<b>300 000</b>
Training events for TA teams	20 events	15 000	300 000
<b>Activity: Training family farmers in public policies</b>			<b>1 000 000</b>
Course preparation, including content and teaching material	1		80 000
Organization of training events for access to public policies	280	2 300	644 000
Training events for access to public policies on current environmental regulations (pesticides, deforestation) and 'good practices' that restore and preserve environmental resources	120	2 300	276 000
<b>TOTAL for subcomponent 2.1</b>			<b>20 252 800</b>

### 3.1.6 Results

Approximately 18,000 families will benefit from TA services, of which 50% should be represented by women, 30% by young people and at least 20% by PCT. Part of this same public (approximately 2,600 people) will be served with complementary training events. Approximately 150 technical TA agents will also be trained.

The Public Policy courses should benefit a total of 32,000 families, of which 50% should be represented by women, 30% by young people and at least 5% by PCT.

### 3.1.7 Implementation schedule

### 3.2 Subcomponent 2.2 - Strengthening organizations' commercialization capacities

#### 3.2.1 Objective

The focus of this subcomponent is to strengthen the capacities of the teams of the economic organizations (mainly cooperatives) served by the Project. The Project will also work with farmer’s groups and organizations to create or strengthen local fairs and small marketing centers. In the context of improving marketing conditions, the Project could also support the creation and/or strengthening of health inspection services at municipal level or for groups of municipalities organized into territories or 'consortia of municipalities'.

The aim is to help family farming organizations and their products enter diversified marketing channels, generating more income for the benefiting families.

#### 3.2.2 Strategic orientation and methodology

In the previous section, it was seen that all the existing local organizations - with a special focus on family farmers' cooperatives - have significant capacity gaps on several key issues. It will be necessary to strengthen the capacities of the cooperatives' teams to make it possible to draw up and then implement Business Plans (PNs). Once the implementation of the PNs is underway, it will be necessary to ensure that the cooperatives' capacities are strengthened on specific topics, such as financial and project management, good production practices, marketing and commercialization and environmental compliance. They will need support, in the form of training, if they are to play an active and effective role in implementing the various sustainable development initiatives they are called upon to carry out.

To achieve these objectives, the subcomponent will use the following main instruments: (i) the provision of Specialized Technical Assistance (STA), focused mainly on preparing and monitoring the implementation of PNs; (ii) various types of training events will be organized (workshops, training courses, technical visits, exchanges, etc.) which will strengthen the capacities of the organizations in areas such as management (including project management), good production, marketing and commercialization practices, environmental compliance and other topics. Work will also be organized to encourage access to short marketing chains (street markets, Solidarity Economy Centres) and to strengthen organizations about creating and/or strengthening health inspection services.

#### 3.2.3 Planned activities

##### Activity: Provision of Specialized Technical Assistance (STA)

As seen above, it will be necessary to strengthen the economic organizations (cooperatives and similar organizations) that will benefit from the Project. This will be achieved through STA services, which are expected to reach 60 of these organizations.

This activity to provide STA to the beneficiary economic organizations will be primarily responsible for conducting the participatory planning process that will enable the PNs to be drawn up and then monitoring their implementation. It will be up to the STA to organize the provision of training on specific topics that are necessary for the success of the organization in the businesses it intends to carry out (and which will be supported by PROCASE II).

In the end, it is hoped that by strengthening the production and management processes provided by STA, the organizations will be able to better structure their production processes, thus adding more value to primary products and accessing new marketing channels.

Individuals or legal entities may be contracted to provide these STA services. The criteria for selecting providers will include: i) experience in providing assistance services to family farming cooperatives; ii) technical capacity related to the specific problem(s) identified by the cooperative, including issues such as improving processing processes, developing a business strategy and identifying new marketing channels, strengthening management in the accounting, financial and administrative spheres, etc., iii) institutional capacity for coordination to mobilize the specific skills required by the supported organizations; iv) technical capacity to deal with environmental and/or climate issues related to the activities carried out by the supported cooperatives; iv) capacity to work remotely (using digital tools); v) experience with access to complementary public policies to support family farming (such as credit, public procurement).

STA services should encourage supported organizations to look for other sources of funding and service providers to complement the resources allocated by PROCASE II and to meet demands not included in the PNs it supports. As market access-oriented organizations will also have to look for possibilities for cooperation with the private sector, STA should support them in this search.

#### **Activity: Initiatives to strengthen fairs and marketing centers**

By supporting family farming organizations with PNs, the Project is encouraging greater access to markets for family farming products. Another way of improving access to markets is to strengthen short marketing chains, creating new short circuits or strengthening those that already exist, so that farmers have greater predictability for the distribution and sale of their produce.

To this end, support will be given to farmer groups and associations who are interested in setting up or strengthening or expanding open-air markets and points of direct sale to consumers in the urban areas of the various municipalities. Groups of family producers can also be supported so that they can be present at local or wider fairs. The Project will also seek to strengthen, in partnership with the State Secretariat for Human Development (SEDH), the Marketing Centers and Solidarity Economy Houses, following the example of the initiative implemented with the same Secretariat by PROCASE I, which made it possible to strengthen the Solidarity Economy Centers that served family farmers in the municipalities of Soledade (in the Western Curimataú micro-region) and Sumé (in Western Cariri).

The Project is expected to support 50 groups and associations, including groups of market traders and Marketing Centers and Solidarity Economy Houses.

#### **Activity: Pilot implementation of Participatory Guarantee Systems (PGS)**

There are already several organizations in Paraíba working on participatory certification. It is possible that another farmers' organization that is working on production with a focus on agroecology and sustainability may wish to become a participatory certification organization. In another plausible scenario, an existing participatory certification organization may wish to expand the scope of its certification processes, for example by adding the certification of animal products to the certification of plant products that it already operates.

In this circumstance, the Project will be able to provide support to carry out the intense process of mobilization (various meetings), training and the acquisition of basic equipment (files, computer, etc.) that is necessary to be able to set up or extend the scope of a Participatory Guarantee System (PGS).

The very creation, expansion, and operation of new PGSs in the regions served by the Project is a strong incentive for family farmers to advance in the sustainable production and marketing of agroecologically-based products, being able to access new markets, sell their products for better prices and contribute to strengthening healthier local food systems.

Fifteen pilot experiments of this type are planned.

#### **Activity: Structuring Municipal Health Inspection Services**

Brazilian legislation requires enterprises that process animal products to obtain a Health Inspection Seal to be able to sell them. In Paraíba, there are very few family establishments whose products have this seal. It is formally the

responsibility of the municipalities to provide the municipal health inspection service, but they rarely do so, citing a lack of financial and human resources. Several states in the country have launched initiatives to form Municipal Consortia<sup>81</sup> with the aim of providing this type of service to the population (and especially to family farmers), and the Federal Government, through the Ministry of Agriculture (MAPA), has supported this initiative<sup>82</sup>. The government of Paraíba has embraced this idea and has set a target in the next Pluriannual Plan (PPA) under the activity 'articulating Municipal Agricultural Inspection Consortia'.

In line with this state guideline and the initiatives taking place in other states, PROCASE II proposes to stimulate the emergence and strengthening of initiatives of this kind by supporting the establishment of municipal Health Inspection Services. A support initiative of this kind will include at least the following phases or stages: i) identification of municipalities that have already formed or wish to form consortia and are interested in setting up a Sanitary Inspection Service of this type; ii) creation or updating of Municipal Inspection Service (SIM) laws by the City Councils and approval of corresponding decrees<sup>83</sup>; iii) Strengthening operational capacity by acquiring the necessary equipment; iv) Strengthening technical capacity by carrying out a series of training courses for the municipal team responsible for the Service, thus enabling them to start operating in practice; v) Monitoring the first six months of operation of the SIM thus created.

By expanding the supply of these services, family farmers and their organizations will be better able to adapt their production processes to obtain certification and increase the sales range of their animal products.

The Project will support, with some investment and training resources, the establishment of the Sanitary Inspection Services of two Consortia during its time of operation.

#### **3.2.4 Execution arrangement**

STA services will be contracted by the PMU, through a selection process that meets IDB standards, with resources provided for in the subcomponent's budget.

Individuals or legal entities may be contracted to provide STA. Criteria for selecting providers will include: i) experience in providing STA services to Family Farming cooperatives; ii) technical capacity related to the specific problem(s) identified by the cooperative, such as improving processing processes, developing a strategy and identifying new marketing channels, developing a certification system, etc.; iii) technical capacity to deal with and integrate environmental issues related to the activities carried out by the cooperatives being assisted; iv) capacity to work remotely (using digital tools); v) experience with access to public policies.

The implementation of the investments defined in the Support Plan for Solidarity Economy Fairs/Centers will be carried out through agreements, Terms of Collaboration, or Cooperation Agreements signed by the PMU with the market associations or Solidarity Economy Centers. The regional teams will play an important role in coordinating the various players involved in these initiatives. If it is not possible to use the terms of collaboration in this way, it will be up to the PMU to organize and deliver the training and purchases included in the Plans. The participation of other secretariats, such as SEDH, will be done through Technical Cooperation Agreements (TCAs) without transferring resources, and the partner secretariats will be able to mobilize human and financial resources from their own programs.

In the case of the implementation of PGS (Participatory Guarantee Systems) pilots and initiatives to support the structuring of Health Inspection Services, the PMU will be responsible for diagnosing the demands and contracting individuals and/or legal entities for consultancy services, the purchase of goods, equipment, and/or small works.

---

81 In the Northeast, there are Municipal Consortia offering this service in Rio Grande do Norte and Bahia. There are also initiatives of this kind in other Brazilian states.

82 In 2021, MAPA published a booklet entitled "Municipal Inspection Services linked to Public Consortia of Municipalities", which details the process of "how to implement, operationalize, promote health security, reduce costs and create opportunities to expand the market for local products". Ref.: BRAZIL-MAPA; CONFEDERAÇÃO-NACIONAL-DE-MUNICÍPIOS; REDE-NACIONAL-DE-CONSÓRCIOS-PÚBLICOS; SEBRAE. Municipal Inspection Services linked to a Public Consortium of Municipalities. Brasília: MAPA, CNM, RNCP, SEBRAE, 2021. 46 p. Available at: [https://www.gov.br/agricultura/pt-br/arquivos/servicos-de-inspecao\\_v6.pdf](https://www.gov.br/agricultura/pt-br/arquivos/servicos-de-inspecao_v6.pdf).

### 3.2.5 Costs

Table 3 - Costs of Subcomponent 2.2 - Strengthening organizations' commercialization capacities (values in US\$).

Activities	Number	Unit Cost	Value (in US\$)
Provision of STA for Economic Organizations with PNs	60 PNs/ orgs.	20 000	1 200 000
Strengthening Local Fairs and Marketing Centers	50 pcs.	16 000	800 000
Establishing Health Inspection Services with Consortia of Municipalities	2 pcs.	150 000	300 000
Pilot of a Participatory Guarantee System	15 systems	2 000	30 000
<b>TOTAL for Subcomponent 2.2</b>			<b>2 330 000</b>

### 3.2.6 Results

The provision of STA services will work with 60 PNs from economic organizations, benefiting approximately 5,000 families, of which 50% must be represented by women, 30% by young people and at least 5% by PCTs.

The initiative to strengthen local fairs and marketing centers will work with 50 units (fairs and centers), benefiting approximately 800 families.

It is planned to set up 2 Health Inspection Services for Municipal Consortia, as well as 15 participatory guarantee systems - PGS.

### 3.2.7 Implementation schedule

3- Establish Health Inspection Services																								
4- PGS pilot experiment																								

## 3.3 Subcomponent 2.3 - Diversity, gender, youth, nutrition and food security

### 3.3.1 Objective

This sub-component will aim to promote the empowerment of women, young people, PCTs, LGBTQIABP+ and persons with disabilities, as well as improving the nutrition and food security of beneficiary families. The activities will work with the Project's cross-cutting themes, strengthening and supporting the integration of these themes into all the components.

### 3.3.2 Strategic orientation and methodology

#### Gender and Diversity:

The Project will take a holistic approach to transforming gender relations, promoting the inclusion of Afro-descendants and PCTs, the LGBTQIAPN+ community and persons with disabilities, focusing on the environmental, economic, political, and cultural causes of the social vulnerability of these groups. To transform unequal power relations, shaped by patriarchal and exclusionary structures, norms and practices, as well as empower women, Afro-descendants and PCTs, the LGBTQIAPN+ community and persons with disabilities, the following transformation paths will be followed: i) promote economic empowerment and equality by valuing women's contributions to the family economy and community development, ii) address the issue of women's overload due to domestic and care work by promoting a fairer division of the workload between men and women, iii) empower target groups to have a greater voice and decision-making power in rural institutions and organizations, iv) promote advocacy in policies for women, youth and

PCTs, v) prevent gender-based violence, v) value traditional knowledge, practices and ways of life in production, food and natural resource management and vi) promote the inclusion of the LGBTQIAPN+ community and persons with disabilities, seeking to strengthen them, promote their leadership and respect for their rights.

Therefore, this sub-component aims to support the mainstreaming of the gender and diversity strategy throughout the Project, which will have an intersectional approach, considering the overlap of multiple discriminations of gender, race/ethnicity, sexual orientation, and disability. All the activities and products proposed for this component will be contained in and guided by the Gender and Diversity Strategy and Plan to be drawn up at the start of Project implementation.

#### **Youth:**

Among the factors that influence staying in rural areas is access to work and income opportunities, education and training that is suited to the characteristics of rural areas, appreciation of rural lifestyles, and the availability of services and conditions that can offer the possibility of success in agricultural production. To respond to these issues raised in the youth diagnosis, seeking to promote the permanence of young people in rural areas, as well as offering more opportunities for sustainable income and work for young people in general, the strategy of this subcomponent is based on three main lines of action:

- I. Promote a broad training program in agricultural and non-agricultural activities that generate greater employment and income opportunities,
- II. Implement a program to revalue life in rural areas through communication activities,
- III. Promote the formation of Youth Networks and debates on issues relevant to the development of rural youth.

#### **Nutrition and Food Security:**

To improve food security, nutritional status and increase the adoption of healthy eating practices by the Project beneficiaries, this PROCASE II subcomponent will implement a strategy centered mainly on food and nutrition education training. There will be 3 main lines of action:

- i) Raising awareness of good nutrition and health practices (reproductive health, maternal health, and child health), to improve the nutritional and health status of women and children.
- ii) Raising awareness of the food culture, healthy eating, which includes the Underutilized and Neglected Species (NUS) of the target territories, and
- iii) Training vulnerable communities in the processing of healthy local products to increase their daily consumption in a sustainable way and foster the empowerment of vulnerable communities, valuing local food culture.

The nutrition and food security activities in this subcomponent complement the activities to increase access to and availability of food by increasing production, productive diversification, and income as a result of the productive investments provided for in component 1.

#### **3.3.3 Planned activities**

##### **Activity: Gender and Diversity Plan**

The Gender and Diversity Plan will be drawn up in the first few months of Project implementation by the PMU's Gender and Diversity specialist with the support of a specific consultancy hired to detail the general strategy and implementation methodology for all activities related to gender equity and women's empowerment, as well as the inclusion of PCTs, persons with disabilities and LGBTQIAPN+. The activities set out in the Gender Plan should include:

##### Modular training in Gender and Diversity for the Project and TA teams:

All project teams, from the PMU and the decentralized units (RPMUs), will be trained in gender and diversity issues to ensure that these themes are integrated into all dimensions of PROCASE II's management and implementation and that all Project activities are adapted to the specific demands of women, Afro-descendants, PCTs, the LGBTQIAPN+

community and persons with disabilities. Training will take place in all the regional offices in the Project territories. The PMU's Gender and Diversity specialist will be responsible for training the Project team, as well as supporting colleagues in addressing issues of gender equality, women's empowerment, Afro-descendants, PCTs, LGBTQIAPN+ and persons with disabilities in their operations throughout implementation, including in knowledge management, M&E, and results measurement.
